Among the numerous orders received by the Christensen Engineering Co. during last month was an order for 392 air brake equipment from the Massachusetts Electric Companies for their different railway divisions. This order will require 13 cars for its shipment and will be sent from Milwaukee to these roads during the month of September. The order is highly gratifying to the Christensen Engineering Co., inasmuch as it shows a substantial appreciation by the railway company of the efficiency of the air brakes in actual service. The first equipment put on any railway line belonging to the Massachusetts Electric Companies was installed on a car of the Taunton & Brockton Street Railway, in May, 1898, and on account of the excellent service given by this and other equipments installed at a later date, the Christensen company has received orders continuously since May, 1898, from the different railway companies which are now a part of the Massachusetts Electric Companies, culminating in the last order for 392 equipments. This makes a total of 604 air brake equipments which have been purchased by the roads controlled by the Massachusetts Electric Companies, and represents every double truck car in service on their lines.

The Christensen Company has also closed within the past month a contract with the Boston Suburban Ry. for 100 equipments to be put on its double truck cars operating on the Commonwealth Avenue Street Ry., Newton & Boston Street Ry., Newton Street Ry. and Lexington & Boston Street Ry. This contract was closed after exhaustive tests.

The Christensen Engineering Co. has just completed the foundation for a 250-ft. extension to its present machine shop, which is 186 ft. in width. This extension when completed will cover 46,500 sq. ft. of ground space. In addition to the ground floor 41,500 sq. ft. more floor space will be provided by the galleries on each side, and in the center of the building, which is three stories in height.

### IMPROVED TRACK BROOMS

We illustrate herewith an improved form of railway track broom made by H. Thompson of Concord, N. H. This broom is now made with several attachments which render it very serviceable for street railway work. It is both strong and durable and is

sufficiently light in weight to be conveniently handled. One of its important attachments is a tool for cleaning curves and setting switches. This tool is fastened to the handle and contains a chisel of hardened steel, which will wear indefinitely. This attachment being practically indestructible is arranged to be easily changed from one handle to another as the brooms wear out. The maker will be pleased to furnish circulars and prices upon application.

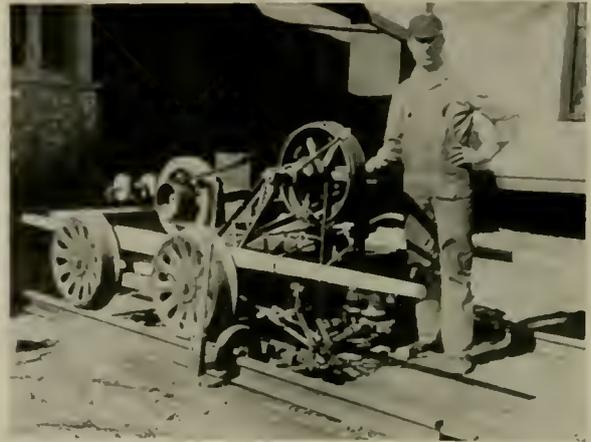

### SPEED ON CLEVELAND-TOLEDO LINES.

A high rate of speed has been attained on the new lines of the Lake Shore Electric Railway Co. between Cleveland and Toledo. Recently a trip was made over these lines by the officials of the road, on which occasion a speed of 80 miles an hour was maintained for a stretch of half a mile, and a speed of 70 miles an hour for the distance of three miles. It required five hours to make the trip, including 50 minutes from the Public Square in Cleveland to Rocky River and 20 minutes' run within the city limits of Toledo. The average speed was from 35 to 40 miles an hour. The roadbed is admirably constructed, especially west of Newark, over which part of the route, for a long distance, the road is almost absolutely level.

The Huntsville Electric Railroad Co., of Huntsville, Ala., has temporarily replaced its electric cars with a line of hacks. The generators at the power plant burned out and these, together with other repairs, will require from ten days to two weeks.

### GOSLING DUPLEX TRACK DRILL.

The accompanying illustration shows the power driven duplex track drill invented and manufactured by Henry J. Gosling, 15 Talbot St., Cleveland, O. The drill is mounted on a light steel framed car of stiff construction, so that no appreciable vibration results from the operation of the motor. The machine employs a gasoline motor of 1½ h. p. capacity, but it may be speeded up to considerably exceed this power. The machine drills two holes at once at any desired distance apart to suit different lengths of bonds and it is flexible in all directions and swings from one side of the truck to the other, so that either rail may be drilled. It is adjustable vertically and may be set to clear all obstacles encountered on construction roads, crossings, etc., and can be operated by one

GOSLING DUPLEX TRACK DRILL.

man, although it is advantageous to have a helper to keep the soda water tank supplied. These machines were used in bonding the rails of the Aurora, Elgin & Chicago Ry. and the electrical engineer of the road states that more than 200 bonds per day were placed on an average and on one occasion 212 bonds were put in place in ten hours' work. This required from 400 to 425 1-in. holes to be bored through the webs of 80 lb. rails. The machine is easily put into position and four men can remove it from the track when desired. In future machines of this kind it is proposed to use horizontal gasoline engines such as are employed on automobiles which will be capable of developing 4 h. p. and be considerably lighter in weight. This form of machine is more compact and easier of access in case repairs are necessary. Mr. Gosling is an English engineer of wide experience, having been connected with various South American railroads, as locomotive superintendent and engineer of construction. He was also connected with the Grand Trunk Ry., the Montreal Harbor Commission and previous to his present business was superintendent of the Acme Machine Co.

### EXCURSIONS VIA PENNSYLVANIA LINES.

G. A. R. Excursions—October 3, 4, 5 and 6. Chicago to Washington, D. C., and return, \$15.85. Good to return until October 14, subject to extension of limit until November 3, 1902.

New York Excursions—October 3, 4, 5 and 6. Chicago to New York and return: Fort Wayne route, \$25.85; Pan-Handle route, \$23.30. Return limit, October 14, 1902.

Boston Excursions—October 7 to 11. Chicago to Boston and return: Fort Wayne route, all rail, \$25.00; Sound Lines, \$24.00. Pan-Handle route, all rail, \$23.00; Sound Lines, \$22.00. Return limit, October 13, subject to extension until November 12, 1902.

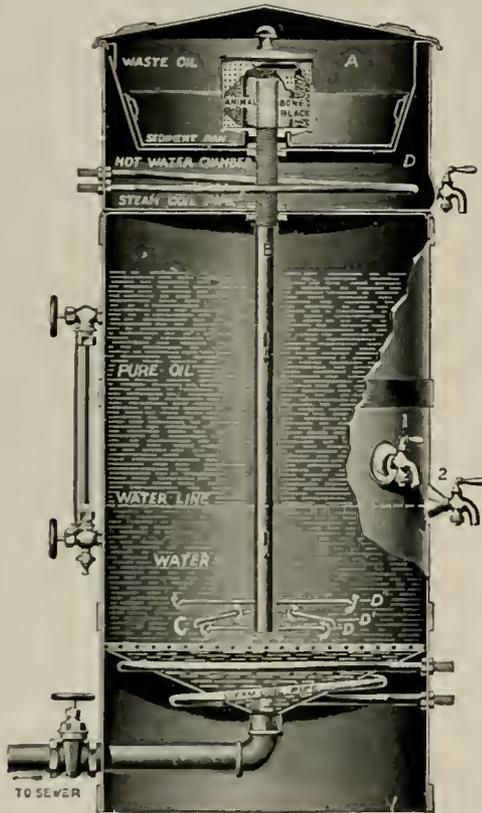

Any further information desired will be furnished by addressing H. R. Dering, Assistant General Passenger Agent, No. 248 S. Clark St., Chicago.

Manistee, Mich., is endeavoring to force the Manistee, Filer City & East Lake Railway Co. to lay new rails on all the paved streets in the city. The city engineer has advised the use of a 70-lb. 7-in. girder rail to take the place of the T-rail at present in use.

**THE AMERICAN OIL FILTER.**

A new filter recently placed upon the market by the Burt Manufacturing Co., of Akron, O., is shown in the accompanying illustration, and a brief description of the principles involved in its operation should be of interest to all readers who appreciate the saving effected by collecting waste lubricating oil, and filtering it over and over until it has been entirely used up. The saving in this way amounts to from 50 to 90 per cent, depending upon how carefully the oil is collected after having been used. This is an economy which is not generally overlooked in large plants, but the "American" oil filter is made in small sizes which are a profitable investment in connection with engines where even as little as two barrels of oil are used per year.

This filter has been especially designed by the Burt company for use with very heavy grades of oil, which cannot be successfully

SECTION OF "AMERICAN" FILTER.

cleaned in an ordinary filter because of the liability to clog up easily. The claim is made that such oils are readily purified by this filter, and obviously, therefore, it must give perfect results in the filtering of common engine oil. The fact that the oil is heated, and thereby thinned immediately upon being poured into the filter, accounts for its high speed of operation and superior capacity.

The pan for receiving the waste oil is surrounded by a hot water chamber, through which passes a steam coil pipe. When this chamber has been filled with warm water, and the lower part of the filter has also been filled with warm water until it flows from faucet No. 2, the filter is ready for operation, the proper steam connections, of course, having been previously made. The cleaning of the oil is then accomplished as follows:

Through the filtering material in the cylinder the oil makes its way into tube B, and down onto the filter plate D, where the pressure of the oil above overcomes the resistance offered by the weight of the water, and the oil spreads out in a very thin film, becoming thinner and thinner as it travels from the center to the circumference of the plate. Every particle of the oil is thus exposed to the action of the water and this process is repeated as the oil flows upon plate D 1 and D 2. The remaining impurities then settle by force of gravity to the bottom of chamber E, and are drained

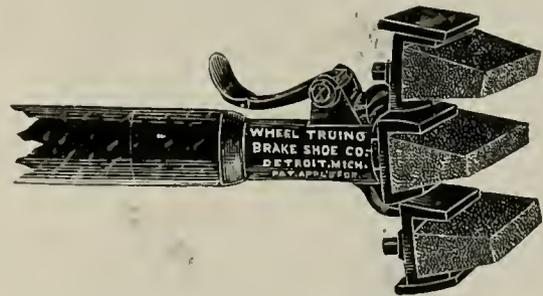

off by simply opening the valve. The pure oil is drawn from faucet No. 1.

Attention is called to the little care required by the filter. Any kind of filtering material may be used, or none at all, and the filtering material may be removed without interrupting the oil service. The method of cleaning the filter is very simple, requiring only that the cylinder at the top be unscrewed, the filtering substance removed, and the sediment pan lifted out and emptied of the dirt and grit which has collected in it. In the "American" filter the bulk of the dirt is collected at the top instead of the bottom, greatly increasing the ease with which the latter may be cleaned.

**COMMUTATOR TRUER.**

The Wheel Truing Brake Shoe Co., of Detroit, whose "truing" brake shoe has been introduced on both electric and steam railroads in all parts of the world, has brought out a new device that promises to meet with as great success in its field as has the brake shoe.

This little tool consists of a handle upon the end of which are a number of sockets or holders, into each one of which is fixed an abrasive block. Some of these holders are fixed while others are

DEVICE FOR TRUING COMMUTATORS.

movable, so that they can be adjusted independently of the fixed ones.

By a simple and ingenious arrangement the tool is made self-adjustable to any sized cylinder; the blocks conforming to a perfect arc of the circle to be operated upon and held in the desired position while the tool is in use. Insulating strips of hard rubber are used wherever necessary, and prevent short circuiting, and the blocks themselves are made of non-conducting material.

The company makes blocks of different abrasives and of different textures according to the work to be done. For certain work, as for instance turning down steel or iron cylinders, the abrasive blocks are replaced by blocks of steel serrated like a file, so that the tool can be used with a lathe for operating upon various metals as well as upon the commutators in a car while the same is running. It will readily be seen that a device which will true up a commutator while the car is running, or, better still, will prevent a commutator from becoming untrue, will bring about a very perceptible saving in cost of electric repairs. Mr. J. M. Griffin, president and manager of the Wheel Truing Brake Shoe Co., is the inventor and has arranged with his company to handle the device. Various forms and sizes are made, adapted for use upon stationary dynamos and motors.

**LOW RATES TO THE NORTHWEST.**

Commencing September 1 and continuing until Oct. 31, 1902, second-class one-way colonist tickets will be sold by the Chicago, Milwaukee & St. Paul Ry. from Chicago to all points in Montana, Idaho, Utah, California, Washington, Oregon, British Columbia and intermediate points at greatly reduced rates. Choice of routes via St. Paul or via Omaha.

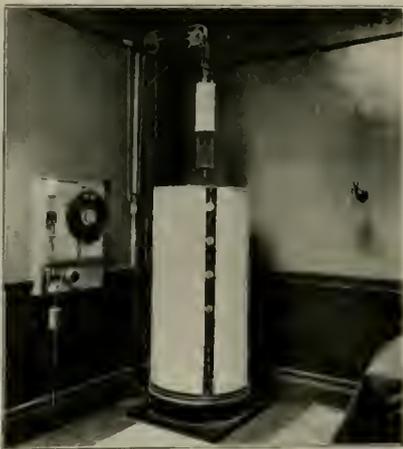

The Chicago, Milwaukee & St. Paul Ry. is the route of the United States Government fast mail trains between Chicago, St. Paul and Minneapolis, and of the Pioneer Limited, the famous train of the world.

All coupon ticket agents sell tickets via Chicago, Milwaukee & St. Paul Ry., or address F. A. Miller, General Passenger Agent, Chicago.

### BLUE PRINTS FROM ELECTRIC LIGHT.

Owing to the difficulty in producing blueprints at times when the weather conditions are unfavorable the Pittsburg Blueprint Co., of Pittsburg, Pa., has introduced a machine which makes blueprinting entirely independent of dark or rainy days. The machine is known as the cylindrical electric copier and a view of one type is shown in the accompanying illustration. This standard, upright machine is recommended as the best type for all general work and consists of two glass half-cylinders bent to true curves and bound together with brass bands at top and bottom. A strong canvas cover fits around the glass to hold the tracing paper in place and this method insures excellent contact so that even with folded or crumpled tracings no marks are shown on the blue print. This cylinder rests upon a base which is mounted on wheels and revolves about the axis of the cylinder.

The printing is done by means of an arc lamp of special design which is suspended directly above the cylinder and which has a vertical movement which is regulated by means of an escapement for

CYLINDRICAL ELECTRIC COPIER.

regulating the speed of the lamp in its descent. The tracing and sensitized paper being placed between the glass and canvas cover, the lamp passes axially through the cylinder, giving a uniform exposure to all parts of the print. The time of exposure for any print being once determined, any number of prints thereafter can be made of absolutely uniform tints, and the operation of the machine is extremely rapid, taking only one or two minutes for an ordinary exposure.

It has also been found that the cost of printing with this machine is considerably less than by the old fashioned sunlight exposure.

The Pittsburg Blueprint Co., also makes a tilting machine specially adapted for making copies of small tracings, a large number of which are to be placed in the machine at each loading. The cylinder is mounted on trunions at the center and may be turned over to a horizontal position while being loaded with tracings and paper. It is then turned into an upright position and exposed in the manner just described.

These machines require considerably less floor space than any other type of blueprinting machine, and the company keeps a complete stock of repair parts on hand and can therefore guarantee its customers against any serious delay when repairs are needed.

### NEW PLANT FOR KNELL AIR BRAKE CO.

The Knell Air Brake Manufacturing Co., Ltd., of Battle Creek, Mich., which was organized recently to carry on the manufacture of the Knell air brake, is now in full operation. The company's new plant is completely equipped with the most modern machine tools and in addition to the brakes, the company is prepared to build all sorts of special machinery. The company is much gratified at having recently received a number of duplicate orders from roads having the Knell brake in service. The officers of the company are:

President, Charles E. Thomas; vice-president, Minard Lafever; secretary, Joel C. Hopkins; treasurer, R. F. Hoffmaster; manager, A. H. Metzelaar.

### THE NEW WESTINGHOUSE FOUNDRY AT TRAFFORD CITY, PA.

The remarkable growth of the affiliated Westinghouse industries was recently signalized by the creation of a new city and the building of another Westinghouse manufacturing plant. This new industrial center is located 17 miles east of Pittsburg on the Pennsylvania R. R. and is to be known as Trafford City. Extensive factory sites have been laid out here to provide for the overflow of the several Westinghouse industries, a number of which have already used up all the available building room at their present locations and are still pressed for space. The first of the Westinghouse companies to erect buildings in the new city is the Westinghouse Foundry Co., which is at present putting up an extensive and model foundry plant and pattern shop described in this article. This addition is necessitated by the rapidly increasing business of the Westinghouse Machine Co., especially in connection with very large steam and gas engines and steam turbines.

In laying out Trafford City provision has been made, not only for the factories that are to be erected there, but also for homes and all modern improvements and comforts for the men who are to work in the factories. The latter will be located on a fairly level area between the Pennsylvania Railroad and the residence portion of the city, which will be reached from the railway station by a steel viaduct 1,100 ft. long. The residence district has been laid out upon hillsides and a generally level plateau, high enough above the factory sites to render it free from smoke and dirt. The town consists of two oblong areas, one of which is about  $\frac{1}{2}$  mile by 1-5 mile, and the other  $\frac{1}{2}$  mile by 1-7 mile, the two areas meeting in such a way as to form a reversed letter "L," the corner of which is the most northerly part. The town has been laid off into about 800 building lots, each with an average frontage of about 30 ft. and a depth of 100 ft. In addition to this, space has been left for six parks. The entire town has been provided with waterworks and sewer systems, the latter including separate storm water and sanitary sewers. This work, as well as the paving of the streets, was completed before the town was opened to settlement, on June 7, 1902. Many intending purchasers of lots came to the site a day before the sale was to commence and "squatted" on the ground which they wished to possess.

Besides the transportation facilities afforded by the Pennsylvania R. R., over which there are 46 local passenger trains going each way daily and reaching Pittsburg in from 25 to 35 minutes, a street railway line has been built, connecting with the Pittsburg Railway Co.'s line at Wilmerding,  $2\frac{1}{2}$  miles distant. This street railway passes over a steel viaduct into Trafford City and forms a loop through the principal streets.

The factory site, located in a bend of Turtle Creek, provides room for nine factory buildings, each about 200 ft. by 800 ft. A system of railway yards and tracks serving this area has been laid out in a very thorough manner, providing a track alongside of each building and transversely through each end. The storage tracks, in connection with this, occupy an area of about 300 ft. by 200 ft. This system of tracks is connected with the main line of the Pennsylvania R. R. by the Turtle Creek Valley branch of the latter. It is also to be connected with the towns of Wilmerding and East Pittsburg, where the works of the Westinghouse Air Brake Co., the Westinghouse Electric & Manufacturing Co., and the Westinghouse Machine Co. are located, by an interworks railway which will be operated by the Westinghouse interests.

The new foundry and pattern shop of the Westinghouse Foundry Co., which, as before stated, are at present being erected, are located at the extreme southern portion of the factory site and near the steel viaduct mentioned above. The pattern shop and storage building, which has already progressed well towards completion, is a steel and brick structure 605 ft. long and 80 ft. wide, with a height to the eaves of the roof of 47 ft. The pattern shop occupies 160 ft. at one end of this building. It is divided into two floors, the second floor being suspended from the roof trusses in order that the first story may be entirely free from columns, thus providing ample space for handling the largest patterns. The remaining 447 ft. of the

building is to be used for the storage of patterns and has three floors, the two upper floors being supported on steel columns and the entire space being divided by interior fire walls into three separate compartments. The foundations are of concrete and the superstructure of steel and brick. The foundation of the ground floor is made up of 8 in. of concrete into which the floor sleepers are bedded and on top of these is a layer of 2-in. maple flooring. The upper floors in both the pattern shop and storage building are supported on steel beams and steel girders, and are made up of 3-in. yellow pine flooring covered by one thickness of maple flooring.

The foundry building is 611 ft. 8 in. long and 184 ft. 3 in. wide outside of the brick walls, which are 36 ft. high at the eaves and 80 ft. at the peak. As in the case of the pattern shop, the foundations are built of concrete and the superstructure of steel and brick. The foundry is divided transversely into three bays, the center bay being 80 ft. 3 in. wide between centers of columns, runways being provided for traveling cranes of 80-ft. span and 150 tons' lifting capacity. The cranes will be electrically driven. The two side bays are each 50 ft. 6 in. wide from center to center of columns and are provided with runways for traveling cranes of 47 ft. 2½ in. span and 50 tons' lifting capacity. At one side of the foundry building runways are provided for yard traveling cranes of 100-ft. span and a lifting capacity of 75 tons. The I-beam purlins are spaced 8 ft. center and center and are covered with 3-in. yellow pine roof sheeting. The roof is covered with slate.

At the middle of one of the side bays, where the cupolas are located, is a charging floor about 50 ft. square, constructed entirely of steel. The melting equipment of the foundry will consist of two air furnaces, each having a capacity of 30 tons, and three cupolas capable of melting 18 tons per hour each. This will enable a casting weighing as much as 100 tons to be easily poured and the casting can afterwards be lifted out of the sand by one of the 150-ton traveling cranes. The air furnaces will be used for the largest and most important castings, owing to the fact that they yield a superior quality of iron, and the cupolas will be used for the ordinary classes of castings, and particularly small castings.

The buildings will be equipped throughout with modern lavatories and conveniences for the comfort of workmen and will be in every respect up-to-date. They will be heated by hot air, the foundry, pattern shop and pattern storage rooms to have minimum temperature of 50, 60 and 35° F. respectively, in zero weather. Artificial light will be furnished by both arc and incandescent lamps. In order to insure plenty of light during the day, the windows are large, and both the foundry building and pattern shop are provided with skylights of large area. The plans for the buildings were prepared under the supervision of the Westinghouse Machine Co. The Security Investment Co., of Pittsburg, Pa., is the financial agent and general contractor for the entire works, and James Stewart & Co., of St. Louis and Pittsburg, are the managers of construction. The Real Estate Trust Co., of Pittsburg, Pa., successfully handled the extensive sale of city lots adjoining the new works.

### TRADE NOTES.

DURING THE MONTH of August the New York office of the Otis Elevator Company closed contracts for 63 electric elevators.

THE DEWITT SAND BOX CO., of Troy, N. Y., has appointed C. J. Harrington, 15 Cortlandt St., N. Y. City, its New York agent.

THE "CLIMAX" CATTLE GUARD, as made by the Climax Stock Guard Co., Marquette Bldg., Chicago, has been approved by the Michigan Commissioner of Railroads, as complying with the law of that state.

EM. TERQUEM, 5 Rue des Mathurins, Paris, has sample copies of the publications of the Windsor & Kenfield Publishing Co., and persons in France desiring to subscribe can conveniently order through him.

THE LORAIN STEEL CO. is preparing to erect two new furnaces at a probable cost of \$1,500,000. The plans for these furnaces are now being prepared and a new power mill will also be added to run the furnaces.

THE GOLTZ ENGINEERING CO., Chicago, makes a specialty of manufacturing metal block letters for electric signs and its new bulletin No. 3, just published, should be in the hands of every firm installing electric signs.

THE MANSFIELD ENGINE CO., of Mansfield, O., has just been formed by the consolidation of the Mansfield Machine Works and the Century Machine Works. The new company has a capital of \$100,000, and is erecting a thoroughly modern plant on the site of the old Century plant.

THE WHEEL TRUING BRAKE SHOE CO. reports 1902 as its banner year. Its trade now extends all over the world, and it has recently made shipments to Australia, South America, Portugal, India, Africa, The Netherlands, Ireland, Scotland, England and other foreign countries. Its customers include over 400 electric roads and many steam roads.

THE INDIA RUBBER & GUTTA PERCHA INSULATING CO., of Yonkers, N. Y., has recently installed alternating current motors to replace a number of small isolated steam engines formerly used for driving the carpenter shops and the winding and braiding department. The motors used are of the Westinghouse type and are in sizes from 1 h. p. to 15 h. p.

THE DETROIT AUTOMATIC STOKER CO., of Detroit, makes a side-feed stoker in which hot air is admitted in jet form over the coking coal, and proportionable with the volatile gases distilled from the fuel. The president of the company is T. H. Simpson; vice-president, R. P. Joy; manager, G. L. K. Morrow, and the secretary and treasurer, F. C. Thompson.

THE MICA INSULATOR CO., of New York and Schenectady, announces that it is making an addition to its plant which will increase the output 50 per cent and enable it to fill all orders very promptly. The company was led to take this step in order to meet the increasing demands of the trade for its well-known specialties, Micanite goods, "Empire" goods and M. I. C. compound.

"THE RAILWAY EQUIPPER" is the title of an interesting monthly published by the M. Mitshkun Co., of Detroit, and intended for circulation among railway, mining, lumber and construction companies as well as contractors of all kinds. The September issue is now ready and the paper will be mailed free each month for one year upon application. Trade catalogs will be acknowledged in the paper.

AN INGENIUS CARD device, for displaying the colors of Dixon's silica-graphite paint in such manner as will permit of an exact idea of each color, is being issued by the Joseph Dixon Crucible Co., Jersey City, N. J. The color chart carries with it suggestions as to the class of construction that can be protected with this paint, also instructions as to best methods of applying protective paint. This chart can be secured by request to the company.

JAMES W. COPELAND, 934 Equitable Bldg., Denver, Col., has been appointed sales agent for his state for the Scaife and We-fu-go water softening and purifying systems made by the William B. Scaife & Sons Co., of Pittsburg. Mr. Copeland was formerly located at St. Paul and recently opened an office in Denver, where he acted as manufacturers' agent. He is well known throughout the west in engineering circles and has given much attention to water purification.

F. H. LOVELL & CO., 100 William St., New York, have recently engaged A. Hall Berry as general manager, who will be glad to furnish the trade anything in the way of railway insulations, special molding insulations of all kinds for switch work and for motor controllers, arc lamps, and where high temperatures have to be met. This firm is prepared to supply enclosed fuses, a line of brass castings and intends to push its trade in the general line of electric supplies.

THE LIBERTY MANUFACTURING CO., of St. Louis, Mo., maker of the "Famous" oil refiner and purifier, is mailing a folder explaining the method of testing purified oil. The folder is accompanied by a flat tin pan in which to place some dirty waste oil upon the steam chest of an engine where it is heated from 150 to 200 deg. F. By means of this heating all the grit and other impurities are precipitated and the oil on top becomes clear and bright. This method of heating is the principle adopted in the operation of the "Famous" oil filter.

THE BULLOCK ELECTRIC MANUFACTURING CO., of Cincinnati, O., has recently issued four bulletins on its various electrical apparatus. Bulletin 1,002 describes the Bullock type of "N" motors, 1,003 gives descriptions and dimensions of the Bullock marine generating sets, 1,012 shows views and describes the Bullock motors installed at the Hudson County Brewery, Hoboken,

N. J. and 1,013 illustrates the power house of the People's Electric Railway Co., of Wilmington, Del., which contains five Bullock generators ranging in size from 250 to 350-kw.

THE WESTINGHOUSE ELECTRIC & MANUFACTURING CO. has installed a 440-volt plant for lighting five new buildings of the University of Illinois, at Champaign. Two phase alternating current will be used, and each phase will be treated as a single-phase circuit operated on the three wire system, the neutral wire being supplied with current from an auto-transformer. The generating plant contains two belted two-phase generators of 50 and 75 kw. capacities, operated at 440 volts, to which will shortly be added an engine type revolving field 120-kw. alternator.

J. HOWARD EWALD has been appointed general sales agent for the Scaife and We-lu-go water softening and purifying systems for the territory of Southern Illinois, Missouri and Texas. Mr. Ewald's headquarters will be 83 Laeclde Bldg., St. Louis, Mo. These systems for water softening and purifying are manufactured by Wm. B. Scaife & Sons Co., of Pittsburg, Pa. Mr. Ewald has made a special study of water purification, and is well qualified to take care of this line of work. He has been for many years identified with the iron and steel industries in this territory, and is well known in engineering circles.

PROBABLY THE LARGEST elevator contract ever awarded is that given the Otis Elevator Co. by the Metropolitan Life Insurance Co., for the additions to its building, Fourth Ave., 23d and 24th Sts., New York City. The new equipment consists of 23 high-pressure passenger elevators, 4 hydraulic freight elevators and 2 electric passenger elevators, and contemplates converting the 13 passenger elevators in the original building, so as to operate them at the increased pressure. The plant, when complete, will consist of 40 hydraulic elevators, operated from one pumping station. Messrs. N. LeBrun & Sons are the architects and V. J. Hedden & Sons, builders.

THE UNITED RAILWAY & ELECTRIC CO., of Baltimore, has awarded a contract to E. Saxton, the well-known contractor of Washington, to lay 200,000 feet of conduit in the outskirts of Baltimore, and the contract calls for a nine multiple duct to be manufactured by the Standard Vitrified Conduit Co., of New York. The Standard Underground Cable Co., of Pittsburg, is to furnish the cable. The Standard Vitrified Conduit Co. has also an order for 200,000 feet for the Richmond Telephone Co. of Richmond, Va., large orders for the Niagara Falls Power Co., the Southern Bell Telephone Co., and the Mobile Light & Railway Co., of Mobile.

THE J. A. FAY & EGAN CO. and THE LANE AND BODLEY CO. are planning the erection of a building near their Bond Hill factories for the use of their workmen. The building is to be in the nature of a boarding house and restaurant, and it is to be conducted so as to take the place of the saloons and boarding houses which are invariably found in the neighborhood of large manufacturing establishments. Everything offered by the saloon except liquors will be offered here, but in an attractive way, and at such an economical price as to make saloon competition impossible. Meals and rooms will be offered at a price much less than workmen could otherwise secure.

C. J. HARRINGTON, 15 Cortlandt St., New York City, is out with a new catalog of the electrical material handled by this firm. The book contains 127 pages, with complete index and code, and is fully illustrated. This house keeps in stock a large assortment of overhead line material and other supplies and is in a position to furnish anything needed by electric railway, lighting and telephone companies. Among other prominent concerns represented by Mr. Harrington may be mentioned the Heil Railjoint Welding Co., the New Century Car Heater Co., the Knell Air Brake Co., the United States Fender Co., and the Seranton Fire Brick & Conduit Co. The new catalog will be sent on request. Mr. Harrington has purchased the entire plant where "Medbury" insulation was made and removed it to his Newark factory where Medbury material will be made and sold under the name "Empire."

THE BUDA FOUNDRY & MANUFACTURING CO., of Harvey, Ill., has issued its 1902 catalog of "Railway and Contractors' Supplies," which is a book of 150 pages, pocket size, bound in flexible leather covers. Among the apparatus and supplies which will particularly interest street railway companies and contractors we note the following: Dump cars, of from 1½ yd. to 5 yd. capacity; rock dump cars; the "Buda" pattern heavy base rail drills; the Paulus track drill; a complete line of switch stands; rail benders;

the Bogue & Miller system of street and crossing guards. Interested parties can secure copies of the catalog by addressing the company at Harvey, or at the Chicago office, 617 Monadnock Bldg.

"A NEW DEPARTURE IN CIRCUIT BREAKERS" is the title of a catalog issued by the Hartman Circuit Breaker Co., of Mansfield, O. These circuit breakers are designed on new lines and are practically oil switches as well as circuit breakers, as the break in all cases is made in oil. They are made in various types suitable for motors, switchboards and trolley cars. Larger instruments of the double pole type are set by means of two handles so that if a short circuit exists on closing the second handle the first one will immediately fly open. The catalog contains illustrations and descriptions of all the different types, together with tables showing the carrying capacities, range of adjustment and price list.

THE J. G. BRILL CO., Philadelphia, has issued a new catalog on the Brill snow sweepers, snow plows and track scrapers. These machines are all illustrated and briefly described and the standard dimensions are also given. In the standard sweeper short brooms are used, independently adjusted, which conform to the curvature of the pavement and are set at an angle so that the snow is thrown clear of the tracks instead of being pushed ahead. The plows are made in three styles, namely, the shear plow, the nose plow and the combined snow plow, electric locomotive and construction car. The track scraper is designed for use on either high or low cars and is provided with an attachment whereby the blades are dropped instantly into place by a touch of the foot.

THE GENERAL RAILWAY SUPPLY CO., of Pittsburg, Pa., is rapidly taking its place among the leading street railway supply houses. Commencing business a few years ago practically unknown to the street railway trade, this company has enjoyed a remarkable growth, representing at present many of the leading manufacturers of railway supplies, among which are the R. D. Nuttall Co., the Mayer & England Co., the International Register Co., the Speer Carbon Co., the Protected Rail Bond Co., the Frank Ridlon Co., the Sills-Eddy Mica Co., and the Garton Daniels Co. The manager, Mr. George W. Provost, who has by hard and persistent efforts brought about the success of this company, is well known to the trade, and it is needless to say that under his capable management its future success will be equally marked.

THE STUART-HOWLAND CO., of Boston, has recently appointed Mr. Harry DeSteele manager of its New York branch. Mr. DeSteele has been for 12 years constantly engaged in various branches of street railway work, both in this country and Europe, and has shown marked ability in his line. His earliest experience was gained under Postmaster General Payne at Milwaukee. He was manager of the railway department of the Western Electric Co. at New York from 1896 to 1900 and left to take charge of establishing a supply business at London, Eng. His many friends throughout this country will be glad to learn that he has become associated with this enterprising house, and the Stuart-Howland Co. are to be congratulated on having secured so able and energetic a representative.

THE ELLIOTT BROTHERS ELECTRIC CO. has been organized with W. H. Elliott president and manager, and G. E. Elliott secretary and treasurer, the offices of the company being 970-972 Hamilton St., Cleveland, O. Announcement is made that Messrs. Elliott have severed all connection with the Van Dorn-Elliott Electric Co. and opened a new factory which is equipped with modern appliances for doing an extensive repair and supply business. A special effort will be made to give prompt service, and quick deliveries as well as first class repair work. W. H. Elliott will have charge of the trade in the field and will spend a considerable portion of his time in traveling, while G. E. Elliott will have the management of the office and plant. Particular attention is directed to the armature and motor field coils for the manufacture of which special designed machinery has been installed.

THE SYRACUSE RAILROAD CONSTRUCTION CO., which is building a twenty-five-mile electric railroad between Auburn and Syracuse, New York, has recently closed a contract with the Westinghouse Electric & Manufacturing Co. for two 650-kw. engine-type alternators, delivering three-phase current at 360 volts and 2,000 alternations; also for five 400-kw. rotary converters, together with raising and lowering transformers for operating a 15,000-volt transmission line to two sub-stations. A complete switchboard is included and in fact everything for the operation of a

complete railway line. The generators are to be direct connected to two 22 and 44 x 48-in. cross-compound, horizontal, Corliss engines, purchased from Westinghouse, Church, Kerr & Co., and built by the Westinghouse Machine Co. The engines are to receive steam at 150 lb., are to run at 100 r. p. m., and are rated at 1,000 h. p. each, with a maximum rating of 1,800 h. p.

THE AMERICAN BRAKE SHOE & FOUNDRY CO., which our readers will remember was organized a few months ago to operate the plants formerly controlled by the Ramapo Foundry Co., Mahwah, N. J., the Lappin Brake Shoe Co., Bloomfield, N. J., and Buffalo, N. Y., the Corning Brake Shoe & Iron Works, Corning, N. Y., the Sargent Co., Chicago Heights, Ill., the Ross Meehan Foundry Co., Chattanooga, Tenn., is now in the field as a manufacturer of brake shoes under all the different patents controlled by the companies mentioned. The American company will, in its product, combine all the merits of the various brake shoes and eliminate the disadvantageous points from the design. Among the names well known in connection with this company's shoes are the Sargent, "Diamond S," Lappin, Corning, Streeter, Herron and Cardwell. A considerable portion of the output of the company is in miscellaneous steel and iron castings.

METROPOLITAN INJECTOR is the title of the latest catalog of the Hayden & Derby Manufacturing Co., of New York City. The products of this company are the Metropolitan automatic injectors, the Metropolitan 1898 injectors and the Metropolitan double tube injectors, which are used in stationary plants and for marine and portable boilers. The company also manufactures H. D. ejectors and other jet apparatus. The company has lately moved into its new factory, where it has installed the most improved machinery. Its laboratories are equipped with every kind of instrument for carrying on experiments and research, and its testing facilities are excellent and are arranged so that its products can be tested thoroughly under all conditions found in practice. The catalog embodies a great deal of useful information relating to injectors and ejectors, showing the results that can be attained under the various conditions. Copies of the catalog will be forwarded to any one interested in the subject.

THE GENERAL ELECTRIC CO. has recently issued the following publications: "Electric Pumping Machinery," a 106-page pamphlet illustrating and describing modern types of electrically driven pumps. Bulletin No. 4287, on "Single-Phase Alternating Current Generators—125 cycles." Bulletin No. 4290, on "Electric Railway Apparatus," being a reprint of the paper by Ernest J. Berg, read before the American Institute of Electrical Engineers, at Buffalo, Aug. 24, 1901. Bulletin No. 4291, on "Compensated Revolving Field Generators." Bulletin No. 4292, on "C. E. Generators." Bulletin No. 4293, on "Constant Current Transformer Panels." Bulletin No. 4294, on "The G. E.-73 Motor." "Lightning Arresters," a 68-page pamphlet describing General Electric lightning arresters, with an introduction on "Atmospheric Electricity and Lightning Protection," by Elisha B. Thomson. "Advantages of Using Oil in Transformers," a 14-page pamphlet. Catalog and Price List No. 7550 (superseding No. 7529), on "T-H Series Open Arc Lamps." Price Lists Nos. 5100 and 5101, on "General Electric Measuring Instruments" and "Lightning Arresters."

PAWLING & HARNISCHFELGER, Milwaukee, Wis., state that the demand for electric cranes and hoists remains very satisfactory and that buyers are now inclined to secure hoisting apparatus conforming to standard design. Among recent sales the following may be noted: Davenport Foundry & Machine Co., Davenport, Ia., one 5-ton crane. Allan Wood Iron & Steel Co., Conshohocken, Pa., one 15-ton crane. Smeeth Copper & Bronze Co., Chicago, one 10-ton crane. Copper Queen Consolidated Mining Co., Bisbee, Ariz., three 10-ton cranes. International Harvester Co., Deering Division, Chicago, two special 5-ton hoists. Vulcan Crucible Steel Co., Allquippa, Pa., one 15-ton crane with 3-ton auxiliary hoist; American Sheet Steel Co., Cambridge, O., and McKeepport, Pa., two 30-ton cranes with 5-ton auxiliary hoists and one 10-ton crane. Greenlake Foundry Co., Milwaukee, Wis., one 15-ton crane. American Foundry & Construction Co., Pittsburg, Pa., one 3-ton crane; Reading Iron Co., Reading, Pa., one 10-ton crane. Canonsburg Steel & Iron Works, Canonsburg, Pa., one 25-ton crane with 5-ton auxiliary hoist. The Holthoff Machinery Co., Cudahy, Wis., one 3-ton hoist. Albi-Chalmers Co., Milwaukee, Wis., for Sanitary District of Chicago, one 15-ton crane. McCroway & Lorley Co., Pittsburg, Pa.,

one 2-ton crane; Brown Corliss Engine Co., Corliss, Wis., one 30-ton crane with 5-ton auxiliary hoist; Gisholt Machine Co., Madison, Wis., one 10-ton crane; The Milwaukee Electric Railway & Light Co., Milwaukee, Wis., one 5-ton special hoist; The Standard Steel Works, Burnham, Mifflin Co., Pa., one 10-ton crane; Christensen Engineering Co., Milwaukee, two 10-ton cranes; Hanson & Tunelis, Chicago, one 1½-ton hoist crane; Sterritt-Thomas Foundry Co., Pittsburg, one 10-ton crane; The Elyria Iron & Steel Co., Elyria, O., one 15-ton crane.

THE ALLIS-CHALMERS CO. reports for July the following partial list of "1890" frame Reynolds-Corliss engines: L. T. Williams & Sons, New York; G. A. Bergland, Milwaukee, Wis.; John M. Stone Cotton Mills, Starkville, Mass.; Combination Rubber & Belting Co., Bloomfield, N. J.; Lidgerwood Manufacturing Co., New York; Brunswick-Balke-Collender Co., Chicago; C. A. McDonald, Chicago; Griffin Wheel Co., Chicago; International Paper Co., New York City; also the following orders for girder frame Reynolds-Corliss engines: Owosso Casket Co., Owosso, Mich.; Rock Plaster Co., New York City; Madero & Rinson Gallardo, Lagos, Mexico; Springfield Manufacturing Co., Rockville, Conn.; Keye Brothers, Argyle, Minn.; Barnet & Record Co., Minneapolis, Minn.; Cashier Mining & Milling Co., Breckenridge, Col. The following miscellaneous sales were also made: Buffalo & Susquehanna Iron Co., Buffalo, N. Y., four boilers of the convertible cross-compound steeple type blowing engines; Studebaker Brothers Manufacturing Co., South Bend, Ind., independent air pump and condenser; Thomas Kent Manufacturing Co., Clifton Heights, Pa., one Reynolds convertible boiler; Milwaukee Electric Railway & Light Co., Milwaukee, Wis., two convertible cross compound direct-coupled engines; Tonawanda Iron & Steel Co., North Tonawanda, N. Y., one vertical long crosshead type blowing engine; American Steel & Wire Co., Pittsburg, Pa., six pairs of convertible cross-compound steeple type blowing engines and two convertible low pressure long cross head blowing engines; McCormick Harvesting Machine Co., one vertical cross-compound direct-connected Reynolds-Corliss engine; New Orleans Railways, New Orleans, La., two vertical cross compound direct connected engines; Omaha Water Co., Omaha, Neb., one 20,000,000-gallon vertical triple pumping engine; San Antonio Water Co., one 50,000,000-gallon vertical triple pumping engine; the Ptarmigan Mines, British Columbia, one single Riedler express compressor; Pennsylvania Railroad Co., Pa., two Sederholm boilers.

### SEVEN HOURS AND FIFTEEN MINUTES TO ST. LOUIS—FAST TIME MADE BY THE B. & O. S. W.

The Cincinnati and St. Louis Express, No. 1, due to leave Cincinnati via B. & O. S. W. 9:00 a. m., arriving St. Louis 5:45 a. m., made a fast run Saturday, August 16th. The train left Cincinnati 51 minutes late, was delayed 22 minutes en route, and arrived St. Louis on schedule time. The run was made in 7 hours and 47 minutes; the distance is 339 miles, and the regular time 8 hours 45 minutes.

This fast time was beaten a few days later. Second No. 1 left Cincinnati 10:30 a. m., made the run to Washington, Ind., a distance of 170 miles, in 210 minutes; consolidated with regular No. 1 at the latter point, arriving St. Louis 5:45 p. m., on time, making the run from Cincinnati to St. Louis in 7 hours and 15 minutes. This is the fastest run ever made between these two cities.

### WIRES CUT AT TAMAQUA, PA.

The striking miners in the Panther Creek Valley committed depredation on the electric railway that runs from Tamaqua, Pa., to Summit Hill, August 27th, for the purpose of incapacitating the line and thus preventing the expected arrival of troops from Manila Park. Several of the poles on the line were chopped down and the wire cut.

The Interurban Motor Co., which was recently incorporated at Indianapolis, with a capital of \$5,000, has commenced making regular trips with an automobile buss between Garrett, Auburn and Waterloo, Ind.

## FINANCIAL.

## BROOKLYN RAPID TRANSIT.

The report of the Brooklyn Rapid Transit Co. for the year ending July 30th, last, shows a decrease in the net earnings of \$292,000, but it also shows an increase in the gross earnings of \$688,507. The decrease in the net earnings is due to the fact that they have been used for improvements, betterments, and equipments, but hereafter as the company is now provided with dividends for its new bond issue the earnings will not be diverted in this way. A comparative statement of operation for the months of June and July, 1901 and 1902, are as follows:

	JUNE		
	1902.	1901.	Increase.
Miles operated (single track).....	489.3	488.9	.40
Gross receipts .....	\$1,195,287	\$1,181,023	*\$ 14,264
Expenses, including taxes.....	732,152	732,740	*588
Net receipts .....	433,135	448,282	*15,147

	JULY		
	1902.	1901.	Increase.
Miles operated (single track).....	489.3	488.9	.40
Gross receipts .....	\$1,236,400	\$1,203,700	\$ 32,700
Expenses, including taxes.....	708,130	759,494	*50,358
Net receipts .....	528,263	445,206	\$ 83,057

\*Decrease.

A comparative statement for the fiscal year ending June 30th, 1901 and 1902, is given as follows:

	1902.			1901.		
	Miles operated (single track).....	Gross receipts .....	Expenses, including taxes.....	Net receipts .....	Increase.	Decrease.
Miles operated (single track).....	489.3			488.9	\$688,507	
Gross receipts .....		\$1,278,704		\$1,201,107	\$77,597	
Expenses, including taxes.....		8,952,214		7,970,634	*203,072	
Net receipts .....		3,837,490		4,130,503		

\*Decrease.

It is stated that the earnings of the system for the month of August exceeded by \$75,000 the large returns for the corresponding month a year ago.

## NEW YORK METROPOLITAN.

The Metropolitan Street Railway Co., of New York, it is stated, has paid all of its fixed charges, with the deficit of about \$104,000 after the 7 per cent dividends guaranteed by the Metropolitan Securities Co. were paid. This is considered very satisfactory in view of the condition of the streets on which some of the leading lines run, on account of the excavations for the rapid transit subway. The Third Ave. line is reported to have earned its fixed charges and a small surplus. With the securities company furnishing the money to make the necessary betterments the earnings will hereafter, it is generally considered, more than suffice for the 7 per cent guaranteed dividends.

## NEW YORK RAPID TRANSIT.

The total expenditure for the Rapid Transit work, including that for the month of August, has been \$20,300,000, or 58 per cent of the total appropriation of \$35,000,000. The figures for the last five months showed an average monthly expenditure of \$1,200,000. The road has now assumed a very tangible shape and the engineers in charge of the work are confident that the west branch will be completed within 16 months, and the entire east branch will be finished at about the same time.

## MANHATTAN ELEVATED, NEW YORK.

The Manhattan Railway Co. recently issued its report for the fiscal year ending June 30th. The gross earnings for the year amounted to \$10,665,911, an increase of \$1,242,233. The balance available for dividends was \$3,073,476, an increase of \$751,120. The number of passengers carried during the year was 215,250,345, which is the largest number carried during any year since 1893. During 1899 the management of the road raised \$18,000,000 from the sale of new stock authorized to meet the expenses of the change in motive power. A portion of this capital is loaned on interest, which considerably augments the revenue of the company. The following table shows the earnings of the company during the last fiscal year in comparison with that of the previous year:

	1902.	1901.
Gross earnings .....	\$10,665,911	\$ 9,416,888
Operating expenses .....	5,518,585	5,253,239
Net earnings .....	5,147,326	4,163,658
Other income .....	625,800	836,384
Gross income .....	5,773,126	5,000,042
Interest and taxes .....	2,699,671	2,677,706
Net income .....	3,073,455	2,322,335
Dividends, 4 per cent. ....	1,920,000	1,920,000
Surplus over dividends.....	1,153,455	402,335
Passengers carried .....	215,250,345	199,049,741

## THE PHILADELPHIA CO., PITTSBURG.

The Philadelphia Co. with its affiliated corporations has issued a comparative statement of earnings, expenses and net income for the months of August, 1901 and 1902, as follows:

	1901.	1902.
Gross earnings from operations.....	\$928,868	\$1,061,378
Operating expenses and taxes.....	592,641	793,925
Net earnings from operations.....	336,257	357,453
Other income .....	17,489	83,198
Total earnings and other income.....	353,743	440,652
Deductions from income.....	34,593	70,519
Total income .....	319,150	370,132
Fixed charges .....	266,953	321,989
Net income .....	53,099	48,143
Less proportion of same to credit of owners of capital stock of affiliated corporations other than the Philadelphia Co.....	69,172	1,386
Balance represents Philadelphia Co's interest in the total net income.....	*16,076	49,756

\*Deficit.

The Philadelphia Co. includes the Consolidated Gas Co., of Pittsburgh; Allegheny Illuminating Co., the Allegheny County Light Co., Chartiers Valley Gas Co., Union Gas Co., of McKeesport, and the Equitable Gas Co., of Pittsburgh, in addition to its electric railway properties.

## CINCINNATI, NEWPORT &amp; COVINGTON.

The Cincinnati, Newport & Covington Railway Co. has issued a financial statement showing comparative figures for July, 1902 and 1901, and also for the first seven months of each year. The statement is as follows:

	JULY.	
	1902.	1901.
Gross receipts .....	\$ 77,887.00	\$ 76,620.00
Operating expenses .....	29,875.00	33,458.00
Rents .....	215.00	215.00
Taxes .....	3,500.00	3,000.00
Rents .....	1,565.00	1,511.00
Tolls .....	7,763.00	7,846.00
Total expenses .....	42,853.00	46,021.00
Net earnings .....	35,034.00	39,599.00
Fixed charges, interest on bonds.....	15,416.00	15,416.00
Interest on temporary loans.....	551.00	
Total fixed charges .....	15,967.00	15,416.00
Net profit .....	19,066.00	15,182.00
Operating ratio .....	38.35	43.66
Same including damages, taxes and rents....	45.05	49.80
Same, including damages, taxes, rents and tolls .....	55.01	60.00

## SEVEN MONTHS.

Gross receipts .....	500,937.00	461,258.00
Operating expenses .....	199,706.00	194,550.00
Damages .....	10,500.00	10,500.00
Taxes .....	24,500.00	21,000.00
Rents .....	1,505.00	1,511.00
Tolls .....	54,519.00	54,311.00
Total expenses .....	290,730.00	281,873.00
Net earnings .....	209,306.00	179,385.00
Fixed charges, interest on bonds.....	108,244.00	107,916.00
Interest on temporary loans .....	748.00	1,604.00
Total fixed charges.....	108,992.00	109,520.00
Net profit .....	100,314.00	69,865.00
Operating ratio .....	39.93	42.17
Same including damages, taxes and rent....	47.23	49.33

# DAILY STREET RAILWAY REVIEW

PUBLISHED BY

WINDSOR & KENFIELD PUBLISHING CO.

65-69 Congress St., West

Detroit, Mich.

## SUBSCRIPTION, PER YEAR, \$3.00

CHICAGO OFFICE,	- - - -	45-47 Plymouth Court

Application made for entry as second-class matter.

**VOL. XII.      Wednesday, October 8, 1902.      No. 1**

Special attention is called to the fact that all the meetings will be called on Detroit city time, which is 28 minutes faster than central standard time.

The local committee announces that there is a large amount of mail matter and a few telegrams still uncalled for at the manager's office in Exhibition Hall. All exhibitors and representatives of supply houses are encouraged to call and enquire for mail.

Our readers will note that the first page of this issue is No. 613. The folio numbers for the "Daily Review" are consecutive with those of the regular monthly issues of the "Street Railway Review" and all four "Dailies" should be preserved for binding, in order to have the year's file complete.

The headquarters of the "Review" at the Convention Hall are at Space No. 28, just at the left of the main entrance, where we shall be glad to welcome our friends. Both street railway men and supplymen are requested to leave their cards at the "Review" space in the Armory.

We hope that the American Street Railway Association will seriously consider the question of changing its name to that of the American Electric Railway Association, as was suggested in the "Review" for Sept. 20, 1902. As we said in that issue, all the arguments in favor of changing the name of the association apply with equal force to the name of the "Street Railway Review," and we then announced our intention of changing the name of the "Street Railway Review" to the "Electric Railway Review."

It is noticeable that every year a larger number of street railway companies are sending as delegates to the convention their heads of departments, as well as the president and general manager. Among the companies that are sending large delegations this year are those of Milwaukee, Wis.; Rochester, N. Y.; Philadelphia, Buffalo and New York City.

Messrs. Berry Brothers, Limited, the varnish manufacturers whose home is in Detroit, will give a carriage ride, Thursday afternoon, to the ladies in attendance upon the convention. This feature of the entertainment was determined upon after the official program was printed so it does not appear in that. An announcement will be made in tomorrow's "Daily Review" of the time the carriage and ladies will leave the Cadillac.

The Crocker-Wheeler Co. invites its friends to join it on a trolley party Thursday afternoon to the Rochester Power House of the Detroit United Ry. Special cars will leave from Griswold and Congress Sts. at two o'clock sharp (city time) for the delegates and representatives attending the convention. The trip will afford an entertaining ride through an attractive country and give an opportunity of inspecting a complete railway plant in operation. Mr. Charles W. Startsmann, of the Crocker-Wheeler Co. can be found at the Knell Air Brake exhibit, Space No. 23, Exhibition Hall.

The American Street Railway Association will meet at 11 o'clock, in the assembly hall, which is on the floor below the main exhibit hall.

There will be a meeting of supplymen at the convention hall at 11:30 a. m. today, to hear the report of F. S. Kenfield, the secretary of the committee appointed last year at New York to consider the organization of a Street Railway Manufacturers' Association. Further information may be had by inquiring at the "Street Railway Review" space or at the general information bureau.

The Wheel Truing Brake Shoe Co., of Detroit, advises us that it has arranged for an "overflow theater party" for Thursday. For fear that the capacity of the Detroit Opera House may not be sufficient to accommodate all those desiring to accept the courtesies of the A. S. R. A., the lower floor of the Temple Theater has been secured for the same evening, and those failing to secure tickets for the Detroit Opera House may get places for the Temple by applying at the space of the Wheel Truing Brake Shoe Co. in Convention Hall.

### ANNOUNCEMENTS FOR REVIEW DAILY.

The editors of the Daily Street Railway Review will be pleased to receive copies of any special announcements or invitations, and notice of outings, or excursions of any kind not arranged for by the official program. A memorandum of any coming event or notice of any kind intended for the "Daily" may be left at our headquarters at Space No. 28, Exhibition Hall, at the Hotel Normandie, or at our printing headquarters with the R. L. Polk Printing Co., 65 Congress Street West, Detroit Mich.

### HOW TO REACH EXHIBITION HALL.

The annual exhibition of street railway material is being held this year at the Light Guard Armory, corner of Larned and Brush Streets. To reach the hall from the Cadillac Hotel, take a Michigan avenue car and transfer to Jefferson avenue, getting off at Jefferson avenue and Brush street. The hall is one block north of this point. From any of the Woodward avenue hotels, take a Jefferson avenue car and get off at the same place. The hall is about eight minutes ride from the Cadillac.

### PRESIDENT HUTCHINS.

It was extremely gratifying to learn that President Hutchins, of the Detroit United Railway, had sufficiently recovered from his serious illness to meet the officers of the association yesterday, and everyone regrets that Mr. Hutchins' health will not permit him to take a more active part in the association meetings and entertainments.

### SECRETARY PENINGTON'S GOOD WORK.

It is difficult for an outsider to appreciate the hard work involved in getting under way a large convention such as the American Street Railway Convention. Much of this task naturally falls on the secretary of the Association, and too much credit can not be given Secretary Penington for the able way in which he has handled the exhibits, the registrations, and the matters in general incident to starting the convention.

Secretary Penington has been on the ground since Saturday, working hard to clean up the odds and ends and have everything in readiness for the opening day. An innovation this year was the opening of the registration books on Tuesday afternoon and evening, thus enabling supplymen and delegates to obtain badges, theater and banquet tickets, etc., before the rush on Wednesday morning.

Anyone seeing the secretary without his coat and eating his supper and giving out badges at the same time will not doubt the truth of what we have said.

### A. S. R. A. PROGRAM.

All meetings, etc., will be called on Detroit city time. Detroit time is 28 minutes faster than standard time.

Papers will be presented at the American Street Railway Association convention on the following subjects.

"Registration of Transfers"—Brooklyn Heights Railroad Co., by C. D. Meenely, secretary and treasurer.

"Benefit Associations"—Metropolitan Street Railway Co., of New York, by Oren W. Root, assistant general manager.

"Discipline of Employes by the Merit System"—Metropolitan Street Railway Co., of Kansas City, by W. A. Satterlee, general superintendent.

"Transportation of Light Express and Parcel Delivery"—Detroit United Railway, by George W. Parker, general express agent.

"The Steam Turbine: Its Commercial Aspect"—E. H. Sniffen, of Westinghouse, Church, Kerr & Co., New York.

"Signals for Urban and Interurban Railways"—Old Colony Railway Co., Boston, by G. W. Palmer, jr., electrical engineer.

"The Adjustment of Damage Claims"—Chicago City Railway Co., by M. B. Starring, assistant general counsel.

The papers have not been assigned to the different sessions, but other details of the program are as follows:

#### WEDNESDAY.

Address of welcome by Mayor W. C. Maybury, of Detroit.

Roll call.

Invitations extended to join the Association.

Address of President.

Report of Executive Committee.

Report of Secretary and Treasurer.

Appointment of committee on nomination of officers and selection of next place of meeting.

#### THURSDAY.

No business session will be held on Thursday.

#### FRIDAY.

Report of Committee on Rules for the Government of Employes: J. C. Brackenridge, general manager Brooklyn Heights R. R., chairman; E. C. Foster, general manager Old Colony Street Railway Co.; T. E. Mitten, general manager International Railway; W. E. Harrington, general manager Camden (N. J.) & Suburban Railway Co.

Report of Committee on Standards: N. H. Heft, president Meriden (Conn.) Electric R. R., chairman; E. G. Connette, vice-president and general manager, Syracuse (N. Y.) Rapid Transit Co.; C. F. Holmes, Kansas City; John I. Beggs, president and general manager Milwaukee Electrical Railway & Light Co.; E. A. Newman, general manager, Portland (Me.) Railroad Co.; R. T. Ladd, general manager, Worcester (Mass.) Consolidated Street Railway Co.; Will Christy, vice-president Northern Ohio Traction Co., Akron, O.

Election of officers.

### ENTERTAINMENTS.

#### WEDNESDAY.

An informal reception will be tendered the ladies in attendance at the convention from 10 a. m. to 4 p. m. at Hotel Cadillac.

A general reception will be held at Hotel Cadillac at 8 o'clock in the evening.

#### THURSDAY.

The entire day will be devoted to the examination of exhibits at Convention Hall.

Thursday evening there will be a theater party at the Detroit Opera House to see "When Johnnie Comes Marching Home."

#### FRIDAY.

A trolley ride will be given for the ladies on Friday morning, leaving Hotel Cadillac at 10 a. m. for Mount Clemens, via the Rapid Railway and Gratiot Ave., returning via the Shore Line to the Country Club, Grosse Pointe, where luncheon will be served at 1 o'clock. The return to the city will be made at 4 p. m.

The banquet will be held at Hotel Cadillac at 8 o'clock, at which the installation of the officers elect will be held.

### PROGRAM OF ACCOUNTANTS' ASSOCIATION

WEDNESDAY, OCT. 8, 1902, 10 A. M.

Address of Welcome by Hon. F. A. Blades, Comptroller of the City of Detroit.

Annual Address of President

Annual Report of Executive Committee.

Annual Report of Secretary and Treasurer.

Paper: "The Collection and Reporting of Fares on City and Interurban Lines," by Wm. C. Sampson, treasurer Union Traction Co. of Indiana.

Appointment of Convention Committees on Nominations and Resolutions.

Afternoon, 2 o'clock.

Annual Report of Committee on Standard Material and Supply Accounting.

Paper: "The Stationery Store-room," by J. R. Shurtz, auditor South Jersey Gas, Electric & Traction Co., Camden, N. J.

NO SESSION ON THURSDAY, OCT. 9, 1902.

FRIDAY, OCT. 10, 1902, 10 A. M.

Chart of Street Railway Blanks, suggested by G. E. Tripp, general auditor, Stone & Webster's Co.'s, Boston, Mass.

Annual report of Standardization Committee.

Afternoon, 2 o'clock.

Report of Committee on Standard Form of Report for Electric Railways.

Report of Committee on Nominations.

Election of Officers.

Report of Committee on Resolutions.

Installation of Officers.

Adjournment.

### ANNOUNCEMENTS.

Badges of the Association will be honored on all city and interurban lines.

Information bureaus will be established at Hotel Cadillac and at Exhibition Hall.

The Western Union and Postal Telegraph companies will establish offices in the Exhibition Hall and the Michigan Bell Telephone Co. has installed telephone instruments for the use of the delegates at the hall.

The American District Telegraph Co. will also install its service at Exhibition Hall.

The power houses and storage battery stations at Riopelle St. and Hancock and Third Aves., in Detroit, and at Farmington Junction, Birmingham, Rochester, Ecorse, New Baltimore, Ypsilanti, on the interurban lines, will be open for inspection of delegates at the convention.

"TO WHOM THE HONOR BELONGS."

To the convention delegate or visitor who walks into the Light Guard Armory for the first time Wednesday morning there may not be anything that will strike him as being particularly remarkable. We have had tastefully decorated exhibit halls before, and we have even had conventions where most of the exhibits were in place by Wednesday morning, as they are here, but if the visitor will take the trouble to ask the first exhibitor what kind of treatment he has had from the local exhibit committee, the reply will be, "Never finer in the history of the Association." The words may be changed, but that will be the sentiment. Yesterday the hall was chaos. To-day every display is practically completed, and the suppliers are ready to receive the delegates.

Who made it possible?

First and foremost must be mentioned Mr. John H. Fry, chairman of the exhibit committee. The boys call him the "man on deck." If you wanted Mr. Fry, all you had to do was to speak his name, and he immediately stood not a dozen feet away. You told him your troubles, and instantly the telephone, the telegraph, half dozen messenger boys, all the machinery of the Detroit

United Railway, and all the influence of the City of Detroit, were called into action to get what you wanted. Mr. Fry doesn't sleep, doesn't eat, and unfortunately doesn't smoke. The only thing Mr. Fry cannot do is grant additional exhibit space this morning because he thinks most of the exhibitors would object to having exhibits more than one layer deep. He has even accomplished the seemingly impossible by adding several hundred square feet to the floor space available by getting a special resolution from the Detroit City Council giving the committee permission to cover one half of the adjoining streets as an annex to the exhibit hall.

Next comes Mr. Edward J. Burdick, assistant superintendent of motive power for the Detroit United Railway. Mr. Burdick is the electrical man who did all the wiring. If you wanted power of any description you asked Mr. Burdick. He went out, touched a button, and on came the power. Mr. Burdick arranged the striking electrical sign over the front entrance to the hall, and also the festoon of colored lights over the street.

And then there is Mr. John Kerwin, superintendent of track construction. Mr. Kerwin can carry a 60 ft. car from any freight depot in the city to the hall in less time than the messenger boy can get there with the bill of lading. Mr. Kerwin's scheme of portable track laying solved the problem of unloading the heavy exhibits.

JOHN H. FRY,  
 Chairman Exhibit Committee.

Then there is Mr. Eastman. Mr. Eastman is the man who finds things. If you have lost anything from a street car to your hair, Mr. Eastman can help you. When he hears your troubles he puts his forefinger up to his forehead, waits a minute, goes to the telephone, says a few mystic words to his steam railroad friends up at the freight office, and before you get back to your space, your boxes are all there with a written apology from the railroad or express company for having kept you waiting.

We might go on indefinitely telling how things are done by Mr. Farmer, Mr. Parker, Mr. Russell, Mr. Lynch, and all the rest of the efficient staff from the Detroit United Railway, but it is late, and we must get to press. Sufficient it is to say that we never had more courteous treatment or attention. Gentlemen, the suppliers doff their caps to you.

Mr. John C. Dolph, manager of the insulating varnish department of the Standard Varnish Works, of New York City, is busy talking the good qualities of "Standard" varnishes. Mr. Dolph can be found at the Cadillac and at Convention Hall.

Some of the phcenrds around the lobby of the Cadillac Hotel give the following information:

- "C. J. Harrington, of New York, has headquarters in Parlor E."
- "See Brill Convertible and Semi-convertible Cars at Convention Hall Annex, Space No. 3."
- "Rossiter MacGovern & Co. are at Parlor I."
- "J. G. Brill Co. headquarters are in Parlor J."
- "MacPherson Safety Switch & Frog Co. has working model of its appliances on main floor of Cadillac Hotel."

## DETROIT, THE "CITY OF THE STRAITS."

From first to last Detroit has had a thrilling history. This is one of the few genuine "oldest" cities in the United States, for before New York, New Orleans, Philadelphia, or Boston had been actually founded, the site later known as Detroit from "de-troit," meaning strait, had been visited and described as a fort and trading post of the Indians. The first permanent settlement by white men was effected in 1701, when Cadillac, a sailor, soldier, explorer, and statesman of France, made his way down Lake Huron, through the St. Clair River and Lake St. Clair, into the Detroit River, and (it is interesting to note), landing at a spot very near the present offices of the Detroit United Railway, took possession of all the region for his majesty, Louis XIV, King of France. The old fort which he built occupied what is now the site of the City Hall.

For a century following, the territory about Detroit was drenched in blood, Indian massacres and wars alternating with strifes and deadly discords between the French and the British for the possession of the coveted land, which all could see was to become the key to all the Great Lake region with its vast

Lakes, and of all this trade Detroit took the lion's share. Under the guidance of General Cass, the first civil governor, and a long line of gifted public spirited citizens, Detroit and the state of which it is the chief city, have been given over to the more peaceful pursuits of trade and commerce, although the martial spirit is still there and ready to be roused into action.

During the war with Mexico, the Civil War and more recently the war with Spain, Detroit and Michigan have sent their full quota of men to fight the battles of the Union. As a permanent memorial of this patriotism there stands in the Campus Marthus, the chief center of the city, a striking monument to Michigan's soldiers. This work of art was designed by Randolph Rogers, of Rome. It is constructed of Rhode Island granite, with statues of golden bronze cast at Munich, the whole costing upwards of \$70,000. It is 60 ft. in height, and was unveiled April 9, 1872. On its four sides are medallions of Lincoln, Grant, Farragut and Sherman. On the plinths at each corner of the base are statues 7 ft. high, representing the Infantry, Cavalry, Artillery and Navy, and higher up are allegorical figures of Union, Victory, Emancip-

BIRDSEYE VIEW LOOKING UP GRATIOT AVENUE, DETROIT.

and varied commerce. Not only was ownership in the land disputed by the Iroquois, the probable rightful claimants, but roving bands of Indians and wild English, French, and Spanish voyagers as well whom someone has called the first commercial travelers of America—laid claim to certain tracts along the Detroit and joined in the general melee. The discovery of the bloody conspiracy of the great chief, Pontiac, who designed to capture and burn the fort, the battle of Bloody Ridge, and an attempt to fire the powder magazine at the citadel, are important incidents related by history of this strenuous period.

Despite this hard life the settlement grew and prospered. In 1760 it passed into the hands of the English as a result of the British victory over the French at Quebec. The city was formally ceded to the United States in 1783, but the Americans did not take full possession until 1796. After a period of desultory border warfare, and the almost total destruction of the city by fire in 1805, came the war of 1812, the fall of Mackinaw and the surrender of Detroit to the English by Hull in 1812. The advance of General Harrison and the victory of Commodore Perry in Put-In-Bay, on Lake Erie, again restored the city to the United States, and ended the long regime of siege, warfare and strife. During the next few decades the population increased enormously and the city began to develop at a rate almost unprecedented. Fleets of steamboats from the East, and from the North and West as well, began to ply up and down the Great

pation and History. The whole is mounted by a female figure, 11 ft. in height, with sword and shield, representing the State of Michigan. On granite pedestals in front of the faades are four bronze eagles.

Even in the number and variety of the names by which it has been known, the city of Detroit has been favored above most cities. In the old traditions of the Algonquin Indians, it was referred to as *Yon-do-tiga*, or *Yon-do-tia*, Great Village. It was also called *Wa-we-a-tun-ong*, Circuitous Approach, on account of its location at the bend of the river. The Wyandotte called the site of Detroit, *Toghsaghrondie*, or *Tyschsarondia*, modernized into *Teuchsa Grondie*, and also referring to the course of the river. The Huron Indians called the place *ka-ron-ta-en*, the coast of the strait.

When first settled by Cadillac, the location received the name of Fort Pontchartrain, in honor of Count Pontchartrain, then French Colonial Minister of Marine. As the number of inhabitants increased, and the village grew, it received its present name.

The city's corporate names have been as follows: By Act of Jan. 18, 1802, it was designated the "Town of Detroit;" by act of Oct. 24, 1815, it was called the "City of Detroit;" on April 4, 1827, an act was passed providing that the corporate name should be "The Mayor, Recorder, and Aldermen of the City of Detroit;" and on Feb. 5, 1857, it was enacted that the name should be "City

of Detroit." Some time after the almost complete destruction of the city by fire, in 1805, the present emblematic seal of the city was adopted, the design appropriately bearing the motto, "Resurget Cineribus"—"She rises from the ashes" and "Speramus Meliora"—"We hope for better times."

Detroit lies on the westerly and northerly bank of the Detroit River, which separates Canada from the United States, or, to be more specific, the British Province of Ontario from the State of Michigan, County of Wayne. The river makes a sharp bend within the city limits, thus bringing that portion of Canada across the river south of the city of Detroit. It would be well to keep this topography in mind, as it is apt to be confusing to the stranger when told for the first time that Canada is south of Michigan.

The Detroit River in some respects is undoubtedly one of the most remarkable in the world. From the northern end, where it leaves Lake St. Clair, to its southern end, where it empties into Lake Erie, the river is 27 miles long, and varies in width from one-half mile to three miles. The total tonnage of all vessels passing Detroit in the seven months of the year during which navigation is open aggregates 35,000,000 tons, or is nearly equal to the combined tonnage of all the vessels clearing annually at London and Liverpool.

The depth of the Detroit River varies from 10 to 60 ft., and averages 34 ft. The river bottom is sandy or stony, and is free from dangerous obstructions. The stream is navigable for vessels of the largest class, and forms one of the safest harbors in the world. Through this comparatively short water-course passes all the water from the three northern Great Lakes, Superior, Michigan and Huron, and from Lake St. Clair and the bays of Green, Saginaw and Georgian, or a water surface of 82,000 square miles, comprising the drainage from 125,000 square miles of land. The water is very pure, and the current is rapid and generally uniform, the direction being first west and then south.

There is, of course, no tide, but, like other portions of the remarkable body of water comprising the Great Lakes, there is considerable fluctuation in the mean water level, the extremes seemingly dependent for the most part on the direction and velocity of the wind, a strong southwest wind having been known to lower the river 5 ft. below mean level. In addition to this, however, there seems to be through all the lake region a rise and fall in the mean water levels that amounts almost to a tidal movement, but the cycle of this fluctuation has never been satisfactorily determined, and it is not even known whether the periods are regular or subject to variations.

The river forms part of the International boundary line between the United States and Canada; the boundary line opposite Detroit is located about midway of the stream, and for the most part nearest the Canadian shore, so that the United States controls the greater portion of the water-way, although the stream has been declared a public highway by Act of Congress, dated Dec. 13, 1819.

A recent innovation on the river, instituted by the government, is the collection of mail matter from all vessels passing Detroit in either direction. Many of these crafts do not stop at Detroit and the government has made arrangements to have a steamer meet all vessels in mid-stream and deliver and receive mail matter. The mail steamer, which is a small white boat, can be seen from the foot of Woodward Ave. at all times of the day, darting in and out from the shore, intercepting passing craft. The procedure is to send off a man in a row boat from the main vessel, who pulls alongside the passing steamer, and throws a line to the deck. The steamer takes the row-boat in tow long enough to pass the mail over the taut line; the row-boat is then cut loose and man and row-boat are picked up by the mail steamer, which, during the operation, has been hovering near. This service is given regardless of weather conditions, and at times is fraught with considerable danger to the man in the row-boat.

It is claimed that in the Detroit River were made the first experiments with submarine craft of the Holland type. The first Holland boat built for subsurface navigation was constructed at the Detroit Boat Works, in 1891.

Detroit is 18 miles from Lake Erie; 207 miles from Saginaw River; 303 miles from Mackinac; 509 miles from Milwaukee; 634 miles from Chicago; 316 miles from Sault Ste. Marie; 742 miles from Duluth; 57 miles from Toledo; 105 miles from Cleveland; 255 miles from Buffalo; and 629 miles from Montreal.

Detroit lies in latitude 42° 19' 50.28" north, Boston, Rome and Constantinople being in about the same latitude; the longitude is 83° 2' 47.63" west of Greenwich, England, and 5° 59' 45.83" west of Washington, D. C.

POST OFFICE.

In this region the Detroit River has been made the dividing line between eastern and central standard time, and all trains arrive at and depart from Detroit on central standard time, which is the same as Chicago time, or one hour later than New York or Washington time. Across the river from Detroit the time changes to eastern standard.

However, in all ordinary matters in the city of Detroit, standard time is frequently disregarded and local, or sun, time is used. This time is 23 minutes and 59.06 seconds slower than Washington, or eastern, standard time. This gives rise to a great amount of confusion, and strangers are cautioned when making appointments or referring to clocks in the city, to make sure which reckoning is designated. To make matters worse there is considerable lack of uniformity among the residents and store-

PAVILION IN BELLE ISLE PARK.

keepers as to the adoption of a standard. For instance, the clock on the city hall gives local, or sun time, and the clock on the Post Office gives central standard time. The clocks in the lobbies of most of the hotels give central standard time. The clocks in some of the stores give central and in others local time. The street railways are operated according to local time.

Much of this confusion arises from a recent decision of the Common Council. Formerly all clocks in the city were set by local time, which was acknowledged as authority. A few months ago, in response to a strong public sentiment, the Common Council passed an ordinance abolishing the local standard and recognizing central standard time as official. This ordinance was generally heeded throughout the city, but immediately gave rise to a number of difficulties, such as the use of street railway tickets bearing certain designated hours of the day within which they could be used, etc. After several lawsuits had arisen, in which the courts held that local, or sun, time was the official standard of the city, the Common Council repealed the ordinance and restored sun time as official. But many of the citizens who had petitioned for the change to central standard refused to abide by the later act of the council, and still adhere to the central standard for reckoning. Hence the confusion.

On the opposite side of the river from Detroit are the Canadian towns of Windsor, Walkerville and Sandwich, where are terminals of several of the main steam railroad trunk lines. The owners of lake shipping have thus far prevented the building of

land side and connection can be had by boat from several points.

Nearer the city are several islands that vie in popularity with the Flats as resorts for the summer excursionists in search of recreation. Chief of these is Belle Isle, reached by boat from the foot of Woodward Ave. or by Jefferson Ave. electric cars. Belle Isle is north of the center of the city, but lies within the city limits. The island comprises a beautiful park, containing about 700 acres. It has been improved and beautified and forms a charming place for recreation and amusement. Beautiful lawns, walks and flower beds, facilities for boating, bathing and picnicking, a fine collection of birds and animals, and opportunities for rest, refreshment and amusement, are among the attractions offered. The island is reached from the Detroit side by a bridge, the only bridge over the Detroit River, and this passes over only one channel of the river. There has been spent in improving the island, including the cost of the bridge, nearly \$1,850,000.

Tashmo Park is another resort in great favor with pleasure seeking Detroiters and their visitors. The property is owned by the White Star Line, and comprises 60 acres of land in the St. Clair River, about 20 miles above Detroit. The park is reached

CENTRAL AVENUE IN BELLE ISLE PARK, DETROIT.

bridges across the river at Detroit, and all the steam roads entering this point from the east are therefore compelled to ferry all freight and passenger cars over the stream on barges. There are some half dozen of these railway ferry routes, and there are in addition numerous ferry and steamboat lines plying across and up and down the river to the various islands and Canadian points.

In the matter of attractive pleasure and outing resorts made easily accessible by steamer lines up and down the river and by the interurban electric lines, Detroiters are especially favored. In the warm months the pleasure traffic carried by the pleasure boats and by the interurban cars is enormous.

A very popular trip is up the river, through the United States ship canal to the St. Clair Flats, a group of wooded and marshy islands near the entrance to Lake St. Clair. The Flats are famous throughout the region as the home of many specimens of the feathered and finny tribes, and for the splendid club houses, hotels, cottages and pleasure resorts that cover the islands and line the banks of the many crystal water streams. The electric line of the Detroit Rapid Railway also approaches these happy hunting, fishing and pleasure grounds and waters from the main-

during the excursion season by the mammoth new steamer, "Tashmo," which is said to be one of the finest excursion steamers on the lakes. Access is also had to the park by way of the Rapid Railway system to Algonac, and by launch ferry to Tashmo Park. The property is laid out with fine groves, ball grounds, race track, bathing beaches, and has all the attractive features that go to make up a modern pleasure park.

A little beyond Tashmo Park lies the popular summer resort known as "Grande Pointe." There are many attractive and expensive family cottages here, and a well-appointed hotel, with wide verandas, from which an exceptionally delightful view is commanded.

These two resorts are within easy rowing distance of the best fishing banks of the St. Clair Flats.

South of Detroit, on the Detroit River, is the popular "Bois Blanc" park, which is owned and managed by the Detroit, Belle Isle & Windsor Ferry Co. It is 14 miles from Detroit, at the confluence of the Detroit River and Lake Erie. The company has made many improvements in this place, and fitted it up with every detail for the amusement and pleasure of visitors. It is particularly used for picnic parties. There is also a fine cafe

where meals may be enjoyed amid the ever-changing panorama of the Detroit River. "Bois Blanc" Park is reached by excursion steamer "Columbia," which leaves from the foot of Woodward Ave. twice daily during the summer season.

Another large island in the Detroit River that is much frequented by excursionists is "Grosse Isle," 12 miles below the city and reached three daily by the steamer "Wyandotte," and also

WATER WORKS PARK.

by ferry from Trenton, where connection is made with the Trenton Division of the Detroit United Ry.

In addition to these resorts on the river and Great Lakes, the interurban lines of the Detroit United Ry. serve a score or more of inland lakes, ranging from mere ponds to extensive bodies of water, each one of which has become a center for groups of summer homes that are occupied by all classes of Detroiters seeking to escape the crowded city during the summer months. These lakes abound in fine specimens of the "finny tribe," and small game of almost every description can be found around their shores during the seasons. Cass Lake, Pine Lake, Sylvan Lake, and Orchard Lake are a few of this group of small inland lakes reached by the Orchard Lake Division of the Detroit United Ry. On the Flint Division of the same system is Lake Orion, where is held every year a popular and well-attended "Bible Conference."

In the matter of public parks Detroit is well equipped. There are numerous squares and open areas, chief of which are the Campus Martius (named after the military camp of Rome), in front of the City Hall, and Cadillac Square, running east from the City Hall. There are nearly 1,000 acres embraced in the park system, which includes Palmer Park, Water Works Park, Cass Park, and Clark Park.

Detroit owns its own water works and its own electric lighting plant. The water works are on the river front, in the extreme eastern portion of the city. The grounds about the plant embrace 70 acres, and are given over to fine floral displays and ornamental gardening. The property is worth \$5,000,000; there are over 500 miles of water mains, and 10,000,000 gallons of water are pumped daily.

The method of lighting the city is unique, and will attract the immediate attention of strangers. The arc lamps are supported on steel towers, placed to average six towers to each square mile, there being from four to eight 2,000 c. p. arc lights on each tower. The towers vary in height from 101 to 150 ft. They are triangular in section, and are made of steel pipe and rods, each tower being thoroughly braced from four directions by long guy cables attached to posts in the streets or sidewalks. The towers are fitted with a small cage-like elevator in which the man who cleans and trims the lamps raises himself to the platform at the top. The elevator is counterweighted to balance the weight of an average man, and the lamp cleaner has merely to apply

enough force to the rope to overcome friction and slight excess of weight. There are 133 of these towers in the city. They were erected in 1884 at a cost to the city of \$1,200 for each tower, although the actual cost of building them was about \$100 for material and \$100 for labor, per tower. The theory followed in placing the arc lights on high towers seemed to insure a more even and uniform distribution of light over the entire city than could be secured by lights mounted on single poles of the usual height. The same scheme has been tried in New Orleans, Mobile, and various other cities, but does not appear to have met with the same success elsewhere as it has in Detroit.

It is noteworthy that Detroit has been remarkably free from large fires, since the great fire of 1805, when most of the city was laid in ashes. The fire department is excellent, there being 24 steamers, 5 chemical engines, 10 hook and ladder trucks and a force of 500 men. The water front is protected by the fire-boat "Detroit," which is manned by 12 men and can throw 15 effective streams at one time.

The police force is maintained in splendid condition, there being a total force of 500 men and officers located at 10 central stations.

The city has two telephone systems, one operated by the Michigan Bell Telephone Co., and one by the Detroit Telephone Co., and public pay stations are placed in convenient places in all parts of the city. City calls may be made for five cents, either from central offices or from automatic nickel-in-the-slot 'phones.

The schools, theaters, churches and city and public buildings in Detroit cannot be excelled by any city of equal size. Detroit has long enjoyed the appellation of the "Convention City," and there are upwards of 20 good hotels, which, with innumerable good boarding houses, insure comfortable accommodations to suit all tastes and likes from the most fastidious down. The Russell House, opposite the City Hall, is the oldest house, and is first-class in all appointments.

Among other things for which the city is noted are the following: Population (1900), 285,704, with suburbs, 300,000; 250 miles of paved streets; 461 miles of sewers; 66 public schools, 91 private schools and colleges; 190 churches; 52 banks; banking clearings per year, \$100,000,000; the largest seed house, the largest

DETROIT MUSEUM.

stove factories, the largest chemical laboratory, the largest varnish factory, the largest parlor and library table factory; and the second largest pickle and condiment factory in the world; more conventions than any other city in the country; largest directory publishing house in the world; largest patent factory in the United States; largest factories in the United States for the making of capsules; large car and wheel works; immense plants for the production of iron, steel and brass castings, machinery of all kinds, and plus.

## PRESIDENT VREELAND.

TEN AND TWENTY YEARS AGO.

Mr. Herbert H. Vreeland, president and manager of the Metropolitan Street Railway Co., of New York City, has earned the distinction of being known as "the busiest man in Manhattan."

Mr. Vreeland was born in 1858, in the little town of Glen, in the Mohawk Valley. He was the youngest of a large family of children, whose father was for a quarter of a century pastor of the Dutch Reformed Church at Glen. Mr. Vreeland's business career began at the age of 13, when he obtained employment delivering ice in Newark, N. J. In 1875 he entered the service of the Long Island R. R., first on one of the company's night construction trains, and later as inspector of ties and roadbed. In 1881 he was employed as a freight brakeman on the New York & Northern R. R. Subsequently he was a conductor on a train on this road and was advanced in their order to the positions of train

H. H. VREELAND.

master, assistant superintendent, general superintendent and general manager. While serving in one of those capacities, Mr. Vreeland first made the acquaintance and won the regard of William C. Whitney, who was one of the principal owners of the New York & Northern R. R. When Mr. Whitney organized the Houston Street, West Street & Pavonia Ferry R. R., Mr. Vreeland was made a director of that company, and thus began his connection with the street railways of New York. In 1893 he was elected president of the Metropolitan Street Railway Co., which was the successor of the Houston Street, West Street & Pavonia R. R.

Mr. Vreeland has repeatedly held offices on the board of the American Street Railway Association and other prominent transportation societies.

The Rapid Transit Co. of Chattanooga will put six new passenger cars in service for regular passenger traffic. The company has converted a work car into a handsome and commodious "special" car, provided with upholstered, revolving chairs and many luxurious appointments. A compartment at one end of the remodeled car will be used as a smoker.

The Christensen Engineering Co. will distribute at the convention a booklet containing the names of the roads upon which its air brake apparatus is installed, together with the number of equipments on each road. This is in accordance with the Christensen company's well-established policy of publishing the names of patrons, so that anyone who desires to consider the merits of the Christensen air brakes may know where to see the equipments in use under the severe conditions of actual service, which is the only satisfactory test for mechanical appliances.

The American Street Railway Association was organized in Boston 20 years ago, at a most auspicious time—the beginning of the epoch of electric transportation. At the time the association was organized there were 415 street railways doing business in the United States and Canada, employing a total of 35,000 men and operating altogether 18,000 cars over 3,000 miles of track. These roads carried annually about 1,212,000,000 passengers, who depended as to the manner of local transportation solely upon the horse or mule, these beasts of burden not having at that time been rendered hors de combat by the electric motor. The total amount of capital invested in these roads was \$150,000,000, "with no security but the faithfulness of the service rendered by the companies themselves." The organizers of the association very justly considered these conditions greatly in advance of those of the previous decade during which the omnibus had rattled erratically through the streets of the principal cities, and the street car had been avoided by a certain class as suitable for persons bound on vulgar business, but not at all adapted to the requirements of polite society. At the first convention meeting one of the organizers in a speech before the assembly boasted that society folk had lately availed themselves of the horse car and that it was no longer an uncommon thing "for ladies in silks and velvets and resplendent with gems" to affect this means of transportation to and from the theater and concert hall. What would the amazement of this gentleman have been had it then been revealed to him that within 20 years street cars would be in requisition for funerals, weddings and fetes of all kinds, that in the course of events, even senators of the United States would be ejected for failure to pay their fare, and that the street car, sans horse, or locomotive, or any visible motive power, would daily carry many thousands not only about town, but from one large city to others in a neighboring state.

The first meeting of the association was held in Boston, December 12th, 1882, in response to a circular issued by Mr. H. H. Littell, of Louisville, Ky., to all the presidents and superintendents of companies in the United States and Canada, calling upon every road to send a representative for the purpose of forming a fraternity. The meeting was held at Young's Hotel, Boston, and was called to order by Mr. Littell at 2:15 p. m. with some 60 representatives of street railways in attendance. The enthusiasm with which the business proceeded indicated the extent to which the need of such a fraternity had been generally felt and helped to expedite the progress of organization. Hon. Moody Merrill, president of the Highland Street Railway Co., of Boston, was elected chairman and made an eloquent address, in which the necessity of concerted effort in the acquisition of knowledge concerning the operation and management of street railway systems, the benefits of business fraternity, and the present outlook were clearly stated. There followed a general discussion of the situation, and the appointment of committees for the framing of constitution and by-laws. The matters principally discussed were whom should be eligible for membership, and whether members should pay initiation dues and assessments per ratio of the business done by their respective roads, or whether Big Clause and Little Clause should share and share alike in the expenses as well as the benefits of the association. The manner in which these matters were adjusted is surely as familiar to all good members of the present day as the articles of catechism, and it is safe to say that no similar body was ever organized with greater unanimity of spirit, as none have been organized to better purpose.

At the meeting on the following day, December 13th, the organization was completed by the adoption of constitution and by-laws, the first article of the former reading: "The name of the association shall be the American Street Railway Association, and its office shall be at the place where its secretary resides," and the second, "The object of the association shall be the acquisition of experimental, statistical and scientific knowledge relating to the construction and operation of street railways, and the diffusion of this knowledge among the members of the association, with a view to increasing the accommodation of passengers, improving the service and reducing its cost,—the establishment and maintenance of a spirit of fraternity among the

members by social intercourse, and the encouragement of cordial and friendly relations between the roads and their patrons." The following officers were elected: President, H. H. Littell, of Louisville; first vice-president, William H. Hazzard, of Brooklyn, N. Y.; second vice-president, Calvin A. Richards, of Boston, Mass.; third vice-president, George B. Kerper, of Cincinnati, O., and secretary and treasurer, Wm. J. Richardson, of Brooklyn, N. Y.

The meeting adjourned, and delegates and visiting friends attended a banquet at 4 p. m. at Young's Hotel, tendered by the presidents of the street railway companies of Boston. At the conclusion of an elaborate repast, Mr. Richards, president of the Metropolitan Railroad Co., of Boston, who acted as host, in an after dinner talk, spoke in part as follows:

"The position of the horse railroad president is not to be described. It is an onerous position, calling for indomitable perseverance because it supplies the demands of the public. The public will put up with everything in steam cars, but the least thing out of the way in horse cars will cause complaint. This is a peculiar freak of human nature. In Boston we have great difficulties to surmount. Owing to the great competition in this city between street railway companies the public has been educated to expect everything, and I should not be surprised if we were obliged eventually to back our cars up to the very doors of dwellings. There should be an exact understanding of what we have to do. We should consider the best way of feeding horses and caring for them, the best pattern and manufacture of cars, and how to make conductors honest. Above everything else let the members of this association foster a brotherly regard for each other, so that, when we meet in strange cities we shall be as brothers, and there shall be no north, south, east or west with us."

The American Street Railway Association prospered and grew to large proportions in the 10 years that followed the organization meeting at Boston in 1882. The association convened in Cleveland October 19th, 1892, with some 250 representatives of member companies in attendance, about 100 representatives of non-members, and 7 representatives of applicants for membership. The president, Mr. John G. Holmes, of Pittsburg, Pa., called the meeting to order at 10:45 a. m. and introduced Hon. William G. Rose, mayor of Cleveland, to the assembly, whose speech of welcome is here quoted as showing the change that had been brought about in 10 years in transportation facilities and the fact that the trials of the street railway manager, as experienced in Cleveland, had not been mitigated by reason of the vast improvement in the service rendered. Mayor Rose said in part: "This convention, representing all kinds of surface street railways, steam dummies, horse, cable and electric cars, is one of the most important conventions that ever assembled in this or any other city. \* \* \* In the New York World of August 15th there is a communication written from this city, two and a half columns in length, from which I will read the following extract: 'Prospect street, from one of the finest residence streets in the country, has been transformed into a street where life is almost a burden. The electric cars with their horrible uproar are tearing up and down at all hours of the day and night and at intervals of less than a minute. The charged rail is continually knocking horses high into the air and sending them sprawling to the ground. Driven mad by the electric shock and terrified by the electric motor the crazed animals tear through the streets strewing the roadway with wrecks of carriages and with thrown riders.' The mind shrinks back appalled at the contemplation of such a scene. Horses 'knocked high in the air.' You may search in vain for a man, woman or child who ever saw one of these horses, that was knocked so high in the air, come down again. Where have they gone? Perhaps beyond the reach of the earth's attraction, and they may still be soaring through space. What a picture Prospect street, as portrayed by this writer, would be for the brush of a Raphael, a Rubens or a Michel Angelo.

It is true that accidents often happen. I would, however, rather bear the ills we have than to go back to the barbarous system of horse cars. The use of electricity as a motive power is yet in its infancy, and it is only a question of time when all desirable improvements will be accomplished. It is less than five years since the first electric railway was successfully put in operation in the United States. You will find in the Forum for

September, 1891, a very able article on this subject from the pen of Mr. Frank J. Sprague, who says there were then in operation and under contract in the United States, Europe, Australia and Japan not less than 350 electric street railways, using more than 4,000 cars and 7,000 motors, with 2,600 miles of track and a daily mileage of nearly 500,000 miles, and carrying nearly a billion passengers annually. This was over a year ago, and the tabulated statement contained in the "Electrical Industries" for October, 1892, shows that on the 15th of September last, just one year later, there were in the United States alone 469 electric roads, with 5,446 miles of track, using 7,769 motor cars and 3,790 trail cars. If these statements are both correct, wonderful progress has been made in the construction of electric railways during the past year."

President Holmes in his address said: "This city offers a fine opportunity for the study of practical street railroading. Here we see the most advanced ideas of construction, the highest development of the electric system, and a splendid new cable plant as nearly perfect as capital, invention and engineering skill have been able to make it, and by way of contrast and historical interest we find a few horse car lines to remind us of the meetings a decade ago when we used to grow excited over discussions of the relative merits of the horse and the mule as a street railway motor. The street railway interests of the United States are assuming wonderful proportions. Every day some new company is born, and every morning paper brings us rumors of consolidations, absorptions and syndicate purchases until the statistician lays aside his pencil bewildered by the mass of accumulating and shifting figures. Definite data is out of the question and I shall not attempt to tell you how great we are even in round numbers."

The convention proceeding in the order of business, a summary of the treasurer's report was read, which showed receipts of \$7,574 and disbursements of \$6,049.

The reports of the special committees were then read, the program being as follows: A history of the Events Leading up to the Formation of the American Street Railway Association, by Mr. D. F. Longstreet, general manager of the West End Street Railway Co., Denver, Col.; A Model Electric Street Railway Roadbed and Underground Wiring, by Mr. George W. Baumhoff, general manager of the Lindell Ry., St. Louis, Mo.; A Perfect Overhead Electric Construction, by Mr. Charles H. Smith, superintendent of the Troy & Lansingburg R. R., Troy, N. Y.; Economy of Machine Shops for Electric Street Railways, by Mr. J. H. Bickford, engineer Naumkeag Street Ry., Salem, Mass. Other reports of committees covered Forms for Street Railway Electrical Statistics, Power House Engines, Relative Cost of Operation of Horse, Cable and Electric Roads, and Standards for Electric Street Railways.

Resolutions were adopted that the association send greeting to the tramway managers and officers of Europe and foreign countries, cordially inviting them to attend the 12th annual meeting of the association to be held at Milwaukee in 1893, during the World's Columbian Exposition, and a vote of thanks was extended to the Short Electric Street Railway Co. for its entertainment of the delegates while in Cleveland. On the morning following the adjournment of the last session carriages were provided by the Walker Manufacturing Co. in sufficient numbers to transport all who were in attendance at the convention, including delegates, supply men and the ladies who had accompanied them, for a drive about the city and a visit of inspection to the Walker company's works. Subsequently a banquet was served at the Hollenden Hotel, at which the late Thomas H. McLenn, first vice-president, presided in lieu of the president, Mr. John G. Holmes, who had been called home on account of a sudden bereavement in his family. Following the speech of the toastmaster, Mr. McLenn, these toasts were in order: "Some Phases of the Legal Liabilities of Street Railroad Companies," by Mr. Andrew Squire; "The City of Cleveland," by Gen. Edward S. Meyer; "An Ideal Street Railway, a Prophecy," by Mr. R. A. Russell; "The Currier, from the Standpoint of the Currier," by Mr. James H. Hoyt; "The Benefits of Street Railroads to Cities and Citizens," by Mr. Richard Bacon; "The Press," by Mr. W. W. Armstrong. Mr. Tom L. Johnson and Mr. William Richardson addressed the company, after which the banquet came to an end by all rising and singing "Auld Lang Syne"

## PRESIDENT MACKAY

Mr. H. C. Mackay, president of the Street Railway Accountants' Association, has been an active and invaluable member of the organization since being elected to the executive committee at the meeting in 1898. One service of his to the Association would alone suffice to prominently distinguish him; that is the practical suggestion of his paper read before the Chicago convention in which Mr. Mackay advocated the use of the car hour for general comparisons in preference to the car-mile unit. Mr. Mackay is a native of La Salle, Ill., where he was born on October 6, 1869. At the age of 18 he began his railroad career as a clerk in the general offices of the Minneapolis, Lyndale & Minnetonka Ry., and was made paymaster of the company in 1888. He was later ad-

H. C. MACKAY.

vanced to better positions and retained his connection with the Minneapolis lines after they had been absorbed by the Twin City Rapid Transit Co. Mr. Mackay was made chief clerk and assistant auditor after the merger, but resigned the latter position in 1897 to become comptroller and auditor of the Milwaukee Electric Railway & Light Co. Mr. Mackay's election to the presidency of the Street Railway Accountants' Association is perhaps no less a tribute to his ability as an accountant than a fitting recognition of the efficient manner in which he has espoused and promoted the interests of the fraternity.

## A. H. STANLEY.

Mr. A. H. Stanley, general superintendent of the Detroit United Ry., although still youthful in years, has had street railway experience equal to many of the veterans in the street railway industry. He commenced work 13 years ago, as a clerk in the office of the Citizens' Street Ry., and has literally grown up with the property. He successively filled the office of time-keeper, bookkeeper, schedule maker, division superintendent, and under Mr. Tom L. Johnson, and later under Mr. Du Pont, he held the office of assistant superintendent of the Detroit United Ry. In March of the present year he was given full charge of all outside work and operation, with the title of general superintendent.

Mr. Wm. W. Donaldson is representing the Gould Storage Battery Co., of New York City. His company's exhibit will comprise various forms and sizes of battery plates and a large single cell which is one of the largest battery cells ever made.

## BROAD-GAGED POLICY AT BUFFALO.

By making a general increase of 10 per cent in the wages of its entire force of conductors and motormen, numbering about 1,200 men, the International Railway Co., of Buffalo, has again shown its faith in the belief that the welfare of its employes, and therefore the welfare of the company, can best be subserved by adopting toward them a broad and liberal policy. This is the second increase in trainmen's wages in Buffalo since the first of last year. The action of the company was taken shrewdly as a recognition of the excellent service performed by its employes, and owing to the fact that the company is prosperous, and is therefore able to carry out the desire and intention of the management to make the positions held by its men worthy of their best endeavors and earnest, faithful work.

The following is the letter announcing the increase sent by General Manager Mitten to each one of the employes:

"Dear Sir: The general excellence of the service rendered by our trainmen prompts me to express my appreciation and to take this opportunity of thanking you personally for the part you have taken in bringing about such a gratifying state of affairs.

"Your painstaking efforts have made the present success possible, and in recognition thereof I now advise we will at once materially increase the wages of the trainmen. The new rate is as follows:

"Twenty cents per hour, platform time, for the first year continuous service.

"Twenty-one cents per hour, platform time, after one year's continuous service.

"Twenty-two cents per hour, platform time, after two years' continuous service.

"I would also remind you that the wages paid on the various lines controlled by this system, in March, 1900, ranged from 14 to 18 cents per hour, an average increase of over 5 cents per hour having been made since the date of our meeting in Saint Stephen's Hall. Superintendent Conns and his assistants have aided me in carrying out the promises made at that time and as a result the rules have been modified and revised; regular men are not obliged to forfeit their runs as formerly; runs have been so arranged as to make the hours of relief most pleasing to all the men; all high-speed cars have been equipped with air brakes and seats have been provided for motormen of inter-urban lines.

"It is, therefore, apparent that we appreciate your loyal support and intelligent work, and, in consequence, are endeavoring to so improve both the wages and surrounding conditions as to make the positions worthy of your best efforts.

"Trusting that the present happy state of affairs may continue undisturbed and that each man will do his utmost to give this company the reputation of having the most careful and courteous trainmen in the world, I am,

(Signed) "T. E. MITTEN."

## VAN DORN-DUTTON AND VAN DORN-ELLIOTT.

The Van Dorn & Dutton Co. and the Van Dorn-Elliott Electric Co., both of Cleveland, occupy a space together at No. 24. The Van Dorn & Dutton Co. will exhibit gears and pinions, an armature lift and a track cleaner.

The Van Dorn-Elliott Electric Co. shows a line of re-wound armatures, armature coils, field coils and commutators, which are attracting a great deal of favorable comment.

The two companies are represented by W. A. Dutton, J. N. Elliott and O. E. Foote.

A shower of sparks from the overhead structure of the Manhattan Ry., N. Y., extending for 25 yards along Bayard street, was caused September 15th by a workman's dropping a bolt on the third rail, and resulted in a panic among pedestrians.

Mr. C. S. Akeley, representing the Sterling-Meaker Co., of New York City, is at the Griswold. Assisted by Messrs. E. B. McLean and E. F. Wickwire, he will exhibit eight different forms of fare registers, brakes and sand boxes.

WHEELING TRACTION CO.

The report, which has recently been confirmed, that options on a controlling interest in the Wheeling (W. Va.) Traction Co. have been given to the president, Mr. Conderman, indicates that negotiations are in progress for the sale of this property and it is believed that eventually the road will be incorporated in a larger system. The Wheeling Traction Co. completes the extensions now under way it will have 70 miles of track and serve 100,000 people.

It is understood that the holders of stock are now asking par and have been offered 97, while less than a year ago the stock was a drug on the market at 40. This appreciation is very gratifying to the owners and reflects great credit on the manager, C. E. Flynn, who has had charge of the property since November, 1901. This is no new experience for Mr. Flynn, however, as the Wheeling Traction Co. is the fourth railway property that he has pulled out of the hole and put on a paying basis.

FILER & STOWELL ENGINES IN DETROIT.

Engineers visiting Detroit will be interested in noting the Filer & Stowell engine installed in Station "B" last fall. This engine, which drives a 1,500-kw. Westinghouse generator, has a number of details not found in engines of similar type, among which may be noted the design of valve gear, the cylinder, piston and crosshead details, the water-jacketed main bearings, and the foundation plates under the cylinders, which extend beyond the valve gear and dash-pots. The frame is of an unusually strong design such as is used in the heaviest rolling mill practice and the bearing and guide sections are comprised in a single casting, this arrangement gives a continuous bearing on the foundation up to the cylinder.

The principal features of the design were suggested by Mr. Thomas Farmer, superintendent of motive power of the Detroit United Railway, and represent the result of his extended experience with electric railway machinery. The orders for the engine now operating and for a duplicate now building by the Filer & Stowell Co., of Milwaukee, Wis., were secured by Mr. Frank Engelhardt, of the Chicago office.

The Filer & Stowell Co. is one of the oldest concerns in Milwaukee, having been in business since 1856, but it is only during the twelve years that the company has been devoting special attention to its engine business. This company has installed some of the largest engines ever built in this country. Among the other electric roads having Filer & Stowell engines in their power plants are the Chicago & Milwaukee; the Union Railroad of Providence, R. I.; the Grand Rapids Ry., of Grand Rapids, Mich., and the Union Street Ry., of New Bedford, Mass.

EMERGENCY STEAM TRAP.

The Wright Manufacturing Co., maker of steam specialties, has its headquarters in Detroit. The Wright emergency steam trap is one of its leading devices. Of this trap Master Mechanic Bryen of the Carnegie Steel Co., Duquesne, Pa., writes: "After a thorough trial of the trap at a place where exceptional high duty is demanded it was found to perform its work in an absolutely faultless manner. The location of the trap in question is at the separator of the 40 in. blooming mill engine, the separator having a 20 in. steam inlet and 18 in. outlet with very much intermittent flow of steam." This emergency trap is claimed to be "in a class by itself." Three steam tight outlet valves are employed instead of one. These valves are placed at the top of the trap. One of the valves is equal to the task of taking care of the water under ordinary conditions, but in event of the water coming into the trap faster than one valve can discharge it the water rises in the trap carrying a float with it and opening the second valve sufficiently to discharge the surplus water, or wide open if necessary, and so with the third valve, if the volume of water coming into the trap be sufficient to tax the capacity of the three valves. The discharge from each of these valves being continuous, is very great. The Wright improved safety water columns are another specialty of this company.

THE "DETROIT" RE-INSULATING MACHINE.

Among the many important exhibits in Exposition Hall will be found the "Detroit" field re-insulating machine and the Allen & Morrison Company's "Composition" brake shoe, adjoining Space No. 52. Two of these machines have been in successful operation for the past three years upon the Detroit United Railway and an opportunity is thus afforded to see it in actual use; it is highly endorsed by numerous other roads. The company's brake shoe is also extensively used. H. Rawstron, secretary of the Allen & Morrison Brake Shoe & Manufacturing Co., and Donald Rawstron, superintendent, are in charge of these exhibits.

THE AUSTIN SEPARATOR.

The Austin Separator Co., of Detroit, has a legion of friends and endorsers, and General Manager F. F. Wormer will be very glad to see all who call. In the Austin separator the steam is given a circular course and all condensation and impurities that may escape the corrugations are removed by the joint operation of centrifugal force and gravity while passing over the separating plate. All steam passing through the separator has an unbroken contact with separating surfaces. It is claimed that this separator removes all grease, oil and every other impurity. The Austin company's new cast iron horizontal receiver-separator is receiving much attention, being designed for high pressure service and where a larger storage capacity is desired than in the regular standard pattern.

In the new pattern the steam on entering is impinged against corrugated surfaces of a baffle plate, on either end of which there are openings, through which the entrained water is projected, and is also led by grooves, assisted by gravity into a receiver through an opening below the inlet. The steam after passing over the top of the baffle is carried to the outlet side where a lip or projection stops any moisture that is left in the steam, which in turn is carried around the outlet opening and drained through a drip hole into the receiver. There is an Austin patent spraying device which is found to be of great value attached to the Austin separator, its invention resulting from the discovery, after careful experimental study, that the successful operation of an oil separator is dependent upon the capacity of the steam for wetting the inner walls of the separating device.

MINIATURE RAILWAYS ARE POPULAR.

The Miniature Railway Co., of 391 Broadway, New York, has issued a catalog giving full descriptions of its various types of diminutive railways and pictures showing them in operation in different parts of the world. These railways are exceedingly popular and no large amusement enterprise is complete without one of the hillputian outfits. Visitors to the recent Charleston Exposition will readily attest that the outfit installed there by the Miniature Railway Co. was one of the best paying features on the grounds. The cars are only 6 ft. long and 24 in. wide and weigh 125 lb. each, while the locomotive and tender have a total length of 9 ft. 6 in., and weigh 1,200 lb.

The Miniature company's exclusive specialty is the manufacture of light steam locomotives of every size and style, adapted to wide or narrow gage track. They can be used for industrial purposes where ordinary locomotives are unsuitable or too expensive. The Miniature Railway Co. has installed logging railroads that annually haul timber enough to denude 500 square miles and are generally in use in the Southern Atlantic and Gulf states, the northern lake districts and on the Pacific coast. The company's catalog will be sent on request.

THE G. B. ESSEX BRASS CO. has a very comprehensive line of specialties that make a visit to its office and works, 480 & 482 Franklin St., Detroit, well worth while. Furthermore, visitors will be very cordially welcomed. Some of the leading specialties manufactured by this house are Essex's "Combination" hand oil pump; the Essex "Standard" sight feed lubricator for stationary engines; the Essex double sight-feed lubricators; Essex's glass body oil pump and Essex's improved all brass oil pump.

## ELECTRIC STORAGE BATTERY CO.

The Electric Storage Battery Co., of Philadelphia, has an interesting exhibit in Space No. 25 on the ground floor, where several types of the company's standard cells of "Chloride Accumulator," as used in street railway work, are displayed. There are one cell each of type 17-F, 17-G and 67-G in lead lined wooden tanks and a 15 F cell in a glass jar. Several examples of the

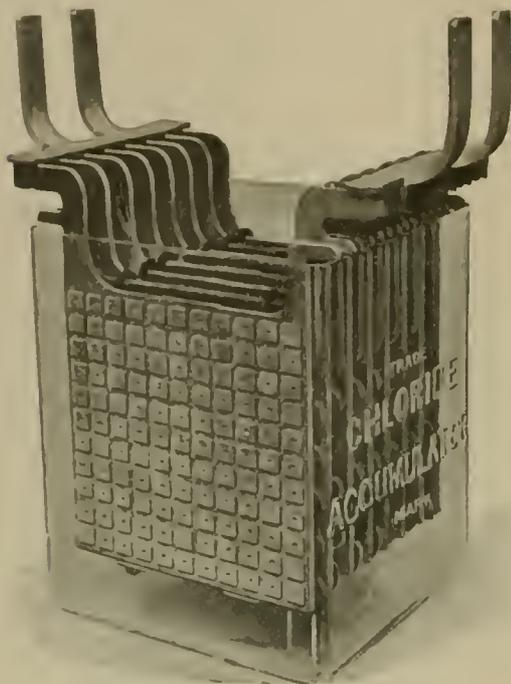

FIG. 1—15 F ELEMENT IN GLASS JAR,

vehicle type of battery are also shown, consisting of types MV-5, MV-7 and PV-9. Two switchboards are exhibited, showing the standard instruments, installed for railway service, one of which is illustrated in Fig. 3. The company is represented by Charles Blizard, manager of sales department; J. Lester Woodbridge, engineer sales department; E. Vail Stebbins, manager Cleveland sales office; R. H. Klauder, manager St. Louis sales office; G. H.

FIG. 2—10-G ELEMENT IN LEAD-LINED WOODEN TANK.

Atkin, manager Chicago sales office; R. B. Daggett, manager San Francisco sales office, and J. E. Lockwood, president of the Michigan Electric Co., the Detroit agent of the Electric Storage Battery Co. The three batteries of the Detroit United Railway will be of special interest to those attending the convention; the first located at the River St. station, opposite the power house, consisting of 276 elements, with a capacity of 2,500 amperes; the second located at the Third St. sub-station, consisting of 250 elements, with a capacity of 2,200 amperes, and the third located at

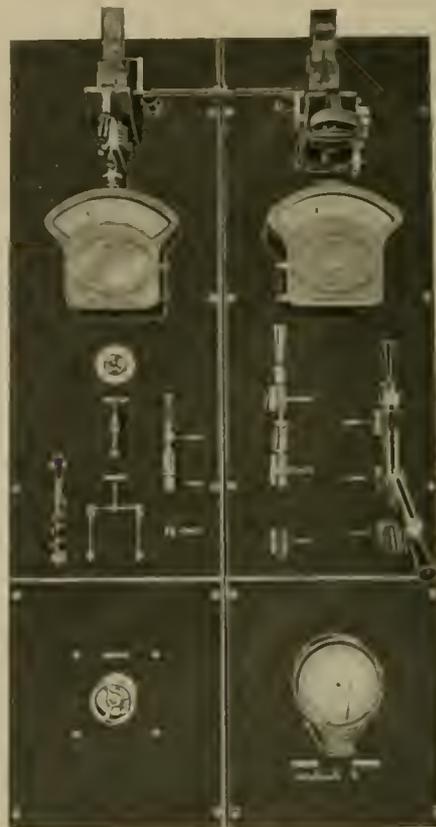

FIG. 3.

located on the Wyandotte Division, consisting of 276 elements, with a capacity of 2,800 amperes. These batteries, together with several other typical railway installations, are described in a booklet which the company is distributing during the convention. They were fully described also in the September "Souvenir" issue of the "Review."

## THE H. W. JOHNS-MANVILLE CO.

The exhibit of this company is very complete, there being shown a full line of overhead line material, comprising a number of newly-designed devices, a working display of electric car heaters, and Sachs "Noark" fuse protective devices. Particular attention is called to the newly-designed insulated and metallic crossings and section insulators, which embody new features that, it is claimed, entirely eliminate the trouble experienced with other devices used for similar purposes. The line of subway fuse boxes is believed to represent the largest and most complete line of work ever built of this description, and is very interesting together with the other new features in the fuse manufacture that are also exhibited. Those present at the convention are: J. W. Perry and J. E. Meek, of the New York office; D. T. Dickson, of the Philadelphia branch; S. H. Finney, of the Chicago branch; Wm. A. Buddecke, of the St. Louis branch; also E. B. Hatch and Mr. White representing the Johns-Pratt Co.

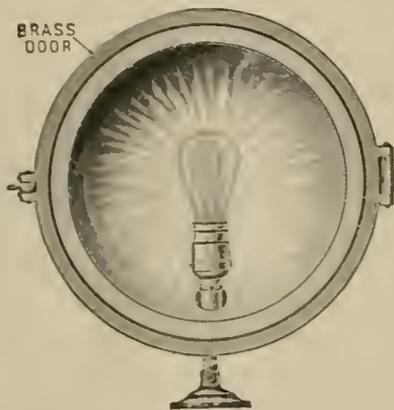

Mr. O. D. Henry, associated with Lorain Steel Co., is in attendance.

The central chandelier at the Armory is lighted by Nerust lamps.

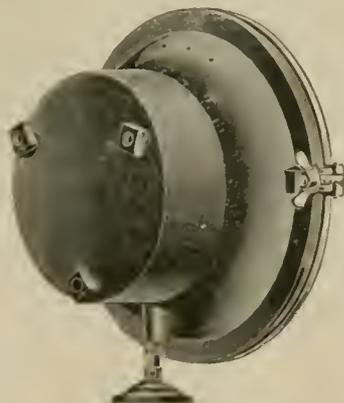

**"DON'T CUT YOUR DASH!"**

This is the pointed caption that the Smith New York Co. adopts to call attention to its latest improvement in electric car dash headlights. This headlight, the result of many years' experience, has some very desirable features. It is a new departure and is constructed on scientific principles. It is made in

FRONT ELEVATION SHOWING DOOR CLOSED

two sizes. The body is of heavy cast or malleable iron, the reflector of the best bronze metal, heavily plated, and the door of heavy cast brass, with heavy glass imbedded in rubber and held in place by an adjustable cast brass ring. The inside of the door is provided with a 3/8-in. square rubber gasket, which is imbedded in the door and projects 3-16 in. above the surface, making the lamp perfectly weather and dust proof when the door is closed. The whole fixture is bolted on the dash, thus

VIEW OF SIDE AND BACK

obviating the necessity of cutting a hole in the dash. This makes it especially desirable for vestibule cars. Two views of the headlight are here shown. The Smith New York Co. was established in 1849 and is well known the world over for the excellence of its products. Its general offices are at 248, 350 and 352 Pearl st., New York, and at 60 King William st., London, E. C., England

**A PHILANTHROPIC IDEA**

The J. A. Fay & Egan Co., of Cincinnati, O., and the Lane & Bodley Co., are planning the erection of a building upon the site of their Bond Hill factories for the benefit of the workmen employed. This will be something in the nature of a combined boarding house and restaurant, and the purpose is to so conduct it that it will take the place of the usual saloon and boarding houses which spring up in the neighborhood of large manufacturing establishments. Everything offered by the saloon will be offered here, but in a more attractive way, and it is the intention to offer everything at a price so much less than no ordinary saloon in the neighborhood can compete. The compa-

nies expect to derive a benefit by securing abundant labor of the class which patronizes boarding houses by offering attractive rooms and meals at a cost much less than the workmen could otherwise secure.

**DORNER TRUCK & FOUNDRY CO.**

This company has on exhibition one of its latest improved high speed motor trucks, the "Reliance" track cleaner which needs only the name for description, and Burke's patent safety switch, a new device, to which the attention of railway men is particularly directed. The features of the Burke switch are that the lock is designed to lock or hold the switch toggle in whichever position it may be thrown; this allows double truck cars to pass through a switch without the rear truck taking the wrong track, thereby throwing car crosswise and blocking the track. The lock is made with a steel rod inside of a steel coil spring and cast steel racks, incased in a water-tight cast-iron box. The claims made are that it is very compact, taking up little room, easily put in, always in working order, needs no repairs or attention, easy to operate. Motormen throw the switch with a switch rod, the same as with an ordinary switch, and it can also be arranged to operate automatically, if desired. The company has a number in satisfactory operation.

The Dorner truck exhibited is designed for high speed, and is built as near the M. C. R. specifications as was practicable in a motor truck. Some of the principal points about the truck are:

The top frame is made of 4x1 in. iron and is continuous, having no splice. The ends of the frame are half turned making them vertical, this form being patented. The transom of the trucks is formed by two 1/2x8 in. steel plates reinforced by 3 1/2x2 1/2 in. angle irons extended across the track and attached to the truck frame proper through the combined transom end and swing hanger pivot. This in turn is secured to the frame and arch bar by means of vertical bolts passing through it. The transom is further braced by gusset plates which are riveted to the frame and to the reinforcing angles of the transom. The lower swing hanger pivot rests under and is attached to the swing plank. Elliptic springs rest upon the bottom spring seat which is secured to the spring plank, and the top spring seat is attached to the iron truck bolster. The truck bolster supports the center plate and side bearings, the top spring seat forming a chafing plate to wear against the 1/2x8 in. plate which forms a part of the transom. The swing bolster and the brake rigging are secured by safety hangers to eliminate the possibility of accident. The spring base of the truck is increased by hanging the equalizer bar underneath the box, thus enabling it to have double helical springs on each side, four more than are generally used. With a 6-ft. wheel base, brakes on the outside of the wheels and the swing hanger in front of the wheels, a large amount of space for the motors is secured. The brake head and shoe are attached by a key, making it a simple operation to remove the worn shoe. The brake leverage can be altered as desired, according to the power required. By removing the pedestal tie bar bolts the truck can be lifted away from the journal box, thus leaving the latter with the equalizer and equalizer springs in their normal position. The journal boxes are of large size, giving ample room for oil and packing, and will take a 1 3/4-in. journal. The axles are 5 in. in diameter. The total weight of the truck is 8,700 lbs. The company has lately made three large shipments of this type of truck and has several other orders under way at its works which have recently been built with special reference to this line of manufacture. Because of its substantial construction, its easy riding and the nominal cost of repairs required, this truck is particularly recommended by the makers for heavy interurban work. H. A. Dorner, general sales agent, represents the company.

The Christensen force is here 20 strong. The company's work-lug exhibit at the Armory is also strong and forcible. Christensen headquarters are at Hotel Cadillac.

"The American Street Railway Convention" sign over the entrance to the Armory is a beauty. The sign on t. > City Hall is also O. K.

## A "BRILLIANT" SIGN.

Inasmuch as the old practice of painting the names of routes directly on the sides of cars has gone out of favor a legible adjustable sign has become a very necessary part of every car's equipment. To avoid confusion to passengers and prevent delays through the necessity of conductors having to stop to answer questions of bewildered passengers a car sign should be legible from a distance of at least 500 or 600 ft.; should be as easily readable at night as at day; should be of standard dimen-

NEW BRILL SIGN.

sions and adjustable to any car owned by the company; and should be strong and substantial enough to withstand hard usage.

The J. G. Brill Co. is putting on the market a new sign for which much is claimed. This will be sold under the catchy and appropriate name of the "Brill-iant." The designating faces of the sign are made of celluloid with letters in patented enamel. There are no lights in the sign itself. It is to be placed on the car roof before the end or side transoms, so the light from the interior of the car will shine through the lettering. The sign is of the turn-over variety and can be furnished with double, triple or quadruple faces. A peculiar quality of these celluloid transparencies is that although the different faces of the sign

NEW BRILL CAR SIGN.

may be close together, in the double sign, for instance, there being scarcely an inch of interspace, not a trace of the back face is seen through the front one. The celluloid diffuses the light so that although the lettering on the outward face will stand out or "glow" with great distinctness, the individual characters on the side toward the light do not show the slightest trace on the outward face. The "Brill-iant" sign is adaptable to various style of holders or hangers.

The Wichita (Kas.) Railroad & Light Co. on September 12th gave the inmates and teachers of the Children's Home, of Wichita, a free excursion over all the lines of its system. A special summer car was furnished for the purpose, and a number of stops were made at parks and pleasure resorts in order that the entertainment might be complete. The children and the manager of the Home duly voted thanks to the company.

## AMERICAN INJECTORS.

The American Injector Co., with offices corner of Congress St. and Brooklyn Ave., Detroit, is especially well equipped to supply the trade at this time and an inspection of its establishment will be well worth while. This company is the sole owner and manufacturer of the U. S. "Automatic" and "World" (double tube) injectors. Several points of superiority are claimed for the U. S. automatic injector, viz.: It is easy to operate, being started by simply turning on the steam; it starts at a low steam pressure and works at high pressure; it handles hotter water and feeds hotter water into the boiler; the capacity can be reduced to a greater extent; it is automatic, with wide open suction, at lower steam and with throttled suction it is automatic at any pressure sufficient to enable the injector to get the water; it works equally well as a lifting injector or as a non-lifter; it never "breaks" through jarring. A distinctive feature of the U. S. automatic injector is the drip cock, which has special advantages. It drains the injector when not in use, and thus prevents freezing; by leaving it open the injector can be started even though the check valve leaks; by opening, a start can be made with lower steam; by leaving open when not in use it prevents the suction pipe from getting hot; it enables one to take hot water out of a hot suction pipe on a long lift and it is always handy for drawing hot water when the injector is working. The positive or double tube injector is provided with two sets of tubes or jets, one set adapted to lift the water and deliver it to the second set, which forces the water into the boiler. It is better to use the double tube injectors where the feed water is of too high a temperature to be handled by an automatic injector and when a great range of steam variation is accompanied by the condition of a long lift. The American company also makes a full line of ejectors, jet pumps, drive well jet pumps, exhaust injectors, fire plugs, grease cups, brass oil cups and all kinds of jet work for steam, water, oils, acids or chemicals.

## STREET RAILWAY DEPARTMENT OF STUART-HOWLAND COMPANY.

The Stuart-Howland Co. has enjoyed a most remarkable growth in its street railway department, and for the last seven months the company reports having sold and delivered 808 miles of complete overhead and pole equipment, excepting wire. This is distributed over a wide area, having gone into 23 states of the Union, four provinces in Canada, and five foreign countries. These equipments have been entirely of the company's own manufacture, with the exception of the wooden cross-arms and pins, which are turned out in immense quantities by a large mill in the South, the entire product of which is controlled by the Stuart-Howland Co. In addition to its own manufactures, the company carries one of the most complete lines of street railway, telephone and lighting supplies to be found in the United States. It also holds many exclusive territorial agencies for valuable specialties, a recent acquisition to this list being the Ham sand box and Ham trolley catcher, for the six New England States and the Dominion of Canada.

## GARRIGUS MECHANICAL BOILER CLEANER.

This invention will be shown at the convention, although it is well known and is being used in a large number of the electric railway and lighting plants as well as by the largest corporations in the country in other lines of business. It is claimed that its use shows such a large saving as to make it really indispensable on such plants. The company is represented at the convention by W. R. Mason, western manager, and P. A. Doughty, mechanical superintendent.

All of the double-truck cars of the Detroit United Railway, the Detroit & Wyandotte, the Detroit & Northwestern, the Detroit & Pontiac and the Detroit, Rochester, Romeo, Lake Orion & Flint Ry., operated in and through the city of Detroit, are equipped with Magann storage air brakes.

FLEXIBLE ONE-PIECE RAIL BOND.

The importance of having the ground return circuit as nearly perfect as possible is readily apparent to street railway men. A poor or defective rail return means the same as insufficient copper in the overhead system and materially reduces the efficiency and correspondingly increases the cost of operation of the system.

Among the later types of rail bonds on the market, the "All Wire" bond made by the Ohio Brass Co., of Mansfield, O., has attracted much attention as embodying a new idea in rail bond construction. The mechanical features involved in making this bond were most carefully worked out before it was placed on

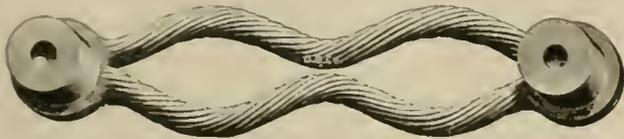

FIG. 1. FINISHED BOND, TYPE B FORM 2.

the market, so that it was presented in a fully developed and perfected form.

As its name indicates, it is made entirely from wire, including the bond terminals, so that the highest conductivity, that of pure soft drawn copper, is maintained throughout the entire length of the bond. The ends of the cable are formed of wire and are cold pressed into shape ready for welding. These terminals are afterward heated to the welding point, and welded between dies under sufficient pressure to weld the strands of wire composing the terminals into a solid mass of copper.

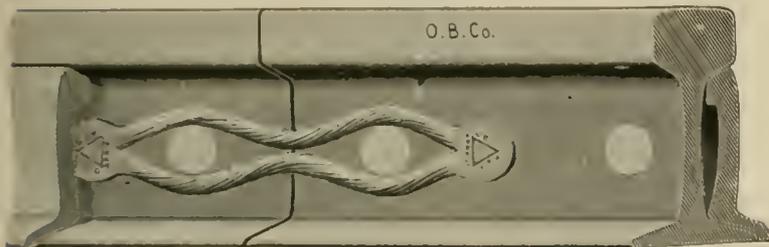

FIG. 2—70 lb. T RAIL BONDED WITH ONE TYPE B FORM 2 BOND

The "All Wire" bonds, some forms of which were more fully described in our issue for March 15, 1902, are made in a great variety of types. One of the loop style is shown in the illustrations. This bond is intended for use either under the fish plate or around it, or under the base of the rail.

CONSOLIDATED CAR-HEATING CO.

The Consolidated Car-Heating Co., of Albany, N. Y., is represented at the convention by Francis C. Green, general manager; C. S. Hawley, New York agent; C. W. Martin, Chicago agent; W. S. Hammond, jr., who is attached to the Chicago office, and Mr. Sprague, who is in charge of the operation of the exhibit. The exhibit comprises samples of the company's different types of heaters; apropos of these heaters it is interesting to note that the company has, during the nine years it has been in business, equipped over 11,000 cars involving the use of 120,000 heating coils, and that equipments furnished in 1892 are still in efficient and regular service.

Among the heaters exhibited are the following: The No. 1431, a panel heater 20 3/4 x 13 3/4 x 5 in., which is similar to those furnished on a recent order for 51 cars for the Metropolitan Street Railway Co. of New York and is now standard on that road. The 118WS heater, slightly longer than the company's ordinary cross-section heater, which is the one furnished on the principal elevated roads in Chicago, and is their standard. The 118W heater, which the company is just sending for 80 cars on the system of the Chicago Union Traction Co.; this type of heater is standard on the Chicago City Ry. to which were recently furnished 75 equipments. The sample Manhattan heater which is standard on the Man-

hattan Ry. of New York City; the contract for the equipment of this road called for 21,600 heaters of this type, making 1,200 equipments of 18 heaters each, which are very nearly completed at the present time. The No. 93 heater, which is the most satisfactory one on the market for chair cars, and which is very frequently used in the express compartment of combination cars.

LEE INJECTORS.

The Lee Injector Manufacturing Co., of Detroit, publishes the following working ranges within which the Lee ball valve automatic injector will operate. Start low, 18 to 20 lb. steam pressure on 4-ft. lift; work high, 150 to 160 lb. steam pressure or over on 4-ft. lift; lift water 20 ft. on 60 to 100 lb. steam pressure; handle hot water 120 degrees to 130 degrees at 65 to 80 lb. steam pressure; handle hot water 110 degrees to 118 degrees at 100 lb. steam pressure; handle hot water 95 degrees to 100 degrees at 125 lb. steam pressure.

The company's latest catalog contains a considerable amount of valuable information relative to injectors, their construction and the principles upon which they work; also a number of tables and considerable data of general interest to steam engineers.

DETROIT LUBRICATOR CO.

The Detroit Lubricator Co. has general offices in the Hodges Building Detroit, and its factory is at the corner of Lincoln Ave. and the Railroad. Its officers will be pleased to welcome visitors at any time and explain to them the reason why the Detroit sight-feed lubricators have been universally recognized for more than 20 years. It has always been the aim of this company to keep in the lead in improvements in design and quality of workmanship. During the past year it has added a number of specialties to its line, which now includes sight-feed lubricators, plain lubricators, brass and glass oilers, brass and glass oil pumps, multiple oilers, oiling devices, grease cups, boiler oil injectors, low water indicators, throttle valves, globe valves, steam and hot water valves, etc. More than half a million of the sight-feed lubricators have been sold. Their operation depends upon the action of natural laws, so unless some part is injured or defective, or some mistake is made in attaching or operating, they must work positively. The officers of the Detroit Lubricator Co. are: President, H. C. Hodges; vice-president and manager, C. B. Hodges; secretary and treasurer, F. W. Hodges; assistant secretary, A. B. Wetmore.

HAROLD P. BROWN.

There is no more regular attendant at the conventions than Harold P. Brown, manager of the Edison-Brown plastic rail bond, and his exhibits are always among the most interesting ones in the hall. This year Mr. Brown is located at Space No. 8 where he is operating a large testing plant and showing bonds of different types applied on rail joints and carrying current up to 3,000 amperes. He also exhibits his bonding tools, the Brown hand power grinder with flexible shaft, and the Brown portable track drill. The testing plant, which is the most complete one of its kind in the country, will be placed at the disposal of any railway engineer or official who desires to test the conductivity of any type of rail bonds, switches, circuit breakers, fuses, etc. Besides Mr. Brown, James Hollowood, superintendent; J. Maxwell Coote, electrician; Wm. Temple and S. H. Dalley are at the convention.

HOLDING THE FRANCHISE.

The story is told in California that in the town of Garvanza, a few miles from Los Angeles, a railway promoter who began construction in order to hold his franchise, laid a piece of track one rail long, the rails being supported on six ties and in order to keep this from being stolen buried the whole track some two feet under the surface of the road.

Messrs. C. E. Nicol and C. K. Freeman are looking after the interests of the Armspore Manufacturing Co., of New York City.

## USEFUL IN RAILWAY WORK.

The success of the "Wells Light" (Wallwork and Wells' patents), has been immediate and remarkable, both in the United States and abroad. There are more than 17,000 of them in use. It is really a wonderful invention, the more so because of its simplicity, and its adaptation to railway uses is marked. It is a portable light, obtained from oil, of from 800 to 5,000 candle power, and neither engine, boiler, compressor nor fixed plant is required to operate it. It is strong, safe and reliable, continuous in action, unaffected by weather, steam or smoke, and it is also cheap.

The light is produced by passing kerosene oil through a heated burner, where it is generated into gas. Oil is forced into a tank by a pump until it is two-thirds full, compressing the air already in the tank to about 25 lbs. pressure. The burner is heated by turning a little oil in a dish at its base, the heat being concentrated around the burner tubes by a chimney. When the burner is sufficiently heated a valve is opened and the oil from the tank is forced by the air into the heated burner, where it is converted into gas, which issues from a jet mixing with sufficient air in a cone where it may be ignited. The chimney is then removed and the flame passing through the rings of the burner maintains the heat and gives a clear white light free from smoke or spray.

THE LIGHT IN ACTION.

A few strokes of the pump every few hours will renew the pressure and oil or air may be pumped into the tank while the light is burning. It uses kerosene oil from 110° to 150° fire test and throws no unconsumed oil spray about. The special features in the lamps and burners are protected by over 50 United States and foreign patents. The "Wells Light" is a valuable aid in track laying and repair work generally. It is also used for tire expanding by many railroads, and it is invaluable for water works. By its use lead joints may be quickly burnt out, saving 90 per cent of the lead, it is claimed. A list of the users of the light would include many of the leading railways, engineers, mines and contractors of the world. For instance, more than 100 are in use on the Chicago drainage canal. Mr. Edward Robinson is the sole proprietor of the "Wells Light." The business is conducted under the style of The "Wells Light" Manufacturing Co., 41 and 46 Washington st., New York.

The Bidwell Telephone Co., of Grand Rapids, Mich., which had secured space and intended to make an extensive exhibit of its car telephone system, has unfortunately been obliged to abandon this exhibit on account of the illness of Mr. Benson Bidwell.

Mr. Albert Eastman, of the Detroit United Ry., in addition to his duties of traveling express agent, will hereafter represent the company as its traveling passenger agent, his title now reading traveling express and passenger agent. Mr. Eastman represents the Rapid Railway System as well as the Detroit United Ry.

## DUFF MANUFACTURING CO.

The Duff Manufacturing Co., of Allegheny, Pa., has on exhibit a complete line of Barrett lifting jacks, comprising both automatic lowering jacks and trip or track jacks, for car use, work in the barn, track construction and repair work. These jacks shown have lifting capacities ranging from one to fifteen tons, varying in sizes and dimensions. There is also exhibited, for the first time, the company's new Barrett motor armature lift for removing and replacing armatures. This armature lift is constructed throughout of iron and steel and the truck is provided with either flat or flanged wheels as desired, arranged for a track of 24 in. gauge. There is a side adjustment of 6 in., which is a feature very essential under many conditions. The jack used is our well-known "Barrett" automatic lowering jack, having a cradle top with wood rolls, but a flat of special top can be used if desired. This lift is light, strong, durable and easily operated and it can safely carry a load of three tons. It is designed to meet the demand for a first-class armature lift at a reasonable price and is adapted in every way to the purposes for which it is intended. The principal dimensions are: Width, 29 in.; length, 33 in.; gauge, 24 in.; height, bar down, 36 in.; raise of bar, 21 in. The company also exhibits the Barrett automobile jack, which has just been placed on the market during the past year, and which has been pronounced the best adapted jack for

BARRETT MOTOR ARMATURE LIFT

all automobile purposes, now on the market. It is also adapted to light machine work. The Barrett jacks are so well known that no description of them is needed here. The company advises us that these jacks have been adopted as a standard by all the leading street railways and steam railroads in the United States, and that it now supplies nearly every street railway in the country with Barrett jacks. The merits claimed for Barrett jacks are efficiency, excellent design, practicability, quickness and ease of operation, good material and workmanship. The company is represented at the convention by T. A. McGinley, treasurer, and George F. Freed, superintendent.

ALLIS-CHALMERS CO.

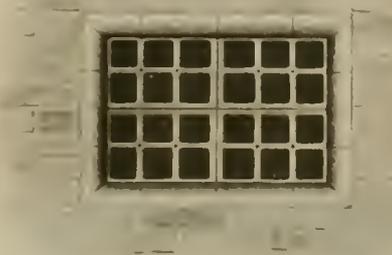

Among the engine sales of the Allis-Chalmers Co. for August are the following. Armour Institute, Chicago, one 9 and 18 by 24 in. 1890 cross-compound Reynolds-Corliss engine; Pawling & Harnishfeger, Milwaukee, one 18x36 in. 1890 frame Reynolds-Corliss engine; Interurban Construction Co., Ottumwa, Ia., one 18x42 in. 1890 Reynolds-Corliss engine; Denver Tramway Power Co., Denver, Col., one 32 and 68 by 60 in. 1890 cross-compound condensing, and one 30 and 64 by 48 in. 1890 cross-compound condensing Reynolds-Corliss engine; Southern Electric Light & Power Co., Philadelphia, one 42 and 86x60 in. combined vertical and horizontal duplex compound condensing Reynolds-Corliss engine.

Mr. Bertram Berry is at the Cadillac. The Heywood Bros. & Wakefield exhibit at the Armory will be exceptionally fine.

CONDUIT TERMINAL FRAMES.

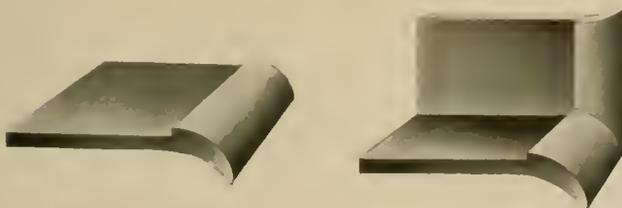

The accompanying illustrations show an adjustable terminal frame for ending underground conduit in manholes which serves not only to give the work a more finished and neater appearance, but also allows a better arrangement of cables as the cables can be placed closer to the walls without kinking the lead sheath and without being damaged by sharp corners. The common practice

FINISHED MANHOLE, WITH GEST'S CONDUIT TERMINAL.

in ending conduit in manholes has been to bring the ducts flush with the face of the wall, thereby causing a sharp corner which is encountered when drawing in cables and is liable to cut or scrape the lead cable sheath so as to cause serious injury. In shaping the cables to the walls a good arrangement can not be obtained without kinking the sheath where the ducts are flush with the wall.

The adjustable terminal frame is a radical improvement over the old method and being smooth and having no sharp edges or

SECTION OF FRAME

CORNER PIECE.

corners offers no obstruction to the drawing in of cables. The frame is adjustable to a run of any number of ducts.

This adjustable terminal frame is one of the many specialties now being placed on the market by G. M. Gest, the expert subway contractor of New York and Cincinnati, who is treating conduit construction from a scientific standpoint and is solving the problems in an artistic manner.

SMITH HEATERS IN DETROIT.

The falsity of the proverb, "A prophet is not without honor save in his own country," is clearly shown in the case of the Peter Smith Heating Co. and the street railways in and about Detroit. The heaters made by this company are used by seven of the Detroit companies, there being 50 equipments on the Rapid Railway System, 12 on the Detroit and Flint division, 12 on the Detroit, Rochester & Romeo, 11 on the Detroit & Pontiac, 12 on the Detroit & Northwestern, 12 on the Detroit & Wyandotte Rv. and 12 on the Detroit Shore Line, a total of 120.

THE SUPERIOR GRAPHITE CO. of Detroit, recently received orders in the same mail, for its "Superior" graphite paint, from Manila, P. I. and from San Juan, Porto Rico. The company has two machines working constantly putting up new machinery, and the factory is working to its fullest capacity and overtime in taking care of current orders.

ON THE SPOT.

Part I.

As I stepped onto the car platform a few evenings afterwards, No. 89 stood in the far corner of the vestibule and, with one finger on his lips, motioned me with the other hand to go inside. I went in much mystified and found the only occupants to be a mildly intoxicated Irishman and a clerical young gentleman in spectacles intently engaged in reading a book. After a while No. 89 came inside, sat down near the door and, taking a lot of tickets and transfers out of his pocket, laboriously thumbed them over. He then counted his change, figured for a few minutes with a well-sucked pencil on the back of his trip-report and then slowly rang up five fares, and—after a little more figuring—he rang up four more. This done he resumed his place on the platform and when, soon afterwards, the clerical young man got off he beckoned me out.

"Thought I was crazy, didn't you?" was his greeting. "Saw that laddie with the specs that just got off? Well, he's a spotter. New one. Boys just put me up to him an' I didn't catch on to him when he got on the car to-night down in the city an' as I had a fair crowd on when I started I thought I might 'a missed rugin' up some fares."

"I see."

"Yes, an' sure enough, I had! Lucky he stayed on long enough for me to find it out an' rect'fy it where he could see it, wasn't it?"

"Very! 'Conductor No. 89 is honest but careless about ringling up fares.' Is that the way you think the report will go in?"

"That's it, sir, to an allspice. Guess you must 'a been in the biz."

"How did the boys plek this young man out as a spotter?"

"Oh, that's dead easy. First of all he's a new reg'lar rider an' them's always suspicloned. Then he always looks direct at th' register soon's he comes in. Then he changed to th' Avenoo line onc't an' didn't ask for no transfer—paid fare on both lines. Then he always reads the same book an' turns over a page most every time a passenger comes in. Then he purtends to read, but all the time he's watchin' the conductor. Oh, there's dozens o' ways you can tell what he is an' that he's new at th' biz, an' now he's located he won't do any harm—makes him a livin', keeps a better man out o' th' way, pleases th' comp'ny an' amuses th' boys—we ain't got nothin' against him!"

"Then you believe in spotters?"

"Certain! 'f I was runnin' a road this size I'd have 'em every time or I'd soon have to go out o' business. It's diff'ent in a small road where you know yer men an' all about 'em an' even there there's knockin' down, but here 'n the city you get all kinds o' men to run the hind end 'f a car, careful men an' honest men an' men as isn't ether an' you've gotter have spotters!"

"Do they do any good?"

"Aw—say, you're kiddin'! Do good? Why there's men conductin' on this road that'd own it in a year 'f it wasn't for the spotter!"

"But they don't stop it?"

"Course not—not entirely, but they stop a lot of it—or the fear of 'em does. Stop it? Nothin' 'll stop it entirely but 'savin' grace'—as th' preachers call it—an' you don't get much o' that included for twenty cents an hour an' stand all the passengers an' Comp'ny does to you! Stop it? Why it's just this way, you see there's some as 'knocks-down' for their tobnaker, an' some fer their beer an' some for their other small spendin' money—them's not the kind as hurts an' they'll average up their stakes, spotters or no spotters. It's th' kind as steals, takes all they c'n lay their hands on, makes a reg'lar biz of it—it's them as I'd spot for."

"Then you think there's a difference between 'knocking-down' and stealing, eh? Which do you do?"

No. 89 grinned sheepishly.

"Well, I guess that's what o' Johnnie useter call 'a distinction 'thout a difference! But you know what I mean, sir there's some men as 'd steal 'f they was gettin' fifty cents an hour, an' have no conscience 's to how much they took—them's th' kind as I say 'steals' but what little some o' the rest of us

takes never hurts th' comp'ny an' we makes it up 'n other ways."

"Ah, I catch your point of view, but does the company look at it your way?"

Again there was a grin.

"Guess not, from what I've seen an' heard—it's all distinction an' no difference with them," and there was a contemplative silence for a minute. "But, Lor', talkin' about knockin' down, there ain't any of it now t' what there was in th' old days. Don't know whether th' boys is gettin' honest or what, but in them days a man could make a stake. Soon after Bill Hendricks died—he was my driver—somethin' happened as scart me away from here so I quit an' went to Philadelphia an' got a job conductin' there. Say! But that was a cinch! Seven cents single fare an' four tickets for a quarter; blue cents for an 'exchange' (that's Quaker for a transfer), bell punches, different colored trip-slips to punch for different fares an' a way o' gettin' around every one on 'em! An' that wa'n't th' best of it; instead o' cardboard tickets they had little round red an' black rubber checks with th' name o' the road on 'em an' a hole in the middle so's you could carry 'em strung on a leather shoe string! Oh my, but they were easy; reg'lar 'legal-tender' in the stores all around the barns for a plug o' tobacco, a seegar or a glass o' beer, an' they come in might handy at a little game o' draw-poker—five cent ante an' a quarter limit! But it didn't last—it was too good a thing an' such fellers as I was talkin' about got hoggin' it an' spoilt it all! Why, some of 'em built 'emselves houses an' bought 'emselves hosses an' the balance of us as wasn't makin' more 'n our tobacco an' beer, got th' benefit o' their doin's—so I come back to th' city. You see 't was too swift a pace for a slow town an' th' directors was beginnin' to get next! This street's your's sir."

#### SCENIC RAILWAYS.

The United States Scenic Railway Construction Co., 90 Griswold St., Detroit, is coming to the front very rapidly as an amusement purveyor and its attraction is one of the best money makers a city upwards of 20,000 inhabitants could have. Street railway managers have come to feel that it is profitable for them to open and maintain parks, and what to place in the parks to please the general public has been an important question. The scenic railway possesses peculiar adaptability to the requirements of street railway pleasure resorts. Changes can be made in the attractions of the tunnel, illusion devices and electrical effects and the attraction is always new. It is the aim of the United States company to organize a company in every important city in the United States and erect one of the roads in all large centers of population. These roads are built under the Welsh single track system, which is claimed to be the only single track system in practical use in the country.

The officers of the United States Scenic Railway Construction Co. are: President and general manager, C. W. Moore; vice-president, A. A. Schantz; acting secretary, F. J. Peddle; treasurer, William E. Reilly.

The company has built one of its scenic railways at a pleasure park near the Belle Isle bridge and this now forms one of the chief attractions in Detroit.

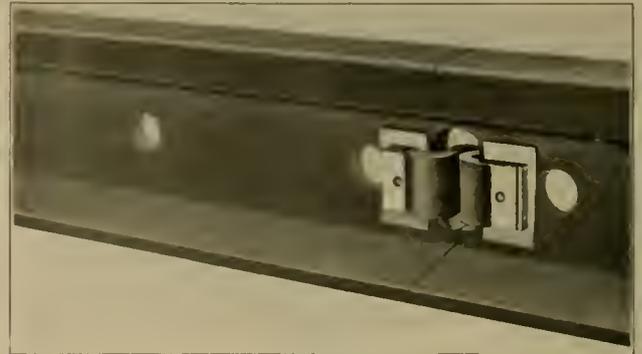

#### THE THOMAS RAIL BOND.

Among the railway materials exhibited for the first time is the Thomas rail bond—which is presented as something new in the way of "under the fish plate" bonds. It ingeniously utilizes the space between the fish plates and is designed to avoid entirely any pinching of the bond between splice bars and rail.

The Thomas bond consists of a series of flat strips of soft rolled copper, soldered to one another at the ends, but having a central flexible portion where the strips are unattached; the ends form flat feet which are soldered to the rails, while the flexible part is bent into a loop which projects through an opening punched in the rails at the point of meeting. The flexible part of the bond occupies that part of the space between the joint plates where the distance is greatest, and no part of the flexible part of the bond extends to the narrow space at the head and foot of the rail. A soft copper strip is placed under each end of the bond

and extends to the head and foot of the rail, giving a large contact area between the bond and the rail. For convenience in installing the bond and as an additional element of strength in the attachment of the bond to the rail, a small cap screw is put through the web of the rail and tapped into the foot of the bond; this serves to draw the bond into close contact with the rail, and in addition to relieve the solder of much of the stress which comes upon it in service. Since the cap screw becomes soldered both to the rail and bond in the process of attaching the bond, it is impossible for it to become loose. The construction of the bond and its application to the rail are shown in the illustration.

The punching of the necessary opening at the ends of the rails may be accomplished at the rail mills or at the point of use, but the work will preferably be done after the rails are laid and the track is surfaced by a hydraulic punch of sufficient power to punch both rails at one time. The rails are then drilled for the cap screws and ground with an emery wheel, where the bond is

THOMAS RAIL BOND.

to be attached, until the surface is bright. The bond is then placed in position and held by the cap screws, and the rail and bond brought to a soldering heat by gasoline heater. When the solder in the feet of the bond is thoroughly melted, enough is added with acid to ensure the complete filling of the space under the foot of the bond, and the cap screws are turned up hard, drawing the layers of the bond together and pulling the bond as a whole into intimate contact with the rail. The rail and bond are then allowed to cool slowly.

The advantages claimed for this bond are that it is very short (but  $4\frac{1}{2}$  in. between centers even for double bonding), that the rails are punched at the extreme ends, and that but little metal is removed from the rail web. Shop tests are reported to show a long life both under horizontal bending, such as would occur because of the expansion and contraction of the rails, and under vertical deflection such as would result from a loose joint.

The Thomas bond is made by Edward G. Thomas, 4 State St., Boston, who is prepared to undertake the installation of these bonds under contract.

#### THE DEACON RODE HOME.

At the time the Middlesex road was built in Boston, many years ago, there was by no means a unanimous opinion as to the morality of Sunday cars, as illustrated in the following.

A good deacon had visited Boston one Sunday, presumably making the journey from his Charlestown home on foot. As he was about to return he caught sight of a Middlesex car, and the day being inclement he pocketed his moral scruples and entered it.

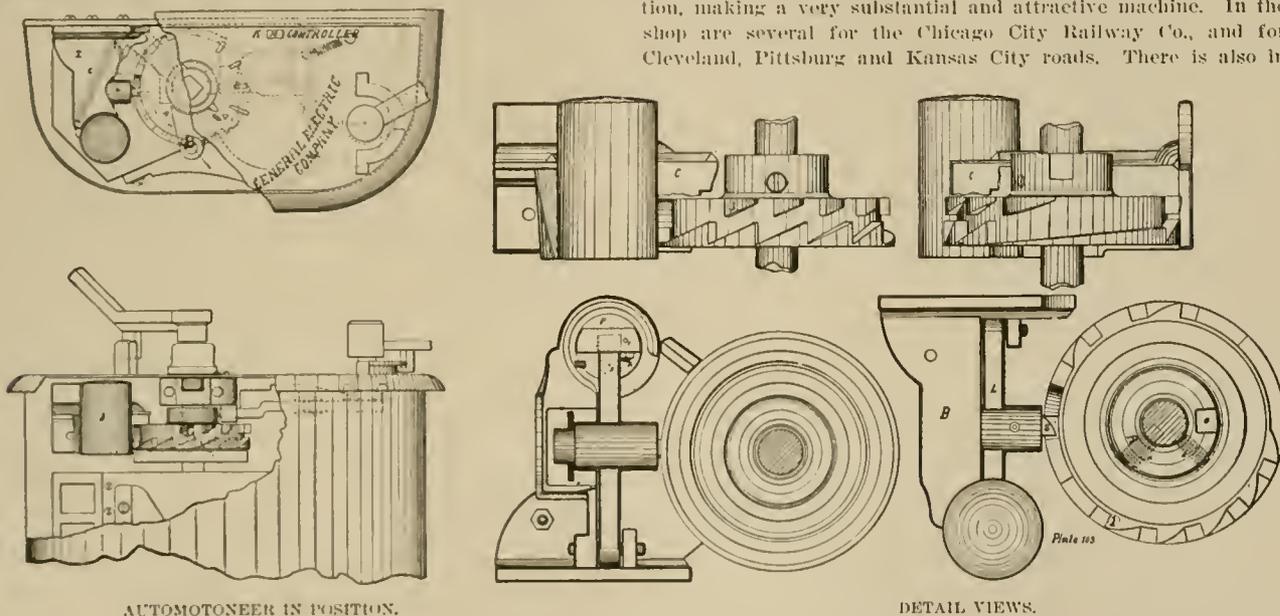

When comfortably seated in the car he said to the only other occupant, a prominent citizen of Charlestown: "What's this car doing over here on the Lord's day?" Being informed by the citizen that it was the intention of the company to run its cars regularly on Sundays as on other days, but little more was said until the car had proceeded some distance, when the deacon, who, no doubt, had been mentally debating the moral aspects of such a course, suddenly exclaimed: "Well, I must confess it's mighty comfortable!"

THE AUTOMOTONEER.

The exhibit of the Garton-Daniels Co., of Keokuk, Ia., which is located in the space of the Ludlow Manufacturing Co., No. 54, is a particularly interesting one, this being the first time that the great majority of the convention delegates have had an opportunity to see the "Automotoneer" in its present form. Our readers are doubtless all familiar with the object of the automotoneer—a mechanical device placed in the car controller for fixing a predetermined time limit for the rate at which the controller can be advanced from one point to another. The device acts only as current is being turned on, and the current can be turned off just as if the automotoneer were not attached.

In the "Review" for Aug. 15, 1902, a number of half-tone illustrations of the automotoneer were published, but the accompanying line drawings serve to better show the mechanism in its relation to the controller.

The wheel marked A is put on the controller shaft in place of the usual notched plate. It has a zig-zag groove cut in its periphery with the points in the groove corresponding with the points on the controller. A spawl which enters this groove is raised every time the controller is advanced one point; (this spawl, S, is shown projecting from the small cylinder.) It is mounted on a lever, one end of which is pivoted at the back of the controller

and the other end of which is attached to a piston working in a dashpot.

Movement of the controller handle forward, to turn on current, raises the dashpot piston, driving the air out of the dashpot through an automatic relief check valve. Once the dashpot piston is raised, air begins to flow into the dashpot through an adjustable opening, allowing the piston to fall back to its original position in a time depending on the amount of opening allowed for the air to flow through. As soon as the dashpot falls back to its first position the spawl, which is on the same lever, falls so that it does not engage a tooth in the zig zag groove and the controller can be advanced another notch. The spawl being constructed on the well known principle of a door catch with one edge beveled off, allows the controller wheel to be revolved so as to shut off current without engaging any of the teeth. It works in a cylinder, as shown, and is held out so as to enter the groove by a solid spring which allows it to retract when the controller is thrown off so that the point of the spawl does not engage. There is no binding or side strain on the dashpot piston that could make it work hard, because the end of the lever is allowed more lateral movement than it ever could require in the slot which it enters on the end of the dashpot piston. There is a cover for the moving parts which prevents tampering by unauthorized persons.

The claims made for the automotoneer are that it will stop wasteful methods of car acceleration, so reducing coal bills; that

it will insure smooth starting of cars and so do away with a great source of discomfort, and even danger, to passengers; that it will tell the motorman just how fast he should advance his controller, relieving him of the necessity of judging; that it will prevent abuse of motor equipments and make armature and fields last longer; that it will reduce voltage fluctuations and line losses better than more feed wire in many cases; that in reversing for an emergency stop, it prevents the excited motorman from reversing too far, and so opening the circuit breaker; that it is cheaper and better than buying more generators and more copper to carry the load peaks due to improper controller handling.

The Garton-Daniels Co. is represented by J. V. E. Titus, secretary of the company.

McGUIRE MANUFACTURING CO.

The McGuire Manufacturing Co., of Chicago, has added a new wood-working shop to its plant this summer, which is especially intended for the sweeper business. The company reports the largest sale of sweepers it has had for years. Among the recent orders is one for five sweepers for the Union Railroad Co., of New York City, which differ from the others in that the side sills and end sills, and indeed the whole platform, is of steel construction, making a very substantial and attractive machine. In the shop are several for the Chicago City Railway Co., and for Cleveland, Pittsburg and Kansas City roads. There is also in

the shop a 4,000-gallon sprinkler mounted on double trucks, for Hampton, Va., where the railway company is to sprinkle the streets. (Two of these large sprinklers were shipped to Durban, Natal, South Africa in September.) The tank has a compressed air compartment, which is charged by an electric air compressor, and the machine is guaranteed to throw the water 50 feet on each side of the track, the compressed air forcing the last gallon of water from the tank to the same distance as when the tank is full. The whole sprinkler is of very substantial construction, and is intended to be used as a locomotive when not in use as a sprinkler.

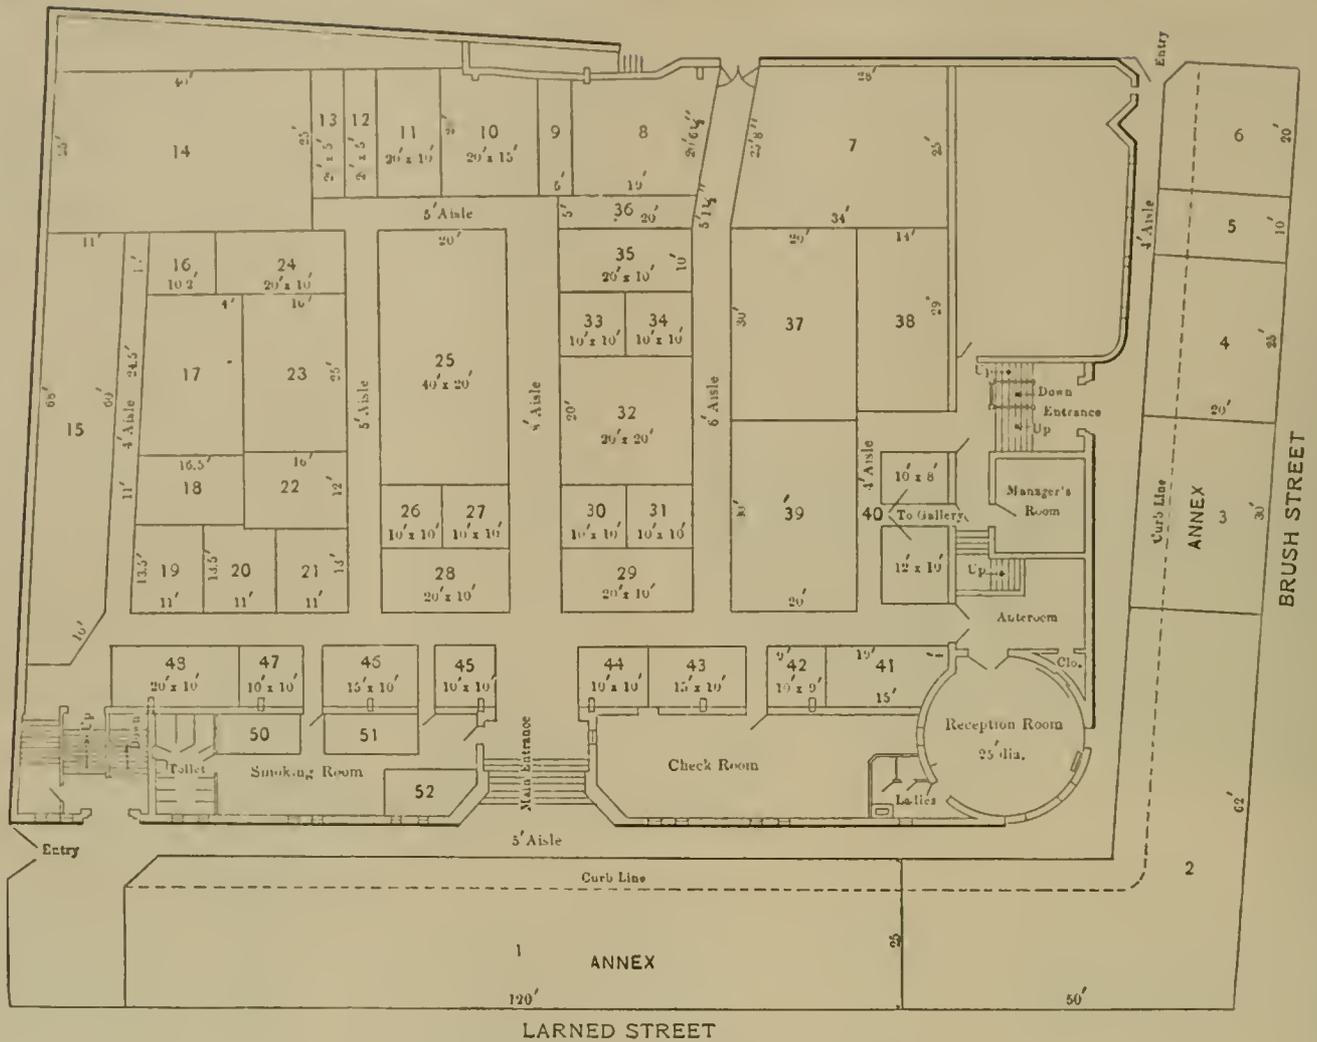

The McGuire company is also very busy in the truck building department, among the orders being 20 for Bangkok, Siam, and 175 for the Union Traction Co., of Chicago. One of the Union Railroad sweepers and the pneumatic sprinkler, with other samples of the company's product, are on exhibition at Detroit.

The Port Huron people think Superintendent Wood, of the Rapid Railway is a natural born joker because he claims that none of his patrons ever find fault.

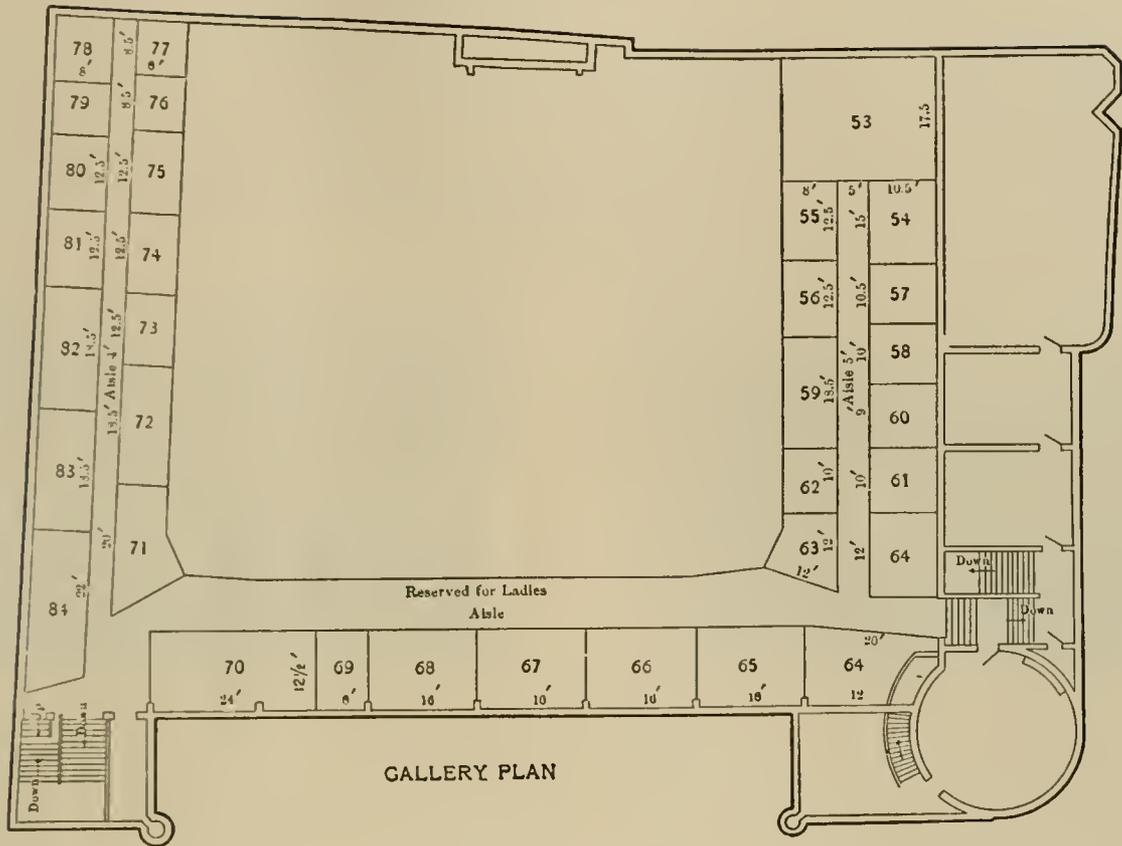

Telephone service at the Armory is free to exhibitors and delegates.

Mr. Pinckney J. Balaguer, secretary and auditor of the Charleston Consolidated Railway, Gas & Electric Co., of Charleston, S. C., is stopping at the Normandie. Mr. Balaguer reports street railway matters at Charleston and through the south in general in excellent condition. Many of the southern roads now equal the finest of the northern roads in point of equipment and operation.

POSITION WANTED.

First class armature foreman, wants position. Extensive experience. Seven years in charge of armature department of one of the largest roads in the west. Well acquainted with all types of Westinghouse and General Electric motors. Call at "Street Railway Review" Booth.

## MACPHERSON SWITCH &amp; FROG CO.

The MacPherson Switch & Frog Co., of Niagara Falls, N. Y. is represented at the convention by Chilton P. Conger, general manager of the company, who is making his headquarters at the Hotel Cadillac, where he has on exhibition a large working model of the patented MacPherson switch and frog, which will be examined with great interest by the railway men who are not already familiar with this device.

The object of the MacPherson switch and frog, which has been manufactured for the American market only since January 1st,

MACPHERSON SWITCH SET FOR SIDING.

is to solve the problem of making an absolutely clear main line and at the same time provide a safe and practical use of a switch and frog in the track when needed. The company states that the device has attracted wide attention and that some five or six years ago the Canadian Pacific placed two or three of these switches and frogs in its tracks at little used outlying sidings

SWITCH SET FOR MAIN LINE CLEAR.

in order to test the device, placing them where it thought the least harm would be done if there was anything defective in the device. Today it has between seven and eight hundred in use on the main line, and between Ottawa and Montreal, where a very high rate of speed is attained, every switch and frog is of the MacPherson pattern.

It is also used on the Adirondack division of the New York Central, the Cape Breton road of Nova Scotia, the Canada Atlantic, Portland & Rumford Falls, the Southern Pacific, Chicago, Milwaukee & St. Paul, Pennsylvania, Grand Trunk, Intercolonial, Junction Railway and other roads, while such roads as the Illinois Central, "Big Four," New York, Ontario & Western, the Rutland and other roads are preparing to place the device in their tracks with a view to testing its merits.

The main points of advantage claimed for the device are that main line trains, when not taking sidings or crossovers, do not touch the switch rails and frogs thus saving about 90 per cent of wear and tear on the two most expensive and most dangerous points in the track; also saving the breaking of wheels and other accidents caused by switch points and frogs to trains when running at a high rate of speed on main line over the present switch and frog, as when not in use both the MacPherson switch and frog are entirely clear of the main line track. The advantage which follows from this is obvious.

The desideratum in modern railroading is to eliminate all unnecessary parts. The facing point switch and the frogs set in the track, no matter how perfect the device is, are and always will be the danger point in railroading, and if such can be eliminated from the main line track when fast trains are running over such track, and something put in their place which will accomplish the purpose for which they are intended, namely, for use only in passing to a siding or crossing over to the parallel track, such a device, if safe and practicable, warrants the careful attention of all men interested in the operation of a railroad. In this device the main feature is that when the switch and frog

MACPHERSON SWITCH SET FOR SIDING

are set for the main line, both main line rails are continuous at the passing point of switch and frog. All parts of the frog and switch are well clear of main track rails. Accidents, which are sometimes caused by broken or foul switch rails or contact with parts of frogs, cannot therefore occur with MacPherson switch and frog.

SWITCH SET FOR MAIN LINE CLEAR.

The parts of the frog are simple, being composed of two rails, one 7½ and the other 9 feet long, with two connecting rods, 1¾ or 2 in. thick, and the pipe line which throws both the frog and the switch with one movement from the switchstand.

\*\*\*

## ONE LIFE SAVED.

That buying Providence fenders, as made by the Consolidated Car Fender Co., of New York City, is a profitable investment, is attested by the following clipping taken verbatim from the Springfield (O.) Sun of Sept. 18, 1902: "A practical demonstration of the life-saving tendency of the simple and in no wise costly street car fenders recently placed on local cars was held yesterday at Limestone and Main streets, when Harry Rosenberg, a messenger boy, was saved from being crushed to death. The boy is employed by the Western Union company, and rides a wheel. He was riding along Limestone street, and in attempting to turn out of the way of a car his wheel slipped on the rail and he was thrown to the ground. He was picked up completely by the fender, and carried until it was found that with the exception of a few bruises he was all right. Without the fender he would have undoubtedly been killed. His home is 247 Gallagher street."

MEETING OF THE EXECUTIVE COMMITTEES.

The executive committee of the American Street Railway Association was held at the Cadillac Tuesday afternoon. Only three members were absent, those in attendance being H. H. Vreeland, Charles W. Wason, Elwin C. Foster, H. M. Sloan, D. B. Dyer and T. J. Nicholl, all of whom were among the early arrivals yesterday. Secretary Penington had been in Detroit since Saturday giving the final touches to the arrangements of the Association. Mr. Penington presented his report as secretary and treasurer and the usual business of the executive committee was transacted.

The executive committee of the Accountants' Association met at 8 p. m. yesterday, the members present being President Mackay, C. L. S. Tingley, Irwin Fullerton, D. Dana Bartlett and Secretary Brockway. The regular business preparatory to the convention was transacted.

DELEGATES REGISTERED YESTERDAY.

- Augusta Railway & Electric Co.: D. B. Dyer, president; A. J. McKnight, auditor.
- Boston & Northern Street Railway Co.: E. C. Foster, general manager; D. D. Bartlett, auditor.
- Old Colony Street Railway Co., Boston: Robert S. Goff, general superintendent; Geo. W. Palmer, electrical engineer.
- Charleston Consolidated Railway, Gas & Electric Co.: P. J. Balaguer, auditor.
- Calumet Electric Street Railway Co.: H. M. Sloan, general manager.
- Chicago City Ry.: T. C. Penington, treasurer; C. N. Duffy, auditor; Richard McCulloch, assistant general manager; M. O'Brien, master mechanic; C. E. Lund.
- Cleveland, Painesville & Eastern R. R.: C. W. Wason.
- Denver City Tramway Co.: Geo. L. Rice, Jas. L. Adams, J. B. Hogarth.
- Grand Rapids, Holland & Lake Michigan Rapid Ry.: H. P. Strong.
- Grand Rapids Ry.: G. S. Johnson, general manager; B. S. Hauchett, Jr., secretary; J. C. Modigan.
- Hamilton Electric Light & Cataract Power Co., Hamilton, Ont.: C. K. Green, general manager; T. B. Griffith, superintendent.
- Hartford Street Ry.: E. S. Goodrich.
- Johnstown (Pa.) Passenger Ry.: H. C. Evans.
- Montreal Street Ry.: W. G. Ross, controller; D. Robertson; T. W. Casey, purchasing agent.
- Union Street R. R.: E. E. Potter, general superintendent.
- Interurban Street Railway Co., New York: H. H. Vreeland, president; H. A. Robinson, collector; J. F. Daly; H. E. Vreeland; Frank Wells; R. W. Mead.
- Consolidated Traction Co., Pittsburg: W. B. Carson, secretary; C. S. Mitchell, auditor.
- United Traction Co., Pittsburg: C. W. Lepper, purchasing agent; F. Whlenhart, chief engineer; H. P. Clark, master mechanic.
- Peoria & Pekin Terminal Ry.: L. E. Myers, N. C. Draper.
- Rhode Island Co., Providence R. I.: A. E. Potter, superintendent transportation; W. E. Elliott.
- Rochester Railway Co., Rochester, N. Y.: T. J. Nicholl, vice president; J. W. Hicks, superintendent; C. T. Chapin; A. Greep, master mechanic; J. H. Stedman.
- St. Louis Transit Co.: C. A. Moore, chief engineer.
- Worcester (Mass.) Consolidated Street Railway Co.: J. W. Lester, treasurer.

Mr. Frederick V. Green, representing the Standard Traction Brake Co., of 26 Cortlandt Street, New York City, is at the Cadillac. Mr. Green will be glad to talk brakes with anyone interested, and has a fund of information on the subject that will be valuable to street railway men who have the brake question under consideration.

LADIES REGISTERED YESTERDAY.

- Mrs. W. Bunting.
- Mrs. J. W. Oliver.
- Mrs. J. F. Dixon, Jr.
- Mrs. F. N. Root.
- Mrs. H. W. Frost.
- Miss Maltby.
- Mrs. Peter Conway.
- Miss G. White.
- Miss M. E. Greene.
- Mrs. D. D. Bartlett.
- Mrs. R. S. Goff.
- Miss Penington.
- Mrs. C. W. Wason.
- Mrs. J. B. Hogarth.
- Mrs. G. S. Johnson.
- Mrs. F. B. Black.
- Mrs. H. C. Schwable.
- Mrs. G. A. Harwood.
- Mrs. M. de F. Yates.
- Mrs. H. E. Bush.
- Mrs. Willis M. Anthony.
- Mrs. W. S. Berry.
- Mrs. J. Heil.
- Mrs. P. J. Sylvester.
- Mrs. Jas. Leidenger.
- Miss Ludlow.
- Mrs. N. C. Keeran.
- Mrs. Edgar S. Nethercut.
- Mrs. W. J. Richards.
- Mrs. Geo. S. Hastings.
- Mrs. E. S. Miller.
- Mrs. W. Porter.
- Mrs. C. K. Green.
- Mrs. T. B. Griffith.
- Mrs. H. H. Vreeland.
- Mrs. H. A. Robinson.
- Mrs. J. F. Daly.
- Mrs. H. E. Vreeland.
- Mrs. Frank Wells.
- Mrs. H. P. Clark.
- Mrs. A. E. Potter.
- Mrs. F. B. Hall.
- Mrs. C. J. Harrington.
- Miss McGuire.
- Mrs. L. A. Parshall.
- Mrs. J. W. Fraser.

THE WABASH SPECIAL.

The Wabash A. S. R. A. special from Chicago, in charge of N. C. Keeran, was in on time last evening with 80 street railway men on board, including representatives from Los Angeles, Salt Lake City, Omaha, St. Louis, Minneapolis, and other western points. Among the passengers on the special were C. G. Goodrich, vice-president and general manager of the Twin City Rapid Transit Co.; W. B. Tarkington, general superintendent Omaha & Council Bluffs Railway & Bridge Co.; Geo. W. Knox and wife; J. G. McMichael and wife; William Walmsly, general manager South Chicago Street Ry., and wife; E. S. Nethercut and wife; L. E. Myers, general manager Peoria & Pekin Terminal Ry., of Peoria.

Mr. E. H. Chapin, representing the Rochester Car Wheel Works, of Rochester, N. Y., is as usual distributing a neat little souvenir. This year the favor takes the form of a handsome pocket match safe. Mr. Chapin is registered at the Cadillac.

The Lumen Bearing Co., of Buffalo, N. Y., has issued a pocket edition of the official program for the convention. The pamphlet gives the names of the officers, executive committee, etc., and the papers to be presented at the various sessions. It also calls attention to the good qualities of "Lumen" bronze, which is a composition metal that is said to be extensively replacing phosphor and other high grade bronzes for use in machinery bearing of all kinds. Lumen has a specific gravity of 6.93 and is about 20 per cent lighter in weight than brass. The tensile strength, compressive strength and electrical conductivity of "Lumen" are greater than those of brass, and it has an extremely low coefficient of friction.

Major H. C. Evans, agent for the Lorain Steel Co., is at the Cadillac. No street railway convention would be complete without the major.

Mr. W. T. Van Dorn, of Chicago, is at the Brunswick. The Van Dorn automatic couplings are standard on several hundred electric railroads in this country and are performing service ranging from comparatively slow city speeds to the heaviest work on high speed interurban roads and the elevated roads of Boston, New York, and Chicago.

Mr. R. E. Belknap, of the Pennsylvania Steel Co., has headquarters at the Cadillac and also at the Russell. The Pennsylvania company has a large staff of representatives on hand who may be found either at the two hotels mentioned or at the company's fine exhibit at Convention Hall.

ELECTRIC BLDG.,

CLEVELAND, OHIO.

**THE TROLLEY IN THE HOLY LAND.**

A company has been formed at Cleveland to build trolley roads in the Orient. Lines are now in operation through the Holy Land, and it is proposed to build others from Cairo to Mount Sinai and Mecca, with branches extending to Damascus, so that hereafter the followers of Mahomet may travel by rail in making their annual pilgrimages to the prophet's tomb. A network of trolley lines centering at Jerusalem is projected.—News Dispatch,

The trolley car goes whizzing on the shores of Galilee,  
And the ass that used to amble through those districts, where is he?

O'er the sacred hills they hurry, going down to Jericho,  
Waving kerchiefs from the cars or playing euchre as they go;  
From Jerusalem to Joppa, once a long and tedious trip,  
People travel now by trolley, reading novels as they zipp.

Through the lands where Moses tarried, where he smote things  
with his rod  
And received for Israel's children sacred messages from God,  
They will string the copper wire and put down the flattened ties,  
While the camel and the donkey rest and watch through sleepy  
eyes.

And anon the cars from Cairo and Damascus and Kerak  
Will go whizzing down to Mecca, maiming things along the track,  
Where they once went down to Egypt out of sacred Palestine  
They will bridge the crooked ways and equip the trolley line;  
Up along the highway traveled by the Good Samaritan  
They will keep the trolley humming from Beersheba to Dan;  
And where Joseph once trudged slowly and with weary, aching  
feet.

The gay tourist'll fit, lolling with his heels upon a seat.

They will substitute the trolley for the old-time caravan,  
With its picturesque attachments, just as quickly as they can;

Then the ass and eke the camel may lie down to rest serene  
While the yellow cars go rumbling over many a storied scene,  
As they take the unwashed Moslem down the Red Sea's sandy  
shores

To the prophet's tomb and get him home in time to do the chores.

If there still are bulls of Bashan browsing on the hills, some day  
They may holst their tails and bellow as the cars whiz out that  
way.

Down along the ancient highways leading from Jerusalem  
The natives hear the rattle of the cars and shy at them;  
Oh, the trolley poles are standing where the Jordan gently flows,  
And the tourist zips through Hebron, smoking stogies as he  
goes.

—S. E. Kiser in the Chicago Record-Herald.

**NEWS OF THE STRIKES.**

As a result of renewed activity by the striking employes of the Hudson Valley Electric Railway Co., at Glens Falls, N. Y., last Sunday, the militia was again called out, after having been dismissed on Thursday. The strikers and their sympathizers virtually took possession of the city of Glens Falls for four hours, defied the police, seized street cars and stoned the company's power house and other private property. The militia charged the mob and after wholesale arrests had been made some semblance of order was restored.

At New Orleans the first attempt of the railway company yesterday to move cars was followed by violence and rioting. The first cars out, manned by police, were stoned and finally totally destroyed, the small police force on hand being powerless to protect the company's property. Last night's evening papers announced that in all probability the militia would be called out to take charge of the situation.

Mr. Alfred Johnson, electrician for the street railway company of Quincy, Ill., is telling about his new reliable trolley harp which was described in the last issue of the "Review."

Mr. C. K. King, of the Ohio Brass Co., is at the Cadillac. The Ohio Brass will be represented at the convention by over 20 of its representatives from various parts of the country.

The American Brake Shoe & Foundry Co. is represented by F. W. Sargent, J. S. Thompson, W. W. Gardner and Arthur Gemunder, who are all at the Oriental Hotel. The company's exhibit this year is finer than ever.

Ask Mr. W. J. Cook for one of his souvenirs. The souvenir is known as a handy lady's purse.

**VOL. XII. Thursday, October 9, 1902. No. 2**

All the association meetings and entertainments are held on Detroit city time which is 28 minutes faster than central standard time.

Inquire at the manager's office in Exhibition Hall for mail and telegrams.

The following numbers of the "Daily Review" are consecutive with the regular monthly issue, and all four "Dailies" should be preserved for binding.

The "Daily Review" is mailed regularly to all our subscribers.

The weather predictions for to-day are partly cloudy and cooler with brisk southwesterly winds.

In concluding his annual address yesterday morning President Vreeland admirably defined the field which the American Street Railway Association now covers, and while taking a conservative attitude in regard to changing the name, the facts he presented are a strong argument for such action. The electric railways which do not operate in streets have become very numerous within a few years, and the question of adopting electricity is receiving much attention from steam railways at the present time. The natural affiliations of electric railways of every character are with the American Street Railway Association, yet such a company as the New York, New Haven & Hartford, which was one of the pioneers in electric third rail work, is only indirectly represented in the A. S. R. A. by an officer who is also president of a street railway company. The association should change its constitution so that it might admit to membership all companies that are interested in the field which the association covers.

### HAIL TO THE SUPPLYMEN.

This is "Supplymen's Day," an institution that has been growing in importance ever since the plan of settling apart one of the intermediate days for examining exhibits, instead of postponing it until the very last. Street railway men are always anxious to see what is new at the conventions, and settling apart Thursday for this purpose gives them ample opportunity.

The carriage ride around Belle Isle, which will be given by Berry Brothers, Limited, to the ladies of the convention, will be this afternoon. Carriages will leave the Cadillac Hotel at half-past two (city time) and ladies will be admitted to the carriages upon showing their badges.

Secretary Pennington announces that the registration yesterday was larger than at any other previous convention with the exception of New York and that by to-day the total registration may even exceed that of New York. Over 2,100 badges were distributed yesterday.

For other special announcements see page with engraving of Convention Hall.

## A. S. R. A. PROGRAM.

THURSDAY.

No business session will be held on Thursday.

FRIDAY.

"Discipline of Employes by the Merit System"—Metropolitan Street Railway Co., of Kansas City, by W. A. Satterlee, general superintendent.

"The Steam Turbine: Its Commercial Aspect"—E. H. Sniffen, of Westinghouse, Church, Kerr & Co., New York.

"Signals for Urban and Interurban Railways"—Old Colony Railway Co., Boston, by G. W. Palmer, jr., electrical engineer.

"The Adjustment of Damage Claims"—Chicago City Railway Co., by M. B. Starring, assistant general counsel.

The papers have not been assigned to the different sessions, but other details of the program are as follows:

Report of Committee on Rules for the Government of Employes: J. C. Braekenridge, general manager Brooklyn Heights R. R., chairman; E. C. Fester, general manager Old Colony Street Railway Co.; T. E. Mitten, general manager International Railway; W. E. Harrington, general manager Camden (N. J.) & Suburban Railway Co.

Report of Committee on Standards: N. H. Heft, president Meriden (Conn.) Electric R. R., chairman; E. G. Connette, vice-president and general manager, Syracuse (N. Y.) Rapid Transit Co.; C. F. Holmes, Kansas City; John I. Beggs, president and general manager Milwaukee Electrical Railway & Light Co.; E. A. Newman, general manager, Portland (Me.) Railroad Co.; R. T. Laffin, general manager, Worcester (Mass.) Consolidated Street Railway Co.; Will Christy, vice-president Northern Ohio Traction Co., Akron, O.

Election of officers.

## PROGRAM OF ACCOUNTANTS' ASSOCIATION.

NO SESSION ON THURSDAY, OCT. 9, 1902.

FRIDAY, OCT. 10, 1902, 10 A. M.

Chart of Street Railway Blanks, suggested by G. E. Tripp, general auditor, Stone & Webster's Co.'s, Boston, Mass.

Annual report of Standardization Committee.

Afternoon, 2 o'clock.

Report of Committee on Standard Form of Report for Electric Railways.

Report of Committee on Nominations.

Election of Officers.

Report of Committee on Resolutions.

Installation of Officers.

Adjournment.

## ENTERTAINMENTS.

THURSDAY.

The entire day will be devoted to the examination of exhibits at Convention Hall.

Thursday evening there will be a theater party at the Detroit Opera House to see "When Johnnie Comes Marching Home."

FRIDAY.

A trolley ride will be given for the ladies on Friday morning, leaving Hotel Cadillac at 10 a. m. for Mount Clemens, via the Rapid Railway and Gratiot Ave., returning via the Shore Line to the Country Club, Grosse Pointe, where luncheon will be served at 1 o'clock. The return to the city will be made at 4 p. m.

The banquet will be held at Hotel Cadillac at 8 o'clock, at which the installation of the officers elect will be held.

### THE BLANKS DIDN'T COME.

Secretary Brockway advises us that the trunks containing the exhibit of blanks usually made at the conventions have in some way unaccounted for been delayed in transit. He hopes they will show up before the convention is over, as telegraph tracera have been sent out over the route.

## TWENTY-FIRST ANNUAL MEETING

# AMERICAN STREET RAILWAY ASSOCIATION

Detroit, Mich.—Oct. 8—10, 1902.

### TUESDAY MORNING SESSION.

President Vreeland called the Convention to order at 11:15 o'clock a. m. and said:

Ladies and Gentlemen: The first thing on the program this morning is an address of welcome to the delegates of this convention to be made by the Hon. Wm. C. Maybury, mayor of Detroit. The delegates to the convention from the city of Detroit require no introduction to their mayor. Those from the other sections of the United States who have read an account of the events connected with the social, financial and political history of this section and other sections of the country, also need no introduction to the Hon. Wm. C. Maybury. Ladies and gentlemen, I have the honor to present Mayor Maybury, of Detroit, who has kindly consented to address the convention.

### ADDRESS OF WELCOME.

Mr. President, Ladies and Gentlemen: Your good president has said that I have consented to deliver a few words of welcome to you upon your visit to this good old city; but I beg the privilege of changing that word consent by saying that I have craved the privilege of welcoming you to this city. To say welcome, to ladies and gentlemen like you, is not a matter of consent, it is a privilege; and I have been waiting for several months for this privilege, and I am glad that the time has come when I can avail myself of it.

It is not a question of telling you that you are welcome, it is rather the privilege of thanking you because you have come. The favor is all on your part, because no convention can assemble for the purpose of bringing men of your standing in the business world together that is not a favor to the city of Detroit, but to its people. The conventions that are held in this city every summer, and throughout the year, form a sort of academic course for our people; and you will appreciate, if you will reflect for a moment, the privilege that you give us of learning of those things, whereof we would be in ignorance were it not for your coming. Thousands of our people will come and learn from the exhibition of appliances in the hall above and on the street. They will learn things that they never knew before, by an object lesson, given to them by your most admirable exhibition of railway appliances. Through the discussions of this convention we shall learn more and know more of the operations of the great systems of street railways, both city and suburban, throughout this God-favored land. Therefore, when I say to you welcome to Detroit to-day, we thank you because you come; and you will appreciate the warmth of that welcome.

Now, my dear friends, you occupy a very close place in the relations which bear upon the comfort and convenience and well-being of our people. Conventions often assemble here the local interest in which is confined largely to those who assemble and discuss things which are important to them; and the importance to us, the public, is very indirect, and oftentimes hardly to be appreciated, but in your case, the operation of the street railways of the country, which is the life work of the gentlemen who are assembled here this morning—in your case you come very near to the comfort and well-being of the people; so we are particularly interested in your convention, and your discussions become a part of the history of what we want to know. Therefore, for that and for other personal reasons which we are glad to consider, you are doubly, yea, thrice doubly welcome, to this good old city of Detroit.

We have here a city that is so laid out as to be peculiarly

adapted to street railway service. Here we have a converging of all lines from the suburbs into one center, practically, and that also is the plan of the city itself; for it was laid out about a century ago after the plan of the city of Washington, in fact, the plan was brought here and as far as it could be made applicable to the new city of Detroit, you have a reproduction of the capital itself. If you will take the city hall as the capitol, the radiating streets and avenues are identically the same as in Washington; but the persons who laid out the city, the territorial governor and judges, had little knowledge of what Detroit was to be. Perhaps, I ought not to say that, as they gave us a good city, yet, they laid out the city with the streets radiating for a distance much less than a mile from the center, and from that point the plan is discontinued. Now, I say that you come close to the well-being of our people, and in the city of Detroit the conditions are most favorable for the prosecution of your particular business. Our avenues are wide; our people ride in the cars, and they want to get the best conveniences in the matter of transportation that are possible, and we believe we have them. We are after the best and do not want anything less than the best. Not alone that, but we have no hills to contend with. Aside from the slight rise from the river, which is scarcely to be considered, Detroit is practically almost flat, just rising enough towards the north to give fair drainage; but in every other way

Hon. W. C. MAYBURY,  
Mayor of Detroit.

I think the conditions in Detroit are peculiarly favorable to the successful operation of a street railway. I desire to say, in spite of the modesty of our railroad management in Detroit—for you know anything managed by Mr. Hutchins would be managed modestly—that we point with pride to the splendid operation of our street railway, to the cleanliness of our cars, to the gentlemanly conduct of those in charge, and everything that goes to make the operation of a street railroad substantially successful and complete.

My dear friends, the notable thought that comes to us in a convention like this is the fact that the world is growing so catholic and so broad. You may say the men upstairs who have inventions and apparatus to display are here for commercial reasons. I grant you that the inventor is worthy of a proper

return for his genius, as the laborer is worthy of his hire; but in the broadest sense those exhibiting appliances that are meant to make the operation of the cars safer, more rapid and to insure greater comfort and cleanliness in them are inspired by other reasons. These men give these things to you and to the world, actuated not alone by commercial considerations, but in order that the cult which you are connected with shall be a great success. For it is a grand thing to stand up in the race of men, as some individuals do, like mountain peaks that are themselves above the ranges about them; and it is a pleasure for most of us to belong to something in this world, some organization or association, that we are proud to say, for example, "I belong to the cult of railway operators, the men who supply the railway appliances and the railway systems in the great cities of this country." You are proud to say that you belong to such an organization; you are proud of it because the connection with such an organization is one which places honor on any man; and a measure of any man's usefulness in this world, is not what he can do for himself alone, for the meanest man you can think of is the man who has some secret that belongs to the world and yet he tries to hide it. This world of ours has been rich and poor a thousand times;— why, because in the providence of God, as I believe, there are times when men are singled out here and there, in the palace and in the cottage, in the humble walks of life, as well as those of the learned, some man is singled out who seems to have a gift. In medicine it may be a man who has the gift of curing some peculiar disease; in mechanics it may be a Tesla who discovered the power of looking through space or an Edison who from day to day beholds the wonderful propositions which appear before his eyes and which he puts into practical use. Had these men lived hundreds of years ago, they would have had no idea of the stewardship reposed in them by the discoverer which they had been inspired to make, they would have had no thought of giving them to the world, but would look upon them only as something they could turn to their own individual advantage. Years ago almost every neighborhood had some old person who had the secret of the mad stone, but it was effective, and could cure rabies. If you asked him, "Will you give me that secret?" he would answer, "No, I have it from my father and will transmit it to my son." Possibly he died and the secret dies with him. Could Pasteur do that to-day? Could he wrap himself up in the secret of his art, and say, "Bring to me the children threatened with rabies and I will cure them"? No, the world would take hold of him and say, "No, if you have this, give it to the world and the world will pay you. You will be paid a thousand fold in the honor that will surround your name, far above any reward in money." It is so in every art that is discovered. It is discovered for the world. If Edison should die to-day, there are hundreds who are on the line of his discoveries. If Tesla should die to-day, there are thousands considering the things which he discovered. In every branch of medicine, every art we know of, there is no man who wraps the secret up within himself and says, "I am going to keep it." No, he must give it to the world and recognize the stewardship which God has put upon it.

These conventions are significant of the age in which we live, and the world will not be poorer, but richer, because, once discovered, inventions are committed to the children of men for their good and go on for all time. The world will continue to be enriched as long as the children of men dwell upon its surface. At a recent exhibition of our State Fair at Pontiac recently I saw something that struck me as a peculiar invention. I am now trying to give you an illustration of my idea, when I say that the measure of each man's usefulness is what he does in the world, not only for himself but others. I passed the plow department at the Fair and saw a man, evidently a farmer; you could see by his general appearance and his hard hands that he had held the plow many a day, and he stood there exhibiting a device whereby, with the movement of a lever, the plow could be turned at the end of the furrow. I could not but think of the relief in the use of this device to the plowman as he came to the end of the furrow. Instead of following the old way, of pulling the plow around with the horses, and the feet of the horses becoming entangled in the traces, causing the little cuss words that steal out, here was an invention which did away with all this cause of trouble. I thought to myself that here was a man who has done something for the world, something of practical

value, of every day need, who contrived by a simple arrangement of a lever to enable a man to easily turn a plow. I felt that this man had done his share of the world's work, I wish that I could do something as plainly for the good of the children of men as you have done, was my thought, and I felt that there was a man who had accomplished something of real value, whose useful invention would confer benefits upon mankind after his name had been forgotten. So it is in all avenues of life, where men are constantly striving to produce that which will make existence better for us all.

Coming with such thoughts and purposes, why are you not welcome to Detroit. We have not a very abundant supply of coal, but possibly after the convention of to-morrow we may have a good deal more. Now do not think of the cold; talk. I believe many of these things are as we think they are. Just imagine that it is warm. It is not October; it is July; and reach out, wrap yourself with a blanket of the hospitality of these good people of our city, and you cannot be cold, coal or no coal. You come, my friends, to a peculiar city; old, and yet new. I said to you a few moments ago that the city was laid out on the plan of the city of Washington about 100 years ago; but that was not the beginning of its history. Detroit was founded in 1701, and a year ago we celebrated the 200th anniversary of the founding of the city. For the first hundred years Detroit was, allow me to say, a French city, where the French language was spoken and where all the simple ways of the courteous people were exercised in all their refinements and higher attributes. Indeed, in my own lifetime, and I will say for the ladies present that I am not as old as I look, and that being a bachelor I never lose any opportunities—even in my boyhood I remember the scenes along the river were such as would remind you of the opening lines of Longfellow's "Evangeline," where he describes beautiful Arcadia, the old French homes, the era of plenty, with happiness and buoyancy and cheer everywhere, and the doors wide open, or perhaps a latch string hanging out, easily pulled, with a disposition to give comfort to the stranger and to make hospitality almost a part of religion. I sometimes think that the blessings that have come down to this goodly city, and its exemption from pestilence and disease, is consequent upon the blessings bestowed upon the early founders; for you will not dispute the fact that Detroit is the gateway of the civilization and christianization of the great northwest. Some had passed up the Mississippi, like the followers of De Soto, and some through Illinois; some were missionaries who were led mainly by the zeal of the cause, and in other cases they were adventurers led by the story of springs and rivers filled with golden sands; but those who came to Detroit were settlers and came with packs on their backs, and they brought with them implements of industry, the farmer, carpenter, cobbler, all came to make a community and landed within a stone's throw of where you are assembled this morning. Their first act was not one of savage onslaught on the Indians, who watched from behind a tree to see what the white settlers would do; the Indian discovered that one of the first acts of the new settlers was an act of worship, with no temple save that which is always above us, no canopy save the trees which grew beautifully on the river shore, no witness save the wild animal and the bird, and when the Indian peered through the bushes, what did he see. He saw a kindly invitation to come in and kneel down in quiet thankfulness to God that he had cast the lot of the settlers in such a beautiful place, and that the homes which they were about to build should be happy and prosperous. For fifty years no Indian blood was shed, so kindly were the people and the Indians that they brought the amity of Bethlehem with them. The white settlers treated the Indians fairly and for fifty years they lived on terms of peace and good will, and our city was founded amid such blessings as those.

My dear friends, if it requires anything more to add to the warmth of your welcome in Detroit, you must certainly see it in the bright sunlight of this morning. I do not know but it is in answer to the prayers of those who looked for your coming. The skies for the last week have been very dark and heavy, and perhaps in answer to their prayers they have broken away and given us this glorious sunshine this morning. You will find a welcome in the broad streets and walks; hospitality is marked in this city; and as you go along you do not feel you are elbowing

someone. We built our city for the accommodation of the stranger and are lonesome when we have not guests. You must feel that the streets were laid out on the broad scale that you see them, for the accommodation of the friends who might be with us. I hope your stay will be in every way enjoyable. The streets of the city are laid out in a somewhat irregular manner, and even those who are natives and to the manner born occasionally, when the night is dark and the lights somewhat dim, do not always find their way in the most direct route to the place for which they are bound; and if any such fate should overcome you, and it is possible that it may, permit us to mention that you will notice on the street corners here and there gentlemen who in other cities would be denominated policemen. They are not known as such here. They are guardians for the stranger. Do not pay any attention to the belt around the waists of these gentlemen. They never draw the little clubs which they have in these belts. They are used to frighten the children. If this confusion as to your whereabouts should overtake you at any time, step up to one of these gentlemen and tell him that you are attending the railway convention, and you will be wafted to the haven you desire.

The President: Mr. Mayor, on behalf of the officers and members of the American Street Railway Association, I tender to you our hearty thanks for your very cordial address of welcome. We represent a body of practical, hard-working men; our industry has more to do with the comforts and conveniences of the daily lives of the seventy millions of people of the United States than is represented in any other industry. We have to carry this great mass of people safely over the cities' streets to the suburban areas; to the home and school; and we are most important factors in the social and business life of every community in the country. The stores, the manufacturing industries, in fact, all of the daily life of the city, is dependent upon the regular and orderly conduct of our business; and if our systems are interrupted it means inconvenience and loss to every city.

The next order of business is the calling of the roll. The registration at the door will be taken in place of the roll call, and that will be passed.

On behalf of the executive committee and the officers of the Association, I desire to express our thanks for the large and representative attendance we have this morning on the opening exercises of the convention. This is certainly a larger attendance at this hour of our first day's meeting than I have ever seen in the many conventions I have attended. It devolves upon the president each year to deliver what is known as the president's address. For the first time in addressing a body of railroad men I am going to read that address. There are some points connected with it that are rather novel in connection with the work of a street railway association. There will undoubtedly be selections made from it by the press, without the context in some cases, to shade some of the points, and I want to be careful in what I say, as a gentleman who is connected with the press in a large way, who happened to read my address the other day said, "If you ever expect to run for governor of the State of New York or president of the United States, do not read that address."

#### PRESIDENT VREELAND'S ADDRESS.

It is exceedingly appropriate that the twenty-first annual meeting of the American Street Railway Association should be held in the beautiful City of Detroit, for, while the city street railways of the country have not been idle during the past year, the greatest development in electric railway work since our last convention, and, in fact, for several years has been in the direction of interurban electric railways, and in this class of road Detroit railway enterprise has always been prominently identified. Radiating from this city can be found some of the largest and most modern of interurban railways, and Detroit ranks with Cleveland, Indianapolis, Cincinnati and Dayton as the important centers in this country of the interurban railway industry. It is connected by high-speed electric railways with Port Huron on the north and Toledo and Cleveland on the south and east, while the lines to the west extend with only a slight break as far as the eastern shore of Lake Michigan, and will probably before long find entrance into Chicago.

The interurban railways have long since passed the stage when

they could be considered simply as suburban extensions of city lines. They are doing a through business, which is constantly growing, and the later and more ambitious examples of roads of this class are built with a track construction inferior in no respect to the best practice of the steam railroad companies. They operate usually for the greatest part of their distance over private rights of way, and attain speeds which enable them to compete successfully with their steam-railroad rivals for nearly every class of traffic except long-distance passenger and freight business. This extension of the electric railway has introduced new problems of discussion, such as fares, transportation of freight, etc., into the operating department, as well as the exercise of the most advanced electrical engineering methods, not only in the transmission of the power at high voltage necessary to operate the cars, but in the car equipment as well. Up to the present, direct current has been used on the trolley wire or third rail, but if the experiments with single-phase motors, which it is announced are soon to be tried, prove successful, the possibility of the direct application of alternating current to railway work will remove some of the inconveniences which now exist in the present system.

I will not take the time of the convention to give the statistics showing the advances made in street railroading during the last year. Some of them will be brought out in the papers to be read, and statistics on the subject are published in the technical press from time to time. It is interesting in passing to note, however, that eleven years ago there were about 1800 miles of electric railways in the country, while to-day there are between 24,000 miles and 25,000 miles, and that against an investment eleven years ago in street railways of about \$75,000,000, the total capital invested to-day is in the neighborhood of two billion dollars. These figures show that the time has come when we should no longer apologize for our existence, but should take a stand individually and as an association for the protection of our rights as a corporation.

It is a venerable saying that corporations have no souls, and, perhaps, the credit that has attached to this aphorism accounts for the evident belief of the public that they have no feelings. We are here as members and managers of a class of corporations which is more intimately related than any other to the comfort, convenience and success of the people who live in cities and towns. Upon the orderly operation of a street railroad depends substantially everything else that goes on in a thickly settled community. It is true that what we are operating is a valuable privilege granted by the public, but its value depends chiefly upon the sufficiency with which the public is served, and the public was moved to grant it solely from considerations of its own comfort and interest. The contract between the public and the street railroads, therefore, is a contract of partnership and the interest of the partners is identical. What the public wants is the best possible service, and only by giving the best possible service can we obtain the largest possible returns for our money.

And yet, despite this close association of interest, it is the experience of all of us that there is scarcely any limit to the impositions which the public will permit, and rather cheerfully permit, to be laid upon street railway corporations. Legislatures and boards of aldermen seem to regard street railroads as fair game to be hit as often and as viciously as anybody chooses, and the public newspapers, so far from taking into account the service we are rendering and protecting us against the schemes of demagogues, are rather inclined to regard injuries so inflicted with amused indifference, if not with positive favor.

In every other form in which property manifests itself, except in shares of corporate stock, it has well defined rights and valuable privileges. One thousand dollars invested in bank notes or government bonds, or even in real estate mortgages, are surrounded with legal safeguards to maintain their value, and if the hand of the despoiler for one moment seems to menace them everybody begins to talk about the sacred rights of property. That is just as it should be. But money lent to the government at a comfortable rate of interest is no more directly employed upon the public business than that which is represented by the stock of a street railroad, and it is no answer to the claim that it ought to have fair treatment, that it ought not to be the object of special prejudice and attack to say that it is particularly valuable. Its value is strictly measured by the public service it renders. The

contract, of which our charters and certificates of incorporation are the witnesses, authorizes us, as the universal law of business authorizes every one, so to employ our abilities and resources as to obtain from them the greatest possible results to ourselves, and if, in recent years, street railroad shares have been especially good income earners, it is because the street railroad companies are meeting the public ends for which they were organized, because they have studied and facilitated the public interests and needs, because they have put themselves in advance of the development of the cities and towns they run through, because at vast expense they have introduced new methods, new machinery, swifter, more frequent and improved accommodations, and it has never been laid down by the courts that a contract could be broken and new conditions imposed because either of the parties to it had done better than was anticipated, and certainly not because both had. And yet the contracts between the public and the street railroad companies are being continually intruded upon by the imposition of new taxes and new requirements, and it has come to be considered almost an impertinence for a corporation so injured to offer ever so mild a protest.

In the theory of the law a corporation is an individual, but apparently only for the purpose of enabling it to be got at. It has all the obligations of individuals, but of their rights few. The politicians of all parties talk themselves hoarse with eloquent protestations of their love of individual liberty and individual rights, and so well have their laws justified these pretensions that no man in this country is so idle, so worthless, so bereft by his own acts of character, property or position but that if he contrives to keep out of prison he has a vote and the opportunity of making his equal influence felt in the determination of public questions. But a corporation, even such a corporation as is organized to serve the public convenience, may neither vote nor in any other way participate in making the laws by which it must be bound. The proposition before the public on which an election is to be held and a policy defined for future legislation, may be one which vitally concerns the interests, even the life, of a corporation, but if it were to undertake to express its views from a public platform or to influence the votes even of those persons who derive their means of livelihood from its operations, the very foundations of social order would seem to be attacked. It must stand by on such occasions in submissive silence. It must affect an attitude of indifference, and if it does not actually proclaim to its employes their title to vote as they please it becomes at once the object of suspicion and prejudice.

Wars have been fought and governments formed to vindicate the principle that there shall be no taxation without representation, but if a corporation should ask to be represented in a public body that had the power of taxation and was proposing to exercise it upon corporations, its action would be observed with indignation and amazement. Even in the courts its standing is prejudiced, and before a jury sworn to render an impartial verdict upon the facts, its first and constant care is to remove from the minds of the jurymen a frankly admitted antagonism.

It is not remarkable that in this situation the law should discriminate against corporations. The failure to assert rights when they are threatened is always taken as a confession that they do not exist, and encroachment follows encroachment with ruthless certainty. Timid counsels have so far prevailed among the street railroad companies in the adjustment of their affairs with the public that in many states there is a gross discrimination in the taxing laws against such corporations. When by Federal legislation it was proposed to tax the incomes of individuals, although a limit was placed which protected the poorer classes, public protest made itself felt so powerfully that the Supreme Court of the United States, after holding that an income tax was lawful, proceeded to reverse itself and to find constitutional objections that absolutely killed the income tax law. And yet an income tax upon the earnings of corporations is found upon the statute books of many of our American commonwealths, and corporations with which a state has made definite contracts fixing and limiting the obligations on either side are required, notwithstanding these contracts, to pay other and additional taxes upon their gross earnings.

When money is invested in a public franchise upon terms and conditions expressed in a charter or a certificate of incorporation

under a general act, the shareholders have a moral, and it ought to be a legal, right to understand that what they are to pay and to do in making their franchise effectual is nothing more than or different from the conditions of which they had notice and to which they agreed. The rule that there can be no impairment of the obligations of a contract is to be found in the fundamental law of the United States and of every state, and in controversies between individuals no constitutional guarantee is more carefully protected by the courts. And in a contract between the state and a corporation there is no trouble about holding the corporation. If it violates its contracts, or if it does not give the promised service or duly make the promised payments, the attorney-general is authorized to institute proceedings for its dissolution. But the rule of performance does not work both ways. It appears to bind only the corporation. The state can pass new laws imposing new conditions and the corporation will have its pains for its protest.

I look forward to the day when the shareholders in street railway corporations will stand up for their rights as shareholders in the same sturdy spirit which they would at once bring to the defense of their rights as individuals. The great street railway properties of this country, and even the little ones, are no longer in the hands of a few rich men. They are distributed in hundreds of thousands of shares ranging in par value from five dollars to a hundred dollars among a countless body of the people. The heads of these properties are no longer in any material degree their owners. They are, and are coming more and more to be, simply the salaried employes of a great number of shareholders. They conduct the business of these properties as a trust, and they have nothing to do with the stock market. Their one concern is to earn a dividend for their shareholders and pay it where it belongs. Every shareholder is as much interested to protect the property against unjust discrimination in the laws and to protect its reputation as a business organization as are any of us who are placed for the time being in charge of the property. It is no less their duty than it is ours to insist that public officials shall treat these corporations equitably and honestly.

It will not be denied that inasmuch as our opportunity to earn money proceeds out of a public privilege we should pay to the public a fair return for what we get. But what we give in the way of service and what it costs us to give it are elements just as much entitled to consideration in the making of the contract as any other; and when the contract is once made it ought to be as little subject to repudiation or change as any other contract. The faithful discharge of our obligations requires a continually increasing investment, the constant incurring of new risks. It is not enough that we shall meet the demand as it exists from day to day; it is necessary that we should anticipate it. And if the profits upon our investment prove in the end to be considerable, that is the reward to which intelligent foresight, courage and good management are always entitled. The spirit that seeks to confiscate anybody's legitimate earnings is unfair and reprehensible, and honest-minded men should be strong to oppose it.

This association has served an honorable and useful purpose for 20 years, but the time may be at hand when the scope of its usefulness can be materially increased. I have already pointed out the injustice which is done corporations by municipalities and the need for public enlightenment, not only on the equity of their cause, but also on the service which they are rendering the public. There is one other point to which, however, I would like to direct your attention, and that is in connection with the broader field of electric railroading which this country will certainly see during the next decade.

I have already referred to the immense mileage of interurban electric railways which has been built during the last few years, especially in the Middle West. Many of these roads are hauling freight, and it is a matter of great importance, not only to these roads themselves, but to the cities and towns which they serve, that the facilities which they should enjoy as regards the interchange of freight with the steam railroads should be as free as those between the steam railroads themselves. The first point requisite to this end is to have convenient connections with the neighboring steam railroads, so that the freight cars can be passed from one to the other. The right of the electric company

to demand this has only recently been decided in New York State in a case which was contested between the Hudson Valley Railway Co. and the Boston & Maine Railroad Co., in which the Court of Appeals reversed the decision of the Appellate Division and rightly decided that an intersection and connection of the electric road and the steam road should be made in the interests of the local shippers. This right should be of great advantage to the electric railroad company, but the full benefit to the local shippers will not be derived until the full privileges of an interchange of freight cars between the two systems shall be as universally recognized as they now are between steam railroads, so that freight can originate on either the steam or electric road. Heretofore, in many cases, the steam railroad companies have shown an unwillingness to interchange freight with the competing electric roads, on the plea that the latter were not responsible in the same degree as the steam railroads, and by this means considerable freight transportation has been diverted from the electric railroad.

The points just mentioned indicate the broader problems which are being forced upon the electric railway interests of the country, through the large increase in interurban electric railway companies, which naturally look to this association as the exponent of their interests. This is only natural because while these lines do not operate upon the streets, the electrical equipment problems connected therewith, as well as many of the other questions which arise in connection with their operation are the same as those which interest "street railway" managers proper. And while it may appear inadvisable to change the name of the American Street Railway Association to accord with the broader field of electric railroading in which many of its members are engaged, it should be understood that the association is not merely a street railway organization, but its scope covers the entire field of electric railway transportation. More than this, it may seem desirable to welcome the participation of all companies engaged in electric railway transportation, for the reason that there is no organization in the country which has accomplished so much, or at its annual conventions and exhibitions can afford anywhere near the same opportunity for instruction to those interested in electric transportation in its different phases. Heretofore no manager or engineer of a trunk line company which is contemplating or has installed a system of electric traction could join this association except as a representative of some street railway company; but in view of the interest which is being taken in electric railway equipment by some of the large trunk line interests and the undeniable future which electric power will have for such transportation, especially for terminal and suburban work, the question will arise in the near future, if it has not already done so, whether the benefits which this association can confer are available for companies which are not now eligible to membership.

I will not attempt to suggest an answer to this question, but all signs indicate that it will be an important one during the next few years, if it is not so already.

Mr. N. H. Heft, Meriden, Conn.: I move that the thanks of this association be tendered to our president for his able and courteous address, that it be spread upon the minutes, and that the secretary be instructed to have the address printed, and that each member of the Association be furnished with several copies.

Secretary Pennington put the motion which was carried.

President Vreeland: Gentlemen, I thank you for that expression, on behalf of the Association. Those of you who are connected with electric railroads in the eastern section of the country have heard expression of such sentiments from me a number of times and to that point. I felt that it was a duty I owed to the street railway interests of the United States to take a stand on this question as I did in the east a few months ago. The problem we have confronting us, as I have indicated in the address, is not the problem it was ten years ago; it is not the problem that confronted the managers of street railroads ten years ago. The man who ran a street railroad at that time usually owned a large part of the capital stock and dictated its policy with his hand on his pocketbook. The policies of the street railroads of to-day are dictated by men who are technically and scientifically educated in the methods of management and control and operation of these large corporations. The character of the service which is ren-

dered to the public throughout the country, the development going on in the hands of men who have nothing to do with the financial questions connected with the property is what has brought the electric railroad properties up to their present state. The electric railroad system has no history back of it. The man who works in this field is a pioneer, whether he is an operating manager, or the electrical engineer or mechanical engineer. He has no literature to go to from which to gather information relating to the operation of these systems; all experience in connection with this work must be obtained by hard work, and the hard knocks that come from the actual operation of these properties. That electric railroading has advanced to the stage in the world's transportation that it represents today, particularly in the United States and Canada, is an evidence of how hard we have worked and how well directed our efforts have been, and how ably we have been supported by the great electrical and mechanical equipment companies in this country. They have spared no expense and no pains in the developments which have had to do with the success of our industry, and it is but fair to them to say in the convention that they have had just as much to do with placing the electric railway in the high pinnacle of advancement it occupies to-day as any distinctly operating or mechanical men in the country. Gentlemen, I thank you.

#### REPORT OF EXECUTIVE COMMITTEE.

The secretary read the report of the Executive Committee, which consisted, as in past years, of the minutes of the several meetings held during the year, showing what has been done by your committee. Our readers are already familiar with the action taken at the meeting of the committee in February last.

The special meeting of the Executive Committee yesterday was called to order at 12:30, with Messrs. Vreeland, Wason, Foster, Sloan, Dyer and Nicholl and Secretary-Treasurer Pennington present.

After approving the minutes of the last meeting, the secretary and treasurer submitted his report, which was accepted.

Other business transacted at this meeting was as follows:

The president appointed Messrs. Foster and Nicholl a Committee on Memorials.

On motion of Mr. Nicholl it was voted that the Local Committee be supplied with banquet tickets in appreciation of the work the committee has done and the courtesies extended by the committee.

On motion of Mr. Sloan it was voted that the thanks of the committee be extended to the Detroit Club for courtesies shown the committee.

On motion of Mr. Foster it was voted that the thanks of the Executive Committee be extended to the Local Committee for the efficient manner in which they have performed the work incident to the arrangements for the present convention.

On motion the report was accepted.

#### REPORT OF SECRETARY AND TREASURER.

The secretary and treasurer then read his report, which showed the present membership of the association to be 191, there having been a net increase of 12 during the year, although nearly 25 companies withdrew by reason of consolidation.

The treasurer's report showed a balance Oct. 1, 1901, of \$10,128.63; receipts, \$8,378.85; expenses to Oct. 1, 1902, \$8,530.50, cash in bank Oct. 1, 1902, \$9,948.03.

On motion the report was accepted.

The President then read letters of regret at their inability to attend the convention from Hon. H. C. Payne, Milwaukee; Capt. Robert McCullough, Chicago; and Charles S. Sergeant, Boston.

Mr. E. C. Foster, of Boston, presented the report of the committee on memorials, which was as follows:

#### REPORT OF THE COMMITTEE ON MEMORIALS.

J. Bannister Hall.

J. Bannister Hall died in the city of Baltimore, on Feb. 4, 1902, in his 66th year. He was secretary and treasurer of the Charleston Railway, Gas & Electric Co. He was born in Baltimore in 1837, of Irish descent. Mr. Hall for many years was a member of the Corn and Flour Exchange, of Baltimore, and later was the Maryland manager of the Massachusetts Mutual

Life Insurance Co. He subsequently became one of the original members of the board of directors of the Charleston Railway, Gas & Electric Co., and was elected to the office of secretary and treasurer, which position he held at the time of his death. Mr. Hall was highly esteemed for his estimable qualities of character, and is survived by four children.

C. C. Howell.

C. C. Howell, general manager of the Knoxville Traction Co., died May 7, 1902, at Phoenix, Ariz., where he had gone in the hope of improving his health, which had been in poor condition for some time. Mr. Hall went to the West at an early age, and laid the foundation of his useful career and comfortable fortune. He went to Knoxville in 1895, and was the main mover in the consolidation of the competing electrical interests, having consolidated the street railway and electric lighting properties. He was a member of the Knoxville Chamber of Commerce, vice-president of the City Hospital, and an ex-member of the State Legislature, as well as a director of many financial enterprises. He left a wife and two daughters.

Dell H. Goodrich.

Dell H. Goodrich, secretary of the Omaha Street Railway Co., died at his home on May 11, 1902. Mr. Goodrich was born at Brandon, Vt., May 13, 1818. His early business experience was gained in the employ of Bradstreet's Mercantile Agency. He afterwards went to St. Louis as a representative of the R. G. Dun Co., and in 1876 went to Omaha as the manager of that commercial agency. Later he was superintendent of the city water company. In 1887 Mr. Goodrich was one of the organizers of the Omaha Cable Tramway Co., and when that company was consolidated with the Omaha Street Railway Co., he became secretary of the consolidated company. Mr. Goodrich is survived by a widow and three children, to whom in his lifetime he was a devoted husband and father.

Winfield Scott Stratton.

Winfield Scott Stratton, president of the Colorado Springs Rapid Transit Co., died September 14, 1902. Mr. Stratton was a man of very large wealth, which he had accumulated in mining operations. He was born in Indiana in 1818, and was educated in the schools at Jeffersonville, in that state. He had varying experiences in life until 1891. In that year he located a "claim" which netted him sufficient means to develop the mining properties under his control, and his vast wealth, estimated at \$20,000,000, thereafter accumulated very rapidly.

Walter V. Crouch.

Walter V. Crouch, secretary of the New Orleans & Carrollton Railroad Co., of New Orleans, La., with which company he had been connected for 27 years, died May 16, 1902.

The President: The next order of business is the discussion of technical subjects. Before taking up these papers, I wish to say, for the information of those who are not connected with the executive committee, who happened to be here yesterday, that President Hutchins of the Detroit United Railway, who has done everything in his power, assisted by his able staff, to make this a successful convention and to add to the comfort and convenience of the Association as well as its guests, has been quite ill the past week, confined to a hospital. He was able to come out for a few minutes yesterday, and I see this morning that his doctor has again allowed him to come to this session of our convention. I told him yesterday that in view of the condition of his health we would fully understand his absence and the causes of it if he did not appear. I am glad to know that he is so far improved as to be able to be with us this morning. You must not expect any response from Mr. Hutchins to what I am saying. I only wish you to know he is here and to know the reason why he is not personally greeting you this morning. He is not in a condition to do any talking, but I know he will appreciate my sentiments, as well as those of you gentlemen who are directly connected with the work of the Association. (Loud applause.)

Mr. Hutchins bowed his acknowledgments.

The President: The first technical paper is on the subject of the "Registration of Transfers." This is an important subject to the members of this Association as evidenced by the many letters I have received within the past year, asking our practice in New York regarding transfers and the opinion of the management of

the company on this question. It was considered by your executive committee as one of the important questions. It was a very hard matter to get anyone to write the paper, and it has been absolutely impossible to get anyone who would open the discussion on it. Some gentlemen who have written to me within the last year and asked an expression of opinion from me on this question have flatly refused to write or speak on this topic. I did not know but what this question occupied the same position as some of the larger questions I indicated in my address. Certainly, nothing in connection with the practical part of the business is as necessary to decide as the method in which the revenue of the company shall be cared for. If any of our members have views on this subject, they should be certainly willing to express them. That is one subject I have had more experience with than anything connected with the practical operation of railroads. I asked Mr. C. D. Meneely, of the Brooklyn Heights company, to prepare this paper, and he has done so, but it is impossible to be present at the convention. There is no necessity of reading it as a whole, for the reason that we have succeeded this year in getting all of our papers very early, and the secretary has distributed them at an early date, and they should be in the hands of every delegate. The purpose of having the papers prepared in advance is to do away with the reading of the paper as a whole, as the discussion is fully as valuable as the paper. Mr. Meneely treats of the subject of transfers under two heads, first discussing the question, Does non-registration divest the transfer of its cash value? The second subdivision is under the head of the Registration of Transfers and takes up the practical questions connected with that subject. The points are pretty fully covered in the paper.

I have been requested by a number of gentlemen, that, owing to the paper being short, they would like to have it read. Mr. Robinson, who is a good reader, will read the paper.

Mr. H. A. Robinson, of New York, read the paper as follows:

REGISTRATION OF TRANSFERS.

By C. D. Meneely, Secretary and Treasurer Brooklyn Heights R. R.

Regarding the registration of transfers there is wide diversity of opinion in the street railway world. While there is a large contingent which advocates the registration of transfers, there is a numerous body which strenuously opposes it, and many who have studied the problem have been unable to reach a definite conclusion concerning it.

No mathematical solution of the problem has yet been offered, nor will I attempt any, but will here briefly outline for discussion the chief arguments for and against the registration of transfers with a view to determining, if possible, the weight of evidence from which to draw a conclusion.

Those who advocate the non-registration of transfers place great stress upon the contention that this course divests the transfer of its cash value, and focuses the attention of the conductor on the collection and registration of the real revenue, namely, the cash fares.

On the other hand, the advocates of registration are equally insistent that the non-registration of the transfer does not eliminate its cash value, except to the extent of preventing trading between conductors, and the consequent substitution of transfers for cash fares.

First, does non-registration divest the transfer of its cash value?

Undoubtedly, the fact that the transfers of other lines cannot be turned in at a cash value prevents the conductor from obtaining fraudulently, either directly or through an intermediary, the transfers of intersecting and transferring lines and converting the transfers so obtained to his own dishonest gain. Nevertheless, while the non-registered transfer may not be used by the conductor in this particular manner, its value has not been one whit diminished to the travelling public, to whom the conductor may, within limits determined by the accounting, either sell or give away rides on the company's cars, which would otherwise go to swell its earnings; for no accounting method has yet been devised which will accurately check the issue of transfers on a large system without undue expense.

Moreover, the non-registration of transfers renders so easy the appropriation of cash fares by conductors that many conductors, who would otherwise be indisposed to take the risk of open stealing, become dishonest. This has been forcibly illustrated on the Brooklyn Rapid Transit Co.'s system. In the summer of 1900, during the months of May, June and July, conductors were instructed to discontinue the registration of transfers. On August 1st of the same year the registration of transfers was resumed, and, coincidentally therewith, a large number of supposedly reliable conductors, long in the service, were detected stealing the company's revenue. The increase in the number of old conductors, previously possessing excellent records, who were at that time discovered appropriating fare was so marked as to lead to the conclusion that during the preceding three months the ease and safety with which the company's revenue was plundered had tempted these men to steal, and, that upon the resumption of the registration of transfers, the exercise of the habit then formed proved too strong to be deterred by the added chances of detection.

Second, as to the registration of transfers.

It will be conceded, I think, by all practical street railway men that the ideal method of obtaining revenues, assuming one uniform rate of fare and a sure method of preventing transfer trading, would be to register all fares and transfers upon a single register.

Under the above noted assumption the advantages of such a method are obvious. The query naturally arises, do these advantages more than compensate for the loss occasioned by transfer trading? On the Brooklyn Rapid Transit system we think that they do.

By taking transfers out of the hands of conductors and placing transfer agents at points where cars from the same depot intersect and transfer, thereby preventing conductors from trading directly with each other and compelling the use of an intermediary, we endeavor to keep this evil in check and supplement it by the vigilant watchfulness of our inspectors and secret service operators. Our system of stationing uniformed register inspectors between all practical terminal points and the first transfer intersection practically protects the revenue between the outer transfer and terminal points, and enables us to concentrate our secret service in the central portion of the system to locate register shorts and detect transfer trading.

To further limit the risk of trading to the day of issue we introduced and, I believe, were the first to use a daily dated transfer ticket, which has since been adopted by many of the principal systems in the country.

Doubtless, a further check upon transfer trading is provided by the turning in of transfers by trips and the subsequent checking of line exchanges by the Accounting Department.

Were it not, however, for the lottery law and a certain demoralizing effect that distribution of property by chance has upon the community by inculcating the gambling spirit, it would be possible to offer such inducements to street railway patrons as would absolutely check the cash fares received and the transfers issued. Such a governing inducement would be, to offer cash prizes of a large amount monthly, which would yet form in the aggregate only a small fraction of the amount which is now diverted from the company's revenue by conductors.

In addition to carrying a pad of transfers the conductor would be provided with a pad of numbered cash-fare receipts, each one of which receipts would bear on its face an injunction to hold until the end of the month, when the bearer might be entitled to any one of a number of prizes, determined impartially by a drawing; the prizes consisting of a capital sum, together with lesser sums graded down to a large number of small premiums, which would distribute the cash prizes as far as possible.

The operation of this plan would involve the issue of a transfer only for a cash fare. In practice it would work as follows:

A passenger, boarding a car, would be asked by the conductor, upon payment of fare, if he wished a transfer. Upon receiving an affirmative reply, the conductor would issue a numbered transfer to the passenger from his pad, and upon turning in his pad would have to produce one cash fare for each transfer ticket detached from his pad.

All passengers who desire transfers are sure to get them, as they are needed for a ride on the transferring line, and conductors would, therefore, not be able to again issue detached transfers.

On the other hand, if a passenger, upon paying his fare, stated that he did not wish a transfer, it would become the conductor's duty to detach a cash fare receipt and hand same to the passenger. For every cash fare receipt so detached the conductor would also be held accountable for one cash fare. The inducement for a passenger to take a cash fare receipt would be even stronger than in the case of a transfer ticket, as it might mean a large sum of money in case the number of the ticket drew a prize, and when a passenger, ignorant of its possible value, refused to accept his fare receipt, others would eagerly seek its possession. Assuming that both transfer tickets and cash fare receipts were taken by passengers for all fares paid, the stubs returned by the conductor would accurately indicate the number of fares collected and would insure the turning into the treasury of all the revenue collected on the cars. Several marked advantages would follow from the adoption of this plan, as, for example, the reduction in the number of transfers used, since many persons, who would ordinarily take a transfer for a short ride after a long one, would prefer the chance offered by the cash fare receipt and decline the transfer, which carried with it no chance for a prize.

Moreover, the number of short-riders would, probably, be increased to an extent that would realize a larger sum than the aggregate of the prizes offered, and again, the trading of transfer tickets between conductors would be rendered absolutely impracticable, and he would, therefore, be debarred from substituting mean a corresponding cash fare to be turned into the company's treasury, and he would, therefore, be debarred from substituting transfers from other lines for cash fares.

While according to the opinion of counsel, the operation of this plan would not violate the letter of the lottery law, inasmuch as no consideration is asked or received for the cash prizes distributed, yet the decisions under the federal lottery law, which absolutely prohibit the circulation of notices of drawings through the mails, in the opinion of counsel renders the operation of the plan inadvisable.

While, perhaps, the adoption of this plan might stimulate a speculative spirit in the community, it is unfortunate from the point of view of street railway companies that some similar scheme for the absolute protection of revenue could not be devised that would not contravene state or federal laws.

So long as street railways continue to operate there will be more or less dishonesty on the part of conductors, which no mechanical appliances can wholly prevent; but while the careful choosing of material; fair and considerate treatment and the encouragement of a spirit of honesty and integrity will always be the best safeguards for the protection of revenue; at the same time the study of improved methods of protecting the revenue by mechanical, or other means, should not be neglected, for, though perhaps an uncomplimentary commentary on human nature, it is none the less true, that many men remain honest only because of the fear of detection, and to such it should be our object to minimize the opportunity by all means in our power.

Mr. Root, New York: I partly agree with Mr. Meneely when he says that the non-registration of the transfer does not eliminate entirely its cash value, but that the non-registration of transfers eliminates their cash value to such extent as is possible; in other words, there still remains the possibility of the conductors giving away tickets to other conductors or to their friends, which possibility still remains if you register the transfers. Eliminating that point, it seems to be the only thing to be decided in the question of this registration or non-registration is the question whether the cash value, which I think all admit is given a transfer by its registration—whether that balances the possibility of the difficulty which the secret service men had in detecting the non-registration of transfers. It has been our experience in New York, which is contrary, apparently, to that which Mr. Meneely has had in Brooklyn, that the non-registration of transfers does not make the conductors steal the cash fares—it has not that tendency, and on the other hand it does not in any way confuse our

secret service men. This is perhaps peculiarly so in New York, on account of the great number of short riders. With us our secret service men pay absolutely no attention to whether the number of passengers on the car corresponds with the number of passengers indicated on the register, for the reason that a car starting at any terminal of the road may take on ten passengers, five of whom will get off within a half mile. This is more so in New York, on account of the great number of short riders, than in any other city in the country, probably, and for this reason more than any other we are very emphatic in our opinion that the non-registration of transfers is the best for our system; but I personally am of the opinion that for any interurban or suburban road, where they carry passengers for long distances, and have few riders, and check to a large extent the honesty of their conductors, through a comparison of the number of passengers in the car as against the number registered, and the registration of transfers in that case may be advisable. But for a city service like New York I am emphatically opposed to the registration.

Mr. W. E. Harrington, Camden, N. J.: We had been operating for some years up to last summer without registering our transfers. We had reason to believe there might be some trouble in connection with it, and we started to register the transfers last summer and did it for three months. Our secret service department showed such a wholesale trading in transfers that we stopped it, and since that time we do not allow them to register the transfers. We are not registering our transfers, and are of opinion that we are pursuing the right course.

Mr. H. M. Sloan, Chicago: It seems to me if transfers are to be registered at all, it should be done by a double register. My company was one of the first to put in the double register, and at the time we put the double registers in I was anxious about the outcome. I thought the conductors might register the cash fares on the transfer register; when they collected a cash fare they would ring up the transfer side, and the inspectors were given particular instructions to watch that point, which they could easily do on our road at the transfer points. I found to my astonishment that there was very little of it. It seems to me that the only scheme for registering transfers on the same register with the cash fares is to introduce some such system as they have in St. Paul. They have a very elaborate system there, and I believe a paper was read on the subject some years ago, I think at Niagara Falls, explaining the system in detail, and the system was described as having the cars come to a given point, and when a conductor gets off the car his transfers are taken from him, and when he gets on they are given back to him, and following this up they have an elaborate system of checking in their office, and in that way they are able to eliminate all stealing of transfers.

Mr. E. G. Connette, Syracuse, N. Y.: The conductors of the Syracuse Rapid Transit Ry. Co. are required to register transfer tickets. It occurs to me that a non-registration of the transfer ticket only eliminates the value of the ticket to the conductor. It does not prevent the conductor from giving away transfer tickets to people along the road, or to agents at the points where they may be sold at a reduced price. The registration of transfers, of course, gives them the same value as a 5-cent fare; and we use as a rule a single register, because we have not yet received an explanation of the advantage of a double register that would justify a separate register for 5-cent fares and also a register for transfers. The advantage in registering the transfers as we have discovered was that if there is any speculation on the part of the conductors it occurs to a great extent when the cars are crowded and when inspectors are on the cars it is a very difficult job for them to detect whether the passenger pays his fare with a transfer or with coin, but it is not difficult to count the number of passengers that the conductor has on his car, and by that means at least get a check on the carload of passengers. The trading of transfers can, to a large extent, be detected without very much expense by proper clerical help. If there is any wholesale trading between the conductors, the conductors are bound to maintain the sequence of time in which the tickets are issued, and from time to time we check the transfer tickets that are turned in with a view to seeing whether or not the time limit on the tickets is punched with regard to the sequence of time, so if there is any trading between the conductors, they must observe

the sequence of time in which the tickets are issued, otherwise they can be detected when the tickets are checked up.

Mr. John I. Beggs, Milwaukee: I thoroughly believe the necessity of giving to the transfer, and every other evidence of a right to ride on the cars, all the value that is given to a 5-cent nickel paid on the car. Under our system the transfers are deposited in boxes at the terminals of the lines every trip. The conductor does not keep them until the end of the day, but they are placed in envelopes and dropped at the terminal points. He likewise does not keep his pad of transfers, but turns it over to the man who takes his run when he exchanges cars. If transfers are to be registered, I believe it should be done upon a double register; that does not necessarily mean two registers in a car, but a double dial. In our own practice some four years ago we adopted a double register which showed the number of passengers carried on any particular trip on one disk. We are at the present time, after a use of four years, arranged for an exchange of registers which will show the two classes of fares gathered on each trip, as well as the two totalizers, and it is surprising to what extent the public does note the character of fare that they have paid as indicated on the dial, not at all times, nor all people, but many people do, and we believe it does have a restraining effect upon the conductor. We have some 50 transfer points on our system—50 points at which transfers are given and to which they are given, consequently I do not believe it would be possible for any inspector to detect whether a passenger, particularly at the crowded hours, had paid his fare with a transfer or whether he had used one of the various types of tickets we have. As Mr. Root said, the system in New York is peculiar because of the large number of short riding passengers, and the small amount, I presume, of anything but nickel fares. Our system, controlling all of the interurban lines, centering in the City of Milwaukee, has ten or twelve possible commutation rate points, the tickets of which are given on our city lines to carry the passenger out into the suburbs, the tickets being sold to represent the commutation rate. Instead of two straight fares of 5 cents each, we may have a combination fare of 7½ cents, the passenger getting a transfer beyond the first fare point; consequently, on one of the disks which come up on the register there are transfer tickets and 5-cent fares, that comes up with a light-colored disk, and when the 5-cent fare there comes up a red flag, and in this way the public is to a certain extent a detective as to whether the conductor is ringing up the class of fare which has been paid. We believe it facilitates the checking of a conductor, and I would not consider disregarding the value attached to a transfer. To our trained men it has all the value of a cash fare and is treated as such. They never know when a particular line may be checked up; as the lines are checked up either in regular order, or if there is some suspicion, the transfers are brought in, messengers bringing in the transfers at various times during the day, and we may take one line or another, make a thorough checking on a day, or series of days, each following the other. Therefore, I am thoroughly convinced in my own practice, for the ordinary road, outside of roads like New York City, that it is necessary to give to the transfer the same value that attaches to a cash fare or a regular 5-cent ticket sold by many roads.

Mr. W. B. Tarkington, Council Bluffs, Iowa: We have also registered transfers. We cannot understand why anyone should ride and present something for his fare which the conductor is not required to ring up. We require every passenger who crosses the bridge from Iowa into Nebraska over the Missouri River to pay 10 cents. If he has paid 5 cents on the local line and given a transfer, we want the conductor to ring up that transfer. If the passenger has a commutation book which entitles him to a ride for 5 cents, we want the conductor to ring twice for that 5 cents, if the passenger crosses the bridge. If the passenger has a ticket to a summer resort that costs 25 cents, we require the conductor to ring twice for the coupon which carries the passenger over the bridge or vice versa. We are thoroughly convinced that it is to our interests to have the conductors ring up for every class of ticket which they accept. We have upon the advice of Mr. Sloan put in a double register, and our experience has been that the passengers themselves take an interest in noticing what class of fare the conductor rings up and the bells of the register have different tones. The men who do the checking are enabled to tell by the tone of the bell what class of fare

is rung. This is a matter which affects the revenue of the company, and we want to find out what is the best way to handle it.

Mr. Connette: I would inquire, if the transfer has the same value as a 5-cent piece, what advantage there is in ringing them up on separate registers, or double registers; and even if the passengers do know that a conductor makes a mistake and rings a transfer for a 5-cent fare or vice versa, what is the difference?

Mr. Sloan: That is rather a difficult question to answer. The line of demarkation as to whether it is better to register a transfer or not, is so fine that it is oftentimes only a matter of opinion; but my conclusion, after having put the system in and used it for four or five years is that the transfer is registered very accurately, and that a conductor very seldom collects a nickel and rings up a transfer. I watch this matter very closely. Sometimes conductors believe that the passenger is watching him and he will ring the correct fare even though he might be tempted not to do so. A register is a monitor. If the conductor supposed that nobody but an inspector was watching a register, the peculations from the company would be very much increased. There are many passengers, as all of us know, who have an interest in the operating department, and a conductor will say that so and so is a spotter. I like to have the conductors believe that such persons are spotters. I look upon the register as a monitor which reminds the conductors that the passengers are watching him.

Mr. N. H. Heft, Meriden: I am willing to admit this is one of the subjects upon which I have spent considerable time racking my brain as to whether to register or not to register transfers. We have tried the system of not ringing the transfer and also the system of ringing the transfer, and we are using now on our system the "Duplex" transfer which is printed in pads of one hundred, numbered consecutively, and these pads are charged to a conductor when he goes out on his run, and he is required to punch the transfer, tear off the Duplex, and return the original in his envelope, and pass the other to the passenger, punching in the time limit. When the passenger boards the car to which he is transferred, the conductor of that car is required to punch the time that he received the transfer, and we have been unable to find more than one way by which the conductor could successfully beat this transfer ticket and that would be at a transfer point where he had an understanding with the meeting conductor, who would punch up about the number of transfers he thinks the conductor would sell for cash fares on the other car. That is a risky piece of business, because the spotter on the car would detect it very quickly, and with that system it does not seem possible for the original conductor to part with the company's transfers unless he turns the cash fare into the company, and with our system of blanks it is very easy to keep track of the transfers and to make a complete accounting of them with that system. We are just introducing the system on one of our other lines, and we think very well of it so far. As a general proposition I believe that every ticket received by a conductor as an evidence of fare should be registered.

Adjourned till 2:45 p. m.

#### TUESDAY AFTERNOON SESSION.

Called to order at 3:15 p. m.

The President: I have received a letter and telegram within the last half-hour which undoubtedly you will be interested in. The kind invitation of the Association through you to be present at this Detroit meeting is acknowledged. I had hoped I could attend, but urgent business prevents. In presenting my sincere regrets, please assure the members of my esteem and best wishes for the most successful meeting in the Association's history. I cherish my honors from the Association as one of the most delightful episodes of my life. With thanks and highest regards for yourself and my former associates, Walton H. Himes."

"I regret very much that I will be unable to attend the convention on account of the Board of Arbitration being in session this week, and where I am in daily attendance. I expected to be present and avail myself of the benefits of this convention, which are of great importance in conducting large enterprises similar to those in which most of us are engaged. Hoping that this convention will eclipse all former conventions, I am, yours truly, J. M. Roach."

We closed the discussion on the Registration of Transfers prior to our adjournment. The paper on "Steam Turbines" has been laid over until Friday, at the request of the writer and some two or three gentlemen who desire to discuss it, but could not possibly be here today.

The next regular paper is by Mr. Root, of New York City, on "The Street Railway Mutual Benefit Association." I will ask Mr. Root just in a general way to present some of his points without reading the whole paper, and then we will take it up for discussion.

Mr. Oren Root, Jr.: Mr. President, the points are rather short and you can yourselves glance over the paper itself and get the gist of it probably as quickly as I can tell you. But as a preliminary statement to this paper, as I have stated here, through the instigation of President Vreeland some four or five years ago, this subject and others were taken up; and at that time this mutual benefit association was put into effect and has been worked out as I have described in this paper. About the same time or shortly after the Association was formed there was another subject which is very closely allied to this to be taken up, and that is the Pension System. It has occurred to me that it might be of some interest to this convention to have a brief statement made of a pension system which has been adopted by the Metropolitan Street Railway Co. of New York, since this system was so closely correlated with the workings of the Mutual Benefit Association and is really supplementary to the work which I have briefly described in this paper. The employes who are retired under the Pension System which has been adopted in New York may be divided into two classes. First, all those employes who are 70 years of age and who have been 25 years in the service of the company. Second, all those employes of the age of 65 to 69 inclusive who have been 25 years in the service of the company. All those employes who are 70 years of age are retired by the limit—by the age limit itself. That is compulsory. And all those employes between 65 and 69 are retired at the discretion of the trustees of the Pension Fund, if they are found in the opinion of the trustees to be incapacitated for active work. The allowance as paid to these retiring employes is divided into three classes. If service has been in the company for 35 years or more, these retiring employes are paid at the rate of 40 per cent of their annual average wage for the previous ten years. If service has been for 30 years, they are paid 30 per cent of the annual average wage for the previous ten years; and if their service has been 25 years, they are paid 25 per cent of their annual average wage for the previous ten years. This fund from which each of these allowances are made is appropriated solely by the company and the employes contribute in no way to it. The object in establishing this Pension Fund is to step in where the Mutual Benefit Association leaves off and to preserve the welfare of the aged and infirm employes and to recognize loyal and efficient service. We believe that all the employes who are now and who will hereafter enter the company, unless they should be subjected to very unusual periods of illness, that both they and those dependent upon them will be taken care of if they remain in the service of the company from the time they enter the service of the company to the time of their death. We, of course, do not intend that all our employes, for instance men who are engaged in the operation of the cars as motormen and conductors, should continue in such positions until they are 65 years of age, at which period they are eligible to retire under the pension, but we do believe that on the average, a conductor or motorman, for example, can properly operate his car up to, we will say, 55 years of age. And from that time to the time when he is 65, when he is eligible for a pension, we expect to take care of him in such positions as that of transfer agents, switchmen, flagmen, messengers, etc., which positions a man in that time of life can, we think, perform with satisfactory efficiency and without any hardship to the man himself. It is scarcely necessary for me to say that our employes and their families have deeply appreciated the establishment of this Pension System. You might consider or think at first blush that the allowances paid, that is, 40 and 30 and 25 per cent of the annual average wages, which I have spoken of before, is not a material sum; but if you will stop and consider that for every man who retires under the 40 per

cent clause of the Pension System he is practically having held in reserve for him the sum of ten thousand dollars from the time he retires under this system to the time of his death. In other words, if a man has been earning an average of a thousand dollars a year and retires under the 40 per cent clause of the Pension System, he will receive \$400 a year, or 4 per cent on \$10,000; which is a half of 1 per cent more than the savings banks pay in New York City. This brings about a situation that any employe who enters the service of the Metropolitan Street Railway Co., of New York, to-day can say to himself when he reads over the Pension System, that if I stay in the service of the company for 25 years, or until I am 65 years old, with 25 years of service, I can have placed at my disposal from that time until the time of my death, \$10,000. Where is there in this country any other similar situation or where is there a company or a business where a man with the same amount of skill or with the same ability that we require in the street railway work—where is there such a situation that a man, eliminating this pension situation, can, if he enters the service of any concern at, say the age of 25, during his entire life save and have the amount which the Metropolitan Street Railway Co. to-day says that they will place at their employes' disposal after they are 65 years old, with 25 years of service behind it. We do not wish our employes to consider and we do not consider ourselves that we are going to pay these men this amount in any spirit of charity, but we feel and we believe that they will feel, and do feel, that we are merely paying to them something which they have themselves earned through their years of service and their loyalty to the company. I have made this statement outside of the paper, because, as I say, it is so closely correlated with the work of the Association, and is merely fulfilling President Vreeland's idea which he had when he originally promoted the Metropolitan Benefit Association—that is, when this Association was formed through his instigation.

#### STREET RAILWAY MUTUAL BENEFIT ASSOCIATION.

By Oren Root, Jr., Assistant General Manager, Metropolitan Street Railway, New York.

While the purpose of this paper is to discuss mutual benefit and assessment insurance associations as applicable to street railway employes, it will be well, before treating of that special subject, to say a word on the general topic of mutual benefit associations and assessment insurance, the main features of which must be embodied in any plan intended to benefit the class we have under consideration.

The history of assessment insurance, when extended beyond a single and continually recruited class, is not encouraging, and insurance practice demonstrates it to be, at its best, more expensive and uncertain than ordinary corporate insurance by strong companies. Assessment insurance, however, when applied to particular crafts, which in the very nature of things must be continually recruited, has shown phenomenal results, especially when accumulated surplus has been invested for the benefit of the insured and not dissipated in executive salaries.

I take a street surface railroad in a growing community to be in the indicated class where assessment insurance can be, so far as the beneficiaries are concerned, profitably applied, as is evidenced by a case in point—the Metropolitan Street Railway Association of New York, with whose workings I am familiar and concerning which some details may be of interest.

This association was organized in the spring of 1897 by the employes of the company at their own suggestion, and was so planned that any employe between the ages of 21 and 45, who had been in the service of the company three months, was eligible for membership upon the payment of an initiation fee of one dollar and dues of fifty cents per month.

In return for these payments, the association guarantees to its members:

1. In case of sickness, the payment of one dollar a day for a period not exceeding ninety days in any one year.

2. In case of death, the payment of \$200 to any beneficiary named by the insured.

3. The free service of a physician who devotes his entire time to the members of the association.

4. The use of reading rooms which are supplied with weekly and monthly papers and magazines, technical journals and a library consisting of over 2,000 volumes.

5. Use of ten pool tables, for which one cent per cue is charged.

6. Free monthly lectures and entertainments during the winter months at the association rooms.

7. Eligibility for pension under the pension regulation of the Metropolitan Street Railway Co.

The association started with 30 members and from that time it has steadily grown until to-day it has a membership of over 4,500.

The association is operated with absolutely no expense beyond the stipulated salary of a physician, as all the officers of the association are officers of the company and their services to the association are given gratuitously. The association rooms are given rent free by the company; the library and pool tables were donations from individual stockholders and directors.

This plan, which I believe with slight modifications, is applicable to almost any railroad property of considerable size, has worked out, in its financial details, some surprising results; for instance, we found that the amount of the tax, fifty cents per month, is a trifle more than is necessary to pay sick benefits and supply life insurance of \$300, but it is so small, in each individual case, as to make an exact adjustment both inconvenient and impossible, and hence there has grown up in this association a practice of investing the surplus in the securities of the property on which the members are employed. And so we have in this association the unique feature of each member contributing monthly, in an infinitesimal way it is true, to a proprietary interest in the property he helps to operate.

Before going further into the details of the workings of the association and discussing the beneficent results it has accomplished for the men and owners of the property, I must, in order to be thoroughly understood, say a few words about certain human agencies, account of which can not be taken in any written rules of practice.

The success of the Metropolitan Street Railway Association is primarily due, not so much to its sound economic features as to the personal relationship established and maintained between the responsible head of the railway company and its employes.

All of us who have to do with masses of men are aware of the fact that it is not always easy to induce them to do that thing which is obviously for their betterment, whereas experience shows that when their sympathies are stirred and their feelings appealed to they can be and have been induced to the most suicidal courses.

The phenomenal success of the Metropolitan Street Railway Association is due primarily to an intelligent, sympathetic relation fostered and encouraged between the manager and his men who early realized that they were under the discipline of a man who was in thorough accord with them as a class and whose life experiences had been along the very lines they themselves were travelling.

The fusing influence of this relationship, which is as active to-day as at any time since the formation of the association, has welded the membership into a body, the tremendous force of whose loyalty has been frequently tested in critical emergencies.

The impetus thus given to this association is great enough to assure its permanence beyond the accidental loss of the influence of the individual who is responsible for its present energy.

I have said this much in order that I may not be misunderstood as imagining so vain a thing as that the mere formulation of a beneficent plan is sufficient to secure its success. In the application of social benefits, as in everything else of human devising, some vivid personal influence is necessary to success, and this success, believe me, can not be achieved by mere formal approbation or endorsement. If you want to make a concern of this kind go you must give it your time and thought and above all you must be convinced at bottom that it is the right thing to do and that it will succeed.

If I might presume, before proceeding to further discuss the

results of associations, to make a suggestion to those contemplating an experiment in this direction, it would be to avoid patronizing the men. Many good things are spoiled by being overmagnified, and it is my experience that among American and Americanized working men there is a resentment of official patronage. The quickening influence of the idea that you and your men are engaged on the same job but in different capacities, when once fixed, is surprising. It would be well, too, not to lose sight of the fact that the benefits arising from helping your men to take care of themselves are not all one-sided.

This thought brings me to a consideration of the benefits arising from associations.

These benefits may be divided into two classes: First, those derived by the employes, and second, those derived by the employer. There is nothing which appeals more strongly to the large majority of people, certainly to those who have worked for a living, than those things which yield a direct or indirect financial return. No one can fail to see the great benefit which the distribution of from \$20,000 to \$50,000 a year means to the men who are working for wages, and without reserves to draw upon in cases of sickness or other disaster. The services of a physician, the free use of a library, the opportunity to play pool or billiards in a well lighted and well ventilated room at a nominal cost, are the financial benefits as well as pleasures which are assuredly appreciated by any body of intelligent workmen, such as are employed by street railway companies. There is a benefit not so apparent but equally real in the creation and strengthening of a common spirit—"esprit de corps"; a realization of common interest in a work of many details but of common end. The gain is the greater as all employes are included, from the helper to the manager. The perfection of army organization is where the soldiers have entire confidence in the leader, and the leader absolute trust in the soldiers. When something of the strength of all goes into the work of each, tasks are more easily done; there is more careful attention to details, a common interest taking hold beyond the working hours gives heart to labor, when the time comes. A street railway touches the public at numberless points; the work of its employes is at each of these points; work with something of heart in it is easier and better than mere hand and head work.

When one remembers that in such a scheme as I suggest there is no demoralizing taint of official charity and that the men are gradually realizing that in truth they are doing all the help-work with their own money, he will realize that the moral uplift far exceeds any of the material advantages.

The benefits of the second class from these associations—those to the employer or stockholder—are not so tangible as those received by the employe, but, nevertheless, exist to a large extent and are apparent to those who are in close touch with the workings of such associations and their bearing upon the management of the company's affairs. It may be difficult to demonstrate to an outsider, or to put your finger upon particular cases where the use of the library or the association rooms or the pool tables accrues to the advantage of the company. It is unquestionably true in my mind, however, that all of these things create a certain sentiment in the mind of the employe favorable to his employers, and which in times of labor troubles, when the misguided and unscrupulous agitator attempts to cause dissatisfaction, crystallizes into a feeling of loyalty toward the company which could not have been gained in any other way.

At the monthly meetings of the Metropolitan Association, which are held in the association rooms and at which men of prominence and officers of the company speak to the men, the employer, as represented by the officials of the company, is brought into a personal relation with his employes, not as employer and employe, but as man and man, and in this way there is established a personal relation between them and a feeling of friendliness which certainly, in a large company like the Metropolitan, is not possible in any other way. I believe, as illustrated in the late trouble in Ohio which a large manufacturing company had with its men, that it is possible to overdo this kind of work. When you begin to wet-nurse and patronize workmen, you are offending them and making trouble. The idea is to teach them to help themselves.

As an illustration of what opportunity for amusement means

to working men one of the pool rooms located at 50th St. and 7th Ave., takes in on an average of \$45 per week. Several games of pool, at a cent a cue, must be played in the course of a week to make receipts \$45.

There are, to my mind, three dominant problems in the handling of a street railway property. First, is the relation of the management to its employes; second, its relation to the public and the press; and third, its relation to the state and city officials. Of these, the relation of the management to its employes is of the greatest importance. Fair, considerate treatment of men's natural rights, the establishment of friendly and harmonious relations between it and its employes, is a railway company's most valuable asset. The great successes in the street railway world have been made by ability to successfully handle men.

However unjust it may be to the responsible head of any street railway property, how often has it been the case that the faithful and efficient work of years has been practically forgotten and nullified by differences which have arisen with the company's employes. The fact that a manager has been able to operate his road at a less cost than ever before and has brought the standard of equipment and the roadbed and the entire physical condition of the property to a higher level, is apt to be overlooked by the company's directors and stockholders in case serious labor difficulties arise. The stockholders of a property not only look to the management for a return upon their investment but value once established they look for their stability and permanence. To assure the stability and permanence, moral forces must be set to work and carefully fostered until they gradually become traditional with the concomitant result of loyalty and efficiency of service.

I believe that the interest the employes take in a financial investment of 50 cents a month in an association and the enjoyment of the opportunities afforded by the libraries, pool rooms, and entertainments, etc., together with the personal contact between the employes and management, bring about a relation between them similar to that which the millions deposited in the savings banks bring about between citizens and their government. I think, with rare exceptions, that there will be found among savings bank depositors but few anarchists, socialists, or those dissatisfied with existing conditions. The millions of savings bank depositors are among the strongest influences toward the proper government of the country, and I believe that the financial and other interests of employes in a street railway company through their association are equally strong influences for good.

We are living in an age in which no industry has made more rapid strides than the street railway. What was considered ten years ago a liberal policy on the part of street railway companies toward their employes would be considered penurious today. The methods of ten years ago cannot be used effectively at the present time.

The relation of capital and labor as represented in street railway properties has undergone a radical change in favor of the condition of labor. The betterment of labor conditions has been just and fair, and, in my opinion, any street railway management will do well to recognize it and meet it with liberality. There is no better way of keeping abreast of this movement than the encouragement and fostering of mutual benefit associations.

There are many things that are necessary to establish proper relations between the management of a company and its employes, but I believe that the most potent factor of all is the benefits received by the employes through a voluntary association and the relations which the social side of such an association establishes between the management and its men.

The President: Gentlemen, the paper is before you for discussion; on any social points connected with it, Mr. Root is very familiar with the facts of the management in connection with the Association and with the Pension System. I know he will be very glad to answer any questions that may occur to you. And you, gentlemen, quite a number of you, who have written me letters about this, can get your letters answered now. I will ask Mr. Connetto, general manager of the Syracuse Rapid Transit Co., to open the discussion.

Mr. Connette: The Mutual Benefit Association of the Syracuse Rapid Transit Co. was organized in 1898. The admission fee is \$1.00. The monthly dues are 50 cents. The joining of the association is entirely voluntary on the part of the employe. The association has paid out in the last two years, according to their financial statement, in sick claims, \$1,915.50. In death claims \$900, making a total of \$2,815.50 paid out in two years. Upon September 1st this year the association had to its credit \$952.17, \$500 of which was invested so that it was getting an interest return. They also have as a special fund, as a contingent fund, for the purchase of such things as they may need to make their rooms more pleasant and agreeable, \$319.48, which they have secured by holding entertainments from time to time. They have rooms equipped with pool tables, card tables, reading rooms with all the weekly and daily periodicals where the men can rendezvous at times when they are not on duty and enjoy themselves. The association is entirely controlled by the employes. The board of trustees being composed of members of various departments of the system and membership is not only limited to the employes but the heads of the departments and the officers of the company are also members of the Mutual Benefit Association. We have a meeting once a month, and we not only have a meeting of the employes, but the heads of departments and the officers of the company meet with the men. We not only discuss matters pertaining to the Mutual Benefit Association, but from time to time we take up subjects of interest to the railroad company, such as accidents, for instance, and we have the employes participate in discussing those subjects and the best methods of avoiding accidents and things of that sort. We bring out what is in the minds of the employes themselves. You will find, or at least we have found, that this benefit association does not wholly result in the discussion of the sick and the afflicted and the bereaved families of the employes; but it results in a friendly relationship between the employes, the subordinate officers and the management of the company; and by reason of that close relationship which is brought about by the intermingling at the meetings of this Association we learn to know each other better. We learn to feel an interest in each other's welfare, in the management of the property; and it has been impressed upon the employes that the success of the company does not depend entirely upon the management, but that every employe imparts his share to the success of the enterprise. It has been a means of bringing about a co-operative feeling between the management and its men, and we feel that the Mutual Benefit Association, so far as our company is concerned, is a great success. The fees are deducted each month by the auditor of the company when the men are paid off; and the amount then is turned over to the treasurer of the Association and deposited to its credit by him. All checks that are payable for sick and death benefits have to be approved by the general manager of the company before the checks can be paid by the bank, so that there is no possible way for any defalcation or for any diversion of the funds of the Association. The board of trustees, which is composed of the employes of the company, are allowed one-half day each month on pay to assemble in the association rooms to discuss matters in connection with the management of the association, and to arrange for its monthly meetings. The secretary, who is one of the conductors on the road, is allowed two days each month on pay for the purpose of arranging his books and making up his checks to pay death and sick benefits, etc. Altogether we feel that the Mutual Benefit Association of the Syracuse Rapid Transit Company is a success from every standpoint.

Mr. Haggerty, of the Michigan Traction Co.: I would like to ask the gentleman in case an employe is a member of the association and then leaves the company's service, what procedure it takes in regard to his membership?

Mr. Root: As soon as a man severs his connection with the company he severs his connection with the association, and does not get any return for the money he may have paid in.

The President: The question asked by that gentleman is a question that has been asked very frequently, and the answer is the same as made by the Pennsylvania R. R. Relief Fund. The Pennsylvania R. R., which you know by its relief system handles over \$200,000 a year puts every case in a question and answer form and the proposition is that it is exactly the same as

to buy a traveller's insurance policy for 25 cents to protect you 24 hours, and you get that 24 hours' protection. They have done their duty and you get your returns for your money. The Pennsylvania road has one of the oldest associations and largest in the United States. The theory of it is a man pays 50 cents for a month's protection in the association, and all that goes with his protection. If a man leaves on the 15th of the month he gets 25 cents back that he has paid. If he leaves the 20th he gets a proportionate amount. In a word, the idea is that a man is not paying for anything but one month's protection when he pays under the system under which it is conducted.

Mr. Beggs: I would like to ask Mr. Root what policy the Metropolitan company pursues as to the care of the fund that takes care of this pension expenditure, which naturally will grow greater as time goes on and more men because of length of service in the company become entitled to the benefits of the pension system. I would like to ask, as a matter of finance, whether the Metropolitan company has made an appropriation to its Pension Fund, or revenue from which will meet these pension demands as they accrue. Or whether it has made an annual charge against operation. I ask this because I am myself interested at the present time in formulating the rules for a similar pension fund. I would like furthermore to know what the experience of Mr. Root is with the Metropolitan company, and likewise Mr. Connette, as to men laying off a day or so in order to obtain sick benefits. I ask this more particularly for the reason that many years ago I gave a great deal of time to a number of beneficial organizations in the State of Pennsylvania, among which was the Odd Fellows and Knights of Pythias and kindred organizations for quite a number of years. I held a prominent position in those organizations, and gave to them a great deal of time. I believe they would have been wrecked ultimately had it not been for the principle adopted by us about twenty years ago, whereby a man had to be incapacitated from work a certain length of time before the weekly sick benefits began to accrue to him. I was wondering whether in these organizations any experience of that kind had been encountered. Whether there were, as there is in nearly every body of men, a certain number who feel they must get square with the organizations to which they are paying funds. Whether or not it has shown any tendency to have men lay off a day or so each month or at periodical times, in order to know that they had a certain amount which they would receive any how. I would like, furthermore, to ask what is the rule when a man is possibly injured in the company's service. We, in our organization, usually deal with each of those cases individually. If incapacitated by injury in the proper performance of the company's service, we usually make him an allowance of his wages. Half sometimes and sometimes more than that, dependent upon the circumstance in which the injury occurred. I would like to ask whether it is considered by these two companies which are running this beneficiary organization that the dollar per day acquits the company from any further obligation to the employe?

Mr. Root: As to the first question I will say that the directors of the Metropolitan company have authorized the officials to go as far as \$50,000 to pay above this pension allowance. There is a provision in the regulations themselves which permits the Board of Trustees at any time, when they consider a payment under this system excessive, to make a revision of the ratio of payments, so that they are not bound by anything they do to-day or a year from now. In fact, when they consider it to be excessive they can revise the ratio at which the employes who retire under this Pension System are paid.

Mr. Beggs: You have struck just the point I wanted to get at. Aren't you running them somewhat upon the plan of a great number of these assessment associations that have been formed throughout the United States in the past two years; that in the early stages they were well able to meet the amounts payable, but as the number of members increase, as they will 25 years from now, these men that remain in your service a considerable length of time, if then an effort is made to reduce the amount that you have paid to employes before that time, will that not be a source of dissatisfaction and a feeling of injustice, that if they had been able to retire a few years earlier they would have received 40 per cent, whereas you may be compelled to reduce the

amount that they will receive to 20 per cent or some other figure or something much lower than their fellows receive? That like wise raises an important point in my mind and you have touched upon it very well in your paper. Indeed, whether it would not be well to exact from them, let the amount be very small, but some amount, I don't care whether it is one cent a week or two cents a week during the time they have been in your service, to be paid into this permanent pension fund, and that be invested and kept, the revenue from which would provide and guarantee the payment of these amounts in the years after your men had grown old in your service. That has been the complaint against many organizations that have been attempted in this country with very good purposes, but which were found to be impossible to carry along. I, myself, belonged to a number of them for a considerable length of time. I raised this same warning cry twenty odd years ago, in the order of the United Workmen and the Royal Arcanum, where we were compelled very greatly to increase the amount that they exacted from their members. There should be rules standardized to govern the employees and to standardize these beneficiaries of the companies, and which I think is for the benefit of their employees. I throw out these questions more particularly for the purpose of arousing a spirit of inquiry among those who are charged with the very serious responsibility who operate these public utilities throughout the country.

Mr. Root: I do not consider that that condition of overrunning the allowance by the length of service is apt to arise, because I believe if their employees get to that condition where the payments shall be greater than the amount that we have now appropriated that the benefits the company have received through their length of service will be proportionately greater, and that the company can in that same proportion fairly pay them at the same rate as they do now. That was merely put in as precautionary, because this thing has not been worked out. We are, I think, the pioneers in the street railway world. The Pennsylvania, I believe, is the first one to adopt it. I think it was about two years since it was established, and we have got to fall back on some precautionary measure, so that if we do get into trouble we can avoid it, but we do not anticipate that we will. We have got a good deal of precedent from Germany and England, where they have done a great deal of this pension work, and they have found there that where the superannuated body contributed themselves, it has not been as satisfactory as where the government has taken the thing entirely in its own charge. This is a matter, however, which only time can work out. We have not the experience, but we are going into it now and making such regulations as we deem proper. When these things arise ten or fifteen or twenty years from now, as they may, as Mr. Beggs suggests, we will have to work it out on those lines then. As far as the association itself is concerned, about the men attempting to defraud the association through laying off when they are not sick, our regulations provide that any employe may receive \$90 in one year, that is, at the rate of a dollar a day, but his benefits do not begin until he has been sick for seven days, unless he is injured in the service of the company. If in the service of the company, it begins from the day on which he was injured. There can be very little question about a man when he is injured in the service of the company, whether he is injured or not. The association's physician is a man, of course, who is very reliable, and upon whose judgment we place entire confidence; and there is no one who receives any benefits from the association unless he makes a prompt application to the secretary and is examined by the association's physician. Even if a member elects to have his own physician, he is not paid any benefits from the association until the association's physician himself makes an examination and reports to the secretary that he is entitled to this benefit for which he has made a claim.

Mr. Beggs: I do not think the seven-day clause appears in your paper.

Mr. Root: I think that is an amendment which has been passed and perhaps is not in the regulations as originally printed.

Mr. Beggs: I think it is a very important one to have brought out here. It did not appear in your paper, but it covers the point I am getting at. I am very glad indeed that this has been brought out for the benefit of anyone who intends to establish a system of this kind. You will find men that will lay off, but

Mr. Root's amendment, which does not appear in his paper, is a very important one.

Mr. Root: I shall be very glad if any of the members of this convention desire our regulations, which enter more into detail, to send them to them.

Mr. Conette: As far as our Association is concerned, the by-laws specifically state that the benefits do not commence until a member has been disabled for seven days. Furthermore, the association employs its own physician, and when a member is sick that physician must wait upon the member, and the association pays the doctor bill.

Mr. Harkness, Connell Bluffs: The laws of the state of Iowa are very stringent in regard to assessment insurance companies. An organization has been organized in Iowa, and the laws of the organization follow the points brought out by Mr. Beggs. The Modern Woodmen and those assessment companies which have a very rapid growth and have no reserve fund are now confronted with a possibility of a great deal of trouble by not having anything to pay claims with. The new company provides a reserve fund from the beginning. If you join at the age of 25, and die at the age of 31, your expectancy of life would be based upon the tables of the old line insurance companies and you would be required to pay the assessments to the limit of your expectancy, which perhaps might be 55 years; so that out of the amount of money which you would receive, if it were \$1,000, they would deduct the amount from 31 to 55 years, the assessments for all those years, and lay it aside as a reserve fund the accumulation of which it is believed will take care of this.

Col. Heft: I would like to ask a question of Mr. Root; if I understand him right, he said when you organize your pension fund, you set aside the sum of \$50,000, believing that to be adequate to take care of the pension. I would like to ask if that sum has been set aside now and is at interest; or is it an assessment against the operating expenses of the corporation to be taken care of at the time that you are called upon to pay these pension amounts?

Mr. Root: Mr. President, I intended to say that the board of directors authorized the officials to expend that much money, \$50,000 in any one year in payment of these allowances, and that will be considered as an operating charge and will be charged up just as if these men were working in their regular duties which they had been before they were retired under the pension. It does not become a charge against the operating expenses of the corporation until such time as you are required to make payment. We have retired men already under the pension. It is not retroactive, but it goes into effect on July 1st; and any employe who was 65 years old and who has been 25 years in the service is eligible for retirement and some have been retired.

Col. Heft: How can you treat him as being 25 years in the service when your corporation is only some four or five years old?

Mr. Root: There is a provision in the pension articles which says that it refers to any constituent company, either prior or subsequent to the requirement by the Metropolitan Street Railway Co.

The President: Anything further on this paper, gentlemen? If there is nothing further to be said on this, we will order this discussion closed and proceed to the next paper.

Mr. Lang, of Toledo: I desire to ask the attention of this convention for a moment. I would like to offer a resolution at this time, in order that the matter may get to the ears of as many of our members as possible, and there seems to be a good representation here, and there may not be later in the session. I have a motion to make following the reading of this resolution which may be of interest to everyone: "Whereas, The American Street Railway Association in convention assembled has learned with much gratification of the extensive plans that have been made by the Louisiana Purchase Exposition for the proper presentation at the exposition of the American street railway interests; Resolved, that this Association extends to the transportation and electricity departments of this international exposition assurances of its hearty interest in the work they have undertaken, and its hope that the plans will be brought to a full realization."

NEW SPRING SHOP AT BRILL PLANT.

The J. G. Brill Co. has lately added to its extensive works in Philadelphia a spring shop in which has been placed the very latest patterns of furnaces and machines for making high-grade coil and flat springs of every description. The spring shop was instituted primarily with the idea of making all the springs used in the construction of Brill single and double trucks, but the company is now in position to supply springs not only for its own

that can be obtained. The entire force is in charge of an expert spring-maker of long experience. Special care is taken in the inspection and testing of the entire output of the spring department. To insure absolutely faultless work, samples from each lot of springs made are first placed in the testing machines and destroyed in order to determine the capacity limit, and each spring of each lot is then tested individually to insure that it comes up to the specified standard. The company buys all its material in the rough, and is therefore able to over-see each indi-

EXTERIOR OF THE SPRING SHOP OF THE J. G. BRILL CO.

purpose, but also for sale in the open market as well, and orders are solicited for all the standard sizes and forms of springs, and also special springs for special purposes.

The new spring shop is housed in a brick building near the office building of the Brill works. The shop equipment for carrying on the various processes of cutting, tempering, shaping and finishing coil and plate springs include the following: Two fitting furnaces, two coil furnaces, two punching machines, one punch and rolls machine, one back machine, two coil machines, two testing machines, one banding machine, two double shears, four dressing tables, four fitting tables, one lathe, one eye back, three

visual process in the work of turning the rough stock into the finished product.

All the machines in the shop are driven by a 50 h. p. motor. Adjoining the spring shop is a new forge shop built to take care of the overflow work from the main forge shop of the company. In this room have been placed two 2,000-ton hydraulic presses, one 1,500-ton steam hammer, and several furnaces and forges. This new department will be occupied almost entirely in forging the side frames of Brill trucks.

These additions to the plant are in line with the general policy of the Brill Company to keep its plant strictly up to date, and to give its customers the advantage of every possible improvement in the various processes entering into the making of Brill cars and trucks. In this same direction the company is continually expending much labor and time in making new and improved dies and forms to enable it to turn out truck parts in a manner in keeping with the high standards aimed at. New and heavier machinery has been added in all the departments, and both the quality and quantity of the output thereby kept up to the requirements of the business.

CHRISTENSEN ENGINEERING CO.

The Christensen Engineering Co. has an interesting exhibit, including a Christensen straight air brake set of equipment and a complete automatic equipment for a two-car multiple-unit train. Both these equipments are shown in operation. In the school-equipment the general arrangement of all the apparatus is the same as used on a car, but the motor driven compressor, engineer's valve, and other parts are all mounted so that they can be easily examined while in operation, and the function of each device can be readily understood.

The remarkable growth of this company's business is indicated by the large list of patrons mentioned in the handsome booklet the company is distributing; this also shows cars of different type upon which the Christensen air brakes are installed and several

A CORNER OF THE BRILL SPRING SHOP

oil tempering tanks, and one bending machine. This equipment is to be increased by the addition of one tapering hammer for tapering steel bars, and a steam hammer. The furnaces are the latest oil burning type, capable of giving the very best results.

A feature of this branch of the business is the high class labor employed, each workman in the shop being the best of his class

interior views of the company's works, which indicate the illustrations of excellent facilities for the manufacture of its product.

The company's interests at the convention are well cared for by representatives of the sales and engineering departments, including F. C. Randall, manager of sales; J. H. Denton, J. T. Cunningham, J. F. Dixon, jr. and J. J. Nef, of the New York office; W. W. Power, Philadelphia; H. N. Ransom and O. N. Leet, Cleveland; J. E. Ekdred, jr. and C. P. Tolman, Chicago; W. A. Granten, Pacific Slope; W. L. Waters, C. D. Knight, J. C. James, R. J. Sutton, W. J. Richards and F. L. Hutchinson, of the home office, Milwaukee.

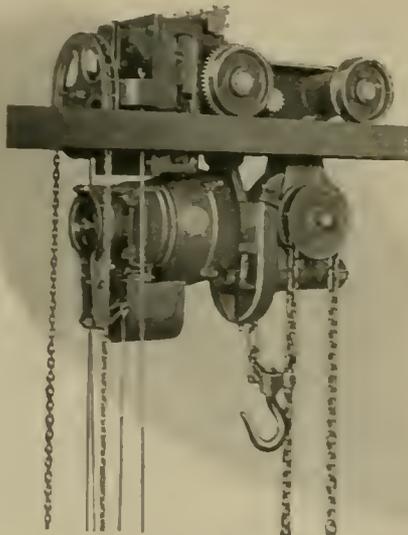

#### A NEW ELECTRIC HOIST.

Various attempts have been made to design an electric hoist capable of handling heavier loads than come within the range of hand hoists, and not requiring the heavy and expensive supporting structures necessary to carry the large amount of dead weight of ordinary travelling cranes. The Sprague Electric Co. has lately placed on the market a machine of this character which is claimed will stand the use and abuse to which all such apparatus is subjected, and will effectually fulfill the requirements of modern shop practice.

This hoist is designed to transfer light work rapidly around shipyards, factories, etc., and when supplied with trolley carriage, geared hand cross travel and bridge travel motor, to take the place of small traveling cranes.

This hoist has many advantages. It has a high efficiency and is small and light. It consists of few parts, all of which are interchangeable. It is easily adaptable to all types of runways and bridges, and the sizes range in maximum capacities from 1,500 lbs. to 10,000 lbs.

SPRAGUE ELECTRIC HOIST.

The smaller sizes can be equipped with a trolley arranged to run on a single rail, or 1 beam, and if so arranged will take curves of a reasonably small radius.

In designing this apparatus the manufacturers have carefully kept in view the fact that it would be subjected to rough usage. All parts are made of great solidity, and of the highest grade material and all bearings have been made self-oiling, requiring but trifling attention at long intervals.

All the different movements necessary for a traveling crane, namely, hoisting, lowering, cross-travel and bridge travel, are controlled by a simple pulling of the chains and cords connected to the mechanism, and which can be operated by the ordinary workman in the machine shop, factory or other place where the hoist may be used. This is a unique feature to which especial attention is called. No special crane operator or cage is necessary.

The motor and hoisting mechanisms can be hung from a strap if only a hoisting and lowering motion is desired, or they can be attached to a trolley carriage arranged for cross travel, either by pushing the load, or by a geared hand traverse motion. A bridge travel is also provided, the controller for which is mounted on the end of the trolley carriage, as shown in cut. This controller is operated by cords, the handles of which are located near the work. The bridge-travel motor itself is mounted in some convenient position on the crane. The bridge-travel motion is reversible, and in practice it is possible to obtain a very short movement in either direction.

The motors furnished with this equipment are the Sprague Electric Co's. round type motors entirely enclosed and the hoist can be operated out of doors without being affected by the weather. The resistance plates for the bridge-travel controller are of the enclosed type, and have a very large overload capacity.

The Sprague Electric Co. makes and furnishes the complete hoist as shown, consisting of hoist wheels and chain, worm and spur gear, gear cases, hoisting motor and attached cylindrical switch, trolley carriage, geared hand operated cross-travel of trolley carriage, and motor and controller for bridge-travel of crane. The hoist and motor can also be furnished complete without trolley carriage or with trolley carriage and geared hand cross-travel, but without bridge-travel motor and controller.

The Sprague Electric Co. does not make cranes, but will equip them complete with this apparatus, including wiring. A very complete description of the hoist is given in Bulletin No. 8200 which may be obtained by addressing the Sprague Electric Co., New York.

#### WM. WHARTON, JR. & CO., INC.

The tastefully-arranged exhibit of Wm. Wharton, Jr. & Co. shows a number of samples of special track work for street railways manufactured by this concern, particularly their "Manganese" steel hard center work, which has proved such a great success in the more than six years that it has been in use under the heaviest traffic. A worn-out frog of girder rail construction with Manganese steel center, attracts great attention; it was exhibited to prove that the manganese steel centers which the Wharton & Co. use, actually do out-last the adjoining rails. Some of their samples of new work exhibited show the details of the construction, and the peculiar manner of fastening the centers, which is so secure that even under the heaviest traffic the centers remain perfectly tight and do not become loose. At the same time, the method of fastening is such that the centers could be renewed should necessity arise, but the Wharton & Co. state that in all their experience this has been limited to only a very few centers which developed some hidden defect, and the claim made that it is not necessary to renew their manganese steel centers on account of wear. This is apparently shown by the worn sample above referred to.

The Nichols protected heel switch exhibited, while it had been shown before in its general features, embodied a number of improvements, one, in particular, being a new method of tightening up the bearing of the tongue pin, and a new simple fastening device for the manganese steel cap which protects the heel of the tongue, and by which this cap can easily be removed should it become necessary to take out the tongue on account of some accident to it. This type of tongue switch has proved a most marked success. The construction prevents the tongue from throwing between wheels or between trucks of cars, and the heel of the tongue does not knock down. The standard tongue switch of Wharton & Co., also shown, had already, to a great extent, overcome the two troubles mentioned, but the protected heel switch, although more expensive, is regarded as well worth the difference on account of the greater efficiency in regard to these two points.

The manganese steel construction for standard T-rail work, of which samples were included in the exhibit, represents a comparatively new departure, and has been greatly improved by Wharton & Co. within the last few years. The special pieces in

this track construction are made of solid manganese steel cast-lugs. The abutting rails are joined to these pieces by means of fish plates and wings extending from the manganese steel casting, making an exceptionally solid joint. This class of work is extensively used where permanency, rather than saving of first cost, is aimed at.

Although no samples are shown, Wharton & Co. report extensive use of the manganese steel on steam railroad tracks and elevated roads with most phenomenal results, the manganese steel frogs on the Pennsylvania Railroad having out-lived as many as ten ordinary frogs, and being still in use. They also have recently furnished rails cast out of manganese steel, in curves for the Boston Elevated road, which promise to exceed all expectations in regard to their wearing qualities. Photographs exhibiting various pieces of track work manufactured by Wharton & Co. show that their trade extends to all parts of the world—Europe, Australia, South and Central America and South Africa.

CONANT TESTING INSTRUMENTS.

The improved testing instruments exhibited by R. W. Conant, of 28 William St., Cambridge, Mass., are attracting much attention, especially two of the latest designs which are here shown for the first time at an A. S. R. A. convention. The T-pole bond tester is shown in Fig. 1 as it appears when being used. The principle of this instrument involves the use of a telephone receiver. First, contact is made at three points on the rail, giving two sections of equal length, one being solid rail and the other including the joint; then a resistance box is manipulated until no roaring is heard in the telephone, indicating that the resistance of the two sections of track are then equal. The position of the "balancing switch" shows on a scale the ratio of the resistance of the joint section to the solid section of equal length.

FIG. 1—CONANT PORTABLE JOINT TESTING INSTRUMENT.

The contact apparatus consists of a center pole with steel chisel welded to a socket at its lower end, to which are bolted by one thumb screw, two extension beams reaching out on the rail 5 ft. on either side. These carry two hardened steel chisels which are sharpened so as to bear at their centers. The edges are set so as to extend in the direction of the length of the rail, while the center chisel edge is at right angles to the rail length. The extension beams are of tough and elastic wood. The wrought steel knees, by means of which the extension beams are bolted to the center chisel, are permanently fastened to the beams in such positions that when the T is placed on the rail, the outer chisels touch first, while the center chisel edge is about an inch above the top of the rail. Then by resting the hollow of the foot on one side near the center, the T is sprung down so that center chisel rests firmly on rail. This springing action forces the other chisels outwards with a scraping movement that cuts them into contact with the rail. An additional means is provided for intensifying this cutting effect, by pushing the handle of center pole back and forth, causing both outer chisel

edges to cut through the scale on the rail produced by the rolling action of the car wheels, but does not disturb the contact of the center chisel.

With the T pole connected to the instrument and the telephone in position, the operator places the T-pole on the rail with the rail joint about a foot from the center chisel. The instrument is started by its release switch at the side and the balancing switch is placed on the point numbered 1.

FIG. 2—CONANT MOTOR TESTER IN USE.

A roaring sound in telephone indicates that balancing switch is to be moved to point of silence. When this has been done the number at which switch stands is read off. This number shows the value of the resistance of the rail joint in terms of the standard length of rail spanned which is 3 ft.

Fig. 2 illustrates the Conant motor tester in operation on a car. This apparatus has been adopted by a number of roads, including Boston Elevated Railway, and is reported to be giving perfect satisfaction in every respect.

IT PAYS.

"One bad accident averted pays the cost of equipping all the cars on an entire system with the Providence fender," is one of the very substantial reasons advanced by the Consolidated Car Fender Co., of New York City, why every electric car in the country, whether for city or interurban service, should have one of its life-saving devices.

No better testimonial to the efficiency of this fender could be desired than the hundreds of newspaper clippings that are being received continually at the New York office of the company, relating incidents in which lives have been saved by the fender, in the cities where the Providence fender is standard.

The following is a sample selected at random from these clippings. This one is taken from the Elmira (N. Y.) Advertiser, of Sept. 2, 1902:

"A fender on a street car and a great presence of mind on the part of a motorman saved the life of a boy at the corner of Lake and Church streets last night at 5:30 o'clock. A car running south was about to hit the lad, when the motorman dropped the fender and the boy was tossed into it. Bystanders were horror-stricken, but before anyone could get to him the boy climbed out of the fender and ran like a deer up Lake street and nobody could get his name."

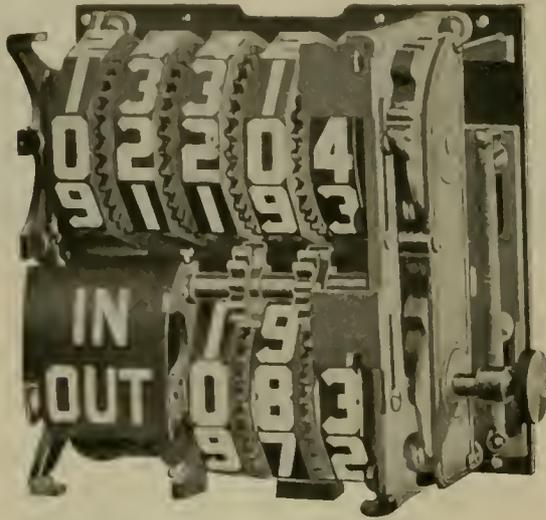

C. J. HARRINGTON, 15 Cortlandt St., New York City, dealer in general electrical supplies, has purchased the entire plant where "Medbury" insulation was formerly made. The plant has been dismantled and removed to the Newark factory of C. J. Harrington, and hereafter the well-known "Medbury" insulation and electric railway material will be sold under the Harrington trade name of "Empire." The firm has space No. 6 at

Exhibit Hall at Detroit in connection with the A. S. R. A. convention; also Parlor B at the Hotel Cadillac, where it will entertain its friends. All are cordially invited to visit both these spaces.

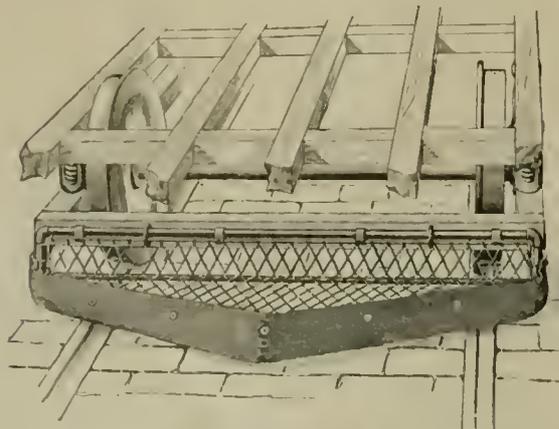

#### THE STERLING-MEAKER EXHIBIT.

The exhibit of the Sterling Meaker Co. at Space No. 81 includes samples of all that company's products, among which are the Sterling safety brake, the Sterling sand box, the Sterling fender, and fare registers. The brake, sand box, and fender are all shown mounted so that visitors may see the mode of operation in service. Of fare registers there are some six or seven kinds, and of these the new Sterling No. 5 will probably attract the most attention, especially from mechanical experts who understand the problems to be solved in register con-

THE STERLING NO. 5 WITH COVER OFF.

struction. The No. 5 is a development and an evolution, and yet embodies a number of ideas not heretofore brought out in fare registers, and the manufacturer is satisfied that this is the most certain, strongest and most durable register ever built. All wearing parts are of steel; the number of parts is comparatively small, thus promoting simplicity and strength and avoiding complex and delicate adjustment. The new Sterling "Double" register is on

THE STERLING FENDER

exhibition at Detroit and visitors should be on the lookout for it in the Sterling "parlor." There are also the well-known numeral disk register, Sterling No. 1; the stanch old "clock" face, Sterling No. 3; the Meaker 94, which remains the standard on some of the largest roads in the country; the convenient Meaker portable, of which thousands are in use, and one or two more.

#### ON THE SPOT—PART II

Some few days afterwards I was walking towards my home when, on turning a corner, I nearly ran in to No. 80 clad in a tweed suit and a straw hat and having a marked air of freedom about him. He paused as if to speak to me and so I stopped and said:

"Taking a day off?"

"Naup."

"Have you quit?"

"Naup."

"Vention?"

"Case of 'had to.'"

"Lay off?"

"I'm."

"What's the matter?"

"You r'member that young feller with th' spec's as I thought was a spotter?"

"Yes. Did he report you?"

"Him? Why, he's a d'v'n'ty student up at th' sem'nary; th' boys put me on to him for a joke just to cod me!"

"Where did the trouble come in then?"

"Why, you remember that red-headed Mick, with a little jag on, as sat in the front part of th' car the same night? Well, he's the feller all right, all right! Special from one o' the big d'tective offices out West, best in the biz they say, an' there's a whole lot o' the boys lookin' for him—wantin' t' explain things to him! Say—he was no fo l, that fellow wasn't—fodded me t' the top o' my bent an' he got lines on some o' th' slickest men on the lines, got 'em dead to rights, no chance for forgettin' nor 'n alleyby—no, sir! Had their time an' their trip, an' passengers, an' cash, an' transfers, an' tickets an' everything down pat in every single case—oh, he's a wonder, dinged 'f I don't admire him!"

"What was his report on you; did you find out?"

"Yes, th' old man always tells us the facts. Oh, the report? Say—it was a peach, went like this: 'Conductor No. 80 is either careless or cunning. From previous record an' from character given by other employes' (some o' th' other boys been blabbin') 'I should say the latter. I recommend 30 days lay-off an' a warnin' that discharge will follow next adverse report.' Short an' sweet—like a roasted chestnut maggot—ah't it? Oh, he had me down fine!"

"Did the superintendent show you the report?"

"Not he! He calls me in nex' morning' an' says, 'Mat,' he says, 'here's a report on you,' an' then he reads it an' says, says he, 'Does it go,' he says, 'or do you want to enter an explanation?' An' he looks at me sort o' queer. Now I know th' ol' man pretty well—ever since he started in at the biz—an' he's been through it all from greasin' track-up, an' I know from th' way he looked 't me that I was up against it an' I thought hard for a minute an' made up my min' I'd own up an' take my med'cine. An' while I was thinkin' he goes on an' says, 'The man as made this report,' he says, 'does not look like a young minister, but he does look like a tipsy Irishman'—them's just his words—an' he looks at me sort o' queer again an' I says, says I, 'I guess the report stands, sir—an' shall I report again in 30 days?' An' he says, 'Well, that's up to you, Mat. Does the comp'ny get what's comin' to it after this?' says he, an' I says 'It does,' an' he says, 'Report to me at th' end o' th' time an' I'll give you your run back an' you can go 'nd get what's comin' to you now. An' I says, 'Thank you, sir!' an' puts off to the cashier's office an'—oh, my stars!—if there wasn't about fifty o' the boys there drawin' their pay envelopes—an' some o' them drawin' their last ones, too, an' wasn't there some cussin'! Say, if cusses could 'a burnt, that spotter'd been a cinder! You see, he was a crack-a-jack at the biz, he'd been an ol' railroad man an' was a master-hand at disguisin' an' he'd spotted most all o' them under a diff'rent rig—Mick, Dago, Jew, coon, ol' man, young gal, ol' woman, minister, drunken man—just everything you can think of! I'll be blest if the boys won't be scared to knock down after this if there's no one on board but a three months' old baby—I believe I'd suspicion my ol' gran'mother after what they tol' me. Well, it's learnt me a lesson, I've got a little put away 'n a savings bank an' some shares 'n a buildin'loan 'society an' I'm goin' to buy my tobacker outter my own money after this—guess it'll taste sweeter. Good-bye, sir, see you next month!"

# SIXTH REGULAR ANNUAL MEETING STREET RAILWAY ACCOUNTANTS' ASSOCIATION

Detroit, Mich.—Oct. 8—10, 1902.

## WEDNESDAY MORNING

President H. C. Mackay called the meeting to order at 10:45 a. m., and introduced Hon. F. A. Blades, Comptroller of the City of Detroit, who addressed the convention as follows:

### ADDRESS BY MR. BLADES.

Mr. President—Permit me sir, at the first moment of my meeting you, in behalf of the city government of this goodly city and the people thereof, of whom there are no better in this world, to bid you a most cordial welcome. In welcoming you to our city, we do so with the assurance that nowhere on this round earth will you find brighter sunshine or bluer skies, or a more beautiful or historic river, or a more generous, big-hearted people than you will find right here in Detroit. As to our bright sunshine, we speak on general lines, for 1902 is an exceptional year, and we cannot promise much.

We hope that while here, you will not fail to visit Belle Isle Park, beautiful for situation, and we think without a peer in the world. As you are guests of the Detroit Street Railway people, you will no doubt have opportunities for visiting points of historic interest.

F. A. BLADES,  
Comptroller of Detroit.

The only difficulty I have any occasion to fear is that with the officers and employes of the Detroit Street Railway as chaperons, they are so proud of their railroad tracks, and trolley cars, and equipments, motormen, conductors, and officers clear up to President Hutchins, all of them full clear up to the cabin of the beauties, glories and success of the whole system, that they may consume all of your time. Still, if you should say to any one of them by the simple inquiry, "Is there anything else in Detroit besides the Detroit Street Railway system?" they will quickly respond, "Oh, yes," and then you may be reminded that flowing right in front of this beautiful city, there is the Detroit river, that annually floats upon its fair bosom, more commerce than any other river in the world, besides here are as broad and as clean streets as are shown by any other city in the land, while her people are noted for less crime and more public spirit than can be found anywhere else that we know of.

We should be glad to call your attention to our street railway system, only that you are the guests of that corporation, and that we hardly dare in its presence to tell you what we do think of it, and the railroad service, for fear of its reactive influence on the officers to make them think so much more of themselves than they now do, there would be no living with them. Confidentially, however, to you, it is the best street car system and the best managed of any in the whole country. I note that this convention, like some large railroad trains, is run in sections, and of course this is the first section, or aristocratic section, or the governing section, because it is the money section. Here are the men who handle the money, gather it, count it, direct its credits to the several accounts, and departments, and account for it in gross and detail. Here are the men who handle the sinews of war in railroading.

It is said that no chain is stronger than its weakest link. If this link should give out, then the whole thing would have to go, and it depends on you men, and your associates, that the money earned by the money invested and the labor added, shall be honestly gathered, honestly credited, and honestly accounted, and by others like the second section of this gathering, judiciously expended, then the whole railway family will be happy, the stockholders in dividends, the officers and men down to the humblest employe, in fair and increasing salaries, and all will be well, but failure here bodes disaster elsewhere. I have no statistics on the subject, but in answer to some inquiries, I understand that the record of this department of street railway work is one of which every one of you can be justly proud.

Still, it is well to remember that often it requires more skill and toil, and real hard work, to maintain and defend a record or a reputation than it did to make it. An Arabian legend or tale that I read in my boyhood days, has often come to me helpfully in mature years in the fight for life. Two chiefs and their tribes had long been at war, and one had succeeded in mastering the other to such an extent that the unfortunate chief called of counsel of the very best warriors of his tribe, and the question submitted by the chief was, "Why am I, with as good men, as brave men as the desert knows, always beaten by my enemy chief?" After waiting some time for an answer, an old and scarred veteran arose, and said to the chief: "You, sir, have as brave and as true men as can be found in the desert, but your enemy's men are better mounted than are your soldiers. The mare that that chief rides, her ancestors have ruled the desert for many, many years, and until some means are devised for horses that will rank his horses for speed over the yielding sands of this desert, there is but little hope for you or your tribe." The chief dismissed his soldiers and set himself down to solve the problem. He finally reached the conclusion that by some means, either fair or foul, he would possess himself of his rival's favorite mare that he rode in every raid, and finally decided upon the plan that he would disguise himself as a poor sick pilgrim, and lay himself down by the path where he knew his rival would pass, and on his approach would beg for a drink of water, and on his rival's dismounting to give him the drink, he would try to leap upon the back of the coveted mare; and so he did, as the legend goes.

Lying by the path, disguised as a poor sick pilgrim, the rival chief came riding leisurely along, when his eye caught the form of the pilgrim. Checking his mare, he heard the request, "For the love of God, give me a drink or I die." The chief, dismounting, unstrung his bottle of water, always carried by every traveler in the desert. He gave the poor pilgrim to drink, and partially turned around to drink from the same bottle, and assuage his own thirst. At this opportune moment, the pilgrim with a

sudden spring was on the back of the coveted mare, and riding away with a joy his heart could hardly hold, when the voice of the chief called him, "Stop and listen for a moment." Curbing the mare, he heard his rival and enemy say, "You are welcome to the mare; you have gained her, but remember, how many a poor pilgrim lying by the path, where men do pass, dying from thirst, who might have been relieved but for the story of your treachery, and men will not dare to help them in their distress and they shall die. With the mare carry this memory with you that shall shut out all light in the future." Hesitating, the legend says, the chief replied, "I could take your mare and rejoice over my triumph, but I cannot keep her and burden my soul with the memory of men dying for the want of help that they might have had, but from the fear of others, who knowing of my treachery, refused them help and they died. Here, take your mare, and I will still be as free as the air of the desert."

I know of no trust more sacred than that of handling and having custody of other people's money, and no treachery is more damnable than the betrayal of a trust that destroys the confidence of man in his fellow man. Gentlemen, I believe you have the post of honor in the street railway industries of this country. There is no place in the economy of these industries more important, more vital to their success, than is your place. I note that you are mostly young men, I congratulate you on your work, its dignity, and its importance, and I congratulate the street railway companies of the country that they have in you and your associates at home, so competent and trustworthy a body of men.

In no department of human life and industry is the old simile of the human body more forcefully applicable than to the street railway industries of this country, for to a complete human body there are several parts and organs, each dependent upon the other for a complete whole. The head cannot say to the foot, "I have no need of you," nor the hand say to the eye, "I have no need of you." Each in its place makes a human body complete, and each doing its work perfectly, make existence a joy, but when one part or organ becomes diseased, and gets off the track, or in your parlance "off the trolley," then there is trouble all along the line, and every member suffers, and so it is with the enterprises with which you are connected. When every member and organ, from the president down, are faithfully doing their best, to serve the public, and earn the money they charge and get, sometimes as much for poor service as for good service, it secures cheerful patronage and prompt pay and no grumbling. Plenty of money and no grumbling makes every one peaceful and happy.

Gentlemen, I hope that in Detroit, in this month of October, 1902, you will have the best and the most profitable convention you have ever had, and when you have completed your labors incident to the convention, and turn your eyes toward home, and wife and children, as I at first, and repeat it again, bid you a hearty welcome, so then, I will bid you "God-speed and a safe journey home." Gentlemen, I sincerely wish you success, and prosperity, which I believe you richly deserve.

President Mackay expressed to Mr. Blades and the people of Detroit, as represented by him, the thanks of the Association for the kind words of welcome just conveyed to the meeting, and assured their hosts that, although the office of accountant did not carry with it as a rule the gift of oratory, the feelings of the members are just as sincere and grateful for the hospitality shown, as if they were expressed in words of the choicest eloquence.

The President then read his annual address.

#### ADDRESS OF THE PRESIDENT.

It is with great pleasure I rise to welcome you in this beautiful city, to the sixth annual convention of this Association, and, in this connection, I desire to express my gratification at the confidence you have reposed in me, by the election to the position which makes it both my duty and my pleasure to preside over the deliberations of this representative body. I trust the meeting will prove to be as instructive and interesting to our members as the previous ones have been.

Our Association has established a reputation of which we may feel proud. In its chosen field it has brought order out of chaos by formulating a "Standard Classification of Construction and Operating Accounts" which has met the requirements of the various interests represented from all parts of this great country, and has stood for several years the test of actual practice without the necessity of amendment, demonstrating the careful thought and study which it received.

The Association has adopted a "Standard Unit of Comparison" which has furnished the means of making correct comparisons. This unit, the car-hour, will continue to be appreciated in more and more as its use becomes more general.

The work of our Association has been the means of elevating the standard of the science of street railway accounting until it has become recognized as the corner stone of success. It has brought into more intimate relations the operating and the accounting departments to their mutual advantage.

With the foresight which has characterized the work of this Association generally, it has seen the necessity of securing the co-operation of the National Association of Railway Commissioners, as in a number of states the state boards have authority to prescribe the methods of accounting to be used by electric roads. Without their co-operation, it will be readily seen that, at least in these states, the results would have been to nullify the work of our Association, and, without going into the details, of which you are aware, we secured by that honorable body, the adoption of the classification of construction and operating expenses and forms of report, due credit being given to our Association, and acknowledgment made by it of the value of our work. The states of New York and Connecticut have put this in use, and all electric roads in those states now report to their respective commissioners in accordance therewith.

Your attention has heretofore been directed to the efforts that have been made to secure the enactment of legislation that would place electric railways in the same category as steam roads, and I particularly wish to emphasize the fact that too great importance cannot be attached to the policy of continuing our very cordial relations with the association of railway commissioners. This desirability increases in corresponding ratio with the adoption of our system by each additional state.

Our Association has been officially represented at the last three conventions of the National Association of Railway Commissioners, as explained by my predecessor, Mr. W. F. Ham, in his annual address to this Association. We have been honored by being elected as honorary members of the Association with privilege of debate on matters of accounting, and accorded a representation of three delegates at all subsequent conventions, thus placing our Association on the same footing as the Association of American Railway Accounting Officers.

During the past year, the president of the National Association of Railway Commissioners further honored us by the appointment of our Mr. C. N. Duffy as a member of the committee on "Railroad Statistics," to report at the Charleston Convention, February 11, 12 and 13, 1902. In view of the foregoing, your president appointed as the rest of our accorded representation, Mr. W. F. Ham, of Washington, D. C., and myself.

Our efforts were directed mainly toward securing through individual members the adoption of our classification in states where reports are required, and towards cementing the many friendships heretofore formed, and we are confident that the seed sown will, in the near future, bring forth fruit.

In accordance with a resolution passed at the San Francisco Convention of the National Association of Railway Commissioners, a committee of three was appointed to prepare a standard form of report for electric roads, and to report at the Charleston Convention; this committee to confer with a committee of like number to be appointed by our Association.

A meeting of this joint committee was held in New York, Jan. 10, 1902, where the matter received consideration, but, owing to the sickness of the chairman of the commissioners' committee, and to the limited time before the convention it was decided that a complete statistical report could not be got out which would reflect credit on the committee, and it was decided to so report to the convention, suggesting that the matter go over for another year.

I regret that none of the commissioners' committee was present at the convention, no report being submitted, nor action taken in the matter.

Your president is pleased to report, however, that he has received the assurance from Mr. B. F. Charbourne, the president of that Association, of his hearty co-operation in this matter, and of the re-appointment of the same committee, to confer with a like committee from our Association, in order to present a report at their next convention, to be held in July, 1903, further assuring me that the report would receive careful consideration by that Association. In accordance therewith, Messrs. Wm. F. Ham, Elmer M. White and C. N. Duffy were re-appointed as the committee who will present to this body the reports of their labor. A meeting of this committee was held at Atlantic City, N. J., May 22, 23 and 24, 1902, where the subject was given the same careful scrutiny that always marks the work of the gentlemen of which this committee is composed, and, doubtless, their efforts will be acceptable to both Associations. In this connection, the committee report that they had the assistance of our Mr. Tingley, of Philadelphia, and Mr. Audson, the accountant of the New York State Board, which is very gratifying, inasmuch as it shows the mutual feeling of interest in this work.

In the preparation of the program for this convention, your president has endeavored to secure subjects of general interest, believing that the interest in our meeting and the benefits derived from same will be proportionately greater than by the discussion of subjects wherein only a limited number of our members are interested. Special matters can be considered after we have satisfactorily solved the general problems.

In view of the financial difficulties, receiverships, etc., that have befallen some of the street railway interests during the past few years, (which, in my judgment, have occurred by reason of erroneous methods of accounting) it was my first intention to have a paper prepared and presented to this convention on "Correct Accounting Methods for Electric Railways," being a treatise on the broad, underlying principles of Accounting, including Depreciation, Injuries and Damages, Sinking Fund, etc., with the object of instilling into the minds of those who have the guidance or direction of street railway affairs the vital necessity of making adequate provision for depreciation.

To secure an expression of opinion on this subject, a circular letter was mailed to about one hundred of the different street railways of this country, asking whether the subject would be of interest to them. The replies were practically unanimous in favor of it, but one of the replies received stated that, while of great interest, it was, in their opinion, going beyond the jurisdiction of our Association to discuss matters of policy, and, as we are but the representatives of the members (the companies being the members), and some of us not even being officers of the companies we represent, it might be presumptuous to vote on such questions. Nevertheless, as accountants, we are expected to furnish true accounts and true methods of accounting, which should recognize all the provisions mentioned. In deference to this minority, we have refrained from bringing it before the convention for discussion, but I cannot permit the opportunity to pass without expressing my personal views upon this subject, and without in the slightest deprecating the work of our Association, will say that we have devoted a great deal of time to matters pertaining to true accounting, with scarcely a moment's dissension of one of the very foundation stones of this whole structure.

As an illustration of the manner by which roads have been re-capitalized over and over again, by reason of the failure to apply correct accounting methods, it is but necessary to refer to the article read before the last convention by Colonel T. S. Williams, vice-president of the Brooklyn Rapid Transit Co., whereby the methods of the Third Avenue Railroad Co. were explained.

Before true costs and profits can be shown, there must be created out of operating, or, as a deduction from income, a sum sufficient to equalize all depreciation which has occurred during that period.

Only recently, your president was informed by the general manager of a large system that with them there was no such thing as depreciation; that as far as physical property was concerned it was repaired or renewed as worn out, and expense of same charged to operation.

The fallacy of this line of argument is to my mind so apparent that I need only say that, if the same policy were continued to the expiration of the franchise, and the company obliged to cease operations, there would be a depreciation ranging from practically nothing on the portions that had just been renewed, to almost total value on the portions which were to be renewed within the near future had the company continued to operate.

Not only this, but the method of charging heavy reconstruction charges into operation is destructive of all comparisons. This provision for depreciation must not be considered as covering ordinary maintenance or repairs which must be charged to operating expenses, but applies when the property can no longer with economy be repaired, and must be renewed or replaced. As an illustration, we will assume the life of a track to be fifteen years. A company constructs five miles the first year and a corresponding mileage each succeeding year for the next fourteen years. Now, at the beginning of the sixteenth year, with a total track mileage of 75 miles, it becomes necessary to replace the five miles built the first year in order to retain the original track. This expense, amounting to one-fifteenth of the total track construction, has no place in a property account, as it is simply a renewal of what has been already charged to the property, but must be included in operation unless provision has been made for a Depreciation Reserve, as before mentioned. Bear in mind that, by charging against income monthly a sum sufficient to cover this depreciation, you are distributing this expense over the period during which the depreciation is going on. It is necessary that provision be made, not only for such depreciation, but reserve funds must be created to preserve the capital intact from loss, which may at any moment be sustained through serious accidents, etc. There are unsettled suits and claims for damages always hanging over every company which has been in operation for any length of time, and this contingent liability should appear on the books and be anticipated by proper charges against operation, thus creating an Injuries and Damages Reserve Fund, and a like provision should be made to cover uninsured fire losses.

Sinking Funds should be created to retire outstanding bonds at maturity, and to guarantee the return of original investment to the stockholders, this being particularly applicable to all systems operating under limited franchises.

These funds should not be mere book-keeping accounts, but should consist of interest-bearing securities held in trust for the particular purpose, and not assignable to any other use.

To my mind, one of the strongest arguments that can be used to refute the statements of agitators for municipal ownership is public accounting and statements of true costs and profits, which would have the effect of strengthening our securities.

Individually, if not as an association, we can and should use our influence in this direction, and I consider we would not be performing our duty, were we, realizing the danger, to permit without protest the continuation of erroneous methods simply on the theory that it involved a question of policy and that the directors were responsible for that. The directors, without doubt, feel that the head of the accounting department will give them the benefit of his experience and show them the ultimate results of any line of policy affected by accounting methods.

True, in case an organization is being conducted with the desire on the part of the directors of making a flattering showing in order to unload their securities at a handsome profit, the accounting officer offering such a suggestion would have only labor for his pains, but I am optimistic enough to believe that these are exceptions; that the great majority are laboring to secure fair returns upon a permanent investment, and are desirous of having only correct accounting methods used.

We are reminded of the many courtesies received by us at the hands of the American Street Railway Association, and I am pleased to acknowledge our appreciation of the same. We are likewise indebted to the "Street Railway Review" and the "Street Railway Journal" for the interest they have always taken in our welfare, and gladly give them credit for a great deal of the success which has crowned our efforts.

We have the same able committee on "Standard Blanks and Accounting for Material and Supplies," which is prepared to submit a report of its deliberations, which we trust will bring out a full and complete discussion, and harmonize the many con-

difficult ideas relative to this very important branch of our work.

I desire to thank the gentlemen who have so readily responded to my request to prepare and present to this body the various papers and matters for their information, and the members of the various committees who have given their time and study, and to our worthy and efficient secretary, to whom we are indebted for the printed copies of these articles having been placed at our disposal in time for careful study before this convention. I trust this policy will hereafter be readily followed, as it permits of much more complete discussion. The necessity of having copy in hands of the secretary not later than August 15th is respectfully urged upon members contributing papers or reports, in order that the minimum expense and labor be incurred. In accordance with the authority granted by the last executive committee, your president has approved for payment vouchers covering the traveling expenses of members of committees, there being no reason why expenses incurred wholly on account and for the Association's benefit should be borne by the individuals, in view of the financial condition of our Association.

Your attention is respectfully called to the desirability of hereafter incorporating in the annual report of our convention the "Classification of Accounts and Forms of Annual and Monthly Reports." This can be added to and kept up with very little labor and expense, forms for same being locked up and set aside by the printer for the use of each succeeding report. The advantage of this being that, by referring to the last report, it will be possible to get the complete and corrected classifications, etc., without the necessity of reading through the various reports to ascertain what action was taken upon any given subject. Any amendments or changes would thus be readily seen by a comparison with the previous report. The necessity of a standard classification of construction and operating accounts covering the lighting business is becoming apparent, by reason of the increasing number of electric railway companies that are absorbing lighting systems. The accounts covering the operation and maintenance of a railway power plant apply with equal force to a lighting plant, and with slight modifications, the General Expense accounts are likewise applicable, thus leaving only the cost of distribution to be provided for. These few accounts could be added to our present classification.

The lack of a "Standard Classification of Lighting Accounts" was very forcibly brought to mind by the receipt of a letter from Mr. T. C. Martin, expert special agent of the Electrical Division for the 12th United States Census, in which he stated that blanks of inquiry were being prepared for statistical information covering the street railway industry of the United States, and that these blanks were to follow very closely the classification of accounts as prescribed by our Association, as far as the railway features are concerned, but, inasmuch as the statistics of the lighting industry were likewise being compiled, it was necessary to have similar detailed statements of earnings, expenses, etc., for that department. It is to be regretted that we were not prepared to submit a classification for their guidance, the importance of which is very manifest.

During the past year the secretary has had printed and distributed to all members the verbatim report of the organization meeting, thus completing the history of this association from its inception to the present meeting. I think we will all appreciate the value of this work, which has been got out with the usual good taste displayed by Mr. Brockway.

It is gratifying to be able to report that our finances are in very good shape, and while we continue to lose some of our old members through consolidations, the interest in the Association's welfare has brought in new members, more than enough to offset its losses. Persistent and aggressive solicitation by individual members, as well as by the Association officials, is necessary to maintain our average increase in membership. Our secretary has sent circulars, and otherwise made especial efforts to reach the street railways of this country who are not on our membership list, and particularly those who are members of the American Street Railway Association.

We trust the reputation we have established of promptly and systematically threshing out the wheat from the chaff, throwing out the obsolete methods and agreeing upon those which will increase the efficiency of our departments, and, at the same time

the usefulness of this Association, will be maintained. Let me remind you that we each and all owe to the Association and to the companies we represent prompt and faithful attendance at all meetings.

Then followed the

REPORT OF EXECUTIVE COMMITTEE.

The report commented on the gain in membership and recommended that members in arrears for dues for two years be dropped, and that the Association Reports be withheld from other delinquent companies.

The committee stated that it had had approved the publication of a monthly bulletin to contain such current items of interest that will keep the membership in touch with the Association, and that the books of the treasurer had been audited and found correct.

Secretary Brockway then read his report.

REPORT OF THE SECRETARY AND TREASURER.

I beg to present the following as the report of this office for the year just ended:

Unpaid dues amounting to \$300 are now outstanding.

In addition to the usual routine work of the year, there has been published and furnished to the members the verbatim report of the meeting held in Cleveland, O., March 23-24, 1897, at which this association was organized. As explained in its preface, this was published to supply the demand caused by its not having been printed in a form to correspond with the regular annual report.

During the months of August and September, the work of the office has been carried on under great disadvantages, caused by the removal of the secretary from New Orleans to New York.

On motion the report was accepted.

The first paper on the program was then read:

**COLLECTION AND REGISTRATION OF FARES ON CITY AND SUBURBAN LINES.**

By William C. Sampson, Treasurer of the Union Traction Company, of Indiana.

Our company has been in search of a satisfactory system for the collection and registration of fares upon interurban cars from the time we began to operate lines requiring a variety of denomination of cash fares. We have passed through a series of experiments, trying aside various methods as a new one presented itself which seemed better than the old plan then in use.

The first plan in vogue was to collect by sections requiring each passenger to pay a 5-cent fare for each section traveled over, each fare being rung up separately. This plan was used upon the line running from Anderson to Marion, a distance of 34 miles, and the fare being 25 cents required each through passenger to pay his fare seven times; and had the same plan been used upon the Muncie-Indianapolis line each through passenger would have had to pay 13 times. This plan proved impracticable for our system and was soon discarded.

The next system put into practice was the torn ticket, one portion going to the passenger and the other to the auditor. The form of ticket used was one with all stations printed across the top of the ticket and also down the left-hand margin, and the tearing was regulated by a metal square which would leave the amount paid by the passenger upon each portion of the ticket in the angle of the square. This system was operated without registration. The tickets were consecutively numbered and conductors were required to account for all tickets charged against them. The principal difficulty with this system was the inaccuracy of the conductors in tearing the tickets, and in a great many cases it was impossible to determine the correct amount to credit the conductor. This system was also very slow of audit and was soon discarded.

The next system used was the collection of the fare from each passenger through to his destination and registering it upon a portable register, ringing once for each nickel collected. This system was in use until March 1st of this year, at which time we adopted the Oliver car register, which registers six classes of fares. While this register does not entirely fill the bill, it has come nearer giving the desired result than any other system we have tried. As above stated, this register takes care of six classes of fares, four of which we use for 5, 10, 15 and 20 cents, respectively; the fifth, together with the use of a duplex

NOTE - Comparisons are made with corresponding DAY OF WEEK in previous year, except in case of LAST DAY OF MONTH which is compared with first day of same month in previous year, in order to obtain a monthly comparison. HOLIDAYS are compared with corresponding HOLIDAY in previous year.

EXHIBIT K (ORIGINAL 8 1/4 x 10 1/2 IN)

When the reports are all completed and checked, this clerk makes a report to the passenger department on blank marked Exhibit II of the differences in conductors' reports.

The reports are then turned over to another clerk, who makes up the permanent record in a book (a sample sheet of which is marked Exhibit I) and renders a report to the general manager

EXHIBIT M. (ORIGINAL 5 1/4 x 3 in)

Interurban cars, they are registered as a 5-cent fare. When the total receipts from Interurban lines are obtained the amount is transferred to blank G, and added to the receipts from city lines which gives the amount to be deposited in bank for the day's business from that office. This deposit is made by the local cashier and a duplicate deposit ticket signed by an officer of the bank forwarded with the reports to the auditor's office.

As before stated, the register statements are forwarded by the inspectors direct to the auditor's office, and while the cashiers are counting the money and making up as much of the daily

on blank marked Exhibit J and to the directors on blank marked Exhibit K. The daily earnings from each line are kept tabulated in books prepared for that purpose, so that at the end of the month such portions of the totals as go to make up the monthly report are ready for use.

In addition to the records mentioned, an account is kept with each train blank marked Exhibit L. This is made up from

the register statements and the reports of Duplex and pass tickets as given on blank 13, which record also contains the number of passengers carried on interurban lines.

The system explained up to this point has been treated as if pertains to interurban lines with only occasional reference to city lines.

The city cars of this company have also been equipped with the Ohmer register and arranged for the registrations of six classes of fares, to wit: 5-cent, 6 for 25 cents tickets, half-fare ticket, passes, employes and transfers. As in the case with interurban cars, an impression of the register is taken by the inspector before turning the car over to the conductor, who also takes his impression when he takes the car. The register then compiles without an additional impression being taken until the conductor in charge is relieved, at which time he takes an impression, and the conductor relieving him also takes an impression using a different number, and so on until the car is turned in to the barn, when the final impression is taken by the inspector in charge and the entire sheet with all impressions for the day's work of that car is removed by the inspector and forwarded to the auditor's office.

The conductors on city lines make up their reports once each day immediately upon finishing their day's work and deposit same in a safe at the company's office. The report required to be filed out is printed on the back of the envelope in which they deposit their collections, a sample of which is marked Exhibit 10. This is the only report required from them, the register does the rest.

The method of handling the receipts and reports from city lines by the cashier and auditor is practically the same as that of handling the interurban business, and I think will be made entirely clear by an examination of the blanks used for that purpose.

I have omitted up to this time any reference to the collection and reporting for such package and baggage business as is handled on our passenger cars. This branch of the business is taken care of by the conductor in charge of the car, except at such prominent points at which the company has an agent.

We use for this business a triplicate check printed upon an ordinary shipping tag (a sample of which is shown in Exhibit M), one portion being attached to the trunk or parcel, the duplicate given to the passenger, and the triplicate turned in to the cashier with the money. There is no registration made for these checks as we do not wish to confuse them with our passenger business.

These checks are issued by the passenger department and charged to the local superintendent at each station by consecutive numbers, who again charges them to the various conductors by consecutive number, and the auditing department checks up the use of the checks—all three portions being returned through various channels.

In concluding, I wish to say that the systems used by our company have been developed to meet the necessities of our local conditions, and the results obtained are reasonably satisfactory.

An interesting discussion followed on the merits of different fare registering and accounting systems and Mr. Pease, of the International Railway Co., Buffalo, explained the system of tickets in use by that company, which comprised upward of 200 forms. They gave a transfer at both ends, and found that it worked very nicely where the transfer was given as the passenger left the car; but they issued return tickets, and when the passenger came back, if the company did not have the coupon of the local fare the passenger was compelled to pay another 5-cent fare to get him back to his starting point; and if the company had a coupon for each one of the tickets, the passengers that did not need the transfer might use it for a city fare and thereby beat the company out of a local fare sometimes.

In answer to a number of inquiries as to details, Mr. Pease explained the additional complications in the problem as presented by their system, and several suggestions were advanced by the members by way of meeting the situation, but without anything definite being brought out as a thorough remedy.

The President asked for information as to the keeping of a record of through and short line riding on interurban lines, so as to determine the amount of riding from any one station to any

other station. Mr. Sampson and Mr. Pease replied to the question from the bearing of their respective practice in that regard, and the President stated that his company had had in operation for some time an interurban system from which they obtained all this information, and he gave the details of its use.

Another point brought out for discussion by the President was as to the time noted on the trip sheet, whether it should be the time of arrival or the time of departure, and whether the card time or the actual time. A call for a show of hands disclosed the fact that 16 members used the actual time, while 6 used the card time.

The preservation of trip sheets as evidence in suits brought for damages was discussed somewhat fully, and the methods employed for filing these sheets, in a way to overcome the inconvenience resulting from their rapid accumulation.

The President called upon Mr. C. N. Duffy, of Chicago, for information regarding their practice of printing their own transfers.

Mr. Duffy replied that they had found this method much more economical than buying them from the printer. They had been following the method of printing their own transfers for some 18 months. They had a printing office of their own, with seven people employed in it; and outside of ruled account books, lithograph work or very fine ruled work, they did nearly all their own printing. They had a press which cost something like \$4,500, with a capacity of 50,000 transfers an hour. They simply put in a roll of paper at one end of the press, and the tickets came out, cut, at the other end. They were then turned over to the man who ran the stitching machine and stitched with wire, in hundred blocks all consecutively numbered and numerically arranged. They printed about ten million transfers a month.

The President appointed the following committees:

Nominating Committee—Messrs. P. E. Smith, of Chicago, chairman; C. L. S. Tingley, of Philadelphia, and C. S. Mitchell, of Pittsburg.

Committee on Resolutions—H. L. Wilson, of Boston, chairman; J. B. Hogarth, of Denver, and A. L. Lynn, of Utica, N. Y.

On motion, the order of business for the afternoon session was modified by placing the paper on "The Stationery Store Room" first and the Annual Report of Committee on Standard Material and Supply Accounting second, for greater convenience in the consideration of the committee report.

Adjourned until 2 p. m.

#### AFTERNOON SESSION.

President Mackay called the meeting to order at 2:50 p. m., and the first business taken up was the reading of the paper:

#### THE STATIONERY STOREROOM.

By J. R. Shurtz, Auditor South Jersey Gas, Electric & Traction Co., Camden, N. J.

In presenting a paper on "The Stationery Storeroom" I shall first endeavor to give you an idea as to the origin of our stationery supplies, which grew to such proportions that it became absolutely necessary to establish a suitable stationery storeroom. Three years ago, our company consisted of two departments,—a gas works and an electric light plant, operating in one city; since that time, we have taken in and now operate, under one company, nine gas works, eight electric light plants, and a railway with 21 miles. In carrying out the consolidation of these various properties, I found that each had been run in a very conservative way, receiving, smilingly, whatever business came, without any effort, and with particularly no care on their part, a total absence of any system of accounting from which monthly reports or details could be gathered; where our policy is to get all that comes our way, reach out for more, and make a big effort to get it. Such little stationery as they had was extremely varied, and was used in many different ways, frequently, the most handy. On this account it became necessary to look for a great deal of information from such clerks, as we had received from the generosity of the previous owners, as well as to make a personal study of a great number of various blanks and forms, which I had gathered from a few of my progressive friends, who had "been there before"; these, together with such original forms as

our experience had prompted us to use—adding here and there a new idea—served as a basis of operation. In the preparation of these blanks, my time was of necessity limited; it generally happened that I would receive notice of a plant having been purchased one day, and that we were to take it over and operate it the next. Then my troubles would begin, endeavoring to convince the newly acquired old clerks that they could do their work differently, and that there were new methods in operating corporations as well as other things.

"Things" I have run up against in the operation of our various departments are numberless, as well as varied,—harvesting lea, selling electric fans, connecting gas stoves—with which to roast the cook, and, at the same time, keep peace in the household,—endeavoring to see the man, who had fallen off a car before he found his doctor dawyer to tell him how badly he is hurt,—issuing an attachment on the menagerie of the last circus for current consumed in their endeavor to leave the city before banking hours,—testing typewriters who "Don't have to work, but will if they like us."

J. R. SHURTZ.

You can readily see that to carry out the detail of such a business, and for the recording of it, we have to have a thousand and one different blanks. But as the fad is "to combine"—and we work on the community of interest plan—I have eliminated a great number of forms, and substituted others giving as much detail, and at the same time covering as many departments as practicable.

We have established a standard size for a great number of blanks, which is a great advantage in filing. It quite often happened that we would have a number of forms, measuring about the same size,—as for instance—blanks between 8 and 9, and 11 and 12 in. These forms can be readily changed, as follows:—first, by ascertaining the size sheets that would cut to the best advantage from paper stock, finding it very easy to cut off a quarter or half-inch, i. e., if needs be, add this amount. I also found it an advantage to use as many different light colors in paper, as possible; when one order called for the performance of one kind of work, I used a paper with as great a distinction in color for the order blank, reversing the work.

I have also found it a great advantage in paying particular attention to having duplicated orders of stationery, cut the exact size of the previous lot, as a tendency of all printers is to add something, or make the forms a little different in size or printing. On account of our business being extended over some 50 square miles of territory, containing some 25 different cities and towns, you can imagine the quantity of printer's ink we have thrown at us from all quarters of that territory; but, in order to collect accounts, in some instances,—and in other cases to stand well in the editor's eyes,—we have not been able to concentrate our purchases, and obtain—at all times—good work for the best prices, it being necessary for these reasons—and others well understood—to distribute our work a great deal. This in time can, and should be, corrected, the business going strictly to the lowest reputable bidder.

Our storeroom is fitted with shelves 18 in. deep around the entire walls of the room, and about 14 in. apart; this allows us to store most of the blanks in a very nice fashion. It is very satisfactory to have the blanks tied up by the printers in as small

packages as practicable, and so delivered; this relieves us of the annoyance of opening packages in the storeroom unnecessarily, as the blanks sell very readily, even with the best of care. In addition to the shelving, we had to provide a cabinet of 100 drawers, running from 1 in. to 8 in. in depth, to take care of small blanks, pencils, pens, erasers, etc., and have found it a most convenient contrivance.

Once the orders are issued for the stock of the stationery storeroom, and the goods delivered and placed upon the shelves and in the drawers, as described, the issuing of it is readily controlled. In the distribution of stationery to the various departments, we make the allotments cover a certain period, guided by the wants of each, so that they will run out, at about the same time; it is not well to issue large quantities, as it serves to make the clerks wasteful and careless.

In charging up the expense of books, blanks, etc., we charge all stationery, first, to the Storeroom Account, under which we have separate columns for each department, charging to Management the general books, reports covering all departments, and the blanks in connection with the work of the railway, to its Expense Accounts; to the Gas Department, the ledgers which extend over a period of twelve months, and all blanks pertaining to that line of our business, and so on through all Departments.

We are using a number of loose leaf filing cases, similar to a ledger,—a style manufactured by a firm in Holyoke, Mass.—and find it very convenient to use the same style in a number of departments, and in as many different ways, one in particular being a file 9x9 in., which permits using the same kind of paper for duplicate and triplicate orders, together with copies of correspondence, and numerous other items.

Mr. Shurtz's paper was discussed by the President and Messrs. Duffy, Burlington, Hogarth, Smith and Mitchell, in a comparison of the methods used by them with those referred to in the paper, and the elicitation of additional details from the author of the paper, who stated that his forms all passed through one person's hands, he (the speaker) looking after that personally; they started in with a lot number for each form, and that was continued on. There was no classification of numbers. As each new blank came along it took the next number. When the form of a number became obsolete, they took that number up with the next blank. The object of carrying the ledger account under separate headings, as stated in the paper, was in order to determine the quantity of stock that applied to a department. There was a special account; it was all charged to stationery store room, and then there were divisions in that; probably \$2,000 charged up to stationery store room in the general ledger, and the man that had charge of the store room had that subdivided and could tell approximately the situation.

Mr. F. E. Smith, of Chicago, for the Committee on Standard Material and Supply Accounting, then read the annual report of that committee.

#### REPORT OF THE COMMITTEE ON STANDARD BLANKS AND ACCOUNTING FOR MATERIAL AND SUPPLIES.

F. E. Smith, Auditor Chicago Union Traction Co.; C. L. S. Tingley, Secretary American Railways Co., Philadelphia;  
Frank R. Henry, Auditor St. Louis Traction Co., Committee.

At the New York meeting of this Association, held October 9th to 11th, 1901, it was voted that the committee which had presented a report on the above subject be continued until this meeting, when they should again report and together with their report present the forms intended for use.

The committee commenced its labor by having sent to each of the members a circular asking an expression of opinion on the several divisions of last year's report, with the idea of letting the members say what they wanted and preparing a report which should be acceptable to the majority. Four members were kind enough to favor us with their ideas, and we, in preparing this report, have tried to comply with their wishes, that the system should be less complex than the one presented last year. From

the discussion at the New York convention, and from what we have learned since, we are of the opinion that most of the larger roads have in operation systems with which they are perfectly satisfied, and that they would not adopt any other system even though it should have the approval of our Association, but that some of the smaller roads are not so well provided. In preparing this report, therefore, we have tried to obtain a good accounting with the minimum of labor. With this end in view we recommend that practically all the clerical work, so far as pricing and charging out are concerned, be done in the accounting department, letting the storekeeper deal with quantities in and out only.

We will divide the report under the same general heads as last year, viz.:

- A. PURCHASE.
- B. RECEIPT.
- C. DISBURSEMENT.
- D. ACCOUNTING.

which we will sub-divide as follows:

A.  
PURCHASE.

(1) Requisition for Purchase.

The first requirement is a proper requisition for the purchase of material and supplies for stock or for immediate use. It should be made in duplicate, the original for the purchasing department, the duplicate to be retained by the department making the requisition. It should state for what purpose the material is needed, that is, whether for stock or for some specific work. If for stock, should state the quantity on hand as well as quan-

retaining Form 6 in his own department. If the order is on the company's shop, the original should also be sent to the accountant who should enter the number assigned same on it, to enable the shop department to make its charges against this number. All labor and material used by the shop in filling these orders should be charged to some designated account and a report made of same on Form 7, when work is completed, to the accountant, who should extend prices of material and make a total of the cost and advise the purchasing agent, at the same time crediting the account which had been charged temporarily with the labor and debiting Stores Account or the proper expense account if made for immediate use. The purchasing agent should advise the accountant of all payments to be made by the company that should be deducted from the face of the bill as well as those payments which add to the cost.

(3) Record of Bills Approved by Purchasing Department. (Form 8.)

This department should be required to keep a record of all bills approved by it. It should be in such form that a total of all bills approved will be shown, and can be made in sheets so that one can be sent to the accountant and a copy kept, or in book form, which can be sent to the accountant as soon as the entries for the month are closed. The accounting department should check the charges to material and supplies on the voucher record by this record.

B.  
RECEIPT.

(1) Recording and Reporting.

Upon receipt of a consignment of material at stores, the receiv-

ty needed and a description of the material required. The original should be sent direct to the general manager or some other official with equal authority, who should make such corrections as to quantity to be ordered, as he desires, and after approval, send to the purchasing agent. (Form 1.)

(2) Order from Purchasing Department, and Assignment of Lot Numbers by Accounting Department. (See Form 2.)

This should be made in triplicate, but the original only is reproduced. The duplicate instead of having the receipt attached should have a column at the side in which the accountant can enter the lot numbers. The original for the party or company's shop from whom goods are ordered, the duplicate for party to whom goods are to be consigned, and the triplicate to be retained in the purchasing department. These orders should be consecutively numbered, should bear the requisition number and contain full shipping directions. The original should also show the conditions of purchase, which can be made to fit the specific requirements of each company and should be signed in the name of the company by a properly authorized person. When the purchasing agent has drawn the order he should send the duplicate to the accountant, who will enter same on his Lot Number Record (Form 3) enter the proper numbers in spaces provided for same on the duplicate, fill out as far as Number and Description of Material are concerned, the cards (Forms 4 and 5) and the sheet (Form 6). He should then forward the duplicate and Forms 4 and 5 to the department for whom goods were ordered,

ing clerk should check same by the duplicate order (Form 2). When goods are received at a branch storeroom where it is not convenient to have these on file, the person in charge should be provided with suitable blanks on which to enter the materials received and report to the storekeeper. Consignors should, so far as possible, be required to make a bill for each order and send same to the purchasing department as soon as filled. If, however, a part of the order remains unfilled at the end of the month, a bill should be sent for such material as they have delivered, in order that the accountant may have the necessary data to complete his record. The storekeeper should make a report each day to the accountant on Form 9, sending the original and retaining the duplicate as his record of material received. Upon receipt of the bills by the purchasing department they should be checked by the order and certified as to the correctness of prices and terms. They should then be entered on his record (Form 8), giving them the first open bill number, which number should then be placed on the bills to thereafter identify them. They should then be sent to the accountant who will check them by the storekeeper's daily report of material received and note on bills that goods have been received. He should then fill in the balance of data on Form 6 and, if correct in all particulars, put the bill in line for voucher. A rubber stamp containing information as shown on Form 10, may be applied in the purchasing department to facilitate matters. By the adoption of the above plan all confidential prices are confined to departments of the pur-

chasing agent and accountant. This plan, too, does away with the delay incident to the sending of bills to various departments for their approval. It will perhaps be held by some that general managers will object to approval of vouchers for these bills if they do not find thereon a prior approval by the head of the department ordering the same, but the stamp notation on the bill showing that the goods have been received, giving reference to the advice of same, we think will obviate this difficulty.

(2) Stock Ledger.

We believe that the use of Forms 5 and 6 will entirely obviate the necessity of keeping a regular stock ledger. It is intended that these cards shall be indexed after the following plan:

Lamps, Incandescent, Lot Numbers 26 and 364. This would indicate that two consignments of Incandescent Lamps had been received and designated by Lot Numbers 26 and 364. A reference to the cards or sheets arranged numerically, would show the quantity still remaining on these numbers. As soon as all of Lot Number 26 were used up, this number could be checked which would indicate that the only incandescent lamps on hand were those under lot number 364. A reference to the card at any date would show the storekeeper, by referring to his Form 5, and the accounting department by referring to Form 6, the quantity on hand.

(3) Handling of Second-hand Material and Scrap.

The plan outlined in our report of last year seemed to meet the approval of the members at New York and is therefore repeated in this report as follows:

If this class of material is entered on the stock books at a value when it is stored for future use or sale, it then comes under the care of the storekeeper and more importance will attach to it than if it were simply dealt with when sold. Another advantage to be gained by this plan is that the expense or other accounts to be credited with scrap, will receive the credit at the same time they receive a charge for the material which replaces the scrap. Any discrepancy which may occur between the price obtained for the scrap and the value placed upon it, would have to be adjusted proportionately between the accounts credited. When obsolete material is scrapped, stock material account should be credited with the scrap value and the difference charged to proper expense account or to a depreciation account, if one has been provided, or to profit and loss direct. See paragraph B, under "Manifesting," for forms to be used.

C.

DISBURSEMENT.

(1) Distribution and Charge of Material.

(a) Regular Requisition.

Regular requisition should cover the needs of a department for a specified period, being made but once a month if practicable. They should be drawn in duplicate, the original to be submitted to the general manager or some other official of equal authority, for approval before being filed, and the duplicate to be retained by the person drawing the requisition. They should be numbered consecutively. (See Forms 11, A and B.)

(b) Emergency Requisition.

The emergency requisition is designed to provide for material for emergency use, which could not be anticipated or covered by the regular requisition, and should be honored by the storekeeper without the same approval as surrounds the regular requisition, with the understanding, however, that a regular requisition will be drawn later, covering such emergency requisition honored. They should be drawn in duplicate, the original to go to the storekeeper, and the duplicate to be retained by the person drawing the requisition. They should be numbered consecutively.

(c) Request for Material and Supplies.

This form provides for the drawing of material by employes of the shop, track, electrical or other departments, after the request has been signed by the foreman in charge of the employe, and the goods should be delivered to the employe upon presentation of the request. The request is honored by the storekeeper with the understanding that the head of the department making same will sign a manifest for the material so delivered, or requisition the request later, if so desired by the storekeeper. This form is put up in blocks, is drawn only in original, not numbered, and operates as a sight draft on the storekeeper.

(Note: No blanks are provided for the emergency requisition

(2) Manifesting.

(a) A regular manifest (form 12) should accompany each shipment of stock from the storerooms. This should be in triplicate, the original and duplicate going with goods, the original to be receipted and returned to storekeeper, the duplicate to be retained by person receiving the goods, and the triplicate to remain in storekeeper's book. It has been suggested that the labor and expense of manifesting can be avoided by having the requisition (Form 11) made with a receipt attached and sending same back with the goods. When receipted they would be returned to the storekeeper who would in turn send them to the accountant. This plan would obviate checking the manifests, all entries being made from the original requisition which has been duly approved. Consideration of both plans by the members is desired.

(b) A blank to be used for one or all of the following purposes (Form 13):

The transfer material from one storeroom or department to another.

Second-hand material transferred to storehouse.

Scrap material transferred to storehouse.

Material transferred from storage yards to the place where it is to be used.

This form should be in triplicate. The original to go with the goods and be receipted and returned to the sender, the duplicate to be sent to accountant, to be given a lot number and entered on his record and then sent to the department (if a storeroom) to which same were sent, with the necessary cards.

(c) A blank that may be called "suspense." Being a manifest designed to cover the issuance of material which cannot be intelligently charged out when issued, for instance, the delivery by the storeroom of material for line repairs which is to be used on emergency or tower wagons. This should be made out by the heads of departments and consecutively numbered and be in duplicate, the original to be retained by person responsible for the material issued upon it, until every article is accounted for on a place provided on the blank, and the duplicate to be retained by the person sending out the material. All material which has been issued upon this manifest which is unused on the last day of the month, must be returned to the storekeeper for inspection; the storekeeper will receipt for it and re-manifest it. The person to whom the material is issued shall report upon this blank the use to which the material was put, giving all particulars regarding same. No sample form has been provided, but may be seen among forms on file.

REPORTING.

No reports, other than the daily reports of material received and sent out or the receipted requisition for same, will be required from the storekeepers. They should be required, however, to send in the receipted manifests covering all shipments sent out to enable the accountant to check their work.

ACCOUNTING.

Suitable blanks or books will be required on which to enter the daily reports received from the storekeepers and distribute same among the various expense accounts, but as these forms must of necessity be of large size and would vary considerably to cover the special accounts each road has, the committee has not felt warranted in going to the expense of getting them out and having them reproduced.

In transmitting this report the committee desires to thank those members who have aided them by their suggestions, and also the Library Bureau, who kindly offered their assistance in getting out such of the forms as their system would apply to and did prepare Form 5, for us.

We trust the members will come to the Detroit Convention prepared to thoroughly discuss this report so that some conclusion may be reached at this meeting.

The President called for an expression of opinion, and in reply Mr. Longyear stated that their system of store room accounting was not the lot number system; they used the bin number and card system combined, and the same form of requisition made out by the head of the department or by the general storekeeper, which was required to show the quantity on hand, quantity required, and the quantity consumed during the month. That

requisition, if made out by a department, went to the general storekeeper, and he noted thereon the quantity of material that he had on hand which he could apply toward that requisition, and in the use of a new form just adopted, the general storekeeper sends the original requisition, so endorsed by him, to the purchasing agent. All material except for specific work went direct to the storeroom, whence it was drawn on monthly requisitions by the heads of departments and the latter were not allowed to overdraw their monthly requisitions. If they needed additional material they made out special or emergency requisitions. If they did not draw out as much as requisitioned for a month, the balance left went back into the stock and was considered as new stock. In regard to the requisition their system did not differ from the plan reported by the committee.

Mr. Mitchell also described the methods used by his company in this respect, which included the requiring of duplicate bills for all goods purchased.

Mr. Wilson objected to requiring duplicate bills, and thought the same result could be accomplished very easily by requiring the persons of whom goods were purchased to send a statement of all the charges they had each month, and then as the bills came in they could be checked up.

After some further discussion as to practice in this regard, Secretary Brockway read Section A, Purchase, Clause 1, Requisition for Purchase, from the report of the committee, and suggested an amendment in the phraseology thereof by changing the word "equal" to "proper" so as to read: "The original should be sent direct to the general manager or some other official with proper authority," etc.

Mr. Burlington, after some further discussion of the question, moved that it be changed to read as follows: "The original should be sent direct to the properly authorized official, who should make such corrections," etc., which was adopted.

Secretary Brockway then read Clause 2 of the report under the same section, "Order from purchasing department, and assignment of lot numbers by accounting department."

The President referred to the fact that the duplicate, according to the report, was to be sent first to the accounting department and then to the party to whom the goods were to be consigned, and yet the triplicate which was to remain in the purchasing agent's department must have the terms and instructions, etc., and as he (the President) understood it, the purpose of the committee was to eliminate that from anyone except the accounting department and the purchasing department; and, having the duplicate go to the party to whom the goods were to be consigned, he wished to inquire how it would be arranged to eliminate the prices and terms.

Mr. Smith replied that they had Form 2, and they were made so that the one part that went to the firm was a little smaller than the other two, and the other two had a stub which was perforated, to be filed. They were made out on typewriter, and if it was desired that the storekeeper know nothing about the prices, it would have to be arranged to use a short carbon, so that on the copy that went to him that would not print; have a long carbon between the duplicate and the triplicate.

Mr. Smith added that in discussing the report with some persons since it was written, it was suggested that the Form 6 which the committee recommended be kept in the accounting department was entirely unnecessary; it was a duplicate of the one kept in the store room, and he (the speaker) was rather inclined to think that it was not necessary. By having the lot number record made a little larger so as to include the data now assigned to Form 6, the latter could be dispensed with.

Asked by the president what he would do in case of a fire that destroyed the records of the storeroom, Mr. Smith replied, "Well, we would be up again it." Of course the committee recommended the first plan, but he suggested the modification as more economical if any one preferred it.

At the suggestion of Mr. Schurtz the president asked how many of the members secured reports from their storekeeper without his knowledge as to what should be returned, and three members indicated that they so received reports.

Mr. Duffy moved that Section 2 be adopted as read, unless there was objection.

Mr. Smith: The merit of the whole thing is right in there.

That is the lot number that you kiked about last year.

The President: Mr. Ham, can't you give us some pointers on this?

Mr. Ham asked the chairman (Mr. Smith) whether in his opinion this system was one which he would recommend for all storerooms, large and small, to which Mr. Smith replied in the negative. Mr. Ham thought for the smaller system, the plan reported was entirely too cumbersome, and that as good results could be obtained for such systems in a simpler way. On the system represented by him (the speaker) the storekeeper and the purchasing agent were the same and they had an intimate knowledge of everything that went on; he believed that the more these officers knew as to prices, etc., the better it was for the company.

The president called attention to the fact that the primary object in attempting to standardize the material and supply system was to weed out all unnecessary items and get something that would apply both to large and small companies.

Mr. Smith said he thought the system presented was pretty simple, and that, if anything, there would not be enough to it to suit a large road. That was why he had said "no" in response to Mr. Ham's question. So far as small roads were concerned he thought this system would fit their needs.

Mr. Smith stated, in reply to Mr. Longyear, that the number of times each article would have to be copied before the order was placed with the dealer, would be five. This Mr. Longyear conceded to be a necessity if the lot number were adopted, but why go so far? Why not have the requisition and the order number, and then when the material was delivered it was only necessary to make two copies.

Asked by Mr. Duffy to explain the difference between the bin card and the stock card, Mr. Smith stated that as arranged in the report, the bin card was simply one lot number and description of material. It might be a very small piece of paper tacked right up on the bin. That was all there was to that part of it, just the top part of the card, without any reference to the going out part. It was simply an identification check, that the bolts in a given bin were lot number so-and-so and of such a size.

Mr. Longyear thought that the principle laid down in the report was an advance in supply accounting; that it would be adopted in whole or in part according to the requirements of different companies.

(The President put the question on Mr. Duffy's motion to adopt Section 2, and it was determined in the affirmative.)

Mr. Ham stated that personally he was heartily in accord with the suggestion of Mr. Longyear that the report was in many respects far ahead of any system that there had been, though he still believed it was not the simplest that could be devised. As a general proposition, however, he was heartily in favor of the system reported, and he moved that the report of the committee be adopted as read.

The President then put the question on the adoption of the report in its entirety, with the amendments heretofore made therein, and it was determined in the affirmative.

On motion, the program was modified and the report of Committee on Standard Form of Report for Electric Railways, called for, and read by Mr. W. F. Ham, of Washington, D. C.

Mr. Duffy moved, owing to the lateness of the hour for taking up the discussion of this important report, and the absence of Mr. Judson, of the New York Board of Railroad Commissioners, and Mr. Stewart, of the Census Department, who by special invitation were expecting to be present at the consideration of the report, its further consideration be postponed until the next session.

The President stated he considered the suggestion a very appropriate one, and, on motion, an adjournment was taken until Friday morning at 10 o'clock.

Everyone in attendance at the convention will be glad to know that Mr. Hutchins was sufficiently recovered yesterday to spend some time on the floor of the exhibition hall. He was very enthusiastic in his words of appreciation regarding the fine display of street railway apparatus and was much gratified at the unusually large attendance. We all hope Mr. Hutchins will be himself again before the convention closes.

Mr. Albert Korst, of New York, is hustling among the delegates in behalf of the Union Mica Co., which he so ably represents.

#### EXCURSION TO MALBY LUMBER YARDS.

The Malby Lumber Company sends us the following: "It's only a two-hour trolley and launch trip to the cedar pole yard of the Malby Lumber Co. Take any car on Fort St. line except a "Woodmere" or "Through" car. Car every 10 minutes. Representatives of the company meet every car and the launch makes constant trips. No time lost."

#### RECEPTION TO THE LADIES.

From 10 a. m. until 1 p. m. yesterday an informal reception was held in the Cadillac parlors for the visiting ladies, and this proved to be a most delightful function. The visitors were received by ladies' committee.

The rooms were most tastefully decorated, roses and palms being in profusion, and refreshments were served. The reception was much appreciated by the visiting ladies, as it afforded an opportunity to become acquainted with each other before the excursions.

#### HART TIE PLATE.

The Hart tie plate, as its name implies, is a device designed to be attached to the tie for the purpose of affording lateral strength to the rail and prevent buckling. The company in announcing the invention furnish the following description:

"The top surface (not the entire plate) is cambered. To prevent the accumulation of sand under the rail, thereby minimizing a sand-cutting effect on the plate on the rail; to act as a natural shed for water, brine, acid, or other drippings from the cars; to increase the adhesive qualities of the plate to the tie by minimizing the wave motion on the plate, and also to prevent buckling.

"The top surface of the plate is corrugated. These oblique corrugations beginning near the median line of the plate gradually widen and deepen as they approach the outer edge of the plate. This is done to prevent the accumulation of sand on any part of the plate's surface; to carry off water, brine, acid, or other drippings from the cars; and also strength is added without destroying the fibre or grain of the metal or causing crystallization of the metal in process of manufacture.

"The under surface of the plate is provided with longitudinal flanges. The flanges are designed to compress the fibres of the wood, thereby increasing its density, and to firmly embed the plate in the tie. The design of the flanges and the distribution of metal furnish greatest transverse strength.

"The camber and corrugations in combination form a natural means for shedding foreign matter. Brine and other liquids drain from the surface of the plate, and sand will gravitate and be carried off from the corrugations, thereby automatically clearing the surface of the plate."

#### "CLIMAX" POSTS.

The Climax Fence Post Co., of Chicago, is represented by H. E. Overstreet, general manager of the company, and exhibits at space No. 35. The patented posts of this company consist of a steel top, for strength, with a clay base to prevent destruction by corrosion.

The Atlas Railway Supply Co. is offering a reward of \$100 for the return of a box containing 800 souvenirs intended for distribution at the convention. The box was lost or stolen from the company's space on Tuesday or Wednesday.

Mr. G. Edgar Barnes, certificate clerk, announces that the railroad certificates will be ready for delegates and visitors after 10 o'clock on Friday.

Mr. Neil Paulson, superintendent of the Jewett Car Co., of Newark, Ohio, is on the scene.

Mr. Nat P. Lane, manager of the railway department for Parrott Varnish Co., of Bridgeport, Conn., is busy talking the good points of Parrott varnishes. Mr. Lane is one of the oldest varnish men in this country.

## A. S. R. A. PROCEEDINGS.

(Continued from page 653)

Professor Goldsborough, of Purdue University, received the managing directorship of the electrical department of the Louisiana Exposition and he is present to-day for the purpose of enlarging a little upon the scope of these resolutions and giving a little better understanding of them, and I would ask the convention to extend to Prof. Goldsborough five or ten minutes' time in which to speak upon this resolution. I therefore make it a motion.

Motion carried.

Professor Goldsborough: I greatly appreciate the honor you confer upon me, permitting me to tell you something of what we intend to do for the street railway interests at the Louisiana Purchase Exposition. I come here to-day as a representative of the Exposition and of the Business Men's League of St. Louis, to invite you to meet in St. Louis in 1904, because we are preparing for you there a feast that I believe every one of you will thoroughly enjoy. The Louisiana Purchase Exposition, as you probably know, will by the time the gates open, have expended fifty millions of dollars in preparing what we hope will be the greatest international exposition. I think that our hopes in this line will be realized, for the reason that the Federal Government has made a most generous appropriation toward the work. This has been seconded by the city of St. Louis, by the citizens of St. Louis, and by the state of Missouri. So that the Exposition company starts out with \$17,000,000 to devote to the Exposition. The Chicago World's Fair, which at that time was the greatest exposition the world had known, started out with \$13,000,000; so that you see from the financial standpoint the initial movement is well backed. We also have ample space in which to present the picture of our national growth. Chicago used Jackson Park with its 600 acres in presenting its picture. The St. Louis association has Forest Park, in which there is 1,200 acres or double the amount of ground. Of the 15 large exhibit buildings on the ground the smallest has an area of four ordinary city blocks. I give you this measurement because we are all in the habit of thinking of a city block being 300 feet on a side. The largest of the buildings will have an area of ten city blocks, which is the largest building under one roof that has ever been built or attempted. I am quite certain that when you know we are organizing a power plant which will have a capacity of over 20,000 horse-power you will feel that our illuminations which will be shown at St. Louis will probably equal those of any other exposition. Buffalo presented beyond all doubt the most beautiful picture of illumination which the world has ever seen. It has been very aptly termed by Dr. Penello, the crescendo in illuminations. There they used about 5,000 horse-power. But with six times this amount of power used at St. Louis, we will probably be able to present to you a picture glorious indeed, when viewed by the electrical engineer; and I think it will be one that we will all be glad to feel we have some part in as electrical engineers and as people interested in electricity.

When we come to the street railway presentation at the exposition we have a very pleasing problem. Naturally, since your work is part electrical and part mechanical, a division must be made at some point. Willard Smith, Chief of Transportation, has used every effort to exploit all the mechanical details of the railway problem on a very broad line in the transportation building. There all matters pertaining to traffic maintenance, maintenance of way, trucks, car bodies, mechanical construction of the line, etc., will be pictured. In the electrical department the electrical side of the problem will be pictured. All matters relating to the generation and the distribution of electricity and to the control of cars and trains by electrical methods come in the electrical department. In other words, the electrical engineer in the electricity building will study the street railway or the electrical railway problem from the generator through the transmission system, through the transforming devices, through the substations and storage battery, out over the line, through the motors to the car axle. In the transportation department he will study all those things that pertain to the building of the track, ballasting, the construction of viaducts, of car bodies, of automatic signal devices and other matters that pertain directly

to the mechanical study of this great problem. Mr. Smith and myself have been working for some months past on a matter which I think will give our exposition an added interest to you. We want to have a track some 1,300 ft. in length, double and triple track, as conditions may permit us to make it, on which experiments can be made of all street railway traffic systems. Whether these be pneumatic, steam, gas or electrical in power, or electrical systems, they are all to be exploited. We want to organize the thing on very broad lines. I think you will all agree with me at that time there will probably be a large number of systems using alternating current, as well as the systems we now have using a direct current, and I cannot imagine a picture which will present a greater interest to you than that of seeing these various systems all exploited on the same ground and at the same time by the engineers of the various companies exhibiting there. This in a nutshell gives you a slight idea of the great undertaking which we have at St. Louis. We have advanced in the St. Louis exposition ten years beyond Chicago as gauged by the inventions that have taken place in that time in our national growth. We realize that unless our exposition is ten years in advance of Chicago, it will be a failure. They have gone into the work in that spirit, and I feel as time goes on and I am brought closer in contact with the work, that they will succeed. Thank you.

The President: The next paper is on "Electric Express and Parcel Delivery, by George W. Parker, General Express Agent of the Detroit United Ry.

[After the discussion on this paper, which lack of space prevents our publishing in this issue, the chair appointed as the committee to nominate officers and select a place of meeting the following: R. S. Goff, N. H. Heft, R. McCullech, C. G. Goodrich, D. B. Dyer.]

The convention then adjourned till Friday, at 10 A. M.

## SUPPLYMEN'S ASSOCIATION.

The committee on organization of supplymen met yesterday morning and arranged to hold a general meeting of all exhibitors Friday morning at an hour to be announced later.

In addition to the official entertainments provided for to-day, there will be various side trips arranged by the Crocker-Wheeler Co., the General Electric Co., Berry Bros., and the overflow theatre party this evening given by the Wheel Truing Brake Shoe Co.

The Union Mica Co., of New York, arrived too late to get any space on the Convention Hall floor, and has made arrangements to show its various specimens of mica board, flexible mica varnish cloth, segments, rings, etc. Mr. Albert Korst, the company's representative, is in attendance and promises to interest all callers.

Exhibit Hall will be open every evening of the convention, from 10:30 o'clock.

## WEBER RAILWAY JOINT MFG. CO., NEW YORK.

This company is showing this year samples of its standard railway joint for T rail, the standard joint for girder rail and the compromise or step joint. At the back of the booth are shown photographs of track laid with Weber joints and also blue prints setting forth the construction of the joints used by the Union Traction Co., of Albany, and the Lynn & Boston R. R. Co., of Boston. The remarkable success of the Weber joint was attested by a large reproduction of the medals granted by the Exposition Universelle at Paris, 1900. The Weber booth was in charge of J. M. Barr, of New York, assisted by Mr. F. A. Poor, W. T. Smethem and H. C. Holloway.

Mr. Clifford Taft Hanson, of the Bethlehem Steel Co., keeps busy distributing a souvenir pamphlet in which the special products of the company are succinctly set forth.

EXHIBITION HALL AT THE OPENING OF THE CONVENTION, OCTOBER 8th.

#### IMPORTANT ANNOUNCEMENTS.

A series of jolly trolley parties was inaugurated yesterday by the General Electric Co. representatives, who have secured the private car "Detroit" for the purpose, through the courtesy of the Boland line officials. The car is equipped with the Type M control and the excursionists leave the General Electric booth in the annex at 11 a. m., 4 p. m. and 8 p. m.

Mr. Thomas Farmer, superintendent of motive power of the Detroit United Railway, has called a meeting of all master mechanics present in the city to be held at 3 p. m. this afternoon in Power Station A, for the purpose of organizing a master mechanics' association.

The local committee announces that exhibitors' mail will be kept at the office of the chairman of the exhibit committee, while mail for the delegates will be held at the Bureau of Information at the entrance to the hall.

The Exhibit Committee announces that special provision has been made for the ladies at Exhibition Hall. A large room on the main floor, just to the right of the main office, has been set aside for their use and in addition several boxes in the gallery have been reserved for the accommodation of the ladies who may care to rest after "doing" the exhibition.

The Information Bureau is in the registration office, just inside the main entrance.

Among the visitors to the accountants' association yesterday morning were Mr. Judson, of the New York Board of Railroad Commissioners; Mr. T. C. Martin, and Mr. Stevenson, representing the Census Bureau.

Mr. J. E. Sullivan, florist, of 214 Woodward Ave., Detroit, Michigan, announces that some of the delegates while calling on Tuesday at his establishment left a bunch of keys. The owner can have the keys by calling and identifying them.

#### "A CROCKER-WHEELER TROLLEY TRIP."

Delegates and representatives at the convention are invited to join the Crocker-Wheeler Co. in a trolley party this afternoon to the Rochester power house, on the Flint division of the Detroit United Ry. Special cars have been provided and will leave from Griswold and Congress Sts. at two o'clock sharp, city time. The trip will doubtless be an interesting one, as the road lies through a very pretty country and the power house contains considerable apparatus of interest to street railway men.

One car will be given up to the ladies who may wish to join the party, and will make a run beyond Rochester to a very pretty spot, Lake Orion, while the gentlemen have stopped at the Rochester power plant. It is hoped that as many of the ladies as can will make the journey. The trip promises to be an enjoyable and entertaining one and the delegates and exhibitors generally are invited to be on Griswold St. promptly at two o'clock so that there may be no delay in getting away. The party will probably reach the city about five on the return, in ample time for the theater party in the evening.

REGISTRATIONS ON TUESDAY AND WEDNESDAY.

A. S. R. A MEMBERS IN ATTENDANCE.

Akron, Ohio—Chas. Currie, W. H. Douglas, T. W. Sheldon, J. T. Ross, Northern Ohio Traction Co.  
 Alton, Illinois—Geo. D. Rosenthal, Alton Ry., Gas & Electric Co.  
 Altoona, Pa.—J. J. Crane, Altoona & Logan Valley Electric Ry. Co.  
 Asbury Park, N. J.—J. B. Cade, S. F. Hazelrigg, Atlantic Coast Electric Ry. Co.  
 Atchison, Kansas—C. M. Marshall, Atchison Ry., Light & Power Co.  
 Atlanta, Georgia—Geo. B. Travers, A. M. Moore, P. S. A. Knight, Thos. K. Glenn, D. A. Belden.  
 Augusta, Ga.—D. B. Dyer, A. J. McKnight, Augusta Ry. & Electric Co.  
 Aurora, Ill.—F. M. Zimmerman, Elgin, Aurora & Southern Traction Co.  
 Austin, Texas—  
 Anderson, Ind.—Albert L. Riehey, Wm. H. Bloss and wife, Wm. C. Sampson, Union Traction Co. of Ind.  
 Baltimore, Md.—H. H. Adams, W. H. Staub, United Ry. & Electric Co.  
 Bay City, Mich.—E. J. Dimmock, J. J. Thomas.  
 Binghamton, N. Y.—G. T. Rogers, Binghamton Ry. Co.  
 Birmingham, Ala.—W. B. Brockway, Birmingham Ry., Light & Power Co.  
 Boston, Mass.—Howard F. Grant, Henry L. Wilson, Boston Elevated Ry. Co.  
 Boston, Mass.—Walter Trumbull, J. F. Shaw, H. Fisher Eldridge, Boston & Worcester St. Ry. Co.  
 Boston, Mass.—E. C. Fisher, D. D. Bartlett, Boston Northern St. Ry. Co.  
 Boston, Mass.—Robt. S. Goff, Geo. W. Palmer, Old Colony St. Ry. Co.  
 Bridgeport, Conn.—R. C. Crane, A. Bass, Connecticut Ry. & Light Co.  
 Bridgeport, N. J.—B. F. Hires, Bridgeport & Millville Traction Co.  
 Buffalo, N. Y.—E. F. Seixas, C. P. Wilson, G. E. Stephenson, A. J. Farrell, C. A. Coons, J. H. Murray, Fred D. Hoffmann, C. F. Welz, J. F. Bothny, J. Millar, P. Murphy, H. M. Dease, T. W. Wilson, J. M. Bostwick, R. F. Hankins, T. E. Mitten, International Ry. Co.  
 Butte, Mont.—J. R. Wharton, Butte Electric Ry. Co.  
 Camden, N. J.—W. E. Harrington, G. G. Browning, Houlings Lippincott, Camden & Suburban Ry. Co.  
 Charleston, S. C.—P. J. Balaguer, Charleston, Carrol Ry. G. & Elect. Co.  
 Chicago, Ill.—H. M. Sloan, Calumet Electric St. Ry. Co.  
 Chicago, Ill.—T. C. Pennington, C. N. Duffy, Richard McCulloch, M. O'Brien, C. E. Land, Chicago City Ry. Co.  
 Chicago, Ill.—T. E. Smith, Chicago Consolidated Traction Co.  
 Chicago, Ill.—W. O. Griffin, Frank Hedley, Northwestern Electric Ry. Co.  
 Chicago, Ill.—T. E. Smith, Chicago Union Traction Co.  
 Chicago, Ill.—Wm. Welmsly, South Chicago City Ry. Co.  
 Cincinnati, Ohio—Geo. H. Searough, Ella G. Renkeel, Cincinnati & Eastern Electric Ry. Co.  
 Cincinnati, Ohio—H. C. Genrich, Robt. Dunning, D. Stevens, Cincinnati Traction Co.  
 Cleveland, Ohio—W. C. Phelps, John Ehrhardt, Geo. L. Raleigh, T. Scullen, C. W. Callaway, Geo. A. Stanley, Cleveland City Ry. Co.  
 Cleveland, Ohio—A. C. Kennedy, D. S. Moffatt, W. S. Moffatt, W. G. McDole, Cleveland Electric Ry. Co.  
 Columbus, Ohio—M. S. Hopkins, P. F. Burlington, Columbus Ry. Co.  
 Council Bluffs, Iowa—W. B. Tarkington, Omaha & Council Bluffs Ry. & Bridge Co.  
 Canton, Ohio—L. E. M. Yers, G. W. Reynolds, E. W. Beach, L. J. O'Toole, Canton & Akron Ry. Co.  
 Columbus, Ga.—H. S. Reynolds, Columbus Railroad Co.  
 Cleveland, Ohio—Chas. W. Wason, J. Jordan, Cleveland, Palmsville & Eastern Ry. Co.  
 Danville, Ill.—S. L. Nelson, Danville St. Ry. & Light Co.  
 Davenport, Iowa—Jas. F. Lardner, Jno. D. Fish, Tri-City Ry. Co.  
 Dayton, Ohio—C. L. H. Tingley, J. R. Beckhall, J. Green, People Ry. Co.  
 Denver, Col.—Geo. L. Rice, Jas. L. Adams, J. B. Hogarth, Denver City Tramway Co.

Des Moines, Iowa—H. H. Polk, A. L. Malish, C. D. Cunningham, J. E. Welsch, W. J. Hasket, Thos. Martin, Des Moines City Ry. Co.  
 Detroit, Mich.—H. A. Everett, J. C. Hutchins, Arthur Pack, Geo. H. Russel, Irwin Fullerton, A. E. Peters, A. H. Stanley, Thos. Farmer, Jno. H. Fry, Geo. W. Parker, Albert Eastman, E. J. Burdick, Jno. Kerwin, Harry Bullen, Walter Ross, Jas. Bampton, H. V. Catlin, W. R. Frazer, C. B. King, Robt. Oakman, Detroit United Ry. Co.  
 Grand Rapids, Mich.—E. S. Hanchett, Jr., S. Hendrie, H. P. Strong, W. L. Granger, Jas. Van, Jno. Busbee, W. H. Beach, T. W. Gorman, Grand Rapids, Holland & Lake Mich. Rapid Ry.  
 Grand Rapids, Mich.—J. D. Hawks, Wallace Franklin, Carl M. Vall, J. E. Webster, W. W. Churehill, H. J. Raynor, H. H. Kerr, Grand Rapids, Grand Haven & Muskegon Ry. Co.  
 Detroit, Mich.—P. W. Brooks, W. O. Wood, H. S. Swift, H. C. Marshall, Rapid Railway System.  
 Duluth, Minn.—H. Warren, Duluth-Superior Traction Co.  
 DeKalb, Ill.—Jno. W. Gridden, DeKalb Sycamore Electric Co.

## Track Sanding System

Saves

EQUIPMENT CURRENT

TIME AIR SAND

PREVENTS ACCIDENTS

ELECTRIC BLDG.,

CLEVELAND, OHIO.

**THE N. Y. C. SPECIAL.**

A goodly number of supply men arrived in town yesterday morning on the Detroit special which left New York at 4 p. m. Tuesday over the New York Central, coming from Utica via the Michigan Central.

It was expected that a large Boston contingent would meet the special at Albany, among them several New England street railway men of prominence, including General Manager E. A. Newman, of Portland, Me., and General Manager R. T. Laffin, of the Worcester (Mass.) Consolidated Street Railway Co. So sure was Colonel N. H. Heft, president of the Meriden (Conn.) Electric R. R., that the "Downcasters" would connect with the special that he had reserved two staterooms on the special for their accommodation. It seems that the Boston train reached Albany before the special and continued on its way to Detroit. The uncalled for berths in the staterooms were given over to supply men who asked for them.

Beside Col. Heft on the special, other street railway men were his son, Dr. G. Stanley Heft, of Port Chester, N. Y.; Roy Copeland Cram, of the Connecticut Railway & Light Co., Bridgeport, Conn.; Charles G. Fitch, superintendent of New York & Queens County Railway Co., Long Island City, N. Y.; F. P. Maize, master mechanic of the N. Y. & Q. C. Railway Co.; J. C. Welch, electrical engineer of the Schenectady Railway Co., and J. R. Shurtz, auditor of the South Jersey Gas, Electric & Traction Co., Camden, N. J.

The special was a finely equipped combination of four Pullman coaches, a diner and a buffet smoker. Attached to it for part of the run was the private car of District Superintendent Smith, of the New York Central, who had a party of friends on board. The wants of the passengers were carefully conserved by Passenger Agent J. Frank Myers, of New York, who was in charge to Utica, where Passenger Agent C. A. Cascardin, of Buffalo, took charge for the Michigan Central.

**CURTAIN SUPPLY CO.**

The Curtain Supply Co. has a very effective and complete exhibit of all kinds of car curtains, curtain fixtures, and curtain materials. As the originators of curtain fixtures, it has kept pace with the progress in car construction and equipment and is offering to the trade curtains and curtain fixtures that have been tested and tried for years in all parts of this country as well as abroad, and have proven to be perfectly satisfactory. The policy of this concern is to stand back of all goods that it manufactures. Owing the basic and fundamental patents on curtain fixtures, it is also able to afford complete and absolute protection to its many customers and friends.

The exhibit is tastefully arranged and is the headquarters for many of the delegates. Mr. W. H. Forsyth, general manager, and Mr. A. C. Whipple, general sales agent, are representing the company. The company recently opened an eastern office at 2131 Park Row building, New York City, and is thus better able than ever to care for its trade.

## THE CLIMAX STOCK GUARD

H. S. OVERSTREET, Manager,

**714 Marquette Building, - CHICAGO, ILLINOIS.**

Manufactured from Shale Clay, Burned Hard, Vitrified and Glazed. Blocks 24 in. long, 8 1/2 inches wide, 4 1/2 in. high. Material in ridges 1 1/4 in. thick.

40 Blocks to each guard, 8 ft. x 8 ft. Weight, 1,200 pounds.

**A FEW REASONS WHY IT IS SUPERIOR TO ALL OTHERS.**

Its own weight is all that is necessary to keep it in position with a two-inch wooden cleat around the guard. It can neither burn, rust or decay, and is practically indestructible. It is cheaper than either wood or iron, and, in fact, has no competitor in price.

It, unlike other guards, does not require to be taken up at least twice a year, that the weeds growing through it may be cut; no weeds grow through this guard. The expense of installation is practically nothing, as it needs no special preparation to place it in the track; no excavation, and no changes in the track beyond the possible replacing of seven (7) ties, requiring the use only of ordinary section labor. It can readily be adapted to any gauge and to any length of guard desired.

In case a wrecked car or train passes over it, or break beam strikes it, it sustains less damage than any other guard manufactured. Should any of the blocks be broken, they can readily be removed and new ones put in, leaving the balance of the guard intact. A guard of any other form, under such circumstances, would be totally destroyed or so much damaged as to prevent its being reconstructed. It is impossible for train men or others crossing the guard to be injured by falling on this guard or caught in it. In repairing or changing the track, it can be taken up and replaced without the slightest damage and at practically no cost.

**The following is a list of Sales for Four Months, ending August 1, 1902:**

Chicago, Milwaukee & St. Paul R. R. ....	250 Guards

**NOT BAD FOR A NEW THING—IS IT?  
 LET US ENTER YOUR NAME IN THE LIST.**

**RECEPTION AT HOTEL CADILLAC.**

The reception last evening tendered by the local committee to the delegates and visitors was more than usually enjoyable. Several hundred attendants and ladies assembled in the spacious parlors of the Cadillac and enjoyed the music, dancing and refreshments, provided by the committee as an aid in getting everybody acquainted. Once more we take pleasure in acknowledging the hospitality of our local hosts.

**POSITION WANTED.**

First class armature foreman, wants position. Extensive experience. Seven years in charge of armature department of one of the largest roads in the west. Well acquainted with all types of Westinghouse and General Electric motors. Call at "Street Railway Review" Booth.

## MEETING OF MASTER MECHANICS.

In pursuance of the suggestion made by Mr. Thomas Farmer, superintendent of motive power for the Detroit United Ry., a meeting was called yesterday for the purpose of organizing an association of electric railway mechanical and electrical men. This meeting, which was held at Power Station A of the United Railway, was well attended, and after thoroughly canvassing the benefits to be derived from such an association a temporary organization was effected, and a call issued for a meeting to be held to-day at 1 o'clock at the office of the Detroit United Railway, 12 Woodward avenue, for the purpose of perfecting a permanent organization. At yesterday's meeting the following gentlemen were elected temporary officers: Mr. Thomas Farmer, chairman, with power to appoint a secretary. Executive committee: E. W. Olds, superintendent of rolling stock, Milwaukee Electric Light & Power Co., Milwaukee, Wis.; Wm. Pastell, superintendent of motive power and machinery, Consolidated Street Ry. Co., Worcester, Mass.; G. W. Palmer, Jr., electric engineer, Old Colony Street Ry., Fall River, Mass.; C. A. Brown, M. M., Toledo Railway & Light Co., Toledo, Ohio; W. O. Mundy, M. M., St. Louis Transit Co., St. Louis, Mo.

In addition to those mentioned the following gentlemen were present: H. H. Adams, superintendent of shops, United Railways & Electric Co., Baltimore, Md.; R. H. Coleman, superintendent of transportation, Fond du Lac Street Ry. & Light Co., Fond du Lac, Wis.; T. F. Grover, president and manager Fond du Lac Street Ry. & Light Co., Fond du Lac, Wis.; J. E. Welch, master mechanic Des Moines City Railway, Des Moines, Iowa; W. S. Patterson, master mechanic Salt Lake City Railway & Power Co., Salt Lake City, Utah; J. W. Glidden, superintendent Dekalb Sycamore Elec. Co., Dekalb, Ill.; J. M. Yount, master mechanic North Jersey Street Ry., Newark, N. J.; Lewis Pfingst, 31 State street, Boston, Mass.; H. E. Bradford, Zanesville, O.; S. M. Coffin, master mechanic M. M. Mobile Light & Railroad Co., Mobile, Ala.; J. W. Lewis, chief engineer Toledo & Monroe Traction Co., Monroe, Mich.

No definite action was taken yesterday with the exception of the appointing of the officers, it being decided to leave all questions referring to the scope of the association, its aims and purposes, etc., to the action of the meeting to-day. As a name for the proposed organization "The Mechanical and Electrical Association of Electric Railways" has been suggested, and will be presented at the meeting for final approval. Other points to be discussed are the advisability of holding the annual convention at the same time and place as the American Street Railway Association, the work to be attempted by the association, dues, qualifications for membership, etc.

\*\*\*

Mr. A. H. Stanley, general superintendent of the Detroit United Railway, spent considerable time at Convention Hall yesterday. Mr. Stanley expressed himself as being very much gratified that the convention in Detroit should have been so well attended, and he wishes to acknowledge the words of appreciation heard on all sides of the efforts of his company to make the convention an unqualified success. Mr. Stanley also wishes to acknowledge the spirit of cooperation displayed by the citizens of Detroit in seconding the efforts of the United Railway company to keep up the reputation enjoyed by Detroit as a convention city.

## A. S. R. A. PROGRAM.

"Discipline of Employes by the Merit System"—Metropolitan Street Railway Co., of Kansas City, by W. A. Satterlee, general superintendent.

"The Steam Turbine: Its Commercial Aspect"—E. H. Sniffen, of Westinghouse, Church, Kerr & Co., New York.

"Signals for Urban and Interurban Railways"—Old Colony Railway Co., Boston, by G. W. Palmer, jr., electrical engineer.

"The Adjustment of Damage Claims"—Chicago City Railway Co., by M. B. Starring, assistant general counsel.

Report of Committee on Rules for the Government of Employes.

Report of Committee on Standards.

Election of officers.

\*\*\*

## ACCOUNTANTS' ASSOCIATION.

Chart of Street Railway Blanks, suggested by G. E. Tripp, general auditor, Stone & Webster's Co.'s, Boston, Mass.

Annual report of Standardization Committee.

Afternoon, 2 o'clock.

Report of Committee on Nominations.

Election of Officers.

Report of Committee on Resolutions.

Installation of Officers.

\*\*\*

## ENTERTAINMENTS.

A trolley ride will be given for the ladies this morning leaving Hotel Cadillac at 10 a. m. for Mount Clemens, via the Rapid Railway and Gratiot Ave., returning via the Shore Line to the Country Club, Grosse Pointe, where luncheon will be served at 1 o'clock. The return to the city will be made at 4 p. m.

The banquet will be held at Hotel Cadillac at 8 o'clock, at which the installation of the officers elect will be held.

\*\*\*

## MICHIGAN STATE ASSOCIATION.

One of the most gratifying announcements that it has been our privilege to make is the call for a meeting to organize an electric railway association for the state of Michigan. Those interested are requested to meet in the billiard room of the Light Guard Armory (Convention Building) at 2:30 p. m. (city time) to-day.

\*\*\*

## MAIL AND TELEGRAMS UNCALLED FOR.

Mail and telegrams for the following are uncalled for at the office of the chairman of the Exhibit Committee:

Telegrams: Frank Silliman, Jr., W. A. Shirley, C. T. Maines, C. O. Maillonx, Thos. R. Elliott, G. W. Hamilton, W. R. Garton, G. W. Chance, H. M. Pease, W. E. Jaques, Henry L. Doherty, Cornell Hawley, Frank Schneider.

Mail: M. S. Walker, George R. Mitchell, Frank S. Given, Thos. Elliott, Wm. A. Snow, E. D. Helms, Ralph H. Beach, Herbert Warren, Geo. W. Rounds.

\*\*\*

## ANNOUNCEMENT FOR EXHIBITORS.

The Local Exhibit Committee wishes to inform exhibitors that they can save themselves considerable annoyance by notifying Mr. Albert Eastman, in the office of the Exhibit Committee, just when the shipments will be ready and their nature. Those who will have enroute shipments to make on Saturday or the early part of next week are particularly requested to give advance notice to Mr. Eastman so that proper arrangements may be perfected.

\*\*\*

Secretary Prockway of the Accountants' Association well deserves the many compliments we have heard passed upon his work since the convention opened. By printing the papers, and especially the reports in advance of the meeting, the members were enabled to devote practically the whole of the sessions on Wednesday to the discussions, and to dispose of even more business the first day than was called for on the program.

## TWENTY-FIRST ANNUAL MEETING

# AMERICAN STREET RAILWAY ASSOCIATION

**Detroit, Mich.—Oct. 8—10, 1902.**

(Continued from page 671.)

### ELECTRIC EXPRESS AND PACKAGE DELIVERY.

By George W. Parker, General Express Agent, Detroit United Ry.

The establishment of the electric service is a boon to interurban towns, to which lines are being rapidly extended in all directions within a radius of from 75 to 100 miles, and in a great many cases reaching towns and villages which have never heretofore enjoyed a railroad connection, or at the best, in a roundabout way, entailing great delay and almost prohibitive expense. Electric service has also made next-door neighbors of communities between which, before its establishment, even wagon communication was not satisfactory or feasible, so that the electric service may justly be regarded as the chief factor in suburban progress, though not yet a decade old.

GEO. W. PARKER.

To the lay mind, the express and parcel business of the electric line or system would appear to be an additional and profitable use of the franchise, involving no additional expense beyond suitable rolling stock, and the necessary train crew; but my experience has been that the operating expense tends to become greater than that of the passenger service, for the latter calls for no local station or agents, the company assuming no responsibility before the passenger has been sighted and after he alights, while it does become an insurer of freight or express from the moment of the giving of a receipt until it has taken one, thus necessitating a salaried agent and suitable depot facilities, stationery, etc.

In addition to the foregoing handicap to a profitable operation of the express service, I find myself confronted, in Detroit, by an ordinance which prohibits the use of trailers, and worse still, which levies a tax of one dollar per car per round trip, regardless whether the car is empty or loaded. This tax is a radical departure from the good old days, when the town or its public spirited citizens gladly raised a bonus to encourage a railroad connection, and then considered themselves highly favored.

The management of a system should show a proper appreciation of the importance of the express department, and its bearing on the continued and increasing prosperity of the system, in the building up of an interurban patronage, for it seems a necessary conclusion that the out-of-town dwellers will avail themselves of the mail-order and telephone facilities of the large city stores

because of the convenient and speedy electric express car delivery to their doors, and the habit once formed of sending their shipments or orders via the electric express car must eventually result in more frequent trips on passenger cars for personal and wider selections of their requirements.

But it must not be assumed that all branches of the system, or even all towns and villages on a branch, warrant the establishment of an electric express service. The population, situation, products and future of each individual place, and the competition of existing steam roads, if any; also the old established express companies, must be carefully weighed, or that terrible ledger must be faced at the end of the year.

To secure and hold the favor of the public I have found it necessary to insist upon and maintain high-class service, which means all the little details of careful handling, prompt transit and courteous treatment. This naturally calls for the cooperation of the entire management, especially in the operating department, and the personal attention of the general express agent, and his assistant, at all hours, in all kinds of weather, and the ability to avert disaster when least expected. But he must not at any time neglect his office, to which all matters pertaining to the handling of express should be referred, and from which all instructions as to rates, claims, complaints, etc., should issue. The best results can be only obtained by the employment of a traveling express agent, whose special duties should be the soliciting of business and securing of routing orders from consignees on shippers, which routing orders are instructions to shippers to forward all shipments in connection with the electric express.

The traveling express agent should have an open ear for all complaints, diplomacy, and a knack of handling people so he can always retain their friendship. In addition to the above, the traveling express agent should have the oversight of the local agents at the various points, who are usually subject to frequent lapses by reason of inexperience. He should, moreover, be capable of acting as trainmaster in the proper distribution of rolling stock, especially in case his road or system should be so unfortunate as to be in the vicinity of the sugar-beet business, or in close proximity to freight of that character.

Where the system includes leased or other lines, in addition to its own, a central freight or express depot and a joint agent are absolutely necessary as a measure of economy and the proper handling of the business. At Detroit, the most important thing to contend with has been the expense of handling, which prior to the consolidation of the electric lines was cared for through three separate depots. For instance, express from the Rapid Railway system was handled through one depot; that from the Detroit & Pontiac, Detroit & Wyandotte, Detroit & Northwestern and the Detroit, Rochester, Romeo & Lake Orion roads through another depot, and that express for the Detroit, Ypsilanti, Ann Arbor & Jackson Railway through yet another. This entailed an expense for each depot of an agent or staff, which till only recently has been changed and the stations consolidated in one large joint depot, now located on the corner of Fifth and Congress Sts., in close proximity to depots of steam and navigation companies, thus also decreasing cartage expense where interchange is necessary.

The building is 45 by 195 ft. On one side is the team track or driveway, where freight is received and delivered. The illustrations give a fair idea of the traffic handled. On the east side of the shed there are double tracks with accommodations for four cars on each track, with ample room for switching. The interior

of the shed is clear of all posts, thus giving ample floor space necessary for prompt receiving, sorting and loading the express and freight. There is also cold storage for the protection of perishable goods during the summer months.

The joint express agent who would have charge of a depot of this kind must of necessity be an experienced railroad man, also an accountant of no mean ability, as the duties covered are manifold, from the handling of a truck on a punch, in the depot, to the settlement of his station accounts, which latter job becomes complicated at times from various reasons, such as change in rates, errors of agents, careless checking and handling of freight, etc.

It may be asked to what class of freight or express should an electric service be confined? In this part of the country, the electric express service may be said to have its origin in the transportation of milk, which was originally handled in the small compartment on passenger cars, reserved for baggage, but which has now grown to such proportions as to tax daily the capacity of entire cars.

MILK TAG.

In the handling of milk our experience has been that the best results are obtained by the issuing of milk tickets, which are consecutively numbered, and taken into account through the cashier's office. These tickets resemble our ordinary shipping tag; they are perforated in the middle, the lower portion being detached by the conductor carrying the cans when filled, and the other portion being left on to pass the empty cans on return trip. This ticket, as per sample, you will notice, shows the point of shipment, shipper, destination and to whom consigned; this information being on both portions of ticket, eliminates the possibility of errors in delivery of cans when either filled or empty. These milk tickets are charged for at so much per ticket, according to distance the milk is to be carried, and by their use assures protection from loss through bad accounts.

It may be added that the conductor when accepting shipments of milk, notes carefully that there is a ticket for each can. After the shipment is loaded, he detaches the lower portion and encloses same to the auditor at the end of his trip with regular way-bill showing full particulars of cans loaded, ticket numbers, consignees' names, etc., who in turn checks over the number of tickets enclosed and if any irregularities, promptly advises the general express agent, who takes the matter up with the conductor for explanation.

When delivering the full cans on arrival at destination, the upper portion of ticket is left on the full can, which portion must be on the can when it is to be returned for refilling, otherwise the conductor should not accept it until a ticket is provided. These instructions are necessary on the return empties, otherwise there is possibility of your service being imposed upon, through unscrupulous milk dealers sending their milk in by wagon or stage road, and leaving your line to carry the empties back free of charge.

The question may be asked, what is done with the lost portion of the ticket? This portion is left on the can until the conductor starts to distribute cans along the line, when this portion is detached and also returned to auditor at the end of trip, and handled in the same manner as the first portion.

Shipping a good deal of territory that has hitherto had no railroad connection has necessarily thrust upon the electric express for the at Detroit a class of freight that ought not to be carried in equipment of that character and which cannot be dis-

criminated against, the rates charged being governed by railroad tariffs for similar class of freight are in some cases insufficient, and therefore unsatisfactory from the revenue standpoint.

It may be interesting to know how the express is handled on the system in this vicinity, so the following is a brief outline. For use in this service a full set of blanks has been designed and prepared with care. The shipper fills in the receipt, showing the date, from whom received, to whom consigned, destination and a complete list of articles making up the shipment. This receipt is made in duplicate, a carbon copy being taken. The Detroit United Railway receives the property "subject to the conditions on the back hereof," which are in the form usually adopted by common carriers.

When express is received at the depot, it is checked in on this shipping bill, or that part of the form marked "Duplicate." If the shipment agrees with the shipping bill, the original is receipted by the checker signing agent's name with the checker's initials. This receipt is retained by the shipper, and the duplicate is kept by the company and the shipment rechecked into car, thus giving the company a double check on each shipment. Any exceptions as to shipment being in bad order, etc., are noted on these shipping bills, thus enabling the company in case of claim to know the exact condition the goods were in when received and forwarded.

After goods have been received and loaded into express cars, they are then billed out on a way-bill, this form being printed in three sizes—quarter sheet, half sheet and full sheet—the latter being 12½x16 inches. The way-bill is the same as express and railroad way-bills, forwarding point, destination, date of shipment and way bill number showing in proper places. The way-bill numbers are arrived at by commencing with number one the first of each month, and numbering them consecutively until the end of the month. This way-bill number is used as reference in all correspondence relating to any particular matter coming up in regard to any shipment covered by this particular way-bill. The facts shown on the way-bill are designated by the headings of the various columns, which includes consignor, consignee, number of packages, description, weight, rate, charges, advances, amount prepaid and total to collect.

The rate is taken from the company's regular express tariff, which is governed by the rules of the official classification.

Form 158.

WAY-BILL of Express Forwarded from To 190

Conductor Time Via W. B. No.

Consignor	Consignee and Destination	No. Pks.	Description of Express	Weight	Rate	Charges	Advances	Prepaid	Total to Collect

WAY BILL.

The rates on the different commodities handled are according to the value, dimensions and weight of each article. For example, shipments of glassware, furniture or any articles liable to damage from leakage are given a much higher rating than articles that are packed in such a manner as to occupy less space in the express car and which will weigh more than the articles first mentioned.

After this way bill is complete, it is then copied in a tissue book, one extra tissue being taken. These extra copies are forwarded to the auditor daily, who checks the weights, rates and extensions, and files the tissue copy for future reference.

On arrival of the shipment at its destination the receiving agent checks the various shipments billed to his station from the original way bill in thing overplus, if there be any, as to condition of express when received from car. In case of there being any articles damaged, over or short, the receiving agent makes report of the fact on a special form, filling in the information

called for in the various blank spaces. This form is made out in duplicate, the original being sent to the forwarding agent for his report, on that portion of this form designated "Forwarding agent answer following questions." This enables the forwarding agent to advise the receiving agent to correct, in case of error in billing, and what course to pursue in case of overs and shorts. This form is 9x8 1/4 in. and is shown reduced in Fig. 1.

The duplicate of this form is sent to the general express and passenger agents' office, where it is recorded in what is known as "The Over, Short and Damaged Register." These records remain open until the matter has been finally settled, thereby making it impossible for either the forwarding or receiving agent to allow the matter to drag along without receiving the prompt attention due such matters.

The way-bill is then entered by receiving agent in his "Express Received" book. The pages of this book are 16 1/2 x 22 in., and the column headings are shown in Fig. 2.

The keeping of this book correctly is the key to what is known as a Station Balance, as the various amounts shown under the headings of "Weight, Pre-Paid, Express, Advance Charges, Total of Way-Bill," etc., must agree with the corresponding columns of the "Abstract of Way-Bills Received." This form is, as its name designates, an abstract or summary of the totals of all way-bills received, and is made up for periods ending 7th, 14th, 21st and last of each month, and a like abstract of "Way-Bills Forwarded" is made up on a similar form.

The DETROIT UNITED RAILWAY, will receive and carry the property marked, consigned and destined as indicated below to the said destination, if on its road, otherwise will deliver to another carrier on the route to said destination.

Marks, Consignees and Destination	DESCRIPTION OF ARTICLES	WEIGHT Subject to Correction

Consignor.

**SHIPPING RECEIPT.**

The abstracts of way-bills forwarded is compiled from the tissue book copies and shows Date, Way-Bill No., Weight, Freight, Advance, Prepaid.

After the particulars have been entered in the Express Received book an "Expense Bill," shown reduced in Fig. 3 (original size 9x6 in.), is made out, a carbon copy being taken. When the shipment is delivered, the consignee's receipt is taken on the duplicate and the agent receipts for charges on the original. Collections are made on delivery unless the consignee has a regularly authorized ledger account.

When money has been collected by the receiving agent, he makes an entry of it in his cash book. Agents make daily remit-

ances of money collected, holding in the cash drawer only a small amount for change.

At designated times a balance sheet, form No. 166, is made out by the agent; the particulars of the debits and credits are shown opposite the various numbers on this sheet, and are arrived at from the totals of the different forms and books already described.

Form 77

**Detroit United Railway.**  
RAPID RAILWAY

**Until Further Advised Please Ship All My Orders Via ELECTRIC EXPRESS**

ROUTE ORDER SIGNED BY CONSIGNEE.

(Original 4 x 6 in.)

Form No. 166 is a double sheet 13 1/2 x 8 1/4 in. when folded once. The balance sheet is on the first page. The second and third pages show statements of express on hand forwarded and received, arranged under the heads in Figs. 4 and 5. On the fourth page is a statement of the remittances for the month.

This system for the express service on electric lines radiating from Detroit was adopted with a view to handling express and all accounts relating thereto in a simple, practical and systematic manner as possible.

Baggage is no longer carried in and out of Detroit on regular passenger cars, but follows on the next express car at a uniform rate of 25 cents per piece not exceeding 150 lbs. Where the actual weight exceeds the latter-mentioned minimum, the first-class rate named in the express tariff is applied from and to the point to which baggage is going at actual weight. This arrangement was necessary on account of the additional expense involved in the handling of baggage and the low passenger rates in effect which would not allow of a free checking system.

It is still an open question whether compartment cars could not handle both baggage and passengers during certain light hours of the day, thus giving baggage early preference and more suitable care.

Under our present arrangement of checking baggage, a passenger can have his baggage checked from any point on our system at which we have agents, which arrangement, if the passenger is coming to Detroit, includes delivery to all hotels, steamboat landings, railroad depots and residences, is working out admirably in connection with the Detroit Omnibus Line. It might be added that this company (D. O. L. Co.) has representatives to meet all trains and boats, so that the passenger coming to Detroit can by turning over his checks to one of these representatives be relieved of all responsibility in connection with his baggage in case he desires to avail himself of the frequent electric service.

There is a future in the parcel feature of the business, if properly conducted, which problem we have not yet been able to solve to our satisfaction, owing in a measure to the peculiar condition existing at this point. Under our present arrangement we are accepting parcels weighing from one to fifty pounds for a minimum charge of 15 cents going to points within a radius of forty miles, and a charge of 25 cents when going to points beyond forty miles. This charge, it must be understood, is for the electric express service only, with a slight additional charge for cartage in case the consignee wishes package delivered.

[The other blanks referred to may be found in the article by Mr. Parker in the "Review" for Jan. 15, 1902, page 25.]

## DISCUSSION.

The President: In considering the subjects for this meeting your Executive Committee went over the question very thoroughly and took up some matters that had been presented to them by correspondents, as questions some of the members would like to have brought up, being important new questions in connection with interurban electric operation, and this is one of the questions. Our Detroit friends consented to take this matter up from their standpoint, they probably having had the largest express and freight service in connection with interurban operation. They have given us a very valuable paper and I should like to hear it discussed or any questions asked that may enlighten the meeting with regard to this class of service.

I would inquire of the author of the paper if the original franchise contemplated the hauling of freight through the streets of Detroit, and if not, what conditions did the city impose when it granted this right.

Mr. Parker: The original franchise, I believe, did not allow the Detroit United Railway to carry freight through the streets of the city, but an ordinance was passed granting that privilege. The original franchise did not specify anything, if I remember correctly, about carrying freight, but the electric express and freight system was started, and while it was not satisfactory at the beginning owing to various conditions, the city council passed an ordinance prohibiting us from loading or unloading on the streets, compelling us to put up a depot of our own, and still further taxing us \$1.00 per car per round trip, whether the car was loaded or empty.

Mr. C. W. Wason, Cleveland: I would ask the gentleman, from the moneys received, whether the business increases month by month?

Mr. Parker: It is only a year ago this month, as I remember, when the express service was started. The business shows some increase.

Mr. Connette: There is another question which suggests itself to my mind which, perhaps, would be impertinent, but the gentleman can use his discretion whether or not he answers it. I wish to know if he keeps his accounts so that he can tell what proportion of the income from the operation of the freight and express service it costs to operate it?

Mr. Parker: As a matter of policy, I prefer not to answer that question.

Mr. Crafts: I would ask Mr. Parker if he has noticed any material increase in the business of the passenger service due to carrying packages and light express matter.

Mr. Parker: Yes, there is; it always has a tendency to increase the business.

Mr. Crafts: You think it gives you a marked advantage in carrying the package business, that is, that you gain in your passenger service?

Mr. Parker: Yes, sir.

The President: I gave the president and general manager of the Express company in New York City in the annexed district, and expected he would be here, with some statistics which would answer many questions regarding this subject, but some local business conditions have made it impossible for him to come. Under the conditions of operation that we have there the company has nothing to do with the express service. The express company has a contract with the street railway company for operating on its tracks, and the business is only limited by the facilities which the express company have been able to establish at the present time. In other words, it has all the time at least 30 per cent more business offered it than it has had facilities to take care of. As fast as the facilities increased the business has increased in larger ratio. As far as the question of the division as between the actual cost and receipts, based upon percent gain, in the original operation of the system, which means, as you know, the operation of 15 or 20 cars for the first six months to establish the business, the average of the whole would more than pay for the operation of the cars and the interest on the investment is paid by the express company, so that answers your question as far as we are concerned. There has been no expense entailed on our company in the operation of this service even in its infancy. What the losses of the express

company, that is not so easy for me to answer.

The secretary read the following letter from Mr. Farmer: "Will you kindly announce that there will be a meeting of all master mechanics at the Detroit United Power Station A at 3 p. m. Thursday. This meeting is called for the purpose of organizing an association of master mechanics of the different street railway companies."

Mr. Beggs: May I say a word in connection with the announcement which has just been made? I presume this invitation includes the superintendents of maintenance of way and all others connected with the mechanical department as well as master mechanics. I desire to impress upon the presidents and general managers who may be present, the importance of their urging on their mechanical staff an attendance as requested by Mr. Farmer. I think there are some here who recollect that at the last two meetings I have suggested the very thing which is contemplated in this communication, a matter which is of great importance to our industries, and that is an organization of the master mechanics of the various companies. We all know how important it has been in steam railroad practice. We have had an illustration ourselves of what has been accomplished by the Accountants' Association, those in charge of that branch of our business. I believe that even greater good will accrue to the several companies by the organization and the annual getting together of those charged with the design, with the construction, and with the maintenance of the mechanical elements entering into our business. I heartily hope that this matter will be urged and that hereafter we may have an organization as enthusiastic and as effective as has been the Accountants' Association. It would be the best standardizing committee that we could have, Mr. President and gentlemen.

The President: Following out the lines of Mr. Beggs's suggestion I want to say something about what is being done in steam railroad work in connection with associations of this character. I am and have been for four years president of the New York Railroad Club, which takes in all of the transportation, mechanical and operating men of the whole eastern section of the country, the middle states, and in fact, portions of the entire country. That club has a membership of over 1,200. The average attendance of each monthly meeting last year was over 200 and went as high in some instances as 450, men coming from Chicago, St. Louis, Boston, and numerous points in the east to attend these meetings for the purpose of getting what good there was in them. The discussions which we have had during the past year have had an important influence in connection with transportation and mechanical problems. And the importance of these meetings to the members in their work has been emphasized that there is scarcely a meeting of the association when the president doesn't have to stop the discussion so as to give the members an opportunity for lunch and so that they may catch the late trains for their homes.

As far as your association work is concerned, I have already said it—I certainly have done so in connection with the New York State Association—and it would certainly be true of this association that the young men who are connected with the various street railways in the country cannot overestimate the value of this association to them in their work and bringing themselves into prominence. I have seen in the New York Railroad Club a number of men who have secured prominent positions through a paper read on the floor of that club. The paper was read before the men who represented a great railroad system. Any young man who reads a paper at one of these meetings, which shows intelligence and ability to analyze and good judgment, is bringing himself before every man who is connected with prominent street railroad systems of the United States. I take this opportunity, as President of the Association this year, to call the special things to your attention, in the hope of creating an interest in the minds of young men in this particular work.

The fact of my getting up on this floor and reading a paper, or Mr. Beggs reading a paper, or Mr. Dickinson reading a paper, men who have established reputations in the railroad world, is not of as particular value to them, except as it may help you; but in the case of any young man connected in any branch of the work it gives him an opportunity, and brings him prominently

before the men who are at the head of the various companies. In my 25 years of railroad experience I have been able to place a great many men in railroad positions for steam and street railroads, and the first knowledge I had of the capabilities or possibilities of these men was in listening to them before the American Society of Railroad Superintendents, or the General Time Association, which is now known as the American Railway Association, or the New York Railway Club, or the American Street Railway Association or the New York State Street Railway Association. You may work earnestly in your own city, and feel that you are somebody there and attracting some attention, but the United States is large and there is a good deal going on in it. It is only by bringing yourself prominently before a large association that the young men may hope to gain a reputation among the various managers of the country, at least in the majority of cases.

I apologize for taking so much time, but in work of this kind I either go into it to do something, or want to get out of it. I am glad to say that the two sessions that we have held here have been very much above the average of the sessions of this association, both in attendance and in interest. I hope that this association will go forward and occupy the place in the electrical railway world to which it should attain. If it does not go ahead and take its proper place I for one do not want to stay in it. I have not the time and am too much pressed to give my time to an institution unless it is being pushed up hill by its members. Adjourned.

#### KNELL AIR BRAKE.

The Knell Air Brake Co. is located at space 23 near the center of the main floor. Its exhibit this year comprises a car truck completely equipped with the axle driven air brake system and is in full operation. The company has this year one of the most elaborate exhibits and is showing the various styles of axle driven compressors adapted for all styles of trucks. The elevated style compressor is on exhibition this year for the first time and has already proved a great success. The elevated style compressor is especially adapted for maximum traction trucks and has been used for nearly two years on the Coney Island & Brooklyn road. The present master mechanic of that road highly commends the merits of the Knell system. The company will distribute on Thursday and Friday flowers as souvenirs. This has been the custom of the company for the past few years and has always been appreciated by the members of the Association, and particularly by the ladies in attendance. The company is represented by Mr. A. H. Metzelaar, general manager; Joel C. Hopkins, secretary; A. C. Wisner and others. The company hope to see all street railway members at its booth, where it is distributing its new catalogue descriptive of the Knell air brake system.

#### ATLAS RAILWAY SUPPLY CO.

The interests of the Atlas rail joints, tie plates and paints are being looked after by Mr. J. G. McMichael, R. B. Kent and C. D. Porterfield. Mr. McMichael is well satisfied with the prospects of a fine convention, and is especially gratified with the words of approval that he hears on all sides concerning the good qualities of the Atlas supplies. The Atlas joint has been adopted as standard by over 50 of the leading steam and electric railroads in America, and is used extensively abroad. The paints made by the Atlas Co. are particularly adapted to street railroad work for priming and surfacing of cars, the primer taking the place of paste or oil, wood fillers, and is to be applied on the bare wood without any other preparation. The Atlas surfacer takes the place of oil and lead surfacers and under colors. These products reduce the time required to paint a car several days and lessen the cost per car from \$15 to \$20. The company is prepared to guarantee its primer and surfacer, which can be painted over ordinary cracked old work provided the old paint is on firm and solid, without burning the old paint off. They fill all old cracks in the work, no matter how badly the surface has been damaged. A passenger car 60 to 65 ft. long will require four gallons—that is, one gallon of primer and three gallons of surfacer; or a car

20 ft. long with vestibule will require about two gallons, including primer and surfacer, one prime coat and three surfacer coats.

#### THE CRANE CO., CHICAGO.

The chief features of the Crane exhibit this year consist of samples of heavy piping with flanges formed according to the new process recently developed by this company by means of which the pipe is rolled into the flange, taking the place of the older methods of shrinking flanges on to pipe. The sample that is exhibited has been put under test of 1,100 lbs. without a gasket being placed on the connection of pipe to flange to determine if a leak should be discovered. At this pressure no leak developed.

The other feature in connection with the valves is the new method of placing the by-pass valve. Formerly these by-pass valves were put on with gause necks. Now the valve is self-contained and can be easily replaced, making a much simpler device. The company's new catalog, just issued, illustrates all these features and can be had by asking or writing for same.

Capt. G. A. Hurd, of the home office, is looking after the interests of the company. Former members of the association will remember Capt. Hurd as having been with the Second U. S. Vol. Engineers during the Spanish-American war.

#### CHRISTENSEN ENGINEERING CO.

The Christensen Engineering Co., Milwaukee, has a very interesting exhibit, including a straight air-brake school equipment, and an automatic air brake multiple unit equipment, both of which were in operation. Also a Christensen portable motor driven air compressor in operation by means of a hook connection to a trolley wire.

The company also exhibits some of its new electrical machinery, including a 250-k. w. 3-phase 2200 volt alternator; a 30 h. p. 500-volt open style motor, and a 4 h. p. 500-volt enclosed style motor.

The company distributed very attractive booklets on its air-brake equipments and electrical machinery.

The Christensen Engineering Co.'s interests were cared for by the following representatives: F. C. Randall, manager sales department, New York; J. T. Cunningham, eastern sales agent, New York; J. J. Neff, engineer, New York; J. F. Dixon, Jr., secretary sales department, New York; J. H. Denton, chief engineer sales department, New York; W. W. Power, Pennsylvania sales agent, Philadelphia; Wm. Gobel, Pennsylvania engineer, Philadelphia; H. N. Ransom, sales agent, Cleveland; J. J. Riley, Cleveland; J. E. Eldred, Jr., sales agent, Chicago; C. P. Tolman, assistant chief engineer sales department, Chicago; S. A. Christensen, consulting engineer, Milwaukee; Chas. D. Knight, mechanical engineer, Milwaukee; W. L. Waters, electrical engineer, Milwaukee; J. C. James, Milwaukee; W. J. Richards, Milwaukee, F. L. Hutchinson, advertising manager, Milwaukee.

#### AMERICAN STEEL & WIRE CO.

One of the most attractive booths is that of the American Steel & Wire Co., with its display of trolley wire, conduits, cables, fencing for right of way, and rail bonds. The company is represented by C. S. Knight, Jr., F. A. Keyes, T. A. Sheppard, George Chandler, H. T. Pratt, W. H. VanSicklen and W. C. Bogue. The brightest feature of the exhibit, and, in fact, the brightest feature of the entire exhibition is the large electric sign over the entrance to the booth. Over 350 incandescent lamps were taken to spell out the company's name in full. The various small samples are artistically displayed on bulletin boards at the back of the space. The company's souvenir this year consists of a very neat little pocketlock.

One of the most jovial attendants at the convention is M. W. Conway, of Brooklyn, N. Y., who looks after the interests of the New York Switch & Crossing Co., of Hoboken, N. J., the Catskill R. R., and several other business enterprises with which he is actively identified. He came to town on the "Detroit special" that arrived Tuesday morning.

THE OHIO BRASS CO. EXHIBIT.

With customary progressiveness the Ohio Brass Co. presents this year an exhibit which is a radical departure from any heretofore attempted by the company, and which is, in fact, one of the most unique and attractive exhibits at the convention. The exhibit is located in Space No. 39 on the main aisle of the building, and fronts on three aisles. In lieu of a railing, the space is surrounded by a number of third rail insulators which support a standard section of steel rail. These rails are bonded with various types of the well-known "All Wire" rail bond made by the company, and well illustrate the application of the bond. A very complete and varied line of overhead line material is shown, including a number of track bonding devices, and various motor and car appliances, such as are manufactured by the company. These are very attractively displayed on five stands of unique design, which permit of a ready inspection of the different articles.

Among the larger products of the company might be mentioned a variety of different styles of flexible pole brackets, including the well-known "Richmond" and "Detroit" types, a "Monarch" track cleaner, and an emergency hose bridge. A great profusion of "All Wire" rail bonds is displayed, in all the various types and forms made by the company. The company has arranged to distribute among both the lady and gentlemen visitors, a number of attractive and useful souvenirs.

An office is situated at one end of the space, and enclosed with palms and screens.

Those in attendance at the exhibit are: F. B. Black, president; C. K. Kling, secretary; G. A. Harwood, general agent; G. A. Mead, electrical engineer; A. B. Edes, H. C. Schwable and C. N. Manfred, of the Mansfield office, and the following representatives of the company: A. L. Wilkinson, of Mansfield, O.; N. M. Garland, manager New York office; Burt Gellatly, manager Pittsburg office; M. A. Berg, J. W. Porter and E. R. Mason, of the Chicago office; Otto W. Uthoff, manager St. Louis office; J. C. Warren, jr., manager Norfolk office, and E. D. McCormack, of the Canadian General Electric Co., Limited, of Toronto, the Canadian representative of the company.

POLES AND TIES.

The view of the pole yard on this page was taken in the pole and lumber yards of the Maltby Lumber Co., of Bay City, Mich. The yards are situated near Detroit on the River Rouge, and from here are shipped the large orders for poles from the West-

LOGS IN YARD OF MALTBY LUMBER CO.

ern Union Telegraph Co., the American Telegraph & Telephone Co., and from other telephone companies, as well as from many electric railway companies.

Although the boats' down unloading might give the idea that all the pole come by water that is not the fact as a greater

portion come in by rail. At one time last winter there were 75 cars on tracks at the yards waiting to be unloaded. The photograph of the steamer "Emerald" was taken on her arrival from her sixth trip. She has made two trips since then, and the steamer "Seattle," not shown, has made one.

Next adjoining this yard are the yards of the Western Union Telegraph Co., in which are stored at all times from 75,000 to 85,000 telegraph poles. The two yards together probably constitute by far the largest stock of poles anywhere in the United States.

HEADQUARTERS FOR HIGH GRADE VARNISHES.

The illustration herewith shows the handsome and dignified building recently erected by Messrs. Berry Brothers, Limited, the varnish manufacturers of Detroit, to be used by them as an office. The term office seems inadequate in the present case, however, as the various departments and large clerical staff handling not only the Detroit business, but that of the many branches located in the principal cities of the United States entitle the structure to be called the administration building of the firm which it is in reality.

OFFICE OF BERRY BROTHERS, LTD.

The building is a type of the modern French Renaissance, and all its details, both exterior and interior, have been dominated by this idea. The wall field is of dark red pressed brick laid up in English cross bond, the main cornice, main entrance and exterior trimmings generally being of gray terra cotta. The roof is of red terra cotta tile. The interior trim is of antique finished quarter sawed oak, the finely developed grain of the wood bearing eloquent tribute to Berry Brothers' celebrated hard oil finish. The ceiling is supported by massive columns of Florentine marble with bronze capitals and Verde antique marble bases. The columns carry ornamental stucco cornices of handsome fluted design with which the entire ceiling is paneled. The main office floors are of quarter sawed white oak laid in herringbone pattern in pieces 12 in. long, and, as finished with Berry Brothers' liquid granite, present a very handsome appearance.

The large and finely appointed private offices, of which there are six, are divided by wide panels built up of veneers with moulded cornices, the spaces between them and the ceiling being filled with polished plate glass set in antique brass. The private offices have also antique oak mantels and fireplaces of Verde antique marble, and bronze.

An extensive system of fire proof vaults is fitted up with the latest devices in steel shelves, lockers, etc., and the entire building is heated by hot water with both direct and indirect radiation with the fan system for ventilation.

The dimensions of the building are 95x115 ft.; no striking effects are aimed at, the building being a perfect specimen of the restful and conservative type of architecture, and exciting admiration for the dignified symmetry of its lines and proportions.

# SIXTH REGULAR ANNUAL MEETING STREET RAILWAY ACCOUNTANTS' ASSOCIATION

Detroit, Mich.—Oct. 8—10, 1902.

(Continued from page 670.)

## REPORT OF THE COMMITTEE ON A STANDARD FORM OF REPORT FOR ELECTRIC RAILWAYS.

W. F. Ham, Comptroller Washington Railway and Electric Co.; E. M. White, Cashier Hartford Street Railway Co.; C. N. Duffy, Secretary Chicago City Ry.; Committee.

### REPORT FOR ELECTRIC RAILWAYS.

To correctly understand the objects sought to be accomplished by this committee, it is necessary to review briefly the circumstances leading to its appointment. As stated in the constitution of this Association, one of its objects is to promote the adoption of a uniform system of accounts. At its first meeting held in Cleveland, Ohio, March, 1897, a committee was appointed to submit a report on a standard system of street railway accounting. With the work of that committee, known as the Standardization Committee, you are all familiar, and it is only necessary to say that the classifications reported by them were adopted by this Association as standard and are now in general use throughout the country.

We should, however, speak more particularly of the relations existing between this Association and the National Association of Railroad Commissioners. The Standardization Committee had two objects.

First. To devise a standard system of street railway accounting, covering the classification of construction and equipment accounts, classification of operating expense accounts and forms of monthly and annual reports; and

Second. To promote in every way possible the adoption and use of the above classifications and forms.

From the first they realized the desirability of working in harmony with such public officials as exercise supervision over the accounts of street railways, with a view to having the classifications of this Association approved by them and used in the reports of street railway companies.

Learning that the National Convention of Railroad Commissioners had appointed a committee to prepare a standard system of street railway accounts, the Standardization Committee put itself in touch with them and after several conferences, the system prepared by the Standardization Committee and adopted by this Association was approved and recommended for use by the National Convention of Railroad Commissioners held at Denver, Col., August, 1899.

You will understand that this approval by the National Convention of Railroad Commissioners did not necessarily mean its adoption and use in any individual State. To accomplish this result required action by the several State Boards of Railway Commissioners. Up to the present, the only states that prescribe our system are New York and Connecticut, so that much remains to be done by this Association and its Standardization Committee to bring into line the other states that exercise supervision over the accounts of street railway companies.

Our position, however, was much strengthened by the action of the Denver Convention and we were invited to send representatives to the Convention of Railroad Commissioners held in Milwaukee in May, 1900, and again to their convention held in San Francisco in June, 1901. At the latter convention, a constitution was adopted in which it was provided that the Street Railway Accountants' Association should be made an honorary member of their Association and should be represented at each convention by three delegates, thereby giving us formal and permanent recognition.

At the San Francisco Convention, the following resolution was adopted: "That a special committee of three be appointed by the Chair to prepare a form for reports of electric railroads and that said committee be authorized to act in co-operation with a similar committee to be appointed by the President of the Street Railway Accountants' Association of America, and to invite the assistance of any other person possessing expert knowledge of the subject and that they make report of the result of their proceedings to the next annual convention of this body."

In accordance with the above resolution a committee was appointed consisting of Hon. Lavant M. Read, of Vermont; Hon. George W. Bishop, of Massachusetts; and Hon. Ashley W. Cole, of New York. The President of this Association was informed of the appointment of the above committee and was asked to appoint a committee to confer with them in the preparation of a report. Our committee met a majority of the committee of the Association of Railroad Commissioners in New York in January, 1902, but owing to the severe illness of Judge Read, the chairman of their committee, and the short time intervening before the next convention to be held in Charleston, S. C., in February, their committee decided to allow the matter to go over for another year.

Since the Charleston convention, the president of the National Association of Railroad Commissioners, Hon. Benjamin F. Chadbourn, of Maine, communicated with the president of this Association, suggesting that our committee submit a report to our Association at the present convention, and that this report be the subject of conference between their committee and our committee, the result of such conference to be reported to their next convention to be held in Portland, Maine, July, 1903.

From the foregoing, you will correctly understand why this committee was appointed and what it hopes to accomplish. As it has been the aim of the Standardization Committee to secure the adoption of a standard system, so it is the aim of this committee to assist the National Association of Railroad Commissioners in their efforts to secure uniformity in the form of reports by street railway companies to state boards or other bodies exercising supervision over their accounts. It is needless to say that such a result will be of the greatest benefit. To the public, it will be the culmination of our efforts in the direction of standardization of accounts.

The Standardization Committee confined itself to a classification of construction and equipment accounts, classification of operating expense accounts, and forms of monthly and annual reports.

This committee has gone somewhat further by preparing a Comparative Balance Sheet, with accompanying schedules; a form for description of road and equipment; a form for mileage traffic and miscellaneous statistics; and a form for historical and general information. We have eliminated certain features of the usual report required by railway commissioners, which have been outgrown in the development of the business. We believe the report submitted contains all essential information and gives to the public a complete and intelligible report in a simple and concise form.

This committee suggests no change in the classification of construction and equipment accounts.

In the classification of operating expense accounts, we suggest the following minor changes:

Account No. 19: To read "Wages of Miscellaneous Car Service Employees" instead of "Wages of Other Car Service Employees."

Account No. 22a: "Hired Equipment." The insertion of this

account to cover rental of cars, electric equipment of cars, and other equipment.

Account No. 20: To read "Stores Expenses" instead of "Store-room Expenses."

Account No. 35: To read "Miscellaneous Legal Expenses" instead of "Other Legal Expenses."

In the form of income account, we suggest changes of more importance.

Gross Earnings from Operation are separated into two divisions:

First: Car Earnings, to include all earnings derived from the operation of cars, and

Second: Miscellaneous Earnings, to include all earnings resulting from the operation of the property not included in car earnings.

Income from Advertising, Rent of Land and Buildings, and Rent of Tracks and Terminals, previously included under "Income from Other Sources," are now treated as "Miscellaneous Earnings."

A new account "Income from Rent of Equipment" is also treated as "Miscellaneous Earnings."

Sale of Power, previously classified as "Miscellaneous Income from Other Sources," is now treated as "Miscellaneous Earnings." Under the former classification, the amount shown as "Miscellaneous Income from Other Sources" was the net amount after the cost of the production of the power sold had been deducted. In the present report, the gross amount received from the sale of power is shown as Miscellaneous Earnings and the cost of the production of this power is included in operating expenses.

With regard to "Rent of Land and Buildings" exception is made of Income from Rent of Real Estate purchased or conducted as an outside investment, and with regard to "Rent of Tracks and Terminals," exception is made of Income from Leased Lines or Terminals, the operation of which has been temporarily or permanently abandoned by the lessor.

Your committee have not made the changes in transferring the above accounts from "Income from Other Sources" to "Miscellaneous Earnings" without a careful consideration of the advantages and disadvantages of so doing. They realize the undesirability of making changes in the forms adopted by this Association as standard and would not recommend changes of consequence were they not fully convinced that the former arrangement was illogical and improper from a correct accounting and common-sense standpoint.

The gross earnings from the operation of a railroad property as surely include income from advertising in its cars, rents from tracks, terminals, land, buildings and equipment, and income from sale of power as the earnings from passengers, freight, mail, etc.

The definition of earnings is "money or other compensation to which one has a claim for services rendered." Surely a service is rendered when we allow others to use the space in our cars for advertising privileges, to operate their cars over our tracks, to use our land, buildings, cars or other equipment, to utilize our power for lighting, heating or other purposes. If these things are not earnings, nothing can be classed as earnings. That they are different from the earnings derived from the operation of the cars, we admit, and have for that reason made two divisions of earnings as above stated, namely, Car Earnings and Miscellaneous Earnings.

Another reason why these items should be treated as earnings from operation is that the expense of maintenance of track, terminals, buildings and equipment is naturally included in operating expenses, and if excluded, the total cost of operation is not shown. This is also true of receipts from sale of power, where in addition, the actual cost of the production of the power sold can not be determined with any degree of accuracy.

The reason for excluding from earnings from operation the rents received from property purchased or conducted as an outside investment is manifest, as we are dealing with the operation of a railroad property. Likewise, the reason for excluding from earnings the income from leased lines or terminals, the operation of which has been temporarily or permanently abandoned by the lessor is apparent, as we are dealing with earnings

from operation and that which is not operated can certainly yield no earnings from operation.

The title "Miscellaneous Income" has been substituted for "Income from Other Sources."

The title "Income from Securities Owned" has been substituted for "Interest and Dividends on Securities Owned."

The title "Gross Income less Operating Expenses" has been substituted for the title "Gross Income."

Here a word of explanation seems desirable. Your committee feel that the title "Gross Income" as used in our previous report and now in general use in street railway and steam railway accounting is radically wrong. Turn, if you will, to Webster's Dictionary and you will find the word "gross" defined, "Undiminished by deduction, entire;" yet in common use as applied to street and steam railway accounting, gross income means "Gross Earnings from Operation and other Sources with Operating Expenses Deducted." This is a manifestly improper use of the word "gross," and we have therefore in our present report used the term "Gross Income less Operating Expenses," as being the correct title in place of "Gross Income."

Taxes we have shown in four separate divisions:

1. On real and personal property.
2. On capital stock.
3. On earnings.
4. Miscellaneous.

The title "Rent of Leased Lines and Terminals" has been substituted for "Rentals of Leased Lines."

As the first deduction from net income we have placed "Reserves and Special Charges" which takes the place of "Additions and Betterments" and "Sinking Funds" in the old form.

At the foot of the Income Statement we have placed a statement of Profit and Loss adjustments during the year, which are to include all items affecting Profit and Loss which have not passed through the Income Account. In this way a complete exhibit is made for the year.

We ask your careful consideration and open criticism of the forms that follow.

#### FORM OF REPORT FOR ELECTRIC RAILWAYS.

To include:

1. Income Account for the year, with accompanying Schedules.
  - a. Gross earnings from Operation.
  - b. Operating expenses.
  - c. Detailed Statement of rentals of Leased Lines and Terminals.
2. Comparative General Balance Sheet, with accompanying Schedules.
  - d. Construction and Equipment.
  - e. Construction and equipment, Leased Lines.
  - f. Capital Stock and Funded Debt.
3. Description of Road and Equipment.
  1. Mileage, traffic and miscellaneous statistics.
  5. Historical and general information.

#### REMARKS.

GROSS EARNINGS FROM OPERATION—Divided into

First: Car Earnings, to include all earnings derived from the operation of cars.

Second: Miscellaneous Earnings, to include all earnings resulting from the operation of the property, not included in car earnings.

CAR EARNINGS: Divided into earnings from passengers (whether cash or ticket), chartered cars, freight, mail, express and other car earnings.

As an illustration of a proper charge to the last named account, might be mentioned the fixed compensation received for the transportation of letter carriers in uniform.

MISCELLANEOUS EARNINGS:

Advertising:—If a company conducts the business of selling or renting advertising space in its cars instead of leasing this privilege to others, the amount shown as "Income from Advertising" should be the net income from this source after deducting all expenses of conducting the business.

**Rent of Land and Buildings:** This refers to Real Estate that has been or is intended to be, used for the operation of the property, and should show the gross rent without deduction of any expenses.

Income from rent of real estate, purchased or conducted as an outside investment, in which might properly be included office buildings used in part for railway purposes should be included in "Miscellaneous Income," after deducting all taxes, insurance, water rents or rates, cost of repairs and other expenses connected with such real estate.

**Rent of Tracks and Terminals:** To include all compensation received for the use of tracks, terminals and bridges, the operation of which has not been abandoned by the lessor on whatever basis such compensation may be determined. It may be a fixed sum per annum or a fluctuating rental based upon the number of car miles run, passengers carried, etc.

The word "terminals" is not meant to refer to depots, car houses or other buildings at the termini of the road.

Income from leased lines or terminals, the operation of which has been temporarily or permanently abandoned by the lessor, should be included in "Miscellaneous Income."

**Rent of Equipment:** To include all rent received for cars and other equipment, on whatever basis such rent may be determined.

**Sale of Power:** To include all receipts from the sale of power, whether for heating, lighting or motive purposes.

If the company conducts a lighting as well as a railway business, this account should not include receipts from the lighting business, but the Net Income resulting from the lighting business should be included in "Miscellaneous Income." The same principle applies to any other outside business conducted by the company, including operation of parks, park resorts and similar property.

**Other Miscellaneous Earnings:** To include all other miscellaneous earnings not specified above.

**MISCELLANEOUS INCOME:**

**Interest on Deposits:** To include interest on current or special funds on deposit.

**Income from Securities Owned:** To include income from stocks, bonds or other securities owned.

**Rent of Leased Lines and Terminals:** To include income from leased lines or terminals, the operation of which has been temporarily or permanently abandoned by the lessor.

**Other Miscellaneous Income:** To include all miscellaneous income not specified above.

Income from rent of real estate purchased or conducted as an outside investment, in which may properly be included office buildings used in part for railway purposes, should appear in "Miscellaneous Income" and the amount shown should be the net amount received after deducting all taxes, insurance, water rents or rates, cost of repairs and other expenses connected with such real estate.

Income from the operation of parks, park resorts or similar property should appear in "Miscellaneous Income" and the amount shown should be the net amount received after deducting all expenses connected with such operation.

If the company conducts a lighting as well as a railway business the net income resulting from the lighting business should appear under "Miscellaneous Income." The same applies to any other outside business conducted by the company.

**DEDUCTIONS FROM INCOME:**

**Taxes:** To include all taxes on real estate and personal property, track taxes, franchise taxes, taxes upon capital stock, taxes upon gross earnings, car licenses and other vehicle licenses; excepting, however, taxes on property such as real estate purchased or conducted as an outside investment the net income from which is credited to "Miscellaneous Income."

**Rent of Leased Lines and Terminals:** To include rent of leased lines or terminals the operation of which has been temporarily or permanently abandoned by the lessor.

1. Maintenance of Track and Roadway	\$.....
2. Maintenance of Electric Line	\$.....
3. Maintenance of Buildings and Fixtures	\$.....

The items under this are Preferred and Common, with a summary showing Total number of stockholders, Total number of stockholders in this State, and Amount of stock held in this State.

For the funded debt the column headings are: Date of Issue. Term of years. Date of maturity. Amount authorized. Amount outstanding. Interest rate, when payable, accrued during year.

A summary shows the stock and debt per mile of track.

#### DESCRIPTION OF ROAD AND EQUIPMENT.

This form is divided into TRACK and CARS, ETC.

Under "Track" the column headings are: Owned. Leased. Operated under Trackage Rights. Total Operated.

The items under "Track" are: Length of road (first main track). Length of second main track. Total length of main track. Length of sidings and turnouts.

Under "Cars, etc.," the column heads are: With Electric Equipment. Without Electric Equipment. Total Number.

The items are: Closed Passenger Cars. Open Passenger Cars. Combination Closed and Open Passenger Cars. Total Passenger Cars. Freight Cars. Mail Cars. Express Cars. Baggage Cars. Combination Cars. Work Cars. Snow Plows. Sweepers. Miscellaneous. Total.

#### MILEAGE, TRAFFIC AND MISCELLANEOUS STATISTICS.

Passenger car mileage.

Freight, mail and express car mileage.

Total car mileage.

Passenger car hours.

Freight, mail and express car hours.

Total car hours.

Fare passengers carried.

Transfer passengers carried.

Total passengers carried.

Average fare, revenue passengers.

Average fare, all passengers (including transfer passengers).

Car earnings per car-mile.

Miscellaneous earnings per car-mile.

Gross earnings per car-mile.

Car earnings per car-hour.

Miscellaneous earnings per car-hour.

Gross earnings per car-hour.

Operating expenses per car-mile.

Operating expenses and taxes per car-mile.

Operating expenses per car-hour.

Operating expenses and taxes per car-hour.

Operating expenses per cent. of gross earnings.

Operating expenses and taxes per cent. of gross earnings.

Average number of employes, including officials, during year.

Aggregate amount of salaries and wages paid.

#### SUMMARY OF ACCIDENTS DURING YEAR.

(The number of killed, injured, and total classified as passengers, employes and others.)

#### GENERAL INFORMATION.

Historical sketch of organization, construction, leasing and consolidation of lines now operated.

Corporate names and address of company.

Names and addresses of officers and directors.

Date of close of fiscal year.

Date of stockholders' annual meeting.

\*\*\*

#### KINNEAR STEEL ROLLING DOORS.

The Kinnear Manufacturing Co., of Columbus, O., displayed samples of its rolling doors for car houses, of which the company's circulars say: "They are fireproof, durable, easy to operate and minimize the cost for maintenance and repairs." These doors are equipped with special trolley arrangements which afford uninterrupted current to each track in the car house, no matter what the position of the entrance door may be. The Kinnear rolling door has been adopted by the Boston Elevated Railway Co., of Boston, and is used by many of the leading roads of the country.

#### LORAIN STEEL CO.

The Lorain Steel Co. has been badly disappointed in not receiving its exhibit, the car containing the various parts of the display having been delayed by a bad wreck. The company is doing business, however, at its space in Convention Hall and all visitors will be more than welcome at the booth and at the company's parlors in the Cadillac. The following staff of representatives is on hand: P. M. Boyd, Lorain; A. S. Littlefield, Chicago; D. J. Evans, Chicago; Maj. Henry Charles Evans, New York; W. W. Kingston, Atlanta; Randolph Clitz, Lorain; S. P. S. Ellis, Pittsburg; E. B. Entwisle, Johnstown.

\*\*\*

#### LARGE CONTRACT FOR HEATERS.

General Agent Cornell S. Hawley, of the Consolidated Car Heating Co., states that a recent shipment of 21,600 heaters to the Manhattan elevated railway of New York is the largest contract for electric heaters ever given in the world. Mr. Hawley also calls especial attention to a chair car heater largely used for high speed interurban cars, and which is exhibited here. This heater may also be seen in Detroit in Detroit, Ypsilanti, Ann Arbor and Jackson Railway cars.

\*\*\*

#### A NEW SECTION INSULATOR.

The Albert & J. M. Anderson Manufacturing Co., of Boston, Mass., has space with the Morris Electric Co. in the balcony, where Mr. Ernst Woltmann calls attention to the new Anderson Section Insulator. This device, it is pointed out, has a dozen good points and is calculated to save the trolley wire, the line-man's time and contributes to the general permanence, safety and economy of the line. It is made in malleable iron, galvanized or strong bronze metal, as desired. It is adapted to either round or grooved trolley wire, and the terminals which hold the trolley wire at either end of the device may be detached from the body and renewed without removing the body from the line.

\*\*\*

#### STANDARD UNDERGROUND CABLES.

In a corner of the balcony in the exhibit hall, adjoining the exhibit of the Standard Paint Co., is a display by the Standard Underground Cable Co. The exhibit includes samples showing various styles of underground cables especially designed for street railway work, also new copper rod and wire mills. The company advises its friends to keep December in mind, because its new copper rod and wire mills and weather-proof wire and cable factories are to be in full operation about the 20th. The new factories are claimed to be the finest and most modern in this country. The company is represented here by H. P. Kimball, of New York; J. R. Wiley, of Chicago, and A. A. Anderson and F. S. Viele, of Pittsburg.

\*\*\*

In connection with the exhibit of Heywood Bros. & Wakefield Co. the Union Switch & Signal Co., of Easton, Pa., is showing a set of its electric staff instruments for blocking high speed electric railways. Mr. T. H. Patenall represents the company.

\*\*\*

The Grillin Wheel Co., of Chicago, is so well and favorably known that it is only necessary to state that it has a space conveniently located to the main entrance to the exhibit hall to insure a constant stream of callers at its booth. This company began business in '77 and now has six large plants turning out its products. Its representatives at the convention are W. S. Harpwell and C. K. Knickerbocker, of Chicago, and J. S. Young, of Detroit.

\*\*\*

Mr. C. S. Hawley, general agent for the Consolidated Car Heating Company, of New York, can be found at his space in Exhibition Hall every day and will be glad to talk heaters to anyone interested.

\*\*\*

Mr. Geo. M. Hoadley, of the Bemis Car Truck Co., and who was for ten years manager of the Bemis Car Box Co., is in attendance at the convention.

HEYWOOD BROTHERS & WAKEFIELD CO.

The Heywood Brothers & Wakefield Co., which claims to be the largest chair manufacturer in the world, and which has four large manufacturing plants and eight warehouses in various cities, shows a full line of their railroad specialties consisting of car seats, spring seating, rattan webbing, snow broom rattan, mats, etc. The Wheeler No. 42 is shown in rattan, with backs offset, by which means 3 in. is gained in the aisle space of a car at the hips, where the aisle room is most required; this seat also has a brass grab handle on the back for the convenience of passengers standing. There is also shown a handsome sample of this seat in plush, with high back and head rest, and a spring edge cushion, making a most comfortable seat for a long ride; it has a pedestal base, which is a convenience when cleaning the car, and a movable foot rest, allowing room under the seat for grips and packages. Other exhibits include a sample of the double revolving chairs, such as used in Brooklyn; samples of spring seating, which the company furnishes in rattan, carpet, plush or artificial leather; samples of rattan webbing, snow broom rattan and cocoa mats for elevated cars.

The company is represented by Mr. Fred Henry, whose headquarters are at Wakefield, Mass., and Mr. Bertram Berry, who is located at 129 Carlton St., New York.

GOULD STORAGE BATTERY.

The Gould Storage Battery Co., of New York, has an exhibit at space No. 31, where are shown samples of plates of all sizes from small 3x3 in. to large central station type. Glass and lead line tanks are shown with special glass covers to reduce evaporation and loss of acid by "spraying." Attractive features of the exhibit are photographs of railway installations and boosters. Bulletin No. 2 of the Gould company describing plants equipped with Gould C. T. M. P. boosters was printed especially for the convention. The company's representatives are W. M. Donaldson, sales manager in charge; E. L. Draffen, manager Chicago office; Albert B. Herrick, electrical engineer.

AUTOMATIC BLOCK SIGNAL.

One of the busiest men at the convention is Mr. W. S. Berry, general manager of the Pittsburgh Switch & Signal Co., who is constantly called upon to explain the working of the Berry automatic block signal and car spacing device. It is a semaphore signal that does not depend upon incandescent lamps for signaling, but a red target, signifying danger, and a green target, signifying safety. A group of incandescent lamps is so arranged that they can be thrown off during the day and on during the night. It is claimed that as many trains or cars going in the same direction as the management of the road may desire can run into a gauntlet or block at the same time and the targets will not show safety until the last train or car has left the block; also, if from any reason a wire breaks or a magnet burns out the signal will at once go to danger by gravity.

When no car is in the block or gauntlet, the semaphores are held in a perpendicular position by magnets. These signals can be used as car spacers, and where sharp curves occur between turnouts signals can be placed as an extra precaution, so that a careless motorman who may have run against the danger signal at the turnout will be again warned. The signal operates whether the motorman uses power or not and is entirely out of the crew's control. There are no triggers or other obstruction for the trolley wheel or pole to strike to operate signal. Mr. Berry has the assistance at the exhibit of Mr. B. J. Sammon.

A TRACK BARROW.

The American Trackbarrow Co., of Lowell, Mass., has hit upon a new idea in convention waycenders. It is furnishing delegates and visitors souvenir postal cards and engraved letterheads for carrying on their correspondence during the convention. The letterheads bear portraits of the officers of the A. S. R. Association, views of the Cadillac Hotel, the Light Guard Armory, the Masonic Temple and of the American Trackbarrow.

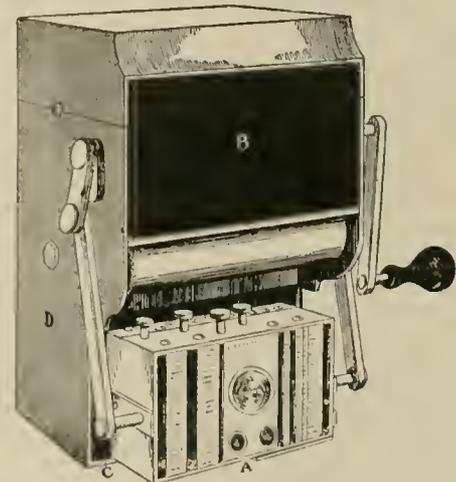

PITTSBURG TRANSFER TICKET MACHINE.

The Pittsburg Blue Print Paper & Manufacturing Co., 1505 Park Building, Pittsburg, has on exhibition a transfer ticket machine which is attracting much attention. The machine has been designed primarily to prevent fraudulent tickets being issued by dishonest or ignorant employes, and is described and the operation explained by the maker as follows:

The machine consists of the printing block A., ink pad B, impression platen C and case D.

The case contains alarm bell, automatic counter, automatic feed rolls and paper roll. The upper end of the case is hinged and may be opened at any time by the operator to put in a fresh roll of paper. The counter and bell are operated at the instant of printing by suitable cams and trip levers.

The printing plate is shown at A. The visible or face side of the plate is made up of actual proof prints from the type side and consequently corresponds to it exactly. The time setting mechanism is worked through ratchet and pawl, which prevents the motion of the hour and minute hand being reversed at any time. A locking pin is adjusted to lock the whole time mechanism at 12, midnight, or any other predetermined hour. The ends of the date indicator screws are covered by a plate which is locked in place before the car leaves the barn each morning.

TRANSFER TICKET MACHINE.

In operation, the day, month and date indicators are set and the time mechanism released before the car starts on its first trip each day. The conductor sets the "from" and "to" indicators and moves the hour and minute hands forward to correct time, and also sets the direction hand. He then turns the crank on the right hand side of machine through one-half revolution, thus bringing the printing block down onto impression pad, printing his ticket, ringing the alarm bell and counting the ticket. By completing the crank revolution he brings the printing plate back to its position on the inking pad and feeds out enough paper for the next transfer ticket.

The principal advantages claimed for the apparatus are its simplicity, its ease and certainty of operation, its economy in that only so many transfers as are actually used need be printed, and the fact that it gives the company absolute control over the transfer business.

LE VALLEY VITAE BRUSHES.

Although at first discouraged by his inability to procure exhibition space, President J. V. Clarke, of the Le Valley Vitae Carbon Brush Co., persevered and at the last moment secured a desirable location in the right balcony, where is displayed to good advantage the brushes for which this company is noted. The Le Valley brushes have been subjected to some pretty severe tests and are reported to have given satisfaction wherever used. Mr. Clarke shows some "old stagers" that have had interesting experiences. Among them is a brush that was used on the Tarry

town, White Plains & Mamaroneck Railway for 16,836 miles and was only worn one-half inch. Another was tested by the Lorain Steel Co. at Johnstown, Pa., where it ran 11,000 miles and was worn but 7/16 of an inch. The Edwards Headlight Co. has adopted Vtae carbons for all of its headlights, and Mr. Clarke states that one large railway company has just placed a very large order, after having tested the brushes for the past year on all its machines. The company has on its books many orders from large railway and electrical concerns all over the country. For a souvenir Mr. Clarke gives all comers a small carbon brush.

#### GENERAL ELECTRIC EXHIBIT

The General Electric Co.'s exhibit is located in the corner of the Annex and occupies 2,000 sq. ft. of space. The principal feature is an installation of the Type "M" Control now in use on the Manhattan Elevated Railway in New York City. This exhibit is mounted on a frame which permits free examination of the parts during its operation and shows the rise in voltage which, of course, corresponds to the increase in speed of the motors. To indicate this rise in voltage a number of incandescent lamps are used, grouped in the form of the company's monogram, which start at a dull red and gradually come up to full candle power. Other General Electric apparatus for electric railway service exhibited consists of a line of railway motors of various sizes, including the 125 h. p. GE-66 motor which has been adopted by the Manhattan Railway Co. A Brill 27-E truck is shown with two GE-57 motors mounted upon it and equipped with the General Electric new type of shoe for use on the protected third rail system. This latter is here exhibited for the first time. There are also exhibited General Electric air compressors of standard types with automatic governors; these are in operation connected to a standard reservoir.

A Type H electrically controlled oil break switch with a capacity of 300 amperes at 12,000 volts makes a very interesting operating exhibit; the switch being substantially installed as in actual service. Direct and alternating current rotary converter panels of standard type are also shown. Among the small supplies here exhibited may be mentioned a 6,000 ampere carbon break circuit breaker for railway use, beside smaller sizes of the same type. An attractive display stand for rail bonds, incandescent lamp sockets and other small devices is also shown.

The entire exhibit is arranged for convenience of examination by visitors, and the attractive reception space at the center of the exhibit makes a pleasant resting place for the delegates.

A feature of considerable interest which forms a part of the exhibit is a 60-ft. interurban car lent by the Jackson & Suburban Traction Co. and used by the company in demonstrating the system for operating such cars. This car is equipped with the Type M control and four GE-66 motors. It is located on the Detroit United Railway tracks at a point near the Convention Hall and may be used by the delegates and their friends for rides around the city of Detroit.

#### KELLOGG SWITCHBOARD EXHIBIT

It is the avowed aim of the Kellogg Switchboard & Supply Co. to produce the finest telephone apparatus in the world and, judging by the variety and finish of the instruments shown by it in booth 80, in the balcony, a long step in the right direction has been taken. A full line of common battery and magneto telephones is set up, together with a common battery switchboard with which the telephones are connected. This common or central battery dispenses with batteries at subscribers' stations, the entire exchange being worked from a battery at the central office. The battery may be primary or secondary.

These boards have the advantage of automatic signaling and the line signal used may be a small incandescent lamp placed in proximity to the line jack, or it may be a mechanical target type. Kellogg telephones have been designed and built with the idea of meeting all classes of service. They are all equipped with the new Kellogg transmitters and receivers. Every movable contact in the Kellogg telephone is platinum. The Kellogg factory in Chicago is the largest and best equipped of any independent telephone manufacturing concern.

The exhibit is in charge of Messrs. R. H. Manson, of the engineering department, and F. L. Martin, of the advertising department. These young men know how to create an interest in their display, one of the means employed being to give every caller a chance to talk through himself. Connected with one of the telephones is a hand battery outfit such as physicians use and all that is necessary to enable one to get a shock is to hold the handles and speak into the transmitter. The louder the tones, the stronger the shock.

#### SOMETHING NEW IN CURTAINS.

The United States Curtain Co. is one of the exhibitors that secured space too late for announcement. Its quarters may be found in conjunction with the Sterling-Meaker exhibit on the main floor. It shows curtains that will absolutely keep out sun, wind and rain. The construction is simple and the curtains are very easy to keep in repair. The device consists of a metal strip fastened to the edge of the curtain, traveling in a metal run in the groove of the post which holds the edges. There is also shown a new device by which by pressing a button on the inside of the car the curtain is released and raised by the spring. This company also makes the pinch-bar fixture, but the curtain recommended is the new balance curtain, as the first-named is called. Mr. Alonzo E. Nutter represents the company here.

#### THE "P. & B." DISPLAY.

The Standard Paint Co. exhibits in the balcony, displaying the famed P. & B. paints and insulating compounds, P. & B. tape, Ruberoid roofing and P. & B. insulating papers and motor cloth. A feature of the booth is the decoration of the rear wall, which is hung in purple, in the center of which appears in gilt the P. & B. rooster trade mark of the company. Messrs. J. C. Shalnwald, western manager, and B. C. Beckman and E. R. Willard, all of Chicago, dispense hospitality and souvenirs in the shape of a dainty Russia leather combination card case and engagement book.

#### A LARGE PAINT CONCERN.

The Sherwin-Williams Paint Co. has spacious headquarters in Booth 19, where its representatives are kept busy setting forth its claims, among which is that it is by far the largest paint and varnish concern in the world. This company has four large plants, in Cleveland, Chicago, Montreal and Newark, and warehouses and offices in seven other cities. It makes, treats and refines all its linseed oil; manufactures dry colors; makes varnishes, japans and driers; makes its tin cans; operates its own box factory; has its own printing plant; runs its own machine shops for making the mills and machinery of its exclusive design, and owns a screw steamer for carrying flax seed and lumber down the Great Lakes.

The Sherwin-Williams company specializes in every department and gives individual attention to every order. The exhibit is in charge of S. M. Williams, manager of the street railway department, assisted by Thomas Medill, manager of the railroad department west, and F. A. Elmquist, whose headquarters are at Ste. Claire Hotel, Detroit.

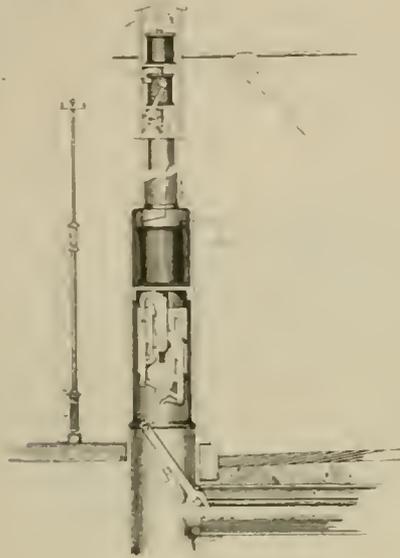

#### SCARRITT CAR SEAT CO.

The Scarritt Car Seat Co., of St. Louis, exhibits in the smoking room three swing back and two walkover car seats, upholstered in cane, plush and imitation leather. The walkover seat is a new type, which has not been put out to any extent. The other seats are well known and used by many railway companies. Mr. R. R. Touhy, assistant superintendent, has charge of the exhibit. The superintendent, Mr. George E. Howard, intended to be here today, but late yesterday sent word that business engagements would prevent his coming.

PORTER ELECTRICAL OPERATOR.

The Porter "Electrical Operator" for operating track switches is the latest invention in this line. Mr. Porter has been making electrical switch operators for seven years and has carefully studied the difficulties to be surmounted, and has at last produced an operator which he is satisfied overcomes all the objections heretofore found in this class of switch operators. First, he has placed the working and electric mechanism all above ground and has so simplified the mechanism that anyone can readily see the mode of operating, and any motor car which can run on the track can operate one switch or ten or more switches at the same movement.

ELECTRICAL SWITCH OPERATOR.

It is claimed that this operator is the only one which can supply an unlimited amount of current to the motor car while its trolley is on the 3-ft. trolley wire, and that when this operator is used with a Porter rocker switch both operator and switch will work winter and summer without care or cleaning.

The Porter Railway Switch Co. has its offices at 151-153 Jefferson Ave., Detroit.

MORRIS ELECTRIC CO.

Upon entering the exhibition hall, the first glance at the corner of the right hand balcony shows the large signs denoting the booth occupied by the Morris Electric Co., of New York, one of the most enterprising concerns in the country. Recently the American Union Electric Co. was incorporated to take over a number of other companies, among them the Morris Electric Co., the Fountain Manufacturing Co., the Electric Motor & Specialty Co., the Federal Manufacturing Co., the Falcon Electric Co., and the Refrigerating Machine Co., all of them more or less manufacturers of electrical appliances, but none of conflicting interests. The Morris Electric Co. is the predominant member of this big family. The exhibit here includes, in addition to a general line of railway goods formerly manufactured by the Morris Electric Co., consisting of rail bonds, fare registers, overhead line material, iron pulleys and brackets, a full line of switchboards for railway and power circuits, panel boards and switches for lighting work, junction outlet and a general line of conduit wiring apparatus.

The factory has been increased to more than four times its previous capacity, and the concerns in the combine have been removed to Amperes, N. J. The plant is running with over 200 workmen on full time. In addition to the above products the Morris company makes an illuminated sign for the Mason Monogram Co. This is a large street sign with three slides showing at the same time. It has a revolving mechanism and each box contains eight signs. Mr. Elmer P. Morris states that the rail bond

business is in splendid shape, and that they now have a capacity of 18,000 per week. Mr. Morris also calls attention to the Buffalo car seat for motormen and conductors, the invention of Charles Coons, superintendent of the Buffalo Railway Co. It has an adjustable stool and may be either leather or wood. He gives his friends a very useful souvenir this year, consisting of an "Indian" ink stand made of pottery. Assisting Mr. Morris at the exhibit are Messrs. John Fountain, Jr., E. Packer, A. Avery and E. Woltmann.

THE STERLING LUBRICATOR CO., ROCHESTER, N. Y.

The Sterling Lubricator Co., manufacturer of force-feed lubricators, has a working exhibit of its lubricators in various sizes near the main entrance to the hall. The company believes that the force-feed method of lubrication for engine valves and cylinders or other machinery by means of properly constructed automatic pumps is the very best to be had, as lubrication is provided when needed and ceases when the machine is at rest. The Sterling lubricators are made of selected material, are of superior design and workmanship and have several valuable new features. The driving wheel is on the back of the lubricator and the shaft is enclosed and passes completely through the oil reservoir. The driving lever being on the back does not pass to and fro in front of the pumps, thus permitting free and easy access to them and the rocker at any time and while lubricator is in operation. The lubricator has a hand attachment which permits operation of the lubricator while the machine is at rest. The rocker on the lubricator is one of its most valuable and desirable features permitting a large range of discharge per stroke of the pumps, as any pump may be quickly and independently adjusted from zero, or no stroke, to full stroke or any intermediate point. The company is represented by Mr. J. Sherry.

GOLD CAR HEATING & LIGHTING CO.

The well known and always popular Gold heaters are shown in operation just at the main entrance of the hall. The new feature this year is a bank of 18 heaters suitable for elevated or interurban street railway cars. These heaters are arranged to provide gradation of heat and are controlled by a new and novel 3-point regulating switch. This switch is capable of handling with safety and certainty at least 75 amperes at 650 volts. A number of other styles of electric heaters suited for cars fitted with longitudinal seats are shown, also other heaters adapted for use on the outside of riser boards or in baggage cars were exhibited. The Gold company calls attention to its system of hot water circulation for use in street cars. This latter system is now being applied to several hundred cars throughout the country, and by its use it is possible to heat a car rapidly, uniformly, at an expense of not over 10 cents per day. The Gold company has just completed a contract covering electric heaters sufficient to equip all of the cars in Louisville and its suburbs. Edward E. Gold, president, John E. Ward and Frank Cahill are representing the company.

IMPROVED BRAKE SHOES.

The American Brake Shoe & Foundry Co. is showing improved types of street car brake shoes at its booth near the main entrance of exhibit hall. The shoes are manufactured under the "Diamond S." Lappin, Corning, Streeter and other patents, covering the approved types for all classes of railway service. The company's plants are situated at Mahwah, N. J., Bloomfield, N. J., Corning, N. Y., Buffalo, N. Y., Detroit, Chicago, Ill., Chicago Heights, Cincinnati, O., St. Paul, Minn., Denver, Col., and Chattanooga, Tenn.

Mr. F. W. Sargent, chief engineer, is in charge of the exhibit, assisted by S. J. Thompson, assistant engineer. Salesmen in attendance are Arthur Goumber of Columbus, O., W. W. Gardner of New York and H. S. Bradfield of Buffalo, N. Y.

Among the early arrivals yesterday morning were Mr. Putnam A. Bates, assistant secretary of the Crocker-Wheeler Co., and Mr. W. F. Sullivan, who represents the same company in Cleveland, O.

### VERY ENJOYABLE TROLLEY RIDE.

The General Electric Co., by courtesy of the Boland line, was enabled to treat 65 guests to a very enjoyable trolley ride yesterday afternoon in one of the Boland interurban cars, which is equipped by the General Electric Co. The run was made on the Northwestern tracks as far as Farmington Junction and return. The party was in charge of P. H. Gale, of Schenectady, and E. H. Mullin, of New York, both representing the General Electric Co. Mr. Gale speaks very highly of the track construction in Detroit, which, together with the General Electric equipment, made some fast time possible.

### BALL-BEARING TROLLEY BASE.

One of the most interesting exhibits is that of a ball-bearing trolley base, shown by President W. S. McDonald, of the Detroit Trolley & Manufacturing Co. The most noticeable feature of this appliance is the free and easy movement of the base, due to fifty 1-in. steel balls, running in two races, used in its construction. The base is made to wear and is guaranteed to keep the trolley on the wire, save the overhead construction and wearing on the trolley wheel, and to prevent the wear of the pole. Mr. McDonald claims that the life of the trolley pole will be lengthened about one-third by using this device, in consequence of doing away with binding on the trolley wheel. Aside from saving expense in repairs, conductors will be enabled to run on schedule time, which they cannot do now, says Mr. McDonald, on account of the trolley flying off the wire all the time.

### UNIVERSAL SANITARY CUSPIDOR.

In order to supply the growing demand and to provide an absolutely sanitary cuspidor for street railway office and general purposes, the Universal Sanitary Cuspidor Co. of Worcester, Mass., is putting on the market an ingenious device which it is believed will come to very extensive use for street cars and all public places where expectorating on the floor is a nuisance. The company is showing samples of the cuspidors in the smoking room, and to show its faith in the cuspidor has placarded the walls with the unusual sign, "Spitting Allowed Here." The cuspidor is a receptacle made of gun metal designed to be set into the floor with the top of the cuspidor flush with the floor so that its contents can never be overturned. By an ingenious arrangement of piping and an automatic valve the cuspidor is flushed with clean water either continuously, as would be desirable in railroad stations and offices, or it can be arranged to be flushed at any interval of time desired. For street railway work the idea is to flush out the cuspidors at each terminal. The exhibit is in charge of Mr. N. R. Thibert, assisted by N. J. Beaudin. The company announces that since the convention opened, the Detroit United Railway has ordered 500 of the cuspidors.

### NICHOLS-LANTERN SANDER.

The Nichols-Lantern Co., of Cleveland, Ohio, represented by Louis G. Wright, president, and William Lantern, general manager, had its well-known track sanding system in operation at space 17, with an auxiliary exhibit at the Ludlow Supply Co.'s space. A striking feature of the Nichols-Lantern system is that it is applicable to any and all conditions. On city cars without air equipment the use of a Nichols-Lantern foot compressor gives all the advantages of pneumatic force, enabling the placing of sanders at any point on car, without any mechanical complications and with absolute certainty of its operating at all times. It has been found to be a wonderful power saver when put on so as to sand one rail near the front truck and the other rail near rear truck. For heavy suburban service this company manufactures hoppers and special traps to accommodate any conditions existing on truck or car body. Mr. Wright says that sand cars, or the sanding of curves by manual labor, is expensive, inefficient, and unnecessary when this system is used. The company is making a specialty of equipping snow plows, and in view of the necessity of the highest efficiency at all times on short service apparatus the apparatus is valuable.

### ARMISPEAR LAMPS.

Delegates are showing much interest in the exhibit of the Armispear Manufacturing Co., one of the features of which is a new trolley car tall lamp, especially valuable for interurban roads. The double steel guard, solid top lantern shown, also comes in for commendation. The frame is practically unbreakable, a fact which will be appreciated by those who pay for lanterns for the employes to hang about.

### A USEFUL DISPATCHER SYSTEM.

The Union Stop & Signal Co., of Fall River, Mass., O. W. Hart, general manager, is displaying its union system of dispatcher signals for electrically operated railways. Briefly, this system consists of a telephone line and signal wire extending the length of the road, with telephone stations in suitable boxes, where easy access can be had by any employe, and he be connected with the dispatcher's office.

These telephones on single-track roads are generally placed at turnouts or sidings, while on double-track systems they are placed at convenient intervals. In conjunction with the telephones are placed the "Dispatcher" signal boxes, designed to set a signal from the dispatcher's office to call the attention of the motorman to the fact that a message is to be given his car and that the conductor is wanted at the telephone. As can be seen, the advantages of such a system are numerous.

### "LONG LIFE CARBON BRUSH."

General Manager J. S. Speer, of the Speer Carbon Co., of St. Mary's, Pa., has succeeded in arranging samples of his company's product most attractively. The exhibit includes the "Long Life" carbon brush, which is something new in the brush line that is given a special treatment during the process of manufacture to close the pores of the carbon, the idea being to impart to the brush a dense and uniform texture and an absolute lubrication which will insure that the brush will not cut the commutator, it is claimed. The regular grade motor brushes made by this company are made specially for railway motor work, and its high-grade brushes are adapted for all classes of generator work and for high-speed machines where a very low resistance is required to carry the current without excessive heating.

### AMERICAN CAR SEAT CO.

The American Car Seat Co., of Brooklyn, N. Y., has a very comprehensive exhibit under the supervision of Superintendent Louis Jansen, aided by Hiram E. Ackerly. This company manufactures push-over car seats in rattan, plush, leather, etc. The construction is simple, containing few parts, and the material is chosen for durability, as well as efficacy in other directions. The steel entering into the construction of the cushion frame and springs is especially manufactured for the American company. The back of this push-over seat is practically locked without additional mechanism and cannot be forced over by being leaned against. The seat also affords full seating capacity and is fitted with a patent "hold-on-handle" attachment, although, when desired, the corner grab handle is furnished. Particular attention is called to the longitudinal rattan spring seating, which is in great demand. For a souvenir the company presents an oxydized sterling match box, handsomely chased, and filled with wax tapers.

### LARGE JEWETT CAR.

The Jewett Car Co., of Newark, O., yesterday morning put in place on the street trackage near the Armory the 66-ft. interurban car built by it for the Columbus, Delaware & Marlon Ry., which was fully described in the "Street Railway Review" for Sept. 20, 1902, page 568. This car, which is, we believe, the largest electric car yet built, presents an extremely handsome appearance and is attracting much attention from the interurban railway men at the convention. Mr. A. H. Sisson, general manager of the Jewett company, was one of the early arrivals.

PECKHAM HIGH-SPEED TRUCK.

The 66-ft. interurban car built for the Columbus, Delaware & Marion Ry., and exhibited by the Jewett Car Co., is mounted on Peckham high-speed M. C. B. No. 32 electric trucks made by the Peckham Manufacturing Co. This truck is shown in the accompanying illustration.

The side frames are of bridge truss construction, with a strong and deep truss, and are spring supported upon equalizing bars and also upon the journal boxes to prevent teetering. To prevent the tilting of the top frames, the spring base of the truck is increased by locating helical springs each side of and supported by saddles from the journal boxes. The pedestal springs are designed to carry a sufficient part of the load to prevent the tilting of the top frames, the greater part of the load being carried by the equalizing bar springs. The side and end portions of the top frame is all one piece of forging.

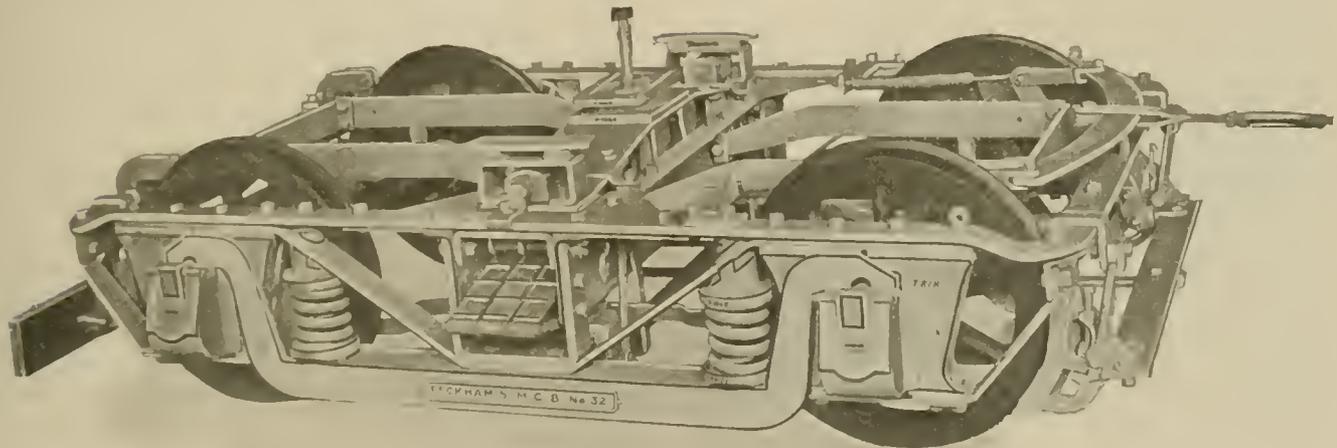

The transoms are bulb angles 10 in. deep, which extend full

crow bars, lanterns and all the tools and appliances that would be of service in emergencies or in the work of transporting supplies. The car is mounted on du Pont double trucks equipped with four Westinghouse motors. The car was more fully described and illustrated in the "Review" last year.

MICA EXHIBITS.

Eugene Munsell & Co. and the Mica Insulator Co., are represented at the convention by Charles E. Coleman, manager for both concerns at Chicago. Mr. Coleman had a very prominent location in the center of the hall. The "Micanite" and "Empire" insulating materials are exhibited in their various forms, and the company's circular matter is being distributed; this included a very neat blotter, which was put in the writing rooms of the various hotels. The company reports a heavy demand for all its mica and micanite specialties, and has just completed an addition to its already extensive works at Schenectady, which

PECKHAM HIGH SPEED M. C. B. NO. 32 TRUCK

size with the side truss frames to which they are rigidly secured. Gussets of steel steel connect the transoms to the side frames and hold the frame rigid and square. The bolsters are all steel and the end sections are supported by full tripple elliptic springs. Straps secured to the transom and extending over the bolsters prevent the latter being lifted out. The king pin is 2 in. in diameter. The swivel plates are large in diameter, machine fitted, with a boss ground the king pin which prevents the escape of the lubricating grease.

The journal boxes are of the M. C. B. standard pattern with M. C. B. journals. The axles are 5 1/2 in. in diameter and the wheels 32 in. The pedestals are of cast steel machine fitted where they are in contact with the boxes and top frame, and all bolts are machined and driven in reamed holes. Each truck weighs 10,000 lb. without the motors which weigh 8,750 lb.

The wheel base is 6 ft. 6 in.

MR. FARMER'S SUPPLY CAR

The first car on exhibit as one walks to Convention Hall from Woodward Ave. is the general service and utility car designed by Mr. Thomas Farmer, superintendent of motive power for the Detroit United Ry., and built in the company's shops. One end of the car is enclosed, forming a cab, which is used as an office and also for sleeping purposes, there being two drop berths arranged to swing up against the wall when not in use. The "Carmen Hall" of the boys call the car, supplied all the power lamps and traps with their dolly regulations.

The other half of the car is open and is provided with hand derrick for pulling up trucks, broken axles, armatures and heavy material generally. It is equipped with bars, jacks, wrenches,

will give it an increased capacity of 6,000 sq. ft. of floor space, enabling it to execute all orders speedily.

PETER SMITH HEATERS.

The Peter Smith Heating Co., of Detroit, has samples of its well known hot-water heaters especially adapted for interurban cars. No. 1 heater shown is a railway coach heater for the largest cars made. No. 2 is made for suburban and interurban cars. No. 3 heater is for city cars, being considerably smaller than the others. All of these sizes are designed to go in the vestibule, where they will take no paying room, or they may be placed inside the car if desired.

The Peter Smith heaters are standard on all the interurban lines of the Detroit United Railway, the Toledo & Monroe, and several hundred other roads. One feature of the exhibit is a large oil painting of a Smith heater shown in a gilt frame, surmounted by incandescent lights.

Mr. Peter Smith, president and manager, is doing the honors for his company.

Mr. J. A. Dawson, of J. A. Dawson & Co., Montreal, P. Q., visited the convention hall yesterday. Mr. Dawson is one of the largest dealers in street railway and electrical supplies in Canada.

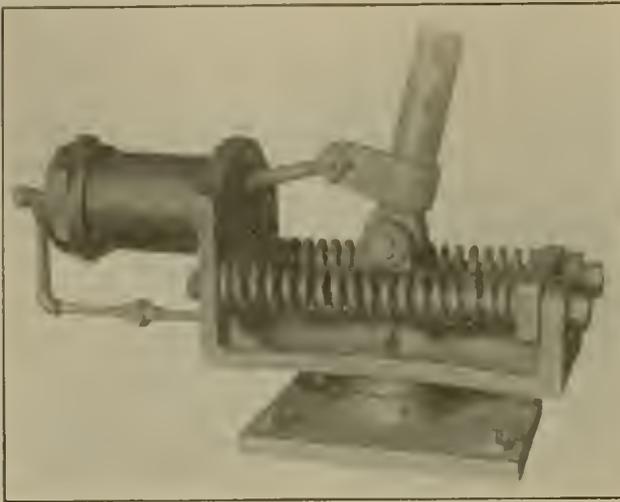

The National Conduit & Cable Co., of New York, has no exhibit this year, but its interests are being looked after at the convention by Mr. W. S. Eckert.

Manager J. P. Hell of the Hell Railjoint Welding Co., of Milwaukee, Wis., renewed old friendships by the score yesterday. Mr. Hell is very popular and, without a jolly good fellow.

## AIR ELECTRO TROLLEY CONTROL.

One of the most interesting working devices in the exhibit hall is the "Air Electro Trolley Control" manufactured by the Pneumatic Railway Equipment Co., of Cleveland, O. This device, shown by the accompanying cut, is designed, as the patentee states, for the protection of overhead construction. By its use, the instant the trolley wheel leaves the wire it opens the circuit in a pair of electro magnets in the motorman's vestibule which control an air valve inserted in the line running from the air reservoir of the car, allowing the air to flow to a cylinder at the base of the trolley pole, throwing the pole to an horizontal position. The pole will remain in this position until released by the motorman or conductor, the appliance being operated from either end of the car. When the air is released the pole is allowed to rise rapidly or not, as desired. When the wheel makes contact with the wire it automatically locks the valve.

AIR ELECTRO TROLLEY CONTROL.

The device being under the control of the motorman at all times, all he has to do, in case of a fallen wire or other obstruction, is to open a switch on the valve box and throw the pole down to a horizontal position.

In switching around the car barn, where the trolley pole has to be handled the same as others, the motorman raises a lever on the valve box and cuts out the automatic attachment, so the pole can be handled freely. By means of a swivel joint the trolley rotates as freely as any in use without injury or inconvenience to anything.

The Pneumatic Railway Equipment Co. is represented here by Robert C. Beebe, the vice-president, and George R. Tomb, mechanical engineer. Mr. Tomb invented the control and Mr. Beebe helped to perfect it.

## FRANK RIDLON CO., BOSTON.

The Frank Ridlon Co., of Boston, is showing its standard appliances and calling especial attention to its Weld babbitting device for babbitting bearings of various kinds. This method requires molding only, instead of molding and then turning out, thereby saving valuable time. It molds and finishes the bearings ready for the shaft in one operation and it is claimed that it finishes them so they will run smoother and wear longer than when bored on a lathe.

The Ridlon track drill and its track sanding device are also featured at the exhibit. For the drill it is claimed that it will drill  $\frac{7}{8}$  in. holes in heavy rails for bonding, day after day, without breaking down. The drill is provided with an automatic friction feed. The track-sanding device is known as the Kilbourn. It uses any kind of sand with equal facility and deposits the sand in small scoops in front of the wheel as often as it is wanted. Many railway superintendents endorse the Kilbourn.

In conjunction with the exhibit is that of the Wilson Trolley Catcher Co.

Vice-President C. N. Wood and General Manager N. L. Wood superintend the Ridlon exhibit and take great pleasure in distributing "Ridlon's Representative," a breezy little publication inaugurated "for booming the business of Frank Ridlon Co., Boston."

## KALAMAZOO TROLLEY DEVICES.

Manager F. B. Crockett, of the Star Brass Works of Kalamazoo, Mich., is kept busy impressing upon passers-by the merits of the Kalamazoo trolley wheels and harps. The Kalamazoo wheel, according to the new 1902 catalogue, is made of pure lake copper, treated by a special process which gives it the quality of softness combined with a remarkable degree of toughness. The result is a wheel which has extraordinary durability and yet causes no injury or wear upon the overhead wire. No scrap brass nor alloy is used in its make-up—only pure ingot metal.

The Kalamazoo trolley harp springs are so protected that they cannot be broken. As the friction of the wheel is borne entirely by heavy washers or lugs, there is no wear upon the springs.

Mr. Crockett points with pride to the record of some of his trolley wheels, one of which, now in service, has traveled nearly 35,000 miles. The wheels are adaptable for high speed roads or city lines. Mr. Crockett's son, L. M. Crockett, assists in entertaining callers at their booth.

## NATIONAL TICKET CO.

The National Ticket Co., of Cleveland, O., is represented by Manager A. J. Reynolds and Secretary C. F. Bates. This company has been in existence only three years, but is already well and favorably known as manufacturer of railroad tickets and transfers. It publishes monthly, also, a clever little magazine for the general office, entitled, "The Electric Railway Interchange." Its convention number is being distributed at its booth in the balcony.

## STANDARD VARNISH WORKS.

The Standard Varnish Works, of New York, London and Chicago, is represented by Mr. John C. Dolph, who has space just off the main aisle. Mr. Dolph is showing the samples of various types of General Electric and Westinghouse formed armature coils coated with insulating varnishes and compounds manufactured by the company. Both baking and air drying compounds are shown. As pointed out in recent issues of the "Street Railway Review," the general opinion among master mechanics seems to be away from the old practice of using linseed oil requiring from one to three days' baking at high temperature, and is crystalizing in favor of what are known as soft gum compounds requiring but little drying of the coils and no drying whatever of the completed armature. This class of varnish, it is found, resists the effects of heat and vibration. The Standard Varnishes are sold under the name of "Votalac" and "Baking Votalac." The souvenir of the company this year is a very acceptable aluminum match safe.

## SUPERIOR GRAPHITE PAINT.

The Detroit Graphite Manufacturing Co., of Detroit, makes a protective paint that has had a very large sale for use on bridges and viaduct. It has proven to be entirely acceptable for this purpose as proved by constantly increasing orders and its adoption by many of the leading railroads of the country. Not only is it specified for new structures, but it is also being used to a very great extent in repainting old bridges where corrosion has already taken place. Consumers have testified that with proper precautions the "Superior" graphite paint arrests such corrosion and forms a permanent protective coating.

The Ohio Brass Co. is distributing a ping pong bat. This is a "bat" for the ladies and not for the men.

## DEARBORN DRUG &amp; CHEMICAL CO.

A street railway convention would be a dismal failure if the Dearborn Drug & Chemical Co., of Chicago, should forget to exhibit, for the representatives of this representative concern know well how to combine business and pleasure and not only furnish a good display, but also souvenirs to appeal to all tastes. This year, as usual, the Dearborn booth is crowded all day, and the amount of jollity that emanates therefrom would do credit to a pink tea. Seriously, however, the exhibit by this company is well worth noting. It includes barrels of its feed water treatment for boilers and samples of high-class lubricating oils and greases.

The Dearborn company is employed to test feed waters in a great many of the street railway power plants in the country, as well as many railroad, steamboat and other steam engineering plants. The company's plant in Chicago is one of the largest and most complete in the world. The company has offices in nine cities outside of Chicago. One of the most popular souvenirs given out is a bottle of perfumery for the ladies, the product of the Dearborn laboratories. Representing the company are Vice-President R. F. Carr, Eastern Manager W. B. MeVickar and Messrs. G. W. Spear and Otto Finiegel.

## McGUIRE MANUFACTURING CO.

This company is showing a rotary snow sweeper with steel I-beam underframe. The sweeper is a "double ender" with full width brooms on both ends. It is one of 12 ordered for the Union Ry. of New York City. The interior equipment is the usual, furnished with McGuire plows and sweepers. A Columbia heater is shown in connection with the sweeper. The sweeper complete, without motors, weighs 2,000 lbs.

The company also shows a double truck street sprinkler built for the Newport News & Old Point Railway Co., Hampton, Va. It comprises steel tank 6 ft. 6 in. in diameter, and 18 ft. 6 in. long, provided with an air reservoir, 30x78 in., and an electric motor air compressor which stores air in the reservoir compressed to 80 lbs. The sprinkler is mounted on McGuire, 39A, double truck equipment and is complete with all necessary valves and appliances for sprinkling streets of 100 ft. or more in width.

The representatives on the ground are W. J. Cooke, vice-president, and B. F. Stewart, sales manager.

The exhibit also includes a McGuire steel truck and a sliding cushion fender.

## CONSOLIDATED CAR HEATING CO.

The prominent feature of the Consolidated exhibit is a chair car heater designed for use on high speed interurban roads. It is fastened to the truss plank and extends nearly the full length of the car. It has recently been adopted by the Aurora, Elgin & Chicago, Chicago & Joliet, Canton & Akron, Detroit, Ypsilanti, Ann Arbor & Jackson, Lackawanna & Wyoming Valley, and is shown at the convention on car exhibited by the Jewett Car Co. It is also used on chair cars running between Albany and Schenectady. The company is also exhibiting one of these heaters with special finish, designed for private car for the Connecticut Railway & Light Co.

## CONSOLIDATED CAR FENDER CO.

This company is showing prominently two of the latest fenders brought out by this company. These are known as Model "C" for city cars and Model "H" for high speed interurban cars. The fenders are shown attached to a stationary platform which is also fitted with the Millen car step lifter. At one side of the space are samples of the Campbell snow broom. All of these devices are well known to readers of the "Review." The exhibit is in charge of George H. Hollingsworth. The company is distributing a pocket writing tablet with leather cover. Col. Woodworth was unable to be present and was missed by the regular convention goers as there is no more familiar figure at the street railway conventions than Col. Woodworth.

## NATIONAL LEAD CO.

The National Lead Co. is showing samples of its "Phoenix" and heavy pressure metals for bearings. On a table are shown specimens of armature bearings lined with Phoenix babbitt. One of the bearings shown has been in continuous service on a Detroit United Railway car since Aug. 22, 1901, and will be put back in service again as soon as this convention is over. Its exhibits comprise samples of armature bearings, motor axle bearings and car journal bearings, all of which have made phenomenal records. These samples were taken out of active service and brought to the hall for exhibition purposes and will go back into service as soon as the convention closes. The National Lead Co. is represented by F. B. Pierson, of Detroit; Walter H. Baker, of St. Louis; Mr. Arthur E. Jones, of Cincinnati; R. L. Weithas, of New York; Walter F. Marks, of Chicago, and Albert G. Marks, Detroit. The company's souvenir is a neat pocket knife bearing the company's name.

## C. J. HARRINGTON'S EXHIBIT.

C. J. Harrington, the well-known New York dealer in railway supplies, exhibits in the annex, where he has the assistance of Mr. Frank Miller, his New England representative; Mr. P. R. Goldey, representing the Arco Circuit Breaker Co., and Mr. J. P. Heil, manager of the Heil Rail Joint Welding Co., of Milwaukee. Mr. Harrington's display is very complete and includes overhead material, gears and pinions, pipe brackets, lightning arresters, third rail arresters, commutators, fuse strips and wire, incandescent lamps, vitrified conduits, mica and numerous other devices.

The delegates seemed especially interested in the Heil cast-weld rail joint. It is claimed for this joint that it is cheaper to prepare and repair the track for welding the joints, that the joint is perfectly fused and perfectly welded, that it furnishes the best electrical conductivity, that it is the neatest and strongest joint, and that the joints, when welded, make a perfect track.

## LUDLOW SUPPLY CO.

This company's space is located in the right hand gallery and the list of companies whose specialties it handles is a long one. Special attention is directed, however, to the "Automotoneer" of the Garton-Daniels Co., the pneumatic jacks of the Garry Iron & Steel Co., the Gore track drills, and the Johnson trolley retriever. The complete list of companies it represents is as follows: Morris Electric Co.; The Chisholm & Moore Mfg. Co.; Garton-Daniels Co.; Duff Mfg. Co.; Nichols-Lintern Co.; H. Gore & Co.; Frank Ridlon Co.; Garry Iron & Steel Co.; Dornier Truck & Foundry Co. The Ludlow souvenir this year took the form of a small envelope Co.; R. Bliss Manufacturing Co.; Lumen Bearing Co.; Crouse-Hinds Electric Co., and Detroit Trolley & Manufacturing Co. Ltd.

Among those making their headquarters at this space are Mr. W. E. Ludlow, president; Mr. J. B. Ludlow, secretary; Mr. A. J. Johnson, of the Federal Manufacturing Co.; Mr. J. V. E. Titus, of Garton-Daniels Co., and Mr. E. C. Powers, of Garry Iron & Steel Co. The Ludlow souvenir this year took the form of a small envelope opener bearing on the handle the familiar trade mark of the Ludlow Supply Co.

## CONTINUOUS RAIL JOINTS.

The Continuous Rail Joint Co. of America shows a full line of joints for both girder and T sections of rails, together with a special display showing bonding for street railway uses. General Manager L. F. Braune, of Newark, N. J., superintends the exhibit, and other representatives present are B. M. Barr, of New York; S. P. McGough and J. H. Allen, of Chicago; W. A. Chapman, of Boston; P. J. Dalton, of Troy, and J. G. Miller and C. E. Irwin, of St. Louis.

Mr. J. S. Hamlin, manager of sales for the United States Steel Co., of West Everett, Mass., which makes the Neal duplex brake, is at the convention. Mr. Hamlin was formerly master mechanic of the Union Traction Co., Anderson, Ind.

## SUPPLAEMEN'S DAY.

With associations set apart the whole of yesterday for an inspection of the exhibits and it was only necessary to walk through the Exhibition Hall, the Annex, the streets adjacent to the Armory, or the hotel parlors where exhibits were shown to see that delegates lived up to the program.

## THEATRE PARTIES LAST EVENING.

There were two theatre parties last evening, one at the Detroit Opera House, under the espionage of the local committee, and the other at Temple Theatre, given by President J. M. Griffin, of the Wheel Truing Brake Shoe Co. There was a large attendance of delegates and associates, with their ladies, in each instance, and the entertainments provided were pronounced most enjoyable.

## CROKER-WHEELER TROLLEY TRIP.

The trolley party given by the Croker-Wheeler Co. to the Rochester power plant on the Flint division of the Detroit United Railway was a most enjoyable affair. A large number of delegates were in attendance and the "run" was made in record time to the power plant which was inspected, after which everyone regaled themselves with refreshments which were served in abundance. Mr. Putnam A. Bates, assistant secretary of the company, was master of ceremonies and made it pleasant for all in attendance.

Mr. C. P. Wilson, general manager and chief engineer of the Camps Bay Tramway Co., Cape Town, South Africa, arrived early on Wednesday; he is now in this country on a leave of absence for a few months, and is making his headquarters in Milwaukee. Mr. Wilson has been in Cape Town since January, 1901, and reports that he is greatly enjoying the opportunity the convention gives him to meet his street railway friends. Mr. Wilson is one of the modern street railway men, young in years, but old in experience. Soon after his graduation from Cornell, about eleven years ago, he was superintendent of the 33d and Market st. lines of the Philadelphia Traction Co.; later chief engineer at Sioux City, Ia., and afterwards chief engineer of the Milwaukee Electric Railway & Light Co., which position he resigned to go to Cape Town.

Among the representatives of the Christensen Engineering Co. present at the convention are James J. Riley and W. H. Goble, both of New York.

Mr. Alexander V. Reed, vice-president of the United States Wood Preserving Co., 29 Broadway, N. Y., is here to introduce the wooden block pavement made by his firm. On August 5th the Railroad Commissioners of Connecticut rendered a decision giving the Hartford Street Railway Co. permission to lay wooden block between its tracks on Main St.

The Sterling-Meaker Co. is represented at the convention by its president, C. S. Ackley, E. F. Wickwire and E. B. McLean.

Mr. F. R. Spear, of the Spear & Miller Co., brake shoe manufacturers, of Chicago, is here renewing old acquaintances and making new ones.

Mr. A. B. Dalby, formerly president of the Hipwood-Barrett Car Fender Co., and now manager of the street railway department of the General Supply Co., New York, is an interested visitor at the convention. The General Supply Co. has just opened a depot for street railway supplies. It handles brake shoes, malleable iron castings, overhead material and track and shop tools.

The National Lock Washer Co., of Newark, N. J., exhibits the well known National Sash Lock and the National Curtain Fixture, among other products of its factory. Their exhibit is in charge of Secretary W. C. Dodd, assisted by Mr. R. L. Thomas.

## THE BRILL EXHIBIT.

The Brill exhibit is in the annex just off the main aisle, and the cars and trucks displayed are attracting their full share of attention. The company has a large representation both at its exhibit space and at its parlors in the Cadillac.

## WESTINGHOUSE EXHIBIT.

The Westinghouse Electric & Manufacturing Co. as has always been its custom, makes an elaborate display, its apparatus being classified into six exhibits. No. 1 is a 1,500-kw. rotary converter of the same design as those ordered by the Rapid Transit Subway Construction Co., of New York; 60 of these machines have been built or are on order since the first one was put out about a year ago. No. 2 is an exhibit of a complete multiple control apparatus for two cars with two No. 431 controllers and four No. 50 C. motors, all arranged on tracks for operation.

Exhibit No. 3 is devoted to railway motors and includes a No. 50-C, which is the type used by the Union Traction Co. of Indiana; a No. 76, such as is in use on the Rapid Railway System of Detroit, in two-motor equipments, and by the Toledo, Fremont & Norwalk in four-motor equipments; and a No. 81, a type of which 1,700 are used by the Brooklyn Height R. R.

Exhibit No. 4 is the Type X transformer, which has been designed to obtain good efficiency and regulation with all kinds of loads and high insulation. Exhibit No. 5 comprises three-phase Type C induction motors.

Exhibit No. 6 is given to detail apparatus including cell-type diverters as used for starting resistance in street cars; canopy switches for street railway equipments; automatic car circuit-breakers; automatic circuit-breakers for direct and alternating current, with laminated copper brush, swinging arms and carbon shunts at the top; iron fuse blocks for street cars; direct-current illuminated dial voltmeter and ammeter; and low-equivalent lightning arresters.

The company is represented by F. H. Taylor, L. A. Osborne, Arthur Hartwell, W. H. Whiteside, C. E. Skinner, A. Whitley, and J. M. Duncan, of Pittsburg; T. P. Gaylord, C. W. Register, and Irvin Dryer, of Chicago, and C. B. Humphrey, R. E. Drake, C. W. Underwood, W. E. Parker, Geo. B. Dusinger, F. B. H. Paine, J. R. Gordon, R. S. Brown, N. S. Braden, D. D. Pendleton, B. T. Brady, H. B. Shute, N. W. Storer, S. W. Kier, H. P. Davis, P. N. Lincoln, C. Renshaw, H. N. Cheny, C. F. Medbury, W. B. Wriaks, M. Baxter, J. L. Crouse, from other of the company's offices.

## CADILLAC HOTEL.

Nearly all the parlors on the second floor of the Cadillac are being used as reception rooms by manufacturers. Among those entertaining are: John Stephenson Co., Parlor A, in charge of E. J. Lawless, general sales agent, assisted by Thomas Carey, of the Boston office, and J. A. Hanna, of Cleveland; C. J. Harrington, Parlor E, in charge of Mr. Harrington, assisted by Frank Miller, New England representative, Samuel Haigh, Philadelphia office; Peckham Truck Co., Parlor D, E. Peckham, president of the company, assisted by J. A. Hanna and F. A. Richards, of Cleveland. In Parlor K the Christensen Engineering Co. is well represented by N. A. Christensen, F. C. Randall, manager of sales, J. T. Cunningham, J. F. Dickson, F. L. Hutchinson, R. T. Tell, J. H. Denton, Harry Ransome, W. J. Richards, C. D. Knight, E. Eldred, C. James, Wm. Powers, W. Waters, W. H. Gold, J. J. Nef, C. P. Tollman. The J. G. Brill Co. at Parlor J is in charge of Wm. H. Hollings, Jr., who is assisted by D. B. Dean, Samuel Curwen and G. M. Haskell.

## LUMEN BRONZE.

The exhibit of the Lumen Bearing Co. is just at the head of the stairs leading into the gallery, and comprises bearings of various sizes and styles filled with the Lumen bearing metal, which has been described in the "Daily Review."

PLASTIC RAIL BOND.

Harold P. Brown has prominent space at the end of the main aisle. He has arranged a unique and very striking exhibit, consisting of apparatus for performing various tests on rail bonds. The chief feature is one joint of 75-lb. T-rail with two No. 00000 solid copper bonds in which the drop of 1 ft. of rail with 1,000 amperes is reported to be greater than the drop of 1 ft. of rail with the bonds; as also was the case when the current was raised to 3,000 amperes. The 3,000 amperes passing through the 75-lb. rail produced such strong magnetic field that a copper bond carrying the current past the joint was attracted from a distance of  $\frac{1}{2}$  in. up to the web of the wire by magnetic attraction, an action that was doubted by practically every electrical engineer who called at the exhibit until he saw it actually done.

In conjunction with the exhibit was shown a new motorman's mirror, designed to afford a means by which the motorman can see the entire right side of the car and watch passengers getting off or on without doing more than slightly turning his head. The mirror projects about six inches beyond the side of the car but it is supported on a novel double swing spring hinge which permits the mirror to give in either direction if it is struck by a wagon or other obstacle, without damage to itself. The action permits the mirror to at once resume its normal position after the obstruction has been passed. The mirror itself is mounted in a backing of cork which effectually prevents breaking or damage.

WHEEL TRUING BRAKE SHOE.

The Wheel Truing Brake Shoe Co., of Detroit, exhibits two specialties,—its truing brake shoe and its commutator truer. In the brake shoe President J. M. Griffin declares that the flat wheel problem has been solved. That is, he does not mean to say that a means has been discovered of preventing flat wheels, but that his company's shoe makes it possible to true them up quickly and cheaply without taking the car or engine out of service.

The commutator truer not only cleans the commutator, but at the same time trues it up by removing any inequalities which may have formed upon its surface. This is done with an abrasive upon the same principle used by this concern in truing a flat wheel. The device is safe, is automatically adjusted to any diameter. It has a three point bearing and cuts truly. It is insulated and the abrasive is non-conductive. Mr. Griffin calls attention to an advertising folder that tells by means of illustrations and a conversation between a general manager and his master mechanic of the value of the company's products.

BALDWIN TRUCKS.

At the head of the street exhibits is the exhibit of the Baldwin Locomotive Works, consisting of two trucks, one a motor truck built for Westinghouse, Church, Kerr & Co., for the Lackawanna & Wyoming Valley Railway Co., and the other a trailer truck for the same people. The headquarters of the Baldwin Locomotive Works are at the Westinghouse exhibit in Convention

THE VAN DORN COUPLER.

The W. T. Van Dorn Co. exhibit of the automatic couplers that bear Mr. Van Dorn's name is in the building at 171 Larned street, near the entrance to the convention hall. The Van Dorn coupler is standard on many of the surface roads of the country. It is made in thirteen distinct patterns of different sizes, it is machine fitted and the links are milled with a milling machine, which makes everything absolutely exact. The Metropolitan West Side Elevated Railroad, Northwestern Elevated and the Lake Street Elevated of Chicago and the Boston Elevated are among large customers of Mr. Van Dorn. The exhibit is in charge of Mr. W. T. Van Dorn, who smilingly greets visitors and presents each caller with an aluminum cigar case.

Mr. Paul R. Goldey represented the Ar-Co Circuit Breaker Co., of Philadelphia.

THE CHASE-SHAWMUT FLEXIBLE BOND.

The Chase-Shawmut flexible rail bond is again attracting much attention as one of the latest types of soldered bonds. The advantages claimed for this bond are that it is easy to apply, that a high conductivity is guaranteed by the soldered contact, that the cost of installation is small, and when once in place it is very difficult to dislodge, and that it is always open to inspection.

The Chase-Shawmut Co., which is a Boston house, is represented here by Frank D. Masterson, its bond representative. Mr. Masterson wishes it known that his company will be pleased to send to all who request it a copy of "Electrical Data," a useful little handbook published by the company.

CHRISTENSEN AIR COMPRESSORS.

Mr. N. A. Christensen, of Milwaukee, is showing in the annex a Christensen motor driven air compressor for use in shops, power houses, etc., for furnishing compressed air for cleaning purposes, for pneumatic tools, etc. His shops are turning out these self contained compressors in sizes up to 175 h. p. The motor for driving the compressor is provided with automatic cut in and cut out control, which is positive in action, and throws the load onto the motor direct without resistance control.

KALAMAZOO RAILWAY SUPPLY CO., KALAMAZOO, MICH.

This company's display is in the balcony. The Kalamazoo Railway Supply Co. sells hand cars, inspection cars, trolley line cars, push cars, rail cars, track velocipedes, Kalamazoo trolley wheels and harps, cattle guards, friction jacks, jack screws, car replacers, railroad tanks, and a hundred other electric and steam railroad specialties.

THE LAST HORSE CAR IN DETROIT.

Detroit was the fourth city in the United States to have horse railroads, and was one of the first to abolish them in favor of electric traction.

The last horse car, No. 30, operated in Detroit was run on the Woodward line from the foot of Woodward ave. to the City Hall on Nov. 9th, 1895, at 3:00 o'clock p. m. At this point the horses were unhitched and sold to the highest bidder, the pro-

ceeds to go toward the Detroit Journal Explosion Sufferers' fund. The team brought \$200.00. The car was then attached to a motor and trailed up Woodward avenue to the end of the line. By the time it reached there, about all there was left of the car was the trucks, the body having been knocked to pieces by the crowds as souvenirs.

Mr. G. O. Nagle, manager of the Savannah (Ga.) Electric Co., is one of the delegates from the south. Mr. Nagle received a cordial welcome from all his old friends in the north and west. Mr. Nagle is accompanied by L. A. Powers, assistant treasurer.

The Eccleston Lumber Co., of New York, makes a specialty of ties, poles and cross arms. Its facilities are such that orders, no matter how large, can be promptly delivered from stock in the New York City yard or direct from the mills.

### PANTASOTE.

The many attractive shades and designs in which "Pantasote" is made were brought forcibly to the attention of delegates by the exhibit of the Pantasote Co. in the balcony. As is well known, this material closely resembles morocco leather, and has worked its way into wide use for car seats, car curtains, head linings, etc. The material is waterproof, stain proof, grease proof and odorless, and is guaranteed not to rot, crack or stiffen in service. Mr. John High did the honors for the company.

### JOHNSON CAR REPLACER.

This device is manufactured by the Johnson Wrecking Frog Co., of Cleveland, O., for the purpose of providing a means for replacing cars, trucks, locomotives or any other class of rolling stock that is liable to derailment. The devices comprise two steel castings, one for each rail, so arched as to lead the wheels of a derailed car from the paving or road bed onto the rails. Mr. O. W. Johnson is exhibiting the replacer. The castings will work on any size or shape of rail.

### PECKHAM TRUCKS.

This exhibit occupies considerable space just outside the main entrance to the hall. It is made up entirely of trucks, the various types being as follows:

Peckham No. 32 M. C. B. truck, one of 20 now being built for the Columbus, Delaware & Marion Ry., and is also the type used by the Indianapolis, Lebanon & Frankfort Traction Co. and the Toledo & Indiana Ry. This truck is M. C. B. standard throughout with triple elliptic bolster springs and fitted with steel tired wheels. It is prepared for four 75 h. p. motors per car. This truck weighs about 9,000 lbs.

Peckham "Extra Strong" 14 B-3 short wheel base truck. This is one of 100 now building for the Cincinnati Traction Co., this being the third order for similar trucks. It is constructed for four Westinghouse 68 motors per car and has triple spring suspension with wheel base 4 ft. 6 in. The weight of each truck without the motors is 5,540 lbs. Four hundred of these 14 B-3 "Extra Strong" trucks have been furnished to the Massachusetts Electric Cos. of Boston. The company had intended to exhibit a new truck built for the Aurora, Elgin & Chicago Electric Ry. Co., but unfortunately the truck was delayed in transit and has not yet arrived. The Peckham staff of selling representatives and agents was out in force.

### PENN. STEEL CO.'S EXHIBIT.

The Pennsylvania Steel Co. has a commodious booth where it displays models of the Long safety switch stand, the "Anvil Face" frog, adjustable angle bar re-enforced split switch, "Challenge" split switch and other devices. There are also shown some interesting blue prints of special work layouts and pictures of bridges, particularly the Goktiak viaduct of Burmah, India. In addition to giving callers a new catalog on special street railway work, the company presents each with a steel tape souvenir. The booth is attractively arranged and furnished with office equipment. R. E. Belknap, of Chicago, is in charge, and other representatives in attendance are W. C. Cuntz, of Philadelphia; J. G. Miller and A. F. Irwin, of St. Louis; Clifford J. Ellis and H. K. Parsons, of Chicago; Charles S. Clark, of Boston, and C. F. Alden, of Steelton, Pa.

### THE CREAGHEAD PRODUCTS.

The Creaghead Engineering Co., of Cincinnati, is represented by its sales manager, Mr. A. E. Payne, who takes pleasure in detailing the excellent points of the company's exhibit. A full line of overhead material is shown, including the Creaghead incandescent lamp and the Bourbon strain insulator. To enumerate the street railway companies using the Creaghead manufactures would take a long time. The Creaghead company also handles the American Car Seat Co.'s products. Mr. Payne gives each caller a handy pocket rule.

### JOHNSON'S TROLLEY RETRACTOR.

The Federal Manufacturing Co., of Cleveland, is putting on the market a device known as the "Johnson Trolley Retractor," which, as its name implies, is designed to afford protection to the overhead construction when the trolley pole leaves the wire. The machine consists of a rotatable casing mounted in frame and containing a tension reel provided with an automatic adjustable locking device, a retractor arm of proper length receiving the power of the springs through the medium of the arm and yoke. As the retractor springs can be wound up by the ratchet to agree with the trolley pole tension, the vicious action of unnecessary power in the start is obviated in case the harp should be pressed against the wire.

The action is briefly this: When the car is running and the trolley on the wire, the tension reel accommodates the variations in the heights of line, but when the trolley jumps from the line a sudden upward movement of three or four inches locks the reel and raises the latch. The arm then swings down like the action of a human arm and carries the trolley with it, the reel remaining securely locked while in that position, but is released when the arm is raised to upright position to replace the trolley on the wire. The device is in use on cars of the Western Ohio Railroad, the Toledo & Western, and the Cleveland, Elyria & Western.

### HALE & KILBOURNE WALKOVER SEATS.

This year's exhibit by the Hale & Kilbourne Co., of Philadelphia, manufacturers of car seats, is much more elaborate than usual, there being a greater variety of "Walkover" seats displayed. The steel construction of these seats has been highly commended by many railway officials. The company showed several new features, among which is a bronze back band, instead of the old-style wooden back band so long used. Mr. H. T. Bigelow, of Chicago, extends a cordial welcome to callers.

### A BURGLAR-PROOF VEST.

The Bellamy "Vestlette" for street railway conductors is exhibited in the balcony by Mr. O. N. McClintock, assistant manager of the Bellamy Vestlette Manufacturing Co., of Cleveland, O. The "Vestlette" is made of strong, durable material, with cloth finish of same color as the uniform and of a quality suitable for any gentleman's wearing apparel. It has nine commodious and convenient pockets for money, tickets, reports, pencils, punch, transfers, watch, etc. Owing to its peculiar construction, it is impossible for a pickpocket to get his work in undetected. Neither can change be lost in running to switches or jumping on or off cars.

### THE "CLIMAX" STOCK GUARD.

Mr. H. S. Overstreet, manager of the Climax Stock Guard Co., Marquette Bldg., Chicago, who is at the convention, gives the following reasons why interurban roads should use the "Climax" guard:

Its own weight is all that is necessary to keep it in position with a 2-in. wooden cleat around the guard. It can neither burn, rust or decay, and is practically indestructible. It is cheaper than either wood or iron, and, in fact, has no competitor in price.

It does not require to be taken up at least twice a year, that the weeds growing through it may be cut; no weeds grow through this guard. The expense of installation is practically nothing, as it needs no special preparation to place it in the track; no excavation and no changes in the track beyond the possible replacing of seven ties, requiring the use only of ordinary section labor. It can readily be adapted to any gage and to any length of guard desired.

In case a wrecked car or train passes over it, or break beam strikes it, it sustains less damage than any other guard manufactured. Should any of the blocks be broken, they can readily be removed and new ones put in, leaving the balance of the guard intact. It is impossible for train men or others crossing the guard to be injured by falling on this guard or caught in it. In repairing or changing the track, it can be taken up and replaced without the slightest damage and at practically no cost.

OAKLEY STEEL TERMINAL RAIL BOND.

The Worcester Steel Foundry Co., of Worcester, Mass., is showing at the Chase-Shawmut booth the Oakley steel terminal rail bond fused joint, which embodies what is believed to be a new idea in electric railway bonding. The terminals are made of a special steel alloy very low in carbon and cast on the copper cable or ribbon, making a fused joint. When the terminal is expanded in the rail it makes a joint of high conductivity.

The steel terminal bond possesses many advantages but heretofore the difficulty in the way of properly fusing steel and copper has hindered development along that line. The inventors of the new bond claim to have discovered a way to form a perfect amalgam of the two metals.

The following letter has been received from H. B. Smith, professor of electrical engineering at Worcester Polytechnic Institute, Worcester, Mass., concerning this bond:

\*\*\* "The two samples on which the most conclusive measurements were made consisted of cast steel terminals on a stranded copper cable of 49 strands of No. 16 B. & S. wire. The resistance of the two cast joints and steel terminals gave approximately .000038 ohm, in one instance, and .000021 ohm, in the second instance. By measurement, and in terms of the stranded cable itself, the resistance of the two joints and terminals was approximately equal to the resistance of 7.3 in. and 4.1 in. of cable respectively. These measurements were by the 'fall of potential' method and with as high as 100 amperes applied to the bond. Close inspection and tests indicated that these samples had an excellent fused joint of high conductivity."

A NEW STEPHENSON CAR.

The up-to-date interurban car exhibited by the John Stephenson Co., on Larned street, is attracting a great deal of attention. It is intended for use on the Muncie, Hartford & Fort Wayne road and is especially designed for high speed. It is a combination passenger and baggage car, the baggage compartment being equipped with folding seats in order that it may be thrown into a smoking compartment. The car is piped for the Peter Smith system of hot water heating; there is a toilet at one end; at the sides above the seats are racks for parcels; the floor is double; there are Stephenson spring bumpers at the ends, and in all respects it is much like a steam railroad coach. Between the seats in the center of the car removable card tables are placed. The interior finish is of mahogany, very plain, but not the less pleasing to the eye. The seats are of the Hale & Kilbourne rattan walkover pattern and the register is a Ohmer make. The trucks are the Stephenson No. 8, built expressly for high speed. The Stanwood car step is used. The length of the car over all is 55 ft., the car body being 45 feet, and the vestibuled platforms 5 ft. each. The car was built under the specifications and inspection of E. P. Roberts & Co., Cleveland, O. It is in charge of Mr. J. A. Hanna, the Stephenson Co.'s sales agent at Cleveland.

SQUIRES' AUTOMATIC FEED WATER CONTROLLER.

The Standard Steam Specialty Co., of New York, announces that after a thorough investigation it has taken the agency of the Squires automatic feed water controller. This device has been on the market some years, and is recommended highly by all of its users. It is so constructed as to allow a full opening of the feed valve, and it is claimed will maintain a true water line in surging boilers, either marine or stationary. It is simple in construction, and as a consequence of this will cost less for repairs and is less liable to get out of order. The operation of the controller being continuous, the greatest economy in coal consumption is obtained; because, adjusting itself as it does to the varying demands for steam, it keeps in the boiler just the amount of water necessary to most advantageously make steam, and no more. There is consequently no coal wasted in making steam simply to blow through the safety valve. Mr. F. H. Lovejoy represented the makers.

Dalzell & Co., of Philadelphia, distributed circulars and pamphlets descriptive of its supplies and specialties.

MOTORMAN'S SEAT.

The motorman's seat which has been adopted by the International Railway Co., of Buffalo, N. Y., and which was described in the "Review" for July, 1902, is to be found among the exhibits of the Morris Electric Co., of New York.

Managers who have motormen making long runs on interurban roads and have lost men because of sore feet would do well to see this seat.

WHEEL GRINDING MACHINES.

At 171 East Larned street, adjacent to the exposition building, may be seen one of the Springfield Manufacturing Co.'s car wheel grinders in operation, under the supervision of General Manager George W. Jackman, of Bridgeport, Conn., where the plant is located. The No. 2 steam and electric car wheel grinder made by this company is designed to grind wheels either on or off from axles, and is arranged to grind two wheels at one time. The emery wheels or rims are held by a patent chuck, which allows a very high speed and with perfect safety. By the introduction of these chucks the centrifugal strain is overcome and the danger of broken emery wheels reduced to the minimum. It is claimed for this machine that by having tail stock and wheel heads fastened to one bed wheels may be ground perfectly round, and when so ground will give a greater mileage and not become skidded nearly as quickly as when ground on their own bearings. The No. 1 grinder is equipped with 18x1½-in. emery wheels, and where a comparatively small number of wheels are to be ground a No. 2 wheel, which is practically the same as No. 1, is recommended. Mr. Jackman has the assistance at the exhibit of James Harvey, also of Bridgeport.

THE OHMER REGISTER SYSTEM.

The Ohmer Fare Register Co., of Dayton, O., has a very complete exhibit in the left hand balcony, where the workings of its improved dial system is frequently expounded daily. This system is adapted for all roads collecting two or more denominations of fares, and has been fully described in the "Review." In addition to the register, dials are placed on the front and rear platforms and, if the car have a smoking compartment, on each side of the partition. By this means each passenger can see all the fares registered. The classification of fares collected along the line are arranged on each dial.

There is also a trip number dial on one side of the register, which runs from 1 to 31, and on the other side is a dial that shows the month and the day of the month. Each conductor has an identification or badge key to correspond with his badge number.

In order to unlock the machine it is necessary that the conductor insert this badge key into the register and then insert an impression key below the other and take an impression of the register by turning the key once, which unlocks the machine and the register is ready for service.

The conductor, on the first trip out, will turn the trip dial to 1 and take the first impression under the head of "1." That impression gives the company a printed statement showing the reading of each classification of fare, also the month and day, the trip number and the conductor's badge number.

With the Ohmer machine the conductor has no knowledge of how many fares he has collected during the day. When he finishes his day's work he takes his own change out of the cash and turns the balance over to the company. He has no knowledge of how sold cash, tickets or paper will balance with the sheet printed in the machine. The totalizer on top of the register gives the conductor the actual number of fares collected and the sheet printed in the register gives the company the classifications. General Manager John F. Ohmer is at the convention and is assisted by Mr. M. McDonald.

The Hell Railjoint Welding Co., of Milwaukee, Wis., distributed flowers to all its visitors to-day, as did also the Knell Air Brake Co.

## THE PASSING OF CADILLAC.

Two hundred years ago there was no city of Detroit. The site was occupied by a French military post, Fort Pontchartrain, under the command of one Cadillac, a gentleman of prodigious valor and a soldier of fortune who battled in the wilderness for the bubble reputation and was ruined in the quest of it. A row of rough log cabins, the homes of voyageurs and pioneers, faced the river, and in the midst of these Cadillac had built himself a manor where he affected as much of pomp and courtly fashion as was possible in such environment. His house was distinguished from the rest by the "gallerie" above the door and the maypole which fronted it, by the silver plate which adorned his table, and chief of all, by the presence of Madame Cadillac, a beautiful and admirable lady, who was the first white woman to take up her abode among the Indians and French soldiers at Fort Pontchartrain. On holidays the seigneur and his lady entertained, the hospitality of Cadillac being of equal degree to the severity of his discipline, and on such occasions strange scenes were enacted on the banks of the Detroit. The courtyard of the manor was filled with soldiers, voyageurs and Indians, in picturesque attire, and echoed to the racket of trumpets and drums, and to the song of the French adventurers:

"Grand Dieu, sauve le Roi,  
Grand Dieu, venge le Roi,  
Vive le Roi,  
Que toujours glorieux  
Louis victorieux  
Voye ses ennemis,  
Toujours s'unis,  
Vive le Roi!"

The fleurs de lis of France fluttered from the maypole, around which the soldiers danced while Cadillac and his wife, and such other persons of quality as had followed the Seigneur to Fort Pontchartrain, witnessed the festivities from the "gallerie" of the manor. The Seigneur's wine was free to all, and all partook of it. After the maypole dance there were games and sports, becoming more boisterous, toward the close, by reason of the Seigneur's generous dole of wine. When the long merry-making had come to an end all paid homage to Seigneur and Madame, and departed, singing the praises of both, and petitioning the Virgin to defend them from "le petit homme rouge,"—a goblin of malevolent propensities, much feared by the superstitious as possessing the power to wreck the fortunes of all whose path he crossed.

Adjoining the manor was a long rose garden, in the cultivation of which Cadillac delighted. It extended from the river to the present site of the Chamber of Commerce in Detroit, and here all varieties of roses bloomed in profusion. Paths wound among the bushes under the shade of great trees, and lawns sloped gently to the river. When the Seigneur was oppressed with the uncouthness of his frontier home, and longed for the luxuries and refinements of the life he had led at the court of Louis, it was his custom to stroll through the rose garden arm in arm with his wife, for here were beauties which Versailles could not surpass. It is related that at the close of one of the maypole festivals the Seigneur and Madame Cadillac were thus strolling through the garden, when a dwarf, habited in red, crossed their path, and impudently addressed them. The Seigneur, being a man of quick temper and unaccustomed to forbear in punishing offenders, struck at the dwarf with his cane. The latter cursed him roundly, whereupon Cadillac thrust out his hand to grab him, but instead of encountering le petit homme rouge, his hand grasped a crimson rose on a bush near by. The dwarf had mysteriously disappeared, and the search of the manor servants through the garden and along the river banks, a search which lasted until morning, failed to discover him. The decline of the Seigneur's fortunes began from that day, and he and his wife, in all the subsequent times of financial disaster and banishment, never doubted that their ruin had been directly brought about by "the little man in red."

The story of Cadillac from the beginning reads more like an old romance than a bit of history. This man had a long and fanciful name, as becomes and generally falls to the portion of explorers and adventurers. In full it was Antoine de la Mothe

Cadillac, later Lord of Donaquee, and from the prowess of his deeds there is every reason to believe that the bearer of the name faithfully tried to live up to it. Cadillac was a native of Gascony, and, it is probably, the counterpart of those Gascony Cadets who appear so formidable and so amusing in *Cyrano de Bergerac*:

"The bold cadets of Gascony,  
Brawling and swaggering boastfully,  
With flaming feather that gaily prauks,  
Hiding the holes in their hats, forsooth,  
Eagle-eye and spindle shanks,  
Fierce moustache and wolfish tooth,  
Bold cadets of Gascony,  
Brawling and swaggering boastfully."

This is what Cadillac may have been, before he learned the elegancies of the court of Louis XIV., for we are told that he entered the service of the king much scarred and hardened in the practice of self-defense, and it is certainly true of him that he indulged an inordinate taste for grandeur, as appeared at Detroit, where the pomp of the seignory, figuratively speaking, "hid the holes in his hat, forsooth," for Cadillac, though possessed of vast estates, was invariably in straits for ready money.

After being captain of the French marine service, Cadillac came to Acadia (now Nova Scotia) in the latter part of the 17th century. In all his seafaring expeditions he had had for a worthy partner, Francois Guyon, also in the service of the king. Guyon was the elder man, and he had, living in Quebec, a daughter of great repute for her beauty, wit and gentleness of disposition. Cadillac, on hearing these desirable qualities praised by Guyon, determined that she was the wife that the fates were saving up for him, and he immediately set out for Quebec with the intention of proving the correctness of his supposition. This he was successful in doing, as is evidenced among the archives of the cathedral at Quebec, where the marriage register of Antoine de la Mothe Cadillac and Therese Guyon are still shown to visitors. At the time of his marriage, Cadillac held both military and marine commissions from the king, was a lieutenant in the famous Carignan regiment, a seigneur of Acadia and Lord of Donaquee. A year later he was commissioned to lead an expedition against the English, piloting the fleet of Sieur de la Casiniere to the bay of New York. The expedition resulted disastrously, and Cadillac was summoned by the king to France. During his absence of more than a year, Therese, his wife, who was then but 18 years old, managed his estates and interests in the wilderness of Canada. Port Royal, in which place she lived, was attacked and burned by the British, and Madame Cadillac narrowly escaped death in the conflagration which destroyed her home. With the enemies of the French in pursuit she set out on a perilous journey for Quebec and reached her destination half dead from exhaustion and hunger. After many months' detention caused by his business and by the intrigues of his enemies, the Seigneur rejoined his wife and cheered her with agreeable news. He had regained the favor of Louis, and had won the esteem of the great Comte Frontenac, through whose influence he had been made a Knight of St. Louis, and expected to be made the commander of Michilimackinac. In the following year Cadillac obtained grants of Mount Desert Island and a large tract of land on the coast of Maine. He organized a patrol of boats for the St. Lawrence, and in recognition for this service to the crown his appointment to the post of Michilimackinac was ratified. Cadillac commanded there until 1697, when he returned to France and petitioned the king for the establishment of Fort Pontchartrain on the Detroit River. In 1701 Fort Pontchartrain was built and the Seigneur and Madame were installed in their manor with its gallerie, its rose garden and its maypole. It is said that on her arrival at Detroit, the Indians, who had never seen a white woman, pressed around her to kiss her hands, saying, "Now we know that the French mean to be friends with us, since they have brought a white woman to live in our country."

The day after the alleged encounter with le petit homme rouge Cadillac was appointed Governor of Louisiana. That was in the year 1712. During his five years' incumbency of this high office he became involved in many unfortunate affairs. He endeavored to work the silver mines in that part of the French dominions which is now Missouri, and lost his own and others'

fortunes in the venture. Equally disastrous was his attempt to open trade with Mexico. He was, however, successful in establishing forts among the Alibamons and Nachitoches, but by his unwise conduct incurred the hatred of the Indians and precipitated wars with them. For these reasons after the death of Louis XIV., Cadillac was in disfavor at court. He was commanded by the new king to return to Paris, and obeyed the command, Madame Cadillac accompanying him. The enemies of the Selgneur succeeded in securing his imprisonment on a false charge that had nothing to do with his misadventures in America, and subsequently his banishment. Madame Cadillac, who had so stanchly braved the terrors of the wilderness by her husband's side, remained loyal to him in exile, continually soliciting the king for his pardon and reinstatement as governor of the American provinces. She grew old in this vain service, and her death soon followed that of her husband in the year 1719.

But the malevolence of le petit homme rouge, though the failure of the fortunes of Cadillac be attributed to it, did not suffice to make his illustrious name forgotten, or to diminish the homage which is paid to the devotion and nobility of Madame Cadillac.

MR. JOHNSON HELD THE WATCH.

A street railway man in the Russell House lobby yesterday told a good one on Tom L. Johnson, that is too good to be lost to posterity. It will be remembered that Mr. Johnson was at one time considerably identified with the electric railway situation in Detroit.

As the story goes, Mr. Johnson was delayed down town one night at a meeting of the board of directors, and took the 12 o'clock car for his beautiful residence in the suburbs of Detroit. The walk from the car line to his house was rather a lonely one, and on this particular night, as he alighted from a car and it sped on its way, leaving him in the obscurity of a single electric light, Mr. Johnson noticed two rather dilapidated-looking gentlemen lurking in the shadow of a large oak tree. Now, Mr. Johnson enjoys the reputation of rather enjoying a good discussion, and besides, the car had gone, and there was no place to run. So buttoning up his coat, and taking a firmer grasp on his gold-headed walking stick, Mr. Johnson started up the street, past the two men, determined on the slightest show of hostility on their part to give a good account of himself. Much to his surprise he found the two men quietly smoking, and evidently merely enjoying the fine evening. As he passed, one of them asked for a match in a perfectly gentlemanly tone. Mr. Johnson handed him one, and went on his way, harshly criticising himself for being so suspicious.

He had not gone but a block, when placing his hand at his waistcoat pocket he found that his handsome gold time-piece was missing. Thereupon he began to criticise himself for being so easy, but he could not help but respect the quickness with which the light-fingered gentleman had removed the watch without attracting the slightest attention. The more Mr. Johnson thought of the matter, the angrier he became, and just before reaching the house, finally decided to go back, and if possible, find the two thieves and force them to give up the cherished time-piece. To decide was to act, and taking another hold on the cane he started to retrace his steps at a lively pace. Somewhat to his surprise he found the two in the same position at the tree, and they, probably noticing his foreboding attitude, started on a run for a near-by alley. Now assured that one of the men had taken his watch, Mr. Johnson raised his cane and started for the two culprits at a lively pace. Turning into the alley he unexpectedly stumbled over the two men, who were crouching in a dark corner. Seizing one of them by the throat, he demanded in strong terms the delivery of his watch. The robbers were now probably thoroughly cowed, for one of them thrust out into the darkness something that Mr. Johnson felt was his watch. Satisfied with the recovery of his property, Mr. Johnson once more started for home, with a very satisfactory smile on his face.

Reaching his mansion he was met by his wife, who had become exceedingly anxious at his long delay. "Oh! Tom," she

cried, "I have been so worried, and thought that something dreadful had happened to you."

Under the circumstances, Mr. Johnson could afford to be dignified, and assuming an injured expression asked his wife if she did not think he was old enough to take care of himself. However, once upstairs he could not resist the temptation to tell of his little encounter. As he got to the place in the tale where he forced the robbers to give up his watch, the look of acute anxiety on his wife's countenance changed to one of dismal dismay. Before the tale was ended, Mrs. Johnson had collapsed into a chair, and was weeping hysterically. By this time Mr. Johnson was also worried and unbended sufficiently to inquire the cause of this unusual outbreak. "O Tom, Tom, what will they do with you?" was all his wife could sob between her two hands in which her face was buried. "Do with me," replied Tom, "why, they won't do anything; they are only too glad to get off so easily."

"But, O Tom, you left your watch under the pillow this morning, and now they will arrest you for highway robbery."

This put a new light on the matter, and drawing out what he supposed was his recovered property, he found the watch was a very handsome one, but very different from his own. At this Mr. Johnson also became anxious.

Next morning a small advertisement appeared in the papers as follows: "If the two gentlemen who were relieved of a watch on Blank street last evening will address the undersigned, they can have their property back, and no questions asked or answered. Address P. D. Q., P. O. Box 24."

This advertisement evidently did not reach the eyes of the proper parties, and now Mr. Johnson is the possessor of two valuable watches, one of which he never wears, however. It rests undisturbed upon the top shelf of the attic closet.

Mr. William H. Sheldon, Jr., secretary and treasurer of the Miller-Sheldon Electric Co., Detroit, has been making many new friends this week.

Mr. Arthur S. Partridge, a St. Louis railway supply man, is enjoying the convention and exhibits thoroughly.

Mr. F. J. Coakley, western representative of the Samson Cordage Works, of Boston, came on from Chicago to see what's doing at the convention.

Stromberg Carlson telephones are shown at 171 Larned street annex.

Mr. Albert F. Schroeder, of Cleveland, is looking after the interests of the Globe Michigan & Stamping Co., which makes the King trolley stand and pole, the "Improved" trolley-harp, and Globe headlights.

The C. C. Wormer Machinery Co., of Detroit, general dealer whose factory floor space is about 300,000 sq. ft., is represented at the convention by Mr. P. H. Briggs, who is to be found at booth No. 59 in the balcony.

Mr. William Sutton, who was president of the American Car Co. for many years, was in evidence at the hall yesterday. Mr. Sutton is now associated with the St. Louis Car Co., where he will be pleased to meet all old friends, who are legion.

J. P. Heil, manager of the Hell Railjoint Welding Co., of Milwaukee, attended the convention and reports business for his company as being first-class. Among the recent orders are a complete welding outfit for Toronto, Canada, also a contract for 9-in. girder work for the Pittsburg Railway Co., the work to commence November 15th.

The Burroughs adding machine, manufactured by the American Arithmometer Co., of St. Louis, is exhibited by W. E. Weatherby, who has the space originally assigned to the Bishop Gutin-Percha Co.

### JONES UNDER-FEED STOKER.

The Under-Feed Stoker Co. of America is represented at the convention by Mr. A. H. Charles Dalley, of Chicago, who calls attention to the good qualities of the "Jones under-feed stoker," as proclaimed in a special catalog designed for this occasion, and showing views of the Oneida street power house of the Milwaukee Electric Railway & Light Co. In this plant are installed 15 Jones stokers beneath 3,000 h. p. of Edge Moor water tube boilers. In addition 32 machines (6,400 h. p.) are being installed in the same company's new Commerce street plant, now building. Upon completion of this plant there will be 50 Jones stokers (10,000 h. p.) in the plants of this company.

Delegates and associates who may be interested in the subject of mechanical stoking are invited to visit some of the Detroit installations of the Under-Feed Co. They may be found in the works of Berry Bros., Ltd., Detroit Soap Co., Ireland & Matthews Manufacturing Co., Detroit City Gas Co., the Union Trust Co. building Hammond building and Stevens building. Across the river there are 10 Jones stokers in Uiram Walker & Sons' distillery and two in the Parke, Davis & Co. plant, both in Walkerville, Ont. In Windsor the machines are installed in the internally fired plant of the Canada Salt Co., Ltd.

### A UNIFORM CAP DISPLAY.

F. H. Newcomb, the Brooklyn manufacturer of uniform caps, is on hand as usual with a fine display of his products, together with a very nice bill pocketbook that he gives to all old friends who call upon him at his booth in the balcony. Mr. Newcomb supplied the Brooklyn Rapid Transit Co. with 8,000 caps last year and says that orders are coming in from railroad and steamboat companies all over the country.

### MAGANN AIR BRAKE CO.

The Magann Air Brake Co., of Detroit, is making an elaborate working test of the entire equipment as constructed by this company for the use of modern interurban roads. The exhibit includes a car equipment consisting of a Magann straight air storage equipment, the jam cylinder working against heavy springs so that actual service conditions are reproduced. Air for this equipment is supplied by a motor driven compressor having capacity of 14 cu. ft. of free air per minute. The compressor stores air at 300 lb. pressure in large steel cylinder tanks, the main storage tank being 36 in. in diameter and 15 ft. long and the surge tank being 18 in. in diameter and 7 ft. long. This is the equipment the company recommends for placing at a convenient point on the road so that cars can be charged with air to give the best results. It requires about one-half minute to charge a car from these tanks, supplying the car with enough air for 200 stops without recharging. The Magann air brake is now used on four of the interurban lines running into Detroit, also on the Kansas City & Leavenworth, Cleveland & Eastern, and many others. Among the recent orders is one for 40 equipments which have been placed on the new cars of the Schenectady Ry. Co., operating between Schenectady and Albany and Troy.

A feature of the exhibit which calls attention to itself is the whistle attached to the air brake mechanism, fed from the air tanks, which can be operated efficiently at the low pressure of 10 lb. This can be installed with the device or detached, as the buyer prefers. The company is represented at Convention Hall by E. C. Rutherford, W. E. Omick, F. Y. Harrison, and C. L. Main.

The G. P. Magann Air Brake Co.'s special car took a party out to Royal Oak yesterday. The car was among the number equipped with the Magann air brake, which was thoroughly demonstrated to the pleasure and satisfaction of the visiting street car men aboard. Among the guests were N. H. Heft, electrical engineer of the New York, New Haven & Hartford, and E. H. Keating, general manager of the Toronto Street Railway.

The pocket book given away by the American Steel & Wire Co. is useful as well as ornamental.

Mr. George C. Ewing, who is now located in Boston, dealing in electric railway material, was in attendance, and also represented the Nernst Lamp Co., of Pittsburg.

Mr. George E. Pratt, in addition to his duties as assistant general sales manager and contracting agent for Niles Car & Mfg. Co., Niles, O., will act in the future as purchasing agent for this company.

Mr. George C. Bailey, secretary and treasurer of the John A. Roebbing Sons Co., Chicago, Ill., was in attendance, meeting his many friends.

Mr. Eeeker S. Barnard, vice-president and secretary of the Standard Vitreous Conduit Co., New York City, was in attendance.

Mr. Carl M. Vail, secretary and treasurer of Westinghouse, Church, Kerr & Co., New York City, was in attendance, and while in Detroit inspected several plants that have been put in by his company.

Mr. J. B. Crankshaw, electrical engineer for the Electric Railway Equipment Co., of Cincinnati, Ohio, was in attendance.

Mayer & England Co. and Protected Rail Bond Co., of Philadelphia, were represented by C. J. Mayer, J. W. Gallagher, Wm. A. Armstrong, and W. A. Coekley.

A souvenir that appeals to visitors is a small celluloid dice box covered by mica, in which repose five diminutive and innocent looking bits of bone. It is the gift of the Ohmer Fare Register Co.

The Powell & Turner Truck Co., Troy, N. Y., is distributing an appropriately inscribed coat lapel button as a souvenir.

The Stuart-Howland Co.'s souvenir this year is a miniature bronze trolley wheel dependant from a coat button, or badge, which is inscribed "Stuart-Howland Co., Boston and New York," and in the center, "Detroit, 1902."

The International Register Co. is represented by President A. H. Woodward, Secretary and Treasurer W. H. Brown, and Messrs. F. B. Hall and E. T. Runge.

In the balcony on the right is a modest but none the less interesting exhibit of a model of the patent railroad crossing made by George W. Willebrands & Brother, 52 Jefferson avenue, Detroit. The action of this new crossing is automatic, responding to the movement of the car, and no matter in which direction the car is going a continuous rail is presented.

The exhibit of Mr. C. S. Knowles, of Boston, failed to arrive, so he surrendered his space to the Bellamy Vestlette Manufacturing Co. and the C. C. Wormer Machinery Co.

Dumee, Son & Co., of Philadelphia, would like to open correspondence with those who desire to buy franchises and rights of way of electric railways, also existing paying roads. The company has a number of first-class propositions which it would like to put before first-class parties who would be interested either in buying or financing.

Mr. W. J. O'Connor, general storekeeper of the Brooklyn Rapid Transit System, attended all the accountants' meetings.

Mr. Lehman B. Hoyt, district manager for the Bullock Electric Manufacturing Co., at Cincinnati, aided in distributing the company's souvenir medal.

G. S. Allison, of New York, dealer in second hand material, was represented. Mr. Allison has some bargains in railway goods.

## ON TRAMWAY EXPOSITIONS.

It is evident from the following published in the Electrical Times, of London (with apologies to Mr. Dooley), after the International Tramways and Light Railways Exhibition held in London last July, that the social features were not entirely neglected.

"If there's wan thing I hate," said Mr. Dooley to Mr. Hennessy, "it's exposishuns; they're all th' same, fr'm canned pork Wur'ld Fairs to Baby Shows in West 56 street. P'inty iv moosic, good an' bad; lots iv drink, mostly indiff'rent; any amount iv things to see wid no connecshun to th' exposishun; an' lastly, stowed away in th' annexe, somethin' to give th' show a name. Phwat I say is this: exposishuns is run in th' interest iv the cigar, brass-band, an' liquor thrades, takin' th' bread away fr'm honest folk loike mesilf an'—"

"Divvle-a-bit it is I understand ye," said Mr. Hennessy; "eg-poshishuns is fr'th' good iv thrade—"

"Thrade be damned an' you too," cried Mr. Dooley, "fr' expressin' opinions whin ye don't understand. Exposishuns is got up be other nayshuns fr'to sell their rubbish, an' to find out phwat is doin' in this country. Whin they've had a free demonstrashun, they go home an' copy th' goods thimsilves, bad luck to them. Have ye been to th' Thramway Exposhishun? No. Thin I have. Phwat d'ye know about it? As much as I do. Thin ye've been there,—Casey's been there,—Mike's been there; we've all been there some time or other. It's been a flower show, a dime wax work show, a food show, a charity bazaar, an Aztec circus. They're all alike."

"How did ye git there?" asked Mr. Hennessy.

"I wint to London fr'to see th' Coronashun," said Mr. Dooley, "an' just as I was lookin' th' rayturn journey—here, fill up your glass, take off that hat an' stand up, ye spalpeen; here's to King Edward, God bless him, an' confound his politics!"

The two cronies drank with enthusiasm. "As I was sayin' whin ye lutherrupted," Mr. Dooley went on, "I was bookin' th' rayturn billet, whin I picked up a yaller ticket fr' free admishun to th' Tramway Exposishun. They was lyin' about in thousands, so I shopped another week—"

"Another week?" asked Mr. Hennessy, in surprize.

"Another week," repeated Mr. Dooley, "an' if it had been you, y'd've stayed another month, with th' cigars an' whiskeys that was bein' handed around. Whin I got to th' gates I showed me yaller ticket an' th' minton bowed; he touched his hat to people with white tickets, took no note iv people with blue tickets, an' those who paid a shillin' he laughed at."

"They must have been fools," said Mr. Hennessy.

"Thru fr' ye, so they were," replied Mr. Dooley. "Whin I got into th' Hall, th' on'y thing I could see was acres iv red signs hung fr'm th' roof with white letters. Those were th' names iv th' fur'rums exhibitin'; th' smaller th' show th' bigger th' sign. Aft'er me eyes were accustomed to th' dazzlin' display, I saw a few people movin' about. They was mostly small bhoys with yaller bosoms an' black elsewhere, fr' all th' wur-ruld like spadger-cannarin bur-ruds, sellin' newspapers which were bein' published iv'ry month, iv'ry week, iv'ry day, iv'ry hour an' iv'ry minute iv th' Exposhishun be th' promoters. These they couldn't sell was given away, an' th' circulashun was tremendous. There was lots iv tellygraph bhoys an' m'essenger bhoys, an' th' r'ist iv th' people were tall men with red faces an' straw hats. Each wan had a cigar in his mouth, an' they all looked very hot. They was more of these people in the Exposhishun, excepting th' news-boys, than any other kind, but I saw a few ladies. Th' ladies was mostly teatin' th' magnetite brakes iv a kyar; they looked so happy an' unconcerned, ridin' in a kyar with so many convenient stops; an' th' motorman looked so proud, Hinnessy, I'm sure he must have sold thim dozens iv magnetite brakes. They was lots to see in th' thramway line—paints, writin' desks, sponges, shells, tailors' models, kyard-systems, typists, printin', engravin', an' many other things equally interestin'. Up in th' gallery a brass band was playin' Dutch moosic, an' over-all some billins lookin' an're lamps was throwin' a steady light. On th' fur'r'nd day th' Hall was full iv Dutchmen an' Reoshilans, an' Boogarlans, an' Turruks, an' Egetallans, wearin' bits iv ribbon an' medals, all talkin' to wanst with their hands an' feet an' shoulders, an' swearin' an' cussin' turrbly; leantwys so it

seemed to me, although someone said they has havin' a quiet talk, tryin' to make each other understand. They was th' furrin dillygates who had come fr'to do th' copin', an' they took miles iv notes; an' it was tur-rble to see phwat they could eat.

"Most iv th' sthands was kept be obligin' young men, though some iv thim had young women. Th' sthands kept be th' young women had big crowds around outside payin' fr' whiskey, but those kept be th' young men had th' crowds inside, gettin' whiskey an' cigars free. It was th' best exposishun I've seen, Hinnessy. I wint up to an obligin' young man behind th' sthand an' looked interesthed. 'Can I do anythin' fr' you?' he says. 'Yes,' I says, 'I want this invinshun explained.'

"'Right y'are,' he says, 'it is me own invinshun, an' th' on'y wan that's any good,' he says. 'It is so simple,' he says, 'an' no kyar should be without it. Thin there's this here,' he says, 'which is in use on ivry line in th' country,' he says, 'an' here's another fr'th' trolley, an' here's a speshul switch, all me own invinshun an' nawthin' else any good,' he says. 'Thru fr' you,' I says, 'these are just phwat I've been wantin' fr'th' electric thramway in me back yard; give me all th' pa-apers ye've got,' I says, 'an' I'll send you th' order whin I git back.' He hands a bundle iv pa-apers into me bag, an' thin he says, 'Come round this way,' he says, 'an' have a dhrink.' 'I'm comin',' I says, an' he leads th' way to a little box behind th' sthand, full iv other fellows who'd been promisin' orders. 'I think ye'll like this cigar,' he says, 'an' here's to your health. These are me frinds iv th' Society iv Corporashun Engineers,' he says, an' we all shook hands. We were that comfortable we didn't like fr'to part fr'm such an obligin' young man; but they was other interestin' sthands to visit an' many invinshuns to see, an' so I wint round with some iv th' Corporashun Engineers. We found all th' young men so obligin', an' we promised lots iv orders, an' had a rare good time iv it. There was on'y wan rift in th' loot, as Hogan says. As I was comin' out, I see an' old chap workin' a sort iv lever like I've got in th' bar here, Hinnessy. Thinkin' as w'd had a lot iv dhrinks free, it would be fair to sthand treat, I says to him, 'I'm payin' fr'th' company,' I says, 'so look sharp an' ladle out,' I says, an' they all laughed. 'Young man,' he says, 'ye've made a mistake; this is my ever-dry seat,' he says. 'Well,' I says, 'we ginrally feel dhry in th' throat, but if ye've a likin' to go into that tank iv yours—' an' I was fr' puttin' him in there an' thin, but th' polis came; an' th' next I raymimbered was, was wakin' up in bed with a head-ache. It was a interesthin' exposishun, Hinnessy, an' th' electric thramways should benefit."

"But phwat about those orders ye promised?" asked Mr. Hennessy.

"Wait till th' Bill is passed," said Mr. Dooley.

\*\*\*

In the smoking room will be found the comprehensive exhibit of vitrified clay conduit, both single and multiple duct, of the H. B. Camp Co. Mr. Charles C. Baird, of New York, is in charge of the exhibit and Vice-President H. H. Camp is expected to arrive to-day.

\*\*\*

A convention of the A. S. R. A. would be incomplete without a representation by the Globe Ticket Co. This year its booth is presided over by P. C. Snow, the general eastern representative, and D. C. Griffiths, general western representative. Vice-President W. C. Pope will be here to-day, also. The interests of the duplicate transfer and rebate department are looked after by H. N. Brown, the gen'ral general manager. The Globe is presentin' friends with a useful cigar perforator.

\*\*\*

The American Circular Loom Co. is represented at the convention by Western Manager Thomas G. Grier, who also exhibits the Nungesser electric battery. Mr. Grier has a section of the Standard Patent Co.'s booth in the balcony.

\*\*\*

Mr. Arthur Hartwell, sales manager of the Westinghouse Electric & Manufacturing Co., arrived Wednesday, and met with a hearty welcome from his many friends, especially those in the west who do not see him as often as they did before he was promoted from the head of the Westinghouse Chicago office.

## FROM THE DETROIT UNITED RY. WEEKLY.

The Detroit United Ry. has been publishing a weekly folder for some time that has been the instrument of bringing about a very friendly relation between the public and the company. The folder contains information as to schedules, new car routes, transfers, etc., and is intended to be a source of education and instruction to the company's patrons, on all subjects related to the company's business.

Here is a little item from one of the recent weeklies, that may be suggestive to companies who are interested in similar enterprises:

"We are a variegated lot—not in the matter of complexion, but of temperament. No two of us are identical by nature and our environments tend to increase the disparity. No two of us think the same way and no two of us have the same things to think about. An infinitude of human interests is pulling us this way and that. Sometimes we are bumped together, but Fate soon disentangles us and we go oscillating on until the tiny thread of each snaps in its vibration. The youth on your right has just had his salary raised and he is pulling out his chest and smiling at the sheer joy that he finds in living. The man on your left is not smiling. He is older. He is paler. There are lines in his face which are drawn and peaked. In the seat ahead he may be looking into the face of death or ruin, or grief, or the callow end of a futile struggle. They are both in your seat. The sun shines on both. Both feel the same summer breeze. Both hear the same laughter about them. But there is the gulf between them. They are swinging on different threads.

"The infinitude of swinging threads is what we have to deal with, for we are servants of the people. We serve all temperaments, all moods, all conditions—for you find them all on the street cars. Exuberant youth rides with us to the ball games, to the parks and excursions, and to work, and pays his fare with a laugh. Age rides with us—grief rides with us—foreboding, suspense. These, too, pay their fare, but usually they do not laugh.

"It's our task to find a path through this snarl of comedy and tragedy. The conductor must humor the mood, without knowing its extenuating cause. The conductor must propitiate hot-headed youths, needlessly excited old ladies, adventurous juveniles, grouchy maturity, pugnacious inebriacy, and all the rest of those swinging threads. He must be an altruist, a counselor, a cashier and above all a diplomat. He must enforce the rules for exuberant youth and disconsolate old age. The conductor is himself human. He, too, swings on a thread.

"We try to reconcile these extremes; to find a safe middle ground. Be charitable with us—for, at best, we all are swinging threads."

## HAZEN S. PINGREE.

Of all of Detroit's many famous sons, none have attracted more wide-spread attention and prominence than did the late Hon. Hazen S. Pingree. Taking it all in all, he was one of the most interesting and picturesque characters ever produced in this country, and inasmuch as he interested himself, in more ways than one, in various matters pertaining to street railway operation, a brief sketch of his career is not out of place at this time, and may prove interesting.

Mr. Pingree was born Aug. 30th, 1842, in Denmark, Me., of the proverbial humble New England parentage. In 1856 he took his first position as mill-hand in a cotton mill at Saco, Me. Four years later he was working at a shoe factory at Hopkinton, Mass. In 1862, he enlisted in the First Massachusetts Regiment of heavy artillery. He was captured in 1864, and sent to Lynchburg, Va., and then to Andersonville; was subsequently exchanged, and rejoining his regiment served to the end of the war. After peace had been declared, he went to Detroit and became an ordinary shoemaker. By the display of remarkable energy and sagacity, he soon rose from the position of cobbler to that of manufacturer, and in the course of years became the head of the Pingree shoe factories, which now enjoy a world-wide reputation.

Without previous political training, in fact without previous political activity, other than the interest taken by the average

citizen in the local politics of his community, Mr. Pingree in October, 1890, was selected by the Republican party as the party's nominee for mayor of Detroit. Political reform had become the popular cry, and Mr. Pingree was selected almost without regard to party affiliations to fill the popular demand for a conservative business administration in the city of Detroit.

Mr. Pingree was elected mayor by an overwhelming majority, and assumed the duties of mayor of Detroit on Jan. 1st, 1890. His public career began on that date and lasted until his death. He served as mayor of Detroit through four terms, and was then elected governor of Michigan, in which capacity he served two terms.

From the first year of his political life to his death, in June, 1901, Hazen S. Pingree was an enigma and a surprise to friends and foes alike. Elected mayor as the choice of the conservative business elements of the city, he at once commenced a wild crusade on capital and vested interests. His hurricane ideas of municipal reform made necessary the coining of a new word, "Pingreeism" may be said to mean a change—no matter from what to what, so long as a change is made in existing conditions. Just here it must be inserted that in all the time Mr. Pingree was occupying his conspicuous position in the public mind, no one was able to bring a verified charge of dishonesty, fraud or deceit against him, and even those to whose interests he was most antagonistic are willing to admit that he thought he was right.

The second year of Mr. Pingree's office as mayor brought to light most of his eruptionary ideas for securing free everything for everybody. He declared the city was paying too much for its public light, and advocated a municipal lighting plant. He announced the gas company must reduce the price of gas or get out of business. He wanted to pave all the streets and put all telegraph and telephone wires underground. But the one all-absorbing object of his life was to secure municipal operation and 3-cent fares on the city street railways. For this he worked during all the latter years of his life. In his efforts in this direction perhaps he conferred a benefit on the country-at-large for he proved by actual experiment that in the average city of the United States 3-cent fares are impracticable and impossible from the standpoint both of the municipality and of the street railway companies. The history of this 3-cent fare agitation will be found in the "Street Railway Review" for Sept. 20, 1902, page 507.

Another of Mr. Pingree's ideas brought him the appellation of "Potato Pingree." This scheme was one for utilizing idle land in the outskirts of the city for cultivation by the poor in raising food for themselves. Donations of land were made by liberal citizens, and about 438 acres were accepted, plowed, harrowed and staked off into lots of from one-quarter to one-half an acre by a committee appointed by the mayor. Nearly 1,000 dependent families were assigned to these lots, and seed potato, beans and other seeds were furnished by the committee. Each family planted its own seeds and attended the crops, and the crops so raised were kept by the individual family for consumption during the winter. Several of these potato fields may still be seen in the outskirts of the city.

Mr. Pingree died in London, Eng., June 18, 1901, after an extended trip through South Africa.

The medallion souvenir given away by the Bullock Electric Manufacturing Co., of Cincinnati, was in great demand, and the supply was exhausted before yesterday evening. Mr. Frank G. Bolles, representing the company, was kept busy distributing the medals or else telling anxious inquirers that he hadn't any more.

Mr. A. A. Hilton, manager of the Fort Wayne Foundry & Machine Co., is in attendance. Mr. Hilton has a very extensive acquaintance among railway men, having been for six years general sales agent of the St. Louis Car Wheel Co. before going with the Fort Wayne company.

Among the early arrivals is Alfred Johnson, electrician for the Street Railway Co., of Quincy, Ill., who is also well known as the inventor of the "Reliable" trolley harp, a simple, cheap, yet durable contrivance, which has proven especially serviceable on large motors.

THE EXHIBITION HALL ON SUPPLYMEN'S DAY.

THE KUHLMAN CAR CO.

Appreciating the fact that presidents and general managers of large suburban roads would need the same accommodations as presidents of big railroads in the matter of their own private cars, this company has designed and built a private car which was shown on the street approaching convention hall. In finish, in design, and in general equipment, it would be difficult to decide how this car could be improved upon in any way.

The car is 17½ ft. long over all and 8 ft. 6 in. over sills. This car is set out of the center of the trucks 2 in. away from the devil strip side in order to allow it to be operated in cities where they have a narrow devil strip. In the center of the car is a private bed room and bath with a three-quarter mahogany bed, wash stand, bath tub and water closet. The interior finish is of Mexican mahogany, every piece of wood being selected for grain and quality. The ceiling is of the Pullman circular type with gilded mouldings, deck lights of cathedral glass and windows of ground French plate. The front part of the car is divided into a motor-man's room and observation room. The seating arrangements are movable cane seats with leather and plush cushions. The carpet is the best Wilton carpet and was selected to match the curtains and ceiling. The curtains are of silk. The car is mounted on Peckham trucks and equipped with Christensen air brakes, and is to have 4 General Electric 75-horse power motors with type M controllers. The car has a buffet at the rear end with leaded glass doors and ice chest for cooling purposes. On account of the delay in getting materials, this buffet does not

show in the car at present, but will probably be placed to-day. The lighting arrangements comprise 30 lamps arranged in clusters at convenient intervals.

R. D. NUTTALL CO., OF PITTSBURG, PA.

This company's well known line of gears and pinions forms one of the main features of its exhibit which is located just off the main aisle. The samples of gears and pinions include types of newer and heavier forms brought out by the Nuttall company to meet the conditions of modern high speed electric railroading. At the back of the space was shown a 5 ft. gear, 1 ft. across the face, demonstrating the ability of the company to turn out work ranging from the smallest to the largest sizes. The Nuttall trolley wheels were exhibited in various sizes for different grades of service. The well known trolley stand was also displayed and attracted a great deal of attention. As a souvenir the company is distributing a technical work on gears and their manufacture. The company is represented, in addition to its regularly appointed agents by Mr. F. A. Estep, George W. Provost, Arthur S. Partidge, Mr. McGill, of Chicago, the Frank Bidlon Co., the Mayer & England Co., and a staff of special representatives.

The Sherwin Williams Co. furnishes the paints used throughout the handsome Kuhlman car exhibited on the street.

Mr. T. E. Mitten, general manager of the International Ry. Co., returned home yesterday afternoon at 4 o'clock.

## REGISTRATIONS THURSDAY, OCT. 9, 1902.

The Wayclark Wire Co., of New York City, is represented by Mr. H. F. Sanville, Philadelphia agent. The Wayclark company sells trolley and feed wire of all descriptions. Mr. Sanville also represents the Simonds Manufacturing Co., of Pittsburg, maker of the well known Simonds gears and pinions.

One of the most familiar faces at the A. S. R. A. conventions is that of Mr. E. Packer, traveling salesman for the Morris Electric Co. With two exceptions Mr. Packer has attended all the A. S. R. A. conventions. He missed Kansas City and Montreal, much to his regret.

Engineer

A WINTER'S TALE.

My greeting from No. 89, when I boarded his car a couple of months later, was a hearty one. At first I hardly recognized him; a new uniform, clean shirt, neat tie and well blacked shoes were pretty nearly as good a disguise as that of his friend the spotter. I looked him over carefully and something in the sheepish way he avoided my gaze gave me an inspiration.

"You've been getting married!"

"Somebody's been telling you."

"Not a soul—it was a pure guess."

"Well, you're a wizard! Yep, it's a fact. I thought I might 's well make use o' that v'cation o' mine so I got spliced, rented a house, furnished it an'—there you are!"

"Well, I congratulate you. Who is the lady?"

"That's her."

I peered into the car at the only "her" in sight and saw a nice looking woman of about 35.

"Pretty neat woman for a mucker like me?" And there was a self-satisfied smirk on No. 89's countenance.

"Better than you deserve, I guess!" was my uncomplimentary remark, but the smirk only deepened into a grin.

"Oh, I do know! Me an' Bill Hendricks useter—"

"That reminds me," I interrupted, "what was that yarn about Bill's death that you were going to spin for me?"

The grin disappeared instantly.

"That's no yarn, sir. It's the gospel truth!"

"Well, let's have it."

"Can't tonight, sir; it's too long a tale an' this is my last trip in an' I've got to make up my report. But tell you what we'll do: You're a 'buck,' I take it, ain't got no women folks to sit up for you? Thought so! Well, go with th' woman round to the house—it's only a block away—an' I'll come 's soon 's I can an' bring a can o' beer an' the woman'll make some sandwiches an' I'll tell you about Bill an' what followed."

"But—your wife?"

"Oh, she'll be tickled to have you, I been tellin' her about you,

an' me an' her always has a bite an' a sup after I come home. Come in an' I'll interjuice you."

After a big, solid glass of beer and a well-mustarded "sam-wich" was in easy reach of each of us, I offered No. 89 a cigar. "Is this any kin to th' first one you g'in me—mos' a year ago!"

"No relation!"

"Then I'll lght her up an' tell you about Bill. 'T was that cold winter,—lemme see, must 'a been nigh onto twenty-five years ago, I ferget just the year—anyway, 't was most awful cold. He an' Bill had th' owl car that night an' it took in the whole length o' th' line, over five miles from the stand to th' barn. It was just perlishin' cold, a keen wnd an' little scales o' snow in it that cut like a knife when they hit your face. I was bundled up 'n everythin' I could lay my hands on an' even then I couldn't stand it on the platform so I come inside. Bill, he'd pulled down his cap an' pulled up his collar 'till there warn't nothing' of him showin' but his eyes an' he'd wrapped his legs around with the blankets off'n the hosses and sot up on his stool with his back again' the front door an' he started that team for all 't was worth. We didn't have a passenger th' whole trip an' first off I opened the door a crack once or twlee an' asked Bill 'f I shouldn't spell him a bit drivin' an' all I got was 'Get t'ell outer here an' shut that door,' so I didn't pay no more attention to him but jus' jogged back'ards an' forrards over the hay in the aisle an' hammered myself with my arms to keep from freezin'—it was me s' fearful cold!"

"Didn't you have a stove in the car?"

"Yes, but it went out on our down trip—never would burn 'n a wind, an' I had no kindlin' to start it an' Bill wouldn't wait at the stand for me to get any, said 't 'd be better to get to th' barn 'fore the hosses froze. Well, as I was sayin', we jogged along that way an' never stopped 'till we got to the barn an' the night hostler heard the bells an' swung the doors open an' Bill he never stopped to let me off nor nothin', but just salled right in an' I was so stiff with cold that when I went to jump off to go into th' office to sign up an' turn in my punch, I fell all 'f a heap. When I piked myself up I heard the hostler holler, 'Where 'n

**CLEVELAND, OHIO.**

blazes yer takin' that car, Bill?" but I didn't pay much attention to it, but jus' scrambled for th' office an' the fire. Well, I hadn't more'n got unwrapped when th' hostler comes tearin' in, his face like chalk, an' his eyes like saucers an' he yells out 'For God's sake come out here, som'n's th' matter wth Bill!

"Well, the watchman tumbled out an' I followed 's fast 's I could hobble an' there was Bill's car clean at th' end o' the track an' the hosses turned off agaln' the side o' the barn—dodgin' it same's they was useter dodgin' a truck in the street when it backed up on 'em. That seemed strange, 'cause Bill was a good driver an' careful of his teams gen'rally, so the watchman sings out 'What 'n the dickens 's the matter with you, Bill, tryin' to jam them hosses? Don't your brakes work? There wa'n't no answer from Bill an' the watchman says, 'Are you 'sleep.' An' we goes up to him an' the watchman gives his arm a pull an' Bill an' the stool comes over just like a tree a-fallin' an' then we was scared. I forgot all about my beln' cold an' me an' the watchman grabs him an' starts to haul him into th' office an' somethin' pulls him back an' there was the lines fast in his hand an' it stiffen' iron; we just had to cut them apart afore we e'd move him an' the whip in his t'other hand was the same way an' we carried him into th' office an' it a'wavin' in his hand. Well, we fetched a doctor, but 't wa'n't no good, poor Bill was deader 'n Hector—whoever he was! They had 'n inquest next day an' the doctor said 't was a weak heart 'su'ndooed by th' intense friggiditty o' th' atmispheer'—yes, he did, them's his very words! An' he said he must 'a been dead most an hour when we found him, he must 'a died soon after I last spoke to him.

"Well, you may jus' believe that broke me all up, me an' him had been on the same car for clos't onto three years an' always got on well, fer Bill was rough spoken but straight 's a string. The thing preyed on me for a good spell, I sorter blamed myself for my not makin' him come in an' lettin' me spell him a-drivin'—'t wouldn't 'a done any good I know, but you know how you feel about a dead person—sorter 's if you might 'a helped it 'f you'd 'a tried?"

I nodded.

"Well, that's the truth about his death an' you might say as there wasn't anythin' wonderful about that but it's what happened after that that I was goin' to tell you—you'll understand it better now 't you know about his dyin'. Lemme fill up that glass again, sir, it's dry work lis'enin', an' I'll tell you what come after.

**HUNTER CAR SIGN.**

Mr. Lytle J. Hunter, the sign and fender man, was just about as busy as he ought to be in the annex taking orders and describing the Hunter devices. Mr. Welling, superintendent, had charge of the display when Mr. Hunter was not there. The new vestibule sign recently put on the market by Mr. Hunter attracted considerable attention.

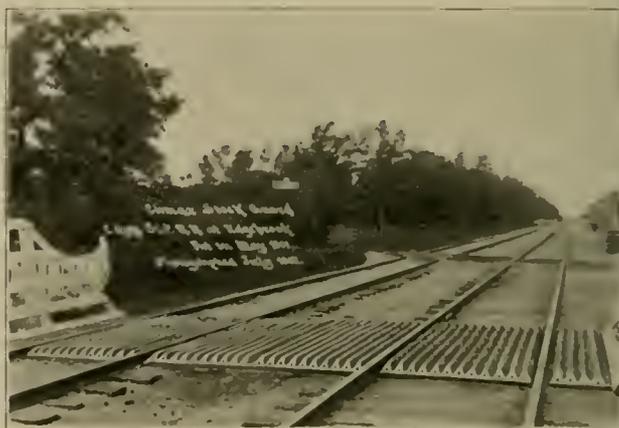

Everybody knows and everybody was glad to greet Scott H. Blewett, general agent of the American Car & Foundry Co., of St. Louis, who showed up smilingly in the exhibit hall yesterday afternoon.

**NOT BAD FOR A NEW THING— IS IT ?  
 LET US ENTER YOUR NAME IN THE LIST.**

### TRENTON TROLLEY WAGON.

J. R. McCardell & Co., of Trenton, N. J., have a novelty in the form of a Trenton automobile tower wagon. The wagon itself is the standard Trenton type but the mechanism and running gear have lately been perfected by the Motor Truck & Vehicle Co., of Columbus, O. The motive power is furnished by a gas engine of approved type driving the axle through chain and sprocket wheel.

It was announced yesterday that the Bishop Gutta-Percha Co., of New York, which had secured booth 48, had decided not to exhibit, much to the regret of many friends of President Reed. The space has been assigned to the Burrongs Adding Machine Co.

## THE "DAILY REVIEW."

Although we are very modest we cannot refrain from pointing with pride to the four issues of the "Daily Street Railway Review" published in Detroit. In the four days we have published 132 pages of reading matter, giving a complete account of the two conventions and exhibits. Doubtless only men in the newspaper business appreciate the labor involved in a monthly journal moving its publication office so far from home and publishing a paper that comes out every day instead of once a month.

The success of the "Daily Review" has only been made possible by the efficient work of our printer, the R. L. Polk Printing Co., of Detroit, and the cordial co-operation of the secretaries of the two associations, Messrs. Pennington and Brockway, and the official stenographers, Messrs. T. E. Crossman and A. B. Weaver.

The prompt publication of the list of attendants was greatly facilitated by the courtesy of the Detroit United Railway in assigning a number of its employes to assist us.

## THE FUTURE OF THE A. S. R. A.

This year the committee appointed to select the meeting place of the A. S. R. A. for 1903 was unable to report a decision.

The fact is that the association has attained such a size and the need of a large exhibit hall has become so imperative that there are but few cities in the country which are suitable meeting places. It is also true that the burden of entertainment imposed upon the street railways of the convention city is greater than most of the member companies care to assume.

One can count on the fingers of one hand the cities of the country that have the needed hotel and exhibit hall accommodations, and it would be unreasonable to ask that the railways of these few cities assume the entire burden of entertainment. The association will probably have to radically change its plans and in the future pay its own entertainment expenses, or let this privilege devolve upon the suppliers, as is done by the steam railroad conventions.

The organization of the master mechanics' association this week also indicates a tendency to differentiate which may result in an entire change in the scope of the A. S. R. A. and result in the parent association becoming a supervising body only, which will bear the same relation to the subordinate associations of master mechanics, mechanical engineers, maintenance of way men, and accountants that the American Railway Association bear to the M. C. B. Association, the Master Mechanics' Association, the Association of Railroad Accounting Officers, and the host of smaller steam railroad organizations. The subordinate bodies will recommend and the superior association will act.

The coming year will certainly be the most important in its history for the A. S. R. A., for upon the action taken by the incoming executive committee will to a great extent depend the future of the Association. It is a reason for congratulation that the men who will be in charge are among the ablest representatives of the member companies, and we may feel sure that they will act for the best interests of all concerned.

**A. S. R. A. OFFICERS.**

President—Jere C. Hutchins, President Detroit United Railway, Detroit.

First Vice-President—W. Caryl Ely, President International Railway Co., Buffalo.

Second Vice-President—W. Kelsey Scheff, President Cincinnati Traction Co., Cincinnati.

Third Vice-President—P. S. Arkwright, President Georgia Railway & Light Co., Atlanta.

Executive Committee—The President, the Vice-Presidents and H. H. Vreeland, President Metropolitan Street Railway Co., New York.

R. T. Laffin, General Manager Worcester Consolidated Street Railway Co., Worcester.

Andrew Radel, Vice-President Middlesex & Summerset Traction Co., Bridgeport.

Walter P. Read, Vice-President Consolidated Railway & Power Co., Salt Lake City.

Willard J. Held, General Manager Twin City Rapid Transit Co., Minneapolis.

Secretary and Treasurer—T. C. Pennington, Treasurer Chicago City Railway, Chicago.

**ACCOUNTANTS' OFFICERS.**

President—Henry I. Davies, Secretary Cleveland Electric Railway Co., Cleveland, O.

First Vice-President—Irwin Fullerton, General Auditor Detroit United Railway, Detroit, Mich.

Second Vice-President—D. Dana Bartlett, General Auditor Boston & Northern Railroad Co., Boston, Mass.

Third Vice-President—J. B. Hogarth, Auditor Denver City Tramway Co., Denver, Colo.

Secretary and Treasurer—W. B. Brockway, Consulting Accountant, Birmingham Railway Light & Power Co.

Executive Committee—The officers and H. C. Mackay, Comptroller the Milwaukee Electric Railway & Light Co., Milwaukee, Wis.

O. M. Hoffman, Treasurer Conestoga Traction Co., Lancaster, Pa.

Elmer M. White, Cashier Hartford Street Railway Co., Hartford, Conn.

The fourth member left blank, to be supplied by the committee, pending the determination of the next place of meeting.

**MAIL AND TELEGRAMS UNCALLED FOR.**

The following mail and telegrams are uncalled for at the office of the chairman of the exhibit committee:

Mail: George W. Rounds, E. D. Hebbes, J. P. Doane, Wm. A. Snow and C. W. Powell.

Telegrams: Frank Silliman, W. A. Shirley, G. W. Hamilton, W. E. Jacques, Henry C. Doherty, C. O. Mailloux, H. M. Pease, and C. T. Maines.

**NOTICE TO EXHIBITORS.**

The exhibit committee announces that the Michigan Car Service Association has agreed to waive storage charges on all shipments brought in for exhibit purposes up to and including October 15th. This is an unusual concession and exhibitors will appreciate the efforts of the committee in caring for their interests in this regard.

The reelection of Mr. W. B. Brockway as secretary and treasurer of the Accountants' Association was eminently fitting and proper. No member of the association has worked harder for the welfare of the organization than Mr. Brockway, and we predict that his interests will continue to have his best care and attention. Mr. Brockway left last night for the east and will stop by the way at Cleveland to officially notify Mr. Davies of his election as president of the Accountants' Association.

## J. C. HUTCHINS.

Mr. J. C. Hutchins, president of the Detroit United Ry. and the Rapid Railway System, was born in Carroll Parish, La., Oct. 13, 1853. As constructing and civil engineer he had years of experience in the early days of railroad building in Missouri, Texas and through the southwest, and was afterwards in newspaper work for a short time in Waco, Texas. He went to Detroit in 1894, and was made vice-president and treasurer of the Detroit Citizens' Street Railway Co., and later was elected to the same offices in the Detroit Railway Co. On the organization of the Detroit United Ry. Mr. Hutchins was chosen vice-president and general manager; he was elected president Jan. 21, 1902.

Since identifying himself with the Detroit United Ry. Mr. Hutchins has taken an energetic interest in its welfare, and many of the details of operation in all departments have been

J. C. HUTCHINS,  
President A. S. R. A.

instituted as the direct results of his suggestions. He has been particularly interested in the welfare of the company's employes, the present system of reward by merit and demerit marks being one of his latest plans for improving conditions of the men. In selecting his heads of departments and operating men, he has believed in finding the best men possible, giving them free rein, and then holding them responsible for the organization and results under their respective departments.

Mr. Hutchins has been the official head of the company through the several mergers of the last few years, and in particular has been instrumental in bringing about the acquisition of outlying suburban and interurban lines. He has had supreme faith in the future of the United system, and recognizing the advantage of having all the roads about Detroit under one management, he has worked steadily to that end, and the result is the present efficient and well-managed Detroit United Ry. property.

## MASTER MECHANICS' ASSOCIATION.

At an adjourned meeting of the master mechanics, held at 12 Woodward Avenue yesterday, it was decided to increase the committee membership with a view of effecting the permanent organization. The meeting adjourned to meet at Cleveland on Jan. 12, 1903.

## H. J. DAVIES.

Mr. H. J. Davies, the new president of the Accountants' Association, is secretary of the Cleveland Electric Railway Co. He was one of the charter members of this organization and also one of its hardest workers during the first year of its life. It will be remembered that at the time of the Kansas City convention Mr. Davies withdrew from active street railway work and was then elected an honorary member of the association. Mr. Davies' many friends and especially his brother accounting officers, will welcome him back to active membership.

## THE BANQUET.

The 21st annual banquet was held at the Hotel Cadillac, plates being laid for 400 guests. The toast list was as follows:

"The Growth of Detroit as I Have Known It," Hon. Wm. C. Maybury, Detroit.

"The F-30 Motor," Gen. Eugene Griffin, New York.

"How the People Would Run a Street Railway," Michael Brennan, Detroit.

"The Future Electric Railway," W. Caryl Ely, Buffalo.

"The Trolley: Its Future State," James T. Keena, Detroit.

## A CURIOUS MISHAP.

Mr. Warren Bicknell, general manager of the Aurora, Elgin & Chicago Electric Railway, is in attendance at the convention, and is telling a story of an exceedingly curious accident which occurred recently on his road. He narrates:

"A gentleman waiting to take a car at a platform stop in the country upon a rainy night last week, was standing on the platform with his umbrella raised, when a car passed going at the rate of 65 to 70 miles an hour. The suction from the passing car filled his umbrella, carried the man off the platform, hurled him against a fence and broke his arm."

Mr. Bicknell is trying to decide whether the company is liable or not for the injuries sustained by this man. Perhaps some of the legal minds in attendance can answer this query.

A noteworthy feature of the Detroit convention has been not only that the registration is larger than any other previous convention with the exception of the New York meeting, but that almost the entire attendance was registered on the first day. This proves that delegates and supplymen have found the three days of the convention none too many in which to transact business, and are therefore arranging to be on hand at the opening hour. At former conventions it has usually been the case that nearly half of the total registration was made on the second day. We believe that at least four days should be given to the convention in the future.

One of the neat souvenirs at the convention is a silver match box distributed by the Crocker-Wheeler Co., the body of the receptacle being covered by celluloid upon which is printed the donor's trade mark in colors.

Never in the history of the association has there been so large a number of ladies registered and in attendance. This probably accounts entirely for the success of the meeting.

Mr. W. H. Gray, of Townsend, Reed & Co., with headquarters at Indianapolis, arrived in Detroit Wednesday morning and has seen the convention to the finish. Everybody remembers Billy when he was one of the Peckham Track men, and his new position of "magnate" has not changed him.

A feature of the convention was the force of "White Wing" street cleaners furnished by Public Works Commissioner Moreland to keep the Convention Hall and surroundings tidy and free from the usual accumulation of litter and refuse. Their spotless uniforms, business-like demeanor and effective work are evidently the results of careful training and discipline.

## TWENTY-FIRST ANNUAL MEETING

# AMERICAN STREET RAILWAY ASSOCIATION

Detroit, Mich.—Oct. 8—10, 1902.

### FRIDAY MORNING SESSION.

President Vreeland called the meeting to order at 10:40 a. m. and announced that the first business this morning will be the report of the Committee on Standard Rules for the Government of Street Railway Employes.

Mr. Harrington, Camden: Mr. Brackenridge, the chairman of the committee, is not here, and it seems to be the sense of the committee that the rules which have been submitted express only the preliminary work of the committee on this subject, and we would therefore request that either the committee be continued, if it is your pleasure, or that a new committee be appointed.

President Vreeland: Your President has had some conference with the members of the Committee on Rules. It seems advisable that the work of this committee should be done in a very thorough way, before any set of rules is adopted. The matter of framing a standard set of rules, as you gentlemen know, took a great deal of attention for many years in connection with the work of other associations. The New York State Street Railway Association has a committee now working on this subject, and this committee recently made a preliminary report at the meeting of that Association held last month. It has been suggested that inasmuch as Mr. Brackenridge, of the Brooklyn Rapid Transit Co., has given up the operating department, that there be a substitution in his place, and that another gentleman be added to the committee so that the committee can go forward with the work during the next year. It is advisable, in the mind of the chair, that the same members of the committee, with additional appointments, should go ahead with the work this following year so that they will not lose the value of the work which they have already done. It has been suggested that Mr. E. G. Connette, of Syracuse, be appointed in place of Mr. Brackenridge, which will make two members of the committee, Mr. Mitten, of Buffalo, and Mr. Connette, of Syracuse, working on this proposition, each being members of the Committee on Standard Rules appointed by the New York State Association, which will undoubtedly facilitate the work of forming a standard set of rules; and the chair will appoint as the Committee on Standard Rules for the ensuing year Mr. T. E. Mitten, of Buffalo; Mr. E. C. Foster, of Lynn; Mr. W. E. Harrington, of Camden, and Mr. E. G. Connette, of Syracuse; Mr. Connette to be the chairman of the committee.

Mr. John I. Beggs: I would make a suggestion in connection with the work of this committee. I do it without any disparagement to those on the committee, but in the hope of hastening, if possible, the presentation of a report upon which action may be taken by this Association. There are a number of roads throughout the United States, among which is the road with which I am associated, that have been waiting for two or three years, at least, in the publication of rules to govern their employes, until this Association should have given the stamp of its approval to a set of rules that might give greater uniformity to the conditions under which our employes throughout the country work. I for one will feel compelled to take this report as a basis—or the report of the committee of the New York State Association, which I think is much better, and I say it without disparagement to this committee—because you will find in sections 52 to 55 of these rules as submitted a set of conditions—I do not know who is responsible for them—to conform to which, would in my judgment, make it absolutely impracticable to operate a street railway in any metropolitan city. These rules in question may be very well for an interurban line, but are absolutely impractical of application, in any city of any considerable size. I furthermore think that there should be some representa-

tive of this committee from a large city, like Chicago or St. Louis. We know that in different sections of the country there are different conditions confronting the operators of street railways, and this committee as organized is largely confined to the east. I am perfectly satisfied with the committee as it is now constituted, but I think there should be some one from a great city like Chicago or one of the western cities, to give expression to their views in the formation of these rules. I have read the rules very carefully. The rules Sections 52 to 55 inclusive, require a car to come to a full stop every time it passes another car; to come to a full stop before it crosses any other street railway intersection, etc. In a large city that would be absurd. It is absolutely impractical to carry out, and I cannot understand who would be responsible for four rules such as these. I simply throw this out as a suggestion of a criticism which might be made upon the work of this committee; and I would like to suggest, without the necessity of making a motion, that the committee be increased by at least one other member, who should come from, say, the city of Chicago. This would more nearly represent the practice throughout the west.

The President: The chair will very gladly do what Mr. Beggs suggested. It has been the experience of your chairman in dealing with the subject for many years, and on other subjects handled by committees, that it has been wiser in appointing a committee, to appoint the members of the committee from some section of the country where the members can get together and hold a meeting. Questions connected with other cities, as a rule, can generally be covered in a satisfactory manner by correspondence; but inasmuch as the appointment of an additional member will not make any difference to the committee, the chair will follow the suggestion made by Mr. Beggs and appoint Mr. Robert McCullough, of Chicago, as an additional member of the committee.

On motion the report of the Committee on Standard Rules as presented at this meeting was accepted.

[The report of the Committee on Standard Rules is so voluminous that want of space prevents our publishing them in this issue.—Ed.]

The President: In order to dispose of the reports of the committees, as some of the members of the committees find it necessary to leave the city rather early to-day, we will have the report of the Committee on Standards, of which Mr. N. H. Hefl, of Meriden, Conn., is chairman.

Mr. Hefl then presented the report of the committee and said:

I think I stated correctly that it is the unanimous opinion of the committee that this Association could adopt at this meeting the standards recommended by the committee, as they are in line and in most cases an exact duplicate of the M. C. B. standards for rails, axles, journals, brasses, wheels, journal boxes, brake heads, brake shoes, etc.

[As the illustrations accompanying this report are not available the printing of the text of the report has been deferred.—Ed.]

The President: Gentlemen, you have heard the report of the Committee on Standards. This committee was appointed for this important work with the full confidence of the Association in the value of their recommendations. There is no member who has to do with the larger questions connected with the present electric systems of operation, city, interurban and suburban, heavy city work as well as work outside of the city limits, but appreciates the fact that the standardizing proposition is an important one at the present time. In the light of the experience of the last half century of steam railroad operation, it is hardly worth the while of the members of this Association to go ahead spending money in as many different directions as there are

managers represented, because the era of consolidation is at hand, not approaching, and we will find ourselves with many interurban roads, through consolidations, which will have as many different standards as the ideas of the managers handling the property. You have heard the recommendation of the committee that this Association accept the recommendations contained in the report as standards, and inasmuch as the chairman stated that the standards selected by the committee are the established standards of the United States through the M. C. B. rules, it is hardly worth while to take up much time in the discussion of the report. However, the report is before you and the chairman will be glad to answer any questions. We would like to have any member who has anything to suggest to do so at once, as we have considerable work to get through with what we have to-day by an early hour this afternoon. If there is no gentleman who desires to discuss the report, a motion is in order that the report be received and the recommendations be accepted, and that the full report on standards as recommended by the committee be printed in the proceedings of the Association. The chair will be glad to have that motion made.

On motion the report was accepted and ordered printed, and the committee discharged, and the officers for the ensuing year authorized to appoint a new committee.

The chair appointed W. Worth Bean, of St. Joseph, Mich., and H. W. Dickinson, of Seattle, as a committee on resolutions.

Mr. Sniffin then presented his paper on "The Steam Turbine; Its Commercial Aspect," which will be found on page 723.

Mr. Beggs: I have read the paper on steam turbines with a great deal of care, for the reason that two years ago I postponed all progress in the construction of a power house in which we expected to expend a large amount of money on units similar to those installed by the Manhattan Railway Co. in New York, and now being built in our city for the Subway company in New York, because the matter of steam turbines was then being seriously agitated; and I did not wish to proceed with the work at that time and have some one say five years hence that it was a mistake to spend three millions of dollars on a power house with reciprocating engines when it was about to be demonstrated that the steam turbine was destined to displace the reciprocating engine. Consequently I have read this paper with a great deal of interest, and have gained from it some useful information. There is one point which has not been touched upon as fully as many others and that is the relative cost of the generator by itself to be connected to the steam turbine; in other words, you have left out apparently the differentiating cost as to the turbine itself and the generator to be connected to it. I would like to know whether your estimates of cost in the paper, when you say that the turbine costs less, means that the gradual or that the reduced cost is due to the reduced cost of the generator rather than to the turbines?

Mr. Sniffin: That question is not so material when you consider that these companies are either offering or expect to offer these turbine units as complete outfits. It makes no difference what the steam or electrical end costs individually, so far as we have the comparison of the cost of the complete unit. In a general way it may be said that the electrical end of the unit is lower in cost of manufacture than the large revolving generator that goes with a reciprocating engine. While the steam end itself is perhaps comparatively inexpensive, yet the price of the complete unit compared with the cost of the reciprocating unit, including its generator, is the comparison I made in my paper. It is not the purpose of the Westinghouse Company to furnish the steam turbine alone, but to furnish the generator with it as a complete unit.

Mr. Beggs: This is really a manufacturers' paper, and Mr. Sniffin has proceeded with the conclusions urged in that paper as a maximum cost upon lines which it will hardly be possible to be followed by those who are going to pay for these units. There are two or three concerns in the United States at the present time which are developing the steam turbine in connection with generators, but I do not think that those of us who are spending millions of money in the construction of power plants, are going to be satisfied to depend upon two electrical manufacturing concerns for the construction of the steam turbine, which is a mechanical device and entirely independent

of the electric generator. For instance, the largest manufacturer of steam engines in the world is located in the city of Milwaukee, the Allis-Chalmers Co., and I do not suppose for one moment I know as a matter of fact—that it would propose to have its business taken from it by even the Westinghouse or General Electric Co., and it is to-day experimenting on a large steam turbine. Therefore, it is important that we know what the difference in cost is, and know how the varying elements are reached in considering the expense of constructing a power plant, including that of the generator. One of the important points, which is entirely ignored in the paper before us, is the effect of the greatly reduced cost of the generator to be attached to the steam turbine because of the high speed at which it must necessarily run. I believe the lowest speed at which it is considered you can make a large turbine operate successfully is about 750 r. p. m. Is that correct?

Mr. Sniffin: Yes.

Mr. Beggs: Those gentlemen who know the difficulty we have had of getting the electrical manufacturers to build a generator of sufficiently low speed to operate satisfactorily with the larger types of Corliss engines that are now being built, know how much they have had to pay because of the slow speed. In this matter of the development of our power house, it became important whether or not we could cut down the revolutions of our engines, 7 revolutions, from 75 to 68 revolutions, which the builders of the engines said would measurably improve them from the operative standpoint; yet that reduction of 7 revolutions per minute added greatly to the cost of the generator to be attached to that engine. It likewise added to its weight and made it almost impractical to construct the units to run at 68 instead of 75 revolutions per minute.

I thoroughly understand the great desirability for the two or three large electrical concerns of compelling the purchase of the entire unit; but where there are only about two electrical manufacturers to-day that we might feel safe in—there may be a third in the future, and very likely a fourth, who can build a 5,000-kw. generator which we would be justified in making a contract for—there are almost a score of concerns in this country that can build a turbine to run at 750 r. p. m. because of the greatly reduced size and weight of the parts to be used. That is one point I think that would have been very valuable indeed to those of us who are interested in this new form of utilizing power that may come to displace the reciprocating engines, and it would have been very interesting for us to have had some information on that subject. If Mr. Sniffin has any data on that point, I would like to have him give them to us, because when I go into the market to buy a steam turbine I want to buy it as a piece of mechanical apparatus and not a piece of electrical apparatus. It becomes a very different proposition whether you buy it in two parts from two concerns, or buy it from one concern, if you have absorbed the saving in the generator that would be realized, and turned it in as an excessive profit on the turbine there is no advantage; we are looking at the commercial side of the subject, as well as the mechanical and electrical side of it.

Mr. Hefl: I would ask Mr. Sniffin what history the steam turbine manufacturer has behind him, and what he proposes to give to the purchaser in the way of a guarantee as to the cost of maintenance if we buy this steam turbine?

Mr. Sniffin: In my paper I believe that I said something about the cost of the maintenance that was found in a station in England, where something like a dozen turbines have been used. It is true the steam turbine has behind it not as many years of history as the reciprocating engine. It has, however, sufficient history behind it to show that there is no reason why a steam turbine, properly built, should not be less in maintenance cost than a reciprocating engine, which must be so by virtue of its very nature. I do not know what could be said about a guarantee of repairs; you could hardly get a guarantee of repairs on a reciprocating engine or any piece of moving machinery. That feature is gaged not only by its excellence of design and construction, but by the way in which it is handled. I think I can best answer that question by saying that the Westinghouse company in manufacturing a turbine is willing to make for it the same guarantee as to maintenance which it will make for any other piece of machinery which it produces. It will assume to be responsible for its sufficiency of design and construction and

will agree to make good any defects in it within any reasonable time after its installation. What more can you ask?

Mr. Heft: It depends entirely on how the contract was drawn.

Mr. Sniffin: Precisely; but that in substance is about all you can ask of any manufacturer in regard to his machinery. I might say further that there is no hesitation on the part of the manufacturer of the turbine in making guarantees of economy, that are a great deal more valuable as guarantees than warranties of economy made on reciprocating engines. We all know that it is common to ask and obtain guarantees on reciprocating engines, but they are almost a dead letter. The value of the guarantee is practically never demonstrated as far as the engines are concerned: the engines are constructed, partly assembled in the shop, wheels never put on, and it is a physical impossibility to test large engines at the works. The engine is shipped and put into service, and it is only once in a great while that we find efforts to make tests on these engines and when we do there are always many questions introduced affecting the actual results we get in such tests. Now, in the case of the steam turbine a guarantee is not only made, but it is demonstrated. If you purchase a 1,000-kilowatt turbine on the guarantees of efficiency, based upon different conditions involved so many degrees of superheating, so many inches of vacuum, and so much steam pressure, it is a fact that that turbine will be tested for efficiency under those conditions. At the particular works I know most about, there are facilities for making such tests, large boiler plant, superheating, condensing apparatus, and it will be found quite advisable and possible, and will be the regular practice, to put these turbines under service condition tests. I think, therefore, that the assurance had in that way is much greater than we have ever had on reciprocating engines, and I think it is a great advantage in the engine building practice.

Referring to the question of subdividing the cost of the steam turbine, I can only say that the turbo-generator unit itself is to be developed as a complete entity. You cannot have a good turbine and a good generator, and put them together and conclude they are going to make a good unit, unless they have been developed with relation to each other. As has been said, there are not many concerns in the turbine business at the present time. There will be doubtless many more. There are a good many generator builders, and doubtless many of them are expecting to find occasion to build generators for steam turbine use. Let them go ahead—the more the merrier. If any combination engine builder and generator builder can build a good steam end and a good electrical end, and put them together and make them run, that is all we want. So far the Westinghouse company has put money and time into it, and can give you a unit with the assurance of operating ability, economical performance, and I think reliability of service—all that can be had on the reciprocating engines, and at a first cost and under contract conditions that will be easily understood.

Mr. Heft: I think Mr. Sniffin should be commended for his frankness, but I think it would have been a great satisfaction to the members if he had brought some data here with some history behind it, so that we could look upon the question from the commercial side and not from the engineering side. I have been trying to get some data as to steam turbines for a year. I have gone to Hartford to see the plant that was erected there. I have been to Hartford three times, and every time I have been there the plant was not running. It was shut down because they were changing something. They told me that there had been some little changes which were necessary. I asked the General Electric people to direct me where I could see a plant in operation. They replied that they had one at Schenectady that they were experimenting with, and that they were taking many orders for steam turbines. That will not go with me. I have got to know what you are going to do before I will buy one. I will be very glad to be furnished with any history or data bearing up on the question of steam turbines, with a view of purchasing large units. I do not care whether Milwaukee builds the engines and you build the generators, I will take it as a whole on condition that I have some guarantee as to the life and efficiency of it—what it will do.

Mr. Beggs: Mr. Sniffin's paper carries with it a contradiction to a part of his statement. One of the claims made for the steam turbine is the greater reliability in its regulation, its ability to accommodate itself to varying loads. I believe that general statement appears in your paper, Mr. Sniffin?

Mr. Sniffin: Yes.

Mr. Beggs: If it does not, it is at any rate the claim that is made for the steam turbine, and I take it this discussion is for the purpose of directing the steam turbine to the attention of those who may be interested in either increasing their steam plants or in starting new ones on certain lines of thought and information which they are able to receive. I have had exhaustive investigation made of the steam turbine made for two years past. We have held up the construction of a power plant in which there is to be expended three or four million of dollars. I have had my chief engineer travel all through the East, visit the works of the Westinghouse company for two or three days, and likewise the works of the General Electric Co. at Schenectady. There is a steam turbine running in Michigan, and it is said that the installation of a number of them in various places is contemplated. However, as to what the steam turbine will do when it comes to large units is as much a matter of conjecture on the part of the manufacturers of to-day as on the part of those who are considering buying steam turbines. We do know what a reciprocating engine will do, because they have been built and are in practical operation, and have been developed to their present perfection by the gradual process of many years' practice and experience. Therefore, if the steam turbine is going to simplify the matter of regulation, and make it possible to run generators in parallel with a greater degree of success and a reduction of all the contingencies likely to arise which cause trouble, it seems a much simpler matter to build a generator to operate with that piece of apparatus, than it is to build a generator to operate with a reciprocating engine, the governing of which is such a delicate matter. Therefore, I take it that instead of there being one or two concerns in this country which will build steam turbines there will be a score of them. This is a very important matter to us; it is especially important when we come to consider that the price of a 5,000-kilowatt generator alone runs anywhere between \$65,000 and \$75,000. It becomes an important question whether a piece of steam apparatus is being developed which will cut the cost down to \$15,000 or \$20,000—of course, these figures are only approximate. It seems, however, that we shall require competition in the production of the steam turbine before we get the ideal condition. I have a fine buggy, but if there is only one concern in the country who can sell me a good horse, it puts me in a rather unsatisfactory plight. That is the position we want to avoid. I understand there is a 5,000-kilowatt turbo-generator now being built for a company in the city of Chicago. I am awaiting the installation of that apparatus with interest and curiosity, to see the tests on that steam turbine unit. There is no history back of them as to large units. They have some history as to small units. I believe the only data we have regarding the steam turbine is with units of a thousand kilowatts. I think the Association is indebted to Mr. Sniffin for what he has given us in his paper, notwithstanding the fact that the information is somewhat limited.

Mr. Heft: I want to say to the members that I am not opposed in any way to steam turbines, but on the other hand I am a believer in them; but I also believe that if all the manufacturers should attempt to sell these turbines; in other words, have the purchaser exploit the machine, they should do something themselves, and give us some data as to what the cost of maintenance and the life of these engines would be as compared to the reciprocating engine. If a man comes along to sell you a steam engine, he is offering you something with a record and a history; but you have no history behind the steam turbine. There are very few steam turbine plants in operation, and with those that are in operation, as far as I can learn, it has been necessary to make changes and the turbine has not come up to the expectation of the designers and builders. Yet I believe for the operating of generators they will eventually become a great commercial success. I believe a manufacturer coming before this body, should come here with some data,

some history, regarding the turbine, so that we might know under what conditions we were buying the machines.

Mr. Bean: If I had the money I do not know whether I would buy a steam turbine, but I think the gentleman is in the same position as the American Street Railway Association was before we adopted electricity. How did we know how this was going to work? But the turbine engine, like the electric motors and generators, is a new thing, and we should not be afraid to put our money in as we were obliged to before. That is the way we developed the other industry. Let us do that now with the turbine.

Col. Heft: That is all very well if you have the money, but I have had a very little experience developing the street railway motor up to its present standard. If I had not been in a position to contract with the electric companies in such a way as to bind them to exploit these machines at their own expense, they would have bankrupted the New Haven road. When I buy a machine to-day I want to know something about it. I want it as good as it can be made, and I want the fellow that made it to pay for the experiment.

Mr. Bean: The New Haven road has been playing second fiddle, and I am very glad to have Mr. Heft bring out this proposition. They have always been playing the second fiddle, and the small fellows have had to go into their pockets. I am willing to say, myself among the number, that there is a damned good many dupes in this Association.

Mr. Wyman: I cannot speak from a technical point of view as cleverly as Mr. Beggs or Col. Heft, who have spoken upon this subject, but we have made on the part of our company some investigation into this matter of steam turbines, both for the larger units and the smaller ones. We have been treated with the utmost courtesy by the Westinghouse people and the General Electric people. I think they have been good enough to give us the most of the information that they themselves possess. It has been acknowledged, I believe, by most of these gentlemen who are experimenting in this field, that it is yet somewhat in the nature of an experiment. I think, therefore, perhaps it is rather premature for us to demand the exact facts and exact statements as yet. We should rather applaud the experimental work which they have taken up in this direction. We should feel very grateful to them for having done as much as they have. While we may none of us be willing yet to make any very extensive investments in this new power, or rather method of developing it, we should aid in every possible way we can the progress of these investigations. I am aware that the Delburne people have already built some large steam turbines which have been shifted to the Delaware & Lackawanna road, and I am watching with interest the tests, or rather the experience, which the engineers of that road will have with those machines. I feel very certain that we are upon the eve of some very important developments in the line of steam turbines. I simply want to say that for myself I feel very thankful for this paper, and I am willing to wait until these gentlemen are ready to give us a little more.

The President: It is the purpose of the chair to give Mr. Sniffen an opportunity to reply briefly to anything that is suggested. It would be better if any of the members have anything to advance to say it now and let Mr. Sniffen's reply close the discussion. I will be very glad to hear from anyone on this important subject, that is, any new points to be brought out.

Mr. S. A. Palmer, Fall River: I would like to ask the gentleman whether or not the cost of the condensing plant for use of the turbines is greater or not than it is with engines?

Mr. Catta: I just want to ask Mr. Sniffen if the central condensing plant could be used in connection with a turbo-generator instead of independent condensers for each unit. For instance, in a small size, up to 750 kilowatts, or in a plant of two or three or less units would an independent condenser be necessary for each unit that is installed?

Mr. C. O. Mailloux, New York: I can answer the question of the gentleman who just spoke from my own information. I am now about installing a plant containing two units which is sought to be operated by the same condensing plant. I see no reason why myself it would not be possible to operate any number of units with the same condensing plant, though it

might in very large units have a condenser for each unit. The cost of the condensing apparatus as far as my investigations have disclosed it to be somewhat larger than the cost with an ordinary steam engine. This is due to many reasons. It is also a fact that the exhaust piping has to be done more carefully and is of larger diameter. That, however, is offset by many other advantages, one being the ability to use superheated steam of almost any temperature without mechanical detriment to the engine. I have had occasion to design large plants in which I have seriously considered the question of using superheated steam, and found much to my sorrow that there were many of the engines as at present constructed there is a limit to the temperature that can be allowed in a high pressure steam, owing to the difficulty when you reach a temperature of 500 Fahrenheit the steam will reach very near a point at which lubrication becomes almost impossible. With a steam turbine, on the contrary, there is no limit to the temperature of superheating that you may attain, its only limit being the melting point of the material of which the engine is made. I see no reason why you could not run a steam turbine at a point where it would be cherry heat, and glow in the dark, if there was any advantage in it. Of course, we all know there is a great advantage in superheating steam. I believe that the steam turbine in that respect is bound to be a very important element in a new way of using steam in steam engines. I have observed it carefully for the last five or six years. I first met it abroad and was surprised to see the extent to which it was used, although it was in smaller units. Until two years ago, I think, no units had been attempted which were of greater capacity than 300 kilowatts. The two units which I have ordered are 400 kilowatts each. My own observations lead me to believe that the larger turbines will be a much simpler machine, a more practical machine, as well as a more economical machine. I have been presented by the turbine people with a brilliant prospectus looking forward, in which we will have economies of something like 10½ or 11 lb. per indicated horse power, or the equivalent thereof. Now, gentlemen, I think you will all concede that such brilliant promises are worthy of investigation, even if we have to make a large discount on them, but still then we will be doing very much better than it is possible to be done with the very best reciprocating engines. The reciprocating engine is in a high state of perfection. It is not a machine to be despised, but I believe at the same time that the turbine is the coming machine. I am not prepared to say that I believe that it has arrived, but I believe in a very few years, perhaps in a year, it will be possible for us to say conscientiously that it has arrived and is going to stay. I have reached that conviction partly by discussing the matter with makers of reciprocating engines, who have all confessed to me that they are looking to the turbine with the greatest attention. Many of them stated that they believed themselves that it is the coming machine, and they told me with some satisfaction that they hoped to be able to go into the business themselves, if there were no great fundamental facts likely to interfere. Some of them assert that they believe there will be an opening for them to enter the field. Hence we as engineers and as users of steam engines and as companies also who have to install plants need not fear that there will be lack of competition that will be sufficiently keen to keep the prices down. One of the difficulties of steam turbines to-day is not so much mechanical as it is electrical. The fact is that the steam turbine cannot be successfully used with direct current generation. The defects of the machine are so great that in the case of large units where it is attempted to put the armature on the turbine shaft direct instead of putting it on the countershaft, the hope of making it successful appears to have been abandoned on the direct current machine. The turbine is admitted by its best friends to-day to require alternating generators. A further detail of the defects is the fact that these machines make considerable noise. That appears to be more of an electrical defect than a mechanical one. It is largely related, probably, to the design of the dynamo, flat poles and the cords, numerous slots, etc. This problem is receiving attention, and it is hoped that in another year or two it will be fully eradicated. You must remember that the first machines which were made, the first dynamo generators, or the first dynamos used

were imperfect, and they also had, in addition to their imperfections, the fault of making a great deal of noise. That fault has been greatly remedied until to-day we are not complaining on that score. I believe the turbine will doubtless be developed in the same manner. I do not think that there need be any apprehension on the part of regulation. I have myself watched carefully, both here and abroad, and find that the direct regulation of the machine will compare at least favorably with any of the existing reciprocating steam engines, and it is my opinion that on the score of economy we should use it to-day.

Mr. Sniffin: The last question seems to have been answered in regard to the character of the condensing apparatus. I would only add that we like to have the exhaust pipe large, and leading up in such a way as to get the steam away from the turbine readily, and so long as the pipe is tight and the vacuum maintained, I don't see that it makes any difference which method is employed. I think that the questions that have been asked and the answers to them will leave in the minds of the Association generally, a feeling that the turbine is still something of an experiment. I think I can disprove that. Col. Heft remarked about his visit to Hartford on two or three occasions when he found the turbine shut down, due to some changes they were making. I treat of that in my paper and I very frankly gave the troubles we had at Hartford. That turbine now has been running since the early days of its installation for some months whenever they wanted. It does enough to please the builders and I think it pleases the customers. I think if Col. Heft were to interview the people who bought that turbine, and who paid for it and have operated for some months, he could probably get a letter answer. I may say that that turbine was sold as a 1,500-kw. carries from 1,800 to 2,000 kw. and it has carried, without any apparent trouble, 2,800 kw. I think you have all seen the results of tests made by Prof. Robb on a turbine carrying about 1,900 kilowatts, running with 150 lb. steam pressure and giving a result of about 19 lb. per hour. That I believe would be admitted to be well within the line of the very best engine pressure. There is a turbine at Wilberton of 100 kw. which has run since the first of February and which has run ten hours a day carrying its full load, generating current for factory power and for light. The Westinghouse Air Brake Co. has four 400 kw. machines that have been running for about three years. That plant is running to-day and it is doing all the work of the factory. Its economy is very high and its repairs are practically nothing. You can see no evidence of wear in these turbines, and they are running to-day, that is, three of them about three years and one a little less. Now there is some history. History grows quickly. It has been stated that we did not know whether a 5,000-kilowatt turbine will operate. Up to three months ago we did not know that about a piston engine. So far as I am aware, there was not a 5,000 kilowatt generator driven by piston engine in this country until one in New York in the Manhattan power house. With the 1,500-kw. machine at Hartford, with the one at Wilberton, with the four at the Westinghouse, with the work that has been done abroad, with the work that is now being done and the history that will now be rapidly made, I think that the turbines can hardly be called an experiment. We are to-day building 1,000-kw. turbines. For the Rapid Transit Subway in New York, we are making three 1,250-kw. units to be used for lighting the subway. There are four 5,000 kilowatt turbines to be built for the Metropolitan District road in London, to operate the entire system; and we are building three 3,500-kilowatt for the Metropolitan Railroad, of London. The DeBeers Co., of Kimberly, South Africa, ordered two 1,000-kilowatt turbines and they will both be shipped within the next thirty or sixty days. Prof. Thurston, acting as engineer for the DeBeers Co., will conduct a series of tests of these engines before they go forward and I believe the data we get will be very valuable. We will have the result of tests on a 1,000 kilowatt machine in regard to superheating, steam pressure, and vacuum, and it will not be long before we will know more about turbines than piston engines. I may say that the Cleveland & Western Ry. is putting in two 1,000 kilowatt machines for driving its new trolley system. Turbines are being built. They have been built for people who have investigated turbines and seen

turbines in operation and visited the works and seen how they were put together and formed their own conclusions on which to act. I think that answers the two questions.

Col. Heft: I would like to suggest that at the coming meeting next year, that the other half of this large electric trust be invited to read a paper on turbine engines, because I believe there is some difference in the construction of the two, there being, however, no difference in the price. It would certainly be interesting for the gentlemen here to see the ingenuity that they would display in showing up to us the best machine.

Mr. Beggs: I think Mr. Heft's suggestion is a suggestion that the incoming officers might give some time to. I would like to add to that, that the manufacturers of reciprocating engines in this country likewise be given an opportunity to have their side of the case presented here, in order that we may have some of the views of the engineers of standing and reputation in this country, who do not think to-day that the steam turbine is going to successfully compete with the reciprocating engine.

The President: The suggestion of Col. Heft and Mr. Beggs are suggestions that necessarily must be made to the Executive Committee of the Association in considering topics for next year. The discussion so far as the turbine is concerned, is closed, by Mr. Sniffin's remarks, and the Association is very much obliged for his kindness in preparing this paper.

A vote of thanks was tendered to Mr. Sniffin for his very able paper.

---

The next paper was "The Adjustment of Damage Claims," by Mr. Starring, which is printed on page 722.

---

Mr. Beggs: There is not a single line in Mr. Starring's paper with which I can take issue. It is an admirably prepared paper. There are one or two points in Mr. Starring's paper that I particularly desire to lay stress upon, and that is, the maintenance of an absolutely rigid policy as to dealing with all classes of claims regardless of who may be affected or what influences may be brought to bear to compel or induce the company to make more liberal settlements. It is not an unusual thing to have influential directors of the company, influential politicians, and sometimes directors influenced by politicians attempting to prevail upon the agent to adjust some claim or to allow something in a case of some injury for which there is no legal liability. I may say, as far as that is concerned, if the entire board of directors, if all of the officers and all the politicians of the city in which I am located were to enter into a petition to make some adjustment more favorable than the conditions would warrant, I would not permit it to be done. But when that policy is known throughout the city, it has much to do with deterring the pettifogging lawyers from instituting suits against the company. I might say that in the history of the company I represent, my orders are that in every case, where there is a fair belief that the company is liable, to make a settlement, if it can be done on any fair basis, and to make it as quickly as possible. As an indication of that, during the year 1890 we had eleven cases tried in court, of which we obtained a verdict in nine of them. One of the two that went against us was afterwards reversed by the higher court. Last year we won nine out of ten cases, which was all we had to go to the courts. That is the best way of preventing pettifogging lawyers from sandbagging our companies. I commend this paper of Mr. Starring's to the careful perusal not only of those that may be immediately connected with the claim agents of the various departments, but with every officer and particularly every executive officer of the company, as there may be other principles involved here. One of the great difficulties to contend with in dealing with accident cases, is to know exactly what the facts are. This is sometimes rendered more difficult because of the inclination of the employe who may be responsible for it to attempt to shield himself even under a sworn statement. The practice of our own company is to require a sworn statement from both the motorman and conductor in every case. We prepare every case, no matter how trivial, as though it were to go to court, and we obtain as many sworn statements in the fewest possible hours, as is practicable, from as many witnesses as possible. One of the most serious cases that we have had to settle for two years, we were led into

unwittingly because of the perjury of the motorman on the car. It was a case of where the car was claimed to have made a sudden start, the woman was thrown from the steps and seriously injured. She was a woman of middle age. We proceeded upon the presumption that she had fallen from the steps. One of the most reputable firms of attorneys in our city was her counsel. When we began to get into this case we were confronted with the fact that there were three young ladies who were getting off at this stopping point, which was the young ladies' college of that city, but who were in Europe then. But, nevertheless, their depositions were there, to the fact that there had been a momentary jerk of the car that threw this woman off, which had not been noticed by any other passenger whose evidence we had, but whose evidence and the statement both of the conductor and the motorman were directly contrary to that. It developed afterwards, and the motorman admitted it, notwithstanding it was a case of perjury, that he had stooped down to take his pin, or something of that kind, out, and in raising up his shoulder for a second struck his controller handle, which gave the car a sudden lurch for only a fraction of a second, but sufficient to throw this woman. As soon as that came to my knowledge, I ordered a settlement made. We now brought up that man from St. Louis, where he was employed as a motorman, and he demanded \$100; for \$100 he would go on the stand and give evidence to the same effect as he had put in his affidavit. After some time we obtained a letter from him virtually agreeing to accept this \$100. Then I gave orders that we would not try the case at all. I wanted to get him on record, and we settled that case for a large amount of money. It could have been settled for \$100. In fact, an offer was made a short time after the injury to settle for that amount. We paid \$3,500, of which \$1,500 or \$1,800 had already been paid out in doctor's bills, nurse hire, and all that kind of thing. There was a case where our own employes misled us.

A number of us make a great mistake in looking only for evidence for the company. We always look for evidence, even the worst that can be said by the adverse party in order that we may be in possession of all the information that will enable us to determine whether we shall contest that case. My policy, in the treatment of accident claims, is that if we could settle a claim for \$10 which would require \$100 to defend it, we would far rather spend \$100 than to give to any pettifogging lawyer the \$10 which he is very willing to take and sell out his client. (Applause.) I will not permit the purchase of any pettifogging lawyer. That policy has been persistently pursued for two years with very beneficial results. This is a change of policy to some extent from what had been previously pursued. There are companies, unfortunately, which I think short-sighted, that will, if they can, pay one of these lawyers \$25 or so to avoid litigation. They say it may cost \$100 or more if it be contested. I say, if it costs \$500 go into court and beat them.

Last year our accident cost was reduced to a fraction over 2 per cent of our gross receipts. We carry 4 per cent of our gross receipts every month to the injury and damage reserve. Year before last it was about 2.9 per cent, I think. Last year we reduced it to 2.12 per cent. This year it is less than that, and it is largely due to this persistent pursuit of the policy of the application of fair common sense to the settlement of every case and permitting no case to be settled simply to get rid of it, if you do not feel that you are justly liable. Therefore, I say, gentlemen, do not permit the influence of boards of directors nor of politicians to affect the settlement of any injury or damage case. Cross-examine your own investigators and employes to find out the real facts in connection with it.

We are very often confronted with the evidence of the attorney for the plaintiff and we are dumfounded to know that we didn't know what was going on in our own cars. As I said before, we have only lost on an average one case out of ten, in the last two years. That we consider is phenomenal considering the juries before whom these cases are tried, who have the prejudice that exists against every corporation, particularly a public utility.

Mr. Sloan: I would like to ask Mr. Beggs whether or not he makes all his investigators notaries, so as to obtain the sworn statements from the witnesses. We find it very difficult in many cases to get the statement even signed. Witnesses object to it.

Mr. Beggs: All our investigators, in fact everybody connected with our claim agency, is a notary. Sometimes it is very difficult to get a statement, and we sometimes get a witness by one means or another into our office. A cross-examination goes on, the notes of which are being taken by a stenographer, unknown to them, in important cases, and this is afterwards submitted to them to say whether or not it was what was said. Every investigator in our service, and everybody connected with our department is a notary, and we try to have a sworn statement from every witness. Every motorman and conductor in connection with these cases, who makes a statement, has to be sworn to it, and sign it.

Mr. Bean: I would next like to ask Mr. Beggs whether, in a majority of the cases, the juries are from the city or from the country?

Mr. Beggs: They are nearly all city jurors. Apropos to notaries in the claim department, every division superintendent is likewise a notary. We employ counsel by the year, and pay them a large compensation to defend all cases of injury or damage of whatever kind, either to persons or property. We likewise employ a physician. While he does not give his entire time to the service of our company, it is largely given to it; and we pay him likewise an annual salary. That physician is usually on the ground in any case of injury to persons within a very few minutes after it has occurred. We usually try to get two or more investigators and our physician there in the fewest moments possible. Our physician is one of the most important agents we have in our service, being a level-headed, practical man. Even if the person is taken to the hospital—it may be the emergency or some private hospital—we try to have our own physician there as soon as the patient is. Furthermore, a policy which we inaugurated two or three years ago, was to render no medical attention unless there was a case of liability. We had squandered large amounts of money for several years in giving medical attention by our physician in nearly every case. Our policy now is not to render any medical or surgical service unless it is a case of liability. It has cost us a large amount of money.

Mr. Robinson: I think Mr. Beggs is to be highly congratulated on the very successful result which he has attained in Milwaukee. I have no doubt it is due to the peerless and courageous method he has taken for treating these claims. I hope his good work will continue. During the past year, the corporation that I have control of in New York tried 1,145 cases. Out of that number, we were successful in about 650 of them. With this great amount of litigation, of course it is very difficult to handle it as Mr. Beggs has suggested. I insist, generally, on the taking of affidavits of the motorman and conductor, but a statement in writing and signed, let alone under oath, is very difficult to obtain from a large number of witnesses, who are, as a rule, of the lower class. It is very difficult in handling a large number of cases to get these statements. Some days we have a large number of reports come in and it is very difficult for the claim agent to say from reading the report whether the injury is severe or whether there may not be some elements which make it a case of a liability on the company. The number of cases of injury some days runs as high as 110 or 115, so you will see it is impracticable at times to adopt all the methods suggested by Mr. Beggs. The only point that I think Mr. Beggs is mistaken in is that relating to the examination by a physician. It seems to me that in all cases, where the injured party is not known, nothing known about him, that an examination by a medical man should be made. One of the great difficulties we have to contend with in New York is the unscrupulous character of the doctors who attend the plaintiff. Old injuries of years' standing are tried to be palmed off on the company. Injuries which develop four or five months after the accident are made to relate back to the accident itself. And the greatest exaggeration is promoted on the part of the plaintiff's doctor in case there is not an examination by a surgeon of the company. We have in the company's employ, six physicians. Even with the hard work they do in all these cases, we very frequently have to try suits in court without a medical examination. I think the best method

(Continued on page 739.)

PAPERS BEFORE THE AMERICAN STREET RAILWAY ASSOCIATION.

Read Friday, Oct. 10, 1902.

DISCIPLINE OF EMPLOYEES BY THE MERIT SYSTEM.

By W. A. Satterlee, General Superintendent Metropolitan Street Ry., Kansas City.

The merit system of discipline, as applied by managers of steam railways throughout the country, has recently been brought to the attention of street railway managers, through able articles in the "Street Railway Review" and the Street Railway Journal, in such a way that the system is now receiving much attention. It has been adopted by a number of roads, and their experience with it has been such that it is surely worthy of deep thought and attention on the part of all street railway officials. It seems to fill a long-felt want in street railway discipline, and, in importance, is second to none of the recent improvements and betterments constantly being adopted and in successful operation.

I know of no single change made in the old methods of operation, unless it be the adoption of the Standard System of Street Railway Accounting, that should receive a more hearty support from all. Certainly no system has been adopted that is fairer to the trainmen, or is more likely to produce in them a desire to keep their records clean, and as many demerit marks from appearing against them as possible.

There are many trivial acts, small in themselves, committed by trainmen in handling passengers, that as a whole tend to produce a feeling on the part of the traveling public either favorable or unfavorable to the company, which once formed is hard to offset. Small acts of courtesy toward passengers by trainmen are felt by the management in ways unknown to the men who perform these acts, and are as far-reaching for the good of the company as small acts of discourtesy are damaging.

To teach employes to be guarded in their talk, their acts, and their deportment on duty toward those with whom they come in contact, is a problem nearer solved in the merit system than in any other way. The value of courteous, accommodating and careful trainmen to any street railway system is of such importance, and so eagerly sought for, that any method of discipline which will accomplish that end will be of so great worth as to make management of street railway property a pleasure instead of care and worry that breaks down the health of any but robust men.

As a rule, men who seek employment in the train service of street railway lines are inexperienced in the art of handling the public in the way an exacting public expect, and acquire the tact only by continuous contact and experience, after training under some system of discipline worked out by those who, for years, have watched the needs and exactings of a people who expect the same attention from an inexperienced street car conductor, who may have been in the service only a few weeks, that they get from a steam railway conductor who has been under a system of training with his company for from eight to ten years before he has acquired the position where he comes in contact with the traveler.

To give the street railway public the service which they expect, and which they exact, is the aim and desire of all managers, but is a well-nigh impossible thing to do. To come as near the goal as human ingenuity can, may be done through the different experiences and methods used by well-managed roads, and by discussions and friendly criticisms brought about through the several papers written by different parties for this convention, and it would appear to me that the subject assigned to my company is one that should call forth from all representatives present a most interesting and instructive debate.

In brief, the system consists of a debit and credit account with each trainman, kept in a book ruled for that purpose, or in alphabetical files, his violation of rules being charged against him by a certain number of demerit marks, the number for any one offense depending upon the seriousness of it. As an offset against these demerit marks, he is entitled to receive a certain

number of merit marks for acts performed which would be considered by the company worthy and deserving of recognition.

If at any time within one year the demerit marks exceed the merit marks by a certain number fixed upon by the company, then the party receiving them is liable to discharge.

The detail of the working of the system as practiced by the company with which I am connected, but which can be varied to suit the ideas of different operators, is as follows:

A list of violation of rules with the number of demerits imposed for each is posted in a frame at each reporting place, that trainmen may know in advance the penalty, and also a list of acts considered worthy of merit with number of merits given for each.

A blank notice, made in carbon copy which is filed in office, reading as follows, is sent to each trainman, with his name filled in blank space, whenever he gets demerits or merits:

METROPOLITAN STREET RAILWAY COMPANY.

Kansas City, Mo.....190....

DEMERIT MARKS.

Mr.....

You have to-day been given ..... DEMERIT MARKS on charge No. .... contained in the merit system of discipline.

Date.....

Time.....

Place.....

Assistant Superintendent.

METROPOLITAN STREET RAILWAY COMPANY.

Kansas City, Mo.....190....

MERIT MARKS.

Mr.....

You have this day been given ..... merit marks on No..... contained in merit system of discipline.

Time.....

Date.....

Place.....

Assistant Superintendent.

Another notice, without trainman's name, is posted on board at reporting place, as notice to all other men that a conductor or motorman has been disciplined, with the charge, and number of demerit or merit marks he has received.

METROPOLITAN STREET RAILWAY COMPANY.

NOTICE.

Kansas City, Mo.....190....

A.....on.....line has this day been given..... marks on charge No..... in merit system of discipline.

Assistant Superintendent.

Whenever a man's demerits exceed his merits by 100, he is liable to discharge.

The old system of lay-offs and fines has been done away with and the service much improved in the short time the new system has been in vogue, since June 1, 1902.

Merit No. 10 for conductors (No. 9 for motormen) is broad enough to cover many things coming under the observation of inspectors, that show good judgment and interest in handling the public, and in such cases a liberal giving of merit marks will be appreciated by trainmen, and will redound to the profit of the company. A little praise given any employe by an employer is worth more and is more productive of good work than

fold than any reprimand. We all, no matter what position we hold, are pleased with notice taken of our work by those who are our immediate superiors, and a word of praise coming from a superintendent or manager to any employe working under the merit system will certainly not be lost.

The trainman who takes off his coat and gets to work first in a lay-out caused by a broken-down car or a wire down, etc., marks himself right then and there as a man the company needs, and he should get merit marks. If he takes an interest in clearing up such trouble, it is safe to say he will take the same interest in other matters. Too many men wait for some other man to take the lead and in that way much valuable time is lost in blockades, when there is no incentive or reward to spur them on. Those with demerit marks wait for an opportunity to reduce the number by getting enough merits to offset their demerits, and come to the front in case of trouble, showing by their desire to render assistance an interest in company matters not shown before. Whenever men can be taught to take

W. A. SATTERLEE.

the same interest in their employer's business they would in their own business, then that employer will get the most perfect service possible, and when the employer succeeds in getting a system of discipline that will bring about that result, then he has what has long been sought for, and until some system has been discovered better than the merit system, the latter should receive the hearty support and assistance of all managers of street railway property. Good train service is the vital cord in operation and trainmen make it good or bad according to their training.

**METROPOLITAN STREET RAILWAY CO.  
MOTORMEN AND GRIPMEN—DEMERITS.**

**Immediate Discharge.**

1. Disloyalty to company.
2. False statements.
3. Intoxication.
4. Dishonesty.
5. Gross ungentlemanly conduct.

**Demerits.**

6. Failing to report accidents..... 10 to 100
7. Missing—
  - First time ..... 10
  - Second time in one month..... 20
  - Third time in one month..... 30
8. Smoking on duty..... 30
9. Failure to make safety stop at crossings where required ..... 30
10. Incomplete and poor accident reports..... 1 to 5
11. Untidy condition of dress..... 2
12. Recommending unworthy men for employment... 5
13. Neglecting to pick up passengers..... 10
14. Running over circuit breakers and overhead crossings without throwing off current..... 5
15. Allowing unauthorized persons in front vestibule.. 5
16. Fast running ..... 5
17. Front headlight not burning..... 8
18. Entering saloons in uniform without good excuse.. 10
19. Frequenting saloons at any time..... 50

20. Gambling ..... 50
21. Drinking on duty or before going on duty..... 20
22. Disobedience of orders (if flagrant—discharge).... 10
23. Profanity on duty..... 5
24. Accidents when avoidable in opinion of superintendent ..... 10 to 100
25. Unnecessary conversation with passengers..... 10
26. Talking to conductors on duty..... 5
27. Failing to report trouble with car..... 5
28. Not answering signals promptly..... 1
29. Feeding current too fast..... 3
30. Running away from passengers at transfer points 10
31. Not ringing bell in passing car..... 2
32. Running ahead of schedule time..... 3
33. Not slowing up in passing car..... 5
34. Skinning the cable..... 25
35. Starting car without proper signal, except to avoid collision ..... 20
36. Following car in front too close..... 10
37. Starting electric car before closing gates..... 10
38. Opening electric gates before car stops..... 10
39. Running too close to wagons upon track before getting car completely under control..... 10
40. Bad judgment on special occasions..... 1 to 10
41. Leaving car without taking reverse lever..... 10
42. Flattening wheels ..... 10 to 20
43. Injury to car equipment that could be avoided by proper care and judgment..... 10 to 20
44. Not stopping for passengers to get on (if at proper place) ..... 10
45. Not obeying conductor's signal..... 5
46. Running crossings without proper flagman's signal where required ..... 20
47. Cutting rope ..... 25 to 50
48. Trouble with passengers when gripman or motorman is to blame..... 10
49. Garnishee—
  - First time ..... 10
  - Second time ..... 10 to 50
  - Third time ..... 50 to 100
50. Assignment of wages or security deposit..... 25
51. Talking to others than proper officers of company about accidents ..... 20
52. Careless and indifferent operating of car..... 3 to 10
53. Criticizing management of road in presence of passengers ..... 3
54. Failing to report delays..... 2
55. Not having proper tools..... 3
56. Plugging car except to avoid accidents..... 5
57. Running without sand in sand box..... 3
58. Acts detrimental to good service in opinion of superintendent ..... 3 to 20
59. Incompetency ..... 25 to 100
60. Holding train with cable..... 10

**MOTORMEN AND GRIPMEN—MERITS.**

**Merits.**

1. Warning persons in act of jumping on or off moving car to wait for car to come to stop..... 2
2. Securing names and addresses of witnesses who saw accident, other than those on accident report ..... 2 to 5
3. Politeness and attention to passengers noticed by inspectors ..... 3
4. Assistance rendered in case of accident, such as to bring commendation from passengers..... 3
5. Informing company of matters in the interest of good service, etc..... 3 to 10
6. Complete and perfect accident reports..... 2
7. Good stop in avoiding accident..... 5
8. Good judgment and work in handling lay-out or blockade ..... 2 to 5
9. Special meritorious act calling for recognition from company ..... 10 to 50
10. Careful handling of car..... 5

CONDUCTORS—DEMERITS.

Immediate Discharge:	
1. Disloyalty to company.	
2. False statements.	
3. Intoxication.	
4. Dishonesty.	
5. Gross ungentlemanly conduct.	
	Demerits.
6. Failing to report accidents.....	10 to 100
7. Giving bells too quick.....	5
8. Smoking on duty.....	30
9. Error on trip sheet.....	1 to 5
10. Shortage.....	
11. Overage (except when pay check is turned in)	
Over six in one month, each.....	2 to 5
12. Missing fares.....	3 to 10
13. Failing to ring fares.....	5 to 20
14. Failing to properly flag crossings when required..	10
15. Incomplete and poor accident reports.....	1 to 5
16. Inattention to passengers.....	2
17. Trouble with passengers when conductor is to blame.....	10
18. Missing—	
First time.....	10
Second time in one month.....	20
Third time in one month.....	30
19. Dirty car.....	5
20. Untidy condition of dress.....	2
21. Recommending unworthy men for employment....	5
22. Back headlight burning except in case of fog.....	1

11. Turning in passes or badges ordered up by Company.....	5

THE STEAM TURBINE: ITS COMMERCIAL ASPECT.

By Edward H. Sniffin.

The steam turbine is not as young as it looks. Although its application, in its present several forms, to commercial power generation, is the achievement of recent years, its principle is neither new nor novel, and it may be wondered that a century of effort should have been applied to the reciprocating engine— which became, indeed, more complicated as it grew, before the primal theories of the heat motor assumed corporate, practical form. It is true that later knowledge of materials, and how to work them, has made the way clearer; and the wider use of the steam turbine has in a measure depended upon the development of electrical practice, with which latter it is now so intimately identified.

E. H. SNIFFIN.

Much interest has for some time been centered in this type of prime mover and the possibilities of its application. The history of its development is quite generally known, and up to this time attention has been more particularly directed to its engineering and mechanical characteristics. It now seems appropriate to inquire into the controlling features of its commercial utility, and determine, if we may, whether the steam turbine, subjected to a somewhat careful analysis, is a machine still to be developed, though of ultimate promise, or whether it has been well tried and its advantages proved. What has it accomplished? What justifies its use? What otherwise unattainable results will it produce? What are its limitations? It is this aspect of the case on which the light is needed.

It is of little moment what the direct or contingent advantages

of the turbine may be, if its reliability remains in doubt. Offered as it is, in large units, and being apparently more related to the classes of service which impose the most exacting requirements, the demand is imperative that in this one vital respect there be little left to chance.

Before recurring to actual experience, it may be instructive to consider for a moment the general character of the turbine as a type of motor, contrasted with the piston engine. Fig. 1 shows the longitudinal section of the Westinghouse turbine. The steam entering the governor valve, arrives at the chamber "A," then turns to the right, passing first a set of stationary blades, then impinging on the moving blades, driving them around, and so on, until it arrives at exhaust chamber "H". And here is an interesting lesson in physics,—a demonstration of the conversion of heat into energy; for while the temperature of the inlet end is that of the entering live steam, the exhaust end, but three or four feet distant, is not so hot (about 126° F.) but that one may bear the hand. The illustration will show that the only

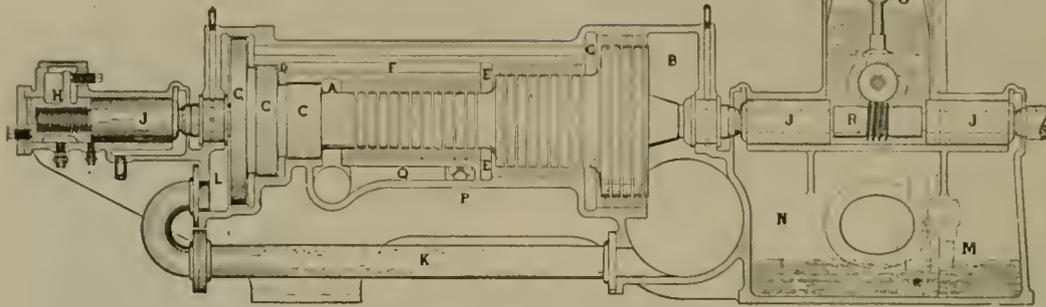

FIG. 1—SECTION OF WESTINGHOUSE TURBINE.

real moving part is the spindle, revolving in its bearings, the governor mechanism and oiling arrangement being comparatively insignificant. The blades do not wear, as the steam velocity—some five or six hundred feet per second—is not sufficient to affect them. The blades are made of a special material, and are caulked in such manner that the force required to pull them out would exceed the elastic limit of the material in the blades. They are subjected in regular practice to a stress of about one-fortieth of this amount. The actual pressure exerted on each blade is about an ounce. A complete description of the mechanism is not needed here.\* It is sufficient to note its general character and to contrast its obvious simplicity and freedom from complication, with the recognized complexity of the piston engine. The inference is clear that in constructive opportunity, at least, the turbine should be the more reliable.

The steam turbine, before it had obtained any considerable recognition here, was not entirely without success abroad. Parsons and others had done much to prove its reliability. For instance, in 1897 the Newcastle & District Electric Lighting Co., operating 11 turbines of 75 to 130 kw. each, showed the cost of repairs and renewals on the entire plant, including turbines, generators, boilers, condensers, pumps, fittings, cables, etc., to be 0.26 cent per kilowatt per annum.

In this country the steam turbine is now operating in several plants. The first prominent installation was at the Westinghouse Air Brake Company's works, at Wilmerding, Pa., where the first unit was started in August, 1899, two more shortly after, and the fourth unit in April, 1901. Thus, the plant has been in service, for the most part, more than three years, and the fourth unit about eighteen months. The plant operates regularly 11 hours per day, the service being electric power and lighting. With the iron foundry running at night, one turbine is run 22 to 23 hours per day. In general, the units have run quite to their rated capacity—perhaps within 20 per cent of it, as a minimum. An interesting comparison has been made elsewhere of the efficiency of this turbine plant with the installation it supplanted, the latter comprising simple and compound engines, scattered about the works. After the three turbine units had been placed in operation, they were shut down and the steam engines previously in

use (not yet disconnected from service) were again started up and a test made. A test was then made of the turbine plant. These were based upon a week's run, careful measurements being taken of fuel and water. The saving of coal in favor of the turbine plant averaged 35.7 per cent during the day, and 55.4 per cent during the night. The saving in feed water averaged 29.8 per cent during the day and 41.1 per cent during the night. In round numbers, this meant a saving of about 40,000 lb. of coal per 24 hours. This improvement, of course, was attributable not entirely to the turbine itself, but also to the more efficient method of electric power transmission in comparison with the previous

scattered arrangement of steam engines, with long runs of steam piping, use of belts, etc. It is, however, instructive as indicating the results accomplished in a specific and prominent case, as between an old and still commonly used system of power transmission, and a modern method.

This plant at Wilmerding was the first of its kind. It naturally was not without its minor difficulties. The turbines themselves from the time of starting have been practically free from trouble of any kind. Some armature difficulties were at first experienced—not of enough moment to interfere with operating—and were readily corrected. Summing up the experience had with this first installation, undertaken somewhat experimentally at the time, the net result is that the plant has operated about three years in heavy daily service, that the work has not suffered interruption, and that the plant is to-day running with sustained satisfaction and with no visible signs of wear in any of the parts. Fig. 2 shows this installation, comprising four 400-kw. units located within a space 45x61 ft., the height of the engine room being 20 ft. 6 in.

The Yale & Towne Manufacturing Co., at Stamford, Conn., has a 400-kw. steam turbine furnishing 240-volt, two-phase current at 7,200 alternations. This outfit was started in operation Feb. 1, 1902. Since that time it has been in regular daily service, carrying about its rated load, operating 10 hours per day, furnishing current for electric motors and some lighting. Up to this time, therefore, it has been in service some 8 months, and its mechanical operation has been most satisfactory. No quantitative tests have yet been made of steam performance, but there is general evidence of its economical operation.

The Hartford Electric Light Co., at Hartford, Conn., has a 1,500-kw. two-phase, 2,400-volt, 60-cycle, turbo-generator unit, which was started in April, 1901. This, at present, is the largest turbine yet installed in this country. Put in, as it was, to relay the water power, it has not been in constant service, but has usually been required but one or two days a week. At such times, however, it has carried the full station load of some 1,800 or 1,900 kw. Reference will hereafter be made to its striking economy.

A great deal of interest has centered in this early installation of a good sized outfit in a prominent location, and its excellent performance is now generally well known. Some difficulties were

\*See paper by Mr. Francis Hodgkinson before the Engineers' Society of Western Pennsylvania, November, 1900; Street Railway Review, Jan. 15, 1901, page 98.

at first experienced, nor were they entirely unexpected, for there had been no facilities, as there now are, for testing the unit before shipment, and it was merely run at the shop without load. Before the machine was successfully in operation, one trouble that developed was with lubrication. The packing glands around the turbine shaft leaked somewhat, and the construction of the oil passages with reference to these glands enabled the oil to come into contact with the steam, impairing its lubricating quality. This was easily overcome by modifying the vents and employing glands of different construction.

Some time was also required after erection to make necessary adjustments to relieve the turbine of longitudinal end thrust. This would have been corrected at the shop had the opportunity then been present for making a complete test. It was found, too, that the shaft, which had been designed to afford the utmost ease of dismantling, was subjected to a considerable unevenness of temperature under superheated steam, and means were taken to make the temperature at all points more uniform. Having

efficiency and determine if the standards of present practice may not be improved.

It is well that the makers of the turbo-generator have been compelled to adopt the practice of basing the steam consumption on the unit of output, so that their guarantees are given on the electrical horse-power or kilowatts delivered on the switchboard, and not on the indicated horse-power developed. This at once eliminates the factors of engine friction and generator loss, and thus more definitely establishes a measure of performance.

One is impressed with two distinguishing features of the turbine's steam efficiency, namely:—that it seems to vary but little over wide ranges of load, and, further, that the size of the unit has comparatively little bearing. It follows, then, that if good results are possible at all, they are neither restricted to the larger plants nor to the requirement of steady load.

Fig. 4 illustrates this. Herein are given the results of tests on a 400-kw. turbine, made at the builders' works before shipment, the machine having since been in daily operation some

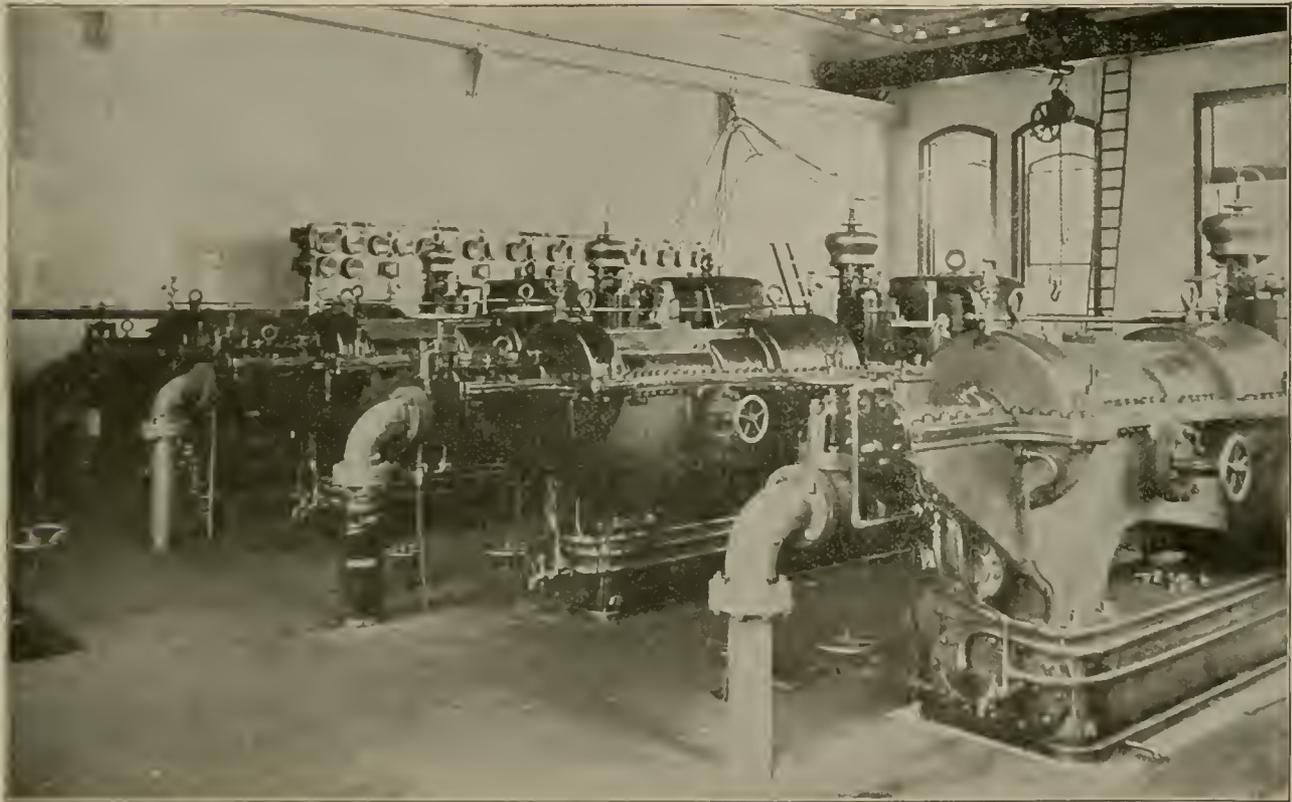

FIG. 2. STEAM TURBINES AT WORKS OF WESTINGHOUSE AIR BRAKE CO., FOUR 400 KW. UNITS

in due time overcome these local defects, which partook in no sense of functional fault, the turbine was then in serviceable condition, and its operation has since been most satisfactory. And the Hartford company, notably alert to adopt the newer thing if there seemed advantage in it, has found when the water supply ran short, that it paid to run the turbine and allow the corliss engines to remain idle. This turbine is seen in Fig. 3.

Is the steam turbine efficient? And what, if it may be so termed, is the character of its efficiency? Is it, like the various types of piston engines, peculiarly fitted to certain conditions which permit of little change if economical performance be retained, or is there evidence that the turbine has a greater inherent efficiency that is less affected by attending circumstances.

The interest of engineers in the turbine has, perhaps, been drawn chiefly to the evident possibilities of its steam economy, and to the data already acquired, with the discussion they have provoked, much more of value will be added. We may in a general way, however, without referring to its thermodynamics obtain from the evidence of actual results some knowledge of its

eight months. These tests were conducted under brake load, so that the figures are based on the brake horse-power developed. The rated load would be about 600 b. h. p. The steam consumption curve is seen to be very flat, gradually rising from 14.47 lb. at full load, to 16 lb. at half rating, and to less than 19 lb. at one-quarter capacity. The relation of the consumption of steam in pounds per hour to the brake horse power developed is also shown, this line being almost straight. In the tabulation may be observed the interesting comparative effect of vacuum and superheat.

If it is thus shown that with a unit as small as 400 kilowatts we may obtain a result of 14.47 lb. of steam per brake horse-power per hour, corresponding to less than 13¼ lb. per l. h. p., it is evident that moderate sized plants may with the turbine be sufficiently subdivided to give the maximum flexibility of service, with insurance of relay, and yet possess an efficiency heretofore identified only with very large units. Further than this, a fluctuating load is not incompatible with high economical performance.

As the units become larger the turbine is then brought into comparison with the best steam engine practice, where it still preserves its uniform efficiency, and where its practical advantages are no less evident. In a recent instance, a result of 11.7 lb. of steam per electrical horse-power per hour was guaranteed on a turbine of 750 kw. capacity, corresponding to about 10.17 lb. per i. h. p., which, though the size is moderate, is perhaps within the ability of but few engines, of any size or type, that have ever been built.

It may be pertinent to cite a few results obtained in regular service. The turbine at Hartford, under test conducted by Professor Robb, at an average load of 1,800 kw., with 155 lb. steam pressure, 27 in. vacuum and 45° superheat, gave a result of 19.1 lb. of steam per kilowatt-hour; or an equivalent of about 11.46 lb. per i. h. p. hour. An interesting comparison has been made at this plant of the relative efficiency, under regular operating conditions, of the turbine and the company's corliss engines. There are two corliss engines, one 18 and 31 by 48, and

averaging 95 lb., running condensing, and with 16.3° of superheat, the result obtained, at maximum load, was 19 lb. per kw. hour; or about 11.4 per i. h. p. hour.

Many other results have been recorded, but those given will probably be sufficient to show that under service conditions, the turbine has demonstrated its high efficiency.

But is its efficiency maintained? A question often asked, and a very important one, too. Looking at the turbine casually, it seems as though there would be little opportunity for any change in its mechanical functions. There is no complicated valve gear to get out of adjustment; no pistons to leak; no rubbing surfaces to set up excessive friction; little chance of misalignment; and altogether there seems to be no good reason why its original condition should ever be very much disturbed. The blades appear to be the vulnerable point, for they do the work, and there are a good many of them. Their number, though, is in their favor, and being loaded as they are to only about 2½ per cent of the pressure they are built for, they possess an ab-

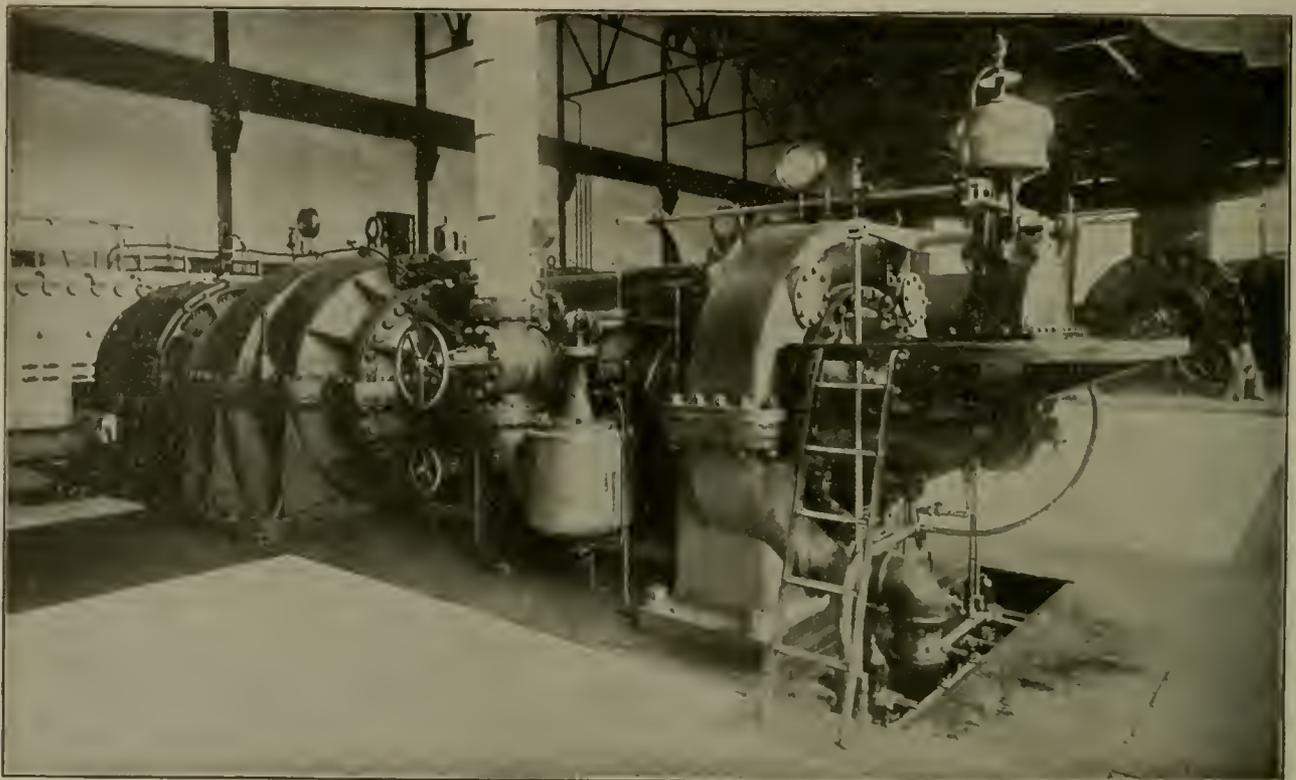

FIG. 3—1500-KW. UNIT, HARTFORD ELECTRIC CO.

one 24 and 44 by 60, both cross-compound horizontal. These engines drive direct by belt one 400-kw. and one 600-kw. generator. The turbine is, of course, direct-connected to its generator. The company has made comparisons of operation based in each case on rather extended runs. It has been found that the turbine requires in delivering 1,900 kw. on the board about the same amount of coal that is used with the corliss engines to deliver 925 kw., the steam pressure and vacuum being identical in both cases; and this with the engines running at about their point of best efficiency, and known to be in excellent condition. Comparisons of this kind, while not scientifically exact, are perhaps of greater interest as a measure of commercial performance.

The data at hand of tests on one of the 400 kw. turbines at Wilnerding show a result of 16.4 lb. per electrical horse-power-hour at full load, with 125 lb. steam pressure and 26 to 27 in. vacuum. At half-load it is 18.2 lb.

At the Elberfeld Municipal Electricity Supply Works in Germany, two 1,500-h. p. Parsons turbines, which are run in parallel with two Sulzer horizontal engines, were tested by Prof. Schroter, Dr. Weber and Mr. Lindley. With steam pressure

normally large factor of safety. The experience has been that the turbine is less liable to depart from its original standard of performance than any other type of prime mover, and there seems little reason to suppose that it is capable of much deterioration.

A recent interesting investigation along this line was made at the plant of the Cambridge Electric Supply Co., Limited, in England, where there is a 500-kw. Parsons turbine. The unit was erected in January, 1900, and during the past year has been doing very constant work. After it had operated about eight months, a second one was installed. The first unit had been tested at the maker's works before shipment and showed a result of 24.1 lb. of steam per kilowatt hour, at 526.4 kw. And it was for the purpose of noting its performance after a year's operation, that Professor Ewing conducted recently a second test. (London Engineering, June 14, 1901.) In this latter test the turbine at 518 kw., under nearly equal conditions of steam pressure and vacuum, gave a result of 25.0 lb., and at 586 kw. 24.4 lbs. In the second instance the turbine, beside trouble experienced with wet steam, was driving its own air and circu-

lating pump, (a surface condenser being used) and the steam required to drive these auxiliaries was charged to it. In the test at the builder's works, the turbine did not drive its pumps. The results, to use Professor Ewing's words, give most satisfactory evidence that the turbine retains its character as a highly efficient generator.

It remains to be said in this general connection that there will be found in steam turbine practice a more satisfactory treatment of the economy question than has heretofore prevailed. There will exist not only a truer basis of measurement than the indicated horse power, but there will be opportunity for more thorough demonstration. It is now generally recognized that efficiency guarantees on large engines have little significance. The builder is physically unable to completely assemble and test such engines before shipment, and the user is seldom able or disposed to incur the distraction and expense which a field test involves. It is in the exceptional case, therefore, that actual tests are made, and there is still much to be known concerning the economy performance of large engines. It might be said, too, that while builders and engineers generally recognize the elements of design that conduce to efficiency, there is no unanimity of opinion as to what those elements will actually produce.

cylinder, gives about 1,400 i. h. p. It will be seen that the floor area of the turbine is about two-thirds that of the vertical engine and about two-fifths of the horizontal. Such comparison, of course, is limited in its application. With each set of conditions requiring special treatment, no standardization of space requirements can be established. Still, with the limitation of isolated experiences, it is possible without attempting to establish any universal laws, to make some reasonably close comparisons of the space required for the turbine as against the conventional types of engines. It has been thought desirable, then, to take a number of different sized plants, each composed of several appropriate sized units, the selections being as follows:

- 1,000 horse-power in two 400-kilowatt units.
- 3,000 horse-power in three 750-kilowatt units.
- 5,000 horse-power in four 1,000-kilowatt units.
- 10,000\* horse-power in three 2,500-kilowatt units.
- 15,000 horse-power in four 2,500-kilowatt units.
- 30,000 horse-power in four 5,000-kilowatt units.
- 50,000 horse-power in seven 5,000-kilowatt units.
- 75,000 horse-power in ten 5,000-kilowatt units.

\*In this size the horizontal engine is figured on 5-1,500-kw. units.

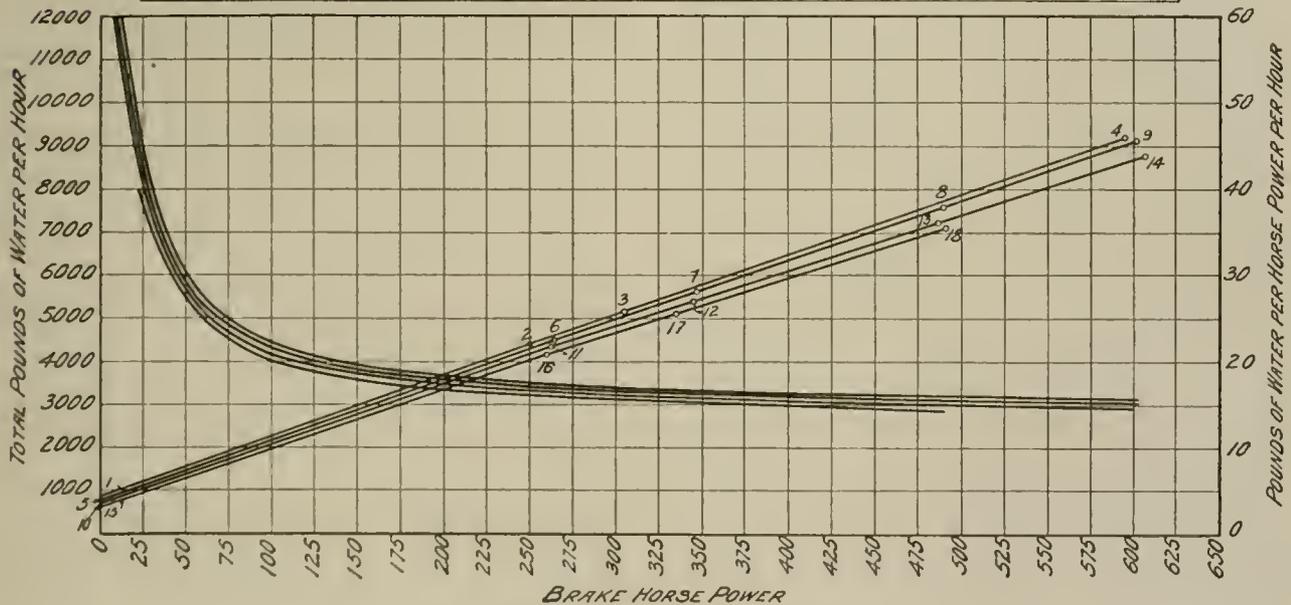

FIG. 1. RESULTS OF TESTS OF STEAM TURBINES.

It is, therefore, gratifying to know that one builder, the Westinghouse company, is now erecting a new testing room in which a complete plant of boilers, condensing and superheating apparatus will afford facilities for testing turbines up to 3,000-h. p. at all loads up to full capacity, and larger units up to this point, with practically any steam pressure and wide ranges of vacuum and superheat. Thus, the conditions to be met in practice may be approximated in the shop, and the information acquired will be of the highest value.

Turning now to one notable feature of the turbine, its compactness, Fig. 5, is a graphic illustration of the floor space it occupies, compared with the vertical and horizontal cross-compound corliss engines, the basis of comparison being a 1,000-kw. unit, including the direct-connected generator, the engine cylinders being 28 in. and 56 in. by 48 in. stroke, which, at 95 revolutions, with 25 lb. mean effective pressure referred to low pressure

These combinations were laid out for the turbines, and for the vertical and horizontal cross-compound corliss engines, all with their direct-connected generators. A clearance space of 7 ft. in all directions was allowed, and is probably a fair average. The computations were confined to the units themselves, with the clearance stated; the disposition of the rest of the plant being assumed to be unaffected by the type of motive power.

Fig. 6 shows the comparison of floor space. The curves show the turbine to require about 80 per cent of the space needed for the vertical, and not over 40 per cent of that wanted for the horizontal. In this diagram the vertical engine compares less unfavorably with the turbine than might generally be supposed, while the horizontal engine curve is about where one would expect to find it. The latter is not carried beyond 10,000 horse-power, this type of engine being practically limited in size to that required for the 1,500 kw. generator.

Fig. 7, showing the cubic yards of foundation material required, is at the same time a more exact and striking comparison. The turbine would appear more advantageously still if the actual foundations needed for stability had been computed. Instead, the foundations in all three cases were figured at 15 ft. depth to give space underneath engine room floor for condensers, etc., though for large engines this depth is usually inadequate. The only foundation needed for the turbine is that necessary to hold its weight, as though it were a tank, or some other stationary affair. It does not even require foundation bolts, there being no vertical or horizontal thrusts to be resisted. Comparing again the 1,000-kw. units, it is found that in actual foundation volume required, the ratio of the turbine to the vertical and horizontal engine is that of 1 to 9 and 15 respectively.

In Fig. 8 will be observed the comparison of engine room building space, in which the turbine appears to hardly less advantage, though in this diagram the horizontal engine, gaining in head-room what it lost in floor space, compares more favorably with the vertical. In plotting these curves sufficient head-room was allowed to accommodate a crane, leaving adequate clearance for handling any part.

Having noted, then, the marked advantage which the turbine appears to offer by virtue of its compactness, it would seem that the comparison might be carried a little further, and with assumed valuations of masonry work and building construction, as well as of land, the money saving to be effected in these important features of initial cost to be defined.

Still adhering to the same plant size and combinations of units, in Fig. 9 is found the comparative cost of foundations; the basis assumed being \$7.00 per cubic yard for concrete, laid. It will be seen that while the turbine seems to average a foundation cost of about 50 cents per horse-power, the vertical engine in the more frequent sizes is approximately \$1.50, while the horizontal is not far from \$2.50. Not forgetting that all three foundations are computed of equal depth, 15 ft., to provide space below, as above stated. In the instances where special foundation work is required, such as piling or otherwise preparing suitable bottom, or shoring up building walls to enable sufficient depth of excavation, the expense avoided by the use of turbines is obvious.

In Fig. 10, showing comparative engine room building cost, the basis assumed is 15 cents per cu. ft. of space inside of walls. Building construction necessarily varies widely with the size, design and materials employed, but the figure taken is perhaps not far from a fair average for building built of brick, with steel trusses and fire-proof covering. The curves show that the building cost for the turbine is about one-half of what is required for the horizontal or vertical engine, the latter two, apparently, not being far apart. In this comparison of building cost experience would differ widely. Architectural considerations and local conditions would produce varying results. Exigencies would, however, favor the turbine because of its smaller size and rectangular proportion, and it not infrequently happens that increased power may be supplied by locating the turbine in existing space, whereas an engine would necessitate building extension and perhaps the purchase of additional land. An instance of this kind arose at Akron, Ohio, where in the existing space no arrangement could be devised to accommodate additional engine power. It was found possible, however, by rearranging auxiliary apparatus, to provide space for one 750 and one 400-kw. turbo-generator outfit which will shortly be in operation.

Fig. 11 gives the comparative cost of land to accommodate the engine room space, the land valuation being placed at \$5 per sq. ft. Whatever may be the value of land, the relative comparison would remain unaffected. Land value, however, is never of minor importance, for desirable power house sites, with transportation and water facilities usually cost a good deal. And allotting about half a square foot of floor space to the horse-power of generating unit, it takes but little figuring, where plants are located on expensive ground, to show that the turbine in this respect alone may save a considerable part of its first cost.

The last diagram of the sequence, Fig. 12, summarizes the preceding curves, and shows, with foundations, building and land at the valuations given, how these factors of cost compare. The data will have served their purpose if they show that in a prop-

erly designed plant, using the steam turbine, far more money may be saved in these particulars than is ever represented by the difference in cost between machinery of high grade and that of inferior quality.

A case or two may be to the point. A plant was recently laid out to contain three 1,000-kw. units, with vertical cross-compound Corliss engines. Subsequently, three more 1,000-kw. units were contracted for, steam turbines being ordered. It was found that the turbine saved 900 sq. ft. of engine room floor space, and about 38,000 cu. ft. Had the whole plant been originally designed for turbines, the saving of space would have been double these amounts, and the cost of land, building and foundations been reduced about \$50,000.

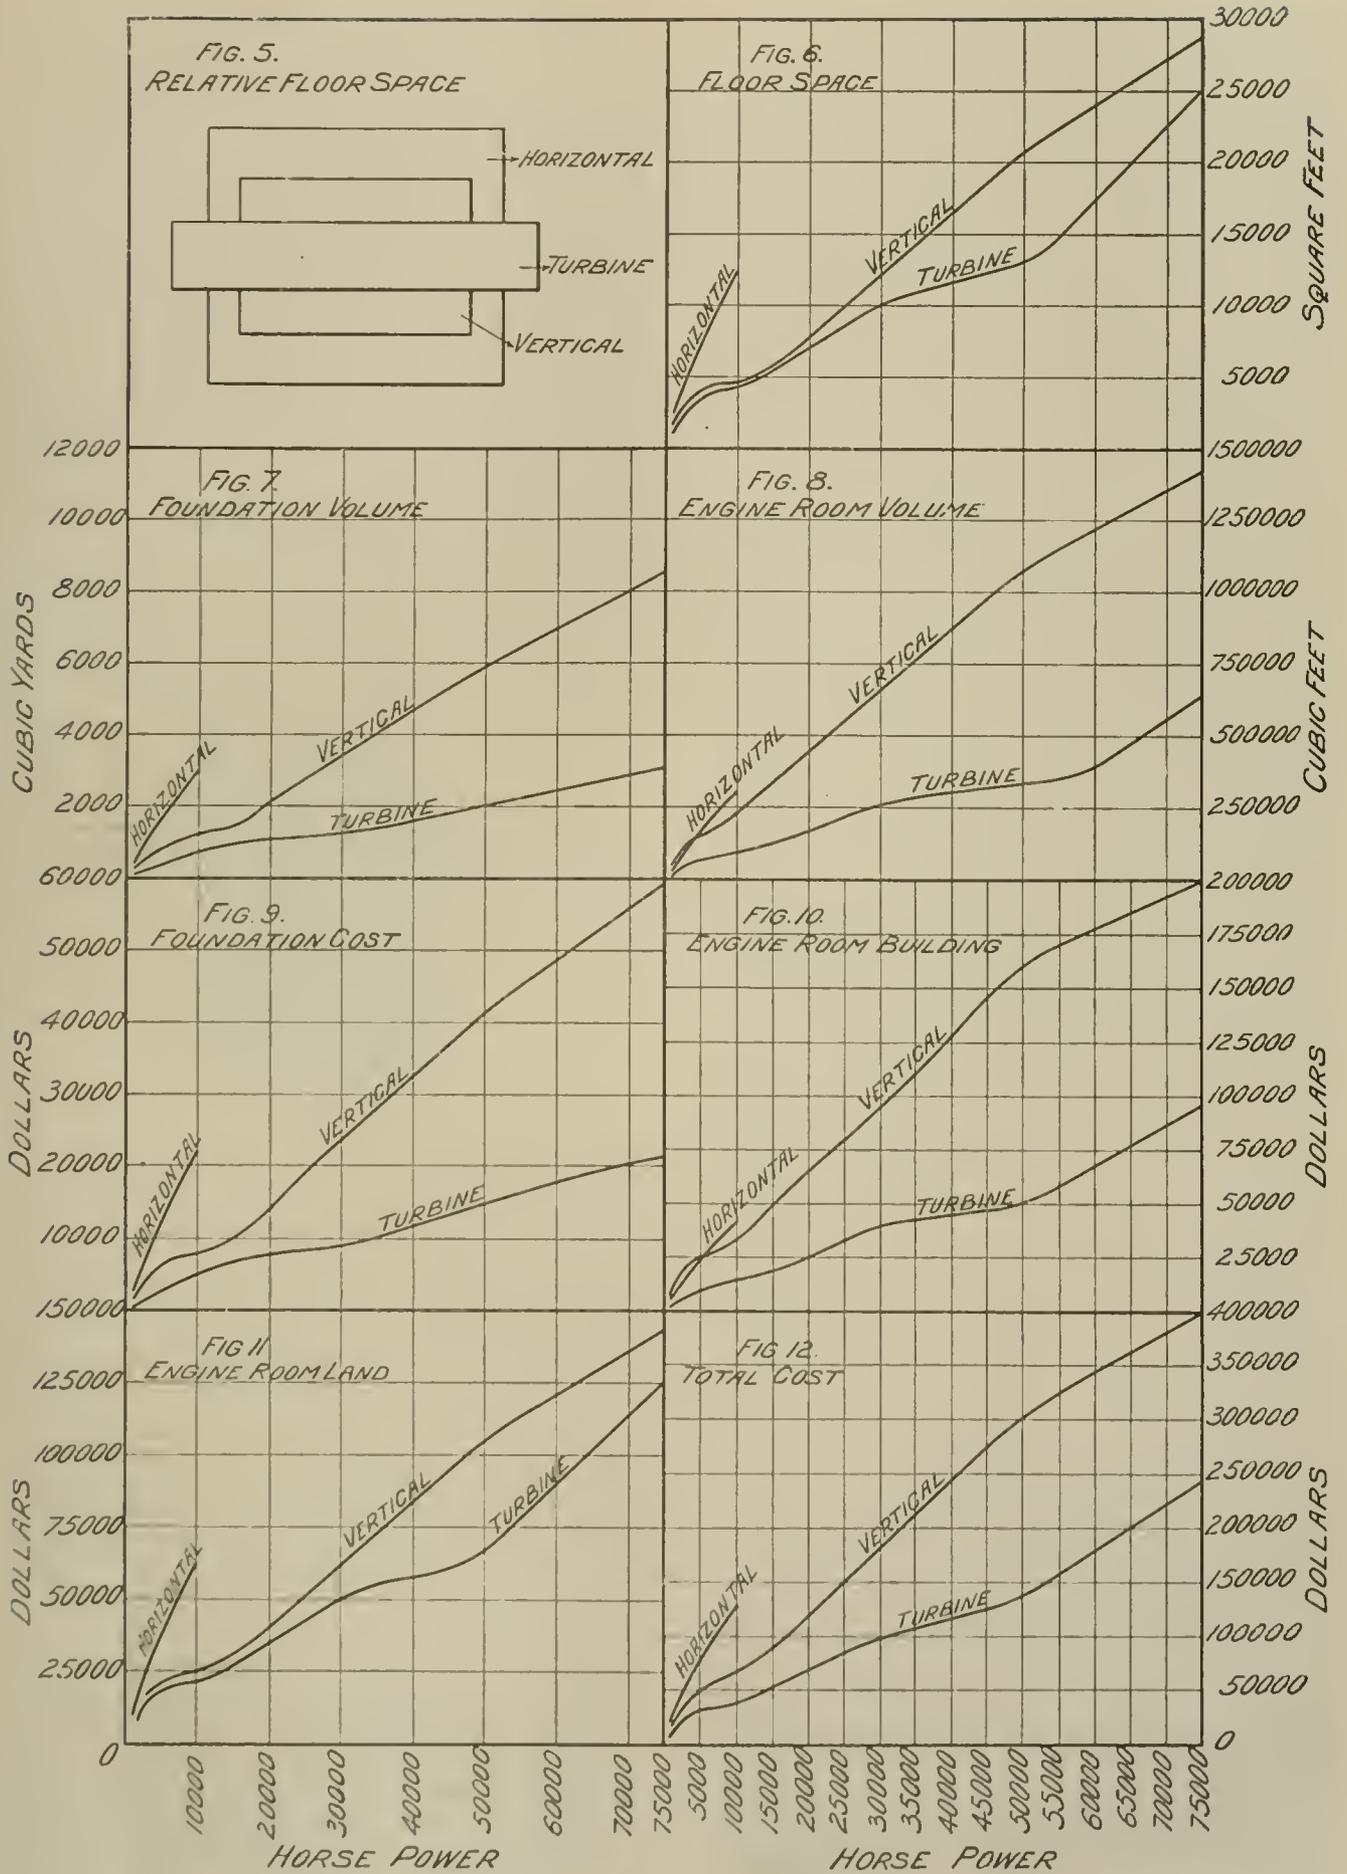

An electric railway plant in Ohio was some time ago installed, in which there are two 500-kw. generators direct-connected to cross-compound Corliss engines. Space was provided for two more units of the same size. For the increased power two 1,000-kw. turbine outfits were purchased, which will go in the space left, and leave room for another turbine of 2,000-kw. Thus, the engine room space planned for 2,000-kw. is found sufficient for 5,000-kw. It is estimated that the boiler plant extension will be reduced about one-third because of improved efficiency. It figured, too, that a saving of \$2,900 was effected on each 1,000-kw. foundation.

One other case, of perhaps greater interest, recently came to notice, that of a plant of 8,100-kw. capacity, laid out on modern lines, using vertical cross-compound condensing engines. There is no space for additional engine power, and any increase would require building extension and encroachment upon valuable land. It was shown that without going beyond the present building walls, and without disturbing the existing machinery, the plant might be doubled in capacity by installing turbines in the space available below the present engine room level and adding another deck of boilers. And it has been figured that this arrangement would effect a reduction of over \$3 per kilowatt per annum in the present interest charge.

With some measure thus obtained of the comparative indirect expenses of installation, we may turn to consider the cost of the turbo-generator itself. Is it high in price, or is its cost, if not an attractive feature, still within our common idea of value? The answer is that its price is reasonable; that, indeed, where the comparison is fair, the turbine will require the lesser first investment. It is, unhappily, quite as difficult to compare the costs of the turbine and piston engine as to compare the costs of engines themselves. A thing is, of course, high or low in price by comparison, but where the steam engine is concerned, to measure values were a hopeless task so long as there are held divergent views of design and construction and of engineering adaptation, with the builders themselves wide apart in their practice.

There are engines of good workmanship and of poor, of heavy proportion and light, and generous and scant proportioning of cylinder size and ratio, and of piston speed, to the work to be done. Perhaps, too, the voice of experience may protest that the buyer's insistence on his bargain is not always in keeping with the quality he would have, or should have, and it is not surprising that commercial necessity should sometimes affect engineering ideals. While the reliable builder will adhere to his high standards, there still will be found those whose more flexible practice will suffer impairment of quality to fit the price.

Proceeding with the comparison, however, it may be assumed that the larger field for the turbine begins about where the high speed engine leaves off. Its steam economy at once identifies it with the most efficient engine practice, and it therefore applies more appropriately to the classes of service where medium and large size units are used. The comparison, then, lies generally between the turbine and the slow speed engine. It remains merely to take an engine and generator of good construction, bring the engine efficiency as nearly as possible into parity with that of the turbine, also having it possess the same overload capacity, to find that the turbine is reasonable in price. And when we add the possible saving in foundations, buildings, etc., the first cost of installation is usually much in its favor.

There remain still one or two important features of electric power plant operation wherein the use of the reciprocating engine is attended with difficulty, and with respect to which the steam turbine offers unquestioned improvement.

One of these—the running of direct connected alternating current generators in parallel—has come to be a frequent requirement; but frequent as it is, and essential as it is, its accomplishment has been anything but an exact science. There has in fact been so little synchronism of method as to justify some wonder at the results that have really been obtained. There is no need here to particularize the complications of the problem. It obviously is not the work of the tyro to introduce into two or more units the identical conditions that will convert reciprocating motion into synchronous rotating motion, co-relating, as he must, the features of governing functions, inertia of reciprocating parts, fly-wheel weight and radius, and the like. And it becomes evident that where successful parallel running is achieved, it is the triumph of skill not only in design but in the handling of the machinery itself.

These difficulties cease with the turbine. In it there is no fluctuation of angular velocity. There is but one direction of motion, with no element to detract from even turning moment, and due to its speed there is stored up more fly-wheel effect than is present in the piston engine.

It is, therefore, found that not only do steam turbines easily run together in parallel, as hydraulic turbines have always done, but it may be expected that they will operate with piston engines and the performance of the latter in this respect be much improved. In electric railroad work especially is this feature of the steam turbine of much interest, for it is well known how irregular loads accentuate the difficulties of regulation. Furthermore, the question of operating high frequency apparatus in combination electric railroad and lighting service may be more satisfactorily approached.

The feature next in importance, perhaps, is that of superheated steam. It is now quite generally recognized that superheating is of advantage, though there is still much about it to be learned. Future investigation, however, in which the turbine will take important part, will reveal more precisely its economical status, and it may be hoped that before long the net advantages derivable from different high steam temperatures will be known. Meanwhile, superheaters are being installed, and collaterally the problem of handling superheated steam has assumed importance. Engine builders themselves are feeling their way, for while some appear to unrestrictedly offer the corliss valve for superheat work, others seem prone to confine it to the more conservative temperatures, and others still reject it altogether and hold to the poppet valve where superheat is employed.

The turbine may be used unreservedly with superheat of any feasible temperature. It has no internal rubbing surfaces, and there are no glands to become injured. Also, as no cylinder oil is required, there is no opportunity for lubricating trouble. Furthermore, there seems to be with the turbine rather more proportionate benefit from superheat than with the piston engine, because of diminished skin friction.

Having said that the turbine requires no cylinder lubrication, the inference follows that the steam is therefore uncontaminated with oil, and that the exhaust, when condensed, is pure distilled water. This is true, and while it is of little consequence where water supply is abundant and good and cheap, it becomes, where conditions are otherwise, of exceeding importance. In many sections of the country, where the water contains either mud or scale-making impurities the cost of repairs to boilers, with the expense in labor and interruption of service entailed by constant cleaning, is a besetting evil, and to alleviate this trouble large surplus boiler plants are often installed. As a usual thing, too, difficulty is experienced in attempting to extract oil from exhaust steam.

To recur once more to this feature of lubrication in the turbine, it may be remarked that it is an item of very little expense. The bearings are the only points requiring oil, the lubricant being circulated around under pressure. The reservoir being once charged, very little is needed to maintain the supply.

Finally, in this commercial consideration of the turbine, one

other question should perhaps not be omitted, one in fact which sometimes seems to outweigh almost every other, namely: How long does it take to get it? While the demand has in truth for some time exceeded the capacity for production, (there being now under construction at East Pittsburg some 41,000 kw. on order) so that the turbine has required about as much time to build as everything else, the extended facilities now nearing completion will better this considerably. Certainly, under normal conditions, these outfits, made of comparatively small parts, with no enormous pieces to be handled, ought to be quickly built, and what is quite evident, they can, when delivered in assembled condition, be so readily installed that the months sometimes required to erect large engines will be reduced to weeks.

If it is, then, seen that the steam turbine in all the essential aspects of its commercial utility appears to stand on solid ground, there cannot be yet attributed to it the virtue of universal application. It has its field chiefly in electric lighting and power work, though in small sizes it has been extensively used for driving blowers, pumps and other devices. Its speed, of course, prohibits belt drive.

But the direct-connected electrical generating unit has been the *sine qua non* of modern power development, and the reciprocating steam engine, under the stimulus of opportunity, has been brought nearly to its mechanical and thermal limit. With all the ingenuity and skill and patient effort that have marked its growth; with its notable achievement, symbolizing, as it does, the march of industrial progress, it still remains, even in its most advanced form, a wasteful and complicated means for converting heat into energy. If we are to exact further tribute from the agency of steam; if we would hope to reduce complexity, and by a more simple, reliable and durable method of operation reduce the interest and maintenance charge; if, in a word, we would improve the standard of existing practice and surmount many of its limitations, we must then change the character of our medium, employ different principles, and give to the generation of power a new and greater significance. The steam turbine seems destined to mark the way.

#### SIGNALS FOR URBAN AND INTERURBAN RAILWAYS.

By G. W. Palmer, Jr., Electrical Engineer Old Colony Street  
Ry., Boston.

The many recent disastrous collisions on street railways must have convinced operators and managers that the use of an efficient and reliable signal system would add to the safety and facility of the handling of their traffic. As faster schedules and heavier cars come into use, there is imperative need of a system of operation which will guarantee freedom from accidents caused by cars meeting head on, or by one car overtaking another.

There is only one way to prevent these accidents; namely, to adopt such rules and methods of operation as will insure that but a single car will occupy any block or section of track at any one time; any signal system which will aid in accomplishing this result is worthy of consideration.

We believe that the steam roads in their early days were confronted with precisely the same problem in relation to signals as the electric roads are now contending with. The steam signals are now probably as nearly perfect as human skill and ingenuity can make them. They did not, however, spring into existence in their present perfect condition, which has been reached only after years of work and effort to eliminate the defects shown up in practical work.

Electric roads should not, therefore, say "show us a perfect system and we will adopt it." It is decidedly our interest to encourage the efforts of those who are endeavoring to work out something which will be accurate and reliable and to contribute whatever we can to this end.

It is obvious, however, that even a perfect signal system cannot, after its adoption and installation, operate a road. Careful management, and good discipline on the part of the men are still vitally necessary. We believe that no man should be given a second opportunity to disregard a signal set against him or to

break any rule which it has been found necessary to make to insure safe operation. The employment of such a man involves a risk which should not be disregarded.

When electricity was adopted as a motive power on street railways, and especially when lines were built between cities, in some cases paralleling steam roads, and invading a field hitherto occupied solely by the latter, many saw that methods which prevailed during horse car operation would not do under conditions of higher speed, heavier cars and greater volume of traffic.

The need of something which would show that a car was approaching from the opposite direction, or was a short distance ahead going in the same direction, was quickly perceived and the problem attacked by a number, on various lines, but all having a common end in view. Several systems of block signals were put upon the market, and have since their early adoption and use undergone a process of development to get rid of the faults which became apparent by their continued use.

We believe that all single track suburban and interurban roads should adopt the best obtainable block system together with a telephone system which will enable a dispatcher to reach any car crew at regularly established stations.

A signal to be reliable and efficient, should be quick and positive in action; it should be impossible to set the cautionary or permissive signal at near end of the block before setting the danger indication at the far end; incandescent lamps should not form a part of the main signal circuit, nor should the lighting and extinguishing of lamps be the only visual indication of the

G. W. PALMER, JR.

signal. This should be supplemented by the movement of an arm or semaphore blade which will move each time the signal is operated whether the lamps burn or not. The device will then be operative if the lamps burn out, as sometimes will happen. Manual control affords unauthorized persons a chance to interfere with the signal, and should not be used; the setting and clearing circuits should be closed automatically, and when the signal has been set at danger it should lock so that it cannot be cleared until all cars have passed out of the block. It should be possible to set the signal only one way by two cars entering a block from both ends at the same time.

Special attention should be given to freedom from damage by lightning. As the pressure is liable to fall considerably at the ends of long lines, and also on parts of the system when heavy local loads are carried, the signal should be able to operate through a wide range of voltage, and should not be liable to damage through crossing of the signal circuit with the lines.

There are several differing systems now in use on various roads: one using simply a circuit of lamps operated by a two way hand switch at either end of the block, part of the lamps being lit as a permissive signal at the rear end, while the rest indicate danger to an approaching car at the far end; this system is peculiarly susceptible to trouble from lightning, and also fails when any lamp burns out. As commonly used the switch and lamps are in the same box, and generally the car is run into a position where the conductor can easily reach the switch. In most cases the motorman then cannot see the lamps and depends on the bell signal from the conductor.

The proper method would be for the car to be stopped at a

point far enough to the rear of the box for the motorman and passengers to observe the character of the signal, the conductor going ahead and throwing the switch; where the blocks are many, this will cause an annoying delay, which could be avoided by having the switch separate from the signal box, at a point about a hundred feet to the rear of it, and at such a height that the switch cannot be reached from the ground. When permission to proceed has been obtained, the motorman should not enter the block until the conductor has struck two bells, thus making the men jointly responsible.

An improved method of operating the signal is by means of a circuit closer hung overhead and at a point sufficiently in the rear of the box, the circuit being closed by the passage of the trolley wheel; there are devices of this kind now obtainable which are reliable and effective in action.

A better system is one which uses a setting and clearing circuit separate from the lamp or semaphore circuit; most of these, however, can be cleared by the passage of any one car out of the block, and in case of running several cars together, all trolleys but the one on the rear car must be pulled down when passing the switch, or if the leading car clears the block, the car proceeding in the other direction must be notified of the number of cars following; this is an element of danger, as it should be absolutely impossible to clear a block while any car remains.

Some device should be used which will record the number of cars entering the block from either end, and hold the setting circuit closed until all cars have passed off the block. It should also be possible to clear the danger signal from both ends of the block, as it is often necessary for a car to leave a block from the same end at which it entered.

There are certain single track blocks on the Old Colony system which are operated by means of what is locally known as the "red stick." This is a small club or billet of wood painted red which controls the block to which it belongs, and no car is allowed to enter the block without it carries the "red stick." It being replaced by a red lantern at night. This is a safe but not very flexible system, the absence of the stick showing one that there is a car on the block, but not the direction in which it is going. Nor does it show when the block is cleared from the other end. In case of delay or blockade of cars going in the opposite direction the stick could not be carried back and all cars going in the same direction as the one which first entered the block would be held up. It does prevent effectually the "bunching" of cars at one end of the line.

Double track roads are also feeling the need of some system which will prevent rear end collisions. Where cars are operated on quick headway and a direct view of the track ahead cannot be had, there is always danger of a car overtaking the preceding one. This is particularly the case at night, and all cars operated on suburban lines should carry a rear end red lantern. This simple precaution is so obvious that it would seem as though it must have been adopted by every one. Such, however, is not the case.

There has been some work done along the line of cutting off the trolley current from a car which has not the right of way, thereby making it impossible for the car to proceed. This scheme seems to us to be a very attractive one and it is possible that it may be effectively developed.

Too much stress cannot be laid on the necessity of giving careful attention to the proper erection and maintenance of the signal lines and devices. In regard to the lines, their maintenance is more difficult with us than with the steam roads. We are forced to carry many of our wires in streets lined with thick and heavy trees, through which it seems almost impossible to obtain good and reliable construction. In all cases special attention should be paid to keeping the wires clear from the limbs and a tough and impervious insulation should be used.

Regular and careful inspection of all parts of the system should be made, and everything done which may be necessary to keep it at all times in the best of condition. No devices should be left without care until they fail to work, which they may do at a time when there is the greatest need of their reliable action. Efficient maintenance may be expensive, but one accident which might have been prevented may result in a loss far greater than the combined cost and maintenance of a good signal system.

## THE ADJUSTMENT OF DAMAGE CLAIMS.

By Mason B. Starring, Assistant General Counsel, Chicago City Ry.

Not many years ago the caption of this paper was a subject which managers regarded in much the same light as that in which the modern horse first looked upon the automobile; it seemed sure enough an invention of the Evil One and dead certain to hurt something or somebody, but with the growth of the street railway and the community it supplies with means of transportation, that cancerous growth, yeapt, damage claims, which had already fastened itself upon the steam roads, began to develop in the street railway body corporate, and as it grew so grew the study and care bestowed upon its treatment, and all careful managements have long since commenced to place experts in charge thereof. The successful adjustment of damage claims depends largely upon the personal equation; the personality and mental characteristics of claimant and adjuster are the prime factors in all settlements. No matter how fair a corporation may be, may its adjuster be never so able, yet if the claimant is so constituted as not to know fairness when he meets it, or so determined to bilk the company that no reasonable amount will appeal to his sense of right, then an adjustment must fail, and resort be had to law; then, too, the question of locality must

M. B. STARRING.

be taken into consideration. Some cities are pest ridden with the itch for personal injury litigation; in Chicago, for instance, there seems to be from five to fifty "drummers" for personal injury suits to every personal injury, or person willing to claim one, to be drummed; and its taxpayers are even now being asked to add a large number of judges to the already large bench of the county in order to secure the trial of cases within a reasonable period of time after their commencement—what that city needs is not more judges, but an enforcement of the laws against champerty, barratry and maintenance; if I am rightly informed my own fair city is not by any means the only one suffering from such necessity.

To further the proper adjustment of claims of this class, a proper foundation must be laid at their very inception; preparation for a lawsuit must go hand in hand with preparation for adjustment; the knowledge the claimant has that the adjuster is fully cognizant of all the details, not only of the accident which gave rise to the claim in question, but also of the surgical side of the case, and the etiology of those special ailments which the claimant alleges to have resulted therefrom, goes a long way toward making an unreasonable claimant reasonable. In preparing for the adjustment of a claim of this nature, it is always wise to ascertain so much as is possible of the antecedent history of the claimant, for, since the growth of the personal injury claimant business into an industry, it is no unusual thing to find one person with a record of several antecedent injury claims, some of them settled amicably and others adjusted at the end of the litigation; I have in mind at this writing the case of one woman

who, starting in Philadelphia, had, as westward she took her way, accumulated injuries and suits until the one which she prosecuted against the company I represent numbered seven upon her list, and it was her lucky number, too. It is very frequently found, especially in the claims of women, that prior to the occurrence of an accident there had existed certain obscure troubles which sooner or later must, by the progress of nature, force themselves upon the notice of their unfortunate possessor and his or her physician or physicians, but which had not aroused in the sufferer, up to the time of the happening of a street railway accident, sufficient attention to cause medical attendance to be secured; but when an accident happens which presages the recovery of damages, every ache and pain is then watched with interest, one might also say with desire, and each and every grunt, whether caused by an actual twinge or by auto-suggestion, is attributed to the "awful" accident, and to the wicked conductor who started the car at the supreme moment when an old lady had one foot firmly planted upon the car step and the other deftly poised in the air. Some physicians find it to their interest to humor their patients and having a natural distaste for antagonizing their patients by telling them that the complaints made by the patient and the conditions found by the physician have no reference whatever to the probable consequences of such an accident as that under consideration, leave them firm in the belief that all their troubles are due solely to the violence applied at the time of the alleged accident. This is especially true of pelvic and nervous disturbances of the fair sex; many a woman directs her doctor's attention for the first time to pelvic troubles subsequent to an accident, when her comfort and possibly her health for a life-time might have been subserved by consulting him promptly relative thereto when the first manifestations of disturbance made their appearance. Occasionally instances are met with where the courage to undergo voluntary torture for the sake of the few dollars that can be secured out of a claim, attains so abnormal a development as to amount practically to insanity. Of these strange phenomena an extreme example which came under my personal observation is so abnormal as to almost pass beyond belief by any person not confronted with proof. Shortly stated it was as follows: A woman physician, related to a fine family and of independent means, brought suit for damages. The only injury that she was able to show she sustained at the time the accident occurred was a slight sprain of one ankle. She was exceedingly heavy and in the course of the trial it developed she had had both breasts, weighing some twenty-eight pounds, excised, and upon being asked the relation this operation had to the accident to her ankle or why she had it performed, she replied that it was done in order to lessen the burden of weight which her "poor sore ankle" was compelled to sustain. It afterward appeared that at some time antedating the accident she had undergone an operation known as oophorectomy for the purpose of bringing on an artificial menopause, in order that the conditions which nature had imposed upon her sex should not interfere with her attendance upon her duties as a physician. Subsequently to the trial and disposal of this case, it was said, that having learned of an operation performed in France for the removal of flesh from the thighs she hid herself to Paris to try this operation.

Science has come mightily to the aid of the adjuster in throwing the tell-tale searchlight of the X-ray machine upon the human anatomy. This marvelous discovery is effecting great and good results in all personal injury departments of those corporations which have had the good fortune to come in contact with, and secure the service of, an expert in its use; many and many are the cases of fraud and imposition which it has exposed, and a great, great many show many I never have gone into the details to carefully ascertain) of the claims that bones have been broken or fractured in steam or street railway accidents have thereby been shown to be mere frauds, and that no fracture or fractures existed. Previous to the invention of the X-ray instrument it was much more difficult for the adjuster to ascertain the truth in regard to this point. A limb placed in a plaster cast is thereby put beyond the close inspection of a physician, and it is manifestly impossible to compel the removal of the cast for the direct

inspection of the wound; this afforded an easy and successful mask for deceit. Now, however, the X-ray reveals, almost at a glance, the real condition of the hidden bone. Could an instrument be invented which would as indisputably and as accurately determine the extent of injuries to nerves and muscles as this machine does to bones, the task of adjusting personal injuries would be greatly lightened and the uncertainty which prevents an always accurate decision would be very largely removed.

Not all the experiences met in the adjustment of personal injury claims are of the depressing order; some either in or out of court are relieved with touches of humor which serve to lighten the dreary routine of fighting frauds and imposters. For example: A homeopathic physician, of the female persuasion, brought suit against a street car, claiming that a fall received from one of its cars had caused her to suffer so severe a brain and nerve injury that her ability to discharge her professional duties had been seriously impaired. In the course of cross-examination she was asked if she had not fallen down a full flight of stairs in a certain department store. Without hesitation she replied:

"I did, sir, but this fall partially restored me to health. I have had no headaches since." With great suavity in tone she said to her tormentor. "If you were familiar with the great principle upon which my school of medicine rests, you would easily understand why this was a natural result."

Knowing the familiar motto of the homeopathic school, "similia similibus curantur," the company's attorney remarked:

"I believe your motto is—"

And before he could finish his sentence she interrupted him, "Simile similibus similitur." Bench and bar had hardly smothered their laughter when in reply to a question concerning the whereabouts of a certain patient of hers, she said: "He has passed beyond my jurisprudence." Certainly the originator of Mrs. Malaprop need not have searched beyond this good lady for a prototype. It may interest you to know that the verdict indicated that the jury thought that the practice of this physician had not been seriously damaged by the great and severe injuries she claimed to have sustained.

In making investigations leading up to physical disabilities, and dating accidents, with a view to ascertaining whether or no ailments complained of are a result of traumatism and are properly attributable to that cause or are due to other and pre-existing causes, much delicacy should be displayed so as not to unnecessarily annoy either the claimant or his or her friends or family—and in the trial of damage suits, however solid an array of testimony it may be possible to present reflecting upon the character of a man or a woman, a party to a contention of this kind, it must always be borne in mind that the natural chivalry of our race is prone to resent what may seem to the auditors of such testimony an unnecessary, or to some, mayhap, a malicious attack upon some person for or because of the presentation by that person of a damage claim. The arousing of such prejudices should be avoided, as, in most cases should the introduction of evidence as to intoxication, because, while it is true most of American mankind take a drink occasionally, few like to be charged with taking so much as to cause the enemy in the stomach to take away the wisdom in the head.

I think we will all arrive at the deduction that there is no department in the entire management of street or steam railway properties into which the personal equation more strongly enters, and that personality of the right stamp in the head of that department charged with the adjustment of claims, whatever his title may be—even when dubbed "Claim Agent," that title now so thoroughly despised more by reason of its adoption by that vast body of ghouls sometimes called "ambulance chasers" which preys alike upon the injured and the railways, than for any other cause—is the most essential requisite to the proper handling of this unfortunate part of our street railway machinery. My first precept, therefore, is "seek the man." Get a combination of absolute honesty and industry, with a moderate supply of brains, and you have a good man; let any one of this trinity be absent and the settlements he makes will be mostly unsatisfactory, if he succeed in making any at all. If the claimant possesses these same sterling attributes, the result will be an adjustment satisfactory to both parties, for in that event there must of necessity

be merit to both sides of the case, or no claim would be made, and no adjustment sought. If all claims were just, and all claimants fair, the matter of adjustment would be simple, but as a rule comparatively few claims are just, and fewer yet of the claimants are fair, so that the faculties and perceptions of whoever represents the company's interests must be ever alert not to be duped by dissimulation, exaggeration and guile, and to discover actual and intentional fraud whenever and wherever it exists. Some claimants possess honesty, but not enough to leaven the lump; many possess industry to some degree, and all possess a certain species of brain; most of them possess what might be justly termed a low order of cunning; the doctrine of our homeopathic friend, that like cures like, must not be applied to an adjustment.

Precept number two is "get facts." Facts are what win! He who can uncontrovertibly and openly place facts before a malingerer puts him at a disadvantage from which he can never recover. Facts, too, are the enemies of some physicians. Look out for the doctor who puts the plaster cast upon the unbroken limb. He is a stumbling-block in the path, but employ to meet him not one who has a beam to pluck from his own eye. Rarely should the attending physician, if honorable and a fair practitioner, be ousted from the care of his patient. Be the recovery of the patient never so good, if the company furnishes the surgeon who attends the injured person, by some perversion of mental vision it is claimed alike by patient, relatives and friends that he is and has been sent to the bedside of the patient to injure him in some occult way, and by so doing, affect detriment to his interests and protection to those of the street railway company, slight being lost of the fact that the complete and early convalescence and recovery of health of the patient is best for all.

A little book, lying on my desk as I write, says very appropriately of this theme: "Pettifoggers in law and empirics in medicine, whether their patients lose or save their property or their lives, take care to be, in either case, equally remunerated; they seize both horns of the dilemma and press defeat, no less than success, into their service. They hold from time immemorial the fee simple of a vast estate, subject to no alienation, diminution, revolution or tax; the folly and ignorance of mankind. Over this extensive domain they have long had, by undisputed usage, the sole management and control, inasmuch as the real owners must strenuously and sturdily disclaim all right, title and proprietorship therein."

Meet fairness with fairness; fraud with firmness. "Fighting fire with fire," avoid as you would His Satanic Majesty himself. Fire cannot be handled without burns, and burns are at least painful. Avoid a reputation for settling everything; it hurts stockholders' pockets; equally avoid a reputation for fighting, but when you do fight, win; settle all the grave cases that presage loss; litigate all those that possess little or no merit. It is a juster as well as a wiser policy—for once, at least, Justice and Expediency run hand in hand.

Very often I am asked to furnish copies of the form of release which is used in concluding an adjustment, and willingly comply; but one form of release is about as much like another as pens in the same pod, and in the event that a settlement is contested in court by an ignorant person, and especially by one having no knowledge of the English language, the more technical in its terms and the more involved in its legal phraseology a release is, the more apt a jury is to say that the person who signed it was totally ignorant of its contents and that the execution of the document was obtained by fraud.

Some time ago the writer had occasion to cause a release to be obtained from a German girl who had stepped from a moving car as it was coming to a stop for her to alight, while the car still had sufficient motion to disturb her equilibrium. The girl lost her leg, and an adjustment was made very shortly after the accident, while she was still in the hospital, and was not made because of any liability, but merely to avoid litigation. After she got out and around, she was very easily persuaded by somebody—we can all suspect whom—that she had been imposed upon, and the foolish woman went upon the witness-stand and testified, under her solemn oath, not only to a state of facts which created a liability on the part of the defendant company, but also

that she did not know the contents of the paper she had signed; that she could not read English, and that even if the paper had been translated to her in German (which, by the way, it was, although she denied the fact), she would have been unable to comprehend and understand what it meant; but unfortunately for her and her attorneys, who had a large fee contingent upon the result of her story, she had written in the German language in her own handwriting, over her own signature, on a portion of the hospital record which hung by her bedside, "I got one hundred dollars from the railroad company, and I know I can get no more for my leg." Certainly not a very artificially drawn legal document, but without it there is no doubt but what the very perfect release which was properly and understandingly executed by her would have been set aside. It is, therefore, fair to draw the conclusion that in settling with ignorant people, it is wise to have them express in their own way their understanding of the purport and effect of documents which they sign; and I have always cautioned adjusters to be particularly careful in this respect—never to make any misrepresentations, never to allow a person who has been drinking to sign a release, and wherever it seems wise to the adjuster, owing to the circumstances surrounding the settlement, to obtain from the claimant in claimant's own handwriting such a statement as that referred to above; and, in the event that claimant signs by mark, to obtain disinterested and reliable witnesses to the mark. Perhaps this little suggestion may seem to many discursive and entirely unnecessary, but to others it may exemplify, as it did to me, the need of the utmost care and precaution in concluding matters of this kind, for, generally speaking, the public maintains a double standard of morals—one for dealings with corporations, another for transactions with individuals. The man who holds himself bound to govern his relations with a corporation by the same rule of morals and ethics which regulates his relation with the natural instead of the artificial citizen, is fast becoming as extinct as the dodo. Almost the universal attitude is that a corporation is not entitled to receive that strict application of the law of good morals and common honesty which is shown to individuals acting in private capacities. Put into common parlance, the public code in dealing with a corporation seems to be that "A man is entitled to all he can get out of a corporation."

The atmosphere of such a feeling is typical of a very large share of the cases which come for adjustment before the metropolitan law or claim department. There is no escaping from the conclusion, enforced by careful observation, that men who could not be induced to deal dishonorably with private individuals, acting as such, do not scruple to make false representations as to the nature and value of any old claim against a corporation. This practice is so common that it may be classed as almost universal. And the men, or a decided majority of them, who justify and indulge in this kind of "sharp practice" in dealing with a railroad corporation, might safely be trusted with a private loan, unsecured, and amounting to more than the sum involved in their suits for damages.

Previous to a very few years ago, the steam and street railroad companies of every kind and the "common carriers" of various descriptions have been the main sufferers from this deplorable attitude of the public conscience which decrees one moral standard for dealings with the private individual and another and a much lower one for transactions with a corporation. Now the application of this double standard is being made to many other kinds of corporations. The municipality is the worst sufferer of all; but the manufacturer, even the smaller and the private industrial concern, is being brought under the application of this sentiment and practice.

Possibly, of all the varied classes of claims, with which the adjuster of damage claims meets, the most dreaded and difficult for him to handle are those which bring to bear the subtle influence of "pull." Not infrequently a conscientious adjuster finds that this influence has reached "above his head," and that the discharge of his duty brings him into opposition with others more easily influenced and of higher rank on the company's roster. Quite generally claims pressed with this kind of backing are either fraudulent or extortionate. Of course, there are exceptions to this rule; but the very fact that the claimant feels called

upon to exert a personal, or social, or political pressure, or add to his claim the weight of some powerful financial interest in the institution in question, is a strong presumption that the claim for which this influence is solicited is too weak to stand upon its own merits. In this connection it might be stated that corporate officers, and particularly those engaged in passenger transportation, are not unmindful of the public attitude of sensitiveness and quasi-hostility towards them, and are, therefore, willing to make a just and liberal settlement without any undue influence exerted upon them, and for that reason adjust rather than contest even doubtfully meritorious claims. But, to go back a little ways, let us always consider an adjuster's trials and tribulations and not make his pathway too hard, for if he learns that claims which he declines are subsequently increased by reason of the so-called "pull" he soon gets to thinking that if somebody is to be a "good fellow," why should not he be that somebody? And if his superior officers are so willing to give away the company's money to please their friends, or to make friends for other departments of the company's service, why is it not perfectly proper for him to do those self-same things? Thus the company soon finds itself with a vastly increasing damage account. It is a good rule for any company to adopt to reverse rarely, if ever, a decision of its adjuster. If upon consultation with an adjuster it would seem that on the merits of the case in question, some action different from that already taken by him should be had, let the adjuster attend to that in his own way; do not have him feel disgruntled and overridden. There is no excuse for inflicting personal humiliation upon a man who possesses your confidence, who has your money in his pocket and your best interests at heart. Many and many a good man has been spoiled, I fear, by the unfortunate proclivity on the part of his managers to yield to the so-called "pull." If a company has any friends to make, or debts to pay, let them be paid through some other department and in some other manner. Debts paid in this manner are never considered liquidated, and a person who has obtained something for nothing for some one, by reason of his influence, nevertheless, thereafter boasts of the amount he has saved the company and the obligation under which it has been placed to him by his getting this or that case settled for them. This brings to my mind the subject of "go-betweens." There is in every community a class of people which seeks its livelihood by preying upon both sides of personal injury claims. It seeks the individual and impresses upon him how much can be obtained through the go-between, and how little without such influence, embellishing the yarn with wonderful stories concerning that influence, often to the detriment of honest officers, trying to make the claimant believe he has some hold upon them and that they are corrupt, and trying to persuade the claimant to see that the sun of success rises and sets in the great and only negotiator, and his Scengall-like "influence." And should this creature be treated with any consideration he swells himself larger and larger, and as he himself swells, so swells he the head of the claimant, and at last, if he succeeds in bringing the opposing parties together, his grandiloquent attitude dwindles to the proposition tritely expressed in the words, "How much is there in it for me?" while he assumes all the time the attitude that without his invaluable services, claimant and claimee, if I may coin the word, never could have come together or have reasonably disposed of their differences. There is one claim department of which I know, into which such an individual is not allowed to enter. Some things, in the human race, are more despicable than this creature, but he is sufficiently low in the scale to make it unwise, unsafe and, to every fair-minded person, disgusting, to have any dealings with him. Perhaps it is not fair to our sex to use the pronoun he so often in this connection—many and many such a creature masquerades in petticoats. Much success depends upon the care and discrimination shown in selecting cases for trial, and while this paper should mayhap deal only with the "Adjustment of Damage Claims," a word or two upon the corollary thereof, the litigation of damage claims, may not fall amiss. To illustrate, given a company, which employs and enjoys the reputation of employing only the ablest counsel obtainable and prosecuting its every defense vigorously and uprightly, and which wins a great major-

ity of the cases which it tries, ninety per cent of the bar will seek settlements in terms not unfavorable to that company rather than meet it in court. Right here let me say another word about trials and their results. Never compromise the verdicts when results are unfavorable. If they ripen into judgments, make the best you can of them after they have been affirmed by a court of last resort, not before. The fact soon becomes known as to who will and who will not compromise for fifty, or some other, per cent of the amount of a verdict, after one is rendered, and that company or person having such contingencies to contemplate, and compromising upon verdicts in the manner heretofore suggested, will soon be confronted with the necessity of trying each and every case brought against it. The results are so much more satisfactory to the practitioner who gets fifty per cent of the amount recovered by suit and only thirty-three and one-third per cent, or less, in the event of settlement. Then, too, think of the disappointment this same gentleman feels when he cannot add mention of such compromise to his scrapbook of newspaper clippings reciting his recovery of a \$10,000 verdict against this company and a \$25,000 verdict against that one, which volume he so proudly displays when luring to employ him some unsophisticated, but possibly injured, person whose clientage he seeks, but who never saw or heard of him before his call. The sadness is appalling; weep with me, my hearers! Never, as the expression goes, settle "behind the back" of a reputable lawyer. If in rare instances circumstances compel such action, see that he receives a reasonable fee. On the other hand, never settle with the "ambulance chaser"; it is far better to pay the client of such an one a hundred dollars than to pay him ten. Try it and see.

In writing concerning the adjustment of damage claims, I have confined myself to those arising from injuries to persons and omitted referring to those relating to damage to personal property, realty, etc. I have also intentionally refrained from going into the detail of the different means of procedure advisable to be followed from the moment an accident happens down to the time at which any claim, or claims, arising therefrom are finally laid at rest. Every company, I take it, whose claims are sufficiently numerous and whose damages are sufficiently large to

restrained impatience, a reply requiring no straining of the ear to hear, "We don't want it any longer; its present length suits us very well."

NEW SHOPS FOR DETROIT UNITED.

A few weeks ago the Detroit United Railway purchased the old Pullman car shops in Detroit, which were abandoned in 1893, and since September 19th Mr. Farmer has had a large force of men at work remodeling the plant. When this work is completed the Jefferson avenue shops will be abandoned and their equipment removed to the new plant.

The site of the new shops occupies the block bounded on the north by Macomb street, on the east by St. Aubin avenue, on the south by Monroe avenue, and on the west by DeQuindre avenue, and is 644 ft. long by 225 ft. wide. The arrangement and dimensions of the buildings as they will be after the extensive remodeling now in progress is completed are shown in the accompanying plan.

The row of buildings on the north side, which are of a uniform width of 80 ft., will be occupied, beginning at the west end, as follows:

Two-story building, 28 ft. long; car washing room in lower story; upper floor which is served by elevator, used for cleaning sash and interiors.

One story, 288 ft. long; paint shop with 22 tracks running from north to south.

One story, 13 ft.; at north end oil and paint room, 50 ft.; at south end lavatories, 30 ft.

Three-story building, 109 ft. long; ground floor, mill shop; second floor, cabinet and pattern-making shops; third floor, storage.

Boiler room section, 19 ft.; boilers on ground floor; dry kiln on second floor.

Three-story building, 42 ft.; machine shop on ground floor;

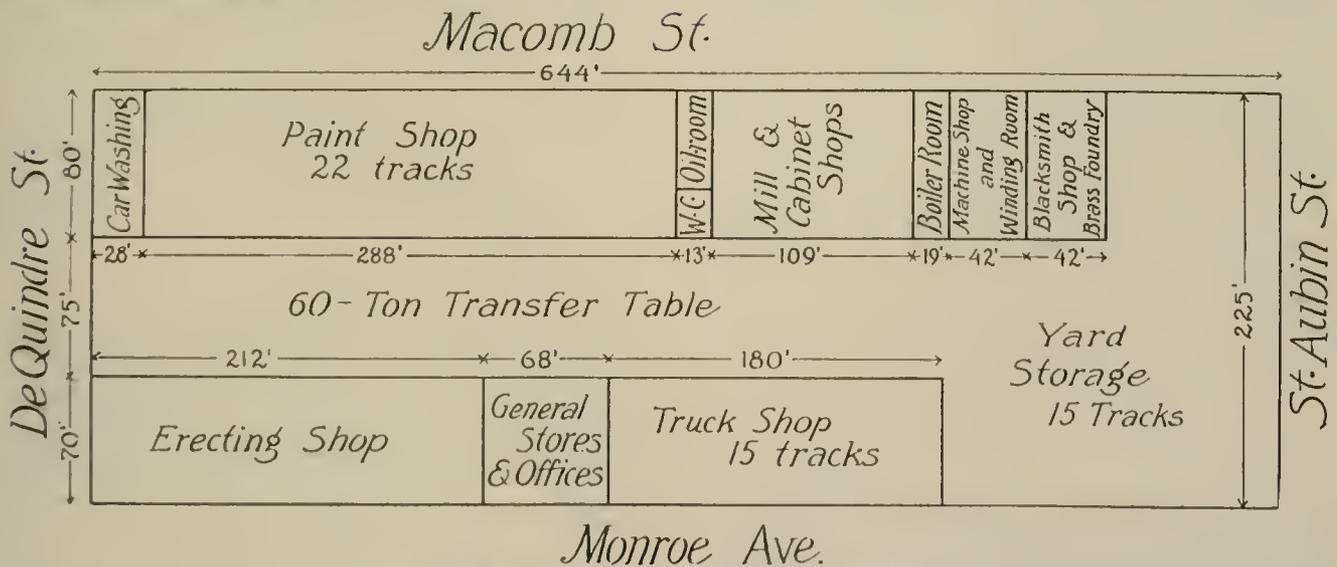

DIAGRAM OF THE DETROIT RAILWAY'S NEW SHOPS.

invite any special attention thereto has adopted careful, and one may say almost scientific, methods of caring for the injured person or persons, preventing fraud and starting immediately upon the happening of any occurrence which might give rise to a claim—the rolling of that ball of investigation which as it moves along grows and grows until it assumes and becomes a perfect and symmetrical globe of defense.

The temptation to overstep the bound of time and space allotted for this dissertation is so strong that it now becomes me to say, with the old dominie, lest like him I might fail to hold the interest of my auditors, "I can make this paper longer, but I won't." To which comes surging back on the tide of courteously

armature winding room on second floor; third floor for storage; building served by a hydraulic elevator.

One-story building, 42 ft. long; blacksmith shop on north side, 60x12 ft.; brass foundry on south side; in the southwest corner of the brass foundry will be a core oven 15x12 ft., above this will be the armature baking oven, this being adjacent to the armature room, which will be fully equipped with overhead trolleys, air hoists. The machine room will also have air hoists, and the pump pit will be located in the machine room.

On the south side, along Monroe avenue, are three buildings of a uniform width of 70 ft., beginning on the west or DeQuindre avenue end there are:

One-story building, 212 ft. long, to be occupied as an erecting shop.

Two-story building, 68 ft. long. The lower floor will be occupied for general stores, and the upper floor by the offices of the superintendent of motive power, Mr. Furmer, the chief inspector, and the superintendent's chief clerk, A. G. Thompson, and the drafting and clerical forces.

One-story building 180 ft. long with 15 tracks running from north to south, to be used as the truck shop. This shop will be equipped with lifts for removing car bodies from the trucks, which is the practice except with cars mounted on Brill trucks; for earling for these cars five of the tracks will be provided with pits, and equipped with hydraulic jacks. In the southwest corner of the shop will be located the wheel borer, the axle lathe, and the wheel press. The shop will be served with overhead air hoists with capacity for six tons and under.

All the shops are to be lighted by electricity and tools are driven in groups by motors. The heating is by steam.

Between the two rows of buildings is a space 71 ft. wide which will be served by a transfer table 52 ft. long with a capacity for 60 tons. The transfer table will receive loaded freight cars (coal, car wheels and supplies) from the railroad siding in Dequindre street and carry them directly to the boiler house, truck shop, or store room. The loaded cars are handled on the table by a dinky car electrically equipped.

The transfer table was ordered from the Taunton Locomotive & Manufacturing Co., through Geo. S. Hastings, of Cleveland.

The vacant space at the southeast corner of the lot is to be used for car storage, there being room for 15 tracks, this space being enclosed by an 8-ft. brick wall.

This plant is to be known as the Monroe avenue shops.

#### THE NERNST LAMP.

The place to see the Nernst lamp in detail and variety was at the Larned street exhibit of the F. Bissell Co., of Toledo, O., selling agents for the Nernst Lamp Co. This is the lamp that so brilliantly illuminated the Westinghouse and other exhibits. Its light is soft and light, there being no shadow or flicker, and it is operative on all alternating current circuits. It is highly recommended for railroad service. It comes in four sizes, one, two, three and eight-glower, running from 88 to 528 watts, or 88 watts per glower. Each glower is equal to three ordinary 16-candle power incandescent lights. The life of a glower is about 800 hours on 60 cycles and 400 hours on 25 cycles.

The "glower" is the life-giving element of the Nernst lamp. It is a small white rod about 1/32 in. in diameter and 1 in. long. It is a non-conductor when cold. Representing the Bissell company were M. S. Walker and C. M. Hamilton.

The Nernst Lamp Co. had the following representatives at the convention: A. E. Fleming, Pittsburg; G. J. Stanley, Pittsburg; Geo. C. Ewing, Boston; Walter Floyd, New York.

#### THE AMERICAN TRACKBARROW.

The American trackbarrow was shown in the ante-room and came in for favorable comment. Although used chiefly by steam roads, it is pointed out that it is an excellent tool for distribution of ballast ditching and cleaning tracks for electric railways. It runs on either earth or rail, the wheel being grooved for the latter. The American Trackbarrow Co., of Lowell, Mass., makes it, as well as very useful cars for carrying coal or ashes, tools, etc.

#### NATIONAL CARBON SPECIALTIES.

The National Carbon Co., of Cleveland, O., showed some interesting samples of Partridge solar and National carbon brushes. "Columbia" are carbons, "Columbia" dry cells, "Columbia" brushes, the "Auto Cell," Partridge plumbago for voltages under 220 and other supplies. There was a miscellaneous lot of special shapes in the brush line. The company is just introducing a new cell called "Special Columbia," which has nearly double the amperage of ordinary cells. The "Auto Cell" is designed for

automobile and gasoline work. It is a combination of small cells in a water tight case. There is claimed to be no possible chance for short-circuiting, and an amateur is in no danger of accident by careless handling. The company is pushing the "Columbia" brush, which is said to have exceptionally long life. It saves the wear of the commutators, also. The National was represented by Manager James Partridge, of Sandusky, and R. K. Mekey, of the general office.

#### THE VAN DORN-DUTTON AND THE VAN DORN-ELLIOTT EXHIBITS.

The Van Dorn & Dutton Co., of Cleveland, O., displayed gears, pinions, track cleaners, and other appliances, a special feature of the exhibit being an armature lift which was examined with interest by many of the railway men.

The Van Dorn-Elliott Electric Co., also of Cleveland, showed armature and field coils and commutators. It also exhibited re-winding armatures that came in for considerable attention.

The Van Dorn & Dutton and the Van Dorn-Elliott companies were represented by W. A. Dutton, K. N. Elliott, H. Ludwig, O. A. Foote and F. Schneider. They gave friends very neat souvenir note books.

#### TAYLOR ELECTRIC TRUCKS.

The Taylor Electric Truck Co., of Troy, N. Y., had a good exhibit in the annex, showing the Taylor heavy single truck, an up-to-date short wheel base double truck, with swing motion, a high speed double truck for suburban service and a regular swing motion truck. Mr. John Taylor, for the company, had charge of the exhibit and reported it altogether profitable.

#### THE ARMSPEAR LANTERNS.

The Armspear Manufacturing Co., of New York, exhibited a new trolley car tail lamp, which was described in the Wednesday "Review," a new steel guard solid-top lantern, a standard classification lamp, the "Armspear" marker lamp, the "Armspear" switch lamp and the "Armspear" semaphore lamp. Of the steel guard solid-top lantern it is affirmed that as at present constructed it has never been discarded by a road after having been adopted as standard. The frame is composed of flat metal rings and upright guards. No solder is used and a new feature is a brass hasp on the top, doing away with old-fashioned springs. It is a very strong lantern and cannot be broken by jumping on it. Mr. C. K. Freeman, of Freeman & Buckley, Chicago, and Mr. C. E. Nicol, of New York, had charge of the Armspear display.

#### STANDARD VITRIFIED CONDUIT.

The Standard Vitrified Conduit Co., of 39 Cortlandt street, New York, was represented by B. S. Barnard, the vice-president and secretary. This company showed samples of multiple and single duct conduit, as well as third rail insulators such as were installed on the Manhattan Railway system in New York and the Mersey Railway of London, Eng. Mr. Barnard states that he will be pleased to answer inquiries concerning the Standard products, feeling assured that investigation will result profitably all around.

#### AUTOMOBILE TOWER WAGON.

The Trenton automobile tower wagon exhibited on Randolph St., corner of Larned, attracted considerable notice. It is a Trenton trolley wagon, built by J. J. McCardell & Co., Trenton, N. J., combined with a special automobile gear designed by the Motor Truck & Vehicle Co., Columbus, O. In building the new gear the whole weight of the mechanism is hung low, which gives a greater stability and firmness to a high tower than is usually secured. During the past five years heavy trucks of the same design have been placed in severe continuous service and have successfully withstood all tests. The engine used for motive power is a modern high efficiency stationary gas engine of standard type. The transmission mechanism is very simple. Mr. M. J. McDonald represented the Trenton company.

# SIXTH REGULAR ANNUAL MEETING STREET RAILWAY ACCOUNTANTS' ASSOCIATION

**Detroit, Mich.—Oct. 8—10, 1902.**

## FRIDAY MORNING SESSION.

President Mackay called the meeting to order at 10:45.

The President read telegrams of greeting from Mr. J. F. Calderwood, and from Messrs. Ross, of Montreal, Cooper, of Cincinnati, and Henry, of St. Louis; also from the Detroit Stock Exchange inviting the members to visit the exchange, which, however, owing to the want of time, the Association was unable to accept.

Mr. C. N. Duffy read the report of the Standardization Committee, as follows:

### REPORT OF STANDING COMMITTEE ON THE STANDARD SYSTEM OF STREET RAILWAY ACCOUNTING.

To the Members of the Street Railway Accountants' Association of America:

Gentlemen:—Your committee on a standard system of street railway accounting beg leave to submit the following report:

We recommend that the classification of construction and equipment accounts remain unchanged, unless the convention directs otherwise.

We recommend the following changes in the classification of operating expense accounts:

Account No. 19, to read "Wages of Miscellaneous Car Service Employees," instead of "Wages of Other Car Service Employees"; Account No. 22a, "Hired Equipment." The insertion of this account to cover rental of cars, electric equipment of cars and other equipment.

Account No. 29, to read "Stores Expenses," instead of "Store-room Expenses."

Account No. 35, to read "Miscellaneous Legal Expenses," instead of "Other Legal Expenses."

Respectfully submitted,

C. N. DUFFY,  
W. F. HAM,  
J. F. CALDERWOOD,  
H. L. WILSON,  
W. G. McDOLLE,

Committee.

Mr. Duffy presented a communication from Mr. J. F. Calderwood suggesting the substitution of the title "Supplies Expense" in place of "Store Room Expenses."

Upon the conclusion of the foregoing report, Mr. Duffy gave a very interesting resume of the negotiations had with the Hon. W. R. Merriam, director of the United States Census; Mr. W. M. Stewart and Mr. North, of the Census Department, and Mr. T. C. Martin, the government expert on street railway and other electrical statistics of the forthcoming census, which negotiation on behalf of the Accountants' Association has been carried on thus far, though without any special authorization, by Messrs. Duffy, Calderwood and Ham. Mr. Duffy reported that the utmost amity existed between the latter gentlemen and the government representatives, in their purposes to make the work of the Census Department conform to the needs of the street railway interests, and, on the other hand, in the mutual co-operation of the companies and the government in facilitating the work in a way to satisfy the interests of all concerned. Mr. Duffy found the government officials conciliatory to the last extreme in the adoption of the suggestions made in the interest of the street railway interests, so as to impose upon the latter the least burden consistent with the obtaining of the practical results desired.

A vote of thanks was given Mr. Duffy for the interest taken by him in the matter and the services rendered.

Mr. W. M. Stewart was invited by the President to address the meeting, and in doing so corroborated Mr. Duffy's statement that

it was the desire of the Department to show every consideration to the electrical interests of the country in the work before them, and he at the same time expressed the appreciation of the Department for the co-operation which was assured in the work on the part of the Accountants' Association and the interests which it represented. Their conferences with the members of the Accountants' Association had impressed them with the necessity of adopting the form of accounting adopted by the latter; that system had been adopted and would be promulgated by the Department throughout the street railway companies of the entire country, and would be accompanied with a detailed statement of the Association's instructions as to the items which went to make up the totals for each of the subdivisions. He wished every one to appreciate that the Department was trying to get what the companies wanted, and to give the latter the statistics that would be of most assistance to them, which they regarded as one of the main objects of the census. Of course, another object in the work was the making of history. The history of our country was complete without statistics dealing with its material interests, and certainly the industries represented in this Association were among the important material interests of the United States.

President Mackay said he thought he spoke for the Association in saying that they could ask for no higher compliment than that which was conveyed in Mr. Stewart's remarks, and that the members of the Association would be glad to co-operate with the government officials in furnishing any information that the Census Bureau desired.

President Mackay then put the question on the adoption of the amendment proposed by Mr. Calderwood's communication, altering Account No. 29 to read "Supplies Expense," instead of "Store-room Expenses," and the vote resulted in the negative.

On motion of Mr. C. S. L. Tingley, the report of the committee was adopted.

Mr. Judson, of the New York State Board of Railroad Commissioners, was invited to address the meeting, and spoke briefly, assuring the Association of the desire of the Commissioners to join in the co-operation necessary to get a form of report that should be alike valuable to the street railway interests and to the public. He called attention to the fact that the street railway business was a large and growing industry. He thought the time was not far distant when all the railroads in the country would be electrically operated, and this Association should recognize that fact and make provision as early as possible to have their accounts so arranged that when the steam railroads got ready to change, there would be a system of accounting ready for them. (Laughter and applause.)

Mr. T. C. Martin was asked to say a word to the Association as the expert Census Statistician, and explained his relation to that work to be the clothing of the statistical skeleton in its application to electrical industry, with a view to elucidating the meaning of the figures when gathered. The United States was now turning out apparatus used in the various branches of this industry to the value of nearly \$150,000,000 a year, an enormously large proportion of which went into the hands of street railway companies, and it was a necessary sequence that the government and the public should like to know what became of that apparatus. When the figures were collated they would furnish a body of information which could not be surpassed in value in regard to any industry in any country in the world. He hoped that when the next Accountants' Convention met they should be able to have presented to them the gross totals and statistics of the art and the industry as a whole, and he could not help feeling that in adopting the system of the Association practically en bloc, they were assisting not only in putting this Association

on a higher plane than ever before, but were also doing for the street railway industry of the United States an incalculable service which would be better appreciated when their work was finished.

President Mackay said he thought as accountants they all appreciated Mr. Martin's remarks, especially what he had said as to the eliminating of such items as were considered unnecessary. They did dislike getting out unnecessary statistics.

The President stated that the next order of business would be properly a consideration of Mr. Tripp's paper, which had been read by Mr. Duffy. Mr. Tripp had been detained on account of the death of a brother.

At the suggestion of Mr. Duffy the Association directed its secretary to express to Mr. Tripp its regret at his absence and at the cause of his inability to be present.

The report of the Committee on Standard Form of Report for Electric Railways was then taken up for consideration, and discussed at length.

Mr. Judson, of the New York State Board of Railroad Commissioners, suggested the advisability of distinguishing more closely between freight and passenger business, and this subject was quite fully discussed; with the result that the arrangement proposed was generally conceded to cover all practical needs for the present at least, although it was suggested by Mr. Judson that the time would come when it would not be found adequate.

On motion of Mr. Burlington the classification of Car Earnings as divided under Schedule A was adopted.

Under the heading Miscellaneous Earnings, Mr. Smith offered an amendment striking out the words "has been" and "is intended to be" so as to cover only real estate that "is being used for the operation of the property." He moved this amendment because he believed that real estate which never had and never would be used in the operation of a road, but was bought for purposes of acquiring right of way, etc., should not be included.

Other members cited instances in which real estate formerly used for horse barns, but now rented to other parties awaiting the earliest opportunity to sell it, and being of no service to the street railway company, were not in any sense used in the operation of the road.

After further discussion Mr. Smith's amendment was adopted.

Secretary Brockway announced that the place of the next meeting of the American Street Railway Association had been referred to the Executive Committee of that Association, with Chattanooga the only city from which an invitation had been received, which would have its bearing on the action of the Nominating Committee of this Association, in view of the rule that at least one incoming officer must be from the next place of meeting.

A recess was then taken until 2 o'clock, central time.

#### AFTERNOON SESSION.

President Mackay called the meeting to order at 2:30 p. m.

The consideration of the report of the Committee on Standard Form of Report for Electric Railways was resumed, and Schedule A, Miscellaneous Earnings, further discussed.

Mr. Tingley, on behalf of a member who could not be present, brought up the question of including sale of power, the point being the advisability of swelling the gross income from conditions brought about by consolidations, thereby making a false return in that respect and subjecting companies to taxation for income that really was not earnings.

Mr. Judson thought the first thing to be decided in connection with the report was whether it was correct as to principle, and then stick to it all the way through. As far as taxation was concerned, it did not make much difference where these items were put, such as sale of power, for instance. If the tax assessors made up their minds that they wanted to assess advertising, sale of power and so on, they would find those items and tax them, regardless of where they were put in the accounting.

Mr. Ham called attention to one very important principle embodied in the report, which, if departed from, would destroy the entire plan reported; the committee took the ground that gross income represented everything that came in, without deduction. That gross income consisted of two items, gross earnings and

miscellaneous income. If deductions were made from either one of these items, it put an absolutely incorrect interpretation upon the word "gross."

Mr. Longyear maintained that if all items were excluded from earnings except operating earnings, it would amount to making comparisons with other roads, and that comparison could not be made in any other way.

Mr. Duffy saw no reason why earnings per car-mile or per car-hour of the Chicago City Railway could not be compared with those of the Brooklyn Rapid Transit as per Schedule A, as reported, if Mr. Longyear would fill out the report.

After further discussion, the Miscellaneous Earnings portion of the report, under Schedule A, was adopted, as revised on the previous amendment.

The President asked for any further criticisms that might be offered to the balance of the Income Account.

After discussion, Mr. Ham moved the adoption of the Income Account in its entirety with the accompanying schedules, with the following changes: That under Miscellaneous income, "and terminal's" be omitted, so as to make the account read "Rent of leased lines"; and under Deductions from Income, the same change to be made; that under Rent of Land and Buildings, "Miscellaneous Earnings," it shall read, "This refers to real estate that is being used for the operation of the property;" under Advertising, that that instruction be omitted entirely. That embodied page 12 of the report in its entirety, with the accompanying schedules.

Report adopted.

The form of Comparative General Balance Sheet was considered and adopted.

Schedules D and E, covering construction, were adopted without discussion, as was also Schedule F, carrying Capital Stock and Funded Debt.

"Description of Road and Equipment," "Mileage Traffic, Miscellaneous Statistics," and "General Information," were adopted, after a brief discussion, which indicated that the conservatism of the committee in refraining from including too much statistical detail, was to be commended.

On motion of Mr. Duffy, the consideration of the paper of Mr. G. E. Tripp, of the Stone & Webster's companies, on "Chart of Street Railway Blanks," was passed, owing to the absence of Mr. Tripp, for reasons heretofore referred to.

The Nominating Committee then presented its report, which will be found on page 713.

On motion the rule was suspended and the secretary cast one ballot for the nominees reported.

In the absence of the president and first vice-president-elect, Second Vice-President-elect, Mr. Bartlett was conducted to the chair by Messrs. Wilson and Duffy.

Mr. Ham offered a resolution thanking the Committee on Store Room Accounting for the splendid work done by them and for the able and valuable report which they had submitted, and the motion was carried unanimously.

On motion of Mr. Wilson, seconded by Mr. Smith, one hundred dollars per year was allowed for the secretary and treasurer to pay the necessary expenses to which he is put for stenographic and clerical help, etc.

Mr. Smith moved that the Committee on Standard Form of Report for Electric Railways be continued, and allowed to agree to such corrections as the Railroad Commissioners may require.

After some discussion as to the advisability of delegating this authority to a committee, and on the other hand, the necessity of clothing the committee with such power as would be needed, in its further conference with the committee of the Railroad Commissioners, to arrive at practical results, Mr. Smith's motion was adopted, with one negative vote.

On motion adjourned.

Aside from the very excellent exhibit of trucks by the Peckham Manufacturing Co., three other of its standard products were shown in conjunction with the interurban car exhibit. The Kuhlman car was equipped with a high-speed Peckham No. 15, the Jewett car with a No. 26 truck, and the Boland car used for the General Electric trolley parties had 11-A Peckham trucks.

## A. S. R. A. PROCEEDINGS.

(Continued from Page 730.)

of handling this class of claims which come in in large quantities is to have an examination made of every one of them by a medical man.

There is one point in the paper which has been presented, which I think is of interest, and I think in view of the progress made by this Association that they should consider it and take a step in advance—that is to say, the execution of the general release by the injured party. I think it must be conceded that it is quite a ridiculous position to put to the ordinary class of man the general release which is the standard in the United States, containing the legal verbiage such as bills, specialties, and judgments of whatsoever demand and nature, etc. A great many lawyers learned in the profession would have some difficulty in explaining it. It seems to me we should formulate a release which would take care of all these propositions without the great use of verbiage which is used in the present document. I do not know all the decisions in the United States, but we have had in New York cases which went to our Court of Appeals and which were decided in some very early cases. In one case of Kuhn vs. Kanpp, the receipt read as follows: "Received forty dollars in full for damages done to us, for all demands, on the thirteenth June last." The Supreme Court held this to be a full release, and could not be attacked by the injured party, and the only claim on it was to recover the amount of compensation set forth in the receipt. In another case, I find the following language was used: "Received fifty dollars as a compromise for the full amount of my claim." The court said in that case the use of the word compromise was sufficient to make this appear as a settlement, and there could not be any demand made except to recover the fifty dollars. It seems to me that this Association might do well to draft some form of general release which might be used by all its members. I have no doubt there would be litigation, but I think in most of the states they have settled that some form of release would be upheld and be for the benefit of the corporations and greatly facilitate all claim agents in taking care of these matters.

At this point Mr. Beggs asked to be excused from the meeting so that he could meet an engagement in Milwaukee on Saturday. He expressed his gratification with the convention.

The next paper was on "Signals for Urban and Interurban Railways" by Mr. George W. Palmer, Jr. This is printed on page 730.

Mr. W. B. Potter, Providence: What provision is made in the signal system for the second or third car?

Mr. Palmer: I have no signal system. I am not here as the advocate of any signal system. I am simply here as an operative man.

Mr. Potter: I had reference to something I supposed you were using on the Old Colony System.

Mr. Palmer: I think, for any system to be reliable and safe, that it should be absolutely impossible to clear the car while there is another car on the block from one end to the other. We have also in use a system which is simply a circuit of incandescence lamps, part at one end, and part at the other end of the block, and which with us is more efficient as a lightning arrester than as a signal. I do not know that it should be considered a signal.

The President: Mr. Wason, whom I asked to say something on this subject, was unexpectedly called home last night. I then asked him if he would not before he left briefly give some of his views on this subject, and they largely agreed with those of the writer of the paper. Mr. Wason prepared a paper which I will read, as follows:

## DISCUSSION BY MR. WASON.

Any system of signals that will prevent accident is most desirable street railway work. This is one of the most serious problems the railway manager has to contend with. In trying any new scheme the question at once arises, if the signals fail to work, will the results be more dangerous than at present? I think that is the general feeling among railroad men. They are anxious to find a signal, but do not feel warranted in trying new inventions.

I do not believe any employe should be discharged on the first offense. He may be an old man in the service, and before you are able to educate a new man he has cost the company much money. I think men running urban and interurban cars should be well paid for their services. You cannot get something for nothing. Men with capacity to fill positions on fast running cars cannot be hired at the old horse car rates. A signal system, to be satisfactory, must work at all times and in all weathers, and with any number of cars running in either direction. As lightning frequently burns out lamps on the trolley any system depending upon the main line current must be unreliable.

On double track roads the end-on collision is eliminated, but rear-end collisions occur even under the best management. The red lantern ought always to be carried on the rear of the car. I think it is required by law in some cities. When a car follows the regular, a green lantern should be carried on the regular. Where an electric headlight is used the throwing of a portion of the rays in a perpendicular direction often shows the motormen the location of other cars. In this connection, it seems to me that too much attention cannot be given to the braking equipment of the car. This, of course, includes the sand-box and contents. Money spent in eliminating the curves of a road is well invested in more ways than one.

The President: Mr. Ira McCormack, now with the New York Central, promised to make some remarks on this question, he being familiar with signal systems. Mr. McCormack has been in attendance at the convention, but he also found it necessary to leave last night. He promised he would prepare a paper in connection with the subject. He has done so and left the paper with us; his paper is largely of a statistical nature, and he makes quotations from several authorities on this subject. The paper will be of considerable value in connection with the proceedings of the Association, and we will order the paper printed in the proceedings.

I want to call attention to one point of many in connection with this paper, and that is the recommendation with reference to the proper signal on the rear of cars. On three railroads, of which I was asked to investigate the physical and operating conditions of the property during the past two years, they were operating cars under steam railroad conditions that prevailed fifteen years ago, as to speed and everything that went with it. With reference to each of these systems I recommended that they put on proper signal systems—I am now speaking of electrical railroads—to compare with the steam railroads with reference to lights for extra cars, and particularly the rear lights. My recommendations were not regarded in any of the three instances, they being considered as the views of a steam railroad man rather than of a street railroad man, and each of the electric railroads in question have had accidents from rear-end collisions, of which the least cost was \$10,000, and now they are carrying the rear lights and also the other signals that go with them. There are many methods of signals that are open for inspection in various parts of the country; and I say, gentlemen, based upon twenty-five years of operating experience in steam and street railroads that there is no more important question to you (more important than track construction and car construction) than that of proper methods of car dispatching and protection of cars on these high speed interurban roads. As I said at the last convention, there is no collision in the transportation world that can compare with a collision between two electric cars in its dire results. I have had any number of collisions and wrecks to clear up with steam trains, but in all my steam railroad experience I have never seen as bad a collision as occurred between two electric cars. There are two enormous bodies of steel, baggage or express cars—interposed between the points of contact and your passengers on steam trains. In our electric railroad work generally the front ends of the cars are of the flimsiest construction and that is the point where the motorman rides, and on many roads the passengers are allowed to ride on the seat back of the motorman. In two or three collisions which occurred in New York State last year, and in other parts of the country, there were more people killed and injured than in any steam railroad wreck in the properties I have had to do with, simply for the reason that every one in the front seats were killed in

the collision, there being nothing between them and the contact of the two high speed cars. I would rather, if I were operating a railroad, have two steam trains come into collision at fifty miles an hour than two electric cars at twenty miles an hour. I am satisfied the results would not be so disastrous in the case of the steam cars. It is very important in the interests of interurban operation before you are compelled by state and municipal regulations to do these things, to take them up and constrist them and do them yourselves. The history of steam railroading is open to you. It is not the theory of anyone. It is a scientific development. It has developed from the staff system, up and onward. I operated as a conductor 25 years ago under the staff system, the system of signalling spoken of in the paper. The little points in connection with these things come back into a man's mind. When the staff system was spoken of it reminded me of something that occurred on the New Haven road where they used the staff system across one of the bridges, single track, and there was positive orders that no trains should proceed over the bridge unless the engineer had the staff in his possession. It was a brass staff. A train came across the bridge and the fireman handed the staff to an engineer on a train which was about to proceed over the bridge and the staff fell through the trestle and went into the river. The road was tied up until some method was discovered of getting across the bridge without the particular brass staff that had been used. Col. Heft will undoubtedly defend the New Haven road.

Mr. Heft: What you say is true. It only goes to show what a perfect system we have on the New Haven road.

Mr. Bean: Had someone experimented with that staff before he adopted it?

Mr. Dickinson: They came from Europe originally. I might say I have had considerable steam practice myself, and there seems to be a mistaken idea given out here that the steam roads have a perfect system of signals. They have not; neither have the street railroads. They all depend on the human agency, and that will fail sometimes. In the steam practice the desire and the effort have been to reduce the number of chances of misunderstanding by reducing the number of people who control the movement of trains. With us in Seattle we are doing the same thing. We originally installed our interurban service with a telephone system for signalling, and we are about to take the telephone out and put in the telegraph, because we find it impracticable to protect our train orders by telephone. Persons who have no right to answer the telephone will do so, and the dispatcher will send orders and they get mixed up. We are going to run under the Standard Rules governing train orders, both as to lights and signals; fuses, rear lights—all in accordance with the standard system of train despatching.

The next paper was, "Discipline of Employes by the Merit System," by W. A. Satterlee, which will be found on page 721.

Mr. Harrington, Camden, N. J.: The paper just presented by Mr. Satterlee is a valuable contribution and is a clear and concise statement, indicating the tendency of recent practice in disciplinary methods. The interest taken in the subject of discipline, the method, the rule of procedure and the relation the employer should bear to the employe has never been greater than at the present time. The individuality of the employer has as much to do with the results of any system of discipline if not more, than the system itself. A system is not the panacea. It is conceded by all that the old method of suspension for violation of rule is not fruitful of results. The reasons for this conclusion are too well known to be discussed here.

Certain facts have become patent as being essential to any system of discipline, to wit:

A. The keeping of a thorough history of each employe from the date of his employment, showing clearly all irregularities, violations of rules, relation to complaints, accidents, and secret service.

B. The employe to receive a hearing, to be treated with consideration, to be given opportunity to explain under proper conditions and surroundings his position, before discipline be accorded.

Any system in which the employe is disciplined conforming to

the above features will conduce to better feeling and be followed by generally better results.

Experience has dictated that in exercising discipline great care must be observed in not passing judgment until all facts have been thoroughly investigated.

Experience has furthermore demonstrated that the various misdeeds, violations of order, breaches of discipline of the employe, in some way or another, are brought to the attention of the employer. Whereas, the commendable acts, the little refinements of courtesy, tact, observance of duty and rules, that may be the practice of the employe are seldom known of and are really and legitimately expected.

Threats are not conducive to good discipline, to good results. What good can possibly come from balancing bad against good? When bad is from the very nature of things bound to crop out and be known, while good is less apparent, less known and never as strenuously obtruded upon us. Wherein does the good, conscientious, able, trustworthy employe profit from a system of merits and demerits? It does not seem that the merit and demerit system reaches the core. I have in mind men who would not care in the slightest whether they had ten or one hundred demerits, or merits, they will run the chances of detection in just the same fashion certain conductors will run the chances of detection in the matter of irregularities in fare registration; however, let these same men actually lose something, though it be but a little, in their standing in the grade, class or seniority—it need not, and in fact better not, be an action that would eventually hold out the threat of discharge—what is the result? The punishment is immediate, the penalty is made at once, the evildoer suffers, and what is more advantageous, the worthy, painstaking employe receives immediately what he is entitled to, recognition and advancement.

I have tried the suspension system, the merit and demerit system, and abandoned them both after careful and persistent trial and effort. The demotion system was first put into effect upon our railway just about two and a half years ago and has been gradually developed into a thoroughly operative, practical system and conducive to the best results. Under this system an employe for any irregularity is notified that he will be demoted one or more points on the seniority list if proper explanation be not made on or before a specified date. This notice with an account of the irregularity is posted on the bulletin boards at the meeting places of the men. This usually results in the men whose names are posted arranging to meet the general manager, affording an excellent opportunity to exercise judgment in enforcing discipline. The wholesome effects are most noticeable, and efficient and reliable employes under this system forge gradually and surely ahead, obtaining the best and most profitable runs at the disposal of the company, and in such men the general stability of the working force is maintained against any possible disaffection upon the part of the men suffering from demotion. It can be seen that this system, while not directly taking cognizance of the efficient employe, in fact does take the most pronounced action in his behalf.

The President: The secretary will issue a request to members, asking for suggestions as to topics for papers, and we hope the members will give the subject careful consideration, and that when they suggest subjects they will also indicate a proper person to write on the subject.

Mr. John G. Holmes, of Pittsburg, one of the past presidents of the Association, to whom I extended an invitation to be present at this meeting, sends a letter in which he regrets his inability to be present on account of business engagements, recalls his many pleasant acquaintances among the members and wishes to be remembered to them.

Secretary Pennington: I desire to thank personally the writers of all the papers for their promptness in forwarding copies of their papers so that they might be printed in ample time before this meeting. This helps the work of the secretary very greatly. I received all of the papers about five weeks before the date of this meeting and had them in the hands of the members fully two weeks before the convention.

The Committee on Resolutions then reported a resolution thanking President Hutchins, Mr. Fry, chairman of the Exhibit Committee, and their associates; the local committee, the supply-men, the press and others contributing to the success of the convention.

This report was unanimously adopted.

The committee on nominations and the next place of meeting reported the nominations, and that it would recommend that the choice of the next meeting place be referred to the incoming executive committee with full power to act.

Mr. J. W. McFarland, superintendent of the Chattanooga Electric Railway Company, Chattanooga, Tenn., appeared before the committee and extended an invitation on behalf of his company and the city, but owing to the limited information in possession of your committee, it did not feel warranted in recommending Chattanooga.

On motion the secretary cast the ballot of the Association for the officers named by the nominating committee. (The officers chosen are given on page 713.)

Adjourned until the banquet.

#### BRILL EXHIBIT.

The J. G. Brill exhibit this year comprised the following:

A Brill semi-convertible car, shown in the street exhibit. This car has been fully described in previous issues of the "Review" and continued to attract the attention and approval of street railway managers.

The interior exhibit was in the annex and comprised in addition to a full line of trucks, three sections of the Narragansett semi-convertible and convertible cars.

The truck exhibit consisted of the following: A Brill No. 27 truck for fast city and suburban service; a Brill No. 22 Eureka maximum traction truck which is the standard on the Metropolitan Street Ry. of New York and the Brooklyn Rapid Transit Co. of Brooklyn, N. Y.; and a Brill No. 21E truck. All of these trucks have solid forged sides and in addition an exhibit board was shown on which were mounted four samples of Brill solid forged truck frames.

In addition the company showed its "Brill-lant" sign which was described in the "Daily Review" for Wednesday.

The exhibit also included a line of track scrapers, Dedenda gongs, the Brill brake handle, and Adams's patented broom, round corner end seat panels, safety gates and other of the Brill appliances for electric railways. The company had a large staff on the grounds, including Samuel Curwen, W. J. Heulings, Jr., Dwight Dean, George Haskell, and J. Elwood Brill.

#### AUTOMATIC FEED WATER CONTROLLER.

The Strong, Carlisle & Hammond Co., of Cleveland, through its Boston representative, Mr. F. H. Lovejoy, showed to excellent advantage its specialties, the Squires automatic feed water controller and the Squires pump governor. In no uncertain way Mr Lovejoy proved to many inquirers that the automatic feed water controller is a good thing and the company's offer to transport and install its device for a free trial, and to pay the freight back if not satisfactory, was most convincing. Both appliances are the invention of Mr. C. E. Squires, of Cleveland. Messrs. Sales & Broad, of 86 Jefferson avenue, Detroit, are the company's sales agents in that section.

The great value of the controller lies in the fact that the main feed valve is handled by direct boiler pressure, making it positive in all its operations and allowing it to be opened to the full extent, thus making it unnecessary to carry an excess pressure of more than 10 or 15 lb. for feeding. This is made possible by the introduction of an auxiliary valve, for the successful operation of which a movement of not over 1/64 in. is required, this motion being automatically produced by the expansion and contraction of copper tubes composing the harp which is part of the invention. The operation of the Squires controller is very simple. There are but few working parts and these are so arranged as to be subjected to but little wear. It is the only controller that works without floats. It works on marine engines and there are 60 in use on the lakes. There are 400 controllers out already and among those recently installed is one at the Brooklyn Heights Railroad plant, of which Mr James Anderson is chief engineer. Other installations have been: Hotel Manhattan and St. James Building, New York; Walworth Manufacturing Co., Boston, Parker & Taft, Providence; Salul & Wyckoff, Springfield, Mass.; Foskett & Bishop, New Haven; Curman

& Thompson, Lewiston, Me.; Rutter & Co., and J. H. Horn & Sons, Lawrence, Mass.; H. R. Barker, Lowell, Mass.

The Squires pump governor is for use on steam pumps for feeding boilers of every description.

#### STANLEY ELECTRIC MANUFACTURING CO.

The Stanley Electric Mfg. Co., of Pittsfield, Mass., had at the convention an extensive exhibit of its standard apparatus for a rotary converter sub-station. This consists of one 300-kw. rotary converter and switchboard. The switchboard has three panels as follows: One A. C. panel equipped with a 450-volt voltmeter, a 600-ampere ammeter, and one phase indicator. At the top of the board above the instruments are mounted the synchronizing lamps and below the instruments is the voltmeter plug switch for connecting the voltmeter on any one of the three lines. Below this is mounted a three-pole single-throw 500 ampere main alternating current switch. Upon the sub-base of this panel is mounted the handle which operates the high tension oil switch and circuit breaker standing back of the board.

The second panel is a D. C. panel. At the top is mounted a circuit breaker and directly below it a 750-ampere ammeter and field rheostat. Below the rheostat are mounted four switches: One field transfer switch for connecting the fields of the rotary directly to its own brushes for self-exciting or to the trolley circuit for separately exciting at the starting up; one main single-pole single-throw positive switch; one starting switch connected to an iron grid rheostat back of the board; one double-pole single-throw field switch equipped with resistance for taking the field discharge upon opening.

The third panel is a double feeder panel for the 500-volt circuit. This panel is equipped with two circuit breakers, two ammeters and two single-pole double-throw switches. The direct current voltmeter for this board is mounted upon a swinging bracket at one side of the board. The instruments and switches upon the board are positive and the negative lead is brought from the rotary to the negative switch mounted upon a separate pedestal.

Back of the board stands a Stanley 15,000-volt three-pole single-throw combined oil switch and circuit breaker. This circuit breaker is attached to the board and is operated by a handle projecting through the sub-panel of the A. C. panel, as above described.

The company was represented by Dr. F. A. C. Perrine, D. B. Rushmore, S. T. Dodd and H. R. Wilson, of Pittsfield, Mass.; R. D. Lillibridge and B. K. Hough, of New York; C. VanDeVenter, L. M. Harvey, W. V. Bergenthal and Ward S. Arnold, of Chicago; J. E. Lockwood and M. W. Thomas, of Detroit.

#### TIES FOR TROLLEY ROADS.

The Eccleston Lumber Co., 29 Broadway, New York, has been rushed with orders all along, especially for ties, which it makes a specialty of furnishing to trolley and steam roads. All kinds and sizes of ties can be shipped promptly, the company being especially well equipped to handle business of this nature. It also does a large pole and cross arm business, furnishing poles of long leaf yellow pine, octagonal or square, Juniper or Southern white cedar, chestnut and cypress. President J. B. Eccleston states that it has been an unusually prosperous season and the outlook for 1903 is better than ever.

#### AMERICAN RAILWAY SUPPLY CO.

One of the most attractive exhibits was that of the American Railway Supply Co., of New York, under the direction of General Manager Walter Chur. In a large oak frame surrounded by another of ornamental brass were shown on a red plush background the various cap and coat badges for which this company is so favorably known. Manager Chur said that he was very well satisfied with the convention, having received many requests for samples and prices, and promises of business. In fact, it was the best convention he ever attended. For a souvenir Mr. Chur provided a hat pin to please the ladies. The head of the pin was marked, "A. S. R. A., Detroit, 1902."

## STANDARD TRACTION BRAKE CO.

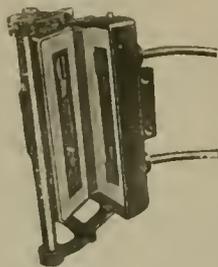

The Standard Traction Brake Co.'s display, which was in the Westinghouse section, consisted of 32 exhibits, as follows: Westinghouse magnetic brake installed on a Brill pivotal truck No. 27 F; Westinghouse magnetic brake on St. Louis Car Co.'s M C B type No. 23-A; standard independent brake controller interlocked with a K H controller; electric heater used in connection with the magnetic brake and as applied beneath longitudinal seats; electric heater as applied in connection with the Hale & Kilbourne Manufacturing Co.'s No. 80 two-quarter cross seat; 8-in. diameter brake cylinder with automatic slack adjuster attached; O V F operating or engineer's valve; O V T valve sectioned to show movement of parts of engineer's valve; O V G operating or engineer's valve; whistles used in electric railway service; hose couplings and fittings used with standard system of air brakes for electric railways; electric heater as applied to Heywood Bros. & Wakelind's cross seat No. 42; heater switch No. 10, used in connection with "Standard" Form D controllers to regulate the temperature in the car; heater switch No. 7, used in connection with the combined running and brake controllers; improved incostat, or diverter; demonstration of the path of the magnetic flux through the track magnet and the rail; designs of magnetic brake as applied to trucks; A C N duplex-gear axle-driven compressor; A C C duplex-gear axle-driven compressor; D R E regulator for compressors; preliminary and main reservoirs with duplex check valve interposed; C V F duplicate check valve, sectioned; D-1 motor-driven air compressor; D-2 motor-driven air compressor; D-3 motor-driven air compressor; E-1 motor-driven air compressor with two vertical cylinders; electric pump governor, Form C; electric pump governor, Form D; motorman's brake valve with slide-valve feed valve; No. 1 pressure reducing valve; reservoir with all welded joints.

The company's representatives at the convention were: J. R. Elliott, C. R. Elliott, New York; G. A. Hager, C. C. Farmer, Chicago; P. J. Myler, Hamilton, Ont.; A. D. Brown, Buffalo; S. D. Hutchins, Columbus, O.; W. Cummins, Cincinnati; I. B. Clarke, E. H. Dewson, F. C. Newell, Pittsburg; F. V. Green, A. J. Brislin, New York.

## IRON FUSE BLOCKS FOR STREET CARS.

One of the minor exhibits of the Westinghouse Electric & Manufacturing Co. was an iron fuse block for cars, which is shown in the accompanying illustration. This fuse block is completely enclosed by an iron casing, except where the vent extends through the bottom. It is easily accessible for renewing the fuse and when open the contacts on which the fuse is sup-

ported are cut out of circuit, thus making it perfectly safe to renew the fuse while the line is alive. A straight piece of copper wire is used for a fuse, and it is secured in place and clamped in the contacts by the act of closing the block. Hence, in renewing, it is only necessary to open the block, drop a piece of straight copper wire in place, and again close the block; this is a very desirable feature in cold or stormy weather.

The Crocker-Wheeler Co. was represented at the convention by the following members of the company's selling force: Patnam A. Bates, assistant secretary, and Charles W. Staatsmaa, Ampere N. J., Francis B. De Gress, manager New York office; Julian Roe and Bert Forde, Chicago; William H. Wissing, St. Louis; W. F. Sullivan, Cleveland; W. J. Hartwig, Detroit agent.

## NEW HAVEN CAR REGISTER CO.

The exhibit of the New Haven Car Register Co. was very complete and included some noticeable features. There was a new controller device calculated to keep the motorman from turning on current more than one notch at a time, although the device can be worked rapidly. A great many visitors, especially motormen, evinced much interest in this appliance, which is entirely new and simple. It has one endless flat spring inside, the lug of which works on the principle of a door latch.

The new Boston model register was also a feature. This machine works on similar lines to others, the difference lying in a device that makes it impossible, even if the glass is broken, to change the figures on the main train or totalizer. Attention was called to the fact that this is the only company that makes a triple register that records three styles of fares and is operated in the regular way.

Another specialty of the display was a new trolley wheel that requires no oil and has no bushing. The barrel is made by the same method as graphite lubricant. It is machine rifled and all made solid. The groove is wide, being easy on overhead construction. The company exhibited letters to show that the wheel gives eminent satisfaction. In addition to the articles enumerated the exhibit included the company's standard registers, cord fixtures, punchers, insulated tape and varnish and other products. A unique souvenir was distributed, consisting of pocket mirror and pin cushion. The looking glass is concave, so that the entire face is reflected. The representatives of the company present were: Willis Anthony, president; F. Coleman, vice-president and general manager; John S. Bradley, secretary and treasurer; J. M. Hayes, M. de F. Yates and Harry Beach.

## THE ADAMS &amp; WESTLAKE CO.

The principal features of the Adams & Westlake Co. exhibit were the Mosher arc headlight, the contra-twist door fixture and the Kling & Adlake brake handle. There were also samples of marker lamps, switch lamps and lanterns. An excellent feature of the Adams & Westlake lamps is that they are non-sweating, which in cold weather prevents the gathering of moisture and ice on the inside of the lenses, thus giving an efficient signal. Another point brought out by the company's representatives is that the A. & W. lights are standard on some of the largest street railway and railroad lines in the world. Mr. A. S. Anderson, of Chicago, and Mr. James Foster, of Philadelphia, presided over the Adams & Westlake booth, which was easily seen on account of the powerful rays of a Mosher arc headlight which was in operation constantly.

## THE NEAL DUPLEX BRAKE.

The United States Steel Co. exhibited the well-known Neal duplex brake, large shipments of which have recently been ordered from Indianapolis, St. Louis and Jersey City. Successful trial equipments have been sent to Cleveland, O., also. The company sends the brakes subject to a satisfactory trial.

## AN INTERESTING POLE EXHIBIT.

The Standard Pole & Tie Co.'s exhibit was one of the most interesting in the hall. It was in charge of Vice-President E. G. Chamberlin, aided by Secretary and Treasurer Fred L. Merritt. This company makes a specialty of octagonal and square poles and when its new plant at Brooksville, Fla., is completed it will make a specialty of cross arms. It has sold upwards of 10,000 southern white cedar poles in the middle west during the past 12 months. A large section of one of these poles was exhibited this week, as were several explanatory photographs of the company's pole yard at Wilmington, Ala. It was also explained that the Standard company furnished the corner posts, of Florida heart pine, in the car used in the Providence Car Pender Co.'s exhibit adjoining that of the pole company. Mr. Chamberlin goes from Detroit to superintend the completion of the Brooksville plant.

MANUFACTURE AND SALE CONTROLLED BY

**GEORGE FULLER, 1300 OLD COLONY BUILDING, CHICAGO.**

Republic Railway Appliance Co. Lincoln Trust Bldg., St. Louis, Mo.

**OHIO BRASS CO.'S SPECIALTIES.**

The Ohio Brass Co. had a large and tastefully arranged exhibit that was a mecca for inquirers throughout the convention. The display of all-wire rail bonds was exceedingly interesting. In this type of bond the terminal is made from the wire, forming a continuous conductor and eliminating contacts that usually prevail in cast terminal bonds. The sales of these bonds are reported to have been exceedingly large.

A very neat display was afforded by the railing made of 80-lb. rails, bonded with all-wire bonds and set upon various forms of the Ohio Brass Co.'s third rail insulators. A full line of overhead material was also attractively laid out.

The representatives of the company in attendance were the following: C. K. King, secretary; George A. Hanwood, general agent; H. C. Schwable, of the general office; N. M. Garland, New York; Hurl Gellatly, Pittsburg; Otto W. Uthoff, St. Louis; A. L. Wilkinson, Mansfield, O.; George A. Meade, chief engineer, and Porter & Berg, the Chicago agents. A cigar holder and ash receiver of nickelled brass was the 1902 souvenir.

**H. W. JOHNS-MANVILLE CO.**

The H. W. Johns-Manville Co. had a diversified display of electrical supplies, including the "Noark" fuses, "Johns" electric car heaters, Philadelphia break, metal crossings, giant strain insulator, toggle-clamp feed wire insulator, Philadelphia Insulated crossing, "H. W. J." arc lamp hangers, Vuleabeston insulating sheets, sleeves, hangers and other specialties. There were many inquiries at the Johns-Manville booth and many requests for catalogs and price lists.

The F. Bissell Co., agents for the Nernst lamps, presented callers a useful souvenir in the shape of a steel key ring with an ivory tag.

Merritt & Co., of Philadelphia, displayed a set of metal lockers in the annex. Expanded metal is the material used, cut into diamond shaped meshes. There are no joints or connections and the locker is very neat and attractive. The General Electric Co. has these lockers in its Schenectady plant. They insure ventilation and are fire proof.

The R. D. Nuttall Co. is giving to master mechanics, engineers, and other callers a useful little technical book on gearing. It is a very practical souvenir.

Westinghouse, Church, Kerr & Co. were represented at the convention by E. H. Smith and C. M. Vall of New York; H. H. Kerr Chicago; W. Franklin Detroit; S. A. Jenkins, Boston; H. J. Raynor Detroit.

**MILLER'S SANDING MACHINE.**

A new sanding machine, shown by D. N. Miller, of Detroit, is equipped with forced-feed handles, which permits using green sand without its having to be kiln dried. This sander is in use in Hamilton, Ont., and Mr. Miller stated that he would place it on any road in America for trial. He intends to put it on the market at a price that will ensure its general use.

Mr. B. B. Jenkins, of Toronto, Ont., was at the convention showing the "Jenkins improved car sander."

In the annex was shown the Norwood ball bearing base, both center and side bearings, controlled by the Ball Bearing Co., of Baltimore, Md.

The United States Steel Co. gave out two neat souvenirs, an aluminum covered memorandum book and an aluminum business card, upon the back of which is the yearly calendar.

The Standard Pole & Tie Co.'s souvenir was an octagonal pen holder shaped like one of the octagonal poles the company makes.

Mr. Herbert W. Smith, assistant manager of the railway department of the Stuart-Howland Co., Boston, was on hand at his company's space.

The Pittsburg transfer ticket machine, manufactured by the Pittsburg Blue Print Paper & Manufacturing Co., and which was illustrated and treated in yesterday's daily, was exhibited by S. B. Whitney, secretary and general manager, aided by Robert Gibson.

General Manager J. S. Speer of the Speer Carbon Co., states that the convention has certainly been good to him. The outlook for business, as a result of the convention, is enhanced and altogether he considers the convention a great success.

Mr. H. De Steese, representing Stuart-Howland Co., Boston, showed samples of railway and lighting supplies in room 320, Hotel Cadillac. Mr. Herbert W. Smith, assistant manager of the railway department of the same house, was also in attendance.

Mr. P. A. Poppenhusen, president of the Green Engineering Co., of Chicago, was on hand to tell about the economies effected by the use of Green traveling link gratings.

Of the Duff Manufacturing Co.'s officers, Treasurer T. A. McGinly and Superintendent George F. Freed were much in evidence during the convention.

## LIVERPOOL'S NEW ELECTRIC CAR.

At the last meeting of the Tramways Committee of the Liverpool Corporation, the proceedings of the Finance and Sub-Committee, which included a report by the city tramways general manager (Mr. C. R. Bellamy) as to a new covered car which he had designed, were adopted.

The report stated that the experience of the committee, after trying the American and German types of cars, was that outside seats were very popular. But it was recognized that outside passengers had certain grievances arising from discomfort in bad weather, wet seats and exposure. There were other people, more especially ladies, who were more or less nervous in regard to the trolley standard. A further question which the committee had constantly before them was the overcrowding, both inside and outside. All these things had occupied the closest attention of the general manager, and, with the assistance of his staff, Mr. Bellamy had now produced a car with the upper deck cleverly covered in. The roof of this cover was 6 feet 2 inches from the deck, and was constructed of a light frame of steel, with movable sides and tops of waterproof canvas. The contrivance was in sections, which could be moved at will in the space of a few minutes. The covering was set back fore and aft sufficiently to avoid the current of air which came up from the staircase, and an additional advantage was that the trolley standard was removed. On the new car seating accommodation was provided for 42 persons outside and 31 inside. Therefore, by limiting the overcrowding inside to its present extent of nine passengers, they would be enabled to carry 73 passengers on a car. This meant that overcrowding would be very greatly restricted, and that in time they would abolish completely anything approaching overcrowding. It was proposed to apply this covering to 30 cars now coming from the makers, and to twelve which were being built in their own works. The upper deck would be thoroughly well lighted by three lights in addition to the end ones.

## NEW YORK OFFICE OF CHRISTENSEN ENGINEERING CO.

By reason of the increasing demands of its business the eastern offices of the Christensen Engineering Co., at 135 Broadway, have been enlarged by the acquiring of several additional adjoining rooms which will be used for general office and exhibition purposes. The new suite has been elegantly furnished and the company's many friends are cordially invited to visit the company in its enlarged quarters. Out-of-town visitors to New York are particularly invited to partake of the comforts furnished and to make the place their headquarters while in town.

Mr. F. N. Root, manager of the Root Track Scraper Co., of Kalamazoo, Mich., emphasizes the fact that the Root scraper is the only one that fastens to the truck on a double truck car, making the liability of the scraper leaving the track on curves out of the question.

## ONE MORE OF THE SAME KIND.

The following is still another sample of the kind of clippings the Consolidated Car Fender Co., of New York City, receives every day from some one of the 200 cities in which the Providence fender is used exclusively:

"Yetta Levine, 3 years old, of 54 Montgomery street, was crossing the street in front of her home Saturday afternoon when she was run down by Court House car No. 259. The motorman could not stop the car, but the child was not hurt. She fell in the fender. Her father took her home."—From Jersey City (N. J.) Journal, June 16, 1902

## THE HART TIE PLATE.

Spencer, Otis & Co., of Chicago, sales agents for the Hart tie plate described in Thursday's "Daily Review," report a great deal of interest manifested in the device by street railway men, particularly track engineers. The manufacture and sale of this plate are controlled by George Fuller, Old Colony building, Chicago. The Republic Railway Appliance Co. is St. Louis agent.

Mr. H. K. Doolittle, of Watertown, N. Y., was kept busy explaining a model of his new window, so constructed that either sash can be removed without disturbing a stop or a screw. Mr. Doolittle is an expert mechanic, and his townspeople endorse him very highly.

Mr. Henry A. Dorner, of Logansport, Ind., was on hand to explain the merits of the Dorner truck that stood on Larned street, near the entrance to the hall.

President E. Lockwood, of the Michigan Electric Co., dropped into the convention frequently. He said it struck him that it could hardly be improved upon.

The General Electric Company's representatives were, among others, J. R. Lovejoy, J. J. Mahoney, C. C. Pierce, J. B. Pevear, B. E. Surroy, G. D. Rosenthal, J. H. Livsey, J. C. Callsch, T. P. Bailey, F. H. Gale, R. H. Beach and E. H. Mullin.

The Northern Electrical Manufacturing Co. interests in the convention were represented by Manager L. M. Harvey, of Chicago, who also looked after the Stanley Electric Co. exhibit.

President W. R. Garton, of the W. R. Garton Co., electrical supplies, of Chicago, was here there and everywhere during the convention making his presence known and keeping his eye open for business.

The Wheeler Walkover car seat exhibited by the Heywood Bros. & Wakefield Co. is standard on the Pennsylvania railroad. Orders have been received from that road for nearly 6,000 seats so far this year. Visitors to the exhibit evidenced much interest in this seat.

**CORRESPONDENCE.**

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

**DOES THE MANAGER WANT ANYTHING?**

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. XII. OCTOBER 20, 1902. NO. 10

This year for the fourth time the "Street Railway Review" published a "Daily Edition" on the occasion of the annual meetings of the American Street Railway Association and the Street Railway Accountants' Association, the "Daily" being published in Detroit and appearing on the mornings of Oct. 8, 9, 10 and 11, 1902. These four numbers of the "Daily Street Railway Review" aggregated 132 reading pages and included full accounts of the proceedings of the two associations with the exception of two committee reports, one of which is given in this issue; publication of the other report, that of the Committee on Standards, will have to be further delayed by reason of the drawings to accompany it not being ready.

The "Daily Review" is a separate publication, but is in its nature supplementary to the monthly "Street Railway Review," and for convenient reference should be bound with the latter, and for this reason the folio numbers of the "Daily" were made consecutive with those of the regular "Review." All four copies of the "Daily" should be filed with the monthly in order to have the 1902 "Reviews" complete.

It is extremely gratifying to us to know that our enterprise in publishing the first complete convention reports and placing them in the hands of our readers promptly, is more highly appreciated each succeeding year. This undertaking has grown rapidly and we trust that some statistics for the "Daily" will not be found uninteresting:

Year.	City.	Issue.	Pages Reading Matter.	Total Pages.
1899	Chicago	5	102	212
1900	Kansas City	4	88	188
1901	New York	4	125	252
1902	Detroit	4	132	300

It will be noted that the four Detroit "Dailies" contained practically twice the number of pages of reading matter that are to be found in two of the monthly issues of the "Review."

We congratulate both the A. S. R. A. and the Accountants on re-electing their secretaries for the ensuing year. The success of an association of the character of these is to a very great extent de-

pendent upon its active executive officer, who is of course the secretary, and no policy is more certain to bring good results than that of continuing an efficient secretary in office.

In his presidential address at the opening session of the Detroit convention Mr. Vreeland laid stress on the opportunities of the A. S. R. A. to enlarge its scope, and one of the points to which he directed attention was that discussed editorially in the "Review" for Sept. 20, 1902. He pointed out the rapid increase both in number and in magnitude of the electric railways which are not organized as "street railways" and do not have their tracks laid in streets, and are, perhaps, not eligible to membership in the association under a strict construction of Article III of the Constitution, but which look to the American Street Railway Association as the exponent of their interests, and expressed the belief that even were a change of the name of this association considered inadvisable it was desirable to welcome the participation of all companies engaged in electric railway transportation. Attention was also directed to the fact that the present development of interurban railways had brought with it certain questions that affect street railways proper, for instance, the interchange of freight, the handling of express and parcels by city lines, and the joint use of urban tracks for terminal purposes.

An important event at the Detroit convention was the meeting of master mechanics and chief engineers, at which steps were taken to organize a new association of electric railway men—one that shall comprise the heads of departments in charge of the motive power and rolling stock. One of the effects of consolidations of railway companies has been to impress on the managers of the merged companies the disadvantages of having to operate and repair diversified equipments, which included "one of every kind," and it is doubtless due to this fact that for the last two years committees of the A. S. R. A. have been appointed to report on standards for rolling stock. Neither of the reports on this subject recently submitted (1901 and 1902) were discussed before the convention, which must be taken as indicating that the A. S. R. A. had not the time to properly consider them. The adoption of rolling stock standards can only result after a full consideration of a multitude of details with which the master mechanic is entirely familiar, and therefore is a matter peculiarly the province of such an association as the new one is designed to be. Similarly the question of reciprocating engines versus turbines, which is undoubtedly a live one now, is not one that many railway managers would care to decide until after thoroughly canvassing it with the head of their motive power departments.

The A. S. R. A. has always been a progressive body and its position today is due to the liberal spirit in which it has met the changes resulting from the rapid development of the field it now covers. We may therefore expect the association, both as a body and through the managers of its member companies, to give cordial support to the new association.

"The Mechanical and Electrical Association of Electric Railways" will meet at Cleveland Jan. 12, 1903, for the purpose of effecting a permanent organization. We predict success for it and assure the committee that it shall always have the heartiest cooperation of the "Review."

The Detroit convention of the American Street Railway Association was in many respects the most successful one that has ever been held, particularly in the character of the papers presented, in the increased attendance at the business meetings, and in the large number both of delegates and manufacturers at the convention. At Detroit many of the almost innumerable expressions of satisfaction that were heard concluded with, "It is the largest convention the association ever held, excepting last year at New York." In view of the fact that this opinion is doubtless the one generally held, a comparison of the registrations for the New York and Detroit conventions will be interesting and perhaps surprising.

\* \* \*

At New York in 1901 the total number of persons registering was 1,414; of these 478 were delegates of members, 39 were registered as accountants, 86 were ladies and 755 were classed as miscellaneous, including in this term the representatives of non-member street railway companies, of manufacturers and of the press. At Detroit, in 1902, the total registration was 1,779, or some 360 more

tion in New York, of those 193 were delegates, 48 were accountants, 325 were books, and 1013 were classified as miscellaneous, excluding books the only variation at Detroit was, in round numbers, 1,450 as against 1,250 for the year before.

As regards the exhibit at the official list for the New York convention shows that 132 companies and firms were assigned space in Madison Square Garden while at Detroit the total number was 166. Every thing in connection with the exhibits was this year handled in most excellent shape and the display itself was certainly one of the most elaborate ever given under the auspices of the Association, and despite the limited space available, which prevented many of the firms making more extended exhibits, we are inclined to think that this feature of the convention was second to none. For the admirable manner in which the details were handled the thanks of all concerned are due to the chairman of the exhibit committee, Mr. Fry, and those who were his principal assistants, Messrs. Burdick, Kerwin, Fastman, Parker, Russel and Lynch.

\* \* \*

The only cloud over the convention was the illness of President Hutchings, of the Detroit United Railway, which prevented him from taking an active part in the meetings; with characteristic fortitude, however, Mr. Hutchings made a point of being present at the business sessions for at least a short time each day, and on Friday night was able to be at the banquet and deliver an address on the occasion of his installation as president of the association.

The incoming executive committee of the A. S. R. A. is charged with more important duties than have fallen to many of its predecessors. Two points of policy that must receive consideration relate to the future scope of the organization, and to the future meeting places for conventions. It was realized at Detroit, as never before, that the association makes extraordinary demands on the convention city for exhibit space and hotel accommodations, and the fact that the committee on nominations was unable to decide upon a meeting place for 1903 indicates that the entertainment of the association imposes burdens that the street railway companies of few cities care to assume. A change that has been suggested is to hold the annual convention always in the same place, or perhaps alternate between such large cities as New York, Chicago, St. Louis and Philadelphia, where exhibit halls of the requisite size are to be found, together with sufficient hotel accommodations. Such an arrangement would probably result in greatly changing the present plan for entertaining delegates, and might seriously affect the interest which delegates now take in the annual meetings because of the opportunity afforded to investigate an important railway system.

Some prominent members of the retiring executive committee are in favor of entirely changing the scope of the A. S. R. A., and making it an association for operating railway men; on the other hand it is urged that the time has not yet come for such a complete differentiation. The tendency, however, we believe to be in the direction of relinquishing portions of the older association's field to a number of other bodies which will be able to specialize to an extent now impracticable with the A. S. R. A. How well this plan has worked with regard to accounting we all know. Accounting was not entirely overlooked by the A. S. R. A., and in 1884 and in 1894 the question of a standard system of street railway accounting was reported upon, yet it is very probable that the A. S. R. A. would never have developed the "standards" that have been so well worked out by the Accountants' Association. The latter body has devoted the same amount of time to the comparatively limited subject of accounting that the parent association gave to the entire field of electric railways, and naturally the accountants covered the ground more thoroughly. If the American Street Railway Association keeps abreast of the industry it represents it will have to decide between assigning the subjects involving consideration of details and extended debate to special committees to which is delegated power to act, or to allied associations with comparatively restricted fields. The new association of shop and motive power men will give another opportunity to test the results of the latter policy.

It appears certain that in the near future the alternating current will play an important part in long distance and heavy railroading and our readers will be interested in the paper of Mr. Lamme, read before the last meeting of the American Institute of Electrical Engineers and printed in this issue, in which he describes a new

efficiency which is to be made to adapt single phase alternating current to this class of work. We are glad to welcome an advance in this important field of electric railroad work and there can be but little doubt as to its successful outcome in view of the competent hands in which the project rests, but we regret that Mr. Lamme's paper is incomplete in that it avoids all allusions to the details of the proposed equipment. It may be said that the general arrangement of the apparatus to be used is by no means new, as several attempts along the same lines have been made in years past.

The motor which Mr. Lamme proposes to use is simply a direct-current series motor adapted to alternating current by laminating the fields. This plan has been repeatedly tried as far back as ten years ago and the objection to such a motor, which has been found almost insuperable, is the vicious inductive sparking at the brushes, and this has heretofore proved such a difficulty as to entirely prohibit its use. As no special means were described for eliminating this sparking it may be assumed that this has been accomplished by the improvement in the design of the motor, and if such is the case it certainly reflects credit upon the designer. The paper, in fact, gives no indication that any new features are to be introduced. The method of control is by means of the so-called induction regulator, by which the pressure is varied according to the load and this method, as claimed by the author, avoids the troubles inherent to the direct-current controller. While this is true from a mechanical standpoint, it is hardly to be expected that this method of control will equal in efficiency the series-parallel method employed in direct-current railway equipments, especially in starting a car, when the work done is small. The series-parallel method of control and the very high initial torque of the direct-current series motor are its most important features and are the ones which have placed it in its pre-eminent position in the railway field today; the new system, however, being designed especially for long distance, high speed and heavy work, where stops are infrequent, can afford to sacrifice efficiency at starting in view of the great advantage it possesses in being able to utilize very high voltage distribution. The latter qualification being essential to long distance railroad work, any minor deficiencies will be readily condoned in a practical alternating-current system of an efficiency approximating the system in general use.

The development of alternating-current railway systems is now apparently at hand, as within the last two years the problem has been attacked both here and abroad by engineers of the highest standing. The Valtellina polyphase alternating-current railway in Italy has recently been opened to the public; the single-phase system invented by Mr. B. J. Arnold and described by him at the Great Barrington meeting of the A. I. E. E. in June last, is being installed on the Lansing, St. John & St. Louis Ry. in Michigan, which is nearly completed, and the system of Mr. H. Ward Leonard is being exploited by the Derlikon works.

Doubtless the great majority of street railway men do not fully realize what has been accomplished by the Street Railway Accountants' Association during the 5½ years since it was organized. One of the first committees appointed was on a "Standard System of Street Railway Accounting" covering the classification of construction, equipment and operating expense accounts and the forms of monthly and annual reports. The "Standard Classification" formulated by this committee has stood the test of actual practice for several years without the need of substantial amendment. Moreover, this has received the approval of the National Convention of Railroad Commissioners, and the form has been adopted by the railroad commissioners of New York and Connecticut.

In 1899 the subject of a standard unit for comparison was discussed and from this resulted, after a practical trial, the adoption of the "motor car-hour," a unit which has proved to be most convenient and useful.

For several years the association has had a standing committee on "Standard Classification of Construction and Operating Expenses," in 1899 a committee on "Standard Unit of Comparison" was added, and in 1900 a third committee on "Standard Blanks and Accounting for Materials and Supplies;" last year a committee charged with the important task of formulating a "Report for Electric Railways" was appointed.

At the Detroit meeting the two committees last mentioned filed reports which included sample forms and blanks; in connection with the discussion of these two reports, both of which were adopted, the fact was brought out that there was close harmony between the

association and the United States Census Bureau in regard to the plan to be followed in tabulating the street railway statistics for the census. Mr. T. C. Martin, who is the government's expert statistician on electrical industries, stated that the Census Bureau had adopted the system of the Accountants' Association practically en bloc, which action he believed would materially strengthen the position of the association; and also increase the value of the statistics to an extent that would only be fully appreciated when the work was completed.

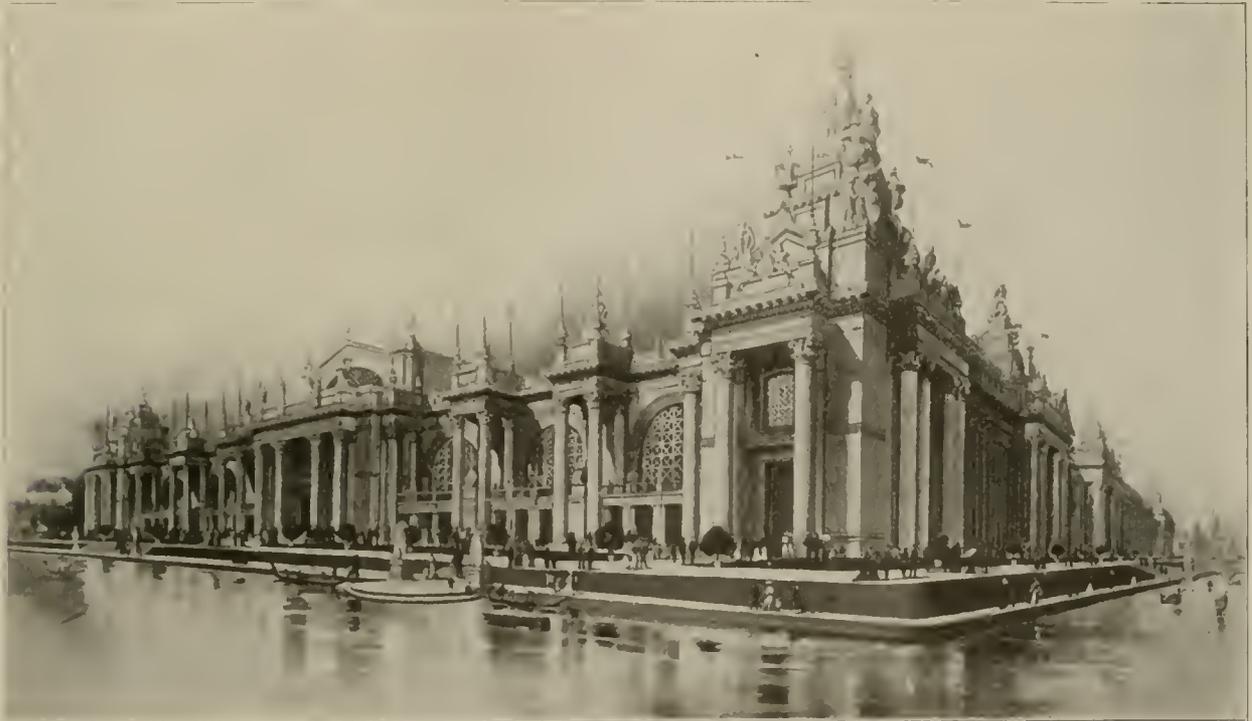

These several standard forms and reports which have been developed, the cordial relations with the association of Railroad Commissions which this association has been largely instrumental in establishing, the value of the "Department Blanks and Forms" to which Secretary Brockway has given much attention, and the opportunity which the association affords for discussion of mooted questions in accounting will all be more and more appreciated as time goes on. The Accountants' Association was organized just when the present era of electric railway consolidation was beginning and has been a large factor in developing accounting along the right channels, its future is at this time brighter than ever before.

**ELECTRIC RAILWAYS AND THE ST. LOUIS EXPOSITION.**

BY W. E. GOLDSBOROUGH.

The St. Louis Exposition of 1904 will afford an excellent example in detail of the operation of the business laws that illustrate the advantages which times of prosperity afford for the extension of business.

This seems a significant and extraordinary statement, and must imply an extensive general plan for the Exposition. All of this is true. A mistaken idea exists in the public mind of the scope and importance of the St. Louis Exposition. It does not seem to be understood that the Universal Exposition of St. Louis in 1904 is to be the most important and extensive universal and international exposition ever held. Too much attention can not, however, be directed to the words "international" and "universal", as they really describe the nature and scope of the St. Louis Exposition. It is not to be a local, or territorial, or even a national exposition. It is to be a World's Exposition in the fullest sense. It will almost double in

ELECTRICITY BUILDING FOR THE LOUISIANA PURCHASE EXPOSITION.

**A CORRECTION.**

Mr. W. Worth Bean, president of the Benton Harbor & St. Joseph Electric Railway & Light Co., of St. Joseph, Mich., has written us repudiating the profanity attributed to him in the course of the somewhat humorous discussion between himself and Colonel Heft on the subject of "Turbines," and reported in the "Daily Street Railway Review" for Oct. 11, 1902, at page 718.

Concerning the installation of electric power on the District Ry. in London, Mr. Charles T. Yerkes is quoted as stating that the work will be completed within 18 months, if the promoters are accorded the treatment which they consider just. Mr. Yerkes, in the interview, anticipates ruinous competition if the project of the Morgan interests for a practically parallel system shall be consummated.

It is stated that a bill is being prepared to be presented at the next session of the Pennsylvania Legislature, giving electric railways the right to carry freight and express matter and other privileges similar to those held by steam roads. The bill also provides for the granting of the right of eminent domain to street railways and, it is said, will contain a clause providing for the consolidation of all the electric railways in southeastern Pennsylvania.

size the Chicago Exposition; it is to cost nearly twice as much money; will be, in fact, approximately a \$50,000,000 exposition; will cover twice the amount of space and will offer almost twice the amount of exhibit area to exhibitors and the public. Its installation and entertainment places will be the most imposing ever raised. The architects of the exposition have the precedence of the experience and ideas of the past expositions, including the recent exposition at Paris, and the Chicago Exposition, with almost unlimited funds, and it will certainly be surprising if a result is not attained surpassing public expectation.

When, in connection with this great exposition, the problems connected in urban and inter-urban transportation are studied, some very interesting facts are brought out. Modern methods of transportation, which have revolutionized the entire world, had their inception after the event which is to be celebrated by the Louisiana Purchase Exposition. The vast territory purchased from France in 1803 is now the heart of the republic. That it has become so rich and powerful a seat of empire in one century is due to the railway and the steamship and their congeners. In 1803 the means of transportation in the Louisiana territory were of the crudest kind, principally the flat boat and the pack-horse, and today the same territory has 65,000 miles of railway, its rivers are traversed by great fleets, and the telegraph, telephone and trolley wires are weaving a close network over its entire surface. The unceasing purpose of

progress has had no better exemplification, and hardly a more fitting one can be imagined in the presentation of the vast progress that has been made within the past decade in the development of the electric railway than in the city of St. Louis, the gateway to the great West, which is destined to reap a rich harvest from the expensive and pain-taking care that the great East has bestowed upon the all important problem of urban and interurban electric transportation.

It has been truly and pertinently said by the president of our American Street Railway Association, that the membership of that association has in its keeping more of the happiness and comfort of the people of the United States than has any other set of vested interest. The electric railway responds to the needs of every element that goes to make up our population. The millionaire, the tourist, the business man, the philanthropist, the laborer and the

class railroad depot which prevails on the European continent. These two essential elements are apparent throughout the structure.

The Electricity Building of the St. Louis Exposition is the largest ever provided by an exposition, or otherwise, for electrical exhibits and displays. It covers virtually 300,000 sq. ft. of ground space as against 250,000 covered by the Electricity Building at the Columbian Exposition at Chicago in 1893 and 75,000 by the Electricity Building at the Pan American in 1901. It is of most graceful design and proportions, forming an elaborate polygon, each of its five sides presenting a succession of splendid columns after the richest Corinthian order, and four sides being surrounded by a balcony of rare grace and beauty. It encloses an open, central court bounded by rich colonnades, which will be banked with masses of flowers, and make a pleasing retreat for visitors to the building. Its location within the exposition grounds is most favorable. It rises right

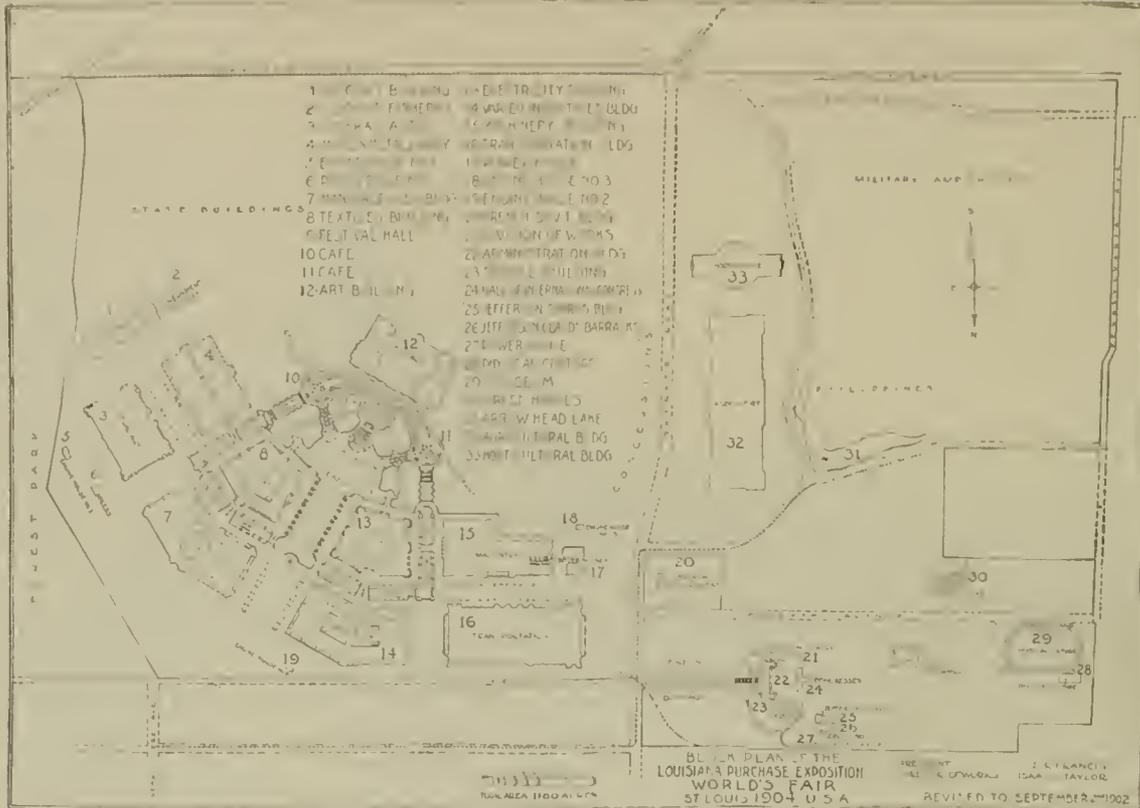

DIAGRAM OF LOUISIANA PURCHASE EXPOSITION GROUNDS.

The buildings under construction are the Textiles Building, the Electricity Building, and the varied Industries Building. The building for which contracts have been let are the Fine Arts Building, Mines and Metallurgy Building, Government Building, Government Fisheries Building, Liberal Arts Building, Manufacturers' Building, Transportation Building, Horticultural Building and Agricultural Building.

very poor meet on a common level when they come within the influence of the union between transportation and electricity.

The Transportation and Electrical Buildings.

At the Louisiana Purchase Exposition the electric transportation problem is given a most prominent place. It will have a broad presentation in two of the finest and most centrally located buildings of the exposition grounds. The Electricity Building has a place right in the heart of the main exposition picture. It is a structure, the architecture of which bears a significant relation to the uses for which the building is intended. It presents many pleasing and salient features, suggests a free use of imagination by the architect, and is adapted to a most brilliant and effective illumination. It possesses just the characteristics that "electricity" presents to the mind; the old, in fact, the very old, wrought into a new, a very new and pleasing picture.

The architecture of the Transportation Building is none the less well adapted to represent, with true feeling, the stability, safety and certainty that abide with the great transportation institutions of America. The building has gained strength at the hands of the architect by the dependence that has been placed on mass effects and the grouping of masses. The best elements of architecture have been used to produce an imposing result. The building combines that feeling of the magnificent exposition building and of the high-

at the foot of the grand terrace and cascades, and thus constitutes a prominent feature of the arrangement of the rich section which is called the main picture of the exposition. This broad thoroughfare leads up from the main entrance to the grand basin and cascades, and is penetrated by the central lagoon. The southern exposure, facing the grand basin and the cascades, is in direct view of the electric fountains, the peristyle of the Festival Hall and the Fine Arts Palace. On the west and north, the building is bordered by principal avenues of the exposition, and additional extended arms of the lagoon. It is, therefore, completely surrounded by water. It is led up to by splendid art bridges, which will discharge the crowds into the broad avenues directly surrounding the building. Four main entrances are provided; one imposing portal at the meeting of the two north facades, one at the center of each of the other sides. Graceful and ample entrances are also provided at the corners of the building. The doors are of gigantic dimensions, 11 x 18 ft. The north facades of the building measure 600 ft., which makes its greater dimensions 525 x 600 ft. One hundred and seventy-six trusses and 185 tons of steel have been used in its construction. Each of the 300,000 ft. of floor space is directly available. It is all advantageously situated, being compact, symmetrical, well lighted, well distributed with regard to aisles and entrances and well provided with all conveniences. Most of all, it is all ground floor

space, there being not a foot of gallery space in the building, a feature that will be welcome and appreciated by exhibitors and the public alike.

At the present time, the construction of this building is well under way. The installation of the big roof trusses has been begun and other work carried to a considerable stage of completion. The staff work of the Court of Electricity Building is practically completed, and has become one of the show places of the exposition.

The Transportation Building is placed on the extreme northwest corner of the main picture of the fair. It is the most expensive structure yet designed for the Louisiana Purchase Exposition. When all the exposition buildings are up, it will be exceeded in size only by the palatial Agricultural Building. The Transportation Building covers an area of 525 x 1,300 ft. (over fifteen acres). The facades show a most pleasing adaptation of the French renaissance. On the east and west fronts are three magnificent arches, which embrace more than one-half of the entire facade. Each of these arch openings will be 64 ft. wide and 52 ft. high. Through these archways fourteen parallel railroad tracks will be laid from one end of the building to the other. At the sides of these three openings the projecting angles are accentuated by pylon effects, which reach to a height of 150 ft. to the base of the crowning statue.

has made very elaborate plans for the exploitation of all the mechanical details of the electric railway problem on very broad lines. In his spacious building all matters pertaining to maintenance of way, grading, ballast, bridges, etc., switches and crossings, transfer tables, turn tables, signal systems and apparatus for securing the safety of traffic, track cleaning, protection against snow, general track repairs, etc., rolling stock, trucks, car bodies, passenger coaches, express cars, freight cars, snow plows, dynamometers, etc., traffic maintenance, time tables, distribution of rolling stock, cleaning and disinfection, passenger department matters, freight department matters and tariffs, methods and equipments for checking fares, and methods and equipment for handling baggage and freight, etc., will find place and be adequately presented. No small section of the Transportation Building will be given over to the exploitation of all the various mechanical details which characterize the operation of urban and interurban electric railways.

The other side of the electric street railway picture will be shown in the Electricity Building. All matters relating to the generation and distribution of electricity and to the control of cars and trains by electrical methods, come in the electrical department. Accordingly, dynamos producing direct, simple, alternating and multiphase currents; transformers, motor generators, boosters, rotaries, storage batteries, conduits, cables, wires, switches, switch-

TRANSPORTATION BUILDING FOR LOUISIANA PURCHASE EXPOSITION.

These pylons are not so much accentuated as to be obtrusive or out of harmony with the structure. On the north and south fronts the architect has deemed it well to repeat the three massive archways, which form the center feature of the smaller fronts. This treatment pleasantly breaks the unwieldy facade of 1,300 ft. On the north and south fronts, the pylon feature is omitted, but massive piers are repeated at intervals and lend dignity to the design. Flanking these opening on the long fronts are great rows of magnificent windows as wide as the archways. Not only will visitors be admitted through the twelve huge portals described above, but subsidiary entrances are supplied at frequent intervals in the remaining stretch of walls. The roof treatment of the building is peculiarly happy. Over each of the big archways is a lofty curve which supplies a background for the architectural features.

The Transportation Building will contain about four miles of standard gage railroad track. Even with this immense trackage, two entire bents of the building are left free of rails and afford an exhibit space of 270,000 sq. ft.

#### The Electric Railway Exhibits.

When we come to the point of taking up the detailed consideration of the allotment to be made, we find that the official classification of the exposition provides for a division along mechanical and electrical lines that makes it possible for both the Transportation and Electricity Department to build up large, dignified and interesting displays, and at the same time present in each of these exhibit divisions, thoroughly complete, logical and systematic arrangement.

Mr Willard Smith, chief of transportation of the Louisiana Purchase Exposition, and who brought the transportation exhibits of the Columbian Exposition to such a high degree of perfection,

boards, lightning arresters, circuit breakers, overhead and underground trolley equipments and appliances, electric line construction material, various forms of series, parallel and multiple controlling devices, electric railway motors and complete electric locomotives, electric train signaling apparatus, the electric signaling of trainmen and various electric systems for assuring the safety of traffic, will be brought together in one building, so that every detail which has to do with the electrical side of the installation, maintenance and operation of an electric railway system can be studied together as inseparable elements of one problem.

Therefore, managers, superintendents and engineers of electric railway enterprises desiring to study those things which pertain to the building of tracks, ballasting, the construction of lines, of car bodies, of mechanical or pneumatic signaling devices, and other matters that pertain directly to the mechanical side of this great problem, will go to the Transportation Building; whereas, when they desire to study the same problem from the generation of electricity through the transmission system, the transforming devices, the substations and the storage battery out over the line through the motors and the car axles, they will go to the Electricity Building, and there find, it is hoped and expected, enough material possessing new and interesting features to hold their attention for a considerable length of time.

It will be a source of gratification to railway men in general to learn that the great car shops and factories of the country supplying the electric railway interests, have taken up the matter of exhibiting at the St. Louis fair with enthusiasm. It is, therefore, not too much to say that a great deal will be forthcoming which will be in the nature of a surprise, and point to the fact that the intent and purpose of the directorate of the exposition has been brought to a successful conclusion. In making these exhibits carry with

them the force and interest which every one connected with the street railway industry desire, they should have more is needed than a mere co-operative interest on the part of those who will be part and parcel with the undertaking. The intention to make a good exhibit will not suffice, the intention to build up exhibits along the line that have been common to previous expositions will fall short of the realization of what must be accomplished to secure for the street railway exhibits that national and international renown which will make them rightly valuable in exploiting this phase of transportation, and in stimulating still greater and more rapid development in this department of our electrical activity. It should be the aim of all street railway men to give a real support to these departments of the exposition, to help, in what measure it may be possible for them to help, in the building up of the historical exhibits; to put thought and effort into the scheming and devising of features for exhibits which will represent the present state of the art, which will make these exhibits no mere wax pictures of what we are doing and what is being done, but pictures full of life and suggestion. To go beyond the measure of success that has attended previous expositions, we must introduce life into as many elements of the work as possible. The still exhibit is, in a large measure, a matter of the past; the present day demands more in view of the liberal education the general public has had in matters relating to expositions. It is for this reason that the exposition places at the hands of exhibitors every facility for carrying out the ideas outlined above. Space in the exhibit buildings is to be free and power will be free in such measure as is necessary to introduce the life element into the exhibits. What has been said must be taken, not as a suggestion, not as an idea thrown out to attract attention, but as a serious matter, and one which will be carried into effect.

That it is the purpose of the exposition to do these things and to have those exhibits which are treated in this article developed in a way to demand attention, is evidenced by the fact that the Louisiana Purchase Exposition has gone many steps further than has any other international exposition in affording opportunities for the proper and adequate exploitation of the street railway traction equipments. The chief of transportation and myself have, for some months, given much thought and attention to the matter of providing a tract on which to make experimental demonstrations of the relative merits of various traction devices. It is my pleasure at this time to be able to announce, and I am certain the announcement will give the exposition an added interest to all railway men, that a tract 1,300 ft. in length and 25 ft. in width has been set apart for the uses of the Transportation and Electricity Departments. This tract is situated just north of the Transportation Building, and on it double tracks can be laid for an outdoor exhibit of electrical and mechanical transportation appliances. Upon this right of way it is hoped a great deal of work will be done during the period of the exposition that will have more than a momentary value. Whether the traction equipments presented for experimental exploitation be driven pneumatically, or by steam, gas or electric power, they will all be fully exploited. It is the intention to organize these tests on very broad lines. When looked at from the electrical standpoint I think you will all agree with me that by the time the fair opens, there will be developed a large number of systems using alternating currents as the propelling power as well as the systems we now have using direct currents, and I cannot imagine a picture which will present greater interest to electrical railway men than that of seeing these various systems all exploited on the same ground and at the same time by the engineers of the various companies exhibiting there. It would not be fair for the electric street railway interests to feel that the Louisiana Purchase Exposition has not in mind to use every effort to give them every opportunity to do justice to this department of our national development, on which the eyes of the world are bent.

Observation cars are now operated over the lines of the Seattle Electric Co. for the accommodation of tourists and sight-seers. The service is well patronized and is resulting satisfactorily.

The Brooklyn Rapid Transit Co. is considering purchasing Christ Church in Bay Ridge, in order that the obstacle to the inauguration of a through service between Bay Ridge and Fort Hamilton may be removed.

## STRIKE CONTINUES ON HUDSON VALLEY LINES.

The strike which was inaugurated over the entire system of the Hudson Valley Railway Co., extending to Warrenburg, Saratoga, Ballston, Troy and Schuylerville, N. Y., August 30th, is as yet unsettled. As was stated in the "Review" for September, the company had partially resumed operations on the Glens Falls division September 18th, the cars being protected by a military guard, which, however, did not prevent the strikers from stoning cars and otherwise jeopardizing the service. Riotous demonstrations have since been frequent along the lines through Saratoga, Washington and Warren Counties, and squads of soldiers, on September 26th, were stationed to guard the lines in Saratoga, and those running between Stillwater and Waterford. A mass-meeting of the strikers was called at Glens Falls on October 4th, and a mob numbering 3,000 collected in the streets, taking possession of the business district of the town. An attack was made on passing electric cars, and four of these were captured, the motormen and conductors being dragged from the cars and severely beaten. Soon after Company K of the National Guard arrived on the scene and cleared the company's right of way. Under a heavy guard the stalled cars were run to the power house, the crowd following and pelting the cars and the soldiers with stones. Near the power house hostilities were again renewed by the mob, and the soldiers responded with a volley of bullets fired into the air. The Second Regiment, Col. Lloyd commanding, was installed at Glens Falls on the night of October 7th, and the town was practically placed under martial law. With this protection cars were operated without further disturbance.

Though Glens Falls has been made the scene of the greatest activities on the part of the strikers, the other divisions of the system have experienced riots of a similar character. At Waterford, on September 21st, a serious outbreak was quelled by the local militia, bayonets being used to disperse the mob. In one hand-to-hand encounter a captain of one company of the National Guard cut a deep gash in the forehead of one of the strikers with his sword. Riots have been of frequent occurrence at Ballston and a large number of arrests have been made. Recent reports from Troy state that the Hudson Valley company contemplates operating its cars in that city over the lines of the United Traction Co., if arrangements can be effected for the lease of such privileges. In that event members of Company D, Second Regiment, will be detailed to guard the cars in Troy.

A number of serious riots are reported from Geneva, Switzerland, in consequence of the strike on all the tramway lines in the city. On October 4th 28 cars were wrecked, and the police had much difficulty in restoring and preserving order.

## NEW COMPANY AT JACKSONVILLE, FLA.

The North Jacksonville Street Railway, Town & Improvement Co., of Jacksonville, Fla., secured a charter in March, 1902, and has just perfected its organization for the purpose of constructing an eight-mile suburban electric line. The company controls 320 acres of land at the terminus of the proposed street railway, and projects erecting several buildings and improving the location as a popular resort. The company has sold stock to the amount of \$20,000, and intends to place \$250,000 more stock and \$75,000 6 per cent bonds. The officers are: R. R. Robinson, president; George E. Ross, secretary, and H. Mason, treasurer.

The Philadelphia Rapid Transit Co. has closed a contract for 40,000 tons of washery coal for steam purposes and with the supply on hand will be prepared to maintain its service under any conditions that may arise in the coal market.

The Boston Elevated Railway Co. has completed the work of equipping 20 of its cars with vestibules in addition to the cars on the Neponset lines which were fitted with vestibules last winter. One hundred more will be equipped with vestibules so soon as the necessary brass fittings can be secured. A smaller percentage of accidents occurred on the Neponset lines last winter than on the lines where cars were operated without vestibules, and the experiment is, therefore, pronounced in every way satisfactory. A tie up on the Boston elevated lines from Malden to Everett occurred October 2d, owing to the snapping of a cable in the draw of the new Malsin bridge, and nearly 100 cars were delayed for an hour.

# From the Lake Region to the Atlantic Sea Board by Trolley.\*

R. H. DERRAIL, BOSTON, MASS.

The writer has been deeply interested in the development of suburban and interurban electric lines in New England since they first began to extend from the city proper to some suburban towns with large populations; this work of extension continued until at present you cannot find a town in Massachusetts with a population of more than 1,500 but has a street railway in actual operation or projected. So rapid has been the growth of the trolley throughout the New England and Middle states that within five years' time one will be able to travel from Augusta, Me., to Chicago, Ill., and even much farther west, as well as through the heart of Michigan, thus connecting the great lake region with the Atlantic coast by a

R. H. DERRAIL.

grand electric trunk line, which, with its tributaries, running in all directions, will form a network of some 7,000 miles. The connecting of the suburban towns with large centers throughout historic eastern New England has been the means of creating a large volume of pleasure travel, and it is increasing as years roll on. The mere bringing before the public the fact that with the exception of a few missing links it was possible to go from 75 miles east and south of Boston to New York city on the electric car has made the trunk line between the two large commercial centers very popular as it offers a diversity of scenery

class of travel, I decided to make a trip over the route to be later traversed by the "Broomstick Train" from west to east, together with its important feeders.

Before starting I had the impression that New England had the most complete system of electric lines, with the most modern and up-to-date equipment, the operation of which could not be improved upon. While I do not want to throw cold water on our great eastern system, I must admit that I was greatly surprised with the progressiveness of the western street railway companies, for while they have not the network like New England, their cars are more modernly fitted up with everything for the comfort and convenience of the traveling public. In most cities the interurban roads depend, the same as the eastern ones, on the revenue received from pleasure travel, which many of them will admit exceeds 50 per cent of the gross receipts, but their method of increasing this class of business is entirely different from the eastern roads.

In 1899 I had the pleasure of addressing the Massachusetts Street Railway Association, using as my subject, "Is Advertising as Profitable to Street Railways as to Steam Railroads." Among my remarks were the following: "There is no street railway man in Massachusetts qualified to give the public the information it desires in reference to the network of electric lines, and it, therefore, seems to me that one of the best paying investments for the street railways is to have them all combine and pay their proportionate share towards maintaining an office in Boston for giving the public this information. I am sure that if a sufficient amount of money were appropriated to publish in the different papers the fact that an office of this kind had been established for the benefit of the general public, it would be a popular office and a great benefit to the mass of people asking for such information. If such an office

VIEW ALONG THE LINE FROM LITTLE FALLS TO SYRACUSE, N. Y.

which appeal to the average tourist. [See Mr. Derrail's article in the "Street Railway Review," June 15, 1899, page 377.—Ed.]

Having made a special study of the trolley excursion business of the eastern states, and being satisfied from personal investigation that the grand trunk line would be completed in a very few years, and with a desire to learn something of what the western interurban lines offered as an inducement to pleasure travel and what the different companies were doing toward catering to that

was opened with photographs of historical places, seashore resorts, inland scenery, etc., it would add greatly to pleasure riding."

It certainly is a pleasure to me to see that the system I had suggested for Boston three years ago is now being operated in all the principal cities and towns through which I have traveled.

Many of the western roads run through a rural country which is sparsely settled, but their passenger revenue is large. There are several reasons for this: Substantial roadbeds built mostly upon private property are thus free from dust, the running of what might be called through palace cars, having smoking compartments, toilet, ice water, etc., the selling of through tickets to any point desired, and the maintenance of information bureaus and ticket offices.

\*Technical description of the roads mentioned in Mr. Derrail's article will be found in the "Review" as follows: Detroit System, Sept. 29, 1902, p. 507; Toledo & Monroe Ry., July 1, 1901, p. 403; Toledo, Fremont & Norwalk Electric Railway Co., Oct. 1, 1901, p. 509; Cleveland & Eastern Railroad Co., March 1, 1901, p. 142; Albany & Hudson Railway & Power Co., Jan. 17, 1901, p. 26; Hudson Valley Railway Co., Apr. 15, 1902, p. 193.

Now let me confine myself to the trip which will take me eastward some 1,500 miles, and the branch lines with their several hundreds of miles, for when this system is connected the steam railroads will not only feel the loss to their passenger and freight business, but the trolley roads will then be in a position to compete with them in inducing pleasure travel, for one can see more of the country, with its historic places, picturesque scenery and points of varied interest by trolley than by steam.

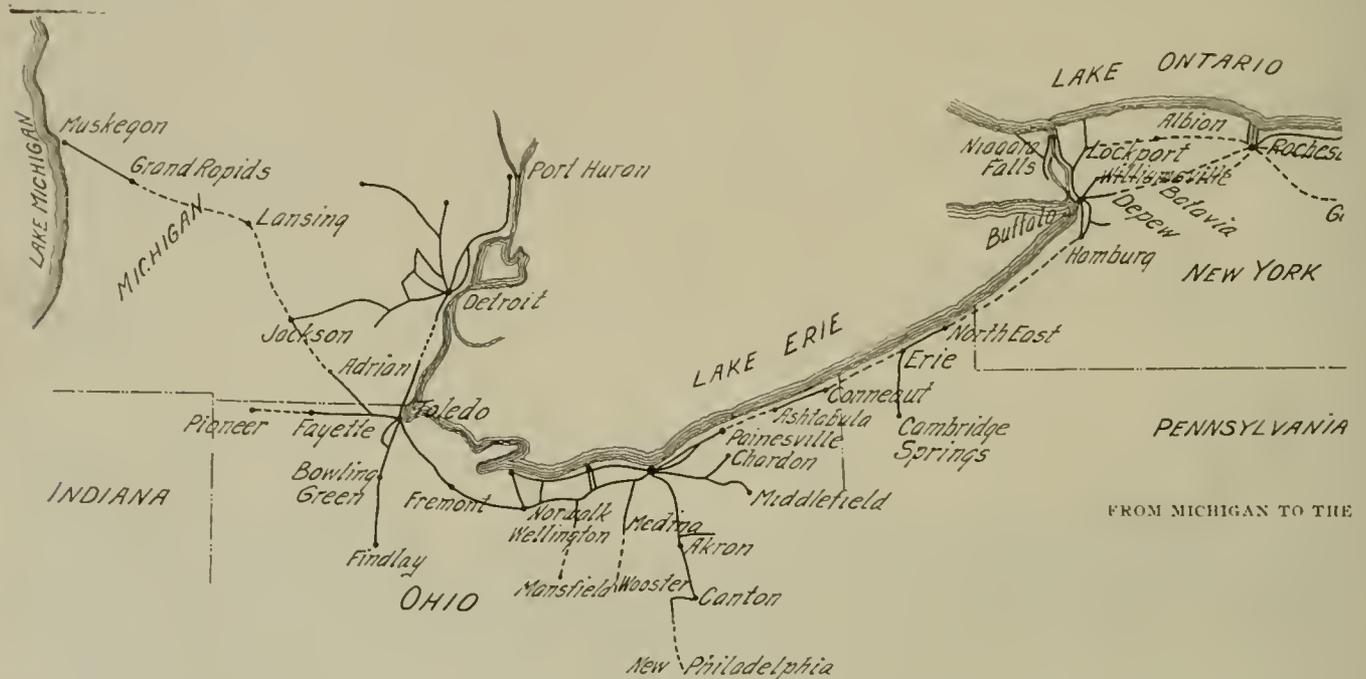

To begin my journey I started at Port Huron, located 73 miles north of the city of Detroit on the St. Clair River. I set out with a determination not to miss anything of interest, therefore a trip around the world was in order. Taking an electric car marked "tunnel" I was soon transferred to a car of the Grand Trunk railroad and in a few minutes disappeared in a great hole in the ground, the largest submarine tunnel in the world, under the St. Clair River; after a distance of some 3 miles I was landed in Sarnia, on the Canadian side of the river. A short ride in a horse car to the ferry and then back to Port Huron by boat, and I had visited two countries, been under the water, over the water, employing electric, railway locomotive, horse and marine engine power, all for the sum of 25 cents.

Port Huron is a beautiful city and noted for its deep spring baths. Here I boarded one of the handsome palace cars of the Detroit Rapid Railway system for a ride along a high elevation affording a grand view of the river and its pleasure boats and steamers which ply on the delightful St. Clair. Still following the river you are taken through the charming little summer resorts of Marysville, St. Clair, Marine City and Algonac, with their camps

with their loads of iron, copper or grain, which is in itself a sight well worth going miles to see.

In order to see Detroit, and see it properly, one should not miss a trip in the handsome excursion car "Yolande," which makes regular trips through the principal business and residential sections of the city accompanied by a competent guide; another year a similar car will be placed in service on the Cleveland lines. The cost of this trip is 25 cents and the time consumed is two hours.

As the object of my trip was not to study up the street railway lines operated in the congested sections of a city, I made good connections on my return from "seeing Detroit" with a car for Jackson, located due west from Detroit just 73 miles. The ride is through a beautiful inland country with many small, thriving towns, villages and hamlets, which served as the trading centers for the farmers before the trolley afforded them an opportunity to market their products in the large city. Although many of the towns were isolated their beautiful streets, fine, comfortable homes with spacious lawns shaded by the foliage of massive trees show clearly to the tourist that the people are contented and happy. Leaving Wayne and the large brick buildings of Wayne County Home, the car enters Ypsilanti, an attractive inland town located on the picturesque Huron River. Passing through the fine shaded street of the town, with its lawns and flower gardens, the high-speed car soon reaches Ann Arbor, the seat of the University of Michigan, located on a high elevation and affording a fine view of the surrounding country. From Ann Arbor the pretty little farming villages of Lima, Chelsea and Francisco are passed before coming to

and summer resorts. The people all along the line seemed to be enjoying themselves, for the car is continually passing croquet grounds, tennis courts, and golf links. Fishing and boating provide ample outdoor amusement for the many summer tourists visiting these resorts each year. At Algonac one has a fine view of Anchor Bay and its many islands locally called the "Flats," the "Venice of America." Turning to the right, the car follows the bay, passing through the villages of Fairhaven, Anchorville and New Baltimore, all summer resorts. From this point one leaves the cool, refreshing breeze from Lake Erie to enter the inland country where the famous "Bath City," Mt. Clements, is located on the banks of the Chauton River. It is indeed a beautiful city, with modern up-to-date hotels at every turn. From this point one has a choice of two routes to Detroit, one through a beautiful country of bewitching scenery, fertile fields, laden orchards, berry and vegetable gardens on all sides, while the other line affords an opportunity to follow the shore of Lake Erie practically the entire distance and view the sails of the fisherman and pleasure crafts as they skim from shore to shore, steam yachts, huge vessels of commerce

Grass Lake, a favorite summer resort located on a small lake after which the town is named.

Eleven miles farther is the terminus of the line, Jackson, the abiding place of some 300 commercial travelers. It is a hustling city and credits itself with a large number of extensive manufactories. A line is now projected from here through Lansing to Grand Rapids, where it will connect with the existing one running to Muskegon. When this missing link is completed it is the intention of the promoters to run through cars from Detroit to the latter city, a distance of some 200 miles. These will have a dining room; sleepers will also be run.

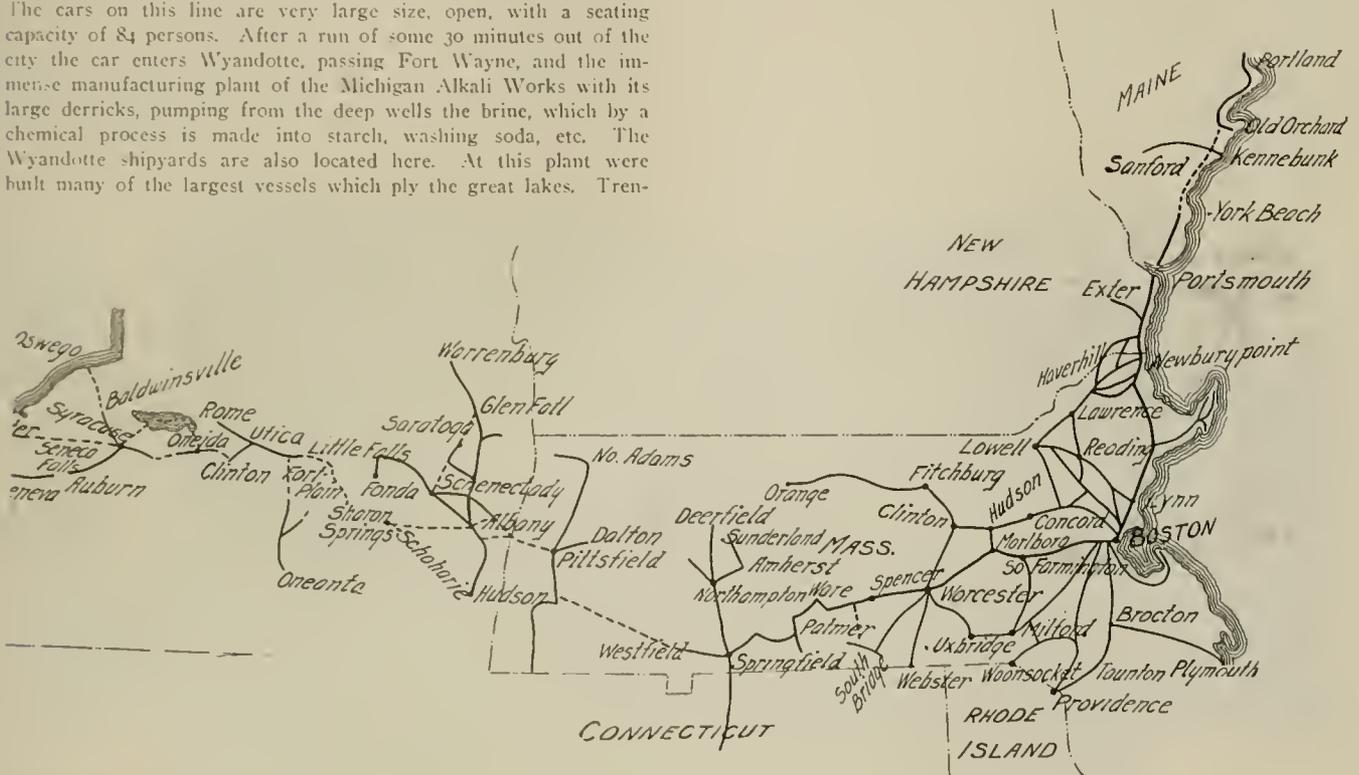

The line running to Flint is the longest line out from Detroit, the distance being 76 miles. The line, running practically due northwest from Detroit, is through a rural farming country similar to that along the Jackson road except each has its own individual features and advantages to offer the tourist. A short run out of the business section brings the car to Royal Oak, where a line diverges to the left, affording one an opportunity of returning to the city via Pontiac, Farmington or Wayne. This is a beautiful

trip through the great chain of lakes for which Oakland county is noted, having some 400 in all, beautifully shaded by fine groves, fertile fields and garden plots, with summer cottages and picnic grounds. Continuing on the Flint line a fine level country is traversed, large sugar beet plantations are seen on every hand, while the oat and wheat industry is not forgotten. At Rochester a branch line to the right leads to Romeo, a suburban town composed chiefly of retired farmers. As the car approaches Rochester it attains a very high elevation, the scene from which is a beautiful one. Down in the valley below lies Rochester nestled among the foliage. From Rochester one enters a rolling country under high cultivation. Flint is noted for its carriage industry. The principal street of the city is lighted by permanent arches extending from one trolley pole to another, attached to which are hundreds of incandescent lights, giving one a splendid impression of the city.

Leaving Detroit on my eastward trip, I boarded a car for Trenton, which followed the banks of the river for most of the way. The cars on this line are very large size, open, with a seating capacity of 84 persons. After a run of some 30 minutes out of the city the car enters Wyandotte, passing Fort Wayne, and the immense manufacturing plant of the Michigan Alkali Works with its large derricks, pumping from the deep wells the brine, which by a chemical process is made into starch, washing soda, etc. The Wyandotte shipyards are also located here. At this plant were built many of the largest vessels which ply the great lakes. Tren-

lasted with broken limestone. The cars are of the usual type used on most of the roads, seating 68 persons, with smoking compartments, toilet, etc. The line follows closely the old Toledo and Detroit turnpike and the route is through a picturesque country with fertile farms. Although this road parallels the tracks of the Michigan Central and the Lake Shore, its speed of 30 miles an hour and sometimes 55 miles, with hourly service, has created a large through passenger service.

Reaching Toledo, I found many interurban lines radiating in all directions, each of which runs through a section of country having its own individual bits of picturesque scenery and points of interest to offer the pleasure seeker. The lines of the Toledo, Bowling Green & Southern Traction Co. follow along the historic Maumee Valley and through the oil region of Bowling Green to Findlay. This line will be continued southward to Cincinnati within a short time, the only missing links to be connected are between Findlay

ATLANTIC COAST BY TROLLEY.

ton, the present terminus of the line, is a pretty little village located on the river bank. It is the summer home of many Detroit citizens.

Here I was obliged to take the train to Monroe, a distance of 18 miles, the fare being 38 cents. There are only five trains daily, three on the Michigan Central and two on the Lake Shore. Less than a year ago the prospects were good for the operation of a trolley line connecting these two places; the track and overhead construction were in readiness for the power and rolling stock when trouble overtook the Everett-Moore syndicate. It is now the general impression along the line and with street railway men in general that the line will be turned into a steam railroad. This state of affairs will not, however, prevent the connecting of Detroit with the trolley network of Ohio, for the Toledo & Monroe company expects to have the missing link completed and in operation by another summer. It will be an extension of the line from Monroe through Flat Rock and will connect with the tracks of the Detroit United at Wyandotte, a distance of some 42 miles. When this is completed the company expects to make the run from Toledo to Detroit a distance of 63 miles, in one hour and forty five minutes, and the fare will be 60 cents. The right of way for the entire extension has already been obtained.

The system of the Toledo & Monroe now in operation, a distance of 21 miles, is considered one of the best in the country, both as to roadbed and equipment. Nearly the entire distance is over private right of way, and 70-lb. T rail are used, heavily bal-

and Lima, projected, and the other is under construction from Wapakoneta to Piqua.

The Toledo & Western traverses a rural farming country that has heretofore been neglected by the steam railroads. The main line runs to Morenci, on the Ohio-Michigan state line, and will be extended in the near future as far west as Pioneer.

A branch line extends from Sylvania, Ohio, to Adrian, Mich., and will eventually be extended to Jackson, there connecting with the line from Detroit. The latter branch is in direct competition with the Lake Shore R. R. Ninety-five per cent of the entire distance is over private right of way. The road is designed and equipped with a view to handling a large amount of freight and express matter as well as passengers, and when everything is in full operation the rate of speed will be materially increased. The company is equipping its entire system with telegraph service instead of the telephone used on most of the other roads. At 11 places along the line substantial faced brick dispatching stations are being constructed, where competent telegraph operators will be stationed, to govern the movement of the cars through the chief dispatcher's office at Sylvania, where the main power station, car houses and offices of the company are located.

The entire route is through a prosperous open farming country, corn, wheat and oats being the principal products while dairy and garden products for a large portion of the company's freight. Mr. C. F. Franklin, general manager of the company, is an old steam railroad man, having been for many years connected with the Long

Island R. R. He anticipates a very large freight and passenger business when the entire system is in operation under the improved methods which are to be employed, and with this in view he has added several large flat and box cars to the present equipment, and is constructing an electric locomotive capable of hauling 12 to 14 loaded cars. The passenger cars are of the most modern type.

I have so far given a brief description of three lines extending from the city of Toledo into the suburban country, where one can study farm life in its many phases, but nothing out of the city can compare with the ride on the "Maumee Belt Line" of two hours along the historic and picturesque Maumee Valley. The trip can be made for 20 cents. The car passes the water works, Walbridge Park, the Country Club, and Orchard Grove, all situated on the banks of the river overlooking the valley below, Ft. Miami, established 1780, Ft. Meigs, Turkey Foot Rock, and many other places remembered as the spots where many bloody battles have been fought.

Toledo is not behind any of the other western cities in the way of providing proper accommodations for the comfort and convenience of its patrons. It has a union waiting room and ticket office, a thing no other street railway company has.

The line of the Lake Shore operating between Toledo and Cleveland is the longest through trolley line without change in the eastern and middle states the distance being 118 miles. The line as far east as Lorain, while the rails and rolling stock are of the best,

on the Lake Shore and passing through a rural section of the country and the village of Berlin Heights to Ceylon, Lake Erie comes in full view. From here the line follows the shore of the lake passing many pretty picnic groves, to Lorain where two lines run to Elyria and out to Sandusky. The line to Cleveland crosses the Black River from which a fine view is had of the immense plant of the Lorain Steel Co.

Following the lake and passing the power station and car house located at Beach Park, the car traverses a great vineyard extending from the lake inland as far as the eye can see. From the elevation which the car reaches a grand view is had of the lake. Scattered along the shore are pretty little groves in which may be seen on any pleasant summer day family picnic parties enjoying an outing. This together with the corn, wheat and oat fields gives the route a most picturesque appearance. Crossing the Rocky River on a high trestle there is seen in the valley below the buildings of a pleasure park maintained by the street railway company, closed in by high stone walls on either side. The car now reaches the outskirts of Cleveland and soon passes over one of its many viaducts. The Public Square, Cleveland, is the terminus of this as well as all the Cleveland suburban lines. For tickets, booklets and general information on the street railway companies the tourist is referred to the general ticket office, located at No. 10 Public Square.

Cleveland is a beautiful city and has one of the finest street

TYPICAL SCENE ON THE BEACHES SERVED BY THE RAPID RAILWAY, DETROIT.

was not in the best condition when the Everett-Moore syndicate which controlled the line, became involved in its trouble, but great improvements are being made. The track is being ballasted in the very best manner, and by another season the entire system will be in first-class shape, and the cars which are now obliged to run at a moderate rate will be operated on a schedule of at least 30 miles an hour, including stops. From Lorain to Cleveland the roadbed and equipment are in first-class condition. The run from Cleveland to Toledo is made in six hours and the fare is \$1.80.

Leaving Toledo the line follows the route of the Western Reserve & Maumee Turnpike, which is the oldest turnpike in Northern Ohio, having been ceded by the Indians over 150 years ago. Many thousand emigrants made their way over this road on their westward journey. The route, mostly over private property, is through a populous oil district with many shafts scattered here and there over the level country. Leaving the oil region the route is through a fertile farming country producing quantities of agricultural supplies and many sugar beet plantations are seen along the route. Fremont, located on the Sandusky River, is about half way between Toledo and Norwalk. Here is located Fort Stephenson which marks the spot where the British and Indians were defeated in 1812. Still following the turnpike through many pretty little villages and farming country the car reaches Norwalk just 57 miles from Toledo. From here a line runs to Sandusky. There will shortly be two trunk lines from Norwalk to Cleveland, the Lake Shore Electric, and the Cleveland, Elyria & Wellington, the latter being referred to in the lines out of Cleveland. Continuing

railway systems in the country. One interested in street railway transportation can enjoy himself for many hours sitting in the spacious square watching the loading and unloading of passengers from the large, commodious cars which run for miles into the country east, west and south. The local railway company has planned many nickel-trolley trips, and is giving considerable attention to the development of pleasure-excursion business, by issuing attractive leaflets and booklets describing and illustrating the points of interest along its lines. A novel feature was employed by the company the Sunday I was there. By arrangement with the various newspapers, each one printed a coupon or ticket good for a return trip from Garfield Park that day. Mr. J. W. Butler, manager of the Outing Department, and to whom a large proportion of credit is due for the increase of pleasure travel, informed me that the results from this experiment far exceeded the expectations of the management. The company has a very handsome parlor car and will by another season put into operation an observation car similar to that now in use on the Detroit-United lines. The company operates a funeral car, which seems to fill a long-felt want, is 28 feet long, painted in ebony black, with gold trimmings. The draperies are of green tapestry and yellow silk. The interior is divided into two compartments. The front receives the casket, while the rear has a seating capacity for 28 persons.

The interurban lines out of Cleveland are so rapidly forming into trunk lines with many important branches that it will only be a matter of two or three years at the latest when the whole state will be gridironed by trolley the same as is the eastern section

of New England. The Cleveland, Elyria & Wellington now operates a line through Oberlin to Wellington, and the line from Oberlin to Norwalk will be in operation as soon as the bridge over the Vermillion River is completed, thus giving two trunk lines between Cleveland and Norwalk. The line from the city runs through several small country towns without any steam railway facilities except between Elyria and Oberlin, where it parallels the Lake Shore. The extension of the line from Wellington southward to Mansfield will also be through a section devoid of steam railroad service. The route is through a farming country with many small villages, whose fine squares, business blocks and shaded streets gives every indication of prosperity.

While the country is not under as high cultivation as some parts of Michigan, the route is none the less attractive, for here and there many picturesque spots reveal themselves to the traveler as the road passes through cornfields and orchards, over its own private roadway, which is constructed in the best possible manner. As a through line from Cleveland to Wellington the electric cars compete with the "Big Four" and it is the only instance I have noticed where the trolley car charges more than the steam road. Round trip ticket by steam cost \$1.20 and by electric cars \$1.30. While the electric cars charge more they carry practically all the through passengers, giving an hourly service from 5:30 a.

informed that the Board of Health prohibits the use of drinking water tanks. Other points of particular interest which draw much patronage for this road are Bedford Glens, a beautiful spot noted for its natural, wild picturesque scenery; the Boston Ledges, Silver Lake Park, Randolph Park and Brady's Lake, all popular summer resorts, being provided with dancing pavilions, boating and other accommodations usually maintained by street railway pleasure resorts.

For a distance of seven miles south of Northfield the valley of the river is walled in on the west by a range of high hills of a gradual slope whose sides are covered with terraced farms and tiny groves which give an almost foreign aspect to the landscape. The company operates two branch lines, one running from the main line to the thriving town of Kent, while the other extends from Akron to Barberton.

At Akron a change is made to the cars of the Canton-Akron line which has been in operation but a short time. The road runs through a beautiful farming country, past Springfield Lake, a summer resort recently leased by the company, with fine natural surroundings. Here the company has erected a pavilion, where dancing and band concerts are provided during the summer months. The grounds offer fine facilities for camping parties. The company was hampered by lack of power, but I was informed

A STREET IN THE WHITE CITY, WINDSOR BEACH, ROCHESTER.

at 8:30 p. m. while the steam railroad makes only a few trips per day.

Another line of the company extends south from Cleveland to Medina, passing Puritas Springs, a popular summer resort owned by the company. The granite quarries located at Berea, the valleys, streams and woodlands give much diversity to the landscape and indeed make it a popular tourist line. Extension of the line is now under construction from Medina through to Crete and will eventually be built to Wooster, thus adding some forty miles to the already large system.

The next in order was a sixty mile trip to Canton via Akron, over the line of the Northern Ohio Traction and the Canton-Akron companies. The latter road was constructed by Tucker, Aronson & Co. of Boston, who are large investors in several other roads in the southern part of the state. The line from Cleveland follows the valley of the Cuyahoga River to Akron, following much of the wild scenic landscape for which this region is noted. The Newburgh Steel Co. now part of the United States Steel Corporation is located on this line, near the city limit. Garfield Park and a Cleveland pleasure resort and the Inman Ashburton estate with its massive buildings hidden by large shade trees which cover the park are noted with much interest by the passengers. While the cars of the company are of the usual standard type, used by the equipment of other companies, I am

by Mr. George W. Rounds, general manager of the company, who, by the way, is an Eastern man having been connected with the West Roxbury & Roslindale Street Ry. (now part of the Old Colony), that the new power house which is nearly completed at Canton will obviate all difficulty. The company will operate its line from this station using 13,000-volt, three-phase current and the necessary rotary converters and transformers. The capacity of the station will be 2,600 h. p. The company proposes to extend its lines from Navarre to New Philadelphia, which when completed will make a total length of 60 miles. Over this main line from the latter point to Akron the company will operate 60-ft. cars equipped with four 300 h. p. motors each. As a large part of this system is over private right of way built with 70 lb. T rails, and well ballasted, the speed at times will be as high as 45 miles an hour. The company's franchise gives it the right to carry baggage and freight and as the road runs through a thriving farming district the company anticipates a large business in handling farm products, and it has easy access to the Pennsylvania and other railroads at Canton, Massillon and other central points.

In addition to the park located at Springfield Lake, there is another one about a mile and a half west of Canton called Myer's Lake, where one of the finest ball grounds in the country is located. This lake contains about 90 acres of water and is surrounded by 200 acres of woodland and groves. Here may be

found the usual attractions which are so common at the resorts maintained by the street railways of eastern New England. It might be well to say here that very few companies maintain such pleasure resorts through Michigan and Ohio.

From Cleveland a line owned by the Cleveland & Eastern runs to Chardon and Middlefield, which is popularly termed the "Maple Route." This line is similar to that of the Toledo & Western for it is through a country heretofore lacking railway facilities and has from the beginning worked up a general freight and express business until today it transports more freight than any of the other street railways running out of Cleveland. This, and its other line out of the city running through Chagrin Falls and Hiram to Garrettsburg, are two of the most popular tourist lines out of any city in the country and were fully described in the "Review" for March, 1901.

A new company, called the Burton, Jefferson & Andover Electric Railroad Co. has been incorporated with Dr. E. Rowdon, of Windsor, Ohio, at the head to build some 100 miles from the terminus of the Cleveland & Eastern lines at Middlefield through Windsor to Colebrook, where it will run south to Howland and north to the line of the Pennsylvania & Ohio Traction Co. at Jefferson; the entire right of way has, I am informed, been obtained. The line to Garrettsville runs through a well-tilled farming country. Dairy products and garden vegetables are the principal products. It is one of the most fascinating trips I have yet taken; stretches of fertile farm lands are immediately followed by perfect wilderness, affording grand opportunities for hunting, while along the banks of the Chagrin River, over which the car passes, may be seen the angler eagerly waiting his prey. A short distance from Chagrin Falls one is carried through a deep ravine forming a perfect horseshoe after which the glen is properly named. Hiram is a pretty little village, best known as the place where ex-President Garfield taught school.

From Cleveland eastward the Cleveland, Painesville & Eastern operates two divisions as far as Willoughby, the "Main" and the "Shore;" the latter line follows the shore of Lake Erie for many miles passing numerous beautiful private and semi-public resorts. The countless little creeks which find their way at frequent intervals into the lake and the wood ravines make this route a picturesque one and it is much patronized by pleasure parties. Near the end of this line is located Willough Beach Park, an ideal resort. It is beautifully situated on the lake with a fine sandy beach, and it consists of twenty-five acres of land. Its natural beauty is enhanced by the erection of rustic bridges and arbors. Tables, seats and swings are scattered about through the well-shaded portions of the park.

The main line follows Euclid Ave., Cleveland, for several miles, along which many millionaires have palatial residences, passing Wade Park, the buildings of the Western Reserve University, the Garfield Memorial and the summer residence of John D. Rockefeller. Along the entire route are many fine highly tilled farms and pretty country towns whose streets are shaded by giant elms forming a perfect archway through which the car passes.

East of Willoughby the car passes through a section which had at one time the greatest vineyards in the state and there still remain many large fields. The company has put into service some limited cars for the benefit of the business men of Cleveland who live in the suburban districts. This service reminds an eastern man very much of the special trains which run out of Boston during the summer months called the "Dude's Train."

At Painesville, the terminus of the line, I was obliged to take the train for Ashtabula, a distance of 26 miles, fare 75 cents. The Cleveland, Painesville & Ashtabula Railroad Co., has been incorporated to build this missing link and Mr. Luther Allen, president of the Toledo & Western, is president of this company. In conversation with his son, E. Brigham Allen, secretary of the company, he informed me that considerable grading had been done and that the company expected to have the line opened by another year. This system will not only fill up one of the gaps of the trunk line but will connect at either end with good paying roads. The entire route, with the exception of through the few small country towns, will be over private property. The company has already made traffic arrangements with the C. P. & E. which will enable it when the line is completed to run through cars from Ashtabula to Cleveland, a distance of some 58 miles. Although the company will have to compete with the Nickle Plate and the

Lake Shore, the frequent service, the high rate of speed at which it is intended to run, the fine equipment and fares cut practically in two, will, it is believed, be sufficient inducement to not only encourage travel, but take away a large portion of the regular patronage which the steam roads now have.

At Ashtabula I found two lines in operation, a local one running from the village to the shore and the other, the Pennsylvania & Ohio Traction Co., east to Conneaut a distance of 15 miles. Both Ashtabula and Conneaut are noted far and wide as the greatest iron ore ports in the world. The company operates a

INTERIOR VIEW OF PARLOR CAR.

branch line from Ashtabula to Jefferson, the county seat, a distance of 10 miles. The line east runs through a very fertile agricultural country and the travel is mostly through, the fare being 25 cents, while on the steam road it is 40 cents. Every other car is a combination baggage and passenger car.

At Conneaut another missing link of 26 miles is promised to be filled up in the near future by the Conneaut & Erie Traction Co., if what Mr. George J. Chapman, a director of the company predicts comes true. The line will run through a very hilly country with many deep valleys and will be a costly one to construct. There is no question but that it will be built, although many others projected, will be realized before this connection is made.

There are three lines operating from the city of Erie, Pa. The Erie Electric Motor Co. has a local one running four miles west to Waldameer Park, a beautiful pleasure resort for the citizens of Erie and surrounding towns. Another line runs from Erie to Cambridge Springs.

Eastward the Erie Rapid Transit Co. operates a line along the Buffalo turnpike a distance of 15 miles to North East and it is extending to Westfield, N. Y. Sixty and 70-lb. rails are used. Its line runs through the great grape belt of northern Pennsylvania and on each side are large vineyards and small fruit farms the entire distance. The cars are of a fine type being 45 ft. in length, vestibuled and having twin Pullman windows gives them a very attractive appearance. They have the usual smoking compartments so popular on all the suburban lines.

I have now reached the state of New York where the connecting of the established lines which go to form the trunk line depends largely upon the promoters throughout the central and western portion of the state. So numerous are the breaks along this section that it was out of the question to study what the various lines would offer a trolley tourist when completed. I did however ride over all the existing lines of consequence, and talked with officials of the companies which intend to build the projected ones, so I feel that I am as able to give as correct an account of the situation as anyone.

At Westfield a company has been incorporated called the Lake Shore Traction Co., to build a line from this point to a place

called Silver Creek there connecting with a line which the Hamburg Street Railway Co. intends to build. Surveys for these two routes have been made. A trip on the Niagara Falls and the Oleott Beach lines of the International Railway is well-known to all street railway officials. These two lines are purely pleasure lines and they are becoming more popular every day through the up-to-date methods of advertising of the passenger department. The line from Tonawanda to Lockport was the first steam railroad to abandon the use of locomotives and adopt electricity. The speed on this line is sometimes as high as 60 miles an hour.

If all the plans formulated for a trolley connection between Buffalo and Rochester, are realized, no less than four will be catering for passenger and express service between these two large commercial centers. The Buffalo, Rochester & Niagara Falls Street Railway Co. was incorporated some time ago to build a line along the old historic Ridge road and several reports have been published purporting to come from officials of the company to the effect that construction would be started at once, but up to the present time it has not received the necessary certificate from the Board of Railroad Commissioners. There is a proposed line along the route of the Erie Canal which seems to be a much more feasible one from a passenger standpoint and much favored by the farmers along the line. Nothing has been made public regarding this route and it is rather hard to obtain information. I had an interview with Mr. Tomlinson, chief engineer, and Mr. Charles B. Hill, secretary and treasurer of the Albion Street Ry., a new company. From this interview although neither one committed himself, I am satisfied that what I predict will come true and within a short time.

The Albion Street Railway Co. was incorporated to build a line in the town of Albion which is about midway between Lockport and Rochester on the canal. The company has received a franchise from the town to build three miles of track extending from the cemetery east of the town to the Fair Grounds on the west side. J. G. White & Co. of New York, who made the survey and have the contract for building the line, also made the survey extending east along the canal to Rochester and west to Lockport.

The Buffalo & Williamsville and the Buffalo & Depew companies have both signified their intention of extending their lines through to Rochester. They will follow the same general direction as far as Batavia, from which point the former will take a more direct cross-country route to Rochester, while the latter making a detour will pass through several small intermediate towns. The former plans to operate as a high speed road and

NEAR CHAGRIN FALLS, OHIO. LINE OF EASTERN OHIO TRACTION CO.

later to through travel, while the latter expects to obtain a greater portion of its revenue from local travel.

Rochester offers many pleasant trips in and about the city. The Seneca and Genesee Valley Parks are both beautiful places through which the Genesee River flows. The upper and lower falls of the river are best seen from the bridge which spans the banks some 200 ft. above the deep gorge. The bridge over the Lower Falls is the third longest tangle span bridge in the world, being 990 ft. in length. There are many other places of interest too numerous to mention.

Few cities have as many beautiful pleasure resorts within easy reach by the trolley as Rochester. Ontario and Windsor beaches located on the banks of Lake Ontario at the mouth of the Genesee River, 7½ miles from the city are popular summer resorts and camping grounds. The ride to these places takes one through the business and residential portions of the city, and a delightful and picturesque country with many handsome summer residences. Many enjoyable trips can be made by a combination of boat and trolley. One of these is by trolley to Glen Haven, a beautiful summer resort with many attractions, located in a charming glen at the head of Irondequoit Bay. From here one may take a boat to Sea Breeze on the Lake and there transfer to another boat for Windsor Beach and thence by trolley to the city. The round trip costs 50 cents. Another trip is by trolley to Windsor Beach, across the river by boat and back to the city by car may be made for 30 cents.

With the exception of the Hudson Valley with its 105 miles of road the Rochester & Sodus Bay line is the longest in New York state, being 40 miles. The line is a direct competitor of the Rome, Watertown & Ogdensburg Railroad which until this trolley line was operated two years ago charged \$2. for a round trip to Sodus Bay. Today it sells round trip excursion tickets for 50 cents. The fare on the electric cars is 75 cents. Large 45-ft. vestibuled cars are used on this line as well as on the beach lines. The company has several combination cars which make two round trips per day for freight service. Although this line is a long one and the rate of speed not so high as on some other roads of similar length, its through travel is heavy. It also gives much better service to the intermediate towns en route than the steam road inasmuch as it enters their main streets while the steam road is some distance from the centers.

One may take the trolley from Rochester to Charlotte, the boat to Sodus Bay and the trolley back to Rochester, affording a splendid day's outing, for \$1.00.

At the terminus of the Rochester line at Ontario Beach, a line runs along the shore of the lake crossing many inlets and small bays, by trestles to Manitou Beach, a distance of eight miles. This also is a charming trip.

The line to Sea Breeze was originally the Rochester & Lake Ontario Railroad until three years ago when it was converted into an electric line by the Rochester & Suburban.

In two year's time the line, and in fact two lines between Rochester and Syracuse, will be operating, one following closely the historic Erie canal and paralleling the tracks of the New York Central, while the other will run through Canandaigua, Geneva, Seneca Falls and Auburn. Along this line I find that the Rochester & Eastern Rapid Railway has done considerable grading and expects to have the line to Canandaigua completed by spring and the rest of the line to Geneva by another year. The entire length of this line from Rochester to Geneva will be 41 miles and the fare 60 cents. The company will locate its power station at Canandaigua, using 10,500-volt three-phase current. The sub-stations will be located at Pittsfield, Victor and Seneca Castle. The rate of speed will be 25 miles an hour including stops. It has purchased a large tract of land on Canandaigua Lake which it will convert into a pleasure resort.

At Geneva it will connect with a line now in operation through Waterloo to Seneca Falls. To connect the Falls with Auburn it will be necessary to build a bridge over the Cayuga river which it is estimated will cost \$200,000. At Auburn an interurban road is now in operation 16 miles east to Skaneateles and the company is constructing the rest of the line to sales to Syracuse which it expects to have in operation by the first of the year.

Returning to Rochester, the Rochester, Syracuse & Eastern Railway Co. has received the necessary certificate from the Board of Railroad Commissioners to build between the two cities. Mr. C. D. Beebe, general manager of the company, informed me that the line will be opened for travel in two years time. It will be mostly upon private right of way and double track with rolling stock of the very best. It is expected to make the run in four hours.

Syracuse is not what might be called an interurban railway center. With the exception of the line to Baldwinsville (to be extended to Oswego) which has some pretty parks along its route and the line of the Syracuse & Suburban to Manlius running over a high elevation affording many beautiful views, the trolley

lines have no charms for the pleasure seeker. Syracuse and Utica must be connected say the enterprising street railway man, and by a double track with heavy rails, private right of way and the best equipment obtainable for through travel. This is being realized.

A year ago we knew the Oneida Railway Co. only as a horse railway running some three miles between the stations of the New York Central and the West Shore railroads. Times have changed for neither the old rails, cars or horses are seen on the street. Some enterprising western business men have not only replaced the old rail by an extra heavy girder, but are building westward as far as Canastota and eastward to Oneida Castle. This system will be in operation before the snow flies. The company is also acquiring the right of way from the latter place to New Hartford, there connecting with the Utica & Mohawk Valley Ry. which was controlled and is operated by the same parties.

The Oneida company will also build a branch to Syvian Beach, a very popular summer resort.

Rome, N. Y., is a good example of a city which on account of its size cannot maintain a profitable street railway. No road operated only within the limits of a city of this size can pay, and this road could only be made valuable through consolidation with an interurban company. The cars operated are of the compressed air type and three cars make the schedule trips. For some reason the city will not allow them to operate over a bridge.

From Rome through Utica to Little Falls will by another summer be one of the best interurban lines in this section of the country, the entire distance being double tracked with 70-lb. rail and over a private right of way. For a scenic route it cannot be excelled, and many historic spots lie along the banks of the Mohawk.

From Rome to Utica the route is through a fertile farming country and the large open cars seating 84 people give the traveler an opportunity to see the mountains and fields decked in their autumn foliage. From Utica to Herkimer the line follows the south side of the Mohawk river, along a high elevation from which a fine view is had of the valley below. From Herkimer the road will, when completed, cross over the valley to the north side by a trestle, now under construction, which will span the West Canada Creek and the tracks of the New York Central. There are 12 spans of concrete with a total length of 820 ft., the tracks of the New York Central are crossed by a steel span 225 ft. in length and 22 ft. high in the clear. The bridge will cost \$140,000. Upon reaching the high banks on the north side of the valley a magnificent view is presented. Down in the broad valley to the right peacefully flow the waters of the Mohawk and West Canada Creek; the shores are dotted here and there with comfortable farm houses and traversed by the numerous trains which run east and west over the tracks of the New York Central and the West Shore. There may also be seen any day canal boats loaded with lumber and drawn by three horses or mules. Few would realize that two of these boats contain something like from 280,000 to 290,000 feet of lumber. The scene as the car reaches Little Falls changes and the valley becomes narrower, and the waters flow over the frequent falls. This bustling little city is nestled in between great mountains of boulders giving it a very rugged background.

A company has been incorporated, called the Mohawk River Interurban, to connect Little Falls and Fort Plain by a trolley line. Nothing has as yet been done towards the construction of the road except making the preliminary survey.

Fort Plain, Cananoharie and Sharon Springs will eventually be connected, the Mohawk Valley Traction Co. having been incorporated for that purpose. Sharon Springs is a very popular summer resort and is today accessible only by the Delaware & Hudson Railroad in an indirect way from Albany. By the building of this electric line the Springs will be connected with the through system of the New York Central and there is no doubt but that it would be a very popular and profitable line. The New York Central people are very much interested in the building of this road as it would divert a large amount of travel from the Delaware & Hudson to its lines. I had a talk with Mr. Wm. Roser, secretary of the company, and he informed me that he has been trying for some time to obtain the necessary franchises along the line but has met with considerable opposition from the farmers en route and the citizens of the Springs who would, without doubt

receive the greatest benefit if the road were built. As the matter now stands nothing will be done until late this fall or next spring. Mr. John W. Boyle, of Utica, who is a large investor in the Utica & Mohawk Valley road is the prime mover in this project.

From Cananoharie to Fonda is the only place between Michigan and Maine that no attempt has been made to build in connection with the trunk line. From Fonda a line runs north through Johnstown to Gloversville, a distance of 10 miles. At Johnstown a line is now under construction and will be in operation within a very short time through Amsterdam to Schenectady following for a greater portion of the way the valley of the Mohawk. At Schenectady this line will connect with the system that now operates up and down the Hudson River for many miles. It is at this point also that one can ride over, as far as Albany, a distance of 17 miles, one of the best paying roads in the country, and I think the only interurban road whose revenue is obtained chiefly from business travel. The large number of people employed by the General Electric Co. and the Schenectady Locomotive Works, some 14,000 in all, has increased the rent of houses to such a price that many families have gone to live in Albany and ride back and forth each day to their work. The line between these two cities is double track and the cars, which are large and commodious, make the trip in forty-five minutes, al-

BENTLEYVILLE BRIDGE EASTERN OHIO TRACTION CO.

though the time could easily be reduced to thirty minutes. The road follows the old turnpike which is as straight as an arrow. The company is building many extensions; one is just completed to the aqueduct; it is about completing the one to Saratoga, there connecting with the system of the Hudson Valley Ry. Another line will shortly be in operation from Schenectady to Troy. There was a hard fought fight between the Hudson Valley and the Schenectady road for the right to build the line connecting the latter city with Saratoga but the courts decided in favor of the Schenectady Ry.

At Albany I found a very convenient waiting room and ticket office for the benefit of the patrons of the companies that make this city their terminus. The lines of the Hudson Valley Railway and the Albany & Hudson Railway & Power companies have been described in detail in the "Review." The Hudson Valley has a trackage right over the tracks of the United Traction Co. (of Albany) as far as Waterford, and from here the line runs through the picturesque and historic valley of the Hudson passing the battle grounds of Saratoga and Lake George. It is a direct competitor of the Delaware & Hudson Railroad with which it has had many a legal fight before the Board of Railroad Commissioners and in the courts. This is a thoroughly modern up-to-date road in every respect, its roadbed and luxurious upholstered parlor and observation cars are the finest in the country. The route along the main line through Glens Falls to the foot of Lake George, acknowledged to be the finest sheet of fresh water in the state if not in the country, has many attractions for the lover of natural wild scenery, all picturesque in the extreme, for it is a continual change; one moment you are following the deep

shores of the Hudson with many large water falls from which power is obtained to run the large manufacturing plants located along this section, while the next moment you are either looking out upon an open country with the waters of the river flowing calmly through the valley, or along one of the war trails with its many old taverns still standing. In addition to the numerous attractions which the natural scenery and the noted resorts of Lake George and Saratoga offer to pleasure travel, this enterprising company maintains three pleasure resorts each of which is equal to any resort maintained by a street railway in this section of the country.

Fort William Henry Park is located at the southern end of Lake George on which it borders. In this park stands the Fort William Henry Hotel, from which a fine view is had of the lake and the wild scenery of the Adirondaek mountains. The trip on the incline railway to the summit of Prospect Mountain is a big attraction in itself, and the view from the top overlooking the lake and mountains is one of the finest.

Ondawa Park, on the Greenwich line, and Kaydeross Park, located on the shore of Saratoga Lake, are both ideal summer resorts furnishing band concerts, vaudeville and comic operas, etc., for the entertainment of the road's patrons. The company does considerable freight business, and it also sells tickets to any point on its system.

Returning to Albany I took a trip over the great third rail system of the Empire State—the Albany & Hudson. After crossing the river from Albany into Rensselaer the tracks of the Boston & Albany and the New York Central are crossed by a steel viaduct 2,100 feet long which cost the road \$125,000. From here I was taken through a most beautiful and prosperous inland farming country. Cornfields, apple and peach orchards as well as large vineyards are passed in rapid succession. From the car is a fine view of the Catskill mountains on the right, while on the left may be seen in the distance the rolling hills of the Berkshires. It is the intention of the company to extend its line in the near future to the Massachusetts state line at Lebanon, there to connect with the proposed extension of the Berkshire Street Railway Co.

At Kinderhook Lake the company maintains a very popular summer resort. The line is 30 miles in length all of which is over private property. The cars are 53 ft. over all and are, I am told, heavier than the standard passenger coaches on the Boston & Albany road. Tickets are sold on this line for the convenience of the passengers. The line is a direct competitor of the New York Central as far as Hudson, the fare, 50 cents, being the same on both lines.

The Troy, Rensselaer & Pittsfield Street Railway Co. has been incorporated to build a line from the terminus of the Troy & New England Railroad at Averill Park to the Massachusetts state line, there to connect with the proposed extension of the Pittsfield company. I am informed by Mr. George F. Murray that the line will be completed and in operation next year.

To be continued.

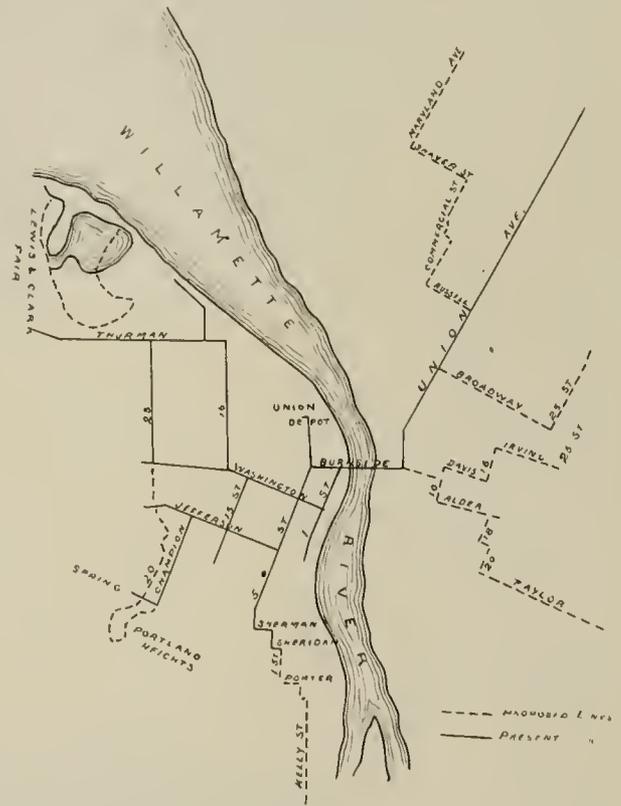

**MUNICIPAL ELECTRICIANS CONVENE AT RICHMOND.**

The International Association of Municipal Electricians held its seventh annual convention at Richmond, Va., October 7th, 8th and 9th, with a large and representative attendance. The delegates were welcomed at the first session by Governor A. J. Montague, of Virginia, and Major R. M. Taylor, of Richmond, who extended hospitality in the name of the city and state. Papers were read of the following subjects: "Municipal Inspection and Control of Electrical Matters," by Mr. Walter M. Petty, of Rutherford, N. J.; "Electrical Government," by Mr. Anton S. Hatch, of Detroit; "Relation of Electrical Interests to Other Branches of the Municipality," by Captain William Brophy, of Boston; "The Joint Use of Conduits," by Mr. Charles L. Hopewell, of Cambridge, Mass.; and "The Telephone Service in Connection with Fire and Police Signal Systems," by Mr. Jerry Murphy, of Cleveland. The privileges of the telephone, telegraph and street railway service were extended to the members by the courtesy of the American Bell Telephone Co., the Western Union and Postal Telegraph Co., and the Richmond Passenger & Power Co.

**PORTLAND (ORE.) RAILWAY COMPANY'S EXTENSIONS.**

The new franchise applied for by the Portland (Ore.) Railway Co., will, if granted, give that company rights on about 10½ miles of street not now occupied by its lines; it now holds franchises on about 17 miles of street. If the ordinance granting these franchises go through the council without delay, it will probably take two seasons to complete the extensions. The expenses of building the tracks and providing the additional rolling stock necessary to operate all the lines would require a new investment of about \$40,000. Other extensions are in view.

The most important change contemplated is the abandonment of the cable trestle to Portland Heights. The proposed extension out 20th St. to the heights will be just two blocks west of the present

SYSTEM OF THE PORTLAND RAILWAY CO.

line. It will also go about half a mile farther than the present line, reaching the very top of the hill.

The proposal for a South Portland extension is merely a renewal of the application that was presented two years ago for advancement of the line passing out Fifth St. In North Portland a franchise is sought for four blocks on Thurman St., in order to connect the present lines of the company and facilitate their operation. These two and the Portland Heights franchise are the only ones applied for on the West Side.

On the East Side a franchise is sought for a street railway from a junction with the Vancouver line, at Russell St., thence west and north a street distance of about 2½ miles. Another branch is projected from the junction of Broadway with the Vancouver line, east to 22d and north to Stanton, a distance of about 1½ miles. From the corner of Burrside St. and Union Ave., where the Vancouver line turns, an extension is projected six blocks east to Tenth St., from which point there are two branches; there will be about 3½ miles in these lines.

The Pittsburg Railway Co. for the past six weeks has employed 500 men and 50 teams in excavating for the foundations for its proposed new power house on Brimot's Island, which will be 100 x 500 ft. in dimensions and is to be in operation within two years. Specifications are being completed for the superstructure and machinery, and it is announced that 24 boilers and 6 engines will be included in the installation.

*David Gray*

*Wm. H. Gray*

## EDWARD F. C. YOUNG.

It has been said of Mr. E. F. C. Young that his career has been one typically American—energetic, arduous and successful. Born of humble Scotch-English parentage in Morris County, New Jersey in 1835, his life work has been largely confined within the borders of his native state, but to this concentration of his energies New Jersey may justly attribute the successful development of more than a score of her largest financial, commercial and public utility enterprises.

With a public school education as a foundation Mr. Young began his business life as junior clerk in the Hudson County Bank of Jersey City. Through the exhibition of executive abilities in many respects exceptional, he rapidly advanced from positions under the direction of others to offices where he himself became the one to direct and manage.

Through successive consolidations of banking interests in the eastern part of the state he assumed greater and greater responsibilities until in 1874 he was appointed cashier and in 1879 was made president of the First National Bank, the largest banking institution in the state of New Jersey. He still holds the office and may be found every business day in the week at his office in the bank in Jersey City, directing the policies and affairs of the institution.

Although Mr. Young is essentially a banker, this is but one phase of his activities. As exhibiting the wide range of his ability his management of the affairs of the Joseph Dixon Crucible Co., of Jersey City, may be cited. In 1881 this company, whose lead and graphite products are known throughout the civilized world, became involved in financial difficulties and Mr. Young was appointed receiver. With wonderful skill and sagacity he reorganized every detail of the business, paid off all obligations of the company and in 1891 turned the plant over to the owners as one of the foremost manufacturing industries in the world. Mr. Young was elected president of the reorganized Joseph Dixon Crucible Co.

Closely identified as he was with the business life of the community, Mr. Young early saw the possibilities that were to be opened up by the application of electric traction to the street railways of the state. He found time to devote to a study of street railway conditions and was interested in forming a number of the first companies operating in and around Jersey City and Newark, all of which were eventually merged into the Consolidated Traction Co., and finally into the North Jersey Street Railway Co., controlling 250 miles of electric railway in the territory named. Mr. Young is president of this company.

In his last annual report to the stockholders of the North Jersey Street Railway Co., Mr. Young was able to report gross earnings of the property for the year ending Dec. 31, 1901, as \$4,172,646, and a surplus after paying all expenses and fixed charges of \$133,769. The company has planned to spend \$1,000,000 in improvements during the current year, a portion of which will be expended in building a 17-mile belt line between the Pennsylvania R. R. station in Jersey City and Bergen Point. As announced in previous issues of the "Review" plans are also well under way whereby the lines of this company will make connection with the surface and elevated lines on Manhattan Island by means of a tunnel under the North River.

Mr. Young has held places in the directorate of nearly forty important companies including the United Electric Co., of New Jersey, the Butler Hard Rubber Co., several trust companies, the Jersey City Coal Co., the Standard Distilling & Distributing Co., and others.

He is a member of over a dozen social and political clubs and an officer of several. He was a presidential elector in 1880 and is actively interested in the affairs of the Democratic party in city and state.

The Valdosta (Ga.) Street Railway Co. has acquired the property of the Valdosta Poultry Co., amounting to about \$7,000, and comprising houses, pens, brooders, etc., and a stock of 1,000 fine chickens. According to reports the company will buy the stock in the road for the property of the poultry company. In connection with the Valdosta railway, Pine Park zoo is to be enlarged, and special attention will be given to the breeding of wild animals. It is proposed to make Pine Park one of the most attractive resorts in the South.

## DAVID YOUNG.

Mr. David Young, who is one of the successful street railway managers of the country, was born in Scotland, May 1849, but at an early age was brought to Newark, N. J., where he received a high school education and first began to gratify his ambition to become a civil engineer. During several years he was connected with various partnerships until 1893 when he entered the firm of Young & Borrie. Shortly afterward he became interested in street railway matters in his part of the state and was made general manager of the Consolidated Traction Co., of Jersey City. He is now vice-president and general manager of the North Jersey Street Railway Co., and president and general manager of the Jersey City, Hoboken & Paterson Street Railway Co.

The life of a street railway manager is never one conducive to the taking of one's ease, but in the management of these two important properties Mr. Young finds the fullest scope for the seemingly tireless energy which is characteristic of the man. His day's work frequently calls for his presence at his Newark office at 7:30 in the morning; at his Elizabeth office at 8:30; at his Jersey City office at 9:45, and at his Hoboken office at 1:30 in the afternoon. Although controlled by a community of interests the two properties are run entirely independent of each other. At his Jersey City office, Mr. Young is vice-president and general manager of the North Jersey Street Ry. At his Hoboken office he is president and general manager of the Jersey City, Hoboken & Paterson Street Ry. And his title of general manager is well given for he is manager not only when broad policies of action are to be settled but, as well, when the minutest detail of operation is in question.

Next to his capacity to do work Mr. Young's most striking quality is his genial good nature. It has been said of him that his is the heartiest laugh in New Jersey—a laugh that has nothing of hidden motive in it, but is the ringing expression of a man who loves his work, with malice toward none, and good will toward all. To the casual visitor, the supplyman, the political visitor, the person with a complaint, the man out of a job, and to all subordinates, he is always the same, easily approachable, genial in greeting, a sympathetic listener, and judge, whose decision is kindly and just but final.

Mr. Young is a believer in the future of the street railway industry and thinks the electric road is the most powerful advance agent of prosperity in this country. In his own words "the electric car is the chariot of the people and the pioneer of progress. Wherever it goes it carries growth and development. The electric car is revolutionizing social conditions." He also points out that the combinations of managements of electric roads that have been going on so rapidly during the decade have resulted in good everywhere, not only in securing faster development and better systems, but also in increasing the number of positions open to intelligent men and in giving greater opportunities for advancement.

Mr. Young was a member of the Newark city council from 1876 to 1882; president of the council for four years; and was elected a member of the New Jersey Legislature in 1882. For 25 years he was town surveyor for Harrison and Kearney, N. J. He is a staunch Republican.

Mr. David Young has been associated for many years in street railway matters with Mr. E. F. C. Young, but the two men, though of the same name, are not kinsmen.

### INCREASED POWER FACILITIES AT CHATTANOOGA.

An agreement has been effected between the Chattanooga (Tenn.) Electric Railway Co. and the Chattanooga Light & Power Co., whereby the latter will furnish power for the operation of the street railway system for the next seven years. In order to fulfill its contract the Chattanooga Light & Power Co. will double the capacity of its plant, installing a 300-kw. and two 700-kw. generators, which have been ordered and will soon be delivered. The present plant of the street railway company will be used as an auxiliary station, and combined, the two will furnish sufficient power for the operation of existing lines and the numerous extensions which the Chattanooga Electric Railway Co. contemplates making in the near future.

### POWER HOUSE AND THIRD RAIL SYSTEM OF THE BERLIN ELEVATED AND UNDERGROUND RAILWAY.

In addition to the description of the structure of the Berlin Elevated and Underground Ry. given in the "Review" for April, 1902, the following details in regard to the power house and third

and the other for closets, wash rooms and dressing rooms for the operating staff, these rooms being near the repair shop of the engine room.

The boiler equipment occupies a much larger space than the engine plant, therefore the whole of the first floor was not required for the engines even after allowing for future extensions. The engine floor is divided by a row of columns on one side of which is an intermediate floor used for a repair shop and the portion

BOILER ROOM—BERLIN ELEVATED AND UNDERGROUND RAILWAY.

rail system will be found of interest as this plant represents the most advanced electric railway practice in Germany. The power house is located near the center of the city at which place the greatest consumption of energy occurs. A continuous current of 750 volts is generated at this station and is conducted directly to the special contact rails and feeders along the tracks of the elevated and underground structures. The return circuit is through the track rails. On account of the cost of land in this locality the power station is built several stories high. The boiler equipment, which is located near the top of the building comprises six Gehrle boilers which operate at a pressure of 135 lb. Immediately above the boiler room is a system of Hunt conveyors for handling the coal.

The engines are located on the floor directly below the boilers, and the feed water is either pumped from the Landwehr Canal or from a tank into which the air pump discharges. The exhaust from the pumps is led into this tank and also the condensation water from the steam pipes. The feed pipes and steam pipes for these pumps are in duplicate to provide against any accident which might occur. The boiler room piping consists of a main ring pipe over the double series of boilers from which branches are carried between the boilers down to the engines. Cast iron bends are employed, the flanges being rolled on. The flanges are protected by removable caps and the whole system of piping is thoroughly insulated. The boilers are provided with superheaters which make it possible to raise the temperature of the steam to 440 deg. F. These superheaters are arranged so that the tubes are very near the fire and by operating a set of valves and filling the heaters with water they may be used to generate steam. The condensers, as well as the air and feed pumps are placed in the basement in an open space around the engine foundation. The air pump is operated by a small crank on the extended engine shaft and there are two tanks in the basement of the station connected with the canal in which the water stands on the canal level and which are connected by a pipe to the condensers. Each condenser has separate injector pipes taking water from the tanks, and the waste water is carried through pipes running back to the canal after first passing through a filtering well. The lower part of the chimney which cannot be used for draft on account of the location of the boilers, is divided into two floors, one of which is used as a store room

underneath this is used for the switchboards and electrical apparatus. The main portion of the engine room is again subdivided into two parts by a row of columns over one portion of which is a 15-ton crane and over the other side is a 20-ton traveling crane. These are operated by direct current motors.

The engine equipment consists of three direct connected units of a normal capacity of 900 h. p. and a maximum capacity of 1,200

VIEW OF COAL CONVEYOR.

h. p. each. These are of the vertical compound type and each is directly coupled to a Siemens & Halske shunt-wound dynamo. The engines run at a speed of 115 r. p. m. and were constructed by Borsig. The high pressure cylinder dimensions are 31½ and 50 in. by 29½ in. stroke. On the high pressure cylinders the valve gear is of the Collman type while on the low pressure cylinders ordinary piston slide valves are employed. There are two platforms

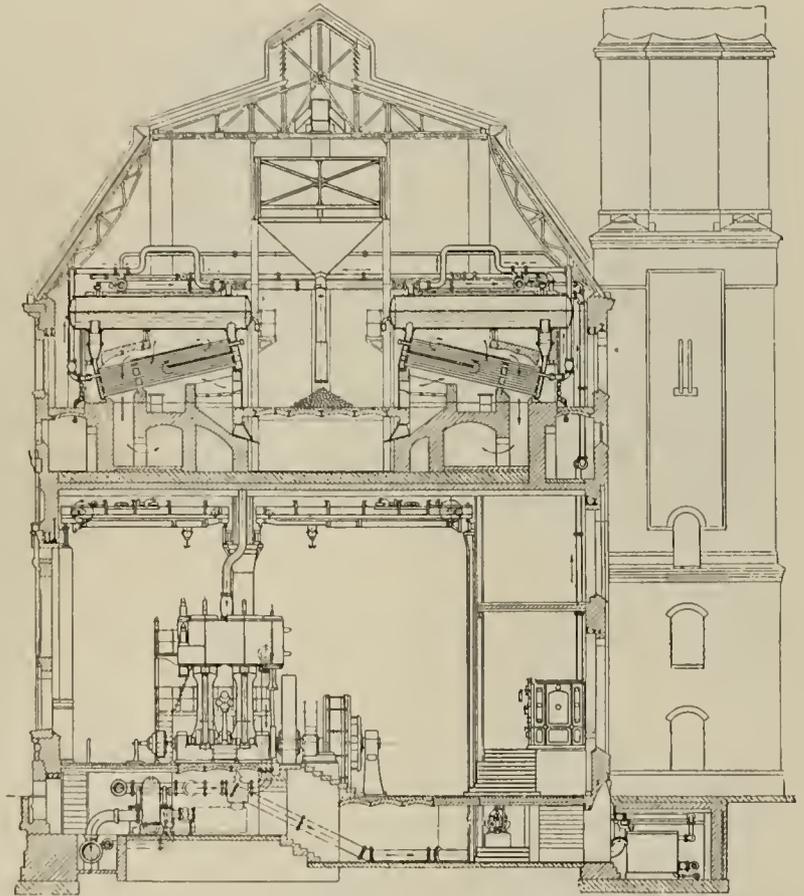

provided on each of the engines for use in adjusting and lubricating the various parts and these platforms are all connected together by iron bridges so that the attendants may pass from one engine to the other without descending to the floor. An extension of the engine crank shaft is provided for operating the governor. The fly wheels are started by a 20-h. p. motor-driven mechanism which is automatically cut out when the engine has attained sufficient speed. The fly wheels are enclosed in sheet metal which prevents the throwing of oil as well as the creation of draughts about the machinery. The generators are of the shunt wound, inner pole type with ring armatures and were specially designed by the Siemens & Halske Co. for this plant. Each of the dynamos has a capacity of 800 kw. and supplies continuous current at 750 volts.

The floor of the dynamo room, as will be seen from the cross section view of the plant, is somewhat higher than that in the engine room proper and all of the parts of the generators which require attention are within easy reach. The two floor levels are connected by stairways.

The main switchboard is mounted on a platform slightly elevated from the floor and is connected to the generators by heavy iron armored and lead covered cables. The switchboard contains the usual switches, circuit breakers, ammeters and volt meters. A small auxiliary switchboard is provided for connecting the main switchboard to the booster and storage batteries used for regulation and lighting. The storage battery has a capacity of 1,200 ampere hours and a small auxiliary motor generator is provided for raising the current to the potential necessary for charging. The storage battery used for regulation, as well as the lighting battery are placed in adjoining rooms in the arches of the overhead railway viaduct. The booster and battery are also used for driving the auxiliary electric motors used in the plant.

The third rails of this system are placed on the right hand side of the tracks in the tunnels and on the left hand side on the elevated structure. These conductor rails are raised about 6 in. above the tracks on the elevated portion and somewhat higher within the tunnel, and by this disposition of the third rail the automatic lighting of the cars in the tunnel is secured. The conductor rails are laid in 40 ft. lengths and have a cross section of  $5\frac{1}{2}$  sq. in. They are iron rails of the ordinary pattern connected by copper bonds

are lighted by incandescent lamps, three lamps of 220 volts being used in series. Where arc lights are used, 12 arc lamps having a difference of potential of 55 volts are connected in series and a compensating device is in use for taking care of the fluctuations.

SECTION OF POWER HOUSE.

The trains consist of three cars, the two end cars each being equipped with four motors, one on each axle. These trains will seat about 125 people and have standing room for about 50 more.

CROSSING OF CANAL, STREET AND STEAM RAILROAD.

at the joints and insulated by vulcanized rubber supports which are bolted to the superstructure. The main feeders are made of copper strip placed on edge and they have a cross section of from  $1\frac{1}{2}$  to  $2\frac{1}{2}$  sq. in. The overhead and underground stations

In addition to the air and hand brakes it is possible to short circuit the motors through resistances for obtaining an electric braking effect in case of an emergency. The motor cars are provided with signal lamps which are lighted automatically in the

day time when the car enters the tunnel. Electric heaters are used which are placed under the seats of the cars and the lighting is effected by two circuits each of 6 incandescence lamps. The motors have a capacity of 70 h. p. each and are operated by series parallel

SHOWING CONSTRUCTION IN TUNNEL.

controllers. The elevated structure is double track throughout, the rails being laid to standard gage of 1,435 meters and the two tracks being 3 meters apart. The sharpest curve has a radius of about 250 ft. and the heaviest grade is about 3 per cent.

#### PRODUCTION OF COPPER

The production of copper in 1901 is reported by Mr. Charles Kirchoff in Mineral Resources of the United States, 1901, now in press, United States Geological Survey.

The conditions surrounding the copper-mining industry during the year 1901 were in many respects extraordinary. Production was only slightly less than it had been in 1899 and in 1900, and consumption in this country was undoubtedly considerably greater. But a determined effort was made during the greater part of the year to maintain values in the face of adverse conditions in the countries which are the principal customers for our large surplus. Prices were kept above the parity of Europe, so that large importations were added to the supply. The result was an extraordinary accumulation of the red metal in the hands of leading interests. For a while co-operation between the principal producers was tried, and, when this failed, coercion was attempted by the breaking of the market toward the close of the year. This was preceded by a very serious decline in the shares of copper companies on both sides of the Atlantic.

The total production of domestic copper in the United States in 1901 was 268,782 long tons, as against 270,588 long tons in 1900. The amounts produced and the relative percentages of the total production of Lake Superior, Montana and Arizona were as follows:

Lake Superior, 69,772 long tons, percentage of total production, 25.9; Montana, 102,621 long tons, percentage, 38.2; Arizona, 58,383 long tons, percentage 21.7. Mr. Kirchoff discusses at some length the conditions and production of the mines in the Lake Superior district, in Montana, in Arizona, in Utah, and in Tennessee.

The total imports of copper in the United States in 1901, from all sources and in all forms, amounted to 124,938,323 pounds, as compared with 103,895,026 pounds in 1900, with 93,172,191 pounds in 1899, and with 50,268,499 pounds in 1898.

The total value of the exports of copper from the United States in 1901 was \$36,071,448, as compared with \$58,875,439 in 1900, with \$43,485,654 in 1899, and with \$35,545,251 in 1898. Germany is by far our largest customer for copper, since the greater part of the metal shipped to the Netherlands is in transit for that country; on the other hand, some of the copper which goes to the United Kingdom is shipped from there to other countries. The details of these movements cannot well be followed.

The estimated consumption of copper in the United States in 1901 was 382,761,014 pounds, as against 356,891,121 pounds in 1900.

The stock of copper on hand in the United States on January 1, 1902, is estimated as being at least 300,000,000 pounds, equivalent to six months' production. In the absence of figures which might be said to represent normal years, it is impossible to do more than make a guess at what might be considered the excess over a reasonable stock. It is probably fair to assume that, even at the beginning of the year 1901, the stocks of copper in this country were beyond the working limit.

The copper market opened in 1901 rather dull at the official prices of 17 cents for Lake and 16½ cents for electrolytic, but actual sales were made at 16⅞ cents for Lake, and at 16¼ cents for electrolytic. By the 13th of January, 1902, the official prices had fallen to 11¼ cents for Lake copper.

The world's production of copper in 1901 was 511,803 long tons, as against 487,206 tons in 1900, 463,693 tons in 1899, and 429,379 tons in 1898.

By far the most important of the new mines which have entered the world's market in recent years is that of the Greene Consolidated Copper Co., whose properties are located at Cananea, Sonora, Mexico. There is every reason to believe that, before the close of the current year, the production of this company will reach 4,500,000 to 5,000,000 pounds of fine copper per month. Such a rapid development has never before been witnessed in the copper-mining industry.

#### KANSAS CITY NOTES.

The site of the new power house of the Metropolitan Street Railway Co. occupies the space of nearly three city blocks. It is a clay bank about 100 ft. high and before the work on the power house can be begun this hill of clay must be removed. The work was let to a local contractor, who attempted to remove it by means of running water. He ran a pipe connected to the city water works along the top of the hill and allowed the water to run down over the side of the hill. Laborers stirred up the water and mud, which ultimately ran to a pump, where it was discharged into the river. This plan did not prove effective and the contractor, becoming discouraged, abandoned the job. The company then took up the work and under the direction of its chief engineer, Mr. Bacon, the pipe along the top of the hill was connected with a 4-in. hose which led down the bank, and was discharged through nozzles which threw it with great force against the side of the hill. This proved a more practicable plan and was so successful that the size of the upper pipe was increased to 12 in. and six 4-in. hose pipes are now employed in tearing away the bank for 24 hours a day. All the available teams in the city have been employed to assist in reducing the hill.

Several more or less serious accidents have occurred on the Ninth St. incline this year, and in order to reduce the possibility of such accidents in the future the company now runs two grip cars on each train running on the incline. The main line cars have been diverted to another route so that less than one-third the usual number of cars are now operating on the incline.

The city council recently passed an ordinance requiring cars to stop on the near side of street crossings. The public and the press, however, criticised the ordinance so severely that the same council was obliged to pass a new ordinance changing back to the farther corner method. It inserted a clause, however, that cars will be stopped on the near side only at points where railway lines intersect.

Labor and teams are reaping a harvest in Kansas City this season, the prevailing price being \$1.75 and \$2.00 per day for labor and \$3.50 to \$4.00 per day for teams. On city work these prices are paid for an eight-hour day.

The South Jersey Gas, Electric & Traction Co., of Camden, N. J., has awarded the contract for the erection of a group of new buildings, which will comprise a three-story warehouse, 59 x 66 ft.; a two-story stable, 102 x 34 ft., and a blacksmith shop, 45 x 34 ft.

An unusual accident is reported from Ithaca, N. Y. A fare register, weighing 20 lb., fell from its position at the top of a car as the latter was rounding an abrupt curve, and struck a woman passenger on the head, stunning her, but fortunately, not causing a serious injury.

**FRANCHISE OF THE INDIANAPOLIS TRACTION & TERMINAL CO.**

The organization of the Indianapolis Traction & Terminal Co. for the purpose of building a system of tracks and passenger and freight terminals for the several interurban lines entering Indianapolis, was described in the issue of the "Review" for August, page 496. This terminal system is to be used by the Union Traction Co. of Indiana, the Indianapolis Northern Traction Co., the Indianapolis, Lebanon & Frankfort Railway Co., the Indianapolis & Martinsville Rapid Transit Co., the Indianapolis & Plainfield Railway Co., the Indianapolis & Eastern Railway Co., the Indianapolis, Greenwood & Franklin Railroad Co., and the Indianapolis, Shelbyville & South-eastern Traction Co.

The franchise, which was granted on August 4th, authorizes the company to construct, own and maintain a single or double-track surface street passenger railway system, to be operated by electricity or other improved power to be approved by the Board of Public Works, on thirty streets and avenues named in the city, and the company as part of the consideration for the grant, expressly disclaims any right to use any street or avenue except such as is named in the franchise. The company shall not have the right to build or operate any line of street railway except such as is specifically named. The operation of any line which may hereafter be built may be discontinued only with the consent and authority of the Board of Public Works, and in case of such discontinuation, the company shall restore the street vacated to a good condition. The tracks shall be laid so that the center line in case of a single track, or the center line of the space between the tracks in case of a double track, shall be the center line of the street. The tracks shall be of the same gage as the tracks of the Indianapolis Street Railway Co. and shall be so constructed that they may be physically connected with the tracks of the latter company at intersecting points.

The franchise gives the new company authority to sell, lease, or otherwise dispose of the system of street railways which it may construct, to the Indianapolis Street Railway Co., and authority is also given the new company to purchase, lease or otherwise acquire from the Indianapolis Street Railway Co., any part of its system of street railways, power houses, car barns and other property.

Under the terms of the franchise, the new company agrees to construct and equip a large portion of its road so as to be ready for operation within 12 months. Other portions of the road are specified to be ready for operation within three years and five years respectively. A five-cent fare and universal transfers are also prescribed. The new company agrees to construct within 18 months from the date of the franchise, a suitable and commodious passenger terminal to be located within a certain prescribed section of the city, which shall be accessible to any suburban or interurban railway company, either directly or by means of lines to be constructed. This terminal is to be used by all of the suburban and interurban railway companies for the purpose of passenger traffic, without discrimination in favor of or against any of these companies, and for such compensation as shall be agreed upon for the use of the tracks of the new company.

The right to the use of the terminal station shall be upon condition that the compensation for such use shall be paid when it becomes due and that reasonable rules and regulations shall be conformed to, and that for failure to pay or to conform to such rules, the suburban or interurban company so failing, shall be excluded from the use of the station.

An emergency repair fund is to be kept on deposit in the city treasury, to be drawn upon by the Board of Public Works when an emergency arises calling for immediate repairs of any dangerous defect in any street or avenue required by the franchise to be kept in repair by the new company.

In case of any improvements in the pavements of streets or avenues occupied by the company's tracks, the company agrees to pave that part of the street bounded by its outside tracks, in the same manner and with the same material as is used on the other part of the street, and that such improvement by the company shall be completed at the same time that the improvement by the city shall be finished.

The franchise requires the new company to make reasonable extensions of its several lines when required for the convenience of the public and authorized by the Board of Public Works. When the board shall have ordered such an extension or new construc-

tion, fixing the time of its completion, the company must forfeit to the city the sum of \$50 for each day that the completion of the new work is delayed beyond the date ordered.

The company is authorized to carry baggage, freight, express and mail in separate compartments of the passenger cars or in freight cars. No live animals except hunting dogs may be carried in any of the cars, and all baggage, express matter, parcels and articles of merchandise must be delivered at the terminal station for distribution. No express or baggage shall be loaded or unloaded upon any of the streets or avenues of the city except at the station or terminals. Fowls properly secured in boxes may be carried in the cars between the hours of 12:30 and 4:30 a. m.

Until the station for the receipt and delivery of freight shall have been provided the company may use the dead track of the Indianapolis Street Railway Co. for loading and unloading freight, provided the selection of the dead track shall be approved by the Board of Public Works, and that the cars shall not be allowed to stand more than 15 minutes at any one time in loading or unloading. The city reserves the right to regulate or change the route of cars operating through the city, used exclusively for carrying mail, express or freight, but only in such a way that such route will connect with the other part of the line on which the company enters the city, and at the same time connect with the terminal station. The rates charged for either freight or express shall not exceed those charged by any other common carrier for similar matter. The companies shall not, however, be required to charge less than 80 per cent of the published rates now charged by other common carriers.

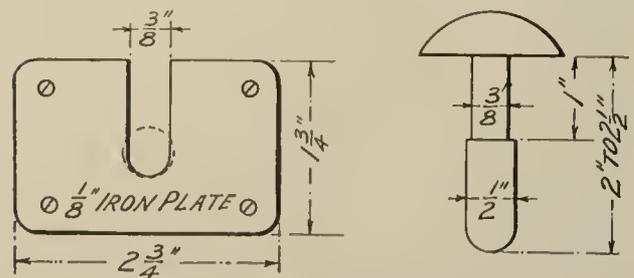

Each of the suburban or interurban companies, with the exception of the Union Traction Co. of Indiana, binds itself to pay one cent for each round trip made by any of its cars during the life of the franchise, and the city cannot charge more. The franchise terminates April 7, 1933.

The Indianapolis Street Railway Co. and the Indianapolis Terminal & Traction Co. have the right to exclude interurbans from their tracks if the latter do not pay the rates agreed upon for the use of the tracks of the two local companies.

**ONE OF THE LITTLE THINGS.**

The foot plunger for ringing the platform gong of a car is a small detail, but it very frequently becomes annoyingly conspicuous by its absence. The plunger hole in the platform sometimes wears away sufficiently to let the plunger drop through; or the men in cleaning the car may knock the plunger out and it becomes lost.

This petty annoyance can be avoided by placing over the hole a small iron plate having a narrow opening through which the plunger

FOOT PLUNGER FOR RINGING GONG.

works. For the suggestion and the sketch we are indebted to Mr. J. C. Sherrill, barn electrician for the Charleston (S. C.) Consolidated Railway Gas & Electric Co. The iron plate is about 2 3/4 in. long, by 1 3/4 in. wide, and is 1/4 in. thick. The slot or opening in the plate is 3/8 in. wide by about 1 in. long. To prevent it from working out of the opening the plunger is cut down to a diameter of 3/8 in. for a distance of 1 in. below the head. It is then placed in the slot and the plate is screwed down over the hole in the platform. The plunger is free to move up and down within the limits of an inch, but it cannot be removed from the hole without unscrewing the plate.

The Chicago Union Traction Co., on October 1st, put a new rule into effect, granting half fares over its lines on the West and North-west side to children between the ages of 7 and 11 years. Children less than 7 years of age will be carried free.

## STREET RAILWAY CONSTRUCTION.

An interesting series of papers were recently read before the Boston Society of Civil Engineers which have been published by the Journal of the Association of Engineering Societies. The papers were as follows:

"The Street Railway System of Providence, R. I., and Vicinity," by George B. Francis; "Street Railway Track Construction in City Streets," by Arthur L. Plimpton; "The Relation of Street Railway Tracks to the Paving of City Streets," by Henry Manley; "Track and Overhead System for an Interurban Electric Railway," by Gilbert Hodges; "Street Railways and State Highways," by Harold Parker.

In the paper on the street railway system of Providence the author stated that the system was first put in operation in 1805 and now consists of 270 miles of track, 743 cars and 2,100 employes. This system includes the lines of the Union Railroad Co., the Pawtucket Street Railway Co., the Rhode Island & Suburban Railway Co., and the Interstate Consolidated Street Railway Co. These four operating companies are all controlled by the United Traction & Electric Co., of New Jersey, and are under the management of the same officers.

There are no less than 27 kinds of rails in the main tracks, not counting the variety of guard rails, etc., in the special work, and a number of improvements in the track work are contemplated and under way. These consist of the placing of concrete beams under the rail and avoiding ties altogether in some instances; the placing of at least 1 ft. of gravel ballast under the ties in all track instead of using whatever material happens to be convenient; the decrease in the spacing of ties to about 22 in. between centers; the increase in width and length of ties to not less than 7-in. widths and 8-ft. lengths; the placing of guard rails on all curves of less than 600-ft. radius; the placing of the switch tongue on the opposite side from usual practice in many cases so that the main track will be free from the tongue; the adoption of a lock for switch points as soon as a suitable method can be found for the various conditions; to locate interurban lines, as far as possible, on private right of way so that control may be had over grades, alignments and drainage as well as speed of the cars; to avoid sharp curves and reverses in curvature as far as possible; to improve the usual country bridges so there shall be no question as to the sufficiency of their strength; to improve private bridge floors up to the standard reached by steam roads; to eliminate the mate, so called, wherever possible and to use double-point switches connected together, thrown by a stand and capable of being locked.

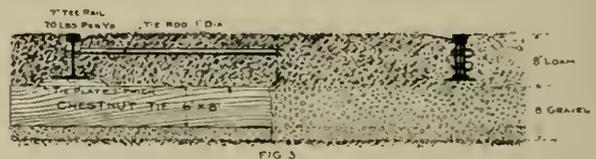

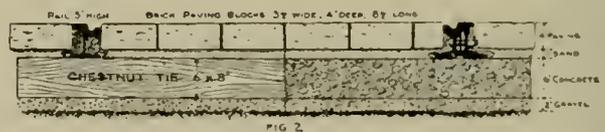

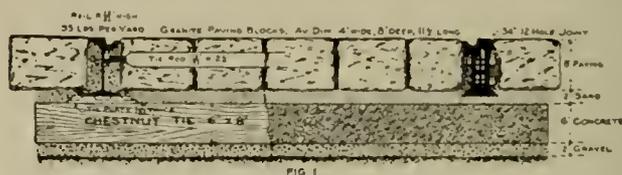

Much trouble has been experienced with chipped flanges, due to running over special work, as it has become the custom in street railway construction to build special work in such a way that when the wheels pass over the mates and frogs they bear on the flanges, thus avoiding the pounding over the break in the rail. While with light horse cars this may have been defensible, with heavy cars which must go through the city streets at moderate speeds and run upon the suburban and interurban tracks at high speed it seems wholly indefensible. At present the chipping of the flanges is a very serious matter and the only reason for building special work in the manner mentioned has been to prolong the life of the track. This is now being done at the expense of the life of the wheels. The only way which comes to mind of avoiding this trouble is the widening of the treads of the wheels from the present widths of 2¼ in. or 2½ in. to 3 in. or more so that by reason of the additional width the wheel may still bear on one portion of the frogs or mates until it laps over the space and begins to bear on the other portion. This is the reason why steam railroad wheels do not drop into the frog openings, and it can be applied to street railroads. This remedy involves care in paving outside of the rails so that the wheel will not have to run upon paving obstructions.

The author then touched upon the car houses and repair shops of the system, which were fully described and illustrated in the "Review" for May, 1902, page 255, and the freight and express service described in the "Review" for June, 1902, page 341.

## STREET RAILWAY TRACK CONSTRUCTION IN CITY STREETS.

The author did not attempt to discuss street railway track construction in general, but confined himself to the track construction of the Boston Elevated Railway Co.'s system. After describing the

well-known early forms of rails used in horse car service the author led up to the deep girder rail, which was designed to allow paving with granite blocks. The accompanying illustration shows the standard track construction which has existed since the 9-in. rail was introduced. On top of the tie there is a plate of cast iron about 1½ in. in thickness, so that with the rail, which is a little less than 9 in., we have a height of 10 in. The plate has the added advantage of backing up the spikes and holding them against the base of the rail. When the city first began to put in concrete foundation and apply it to the streets where tracks existed it was found that this form of track construction was admirably adapted to the new conditions as the depth to the bottom of the tie, about 16 in., agreed exactly with the depth to the bottom of the grade, and no change in the track construction was necessary. Experience here has proved that there is absolutely no advantage in concreting under the tie. The track construction is bonded to the rest of the street by the tie being bedded in the concrete and if there is any settlement of the street below all will go together, and this would occur even if there was a bed of concrete under the tie. The tie rod, which is one of the most important parts of the track and which is required in order to hold it absolutely to gage has been largely increased in size since the days of horse cars and is now made 1 in. in diameter at the threaded ends. This not only is sufficient to stand the

strain, but allows something for rusting so that the rods remain effective and last as long as the rest of the track.

The joints in this rail are fish-plate joints, using 12 bolts. The center of the fish plate is made to bear against the rail; and if that point should meet the web of the rail before the plates come to the proper bearing at the head and base of the rail, the strain of the bolts would bring it to a bearing by bending the plate. It is designed to just touch there when the plates are in their final position.

The form of construction already described which lent itself so admirably to the granite pavement is of much greater depth than is required for the asphalt pavement. There are 3 or 3½ in. of asphalt and then 6 in. of concrete, so that when certain streets were first laid in asphalt it made all the concrete come above the tie so that it was in no way bonded to the track construction. In order to secure permanent track the railroad company decided to carry the concrete to a greater depth in the track than in the rest of the street so that it would be flush with the bottom of the tie. This method has been followed during the last three years, but is, of course, a very expensive construction. It gives a depth of solid concrete between the ties and adds about \$1,100 or \$1,200 per mile to the cost. It is obvious that if a number of miles of track were to be laid a rail not over 5 in. in height which would bring the top of the tie up nearer to the top of the concrete, would give a much more economical construction. The depth of 9 in. for the rail was made necessary only by the depth of the granite block pavement. This 10-in. construction, as it is called, laid with granite blocks on gravel base, costs at present prices about \$18,500 per mile of track in a paved street, where the city paves the roadway and the center between the tracks and the company paves the part

that comes in each track. Similar pavement, laid with pitch and pebble joints on concrete foundations, costs about \$23,400 per mile. The asphalt track is the most expensive, costing about \$26,600. The brick costs less than granite blocks, about \$22,500.

In the outlying tracks of the system where a reservation has been constructed in the roadway, another form of track construction has gradually been introduced which permits all pavement to be dispensed with. It is considered desirable to make these reservations grass areas and thus reduce the dust-bearing area of the street. At first it was thought that here was an opportunity to take up regular steam railroad construction and a T rail was laid in a number of cases in the earlier reservations, but this did not give a sufficient depth over the ties for the raising of grass. The 7-in. section of T rail has been finally adopted, laid on a 1-in. cast iron plate, giving a depth of 8 in. of loam over the ties. This gives a very elastic track and the difference can be noted at once in passing from a solid-paved track to a reservation track.

The author spoke of the welding of joints and said that while at first the process did not prove entirely satisfactory it had been of late years perfected to such an extent that it gave excellent results. The necessary plant, however, for carrying on this process is very expensive and a railroad can scarcely afford to own one for its own use. Furthermore, the track foreman should have it in his power to renew a worn or defective rail and put in a standard joint which would be out of the question with any form of welding, so the joint question appears to be still an open one. The joints used in the Boston subway seem to be nearly fulfilling all requirements. It is a fish plate carried around under the rails so as to provide a base support.

The first improvement in special work was to make it after the general idea of steam railroad work, that is of rails of the desired length and angles bolted together. This improvement was, therefore, a substitution of rolled steel in place of cast iron. The trouble with this class of work was that before it wore out the action of the cars would loosen the fastenings, and as in paved streets the fastenings are difficult to get at, the special work was often broken before it could be fastened, and was then beyond repair. The next step in the line of improvement was producing a solid frog, which was done in two ways. One, by making the center of the frog a steel casting and then welding on the arms, while another consisted of rails cast together by a mass of cast iron so as to give treads of rolled steel all through the frog. The defect which first appeared in this type of special work was actual wearing out of the frog centers, after which a new form of frog called the hardened center frog was offered. This form had a plate of Harveyized steel set into the center of the frog at the point of greatest wear, and these centers proved to be even better than rolled steel. After using the Harveyized steel centers for a year or two a form of construction appeared in which frog centers and parts of switches subjected to the greatest wear were made of manganese steel. The latter is still in use and has been brought to a condition that is difficult to improve upon.

#### THE RELATION OF STREET RAILWAY TRACKS TO THE PAVING OF CITY STREETS.

In the eye of those having the care of city streets, the rails of the street railway tracks are a nuisance; but, as they are permitted by the state, which is the owner of all streets when there is anything to give away, it becomes the duty of the officers of the city, with such co-operation of the railway companies as they may secure, to reduce and abate in part the nuisance which they cannot absolutely control.

The direct connection of the engineering department of the city of Boston with the street railway tracks began in 1891, at which time the street department called upon the engineers for assistance, and since that time substantially all new track work and renewals have been laid to grades furnished by the city. Previous to that time the railway engineers graded their own tracks and endeavored to fit the surface of the street as they best could, while maintaining a practicable grade upon which cars could be run.

There was a general lack of co-operation between the city and the railway; and when one corporation desired to reconstruct a street surface, the other was seldom ready, and the result was that the rails were fitted to the street, and later the street fitted to the rails, and as each work settled more or less, after the round had been repeated times enough, the tracks in the middle of the street were frequently found to be lower than the gutters. Latterly, the city

and the railroad have worked more in harmony, but in rearranging the surface of the streets it has not infrequently been necessary to raise the tracks a foot or fifteen inches.

The form of the head of the rail used is a very important matter to the street surface. The desirable features are: As narrow a head is feasible, with the necessary groove or slot for the flange of the wheel made as narrow as may be, so as to keep wide tires out of it altogether, and of such shape as to enable a narrow-tired wheel to turn out of it easily without a wrench. The sides of the rail on each side of the groove should be of equal height, so that the pavement may be smooth.

The standard rail used in Boston does not absolutely conform to this specification, but is a compromise between the tram rail (which has no groove at all and has a difference in height of about an inch and a quarter between the two levels) and the full-grooved rail with sides of equal height. The difference in height of the two sides of the Boston standard rail is about  $\frac{1}{2}$  in. The full-grooved rail is very extensively used, however, both in this country and in Europe.

The next point in which the tracks affect the maintenance of the street surface is the stability of the track structure. In this matter it has been necessary for the street railway engineer to make a radical departure from the practice of the steam railway engineer. Instead of purposely building an elastic track, the street railway engineer reverts to the primitive idea in tracks and builds a solid and immovable structure. In a well-built track the rail is so deep and the ties so near together that there is no perceptible spring to the rail, and the more solidly and firmly the ties are imbedded in concrete, instead of the loose ballast of the steam track, the longer and better do the rails and ties wear. It is left to the springs of the cars to furnish the desired elasticity. It is apparent that a street in which this kind of track has been built can be surfaced with almost any paving material without much fear of a dissolution of continuity between the track and the rest of the street; but no form of pavement will stand up in contact with an elastic track, and the attempt to find a pavement that will do so, or to persuade different kinds of pavement to do so, has caused endless trouble.

It is the general practice to lay a narrow brow of stone blocks outside the rails in all asphalt pavement, and either to do the same on each side of the rail or to pave all the space from out to out of rails with granite blocks or bricks. It must be remembered that the asphalt part of an asphalt pavement is only a carpet, and is very friable. It is very likely to fray out next the rail, even when the tracks are solidly built. It does just the same when laid against the stone block brow, perhaps not quite so quickly or generally; but by so doing the weak spot has been removed from the area of pavement for which the railroad corporation can be held responsible.

The street railway tracks interfere with the surface drainage of streets built on side hills or on irregular ground, for the reason that nothing short of a flood will cross the track. In a few places drain inlets have been placed between the rails and in a few other places the rails have been furnished with openings at the bottom of the groove, thus providing outlets to be connected with drains.

Substantially all the railway tracks in Boston are paved. In macadam streets, where the ties are not imbedded in concrete, it is necessary to lay a strip of pavement, usually stone blocks, outside each track, wide enough to cover the ends of the ties and to form a bridge or connecting link between the tracks and the macadam. A double track, with its paved strip or brow, occupies about 18 ft. in width. The minimum width of a paved gutter is about 3 ft. or 6 ft. for both gutters, making 24 ft. in all. A street 60 ft. wide has a roadway, between curbs, of 40 ft. If a double railway track runs through it, there will be left two strips of macadam, each 8 ft. wide. Even this is too narrow a strip to maintain at average expense, and any street less than 60 ft. wide must be paved with something beside macadam from curb to curb; not because it is desired, but because of the street railway.

The cost of repairs of any street of moderate width carrying railway tracks is increased, first, by the concentration of the traffic, as teams avoid the tracks; and still more markedly by the formation of ruts and grooves caused by teams moving in parallel lines and all in one direction on each narrow strip of pavement. The extra cost of these repairs is somewhat a matter of conjecture, but it is probably that the cost of maintenance in macadam streets is at least doubled by the presence of the tracks.

## TRACK AND OVERHEAD SYSTEM FOR AN INTERURBAN ELECTRIC RAILWAY.

### Roadbed and Track.

A modern first class and fully up-to-date interurban electric railway should have a location that will admit of the most direct route with as few curves as possible, and so laid out as to grades as to have them as easy as possible. In arriving at this condition, it has been found not only desirable, but most economical to purchase private rights of way, make heavy cuts and embankments and build costly bridges and culverts. The cross-section of the roadbed at subgrade should give a full and sufficient shoulder, beyond the ends of the ties, of not less than 4 ft. on each side. There should be provided suitable drainage or culverts under the track wherever water is liable to accumulate to prevent washouts.

All bridges should be well designed by a competent engineer, and made strong enough to carry a car weighing 40 tons on a 17-ft. wheel base, with a sufficient factor of safety to avoid material tax upon any portion of the structure. If the bridges are to be of wood, they should have short spans of from 12 to 16 ft., and where several spans are required they would naturally have either pile or timber trestle bents. All timber, entering into the framing of a bridge should be of long leaf southern pine of the best grade to be obtained in the market, well framed and thoroughly fastened in every way.

Where piles are used they should be of upland white oak, if possible to obtain it. Red oak, chestnut oak and chestnut do not make satisfactory or durable piles. No piles grown in swampy or low-lying soils should be allowed, as they will generally be found to have a coarse, spongy wood which is sensitive to moisture and liable to early decay. Great care must be used in the driving of piles, to see that they not only reach a firm foundation, but also that they are not split or broomed at the small end by injudicious hammering. This work should always be done under the inspection of a competent engineer. Where steel bridges are used, they should be either of eye beams, plate girders, riveted trusses or pin and link trusses. Eye beams of proper size and number may be used with safety and economy for spans as high as 30 ft., plate girders from 30 to 100 ft., and riveted trusses from 100 to 200 ft. For all spans over 200 ft. in length the best practice is to use the pin and link truss. All bridge floors should have ties not less than 10 ft. long and spaced not farther apart than 8 in. in the clear. On the outer ends of these ties there should be a guard stick, gained down between the ties and securely bolted to every third or fourth tie. The office of these guard sticks is not, as is generally supposed, to prevent a derailed car leaving the bridge, for the stick is generally so placed that, should the car go so far as to reach it, the tendency would be for the car to topple over the side, regardless of this slight obstruction. The guard stick is intended to serve as a spacer for the ties, and to keep them in place longitudinally, so that they shall not bunch up. Hence the importance of having the guard sticks gained down not less than an inch on the ties. For the purpose of keeping a derailed car from leaving the bridge, a heavy rail should be placed inside each track rail spaced about 8 in. away from it, and securely spiked and fastened to the ties. These rails, if properly spaced, will permit of a car dropping between them and the track rail, and will generally keep the car in that position, thus carrying it along in the direction of the track and preventing its leaving the bridge or striking the trusses. Guard rails should extend for a distance of not less than 60 ft. from each end of the bridge, and then be brought to a point at the center of the track. No bridge, however small, should be without a protection of this kind. Assuming that the roadbed has been carefully graded and brought to subgrade, and the drains, culverts and bridges built, we then come to the work of track laying.

On the subgrade, as prepared, are laid the ties, which should be not less than 6 x 6 in. and 8 ft. long, of good sound chestnut, if possible to obtain. Ties should be hewn rather than sawn, and should be straight and lie level and true on their beds. They should be spaced not more than 2 ft. on centers. To these ties are spiked the rails, which should be of a good section of T rail, weighing not less than 60 lb. to the yard. Most interurban roads use 70 lb., and some use 75 and even 80 lb. These rails should be 30 ft. in length, and should have an improved joint, such as the "Continuous" or the Weber joint. Joints need not be over 24 in. long if of either of the two kinds mentioned. Too long a joint is as

detrimental to track as is too short a joint. These joints may be laid squarely across the track, or they may be staggered or broken, as desired.

The discussion on this question is still going on, and each side has many sponsors.

An allowance for contraction and expansion should be made at every joint, usually about  $\frac{1}{8}$  in. for every 30-ft. rail laid at the average temperature. The spikes should be 5 $\frac{1}{2}$  x 9-16 in. and of the best quality of tough material. There should be four spikes to each tie; those on the inside so driven that they do not come directly opposite those on the outside of the rail. Very careful and thorough driving is quite essential. In placing the joint plates in position, care should be taken that they have a good bearing upon the rail, the nuts screwed up on the outside and the whole joint made rigid and firm. Care should be taken to have gage lines of the two rails coincide at all joints.

After the rails have been spiked to the ties to a true gage the ballast should be put in place. The ballast should consist of good, clean sharp gravel or of broken stone of a suitable size, and should have a depth of 2 ft. and extend for at least 2 ft. beyond the ends of the ties. In bringing the track to its proper surface and alignment shovel tamping may be allowed, but no shovel tamping should ever be allowed on finished work. After the track has been thoroughly tamped, the ballast should be rounded off on the sides, and the entire roadbed left in a neat and smooth condition.

When the track has been made secure in true line and surface, the electrical connections may be made. All holes for electrical connection should be carefully drilled, and they should be reamed out or otherwise made bright and clean throughout their perimeter, immediately before the bond is applied. There should be two rail bonds, of not less than 0000 capacity each, at every joint; and cross-bonds of the same capacity should be put in place, one in every 300 ft. These bonds should not be applied by hammer riveting, but should be put in place by pressure, either of screws or by hydraulic pressure, to insure their best possible contact. The track return, on electric railways, has so far not proved entirely satisfactory. Various attempts have been, and some are now being made, to discover a more practical and more reliable means of carrying the current by the joints, but so far it does not appear that any better means have been devised than that described herein; and therefore, with the knowledge that the best we have is not absolutely certain to keep up the voltage a long distance from the sources of power, it is evidently wise for us to use the best methods and best appliances that have so far been found.

All curves of 500 ft. radius or less should be well guarded, not with another rail or other makeshift, but either by a bolted-on Z guard or by a rolled guard rail. On curves of very short radius, both rails should be guarded, and wherever it is possible all curves should be well elevated, to insure the safe and comfortable passage of cars at high speed. Curves of sharp radius should be either compounded or laid with spiral or easement curves at their ends. The turnouts or side tracks for interurban roads should have split switches of the Lorenz or other similar pattern, with spring frogs, and their leads should not be less than 60 ft. Wherever the car houses are located, their switches, curves and connecting tracks should, if possible, lead out of a side track or turnout rather than out of the main line. Wherever cross-connections are used in double track lines, they should if possible be trailing cross-overs, so that cars running on their proper tracks would pass through the heel of the switch first.

The summing up of our remarks on track work will be, then: Prepare a good foundation; use large ties, close together; lay thereon good heavy rails; have plenty of good ballast, well put in place; make the best possible electrical connections and slight nothing; do not for one minute forget that good, substantial, well-laid track is a vital factor in the economical operation of a road and is a large factor in the earning capacity.

This is not imagination. The wisest railway operators are of this opinion, although a realization of its truth came very slowly, indeed, to some of them.

### Overhead System.

Next to the track work, in the construction and equipping of an electric railway, comes the overhead system. In overhead construction the first item to be considered will naturally be that of poles. These should be of good, sound chestnut, if possible to obtain, and

unless otherwise restricted by local requirements. Hard pine poles are to be avoided wherever and whenever possible, as they are often very short lived and therefore very expensive to maintain, as well as being somewhat more costly at the outset. If square or hexagon poles are absolutely required, within the limits of cities or thickly settled villages, it will be found to be economical to obtain good-sized chestnut poles and have them sawed into shape, for they will have the longer life. We know of one urban road in this state, that now has large numbers of this kind of poles, and they have found them to be entirely satisfactory, so far as we have been informed. All chestnut or round poles designed for an interurban railway should not be less than 35 ft. in length. They should finish not less than 7 in. in diameter at the small end, and should be no less than 10 in. in diameter 7 ft. from the butt or large end, and they should be straight and sound. Hard pine poles, if used, should be of good, sound long leaf southern pine, 10 x 10 in. and 35 ft. long, with tops not less than 7 x 7 in. The poles should be fitted with two cross-arms, to provide properly for both direct and alternating current transmission wires as well as the necessary telephone and block signal circuits. These cross-arms should be of such sizes and so arranged as to meet the requirements, which would probably not be the same on any two roads. Generally it is thought well to have one two-pin arm above and one four-pin arm below. It is hardly necessary to say that cross-arms should be so placed as to come on opposite sides of adjacent poles, in order to form what is known as a storm line. Locust pins are used on straight lines, and iron pins or guard pins should be used on all curves or wherever any unusual strain is brought upon the pins. All poles should be well galled and roofed, and entirely stripped of bark before setting. They should be well set to a true line, and with sufficient rake to present a good appearance when the line work is finished. Poles should be 6 ft. in the ground on straight lines, and at least 7 ft. on curves. The earth or other filling should be well and thoroughly rammed around the pole, so that it will be firmly bedded and held solidly in place. No pole should be placed less than 5 ft. from the nearest rail and no two poles should be further apart than 100 ft. Some interurban roads have cross-suspension or span wire construction throughout, on account of the heavy trolley wires and the correspondingly heavy overhead material. Where brackets are used, the flexible or Craighead type has been found to be the best. They should have extra heavy brace rods, and be not less than 9 ft. long. They should be securely fastened to the poles at a uniform height from the rail. Spans should be made of seven-strand 5-16 in. wire, all guy wires of No. 4, and all anchor and pull-off wires of No. 6, best grade of galvanized wire, fastened to the poles by 5/8-in. eyebolts with 5-in. thread. It is considered good practice to have two trolley wires on long distance interurban roads. They are generally of large size, either 000 or 0000, and of a grooved pattern. The wire should be hard drawn and of not less than 95 per cent conductivity. They should be strung not less than 18 ft. above the rail, and may be placed higher. Grooved trolley wires are supported by mechanical clips of brass or composition, of a length sufficient to produce an even surface for the wires. First-class hard rubber or compressed mica, surrounding the metallic portion of the hanger, is considered the best insulation. The very best overhead material that is made is none too good, and quality and durability, rather than price, should govern in the selection of all overhead material.

The feeder and return wires may be of copper or aluminum. The latter is very much lighter than copper. It is generally used at about 61 per cent conductivity. At that value it weighs about half as much as copper of 95 per cent conductivity, and, at present prices of copper, is about the same cost for wire, while a saving will be made in freight, cost of handling and labor of erection. It is strong and durable when in the form of a stranded cable, and has been proved for efficiency and economy. Where high tension or alternating transmission wires are to be put in place, they should have special insulators tested for high voltage, of a good design and reliable manufacture. These high-tension wires may be of No. 2 or No. 4 B. & S. gage, and they are usually arranged for a three-phase system. This will, however, be governed by the types and the voltages of the instruments at the power station. All direct current feeders should be tapped to the trolley wire often enough to give good distribution to the current. This spacing of taps will be governed by the location of heavy grades and by the size and number of the trolley wires in use. The overhead system should be divided into sections convenient for the operation of the road, and,

so far as possible, to obviate the crippling of the service in case of breakdowns, storms or other emergencies on the line. It is not necessary to paint the poles, nor has any form of preservation so far been used that has proved to be of much value for prevention of decay at the ground line. Painted poles, however, present a better appearance, and in villages and thickly settled districts they will be found to be desirable.

Third Rail System.

The third rail system has for a number of years been in use, both in Europe and in this country, but until recently has not been used much for surface roads. In order to have this system of practical value, it should be applied to such roads only as are largely outside of the highways and where the highway travel will not reach it. In other words, a road using this system should be located almost entirely on a private right of way. Of course this would not prevent any such road from using the highways at termini, or at important points en route where the overhead system would be necessary. There must, however, be long stretches of road where the third rail can be safely used, before it can be economical to put it in use.

When they were first brought into use, a hooded or yoke rail was used, of a special pattern costly to roll. This rail was put in place in the center, between two track rails, but it has been superseded by a T rail on insulating blocks, placed either midway between the two track rails, or to one side of the track, according to the location of the contact brushes on the cars. The track construction, on a road of this type, should be about the same as, and ought to be fully up to the standard of, the road which we have just described. The overhead system will, of course, be done away with, and in its place a rail, having a low percentage of carbon, with the necessary joints, insulators, cables at crossings and other applications, must be put in place. When the third rail is located outside of the track rails, it has been placed about 26 in. away from the nearest rail, and it is elevated above the track rails in order to give good and sufficient insulation. For this purpose, extra long ties, about 9 ft. 3 in., are necessary, once in about every 10 ft. These ties should have sawn faces, and be of such wood as will hold bolts or lag screws. The insulators should, beside having the required insulating quality, also have strength to sustain the heavy third rail, which usually weighs about 80 lb. per yard. As already stated this rail should be of a stated mixture of metal, and have an exceedingly low percentage of carbon, manganese and phosphorous.

It is the custom to provide, in the third rail, sufficient capacity to carry the entire current between sub-stations without any added feeders, and on this account the bonds at the joints must be of a capacity to carry this current, probably upward of 400,000 c. m. in most cases. These bonds can be applied to the bottoms of the rails, where they are out of the way and where a very satisfactory attachment can be made. Underground cables are used at highways and farm crossings to complete the circuit, on account of the rail being broken at those places.

In addition to a very careful fencing of the right of way, it will be necessary to construct cattle guards at all points where crossings or openings into the highway occur. There are at present, in New England and vicinity, but two roads which use the third rail outside of the Boston Elevated, which, of course, is a purely city road and is not of the class now under consideration.

Cost.

The cost of the roadbed, track and overhead system for interurban roads will vary, of course, according to the type of construction adopted, the character of the country through which it is located and the relative location and number of its power stations. For an example I will quote a road that is now approaching completion, and which is a good sample of the road which I have described. The cost per mile, not including anything for equipment, power plant, buildings, etc., will be practically as follows:

COST OF ROADBED AND TRACK FOR ONE MILE.

14,300 cu. ft. of earthwork at 45 cents.....	\$6,435.00
325 cu. yd. rock work at \$1.75.....	568.75
Three acres of clearing and grubbing at \$75.....	225.00
3,000 cu. yd. of gravel ballast at 50 cents.....	1,500.00
640 rods wire fencing at \$1.....	640.00

Pipe culverts . . . . .	50.00
Masonry for bridges and culverts. . . . .	1,000.00
Wooden and steel bridges. . . . .	1,300.00
Land for private right of way . . . . .	1,000.00
<b>Total roadbed . . . . .</b>	<b>\$12,718.75</b>

## TRACK

110 tons 70-lb. T rails at \$31.50 . . . . .	\$3,465.00
360 "continuous" rail joints at \$1.54 . . . . .	554.40
2,640 6-in. x 6-in. x 8-ft. chestnut ties at 54 cents. . . . .	1,425.60
5,870 lb. spikes at 2 1/4 cents. . . . .	132.07
720 bonds in place at 61 1/2 cents. . . . .	442.80
17 cross bonds at 50 cents in place . . . . .	8.50
Labor laying track . . . . .	1,056.00
Teaming material . . . . .	270.00
<b>Total track . . . . .</b>	<b>7,354.37</b>
Superintendence and engineering. . . . .	500.00

Total roadbed and track. . . . . \$20,573.12

## OVERHEAD SYSTEM FOR ONE MILE.

Poles, brackets, cross-arms, etc., in place. . . . .	\$650.00
Trolley wires and overhead material in place. . . . .	1,100.00
Direct and alternating current feeders in place. . . . .	1,750.00
Block signal and telephone systems. . . . .	2,000.00
Superintendence and engineering. . . . .	100.00
<b>Total overhead system. . . . .</b>	<b>5,600.00</b>
<b>Total . . . . .</b>	<b>\$26,173.12</b>

The foregoing figures include nothing for interest during construction. The construction of the roadbed and track for the third rail system, as applied to an interurban railway, will be found very nearly, if not quite as high, as the cost of a railway using the overhead system and on the same locations, when the cost of all the necessary additional safeguards is taken into consideration.

With reference to the general subject of the need of the best, most substantial and most carefully planned roadbed, track and overhead system for interurban roads, we wish to reiterate what we have before said as to its importance, its ultimate economy and advisability from all practical points of view. When we consider that 40 miles per hour will be the possible speed of the cars upon a road now being built in Massachusetts, which is, we are informed, to adopt a schedule time of 20 miles per hour including all stops, and that we, ourselves, have ridden on a single track interurban road in Ohio at the rate of 60 miles per hour for 21 miles on a special trip, and that the schedule on that road calls for nearly 50 miles in places, it is evident that the money, carefully and judiciously spent to secure the very best construction in all parts of a property which goes to make up the way for the passage of the cars at these high rates of speed, is well spent, and that any scrimping or saving in this direction is not only poor economy, but is the most unwise policy that can be pursued. To those who have long advocated the building of roads in a substantial manner, who have on their part endeavored to see that roads under their supervision were so built, it is a source of satisfaction to see, at last, the owners and operators of railway properties fast coming into line and constructing their roads more and more in accordance with what is the best and most modern practice.

## STREET RAILWAYS AND STATE HIGHWAYS.

The author of this paper stated that the Massachusetts Highway Commission was organized upon a plan laid before Governor Russell by a preliminary committee and after a year of hard work this committee framed a bill which became the foundation of the highway laws of Massachusetts. Slight modifications have been made from year to year, but the main law stands as at first drawn. The theory of the Massachusetts highway policy is to shape a network of excellent roads connecting each town with its market and ultimately creating continuous roads from city to city from end to end of the state and with adjoining states. The commission does not consider through roads leading directly from one large city to another as the

main object, but believes that these through roads will be the ultimate result of first uniting each town with its neighboring town.

The distinction drawn by the author between a state highway and a street railway, as far as the actual relation to the public is concerned, is that the latter is used for greater distances than the former. The average distance driven is not over 500 miles; for greater distances other means of conveyance than carriages will generally be employed. Both the highways and street railways follow the same general lines of travel and although one conveys passengers to a greater distance than the other, they both lead into the nearest important centers of population and must pass through as many towns on the way as possible. These two great foundations for travel have grown in importance side by side, and they must, of course, come into contact. The laws of the state give the state highway commission necessary authority to protect the public welfare except that they do not give it the right to act in a judicial capacity. It can fix the location and grade of any street railway that proposes to come within the side lines of a state highway, and it may apportion the cost of changing the grade or line. It may also upon the petition of the proper parties, establish lines of grade for the street railways on any road that it may decide shall, at some future time, become a state highway, and may apportion the expense between the highway commission and the street railway company. It may determine the size and shape of the rail, the kind of service, the place and method of crossing, and the extension of culverts and bridges. No contract may be let within the limits of a state highway without a special decree showing the exact location of track and profile with detailed specifications. The inner rail is never allowed to be nearer than 4 ft. from the edge of the macadam and a greater distance is preferred. The commission usually requires the street railway track to conform to the line of the cross-section, following the regular slope of 3/4 in. to 1 ft. In practice, however, it has been found that this outline of cross-section is not always the best, as water in passing off the road surface follows the rails and on grades often does much damage. It seems to the author that under ordinary conditions it is probably better to lay out a shallow depression or gutter between the shoulder of the highway and the end of the tie. It frequently happens that, for other reasons than these it is better to elevate the track above the road. Where it is necessary for a street railway to cross a highway the grade line is accurately determined so as to cause as little depression in the highway as possible. The weight and section of rail and kind of surface to be used are specified in the decree. The commission has usually found that a brick surface between the rails, and 18 in. or more outside are best. There are, of course, no end to the number of points of contact between street railway companies and the highway commission, but since the author has been a member of the commission he has seen hardly an instance in which the street railway officials have not readily accepted the conditions prescribed, even where they involved considerable additional expense.

## PITTSBURG RAILWAYS TO ACCOMODATE ISLANDERS.

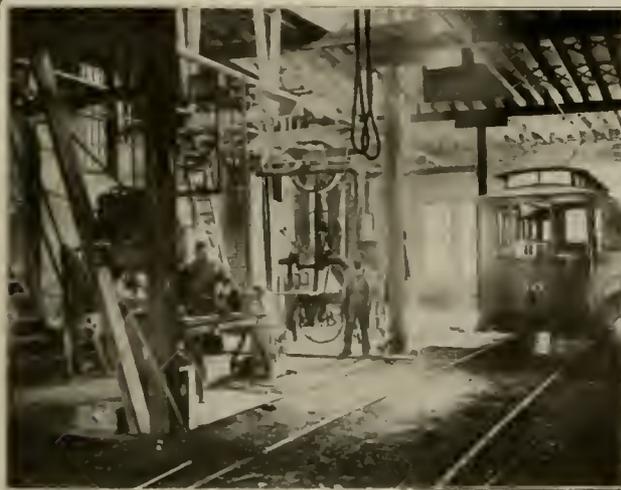

The Pittsburg Railway Co. has acquired the rights and franchises of the Pittsburg, Coraopolis & Monaca Street Ry. and will build a double track system across Neville Island to connect at Coraopolis with other lines, thus affording a through trip in one direction, 32 miles long. The object is to render Neville Island more easily accessible from Pittsburg and to accommodate the employes of the large manufactories which have secured sites for prospective plants on the island. The island has an area of 1,000 acres and was formerly occupied by farmers. Owing to the ingress of manufacturers, streets are being surveyed and other improvements effected which will render the island habitable. At present, connections with Pittsburg are made by a single electric line, running across the bridge into Fleming Park. The proposed double track system will be 14 miles in length and an agreement will be effected with the independent company which operates between Monaca and Beaver Falls, so that a through route to the latter city will be afforded, the route for a part of the distance practically paralleling the Pittsburg & Lake Erie R. R. The company will expend \$120,000 in making the improvements of the lines on the island. Cars of the large interurban type will be operated.

**IMPROVEMENTS ON THE KANSAS CITY-LEAVENWORTH INTERURBAN.**

BY N. B. PERRY.

Owing to the enlargement of Fort Leavenworth to a garrison of 3,000 troops, the Kansas City-Leavenworth electric lines have recently met with a heavy increase of traffic and it has been found necessary to considerably increase the capacity of the road. New tracks have been laid to reach the new Federal prison at the north-west limit of the city, and a new route, which does away with a large number of trestle bridges, has been built over the government reservation between the city and the fort. The headway of the cars has been considerably shortened and four new 51-ft. Kuhlman cars have been added to the service between Kansas City and the post.

A sub-station is located at Fifth and Spruce streets, in the heart of the city, and with other buildings of the company, occupies about a quarter of the block. A new three-story building to contain the general offices of the company is being located on this site, and a

A CORNER IN THE MACHINE SHOP.

car barn 65 x 170 ft., capable of accommodating 25 cars, has also been built.

Adjoining the sub-station is a machine shop 30 x 100 ft. in size, where repairs are made, and there is also a store room 15 x 30 ft., and an armature room 40 x 60 ft. on this site. In one end of the latter room freight is handled and the freight traffic has grown to be a considerable feature between Kansas City and Leavenworth. The buildings of this group which are now finished cover 180 x 285 ft. of ground.

The sub-station receives current from the Wolcott power house, 12 miles distant, and contains a three-phase rotary converter running at 500 r. p. m., transforming alternating current of 375 volts to direct current of 550 volts, and three step-down transformers of 12,500 volt primary and 375 volts secondary. The rotary converter is brought up to synchronizing speed by the direct current from Wolcott. The transformers are cooled by a fan giving an air pressure of 3/8 of an ounce. Power is generated at Wolcott at 13,000 volts and the current is stepped down and transformed at the Leavenworth sub-station to 550 volts, at which it is distributed to the lines.

Another sub-station is located at Chelsea Park, at the Kansas City end of the road, 12 miles from Wolcott, and contains a 250-kw. rotary and transformers, and at Wolcott there is a Stanley 400-kw. rotary and transformers.

A wealthy citizen of St. Louis, whose name is withheld from publication has contracted for the space in the local street cars which is usually reserved for advertising, and has caused to be placed therein scriptural quotations of an admonitory character for the edification of the traveling public. The contract provides for the display of such cards in 200 cars for a period of six months.

**THE CROYDON (ENGLAND) TRAMWAY SYSTEM.**

The tramways in Croydon cover a route of 10 1/2 miles of track and are being operated, during a limited period, by the British Electric Traction Co., Ltd., under contract with the municipality. The company pays the city 6 1/2 per cent of the investment and 4 cents per unit for the current consumed. The road consists of 5 miles of double track and 5 1/2 miles of single track, and the cars are of the double-deck type, seating 52 passengers. The company has 37 cars in service, with a number in reserve. These travel at speeds varying from 4 to 10 miles an hour according to whether the district is in the city, or suburban. The outside seats are of the reversible back type and the inside seats are of perforated bent wood. The staircase is of the reversible type which has been criticised as causing loss of time in reaching and leaving the outside seats as passengers cannot pass upon the stairs. The city has accepted bids for supplying 10 double-deck cars capable of seating 69 passengers.

The car shops are situated in Thornton Heath, are capable of accommodating 30 cars, and are built so as to be readily extended. In the new portion of the barn the tracks are carried on cast iron columns and are floored with loose planks to facilitate the machinery being easily removed into the pits when necessary. A room is being provided for the employes at these barns, which is to be comfortably furnished and supplied with papers, magazines, games, etc.

**THE STUDENT OF MECHANICAL ARTS, AN APPRENTICE.**

A paper on this subject was read by J. D. Hoffman, M. E., of Purdue University, at the 14th Annual Convention of the Association of American Agricultural Colleges and Experimental Stations. The author stated that many writers on the subject of technical education seemed to believe that the product of an educational institution is far inferior to that produced through the busy marts of trade. The central point of attack of these writers is the apparent inability of schools teaching mechanical arts to turn out machinists, pattern makers, foundrymen and other tradesmen who, at the time of completing their course, are skilled workmen. The author speaks of the technical school and of the shop both as training places where a young man may educate himself in the line of general mechanical work. These places, he believes, should not be considered antagonistic, but mutually helpful to each other, since both are endeavoring to turn out men of the highest possible shop value. The comparison of the student and apprentice is difficult to make on account of the training of each being along such dissimilar lines. The student that has experience in many lines should not be called upon to stand an examination in only one subject in competition with a man thoroughly experienced in that special feature, yet in many cases this is done and the student is told he is inferior to the shop-trained man. Examination as to his fitness as a shop hand should not be conducted along any one line, but along various lines, in which case he presents an entirely different appearance. The author claims that the student receives largely an equivalent practice in shop methods, but much more than that goes to make him a valuable member in any working force, and which cannot be obtained in the shop. No claim is made that the graduate can turn threads as fast as the man who has served his entire apprenticeship of three or four years as a lathe hand, or that he can chip and file a surface as quickly or as well as the vise hand of several years' experience, but rather that he will take a job from its inception and carry it through the various lathes, planers, grinders, shapers, drills, etc., to completion and will keep alongside, if not a step ahead of the man who has had the benefit of the training usually given to the apprentice. The demands for technical men at present prove that the student has so far been successful and the statement that the technical graduate is falling into disrepute is not well founded.

Detectives in the employ of the South Side Elevated Railroad Co., of Chicago, recently discovered that a systematic fraud was being practiced by the ticket sellers at two of the "Alley L" stations. The plan consisted in the selling of bogus tickets during rush hours, and in consequence of its being discovered two employes have been discharged.

# IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

## FOR DETECTING GROUNDS AT THE POWER HOUSE.

A power house engineer soon learns that the different lines feeding from his station have individual temperaments, so to speak, almost as varied as human nature. On one feeder panel the circuit breaker may go out on the average half a dozen times a day owing to temporary combinations of conditions brought about by the number and size of cars on the line, the number and location of grades, poor handling of controllers, or one of a score of other causes. On the other hand the breaker at another panel may not blow once a week, but when it does go out the attendant usually is justified in assuming there is a serious ground somewhere.

For aiding the engineer in determining the degree of ground on any line and therefore to some extent the steps that should be taken to remedy the fault there is used at the several power houses of the United Railways & Electric Co., of Baltimore, a ground detector, the details of which were suggested by Mr. Carsoll Thomas, an electrical inspector for the company, Mr. Thomas furnishes us the following description of the instrument and the way it is made:

The accompanying sketch shows a ground detector used on the 500 volt circuit at the Pratt street power house of the United Railways & Electric Co., of Baltimore. To make this instrument, take a Weston illuminated dial ammeter of the type that measures the drop in potential through a resistance inserted in the circuit, or a voltmeter will do if only the armature coil is used and the resistance cut out. Take off the lamp receptacle from the center of the

of the dial. The object of the box is to exclude the daylight from back of the dial. The receptacles in the box should be placed in the locations shown.

Take 6 lamps wired in series, the lamps being of the same kind that are to be used in the instrument, also take the wire that is to be used as the resistance C, A, and B and make connections according to the sketch Fig. 2. Connect the negative side of the meter to the

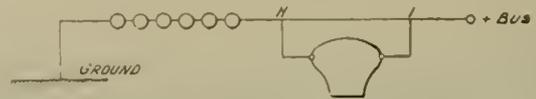

FIG. 2—METHOD OF CALIBRATION.

wire at II and move the positive side towards the positive bus until the needle gives a full deflection. This length of wire will be the length of A C in Fig. 1.

Let the wire of which A C forms a part extend in one unjointed piece from receptacle E to receptacle F, then tap the wire from the first four lamps in the center at A, and make A C and A B equal in length. The reason for using this number of lamps is as follows:

There are four lamps to start with and a resistance equal to one lamp in the series will allow them to come up to candle power. On the ground side there are two lamps, which is one more than necessary, but when the line wire is connected through the ground there are two lamps in parallel with the other two which halves the resistance, making a resistance equal to one lamp, which, added to the first four, brings them up to candle power.

Another object in using the two lamps in series on each side (ground and line) is to avoid burning them up by getting the line permanently connected to the full voltage, which should not happen, as the wire should always be removed before throwing in the switch. If it should be connected for only an instant the lamps will flare up, and if left on the only damage will be to burn up one or both of the ground lamps as there will be only four lights on this circuit and the ground lines will also get current from the lamps connected to the positive bus.

To calibrate the instrument make the wire to the ground and the wire for the line connections of equal resistance. The upper figures on the scale represent amperes that will flow the instant the switch is pulled. The bottom scale shows the resistance in ohms of the line and cars, or of the ground. Then take some value in amperes, say 300. If the station voltage is 500, insert 1.66 ohms between the end of the line connection and the ground. Continue this down to 1/2 amperes and 1,000 ohms, which would represent one car on the line with one lamp circuit burning. When the needle stands at the left hand end of the dial it shows there is no flow of current through it and the drop is the same from A to B as from A to C. When the needle stands at the right hand end of the dial it shows that the line is clear.

To test for grounds on the line, hook the line connection to the line wire, disconnect from the positive bus by leaving either the switch or circuit breaker open. If only the left hand lamps light up and the needle swings to the limit on the right hand side the line is clear. If both sides light with equal intensity and the needle stands at same position as when disconnected from the positive bus it shows there is a bad ground or an unmeasurably low resistance on the line. The readings are affected somewhat by the drop in the rail due to the flow of current from the other lines, but the operator soon becomes acquainted with the action of the instrument on the different lines and can judge by the character of the fluctuations what the nature of the trouble is.

A simpler method of testing grounds than that described is used

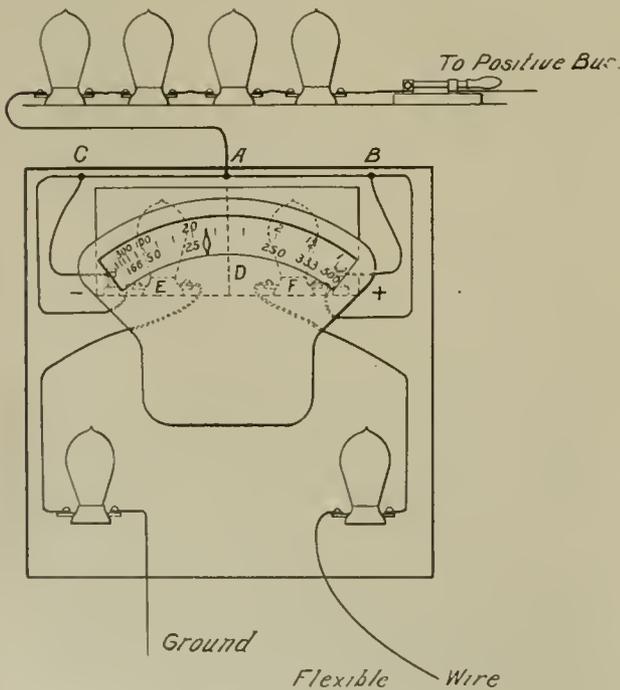

FIG. 1—GROUND DETECTOR.

meter and mount the instrument in a wooden box having its sides lined with tin. The function of the tin is to act as a reflector. This box should be large enough to hold the lamps and receptacles as shown in the sketch. Place a thin partition in the center of the box from the center of the dial to the back of the box. The object of this partition is to keep all the light from each lamp on its own side

by some of the other stations on this road, which consists in connecting the lamps in the same relation but omitting the instrument and depending for an indication only on the variation in the lighting of the lamps. The lamps connected thus will show a change varying with the line voltage, when a straight series of five lamps will not show a flicker. The lamps on the instrument may be tested by attaching the line connection to the ground connection and if the lights are not equal it shows that the lamps are not alike. The lamps should then be changed until the lights show all equal.

## POWER HOUSE NOTES.

BY ARTHUR B. WEEKS.

An occurrence which once proved a great surprise at two power houses was due to a severe short circuit on a 10,000-volt transmission line. A fire, caused by defective lightning arresters, and lasting a couple of hours, was extinguished with water, after a hard fight. One part of the building, where the three-conductor cable entered the power house from another power house three miles distant, was comparatively remote from the scene of the fire, and was supposed to be unharmed. In closing the switches there, however, a sound was heard which nobody about a power house where high voltages are used could possibly mistake for anything but a short circuit. Large cables, 300,000 c. m., were burnt off back of the switchboard as though they had been chopped off with an ax. Although there was an automatic oil switch on the secondary, and circuit breakers on the primary, yet the circuit breaker did not open until much damage was done. The trouble was traced to water, which had found its way into the cable head, where the three conductors were separated from the cable, for the purpose of making connection to the switchboard.

On another occasion, a short circuit occurred on a 10,000-volt line, and the circuit breaker did not open, having stuck fast. The cause of this sticking was found to be due to the expansion of the large copper contacts of the breaker, from continued overload.

A peculiar freak on a 22,000-volt feeder at a series converter took place one night without a second's warning. It was accompanied by a most peculiar noise in the generators, a very loud rattling. The load was immediately thrown off, and investigation disclosed that one of the three wires of the circuit was burnt off at the series converter as clean as in the case first cited. There were five feeders in parallel, and it was necessary to start up with reduced load until the trouble was remedied, which was done by making a splice, leaving out the converter in absence of another.

Among the things about a power house which seems to concern no one after they have been installed, excepting to keep the oil replaced or the air in circulation, are the station transformers. The writer recalls a plant of large capacity in which this portion of its equipment had not been examined in five years, until the feeder wattmeters read rather suspiciously. The removal of the large top cover disclosed two cables loose in their terminals, and very highly discolored. Right here is a lesson on the proper method of securing such cables to their binding posts, and making them accessible.

The resoldering of the cables was a serious problem with the repair men, and there was a feeling that they might not remain tight, even when the resoldering was accomplished.

Another point of great value to the switchboard electrician in charge of the operation of such a plant, is to have the feeder indicating wattmeters or ammeters, as the case may be, located where he may know the condition of the load at all times. He cannot intelligently operate a system where such meters are in a remote building, or in a superintendent's office, or in a cellar. They should be either on his switchboard, or at least in the same room, where he can easily see them. One chief advantage is that when a short circuit occurs, where the plant is not equipped with the most modern devices, he can tell when the arc has let go, and can then safely open the feeder switch to save the rest of the load. To open the switch without this knowledge would not be advisable, as a destructive arc might follow on opening the switch, and cause a shut-down after all, doing much damage as well.

One of the errors in power house designing, is not allowing for enough space between the high potential panels and other nearby apparatus. The writer, for instance, remembers a case where there were selector single element knife-blade switches, double throw. The upper connection was for bus-bar No. 1, and below was bus-bar

No. 2, both at times having loads which were not in parallel. The switches were operated by a 3-ft. pole which engaged in eyes at the end of each switch blade. Less than 4 ft. from the switch panels were large transformers. The attendant ran the risk of pulling the switch too low or dropping it to the bus-bar below, which of course, being out of synchronism with the bus-bars above, would produce disastrous results. There was almost always a severe arc on opening any of these switches, and on one occasion the attendant barely escaped cremation from this cause.

To design a system of bus-bars for high tension feeders requires considerable experience to avoid trouble. But however well the bus-bars may be insulated, and however neatly constructed, the improper dividing of the outgoing lines may cause serious errors which are very expensive. For instance, there may be four three-phase lines tapped from the common bus-bar. The first two legs of No. 1 line are side by side, with a marble slab carrier between, then a space; then the third leg of No. 1 line, followed by three others of line No. 2. Another space, and four switches, etc. An attendant, when taking off lines and putting on others, especially under the excitement of short circuits, is very liable to open or close the wrong switches, adding to the excitement already at fever heat.

Coupled with improper designing of power house switchboards as cited, is that of switches and circuit breakers too small for the work they are designed to do. Switches should be given length enough to rupture the arc, if they must be depended upon to do so when opened. The writer recalls a case where it was necessary for an electrician to request one of the power house customers to open his feeder switches, which were quick break, because the switches at the power house would not rupture the arc.

There could hardly be a worse condition than the arcing across phases when a switch or a circuit breaker opens, because of the barriers not having been properly proportioned, or more load put on the line than the circuit breaker can safely carry. There are numerous cases of this character which would be very instructive if published. Some plants have been able to remedy the trouble in part, where the arcing was due to short circuits when the circuit breakers opened, by placing an oil switch in series with the circuit breaker. In some cases, larger barriers have been the remedy, but where the duty is very severe—that is, the lines at times greatly overloaded—or where the power house requests its tenant to open its breakers in time of emergency, the better plan is to have the switches in series.

Piecing out marble barriers which were not large enough for the purpose intended with wood, asbestos lined, may be satisfactory enough on low tension lines. It is absolutely useless, however, on those of high tension; for one who has seen the results of electric arcs on asbestos, even at 500 volts, would never dream of placing it at the mercy of a 10,000-volt line.

Another defect is failing to allow space between high tension switches and circuit breakers, so as to properly open the switches. Still another is obliging one to go through a long, narrow passage between switches and breakers, upstairs, to close the circuit breakers of one line, and to go downstairs again to close the switches on that line. One must go upstairs as many times as the breakers open, which at times is very frequently.

On one occasion a short circuit blew the fuses on a certain feeder, and one of the circuit breakers of a two-phase line opened; but, as the cables to the switches were not marked, it was not certain which of the switches belonged to that circuit. Current was on the other phase, so it was essential to know positively which was the proper switch to open. This was found only after tracing the cables. Proper marking of circuits, switches, and circuit breakers would be the remedy in a case like this.

An original method for starting a 350-h. p. synchronous motor recently came to the writer's notice. Owing to the disabled condition of the direct current apparatus at the power house, the electrician could not start the motor in the usual way. With the assistance of a couple of men to pull on the rope of a block and tackle, the rope, which had been passed several times around the pulley of the motor, gave the armature sufficient speed to enable the electrician to plug in the alternating current switches. The motor started all right.

In certain cases where a plant is overloaded and a large induction motor is to be started, since it draws so heavily on the system when starting, if it can be started in some manner similar to that above described, there will be no difficulty in carrying the extra load after

the motor is once set in motion and the switch closed. Otherwise it would be better not to attempt to start it at all.

A common source of annoyance is due to placing feeder circuit breakers too close on the switchboards. A circuit breaker frequently, if opened under a heavy overload, arcs to an adjoining breaker and causes great damage. An asbestos box, asbestos lined, would prevent further damage, but the arrangement is anything but good in design, and far from being artistic.

Important switches for various circuits that are apparently an afterthought, something overlooked in the original design, are often placed in inaccessible places, where one is helpless, should it be necessary to use them in times of emergency. This condition of things should be carefully guarded against.

**SOME STATISTICS ON THE COST OF POWER.**

Statistical data on the cost of power are always of interest because managers all wish to know what their brethren elsewhere are paying per kilowatt-hour, even if the figures are not directly comparable with those from their own stations by reason of differences in conditions.

The following statistics are furnished us by a prominent street railway auditor. We are not at liberty to state the names of the companies, but the figures are actual records taken from the companies' books.

Case I is a large city system operating about 175 miles of electric track and about 1,000 cars. Power is generated in two stations, three miles apart, containing belt driven apparatus that is more or less antiquated and the stations are being run at a great disadvantage.

\* For one year. \*\* For one month.

As an aid in examining the figures the following explanations are given: (a) Fuel for power: Indiana bituminous screenings are used; at one of the plants the coal is delivered on track, at the other by wagons; the average cost per ton in the year reported was \$1.55. (b) Miscellaneous supplies and expenses of power plant: Some of the largest items in this account are the cost of boiler compound, rendered necessary by the quality of feed water used, and the cost of removing cinders and ashes, which has to be done in cars and wagons. (c) Pounds of water evaporated per pound of coal, per car-mile, per car-hour, and per kilowatt-hour: The figures on water evaporation represent only the water registered by water meters, and do not include all of the water consumed, for the reason that a part of the time at one of the power plants water was used from a reservoir into which flowed the drainage from rainfalls and the water used for washing out the boilers. A fairly conservative estimate of the amount of water used, in addition to the amount registered by the water meters, would be about one third more. This would make the water evaporated per lb. of coal 6.5 lb.; water evaporated per car-mile run 77.1 lb.; water evaporated per car-hour 615 lb.; water evaporated per kw. h. 57.5 lb.

The following additional data are furnished for Case I:

	Per cent of total.	Total.
Maintenance of buildings.....	.46	\$ 1,004.14
Maintenance of steam plant.....	6.85	15,157.32

**COAL CONSUMED FOR "FUEL FOR POWER."**

Tons in the year.....	92,626
Tons per day.....	254
Pounds per day.....	507,540
Pounds per day per car.....	1,071
Pounds per car-mile.....	11.8
Pounds per car-hour.....	94
Pounds per passenger.....	1.9
Pounds per kilowatt-hour.....	8.8

Case II is a system furnishing from one station current for lighting and for operating 230 miles of electric railway with 500 cars. The figures are for an average month.

Case III is one of the power houses on a large city system. The figures are for an average month.

Case IV is a combined lighting and street railway plant. The figures are given for month of July, one of the heavy months, and for November, one of the light months.

Case V is also a combined lighting and street railway station operating a city system, and an interurban line (by booster). The figures are for 12 months.

The Harrisburg (Pa.) Traction Co. has increased the wages of its employes, the new scale going into effect October 1st. The rate is now equal to the highest paid for similar service in the state. One hundred and sixty-five motormen and conductors are affected.

## RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

### PREMATURELY STARTING CAR.

*Kellegher v. Forty-Second Street, Manhattanville & St. Nicholas Avenue Railroad Co. (N. Y.), 63 N. E. Rep. 1096. May 27, 1902.*

It is doubtless true, the court of appeals of New York says, that it is the duty of carriers of passengers to allow persons entering their car a reasonable time within which to enter, and, if it is prematurely started with such unusual or unnecessary violence as to do the passenger injury while entering, a jury may be justified in finding the defendant guilty of negligence.

### PROPERTY ADDED TO PLANT PASSES UNDER PRIOR MORTGAGE.

*Westinghouse Electric Manufacturing Co. v. Citizens' Street Railway Co. (Ky.), 68 S. W. Rep. 463. May 27, 1902. "Not to be officially reported."*

The law is well settled, the court of appeals of Kentucky says, that property added to the plant of a street railroad, and which becomes an essential and integral part of its road, passes under a mortgage previously executed and recorded covering its entire property and road constructed and to be constructed, although furnished under a contract by which the title was to remain in the seller until payment made.

### INJURY TO WOMAN ATTEMPTING TO ALIGHT FROM CAR IN MOTION—INCREASE OF SPEED.

*Blakney v. Seattle Electric Co. (Wash.), 68 Pac. Rep. 1037. May 13, 1902.*

It need not, of course, be argued, the supreme court of Washington says, that a woman of mature years and discretion cannot recover from a street car company for injuries received by her while attempting of her own volition to alight from one of its cars while the same is in motion; nor need it be argued that it is not negligence per se (or in and of itself) to increase the speed of a car, nor that it is not negligence to do so when a passenger is in the act of alighting therefrom unless the car company knows, or could, by the exercise of reasonable diligence, have known, of that circumstance.

### SILENCE DOES NOT RENDER COMPANY LIABLE FOR PAVING BETWEEN TRACKS.

*City of Williamsport v. Williamsport Passenger Railway Co. (Pa.), 52 Atl. Rep. 51. May 19, 1902.*

Where under its charter a street railway company is not liable for paving or repaving streets occupied by its tracks, or any portion of them, but only for keeping the streets in repair, it is not liable for the cost of paving between its tracks because it had knowledge that a paving company was proceeding to do the paving, and it did not in any way repudiate the alleged implied contract, the supreme court of Pennsylvania holds, when the paving was done by the paving company under a contract made with the city to pave the entire street, but to look to the street railway company only for paving between its tracks.

### CONDEMNATION AS AGAINST ABUTTER IN NEW YORK.

*Adee v. Nassau Electric Railroad Co. (N. Y. Sup.), 76 N. Y. 589. May 29, 1902.*

The second appellate division of the supreme court of New York holds that, under the law of that state, where the establishing and running of a street surface electric railroad in the public streets of a city is an additional burden on the land of the adjoining proprietor, for which compensation must be made, a street surface railroad has power to acquire by condemnation the easement to construct and operate a surface railroad over a public street, as against an owner of abutting land, who also owns the fee of one-half the street in front of his land, and this notwithstanding the

declaration in section 90 of article 4 of the railroad law that "nothing in this section shall be deemed to authorize a street railroad corporation to acquire real property within a city by condemnation."

### CONSTITUTIONAL FRANCHISE LEGISLATION.

*Smith v. Indianapolis Street Railway Co. (Ind.), 63 N. E. Rep. 849. Apr. 30, 1902.*

The supreme court of Indiana holds constitutional the act of 1899 providing, in substance, that it "may be lawful" for any city having a population in excess of 100,000 persons by the last federal census preceding the incorporation of "any street railroad company, now or hereafter organized," to enter into a contract with said company for the granting to said company of a franchise for a term not exceeding 34 years, subject to many conditions, relative to compensation, fares, paving, the use of its lines by suburban and interurban railroad companies, the right of control of the city, etc. It especially does not think that the act violates the constitutional provision that "the general assembly shall not grant to any citizen, or class of citizens, privileges and immunities which, upon the same terms, shall not belong to all citizens."

### ATTEMPTING TO DRIVE ACROSS TRACK WITH CAR 75 FEET AWAY—DUTY OF MOTORMAN AT CROSSING, ESPECIALLY WITH VIEW OBSTRUCTED BY ANOTHER CAR.

*Schoener v. Metropolitan Street Railway Co. (N. Y. Sup.), 76 N. Y. Supp. 157. May 9, 1902.*

It certainly was not an act of negligence on his part, the first appellate division of the supreme court of New York holds, for the driver of a horse attached to a delivery wagon to attempt to cross the street, at a street crossing where he had as much right to the use of the street as the street railway company did, if the latter's car was then 75 feet away, and the jury would have a right to find, if the car were this distance away, that the company was negligent if it did not check the speed of its car and prevent a collision. A duty rested upon the motorman to have the car under control as it approached the crossing, and this duty was increased, if it was true, as contended by the company, that his view of the crossing was obstructed by the car of another company on a parallel track, for which reason he should have exercised more care. He could not approach the crossing at a high rate of speed, and then, when a collision occurred, excuse himself because there was another car in front, which prevented his seeing the crossing.

### DILIGENCE REQUIRED TO PROTECT TRAVELERS FROM TROLLEY WIRE—NOTICE TO MOTORMAN AND CONDUCTOR.

*Read v. City & Suburban Railway Co. (Ga.), 41 S. E. Rep. 629. Apr. 28, 1902.*

When a street railway company with reasonable promptness discovers the sagging of one of its trolley wires, which has been unexpectedly caused by the falling of a wire belonging to another, and immediately takes proper steps to prevent its wire from causing injury to travelers in the street over which the same is suspended, the company, the supreme court of Georgia holds, meets the legal requirements as to diligence under such circumstances.

Notice to the servant of a corporation with respect to a matter over which he has no authority, and as to which he has no duty to perform, the court holds, is not notice to the corporation. So, in this case, if it was not within the scope of the duties of a motorman and conductor to immediately take steps to guard the public from the danger created by the sagging of the company's trolley wire, it would not be proper, in determining whether, after the company became informed of the emergency to be met, it acted with reasonable diligence in taking proper steps to protect travelers passing along the street, to regard notice to the motorman and

conductor as notice to the company itself, and thus place upon it the unreasonable requirement of taking action in the premises before any of its officers or agents who were authorized to act in its behalf had received information of the necessity to do so.

INJURY TO PASSENGER BY RECEIVING ELECTRIC SHOCK FROM HANDHOLDS WHILE ATTEMPTING TO BOARD CAR AND BEING DRAGGED ALONG BY ITS STARTING—CARE REQUIRED OF COMPANY.

Dallas Consolidated Electric Street Railway Co. v. Broadhurst (Tex. Civ. App.), 68 S. W. Rep. 315. March 29, 1902. Re-hearing denied May 3, 1902.

The evidence showed that the party suing in attempting to board a car took hold of the handholds designed to aid passengers in getting on board the cars. He put one foot on the step of the car, and was in the act of getting aboard, when he received an electric shock which fixed his grasp upon the handhold of the car, and while in this attitude the motorman started the car in motion, and he was dragged some distance, when his hand relaxed his hold, and he fell in the street. The electric shock and the violence suffered by having been dragged along by the car inflicted serious injuries upon him. In affirming a judgment in his favor, the court of civil appeals of Texas states that it is of the opinion that the circumstances surrounding the injury were sufficient to raise a presumption of negligence on the part of the company. It says that the handholds and steps of the car were designed to be used by passengers as aids in their entrance to or exit from the cars; the cars and their equipment were under the control and management of the company; and the accident was such as, in the ordinary course of things, would not happen with the use of proper care by those who have their management. Moreover, it is of the opinion that a higher degree of care than is required by law was not imposed upon the carrier by a charge in which the jury were told that the company "owed to its passengers the duty of exercising great care and caution to keep the machinery and appliances of its cars in reasonably safe condition and repair, and to exercise like caution in the operation of its cars."

INJURY FROM ELECTRIC SHOCK TO PEDESTRIAN STEPPING ON RAIL—PRESUMPTION OF NEGLIGENCE—EVIDENCE OF EMPLOYEE.

Braham v. Nassau Electric Railroad Co. (N. Y. Sup.), 76 N. Y. Supp. 578. May 29, 1902.

While crossing the street one afternoon the plaintiff stepped on one of the company's rails and received an electric shock. A judgment in his favor for damages for the resulting injuries is affirmed by the second appellate division of the supreme court of New York. It says that the company claimed that the complaint should have been dismissed—First, because no negligence on its part was established; and, second, because, if a prima facie case of negligence was established in the first instance, the circumstances were conclusively rebutted by the proof that no defect existed at the place of the accident which would permit the escape of the electric current. These claims were untenable. It was clearly established that the shock which the party received would have been impossible if the company's track was in good order. It was further proven that close to the place where he was walking was a joint where two rails met, which, if not properly bonded or welded, would permit the infliction of an electric shock upon any one whose foot should be placed upon it; and there was some evidence that the rails at the time were so laid as not to allow in the usual manner for expansion and contraction, and that such manner of laying the rails was calculated to result in imperfect joints. This evidence, together with that of the shock actually received by the party, established the company's liability, and called upon it for an explanation of the occurrence, in order to relieve it from the charge of negligence, on the principle of *res ipsa loquitur*, or the matter speaks for itself. The presumption of negligence arising from the proof referred to was not so far overborne by the company's evidence as to make the question one of law. The explanatory evidence was principally that of an employee of the company whose duty it was to keep the tracks in order, and who testified that they were in order at the time and

place of the accident. Waiving the question whether this evidence could be regarded as explaining the occurrence, it was clear that, in view of the position and employment of the witness, a submission of the charge of negligence to the jury for determination was required. The happening of the accident under the circumstances tended to prove the existence of conditions necessary to cause it which could not arise without either negligence on the company's part, or a defect of some kind, for which, if such a thing be possible, it was not to blame; and proof merely that no defect whatever existed would not serve to remove the case from the province of the jury, where the proof was furnished by an interested witness in the company's employment, and question of credibility was accordingly a factor.

UNCONSTITUTIONALITY OF STATUTE REQUIRING POLICEMEN AND FIREMEN TO BE CARRIED FREE.

Wilson v. United Traction Co. (N. Y. Sup.), 76 N. Y. Supp. 203. May 7, 1902.

The third appellate division of the supreme court of New York holds unconstitutional and inoperative as against the company chapter 417 of the New York laws of 1895 providing that the mayor of each city of the state and the president of each incorporated village of the state may issue to each policeman and fireman a certificate of the appointment and qualification of such policeman or fireman as such, and it shall thereupon be the duty of every street surface and elevated railroad company carrying on business within such city or village to transport such policeman or fireman free of charge while he is traveling in the course of the performance of the duties of his office. It says that the decision in the *Beardsley Case*, 162 N. Y. 230, which follows the decision of the federal court in *Railroad Co. v. Smith*, 173 U. S. 684, seems to be a clear authority for the proposition that the above statute operates to deprive the company of its property without due process of law. In those cases the companies were required to issue mileage books, at a reduced rate of fare, to those willing to purchase a designated number of miles at one time. In this case the company is required to carry a certain specified class of persons entirely free of charge. If the former is an invasion of the companies' property rights, the latter is equally so; and in neither case is there any process of law provided for, save the mandate contained in the act itself.

Nor does the court consider that the statute can be sustained as a valid exercise of the police power of the state. It says that its evident purpose and effect is to relieve the municipalities referred to therein from a portion of the burden of maintaining their police and fire departments at the expense of the several street railway companies within their limits. Concede that the public safety requires that the public officers mentioned be carried upon such railroads, it is not apparent why, in order to promote that safety, they should be carried free of charge. There is no pretence that the act is necessary to secure their right to ride upon such roads. The sole purpose is to secure their right to ride free. Thus the only advantage secured by the act to the public is that the railroad company, instead of the municipality, pays the fare. Such an advantage may be a public convenience; but the right to take the property of the individual citizen, or of a class, for the sole reason that the proceeds of it would be convenient to aid the municipality in defraying its general expenses, has not yet been conceded as a legitimate exercise of the police power, and this court is not disposed to concede it now.

REQUIREMENTS FOR ENFORCEMENT IN COURT OF EQUITY OF CONTRACT WITH CITY—VALIDITY OF GRANT OF EXCLUSIVE RIGHT TO DECIDE AS TO OCCUPATION OF STREETS—REQUISITES OF ELECTION TO OCCUPY STREETS.

Logansport Railway Co. v. City of Logansport (U. S. C. C., Ind.) 114 Federal Reporter, 688. Mar. 8, 1902.

Before a street railway company can, in a court of equity, complain of the violation by a city of its contract rights, it must show, the United States circuit court district of Indiana, holds, that it has a contract, and that such contract is free from fraud and enforce-

able at law, and one that is fair and reasonable in all its parts, and within the power of the city lawfully to enter into. If the contract is unfair, unreasonable, or against good conscience, a court of equity would be justified in refusing to enforce it, and would leave the party to its remedy at law. The court, too, must enforce the contract, if it enforces it at all, just as it is written; and it has no power, by changing or varying material terms, to make, in effect, a new contract for the parties.

Under ordinances granting the exclusive right to use in perpetuity certain streets, designated by name, and also the right to use and occupy such other streets and bridges in the city as the street railway company, its successors and assigns, might from time to time elect to use and occupy, the court holds that the right granted, except as to the designated streets, was a mere offer, which could only become contractual obligation by the election of the company to use and occupy the streets for railway purposes. Such election must be made in good faith, and evidenced by some open and notorious act brought to the notice of the common council. Until the offer was accepted by such an election, it could be withdrawn.

Moreover, the court holds that it was ultra vires, or beyond the legal power of the common council to surrender its control of the streets of the city in perpetuity to the company. The municipal authorities had no power to grant forever to the company the right, at its own uncontrolled election, to use and occupy such or all of the streets of the city as it might from time to time elect. The right to determine for itself from time to time what streets could be used and occupied for street railway purposes consistently with the public safety and welfare is a power incapable of absolute alienation by the common council. By the ordinances in question, if valid, to the company's election was relegated the question whether or not a street could, with due regard to the comfort and safety of the people, be occupied by a single or a double-track railway. Such a surrender of corporate power in perpetuity to a street railway company cannot and ought not to be upheld. It cannot be supported as a reasonable exercise of the power of a trustee over a trust estate committed to its charge, to be administered in the interest of the public, and for the private advantage and gain of railway or other corporations.

LIABILITY FOR INJURY TO PASSENGER KNOCKED OFF PLATFORM OF CROWDED CAR AND TRAMPLED ON BY PASSENGERS FRIGHTENED BY FLASH—DUTY OF COMPANY—CARE REQUIRED OF PASSENGER—PROOF OF DEFECT IN CAR OR APPLIANCES CONNECTED THEREWITH.

Davis v. Paducah Railway & Light Co. (Ky.), 68 S. W. Rep. 140. May 7, 1902.

On account of its crowded condition the party suing was on the front end of a motor car, and, according to the proof for her, when the motorman applied the full power the car began to slow up, and there was a flash of light. The motorman called loudly to have the trolley thrown off, and for nobody to get off the car; that there was no danger. The passengers in the car cried, "Fire!" and began to rush out pellmell. The party suing was holding on to the car, but the heat which flashed up burned her hand so that she had to let go, and when she did this the crowd surging by knocked or pushed her off the car and trampled upon her, inflicting very serious injuries.

In reversing a judgment rendered in favor of the company, the court of appeal of Kentucky holds that a company's duty to its passengers is not fulfilled by recent inspection, or by an inspection by a competent employe. The rule, it says, is thus well stated in 2 Shear. & R. Neg. Sec. 495 "Out of special regard for human life, and acting upon the presumption that every man who commits his person to the charge of others expects from them a higher degree of care for his bodily safety than they would bestow upon the preservation of his property, the law very wisely exacts from a common carrier of passengers for hire, in the performance of his duties as such, the utmost care and skill which prudent men are accustomed to use under similar circumstances." This rule was followed in *Railway Co. v. Weams*, 80 Ky. 420, where the court added: "The degree of care and skill increases with the hazards of the mode of conveyance employed by the carrier."

The court next pronounces objectionable an instruction that it became the legal duty of the party suing when going upon the car, to exercise due care and caution, use her eyes, and act with reason-

able care and judgment for her own safety, more especially if she found the car unusually overcrowded with passengers. In lieu of this, it says, the jury should have been told that it was incumbent on the party suing while on the car to exercise such care and caution as might be reasonably expected of a person of ordinary prudence situated as she was.

A still more objectionable instruction, the court holds, was one by which the jury were told that the party suing could not recover for the injuries received by the passengers running over her after she was pushed off the car by them and fell to the ground. If the company's negligence caused the panic among the passengers, and their conduct was the natural result of its negligence, or was such as might reasonably be expected under the circumstances, considering the crowded condition of the car, and the fact that it was propelled by electricity, the company was answerable; although it would not be responsible if the panic among the passengers which caused the injury to the party suing was needless, and there was no apparent danger that might reasonably be expected to cause a panic among the passengers. If the company was negligent, and this negligence produced a flash of fire, followed by smoke in the car, and this caused the stampede of the passengers, and made them run over the party suing, it could not be held as a matter of law that her injury was not the proximate and natural result of the company's negligence.

Furthermore, the court holds that the rule is settled that, where the passenger shows a break in the railroad track, or the breaking of an axle or wheel of a car, he makes out a prima facie case in a suit to recover for an injury received by reason of such defect. This rule applies to all those things which the carrier is bound to supply, and are defective, by reason of which an injury to the passenger occurs. But this court has in a number of cases said that it is better not to instruct the jury as to burden of proof, and it is safest to so frame the instruction as to indicate the burden of proof without expressly referring to it. Under this rule the court should have instructed the jury that, if the injury of the party suing was due to any defect in the car or cars on which she was riding, or the machinery or appliances connected therewith, and she did not, by her own want of ordinary care, contribute to the injury, they should find for her the damages she thereby sustained, unless they believed from the evidence that the company had exercised the utmost care and skill which prudent men are accustomed to use under similar circumstances to ascertain any defects in the car and appliances and secure their safety.

LIABILITY FOR INJURY AFTER CARRYING VEHICLE 25 TO 40 FEET—PROOF NECESSARY IN PERSONAL INJURY CASE—CONTRIBUTORY NEGLIGENCE WHICH WILL NOT BAR ACTION—PROXIMATE CAUSE OF ACCIDENT—TEST.

Rider v. Syracuse Rapid Transit Railway Co. (N. Y., 63 N. E. Rep. 836. May 13, 1902.

The general rule, the court of appeals of New York says, is that in an action to recover damages for personal injuries founded upon negligence it is incumbent upon the plaintiff to prove negligence on the part of the defendant and the absence of contributory negligence on the part of the injured party. The courts have, however, ingrafted upon this rule an important exception, and that is that the contributory negligence of the injured party which will bar an action in his behalf must be the proximate, and not a remote contributing cause of the injury. The plaintiff's contributory negligence, it is said, must not only be a contributing cause, but a proximate, and not a remote, cause of the injury. The proximate cause of an event must be held to be that which, in a natural sequence, unbroken by any new cause, produces that event, and without which that event would not have occurred. The plaintiff's fault will not affect his cause of action unless it proximately contributed to his injury. It must be a proximate cause in the same sense in which the defendant's negligence must have been a proximate cause in order to give a right of action. Contributory negligence, however great, is no defense to an action for damages for an injury which was reckless, willful or wanton. When the negligence of the deceased is but a remote cause or antecedent of the injury, while the negligence of the defendant is made the proximate cause of it, then the plaintiff will not be debarred from prosecuting his claim by his negligence, nor will the defendant be excused from the consequences of his.

This action was brought to recover for the death of a man caused by a delivery wagon in which he was riding being struck by an electric car at an intersection of two streets. The accident differed from all such accidents at street crossings only in this respect—that the injury was not inflicted upon the deceased at the instant when the car struck the vehicle, but after carrying it forward upon the track for a distance, which was claimed by the plaintiff to be from 25 to 40 feet, the carriage was overturned, and the driver injured. It was claimed on the part of the plaintiff that the motorman could have stopped the car within the space of 8 feet of the vehicle, while on the part of the defendant the evidence tended to show that it could not be stopped in less than from 50 to 60 feet. Thus, the case turned largely, if not entirely, upon the ability of the motorman to stop a car moving at the rate of from 6 to 9 miles an hour before the collision, and before the carriage in which the deceased was riding was overturned. But the court does not think that the exception to the general rule in cases of this character was properly applied to the facts in this case by an instruction, in substance, that, although the deceased negligently drove upon the railway track, yet the plaintiff could recover if the jury was satisfied that the motorman, upon seeing that the deceased was about to cross, could, by the exercise of reasonable care, have brought the car to a stop before the collision which resulted in the injury. And it holds that it was error to refuse to charge that, if the jury found that the deceased was negligent in going upon the track as he did, there could be no recovery, and that he was not permitted to take doubtful chances as to whether it was safe to cross.

The contributory negligence of the injured party, the court says, cannot be taken from the jury except in cases where it is clear that there was some new act of negligence on the part of the defendant that was the proximate cause of the injury. The negligence of the deceased, if any, was substantially concurrent with that of the motorman, if he was negligent at all. The whole collision was the work of but a moment of time, and to attempt to separate what took place before the contact of the car with the vehicle from what took place afterward would be to create distinctions and refinements that in the end would practically abrogate the rule in such cases that the injured party cannot recover when his negligence is a contributing cause of the injury. In this case, if the deceased was in fact negligent in driving upon the track, when the approaching car was so near as to render the act dangerous, then such negligence could not be regarded as remotely connected with the accident, within the meaning of the rule stated, but a proximate concurrent cause which precluded a recovery. Unless the character of the accident is such that it can be fairly said that the negligence of the injured party is but a remote cause, the exception is not applicable. In determining whether the cause of the accident is proximate or remote the same test must be applied to the conduct of the injured party as is to be applied to the defendant. The conduct of the latter cannot be judged by one rule and that of the former by some other rule.

CARE REQUIRED IN APPROACHING STREET CROSSINGS—FAILURE TO GIVE WARNING—INJURY TO BOY ON TRACK 20 FEET BEYOND CROSSING—UNREASONABLE OR DANGEROUS RATE OF SPEED—DUTY TO YOUNG CHILDREN—RESPONSIBILITY OF CHILD OF SIX OR SEVEN—EXTRA CARE REQUIRED AT CROSSING NEAR SCHOOL.

Chicago City Railway Co. v. Tuohy (Ill.), 63 N. E. Rep. 907. Apr. 16, 1902. Rehearing denied June 4, 1902.

It is incumbent upon those in control of a street car, the supreme court of Illinois holds, to exercise a greater degree of care or watchfulness at street intersections than at other places along the route. Drivers, gripmen and motormen of street cars are obliged at all times to exercise reasonable care in the conduct of their cars; but the requirement of reasonable care imposes upon them a more exacting attention when they approach street crossings in a crowded city, where vehicles and pedestrians may always be expected in front of them. The failure under such circumstances to ring the bell, sound the gong, or give other proper warning, is undoubtedly evidence of negligence to be submitted to a jury under all the circumstances, whether there is an ordinance requiring such precautions or not. The increase of danger to the public at such crossings demands a corresponding increase of vigilance and energy on

the part of such driver, gripman and motorman. They ought to notice whether or not the tracks are clear when they approach such public crossings and sound the gong or warning.

In the case, where a boy between five and six years of age was injured, the evidence tended to show that it was about 20 feet beyond a crossing, and that at the time he was looking towards the track, talking with another boy, 11 years old, standing upon the sidewalk or curb. The court intimates that the boy injured was so near to the crossing as to have required a slackening of the speed of the car. But even if he was not sufficiently near the crossing to justify the application of the increased vigilance required of a street car company in approaching a crossing, yet, it says, there was evidence tending to show that the speed of the tram was unreasonable and dangerous. Street cars propelled by electricity cannot be lawfully run at a rate of speed which is incompatible with the lawful and customary use of the highway by others. Here the boy had as much right to be upon the street as the company. A street railway company has no property interest in the street, and therefore no right to run its cars at a rate of speed which will interfere with the customary use of the street by others of the public with safety. Such cars can be more readily and quickly stopped than the train of an ordinary railroad. Where the motorman or gripman runs his car at such a rate of speed that he is prevented from keeping control of it, so as to stop it within a reasonable distance upon an appearance of danger to others, the rate of speed at which he propels the car is to be deemed unreasonable or dangerous. It has been held that, where an electric car was running at the rate of 10 or 11 miles an hour over a crossing in a much-frequented street, without giving any signal, there was such evidence of negligence as justified a submission of the case to a jury.

The evidence also tended to show that when the car stopped it had probably passed the boy by about 75 feet, and the court says that it is a question of fact for the jury whether the gripman or motorman on such a car keeps such a lookout as the circumstances demand, or gives such warning of approach as is necessary when he discovers that a child is upon the car track or approaching it, and the circumstance that the car has run an unusual distance before it stops is some evidence of improper management. When a young child is discovered approaching the car track with the apparent intention of crossing in front of a moving car, or is discovered on the track, it is certainly the duty of the gripman to exercise a high degree of diligence in order to prevent injury to the child. A verdict in favor of the plaintiff will not be disturbed where it appears that a street car approaches a street crossing at a very fast rate of speed, without any alarm, while a boy is standing on the track in full view of the motorman, or standing in the center of the track, with his back towards the car.

Moreover, the court says that it is of the opinion, upon further consideration, that, where the testimony shows that a child is only six years old, or less, he is incapable of such conduct as will constitute contributory negligence. In other words, a child of the age of only six years, or under, is exempt from responsibility in the matter of contributory negligence, and so far as the exercise of due care for his own safety is concerned. Again, it says that, in view of the authorities in Illinois, which it quotes, it is certainly justified in holding that a child under six years of age is prima facie incapable of exercising care for his own safety, so that negligence cannot be imputed to him, and in such case it devolves upon the party defending against liability for injuring him to prove that he has sufficient capacity and intelligence to exercise care for his own safety. And still again, it says that it holds, in analogy to the rule of the common law, which exempts children under seven years of age from criminal responsibility, that up to the age of seven years a child is incapable of such conduct as will constitute contributory negligence, and that the court may so declare as a matter of law.

As to the point sought to be made with regard to the boy's intelligence and capacity to care for himself from the fact that he had been allowed to go alone to a public school for more than a month, to reach which it was necessary to cross the tracks, but which was not more than a block and a half or two blocks from his home, the court says that the presumption was that, in passing the school, the cars obeyed the law, which demands greater care in view of the crossing of the street at that point by children going to school. It did not follow, therefore, that in going to the school every day, which was so short a distance from his home, the boy was running the same dangerous risk as he would run in crossing the track at any other point.

MERSEY TUNNEL RAILWAY.

The power station, machinery and track work for the Mersey Tunnel railway in England are all being pushed rapidly to completion and the last of the main generators and engines for this plant are about to be shipped from the Westinghouse works at Pittsburg. These generators are of 1,200-kw. capacity and are to be direct connected to vertical cross compound Westinghouse corliss engines of 1,500 h. p. each. A separate generating plant will supply the lighting of the power house, all stations, sidings, etc., and will consist of two compound-wound 200-kw. generators of 650 volts, direct connected to Westinghouse compound engines running at 250 r. p. m. The total output of the generating plant will be 6,000 h. p. for railway use and 600 h. p. for lighting. The Westinghouse electro-pneumatic system of control will be used and the rolling stock will consist of 60 cars, each 60 ft. in length. Five cars will be operated in a train, the first and last of which will be motor cars equipped with four 100-h. p. motors each, and Westinghouse high-speed air brakes.

The Mersey railway, connecting Liverpool and Birkenhead, passes under the river Mersey through a double track tunnel. The length of the line is 4 1/2 miles and the total length of track, including sidings, is about 12 miles. The only competition which the road has is from the ferry boats on the river, and its traffic is very large. The passengers carried amounted to between 7,000,000 and 8,000,000 per year with the steam locomotive system. The road is built to standard gage, the rails being of the ordinary English bull-head type, weighing 86 lb. per yard. The line is to be equipped with a third rail system with the conductor rail outside of the running track. The latter will not be used as a return conductor, but a fourth rail will be placed between the tracks for this purpose. The third and fourth rails will be similar in size and arrangement and this plan will prevent any destruction to buried pipes, etc., by electrolytic action. Both conductor rails will be T rails in 60-ft. lengths and will weigh 100 lb. per yard and be carried on stoneware insulators spaced 7 or 8 ft. apart. It is expected that the trains will be run on a three-minute headway.

CARD INDEX FOR CABLE RECORDS.

We illustrate herewith a card index system for keeping records of cables which is in use on the Aurora, Elgin & Chicago Ry., the details of which were arranged by Mr. Ernest Gonzenbach, the electrical engineer of the company.

There are a large number of comparatively short cables used on this road for connecting the ends of the third rails at street cross-

CABLE NO.	1158-2	LOCATION	HX, S. Rail	SIZE	1 mil C M	
DATE INSTALLED	July 17	1902	LENGTH	148 ft	SPEC	Paper
REMARKS						
DATE	RES IN OHMS	REMARKS	DATE	RES IN OHMS	REMARKS	

ing, and each of these cables is numbered and lettered. A separate card is used for each cable and at the top of the card is recorded the number of the cable, its location, its size in circular mils, the date on which it was installed, its length and the character of the insulation. Under this data are two lines left for general remarks. Whenever a cable is tested the date on which the test took place is entered on the card, as well as the resistance of the cable in ohms, and a blank is also left for inserting any general remarks in connection with the test.

The card index system provides an extremely handy method for

ascertaining the condition of every cable on the line, and as the cards are arranged according to numbers, the exact condition of any cable can be readily found at any time it may be required. Each card also comprises a brief history of a cable and shows just what troubles, if any, have been found during the life of the cable.

WESTERN NOTES.

A special election is to be held in San Francisco on December 2d, at which a proposition for the city to acquire the Geary Street Railroad at the expiration of its franchise, is to be submitted to a popular vote. The present franchise expires on November 6, 1903, and it is proposed to issue bonds to the amount of \$700,000 to pay the cost of the property and to equip the system.

Negotiations are said to have been concluded for the purchase of the franchises, track, rolling stock, etc., of the Hawaiian Tramways Co. by the Honolulu Rapid Transit & Land Co. The purchase price is in the neighborhood of \$300,000 and Mr. C. C. Moller, who represents the Hawaiian Tramways Co. in Honolulu, negotiated the sale.

The Oakland Transit Co. is preparing to install on the Hayward's electric line, a block and signal light system similar to that in use on steam railroads. This company is building six 40-ft. double truck, standard gage electric cars, having a seating capacity for 40 passengers, at its shops near the Piedmont power station. These cars are to be equipped with four motors each, making them capable of attaining high speeds.

MASSACHUSETTS STREET RAILWAY RULINGS.

The railroad commissioners of Massachusetts have, under a new approval law, adopted a set of rules under which certain conditions shall be uniform throughout the state. They will require rails weighing not less than 60 lb. per yd. and ties not less than 7 ft. long, 6 in. thick with 6-in. face, and spaced not more than 2 ft. between centers, shall be used; that the roadbed shall be constructed with at least 18 in. of suitable ballast below base of rails and properly drained; that when practicable the railway shall be built continuously either on one side or in the center of the highway and separate from the driveway, with a clearance from any obstruction of at least 4 1/2 ft. on tangents and proportionally more on curves; that the roadway independent of the railway shall be of sufficient width to properly accommodate other travel; that crossings of the railway from one side to the other of the highway shall be avoided and shall only be permitted where provision is made for proper regulation respecting the operation of cars and restriction of speed.

The board also calls for plans in each case showing the place the rails are to occupy in the highway and the location of each pole. The board also adds that these requirements will not exclude other suitable conditions imposed by local boards or by themselves in special cases.

The board has handed down a decision dismissing a petition of the Waltham company for the extension of its franchise into the town of Lincoln. In this it makes several rulings that are likely to be standards in the future. It says that the term "constructed railway," the statutory requirement before it can extend into another town, does not mean an absolutely finished construction or one sufficient merely to show the good faith of the company, but rather a substantial construction.

The board does not accept literally the statutory provision that a railway must be constructed to the boundary line before the company can petition for a location in the second town. It believes that there is no need that this should be done before bringing a petition. A company with an established railway in one town should know whether it can secure a location in an adjoining town before it builds a branch solely to connect with it. The latter course might entail a waste of money and needless capitalization should a location in the adjoining town subsequently be denied by the selectmen.

Owing to the theft of 1,600 ft. of trolley wire from the lines of the Elizabeth (N. J.), Plainfield & Central Jersey Railway Co., the lines at Westfield were recently tied up from an early hour in the morning until 10 a. m.

REPORT OF THE COMMITTEE ON "RULES FOR THE GOVERNMENT AND INFORMATION OF CAR SERVICE DEPARTMENT EMPLOYEES."

Presented at the Detroit Convention of the A. S. R. A., accepted and ordered printed.

For the discussion of this report see "Daily Street Railway Review," Oct. 11, 1902, page 715.

In effect 12301 a. m. . . . .

Modeled on the standard code of the American Street Railway Association.)

GENERAL NOTICE.

The rules herein set forth apply to and govern on all lines operated by the . . . . . Railroad Co.

They shall take effect . . . . . and shall supersede all prior rules and instructions in whatsoever form issued which are inconsistent therewith.

In addition to these rules, special instructions will be issued from time to time, as may be found necessary, and such instructions posted on the various bulletin boards, whether in conflict with these rules or not, which are given by proper authority, shall be fully observed while in force. Bulletin boards are located at the following points and must be consulted daily by each employe of the transportation department:

- .....
.....
.....

Every employe whose duty is in any way prescribed by these rules must always have a copy of them at hand while on duty and must be familiar with every rule.

The head of each department will supply copies of these books to his subordinates, see that they are thoroughly understood, enforce obedience to the rules and report all violations to the proper officer.

All employes are required to be polite and considerate in their dealings or intercourse with the public; the reputation and prosperity of the company depend upon the promptness with which its business is conducted and the manner in which its patrons are treated by its employes.

All employes will be regarded in line for promotion, advancement depending upon the faithful discharge of duty and capacity for increased responsibility.

While for the effective management of a large system the observance of stringent rules and the maintenance of strict discipline are necessary, that enforcement must be impartial as between employes.

Employes may be charged with and required to pay for any damage done to the property of this company for which they are responsible, or for any loss or expense incurred by the company by reason of carelessness, neglect or disobedience of these rules.

Employes must refrain from the use of profane or indecent language and from improper or ungentlemanly conduct; politeness and courtesy must be observed in their dealings with one another as well as with every one with whom they come in contact in the performance of their duties.

In the absence of the proper officials to whom they may apply for advice, assistance or authority all employes are expected to use good judgment and discretion in dealing with matters not covered in these rules.

.....
Chief Executive Officer.

GENERAL RULES.

1. The safety of passengers is of the first importance; all work must be entirely subordinated to safety, first, and then to the regularity and punctuality of the service and the comfort and convenience of the passengers. Line repair men, emergency crews and track men will be required to subordinate their work in accordance with this rule to the requirements of the operation of the road.

2. Employes of any grade will be considered as accepting or continuing in employment subject to the dangers incident to this hazardous occupation.

(a) The fact that any person enters or remains in the service of the company will be considered as an assurance of his willing-

ness to obey its rules. No one will be excused for a violation of them even though such rules are not included in those applicable to his department.

(b) Employes of this company will not be identified with or engage in any other business except with the specific permission of the head of the department in which employed.

(c) Employes shall not make assignments of pay; such assignments will not be recognized or honored by the company.

3. If in doubt as to the meaning of any rule or special instructions, application must at once be made to the proper authority for an explanation; ignorance is no excuse for neglect or omission of duty.

4. If an employe become incapacitated from sickness or any other cause, the right to claim compensation will not be recognized; an allowance, if made, will be a gratuity justified by the circumstances of the case and the previous good conduct of the employe.

5. When an employe is discharged from the company's service, he will not be re-employed without the consent of the head of the department from which he was discharged.

6. Employes when leaving the service of the company must sign receipt for their final pay and return to the company all of its property with which they have been entrusted; in default of such return they will be charged in final settlement for all such articles short.

7. No employe will be allowed to absent himself from duty without special permission from the proper officer, nor will any employe be allowed to engage a substitute to perform his duties while he is absent.

8. The use of intoxicating drink on the road or about the premises of the company is strictly forbidden; no one will be employed or continued in employment who is known to be in the habit of using intoxicating liquor; smoking by an employe while on duty is forbidden.

9. In the event of any of the company's apparatus, breakage of the overhead line, charging a pole in the public street, unsafe settlement of building or structures, etc., whereby imminent danger of personal injury is caused, the first employe discovering the fact must arrange to protect the danger point, advising the proper authorities by the first available means of the character and location of the trouble; he must not relinquish such responsibility until properly relieved.

10. All medical examinations in behalf of this company of injured persons will be conducted by the regularly appointed medical examiner. Medical attendance to injured persons, whether employes or other persons, will not be supplied by this company except in unusual emergencies.

(a) Whenever, in emergency, any authorized official deems it advisable to call an outside physician such official must immediately notify the claim department, giving the name of the physician called and the reason therefor.

(b) In ordinary cases of personal injury if proper attention to the injuries cannot be given by an employe using the "emergency cases" provided for rendering first aid to the injured an ambulance call is usually sufficient, accompanied by prompt notice to the claim department.

In the case of an accident wherein the question may be raised as to the condition of the car, either motor or trailer, such car must be "run in" at once to either the home or nearest depot, passengers thereon transferred and the car immediately and thoroughly inspected by the shop foreman, who will promptly make special report thereon to the superintendent.

11. Information concerning the affairs of the company must not be given to any one except its authorized representatives, who, if unknown, shall in all cases show proper credentials before information is given.

12. Each employe of the transportation service must have a reliable watch, maximum variation allowed . . . seconds daily,

which shall be kept in good and accurate condition and compared daily with the standard time of the road.

13. The collection or solicitation of money by employes of this company from other employes or any other persons in the nature of fees, gifts, etc., is forbidden.

(a) The solicitation of advertisements or contributions for entertainments or similar purposes by or on behalf of any employe or employes of this company is also prohibited.

14. Intoxicated, disorderly or otherwise obnoxious persons are not allowed on the cars operated by this company; conductors are authorized to refuse to carry any such person.

15. Large, bulky packages will not be carried in the passenger cars of this company—passengers will be accepted with only such bundle or packages as can conveniently be carried on the lap or satchel or valise of reasonable size. Freight will be carried only under the conditions and the tariff as bulletined.

16. Under no circumstances shall any article be hung on any brake handle of any car nor shall any obstruction be so placed or allowed to remain as to hinder access to and use of any brake.

17. Dogs or small animals will be transported in the passenger cars of this company only under the conditions bulletined.

#### INSPECTORS.

18. Inspectors report to and receive instructions from their superintendent, daily, before they are due to go on duty.

19. They will be expected to set an example to the other unformed employes in the neatness of their attire, the excellence of their deportment and their loyalty and devotion to the company's interests.

(a) Each inspector will be supplied with the following equipment:

- One pair rubber-handled pliers.
- One pair rubber gloves.
- Small roll adhesive insulating tape.
- Ten feet insulated wire.
- Supply of fuses—where used.
- Light switch plugs.

20. Inspectors must be thoroughly conversant with all rules and instructions issued, render all assistance in their power in carrying them out and report all violations to their superior officer.

(a) They will be responsible for all time tables, running times and time points; they will see that cars are operated on schedule time and properly spaced; when blockades occur the movement of cars will be under their direction.

(b) They will also satisfy themselves that all new men under instruction within their territory by regular motormen or conductors are properly instructed.

21. Inspectors will arrange for any extra service needed and withdraw unnecessary service on their lines in accordance with the requirements of the traffic, keeping their superintendent advised thereof; at all times their effort will be to improve the service.

(a) They will facilitate the movement of cars or trains carrying mail and give special attention to chartered cars.

22. Inspectors must be familiar with the different types of motors and controllers and be able to remedy slight defects occurring on the road.

23. Inspectors have authority to relieve conductors and motormen on duty while on their road on account of sickness or any other cause that would prevent them from properly doing their duty.

(a) They must remain on that part of the line or division assigned to them unless it is absolutely necessary to take a car in charge.

(b) They will see that line repair and track men and emergency crews while at work do not unnecessarily interfere with the regular operation of the road.

(c) When a fire occurs to interfere with the operation of the cars they must notify terminal depots of the lines affected, order out the emergency crews of that district and see that hose jumpers or other appliances are procured as promptly as possible.

(d) During the winter season they will see that heaters in cars are regulated in accordance with outstanding instructions; electric

heaters must be turned off to one notch in case the power runs low; if necessary they will be cut out altogether.

24. Inspectors will note in detail the condition of the cars, whether properly cleaned, heated, ventilated, lighted and equipped, and that all signs are properly displayed.

(a) When a car becomes disabled so that it cannot be repaired on the road they will have the following car push it to the first turnout and transfer the passengers to the next car of the same line; after the delayed cars shall have passed, such car will be hauled to the nearest depot. When a car is being pushed a drawbar must be used to connect the two, movement must be slow, proper care exercised and the reversing switch set on the disabled car in the direction in which the car is moving.

(b) They will carefully check the load with the register on every car they board; in case of discrepancy they will take up immediately with the conductor, reporting the occurrence to the superintendent.

(c) When transferring passengers from one car to another (Sec. A) they will require the conductor to whom transferred to ring up the number in their presence and will then note on that conductor's day card the number transferred, with statement or cause, signing the memorandum.

(d) They will be familiar with the transfer points of all lines and be able intelligently to direct the traveling public.

25. Inspectors will promptly report all defects in track or overhead work to the proper officer at once and take necessary precautions to avoid accidents.

(a) In case of break in the overhead line or serious derailment of cars they will at once notify the nearest emergency station, stating cause and location of trouble, which must be promptly repaired; for this purpose the nearest telephone will be used—if charge therefor be made the superintendent will refund the amount.

(b) Should the armature, terminal wires, brush-holders, brush or any part of a motor break that motor must be cut out.

(c) They must see that the track is properly sanded when necessary, especially on grades, approaching junction points, terminals and crossings; they must see that switches and guard rails on curves are kept clean and properly lubricated.

(d) If any buildings are to be moved across the track or any excavation under or alongside the track, the fact must be reported to their superior officer at once.

(e) In the event of a snow storm they will report to their superintendent promptly for duty and assignment as required.

(f) They will render every assistance possible upon arrival at the scene of an accident, secure the names and addresses of as many witnesses as may be possible and make written report to the claim department, giving in detail all the information obtainable. Their aim will, however, be to so thoroughly train car crews that no accident occurring could have been avoided.

26. They must arrange to be notified in case of fire, blockade or severe storms and must at once take charge of the operation of the line or lines until properly relieved.

(a) In case of snow storms they must arrange for snow plows and sweepers to be run and the lines kept open. They must arrange to sand and salt the rail when necessary, giving special attention to grades, junction points and railway crossings.

#### RECEIVERS OF THE COMPANY'S MONEY.

27. Receivers will report to and receive their instructions from the superintendent; they will comply with instructions from the accounting or treasury department.

#### DEPOT MASTERS.

28. Depot masters report to and receive their instructions from the superintendent or the inspector.

29. The depot master will have charge of the depot, barn or terminal and the company's property at which they are located, and will see that all worn-out, broken or defective articles are returned for new; they will have charge of all persons employed thereat, unless otherwise instructed, and will see that every employe reads the bulletin board at least once daily.

30. They must attend to the proper arrangement of cars, see that they leave promptly on time and that all cars are promptly cleaned, heated, lighted, inspected and equipped.

31. They must see that all employes reporting at that depot, terminal, line or division are prompt and efficient in the discharge of their various duties.

32. They must see that conductors and motormen are ready for duty at the time required and are provided with all the appliances necessary for the safety and proper management of the cars.

33. They must preserve order about the depots, preventing confusion, delays, loitering, drinking of liquor, gambling, etc.; eating in cars is permitted only at those terminals having no other facilities.

34. They must not allow conductors and motormen to go on duty unless they present a neat and cleanly appearance, are properly uniformed and are physically fit for duty.

35. They must require all articles found in the cars or on the company's property to be promptly delivered to the designated office or person, all such articles to be plainly marked with the name of the finder, time and date when found, together with place or car in which found; persons inquiring for lost property will be directed to the lost property clerk.

36. No transfer of cars or property shall be made from the depot without an order from proper authorities, and they must immediately notify their superintendent of the transfer desired or made.

37. They must see that all the blank forms and reports used in the transaction of the company's business are properly filled out and forwarded—especially accident reports, which must be given utmost dispatch.

38. They must see that conductors and all others handling the company's money turn in the money, transfer and other tickets, etc., to the designated persons promptly in accordance with the requirements of the treasurer—they must promptly call to account any one failing to do so.

39. In case of snow storms they must report promptly at their depots to assist in getting out plows, sweepers, sand and salt cars, etc., and assisting in so far as they may in keeping the road open.

#### GENERAL RULES FOR CONDUCTORS AND MOTORMEN.

40. Conductors and motormen report to and receive their instructions from the superintendent or his authorized representative; conductors will also be governed by the instructions of the accounting department which may be issued relative to the handling of transfers or receipts.

(a) The bulletin board must be consulted before starting and at the end of each day's work.

41. The conductor has charge of the car; the motorman is under his direction and will obey his orders (so far as reasonable). The motorman is directly responsible for the handling and condition of the equipment.

Under no circumstances shall both motorman and conductor be away from the car at the same time, unless properly relieved; in the absence of the conductor the motorman is held responsible for the car and its management and must notify the conductor the number of passengers who have entered in his absence.

42. Conductors and motormen must be neat and clean in appearance and wear the uniform and badge prescribed by the company—the badge must be kept in good condition and worn on the front of the cap, and the uniform must be clean and in good repair.

(a) A deposit will be required for the small property of the company entrusted to conductors and motormen; this deposit will be returned at termination of service, when such property must be returned; in default of such return deduction from the deposit will be made in accordance with the bulletined penalties.

(b) Under no circumstances shall employes exchange badges with each other; the official badge must never be worn by another than the person to whom issued.

43. Before leaving the car house or starting from a terminal or after relieving a crew, motorman and conductor will see that all signs are properly adjusted and displayed—each will be held responsible for his end of the car.

(a) While on the road all safety devices must be in place and the different articles of car equipment fully operative; for this the motorman and conductor will be held severally responsible.

44. It is the duty of both motorman and conductor to be on the lookout for passengers; motormen must never run by or pass passengers unless instructed so to do by the conductor or an inspector, when they must either point to the rear or call out "Take the next car."

(a) When approaching passengers on a street on which several lines of cars are operated or on which the cars run to different destinations conductors and motormen must announce to intending passengers the route and destination of their cars.

(b) Should a motorman at any time attempt to diminish the receipts of his car by running ahead of time or too near his leader or by not promptly stopping car for passengers, or shall directly or indirectly harass a conductor or be guilty of any misconduct, the conductor must report the fact at once to the inspector or the superintendent.

45. When any fire department vehicle, ambulance or this company's emergency wagon is running on the street, cars must be promptly stopped until such vehicle has passed, avoiding as far as possible stopping on a cross street or alongside standing cars or wagons.

(a) Motormen will receive and carry on their platforms, in lieu of a baggage compartment on the car or train, all mail sacks with which they may be entrusted, either United States or company mail. They will stow securely and handle carefully all such mail matter.

46. Conductors and motormen must conform to time table in running their cars, be particular in making time points as laid out on the time cards and avoid loitering on the line.

(a) When unavoidably delayed on the line the time lost is not to be made up by fast running as soon as the fact is noted, but by running slightly faster over the entire remaining length of the trip, and then only when this can be done with safety.

(b) When running through dark spots on the road or through fog banks or at any other time when the clear view of the tracks is limited, the motorman shall, except on private right of way, check the speed of his car and run only at such rate as will enable him to stop within the limit of his vision. Conductors for permitting a violation of this rule will be held equally responsible with the motorman.

(c) Crews of all special, express, chartered, mail, supply or other cars while on the road are subject to and must be familiar with the rules, regulations and requirements of the lines on which they are to run; all cars running on the road are subject to the jurisdiction of the superintendent.

(d) When, in case of blockade, a car is run around such obstruction and on tracks not usually used by cars of that line, or in handling mail, express chartered, official or special cars, the crew must see that all switches used are left in the same condition as when found. When under these circumstances a motorman has occasion to turn a switch he shall, after passing over it, stop, give the conductor the proper bell signal notice and the latter will then reverse the switch, making sure it is fully and properly thrown before boarding his car and giving the signal to start.

(e) In case of blockade it may be that several cars of one line will be bunched; upon the block being lifted such cars will spread again and not crowd together to destination. For the observance of this rule conductors will be held equally responsible with motormen.

(f) When either on or off their time a crew will not switch a car back or turn short of its signed destination without specific authority from an inspector or an authorized representative of the superintendent, excepting in the single case of an accident occurring and the car being disabled or required, under these rules, for inspection.

47. Conductors and motormen on duty are not allowed to sit down while the car is in motion except seats are provided for that particular purpose by the company, and then only on specified sections of the line as bulletined.

(a) Conductors and motormen on duty must not shout, signal or telegraph to motormen or conductors on passing cars or on the street nor carry on any unnecessary conversation with each other or any other person.

(b) The reading of newspapers, books or any other matter

than pertains to the immediate conduct of the company's business, while on duty, is prohibited.

48. No one but the duly authorized officers of the company will be allowed to stand on the front platform of passenger cars or ride on any other cars run over these lines. Exception can be made only in favor of policemen on duty and then only in emergency cases.

49. When passengers attempt to get off the car while it is in motion the motorman or conductor must call out to them, "Wait till the car stops." When passengers are alighting and a car is approaching in an opposite direction notify them to look out for the car on the other track.

50. Employees while riding free must not occupy seats to the exclusion of paying passengers or hold any conversation with motorman or conductor of the car. This rule applies generally to all free passengers.

51. When cars are run in the house in the day or night the conductor will see that the lights are turned off and the seats in closed cars turned up; the motorman must see that the controller is on the "off" position, the brakes are set, the power circuit is broken from the car by removing the trolley from the wire, securing the shoe up from the rail, throwing off the main motor or overhead switch and the power handles (also air when used) are deposited with the proper custodian or in the proper place, together with switch iron and all other tools or implements as required by bulletin.

52. On double track when a car or train is standing still, receiving or discharging passengers, any car or train approaching in the opposite direction must make a full stop directly opposite the front of the standing car or train; on single track when a car or train is approaching a car or train standing on a siding the motorman of the oncoming car or train will have his car or train under absolute control and run with extreme caution.

53. No car or train shall under any circumstances be backed up more than . . . . feet without the pole (in overhead construction) being changed, and then only with the conductor on the last or rear platform to give the back-up signal when the way is clear and to protect the rear against accident.

54. The motorman must bring the car to a full stop at steam railroad crossings, not nearer than one hundred feet to the nearest track. He will not proceed until the conductor has gone ahead to the track to be crossed, looked both ways and from that point given his signal by hand, flag or lantern to start. The motorman will also observe the utmost watchfulness for approaching trains and should, in his judgment, danger be imminent from any source he will refuse to start until the crossing is clear and free from all danger. When the conductor has gone ahead of car the motorman before starting will look back and see that no one is about to get on or off the car. This rule can only be abrogated by bulletin notice covering such crossings as are protected by gatemen or flagmen or tower-switchmen at points where the crossings are protected by interlocking signals and derail switcher; in such cases the conductor will remain on the car or train, holding the trolley rope over the crossing.

55. The motorman must bring the car to a full stop at all trolley or electric road crossings and junction points, and must not proceed until he receives the proper signal from the conductor. (This rule can be abrogated only as the preceding and only at similar points.) The conductor must not give the signal to go ahead until a full stop has been made. Conductors and motormen will be held jointly responsible for a violation of this rule.

56. If for any cause the motorman has stopped the car without a signal and a passenger should want to get on or off, the conductor will give the signal to stop the same as if the car were in motion. The motorman must wait for the conductor's signal before starting the car, whether he has received the signal to stop or not.

57. Cars must not pass on curves unless the motormen know there is ample clearance.

(a) Speed must be reduced on all curves and switches; on public thoroughfare the speed at such points must not exceed . . . . miles per hour.

(b) The car must not be stopped on a curve except to avoid accident.

(c) When running on public streets the conductor on any trol-

ley line will signal the motorman to go ahead if he has the trolley rope in his hand when approaching a curve; should the motorman fail to receive the signal he will signal the conductor and, failing response, should stop before reaching the curve. The conductor must hold the trolley rope around curves and under special overhead work.

58. Time tables of the different lines will be posted at . . . . . for the government and information of employes. They will show the assignment of crews to the different runs and the starting time from the terminal of the several trips of each run.

(a) Employes will receive notice of temporary changes (or patches) of time tables by the posting at . . . . . of a sign reading "new table" or "table changed." They will be expected to keep themselves posted concerning current time tables and all changes thereof.

(b) New time tables will be posted not later than — o'clock p. m. of the day previous to their becoming effective. Temporary changes (or patches) of time tables on account of weather or other variable conditions are likely to occur at any time.

59. There shall be a seniority list at each depot which shall show the names of all conductors and motormen in consecutive order according to the date of their assignment to that depot, excepting that for purposes of discipline a man shall have lost any numbers in his chronological standing. When vacancies occur conductors and motormen, each on their own list, will be advanced in seniority in accordance with their then standing on the list.

(a) When changes are necessary in the assignment of crews and runs on time tables (old or new) they will be made according to the seniority listing of the men, to take effect as far as possible on Mondays only.

60. Compensation will be a certain rate per hour or per trip, according to the line where employed; the rate will be the same for conductors and motormen.

(a) In assigning men for duty on regular runs or week-day time tables it shall be done in accordance with the seniority list and the runs given away in the following manner:

1—Full pay straight runs (early and late and night cars in sequence).

2—Full pay swing runs (early and late in sequence).

3—Straight trippers (early and late in sequence according to 39Y).

4—Swing trippers (early and late in sequence according to pay).

61. All conductors and motormen shall be considered as either regular or extra men; regular men are those that have regular runs on the week-day tables; extra men are those that are not assigned to regular runs on the week-day tables. When first appointed conductors and motormen will serve as extras, working up gradually to regular runs.

62. There shall be at each depot a daily working list which shall show the names of all extra men in the order in which they stand for work on the following day.

(a) The daily working list shall be a revolving list; that is, when first for work is assigned for work his name (provided his work for that day shall have amounted in value to at least \$—) shall be dropped to the bottom of the working list and work shall not fall to him again until every man whose name followed his on the working list of that day shall have been excused, jumped, suspended, discharged or put to work.

63. There shall be a daily excused list at each depot which shall show the names of all men, regular and extra, who have been excused, suspended or discharged, and the names of those who will fill their places for the day.

(a) When an extra man is excused for but one day his name shall be dropped to the bottom of the working list of that day, irrespective of whether work would have fallen to him or not.

(b) No conductor or motorman will be excused from duty until he sees his name posted on the excused list, except in case of sickness, when his written statement of the fact must be sent to the agent to whom he reports at the depot by at least such time as he would personally report for duty were he going to work; no telegraph or telephone message will be accepted.

(c) It shall be understood that conductors and motormen excused on account of sickness and so marked on the excused sheet

are off for an indefinite time, which shall be not less than two days nor more than thirty days. At the end of thirty days, unless the sick leave shall have been extended upon proper application, the absentee may be dropped for non-attendance.

(d) When an extra or regular man who has been marked off sick desires to return to work he must report to the designated agent before 6 o'clock p. m. of the day previous to the one on which he wishes to return to work so he may be marked up for work the next day.

(e) Any conductor or motorman absenting himself for ten days or more without having been excused and without being heard from shall, in the discretion of the superintendent, have his name dropped from the seniority list and be discharged for non-attendance. Should he return within ten days he shall give satisfactory explanation of his absence to the superintendent before resuming work.

64. The working and excused lists shall be posted at each depot daily not later than 4 o'clock p. m.

(a) The names of conductors and motormen not shown on the time tables as in charge of regular runs will be shown on the excused list or the working list.

(b) Unless otherwise marked on the excused list or the working list, extras must be in attendance at the depot at least 45 minutes before starting time of the first car out in the morning and be prompt in attendance on all changes during the day thereafter until assigned for work.

65. Regular men shall be assigned, in so far as possible, on Sunday, holiday or special day time tables according to the seniority list; extra men shall be assigned on such tables after the last regular man desiring it has been assigned, according to their standing on the daily working list—that is, the extra standing first for work on Sunday morning, for instance, shall be given the first run following the regular men, and so on. An exception may be made to this when necessary to insure to certain men their proper amount of rest between the time of their week-day and Sunday assignment.

66. Conductors and motormen having regular runs must report verbally to the designated agent not less than 45 minutes nor more than 1 hour before their starting time from the depot. If he is not at his post they will await his return and then report.

(a) When a crew is to relieve another crew at a distant point from the depot the conductor and motorman must report to the above designated agent not less than 45 minutes nor more than 1 hour plus the running time before the starting time from the point of relief.

(b) No compensation will be allowed for reporting as required in the above rules.

(c) The above rules apply as well to the latter part of swing runs.

(d) Extras when assigned temporarily for regular runs are subject to the above rules.

67. A conductor or motorman shall be considered to have been "jumped" when he has been superseded for work by another for the following reasons:

1—Failure to report to the designated agent in accordance with the requirements of rules 63 to 66 inclusive.

2—Failure of conductor or motorman to be on his car at the starting time, even though he had reported to the proper agent at the proper time. This is applicable to all trips, unless the conductor has been excused by the same agent or authority.

3—Failure of extra men to report in accordance with the rules governing regular men when they are assigned for regular runs.

4—Failure of extra men to respond to call for work during changes.

5—Failure to respond to call for work or to report at the expiration of time for which they have been excused or at time marked on the working list.

(a) When necessary to assign conductors and motormen from one depot for temporary service at another depot, their names shall be shown on the working or excused list at their own depot with the time they are expected to report at the depot where they are to work; and failure to so report in accordance with these rules will result in being jumped.

(b) In case of delay from blockade, especially at hours of the day when headway is long, should it be clearly proven that a conductor or motorman was prevented by such blockade from reaching his depot previous to his reporting time, and providing there was no other way for him to reach the depot, the jump shall not be counted.

(c) In the matter of discipline for being jumped, regular and extra men shall be upon the same footing and so far as possible they shall be treated alike. An accurate record of each and every jump will be kept.

(d) Penalties for jumps shall be as follows:

- .....
- .....
- .....
- .....

68. Bell signal rules:

Conductors to motormen—

**CONDUCTORS MUST KEEP THEIR HANDS OFF THE BELL SIGNAL CORD OR ROPE EXCEPT WHEN IN THE IMMEDIATE ACT OF TRANSMITTING A SIGNAL.**

One signal, car standing at transfer point, motorman will then signal the number of passengers boarding the car by the front platform.

Two signals, car standing, go ahead—all clear.

Three signals, car standing, back the car slowly—all clear.

One signal, car in motion, stop at the next street, station or other designated point.

Two signals, car in motion, conductor has hold of trolley rope and is on the rear platform ready to take the curve; or, on answer to the motorman's signal of a possible obstruction standing or moving alongside the track near the car, that the car can pass slowly.

Three signals, car in motion, danger—stop immediately, emergency.

Four signals, car in motion, passengers to be transferred to the intersecting line—motorman will so signal.

Conductors will be careful to give each signal clearly and distinctly.

Motormen to conductors—

Motorman must not assume any signal is INTENDED—they must require a clear and distinct stroke of the bell for each.

One signal, car standing, one passenger has boarded car by front platform; this is to be repeated after the conductor's signal for the information as often as necessary to cover the case.

Two signals, car standing, conductor will reverse switch over which car has just passed.

Three signals, car standing, car must be backed. Is all clear?

Four signals, car standing, conductor is needed forward.

One signal, car in motion, approaching a curve, conductor will hold rope; or, on approaching a possible obstruction standing or moving alongside the track near the car, on receiving this conductor will promptly respond after taking proper action, as above.

Two signals, car in motion, conductor will immediately set the rear brake and stop the car.

A succession of quick signals is notice to conductor that trolley has left the wire.

(a) Air, gong or whistle signals—

One signal, .....

Two signals, to be sounded on approaching a cross street or any danger or to give notice of approach.

Three signals, another car is following on the same time and rights, a headway behind. **ON SINGLE TRACK LINES THIS SIGNAL MUST BE REPEATED IN ACKNOWLEDGMENT BY THE MOTORMAN OF THE CAR OR TRAIN PASSED.**

Four signals, approaching an intersecting line is notice to the crew of the car on that line that passengers are to be transferred to them.

(b) Classification signals—

These are conveyed to all concerned by a lamp or flag on the forward end of the car, carried in the bracket provided for the purpose. Their significance is as follows: **WHITE** light or flag signifies the car or train is an extra and running on no scheduled time.

**GREEN** light signifies another car or train is following a space

distance behind and running on the same time and rights. Motorman on any car carrying this signal must notify the motorman on each car passed (on single track lines) by the signal (Rule 68a), as provided, and the motorman so notified will repeat the signal in acknowledgment; in case a reply is not promptly made the motorman giving the signal will stop and verbally notify the other, reporting the occurrence to the superintendent on reaching the end of the run.

(c) Color signal rules—

RED invariably signifies danger, and a red flag by day or a red light at night is the order to stop. Under NO circumstances will such a signal be passed without a full stop having been made within not less than ten nor more than one hundred feet BEFORE the signal is reached, and the conductor must make certain that any further order or instructions intended are received and thoroughly understood before he gives the signal to start.

GREEN signifies the necessity for caution, and a green flag by day or a green light at night is the order to proceed with the car or train under absolute control.

WHITE, when used for signaling, indicates safety; but the swinging of a white lantern at night over or alongside the track is a signal to stop. A white lantern is also used at night hung on the gates protecting a railroad crossing to indicate the position of the gate.

(d) Fixed signal rules—

SIGN signals, such as "stop," "slow" or "breaker" signs, are placed at points requiring special protection; special instructions will be issued covering their position and use.

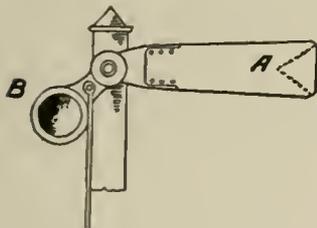

FIG. 1.

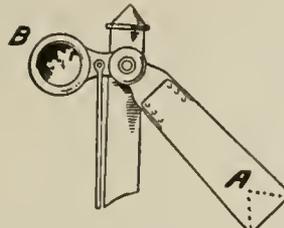

FIG. 2.

SEMAPHORE signals, as shown in figures 1 and 2, are of two classes, "HOME" and "DISTANT."

The home signal is supplied with a red lens, B, and the blade, A, of the signal is painted red and is square-ended, as shown by the full lines in the illustration. When in the position shown in Figure 1 this signal will show a red light at night and the signal in this position is an absolute order to stop (see Section C above). Such stop must be made not less than ten feet nor more than one hundred feet distant from and BEFORE reaching the signal, and the car or train must not proceed, when so stopped, until the signal is "cleared." The clear or safety position of the home signal is shown in Figure 2 by the blade being in an inclined position which will show a white light at night, and when in this position gives permission to the car or train to proceed.

The distant signal is supplied with a green lens, B, and the blade, A, is painted green and is "fish-tailed," as shown by the dotted lines on Figures 1 and 2. When in the position shown on Figure 1 this signal will show a green light at night and the signal in this position is an order to proceed only with the car or train under perfect control, this order to remain in force until the next signal is reached or the point or obstruction to be protected by slow speed has been passed. The clear or safety position of the distant signal is shown in Figure 2 by the blade being in an inclined position, which will show a white light at night, and when in this position gives permission to the car or train to proceed without slackening speed.

When two or more semaphore signals of the same class are located on the same post the top blade (and light) governs the right-hand track or route; the next lower signal governs the next track or route to the left of the first, etc.

A SIGNAL IMPERFECTLY DISPLAYED OR THE ABSENCE OF A SIGNAL AT A PLACE WHERE A SIGNAL IS

USUALLY DISPLAYED must be regarded as a danger signal and the fact reported at the first opportunity to an inspector or the superintendent.

SPECIAL INSTRUCTIONS FOR CONDUCTORS.

69. Conductors must be civil and attentive to all passengers, especially ladies, children and elderly persons. They will endeavor to provide seats for all, when necessary requesting passengers to sit closer together.

(a) Conductors must announce distinctly the names of streets and stations, in each case calling the following street or station immediately on leaving or passing any street or station. They will also announce the approach to any point of considerable travel and at transfer stations or points will announce the lines to which transfer is made and their destinations.

(b) Conductors must keep the rear platform, doorway and brake free from obstruction as far as possible and not allow passengers to stand in front of the controller box. When the platform becomes crowded they will request passengers standing there to step inside the car.

(c) On closed cars when passengers crowd inside the rear door the conductor must request them to move forward and make room for others. Under no circumstances will conductors allow passengers to ride on the bumpers, roof or side step (especially when crossing a bridge) except .....

(d) Conductors must see that passengers do not place their feet upon the seats.

(e) Conductors must give particular attention to the ventilation of closed cars. No set rules can be issued to cover; good judgment must be employed to secure the comfort of passengers.

(f) Conductors will be governed in the handling of heaters in the cars by the instructions as bulletined.

(g) Smoking will be permitted .....

70. Conductors must never under ANY circumstances operate the controlling mechanism of the car or train; should the controller on the head end of the car or motor car prove defective and inoperative the conductor will take position at the head end of the car or train and transmit signals to the motorman, who will then run the car or motor car from the rear end of the car or from the rear end of the forward motor car of the train. In this event only half speed shall be used in such movement and the conductor must have protected the rear end of his car or train from any following car or train as per detailed bulletin instructions. While in this position the motorman will look out for any passengers desiring to leave the car. Should the motorman become incapacitated the conductor will at once stop the car or train and protect it.

(a) On double-track lines the in-track gates front and rear must be kept closed and the in-track side steps securely fastened up. Should such appliances become out of order on the road the conductor will be particular to guard against accidents occurring therefrom and will turn the car in upon reaching the end of trip or the depot.

(b) When possible to avoid it conductors must not give the go-ahead signal from any point other than the rear platform of the car or forward car of the train, and then only after being careful to see that all is safe.

(c) The conductor shall never leave the car for any purpose while on the road without first notifying the motorman, who will then be in responsible charge of car and passengers.

(d) In case of thunder storm the conductor will turn on the light circuit and keep lights burning until all signs of lightning are past; in case any considerable stop is made the conductor will remove the trolley wheel from the wire until ready to proceed.

(e) When another equipped car is being towed its pole must be drawn down and tied to the dash rail.

(f) When two cars are coupled for running or a trailer is used the signal for starting must be given by the conductor on the rear car first, after each stop, and promptly repeated by the conductor on the forward car, each conductor being careful to know that passengers are safely on or off his car. Should the two cars be under the charge of a single conductor he must not give the

starting signal unless standing on one of the platforms between the cars, and then only after satisfying himself that all is safe.

(g) Except in case of absolute necessity to avert accident, the conductor must never remove the trolley from the wire until after the power has been shut off and the car stopped.

(h) When not otherwise engaged the conductor must be on the rear platform of the car, or if a trailer is used on the front platform of the trailer on the lookout for passengers who wish to board or leave the car; while on the stand the conductor must be near the rear platform of the car or train to solicit passengers and give information; when on a grade the conductor must be on the rear platform of the car or on the front platform of the trailer used, ready to apply the brake if necessary; when passing any transfer point the conductor as well as the motorman must be on the lookout for the transfer signal from an approaching car on the other line, in order that passengers may make the transfer without undue delay.

(i) The conductor will see that the light circuit of the car is in good order before leaving the depot and will turn the lights on and off as needed; in case other than electric lights are used he will be sure to see that they are always ready for use and light them when necessary, but will not fill kerosene lamps. He must, with the motorman, make sure the headlight is burning brightly on the head end of the car after nightfall.

(j) Where tail lamps are used the conductor must see that they are in proper condition for use and at sunset he will see that they are lighted and kept burning on their proper position on the car.

71. Conductors must not take charge of or become responsible for any article not paying transportation charges as per freight tariff posted, except only articles used in the company's service and placed on their car by an authorized employe of the company.

(a) Conductors must promptly turn in to the authorized receivers of such property all articles found in their car or on the company's property, noting on a tag attached to each article their name, trip, date, time and place of finding.

(b) Conductors will prohibit all begging, peddling or vending on their car or train except by the agents of the company authorized by this company to so sell; in no case, however, should any attempt be made to remove such vendor, etc., from the car while it is in motion, and no threat or intimidation should be used to such persons.

72. A day card or train card will be furnished the conductor upon reporting for work by the agent to whom he reports, such card calling for information which must be filled out in detail and in accordance with bulletined instructions for each half-trip. Conductors will make up this card at the end of every half-trip and will be held strictly responsible for the accuracy of each and every statement made thereon. On the back of this card conductor will note any occurrence on each trip of which memorandum should be made; such card shall be turned in with the transfers and money collected to the receiver of moneys at the end of each day's work or at the end of any number of consecutive trips.

(a) Conductors will receive transfer pads and a punch from ..... before starting work each day or swing and will return the unused transfers with the punch to ..... after each swing or day's work; when making such return they will be given a properly numbered check which will serve as a receipt for the punch.

(b) Each conductor must provide himself with \$..... in change before going on duty.

(c) Before taking car out of house or from terminal when beginning work, conductor must see and know that the register is securely bolted and locked to the register block; for the condition of the register the conductor will be held strictly responsible.

(d) The conductor will see that the register is set in the proper direction in which he is about to move and will turn the direction only as instructed by bulletin notice.

(e) The conductor must promptly collect and register the fare of each passenger on the car, if possible within a block after boarding it, except at such points where an agent of the com-

pany shall have made the collection—as shown in bulletined orders—and excepting in such cases as scheduled herewith where the passengers are entitled to free transportation:

- .....
- .....
- .....
- .....
- .....

(f) Conductors must not collect fares when approaching railroad crossings, transfer points, curves or switches.

(g) After making collection of fares conductor shall count the number of passengers on the car or cars and know that, excepting for the free, collection has been made from each and registration properly made. Fares must be registered singly as collected and not in bunches. When compelled to make change he will face the rear of the car, or, if on a trailer and working the train alone, face forward.

(h) If, after his fare has been collected and registered, the passenger discovers he is on the wrong car, the conductor will exercise his judgment as to return of the fare; if refunded, the conductor must not fail to ring up each other fare collected thereafter, but will make a note of the occurrence on the back of his day card and deduct the amount from the amount thereon called for to be turned in to the company's receiver. Also, when a conductor registers more fares than he collects such mistake can be corrected only by reporting it to the office.

(i) When passengers are transferred from one car to another at any place other than a regular transfer point the number of persons transferred, cause of such transfer and number of each car will be noted on the back of each day card and signed by each conductor engaged in the transaction; such persons will be registered on the car they board, but no further fares will be collected from them. If an inspector be present his signature must be secured on each day card as authorizing the transfer. The conductor must remain in charge of the disabled car until relieved.

(j) Should a conductor for any reason change his car after commencing his day's work he must not only note the number of the new car on the face of his day card opposite the half-trip on which the change occurred, but as well note on the back of the card the reason for the change and any damaged or filthy condition in which the new car or its equipment may be found.

73. When any conductor has any personal knowledge of an accident occurring in which any property may be damaged or any person or animal is likely to or may have been injured he will make prompt report of all the facts in the case to his depot immediately upon arrival at that point and as soon as possible fill out in exact and full detail a blank form provided for his use in such cases headed "Conductor's Accident Report." If the conductor was a passenger on a car involved in the accident or a nearby eyewitness of the occurrence or reaches the spot in time to do so, he will render every possible assistance to the conductor of the car and secure the names of as many witnesses not on the car as he can. If in charge of a car involved in any disturbance or accident he will secure the names and addresses of all possible witnesses, whether they actually saw the occurrence or not; in any event securing the name and address of every lady on the car. It is much preferred to have a witness write his own name and address if he can be induced to do so. Soon as the accident report is filled out it must be delivered, with the name slips of witnesses, as promptly as possible to the authorized representative of the superintendent.

(a) In case of serious accident the conductor or, if he so delegate, the motorman must immediately report the case by nearest telephone or telegraph to the nearest operating depot, dispatcher or division point, stating briefly the nature and probable extent of the trouble so that adequate assistance can be sent.

(b) The conductor must never eject a person from the car for disorderly conduct or non-payment of fare unless they get the names and addresses of witnesses. They will use no more force than is necessary in making the ejection, first bringing the car to a full stop at a traveled road, street or highway, a regular stopping point for passengers or a station.

(c) For each light of glass maliciously or wantonly broken

by a passenger or bystander the conductor will collect from the offender the sum of \$ . . . and turn in such collection with his fare returns for the day or swing; a note must be made on the back of the day card to cover the occurrence and refer to the remittance.

#### SPECIAL RULES FOR MOTORMEN.

71. While the car or train is in motion responsibility for safe running and its safe handling lies with the motorman; he must never attempt at such time to do anything but handle the controlling mechanism and watch the road ahead, being prompt to give warning of his approach to danger points or on the appearance of danger.

(a) Under NO circumstances will any motorman permit another motorman or any person, other than a student placed by proper authority with him for instruction, to run the car or train of which he is in charge while he is on duty.

(b) Upon leaving the operating position, box or platform for any reason whatsoever when the train or car is standing, the motorman must remove and carry with him the controller and reverse handles (together with the power brake handle where power brake is used), and must in all cases have shut off the current through the controller, broken the circuit through the car (by throwing the overhead circuit breaker, main motor or cut-out switch) and fully set the brake.

(c) Under no circumstances and for no cause whatsoever shall the motorman leave the operating position, box or platform of any motor while the car or train is in motion, except in the single case that an accident endangering himself is imminent and he shall have done all he can to stop and reduce to a minimum the impending damage to person or property.

75. Motormen are expected to become familiar with the electrical and mechanical construction of the cars in order to be able to meet emergencies arising on the road; they will be held directly responsible for the condition of that equipment.

(a) They must make it their special business to carefully examine all parts of the car before leaving the barn, depot or terminal or taking charge of the car to see that all safety devices, signal gong, foot gong, air whistle, fender, controller reverse, sand boxes, etc., are in place and in good and fully operative condition headlight glass and reflector clean and after sunset the light on the forward end of the car or train is burning properly and brightly.

(b) They will see that all tools required to be carried are on the car or motor; where fuses are used they will be sure to have a sufficient supply of the proper design and amperage and shall never use heavy wire or any substitute therefor for a fuse. They must have at all times an ample supply of sand to cover any possible demand.

(c) Motormen must apply to the shop foreman in charge of cars for any specific information regarding operation which they do not thoroughly understand or regarding any part or parts of machinery or electrical apparatus or wiring which is liable to get out of order on the road or during service.

(d) They will never attempt to do any work on motors unless the circuit through the car has previously been broken by throwing the main motor switch, the overhead circuit breaker or withdrawing the trolley from the wire; they will never do such work with any loose metal article in an upper pocket, which is liable to fall out and cause ultimate if not immediate damage.

(e) They will examine motor and journal bearings as often as may be possible and if too warm the fact must be promptly reported; the armature, field coils, diverter coils and commutator should never get so hot that it is impossible to hold the hand on them. Motormen must never try to run a motor that is seriously out of order, but shall promptly cut out the motor at fault.

76. When current is cut off between the power house and the motors the motorman shall throw the controller handle to the "Off" position and come to a stop to ascertain the cause; if in the day time he will turn on the light circuit to determine if the power is on the line. If the rail be dead or dirty and power is on the line, connection must be established with the nearest live rail and the wheel by the conductor, contact being broken with the wheel first to avoid a shock. Both controllers should be tried; if one works the trouble is in the other; if neither works, with

power on the line, a fuse has probably been blown. In that event the conductor will remove the trolley from the wire or the motorman will break the circuit through the car before anything else is done, and then if on examination a new fuse is found to be necessary the motorman will remove and retain to be turned in the stubs or ends of the former fuse and, after placing the new fuse in position, set up the binding screws, holding it tightly in place, being very careful to secure a good contact at each end. Should the new fuse be blown the motor at fault, as designated by the position of the controller handle at which the blowing occurred, should be cut out. If both motors prove disabled so as to prevent the self-movement of the car the circuit must be broken through the car and assistance called for; in the case of a multiple-unit train, if the other motors in the train can propel it, the train will be moved in accordance with Rule 70.

(a) In case the power is cut off and the brake is found to be defective, the motorman before signaling the conductor to set the rear brake will set the reverse handle opposite from the direction in which the car is moving, throw the controller handle to the last position and allow it to so remain until the effect takes place, then, being careful to throw the handle to the "Off" position. Should this for any reason prove inoperative the motorman will promptly signal the conductor to apply the rear brake.

(b) The motorman must not reverse the power under usual running conditions; reversing is a severe strain upon the apparatus, especially when the car is under high speed. When necessary to reverse, and the car has been brought to a full stop, the motorman will return the handle to the "Off" position and apply the brake fully.

(c) When tracks are covered with water or slush motormen will run slowly and carefully, with power off where possible in order that the splash of the water may not cause a short-circuit in the motors or wiring of the car. They must never try to run through water so high as to touch the bottom of the motor-shell.

77. Before completing the circuit through the car on starting to work the motorman will see that the controller handle or cylinder indicator points to the "Off" position; main motor switch or overhead circuit breaker will then be closed and the brakes released before the power is applied to start the car. In starting at any time power should be applied gradually and fed with only proper speed in order that no damage may be done the equipment or injury caused to passengers by the sudden jolt. The controller handle must never be thrown on the last point if the car does not start on the preceding points.

(a) Motormen must conform to time table requirements as closely as possible, regulating speed in accordance therewith and with the limits of the time point cards. If a motorman should be delayed he will not undertake to recover the time lost in the minimum distance, but, IF IT BE ENTIRELY SAFE TO DO SO, he will run slightly faster during the entire run, aiming to reach destination or end of trip as nearly on time as may be possible.

(b) Motormen shall never run ahead of time unless directed to do so by an authorized officer of the company.

(c) On descending grades the motorman shall allow the car to coast as much as possible with power thrown off, always being careful to keep the car under control and never allowing it to run down hill faster than the motors will take it up the same hill. Coasting being good and economical practice, will be done wherever possible.

(d) In stopping, brakes will be applied gradually to reduce the deleterious effect of a sudden retardation of motion in all service stops; just before the car or train comes to rest the brakes will be released slightly or partially kicked off so as to obviate the recoil that would otherwise ensue.

(e) Brakes must never be applied while the current is being used nor current applied while the brakes are on; serious consequences are liable to follow disregard of this rule.

(f) When, on applying brakes, the wheels are felt to be slipping the motorman will release the brakes partially, start sand to running and again set up the brakes.

78. Motormen will sound the gong with a double signal when approaching a station, standing car (see Rule 68a) or at any other times when necessary to call attention to the movement of

the car; where air whistle is used this signal will be given thereon.

(n) Motormen will use particular care when approaching or passing schoolhouses or any other places where children are wont to congregate, having speed materially slackened and cars under control.

(o) Where streets are dug up or excavations are made under, alongside or near the tracks, motormen will observe particular care in running, taking no risks. In passing men at work in the streets or along the tracks particular care will be used.

79. Motormen will observe the minimum spacing distances as bulletined allowed between any two cars moving in the same direction on the same track.

(a) On limited curves (where two cars cannot pass) when two cars arrive at the same time the car on the outer track has the right of way.

(b) On double track lines a car will be run slowly approaching and passing a car in slow motion in the opposite direction.

(c) Motormen must throw off power immediately before striking a curve, or before passing over or under any circuit breaker, special work, insulated joint, slip joint, frog or any similar mechanical contrivance.

(d) When any vehicle is seen in the track ahead or so close thereto that a car may not pass it the motorman shall slacken speed and not approach nearer than . . . . . feet until he has received the conductor's signal that the car will pass.

(e) Motormen will not run over any sticks, stones or other small obstructions on the rail, but will see that the track is at all times clear.

80. Motormen must never run against a facing switch point when meeting a car without first coming to a full stop and then proceeding only with the car under perfect control. This rule refers particularly to all crossovers and curves having switch points facing opposite to that in which the car is going.

(a) Motormen must not pass over any switch until they KNOW that the tongue is properly and fully turned, and then only at reduced speed. Particular care must be taken when switches are covered with snow or water.

81. Every motorman, after having run any car, whether for a day or but a single trip, will, upon being relieved and before leaving the depot, report the condition of the car or cars he has handled on the shop sheets provided; these sheets will show the run number and the motorman will enter thereon opposite his run number (or below the regular runs if he has been on an extra car) the number of the car he had on that run or any part thereof on that day, any defects of the car or its equipment and sign his name thereto. No excuse will be accepted for failure to so report.

(a) When any motorman has any personal knowledge of an accident occurring in which any property may be damaged or any person or animal is likely to or may have been injured he will make prompt report of all the facts in the case to his depot immediately upon arrival at that point and soon as possible fill out in full and exact detail a blank form provided for his use in such cases headed "Motorman's Accident Report." If the motorman was a passenger on a car involved in the accident or a nearby witness of the occurrence or reaches the spot in time to do so, he will render every possible assistance to the crew of the car. If running a car that becomes involved in any disturbance or accident, he will see to securing as many names from witnesses to the occurrence from the sidewalk or adjacent stores as may be possible, giving such names to his conductor.

Respectfully submitted,

J. C. BRACKENRIDGE,  
E. C. FOSTER,  
T. E. MITTEN,  
W. E. HARRINGTON,

Committee.

A car which has been remodeled and handsomely furnished by the Topeka (Kan.) Railway Co., was christened with imposing ceremonies on the eve of being again put into service, September 26th. The name conferred was Pearl in honor of a member of the local fashionable set, who performed the christening rites in the preferred way by smashing a bottle over the coupling rod of the car.

## ROADMASTERS AND MAINTENANCE OF WAY CONVENTION.

The 20th annual convention of the Roadmasters' and Maintenance of Way Association was held in Milwaukee, Wis., September 9, 10 and 11 and about 80 members were present. The meeting was opened by an address of welcome by Mr. J. H. Stover, representing the mayor, which was responded to by Capt. Isaac Burnett, the first president of the association. Twenty-three new members were elected and Mr. J. H. Linsley was elected an honorary member.

The program for the first session included a report on the education of young men for foremen and the discipline of section men. At the afternoon session an address was made by Mr. J. P. Brown, secretary and treasurer of The International Society of Agriculture. Mr. Brown advocated the starting of tree plantations by railroads for growing tie timber and mentioned in particular the catalpa speciosa plantations of the Illinois Central and the Boston & Maine Railroads. This was followed by the report of the committee on track jacks and a paper entitled "Should Rails be Curved Before Laying" by J. C. Rockhold of the Santa Fe. A report on right of way fences, cattle guards and wing fences was read and was followed by a paper on "Track Drainage" by Mr. J. M. Meade of the Santa Fe. The morning of the second day was devoted to a discussion of a gasoline inspection car made by the Sheffield Car Co. Mr. J. M. Huss, representing the makers, described the car and explained its method of working. A paper was then read by Mr. C. Buhner describing his method of converting old rails into steel ties. This was followed by a general discussion on ties, tie plates and tie preservation. At the final session on Thursday the report on new and improved appliances was read and received without discussion. The following officers were elected: President, John Doyle, superintendent of tracks, Pere Marquette; first vice-president, F. R. Coates, chief engineer, Chicago Great Western; second vice-president, J. A. Kerwin, roadmaster, Missouri, Kansas & Texas; secretary and treasurer, Charles McEniry, general roadmaster, Chicago, Rock Island & Pacific (Northern District); members of the executive committee, C. E. Jones, roadmaster, Chicago Burlington & Quincy, and J. L. Single, division supervisor, Long Island Railroad. The place selected for the next meeting is Kansas City, Mo. It was decided to have a four days' meeting.

## SIDNEY (AUSTRALIA) TRAMWAY SYSTEM.

A new power house for the Sidney tramway system has recently been completed. This additional power house, which is located at Ultimo, Sidney, has been built preliminary to the change of a large part of the company's cable and steam roads to electric propulsion.

The Balmain line has already been converted into an electric line and this will be succeeded by the Waverly and Bondi lines in a few weeks. All the other lines of the company will be electrically equipped in turn. Four steam roads operated by this company, known as the North Shore, Dulwich Hill, Leichhardt and Glebe Point lines, were converted into electric lines before the new power house was built. These changes have brought a new class of rolling stock into use and the company now has 338 electric cars in operation in Sidney. The new cars are all equipped with Christensen air brakes.

The company has four large car barns already built at Ultimo, Newtown, Rush Cutter Bay and North Sidney, and three large new sheds are being erected at Ft. MacQuarie, Waverly and Rozelle Bay. These barns are all provided with track pits so that inspection and minor repairs can be carried out on any car in whichever barn it is located.

During the last fiscal year 107,000,000 passengers were carried by the company, and its receipts amounted to \$3,158,750. There were 104 miles of track operated and the employes of the company numbered 4,075.

The Seattle (Wash.) Electric Co. will construct a freight depot at Ballard, Wash. Nearly all freight that is brought into that city is carried by the electric company.

The Montpelier Electric Light & Railroad Co., with headquarters at Mont Pelier, Idaho, has been incorporated with a capital of \$25,000. The directors are J. A. Bostan, L. C. Miller, Charles Hoff, J. A. Bagley and W. E. Raines.

**WASHINGTON, BALTIMORE & ANNAPOLIS  
SINGLE PHASE RAILWAY.\***

BY B. G. LAMME.

The Washington, Baltimore & Annapolis Ry. is a new high-speed electric line extending from the suburbs of Washington to Baltimore, a distance of about 31 miles, with a branch from Annapolis Junction to Annapolis, a distance of about 15 miles. The overhead trolley will be used, and schedule speeds of over 40 miles per hour are to be attained. This road is to be the scene of the first commercial operation of an entirely new system of electric traction.

The special feature of this system is the use of single-phase alternating current in generators, transmission lines, trolley car equipment and motors. It constitutes a wide departure from present types of railway apparatus, and while retaining the best characteristics of the present standard direct current motor system, the use of alternating current makes it possible to avoid many of the bad features.

The standard direct current railway equipment possesses several characteristics which fit it especially for railway service. These characteristics have been of sufficient importance to overbalance many defects in the system. In fact, a far greater amount of effort and engineering skill has been required for overcoming or neutralizing the defects, than for developing the good features possessed by the system. By far the most important characteristic possessed by the direct current system is found in the type of motor used on the car. The direct current railway motor is in all cases a series-wound machine. The series motor is normally a variable field machine and it is this feature which has adapted the motor especially to railway service. Shunt-wound motors have been tried and abandoned. All manner of combinations of shunt, series and separate excitation have been devised and found wanting, and in many cases the real cause of failure was not recognized by those responsible for the various combinations. They all missed to a greater or less extent the variable-field feature of the straight series motor. It is true that a variable field can be obtained with shunt or separate excitation, but not without controlling or regulating devices, and the variation is not inherently automatic, as in the series motor.

Polyphase and single-phase induction motors do not possess the variable field feature at all, as they are essentially constant-field machines. They are equivalent to direct current shunt or separately excited motors, with constant field strength, which have been unable to compete successfully with the series motor. The variable field of the series motor makes it automatically adjustable for load and speed conditions. It also enables the series motor to develop large torques without proportionately increased currents. The automatically varying field is accompanied by corresponding variations in the counter e. m. f. of the armature, until the speed can adjust itself to the new field conditions. This feature is of great assistance in reducing current fluctuations, with a small number of steps in the regulating rheostat. Any increase in current, as resistance is cut out, is accompanied by a momentary increase in the counter e. m. f., thus limiting the current increase to a less value than in the case of a constant field motor.

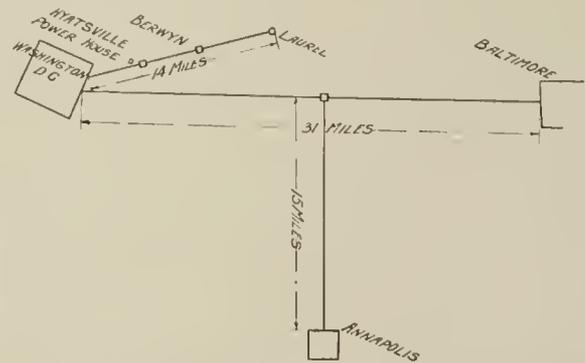

Next to the type of motor, the greatest advantage possessed by the direct current system lies in the use of a single current or circuit, thus permitting the use of one trolley wire. The advantages of the single trolley are so well-known that it is unnecessary to discuss them. For third rail construction, the use of single current is of even greater importance than in the case of the overhead trolley. It is seen, therefore, that it is not to the direct current that credit should be given for the great success of the present railway system, but to the series type of motor and the fact that up to the present time no suitable single-phase alternating current motor has been presented.

Some of the undesirable features of the direct current railway system should also be considered. The speed control is inefficient. A nominally constant voltage is supplied to the car, and speed control is obtained by applying variable voltage at the motor terminals. This variation is produced by the use of resistance in series with the motor, with a loss proportional to the voltage taken up by

the resistance. By means of the series-parallel arrangement, the equivalent of two voltages is obtainable at the motor terminals without the use of resistance. Therefore, with series-parallel control, there are two efficient speeds with any given torque, and with multiple control there is but one efficient speed with a given torque. All other speeds are obtained through rheostatic loss, and the greater the reduction from either of the two speeds, series or parallel, the lower will be the efficiency of the equipment. At start, the rheostatic losses are always relatively large, as practically all the voltage of the line is taken up in the rheostat. For heavy railroad service, where operation for long periods at other than full and half speeds may be necessary, the rheostatic loss will be a very serious matter.

The controlling devices themselves are also a source of trouble. An extraordinary amount of time and skill has been expended in perfecting this apparatus. The difficulties increase with the power to be handled. The controller is a part of the equipment which is subjected to much more than ordinary mechanical wear and tear, and it can go wrong at any one of many points. The larger the equipment to be controlled, the more places are to be found in the controller which can give trouble. The best that can be said of the railway controller is that it is a necessary evil.

Another limitation of the direct current system is the trolley voltage. Five hundred volts is common at the car and 650 volts is very unusual. By far the larger number of the railway equipments in service to-day are unsuited for operation at 600 volts, and 700 volts in normal operation would be unsafe for practically all.

ROUTE OF THE WASHINGTON, BALTIMORE & ANNAPOLIS RY.

The maximum permissible trolley voltage is dependent upon inherent limitations in the design of motors and controllers. The disadvantages of low voltage appear in the extra cost of copper and in the difficulty of collecting current. In heavy railroad work the current to be handled becomes enormous at usual voltages. A 2,400-h. p. electric locomotive, for example, will require between 3,000 and 4,000 amperes at normal rated power and probably 6,000 to 8,000 amperes at times. With the overhead trolley these currents are too heavy to be collected in the ordinary manner, and it is a serious problem with any form of trolley or third rail system which can be used. It is evident that for heavy service, comparable with that of large steam railways, a much higher voltage than used in our present direct current system is essential, and the use of higher voltage is destined to come, provided it is not attended by complications which more than overbalance the benefits obtained.

A further disadvantage of the direct current system is the destructive action known as electrolysis. This may not be of great importance in interurban lines, chiefly because there is nothing to be injured by it. In city work its dangers are well-known, and very expensive constructions are now used to eliminate or minimize its effects.

From the above statements it is evident that an alternating current railway system, to equal the direct current system, should possess the two principal features of the direct current system, viz: A single supply circuit and the variable field motor, and to be an improvement upon the direct current system, the direct current should avoid some of the more important disadvantages incident to the present direct current apparatus.

The system must, therefore, be single phase. The importance of using single-phase for railway work is well known. The difficulties and complications of the trolley construction are such that several alternating current systems have been planned on the basis

\*Read at the 100th meeting of the American Institute of Electrical Engineers, New York, Sept. 26th, 1902.

of single phase supplied to the car, with converting apparatus on the car to transform to direct current, in order that the standard type of railway motors may be used. Such plan are attempts to obtain the two most valuable features of the present direct current system. The polyphase railway system, used on a few European roads, employs three currents, and therefore does not meet the above requirement.

The motor for the alternating current railway service should have the variable speed characteristics of the series direct current motor. The polyphase motor is not suitable, as it is essentially a constant field machine, and does not possess any true variable speed characteristics. Therefore it lacks both of the good features of the direct current railway system. A new type of motor must, therefore, be furnished, as none of the alternating current motors in commercial use is adapted for the speed and torque requirements of first-class railway service. Assuming that such a motor is obtainable for operation on a single-phase circuit, the next step to consider is whether the use of alternating instead of direct current on the car, will allow some of the disadvantageous features of the direct current system to be avoided.

The direct current limits of voltage are at once removed, as transformers can be used for changing from any desired trolley voltage to any convenient motor voltage. Electrolytic troubles practically disappear. As transformers can be used, variations in supply voltage are easily obtainable. As the motor is assumed to have the characteristics of the direct-current series motor, speed control without rheostatic loss is practicable when voltage control is obtained. This combination, therefore, allows the motor to operate at relatively good efficiency at any speed within the range of voltage obtained. If the voltage be varied over a sufficiently wide range, the speed range may be carried from the maximum desired down to zero, and therefore, down to starting conditions. With such an arrangement no rheostat need be used under any conditions, and the lower the speed at which the motor is operated, the less the power required from the line. The least power is required at start, as the motor is doing no work and there is no rheostatic loss. The losses at start are only these in the motor and transforming apparatus, the total being less than when running at full speed with an equal torque. Such a system, therefore, permits maximum economy in power consumed by motor and control. This economy in control is not possible with the polyphase railway motor, as this motor is the equivalent of the direct current shunt motor, with which the rheostatic loss is even greater than with the series motor.

The use of alternating current on the car allows voltage control to be obtained in several ways. In one method a transformer is arranged with a large number of leads carried to a dial or controller drum. The Stillwell regulator is a well-known example of this type of voltage-control. This method of regulation is suitable for small equipments with moderate currents to be handled. The controller will be subject to some sparking, as in the case of direct current apparatus, and therefore becomes less satisfactory as the car equipment is increased in capacity. Another method of control available with alternating current is entirely non-sparking, there being no make-and-break contacts. This controller is the so-called "induction regulator," which is a transformer with the primary and secondary windings on separate cores. The voltage in the secondary winding is varied by shifting its angular position in relation to the primary. With this type of voltage controller, very large currents can be handled, and it is especially suitable for heavy equipments, such as locomotives. It is thus seen that there is one method of control available with alternating current, which avoids the inherent troubles of the direct current controller. The induction regulator is primarily a transformer, and all wear and tear is confined to the supports which carry the rotor. Therefore the objectionable controller of standard direct current system can be eliminated, provided a suitable alternating current motor can be obtained. This ideal type of controller is not applicable to the polyphase railway motor, in which speed control can be obtained only through rheostatic loss. The polyphase control system is even more complicated than the direct current, as there must be a rheostat for each motor, and two or three circuits in each rheostat. It is thus apparent that by the use of single-phase alternating current with an alternating current motor having the characteristics of the direct current series motor, the best features of the direct current system can be obtained, and at the same time many of its disadvantages can be avoided.

This portion of the problem therefore resolves itself into the construction of a single-phase motor having the characteristics of the direct current series motor. There are several types of single phase alternating current motors which have the series characteristics. One type is similar in general construction to a direct current motor, but with its magnetic circuit laminated throughout, and with such proportions that it can successfully commutate alternating current. Such a motor is a plain series motor, and can be operated on either alternating or direct current and will have the same torque characteristics in either case. Another type of motor is similar in general construction to the above, but the circuits are arranged in a different manner. The field is connected directly across the supply circuit, with proper control appliances in series with it. The armature is short circuited on itself across the brushes, and the brushes are set at an angle of approximately 45° from the ordinary neutral point. The first of these two types of motors is the one best adapted for operation in large units.

This is the type of motor which is to be used on the Washington Baltimore and Annapolis Ry. Several motors have been built and tested with very satisfactory results, both on the testing stand and under a car. The results were so favorable that the system was proposed to the Cleveland Engineering Co., representing the Washington, Baltimore & Annapolis Ry., and after investigation by their engineers, it was adopted. A description of the apparatus to be used on this road will illustrate the system to good advantage.

Single-phase alternating current will be supplied to the car at a frequency of 16 2/3 cycles per second, or 2,000 alternations per minute. The current from the overhead trolley wire is normally fed in by one trolley at approximately 4,000 volts. Within the limits of the District of Columbia two trolleys are employed, as by Act of Congress the use of rails as conductors is prohibited in this District, presumably on account of electrolysis. In this case the trouble, of course, will not exist, but the contracting company has been unable to obtain permission for the grounded circuit.

The alternating current to the car is carried through a main switch or circuit breaker on the car, to an auto-transformer connected between the trolley and the return circuit. At approximately 300 volts from the ground terminal a lead is brought out from the auto-transformer and passes through the regulator to one terminal of the motors. For starting and controlling the speed, an induction regulator is used with its secondary winding in series with the motors. This secondary circuit of the regulator can be made either to add to, or subtract from the transformer voltage, thus raising or lowering the voltage supplied to the motors. The regulator therefore does double duty. The controller for direct current motors merely lowers the voltage supplied to the motors but cannot raise it, but an alternating current regulator can be connected for an intermediate voltage, and can either raise or lower the motor voltage. In this way the regulator can be made relatively small, as it handles only the variable element of the voltage and the maximum voltage in the secondary winding is but half of the total variation required.

In the equipments in question, the range of voltage at the motor is to be varied from approximately 200 volts up to 400 volts or slightly higher. The transformer on the car will supply 315 volts, and the secondary circuit of the regulator will be wound to generate slightly more than 100 volts when turned to the position of its maximum voltage. This voltage of the regulator is about one-fourth of that of the motors at full voltage. The regulator can consequently be made relatively small, in comparison with the motor capacity of the equipment. It has been found unnecessary to use much lower than 200 volts in this installation, as this allows a comparatively low running speed, and approximately 200 volts will be necessary to start with the required torque. The greater part of this voltage is necessary to overcome the e. m. f. of self-induction in the motor windings, which is dependent upon the current through the motor and is independent of the speed of the armature.

There will be four motors of 100 h. p. on each car. The full rated voltage of each motor is approximately 220 volts. The motors are arranged in two pairs, each consisting of two armatures in series, and two fields in series, and the two pairs are connected in parallel. The motors are connected permanently in this manner. Since voltage control is used, there is no necessity for series parallel operation, as with direct current motors. To ensure equal voltage to the armatures in series, a balancing or equalizing action is obtained by the use of a small auto-transformer connected perma-

cently across the two armatures in series, with its middle point connected between them. The fields are arranged in two pairs, with two fields in series and two pairs in multiple. This parallels the fields independently of the armatures, which was formerly the practice with direct current motors. It was a defective arrangement with such motors, as equal currents in the field did not ensure equal field strengths in the motors, and the armatures connected in parallel, therefore, could be operating in fields of unequal strength, with unequal armature currents as a direct result. With alternating currents in the fields, the case is different. The voltage across the fields is dependent upon the field strengths, and the current supplied to the fields naturally divides itself for equal magnetic strengths. The chief advantage in paralleling the fields and armatures independently is, that one reversing switch may serve for the four motors and one balancing transformer may be used across the two pairs of armatures. The ordinary direct current arrangement of armatures in series with their own fields can be used, with a greater number of switches and connections.

The general arrangement of the auto-transformer, regulator, motors, etc., is shown in Fig. 1.

The induction regulator or controller, resembles an induction motor in general appearance and construction. The primary winding is permanently short-circuited on itself. The function of this short-circuited winding is to neutralize the self-induction of the secondary winding as it passes from the magnetic influence of the

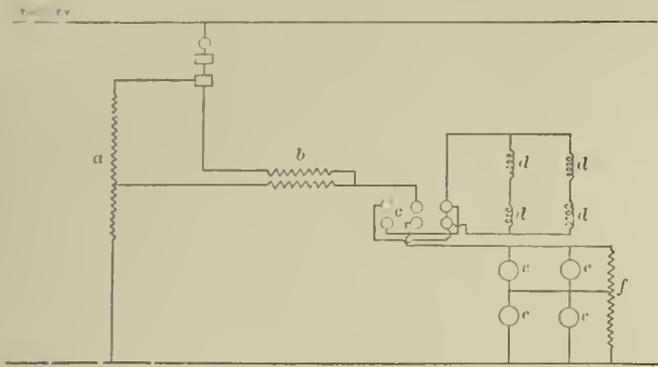

FIG. 1.

primary. The regulator is wound for two poles, and therefore is operated through 180° in producing the full range of voltage for the motors. One end of the primary winding of the regulator is connected to the trolley, and the other to a point between the regulator and the motors. It thus receives a variable voltage as the controller is rotated. There are several advantages in this arrangement of the primary in this particular case. First, the regulator is worked at a higher induction at start, and at lower induction when running, the running position being used in these equipments for much longer periods than required for starting. Second, when the motors are operating at full voltage the current in the primary of the regulator passes through the motors but not through the auto-transformer or the secondary of the regulator. This allows considerable reduction in the size of auto-transformer and regulator.

The motors on the car are all of the straight series type. The armature and field being connected in series, the entire current of the field passes through the armature as in ordinary series direct current motors. The motor has eight poles, and the speed is approximately 700 revolutions at 220 volts. The general construction is similar to that of a direct current motor, but the field core is laminated throughout, being necessary on account of the alternating magnetic field. There are eight field coils wound with copper strip and all connected permanently in parallel. The parallel arrangement of field coils is not in equalizing the field strength in the different poles, due to the balancing action of alternating currents in parallel. The arrangement is not really necessary, but it prevents some damage, and therefore has been used. With equal magnetic strength in the poles, the magnetic pull is equalized over with the armature out of center.

The structure is similar in general construction to that of a

direct current motor. The fundamental difficulty in the operation of a commutator type of motor, on single-phase alternating current lies in the sparking at the brushes. The working current passing through the motor should be practically no more difficult to commutate than an equal direct current, and it is not this current which gives trouble. The real source of trouble is found in a local or secondary current set up in any coil, the two ends of which are momentarily short-circuited by a brush. This coil encloses the alternating magnetic field, and thus becomes a secondary circuit of which the field-coil forms the primary. In the motors of the Washington, Baltimore and Annapolis Railway, this commutation difficulty has been overcome by so constructing the motor that the secondary or short-circuit current in the armature coil is small, and the commutating conditions so nearly perfect that the combined working and secondary currents can be commutated without sparking. This condition being obtained, the motor operates like a direct current machine and will give no more trouble at the commutator than ordinary direct current railway motors. Experience covering a considerable period in the operation of motors of 100 h. p. capacity indicates that no trouble need be feared at the commutator.

An extended series of tests were made with these motors at the Westinghouse shops at East Pittsburgh, both in the testing room and under a car. Fig. 2 shows curves of the speed, torque, efficiency and power factor plotted from data from brake tests.

It should be noted that the efficiency is good, being very nearly equal to that of high-class direct current motors. The power factor, as shown in these curves, is highest at light loads and decreases with the load. This is due to the fact that the power developed increases approximately in proportion to the current, while the wattless component of the input increases practically as the square of the current. The curve indicates that the average power factor will be very good. The calculations for the W., B. & A. Ry. show that the average power factor of the motors will be approximately 86 per cent.

The average efficiency of these equipments will be much higher during starting and accelerating than that of corresponding direct current equipments, as rheostatic losses are avoided. When running at normal full speed, however, the efficiency will be slightly less than with direct current. This is due to the fact that the alternating current motor efficiency is slightly lower than the direct current, and in addition there are small losses in the transformer and the regulator. The alternating current equipments are somewhat heavier than the direct current, thus requiring some extra power, both in accelerating and at full speed. Therefore, for infrequent stops the direct current car equipment is more efficient than the alternating current, but for frequent stops the alternating current shows the better efficiency. Tests on the East Pittsburgh track verified this conclusion. But the better efficiency of the direct current equipment with infrequent stops is offset with the alternating current by decreased loss in the trolley wire, by reason of the higher voltage used, and by the elimination of the rotary converter losses. The resultant efficiency for the system will therefore be equal to or better than that of the direct current.

In the W., B. & A. Ry. contract the guarantee given by the Westinghouse Electric and Manufacturing Co. states that the efficiency of the system shall be equal to that of the direct current system with rotary converter sub-stations.

There is one loss in the alternating current system which is relatively much higher than in the direct current. This is the loss in the rail return. Tests have shown that at 2,000 alternations it is three to four times as great as with an equal direct current. This would be a serious matter in cases where the direct current rail loss is high. But the higher alternating current trolley voltage reduces the current so much, that the alternating current rail loss is practically the same as with direct current at usual voltages. In many city railways the direct current rail loss is made very low, not to lessen waste of power, but in order to reduce electrolysis. In such cases the alternating current rail loss could be higher than direct current, thus decreasing the cost of return conductors. More numerous transformer sub-stations, with copper feeders connected to the rail at short intervals will enable the rail loss to be reduced to any extent desired.

At a frequency of 2,000 alternations per minute is used, the lighting of the car and the sub-stations was at first considered to be a serious difficulty, due to the very disagreeable winking of ordi-

ary incandescent lamps at this frequency. Two methods of overcoming the winking were tried, both of which were successful. One method was by the use of split phase. A two phase induction motor was run on a single-phase 2,000 alternating circuit, and current was taken from the unconnected primary circuit of the motor. This current was, of course, at approximately 90° from the current of the supply circuit. A two-phase circuit was thus obtained on the car. Currents from the two phases were put through ordinary incandescent lamps, placed close together. The resulting illumination a few feet distant from the lamps showed about the same winking as is noticed with 3,000 alternations. With two filaments in one lamp the winking disappears entirely. A three-phase arrangement would work in the same way.

A much simpler method was tried which worked equally well. This consisted in the use of very low-voltage lamps. Low voltage at the lamp terminals allows the use of a thick filament with considerable heat inertia. Tests were made on lamps of this type at a frequency of 2,000 alternations, and the light appeared to be as

are placed in partially closed slots. There are four coils per pole. The proportions of these machines are such that good inherent regulation is obtained without saturation of the magnetic circuit. The rise in potential with non-inductive load thrown off will be approximately 4 per cent. An alternative estimate was furnished for the generators proposing 20,000 volts instead of 15,000. The simplicity of the type of winding used, and the low frequency, are both favorable for the use of very high voltage on the generator. As 15,000 volts was considered amply high for the service, the engineers for the railway considered it inadvisable to adopt a higher voltage.

There are to be two exciters, each of 100 kw. capacity at 250 revolutions. The exciters are wound for 125 volts normal. The armature of each exciter has, in addition to the commutator, two collector rings, so that single-phase alternating current can be delivered. It is the intention to use the exciters as alternators for supplying current to the system for lighting when the large generators are shut down at night.

The main station switchboard comprises three generator panels, one load panel, and three feeder panels. High-tension oil-break switches are to be provided, operated by means of controlling apparatus on the panels. The switches, bus-bars and all high-tension apparatus will be in brick compartments separate from the board. In each generator circuit there are two non-automatic oil-break switches in series; and on each feeder circuit there are two overload time-limit oil-break switches in series. The two oil-break switches in series on the same circuit can be closed separately and then opened to test the switches without closing the circuit. With the switches in the closed position they are both operated at the same time by the controlling apparatus, to ensure opening of the circuit, and to put less strain on the switches, although either one is capable of opening the load. There will be nine transformer substations distributed along the railway line. Each station will contain two 250 kw. oil-cooled lowering transformers, supplying approximately 1,000 volts to the trolley system. Two transformers are used in each station so that in case of accident to one transformer the station will not be entirely crippled.

It is the intention of the railway company to operate a direct current road already equipped with the direct-current system. The present direct current car equipments are to be retained, but the current will be supplied from a rotary converter sub-station fed from the main system of the W. B. & A. Ry. As this system is single-phase, it is necessary that single-phase rotaries be used in the substations. There are to be two 200 kw. 550-volt rotary converters. These are 4-pole, 500-revolution machines. The general construction of these machines is very similar to that of the Westinghouse polyphase rotary converters. The armature resembles that of a polyphase rotary except in the number of collector rings, and in certain details of the proportions made necessary by reason of the use of the single-phase. The commutating proportions are so good that any reactions due to the use of single-phase will result in no injurious effect. The field construction is similar to that of a polyphase rotary. The laminated field-poles are provided with dampers of the "grid" or "cage" type, a form used at present in the Westinghouse polyphase rotary converters. The dampers serve to prevent hunting, as in the polyphase machines, and also to damp out pulsations due to single-phase currents in the armature. The damper acts to a certain extent as a second phase. Each rotary converter is started and brought to synchronous speed by a small series alternating current motor on the end of the shaft. The voltage at the motor terminals can be adjusted either by loops from the lowering transformer or by resistance in series with the motor, so that true synchronous speed can be given to the rotary converter, before throwing it on the alternating current line.

From the preceding description of this system and the apparatus used on it, some conclusions may be drawn as to the various fields where it can be applied to advantage. It is evident that a good field for it will be on interurban long-distance lines such as the W. B. & A. Ry. On such railways, high trolley voltage and the absence of converter sub-stations are very important factors.

For heavy railroading also, this system possesses many ideal features. It allows efficient operation of large equipments at practically any speed and any torque, and also avoids the controller troubles which are ever present with large direct current equipments. It also permits the use of high trolley voltage, thus reducing the current to be collected. In this class of service the advan-

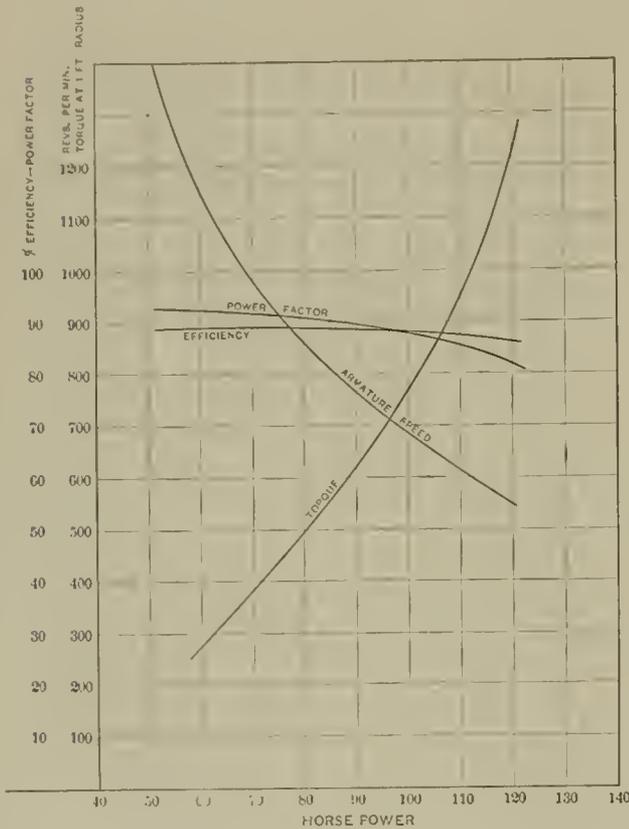

FIG. 2.

steady as that from the ordinary high-frequency incandescent lamp. The low voltage is not objectionable in this case, as a number of lamps can be run in a series, as in ordinary street railway practice, and any voltage desired can readily be obtained, as alternating current is used on the car.

There will be an air compressor, driven by a series alternating current motor, on each car, for supplying air to the brakes and for operating the driving mechanism of the controller. The details of this mechanism are not sufficiently near to completion to permit a description of it. The method used will be one which readily allows operation on the multiple-unit system.

The generating station contains some interesting electrical features, but there is no great departure from usual alternating current practice. There will be three 1,500 kw. single-phase alternators. These are 24-pole machines operating at 83 revolutions and wound for 15,000 volts at the terminals. They are of the rotating field type, with laminated magnetic circuits and field-coils of strap on edge. The field-coils are held on the pole-tips by copper supports, which serve also as dampers to assist in the parallel running. The armatures are of the usual slotted type. The armature coils

tages of this alternating current system are so great that it is possible that heavy railroading will prove to be special field for it.

For general city work, this system may not find a field for some time to come, as the limitations in the present system are not so great that there will be any urgent necessity for making a change. It is probable that at first it will be applied to new railways, or in changing over steam roads rather than in replacing existing city equipments. One difficulty with which the new system will have to contend, is due to the fact that the alternating circuit equipments cannot conveniently operate on existing direct current city lines, as is the present practice where interurban lines run into the cities. It will be preferable for the alternating current system to have its own lines throughout, unless very considerable complication is permitted. When the alternating current system applied to interurban and steam railways finally becomes of predominant importance, it is probable that the existing direct current railways will gradually be changed to alternating current as a matter of convenience in tying the various lines together.

As was stated above, alternating current equipments cannot conveniently be operated on direct current lines. It does not follow, however, that the motor will not operate on direct current. On the contrary, the motor is a first-class direct current machine, and if supplied with suitable control apparatus and proper voltage it will operate very well on the direct current lines. This would require that the motors be connected normally in series, as the voltage per motor is low. A complete set of direct current control apparatus would be needed when the alternating current equipment is to be run on direct current, and considerable switching apparatus would be necessary for disconnecting all the alternating current control system and connecting in the direct current. The complication of such a system may be sufficient to prevent its use, at least for some time to come.

In some cities, very strict laws are in force in regard to the voltage variations in various parts of the track system. The permissible variations are so small in some cases that an enormous amount of copper is used for return conductors; and in some cases special boosters are used in the return circuits to avoid large differences of potential between the various parts of the track system. The object in limiting the conditions in this manner is to avoid troubles from electrolysis. The alternating current system will, of course, remedy this.

For city work, it is probable that voltages of 500 or 600 would be employed instead of 1,000 or higher. The transformers and controllers can be designed to be readily changed from full to half voltage, so that low voltage can be used on one part of the line and high voltage on another. As the car equipments of such railways are usually of small capacity, it is probable that speed control will be obtained by means of a transformer with a large number of leads carried out to a control drum, rather than by means of the induction regulator, as the latter device is much more expensive in small units. This is chiefly a question of cost, and if the advantages of the induction regulator are found to overweigh the objection of high first cost, then it will be used even on small equipments.

In the W., B. & A. Ry. the generators are wound for single phase. In the case of large power-stations with many feeders, the generators may be wound for three-phase, with single-phase circuits carried out to the transformer sub-station; or three-phase transmission may be used, with the transformers connected in such a manner as will give a fairly well balanced three-phase load.

There are many arrangements and combinations of apparatus made possible by the use of alternating current in the car equipments, which have not been mentioned, as it is impracticable to give a full description of all that can be done. But enough has been presented to outline the apparatus and to indicate the possibility of this new system which is soon to see the test of commercial service.

Senator Stephen B. Elkins is reported to have purchased the Morgantown (W. Va.) & Kingbridge R. R., a 14 mile steam road running out of Morgantown, which will ultimately be extended to Kingbridge. Senator Elkins is the owner of extensive coal lands along the line and proposes putting in a large number of coke ovens. It is stated that the road may be used as a feeder for the system which the Wabash interests project building to Pittsburg from some point on the West Virginia Central.

ENGLISH CALIFORNIA CARS.

We have received from the Electric Railway & Tramway Carriage Works, Ltd., of Preston, England, photographs of the California style of car which they are building. The car adheres pretty closely to the original California design in many of the leading features, as will be seen by a glance at Fig. 1. A pair of transverse seats, however, are all that are used at the ends and these are placed back to back.

The seats are made with round corners, but evidently there was difficulty in producing the end panel for it has only a single curve and apparently does not have a pocket for the post, nor a complete

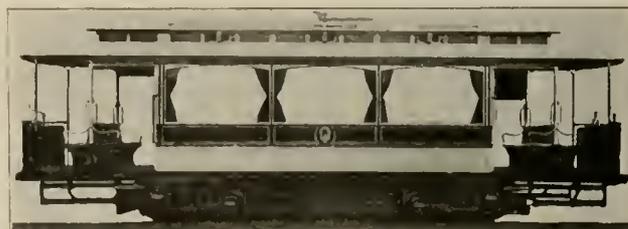

FIG. 1 ENGLISH BUILT CALIFORNIA CAR.

bearing on the post. The windows in the body are the usual English type, very large, and fitted with drapery curtains as well as roller blinds. The platform steps are novelties. They are shown on a larger scale in Fig. 2. This design is evidently forced upon the construction by the narrowness of the body and the limited space available.

The height of the body made two steps necessary. The lower one had to be cut away to make room for the truck to swing on curves.

The width was limited to such a degree that the steps had to be placed vertically one above the other. To give standing room on the lower step the upper one is cut away in the center. The design is ingenious, but it is not one which would be adapted except under

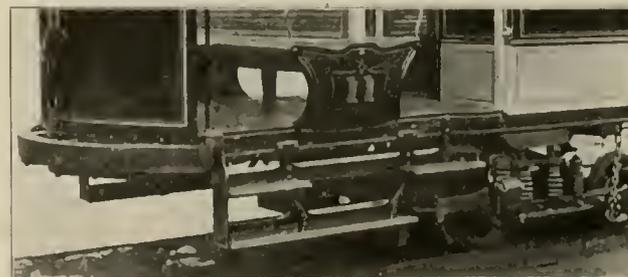

FIG. 2 ARRANGEMENT OF STEPS.

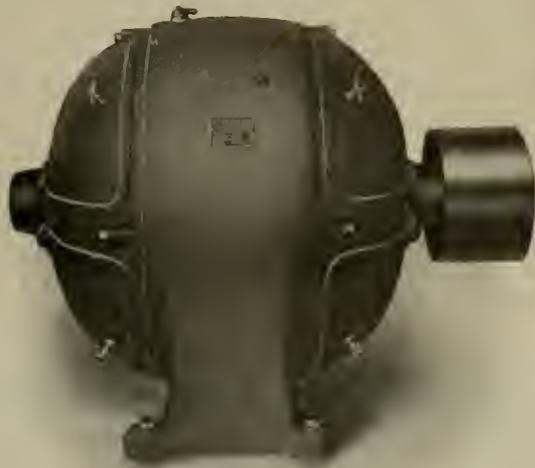

the compulsion of circumstances. The platforms or open ends have little or no protection, curtains close the openings next the car body, but they only come down to the seat level. The seat end panel is curved in such a way as to make it impossible to bring the curtains lower. The car as a whole is an instructive example of the California design modified to meet the wants of the English climate, and the requirements of a narrow gage road where a minimum space in the street limits both width and length. In America there are fortunately for car designers but few cities in which unlimited space for rolling stock cannot be obtained. On the Continent, however, it is not unusual to have a limiting width of 7 ft. or less to contend with.

The Wheeling (W. Va.) Traction Co. on October 1st began running cars on the new Wheeling & Western Ry. to Pascoe, four miles distant, and also on that day began operations over part of a 16 mile extension to St. Clairsville, O., from the present terminus of the company's "Brookside" division, west of Bridgeport, O. One of the company's new 1,000 h. p. units was started and has since been working satisfactorily.

### "CECO" ELECTRICAL MACHINERY.

The Christensen Engineering Co., of Milwaukee, has just placed upon the market complete new lines of electrical machinery, including direct current motors and generators, alternators and transformers, known as the "Ceco." For several years this company has been manufacturing electric motors for driving air compressors used in connection with the well-known Christensen air brake equipments on electric cars, and we understand that more than 6,500 of these motors are in highly satisfactory service throughout the world. The company has also built a large number of motors of various capacities for driving air compressors used in general commercial service, and all the motors for driving machine tools and shafting in its own works. In order to manufacture these motors the company has maintained an extensive equipment, particularly suited to the purpose, and some time ago it was decided to greatly increase the company's manufacturing facilities and to develop a complete line of electrical machinery of the highest grade.

The policy of the Christensen company has always been not to place any apparatus upon the market until the entire work of development has been satisfactorily completed, and the reputation and success of the air brake apparatus are largely due to this policy. Therefore the company has made no announcement regarding its electrical apparatus until the various lines were completely developed and severely tested. The company is now

DIRECT CURRENT TYPE C. E. OPEN MOTOR.

prepared to build machines up to 1,500-kw. in capacity, suitable for general power, railway or lighting service.

The line of "Ceco" motors known as Type C. E., ranging in capacity from 2 to 50-h. p., is illustrated herewith. These motors are made in three styles, open, semi-enclosed and enclosed. The standard styles are belted, but any motor can be geared or direct connected to the driven machine or shaft. The C. E. motors are for general service in industrial establishments of every kind where a high grade, durable and reliable machine is required.

The frame or magnet yoke to which the poles are secured is cylindrical in shape. It is composed of a single steel casting. The bearing brackets are secured to the frame by bolts. The terminals are mounted on top of the frame where they are not liable to be accidentally touched, but where they are readily accessible in case it is desired to change the connections in order to reverse the direction of the motor. The two bearings are supported by two end brackets, which are identical and interchangeable, so that the motor is symmetrical and pleasing in appearance. The semi-enclosed style is the same as the open, but with the addition of four perforated malleable iron cover plates. The plates fit into four open spaces between the arms of the end brackets, and can be quickly and easily removed or replaced. The enclosed style is the same as the semi-enclosed except that the cover plates are solid instead of perforated. Either style of cover plates will fit into the open style motor, consequently the same motor may be used as open, semi-enclosed or enclosed.

The field poles are built of laminated sheet steel. The larger machines have four poles, and the smaller sizes are built with two only, thus permitting the use of a commutator that can be insulated far more satisfactorily than is possible in small machines of the usual four-pole construction. The poles are bolted to the yoke so that a rigid construction is obtained, and the pole is easily removable without disturbing the armature.

The field winding is composed of machine formed coils accurately wound by automatic machinery. Any field coil can be readily and quickly removed without disturbing the armature by simply withdrawing the pole as explained above. The armature core is built up of punched disks of soft sheet steel slotted around the periphery to receive the armature winding. These disks are re-annealed and insulated after being punched, before assembling.

The shape of the punching is such, that when assembled on the steel shaft openings are provided for ventilation parallel to the shaft. Additional ventilation is secured by the use of radial air ducts.

The armature coils are all machine wound. Those for the smaller motors are of wire, while those for the larger sizes are composed of copper bars. The coils are all carefully insulated, then dipped into a bath of special insulating compound, and finally placed in a drying oven until they are thoroughly baked. Surface bands are used to retain the coils in the slots on the smaller sizes, while the same result is secured in larger sizes by the use of retaining wedges placed in specially provided notches near the top of each slot.

The commutator is built up of pure hard-drawn lake copper

ARMATURE FOR DIRECT CURRENT "CECO" MOTORS

segments insulated from each other by sheets of the highest grade of mica, of hardness corresponding to that of the copper, so that a smooth and even wearing surface is presented to the brushes. The segments are of generous length and depth, to insure cool running, and allow ample margin for wear. The commutator is easily removable from the armature shaft, tapped holes being provided in the face of the commutator sleeve for that purpose. As the commutator is usually the cause of more trouble than all other parts of a motor combined, unusual care has been given to the design and construction of this important element of the "Ceco" motors.

Carbon brushes are used, and the brush holders are of the Christensen company's coil spring reaction type. They are very simple in design and absolutely reliable in operation. The brush holder studs to which the holders are secured are mounted upon a yoke, which is fastened to the inner side of the bearing bracket. Each brush can be readily adjusted and any brush can be quickly and easily removed while the motor is running.

The brush contact area is such as to make the current density as low as is consistent with economical design. Wear of the commutator is provided for by radial adjustment of the brush-holder studs. After the brushes are properly set no shifting is required, and the motor operates without noise and without sparking.

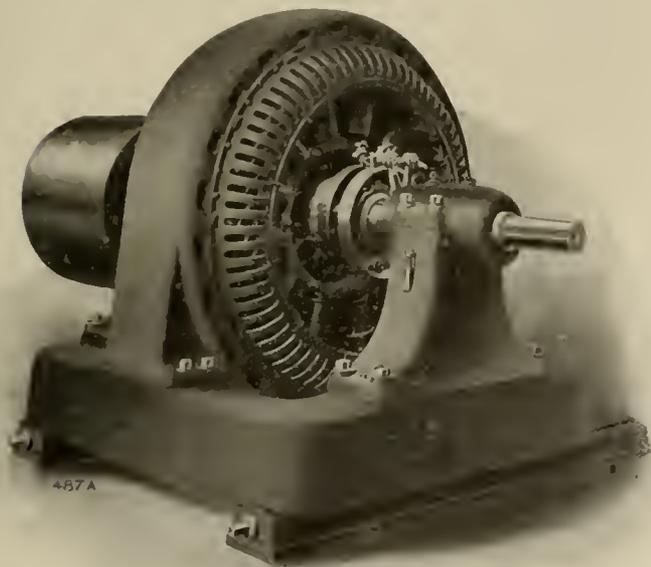

The bearing surfaces are generous in area. Self-aligning bab-bitted bearings with the well-known self-oiling ring arrangements are provided.

The motors are mounted on a cast iron sub-base which is composed of a single casting, thus insuring perfect alignment. Belt tension is accomplished by moving the motor upon the sub-base in the usual manner.

The "Ceco" motors are designed to operate at their rated loads without the temperature of the armatures rising more than 30° C. The rise in temperature of the field coils under these conditions is not to exceed 40° C., and of the commutator 45° C. The machines are intended to operate from no load to full load with the brushes in a fixed position without sparking, and also operate for two hours with 25 per cent overload and for two or three minutes with 50 per cent overload without injurious heating or sparking.

These motors will operate in any position in which the shaft is horizontal. This is accomplished by shifting the bearing brackets on the frame so that the oil chambers remain in the proper position, whether the motor is secured to the floor, the ceiling or the side wall.

A rigid system has been established for the inspection of the parts of each machine while under construction, and there is no poor material or workmanship to hide under canvas, rope, or

250-KW. THREE-PHASE BELT DRIVEN ALTERNATOR.

other "protecting" material. When completed each machine is given a severe running and high insulation test. Then the frame is rubbed with a good filler and painted. All bright parts are polished, so that in addition to being compact in design, substantial in construction and superior in performance, each machine presents a graceful and pleasing appearance.

All the "Ceco" alternators, whether belted, engine type or direct couple, are of the revolving field type, thus leaving the armature stationary and easily accessible. By this form of construction the difficulties of properly insulating the armature coils which have caused much trouble in rotating armatures are eliminated.

The frame consists of cast iron housings, into which rings of laminated steel with inwardly projecting teeth are assembled, thereby forming slots for receiving the armature windings. The armature is designed with six slots per pole so that it may be wound or rewound for single, two, or three phase, as required. The armature frames for the belt-driven alternators are cast in one piece, while the frames for the direct driven machines are divided horizontally. All the armature coils for each "Ceco" alternator are of the same size and shape so that they are interchangeable. The coils are specially insulated, so that they will stand without injury, the highest temperature that will ever be reached in service.

The poles are built up of laminated steel upon a cast iron spider, which is mounted upon a forged steel shaft. In the large sizes the laminated poles are assembled upon a steel ring which is carried on the shaft by means of the cast iron spider. The individual poles are in all cases easily removable with their coils,

without dismantling the machine. The field coils are composed of rectangular copper strap bent on edge. The collector rings are made of cast iron, and carbon brushes are used, thus reducing the tension required, and the wear of the parts. Standard frequencies are 60 and 25 cycles per second. With the exception of the smaller sizes "Ceco" alternators can be wound for any voltage up to 15,000. The temperature rise when running continuously with full load at any power factor will not exceed 35° C. in the armature or 40° C. in the fields. At 25 per cent current overload the corresponding temperatures will not exceed 40° C. and 50° C. The machines are all designed so that they will carry satisfactorily a 50 per cent current overload for two hours at any power factor without injurious heating.

The Christensen Engineering Co. is entering the electrical manufacturing business with exceptional advantages. Its present works were completed but two years ago and no expense was spared in providing every facility for the rapid, accurate and economical manufacture of its product. The equipments of machine tools, cranes, special machines, etc., is unusually extensive, modern, and complete. The foundation for a 250 ft. extension to the main machine shop, which is 186 ft. in width, has just been completed. There are three stories, and this extension will provide 88,000 additional sq. ft. of floor space.

### PITTSBURG AND WHEELING UNITED BY TROLLEY.

Direct communication between Pittsburg, Pa., and Wheeling, W. Va., via electric lines will be inaugurated within three years, if the plans of the Washington & Canonsburg Railroad Co. are consummated. The latter was organized six months ago to take over and extend the lines of the Washington (Pa.) Electric Street Railway Co., which for the last 10 years has operated a five-mile electric system in the borough of Washington. Francis J. Torrance, president of the old company, and ex-Senator Arthur Kennedy, of Pittsburg, were principally instrumental in effecting the reorganization, and now propose to extend the system, under a new charter, which was recently obtained, to Canonsburg, a distance of 10 miles, and to build another line in the direction of Pittsburg. The distance from Washington to Wheeling is 33 miles, and a portion of this route is already served by electric lines, so that but 18 miles remain to be built in that direction. Connections will probably be made between the proposed extension of the Washington & Canonsburg company and the Wheeling & Elm Grove R. R., which latter was recently converted from a steam dummy line into an electric system, and is now operated to West Alexander, 18 miles from Washington. A portion of the track laying between Washington and Canonsburg has been completed, and this line is to be open for traffic within six months. Formerly the Washington lines were operated by power supplied by the Washington Light & Power Co., but for the 10-mile extension to Canonsburg it is proposed to erect a large power house at an estimated cost of \$100,000. The equipment of the plant will be entirely Westinghouse, and the capacity will be from 1,700 to 2,000 h. p. The proposed single track system between Washington and Canonsburg will be of standard construction, 70-lb. rails being used, and all railroad crossings will be made overhead. The crossings include a number of steel bridges, the longest of which will be 500 ft. in length, and will span the Panhandle tracks at Houstonville. The bridges are being constructed by the Fort Pitt Bridge Works at Canonsburg.

The promoters recently arranged for a bond issue to the amount of \$650,000, the proceeds of which will defray the expenses of the improvements and extensions at present under way, and the cost of constructing the proposed extensions east of Canonsburg.

The Quincy (Ill.) Horse Railway & Carrying Co. recently donated the earnings of its system for a day to the two hospitals in the city. At a subsequent meeting of the hospital trustees a resolution of thanks to Manager Chubbuck was passed.

In Paris, France, a provisional authorization has been granted for an overhead electric railway along the Rue Quatre Septembre and the Rue Reaumur, into the heart of the city. The Paris papers deplore the extension of the trolley system as having the effect of marring the beauty of the French capital.

## NEWS OF THE MONTH.

The Manhattan Railway Co., New York City, began operating trains on its newly completed third-rail electric system on the Sixth Ave. elevated road between the 58th St. station and Rector St., October 1st, with entirely satisfactory results. The work of substituting electricity for steam as a motive power on the remainder of the system is rapidly progressing, but until the change shall be effected over the entire line, the express and local service to Harlem will be made as usual by locomotive trains. The greater effectiveness of the electric service, which has thus far been demonstrated by experiment, is largely the result of the decreased weight of the trains. Trains are made up of six cars, four of which are motor cars, the weight of their motor equipment, about 18 tons, being five tons less than the weight of the old locomotive. Also, the motive power of the new trains is about four times greater than that of the trains formerly in use. Work is rapidly being pushed on the unfinished section through 53d street, connecting Ninth and Sixth Aves., and so soon as it shall be completed trains on the west side will be propelled by electricity.

The Brooklyn Rapid Transit Co. has acceded to the petition of residents of the Eastern District, by reducing the fare on the elevated line from the Eastern District to Brighton Beach from 15 to 10 cents. Transfers from the Lorimer St. line to the Brighton Beach line are now issued at Malbone St. and Flatbush Ave. The Rapid Transit company expects, if the conditions in the labor market are favorable, to complete the power house now in course of construction at First St. and Third Ave., Brooklyn, by spring, at which time the change of motive power to electricity on all trains will be effected. In view of the scarcity of anthracite, the company has secured a large supply of soft coal, and is equipping all its cars with modern heating apparatus in preparation for cold weather.

The plans for relieving the congestion at the Brooklyn Bridge terminal, which were prepared by Neils Poulson and submitted by the Manufacturers' Association of Brooklyn, were finally disapproved by the committee to which they had been referred for investigation by Mayor Low. Mr. Poulson had offered two suggestions, one providing for a change of switching arrangements for the bridge and elevated trains which would do away with tail tracks and have each train discharge and load simultaneously, and one providing for a new method of operating the trolley cars. The former plan was deemed ingenious but impracticable, as it would entail a grade crossing for all incoming trains at a time when such trains are loaded with passengers. After further investigation the committee formulated a new plan, which involves the construction of four additional loops at a point midway between the present loops and the end of the station, and the changing of the position of the galleries to a place directly beneath the bridge platform so that the trolley cars may pass under them. Bridge Commissioner Lindenthal has approved the recommendations of the committee, and if the proposed change be effected in accordance with these plans, the expense will be borne by the Brooklyn Rapid Transit Co. Subsequently, the engineers of the latter company submitted plans to Mr. Lindenthal providing for the location of tracks on Liberty St. for convenience in handling traffic during rush hours, and for the establishment of a bridge plaza at the Brooklyn terminal at Liberty St.

Mr. William Barclay Parsons, chief engineer of the Rapid Transit Commission, in an interview prior to his departure for Europe on October 7th, stated that satisfactory progress was being made on the subway, and that the work of laying rails would probably be begun in December, by the end of which month it is expected to have seven miles of four-track road completed. According to the plans of the Commission, the main section will be opened next October, 15 months within the time limit of the contract. Contracts have been let for the stations, which will be of three classes, one appropriate to the residence district, one to the shopping district, and one to the commercial section below 14th St. The stations will be designed with a view to securing artistic effects, a distinctive color scheme for each section of the road having been adopted. Panels, outlined in colored tiling will be used, and the stations will be lighted by electric lamps recessed in the ceilings, and protected by ground glass shields. Wood will be dispensed with in the construction of the stations to as great a degree as possible, the walls and partitions being of vitrified

brick and white glass tiles, and the ceilings of white glass tiles, suspended from the roof beams. Some of the stations will be provided with elevators for the convenience of transferring passengers to the street, and the station equipment will in most cases include telephone booths and telegraph stations. The stairways will be twice as numerous as those of the elevated roads, and much wider. Outgoing and incoming passengers will be kept entirely separate.

An accident, insignificant as such, but interesting from a mechanical point of view, happened on September 30th at the bridge across the Coney Island Creek, which was completed some two months ago by the Brooklyn Rapid Transit Co. to replace the antiquated structure of the old Nassau Co. The new bridge, which was described in the "Review" for February, 1902, met the approval of the Government, and is in every way a substantial structure. It is not equipped with a draw, but is arranged to fold up in the manner of a fan, the shore end of the girders being worked on a pivot. Owing to a defective eyebolt at the lower extremity of the suspender rod, the latter gave way, without warning, and the swinging portion of the bridge fell, each separate section striking the water with a tremendous splash. A train was due at the time of the accident, but through the prompt action of the watchman was stopped before it reached the bridge. It would have been practically impossible for the train to run into the creek in any event, as ample means of protection had been provided against the remote contingency of accident. Repairs were soon effected, and the bridge was again in use before night.

The reports which were recently circulated to the effect that negotiations were under way looking to the consolidation of the North Jersey Street Railway Co., the Jersey City, Hoboken & Paterson Street Railway Co. and the Orange & Passaic Valley Railway Co. are denied without qualification by both E. F. C. Young, president, and David Young, vice-president and manager, of the North Jersey Street Railway Co., in an interview with the press. The North Jersey company has experimented with satisfactory results in the use of a new heating and ventilating apparatus on its cars between Jersey City and Bergen Point. A portable furnace is placed in the center and under the floor of the car, the hot air issuing through the grating or register in a degree corresponding to the draft which is obtained from the open ventilators under the car ceiling. When the furnace is not in use, the basin holding the fuel may be removed, thus obviating all danger of fire. Mr. David Young has endorsed the plan as being eminently practicable, economical and efficient.

It was reported from New Brunswick, September 29th, that if coal were not received within a week, the electric railway system would be shut down, or else horses would be used as motive power. Though there has been no further news of such a crisis having been precipitated, the statement has been made that the local company was obliged, by reason of the scarcity of coal, to reduce its service on suburban lines, and to lay off a number of conductors and motormen in consequence.

The Pittsburg Railways Co. has effected a number of important changes in its service, among which is the extension of additional routes to Wilkesburg. The "Liberty & Lincoln Ave." cars, which formerly had their terminus on Lincoln Ave., are operated over the route known as "East Wilkesburg via Liberty and Frankstown." Cars on the "Grant and Shady" route, formerly having their terminus at Shady Ave., run out Fifth Ave. to Penn Ave., to Trenton St., to Rebecca St. and to Hay St. in Wilkesburg, returning via Franklin St., Penn Ave., Highland Ave. and Fifth Ave. to Grant St. The fare between Coraopolis and McKees Rocks has been reduced from 10 to 5 cents. Transfers will now be issued between Greenfield Ave. cars and cars on the Monongahela division. The foundations for the steel viaduct across the tracks of the Pennsylvania R. R. at Wilmerding have been completed, and the viaduct, which will be 1,230 ft. long and will cost \$150,000, will be completed as soon as the steel shall be delivered. When finished, it will form a connecting link in the 30-mile loop extending from Pittsburg through Braddock, East Pittsburg, Wilmerding, East McKeesport, McKeesport and Dravosburg.

The Philadelphia Rapid Transit Co. and the city authorities of Philadelphia have reached an agreement whereby the piers of the Market St. bridge will be extended on the south, and the entire bridge will be moved several feet in the direction of Chest-

nut St. The piers at the north end will also be extended for a considerable distance and strengthened to support the elevated structure, an arrangement which will permit cars emerging from the subway at 23d St. to proceed over the elevated road in a westerly direction.

The Harrisburg (Pa.) & Mechanicsburg Electric Railway Co. has granted its employes an increase of wages of 1½ cents an hour, the new rule going into effect October 1st.

A lineman in the employ of the Conestoga Traction Co., at Lancaster, Pa., recently sustained a shock of 2,300 volts of electricity, and except for severe burns on the hands is now not much the worse for it. He had ascended a pole to cut a supposedly dead wire, which, however, was crossed with one that was heavily charged. He was in contact with the wire for five minutes before he was released from his perilous position.

The new electric line between Reading and Kutztown, a distance of 16 miles, was recently opened for traffic. Connections with existing lines afford a direct route from Reading to Allentown.

The southern division of the Central Market Street Ry., in Columbus, has been completed, and an experimental trip was made over the lines September 27th. Although the conditions were not favorable to a rapid service, the run from the south corporation line to Rich and Third Sts. was made in 20 minutes, and the circuit of the interurban loop was made in 10 minutes, clearly proving that a satisfactory schedule can be maintained when the regular service shall be initiated.

October 1st, the lower house of the Ohio Legislature adopted the Guerin amendment, providing that differences between street railway companies and their employes shall be settled by compulsory arbitration. Other provisions of the amendment apply to the regrants of franchises, affecting in particular the franchises of the Cincinnati Street Railway Co., and require that all franchises granted to street railway companies shall contain an arbitration clause, and that arbitration may be invoked by a petition of five or more employes of any company. The House, by a vote of 51 to 31, accepted the amendment as applying to all regrants of franchises.

The Columbus, London & Springfield Railway Co. contemplates a through service from Columbus to Cincinnati, and for this purpose proposes to build an additional line from Lafayette to Somerford, which will eliminate a considerable portion of the distance. The company is pushing work on its sub-stations, which will be located at West Jefferson and London, and on the main power house, at Medway, which is to be completed in the early winter. The inauguration of a through service to Dayton is now under consideration.

The Columbus, Delaware & Marion Electric Railroad Co. has opened its lines between Delaware and Columbus, and it is stated that the company's general offices and headquarters will be removed to Delaware so soon as the entire system shall be ready for traffic. The installation of the power house at Stratford has been completed and a number of 66-ft. cars of the heavy interurban type have been received.

The Cleveland, Elyria & Western Railway Co. opened its new lines to Norwalk, via Elyria and Oberlin, October 2d, the first round trip being made by a special car which started from the Public Square in Cleveland at 10 a. m., carrying Messrs. A. H. and F. T. Pomeroy, respectively president and manager of the company, and some 35 guests. A regular hourly service has since been maintained. The new steel bridge at Birmingham is one of the notable features of the construction of the road.

The Toledo, Bowling Green & Southern Traction Co. expects within a month to begin operating freight cars between Bowling Green, Toledo and Findlay, the power for this service to be supplied from the new plant at Cygnet. Three trips per day in each direction will be made, and the company will appoint a superintendent for the freight service.

The Indianapolis Street Railway Co. has broken ground for a new carhouse which will have a capacity for housing 300 cars. The brick and the structural iron work have been contracted for, and work will be pushed with all possible rapidity. A part of the new building will be used as an auxiliary power station.

Three 40 ft. interurban cars have been received at Richmond, Ind. from St. Louis shops, and will be added to the service between Richmond and Cambridge City. Other cars will be received this winter for the line between Richmond and Eaton, O., which will be opened

in the spring. The latter road will afford a through route between Indianapolis, Richmond and Dayton, O. Grading is now under way between Cambridge City and Knightstown.

Three obstreperous passengers on the lines of the Union Traction Co. of Indiana, between Alexandria and Elmwood recently created a panic among the passengers by drawing revolvers and firing several shots, the bullets burying themselves in the woodwork uncomfortably near to the passengers' heads. On arrival at Elmwood the rowdy element was subjugated by the police and steps were taken by the traction company to prosecute the offenders.

Four suits for damages against the Union Elevated Railroad Co. of Chicago, were filed October 1st by the owners of property abutting or adjacent to the elevated loop. In these cases it was claimed that property values had deteriorated since the structure had been built by reason of its shutting out the light and air, and through the noise occasioned by the operation of trains. Altogether, the suits for damages for such cause which are pending aggregate from \$500,000 to \$1,000,000, and there would probably be a greater sum involved if the statute of limitations did not render claims of this sort invalid if brought subsequent to October 3d, on which day five years had expired since operations were begun on the loop. Mr. Clarence A. Knight, general counsel for the Northwestern Elevated R. R., in an interview stated that there was not a modern building facing the elevated structure of the loop that is not getting from 25 to 100 per cent more rent than in 1897, when the loop was built. Among the prominent petitioners for damages in the present instance are Leon Mandel, for \$50,000; Mandel Brothers, for an equal amount, and the Central Trading Co., for \$5,000, these cases being submitted to the Superior Court; and P. H. Sexton, in the Circuit Court, for damages to the amount of \$100,000 for damages to property at Clark and Van Buren Sts. On September 29th, William McCoy, the proprietor of a hotel at Clark and Van Buren Sts., brought suit for \$150,000 damages against the Union Elevated loop and the lines using it.

The elevated railways of Chicago, during the month of September, did, in general, a better business than is recorded for any September during the history of their operations. In comparison with the corresponding month last year the Metropolitan West Side Elevated Ry. increased its traffic 24.39 per cent; the Northwestern Elevated R. R., 18.28 per cent, and the South Side Elevated R. R., 13.25 per cent. The Metropolitan carried a daily average, during the month, of 107,751 passengers, as compared with 88,226 in September, 1901; the Northwestern carried 63,970 as compared with 54,965, and the South Side carried 76,572 as compared with 67,626. The exceptionally pleasant weather and the large number of retail openings during the month account for the excessive traffic on the elevated lines.

The city engineer of Chicago has submitted an opinion as to the probable cost of subway construction in Chicago, if it should be finally decided to follow the initiative of New York in adopting underground transportation. According to this estimate, a subway extending from curb to curb and excavated at a depth of not more than 20 ft., would cost \$1,500,000 per mile, which is \$1,000,000 per mile less than the estimates of such construction work in New York, where the excavations are being made through solid rock. The pressure of the larger buildings in the down town district in Chicago would, in Mr. Ericson's opinion, forbid the construction of a "double-deck" or two-story subway.

At Aurora, Ill., a stretch of about 50 ft. of track in North Broadway sank to a depth of six inches during a recent heavy rain storm.

It is stated that the Big Four R. R. contemplates installing electric motive power on its interurban lines on the Cairo division, between Danville, Ill., and Ridge Farm, a distance of 17 miles.

The St. Louis (Mo.) Transit Co. is considering introducing a new grooved surface rail in that city, such as is commonly used in the east. The principal advantage offered by this pattern is that teamsters will find it less convenient to monopolize the company's right of way on occasion, since the rail does not afford a good hold for wagon wheels.

The reports issued by the Butte (Mont.) Electric Railway Co. show that since May 1st, over 393,299 passengers have been transported over the electric lines in the city of Butte. A large proportion of the summer travel over the lines was due to the special amusement features afforded at the suburban parks and resorts.

The Burlington Route has opened its new electric interurban line between Lead and Deadwood, S. D., the construction of which

has been in progress for more than a year. The road was originally the old Deadwood Central, which was purchased by the Burlington and converted into an electric system, as the steam equipment was inadequate to handling the enormous traffic between the two cities by reason of the steep grades en route. A regular service over the electric line has been established and the trains are well patronized.

A regular through service over the lines of the Seattle-Tacoma Interurban Ry. was inaugurated September 20th. Cars have since been running on a two-hour headway.

The Seattle Electric Co. has under consideration a plan for erecting a freight depot at Ballard, Wash., and for improving the inter-urban service between that city and Seattle. Negotiations have been opened for securing a site for the proposed freight depot.

### STRIKE VIOLENCE AT NEW ORLEANS.

The recent street railway strike at New Orleans furnishes an example of aggressiveness on the part of the strikers and of a conservative and effective policy on the part of the New Orleans Railways Co. which has seldom been paralleled in instances of similar strife. The strike was declared on September 27th, the contention of the employes being that the company had violated the terms of agreement whereby the strike of last April was settled. The assertion was made that in view of the company's abrogation of such terms, the contracts under which the employes had agreed to work until April, 1903, were cancelled, and a demand was then presented for radical changes in the conditions of service. A new wage scale was proposed, under which motormen and conductors should receive 25 cents per hour, and 10 consecutive hours should comprise a day's work; runs of less than five hours should be counted as extra runs, and regular wages should be paid to men laid off pending investigation of complaints against them. It was demanded that employes should have an unquestioned right to join any association they might desire to join, and that no employe should be discharged for his connection with labor organizations. The wage to be paid to head pitmen, pitmen and pitmen's helpers was stipulated. These amendments to former contracts were presented on Thursday, September 25th, and the company answered the demands on the following day, refuting the proposition that the terms of contract had been violated and requiring the men to return to work under the old contract until the alleged abrogation should be established by proof. Strike was declared on September 27th, and on Thursday, October 2d, the men qualified their demands, proposing to work eight hours a day at the rate of 25 cents an hour, but this proposal was promptly rejected by the company. The long and tedious strike which ensued paralyzed street railway traffic in New Orleans. The efforts of Mayor Capdevielle, the police board and a committee representing prominent merchants of the city, to effect a compromise were unavailing, and on October 3d, the merchants proposed shutting the principal retail shops until the strike should be settled, a measure which would have involved throwing 5,000 clerks out of employment, and was later abandoned. The mobs of strikers contented themselves with cutting the company's wires and damaging such property as was easily accessible, their demonstrations being held in check by the company's having suspended operations. October 6th Mayor Capdevielle issued an order to the company to resume regular service on the following day, and the company prepared to do so, but was stopped by a subsequent order from the mayor, who had some new cause to believe that a compromise would be reached before the time appointed for the starting of the cars. The first attempt to resume service was made at 10 a. m., October 8th, when a car, manned by a non-union crew and protected by special police, started from the Canal St. barn despite the threats and missiles of a great mob of strikers. The car had not proceeded a block before an obstruction was placed upon the track which brought it to a stop, and a concerted movement was made to drag the crew from the platform. The action precipitated a fight in which about 50 shots were fired, resulting in serious wounds to four or five on either side, one officer on board the car receiving a bullet wound in the head from which he is not expected to recover. A squad of mounted police succeeded in clearing the streets, but the attempt to move the cars from the Canal St. barn was abandoned for the day. Warrants were sworn out in the Federal Court for the arrest of all who participated in the riot, on the ground that the service of the mail cars was interrupted. Immediately after the disturbance the mayor sent for General Glynn, with a request

that the troops at his command be called out to preserve the peace in New Orleans. The answer was returned that the troops were ready to respond to any demand made upon them, but that nothing could be done until orders had been received from the governor. On the following morning Governor Heard, who had been absent from New Orleans, arrived in the city, and gave orders that the local troops be assembled at their armories to co-operate with General Glynn and the New Orleans authorities in the suppression of violence. Before the militia was actually on the scene, however, 150 policemen, mounted and on foot, were stationed at intervals along Canal St. for a distance of a mile and a half, and with this protection three cars were started over the line without being molested by the crowds which witnessed their departure from the barns.

October 11th Governor Heard issued an ultimatum proposing a basis of settlement which was submitted to both the company and the executive committee of the union for approval. The terms proposed provided for a 10-hour day at the rate of 20 cents per hour. Seven and one-half hours should be the minimum time to which the employes should be reduced, and when employed for fewer hours they should, notwithstanding, receive pay for said minimum. The company immediately acquiesced to those and other terms proposed by the governor. The committee, on the other hand, after demurring for five hours, finally declined the ultimatum, and submitted a counter proposal for arbitration which the governor refused to consider. The strikers persisted in this demand until the afternoon of October 12th, when the union almost unanimously accepted the governor's ultimatum on a secret ballot. The men returned to work on Monday morning, October 13th.

### PENNSYLVANIA RAILROAD FRANCHISE BEFORE NEW YORK ALDERMEN.

The matter of granting the Pennsylvania R. R. a franchise to enter New York City now rests with the New York City board of aldermen, negotiations having been concluded, so far as the rapid transit board is concerned, by the passing of the franchise without a dissenting vote, October 9th. Mayor Low's determination to incorporate into the franchise a clause binding the railroad company to pay its laborers a certain rate of wages and to limit the number of working hours per day was met by the persistent refusal of President Cassatt of the Pennsylvania to accept such terms, or to compromise on the appointment of a board of arbitration to settle labor difficulties. The issue had reached a point where the city had either to accept the terms of the railroad, or reject an improvement of incalculable utility which will cost approximately \$50,000,000.

Previous to the passing of the franchise, the Rapid Transit Commission, on October 2, gave a hearing on the matter before representatives of capital and labor, at which ex-Mayor Abram S. Hewitt, in a speech, strongly advocated granting the franchise on such terms as the railroad should consider desirable, since, in his opinion, the Pennsylvania would be conferring an inestimable benefit to the city directly, and on the labor classes indirectly by so enormous an undertaking.

The arbitration clause subsequently proposed by Comptroller Grout was objected to as calculated to invite all sorts of strike troubles and the answer of President Cassatt, on the 9th inst. was decisive, whereupon the Rapid Transit Board passed the franchise.

### VAN DORN-ELLIOTT ANNOUNCEMENT.

The Van Dorn-Elliott Electric Co., of Cleveland, O., makes the following announcement to the trade: "We are pleased to inform you that we have made certain changes in our factory which we believe will be of mutual benefit to our customers and ourselves. We have greatly increased our facilities for making armature and field coils, a department that heretofore has not been equal to the demands. Mr. J. Norman Elliott has been appointed general superintendent of our factory, succeeding Mr. W. H. Elliott, who is not now in any way connected with us. Mr. J. T. Thompson, one of the best known winders in the country, is now foreman of our winding department. With our increased facilities we believe that our customers' interests will be better taken care of than ever before."

### ACCIDENTS OF THE MONTH.

A head-on collision occurred on the afternoon of September 27th, on the Medford division of the Boston & Northern Street Ry., near Tewksbury, in which the motorman of the southbound car was probably fatally injured, and slight injuries were sustained by several passengers. The southbound car, owing to an alleged defect in the signals, did not wait at the proper turnout for the passing of the other, but proceeded for half a mile at a fair rate of speed, when, at a turn in the track, it met and telescoped the northbound car.

Fourteen passengers were injured in a collision between a repair car and a passenger car on the Brockton lines in Raynham, Mass., September 30th.

Two cars on the lines of the Hartford (Conn.), Manchester & Rockville Tramway Co. met in a head-on collision between Rockville and Talcottville at 2:45 p. m. September 24th, and both were badly damaged. One of the cars was running off schedule on a special trip to accommodate the crowds at the Rockville fair, but it has not been ascertained whether the motorman of the special or he of the regular car was to blame. Both motormen and many of the passengers jumped from the cars when it was plain that a collision could not be avoided, and several were injured in doing so.

September 21st a head-on collision occurred between a large interurban car on the Bristol branch of the Interstate Consolidated Street Ry., of Pawtucket, R. I., and an open car on the Crescent Park line. The failure of the block signals to operate is assigned as the cause. Of a total of 50 passengers, but four were injured, and these but slightly.

The blowing out of a fuse in one of the cars of the Coney Island & Brooklyn R. R. near the Brooklyn Bridge, on September 21st, resulted in burns and slight injuries to 11 passengers. The bursting of flames through the floor of the car created a stampede which was more dangerous than the original cause of disturbance.

Two cars on the Hudson Valley Ry. came together in a head-on collision near Ballston Spa, N. Y., early in the afternoon of October 3d. No one was injured as the cars were not going at a high rate of speed, and the force of the impact was not sufficient to throw either car from the track. The responsibility is believed to rest upon one of the motormen who is alleged to have passed a switch without orders to do so.

A rear-end collision between a Fort Lee car and a car on the Hudson Heights line, at Union Hill, N. J., occurred on the evening of September 26th, resulting in injuries to 10 passengers. Both cars were speeding down a sharp grade from the West Shore ferry but a few rods apart when the car ahead came to a stop. The rails were slippery, and the motorman of the rear car was unable to slacken speed. Both platforms were demolished, and several persons were imprisoned in the wreckage.

A collision at Columbus, O., between a West Broad St. electric car carrying seven passengers and a freight train at the Little Miami crossing, at 5:30 p. m. September 30th, resulted in demolition of the street car and injuries to all the passengers. The electric car was descending a hill when the motorman saw a freight engine and a cut of coal cars obstructing the crossing; he applied the brakes, but without effect as the rails were slippery. The collision completely severed the vestibule from the main body of the car.

A similar accident occurred in Cleveland at 4:15 a. m., October 1st, a north-bound Willon Ave. car being struck by a freight train at the crossing of the Erie R. R. According to witnesses the gates were not lowered. The conductor, on approaching the crossing, closed the derailing switch and signaled the motorman to proceed, but, as the electric car was crossing the labyrinth of tracks, a cut of coal cars, with no engine attached, which was being shunted to a siding, crashed into the car at about a third of the distance from the rear end. The entire side of the electric car was smashed and a portion of it was thrown some distance from the tracks. None of the 12 passengers was so seriously injured as to require being carried from the scene in the ambulance.

At Indianapolis, on the afternoon of September 26th, a switch engine on the Belt R. R. struck an electric car on the Shelby St. line and hurled it for a distance of 10 ft. where it fell against an electric light pole. The pole was broken in two and fell, carrying the wires with it, but the electric car was not damaged to a great

extent, and no one was seriously injured. The conductor is alleged to have been responsible.

Fifteen persons were injured in an accident which occurred on the Elston Ave. lines, Chicago, at 10:15 p. m. September 21st. The car jumped the track at Rockwell St. and fetched up against the side of a house. Neither the conductor nor motorman was held to be responsible.

Traffic on the North Clark St. lines in Chicago was blocked for nearly three hours on the evening of September 27th, by the breaking of a spring in the grip clutch when the gripman attempted to change cables at Clark and Elm Sts. Three persons were injured by the sudden stopping of the car when the accident occurred.

The wreck of a freight train on the Chicago & Alton Ry., at 35th St., Chicago, at 7 p. m. October 1st, involved serious damages to an electric car on the 35th St. lines which was waiting at the crossing for the freight to pass. The wreck resulted from a defect in the air brakes, and eight cars were hurled from the tracks, some of them demolishing an adjacent tower house, and one bumping into the electric car. Passengers were thrown from their seats and a panic ensued in which several were trampled upon. The motorman escaped by jumping from the front platform.

A car on the Chicago & Joliet Electric R. R., nearing Lamont on the afternoon of October 4th, struck a steer which has strayed upon the track and was hurled into the ditch. Several of the passengers were bruised.

Eight persons were injured in a collision on the interurban lines between Fort Worth and Dallas, Tex., on the morning of September 29th. The cars collided on the main track while running at high speed.

### HOLLOW FORGED SHAFTS.

The Bethlehem Steel Co., of South Bethlehem, Pa., issued an attractive souvenir for distribution at the convention of the American Street Railway Association. The book is neatly illustrated and describes a number of the hollow forged shafts made by this company for a large number of street railway engines. The book gives the dimensions of forgings made of the different grades of steel used, which are nickle steel oil tempered, nickle steel annealed, carbon steel oil tempered and carbon steel annealed. The tensile strengths and elastic limits of these different forgings is also tabulated. A description is given of Harveyized nickle steel burglar proof armor plate vault built by this company for the Philadelphia Savings Fund Society, the door of which alone weighs 16 tons. The company's marine forgings are also illustrated and described and special mention is also made of the shaft for the tow boat "Sprague" having the largest stern wheel shaft ever made, its outside diameter being 31 in. and its length over all 47 ft. 2 in. The pamphlet concludes with a view of the works of the Bethlehem Steel Co., which cover an area of about 75 acres.

### N. A. CHRISTENSEN, MILWAUKEE.

Mr. N. A. Christensen, of Milwaukee, makes the following announcement for the information of the trade:

The Christensen Engineering Co., with which I have been connected as superintendent since its organization, and am still engaged as consulting engineer, and with which my other interests remain undisturbed, will hereafter manufacture my air compressors connected with air brakes exclusively. This will place under my control the manufacture of air compressors for all other uses. The previous correspondence in relation to such compressors not connected with air brakes for electric cars, together with the plans, specifications and patterns, have become my property. The air compressors furnished by me will be manufactured by the Christensen Engineering Co. under my designs, specifications and inspection, insuring the same excellency in design, detail and workmanship which the products of this company have always possessed. It also leaves me free individually to extend the introduction of my system of air compressors in a rapidly extending field. There are now in use over 7,000 of these compressors of all sizes and capacities constructed under my patents and used for various purposes. My engineering and sales offices are located in the Herman Building, corner of Wisconsin St. and Broadway, Milwaukee, where I will be pleased to see inquiring and interested friends.

### TWO HEAVY SNOW PLOWS.

The J. G. Brill Co. calls special attention to two types of snow plows designed for extra heavy service, one a single truck shear plow for suburban and outlying lines of city systems, and one a double truck plow for interurban service.

The single truck plow is claimed to be the heaviest and most

in.; length of adjustable shear, 10 ft. 7 in.; width of adjustable shear, 2 ft.; length of wings, 4 ft.; weight without motors, 12,500 lb.

The double truck plow is in reality a snow plow, electric locomotive and construction car combined. By this combination weight and power are economically obtained. The upper and lower plows are removable and when taken off uncover short platforms at each end, fitted with couplers, and the car can be used as an ordinary

SINGLE TRUCK PLOW—J. G. BRILL CO.

effective shear plow ever built for double-track service. The double shear boards, the upper one stationary and the lower one vertically adjustable with play of 8 in., present a large and firm front to the work. The shear boards are set at the unusually acute angle of 45 degrees, reducing the resistance. The adjustable shear boards are stoutly held in place by four guides 3 in. in diameter. The adjust-

construction or freight car. At the approach of winter the plow attachments can be placed in position with little trouble.

The levers are raised and lowered parallel with the ground, instead of at an angle, and thus obstacles near the rails are avoided. The long-handled levers which raise the levelers make the operation easy and rapid.

DOUBLE TRUCK SNOW PLOW—J. G. BRILL CO.

able wings are designed to deliver the snow sufficiently far to the side to prevent its being readily thrown back on the rails. Diggers are included in the equipment. Levelers may be added if desired.

The standard dimensions are as follows: Length over all, 27 ft. 2 in.; length over end sills, 16 ft. 9 in.; width over side sills, 6 ft.; length of upper shear, 8 ft. 6 in.; width of upper shear, 1 ft. 1½

The dimensions of the plow are as follows: Length over all, 36 ft. 11 in.; length over end sills, 20 ft. 6 in.; width over side sills, 6 ft. 11 in.; length from point to side of adjustable plow, 8 ft.; width of adjustable plow, 2 ft. 6 in.; length from point to side of upper plow, 7 ft.; width of upper plow, 1 ft. 6 in.; length of leveler, 12 ft.; weight without motors, 23,000 lb.

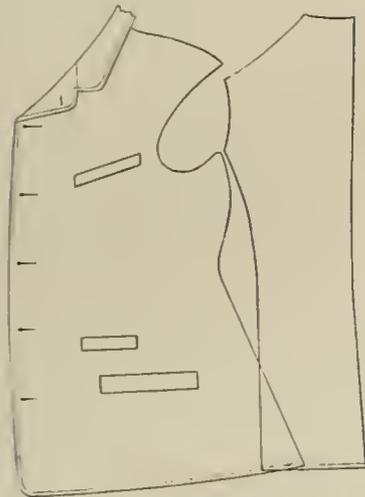

**STANDARD UNIFORMS AT BUFFALO.**

Through the courtesy of Mr. T. E. Mitten, general manager of the International Railway Co., of Buffalo, N. Y., we present descriptions and specifications for the style of uniform selected as standard for the trainmen of that system. Every detail of this uniform is the result of careful deliberation, and it is believed the whole suit, including overcoat and cap, will prove exceptionally durable, neat in appearance, and at the same time reasonably inexpensive.

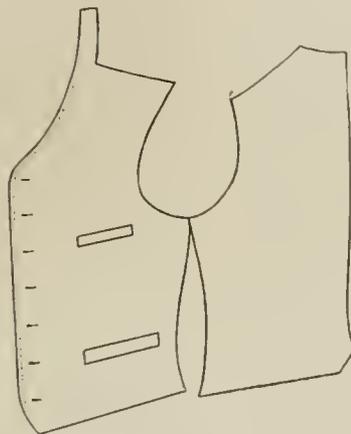

The company issues the following specifications:

**COAT.**

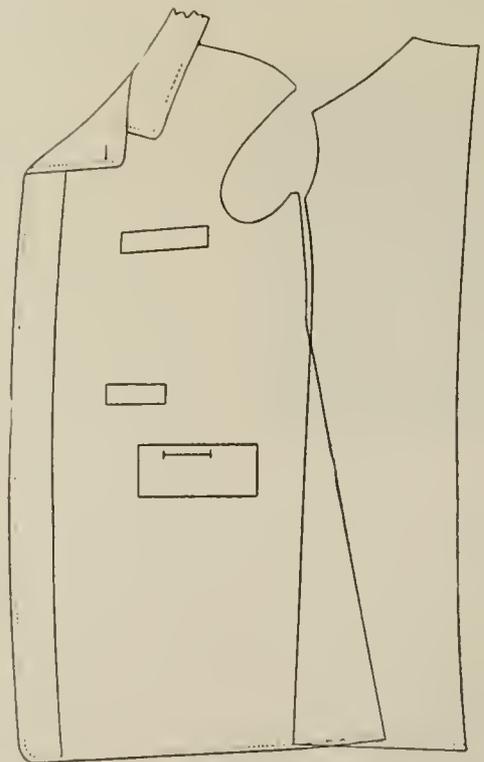

Cloth required, 13 1/4 yards.  
 Coat, 5-button single-breasted sack, lapel rolled to first button, corners slightly rounded.  
 Length, to extend 1 in. below the crotch seam.  
 Edges, double stitched 1/4 in.  
 Seams, plain.  
 Cuffs, 3 in. deep with two buttons on each, and stitched to match edge.

Coat.

Vest.

Overcoat.

Summer

Winter.

**BUFFALO STANDARD UNIFORMS AND CAPS.**

Pockets, 6 outside and 6 inside; all to be finished with welt, made of heavy duck and well stayed to prevent sagging.  
 Body lining, heavy Italian cloth.  
 Sleeve lining, extra durable cotton stripe  
 Cloth, No. 6615 Middlesex 24-oz. standard blue.  
 Buttons, to be furnished by the company.

**VEST.**

Cloth required, 1/4 yards.  
 Velt, single breasted, no collar, 7 buttons, opening 9 to 10 in.  
 Edge, to correspond with coat.  
 Pockets, 2 upper and 2 lower outside, 1 inside.  
 Lining, extra durable cotton stripe.  
 Back, heavy Italian cloth.  
 Cloth, same as coat.  
 Buttons, to be furnished by the company.

**TROUSERS**

Trouser, at knee and bottom medium size.  
 Cloth required, 1 1/8 yard.

Two top or side pockets, 2 hip and 1 watch pocket. Seat lined.  
 Seams, cord 1/8 in.  
 Cloth same as coat and vest.

**OVERCOAT.**

Cloth required, 2 1/2 yards.  
 Overcoat, single breasted, fly-front; collar 2 1/2 in.  
 Edges, stitched double 5/8 in.  
 Seams, welt 5/8 in.  
 Pockets, 1 outside breast pocket with welt, 2 outside ticket pockets with welt, 1 ticket pocket inside of large lower right hand pocket, 2 lower pockets with flaps, 2 inside breast pockets.  
 Body lining, heavy wool cloth.  
 Cloth, No. 620 Waterloo 30-oz. standard blue.

**CAPS.**

Caps are specified as the standard uniform cap for summer and winter as made by a local firm.  
 Uniform cloth, Middlesex 24-oz. standard blue No. 6615, for suits can be secured from the office of the superintendent of transportation at \$2.25 per yard net; and Waterloo 30-oz. standard blue

No. 620, for overcoats, at \$3.25 per yard net. The tailoring may be done by any responsible firm, but the company has made arrangements with a prominent local tailoring establishment to furnish uniforms in accordance with the prescribed specifications at the following prices, these figures including the repairing and pressing of all garments for two years after date of purchase:

Overcoats .....	\$16.00
Suits .....	15.00
Coat .....	8.50
Vest .....	1.75
Trousers .....	4.75
Cap, summer .....	.75
Cap, winter .....	.95

The cloth required for a full suit of average size is 3 1/4 yards. All uniforms must pass inspection of the superintendent of transportation before being worn on duty. Winter caps are to be worn from December 1st to April 1st. Motormen may wear black sweaters from December 1st to April 1st. Trainmen must invariably wear white collars, black ties and black shoes.

## PERSONAL.

MR. J. SANFORD POTTER has been elected a director of the Whitehall (N. Y.) & Granville Railway Co. in the place of ex-Judge Lath.

MR. GEORGE D. WIDENER has been elected president of the Philadelphia Traction Co., one of the subsidiaries of the Philadelphia Rapid Transit. Mr. Widener is vice-president of the latter company.

MR. WILLIAM H. TUCKER, formerly superintendent of one of the principal divisions of the Old Colony Street Railway Co., at Fall River, Mass., has been appointed manager of the Jacksonville (Fla.) Electric Co.

MR. A. V. ABBOTT, of Westinghouse, Church, Kerr & Co., in making a recent trip over New York to Chicago, covered 600 miles of the distance over electric lines. Mr. Abbott stopped at Detroit, en route, to visit the convention.

MR. GRIER HIRSH, vice-president of the York Street Railway Co. and the York County Traction Co., and also president of the York National Bank, is one of the most active members of the executive and operating departments of the railway companies with which he is connected. Mr. Hirsh is a representative of one of the oldest families in southern Pennsylvania, and was born in York County, Jan. 29, 1863. He is of German descent, his forefathers having settled in Lancaster County as early as 1742. His father, Samuel S. Hirsh, was born in Adams County, and being a man of large means, led a life of retirement, although serving as a director of the First National Bank of York. His mother was Margaret J. Lewis, daughter of James Lewis, at one time presi-

GRIER HIRSCH.

dent of the York National Bank, a position now filled by Mr. Grier Hirsh. On the death of his father, Mr. Hirsh who was an only child, inherited a large estate which placed him among the millionaires of York. He was educated at the York County Academy and the York Collegiate Institute and afterwards entered the Pennsylvania Military College, of Chester, Delaware County, from which he graduated in 1880. He then entered Princeton University from which he graduated in the class of 1884. Returning to York he immediately entered into active business life and became interested in a number of financial, real estate and railroad enterprises. He is a director of the York Gas Co., of the York Water Co., of the Baltimore & Harrisburg Railroad Co., of the York Trust, Real Estate & Deposit Co., of the York, Gettysburg Turnpike Co. and has served for a time as president of the York Gas Co., the York & Maryland and the York & Liverpool companies. In 1895 he succeeded his uncle, G. Edward Hirsh, as president of the York National Bank. Mr. Hirsh, in connection with Capt. W. S. Lanus, was one of the organizers of the York Street Ry. and the York County Traction Co. of which he is now vice-president. In 1887 he married Miss Julia Mayer, a daughter of John L. Mayer, a prominent lawyer of York County. His home is at Springdale, on the outskirts of York. During the past year Mr. Hirsh was president of the Pennsylvania State Bankers' Association.

MR. EDW. WAGENHALS, formerly superintendent of the Millcreek Valley Street Railway Co., has been appointed manager of the New York & Philadelphia Traction Co. which is about to open a new road from Trenton to New Brunswick.

MR. WALLACE D. LOVELL, of Newton, Mass., is reported to have retired from the management of the Lovell electric railway system in southern New Hampshire in order to devote his time to promoting electric plants in the White Mountains. Mr. Lovell will be succeeded by Mr. Howard A. Biels, of Chicago.

MR. JAMES P. GILBERT, who has been general superintendent of the New York & Ohio Co., Warren, Ohio, maker of Packard lamps and transformers, has resigned that position and will take the general management of the Standard Electrical Manufacturing Co. at Niles, Ohio, maker of the Standard incandescent lamp.

MR. RANDOLPH PEYTON, assistant superintendent of the Berkley division of the Norfolk (Va.), Portsmouth & Newport News Railway Co., has been transferred to Norfolk to assume the charge of the company's railway and lighting interests in that city. Mr. Peyton will be succeeded at Berkley by Mr. Allen MacKenzie.

MR. E. W. GOSS recently resigned as president of the Middletown (Conn.) Street Railway Co. in order to give his undivided attention to the Milford, Holliston & Framingham Street Ry., of which he is treasurer and superintendent. Mr. Oliver Gildersleeve, of Portland, will succeed Mr. Goss as president of the Middletown company.

MR. GEORGE C. MURRAY has resigned as superintendent of equipment of the Brooklyn Rapid Transit Co., to become superintendent of the repair department of Rossiter, McGovern & Co. Mr. Murray, on severing his 10 years' connection with the former company, was presented by the employees of the repair shops with a gold watch and chain, and a diamond locket.

MR. H. P. O'DOUGHERTY, who for the past six years has been superintendent of the San Jose (Cal.) & Santa Clara Railway Co., has resigned that position to become master mechanic of the Los Angeles Traction Co. On his departure from San Jose, Mr. O'Dougherty was presented by the company's employees with a diamond-studded watch chain and a gold chain.

MR. CHARLES S. KIMBALL, who is connected with the Interurban Street Railway Co., of New York City, as designer of structural steel and track work, was married on October 8th to Miss Margaret E. Ireland, at St. Nicholas' Episcopal Church, New York. Mr. Kimball's best man was Mr. F. G. Clark, electrical superintendent of the 96th St. power station of the Interurban company.

MESSRS. LOUIS F. HYDE and CHARLES S. BAXTER, comprising the firm of Hyde & Baxter, which has had charge of the legal and claims department of the Boston Elevated Railway Co. since its organization, have resigned for the purpose of entering into a general practice under the same firm name. They will remain, however, at the head of the legal department of the Boston Elevated until the company shall find satisfactory successors.

MR. JOHN W. RAMPEE, formerly chief engineer at the power house of the Worcester (Mass.) Consolidated Street Railway, has resigned to enter the employ of the Slater Cotton Mills at Pawtucket as chief engineer. On the eve of his departure from Worcester Mr. Rampee was visited at his residence by a party of street railway employes who presented him with several handsome presents as a memorial of their regard.

LT.-COL. HORATIO A. YORKE, of the royal engineer army corps of England, and chief inspecting officer of railroads for the Board of Trade, London, arrived in New York on the steamship Celtic, September 28th, for a month's tour of the principal cities of the East. Mr. Yorke has been commissioned to prepare a report on the workings of American railroads and on the underground conduit systems employed in America.

MR. E. F. FOOTE, general traffic manager of the British Electric Traction Co., is at present in this country securing experienced men to return with him to England to fill places in the British company's repair shops and offices. Mr. Foote was formerly general manager of the Union Traction Co., of Rutherford, N. J., and was subsequently connected with the New Jersey & Hudson River Railway & Ferry Co., removing to Gateshead, England, in March of this year to take charge of one of the constituent properties of the British Electric Traction Co. The introduction of American methods on this road soon resulted in an increase of traffic of 75

per cent. and Mr. Foote was assigned to the management of a larger property in Scotland, owned by the same company. His present position requires his surveillance of some 40 different roads in the United Kingdom, on which the innovation of modern transportation methods is resulting in deserved success.

MR. JOHN H. VAN BRUNT, formerly superintendent of the St. Joseph (Mo.) Railway, Light, Heat & Power Co., has been appointed general manager of all the company's property in St. Joseph. Mr. John Van Brunt has been associated for several years in the management of the St. Joseph railways with his brother, Mr. W. T. Van Brunt, president of the company, and is thoroughly familiar with all the details of the system.

MR. HARDIN H. LITTELL, formerly president and general manager of the Louisville (Ky.) City Railway Co. prior to the consolidation of the railways at Louisville, has been elected president of the Springfield & Central Illinois Railway Co. which was recently organized by Kentucky and Illinois capitalists to construct an interurban system between Springfield, Ill., Bloomington, Decatur and Jacksonville. Mr. Littell at present resides in Buffalo, N. Y.

MR. PHILIP DAWSON has become a partner in the firm of Kirke L. Waller & Manville, which will conduct a consulting engineering business at 89 Great George St., Westminster, London, under the name of Kincaid, Waller, Manville & Dawson. Mr. Dawson is well known to the engineering profession, as the author of numerous papers before the institutes of civil engineers, mechanical engineers and electrical engineers, of which societies he is a member or an associate.

MR. W. G. WAGENHALS severed his connection with the Millcreek Valley Street Railway Co., of Cincinnati, on the merger of that company with the Hamilton, Glendale & Cincinnati Traction Co. under the title of the Cincinnati & Hamilton Traction Co., and will be succeeded by Mr. W. G. Gilpin, formerly of Washington, D. C. Mr. Wagenhals has been connected with the Millcreek Valley company since its organization and was the builder of the extension to Hamilton.

MR. JOHN FRITZ, of Bethlehem, Pa., who is famed as an inventor as well as the head of a great industry of Pennsylvania, attains his 80th birthday on October 31st, on which night a banquet will be given in his honor, at the Waldorf-Astoria, in New York. The auspicious occasion will mark the founding of the John Fritz Gold Medal, a cherished project of the eminent octogenarian for encouraging achievement in the industrial sciences. Annually, a medal will be awarded by a committee representing the American Society of Civil Engineers, the American Society of Mechanical Engineers, the American Institute of Mining Engineers and the American Institute of Electrical Engineers for the most distinguished performance in engineering for the current year, the conditions of the award to be prescribed by the committee which will be selected by the governing councils of the several societies. The medal will be designed by the American sculptor, Mr. Victor D. Brenner.

MR. W. W. WHEATLEY, superintendent, and Mr. W. B. Yerance, assistant superintendent, of the surface lines of the Brooklyn Heights Railroad Co., resigned their respective positions October 1st, and it is stated that for the present the duties of these officers will be performed by Mr. Dow S. Smith, general superintendent of the Brooklyn system. Mr. Wheatley was formerly connected with the Chicago & Northwestern Ry. and the Louisville & Nashville R. R. in the capacity of train dispatcher, and was at one time assistant superintendent of the Buffalo division of the West Shore R. R. He entered the service of the Brooklyn Rapid Transit Co. in 1896 as superintendent of the southern division, and three years later succeeded Mr. Ira McCormack as superintendent of all the surface lines. For several years Mr. Wheatley was secretary of the New York Railroad Club, and in 1900 became first vice president of that organization. It is announced that both Mr. Wheatley and Mr. Yerance, will, after a few months' vacation, enter the service of the Metropolitan Street Railway Co., of New York City.

## OBITUARY

MR. WINFIELD SCOTT STRATTON, president of the Colorado Springs Rapid Transit Co., died at Colorado Springs, September 14th, aged 54 years. Mr. Stratton was a native of Jeffersonville, Ind., where he resided until 20 years old, learning the trade of the carpenter and draftsman, at which he subsequently worked in Sioux City, Omaha and Lincoln, Neb. He settled in Colorado Springs in 1872, where his experiences were those common to the average prospector until 1891, when he began the operation of the Independence mine and rapidly accumulated a fortune which is reported to exceed \$20,000,000.

MR. HARRY S. PARMELEE, president of the Fairhaven & Westville Railroad Co., of New Haven, Conn., and a prominent manufacturer of the latter city, died suddenly of heart's disease, September 27th, on board the yacht "Alert," at the foot of 57th St., Brooklyn. Mr. Parmelee had served through the Rebellion in the First Connecticut Cavalry, and lost an arm before Richmond. He was the inventor of an automatic sprinkler which is now extensively in use, and he was president of the Mathushek Piano Co., a director of the Treat & Shepherd Co. and of the Second National Bank. He was an enthusiastic yachtsman, and was enrolled as a member of the yacht clubs of New York, New Haven and Larchmont.

## TUNNEL CONTROVERSY IN CHICAGO.

The question of lowering the tunnels under the Chicago River for the purpose of expediting harbor traffic, was again the subject of discussion in a conference on September 30th, between the representatives of the Chicago city council, the drainage board and the traction companies, whose right of occupancy of the tunnels is the chief obstacle to a solution of the problem. Despite the mayor's contention that initiative action in the matter comes within the province of the sanitary district, the drainage trustees present disclaimed all responsibility until the city shall have formulated a method of procedure. The question then arose whether the traction companies would surrender their rights to the tunnels if allowed to run their lines across the bridges, in reply to which the attorney representing the Union Traction Co. at the conference stated that "if the company were protected and lost none of its rights and sustained the dissolution of none of its privileges, its directors would undoubtedly act in the interests of the people."

A plan was submitted by L. O. Goddard, chairman of the River Improvement Association, which provided for the removal of the bores by first giving the street railways the right to cross the bridges, and then blowing off the tops of the tunnels and scraping six or seven feet from the top of the walls. This plan was heard with attention, and will be discussed at the next conference. An estimate of the cost of lowering the three tunnels as submitted by City Engineer Ericson included the details of the cost of lowering each tunnel, and presented an aggregate sum of \$1,060,000.

## RULING OF BOARD ABSOLUTE.

The Massachusetts Board of Street Railroad Commissioners has dismissed the application of selectmen of Stockbridge to require the transfer of the tracks of the Berkshire Street Railway Co. from private land locations to the public highway, at least until new evidence shall be available. The board had recently viewed the premises and decided that private land locations were best in accordance with public interests. The dismissal of the selectmen's petition for a change was in recognition of the new law which gives the board authority to approve locations without being influenced by local considerations.

Mr. George E. Moffat, chief engineer for the Fargo & Morehead Railway Co., of Fargo, N. Dak., advises us that the road is to be built at once and that the company is in the market for all material and supplies for ten miles of track.

An express business over the lines of the Lake Shore Electric Railway Co. between Cleveland and Norwalk has been inaugurated by the Electric Package Co., of Cleveland.

**IMPROVED SEMAPHORE BLOCK SIGNAL AND CAR SPACER.**

In the "Review" for July, page 423, we illustrated and described at some length the automatic signal for block system and car spacing device which had been brought out by the American Electric Signal Co., of Pittsburg, Pa. That system used red, white and green lights only for the signals, but a later improvement, known as the Berry automatic block signal and car spacing device, has just been put on the market by the Pittsburg Switch & Signal Co., which is the successor to the American Electric Signal Co., and some details concerning the Berry apparatus will be found of particular interest at this time.

The improved semaphore signalling device shown in the illustration is a feature of the new system so that incandescent lamps are not depended upon for the signals, though groups of lamps are arranged so that they can be cut out during the day. The semaphore arm on the right of the illustration has a green blade and green glass, while the arm on the left has a red blade and a red

glass, the glasses providing green or red lights in conjunction with the incandescent lamps. In event of an operating circuit wire breaking or a magnet burning out the semaphore arms come to the danger position by gravity.

For the operation of a single track system with turnouts, the arrangement of magnet and semaphore circuits is in general similar to that of the light and magnet circuits shown in Fig. 1 on page 423 of the "Review" for July, and the same is true of the double track system where one car controls two blocks, the wiring being analogous to that shown in Fig. 2, page 423. The semaphore apparatus has, however, the necessary magnets for actuating the semaphore arms, which was not necessary where only lights were used for the signals. The ingenious mechanism by means of which when several cars may be permitted to enter a block, the block is not cleared until the last car leaves, is retained, this being a valuable feature of the system. The trolley contacts also are arranged as in the installations previously described.

The wiring for an installation on a double track line where it is desirable to have the car signal one block only is shown diagrammatically in one of the illustrations herewith. The method of operation may be thus described:

The diagram shows a car having run into block between stations 5 and 6, throwing up a red or danger signal at block 5 so that the crew of any car following, arriving at station 5 and seeing a red or danger signal, knows that there is a car in that block. The method of operating this signal is as follows: Having reached station 5,

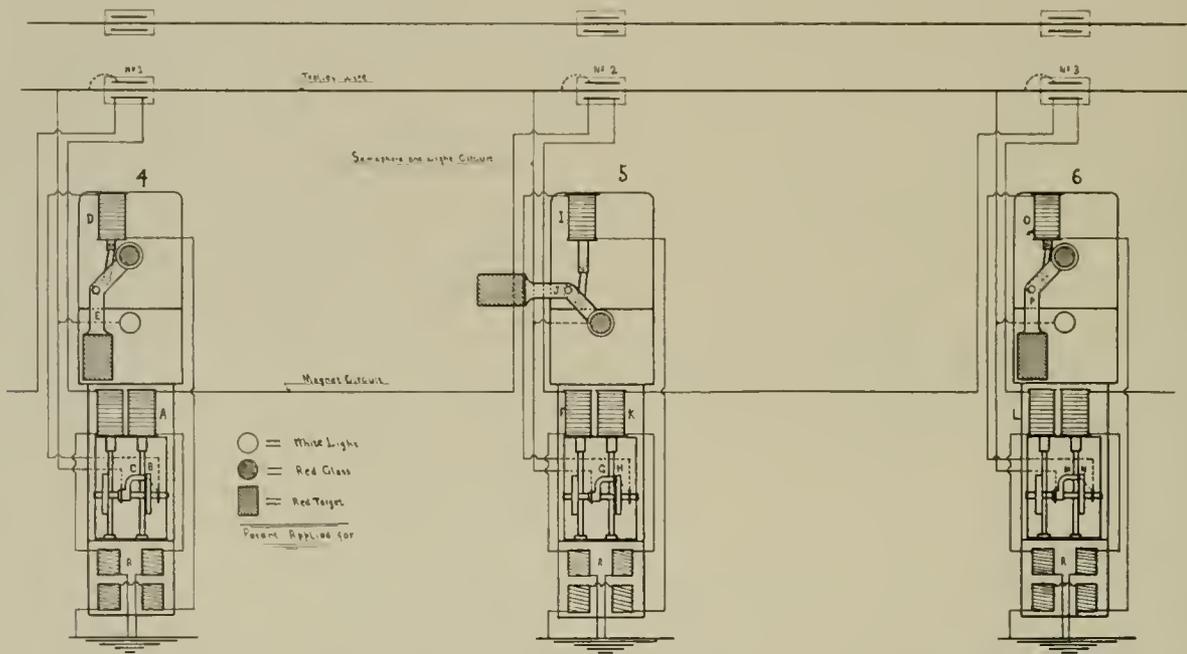

DIAGRAM OF CONNECTIONS OF AUTOMATIC BLOCK SIGNAL AND CAR SPACING DEVICE.

**CONVENTION NOTES.**

The Q. & C. Co., of Chicago, was represented at Detroit by Mr. Kalas. The company was unable to secure space for an independent exhibit, but the well-known "Stanwood" steel step—the one with a light and airy tread—was shown in the exhibit of the John Stephenson Co.

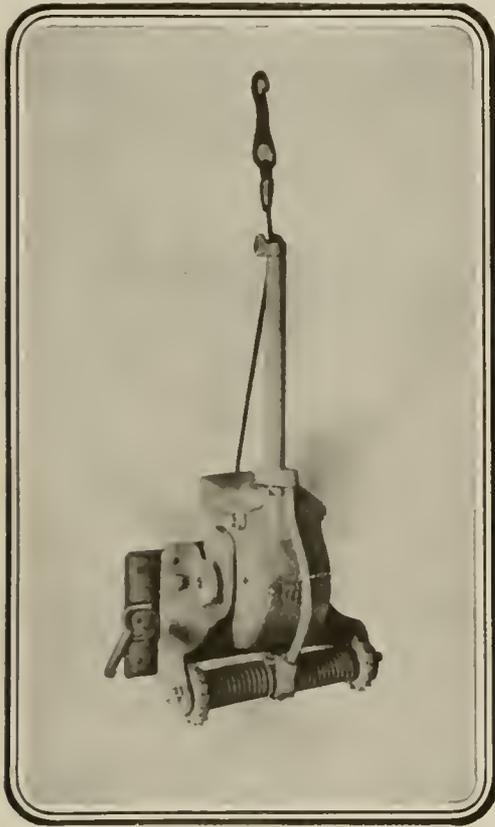

H. H. Hart, who exhibited the Hart Tie Plate at the Detroit convention, secured a large order from the Michigan Central Railroad while in that city. The tie plate is manufactured by George Fuller, Old Colony Bldg., Chicago, Ill.

Porter & Berg, of Chicago, and their representative, C. R. Mason, were very much in evidence although they did not have an exhibit, and report that they took a number of nice orders for supplies. They distributed a very unique souvenir in the shape of a "Frog" match safe which created considerable interest among convention visitors.

The H. P. Heil Co., Milwaukee, Wis., through its eastern representative, C. J. Harrington, of New York, has just closed a contract with the Consolidated Railways of Pittsburg for cast-welding several thousand joints, the style of welding to be the Heil improved cast-weld joint for 9-in. rails. The company has also closed a contract with the Toronto Railway Co. for a welding outfit.

**JOHNSON TROLLEY RETRACTOR.**

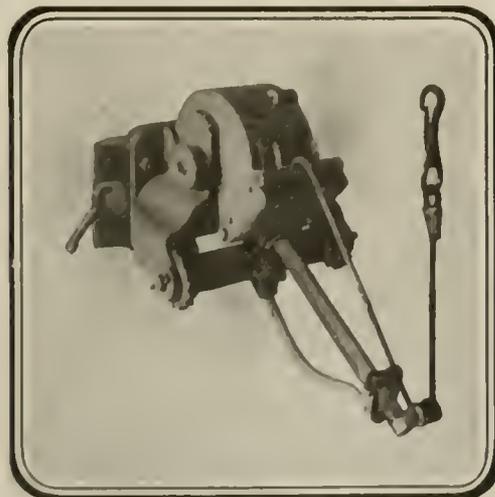

The device shown in the accompanying illustration is designed to furnish absolute protection to the overhead construction, trolley poles and wheels by instantly retracting the trolley about fifteen in. below the wire whenever it gets off the line. In a test over a year it is reported that the retractor has not failed to act in a single instance, and without the slightest damage to wire or poles,

working through severe storms and in extremely cold weather without being out of service at any time.

It is made entirely of steel, is simple in construction, and every adjustment can be made from the outside and on the car.

Fig. 1 shows the retractor in position on the dash of the car, connection being made with the regular trolley rope by means of the clamp *I* (Fig. 2). Fig. 2 shows position when trolley is retracted,

The machine consists of rotatable casing mounted in a suitable frame and containing a tension reel provided with an automatic adjustable locking device; a retractor arm of suitable length receiving

the power of the springs *E* through the medium of the arm *F* and yoke *G*. In Fig. 1 there is a maximum of spring power and minimum of leverage. In Fig. 2 the order is reversed, the minimum of spring power and the maximum of leverage at *H*, which in this machine gives 75 per cent more power in the last position. As the retractor springs can be wound up by the ratchets *D* to agree with trolley-pole tension, the vicious action of unnecessary power in the start is obviated in case the harp should be pressed against the wire.

The spring at *E* being divided, should one of the springs break, it still leaves energy enough in the remaining one to get the trolley out of danger. The breaking of both springs would resolve the machine into a trolley catcher. A broken spring can be replaced in three minutes.

When the car is running, and the trolley on the wire, the tension reel accommodates the variations in height of line, but when the trolley jumps from the wire the sudden upward movement locks the reel and raises the latch *C*. The arm then swings down and carries the trolley with it, the reel remaining securely locked while in that position. But when a small lever, which is raised to an upright

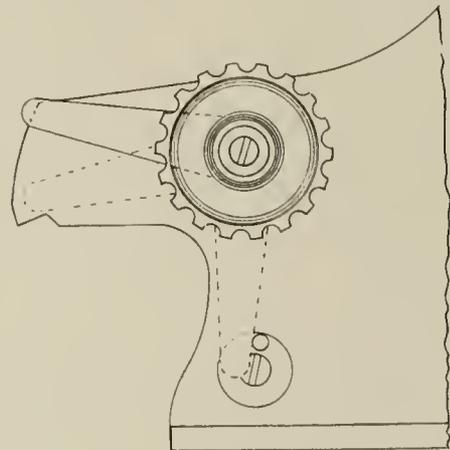

FIG. 3.

position behind the button *B* is moved to the left and a pull given downward on the trolley, the locking device is thrown out of gear and the trolley can be manipulated with freedom. After the trolley is replaced on the wire, the arm is raised to an upright position and the locking device shown in Fig. 3 set in action, the small lever being locked so it cannot be tampered with.

This retractor is fastened in the center of the dash with top of the arm level with top of dash. The arm is let down and connected with the trolley rope, with the trolley free from the wire; then the springs *E* are wound up until the arm draws the trolley down freely.

The trolley rope is connected so that at low points the rope in the machine will have a clearance of six inches above the top of arm, and the rope can be adjusted to pay out fast enough to meet all requirements as to curves, sudden rise of line at railroad crossings, and incidental jolts. This retractor is made by the Federal Manufacturing Co., of Cleveland, O.

**WORLD'S FAIR INTRAMURAL RAILWAY.**

An intramural railway is to be constructed upon the World's Fair grounds at St. Louis which it is estimated will cost about \$750,000 to build and equip. This system of rapid transit will include about eight miles of main line and branches and will enable visitors to see the exposition with as little fatigue as possible. The chief consideration in planning the intramural road has been to locate it where it would not mar the beauty of the exposition, and it is believed that the plan presented by Mr. Charles V. Weston, of Chicago, comes nearest to a perfect solution of the problem. Owing to the varying altitudes of the exposition grounds the road will be at times an elevated line, a surface road and an open cut.

The Dallas (Tex.) Consolidated Electric Street Railway Co. has ordered 13 new winter cars of the latest improved pattern, which will be shipped from St. Louis for service on the Dallas lines.

## TRADE NOTES.

THE KINNEAR MANUFACTURING CO., of Columbus, O., is distributing an ingenious advertising novelty to its street railway friends. The card represents the Kinnear steel rolling door as used for car barns and the doors are made so as to operate on miniature rollers.

GEORGE E. WATTS, who has been connected with the Columbia Incandescent Lamp Co., of St. Louis, for the last five years as sales agent for St. Louis, Kansas City, Omaha, Cincinnati, Indianapolis and Louisville, announces that he has entered the electrical field on his own responsibility as manufacturers' agent. Mr. Watts' headquarters are at 514 Chemical Bldg., St. Louis, where he will be pleased to welcome his old friends.

SARGENT, CONANT & CO., of Boston, will shortly complete the electrical equipment, for power and lighting, of the Hampton Co., Easthampton, Mass. The entire plant will be electrically driven, current being supplied from two multiphase generators, one direct coupled to a Corliss type engine, and the other bolted to a water wheel; either or both may be used for operating motors or arc or incandescent lamps.

THE CRANE CO., of Chicago, has just published a new pocket size catalog of its steam goods, etc., comprising 464 pages and including a complete line of the company's goods such as standard, medium, low pressure, extra heavy, and hydraulic goods in brass and iron, engineers' supplies, tools, pipe, etc. The book contains a great deal of useful information, tables, rules, etc., and will be furnished on application to the home office in Chicago, or to any of the company's branch houses.

THE ANNUAL MEETING of the stockholders of the Sprague Electric Co. was held Tuesday, Oct. 14th, 1902, at the office of the company in Watsessing, N. J. The following directors were elected for the ensuing year: Allan C. Bakewell, D. C. Durland, S. M. Hamill, J. R. Lovejoy, John Markle, J. R. McKee and E. G. Waters. At a meeting of the directors held later in the day officers were elected as follows: President, Allan C. Bakewell; first vice-president, S. M. Hamill; second vice-president, D. C. Durland; secretary and treasurer, Harry R. Swartz.

THE ELECTRIC STORAGE BATTERY CO., of Philadelphia, maker of the chloride accumulator, distributed a pamphlet at the American Street Railway Convention entitled "A Few Illustrations Selected from 220 Installations of the Chloride Accumulator Batteries in Street Railway Service." The pamphlet contains 11 half tone illustrations of the interior of several battery houses with brief descriptions and a statement is given in the preface of the increase in installations of the chloride accumulators from October, 1901, to October, 1902.

THE MICA INSULATOR CO., of New York and Chicago, is now manufacturing its "Empire" oiled cloths in the form of a tape under the name of "Linotape." It is made in any width from 1/4 in. to 36 in. and has proved itself to be an excellent tape both mechanically and electrically. The foundation of this tape is a closely woven cloth made so as to secure the greatest mechanical strength and the coating consists of the company's Empire oil on both surfaces. It is stated that this coating never cracks or hardens and that it renders the cloth impervious to moisture and acid and alkali proof.

"FOUR TRACK SERIES" No. 35, published by the New York Central & Hudson River R. R., under the head of Historical Pilgrimages About New York, tells in entertaining style the story of the growth of the Empire State and its struggle for supremacy. The events of its civil and literary history are narrated under the names of the towns and cities most familiar to the student as landmarks of the progress of the state and the route and schedule of trains for reaching these interesting places are also given in detail. The publication contains a fine map in colors of New York from the Battery to Newburgh, and is illustrated with half-tone engravings.

THE GENERAL ELECTRIC CO. has recently issued the following publications: Electric Hoists, a handsomely illustrated catalog describing this class of machinery for power and mining work; Bulletin No. 4295, on "oil switches;" Bulletin 4296 on "switch for a system of remote control;" bulletin 4297 on "high voltage type H transformers;" bulletin No. 4298 on "Thompson high torque induction meter." Catalog and price list No. 7560 superseding No. 7524 on "Repair Parts of Type K Series Parallel Controllers;" catalog and price list No. 7561 on "Parts of Standard Carrier Bus Are Panels;" catalog and price list No. 7562 on "Parts of Form 3 Carbon Feed Alternating Current Series Enclosed Arc Lamps;" catalog and price list No. 7563 on "Parts of Form 5 and Form 6 Carbon Feed Direct Constant Current Series Enclosed Arc Lamps." Flier No. 2104 on "G. E. Alternating Current Lightning Arresters" and flier No. 2105 on "Reflectors for Enclosed Carbon Feed Arc Lamps."

THE REYNOLD SILENT CHAIN GEAR is the title of bulletin No. 1001 published by the Link Belt Machinery Co. of Chicago. This chain gear consists of a chain made of stamped links of special form, shouldered studs and countersunk washers. The chain is made in six pitches and in many widths of each pitch. These chains run on cut sprocket wheels with accurate teeth and having straight sides and varying forms. One of the principal advantages claimed for this gear is that it can be run at high speeds with no noise; it is also claimed to be superior to leather or rubber belting for the reason that it cannot slip. It can be run on short centers without an idler, it can be used in hot or damp places and is run slack, and therefore produces no excessive journal friction. The silent chain gear is particularly recommended for motor gearing and in many cases makes the use of a motor possible where belting or spur gearing are found impracticable. While the Reynolds silent chain has been on the market in this country for less than a year its application has already become extensive.

THE WESTERN ELECTRICAL SUPPLY CO. of St. Louis has recently taken the agency for the Hartman Automatic Oil Circuit Breakers. This is one of the most practical circuit breakers for cars that has even been gotten out. It is designed on entirely original lines and embodies in its construction many new and valuable points which will at once commend itself to the engineer. The extreme simplicity in its construction is one of the many good points in its favor. The parts are reduced to a minimum in number, and there is no delicate and complicated mechanism to get out of order.

A particularly valuable and entirely new feature is the operation of the switch mechanism in oil enclosed in a tight metal case. By this method the arcing feature has been almost entirely eliminated by surrounding the contact mechanism with a non-conducting fluid. The contacts are of the laminated type, the advantages of which over the ordinary knife-blade type are well-known. Special attention is also called to the fact that the instrument is a perfect oil-break switch as well as a circuit breaker. Bulletins, descriptive matter, etc., are mailed on application.

The Western Electrical Supply Co., of St. Louis, have recently taken the agency for the celebrated Shelby Seamless Cold Drawn Steel Trolley Poles. We are advised that they are carrying a complete line of these poles in stock, and are prepared to ship promptly.

THE H. W. JOHNS-MANVILLE CO. has issued its catalog No. 5 relating to "Vulcabeston" packing. The increased temperature and pressure in modern steam plants require the most effective kind of steam packing and "Vulcabeston" is claimed to give excellent service under all conditions. This material is tough, pliable and yielding and can be moulded into any shape of gasket. It is made of any desired density, from soft for ordinary purposes, to hard for valve seats, coupling rings, etc. The catalog describes the use of Vulcabeston concave and convex packing rings on the valve rods of locomotives for more than a year without the necessity of even screwing down the follower, and a number of testimonials are included in this catalog from users of this packing in locomotive and air brake equipments. This material is manufactured in flexible rope for packing, in pressed rope rings and gaskets, in moulded gaskets, washers for standard unions, moulded faucet washers and convex and concave packing rings, etc. The company will be glad to send a copy of this catalog to any one interested upon request.

PUBLISHED ON THE 20TH OF EACH MONTH.

CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

By reason of the attention which street railway men are now devoting to the subject of discipline the article in this issue by Gen. W. A. Bancroft, president of the Boston Elevated Railway Co., describing the methods used by that company in choosing, training and disciplining its motormen and conductors will be found of exceptional interest at this time. This system which General Bancroft describes in detail is probably more elaborate than is used by other street railway companies, and it will certainly be surprising to the layman—the "average man"—to know that the ideal of discipline for street railway men is considered to be even higher than that of our military force.

From the latest reports it appears evident that if Ohio interurban electric railways desire peace and happiness in their relations with municipalities they will do well to secure private rights of way. Thus in a controversy between the Stark Electric Ry. and the Canton-Akron Ry. over the proposed grant for a terminal of the former road in Canton, the trial court on October 22d decided that an interurban electric line is a railway and that it is not necessary for such a company to follow the ordinary course of applying for a franchise from the city; but that it may appropriate a right of way and pay any damages incurred by owners of the property.

On the other hand, a trial judge has held in the case of the city of Dayton versus the Southern Ohio Traction Co., that as soon as the company's line enters the city it becomes a street railway and not an interurban line, and as such must give reasonable service, stop at street crossings, sell tickets, announce names of streets, run cars at specified speed, and, in the language of the court, "furnish a continuous local street car service."

These two decisions are not as conflicting as might be thought; the first allows an interurban to condemn a right of way for itself and not use the city streets, while the second shows what may happen if a company uses the streets.

Reserves of power generating machinery which would insure against delays to traffic in event of accidents at the power station or provide for extraordinary temporary demands for current, have always been among the prime requisites in electric railway stations. In the main power plant the units are chosen of such a size that one may always be held as a reserve, but with the development of long roads using multiphase apparatus at the main station, and high-tension transmission lines with rotary-converter sub-stations, the installation of duplicate converter units at all sub-stations requires such an investment that other plans received consideration.

Perhaps the most ingenious design to reduce the initial investment in converting apparatus and at the same time provide against delays to traffic is the portable sub-station car. The first proposal to use such a car of which we know, was in connection with the Chicago & Milwaukee Electric Railway, for which Mr. B. J. Arnold was the engineer. In describing this road in the "Review" for August, 1898, we said: "It will be noticed that the electrical equipment of the sub-station is not in duplicate. This has been considered unnecessary as it is intended to mount the machinery needed for a sub-station, static step-down transformers, and one rotary converter upon a track fitted with motors. In case of a break-down at any sub-station the storage battery can be relied on to supply current for several hours, during which time the portable reserve sub-station equipment can be taken to the crippled station and be connected ready to operate until the repairs have been made."

This scheme was never put in practice on the Chicago & Milwaukee line, but in 1901 the Union Traction Co. of Indiana built a portable sub station car, the drawings for which were published in the "Review" for April, 1901, page 212; this was, we believe, the first portable station of this character to be put in service. This car has proved to be very satisfactory and convenient in operation and but one change in that design has been suggested as a betterment—making the roof easily removable in order to facilitate handling apparatus in the car by an overhead crane.

It is rather surprising that this plan of providing for emergencies has not been more widely adopted, since it has proved successful in practice and we know of no serious objections urged against it by engineers. In this issue we illustrate a sub-station car recently built for the Wilkesbarre & Hazelton Railway, a new Pennsylvania interurban, which may be taken as indicating an increasing popularity for the portable sub-station. In considering the merits of this device it should not be overlooked that the car is equally serviceable for temporarily increasing the capacity of a sub-station

when traffic on the portion of the line supplied by it may be heavier, as for a reserve in case of accident.

In several respects the high tension alternating installation of the Berkshire Street Railway Co. at Berkshire, Mass., which is described in this issue (supplementing the description published in the "Review" Feb. 15, 1902), is a somewhat radical departure from usual engineering practice. In the first place, the scheme for generating and distributing current is new, in that step-up transformers are avoided by the use of direct connected alternators of the revolving field 3-phase type, giving current at 13,300 volts and 25 cycles per second, this current passing directly to the transmission line at this voltage. The idea of this is of course plainly to avoid step-up transformer losses. Under usual conditions the design would, however, be questioned, inasmuch as theoretically the step-up transformer is the most efficient part of the usual high tension alternating installation, and when working at full load, it can be assumed to give very nearly 98 per cent efficiency. In this particular installation, however, the consulting engineer in charge decided that, for a long time to come at least, the transformers could not be operated at their full capacity, and in all probability would not average much over 50 or 60 per cent of full load; and he was therefore probably entirely justified in eliminating the step-up devices. The question naturally arises, How are the alternators of this type going to stand up under electric railway load conditions? During four months of continual running, they have given no undue trouble. As far as safety is concerned, these high tension machines are probably attended with no more danger to operators than are the ordinary 600-volt direct current machines. The only high potential parts are the stationary armatures and these are entirely enclosed and protected, and the builders claim it is impossible for an employe to obtain a shock unless he deliberately and intentionally places himself in danger. The machines are protected by static interrupters, by lightning arresters and by barb wire suspended over the high tension transmission lines, the wire being grounded at every fifth pole.

It will be noted that the revolving fields of the station alternators are separately excited by 110-volt independent steam driven units. The service on these exciting units is unquestionably very severe, and they require considerable attention. It is urged, however, that the gains offset the drawbacks, and not the least conspicuous advantage is the convenience of running one or both of the small exciter units for lighting the power house and car barn when the main generating units are shut down. The piping arrangements as described and illustrated in this issue will also be found of interest and worthy of study, the most noticeable feature being the flexibility and diverse connections provided for meeting almost any emergency that can be imagined caused by the disablement of a live or exhaust steam feed water system.

Another interesting feature will be found in the arrangement of the high tension transmission line. The transmission lines are No. 4 and No. 6 bare copper wire arranged in two circuits, one 13 miles long, and one 26 miles long. Three wires of each circuit are placed at the corners of an imaginary equilateral triangle, having sides 18 in. long, but the wires are not transposed at any point of the circuit. The question naturally arises how much loss of current is there due to lag through induction. The engineer states that thus far he has been able to discover no appreciable loss, but adds that this is undoubtedly due to the low amperage and high potential. The maximum current never exceeds 50 amperes, and the average is less than 20 amperes. This, at 13,000 volts, seems to give no trouble in the three-phase circuit with straight away wires. The working of this installation will be watched with unusual interest.

It is not always that the discussions before our technical clubs and associations produce information of so practical a value as was brought out at the September meeting of the New York Railroad Club, when the topic for discussion was "The Construction of Perfect Track." Mr. J. C. Brackenridge, chief engineer of the Brooklyn Rapid Transit, who was appointed to open the discussion, in the first place admirably defined a perfect track as one "that will always keep its alignment and service, and never wear out," and then in the next sentence with commendable frankness summed up the situation in the words "unfortunately I cannot tell you how to build a perfect track or tell you where you can find out." However, Mr. Brackenridge goes on to give some valuable data on the subject of track building. His remarks are

quoted at length in another column of this issue. The New York Railroad Club includes in its membership over a thousand of the leading steam railroad and street railway men of the country, especially of the East, and this subject of track laying was thoroughly discussed from the standpoints, both of the steam railroad engineer and the electric railway engineer. In view of the fact that it is frequently said in electric railway circles that we must come to steam railroad standards in track laying, it is of interest to read the views of some of the members on this point. Mr. R. Trimble, a steam railroad engineer, pointed out that some steam locomotives now in use concentrate on a wheel base of 16 ft., about 225,000 lb. Considering that this load is distributed over an area of about 200 sq. ft., we have an average load on the supporting roadbed of 1,100 lb. per square foot, and Mr. Trimble is of the opinion that 6 or 8 in. of ballast under the bottom of the ties is not sufficient to make a perfect distribution for steam railroad work, and he advocates that 14 in. of ballast under the ties is not too much. Mr. Reed of the Metropolitan Street Ry., of New York, also pointed out that, where the power applied to the locomotive drivers is conveyed by reciprocating parts, no matter how much care is used in balancing, there is always a hammer-blow struck with each revolution of each driving wheel. With a solid foundation, therefore, for steam railroads, there would not only be excessive wear on the track structure, but upon the locomotives as well, so that a flexible track is desirable. The discussion at once turned upon this question: Is a flexible track desirable or undesirable for electric railway work in city streets? On this point Mr. Brackenridge, speaking from his experience with electric railway work in Brooklyn, and Mr. Reed referring to the experience on the Metropolitan in New York, take diametrically opposite positions. Mr. Brackenridge said: "I am a believer in wooden tie construction, having used a longitudinal concrete beam with steel tie rods, and found that the rigid foundation shortened the life of the rail more than 25 per cent." Mr. Reed said: "I must differ from Mr. Brackenridge as to the best track construction for electric railways, especially for paved streets. As the power applied to the wheels emanates from a revolving armature there is, or should be, an even application at all points of the circumference, and there is nothing to cause a pound or hammer-blow, therefore, I believe there is no necessity for a flexible roadbed; I consider a perfectly rigid roadbed by far the best."

This difference of opinion between two experts of so high a standing as Mr. Brackenridge and Mr. Reed is certainly confusing, especially when both speak from actual experience with rigid roadbed construction under similar conditions. The situation is just this; in Brooklyn it has been found that with heavy traffic on track supported on concrete beam, the head of the rail itself is ironed down or worn out prematurely, while in New York under practically the same traffic this trouble has not been experienced. The testimony from other cities on this point is of value.

In the September issue of the "Review," Mr. Stanley, general superintendent of the Detroit United Ry., said: "We are satisfied with a 9-in. girder grooved rail with concrete foundation, but our experience in Detroit has shown that 6 in. of concrete is not sufficient foundation for heavy rails." In other words, Detroit wants a still more rigid roadbed than 6 in. of concrete gives. At Buffalo, concrete work with electrically welded joints has been used, and is being retained in new work. Kansas City—which claimed to be the home of the concrete beam under electric railway track,—has several miles of track with 6 in. or more of concrete under each rail, and in 1900, Mr. E. Butts, the company's engineer, authorized the statement in the "Review" that the Metropolitan company of Kansas City was so well pleased with the results of this tieless concrete construction, that it had decided to follow this practice wherever possible in new work and in rebuilding. We do not recall an instance where concrete construction has been abandoned after trial. On top of this testimony, and to add still more confusion to the unsophisticated, is the decision of the Rapid Transit Commission in New York to use a ballasted track with an exceedingly thin quantity of ballast beneath the ties, this decision having been reached after an experimental stretch of track had been built and used with ties and rails embedded solid in a concrete bed. It looks as though the question of the relative advantages of concrete construction as compared with wooden ties and ballast is still a debatable question in every individual case, as the testimony at hand is certainly conflicting.

# The Employing, Training and Disciplining of Car-Service Employes of the Boston Elevated Ry.—1.

BY MAJ. GEN. WILLIAM A. BANCROFT, PRESIDENT OF THE BOSTON ELEVATED RAILWAY CO.

If that nebulous and oracular personage, "the average man," were asked to name the most highly organized and perfectly disciplined body of men in this country, it is probable that the Army or Navy of the United States would be promptly mentioned. Such an answer would be conclusive evidence that the "average man" has never undertaken the management of an important street railway system conducted in accordance with modern principles, and attempted to operate it under the conditions that prevail in our large American cities.

The "average man" knows that a vast army of men is employed in the running of the street cars that carry him with considerable speed and almost absolute certainty to nearly any street or corner he may desire to reach in the city, suburb or country town; he knows that these men are units in the organization of a great corporation that

undertakes to supply transportation to the public in a more or less systematic and convenient manner; he knows, in a general way, that the conduct of the men is governed by numerous rules promulgated by what is known as "the management;" and he may, perhaps, know that before a man is entrusted with the running of a car he is instructed in his duties and in the manner and means of performing them.

More than this the "average man" may not be expected to know. The care that is exercised in the selection of new men; the infinite pains taken in the in-

struction of recruits; the constant inspection of the daily work of all employes, and the unceasing efforts that are continually being exerted to increase the individual and collective efficiency of the car service force are matters beyond his ken or imagination.

There is no branch of street railway activity that causes a manager more concern than the production and maintenance of a corps of capable and dependable men to man the platforms of the cars—men who can and will do the right thing at the right time when no superior officer is at hand to watch or aid them. Every railway company is striving with greater or less success for the realization of this ideal, and the purpose of this writing is to describe the methods adopted by a company that has met with some success in its efforts to reach this Utopian condition.

The Boston Elevated Railway Co. operates somewhat more than 410 miles of surface, underground and overhead track and employs about 5,000 motormen, conductors, guards and brakemen. The men who constitute its car service force are generally conceded to be as well trained a body of operatives as exists in the country. This opinion has been expressed not only by railway specialists but by persons who travel extensively and view the matter from the standpoint of the public and the passenger.

As a logical and natural starting point for a recital of the means by which this company trains its men, it may be well to begin with an account of the methods adopted for securing good raw material, so to speak, out of which the capable railway man is produced. No department of the service has its work more completely systematized than the employment department, and no pains are spared to eliminate every possibility of giving employment to unpromising applicants. The company is very exacting in its requirements and no person is allowed to fill out an application blank who falls in the slightest particular below the standard.

Every applicant who is seriously considered comes before the Superintendent of Employment personally. Those whose general

appearance is slovenly or unprepossessing are dismissed summarily. Those whose neatness, address and apparent intelligence commend them are subjected to a preliminary examination, and those who pass the various tests made at this time are allowed to file formal applications.

The requirements are, in brief, that the applicant must be not less than 21 years nor more than 35 years of age for elevated service, nor more than 45 years of age for surface car service. The eyesight must be perfect. This is tested by the usual methods employed by oculists in fitting glasses, and the slightest defect in either eye is an absolute bar to further consideration. The hearing must likewise be perfect, and the applicant is required to nod his head in response to the clicks of a device that is sounded at varying distances and from different directions as a test for the quickness and accuracy of each ear.

Since the elevated lines were placed in operation, a year and a half ago, a test for color blindness has been added. The candidate is required to select from many skeins of worsted of various hues and shades, those which he thinks match in general color certain samples that are handed to him. He is further required to name correctly the colored disks of light displayed by a lantern in a dark room, and a failure to select and name correctly is sufficient cause for rejection.

No man is employed as a conductor who is less than 5 ft. 4 in. in height, nor as a motorman or brakeman if he falls below 5 ft. 6 in., and no man can enter the car service unless he possesses four fingers and a thumb on each hand in good working order. Conductors must possess a common school education and motormen must be able to read and write the English language.

If this preliminary examination discloses no defect, the applicant is required to state the names of every person or concern by whom he has been employed during the preceding five years and to state the cause of his leaving each position he has held. If he has had no employer during the whole, or any considerable part, of that time he is required to name as references a sufficient number of reliable persons who have known him during that period and are in a position to express an intelligent and authoritative opinion of his habits and character. A brief description of the man is then entered upon the examination blank, and the following form of application is filled out and sworn to.

## BOSTON ELEVATED RAILWAY CO.

### Application for Employment.

Boston, .....190

Superintendent and Employment Department.

Dear Sir:—I hereby make application for a position as.....  
..... in the service of the Company, with the full understanding that in the event of my securing employment I am to abide by such rules and regulations governing its employes as the management may from time to time establish.

If employed I promise to loyally and faithfully serve the Company, and to do all in my power to further its interests. To conduct myself honestly, soberly, and with proper obedience and respect to its officials, and courtesy to passengers and the public.

Age..... Where born?.....  
Married or Single?..... General condition of health.....  
Employed the past five years as follows:      Reasons for leaving:

.....  
.....  
.....  
.....

Have you ever been employed by a Railroad or Railway Company, other than stated above?  
.....

Have you ever made any assignment of wages that has not been discharged?  
.....

Have you ever been convicted of a Misdemeanor or Felony?.....  
 Section of Road preferred.....  
 Do you use intoxicating liquors?.....  
 (Full name of applicant).....  
 (Residence).....  
 (P. O. Address).....

Commonwealth of Massachusetts,  
 County of Suffolk,  
 Boston, .....190

Then personally appeared the above named.....  
 and made oath that the foregoing is true to the best  
 of his knowledge and belief.

.....Justice of the Peace.

To each of the former employers or persons whose name has been  
 given as references a circular letter of inquiry is promptly sent,  
 and a failure to receive a satisfactory reply from each of these is  
 prima facie evidence of unworthiness. The letter is as follows:

**BOSTON ELEVATED RAILWAY COMPANY,**  
 82 Water Street,

EMPLOYMENT DEPARTMENT,  
 A. W. Senter, Supt.  
 Boston, Mass., .....190

M.....  
 Dear Sir:

In applying to this Company for a position as .....  
 Mr. .... Age, ..... Height,  
 .....ft., ..... in., Eyes, ..... Hair, .....Com-  
 plexion, ..... Born in.....refers us  
 to you. Will you favor us with your opinion of his honesty, charac-  
 ter, habits and ability, etc. Please state definitely as to honesty and  
 habits. Has he ever to your knowledge been employed by any Rail-  
 road or Railway Company? It is very essential to applicant that  
 this letter be answered promptly; also if ever in your employ that  
 the dates of entering and leaving your service be given. The in-  
 formation that you give us will be thankfully received, and con-  
 sidered confidential.

Very truly yours,

N. B. Employed as .....from.....  
 to.....

If this investigation establishes positively that the candidate is of  
 good habits he is summoned to the employment office and turned  
 over to the company's physician for final physical examination.  
 This examination is intended to disclose any constitutional or or-  
 ganic defects that might interfere with the discharge of his duties  
 in a long term of employment. About one out of every eight is re-  
 jected by the physician. The kidneys, heart, lungs, and feet have  
 been found to be particularly vulnerable points in men employed  
 upon the cars, and the company feels that it is not justified in the  
 expenditure of the time and money necessary to break in new men  
 who are not absolutely sound in these respects. The scope and  
 nature of the physician's investigation is shown in the following  
 form used for the final physical examination:

**BOSTON ELEVATED RAILWAY CO.**

EXAMINATION OF .....FOR THE POSITION  
 OF .....

Date of Examination, .....Place of Examination,.....  
 Analysis of Urine .....reaction, .....  
 Sp. G..... albumin, .....sugar .....  
 Cause of rejection, .....  
 Weight, .....Hearing, .....Temperature .....  
 Pulse (rate and character), .....  
 Have you ever been vaccinated or had Small Pox?.....  
 Have you ever received an injury or wound upon the head?.....  
 Have you ever had any difficulty in urinating?.....  
 When were you last attended by a physician?.....  
 For what complaint?.....Name of Physician?.....  
 Are you subject to fits?  
 Chest measurements,  
 Forced inspiration,  
 Forced expiration,  
 Measure of abdomen .....  
 Examination of abdomen, .....  
 Lung examination,

Percussion,  
 Auscultation,  
 Heart, .....  
 Feet, .....  
 Applicant is .....in my judgment, physically qualified for  
 the position of conductor or motorman.

Remarks:—

(Signed)

Dated this .....day of .....190 .

The number of men who succeed in running the gauntlet of all  
 of these examinations amounts to only about 25 per cent of the  
 total who apply for positions. It is doubtful if any other corpora-  
 tion or concern, public or private, exercises so great care in the selec-  
 tion of men for service. As a further precaution the company re-  
 quires every conductor to furnish a bond with two real estate owners  
 as sureties, each in the sum of \$300. The bonds of surety companies  
 are not accepted for the reason that it is believed that the stipula-  
 tion of private bondsmen is certain to result in securing greater  
 fidelity among the employes. An individual will not assume the  
 risk of losing \$300 by the misconduct of another unless he has very  
 excellent grounds for believing in the honesty of the person for  
 whose possible wrong doing he is to be held liable. The bond is as  
 follows:

**KNOW ALL MEN BY THESE PRESENTS,**

That we, .....of .....in  
 the county of .....as principal .....  
 .....of .....and .....  
 .....of .....as sureties, are  
 held and firmly bound unto the Boston Elevated Railway Company,  
 in the sum of three hundred dollars, lawful money of the United  
 States of America, to be paid to the said Boston Elevated Railway  
 Company, its successors and assigns, for which payment, well and  
 truly to be made, we bind ourselves, our heirs, executors and ad-  
 ministrators firmly by these presents.

Dated this .....day of ..... one  
 thousand nine hundred .....

The condition of the above obligation is such, that if the said  
 .....shall be appointed  
 Conductor by said Company, and shall faithfully discharge all the  
 duties assigned to him as such Conductor, and shall pay over all  
 money received by him as such Conductor, and shall fully indemnify  
 and save harmless the said Company from any expenses, which said  
 Company may incur, or sustain by reason of any misconduct of said  
 .....while in the employ  
 of, or acting as a Conductor for said Company, and upon leaving  
 the service of said Company, shall return all property entrusted to  
 him, and pay all debts owing by him to said Company, then the above  
 obligation to be void, otherwise to remain in full force and virtue.  
 Sealed and delivered .....  
 in the presence of .....

When the medical examiner has made his report the investigating  
 stage is completed and instruction begins. The applicant is given  
 a badge and is assigned to one of the several divisions. He is  
 now termed a "learner." The general principles of instructing  
 learners are substantially the same in both the elevated and surface  
 car service, but the methods and details of the training process  
 are necessarily so dissimilar that they must be described separately.

A man assigned to a surface line division reports to the Division  
 Superintendent, bearing a certificate of assignment from the Super-  
 intendent of the Employment Department. He is at once turned  
 over to the Chief Inspector of the division for instruction, is  
 given a running time book and a book of rules and regulations  
 which he is required to learn and understand in the minutest  
 detail, signs the weekly assignment sheet, and is entered upon the  
 division rating list.

This rating list is a valuable check list of the progress made by  
 every individual from the time his name is entered upon the books  
 to the time when he becomes a full fledged conductor or motor-  
 man and is equipped with the full uniform of the company, for  
 until he is fully instructed and has passed successfully the proba-  
 tion period he is required to wear no more of the uniform than  
 the regulation cap upon which is displayed his badge of occupa-  
 tion and his number. The form of rating list, which is here

After the learner has been in charge of several instructors and has been pronounced competent by each he is sent to the pit foreman in the car-house to which he is assigned for a finishing course in the mechanism of electric cars. Here he obtains a fuller and more technical knowledge of the mechanical and electrical equipment of the car and is instructed, so far as need be, in the making of minor repairs. When the pit foreman has added his certificate of approval to the record of the embryo street railway man, his course of instruction is completed, and then comes an examination at the hands of the Chief Inspector of the division. If the Chief Inspector is satisfied that the man is competent to take charge of a car he is sent back to the Superintendent of Employment for a final examination. The various certificates of competency are filled in on an instructor's blank similar to the one reproduced herewith.

The instructor's blank for a conductor differs from that of a motorman only in the points covered by the instruction of the pit foreman, which are as follows:

Anderson Trolley.—Turning of Base.

How to Replace a Short Circuited or Burned Out Lamp.

Trolley Catcher.

Box on Car for Carrying Cage.

Illuminated Signs.—Handling Same.

Light Switch.—Throwing On and Off of Same.

Heater Switches.—Throwing On and Off of Same.

The examination by the Superintendent of the Employment Department is thorough and searching. It consists of written and oral questions and demonstrations upon a dummy car platform that has been built in the office. The written examination for conductors contains the following questions:

What were your instructions regarding the following?

1. Who has charge of car?
2. Who is responsible for time of car?
3. If driver runs car recklessly?
4. If driver runs car over switches and curves faster than a horse walks?
5. Position when crossing special work, curves, overhead switches, etc.?
6. Civility to passengers?
7. Where should conductors solicit business?
8. What duties devolve upon conductors in connection with stopping-places?
9. What should be reported as an accident?
10. Doors (closing same)?
11. Accidents on or near car?
12. When passengers are disorderly or obnoxious?
13. Passengers refusing to pay fare?
14. Passengers tendering check incorrectly cancelled?
15. Who are allowed to ride free?
16. What part of car are free riders allowed on?
17. Articles found in car?
18. Dogs on car?
19. Smoking on car?
20. Receiving or giving foreign or mutilated money?
21. Passengers blocking platforms or standing on steps?
22. When receiving three bells from driver?
23. When receiving four bells from driver?
24. Number of bells required as signal to driver to stop car instantly?
25. What announcement to make on beginning general collection of fares?
26. When to collect fares?
27. Collection of fares on front platform?
28. Number of fares to be collected before registering?
29. When and where to register?
30. When should the register be turned back to O?
31. When and where to deposit receipts of the day?
32. Free transfers? (Where are passengers required to board car?)
33. Where is badge number to be placed when selling 8-cent check?
34. Crossing steam railroad tracks?
35. Seating passengers?
36. Transferring passengers from disabled car?
37. Parcels, bundles, etc., carried on car?
38. Shifting gates and fenders?
39. Leaving service of company?
40. If your car stopped between stations in the subway?
41. Passengers riding in prohibited places?
42. Lights during a thunderstorm?
43. Signs?
44. Use of tobacco or liquor?
45. Use of heaters?
46. Trolley wire down?
47. Number of bells required as signal to driver to stop car?
48. To start car.
49. To back car?

Motormen are examined orally and are required to illustrate their ideas and knowledge by use of the brake, rheostat and other equipment on the dummy car. The prescribed questions for motormen to answer are as follows:

1. What does one bell from the conductor mean?
2. What is the rule in regard to stopping in front of churches?
3. What does two bells from the conductor mean?
4. What does three bells from the conductor mean?
5. If the emergency signal is repeated what do you do?
6. On receiving the emergency signal would you stop on a street crossing or on a curve?
7. What does four bells from the conductor mean?
8. What is the signal to the conductor to let off the rear brakes?
9. What is the signal to the conductor to set the rear brakes?
10. What is the signal to the conductor when you wish to back the car?

11. When outside the eighth division should you back car without shifting ends?
12. What is the signal for front end passengers?
13. If your car is disabled and being pushed, how do you signal the motorman pushing you?
14. If being pushed or towed, how would you have reverse handle set?
15. What do you do with the brakes when reversing for an emergency stop?
16. Do you have the slack of your brake chain taken up while running?
17. How do you test your car when first taking it?
18. If the brakes or other mechanism of your car are out of order on your return to the car house what would you do?
19. How do you apply the power on a rheostat car?
20. How do you apply the power on a controller car?
21. How do you start the car on a bad rail?
22. How do you use the power when using sand in starting?
23. What part of the rheostat should you use when running?
24. What notches of the controller do you use when running?
25. What damage will result from running on short notches of controller or any part of rheostat except end or loop?
26. What do you do when passing under insulating joints?
27. Should you run with power between series and parallel?
28. How do you use sand for an ordinary stop?
29. How must your brakes be set when using sand?
30. What would be the result if brakes were set so tight as to skid the wheels?
31. If your car is going down hill and the brake chain breaks, what should you do?
32. If the rear brake falls, and you blow a fuse or the trolley leaves the wire, how can you stop your car if equipped with two motors?
33. What precaution should be observed when the rail is slippery?
34. How do you proceed to cross a steam railroad?
35. How do you shut off the power with a rheostat?
36. How do you shut off the power with a controller?
37. Can you get your power off any quicker by throwing the power handle suddenly to "off" position either with a controller or rheostat?
38. During thunderstorms when at the end of the route, should the overhead switch be on or off? Also light switch?
39. When waiting at a steam railroad crossing or draw bridge, what is the rule regarding the overhead switch?
40. When there is water on the track what precaution should be observed?
41. When leaving the car in the house what do you do with the handles?
42. When leaving the car on the street what do you do with the handles?
43. What distance between cars is required by the Board of Aldermen?
44. What space between cars is proper when running?
45. In regard to spacing of cars on the street, what is expected of you?
46. What speeds are allowed on different portions of the road by the ordinances?
47. What is the rule regarding making up time?
48. How fast should you run when passing standing cars or cars just starting?
49. What is the proper speed at special work?
50. What precaution should be observed when you have passengers on your running board?
51. What when passing cars which have running board passengers?
52. Who is in charge of the car?
53. If it becomes necessary to leave the car on the street and there is no inspector at hand what should you do?
54. Should conductor's orders always be obeyed?
55. If he gives you orders contrary to the rules what should you do?
56. What rights have people on the street?
57. What vehicles have the right of way over a car?
58. If a teamster persists in blocking the track after he has been warned what should you do?
59. Would you help eject a person if called on by the conductor?
60. In case of accident, however slight, what is your duty?
61. What should be reported as an accident?
62. Should you ever leave a stopping place without giving all those who wish to ride an opportunity to board your car except disorderly or intoxicated persons?
63. In approaching a stopping place or street what is your duty?
64. What should you do in order to save power?
65. Should you solicit business at all stopping places by calling clearly the destination of your car?
66. Where should the rear platform be when the car is stopped to take on or let off passengers?
67. Are you allowed to talk with any one while running your car?
68. What are the rules regarding the use of liquor?
69. What use of liquor do you make if any?
70. What is the rule regarding the use of tobacco?
71. What do you do with the brakes just before the car comes to a full stop?
72. On approaching a switch which is to be turned what should you do?
73. If the trolley leaves the wire what should you do?
74. If the power handle sticks so that you cannot throw it to "off" position, what do you do?
75. If your car is on the street disabled and you cannot start it what should you do?
76. If you blow a fuse what do you do?
77. If the cable on the rheostat should break what should you do?
78. If there is dirt or sand on the rail so as to prevent a good contact what should you do?
79. If the power leaves the wire what should you do?
80. If obliged to start the car in the absence of the conductor what should you do?
81. What constitutes "absence of the conductor" from the car?
82. When shifting ends are you allowed to pass through the car?
83. Would you pass another car with a person standing between cars?
84. When inward bound at public garden entrance to subway, what do you wait for before starting from the top of grade?
85. At the Pleasant St. entrance what do you wait for?
86. In the subway, except at stations, what is the nearest you are allowed to approach the car ahead?
87. What is the rule in regard to the use of sand in the subway?

[The blank on which these questions are printed has two columns headed, respectively, "Right" and "Wrong" for the convenience of the examiner in checking the answers.—Ed.]

If the Superintendent of Employment is satisfied with the showing of the candidate he is given a provisional appointment upon probation and is tested in actual service for sixty days.

## Power House of the Berkshire Street Railway Co., Pittsfield, Mass.

On August 21st last the Lenox and Lee division of the Berkshire Street Ry. was placed in operation on regular schedule. This add-another link to the Berkshire Street Railway system which it is intended will ultimately form a continuous line from Cheshire and Berkshire, south through Pittsfield, Lenox, Lee, Stockbridge, Housatonic, Great Barrington, and Sheffield, to the Connecticut state line. The line is now running from Cheshire to Lee. At Cheshire connection is made with the Hoosac Valley Street Ry. running north through Adams, North Adams and Williamstown, Mass.

The plans of the Berkshire Street Ry. were fully described in the "Review" for Feb. 15, 1902, page 65, and at that time complete descriptions were given of the roadbed, overhead construction including high tension distributing line, car house, rolling stock and method of generating and distributing power. The power-house itself, however, had not been completed and the following description

The power house is a brick structure with engine room 67x107 ft. and boiler room 42x95 ft. The two rooms are separated by a heavy brick wall. The engine room floor is 8 ft. 8 in. above the level of the boiler room floor and below the engine room is a basement, the floor of which is 12 ft. below that of the engine room. Adjoining the boiler room this basement floor is depressed 5 ft. 4 in. below the level of the boiler room floor, forming a condenser pit wherein are located the condensers and steam and water piping, also the primary heaters, thereby leaving the engine room unobstructed in this respect.

All parts of the building below the floor level, including the engine foundations, are formed of concrete, made of best Portland cement, mixed by machinery on the grounds, in the proportion of 1-3-6. The concrete was laid during the winter months, and has been found to give more satisfactory results than brick.

ENGINES AND GENERATORS, BERKSHIRE STREET RAILWAY POWER HOUSE.

of the generating apparatus and power plant will be read with interest.

As outlined in the article in the "Review" referred to, the power scheme includes a central generating station at Pittsfield with a sub-station in Lee, and one in Housatonic, distant respectively 13 miles and 23 miles from the main station. Three-phase alternating current is generated at the main station at 13,300 volts and transmitted at this voltage directly to the transmission line without the use of step up transformers. From the line the current passes to the sub-stations and is there transformed to 380-volt alternating current, and converted to 600-volt direct current, passing from the converter to the trolley wire. For feeding the district adjacent to the main power house there are two 300-kw. rotary converters located at this station with the necessary step down transformers. At each of the two sub-stations there are two 250-kw. rotary converters with their transformers. One of the two generating units, one converter at the main power house and one converter at each of the sub-stations are sufficient to take care of the average load leaving the other set of apparatus at reserve for emergencies.

The station is on the main line of the Boston & Albany R. R. about two miles from the postoffice in Pittsfield. A nearby stream furnishes feed and condensing water.

### Generating Units.

The generating units comprise two 750-kw. triphase revolving field Westinghouse alternators, each driven by a 1,200-h. p. horizontal cross compound condensing direct connected Rice & Sargent engine, built by the Providence Engineering Works, of Providence, R. I.

The generators, rated at 750 kw., are designed to run at 94 r. p. m., giving 32.6 amperes per phase at 13,300 volts and 25 cycles per second. The stationary armature is thoroughly protected and the design of the machine is such that an employe working around the unit could by no possible mishap come in contact with any of the high potential parts and would have to deliberately place himself in jeopardy to obtain a shock. Each alternator is separately excited by its own exciter set, consisting of a 20-kw. Westinghouse machine (e. m. f. 125, amperes 160) driven by a small Westinghouse steam

engine. At night when the main engines are shut down these small exciter units are used for lighting the station and car house.

The engines follow in the main the general design of the Rice & Sargent standards. The general dimensions are as follows: Diameter of cylinders, 22 and 44 in.; stroke of piston, 48 in.; r. p. m. 64; diameter of middle portion of shaft, 21 in.; main shaft

easy; the valves can be moved without universal joints; and examination and repair can be readily effected.

The valve gear is the Rice & Sargent patented rotary four-valve type, with independent eccentrics for the steam and exhaust valves. The point of cut-off is controlled by the governor from 0 to  $\frac{3}{4}$  stroke.

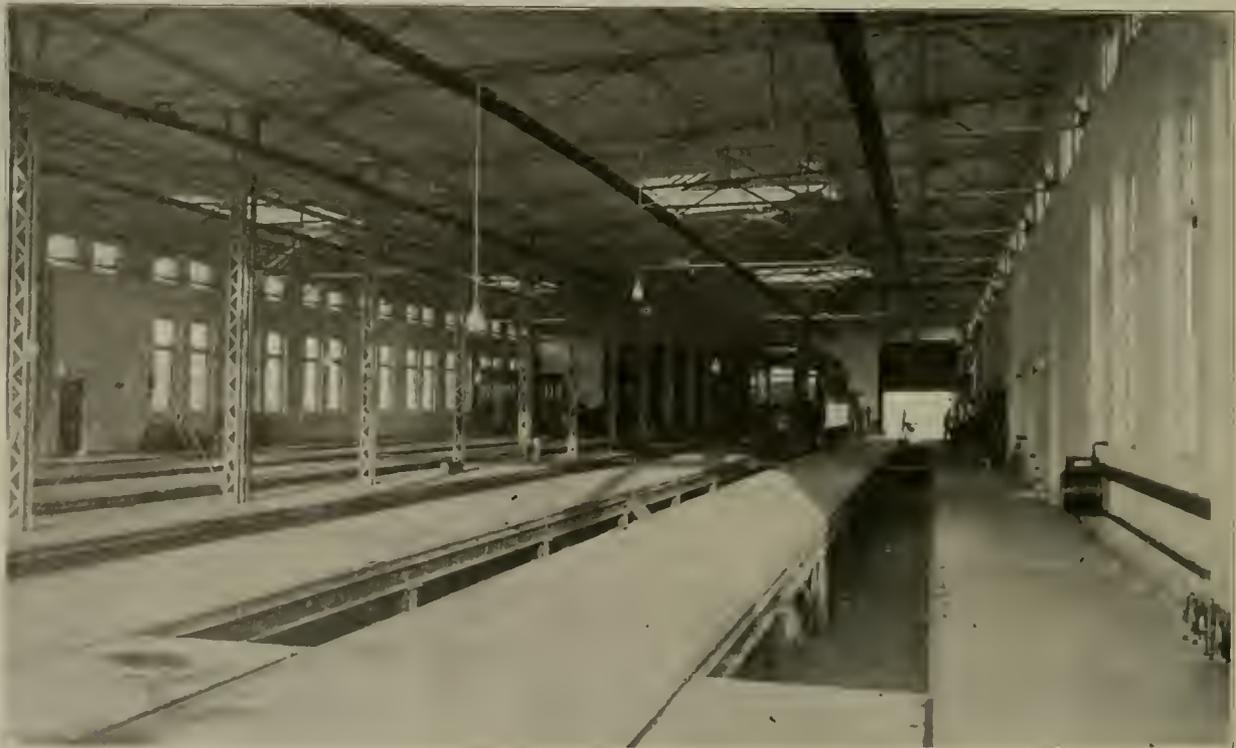

CAR HOUSE—BERKSHIRE STREET RAILWAY.

journals, 18x32 in. The rating at 150 lb. steam and  $\frac{1}{4}$  cut-off is 1,120 h. p.; at  $\frac{6}{10}$  cut-off is 2,150 i. h. p. The total shipping weight of each engine is 225,000 lb.

As is usual in the Rice & Sargent design the cylinders are made of close grained cast iron, as hard as can be worked, with faced heads and pistons, and water relief valves at each end. They are made to safely withstand a working pressure of 150 lb. after having

The governor is the builder's improved patented inertia governor, guaranteed to so regulate that the speed will not vary more than 1 per cent from no load to full load, and that the instantaneous variation under any condition of loading will not exceed 2 per cent. The governor is free from vibration and is in perfect balance at all speeds. A special stop motion is provided to immediately stop admission of steam to the cylinder, if the governor becomes disabled.

INTERIOR OF CAR HOUSE—BERKSHIRE STREET RAILWAY.

two ordinary reborings. The exhaust valves are located and shaped according to this company's patented design, the steam passages being formed in the valves themselves instead of in the cylinder. For this arrangement the builders claim these advantages: The clearance space is reduced to minimum; the valves wear and remain tight, even after long use; the movements are short and

Each governor has the same characteristic and there is no pumping or hunting the load. A variable check valve arrangement is located in the dash pot whereby the governor action may be dampened to any desired point for successful operation of alternating dynamos in parallel on railway loads. The governor has control of both cylinders, and low pressure gear is under control of hand adjust-

ment while engine is in operation, so that the relation of cut-off in one cylinder to the other may be changed to suit the load.

The balance fly wheel is 18 ft. in diameter and weighs 50,000 lb. The wheel is made in halves with oval arms. The rim is

THE BOILER ROOM.

turned as far as the arms will allow and the rim joints are made by steel arrow head keepers shrunk in flush with the rim. The hub bolts are of Norway iron turned and driven into reamed holes. The builders guarantee that with the 50,000-lb. wheel, the engine

The receiver is of the reheating type with a capacity at least four times that of the high pressure cylinder. The reheating coils are sufficient to superheat the incoming steam, so there is no appreciable drop to the low pressure cylinder. There is a 3-in. pop

MAIN EXHAUST PIPING, PLAN AND ELEVATION.

will, under a load not greater than 1,400 h. p. give a maximum variation in angular position in one revolution not exceeding .185 of a degree, figured from the point of minimum deviation on the other; the e being the requirements of the electric company.

safety valve on the receiver, set for 40 lb. The receiver is tapped for drips from both shell and reheating pipes.

Each cylinder is furnished with mechanical cylinder lubricators with hand oil pump. A centrifugal crank pin oiler is furnished

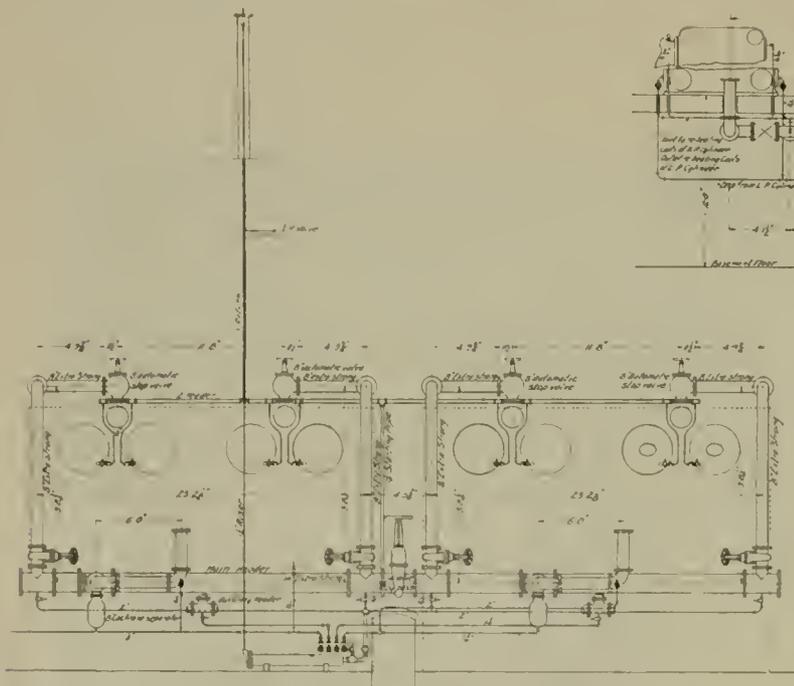

for each crank pin; a wiper oiler for cross head pin and oil boats for the eccentrics; also a full set of nickel-plated, glass, sight-feed flushing oil cups of approved make, for all parts requiring them. The main pillow block is fitted with chain continuous oiling arrangements in addition to a pressure oil system.

Steam Equipment and Piping.

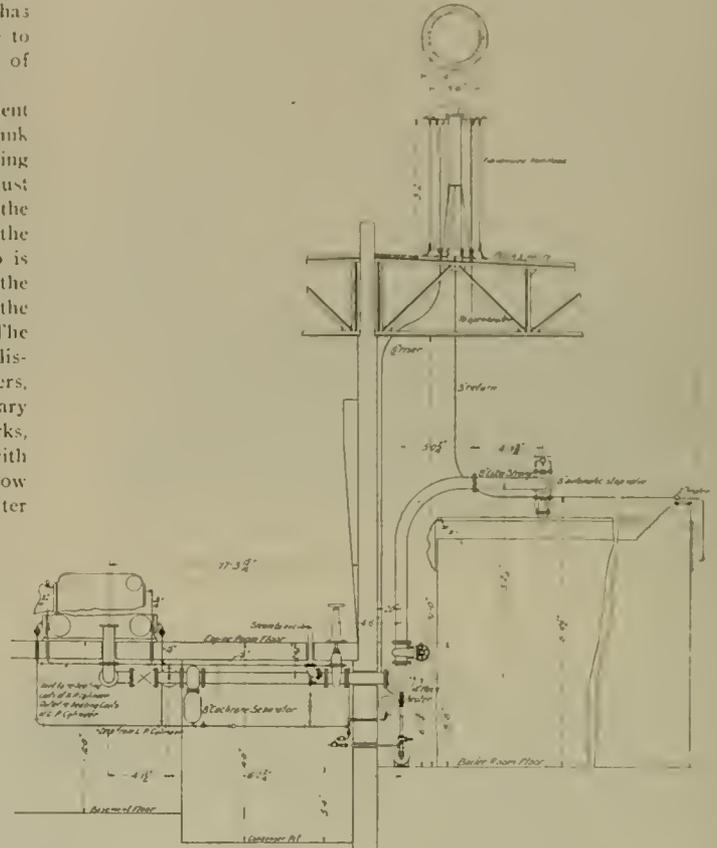

The boiler room contains four 380 h. p. water tube boilers built by the Aultman-Taylor Machinery Co., of Mansfield, O., set in two batteries. Each boiler has 3,930 sq. ft. of heating surface arranged in 4-in. tubes, in 16 sections, each 12 tubes high, and has 68 sq. ft. of grate surface. Steam is carried at 150 lb. pressure to the square inch. Each boiler is rated to evaporate 11,800 lb. of water per hour.

For supplying water each condenser has a 10-in. independent cast iron suction pipe leading from a cold well 10 ft. deep, sunk in the bed of a nearby stream. There is a 6 in. suction pipe leading to the boiler feed pumps in the boiler room. The hot well is just outside the building, the discharge pipes to the well from the condensers being 16-in. in diameter, or 2½ times the area of the injection pipe. The connection from the well to the feed pump is 6 in. in diameter. The intake pipes also have connection with the city water mains thus giving three sources of water supply, the cold well in the stream, the hot well and the city supply. The water is drawn by a Warren duplex pump, 6x6x6 in., which discharges it through a 4-in. wrought iron line to the primary heaters, and from them in a brass pipe, to the 2,000-h. p. Cochrane auxiliary feed water heater furnished by the Harrison Safety Boiler Works, of Philadelphia. The feed water pumps are Warren make, with cylinders 10x6x12 in. The design is such that the small or low pressure pump can also discharge directly into the Cochrane heater

The steam piping system includes two steam headers, one 14 in. in diameter for the main engines and one for the auxiliary apparatus. From the cross connection between the two 42 in. drums on each Euler leads an 8 in. connection starting from an automatic stop and check valve, and bending horizontally, and then vertically downward to the header where there is a gate valve about 8 ft. above the floor level, controlling the boiler supply pipe. The header is about 6 ft. above the floor. Steam is conveyed to each engine

END ELEVATION, MAIN STEAM PIPING.

SIDE ELEVATION, MAIN STEAM PIPING.

through an 8-in. connection leading horizontally from the header to a point beneath the engine room floor directly under the engine cylinder. The connection then turns upward through the floor to the cylinder, first leading into and through a Cochrane separator. The arrangement is such that steam can be fed to both engine cylinders or to either of them. In the branch leading to the low pressure cylinder is a Kieley reducing valve by means of which the mean effective pressure in the low pressure cylinder can be regulated throughout a considerable range.

The arrangement of drip lines is novel. The drip is led to a header located in the condenser pit referred to and low enough to receive the water by gravity. The water is drawn from the Holly header by a forcing tee which has direct connection with the main steam header. A 1½-in. riser carries the steam and entrained water to the condenser of the system, which is located on the roof of the boiler house, 37 ft. above the boiler room floor. In addition to the condensation of steam taking place in this condenser by reason of its exposed position, a pipe fitted with a relief valve leads from the top of it to the auxiliary feed-water heater. A 3-in. return pipe carries the water to a 2-in. header extending across the front of the boilers for the return to the boilers of the water of condensation from the high-pressure steam lines.

This adaptation of the Holly system was installed by Westinghouse, Church, Kerr & Co.

In the layout as designed for the exhaust piping the high pressure cylinder exhausts into a receiver, or when the low pressure cylinder is out of commission, into the main exhaust header. This header is 16 in. in diameter and toward each end feeds through a primary

and the boiler-feed pumps can also receive the water from the hot and cold wells and pump either directly into the boilers or through the primary heaters, and thence into the boilers. The open heater receives the steam from the exciter units and the steam pumps, and also the condensation from the heating system for the building and the drips from the engine receivers, each of the receivers being provided with a trap for the purpose. The auxiliary exhaust is cross-connected with the main exhaust in the boiler room, with a valve in the cross-connection so that when desired the main exhaust riser can be used to carry off the exhaust from the auxiliary plant or the exhaust from the main engines may be utilized in part in the auxiliary or secondary heater. The boiler feed-pumps can be controlled by means of an automatic valve inserted in a live-steam supply to them, the valve being actuated by the level of water in the heater.

feed water heater. It is arranged with valves so that if necessary the exhaust into one end can pass through the exhaust outlets corresponding to the other unit. The feed water heaters are 1,000-h. p. Goubert horizontal type. Just beyond the heaters are the vertical twin jet condensers, which were built by the Warren Steam Pump Co., of Warren, Mass. At this point is the relief valve for service when running non-condensing.

The auxiliary feed water heater together with the feed and circulating pump are located in the boiler room. The auxiliary header is just below the main header near the fire wall separating the boiler and engine rooms. The connection from each boiler is fitted with an automatic valve at the boiler and each battery is controlled by a gate valve immediately above the header. The connections to the exciter units, steam pumps and other auxiliaries are taken from the top.

All the steam piping is extra strong, with Chapman valves and Crane fittings.

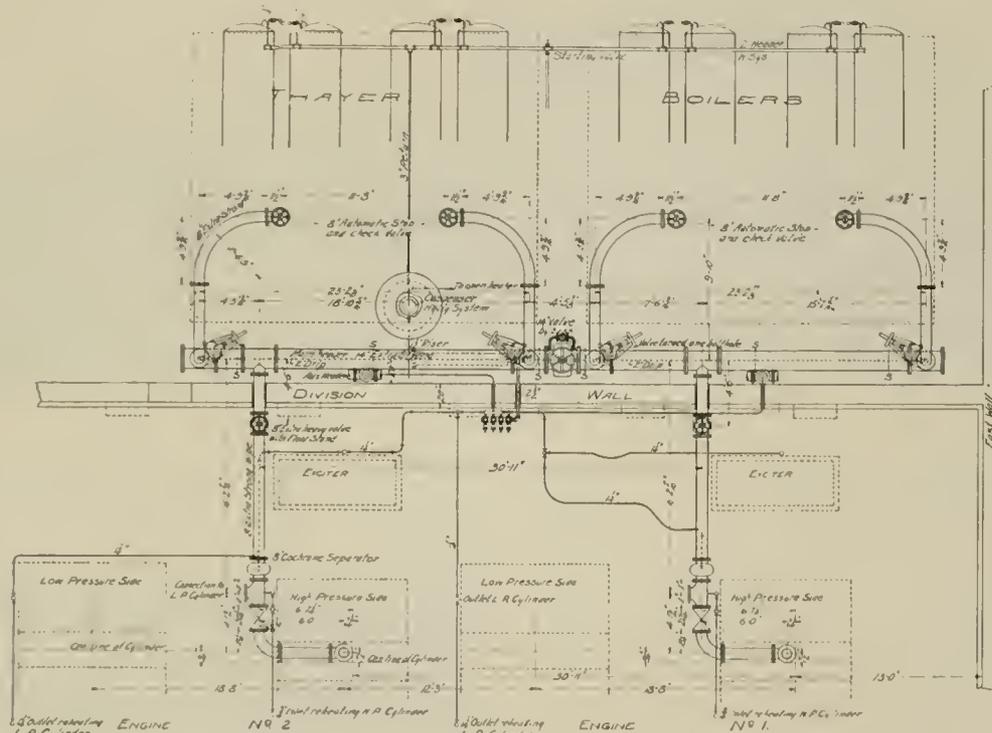

The entire plant is heated by steam and connections are provided for feeding live steam into all the conductors in the event of pipes becoming frozen in winter.

A Westinghouse air-compressor furnishes compressed air for

**ALLEGED ACCIDENT ON LONDON UNITED TRAMWAYS.**

October 12th, a young woman who was crossing the Uxbridge road at Shepherd's Bush, through which the lines of the London United Tramways run, was seen to fall in the road, where she shortly expired. The newspapers published the rumor that the young woman had been practically electrocuted by the breaking of one of the guard wires of the electric tramways. In the coroner's inquest the fact was brought out that her death resulted purely from heart disease and that the breaking of the wire of the tramways had nothing to do with the case, the break occurring some hundred yards from the position occupied by the woman. The post-mortem examination disclosed that the young woman had suffered very much from heart disease and there was no sign of her having been struck or burned by an electric wire.

Mr. James Clifton Robinson, managing director and engineer of the company, also testified that a guard wire which had fallen and crossed the trolley wire had short circuited the system and this had blown out the fuse, so that the current was entirely cut off from this

PLAN OF MAIN STEAM PIPING.

cleaning purposes and also for operating the oiling system, the oil storage tanks having been located in the basement.

Coal is brought to the rear wall of the power house on elevated tracks and is dumped in front of a door leading to the boiler room. For carrying it to the furnace doors, specially constructed side-dumping hand cars are provided, these cars running on a system of narrow gage tracks or guides let into the boiler room floor. Each car has a capacity for 2,000 lb. of coal. Cars are also provided for removing ashes. Just before entering the boiler room the cars filled with coal pass over a platform scale and are weighed and recorded. This coal handling tramway was installed complete by the Hoher Platt Co., of New York City.

The stack adjoins the power house and was erected by the Alphon Crotodis Chimney Construction Co., of New York City. The stack is 175 ft. 8 in. high and 8 ft. in diameter at the top. The foundation upon which it rests is entirely of concrete, the foundation bed going down about 10 ft. The weight is distributed is about 1 1/4 ton per sq. ft. The settling of the foundation has been carefully watched, but it is now determined that it has been absolutely uniform amounting to 1 1/2 in. No settlement has occurred in the last 6 months.

The station was designed and erected under the supervision of Charles K. Stearns, of Boston.

section and all of the wires were perfectly harmless. After hearing a large number of witnesses the jury returned the verdict of "death from natural causes."

**ALLENTOWN (PA.) & READING TRACTION CO.**

The new electric line connecting Allentown and Reading was formally opened October 16th by an inspection trip between Reading and Kutztown. About one hundred invited guests participated in the trip. At Blandon the storage battery plant was inspected and a short stop was made at Kutztown. The party returned to Reading and enjoyed a banquet presided over by President G. H. Gerber of the Traction company.

One of the cars of the Lake Shore Electric Railway Co. has a record of 69 miles an hour. This car is equipped with four G. E. 60 motors and is in regular service between Toledo and Cleveland.

The first through car on the electric line between Mansfield, O., and Crestline was run October 20th. An hourly service has been established.

### Moving Small Fruits by Electric Railway.

The International Railway Co., of Buffalo, was one of the first companies in the United States to recognize and demonstrate the practicality of utilizing electric railway routes for marketing perishable farm products. The Niagara region, served by the company's international lines, is widely famous for its agricultural and horti-

about route, and at least one transfer of shipments from car to car. The electric express fruit service was instituted about August 20th, when the earlier varieties of peaches were ready for the market, and the service at once received the favorable indorsement of the fruit growers and commission merchants. Not only did the

TRANSFERRING FREIGHT BY ELECTRIC LOCOMOTIVE AT BUFFALO.

cultural wealth, and by careful planning and management, the larger portion of the output of the farms in this section intended for the Buffalo and nearby markets, is now handled in the express cars of the International Railway. This past season, Mr. T. E. Mitten, general manager of the International company, has caused particular attention to be given to the matter of handling small fruits, especially peaches, and it is a conservative statement to say that practically the entire peach yield of the Niagara district that has been marketed in Buffalo this fall, has been carried over the

electric railway company demonstrate its ability to place the fruit in Buffalo at an earlier hour in the day than formerly, but it also became evident that fruits carried in the electric cars were re-

FRUIT TRAIN DRAWN BY MOTOR CAR.

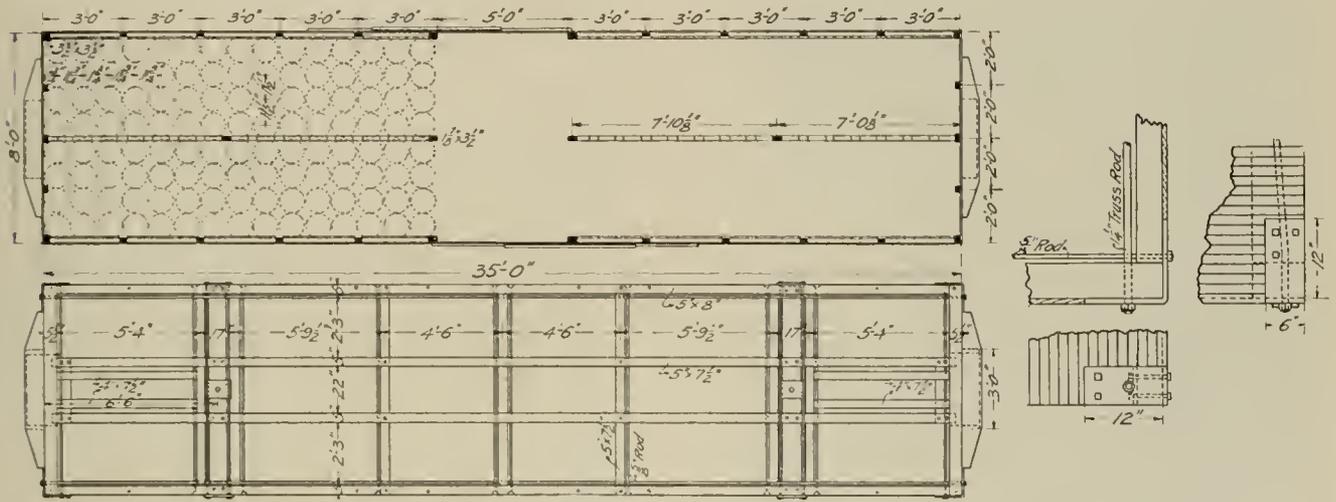

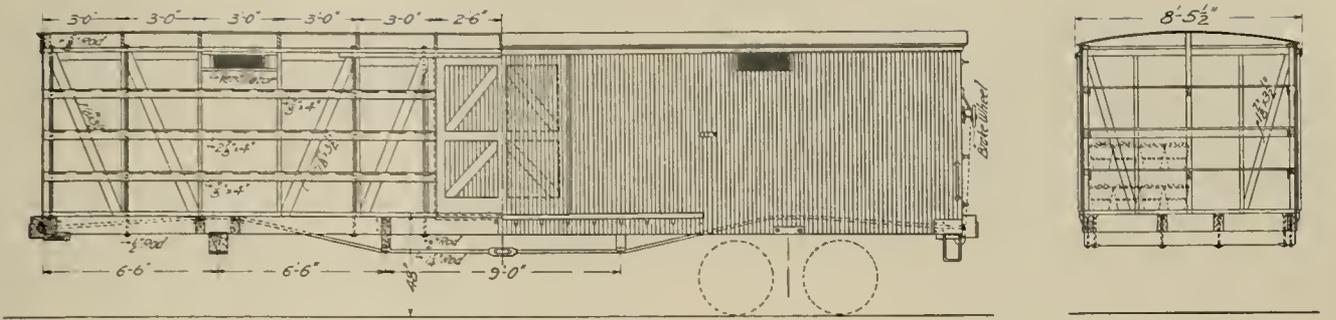

INTERIOR OF CAR SHOWING PEACH BASKETS AND MOVABLE SHELVING.

Lockport branch of the International Railway. This output has amounted to between 150,000 and 200,000 baskets of peaches.

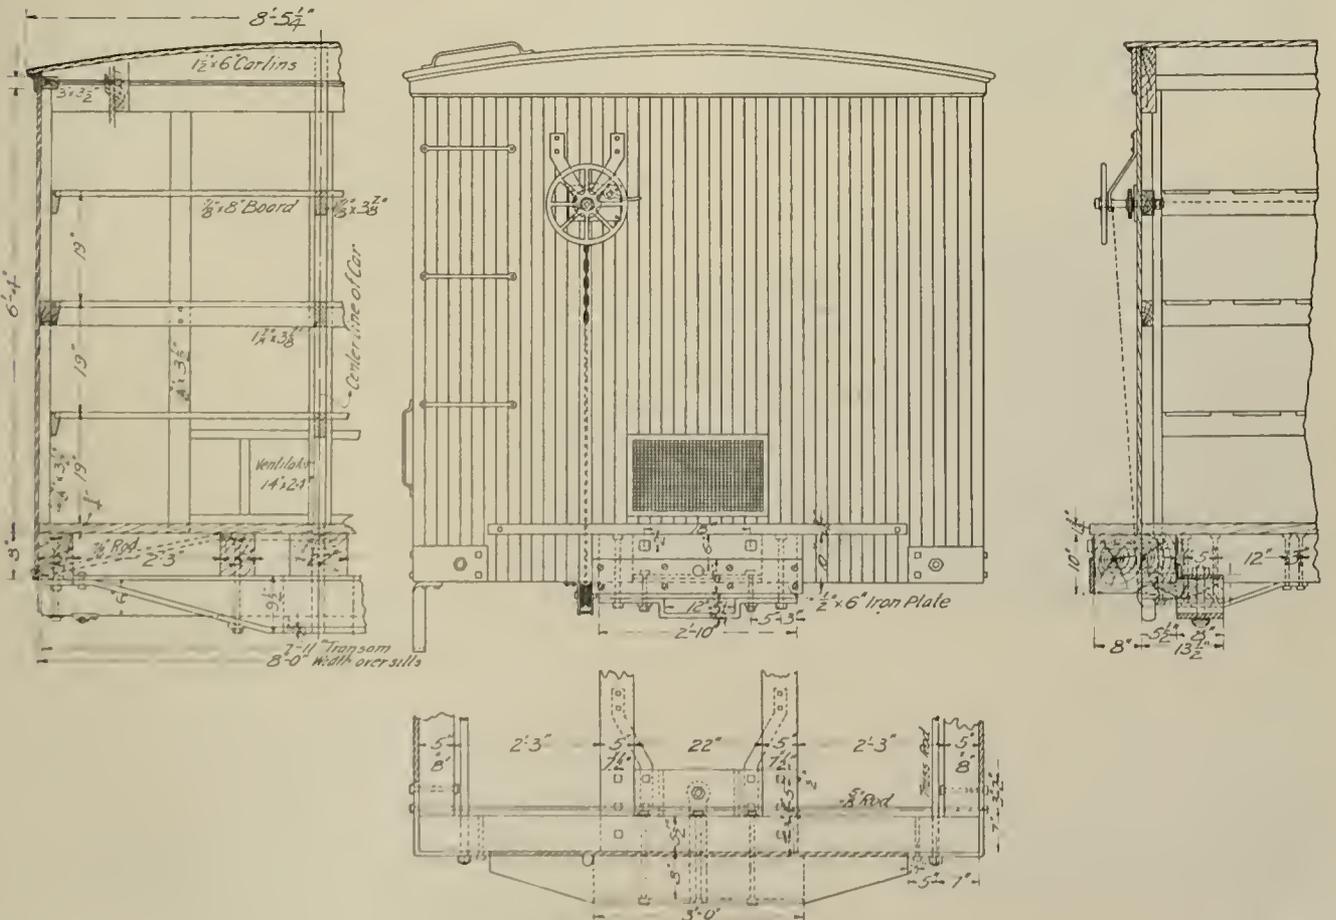

Previous to the inauguration of the fruit car traffic by this company, the fruit growers shipping to Buffalo were dependent on the old-line express companies' service, necessitating a round-

ceived at the markets in such excellent condition as to bring better prices than if shipped by other means where rough handling caused much damage and injury.

In preparing for the fruit traffic of the present season, the company constructed six freight cars of the pattern and dimen-

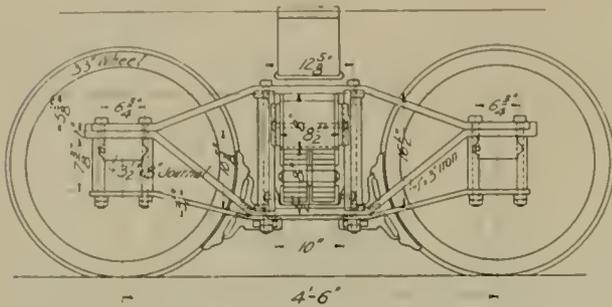

PLAN, ELEVATION AND SECTION OF FRUIT CAR FRAMING.

END ELEVATION OF FRUIT CAR.

sions indicated by accompanying engravings. The fruit car as here shown follows standard steam railroad box car construction with ample provisions for ventilation. The distinctive feature in the design is the interior arrangement of adjustable shelving, suitable for the storage of baskets filled with peaches. The details of the shelf will be understood by reference to the working drawings and reproductions from photographs shown herewith. After the peach season has closed the interior racks can be removed and the cars used for the transportation of regular freight and express matter. A fruit car 35 ft. long with this arrangement of shelving

TRUCK FOR FRUIT CAR.

will accommodate 1,000 baskets of fruit with absolutely no danger of injury to the contents, without unnecessary waste of space, and in a manner to insure perfect ventilation. It will be understood that in loading a car with peach baskets the shelving is built up as the loading progresses, thus facilitating to the utmost the work of handling the fruit. The fruit cars are designed to be handled in trains as trailers, are equipped with Christensen automatic air brakes, and are mounted on a special home-made truck. All fruit cars in addition to having the regular draw bars are equipped with Gould couplers so they can be made up into trains with either steam freight cars or electric cars. One of the engravings shows a train of five fruit cars attached to a motor car equipped with four G. E. 57 motors.

During the fruit handling season empty fruit cars are distributed every afternoon along the road between Olcott Beach and Buffalo. The fruit growers deliver their shipments into these

FRUIT CAR USED ON BUFFALO LINES.

cars, and obtain shipping receipt, the consignment being way-billed by a billing clerk who accompanies the cars until all shipments are properly way-billed. Late in the evening the motor car starts from Olcott, the northern terminus on Lake Ontario, and picks up the fruit cars at the various stations along the line. When complete the train at once starts for Buffalo, where the cars are unloaded in the city market, in close proximity to the commission houses, being delivered to the consignees before 4 o'clock in the morning, and in plenty of time for the opening of the business day.

The company charges for this service regular express tariff rates of 40 cents per hundred pounds. The ordinary peach basket filled with peaches weighs approximately 22 lb., and five baskets are allowed to the hundred pounds, making the charge 8 cents a basket for transporting the fruit from any point on the Lockport line to the Buffalo market. The haul varies from 30 to 40 miles. The fruit service of the International Railway Co. has required the constant use throughout the fruit season of from five to eight fruit cars daily, and the business for the season is stated by the management to have been entirely profitable and satisfactory.

As is well known, the International Railway Co. is doing a large car transfer business with the aid of electric locomotives, which have been fully described in previous issues of the "Review." One of the views herewith shows the proportions to which this branch of the business has grown.

### CAR WASHING VERSUS CAR PAINTING.

It is natural in most cases for men who seek to gain the highest eminence in their chosen occupations, after accomplishing their work in a most commendable manner, to suddenly lose this laudable interest, which they have endeavored to maintain regardless of the many discouraging circumstances which arise in the course of the every-day routine of their work, when it becomes evident that with all their efforts to attain the highest degree of perfection they must see their work reduced to untimely ruin under circumstances over which they have absolutely no control.

Would any just man condemn the mural artist who, anticipating the destruction of his paintings by the gross carelessness of some people whose duties were to clean the walls, should lose that keen interest which is so essential to his success and relapse into indifference which would be reflected in his work?

It is quite safe to say that this indifference is somewhat prevalent among master painters of today, who, after exerting every effort for the satisfactory completion of their work, to the end that a car may be painted and varnished in a workmanlike manner, so that it should last with proper treatment eight or ten years, must feel discouraged when they reflect that in one-quarter of the allotted time of the life of this paint and varnish it will be destroyed by the ruthless hands of car washers, while the painter stands helplessly by, being powerless to act.

Would it not be profitable for those in authority, who advocate the proper maintenance of their cars, to occasionally inspect the methods employed for washing and cleaning them? It is more than likely that in the course of their inspection they would discover many reasons why varnish and paint sometimes give such poor satisfaction. Such inspections might possibly lead to instructions being given whereby certain damaging methods would be abolished. These methods, from the master-painter's point of view, are absolutely unnecessary and are only tolerated through lack of proper care by those in authority, and who, in a certain sense, are responsible for some almost maliciously ignorant practices which are in use.

And yet the fault is not always with the car-washers or the station foremen, whose duties include the supervision of the car washing. The washers might be exceptionally well trained in their work, but the trouble may lie with the management, who from a commendable desire to reduce expenses may refuse to allow the employment of an adequate force to properly accomplish the work. It should not require a barrelful of wisdom to see the fallacy of these arrangements, when the truth is that one man the fallacy of these arrangements, when the truth is that one man added to the car-washing ranks might possibly be the means of reducing the force in the painting department by two or three men, who are paid much higher wages. So it is evident that a manager has an erroneous conception of economy when he fails to take into consideration all of the injurious results that possibly may follow an overzealous desire to consider first costs exclusively.

The same logic may be applied to the reduction of the cleaning force, made possible by the use of washing fluids and all like concoctions, whose combination of ingredients forms, to a degree, a solvent,

which after repeated applications must eventually destroy the varnish which is depended upon to protect the paint, and subsequently the inevitable result must be an increase in the number of men on the repair shop pay roll. The unattractive appearance of the cars when in service should be a reminder that even if it cost a trifle more by reason of the employment of a sufficient number of men to do the work properly, it matters not if the final results justify this expense.

From the fact that the varnish on a car, after being finished, begins to slowly oxidize, it is obvious that all the dirt that is deposited on the car during the first weeks that it is in service, if not removed in a reasonable time, must in this hardening process become firmly attached to the varnish and cannot be removed with the use of water alone. This often tempts the washer to use some preparation that will easily release it, which, in other words, means removing the varnish that is retaining it. After repeated doses of this description, the ultimate durability of the varnish can be determined by the number of times the car is washed.

The washing of cars with a brush attached to a hose, where a continual supply of water is being used in the operation, can be done without injury to the varnish, provided care is exercised by the washer and he uses the brush lightly. If it is used too forcibly the bristles of the brush would have the same effect on the varnish as curled hair, which is often used in the paint shop for removing the gloss of varnish preparatory to applying another coat. This continual supply of water gives the brush an advantage over the sponge which is generally used for car washing, and which is liable to retain some of the grit which is being washed off, thereby causing the grit to act in a similar manner to pumice, when used for "rubbing down" varnish. Taking into consideration the type of workman that is usually employed for car washing, the brush attached to the hose is far preferable to the sponge and bucket method.

There are some very destructive methods employed by car washers. For instance, where white paint is used for window posts and lower panels it becomes very dirty when neglected, and a trick of adding kerosene oil to the water used for washing is sometimes secretly employed. Doubtless this method originated from that of wash-women who use oil in the water to bleach clothes. While it may not have any bad effect on cloth, it is certainly very destructive to varnish. However, this trick can be easily detected on inspecting the sponges in the washroom by the odor of the oil, which fortunately never leaves them.

The practice of hastily rubbing the dust from the body of a car with cotton waste, which is often done, is very damaging to the varnish, and more especially to a newly varnished car. The waste soon becomes filled with grit which transforms it into a most formidable weapon, capable of the complete destruction of the gloss of the varnish.

All the burden of improper cleaning must subsequently fall upon the painting department, and possibly extend to others; for after the paint and varnish is destroyed the wood and iron must be exposed to the elements, which have no respect for either.

If the whole car-washing force could be placed in one department, under the supervision of an inspector whose duties would be to thoroughly inspect the details of the work, much benefit no doubt, would be derived from the care that would be insured by his being continuously in touch with the men. The proposition of placing the washing of cars under the master painter's supervision might possibly be questioned. Yet, admitting that this innovation might be productive of some conflict between the heads of the painting department and the station where the cars are cleaned, still if it could be managed satisfactorily to all interested much benefit could be derived from this venture. Owing to the master painter's entire familiarity with paint and varnish, he would be capable of instructing men in regard to the proper methods to be employed, and the suitability of articles to be used in this important operation.

While it has always been regarded as a matter of inferior importance, the car washing question is one that might open up new avenues of economy if time were devoted to its serious consideration.

Plans of the Brooklyn Rapid Transit Co. for providing through tram between Manhattan and Bay Ridge and Fort Hamilton have been completed and it is announced that work on the extension will be begun during the present month.

## HENRY J. DAVIES.

Mr. Henry J. Davies, who was at the Detroit meeting elected president of the Street Railway Accountants' Association, is well deserving of this honor by reason of his part in organizing the association and the active interest taken in it up to the date of his withdrawal from active railway work in 1899, at which time it will be remembered the association paid Mr. Davies the compliment of electing him an honorary member.

Mr. Davies was born near Toronto, Can., July 26, 1850. When he was three years of age his parents removed to Cleveland, O., where he received a grammar-school education, after which he spent

H. J. DAVIES  
President Street Railway Accountants' Association.

three years in the study of stenography and law. At the age of 19 he became a court and convention reporter and soon acquired a very large practice. In the fall of 1880 he acted as private secretary for Hon. Tom L. Johnson, and on Jan. 1, 1880, was elected secretary and treasurer of the Brooklyn and the South Side street railroad companies of Cleveland, which Mr. Johnson controlled. When these companies were united with others in 1893 to form the present Cleveland Electric Railway Co., Mr. Davies was appointed assistant secretary and claim adjuster, and later assistant treasurer. He voluntarily left the company in 1899 when Mr. Horace E. Andrews, president, and Mr. John J. Stanley, general manager, retired from the management, and was immediately elected secretary of the National Carbon Co., a position which he still holds. On the retirement of Mr. H. A. Everett and his associates and the re-election of Messrs. Andrews and Stanley, Mr. Davies was elected secretary of the Cleveland Electric Railway Co. He also holds the position of secretary of the Iroquois Portland Cement Co., and is a director of that company, of the Factory Mutual Insurance Co., of Ohio, the Lakewood Savings & Banking Co., and several other corporations. Oct. 27, 1896, Mr. Davies married Miss Helen A. Williams, and they now occupy a home in Lakewood, a beautiful suburb of Cleveland.

The Easton (Pa.) & Nazareth Street Railway Co. and the Easton, Tatamy & Bangor Street Railway Co. have been consolidated and will hereafter be operated as the Northampton Traction Co. They connect the slate and cement districts in the northern part of the county with Easton.

### HUDSON VALLEY STRIKE ENDED.

The strike on the line of the Hudson Valley Railway Co., noted in the October 'Review,' terminated November 3d, when the men returned to work. On October 17th representatives of the International Street Car Men's Association and the National Amalgamated Association of Street Railway Employes arrived for the purpose of directing the strike and encouraging the strikers to remain firm. After a conference held on the same date between a committee of strikers and Mr. Colvin, president of the company, the latter stated that the ground had been gone over thoroughly and no formal proposition for adjustment had been made by either side. He further stated that the company was willing to reinstate those employes who had not been implicated in any riotous demonstration and who would apply at once for their former positions, he considering that there were only 20 of that class. He also stated that the company would not discriminate against a man because he might or might not belong to a union. The representatives of the strikers insisted upon an increase in wages and recognition of the union. It was also announced that the control of the road had passed into the hands of Hon. J. W. Herbert, of Helmetta, N. J.; George H. Helme, of New York, and George B. Wilson, of Philadelphia, who, with Mr. Colvin, now own the entire stock of the company. John H. Powers, first vice-president and director, severed his connection with the company and was succeeded by Mr. Herbert.

Under the new management it was thought that a settlement would be reached without recognition of the union. The president was authorized to effect a settlement if possible, but was restricted in two particulars. No contract was to be signed with the union, and the men who left the union during the strike and re-entered the employ were not to be dismissed. It was stated that if the union would incorporate, making it a responsible body, the company would not object to making a contract with it, as under the present conditions a contract with the union could not be enforced. The company was willing to make contracts with the men as individuals.

October 20th a joint committee representing the company and the strikers met and a proposition was made on behalf of the company to submit all difficulties to arbitration. The representatives of the strikers demanded recognition of the union and expressed a willingness to arbitrate all other difficulties. It was finally agreed to submit the matter to arbitration, the arbitrators selected being B. S. Josselyn, general manager, for the company, and James M. Sheehan of the Amalgamated Association, for the union, who were to call in a third person, if necessary, to constitute the board, which was to hear all questions of dispute and present its report at noon of the 22d. Before the report was presented the strikers ignored the agreement to arbitrate and demanded recognition of the union, increased pay, and reinstatement of all striking employes. J. M. Sheehan withdrew from the board and declared that further dealings between the union and the company would have to be done through Mr. Fitzgerald, president of the Amalgamated Association, with whom the company strongly opposed having any relations whatever.

After a meeting of the representatives of the company in New York, October 24th, it was reported that no more cars would be run in Washington, Saratoga, and Warren counties than absolutely demanded by the franchises of the road. As order among the strikers had been well preserved, on the same date six companies of troops were withdrawn, leaving only four companies along the line. On the following day twenty of the non-union employes, whose term of contract had expired, returned to their homes, their places soon being filled by others, and the company operating its schedule at longer intervals.

October 31st a committee of former employes called on Mr. Colvin for an interview, at which he expressed a willingness to consider any proposition submitted by them for settlement. The strike was satisfactorily settled November 2d, by a proposition presented by the strikers. Under the terms of the settlement motormen and conductors in the employ of the company less than two years will receive an increase of one cent, or 17 cents per hour, all others will receive an increase of  $\frac{1}{2}$  cent, or 10 cents per hour. The employes agree to withdraw their affiliation with all other labor organizations and form a local union. All former employes, with the exception of those under indictment for inciting riot are to be restored to their former position as far as possible, and in future the company is to employ either union or non-union men as it deems advisable. The work of inspecting cars, as formerly done by the motormen, who re-

ceived extra compensation for this work, will be performed by regular inspectors. The reinstatement of the motorman, whose dismissal on account of an accident at Fort Edward in August, was the primary cause of the strike, was left to Mr. Josselyn, general manager, for settlement.

### CONSOLIDATION OF THE INTERURBAN RAILWAYS OF CINCINNATI.

At a meeting of the stockholders of the Rapid Railway Co., the Suburban Traction Co., the Cincinnati & Eastern Electric Railway Co., and the Interurban Terminal Co., whose depot is in course of construction on Sycamore St., a consolidation of these interests was effected. The new company will be known as the Interurban & Terminal Co., with a capitalization of \$2,500,000. Each share held by the stockholders in the various companies merged will be exchanged for a share of the consolidated stock. The capitalization of the old companies was: Rapid Railway Co., \$700,000; Suburban Traction Co., \$600,000; Cincinnati & Eastern Railway Co., \$500,000; Interurban Terminal Co., \$150,000, making a total of \$1,950,000. There had been expended on the new Sycamore St. depot \$55,000, which was taken up by the stockholders. The new company holds in reserve a stock of \$700,000 to be taken up as the money is needed for the completion of extensions and the new depot. Each share of stock issued thus far represents its face value expended in building the properties. The Cincinnati & Eastern Ry. will cost \$150,000 more than was at first anticipated on account of increased length of double track and an increase in rolling stock from 6 to 18 cars.

The combined mileage of the lines of the company is 96 miles, as follows: The Cincinnati & Eastern, which will be in operation early in November between Cincinnati and New Richmond, 28 miles; Suburban, which will be ready next February, to Bethel and Batavia, 32 miles; Rapid Transit, about completed to Mason, a distance of 22 miles, and will be completed to Lebanon by next March, 18 miles. The terminal depot is expected to be finished by January 1st.

It is anticipated that when the roads are all in operation over 300,000 passengers will be carried monthly besides a large amount of express and freight.

The consolidation is made possible by the Chamberlain law recently enacted in Ohio, which provides that when electric railways are not competing and can be operated from one power house a consolidation is permissible.

The officers of the new company are: G. R. Scrugham, president and general manager; Lee H. Brooks, first vice-president; Ellis G. Kinkead, second vice-president and general counsel; John M. Kennedy, treasurer; William E. Hutton, secretary; the officers together with Charles H. Davis, Guy W. Mallon and George H. Worthington, compose the board of directors.

### LOUISVILLE STEAM ROAD CONVERTED TO ELECTRICITY.

The Louisville (Ky.) & Nashville Railroad Co. has leased to the River Road Co., which was incorporated September 27th, with a capital of \$350,000, a line of track extending from a central point in the city of Louisville to the village of Prospect, the road lying on the southern banks of the Ohio River and having a length of 12 miles. The line will be converted from a steam road to an interurban electric line with first class equipment in every respect. A half-hour schedule is to be established during the busy parts of the morning and evening and an hourly schedule during the middle of the day. It is expected that extensions will ultimately be made, their extent depending on the success of the present line. The officers of the new company are: Lafon Allen, president; Owen Tyler, first vice-president; Bethel B. Veech, second vice-president; W. N. Cox, secretary and treasurer; Henry A. Bell, William F. Booker and Edmund T. Halsey, directors.

October 16th a runaway coal car on the Jackson St. line of the Seattle (Wash.) Electric Co., struck and instantly killed a pedestrian. The car had broken loose from its train and ran eighteen blocks down grade before leaving the track where it dashed into the sidewalk cutting a telegraph pole in two.

## NOTES ON MOTOR AND BOND TESTING.

BY R. W. CONANT.

It has been demonstrated by five or six years of severe service on the modern types of street railway motors, that the final test of their capacity lies in their ability to withstand heavy currents during long periods of time.

Cotton, which is the basis of the insulation of their windings, has but a limited life, when subjected to the long continued baking by the heat generated in the windings, under the ordinary operating conditions of the motors. This heat is produced in every part of the wire carrying the current and is greater the higher its resistance and the more current that is received. The heating is also increased by poor ventilation, conduction and radiation. Once this action starts it is cumulative to a surprising degree. The main facts tending to make this destroying heat action augment itself may be explained as follows: First, any increase in the temperature of the windings increases their resistance and as the current is forced to overcome the greater resistance, heat is generated at a still more rapid rate. The ultimate temperature attained impresses itself on the cotton insulation, scorching it to a brown color, as will a hot flat-iron when held on a piece of cotton cloth. During the next severe period of service of this motor the cotton receives a little more baking and scorching until it is reduced to a brownish or even black powder that crumbles away and allows the wires to come together.

On account of some of the coils in the motor receiving more heat than the others these bake out first and many times all the coils are taken out when one only is defective. As soon as one coil short circuits it weakens and distorts the field causing the motor to take more current and spark badly, thereby increasing the heat and hastening the deterioration of the rest of the winding. When a general short circuiting has taken place, and in some motors before they have reached this point, flashing and bucking occurs which burns the armature and controlling mechanism besides causing great loss of time and waste of power.

If this trouble can be detected at the start by locating, removing and inspecting the defective coil, much time and money may be saved by attending to the betterment of the conditions causing the defect.

Some of the most common causes of these troubles are as follows: Brakes set too tightly causing motors to take greatly increased current; poor judgment of the motorman in handling his controlling mechanism causing overheating by increased current; other coils short circuited in the motor by baking out, defective workman-hip in constructing or repairing the coils; leads chafing together inside of motor abrading the insulation allowing the copper wires to come in contact, cutting out a coil, throwing more load onto the others; a sandy rail in which the groove has been allowed to fill up with dirt that binds the wheel flange, causing an enormous increase of power consumption; low voltage on the line caused either by poor bonding or too little feed wire or both.

The effect of low voltage in overheating the motors is not due, as has been supposed by some, to any increase in the strength of the current or a higher amperage necessary to do the work, but on account of the lower speed during the application of the power, the current must be kept on for a much greater portion of the time, allowing less time for coasting, stops and cooling of the motor. This low voltage and consequent overloading of the motors is a very important factor in hastening the baking out of their windings especially where the grades and loads carried are heavy.

One of the common causes of low voltage being poor bonding of the rail joints it will be interesting to discuss methods for obviating this.

## Bonds and Rail Joints.

The chief reason for testing rail bonds is to enable the loss in returning the current to be reduced to a minimum, in order that needless waste of fuel may be saved, the corrosion of pipes checked and the voltage and service improved. This is best done by systematic tests made when the bonds are first installed and again six months later or after the frost has been in the ground and thawed out again. The necessity for such testing is very great as it may be noted that there is as much damage done by a good bond poorly installed as by the worst type of bond ever used.

The standard of good bonding is with the joint resistance equal

to about 4 ft. to 6 ft. of the rail itself. A greater resistance should not be allowed as it will rapidly become worse until it is so high that most of the return current is obliged to take some other path with the resulting damage and consequent loss of power. It is apparent what one bad joint will do when it is remembered that it cuts out all the rail between it and the power station, excepting in so far as there is leakage through the earth or it is bridged by cross-bonds. It is also to be noted in this connection that cross-bonds are not any more likely to be properly installed than is the joint bonding.

On a road recently tested by the writer, out of 400 joints 100 had a resistance greater than 90 ft. of rail and 50 were above 270 ft. of rail. In this instance the bonds had been installed only a year and were thought to be in good condition when put in, although they had not been tested. The expense of testing is not great and would be amply repaid by the results obtained.

It is a source of surprise to many to learn of such conditions existing as those mentioned above, but they may be explained as follows: In order for a joint to be properly bonded, there must be a clean metallic contact between the bond terminal and the iron of the rail. Unless the plug is put in tightly moisture will creep in between it and the inside surface of the hole in the rail and the iron rusts causing a high resistance at this point that in many instances is almost equal to a break in the rail. It is in the making of this contact that most bonds fail. It has been held by some that with the class of men usually employed on this work it is impracticable to obtain good bonding of joints and recourse must be had to the use of a supplementary wire.

Judging from measurements taken of the resistance of over 40,000 rail joints the writer believes that by proper testing and care in bonding the use of a copper return wire in parallel with the rail or a supplementary wire may be dispensed with in any ordinary case and that bonding the joints is all that is necessary to make the return as near perfect as is commercially possible.

## TENNESSEE INTERURBAN ELECTRIC RY.

The Nashville & Columbia and Nashville & Gallatin Electric Railways have been consolidated under the name of the Tennessee Interurban Electric Ry., and the capital stock increased to \$3,000,000. The line has been surveyed to extend through Nashville as a center, from Gallatin to Mt. Pleasant, Tenn., touching Brentwood, Franklin, Spring Hill and Columbia southward, and Goodlettsville, Edgefield Junction, Hygeia Springs, Ridgetop and Edwards Springs northward. The line will be 119 miles in length and passes through a densely populated country and a magnificent agricultural and stock raising section. The traffic will be passenger, express and freight. An extensive power plant and an elaborate equipment will be required, making it one of the leading lines of the South. A number of manufacturing companies are preparing to locate along the line. The offices of the company are located at Nashville. The incorporators are: C. W. Ruth and Frank Haskell, Pittsburg; J. H. Connor, J. P. Fulcher and John H. McMillin, Nashville; Van Leer Polk, Paris, France; D. D. Spillers, Gallatin, Tenn.; J. M. Dedman and Major W. J. Whitthorne, Columbia, Tenn. The officers are: Frank Haskell, president; C. W. Ruth, vice-president and treasurer; Frank P. Bond, secretary; J. H. Connor, general manager.

## ALLEGED FRAUDULENT SCHOOL.

According to press dispatches of recent date four officials of the Correspondence Institute of America, with headquarters at Scranton, Pa., have been arrested on a charge of using the United States mails for fraudulent purposes. This institution, which was organized some two years ago to give instruction in "caricature, newspaper illustrating, advertisement writing, proofreading, book-keeping and stenography," should not be confounded with the International Correspondence Schools, also of Scranton, Pa. There is, of course, no danger of anyone familiar with the work done by the International Correspondence Schools, making such a mistake.

The Peoples Traction Co., of Galesburg, Ill., hauled its first load of express on Saturday, October 18th.

## From the Lake Region to the Atlantic Sea Board by Trolley.—II.

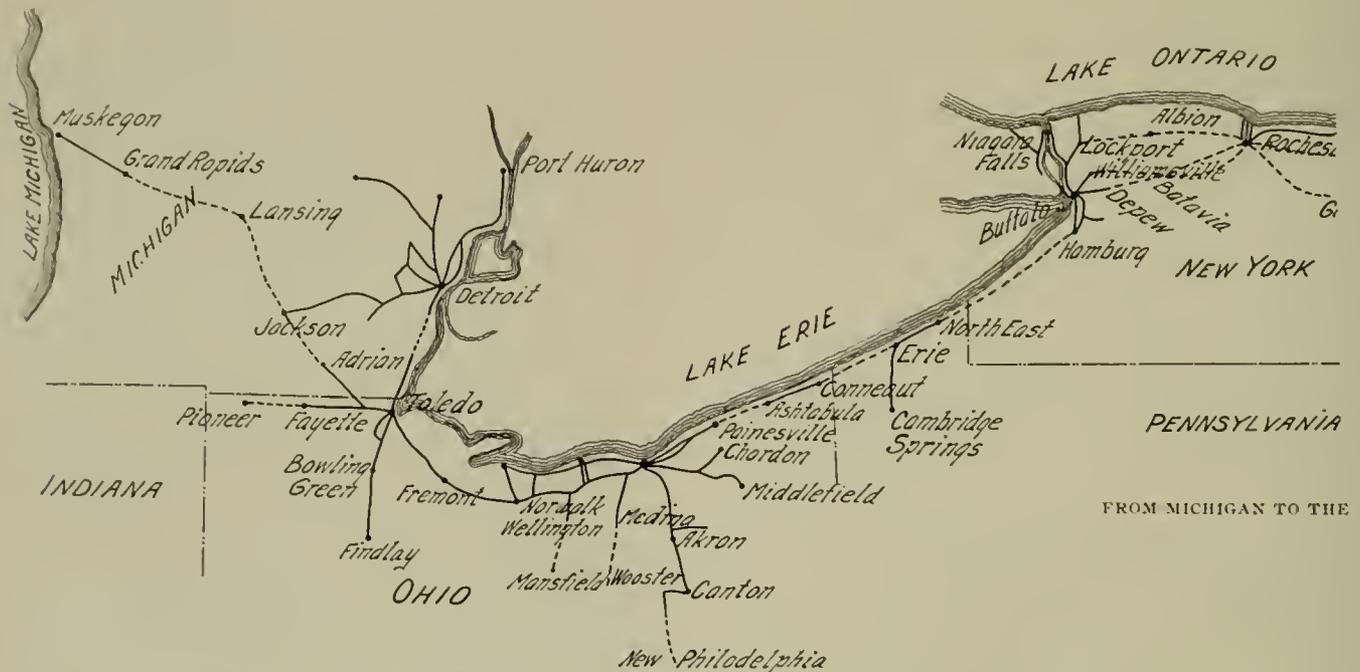

BY R. H. DERRAIL.

At Albany a union ticket office is located for the convenience of the patrons of the different roads. Tickets are also sold to any point along the lines.

The Albany & Hudson Railway & Power Co. will within a short time extend its system to the Massachusetts state line there to connect with the proposed extension of the Berkshire road which is to be built west from Pittsfield. The Troy, Rensselaer & Pittsfield Street Railway Co., which controls the Troy & New England, now operating as far east as Averill, has the right from the Board of Railroad Commissioners to build to the state line, and I am informed by Mr. George F. Murray, of Troy, N. Y., that the line will be constructed next year.

At Pittsfield I find a line running through the heart of the Berkshire and Greylock Hills, from Lee through Pittsfield, Cheshire, Adams, North Adams to Williamstown, and by the first of November it will be extended south from Lee to the Connecticut state line. This system running as it will north and south through the entire state is owned by two companies, the Berkshire, and the Hoosac Valley Street Railways. The Pittsfield Electric Co. operates a local line in the city with an extension to Dalton and another one running north to Cheshire in competition to that of the Berkshire company.

range of mountains. The diversity of scenery along this line can be appreciated by those who have travelled through this section by the Boston & Albany road. This line will start from the line of the Berkshire road at Lee and connect with the Springfield lines at Westfield. Mr. R. D. Gillette is interested in this projected road, and it is his intention to have it constructed in the same thorough manner as the Berkshire road. At Westfield I touch the western end of my journey to Boston by the "Broomstick" train. It is the western end of one of the greatest trolley systems in the world, as far as mileage is concerned. It might be well to state here that the writer is fully satisfied, judging from what he has observed on his trip, that if the street railway managers of the middle states had control of some of the eastern roads, longer runs would be made than are now to be found in eastern territory. There is no reason but that Springfield, with a population of 63,000, and Boston with over a million, only 110 miles apart, should not have through car service similar to that in force between Toledo and Cleveland, a distance of 118 miles. It is now necessary to make eleven changes by the most direct route, or a change of cars every 10 miles. Of course the eastern section of the trip a distance of 50 miles will be well taken care of when the Boston & Worcester air line is put into operation in the near

Who would have imagined a few years ago that to-day a model up-to-date electric road would be penetrating this famous mountainous country full of wild, picturesque scenery and summer homes of many wealthy people? The rails average from 70 to 75 lb. and the cars are of the most modern type, 45 ft. long with a seating capacity for 48 people. Of the 12 cars three have smoking compartments and are geared for a very high speed although their average running schedule is 25 miles an hour including stops. The company has the right to carry freight south of Pittsfield but no attempt has been made to cater to this class of traffic. About a quarter of the 41 miles is over private right of way. At Cheshire connections are made with the cars of the Hoosac Valley for Adams, North Adams and Williamstown, all of which places are well worth visiting.

I was obliged to take the train for Westfield, but the trolley will be available for pleasure travel in two years' time if the plans formulated by the Western Massachusetts Street Railway Co. are carried out. The road will follow the route now traversed by the Boston & Albany Railroad, through many glens hedged in by a

future by James F. Shaw, who has built more long distance inter-urban lines in New England than any other promoter. There is no question but that this road will be a grand success from the start.

Returning to Springfield we find one of the best equipped city and suburban roads in the country, and it is looked upon by all the street railway men in this section as the model road in New England. Cities of every size have cars in operation that have seen better days, but this cannot be said about the Springfield system for its cars are of the very best. The city is noted not only for its fine electric system, but as a trolley center, for one can ride north along the valley of the Connecticut through Holyoke, Northampton, and the quaint old towns of Deerfield and Greenfield, a distance of 43 miles, a most delightful ride through a charming country, while southward, with the exception of two breaks of a few miles each, there is a continuous trolley line to New York City, a distance of over 170 miles. The route from Springfield to Boston has been described so often that I shall not make any attempt to go into detail. It might, however, be of in-

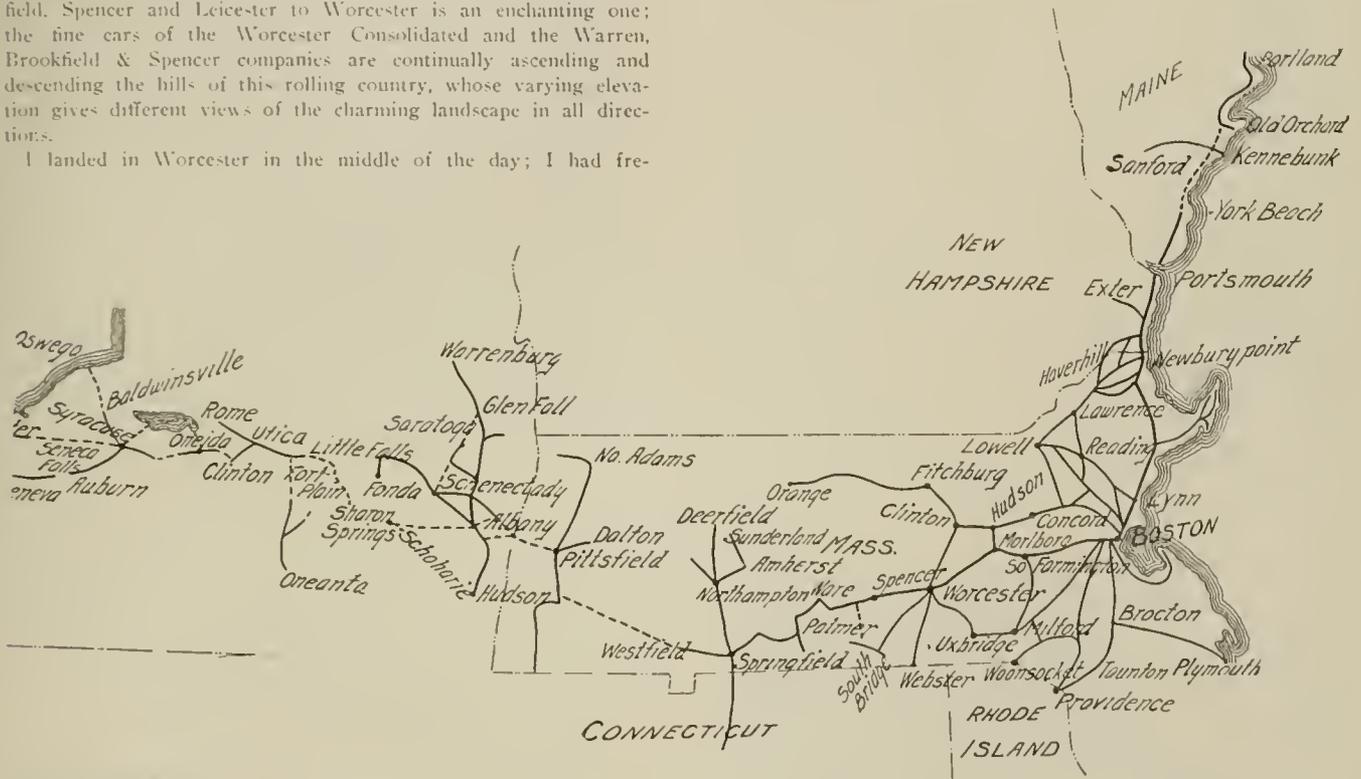

terest to know that with the exception of one break which exists between Athol and Turner's Falls, one can start from Springfield and ride seven hours per day for twenty-four days at an average rate of speed of 14 miles an hour through suburban country and arrive back in the city without going over the same ground twice.

To continue my journey eastward, I took a car of the Springfield & Eastern Street Railway Co., running over the tracks of the Springfield company as far as Ludlow and thence over its own tracks, paralleling the Boston & Albany most of the way. The ride is through a very pretty farming country. The business of the road consists chiefly of through traffic. At Palmer another change is necessary to continue the journey eastward, passing Forest Lake Park, a popular pleasure resort located midway between Palmer and Ware. Between Palmer and West Warren the Boston & Albany Railroad is obliged to make a southerly detour to avoid the hills while the electric line wends towards the north through Ware to Brookfield. The ride from Ware through Brookfield, Spencer and Leicester to Worcester is an enchanting one; the fine cars of the Worcester Consolidated and the Warren, Brookfield & Spencer companies are continually ascending and descending the hills of this rolling country, whose varying elevation gives different views of the charming landscape in all directions.

I landed in Worcester in the middle of the day; I had fre-

comprising some 3,000 miles, and connecting five of the six New England states with the city of Boston. He finds no union ticket office in the city representing this great system, similar to those in vogue in the middle states, nor is it possible for him to obtain any definite information concerning the numerous scenic routes available by trolley from the great city except through a street railway guide which is published independent of the different roads.

I have finished my trip by trolley as far east as Boston by travelling 483 miles over the grand trunk line by trolley and 451 by steam. The actual time consumed in making this trip was 28 hours by electric railways and 17 hours by steam, and the fare by electric railways \$6.70, by steam \$9.71. In addition to this I travelled over the branch lines out of the cities of Detroit, Toledo and other centers, the mileage, rates of fare and running time being enumerated below.

ATLANTIC COAST BY TROLLEY.

quently visited Worcester and ridden over its many city and suburban lines during the past few years, but there seemed to be a change. The rolling stock was much improved, the roadbed had been rebuilt and the cars ran with more smoothness and on seemingly perfect schedule time. Up to this time I had not realized (on account of my year's absence from the city) that this change which was brought about by Mr. R. T. Laffin, general manager of this company since its reorganization two years ago. Mr. Laffin has proved himself one of the most far sighted and practical street railway men in this section of the country.

From Worcester electric lines radiate in all directions, one line running through Clinton to Leominster and Fitchburg, thence westward to Athol and Orange. To the south a line runs through Webster to the Nutmeg state, while connections are made with Providence, Southbridge and other places. There are several desirable lines to Boston, two of which are worthy of mention here, one through Marlboro and South Frammingham passes many historic places and the great water basin of the Metropolitan Water Works. The route is through a picturesque farming country. The other line was taken by the writer from Worcester to Clinton, thence to Hudson, Maynard and Concord and thence over the "Paul Revere Route" through historic Cambridge to the Park St. station of the Boston subway. A flight of stairs brings one to the extreme of the great hole in the ground located on the Common, Boston's breathing place. Imagine the feeling of a western trolley tourist located in the center of a perfect network of electric lines,

	Mileage.	Rate of Fare.	Running Time.
Detroit	306	\$4.25	16 hr. 50 min.
Toledo	279	4.55	14 " 15 "
Cleveland	441	8.20	25 "
Eric (Pa.), Buffalo, Utica and Albany (N. Y.)	432	7.50	22 " 40 "

I found that the rates of fare varied; in some places where the electric lines operate through a territory not served by steam the rates average over 2 cents per mile, but on the whole the general average was about 1 1/2 cents per mile.

In conclusion I predict that this trunk line connecting the Atlantic with the great lake region will be completed and in actual operation in less than five years, at which time one will be able to travel over this line, some 965 miles in length, in less than six days at the average speed the interurban cars are run to day, namely 18 miles an hour.

To connect this trunk line it will be necessary to construct some 43 miles of track in Ohio, 35 miles in Pennsylvania, 325 miles in New York and 74 miles in Massachusetts.

Freight.

While my trip over the various lines was solely for the purpose of studying the country traversed by the trolley from a tourist's standpoint the freight and express business on the interurban lines out of Detroit is carried on to such an extent that I am satisfied that it contributes no small portion of the revenue of the different

suburban lines through the states of Michigan, Ohio, Pennsylvania and New York that I travelled over. This business is developing wonderfully, in fact to such an extent that the steam roads are throwing every obstacle in its way. It was only two years ago that the right of the electric cars to carry freight in the state of Ohio was questioned, but it was decided by the Supreme Court that all interurban lines had the power to transport freight as well as passengers.

While practically all the suburban lines in the states mentioned have the right and do carry light freight and baggage, only a few have gone into the business on so extensive a scale as to have a very complete equipment of standard freight cars. The popularity of this service is due to the fact that the merchant in the outlying town can telephone to the city for his goods and be assured of prompt delivery, or the farmer can have his products landed at the markets of a city without any trouble or inconvenience and at a less cost than by steam.

All the lines out of the city of Detroit do a light freight and express business. The line to Mt. Clements and Port Huron being through a rich agricultural country with many large intervening summer resorts, the carrying of fruit, vegetables, groceries and general merchandise forms a great portion of its business.

On the Jackson line, although two round trips per day are made to Ann Arbor and one to Jackson, the cars are taxed to their utmost. On the Flint division one round trip is made to the terminus of the line and one to Romeo, thus giving Rochester, which is at the junction point of the two lines, the benefit of two round trips per day. On the Pontiac line one round trip is made per day taking in all the intermediate towns and villages. Freight and express is also carried on the line from Detroit to Trenton. Two round trips are made on this line.

Many of the companies through the entire section which I have travelled use their power sub-stations as receiving and distributing stations for freight and express and in addition to this platforms are erected at convenient points for the collection of milk cans. On the line from Monroe to Toledo (Toledo & Monroe Ry.), two round trips are made each day. In Toledo there is a Union Freight Station located in the business section of the city. It is maintained by the different suburban lines and some 20 loaded cars are sent out each day to the outlying towns.

While many of the electric roads have entered into the light freight and express business only four have come under my personal observation which are thoroughly equipped with standard freight cars—the Toledo & Western, the Cleveland & Eastern, The Hudson Valley and the Albany & Hudson.

The former company has some 50 cars comprising flats, boxes and hopper bottom gondolas. Although the road is young it is doing considerable business in the handling of coal, lumber, brick, grain, hay, etc., which is handled entirely at night. These cars are hauled by electric locomotives to and from the freight house located at West Toledo, where connections are made with the Lake Shore and the Michigan Central Railroads. An electric locomotive is practically completed which will be capable of hauling from 12 to 15 loaded cars.

The company intends in the near future to erect elevators at several points along the line for the convenience of the farmers, which will be an innovation in the carrying of freight by electric roads.

The lines of the Toledo & Maumee Valley and the Toledo, Bowling Green & Southern do considerable in the way of carrying light freight and express. The Lake Shore running from Toledo to Cleveland is equal to the other lines in the carrying of light freight and express matter as well as running combination cars. Three round trips are made as far as Fremont two of which run through to Norwalk and in the near future, if they have not already done so, through cars will be run to Cleveland, the same as the passenger cars now are.

Cleveland is the center of what is probably the most extensive light freight and parcel service in the United States. Its location and the network of interurban trolley lines entering the city furnish the very best conditions for the development of traffic of this kind. The Electric Package Co. handles this business on the lines of the Cleveland, Elyria & Wellington, the Cleveland, Painesville and Eastern, the Northern Ohio Traction Co., and the Lake Shore Electric. The Cleveland & Eastern has its own depot and freight agent, but a new union depot will be erected

as the joint property of all companies entering Cleveland. This company does a larger business than any other single company running out of the city. The section served by its lines has no steam railroad facilities and this part of the business has been a success from the start. The company has several flat cars on which it hauls a large quantity of stone outside the city limits.

The cars of the Cleveland, Elyria & Wellington are in some cases combination baggage and passenger and the company does a very large business in the handling of milk. This is also true of the Northern Ohio. The Canton-Akron line expects to do quite a large business in the handling of farm products.

In fact all along the line east the street railways do a general light freight and express business. The Pennsylvania & Ohio Traction Co. operates on its line between Ashtabula and Conneaut several combination baggage and passenger cars.

In the state of New York the lines have the right to carry freight and express and considerable is done on the Lockport division of the International Railway Co. In Rochester the line running out to Sodus Bay (Rochester & Sodus Bay Ry.) makes two round trips per day with freight cars, and every second car operated on this line is a combination car. The lines of the Rochester Railway Co., running north to the beaches do only an express and passenger business.

As you follow further through the state of New York you will find that the Syracuse & Suburban, the Geneva, Waterloo & Seneca Falls, the Fonda, Johnstown & Gloversville, the Schenectady, and the United Traction Co., all do a general light freight and express business. At Albany a Union Express office is maintained by the two latter companies and the Albany & Hudson.

The Hudson Valley Railway Co., with a system of some 100 miles, handles much of the outgoing freight along the upper Hudson in car load lots, consisting chiefly of paper, wood pulp, lumber, machinery, etc. Some of the largest paper mills in the country are located along the Hudson River all of which have spur tracks from the main line of the electric road to their yards.

The Albany & Hudson does a very large business in the handling of heavy freight which is transferred to and from the different steam railroads. This line runs through a section where there are no steam railroads therefore its relations with the steam roads with which it connects are of a friendly nature.

Reaching Massachusetts one loses sight of all this branch of the transportation business on electric roads, although several of the companies have received by special act of the legislature the right to carry, express, baggage and United States mail.

#### TWIN CITY LINES TO FORT SNELLING.

An agreement has been effected between the Twin City Rapid Transit Co. and the prominent retail merchants of Minneapolis for the extension of the company's electric lines to Fort Snelling. The company has long considered the advisability of such an extension, but was deterred from proceeding in the matter by the indisposition of the War Department to grant a right of way across the government reservation. The Commercial Club of Minneapolis has now taken the initiative and after a canvass of the merchants of the city, a delegation has been appointed to visit Washington and secure authority for a line to the military post, an errand which there is reason to believe will result successfully. If the right of way be granted the merchants will bear a proportion of the expense of constructing the line, and for this purpose stock to the amount of \$8,000 has been subscribed. The construction will be undertaken by the Twin City company and the cars to Fort Snelling will be operated as a part of the latter's extensive system.

#### FUMIGATING STREET CARS.

In the interest of good health, the Cleveland City Railway Co., of Cleveland, O., is fumigating its cars every night with a composition recommended by the city health officer. The disinfectant used is a powder which is burned in the cars after the doors and windows are closed and is warranted to kill all germs.

The Lexington (Ky.) Railway Co. has agreed to furnish three cars free to school children participating in Arbor Day exercises.

## ELECTRICALLY WELDED RAIL JOINTS AND BONDS.

The advent of heavy cars on street railways has brought with it increasing destructiveness to the joints in the track, and the demand for a better bond around the joints to properly care for the greater volume of current necessary for the propulsion of these cars. When the first electric roads were operated little attention

SAND BLAST CAR.

was paid to either of these subjects, but motors partly suspended from the axles of the cars without intervening springs played havoc with the joints. Heavier rails were rolled and splice bars with twelve bolts were provided, but even these in time work loose and long before the full wear of the rail has been realized, the rail ends at the joints are worn out by the continual pounding of the wheels as they pass from one rail to the next. The bonding at the joints also deteriorates and it becomes frequently necessary to rip up the pavement to get at the joints and replace the bonds, or else the power is found to elb lower and lower and the difficulty is sought to be overcome by putting in more generators at the power station or increasing the capacity of the overhead feed wires.

Considerable progress has been made in the last five years in doing away entirely with joints and bonds in all track that is laid in surrounding pavement. In several cities rails have been laid that were unprovided with the usual holes at the ends for the bolted splice bars, and bars electrically welded to the rails at the joints are used. The bars and the rails are thus made integral and the necessity of a copper bond at the joints is done away with.

In the manufacture of a continuous rail it is important that the ends of the abutting rails be in intimate contact, for if there is the slightest opening at the joint the metal in the head of the rail will be forced into it, and this will in time produce a low spot no matter how rigidly the rail ends are held. Another important point is to have the bars used in making the joint of a nearly the same quality of metal as the rail itself as possible, in order to introduce no extra resistance to the passage of the electric current. It is also desirable not to have the joint go below the bottom of the rail, especially in old rails where ties have previously been used under the joints, as it becomes necessary to remove the latter where the welded joint extends below the bottom of the rail. Joints which include these features are made by the track welding department of the Lorain Steel Co., which controls the use of the Thomson electric welding patents for purposes of railway construction in addition to patents on its improved process of electric welding and also on its welded joints and bonds.

In welding joints by the Lorain company's process two rolled steel splice bars are used. These have at the ends on one side projections, or raised portions, which originally form the contact points between the bars and the rail web and confine the welded area to these sections. Welds are made at each end and at the middle of the bar. The middle weld is made first, the bars being thereby heated and elongated before the ends are welded. After the ends have been welded, the shrinkage of the bars in cooling exerts a powerful pull to bring the abutting rails together thus closing the slightest opening, leaving practically no joint at all.

The apparatus for welding is carried on trolley cars illustrated herewith. These cars are provided with special axles enabling the wheels to be set to any gage. A sand blast is used for cleaning the rails and bars at the points where the welds are to be made. Following the sand blast car comes the welding train. This consists of two cars coupled together, the first of which carries the welder hung from a crane at the front of the car. The welder itself consists of an alternating current transformer, for stepping down a current of 300 volts and 650 amperes to one of 7 volts and about 28,000 amperes with which the actual welding is done. Pressure is obtained from an hydraulic pump and communicated to the welds by means of two large forged steel levers. By this means a pressure of 37 tons is developed at the weld. The car behind the welder contains a rotary converter and suitable regulating apparatus for transforming the current taken from the trolley wire to an alternating current of 300 volts. This apparatus has recently been installed and does away with a rotary converter and a booster in two separate cars, which was previously used. By means of this apparatus the primary current to the welding transformer is kept practically constant at 300 volts with a line voltage of from 325 to 600. With a line voltage of 500 about 250 amperes are taken and it requires about 125 kw. to make a weld; as the current is on about two minutes at each weld the power consumed is about 12½ kw. h. per joint. As a continuous process it takes from twelve to fifteen minutes to complete a joint.

Following the welding train comes a surface grinder, by means of which the head of the rail is reduced to a true surface. This tool is not needed on new rail. In welding old rail the receiving

ELECTRIC WELDER.

rail is purposely welded a little higher than the other and the grinder then removes the inequalities leaving the head of the rail a true surface again. This machine was devised especially for the purpose of joint grinding and differs entirely from the common method usually employed. No flexible shaft is used and it is impossible for the operator to allow the emery wheel to drop down into the low places.

To derive the proper benefit from continuous rail in the saving of power, by providing a ground return for the current of least resistance in the rails themselves, it becomes necessary to make special provision where switches and crossings are located in the tracks, and also where the ground cables from the generators at the power house connect with the rails.

The same apparatus for welding joints is also made use of in electrically fastening copper cables to the rails. This is done with

WELDING TRAIN.

copper blocks having on one side a groove to receive the cable; the block and cable are then electrically brazed to the rail web. By this means cable of any diameter is attached to the rails so that the area of contact between the copper and the steel is ample to allow for the difference in conductivity of the two metals. Where welded track abutts special work copper cables are passed underneath from welded rail to welded rail and the ends electrically brazed to the rails. An unbroken metallic return is thus secured having no joints whatever. Worn pieces in special work can thus be renewed without breaking the continuity of the return circuit. The trouble from electrolysis is avoided as the rails are made the path of least resistance and there is but little tendency for the current to seek other paths of return.

The application of electricity to the manufacture of a continuous rail was first introduced by The Johnson Co. in 1893, when little was known regarding the handling of so large a current as was required for welding rails, and experience soon demonstrated the advisability of experimenting before continuing on a commercial scale, and operations were therefore suspended. Continuously during the years of 1895-6-7 experiments were prosecuted until the present form of welded joint was perfected. In the early experiments an erroneous impression was obtained that the electric current affected the structure of the steel, but subsequent experiments

SURFACE GRINDER.

demonstrated that far from affecting the steel detrimentally, no other method of heating leaves the steel so little affected as does the electric current properly applied. Welds of extraordinary toughness are now made which are unexcelled in strength or ductility by any other form of welding. The improved process was first introduced in 1897, and work on a commercial scale has been going on ever since with very gratifying results and giving entire satisfaction. In the last three years the Lorain Steel Co. has

welded in Buffalo, N. Y., alone, over 100 miles of track. During this season contracts have been completed at Rochester, N. Y., and Worcester, Mass., and welding is now being done at Columbus, Ohio, and on the lines of the Boston & Northern Street Railway Co. at Lowell, Mass.

#### FOND DU LAC & OSHKOSH ELECTRIC RY.

With a view to operating the Fond du Lac & Oshkosh Electric Ry. this fall the construction work has been pushed forward with all possible dispatch. The grading of the entire line was completed last month and 8 miles of the 11 miles necessary to connect the lines of the Fond du Lac street railway and the Winnebago Traction Co. at Oshkosh have been laid.

The Columbia Construction Co., which is building this line, has also completed setting 9 miles of new poles and the work of erecting the span wires and overhead material was commenced early this month. The feeder system has been erected through the city of Fond du Lac from the power house to the end of the Fond du Lac line. The feeders consist of three 500-c. m. and one No. 0000 cables. The current is furnished chiefly from the Fond du Lac power house and for this purpose a 500-kw. Westinghouse direct current generator has been installed. A booster will be used to keep up the pressure on the longest feeders, and power for the north end of the road will be furnished by the Oshkosh power house. The cars for the new line are about ready for shipment. These will be furnished by the St. Louis Car Co.

An arrangement has been made with the Chicago & Northwestern Railway Co. and the Wisconsin Central Railway Co. whereby a subway will be built at North Fond du Lac, through which the electric line will pass under these railroads. The subway will be 32 ft. wide and will be laid with a double track to avoid any possibility of collision between cars. The work on this subway has progressed considerably and the temporary support for the steam railway track are now in place. The excavations for the roadbed and the masonry retaining walls are now under way.

The new line is built over a private right of way 50 ft. in width, of which the company has the fee and the electric railway track parallels the Chicago & Northwestern Ry. for 9 miles north from the subway; the grade is practically the same as that of the steam railroad. The roadbed is laid with 70-lb. rails in 62-ft. lengths. All of the rails and other material are now on the ground and if the weather permits the subway to be completed before winter sets in the road will be put in operation this fall.

The Columbia Construction Co. is also just completing the graveling of the Oshkosh & Omro Electric Ry., which is a branch of the Winnebago Traction Co. running from Oshkosh 10½ miles west to Omro. The line has been in operation for two months and is proving a valuable feeder to the Winnebago company's system.

#### NEW FRANCHISE AT PORTLAND, ORE.

Ordinances have been introduced in the common council of Portland, Ore., prohibiting the transportation of freight in open cars through certain streets during the hours between 7 a. m. and 7 p. m., except it be for construction purposes, and providing for the payment of an annual license of \$100 for each freight car with motor-power attachment, of \$80 for each car without such attachment and \$20 for each car used for construction purposes.

Another ordinance provides for franchises for the City and Suburban Railway Co. on certain streets. The lines may be single or double track and are to be completed within one year from the date of approval of the ordinance, and during construction no street shall be obstructed for more than two blocks at a time. The company shall establish a 10-minute service between the hours of 6 a. m. and 8 p. m., and a 20-minute service between 8 and 11 p. m., and shall pay a license of \$50 per year for each car.

The New Orleans Railway Co. was among the first to discover that the "Jim Crow" law recently enacted in Louisiana which was supposed to go into effect October 13th, was not really effective in New Orleans until November 3d, at which time the company arranged to have its cars equipped with screens or partitions in compliance with the law.

**THE PRIVATE RIGHT OF WAY.**

ALTON D. ADAMS.

Copyright, 1902, Alton D. Adams.

Electric motive power was certain to cause the extension of street railways into interurban and interstate lines. This extension is likewise certain to carry electric railways off from country roads and onto the private right of way in at least a large number of cases. Reasons for this change are many and weighty. In cities the value of real estate is relatively great and the damages that must follow the construction of an elevated railway an unknown quantity. Furthermore, passengers prefer to alight directly on city streets. In spite of these facts, the disadvantages of operation in the streets have driven a part of the electric railways to underground and elevated structures in some of the great cities. On most interurban lines conditions are far different. Land is cheap and the cost of a private right of way along the surface moderate. Most of the travel is between cities or town centers, and it is not necessary to deposit passengers at frequent intervals along country roads. The right of way offered by these roads to electric lines is not particularly inviting. Such roads are usually narrow, seldom graded, often crooked, sometimes roundabout, and generally afford a poor foundation for heavy tracks and high-speed cars. Town and county roads have political as well as physical disadvantages when used as the right of way for electric car lines. As long as railways occupy the public highway restrictions are sure to be put on the speed of cars, often rightfully. Such locations make it also possible to lay heavy burdens on electric railways in the form of road building and the removal of snow, whether rightfully or wrongfully. Legislative authority in the regulation of fares is apt to be carried much further over railways that occupy the public streets than over those on private rights of way, as the experiences of steam and electric roads plainly show. In the matter of taxation, also, a line that operates in the streets offers a more shining mark than one which owns its own roadbed. Perhaps the strongest single reason tending to the location of interurban electric railways on private lands is the desire to meet the public demand for rapid transit. Owing to the difficulties outlined, both physical and legal, this demand cannot be satisfactorily met in some cases by railways that follow the highway. Much the most important traffic of interurban electric lines is that between centers of population, even though these centers are only towns and villages. In order to secure a large through business from one town center to another, for which high speed is necessary, electric cars can well afford to miss an occasional lone traveler on the highway. Where electric lines compete with steam roads for through passengers, which is the case between most large towns and cities along their routes, the amount of traffic over each depends to a very large extent on their relative running time.

The general use of highways by interurban lines of electric railway is no doubt based on the idea that the public road offers a cheaper location than a private right of way. This idea is no doubt well founded in many cases, but in many others it is incorrect. Though many electric railways have some portions of their tracks on private right of way, the costs of these portions are usually mixed with the costs of the parts that are on public roads. In some cases, however, the length of track laid on private right of way forms a large part of the total, so that its influence on the average cost per mile may be noted. Several electric railways of Massachusetts have been selected for comparison as to the cost of roadbed and tracks alone. It is obviously unnecessary to consider the cost of electric line construction in this comparison because this cost may be expected to be the same on public roads as on a private right of way. The electric railways here considered are either located entirely on town and county roads, or else have by far the greater part of their length on such roads, though they terminate in cities. This plan is followed to avoid the question of comparative cost between tracks on dirt or gravel roads and those on the paved streets of cities. In each case the length of track given include both main and side tracks. The Shelburn Falls & Colman electric railway has a total of 7.01 miles of track, of which 2.55 miles or 36 per cent, is on private right of way. For the entire length of track the average cost was \$7,324 per mile. Of the 30.27 miles of track owned by the Springfield & Eastern Electric Railway, 6.1 miles or 20 per cent, are on its own right of way. The average cost of the entire track and roadbed was \$11,594 per mile. With a

total of 28.26 miles of track, the Haverhill & Amesbury Electric Railway has 4.5 miles, or 16 per cent, on a private way, and the average cost of the entire line was \$8,410 per mile. The Nantasket Beach Electric Railway, owned by a steam railroad, is located entirely on private right of way and has 18.33 miles of track. Along nearly its entire length this road is equipped with a third rail to conduct the current. The track is well ballasted, in part with broken stone, and the construction is very substantial to support cars that are similar to railway coaches in weight. Owing to the way in which reports of steam railways are made out, the figures for the cost of this Nantasket line include the electrical construction as well as the roadway and tracks. This cost amounted to \$13,638 permile. For comparison with the foregoing costs the following are given for electric railways that have all or nearly all of their tracks located on highways.

Name.	Length of track.	
	Miles.	Cost per mile.
Brockton & Plymouth.....	23.68	\$10,266
South Shore & Boston.....	66.03	10,616
Fitchburg & Leominster.....	28.68	12,079
Worcester & Suburban.....	24.07	15,245
Worcester & Webster.....	15.73	10,077

This list, which covers the costs of merely roadbed and tracks, might be greatly extended with figures not far different from those given. A comparison with the costs of roads which have a large portion of their tracks on private land tends to show that such roads cost no more than those on the public highway. The figure of \$13,638 per mile for the Nantasket road complete with electrical construction would be hard to duplicate with equal depth of ballast, weight of rails, alignment and easy grades, on most highways.

Costs of track and right of way for steam railways offer some interesting data as to the probable costs of electric roads when built on private land. It should be held in mind in connection with steam railways, however, that heavy locomotives and high speeds have made it necessary to give them much more substantial roadbeds than have thus far, with a few exceptions, been constructed for electric railways. Another factor in the figures for steam roads that makes the cost of a private right of way seem larger than it really is, exists in the item of buildings and depots. Available figures for the costs of steam railways include all buildings owned and used in connection with the roads. Evidently freight and passenger depots may form a very material item in the cost of steam railways.

STEAM RAILWAYS.

Name of road.	Miles of Track.	Cost per mile.
Stockbridge & Pittsfield.....	35.97	\$12,794
Chatham .....	7.84	12,555
Boston & Providence.....	225.56	22,371
Ware River .....	56.64	19,688
Nashua & Lowell.....	41.81	16,365
Plymouth & Middleboro.....	16.05	19,003
Pittsfield & North Adams.....	25.03	16,026
Holyoke & Westfield.....	24.56	18,822
Milford & Woonsocket.....	18.77	9,237

In each case the miles of track given cover the entire length of main and side tracks. Variations in the cost per mile are to be accounted for largely by the unequal requirements for grading in different sections of the state and by the character of buildings and terminal facilities. The entry of the Boston & Providence Railway into Boston and Providence and the depots there erected must have added a very material item to the average cost per mile of track. It will be noted that in spite of the substantial construction of roadbeds and the erection of depots the average cost of steam railways per mile of track is not much greater than that of electric railways laid on public roads, in a number of instances. The figures presented make it appear probable that in many cases with given conditions as to alignment, grades and ballast, the cost of an electric railway will be less over a private than over a public right of way. As is well known, the T rail, which cannot be used on the highway, is stiffer and wears longer than girder rails of equal weight, such as are generally employed on electric roads.

Appreciation of the advantages of a private right of way is rapidly growing with the managers of electric railways. On Sept. 30, 1897, eighteen electric railways in Massachusetts had small parts of their tracks on private right of way, and the total length of tracks

so located was 32.64 miles. On Sept. 30, 1901, the number of electric railways with parts of their tracks on private rights of way in this state was not less than 51, and the total length of tracks so located was 117.58 miles for this number of roads. These figures do not include any systems that were under construction at the date just named. Of the 51 railways seven had more than five miles of track each on private right of way, as follows:

	Miles.
Boston & Northern	10.52
Worcester Consolidated	9.88
Lowell, Lawrence & Haverhill	8.38
Springfield & Eastern	6.10
Old Colony	5.78
Milford, Attleboro & Woonsocket	5.72
Holyoke	5.14

Besides these electric railways in operation, one of those under construction was building about twenty miles of track on its own right of way.

Other states present a movement of electric tracks to private land similar to that in Massachusetts. Two long electric railways in New Hampshire, for which exact figures are not yet available, are laying large portions of their tracks on their own rights of way. In the state of New York 15 electric railways are located in part on private land, and the combined length of their tracks thus located is 112.43 miles. The greatest length there of track owned by one company on private right of way is that of the Albany & Hudson, 35.1 miles. Electric railway history is being made rapidly, but perhaps in no direction faster than in that of location. In document No. 475 of the Massachusetts House, for 1898, a committee of three eminent gentlemen, appointed by a special act for the purpose, made a report on the relations of street railways to cities and towns. In that report it was said: "This is all the street railway was fifty years ago, when first laid; it is all that it is now—an improved line of omnibuses, running over a special pavement. \* \* \* The analogy throughout is with the omnibus line, and not with the railroad train; with the public thoroughfare, and not with the private right of way." In spite of this report one may travel today across Massachusetts over several routes from north to south, and nearly from east to west, by electric railways laid for long stretches on private rights of way.

#### A LETTER FROM AUSTRALIA.

Editor "Street Railway Review":

At the present time, while so much is being published favorable to the theory of municipal ownership of street railways, a little news from Australia, where the scheme of public ownership is being tested, may be of more than passing interest.

In May last the Brisbane Tramways Co., Ltd., a private company owning the street railway system in Brisbane, the capital of Queensland, a city of 125,000 population, tendered its employes a banquet as a token of the company's appreciation of their care and faithfulness in handling the immense crowds during the occasions of the visit of the imperial troops and of His Royal Highness, the present Prince of Wales.

Two nights were given up to the festivities and nearly every employe, from the resident officers to the humblest "points-boy," was present. Among the invited guests were the Minister for Railways of the State and the Attorney-General. Each addressed the company, expressing the highest appreciation of the work of the Tramway company in taking over a bankrupt horse-car line and equipping it electrically and of the service rendered the public. Coming from such a source, anything in commendation of private ownership should have considerable weight, particularly as the railways of Queensland are owned by the state, and as there is a great clamor that the state should take over the tramway system as soon as permitted by their franchise.

In the course of his remarks, the Attorney-General said: "There have been persons who have cried out at giving privileges to what they had termed a foreign company; but there could be no two opinions as to the value given in return, and as he had said to a representative of the South Australian government, who recently inquired into the workings of the trams, if they had been under the control of the government they could not have been the success they had been."

Among other things, the Minister for Railways said: "No government could do as well as a good single man. The government did not run the railways of Queensland. The railways were to a large extent run by parliament, which, of course, was composed of representatives of the people. Members of parliament would pass a resolution that a certain thing should be done, and whether that thing was right or wrong, their influence was occasionally strong enough to cause it to be done. Neither the commissioner nor government ran the railways. They were controlled by parliament, and yet people wondered why the railways were not better managed."

The leading newspaper of Brisbane, commenting editorially on the function and the speeches, mentioned the remarks made by the ministers and said: "But were not the ministers right? Consider the position. Start with the consideration that in the nature of the case the government has not before its eyes the imperious necessity of a service paying its way, as a private company has. The first result is that routes are not selected on a business basis; they are selected more or less from party and private influence. We have abundant illustration of that evil in our railways. For the same reason, the service itself would not be aimed at the public requirements; and a thousand reasons other than personal fitness would operate in the choice of servants. The attitude of a private company is: 'We must induce the public to travel; the attitude of the government is, 'There is the provision, the public can use it or not, as it pleases.' Yet another result of the absence, or the ignoring, of the natural economic conditions, is that the government is pressed into paying higher wages than the business warrants. \* \* \* It is certain that had this been a public enterprise, the labor party would have put forward wage demands which took no account of the economic limits of the enterprise itself."

The paper alludes in this connection to the plight of the government of New South Wales, which publicly announces an expected deficit of \$150,000 for the current year on the Sydney street railway, caused by having to reduce the hours of employes from nine to eight—the political pressure being so great that the demand had to be granted even with the knowledge that it might cause such a large deficit.

These are facts presented by men who have seen efforts at public ownership given a fair trial, and they themselves have assisted in the effort, with what degree of satisfaction to themselves their views as here quoted give no uncertain sound.

Will American cities attempt an experiment which is discredited where it has had every opportunity to succeed? C. E. BADGER.

#### INTERURBAN LINE BECOMES STREET RAILWAY IN CITY.

A decision has been rendered by a trial court in the case of the city of Dayton against the Southern Ohio Traction Co., in which the city claimed that the company was not fulfilling its contract. The court holds that as soon as the railway company's line enters the city it becomes a street railway company and not an interurban line and must, therefore, exercise the functions of a street railway, such as providing reasonable service, stopping at street crossings, selling tickets, announcing names of streets. The company is also required to furnish a continuous local street car service. The effect of the decision, if sustained by the higher courts, will be to require the Southern Ohio Traction Co. to give local service all the year around in the city of Dayton. The company has heretofore operated one local car during the summer months, but discontinued it in the winter because of the small patronage.

#### MOTORMAN RESPONSIBLE FOR ACCIDENT AT PITTSFIELD.

In a report upon the accident in which President Roosevelt's body guard, William Craig, was killed and the President and Secretary Cortelyou were injured at Pittsfield, Mass., last September, the board of railroad commissioners finds that the responsibility for the accident rests with the motorman of the car which ran into the president's carriage.

The Blue Grass Traction Co. expects to have its line running between Lexington and Paris, Ky., next March.

# The Proper Type of Steam Motor for Large Generators.

## Two English Opinions Relative to Steam Turbines and Reciprocating Engines.

At the meeting of the Incorporated Municipal Electrical Association at London, England, in July, 1902, the subject of steam turbines was presented in a paper by Mr. S. E. Fedden, city electrical engineer, of Sheffield, and Mr. A. A. Day, borough electrical engineer, of Bolton, contributed a paper dealing with the relative merits of horizontal and vertical reciprocating engines. Both topics were considered from the view point of generating-station service, and were of much interest, as shown by the generous and spirited discussion which they called forth. The papers are of timely value and are here reproduced practically in full.

### STEAM TURBINES.

BY S. E. FEDDEN.

The technical details of the steam turbine have been so very prominently placed before engineers lately in numerous able papers, that the author does not consider it necessary to go over this ground again. Suffice it to say that the construction of the steam turbine is simplicity itself, as it consists only of a hollow drum revolving in a stationary drum or cylinder, each with teeth or vanes attached, and so arranged that they clear each other. The two cylinders are steam packed, and, of course, the thrust guides require careful adjustment so that the vanes do not clash. Of late years this turbine engine has been meeting with signal success, and many engineers are now considering whether it is not destined to revolutionize the means of obtaining power from steam, both by land and by sea. The author suggests, however that engineers and inventors should turn their attention toward bringing to perfection gas turbines, now that cheap gas is available, and the ideal engine, combined with the most economical way of obtaining electrical energy from coal, may then result.

The fundamental principle attending all methods of electrical working is implied by the word "velocity," a requirement eminently possessed by the dynamo, motor, and rotary convertor, owing to the entire absence from these machines of reciprocating parts. This requirement, however, is not possessed by the prime mover, the modern reciprocating engine. Velocity was first obtained on the dynamo by means of belts, or ropes, but this method of driving was soon discarded; it took up too much available floor space, and was an unsatisfactory and inefficient arrangement at the best. The attention, therefore, of the most prominent engineers in the world was directed toward increasing the speed of the engine, so as to adapt it for direct coupling to the high-speed dynamo or alternator. The efforts of these engineers were attended with very great success in Britain, and they were able not only to couple their new high speed engines to the dynamos, but they also obtained those qualities of economy and reliability of working claimed for the slow-speed engine with its belt drive; and the market now supplies high-speed engines of moderate sizes and of British manufacture, which are second to none in the world.

The demand for electrical energy for all purposes has, however, increased by leaps and bounds, and has thus called for larger generator and larger engines with heavy reciprocating parts, and, therefore, more strain and wear, bringing increased engine troubles. High speed engines are now being built with pistons weighing considerably over two tons. Such a piston will have to start and stop from 400 to 500 times per minute. When this enormous weight, making 60 many reversal per minute, is considered, it will not be difficult to imagine the steam hammer effect obtained if the least thing goes wrong with the valve setting or the compression. On account of the increased engine troubles with high speed engines, manufacturers are now falling back to moderate speed, and many to low speed, although this is attendant with an increased cost of plant. Taking into consideration the large demands for electrical energy which must be made in the near future, it seems probable that the size of the generator and slow speed engine will become unmanageable also great difficulties will be experienced in shipping and erecting them. The aim of all engineers should be simplicity, and the modern reciprocating engine, with its numerous complications, cannot by any means be considered the embodiment of this

principle of simplicity. The great number of its moving parts, which require watching and adjustment, increases the cost of maintenance and attendance.

Engineers who have had charge of power stations of from 6,000 h. p. to 10,000 h. p. are fully aware of the laborious and never-ending work and watchfulness required to maintain their reciprocating engines in fair running order; the station calls, incident to the taking up of brasses, repairs and adjustments to valves, gland packing, cylinder lubrication, automatic governors, trip valve gears, and many other things, are items that go to build up the daily and nightly experience of the present-day station engineer. Engineers laying down new plants have to consider the increased cost of building, the larger floor space required, the longer lengths of steam and exhaust piping, valve-opening gears, and heavy cranes for lifting, which are required in the case of large reciprocating engines, as against the requirements of a station laid out with steam turbines. The massive nature of foundations, the time required for delivery and erection of large plants, are items which often seriously delay the speedy completion of contracts.

It was owing to these and similar reasons that the author's attention became directed towards the steam turbine as offering a possible solution of the difficulty, and a short experience with machines of this type has since formulated his belief that progress in the generation of electrical energy lies in this direction. The failure of the steam turbine to secure earlier appreciation was probably due in great measure to that inherent conservatism to which British engineers are only too liable. Two years ago the author had the opportunity of going through the country to inspect all the larger turbine installations, and the conclusions then arrived at were: (1) It was inadvisable to put down a steam turbine to exhaust to atmosphere. (2) It was inadvisable to put down a steam turbine of a small size. (3) It would be policy to install steam turbines from 200 kw. to 300 kw. and upwards either for alternating or continuous current generation for lighting or power, provided there is a plentiful supply of cold water available for condensing purposes, and also provided the surface condensers were used, all the water being returned to the boilers.

From the year 1885 until 1890 nearly all the turbines manufactured were non-condensing and of comparatively small size. They were not economical; in fact, many engineers called them steam-eaters, but great improvement, both in construction and design, has since been made in them, and has led to a very much smaller steam consumption, so that there is now on the market a steam turbine which, in the larger sizes, and in the matter of steam consumption, is capable of holding its own against any triple-expansion engine yet produced. Even in the early days, when they were considered steam-eaters, their smooth running and general adaptability to the driving of electrical machinery was the subject of much comment. The author, however, wishes to call the attention of the members to a few of the advantages which the adoption of the steam turbine, when running under ordinary conditions in a power station, has impressed upon his mind.

As many members are no doubt aware, a steam turbine of 500-kw. capacity 100 cycles, single phase, was brought from the Paris exhibition into the Sheffield station about 18 months ago, and was running on the town load within three days of the time of its arrival at the station doors, and within about three weeks of the date of the order by telegram. It was simply dropped down on the station floor, without any preparation in the way of foundations, and has since, over the period stated above, run more or less continuously and during longer hours than any other unit in the station. It runs in parallel with alternators both of the iron and copper type, with engines of the triple and compound type, and can be brought up to speed to meet the demand of a sudden load much more quickly than any other of the neighboring units. Boiler priming or wet steam simply causes momentary slackening of speed until the turbine clears itself of water. Other advantages are as follows: (1) Absolutely steady nature of turning moment. (2) Entire absence of cylinder lubrication, which, therefore, allows of all the condensed steam being returned to the boilers. The saving in this one item alone materially assists in the reduction of station costs. (3) The time occupied in

cleaning down is brought to a minimum, and is about one-sixth of that required with a reciprocating engine of similar capacity. (4) The entire absence of rubbing surfaces and packed glands within the steam chamber will permit of the use of superheated steam without fear or injury. The turbine specially lends itself to the use of superheat of a high temperature, and in this respect possesses a considerable advantage over a reciprocating engine. (5) Exceedingly small costs for attention and repairs, and great reliability of working. These last items bring home to the engineer more forcibly than anything else the advantages of a purely rotary as opposed to a reciprocating motion.

When considering laying down a steam turbine plant, the main factors to be considered are:

1. Good vacuum in the condenser. This is even more necessary than with an ordinary engine, as the makers claim that the turbo expands the steam right down to the vacuum of the condenser. The following table of actual tests taken on a 500-kw. turbo-alternator set, running at 2,500 r. p. m. with 130-lb. steam pressure and no superheat, illustrates how important it is to obtain a high vacuum:

Vacuum, Inches of mercury.	Steam consumption per kilowatt-hour.		
	Full load.	Half load.	Quarter load.
28	22.2	25.6	32.4
27	23.1	26.9	34.5
26	24.0	28.2	36.6
25	25.1	29.7	39.0
24	26.2	31.2	41.2
23	27.5	32.9	44.8
22	28.9	34.7	46.3

2. Arrangements for high superheat, as tests show that with 50° F. of superheat, there is 8 per cent, and with 100° F., 12 per cent economy in steam consumption. From the tests taken on the 1,250-kw. steam-turbine sets, which are now working satisfactorily at Ellerfeld, in parallel with Sultzer engines, where the speed ratio is something like 16 to 1, it was shown that there was a gain of 12 per cent with 55° C. superheat, and that every inch of vacuum improves the steam consumption by 4 per cent. It was also shown that the steam consumption in the turbines, other things being equal, decreased constantly with increasing loads, whereas the Sultzer engines showed a less economy over three-quarter load.

The steam consumption in a turbine closely follows the right line law, or is proportional to the load added to a constant quantity which represents the consumption of steam at no load. The new 1,500-kw. turbo-alternators which the author is installing at Sheffield power station will, with their own condensers, only occupy the space of 730 sq. ft. The foundations will be of the simplest description, and the general compactness of the sets and the ease of erection are expected to effect a considerable saving of time and money. The appearance of the station will be improved by the absence of ugly lengths of steam piping, or cylinders poised up in mid-air to obstruct the lighting of the building, and altogether the author hopes that there will be a general absence of that complexity of moving parts which to the trained eye of a station engineer offers so many possibilities of failure. The author has been severely criticised for starting a large power house with steam turbines, but time may show whether this criticism is deserved. At present, however, he feels quite confident, after considering the problem from all points, that the steam turbine stands in a most favorable position when compared with reciprocating engines of large powers for the supply of electrical energy.

#### THE CORRECT TYPE OF ENGINE FOR LARGE GENERATING STATIONS.

BY A. A. DAY.

In bringing the subject of the correct type of engines to be used in future electric power stations before this association, I would point out that many stations have now arrived at that state of congestion which will necessitate before long a larger electric supply station being put down. Under these circumstances, it seems to the author very desirable that the type of engine which should be employed in such a station should be discussed by this association. Further than this, it is quite apparent, if the various types of plant employed in central stations throughout the country are considered, that it is not an easy question to settle which is the correct one. I think it may be taken generally that the engines used in the United

Kingdom are mostly high speed with a sprinkling of the low-speed type, both horizontal and vertical. In America the low speed type, both horizontal and vertical, is almost exclusively employed. On the Continent low speed is also almost universal. It must, therefore, be taken as a matter of fact that all three types can be used and are used successfully in electric lighting and power works. It may, perhaps, also be further noted here that in the case of the power schemes which have recently sprung up in England, the engines proposed for these are of the low-speed type, and also that the larger generating sets in the large stations of this country have also been put in at low speed. On the whole, therefore, I think it may be taken at the present time, having regard to the fact that larger generating sets are being used, that there is a tendency towards the low-speed type. One great factor in the matter is that the space occupied by large generating sets does not appear so unfavorable to the low-speed type when the set is large, say 2,000 h. p. or upwards.

The whole question of high versus low speed I do not purpose to enter into in this paper, as I am quite sure the members of this association are familiar with the advantages and disadvantages of both types, it having been discussed repeatedly before various societies and in the public press. If, however, one goes outside electrical engineering and compares the results from the engine point of view only, one finds the low-speed engine still holds the record for low steam consumption. The conditions under which engines in existing electric power stations run are such that very little can be gained from their records which will help towards the solution of this question, as not only is the load factor bad in most cases, but the plant factor also, and the very large amount of steam piping which is necessarily kept alive (but not to the full extent of its usefulness) all combine to produce the very poor results which most central stations at the present time show in pounds of coal per unit generated. The effect of these factors together is so marked that it is almost impossible to gain any figures from central-station statistics bearing upon the relative figures of merit of different types of plant, for it might even be argued from such statistics that condensing was the reverse of an economy.

The author's opinion on this question of high versus low speed is that if one adopts the principle of high speed it should be high speed, and not, as is very frequently the case, and especially with engines developing large power, only a moderately high speed, and the larger the set generally the less the speed, so that when one comes to a set of about 2,000 h. p. the space which is necessary for a high-speed set or a low-speed set is approximately the same. If one adopts the high-speed principle, he must of necessity abandon the idea of personal human supervision of the working parts. If this is admissible, the higher the speed the better the results, both as regards economy of steam, space, and material. The question of space occupied is not, however, of vital importance where a station is being built on large lines for the supply of a considerable amount of power, say on the three-phase alternating system, giving a high-pressure supply, and therefore rendering the position of the power house a question of much less moment than it was in the case of the first electric light stations put up, when the public was timid as to the utility of an electric supply, and had very small notions of what that electric supply would develop into in the course of a few years. The author also thinks it may be generally taken that the question of space occupied per horse power has been very considerably overdone in the past. Many stations now are very cramped, and when repairs are necessary, a good deal of inconvenience is caused by the cramped way in which the engines are arranged, and when, as appears to be the tendency, the generating sets are of much larger dimensions than they have been hitherto, the necessity for space round the engine is much greater, and a larger amount can be allowed without making the horse power per square yard of the engine room as a whole too small. It should also be borne in mind that in a station employing large units, if the engines are placed close together, it is impossible to put the boiler power into so compact a space. The consequence is that if one generating set requires half a dozen of any type of boilers to supply it with steam, there is no reason why that set, from a space point of view, should occupy less than the length of the engine room covered by the boilers. If this rule be carried out (and it will be found a point of considerable importance in the designing of large stations), it will be found that it is unnecessary to cramp an engine for the sake of saving its floor space, especially in putting down a station such as is here being considered where the power units are large, while at the same time paying due

regard to the importance of having as small an amount of steam piping as possible. It therefore seems to justify the employment of low-speed engines in a station such as we are discussing.

It may be objected that the large unit is not a necessity in the case of an ordinary town supply. If, however, a little consideration is given to the probable demand for electric energy during the next 20 years, the author feels sure that the putting in of small sets, such as one repeatedly sees even now, will cease. There is no reason why large towns such as Manchester, Glasgow, Liverpool, and so on, should not be employing at the end of the period above stated 100,000 h. p. for all purposes. On the Continent, Berlin has already reached half that amount, and the output is seven times that of Liverpool. In England we have just as good an opportunity, and probably the demand for electric energy will be quite as great once the principle is grasped that electric motive power is undoubtedly the coming means of power distribution. This cannot, however, come about in England until the price of current is reduced below the figure at which it now generally stands for motive power, because in England we have a very good supply of cheap coal in the manufacturing districts, where a motor demand is likely to be of the most importance. Nevertheless, the author thinks the figure above stated for such towns is a reasonable one, and if one takes 50,000 h. p. in the same period for towns next in point of size, and 20,000 h. p. for comparatively small towns in the manufacturing districts, it will be at once evident that if these figures are reasonable, large generating sets must be the order of the day; if not, the power stations connected with such towns will become unwieldy in size, and the advantages of large engines will be lost, and the loss in steam pipes will become enormous.

After very carefully considering this subject from all points of view, the author considers the low-speed type of engine should be the one adopted in the future for large power stations; that it will be condensing goes without saying. The type which the author suggests as most suitable in the long run (and it should be borne in mind that the power stations must be put down to last as a business concern and without anything about them of an experimental nature) is a horizontal low-speed compound or triple-expansion engine with direct-coupled generator between cranks. This type does not appear to have been very largely tried in England. It has, however, succeeded well on the Continent, and in the author's opinion may generally claim to have the following advantages, if the question of the space occupied is left out.

1. The most economical engines have been built of this type, and certainly it can hold its own, if properly built, with any results obtained in electric light stations. These results, as far as they have gone, do not require any very economical engine to obtain them, although one is fully aware that the reason why the pounds of coal used per unit in electric light stations generally is very large, is due to the poor load factor which these stations have. The author recently had occasion to inquire very closely into the question of the cost of producing power in large cotton factories such as there are in Bolton, and the figures obtained were equally a good advertisement for the horizontal type of engine, which is almost universally employed, and also very useful as a guide to the price at which it is necessary for power to be supplied in order to make its use become general. Such engines are found to give an indicated horse power hour for less than 1 d with coal about 78 per ton, and this on a load having a variation of 10 per cent.

2. The horizontal engine does away with the necessity for steam pipes in the engine room, or rather, above the engine room floor, and enables the steam pipes to be reduced to a minimum. This is a question of vital importance in a large station, and one of the points which requires very careful consideration. By adopting the horizontal type of engine the difficulty of steam pipes can be satisfactorily overcome as far as the engine room is concerned, and at the same time keep the engine room neat, doing away with all obstruction to the free use of a traveler from one end of the engine room to the other.

3. The engine can be kept clean at a minimum of expense and trouble.

4. The repairs to such an engine will be found to be reduced to a minimum if the valve gear be of the corliss type, which appears to frighten some engineers by its complication. The complication seems to the author to be far more apparent than real. It is no more necessary that the gear should be more complicated than in the case of an enclosed high-speed engine, but it is seen in one case

and not in the other, and a good deal of complication can be done away with if the motion work were not made so that it could be adjusted while the engine was running, which the author considers to be too great an advantage to be thrown away for the sake of appearances.

5. The engine is easily accessible for repairs, and the same applies to the dynamo. It seems to the author that the weak point of a similar type of engine to that under discussion, but vertical instead of horizontal, is that to remove the top half of the field-magnet ring, or to get at anything of importance on the dynamo, necessitates the dismantling of the engine to such an extent that it practically means rebuilding, and if this dismantling has to be done in a cramped space it is a very costly and lengthy business.

6. The dynamo being placed between the two cranks, the shaft is not in any way cut up. We all know the difficulty that has been found to exist in making a crankshaft with built cranks strong and able to withstand the throwing off and on of the full load repeatedly, as must necessarily be the case with electrical generators for power purposes and traction. The author does not mean by this that there is anything extraordinary in the strains set up in a generator on traction supply as it has been attempted to prove. It is obvious that such strains cannot exist. Nevertheless, practice bears one out that a three-crank shaft is not so easily made strong enough to stand the shocks which do occur, as one with two cranks at the end of a plain, simple shaft.

7. The bearings of such a horizontal engine can be adjusted both vertically and horizontally, enabling the armature to be adjusted inside the field, which it is very advisable should be possible. A point about which there has been considerable discussion, and which seems to have been at one time considered insurmountable in connection with low-speed engines, is the difficulty of getting a very even turning moment without an abnormal fly-wheel. It is, of course, of the utmost importance that the turning moment should be very even in the case of three-phase or polyphase transmission, but a good deal more has been made of this point than is necessary, as there are three-phases running on the Continent, and running satisfactorily, with engines that have only a single crank, the percentage of variation being 0.3 per cent of the angular velocity; and it is not at all difficult to make a two-crank engine such as has been described, with a far more even turning moment than is possible with a single-crank engine, however well designed. The weight of the magnet wheel in the above-mentioned instance is 43 tons.

This proves conclusively that an even turning moment can be obtained from low-speed engines, enabling such a type to be used in connection with alternating-current machinery; and, therefore, the arguments which have been adduced as to the advantages which high speed gives in this matter are, to a certain extent, done away with, because there can be no need for the fly-wheel of a low-speed generating set being made abnormally heavy to obtain a sufficiently even turning moment, especially if the engine is not a single-crank one. One knows that the usual way of looking at this question of high versus low speed is that a high-speed engine with a short stroke gives a higher mean effective pressure in cylinders and that, in combination with the quick stroke, reduces the condensation in the cylinders to a minimum, and, in so far as this takes place, the high-speed engine has the advantage over the low-speed one; and it is not practical to make a high-speed horizontal engine of large size, it has that advantage over that type, but the horizontal type of engine if fitted with corliss valves is much better drained than the vertical, either high or low speed; and if the condensed steam can be easily disposed of, the advantage if the high-speed vertical type due to lessened condensation is minimized. It is also true that the wear and tear of pistons on a horizontal type is greater than in the vertical, but this can be minimized by having tail rods without side bearings, etc., and the amount of wear which actually takes place is, to a certain extent, due to the material of which the cylinder and piston, respectively, are composed, and in a well-designed engine of good proportions the wear is not excessive. When we see engines that have run for 20 years without new cylinders or reboring, and still show good economy, it may be argued that this wear is a matter of small importance.

A very great point is gained when, in trying to arrive at the correct solution of this question, one can get the various points down to their relative importance. For instance, taking the question of condensation in cylinders, this is a point on which great stress is laid by some engineers. At the same time the condensation in the

steam pipes, and which is more easily avoided than that in the cylinder of the engines, amounts to many times the latter. The same thing with regard to the friction of the piston and cylinder liner. The difference in this item between a horizontal and a vertical engine does not equal that which may be caused by a slightly inferior grade of cylinder oil, and although one does not say for one moment that all these points are not of great academic interest, and that we should all strive to obtain as perfect a result in all parts of central stations as is possible, still it is not worth while nor likely to increase the efficiency of the station as a whole, if such small points of economy are to be considered without the question of convenience and the relative importance of such points being taken into consideration, since indirectly they may very materially add to the running costs of the station. In the matter of convenience, for instance, the time occupied in making the bottom cylinder cover joints on a vertical and horizontal engine respectively would probably be somewhere in the ratio of 3 to 1, or if through any cause the work had to be done quickly, the probable time the joint would stand would show a still greater difference in favor of the horizontal type. This matter of convenience in getting at parts for repair work is very much greater in the case of horizontal engines than in vertical engines, and this point very largely outweighs the economy due to the reduction of condensation losses, especially seeing the relation the comparatively insignificant proportion of these losses bear to the total, and if the engine of the slow-speed type can produce an indicated horse power hour for .05d or .06d for coal, and the question of the space occupied is not of vital importance, as it should not be in the case of a power station put down on the high-tension alternating-current system, on the whole there can be no question that the horizontal low-speed type is the one which should be employed in the future.

The author has previously stated that with regard to the question of high and low speed, if it is to be high speed it should be a very high speed, and as it is not likely that engines of the reciprocating type would be obtained giving a higher speed than that now usually employed for that type of engine, where space is important, the steam-turbine type would be the correct one to adopt. The author has not had any recent experience with the steam turbine from which he is able to draw conclusions, and after the paper we have had from Mr. Fedden he does not propose to enter upon that question, but some years ago, in the early days of the steam turbine, he ran one which was very satisfactory except in one point, and that was the question of governing. He has since seen engines of this type running, and in their case the governing seemed to be excellent. There is a great future for this type of engine, and where space is of importance it seems likely to come to the front. However, he would give preference to the low-speed type for power-station work of the size which is being considered in this paper, because, as in the case of both alternators and dynamos, it is an advantage to build them of such a size that it is not necessary to employ a high speed of rotation in order to get the necessary e. m. f., and at the speed at which a turbine runs the rotating part of the dynamo or alternator will become too cramped to make a thoroughly sound engineering job of it, which is very necessary at such a high speed of rotation. There is one point in connection with low-speed engines of large power which some members may be inclined to bring forward, and that is, on large sets, especially on the Continent, it seems necessary to employ a large number of men. In the engines recently erected in the power station at Pinkston a very large number of men were employed, but this is not necessary, and was mainly due to the contractors wishing to have no mishaps on a brand new engine. At any rate the number of men required is not excessive in the case of horizontal low-speed engines, and there is no reason whatever why two men, one to drive and one to grease, should not run a 5,000-h. p. set of the horizontal type, and not lead a very hard life at that.

It has always appeared to the author that an electric supply station is somewhat analogous to a pumping station, and the contrast between the quiet, cool and clean engine room of a pumping station which runs night and day, and the easy and very free-from-anxiety sort of life that the drivers of such engines seem to have, when compared with the unrest which exists in the electric power house, is very great. This notwithstanding that the high-speed engineer would probably say that the valve gear of such pumping engines was the most complicated box of tricks that he ever saw in his life. There is no reason why the future power house should not be as

clean, tidy and free from noise and heat as the ordinary pumping station, and this will be most easily obtained, without the sacrifice of any economy, by the employment of low-speed engines of the horizontal type, coupled to steam pipes carried underneath the floor direct to the boiler house. We should, then, in our future power houses probably be able to show results such as some members of the Institution saw during their trip to the Continent, where the cleanliness of the engine room and machinery was remarked by everybody, and where, notwithstanding complications and the alleged disadvantages attached to low speed, the results obtained were sufficient to advance the business at a much more rapid rate than any English stations can show, and sufficiently low to bring electricity into far more general use than it has yet attained in England.

The author does not wish to be misunderstood in this matter. The claims of the high-speed engine to economy of space and steam, at any rate in small sizes, he admits, also the advantages of all engines of the vertical type as regards floor space; but the horizontal type has advantages as above stated, and these outweigh those of the other types except in the matter of space. If an electric light station were not so largely affected by its load factors, the relative values of the different types would be apparent, and we, as station engineers, should be able to lay ourselves out to get the very utmost economy of coal, as in the long and steady runs of marine engines; but as in the very nature of the case we cannot hope to establish records for coal consumption per indicated horse power in electric supply stations, the refinements which lead to the utmost economy in steam may be dearly purchased, and it is for this reason that the convenience, economy of oil and labor, easy access for repairs, with the other points already mentioned, the horizontal engine of low-speed type appears to the author to be the most suitable for large sizes where space is not of supreme importance.

The author has not gone into the question of the arrangement of cylinders, or the question as to whether compound or triple-expansion engines should be used. Personally, he would divide the plant up, some triple-expansion and others compound. This is a matter which has to be settled for each individual station, but generally triple-expansion is not warranted except in the case of very large sets when they can be kept fully loaded. In any case, the horizontal engine can be made triple-expansion or compound, and the cylinders can be so arranged that the turning moment for either will without doubt enable alternators to run perfectly in parallel. The question of price the author has not gone into in this paper (although this is not against the type proposed), because in the question of electrical machinery price is of secondary importance, the more so as the importance of the electric supply increases. It is also rather difficult to discuss the question of engines without taking into consideration the kindred question of boilers, or, indeed, the question of the whole of the station plant, every part of which is so much dependent upon every other. If, however, sufficient has been said to bring about a discussion on this important point, it may be of use to us in the future.

### BROOKLYN EMPLOYEES' BENEFIT ASSOCIATION.

Over 800 members of the Brooklyn (N. Y.) Rapid Transit Employees' Benefit Association met Friday, October 17th, at Association Hall, Brooklyn, to discuss means for extending the membership and increasing the efficiency of the association. The secretary presented his financial and statistical report showing a membership of 2,600; gross receipts to Oct. 1, 1902, \$9,062; gross expenditures, \$5,000.72; balance on hand, \$3,161.28. To date 173 members had received \$2,587 in sick benefits and five death benefits had been paid. Preliminary plans were presented for a new clubhouse to be erected as permanent headquarters for the association at East New York. Provision was made for the enlargement of the Sick and Claims committee by the appointment of a local committee at each depot. On behalf of the board of trustees the chairman made formal presentation of the bowling trophy won at the Rockaway outings by the Ridgewood team. A visit was made to the Y. M. C. A. gymnasium where the evolutions of several classes at athletic drill were witnessed.

The Milwaukee Light, Heat & Traction Co. has been granted a franchise for a line from the city limits to St. Francis.

## RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

### EXTENT OF DUTY WITH REGARD TO KEEPING RAILS FROM PROJECTING ABOVE SURFACE OF STREET.

*Citizens' Railway Co. v. Gossett* (Tex. Civ. App.), 68 S. W. Rep. 766. May 7, 1902.

The court of civil appeals of Texas holds erroneous an instruction in which the jury was charged that the company would be liable if it permitted the surface of the street to become lower than the rails of the railway track, and which grouped facts that would authorize a recovery if this was the case. It says that if the company had exercised ordinary care to keep the street and the tracks in a reasonably safe condition, so as to permit the crossing of vehicles, it would not be liable, although the rails may have been projected above the surface of the street.

### INJURY TO PASSENGER FROM CATCHING FOOT IN RING IN FLOOR OF CAR—EVIDENCE OF RING RISING AFTER ACCIDENT EVIDENCE OF NEGLIGENCE—REPUTABLENESS OF BUILDER OF CAR NO DEFENSE.

*Kingman v. Lynn & Boston Railroad Co.* (Mass.), 64 N. E. Rep. 79. May 21, 1902.

The party suing and two other passengers present at the accident testified that the ring in which the former testified that she caught her foot was standing erect immediately after the accident, and was then pushed down by another passenger with an umbrella, and that repeatedly thereafter the same ring whenever the car started after a stop, rose and remained upright until pushed down by some passenger or by the conductor. The supreme judicial court of Massachusetts holds that the evidence was competent. It says that there was no reason to infer that anything about the car was different at the time to which the testimony referred from what it had been when the car left the barn after its morning inspection. If during the time testified to the ring rose frequently as the car started, and remained up until pushed down, this tended to show that it had been doing the like since its use on that day began. Knowingly to use a car in that condition was negligence on the part of the carrier, and the evidence was competent to show that the car had been in fact in that condition for so long a time before the party suing became a passenger that the company should be charged with knowledge of the dangerous condition, or with negligence on the part of the conductor in not ascertaining the danger. In the testimony of the three witnesses as to the action of the ring at the time of and immediately after the accident there was evidence which would warrant the jury in finding that the company and its servants were negligent. However reputable the builder from whom the car was bought, and however usual the particular device of the ring, if the device was allowed to get into and remain in a condition which usually raised it when the car started, it was negligence not to discover and remedy that condition.

### FRIGHTENING OF HORSE BY NOISE AND SMOKE FROM BRUSH HOLDER GROUNDING—PRESUMPTION FROM NOISE AND SMOKE NOT INCIDENT TO ORDINARY OPERATION OF CARS.

*Richmond Railway and Electric Co. v. Hudgin* (Va.), 41 S. E. Rep. 736. June 12, 1902.

Here it appeared that when the latter named party, by whom the action was brought, was shown a horse and wagon's length distant from a car, which had one of the older styles of motors and was used in emergencies to take the place of other cars undergoing repair, he heard the car make a loud, unusual noise, to which neither he nor the horse paid any special attention; but just as the horse got even with the car the car stopped, and an unusual volume of smoke came from under the front of the car, right in the horse's

face, which caused the horse to take fright and start to run away. The party pulled the horse up, and, in order to keep it off the curbstone, pulled the left rein harder than he did the right, whereupon the horse darted across the street to the left; and the sudden turn of the wagon threw the party, who was sitting on the right side, out of the wagon, the wheel of which passed over his leg, breaking and crushing it severely. What happened to the car on the occasion of this accident was described as the "brush holder grounding." The supreme court of appeals of Virginia affirms a judgment in favor of the party for \$2,000 damages, holding, among other things, that there was no error prejudicial to the company in the giving of the following instruction: "If the jury believe from the evidence that the horse of plaintiff was frightened by the noise and smoke arising from the machinery of the car of defendant, and that said noise and smoke was not incident to the ordinary operation of their cars, they are instructed that this raises the presumption that such noise and smoke would not have been caused if those who had the providing, maintaining, and care of defendant's machinery had used proper care in regard thereto, and, in the absence of an explanation on the part of the defendant showing due care on its part, they may infer that the defendant was guilty of negligence; and if they further believe that such negligence caused the accident as set forth in the declaration, and that the plaintiff was free from fault, they must find for the plaintiff."

### SUFFICIENCY OF INDICTMENT FOR OBSTRUCTION OF STREET BY RAILS TOO HIGH AND NOT PROPERLY FILLED BETWEEN—CITY CANNOT AUTHORIZE DESTRUCTION OF REASONABLE USEFULNESS OF STREET.

*Commonwealth v. Camden Interstate Railway Co.* (Ky.), 68 S. W. Rep. 628. June 3, 1902. "Not to be officially reported."

An indictment read: "The grand jury of Boyd county, in the name and by the authority of the commonwealth of Kentucky, accuse Camden Interstate Railway Company, a corporation, of the offense of creating and maintaining a public nuisance obstructing a public street and highway in the city of Catlettsburg, Ky., committed as follows: The said defendant on the 10th day of Sept., 1901, and on divers other days within one year before said date, in the county and circuit aforesaid, did unlawfully create and maintain a public nuisance on a public highway in a public neighborhood, by so placing its ties and rails as to leave them above the level of the street, and by failing to fill between said ties and rails so as to enable vehicles and wagons to pass over them on Oakland avenue, a public thoroughfare in the city of Catlettsburg, Ky., to the great hindrance, delay, and inconvenience of the traveling public and many people who live in the neighborhood; said defendant being a corporation, and operating a street railway in said city and over said avenue under the laws of the commonwealth of Kentucky. Against the peace and dignity of the commonwealth of Kentucky."

It was contended that this indictment did not state facts sufficient to constitute an offense. Objection was also urged against it because it did not sufficiently specify the points of obstruction. The court of appeals of Kentucky is, however, of the opinion that the charge that it obstructed the street (naming it) sufficiently described the place. Nor does it think that the indictment should necessarily have stated how high the rails were placed above the level of the street, nor how deep the spaces between the rails. The indictment, it says, explicitly charged that it was so constructed that vehicles could not cross the road. If it should turn out in the evidence that the depressions and elevations were only such as reasonably attended the legal and proper construction and operation of the railway, it would, of course, follow that the defendant could not be guilty.

The indictment, it was further insisted, failed to allege that the road was operated contrary to the ordinance of the city. But the court does not think such contention was tenable. The city, it says, would have no power to authorize the construction and operation of a street by a railway company in such a manner as to de-

destroy its reasonable usefulness to the public. In other words, the street could not be entirely destroyed or rendered useless for public purposes simply to suit the convenience of a railway, and it may be fairly assumed that no such ordinance was ever enacted by the city, if a city will not presume to enact an ordinance in violation of the general law of the land.

Wherefore the court holds that it was error to sustain a demurrer to the indictment.

#### SEPARATE TAXATION OF FRANCHISE.

*City of Dallas v. Dallas Consolidated Electric Street Railway Co.* (Tex.), 66 S. W. Rep. 835. Mar. 6, 1902.

Section 118 of the charter of the city of Dallas provides that "the city council shall have power to levy and collect the ordinary municipal taxes upon the roadbed, rights, franchises, and all other property of street railroads of every kind," etc. Section 131 provides that "the city council shall have power to assess the property and shares of corporations, companies, banks, and such other institutions as the same are now or may be assessed by the state law in such cases made and provided," etc. Section 135 confers the power upon the council to prescribe the manner of rendering and assessing property for the purpose of taxation by the city. The supreme court of Texas holds that the charter authorizes the assessment of the franchise of a street railway company as a separate item in the rendition of its property for taxation, or, as it states it in another place, the city council has the power to require the franchise of a street railway company to be assessed separately from its tangible property.

However, it was insisted on behalf of the company that since, under the ordinances by which it acquired the right to operate its line over the streets of the city, it is required to pay an annual sum for the privilege, it could not be held liable to pay a tax for the franchise. In other words, the contention seemed to be that the sums required to be paid annually are a franchise tax, or are in lieu of such tax, and that the exaction of the tax here in question was double taxation. In some of the ordinances the fixed annual charge so imposed is called a "franchise tax," in others it is called a "bonus," and in still others it is simply imposed without being called by any name. It is clear, the court holds, that the ordinances which simply impose the annual payment as a condition of the grant and those which call such payment a bonus do not import a contract for exemption from taxation of the franchises granted. As to those in which the annual payments are called a franchise tax, the construction is not so clear. Still the court hardly thinks that such designation of itself is sufficient to show such clear and unmistakable purpose to contract for an exemption from taxation as the authorities hold necessary to show a contract for such exemption. But it says that it was not called upon to decide that question in this case. In the absence of legislative authority, a city has no power either to exempt property from taxation or to contract for a commutation of taxes legally assessable upon it. No provision in the municipal charter giving such authority was referred to in this case, and the court takes it for granted that none exists. It would seem, however, it adds, that the fact that the company is required to pay a sum annually for the use of the street is an important matter to be considered in assessing the value of its franchise. It is evident that a franchise burdened with such an exaction is not as valuable as it would be did no such burden exist.

#### DUTY WHEN A HORSE IS FRIGHTENED AT A CAR—AS TO RINGING OF BELL.

*Oates v. Metropolitan Street Railway Co.* (Mo.), 68 S. W. Rep. 906. May 21, 1902.

The sum of the adjudicated cases bearing upon the relative rights and duties of street cars and citizens traveling in vehicles drawn by horses or other animals is, the supreme court of Missouri, division No. 1, says, that both have a right to use the street, but that neither has an exclusive right. The operator of a street car is not necessarily obliged to stop the car every time a horse shies or scares at the approaching car; but when the operator of the car sees that a horse is frightened at the car it is his duty to manage his car in such manner as a man of ordinary prudence would do under the same circumstances, and it is always a question of fact for the jury

whether such care in the running of the car has been observed. This duty may or may not lead to the necessity for bringing a car to a full stop. The duty of the company in this regard is just the same as the duty of one individual or citizen to another when they meet on the highway and the horse of one becomes frightened at the vehicle of the other, or at anything upon the vehicle of another. Because a street car carries more people than any other kind of a conveyance, or because it is authorized to run more rapidly than a vehicle can ordinarily be legally driven, or because the rush and restlessness of the age makes unreasonable demands for more and more rapid transit along the crowded thoroughfares of populous cities, it does not follow that a street car can be run in disregard of the rights of persons traveling by other means, nor that a street car company is any more exempt from the common law duty of every one to exercise ordinary care, nor that it is only liable where the agents act wantonly, maliciously, and heedlessly.

Again, the court says that even a court may indulge the information that is possessed by every man that ringing a bell will not stop a runaway horse, or cause him to deflect his course so as to avoid a collision with a street car. The company admitted the ringing of the bell, but sought to justify it on the ground that it was thereby trying to assist the party suing in keeping his horse away from the car. Such an explanation did satisfy the jury, but it fails to satisfy the court. There was ample evidence to sustain the contention of the party suing that the horse became frightened at the approaching car, and began backing until the buggy was forced onto the track, and that the company's agents slowed up the car, but continued to approach the horse, all the while ringing the bell violently, until, when the car was within a few feet of the horse, he suddenly wheeled around, nearly turned over the buggy, ran away in the direction he originally came from, and threw the party suing out and injured him. This being so, a demurrer to the evidence was properly overruled, and the point here principally relied on by the company, that in no event would the party suing be entitled to recover, and therefore the verdict in its favor was for the right party, and the verdict should not be set aside, became untenable.

The true rule is, the court says, that while the bell must ordinarily be sounded to give notice of the approach of the car, still if the operator of the car sees that a horse is already frightened by the approach of the car, and that the citizen is in danger, it is his duty to cease sounding the bell, and to even stop, if necessary; and if, instead of doing so, he continues to sound the gong or ring the bell, and further frighten the horse, and cause him to run away, the company is liable for injuries inflicted in consequence thereof. Of course, if the driver of the horse knows that the horse is liable to become frightened at street cars, and to run away, and with such knowledge drives him on a street with a car line on it, he does so at his own risk. But this does not authorize or justify the operator of a street car to needlessly sound the gong or ring the bell, nor to continue to do so when it is apparent that the only effect thereof is to further frighten the horse.

#### OLD SPEED ORDINANCES NOT APPLICABLE TO ELECTRIC LINES.

*Bonham v. Citizens' Street Railroad Co.* (Ind.), 62 N. E. Rep. 996. Feb. 21, 1902.

The supreme court of Indiana holds inapplicable to an action for a personal injury by an electric car a city ordinance of 1864 granting to the company's predecessor in title a franchise and containing a speed restriction, as also an ordinance of 1876 practically re-enacting the latter, and this notwithstanding that the company assumed all of the obligations resting upon its predecessor. It says that there was no claim made, upon the evidence or otherwise, that the company was not entitled to use electricity as a motive power, and, as the court knows judicially that within 15 years last past electricity has become the ordinary motive power that is used in the propulsion of street cars, it feels justified in holding that prima facie the company was rightfully entitled to use electricity for that purpose. Assuming, then, the rightfulness of the company's action in that particular, could it, the court asks, be said that the speed ordinances referred to were violated by it upon the occasion when the party suing was injured?

The court knows that after the advent of electricity as a motive power for street cars such carrier corporations granted the demands of the public for swifter transit, and that by extending their lines

into what was before suburban territory such corporations have caused the environs of cities to expand until populous residence districts have sprung up at distances so great from the business portions of such cities as to now be practically inaccessible if there were an enforced return to the rate of speed that obtained in the operation of street cars 20 years ago. At the same time, while it is undeniable that the increased rate of speed at which street cars are now propelled has had a tendency to increase the peril to life and limb and property upon the street, yet that tendency has been in some measure neutralized by the greater care that the public now generally exercise in going upon or along street car tracks. The question as to the maximum rate of speed at which street cars shall be permitted to be propelled along the streets of a city is, in the first instance, at least, a legislative question, and it is evident that the new factors suggested could scarcely fail to receive due consideration in enacting a new ordinance.

Continuing, the court says that it is not called upon to and does not condemn the speed ordinances in question as unreasonable, but it points to the above considerations as manifesting the fact that the ordinances are inapplicable, because almost every material condition is now different from what it was at the time of the adoption of such ordinances. When substantially new factors enter into the problem as to what the written law ought to be as applied to a particular case, then the courts can no longer treat the statute or ordinance as an expression of the legislative purpose as applied to that case. Nor does the court consider that there was under these circumstances any force in the argument that the company ought not to enjoy its franchise without complying with that portion thereof that fixed a maximum rate of speed. The city, it says, has at all times had, and still has, the authority to enact a reasonable speed ordinance.

INJURY OF EMPLOYE BY STARTING OF CAR AFTER  
INSPECTION OF ELECTRICAL APPARATUS—  
INSPECTOR A FELLOW SERVANT OF  
CONDUCTOR.

Shugard v. Union Traction Co. (Pa.), 51 Atl. Rep. 325. Feb. 24, 1902.

When a trolley car reached the terminus of the line on one of its trips, an inspector of the company was there, waiting with a testing car, for the purpose of making an inspection of the electrical apparatus. The test consisted in applying a wire connected with the testing apparatus to the various notches of the controller box, step by step. As the application to each notch was made, and indicated the proper condition, a bell was rung by the chief inspector, and then the assistant proceeded to turn on another notch by means of the controller handle. The test occupied but a few moments of time. The car was not taken away from the motorman or conductor, but was simply halted upon the track. While the test was being made, the motorman was within arm's length of his controller box and of the controller handle, and actually assisted in opening and closing the cover. The conductor, meanwhile, was sitting inside the car, looking over his accounts. There was some evidence to show that upon the completion of the test the inspector made use of the expression: "All right. Put on your pole." But whether or not he used the words, he undoubtedly did signify that the test had been completed and was satisfactory. The assistant inspector stepped down from the platform. The motorman was in the act of stepping upon the platform to take his regular place, when the car suddenly started, and ran upon the conductor, who had untied the trolley pole from the rear platform, to which it had been tied down during the inspection, and in accordance with his duty and his custom at that point had swung the pole around to the other end of the car, when, upon its coming in contact with the overhead wire, the car started.

Under these circumstances, the supreme court of Pennsylvania holds that there was nothing shown for which the company should be justly held responsible. It says that, under any aspect of the case, the inspector was not acting in the discharge of any duty which the law imposed upon the employer, and therefore could not be considered as a vice principal. When the employer has furnished reasonably safe appliances, and made suitable provision for their inspection and repair, his duty is done. He is not liable to an employee for the negligence of another employee who is intruded with the use or management of the apparatus. The purpose of the inspection

made in this case was not to determine the safety of the car, either for the employe or the public. The inspector was merely testing the efficiency of the electrical appliances, and while so engaged was merely a co-employe with his fellow workers. It would never do to hold an employer liable to one employe for the negligent or unskillful use by other reasonably competent fellow workers of the necessary and reasonably safe tools and appliances which had been furnished. The responsibility for this most unfortunate accident must therefore rest upon those who were co-employes of the conductor. The negligence, if any, was theirs, and not the company's.

ASSAULT OF INSPECTOR ON PASSENGER NO CAUSE  
FOR AWARD OF PUNITIVE DAMAGES—REASON-  
ABLENESS OF RULE AGAINST ANY ONE IN COM-  
PANY'S UNIFORM SITTING ON FRONT SEAT  
OF OPEN CAR—PAYMENT OF FARE HAS  
NO EFFECT ON RULE.

Rowe v. Brooklyn Heights Railroad Co. (N. Y. Sup.), 75 N. Y. Supp. 893. Apr. 18, 1902.

The version of the party suing was that, while an employe of the company and clad in its uniform, which he owned, and off duty, he boarded one of its open cars, seated himself on the front seat, and paid his fare; and that upon his refusal to leave the front seat and take a place in some other part of the car he was assaulted by one of the company's inspectors. The jury was instructed that it might award punitive damages. The second appellate division of the supreme court of New York holds that this was error. It says that it found no evidence in the record that proved or tended to prove that the company either wittingly or negligently had engaged or had retained an improper servant, or that it had ever authorized him by special command or by general warrant to assault the party suing, or that it had in any way participated in the act, or had ratified or had approved it. It thinks that the charge was erroneous, and required a reversal of the judgment which was rendered for \$1,000 in favor of the party suing, particularly in view of the fact that the damages inflicted upon his person and property were but trifling, and were incidental to a mere scuffle or bout at fisticuffs, in which he appeared to have retaliated.

Moreover, the court says that it does not agree with the trial justice in his doubt that the company "had any right to make a rule that if a man is off duty and is riding as a common citizen and wearing his own clothes (i. e., a uniform of defendant, but bought by the plaintiff), he may not ride on the front seat," and in his holding, further on, that, as matter of law, "if such a man paid his fare he had a right to ride there despite any rules," or that, "even though the rule was as stated by counsel for the company on his opening, it gave to them no right to insist upon it if the man paid his fare," or similar holdings as to the validity of such a rule. It is the right and the duty of the company, the court says, to make rules and regulations for both the public convenience and the public safety, and the reasonableness of a regulation is a question of law. The court is of the opinion that a rule of the company that no man in its uniform could sit upon the front seat of one of its open cars while such car is in operation can be sustained as reasonable. It thinks that it promotes the safety of passengers. The car is operated by a motorman who alone applies and withholds the power, and who alone controls the brake and other checks. He stands at the front of the car. Immediately behind him is the front seat. There is no structure between him and that seat. It needs no detail of his duties to show that ordinary care and prudence on his part may require his constant and uninterrupted attention to prevent collisions or other accidents which may be fraught with danger to the passengers. Anything which diverts his attention from his work may entail accident. Conversation between the passenger and the motorman would tend to divert his attention and to impair his vigilance. The company had a right to assume that acquaintanceship between passenger and motorman might provoke conversation between them. It had the right to assume that an employment common between the passenger and the motorman might have made acquaintanceship between them, or might be a passport to acquaintance. If the passenger and the motorman were both clad in the uniform of the company, it had the right to assume that they were both in its employ. Therefore, when it enacted a regulation that no person in its uniform should occupy a

seat which afforded every opportunity to conversation with the motorman, it adopted a regulation which tended to prevent conversation with the motorman, and thus to remove a cause which might divert his attention from his duties. The rule worked, then, for the protection of the passengers, and is entirely reasonable.

Payment by the employe of the fare, the court continues, did not affect the reason of the rule, even though such payment might make him a passenger, in contradistinction of an employe who rode free. He was still an employe of the company, subject to the presumption that he either knew his fellow employe, or that common employment might beget acquaintance. The fact that the company might have secured the attention of the motorman by a rule that he should not speak to any passenger does not affect the reasonableness of the rule in question. It was argued that the reasonableness of the rule was not to be found in the safety of the carriage, because the rule did not prohibit occupancy of the rear seat. But there is a manifest difference, the court says, between the duties of a conductor and a motorman, for the latter is required to exert a vigilance which, if relaxed for an instant, even to the turning of his head, may bring danger or death, while the momentary inattention of the former is not fraught with any similar degree of peril to the passengers. And the court fails to see that such a regulation is attended with any unnecessary inconvenience to an employe who chooses to become a passenger to the extent of payment of fare. It was not contended that he is shut out from the car of the common carrier, or that he cannot occupy a seat in the place where the main body of the passengers must necessarily be seated.

LIABILITY FOR INJURIES FROM SHOCK FROM SLOT RAIL OF UNDERGROUND TROLLEY AFTER SNOW-STORM—TESTIMONY OF CERTAIN EMPLOYEES ONLY OF NO NOTICE OF LEAK—INSTRUCTIONS TO JURY—ESCAPE OF ELECTRICITY AFTER EXERCISE OF PROPER CARE.

Ludwig v. Metropolitan Street Railway Co. (N. Y. Sup.), 75 N. Y. Supp. 667. Apr. 11, 1902.

The party suing gave evidence tending to show that in stepping upon the slot rail of an underground-trolley road he received a shock of electricity in his foot and leg, which precipitated him to the ground, whereby he sustained a fracture of both bones of his right leg below the knee. There had been quite a severe snowstorm, and the first appellate division of the supreme court of New York says that there was a sharp question for the determination of the jury as to whether the party's injuries were sustained in consequence of an electrical shock or by his slipping upon the rail. But it says that the trial court fairly submitted that question to the jury, and in the charge in chief instructed them that the burden of proof was on the party suing of showing that his injuries were caused by an electric shock; and it affirms a judgment in his favor. The doctrine of *res ipsa loquitur*, or the matter speaks for itself, it thinks properly applied to this case, and that the trial court properly instructed the jury that, if the injuries were received through an electric shock from electricity escaping from the company's rail, negligence on its part would be presumed to such a degree as called upon it for an explanation or put it to its proof.

The track master, chief engineer, and electrical engineer of the company testified that they received no notice of any ground or leak at that time, but no one in direct charge of the company's appliances at the power house for indicating a leak was called to give testimony as to whether or not any leak was indicated, or record made thereof. In these circumstances, every inference warranted by the evidence, the court holds, would be indulged in against the company, which, presumably, having the evidence in its possession, omits to produce the same or explain the omission.

A request for an instruction which recited the conceded proper construction of the road, and that there was no evidence that the electric current could escape except as a consequence of the snowstorm, and stated that, if the jury found that the snowstorm was in fact the cause of the party's injury, the company was not responsible for that, and the jury must render a verdict in favor of the company, the court holds was properly refused. It says that it erroneously assumed that there was no evidence that the electrical current could escape except in consequence of the snowstorm; and it likewise erroneously assumed that the company would not be

liable if the escape of the electrical current was caused by the snowstorm, regardless of whether the company exercised care to remove the snow.

The jury were instructed that the company's duty was to exercise ordinary care, which is that care that an ordinarily prudent person would exercise under like circumstances, in view of all the circumstances requiring the exercise of watchful care and prudence to prevent the escape of the electric current. It was stated to the jury that the claim of the party suing was that the escape of electricity was due to the failure of the company to clear its slot rails of snow or other substances of a conducting nature, and their attention was drawn to testimony introduced by the company tending to show that it had exercised care in removing the snow and other substances that might be in the conduct, and they were told, "If you believe such testimony, it will be your duty to render a verdict for the defendant. No evidence to the contrary of the defendant's witnesses as to the cleaning of the track and of the slot rails has been given, except such as might be inferred from the accident in question." Evidence was given on the part of the company tending to show that it would be impossible for the slot rails to become charged with electricity, and the jury was instructed that, if they believed this evidence, it would be their duty to render a verdict in favor of the company. The jury were again told that if the company had given a sufficient explanation of the accident, or if the accident was unavoidable, and could not have been prevented or guarded against by the exercise of ordinary care and prudence, they should render a verdict in favor of the company. They were also charged that if they should find from all the facts and circumstances that the party suing was free from contributory negligence; that the accident was due to an electrical shock, and not to a fall in consequence of the slippery condition of the sidewalk; that the accident was not inevitable, but one that could have been prevented or guarded against by the exercise of ordinary care and prudence, and that the company was guilty of negligence, then they should render a verdict in favor of the party suing. At the close of the charge the jury were again instructed, at the request of the counsel for the party suing, that, if the slot rails were alive with electricity, and the company, by the exercise of ordinary care, could have discovered and remedied it, the company was liable; provided the party suing received a shock of electricity which caused his injuries. But at the request of the company and of the party suing, the jury were charged that the burden of proof rested on the party suing, and that, unless he established by a fair preponderance of evidence satisfactory to the jury that his injuries were caused by some negligence on the part of the company, he was not entitled to recover. Again, at the request of the company, the jury were instructed that, if the evidence was as consistent with the absence of negligence on the part of the company as with its negligence, then the party suing could not recover, because he was "bound to make it more than a balanced case." Further, at the request of the company, the jury were instructed that, there being no contractual relations between the party suing and the company, the former could not recover without affirmative proof that the company did not exercise ordinary care in the construction, management, and operation of its railroad on the occasion in question.

The company contended that it had overcome the presumption of negligence on its part raised by the doctrine of *res ipsa loquitur*, or the matter speaks for itself. But the court says that it did not sufficiently overcome the presumption as matter of law. The question was still for the jury to weigh the evidence introduced on the part of the company, in the light of the legal presumption of negligence arising from the happening of the accident, and determine from the whole whether the party suing had sustained the burden of proof which rested upon him of establishing that his injuries were caused through the negligence of the company. Of course, if the company exercised proper care, and, without negligence on its part, the insulators got out of repair, or the electric current escaped owing to snow or moisture, it would not be liable, unless it failed to remedy the defect within a reasonable time after actual or constructive notice thereof. In this case, however, the presumption of negligence was not so clearly or satisfactorily met as to warrant or require that the case be taken from the jury. Furthermore, the evidence tending to overcome the presumption of negligence was given by the company's employes, whose credibility was for the jury.

## REMOVAL OF SNOW AND ICE IN THE BOROUGH OF MANHATTAN, N. Y.

BY W. BOARDMAN REED.

The handling of snow in the larger cities may well be treated under two heads. First, the keeping of the tracks clear for the moving of cars, and second, the clearing up of the streets in accordance with certain statutes and ordinances, and as we in Manhattan believe, for the benefit of our service and receipts.

My first experience as a railroad man was gained on a little steam road about sixty miles north of here, where twelve inches was not a heavy snowfall. I recollect some snow we had to handle there in 1888, after the storm ever since known as the "Blizzard," when one of the foremen stationed at an outlying mine came to the main office on snowshoes and was able to rest his hand on the top of the telephone poles on the way down. We were not, however, operating conduit electric lines, and in some way the locomotives of this northern country get used to traveling through the snow. A six-inch fall will tie up some of the steam roads entering New York, whereas up here such a storm is hardly noticed. We do not have such heavy storms in Manhattan as are usual in this section and the western part of the state, and our cars, like the New York locomotives, are not accustomed to traveling through snow and will balk at a few inches on the rails. Still, we have had storms during the past few years that have at times called forth our best efforts and once or twice tied up our cars not primarily from snow on the track, but from the conduit being filled so that the plows could not pass through it or get proper contact with the conductor bars. We hope, however, that we shall be able to overcome this difficulty in the future, as we have increased very materially our equipment for the cleaning of the conduit.

In 1893 I completed the construction of an electric road in Fulton County and remained a few weeks to finish estimates, etc., so was able to watch its operation. The master mechanic, a young Irishman, had charge of cars, equipment, maintenance and all else. The first snowstorm stalled many of the cars. He was appealed to by the general manager and asked what could be done. He replied with ready wit "Kape the cars a-moving." We in Manhattan endeavor to keep our tracks clear of snow upon this same principle, for we use rotary sweepers only and depend upon the frequency of their running. On about 153 miles of single track we have 58 rotary sweepers, or one for little more than each two and a half miles of track, enabling us to operate them on from fifteen to twenty minute headway, so unless the snow is dry and drifting badly there is no chance for much accumulation on the rails. In addition to rotaries we use walkaways or ordinary road machines drawn by two or four horses to shove the snow well back from the rails. These are worked in pairs, two machines covering from two to four miles of street. On streets that are narrow or have elevated railroad columns near the tracks we are obliged in case of heavy storms to shovel the snow back from the rails by hand, and, of course, use hand power to get rid of what falls between the tracks. Special work is also cared for by hand, from one to four men being sent to each place where there are switches, curves or cross-overs as soon after it begins to snow as possible. They keep the curved rails, frogs and switches, both slot and tram rails, swept clean, and use a very small amount of salt on the moving parts. No salt is used on straight track except on a few very steep grades, and none on curves except in severe sleet storms, when ice is forming in the groove. In Manhattan the "Trilby" section of rail is used almost exclusively. To keep the groove clean diggers or small scrapers fitted to the shape of the groove are attached to each sweeper. These have always proved sufficient for the purpose, except in the few cases where the road has been tied up and rails became covered with ice and packed snow, when picking and pickeling had to be resorted to.

In regard to pickeling, would say that we find salt plays havoc with electrical equipment, especially the plows. Salt water getting on the shank destroys the insulation and often forms a short circuit around the plow. No amount of paint or grease will prevent it. A few winters ago we were called upon to assist in the operation of a new conduit electric line in Manhattan. The superintendent,

who received most of his education on horse-car lines where salt is the principal factor in snow removal, had general charge of the operation and maintenance. I sent a track foreman with some men to help him handle a light snowstorm, cautioning both the foreman and superintendent regarding the use of salt.

In a few hours his entire line was in bad shape from burnt-out plows. The superintendent denied using much salt and the receiver, in whose hands the road was, severely criticized our electrical department for furnishing his road with poor plows. Investigation showed, however, that considerable salt had been used, which doubtless caused all the trouble. On overhead trolley lines salt does not cause such immediate damage, but I think many motors which show defects a few days after a snowstorm have been injured by salt water.

For cleaning the conduit we use a rubber scraper similar in section to the conduit suspended from a small flat car drawn usually by horses, though sometimes hitched behind a car. At all switches the conduit is much smaller than on straight track and a scraper has to be used that will pass them. It will, therefore, not remove all snow from the conduit, but keep it sufficiently clear to allow passage of plows and leave the conductor bars clean. From the conduit the snow is scraped into manholes situated from one to two hundred feet apart. These drain into sewers, but after little more than six inches of snow has fallen they have to be cleaned out. With the beginning of freezing weather we put a layer of salt in the bottom of the conduit and keep it thus salted all winter. This prevents the forming of hard ice and enables us to keep the conduit clean. We have always used mined salt when we could get it and consider it the best for our purpose.

To strictly comply with the statute which provides that street railway companies shall remove all snow that falls on its track, between its tracks and two feet outside it would be necessary to stop operation of cars as soon as it began to snow, fence in the area and stop all trespassing or else have some method of marking each flake for identification.

In Manhattan the street railways have always removed more or less of the snow from the streets, but until 1896 there was no system about it. That year an agreement was made with the street cleaning commissioner whereby the street railway companies were to remove all snow and ice from the entire area of certain streets or parts of streets, such area being as nearly equal as might be to the area they should clean under the statute, the street cleaning commissioner agreeing to remove the snow from all other streets having tracks upon them as promptly as possible. This arrangement has proved of great benefit to the public, to the commissioner of street cleaning and to the railway companies.

Previous to this arrangement little attention was paid by the commissioners to railway streets. It was therefore necessary to run horse cars doubled up, that is, four horses and two drivers to each car, electric and cable cars were badly blocked by trucks, passengers could not get on or off the cars without getting over their ankles in slush and snow machines were kept running until the snow melted or wore away. These conditions often lasted more than a week, whereas it is rare for us to be troubled more than 24 or 36 hours after a storm is over. In former days it required from four to five hundred bushels of salt per mile of track per season. Now I allow 275 bushels for horse car lines and 415 for electric and nearly all of which is used in the conduit.

The prompt removal of snow enables the public to go about its business and pleasures with comfort, thus adding very materially to our traffic; so the expense we are put to is about made up in the additional receipts.

Various ways of disposing of snow have been suggested and tried, but though the method may seem primitive, we have found no better one than hauling it by carts or trucks to the water front and dumping it overboard.

The island of Manhattan is of such shape that most of the snow can be thus carted with an average haul of little more than half a mile.

Melting machines have been tried and were used experimentally by the city last year, but they are not practical for our conditions. A few years ago the late Colonel Waring, then commissioner of street cleaning, thought it would be a grand thing to line sewer manholes with coils of steam pipe, then shovel the snow into them when it would melt and run away. We constructed for him a man-

\*Read at the annual meeting of the New York State Street Railway Association, September 1902.

hole for this purpose and gave it a trial. It took but a few moments to fill it with snow but an hour or more for the snow to melt. It is hard to overcome the fact that it requires 142 units of heat to make water out of snow or ice. Carting snow by cars has been suggested many times and doubtless this method would be cheaper and more expeditious than carts and trucks if there were proper dumping facilities and the street railway company could give up the use of its tracks for a sufficient time to allow snow cars to do the work. On our lines cars are rarely operated on less than two minute headway, except between one and five o'clock in the morning, and even then they run on from five to ten minutes schedule, which would give no time for loading and handling of snow trains. A short time ago I estimated that were we to abandon the running of cars on 23d street between Broadway and the East River, about one and a half miles, between one and five in the morning, giving snow cars exclusive use of them, it would require for a 12-in. fall with two trains of four cars each, 36 hours, or nine such nights to clean up this small portion of the city, whereas it is done with carts and trucks in about twenty-five or thirty hours, and as these work both night and day this means but one or one and a half days.

Contractors are paid by the cubic yard of snow removed, both by the city and the railway companies, the latter using their own carts, trucks and men as far as they are able. This year, however, the city is to endeavor to let the work per inch of snowfall. Could this be done it would prevent much fraud that is sure to be practiced under the yardage system, especially since work of this kind coming but five or six times in a year does not permit the maintenance of a proper organization of foremen, tallymen, checkers, ticket men, etc., the city being obliged often to use ordinary laborers to act in such capacities.

The shrinkage of snow is so variable, however, that one making a contract in this way must be something of a gambler. The average shrinkage on our work last winter was 80 per cent, though the heaviest storm gave only 59 per cent; that is, of the quantity that fell on the area of streets we cleaned we removed on an average only 20 per cent, whereas in the larger storm we removed 41 per cent. This shrinkage is caused by the packing, wearing away by vehicles and melting of the snow depending on the humidity and temperature of the atmosphere and the amount of snow that falls at one time.

Last winter the street railway companies of Manhattan removed the snow and ice from about 90 miles of streets and with a total snow fall of 30.16 inches hauled about 117,000 cub. yd. of snow. In the heaviest storms, which occurred February 16th to 20th, there was a fall of 12.2 in., and we removed 681,727 cub. yd. at a cost of about 30 cents per yard, including superintendence, etc.

#### ADDITIONS TO RAILWAY POWER PLANT AT PROVIDENCE.

The Rhode Island & Suburban Railway Co. is making extensive additions to its power station on Eady St., Providence. The plant now building was originally designed for a rated capacity of 7,500 h. p., but recently the company decided to largely augment its power equipment and contracted with Westinghouse, Church, Kerr & Co. for a new Westinghouse vertical cross-compound Corliss engine designed for a maximum capacity of 6,600 h. p. The cylinder dimensions of the engine are 42 and 86 in. diameter with a stroke of 60 in. The engine will be approximately 35 ft. in height and will be direct connected to a 2,500-kw. Westinghouse 600-volt direct current railway generator, mounted between the main bearings together with a flywheel 24 ft. in diameter and weighing 125 tons. In encouragement of the proposed legislation upon smoke prevention the Rhode Island & Suburban Railway Co. has contracted with Westinghouse, Church, Kerr & Co. for a complete equipment of mechanical draft and Roney mechanical stokers for the 5,200 h. p. of boilers which the new station will contain. Provision for the greatly increased boiler capacity will be made by the addition of a second story to the boiler house for the accommodation of the upper deck batteries.

The line of the Doylestown (Pa.) & Easton Railway Co. has been opened as far as Pipersville and cars are running on a regular schedule.

#### MASSACHUSETTS NOTES.

The railroad commissioners of Massachusetts have been making a western tour, including Chicago and Detroit, to investigate street railways in that territory. At the last session of the Legislature the commissioners were instructed to report on the advisability of compelling the use of air brakes and fenders and equipping street railway cars with lifting jacks with which to get injured persons from under the wheels in case of accident, and were authorized to go outside the state for their information.

While the lifting-jacks proposition was merely an easy way of letting down the legislator who wanted all cars to be equipped at once, the accident at Pittsfield has brought to the public notice the advantage of power brakes, which it is proper to add, that most of the roads have recognized and already so equipped their cars.

The state has hardly more than entered upon the development of long distance lines with other features, more of a steam road nature so much further advanced in the middle West, and as the railroad commission is having more power delegated to it on these matters yearly by the Legislature, it has determined to investigate for itself.

Several recent hearings have developed the fact that the board is decidedly opposed to any more diagonal crossings of highways by street railway tracks at grades. There have been cases where the board was forced to admit that such crossings were necessary where it has taken pains to suggest to the local authorities that they should order the companies to operate their cars on these crossings at a low rate of speed, an order which the board itself cannot give.

Hearings on approval of locations nearly always develop something that causes an adjournment so that one of the board's inspectors can view the route in person. So common has this become that the board has practically decided to have an inspector look over the ground in all cases before even a first hearing is held.

The statistician of the board is getting in readiness a list of the street railways in the state that have paid 5 per cent dividend for the past five years. Under a new law savings banks are allowed to invest in the bonds of companies that can show such prosperity.

#### PROPOSED IMPROVEMENTS AT NEW ORLEANS.

The New Orleans Railways Co. has given out the general plan of its proposed change to a four-barn system. Superintendent Black of the construction department is working out the details. The barn improvements will cost about \$1,000,000, and it will require a year to complete the work. The Carrollton, Arabella, Canal and Poland barns will be enlarged for the concentration of the equipment and inside work. The Carrollton barn will be enlarged and fixed over for the headquarters of the Carrollton equipment, which is of different gage from the other lines, being 4 ft. 8½ in., whereas the other roads are 5 ft. 2 in. The buildings of the Canal barn will cover four large blocks of ground, containing modern shops, where the company will be able not only to rebuild its old cars but can construct new ones also. The Arabella barn will be increased so as to cover two blocks instead of one as at present. The Poland barn will be largely increased and will contain wash-houses, repair shops and large sheds.

#### THROUGH CARS OVER EADS BRIDGE, ST. LOUIS.

An ordinance was passed by the East St. Louis City Council October 28th, giving the East. St. Louis & Suburban Railway Co. permission to connect its tracks to the Eads Bridge line. For this permission the railway company will make a through rate of 10 cents from any part of East St. Louis to Third St. and Washington Ave., St. Louis. The tickets sold for this ride will be somewhat like the ordinary transfer ticket. The time of its issue will be punched on it and the tickets will be dated so the purchaser will be compelled to use it for a continuous ride. The fare for a single ride across the Eads Bridge is at present 10 cents and this will remain the same, the reduction in the fare applying only to those who use the East St. Louis street car lines in connection with the bridge line.

### SLOW SPEED GENERATING UNITS AT LOUISVILLE, KY.

What is probably the slowest speed generating unit ever built for electric railway work has been operating in the main power house of the Louisville Railway Co. since February of the present year. The management of this company has for several years strongly favored the tendency toward larger direct connected units that has been so manifest in all later day railway power house designs, but it has also urged that not only the size be increased but that the speed of running be decreased, thereby reducing the peripheral speed of fly wheels and minimizing wear and tear on moving parts. Accordingly in 1898 the company contracted for and installed a 1650-kw. unit built to run at 75 r. p. m. The unit comprised a 1650-kw. 22-pole General Electric generator, direct connected to a 2,500-h. p. vertical cross compound Reynolds-Corliss engine having cylinders 40 and 78x48 in.

This unit gave such good results that the company determined to carry the idea a degree further, and requested the builders to design and construct a 1650-kw. unit to run at 60 r. p. m. The E. P. Allis Co. and the General Electric Co. contracted to do this and the unit illustrated herewith was installed and placed in commission in February of this year. It has been running continually since that time, at a speed of 60 r. p. m., and the results are stated to be entirely satisfactory.

The engine is a 2,500-h. p. vertical cross compound condensing engine of the Reynolds-Corliss type with cylinders 40 and 78x60 in., taking steam at 150 lb. The cylinders are made with the exhaust chamber separated by an air space from the cylinder barrel in order to reduce condensation. The valves are in the cylinder heads, and the engine is provided with Reynolds-Corliss automatic valve gear; a special weighted governor controls both the high and the low pressure cylinders and a safety stop is provided to prevent the engine running away in case the governor belt should break.

The main journals are 28 in. in diameter and 48 in. long. The main engine bearings are of the ball and socket type, having the lower bearing shell rounded to fit suitable receptacles in the bed block.

The pistons are made of cast iron heavily ribbed inside and have follower ball and packing rings. The piston is so constructed that the rings may be inspected or replaced without removing the piston from the cylinder or taking it from piston rod. The vacuum pots are not attached to galleries but to lugs on the sides of the cylinders. The throttle valve stem is of extra heavy pipe to serve as drip pipe.

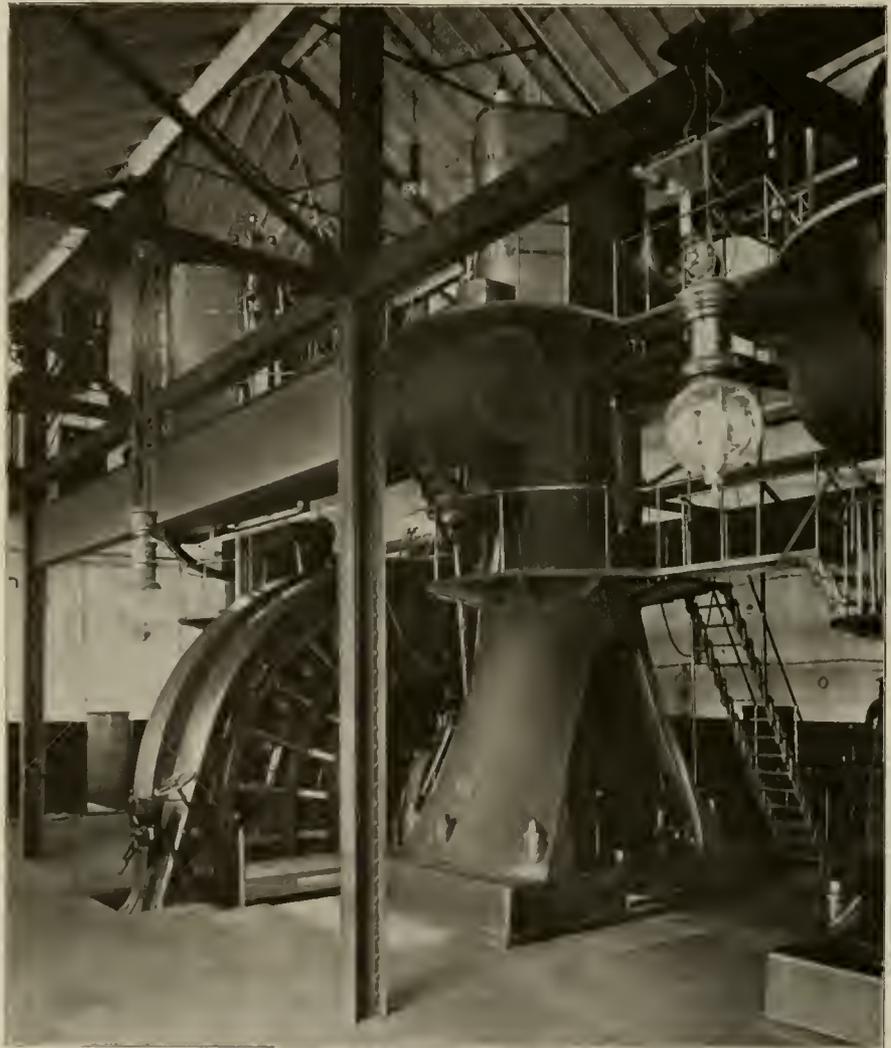

The crosshead pin is 14x11 in. and is fitted into the crosshead with a taper fit and held in place by a heavy steel nut so that it can be removed without dismantling the engine. The crank shaft is 32 in. and the balance wheel 24 ft. in diameter. The latter weighs approximately 200,000 lb. and is made in ten segments. The crank is of the counterbalanced type with crank pin 14x11 in.

The connecting rod is open hearth steel with solid crosshead end and bolted strap crank end, and the cross shaft for the regulating governor has roller bearings. The engine bearing and crosshead guide are water jacketed, the water after passing around the bearings going to the feed water tank to which is also led the exhaust steam from the condenser and feed pump.

The frame is of the Allis circular type bored at the upper end where the crosshead travels. The ends are faced and the slide

bored at one setting insuring perfect alignment. The bored slide reduces the chances of hot journals by allowing the crosshead to travel in any path required by the crank pin should the engine get out of level through settling of foundations. The inside of slide and frame has a sheet iron casing to keep oil from the generator and wheel. The galleries and stairways around the engine are made of checkered cast iron plates supported by brackets attached to the engine and are provided with brass hand rail supported by iron stanchions. The lower galleries as well as the cylinder galleries are connected giving ready access from one gallery to the other.

The generator is a 1650-kw. 26 pole engine type machine built by the General Electric Co. The company guarantees this generator to deliver 3,000 amperes at 550 volts continuously, and also 50 per

ENGINE AND DYNAMO ROOM LOUISVILLE RAILWAY CO.

cent overload for 5 hours without sparking at the brushes, and further guarantees that there shall not be a rise in temperature above the surrounding atmosphere exceeding 40 deg. C. on the 3,000 ampere load and 45 deg. C. on the 50 per cent overload; it also guarantees a 100 per cent overload for short periods without injury to the generator or injurious sparking at the brushes. The brushes remain stationary from no load to 50 per cent overload without appreciable sparking, excessive burning or blackening of the commutator. The dimensions and data on the generator are approximately as follows:

The magnet frame is of cast iron and pole pieces are of cast steel with laminated pole faces bolted to the pole pieces; weight of armature and commutator, 87,000 lb.; weight of magnet yoke and spools complete, 132,200 lb.; weight of generator complete, 226,000 lb.; wire on shunt field, No. 6 B. W. G.; diameter of armature, 204 in.; width of armature and commutator, 54 in.; bore of armature, 32 in.; active length of commutator, 20 in.; allowable wear on

commutator, 2 in.; number of brushes per stud, 12; amperes per sq. in. of contact, 20½

The commercial efficiency at full load is 96 per cent; at ¾ load 95.5 per cent and at ½ load 95.0 per cent.

This unit operates satisfactorily with the 500-kw. and 1650-kw. generators previously installed at this station. The circuit breaker has been pulled at 100 per cent overload without flashing or injury to the machine.

The shaft is 12 in. in diameter and is of Bethlehem open hearth steel, hollow forged, and the unit rests on a foundation of semi-vitrified extra hard brick. The brick foundation is 25x30 ft. x15 ft. deep, and rests on a sub-base which in turn rests on a bed of hard gravel and sand. The sub-base consists of a layer of concrete on which were placed old 50-lb. T rails laid in rows side by side

SLOW SPEED GENERATOR LOUISVILLE RAILWAY CO.

spaced 6 in. apart. Next a leveling course of concrete was laid between and on top of the rails. On this was placed a layer of rails laid at right angles to first layer. This was also filled with concrete, and a third layer of rails laid at right angles to second layer. On top of all was laid about 2 ft. of Louisville concrete cement making a total depth of the sub-base 40 in. The sub-base extends 3 ft. beyond the brick foundation on all sides.

### IMPROVEMENTS AT MONTGOMERY, ALA.

The Montgomery Street Ry. was recently purchased by Mr. Richard Tillis and is being greatly improved. Since acquiring the property Mr. Tillis has expended about \$100,000 in improving and reconstructing the entire 20 miles of road which the system includes. New ties have been placed and 70-lb. T rails, made by the Lorain Steel Co. in 60-ft. lengths, have been laid on about four miles of the road outside of the paved district. Ten new convertible cars have been added to the service and new wheels are being placed on all of the old rolling stock.

The Merchant's Light & Power Co. has been recently incorporated in Alabama with a capital stock of \$100,000, and the whole stock has been subscribed by local people. A large interest in the new company has been taken by Mr. Tillis and the purpose of the new company is to furnish light in the business portion of the city and power for the cars of the Montgomery Street Ry. The plant is to have a capacity of 1,500 h. p. and will occupy half a block in the heart of the city. It is expected to be ready for operation by Feb. 1, 1903.

The Montreal (Que.) Street Railway Co. will hereafter run freight cars over its lines between 1 a. m. and 4 a. m.

### PERFECT TRACK.

At the regular monthly meeting of the New York Railroad Club, held in New York City on the evening of September 18th, the topic for discussion was "The Construction of Perfect Track." Mr. J. C. Brackenridge, chief engineer Brooklyn Rapid Transit System, had been appointed to open the discussion, and said in part:

A perfect track is one that will always keep its alignment and surface and never wear out. Unfortunately I cannot tell you how to build one or tell you where you can find out. I will confine my observations, therefore, contrary to the title of this paper, to that style of track which, in my experience, is the best track.

The track construction replaced by electric track was the stringer construction; this was adequate for the light horse cars in use in former days and for moderate speeds. With the advent of the electric car came successively heavier stringer construction, the "butterfly" box girder, 5-in. girder on chairs, and others with innumerable styles of joint construction, until with the very heavy equipment and high speeds of the present time the 9-in. girder now so extensively used was adopted for city use. Large sums of money have been wasted upon poor designs of rail, of special work, and on poor installation. The conditions existing upon our city streets are distinct from steam railway practice. The track once laid should last the life of the rail head without attention. This is important, as the cost of track work is largely that necessitated by disturbance of pavement.

The secret of securing the best results is due more than half to the care and skill in laying. In preparing the roadbed to receive the ties, care should be taken to excavate as little as possible below the finished grade line of the bottom of the tie. When the holes are dug carelessly, some being deeper than others, it is impossible to tamp up the track in such a manner that it will retain a perfect surface and line. After the tie holes have been dug and ties laid, the rails should be distributed, then driven up tight to the abutting rail spiked (no allowance being made for expansion). The end of the rails being in close contact, the friction between the faces of the ends will help support the joint, prevent working, and the consequent loosening of the electric bonds. Before tightening up the joints, the rail ends should be in surface and line. This latter is a matter that track foremen are very apt to be careless about, and when this is the case a kink will result which it is difficult to get out. The rail is then buried within the pavement which restrains movement of the rail laterally and protects it from sudden temperature variations.

When the track is laid with T-rail without paving, surfaced and lined, it should be filled in to within about 1½ in. of the top of head of rail and to a distance of about 30 in. outside the gage line. This method of covering the ties prolongs their life, and furnishes lateral support for the tracks. Should the rail buckle or get out of line, due to expansion, it can be remedied by taking off a joint at the place affected, and putting in a trailing-point split-switch; this, however, we find is rarely necessary if the track is properly lined and surfaced in the first place. Apropos of this just a suggestion for steam railroad work—when the rails and ties are left exposed, the rails are apt to creep, especially on grades, thus making it difficult to keep crossings with other tracks in line, particularly so if the crossing be at right angles. This difficulty can be overcome and the crossing maintained in perfect line by putting in switch points on either side to take care of the movement of abutting rails. This is a simple method and will double the life of a crossing at points where there is much movement of the connecting track.

The most expensive as well as vexatious question in track work is that of maintaining joints, especially in paved streets. In designing a fishplate, advantage should be taken of every square inch of bearing area that a rail affords for a distance of 10 in. from its end. It stands to reason that a rail can be better supported by using the 50 or 60 sq. in. of bearing area offered by the base of the rail than by the angular bearing obtained by most fishplates under the rail head and on the flange of the rail.

The most expensive as well as vexatious question in track work is that of maintaining joints, especially in paved streets. In designing a fishplate, advantage should be taken of every square inch of bearing area that a rail affords for a distance of 10 in. from its end. It stands to reason that a rail can be better supported by using the 50 or 60 sq. in. of bearing area offered by the base of the rail than by the angular bearing obtained by most fishplates under the rail head and on the flange of the rail.

In street railroad construction, where the best pavements are used, such as granite block, brick or asphalt on a concrete foundation, as I said before, the paving costs more than the actual track work. It is, therefore, of first importance that the track, once laid, and paved up, should not be disturbed until such time as the rail is worn out. This would not be difficult were it not for the joints, which, with the ordinary fish-plates, give way long before the rail is half worn. I have found that by using a sole plate similar to the old stringer joint plate in connection with the regular fish-plates or above-mentioned joints, placing ties 5 in. between faces at the joints (making a suspended joint), and driving the rails up tight together, tightening the joints, then paving the street with as tight longitudinal joints between the stones as possible from the head of the rail toward the curb, being careful to see that the stone next the rail is fitted up close to it in order to prevent the rail from getting out of line (due to expansion)—on such track there will be no necessity for repairs until the head of the rail is worn out. I am a believer in wooden tie construction, having used the longitudinal concrete beam with steel tie rods and found that the rigid foundation shortened the life of the rail more than 25 per cent.

One of the difficulties I have found with the 9-in. girder-rail track under heavy traffic was that it always became wide gage, no matter how carefully the track was laid. After giving this subject considerable thought, I came to the conclusion that this was due to the fact of the web being in a perpendicular line with the gage, which threw the weight outside the center of gravity, resulting in the tipping out of the rail, and the consequent widening of the gage of the track. This difficulty I overcame by designing two rail sections, known as the standard Brooklyn Heights R. R. section, which is a tram rail, and a grooved rail on the same principle. In these sections the web was moved back from the gage line about  $\frac{1}{2}$  in. and no more difficulty was experienced. The design of the groove rail is such that the flange of the wheel forces the dirt over the lip of the rail and insures a good contact between the head of the rail and tread of the wheel. In other types of grooved rail there is a tendency for the flange to pack the dirt in the bottom of the groove, thereby lifting the tread of the wheel off the head of the rail, making poor contact and causing a greatly increased power consumption.

In closing I realize that the discussion may deal largely with the wisdom of laying the track with tight joints, but my experience has been that, even where the joints are left open, it was found that the friction between the plate and the rail was great enough to prevent the expansion from closing up the joint.

After the reading of the paper by Mr. Brackenridge, Mr. R. Trimble of the Pennsylvania Lines West of Pittsburg, presented a paper dealing with the subject of track construction for steam railroads.

President Vreeland of the club then called for general discussion.

Mr. W. Boardman Reed, engineer maintenance of way, Metropolitan Street Ry., of New York, said in part:

The subject of track construction, whether perfect or otherwise, is one of great import to nearly every department of all railroads, and though it has been written about, talked about and discussed for many years, is worthy of more thought. Especially is this so since the great increase in weight of all rolling stock and speed of trains demands a much better structure than was required a decade ago. Then again, the introduction of electric power for urban, interurban and suburban service demands a far better track than had been used for horse-car and also, owing to difference in application of power, I believe requires a different construction for a perfect track than does a steam railroad. The points to be set forth are more for the purpose of provoking discussion than imparting information.

The subject under discussion being "Construction of Perfect Track," it is well to endeavor to decide what would constitute a perfect track. The definition given by Mr. Brackenridge hardly covers the matter, and I must differ from him as to the best track construction for electric railways, especially for paved streets. As the power applied to the wheel emanates from a revolving armature there it, or should be, on even application at all points of the circumference and there is nothing to cause a pound or hammer blow, therefore, I believe no necessity for a flexible roadbed; I consider a perfectly rigid roadbed by far the best. Especially is this true on paved street for every movement of the rail is imparted to the pavement and tends to raise it off its bed. It is impossible to maintain asphalt in even a safe condition unless the track is as nearly

rigid as possible and the repairs to any first-class pavement alongside of a flexible track will exceed the extra expense of rail renewals, if there is any such extra expense, which I doubt.

In Manhattan all electric tracks built since 1868 by the Metropolitan Street Railway Co. are constructed on a perfectly rigid foundation. In lieu of ties cast-iron yokes, bedded in concrete, 5 ft. between centers, are used, so that with a 9-in. 107-lb. rail, and 12-hole, 30-in. joint plates there is but little or no give to the structure even with the heaviest cars. This same result can be obtained on the ordinary trolley roads by laying a good concrete foundation under and around the ties or laying the rails on a concrete beam of sufficient cross-section. To be sure, at crossings, switches and frogs there is always a pound and consequently excessive wear, but that this is increased by having a solid foundation I doubt.

On steam railroads, where the power applied to the locomotive drivers is conveyed by reciprocating parts, no matter how much care is used in balancing, there is always a hammer blow struck with each revolution of each driving wheel. The experiment of laying a copper wire on the head of a rail is old, but it illustrates the effect of these hammer blows perfectly. With a solid foundation, therefore, for steam railroads there would not only be excessive wear on the track structure, but upon the locomotives as well, so that a flexible track is desirable; I believe for this reason joint plates should not be too long and should be supported and fitted as well as possible to the rail, so as to prevent any lateral motion, and to prevent the drop of the drop rail. Track for steam railroad has been laid experimentally on concrete foundation, but did not prove a success, for the concrete was not sufficiently elastic to withstand the pounding of locomotives.

The joint has always been the weakest part of any track, whether on a steam or electric road; the 30-in. 12-hole joint so generally used on 9-in. girder rails for electric railways is strong enough and should never break, yet it will not hold up the rails during their life. The theory of supporting the rail at the base as well as the head by the joint plate is, like many others, better than the practice owing to the variation, slight as it may be, in the height of adjacent rails. Welding, whether cast iron or electric, makes as nearly a perfect joint as can be had, but it is not suitable for rails exposed to great changes of temperature, and even on rails buried by pavement it has its drawback. The necessary heating of the rail-ends makes them brittle, so that either rails or joints will break in cold weather or track will get out of either line or surface, and is likely to play havoc with intersecting lines. Could ends of rails be machined and joint plates of almost any of the existing types be machined to fit them a perfect joint could perhaps be obtained and joints would hold up during the life of the rails, thus lessening materially the worry and labors of all trackmasters.

Mr. J. V. Davies drew attention to the fact that the conditions of loading and operating rolling stock on electric railways are so different from steam railroad conditions that track built for electric railway purposes would not be suitable for steam roads. He also thought that the maintenance and keeping up of track is really of far greater importance than even the original construction, for, an original construction could be imagined that would be almost, if not altogether, perfect, but it would be difficult to conceive, from our present point of view, of a way to maintain track in perfect condition.

Mr. Davies said in conclusion:

In this matter of track construction there is another and new feature which is becoming of considerable importance in this and other large cities in connection with subway construction. In the Rapid Transit Subway there was originally adopted a concrete construction of track, in which ties and rails would be imbedded solid in a concrete bed. There are some samples of this track on the Long Island Railroad in the neighborhood of Jamaica, L. I., which were put down some time ago for experimental purposes; but, I understand, the Rapid Transit Commission has definitely abandoned the idea of using that type of concrete track and intends to substitute therefore a ballasted track with an exceedingly thin quantity of ballast beneath the ties. It seems to me that the ballasted track for this service is without doubt the better type of construction for the heavy and continuous loads placed upon it, principally on account of the ability to surface and maintain it. The construction of track on concrete is one that it seems to me is impossible to maintain in any kind of condition after it once gets out of shape; but it is quite a question whether there is anything which can be designed which

can be better and more advantageous than the ballasted track, under the special and particular conditions of this service.

The president then called on Mr. W. L. Derr, who spoke as follows:

I will not attempt to examine the subject before us from other than an engineering point of view. Speed is speed, no matter whether the power developing it is steam, electricity or other kind of power, and the structure over which the power moves a body is practically the same for all.

The general principles of railway location are so well known to those who make a business of it—and no one else should undertake it—as to need little comment here. It is a matter of careful attention to details, as well as the general situation. Many matters, not engineering but commercial, confront the locating engineer and cause a change of his plans. Naturally, then, results are attained only by a careful attention to details.

To ensure perfect track, one must begin at the beginning and see that the location of the line is correct. To enumerate all the details of location is out of the question, but a few important "don'ts" apropos of safety, the first consideration, may be mentioned.

Don't locate cuttings in drift formation, in or upon a hillside.

Don't dam the flow of natural drainage waters or snow drifts by an embankment.

Don't divert a stream in a formation of porous character.

Don't, in loose soils, locate a railway close to a highway. Even at an outlying station it may be well to keep some distance from a highway. If the railway is above the highway the former may slip on the latter; if below, highway may slip down on railway.

Don't locate stations on other than a surface of natural soil.

Don't fail to examine closely formation on both sides of a valley. Even in the narrowest, one side may be the firmer.

Don't fail to find out which side of a valley receives the greatest amount of sunshine.

Don't fail to remember that the side of a mountain to leeward of prevailing wind generally receives the greatest rainfall.

Don't, in snowy regions, unless there is some very good reason for it, locate a railway on the bare side of a valley, but on the side that has trees.

Don't locate a tunnel under the low point or pass of a mountain. At such point, the rock formation has probably been much more disturbed by geological action.

Don't approach a river bridge by a high embankment.

The drainage of a roadbed must be as nearly perfect as possible if perfect track is to be maintained. Too much attention cannot be given to this detail. Bear in mind that while air, frost, vibration and overloading may cause your earthwork to fail, water in sufficient quantity is sure to do so and is the greatest enemy to the stability of a line. Work above sub-grade is almost wholly a question of details. Ballast of the best obtainable material must be used; the material which will free itself of water quickly is the best, and broken stone will do this better than any other material.

The foundation for the rails, that is the ties, is the next consideration. Wood is, and probably will for a long time be, the principal material for this purpose. Durable timber is necessary in order to reduce cost of reconstruction. It may be safely assumed that for each renewal the unit cost of timber is considerably greater. Wood is generally destroyed by two kinds of rot: common rot and dry rot. Common rot is nothing more or less than the very slow burning of wood by atmospheric action. The difference between active combustion and the effect of air on wood is the relative speed of destruction. Dry rot starts within the wood, and converts the fiber into dry dust; its cause is inherent in the timber, and only requires the concurrence of a few conditions to come into action. To prevent the destruction of timber, more methods have been devised than for any other one purpose. To drive out the sap, and prevent air from entering the wood is the requirement necessary for its preservation. I wish some one would try the experiment of driving out the sap and coating the outside of the tie with a plating of lead. Lead, as you all know, is one of the least destructible of metals.

Next is the rails—the real railway as it were. One of the many things in which our electric railway friends are to be congratulated is the use of rails of greater depth of section. Steam roads are gradually adopting the same practice and will, no doubt, keep doing so until they get a much deeper rail than now used. The principal

reason for deepening the rail, is to increase its vertical stiffness and provide room for a better joint fastening. But another and quite as important reason may be given—the effects of the transverse minute cracks developed in the head of the rail by the loads passing over it are better resisted by a rail having the least deflection. Recent observations seem to indicate that the deterioration of steel rails is confined almost if not wholly to the upper side of the head, or running side of the rail, the character of the base not changing even after long heavy service. Generally speaking, the deterioration consists of increased hardness, with corresponding loss of toughness, and the development of transverse cracks, minute at first but gradually increasing with the use of the rail.

The rail joint comes in at this juncture for consideration. The aim in designing a joint is to make it as strong as the rail, which means that the joint must withstand the action of a passing load the same as the rail. When a joint settles under a moving load it usually moves laterally as well as vertically and, therefore, should be able to resist lateral thrust. On curves, joints always receive lateral thrust from a moving load. I predict that in the near future rails of high-speed lines will be tied laterally, in addition to the ordinary fastening to the cross ties; this can be accomplished only with the use of a deeper rail.

Frogs and switches which are weak points at best must, for safety, be of the best material and workmanship and, if possible, be made of a better grade of steel than the ordinary rails. Indeed, a special grade of material for these articles is needed. The wearing parts of the wings of frogs should be strengthened in every possible way. It goes without saying that perfect track will be fully equipped with perfect interlocking devices for operating the switches.

But after the structure is completed and the very best rolling stock placed upon it the whole aim, safety and comfort at high speed, will be defeated unless it is well maintained. Build as good cars as you may, with the best wheels and trucks known to the mechanical department; build tracks of the best material; but if you do not keep good gage, line and surface, the whole goes for naught.

Mr. M. M. Wood, of the General Electric Co., spoke on the subject of bonding of electric railway track. Mr. Wood said in part:

I would like to refer to surface contacts. We represent here (referring to a sketch on a blackboard) the cross-section of a rail showing the web—this will be half an inch in thickness, generally speaking. Into this we will put a long terminal bond whose terminal we will consider as merely a common copper plug or rivet placed in the web. I will undertake to say that 95 per cent of the holes drilled in rails for the purpose of inserting bonds are left in a rough state. You drill a hole through a piece of steel and there is no man can sharpen a drill but it will leave a little line running down through; as you drill deeper and deeper you apparently get a very fine thread in the hole. As long as the surface is bright that thread is a good thing to have in there—it is better than if you reamed the hole out smooth, because you have an anchorage; but if you do not take advantage of that anchorage it is of no account whatever. If you smooth that hole out and look at the surface through a microscope—you don't have to in general practice, you can see it with your naked eye—you will find many small holes in it and only 60 per cent of the surface is left for contact, the other 40 per cent is made up of little imperfections in the steel itself. If you expand a piece of metal, no matter whether it is copper, silver, gold, or whatever it is in there for the purpose of carrying current you give it a certain pressure and a certain angle, you are supposed to expand it so that the metal will flow into those imperfections or holes in the steel surface and give you additional surface contact.

But this is the result that you actually do get: When you put a solid plug in a hole and then compress the ends together through hydraulic pressure, hammer blows or any other method, and batter that together, as soon as you commence to drive the copper down into the hole it expands and goes into these imperfections or small holes in the steel; not satisfied, however, with getting a little expansion so that the metal in the plug creeps out into these small holes, you try to get a solid connection and therefore ram the plug down just as hard as you can. When you get it down so that it is riveted in there or eyeletted you have carried your copper longitudinally along on the surface, so that the edges of all these imperfections into which the copper has crept have sheared off the

metal along the remaining body of the terminal. We have made tests on plugs of copper in steel, starting at (we will say) a thousand pounds' pressure, applying a certain number of amperes of current and then noting the resistance; increasing the pressure and testing again we have invariably found that a certain limited pressure will produce the best results—but as that pressure is exceeded the results are less and less satisfactory. Try the experiment in this way: Cut one hundred threads to the inch through the web of the rail, or a block of steel, put in a plug of copper and expand it any way you choose so that the copper changes in position as you drive it along. Then saw the block open and you will find that the threads still remain on the steel and are not on the rivet—you have an intermediate film of copper which oxidizes and increases electric resistance.

If you are going to use a flexible bond see that you get a perfect union between your cable and the terminal itself, that you get an expansion of your terminal directly in line at right angles—do not try to get an expansion by shoving the plug through a hole and then expanding it and shoving it a little further. Keep your terminal as near the same length when you get through as when you put it in, and expand it by some means; there are several schemes for that purpose. If with the bond you use a terminal seven-eighths of an inch in diameter, drill your holes with soap water—don't use oil, it is not necessary; have your drilling done right ahead of the man who puts in the bonds, so that the metal will be bright and clean for the reception of the terminals; don't ream the drilled holes out, but wipe them out with a piece of clean waste. When you drill your hole through the plate to the rail, have a little collar made with a cutting edge and put on the drill, so that when the hole is drilled the collar will face off any burr on the edge.

We are indebted to the Proceedings of the New York Railroad Club for the foregoing transcriptions of the remarks before the September meeting.

**YORK (PA.) NOTES.**

Several large companies have recently been organized for building power plants on the Susquehanna River between Havre De Grace, Md., and Wrightsville, and it is stated that these plants are being built in connection with a large electric railway which is to operate between these places for passenger, freight and mail traffic, also for the equipment of the old Susquehanna & Tide Water canal for running freight boats by electricity, and for the proposed Maryland & Pennsylvania R. R., which is to operate trains by trolley from York to Delta, a distance of 50 miles. It is expected subsequently to convert the steam road from Delta to Baltimore into an electric line. Work has been commenced by the power plant companies and surveys are being made for the building of several dams across the lower Susquehanna River. The company which expects to operate the canal boats by means of a trolley system has employed mechanical and electrical experts who are now engaged upon the plans for hauling the boats by means of trolley cars.

The Maryland & Pennsylvania R. R. was chartered in 1856 and since the organization of the York Traction Co., its patronage has fallen off considerably. For this reason it is now proposed to substitute electricity for steam.

**NEW TERMINAL COMPANY IN CINCINNATI.**

The Traction Terminal Co., of Cincinnati, has been organized and incorporated by interests connected with the Cincinnati Traction Co. and several of the interurban roads centering in Cincinnati. The object of the new company is to build a line within the city which will afford entrance into Cincinnati for standard gage interurban railroads, the gage of the Cincinnati Traction Co. being 6 in. wider than the standard. None of the details of the proposed road have yet been decided upon, but the plan includes the building of a terminal station for the joint use of the interurban lines.

Since the Millcreek Valley, O., lines have changed hands and are practically operated by the Cincinnati Traction Co., the by-laws of the Mutual Protective Association of the Traction Company's employees have been amended so that the Millcreek Valley men may become members. A general invitation has been extended them to join the association.

**REMOVING PAINT BY SAND BLAST.**

The ordinary gasoline blow torch commonly used in paint shops for removing old paint from cars and trucks preparatory to repainting is not only an inconvenient thing to handle but is constantly a menace to property and requires the strictest attention to prevent fires.

Mr. J. Millar, superintendent of rolling stock for the International Ry. of Buffalo, has abandoned the use of blow torches entirely in this work and now uses a home-made sand blast consisting of a sand tank, a few feet of 3/4-in. iron pipe, and a nozzle made by

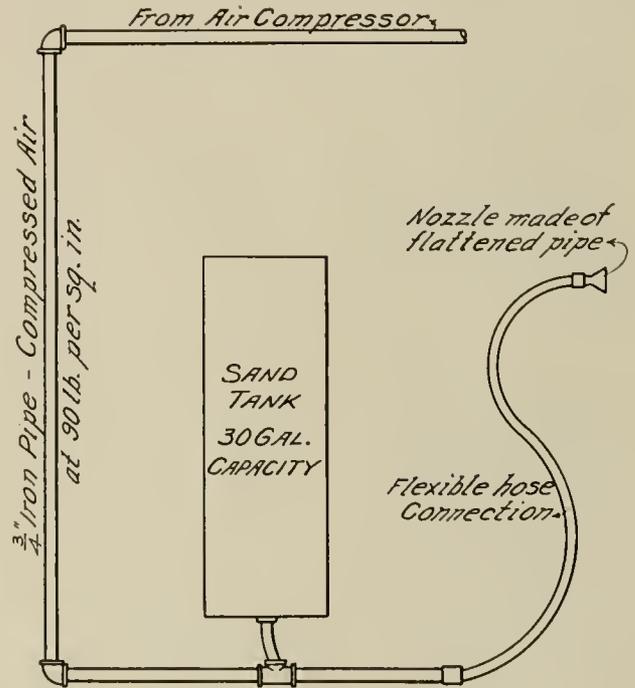

DIAGRAM OF SAND BLAST.

flattening out a piece of 3/4-in. iron pipe. Compressed air is taken through the iron pipe from an air compressor in the main shops. The sand which must be of fine clean quality is fed from the tank into the air pipe in the manner indicated in the diagram, the force of air combined with gravity, being sufficient to draw the sand down into the pipe in a good steady stream. By means of the flexible connection and nozzle one man directs the sand against the surface to be cleaned, exactly in the same way as he would handle a blow torch of any kind. Mr. Millar states that with an air pressure of approximately 90 lb. and a good quality of sand every particle of old paint is removed and a cleaner surface is secured than could be obtained with a blow-pipe flame, and in just one-half the time, inasmuch as one man now does the work formerly requiring the services of two men.

**REORGANIZATION OF THE NORTHERN OHIO TRACTION CO., AKRON, O.**

The reorganization of the Northern Ohio Traction Co., which will be known as the Northern Ohio Railway & Light Co., with a capitalization of \$7,500,000, was completed early in November. The purpose of the reorganization is to raise funds for the purchase of additional cars, double tracking, and building a new bridge over the Cuyahoga River at the gorge between Akron and Cuyahoga Falls. The bridge has already been contracted for. The company is contemplating building an extension from Barberton to Wadsworth, a distance of seven miles, early next year and the entire line will be greatly improved.

Mark W. and George J. Woods, who are small stockholders in the Lincoln (Neb.) Traction Co., have brought suit to restrain the use of the profits of the traction company for the construction of a steam heating plant now under way.

**WEAR OF STREET RAILWAY RAILS.**

The wear of street railway rails at Sheffield, Eng., was the subject of a paper read by Mr. C. F. Wicke, city surveyor of Sheffield, before a meeting of the Association of Municipal and County Engineers and Surveyors.

The municipal railway of Sheffield consists of 50 miles, measured as single track, and about 100 cars are in use. The maximum grade is about 10 1/2 per cent and the shortest curve has a radius of 30 feet. The rails are grooved girders weighing 108 lb. and are in 30-ft. lengths. They have 7 1/2-in. flange, 7 in. total depth and 1 11/16-in. tread, the groove is 15/16 in. deep. The clearance between the wheel flange and the bottom of the groove is 7/16 in. and it is considered that when the rails have worn sufficiently to enable the flange to touch the bottom of the groove their life will be at an end. Before this can happen, steel with a cross-section area of .700 in. must be worn away.

Observations have been taken from time to time to ascertain the rate of wear on these rails and the results are given in the following table. These are interesting as showing how much more the wear is regulated by the gradient than by the number of journeys, the reason for this being that the action of the brakes is much more destructive to rails than the up-hill traction.

Track.	Gradient.	Months wear.	No. of journeys.	Reduction, depth of groove, in.	Total possible reduction, sectional area of tread of rail, per cent.

**CHICAGO UNION TRACTION CO.**

Two court decisions affecting the Chicago Union Traction Co. and one arbitration award have been made public since our last issue.

The two decisions were rendered by the Illinois Supreme Court October 25th, one in regard to transfers and the other on cleaning streets.

**TRANSFERS.**

The court holds that the Chicago Union Traction Co. and the Chicago Consolidated Traction Co. are practically one system, so that transfers must be given everywhere within the city limits between the north and west side lines operated by the Union Traction Co., and between these lines and those of the Chicago Consolidated Traction Co. The court holds it to be apparent that the street railway lines of the outlying companies were built as feeders to and extensions of the West Chicago and North Chicago roads and that they all constitute one system. The Union Traction Co. acquired nearly all the capital stock of the Consolidated company in 1899 and this is held to make the relationship of the two companies still more positive. In the second case these transfers were refused from one line of the Union Traction Co. to another line of that company on the ground that the city council has no power under the statutes to regulate the fares charged by street railway companies or to require transfers to be given. The court states, however, the contention that the city has no power over street railways would be found incorrect upon examination of its charter, and holds that the traction company has not shown that the enforcement of the transfer ordinance would reduce the company's earnings so as to constitute a taking of its property without due process of law. In meeting this contention the court says that "a railroad company is not entitled to exact such charges for transportation as will enable it at all times not only to pay operating expenses, but to meet the

interest regularly accruing upon all its outstanding obligations and justify a dividend on all its stock."

The Chicago Union Traction Co. will apply for a rehearing on this case.

**STREET CLEANING.**

In this case the court says:

"It does not seem unreasonable that the city should require the traction company to clean and render healthy that portion of the street occupied by the tracks of the company under the circumstances of the case. In order to secure the public health and comfort the property of individuals and corporations alike may be subjected to reasonable restrictions and burdens. It does not appear unreasonable that the traction company, having in the exercise of the special privilege enjoyed by it contributed to the unsanitary conditions which injuriously affect the public health and comfort, should be required to aid in removing such conditions. The privilege enjoyed by the defendant in error to maintain its railway in the street and operate its cars thereon is to be exercised in the interest of the public; it was to serve the public that the privilege was granted to it. Its business and property are impressed or affected with a public use. It may therefore be subjected to municipal regulations of a greater scope in the interest of the public at large than that of a railway company exercising its franchises on its own road bed."

The court had previously decided that an ordinance requiring individuals to clean the street in front of their property was invalid, but distinguishes this case from the others because "the street railway occupies the street itself and the presence of its track contributes to the accumulation of dirt and makes it more difficult to keep the street clean.

**WAGES.**

The negotiations between the Chicago Union Traction Co. and its employes which have been pending for several months resulted in the question of wages being submitted to a board of arbitration. On November 6th the board made public its award, which was as follows:

In the matter of the differences between the employes of the Union Traction and Consolidated Traction Street Railway Companies, and said companies, the board of arbitration makes the following finding:

1. The wages of motormen and conductors running electric cars on the Union Traction lines, and conductors of grip cars or trains, shall be 24 cents per hour, except as hereinafter provided.
2. The wages of gripmen and conductors operating more than one car, including combination grip cars, on the Union Traction lines shall be 25 cents per hour.
3. The wages of the motormen and conductors of the Consolidated Traction Co. shall be 23 cents per hour.
4. Employes who have served the company for less time than six months shall receive the same wages as are now paid, provided the company shall not discriminate so as to discharge old employes and take on new ones for the purpose of hiring at a lower rate.
5. Trippers shall receive \$1.75 per day, excepting such trippers as have not been in the employ of the company for a period of six months, and as to such trippers, the rate shall be the same as now fixed.
6. Night men on the West Side shall receive 40 cents per hour; night men on the North Side shall receive \$2.50 per night, for such men as now receive \$2.25, and \$2.65 per night for such men as now receive \$2.40.

This scale of wages shall be in force and effect from Sept. 15, 1902, to May 31, 1904.

The question of reinstatement of discharged employes is still pending before the arbitration board. The board did not find evidence that the company had discriminated against members of the union since the agreement made May 31st not to do so.

The Richmond (Ind.) Street & Interurban Railway Co. has received four new interurban cars which will soon be put into service between Richmond and Cambridge.

The Toledo Railways Light Co. has awarded the G. C. Kuhlman Car Co., of Cleveland, a contract for the construction of ten closed cars which are to be delivered in 60 days. The cars will be of standard size with double trucks and will be equipped with the Detroit platform, rattan seats, and side lights.

## RULES FOR STREET RAILWAY EMPLOYEES.

The Birmingham Railway, Light & Power Co., of Birmingham, Ala., has recently adopted a code of rules for the government of conductors and motormen, in the introduction to which are treated a number of points not usually mentioned in books of rules, and we believe the following extracts will be found of interest.

The rules were formulated by Geo. H. Davis, general manager of the company; J. B. McClary, manager of the railway department, and Geo. H. Harris, superintendent of traffic, who have endeavored to compile a code that would cover all the essential features in the operation of the road.

### ORGANIZATION AND DISCIPLINE.

All employees of the Railway Department of the company engaged in operation and maintenance, with the exception of the overhead line maintenance, are employed and discharged by the manager of the Railway Department. The manager of the Railway Department being responsible to the president and general manager of the company for the condition of the road and the conduct of employees, his authority is necessarily absolute.

General orders or instructions applying to more than one employe at one time and one place will always be issued in written or printed form and published on the bulletin boards of the company or in bound copies issued to individual employees.

Special instructions may be given by any officer in charge at any time. These may be given in oral or written form, but they never apply to more than one employe at one time and one place.

### GENERAL DEPARTMENT.

The officers of the Railway Department of the company are as follows:

- President.
- Vice-President.
- General Manager.
- Manager of the Railway Department and Claim Agent.
- Secretary.
- Auditor.

### TRANSPORTATION DEPARTMENT.

- Manager of the Railway Department.
- Superintendent of Traffic.
- Assistant Superintendent of Traffic.
- Schedule Agent.
- Instructor and Employment Agent.
- Station Foreman.
- Division Dispatchers.

### MECHANICAL DEPARTMENT.

- Manager of the Railway Department.
- Superintendent of Equipment.
- Master Mechanic.
- Roadmaster.
- Shop Foremen.
- Track Foremen.

In general, all orders or instructions issued by an officer to employes will be issued through the officers of the company next in rank, as outlined in the foregoing statement. In case orders or instructions are issued by any officer of the company direct to an employe, the officers in a given department of the service ranking between the employe to whom the order or instructions are issued and the officer issuing them, will immediately be given copies or other information of the orders or instructions thus issued. Where practicable, orders or instructions will be issued in written form and copies sent to all officers of the department receiving the order.

All orders given by any of the above officers of the company in the departments as mentioned will be promptly obeyed. If conflicting oral orders are given, the order given by the officer of superior rank will be obeyed.

If orders given by any of the above officers of the company are exactly carried out, the officer giving such orders will alone be responsible for the same.

### PROMOTIONS

Promotions in a department will be made according to seniority in the service, provided candidate have equal qualifications. A record

is kept of reports of officers of the company of each employe's work for each day, and an employe's discharge is based upon this record.

There are, however, six things, the reports on which do not form a part of this record, and which are, due to their character, considered sufficient cause for immediate discharge. They are:

- (1) Disloyalty to the company.
- (2) False reports, either oral or written.
- (3) Intoxication.
- (4) Dishonesty.
- (5) Fighting, or gross ungentlemanly conduct.
- (6) Failure to flag crossings.

No employe who has been discharged will be reinstated. It is the policy of the company to re-employ men in good standing who have resigned from their positions.

### OPEN RECORDS.

An employe is at liberty to inspect his own record as reported by officers of the company, or that of any other employe at any time.

Records are made according to a fixed scale which applies to all employes alike. This is open to all employes for inspection.

Whenever an employe does anything unusually creditable for the interests of the company (for example, making an excellent stop when a person or vehicle crosses directly and unexpectedly in front of a car), if an officer of the company does not see the occurrence, the company would be pleased to have employes hand in the names of one or two witnesses who observed it; in this way credit can be given for every creditable thing that is done.

### STUDY OF THE STREET RAILWAY BUSINESS.

Many of the employes of the company are studying street railway design, construction, maintenance and operation, with a plan of preparing to advance themselves in the various lines of the business. It is the desire of the company to suggest, from time to time, such lines of practice, reading and study as will be of the greatest advantage to employes in obtaining information in this connection. To prepare for making any advancement in railway affairs, it is necessary to know well the following: Reading, Writing, Spelling, Arithmetic, the correct use of the English language, the elements of bookkeeping and business methods. Also, if possible, an elementary knowledge of: Car Equipment, Shop Appliances, Steam Engines, Generators, Overhead Lines, Tracks, etc.

It is also necessary to know the price of supplies and the various grades and quality of each variety.

In addition, the following publications are most important for study:

- (1) Street Railway Journal, published weekly by the Street Railway Publishing Co., No. 120 Liberty St., New York.
- (2) Street Railway Review, published monthly by the Windsor & Kenfield Publishing Co., 45 Plymouth Place, Chicago.
- (3) American Street Railway Investments, Street Railway Publishing Co., New York.
- (4) Street Railway Law, published by the Windsor & Kenfield Publishing Co., Chicago.
- (5) Reports of the Boards of Railway Commissioners of each of the following states, which can be obtained by addressing the Secretary of State of each state, and paying the expressage on the books: New York, New Jersey, Connecticut, Illinois, Michigan, Massachusetts, Pennsylvania, Ohio, Iowa.

### GENERAL BULLETINS.

#### 1. REQUIREMENTS OF THE SERVICE.

- (a) Skill in the work to be performed.
- (b) Strict attention to business while on duty.
- (c) Absolute reliability.
- (d) Hard and efficient work.
- (e) Genuine interest in the company's success.
- (f) Gentlemanly deportment.
- (g) Neatness.

#### 2. KNOWLEDGE OF BULLETINS.

Ignorance with reference to bulletins will not be considered an excuse for mistakes or delinquencies on the part of employes.

New bulletins issued by the company are kept on file at the different stations of the company. All employes will become thoroughly familiar with bulletins issued previous to their entering the service.

### 3. EXAMINATIONS.

Every employe entering the service will be required to pass examination covering the work to which he is assigned, together with all bulletins of the company. The result of the examination is entered in the record of the employe.

### CITY ORDINANCES.

City ordinances will be carefully obeyed by employes. The following are the ordinances particularly referring to street car operation.

Patrol wagon, fire apparatus, etc., have prior right of way. The patrol wagon, all fire apparatus, trash wagons, and all wagons used for city improvements have prior right of way, so far as necessary for them to perform the work for which they may be detailed or provided, and any person knowingly, carelessly or willingly obstructing, delaying or intercepting the same, or any of them, shall be fined, on conviction, not less than one or more than one hundred dollars.

### RAPID BRIDGE REPAIR WORK.

An interesting piece of emergency bridge repair work was performed at Utica, N. Y., on September 16th. On that date the Savage Reservoir, located about two miles above the city of Utica, suddenly failed, permitting approximately 200,000,000 gallons of water to flow down the valley in a raging torrent, destroying property to the amount of several hundred thousand dollars. After having spent considerable of its force, the volume of water was turned aside by a steam railroad embankment, and brought up against a second embankment, which carried one of the double-track suburban lines of the Utica & Mohawk Valley Ry. At this point in the electric railway embankment was an old culvert, built some years ago of solid masonry, with dirt fill on top. The opening in the culvert was about 40 x 30 ft., but this was entirely insufficient to carry off the flood, the result being that the volume of water rapidly rose above the opening of the culvert and was soon surging against the bank, nearly to the level of the rails. The old

IMPROVED TRESTLE ON UTICA & MOHAWK VALLEY RY.

The following are some of the captions of city ordinances which you will take due notice of and not disobey:

Running over fire hose, Section 554.

Willfully causing a collision, Section 550.

Driving through funeral procession.

Must clear crossing before stopping car, Section 484.

An ordinance to regulate street cars and railroad trains at street crossings:

Be it ordained by the Mayor and Aldermen of Birmingham, That it shall be the duty of all persons having charge of locomotives, cars, trains, electric cars or dummy trains in the city, to bring the same to a full stop before crossing any railroad, street railroad or dummy railroad within the city of Birmingham, Jefferson County, Alabama; and any person violating any provision of this section, shall be fined, on conviction, not less than five dollars nor more than one hundred dollars, and may be imprisoned, and may be required to work at hard labor on the streets in said city for thirty days.

*Provided*, That this ordinance will not apply to any dummy, railroad or electric car crossing where flagmen are now, or may hereafter be stationed, while such flagmen are on duty.

Street railway tracks have been completed and car service inaugurated between Superior, Wis., and Billings Park on the St. Louis River.

masonry work was not equal to the pressure, and in an hour or so the entire culvert and bank gave way.

The break in the reservoir occurred about 2 o'clock in the afternoon, and the break at the electric railway embankment about 3 o'clock. By 5 o'clock of the same afternoon the waters had receded sufficiently to permit inspection and estimate of the damage done. By 7 o'clock Mr. C. Loomis Allen, general manager of the Utica & Mohawk Valley Railway Co., had a force of men at work repairing the damage. At Mr. Allen's suggestion it was decided to repair the break by building four cribs of ties, as shown in the illustration, two supporting piers being put in for each track. The ties used were sawed yellow pine, 6 x 8 in. x 8 ft. A good foundation for the piers was obtained in the bed of the creek, and they were carried up to the top of the bank without bolting or binding of any kind. On the top of the piers were placed heavy stringers 8 x 12 in. x 36 ft. long for supporting the rails and track ties. Several street arc lamps were strung at advantageous points, and a force of 30 men was organized in the repair work all night. By 7 o'clock next morning one track was ready for use, and by 9 o'clock the second track was completed. The illustration shows a double track car on the improvised trestle, the photograph having been taken on the morning of the day after the flood. The trestle has been in use continuously since the break, and is evidently as strong and trustworthy as the old masonry culvert. The total distance from the bed of the stream to the base of the rail is 20 ft., and there are

about 620 ties in the four piers. An odd occurrence in connection with the break, and one that somewhat delayed the work of repair, was the breaking of a trunk gas main, which was embedded in the embankment close to the railway tracks. When the bank gave way this gas main was broken, and the escaping gas became ignited, making an incipient Pelee until the gas company could be notified and the gas shut off.

The Savage Reservoir was built in 1873-1875 at a cost of \$157,000. The bank at the north end was 70 ft. high, had a base of 30 ft., and was 20 ft. across at the top. The reservoir was about  $\frac{1}{4}$  of a mile in length, had an area of 30 acres, and a capacity of 300,000,000 gallons when filled to the brim. The actual quantity usually carried was from 150,000,000 to 250,000,000 gallons, and at the time of the failure the reservoir contained approximately 200,000,000 gallons. The cause of the break was not determined, but was thought to have been due to burrowing by beavers. Fortunately, signs of weakening were discovered in time to give ample warning throughout the valley below, and no lives were lost as the result of the flood.

### TRAM CAR DRIVING.\*

BY H. B. PHILLIMORE.

With the advance of electric trams we have had many examples of a car getting beyond the control of the driver, and accidents resulting of a more or less serious nature. Some have necessitated an official inquiry; in the majority of cases nothing more serious has occurred than a damaged panel, or a shock to the nerves of the passengers. But even these are of serious consequence, for our cars will not be a success or pay as they ought, unless we obtain the entire confidence of the public.

Probably in the future many of these accidents will be averted by our being able to give the driver more instantaneous command over his car.

Meanwhile, we must make the utmost of the means of control at present provided. This we are not doing so long as drivers are to be seen in some of our large towns who have to look at their controller, or who ring their gong with their right foot.

A great deal could be done towards ensuring public safety by more careful training and more efficient supervision than prevails in some places.

And there is another direction in which more trouble might be expended; namely, in the designing of the front platform, and in the arrangement of the various means provided for controlling the car. There are usually six handles and pedals to be manipulated:—

1. Controller handle for regulating power.
2. Emergency brake and reversing lever.
3. Gong pedal.
4. Hand brake lever.
5. Hand brake ratchet pawl.
6. Sandbox pedal or pedals.

These are arranged to be worked as follows:—

1. By the left hand.
3. By the left foot.
4. By the right hand.
5. By toe of right foot.
6. By the heel of right foot.

No. 2 is worked by the left hand for reversing, and the right for the emergency brake.

The various duties are distributed in this way, because it is of utmost importance that it should be possible to perform more than one operation at the same time.

Thus, in the event of a foot passenger not noticing the approach of a car and stepping suddenly in front of it, the driver wants to cut off current, ring the bell, apply the hand brake, and, perhaps, sound the track, and they must all be done instantly. For, suppose it takes the driver one second to cut off current before he can ring his bell, and one second to ring his bell before he can apply his brake, and suppose the car to be travelling 12 miles an hour, then the car will have travelled six yards before retardation commences, and those two seconds may mean much to the future life of the pedestrian.

\*From *The Electrical Review*, London.

A driver who can retard and accelerate the speed of his car quickly can, with equal safety to the public, do quicker time through traffic than one who is less expert.

But there have been cars built in which it is quite impossible to stand in such a position that all the necessary operations can be carried out at one and the same time.

The driver must have one hand on his controller and one on his hand brake lever.

The left heel should be on the floor of the platform, and the toes on the gong pedal. The gong is sounded by raising the toes and then depressing them again.

The right foot should be so placed that the toe touches the pawl of the ratchet, and the heel is at the side of the sand pedal, so that it can be quickly raised and brought down again on a sand pedal. It should be possible to keep the sand pedal depressed with the heel while the toe is pressing the pawl into place.

The hand brake lever should be able to make a revolution without touching the ribs of the driver when he stands with his feet in the necessary positions.

Great care should be taken that a man can comfortably stand in the position indicated, and have instantaneous control over each of the levers and pedals. The best arrangement can be got by trial, and that should be adhered to on all cars.

It then remains for the eventual proprietors of the cars to train and pick their drivers carefully, and for the driver to carry out instructions, drive with care, and keep cool.

Prompt manipulation of his somewhat complicated means of control is only to be obtained at the cost of considerable practice. A man may know everything about the mechanism of a car, but let some unforeseen complication arise in the traffic, and, without practice, he will be unable to apply his knowledge in the fraction of a second which may just avert disaster.

A driver must be able to control his car without having to think what actions he has to go through, just as he walks without thinking which foot has to be moved next.

The exact actions become more or less reflex, with the consequent advantage that they approach as nearly as possible to being instantaneous.

Take the case of a racing cyclist. There was a day when he could not even balance his bicycle. First he had to learn to ride at all; while he could still ride only slowly, he had to learn to steer, and then to use different muscles at different positions of his feet, so as to get as uniform a turning effort as possible. In a race he never thinks of these things. The whole energy of his brain is concentrated on the race itself. To pass an opponent he has to alter his direction several times, each time necessitating a fresh balance of his body, and he must pedal his very hardest. But in the race these actions are all done with no tax on his brain. He considers it time to pass and he passes. Had it been necessary for him to use his brain to think what to do, he could not so accurately have gauged the exact fraction of a second in which to pass his opponent.

So with our car driver. In case of emergency, he should be able to stop, slow down, or accelerate his speed without any tax on his brain due to minor details. The whole energy of his brain can then be absorbed in observing the conditions of the traffic and other affairs outside his car which demand his attention. There would be no reply then at an inquiry into a collision to a question as to the exact distance of the other vehicle. "I cannot say exactly. I was putting on my brake at the time."

Drivers should get practice in making emergency stops. If they are taught by being sent out on cars on service during the day time, then they should have one or two nights on a special car learning to use their brakes and to make the most of them at speeds that would not be permissible in the traffic. Make him drive first from one pole to another with his controller full over and then see how soon he can stop, ringing his bell at the same time. Then do the same yourself, and show him that by your greater experience you can stop the car in a much shorter distance. Show him where you think he made mistakes, and let him try again. Then take him to a hill which has a straight length at the bottom with no turn outs, and give him practice in stopping at as high speeds as possible. If this part of his education is omitted we may get the following case:

A man has learnt in traffic, he is a careful driver, and his car

has never travelled over 12 or 15 miles an hour, and has always been under city control. A day comes, he is starting down a steep hill using his electric brake. One of the controllers contacts him, been deranged, and before he realizes it the speed has increased to the greatest he has ever driven at, and is increasing every second. He has never before driven down that hill at more than 8 miles an hour. By the time he has got his hand brake blocks against the wheels the car is going 20 miles an hour. The feel of his brake is different to anything he has ever felt before, it does not seem to be having any effect, because he is unable to appreciate the difference between 20 miles an hour and 8 miles an hour.

Under these circumstances can we be surprised if he loses his head?

A man who had had practice in making stops at that speed would have no cause for losing his head. He would know the strength that would make the brakes most effective, and he would be able to recognize when the car was beginning to slow down, and would be perfectly confident that he could stop.

Teach the drivers all you can about driving, and try to leave them nothing to find out themselves. Institute a system of driving, and make them stick to it. If not taught, they find out little dodges themselves, and they show some of them to others, and you are apt to get several different methods amongst them all, which makes it harder for you to pick out the drivers who have the best control.

One portion of the equipment of some cars demands a few words—the track brake. This is worked by a wheel on the platform, which turns a screw. The screw enables great force to be applied, and does away with the need of a ratchet. But it takes a long time to move the block down to the rails. It cannot be brought quickly into action as the ordinary hand-brake can. It is, therefore, no use as an emergency brake. Also most of the track-brakes used in this country will not stop a car on a steep hill. The track-brake should be applied at the top of the steep hills, and left alone till the bottom is reached. Stops and starts are made with the hand-brake and controller, and the track-brake simply makes driving down a hill as easy as driving on the level.

#### SAN BERNARDINO TRACTION CO.'S EXTENSION TO REDLANDS.

The San Bernardino Traction Co. is now building an extension of 6½ miles to Redlands to connect with the Redlands Street Ry. Material for the extension has been contracted for; the rails, which will be 60-lb., are now on the way from Antwerp, Belgium, and shortly after their arrival, which will be about Jan. 1st, 1903, the road is expected to be in operation, as the roadbed and overhead work is now well under way.

The company has also applied for a franchise to Highlands, a distance of 6 miles, and will begin the construction of this line as soon as possible. The power now used by the San Bernardino Traction Co., and that to be used on the new lines, is furnished by the Edison Electric Co., of Los Angeles, from its power house in the canyon about 20 miles away. This power is generated by water and the alternating current is converted to direct current at the company's car house. Mr. A. C. Denman, Jr., is general manager of the company.

#### FIGHTING TROLLEY COMPETITION.

The Columbus, Delaware & Marion Traction Co., which has recently been opened for traffic between Columbus, O., and Delaware, is meeting with considerable opposition from the steam roads in this territory, which have combined to fight the new trolley road. The Hoeking Valley, Big Four, and Columbus, Sandusky & Hoeking railroads have issued a commutation ticket good for 20 trips, which is unlimited as to date. This ticket is honored on any one of the three roads and may be used by anybody.

The Twin City Rapid Transit Co., of Minneapolis, has purchased 20 acres of land in Ramsay County. The land was purchased without any immediate idea as to what use it would be put to, but it is considered a good investment.

#### BIRMINGHAM NOTES.

In accordance with an agreement with the city the Birmingham Railway, Light & Power Co. inaugurated a system of transfers on September 20th. Before this, on three of the company's lines formerly controlled by another company a system of transfers was in effect, but now transfers are issued on 13 of the divisions of the company's lines. Each division of the road uses a transfer of a different color and new sets of transfers on which the date is prominently printed are issued each day. Before the transfer system went into effect the company sold various kinds of tickets. For example, 100 tickets for \$4, and on the suburban lines, where the fare was 12 cents, a laborer's ticket was sold for \$3 per month, but, with the adoption of the new transfer system, all sales of tickets are discontinued and now every one is charged a full cash fare. Sufficient time has not elapsed since the inauguration of the transfer system to determine whether the receipts will fall or not on account of the discontinuation of the sale of tickets.

The conversion of the Bessemer & Birmingham dummy line, 13½ miles in length, from a steam to an electric line is being pushed as rapidly as possible; both day and night shifts are at work on it and it is believed that it will be ready for operation by January 1st.

The freight business on this line has increased so materially that it was found impracticable to run a mixed train and do justice to both passenger and freight traffic, so a steam freight train, making three trips to Bessemer daily has been put in service and the train frequently consists of eight and ten cars. The service is more after the fashion of an express service and merchants in the suburban towns are taking advantage of the opportunity to get goods within a few hours after ordering them rather than wait a day and sometimes longer for them by the trunk lines.

The work on Third Avenue, a street on which a franchise was recently granted, is progressing nicely and a lot of special work consisting of turnouts and crossings has just been placed at 3d and 19th Sts.

The city council recently passed an ordinance requiring the company to equip its cars with fenders and to that end an order has been placed for the entire equipment. The type to be used is that of the St. Louis Car Co., which was approved by a committee of the board of aldermen who witnessed some practical tests of fenders.

The first installment of the 27 new cars recently ordered from the St. Louis Car Co. has arrived. They are 21½ ft. long and mounted on Lord Baltimore single trucks and equipped with two G. E. motors. They are vestibuled and have electric arc headlights and Hunter signs set in the upper part of vestibule window. They have a seating capacity for 28 and are supplied with Hale & Kilbourne walkover cane seats. Signal bells with buttons at each seat are provided and the cars are equipped with the type of fender approved by the city council. They are painted the company's standard color, chrome yellow, with white roofs. These cars are to be used on the cross-town lines and are to take the place of the open cars now in use.

In connection with the Brown system of discipline now in effect the management is preparing to adopt a rule that when a man has received a certain number of demerits on his record and has no credits to counter balance them he will be lowered on the list, and when he has a certain number of credits with no demerits he will be promoted. By this means a good man will steadily rise and an indifferent man will go down, and good men will be retained in the service for occurrences that would ordinarily discharge them.

The Guthrie (Okla.) Light and Traction Co. has been incorporated to construct an electric railway system in Guthrie.

Two companies, the Raritan Traction Co. and Central Jersey Traction Co. have made application for a franchise through South Amboy, N. J.

It is reported that an electric railway will be constructed between Withee and Maplehurst, Wis. A. E. Jeffrey, Milwaukee, is said to be a promoter of the scheme.

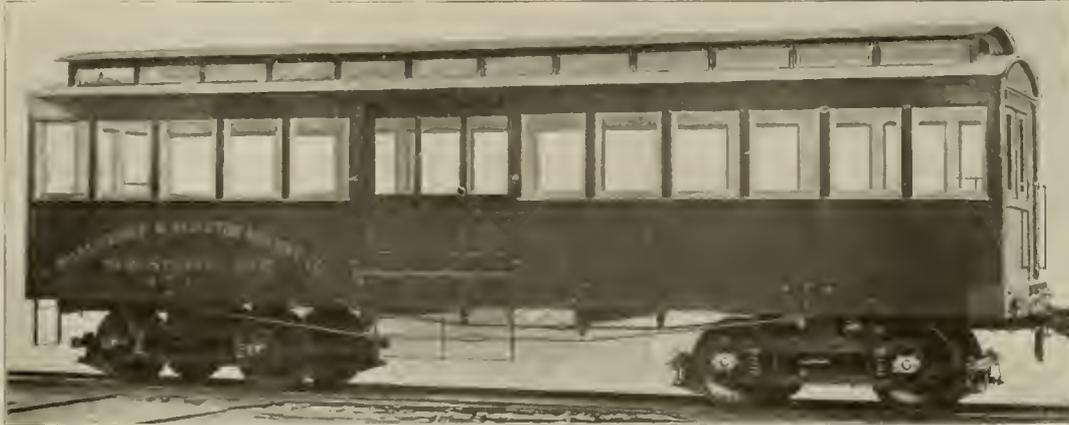

A charter was granted November 10th to the Oklahoma Traction Co. for the purpose of building a line from Guthrie to Oklahoma City and to El Reno. The line will be 75 miles long.

### A MOVABLE SUB-STATION.

Not infrequently the question has been raised as to the most economical method of supplying sufficient current to outlying parts of systems which at times carry heavy traffic. Lines to distant pleasure parks used only, or chiefly, in summer, come particularly under this heading. The delivery of a heavy voltage of direct current over several miles of line involves a waste too great to be continued for

There are no trap doors, as the trucks are not equipped with motors, therefore the floor is entirely clear for the machinery. A 5 ft. 6 in. sliding door is on one side and 30-in. sliding doors at the diagonal corners. The length over sheathing is 36 ft., and width over posts 9 ft. 6 in. Weight of rotary converter, 20,600 lb.; three transformers, 10,050 lb.; switchboard, 1,200 lb.; a total of 50,750 lb. The trucks are Brill No. 28.

The car can be used, with and without machinery, for a variety

PORTABLE SUB-STATION CAR—BUILT BY J. G. BRILL CO.

any length of time, and therefore sub-stations with rotary converters are built, although their maintenance during half the year is a dead loss.

During the past summer a very practical expedient has had a successful trial by the Wilkes-Barre & Hazleton Railway Co., consisting of a car built by the J. G. Brill Co., of Philadelphia, arranged to contain a 400-kw. rotary converter, three transformers and a switchboard. The car is, therefore, a movable sub-station ready to be placed on sidings wherever needed and connected with wire bearing an alternating current. As the percentage of waste for distance is slight with alternating current, the car may be placed as far from the power house as need be. The current operates the converter and is delivered in the proper quantity on the main line through the transformers or boosters.

The roof of the car is constructed to be entirely removable in one piece like a box cover, in order that the large and heavy machin-

of purposes which will suggest themselves according to local needs. The economy and convenience of the rotary converter car will probably bring it into considerable use in the near future.

### PHILANTHROPIC IDEA IN BOSTON.

The Boston Elevated Railway Co. is carrying out the modern idea that it pays to be not only fair and just, but generous as well, with employes, and as an example of its desire to cater in every way possible to the needs of its men, it arranged during the recent coal strike to import from abroad a steamer load of coal which it sold to its employes at very nearly normal price, and at a cost way below the price asked by the coal dealers in the city of Boston.

The circular to its men announcing this move reads as follows: "It having been represented to the Boston Elevated Railway Co. that many of its employes are in great need of fuel which they cannot obtain in the present fuel crisis, the company will undertake to furnish as many of them as possible with 'English Admiralty' soft coal, laid down at such wharf or landing in Boston as may be obtainable, and as nearly as possible, at cost prices, approximating as nearly as may be to \$5.50 per ton of 2,000 lb. small coal and \$6.75 per ton for large coal. To this must be added cost of delivery from dock and other expenses of undertaking. The newspapers are full of instructions for using this coal in house furnaces and stoves.

"Employes who desire some of this coal must sign application blank at once in ink for the amounts they desire and kind preferred, must take whatever kind the company can best obtain, and must be prepared with their money and otherwise to assist in prompt discharge of cargo on its arrival.

"Further information and application blanks will be furnished by the committees of employes designated for each division."

The Ashtabula (O.) and Jefferson extension of the Pennsylvania & Ohio Electric Ry. was opened October 20th with a two-hour schedule between the two points. An hourly schedule will soon be established.

Reports from New Orleans state that the "Jim Crow" law effective November 3d, is being enforced with difficulty. The street railway company reserved the rear seats for negroes and placed screens in the cars, but since the recent strike the number of cars operated is so much smaller that all of them are crowded. The whites are muttering upon riding in the seats set aside for blacks and the conductors are finding it practically impossible to make the law effective. Negroes in many instances had difficulty in getting aboard cars.

INTERIOR OF CAR.

ery may be installed on a crane. Eight large eye bolts, set in blocks secured to the rafter and top plate of the monitor deck, constitute the lifting connections and make the removing process comparatively easy. Every alternate rafter is reinforced with an angle iron carline and all parts of the roof are made extra strong to withstand the stress of moving.

### SIGNAL FOR STOPPING INTERURBAN CARS.

A useful device has been patented and placed upon the market by Mr. A. J. Havcox, superintendent of the Citizens Electric Railway, Light & Power Co., of Mansfield, O., the object of which is to enable intending passengers to signal suburban cars at night.

The device, as will be seen from the accompanying illustration, is very simple in design and at the same time is a very necessary adjunct to the suburban railway as it obviates the necessity of passengers lighting matches or burning paper, which are very troublesome expedients for signaling cars on dark nights. The signal box is usually placed above the bracket on a pole near the point where it is desired to stop cars. This signal box is connected by wires to the contact box or switch which is placed about four feet from the

SIGNALING INTERURBAN CAR AT NIGHT.

ground. The pipe containing the wires is fastened to the pole by staples. By raising the handle the lamps in the signal box are lighted, and but little current is consumed by the device as the lamps remain lighted only while the handle is being held up.

The device, in fact, has the effect of saving power, as without the signal the motorman, not knowing that he is to stop, will leave his controller wide open, and when he sees an intending passenger he is just passing, will throw on the brakes very suddenly to stop the car. In this way he uses current to accelerate his car which would have been unnecessary had he known in advance a stop was to be made. In order to operate a car economically a motorman should know about 1,000 ft. in advance that he has a stop to make and by means of this signal he can handle his car so as not to waste current unnecessarily.

The device consists merely of a group of lamps in the signal box, one end of which is connected permanently to the trolley wire and the other end of the circuit passes to the ground through a switch which is operated by the intending passenger. There is no complication and it is so simple that it is almost impossible for it to get out of order.

The interurban line between Mansfield and Shelly, O., has been

equipped with these signals and they have proved entirely satisfactory both to the railway company and its patrons along the line. The device not only saves current and time, but decreases the liability to accidents and avoids the wear and tear on cars and equipment caused by very quick stopping.

### STREET RAILWAY STRIKE AT GENEVA, SWITZERLAND.

By courtesy of Mr. H. P. Bradford, general manager of the Compagnie Genevoise des Tramways Electriques, Geneva, Switzerland, we have received an account of the labor troubles with which his company has recently had to contend.

This company was formed a few years ago and purchased the existing tram lines in Geneva and the interurban roads in the vicinity which were then operated by steam. Under the new ownership the old lines have been rebuilt and equipped for electricity and a number of new extensions made to small towns in the territory. The first year of operation the return on the capital was but little more than 1 per cent and for the current year will not exceed 2 per cent. The stockholders of the company were insistent upon the property paying a better revenue and one of the results was the resignation of the manager and the appointment of Mr. Bradford as his successor. Mr. Bradford took charge August 16th and having in mind the necessity of reducing expenses, on August 30th published an order discharging 44 employes to take effect September 12th. On the following day a general strike of the men was declared, the total number quitting service being 489. The sympathy of the public was with the strikers, doubtless to some extent because of the fact that Mr. Bradford was a foreigner and also because Switzerland is the home of many socialists and labor agitators who have been driven from other European countries.

On September 1st it was agreed that the questions in dispute should be referred to a commission of three members appointed by the Council of State and on the following day the strikers returned to work pending a decision. This decision was rendered September 12th and was favorable to the employes who obtained a reinstatement of the 44 men discharged and some modifications of the rules to which they objected.

On September 25th a complaint was made to the Council of State by the men, it being alleged that the company was not living up to its agreement. The Council of State heard both sides of the controversy and decided that complaints of the men were without cause. On the 27th of September a strike was ordered for the 28th, but this was not general. A number of cars were sent out that day and more the succeeding day until October 3d when the regular service was given, and the company announced that after that date none of the old men would be reinstated.

The first few days of the strike resulted in but little disturbance but beginning with October 1st it was necessary to call out several companies of militia to suppress disorder. On October 6th it was sufficiently grave for the Council of State of Geneva to issue a proclamation calling attention to the fact that instigators of the trouble were, for the most part, not natives of Geneva and calling on all good citizens to lend their aid in suppressing the disorder.

### ELECTRIC RAILWAYS IN SOUTHERN INDIANA.

"There are railroads talked of, dreamed of, surveyed, prospected, promoted—good, bad and indifferent in this community just now.

"What with the Black Diamond, too dead to skin, the Indianapolis Southern past redemption, the Columbus, Brownstown, Salem, Paoli and French Lick Electric Line just sticking up its head, the Jasper, French Lick and Mitchell with its surveyors in the field and courting two routes, the Walsh road from Indian Springs to West Baden, Paoli and down the pike to the River, the Taggart-Buskirk-Dickerson-Fairbanks line up the pike and a Chicago company awfully anxious to build over the same route it begins to look really dangerous to life and limb, they are so awfully thick.

"But, of course, they won't all get here at once—come gradually perhaps, so that we can become some accustomed to the whiz and roar and clang and bang and be able, with a little time and education, to keep off the numerous tracks and thereby save our scalps."

—Fredericksburg (Ind.) Gazette.

## REPORT OF THE COMMITTEE ON STANDARDS.\*

BY N. H. HEFT, JOHN I. BEGGS, E. G. CONNETTE, E. A. NEWMAN  
AND R. T. LAFFIN.

The members of the committee on standards, appointed in pursuance of the action of the last annual meeting of the associations, have given individually, at their homes, and collectively as a committee at meetings, considerable thought to the matters involved, and have carried on much correspondence in an earnest effort to obtain data which would enable them to present at this meeting of the association ideas that would be of advantage to the electric railways throughout the country.

It is unnecessary, however, to suggest that because of the great changes and vast improvements being made in the type, design and construction of motors that it is difficult to make any definite recommendation upon this point, as we feel that the next year or two may radically change the ideas of the manufacturers as well as the operating departments of the several roads with relation to the matter of motors.

With regard to the matter of rails and trucks we present more definite conclusions for your consideration.

At the first meeting of the committee the subjects to be considered by the committee were divided and assigned to the members as follows:

N. H. Heft (Meriden, Conn.)—Wheels, axles, axle brasses, journals, journal-boxes, brake-heads, brake-shoes, etc.

John I. Beggs (Milwaukee, Wis.)—Rails.

E. A. Newman (Portland, Me.)—Motors.

E. G. Connette (Syracuse, N. Y.)—Trucks.

R. T. Laffin (Worcester, Mass.)—Painting.

Will Christy (Akron, Ohio)—Car bodies for city and suburban service, including ventilation; also the question of the oval roof.

C. F. Holmes (Kansas City, Mo.)—Standard overhead construction for high-speed and suburban roads, including trolley wheels.

### Rails.

The committee having carefully considered this subject, and having consulted with experts, recommends that this association adopt as a standard for either a T or girder rail, the form of rail shown in Figs. 1 and 2; the height of the rails to be governed by the character of the pavement required, in the municipalities, and the weight of the rail to be not less than 70 lb. for the T rail and not less than 90 lb. for the girder rail per yard.

It will be observed by examining these illustrations that the head of the rail is made to conform to the angle of the tread of the car wheels, for the following reasons: First, to increase the contact area, thus increasing the tractive force; and second, to cause a more uniform wear across the head of the rail and tread of the wheel.

The width of this head should be not less than 3 in. With a rail-head of this form and dimensions, a car wheel having a 3-in. tread and flange of  $1\frac{1}{4}$  in. in depth (which should be used on all suburban cars), can be operated without interfering with pavements, with safety, at a high rate of speed on suburban and interurban roads, and with less cost for maintenance than the present form, due to the increased surface contact between the wheel and rail and decreased wear on flange.

The committee is of the opinion that the T rail is the most desirable and practicable rail for all purposes, and advises its use wherever the consent of the municipality can be obtained; and an earnest and persistent effort should be made on the part of all electric railways to obtain such consent.

In all places where a T rail, as here described, cannot be used, your committee recommends a grooved girder rail of the form shown in Fig. 2. This form of rail, owing to the bearing being placed directly over the center line of web, gives a rail of greater stiffness, one with a head of 3 in. in width, as well as a deeper and wider groove, and one which can be paved in the same manner as other girder rails.

In view of the rapid construction of suburban and interurban lines which enter the cities over the tracks of city lines, the committee deems it advisable to recommend, in the renewal of special

work where suburban or interurban cars are operated, and in all special work for new construction, that particular attention be given to the depth and width of the groove, as shown in Fig. 3, applicable to special work in connection with T or grooved girder rails.

### Motors.

Street railway motors are subjected to such varying conditions and uses as to render it almost impossible to outline what might be considered a standard motor. Neither would it be practicable to standardize certain horse-power motors for certain weights of cars, as the conditions of operation are so varied that what might be perfectly satisfactory in one case would be unsatisfactory in another. Generally speaking, for city service motors of between 35 h. p. and 40 h. p. are most practicable. For ordinary suburban service motors of this capacity, with four motor equipments, would meet nearly all ordinary conditions and requirements. For high-speed service on long suburban and interurban roads motors of greater capacity are desirable and should be selected with special reference to the specific duty to be performed.

As there is a possibility of alternating-current motors being developed the committee feels, in view of the experiments now being made both in this country and abroad, that it is advisable to await the outcome of these experiments before any recommendation on this subject is made.

### Trucks.

Your committee is of the opinion that the time is inopportune for recommending any particular design of trucks for motor-car service, especially for single-truck cars, except such parts of trucks as wheels, axles, bearings and journal boxes.

For interurban service the committee recommends that the standard dimensions, as given in this report for wheels, axles, bearings and journal boxes be followed, and also that the M. C. B. practice in the construction of trucks for double-track cars be adhered to as closely as possible.

### Axles, Journals, Journal Boxes.

In view of the great demand on the part of the traveling public for a more frequent and rapid service, not only in large centers of population, but in suburban and interurban service, and in view of the increased weights of the equipment required to safely perform this service, your committee recommends the standard axle adopted by the M. C. B. Association, which is the result of developments and improvements covering a period of fifty years. This standard axle can be applied to all electric railroads, which are now performing practically the same service as steam railroads.

We recommend for adoption an axle of the size and form shown in Fig. 4 for all motor cars weighing under 15 tons, including in such weight trucks, motors and car bodies and full load; also the M. C. B. standard journal brasses, journal boxes, dust guards and key seats, as shown in Figs. 4, 5, 6 and 7.

For all cars weighing from 20 tons to 28 tons, including in such weight trucks, motors and car bodies and full load, the M. C. B. standard axle, also journal brasses, journal boxes, dust guards and key seats shown in Figs. 8, 9, 10 and 11.

For all cars weighing up to 30 tons, including in such weight trucks, motors and car bodies and full load, the M. C. B. standard axle, also journal brasses, journal boxes, dust guards and key seats shown in Figs. 12, 13, 14 and 15.

For all cars weighing up to 40 tons, including in such weight trucks, motors and car bodies and full load, the M. C. B. standard axle, also journal brasses, journal boxes, dust guards and key seats shown in Figs. 16, 17, 18 and 19.

For all cars weighing up to 50 tons, including in such weight trucks, motors and car bodies and full load, the M. C. B. standard axle, also journal brasses, journal boxes, dust guards and key seats shown in Figs. 20, 21 and 22.

### Car Wheels for Suburban and Interurban Service.

Your committee has taken up with operating managers the subject of car wheels for suburban and interurban service to centers of population over public streets, and finds that their views accord with those of your committee.

We recommend for adoption as standard a steel-tired wheel and a cast chilled wheel, as shown in Figs. 23 and 24.

With a view to safety and economy we recommend for motor cars used in suburban and interurban service a steel-tired wheel of the dimension shown:

\*Adopted at the Detroit meeting of the American Street Railway Association, October, 1902.

For use with an axle as shown in Fig. 4, wheel to weigh 640 lb.; in Fig. 8, wheel to weigh 695 lb.; in Fig. 12, wheel to weigh 700 lb.; in Fig. 16, wheel to weigh 840 lb., and a cast-steel wheel of the same dimensions. For use with an axle as shown in Fig. 4, wheel to weigh 440 lb.; in Fig. 8, wheel to weigh 490 lb.; in Fig. 12, wheel to weigh 590 lb.; in Fig. 16, wheel to weigh 640 lb.

Car wheels of the weights mentioned conform to the M. C. R. standard.

#### Brake Head and Brake-Shoe

Your committee recommends for adoption as a standard the brake-head and brake shoe shown in Figs. 25 and 26.

#### Painting.

As a standard method of painting cars your committee would recommend the following: All grease and rust should be removed from the ironwork and the car body should be rubbed down to a smooth surface; then thoroughly paint the ironwork with pure red lead and raw linseed oil. Then the outside of car body should be painted as follows: First, pure lead and oil priming thoroughly rubbed in; second, one coat of flat lead, egg-shell gloss; third, white lead putty; fourth, three coats of flat lead; fifth, two coats of rough stuff; sixth scour to smooth surface; seventh, two coats of ground color; eighth, special color to cover; ninth, ornament on flat color; tenth, two coats of best finishing varnish.

No coat is to be applied until the preceding coat is thoroughly dried.

The roof canvas should have three coats of lead and oil, and no glue size or patent filler should be allowed on the roof.

For the inside or standing finish, we would recommend that one coat of lead and oil and one coat of Prince's metallic be put on back of same before finish is put in place.

All standing or inside finish, if of open grain wood, such as ash, oak or mahogany, we would recommend to be thoroughly filled with Silex filler. If the wood is of open grain nature, such as cherry, maple or birch, we would recommend a good oil stain instead of the filler. Then thoroughly sandpaper, after which apply two thin coats of absolutely pure grain alcohol shellac, either bleached or orange, according to the wood. Then sandpaper and apply two coats of varnish. All inside work should be rubbed to a dead finish, and all outside or exposed work should be left in the gloss.

In car floors, the under or lining floor should have one good coat of oil before the upper or corrugated floor, which has received a coat of oil, is laid. When finished it should receive one coat of bleached shellac and one coat of good floor varnish.

#### Return Circuit.

The committee believes that one of the most important factors in the construction and operation of an electric railway is to provide for a standard return circuit in such manner as to give the least resistance and largest and most reliable carrying capacity, thus avoiding loss of power and increased cost of maintenance. We, therefore, recommend a supplementary return, in addition to the usual practice at the present time, in all congested sections, crossing all special work and in the vicinity of the power plants.

#### Standard Overhead Construction and Car Bodies.

Owing to the inability of the committee to obtain any report from the members to whom were assigned the subjects, "Standard Overhead Construction for High-Speed City and Suburban Service, Including Trolley Wheels," and "Car Bodies for City and Suburban Service, including Ventilation; also the question of the Oval Roof," we are unable to present any report embodying recommendations on these subjects.

#### Conclusion.

We earnestly recommend that the incoming officers of the Association be authorized and directed to appoint successors to the undersigned committee to carry on the work for which they were appointed, as we feel that the recommendations here made are only preliminary to much work that can be done in this direction.

The Pittsburg Railway Co. gave 150 of its motormen and conductors who were members of the National Guard leave of absence when they were ordered out with the militia to assist in quelling the strike disturbances in the anthracite coal region. The company provided substitutes to fill the places of the men until their return.

## KANSAS CITY NOTES.

The work of excavating for the foundations of the new power house for the Metropolitan Street Railway Co. was practically completed on November 15th and the foundations will be put in as rapidly as the weather will permit.

The accompanying illustration shows a view of the new power house site, which will help more clearly to explain how the work is being done, as was described in the "Review" for October. About 1,500 cu. yd. of material is being removed every 24 hours by the six hose lines and 500,000 gallons of water per day are used.

The company is now engaged in changing the lines on 9th St. and 15th St. from cable to electric operation; 109-lb. center bearing rails made by the Lorain Steel Co. will be put down, the steel being already on the ground.

Standard heavy rail construction is being substituted for the cable track on Troost Ave. and Summit St.; by the use of portable

EXCAVATING FOR POWER HOUSE FOUNDATIONS.

crossovers this work is being done so as not to interfere with the regular service cars.

Since the park season closed the company has been giving each of its division superintendents a two weeks' vacation.

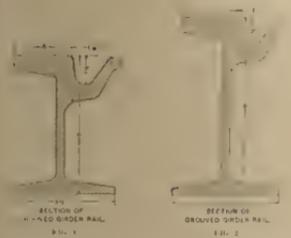

A great deal of interest is being taken by the employes of the Metropolitan in the merit system of discipline and nearly all of them have made a point of reading the paper presented at the Detroit convention by Mr. W. A. Satterlee, general superintendent of the Metropolitan company, on this subject.

## THEFT OF WIRE AT BIRMINGHAM.

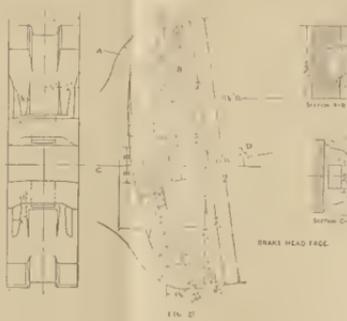

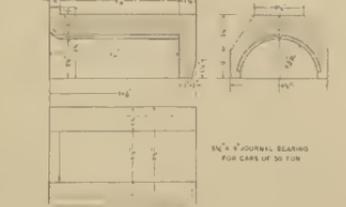

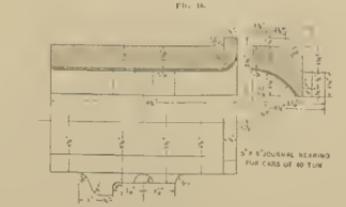

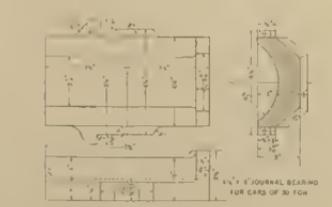

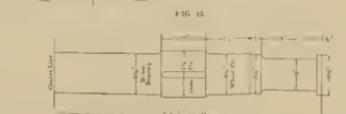

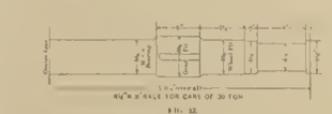

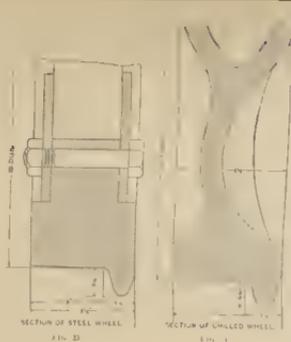

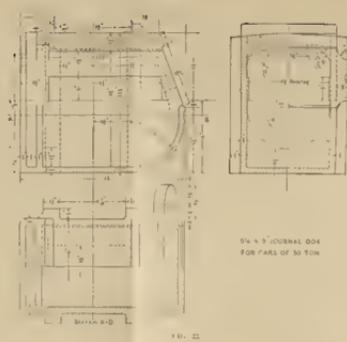

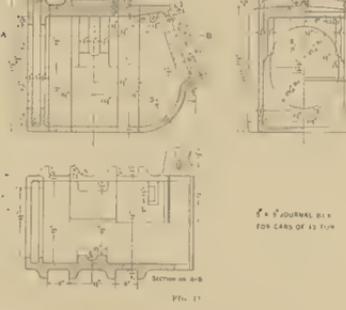

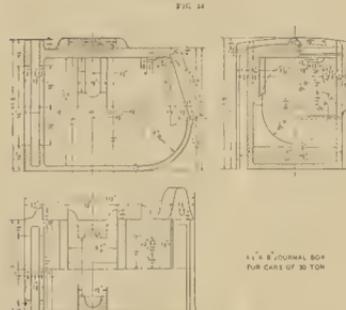

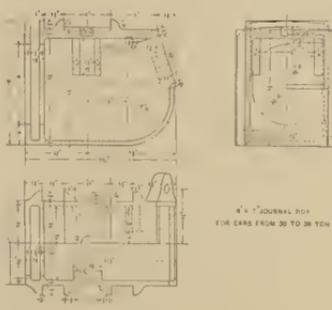

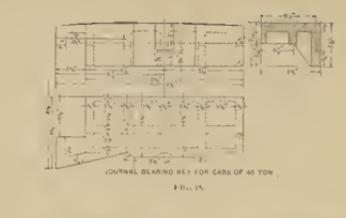

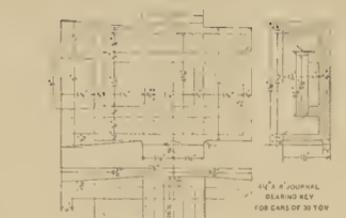

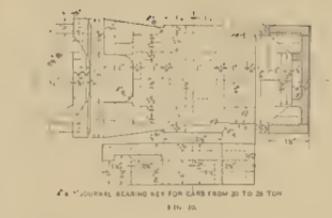

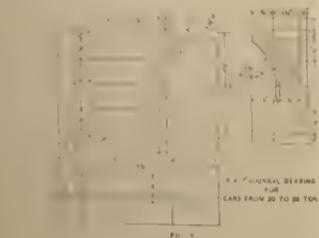

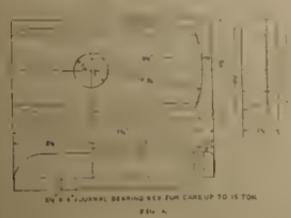

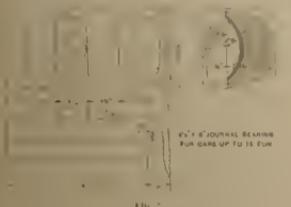

On November 5th nearly a mile of live copper feed wire was cut down on the Ensley line of the Birmingham Railway, Light & Power Co. This wire measured nearly a 1/2 in. in diameter and is worth 18 cents per lb. as old copper. The lot stolen weighed 900 lb. After the discovery of the robbery the following morning, the sheriff was notified and with his men discovered the wire in concealment, rolled up and with the insulation burned off. Men were detailed to watch the wire, and after dark two negroes drove to the place and loaded it upon a wagon. They were immediately arrested, but one of them escaped, although it is believed he was shot. The robbers in the meantime had offered the wire to a dealer in old metal, and while the men were preparing to deliver the wire the dealer notified the police, so that the robbers were being watched from both ends of the line, and in this way another one of the party was caught and placed under arrest. The negroes who stole the wire were formerly employed by the Birmingham Railway Light & Power Co., and their knowledge of electricity probably saved them from being killed in the operation of cutting the live wire.

The New Orleans Railway Co. has purchased the Oteri fuel oil storage tank in New Orleans; the tank has a capacity of 55,000 barrels, and the price paid for the tank and property is reported to have been \$17,000.

Private Street, White Street, Boston, Mass., and 7th Street, New York, N. Y., and 7th Street, New York, N. Y., and 7th Street, New York, N. Y.

Rails, Wheels, Axles, Bearings, Brake Shoes and Journal Boxes recommended by the American Street Railway Association Committee on Standards in its report presented at the Detroit Convention, Oct. 10, 1912. For report see "Street Railway Review," Nov. 20, 1912, page 853.

N. H. HEFL, JOHN J. BEGGS, E. G. CONNETTE, E. A. NEWMAN, R. T. LAFFIN, Committee.

**VERONA & WILKINSBURG INTERURBAN OPENED.**

October 25th, the opening trip over the line of the Verona (Pa.) & Wilkesburg Street Ry. was made by the officers of the company, after which, the line was thrown open to the public. The work on this road has been in progress for a year and the company was under a bond to complete the road by September 1st, the time, however, was extended to November 1st. The new route is six miles and the scheduled time for the run is 20 minutes. Ten cars will be used through the winter and 15 in the summer, and at present they all run only to Verona. The line will be extended to Oakmount as soon as the question of railroad crossings has been adjusted.

**NEW PRIVATE CAR FOR NORTHERN TEXAS TRACTION CO.**

The accompanying illustrations show the exterior and interior of the new private car "Sagamore" built by the G. C. Kuhlman Car Co., Collinwood, O., for the Northern Texas Traction Co.

PRIVATE CAR, NORTHERN TEXAS TRACTION CO. - G. C. KUHLMAN CAR CO.

The length of the car is 50 ft. over buffers and it has seating capacity for 25 people. We are advised by the president of the road, Mr. Geo. T. Bishop, that this car attained a speed of 78 miles per hour on the initial trip.

INTERIOR OF PRIVATE CAR.

The Northern Texas Traction Co. operates 22 miles of city line in Fort Worth and the new interurban line between Fort Worth and Dallas, a distance of 35 miles.

Three men formerly in the service of the Milwaukee Electric Railway & Light Co. as conductor, recently pleaded guilty to embezzlement and were fined, two paying \$25 and costs and one \$50 and costs. The method of defrauding the company was to secure punched tickets which had been once turned in and ordered destroyed.

**MARKING RAILWAY TIES.**

The secretary of the American Railway Engineering and Maintenance-of-Way Association has addressed, under date of Nov. 12, 1902, the following letter to the managing officers of American railways:

"The attention of the managements of American railroads is invited to the system of marking cross-ties, advocated in the report of the Committee on Ties, submitted at the third annual convention of the American Railway Engineering and Maintenance-of-Way Association."

"The plan proposed is similar to that adopted by the U. S. Department of Agriculture in a section of experimental track laid in the state of Texas, and briefly described is as follows: Each tie is marked with a dating nail; this is placed between the rails on top of the tie, generally at a specified distance from the rail. They are of steel, covered with zinc or tin, and have the year stamped in the head. When renewals take place, the date at which each tie was laid is noted, and in this way an absolutely reliable record is obtained. The nails cost very little (about 6 cents per pound, thirty nails), and when put in by the section gang, the labor is very slight. Several American railroads have already adopted this plan,

and it is to be hoped that the practice will eventually become general.

"Accurate statistical information in regard to the life of treated and untreated ties, a comparison of the different kinds of wood used for cross-ties under varying conditions of soil and climate, etc., is essential to the proper study of the tie question. For the purpose of making data of this character available and presenting it from year to year, series of blank forms had been prepared by the Committee on Ties, which have been adopted by the Association as standard, and it is suggested that each road take the necessary steps to at once inaugurate the system of keeping tie records in the manner proposed by the committee.

"The value of an accurate record of the life of ties cannot be overestimated, for it is the only way in which reliable conclusions can be drawn. It is to be hoped that all roads will appreciate the importance to themselves and to others of keeping up this information.

"Samples of the blanks above referred to will be gladly furnished by the Secretary of the Association, 1562 Monalnock Block, Chicago, Ill., on application."

**INJURY SEEKER CONVICTED.**

It has developed that an organized gang of conspirators has been at work in Philadelphia with the object of obtaining money from the Union Traction Co. by fraudulent representations. On Sept. 3, 1901, two young men boarded a Fourth St. car and rode as far as Lasker St. On reaching this street one of them named Rosenberg, stepped on the running board of the car and, it is claimed, allowed himself to be thrown to the ground sustaining slight injuries. He then engaged an attorney who filed a claim for \$5,000 damages said to have been sustained. The Union Traction Co. put an inspector on the case who, after collecting evidence, caused Rosenberg's arrest. The jury, after hearing the witnesses, found him guilty. William Dorn, who was the leader of the gang organized to rob the Union Traction Co., was also arrested and pleaded guilty and was sentenced to five years' imprisonment.

## PERSONAL.

MR. A. H. WARREN has been appointed superintendent of the Houghton County Street Railway Co., Hancock, Mich.

MR. F. F. GROVER, president and manager of the Fond du Lac Street Railway & Light Co., Fond du Lac, Wis., was a recent visitor at the "Review" office.

MESSRS. W. CARYL ELY and T. E. MITTEN, of the International Traction Co., Buffalo, recently visited Chicago for the purpose of inspecting the Aurora, Elgin & Chicago Ry.

MR. ALBION E. LANG, president of the Toledo Railways & Light Co., presented his resignation at a meeting of the directors of his company held November 7th and Mr. Henry A. Everett was chosen to succeed him. Mr. Lang's resignation is to be effective

ALBION E. LANG.

December 15th and shortly after that date he will leave for an extended European trip; his interests in the company are in no wise changed and he will remain chairman of the board of directors, the reason for retiring from the presidency of the company being to enable him to obtain a respite from the arduous duties which he has had ever since first entering the street railway business in 1881, when he acquired the Monroe & Dorr Street R. R., of Toledo. In 1885 Mr. Lang was active in uniting the six street railways then operating in Toledo, and formed the Toledo Consolidated Street Railway Co., of which he was successively, secretary, vice-president and general manager, and president. A second consolidation occurred in 1895 when the Toledo Traction Co. took over the Consolidated and two other companies which had entered the field. Mr. Lang served as president of the Toledo Traction Co. until it was taken over by the Toledo Railways & Light Co., in 1901, and he was then chosen president of the new company. The Toledo Bee editorially pays Mr. Lang the following graceful tribute: "The resignation of Mr. Albion E. Lang as president of the Toledo Railways & Light Co. removes temporarily at least from active business life a man who has been a potent factor during the last quarter of a century in making Toledo a commercial and industrial power. If a man who makes one blade of grass grow where none grew before is entitled to commendation, what may be said of a man who transforms a bob-tailed single line of mule cars into one of the finest electric systems in the country. This development has taken place be it understood under the direct personal supervision of Mr. Lang. Handicapped as he was by many adverse conditions, he has wielded a greater influence in making Toledo the recognized city of beautiful homes than any other living man. That beautiful residence portion of the city, all the way from Bancroft St. to Ten Mile Creek, was fifteen years ago little more than a wilderness. Just as the steam railroad is the pioneer of civilization, so is the trolley car the constructor and preserver through the medium for travel it furnishes, of commodious and comfortable homes. Mr. Lang has been a persistent friend of Toledo's advancement. He has proved the faith that is in him by interesting himself financially and personally in almost every enterprise that has tended to build up the city. It is to be sincerely hoped that Mr. Lang's retirement from public life will be brief. Toledo needs such men."

MR. D. CLARENCE DURLAND has been elected second vice-president of the Sprague Electric Co. For the past three years he has been assistant general manager of the company.

MR. HENRY A. EVERETT, who will December 15th succeed Mr. A. E. Lang as president of the Toledo Railways & Light Co., has announced that he will retain his residence in Cleveland.

MR. H. H. VREELAND denies the truth of the report that he is to resign as president of the Interurban Street Railway Co., of New York, and become manager of the Yerkes road in London.

MR. ERNEST GONZENBACH has resigned as electrical engineer of the Aurora, Elgin & Chicago Ry. and will be succeeded December 1st by Mr. Sylvester Potter, who was formerly with the Toronto (Can.) Ry.

GEN. JAMES JOURDAN, president of the Brooklyn (N. Y.) Union Gas Co., and Mr. T. S. Williams, vice-president of the Brooklyn Rapid Transit Co., have been elected directors of the Mechanics' Bank, of Brooklyn.

THE CINCINNATI TRACTION CO. has made the following promotions: Dana Stevens, treasurer, to be assistant general manager, W. H. McAllister, auditor, to be treasurer, and Charles F. Callaway, assistant auditor, to be auditor.

MR. R. L. CRUMP has resigned his position with Ford, Bacon & Davis to engage in the engineering practice for himself. Mr. W. S. Nichols, of New York, succeeds Mr. Crump with Ford, Bacon & Davis; he will have charge of the excavation and foundation work on the power house.

MR. ROBERT STOCKTON, general manager of the South Jersey Gas & Electric Traction Co., of Camden, N. J., and A. R. Kuser, assistant to the president, and Frank G. Moses, general engineer of the company, have resigned their positions to embark in another enterprise in New York city. Mr. Stockton is succeeded by J. A. Gilkyson, of Trenton, N. J.

MR. H. A. FITZSIMMONS, superintendent of the Troy and Fort Edward division of the Hudson Valley Railway Co., resigned October 25th. Mr. Fitzsimmons entered the employ of the company April, 1901, prior to which time he had spent five years in the employ of the United Traction Co. and the Troy City Railway Co., having charge of the belt line at Cohoes.

MR. GEORGE DORN has been promoted by the New Albany (Ky.) Railway Co. to the position of superintendent, to succeed Mr. Louis Meyer, who recently resigned that position to become manager of the New Albany Coal Co. Mr. Dorn is one of the oldest and most efficient men in the service of the company and is thoroughly experienced in street railway work.

MR. W. G. WAGENHALS, who recently severed his connection with the Millcreek Valley Street Railway Co., of Cincinnati, as noted in the last issue of the "Review," was tendered a pleasant surprise on the evening of October 14th, by the presentation of a handsome gold watch, chain and locket, the gift of the employes of the Millcreek company in appreciation of his kindly treatment during his term of management of the company.

MR. GEORGE A. WARDLAW, who for several years was connected with the advertising and publishing department of the Westinghouse companies, at Pittsburg, has recently moved to New York, and is at present acting as assistant to Mr. Pope, secretary of the American Institute of Electrical Engineers.

PRESIDENT MARSH of the Bryan & Marsh Co., 136 Liberty St., New York City, has resigned the active management of the company, owing to the many demands made on his time by his other interests. Mr. Guy V. Williams, formerly manager of the Minneapolis Agency, succeeds Mr. Marsh as manager of the company.

MESSRS. KERN DODGE and CHARLES DAY, of the firm of Dodge & Day, modernizing engineers, have recently returned from an extended trip through the middle West, where they visited many of the principal machine shops and foundries, gathering data on shop efficiency and critically comparing factory methods.

INVITATIONS have been issued for the marriage of Mr. Henry James Crowley, general manager of the American Railways Co., Philadelphia, and Miss Serena Virginia Ford, daughter of Mrs. Anna M. Ford, on the morning of November 26th, at the Church of the Holy Spirit, Sharon Hill, Pa. Mr. and Mrs. Crowley will reside at No. 55 Owen Ave., Lansdowne, Pa.

MR. C. C. BENSON, who has been superintendent of the Citizens' Electric Street Ry. at Newburyport, Mass., for some time, has resigned to accept a very important position with the new electric railway system at San Juan, Cuba. Mr. Benson's many friends in New England will be sorry to have him leave this country, but extend their heartiest best wishes for his unqualified success in the new position.

COL. ALLAN C. BAKEWELL, who was recently elected president of the Sprague Electric Co., has long been identified with the electrical industry, and has won many friends through his executive ability and honorable business methods. He was vice-president and general manager of the old Interior Conduit & Insulation Co., which was absorbed by the Sprague Electric Co. some years ago. Previous to his present office he was for three years second vice-president and general manager of the Sprague company.

MR. W. S. STOCKS, who for several years has been master mechanic of the Chicago, Rock Island & Pacific R. R., has resigned to become a representative of the Gold Car Heating & Lighting Co.

Mr. Stocks has been with the Minneapolis & St. Louis, the Great Northern and the Rock Island roads for some 25 years, during which time he has held the position of foreman, general foreman and master mechanic in the mechanical departments of these roads.

MR. WILLIAM L. ELKINS, of Philadelphia, the electric railway capitalist, had a narrow escape from death on November 3d by the collapse of a derrick and the consequent fall of an iron girder weighing several tons at the annex that is being added to the sky-scraper office building of the Land Title & Trust Co., Broad and Sansom Sts., Philadelphia. Mr. Elkins was passing in front of the building and the girder in its fall missed hitting him by less than one foot. He was buried in the brick and other debris but was quickly released and on examination was found to have sustained no injuries more serious than numerous bruises and general shock. City Treasurer J. Hampton Moore, George D. Widener and B. F. Whitman, who were with Mr. Elkins, escaped injury. One workman was killed in the accident.

MR. ALBERT EASTMAN, who has just severed his connection with the Detroit United Ry., to become general express agent of the Utica & Mohawk Valley Railway Co., Utica, N. Y., entered the steam railroad field in 1889 as night telegraph operator on the Canada Southern Division of the Michigan Central R. R. He resigned in 1891 to enter the local freight office of the Wabash R. R. at Detroit. The following year he resigned this position to become freight and ticket clerk for the Grand Trunk R. R. at West Detroit, remaining with the Grand Trunk system in various capacities until 1900, when he resigned to accept a position with the Michigan Central R. R. as assistant agent, having charge of one of the important sub-freight houses. He remained with the Michigan Central R. R. until September, 1901, when he received an offer from the Detroit United Ry. to enter its express department. Later he received the appointment of traveling express agent for the Detroit United Ry., and recently was made traveling express and passenger agent, which position he resigns to go with the Utica & Mohawk Valley Ry. as general express agent.

### OBITUARY.

It is with much regret that we have to announce the death of Mrs. Duffy, wife of Mr. C. N. Duffy, secretary and auditor of the Chicago City Railway Co., which occurred very unexpectedly on the morning of November 8th. The interment was at St. Louis on the 10th.

PROF. SIDNEY HOWE SHORT, technical director of the English Electric Manufacturing Co., died at his residence in London last month after an operation for appendicitis. Professor Short was born in Columbus, O., in 1858 and his primary education was in the public schools of that city. He next became a student in the Capital University of Columbus, which he left to enter the Ohio State University. He became a student under Professor Mendenhall, and upon the latter being called to the University of Tokio, Japan, Mr. Short succeeded to the professorship; he became the laboratory director, in 1879, one year previous to his graduation. Immediately after his graduation he accepted a position as professor of physics and chemistry, and vice-president of the University of Denver, Colo. While in Denver, Professor Short invented a motor for street railways and subsequently resigned his professorship to give his entire attention to street railway work. He built a number of lines in western cities using both the conduit and overhead trolley systems. In 1869 he removed to Cleveland, O., where he organized the Short Electric Railway Co. in which the Brush Electric Co. was largely interested. Both of these companies were later bought out by the Edison company, one of the consolidated companies which afterward formed the General Electric Co. In 1893 Mr. Short became connected with the Walker Manufacturing Co., of Cleveland, O., and under his management this concern became a formidable competitor of the older electric companies, until it was finally absorbed by one of them. Mr. Short then went to Europe and completed arrangements with Messrs. Dick, Kerr & Co., Ltd., for the construction of works in England for the manufacture of apparatus under his patents. Since that time Mr. Short has held the position of technical director of the English Electric Manufacturing Co. During the past year he was engaged upon plans which have recently been carried out for the erection of large shops in Paris for the manufacture of machinery under his patents. It was generally under-

stood that Mr. Short considered his work in Europe as nearly finished and it was his intention within a short time to return to America with a view to re-entering the electrical field in this country. Over 500 patents have been issued in his name in the United States and foreign countries. Professor Short was a Fellow of the American Society for the Advancement of Science; a member of the Cleveland Electrical Society; the American Institute of Electrical Engineers; the Institution of Electrical Engineers in London; the Engineering Society of Liverpool, and the New York Electrical Society. He leaves a wife, three sons and a daughter.

### NEW ENGLAND STREET RAILWAY CLUB.

The first fall meeting of the New England Street Railway Club was held at Wesleyan Hall, Boston, October 23d, and the subject of discussion for the evening was the "Multiple Unit System." The first speaker was Mr. Paul Winsor, of the Boston Elevated Railway Co., who read a paper on this subject describing the system of control in use by the Boston elevated. The Sprague system was selected after competitive tests which were carried out in the Tremont St. subway at night.

After giving a general description of the operation of this method the speaker recommended four fundamental requirements for any system of multiple unit control. These are: First, absolute certainty of the opening of the main motor circuits when the master controller comes to off position. Second, proper car direction of movement under all circumstances. Third, motor-control circuit never closed until all resistance is in, and then the step by step cutting out of this resistance. Four, in the author's opinion very important, automatic throttle control.

The best of brakes should be installed on all such high-powered equipments as are today utilizing the multiple unit control. Straight air is easier to handle than automatic air in many classes of service as simply opening the valve handle applies the brakes by direct-air pressure, but with more than one car straight air brakes are very dangerous, especially on grades. The brakes must be entirely released before a second application can be made, and if many are made on a single grade it is not long before the motorman finds himself out of air supply. It takes about one second to restore 1 lb. of air with this system, and unless the valve is in the off position the auxiliary resistance cannot be restored. Steam roads using straight air employ a retaining valve to enable long applications to be made on grades.

In the discussion, Mr. H. S. Knowlton, of Boston, described the multiple unit control installed on the Seattle-Tacoma Interurban Ry., which was built by Stone & Webster. Chief Electrician Hall, of the Boston & Maine Railroad, also stated that his road uses a multiple unit system of control on its electric line between Concord and Manchester, N. H. It has been found very useful, especially in handling rush business.

### SECRETARY OF THE ACCOUNTANTS' ASSOCIATION.

Mr. W. B. Brockway, secretary and treasurer of the Street Railway Accountants' Association, requests us to announce that correspondence on matters pertaining to the association should be addressed to his residence, No. 40 Morris St., Yonkers, N. Y. Mr. Brockway's business address for other than Association correspondence is Room 417, Broad-Exchange Bldg., 25 Broad St., New York City.

The railroad commissioners of Massachusetts have issued an order for the issue of \$750,000 of capital stock of the Boston & Worcester Street Railway Co.

The John W. May Co. has purchased a controlling interest in the street railway lines of Clinton, Ia. The properties will be improved by the laying of new 70 lb. rails and the purchase of new cars throughout.

The Toledo, Columbus, Springfield & Cincinnati Traction Co. has started condemnation proceedings against a number of land owners in Allen and Hardin counties. The managers claim cars will be running early in the spring.

**FINANCIAL.**

**PHILADELPHIA CO., PITTSBURG.**

The Philadelphia Co. and affiliated corporations have issued the following report for the month ending September 30th:

	1902.	1901.
Gross earnings from operations	\$1,085,792	\$938,215
Operating expenses and taxes	650,529	574,870
Net earnings from operations	429,293	393,344
Other income	193,457	15,889
Total earnings and other income	619,720	379,233
Total income	428,218	343,141
Fixed charges	323,145	295,845
Surplus	105,072	77,296
Less proportion of same to credit of owners of capital stock of affiliated corporations other than the Philadelphia Co.	135	58,541
Balance representing Philadelphia Co. interest in the total net income	104,937	18,755

**BROOKLYN RAPID TRANSIT.**

The Brooklyn Rapid Transit Co. has issued its annual report to stockholders for the year ending June 30th, 1902. March 20, 1902, the stockholders authorized a mortgage upon the property of the company, securing bonds bearing interest not higher than 4 per cent, and of a total amount not exceeding \$150,000,000. None of these bonds were issued during the year ending June 30, 1902. Under the terms of the mortgage, these bonds may be issued convertible at the option of the holder into stock of the company, both at par, at any time after July 1, 1904, and before July 1, 1914. The financial report, which is for the whole of the Brooklyn Rapid Transit System, is as follows:

	1902.	1901.
Total earnings from operation	\$12,510,622	\$11,899,824
Total operating expenses	8,209,397	7,216,008
Net earnings from operation	4,301,225	4,683,816
Income from other sources	277,546	235,735
Total income	4,578,771	4,919,551
Deductions for taxes, interest and rentals	4,475,450	4,341,748
Net income	103,321	577,803
Special appropriations	84,428	228,678
Surplus	18,893	349,125

The total car mileage was 52,684,980, or an increase of 2,528,955 over the preceding year.

A comparative statement for the month of September, 1902, and 1901, is as follows:

	1902.	1901.
Gross earnings	\$1,124,383	\$1,080,158
Operating expenses	607,581	604,610
Net earnings from operation	516,802	415,547

**MONTREAL (CAN.) STREET RAILWAY CO.**

The report of the president and directors of the Montreal Street Railway Co., submitted at the 42d annual meeting of shareholders, held November 5th, shows the following for the year ending Sept. 30, 1902.

	1902.	1901.
Gross receipts	\$2,046,268	\$1,900,680
Operating expenses	1,135,176	1,105,266
Net earnings	911,032	795,413
Passengers carried	49,947,467	46,741,000

During the year the company added 14 miles of new track to the system and 29 motor cars to its rolling stock.

The American Railway Co., of Philadelphia, has increased its dividend rate from 4 to 6 per cent. The Chicago & Joliet Electric Railway is one of the profitable constituent companies.

The Aurora, Elgin & Chicago Railway Co. has declared its first semi-annual dividend of 3 per cent on preferred stock, payable Dec. 1, 1902.

The September earnings of the Lake Shore Electric Ry. are more favorable than anticipated, the gross earnings being \$46,051. This is holding very close to the midsummer earnings of the road, the earn-

ings for July having been \$49,121, and for August \$47,967. The good showing for September is attributed to the inauguration of the new through service. The total earnings for the first nine months of the present year were \$331,874. The earnings for the year 1901 were \$358,180.

The Metropolitan West Side Elevated Ry., of Chicago, carried a daily average of nearly 120,000 passengers for the month of October. It is expected to do at least as well as that in November, December and January. Some friends of the road predict a daily average of 130,000 for December. On such a showing it is claimed the company would be fully able to pay 2½ per cent on its preferred stock in February, which would make 4 per cent for the year. The gross earnings for October were \$115,980, as compared with \$96,020, for October, 1901. A large part of the gain is due to the opening of the Aurora, Elgin & Chicago Ry.

The earnings of the South Side Elevated, Chicago, for October, were \$83,112, an increase of \$10,950 over the corresponding month last year.

The Northwestern Elevated, Chicago, reports gross earnings for October as \$69,562, an increase of \$10,518 over October, 1901.

**A. A. HILTON.**

Mr. A. A. Hilton, who is well known to most of our readers, having for several years been general sales agent of the St. Louis

A. A. HILTON.

Car Wheel Co., has recently removed to Chicago where he becomes the successor to the late Mr. Wallace, vice-president and general manager of the Fort Wayne Foundry & Machine Co., who died a few months ago after 30 years continuous service with the J. H. Bass interests. Mr. Hilton has given the subject of wheels for electric cars a great deal of thought and his work in adapting the product of the house he has heretofore represented to various classes of service and to special conditions in different cities is well known. The Chicago plant of the Bass companies

is materially increasing its capacity by the erection of an additional wheel foundry of a capacity of 500 wheels per day and their plants at Ft. Wayne, Ind.; Lenoir, Tenn., and Rock Run, Ala., are said to be much behind in their orders. We congratulate Mr. Hilton on his previous work and welcome him to Chicago.

Mr. T. L. Roy, who has been with J. H. Bass and his successor, the Ft. Wayne Foundry & Machine Co., for over 14 years, has been appointed sales agent with headquarters in Chicago. Mr. Roy will give particular attention to the street railway car wheel department.

The electric street railways projected for Manila by the Philippine Commission will be 35 miles long and cover the important streets of the city. The term of franchise is not to exceed 50 years nor the rates of fare to exceed 7½ cents first class and 5 cents second class in gold. The road is to be completed in 26 months after the award of the contract.

The Toronto (Can.) Railway Co. proposes to carry its fight against the taxation of rolling stock to the Imperial Privy Council. A notice of writ for a declaration by the courts that the assessment of the rolling stock of the company for 1902 is illegal, and for an injunction restraining the city from distraintment on the rolling stock for the taxes until the matter is decided, has been served upon the city. The taxes for this year amount to \$8,775. Under a judgment of the Court of Appeals last year rolling stock is now exempt from taxation. The claim of the city is that the assessment was made before the judgment became effective.

## NEWS OF THE MONTH.

As a result of an investigation into an accident on the Mountain Lake Railroad Co. at Gloversville, N. Y., July 4th, in which 14 people were killed and over 50 injured, the Fulton County grand jury has returned an indictment charging the railroad company with culpable negligence. It further charges the employment of incompetent help and the willful dispatching of two cars close together.

Vice-Chancellor Pitney of New Jersey, has rendered a decision granting an order for the Bergen Turnpike Co., which is building an electric line from Hoboken to Hackensack, to cross the West Shore Railroad at Little Ferry at grade. At the crossing an electric signal system will be established and operated by a watchman in a tower.

Plans have been completed for a large car barn at Montclair, N. J., for the North Jersey Street Railway Co., and also for one at Paterson for the Jersey City, Hoboken & Paterson Street Railway Co.

It is reported that the Philadelphia Rapid Transit Co. is negotiating for the purchase of the 33 buildings between Front and Water Sts., and Market and Arch Sts. These negotiations are in connection with the projected Market St. subway, and the turn-off on Front St. On this site the offices of the company will probably be located. The company is understood to have begun the purchase of these properties four or five months ago, under the agreements providing that the present tenants should be prepared to vacate by next June.

It is rumored that plans are now being discussed in Philadelphia for the consolidation of all the traction, electric lighting, elevated railway, underground railway and gas franchises of the states of Pennsylvania, New York and Ohio. The financiers said to be interested are P. A. B. Widener, W. L. Elkins and John Mack of the Philadelphia Rapid Transit Co.; the Whitney-Ryan syndicate of New York; Thomas Dolan, president of the United Gas Improvement Co., in which Widener and Elkins are interested, and Senator Foraker of Ohio, representing the Ohio and Minnesota capitalists interested in the North American Co., of Milwaukee, Wis. It is understood that for some time past there has been a desire on the part of certain eastern capitalists to combine their interests but the strict laws under which they were chartered prevented such a consummation. It is said that the combination can be effected under the liberal charter of the North American Co. Should the plans materialize the consolidated company would undoubtedly be capitalized for a larger sum than any corporation now extant.

Since the opening of the electric road October 15th between Reading and Kutztown, Pa., Reading has direct communication with Philadelphia via Allentown.

Passenger earnings of the Detroit United Railway Co. for October were \$292,528.96, an increase of \$32,429.28, representing an average daily increase of \$1,046.19.

Passenger earnings of the Toledo Railways & Light Co. for October were \$86,839.01, an increase of \$7,233.96.

The street railway branch of the Young Men's Christian Association of Rochester, N. Y., held its third monthly entertainment in its rooms the evening of November 7th, the entertainment being for the street railway employees and their families. Mr. T. J. Nicholl, vice-president of the Rochester Railway Co., presided during the exercises. The recreation rooms for the men are well patronized and much interest is taken in the work of the Association. Much interest is manifested in the bowling matches between the conductors and motormen, the motormen holding at present the silver cup presented by Mr. Nicholl.

The election of Mr. W. Kesley Schoopf, president of the Cincinnati Interurban Co., as a director of the Cincinnati, Hamilton & Dayton Traction Co., which occurred November 10th, is taken as an indication that the Widener Elkins and Mandelbaum Pomeroy interests have arranged to work in harmony in developing their electric railway in Ohio and Indiana. Some profess to see in this the essential consolidation of a large number of the important electric systems in those two states.

The passenger receipts of the Lake Shore Electric Railway Co., Cleveland, O., for the month of October were \$49,637, an increase over the corresponding period of last year of \$8,343, or 25.6 per cent. The receipts for freight and other sources have not yet been

made up, but are expected to be equally favorable. The October earnings are regarded as about equal to the monthly average for the year.

The Northern Ohio Traction Co. is pushing the work on the stone bridge which it is erecting over the Cuyahoga River between Akron and Cuyahoga Falls. It will be one of the largest stone culverts in the United States and will cost about \$100,000.

Work has begun on the Windsor (Ont.), Sandwich & Amherstburg Street Railway lines from Ojibwa to Amherstburg; 150 men are at work grading and laying track. The line is owned by American capitalists, and American foremen and engineers are in charge.

The G. C. Kuhlman Car Co. has contracted to build several sleeping cars of the same class Pullman type for the Lake Shore Electric Railway Co. When they are completed a fast night service will be established between Cleveland and Detroit.

The Ohio Central Traction Co. is operating its line between Bucyrus and Mansfield, O., on a three-hour schedule. An hourly service will soon be established.

The new car line of the Winchester Railway, Light & Ice Co., Winchester, Ky., was expected to be in operation November 15th.

There is almost always current a more or less well defined rumor regarding plans for a merger of the street railways of Chicago, and a letter made public November 11th from Mr. S. W. Allerton, a director of the Chicago City Ry. to the stockholders of that company, in which he says that "there is an effort being made to secure the property of this company or to lease the same, has given the matter more prominence than usual.

The merit system has been adopted by the Muskegon (Mich.) Traction & Lighting Co., 100 demerits resulting in discharge. Every year three prizes will be given. First, two week's vacation with full pay or \$25 in cash; second, eight days' vacation at full pay or \$15 in cash; third, five days' vacation with full pay or \$10 in cash.

The work of laying the rails has been begun on the line of the Albion Electric Railroad Co. at Albion, N. Y. This is said to be the fifth projected line running west out of Rochester. Ostensibly, the road is to be a street railway for the village, but in reality it is to connect Rochester with Buffalo and Niagara Falls. The road as planned is to pass through several places of considerable business importance and through a productive country. The roadbed will be constructed for heavy traffic. It is not yet decided how much of the work will be attempted this year.

The employes of the Lexington (Ky.) Railway Co. are considering the formation of a benefit association.

It is probable that the new franchises asked for by the Cincinnati Interurban Co. will be granted by the councils of St. Bernard, Elmwood, and Carthage. It is understood that the company will carry passengers between Gas Hall, Carthage, and Cincinnati, giving transfers east and west through the city, for a 5-cent fare.

The Muncie (Ind.), Hartford & Fort Wayne Traction Co. has received a number of interurban cars for service between Muncie and Hartford City this winter. The line is expected to be in operation between these cities by December 1st.

A new \$1,500 street railway depot has been erected on the grounds of the Soldiers Home at Quincy, Ill.

The Springfield & Central Illinois Railway Co. has been organized and will have control of the Springfield Consolidated Railway Co. and the Springfield & St. Louis Railroad Co. In addition it will build an interurban line from Springfield to Riverton, which when completed will give the new company a total of 56 miles of track.

In order to have its line in operation on Saturday, October 25th, the day of the celebration of the opening of the great water power canal at Soo, the Trans St. Mary's Traction Co., of Salt Ste. Marie, Mich., ordered one of its new cars to be sent from St. Louis by express.

The Interurban Railway Co., of Des Moines, Ia., ran its first car over the new line to Mitchellville November 8th.

The streets committee has presented an ordinance to the city council of Salt Lake, Utah, giving the Consolidated Railway & Power Co. to January 1st to have all its street cars provided with fenders.

A bill has been presented to the Legislature of Georgia which if passed will allow electric light companies of the state to own and operate steam heating plants.

## LONDON, AYLMEY & NORTH SHORE ELECTRIC RY.

This road will be a single track line about 45 miles in length, running from London to Port Burwell, Ont., through the counties of Middlesex and Elgin. The road will run through one of the finest farming sections in Canada and there are also numerous factories along the line. The harbor at Port Burwell is one of the finest on Lake Erie, and it is expected, will open up a big freight traffic for this road. It is proposed later to put on a line of boats between Conneaut, O., and Port Burwell for coal trade. The road is to be equipped and operated in a thoroughly up-to-date manner. The officers of the company are, president, R. M. Luton, vice-president and treasurer M. E. Lyon, secretary C. R. Luton, assistant secretary N. E. Stevens. The engineers are Messrs. Field & Hinchman, of Detroit, who are now engaged on the profile. The road will be built by the Aylmer Construction Co., Ltd., of Detroit, whose offices are in the Majestic Bldg. The officers of the construction company are, chairman Frank Hassler, treasurer M. E. Lyon, secretary C. R. Luton, assistant secretary and purchasing agent F. M. Hitchcock, and attorney Paul J. Davis. The company is preparing specifications which will be ready during December, after which the work will be pushed to a finish as rapidly as possible. If possible the company wishes to build its power houses and sub-stations this winter.

## EXTENSION OF SOUTH SIDE ELEVATED.

Plans have been proposed for the extension of the South Side Elevated road to the Chicago Stock Yards which include the elevation of the Chicago Junction Railway Co.'s tracks from Emerald Ave. to the Illinois Central Railroad. According to these plans the elevated road will build a new structure extending from 39th to 43d St. at which point it will turn west, enter the stock yards district and make a loop around the outer edge of the yards. It will extend west to Ashland Ave., south to 47th St., east to Halsted St., and south to 43d St. The tracks of the Chicago Junction Ry. will be elevated to the same plane as the tracks of the elevated road now on 40th St. These tracks will be used by the Chicago Junction Ry. to a point where they turn south between Indiana and Calumet Aves. At this point the elevation of the Chicago Junction tracks will begin again and continue to the Illinois Central right of way where they run down to grade.

To accommodate its growing traffic the South Side Elevated desires to run a third track from 40th St. to Congress, but the ordinance will ask for the extension to 20th St. only. North of 40th St. the company owns the entire right of way, but between 40th and 12th St. it owns only 11/15 of the right of way, and to obtain the other 4/15 for another row of track and pillars the company agrees to open and pave its right of way for use as a street.

## NO TITLE TO FRANCHISE.

Three offers have been made to the city of Lincoln by different parties for the purchase of the franchises and property of the Lincoln Rapid Transit Co. and the Home Street Railway Co. in that city. One offer is from J. E. Riley, of Omaha, who has bid \$10,500 for the franchise and proposes to construct an interurban line for both passenger and freight between Lincoln and Omaha, and with several connections with smaller towns. The second offer was made by E. C. Hurd, who offered \$8,000 for the franchise but whose plans do not include any new track within the city limits. The third offer was made by William J. C. Kenyon, who offered \$7,000 for a franchise and also offered to pay one percent of the gross receipts of operation of the line during the first 10 years and three per cent thereafter. A special committee of the city council has reached the conclusion that it will not recommend the acceptance of any proposition that binds the city to furnish a good title to a franchise and it is deemed that the city has no such franchise to confer upon the purchaser.

Later advices state that the bid of W. J. C. Kenyon was accepted with certain modifications agreed to by Mr. Kenyon. He is to accept the right and franchise with such warrants of title as the city may be able to give, to pay one per cent of gross receipts for ten years and two per cent thereafter, and shall within two years have in operation two miles of street railway and ten miles in ten years.

## MERIT SYSTEM OPPOSED.

The employes of the Scranton (Pa.) Railway Co. object very strongly to the Brown system of discipline which has been inaugurated by the company, and early this month sent an ultimatum to the company threatening to strike if this system of discipline was not discontinued. In the system adopted by the Scranton company 90 demerit marks means dismissal, and as the secretary of the union was discharged under this condition the men have determined to do away with the system if possible. The company, however, has fully as many non-union as union men in its employ and will be able to operate its cars in spite of a strike.

## RECEIVER FOR SUPPLY HOUSE.

Frederick K. Day, of Elizabeth, N. J., was on October 31st appointed receiver of the American Electric Supply Co., which was incorporated last June with a capital of \$7,000,000. Among the concerns acquired by this company were the following: Union Railway, Power & Electric Co., the Morris Electric Co., the Falcon Electric Manufacturing Co., the Electric Motor Specialty Co., the Fountain Manufacturing Co., the Metropolitan Switchboard Co., and the Federal Manufacturing & Specialty Co., all of New York City.

The reason given for the embarrassment of the company is that the price of raw materials has so increased as to make it impossible to deliver goods on long time contracts taken when prices were lower.

## SALE OF BROWNELL CAR PLANT.

It was announced early in November that the Brownell Car Works located in North St. Louis had been acquired by the American Car & Truck Co. This company, it will be remembered, is a reorganization of the American Car Co., which was purchased a short time ago by the Brill interests and which has been reorganized with John A. Brill as president.

## ELECTRIC STORAGE BATTERY CONVENTION.

It is the practice of the Electric Storage Battery Co., of Philadelphia, to have annual conventions of its sales managers and engineers which afford opportunity for the exchange of ideas and experiences, and these meetings have not only proved valuable to the company and its men from a business standpoint, but are also most enjoyable socially.

This year the convention was held in Philadelphia, October 13th to 16th inclusive, the sessions being at the Colonnade Hotel. At the first session the president of the company, Mr. Herbert Lloyd, made the address of welcome, and papers were read by Charles Blizard, manager of the sales department; Walter G. Henderson, secretary and treasurer; and A. D. Stoughton, general counsel for the company. At later sessions technical papers were read by various members of the engineering and sales staff.

The entertainment features of the convention were not neglected, and included a tour of the works, a reception at the residence of Mr. Lloyd, a theater party on Wednesday evening, and a banquet at the Germantown Cricket Club.

The Montgomery (Ala.) Railway Co. is relaying five miles of track with new rails.

The Winnipeg (Manitoba) Street Railway Co. is installing an additional 1000-h. p. boiler in its power house.

The Cincinnati Traction Co. has instituted a trial board composed of three of its foremen, to consider complaints of employes, and report its findings to the general manager for revision.

The Urbana, Mechanicsburg Columbus Electric Ry. has purchased a tract of five acres in Columbus, O., which will be used for terminal and shop purposes; the Columbus sub-station and a freight depot will also be located there.

A car on the Lake Shore Electric Ry. made the run from Cleveland to Toledo, 120 miles, in 3 hours and 10 minutes, leaving Cleveland at 3 a. m. November 13th.

### ACCIDENTS OF THE MONTH.

A collision between a Clybourn Ave. electric car of the Chicago Union Traction Co. and a switch engine of the Chicago, Milwaukee & St. Paul Ry. occurred November 1st at Wrightwood Ave. crossing, Chicago. The street car was thrown ten feet and partly demolished and the cars attached to the engine were derailed. The motorman was killed and three passengers were injured. It is believed the accident was due to a long string of freight cars which obstructed the view of the approaching engine.

A rear end collision occurred on the Hampshire & Worcester Street Ry. at Ware, Mass. the evening of October 18th, by a Gilbertville car slipping on a heavy grade and running into a West Brookfield car. Leaves on the track are supposed to have caused the accident. Twelve persons were reported injured but only two seriously hurt.

October 18th an electric car of the United Power Co., East Liverpool, O., became unmanageable while descending a hill and dashed into a passing freight train with such force as to overthrow a box car. Eleven persons were more or less injured.

An electric car on the Westbrook division of the Portland Railroad Co. ran into the side of two freight cars crossing the track at Cumberland Mills, Me., October 24th. Two persons were slightly injured. The electric car and one freight car were considerably damaged.

At Yonkers, N. Y., October 26th, an electric car collided with an automobile, overturning the latter and throwing the car on its side against the sidewalk. Twenty-two passengers on the car were injured, the four occupants of the automobile and the motorman escaping without injury. The fault is attributed to the chauffeur, who was racing with the car and had several times crossed the tracks ahead of it.

Two electric cars on the line of the Cumberland Valley Traction Co. met in a head on collision near Boiling Springs, Pa., on October 10th. Six persons were reported to be seriously injured and both cars demolished. The collision is said to be due to a misunderstanding of orders and a dense fog obstructing the view of the motorman.

A collision between a rapid transit electric car and a belt line locomotive drawing several freight cars occurred near Chattanooga, Tenn., October 26th. Seven persons were reported injured, two of them seriously. The rapid transit cars are operated over the belt line track. It is said that the belt road engine disregarded a signal which gave the rapid transit car the right of way. The electric car was demolished.

A heavy electric car on the Broadway line of the Metropolitan Street Railway Co., Kansas City, jumped the track on the curve at Fifth St. and Broadway, November 5th, and crashed into a saloon, killing a pedestrian and the driver of a wagon and injuring six others. The saloon front and the car were badly damaged. The accident was caused by the motorman losing control of the car at the top of the hill two blocks away.

On November 8th a similar accident occurred at the same place by a runaway car dashing into another as it was discharging passengers near the foot of the hill. Both cars were considerably damaged and five passengers were injured.

A head-on collision between a suburban on the Kutztown electric line and a street car of the United Traction Co. occurred at North Reading, Pa., November 4th. Both cars were badly damaged. The motorman of the street car had his feet crushed but is expected to recover. Several passengers were slightly injured. The accident was caused by a disregard of signals probably due to the heavy fog which prevailed at the time.

November 8th a collision occurred between a tram of the St. Louis Valley R. R. and a car of the East St. Louis & Suburban Electric Ry. at the Terminal Ry. belt crossing of the Belleville Rock road. Nine persons were injured.

During a heavy fog in Battle Creek, Mich., November 7th, two street cars collided head on at the corner of East Main and Bennett Sts., fatally injuring one of the motormen. One woman passenger was also slightly injured.

In a head-on collision between two cars of the Union Railway Co. at Washington Ave. and West Farms Road, New York City, November 5th, the motorman of one car was killed and the motorman of the other sustained a broken leg. Seven of the passengers received slight injuries. The collision occurred in a dense fog.

### DO ATTRACTIONS PAY STREET CAR COMPANIES?

An instance of the practicability of the park theater as a promoter of street railway traffic is afforded at Macon, Ga., where, for a number of years, the management of the street railway company has treated its patrons to the highest order of summer theatrical entertainments with most satisfactory results. The Macon Consolidated Street Railroad Co., under the direction of its superintendent, Mr. E. E. Winters, closed a 16 weeks' season of vaudeville and musical entertainments at Crumps Park, early in September, the cost of which ranged from \$175 to \$225 per week. A charge of 10 cents was made for reserved seats, but the majority of the park frequenters did not care for these and were admitted to the theater free of charge. The revenue from the sale of reserved seats alone, however, almost paid the expenses of maintaining the theatrical companies, and in fact it was only necessary to draw upon car fares to the extent of \$145 to make up the deficit for the purpose. The attendance at the park throughout the season was from 4,000 to 6,000 per week, which represents from 8,000 to 12,000 increase in fares per week. This is certainly an admirable showing for a city of only 25,000 inhabitants.

### NEW PLANT OF THE JOHN DAVIS CO.

The accompanying illustration shows the new plant and office building now practically completed by the John Davis Co., of Chicago, one of the largest and oldest concerns in the country engaged in the manufacture of valves, piping, and steamfitters' and plumbers' supplies. In 1864 the business was located at Michigan and Wells Sts., the plant being entirely destroyed by the great fire of 1871. After the fire the business was resumed at No. 79 Michigan St., where continual and steady growth resulted in successive enlargements of the plant until it extended from No. 45 to No. 79 Michigan St. Recently it became necessary to secure more commodious quarters and the factory and office building illustrated were erected at Halsted, 22d and Union Sts.

The large building in the foreground is the stock and office building. In this building all the plumbing and steam supplies will be carried. The office will be on the second floor. One half of the entire first floor, 80 x 165 ft., will be devoted to shipping room. In the rear will be a large platform, at which five cars may be loaded or unloaded at the same time.

The one-story building directly in the rear is the pipe-bending and

JOHN DAVIS CO.'S NEW PLANT.

blacksmith shop, 50 x 100 ft. The brass foundry is also in this building, 50 x 50 ft.

The first section of the large building in the rear, 100 x 150 ft., will be the pipe-cutting shop. The rest of the building, 100 x 150 ft., will be the machine shop. The other buildings are foundry, pattern shop, warehouse, barn, and pipe warehouse.

There will be trackage on the property for twenty cars. The entire frontage on Halsted, 22d and Union Sts. is over a quarter of a mile.

This new plant is to be occupied with the latest and most up-to-date machinery, and it will be a worthy home for this old and well-known firm.

**EMERGENCY BRAKE FOR STREET RAILWAY CARS.**

The accompanying illustrations, representing an emergency brake for street railway and other cars is the invention of A. H. Morrow, Allegheny, Pa., and its object is to provide a simple, cheap and effective device which can be readily applied to standard electric street railway cars without in any way interfering with the ordinary brakes. It is designed to be quickly and easily operated by the motorman to check the movement of the car on steep grades or slippery rails, especially at such times and places as the car cannot be controlled by the regular brakes.

Fig. 1 is a side elevation showing the floor framing and truck of an ordinary electric car upon which the improved safety brake is mounted. Fig. 2 is a plan view of the same and Fig. 3 shows some of the details of construction for the brake.

The car is supposed to be running from right to left as shown by the arrow. AA represents the longitudinal timbers of the car and TT are the ordinary traction wheels to which any approved form of brakes are applied. The emergency brake wheel W has its axle at a in yoke Y which is hinged at b, some convenient point on the car frame, and so arranged that it can be swung from the position in which it is shown at the rear end of the car to the position in which a duplicate equipment is shown at the front end, where the toothed flanges of the wheel are brought into forcible contact with the pavement between the rails.

end or to the middle of the car, but cars making return trips by "changing ends" should be equipped at both ends as shown. The inventor claims that this device will stop a car with unflinching certainty, regardless of slippery rails or an ice-coated surface on the street, and that the stop will be made no more suddenly, and with no greater danger to passengers and property than if made with the regular brakes under ordinary circumstances.

**CHEAP POWER IN CALIFORNIA.**

When the Riverside & Arlington Railway Co. built its electric lines in Riverside, Cal., the city made a contract with the company to furnish power for operating the road for \$500 per year for the first three years, \$1,500 for the next two years, \$2,400 for the next three years and \$3,700 per year for the next four years. The city got current from the Redlands Electric Light & Power Co.

About a year ago the city undertook to rescind its contract with the railway company, on the ground that its action had been ultra vires, and charge the actual cost of the power. Nov. 1, 1902, the United States District Court rendered its decision sustaining the validity of the contract.

**NEW QUARTERS FOR STEWART HOWLAND.**

The Stuart Howland Co., of Boston, announces in a circular letter to the trade that owing to the rapid growth of its business it

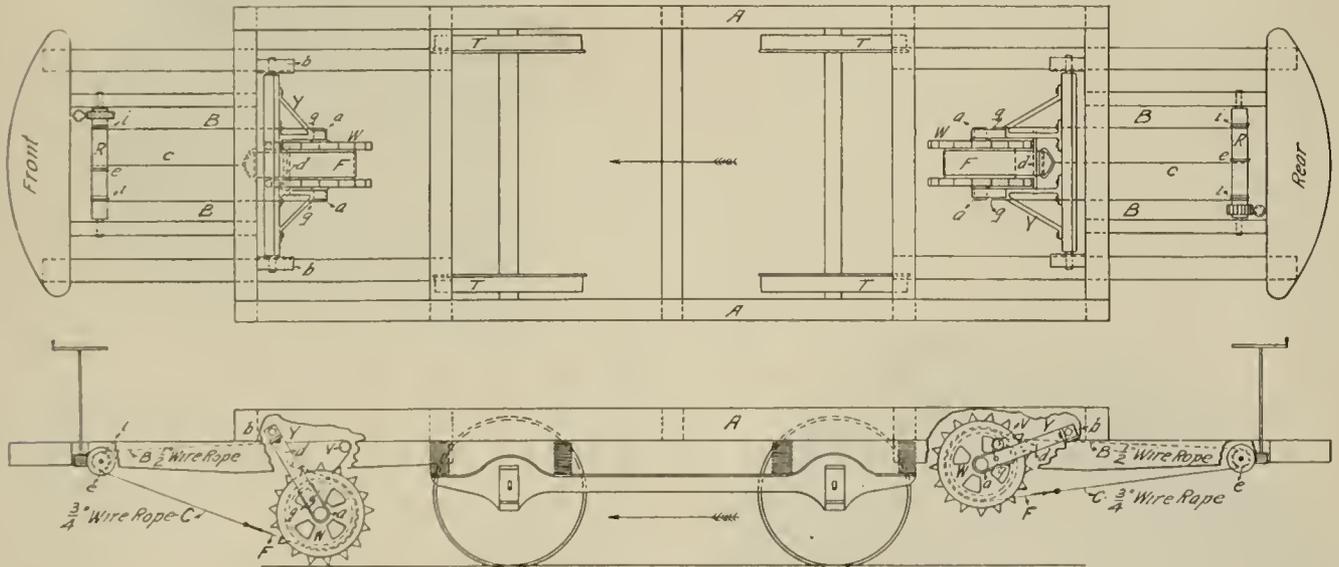

DIAGRAM SHOWING ARRANGEMENT OF EMERGENCY BRAKES.

The two flanges of the wheel W are connected by a drum of smaller diameter, around which passes a steel friction band F. One end of this band is firmly secured to the yoke Y at d and the other end is connected by means of a chain or cable C with the roller R at e. This roller is connected with the brake shaft by means of a worm and spur wheel or other suitable device. When not in use the wheel W is held up by two light chains BB, connected at g, with yoke Y, passing over sheaves V V, thence to the roller R and connecting with the same at i, on the side opposite the chain C.

By turning the brake shaft to the right the roller revolves producing tension in chain C and slackening the chains BB, thus bringing the toothed flange of the wheel W in contact with the pavement with a degree of force depending upon the power applied to the brake shaft. The band F produces powerful friction on the wheel W, retarding the rotation of the latter in proportion to the force exerted upon the brake shaft, and as the wheel cannot slip or kick upon the pavement the speed of the car is controlled or stopped at the will of the motorman.

By turning the brake shaft to the left, the motion of the roller is reversed and tension produced upon the chains BB and chain C is removed. The wheel W is thus elevated to the position shown in the rear end of the car.

The construction is such that the brake can be applied to either

has been compelled for the third time in 18 months to materially increase its quarters. The latest addition includes the entire premises until recently occupied by Pettengill-Andrews Co. This will give the company about 30,000 sq. ft. of floor space with a frontage on Devonshire St. and Winthrop Sq. of about 240 ft., and when remodeled will make a store and offices the equal of any electrical supply store in the United States. The company had much outgrown the former quarters, and the added space was badly needed. Its stock is one of the largest to be found anywhere, and is carefully assorted and includes practically everything electrical. The location is in the heart of the busiest business section of Boston, within three minutes' walk of the South Terminal station and convenient to the car lines from the North station as well as from suburban points. The Stuart Howland Co. started in business less than three years ago, and its growth, which has been phenomenal, proves what can be done by a thoroughly up-to-date business policy, as the business is now one of the largest in the country. We congratulate the company on its enterprise.

The traffic on the Noma & Springfield (O.) Traction Co. was so heavy on November 11th that the company had to redeem several hundred tickets from intending passengers who were unable to find accommodations on the cars.

**EXPRESS SERVICE ON LAKE STREET ELEVATED.**

The express service on the Lake Street Elevated which had been discontinued was resumed Nov. 12th. It was discontinued some days previous for the reason that the Cicero town board ordered the company to remove the cars from the storage tracks west of Lombard St., and the resumption of the express service was made possible by a resolution passed by the city council, granting the company the right to store its surplus cars on the line of the old Chicago, Harlem & Batavia Ry., between South 40th Ave. and South 52d Ave.

**ROOT TRACK SCRAPER.**

With the approach of winter the necessity for making provision for cleaning tracks becomes imperative and one of the most successful devices for this purpose which has been put upon the market is a track cleaner made by the Root Track Scraper Co., of Kalamazoo, Mich. This machine is built not only with a scraper, but with a flanger for cleaning out the grooves of the rails, and the flangers and scrapers are mounted so as to work independently. One of the most important details of this device is the method of fastening. It is made to fasten directly to the trucks and this is a special advantage in the case of double truck cars as it is obvious that by no other manner of fastening it can follow the rails on curves. The scrapers may fasten either to the body or trucks as desired.

**NEW WESTON INSTRUMENTS.**

The accompanying illustrations shows new types of Weston instruments for use on small switchboards which have been designed to meet the demand for good but low-priced instruments. Fig. 1 shows one of the round pattern instruments, known as type K, which are similar in general construction and appearance to the type F instrument, which is extensively used for switchboard work in all kinds of stations.

The type K instruments are, however, much smaller than the type F, and are specially suited for small switchboards, or where

FIG. 1.

space is limited. These instruments are well made and carefully designed, so as to secure the highest grade of reliability and durability. They are absolutely dead-beat and their indications are correct to within one per cent.

Fig. 2 shows a small switchboard equipped with the Weston duplex instrument, which contains both a voltmeter and an ammeter in one case. These instruments, known as Models R and T, are especially useful where practically simultaneous readings of current and voltage are to be made. As the scales are close together

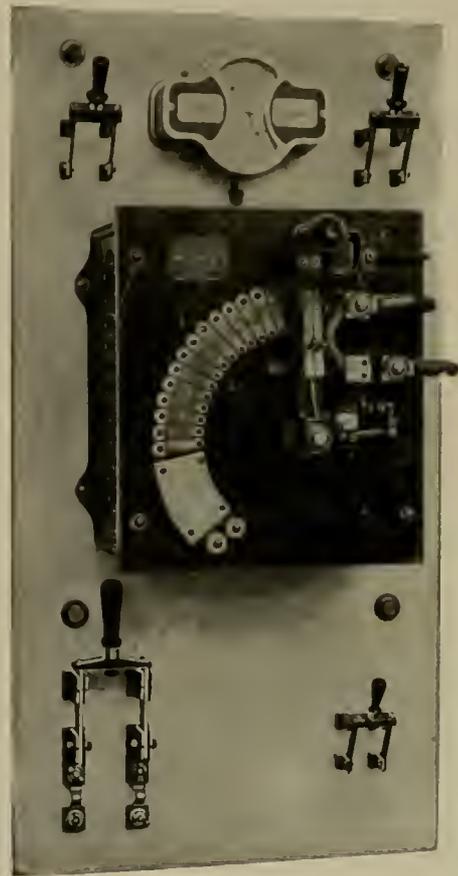

FIG. 2.

both may be read at a glance. Type R is built with a water-proof aluminum case, closely surrounding the operating parts of the instrument, thus reducing both the weight and the size to the smallest amount. This instrument is particularly suitable for outdoor use where water or dampness would affect a less securely enclosed instrument.

Type T is identical in design with type R, except that the scale is larger and can be read to smaller divisions. The case of this instrument is made of wrought iron, and is larger and much heavier than type R. The function of the cast iron case is to shield the instrument from external fields, which it does very effectively.

**WATER TANKS AND TOWERS.**

It has probably not occurred to the casual visitor to an office building or factory that all of the water used in these buildings is obtained from overhead tanks, and in looking across the wilderness of roofs in a large manufacturing city a large number of these tanks placed, either upon the roofs or independent towers, cannot fail to attract attention. An idea of the extent to which tanks and towers are manufactured is afforded by the figures given by the W. E. Caldwell Co., of Louisville, Ky. These tanks are used for fire protection for manufacturing plants, for water supply in villages and for private grounds. This company sends out an average of 30 tank and tower jobs a month, of this class, in addition to from 50 to 200 a month for ordinary water supply. This output calls for about 3,000,000 ft. of lumber, mostly Louisiana cypress and Georgia pine, and 300 tons of steel bands per year. The advertising bureau of this company is a particularly busy one and it sends out between 50,000 and 60,000 catalogs a month.

## NEW PUBLICATIONS.

PROCEEDINGS, Street-Railway Association, of the State of New York. The proceedings cover the twentieth annual meeting of the association, held at Caldwell, Lake George, N. Y., Sept. 9th and 10th, 1902. The volume contains 220 pages devoted to the discussions of street railroad topics, reports of committees, list of officers and members, and constitution and by-laws of the association.

PROCEEDINGS OF THE ILLINOIS STATE ELECTRICAL Association convention, held at Rock Island, Ill., September 24, 1901, has just been published. The book is chiefly devoted to two subjects, one being the insurance of electrical plants and the other, the method of heating from exhaust steam from electric light plants. Extended discussions of both of these subjects are given containing considerable valuable information.

MACHINE SHOP NUMBER of Cassier's Magazine, published by the Cassier Magazine Co., New York, price 50 cents. This special number contains 272 pages of choice reading matter illustrated with 236 half-tone engravings. There are twenty articles written by men well known in engineering circles and who are specialists in their lines of work. The subjects include compressed air, electric power, cranes, portable tools, foundry appliances, milling and grinding machines, tool room, shop floors, tool design, limit gages, shop heating, a new system of rewarding labor, piece work, progress and education, apprentices, factory depreciation, and fire prevention.

"WORK DONE" is the title of a handsomely illustrated pamphlet published by Westinghouse, Church, Kerr & Co., and contains descriptions of a number of the prominent electrical railways and other engineering works installed by this company. The book is excellently illustrated and the descriptions of the various plants are given in great detail. It includes the construction of the Grand Rapids, Grand Haven & Muskegon Ry., the Detroit & Port Huron Ry., the Detroit, Ypsilanti, Ann Arbor & Jackson Ry., the Toledo, Fremont & Norwalk Ry. and the plant of the American Car & Foundry Co.

POSSIBILITIES IN AMERICAN LOCOMOTIVE DESIGN, reprinted in pamphlet form from the Railroad Gazette of Oct. 17th, 1902, is an address at the Deer Park convention of the Baltimore & Ohio Railroad officers, September 20th, by Prof. W. F. M. Goss, of Purdue University, Lafayette, Ind. In the address Prof. Goss comments upon changing conditions and influences at work in the development of the American locomotive. He calls attention to a very general disposition to employ a false standard, based upon the idea of complication, in estimating the value of proposed improvement in locomotive design. The advantages and disadvantages of compound locomotives are discussed at some length, particular reference being made to the de Glehn type which is so much used in France.

A MANUAL OF DRAWING, by C. E. Coolidge, assistant professor of machine design, Cornell University, 92 pages, 10 full-page plates, paper, \$1.00. The object of the Manual is to put into permanent form a single and standard drafting-room system which will tend to alleviate unnecessary burdens upon the student and teach him one good system well. The system embodied in the book is intended to be the average system in use at the present day and is fully substantiated by data and information received from one hundred and thirty of the largest manufacturing concerns in the United States. The writer has discussed in detail the salient points in the selection and use of instruments and materials commonly used in a commercial drafting room. Each alternate page is left blank for the purpose of notes to be made by the student. The final chapter deals with Patent Office Drawings.

The Jersey City, Hoboken & Paterson Street Railway Co. has added John D. Crammins and John J. Waterbury to its board of directors.

An electric car on an outlying line of the Memphis (Tenn.) Street Railway Co. was held up November 8th by four men who secured \$42 from the car crew.

## ADVERTISING LITERATURE.

"RECORD OF RECENT CONSTRUCTION NO. 38" under the title of "Motor and Trailer Trucks" issued by the Baldwin Locomotive Works, of Philadelphia, treats of the recent development and extension of electric motor car service and shows how the Baldwin works has kept pace with this progress, as it has built both motor and trailer trucks for the heaviest electric cars in service up to this time. A large number of trucks are illustrated and a list of detailed information given concerning each.

"ELECTRIC LOCOMOTIVES FOR SURFACE HAULAGE" is the title of a handsomely illustrated catalog issued jointly by the Baldwin Locomotive Works, Philadelphia, and the Westinghouse Electric & Manufacturing Co., Pittsburg. The catalog presents in a very conclusive manner the numerous advantages of electricity as a motive power applied to locomotives for heavy surface haulage as well as for mining service. The engravings show a number of electric locomotives in use at some of the leading industrial establishments in the United States. The standard types and classes are enumerated, and a general description of their construction is given, together with tables of weights and characteristics of each class.

"IT BEATS THE SUN" is the title of a new illustrated catalog issued by the Pittsburg Blue Print Co., Pittsburg, Pa., describing its patent cylindrical electric copier. The machine consists of two half glass cylinders suitably mounted and having a strong canvas cover to hold the tracings and paper in place. An arc lamp of special design descends in the cylinder from an escapement mechanism for regulating the speed of the lamp. Among the advantages claimed for the machine are absolute independence of weather conditions and a reduction in the cost of prints. The company states that over one hundred machines have been installed in the offices of some of the largest concerns in the country. The catalog also describes a blue print wringer placed on the market by the company.

THE CHRISTENSEN ENGINEERING CO., Milwaukee, Wis., has issued catalogs Nos. 53, 54, and 55. Catalog No. 53, "Straight Air Brake Equipments," describes the various devices that comprise the Christensen straight air brake equipment for electric cars and explains the function of each part of the apparatus with instructions for its operation and maintenance. No. 54, "Christensen Air Brake, Where Made and Where Used," is a handsome souvenir issued for distribution at the Detroit convention of the American Street Railway Association, and shows a large number of views of the company's works, together with illustrations of various types of cars equipped with Christensen brakes and a list of names and addresses of roads using them. "Ceco Electrical Machinery" is the title of No. 55 which illustrates and describes various types of electrical machinery, including direct current motors and generators, alternating current generators and transformers. Copies of these catalogs will be sent on application.

MESSRS. DICK, KERR & CO., Ltd., 110 Cannon Street, London, E. C., are distributing the following handsomely illustrated pamphlets: "The English Electric Manufacturing Co., Ltd." is the title of a description of that company's plant and is illustrated by 15 full page engravings. Some idea of the size of the works may be had from the statement that in the eighteen months since the completion of the works electrical generators aggregating 100,000 h. p. capacity and 3,000 tramcar motors with all their attendant equipment have been sent out. "Continuous Current Generators" illustrates the various parts and the process of manufacture of the Preston generator which embodies features of extreme simplicity in design and construction. "Rolling Stock for Electric Traction" represents the most modern practice in electric car building in England by 42 pages of illustrations showing the latest types of cars in various stages of construction at the plant of the Electric Railway & Tramway Carriage Co., Preston, Lancashire. "Electric Traction on Railways" deals principally with the advantages of electricity over steam for suburban lines due to the higher acceleration made possible by the former. "Electric Traction at the Cape" is a description of the Campas Bay, Cape Town & Sea Point Tramways in South Africa and points out the numerous engineering difficulties which were considerably enhanced on account of the work being carried out during the progress of the Boer war.

## TRADE NOTES.

THE CHAMPION TROLLEY HARP CO., of Philadelphia, has been incorporated with a capital of \$130,000 to manufacture improved trolley harps.

THE C. W. TRAINER MANUFACTURING CO., Boston, Mass., has closed a contract for covering all steam heated surfaces of the new power plant of the Berkshire Street Railway Co., Pittsfield, Mass., described on page 813 of this issue.

THE UNITED STATES COAL CO. has purchased from the Westinghouse Electric & Manufacturing Co. two 150 kw. 550-volt direct current generators and two 10-ton electric mining locomotives, for use at its soft coal mines at Dillonvale, Ohio.

THE BILLINGS & SPENCER CO., Hartford, Conn., is sending out a new price list of drop forged lathe dogs manufactured by it. These dogs are drop forged from steel and fitted with hardened steel set screws and are especially designed for heavy work.

THE STANLEY ELECTRIC MANUFACTURING CO. has recently opened a sales office in Atlanta, Ga., to take care of the increasing demand for S. K. C. apparatus in the South. The office is in the Empire Building and is in charge of Mr. George P. Hardy.

HARTSHORN'S ROLLER, published by the Stewart Hartshorn Co., East Newark, N. J., for October, contains a description of some new brackets to be used in connection with the Hartshorn shades, and the pages are also well filled with choice humorous matter.

THE CENTRAL ELECTRIC CO., of Chicago, has recently issued a new general catalog dated 1903, and has distributed it to the trade throughout the country. Any buyer of electrical supplies who has not already received a copy can do so by addressing a request to the company.

THE BILLINGS & SPENCER CO., Hartford, Conn., has issued its Circular A illustrating new automobile parts which the company carries in stock for filling orders promptly. The company is prepared to furnish drop forgings of every description in iron, steel, copper and bronze.

THE GREEN FUEL ECONOMIZER CO. is building an addition to its machine shop, 50 x 150 ft. Among recent orders received for economizers are equipments for the Albany St. plant of the Boston Elevated, and for the Newark and Secaucus plants of the New Jersey Traction Co.

PERRY HODGES, of Boston, announces that owing to the increased business and the consequent necessity for more commodious quarters he has taken offices in the Board of Trade Building, 131 State St., Boston, where he will have charge of the business of the Pittsburg Reduction Co. in addition to his regular supply business.

THE OTIS ELEVATOR CO. has recently received the contract for the elevator and dumb-waiter equipment of the new Astor Hotel, Long Acre Square, 44th to 45th Sts., New York. The plant consists of seven electric passenger elevators, two electric servants' elevators, eleven electric dumb-waiters, and three electric sidewalk lifts. Messrs. Clinton & Russell are the architects and John Downey is the general contractor.

ADAM COOK'S SONS, 313 West St., New York City, the only makers of "Albany" grease, receive many letters testifying to the satisfactory results obtained where this ideal lubricant is used. The J. Sullivan & Sons Mfg. Co., of Philadelphia, writes: "We have our engine and main shafting fitted up with your grease cups; they are working to our entire satisfaction. Albany grease is certainly more economical and cleaner than oil."

THE H. P. CAMERON ELECTRIC & MANUFACTURING CO. has recently been organized under the laws of Connecticut with a capital stock of \$30,000. This company has purchased the interests of the old company which was organized under the laws of New York State and will move into its new factory, which is now

## The Standard Paint Company

<b>NEW YORK</b>	<b>CHICAGO</b>	<b>HAMBURG</b>
100 William St.	189 Fifth Ave.	Dovenhof 93.
<b>PARIS</b>	<b>LONDON</b>	
50 Boul. Haussman	59 City Road S. W.	

being built, about the first of December. The factory will contain a complete line of new machinery for making all kinds of motors, armature coils and electrical supplies in general.

H. E. OVERSTREET is meeting with great success in introducing the "Climax" stock guard on the interurban lines throughout the country. Last month he added to a long list of customers: the Massachusetts Construction Co., 75 guards; the Chicago, Milwaukee & St. Paul Railway Co., 100 guards; the Chicago & South Shore Ry., 50 guards.

THE PITTSBURG SPRING & STEEL CO., which was mentioned in the "Daily Street Railway Review" as organized with Mr. D. C. Noble as president, is progressing rapidly with its new works in which elliptic and coil springs of every variety will be manufactured. It is expected that the company will be in a position to fill orders for delivery after January 1st, 1903.

THE KENNICOTT WATER SOFTENER CO., of 3577 Butler St., Chicago, has found the demand for its water softeners so great that it has been obliged to secure additional manufacturing space. The main building of this new plant is 120 x 50 ft. in area and is equipped with all the modern facilities for building water softeners. The equipment includes traveling cranes, pneumatic hammers, riveters, drills, etc., and will enable the company to fill future orders with great promptness.

THERE IS PERHAPS no better economy to the steam-fitter and the engineer than a perfectly tight joint, yet one that can be easily taken apart if desired, and the Joseph Dixon Crucible Co. claims that it is always possible to have such joints if Dixon's graphite pipe-joint compound is used. Flake graphite is impervious to the action of heat or cold, acids or alkalis. Hence the value of a graphite compound when properly prepared. The Dixon company will send booklet and sample free of charge.

THE PENNSYLVANIA STEEL CO. now has at its office, 210 Western Union Building, Chicago, open for inspection the models of frogs, switches and switch stands, etc., that were placed on exhibition at the American Street Railway Association Convention in Detroit, October last. These models are both typical of interurban, city and steam railroad work and it would especially repay those interested to drop in their office to examine them.

THE LINK-BELT ENGINEERING CO., of New York and Chicago, reports among recent sales of the Renold silent chain, nine line shaft drives from motors for the new works of the Patton Paint Co., Newark, N. J.; eight drives from motors to line shafts and elevators in the new plant of Crompton & Knowles Loom Works, Philadelphia; eight 60-h. p. drives for induced draft blowers in the new Waterside station of the New York Edison Co. There are now 6t Renold silent chains in use in the new building of R. H. Macy & Co., varying in capacity from one to 90 h. p.

THE WESTERN ELECTRICAL SUPPLY CO., St. Louis, has recently taken the western agency for the "Parker" ball-bearing trolley stand. The stand is simple in construction, weighs less than 75 lb. and embodies a number of new features. It is claimed to be one of the lightest, cheapest and most sensitive stand on the market, and that by its use trolley wheels will wear about four times as long as usual. It can be easily and quickly adjusted for tension, follows curves in the wire easily and rain cannot enter its bearings. A catalog giving full description will be sent on application.

THE ADVANTAGES of Albany grease, the well known lubricant, are well stated in a letter recently received by Adam Cook's Sons, the sole manufacturers, 313 West St., New York City, from M. D. Roche, engineer at Caney's granite quarry, Lanesville, Mass. In summing up his experience the writer says: "I find Albany grease to be more durable, cleaner, cheaper and superior to any grease or oil that we have used, and shall certainly recommend it when placing our next order."

THE BROWN CORLISS ENGINE CO., of Corlies, Wis., reports that its business has increased rapidly during the last six

**"Superior Graphite Paint"**

**ESPECIALLY ADAPTED FOR USE BY STREET RAILWAYS BECAUSE IT**  
Offers a positive protection for all exposed surfaces. Makes Metal, Brick or Wood proof against the ravaging effects of weather, smoke, water, steam, etc. We manufacture special paints from special formulas to meet special requirements.  
Our booklet will interest you—shall we send it?

**DETROIT GRAPHITE MFG. CO.**

NEW YORK BOSTON CHICAGO

L. L. CLINE

THE LIFE OF A MOTOR IS PROLONGED BY USING.....

**ALBANY GREASE**

Has Never Failed to Reduce a Hot Journal Where Used.

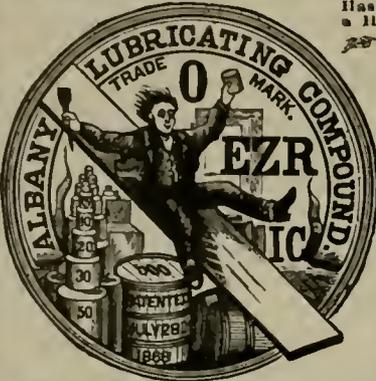

The Albany Electric Motor Grease is the only grease used from Maine to California that gives universal satisfaction. Why? Because it does the work required, has proven itself cheaper than any of the motor greases on the market today, and is always uniform in quality.

Will send a keg (100 lbs.) of our Grease for trial on approval at our regular barrel price.

If it does not prove satisfactory after an impartial test, will make no charge for keg. We know the result: you will want more.

**ADAM COOK'S SONS**  
313 West St. N. Y. City, U. S. A.  
Branch: 81 S. Canal St., Chicago.

This Trade Mark on Every Package

months that the company has found it necessary to erect a foundry which it is expected will be completed within 30 days. This addition to the plant is an entirely modern structure with concrete foundations and steel framework, 350 ft. long by 116 ft. wide. The company is about to undertake the construction of mining machinery, hoisting and pumping engines, compressors, etc., and rolling mill work, and intends to increase its agencies throughout the South and middle West.

THE COLUMBIAN CONSTRUCTION CO., which has been engaged in making extensive improvements on the Metropolitan system in Kansas City, completed its work in the latter part of the summer. In all about 11 miles of very heavy construction was built for the Metropolitan Street Railway Co., including the rebuilding of the 15th St. and Brooklyn Ave. line, which was formerly a cable and now an electric line; the rebuilding of the Prospect Ave. line, which was an old electric line with light rails laid on ties, and is now constructed with 9-in. 106-lb. rails laid on concrete beams; the 10th St. line, which was an old cable line, was also rebuilt with concrete beams.

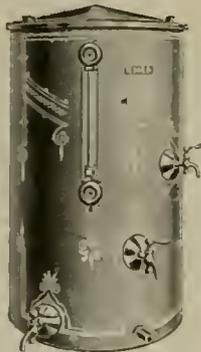

AT THE RECENT Dusseldorf exhibition Arthur Koppel was awarded the silver medal for his exhibit of industrial railway equipment, dump cars, inclined planes, self-discharging ore cars, electric railroads, etc. This is the highest medal given for industrial railway equipment at this exhibition. It will be remembered that the firm of Arthur Koppel also received the gold and silver medal at the Paris exhibition, which was the highest award given there for similar material. Arthur Koppel, whose offices are at 66-68 Broad St., New York City, carries a large stock of all standard goods ready for immediate shipment, and will be glad to send catalogues to all interested parties mentioning this publication.

THE LIBERTY MANUFACTURING CO., of Pittsburg, has purchased from the Sherwood Manufacturing Co., of Buffalo, N. Y., all of its patents and trade marks pertaining to the manufacture of the turbine type of machine for cleaning boiler tubes. This purchase settles amicably two suits involving patents which were pending in the United States courts. The Liberty company will in future manufacture and sell the "Niagara" tube cleaner as well as its standard "Chicago" tube cleaner which has been its specialty for several years past. This purchase was made to give the company control of the basic patents on tube cleaners of the turbine type, and the company's plant will be greatly enlarged. There are now over 8,000 cleaners of this type in successful use.

WESTINGHOUSE, CHURCH, KERR & CO. report extensive sales of the Roney mechanical stokers for the past month among which are mentioned the following: Carnegie Steel Co., Homestead works; Juniata Steel & Iron Co., Greencastle, Ind.; Lackawanna Steel Co., Buffalo; Continental Tobacco Co., St. Louis, Mo.; Atlanta Rolling Mill & Tinplate Co., Atlanta, Ind.; Woodward & Lothrop, Washington, D. C.; Merchants Heating & Light Co., Indianapolis, Ind.; The J. L. Mott Iron Works, Trenton, N. J.; American Locomotive Works, Schenectady, N. Y.; Pennsylvania Railroad, Altoona, Pa.; United States Lighting & Power Co., Washington, D. C.; National Tube Co., Pittsburg, Pa.; Pressed Steel Car Co., Pittsburg, Pa.

EUGENE MUNSSELL & CO., of New York and Chicago, have recently begun the manufacture of mica chimneys for incandescent gas burners which are known as Warren's folding interlocking chimneys. These chimneys are packed and shipped flat like sheets of paper, but can be formed into cylinders by joining the interlocking edges which are provided. This makes it possible to clean the chimney easily and thoroughly, which can not be so easily done with the ordinary chimney. It is claimed that it will transmit more light than any other mica chimney and in addition to these qualities there is a further advantage to the dealer as their shipping weight is considerably less than that of others and they take up but little space on the shelf. A gross of these chimneys covers less space than two dozen of the old-fashioned kind. A descriptive price list will be sent upon application.

THE BRIDGEPORT BRASS CO., of 19 Murray St., New York, and Bridgeport, Conn., is issuing a dainty brochure, containing a

### Filters for Oiling Systems

It is important that the Filter selected shall meet all requirements as regards filtering capacity, perfect cleansing of the waste lubricating oil and ease with which the Filter may be operated.

#### Cross Oil Filters

are in use in a large number of power houses in all parts of the United States. Our experience in furnishing Filters for oiling systems is at the command of companies having such work in prospect. Write for particulars.

## The Burt Mfg. Co.,

We also make the BURT EXHAUST HEAD.

very practical talk on the construction of telephone and telegraph lines with "Phono-electric" wire. The little pamphlet is more than a catalog, and gives in simple and concise language the theory and general principles upon which the modern telephone is constructed. The story begins with an explanation of the form and character of sound waves produced by the human voice, and goes on to tell how these waves are collected, transmitted and impressed upon the receiver. The importance of the transmission line in the operation is pointed out, and the advantages of "Phono-electric" wire over other materials is demonstrated by numerous statistics and tables, derived from actual experiments and tests made on this well-known composition. In addition to its qualifications for telephone lines there are claimed for "Phono-electric" wire many advantages for electric railway work.

THE ELECTRIC STORAGE BATTERY CO. has acquired the business of the Chloride Electrical Storage Syndicate, Ltd., which was formed in England soon after the incorporation of the Electric Storage Battery Co., of Philadelphia. The electrical development in this field has been very slow in Great Britain so that the English company only recently reached a paying basis. A large amount of electrical work however is to be accomplished in Great Britain in the next few years. This is indicated by the large works recently erected by the British Westinghouse Co., and the British Thompson-Houston Co. The Electric Storage Battery Co., seeing the opportunity for a large and profitable business in England and other countries, decided to purchase control of the English company and will now be able to sell batteries in foreign countries and have shipments made from England. It will thus be in a position to handle business all over the world.

THE LUDLOW SUPPLY CO., of Cleveland, states that it has had very gratifying results from its exhibit at the Detroit convention, especially on the Johnson trolley retractor, which not only catches the trolley when it flies off the wire, but pulls it down 15 in.; on the "Milwaukee" trolley pole, the Gore track drilling machine and the Garry pneumatic car and pit jacks. These articles are all new and were exhibited at Detroit for the first time, and attracted a great deal of attention at the convention. The Ludlow Supply Co. is now in correspondence with some of the largest electric railways in the country, with a view of equipping their lines with these various devices. The company has had such a demand for the Gore drilling machine that the makers have been unable to fill all orders promptly; arrangements have therefore been made with H. Gore & Co. and hereafter the Ludlow company will manufacture the drills and carriages complete at Cleveland, which will enable it to make prompt shipment in every instance.

PAWLING & HARNISCHFEGER, Milwaukee, Wis., report that the demand for cranes and hoists is excellent and advise us of the following orders which have been recently booked: Baldwin Locomotive Works, two 10-ton cranes; Manitowoc Steam Boiler Works, Manitowoc, Wis., one 35-ton crane; Consolidated Railway, Light & Power Co., Wilmington, N. C., one 10-ton crane; Pennsylvania Lines West of Pittsburg, Ft. Wayne, Ind., one 1½-ton hoist; Lorain Steel Co., Johnstown, Pa., one 7-ton crane; American Sheet Steel Co., Cambridge, O., one 5-ton crane; Berlin Machine Works, Beloit, Wis., one 1½-ton hoist; The Lorain Foundry Co., Lorain, O., one 5-ton crane; Allis-Chalmers Co., Chicago (for export), one 30-ton crane with 4-ton auxiliary hoist; Colean Implement Co., Peoria, Ill., one 10-ton crane; Allis-Chalmers Co., Frasier & Chalmers Works, Chicago, one 30-ton crane with 8-ton auxiliary hoist; Gruson Iron Works, Eddystone, Pa., one 20-ton crane; Isaac G. Johnson & Co., Spuyten Duyvil, New York, one 3-ton hoist; Allis-Chalmers Co., Chicago, one 5-ton crane; American Bridge Co., Milwaukee plant, Milwaukee, Wis., one 5-ton special crane.

THE CLIMAX STOCK GUARD CO., 714 Marquette Bldg., Chicago, reports that the exhibit of a full-size cattle guard located at the main entrance of the Exhibition Hall at the Detroit Convention, together with its smaller display inside the hall, resulted in numerous inquiries from street railway men who are looking for a cheap and efficient cattle guard. The company during the four months ending Aug. 1, 1902, sold over 1,600 guards, and among

**WHAT TO SEE IN NEW YORK.**

The New York Press on the New Show Places in New York.

What are New York's show places? It would be right hard to enumerate them on short notice. Perhaps the following question and answer may appeal to some: Resident to New Arrival—"Now tell me what you would especially like to see." New Arrival—"Oh just show me New York." I think that very good. But it is no easy matter to show New York. To our list of show places, whatever they may be, we must add the new waiting room at the Grand Central Station. When strangers go there they cry "Enchanting!" "Grand!" "Palatial!" "Prettiest thing I ever saw!" "Finest thing in the world!" "Amn't it splendid!" etc. Mr. Daniels has reason for the new elasticity in his step. "On the Tip of the Tongue" in the New York Press.

The Northern Texas Traction Co., of Fort Worth, Tex., contemplates extensions from Fort Worth westward to Weatherford, 31 miles; northward to Defton, 35 miles; and southward to Cleburne, 28 miles.

The Indianapolis Northern Traction Co., which is obtaining rights of way for its proposed road from Indianapolis to Noblesville, has begun condemnation proceedings for a strip of farm land in Washington township.

Under a law passed at the last session of the Massachusetts Legislature savings banks in that state are authorized to invest in the bonds of street railway companies in the state that have paid 5 per cent dividends for five years or more. This action will give the street railway securities of Massachusetts a wider market than they have heretofore enjoyed and the fact that such investments are authorized by the state cannot fail to have a marked effect upon the attitude of the public towards street railways.

The plans of the Indianapolis Traction & Terminal Co. for erecting a huge terminal station in Indianapolis may be considered epoch-making. It is the intention that this station shall serve not only to bring cars of all of the many interurban electric railways entering that city to a common meeting point, but also to concentrate the various interests allied with these roads in an office building. The advantages of such an arrangement on the score of convenience and economy of time are readily appreciated and the effect upon electric railway building in the state will be an important one.

It is difficult for us on this side of the border to appreciate the reasonableness of that deep-rooted opposition which prevents the operation of street railways in Canadian cities on Sundays. The city of Winnipeg voted upon the question of Sunday street cars on December 9th, and notwithstanding the company had agreed that in event of being permitted to operate it would arrange that none of its employees need work Sundays save of their free will, the proposed by-law was defeated by a narrow margin. Doubtless the result would have been different were the territorial of extent of Winnipeg greater, as residents of larger cities better appreciate the boon that a trip on the trolley is to the great number of people who find on Sunday their only opportunity for relaxation.

The announcement has just been made by the management of the Louisiana Purchase Exposition of the organization of World's Congresses to be held in St. Louis during 1904. The chief of the Department of education will be director of Congresses, assisted by an advisory board comprising Nicholas Murray Butler, president of Columbia University; William R. Harper, president of the University of Chicago; R. H. Jesse, president of the University of Missouri; Henry S. Pritchett, president of the Massachusetts Institute of Technology, and Herbert B. Putnam, Librarian of Congress. It is the intention to make the series of congresses a co-ordinate part of the exposition, its work supplementing the exhibits, and having a scientific value that will attract the attention of scholars and practical experts in all parts of the world, making the congresses truly international.

It is to be hoped that these plans will be fully carried out and in view of the position which the electric railway holds in America, and the fact that by reason of the development of alternating-current apparatus for traction purposes we are just entering upon a new field, nothing would be more appropriate and opportune than an International Congress of Electric Railway Engineers.

We believe the transfer law enacted in 1902 by the Rhode Island Legislature covers the transfer question better than the transfer laws in most other states, and is just, both to the company and the public. As has been pointed out at convention banquets during the past several years, the word transfer, from "trans" meaning "across" and "fer" to "bear," signifies to bear across, and the transfer will always be at the best a heavy cross to be borne by the general manager along with his other troubles and tribulations. But as long as transfers must be, some such regulations as are provided by the Rhode Island law ought to be stipulated for the protection of the company. The sections providing a penalty of not less than \$5 nor more than \$20 to be paid by every person who gives or sells or purchases or receives a transfer ticket, except in a legitimate way within the spirit of the law, is admirable and should operate to prevent trafficking in transfers.

The extract of the Rhode Island transfer law which appears on another page, will probably recall to a number of our readers the decision of the Supreme Court of California, reported in the "Review" for July, 1900, page 406, sustaining the validity of an ordinance designed to prevent the misuse of street railway transfers and imposing a penalty of a fine of not more than \$500, or imprisonment in the county jail not exceeding six months, or both. In the Rhode Island statute care has been taken to avoid the loose phrasing which

made it necessary for the court to read the words "with intent that it shall be used by some other party" into the California ordinance.

The Supreme Court of Illinois, as noted in the "Review" for November, has recently decided that the Chicago street railways have some extraordinary duties in the matter of issuing transfers, and having in mind the abuses of the transfers against which the Chicago companies have had to contend, it would be no more than just for the Illinois Legislature to pass an act similar to that of Rhode Island, which will adequately protect the companies.

From its first issue the "Review" has urged the advantage of street railway parks and pleasure resorts as a means of creating traffic, and in the last twelve years has described a large number of successful enterprises of this nature, but the subject of parks has by no means lost its interest, for at this time there are more electric railways considering this question than ever before. The greater proportion of new companies in the field are operating interurban lines and to these the pleasure resort particularly appeals because of the longer haul to the park, and the higher fare; and in fact we know a number of instances where the promoters of roads now under construction have taken the precaution to get options on park sites at the same time they secured the right of way for the road.

To managers who are contemplating opening parks for the first time next season the experience of others in this direction will be particularly helpful, and with the idea of assisting the newcomers and at the same time affording an exchange of information among those who already operate parks, we have undertaken to collect the most recent data on the subject. On another page will be found the first installment of the reports from park managers, the information being especially useful in indicating what attractions have proved to be most popular and remunerative.

An important point for the consideration of those who intend to open a park is the location of the park with reference to the municipality served. Other things being equal the shorter haul to the park, the better for the company, but an interurban line should not get too close to any of the large towns on its route. An instance is in mind where a city council extended the municipal limits to within a block or two of the railway's amusement park, and as the franchise provided for a 5-cent fare within the city limits, the company's receipts from park travel were cut practically in half.

The operation of a street railway pleasure resort falls within the maxim that "what is worth doing is worth doing well," and a great many companies find that to follow this course leads first to the employment of a park manager, or to leasing the park to an amusement company or park specialist. The latter plan has its advantages for roads of medium size, where the superintendent of the railway has too much to do to take the park management in addition, and yet the company feels it cannot afford to employ a manager solely for the park. It is, however, always prudent where the park is to be operated by a lessee or when the park manager has no other duties during the resort season, to incorporate an independent park company. This would relieve the street railway of liability that might arise because of accidents at the park, and also often deprive a hostile press of some of its "talking points." Doubtless many of our readers can recall instances of street railways which entered into the park business and found it necessary later to sell their resorts to independent companies.

There can be no question but that vaudeville and light opera are the most successful of theatrical entertainments, but smaller roads may find an entire week to be too long a period for presenting the same bill; in such cases companies favorably situated can solve the problem by building a second theater and alternating the attractions presented, as was done by the Indiana Railway Co., operating the interurban road between Goshen and South Bend, Ind. Experience also indicates that band concerts are always good, the fare to the park being 10 cents.

For the younger patrons the well-known merry-go-round, roller coaster, scenic railway and "chutes" have perennial charm; dancing is a drawing card both summer and winter and would seem to become more popular each season; where water is available boating and bathing facilities usually insure a good attendance, and especially is this the case where a water toboggan is erected, and in winter skating will bring out large crowds. Athletic contests, baseball and football are also good attractions in their proper seasons.

On one point all successful railway park managers are agreed—the entertainments must be devoid of vulgarity.

During the past few months we have made references to the attention now being given the matter of discipline by street railway men, as shown by the number of papers on this subject read at the recent street railway conventions and the activity of the committees on standard rules of the American and the New York associations. In the "Review" for November we published the first part of an interesting article by General Bancroft, president of the Boston Elevated Railway Co., which described in detail the careful methods used by that company in examining applicants for employment and instructing the men whom it was considered had the making of competent street railway employes, and in this number appears the second part of General Bancroft's article in which the author elaborates some of the methods of instruction and of keeping records. The "school for employes," which is perhaps further developed in Boston than in the other cities where it has been adopted, is the natural result of the introduction of more complicated apparatus, and will be recognized as a most efficient means to the desired end—the practical instruction of a large number of men in their duties. A school of this character and especially the "manual training" equipment of course appeals to the popular interest far more than do the underlying principles adopted by the company, which make the school desirable, and aside from the practical utility of the institution its effect upon the public is an excellent one. The layman is impressed but little by the statement that a company "uses great discrimination in selecting employes and men must be familiar with the rules before taking out cars," and respect for the industry, for the responsibility confronting the management, and for the trainmen themselves is increased by knowledge of what the motorman must know and do in order to fit himself for the position.

Briefly stated the principles governing the system of discipline of the Boston Elevated Railway train service, as may be gathered from General Bancroft's article, are to make careful preliminary examination before a man is accepted as a candidate; to give thorough drilling in his duties before letting him assume responsibility; to try and make every man accepted perfect in his duties; to promote the best men in the service to higher positions; to keep accurate records and to discharge only for good cause; to pay wages that will attract desirable men to the service, and to deal justly by all.

In connection with the concrete statement as to the practice of the Boston Elevated Railway Co., it will be found interesting to read the paper entitled "Efficient Discipline," presented before the New York Railroad Club by Mr. Thomas E. Mitten, general manager of the International Railway Co., of Buffalo, and published in this issue. Mr. Mitten is a member of the committee on Standard Rules for the Government of Employes, appointed by the A. S. R. A., and also a similar committee of the New York state association.

Mr. Mitten in addition to the matters of careful selection, thorough instruction and subsequent training, promotion on merit, good wages and fair dealing, makes three other points: First, a new man who has satisfactorily passed the examination and instruction periods, should be kept on probation for a longer term than is commonly done, and in event his record is unfavorable he should be promptly removed for the good of the service; this on the theory that having been given an opportunity the record shows he cannot or will not make a satisfactory man. Second, that the system of merits and demerits on a paper record is preferable to one under which men are suspended for minor breaches of discipline. Third, that pensions for superannuated employes would give a most satisfactory solution of a perplexing trouble, lax discipline and inefficiency of service arising from men being carried on the active list when infirmities prevent them from performing their duties properly.

There are probably many managers who are far from satisfied with the rules under which their men are operating, and who hesitate to make the changes which they consider desirable mainly because of the injustice that would be done to individuals who had acquired vested rights, so to speak, under the old system.

The importance of a satisfactory system of discipline is constantly increasing, or what amounts to the same thing the need for a personnel of the first class is becoming more pressing, and we believe that the means to accomplish the result desired may be put in two rules—get the right kind of men; then keep them. And to this end we believe pensions for superannuated employes will go a great way.

## New Lighting and Power Plant of the Galveston City Railway Co.

The City of Galveston, Tex., is located on the extreme easterly end of Galveston Island and Galveston Bay, about two miles in width, separates the island from the coast of Texas.

The Galveston City Railway Co. operates 35.35 miles of track laid to standard gage with 40 and 60-lb. T-rails, and owns 63 motor cars and 8 trailers. The officers of the company are: President and general manager, R. B. Baer; vice-president, W. G. Oakman; secretary and treasurer, A. Dronilhet; assistant secretary and treasurer, G. R. Turnbull.

The station of the Galveston City Railway Co. described in this article was built to replace the one which was completely destroyed by the storm of Sept. 8, 1900, which also damaged other property in the city to the extent of \$20,000,000 and caused the death of from 10,000 to 12,000 people. An interesting account of the damage suffered by the street railway was given in the "Review" for October, 1900, page 610. The power house which was destroyed was a substantial and handsome building, located at the corner of Avenue I and Twentieth St., and covered a space of 85 ft. by 120 ft. The immediate cause of the destruction of this plant was the collapse of the brick stack, which was 153 ft. high, circular, and with a 5-ft. inside diameter. The firm sand foundation on which it stood, carried a weight of 2,800 lb. per square foot. The breeching connection was made with the stack about 14 ft. from the floor level, the opening for which weakened the stack at the point of connection.

During the storm, the wind blew in gusts, which attained an estimated velocity of 120 miles an hour at times. These gusts, it is believed, caused vibration in the stack, brick crumbled at the breeching opening, and the stack fell diagonally across the building, crushing in the roof, and destroying much of the machinery and equipment. Later the walls not demolished by the stack were toppled over by the wind, thus completing the destruction of the station.

It is a notable fact that while, in general, the Gulf waters created the most damage, in this particular instance the damage was entirely due to the wind. The illustration herewith gives a fair idea of the destruction occasioned.

The owners of the property retained Messrs. Sanderson & Porter of No. 31 Nassau St., New York, as engineers, to make an examina-

WRECK OF OLD POWER HOUSE MAR. 1, 1901.

tion of the entire property and submit a report in reference to its rehabilitation. This report, which was adopted, advised the rebuilding of the power station and pole line in accordance with the best modern practice, modified by such special features as were required by the local climatic or other conditions. The new station was erected on the site of the old power house, which is centrally located for both the railway and lighting service, the established grade at this point is 7 ft. above mean low tide, being at present the highest elevation of any location in the city.

The work of reconstruction was preceded by clearing the wrecked debris from the site of the power house, which began on Feb. 15, 1901. The actual construction began on July 6, 1901.

### Foundation.

The building and machinery were placed on concrete foundations; those for the building being carried to a depth of 30 in. and protected around the outer edge by 4x10-in. splined piling driven to a depth of 14 ft. below the surface, at which point clay was encountered. This sheet piling forms an effectual water-tight bulkhead and will prevent the future shifting of sand from under the foundations. Concrete rests on top of this piling at its outer edge. The earth

EXTERIOR OF GALVESTON CITY RAILWAY POWER HOUSE.

formation consists of a firm layer of sand about 2 ft. in depth, which is underlaid by from 10 ft. to 12 ft. of quicksand. Square sawed piles, 14 ft. in length, placed 2 ft. on centers, were used under the building columns. The foundations for the rest of the building and machinery are entirely on sand, the maximum weight per square foot being about 2400 lb. The piling was driven by means of a water jet.

### Engine Foundations.

The concrete for the engine foundations was composed of one part Atlas portland cement, three parts sharp San Jacinto sand and five parts broken brick to a size that would pass through a 2½-in. ring, mixed to a consistency which after thorough ramming showed some water on the surface. After removing the forms, the foundations were rubbed with board and water, which ground the irregularities down, leaving a smooth and neat appearance.

### Boiler Plant.

Three Babcock & Wilcox vertical header boilers, 9 tubes high by 14 tubes wide, were installed, each boiler containing 2350 sq. ft. of heating surface. The fronts of the boilers are supported by columns which also carry a coal pocket. The boilers are equipped with Roney stokers supplied from an overhead coal bunker. Each furnace is also fitted for oil burning, oil being used at present, it having been demonstrated in this installation by a complete and careful series of tests, that both coal and oil may be used in the furnace simultaneously or that either fuel may be used separately without any change whatever in the furnace construction and without any perceptible difference in the efficiency of the unit.

### Economizer.

The boiler plant is equipped with a Green Economizer, 8 tubes wide and 32 tubes long in the rear of the boilers and which is bypassed both for fuel gases and feed water. The waste gases are discharged by duplicate 130-in. draft fans, direct connected to Westinghouse Junior engines, either fan being large enough to handle the gases from the entire boiler plant. The fans are controlled directly by steam pressure through the medium of a damper regulator and balance valve on the steam line which supplies steam to the fan engines.

The destruction of the former station by the collapse of the stack made the use of a mechanical draft system in the new plant imperative, so as to eliminate the possibility of a similar catastrophe and to increase the flexibility of the boiler plant.

#### Fuel Handling Equipment.

Coal is received from an alley outside of the building, and by means of a vertical elevator and horizontal conveyor is delivered into a bunker extending along the front and over the boilers. This bunker has a capacity of about 180 tons and is kept stocked with coal in order to guard against shut downs due to shortage of fuel oil

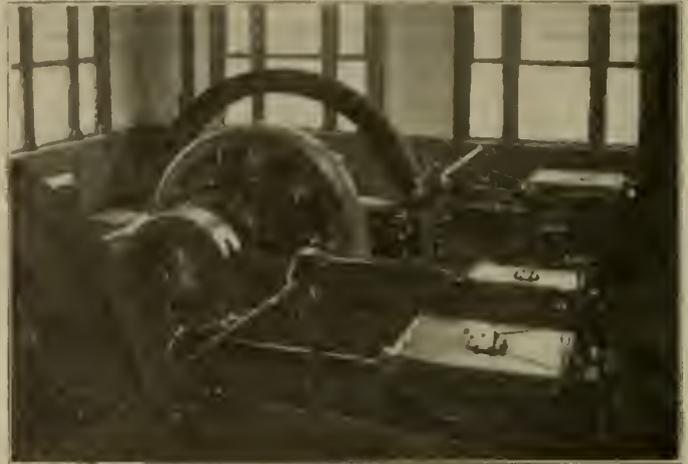

STEAM HEADER ON BOILER ROOM FLOOR.

Beaumont oil is at present being used as fuel, a storage tank and duplicate pumps being provided to store and handle the oil which is passed through a heating chamber and raised to a temperature of 120 or 130 degrees, and thence through a special Worthington meter before it enters the furnace.

#### Feed Water System.

The pumps are in duplicate, each  $7\frac{1}{2} \times 5 \times 6$  in. outside packed plunger pressure pattern, provided with pot valves and placed on

ously and receive their supply from and discharge their contents to separate sources. The water may, therefore, be taken from the city main and delivered to any one boiler by way of the economizer, and the other pump may, at the same time, receive water from the artificial well or cistern and deliver to any other boiler or place. The

NO. 1 AND NO. 2 FILER & STOWELL ENGINE.

water from the pump passes through a Worthington meter, primary heater, auxiliary heater and an economizer before entering the boiler; the average temperatures being from the pump 95 deg., from the primary heater 130 deg., from the auxiliary heater 200 deg., and from the economizer 285 degrees.

#### Piping.

The boilers are set facing the engine room and the steam header is carried along the boiler room floor directly in front of the boilers, so arranged that any boiler may be cut out of the line from the engine

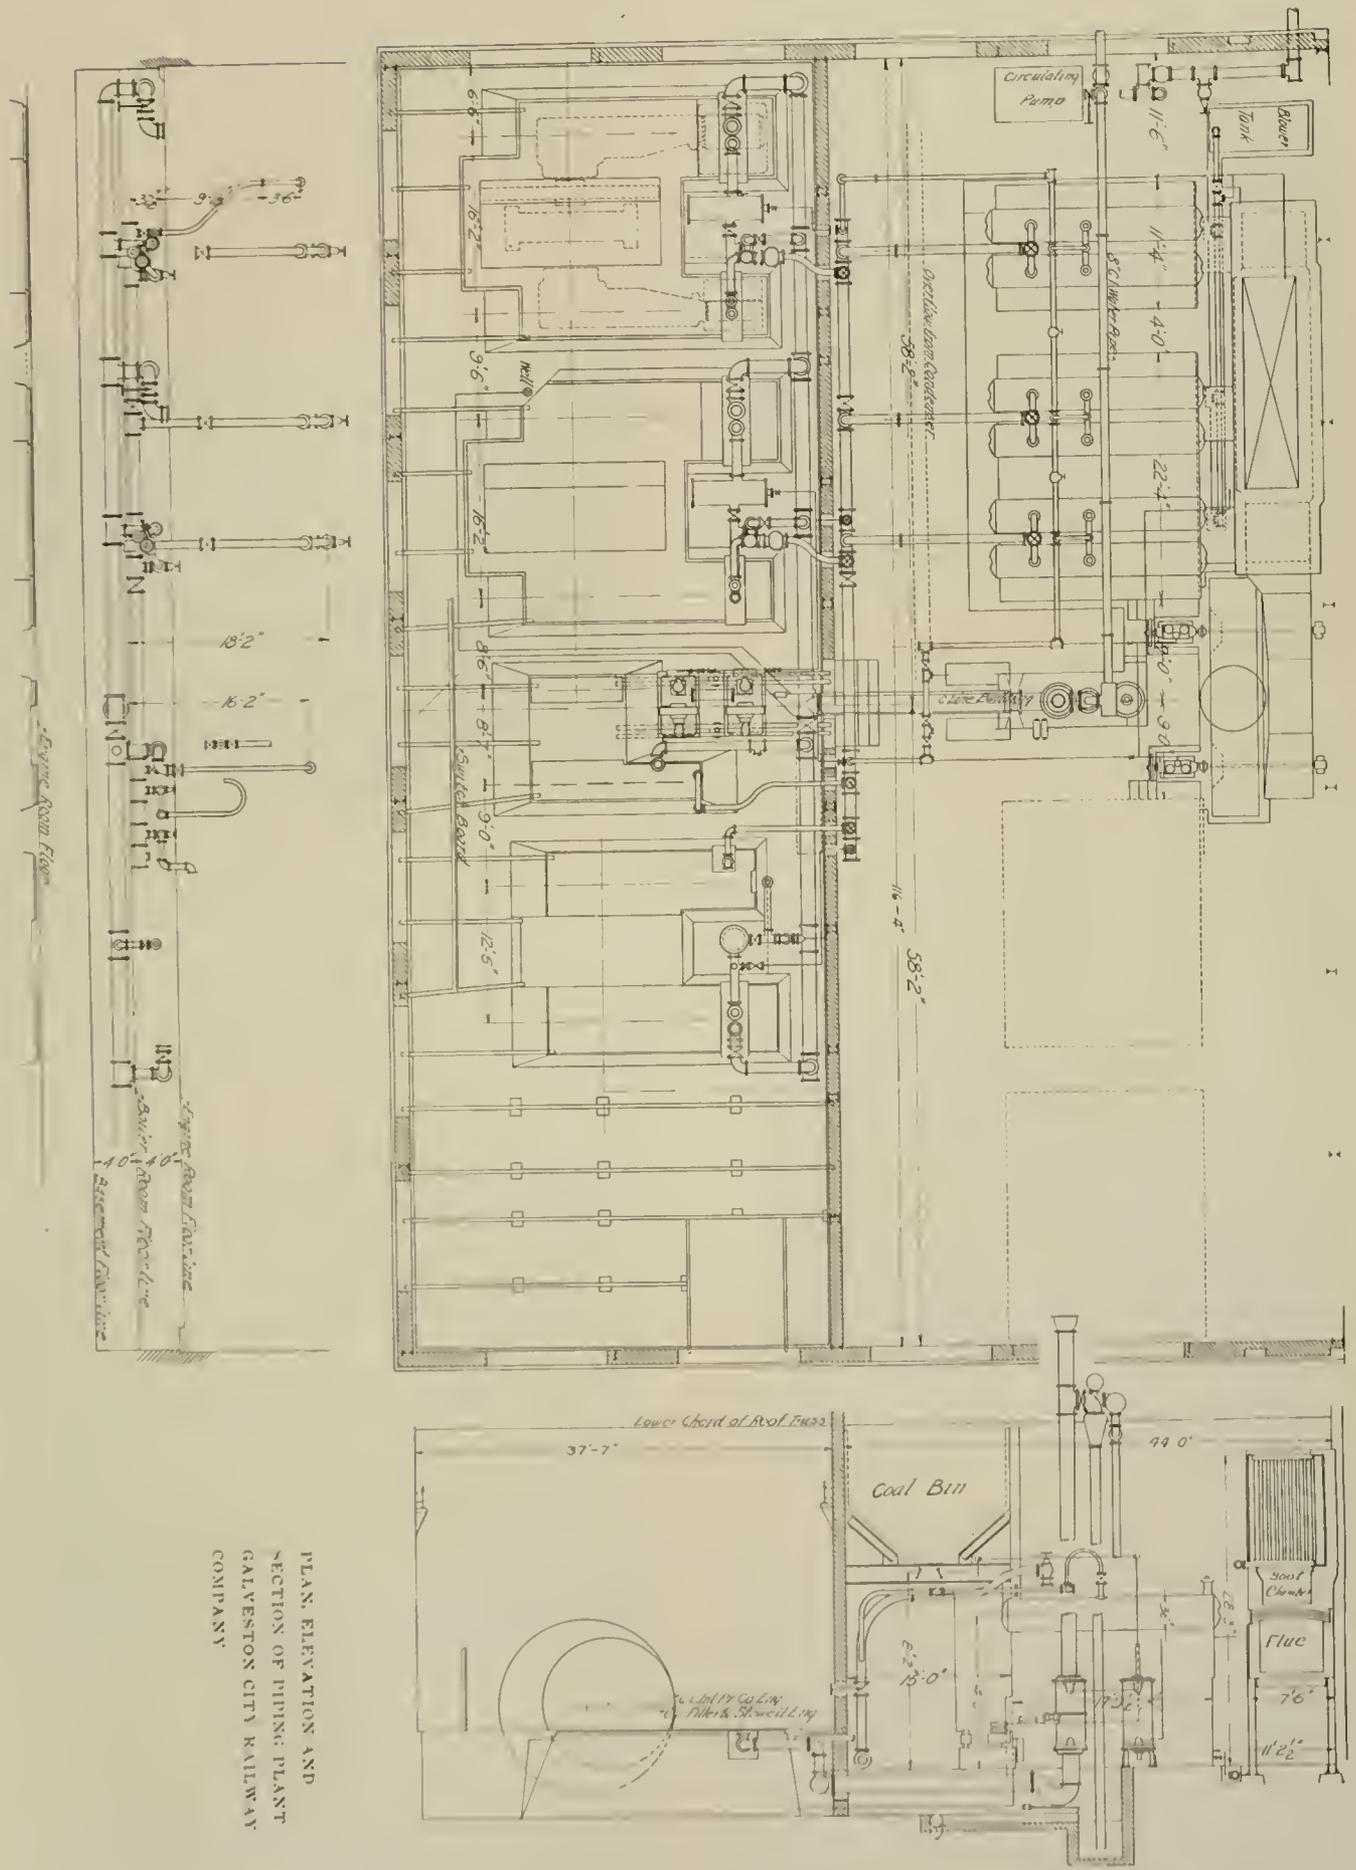

GENERAL VIEW OF ENGINE ROOM.

brick foundations finished off with lipped sole plates arranged to collect any drip from the pumps.

The pumps are connected with double crosses, both in the suction and discharge lines, which permit them to be used simultane-

ously and receive their supply from and discharge their contents to separate sources. The water may, therefore, be taken from the city main and delivered to any one boiler by way of the economizer, and the other pump may, at the same time, receive water from the artificial well or cistern and deliver to any other boiler or place. The

PLAN, ELEVATION AND SECTION OF PIPING PLANT GALVESTON CITY RAILWAY COMPANY

The exhaust header is parallel to the steam header but located in the engine room basement. Exhaust from each engine passes through this header to a primary header and thence to a Worthington central condenser. All steam admission and exhaust valves and stems are carried up through the engine room floor and are supported by stands located for the convenience of the engineer. Extra heavy Crane fittings and flanges were used for all high pressure steam and water piping, and Crane standard weight fittings and flanges for ex-

haust steam and low pressure work. Brass pipe was used throughout for conveying the feed water from the pumps to the boilers.

two by-pass valves, making therefore, six delivery adjustments available. With the present load, the pump has ordinarily operated at half speed and supplies sufficient water at 86 degrees to give a temperature of 118 degrees or 120 degrees at the tail pipe and a vacuum of 24 in. To operate the pump requires 5½ kw.

The auxiliary circulating pump is located in the boiler room of the power house, and is by passed. Either pump may be operated directly from the power house without manipulating valves.

Engine Generators.

The station is designed to furnish current for an aggregate of 50 to 60 single truck cars and for lighting and power service for the city of Galveston.

The railway units consist of two 16 and 30 x 42-in cross compound, improved Filer & Stowell corliss engines, designed to operate with a steam pressure of 150 lb. at a speed of 100 r.p.m., each directly connected to a 325-k.w. 550-volt, direct current General Electric railway generator. The engines are guaranteed to develop a horse power on 14½ lb. of steam per i.h.p. per hour with a pressure of 150 lb. at the throttle and 22 in. of vacuum at the exhaust outlet. The beds have a continuous bearing on the foundations and are provided with a lipped edge to prevent oil drippings to the floor, and each cylinder is provided with a sole plate or pan bolted els to either board. The railway generator panels to the bed, thereby making the bed continuous throughout the entire length of the engine and cylinder.

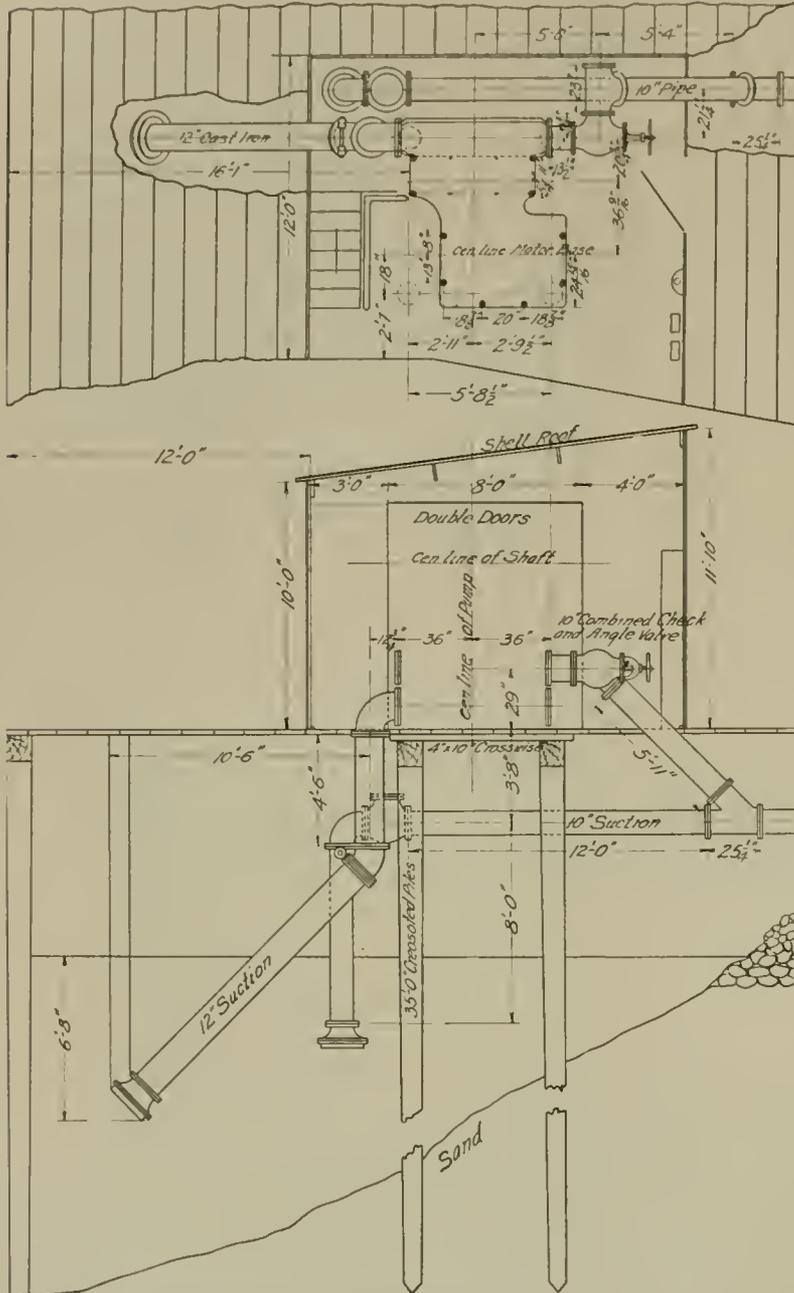

The beds are of the bored guide type, the cross head shoes being adjustable by means of wedges. The connecting rods are solid with side wedge adjustments. The valves of both high and low pressure cylinders are operated by double eccentrics, one for the admission and one for the exhaust valves. All valves are of the doubleported type and are susceptible of adjustment to any desired length. All links and valve rods are provided with solid ends with wedge adjustment instead of the usual bush and set screw. The governor is of the flyball type, and regulates well within the requirements of the service. The main bearings are provided with wedge adjustments on both sides and under the bottom of the main bearing shells, making it possible to adjust the shaft and armature centrally in relation to the pole pieces of the generator regardless of the wear on the bearings. This permits the removing of the bearing shells without raising the shaft.

The alternating current or lighting equipment consists of one 12 and 22 x 14-in. tandem compound standard Harrisburg engine, operated at a speed of 257 r.p.m., directly connected to a 125-k.w. General Electric revolving field, 2300-volt, 2-phase generator. This unit was installed to take care of the day lighting and power load. The second lighting unit is a 13 and 26 x 28-in. Green-Wheelock cross compound engine, operating at 150 r.p.m. and directly connected to a 200-k.w. revolving field, 2300-volt, 2-phase generator. These two lighting units can be successfully operated in multiple when necessary.

Switchboard.

The switchboard panels are of blue Vermont marble, the railway and lighting boards being separated by a space sufficiently large to permit the addition of panels to either of the boards as may be needed. The railway generator panels are each equipped with three single-pole switches, ammeter, voltmeter, lighting switch, double pole, double throw voltmeter switch and laminated type carbon circuit breaker. The load panel is equipped with an illuminated dial ammeter, illuminated voltmeter, recording wattmeter, etc. Each of the six feeder panels is equipped with 600 ampere, single pole, quick break switch, ammeter and laminated type carbon brake circuit breaker. The general arrangement of the rear of this board is shown in an accompanying illustration.

The alternating current switchboard consists of an exciter panel on which are mounted a triple pole double throw exciter switch, ammeter and triple pole fuses for each exciter. One voltmeter, supplemented with a double pole double throw plug device, is intended to

PLAN AND SECTION OF PUMPING STATION, WITH INLET PIPES.

haust steam and low pressure work. Brass pipe was used throughout for conveying the feed water from the pumps to the boilers.

Condensers.

The exhaust from all the engines in the plant is condensed by a Worthington central condenser, having a capacity of 40,000 lb. of steam per hour, which requires the use of a rotative dry vacuum pump, to remove any air that may be introduced into the system. Circulating water may be supplied by a 12 x 15 x 18-in. Dean duplex pump, located in the boiler room or, as it is at present, by a 10 x 12-in. triplex Blake pump, located at the Bay wharf, 3,600 ft. distant, and driven by a 30-h. p. 2-speed, 2-phase, Westinghouse alternating current motor. The triplex pump cylinders are also provided with

be used for either exciter. The exciters are directly connected to General Electric vertical engines and are intended to be operated in multiple if desired, or the idle exciter may be thrown on the railway circuit for the purpose of shifting cars in the car barn when main railway engines are shut down for the night.

Each lighting panel is fitted with double pole oil switches, recording wattmeter, indicating wattmeter, ammeter, voltmeter and synchronizing devices. The field resistance is located in the basement and controlled through a separate floor stand. There are three distributing panels, each of which is controlled by a double pole oil switch and two of the panels are also provided with double pole double throw switches, in order that the two-phase load may be bal-

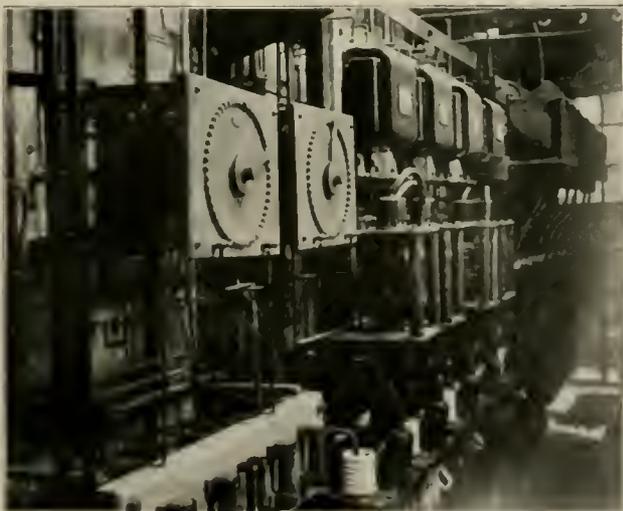

FRONT OF ALTERNATING CURRENT SWITCHBOARD.

anced if necessary. The front and rear of alternating current switchboard are illustrated herewith.

Lighting.

The station lighting is accomplished by 30 incandescant lamps, arranged one at each side of each window at intervals along the center wall. These lamps may be supplied with current either from the exciter switchboard or from the 112-volt alternating current, lighting bus-bars direct. In addition to these incandescant lamps, there are seven arc lamps hung on brackets. These lamps are furnished with alternating current at 112 volts from the lighting bus-bars.

REAR OF ALTERNATING CURRENT SWITCHBOARD.

The gage board is mounted on a glazed tile panel built in the center wall of the engine room, directly above the door connecting with the boiler room, and on which are carried the clock and recording gages.

Building.

The building which is shown herewith was designed with special reference to the local and climatic conditions.

The roof, crane run-way, coal bunker, etc., are supported by a complete steel framework, designed to carry the entire weights, irrespective of support from the brick work. The engine room is 38 ft. wide by 116 ft. long, and the boiler room 45 ft. by 116 ft. inside dimensions. The boiler and engine rooms are separated by a fire

REAR OF DIRECT CURRENT SWITCHBOARD.

wall extending from the basement floor to the top of monitor. A 15-ton hand traveling crane is installed in the engine room.

The building is built of Elgin, Texas, brick throughout, the first 9 ft. 8 in. being of red brick laid in cement mortar, consisting of one part Atlas portland cement to three parts of sharp San Jacinto sand, this being covered with a coating of cement  $\frac{5}{8}$  in. thick and molded.

SETTING 60-FOOT POLES BY JET SYSTEM.

This class of work, sometimes called "stuccoing," is well suited to the Southern climates only, and in this particular locality is much superior to native stone.

From a point 9 ft. and 8 in. from the base, and extending up to the top of parapet wall, the walls are of kiln run Elgin pressed red brick, faced on the outside with Elgin buff dry pressed brick, presenting a very fine appearance and which withstands the climatic conditions better than any other local brick.

There were no heading courses laid, but in lieu thereof a woven wire tie made of No. 14 galvanized wire netting cut 2 in. x 6 in. was used. These ties were laid, one tie to a brick, one every fourth course.

The windows throughout the building were designed to resist the most severe storms. The window openings are 11 ft. by 22 ft., the frames being reinforced by steel channels extended through the

transom bar and 6 in. I beams extending down vertically through the center frames and riveted to a 10 in. channel carried from column to column below the window sills. The sash are stationary, with the exception of the bottom row, which are on hinges and are provided with strong and efficient holding devices. The sash are extremely heavy and rigid and are capable of standing a wind pressure of 70 lb. per sq. ft. The window panes are comparatively small and the glass ranges from 1/8 to 1/4 in. in thickness. All glass, except that in the lower case windows is ribbed, in order to exclude the direct rays of the sun and secure a better diffusion of light.

The engine room floor is of I beam and concrete construction laid as follows: False work was placed under the I beams and covered with a layer of single ply tar paper. Three inch mesh expanded metal was laid over this, each end extending from beam to bottom and a lap made at the beam. This was covered with a

layer of concrete 4 in. thick and thoroughly tamped, and was later finished with a finishing coat of from 1/2 in. to 1 in. in thickness, consisting of one part Atlas portland cement and three parts sharp San Jacinto sand.

The wainscoting, which is 5 ft. high, is formed by using buff pressed brick extending out 2 1/4 in. from the face of the wall proper, and finished off at the top with 2 1/4 in. radius round nose brick laid on top. The interior walls above the wainscoting are laid with selected kiln run Elgin brick and are painted white with "Alabastine" water paint.

Ventilation is provided by means of six 36-in. pancoast ventilators placed at intervals on engine and boiler room roof; in addition to which the monitor, which is 8 1/2 ft long, is provided with a continuous row of swinging windows along each side; these are controlled from the engine and boiler room floors. The present

**RESULT OF TESTS OF BABCOCK & WILCOX BOILER WITH COAL AND WITH BEAUMONT FUEL OIL, USING DIFFERENT BURNERS, MADE BY SANDERSON & PORTER, AT THE POWER PLANT OF THE GALVESTON CITY RAILWAY.**

The boiler had 2,350 sq. ft. of heating surface and was rated by the builder at 235 h. p.; the grate surface was 62 1/2 sq. ft. The fuel used in test No. 1 was Cumberland coal of a calorific value of 12,866 B. T. U. per lb.; the coal contained 0 1/2 per cent of moisture, and the dry coal 10.4 per cent ash. In the other tests Beaumont oil, 27 degrees, was used; this has a calorific value of 19,000 B. T. U. per lb.

A practically uniform load was provided throughout the tests by means of water-cooled resistance. Condensation was removed from steam lines by a trap and steam used in the calorimeter was also weighed and deducted. Indicator diagrams and readings were taken every 20 minutes.

The steam for each test was generated by a separate boiler, no steam being used for auxiliary purposes. The steam pressure and vacuum were maintained as nearly as possible at the contract requirements to each test. Vacuum was produced by means of a central condensing system which carried the entire plant, and consequently the cost of producing the vacuum cannot be computed separately.

equipment does not occupy the entire space in the building, there being room for three additional boilers and one large engine unit, should the future requirements demand their installation.

The entire construction was accomplished under the personal supervision of Mr. W. A. Haller, resident engineer, representing Messrs. Sanderson & Porter.

**MONORAIL CAR SYSTEM.**

An experimental monorail system invented by Howard H. Tunis has been in operation in Baltimore, Md., for several months. The track, which is about one-fourth mile long, is of 30-lb. rail spiked to short ties. There is a light framework above the track through which the car passes and which is designed to maintain its equilibrium. The car has a capacity of 24 persons. The motive power is supplied by a small steam engine geared to the driving axle by means of a chain and sprocket wheels. The engine is located in one end of the car and is about 4 h. p. capacity. Oil is used as fuel. The car weighs about three tons and attains a speed of 8 or 10 miles an hour on the short curved track.

An important feature of the system on which a patent has been secured is the device which maintains the vertical position of the car. Two strips of wood extending lengthwise along the roof of the car are slightly curved towards each other at the ends and pass between spring blocks placed at such intervals in the overhead framework of the track structure that at least two pairs of blocks press against the guide strips at all times. Reduction in friction by the use of ball bearings, a single rail, and greased spring blocks are some of the claims of the inventor. It is said that a 16-mile road will be built in Virginia embodying the features of the experimental road.

The Delaware County & Philadelphia Electric Railway Co., Philadelphia, Pa., has placed vestibules on the fronts of its open cars.

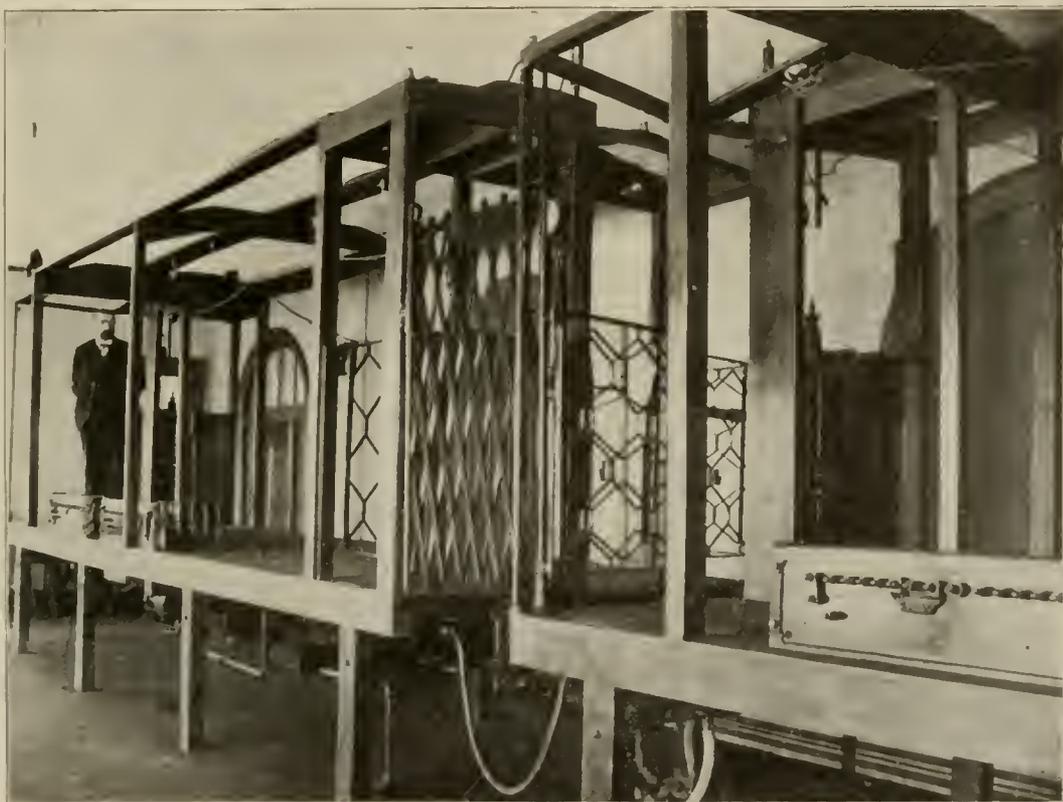

# The Employing, Training and Disciplining of Car-Service Employes of the Boston Elevated Ry.—II.

BY MAJ.-GEN. WILLIAM A. BANCROFT, PRESIDENT OF THE BOSTON ELEVATED RAILWAY CO.

One of the Boston Elevated Railway Co.'s devices for the instruction of men for the elevated service is a trainmen's school. The little establishment has excited an amazing amount of popular interest. It has been talked about, written about, lectured about, photographed and otherwise portrayed to such an extent that the management itself is now and again in danger of half believing that there is something remarkable about it.

It apparently strikes most persons as singular that men of mature years, of at least average intelligence and of physical soundness should be sent to school to learn the A, B, C's of a business before they are permitted to engage in it. Such, however, is the

ous objects of interest that are intended and expected to teach some extremely practical lessons that will prove useful to the students later in life. Along one side of the long narrow room in the Sullivan Sq. terminal, in which the school is domiciled, is a skeleton, three-car, dummy train fully equipped with every piece of apparatus and equipment essential to the running of an electric elevated train, except trucks. It is no toy model, but is to all practical intents and purposes, an anatomical exhibition of a train with the skin removed. The controlling apparatus, motors, air and hand brakes, couplings, and indeed, every piece of mechanism used on an actual train, is installed and is in working order.

SKELETON TRAIN IN SCHOOLROOM.

practice of this company in the case of men who enter its elevated train service.

The course of instruction for an elevated employe is quite different from that prescribed for a surface-car man for the reason that the duties are very dissimilar. The general principles, described in the November issue of the "Review," such as gradual instruction, thorough drill on the rules, and final examination and demonstration before full appointment, are alike in both branches of the service, but there the similarity ends.

Men assigned to the elevated division begin as brakemen, are in time promoted to be guards, and finally become motormen. For each of these positions in the school and the passing of examinations are required. Thus it happens that the company runs a graded school with pupils in several stages of advancement, and like some other schools, undertake to find immediate employment for all students who pass its examination tests and receive its certificate of proficiency in the prescribed studies.

The school is established in a bare-looking room, lacking the works of art and adornment that seem to be a usual part of the equipment of most educational institutions, but it contains numer-

Upon this train new men and candidates for promotion are shown the location, use and operation of the various devices. They learn how to connect and put a train in order to take out of the yard, how to operate it, how to give and how to respond to the various signals, what to do in emergencies, and how to lay up a train when it is hauled off the main line. It is not merely a matter of going through the motions. There is no make believe about anything except the motion of the train. When switches are cut in, the electric current is turned on. When the pumps are worked air is pumped into the reservoirs. When the air is thrown into the brakes they are set.

No man is permitted to assume the responsibilities of his position until he has been thoroughly drilled on the dummy train. It is not enough that a man knows all the duties, rules and general orders pertaining to his work, he must show that he understands their application. All instruction in the school and all examinations are given by the trainmaster, who is held accountable for the proficiency of every trainman appointed to the service. An absolutely perfect examination must be passed before the trainmaster certifies that a candidate is qualified for the service.

The examinations of brakemen, guards and motormen, are all dif-

ferent and consist of prescribed questions that are answered orally or by demonstration. The examination blanks now in use are substantially those adopted at the opening of the elevated lines last year. They are, however, considered somewhat unsatisfactory and are soon to be revised.

They are as follows.

EXAMINATION OF ..... BRAKEMAN NO. ....  
(FIRST EXAMINATION.)  
Give all bell cord signals. (306 to 311.)  
Where are light switches located, and what used for? (272)  
Give all whistle signals. (312 to 320)  
Give all hand, flag and lantern signals, and where you are liable to find them displayed. (321 to 330)  
What would you do if you found red flag or lantern on cable box between tracks?  
Explain what is meant by a yellow flag or lantern placed to right of track. (326)  
What is DANGER signal? (321)  
What is CAUTION signal? (322)  
What is CLEAR signal? (323)  
Whose duty is it to see that proper tail lights and lanterns are put on train when pulling out of yard in the morning?  
Whose duty is it to see that all tail lights and lanterns are removed from train when train is laid up for the night?  
If you found white light displayed what would it signify and what would you do?  
In case of an accident, however slight, what is your duty? (172 and 204)  
What are the rules regarding use of liquor? (1)  
What are the rules regarding use of tobacco? (1)  
When should you announce which way passengers should leave car? (G. O. 233)  
What are the guard's and brakeman's positions on car? (205)  
How should information be given to the public?  
How many persons will a car seat?  
What tail lights should be carried on a train? (211)  
What instructions have you received relative to civility to passengers?  
What would you do with articles found on the train or platform? (200)  
On what part of train are passengers forbidden to ride?  
What does the Board of Health require relative to spitting? (121)  
What action would you take if you observe passengers spitting?  
Where can parcels and bundles be carried on train? (197)  
What duties devolve upon the guard and brakeman at stations? (113 and 190)  
Are dogs allowed on train? (176)  
If train line hose burst, what effect would it have on train and what would you do? (302 and 303)  
When should full regulation uniform be worn? (181)  
Are peddlers allowed to sell articles on train or platform? (201)  
How long should you continue to flag a train? (179)  
What is a tardy miss—a three day miss? (185)  
How should stations and destination of trains be announced? (190)  
If reservoir hose burst what effect would it have on train and what would you do? (304)  
How should chains between cars be handled?  
When should the heaters be used?  
Where is the emergency valve and what is its use?  
Give the markers for all routes?

EXAMINATION OF ..... BRAKEMAN NO. ....  
(FOR PROMOTION TO GUARD.)  
If train line hose burst, what would you do? (302 and 303)  
If reservoir hose burst, what would you do? (302 and 303)  
Give all bell cord signals. (306 to 311)  
Where are light switches located, and what used for? (272)  
How would you call in north bound flagman? (317)  
What is an alarm? (319)  
Give all whistle signals. (312 to 319)  
Give all hand, flag and lantern signals, and where liable to find them displayed. (321 to 330)  
What would you do if you found red flag or lantern on cable box between tracks?  
Explain what is meant by yellow flag or lantern displayed to right of track. (326)  
How would you cut out brake if triple failed to act? (305)  
What is DANGER signal? (321)  
What is CAUTION signal? (322)  
What is CLEAR signal? (323)  
State difference between automatic block and interlock signals; position of arms and color of lights. (22 and 55)  
In case of an accident, however slight, what is your duty? (204)  
What would you do if block signal was at danger? (55)  
What would you do if your train parted? (33-A)  
What would you do if a signal failed at a station? (57)  
When should you announce by which way passengers should leave train? (G. O. 233)  
What are the guard's and brakeman's positions on train? (207)  
What instructions have you received relative to civility to passengers? (G. O. 235)  
What would you do with articles found on train or platform? (200)  
On what part of train are passengers forbidden to ride?  
When should the heaters be used?  
What does the Board of Health require relative to spitting? (121)  
What action should you take if you observe passengers spitting?  
What are the markers for the different routes? (331 to 356 inclusive)  
Where can parcels or bundles be carried on train? (197)  
How should chains between cars be handled?  
What would you do if you had to make an adverse movement? (216)  
Where is the emergency valve and what is its use?

EXAMINATION OF ..... GUARD NO. ....  
(FOR PROMOTION TO MOTORMAN)  
Where is platform switch and what is its use? (265)  
If train starts in rocking or jerking motion, what would you do? (287)  
In case main motor or reversers become disabled, what would you do? (287)  
On leaving platform, what would you do? (292 and 293)  
What would you do if you lost control of train? (295 and 312)  
If air compressor fuse blows on train, what would you do? (273)  
If air brakes failed to release what would you do? (305)  
If train line hose burst, what would you do? (303)  
If train reservoir hose burst, what would you do? (304)  
Where is the five-point switch and what is its use? (305)  
What are the RUNNING and OFF positions of handle of platform switch? (261)  
How would you prepare a train for operation? (221 and 276 to 281 inclusive)

Where and what are the three important switches with which you should be familiar? (265)  
Where are, and what, are pump governor and equalizer switches used for? (257)  
Where is train line fuse located, and what is the effect if blown? (271)  
Where and what is pilot motor switch used for? (268)  
How do you test relays and controllers on one or more cars? (290)  
How would you lay up a train? (295)  
Give all bell cord signals. (327 to 330 inclusive)  
In what position must brake valves be in cab? (298)  
What is LAP position? (264 and 281)  
Where is COAST position? (264)  
When would you reverse car? (255 and 280)  
What is relay line switch used for and where located? (267)  
Where are light switches located and what used for? (272)  
Where is train line switch located, and what is it used for? (269)  
How would you call in north bound flagman? (317)  
What is an alarm? (319)  
Give all air whistle signals. (312 to 319 inclusive)  
Give all hand, flag and lantern signals, and where liable to find them displayed. (321 to 330)  
When and to whom would you report defects or any unusual occurrence? (204)  
What would you do if you found red flag or lantern on cable box between tracks?  
Explain what is meant by a yellow flag or lantern displayed to right of track. (326)  
How would you cut out brake if triple failed to act? (305)  
If EMERGENCY valve were applied, what would you do?  
What is DANGER signal? (321)  
What is CAUTION signal? (322)  
What is CLEAR signal? (323)  
State meaning of different positions of signal arms and different colors of signal lights.  
In approaching junction of bridge, how should your train be moving? (364)  
Where stops occur at steep grades, what precautions are necessary? (300)  
In making station stops, describe proper use of air. (300)  
What have you been taught regarding automatic stop appliances.  
How do you distinguish an interlocking from a block signal, and why should you know the difference?  
What are the speed limits allowed at different points? (370 to 378)  
Where is the emergency valve and what is its use?  
With green flag or light ahead, how would you proceed? (323)  
If you found white light displayed what would it signify, and what would you do?  
If you found signal light out, what would you do? (244)  
In case of an accident, however slight, what is your duty? (204)  
What should you do in order to save power?  
Are you allowed to talk with any one while running your train? (232)  
What are the rules regarding use of liquor? (1)  
When leaving train at end of route what should you do with handles? (237)  
What would you do if block signal was at danger? (55)  
What would you do if your train parted? (33-A)  
What would you do if a signal failed at a station? (57)  
What are the markers for the different routes? (331 to 356)

When the "happy school days" are over the man who has been awarded a diploma, in the surface-car service, dons a blue uniform and becomes a part of the regular operating force of the company. He feels very sure that he knows how to perform his duties perfectly—and why should he not? His instructors, his examiners, and his own judgment have all pronounced him competent to handle a car, and yet the chances are that as between his clean new uniform and his clean new record the latter will undergo the earlier disfigurement. By the time the uniform becomes a little dingy its owner ordinarily does not need to consult a plan of the building in order to locate the office of his division superintendent, and when the time comes for the purchase of a second uniform we shall have a pretty fair railway man or he will have no need of a uniform.

When a man has passed the instruction period no pains are spared by his superiors to make him of the greatest possible value to himself and the company. If he fails to be successful it is because he either cannot or will not develop into one. The company does its utmost to thoroughly instruct new men, and it is equally painstaking in their subsequent development. It aims to perfect every man as fully as possible in all the details of the business, not only because it must have reliable men on the cars, but because it must find its future superintendents, inspectors and other officers among the men who today manipulate the controller and bell cord.

Every man brings a new problem to his superintendent. The problem is to make a capable operative out of the particular individual under consideration. The superintendent and his assistants are expected to find a solution, and not to "give up the answer" because it presents hard questions. It is their duty to see that all accepted men are made into good men, to see that good men are made better, and to see that the best men are recommended for promotion.

No two men are treated alike, except that they are treated fairly. Some men need only to be shown their error, others require severe lecturing, while still others need the infliction of punishment before they completely grasp the hard facts that rules are not mere suggestions but are orders to be obeyed implicitly. A man who is at fault because he did not know what to do is instructed. A man who knows what to do but is too indifferent to do it has his duty impressed upon him by the superintendent in language calculated to

make a lasting impression. A man who knows what the company requires in a given situation but chooses to do otherwise for reasons of his own is suspended for one or more days without pay. Suspension is a severe form of discipline and is imposed only for grave offenses.

The work of every man is watched and studied from the day he begins to run a car until his connection with the company is severed. It is no slight task to keep a watchful eye upon the conduct of 5,000 men who are performing their duties far from the observations of those who are held responsible for what they do, say, or omit, and yet the company manages to keep itself informed of what is going on most of the time. This is accomplished mainly by its inspection forces—in the surface division by the uniformed division street inspectors and the uniformed headquarters inspectors.

Each division is mapped off into districts and a street inspector is assigned to duty in each district and is held responsible, so far as possible, for the correction of mistakes, violations of rules and for report of defects that occur within the district. Whenever an inspector observes the slightest error in the conduct of a motorman or conductor he is required to board the car at once, or at the earliest possible opportunity, and to explain exactly what was

mistake or wrongful act pointed out and explained instantly, while every circumstance is in the mind of the offender. Inspectors explain, instruct, correct and report, but all matters of discipline are decided by the division superintendents and their superior officers.

Another corps of inspectors, who wear no uniform, supplements the work of the division inspectors. These men are selected and trained with the greatest possible care to observe and report upon the conduct of the men as it appears from inside the cars, in the same manner that the street inspectors observe from without. The only material difference in the work of the two classes of inspectors is that uniformed inspectors, who wear a badge of authority, are expected to instruct as well as report, while the ununiformed inspectors are expected to report only. The reports of these inspectors are of the greatest possible value to the management and to the men who perform their work well. The same system, so far as feasible, applies to the elevated division.

These two sets of inspectors furnish much of the information that enables the superintendents to deal with every man in accordance with his individual requirements. It is impossible for a division superintendent to be so intimately acquainted with every man under his authority as to know, as a matter of memory, the ten-

GENERAL VIEW IN TRAINING SCHOOL OF BOSTON ELEVATED RY.

wrong and what would have been right, and later to make a full report of the occurrence to the division superintendent for his information and guidance.

No inspector remains in any one district for many days at a time, frequent changes being made to enable the superintendents to compare and "size up" the different inspectors. If a certain inspector habitually finds but one or two things in a day calling for his action and the other inspectors find eight or ten things in the same district, superintendents very soon inquire, and, at least, suggest that the other men have better eye-sight.

Street inspectors are expected to observe and report upon everything affecting the service, but their greatest effort is exerted to prevent accidents due to negligent or otherwise improper conduct on the part of the men, such as the carelessness of conductors in giving bell signals and the failure of motormen to have the cars under perfect control when crossing streets or approaching vehicles or obstructions that prevent a clear view ahead.

As a result of recent efforts to increase the efficiency of the street inspection force in the prevention of accidents, both the number and proportion of such occurrences attributable to motormen and conductors have been greatly reduced. The plan is to have every

perament, merit and capability of each, and for this reason, among others, a ledger account is kept with every man that makes this information available whenever an employee is under consideration for discipline or reward. These records, if properly kept, are of the greatest value in the management of a large company, but they must be both enlightening and trustworthy or they will do more harm than good.

The method of book-keeping followed by this company is as follows: Every report or complaint concerning the conduct of the men is entered in full upon a daily journal with a statement of all pertinent facts bearing upon the incident. These items are then posted upon the ledger records of the men in cipher. These entries state the date, substance of the report, source of information and action taken. In the elevated division the card system is employed but otherwise the practice is uniform throughout.

The accompanying copy of the record of a motorman on the elevated division—which is a genuine record except as to name and number—illustrates the form used. The more common offenses are given cipher abbreviations of one or two letters. They are grouped under general heads, and each general class of misdeeds is assigned to a special column, so that a mere glance at the card, before

average motorman. The man "Jones" was capable of being a good motorman, but did not have his mind on his business. Had he not committed the unpardonable offense of using liquor he could not have lasted much longer unless he had mended his ways.

The foregoing illustrates to some extent the methods of the company in dealing with its men, but fails to show the pains taken to ensure justice in arriving at important decisions. In every case where severe discipline is contemplated the matter is carried higher than the division superintendent. Certain offenses have fixed penalties, as for example the missing of fares or giving of quick bells by conductors. For the first offense suspension for one day is imposed, for the second offense two days, and the third offense brings discharge, provided, of course, that these all occur within a short time. A motorman on the surface lines receives seven days' suspension for a first collision and for a second is discharged.

Whenever a man is charged with a serious offense he is called before the division superintendent and his statement, together with that of witnesses taken. The division superintendent recommends

Jones, Nathan J., July 16, 1901. Promoted from Guard 1890. Discharged April 11, 1902. Using Liquor.

the items are read, conveys a rough idea of the character of the work of the man whose record is being considered. Under another head check marks show the source from which the information was received. Under the last head upon the card will be found figures or check marks showing the action taken.

The card of the so-called motorman "Jones" tells at a superficial glance that it is the record of a heedless man, one who is not painstaking in his work, for the reason that most of the items are in columns 1, 6 and 7. Carelessness is a dangerous trait and not to be tolerated. It grows on a man like any other bad habit, as is well illustrated by this record. During the first six months "Jones" was suspended twice, once for failing to report an accident and once for releasing the air and allowing the train to start at a station. During the last three months he was suspended four times, once for being ahead of time, once for starting his train on one bell, once for showing incorrect markers, and once for running past a signal on the main line, for which he was suspended seven days. He was finally discharged for using liquor. Two months previously he had been charged with using liquor but had been given the benefit of a doubt.

A very bad record has been selected as an illustration of the way the records are kept and not because it is a typical record of an

whatever action seems to him to be expedient and sends all papers with his recommendation to the Superintendent of Transportation, who also calls in the accused and listens to all he has to say. He in turn reports to the Vice-President his findings in the case, and, if a discharge is recommended, the Vice-President reports the whole matter, giving his views to the President, who takes final action after reading all statements, recommendations and investigations, and, in some cases, giving a personal hearing to the man. In this way full justice is attempted to be done.

There is one case, however, in which this method is not followed. When a conductor fails to register fares which he has collected, he is discharged without notice. No other action is ever taken. He is inspected and investigated until all doubt is removed and is never warned or otherwise notified that he is under suspicion. Especial care is exercised that no mistake should be made and several men are in turn assigned to inspect his work with no knowledge that the conductor is to be watched with more than ordinary care; indeed, the inspector has no reason to suppose that the man's work is below the standard. A simple failure to register is apt to happen now and then under the closest inspection and his subsequent conduct governs the outcome. If the failure is repeated, he is discharged.

Perhaps what has already been said will give a general idea of the manner in which the company deals with the individual. At best it can be no more than suggestive of the many other means adopted to establish an individual relationship between every employe and the central office. The aim is to have every man feel that the management has a personal interest in him, that it is anxious to help him improve, that if he does well it is known and he receives credit, that if he does ill it is also known and he must take the consequences.

In dealing with the men collectively every effort is made to bring about an atmosphere of sympathetic and harmonious co-operation. One of the most successful methods employed for this purpose is the holding of meetings of a semi-formal nature for the discussion of operating problems. Twice each month Mr. Rugg, the Superintendent of Transportation, holds meetings of superintendents of divisions and departments. These meetings are opened with a talk by the Superintendent of Transportation upon some subject relating to division management, the improvement of the service, the interpretation of rules and other kindred themes. After his address an "experience meeting" is held in which all participate. At first the discussion usually centers upon the subject presented by Mr. Rugg, but after that is disposed of all sorts of subjects are brought up. Reports are made, advice is asked and given and ideas are exchanged.

Once a month a similar meeting of chief inspectors, and such other inspectors as choose to attend, is conducted by the Superintendent of Transportation and the same general programme is followed. Division superintendents also conduct meetings of inspectors and starters attached to their division and explain and discuss the affairs of the division. They also hold meetings of the car men at such times and places as will enable every man in the division to attend at least one meeting each month. In this manner the management, through its direct representatives, talks as often as once a month to every man directly engaged in handling traffic.

The company strives to show its interest in the welfare of the men in many ways and does all that is possible for their well-being. Among other things it pays among the highest wages in the country. Conductors and motormen on the surface lines receive \$2.25 per day for ten hours' work and are paid 30 cents per hour for overtime, 35 and 40 cents for snow-plow work. On the elevated lines brakemen, who are, of course, beginners, are paid \$1.80; guards are paid \$2, and motormen \$2.30 the first year, \$2.40 the second year and \$2.50 for subsequent service. The company never discharges a man except for cause, and endeavors to make the lot and life of its employes as comfortable as possible, often going far out of its way to do so. During the recent coal strike the company purchased 8,000 tons of coal to be distributed among its employes at cost, and many a house is warm today that would have been cold and wretched but for this action.

The lobbies at the car sheds are made thoroughly comfortable for the men. They are supplied with papers, magazines and other good reading matter at an annual expense of more than \$1,500. The toilet and sanitary arrangements are adequate and convenient. The

car sheds are business establishments and not clubhouses; nevertheless, the company endeavors to provide wholesome, attractive and comfortable quarters for its employes. The company pays the running expenses of two mutual benefit associations organized and conducted by employes. One of these associations pays to its members \$7.00 a week during sickness not exceeding ten weeks in a year, and \$1,000 on the death of a member. All of the payments for sickness and a portion of those for death are met by monthly assessments of 50 cents, and the remainder is raised by assessments of \$1.00 as needed. The annual cost of membership is about \$15.00. The other association is like the first, except that the payment at death is \$100, and there are no assessments except the monthly dues. The company assumes the cost of collecting and distributing the money, of keeping the books and other incidental expenses, so that every dollar contributed by the men is available for distribution. The contribution of the company for this purpose amounts to nearly \$7,000 annually. A very good band of music has been organized among the men and this is also supported by the company. Then, too, the company comes to the relief of men in individual cases of hardship. Efforts are constantly being made to make the men feel that the management is a friend and helper to every man who is loyal to the service and faithful in the performance of his duties. The President is accessible to every individual at all reasonable hours, and no person having legitimate business to present is ever denied an audience. If, for example, the men or any of them, conceive that some unnecessary hardship or inconvenience has resulted from the making of time-tables or the assignment of cars the President is always ready and glad to discuss the matter with individuals or committees, and make changes or adopt suggestions whenever it is feasible to do so.

#### MOLINE, EAST MOLINE & WATERTOWN RY.

The Moline, East Moline & Watertown Ry. was formally opened November 13th when an invitation trip over the line was made by a party of 150 persons, including the officers of the company, the municipal authorities of Moline, Rock Island and Davenport, and representatives of the Tri-City Railway Co. The party was conveyed in two cars, leaving Moline at 11:45, and an elaborate luncheon was served at the end of the route in the offices of the Union Malleable Iron Works.

The lunch was followed by speeches from the three mayors present, C. M. Stowe, secretary of the Union Malleable Iron Works, J. B. Blood, of Blood & Hale, of Boston, contractors of the new interurban, and J. F. Lardner, general manager of the Tri-City Railway Co.

The Moline, East Moline & Watertown Railway Co. was incorporated June 20, 1901, by Col. U. P. Hord and Frank Y. Keator, of Aurora, Ill., who secured the franchises for the six miles now built, and options on Campbell Island, which it is intended to make a pleasure resort. In April, 1902, the capital stock of the company was increased and Joshua Hale, of Boston, became interested, the organizers retaining their holdings, however.

The new interurban line has been completed for a distance of six miles, and will be extended 25 miles further. It runs from the manufacturing city of Moline, Ill., directly east, along the Mississippi, and with the river on the north and high bluffs on the south the scenery along the route is very attractive. The road is practically level, the only grade being less than 2 per cent. Within the city limits, 73 lb. girder rails, made by the Lorain Steel Co., are used where the track is straight, with 107 lb. rails on curves. The rest of the road is laid with 75-lb. T-rails. The road is single track, standard gage, with but one turnout. White oak ties, 6 x 8 in. x 8 ft. are laid 24 in. between centers; the overhead lines are carried on cedar poles. The work of constructing the track was begun in July and has been delayed by the heavy rain that have affected business in all parts of the State this season, and by the difficulty in obtaining labor.

The overhead wire consists of seven miles of No. 00 copper wire furnished by the John A. Roebling's Sons Co., and five miles of aluminum 76,000 c. m. feeder furnished by the Pittsburg Reduction Co.; the hangers were made by the Morris Electric Co.

The company now has four closed cars built by the John Stephenson Co., two 11 bench open cars from the Jackson & Sharpe works,

and a snow plow made by the Wasson Manufacturing Co. The closed cars, one of which is here illustrated, are 42 ft. long, 8½ ft. wide over the grip rails, and have a seating capacity for 44 passengers each. The cars are mounted on McGuire 39 A double trucks, with four G. E. 67 motors per car, geared for 25 miles per hour. Christensen air brakes and air whistles are used. The seats are of the Hale & Kilburn walkover type of rattan cross seats except in smoking compartment at the front end of each car, where the rattan benches are placed longitudinally to allow a greater aisle space. The cars are equipped with electric push buttons and incandescent electric lights, and are handsomely finished in mahogany and bird's-eye maple. The exterior is painted maroon and cream.

The Moline, East Moline & Watertown Railway Co. rents its power from the People's Power Co. of Moline, for the present, but is preparing to erect its own plant this winter. Plans and specifications have been completed for a new car house which will have a capacity for storing 24 cars, the cars being housed at present in temporary quarters on 2d St., where the general offices are also located. Work on the new car house will soon be under way.

The company's officers are: Charles Deere, proprietor of the Deere Plow Co., of Moline, president; U. P. Hord, of Aurora, Ill., vice-president; Fred W. Rank, secretary; L. D. Taylor, treasurer, and Blake A. Mapledoram, of New York, general manager and chief engineer. The contract for the road was awarded to Blood & Hale, engineers, of Boston, and the road was constructed under the supervision of Mr. Mapledoram as chief engineer, who will continue with the road as general manager. Jerome Applequist, of Rock Island, Ill., was in charge of the engineering corps; F. L.

STANDARD CLOSED CAR, MOLINE, EAST MOLINE & WATERTOWN RY.

Mapledoram was general foreman in charge of construction, and J. C. Hoffman, master mechanic.

Campbell's Island, situated in the Mississippi River opposite Watertown and containing some 230 acres of oak and hickory lands, is owned by the railway company, and extensive preparations are being made to improve this property as a site for a popular summer resort. The island will be rendered accessible by a steel trestle 800 ft. long over the government dam, which latter is 40 ft. in width. The company will build the trestle 6 ft. above the present dam height to avoid high water and will thus be able to convey crowds to the island at all seasons of the year without difficulty. A summer hotel and several pavilions, and a mile race track are projected, as well as the usual attractions such as golf links, tennis courts, baseball grounds, and theater. The company has already secured one of the electric fountains in use at the recent Charleston Exposition and this will be installed at Campbell's Island in the spring. The island is surrounded by shelving, sandy beaches, and bathing and aquatic sports will be among the principal attractions. A considerable force will be employed this winter in clearing the island and accomplishing the preliminary work for the installation of the resort features. The limestone found on the island is of good quality for ballast in track construction, and the company has its stone crusher on the island crushing stone for this purpose.

The rapid growth of Moline as an industrial center and the corresponding development of the contiguous territory is sufficient to assure the success of the new interurban and the company will undoubtedly enjoy a heavy patronage from the three cities to its proposed recreation ground at Campbell's Island.

## Street Railway Park Development.

Summary of Street Railway Park Attractions in Various Parts of the Country.—Suggestions to Managers Who Contemplate Opening Parks.—The Most Desirable Kinds of Entertainment.

There is no longer any question as to whether street railway parks and special entertainments are of value in stimulating street railway traffic as the desirability of establishing such parks is affirmed by the large number of street railway companies which have undertaken this branch of business within the last few years and have almost invariably found it to be satisfactory from a financial standpoint. The questions, however, of the manner in which such resorts should be conducted, what style of entertainment should be furnished, whether the park should be managed by the street railway company or by an independent company, etc., are ones not so easily answered for the reason that conditions vary very widely in different localities. With a view of answering these questions the experience of a large number of managers of street railway parks is given herewith.

In the following paragraphs are presented recent data concerning the parks operated by various railway companies, which will prove of interest and value to others who operate pleasure parks or are contemplating having them next season.

### THE WESTERN OHIO RY.

This company operates McBeth Park, located three miles from Lima, O., the headquarters of the company. At this park there are a theater with seats for 700 persons, a dancing floor, bowling alleys and boating facilities. The manager of the park, Mr. F. D. Carpenter, advises that the best paying attractions have been a good class of vaudeville and comic opera. Besides dancing, boating and bowling, the park has been popular for society and church picnics. For the coming season the company expects to add other features.

### GRAND RAPIDS, HOLLAND & LAKE MICHIGAN RAPID RY.

The company operates a park which is in charge of Mr. Charles Floyd, traffic agent, of Holland, Mich. Mr. Floyd writes us that the company contemplates furnishing complete attractions for the summer months, and is desirous of securing remunerative entertainments for next season. Last season vaudeville, boat races and yachting carnivals proved to be very popular.

### PEOPLES' GAS & ELECTRIC CO., DEFIANCE, O.

The company owns Island Park, two miles from Defiance, which is leased to the Island Park Co., W. P. Engel, manager. There is a theater, seating 600 people, at the park, and also a merry-go-round, a 1-3 mile track, ball grounds and facilities for bathing and boating. The best paying attraction is vaudeville, which must be of the first class, however. The Maumee Chautauqua Association meets at the park July 10th to August 10th each year.

### CLEVELAND, ELYRIA & WESTERN RY.

The company owns Puritas Springs Park, 10 miles from Cleveland, which is leased to J. E. Gooding. This park is some 30 acres in area and has been operated for two years, the amusements comprising dancing, in both hall and grove, merry-go-rounds for children, etc. No liquor is permitted on the grounds.

### ELGIN, AURORA & SOUTHERN TRACTION CO.

This company operates River View Park, three miles south of Aurora, Ill., the headquarters of the company. The park management is in charge of the traction company. While the park has "chutes for shooting," swings, tennis courts and boating facilities, Mr. F. M. Zimmerman, manager of the company, advises us that dancing and base ball are the amusements that have proved to be the most remunerative.

### FOND DU LAC STREET RAILWAY & LIGHT CO.

This company has on its railway line Lake Park, 1½ miles from the center of Fond du Lac, Wis., which is a city park under the city park board. At the park various attractions are provided, such as moving pictures, band concerts, "chutes," swimming school, fireworks, etc. When there is something special offered at the park the railway company furnishes a 2½-minute car service.

### MADISON (IND.) LIGHT & RAILWAY CO.

The company owns and operates Beech Grove Park, two miles west of the center of Madison, which is under the management of Mr. C. R. Johnson, Jr. There is a theater seating 300 persons, and there are arrangements for base ball, bowling and dancing.

### SAGINAW VALLEY TRACTION CO.

The company owns and operates Riverside Park, three miles from Saginaw, Mich., which is managed by Mr. John E. MacCarthy. At the park is a theater seating 1,300; other attractions are roller coaster, boating, shooting gallery, merry-go-round, zoo, swings. Vaudeville is pronounced to be the most remunerative special attraction.

### CAMDEN INTERSTATE RAILWAY CO.

This company, with headquarters at Huntington, W. Va., operates three parks which are under the management of the superintendent of the company. These parks are: Clyffeside Park, half way between Ashland and Catlettsburg, in Boyd County, Ky.; Camden Park, four miles from Huntington, W. Va.; Beechwood Park, in Minton, O. At Clyffeside, which has been described in previous issues of the "Review," is a theater seating 2,000 persons. Stock companies are reported to be the most remunerative theatrical attractions. In addition to the theater there are at the parks boats, swings, picnic and ball grounds. Afternoons and evenings orchestras are provided.

### TRI-CITY RAILWAY CO.

The parks owned and operated by the Tri-City Ry., of Davenport, Ia., and Rock Island and Moline, Ill., are described elsewhere in this issue. The restaurant and amusement privileges at Watch Tower Park, 3 miles south of Rock Island, are leased to John P. Newburg, and those at Prospect Park, 3½ miles south of Moline, are leased to C. S. Brown. The attractions comprise band concerts, dancing, balloon ascensions, moving pictures and other free shows.

### CINCINNATI TRACTION CO.

Three direct lines of cars of the Cincinnati Traction Co. reach the Zoological Garden in that city, which is practically controlled by the Traction company. The garden, by way of additional entertainment, has exhibits of trained animals, fireworks displays, and a concert season from June 1st to September 15th, concerts being given afternoon and evening. The garden is three miles from the center of the city.

Mr. Walter A. Draper, secretary and business agent of the Cincinnati Zoological Co., writes as follows in regard to the operation of the garden: "The Zoological Garden of Cincinnati, operated by the Cincinnati Zoological Co., which is in turn controlled by the Cincinnati Traction Co., was founded in 1873 and opened to the public in 1875. The garden has always been conducted as a public institution, some of the city's best and foremost men having been and still being on the board of directors. Even though it is now practically owned by the Cincinnati Traction Co. it is operated not for profit, a by-law of the company providing that no dividends can be declared from the net earnings of the company, but that all

money made must be expended in improvements and additional animals. The garden has always ranked foremost among zoological gardens of this country and Europe and has a reputation abroad that is quite enviable. Since the present owners took control in the early part of 1902 a large sum of money has been expended in the construction of new buildings, the addition of thousands of dollars' worth of animals and the beautifying of the grounds. The plans are now ready for the building of a new herbivora to cost between \$50,000 and \$75,000. The garden has an area of 45 acres and in addition to the animal buildings and enclosures the landscape gardening and botanical displays are notable, while there are in the garden specimens of practically every tree native to this country or foreign that will grow in this climate. This last feature is an additional cause for the visit to the garden every spring of all the children of the public schools of Cincinnati for the purpose of studying the animals, flowers and trees. The prices of admission to the garden are 25 cents for adults and 10 cents for children."

The other officers of the company are: W. Kelsey Schoeff, president, and S. A. Stephan, manager.

#### PENNSYLVANIA & MAHONING VALLEY RY.

The Pennsylvania & Mahoning Valley Railway Co., of New Castle, Pa., operates Cascade Park, three miles from New Castle, which is managed by Mr. Perry Barge. There is a theater of 2,000 capacity at this park, and the company reports that high-class vaudeville is the most remunerative of the theatrical attractions. There are also toboggan slides, a "laughing gallery," merry-go-round, etc., and facilities for dancing, boating and bathing. This park was described at considerable length in the "Review" for December, 1897, page 815.

#### HIGHLAND GROVE TRACTION CO.

This company, which has headquarters at McKeesport, Pa., owns and operates Highland Grove Park, three miles from McKeesport. This is managed by Mr. T. H. Bowman. The car ride to the park is attractive, as the road leads most of the way around the brow of the hill overlooking on one side the Monongahela River and on the other the beautiful Crooked Run Valley. From Observatory Point at the park one can see for miles in all directions, the view including the Monongahela Valley from McKeesport almost to Pittsburg. Homestead, Braddock, Duquesne and McKeesport lie just beneath. Other scenic attractions at this park are what are known as the Diamond Caverns, Old Mines, Brown's Peak and East Duquesne Canyon. Among the improvements are dancing pavilions and refreshment stands.

#### NASHVILLE (TENN.) RAILWAY CO.

The company operates Glendale Park, six miles from Nashville, which is under the management of Mr. Yeatman C. Alley. The company has built a casino theater seating 700 persons and finds vaudeville and opera to be the most remunerative attractions.

#### DAYTON (O.) & XENIA TRANSIT CO.

The company owns and operated Lucas Grove Park, which is located on the company's interurban line, 13 miles from Dayton and 5 miles from Xenia. This park is under the management of Mr. A. W. Anderson, superintendent of the transit company. The most popular attractions have been found to be Sunday afternoon band concerts, and the concerts and dancing on certain evenings of the week. Boating is also popular.

#### CLEVELAND ELECTRIC RY.

The Cleveland Electric Railway Co. operates no park or other pleasure resort. During the past summer the company advertised the city parks on its lines by contributing liberally to the expenses of Sunday concerts and religious gatherings in them, and by means of cloth banners on the fronts of its cars. Mr. H. J. Davies, secretary of the company, writes us that the company made special rates for public school picnics in the parks, provided the special tickets were used on regular cars during certain hours, when travel was light. He also says: "The advertising probably cost us more than we received directly as a result of it, but we hoped to cultivate a

habit on the part of the people to visit the city's parks and boulevards, and to induce the people residing on our lines to get up little family picnics, school picnics, society picnics, etc., in the parks, any of which could be reached for a single fare. The hauls were short, and we tried to direct the business into the dull hours, and to do it without running extra cars."

For the purpose of working up this business, the company employed for six months, from May 1st to November 1st, Mr. J. W. Butler, who has for many years done an excursion business for the steam railroads. No plans have been made for next year.

#### MARSHALLTOWN LIGHT, POWER & RAILWAY CO.

The Marshalltown Light, Power & Railway Co., operating a 3½-mile electric system at Marshalltown, Ia., a city of 12,000 inhabitants, is making preparations to equip and improve a summer outing park located a mile east of the present terminal of its lines. The tract of 60 acres is practically an island in the river, being connected to the mainland by a narrow neck which will be excavated so that the river will be navigable on either side of the park. The park is not owned by the street railway company, but by a corporation of citizens who have entered into a contract with the management of the electric road by which the latter will extend its line to accommodate park traffic, and will furnish attractions such as concerts, vaudeville shows, etc., in the pavilion which it is proposed to erect on the park site. Communications will be made between the main land and the park by electric boats; bathing will be one of the principal attractions, the island being surrounded by shelving, sandy beaches, and it is also proposed to lay out ball grounds on the island, which during the season should attract many people to the games. The company has practically completed a mile of new track connecting its lines with the island.

At present the street railway lines in Marshalltown are laid with 40-lb. T-rail, but it is expected to double track a part of the line in the spring and to lay 60-lb. T-rail for a distance of several city blocks. The company will also purchase several additional cars. It now operates eight cars.

The company operates a 90-kw. generator which has run daily with the exception of one single day for the last 10 years.

#### URBANA & CHAMPAIGN (ILL.) RAILWAY, GAS & ELECTRIC CO.

This company operates West End Park, located about a mile from the center of Champaign, at which is a theater with capacity for 1,000 persons. The park manager, Mr. H. J. Pepper, states that comedy and vaudeville have proved to be the most remunerative entertainments.

#### DAYTON (O.), SPRINGFIELD & URBANA ELECTRIC RY.

The company owns and operates Tecumseh Park, which is located 12 miles from Springfield and 15 miles from Dayton. The park is under the management of Mr. R. Emery, general manager, and Mr. R. K. Howard, general superintendent, of the railway company. The attractions that have proved most popular and remunerative are dancing, baseball, boating and bathing.

#### OTTUMWA TRACTION & LIGHTING CO.

Mr. J. F. Springfield, general manager of the Ottumwa Traction & Lighting Co., of Ottumwa, Ia., writes under date of December 11th that this company has made some improvements in the line of a park and hopes to have one in operation next season. No decision has yet been made as to the attractions that will be provided.

#### WHEELING (W. VA.) TRACTION CO.

In reply to our inquiry, Mr. C. E. Flynn, general manager of the Wheeling Traction Co., writes us as follows:

"We have no pleasure park of our own, and the only thing that we have in the way of an attraction is the Moundsville Camp Ground, which is located on the Moundsville division of the Wheeling Traction Co.'s system, about a mile and a half from Moundsville and about ten miles from the center of Wheeling. The camp ground is the property of the Moundsville Camp Ground Co., which

is a Methodist organization, and during the summer months revival meetings, etc., are held, at which there is a large attendance. The company has quite a large building in which the meetings are held. There are also a number of cottages which are used by the members of their company and others during the months the services are held. We make a reduction of fare between Wheeling, Benwood, McMechen and Moundsville, the camp grounds being located between the last mentioned towns.

"The different railway companies that I have been connected with in the past have either owned or operated pleasure resorts to a greater or lesser extent. My experience has been that it does not pay railway companies to operate pleasure resorts, as it takes all or more than the income derived from it to pay operating expenses of the resort, and all there is left is the profit from transportation of persons to and from the resorts. The two resorts owned by the railway company with which I was last connected gave us considerable trouble; I found it better to lease the pleasure resort property to some outsider for a nominal amount, and let him reap whatever benefits he could, and in that way we were rid of the annoyance, disappointments and expense of that work, while we still retained the profits accruing from transportation.

"In my opinion a park is a good thing for street railway companies to let alone as far as the operation goes, but I think it is a good plan for a railway company to own property somewhere along its lines and place a few buildings on it, such as a dancing pavilion, ice-cream pavilion, restaurant and possibly tennis courts and baseball grounds, if the property is large enough. A merry-go-round I consider the best attraction, but these can be obtained at any time from people who own them and want to place them on the grounds on a percentage basis."

#### THE STARK ELECTRIC RAILWAY CO.

The Stark Electric Ry., with headquarters at Alliance O., has just begun operation and is planning to open next season a park 2½ miles east of Alliance.

#### PARADE OF ROLLING STOCK AT EVANSVILLE, IND.

The Evansville (Ind.) Electric Railway Co. celebrated Thanksgiving Day by a street parade of its rolling stock, making a display of the various types of cars, ancient and modern, which the company has used at different periods. The object of the parade was two-fold, first to give the public a forcible demonstration of the improvements that have been effected since 1892 when the road was operated by mules, and second, to increase the revenue.

The cars appeared in the following order: Closed car drawn by a single mule, 5-bench open car drawn by a single mule, 5-bench open car with team of two mules, 7-bench open electric car, single-truck closed car, open and closed cars of later equipment, 12-bench double-truck open car, double-truck closed car with vestibules.

The parade was a success in every way, and Mr. H. D. Moran, vice-president and general manager of the company, writes us that in addition to increasing the revenue for the day about \$200 the moral effect was good, giving the public an excellent idea of the improvements made recently and augmenting the general friendly regard in which the company is held.

The parade was freely advertised for several days before Thanksgiving, only one street, for a length of a few blocks, being indicated, and despite the very inclement weather at least 5,000 persons congregated to witness the display. When the company receives the new rolling stock now ordered, it will probably introduce the additional equipment to the public in another parade.

#### INDIANAPOLIS TRACTION & TERMINAL CO.

It is considered certain that on December 29th the Indianapolis Traction & Terminal Co. and the Indianapolis Railway Co. will act favorably upon the proposition made by the former company to lease the property of the latter for a term of 30 years. The agreement is as follows: "When the agreement is signed a dividend of 1 per cent. will be paid, and after July 1, 1903, the yearly rental will be 3, 4, 5 and 6 per cent. for four years respectively and 6 per

cent. thereafter. The stockholders will receive a bonus of \$1,500,000 in stock of the new corporation. The new company will have an issue of \$5,000,000 stock and \$5,000,000 bonds."

The Traction & Terminal Company has purchased a site at the northwest corner of Market and Illinois Sts. (which is midway between Monument Place and the state capitol, and only one square from each) and will expend \$1,000,000 in erecting a building which will be used as a union station for the numerous electric interurban railways entering the city, with waiting rooms and freight depot and offices for the railway companies and others interested in the railway or railway supply business. The office building is to be from 9 to 13 stories in height. Adjoining the station will be storage yards for cars.

#### DENVER CONTEMPT CASE.

The conflict between the executive and legislative and judicial authorities in Denver has assumed a serious aspect for the representatives of the first named branches of the local government.

November 14th last the district court issued an injunction to restrain the city council and mayor of Denver from passing or approving a street railway franchise ordinance then pending "unless it should be modified in certain particulars fully set out in the restraining order of the court."

On November 15th the board of aldermen passed the ordinance, which was later approved by the mayor. November 18th the eleven aldermen voting in favor of the ordinance, and on November 20th the mayor also, were cited for contempt of court. By agreement the only answer made was to allege the want of jurisdiction of the court, and on December 6th the twelve defendants were sentenced to four months' imprisonment. A stay of ten days was granted to permit application to be made for a writ of supersedeas.

This action of the court is believed to be contrary to all precedents, which are to the effect that the judiciary in this country may not exercise control over legislative bodies.

#### OSKALOOSA (IA.) TRACTION & LIGHT CO.

The Interurban Construction Co., Ottumwa, Ia., is engaged in building the electric road and power plant of the Oskaloosa Traction & Light Co., which has acquired the chief interests in the Oskaloosa Light, Heat & Power Co. The officers of the new company have not yet been elected, but it is understood that the officers of the Interurban Construction Co. are principally interested. Since October 15th 4¼ miles of track have been completed and engines and electrical machinery are now being installed. Boilers have been installed and the city wired for electric lights. The alternating system will be used. A heating plant is also being installed. It is expected that a part of the system will be in operation by January 1st. The officers of the construction company are: Harry E. O'Neill, Omaha, president; Samuel Mahon, Ottumwa, vice-president; Calvin Manning, Ottumwa, treasurer; J. B. Sax, Ottumwa, Sumner Wallace, Rochester, N. H., Gurdon W. Wattles, Omaha, directors. John F. Springfield, secretary and general manager, Ottumwa, Ia.

#### MANHATTAN ELEVATED LEASED.

It was announced November 26th that the Manhattan Railway Co., of New York City, had arranged to lease its property to the Interborough Rapid Transit Co., which is to operate the subway now being built. The lease is for 999 years beginning April 1, 1903. The rental from April 1, 1903, to Jan. 1, 1906, will be the net earnings of the Manhattan company, not exceeding, however, 7 per cent. After the latter date the rental will be 7 per cent per annum on the stock of the Manhattan Railway Co., guaranteed by the Interborough Rapid Transit Co. The Manhattan company will increase its stock at once from \$48,200,000 to \$55,200,000 for the completion of improvements. The ultimate increase will be to \$60,000,000. The Interborough company will pay \$10,000 per annum to keep up the organization of the Manhattan company in addition to the dividend paid to the stockholders.

The Cincinnati, Milford & Loveland Traction Co. has purchased the Cincinnati, Milford & Goshen Traction Co. The stock of the latter road will be retired.

## New Shops for the Chicago City Ry.

In the "Review" for April, 1902, page 207, was published an illustrated description of the car house built by the Chicago City Railway Co. at 77th St. and Wentworth Ave. Adjacent to this car house there have been erected extensive shops to which has been transferred the equipment formerly at the 21st St. shops of the company.

When fully equipped this plant will constitute one of the finest street railway shops in the country. We are indebted to Capt. Robert McCulloch, general manager, and Mr. Richard McCulloch, assistant general manager, for data and the accompanying drawings. The plant is in charge of Mr. M. O'Brien, master mechanic, who,

being enameled brick of dark color. The rooms are about 40 ft. high, well lighted and ventilated and very attractive in appearance. The floors of both rooms are on the same level and are of cement. The roof is of terra cotta tile and is supported by steel trusses. The chimney, built by the Alphons Custodis Chimney Construction Co., of Chicago, is 150 ft. high and has an 8-ft. flue. The brick used in the construction are curved to a radius from the center of the chimney, the radii changing at each 16 ft. in height.

Power is generated for operating the shops only, but by suitable emergency switches may be turned onto the car lines, or, power from the lines may be used for operating the shops. The equipment

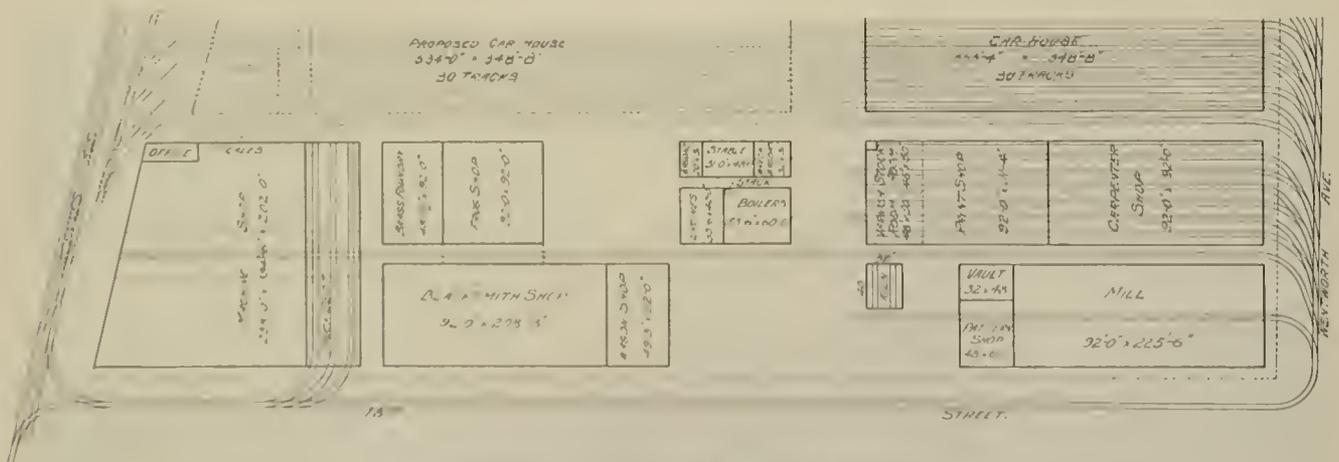

VIEW OF CHICAGO CITY RAILWAY SHOPS.

with Mr. H. B. Fleming, was responsible for many of the features in the arrangement of the tools and power transmission system.

The general view shown herewith is of the southwest corner of the shops at 78th St. and Vincennes Road. The shops extend east to Wentworth Ave., and along Wentworth Ave. to 77th St., occupying the whole block excepting a space at the northwest corner which is reserved for an additional car house.

The buildings are all substantially constructed of red brick with structural work of steel and timber, and are of the most approved modern style; they are of pleasing appearance and well adapted to the purposes for which they were built. The plan of the shops shows the general arrangement of the shop buildings and their rela-

tion to the car barn. There are three Babcock & Wilcox water-tube boilers, each having 144 4-in. tubes 18 ft. long and two 42-in. drums 20 ft. 4 in. long, built to carry 160-lb. pressure and rated at 300 h. p. These are equipped with Babcock & Wilcox automatic stokers. The coal used is run of mine and is received from cars into a storage cellar beneath the power house, from where it is carried by a conveyor made by the Link-Belt Machinery Co., of Chicago, into three large bins having a total capacity of 140 tons located near the top of the boiler room. It is then delivered to the stokers through chutes as shown in the sectional view herewith. Adjacent to the coal bins is a large shavings bin, which receives the

GENERAL PLAN OF CAR HOUSE AND SHOPS.

tion to the car barn. There is one track entirely surrounding the plant, from which all the tracks leading into the various shops and car house branch

### POWER HOUSE.

The power house, a longitudinal section of which is shown in one of the line drawings, is located near the center of the plant and occupies a ground space 53 ft. 6 in. wide by 100 ft. long. The building is a fireproof structure of red brick and is divided by a wall into a boiler room and a generating room. The interior walls are finished in pressed brick, the lower courses to a height of 5 ft.

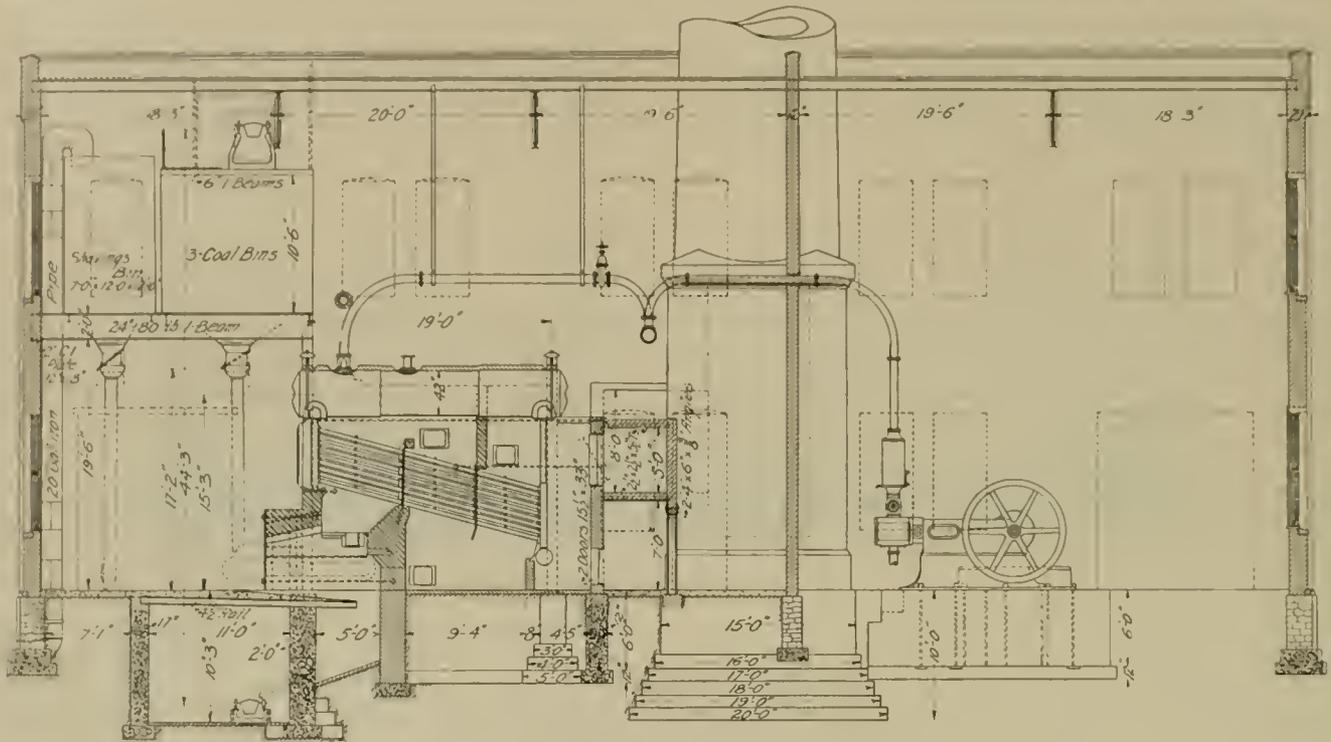

shavings from the wood shop through a 20 in. galvanized iron pipe. The coal conveyor is used to remove the ashes from the ash pit to a suitable tank over the track, from which it is loaded into cars by opening a valve provided for that purpose.

Water is supplied the boilers from the city mains by means of a Worthington Duplex pump. The steam piping is well designed and it will be noted from the sectional view of the power house that the mains are curved to a long radii. Each branch leading to the engine is supplied with a "Direct" separator.

The equipment of the generating room consists of two 300-h. p. Ideal engines, made by A. L. Ide and Sons, Springfield, Ill., and

designed to run at 200 r. p. m. under a steam pressure of 120 lb. These engines are direct-connected to Western Electric multipolar 500-volt generators, type L 734, of 200 kw. capacity. The engine exhaust may be used for heating feed water, or supplying heat to the heating system, or may be discharged into the atmosphere as desired.

main entrance is on Vincennes Road. The offices of the master mechanic and clerks are in the northwest corner of this building on the ground floor. The interiors are handsomely finished in hard woods. Both floors of this shop are of heavy tongue and grooved yellow pine spiked to beveled floor strips imbedded in six inches of cinder concrete. The doors of this shop as well as those of all

LONGITUDINAL SECTION THROUGH POWER HOUSE.

The switchboard, which is of slate, is of neat design, occupying one end of the generating room. The voltmeters are mounted on swinging brackets. The three panels are supplied with the usual meters, circuit-breakers, switches, and other apparatus for the complete control of the current. The feeder panel contains 12 double pole, 300 ampere switches. The feeders, which are all duplex, rub-

the other shops and car houses are of the Kinneer rolling type, furnished by the Kinneer Manufacturing Co., of Columbus, O.

One of the illustrations shows a cross-section through the east end of the shop. The roof trusses and supporting columns are all of structural steel. The second floor is principally of I beams and concrete, upon which the flooring of yellow pine is laid. This

WOOD-WORKING DEPARTMENT.

ber insulated copper, and encased in lead, run through underground conduits to the various buildings.

MACHINE AND REPAIR SHOP.

The imposing structure in the foreground of the general view of the works is the machine and repair shop. The building is a two-story structure having a ground area 238 ft. 5 in. by 202 ft. The

floor is designed to support a load of 250 lb. per sq. ft. The shop consists of five bays running lengthwise of the structure, each 40 ft. in width, the center bay being open through the second floor and providing for the use of the 5-ton electric traveling crane installed by the Whitney Foundry Equipment Co., of Chicago. The roof over this bay is of the monitor type and is covered with heavy wire glass. The roof over the side bays consists of 2 x 6-in. tongue

and grooved flooring overlaid with five layers of "Cincinnati" wool felt, having 100 lb. of cement to 100 sq. ft., and a cap sheet covered with tar and gravel. The coping is of vitrified tiles. There are numerous skylights, which, together with the large window space, make it a remarkably well-lighted shop.

Suspended from the second floor on each side of the shop is a cement sub-floor about 10 ft. wide and 55 ft. long surrounded by an iron railing. On one of these is located a row of water closets and

needed. An axle rack worthy of note is constructed of a framework of wood, having iron rods across for the support of the rows of axles. A single rack contains 350 axles, any one of which may be removed without disturbing the others.

On the second floor are located the tin shop and the armature department, both of which are fully equipped with the usual appliances necessary for the expeditious handling of these lines of work. There is also a large fireproof vault for the safe keeping of inflam-

INTERIOR OF PAINT SHOP.

BAY IN MACHINE SHOP.

on the other a row of enameled iron wash stands supplied with hot and cold water for the use of the men. The entrance is by the main stairways at the side of the building or by the winding stairs shown in the sectional view. This arrangement is unique.

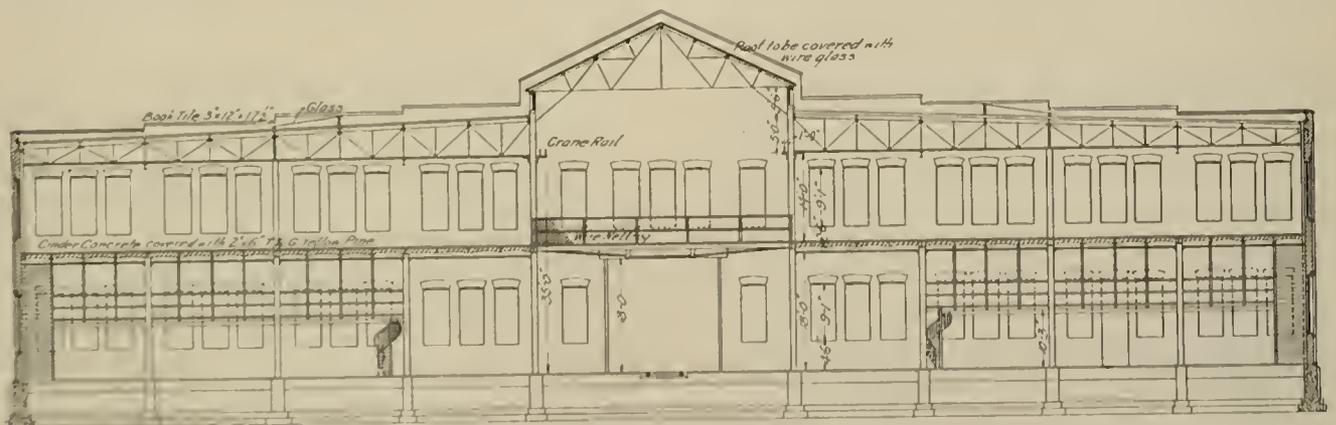

On the ground floor is located the bulk of the machinery, including axle lathes, boring mills, wheel press, etc. In addition to the equipment transferred from the 20th St. shops the following new machines have been added: One 26 x 48-in. 14-ft. McCabe double lathe; one 22-in. x 6 ft. Flather lathe; one 36-in. Bennett & Miles vertical boring mill; one 36 x 36-in. x 10 ft. Gray planer; one 36-in. W. E. Gang radial drill. These machines are driven by counter-shaft belts from three line shafts, which are driven by independent General Electric motors located near the ceiling of the first floor.

The tool room, where all small tools are kept in repair and dealt out, is located near the center of the shop. A new 14 in. x 4 ft.

mable materials. Two of the large heating units to be mentioned later are installed on this floor.

BLACKSMITH AND FROG SHOPS.

Across a 20-foot alley from the machine shop is a large building including the blacksmith and frog shops and the brass foundry. An idea of the general structure may be obtained from the sectional view. The roof trusses and other structural work are of southern yellow pine. The floors are of cinder. The roof covering is the same as that of the machine shop. The blacksmith and frog shops have three bays each; those of one shop being at right angles to the other. The roof of the center bays is of monitor construction and is covered with wire glass. The west end of the blacksmith shop is given up to iron stock and coal. Conveniently located are eight Buffalo down-draft forges, a large combined shears and punch, a 500-lb. steam hammer, a small helve hammer; in addition to these

SECTION THROUGH MACHINE SHOP.

Flather tool room lathe has been added to the former equipment. An up to date system of checking for tools is used.

Two large platform elevators are in operation between the two floors. The east end of the ground floor is provided with three track pits extending across the shop for convenience in making repair to trucks. A section of one of these pits is shown here with. A prominent feature is the systematic arrangement of the machines, allowing ample space between them for the handling of material. Provision is made for the storing in racks and bins of numerous castings and other supplies close to where they will be

are a 1,500-lb. Bennett & Miles steam hammer; a 1 1/2 in. Ajax bolt header; a large Ajax forging machine; a Williams & White punch having a 30-in. throat, and an 80 lb. Bradley helve hammer, all newly installed.

In the frog shop are a large combined shears and punch, a cold saw, a rail bender, and a new 36 x 36 in. x 17 ft. Gray planer.

BRASS FOUNDRY.

The brass foundry, which is located in one angle of the blacksmith and frog shops and under the same roof, is a model for neat-

**B. E. SUNNY.**

Prominent among the men identified with the practical and commercial development of electricity to whom we are indebted for the present commanding position of America in this industry, is Mr. B. E. Sunny, of Chicago, western manager of the General Electric Co., whose connection with the electric field began at a time when it included little besides telegraphy.

Mr. Sunny was born in Brooklyn, N. Y., in 1856, and commenced his business career as a telegraph operator for the Atlantic & Pacific Telegraph Co. in New York City where he was located from 1873 to 1875. In the latter year he came to Chicago in the service of the same company and was made successively night manager and manager of the Chicago office until the Atlantic & Pacific company was merged by the Western Union. In 1878 Mr. Sunny was appointed superintendent of the Bell Telephone Co. in Chicago, and in 1882 was made superintendent of the Chicago Telephone Co. which was a consolidation of the Bell company and the American District Telegraph & Telephone systems. He remained in the service of the Chicago Telephone Co. until 1887 when he resigned to accept the presidency of the Chicago Arc Light & Power Co. in which position he remained for three years during which time the business attained a very satisfactory growth. He then became the

B. E. SUNNY.

western manager of the Thomson-Houston Electric Co. and in 1892, on the consolidation of the Thomson-Houston Electric Co. with the Edison General Electric Co. he became western manager of the new company—the General Electric Co. The territory under his management now includes eleven states, from Lake Superior to the Gulf of Mexico, and from Michigan to Montana.

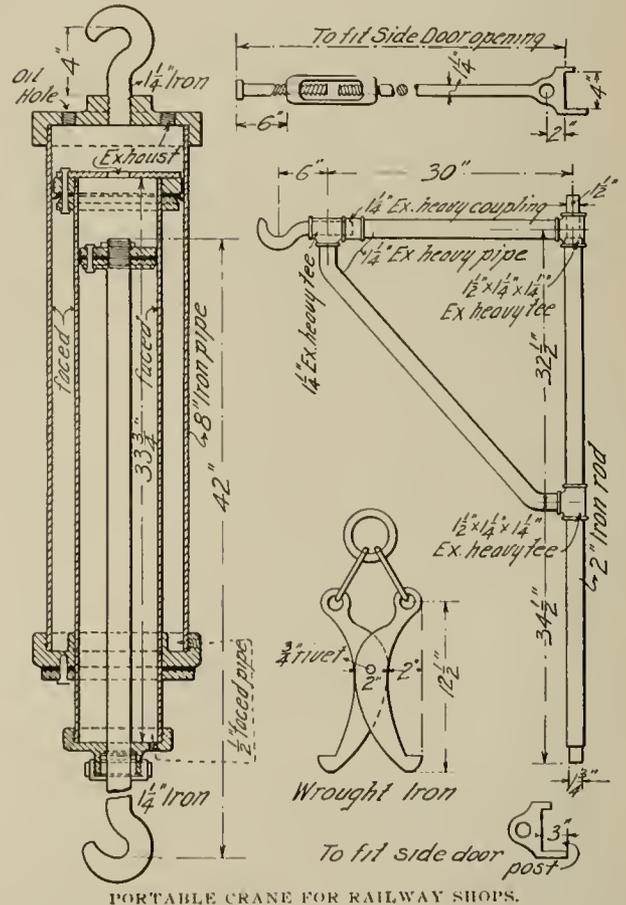

During his connection with telephone work Mr. Sunny was closely identified with the solving of the problem of underground wires for telephone service and later he was instrumental in establishing underground wiring for arc lighting. Mr. Sunny was a director of the World's Columbian Exposition and was president of the company that installed the Intramural railway at the Exposition; this was the first elevated electric railway in this country, and its successful operation led to the adoption of electricity for the elevated roads in Chicago, and later in New York.

Mr. Sunny has been prominent in political reform movements in the city of Chicago. In 1891 he was vice-president of the Union League Club and he is now president of the Civic Federation, which organization is doing hard work in the direction of procuring much needed constitutional modification by the next General Assembly. He has been identified with the movement in behalf of dependent and delinquent boys and has assisted in securing the necessary legislation for creating the State Home for Delinquents. He was also one of the commissioners appointed by Gov. Yates to select a site for the home.

In 1878 Mr. Sunny was married to Miss Ellen C. Rhue, of Brooklyn; he has two children, Helen, aged 16 and Arthur, aged 11.

**A CONVENIENT PORTABLE CRANE.**

The accompanying illustration shows a special form of hoist which was recently described in the Railway Age, and which is stated to have been found of much assistance in loading and unloading car wheels from box cars and in handling material of various kinds in railroad shops. The essential parts of this device are the swing crane and the air hoists, and the method of attachment is simple and strong and at the same time quick of application. The upright part of the swing crane is set in a socket which is fastened on the door post at the bottom and rests directly on the floor. The upper end of this piece is held in position by the compression exerted by a turn buckle on a rod extending across the

PORTABLE CRANE FOR RAILWAY SHOPS.

doorway and pressing against the opposite door post. The frame is made of extra heavy pipe and fittings and round iron. The hoist is made telescopic, by means of which nearly double the stroke of a single length hoist is secured. The view herewith gives the general dimensions of the device. A special hook is made for picking up wheels, the application of which is apparent from an inspection of the drawings.

**MUNICIPAL OWNERSHIP DEFEATED.**

The special election held in San Francisco on December 2d, which was announced on page 779 of the October "Review," resulted in the defeat of the movement towards the municipal ownership of the Geary Street Railroad by its acquirement at the expiration of its franchise which expires on November 6, 1903. The proposition was to issue bonds to the amount of \$700,000 for the purpose of better equipment and operation of the road. The vote was 15,120 for the proposition and 11,334 against it. A two-thirds vote was necessary for adoption.

It is reported that the interurban roads running out of Columbus, O., in which Mr. A. E. Appleyard is interested, have purchased a large property at Gay and Broad Sts., for the purpose of erecting a new freight station.

**FREIGHT AND EXPRESS.**

BY ALTON D. ADAMS.

Copyright, 1902, by Alton D. Adams.

Electric railways are rapidly extending to include interstate as well as interurban systems. Starting from Boston, Mass., one may now travel by electric lines to the capitals of three other states. One route passes north to and along the valley of the Merrimac, through Manchester, the metropolis of New Hampshire, to Concord, its capital city, a distance of more than 70 miles. Going south from Boston about 44 miles brings the traveler to Providence, the capital of Rhode Island, and another electric line extends some 25 miles further to Newport, passing through Fall River on the way. A stretch of 100 miles west from Boston connects that city with Springfield in the same state, and thence a run of nearly 30 miles to the south brings one by electric cars to Hartford, the Connecticut capital. From this point the journey by electric line may be continued, one or two short breaks excepted, to New York City.

Outside of New England, the story of long electric lines extending from city to city, and state to state, is repeated. In New York one may travel by electric cars from Troy, through Albany, to Hudson, a distance of over 40 miles. Connecting trolley lines in Ohio offer continuous transit from Newark through Columbus, Springfield, Dayton and Hamilton to Cincinnati, a trip of more than 150 miles. On other electric roads passage may be had from Cleveland to Toledo over a route above 100 miles in length. These extensions of electric lines have carried them out of the list of mere instruments of urban transit, like the horse railway which they displaced, and entered them as full competitors of steam railways for local passenger traffic. As long as electric railways were confined to city streets, almost their entire income was derived from passenger fares, and this condition has been materially changed only in special cases up to the present time.

There are now cogent reasons for the extension of electric railway business to include the transportation of local freight and express matter. First among these may be put the general public interest and welfare. Steam railways, by reason of the infrequency of their stations and the comparatively long distances between parallel lines, have necessarily met in only a very imperfect degree the demands for quick and cheap transportation of freight and express matter. The requirement that freight must be hauled several miles over poor roads to reach the station of a steam railway often holds it on the farm. Even when the station of the steam road is reached, the local freight rate is frequently so high that the products of farms and gardens cannot with profit be sent to market. With local freights, especially those of a perishable nature, time is an all-important element. An entire day is often consumed in the transportation of freight from outlying towns to a city market only a few miles distant. Again, in the delivery of small express packages to short distances over steam railways the public is generally but poorly served. As a rule the local express service on these lines is too infrequent and the rates are too high to encourage the traffic. In many localities the electric railways are in a position to change all of this. Electric cars stop anywhere or at very short intervals, so that all persons along the line have equal access to the service. Moreover, virtually parallel electric railways are frequently so close together that a very short haul by wagon will bring freight to one of them, if not the other. Instead of a single transportation of freight each way per day, electric cars may make many trips in a like period.

Express matter carried on interurban lines may be readily transferred to the local cars in any of the connected cities, and the necessity of wagon collection and delivery thus largely avoided. In the nature of things there seems to be no good reason why every interurban car, at least, should not have a large express box in which small parcels could be safely transported. At sufficient intervals cars intended for freight alone could be run over interurban lines, and often to the original points where freight must be received from shippers or delivered to consignees over city tracks. Electric railways in a very large number of instances have put the passenger rates per mile at not more than one-half of the charges made by steam roads. Power houses, tracks and the entire equipment of electric railways, except the cars, are already adapted to the transportation of freight and express. There is good reason, therefore, to hold that a moderate investment in rolling

stock would enable many electric lines to engage in the transportation of freight and express with mutual advantage to the public and their owners. From the economic point of view it certainly seems desirable that existing electric lines be made to distribute the products of farms and factories. More directly interested than the general public are the owners of electric railways in the possibilities of their freight and express business. Since the historic electric road at Richmond went into operation, the position of street railways as to the transportation of freight has materially changed. Considering for a moment a single state, Massachusetts, the length of street railway tracks has been multiplied by four since 1888. These extensions have not only formed interurban systems, as already noted, but have also connected each city with a large surrounding area of farm and village territory. Within city limits local express companies compete for the transportation business. Between cities and their outlying territory the carriage of both express and freight remains largely in the hands of the steam roads. This business is now large and is capable of material expansion when such service is offered as only the electric railways can give. Farm products are waiting for more rapid and frequent transportation into cities. Fuel in the form of wood must often come in and coal go out. Suburban freight like suburban passenger traffic will turn from steam to electric roads when the latter are ready to handle it. Moreover, in many instances electric railways reach a territory where there is little competition with steam roads because of its distance from their stations.

To the general addition of the freight and express traffic to the passenger business of electric railways there is a single important obstacle. This is the legal one. In some cases the transportation of freight by street railways is expressly forbidden either in their special charters or by a general statute. More generally the charters and the statute law are alike silent on the point. In either event the result usually is that electric railways have no authority to act as common carriers of freight. Such a result is reached by the general rule of construction for corporate charters, that only those powers are granted which are either expressed or may be fairly implied as incident to the expressed powers. Where electric railways lack authority to engage in the freight and express business an appeal to the state legislature should remedy the difficulty. The only serious objection to the extension of the privileges of common carriers to street railways may be expected to come from the steam roads. Such opposition may delay but it can hardly prevent the general transportation of local freight and express matter by electric railways. The great importance of the freight business may be gathered from the report of the Interstate Commerce Commission for the year ending June 30, 1901, which shows that the steam railways of the United States earned \$426,000,000 by the carriage of passengers and \$1,114,000,000 by the carriage of freight in that year. Of course a large share of these freight earnings are derived from through freight which electric roads are not in a position to handle. Another large portion of freight earnings is received for short hauls that may well be made by electric roads. Street railway companies are rapidly coming to appreciate the possibilities of revenue from the freight and express business and are moving to secure it in a number of states. The rapid though recent growth of freight and express business on electric railways is illustrated by the increase in the number of these railways doing such business in Massachusetts and in their incomes from it. The numbers of these railways in each year and their incomes from freight and express are as follows:

1898	Number railways	8,	freight income	.....\$ 5,728.26
1899	"	9,	"	..... 7,040.50
1900	"	8,	"	..... 14,796.49
1901	"	12,	"	..... 15,298.07

Every one of these roads is partially or entirely interurban, connecting small cities and towns, and not one of them enters a city of as much as 35,000 population. Of the twelve roads only two seem to have made a really effective effort for the freight and express business. The names of these two electric railways and their incomes since 1898 are as follows:

Year.	Conway Electric Street Railway Company.		
	Passenger.	Freight.	Express.
1898	.....\$2,398.33	\$3,424.96	\$419.86
1899	..... 2,744.77	3,635.03	480.11
1900	..... 3,057.41	5,638.31	571.63
1901	..... 3,388.17	5,484.67	636.53

These statements of incomes do not include sums received for the carriage of mails, such sums being obviously capable of only very moderate expansion.

Shelburne Falls & Colrain Street Railway.			
Year.	Passenger.	Freight.	Express.
1898 .....	\$6,885.45	\$4,472.31	
1899 .....	7,179.25	5,404.27	None.
1900 .....	7,047.38	5,566.66	
1901 .....	7,223.76	5,760.25	

Figures are for fiscal years ending on September 30 in each case. For the fiscal year of 1901 the income from the carriage of mails by the Conway road was \$369.39, and from like carriage by the Shelburne Falls line \$305.36. Prior to 1898, the carriage of freight and express by electric railways was of such small importance that the sums received from these sources were included with the incomes for carriage of mails in the reports of the Massachusetts railroad commissioners. It is not, therefore, possible to state the exact incomes from freight and express in earlier years. The Conway company owns and operates 5.91 miles of electric railway line from the steam railway stations to the several villages in the town of Conway. Between 1898 and 1901 the income of this company from passengers increased 41, from express 51, and from freight 60 per cent. In the latter year, of the total income from these three sources, express yielded 7, passengers 35 and freight 57 per cent. This shows what can be done with the freight and express business in a small town with a total population of only 1,458 persons. The Shelburne Falls Street Railway extends from the steam railway station in the town of Shelburne to several villages in the town of Colrain, and has 6.53 miles of line. According to the census of 1900, the population of Shelburne was 1,508, and that of Colrain 1,749 persons. Since 1898 the yearly income of this electric line from passengers had increased 5 per cent and the income from freight 29 per cent in 1901. In the latter year passengers yielded 56 and freight 44 per cent of the sum of these two incomes. On the Conway line freight has been the largest source of income during each of the four years. The Shelburne road received four-fifths as much from freight as from passenger business in 1901. Neither of these electric lines compete with the steam railway, but act to a large extent as feeders for it. When electric railways operating in only one or two small towns can derive the revenues above given from freight and express, the opportunities for longer roads connecting large cities as well as towns are evident. The figures show that while the express business is important and should be built up, freight offers the great prize for which, next to passengers, the efforts of electric railways should be directed.

In Massachusetts the street railways are waking up to these opportunities. As yet the majority of these railways lack authority to carry freight and express, but they are rapidly getting it. The legislature of that state during its recent session of 1902 granted the right to act as common carriers of small parcels or express matter to fourteen electric railways. It is significant of the opposition which legislation along this line encounters that only five of these railways were authorized to carry freight or goods in large quantities. Of these five electric railways, two were authorized to carry freight over only small portions of their respective lines, and on another two the freight that might be transported was limited to fuel and farm produce. Of the fourteen electric lines only one was given authority to carry freight of all classes over its entire length. Some of these street railways pass through several towns and cities each. Two have entry to Worcester and two pass through Pittsfield. One end of the line that has secured authority to carry all kinds of freight is at Agawam, a town just across the river from Springfield. Evidently the movement of electric railways in Massachusetts toward the freight and express business is well under way. An amendment just made there to a general law permits any electric railway to transport road material for use along its own or any other line, or on the streets of any town or city, and to contract for this service.

A striking advance in the acquisition of freight and express business has been made by the electric railways of Rhode Island during the past year. On May 27, 1901, the Union and Suburban street railways, both of which center at Providence, began a freight and express service between Providence and outlying towns, making two trips per day. Refitted passenger cars, each 17 ft. long, were used for this freight business. Since the above date five box-cars, each 40

ft. long, have been added to the equipment for handling freight. This freight service has now been extended throughout the length of the state from Oakland on the north to Narragansett Pier on the south. The Union electric road has a total length of 97.3 miles, and the Suburban road a length of 52 miles, all in Rhode Island.

During the year ending June 30, 1901, the income of the Union road from its freight business was \$10,324.78. In the same year the Suburban road earned \$3,582.19 by the carriage of freight. This is just a beginning. Within five years it is probable that the greater part of freight and express transportation that both begins and ends in Rhode Island will be done by electric railways.

Turning to Connecticut, similar conditions are presented. Quite a number of the longer street railways show some earnings from freight or express. One system centering at Hartford derived an income of \$3,000.59 from express and \$8,777.89 from freight business in 1901. Another system entering Hartford earned \$2,161.61 in the same year by carrying express matter. Figures telling the same story, though perhaps less clearly, might be quoted from other states.

Given the low cost and high speed attainable with electric traction, the expansion of street railways into interurban and interstate systems was inevitable. Given this expansion, it also becomes inevitable that the great bulk of local freight and express matter must pass over the electric roads.

In all this the general public, through far better transportation facilities and lower rates, is the chief and ultimate gainer.

### RECENT ADVANCES IN WAGES.

When Mr. E. G. Connette became general manager of the Syracuse (N. Y.) Rapid Transit Railway Co. about two and a half years ago he met with the employes and stated that he desired the hearty co-operation of every man and assured them that they should share in the success of the company. In compliance with this declaration he advanced their wages Jan. 1, 1901, and on Christmas of that year presented each employe with a sum in cash amounting to from \$3 to \$5. On November 13th last Mr. Connette met with the Employes' Mutual Benefit Association of the Rapid Transit Co., and after the usual routine business announced that on December 15th there would be a general advance in wages. The announcement was a complete surprise and entirely unexpected and was more fully appreciated on that account. Men who have been with the company a year will receive 16 cents per hour; those in service for a longer period will receive an additional cent per hour for each year of service up to five years, which will be 20 cents per hour.

President W. B. McKinley of the Danville (Ill.) Street Railway & Light Co. issued a bulletin announcing that the wages of motormen and conductors on the city system and the Danville, Paxton & Northern R. R. would be increased 10 cents per day beginning November 16th. Along with the notice the men were asked to send in their addresses for the Thanksgiving turkey. A few months ago the company presented the men with an amount equal to five per cent of their year's wages. About 100 men are employed. In sending out the bulletin Mr. McKinley stated that the company realized that the cost of living is increasing and that it desired to keep pace with these conditions.

The management of the Trenton (N. J.) Street Railway Co. voluntarily increased the wages of its employes five per cent November 14th. Under the increase the men will receive \$2.10 a day, or 17½ cents per hour. This is the fourth increase in wages since Mr. H. C. Moore has been president of the company.

The wages of conductors and motormen on the Wilkes-Barre (Pa.) & Wyoming Valley Traction Co. were increased from \$1.70 to \$1.75 per day November 15th. About 250 men are affected.

November 20th the Portland (Me.) Railroad Co. gave its motormen and conductors an increase of 10 cents, fixing their pay at \$1.85 per day. About 300 men are benefited.

The Philadelphia Rapid Transit Co. raised the wages of its conductors and motormen from 19 to 20 cents an hour December 1st. Nearly 7,000 men are said to be affected by the increase. Since January, 1897, wages have been increased from 16 2/3 cents to 20 cents per hour.

The Chester (Pa.) Traction Co. voluntarily increased the wages of its motormen and conductors from 16¾ to 17½ cents per hour November 15th.

LINE CAR AT ATLANTA, GA.

Shortly after the consolidation of electric railway interests in Atlanta, it was determined to practically reconstruct the line and overhead work on the system. For this purpose the engineering department of the new company, known as the Georgia Railway

wise, and the second crosswise, as designated in the plan of top framing. The sides of the car are covered with 1 x 3-in. ceiling stuff. Double floors are put in, in both car body and vestibules. Provision is made in the side of the car for a doorway, 7 ft. high, and 5 ft. wide, provided with two battened sliding doors arranged to slide on inside of the car. There are also two battened sliding doors at each end of the car, these doors being 7 ft. high and 1 ft. 3 in. wide, and also arranged to slide on the inside.

EXTERIOR OF LINE CAR.

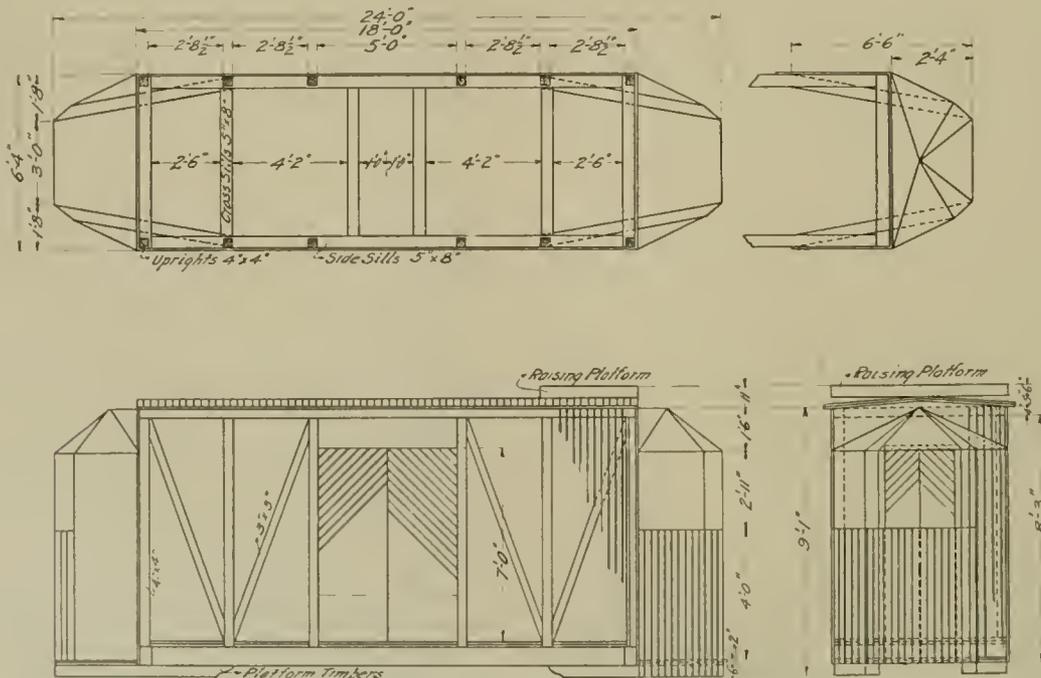

INTERIOR OF LINE CAR.

& Electric Co., designed and constructed the line car herewith described and illustrated. In preparing the plans, it was desired to have a car that would stand rough usage and at the same time particular attention has been paid to securing simplicity of construction.

The vestibules are supported by two 6 x 6-in. platform timbers bolted to the bottom framing. The vestibules are enclosed with matched ceiling stuff to a height of 4 ft. from the floor, and with glass the rest of the way to the roof. The roof of the vestibules is 1 in. stuff put on with as few joints as possible. The uprights supporting the roof of the vestibules are of wood up to the point

The plans comprehend a straight-side box car, 24 ft. long over

PLAN AND ELEVATIONS OF LINE CAR FRAMING.

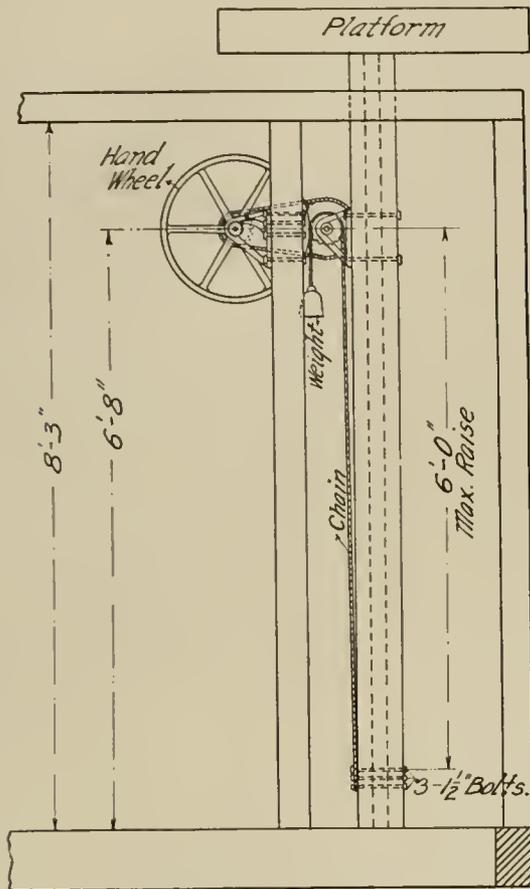

all and 6 ft. 4 in. wide over all. The body is 18 ft. long. The bottom framing is constructed with side sills of 5 x 8-in. timbers and cross sills of the same size stock, as shown by accompanying plan. The upright timbers are 4 x 4 in., and braced diagonally with 3 x 3-in. timbers, as shown in the side elevation. The top framing is formed of 4 x 4-in. timbers covered with a roof consisting of two layers of 1 x 3-in. ceiling stuff, the first layer put on length-

where the glass begins and 1 1/2-in. iron pipe the rest of the way. Each vestibule has one doorway, these on opposite sides of the car, and each provided with a stirrup step.

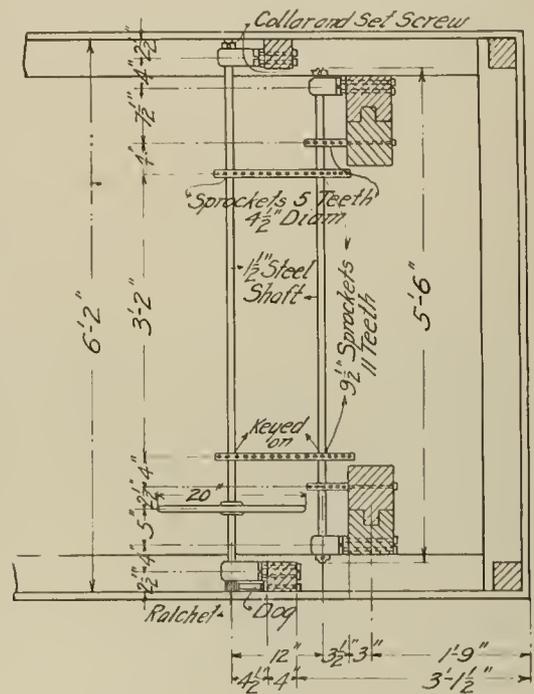

Above the top of the car near one end is a platform 3 ft. 6 in. x 6 ft. 4 in., which can be raised and lowered by an arrangement of sprocket chain, wheels and weights. The platform is made of 5 x 5-in. timbers covered with 1-in. flooring, and is supported on

two uprights which slide up and down by tongue and groove arrangement, in two stationary uprights bolted to either side of the car on the interior, the movable tongued uprights being 6 x 8-in. timbers, and the stationary grooved uprights being 6 x 6-in. timbers.

plan view of hoisting apparatus, these wheels being 4½ in. in diameter and each has five teeth. These wheels connect by sprocket chain to two 9½-in. sprocket wheels mounted on a second shaft placed 12 in. to one side of the first. This second shaft is 5 ft.

ELEVATION OF RAISING DEVICE.

PLAN OF RAISING DEVICE.

6 in. long and works in two post hangers bolted to the grooved upright pieces in which slide the movable platform supports.

Mounted on the second shaft in addition to the two 9½-in. sprocket wheels referred to are two smaller sprocket wheels, each 4½ in. in diameter. Over each of these smaller wheels passes a second sprocket chain, one end of which is bolted by three ½-in. bolts to the bottom of one of the sliding uprights which carry the platform. To the other end of these chains are attached

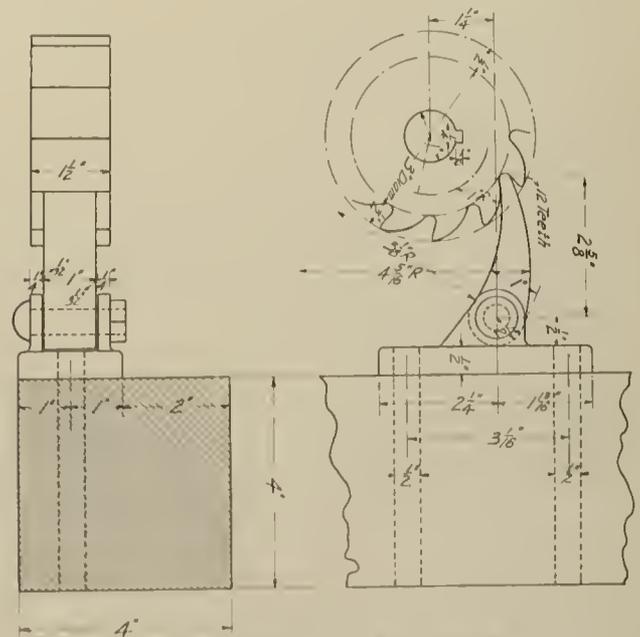

The arrangement for raising and lowering platform on top of the car is set forth in one set of the accompanying drawings.

In further explanation of these drawings it may be said that the platform is raised or lowered from the interior of the car by

ARRANGEMENT FOR CARRYING POLES.

means of a 20-in. handwheel. This wheel is mounted on a ½-in. iron shaft extending across the car on the inside, about 6 ft. above the floor and 3 ft. 10 in. from one end. This shaft is 6 ft. 2 in. long, and on it are mounted two sprocket wheels as shown in the

RATCHET FOR HOLDING PLATFORM.

weights which partially counterbalance the weight of the platform. It will be understood that by turning the handwheel the weights are made to descend and the platform to rise. Both the shafts which carry the sprocket wheels are set in collars at either end

provided with set screw and the shaft carrying the large hand wheel has a ratchet and dog attachment by means of which the platform is prevented from falling and is held at any desired elevation. The chain and sprocket wheel are guaranteed to withstand a working strain of not less than 1,000 lb.

By means of a door in the front dash poles up to 30 ft. long can be carried on the car, as shown in one of the engravings.

### CAR SIGN SUGGESTIONS AND CRITICISMS.

The important question of equipping street cars with designating signs so that people who use them may be intelligently informed as to the destination of the cars has always been a very perplexing one. So much information is required to inform the public in regard to the routes and destinations of cars that it requires all of the available space that can be had for signs, and yet a multiplicity of signs only tends to make the situation more confusing. People, and especially strangers, who are able to detect one particular sign in a cluster of eight or ten while the car is progressing at its usual rate of speed are very much in the minority and it therefore seems useless to designate by signs all of the streets and squares that the car will pass en route. The purpose of such a scheme is well meant, but its object is never attained as it is almost impossible to read all the matter upon a large number of signs in the short time that elapses while the signs are in legible sight as the car approaches. The public, whose patronage makes the street railway a success, reasonably demands that the street railway company shall label its cars in the most simple manner possible. All kinds of people depend upon these signs for the selection of the car they require and, as in many cases this selection must be made from a multitude of cars that are passing in an almost endless procession, it is evident that the signs should be distinct and legible; otherwise the public will be put to much inconvenience and the company will receive numerous complaints.

There is evidently quite a waste of time and material expended on the roof signs of cars at the present time. These signs, which should be the principal mediums of information in regard to the route the car is pursuing, are often rendered almost useless either on account of their position, or the style of lettering which is frequently used. Fancy lettering is used presumably to exhibit certain artistic accomplishments on the part of the designer, and he is sometimes liable to indulge his propensity to make the signs appear ornamental instead of making them useful as it is obvious they should be.

The most reasonable way for painting signs is apparently the most economical, for using expensive leaf and color for this purpose, producing a brilliant effect, only contributes to make the signs, under certain conditions, indistinct and illusive. A rational and sensible sign can be produced by using a white ground and lettering it in plain black block letters which for clear and easy reading cannot be improved. Moreover, such a sign shows to much better advantage when illuminated at night owing to the absolute contrast between the ground and the lettering which gives the latter prominence so that they are perceptible at the necessary distance for the proper signalling of a car.

If ordinary window glass could be made malleable, similar to iron, without losing its transparency, then the illuminated glass top sign would certainly be the most popular one, but until a method of molding glass in semi-elastic instead of an absolutely brittle form is devised, the glass top sign must be condemned because of the prohibitive expense involved for constant repairs caused by breakage in their manipulation by the car men when changing them. Whatever method is employed in adjusting these signs, whether by some attachment or by the use of switch bar, makes but little difference, for the result is the same when the sign works hard as it will invariably do under certain conditions, as the battered condition of many signs on the average street car will bear witness. Experience has shown that a long, narrow pane of glass set into a slender frame will not stand the rough treatment that car men are wont to give signs when their time is necessarily limited. But, if the breaking of the glass in these signs could be avoided they would certainly be universally adopted, for their legible qualities both by day and night would insure their success.

The scriptural reference in regard to the arranging of a light under a bushel is analogous to that of placing a roof sign on the

side of a car. Whether stationary or revolving a sign thus located cannot be read from the sidewalk until the car is nearly opposite to the person reading it which, according to the rules laid down by most companies for stopping cars, is always too late as the car would generally pass the stopping point by the time the would-be passenger had decided that it was the one wanted, and before he had time to hail it.

As street cars are operated for the purpose of carrying passengers and not for show it does not require that the vehicle should be decorated with a showy assortment of lettering. It is impossible for any fixed sign on a car to accurately mark its destination at all times, therefore any lettering upon the car body such as the general name of the route the car is used upon, or any name whatever, is not only superfluous and costly, but it compels the company to use the car exclusively on the route designated by its lettering, which it is not always convenient to do.

It is suggested that all of the cars of one company be painted one color and without any lettering whatever on the car bodies. Four-board revolving top signs which can be rapidly removed should be used on the ends of the car only. If the four boards on one sign are not sufficient to mark the route of the car at times when it is used on special runs this sign can be easily removed and portable dasher signs be used for this temporary work, and by this scheme, if a certain car is required on some route other than that upon which it is ordinarily used it can be made ready to transfer in a short time by simply changing the top sign. Again, it is clearly seen that by this scheme a smaller number of cars would be required to operate the street railway system than where the different color scheme is in vogue. The latter requires a number of cars of each color should be idle to replace any that may be rendered useless by accident, or any that may be sent to the repair shops for painting, repair, etc., and a much smaller number would suffice for this purpose if the one-color scheme were adopted. In this case the cars can be used on any route.

Years of experience with street railways makes one hesitate before suggesting a radical departure, as the one here mentioned would be to many roads whose cars are all painted distinctive colors for each route. The principal objector to changing them all to one color would probably be the public, who, having become familiar with the different colors notes them instead of any signs for the selection of the car required. Yet it is safe to say that patrons could be educated to the one-color innovation in a short time if the arrangement of the top signs was made in an intelligent and legible manner. These should state, therefore, with great distinctness, in an ingeniously condensed form, the course and destination of the cars they mark for the benefit not only of the inhabitants of the city where the cars are operated, but also the stranger within its gates.

### PUEBLO & SUBURBAN TRACTION & LIGHTING CO.

The Pueblo (Col.) & Suburban Traction & Lighting Co. is the outcome of a merger of the Pike's Peak Power Co. and the Pueblo Traction Co. The new company has been incorporated with a capital stock of \$3,500,000. The property of the new company consists of the Beaver Park generating plant, the lines to Victor, Cripple Creek and through the mining district, and the light and power plant of Pueblo. The new company will continue to furnish electric light and traction power to Pueblo and numerous towns in the Cripple Creek district, but the power will be generated at the Beaver Park plant and transmitted by wires now under construction. The Beaver Park plant is 50 miles from Pueblo and is said to have cost nearly \$1,000,000. The incorporators of the company are: M. D. Thatcher, John F. Vail, Ward Rice, T. H. Devine and H. F. Woods, all of Pueblo.

It is reported that F. M. Haines, superintendent of the Northern Texas Traction Co., has had a survey made for a new line between Dallas and Oak Cliff, Tex.

The Lake Erie, Bowling Green & Napoleon Electric Railroad Co. has completed its line into Pembertonville and has it in operation. The road is owned by the people of Bowling Green and the adjacent country and many of its stockholders will be its regular patrons.

# The Concrete Bridge at Herkimer, N. Y., Over West Canada Creek, Now Being Constructed by the Utica & Mohawk Valley Railway Co.

PREPARED EXPRESSLY FOR THE "REVIEW" BY MR. F. C. PHILLIPS, THE COMPANY'S RESIDENT ENGINEER.

That division of the Utica & Mohawk Valley Railway Co.'s line known as the Little Falls Extension is a continuation of the company's tracks east from the village of Herkimer to the city of Little Falls, and will on its completion, make Little Falls the eastern terminus of a system which now extends west to Rome, N. Y. The line from the west enters Herkimer from the direction of Mohawk, and cars now run to the intersection of Mohawk and South Main St. near the New York Central R. R. station on what was formerly the Herkimer, Mohawk, Ilion & Frankfort Electric Ry., a single track road now being changed to one having double tracks laid with 95-lb. 9-in. girder rail. Connection has already been made with the tracks of the Little Falls Extension which is well on its way toward completion.

The Herkimer Bridge, by means of which the company's cars are to cross the West Canada Creek and the right-of-way of the New York Central R. R., is a very important part of the Little Falls Extension now in process of construction. Particularly in that part of the structure which spans the waters of the Creek, this bridge excels in magnitude anything of the kind yet attempted in this country, for while it is true that there are many bridges of concrete-steel construction, and some of them with one, two or even three spans greater than any at Herkimer, yet the boldness of the design which provides for a series of 10 concrete arches with spans from 62 ft. to 66½ ft., and in addition to this, continues the same structure with a 225-ft. steel span, completing the viaduct with three 55-ft. steel spans, and making one bridge 1212 ft. long, puts this work beyond comparison with anything which has yet been done in this line.

### LOCATION.

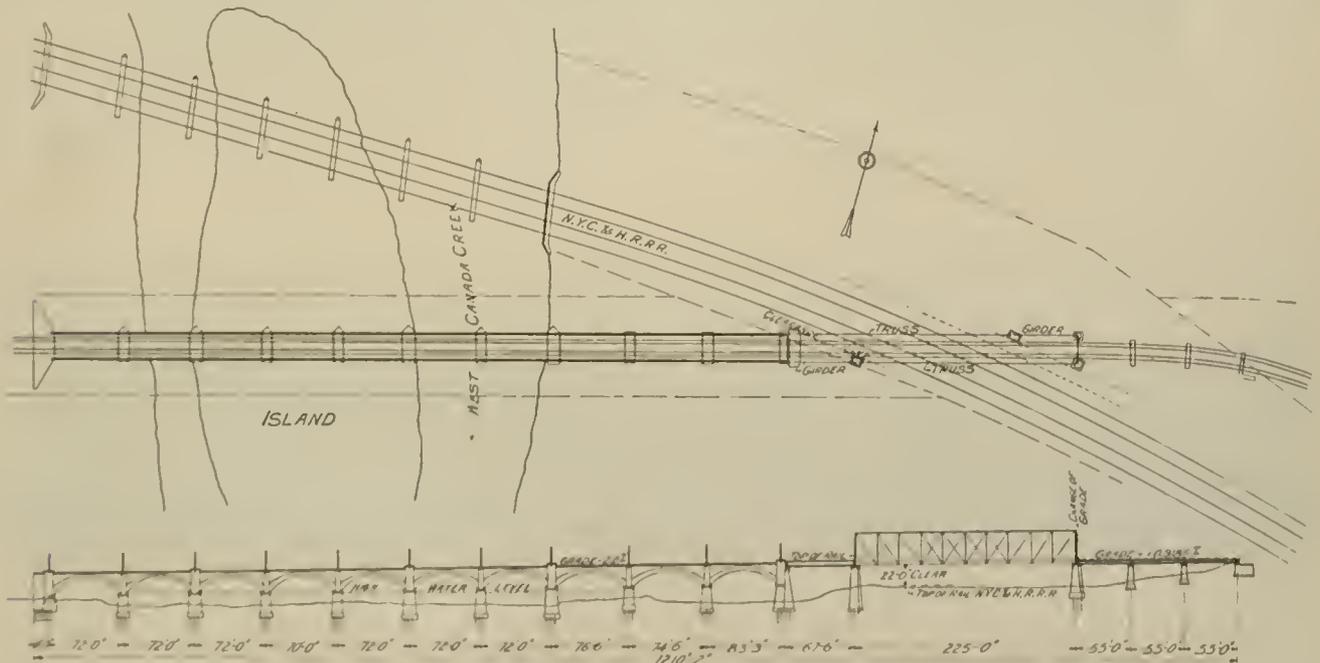

The course of the West Canada Creek is very nearly north and south, and as the eastern boundary of the village of Herkimer passes not far from the middle of the stream, the bridge will be

creek overflows its banks. Protection Ave. is 2,400 ft. east of the New York Central station, and about 1,000 ft. west of the creek, to reach which latter it is necessary to cross a strip of low flat land, which in times of freshet is often several feet under water.

ARCH FORMS READY FOR CONCRETE.

From Protection Ave. east the line of the electric railway is on a private right of way 100 ft. in width. Following the center line, the west bank of the creek is reached at a point about 230 ft. south

PLAN AND ELEVATION OF HERKIMER BRIDGE.

partly within the limits of the village and partly in the township of Herkimer

South of the New York Central R. R. and near the eastern limits of the village the last street extending north and south is Protection Ave., a street well named for the reason that it is really a dike, which protects that portion of Herkimer from inundation when the

of a new bridge now building by the New York Central R. R. for its own use, and as the lines of the electric railway and the steam road rapidly converge at this point, it will be noted if reference is made to the plan showing the general layout of the structure, that when the east bank of the creek is reached the distance south from the New York Central bridge is about 110 ft., and that where the

electric railway company's center line intersects the New York Central's right-of-way, the distance east from the Central's bridge is about 200 ft. Crossing the tracks of the Central, the electric railway company's line is on a tangent, while the Central's curvature is approximately two degrees to the south, the angle between the company's tangent and the chord to the Central's curve being about 23 degrees. The tracks of the Central once crossed, the company's line bends to the east with an easement curve and is soon extending nearly parallel to the Central's line.

As to the grade, the New York Central requires a clearance above

bankment has been provided for by what is known as the "Dry Channel Span" which corresponds in size and location to a similar opening in the New York Central embankment to the north. The concrete abutments, one of which is shown in an accompanying engraving, are of the wing-wall type, and contain together about 610 cubic yards of masonry. They are now ready for the plate-girder bridge which is to carry the electric railway track construction at this point. The length of this span is to be 84 ft. from center to center of end pins.

The normal bed of the creek is to be spanned by a series of 10

VIEW LOOKING WEST SHOWING FORMS IN PLACE.

its tracks of 22 ft., and to attain this elevation, it was necessary to build the electric railway bridge on a 2 per cent grade from the street surface at Protection Ave. to the north side of the Central, at which point the grade breaks to 0.9185 per cent., which is then continued for several hundred feet beyond the east end of the bridge. The total elevation gained from the street surface in Herkimer to the east end of the structure is 41 ft.

#### FORM OF STRUCTURE.

The striking design from which Herkimer Bridge is being constructed was furnished by the Osborn Engineering Co., of Cleve-

arches which begins where the earth fill ends, a point distant about 100 ft. from the bank of the creek, and which ends at a point about 230 ft. beyond the east bank of the creek. During the ordinary stage of water the distance between banks of the creek is 400 ft., and the stream would be included by six spans. The reason for taking this precaution of extending the bridge beyond the banks was to insure ample room for the passage of high water as it rises above the banks. To one who is at all familiar with the West Canada Creek, and has seen it in times of freshet with the ice piled up in the channel and on the banks, checking the flow of water, the reason for this precaution is not difficult to understand.

ARCHES READY FOR CONCRETE.

land, Ohio, Wilbur J. Watson, bridge engineer. The lines are simple, yet even now before the forms have been removed the graceful proportions are quite apparent from the temporary wooden structures, and as the lines of the plans are carefully brought out in construction, the result is a bridge that is beautiful as well as useful.

The road crosses the flat land west of the creek on an earth fill, the material for which has been taken from a piece of land in the vicinity six or seven acres in extent, purchased by the electric railway company for that purpose. An opening necessary for passing the overflow water at times of extreme high water through this em-

The supports for the arches consist of two abutment-piers with nine intermediate piers. One of the features of the design provides that the intermediate piers shall be of two different sizes, the third, sixth and eighth being larger, so that they may act as abutments in case a portion of the bridge should fail. The second to the eighth inclusive are so constructed at the up-stream end as to act as ice breakers. The faces of the piers have a batter of three-quarters of an inch per foot, and are provided with a molding at the top, having a depth of 2 ft.

The arches will have a thickness at the crown of 21 in., this in-

creasing to 4½ ft. at the haunches, and each will contain 32 pairs of 1¼ in. steel rods of the Thacher patent, which are to be placed 3 in. from the extrados and intrados and to extend down into the piers. The first seven arches will have a clear span of 62 ft. with a rise of 12 ft., the last three, a span of 66½ ft. with a rise of 14 ft. The spandrel walls will extend 2 ft. 9 in. above the arches and will be surmounted by a coping 18 in. in depth.

The pilasters above the piers will project 1 ft. beyond the spandrel walls, and those of the larger piers will be extended a certain distance above the coping. Steel poles for supporting the trolley wire will be placed one in each pilaster.

The arches will be covered with two coats of cement grout to render them water-proof, and this coating will be extended part way up on the spandrel walls; the filling over the arches and piers will consist of sand and gravel forming a good roadbed for the electric railway track. Drainage is provided for by 4 in. vitrified pipes located over each pier.

The east abutment pier is to serve not only as an abutment for the arches but also to support one end of the 225-ft. steel through truss which is to span the tracks of the New York Central, thus making the steel bridge continuous with a series of arches.

That part of the structure following the long steel span, namely, the three 55-ft. girder spans, is on a curve to the right, and the

were carried to a distance of 12 ft. below the surface, not to secure a good bearing soil, for that was excellent at all times, but to provide against any cutting out of the loose water bearing material which possibly might occur when the water should be confined to a narrow channel.

In all other cases the records of the borings showed the creek bed to be made up of coarse sand, gravel and boulders, with the upper surface of the clay at approximately the same elevation, except that perhaps in the main channel it was slightly lower. Nothing in the nature of quicksand was shown by the records, except in case of one of the piers, but when excavation for this pier was made, no trouble was experienced.

Clay having been reached, piles were driven for the reason that the bearing power of the clay was not considered sufficient to support the weight of the structure without yielding. These piles were 30 ft. in length and were driven into the clay from 12 to 16 ft. In this connection it may be said that it was calculated that under certain possible conditions the pressure on the foundations under certain of the piers would reach 5.35 tons per sq. ft. In addition to the bearing piles, a layer of coarse sand and gravel was rammed into the surface of the clay to increase its bearing power. In the case of the smaller piers intended to support the 55-ft. girder spans at the east end of the bridge, no piles were used in the foundations,

EASTERN TERMINUS, HERKIMER BRIDGE.

piers are set radially on this curve. The curvature, however, is not abrupt, being a Searles spiral made up of fourteen 20-ft. chords.

#### FOUNDATIONS.

The West Canada Creek in times past has given a great deal of trouble on account of its great power in scouring where the limits of its channel are at all confined. This is accounted for by the fact that the material of the creek-bed is a water bearing stratum of coarse sand and gravel, having a depth in mid-stream of 10 to 12 ft., and overlying a stratum of blue clay. Quite recently the stream gave evidence of its power when one of the piles used to support the centering which had been driven into the bed of the creek 6 or 7 ft., was undermined so completely that it swung in the current from its support above.

The Herkimer Bridge will essentially be a heavy structure, and in addition to this fact, it was designed to carry under certain conditions, very heavy loads. For these reasons it was deemed wise to take extra precautions in preparing the foundations for those piers and abutments in or near the creek, and the result of the decision was that the excavation should be carried to the solid stratum of clay. Accordingly a systematic test was made of the foundations for each pier including the "Dry Channel Span," the borings being made by Mr. A. T. Gibson, of West Winfield, N. Y. The apparatus used was a well boring outfit, using a 6 in. drive pipe.

Contrary to expectation in the case of the Dry Channel, borings to the depth of 30 ft. below the surface failed to reveal anything but coarse sand and gravel, where it had been thought that clay existed at a distance of 15 to 18 ft. at the most. The foundations

but a compacted gravel and sand, approximately 2 ft. in thickness, was put on the surface of the clay and the masonry built on this.

The coffer dams employed in the construction of the footing courses were made by piling up bags filled with sand in tiers about the pit, the thickness of the dam being equal to the length of four or five bags. The work was greatly facilitated by building a dam a short distance up stream near the piers of the New York Central Bridge, which turned the water to the east, while the piers near the west side were being built. It was necessary, however, to build one pier amid stream, and in this case the bags were kept together by being placed in and about piles which had been driven to support the centering for the arches.

All foundation pits were sheeted with 2-in. spruce and the sheeting left in place. The pumps not being able to keep the pits entirely free from water, when it came to the laying of concrete, 8-in. vitrified pipe was used to conduct the water to the well where the pump was operated.

For carrying on the work at different piers to advantage, a working roadway built on piles was constructed from the west bank to the end of the series of arches, and the wisdom of putting it on piles has already been several times demonstrated by the havoc worked by high water on other nearby structures not so substantially made.

The general plan of the work was to put in all the foundations and carry them to an elevation above high water before going on with the superstructure at any point. This plan has been carried out with the result that protection from ordinary high water is now insured.

The sand and gravel for the concrete have been obtained from

the vicinity of the work. A crusher plant with bins and a graduated screen from which gravel of graded sizes could be obtained in quantities desired, was set up on an island in mid stream, and for a great part of the work the materials were obtained from the island and in very low water from the creek bed. A track was laid on the island and cars used to transport the material from the bed of the creek to the crusher. From the crusher bins it was again taken in cars and distributed from the roadway mentioned at various parts of the work. Both gravel and sand obtained from the creek were of good quality, but on account of the dampness, it was difficult to separate the sand from the small pebbles. In the foundations this mixture was treated as sand, tests having been made for the percentage of voids and the concrete proportioned accordingly.

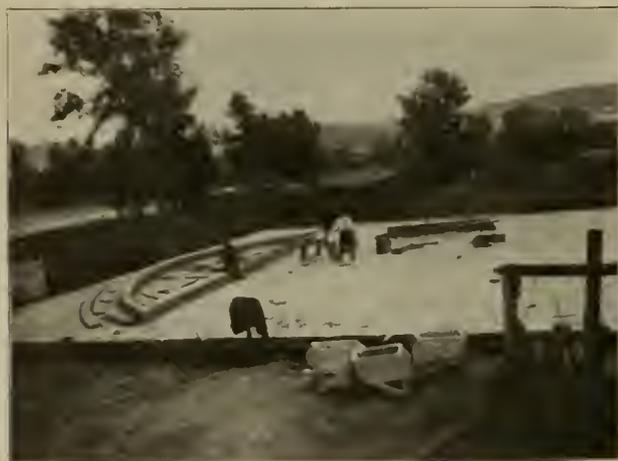

The supply of materials in the creek gave out when the work was about half completed and the crusher plant has been removed to a neighboring gravel bed. Sand is being hauled to the work from a bed a little over half a mile away.

#### PIERS.

In the construction of the masonry above the footings care has been taken to have the sand screened. The concrete has been continued up to a point where the steel rods of the arches begin, it not having been possible to continue them further in all cases for the reason that the rods have been delayed in shipment.

#### ARCH CENTERS.

The form of centering adopted was the Warren truss with seven panels. The upper and lower chords were made up of three thick-

PLATFORM FOR LAYING OUT FORMS.

nesses of 3 x 12-in. stuff mostly spruce, but in some cases of hemlock, and in the first ones built, the diagonals were made of 2 x 10 in. timbers, but it was found that the ends sawed from the bearing piles could be squared at the mill, and utilized for the diagonals.

The centering for each arch consists of seven trusses tied together and well braced, the trusses being supported at each end by two pile bents, spaced about 4 ft., this method not allowing any weight to come upon the forms for the skewbacks. The forms were designed to act as trusses, but to render them rigid and to prevent, if possible, any settlement, two pile bents were driven near the center of each span as additional supports. The sections of the chords are held together by 1½-in. birch pins, no bolts being used. The reason for this is to facilitate the taking down of a centering, which can be done by sawing the pins. The lagging for the arches is of spruce, 2½ x 5 in. dressed on one side and joined on both edges.

#### MASONRY.

All masonry is of concrete and thus far no broken stone has been used, except such as has come from large stones in the gravel, passing through the crusher.

The brand of cement used is "Nazareth," made by the Nazareth Cement Co., at Nazareth, Pa., and sold by the Chas. Warner Co., of Wilmington, Del. The cement has been carefully tested at the electric railway company's laboratory on the work.

In the foundations and in the piers the materials have been mixed

in the proportion of one part cement three parts of sand and seven parts gravel, the only distinction being that in the foundations less attention was paid to the screening of the sand than in the superstructure of the piers. In the arch rings and spandrel walls a proportion of 1 to 2½ to 5 is being used.

On exposed surfaces a facing mortar 1½ in. thick has been used. This mortar was first made 1 to 2, but was afterward changed to 1 to 2½. The facing is placed by means of slip boards and is rammed at the same time with the body of the concrete. On the up-stream ends of those piers which have been sharpened to act as ice breakers, a mixture of 1, 2 and 4 varying in thickness from 6 to 8 in., has been used in addition to the ordinary facing.

The proportioning of the materials in the concrete is on the basis of packed cement, loose sand and loose gravel, and has been determined by tests of the materials combined with the judgment of the inspector on the work.

A word with reference to the method of depositing concrete on the arches may be of interest. The arches are being built in transverse sections, extending the full width of 27 ft. The rods are first placed in position as shown by one of the engravings and the section at the crown deposited first. This section may be in width from 10 to 14 ft. The sections at the haunches are then placed and continued up toward the crown.

By November 1st three of the arches were completed, with portions of the spandrel walls, and it was planned that the rest of the work would be completed December 15th, of the present year.

Work was begun on the earth embankment May 22, 1902; on the abutments of the "Dry Channel Span" June 22d, and on the main structure the latter part of June. Messrs. Beckwith & Quackenbush, of Herkimer and Mohawk, N. Y., are contractors for the masonry, and Messrs. Snare & Trest, of 39 Cortlandt St., New York, will erect the steel work.

The officers of the Utica & Mohawk Valley Railway Co., for which the bridge is being constructed, are: Horace E. Andrews, of Cleveland, president; J. J. Stanley, of Cleveland, vice-president; C. Loomis Allen, of Utica, general manager; Chas. H. Clark, of Utica, chief engineer; Frederick C. Phillips, of Little Falls, N. Y., resident engineer.

#### NORTHERN CALIFORNIA POWER CO.

The Northern California Power Co., which furnishes power to a great variety of industries in one of the most prosperous sections of California, has recently installed a 4,000 h. p. generating plant at its Cow Creek station, which is situated in the high Sierras and is typical of the many transmission plants recently installed in the state. The ultimate capacity of the station will be 8,000 h. p. The company has already installed 3,000 h. p. at the Battle Creek generating station, thus making the present total capacity of the company's electrical installation 7,000 h. p. Among the industries supplied with power by this company are ore-smelters, the city water works at Red Bluff and Redding, and the operation of large air compressors at the Mountain Copper Co.'s mine at Iron Mountain. For lighting current is also furnished to the cities of Redding, Red Bluff, and Willows, and the towns of Keswick, Cottonwood, Anderson, Corning and Vina, all lying along the Sacramento River. Irrigation is necessary on most of the land in this valley and electrically driven centrifugal pumps are employed to raise water to the irrigating ditches. Many thousands of motors are already in operation in California driving pumps for irrigation work. The recent installation of the company in its Cow Creek station consists of two 1,500-kw. 3-phase alternators, which will be driven by impact water-wheels supplied with water under a head of approximately 900 feet, exciters, switchboard and raising transformers, etc. The transmission will be at 34,000 volts. Both stations are equipped with Westinghouse apparatus.

Senator G. B. Davis, of Detroit, president of the Blue Grass Consolidated Traction Co., and a party of capitalists have been looking over the proposed routes of several interurban railways to be built between Lexington, Ky., and nearby towns. It is understood that work will begin before January 1st, as otherwise the franchises in some of the counties expire at that time. Among those in the party were A. K. Patterson, C. R. Adams and W. Eaton of Boston, Mass., and J. P. Clark, Terre Haute, Ind.

## BRISBANE TRAMWAYS RECREATION CLUB.

BY CHARLES E. BADGER.

In July, 1899, the matter of recreation for the motormen and conductors of the Brisbane Tramways when off duty suggested itself to the management and the men almost simultaneously, but by whom the subject was broached is now hardly remembered. Suffice it to say, the matter soon took definite form and on August 8th, the first meeting was held and an organization perfected. The officers chosen were officials of the company. To this the manager, Mr. J. S. Badger, objected, insisting that to attain the purpose of the organization the club should be "of the men, for the men and by the men." Mr. Badger, however, consented to accept the purely honorary office of "Patron" and at a subsequent election officers were chosen from among the men.

Recreation rooms with bath rooms and reading rooms supplied with current literature, illustrated, technical and daily, had previously been provided at the different depots, but as the membership and interest increased, the necessity of larger and more central quarters became apparent and the company offered the use of a building on one of the principal tram lines for the use of the club. The front part of the building was thrown into one large room 54x18 ft. and electric light was installed and the room furnished with punching bag, Indian clubs, dumb bells, quoits, boxing gloves, chess, draughts, etc. The hall is open all day and to a seasonable hour at night, and the men are encouraged when off duty to avail themselves of the privileges of the club. The rear of the building was tendered to one of the married men for living rooms, who assumes the care of the hall in consideration of his rent.

The present membership is about 200 and includes nearly two-thirds of the conductors and motormen, all of those employed being eligible for membership.

The necessary expenses of the club are small, there being nothing for rent or lighting. However, the small monthly due of 6d. (12 cents) is paid by each member from which funds are always available for an occasional "spread."

The government is vested in a committee of twelve, who hold regular monthly meetings, business meetings of the club proper being held annually or upon call of the committee. Frequent formal meetings are held at which guests are entertained, the programmes varying from literary and musical efforts of no mean order, to banquets, at which after dinner speakers are developed. At the latter, the members are their own caterers. No intoxicants nor gambling are permitted under any circumstances. Addresses on topics pertaining particularly to tramway equipment and operation are also presented from time to time. Frequent matches in draughts and chess are arranged, also boxing and fencing matches. Annually a tournament is held at one of the public recreation grounds, at which all forms of outdoor sports (of which Australians are very fond) are contested, medals and prizes being offered by the company, officers and outside parties. The tournaments are usually graced by the presence of state and municipal officials, who have exhibited genuine interest in the club.

As an offshoot of the Recreation Club, a Rifle Club was organized something over a year ago, having now a membership of about seventy. Members of this club are required to take the oath of allegiance to the sovereign, whereupon the state equips the club with rifles, furnishes instructors in rifle practice and the manual of arms, as well as range facilities. Target practice takes place once a week and drills are held twice a week. The Rifle Club by its organization becomes an arm of the State Defence Force and the thoroughness and effectiveness of the drill is shown by the fact that a number of men volunteered for service in the Australian contingents furnished to the Home Government for service in South Africa.

The club has participated in several target matches in which the members acquitted themselves with particular credit.

Another organization of Tramway employes, not exactly an offshoot of the Recreation Club, however, is the Tramway Band. It numbers about twenty members, the company furnishing the instruments and the services of a proficient bandmaster as leader and instructor. Regular practice is held once or twice a week and every Thursday night during the summer, weather permitting, an open air concert is given at a small park on one of the lines where for the purpose of control of the premises the company has leased

some ground and erected a bandstand. That these concerts are popular with the public is attested by the fact that an audience of a couple of thousand is not unusual, nearly all of whom use the trams in going to and returning from the concert. The players are allowed a half day's "time" for each evening's playing at a concert.

More recently, a benefit fund has been established, by means of which employes who are incapacitated through illness receive sick pay while absent from their duties. As a small weekly subscription is all that is required, the majority of the employes are members of this institution, and each branch has been so well managed as to pay all claims in full and have a comfortable fund in bank.

As a result of these organizations the mutual interest of company and men is increased and on the part of the latter has developed the feeling that even a soulless corporation has a desire for the pleasure and contentment of its employes when off duty, as well as for their best service when on duty. A community of interest has thereby been aroused to which may partially be attributable the fact that there never has been any question between the management and employes which has not been readily settled without the slightest friction.

## ABOUT AN ACCIDENT.

The following claim, it is said, was presented by a farmer living at Ararat Summit, Pa., to the New York, Ontario & Western Ry., and the reply is from the pen of the railroad's claim agent:

### THE CLAIM.

My razor-back strolled down your track  
A week ago today,  
Your Twenty-nine came down the line  
And snuffed his life away.

You can't blame me, the hog you see  
Slipped through the cattle gate,  
So kindly pen a check for Ten,  
The debt to liquidate.

### THE ANSWER.

Old Twenty-nine came down the line  
And killed your hog, we know,  
But razor-backs on railroad tracks  
Quite often meet with woe.

Therefore, my friend, we cannot send  
The check for which you pine,  
Just plant the dead, place o'er his head,  
"Here lies a foolish swine."

Ararat Summit is of interest to street railway men as being the scene of the fight between officers and six burglars who had robbed the Carbondale Traction Co's. power house at Mayfield, Mar. 26, 1899. An account of this was given in the "Review" for April, 1899.

## BLUE GRASS TRACTION CO.

The Blue Grass Traction Co., Lexington, Ky., has filed amended articles of incorporation which are designed to widen the field of its operation. The articles provide for an increase in capital stock from \$10,000 to \$350,000, and authorize the company to furnish heat, light and power, to purchase and improve real estate at or near the line of its railway for the purpose of establishing hotels, summer resorts, or parks for the entertainment of its patrons, and to carry passengers, express, freight and the United States mail.

The Metropolitan Street Railway Co., of Dallas, Tex., has been incorporated with a capital of \$4,500,000 to build and operate street railway and interurban lines within and near the city of Dallas. This is believed to mean a consolidation of all the street railway companies of Dallas.

**CONSPIRACY CASE AT BUFFALO.**

About the middle of May, 1902, the claim agent of the International Railway Co. of Buffalo, discovered that a plot was being formed to obtain a large sum of money from the company by means of a fraudulent accident. Mr. A. J. Farrell, general claim agent of the company, informed Mr. T. E. Mitten, the general manager, of what he had discovered regarding the plot, and Mr. Mitten instructed him to give the matter his personal supervision and to lay his plans to unearth the guilty parties, if possible.

Mr. Farrell started an investigation at once and found that the conspirators were Henry Cobb, Adam Willis and George Leonard.

**ANDREW J. FARRELL,**  
Claim Agent.

**FREDERICK HALLER,**  
Assistant District Attorney.

As Mr. Farrell had known Leonard for some time, he was approached and made a party to the scheme and was instructed to get Cobb and Willis to carry it out. Leonard was to assist them and to keep Mr. Farrell informed of all the details of the plot. Cobb and Willis were invited to Leonard's house and the plan was talked over several times.

The night of June 21st was the time selected for the fake accident to occur. Before it was put into execution, however, it was planned to have a final rehearsal at Leonard's house at eight o'clock that night. Three witnesses from the claim department (one of whom was a stenographer) arrived at Leonard's house about an hour before the conspirators. They were placed in an adjoining room where they could see everything that was going on and hear the conversation. Cobb and Willis arrived at Leonard's house at eight o'clock as agreed upon, and the final rehearsal was enacted. The conspirators then left to put their plot into effect,

Willis and Leonard stopped at the corner of Spruce and Sycamore Sts. Willis stood on the northwest crossing or proper stopping place for a westbound car. Leonard stood on the opposite side of the street. Cobb walked one block further east and as a westbound car approached, he walked out from the crosswalk, hailed it, took his handkerchief out of his pocket, and wiped his face. This was a signal agreed upon between them that everything was favorable for their scheme. Cobb walked to the forward end of the car. The conductor followed him to get the fare and Cobb commenced to unbutton his overcoat, which was worn for the occasion. He drew the conductor's attention by asking him which route he would take to get to the depot. As the car approached Spruce St. it was hailed by Willis who was standing at the proper stopping place. The car came to a stop. Willis stepped onto the car, got up onto the platform and into the door. Leonard who was on the opposite side of the street, crossed back of the car and just as it was about ready to start, caught hold of it with his left hand on the dash, his right hand on the body of the car and one foot on the step. As the car started, he fell to the pavement. Willis, who at this time had got to the door of the car, notified the conductor that a man had fallen off. The signal was given by the conductor but the car reached the next street before it could be stopped. Willis, Cobb and the conductor got off and went back and found Leonard lying in the street, groaning and moaning. He was picked up and assisted to the side of the street and his name taken by the conductor. The conductor asked him if he was hurt and he complained of his back and the back of his head being injured. Cobb and Willis gave their names to the conductor but gave fictitious addresses. Leonard was assisted to the police station nearby and taken from there to his home in the patrol wagon. He was carried up two flights of stairs and put to bed. A physician was sent for and when he arrived, made an examination. Leonard, according to instructions, deceived the doctor by claiming a severe pain in the small of the back and also in the back of the head. The doctor made several visits but the improvement in his patient was not noticeable.

Mr. Millard F. Brown was the attorney employed by Cobb and Willis to look after Leonard's case. Mr. Brown called on the claim agent and made a demand for \$500.00 for the injury to his client. The claim agent requested him to submit this in writing so that it could be taken up with the management; he also requested a statement from the doctor in regard to his client's injuries, which statements were furnished.

The time consumed by Leonard's supposed illness was three weeks, and during this time Cobb and Willis were almost nightly visitors at Leonard's house.

The money received from the railway company was to be divided

**ADAM WILLIS, ALIAS HAWKINS.**

Age, 40. Height, 5 ft. Weight, 190 lb. Build, stout. Hair, black. Eyes, dark brown. Complexion, dark. Mustache, dark. Occupation, canvasser.

**HENRY COBB.**

Age, 44. Height, 5 ft., 11 in. Weight, 160 lb. Build, slim. Hair, dark and gray. Complexion, sallow. Mustache, gray. Occupation, taker.

closely followed by the witness. They walked to the corner of Michigan and Goodell Sts., which had been the location agreed upon, but to their surprise they found that the cars on this line were of the open type and not appropriate for the purpose. They then walked to the corner of Spruce and Sycamore Sts., the cars on the Sycamore line being closed cars.

as follows: Leonard was to get one-half and pay his doctor bill; Cobb, Willis and the attorney were to divide the other half.

This time was considered opportune for the arrest of the conspirators, the claim agent therefore swore out a warrant and in company with two detectives went to Leonard's house. It had already been arranged that Cobb and Willis were to be there. The

and were arrested and appeared before a police justice next morning. They waived examination, were held for the grand jury and committed to jail. The case was presented to the grand jury and the men were indicted.

On November 17th their trial took place at the criminal term of the Supreme Court, the state being represented by Fred Haller, first assistant district attorney. The trial lasted two days. The defense put on no witnesses. The case was given to the jury which returned a verdict of guilty as charged in the indictment, after being out only an hour and two hours. Leonard turned state's evidence and made a good witness for the prosecution.

From the time the conspirators arrived at Leonard's house for the last rehearsal, until the fake accident occurred and Leonard was placed in the patrol wagon, they were never lost sight of by the men from the claim department of the company.

The evidence produced at the trial showed that these men were not new at the business and that they had received money from different street railway companies throughout the country for similar fake accidents. After they received the money for this last accident, they were to proceed to Cleveland and in that city they were to have a double fall, that is, Leonard and Willis were to fall and Cobb was to be the witness. From Cleveland they were to go to Detroit and from city to city doing this kind of work. This was agreed upon before the rehearsal of June 21st took place.

On November 20th, Hawkins and Adams were each sentenced to one year's imprisonment at hard labor.

#### ELECTRIC POWER ON GERMAN CANAL.

The Tetlow Canal connects the Havel and Spree Rivers not far from Berlin. It is 23 miles long and has one lock. The annual traffic is estimated at 1,500,000 tons. Early in this year bids were invited for the installation of an electric equipment for traction purposes. Twenty bids were received. The proposed installation of Messrs. Ganz & Co. is of especial interest. It proposes to build a tow path on one bank of the canal, although both could be used if desired, with the exception of a short distance where some special arrangement would have to be made. Power is to be supplied in the form of a three-phase current at 8,000 volts and 50 periods. The company claims that, although its locomotive is very light, it will have a high tractive power due to the two wheels of each pair being inclined at an angle to each other and running on a single rail. The locomotive will maintain its balance by means of another wheel running on the roadway. The greater part of the weight, however, is thrown on the inclined wheels. The locomotive is equipped with a three-phase motor having its axle parallel to the rail. The efficiency at full loads for the motors is 90 per cent, for the gearing 94 per cent, and for the worm gearing 80 per cent, or a total of 68 per cent for the locomotive. The current is supplied to a two-wire trolley line at a pressure of 500 volts, the rail serving as a return conductor, and is taken from these wires by a double trolley arrangement. For some distance the canal passes through a lake, where electric tugs are used to tow the boats. They are driven by two three-phase motors of 67 h. p. capacity each. Current is supplied them by means of overhead lines supported by transverse wires. Six tugs and 53 locomotives would be required for the service. A locomotive can draw a boat of 600 tons or two of 175 tons each. The price quoted by Ganz & Co. for the equipment was \$248,400.

The Omaha Street Railway Co. has secured franchises and will begin at once to construct an extension to Florence, a distance of 3½ miles.

As the result of a large blue heron coming in contact with two high potential wires and short-circuiting the current, traffic was recently suspended for five hours on the Utica & Mohawk Valley Ry. A similar accident occurred on the same line about two years ago when a cat short-circuited the current.

All electric cars in East St. Louis except those from Belleville have been run over the Eads bridge since November 15th. The Belleville cars, which now run to the Relay depot, will also run over the bridge as soon as the new power house is completed. They do not now cross on account of lack of power.

#### KANSAS CITY NOTES.

The Metropolitan Street Railway Co. of Kansas City, Mo., has placed the cars which were bought for the old Heim Lane in service on the North East Division. These cars are of the Pullman type and are particularly handsome in appearance, being finished in mahogany, with plate glass windows, leather upholstery, etc.

The city franchises of the company will expire within a few years and the company has offered the city 8 per cent of the gross receipts and the gift of a 100-acre park for their renewal. It is said that the proposition was favorably considered by most of the city officials and citizens, but certain political aspirants urged amendments demanding so much that the company has stopped work on important improvements until there is some assurance of a satisfactory adjustment. The city officials have made trips with the officers of the company over the proposed route to the park referred to. The Swope Park is 4½ miles out of the city limits. Property owners have offered the right of way for a boulevard to the park 150 ft. in width. The proposed plan is for an elevated strip 20 ft. wide for car tracks, the other 130 ft. to contain a driveway, bicycle path and sidewalks.

It is reported that union organizers have been in the city for the purpose of forming a street railway employes' union. Their efforts were fruitless as the men have been induced to leave their positions several times and go on strike and have lost. The men are satisfied with the treatment of the company and are not willing to assume any risk by joining the union.

The company has under consideration a plan to abandon the Independence Ave. and the Ninth St. cable lines, which are parallel and close together, and build an electric line on a street between them, which it is believed will give a much more satisfactory service.

Mr. S. M. James, formerly superintendent of the 18th Street Division, and later general superintendent, has been promoted to be assistant general manager. Mr. James is yet a young man and has achieved success in the street railway field.

The company is experimenting with an electrically operated switch which, if satisfactory, will be adopted for the entire system.

A man has sued the company for \$1,000 for being put off a car by a conductor who refused to accept a smooth nickel. Another has brought suit for \$20,000 for being arrested and removed from a car by an officer for refusal to pay his fare. He was one of a number who refused to pay fare until a fire was made in the stove of the car. The others were induced by the officer to pay their fares.

The Troost Ave. Line has had the old cable track replaced by a new electric track of heavy construction. This line has also new double-truck cars and other modern equipment. The changes have been made under the direction of Mr. G. B. Tutweiler.

#### ELECTRIC RAILWAY EXPRESS SERVICE AT UTICA, N. Y.

On December 1st the Utica & Mohawk Valley Railway Co. established an express service between Utica, New York Mills, Yorkville, Whitesboro, New Hartford, Clinton, Oriskany, Rome and Frankfort. Two cars will be operated at the outset and others will be added as the increase of business demands. At least two trips a day will be made to each place and possibly three or four to some of them. The central office is located at the Main St. car barns in Utica. A package of any size that can be put into the cars will be received for transportation. Express wagons drawn by horses are used in Utica, Clinton, and Rome. The cars and express wagons have been painted a conspicuous yellow color. The new service is a great convenience to persons from the villages shopping in the city, as they can have packages sent to the Main St. depot and they will be promptly delivered to the address of the purchaser.

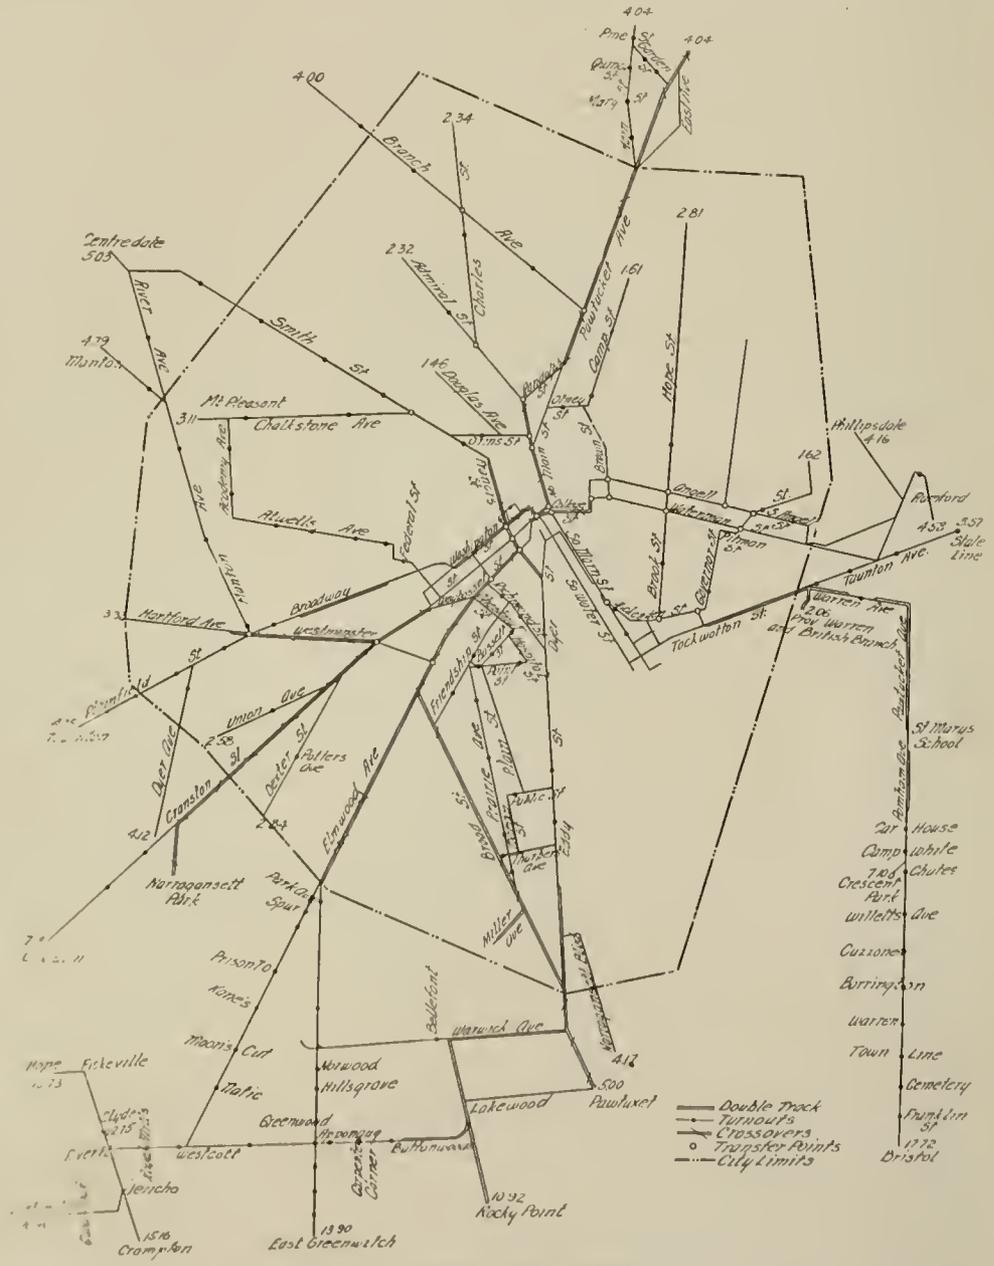

The construction of the Rockford & Freeport Electric Railway was begun in November. The contract for the entire road was awarded to the Northern Construction Co. The price is reported to have been about \$750,000. Contracts for various portions of the work will be sublet. The contract calls for the completion of the line by July 1, 1903.

TRANSFER SYSTEM AT PROVIDENCE.

At its January session, of the year 1902, the General Assembly of the State of Rhode Island passed an act providing for free transfers on street railways in the state. The act which was passed under date of March 28, 1902, forms Chapter 965 of the Public Laws, and is in part as follows:

Section 1. Every corporation operating lines of street railway in this state, accepting the provisions of this act, shall, on or before the tenth day of July, 1902, provide a system of free transfer tickets on its lines, which shall enable any passenger, paying the regular fare of 5 cents on any car operated by such corporation, to ride from the point in any city or town where he enters such cars to any other point in such city or town reached by a second car operated by the same corporation upon a track which physically intersects or connects, at a point toward which the passenger first took passage—the purpose of this provision being to make it possible for one passenger to go, by means of one transfer, from any point within the present limits of any such city or town reached by any line of cars as the same may from time to time be established by any such corporation, by a continuous trip, as near as may be, in the car in which he first takes passage, and by a second car running on any track connecting or intersecting as aforesaid, and used or operated by the same corporation, to any point within said limits reached by such second car, upon payment of a single fare of 5 cents, which fare said corporation is hereby authorized to charge: Provided, however (1), that no passenger shall be entitled to a transfer ticket unless he demands the same at the time of paying a cash fare; (2), that a transfer ticket shall not entitle a passenger to be transported upon any intersecting or connecting track, unless such passenger takes passage, at the point of intersection or connection, on the first car which passes such point after the passenger arrives thereat, and which is being operated over the connecting or intersecting track in the direction in which the passenger desires to go; (3), that such corporation shall not be required to issue any transfer ticket which will enable a passenger to return towards the point where he first took passage, by a line running parallel with or in substantially the same general direction as the one from which he is transferred; (4), that no person shall be entitled to a transfer in any case where he can reach his point of destination on the lines of said company, from the point where he first takes passage, without such transfer, upon payment of a single fare of 5 cents; (5), that transfer tickets shall not be assignable or transferable to any other person, but shall be used only by the person to whom issued; (6) that such corporation shall be required to issue only one transfer ticket for a 5-cent fare, and such ticket shall entitle a passenger to a transfer from the car in which he begins his journey to a second car, but not further; (7) that such corporation may designate upon such tickets the route or routes

upon which, and the direction in which, such tickets will be received in lieu of fare, and the point of intersection or connection at which, and the time within which, such tickets must be presented in order to be so received. And no such ticket shall be valid unless presented at the point and within the time designated upon a car of such corporation operated over the route and in the direction indicated upon such ticket, and by the passenger to whom such ticket has been issued by the company or its agent at the time of receiving from such a passenger a regular fare; and such corporation may establish and print on such tickets all such other reasonable rules and regula-

RAILWAY LINES OF PROVIDENCE, R. I.

tions as may be required to prevent fraud in the issue or use of such transfer tickets, so that the same may not be used contrary to the purpose and intent of this section.

Sec. 2. If any person other than the passenger to whom a transfer ticket has been issued shall present such ticket to the conductor of any car in lieu of payment of fare, or if any person shall present such ticket to such conductor in lieu of payment of fare at a time other than the time when or at a place other than the place where such ticket is by its terms made valid, such conductor may take up such ticket and demand from such person the payment of a regular fare; and if such payment is refused, may eject such person from such car.

Sec. 3. No transfer ticket giving or purporting to give the right

A transfer from one car to another car shall be issued, sold, or given to any person except a passenger, nor at any time except when a regular fare is paid, nor by any person except the conductor or other agent of the corporation who receives such fare. Provided, that nothing herein contained shall prevent a passenger or other person who has lawfully received a transfer ticket from delivering the same to any conductor or other agent of the corporation acting in the discharge of his duties.

Sec 4. No person shall purchase or receive any transfer ticket giving or purporting to give the right of transfer from one car to another, except from a conductor to whom such person has paid a regular fare, nor shall any person, except a passenger who has received a transfer ticket upon payment of a regular fare, present or offer any such ticket to the conductor of any car for passage: Provided, however, that this section shall not apply to conductors or other agents of any such corporation who receive transfers in the regular discharge of their duties.

Sec 5. Every person violating any of the provisions of sections 3 or 4 of this act shall be fined not less than five or more than twenty dollars for each offense.

At the same session this act was amended (Chapter 1008 of the Public Laws) to provide that no transfer ticket should entitle any person to ride in the second car a greater distance from the point of intersection or connection than he would be entitled to ride upon such second car upon payment of a 5-cent fare, and providing further that "if any company shall fail to provide for the system of transfers herein required, on or before the 10th day of July, 1902, it shall be the duty of the attorney general to enforce compliance with the provisions of section 1 of this act by mandamus or by other appropriate proceedings."

In accordance with the provisions of this act, the several companies controlled by the Rhode Island Co. instituted general transfer systems in the cities in which the lines are located.

The arranging of a fair and satisfactory transfer system in the city of Providence proved to be an exceedingly difficult matter. The Providence system includes several comparatively short lines radiating from practically one common center to virtually all the points of the compass. The situation was rendered more complicated by reason of the fact that many of these lines converged near their center terminals, and there are numerous instances in which two or more lines are not more than three or four blocks apart in the residential portion of the city. It will thus be seen that anything like a universal transfer system from one line to another would permit a person living between two lines to go to town on one line, obtain a transfer, transact considerable business within the transfer time limit and return home on the other line by the payment of but a single 5-cent fare, a privilege not contemplated in the act requiring transfers.

In order to restrict circuit riding, and acting within the provisions of the transfer law, the company designated some 30 intersecting points on the system as transfer points, and a transfer ticket was adopted which by means of the conductors' punch marks, restricts the transfer privileges to a prescribed intersecting point, direction, destination, and time. The form of ticket adopted is unusually comprehensive in its scope, and at the same time is designed to reduce abuse of the transfer privileges to a minimum. But one form of

ticket is employed on all lines, thus greatly simplifying the work of distribution, issuing and checking transfers, and also reducing the cost of printing tickets. As will be seen from a sample reproduced, the ticket bears on its face, the names of all transfer junctions, and also the names of all the lines to and from which transfers are issued, and the conditions under which the ticket is good are indicated by punch marks. For instance, the sample shown is punched to read, from North Main St. to Olneyville at Market Square going west, and must be used before 50 minutes after 10 in the morning.

The distinction between a. m. and p. m., is made by punching the name of the line in either the light portion or the shaded portion, as the case may be. It will be noted that although the Main St. line and the Olneyville line may intersect at several additional points than Market Sq., this particular ticket would not be good at the other intersections. It will also be noted that the principles on which the ticket is designed, permits any desired combination to be indicated, and by punching one combination the possibility of using the ticket in any other combination is prohibited. The company uses but one color of paper, yellow, and the date is indicated in advance in the printing. This of course gives rise to some waste inasmuch as all the tickets printed for any particular day may not be used, but the cost of these waste tickets is very trifling, and is offset by the greater convenience secured. The design is open to one objection inasmuch as the conductor has to make at least four separate punches in issuing a ticket, but no other scheme could be devised without requiring a multiplicity of forms, and consequent difficulties in printing, distributing and checking. The company is now issuing on the lines in Providence about 2,200 transfer tickets on week days and about 4,200 on Sunday.

**MANSFIELD & EASTERN TRACTION CO.**

The Mansfield & Eastern Traction Co. of Mansfield, O., was recently incorporated with the object of building two lines of electric railway, one from Mansfield to Ashland, via Millin, and another from Mansfield to Wooster via Hayesville. The president of the company is W. J. Pentz, of Cleveland; secretary Joseph W. Galbraith, Mansfield; treasurer James J. McGuire and vice-president and general manager, Charles Meily, Mansfield. The total mileage of the road contemplated is about 40 miles of single track located as follows: From Mansfield to Ashland 16 miles; from Mansfield to Wooster 22 miles; from Millin to the company's summer resort one mile. The total mileage to be built this season is 17 miles and the company is now ready to undertake construction work and will take advantage of any open weather during the winter. It is desired to have the line from Mansfield to Ashland ready for operation by June 1st if possible, and no work will be done on the Mansfield-Wooster line until the Ashland line is in operation. Eight miles of the Mansfield and Ashland line will be used for the Mansfield and Wooster, and both lines run through a territory not traversed by steam or electric roads.

The route between Mansfield and Ashland is two miles shorter than by the Erie Railroad, and from Mansfield to Wooster is 11 miles shorter than by the Pennsylvania Railroad. The towns en route include Millin, with a population of 300, Hayesville 600, Steamtown 100 and East Mansfield 500. The population along the route is estimated at about 1,580 per mile.

The company has also purchased what is known as the Petersburg Lake Farm which is located midway between Mansfield and Ashland, and it is the intention to make a first class summer resort of this property. There are no other amusement resorts near either of these cities and it is expected this feature will induce a large patronage. The farm covers 163 acres and includes three lakes of deep spring water of 40, 7, and 6 acres respectively, all of which are connected by channels. The large lake has its outlet into the Mohican River which skirts one side of the property.

The Houston (Tex.) Electric Co. began the operation of an observation car November 17th. A fare of 25 cents is charged to view all the interesting points about the city, which are pointed out by a guide.

J. B. Dunn has brought suit against the Memphis (Tenn.) Street Railway Co. for \$10,000 on account of the alleged failure of a conductor in the employ of the company to return 20 cents change due him, and for abuse by the conductor.

## RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

### BOTH LESSOR AND LESSEE COMPANIES LIABLE FOR INJURIES.

West Chicago Street Railway Co. v. Horne (Ill.), 64 N. E. Rep. 331. June 19, 1902.

The law is well settled, the supreme court of Illinois says, that when an injury results from the negligence or unlawful operation of a railway, whether by the corporation to which the franchise is granted or by another corporation which the proprietary company authorizes or permits to use its tracks, both the lessor and lessee are liable to respond in damages to the party injured.

### NO INJUNCTION AGAINST DISPOSAL OF MATERIAL BY CONTRACTOR FOR ROAD.

Orleans & Jefferson Railway Co., Limited, v. International Construction Co. (La.), 32 So. Rep. 218. Mar. 31, 1902. Rehearing denied May 26, 1902.

The mere fact that a contractor who has undertaken to build and equip a street railroad has assembled certain material with the intention of using it for the purposes of the contract gives the other contracting party no proprietary interest in such material, nor does it give him the right to control the disposition of it. Hence, the supreme court of Louisiana holds, an injunction will not lie at the suit of the other contracting party to prohibit the contractor from removing such material or otherwise disposing of it.

### FAILURE TO APPREHEND THAT BOY WILL JUMP FROM BACK OF WAGON AND RUN UNDER CAR—DUTY IN PASSING LOADED WAGON.

Baier v. Camden & Suburban Railway Co. (N. J. Sup.), 52 Atl. Rep. 215. June 9, 1902.

A motorman is not chargeable with negligence, the supreme court of New Jersey holds, because he fails to apprehend that a boy who is riding on the back of a wagon will jump from the wagon and run under his car while he is engaged in looking at the wagon in order to pass it without a collision. The car in this case slowed up as it approached the wagon, which was loaded with about 100 sugar and flour barrels giving it the appearance, as to dimensions, like that of a wagon loaded with hay or straw. The motorman, the court says, was under no duty to stop the car. He had a right to pass the wagon, using due care to do so without striking it.

### UNEXPLAINED FALL FROM STREET CAR—DOCTRINE OF RES IPSA LOQUITUR NOT APPLICABLE.

Paynter v. Bridgeton & Millville Traction Co. (N. J.), 52 Atl. Rep. 367. June 16, 1902.

A mere fall from a street car, without any evidence to show how the fall was occasioned, the court of errors and appeals of New Jersey holds, raises no presumption of negligence on the part of the operators of the car. Again, it says that a fall while alighting from a street car is not such a fact, standing alone, as to authorize the application of the doctrine of *res ipsa loquitur*, or the matter speaks for itself. The doctrine of *res ipsa loquitur* is applicable only when the thing shown speaks of the negligence of the defendant, not merely of the happening of the accident. If it had been proved that a jerk or jolt of the car had produced the fall, that fact, unexplained, might be said to prove the defendant's negligence, although the defendant might furnish an explanation of it which would relieve from responsibility.

### FALL OF PERSON INTO FENDER NOT CONCLUSIVE EVIDENCE OF HIS POSITION WHEN STRUCK.

Hoyt v. Metropolitan Street Railway Co. (N. Y. Sup.), 76 N. Y. Supp. 832. June 6, 1902.

The fact that the party being was thrown into the fender, the first appellate division of the supreme court of New York says, was by no means conclusive of his position at the time when he was struck.

No accurate law of physics can be invoked to determine just how a body ought to fall or will fall when struck under such circumstances. There is the action of the car, the life and movement of the person, and very strange results may and do flow from the operation of both forces. They are not to be accounted for upon any rule which might find application to an inanimate body. The question of this party's position when he was struck, whether, as he testified, he was just leaving the track on which the car was running at the time he was struck, or whether, as the company sought to make out, he could not in any event have gotten further than the center of the track, was therefore for the jury.

### \$2,000 FOR INTERNAL INJURY CAUSED TO PASSENGER HOLDING TO STRAP BY SUDDEN STOPPING OF CAR.

Chicago City Railway Co. v. Morse (Ill.), 64 N. E. Rep. 304. June 19, 1902.

The evidence in this case showed that the car upon which the latter-named party was riding was greatly crowded, and he was compelled to stand in the aisle, and hold to one of the straps suspended from the ceiling, provided for that purpose, and that on one occasion the car came to a sudden and violent stop, throwing the passengers forward who were standing, and some of them were violently thrown against him. He testified that, in order to prevent his being thrown off his feet, he held onto the strap, and at the time felt a sharp pain in his right groin, and that after getting off the car and proceeding to the place of his employment he discovered that hernia had been developed. This evidence was corroborated, and clearly tended to support the declaration. The question was therefore, the supreme court of Illinois holds, one of fact, which was properly submitted to the jury. As to the contention that the \$2,000 damages allowed were excessive, the supreme court says that likewise was a question of fact settled by the judgment of affirmance in the appellate court, which judgment the supreme court affirms.

### CARE REQUIRED OF STREET RAILWAY AS COMMON CARRIER OF PASSENGERS—TO GIVE WARNING IF STOPPING PLACE IS UNSAFE.

Montgomery Street Railway v. Mason (Ala.), 32 So. Rep. 261. Apr. 9, 1902. Rehearing denied June 2, 1902.

It cannot be doubted, the supreme court of Alabama says, that street railway companies, as common carriers of passengers for hire, are under the duty of exercising the highest degree of diligence and care in conserving the safety of their passengers, and are responsible for the slightest neglect. This duty arises when the relation of carrier and passenger begins, and continues until that relation is ended. The same duty of exercising the highest degree of diligence and care in the carriage or transportation of passengers in law and reason extends to and includes the safe landing of the passenger at the termination of his journey or ride, and this duty is not performed when the carrier lands its passenger at a time and place of such unknown environment to him that, in his first effort to depart after alighting onto the ground, he is tripped and thrown by an unseen pile of lumber and debris. And the court holds that if a car stops where it is unsafe for passengers to alight, it is the duty of the company to give warning.

### INJURY TO ONE PASSENGER BY ANOTHER BEING THROWN UPON HER IN CAR ROUNDING CURVE.

Merrill v. Metropolitan Street Railway Co. (N. Y. Sup.), 77 N. Y. Supp. 122. June 13, 1902.

In this case, where a passenger on a cable car was injured by another passenger falling on her, which fall was caused by a jerk in the car rounding a curve, the first appellate division of the supreme court of New York says that the rule would seem to be applicable that the company was only liable for the failure of the gripman to use that skill and care which would be required by an ordinary

car to and prudent man. There was nothing here to suggest that the second passenger, in entering the car when he did, would cause an injury to the other passengers. In the absence of excessive speed or the application of more power than was necessary to round this curve, there would certainly be no evidence to justify the jury in finding that the company was negligent, and, the jury having found that the speed of the car was not excessive, the company was entitled to a verdict. The fact that the person who was thrown upon the other had been talking to the conductor while the car was going through the street from which it turned at the curve would also seem to be immaterial, as this conversation with the conductor had no relation to the accident.

#### LIABILITY FOR NEW PAVING

*Borough of West Chester v. West Chester Street Railway Co. (Pa.),*  
52 Atl. Rep. 252. June 4, 1902.

An accepted ordinance provided that the company should at all times keep the space between its tracks and eighteen inches outside thereof in good repair and to conform to the macadamizing or paving in the borough, and that whenever the borough should thereafter pave or macadamize any street or streets along the line of the railway, with asphalt blocks, asphalt sheeting or broken stone, the company should at the same time pave and macadamize the street occupied by the railway, that is to say, between the tracks and eighteen inches outside thereof, on each side of the railway, with the same kind of block or material with which the borough paved and macadamized the street or streets. A relief resolution provided that by way of encouraging the construction of an efficient street railway in the borough the company be relieved from the obligation of keeping in repair the street, streets or parts of streets, occupied by its tracks, until such time as it should either earn or pay a dividend to its stockholders on its capital stock. The supreme court of Pennsylvania holds that, under this contract, the company was liable for paving between the rails of its road, and eighteen inches outside each rail where a macadam pavement which was down was removed from the streets in the business portion of the borough and one of asphalt laid in its place.

#### LIABILITY FOR PAVING PROPORTIONATE TO SPACE OCCUPIED BY ROADBED—ROADBED DEFINED— INJURY TO PAVEMENT IN STRENGTHENING TRACK.

*City of Shreveport v. Shreveport Belt Railway Co. (La.),* 32 So. Rep. 189. May 12, 1902.

Under a statute making a street railway company liable for that proportion of the cost of paving a street in which it has its track equivalent to the space occupied by its roadbed, the supreme court of Louisiana, which has held that when cross-ties were used that extended to a width of seven feet, the roadbed must be taken as measuring seven feet, now holds that when girders or sleepers are used, the narrower roadbed, which consists of the foundation on which the superstructure rests, is alone to be taken as the width in fixing the company's proportion of costs. The rails are the superstructure. The roadbed does not include part of the adjacent roadway on which rails do not rest. The proportion of the space being limited to the roadbed, the court is without authority to take the outside of the track into account on the ground that the road is benefited by the adjacent pavement. With regard to the statement in the argument for the city that there was already trouble about the superstructure of the track and that in order to build and strengthen the concrete cubes it would disturb and weaken at least a foot of the street on the outside of each bed, the court says that it inferred that the necessity of these changes or repairs was very remote; besides, if it should arise, in its view it would devolve upon the railway company to make the repairs at its costs.

#### NOT ASSESSABLE FOR PAVING AS OWNER OF LOT OR PARCEL OF LAND.

*North Jersey Street Railway Co. v. Mayor, Etc., of Jersey City (N. J. Sup.),* 52 Atl. Rep. 300. June 9, 1902.

Where a city street had been paved and improved under a statute authorizing the board or body having control of the streets and highways of any city of the first class of the state to pave or other-

wise improve any street, avenue, or public highway in such city, and to cause so much thereof as should equal the amount of benefits to be assessed by its proper officers upon the property specially benefited thereby, the supreme court of New Jersey holds that an assessment of such benefits made upon a street railway constructed and operated along the street in question under the authority of a municipal ordinance was unauthorized, and should be set aside. It bases the decision upon the ground that the right of the railway company to locate its tracks in the street and operate its railway therein was not a lot or parcel of land, within the meaning of the statute, which, among other things, directed the commissioners, in making their assessment, to make therewith a report and map showing the benefit to each lot or parcel of land specially benefited by the improvement. An ordinance of the city requiring the railway company to pave the space within its tracks and two feet outside the same, the court further holds, gave no authority in support of such an assessment made against the company under the above statute.

#### STARTING CAR BEFORE INFIRM OR OTHER PASSENGER IS SEATED.

*Herbich v. North Jersey Street Railway Co. (N. J.),* 52 Atl. Rep. 357. June 16, 1902.

In the case of a plaintiff two years and nine months old, who was thrown down by the starting of a street car, which she had boarded, before she had time to be seated, and while she was for the moment out of the reach of her attendant, who was also boarding the car, the court of errors and appeals of New Jersey holds that it was not error to refuse to charge the jury "that the starting of a car before a passenger is seated is not negligence." It says that, as applied to the circumstances for which the plaintiff contended, the proposition was untrue, or at least it was for the jury, not the judge, to say whether it was true. While usually the proposition may be accepted as true, yet the passenger may be so infirm, by reason of infancy or old age or sickness or lameness, or other cause, that even the ordinary movement of a street car in starting before he is seated would be likely to throw him down. In such cases, if the carrier is chargeable with notice of the infirmity, it cannot be the duty of the court to instruct the jury that the starting of the car is not a breach of the carrier's obligation to exercise a high degree of care for the safety of the passenger. In the present case the infirmity of the plaintiff was evident, and must have been observed by the conductor, who, according to his own testimony, had the mother and child in view from the time when they began to board the car until the accident happened.

#### WHEN INTERURBAN RAILROAD AN ADDITIONAL BURDEN ON PUBLIC HIGHWAY AND ELECTRIC PLANT ANOTHER ADDITIONAL BURDEN— RIGHT OF ABUTTERS TO INJUNCTION.

*Schaaf v. Cleveland, Medina & Southern Railway Co. (Ohio),* 64 N. E. Rep. 145. Apr. 22, 1902.

The construction and operation of an interurban railroad laid with T-rails, entirely on the side of a public highway next to the abutting improved farms owned and occupied by the plaintiffs, and entirely between their lands and the traveled part of the highway,—the company having authority to run an unlimited number of cars and trains for the carrying of passengers, and the transportation of freight, express matter, and government mail.—the supreme court of Ohio holds, is an additional burden on the public highway, and obstruction to and interference with the plaintiffs' easements and rights therein, not substantially different from those that are imposed by the construction and operation of steam railroads under like conditions.

The construction and operation of an electric plant in connection with such railway, and on the same side of the traveled public roadway, for supplying heat, power, and light to consumers for profit, constitutes another additional burden, which is an invasion of the plaintiffs' property rights.

The plaintiffs are entitled to injunction, in such case, to prevent the construction and operation of such railroad and of such electric plant, or either, until compensation and damages shall be assessed them in a proper appropriation proceeding, and paid, or secured to be paid.

WHEN DUTY AS COMMON CARRIER ENDS—RISKS ASSUMED BY PERSON WALKING BACK ON RAILROAD AFTER ALIGHTING FROM CAR.

Indiana Railway Co. v. Feirick (Ind.), 64 N. E. Rep. 221. May 27, 1902.

According to the complaint in this case, a passenger on an inter-urban line was put off at the wrong road crossing, on a cold, dark and stormy night. He did not know where he was, except that he was east of the point where he wanted to stop, and did not know of any other route to that point. But all of his averments concerning his taking passage on the car, his place of destination, his want of knowledge of the route, the circumstances of his leaving the car, the supreme court of Indiana says, were merely recitals, as matter of inducement, to show that he was rightfully on the railroad, when, while proceeding with all due care and prudence, he struck his foot against a stake that the company's agents or employes had carelessly and negligently left sticking above the ground four or five inches, and was thrown to the ground, and greatly injured. Under the complaint, as it stood, the court must assume that his discharge from the car was satisfactory to him or justifiable. If satisfactory or justifiable, then the company's duty to him as a common carrier was performed when he left the car safely. And as he stood upon the crossing, after the departure of the car, in the absence of any showing to the contrary, his relation to the company was the same as that of a stranger. This being so, when he took up his journey on the company's private railroad without invitation he did so with no greater rights than an ordinary licensee, taking upon himself all the perils that were incident thereto.

NO IMPLIED CONDITION OF ROAD BEING AUTHORIZED OUTSIDE OF TOWN—VOLUNTARY DEPOSIT OF MONEY CONTRARY TO PUBLIC POLICY NOT RECOVERABLE.

West Springfield & Agawam Street Railway Co. v. Bodurtha (Mass.), 64 N. E. Rep. 414. June 18, 1902.

Where a street railway company deposited \$2,000 with the selectmen of a town, to be turned over to the town treasurer if 10 miles of road was not in operation within a year, and under the location more than 10 miles of railway could have been built in that town alone, the supreme judicial court of Massachusetts holds that there was no ground for implying a condition that the company should be authorized to build outside of that town. Furthermore, it says that it was plain from the facts found by the master that the obligation to pay over the \$2,000 was not one imposed by the selectmen at their own instance, and that such a payment was first suggested and offered by the company itself, in asking for a location, and that the condition, as incorporated in the grant of location, was one drafted by its own attorney, and was more than once accepted by the company. Under such circumstances, the payment was not involuntary or constrained. The company was in this position: If the condition was a proper one, there was no reason why the company should have the money back. If it was against public policy, the company could no more have the help of the courts to recover the money than to recover a bribe. It did not act under any necessity, but of its own voluntary choice; and, in declining to aid in the recovery of money voluntarily paid against public policy, the courts leave the plaintiff where it has seen fit to place itself.

CARE REQUIRED TO PREVENT INJURY TO EMPLOYEES IN RECONSTRUCTION OF ELECTRIC ROAD—SHOCK TO LABORER AIDING IN CARRYING RAIL COMING INTO CONTACT WITH IRON POLE.

Thompson v. New Orleans & Carrollton Railroad Co. (La.), 32 So. Rep. 177. Apr. 14, 1902. Rehearing denied May 27, 1902.

There being great danger of accident in carrying on the work of reconstruction of the overhead lines and the railway track of an electric railway system, as in handling heavy rails, from the falling of pole, danger of wire coming in contact with grounded poles and forming circuits, and other risks attending the reconstruction of an electric railway, the supreme court of Louisiana holds that it imposes a high degree of responsibility on the company, in order,

by every reasonable means, to prevent injury to its employes. Here a laborer, engaged with others in carrying a heavy rail, which came into contact with an iron trolley pole, received an electric shock which killed him. The court, which affirms a judgment for damages, says that it was led to believe from the facts that there was a live wire uninsulated, or defectively insulated, resting on the pole in question, and that companies are liable for accidents due to defective insulation, or to failure to take proper precautions to prevent conductors of electricity from coming into contact with their trolley wires. It further considers it specially requisite to warn the employes of the danger when it is as great as it was in this case. That those in charge expressed some apprehension lest accident, in view of the danger, would occur, could not have the effect of releasing the company from all responsibility. In this case, although the plan of general operations may have been good enough, and the officers mindful of their trust, it did not relieve the company from indebtedness for injury due to some oversight or negligence resulting in a fatal accident to one of a gang of 20 laborers. Whatever special patrol or warning party there may have been, it was not shown that it sought to warn him of the danger by which he was surrounded. The risk was not one assumed by the employes.

INJURY TO CONDUCTOR FROM OVEREXERTION ON TURNTABLE OUT OF REPAIR.

Roberts v. Indianapolis Street Railway Co. (Ind.), 64 N. E. Rep. 217. May 27, 1902.

It was the duty of the conductor and motorman in charge of each car to run it onto a turntable and turn it around at the end of the line. The turntable became out of repair, and a conductor in trying with the motorman to turn it strained and severely injured himself internally. But conceding that the company, under the alleged facts, was guilty of negligence in failing to keep the turntable in proper repair, the supreme court of Indiana holds that nevertheless the complaint, under its averments, clearly established that the conductor, in exerting or straining himself in turning the table, was also guilty of negligence which contributed as a proximate cause to the injuries which he sustained; hence the case was ruled by the maxim of "Dammum absque injuria," a loss without a wrong, and he could not recover in this action. It says that the conductor was under no obligation to the company to overexert or strain himself in his effort to turn the table, and certainly, under the circumstances, the company could not anticipate or foresee that by reason of its failure to repair the table there was any necessity to protect him against his own voluntary action in subjecting himself to the overexertion or strain which resulted in the injury of which he complained. He was shown to have known of the condition of the table, and, from his previous experience in the operation thereof, he certainly was aware of the extra effort or force that was required to operate the table. He was presumed to have known his own strength, and in fact he himself was the only one who, under the circumstances, could measure the extent to which he could safely exert himself in his effort to turn the table. The company neither exacted nor had the right to exact of him any overexertion of his strength in turning the table; hence he assumed whatever risk there was due to such overexertion or strain to which he voluntarily subjected himself. If the complaint could be said to show actionable negligence on the part of the company, it also, under the facts, established a defense in its favor, and therefore, under a well-settled rule of pleading, was bad on demurrer.

AGAINST INJUNCTION PENDING LITIGATION OVER LEASE OF ROAD.

Content et al. v. Metropolitan Street Railway Co. et al. (N. Y. Sup.), 76 N. Y. Supp. 749. June 6, 1902.

The plaintiffs, as stockholders of the Metropolitan Street Railway, brought this action to perpetually enjoin and restrain the defendants from delivering or carrying into effect a proposed lease between the Metropolitan Street Railway Company and the Inter-urban Street Railway Company. An injunction was granted pending the return of an order to show cause why the same should not be continued during the pendency of the action. But upon the return of the order the injunction was vacated, and the first appellate division of the supreme court of New York holds that the

tacts justified the refusal to continue the injunction. It says that the lease was executed by the board of directors of the respective companies, and was approved by unanimous vote of the stockholders of the Interurban Street Railway Company, and by over 80 per cent of the stockholders of the Metropolitan Street Railway Company, and whether the board of directors of the latter company had the power to make such lease, as approved by such a large majority of its stockholders, ought not to be determined upon ex parte affidavits, or affidavits from or upon one side, but rather should be left to a trial where all of the questions bearing thereon could be thoroughly considered and passed upon, when all of the evidence in relation thereto was presented. Moreover, as it was stated upon the oral argument, and the statement was not denied, that the lease had, in fact, been delivered and that possession of the property leased had been taken, the court says that if the order should be reversed, it would not result in any possible advantage to the plaintiffs, but might be of great injury to the defendants, and that therefore it was of the opinion that the parties should remain in the condition they were until the trial and determination of the merits of the controversy, and if, upon a trial, it should ultimately be determined that the defendants had no authority to enter upon the lease, then the same would be set aside, and the property restored to the lessor, and the plaintiffs' rights thereby would be fully protected.

#### DUTY OF MOTORMAN WHEN ANIMALS ON HIGHWAY BECOME UNEASY—TAKING CERTAIN HORSES ON STREET-CAR STREET.

*Doran v. Cedar Rapids & Marion City Railway Co. (Ia.), 90 N. W. Rep. 815. June 3, 1902.*

The injury complained of by the party suing was received while he was riding on horseback, leading a stallion. An instruction was asked stating as a matter of law that it was not the duty of the motorman to stop the car or check its speed unless he saw the horses showing signs of uneasiness or fright, but that it was only his duty to stop the car as quickly as he could, in the exercise of ordinary care, as soon as he saw the party's peril. This, however, the supreme court of Iowa thinks was not a correct proposition of law. It says that much must depend on the rate of speed at which the car is going, the extent to which the person in charge of the animals appears to have lost control thereof, and the imminence of the danger that they will get upon the track, in the way of the car, so as to imperil their own safety and that of the person in control of them. In other words, the supreme court does not understand it to be the rule that the motorman of a street car may run his car at a high rate of speed, even though such speed would not in itself be unlawful, notwithstanding he sees that a person on the street is liable to be dragged or taken upon the track, and is under no obligation to check his car or prepare to avoid a collision until it becomes certain that a collision will take place unless the car is stopped. According to the instruction asked, there is no duty on the part of the motorman to do anything until the animals in such a case actually obstruct the passage of the car. But the rule requiring the motorman of an electric car to do what he reasonably can to avoid a danger which is reasonably apparent seems to the court too elementary to require elaborate citation of authorities. It would certainly not be necessary in all cases that the car be stopped as soon as it becomes evident that animals on the highway have become uneasy and even frightened, but it certainly is his duty to take reasonable steps by way of reducing the speed of his car to avoid an injury which he may anticipate as likely to result from the frightened condition of animals on the street. Persons who are using the public streets on which a car line is operated have a right to the use of the whole of such street, and are not negligent per se, or in and of itself, in being on or near to the street car track, and it plainly is the duty of the motorman to be on the lookout for the purpose of avoiding collision with and injury to persons using the street.

Again, the supreme court says that it does not think that it constitutes negligence per se to take horses along a street on which a street car line is operated, without knowledge as to what will be the probable conduct of the horses on the approach of a car. It certainly cannot be true as a matter of law that one taking animals upon a street upon which an electric car will pass should have first

tested or made inquiry as to the probable conduct of the animals on the approach of such a car. These are considerations for the jury. There is no reasonable controversy as to the duty of one going upon a street to avoid a known danger, and the court correctly said that, if the party suing knew that it would be dangerous to take the horses along this street, then, if he could without serious inconvenience have taken another street, it was his duty to do so. But that, the supreme court thinks, is as far as the rule goes. It was not for the court to say as matter of law, in the absence of proof of knowledge on the part of the party suing that the horses would probably be frightened by an electric car, that it was his duty to know whether they were likely to be frightened, and to take another street if he did not have that knowledge.

#### DERAILMENT AT POINT WHERE TRACKS RUN FROM MAIN LINE INTO CAR STABLES—DUTY TO SEE THAT CARS ARE PROPERLY MANAGED AND THAT TRACKS ARE REASONABLY SAFE.

*Hollahan v. Metropolitan Street Railway Co. (N. Y. Sup.), 76 N. Y. Supp. 751. June 6, 1902.*

Where a passenger on a horse car was thrown from the front platform and it was established by the evidence that the car jumped the track and left the rails at a time when it was going at a "pretty good rate" at a place opposite the car stables, and at a point where there were tracks leading out from the main track into the doors of the stable, the first appellate division of the supreme court of New York holds that, although it might be said that the evidence was not strong and highly satisfactory in support of the inference of negligence which it was within the province of the jury to draw from the facts set forth, still it was sufficient. It says that it is true that the railroad has not a monopoly of that part of the street upon which the rails are laid, nor the right to exclude others from the use thereof, yet it has the paramount right and the exclusive management of its own cars, and control for the purpose of laying and keeping in repair its own rails, and the corresponding duty rests upon it of seeing that the cars are properly managed and that the tracks are at all times reasonably safe. This duty involves the obligation, further, of operating the cars with reasonable care so as to avoid at dangerous points, such as at curves or interseptions with other tracks, accidents which are likely to happen from the negligent operation of the cars. The tracks are constructed for the purpose of having the cars remain upon them, and experience proves that they are well adapted for that purpose; and it would not only be unusual and extraordinary, but highly improbable, that a derailment would occur without some intervening cause. It could not be assumed, therefore, with respect to this accident, that in the ordinary operation of the car over the tracks it would leave them without the car having met with some obstacle on the track, or being dragged or thrown therefrom by some superior force. The proof eliminated the latter, and there was no suggestion in the record that there was any stone or any obstruction which impeded the car's progress, other than the switch rails, which, at the point of the accident, as before stated, ran from the main track into the car stables. The care of these switches was as much under the company's control as any portion of the tracks; and if the further fact had been established that the accident was actually caused by the switch being open so as to change the direction of the car from the main to the branch track, there would be no room for discussion but that with this additional evidence it would be clearly a question for the jury to determine as to whether or not the accident was due to the negligence of the company in not properly looking after the switch track so as to prevent such accident. With that fact out, however, and with no evidence to show that the accident was caused in any other way than by contact with the switches which there existed, was not the company's negligence properly a question for the determination of the jury? Though close, the court is inclined to think it was, and for the reason that, regard being had to the circumstances and the character of the occurrence, the inference that the accident was due to the switch track, as the intervening cause, was both a direct and natural one.

Alderman Foreman, of Chicago, advocates a law providing for a commission to control and regulate the suburban electric lines outside of city limits in the same way that the interstate commerce commission regulates steam railroads.

# Engineering Features of the Western Ohio Railway.

BY D. W. PELL, SUPERINTENDENT OF CONSTRUCTION.

The Western Ohio Railway Co., of Lima, O., was incorporated in October, 1900, with a capital stock of \$1,000,000 for the purpose of building an electric line from Lima to Wapakoneta, and eventually to form a link connecting the cities of Toledo, Lima, Springfield, Dayton and Cincinnati. Early in 1901 the company secured rights to construct additional lines from Wapakoneta to Shelby, from St. Marys to Celina and from the latter city to a point on the west line of Mercer County. Its capital was later increased from \$1,000,000 to \$3,000,000. Mr. A. E. Akins is president of the company, L. J. Wolf, first vice-president, J. R. Nutt, second vice-president; H. C. Lang, secretary; M. J. Mandelbaum, treasurer; C. N. Wilcoxon, superintendent; C. S. Thrasher, auditor; F. D. Carpenter, general manager and D. W. Pell chief electrician.

The company operates at the present time 47 miles of road and has under construction 64.5 miles more. The portion of the line now in operation begins at Lima, in Allen County, Ohio, runs south from Lima to Cridersville and Wapakoneta; thence west to St. Marys; south from St. Marys to New Bremen and Minster, and finally west from St. Marys to Celina.

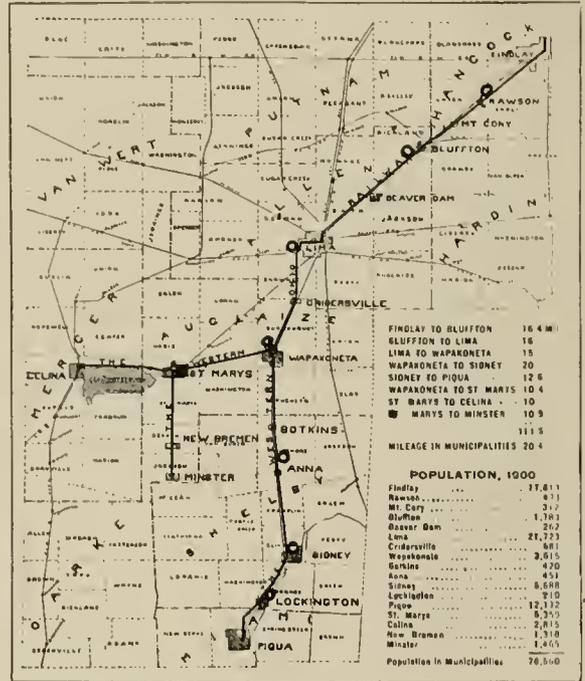

### POWER HOUSE.

The main power house is located at St. Marys and is indicated on the accompanying map by a rectangle. It is of brick and concrete, no-building stone whatever being used in its construction. The building is 104 ft. wide, and 248 ft. long; the boiler room is 45 ft. wide and the engine room 52 ft. wide. The floor level of the boiler room is 12 ft. lower than that of the engine room and under the latter there is a 12-ft. basement. This basement is to be used, when the plant is completed, as a stationary transformer room. The engine room floor consists of steel I-beams with brick arches filled in between with concrete. The roof over the entire building consists of flat steel trusses carrying 3-in. tile, with a four-ply asphalt and gravel covering. The engine room is supplied with a 25-ton Chisholm & Moore hand-power traveling crane.

The maximum capacity of this station, according to the present plans, will be 4,000 kw. At present, however, only two 400-kw. machines are installed and foundations have been completed for two

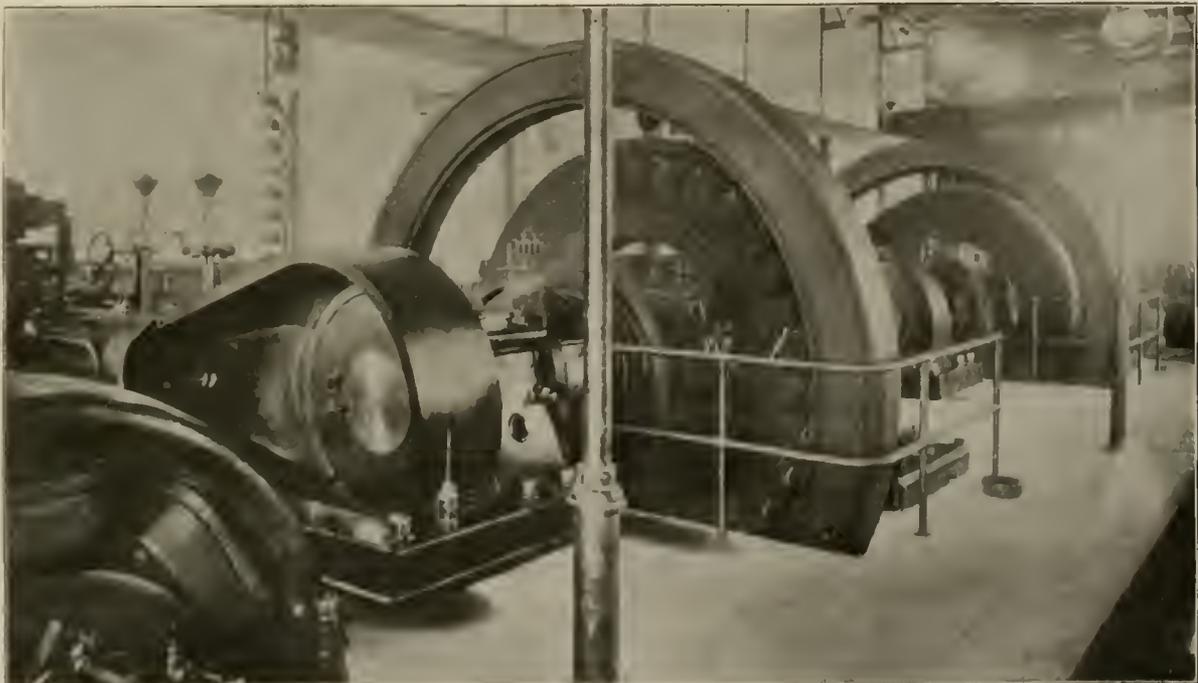

signed for parallel operation on alternating current three-phase work, with a guaranteed regulation within one per cent.

The boiler equipment consists of eight Stirling boilers, of a total capacity of 6,000 h. p. These boilers are equipped with flat grates

WESTERN OHIO RAILWAY.

and are each supplied with independent guyed, steel stacks, each stack being 48 in. in diameter and 80 ft. high. The boilers are all hand fired, coal being supplied directly in front of the fire doors by

ENGINE-TYPE ALTERNATORS IN THE POWER HOUSE.

750 kw generator, which will soon be erected and placed in operation. The engines are of the C. & G. Cooper, horizontal, cross compound, condensing type with corliss valve gear and were de-

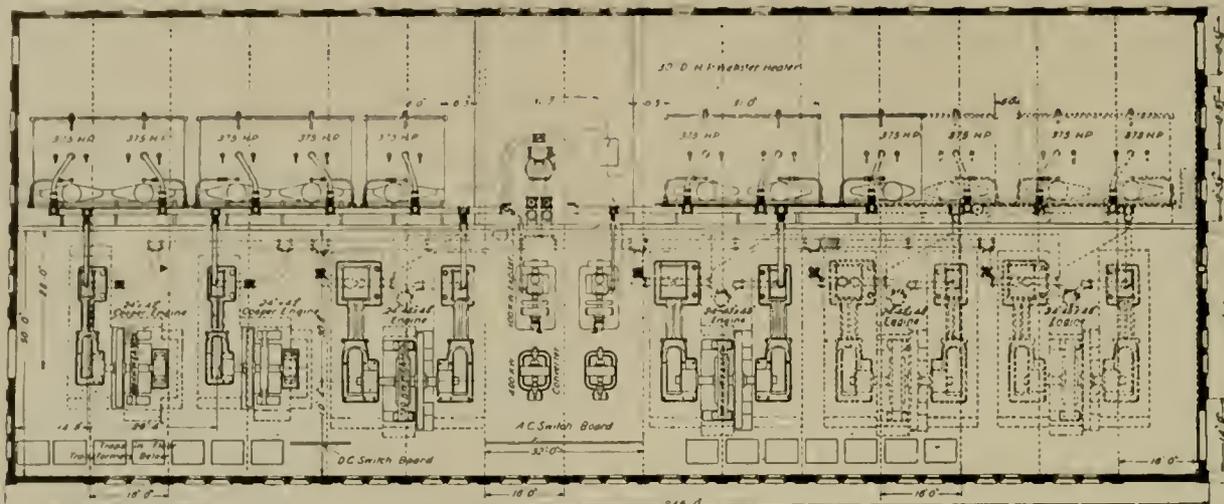

signed for parallel operation on alternating current three-phase work, with a guaranteed regulation within one per cent. The coal is shoveled directly from small cars into the boiler furnaces. The grate bars are all of the well known herringbone type, with 1/2-in. opening. The fuel

burned is West Virginia semi-bituminous "run-of-mine" which has been found to be the most economical for this particular plant.

The pump and condenser room in this plant is located in the center of the main boiler room and contains all of the feed pumps, feed water heaters, circulating pumps, vacuum pumps and condensers for the entire plant. The water supply is taken from the feeder of the St. Marys reservoir and is brought about 3,800 ft. through a 24-in. pipe. The 30-in. Worthington elevated injector condenser includes

GENERATORS.

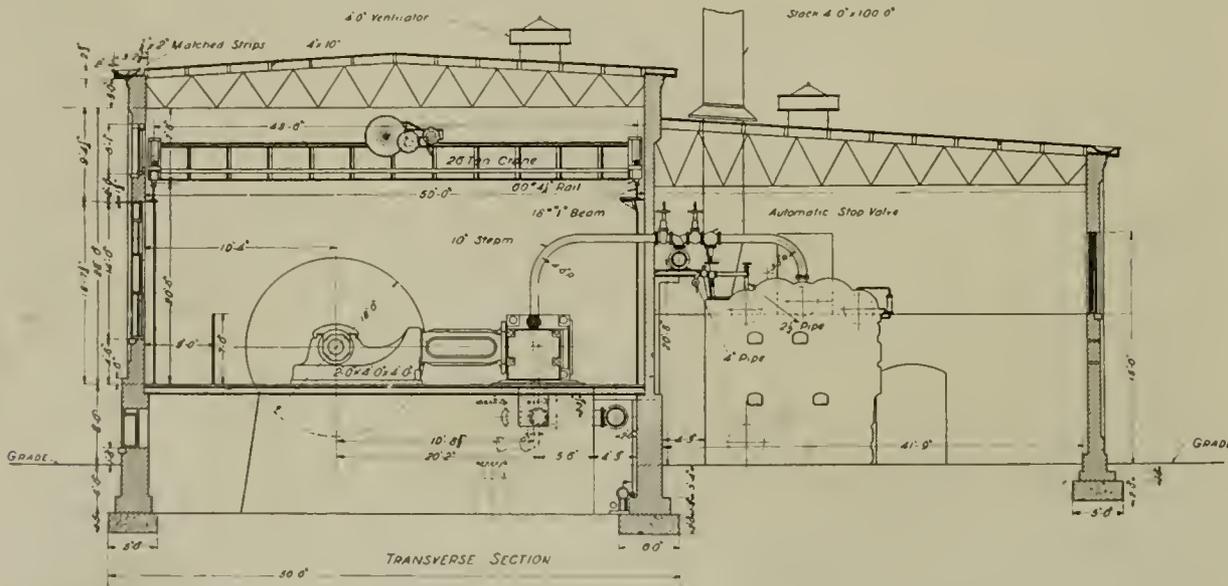

The electrical apparatus is furnished by the Westinghouse Electric & Manufacturing Co. The main generating units are direct connected to their several engines and each of the two units now in operation is of 400 kw capacity. The machines are of the revolving armature type, and since they run at 100 r. p. m. and have 30 poles, they deliver current at 3,000 alternations. The armatures have three-phase windings for a normal out-put of 400-kw., and are

PLAN OF POWER HOUSE.

an 8 x 16 x 12-in. rotative dry vacuum pump and two Worthington circulating pumps, either of which will be of sufficient capacity to operate the entire plant. The main steam header is of 16-in. heavy lap-welded steel pipe made up in sections, with pressed steel flanges shrunk on and then turned and faced. The feed and blow-off pipes, including fittings, are all of extra heavy Crane pattern, as are all the valves. Valves over 8 in. in diameter are by-passed. All valves and fittings over 3 in. in diameter are flanged, the flanges being tongued and grooved. The main steam header is carried on a specially designed, cast-iron roller frame, one end resting on the rear of the upper walls of the boiler setting, and the other being built

guaranteed to deliver 577 amperes each per terminal at 400 volts, with a non-inductive load. These generators are separately excited and require for excitation when the armature is delivering its full rated current, 90 amperes at 100 volts. The 750-kw. generators are designed for a speed of 94 r. p. m. being 32-pole machines of the revolving field type. The normal output of these machines at 750 kw. will be 1,083 amperes per terminal at 400 volts three-phase with a non-inductive load, and at this load they will require 150 amperes at 100 volts for excitation. Throughout the armature spider, core and winding, large ventilating ducts have been provided which permit a free circulation of air during operation. For exciting the

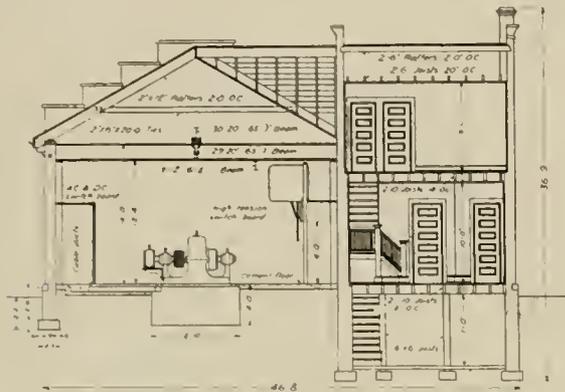

TRANSVERSE SECTION THROUGH POWER HOUSE.

into the brick-work of the division wall between the boiler and engine rooms. The feed piping is suspended from the roof trusses by long eye-bars having turn buckles in them to allow for adjustment and variations of height. All feed valves are arranged to be controlled from the boiler floor line, as are, also, all drips, gage-cocks, water gages, water columns, blow-off pipes and drains around the boilers.

main generators there will be two units, both steam driven and of the Westinghouse type, the generators of 100-kw. capacity and operating at 125 volts and 200 r. p. m., being direct connected to two 13 and 22 x 13-in. Westinghouse compound engines.

The main power house contains, also, a sub-station, that is, a portion of the low potential current from the main generators is carried to two 400-kw. rotary converters supplying approximately 25

miles of the feeder system of the line. The rotary converters in the other sub-stations are all of the Westinghouse type and of 200-kw. capacity. The armature winding of the rotary converters is similar to that of ordinary direct current generators, but it is tapped at certain points from which leads are carried to collector rings at one end of the shaft, while the ordinary direct current commutator is at the other end. The ratio of conversion, alternating to direct current is about 0.62. These rotary converters operate at a speed of 500 r. p. m., and deliver 333 amperes at 600 volts. For starting a small induction motor is permanently mounted on the same shaft with the armature.

SECTION OF SUB-STATION.

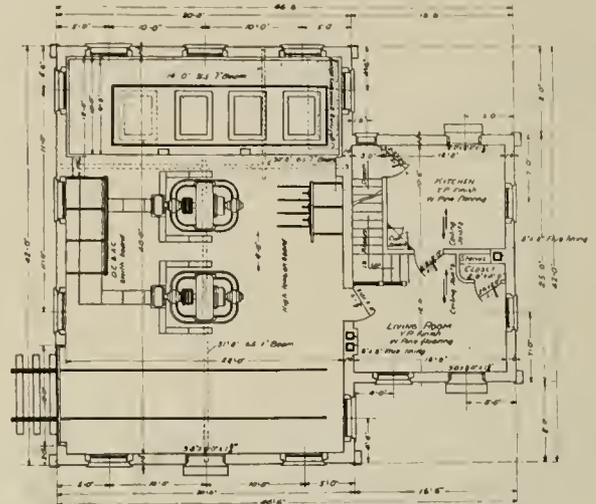

SWITCHBOARDS.

The engine room at the power house will contain two switchboards, a main generating board containing 11 panels and an alternating current board of nine panels, upon which will be mounted the high tension switches for all outgoing transmission lines. These switchboards are all of blue Vermont marble and are equipped with the bus-bars and cables necessary for the proper handling of the apparatus in the station. All instruments on the boards are of the Westinghouse, long scale, dead-heat type.

The step-up stationary transformers, which are located in the basement, are of the Westinghouse oil-cooled type. There will be seven of 400 kw. capacity, transforming the current from 390 to 33,000 volts. From the transformers lead-covered single-conductor

drawing. They will be of brick, with 13-in. walls above the foundation line, the coping being covered with cement. The floors in all sub-stations are to be of concrete, as are also the transformer pits.

In addition to the sub-stations mentioned, there will be a portable sub-station mounted on a car. This car will be 27 ft. long, 8 ft. 10 in. wide and 10 ft. 6 in. high from the top of the rail. The equipment includes one 200-kw. rotary converter; three 150-kw. step-down transformers; three "low-equivalent" lightning arresters;

FLOOR PLAN OF SUB-STATION.

three-fuse switch circuit-breakers with barriers, and one three-panel switchboard, including an a. c. rotary converter panel, d. c. rotary converter panel and d. c. feeder panel.

TRANSMISSION LINE

The high tension line from Wapakoneta to St. Marys is carried on 45-ft. poles, the top of the poles being arranged for three sets of 33,000-volt lines. At Wapakoneta one set turns off south and supplies the sub-stations at Anna, Sidney and Lockington. The other two sets continue north as far as Lima, one set supplying Wapakoneta and Lima and the second set supplying Beaver Dam and Rawson. The transmission cables themselves are all carried

OVERHEAD CROSSING CHICAGO & ERIE RAILWAY.

able will be led up the south wall of the building to the high-potential circuit breaker, of which there will be nine of the Westinghouse type mounted on a wooden framework.

SUB STATIONS.

The sub-stations along the route will be seven in number and will be located as follows: Rawson, Beaver Dam, Lima, Wapakoneta, Anna, Sidney and Lockington. The locations of the various sub-stations are indicated on the map by circles. The sub-station buildings will be of the general construction shown by the accompanying

on steel pins with wooden tops and Locke No. 307 porcelain insulators. The cross arms are of long-leaf yellow pine, fastened to the pole with two 1/2 x 12-in. carriage bolts. All the high-tension lines are completely spiralled every mile, each set being spiralled on a direction opposite to the adjoining one, thus keeping the same phase feeders on the two pins next to the pole on each side.

CARS.

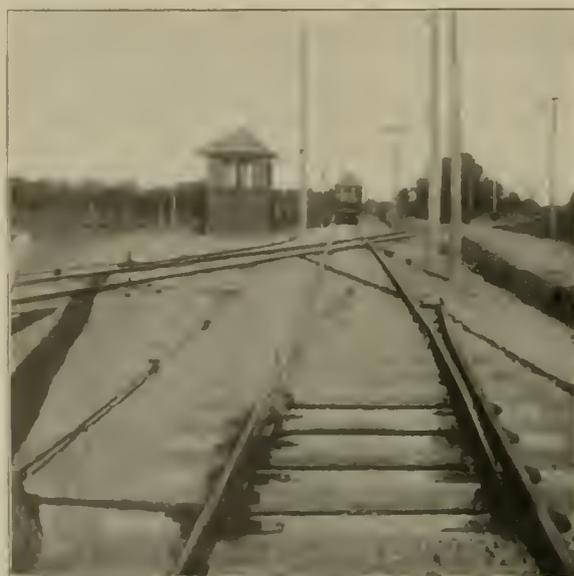

The first eight cars on this road were built by the G. C. Kuhlman Co., of Cleveland, and comprise five passenger coaches and three

combination passenger and express coaches. The cars are 42 ft. 6 in. over all and 8 ft. 8 1/2 in. wide. The car bodies are mounted on Peckham No. 14AX trucks with spoke wheels 33 in. in diameter, 24 in. tread, with 1 1/8 in. flange. The electrical equipment consists of four Westinghouse No. 50 railway motors with K-14 controllers. All cars are geared for a maximum speed of 48 miles per hour with a gear ratio 30 to 52. All axles are 5 in. in diameter and the motors are mounted with nose suspension. Christensen straight air brakes are used and each car is supplied with an independent motor-

45-FT. POLES CARRYING TROLLEY AND TRANSMISSION LINES.

driven compressor mounted in a dust-proof box on the under side of the car. The Niles Car & Manufacturing Co., Niles, O., now has an order from the Western Ohio Railway Co. for 24 passenger coaches each 44 ft. 10 in. long over all and 8 ft. 9 in. wide. These coaches will have standard "I" beam framing for the floor sills and will be equipped and mounted on the same trucks and with the same equipments as those furnished by the Kuhlman company.

INTERLOCKING PLANT.

#### ROADBED.

The roadbed on the first 47 miles of this property is of standard interurban railway construction, with 60-lb. steel rails in 30-ft. lengths, laid on 5 x 7 in. x 7-ft. ties. The bonds are the American Steel & Wire Co's. "Crown" type. The roadbed is heavily ballasted throughout with rock crushed to pass a 1 1/2-in. ring gage and screened, and is from 8 to 12 in. in thickness under the ties. This

ballast is carried out 6 in. beyond the ends of the ties and carefully shouldered and sloped to provide ample drainage for the roadbed proper. The entire line is built upon private right of way. The maximum grades on the line now operating will not exceed 2 per cent, except at points where the line crosses over the main lines of steam roads. The rest of the line, which is now being constructed, will be laid with 70 lb. T-rails in 30-ft. lengths. The bonds are to be the American Steel & Wire Co's. solid terminal type, which are to be placed by a hydraulic compressor. The grades on extensions, as well as curves, are to be carefully looked after and eliminated wherever and whenever it is possible to do so, making the route practically an air line.

#### OVERHEAD CONSTRUCTION.

The poles on this line are all of Michigan cedar, 35 and 45-ft. lengths with 7-in. tops. All cross-arms have been deeply gaged in the pole and fastened by machine and carriage bolts instead of the customary lag screws. The brackets used are of the rigid type with Ohio Brass Co's. hangers. All cars are of the 12-in. semi-cylinder type, soldered in position. The poles are all thoroughly guyed and braced on all curves and it has been the aim to make the overhead line substantial in order to stand the high speed of heavy railway cars. The trolley wires are circular in section, there being two each No. 00. Above the trolley is strung a 211,000-c. m. feeder, carried on a cross arm 12 in. above the trolley bracket. On these same cross arms over the entire route are carried the telephone lines, there being an iron box telephone in a wooden booth at each turn-out, where all cars must report. This telephone system is carried into the general offices of the company at Lima, where the dispatcher is located, so that he is constantly in communication with all of the cars on the system, as well as with the power house and sub-stations.

The portion of the road now in operation traverses the Lima-St. Marys oil fields, which are among the heaviest oil producing districts in the country. It also traverses a rich farming territory and the prospects for freight on this road are very bright. The rate of fare charged is approximately two cents per mile and the run from Lima to Minster, a distance of 36.8 miles, is being made in 1 hr. and 46 min., including all stops.

#### TROLLEY EXCURSIONS ACROSS MASSACHUSETTS.

A unique pleasure trip planned by Mr. John W. Ogden, superintendent of the Concord, Maynard & Hudson Street Railway Co., was participated in by about forty railway officials and newspaper men, Saturday, November 22d. The handsome parlor car "Concord," owned by the company, was used by the party over the route from Maynard, Mass., to Hudson, Marlboro, Northboro, Westboro, Hopkinton, South Framingham, Milford, Hopedale, Woonsocket, R. I., and return, covering a distance of about 130 miles. The party left Maynard at 7:30 a. m. and returned at 9:40 p. m., having stopped at Milford two hours and at Woonsocket half an hour. The object of the trip was to show the practicability and ease of running an excursion over connecting lines of electric roads without change of cars. The roads traversed were the following: The Concord, Maynard & Hudson Ry., Marlboro Street Ry., Worcester Consolidated Street Ry., Westborough & Hopkinton Street Ry., South Middlesex Street Ry., Milford & Uxbridge Street Ry., Milford, Attleboro & Woonsocket Street Ry., and Woonsocket Street Ry. A pilot was furnished by each of the systems travelled over in order to avoid possible accidents or delays, and it was with perfect ease that the journey was made. All participants were highly pleased with the success of the trip. The parlor car "Concord" is said to be one of the finest and best equipped electric cars in New England and the success of this trip augurs well for future excursions of this character. It is understood that the company contemplates placing two other similar cars at the disposal of pleasure parties. The "Concord" has already been chartered by private parties for a number of trips and will undoubtedly be in demand during the coming summer season. An illustrated description of the Concord, Maynard & Hudson Street Ry. and a brief biography of Mr. Ogden appeared on page 11 of the February "Review."

## EFFICIENT DISCIPLINE.\*

BY THOMAS E. MITTEN, GENERAL MANAGER INTERNATIONAL RAILWAY COMPANY, BUFFALO, N. Y.

Railroad service requires men who are steady and reliable in habits. Efficient discipline demands that they be well-trained and prompt in obedience to orders.

In addition to a carefully prepared book of rules it is essential that there be a well-defined policy covering the method by which discipline is to be maintained, the underlying principles of which must be thoroughly understood by those to whom its enforcement is entrusted.

All matters of discipline should be under the general direction of a chief operating head with whom all subordinate officials should be in close touch and accord, and to whom all employes should have the right of appeal.

Much depends upon the selection of new men, and in order that the employment shall be sufficiently attractive to interest the better class of wage-earners, a fair wage, at least equal to that paid for like class of men in other lines of work, should be assured to applicants as soon after they have entered the service as is practicable. The acceptance or rejection of applicants should be entrusted only to those who from their experience have become good judges of human nature and are thoroughly conversant with the requirements of the position for which application is made.

The habits and history of each applicant should be carefully inquired into, his physical condition determined and a conclusion as to his fitness for the service arrived at independent of any outside influence.

Instruction should be given to new appointees only by the most competent men in each branch of the service, who should believe in and be fully familiar with the policy of the management. It should be thorough and systematic in character, and subject to careful review before the final acceptance of applicant is decided upon.

Men who are undesirable do at times secure employment even after the most careful scrutiny of their history and personal appearance, and being on good behavior during instruction are passed as satisfactory, but prove later to be an actual detriment to the service. Such men should not be allowed the latitude and consideration given to old employes, but should be removed by prompt discharge as soon as their unfitness is assured.

Other men, during the early stages of their employment, make mistakes which are due largely to an insufficient understanding of what is required of them; such errors are best corrected by subjecting the offender to further instruction, the logical conclusion being that under these circumstances punishment administered educationally will ultimately correct the man of his shortcomings or prove him unfit for the service.

Men employed for a sufficient length of time to have become thoroughly familiar with the duties which they are required to perform have as a rule acquired a certain pride in their knowledge and skill, and also in the fact of their extended service. Punishment of any character, inflicted upon such men, almost invariably humiliates to such an extent as to leave in their minds a feeling of resentment. More can be accomplished, generally speaking, by a plain, straightforward talk, such as will appeal to their manliness.

A book record should be kept covering the history of each employe during the period of his employment, in which proper entry should be made regarding all matters which have a bearing upon the efficiency of the service rendered.

When accused of shortcomings, men should be notified by written communication setting forth their offense in detail, to which they should be permitted to make written reply, as by so doing they avoid the necessity of being called to the office with consequent loss of time and wage. If the reply is unsatisfactory they should be so informed, and unless they then appear at the office and make a satisfactory explanation an entry, covering the facts in the matter, should be duly made on the record.

For repeated infraction of rules, or in case of serious accident, the party at fault should be given a hearing before the officer by whom discipline is administered, who in rendering decision should

take into consideration the gravity of the offense with which the party is charged, the length of time in service and his previous record. In case of a man's discharge being necessary, the record will show that he has practically discharged himself, having been given every opportunity to mend his ways before being dismissed. As every effort is made to reclaim erring employes before their services are dispensed with, consistency demands that when once discharged they be never again re-employed.

Under this method the number of discharges are reduced to the minimum consistent with the maintenance of good discipline. Employes are made to feel that after having served a company sufficiently long to have become identified with its practice they become a part of its system and are not to be divorced therefrom unless absolutely necessary for the good of the whole. It should be impressed upon them that their employment is of a fixed and permanent character, promotion being open to all, dependent solely upon the faithful performance of duty and fitness for increased responsibility.

The right of appeal to the chief operating head is considered to be of the utmost importance, in that it insures to each employe a review of his case before an unprejudiced judge, who should possess the absolute confidence of his men. Without such a court of appeal employes who feel that they have been dealt with unjustly, having no means of redress, are in some instances almost forced into forming associations for their own protection.

Those entrusted with the enforcement of discipline are also by this method made to be more careful in their rulings, and when in any doubt, will be found to almost invariably submit the question to the chief operating head for decision before taking definite action, realizing that by so doing they avoid the possibility of being overruled.

Subordinate officials should, wherever possible, be selected from the ranks, preference being given to those who have served as instructors. They should be calm and considerate in their treatment of men, and consistent in the enforcement of rules.

Discipline sometimes becomes lax and inefficient owing to superannuated employes being retained in the service, who from no lack of willingness but entirely owing to their infirmities, are unable to properly perform their duties. A most satisfactory solution of this question seems to have been found by some of the larger companies who have set aside a fund for the pensioning of such employes as become incapacitated after long years of faithful service; this not only permits the retirement of those who have outlived their usefulness, but also serves to instill in the minds of all employes a feeling of security and confidence.

Suspension from duty and from pay, which was at one time the generally recognized punishment administered for minor offenses, is rapidly falling into disuse, having proven mischievous in its effects not only by its leaving the man so punished in a disgruntled state of mind but in addition often resulting in his family being subjected to severe hardship by the loss of revenue incident thereto.

Arbitrarily discharging employes guilty of violating certain specified rules, this without reference to previous record, was at one time considered absolutely necessary in order to prevent the increase of certain classes of accidents. While the fear of discharge seemed in some instances to make men more careful, very good men were at times necessarily sacrificed to maintain this principle, the result as a whole being found generally unsatisfactory. The feeling seemed to prevail that as the best and most careful of men were liable to accident on occasion no man could be absolutely sure of retaining his position.

Within the past few years over 57 railroads have abandoned the methods of punishment formerly used and are now relying almost entirely upon the Brown system of discipline by record, either in its entirety or in some modified form, it having become apparent that as the requirements of the service grow more exacting, making necessary the employment of a higher degree of intelligence, men with minds capable of such training are not to be controlled by the arbitrary methods formerly used but respond more readily to moral suasion and appeals to the better side of their natures.

A wedding set for November 27th at Wheaton, Ill., was postponed on account of a collision between an electric train and a wagon driven by the intended groom on his way to secure the marriage license.

\*Read before the New York Railroad Club, November, 1902.

## System and Parks of the Tri-City Railway Co.

The Tri-City Railway Co., which operates a 50-mile electric railway system in Davenport, Ia., and Rock Island and Moline, Ill., is at present accomplishing much towards the improvement of its properties and the betterment of its service, in the face of a somewhat adverse municipal government and difficult physical conditions. The company serves three thriving industrial cities with an aggregate population of 100,000, its cars running from Davenport across the railroad bridge which is owned by the federal government and the Chicago, Rock Island & Pacific Ry., to Rock Island, and in an easterly direction to the manufacturing city of Moline between four and five miles distant. Three years ago the company obtained a 25-year franchise in the three cities.

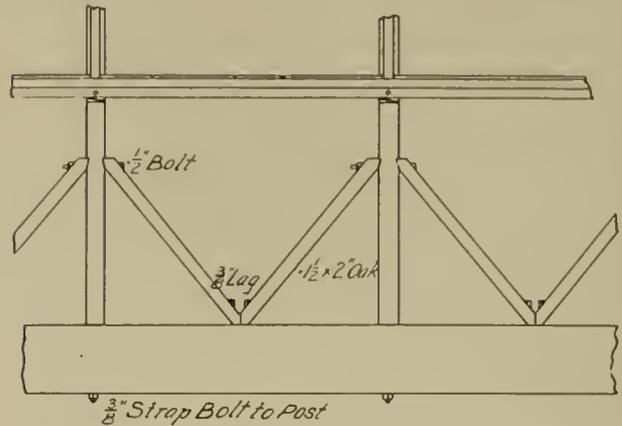

Davenport is built upon a bluff rising from the shore of the Mississippi River, and the street railway lines in traversing its main business and residence districts contend against a grade of  $7\frac{1}{2}$  per cent. Owing to the occupancy of the down town streets by some three steam railroads, the grade crossing problem in Davenport has been a most serious one, especially as the principal crossing is made at the foot of a steep incline on a thoroughfare which is always crowded with vehicles and pedestrians. It may be noted to the credit of the Tri-City company that but two grade crossing accidents have occurred on its system in Davenport in the last seven years, and that neither of these resulted fatally. At the present time, the Chicago, Rock Island & Pacific Ry. is elevating its tracks through the city, and this work when completed will obviate to a great extent the danger and difficulty of the down town crossings.

With the exception of the line from Rock Island to the resort at the Watch Tower,  $3\frac{1}{2}$  miles distant, and two branch lines, the company's system is double-tracked for nearly its entire length. At present old rails are being replaced with 78-lb., 60-ft. girder rails, and the Columbia bond, which has long given satisfactory service, will be maintained. White oak ties, 6x8 in. are used throughout, being laid 24 in. c. to c. In the experience of the company, white oak ties have excelled all others, and showed to particular advantage compared with yellow pine or cedar. Some of the white oak ties that have been down for 15 years are still in serviceable condition, but are being replaced with new ones for the sake of uniformity. In Davenport, Galesburg brick paving is used extensively, the brick being laid in from 6 to 8 in. of concrete. It is the intention of the company eventually to also lay a double track on the line to the Watch Tower. An ordinance was recently passed granting the company the right to build an additional four-mile loop in Rock Island, and the construction of the loop, which will cost approximately \$75,000, will be begun in the spring. The extensions and double-tracking proposed for 1903 will cost about \$216,000.

Certain franchise restrictions have made it necessary for the company to maintain its machine shops on the Davenport side of the river, while the power house, car house and repair and car-building shops are located in Rock Island. A new car house with a capacity for storing 100 cars is practically completed and ready for occupancy at a point two miles east of Rock Island, and about half way between that city and Moline.

Adjacent to the new car house is the building which was formerly used for storing cars, and which has now been converted into a shop. The company has begun the manufacture of its own cars, and has constructed since May, when the first plans were drawn, three new cars which have just been put in service. Thirty more of

the same pattern will be built as rapidly as they can be turned out. The shop has a capacity for four cars at one time. These cars are of the semi-convertible type, 41 ft. over all with a body 30 ft. 6 in. long, and 8 ft. 6 in. wide over the grip rails. Yellow pine is used

CAR TRUSSES, TRI-CITY RY.

for the side rails; the end sills and platform sills are of white oak. The posts, earlines and ribs are of Indiana white ash; the sashes are of cherry, and the doors are of cherry with mahogany panels. The roof, ceiling and sides are of poplar, and the ceiling of the hood is white pine. White ash is used for the vestibules, with red gum panels.

Cars for the bridge run are being painted green, and others, a

GROUP OF BUILDINGS AT WATCH TOWER, DAVENPORT, IA.

light yellow. The numbering and lettering and the interior decoration is done in aluminum and gold leaf, a combination which, while slightly more expensive than the usual practice, gives a brilliant and rich effect.

The cars have an appearance of greater length owing to their height being only 11 ft. from the bottom of the sill to the roof of the trolley board. This dimension was determined by the clearance of the lowest viaduct on the lines, which is only 12 ft. 2 in. from the rail to the trolley wire. Mr. J. D. Fish, chief electrician of the Tri-City Railway Co., who has had charge of designing these cars and superintending the construction, has strengthened the bodies to meet local grade contingencies by the introduction of a vertical truss

mortised to the sill and secured by strap bolts as shown in the accompanying diagram.

The windows of the cars are designed to be removed entirely in element weather, when protection to passengers will be given by pantasote curtains.

There are between 60 and 70 now in service, none of which is less than 10 years old, and some have been in use for 25 years; these range in size from 27 ft. to 30 ft. 6 in. over all.

The new cars are mounted on Brill No. 27 G double trucks and equipment includes four motors, G. E. 52, 54 or 67, Providence fenders and Christensen air brakes and "Consolidated" electric heaters.

Sixty men are employed in the shops, half of that number being engaged on the new cars, exclusively. The equipment of the shops comprises some 20 wood-working machines, the principal among them being mortising and gaining machines, planers and shapers.

The machine shops, paint shops and storerooms are located in Davenport. The equipment comprises one large wheel press, six grinders, three lathes, drills, polishers, shapers and auxiliary apparatus. The company is considering installing a boring machine which it is estimated would effect an economy of \$1.50 for each replacement; at present lathes are used for boring machines. The axle straightener is an important feature of the apparatus. The company makes its own axles, using low carbon crucible steel for the purpose, and there have not been half a dozen crooked axles in the shop in a year. In the last four years there have been but eight broken axles reported, and this is the more remarkable in consideration of the fact that prior to four years ago, when the company was using cold rolled steel or hammered iron in the manufacture of its axles, there were on an average of 12 broken axles reported each month.

The power house at Rock Island contains seven T. H. 75-kw. and one T. H. 80-kw. machines driven by "Ideal" engines. This equipment has thus far been adequate to the demands of the service, but as traffic is steadily increasing, the company now contemplates increasing the capacity of the power station. It is also proposed to arrange for the removal of the machine shops to Rock Island so that all the mechanical departments may be operated in conjunction. The store rooms and business offices of the company will, however, be maintained permanently in Davenport.

The Tri-City Railway Co. owns two parks at which it has maintained various attractions for several seasons past with very satisfactory results. The principal of these resorts is called Black Hawk's Watch Tower and comprises 22 acres of oak forest at the summit of a high bluff overlooking the Rock River, about 3½ miles south of Rock Island. The view from this promontory includes Illinois farms and forests 20 miles distant and the winding course of the beautiful Rock River from an easterly direction to its confluence with the Mississippi. The windows and the broad verandahs of the Watch Tower pavilion command this pleasant prospect, and here in summer the society people of the three cities frequently give exclusive dinners, dancing parties and other entertainments.

During the season (usually from April 15th to October 15th) several thousands of persons are served daily at the pavilion restaurant which is in charge of an expert chef. One of the attractions in the pavilion is a museum of Indian relics and two antique paintings of exceptional merit, commemorating the Sac chief Black Hawk, who in the early part of the last century made his headquarters on the site of the present park during the war of the Sacs and Foxes. The resort was named in honor of him.

Across a small ravine from the main building is another two story structure, also used for dancing, and as a bowling alley. In the rear of it is a water toboggan down the hill side for the use of bathers. The slide is 400 ft. long. After a plunge into the river the occupants of the coasting cars retain their seats and are drawn back again to the top of the incline, the apparatus being operated by an electric motor of 40 h p.

There is an open-air theater in the valley, and 700 persons may witness the performances from benches which are arranged in a semi-circle on the hillsides fronting the stage, which latter is 40 ft. wide by 35 ft. deep and equipped with all the essentials for

quite an elaborate comic opera production. With the one restriction that the entertainments shall be of a kind which could not offend the most fastidious, the management of the theater is now entirely in the hands of the lessee who is meeting with a fair degree of success despite the fickleness of taste which is characteristic of a cosmopolitan attendance. Public opinion has been unanimous in endorsing the management's efforts to make the other attractions pleasing. A crowd of 10,000 people is not an unusual one at the Watch Tower, although a 10-cent fare is charged from Rock Island.

The bathing facilities, bowling alley, dance hall, etc., are well patronized, and the afternoon and evening concerts by an excellent

TOBOGGAN AT WATCH TOWER, DAVENPORT, IA.

orchestra are fully appreciated. Often there are special amusement features such as balloon ascensions, moving picture shows, and the like. Everything on the grounds is free and the company has even provided shelter and hitching facilities for those who come in carriages to enjoy the pleasures of the park without price. The bicycle rider has, however, been debarred from the Watch Tower resort, as several seasons ago when the bicycle was more popular, the wheel took considerable business away from the road. At the entrance of the park is a storage tank with a capacity of 23,000 gallons, supplied by electric pumping apparatus, and from this is furnished an abundance of water for various uses to all parts of the ground. In summer, cars are run at 10 minute intervals to and from the Watch Tower, and in addition to the regular service many "specials" are hired for excursion parties. During the winter months cars run to the park on a one hour schedule to accommodate those who come to enjoy skating and coasting on the company's property. The pavilion is warmed and lighted for this purpose, and a delectable meal can always be secured by giving previous notice.

Prospect Park, two miles south of Moline, Ill., is also owned by

the Tri-City company, and draws about the same class of patronage as the resort at the Watch Tower. The park comprises 24 acres located just off the Rock River and surrounded by wooded hills. An artificial lake, 400 x 900 ft 4 ft deep, is supplied from an artesian well which is sunk to a depth of 2,700 ft. and cost \$4,000. The bottom of the lake is sand and gravel, and ample bathing facilities are provided. There are two buildings on the grounds at Prospect Park, one of which is used as a dancing pavilion, and the other as a cafe. There is a switch-back railroad which has proved a never-failing attraction, and a portable theater. The latter is 60 ft. long, 40 ft. wide and 30 ft. high, constructed of wire mesh sections which may be taken apart as expeditiously and shipped as compactly as the stage scenery. Even the stage and its equipments are portable. The roof and sides of the theater may be quickly covered with boards for the protection of patrons in the event of unexpected showers. The management of the playhouse here is also in the hands of a lessee, and the company is relieved of all the business of organizing and maintaining theatrical attractions. It provides excellent music, however. Another important feature is the "Zoo" where several docile and well-behaved deer, elk, black bear and alligators are kept. There are also a number of burros

PAVILION AT PROSPECT PARK, MOLINE.

on which children ride through the equestrian paths of the park. An average crowd at this resort on an afternoon or evening in summer is 6,000, and greater crowds are often attracted by the Chautauqua meetings and the gatherings of fraternal and social organizations. Last season there was a large attendance of the Chautauqua society whose occupancy of Prospect Park lasted five weeks. Cars run on a similar schedule to that in effect at the Watch Tower. Both parks are advertised by the company in the 10 newspapers of the three cities and in other minor ways. The expense of maintaining the Watch Tower, inclusive of advertising and music and exclusive of theatrical entertainments, was for last year \$3,340, and that of Prospect Park was \$1,562.

Schuetzen Park, at Davenport, though not owned by the Tri-City company, is a considerable factor in inducing traffic over the street railway lines. The tract of 45 acres is owned by a German association, and the principal attractions are the shooting tournaments of frequent occurrence, and the regular weekly concerts which are attended by the most fashionable society in the three cities. Davenport City Park, a suburban resort owned by the municipality, also attracts large crowds over the company's lines.

The line of the Lake Shore Electric Railway Co. was completed from Lorain to Sandusky, O., and opened for traffic November 15th.

## OHIO NOTES.

The Cincinnati, Georgetown & Portsmouth Traction Co. having a route 42 miles in length and extending from Cincinnati to Georgetown, recently ran its first electric car over the line, breaking the record for southern Ohio; seven miles of the stretch being covered in eight minutes. The road was formerly a narrow gage steam road, but was converted into an electric last season. It taps a section untouched by other roads and will prove of great value to Cincinnati merchants.

The Columbus Railway Employees' Beneficial Association held its annual meeting December 1st and elected the following officers for the ensuing year; president, Harry P. Lawson; vice-president, J. W. Powell; secretary and treasurer, L. A. Hambleton; physician, Dr. Frank S. Lott. Fourteen new members were admitted to membership.

Local street car service has been opened at Bellefontaine by the Urbana, Bellefontaine & Northern Traction Co., one of the Appleyard syndicate lines. This is the line that will furnish the connecting link between Columbus and Toledo, when completed. In the spring the line will be pushed to Kenton and Urbana.

The Appleyard syndicate of interurban roads has promised within a short time to establish a sleeping car service out of Columbus, that will equal if not surpass that of any of the steam roads. Of course this is taken as an indication that it hopes soon to get an entrance into Cincinnati, and to complete its other lines to reach all of the important cities of the state. The plans for the new sleepers provide for cars 72 ft. in length, weighing about 30 tons, and to cost about \$25,000 each. They will be geared up to an average speed of about 45 miles an hour. It is also stated that this syndicate is after the Toledo, Bowling Green & Southern road, which would give two lines across the state, one from Cincinnati to Toledo by way of Springfield and the other from Cincinnati to Cleveland by way of Columbus.

A meeting of the officers of the Scioto Valley Traction Co. was held in Columbus recently to hear the report of the engineers as to the plans and specifications for the electrical equipment of the road. This company is building from Columbus to Lancaster, a distance of 33 miles and from Columbus to Circleville, a distance of 25 miles. The roadbed is ready for the rails and the work will be pushed as rapidly as possible. The track will be double for eight miles out from Columbus and the power house will be built at Reese's station. The equipment will be of the very best and a speed of 50 miles an hour between stops will be maintained when necessary, so the officers say.

## ROCKFORD & INTERURBAN RAILWAY CO.

The Rockford & Interurban Railway Co. which is a consolidation of the Rockford Railway, Light & Power Co., of Rockford, Ill., and the Rockford & Belvidere Electric Railway Co., has established a fast express service which is meeting with great success. Mr. J. R. Groneman is the general passenger and express agent of the company and he is advertising the company's express service in various ways. One advertisement recently distributed consists of a card illustrating one of the company's new express cars, and another is an attractive calendar giving a view along the route and calling attention to the electric passenger and express service. The road is also especially equipped for excursion and outing parties.

## REWARD FOR CAREFUL EMPLOYEES.

On June 1st the Pittsburg Railways Co. advanced the wages of its motormen and conductors one cent an hour and at the same time announced that an experiment would be tried for at least six months at the end of which the company would give a bonus of one cent an hour to every motorman and conductor who did not have an accident during that period. About one-half of the men have clean records and will receive an average of about \$20 each on December 20th. The company is said to be satisfied with the plan and will continue it indefinitely.

## MULTIPLE UNIT, VOLTAGE SPEED CONTROL FOR TRUNK LINE SERVICE.\*

BY H. WARD LEONARD.

In February, 1894, I read a paper before this Institute describing a system which I considered applicable to the operation of a trunk line electric railway. The essential features of this system were:

1st. The generation and transmission of a high tension single phase alternating current, the power houses being placed as far apart as the insulation of an alternating current transmission would permit.

2d. The entire elimination of sub-stations.

3d. A transformation of the energy upon the locomotive so as to secure a voltage speed control for the electric motors, thereby obtaining smooth acceleration and efficient control of the locomotive at any desired speed and in either direction.

At that time there were no engineers, so far as I know, who agreed with me that these features were essential for the operation of a trunk line railway by electric motors.

In the recent past, however, many prominent engineers both abroad and in this country have declared themselves in favor of these essential features, and I therefore feel warranted in describing an improvement upon the system I originally proposed, by which I can secure the important and now well understood advantages of a multiple control of any desired number of locomotive units.

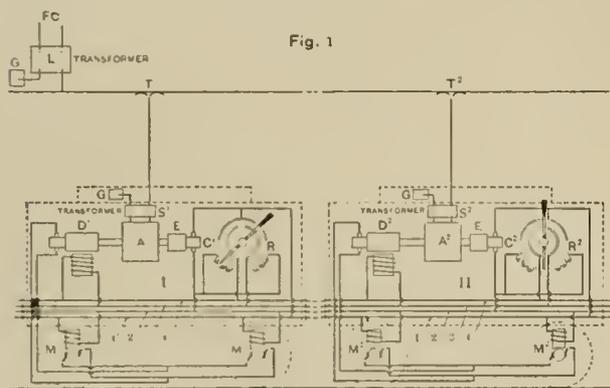

Fig. 1 illustrates diagrammatically one form of my multiple unit voltage speed control as applied to two locomotive units for trunk line service.

The current is generated in the form of a single-phase alternating current at as high an electromotive force as is practicable today, say 20,000 volts. A moving contact leads the single phase alternating current upon the locomotive. If desired, static transformers can be placed at suitable points along the line of the railway which will reduce the initial e. m. f. to any desired lower e. m. f. upon the contact conductor.

In many instances it may be desirable to place upon the locomotive a transformer  $s'$  for reducing the tension of the alternating current led to the synchronous motor  $A^1$ .

A single phase synchronous motor on the locomotive receives this alternating current and is driven by it continuously at a practically constant speed; the current after passing through the motor, being led to ground through a moving contact. This single phase motor  $A^1$  drives continually a small exciter  $E^1$  and also a large continuous current dynamo  $D^1$  whose field is separately excited by the exciter  $E^1$  and has in its field circuit a reversing rheostat  $R^1$ . The armature of the propelling motors are connected in multiple directly across the terminal of the armature of the dynamo  $D^1$ . The field magnets of the propelling motors  $M^1$  are separately and constantly excited by the exciter  $E^1$ .

By manipulating the reversing field rheostat  $R^1$ , the current through the armature of the motor  $M^1$  necessary to obtain the required tractive effort, can be obtained at any desired voltage from the lowest voltage to the full speed voltage, and in either direction.

A perfectly smooth and rapid acceleration can thus be obtained with minimum energy from the source of supply.

The simultaneous multiple control of the several locomotive units

is obtained by means of the four small wires, 1, 2, 3, 4, which are lead along the train.

In Fig. 1 the operator is supposed to be upon the locomotive I. The exciter  $E^1$ , which is producing a constant e. m. f., has its terminals connected to the wires 1 and 2. Across these wires 1 and 2 are connected the field windings of all of the propelling motors on the two locomotives, so that they are all constantly and fully excited.

The wires 3 and 4 are also supplied by a current from the exciter  $E^1$ , but the reversing field rheostat  $R^1$  is in the path of this current. The fields of the two dynamos  $D^1$  and  $D^2$  are connected in multiple across these wires 3 and 4 which extend along the train.

It will be evident that by manipulating the reversing field rheostat  $R$  the operator can vary simultaneously and similarly the field exciting currents supplied to  $D^1$  and  $D^2$  and that therefore he can cause the voltage of these two dynamos to vary in exact unison from 0 to the maximum voltage in either sense. Thus, the operator can cause the two locomotives to start, accelerate, run at full speed, retard, and reverse in perfect unison, always dividing the load perfectly under these various conditions.

By placing the controller  $R^1$  in its open position and going to the other locomotives, the operator can similarly control the two locomotives simultaneously by means of the controller  $R^2$ .

By the use of this system I expect to be able to secure the following advantageous features:

1st. The haulage over existing roadbeds, grades, bridges, etc., of very much heavier trains than can be hauled by any steam locomotive.

2d. A material reduction in the cost of maintenance of the locomotives as compared with steam locomotives.

3d. A material saving in the maintenance of the road bed because of the absence of hammer blow, shouldering, rocking and skidding.

4th. A material increase in the weight of the train which could be hauled around a certain curve by a locomotive having a certain weight on drivers.

5th. A material increase in the load which could be started upon a certain grade by a locomotive having a certain weight on drivers.

6th. A material reduction in the dead load necessarily hauled by a steam locomotive, represented by the part of the steam locomotive and tender not on drivers.

7th. A very large increase in the number of trains of given weight and speed which could be operated from a given power house compared with the series, parallel or cascade systems. Or, to state this another way: a very much higher rate of acceleration with the same maximum output from the power house, the same conductors, the same weight per train and the same watt hours per ton mile, than is possible with the series, parallel or cascade systems.

8th. As each locomotive unit can be equipped with any desired number of driving axles and any desired number of locomotives can be operated under multiple control, the amount of power which can be applied to a single train and controlled by a single operator is practically unlimited.

9th. Fifty per cent. of the energy now wasted on friction brakes can be saved in the form of useful electrical energy restored to the system.

10th. The first cost of equipment will be very much less than that of any system, for equivalent service, which involves the use of sub-stations.

11th. The cost of haulage per ton mile will be greatly reduced as compared with steam locomotives, especially because of the large increase in the weight of the train which can be hauled.

12th. Difficulties due to electrolysis would be reduced to a minimum.

The Savannah (Ga.) Electric Co. has announced an increase in wages of from  $1\frac{1}{2}$  cent to  $1\frac{1}{2}$  cents an hour effective January 1st.

The Lonaconing, Midland & Frostburg Electric Railway Co. has accepted the section of the road between Lonaconing and Frostburg, Md. from the contractors. This is a part of the 33-mile system between Cumberland, Md., and Piedmont, W. Va., which is about two-thirds completed.

### ELECTRIC TRACTION IN LONDON.

The "Battle of the Tubes" in London now more than ever presents the aspect of a game of chess, played, however, with the rules of the game in abeyance, each party's move being referred to an umpire instead. Mr. Yerkes has just called out "check" to Mr. Morgan, his opponent, but the interested spectators in railway and financial circles must wait till the next session of Parliament to find out whether it is "check mate" or whether Mr. Morgan has only allowed himself to be surprised into what proves to be a tight corner, from which he will emerge to fight another battle.

It is as well to recall the incidents which led up to the present extraordinary conflict which has broken out over the transit of London.

The Piccadilly, City & North East London Railway bill, seeking powers from Hammersmith to the city and thence to Palmer's Green was left over from the last session of the Committee which sat to consider the tube schemes. This bill was the result of an amalgamation of interests of the London United Electric railways bill from Hammersmith to Hyde Park Corner, with Mr. Morgan's scheme from thence to Palmer's Green, providing by means of this alliance a complete through route linking at Hammersmith with the London United Tramways, and having a system of cheap through rates. The bill passed the House of Lords and through the first and second reading in the House of Commons. It contained a schedule of through and very cheap fares, and in a large measure it gave effect to the principal recommendation of the Joint Committee on London Underground Railways; it reached the House of Commons, in fact, as an amalgamated and complete scheme for a through route, with a preamble otherwise meaningless. In the House of Commons it was saddled with an "Instruction" intended to emphasise this point and to secure by guarantees that it should be sanctioned only as a complete and amalgamated scheme for giving London a through route. After the bill had been before the committee of the Lords, the two companies hopelessly disagreed about the working of the lines, and during the recess, Messrs. Speyer Bros. of Lothbury (the proprietors of the Underground Electric Railway Co., of London, Limited, controlling the Yerkes Tubes), having the opportunity, obtained the control of the London United Electric Railways bill (Hammersmith to Hyde Park Corner). The transfer negotiations were completed within twenty-four hours and were kept secret.

The next act in the drama was the action of Sir Edward Clarke who before the committee formally withdrew the London United bill. This bill having passed into the hands of the company interested in the District Railway and the Brompton & Piccadilly Ry. the bill for which latter had passed its third reading but the day before and happened to contain also the expensive section from Sloane St. to Hyde Park Corner, the promoters found they could no longer undertake to carry out the bill to the full extent sanctioned, and they had no alternative, therefore, but to withdraw it, since it now entered into dangerous competition with other railways belonging to their group.

The committee thereupon found that under these circumstances the preamble of the Piccadilly, City & North Eastern London Railway bill was not proved, the conditions imposed by the instruction of the House of Commons not having been complied with. Messrs. Speyer Bros. and their syndicate state that they secured the United Tramways because they believed it to be a splendid property and that at the time the Piccadilly & City bill had become practically defunct by reason of the irreconcilable disagreement of the former allies. Mr. Morgan's scheme, which would have established a line parallel to the District Railway owned by the same syndicate was moreover unnecessary.

The proceeding strikes one as a very pretty and clever piece of manoeuvring on the part of the Yerkes combination, inspired by the dissensions in the enemy's camp. Mr. Yerkes intends to lay before Parliament next session an entirely new scheme for a tube railway in London to cover not only all the ground that the defunct bills intended to cover, but considerably more, and which will be constructed more rapidly and at less cost than the other schemes. Mr. Morgan's syndicate is feeling very sore and indignant at the collapse of their scheme and declare their intention of presenting a new bill for the whole route. The umpire will thus be called upon next session to decide on the "check move."

A great deal of feeling was created by the incident in Parliament and a motion was brought forward in the House of Commons by Mr. Ashton for the re-committal of the Piccadilly & City bill, but after a short but animated debate the motion was withdrawn.

This fresh outbreak of the battle of the tubes only brings before us with greater force the necessity for a permanent Board of Control to sift thoroughly and regulate the question of transit for London. A body of men would be required comprising expert engineers, electricians, and traffic organizers, men versed in the financial, legal and economical aspects of the question, and not possessing interest in any of the sanctioned schemes, nor in London's Tramways. The duties of this board would not be to decide on the respective merits of various schemes promoted, but to reconstitute and complete the map of the "Transit of London" from the point of view of the convenience of passengers, inhabitants and workers. That being done, the plans, subject to amendments would be published, tenders invited and the board would be required to hear all parties and local authorities, railway, omnibus companies, etc., entitled to a hearing on the subject.

How necessary such a board of control has become may be gathered from the fact that although it is now nearly 13 years since the City & South London—the pioneer electric railway of the metropolis—was opened, London's railways have only been increased since by two more tubes, the Waterloo & City and the Central London. The other railways sanctioned have either been abandoned or are still incomplete or not begun even. In the session of 1902, 18 tube bills were deposited, aggregating about 82 miles of new lines. Of these, now that Mr. Morgan's combination has collapsed, not a single new undertaking has survived the Parliamentary committees of two sessions; extensions to existing railways alone were sanctioned. Such a situation would be impossible with a board of control.

However, in spite of this future of the crop of tubes, in a few years' time London's needs of rapid, convenient and cheap transit will be considerably better supplied when the lines of the Underground Electric Railway Co. of London—the Yerkes tubes—are opened for traffic.

Mr. Bryce by his question in the House of Commons as to the urgent need of a Royal Commission to investigate the state of London's transit, appears to have brought matters to a crisis. The Government has practically decided to appoint a royal commission to consider the improvement of London traffic. It is to be hoped that the royal commission may prove but a stepping stone to a permanent board of control; it is some consolation at least to find that the crying need of Londoners has at last been recognised to some extent by the legislative body.

D. N. D.

### NEW BENEFIT ASSOCIATION AT MOBILE, ALA.

The Mobile Light & Railroad Co. Employees' Athletic & Benefit Association was recently organized for the promotion of education and a fraternal spirit among its members and to provide a benefit fund for sick or disabled members. The membership is limited to white male employes of the company in sound health. The officers of the company may become honorary members. The officers are elected annually, due notice having been posted previous to election. The board of trustees has general supervision of the work of the association, but the action of the board is subject to appeal at any time. The relief committee consists of the vice-president and three members chosen alphabetically from the roll each month. An investigation committee of three is appointed by the president to inquire into the fitness of applicants for membership. The initiation fee is 50 cents and dues 50 cents per month, with an assessment of \$1 on the death of a member. The monthly dues are deducted by the auditor from the wages of each member and paid to the secretary. The sick benefits are \$1 per day between the fifth and fiftieth day of illness. Medicine is supplied to members free of charge. The death benefit is the necessary funeral expenses of the deceased member. The railway company furnishes the hall, light, heat and bath free. The officers of the association are: Jos. A. Maloney, president; Thomas McCowan, vice-president; Jas. W. Scouyers, secretary; R. P. Priester, treasurer; W. E. Prennett, sergeant-at-arms; S. M. Coffin, J. W. Barnett and R. A. Savage, trustees.

**IMPROVEMENTS ON OLD COLONY SYSTEM.**

BY JAMES H. CREEDON, MIDDLEBORO, MASS.

The Old Colony Street Ry., which constitutes the southern division of the lines controlled by the Massachusetts Electric Cos., is busy making several improvements for the betterment of the service on its lines.

Chief among these are the additions to rolling stock. At the Campello car house, where is the main work shop of the system, the new open cars have been arriving all summer from the works of the J. G. Brill Co. The new open rolling stock has K. 6 controllers, G. E. 67 motors and Christensen air brakes. The motors are geared to give a maximum speed of 35 miles an hour.

The winter cars which have already arrived, are of two types. One kind, built by the John Stephenson Co., measures 30 ft. over all and is extra heavy, following the general lines of steam railroad coaches. The windows raise instead of lower and the fare register and signal cord depend from the center of the ceiling. The cars are mounted on Peckham 14 B, 3 double trucks and are fitted with four G. E. 67 motors, K. 6 controllers, and Christensen air brakes. The seats which are of the Wheeler type are arranged seven on each side of the aisle and one long seat at each end with accommodations for four passengers each. It is believed this arrangement will give more room for standing passengers. The cars have double trolley bases on monitor roofs. They will be used on the Plymouth, Milton, Neponset and Taunton lines running out of Brockton.

The other closed cars were built by the Laconia Car Co. They are mounted on St. Louis trucks with two G. E. 67 motors to each car. They are fitted with longitudinal seating, covered with red plush. The cars will be used on the East Bridgewater and Brockton lines and also in Fall River. Gold heaters have been placed in all these closed cars.

During the past summer 112 box cars were vestibuled in the Campello car house, men working night and day to complete the work before November 1st, to conform with the Massachusetts state law. About 20 cars were practically rebuilt.

It is of interest to note that the Old Colony management has adopted uniform colors for all rolling stock. The summer cars will be yellow and white and the winter cars will be red and white.

A new illuminated sign has been adopted. On winter cars this is placed on the outside of the vestibule just above the motorman's window. It is of metal, with black background and white lettering, and is illuminated by two 8-c. p., 55-volt lamps.

The company is testing the U. S. automatic block signal system on two single track sections with the end in view of demonstrating its practicability for the company's particular traffic conditions.

The company is putting up a two-mile section of insulated wire for the private telephone dispatching system. The insulated wire will be used chiefly where the line runs through trees and it is believed will do away with the "noisy" line which often gives trouble where the bare wires chafe against trees.

A new 4-ton Christensen compressed air hoist has been installed in the work shop at the Campello barn and it is believed will expedite the handling of trucks and motors.

The work of setting up the new cars as well as the vestibuling and rebuilding of the old ones, and the installation of the air equipment has been under the charge of the master mechanic, Frank Radlett, of the Campello barn.

**"COMMUNITY OF INTEREST" IN OHIO.**

The reports which have been published recently regarding the community of interest plan between the Mandelbaum-Pomeroy the Wiedener-Elkin people have become interested to a substantial extent in several of the Mandelbaum-Pomeroy enterprises, namely, the Cincinnati, Dayton & Toledo Traction Co. and the Miami & Erie Canal Transportation Co. This, of course, means that the operation in the Cincinnati field between the two syndicates will be harmonious.

**TRANSFER CONCLUSIVE BETWEEN PASSENGER AND CONDUCTOR.**

In the case of Garrison vs. United Railways & Electric Co., of Baltimore, the Court of Common Pleas of Baltimore City made a ruling upon transfers which is of interest to the public. The action was in tort for wrongful ejection from a street car and for assault and battery.

The plaintiff testified that he boarded a car of the defendant about 3:45 p. m. and the conductor gave him a transfer punched 3:50; that he rode several squares to the transfer point and waited 10 or 15 minutes for a car, and took the first car that came; that when he presented the transfer it was after 4 o'clock. The transfer read "not good after the hour punched in the margin," and had therefore expired. The court ruled that the transfer was conclusive evidence as between the passenger and the conductor as to the passenger's right to ride and that inasmuch as the transfer was bad on its face the conductor had the right to demand that the passenger pay his fare or get off the car and in the event of his refusal that he then had the right to use all reasonable and necessary force to expel him.

Counsel for the defendant argued that the transfer was conclusive evidence as between the passenger and the conductor to whom the transfer was presented, and that if there had been any error by any agent of the company by which the plaintiff had been injuriously affected, the plaintiff's rights were in an action for breach of contract; that it was the duty of the passenger under the circumstances, in the interest of public policy to pay his fare, postpone his claim and not to compel the conductor to eject him. That any other ruling would either compel a conductor to accept the word of every passenger who had a transfer bad upon its face, which would open the door to continuous frauds, or else he would be obliged to eject every passenger who had a bad transfer and who, relying upon the ruling of the court, would compel the conductor to eject him. In other words such a ruling would present an alternative between extensive frauds or breaches of the peace upon the car, which alternative, in the interest of public policy should not be presented to the defendant.

Counsel for the plaintiff cited the Act of 1900, chapter 313, requiring the defendant to give free transfers in the city which should "be good for a continuous ride," but it was argued and so ruled that this did not prevent the company from making reasonable regulations for its own protection, compelling passengers to produce proper evidence of their rights so to ride.

The plaintiff also testified that after the car had gone 7 or 8 squares from the place where the conductor demanded that the plaintiff pay his fare or get off, that the car was stopped and the conductor called a policeman, that thereupon one of the plaintiff's friends with whom he was riding offered to pay his fare, which the conductor refused and attempted to eject him.

The court held that if after the demand by the conductor for payment of fare a reasonable time had been given by him to comply therewith and the car had been stopped for the purpose of ejecting the passenger, the conductor was not at that time obliged to accept a tender of fare by the passenger, but still had the right to eject him.

The plaintiff testified, however, that after he had offered to get off and while so doing, the conductor pushed him from behind against the controller of the car which injured his arm. This evidence was contradicted by witnesses, but the case went to the jury on the question of whether unnecessary or excessive force had been used upon the plaintiff.

The jury found in favor of the defendant company.

**STARK ELECTRIC RAILWAY CO.**

The Stark Electric Railway Co., which operates the street railway system in Alliance, O., and an interurban line to Sebring, has about completed an interurban line between Alliance and Canton. The sub-station has been completed and machinery will be installed at once. The company has also made surveys for an extension from Sebring to Salem. The route has been decided upon from Sebring to Garfield, and a choice of several routes will soon be made for the remaining distance. Work will begin as soon as possible on the extension.

### NEW PUBLICATIONS.

THE APPENDIX TO THE REPORT OF THE BOARD OF REGENTS, SMITHSONIAN INSTITUTION, is a summary of the most interesting scientific events of the year. The volume for 1901 contains 50 articles, many of them illustrated, nearly all prepared by masters of the respective subjects. "Bodies Smaller than Atoms," "The Laws of Nature," "The Greatest Flying Creature," and "The Fire Walk Ceremony at Tahiti" are among the subjects included in the Report. The Smithsonian Reports may be had by purchase at cost price from the Superintendent of Documents, Washington City, and may also generally be obtained free from the applicant's representative in Congress.

POOR'S MANUAL OF RAILROADS OF THE UNITED STATES, thirty-fifth annual volume, 1902. Royal octavo, cloth, 1900 pages, 24 colored plate, state, and group maps and 50 railroad maps, indexes, etc. Published by H. V. & H. W. Poor, New York. Price \$10.00.

Poor's Manual is, perhaps, the most important work of the kind published and with the newly added features and thoroughly reliable information increases in value each succeeding year. The present edition contains interesting data regarding the history, organization, equipment, operation and financial condition, etc., of every railroad company in the United States and Canada, and the leading railroads of Mexico. Every statement was officially revised before publication, which adds greatly to the value of the volume. The Manual shows the total length of railroads of the United States at the time of publication to be about 201,000 miles. The average earnings per mile of road for 1901 are given as \$8,270 gross and \$2,668 net, the average interest paid on bonded debt as 4.24 per cent, and average dividend on total share capital 2.62 per cent. A comparative statement shows also the mileage, equipment, liabilities and assets, traffic operations, earnings, interest and dividend payments, etc., of all steam railroads each year from 1894 to 1901 inclusive. The chief features of Poor's Directory of Railway Officials and Manual of American Street Railways have of recent years been included in the Manual and 240 pages are given to information and statistics for these roads similar to those of the steam railroads. Another department is devoted to miscellaneous industrial corporations, national, state and municipal finances, and fills 110 pages. There are also tables of dividends paid by the railroad and street railway companies, bond lists of leading railroads and finally, a list of railroad officials.

TRAMWAY ACCOUNTS—Gee & Co., 34 Moorgate St., London, proprietors of *The Accountant*, and publishers of numerous works on accountancy subjects, have announced a volume on Tramway Accounts. This will be, we believe, the first work on this subject, and will doubtless be widely welcomed. It is based on the methods of accounting used in the Glasgow Corporation Tramways Department, and will contain facsimiles of all the forms and books recommended, this being a valuable feature. The entire system of accounts, from the commencement to the published results, will be fully described, the difficulties of those inexperienced in the work being kept specially in view. The standardization of tramway accounts is a subject now under consideration by a committee of the Association of Municipal Tramway Managers of Great Britain, and this fact makes the book a timely one. The author is Mr. Donald Metcalf, chief bookkeeper, Glasgow Corporation Tramways.

PROCEEDINGS of the Purdue Society of Civil Engineering, No. 6, 1901-1902, 52 pages, illustrated. Published by the society at Purdue University, LaFayette, Ind. Price 50 cents. The Proceedings contains a number of the most important papers presented to the society during the year, among which are the following: Foundations, translated by the sophomore class from "Der Grundbau," by L. Brennecke, Imperial Engineer for the German Government; Topographic Maps of the U. S. Geological Survey; Literary Training for Engineers; Water Purification by the Use of Sodium Bi Sulphate; and Earthwork Estimates. A list of the instructors in the School of Civil Engineering and a list of the officers and members of the society are also given.

SUBJECT MATTER INDEX of Mining, Mechanical and Metallurgical Literature for the year 1900. Edited by M. Walton

Brown, secretary of the North of England Institute of Mining and Mechanical Engineers, and published by the Institute, Newcastle-upon-Tyne, England. 222 pages, paper. Price 42s. The volume contains an alphabetical list of the publications indexed, which includes nearly every scientific and trade paper in the world. The table of contents is divided and subdivided in such a manner that it is possible to locate any specific subject at once and by turning to the page reference the headlines of every article pertaining to that subject may be found with the page and number of the publication containing it, and also the name of its author. An alphabetical list of authors is given with reference to the page on which the name may be found in the index.

REPORT of the Twenty-First Annual meeting of the American Street Railway Association, held at Detroit, Mich., October 8-10, 1902. Published by the Association, 2020 State St., Chicago, Ill. The volume contains 344 pages devoted to the discussion of the street railway topics presented at the convention, together with the reports of committees, lists of officers and members and the constitution and by-laws of the association. Secretary Penington is to be congratulated on the promptness with which he has published the Detroit report.

THE ANNUAL REPORT for 1901 made by the board of regents of the Smithsonian Institution at Washington is now being distributed. It is a volume of several hundred pages, containing, in addition to a short sketch of the history and work of the Smithsonian Institution, over 50 articles, many of them illustrated, dealing in language "understood of the people" with the most interesting events and discoveries of the scientific year. The articles are nearly all prepared by masters of the respective subjects, and the volume has been called "the best popular scientific annual published in the world." The subjects treated are diversified in character and include "The Law of Nature"; the "Greatest Flying Creature"; "The Fire Walk Ceremony at Tahiti"; and reviews of the year's developments in flying machines, wireless telegraphy, trans-atlantic telephoning, the telephonograph, automobiles, sun engines, etc. The Smithsonian Reports are distributed by the Institution to libraries throughout the world and may be had by purchase at cost from the Superintendent of Documents, Washington City, and may also generally be obtained free of charge through the applicant's member of congress.

PROCEEDINGS of the Convention of the Street Railway Accountants' Association of America, held at Detroit in October last, have been issued in book form and include a verbatim report of the papers, discussions, etc., of the last convention, together with a list of attendants, the constitution and by-laws of the Association and list of members for the present year. The secretary and treasurer of the Association, Mr. W. B. Brockway, is to be congratulated upon the prompt publication of the proceedings in book form, and upon the handsome appearance of the work typographically.

### CAR WASHING AND PAINTING.

Editor "Review": The article on "Car Washing versus Car Painting" in the "Review" for November 20th we are ready to applaud, as in our opinion it hits the nail on the head, only we think the writer might go further if he could look into the material some manufacturers sell under the name of "Compounds for Washing Cars." One in particular which we have in mind is composed of an alkali soap and a mineral oil, and when cars are washed with this compound the oil is never washed off entirely, and as soon as the car has run for a few hours, it is just as dusty and dirty as before, as the oil left on surfaces catches all the dust that is flying. We manufacture a dust-proof car cleaner that contains no alkali or other injurious substances that will eat into the luster of the varnish. In fact, our goods are a varnish protector and hardener. We claim for them economy of money and time. While our car cleaner is more expensive per pound than others there are but 25 to 32 lbs. of it required to make a barrel of the liquid wash. Yours truly,

Delaney Oil & Lubricant Co.

Milwaukee, Wis.

## PERSONAL.

MR. HENRY WINFIELD SMITH, general manager of the Harrisburg (Pa.) & Lewisberry Street Railway Co., is a native of Lancaster County, Pa., and is the son of Joseph Smith, a farmer. His mother is a sister of Mr. Collins, a well-known Pennsylvania Railroad contractor. Mr. Smith received a good common school education, and early in life gave his attention to railroad construction, and for some years served in the construction department of the Pennsylvania Railroad. He also held the position of foreman

H. W. SMITH.

in the machine department of the Pennsylvania Steel Co.'s works at Steelton. After spending several years in railway construction work in Illinois and Texas he returned to his native state and gave his attention to the building of electric railways. His first work in this line was the building of an electric railway track across the Susquehanna River at Harrisburg. Later Mr. Smith built the Greensburg, Jeannette & Pittsburg Street Ry., with its park and famous dam, making what is said to be the largest artificial lake in the state. In this enterprise Mr. Smith won

for himself a high reputation as an electric railroad contractor. Since then he has been actively engaged in the work of promoting and building electric lines, among which may be named the Citizens' Passenger Ry., of Harrisburg, Pa.; the Carlisle & Mt. Holly Ry.; the Cumberland Valley Traction Co., Carlisle, Pa.; the Harrisburg & Mechanicsburg Electric Ry., crossing the Susquehanna River from Harrisburg to Bridgeport; the Greensburg, Jeannette & Pittsburg Street Ry., already mentioned; the railway now in course of construction at Mechanicsburg; the Harrisburg & Lewisberry Street Ry.; the projected interurban between Harrisburg and Lewisburg; the Elizabeth & Middleton Ry.; the Hummelstown & Palmyra Ry.; the Womelsdorf Electric Ry.; and the Boiling Springs & Mt. Holly Ry. Mr. Smith is also building the Steelton and New Cumberland bridge across the Susquehanna River.

MR. RICHARD STOCKTON, assistant to the president, and Mr. Frank D. Moses, chief engineer of the South Jersey Gas, Electric & Traction Co., resigned on November 1st to embark in another enterprise in New York City.

MR. C. H. DEERE was elected president of the Moline (Ill.), East Moline & Watertown Railway Co. at a recent meeting of the stockholders. The other officers are: George W. Wood, vice-president; F. W. Rank, secretary; Joshua Hale, treasurer. The officers, together with F. Y. Keator, constitute the board of directors.

MR. GEORGE M. COLE, of Plattsburg, N. Y., became general manager of the Oneonta, Cooperstown & Richfield Springs Railway Co. December 1st. Mr. Cole has had over 15 years' successful electrical railway experience.

MR. J. BEYERS HOLBROOK was admitted to partnership in the firm of Charles Henry Davis and Partners, engineers and architects, 25 Broad Street, N. Y., December 1st. Mr. Holbrook is the firm's heating and ventilating engineer. The firm has offices in New York, Boston and Philadelphia.

MR. GARDNER F. WELLS, employed by Stone & Webster, of Boston, as manager of the Brockton (Mass.) & Plymouth Street Railway Co., was transferred to Terre Haute, Ind., December 1st, to be manager of the Terre Haute Electric Co. Mr. J. Peyton Clark will continue to be general manager of the company, but his time will mostly be taken up with the development of interurban interests of Stone & Webster.

MR. C. A. TAYLOR, assistant secretary of the Northern Texas Traction Co., Fort Worth, Tex., has been elected secretary and treasurer, succeeding Mr. Geo. F. McKay, of Cleveland, O.

MR. FRED NEWMAN, foreman of the Citizens Electric Street Railway, Newburyport, Mass., retired from the service of the company November 10th and was presented with a fine Masonic ring as a token of good will from the employes.

MR. J. S. MACKENZIE, of the Toronto (Can.) Railway Co.'s offices, has taken charge of the Winnipeg Electric Power & Light Co.'s works. Previous to his departure from Toronto Mr. Mackenzie was presented with a gold chain and locket as a gift from the office staff.

MR. JOHN G. WEBB, vice-president of the Central Market Street Railway Co., Columbus, O., tendered his resignation to the directors November 11th. R. M. Emery, superintendent of the Columbus, London & Springfield Railway Co., will succeed him, and has also been made a member of the board of directors.

MR. ELLIS BURNETT, superintendent of the Citizens Railway, Light & Power Co., Newport News, Va., has tendered his resignation to accept a responsible position in a confidential capacity with W. J. Payne, president of the Newport News & Old Point Railway and Electric Co., and vice-president of the Norfolk, Portsmouth and Newport News Co., recently organized.

MR. R. S. IVES, formerly superintendent of the Chicago & Milwaukee Electric Railway Co., resigned that position November 1st. A few evenings afterward he was surprised by a band of his former employes, who presented him with a diamond ring in appreciation of his kindly regard for them during his management. It is understood that Mr. J. W. Mauck, treasurer, will serve as acting superintendent for the present.

MR. CHARLES CARROLL BENSON, who for over three years was superintendent of the Citizens Electric Street Railway Co., Newburyport, Mass., sailed for Porto Rico, November 11th, where he entered the employ of the San Juan Light & Transit Co., San Juan, as announced in the November "Review." Mr. Benson was born in Manchester, Me., June 4, 1866. His father was a contractor and builder. After completing the public school course he took a business college course at Augusta, Me. In 1886 he entered the employ of the West End Street Railway Co. of Boston, and was soon promoted to foreman of the construction gang of that road. He afterwards entered the firm of Woodbridge & Turner, contractors. After a short stay with that firm, in 1888, he entered the employ of the Thomson-Houston Co. as constructing engineer, and in that capacity assisted in installing electric equipment on a large number of lines in New England and also in the South. He was for some time with the Boston Electric Light Co. and left that position to become superintendent of the Citizens Electric Street Railway at Newburyport. He found the road in poor condition but succeeded in putting it in first class order and giving the public an entirely satisfactory service. He left with the best wishes of his fellow officers, employes and the citizens of Newburyport. He was a member of a number of social and fraternal organizations of the town. A few evenings before he departed he was summoned to the car barn where he was presented with a handsome diamond ring as a token of the esteem in which he was held by his former employes.

CHAS. C. BENSON.

MR. W. H. GRAY has been appointed manager of the Indianapolis, Shelbyville & Southern Traction Co., which now has 27 miles of road in operation.

MR. WILLIAM BROWN, who has been with the Metropolitan Railway Co., Toronto, Can., for several years, has been appointed manager and superintendent of a new company which has secured control of the Guelph (Can.) Street Railway Co.

MR. R. S. MASSON has been appointed consulting electrical engineer of the Los Angeles Railway Co., Los Angeles, Cal. The duties of Mr. Masson in this capacity will be to pass judgment upon all plans for electrical machinery and apparatus and outline the arrangement of installation. He will report to Mr. J. A. Muir, general manager.

MR. HERBERT H. VREELAND, for years the head of the Metropolitan Street Railway Co., of New York, has resigned to become president of the Metropolitan Securities Co., the holding company of the Metropolitan interests. He is also president of the Interurban Rapid Transit Co., which operates the lines absorbed in the recent Metropolitan merger. Mr. William L. Elkins is his successor as president of the Metropolitan Street Railway Co.

MR. W. C. SMITH has been appointed general manager of the Pennsylvania & Mahoning Valley Railway Co., Youngstown, O., to succeed Mr. A. A. Anderson. Mr. Smith was born near Saxon Station, Butler County, Pa. He was associated with the street car companies of Pittsburg for 20 years, and was assistant superintendent of the Citizen's Traction Co. when it was a cable line, and was later general superintendent of the Central Traction Co. When this line was absorbed by the Consolidated Traction Co. in 1896 he was appointed superintendent of transportation of that company. In February, 1902, Mr. Smith was appointed assistant general manager of the Pennsylvania & Mahoning Valley Railway Co. at Youngstown, and on the resignation of Mr. Anderson last month he was appointed general manager.

MR. H. C. REAGAN, Jr., who is at present engaged in the construction of several Ohio interurban railways, was born at Pughtown, Chester Co., Pa., Aug. 19, 1864. He received a high school education at Pottstown, Pa. Inheriting mechanical tastes from his ancestors, who were engaged in the iron and machine business, he began his career as fireman on the New York Division of the Pennsylvania Railroad and was promoted to engineer. Having given some attention to the study of electric light and power plants he entered the service of the Hestonville, Mantua & Fairmount Park Passenger Railway Co., having charge of the transportation department. Since Mr. Reagan entered the electric railway field he has held the position of chief engineer on the Quakerstown (Pa.) Traction Co., the Tarrytown (N. Y.), White

H. C. REAGAN, JR.

Plains & Mamaroneck Railway Co., the Union Railroad Co., New Rochelle, N. Y., the Easton (Pa.) Consolidated Electric Co., and is at present constructing engineer of the new power house and equipment on the Columbus, London & Springfield, and the Dayton, Springfield & Urbana Electric Railroads, and also of the power plant in the Arcade Building, Philadelphia, for the Pennsylvania Railroad Co. He is the inventor of a number of mechanical and electrical devices, among which is a third-rail system for which was granted the Edward Longstreth medal by The Franklin Institute. This system has been thoroughly tested by experts in this and foreign countries and over 40 patents have been granted on it alone. Mr. Reagan is the author of a book under the title of "Locomotives, Simple, Compound and Electric."

MR. ALBERT A. ANDERSON recently resigned as general manager of the Pennsylvania & Mahoning Valley Railway Co., Youngstown, O., after eight years' service. Mr. Anderson went to Youngstown from Indianapolis, where he had already achieved success in the electric railway field, taking charge of the Mahoning Valley Railway Jan. 1, 1894. At that time the business of the company was less than one-third as large as at present. The lines have been extended from the Youngstown system to a street and interurban system over 90 miles in length and extending to Leavittsburg on the west and Newcastle on the east. Mr. Anderson's retirement was made the occasion of a very flattering demonstration by some 500 employes, who, headed by a brass band, called at Mr. Anderson's residence at 2 a. m. Nov. 24th and presented a handsome "grandfather's clock" inscribed as follows: "Presented to Mr. and Mrs. A. A. Anderson by the employes of the Pennsylvania & Mahoning Valley Railway Co., Youngstown, O., Nov. 24, 1902."

A. A. ANDERSON.

MR. JOHN I. BEGGS, president and general manager of the Milwaukee Electric Railway & Light Co., was thrown from his buggy December 7th and received painful but not serious injuries. The accident resulted from the horses becoming frightened and bringing the vehicle in collision with a telegraph pole.

MR. J. H. VAN BRUNT has been appointed general manager of the St. Joseph (Mo.) Railway, Light, Heat & Power Co.

MR. C. W. SIMONSON, formerly with the Dayton, Springfield & Urbana Ry., has been appointed general passenger agent of the Columbus, Delaware & Marion Ry., of Columbus, O.

MR. FRANK H. BROWN has been appointed superintendent of the Plainfield division of the Elizabeth (N. J.), Plainfield & Central Jersey Railway Co. He has been employed for the last ten years as conductor and inspector on the Worcester (Mass.) Consolidated Street Ry.

MR. S. S. NEFF, who was formerly superintendent of the Chicago Union Elevated R. R., and later of the Boston elevated lines, has been engaged by W. E. Baker & Co., N. Y., as superintendent of construction and operation of their street railway enterprises. Mr. Neff has been successfully associated with numerous steam and electric railroads.

MR. GILBERT F. BROWN, general manager of the Jackson (Miss.) Electric Railway, Light & Power Co., died November 17th at his old home in Philadelphia, Miss.

In order to make the new schedule of the Winnebago Traction Co., Oshkosh, Wis., a success and to avoid the danger of possible accidents the company has established a block system. The system is considered necessary because cars on certain branch lines are expected to sandwich their trips with those of the regular cars on the main line.

A bridge spanning both the Lake Shore & Michigan Southern and the Michigan Central railroads and the Kalamazoo river has been completed for the Jackson, Albion & Battle Creek Electric Railway Co. by the American Bridge Co., of New York. The bridge is nearly 900 ft. in length. The two girders over the river are each 75 ft. long. The cost of the bridge is said to approximate \$50,000.

### BIRMINGHAM NOTES.

In order that the claim department of the Birmingham Railway, Light & Power Co. may make prompt investigation of accidents on the lines of the company without waiting for a crew to come in off its regular run there has been prepared an emergency accident report which is designed to bring the important facts of each accident promptly to the head of the department in order that such action may be taken as is necessary. Each conductor and motorman is required to have a blank report in his pocket at all times when on duty and to fill it out in case of an accident and hand it to the first dispatcher seen after the accident. This blank is on heavy manila cardboard, size 4 1/4 x 9 1/4 in. The face of the card contains the name of the company, the department, and the name of the report followed by blank spaces for the Date, Car No., Line, Time, Place, Direction of Car, Number of Passengers, Kind of Accident, Name of Party Injured or Owner of Animal or Vehicle, Description of Accident, Names of Motorman and Conductor with their respective numbers. The back of the card contains blank spaces for the name and addresses of nine witnesses, and the following instructions:

"Conductors will fill out this card when there is an accident of any kind in connection with their car and hand to first dispatcher they see after accident. Motorman and conductor will both sign this report. When crew get off their run they will make out regular accident report, Form 106, and turn it in as usual. Dispatcher on receipt of this will bring to manager's office immediately."

The freight business on this company's suburban roads has so materially increased during the past few months that it was found necessary for the company to move its freight office from the heart of the city to a point further out in order to obtain more yard room. Plans are now being prepared by Messrs. Ford, Bacon & Davis for a large freight depot into which the freight cars may be run and loaded or unloaded from both sides on a platform and into a warehouse.

Until a few weeks ago the freight for Gate City and East Lake has been handled by a freight car attached to a passenger car, but owing to the increase of business along the line a special freight train is run twice daily in each direction between the city and those towns.

### ACCIDENTS. --

The evening of November 10th a freight train on the Chicago, Burlington & Quincy R. R. parted, and after the first section had passed the gateman at Eighteenth St. and Western Ave., Chicago, not knowing that the train had parted, raised the gates for a street car to pass, and the conductor signalled the motorman to go ahead. Just as the motor car with its trailer were in the center of the crossing the rear section of the freight came in sight and despite the motorman's effort to cross by putting on full power the freight struck the trailer, which broke loose from the motor car and was crushed to pieces, being carried more than 200 ft. One passenger was killed and a number injured.

In an accident on the Wilmington (Del.) & New Castle Electric Ry., November 18th, one person was killed and several others injured. The accident was caused by the breaking of the rear axle, which overturned the car. There were 65 persons on the car at the time. The man who was killed was riding on the platform and was thrown under the car as it overturned.

In a collision between a fire engine and street car in St. Louis recently the engine was overturned and completely wrecked.

A head-on collision occurred between a passenger car and a coal car on the Scranton Railway Co's. line at Scranton, Pa., November 23d. One person was killed and nine were injured. The accident is said to have been caused by wet rails, fast running in an effort to make up lost time, and the failure of the conductor of the coal car to give signal to the approaching car that the turnout was occupied. The turnout is around a sharp curve from the direction of the approaching car and on a steep grade.

At Des Moines, Ia., November 27th, two persons were fatally and six seriously injured as the result of a street car collision which is said to have been caused by a broken brake, allowing one car to run down a hill nearly half a mile long and crashing into another.

An accident occurred on the Northwestern Elevated Railroad, Chicago, about 9 p. m., December 2d, in which the motorman was slightly burned and the body of the motor car almost entirely destroyed. Through some unknown cause the current was short-circuited, and blowing out a fuse in the circuit breaker set fire to the woodwork of the car.

An accident occurred on the Philadelphia & Lehigh Valley Traction Co's. line at Hatfield, Pa., on Thanksgiving day in which two persons were killed and a score of others are reported injured. It is said that in descending a grade a bolt in the brake mechanism broke and the car gained such velocity that it overturned on a curve at the foot of the hill.

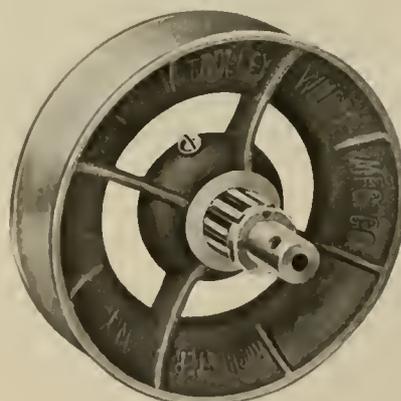

A car on the line of the Pottstown (Pa.) Passenger Street Railway Co. jumped the track on a steep grade November 27th and ran into a stone wall, fatally injuring one passenger.

At Reading, Pa., a young man riding on the front step of a crowded car was caught by a car passing in the opposite direction and rolled between the two cars their entire length. He lived only a few minutes.

### THE "NATIONAL" TROLLEY.

The National Trolley Manufacturing Co. is the name of a new corporation recently organized at Rochester, N. Y., for the purpose of placing on the market roller bearing trolley wheels, bearings for car axles on both steam and street railways, and other specialties.

The "National" trolley wheel differs from the ordinary types in several particulars. Instead of being the ordinary 4-in. or 4 1/2-in. wheel it is 5-in. and 5 1/2-in., giving a larger contact surface, while the weight is but slightly more than the ordinary wheel, because of the open construction as shown in the accompanying illustration. The extra weight is also reduced by the use of silicon bronze material well known for its rigidity and strength. The bearing of the

"NATIONAL" TROLLEY WHEEL.

wheel, which is emphasized as the main feature, is entirely independent in its construction, being a roller bearing and of such mechanism that each single roller must be worn almost to a thread before the bearing gives out. Each roller revolves in a separate pocket and is not hung on small pivots or axles. The bearing is so placed that it is in contact with the axle on one side and presses on the surface of the wheel or hub which is incased within the bushing. This bushing is of brass and is pressed into the main hub of the wheel, becoming a part of it. Back of the bushing there is a space in the hub for an oil box which answers two purposes - lubrication and protection for the bushing against the electrical currents. The bearing is of soft steel case hardened as is also the axle, which is hollow allowing a circulation of air which tends to keep the bearing cool.

These wheels have been tested on high speed lines both in the United States and in Canada and in one instance it is reported that the bearings of a wheel that had run for 9,000 miles when examined, were found to be in perfect condition, the only wear appearing on the surface of the wheel itself. The wheels have been especially designed and are claimed to be particularly adapted to high speed lines. The National Trolley Manufacturing Co. will be glad to furnish any number of wheels for test.

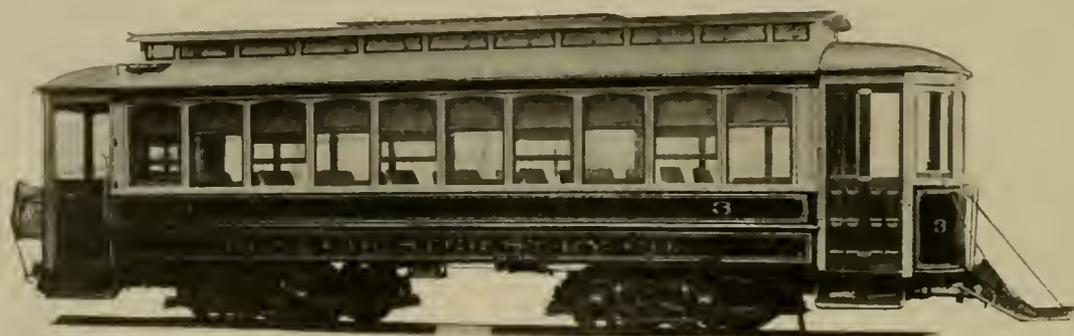

### A CLEAN ACCIDENT RECORD.

In an Article on railroad management in England and the United States by Charles Hansel, C. E., which was recently published in the Railroad Gazette, the following statement in regard to accidents on railroads in the United Kingdom was made:

"The record of railroad operation in the United Kingdom for the year 1901 is phenomenal, for on a mileage of 11 per cent of the mileage of America were carried about 100 per cent more passengers and not one killed. I believe this record was made possible by the completeness of block signaling and interlocking coupled with discipline. The question of protecting traffic by block signaling and interlocking is not left to the decision of the railroad officials. It must be provided and pass the inspection of the Board of Trade. Automatic block working has just been inaugurated and owing to the congested traffic the quicker movement of trains by means of the automatic block will greatly increase the capacity of the railroads and at the same time reduce the cost of operating and maintaining signals."

### NEW CARS FOR WESTCHESTER, PA.

Five handsome semi-convertible cars recently built by the J. G. Brill Co., of Philadelphia, for the Westchester Street Railway Co., are particularly fine specimens of the car builders' art. The structural features include an extra number of steel rafters in the roof, and heavy 12-in. plates, bolted to the inside of the side sills and to the bases of the posts add to the longitudinal and vertical

BRILL CAR FOR WESTCHESTER, PA.

stiffness. The interiors are finished in natural cherry with ceilings of decorated birch. The cars are 28 ft. long over the end panels, and 37 ft. 5 in. over the vestibules. The width over the sills is 7 ft. 10½ in., and over the posts at the belt 8 ft. 2 in. Each car is equipped with Brill rocking sand boxes, angle iron bumpers, "Dedenda" gongs, Brill radial draw-bars and ratchet brake handles. The trucks are Brill 27G.

### GREEN BAY-KAUKAUNA INTERURBAN.

The Knox Construction Co., which was recently incorporated under the laws of Wisconsin, with G. W. Knox, of Chicago, president, and R. M. Haskett resident engineer, will begin the construction of an interurban line between Green Bay and Kaukauna, Wis., which is to be completed before the end of 1903. The preliminary work is well under way and construction will begin as soon as possible. The new road will be equipped in a first-class manner and cars will be used capable of maintaining a speed of 50 miles an hour. The power house will be built near the center of the line. Negotiations will be made with the Fox River Electric Railway & Power Co. for terminal facilities in Green Bay. If these negotiations are not successful the new company will apply for a franchise for its own line into the city.

Mr. Knox is also president of the Knox Engineering Co., of Chicago, which has under construction the interurban lines between Rockford, Ill., and Janesville, Wis.; Alliance and Canton, O., and other lines in southern Illinois and in Oklahoma Territory.

Founders' Day exercises were held at the Thomas S. Clarkson Memorial School of Technology, Potsdam, New York, Monday evening, December 1st.

### ELECTRIC RAILWAY ADVERTISING.

"Nickel Trolley Rides in and About Ohio's Greatest City" is the title of an attractive folder issued by the Cleveland Electric Railway Co., which maintains an outing department under the management of Mr. J. W. Butler. Mr. Butler has at various times published a number of attractive advertising announcements and this latest folder is fully in keeping with the excellent advertising matter which has previously appeared. The folder gives a list of all the principal points of interest in and about the city and beside each point of interest named is a brief description giving its historical relation and the means of reaching the same by the electric cars; it is printed in red and green and comprises a very attractive advertisement.

### RECENT STORAGE BATTERY INSTALLATIONS

The Electric Storage Battery Co., of Philadelphia, has contracted with the Cleveland Electric Railway Co. for the installation of a battery of chloride accumulators consisting of 264 elements capable of discharging at the rate of 1,200 amperes for regulating the fluctuations and maintaining the voltage during the hours of peak load. The battery will also assist in carrying the load on the Euclid Beach line during the heavy traffic of the summer months. The installation will be at Windemere, a point five miles from the power house. The company has also closed a contract with the Baltimore & Ohio Railroad Co. for the installation of a second battery of chloride

accumulators to be operated at the Mt. Royal entrance of the Baltimore tunnel. The first battery was installed in November, 1900. The railroad company has completed its plant for the electric haulage through the tunnel of both freight and passenger traffic, and for this purpose has contracted for two electric locomotives of approximately double the capacity of those now in service. The increased service necessitates a corresponding increase in power equipment, which will be supplied by the installation of this second battery. Previous to the installation of the first battery the load at times required the operation of three 500 k.w. generators. After this installation only one was required. It is estimated that even with the increased service the larger capacity in battery output will require only one generator. The total battery output will be 2500 amperes, there being added to the first battery 320 type G-25 cells.

A fire recently destroyed the new car shed of the Elizabeth, Plainfield & Central Jersey Railway Co. Eight cars were burned. The building was 40x125 ft. and supposed to be fireproof, being built of steel girders with corrugated iron roof and sides. The loss is fully covered by \$21,000 insurance.

It is rumored that H. E. Huntington, formerly president of the Pacific Electric Railway Co., contemplates spending several millions of dollars in southern California building a system of interurban railways.

The Winnebago Traction Co., Oshkosh, Wis., has adopted a block signal system. Red light signals are operated by the car conductors on passing certain points.

**A SOLID RAIL BOLT JOINT.**

The illustrations herewith show a general view and cross-section of a rail joint invented by Dr. O. S. Weddell, of McKeesport, Pa., that uses bolts having a solid head on each end, dispensing entirely with nuts and threads. The angle bars of this joint are securely fastened by means of special shaped solid bolts, which, after being inserted through the bars and rail webs, are tightened by moving the angle bars longitudinally along the rails, which wedges the heads of the bolts against inclined faces on the angle bars.

These joints may be cast instead of rolled, which permits several desirable features which would be impossible in a rolled joint. Instead of round bolt holes in the angle bars, there are inclined recesses in which are oblong openings. These openings are enlarged so as to permit the square shank of the bolts to be turned. Ribs are cast on the sides of the bars for the purpose of giving them additional stiffness, and the lower parts of the bar nearly meet under center of the rails. Part of this lower portion extends down between

SOLID RAIL BOLT JOINT.

the ties and contains the inclined recesses and oblong openings which contain the bolts beneath the rails. Both of the angle bars are exactly alike. The bolts are drop forged, with a square shank or body and a T-shaped head on each end. The heads are flat and of the same thickness as the shank of the bolt and about 1 3/8 in. in diameter. The holes in the web of the rails are made sufficiently large to admit the head of the bolt.

In applying this joint to the rails, bars are placed on each side of the rail so that the enlarged portion of the openings in each bar is opposite the holes in the rails. The bolts may be inserted from either side, both those through the web of the rail and those beneath it. The bolts are then given a quarter turn so that their heads will

SECTION THROUGH JOINT.

and perpendicularly and the angle bars are then moved in opposite directions. By this motion the square shank of the bolts become fully engaged in the opening in the splice bars, which will prevent them from turning down, and at the same time the heads of the bolts will ride upon the wedge shaped portions of the bars adjacent to the openings. By driving the bars along the rails in opposite directions with a sledge the joint is made tight and firm, after which each bar is spiked to the tie through notches in its base. If the joint should need to be tightened at any time the spikes may be drawn from one of the angle bars, the holes plugged and the angle bar driven up tight again and spiked.

Contraction and expansion of the rails is provided for by the holes through the rail being larger than the body of the bolt.

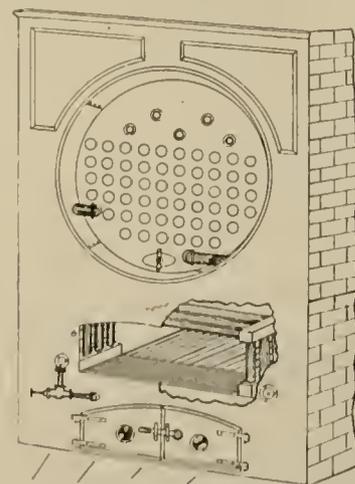

**CEDAR RAPIDS-IOWA CITY PROPOSED INTERURBAN.**

The Cedar Rapids, Iowa City & Southern Railway Co. obtained a charter a year ago to build a 25-mile electric interurban between the cities named in the title. This will be pre-eminently a freight line, connections for through traffic being made at Cedar Rapids with the Chicago & Northwestern and the Chicago, Milwaukee & St. Paul and at Iowa City with the Rock Island system. It is the expectation of the promoters to bill stock and grain through direct to their market destination by special arrangement with the steam roads. The company will own stockyards along the route of the interurban, where the freight consignments will be collected for shipment.

Power for the operation of the electric line will be furnished by the Cedar Rapids Electric Light & Power Co., which, though a separate company, is allied with the interurban interests. Three passenger cars and baggage and express cars will be run between the termini. More definite details of the service have not been arranged as yet. The company is in course of organization and is financing its project. It was chartered under the general railroad laws, and has secured a perpetual franchise in Iowa City and all rights of way. A franchise in Cedar Rapids for 25 years has also been obtained. The officers of the Cedar Rapids, Iowa City & Southwestern company are: W. G. Dows, president; W. J. Greene, vice president; and T. B. Smith, secretary and treasurer, all of Cedar Rapids.

**LAMPREY PROTECTIVE ARCH PLATE.**

This device, which is shown in the accompanying illustration, is made by the Lamprey Co., of Westfield, Mass., and is designed to protect the brickwork and the boiler front from the intense heat of the furnace and to utilize the heat thus diverted. By this means it is aimed to avoid burned out door plates, cracked boiler fronts, etc. The system of pipes around the sides and tops of the openings through the brickwork of the boiler settings may be connected into a

LAMPREY PROTECTIVE ARCH.

feed pipe or be arranged as a circulation attachment to the boiler. By the former method the feed water is heated before its admission to the boiler while with the latter a continuous circulation of water to and from the boiler is maintained, the pipes in either case delivering heat to the feed water, which would otherwise be wholly or partially lost. This absorption of heat which is usually allowed to escape by radiation has the effect of reducing the boiler room temperature. Removable blocks are conveniently located to provide for cleaning and the device is applicable to all types of brick set boilers. The piping connections are easily arranged to suit any special connection.

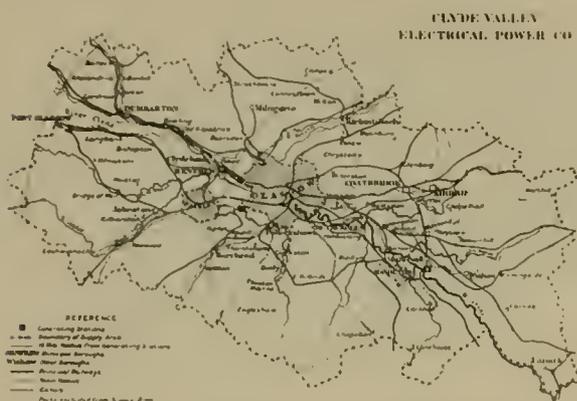

The Western Reserve Traction Co., with a capital of \$10,000 will build an electric railway from Warren to Kenilworth, O.

### POWER DISTRIBUTION NEAR GLASGOW, SCOTLAND.

A bill has recently been sanctioned by Parliament, giving authority for an extensive power-distribution scheme contemplating the supplying of power to the industrial region of the lower Clyde River in Scotland. The district covered by the bill includes that part of the Clyde Valley extending about ten miles on each side of the river and about twenty miles up and down stream from Glasgow. The area covered is about seven hundred square miles, and three generating stations will be erected to meet the demand for power. The scheme has been promoted by a group of manufacturers who desire to obtain cheap electrical power and who realize that this can be better done by joining in a common system than by each putting down his own generating plant.

This is the busiest part of industrial Scotland and contains about twelve hundred industrial plants, many of which are large iron and steel works, coal mines, shipbuilding yards and chemical works. Some of these will alone require more power than many of the local municipalities now provide for lighting purposes, and it was easily shown that it would be inadvisable for the separate boroughs to attempt to supply an amount of power involving so large an expenditure of capital.

The three generating stations are to be built at Motherwell, Yoker and Crookston. The Motherwell station is located in the neighborhood of a large number of manufacturing works and in the center of an extensive coal field and can be connected with the adjoining

ELECTRICAL DISTRIBUTION NEAR GLASGOW.

line of the Caledonia Railway. It is, also, in close proximity to the river Clyde, from which water for steam and condensing purposes may be obtained.

The Yoker station is also situated on the Clyde, near the line of the Lanarkshire & Dumbartonshire Railway, and is in close proximity to a large number of shipbuilding yards, works and docks. Authority has been obtained to lay cables across the Clyde from Yoker to Renfrew, which will enable the works at Renfrew, and other works on the south side of the river, to be supplied from this station.

The third generating station will be situated near Crookston, on the Glasgow & Southwestern Railway Canal line; but, owing to the arrangement allowing the company to cross the river, it will not be necessary to construct this station immediately.

The works from which the most urgent demands for power have been received are situated in the areas immediately surrounding the first two sites and it is intended, therefore, to proceed with these stations first and to install in each a plant of about 4,500-kw. capacity. They will be so designed that they may be enlarged from time to time, as the demand requires. A radius of 14 miles from these stations covers practically the whole district in which the company will be allowed to distribute its power, but a large proportion of the works are located within a radius of six or seven miles of the stations. When the stations are in operation they will probably be coupled together electrically, enabling them to share the loads and average up their power factors or to supplement or aid each other in any emergency. The capacities of the respective stations will ultimately be about 10,000 kw. each at Motherwell and Yoker, and 5,000 kw. at Crookston. By utilizing cheap sites for the stations

outside of towns and near to the coal mines, it will be possible to generate power at a very low cost. Of the 710 square miles covered by the scheme, only 13 are at present supplied with electricity. It is said that over 300 manufacturers petitioned in favor of the proposition, and it is thought that many of the remainder petitioned in favor of the rival Caledonian scheme which was turned down. The carrying out of this mammoth system of power distribution will place the manufacturers of Glasgow on a footing to be compared to that of American manufacturers who are so fortunate as to be within range of our cheap water powers.

The authorized capital of the Clyde Valley Electrical Power Company is \$4,500,000, with borrowing powers of \$1,500,000. The total cost for plant on the transmission lines is estimated at over \$2,000,000. The electrical apparatus, which will comprise polyphase alternating-current generators and transformers for high-voltage power distribution, rotary converters for the supplying of direct current, etc., has been contracted for with the British Westinghouse Electric & Manufacturing Co. Messrs. Strain & Robertson are the engineers of the Clyde Valley Electrical Power Company. Mr. Robert Robertson has recently spent a considerable period in the United States investigating systems and methods of power transmission and distribution, particularly in the large cities and in such localities as Niagara, Snoqualmie Falls, Wash., Canyon Ferry, Mont., and other places.

### ADVERTISING LITERATURE.

THE RODGER BALLAST CAR CO., of Chicago, has issued a handsome catalog under the title "Multi-Service Cars," describing and illustrating the various types of the Rodger ballast car and the Hart convertible car built by the company. The catalog contains 60 9 x 12-in. pages. The illustrations are so complete as to require very little reading matter, as the following preface will indicate: "Only 6 minutes are required to read the printed pages—it is worth your time." The cars are all classified and the illustrations show the methods of operation of each. A list of 74 of the leading railroads in the United States using the Rodger cars is given.

THE WHITING FOUNDRY EQUIPMENT CO., Harvey, Ill., has issued a new catalog No. 36, size 6 x 9-in., 124 pages, superseding Nos. 21 and 32. The catalog illustrates and describes a large variety of cranes and travelers built by the company and operated by hand, compressed air and electric power, up to 100 tons capacity.

THE SHELBY STEEL TUBE CO., Pittsburg, Pa., has issued under date of November 1st a new price list of Shelby cold drawn seamless steel tubing.

THE ATLAS CAR & MANUFACTURING CO., Cleveland, O., in distributing catalogs No. 1008, containing 48 6 x 9-in. pages, describing some of the cars recently built by the company for use in and about brick yards and cement plants, and No. 1012, 10 6 x 9-in. pages, illustrating some of the industrial railroad equipments, such as cars, trucks, switches, turntables, etc., made by the company.

GRAPHITE, published by the Joseph Dixon Crucible Co., Jersey City, N. J., for December, contains among others an interesting article on "Force Feed Lubrication," and also one on "Experiments in the Use of Dixon's Graphite in Air-Brake Equipment," by Prof. W. F. M. Goss, of Purdue University. "Dixon's Graphite Facings" is the title of a booklet, published by the same company, which gives some useful information about the uses of graphite in the foundry.

THE DE LAVAL STEAM TURBINE CO., 74 Cortlandt St., New York City, has issued bulletin No. 2 illustrating and describing the direct current turbine-dynamos ranging in capacity from 1½ to 300 h. p. It is claimed for these machines that the units are absolutely self-contained, free from vibration, occupy an exceedingly small space, and have an economy as good or better than the best compound condensing engine. The bulletin contains much information for persons interested in the application of the steam turbine to driving electrical machinery.

"STEEL CASTINGS" is the title of an illustrated catalog 6 x 9-in., 16 pages, issued by the American Brake Shoe and Foundry Co., New York and Chicago. The advantages of the "Tropenas" process of making cast steel are set forth and several hundred castings more or less complex are illustrated. The company's plant is at Chicago Heights, Ill.

## NEWS OF THE MONTH.

Through car service was established between Boston and Lowell, Mass., November 17th, by running the vestibuled cars of the Lexington & Boston Street Railway Co. from the Sullivan Square Elevated Railway Station, Charlestown, over the surface tracks of the Arlington Heights, Lexington, Bedford, Billerica and Lowell, a distance of 22 miles. A 30-minute schedule has been established at a speed of 10 miles per hour. The fare between Boston and Lowell is 25 cents. Crews are changed at the end of the line of the Boston Elevated Railway Co.

The plans originally outlined by the Massachusetts railroad commissioners for investigating the street railways in other states has been considerably changed because of the illness of Mr. White and the demands of the regular business of the board on Mr. Jackson, the chairman. Accordingly, Mr. Bishop has visited St. Louis, Detroit, Chicago and other western cities alone. It is the intention of the three members of the board to make another trip of inspection, if it is possible for them to do so before their report to the legislature, which is due about the middle of January. It is generally believed that this year the board will ask for a greater power of supervision over street railways and will also take up the matter of workmen's tickets for street railways.

On December 5th the Rhode Island Senate passed an amendment to the 10-hour law, enacted at the last General Assembly, which allows all employes of street railways in the state to contract with the officials for as many hours of work daily as they desire. The 10-hour law took from the street railway employes the right to contract for work lasting more than 10 out of 12 consecutive hours. The law was vigorously contested by the street railway corporations as being unconstitutional.

The boycott instigated by the 'Trades' Assembly of Schenectady, N. Y., against the Schenectady Railway Co. for the purpose of forcing the 250 employes of the company to form a union has proved an utter failure.

The New Jersey & Hudson River Railway & Ferry Co. has secured control of the Newark & Hackensack Traction Co. by the purchase of a majority of the stock and bonds of the company.

Sleet seriously affected the operation of the electric lines of the Manhattan Elevated, New York, on December 5th and 11th.

While sleeping cars are reported to have been ordered by at least two interurban roads, the record for births in street cars lies with Jersey City, N. J., one having occurred in that city on December 1st.

Rioting occurred in West Chester, Pa., and the street railway cars were attacked because the employes refused to join in a sympathetic strike.

Citizens of Chester County, Pennsylvania, are much alive to the advantages of trolley freight service and the members of the Legislature from that county have pledged themselves in favor of all measures calculated to extend this service.

Plans for a consolidation of the Cleveland, Elyria & Western Railway Co. and the Cleveland & Southern Railroad Co. were agreed upon December 9th. The new company will be the Cleveland & Southwestern Traction Co., with a capital stock of \$5,000,000. This company will also purchase the Norwalk Gas & Light Co. A. H. Pomeroy will probably be president of the new company.

The Cleveland (O.) City Railway Co. will build a \$40,000 car house near Woodlawn Hills Ave and Kinsman St. to hold 200 cars.

The Columbus (O.), Delaware & Marion Electric Railroad Co. has put its interchangeable mileage books on the market. The books are good for travel on any of the traction lines out of Columbus; also on the Dayton, Springfield & Urbana Electric Ry. One thousand mile books are sold for \$12.50 and 500 mile books for \$6.25.

The Cincinnati, Georgetown & Portsmouth R. R., operated as a steam railroad since 1877, has been changed for electric traction, regular operation commencing December 1st.

The Houghton County Street Railway Co. began the operation of car service between Laurium and Lake Linden, Mich., on December 1st. The Detroit, Monroe & Toledo Short Line Co. has been organized with a capitalization of \$3,000,000 for the purpose of acquiring the property of the Toledo & Monroe Ry. and extending it to Detroit.

The Rockford & Interurban Railway Co. has established an express service and is also doing a good business in the transporta-

tion of milk over its line. The cost is about one cent a gallon, including the return of empty cans.

The Chicago, Burlington & Quincy R. R. has discontinued its suburban service between Moline and East Moline, Ill., since the Moline, East Moline & Watertown electric line commenced operation.

Over 2,000 persons from Urbana and Champaign, Ill., made use of the new interurban line between those cities and St. Joseph, Ill., Sunday, November 23, though only two motor cars and one trailer were available for service.

A strike of trainmen of the Bloomington (Ill.) & Normal Railway Electric & Heating Co. was declared November 16th and compromised on the 20th.

It is announced that the Metropolitan Street Railway Co., of Kansas City, will spend \$5,000,000 in improvements next year. New rails are soon to be ordered for proposed extensions and 100 new cars will be ordered for delivery next summer.

The stockholders of the old Chicago South Side Rapid Transit Co. have tendered their stock to the city. Their attorney, C. A. Monroe, claims that while the Supreme Court has decided that the present company is the rightful owner of the property, it is not entitled to the franchise and that the city should receive \$200,000 a year for the use of the streets and alleys used by the company.

A rehearing in the Illinois Supreme Court of the case of the City of Chicago v. the Chicago Union Traction Co., wherein it was held that it was the duty of the company to clean the streets on which it had a franchise, was denied December 3d.

A verdict of \$225 damages was awarded a passenger for the loss of a telescope by theft from the rear platform of a car of the Consolidated Traction Co., of Chicago. In a former suit she was awarded \$100. The company has made a motion for a third trial.

Sixteen street car men implicated in the recent strike in New Orleans have been indicted on the charge of interfering with the United States mail.

The Beloit (Wis.), Delavan Lake & Janesville Electric Railway Co. ran its first car into Janesville December 8th.

The "Jim Crow" law recently enacted in Louisiana has been declared unconstitutional on the ground that none but judicial officers may determine whether a person is a negro, and also that the law failed to fix a maximum penalty for its violation.

A strike of the electrical workers and linemen of the San Antonio (Tex.) Traction Co. was declared December 4th, but settled by arbitration on the following day.

December 1st the trainmen of the Houston (Tex.) Electric Street Ry. struck for an increase of one-third in wages and recognition of the union; after four days a compromise was effected and a scale of 18, 19 and 20 cents, according to length of service, instead of 18 cents.

It is announced that the wages of the street railway employes of Dallas, Tex., will be advanced January 1st.

The coming carnival of the La Fiesta de las Flores at Los Angeles, Cal., will have a magnificent trolley parade. Fifteen special floats representing blooming flowers in gorgeous incandescent outline will be one of the features.

At a recent election in Winnipeg, Man., the proposal of running cars on Sunday was defeated by a majority of 409 votes in a total of 4,728 cast.

### ◆◆◆

#### THE KOERTING GAS ENGINE.

The discovery that gas of low thermal value could be used effectively in gas engines has resulted in a growing demand, particularly in Europe, for gas engines of greater capacity, 1,000 h. p. and upwards, and in consequence a great deal of attention has been given abroad to improving this class of prime mover. The gas engine is also receiving more consideration in America, and arrangements have lately been made to manufacture in this country a new type of gas engine invented by Mr. Ernest Koerting. The Koerting gas engine will be built and sold by the De La Vergne Refrigerating Machine Co., which is the sole licensee for the United States.

The Koerting engine is radically different in design from the gas engines with which most of our readers are familiar in that it is double acting; also the engine has a two-stroke cycle, scavenging being accomplished by the admission first of air, and later of the working charge of mixed gas and air, to the cylinder while the

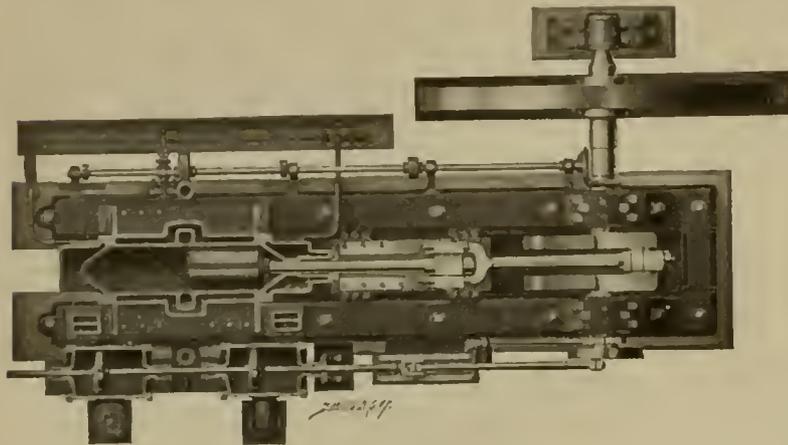

inlet valve is covered, thus forcing the fresh charge into the burnt gases from the cylinder.

The mode of operation and the general design will be apparent from the accompanying illustration and the following description.

The engine is double acting, with the crank and lead ends of the power cylinder similar, the admission valves are located in valve boxes bolted to the cylinder heads. The products of combustion escape through ports cast in the middle of the cylinder from which point the exhaust pipe leads, the piston itself being the exhaust valve. For this purpose the piston is made very long and is packed at each end by self-closing spring rings.

The combustible mixture is delivered through two double-acting auxiliary pumps, one for gas and one for air. These pumps are so proportioned that their combined action is intended to introduce into the working cylinder the proper mixture necessary for perfect combustion. The pumps compress both the gas and air to about 9 lb. per sq. in.

The illustration shows a horizontal section with the piston at the outer dead point, and that the exhaust ports open to the head end of the cylinder. When the piston begins to uncover the exhaust ports, the pressure of the residual products of combustion in the cylinder drops

THE KOERTING GAS ENGINE.

rapidly to that of the atmosphere and the greater portion of the gases leave the cylinder; after this has taken place, the inlet valve is opened and a fresh charge admitted by the pumps. The valve gear of these is so designed that air only is supplied at first (this being to separate the burnt gases from the succeeding mixture) and afterwards gas and air, mixed in proper proportions.

The combustible mixture of gas and air is produced only at the inlet of the cylinder. There is no storing of the gases after being mixed and by suitable construction of the admission device, mingling of the air first introduced with the burnt residue gases, or with the succeeding charge of the combustible mixture, is designed to be avoided. This also prevents loss of the mixture through the exhaust ports, which are open during this period.

On the return stroke, shortly after the exhaust ports are again covered by the piston, the air and gas pump pistons arrive also at the ends of their respective strokes, and the supply of mixture is cut off. The inlet valve closes and the charge is compressed in the cylinder until at the end of the stroke ignition takes place. The working stroke with combustion and expansion then succeeds, release taking place when the piston again uncovers the exhaust ports.

In order to secure the separating layer of air above referred to, between the hot consumed gases and the fresh charge, the gas pump is so designed that no gas is delivered until after a definite point in its compression stroke. The pump has piston valves with the valve gear so designed that the maximum capacity of the pump cannot exceed 50 to 60 per cent of the total piston displacement. This is effected by leaving the gas suction port open during a portion of the compression of the pump so that the gas can escape. The amount of gas furnished is thus made to correspond to the maximum power of the engine.

When the load on the engine is reduced, the gas pump begins to furnish gas at a correspondingly later period, thus discharging a diminished quantity of gas into the working cylinder. This regula-

tion is effected either by the valve gear of the pump and controlled by the governor, or by a by-pass located between each pump end and the compression channel which leads to the inlet valve on the main cylinder. The throttling device in this by-pass is also under the control of the governor.

The engine operates with a variable amount of the mixture, and correspondingly more or less air is sent into the power cylinder. The idea is to keep the air near the middle of the cylinder, while the combustible mixture remains at the heads of the cylinder near the inlet valves and igniters.

For the ignition there are provided two spark coils at each end of the power cylinder, which are operated by a separate shaft, driven by spur gearing from the cam shaft. The gear of the igniter shaft is connected with a sleeve having a feather, which is set helically around the shaft so that by a sliding movement of the wheel the igniter shaft may be set behind or in advance of the cam shaft, and the time of ignition can be varied during the running of the engine to suit the kind of gas being used.

The engine is started with compressed air, air being admitted at both ends of the cylinder, as in a slide-valve steam engine, by a piston valve operated from the cam shaft by an eccentric which may be thrown in or out of gear. Filling the cylinder with air twice is generally sufficient for starting up.

The power cylinder and piston are cooled by circulating water, which in the case of the piston enters the tube carried through the cross-head pin in the hollow piston rod, and returns the same way, but on the outside of the tube. The stuffing boxes in the cylinder heads are surrounded by water. The cylinder walls are cooled throughout except at the middle where the exhaust ports are located.

#### REMOVAL NOTICE.

On and after Feb. 1st, 1903, the Stewart Hartshorn Co. will have its New York stock rooms at No. 7 Lafayette Place, New York, one block east of Broadway, between Great Jones St. and East Fourth St., a central location for all interested. For the last 34 years Hartshorn shade rollers have been carried in stock at 486 Broadway, a location well known to the trade, and al-

though it is a rare thing to see old firms move, it was deemed best by the company in this case. Trade has been increasing, and also the demands for the many improvements which the Stewart Hartshorn Co. has brought into the construction of the shade rollers and accessories, and in order to carry the stock needed for immediate shipment in New York it was found necessary to acquire much larger store rooms.

At No. 7 Lafayette Place the main store room is on the ground floor, besides which the company will also occupy the basement, which is light, dry, well ventilated and equal in area to the main store room. This gives more than double the space formerly occupied so long on Broadway, and here will be carried a full line of new groove tin and improved wood rollers, as well as the older styles of Hartshorn shade rollers which are still called for by some dealers. Besides these a full line of shade roller brackets, pin ends, shade clasps, bottom roller clips, catch pulleys, etc., will be found, also models showing the various methods of placing shades properly in position.

To these new stock rooms the Stewart Hartshorn Co. cordially invites its friends. With more room and fuller stock, quick demands can be promptly met. In future, as in the past, large shipments will be made directly from the company's factories in East Newark.

The Consolidated Railway & Power Co., of Salt Lake City, Utah, has recently installed a 50 h. p. air compressor for the purpose of supplying air to be used in cleaning cars and other work at the East Second St. car barns. The company has received six new cars from the Laeclde Car Co., of St. Louis. The cars are equipped with air brakes, fenders, trolley catchers, etc. Seven hundred tons of 60 lb. steel rails have also been received and will be put down as soon as the weather permits.

CARNEGIE LIBRARY OF PITTSBURGH

3 1812 04298 4808
