CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. XII. JANUARY 15, 1902. NO. 1

The street railway franchise situation in Chicago remains practically unchanged. The mayor has submitted one message on this subject to the council and promises another one at an early date. Though every business man appreciates the absurdity of expecting the street railway companies to make any large investments until the question of franchise extension is settled, the mayor demands improved service at once and yet would postpone negotiations as to the franchises until the Legislature passes an act authorizing the city to own and operate street railways.

Some time ago in discussing the laws passed by various states for the protection of grade crossings of steam and electric railways we pointed out that while Illinois had no laws relating to the crossing rights of electric railways, it was probable that the general laws on crossings would apply to the electric interurbans which were incorporated under the general railroad law. The Illinois Railroad and Warehouse Commission has recently taken the position that it has jurisdiction of such electric lines, and decided that the Freeport General Electric Co., which desired to build a railway across the Chicago, Milwaukee & St. Paul, should erect an overhead crossing. An appeal has been taken from this ruling and the point will soon be adjudicated.

The appointment of a committee of 37 members at the recent meeting of the National Civic Federation in New York to act as a board of arbitration to settle labor disputes is a step in the right direction, and it is to be hoped that this board will be successful in effecting a peaceable solution of labor difficulties and will be able to prevent, at least in great part, the occurrence of strikes, which not only prove costly to the laborer as well as the capitalist, but which give rise to strife and bitter feelings, in stead of promoting the harmonious relations which ought to exist between the employer and employe. Both capitalists and laborers are working in their respective fields and all have rights which must be respected. It

is hoped that the new board will prove a sort of industrial clearing house where the grievances of both sides can be carefully discussed and thoroughly weighed; and with the weight of public opinion upon the side that is right, there is no reason why an amicable adjustment of disputes should not be readily reached. In the street railway field there have been within the last few years but few strikes which could fairly be settled by arbitration. The strikes have been in general the result of ill advised agitation and demands upon street railway companies which could not be reasonably granted. The street railway companies look well after the interest and comfort of their employes, knowing that efficient service can only be secured by a satisfied and contented class of men.

Disputes must arise at times between employers and employes, and the only rational way to effect settlements is by means of amicable argument, which will result in showing which side is right. It is in the prevention rather than the settlement of strikes that the permanent board of arbitration should prove of great value to the laborer and capitalist alike.

January 2d it was announced that the Everett-Moore syndicate found itself unable to meet the liabilities about to become due and had placed its affairs in the hands of a committee of Cleveland bankers who, in connection with the members of the syndicate, would administer the properties for the best interests of all concerned. The statement issued by the committee of bankers will be found on another page.

There cannot but be general regret that the syndicate has been even temporarily embarrassed in carrying out its plans. In the absence of detailed information from those in charge of the properties little can be said on their present condition, but the belief is general that the telephone rather than the traction interests are responsible for the difficulties.

The Everett-Moore syndicate controls about 1,300 miles of electric railways now in operation. Reports of operation for 9 or 10 months of 1901 for companies representing 800 miles out of the total of 1,300 are at hand. It appears that last year during the months covered by the reports, these companies showed gross earnings of \$6,100,000 as compared with \$5,310,000 during the corresponding period of 1900. The amount available for dividends was \$1,560,000 last year as against \$1,190,000 in 1900. Expressed in percentages, the gross earnings were 14.7 per cent greater and the amount available for dividends 31.3 per cent greater for that portion of 1901 covered by the report than during the corresponding months of the preceding year.

Concerning the other railways we have the statement of Mr. Newcomb, chairman of the bankers' committee, under date of January 6th. He says: "The trial balance reports for November indicate that practically all the urban and interurban electric railways of the syndicate are money-makers."

The Union Traction Co. of Indiana is about to commence the publication of a weekly magazine to be devoted to the interests of that company, and we consider this to be one of the best possible methods by which a railway company can keep in touch with its patrons and disseminate information on matters of interest which every street railway company desires from time to time to address to the public. In the "Review" for April, 1899, we published an editorial advising railway companies to do a little printing of their own. This advice was called forth by the hostile attitude frequently if not generally assumed by the daily press in regard to street railway companies, and the necessity of defending themselves at times from wholly unwarranted attacks.

It is gratifying to note that our advice has borne fruit in the shape of several weekly street railway newspapers. Among these may be mentioned the New Orleans & Carrollton Railroad Weekly, the Four Corners, published by the Rochester Railway Co., and the Whalom Breeze, published by the Fitchburg & Leominster Street Railway Co. At the time of our previous editorial on this subject there was no further reason for the publication of papers by the railway companies except, as stated, to counteract the prejudices fostered by adverse daily paper criticisms. It was pointed out that a patient course of education should be carried on by such a publication in which the good work the company is doing should be set forth without boastfulness, but in the same general tenor

that the daily papers treat the local institutions which they desire to commend.

With the growth of the present extensive interurban railway systems there have arisen further reasons for the usefulness of such a publication. On a large majority of roads street railway parks are now maintained by the companies and at most of these parks theatrical and other forms of entertainments are given which can be excellently advertised through the medium of the street railway paper. Most of the long roads now operate under regular time schedules, and the distribution on the cars of a paper containing complete information as to the running of cars would prove most useful and would be generally appreciated by passengers.

We have been advised that in all cases where these publications have been undertaken that they have met with the ready appreciation of the public, and especially where the papers have been made interesting by the addition of bright, readable articles each new issue is eagerly looked for by the company's patrons.

A paper of this kind if conducted successfully will soon command sufficient outside advertising to at least pay the expenses of publication and distribution which, of course, must be gratuitous, and we know of no better means by which a railway company can keep itself well and favorably known to the travelling public.

### Pensions for Employes.

On another page we publish a full exposition of the plan for pensioning superannuated employes, and providing insurance in case of sickness or death, which has been adopted by the United Traction & Electric Co., of Providence, R. I., and which will we believe prove very interesting, especially to those concerned in the management of street railway companies that have already been in business for a long term, or that succeed to the business of such a company. The adoption of such a policy by private corporations is a comparatively new thing in this country and the United company of Providence is the first street railway here to inaugurate it. The question of what to do with faithful employes who have outgrown their period of activity is one which we know has already presented itself to a number of our readers, and it will occur to others each year.

There is no question but that a man who has labored faithfully during the years when work was a physical possibility has earned his living; society will care for him but at the alms house, which cannot but be viewed with terror by a man having any self-respect. It may be argued that the employer in whose service a man's working life has been spent should bear the cost of supporting him when he becomes disabled or superannuated, and pay him as a matter of right, instead of letting him become a public charge. This is often impracticable because the employer is financially unable to bear the burden of paying the pension. The close competition of the present day would often seriously handicap an employer who might feel a moral obligation to pension his men, when others in the same field had different ideas.

The practical side is, will it pay an employer to provide a pension fund in order to retain in his service experienced and reliable men? There are now several of our great steam railroad systems which have answered this question in the affirmative, to the extent of from \$100,000 to \$300,000 per annum.

It is not out of place to briefly review what the railroads have done in this direction. About two years ago Mr. W. H. Baldwin, president of the Long Island R. R., read a paper before the American Economic Association in which was given a history of the relief and pension funds established by various steam railroads in the United States. The first road to arrange for a relief fund was the Baltimore & Ohio in 1880, followed by the Pennsylvania R. R. in 1886, the Chicago, Burlington & Quincy in 1889 and later by others, in 1900 there being about 15 per cent of the railroad mileage and 20 per cent of the employes so provided.

In 1889 the Baltimore & Ohio established a pension system, the cost being borne entirely by the company. The pensions are based on the salary the employe receives at the time of his retirement; if the salary is over \$100 per month the pension is \$1.25 per day; between \$75 and \$100, \$1 per day; between \$50 and \$75, 75 cents per day, and between \$35 and \$50, 50 cents per day.

In addition to the Pennsylvania Voluntary Relief Department mentioned as being established in 1886, the Pennsylvania Railroad

Co. Jan. 1, 1900, organized a pension department to relieve from duty employes over 70 years of age, and those between 65 and 70 years of age who have been 30 years in the service, and pay them monthly pensions equal to 1 per cent of the average monthly wages for the 10 years next preceding retirement, multiplied by the number of years of service. The cost of this is paid by the company and in event the outlay at this rate exceeds \$300,000 per annum, the pensions will be ratably reduced to keep the total within that figure.

Just a year later, at the beginning of 1901, the Pennsylvania Co. by joint agreement with the seven other companies concerned established the Pension Department of the Pennsylvania Lines West of Pittsburg, on practically the same conditions but limiting the total annual cost to \$150,000, and making the maximum pension charge for the entire Pennsylvania system \$450,000.

The Pennsylvania Railroad on Jan. 1, 1901, had about 250 pensioners, and it is estimated that in 1905 the number will be 800 and in 1909, 2,250.

Jan. 1, 1901, the Chicago & Northwestern Railway Co. put in effect the following rules: All employes who have attained the age of 70 years, and who have been 30 years in the service, shall be retired and pensioned; provided, however, that this clause shall not be mandatory in its application to executive officers appointed by the board of directors.

"All employes 65 to 69 years of age, inclusive of both years, who have been 30 or more years in the service, and who have become incapacitated, may be retired and pensioned.

"The monthly allowance paid each person granted a pension shall be upon the following basis: For each year of service 1 per cent of the average regular monthly pay for the 10 years next preceding retirement; provided, however, that the annual pension disbursement of the company shall not exceed \$200,000. Should the aggregate pension allowances exceed this amount, in the absence of action by the board of directors increasing the yearly amount usable for pensions, a new rate shall be established proportionately reducing all allowances. Notice of any change of rate shall be given retired employes before the beginning of the fiscal year in which the change shall become effective."

July 1, 1901, the Illinois Central Railroad Co. put in effect a comprehensive pension system. The company made a cash gift to the fund of \$250,000 and agreed to pay any amount needed for pensions up to \$100,000 annually; if the annual burden exceeds this figure the \$250,000 will be drawn upon until it is gone, but should this reserve be exhausted the company reserves the right to make changes in the rates of the pension payments. The retiring age is 70 years, but there are exceptions, certain classes of employes retiring at the age of 65, and others being retired between the ages of 61 and 70 in case of disability. At least 10 years' service is required to make a man eligible to the pension list, and the monthly pension is 1 per cent of the average monthly wages during the term of service multiplied by the number of years of service. No inexperienced men over 35 years of age or experienced men over 45 years of age are to be hereafter permanently employed.

In September, 1901, the Chicago, Milwaukee & St. Paul Railway Co. established a pension and relief fund for employes. The employes contribute to the fund and their pensions are based on these payments and on their wages. The contributions are based on a sliding scale so that those receiving the larger incomes pay more in proportion than the men with small salaries. In case of accident or sickness the men who contribute more to the fund will receive benefits accordingly. The employe must become a member of the relief association in order to become entitled to a pension; if he has been 10 years in the service the pension right vests at the time of joining the relief association, otherwise only the benefit rights are in force until the 10 year term is completed. It is estimated that under this scheme the average pension will be about one-third of the salary received at the time of retirement.

It has just been announced that the American Steel & Wire Co. intends to pension old employes; this company has not, however, fixed upon any definite retiring age or rate of pension, each case standing on its merits.

Midway between the policy of pensioning superannuated employes by the company and that of doing nothing for them is a third which has been extensively adopted abroad and also by a number of institutions here. This plan is to withhold a portion

of the salary of each employe to create a fund, from which can be paid pensions based on term of service and salary received, the employer perhaps paying an equal sum. In some cases on leaving the service the employe receives his contributions to the pension fund with accrued interest, so that the scheme is merely one to compel the participants to be provident. The financial basis of such a fund is sound because the number contributing never decreases; when a vacancy occurs in the service by death or retirement which creates a charge on the fund, a new employe must be secured to do the work and he in turn becomes a contributor.

This plan was adopted by the Grand Trunk Ry. in 1874 and within two or three years by at least two Chicago banks.

On the State Railroads of France employes may be retired at 55 years of age after 24 years' service and must retire at 64; they receive pensions from a fund provided by retaining 5 per cent of the regular wages and the administration paying an equal sum.

In 1899 there was presented to the German Street Railway and Light Railway Association a report upon the desirability of establishing a Pension Fund for German Street Railways but the committee did not consider it expedient for the association to institute such a fund at that time, one reason being that a number of the street railways were affiliated with other funds or had pension systems of their own. The plans considered by this association provided for contributions on the part of both employer and employe.

In 1900 the British Electrical Superannuation Fund was constituted and placed under the management of trustees. The staff of the British Electric Traction Co. has given this fund satisfactory support and the other companies associated with the Traction company were invited to join. Mr. Emile Gareke, of this company, thus explained the general scheme in a letter to *Engineering* Jan. 25, 1901: "Speaking generally, each contributing company must make monthly a contribution equal to 3 per cent of the monthly salary of each contributing member on its staff, and the member himself must make monthly a contribution equal to 2½ per cent of his monthly salary, plus, in the case of those over 24, a certain extra percentage, varying with age. The 'retiring age' is 60, and a member must be of at least 10 years' standing before he is entitled to a pension. Upon retirement a member will receive for every year of service one-fiftieth of the average annual salary received by him during the seven years preceding retirement, the maximum scale of pension being two-thirds of salary. It is important here that service with any and every contributing company counts towards pension, so that an officer can pass from the service of one such company to that of another without injury to his pension prospects. This scheme, I should add, is intended to apply only to those members of the staff of a contributing company who are on the monthly salary list, and who are between the ages of 18 and 45. The trust deed and rules contain provisions in regard to members who wish to reckon their back years of service, and a number of other details. The secretary of the fund is Mr. W. G. Bond."

While such a plan as that adopted at Providence is a novelty here employes' relief and mutual benefit associations are no new thing among street railway companies, the first one in this country having been the Washington (D. C.) & Georgetown Railroad Employes' Relief Association. This association was organized in 1886 by Mr. Henry Hurt, then president of the company, and a full account of its working was given in a paper read before the A. S. R. A. by Mr. Hurt in 1889 and published in the proceedings of the association for that year on page 44. In the *"Review"* for 1900, page 67, 141 and 230 we gave brief accounts of 15 similar mutual benefit organizations, and during the last year numerous other ones have been started.

It is possible that the mutual benefit associations could be developed so as to include provisions for pensions as well.

In considering this subject it must not be forgotten that the steam railroads are in one very important point on an entirely different footing from most electric railways. The steam roads have in effect perpetual charters and are for the most part independent of municipal and local authorities, while the electric companies as a rule are operated under franchises which run for comparatively short terms, 25 to 50 years. The street railways of Rhode Island are an exception to the general rule and have per-

petual franchises and a contract with the state that the requirements of municipalities in the way of special services shall not be increased without the consent of the companies, nor shall "locations" be revoked without other equally good "locations" being granted. Thus the United Traction & Electric Co. is in an especially favorable position for inaugurating a pension system, that companies in other cities, Chicago for instance, could not attempt.

Many of the interurban electric roads are organized under general railroad laws and own their private rights of way, and are in a different position from the strictly urban companies; these roads are yet too young to feel the desirability of pensioning employes.

The results of the experiment at Providence will be closely watched and we believe that other urban companies will follow that example, though doubtless those less happily situated as regards franchises may incline rather to the "middle ground" of assisting the men to be provident than to a pension system proper.

### CHICAGO FRANCHISE QUESTION.

The Chicago Council committee on local transportation made its report to the council on Dec. 16, 1901. The ordinance submitted as embodying the recommendations of the committee is in substantial accord with the report prepared by Mr. Geo. C. Sikes, secretary of the committee, which was published in the *"Review"* for November, 1901, page 853. A few minor changes may be noted. Concerning the construction of new lines the ordinance provides that the company shall construct and operate any new line ordered by the city council, and the clause permitting this question to be arbitrated in case of objection on the part of the company to the building of the line is omitted. The area in which the overhead trolley is prohibited is changed to read "North Ave. on the north, Ashland Ave. on the west and 22d St. on the south." The underground trolley system is specially named to substitute all the cable railway now in use.

The section regulating the hours of labor of employes, fixing the rate of compensation for them and dealing with labor questions in general has been omitted in the proposed ordinance; city detectives bearing cards signed by the Superintendent of Police are added to the list of those permitted to ride free.

The maximum rate of fare is fixed at 5 cents except in the case of tickets which are to be sold at the rate of 6 for 25 cents. As compensation for the grant the railway company will be required to pay monthly into the city treasury a percentage of its gross receipts.

January 6th Mayor Harrison presented his special message to the council explaining his attitude on the question of franchise extension. Briefly the things he demands are: Better service; compensation to the public; a waiver of the companies' rights under the "99-year act"; provision for the acquirement by the city of the lines at the expiration of the grant; the use of the underground trolley within certain boundary lines and the rearrangement of terminals; prohibition of the transfer of franchises to foreign corporations; a general system of transfers; the publicity of accounts; the use of grooved rails on all paved streets; the reference of all extension ordinances to a popular vote.

The mayor insists on waiting till the Legislature shall have had opportunity to pass an act authorizing the city to acquire the street railways. In the meantime he urges that the council pass mandatory ordinances with a view to improving the service.

### PROPOSED MILWAUKEE ELEVATED ROAD.

It is stated that a company proposes to build an elevated railroad from Milwaukee to connect with the Metropolitan Elevated, of Chicago, and will begin work on the grading and construction as soon as an injunction suit, which is now pending, has been settled. The surveys for this line have been made, and Mr. Peter J. Somers, attorney for the company, states that the capital is in hand to prosecute this work. The time from the limits of Chicago to the limits of Milwaukee is expected to be one hour, and the company figures on having trains running between Milwaukee and Chicago within two years, which will make better time than the steam roads.

# Chicago & Joliet Interurban Railway.

BY A. S. KIBBE, ENGINEER, THE AMERICAN RAILWAYS CO.

Notwithstanding the rapid growth which has characterized the development of suburban and interurban electric transportation throughout the neighboring states of Indiana and Ohio, comparatively little has hitherto been accomplished in this direction in the state of Illinois. While Chicago has for ten years been well provided with means of suburban transportation, almost no effort has been made to compete with, or to supplement, the service afforded by the many steam roads radiating in all directions from the down-town districts of the city to every considerable center of population in the surrounding and neighboring counties. Some few of these roads have brought their local service to a high degree of excellence; others have responded only moderately to requirements of this kind, and many have almost entirely ignored them. In spite of frequent and large accessions to the city's territory, the business district remains and apparently must remain constricted. It is difficult to understand how the steadily increasing railroad traffic can be accommodated without radical revision at an early date. Track elevation makes a road higher but not wider, and delays caused by frequent street crossings at grade constitute only a part of the difficulties. With possibly one exception, the writer believes that the steam roads entering Chicago would profit by the withdrawal of their so-called suburban trains, granted, of course, that acceptable facilities for this business were provided in another way. In localities like the one under discussion, the competition between electric and steam roads is more apparent than real. A well-operated electric road will develop a given district far more quickly than the best known steam suburban service, and the inevitable co-ordinate growth in the through passenger and freight traffic of the parallel steam road is handled by it with

operating toward Chicago in this district, if we except the Suburban Railroad, running between the city limits and the village of La Grange, in the western part of Cook County, about four miles south of Harlem. The lines between Carpentersville and Aurora have been brought under one management and extended to Yorkville. The Aurora, Elgin & Chicago Railway is now in

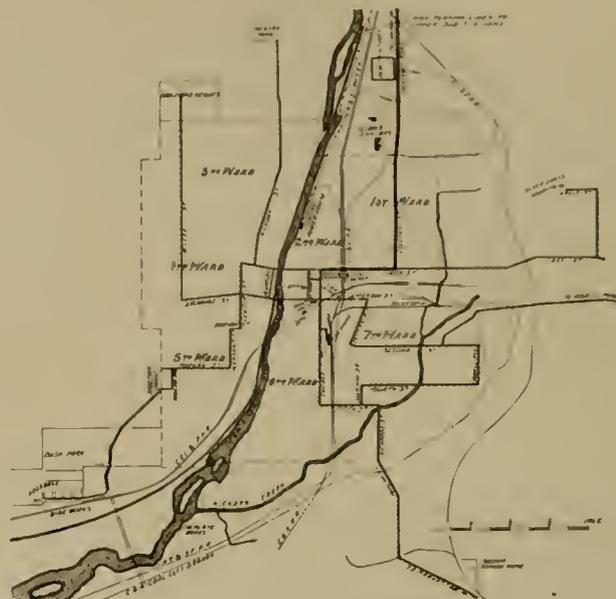

FIG. 2—JOLIET AND VICINITY, SHOWING LINES OF CHICAGO & JOLIET ELECTRIC RY.

course of construction to connect the towns mentioned in its title, with branches to Wheaton and to Batavia.

The Chicago & Joliet system is organized under two distinct charters: The Chicago & Joliet Electric Railway comprises the entire street railway system in and about Joliet and that portion of the Chicago line located in Will County; the Chicago & Desplaines Valley Electric Railway comprises the lines in Cook County. All lines are operated by the Chicago & Joliet Electric Railway Co.

Routes.—The lines of the Joliet Division, as shown on accompanying map, Fig. 2, cover the built up portions of the city very thoroughly, with extensions to all important points in the immediate vicinity, notably to Ingalls Park race track, the Swedish Orphans' Home, the village of Rockdale, the suburb of Boulevard Heights, Theiler's Park and the Silver Cross Hospital and cemeteries.

The Chicago Division parallels the Desplaines River, the Illinois and Michigan Canal, the Chicago Drainage Canal and the Chicago & Alton and Santa Fe railroads. The route is indicated by the following table, excepting the branch from Summit northerly to Lyons, a distance of about 2 2-3 miles.

Station.	Distance in miles.		Route.

FIG. 1 INTERURBAN ELECTRIC RAILWAYS NEAR CHICAGO.

greater ease and at less expense than the carriage of short riders into and out of crowded and inadequate terminals.

Be this as it may, the Chicago city limits were first reached by an interurban line on Sept. 25, 1901, when the Chicago & Joliet Electric Railway Co. opened its service between the two cities named in its title, as indicated on the accompanying map, Fig. 1. The Chicago & Milwaukee Electric Railway runs from Waukegan to Evanston, connecting with the Chicago Union Traction lines at that point. These are the only interurban electric systems now

The Chicago Division operates 15½ miles of single and 16½ miles of double track, and the Joliet Division operates 20½ miles of single and ½ mile of double track, making the totals, 36 miles of single and 17 miles of double, or 70 miles, single track measurement, of which The Chicago & Joliet Electric Railway Co. owns 20 miles of single and 12 miles of double track, and the Chicago & Des-plaines Valley Electric Railway Co., 16 miles of single and 5 miles of double track.

Shortly after leaving the penitentiary, the top of the ridge is reached by a few stations of a 5 per cent grade, attaining an elevation of 40 ft. above the Sanitary District datum. The highest point on the line is at Shea's Hill 22 miles from Joliet and 65 ft. above datum. With the further exception of a few stations of 4 per cent grade at this point, the grades of the entire line are extremely light and nowhere exceed 2 per cent.

Outside of Joliet, Lockport, Lemont and Summit, the curves are elevated for, and may be taken at, a speed of 40 miles per hour. In many places, roads have been widened, or private property acquired, to accomplish this end.

recall, several acres of absolutely unique materials of enormous value, for which a suffering public will now yearn in vain.

The Sag "Short Cut" of 8,000 ft, effected a saving of 3,300 ft. in the length of the road, and of 190° in curvature. The section of highway thus avoided is furthermore narrow and at one point makes a sharp turn of about 135° and a 7 to 9 per cent grade. Notwithstanding the large amount of filling required, the cost of construction, inclusive of land damages, was no greater than would have been involved in following the highway.

The typical section on single track grading is 14 ft. in width at sub-grade on fills and 25 ft. in cuts.

For double track, with span construction, the fills are 25 ft., and the cuts 31 ft. wide at sub-grade, the tracks being laid on 11-ft. centers.

For double track with center pole construction, the fills are 30 ft. and the cuts 36 ft. wide at sub-grade, with tracks on 16-ft. centers.

The Chicago Division is ballasted throughout with crushed limestone between ties, and not less than 6 in. in depth under them.

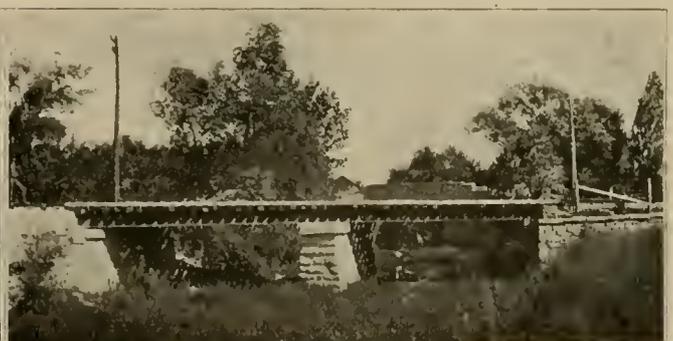

FIG. 3—BIG RUN—FOUR 34-FOOT SPANS.  
FIG. 5—FRACTION RUN—30-FOOT SPAN.

FIG. 4—FIDDYMENT CREEK—TWO 26-FOOT SPANS.  
FIG. 6—CALUMET FEEDER—ONE 50-FOOT AND TWO 20-FOOT SPANS

**Roadway.**

The road in general follows the highways. Where required by municipal authorities along built up portions of villages, the tracks have been laid in the center of the street but elsewhere every effort has been made to separate the paths of cars and other vehicles. Wherever possible, the idea has been to lay tracks on each side of the road leaving a drive-way of 20 to 30 ft. between inside rails. Where the highway lies adjacent to the Alton railroad, and the residences are consequently on one side only, both tracks have been laid on the opposite side of the road.

For the purpose of avoiding heavy grades and curves, private rights of way have been acquired to the extent of four miles between Lockport and Lemont and of 8,000 ft. near Sag Bridge. In only two instances did it become necessary to exercise the power of condemnation and in each of these the jury awarded less than one-half the amount offered to the property owner by the railway company, prior to the trial. Scientists have fondly imagined for years that the Sag Valley is formed from a very miscellaneous mixture of silt, peat and glacial drift, overlying the rock to various depths, but a portion of the evidence in one of these suits would seem to show that the electric railway has ruthlessly hurried beyond

This stone was in part crushed by the construction company, and in part purchased from crushing plants in the vicinity. It was distributed along the track in 5-yard side dump cars hauled by electric car between Joliet and Lockport, and by steam locomotive over the remainder of the road, at costs varying from 50 cents to \$1.10 per cu. yd in place.

**Bridges and Culverts.**

The accompanying views will give an excellent idea of the character of bridge construction. The Joliet Bridge & Iron Co. furnished and erected the 4 single track and 21 double track steel spans required between Joliet and Chicago, which varied from 14 to 56 ft. in length.

In the Big Run and Fraction Run bridges rolled beams were used, 24 in. deep and weighing 100 lb. per ft. For Fiddyment Creek, the beams were 20 in. deep and weighed 80 lb. per ft.

Fraction Run Opening is an extension of the old highway bridge—a semi-circular arch of 30-ft. span. The foundations extend 10 ft. below ground and the new masonry measures over 1,200 cu. yd. This structure was erected at a cost of \$7,000.

Bridges with steel spans are all within easy reach of quarries

and the abutments were thus economically built of coursed rubble masonry laid in "Star" or "Atlas" portland cement.

The future of the old Calumet (or Sag) Feeder being somewhat uncertain, and the depth to good foundation considerable, steel tubular piers were employed, centered on piles and lined with concrete. This bridge cost, complete as shown ready for traffic, \$6,000.

In extending culverts, already in existence, the usual course was to continue the same form of construction, where such was adequate. In a number of instances pipes built of sheet steel

In car barns the 40-lb T was used, except on open pit construction, where 1,100 track feet of 9-in., 106-lb. center bearing girder rails of Lorain section 106-364 were laid.

The subject of rail joints received especial attention. The company's standard drilling for rails up to 7 in. in depth is 1 15-16 x 5 x 6 in. for joint bolts with one 27-32 in. hole for bonds 4 7-16 in. from the end of the rail and in the line of the joint holes. The angle bar section recommended by the American Society of Civil Engineers shows a bulb on top which would interfere with a bond of the necessary size.\*

NORTH END JOLIET CAR BARN, UNDER CONSTRUCTION.

FIG. 7—DECK CONSTRUCTION OF BRIDGES. (Between Lockport and Romeo)

from 1/4 in. to 3/8 in. thick were used. For the smaller sizes double strength terra cotta pipe was used where the fills were of some depth. In very shallow fills and where exceptional strength was requisite the pipe was of cast iron. All culverts are provided with substantial head walls, of rubble masonry in portland cement below Sag, and principally of portland cement concrete between Sag and Chicago.

Tracks.

Within the limits of Joliet all tracks are laid with 6-in. T-rails. The outlying lines of the Joliet Division are constructed of standard T-rails of weight proportioned to the prospective business. One extension 1 1/2 miles, was laid with 40-lb. T; another, 1 mile, with 55-lb. T; another with 70-lb. T; and all others with

For the 70-lb. T-rails, a special joint was rolled by the Illinois Steel Co., conforming in every respect with the A. S. C. E. section, save that the upper face on inside is straight like the lower one, and affording ample room for a No. 0000 "Protected" bond as long as the angle bar is serviceable. This modification has since been made by a number of rail users; it is very slight and hardly affects the weight or value of the angle bar as a joint; and will doubtless become standard for electric railways using such joints.

The Lorain Steel Co. also altered its then standard joint plate, for 6-in. T-rails to provide such room as would permit a small or worn plate to be tightened without pressing on a No. 0000 bond.

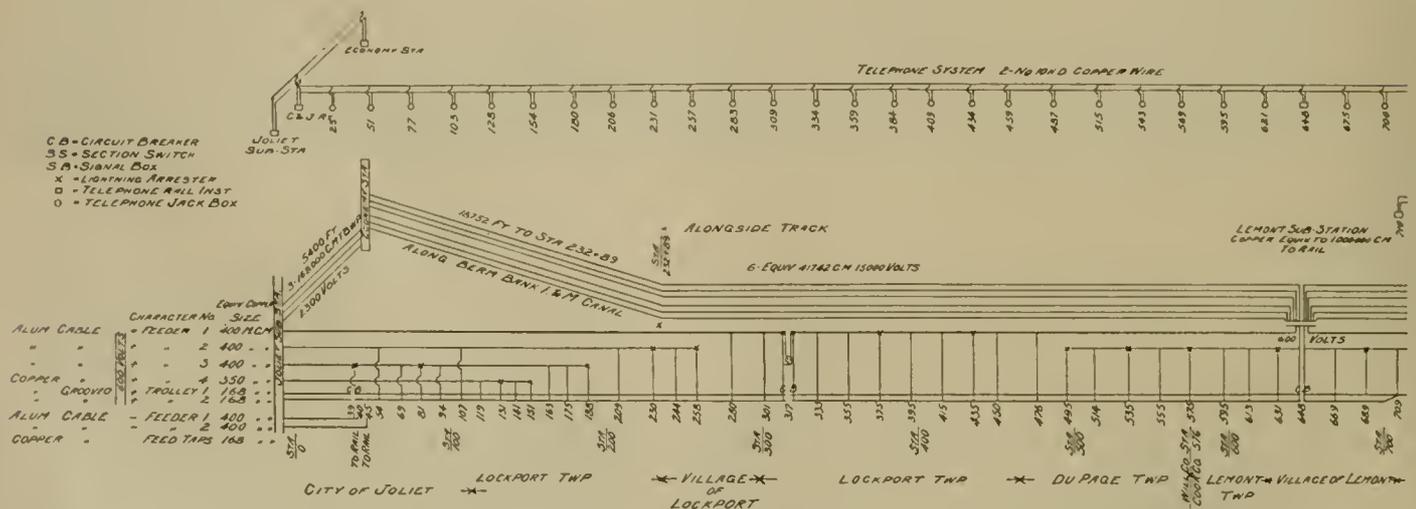

FIG. 9—OVERHEAD DIAGRAM.

6-in. T, to provide against the contingency of paving in the near future.

The Chicago Division outside of Joliet, is laid with 70-lb. T-rail of the A. S. C. E. section, with the exception that through the villages of Lemont, and Spring Forest, 7-in girder rails have been employed. There are 42 miles laid with 70-lb. T, A. S. C. E. section made by the Illinois Steel and Cambria mills; 20 1/2 miles with 60-lb., 6-in. Lorain 60-263 and 5 miles with 73-lb. 7-in. girder rails Lorain 73-291.

As indicated the entire system is bonded with one "Protected" bond at each rail joint; these bonds are 9 in. between the centers of the terminals and have 24 strands with a cross section equivalent to a No. 0000 wire. Cross bonds are of the "Crown" type No. 00,

\*Instances have been numerous in electric railway construction, where the bonds so interfered with the joint plates as to absolutely prevent a bearing on the rail, to the serious detriment of the bond and the ruination of the rails. The writer is aware of a large amount of 9-in. girder rail laid on one of the largest systems under precisely these circumstances and he believes that hundreds of miles of track are now being operated under similar circumstances.

and are placed between the rails of each track and across from track to track at intervals of 300 ft.

Ties are spaced 2 ft. between centers and with the exception of 20,000 white cedars from northern Michigan, and of a few thousand white oaks, the ties on the Chicago Division are of hewnchestnut from southern Ohio. On open work they are 6 in. x 8 in. x 8 ft. 6 in., but in Joliet use was made largely of sawed white oak ties, 6 in. x 8 in. x 7 ft. 6 in.

FIG. 8—ALONG THE SAG SHORT CUT.

The deck construction of bridges is shown in Fig. 7. Bridge ties are 7 in. x 9 in. white oak, dapped for flanges of beams or girders and laid on 16-in. centers. Every alternate tie is bolted to beams. Inner guards of 60-lb. T-rails are laid with 7-in. throat and brought to a point in the center of the track, 60 ft. from the end of the bridge in the direction of approaching traffic. Outer guards are of 6 in. x 6 in. yellow pine dapped one inch for each tie and bolted to every alternate tie.

On lines where traffic is not heavy, use is made of bolted special

past joints in steam tracks. Crossing compromises to 6-in. T are made by cast welding a section of the high T-rail to the crossing arm.

Sharp curves on the Chicago Division are guarded with rail of the same section as the running rail, with cast iron separators and bolts spaced 3 ft. apart.

All girder and high T-rails are laid with two brace tie plates every 10 ft., the braces coming up close under heads of rails.

All tracks thus far laid in paved streets are of 6-in. T-rails. The spaces between ties have been filled with concrete. Along the outer sides of the rails were run two stretcher courses of bricks. Along the gage side of the rails were laid special stretcher bricks, filling the space between flanges and heads of the rails and affording a shoulder for paving between rails and a proper flangeway for the wheels.

Overhead Lines.

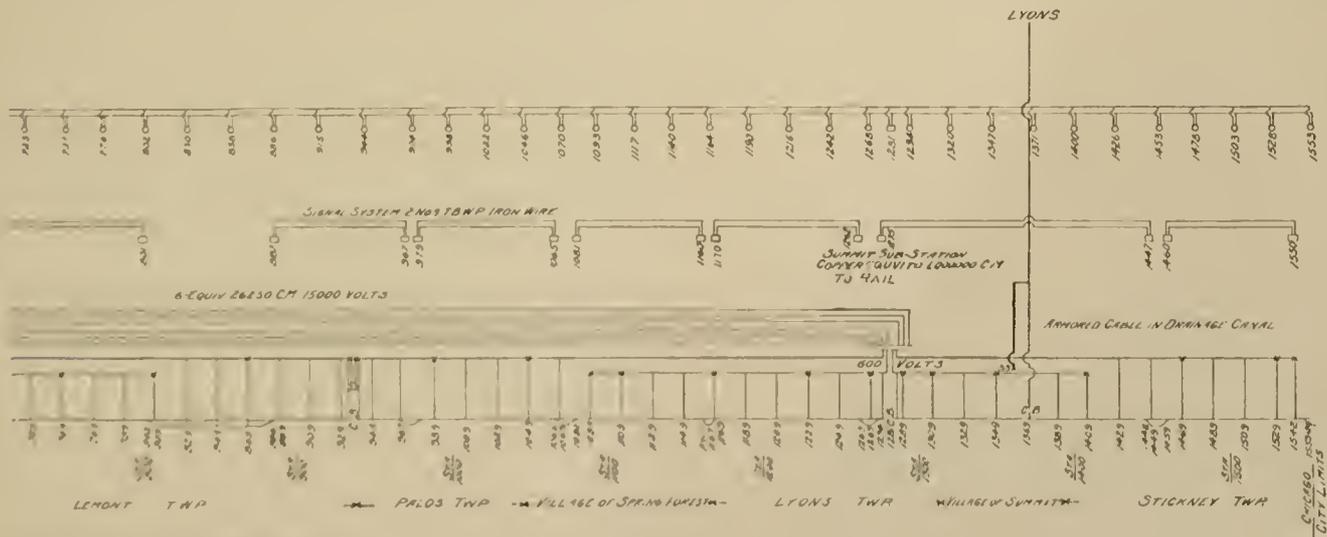

The overhead system in Joliet is all of span construction. Bracket construction is largely used elsewhere on single track lines and span construction along double tracks, with the exception of the Sag Short Cut above referred to. Here a fill was made several thousand feet in length, and of a depth varying from 6 to 12 ft. The nature of the foundation would have necessitated the widening of the fill to such an extent for the proper support of span poles, that it was deemed advisable to employ center bracket construction as shown in Fig. 8.

The accompanying overhead diagram, Fig. 9, exhibits the various circuits installed on the Chicago Division, with taps and connections.

Efforts to obtain suitable chestnut poles within a reasonable time, were unavailing. The entire overhead system of the old lines has been rebuilt and that of the new lines built with cedar poles, the standard being 35 ft. long with 7-in. top.

The pole layout on single track bracket lines of the Chicago Division is shown in Fig. 10. Poles are set not less than 7 ft. in the ground, with face not less than 5 ft. from the nearest rail.

Cross arms are all long leaf Georgia pine, 4 1/4 x 3 1/4 in. The two upper arms in the figure are devoted to the duplicate high tension circuits. They are furnished with 1 1/2 x 11 in. locust pins boiled in paraffine, and so spaced as to form two deltas with 20-in. sides. The third arm is reserved for direct current feeders, and the lower arm for telephone and signal wires, the pins on both

CHICAGO & JOLIET INTERURBAN RY.

work of 6-in. T rail with rolled guard, furnished by the Paige Iron Works, Chicago, and the Indianapolis Switch & Frog Co., Springfield, O. The standard special work is of 6 and 7-in. girder guard rail, with manganese steel switch tongues, mate points and frog centers, manufactured by Wm. Wharton Jr. & Co. Lateral switch tongues are of 100 ft. radius and in equilateral switches the tongues are of the Carver type of 350 ft. radius.

Railroad crossings are built of 85 and 70 lb. T rails, with full rail guard on both tracks and with easer rails extending 18 in.

being standard locust, untreated. All cross arms are set in gains 1 1/2 in. deep and fastened to the pole with one 5/8-in. through bolt. Braces are fastened as indicated with 4 x 3/8-in. bolts, through the cross arms and with 4 x 1/2-in. lag screws into the pole.

Fig. 8 illustrates the bracket work as constructed and shows the character of poles employed. On span construction, as illustrated in Fig. 7, the high tension cross arms are carried on the westerly line of poles, and the direct current circuits occupy the tops of the easterly poles.

The brackets are of the type shown, exceptionally long and heavy. The pipes are 2 in. in diameter, of structural steel tubing, made from high carbon steel by Messrs. Howe & Polk, Danville Pa. The castings are all of malleable iron.

The trolley insulating details in general are of the Macaller make, furnished by the Mayer & Englund Co. The hangers are of round top, extra heavy pattern with 3/4-in. studs. Three-screw malleable iron clips are used on straight line work, and deep groove 15-in. soldered ears on curves.

Feed-spans are of No. 000 copper cable, clamped into and soldered to a bronze feed yoke into which a 3/4-in. stud has been cast, for connection with trolley ears. Feed-tap terminals are connected to feeders with aluminum clamps.

Line lightning arresters are the General Electric M. D. type, installed as shown in Fig. 9.

The trolley wire is of grooved section of No. 000 capacity, drawn by the Roebling company.

The feeder wires of the Chicago Division are all of aluminum cable, furnished by the Pittsburg Reduction Co., with the exception of a short piece of 350,000-c. m. copper cable on the Joliet end. The following table shows quantity and character of the feeders:

Miles.	No. strands	Insulation.	Copper equivalent circular mils.	Voltage	Use.
3 1/2	19	TBWP	168,000	2,300	Economy Sta. to Joliet Sub-station.
7 1/2	7	bare	41,742	15,000	" " Lemont "
7 1/2	7	"	20,290	15,000	Lemont Sub-sta. to Summit Sub sta.
40	37	"	400,000	600	Out of town feeders.
20	37	TBWP	400,000	600	Feeders in city and villages.

Joints in aluminum cable have been made altogether by splicing somewhat after the fashion of a span wire wrap, giving each strand in each piece several wraps about the other piece and cutting it off after hooking it under the succeeding strand. In this manner a tapered joint is obtained, (about 3 ft. in length in the case of the larger cables) having more strength than the original cable

of rendering them less attractive as targets they are glazed in chocolate color. The cables are fastened with aluminum tie wire.

For the direct current feeders, the insulators are of malleable iron screw cap type, made by the Albert & J. M. Anderson Co. Care is taken to keep the saddles and caps smooth and free from any protuberances which might abrade the bare wires.

The only difficulty experienced with the aluminum wires has had its source in the comparatively large co-efficient of expansion of that metal. Men accustomed only to copper feeders, will string aluminum too loose in winter and too tight in summer. The latter is perhaps the more serious error and particularly where the num-

FIG. 11 ECONOMY POWER PLANT, JOLIET.

ber of wires turning a corner is large, the pole line will be severely tested during ensuing cold spells.

The telephone system has a No. 10 hard drawn copper circuit between Joliet and Chicago, with wall instruments in offices and power stations. Compact and heavy malleable iron plug boxes are installed along the line at turnouts and at intervals of one-half mile. The wires are hung on deep groove, double petticoat insulators, and are transposed at every fourth pole. Notwithstanding the proximity of the telephone wires to the high tension circuits for a distance of over 15 miles, the system works very well when kept free from grounds.

United States Electric Signals have been installed along single track portions of the Chicago Division, as indicated in Fig. 9, using No. 9 T. B. W. P. iron wire for the circuits.

Power Generation.

The power required for the operation of the road is derived from the water of the Desplaines River, as re-enforced by the flow in the great Chicago Drainage Canal. This enormous artificial channel, extending a distance of 30 miles from Chicago to Lockport, is fed from the waters of Lake Michigan and discharges into the Desplaines River at the latter place. Up to the present time, no attempt has been made to utilize the power thus afforded, until the arrival of the waters at Joliet, where the Economy Light & Power Co's. plant has been erected, as indicated in Fig. 2 and illustrated in Fig. 11, with a proposed ultimate capacity equal to the flow for which the drainage channel has been designed. While at the present time the old lighting apparatus is being utilized temporarily, it is intended to install six or seven units identical with the one shown in Fig. 12, which gives an excellent interior view of the new plant.

The portion here represented consists of two alternators (one in the foreground and one in the far end of room), and twelve water wheels for driving them. The six wheels have their shafts vertical and each is connected to the generator shaft by bevel gears. The alternators are of the General Electric make; of 750 kw. capacity each with a frequency of 60 cycles at 2,300 volts. The excitors and switchboard are also located at the far end of this room where current of this character is furnished to the Railway company by the Light & Power company.

Transmission.

The Railway company has established sub-stations in Joliet, in Lemont and near Summit.

Current is conveyed to the Joliet sub-station direct from the Economy switchboard at the generator voltage as indicated on Fig. 9, the distance being but a trifle in excess of one mile.

For transmission to Lemont (12 miles) and to Summit (24

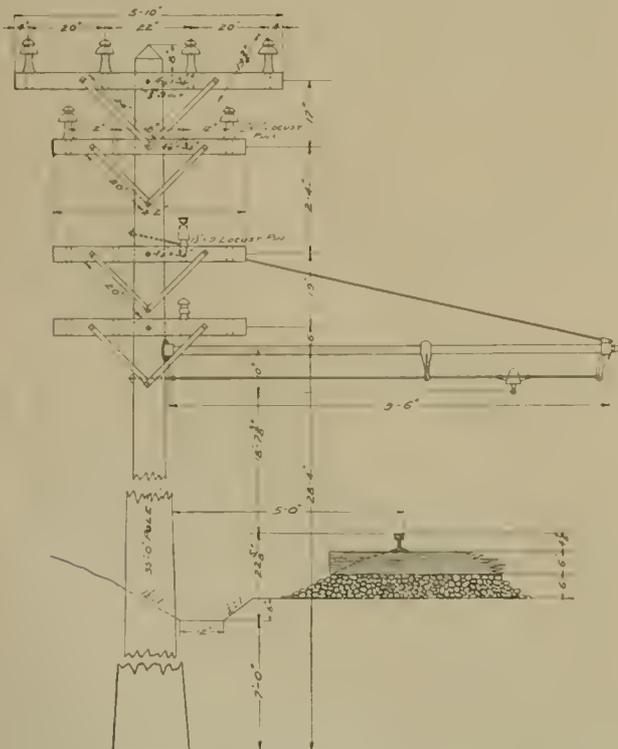

FIG. 10-POLE LAY-OUT.

and with conductivity about one quarter greater. No solder whatever was used in connection with this metal.

For the high tension lines 5-in. triple petticoat porcelain insulators of "Imperial" manufacture, have been used. In the hope

miles), the current from the Economy switchboard is brought into the little apartment pictured in Fig. 13, where it is stepped up, through air blast transformers from 2,300 to 15,000 volts.

These transformers are four in number (three active and one in reserve), and stand upon a concrete air chamber into which air is driven by blowers barely visible in the picture.

Conversion.

Led by the determination of the Economy Light & Power Co. to generate nothing but 60-cycle current, and in view of the annoying lack of stability in 60-cycle rotaries running in multiple on railway circuits under different conditions the Railway company has adopted induction motor-generators for the conversion of the alternating into direct current. Figs. 14, 16 and 18 illustrate the interior of the Joliet sub-station. Fig. 14 shows one of the motor-generators in the foreground. Fig. 16 shows the switchboard of which the first six panels are for the direct current feeders; the next panel is equipped with clock, recording ammeter and recording wattmeter; the next two panels control the battery and booster; the next three, the direct current generators; the next is blank and the last three control the induction motors.

Three units are installed in this station, each composed of a six-pole, 250 kw. 600-volt railway generator, mounted on a common base and shaft with, and driven by a 14-pole 350-h. p., 2,300-volt induction motor, running at 514 r. p. m.

In the upper sub-stations, the current is received at 15,000 volts and is stepped down through oil cooled transformers to 550 volts. In Lemont there are installed three 110-kw. transformers; in Summit, six.

The motor-generators in these stations (one in Lemont and two in Summit), are identical with those in Joliet, save for the induction motor fields which are accommodated to 550 volts instead of 2,300.

In all three stations are installed compensators designed to start the induction motors without the consumption of energy in excess

dam and be wasted, rendered it absolutely essential that the demands by the railway upon the Economy station should be regulated as much as possible.

To attain this end storage batteries have been installed by the Electric Storage Battery Co. at each of the three sub-stations, and Fig. 17 shows the Joliet battery room.

Each battery consists of 288 cells with room therein for one-half as many more plates as have been furnished. The rated capacity of the Joliet battery is 640 amperes, and of the upper bat-

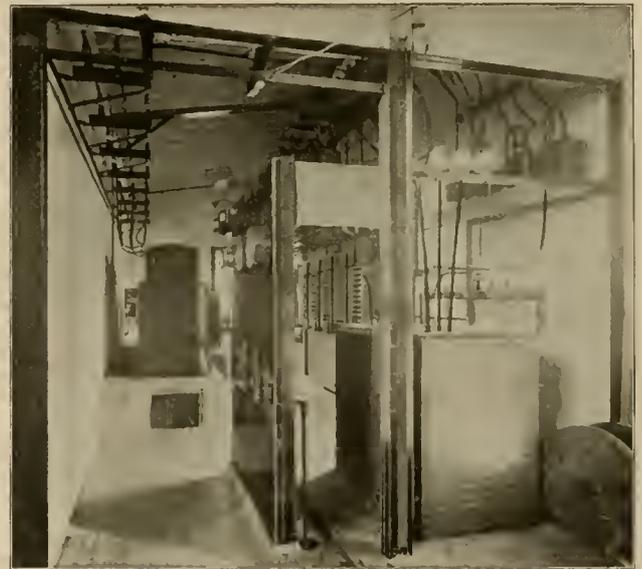

FIG. 13—RAILWAY TRANSFORMING APPARATUS, ECONOMY STATION, JOLIET.

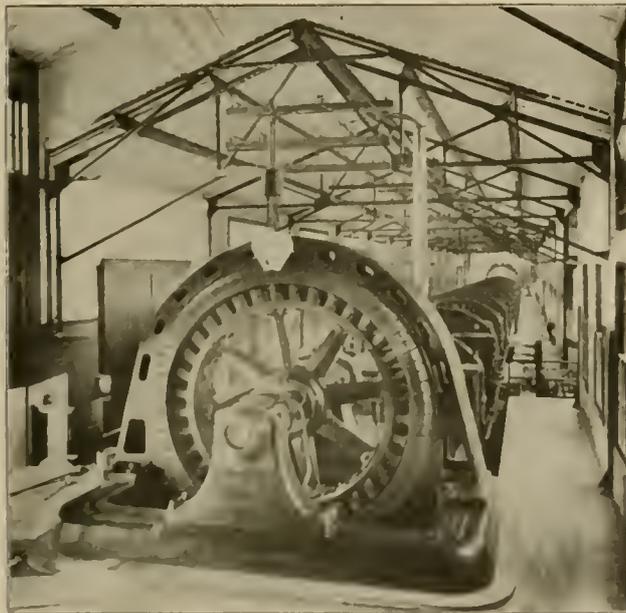

FIG. 12—75-K. W. ALTERNATOR IN ECONOMY STATION, JOLIET.

of the rated output of the sets. Connections and switches are likewise provided on all switchboards to enable the operators to start the machines by operating the generator as a motor until speed is attained, whereupon current is admitted on the alternating end and the generator switched into the line.

All electrical machinery including generators, motors and transformers was furnished by the General Electric Co.

Regulation.

The fact that the railway was to be operated with rented power, derived from a station run by water power; where, if the water were not used when it reached the station, it would flow over the

teries 480 amperes each, but all have been momentarily discharged at double these rates.

The effect of the batteries is not only to regulate the demand for current on the Economy Station, but to reduce the number of motor-generators necessary to take care of the railway business. The generator sets are running with fluctuations of only about 10 per cent of their average output, instead of 100 to 150 per cent as usual in an unregulated plant. Two units now handle the work of the Joliet sub-station where four would be required without a battery.

The charging and discharging of the batteries is regulated in each station by a motor driven booster with compound winding.

Buildings.

All car barn and sub-station buildings are as nearly fireproof as stone, brick, concrete, steel and tile will make them.

The Joliet station is 475 ft. long by 90 ft. wide. The southerly 75 ft. is devoted to generator and battery rooms and paint shop, the latter having a further addition of 30 ft., as shown in Fig. 15. The northerly 400 ft. is divided as shown in Fig. 19, by a longitudinal tile wall, stiffened by steel columns at intervals of 20 ft. The two halves of the trusses are independent of each other, and one-half the roof load is borne by the columns. The north end, Fig. 20, is framed with steel columns and the gable is to be closed with roofing tile, the doors being of the Kinnear rolling pattern.

Space in this building is apportioned as follows

Space.	Dimensions, ft.	Area, sq. ft.	Track, ft.
Car storage.....	45 x 360	16,200	1,440
Inspection pits.....	45 x 230	10,350	920
Wash tracks.....	45 x 60	2,700	220
Repair shop.....	45 x 80	3,600	140
Paint shop.....	22 x 105	2,310	105
Store room.....	90 x 20	1,800	
Holler room and blacksmith.....	45 x 20	900	
Armature repairs.....	18 x 33	594	
Generators.....	54 x 33	1,782	
Battery .....	72 x 33	2,376	
Employee.....	26 x 10	260	
Total.....		42,872	2,825

All floors are of concrete with the exception of car storage tracks which are paved with brick taken from old walls, when the steam plant was dismantled.

Interior partitions are of 8-in., and the south wall of 12-in., hollow hard burned tile made by the Pioneer Fireproofing Co. The other walls are of brick and stone. The roof trusses and interior frame of steel were furnished by the Joliet Bridge & Iron Co.

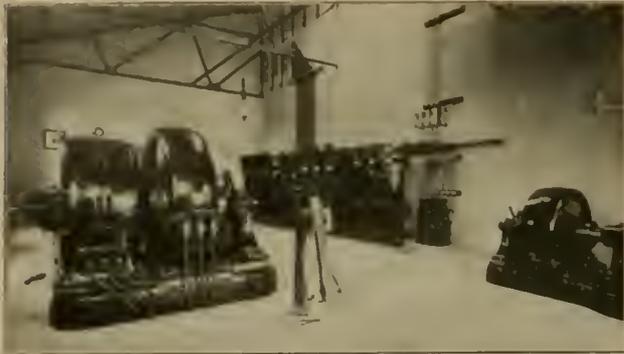

FIG. 14 JOLIET SUB-STATION.

The roof is covered with the Ludowici interlocking tile laid on sheathing over generator, battery and paint rooms and directly on steel angles on all other portions of the building. Skylights are formed with glass tile of identical shape, placed at will and readily changed if alterations are desired.

The details of pit construction are shown in Figs. 19 and 21. Piers of American portland cement concrete were built as indicated, on 12-ft. centers, with 11-ft. clear spans between them. To

floor between tracks is of Roebbling flat construction, finished level with the outer trans of rails, the heads of which thus form a slight rim for pits.

In the boiler room are installed a horizontal tubular boiler with pumps, etc., for heating all portions of the building except the storage barn. For this purpose the Webster system has been adopted, by reason of numerous obstacles to a gravity return. The pits will be heated by radiators set parallel with piers, the steam line running in open spaces above piers and the return line through openings shown at floor level.

The upper sub-stations are identical in plan with the exception that the one at Lemont is provided with a waiting room for passengers. Fig. 22 illustrates this station during construction, and before the completion of the roofs and indicates the general character of construction, and the arrangements for bringing the feeders into the building. The high tension wires are anchored outside and inside, and pass through the walls in 6-in. glazed tiles with 8-in. glazed tile hoods on outside as shown. The ground plan of Lemont station is shown in Fig. 23. The Summit station lacks waiting room and porch. The wire towers are located at the corners of the generator rooms over the switchboard, and the only interior openings in the towers are through the ceilings of generator rooms.

The second story of each sub-station, over the generator room, is divided into living quarters for the operator and his family, consisting of two chambers, living room, kitchen and bath room, with all conveniences. There are also provided two chambers for other employes who may be compelled to pass the night here in case of emergency.

The sub-stations are heated by low pressure steam apparatus, with gravity return.

Two hundred feet of track space is provided in each building for construction cars, snow plows, etc., and for cars which may be required for early or late runs on the upper end of the line.

Fig. 15—South End.

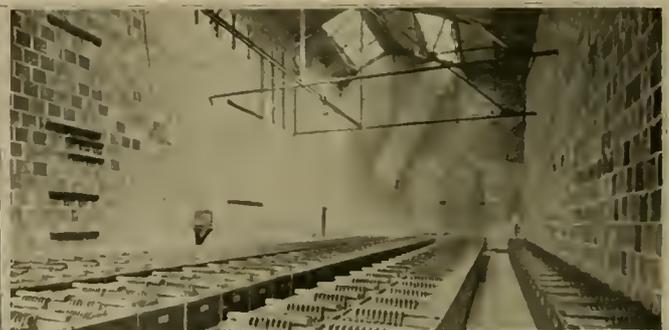

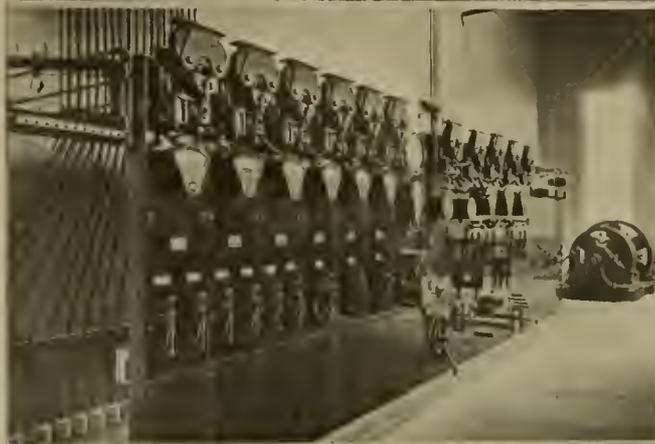

Fig. 17—Battery Room.  
Fig. 18—Booster.

JOLIET SUB-STATION AND CAR BARN.

the upper surfaces of piers are anchored  $\frac{1}{4}$  x 12-in. plates furnished with clips to hold the rails in place. The tracks are formed with 9-in. center bearing girder rails, Lorain section 106-364 (Kansas City standard, weighing 106 lb. per yd.), held to gage across the dummy tracks with tie rods spaced 5 ft. apart. The

In all stations the machine foundations and pits are built of concrete, the space under generators, back of switchboard and under transformers being arched over.

All low tension wiring is done with lead covered cable laid in ducts running under the floors between pits. High tension wires

are insulated with oiled cambric tape and carried on porcelain insulators on brackets back of switchboard and over transformers. High tension lightning arresters are installed on walls of wire tower, with stone barriers between adjacent sets.

The roof construction at sub-stations is the same as that employed in Joliet, with Ludowici interlocking tile covering, of glass where skylights are required and elsewhere of buff clay.

The Lemont and Summit buildings were constructed by the firm

In view of the extent of city and village streets traversed, it was deemed advisable to keep the body low enough for one platform step.

The bodies are 36 ft. long with 13 windows on a side in straight passenger cars, smoking compartments having five and the other portion eight. Fig. 24 illustrates combination passenger and baggage cars which are of same size as straight passenger cars. Other specifications of general interest are as follows: Length over all,

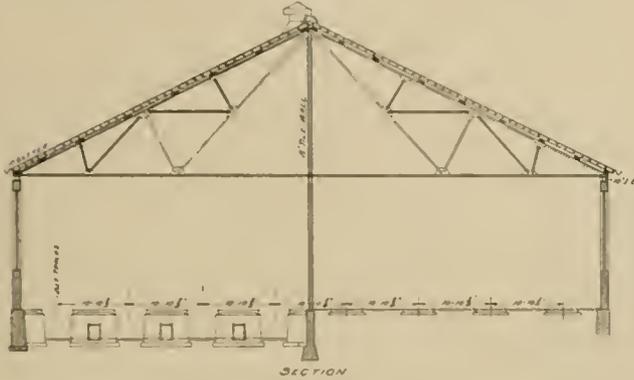

FIG. 19—JOLIET CAR BARN.

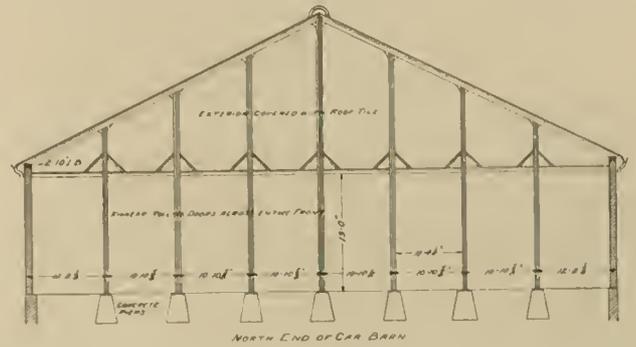

FIG. 20—JOLIET CAR BARN.

of DeFosse & Olsen, under plans prepared in the office of Mr. F. R. Schock, architect.

Cars and Motors.

For service in and about Joliet, the standard equipment consists of 20-ft. closed bodies with six windows and longitudinal seats, built by the J. G. Brill and Pullman companies, and mounted on Peckham "Cincinnati special" trucks. These cars are equipped with two Westinghouse No. 49 motors.

For suburban service, cars with 30-ft. bodies, 40 ft. over all, with cross seats and smoking compartments, have been found very

48 ft.; width over sills, 8 ft. 8 in.; width over all, 9 ft. 1/2 in.; top of rail to under side of sill, 33 3/4 in.; under side of sill to top of trolley board, 9 ft. 6 in.; top of rail to step, 17 1/2 in.; step to platform, 14 1/2 in.; platform to floor, 8 in.; side sills, yellow pine, 5 in. x 8 in.; side sills, plated, 1 in. x 8 in.; end sills, white oak, 5 in. x 7 in.; end sills, plated, 3/4 in. x 6 in.; two 5-in., 6 1/2-lb. channel stringers full length of body; platform knees re-enforced with angle irons.

The exterior is painted in aurora red glazed with light No. 40 carmine, with cream trimmings and lettered and striped in gold; the interior finish is quartered oak.

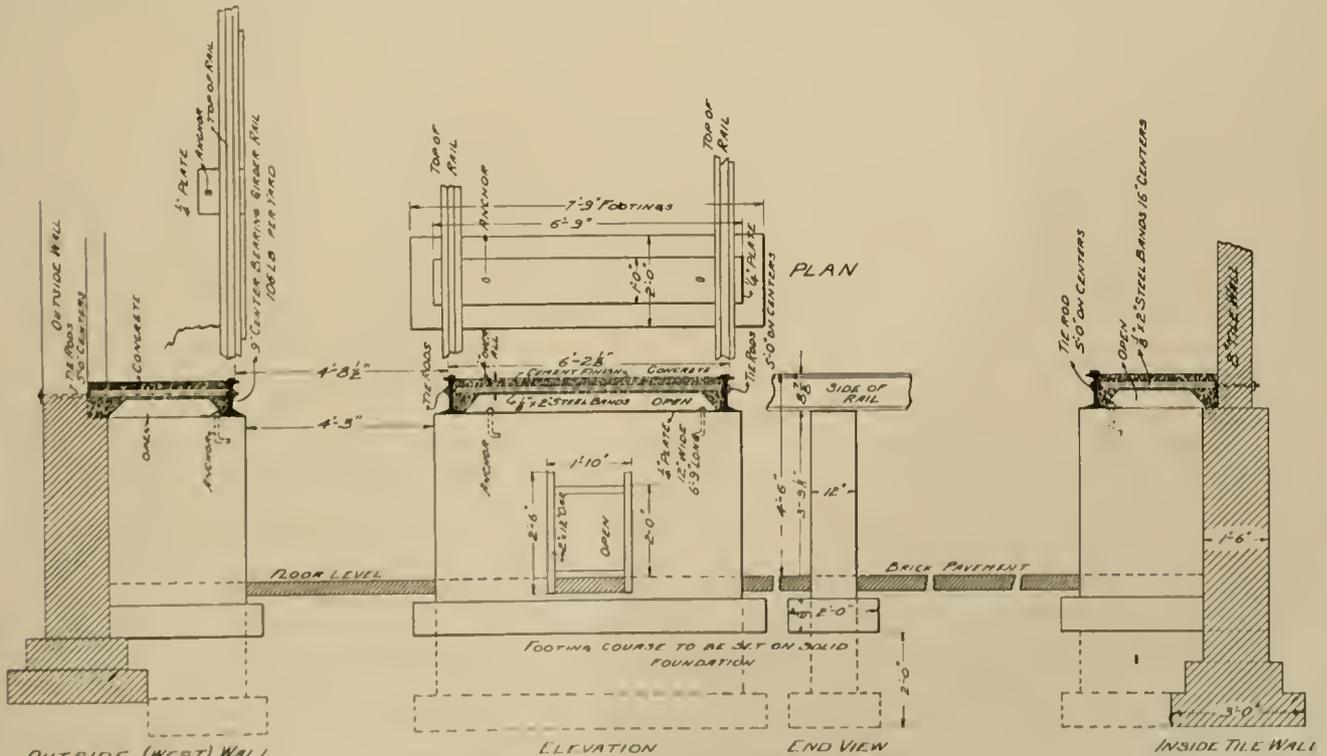

FIG. 21—DETAILS OF INSPECTION AND REPAIR PITS.

satisfactory. They were built by the Jackson & Sharpe Co. and are mounted on Brill No. 27 G trucks and equipped with four Westinghouse 12A motors and Christensen air brakes.

For the interurban line, effort has been made to provide cars of the very best construction possible, affording easy entrance and exit at stopping points, and comfort and safety while under way.

The seats are Wheeler No. 42 "Walkover," in rattan, with offset backs and corner handle. Consolidated No. 93 S heaters run the full length of each side of the car along the truss plank. International double registers with 3/4 in. square rod ringers are used.

The trucks are the Brill No. 27, with solid forged steel frames, and weigh 6,500 lb. each. The wheel base is 6 ft. and the gage

FIG. 22—LEMONT SUB-STATION.

standard. The wheels are single plate, weighing 490 lb.; diameter 33 in.; flanges 1 in. deep, 1 1/4 in. thick; tread 3 in.; axles 4 1/4 in.; brakes are inside hung with Christensen air equipment.

The electrical equipment consists of four G. E. 67 motors, geared to 40 miles per hour, K-6 controllers and Thompson recording watt-meters. Under service conditions, the car weighing about 50,000 lb. loaded, they make the 30-mile run including between twenty and thirty stops, in 80 minutes, with a current consumption of about 75-90 kw. hours.

These cars and trucks were made by the J. G. Brill Co. and they have answered the requirements of the service admirably. Frequent

The cars of this company are all equipped with the Crouse-Hinds removable headlight, in which an ordinary 16 c. p. lamp has given satisfaction on city lines.

The so-called "stereopticon" incandescent lamp made by the General Electric Co. has a filament in the form of a compact conical helix with a maximum diameter of perhaps 1/2 inch, making it possible to focus the lamp in a headlight with nearly the same accuracy as is attainable with an arc. The question is then reduced to one of intensity desirable for the purpose.

Repeated trials showed that a 32 c. p. stereopticon lamp properly focussed in a headlight would so illuminate the track as to render objects visible at a distance of 600 ft. on a clear, dark night, and Fig. 25 shows the method of wiring the interurban cars for lights, whereby the 32 c. p. lamps might be used in the headlights in series with 16 c. p. lamps in the car. The ordinary Crouse-Hinds receptacle might have been used, but in event of the burning out of one of the end pair of lamps, while the headlight was on other end of car, the current through other of the pair would be nearly doubled with resulting violent deterioration or burning out.

The new contact noted on the diagram is connected with the upper one when the headlight stem is inserted into receptacle and the pair of lamps on that end is therefore cut out. With the headlight out, each of the four series of lamps is independent of the others. When the headlight is in use the burning out of any inside lamp will merely dim the headlight until the lamp is replaced.

The Chicago & Joliet Electric Railway Co. was organized as a consolidation of the former Joliet Railroad Co. (operating in and about Joliet with a branch toward Chicago as far as Lockport) with the Chicago & Joliet Rapid Transit Co. under which charter the road was constructed between this terminus of the Joliet Railroad and the point where the Chicago Division crosses the line between Cook and Will Counties, near the village of Lemont. The new line was opened as far as Lemont, on Sept. 19, 1900, and for one year was operated under a rather slow schedule, with medium speed cars, in order to permit hauling ballast and other materials of construction without disarrangement of passenger traffic. Under these circumstances there was no objection to stopping cars at any point and this was done.

The through line to Chicago was formally opened and a regu-

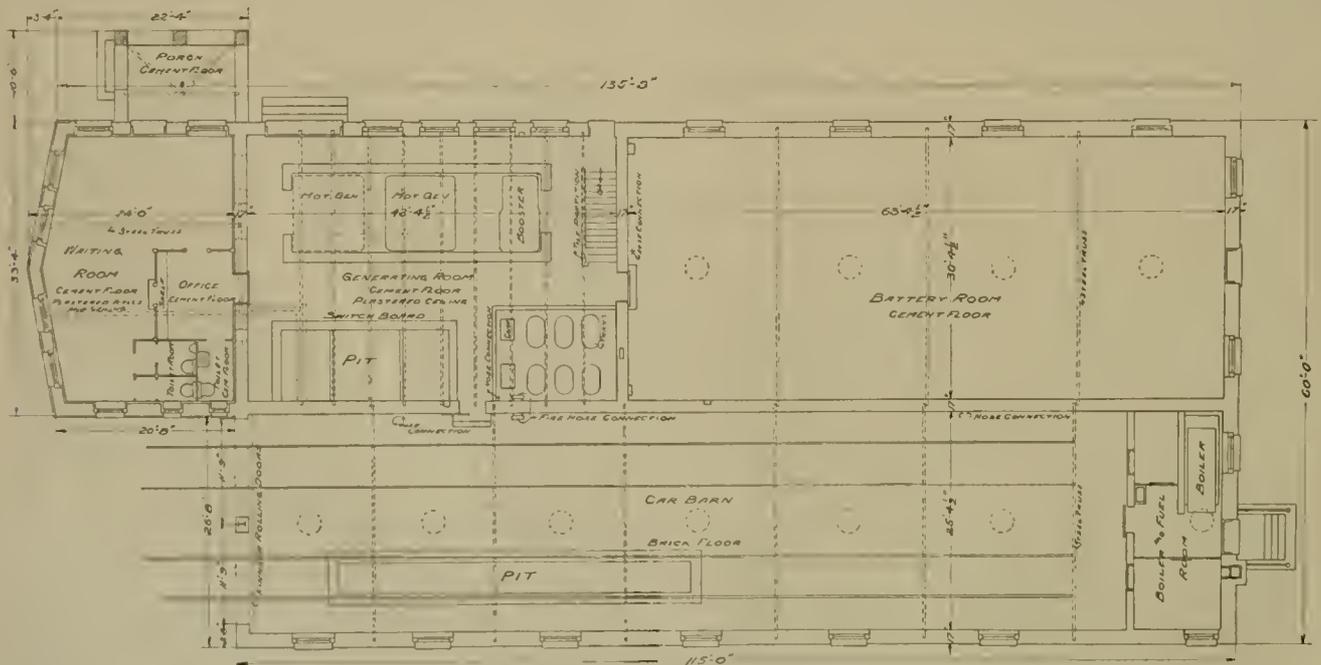

FIG. 23—FIRST FLOOR PLAN, LEMONT SUB-STATION.

favorable comments upon their riding qualities have been a source of much gratification to those responsible for their design.

Careful investigation seemed to establish the fact that the arc headlight is in a state either of transition or of hopelessly arrested development. Its failure at critical moments and the travel of the arc while burning render its use extremely precarious.

The incandescent headlight is reliable, steady and is readily made portable.

lar schedule established on Sept. 26, 1901. For a period of one month the schedule time for the 30-mile run was two hours, the comparatively slow speed being adopted for the purpose of familiarizing those living along, and using, the highway with the new order of things.

On Nov. 4, 1901, the present schedule was put into force, allowing one hour and a half for the run. To make this time, it became necessary to establish regular stopping places and to limit

their number, particularly in the city and villages. Seven stops are made (if desired) in the first two miles, in Joliet; four in one mile through Lockport; four in a mile in Lemont, and four in two miles in Spring Forest, and at suitable intervals elsewhere. The necessity for this might be expected to appeal to the ordinary intellect, where anything like competition with steam railroad service was demanded by the traveling public, and the great bulk of riders promptly acquiesced. Some extraordinarily constituted individuals in Lemont, however, pondered over this invasion of their sacred prerogatives. They took a trip one day to an intermediate point near Lemont and when they were carried a short distance past their chosen destination, advised the conductor of their purpose to amend the rules prior to his return. Their amendment went into force immediately upon the passage of some ties, under their able guidance, from the side of the road to the track, in the path of an approaching car. The general manager could not have changed the rules as quickly and the car did stop. Luckily it was in the day time, and no damage ensued, but the prospect of holding the next committee meeting in the penitentiary has placed matters in a new light to the reformers and the prompt action taken in their case will doubtless have a salutary effect upon similar geniuses.

One-half the Chicago line is double tracked and along the other half are located turnouts 1,000 ft. long and two miles apart. The private right of way is all double tracked, affording an excellent opportunity for making up time, in case of delay.

The line is divided into eight 5-cent fare sections, strip tickets being sold, six for 25 cents or 50 for \$2. By the use of the latter, the fare is reduced to 32 cents from Joliet Court House to the Chicago city line, where a 5-cent fare is collected by the Chicago City Railway Co., by which a passenger may reach the Chicago City Hall or any point on the South Side division of Chicago. There will be placed on sale at Joliet, Lockport, Lemont, Sag, Willow Springs, Summit and City Line, single and round-trip tickets for the convenience of those not provided with commutation tickets above referred to. Conductors are also provided with the ordinary form of duplex ticket.

As indicated, connection is now made with the cars of the Chicago City Ry. at the intersection of Archer Ave. with the city line at 48th Ave. With the completion in the spring of the branch from Summit northerly, connection will be established with the Chicago Union Traction Co.'s lines, giving direct access to all parts of the township of Cicero and the North Side of Chicago. From fifty minutes to one hour is now consumed in the trip from the city line to the Chicago City Hall

The work of construction has been carried on by the DuPage Construction Co., under the immediate charge of Frederic E.

The railway and construction companies are, through ownership of stock, controlled by The American Railways Co., of Philadelphia, Samuel K. De Coursey, president; William F. Harrity, vice-president; C. L. S. Tingley, secretary and treasurer; Silas W. Pettit, general counsel; H. J. Crowley, general manager, and A. S. Kibbe, engineer.

**SOUTHWESTERN ASSOCIATION.**

The fourth annual meeting of the Southwestern Gas, Electric Light & Street Railway Association, will be held in San Antonio, Tex., Apr. 18-21, 1902. The meeting promises to be the largest

FIG. 24 COMBINATION INTERURBAN CAR.

one in the association's history and there will not be less than 100 delegates present, coming from all parts of Texas.

The directors of the association have arranged for the reading of a number of papers on engineering subjects among which may be mentioned: "Fuel Oil," "Flat Rate Evil," "Best Management of Street Railways," "Inspection of Inside Wiring," "Personal Injury and Damage Cases."

The officers of the association are F. H. McGregor, president; E. H. Jenkins, vice-president; F. H. Stuart, secretary; J. D. Miller, treasurer.

**LANGHORN-SOMERTON INTERURBAN.**

Plans are now being prepared showing the route of the Philadelphia & Langhorne Passenger Railroad Co., which has been

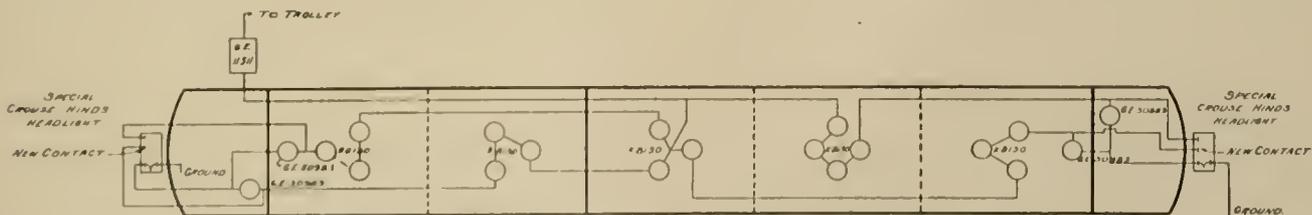

FIG. 25 INTERURBAN LIGHT WIRING DIAGRAM FOR 32 C. P. HEADLIGHTS.

Fisher, general manager; Joseph L. Breen, and H. G. Hinkle, superintendents of construction; John R. Blackhall, electrical superintendent, and Gordon S. Stayman, resident engineer. Legal matters have been in charge of Messrs. Clayton E. Crafts, George M. Stevens and Frank W. Welch. The electrical apparatus was installed by Frederic W. Hill, constructing engineer of the General Electric Co.

The operation, by the Chicago & Joliet Electric Railway Co., of its own lines and those of the Chicago & Des Plaines Valley Electric Railway Co., is under the charge of Frederic E. Fisher, general manager, with W. H. Henn, cashier; Thomas F. Synnett in charge of power stations; William Kelah, maintenance of equipment, and Charles N. Snyder, maintenance of track and line.

chartered to operate a six-mile interurban between Langhorn and Somerton. This road is designed to connect with the lines of the Union Traction Co. in future when that company has decided to build out to Somerton. The rights of way for the new road are all in hand, and Mr. Wm. Barry, president of the company, has announced that contracts for the construction of the road will be let within a short time. He desires to have all the preliminaries arranged so that there will be no delay in starting the work next spring when the weather opens up. The road will be ready for operation by July next, and it is expected that the Langhorne Electric Light, Heat & Power Co. will furnish the current for the railway.

## PENSION AND INSURANCE SYSTEM ADOPTED IN PROVIDENCE.

In November last the United Traction & Electric Co. of Providence, R. I., placed in effect a comprehensive scheme for providing its employes with pensions, sick benefits and insurance, which we believe will be of the greatest interest to other street railways. The plan was proposed by Mr. A. T. Potter, general manager of the company, and embraces the following benefits:

A weekly pension, beginning at age 70 and continuing until death, of the following percentages of the average weekly wages received by the employe during the 10 years previous to attaining age 70.

1.—If his employment has continued for 35 years or more, then 2 per cent of such average weekly wages for each year of such employment, the total, however, not to exceed 100 per cent.

2.—If the employment has been for 30 years, but not so long as 35 years, then  $1\frac{3}{4}$  per cent of such average weekly wages for each year of such employment.

3.—If the employment has been for 25 years, but not so long as 30 years, then  $1\frac{1}{2}$  per cent of such average weekly wages for each year of such employment.

4.—If the employment has been for 20 years, but not so long as 25 years, then  $1\frac{1}{4}$  per cent of such average weekly wages for each year of such employment.

5.—If the employment has been for less than 20 years, then 1 per cent of such average weekly wages for each year of such employment.

Thus, if an employe has been employed 35 years and his average weekly wages for 10 years has been \$15, his pension is 70 per cent thereof, or \$10.50 per week, equivalent to \$546 per annum.

The entire cost of pensioning old employes is borne by the railway company.

As a result of the adoption of this system several of the employes of the United Traction & Electric Co. will go on the pension list at once and a large number will receive its benefits within the next few years. The cost of carrying the old employes under these provisions will become practically a fixed charge against the company's earnings.

The scheme for providing sick and accident benefits and life insurance is on the mutual plan. That is, regular weekly premiums will be paid by all employes, but the Traction company also agrees to make certain contributions to the insurance fund.

The plan for benefits and insurance is as follows:

1.—In the cases of all employes receiving less than \$9 per week, an insurance of \$500, in case of death, and \$4 per week during total disablement by accident or sickness, and if the employe is rendered incapable by accident or sickness of following any gainful occupation, then this payment of \$4 per week will be continued until the age of 70 years, at which time the employe will be put on the pension list until death. The life insurance may be continued at the option of the employe, if he has a wife dependent upon him, his weekly contribution of 10 cents to the insurance fund, as explained later, being deducted from the weekly pension payment.

2.—In the cases of all employes whose wages are \$9, but less than \$12 per week, the insurance is \$750 in case of death, and \$6 per week during total disablement. The weekly payment for continuation of life insurance is 15 cents.

3.—In the cases of all employes whose wages are \$12 or more per week, the insurance is \$1,000 in case of death, and \$8 per week during total disablement. The weekly payment for continuation of life insurance is 20 cents.

Thus the disablement benefits run to age 70, if disablement continue so long, instead of for only 26 weeks, as is customary in companies and societies; then the pension benefits begin.

Time during which an employe is receiving pay for disablement is counted in the term of service entitling him to pension.

The company contributes toward the insurance fund as follows:

1.—\$100 of each \$500 payable at death, \$150 of each \$750 payable at death, and \$200 of each \$1,000 payable at death.

2.—In addition to this, one-fourth as much as the total contributions of the employes. Therefore, under this provision, almost as much more is contributed by the company toward payments at death.

3.—All the expenses of operation.

4.—Any additional deficiency in the funds.

The total contributions of the company, including for pensions, are estimated to more than equal the total contributions of employes on the average.

The contributions of the employes will be as follows:

Employes receiving wages of less than \$9 per week, 10 cents per week.

Employes receiving \$9 and less than \$12, 15 cents per week.

Employes receiving \$12 or more, 20 cents per week.

The company guarantees to pay all expenses of operation and makes the liberal contributions as stated, because the payments of the employes are insufficient in themselves to meet the death and beneficial payments, and it is the desire of the company to avoid making the weekly premiums a burden on any of the men.

In conversation with a "Review" representative, Mr. Potter made the following comparisons between the cost and advantages of the benefits under the company's scheme, and the cost of similar benefits in insurance companies or societies:

"In the company's beneficial department, 20 cents per week secures insurance as follows: Against death, \$1,000; against disability, \$8 per week.

"The disability benefit is payable during the continuance of the disability up to age 70, when the pension begins.

"These benefits would, if purchased from a reliable stock company on an annual premium basis, cost: Life insurance for \$1,000, age 37, per week, 50 cents; accident insurance, \$8 a week, per week, 9 cents; sickness insurance, \$8 a week, per week, 16 cents. Total cost per week, 75 cents.

"The accident benefits would be for 52 weeks only and the sickness benefits for 26 weeks only. The cost as quoted above is 1-52d part of the lowest annual rates for such insurance. Weekly payment rates are always much higher because of the additional expense.

"Thus the lowest cost on weekly payments in reliable stock companies would be as follows: Life insurance for \$1,000, age 37, per week, 95 cents; accident insurance, \$8 a week, per week, 9 cents; sickness insurance, \$8 a week, per week, 16 cents. Total cost per week, \$1.20.

"In this, figures of accident and sickness insurance premiums are given as 1-52d part of annual rates because such insurance in reliable stock companies cannot be had on weekly payments at all.

"The cost of these benefits in mutual societies is variable, and such insurance is also frequently unreliable. The cost might average about as follows: Life insurance for \$1,000, age 37, 30 cents; accident and sickness insurance, \$8 a week, 20 cents; total cost per week, 50 cents.

"This is on the basis of payments being made monthly as in the lodges; weekly payments would surely come higher. The accident and sickness benefits are usually for 52 weeks only, or else continue for reduced amounts.

"The foregoing pension and insurance benefits are under this plan to be given to the present employes of the company, without regard to age or physical condition, the company accepting responsibility for the additional hazard. Hereafter, however, all new applicants for employment will be required to pass a physical examination, and none will be accepted who are more than 35 years of age."

Mr. Potter was asked what might be the legal complications under this scheme, as, for instance, would the company be compelled to pay a judgment secured by an employe for personal injuries, in addition to the benefits he would be entitled to as the result of having paid premiums to the company's insurance department. Mr. Potter replied that this was provided for in a clause of the membership agreement. In the event of accident the employe has the privilege, either of taking the benefits to which he is entitled under the insurance plan, and signing a release, relieving the company of all further responsibility, or else he may bring suit against the company for damages, in which case it is stipulated he forfeits all claim to the insurance fund. The company is liberal in this matter, and even though an injured employe, acting under bad legal advice, commences suit, the company will permit him to retake his privileges under the insurance if he withdraws the suit before it goes to the jury.

These provisions are certainly generous and liberal and the results will be watched with interest. Mr. Potter states that the men themselves have unanimously endorsed the entire scheme, which became operative last November.

## THE RAPID TRANSIT PROBLEM IN LONDON.

The advent of American capitalists in the field of electric traction in the city of London has recently called attention to the rapid transit facilities of that city, and a timely article upon this subject by Mr. Frank J. Sprague has been recently published in the *Engineering Magazine*, from which we make an abstract. Mr. Sprague has made an extended study of the problem of rapid transit in London and his well-known ability and experience in this field gives his conclusions special weight. Within 12 or 15 miles of Charing Cross lies an area of 600 square miles with a resident population of nearly 6,000,000 of people, but a little over one-sixth of this area contains three-fourths of this population. The number of people who daily enter and leave London is indicated by the fact that there are no less than 17 main railroad stations within a radius of two miles and over 300 local and suburban stations.

The movement of the traffic in the city of London is suggestive. Although but a square mile in area, with a day population of 300,000 and a night population of but a tenth of this, in a single day over a million and a quarter people and 100,000 vehicles enter and leave its limits. The street traffic is carried on by about 200 miles of tramways, nearly 150 lines of omnibuses and 12,000 cabs. There are also two lines of underground railways with suburban connections and three deep-level roads operated electrically. Two lines are under construction, two more authorized, and parliamentary rights are sought for 13 railways or modifications or extensions thereof. All new applications were recently referred to a general parliamentary committee, which, after three months of inquiry, has referred most of the schemes to select committees with a report containing certain advisory and mandatory restrictions. This report is not considered by Mr. Sprague entirely satisfying, measured by the needs of London. It recognizes the necessity of rapid transit; recommends underground roads which can connect with surface tramways in outlying districts; suggests that they run from centers of traffic to other like centers and to suburban districts; advises shuttle working at the city ends of roads instead of loops, while permitting them at the outer ends; opposes confluent conjunctions and congested stations; endorses the multiple unit system. The most important question is left without action—that is, the placing of the whole rapid transit problem under a permanent board with full power to deal with it in all its aspects, without which no satisfactory solution of the general problem is possible.

The most important of the existing roads for internal traffic, and admitting of the greatest possibilities, are the Metropolitan and the District railways with their extensions, as they hold the key to an immediate improvement in the rapid transit situation in London. These two railways now present one of the strangest anomalies of railway operation, for while each owns independently a part of the circle, and jointly the connecting link, each runs circle trains in one direction only on one track, trains from outlying sections over both tracks, and each must provide way for trains of other companies. The eventual natural solution of the problem, so far as these roads are concerned, is their operation under one management, the abandonment of running rights of other roads over the circle tracks and their equipment with a system which permits of the highest practical schedule, and trains varying in length and frequency according to the service requirements. The circle should be an exclusive highway, not a trunk stem for several railways, especially unless the latter are similarly equipped. The needs of the traveling public as a whole will be much better served by high speed, two-minute service on the circle with exchange of traffic at junction points than by a ten-minute service mixed with a dozen outlying services which must in turn be also subordinated to the exigencies of local trains.

The three deep level roads, the City & South London, the Waterloo & City and the Central London, were built to relieve specific cases of congestion and are of the tubular type. The roads are of standard gage, but the tunnels vary from 10½ to 16 ft. in diameter, the latter being the only one which can take a standard car. All of these offer splendid examples of civil engineering and construction, and the general features of the Central London in particular have been worked out with remarkable care. The electrical equipment on none of these roads, however, is in accord with the latest developments in electric traction, which are contrary to locomotive traction and fixed make-up of trains.

As at present projected, the deep level roads are limited routes

between centers or along routes of congested traffic and means for interchange of traffic between the great railways. Having but two tracks, however, they must always be excluded from express service.

On account of vested interests, however, tubular railways are probably the only ones which will be constructed in London, but no new roads should be authorized except as a part of a well planned general scheme of traffic under the supervision of a central authority fully alive to London needs. The requirements of London rapid transit are the concentrating of masses of people in the morning and distributing them at night as well as providing quick inter-communication. An idea prevails that London conditions imply require transportation between certain centers of activity. This view must be discarded, isolation of districts destroyed and London made a city whose people have a common interest instead of an aggregation of parishes.

Multiplicity of roads, independently run, on limited and competitive routes, forming no part of a well ordered plan and operated under separate management, will add to, not solve, the difficulties of the rapid transit problem.

Every underground railway in London should be operated by a single local corporation with concentration of management and undivided responsibility, aided by the most advanced methods of equipment and transportation. They should form a net work, grid-ironing London, connecting all the important centers at different levels, having common stations except in the city, and in close contact with the stations of existing suburban railroads. Such a system can, by proper parliamentary action, be created by the absorption and harmonizing of the best parts of authorized roads, and the addition of such others as will accomplish the required object without unnecessary duplication of routes. The general plan having been determined upon, as was done in Paris, construction could proceed upon the most important lines, and the less important sections be added later. With well-chosen routes, perpetual franchises and absence of competition, capital would be readily forthcoming for such a system, but it would be preferable to have the construction authorized under some plan of municipal help similar to that given the new rapid transit road in New York. The operation of such a system should be accompanied by radical departures from English steam railroad methods. There should be an abolition of classes and differential fares as well as of the present type of cars. No roads operating for internal and short local traffic are justified in having class distinctions; they might as well be made in the waiting stations and platforms, or in the lifts. On almost all branches there should be free exchange at common stations except where it might be necessary to divert or restrict travel, as is done on the Metropolitan Ry. of New York and on the elevated and surface lines in Boston.

The compartment car is unsuited to traffic of this character, and while easy to unload, it is not as quickly loaded in practice as the corridor type with free access from one car to another. If train lengths are varied to suit the traffic the latter cars load and unload quickly and run more evenly filled than the compartment type. Grade crossings should, of course, be prohibited, and junctions other than end-on ones should be made only where Y's are required to get necessary car movements or where trains can be safely diverted. Most branches should be operated on the shuttle principle and loops avoided unless they are of considerable size and take in new territory with several stations. Where common stations are impracticable the separate stations should be connected by subways, as is so well done at the city ends of the present deep-level roads. That electricity should be the motive power needs no argument. The underground roads are competitive with surface facilities, and that route will command the most passengers which can offer the easiest access, the greatest convenience and comfort, the lowest fares and the most complete and rapid service. The latter can only be had by a special application of electricity.

There are two classes of traffic, one forced and the other coaxed. The latter is generally needed to fill the trains at light hours and is competitive. The most cogent appeal to this class of passengers is promptness, speed and comfort. The ideal service, so far as the passenger is concerned, would be by single cars run at high speeds and following each other at the shortest possible intervals, but the heavy traffic at certain hours prohibits this ideal condition. There must be an expansion of the car into a train varying in length according to the time of day and lengthening of intervals to

meet the requirements of operation at high speed. These requirements have led to a natural and logical development in modern electric traction generally known as the multiple unit system. In this system every motor car is a unit, and any combination of motor cars or trail cars may also be considered a unit, which can be operated from either end and can be joined with other units. Such a system readily lends itself to every condition of congested service. Similarity of equipment insures flexibility of train operation and provides a motive power proportioned to the requirements. Locomotive switching operations are abolished, trains can be reversed at any cross-over and traffic concentrated on any section of the road. With high powered equipments any required schedule up to the maximum becomes possible, and with any given mileage the number of cars in service can be made a minimum. Where a crowded system has main tracks with branches, units for the different branches can be combined on the main line and split up at junctions, and vice versa. The operation of the multiple unit system is the simplest since every unit is self-contained, as is every aggregation of such units. In case of failure of brakes or on slippery rails the machines throughout the entire train can be speedily reversed.

The current in-put to the machines is automatically limited on each one to its safe capacity. In practice train lengths vary from two to nine cars and equipments from an average of 100 to 300 h. p. per car. Tubular roads having 13 ft. diameter permit of the application of the multiple unit system to any extent. Where the diameter is only 11 ft. 6 in., however, as on some of the roads built or projected, then there can be but limited equipments. These roads are built with accelerating and braking gradients so that good schedules require but two motors on half the cars. By having trains made up of two three-car or two four-car units, the first and last car of each unit being equipped with two motors, a special construction of car in even these limited dimensions becomes possible. On such equipments it is the best practice to cut the trains in two for the lighter hours of service and to maintain a high frequency, alternate trains being sent unbroken into the yards.

At certain hours of the day some of the suburban steam lines have already nearly reached the limit of expansion by steam operation on existing tracks and are seriously considering adding to their facilities by construction of tunnels for their suburban lines. Such construction is utterly unnecessary, and if these roads should operate their suburban traffic electrically their capacity could be very largely increased. On many of them there are from 11 to 13 cars in a train even at times of light traffic, when the trains are often an hour apart. With station distances averaging  $1\frac{1}{4}$  miles the schedule speed is sometimes as low as 13 miles per hour. On such roads the train movements could not only be greatly increased in busy hours, but traffic can be created at other hours by offering superior facilities in higher speeds, more frequent trains and prompt connections with local feeders which, quite apart from any economies of operation, would insure a large return on the cost of an electrical equipment.

Briefly summarizing, then, rapid transit in London depends upon a widespread and radical application of electricity, and this is of even more importance than the creation of new tunnels. The latter should be built according to well matured plans under a central authority. The roads should form part of a general system under a single management. Classes should be abolished, one regular rate of fare should be established with workmen's fares in limited hours, and free exchange except on limited routes or within two zones. Locomotive practice should be abolished and trains operated in small units which could be combined at will. Electrical trains should be provided in place of many of the buss lines on crowded streets. Every steam railway should equip its suburban service at once with electricity. It needs but a practical survey of all that has been accomplished in the United States to realize the immense benefits possible by an intelligent adoption of electrical propulsion.

---

The new electric railway between Lancaster, Pa., and Manheim, has been partly completed, and cars are running between Manheim and Petersburg.

---

The New York & Queen's County Railway Co.'s new line between Long Island City and Flushing was opened for traffic December 15th. The new route reduces the running time between these points by 20 minutes.

## BIRMINGHAM, (ALA.) NOTES.

Since the Birmingham Railway, Light & Power Co. has decided to convert the steam line between Birmingham and Bessemer into an electric line the question of securing good current all the way to Bessemer, and especially at the Bessemer end, has been a very important one. Several plans have been proposed and abandoned. The engineers finally decided that to operate the road successfully it would be necessary to have a power station in Bessemer and the management accordingly opened negotiations with the Bessemer Electric Co. for the sale of its plant and the result was the purchasing of the same at \$24,000. The plant will be overhauled and enlarged, and will not only furnish current for the Bessemer end of the electric road, but will furnish current for the lights in Bessemer and the adjacent furnaces. This acquisition of the Birmingham company now makes it owner of one of the largest lighting properties in the south.

This company has recently purchased two blocks of land lying between Third and Fifth Aves. and 10th and 11th Sts. in Birmingham and will erect thereon a first-class barn and machine shop at a cost of \$100,000. The plans are now being prepared by Ford, Bacon & Davis, engineers, and the barn will be modeled somewhat after that of the new Orleans & Carrollton R. R. in New Orleans, only on a larger and more extensive scale. It will be of brick, with a cement floor and iron roof and doors, making it practically fireproof. The capacity of the machine shop will be such that 50 cars may be worked on at once. It is the desire of the company to keep all the cars of the system at this barn and abandon the other small barns. The purchase price of this site was \$25,000.

As a token of the company's appreciation for efficient and loyal service all employes who worked on Christmas day received an envelope containing one day's wages with the compliments of the season from the company. This in addition to their regular wages. All manifested the sincerest appreciation of this gift on the part of the company and it is hoped that the custom will be maintained.

The laying of 70-lb. high T-rail on 21st St. from First to Sixth Ave. has begun and when completed the paving of this street with vitrified brick by the city will closely follow. The overhead construction on this street has already been changed from center to side pole.

Mention was made in the December issue of the "Review" of the form of examination all applicants for position of motormen and conductors were subjected to. The forms mentioned have been supplemented by two books of questions, one for motormen and one for conductors, consisting of 143 questions each, and covering all the principal rules and bulletin orders. These books are all printed with blank lines under each question on which the applicant writes the answers. These examinations are conducted under the direction of the chief clerk to the manager, who examines the answers and marks the men accordingly. On the mark an applicant makes to these questions depends whether or not he is taken into the service.

To facilitate the inspection of the trolley lines the line inspector has been provided with a special car, a vehicle with four rubber tired wheels on which is set the propelling gear of a bicycle. With this the inspector can cover quite a good deal more ground in a day than otherwise. The car is light and easily removed from the track on the approach of a car.

A folding aerial tower wagon has been added to the "trouble department" of the railway and is operated very much like a hook and ladder of a fire department.

The freight traffic on the Bessemer and Birmingham line has increased to such a marked degree that it has been found necessary to purchase a light Baldwin locomotive for this service alone. At the present time mixed trains are run on this line.

---

The Berlin & Bridgeport Electric Street Railway Co., of Berlin, Ont., has been granted a charter.

---

The United Railways & Electric Co., of Baltimore, has erected a new building at the park terminal station, to replace that which was burned last spring. The structure is divided into three compartments to be used severally as a waiting room, car dispatcher's office, and lunch room for employes.

# The "California" or Combination Car.—I.

BY W. E. PARTRIDGE.

The "California" car has been for years the principal style of street car used on the Pacific Coast. It might almost be termed the only street car of that region. During the last half dozen

they embody the leading characteristic of the type, that of both open and closed portions. So far as the comfort and convenience of the passenger go the two styles are nearly the same, and with

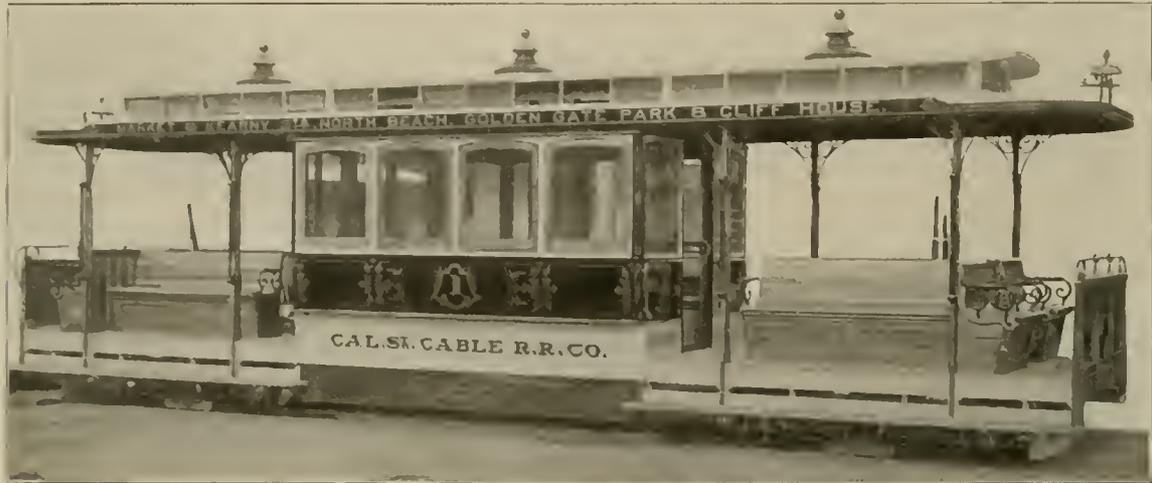

FIG. 1—THE ORIGINAL OF THE "CALIFORNIA" TYPE OF STREET CAR.

years the type has been steadily working its way eastward. Wherever it has been introduced it has encountered strong opposition. The climates of the middle and Atlantic states were said to be

the advantage in favor of the California type. As their usefulness and characteristics are so nearly the same, we may properly consider them together provided we bear in mind the fact that they are by no means identical. In the East nearly everything that runs on wheels and has a combination of open and closed portions is called a "California" car.

FIG. 2 "CALIFORNIA" CAR ON 4-WHEEL TRUCK.

unsuitable for it. But in spite of this and many other objections and prejudices it has won its way, and is in use in considerable numbers as far east as New York. In the milder climates of the middle and southern states it is one of the popular types. In England the car has obtained a considerable popularity. It holds its own well with the double deck car and would probably take the place of that form of construction both in England and on the continent but for the fact that the streets are both narrow and crooked and the double deck car gives a maximum capacity for a given length. As speed is of no importance the slowness of the double deck type is of little consequence.

Strictly speaking the California car is one which has a closed body with two open ends or platform, upon which there are seats like those of an open car. Fig. 1 shows the first form in which the "California" car was built. It might be described as a closed body to placed as to occupy the center of an open car making two open ends and a closed or box center. The name has often been incorrectly applied to cars having an open compartment at one end and a closed body at the other like an open and closed car joined. These are not strictly speaking "California" cars, though

the first California car which, so far as we can learn, was the first combination open and closed car of any kind, for a street railway, was built by the firm of J. Hammond & Co., of San Francisco, Cal., in 1889. The idea and design originated with Mr. John Hammond who was the founder of the firm. The car went into actual service on the California St. cable road in San Francisco on Nov. 6, 1889. It ran continuously all winter and afterwards the firm built a full equipment of these cars for the road. A patent for the invention was issued to Mr. Hammond in 1892. The type made a decided hit. The public approved of it. The expensive and cumbersome turntables at the ends of the cable roads were no longer necessary and a remarkable step had been made in street railway progress. Fig. 1 shows a view of this first car. A little study of it develops several very interesting points. The design was complete in all its details from the first. There were no

FIG. 3 LONG "CALIFORNIA" CAR, MARKET STREET RY., SAN FRANCISCO.

crudities to be corrected later. One important point was that people on the open deck or platform did not tread upon each other's feet in entering or leaving. The car was mounted upon

double trucks and was furnished with track brakes. These are absolutely essential upon the steep grades of the cable roads of San Francisco. The gripman in these cars is placed between the seats where he is out of the way of the passenger and is at the same time not liable to be annoyed by them. It will be noticed that this arrangement of longitudinal seats with the grip or motor man between them is used on all the Pacific Slope cars of the California type.

In a letter to the editor, Mr. E. P. Vining, general manager of the Market Street Railway Co., of San Francisco, throws some light upon the conditions prevailing on his lines and their bearing upon the development of the type. The first cable line began operation in 1870. "The cars used consisted of a closed car much like the horse car previously in use and an open dummy containing the grip."

"When the Market St. cable lines commenced their operation in 1883 the style of combination car still used was adopted. It practically consisted of the closed car and open dummy, formerly

FIG. 4—SHORT "CALIFORNIA" CAR, MARKET STREET RY., SAN FRANCISCO.

used, but consolidated into a single car instead of constituting two separate cars as formerly." The Eastern reader will understand that the dummy was a small open car with longitudinal seats between which the gripman was placed with the levers, brakes, handles, etc.

When the electric cars were introduced in the city of San Francisco in 1893 the electric cars were naturally modelled upon the same pattern as that which had previously given so great satisfaction. In speaking of the combination of open and closed car, Mr. Vining says: "This style of car is peculiarly adapted to the climate of our city. You are aware it is never cold enough here to freeze, and is never oppressively warm, while during a large part of the year we have strong cold winds from the Pacific Ocean. The result is that at all seasons of the year about half of our passengers wish to ride in the open section and about half in the closed section, and our style of car seems precisely to meet the wants and wishes of the public."

Of course this style of construction is not quite so well suited to our eastern climates as to the mild, regular conditions of the Pacific Coast. But we have long summers and cold, raw winds

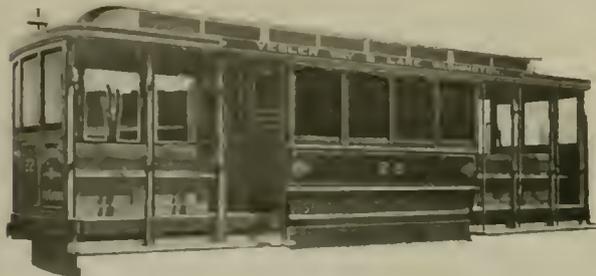

FIG. 5—"CALIFORNIA" CAR FOR SEATTLE CITY RY.

are common. Open cars are called for late in the autumn and early in the spring when only a few of the passengers really care for them. In some of our cities, notably New York, the boards of health order that at least one car in every four shall be closed. This is readily complied with by using a combination or California car in connection with the ordinary open cars.

In the cold, chilly summer evenings common to the Atlantic states a closed car is more comfortable for most people than an open one. With the open types now in uses here there is no protection for the passenger, who shivers, takes cold and makes his complaints, without hope of relief. Many of our eastern car builders have announced that they saw little use for the California type elsewhere than on the Pacific slope. Passengers, however, would welcome such a type on the cold evenings and on those

FIG. 6—"CALIFORNIA" INTERURBAN WITH STRAIGHT SIDES.

raw days which make our climate a terror. It is true combination cars do not answer very well even in New York for a winter service, but they are all right during the season when open cars are used.

Fig. 1, as has been said, is a view of the first California car ever built. It had most of the modern features except the bulk heads at the ends. These have been added in cars built more recently. Fig. 2 shows a late pattern, also built by J. Hammond & Co. The car is much smaller and is mounted on four wheels. It is for electric instead of cable propulsion. Each end of the car is fitted with a bulkhead and drop sash, and there are two steps instead of one. In other respects the car externally closely resembles its larger predecessor of the cable road. The closed body, however, is fitted with cross seats instead of those running longitudinally. A projecting buffer and drawhead protects the dasher. Figures are not at hand in regard to its length, but it is probably but little more than half as long as the earlier car.

Figs. 3 and 4 show two recent cars built by J. Hammond & Co. for the Market St. line in San Francisco. Both are for electric

FIG. 7—SHORT "CALIFORNIA" WITH STRAIGHT SIDES.

traction. Fig. 3 shows an 8-wheel car apparently of about the same length as that shown in Fig. 2, say 40 ft. It has the curved panels of the regular street car pattern. Aside from the different method of propulsion, the cars are much alike. Bulkheads with sash have been added at the ends and the two cross seats with the dasher have been omitted. The closed body is one window longer. There are two steps, a feature found in most of the later cars built by the firm. When a body is of necessity carried high two steps are a great advantage. The passenger easily and quickly gains a footing on the lower step and if this is made of sufficient width the car may be safely started, leaving him to mount to the floor at leisure. Two steps are much safer than the single 16-in. of ordinary four-wheel open cars and very much better than the higher steps found on most open cars mounted on double trucks.

Fig. 4 is a shorter four-wheel car with the details as in the previous figure. In these two Market St. cars the eastern railway man will note with interest the elaborate protection given at the space between the wheels. It would be nearly impossible for a

build a California car with a steam car side and a long body. A car of this style is shown in Fig. 6. It has seven windows upon each side of the closed body. The car is mounted upon double trucks, has the space between them protected with slats and has double steps. The body has a pair of truss rods under the sills and the usual needle beams. This is a high speed suburban and interurban car and is fitted with a trolley pole at each end. A shorter car of the same kind is shown in Fig. 7. It will be noticed that the posts used in the open portions of these cars are of a type quite different from anything of the same sort made in the East. One invention at least seems to be anticipated in the arrangement to carry the drip from the roof gutters down through one of the grab handles.

FIG. 8—40-FOOT "CALIFORNIA" CAR, BUILT BY MARKET STREET RY., SAN FRANCISCO.

person to fall, or be thrown under the car. Wire netting, or slats carried by bars, completely closed the space between the steps. Fig. 5 shows another form of California car built by the same firm for Seattle. As it is to be mounted on a single truck and is carried very low only one step is needed. The space between the steps in this case is guarded by a wire netting.

One position in connection with all these cars is worthy of imitation by street railway men in other parts of the country. All the cars have fenders, but they are all placed so that they are not likely to trip up the pedestrian. They do not project five or six feet in front of the bumper, taking up room and causing more

hood and the sign board are separate and are merely roof members and not a portion of the car framing. Longitudinal strength and stiffness at the posts is secured by large ornamental brackets. Cross brackets are also provided as will be seen by reference to Fig. 9, which shows both the plan and elevation of the Market street line.

The construction shows some peculiar and interesting features. The letter board proper does not extend beyond the closed body. The bow of the

The posts are inserted merely as supports for the roof and to furnish suitable supports for grab handles. They are not intended to strengthen the roof materially against longitudinal or transverse strains. As the seats are longitudinal in the open part there is no way of anchoring them to the sill at the bottom. For this

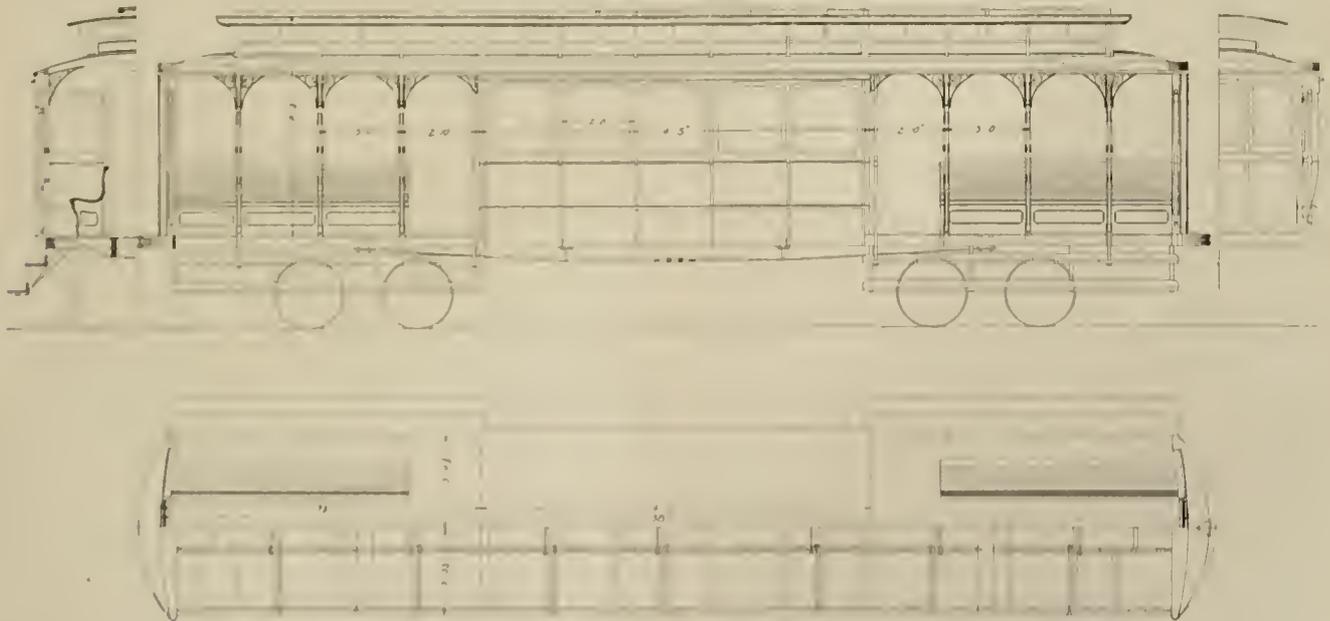

FIG. 9—DETAILS OF "CALIFORNIA" CAR, BUILT BY MARKET STREET RY., SAN FRANCISCO.

accidents than they avoid. Many managers object to such a location because it would be difficult or impossible to change the fender from front to back at each terminus. In Figs. 3 and 4 the slat fenders in front of elastic fender beneath or lack of the crown piece are a very valuable guard.

In addition to the strictly street car type the Messrs. Hammond

reason they are properly made light, as is the whole structure of the roof which covers the open portion.

The flood framing is of great strength. It consists of two side and two center sills. The side sills are of wood in two parts with a 5½-in. channel iron between them. The center sills have an I beam sandwiched between two fillers of wood. The bolsters

are of flat bar iron trussed. There are also truss rods under the side sills extending from bolster to bolster. Numerous "crossings" or transverse timbers are used with tie bolts holding the sills together by pairs. All of the four sills pass from end to end of the car without interruption, thus making a very strong floor. By carrying the body high there is no interference with the wheels and the framing design is not sacrificed to obtain space for the wheels and trucks. The car is about 6 ft. 8 in. wide over the sills and nearly 7 ft. wide over the widest part of the body. The lower step has a projection of about 16 in. The monitor is built with the glass in two sections, making the monitor side 15 in. high. In all the cars illustrated the gong is placed on the roof. This is the natural position and with the cable cars the most convenient, since the gripman always had a hand at liberty. With the advent of electricity the motor man has both hands occupied and the foot has been called into use to sound the gong, often very much to the discomfort of the passengers. Heavy "kicking" is one of the nuisances which passengers in New York and Jersey City at least can often complain. The overhead position has the advantage of being out of the dirt and of giving the sound clearly without obstruction.

These cars are of especial interest as showing the California type in its original form. Other builders while retaining the leading features, have made wide departures from the forms shown. These we shall speak of at another time.

### NEW YORK-NEW JERSEY TROLLEY TUNNEL.

Plans were made public last month for the completion of the old Hudson River tunnel connecting 15th St., Jersey City, with Morton St., New York. Mr. David Young, general manager of the North Jersey Street Railway Co., has stated that his company has made arrangements to run its cars to a point near the mouth of the tunnel where passengers will be transferred to the tunnel cars. Similar connections will be made with the cars of the Metropolitan Street Railway Co. on the New York side. The tunnel company will run its own trolley lines through the tunnel and these cars, owing to the size of the tunnel, will be smaller than the usual trolley cars.

Considerable work was done on this tunnel several years ago. The old plans contemplated a two-tube tunnel and enough work is finished, according to the statement of the engineers in charge, to prove that it is unnecessary to sink supports to the bed rock as it is planned to do in the case of the Pennsylvania Railroad tunnel. On the north tube, 4,000 ft. on the Jersey side and 200 ft. on the New York side were completed 8 years ago and on the south tube, 600 ft. on the Jersey side were finished at the same time. Of this work, 1,500 ft. on the Jersey end of the north tunnel are of modern construction, that is, cast iron tubing, the rest, which was put in many years previously, is constructed of brick and thin steel. The tubes are 18 ft. in diameter.

The Jersey City terminus of the tunnel is covered by a large temporary building in which machinery is installed for building the tubes, and includes the air pumps, water pumps, etc. For several years an engineer and a fireman have been stationed at this building and the tunnel has been kept free from water and the air in it has been constantly renewed. There has been no work done on the approach to the tunnel which is entered at present by a perpendicular shaft.

The new company which is to finance the tunnel project has among its incorporators, F. B. Jennings, of New York, and John Young and Horace C. Golding, of London. The company is capitalized at \$5,000,000 common and \$3,500,000 6 per cent cumulative preferred stock, and \$7,000,000 first mortgage 5 per cent bonds. Neither of the trolley companies in Jersey City or New York will assume any financial obligations in regard to the tunnel, their only connection with it being an agreement for the transfer of passengers between New Jersey and New York. It is also stated that the Jersey City, Hoboken & Patterson Street Railway Co. will carry passengers to the mouth of the tunnel.

The Market Street Railway Co. of San Francisco, has selected a site on which to erect new machine shops. The company proposes hereafter to construct its own rolling stock, and will give employment to a large force of mechanics.

### ANNUAL BANQUET AT LANCASTER, PA.

Nearly 400 employes of the Lancaster County Railway & Light Co. were tendered a complimentary dinner on the evening of January 2d, which was given as an expression of the company's appreciation of the faithful work of the employes during the year. Nearly every one of the employes of the Conestoga Traction Co., the Edison Electric Illuminating Co., the Lancaster Gas, Light & Fuel Co. and the Columbia Electric Light Co. was present. The occasion demonstrated the cordial relations existing between the employes and the company. The dinner followed close upon the announcement that the wages of the conductors and motormen would be increased 10 per cent after January 15th, and both were greatly appreciated by the men.

A year ago Mr. W. B. Given, president of the company, inaugurated the custom of giving a dinner to the employes. The success of the first banquet led him to promise at that time that the dinner would be repeated annually. Since last year several new corporations were merged under the management of the traction company, but the company's hospitality was extended to all the employes of all the consolidated companies.

The operation of the entire street car system was suspended from 9 to 12 o'clock in the evening and substitutes were engaged to take charge of the power house, gas plant, etc., in order that every employe might attend.

At the close of the dinner a number of speeches were made, President Given first addressing the men. After complimenting them on their efficient, competent service of the past year, he stated that as long as they served the company with fidelity and the public with courtesy, their positions were as sure as the rock of Gibraltar; no political or other influence could affect them. The benefit association organized by the men was commended and Mr. Given, on behalf of the directors of the company, presented it with a purse of \$100.

Mr. F. S. Given, general manager of the company, next addressed the men. He is very popular among the employes and was extended an ovation. The other speakers were C. Edgar Titzel, superintendent of the lighting department; Oscar M. Hoffman, treasurer; Thomas P. McManus, one of the oldest conductors on the road; W. W. Hensel, general counsel; B. F. Zook, foreman of the carpenters; Edward A. Reist, manager of the Conestoga Park theater; Major B. Frank Breneman, who presented the benefit association with a \$100 bond of the first street railway line in the city, worth about \$110, and W. M. Franklin. The banquet came to a close at 12 o'clock, at which time President Given extended an invitation to the men to a similar dinner the following year.

### THEY WERE SHORT.

The Washington correspondent of the St. Louis Globe-Democrat tells the following story on Senators Hanna and Lodge: "They got on the car together the second day of the session. The two chatted about the events of the day, and seemed oblivious of the fact that the conductor of the car was standing patiently in front of them waiting for his fare. Lodge was first to realize it. He started to feel first in one pocket, then in another. Senator Hanna pulled back the capacious skirts of his Prince Albert and began a search of himself. Hanna found a rough looking jack-knife and four rubber bands. Lodge brought out a gold match safe and a nail file. Then Hanna looked at Lodge, Lodge looked at Hanna, and both continued the search. Eventually they produced 7 cents between them.

"The conductor, noting their silk tiles and the distinguished appearance of Lodge, hesitated, but finally reached for the 7 cents, with the comment, 'I'll remember you, Judge, and you can pay me the other three the next time you ride.'"

The Fond du Lac & Oshkosh (Wis.) Electric Railway Co. was incorporated December 13th, with a capital stock of \$100,000 and projects an interurban electric line between the cities named in the title. Passengers, mail and express will be carried.

The Catawissa (Pa.) & Bloomingburg Electric Railway Co. has been granted a franchise for the construction of a line through the borough of Catawissa.

### THE BUFFALO HIGH-TENSION CABLE DISTRIBUTION SYSTEM.\*

BY HAROLD W. BUCK.

In the development of the electrical transmission of power many propositions are being presented of a water power or coal mine situated within such a distance of a city that it is cheaper to transmit power from the mine or waterfall than to generate it by steam in the city itself. In such systems three engineering elements must be considered: first, the generating plant; second, the transmission line, and third, the method for distributing the power at the end of the transmission line. Electrical generating plants and transmission lines have been the subject of many discussions, but the terminal arrangements for transmission lines are newer in their development, and it is the object of this paper to bring the matter before the members of the Institute for discussion, the problem presented being the best method of distributing the power throughout a city after a point has been reached in the transmission line where it is no longer safe to carry the power overhead at the transmission voltage. Such limitations exist on the outskirts of all cities.

In order to serve as a basis for discussion and to point out the various considerations which enter, a brief description will be given of the method which has been adopted for the distribution of Niagara power at Buffalo.

Fig. 1 shows a map of the Niagara-Buffalo transmission line indicating the relations between the overhead circuits and the circuits of distribution within the Buffalo city limits, the numeral 3 on the map indicating the terminus of the 22,000-volt overhead three-phase lines. At this point the three overhead circuits, each having a capacity of 10,000 h. p. at 7 per cent line loss, enter a terminal house, and are connected, as shown in Fig. 2, through circuit breakers, selector switches, bus bars, etc., to the 22,000-volt primaries of the step-down transformers. These transformers have a capacity of 3,000 h. p. each, and are of the oil-water cooled type. The secondaries of the transformers are wound for 11,000 volts, making the ratio of reduction of voltage 2:1. The secondaries of the transformers are connected through selector switches and two sets of bus bars to the underground cables, each of which is connected through an air-break circuit-breaker. With the arrangement shown, the Buffalo system can be operated in two sections if desired, and an overhead circuit or any cable connected

from one to another and for cutting out damaged sections of a cable by means of section switches, so that the entire length of cable from the terminal house will not have to be cut out of service. Special attention is called to these section switches, which are shown in Fig. 4. They are of the triple-pole, single-throw type of oil-break switch, with a waterproof hood of iron bolted to the top of the switch frame for the protection of the cable heads and leads. These switches are installed in vaults under the city streets, placed at convenient intervals. Some of the vaults are as large as 10x12 ft. The switches are absolutely waterproof and could be submerged if necessary without danger, and will open the circuits under heavy loads without difficulty. They have proved of great convenience at times when repairs have been made necessary on sections of cables, and for locating faults without the necessity of cutting the cable. I believe that underground section switches of this kind would prove of great service to all high-tension cable

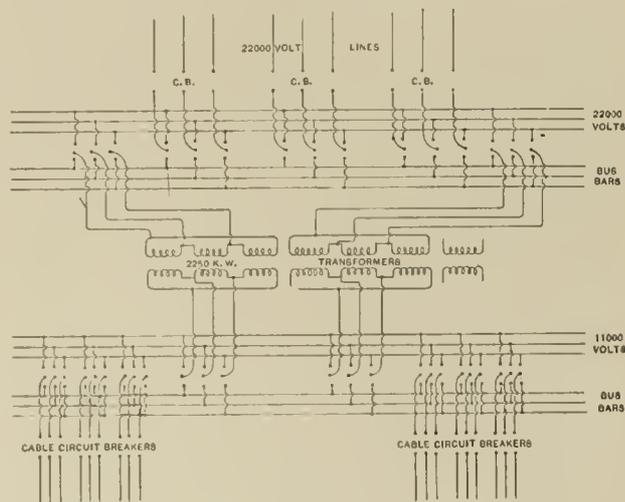

FIG. 2—CONNECTIONS, BUFFALO TERMINAL HOUSE.

systems, and believe that the design shown is entirely safe for service at 11,000 volts.

In all, seven sub-stations are supplied with power at 11,000 volts, three-phase, distributed as follows with reference to Fig. 3:

Station No. 4—2,000 h. p., for railway purposes, transformed from 11,000 volts to 360 volts and fed to four 500 h. p. rotary converters. 1,000 h. p., for general power distribution on a tertiary system at 2,200 volts, three-phase, the voltage being lowered from 11,000 volts by three 250 kw. transformers. This 2,200-volt distribution is partly overhead and partly underground.

Station No. 5—1,500 h. p., for railway purposes, transformed from 11,000 volts to 360 volts and fed to three 300 h. p. rotary converters.

Station No. 6—1,000 h. p., for railway service, as in Station No. 5.

Station No. 7—5,000 h. p. is transformed from 11,000 volts to 360 volts and fed to the plant of the Buffalo Lighting Co. in an adjacent building. 1,000 h. p., transformed to 2,200 volts, three-phase, for general power distribution on the tertiary system.

Station No. 8—2,000 h. p., transformed from 11,000 volts to 2,200 volts, three-phase, for power distribution on the tertiary system.

Station No. 9—1,500 h. p., transformed from 11,000 volts to 360 volts, for supplying power to three 500 h. p. rotary converters for railway purposes.

Station No. 10—1,000 h. p., for railway purposes, as in Station No. 9.

It might be asked why the power is not transmitted from Niagara Falls at 11,000 volts and distributed through the underground cables without transformation. It will be found, however, that the saving in copper on the transmission lines by the use of 22,000 volts more than pays for the transformer installation in the terminal house, and that the saving in line loss is greater than the loss introduced by the step-down transformers. The longer the transmission line the greater would be the proportionate saving. It may also be asked why, if the overhead lines are to be operated at 22,000 volts, the transmission cannot continue at this voltage

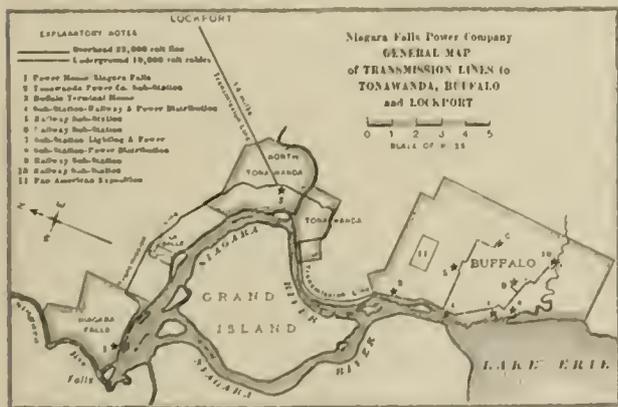

FIG. 1.

to either of the banks of transformers. The 11,000 volt cables supplied from the secondaries of the terminal house transformers are drawn through tile ducts under the streets in the usual manner, and carry the power to the various sub-stations throughout the city of Buffalo. At present there are five feeders, each consisting of No. 000 triple-conductor lead covered cable. Two of these have 9 32 in. rubber, two 8 32 in. rubber and one 6 1/2 32 in. paper and 4 32 in. paper over all. The lead in all cases is 3/8 in. thick.

Fig. 3 shows the general arrangement of cables throughout the city, with the various methods which are used for transferring

\*A paper read at the 15th meeting of the American Institute of Electrical Engineers.

throughout the cable system in order to avoid the use of step-down transformers. It is true that there have been examples of successful operation of underground cables at voltages even higher than 22,000 volts, notably the transmission from the plant of the St. Croix Power Co., but obviously, what can be done on a through trunk line cannot be safely done on a network, and the Buffalo underground system is essentially a network. It has many lateral connections, frequent joints, section switches, cable heads and switchboard connections, and under these conditions, which are probably no different from the requirements of other cities, I believe that 11,000 volts is, in the present state of the art at least, the highest voltage that should be considered. The success of the Buffalo power distribution at 11,000 volts, which has covered a period of about four years, has, however, demonstrated the safety and feasibility of using a potential as high as this, provided the greatest precautions are taken in the selection and installation of cables, and in the insulation of all terminal appliances. It seems to show that there is no longer any reason for fixing the prevailing voltage of 6,600 volts as the safe limit for underground work and for paying for the extra copper and ducts required by the lower voltage.

In cases of short-circuit in the cables, practically no damage is done at 11,000 volts on account of the small current. Short-circuits have occurred on these cables, which have had the whole of Niagara power back of them, and it has been found, after locating the fault, that the lead was barely melted off around the fault. At 6,600 volts such a short-circuit would undoubtedly blow the cables to pieces, on account of the greater current, the heat energy at the fault being nearly four times as great. This is a practical advantage, for it reduces the risk of damage to adjacent cables and ducts.

In the city of Buffalo, then, we find a distributing company called The Cataract Power & Conduit Co., purchasing power from the Niagara Falls Power Co. at the Buffalo city line, at the trans-

which consumers power is supplied from the tertiary system mentioned at 2,200 volts, three-phase, from sub-stations owned and operated by the Cataract Power & Conduit Co.

From a business as well as an engineering standpoint it is believed that the methods used in Buffalo as described are very sat-

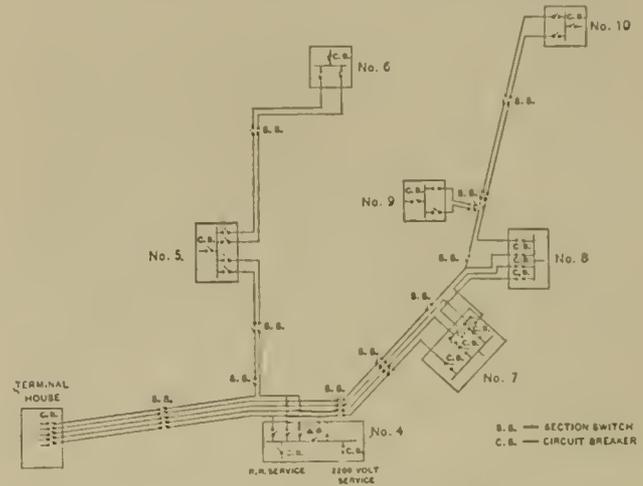

FIG. 3—BUFFALO 11,000-VOLT CABLE SYSTEM.

isfactory and economical. The primary company, viz., the Niagara Falls Power Co., confines its attention to the generating plant and transmission line, the distributing company to the delivery of three-phase 25-cycle alternating current power, and the railway and lighting companies to the interests of their own circuits. This separation of responsibilities is entirely logical and most conven-

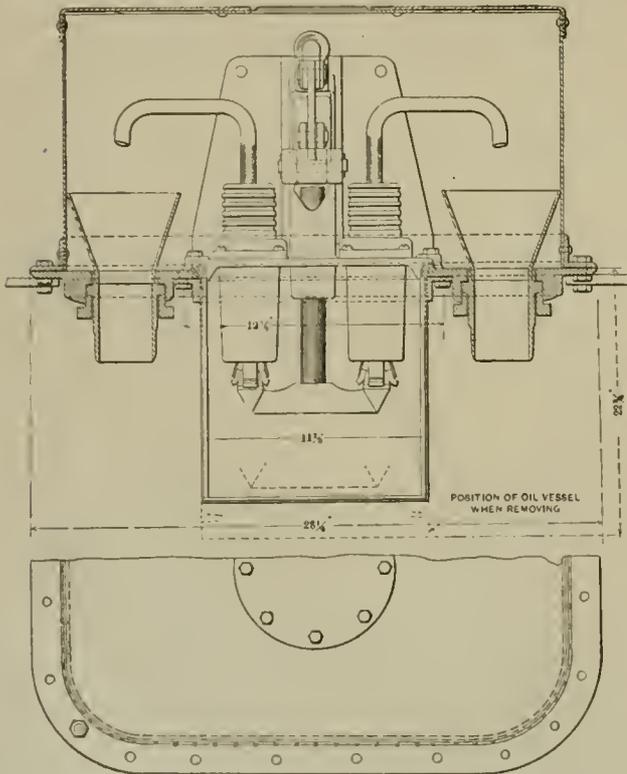

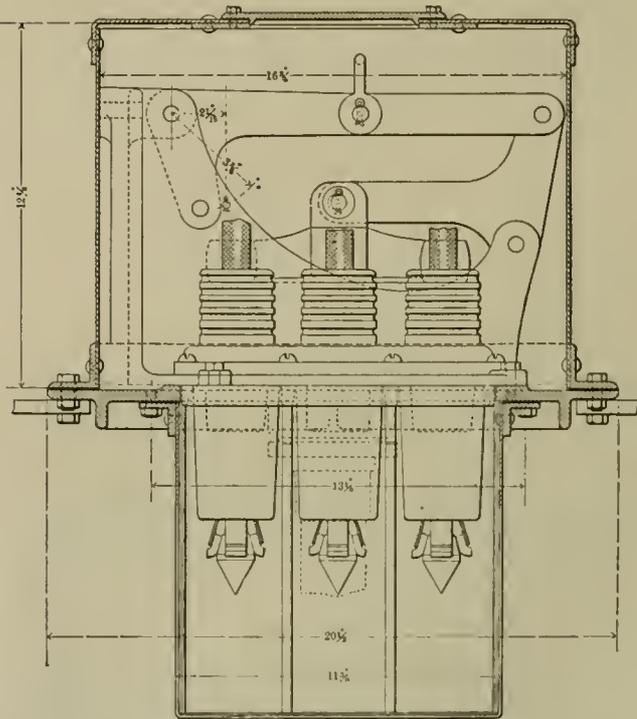

FIG. 4—UNDERGROUND SWITCH.

mission voltage, lowering it to 11,000 volts, three-phase, 25-cycles, and distributing it as raw material in this form as dealers in power. To the railway company it is delivered for transformation and conversion for use on their own direct current circuits, to the lighting company for conversion into the various forms in which they redistribute it to small consumers, and it is also delivered to various factories using power in quantities from 75 h. p. and upwards, to

ient. It would be still better if the Cataract Power & Conduit Co. could confine itself to the delivery of power at a single voltage, viz., 11,000 volts, but the tertiary distributing system at 2,200 volts is necessary, for the reason that it is obviously not safe to supply small consumers of power, such as small factories, with connections at so high a voltage. By transformation to 2,200 volts the numerous "grounds" which occur on these circuits are made in-

dependent of the main cable system, and the introduction of the transformers adds to the self-induction of these circuits and limits the violence of short-circuits which occur upon them.

The transformation of voltage at the city line from 22,000 volts to 11,000 volts, beside being necessary, is also a positive engineering advantage, for the reason that it renders the 11,000-volt cable system independent of "grounds," and high voltage disturbances from lightning, resonance, etc., which occur at times on the transmission line, since there is no electrical connection between the two. Although there have been several instances of rises of potentials on the overhead line far above the normal, resulting probably from resonance, no rises of voltage have been noted as having been transmitted to the cables by induction through the cores of the step-down transformers.

It is believed that the methods here described are practicable and convenient, and can be safely followed in principle by those who are planning similar systems of distribution.

### MILFORD & UXBRIDGE ROAD OPENED.

December 20th the Milford & Uxbridge Street Railway Co. opened its line to the public and the initial trip over the road was made by a large party in charge of Mr. W. E. Goss, general manager of the company. The car was decorated with flags and was greeted with the greatest enthusiasm by the residents all along the line. The road passes through Mendon, which has heretofore been without street railway facilities. At Lake Mendon, which is a short distance from the latter city, a rustic waiting room has been built. The storage battery station of the road is also situated on the banks of this lake. At Uxbridge where the road terminates the party disembarked and spent a short time in examining the handsome new public library which was recently presented to the town.

The return trip to Milford occupied nearly an hour, as no attempt at fast time was made, and the officers of the company were heartily congratulated by the party on the opening of the road. The line passes through a region of beautiful scenery and bids fair to be well patronized. Since the opening, regular hourly trips have been made.

About 15 acres of beautiful wooded territory on the line of the road has been purchased and is to be fitted up as a summer park, which has been named by the company Lake Mendon Park. It is designed to make this a popular place for pleasure seekers next summer as a boat house has been erected and other buildings planned, including a large pavilion, several small ones and a theater. These will be constructed in time for the early opening of Lake Mendon Park in the spring. A number of boats and launches will be placed in commission on the lake which is a beautiful sheet of water covering about 100 acres.

Wausaucum Park, at South Framington, is another pleasure ground supported by this company. These two parks are about 16 miles apart and it is not believed that the attractions of either one will detract from the public interest in the other. No admission is charged to the park for either trolley riders or those who come in carriages.

The company has already a number of open cars, but the additional business expected on the opening of the summer parks has resulted in the placing of orders for a number of new ones. Five new cars are now building at Worcester, and several more have been ordered from other makers. The large double truck closed cars of which the company owns several, have a seating capacity of 50 passengers. The company also owns five large snow plows and two more have been contracted for. All the large cars of the company are equipped with air brakes with axle driven compressors. Whistles are used instead of gongs where compressed air is available.

The officers of the company are: John T. Manson, president; Arthur R. Taft, vice-president; E. W. Goss, treasurer and general manager; Maxham E. Nash, superintendent

The Toledo, Bowling Green & Southern Traction Co., of Findlay, O., is building an addition to its car house at Bowling Green. The structure will be 90 ft long, with a capacity for storing 10 cars. It will be used for housing the new rolling stock which is to be put in commission as soon as the line to Findlay shall be completed.

### NOTES FROM BINGHAMTON, N. Y.

Announcement was made last month of the consolidation of the Binghamton Railroad Co. and Binghamton, Lestershire & Union Railroad Co. with an authorized capital of \$1,500,000. The new corporation will be known as the Binghamton Railway Co. The new company plans to construct a system of suburban roads which will embrace many miles of new track and connect that city with Main, Little Meadows, Pa.; Owego, Halstead, Great Bend, Pa., and other suburban towns. Financial provisions have been made for a complete power house equipment necessary to the efficient operation of the prospective system.

Mr. G. T. Rogers, president of the Binghamton Railroad Co., reports that the consolidation is by no means a new idea, but has been effected after carefully considering the plan for several years. The city system and the Union extension are now both upon a sound financial basis and their full earning capacity has been determined.

An additional power plant with a substation at Union and a new car house will be built as soon as possible. All the extensions will be constructed for both freight and passenger traffic, and it will be the aim of the company to furnish Binghamton and its vicinity with a first-class system of interurban roads and to provide them as soon as they can be built.

The issue of \$1,500,000 of bonds is to be secured by a mortgage of \$2,500,000, the remaining \$1,000,000 of bonds to remain unsigned and unexecuted until the issue thereof is duly authorized by the Board of Railroad Commissioners. The latter sum can only be issued in any case for certain purposes prescribed in the mortgage. The sum of \$1,150,000 is to be held in escrow to redeem the underlying bonds of the two parties to the consolidation. The remainder of the \$1,500,000 issued is to be applied to improvements and extensions.

A suit brought against the city of Binghamton and the Binghamton Railroad Co. to compel the city to collect from the company the expense of paving between the tracks and 2 ft. outside has been dismissed. The suit was brought two years ago by an abutting property owner and the railroad company became a party to the case, its defence being that it had a contract with the city under which the railroad company was only required to pay one-fifth of the expense of paving between the tracks. A decision on this case was rendered in favor of the company two years ago and an appeal was taken to the Appellate Court, which ordered a new trial. The railroad company has already paid the one-fifth which it claims was due the city, and it was accepted by the city. The court holds that it would be an absurdity to claim that the common council of the city of Binghamton had done an illegal act in this case when under the statute the council could, by resolution, authorize the particular act complained of.

The tracks of the company's Ross Park line are to be moved from the south side of Park Ave. to the center of the street. This is the result of an amicable settlement between the railroad company and committee of common council. It has been agreed that the company will make the change requested in case the city will grant it a franchise for a double track over Park Ave., if the property owners will consent to this franchise and if the company is given at least a 40-ft. roadway for these tracks. The council committee which investigated the matter before compelling the company to make the change claimed that the tracks were on the public highway, while on the other hand, the company claimed a private right of way on the strip occupied by its tracks and, therefore, that it could not be forced off. There are no papers or records that can be found to establish or disprove this claim, and as both sides wished to keep the matter out of the courts the above settlement was reached.

### COST OF RAILWAY STRIKE.

Albany County has closed its account with the Albany Trust Co., which advanced the money to defray the expenses growing out of the strike of the employes of the United Traction Co. in the spring of 1901. The account shows that the calling out of the troops which were required to maintain order in the city, their transportation, maintenance, etc., cost Albany County \$34,111. During the strike there was nearly 3,000 checks drawn on the Albany Trust Co. by the county treasurer.

## Express Service in Detroit.

The electric express service has developed rapidly and grows in popularity as the possibilities in the way of frequent communication, quick delivery of express and light freight between cities and the suburban towns in the adjacent territory become better appreciated. Detroit furnishes a striking example of what can be done in this line. There are now 15 electric express cars, each from 35 to 40 ft. long, on the electric railways which center in Detroit and serve the territory within a radius of 60 miles, giving all the various towns in that territory from one to three deliveries per day. Were the express handled by the steam roads the shipments would be one or two days later, and naturally the trolley service with delivery assured the day of shipment, is appreciated by patrons, especially as the charges are almost at freight rates.

As before stated, some of these towns have two and three deliveries a day. The number of deliveries is in accordance with the amount of traffic to go forward. For instance, shipments out of Detroit for Mt. Clemens, a point located on the Rapid Railway, are forwarded three times a day—at 10 a. m., 3 p. m., and 7 p. m.; freight for Algona, New Baltimore, St. Clair and Port Huron, but once a day, at 3 p. m.; for Royal Oak, Birmingham, Circle and Pontiac, twice a day, at 1 p. m. and 8 p. m.; for Delray, Wyandotte and Trenton, twice a day, at 8:20 a. m. and 2:20 p. m., and for Rochester, Washington and Romeo, once a day, at 1 p. m.

These departures being so arranged, so as to cover points en route oftener than the steam roads, still further give perishable goods, if any, immediate despatch, thus avoiding loss through delays.

On the several divisions of the Detroit properties, agents have been placed at principal points. Some on a salary, others on commission, this depending in a measure on the size of the town and prospective business in sight. Still further, experience has demonstrated, better results can be obtained on the salary basis. Where it has been found necessary to establish agents, they have been started on commission, the change to salary being made when the agency has been developed to a certain standard. Where no agents are located, such as prepaid stations, small combination express and waiting room shelters have been erected, where the express and freight can be placed under cover until such a time as owners call

The milk business has also grown rapidly, and in order to properly handle it, it has been found necessary to operate special milk cars on the several divisions, which cars leave the outer terminal of the line the first thing in the morning, and pick up milk all the way into Detroit.

In the beginning the company had much difficulty in the handling of express and light freight because of the careless handling by

TEAM TRACK—DETROIT FREIGHT DEPOT.

car crews and incompetent agents; but this has been remedied and now no agent or conductor is appointed unless he has had some preliminary training along this line. Express must be handled by experienced men; otherwise the earnings will be depleted through the payment of claims resulting from overs, shorts and loss and damages, due to nothing but careless checking and handling.

At Detroit the most important thing to contend with has been

EXPRESS SERVICE IN DETROIT—TRACKS FOR CARS ON EAST SIDE OF DEPOT.

for it. All shipments for these prepaid stations are accepted entirely at owner's risk of delivery, and so receipted for. The idea is to relieve the electric road of all responsibility for delivery after freight has reached its destination.

the expense of handling, which prior to the consolidation of the electric lines by the Everett-Moore syndicate was cared for through three separate depots. For instance, express from the Rapid Railway was handled through one depot; that from the Detroit &

Pontiac, Detroit & Wyandotte, Detroit & Northwestern and the Detroit, Rochester, Romeo & Lake Orion roads through another depot, and that express for the Detroit, Ypsilanti, Ann Arbor & Jackson Railway through yet another. This entailed an expense for each depot of an agent and staff, which since last September

16 in. This way-bill is the same as express and railroad way-bills, forwarding point, destination, date of shipment and way-bill number showing in proper places. The way-bill numbers are arrived at by commencing with number one the first of each month and numbering them consecutively until the end of the month. This

INTERIOR OF ELECTRIC EXPRESS DEPOT, DETROIT.

has been changed and the stations consolidated in one large, joint depot, located on the corner of Fifth and Congress Sts., in close proximity to depots of steam roads, also navigation companies, thus also decreasing cartage expense where interchange is necessary. Still further, the location of this depot is such that it is easy of access by all important wholesale and retail stores and commission houses in case any of them desire to take advantage of quick service.

The building is 45 ft. by 195 ft. On one side is the team track or driveway where freight is received and delivered. Our illustrations give a fair idea of the traffic handled. On the east side of the shed there are double tracks with accommodations for four cars on each track, with ample room for switching.

The interior of the shed is clear of all posts, thus giving ample floor space necessary for the prompt receiving, sorting and loading the express and freight. Comfortable offices for the agent and staff are at one end. There is also cold storage for the protection of perishable goods.

For use in connection with this service the company has a full set of blanks which have been designed with care. The shipper fills in the receipt showing the date, from whom received, to whom consigned, destination and a complete list of all articles making up the shipment. This receipt is made in duplicate, a carbon copy being taken. The Detroit United Ry. receives the property "subject to the condition on the back hereof," which are in the form usually adopted by common carriers, and exactly similar to those printed in the "Review" for April, 1900, page 204.

When express is received at the depot it is checked in on this shipping bill, or that part of this form marked "Duplicate." If the shipment agrees with the shipping bill, the original is receipted by the checker signing agent's name with the checker's initial. This receipt is retained by the shipper, and the duplicate is kept by this company and the shipment re-checked into car, thus giving the company a double check on each shipment. Any exceptions as to shipment being in bad order, etc., are noted on these shipping bills, thus enabling the company, in case of claim, to know the exact condition the goods were in when received and forwarded.

After goods have been received and loaded into express cars, they are then billed out on a way bill, this form being printed in three sizes, quarter-sheet, half sheet and full sheet, the latter being 12½x

way-bill number is used as reference in all correspondence relating to any matter coming up in regard to any shipment covered by this particular way-bill. The facts shown on the way-bill are designated by the headings of the various columns, which include consignor, consignee, number of packages, description, weight, rate, charges, advances, amount prepaid and total to collect.

The rate is taken from the company's regular express tariff, which is governed by the rules of the Official Classification. The rate on

INTERIOR VIEW.

the different commodities handled are according to the value, dimensions and weight of each article; for example, shipments of glassware, furniture or any articles liable to damage from breakage are given a much higher rating than articles that are packed in such a manner as to occupy less space in the express car and which will weigh more than the articles first mentioned.

After this way-bill is complete it is then copied in a tissue book,

This ticket is printed, showing the point of shipment, destination, shipper and to whom consigned, this information being on both portions of ticket, eliminating the possibility of errors in delivery of cans when either filled or empty. These tickets are charged for at so much per ticket, according to the distance the milk is to be hauled.

This system for the express service on electric lines radiating from Detroit was adopted with a view to handling express, and all accounts relating thereto in as simple, practical and systematic man-

**SAN ANTONIO TRACTION CO.**

The present system of the San Antonio (Tex.) Traction Co. consists of a consolidation of all the separate lines formerly operating in that city. These companies are the San Antonio Street Railway Co., the Edison Electric Co., the Alamo Heights Railway Co. and the West Side Electric Railway Co. The latter company had previously absorbed the old West End Street Railway Co., and the Edison company had absorbed the Citizens Electric Co.

ner as possible. Being handicapped in various ways, it is impossible to put into successful operation a more intricate system; hence the adoption of the foregoing simple, yet practical methods, which, nevertheless, are working to the satisfaction of all concerned.

The express department, except for the Detroit, Ypsilanti, Ann Arbor & Jackson Railway Co. is under charge of Mr. George W. Parker, lately connected with the Grand Trunk Railway system at

G. W. PARKER.

A. EASTMAN.

Pittsburg, who is general express and passenger agent, and Mr. Albert Eastman, who has had considerable experience with the Grand Trunk and Michigan Central roads and who has recently been appointed travelling express agent. The electric express depot at Detroit has been placed under the supervision of Mr. A. R. Patterson as joint express agent. Mr. Patterson has had years of experience in local office work with the Michigan Central and consequently he is well fitted for the management of this depot.

**CHICAGO CAR BARN BURNED.**

December 15th, fire destroyed nearly 200 cars in the barn of the Chicago Union Traction Co. at Lincoln and Wrightwood Aves. The fire was discovered about five o'clock in the morning and it was noon before it was subdued. The loss to the company is estimated between \$125,000 and \$135,000. Nearly all of the cars used on the Lincoln Ave. line were destroyed. There was great difficulty in handling the fire, owing to the extreme cold weather, as all the hydrants in the neighborhood of the barns were found to be frozen when the firemen attempted to connect onto them.

It is supposed that the fire originated from an overheated stove in one of the cars in the barn. The company's loss is partly covered by insurance. The building was entirely destroyed, only the north wall adjoining the power house was left standing when the fire was finally extinguished.

The Cleveland Electric Railway Co. has purchased 90 new cars, which will be added to its service.

The beginning of street railway operations in San Antonio was in 1875, when the San Antonio Street Railway Co. was organized. The late Augustus Belknap was chiefly instrumental in the organization and construction of the first road. This was a 3-ft. gage road operated by mules and was less than 2 miles in length.

The first electric street railway line in this city was known as the Citizens' Electric Street Railway. This was succeeded in 1895 by the Edison Electric Co., which built an opposition line and eventually absorbed the Citizens' company. The original San Antonio Street Railway Co. discarded its mule service in 1891 and was converted into electric operation, and the other companies have consolidated from time to time until the present system of 45 miles is operated by a single company.

The equipment of the present company includes 60 electric motor cars, of which 40 are in regular daily service. On all divisions of the system cars are run from 6 o'clock a. m. to midnight, on schedules varying from 10 to 20 minutes. Much of the improvement in the system is due to the management of Mr. E. H. Jenkins, president of the San Antonio Traction Co., who took charge of the service in 1899. At that time the condition of most of the roads was extremely poor and the service was entirely inadequate to public demands. A large part of the roadbed has since been rebuilt with as much rapidity as possible and the number of cars operated was considerably increased. Mr. Jenkins erected a car shop at San Pedro Park station in which for the past 18 months the building of new cars has been carried on continuously. During this time 18 closed and 12 open cars have been built and there are at present 6 cars about completed. The new cars have all been built to replace those formerly in service. An electrical repair shop has also been erected near the car shops in which all electrical repairs for the car equipment and power house are made.

A commodious building near this shop has been erected for the use of the motormen and conductors as well as passengers. One portion is used as a waiting room for passengers and the other is, a reading room for motormen and conductors when off duty. This room is 18 x 30 ft., is neatly furnished and contains an abundant supply of reading matter. The building also contains a shower bath room paved with asphaltum for the use of the employes, which is much appreciated.

A universal transfer system has been inaugurated by the new management which is very complete. It is arranged so that passengers can transfer from one line to any other running in the same direction, and during the first year the transfer system has been so enlarged as to now embrace 22 transfer points in the city.

The officers of the company are: E. H. Jenkins, president; J. J. King, secretary and treasurer; D. D. Midis, general superintendent; Thomas C. Brown, superintendent of transportation.

The Ottumwa (Ia.) Traction & Light Co. is considering building an interurban electric line between Ottumwa and Oskaloosa.

All but two of the conductors and motormen employed by the Butler (Pa.) Passenger Railway Co., went out on strike, December 7th, the cause being the refusal of the company's officials to recognize their union. Pending the settlement of the difficulty, cars were operated on a reduced schedule and without disturbance.

## RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

### ATTEMPTING TO CROSS TRACKS WHERE CARS RUN CLOSE TOGETHER.

*Legare v. Union Railway Co. of New York City* (N. Y. Sup.), 70 N. Y. Supp. 718. May 17, 1901.

The fire appellate division of the supreme court of New York says that whether or not a person crossing a street in the city of New York, occupied, as most of them are, by cars propelled by electricity or cable, and often running at a high rate of speed, is guilty of contributory negligence, where there is evidence which would justify a finding that the company was negligent, must usually be for the jury; for, in a case where a car can be controlled so as to avoid running down a person crossing the track, it cannot be said that it was negligence as a matter of law for the person to attempt to cross the track. In many of the streets, during the busy portion of the day, these cars are running constantly, within a few feet of each other, and if a person about to cross the track is to wait until no car is in sight the track would be impassable, except at the risk of the pedestrian's being guilty of contributory negligence. The right of a railroad company to use the public streets is conditioned upon the right of the public to also use them in the ordinary way, and no railroad company has the right to so block the streets that the public are excluded from crossing them, except at the risk of being run over. It cannot, therefore, be contributory negligence as a matter of law for a person to start to cross a track when the car is at such a distance that the motorman can prevent it running down a person crossing the track, if attending to his business, and operating the car in a careful and prudent manner. Here, two boys started to cross a track and the court holds that they had a right to suppose, seeing a car 75 feet away, and crossing in plain view of the motorman, that he would hold the car in control so as not to run them down. They certainly had a right, it says, to assume that he would not put on power to increase the speed of the car. But there was evidence that when the car was about 15 feet from the boys he put on additional current, and also evidence that would justify a finding that, if he had checked the car when the boys started to cross, they could have both crossed in safety, whereas one was fatally injured. Wherefore, the court affirms a judgment for damages against the company, holding that, on the whole case, the question of negligence and contributory negligence, was for the jury.

### WATERING OF STREET COMPELLED BY INJUNCTION

*Newcomb et al., Selectmen, v. Norfolk Western Street Railway Co.* (Mass.), 61 N. E. Rep. 42. Sept. 3, 1901.

This suit was brought to compel the street railway company to water a street through which its track ran, and the supreme judicial court of Massachusetts has ordered an injunction therefor. It holds that the requirement in the grant of location to the company that it should water the street over a portion of the way between certain dates was a lawful restriction within the provision of the statutes allowing selectmen to grant a location "under such restrictions as they deem the interests of the public may require." The well-known effect of running cars is to raise a dust, and the requirement, although affirmative in form, in substance, it says, restricts the company to running cars in such a way as not to raise a dust. And it holds that the restriction is a regulation which it is given power to enforce, by virtue of a statute empowering it to compel the observance by street railway companies of all laws applying to them and the regulations of the selectmen. It is true, it says, that the statute stated in one place that the power was given "according to the usual course of chancery proceedings," and that it might be argued that this restriction should not be enforced because it is not the usual course of chancery proceedings to compel the specific performance of continuous acts or duties for an indefinite time. But the court is of the opinion that, in view of the obvious purpose of the statute that such regulations should be enforced specifically, it ought to go further than ordinary practice might lead it to go in the absence of legislation, and to do all that it can to see that the requirement is performed. And it thinks that some confirmation of this view is derived from the fact that regulations concerning the

removal of snow and ice were before the mind of the legislature when it gave the court the power mentioned. Moreover, it says that, practically, there will be no difficulty in the specific performance of the street watering. When it is decided that the company is bound, probably there will be no further trouble, especially as the location provides a domestic tribunal by requiring the work to be done to the satisfaction of the superintendent of streets.

### STATE MAY REQUIRE ADDITIONAL SAFEGUARDS AT CROSSING, WITH STEAM RAILROAD, WHEN NEEDED, IMPOSING THE EXPENSE ON BOTH ROADS.

*Detroit, Ft. Wayne & Belle Isle Railway v. Commissioner of Railroads* (Mich.), 86 N. W. Rep. 842. July 2, 1901.

When the joint use of a crossing is obtained, is the position tenable that, because one road is older than another, the junior road must not only compensate the senior road for its present damage before it can cross, but for all time it must bear any additional future cost which may be made necessary by the erection and maintenance of appliances for the safety of the public, resulting from the increased use of the crossing? The supreme court of Michigan thinks that this question must be answered in the negative. It holds that when the right to use the crossing is once acquired, the right of the several corporations to this use is reciprocal, so far as is consistent with the kind of use made of the crossing by them. Again, it says that new dangers upon the public streets require new safeguards in the interest of the safety of the public. It is a matter of common knowledge that where electric cars run at frequent intervals, across a railroad over which trains are frequently run, it is a place of unusual danger, not only to the passengers in the steam cars, but also to the passengers in the electric cars. This danger is occasioned, not by the steam road alone, nor by the electric road alone, but by both of them. And the court declares that it has no doubt that under such circumstances the state, in the exercise of its police power, can take such steps as will minimize the danger, and can impose the expense of so doing upon the corporations causing the danger; has no doubt of the right of the legislature to authorize the railroad commissioner to order the construction of additional safeguards at crossings and apportion the expense incident thereto between the companies affected. Or, in the language of Mr. Justice Grant, who dissents, the court, holds that when a steam railroad company has condemned a right of way, and extended its tracks across a street or highway, on which is an existing street car line, and at the time the public travel upon the street or highway was not such as to require the erection of gates, etc., for the protection of the public, but subsequently, owing to the increase of population, the increase of tracks and trains by the railroad company, and the increase of travel upon the street or the highway, the erection and maintenance of such safeguards becomes essential for the protection of the public, the street railway company can be required to pay a portion of the expense.

### LIABILITY FOR INJURY OF ONE PASSENGER BY ANOTHER, ESPECIALLY AFTER THE LATTER HAS ONCE BEEN PUT OFF THE CAR.

*United Railways & Electric Co. of Baltimore v. State* (Md.), 49 Atl. Rep. 923. June 13, 1901.

It is not because a particular passenger is known by the carrier's servants to be in peril of injury at the hands of a fellow passenger or stranger that a failure to use the means at command to protect him will be actionable negligence; but, the court of appeals of Maryland says, it is because there is a known or discoverable danger that an injury may be done to some passenger, and because no effort is made to avert that injury from all the passengers, that the carrier is liable if an injury is inflicted on one of the passengers when it could have been prevented. It is just as incumbent on the carrier to protect all his passengers from assault by a fellow passenger, when his servants have knowledge or the means of knowing that an assault on some one is imminent, and when they have time and the

means to avert it, as it is to protect all his passengers from injuries likely to result from defective means or methods of transportation.

Consequently it will not do to say, after an assault has been made, that the servants of the carrier did not know or could not have foreseen that the particular individual who was assaulted would be injured by an assault, if they were apprised, or with proper care could have known, of circumstances which indicated that some one would be injured unless the disorderly passenger or stranger were ejected or controlled. In short, if there is danger of any one being injured, and the employes fail to remove, subdue, or overpower the turbulent individual, after knowing that there is danger, or after they ought to have known that there was danger, if they had exercised proper care, that failure is negligence, for the consequences of which the company is answerable.

Moreover, the court holds here that if a certain passenger, who had assaulted another passenger before he was ejected from the car, and who was drunk, disorderly, and turbulent, was properly put off the car because his presence was a menace to other passengers, then it was the plain duty of the employes who put him off, to have kept him off. They demonstrated their ability to keep him off by having put him off, and there being equally sufficient reason for keeping him off that there was for putting him off the car, the failure to keep him off was an act of negligence. If, on the other hand, every effort was made by the employes to avert the injury, but was made without success, then the company would not be liable. It was a question of fact for the jury, and the jury having returned a verdict against the company, the court affirms a judgment for damages for the injury caused by the passenger just referred to after his return to the car, assaulting another passenger, without the slightest provocation, striking him a vicious blow in the eye, which caused the rupture of a cerebral blood vessel, and thereby produced paralysis and ultimately death.

RIGHT TO CROSS RAILROAD TRACKS AT POINT OF SOME DANGER—COMPARED TO RIGHT OF BUS LINE.

Louisville & Nashville Railroad Co. v. Bowling Green Railway Co. (Ky.), 63 S. W. Rep. 4. May 7, 1901.

The weight of authority, the court of appeals of Kentucky says, is to the effect that there is no jurisdiction in equity to enjoin a street railway from crossing a steam railroad's track at grade in a public street unless such jurisdiction has been conferred by statute or some constitutional provision. The court, however, declares itself unable to find anything in the constitution of that state to exclude street railroads from the operation of section 216 thereof, which provides: "All railway, transfer, belt lines and railway bridge companies shall allow the tracks of each other to unite, intersect and cross at any point where such union, intersection and crossing is reasonable or feasible." It says that the language of the section is broad enough to cover all railways. The provision that crossings shall be allowed when reasonable or feasible is necessarily a restriction of the right to such as are reasonable or feasible. To hold that the section only applies to crossings of the right of way, and not to crossings in streets, would be to add to the section an exception which the general words used do not justify.

Then the court takes up the question of whether the crossing in contest was reasonable or feasible. It was shown by the railroad company that trolley wires overhead would be a source of danger in the operation of its trains; also that electric cars were liable to stop from failure of the current, and that this might occur on the crossing; and that the passage of the regular train on the railroad would delay the street cars. But the court answers that all these objections would exist at any grade crossing, and if they were sufficient it would follow that there could be no grade crossings of such a railroad by the street car line. Such a rule it does not think would be in keeping with the constitutional provision. Then, recurring to the particular crossing in question, it says that the number of tracks to be crossed, and the number of trains passing (something like 40 or 45 a day) presented a state of case where, if the crossing were not in a street, it would have great doubt if it should be allowed. For instance, if a crossing was allowed over the railroad company's tracks and yards on the square north this would destroy the yard. But the public had

a right to the use of the street, as well as the railroad company. It had no right to make an unreasonable use of the street. A part of the testimony as to the dangerousness of the crossing and the length of time it was obstructed by the trains might, to some extent, grow out of the use by the railroad company of its tracks at this point in switching and making up its trains. While it was entitled to a reasonable use of the street for the passage of its trains, it had no right to make an unreasonable use of it.

And as the public had the right to cross, subject to the reasonable use of its tracks by the railroad company, the court says that it is unable to see that the addition of the street car line would so materially change the situation that the crossing should be declared unreasonable or not feasible. To illustrate: If the street railway company had undertaken to run a bus line from the landing on the river to the central part of the city, crossing the railroad at this point at regular intervals, just as the street cars would do, clearly the railroad company could not have enjoined its operation. Again, it was shown that the street was a narrow one, and that when the gates were down it frequently became congested with vehicles. But a street car in addition, the court says, would add little more to the congestion than a bus would. A flagman was maintained at the crossing. It appeared from the proof that an approaching train could be seen for some distance on either side, and, if this space were built up, the flagman, with his gate, would give warning of danger. It was true, the flagman might be negligent; but this might occur anywhere, and the danger to the car was no greater than to other vehicles on the street.

AUTHORITY TO GRANT FRANCHISE—TO INDIVIDUAL—ASSIGNMENT TO COMPANY—MAY TAKE PRIVATE PROPERTY—CANNOT BE ENJOINED UNTIL DAMAGE IS PAID—NOR AS A NUISANCE—NOR WHERE CHARTER IS AS RAILROAD.

Watson v. Fairmont & Suburban Railway Co. (W. Va.), 30 S. E. Rep. 193. June 18, 1901.

When the legislative act incorporating a city provides that "the council of said city shall have power to grant and regulate all franchises in, over and under the streets, alleys and public ways of the said city, under such restrictions as shall be provided by ordinance, but no exclusive franchise shall be granted to any individual or corporation," the supreme court of appeals of West Virginia holds that the legislature thereby delegates to the council of such city authority to pass an ordinance granting to an individual or a corporation the right to construct and operate a street railway in the streets of such city. And, although such franchise is usually conferred upon a private corporation, it may be granted, the court holds, to an individual, and, with the consent of the council, having such delegated power over the subject, he may make a valid assignment of the same to a private corporation organized for the purpose of constructing and operating such street railway.

The holder of such franchise, although privately interested in the enterprise thereby provided for, the court further holds, is nevertheless an agency or instrumentality in the hands of the public authorities for the accomplishment of public purposes and benefits, and subject to their control, and private property may lawfully be taken and damaged in the execution of the ordinance, subject to the provisions of the constitution and statutes that just compensation shall be paid to the owner of the property so taken and damaged. But an abutting property owner whose property is not to be taken or destroyed, and thus virtually taken in the construction and operation of the road, but only injured and damaged cannot, under the laws of the state, the court holds, enjoin its construction until his damages are ascertained and paid. Nor, the execution of the work having been authorized by the legislature, as above stated, can an individual enjoin it upon the ground that it is a public nuisance and specially injurious to his property, even in a case in which he might do so had such authority not been given.

Again, when the certificate of incorporation of a railway company states that the purpose of the corporation is to construct and operate a railroad, designating certain points as termini of the proposed road, and that it is to run through a certain city, and said company lawfully acquires a franchise to construct and operate

a street railway in said city, and, in pursuance of the ordinance granting the franchise, is proceeding to build its track in one of the streets of said city, the owner of real estate adjoining said street, the court holds, cannot enjoin the company from so doing, whether the charter of the company authorizes it to construct and operate a street railway or not, unless, upon the ordinary principles of equity jurisprudence, he has grounds for equitable relief against the company. If it be true that the corporation is exceeding its corporate powers, that fact is not alone sufficient ground for equitable interference at the suit of a person who is not a member of the company.

#### SUPERVISORY POWER OF COURT THAT APPOINTS COMMISSIONERS.

In re Nassau Electric Railroad Co. (N. Y.), 60 N. E. Rep. 279. Apr. 30, 1901.

The "determination" referred to in section 94 of the New York railroad law, which closely follows the language of the state constitution where it provides that the "determination" of the commissioners appointed when property owners do not consent to the construction of a street surface railroad, "confirmed by the court, may be taken in lieu of the consent of the property owners," the court of appeals of New York holds, means a determination not only that is in favor of the road, and hence there is no express authority for action by the appellate division of the supreme court (the appointing court) when the report is unfavorable. However, it does not follow from this, it goes on to say, that the supreme court has no authority to set aside such a report for fraud, mistake, or gross irregularity; for the statute does not prohibit such action. The power of the court to appoint commissioners implies power to supervise the conduct of the persons appointed,—at least, to the extent of seeing whether they disobeyed the statute which called them into existence, or acted corruptly, or failed to comply with the order appointing them, by publishing and serving the notices specified therein. The commissioners are not appointees of the legislature, but of the court, pursuant to the provisions of the constitution, to decide a certain question "after a hearing of all parties interested." They are not a distinct tribunal, for they are appointed by the court, and report to the court. If they refuse to hear the parties in interest, the court can set aside their determination and appoint new commissioners to do what the law requires, in the manner specified, after due notice and an opportunity to be heard. While not bound to strict compliance with common-law evidence, or to any particular method of procedure, except as specified by statute, their action is judicial in character, and must, to a reasonable extent, conform to judicial methods; for, by command of the constitution, a "hearing" is to be had, and a "determination" made. A substantial departure from what is fairly to be implied from the use of the words "hearing" and "determination" in the fundamental law authorizes the court which appointed the commissioners to set aside their action and proceed anew. If, for instance, they state in their report that their only reason for deciding that the road ought not to be built was some fact utterly immaterial, or if they show conclusively that they exercised powers they did not possess, or failed to exercise the powers they did possess, because they thought the law withheld them, it is clear that their decision would not be a determination, within the intent of the law. If, through misconduct, palpable error, or accident, they fail to make such a report as the law contemplates, it is the duty of the appellate division, upon proper application, to set their report aside and appoint other commissioners, or remit the matter to the same commissioners with proper instructions. Unless the appointees of the court keep within the law, as well as its own order, it necessarily has power to interfere, not by way of review as upon appeal or certiorari, but in the exercise of original jurisdiction flowing from the power to appoint, as otherwise the object of the appointment would be defeated by the misconduct of the commissioners. When the commissioners make a favorable report, their judgment and that of the appellate division must concur, before the report can become final and effective; for confirmation is expressly required. When they make an unfavorable report, no confirmation is necessary; but the commissioners are not a law unto themselves, and their determination, when made in violation of law, is not such a

determination as the court is obliged to accept from its own appointees. So the court holds that in this case, where an unfavorable report was made, that it was the duty of the appellate division either to exercise its discretion, and refuse to hear the application to set aside the report and appoint new commissioners because no grounds or reasons for interference were specified in the notice of motion therefor, or to examine the record and decide whether the methods pursued by the commissioners were substantially within the law.

#### VALIDITY AND APPLICATION OF ACT GIVING COMMISSIONER SUPERVISION OVER CROSSINGS. III. POWERS—REQUIRING OVERHEAD BRIDGE—THE EXPENSE—WHAT COURT MAY REVIEW.

Jackson & Suburban Traction Co. v Commissioner of Railroads (Mich.), 87 N. W. Rep. 133. July 19, 1901.

The supreme court of Michigan holds constitutional the act of 1893 entitled "An act to regulate the construction of the tracks of railroads and street railroads across each other, and the stringing of wire, electric or other, over railroad tracks, and relative to the maintenance of such tracks heretofore so constructed and wires heretofore so strung," which was, in 1897, made a part of Act No. 35 of the Laws of 1867, by an amendment which provided that all street railway corporations organized or doing business under this act shall be subject to the supervisory control of the commissioner of railroads as provided by the above act of 1893, etc.

The court does not decide whether the act can be applied to rights which vested previous to its passage. But it holds that a company which has acquired its rights since the passage of these laws takes its rights subject to a condition that at crossings of steam roads it shall comply with the requirements of the state, to be determined by the railway commissioner, as to the method of crossing, and the expense of the same. It was competent, it says, for the state to forbid any crossing at grade, and the law indicates an intention to do so in all cases where it is reasonably practicable to avoid grade crossings. A railroad company is not in a position to say to the state: "It is true you have imposed conditions that we cannot or will not comply with; therefore we propose to build a road in a place and in a way that you have not authorized." The state is not obliged to authorize the building of railways in the streets; hence, if it chooses to do so, it may impose conditions.

Continuing, the court says, with regard to this case, where the commissioner of railroads determined that the crossing by the traction company of a steam railroad should be by overhead bridge to be at least 22 feet above the surface rails of the tracks crossed, after those tracks had been lowered at least 3 feet, that if there was authority for the claim that the exercise of the right of eminent domain was necessary before the traction company could construct the road which it was authorized to construct, manifestly it would have to wait until provision could be made for it. It could not do an unauthorized thing, merely because the authorized one was not feasible. So, if it was true that it could not build an overhead crossing until it had secured rights from abutting proprietors, which it had no power to condemn, it would have to acquire them in some other way, or not build the road where contemplated.

Again, the court says, the character of the crossing required, or its cost, might not meet the traction company's approval, but the determination by the railroad commissioner was one of the conditions imposed. If by the fact that the act gave it the right to except to the ruling of the commissioner it was meant (which the court does not say) that this court would review his discretion upon the facts, it could, at the most, the court says, be in a case where there was a clear abuse of discretion, and it would be necessary for the court to have the facts clearly before it to do that. But in this case no evidence was returned, and there might not have been any taken, for the commissioner returned that he viewed the premises, and satisfied himself, in ways not formally judicial (as he might lawfully do, the court says), of the circumstances and conditions upon which his action was predicated. No issue was made in this court, and, it says, it must take his return as true.

But the court does not understand it to be the duty of the com-

missioner to order overhead crossings in all cases, or to impose all burdens arising from the separation of grades upon the applicant in all cases. In this case he did it, so far as the bridge was concerned, but not as to the lowering of the steam roads. He determined the height to which the traction company must construct its bridge, but it did not devolve upon it to lower the steam-road tracks. They would omit obedience at their peril, and the traction company need not be concerned about it.

Last of all, the court says that whether or not it is reasonably practicable to separate grades is a question of judgment. The law does not mean that it shall be done in all cases where it is physically possible. Any reason that shows the unfitness of a separation of grades is sufficient to warrant a grade crossing. Nor is the court prepared to say that the expense might not be taken into consideration, as well as the effect upon abutting property.

#### RIGHTS AND LIABILITIES OF TOWN AND TRACTION COMPANY RESPECTIVELY WHERE A TRAVELER IS INJURED BY A DEFECT IN THE HIGHWAY DUE TO THE COMPANY'S NEGLIGENCE.

*Town of Waterbury v. Waterbury Traction Co. (Conn.), 50 Atl. Rep. 3. Sept. 27, 1901.*

A traveler on a raised highway fell down a bank on the side thereof where there was no railing, and was injured. He sued the town for damages, and, after he had recovered a judgment against it, the town sought to recover over against the traction company that used the highway, charging that the latter had taken down the railing and had negligently suffered it to remain down.

A notice was given by the town to the traction company almost immediately after the action was brought against the town, and long before the trial of that case, which informed the traction company of the pendency and character of the action, of the reason why it was claimed to be ultimately liable, and in effect requested it to take part in the defense. This notice the supreme court of errors of Connecticut holds, was not insufficient because in it the town did not offer to surrender the entire defense of the case to the traction company. The traction company was not entitled to assume the defense to the exclusion of the town from the case. To render the judgment binding upon the company, it was only necessary to show that it had received fair notice and information of the pendency of the suit and of its claimed liability, and been offered such an opportunity to participate in the defense for the protection of its interests as it would have had if it had been a party of record. Had it desired, it could have been made a party upon its own application to the court. Had it chosen to take a more active part in the defense, either as a party or otherwise, the town would still have been entitled to remain in the case, both for the purpose of showing that it was not liable in the action and for the protection of its claim, which was adverse to that of the traction company, that, if liable, it was upon a ground which gave it a right of action over against that company.

Then the court holds that if the evidence showed that the injury was produced by the alleged wrongful act of the traction company, the fact that the town failed to perform its duty in not seeing to it that the traction company put up the railing again, and that by such negligence on its part it became liable for the injury to the traveler, did not deprive the town of its remedy over against the traction company. The town and company were in that case to be considered as in equal fault, and the principle that there can be no contribution between joint tortfeasors or wrongdoers did not apply. As between it and the public it was undoubtedly the duty of the town in such case to properly protect travelers against the danger which the traction company had created, and by its failure to do so it became liable in damages to the one injured. But the primary cause of the accident was the act and fault of the traction company in taking down the railing and failing to restore it, assuming that it took it down as alleged. As between the town and the company, there was no co-operation in the act of negligence which caused the injury. The town did not permit the company to leave the railing down. If the company took it down it promised impliedly, if not expressly, to do so in a way not to endanger public travel, and to put it up again. If it failed to keep that promise, it could not justly charge the town

with negligence either in having relied upon such promise or in having failed to compel its performance. If the traction company removed the railing, and left it down, as alleged, the fact that the town had knowledge of the defect, and neglected to repair it, although it had a fair opportunity to do so, would not prevent a recovery by the town against the company in this action.

#### POWER OF CITY TO REQUIRE SUBSTITUTION OF GROOVED RAILS—ORDINANCE CONSTRUED—"FIXTURES" DEFINED.

*City of Kalamazoo v. Michigan Traction Co. (Mich.), 85 N. W. Rep. 1067. May 7, 1901.*

The supreme court of Michigan says that it is essential that municipalities retain that control over the public streets and highways which is necessary for the protection and proper use of the public. Courts will jealously guard the right of such control. It must be a very plain provision, indeed, in a contract, which will justify the courts in holding that this power has been conveyed away. Where doubt exists, such contracts will be construed against the surrender of such power. Again, it says that it is too late now to question the rule that street railway corporations may obtain contractual rights in streets and public highways which the municipality cannot repudiate or annul, when such rights are not inconsistent with the ordinary uses of streets and highways. That rule is settled. The authorities do not, however, go so far as to hold that the grant of a right to use a certain kind of rail is irrevocable. On the contrary, the conclusion seems to be that, when the use of another kind of rail becomes necessary for the protection and safety of the public, the right to use the specified article must give way to the necessities and requirements of the public. Such contracts must be liberally construed in favor of the municipalities.

Here, a city ordinance granting authority for the construction and operation of an electric street railway provided: "All track hereafter laid, either for extensions or for the purpose of relaying present track, may be of the style known as 'T rail,' or 'girder rail,' at the option of said grantee, its successors or assigns; but, whatever style of rail is used, the same shall not weigh less than forty pounds to the yard if 'T,' and not less than fifty-two pounds to the yard if girder, rail." It also provided: "The city council may from time to time require the said grantee, its successors and assigns, to use such fixtures and appliances upon its said road, plant, and cars as may be deemed necessary to the public safety in the operation of said road," and it reserved the right "to make such further rules, orders, and requirements as may from time to time be deemed necessary to protect the interests, safety, welfare, and accommodation of the public in relation to said railway, not inconsistent with the provisions of this ordinance," excepting to reduce the rate of fare or alter or repeal section 1 containing the grant of authority.

Now, this ordinance, fairly construed, the court declares, could not be held to mean that the company, in the construction of its roadbed in accordance with the provisions of the ordinance, obtained the right, during the existence of its franchise, to maintain its roadbed and rails in the same condition as when laid. The ordinance contemplated improvements which experience might show to be essential, in the growth of the city, for the convenience, welfare, and safety of travelers upon its streets, and the right to compel such improvements was reserved. The words "fixtures and appliances" as used must be given some force. The right to compel their use was clearly reserved. The term "fixtures" does not refer to movable things; it refers to things that are fixed. Trolley poles, overhead wires, rails, and ties are fixtures. But what the court more particularly holds is that the city had power to require the company to substitute a grooved rail for a T rail when it decided to change the paving of the street from wooden blocks to brick, the stipulated facts showing that a brick pavement and the T rail could not be used together without leaving the surface of the street not only rough, uneven, and inconvenient, but dangerous.

The Pittsburg, McKeesport & Connellsville Traction Co., has extended its service to Scott Haven, a mile and a half distant from the former terminus at Boston. A 15 cent fare is charged for the through trip.

## EDWIN REYNOLDS.

Mr. Edwin Reynolds, who was recently elected president of the American Society of Mechanical Engineers, is eminently fitted for this position by reason of his well known and excellent work in the field of engineering, and his election to this office not only fittingly honors Mr. Reynolds, but will also prove an honor to the society.

Mr. Reynolds was born in Mansfield, Conn., March 23, 1831. On his father's side he is descended in direct line from William Reynolds, who came to America from Gloucestershire, Eng., and settled in Providence, R. I., in 1637. His mother was Clarissa Huntington, whose family was among the first to settle in Norwich, Conn. He lived with his parents, doing farm work and attending district school until he was 16 years old, at which age he went to work as a farm hand, under a six months' contract, at \$11 per month. Before the expiration of the six months he had an offer of an apprenticeship with Anson P. Kinney, of Mansfield, for three years in a general machine shop. This he accepted after arranging with his former employer to shorten the time of his contract. During his apprenticeship his wages were \$30 and board for the first year, \$45 and board for the second year and \$60 and board the third year. After completing his apprenticeship he worked for one year as journeyman with Smith, Winchester & Co., South Windham, Conn., manufacturers of paper machinery. He then went as journeyman with the Woodruff & Beach Iron Works, at Hartford, and during his connection with this firm Mr. Wright became chief engineer of the works. It was here that the first Wright engine was built. This company also manufactured machines for dressing stone, and in these Mr. Reynolds became particularly interested. For six or seven years he took charge of the building of these machines as well as their setting up and outside operation.

In 1858 he accepted an offer from Steadman & Co., of Aurora, as superintendent of the company's shops. This concern was engaged in building plain slide-valve engines, farming machinery, saw mills, etc. During his connection with this concern Mr. Reynolds designed pumps for drainage and irrigation purposes and made a number of experiments in this field in which no thoroughly satisfactory machinery had previously been built.

The outbreak of the Civil War seriously interfered with Steadman & Co.'s business, and Mr. Reynolds returned east, going to Boston, which he made his headquarters for several years. While here he took charge of a machine shop for George T. McLaughlin, of Boston, and at the same time became interested in the development of a number of special machines. He spent about six years in Boston and in New York, during which time he was constantly employed as an expert in perfecting all manner of mechanical devices. His sound judgment on all engineering matters became well recognized and he was thus connected with the early development of a number of industries which have since grown to large proportions.

In 1867 Mr. Reynolds was employed by the Corliss Steam Engine Co. of Providence, R. I., as a general engineer and salesman, the company having always made a practice of selecting good engineers for salesmen. After 4½ years in this position he was promoted to general superintendent of the company, a position which he retained until 1877. In that year he associated himself with the late Edward P. Allis and began the development of his own inventions. His reason for making this change is somewhat obscure, as his position with the Corliss company was considered one of the most prominent in the engineering field at that time, and he had not been without numerous offers from other prominent concerns of positions which seemed to be far more eligible than that of superintendent of the Allis works which had failed the year previous. The attitude of Mr. Corliss probably had much to do with Mr. Reynolds leaving that company; Mr. Corliss thought that the Corliss engine was practically perfect and that no chance existed for further improvement. Mr. Reynolds, however, believed that the engine could be greatly simplified and improved, and his future work with the E. P. Allis Co. proves that his belief was well founded.

When he entered the Allis company, Milwaukee was considered the far west as a manufacturing point and the facilities of the works for manufacturing engines were extremely limited. The foundry was fitted up for a pipe foundry and the machine shop contained a rather meagre number of machines which were suited to the manufacture of saw mill and flour mill machinery. Mr. Reynolds succeeded in putting the business on a paying basis almost at once

by the production of his first Reynolds-Corliss engine, which he designed on the back of an envelope during a three hours' railway journey from Milwaukee to Chicago. This engine was designed not as he would have done had he been free to attack the problem purely from the standpoint of machine design. Instead of this he produced an engine which could be built in the Allis shops exactly as they then stood. The frame of the engine was cast in two parts because the foundry could not handle it in one, and it contained only one core and that of the simplest form possible. In a short time the demand for large engines grew faster than the facilities of the shop, and to meet the crowded condition of the foundry Mr. Reynolds brought out the wrought iron frame engine, a type which was built in sizes that it would have been impossible for the foundry of the Allis shops to produce. Finally the time came when Mr. Reynolds could design an engine as he wished it, unfettered by any considerations of the shop equipment, and he brought out the "Reynolds 1890" engine, which has been accepted as perfectly adapted to this work and largely copied by engine builders both in this country and abroad.

The distinctive feature of all Mr. Reynolds' engineering work is the deep study of the fundamental engineering features of the work he has in hand and his rigid adherence to the lines indicated by this study. This has often led to a wide departure from current engineering practice of the period, and the success of Mr. Reynolds' methods have usually led to the revolution of methods in the lines of engineering on which he worked and gave the E. P. Allis Co. a world-wide reputation.

An example of Mr. Reynolds' originality of design is shown in the case of his first blowing engine built for the Joliet Steel Co. The president of that company had designs prepared by his own engineers and also had competitive designs submitted by experts in this line of work both from this country and abroad. Mr. Reynolds submitted a design which was a radical departure from current practice, but which was so clearly an advance over the methods in general use that he was granted the contract. Before this engine had been running a month Mr. Carnegie saw that its effect was revolutionary and ordered one like it. This order was followed by upwards of \$5,000,000 worth of business for the company, and after 20 years of effort to improve on this machine its essential features remain unchanged today and it is still the standard type of blowing engine. A similar case was that of Mr. Reynolds' steam ore stamp. His rigid adherence to the fundamental principles, in the face of great opposition, resulted in increasing the capacity of the original stamp mill by 50 per cent.

Mr. Reynolds was a pioneer in the development of the modern pumping engine, and practically all of the recent high duty engines in this country closely follow the lines of the machines built by the Allis Company. The huge screw and centrifugal pumping engines designed by Mr. Reynolds for draining land and handling sewage are amplifications of the designs produced by him during his connection with Steadman & Co. Mr. Reynolds has also been a leader in the introduction of compound and triple expansion engines of low speed for direct connection to electrical generators. These are now manufactured in units of 10,000 h. p. and upwards and weigh approximately 1,000 tons. The case of the Manhattan Elevated road illustrates the confidence with which engineers regard Mr. Reynolds' work in steam engine design. These engines are of a new type, yet an order for them involving \$3,000,000 has been placed with the company before the engines had ever been tested.

On the death of Mr. Allis, Mr. Reynolds became, through his will, one of the trustees of his estate, and when the business was re-organized Mr. Reynolds entered his present position as second vice-president and superintendent of the company. In addition to the duties of this position, Mr. Reynolds has taken an active interest in the business life of Milwaukee. He is a stockholder and director in several manufacturing companies, is president of the German-American Bank, the Milwaukee Boiler Co., the Central Improvement Co. and the Badger State Long Distance Telephone Co. He has received the honorary degree of LL. D. from the University of Wisconsin, which has recently further honored him by placing his name in the frieze of its new engineering building. Mr. Reynolds is a modest man of charming personality and is most approachable in his manner. He is very considerate of the feelings and welfare of those under him, which is manifested in the respect and affection shown him by the workmen, with many of whom he has come in direct contact for a quarter of a century.

*Yours Truly  
Edwin Reynolds*

# Re-arrangement of Power Generating and Distributing Scheme at Worcester, Mass.

Questions Involving the Relative Economy of Alternating and Direct Current Transmission—Utilizing Present Power House Equipments—Output, Capacity and Car Miles Run.

A street railway operating expert of wide experience when asked recently what in his opinion was the most serious question confronting the street railway fraternity today, replied, "The problem of economically and properly distributing power over street railway systems formed during the past two or three years by the evolutionary power of consolidation is bothering more street railway managers at this time than any other one difficulty." He then went on to explain that if the problem were merely one of distributing a given current throughout a designated territory without regard to investments previously made in power house property,

The Fitchburg & Suburban Street Ry., with one power station located at Fitchburg and about 7 miles of track from Fitchburg to Leominster.

The Leominster & Clinton Street Ry., with one power station at Leominster and about 12 miles of track from Leominster to Clinton.

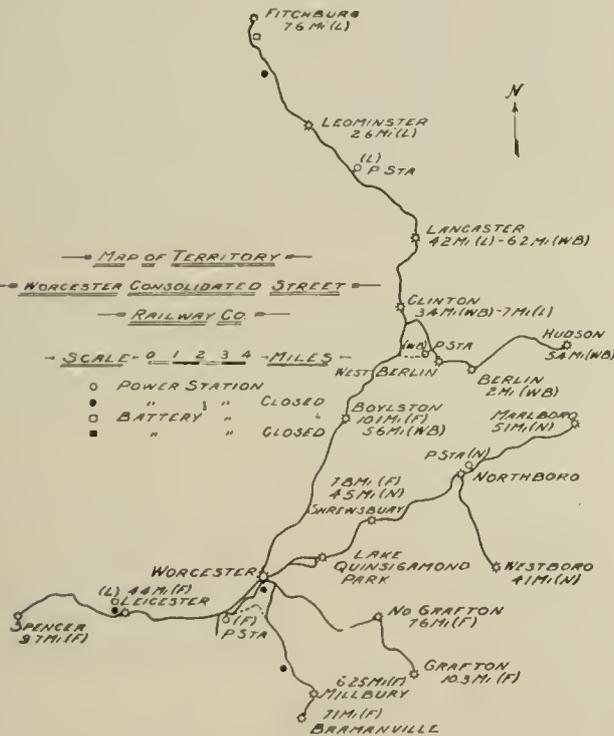

The Clinton & Hudson Street Ry., and the Worcester & Clinton Street Ry., both operated from one power house located at West Berlin, and comprising jointly about 23 miles of track running from Clinton to Hudson, and from Clinton to Worcester. A portion of the Worcester & Clinton road was supplied with power from the Worcester station of the old Worcester Consolidated Street Ry.

The Worcester & Marlboro Street Ry., with one power house at Marlboro, and about 18 miles of track from Marlboro to Worcester, with a branch from Northboro to Westboro.

The Worcester & Suburban Street Ry., with two power houses, one at Leicester and one at Millbury, also a 450-ampere hour storage battery at Leicester and a 240-ampere hour storage battery sub-station at the junction of the two lines in Worcester. This company operated about 19 miles of track from Spencer through Worcester to Millbury.

The old Worcester Consolidated Street Ry., operated from one central direct current power station in Worcester and owning about 50 miles of track in the city of Worcester and its suburbs.

When the plans for re-arranging the power scheme to suit the new conditions of the united property came up for discussion, the situation at first glance seemed to be an ideal one for high tension alternating current generation and distribution. The preliminary calculations seemed to bear out this conclusion but after carefully analyzing the figures, differentiating the costs and savings incident to and resulting from both the alternating and direct current schemes involved, it was found the conditions were such that by making certain changes, and with a comparatively small outlay in additional direct current machinery and copper feeders (most of this new copper would have been required with the high tension

station equipment and copper lines, the obstacles could be easily surmounted by the aid of certain more or less well proved theoretical deductions, and latter day knowledge would probably dictate high tension alternating current distribution from a central power house with transforming and converting sub-stations near the centers of the outlying loads.

Unfortunately this previous investment is the one factor in the situation that can not be disregarded. In the case of several of the largest cities developments in the art have made it possible by installing alternating apparatus throughout, to offset losses on the original investment by computed savings to be made in operating and maintenance charges and the old direct current apparatus has been scrapped. But instances in which the traffic will warrant the entire abandonment of old power houses are few and in most cases the situation has resolved itself into finding a solution for the query, "What can we do with what we have?"

Apropos of this subject recent decisions made by the management of the Worcester Consolidated Street Railway Co., of Worcester, Mass., will be regarded with interest.

On March 1, 1901, the present management found itself in possession of the Worcester Consolidated property which had just been formed by the merger of seven companies operating an aggregate of 130 miles of electric railway track in and about the city of Worcester.

These companies were as follows, and in this connection attention is called to the accompanying map:

AFTER A HEAVY SNOW AT WORCESTER.

system) it would be feasible to shut down three of the steam generating stations, these stations incidentally being the ones at which coal cost the most money. The question as regarded alternating current transmission then resolved itself into the question of the relative cost of operating, including fixed charges, one or more alternating generating stations with rotary sub-stations in place of the four remaining direct current generating stations. The company's engineers have as yet been unable to compute any saving with alternating apparatus, but state, however, that with the expe-

rience of the coming winter and a more accurate knowledge of the load conditions and cost of operation of the combined properties it is possible a saving will be evidenced.

The first move made toward the consolidation of power houses was the shutting down of the 240-ampere hour storage battery in the city of Worcester. This battery was in the office of the old Worcester & Suburban Co. and when the office was abandoned it became necessary to either shut the battery down or maintain an attendant. Inasmuch as the station was near the main Worcester power house it was not deemed essential to keep the battery at this point and recently this entire battery plant has been moved to Fitchburg, near the terminal of the Fitchburg line and at the top of a 13 per cent grade, 7 miles from the generating station.

The next move was to shut down the Leicester station of the Worcester & Suburban Co. As this plant adjoined a car barn and sufficient copper was erected, it simply meant a proper arrange-

HARRINGTON CORNER, OPPOSITE CITY HALL, WORCESTER.

ment of the feeders and making connection with the large station at Worcester. By reason of the high speeds required on this line, it was decided to maintain the storage battery formerly at this station in place of the abandoned generating station. One No. 0000 wire was provided joining the battery station and the Worcester power house, and the battery is charged from an ordinary booster at the last named plant.

Owing to an existing contract the company is obliged to furnish current for street lighting and house service in Leicester and the adjoining towns. To take care of this lighting one of the M. P. 90 generators formerly at this station is utilized as a motor, and taking current from the line through the battery drives by belt one of the old generators removed. This improvised lighting set works very well when the load is not too great for it.

The next move was to shut down the Millbury power house which meant simply the erection of additional copper and some rearrangement of the old feeder lines.

These changes have practically wiped out the generating plants of the old Worcester & Suburban road.

In the meantime the company had decided to install additional equipment at the Leominster power house, move the storage battery from Worcester to Fitchburg and shut down the Fitchburg plant. Accordingly one of the generators and a condenser have been moved from the Fitchburg station to the Leominster power house, and the Fitchburg station has been abandoned. The Leominster power house is operated by water power and additional water wheels have been put in to run the added apparatus. This change also involved an increase in copper feeders on this line. It might be remarked here that in making the changes and additions in the feeder lines at this and other places on the system, the management has kept in view the possibility that future developments may bring about a substitution of alternating apparatus for the present direct current distribution, and the new copper has been so placed as to be best utilized if the changes to alternating trans-

mission is ever made. In the particular instance of this Leominster plant, the fact that it is run by water power would probably insure that the station equipment be kept practically its present form, even if a central alternating station were erected at Worcester.

As the last step in these alterations the company has purchased one new 3,000-h. p. Allis vertical engine to be erected in the main power house at Worcester. This will be direct connected to a new 2,000-kw. General Electric direct current generator. The steam equipment of the Worcester plant has also been increased by 1,800 h. p. in the new water tube boilers, and a 5,000-h. p. twin vertical condenser.

Until this new unit is completed the abandoned stations will be kept in readiness for emergency service, as the present capacity of the Worcester station is hardly sufficient to depend upon in case of snow storm or breakdown. It is anticipated the new machinery will be running by July, 1902.

It should be added that the several stations are all tied together by copper feeders so that they can help each other to the best advantage. Near the midway points in the feeders, where the loads of any two stations merge, fuse switches are placed to avoid damage to either one of the stations should a short circuit in the territory of one plant throw all the load suddenly onto the other.

For additional detail reference we append a summary of the apparatus at each of the several stations on the system:

#### EQUIPMENT OF POWER STATIONS

##### Main Power House at Worcester (Fremont St.)

Engines and Generators.—One 1,000-h. p. vertical cross compound Green-Wheelock engine, with cylinders 30 and 64 in. by 48-in. stroke, direct connected to a 1,600-kw. General Electric generator turning 100 r. p. m. One 1,200-h. p. vertical cross compound Lake Erie engine, with cylinders 25 and 50 in. by 36-in. stroke, direct connected to one 850-kw. General Electric generator, turning 108 r. p. m. Four 450-h. p. vertical cross compound Lake Erie engines, with cylinders 14 and 28½ in. by 24-in. stroke and running 156 r. p. m., each belted to a 300-kw. General Electric generator, running at 400 r. p. m.

Boilers.—Three 150-h. p. horizontal tubular boilers. Nine 125-h. p. horizontal tubular boilers. Boilers are operated at 125 lb. per sq. in. Station is equipped with full complement of condensers, feed pumps, etc.

Booster-Motor, M. P. 4. 118-h. p., 750 r. p. m. Generator, M. P. 4. 80 kw., 750 r. p. m. Rated at 200 amperes, voltage from 0 to 400.

There is now being added to this station one new 3,000-h. p. Allis vertical engine, direct connected to a new 2,000-kw. General Electric generator. Also 1,800 h. p. in new water tube boilers, and a 5,000-h. p. twin vertical condenser.

##### Northboro Power Station.

Engines and Generators.—Two 450-h. p. simple Green engines, with cylinders 20x42 in. One 350-h. p. simple Green engines, 18x42 in. One 225-kw. General Electric generator. Two 325-kw. General Electric generators.

Boilers.—Five 150-h. p. horizontal tubular boilers. Condensers, pumps, heaters, etc.

##### West Berlin Power Station.

Engines and Generators.—Two 400-h. p. Filer & Stowell engines, with cylinders 20x42 in. Two 225-kw. Walker generators.

Boilers.—Three 125-h. p. horizontal tubular boilers. Condensers, pumps, heaters, etc.

Leominster Power Station. (Combined Steam and Water Power.)

Engines, Turbines and Generators.—One 450-h. p. Slater twin engine with cylinders 18x36 in. Two pairs 27-in. McCormick turbines, each pair rated at 160 h. p. One 90-kw. General Electric generator which is run as a booster. Two 150-kw. General Electric generators.

Boilers.—Two 200-h. p. Manning type vertical boilers.

The height of water fall is 19 ft. 2 in.

There is being added to this station one 200-kw. Westinghouse generator to be coupled to one pair of new Hercules turbines rated at 260 h. p.; also a condenser. This additional equipment was originally at the Fitchburg station which has been abandoned.

##### Abandoned Stations.

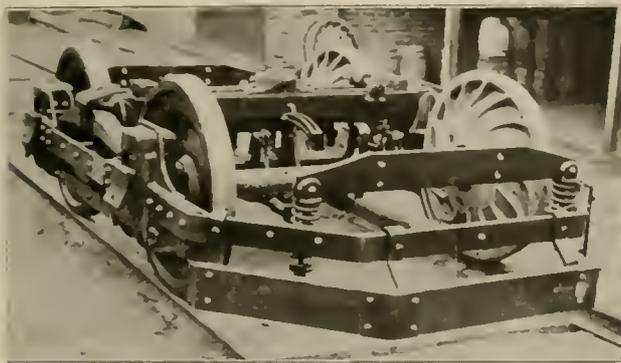

The Fitchburg station contained two 250-h. p. high speed engines, two 200-kw. Westinghouse generators, and four 125-h. p. Phoenix

boilers. As stated, one of the generators has been removed to the Leominster station and the remaining apparatus will be sold.

The Millbury station contained two 250-h.p. Armington & Sims engines, four M. P. 90 generators, and five 125-h. p. horizontal tubular boilers. All this apparatus will be sold.

The Leicester station contained two 450-h. p. Cooper engines driving one 500-kw. generator, one M. P. 80 generator and three M. P. 90 generators. There is also a 150-h. p. Ball engine direct connected to a 130-kw. Wood generator made by the Fort Wayne Electrical Corporation. This equipment will be sold.

This station also contains a 450-ampere-hour storage battery

STANDARD DOUBLE TRUCK.

of 264 "Chloride" accumulator cells which will be retained. As before stated this battery is charged from the main Worcester power house.

In addition the company owns a 240-ampere-hour storage battery which has been previously mentioned. This has been moved to a point near the Fitchburg terminal.

OUTPUT CAPACITY OF STATIONS.

As an indication of the work done by the power houses on the Consolidated system, we append a table showing the results for the month of August, 1901. Owing to the transitory conditions reliable data for a later period are not available, and it will also be noted that the capacity figures will be materially changed when the additions and alterations as outlined in this article have been made.

Location of Station.	CAPACITY				Tons Coal Consumed.
	H. P. Boilers.	H. P. Engines.	Kw. Generators.	Car Miles Run.	
Worcester .....	1,575	4,900	3,650	340,348	1,005,625
Northboro .....	750	1,250	875	30,798	166,635
West Berlin .....	375	800	450	29,796	112,612
Leominster .....	400	600	300	26,588	31,183
Fitchburg .....	500	500	275	10,738	59,663
Total .....	3,600	8,050	5,550	438,268	1,465,118

OTHER IMPROVEMENTS AT WORCESTER.

In addition to the erection of a new car barn and the alterations in its various power houses, the Worcester Consolidated Street Railway Co. has been overhauling changing and improving its track and overhead work, its rolling stock, its maintenance and repair methods, and in fact every department of the property.

In track work the company has built several miles of extensions and has relaid over 11 miles of track, replacing 48, 50 and 85 lb rails with 95 lb, 9 in. girder rails, Pennsylvania Steel Co. section. Over \$20000 has been spent in new special work, all of which has been supplied by the Wharton company. Thousands of dollars are being expended in new feeders and in rebonding and improving the return circuit.

In the renewed track the 95 lb. girder rail has been laid on chestnut ties, 7 ft x 6 in x 6 in placed 30 in c to c, with tie plate. Each joint has two "Protected" rail bonds and the rails and both tracks are cross bonded every 500 ft.

To relieve the congestion at the "Corners" where the interurban

cars connect with the city cars, the circle around the Commons has been double tracked, with curves in both directions.

On the 30-mile line to Fitchburg the roadbed has been filled with gravel and small stone and practically rebuilt.

The company has bought sixteen 14-bench open cars and fourteen 25-ft. closed cars of the Bradley Car Works, of Worcester. These have a special seating arrangement and were fully described in the last issue of the "Review." They are mounted on Laconia No. 8-B high speed double trucks with patented swing bolster made by the Laconia Car Co., of 50 State St., Boston, and Laconia, N. H.

This is a pivotal double truck and is especially designed to be used on roads where short radius curves are unavoidable, the wheel base being 4 ft 4 in. The design provides for center bearing elliptic springs; outside motor suspension, allowing for either two or four motors to car; inside hung brakes, with either adjustable or solid brakehead, a brake mechanism that is very powerful and at the same time simple in construction. All parts of the truck are exceptionally simple and strong, and when worn out can easily be replaced. Either electric or steam car journal bearings are used. The main feature of the truck is the patented "Perfectly Cushioned Swing Bolster," which is designed to prevent the car from receiving any shock while rounding curves at a high rate of speed.

This type of truck is made with any length wheel base required, and although it has been on the market but two years, it has met with great success, and is used on many of the large street railway systems of the United States.

The company uses three types of heaters made by the Simplex Electric Co., the Consolidated Car Heating Co. and the Gold Street Car Heating Co.

All the interurban lines of the Worcester Consolidated Street Railway Co. are to be protected with the United States Electric Signal Co.'s signal system.

The officers of the Worcester Consolidated Street Railway Co. are: President, F. H. Dewey; vice-president, A. G. Bullock; secretary and treasurer, J. W. Lester; general manager, R. T. Laffin; superintendent of motive power and machinery, William Pestell; division superintendents, H. E. Bradford, J. B. Gorman and G. H. Burgess; superintendent of car shops, J. H. McMullin; pit foreman, R. P. Tisch; superintendent of line and tracks, Geo. B. Shapley.

Mr. R. T. Laffin, general manager of the Worcester Consolidated Street Railway Co., received most of his railway training with the Boston Elevated Ry. He held the position of superintendent of division No. 6 of the Boston "L." for 18 or 19 years, this division constituting one of the busiest sections of the system, and being

F. H. DEWEY.

R. T. LAFFIN.

practically in itself a complete street railway system. Mr. Laffin went to Worcester in 1901 and at once assumed charge of the new Consolidated property. Under his management, as outlined in this issue, work has rapidly progressed in the direction of unifying, improving and extending the roads, consolidating the different departments under single heads and placing the operation of the property on a conservatively economical basis.

Mr. F. H. Dewey, president of the Worcester Consolidated Street Railway Co., is a capitalist and financier of prominence in eastern Massachusetts. He is associated with several industrial enterprises and a director in a number of banking institutions.

### EVERETT-MOORE SYNDICATE.

January 2d the affairs of the Everett-Moore syndicate were placed in charge of a committee of Cleveland bankers which issued the following statement explaining this action:

"It became apparent some time ago to some of the members of the Everett-Moore syndicate, so-called, that on account of the tight money situation in the different centers where they were financing some of their enterprises, that, although in their opinion they owned several million dollars' worth of property over and above their liabilities, that they would be unable without temporary assistance to meet their obligations which were about to become due, and the obligations of some of the corporations controlled by them.

"Many of these obligations arose from the fact that the syndicate was engaged in the construction of a number of enterprises which were not yet fully completed, requiring large amounts of money to pay for labor and materials in the construction.

"The syndicate were also recently disappointed in being unable to complete the negotiations for the raising of a large sum of money upon certain bonds and stocks belonging to them which would have furnished them with ready funds, and which negotiations they had reason to believe, until ten days ago, would result favorably.

"Some of the members of the syndicate, when it became apparent to them that many of their liabilities, which were coming due about Jan. 1, could not be met, called together some of their personal advisers to advise with them as to what was best to be done.

"These men examined fully into all of the affairs of those composing the syndicate, and were furnished with full and complete information.

"They found further from their investigations that in the telephone situation, while among its different elements it had many companies that had fully completed their equipment, and were on a paying basis, that there were others that needed material assistance.

"They also found that so far as the personal affairs of the members of the syndicate were concerned that their equities were in their opinion largely in excess of their liabilities, and that in their judgment all of the personal creditors could be paid without doubt from the assets, and several hundred thousand dollars put into the completion of the properties.

"They found that there were in Cleveland upwards of thirty banks that were their creditors, and that these banks held the choicest of the securities and the most equities.

"Messrs. Everett and Moore stated that they were perfectly willing to turn all of their matters and properties over to a committee that should be appointed to handle them in connection with themselves to preserve the most equities, with the belief that when their properties were developed and creditors paid there would be a substantial amount to return to them.

"The personnel of the committee is as follows: H. R. Newcomb, Myron T. Herrick, J. J. Sullivan, Calvary Morris, Kaufman Hays, E. C. Tillotson, and W. C. Mather. These gentlemen were selected, not especially on account of any interest directly involved, but because of their well-known ability and integrity.

"At the meeting held, at which Messrs. Everett and Moore were present, more than five-sixths of all of the Cleveland indebtedness was represented. The parties attending the meeting expressed themselves unanimously in recommending to their institution that they should extend the indebtedness of the Everett-Moore syndicate and its allied interests for a period of not exceeding eighteen months, conditioned upon the committee named having entire charge of all of the affairs connected with the syndicate and their various interests.

"Papers have been drawn looking toward such extension and the empowering of the committee to act, and they have been executed by the members of the Everett-Moore syndicate and are now being executed by the Cleveland banks as rapidly as possible. All other creditors are to be asked to unite with the Cleveland creditors in granting the extension."

The "Everett-Moore interests" include about 1,300 miles of electric railways in operation, some 500 miles of roads under construction or projected, and telephone properties included in the Federal and the United States telephone companies operating in Ohio, Pennsylvania, West Virginia, Kentucky and Michigan.

January 6th William B. Strang, of New York, filed a lien against the Erie Construction Co. for materials and labor furnished for the Detroit & Toledo Shore Line R. R., and the Ohio Savings Bank & Trust Co., and David B. Cunningham, of Detroit, were appointed receivers for the Detroit & Toledo company.

January 10th the Euclid Avenue Trust & Savings Co., of Cleveland, made an assignment. It was announced that the troubles of the Everett-Moore syndicate were not responsible for the bank failure, though the condition of the local security market brought about by the former had added to the difficulties of the bank.

The Painesville Savings Bank, of Painesville, also made an assignment on January 11th.

January 10th Albion E. Lang, president of the Toledo Railway & Light Co., was appointed receiver for the Lake Shore Electric Railway Co., this step being deemed best for the interest of all parties.

### TO RELIEVE CONGESTION ON BROOKLYN BRIDGE.

On January 7th, as a result of a conference between Bridge Commissioner Lindenthal, Chief Engineer Martin, of the Brooklyn Bridge, and President Greatsinger, of the Brooklyn Rapid Transit Co., means were decided upon which it is believed will lessen the crush at the Bridge entrances. A new schedule will go into effect at once, in which the number of hours recognized as the "rush hours" will be increased and the "rush" schedule will be extended so that persons will find very frequent trains both earlier and later than the present schedule calls for. It was suggested that many people would arrange to make their daily trip to and from Brooklyn a little earlier or a little later if they could be sure of catching good trains, and so the volume of travel during the morning and evening rushes would be distributed over a longer period of time, avoiding much of the present congestion and confusion. The idea seems plausible and will be tried for two months.

The new schedule provides that between 6:30 and 7:10 a. m. trains will run over the Bridge on 1¼ minute headway; between 7:10 and 8:55 a. m., 55 seconds headway; between 8:55 and 9:10 a. m. 1 minute headway; and between 9:10 and 9:40 a. m. 1¼ minute headway. In the late afternoon the intervals between trains will be: 4:30 to 6:45, 55 seconds; 6:45 to 6:50, 2 minutes; 6:50 to 8:30 2½ minutes.

In addition to this service through trains on the Fifth Avenue, Bath Beach and Brighton Beach lines will be run between 10 a. m. and 4 p. m. and between 7 p. m. and 1 a. m. It was also decided to do away with the railings on the Manhattan end of the Bridge dividing the local from the through passengers.

### PECULIAR DERAILING ACCIDENT.

On December 29th last an electric car at Northampton, Mass., suddenly left the track apparently without cause. The several passengers were badly shaken up but no serious injuries resulted. Excavation was made for the inspection of a culvert at the place where the car left the rail, and a small cavity was found immediately below the track. It is now supposed the ground over the culvert settled, allowing the crust to yield sufficiently when the car passed to throw it from the rails.

The Cincinnati Traction Co. has completed arrangements for the construction of a handsome new office building at the corner of Fifth and Walnut Sts., Cincinnati, at an early date. The demolition of the old buildings on this site will commence February 1st and the present tenants have been notified to vacate on or before that date.

Merchants of Huntington, Ind., reaped large profits from the Christmas trade by the judicious use of tickets over the Fort Wayne & Southwestern Traction Co's. new line between Fort Wayne and Huntington. Several hundred dollars' worth of the tickets were distributed along the line of the interurban, and the plan was successful in attracting a holiday trade which well repaid the investment.

**THE STANDARDIZATION OF ENGINES AND DYNAMOS.**

The committee of the American Society of Mechanical Engineers on standardization of engines and dynamos has completed its labors and submitted a report of which the following comprise the principal points:

1. Standard size of units recommended.
2. Corresponding revolutions per minute for these units.
3. The size of shafts for the two classes of center crank and side crank engines.
4. The entire length of shaft required for the generator.
5. The height of axis or shaft over top of sub-base.

a permissible variation of speed of 5 per cent either way from the figures recommended. It is believed that these speeds are practically the same as those of all machines which may be considered as standard makes at the present time. The shaft diameters were also determined after careful examination of existing practice. The permissible deflection was the determining factor in regard to diameters.

The question of the length of the generator along the shaft could not be reduced to a single dimension owing to the large variation in the length of generators of the same output, and for this reason it was necessary to make provision for two classes which have been called "long" and "short" generators. For these varying lengths of generator and shaft the engine builder has to provide

**SIZES, SPEEDS AND STANDARDIZED DIMENSIONS OF DIRECT CONNECTED GENERATING SETS.**

100	260	6	8½	6 + 1/1000	8½ + 1/1000	48	42	6	34	Flat.	72	1½	1	¾	¾	1½	4
150	225	7	10	7 + 1/1000	10 + 1/1000	51	45	6	37½	41½	84	1½	1½	¾	¾	1½	4
200	200	8	11	8 + 1/1000	11 + 1/1000	54	48	6	42½	47½	96	2	1½	¾	¾	1½	4

NOTE 1.—Five per cent. variation of speed permissible above and below speeds in table.

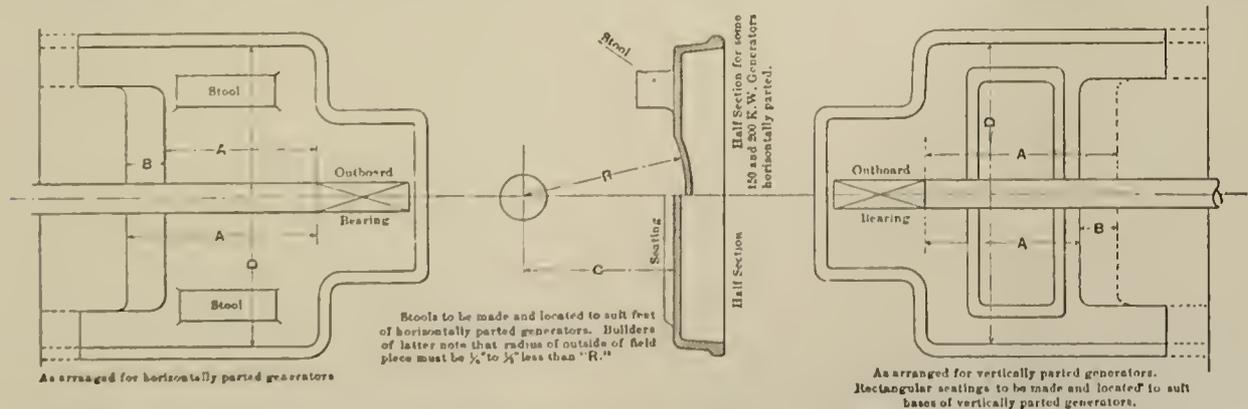

NOTE 2.—Distance from centre of shaft to top of base of outboard bearing may be less than C (to suit engine builder), though not less than possible outside radius of armature.

6. The width of top of sub-base.
  7. Armature fit.
  8. Overload capacity of engines and generators.
  9. Brush holders.
  10. Holding-down bolts, keys and outboard bearings.
- The committee endeavored to reduce the number of standard units to the fewest sizes. This will commend itself to a large number of manufacturers as it reduces the great number of patterns

different lengths of sub-base, but patterns for the latter can be made so that one end can be made adjustable with a standard addition for each unit.

In regard to the armature fit the committee obtained opinions from manufacturers in respect to the allowance to be made for pressed fit and found that .001 in. for shafts of from 4 to 6 in. and .002 in. for shafts 6½ to 11 in. represents the best practice.

As it is evident to every engine builder that to provide an engine

**DIAGRAM SHOWING DIMENSIONS REFERRED TO IN TABLE.**

required to be kept on hand. The report only covers direct current generators.

The accompanying table will show, in connection with the diagram which follows, the sizes, speeds and standard dimensions of direct connected sets as recommended by the committee. The standard speeds were chosen after investigation of the practice of all the engine and generator builders in the country. These provide for

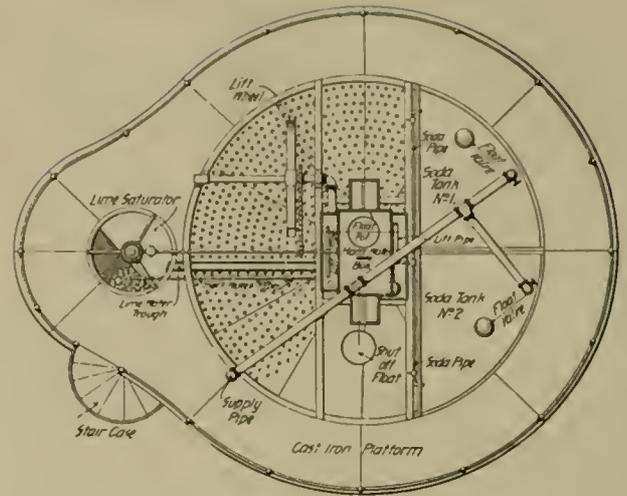

large enough to drive a generator with from 50 to 100 per cent overload gives an unreasonably large engine for the rated load, the committee was led to recommend that the standard overload rating of the direct connected unit should not in any case exceed 25 per cent of the rated capacity. It was also recommended that the brush holder rigging for dynamos should be supported upon the generator frame making the electrical part of the unit entirely

self-contained. The sizes of keys were taken so that standard rolled stock can be employed. The keys are to be made straight and used as feathers.

In the course of the committee's investigation a number of points was brought to its attention which, while not exactly within the scope of its work, were embodied in the report under the head of suggestions. Among these was the question of pressing armatures on shafts. Usually the contract provides by whom this is to be done, but it is suggested that if there is no such provision it shall be understood that the engine and generator builders shall agree who is to do this work so as to avoid any dispute when the separate portions of the unit are delivered.

For convenience in operation and for the information of engine and generator builders it is suggested that for units up to 75 kw., inclusive, the floor line should come at the bottom of the sub-base and for units of 100 kw. to 200 kw. inclusive the floor line should be 1 in. below the rough top of the sub-base.

As in some cases the distance between bearing and commutator is very small it is suggested that engine builders provide some means to prevent oil from the bearing getting on the commutator.

**AUTOMATIC WATER SOFTENING SYSTEM.**

The accompanying illustrations show an interesting water purifying apparatus which has been used with much success by railroads, companies manufacturing artificial ice, and others who appreciate the importance of having a good boiler supply.

The water is treated by adding a solution of lime to act upon the soluble bicarbonates and form the monocarbonates which are insoluble, and a solution of soda ash to react with the sulphates. To be successful, the lime and soda reagents must be introduced in the proper quantity, the amounts being determined after an analysis of the water to be treated.

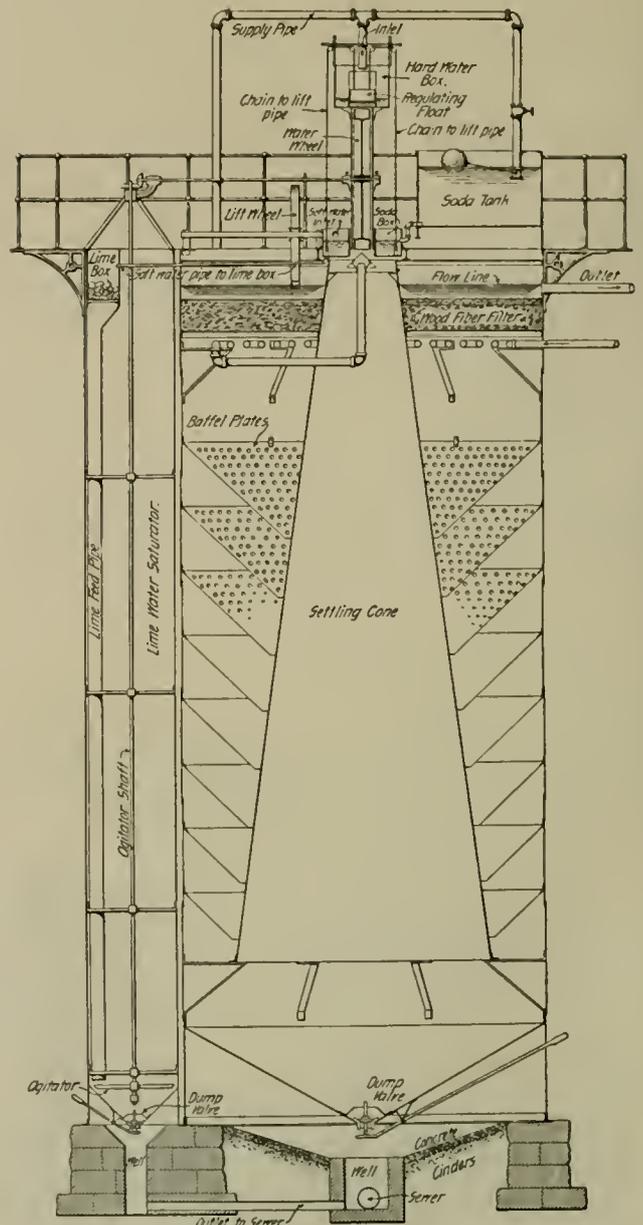

For large plants the advantages of having a continuous process of water purification are quite apparent, and this apparatus has been perfected to give both continuous and automatic action. There are a number of ingenious features in the design which will be seen on examining the accompanying engravings, among these may be noted the use of a conical partition in the cylindrical tank thus insuring a constantly increasing section (with correspondingly diminished velocity) as the water progresses through the settling tank; also that the outlet is but little below the level of the inlet and thus renders it unnecessary to repump the treated water; and also the use of soft water for making the lime solution, which effects a considerable saving of lime.

The water to be treated is brought to the center of the vertical cylinder, where it discharges into the hard water box. From this box the water, on its way to the purifier, turns a water wheel which drives the stirrer in the lime water saturator. After leaving the wheel it passes to the top of the settling cone. At this point it is mixed with the treating solutions. Upon mixing with the chemicals lime, magnesia, iron alumina, and a portion of the silica if the water contains it, all substances which form scale in a boiler, begin to settle out, and the process continues.

From the bottom of the settling cone the water passes up through the outer space, where the settling is continued and aided by baffle plates. Before passing to the outlets the treated water finally passes through a filter of wood fiber. The water passes through the apparatus without loss of head, and on its way automatically regulates the supply of chemicals.

The lime and soda solutions are prepared separately; the former in a smaller and sometimes shorter cylinder, which is secured at one side of the main cylinder. This smaller cylinder is open at the top and an agitator at the bottom of the vertical shaft stirs up the contents. From the top of the lime water saturator a trough takes the lime water to the top of the settling cone. A lift wheel, driven by the water wheel, raises some of the treated water into a box. From here it passes by gravity to the lime saturator through the orifice marked "soft water inlet."

On the other side of the water wheel is the soda box, which is kept full from the soda tanks by a ball valve. There are two soda tanks for use alternately. The relative amounts of soda and lime solutions are determined by the sizes of the orifices through which the solutions pass out of the small tanks at each side of the water wheel. These openings are slits in the ends of pipes. The pipes

PLAN AND SECTION OF APPARATUS.

have swing joints at their fixed ends, and by raising the free ends the flow is reduced by reducing the "head." These lift pipes are controlled by a float in the hard water box, so that the chemicals will be governed by the amount of raw water entering. A valve in the main supply pipe is controlled by a float in the top of the tank, resting upon the treated water, this serves to regulate the inflow of hard water according to the amount of softened water

KENNICOTT WATER SOFTENER.

being used. At the bottom of the settling cone and the lime saturator the sludge is removed by valves opening into a drain.

While the apparatus as described is intended for the treatment of cold water, there is no objection to using hot water.

This apparatus is known as the Kennicott water softener and is made by the Kennicott Water Softener Co., 3567 Butler St., Chicago. It is the practice of the company to make an analysis of the water to be treated and then offer a definite proposal for installing a softener, specifying that in this water the scale forming ingredients shall be reduced to a certain number of grains per gallon at a cost not exceeding a fixed sum per thousand gallons, and guaranteeing the results.

The Steubenville, Mingo & Ohio Valley Traction Co. has recently been purchased by the Wheeling Traction Co., of Wheeling, W. Va., and it is the intention to construct a line from Brilliant to the southern terminus of the Steubenville line at Martin's Ferry by parties closely allied with the Wheeling Traction Co. This will open a through trolley communication between Wheeling and Steubenville, a distance of about 26 miles.

The Westinghouse interests in London have organized the Traction & Power Securities Co., Limited, with a capital of \$5,000,000 to handle the security and agency business of the Westinghouse concerns in England, of the same order as those of Westinghouse, Church, Kerr & Co. of New York. When a railway or other corporation desires to pass an order for Westinghouse equipment and proposes to meet payment by debenture or similar, the new company in London will finance the transaction and pay cash to the producing interest.

## CORRESPONDENCE

### TESTS OF MECHANICAL STOKERS AT THE GENERAL ELECTRIC WORKS, SCHENECTADY, N. Y.

Editor "Review": There appeared in the Engineering News for Nov. 7, 1901, an article, which consisted of extracts from the report of a series of tests made by Prof. J. E. Denton and Mr. George H. Barrus, representing the American Stoker Co., and Messrs. Deane and Main, Boston, representing the General Electric Co. Owing to the manner in which these extracts were presented by the Engineering News and the absence of reference to several important facts connected with the tests, the article in question does not present the case in a manner equally fair to all parties concerned.

As stated in the report, these tests were conducted for the purpose of determining whether the American Stoker Co. had fulfilled certain guarantees in its contract with the General Electric Co. On account of a clause in the contract, in which the American Stoker Co. guaranteed to "generate a net horse power of steam as economically as the Roney stoker," the engineers decided to test one of the Babcock & Wilcox boilers equipped with the Roney stoker, which had been installed in 1898 and which had been in operation continuously, day and night, for over two and a half years.

The position was taken by the engineers, that as the tests were to be conducted for the purpose of determining whether the American Stoker Co. had fulfilled its guarantees, the manufacturers of the Roney stoker had no interest or part in the matter, their stokers having been accepted and paid for several years before. Under this ruling the Roney stoker was brought into a competitive test in which the makers were not permitted to direct its operation and were not represented except by an erecting superintendent who was allowed to witness the final test but not to give directions. One of the results of this ruling is shown in that part of the report regarding "Labor required for operating the stokers," where the report states that—"in the Roney stokers, according to the practice of the fireman during the test, there was continual attention and exertion required," etc. This method of handling the stoker was contrary to the instructions for operation which are furnished with the Roney stoker and was the result of inexperience, the fireman having never fired on a test before. If the manufacturers had been permitted to direct the operation of the stoker, this unnecessary labor would have been avoided.

Under the paragraph "Comparative Economy of the American and Roney stoker," various costs of operation are summed up as follows

Costs per h. p. per year.	---AMERICAN STOKERS.--- Repairs according to 3 mos. record on log book.	Repairs guaranteed in contract.	Roney stokers.
Cost of coal .....	\$34.95	\$34.95	\$35.76
Cost of repairs ..	0.77	0.12	0.48
Wages of fireman and helpers...	1.44	1.44	1.44
Interest and depreciation .....	0.38	0.38	0.38
	\$37.54	\$36.89	\$38.06

In this table, it seems rather illogical from an engineering standpoint to credit the American stoker repair account with the excess over 5 per cent which the maker under its contract assumed for a period of two years. The question of financial liability will not be apt to have much effect on the actual deterioration of the stoker.

As the report assumes that this table demonstrates that "the cost of steam is less with the American stoker than with the Roney stoker," it is but fair to call attention to some facts not brought out in the report which bear on the other side of the question.

The principal item in the table is "Cost of coal" per horse power per year. This is obtained by dividing the amount of water required per horse power for 360 days of 24 hours each by the net

evaporation from and at 212 degrees F. per pound of coal. This method of determining the efficiency of the stoker by means of the boiler performance is manifestly an improper one. The condition of the boiler or the arrangement of the heating surface may be such that its inability to properly absorb heat will neutralize the most perfect combustion obtainable in the furnace. If in these tests the boiler evaporation was to be assumed as the standard of stoker efficiency, the boilers should have been of the same type and the heating surface and settings in the same condition. The Babcock & Wilcox boiler and Roney stoker had been in use over two and one-half years and had never had the fire sides of the tubes cleaned except by blowing from the outside and the setting was more or less cracked, while the Stirling boiler with American stoker was new and recently put in service. A contract test was made some six months after this Babcock & Wilcox boiler and Roney stoker were put in service, at which an evaporation of 12.66 from and at 212 degrees F. per pound of combustible was obtained, exceeding any of the results obtained by either stoker in the series of tests under consideration. Substituting this evaporation for that obtained on June 18, 1901, when the boiler was old and dirty, would make the cost required per h. p. per hour \$34.08 instead of \$35.76, as given in the above table. If the table be corrected to make the "Cost of coal" correspond with what it was when the boiler was new and clean the "Cost per h. p. per year" of operating the Roney stoker would be \$36.40 per h. p. instead of \$38.06, as given in the table and less than either of the amounts given as "cost of operating" the American stoker.

The "Cost of repairs," namely, 48 cents per h. p. per year, is excessive on account of the fact that the draft of the Babcock & Wilcox boiler was only .15 to .16 of an inch in the furnace, due to insufficient chimney. These boilers and stokers are operated with natural draft and the poor draft caused high temperature in the ashpit and excessive repairs. The records of many large plants show that the cost of grate bar repairs for the Roney stoker with proper draft conditions should not exceed 12 cents per h. p. per year.

A stoker does not evaporate water; its function is to burn coal, and the measure of its efficiency is the ability to produce good combustion as shown by the analysis of the flue gases and not the amount of water evaporated per pound of coal by the boiler to which it is attached. The record of the analysis of flue gases from the Roney stoker shows an average of 14.2 per cent CO<sub>2</sub>, 4.67 per cent O, 0.29 per cent CO. This is as good combustion as has ever been obtained, and the fact that the evaporation from and at 212° F. per pound of coal by the Babcock & Wilcox boiler and Roney stoker was 11.69 instead of 11.7 as obtained when the same boiler was new and clean, simply shows that the difference is due to the fact that the boiler was not in condition to absorb the heat generated by the stoker. The heat balance given in the report shows that the Stirling boiler absorbed 77.1 per cent and the Babcock & Wilcox boiler 72 per cent of the heat of combustion. Or, in other words, judged by the ability of the boilers to absorb heat, the Roney stoker was handicapped by a difference in boiler efficiency of 7 per cent. This is more than double the amount given in the table quoted above as the difference between the two stokers in "Cost of steam per h. p. per year," and completely reverses the statement in the report that—"In point of relative economy the guarantee of the American Stoker Co. is fulfilled." It is most important in comparing these tests, to remember that the boiler to which the Roney stoker was attached was old and dirty and that the combustion was of the best. In comparing the economy of the two stokers the operation of the boilers should have been eliminated and the efficiency of the stokers determined by their ability to produce good combustion. To be consistent, the experts should have considered the results of the tests from this standpoint. Had they done so their conclusions would obviously have been different.

New York, Dec. 18, 1901.

William R. Roney.

Mr. T. Fitzgerald, superintendent of construction of the Fairmont (W. Va.) & Clarksburg Street Railway Co., has recently purchased a large consignment of material in Pittsburgh. Cars are now running at both ends of the line; 30 miles of the road have been completed, and the entire route will be opened in the early spring.

## PENNSYLVANIA RAILROAD TUNNEL PLAN.

The plan of the Pennsylvania Railroad Co. for an underground line from New Jersey across Manhattan Island to Long Island, which was mentioned in the "Review" for December, is estimated to cost in the neighborhood of \$40,000,000, and it is thought that, barring accidents, the work will be completed in about three years. Some official statements of the details of this work have been recently given out and plans and maps of the underground system have been filed in New York together with articles of incorporation of the Pennsylvania-New York Extension Railroad Co., which is to build and operate the tunnel. These plans include two single track steel tube tunnels supported upon piers which will reach down to bed rock. These tubes will extend from the Jersey terminus to Eighth Ave. and 32d St., Manhattan. At the latter point there will be built an extensive underground passenger station out of which will run three single tunnels a block apart to the East River and beneath it to Long Island City. The tunnels will converge at a point near Thompson and Purves Aves., about a quarter of a mile from the river, where the Long Island Railroad owns a large tract of land.

\* One of the principal features of this underground construction will be the large station in Manhattan at Eighth Ave. from 31st to 33d Sts. The plans show 25 tracks in these blocks which will run from Tenth Ave. to Seventh Ave. Across these tracks a bridge 100 ft. wide will run from 33d to 31st Sts., from which stairways will reach to the platforms between the tracks. Midway, stairways and elevators will be erected to take pedestrians down to the bridge. Another station is to be erected at Fourth Ave. where the three tunnels will cross the line of the rapid transit subway. The two stations will be connected by stairways and elevators.

A new feature in engineering is said to be included in the enterprise of tunnelling the North River, the bed of which is composed of mud and clay for 100 ft. below the river bottom. This is the erection of piers from the tubes down to the bed rock under the river in order to support the tunnel and make it sufficiently strong to stand the weight of the hundreds of heavy cars which will operate through it.

Mr. A. J. Cassatt, president of the Pennsylvania, is reported to have stated that after years of exhaustive study the conclusion has been reached that a tunnel line operated by electricity is in every way the most practical economical and the best both for the interests of the railroad company and of the city. As the railroad will be wholly underground and operated electrically, in the same manner as the recently constructed Orleans Railroad Extension in Paris, it will not be objectionable in any way. There will not be any smoke, dirt or noise, and as all the surface property may be built upon after being utilized underneath for railroad purposes, the neighborhood of the station will be improved instead of marred.

Immediately upon the necessary authority being granted the work of construction will be commenced and the whole line be put in operation as soon as possible. Both the Long Island Railroad and the Pennsylvania Railroad express trains will all pass through the central underground station in Manhattan. Officials of both the Pennsylvania and Long Island roads are interested in the Pennsylvania-New York Extension Railroad Co.

The directors of this company are A. J. Cassatt, Thomas De Witt Cuyler, Clement A. Griscom, John P. Green, Charles E. Pugh, Sutherland M. Prevost, W. H. Barnes, Samuel Rea and William H. Baldwin.

Mr. Alfred Noble, of Chicago, who was a member of the Isthmian Canal Commission, has been appointed chief engineer.

The Cortland County Traction Co., Cortland, N. Y., was robbed of 1,000 lb. of copper wire from its interurban line between Cortland and Homer on the night of December 10th. A reward of \$50 has been offered for the conviction of the thieves.

The Indiana Railway Co., of South Bend, on December 24th increased the wages of its conductors and motormen by 2½ cents an hour. This is equivalent to an advance of 25 cents per day in the wages of employes on all branches of the company's 43-mile system.

### HENRY C. PAYNE.

The appointment by President Roosevelt of Mr. Henry C. Payne of Milwaukee as postmaster-general to succeed Mr. Charles Emory Smith, resigned, has been received with general satisfaction, and is most warmly approved by those who have been associated with him. Mr. Payne is widely known as one of the ablest and most successful street railway men in this country. He has been vice-president of the Milwaukee Electric Railway & Light Co. since that company succeeded the Milwaukee Street Railway Co.; the old company was organized under his supervision and the system equipped for electric traction. Mr. Payne was president of

HENRY C. PAYNE.

the American Street Railway Association in 1893-94 when the annual meeting of the association was held in Milwaukee and was receiver for the Northern Pacific R. R. during 1893 and 1894. He was postmaster of Milwaukee for 10 years and has been a member of the Republican National Committee since 1880.

Mr. Payne was born at Ashfield, Mass., Nov. 23, 1843, and his early education was gained at the school of that village and in the Shelburne Falls Academy. After graduating from the latter he went into business in Northampton, Mass., at the age of 16 years. In October, 1863, he moved to Milwaukee, where he has since resided. He organized the Young Men's Republican Club of Milwaukee, in 1872, and later this became the Republican Central Committee of Milwaukee County.

### TRIBUTE TO W. KESLEY SCHOEPF.

A unique demonstration in honor of Mr. W. Kesley Schoepf was given by the employes of the Consolidated Traction Co., of Pittsburg, on the night of December 30th. A procession of 1,500 motormen, conductors and office employes left the Oakland St. car barn and marched to the Hotel Schenley, where it took possession of the big banquet hall. The line of march was marked by special illuminations and burning of red lights. A committee was appointed to bring Mr. Schoepf into the banquet hall at 2:30 o'clock in the morning and when the retiring manager made his appearance the band played "Hail to the Chief."

Maj. S. E. Moore, comptroller of the company, acted as master of ceremonies, and Mr. George W. Wilson, in a brief speech presented Mr. Schoepf with a handsome clock, for the purchase of which every employe had contributed. In accepting the gift Mr. Schoepf spoke of the kindly spirit exhibited toward him by the employes and said that during the two years he had been in charge of the company's affairs in Pittsburg he had done all in his power to improve the condition of his subordinates. Everything possible to add to their comfort and at the same time keep the service up to its high standard, had been done. He had always tried to be just and could bear witness that during his incumbency there had been few causes for complaint. He thanked the men for the gift

and the sentiment it disclosed, in the most cordial terms. At the conclusion of his remarks he was handed a book by Major Moore containing the autograph of every one of the employes of the Consolidated company.

On the same day he received a surprise from the Consolidated Company Employes' Relief Association, who presented him with a handsomely engrossed set of resolutions adopted by the association, expressing regret at the retirement of Mr. Schoepf.

Another gift received by Mr. Schoepf was from Mr. Joshua Rhodes, president of the Consolidated Traction Co., and consisted of a loving cup of solid silver bearing the date Dec. 25, 1901, and the names of the donor and recipient. Mr. Schoepf may well feel proud of the ovation received from all of the men in the company's employ, as it was a spontaneous token of the hearty respect and general good feeling in which he is held by them.

During his short career in Pittsburg he has introduced many needful improvements in the service of the traction company, and has won the admiration and confidence of his business associates as well as the cordial esteem of the entire community.

### OHIO NOTES.

The merging of the Canal Dover & New Philadelphia Street Ry. and the New Philadelphia & Urichsville company under the name of the Tuscarawas County Traction Co., was one of the recent eastern Ohio traction deals of importance, and is considered an important step towards a Cleveland-Wheeling line. These properties passed under the control of the Mandelbaum-Pomeroy syndicate of Cleveland. The new company was capitalized at \$350,000.

Cars are now run hourly between Bucyrus and Crestline by way of Galion over the line of the Central Ohio Traction Co., which thus becomes a rival of the Pennsylvania and Big Four railroads between those points.

A bill will be introduced in the legislature to abandon the Miami & Erie canal as a waterway, sell the water for power and lease the banks for a double-track electric railway from Cincinnati to Toledo. It is estimated that the canal costs the state \$15,000 annually over and above the receipts and it gets \$45,000 per year for water power. If the boats were taken off the canal this could be raised to \$135,000 per year.

The Columbus, London & Springfield Ry. opened its new line to Morgan Station, 18 miles southwest of Columbus, on January 8th. Cars will leave the city every 75 minutes until 7 p. m. The company has also ordered two new 62-ft. parlor cars for the spring traffic; these are to be furnished with an observation platform that will accommodate 20 people.

Another electric line is projected into Columbus from the south. It is known as the Ripley, Georgetown, Hillsboro & Columbus Railway Co. and has just been incorporated with a capital stock of \$10,000. The incorporators are M. McKeehan, G. Baumbach, A. M. Kantz, W. J. Marshall, O. E. Bare and J. R. Moore. The proposed line extends through the counties of Brown, Highland, Fayette, Pickaway, Madison and Franklin.

The Columbus, Buckeye Lake & Newark Traction Co. has arranged for a bond issue of \$1,500,000. The bonds are to run 20 years and bear 5 per cent interest. The officers of the company are given as S. Reed Anthony, president; Chauncey Eldridge, treasurer; Fred Gore King, secretary, and Fred L. Eldridge, first vice-president, all of Boston.

A new line is projected from Springfield to Sidney by way of Piqua, by the Springfield, Piqua & Sidney Traction Co. Rights of way have been secured a large part of the way. It is intended to build a line also from Piqua to Troy.

The new line between Columbus and Delaware is nearing completion, much of the work being already finished. It is the intention at present to have cars in operation by April 1st.

An attempt to wreck a car on the lines of the Toledo, Bowling Green & Southern Traction Co., near Bowling Green, O., was made early in the morning of December 28th. The car, containing 20 passengers, was running at full speed when it collided with an obstruction of boards across the track, at a point where the track runs along a deep gully. Fortunately, the car did not leave the rails, and no injuries resulted.

### BROOKLYN BRIDGE TERMINAL PROBLEM.

The recommendations of the committee of engineers appointed to formulate plans for the relief of the congestion of traffic on the Brooklyn bridge, an outline of which was given in the "Review" for November, have been reported upon by Mr. C. C. Martin, chief engineer of the bridge, who endorses the greater part of the recommendations. The proposal to build a cross-town elevated road along Park Row crossing Broadway and through Vesey St., to the North River is not endorsed by Engineer Martin. In condemning this extension his report states as follows:

"I would recommend that the Vesey St. line be omitted. If it were constructed and trains were run on a headway that would be at all satisfactory on that line and on the Center St. line at the same time, there would be a series of grade crossings with loaded trains where the two lines came together, which in my judgment could not be permitted if the safety of passengers were to be considered.

"If the Center St. and Vesey St. lines were built, the connections at the bridge terminal would be so complicated that it would be impossible to retain the present tail switching tracks, and this I consider vitally important. It is proposed to run through trains on 45 seconds headway; I do not think this is practicable or possible, and hence I desire to retain the tail switching system, so that if at any time through trains cannot be run on the specified headway they can be supplemented by local bridge trains as is now done during the evening rush, and in case of an entire blockade of through trains on the elevated roads connecting with the bridge the entire traffic could be taken care of by local bridge trains."

The report favors the system of elevated railroads designed to eventually form an endless track over which trains will pass across all of the new bridges now proposed south of Delancey St. The principal involved in this system is practically to distribute the taking-on places for passengers over a wide area rather than permit passengers to jam and crowd in a single spot as is now the case at the bridge entrance.

Subject to the sanction of the Board of Estimate and Apportionment an elevated road will be built at an early date from the Park Row end of the bridge to run up Center, Marion, Spring and Delancey Sts. to the Manhattan end of the new East River bridge which already spans the river. Where the new bridge at the foot of Canal St. has been completed it is further recommended that a branch be built running from a station on Canal St. of the proposed new road down Canal St. to connect with bridge No. 3 which has not yet begun. Mr. Martin also recommends that the new road run through Grand St. beyond the Second Ave. trains so that connections can be made with the stations of both the Second and Third Ave. roads. Mr. Martin's recommendations, with the exception of the cross town elevated road suggested, are identical with the report of the expert engineers.

### CHANGES AT ROCHESTER.

In reply to an inquiry, Mr. T. J. Nicholl, vice-president and general manager of the Rochester (N. Y.) Railway Co., sends us the following statement concerning the improvements his company has been carrying into effect:

About 17 miles of track have been electrically welded and bonded, and about an equal amount of new rail has been laid. The Lorain Steel Co. is doing the electric welding, and not only are the rails welded at the joints but the company is also successfully welding the copper bonds to the steel rails, enabling the return current to be carried under all special work or where the need of replacing worn frogs, mates and switches makes it undesirable to weld the joints. Mr. Nicholl states he has found this welding process eminently satisfactory. Nearly \$50,000 has been spent in new special work.

About 50 per cent of the cars owned by the Rochester Railway Co. have been rebuilt and lengthened to 28 ft. and supplied with new equipments. New shops of capacity to accommodate the new rolling stock have been built and are now being occupied.

At the power house the company is installing a new Hooven, Owens & Renschler, Hamilton-Corliss engine, direct connected to a 1,050-kw. General Electric generator. This new unit will make possible improved service on all the lines.

The work of renewing and bettering the property will be con-

tinued during the first half of the present year. About 17 miles more track will be electrically welded, new special work put in, and the company expects to lay from 10 to 15 miles of new rails. This, together with the completion of the rebuilding and lengthening of the cars, will put the Rochester Ry. property in very satisfactory shape.

Early this month four of the 100-kw. generators at the Rochester power house, owing to some unknown cause, burst out at one time, giving rise to several sensational newspaper stories. Mr. Nicholl advises us that these reports were greatly exaggerated, the damage amounting to just the loss of the armatures and a temporary suspension of service on one or two of the lines.

### TO LOCATE INSULATION FAULTS.

One of the most troublesome faults for the street railways engineer to locate is the deterioration of the insulation on the coils of the electric motor. When such deterioration has taken place either from the motors being overworked or otherwise, the trouble manifests itself by "bucking" or fuse blowing, or if the trouble is not as far along as this there is an increase of power consumed that is expensive aside from the damage it will eventually cause by baking the insulation of all the coils.

The Conant coil testing instrument, which is the invention of Mr. R. W. Conant, 28 William St., Cambridge, Mass., locates these defects by comparing the magnetic strength of the winding, this method being far superior to measuring the resistance, as it is not affected by the temperature of the motors, and the coils often appear perfect if tested cold.

The method is so simple that the carhouse foreman has no difficulty in applying it, and the instrument is especially designed to meet the severe use that it receives in this class of testing. It has been adopted by some of the most prominent roads in the country after thorough tests, a complete record of which will be gladly furnished on application to Mr. Conant.

### MALTBY-HORNADAY CO.

The Maltby-Hornaday Co., comprising C. S. Maltby, formerly of the Stamm Machine Works, of Aurora, Ind., and J. P. Hornaday who for several years has been connected with large southern corporations, has organized a new banking and brokerage business, with headquarters in the Union Trust Building, Cincinnati. The purpose is to incorporate and finance corporations; buy and sell municipal and industrial stocks and bonds; reorganize old companies and to act as agents in securing the most favorable locations for prospective industries.

So many applications have been received by the Maltby-Hornaday Co. from manufacturing establishments asking for desirable cities in which to locate, that a special department has been organized to take care of this branch of the business. The clientele of the new concern at present includes principally street railway, mining, oil, timber and telephone companies. One of the largest street railway projects of Kentucky will be financed by Messrs. Maltby and Hornaday, and from the present outlook promises a successful issue.

Mr. Maltby is secretary and treasurer of the company, while the legal department is in charge of Mr. Hornaday, a corporation lawyer of ability and experience. Correspondence is solicited, and circular matter and rates will be furnished upon application.

### SNOW BLOCKADES IN MASSACHUSETTS.

The severe snow storms which prevailed in eastern Massachusetts for several days early in December caused an almost total suspension of the trolley service of several Massachusetts cities. The town of Millbury was entirely isolated from Worcester and the other points reached by the cars of the Consolidated company, and for one or two days all efforts to clear the road by means of snow plows were unavailing. The Blackstone Valley line was also practically tied up for a number of hours. Snow plows were put to work to relieve several cars which were stalled in Millbury and the opening up of the line for a distance of six miles was only accomplished after 10 hours work with the plows.

## CANADIAN NOTES.

Mr. Holman, manager of the Chaudiere Electric Co., on behalf of a company composed of himself and some other well known gentlemen, has made a proposition to the town of Levis for the construction of an electric railway at that place. The company wants certain conditions granted, including exemption from taxes for a period of 25 years.

Mr. R. M. Horne-Payne, managing director of the British Columbia Electric Ry. Co., makes the statement that it is the intention to double the present capacity of the power house at Vancouver and to put in one of the most complete lighting plants on the coast. Altogether they propose spending a large amount of money in improvements.

The Toronto Suburban Electric Railway is now pushing the survey for the extension of its lines from Lambton Mills to Hamilton.

The St. Thomas Electric Railway Co. has given notice of an application to the Legislature for permission to extend its line south to Port Stanley and eastwardly through the townships of Malahide and Yarmouth to the town of Aylmer and northerly to London.

Mr. H. J. Cloran, of Hawkesbury, Ont., has patented a device for improving navigation, which he says will do away with the necessity of buoys, lighthouses and pilots along the St. Lawrence River. His idea is to lay a cable at the bottom of a navigable channel and raise from it attached wires with floats bearing lights.

The earnings of the Toronto Street Ry. Co. for 1901 have been given out, and they show an increase of \$152,263 over 1900, the total being \$1,636,861. The greatest monthly earnings were those of September, but the greatest increase in any one month were in October, \$25,973, which is attributed to the visit of the royal couple. The company will have a surplus of \$150,000 after paying fixed charges and the 5 per cent dividend.

Paris, Ont., has granted a 50-year franchise for an electric railway to Dr. Ickes and J. C. Wallace, who represent the Von Echa Co.

Mr. G. G. McPherson, K. C., representing a syndicate, is applying to the council of Stratford, Ont., for a franchise for an electric railway from here to Mitchell.

The following names appear on a notice of application for letters patent to incorporate the Manitoba Water Power Electrical Co.: Henry Burkholder, of Chicago, and N. G. Leslie, W. Georgeson, W. W. McMillan, I. M. Ross and H. Cooper, of Winnipeg.

E. C. Hawkins, who recently resigned as general manager of the White Pass & Yukon Railway, will at the close of navigation when he vacates his position with the company, begin the construction of a radial system of electric railways to the principal surrounding mining districts, following the new government wagon roads along Bonanza Creek to the Dome. Mr. Hawkins, who is an experienced railroad man, is confident that an electric railway from Dawson along the ridge between the Klondike and Bonanza and the Dome will prove the most profitable. This line will also be utilized for freight and will thus supplant a most inadequate team service.

A case affecting the rights of passengers on street railways was decided at the Court of Sessions in Ottawa recently. Wm. Porter sued the street railway company for \$200 damages because one of its conductors would not accept a transfer which he tendered. Porter got a transfer to a Banks St. car, but alighted at Sussex St., five blocks east of Banks St. He called at a hotel, remained there two or three minutes and then returning to the corner of Sussex St. and boarded a passing Banks St. car. The conductor refused the proffered transfer ticket, stating that it was good only at proper point of transfer, and placed his hand on Porter's shoulder with an intimation that he must either pay or get off the car. Porter paid under protest, and the jury awarded him damages, \$100 for assault, and 5 cents the price of his fare.

It is reported that the Peterborough Hydraulic Co. which is controlled by the Quaker Oat Co. is endeavoring to secure control of the Peterborough Light & Power Co.

The company represented by Mr. J. G. Gould, Hamilton, Ont., proposes to build a line from Hamilton to Caledonia and Lake Erie. In the city the cars will run over the tracks of the street railway company, providing a satisfactory arrangement can be

made. The proposed cost of the road will be about \$300,000, of which a considerable amount has been subscribed, and the promoters want the city to take stock to the extent of \$25,000.

It seems that there is still a demand in Paris for Canadians who have a practical knowledge of the street railway business. The latest appointment is that of Mr. A. J. Gadoua, formerly chief of the St. Denis St. station for the Montreal Street Ry. to a responsible position with the East Paris Tramway.

Application has been made to Parliament for an Act to incorporate the Morrisburgh (Ont.) Electric Railway Co., with power to construct and operate a system of electric railways beginning at some point in or near the village of Morrisburgh, and continuing through the Townships of Williamsburgh and Winchester, to the village of Winchester, and a branch line to the villages of Chesterville and Morewood in the Township of Dundas, with power to construct and operate telegraph and telephone lines and electric lighting and power stations along and in connection with said lines and for all other power necessary for the purpose aforesaid.

Those interested in the development of power at Lac de Bonnet, Man., propose building an electric railway from Winnipeg to that place, a distance of 62 miles, at a proposed cost of \$1,000,000. Large pulp and carbide mills, to be run by electric power, are, it is expected, to be built at Lac de Bonnet, and the road will be utilized for both freight and passengers. Mr. Wm. Burkholder, of Chicago, is largely interested.

The construction of the road for which the Provincial Legislature granted a charter to the South Essex Electric Railway Co., will be commenced without delay, the city of Windsor having granted permission for the use of the city streets. The City Clerk, Windsor, will furnish all desired information concerning proposed work upon inquiry.

An unusual number of bills affecting electric railways, showing a remarkable development in this direction, are before the Legislature, and from present indications there will be quite a boom in electric railway construction during the present season. The last issue of the Official Gazette contains notice of applications for some seventeen charters, the most extensive of which is by the Ontario Electric Co. This company seeks incorporation and power to construct and operate a railroad operated by electricity, compressed air or any motive power other than steam, from a point at or near the city of Cornwall, to a point at or near the city of Toronto, a distance of some 250 miles, and also from a point at or near the city of Ottawa to a point at or near the city of Brockville, with power to build branches from these main lines not exceeding 30 miles in each case. The applicants in this case are Sir Richard Cartwright, Ottawa; Albert L. Jewell, Boston; C. Birmingham, Kingston, Ont.; Horace M. Smith, Salem, Mass.; Robert J. Carson, Kingston, Ont.; George Smith, Boston, and John Carson, Kingston. Other applicants are the St. Thomas Electric Railway Co. for power to extend its lines to Port Stanley, Aylmer and London, The Sandwich, Windsor & Amherstburgh Ry., power to issue bonds and debentures to the extent of \$1,000,000 and to extend their lines to Harrow and Tecumseh. The Port Dalhousie, St. Catherines & Thorold Electric Street Ry. seeks power to amalgamate with any other electric company whose lines join its own. The Rapid Electric Ry. asks for incorporation and power to construct and operate a line between Hamilton and Port Dover, passing through several towns. In addition to the above there is a project on foot, headed by Henry T. Thurber, of Detroit, who is representing an American syndicate, for the construction of a line of roads radiating from Hamilton in three sections, Hamilton to Waterloo, Galt to Guelph, and Hamilton to Guelph. This would tap one of the richest and most thickly populated sections of Ontario, and would without doubt handle a large business should the lines be built. The syndicate are applying to the Ontario Legislature for incorporation under the name of the Hamilton Suburban Railway Co. The Port Stanley road also wishes permission to extend to London, and to be granted the power of disposing of its charter if desired.

M. J. Kennedy, general superintendent of the Montreal Street Ry. and the Montreal Park & Island Ry. and will have charge of the traffic arrangements of both systems.

An order placing the Montreal Street Ry. and the Montreal Park & Island Ry. under the charge of one general superintendent,

and the creation of the office of assistant to the general manager, together with other changes and promotions is announced as follows: D. Robertson, assistant to the general manager, carrying out such duties as may be from time to time assigned to him.

W. Punt, assistant superintendent under Mr. Kennedy.

H. R. Lockhart, superintendent of power stations and overhead work on both lines.

J. S. Vindin, engineer in charge of permanent ways, buildings and bridges on both systems.

H. G. Taylor, mechanical superintendent of both systems and is given full charge of all shops at Hochelaga.

---

#### OFFICERS OF THE PHILADELPHIA CO.

According to the plans of the consolidation outlined in the "Review" for December, the Philadelphia Co. on January 1st took charge of all the traction lines in Pittsburg and its vicinity. Mr. Callery, who was formerly president of the Union Traction Co., and the Allegheny County Light Co., has been chosen president of all the lines of the Philadelphia Co. The list of other officers who have been chosen up to the present time is as follows:

James H. Reed, vice-president; S. LaRue Tone, assistant to the president; John Murphy, general superintendent; Charles Fitzgerald, superintendent of the Union Traction Co. lines in Allegheny and the Birmingham and Southern systems; P. J. Callihan, superintendent of the Consolidated, Monongahela and Second Ave. lines; R. G. Clark, superintendent of motive power and master mechanic; W. B. Carson, secretary; C. J. Brown, jr., treasurer, and C. S. Mitchell, auditor. The various lines will have division superintendents as formerly and the present officers in charge will be retained. There will also be no changes in the power house and operating forces.

---

#### LUMEN BEARING CO.

In December last the Bierbaum & Merrick Metal Co., of Buffalo, N. Y., announced to the trade that the company would on and after Jan. 1, 1902, transact all business under the name Lumen Bearing Co. The new name was considered more comprehensive owing to the fact that the company's principal business consists of the manufacture of "Lumen" bronze bearings. At the same time a change took place in the personnel of the company, Messrs. Bierbaum and Merrick giving up all interest in the management, which is now conducted by William H. Barr, general manager, and Edward P. Sharp, manager of the street railway department.

Last April this company owing to its increasing business found it necessary to move from the old plant to one of a much larger capacity which is now being taxed to its utmost to keep up with their increasing business. "Lumen" bronze bearings have been widely used by the leading builders of street railway trucks, and by a number of the large street railway companies throughout the United States. The General Electric Co. is using Lumen for the bearings of the new equipment which it is making for the Manhattan Elevated of New York.

The Lumen Bearing Co. also makes "Ideal" trolley wheels which are rapidly working their way into favor with the street railway trade. The wearing contact rings of these wheels are made of pure lake copper, cast and hammered, giving them the consistency of dropped forged copper. This construction is possible only in a composite wheel, and its wearing qualities are demonstrated by the high mileage records these wheels are making.

---

#### CHANGES IN JOHNS CO.

The H. W. Johns Manufacturing Co., of New York, and the Manville Covering Co., of Milwaukee, each company having heretofore handled the goods manufactured by the other, have consolidated their interests. This consolidation took effect January 1st.

The new company, whose capital stock will be \$3,000,000, will be known as the H. W. Johns-Manville Co. The officers of the new company are: President, T. F. Manville; vice-presidents, C. B. Manville and George W. Gladwin; treasurer, F. R. Boocock; secretary, H. E. Manville. James G. Cannon will be chairman of the board of directors. C. R. Manville will be manager of the West-

ern department, and he, with C. B. Manville will remain in Milwaukee. T. F. Manville and H. E. Manville will remove to New York.

The new company is rapidly completing a plant at Milwaukee for the manufacture of carbonate of magnesia and mineral wool. When this plant is completed, the company will be prepared to furnish a most complete line of all grades of steam pipe and boiler coverings and asbestos goods of all descriptions.

---

#### THE NEW EAST RIVER BRIDGE.

Work on the new bridge over the East River which is to relieve the old New York and Brooklyn bridge of much of the enormous daily traffic to and fro between Brooklyn and New York is progressing rapidly. The approaches are nearing completion and the four main cables which support the central span will soon be ready for the preliminary work of the sub-structure.

As is generally known the contract for all the steel cables, wires and ropes that enter into the construction of the bridge, involving about 5,000 tons of steel wire, was let to the John A. Roebling's Sons Co., of New York and Trenton, which we believe to be the largest maker of steel wire and cables in the world.

The new East River bridge differs from the old Brooklyn bridge in that only the central or main span is suspended from the four cables, the shore spans being carried on trusses independent of the cables. In the Brooklyn bridge the shore spans are supported from the same cables that carry the center span. In the old bridge the towers and approaches were masonry work, but in the case of the new structure they are made up of steel girders and trusses.

The four main cables are not strung in their completed form, but are built up or practically made after the first or foundation wire has been swung into place. Each cable consists of 37 strands bound together, each strand being composed of 282 separate steel wires, 0.16 in. in diameter, making 10,434 wires in each of the four main cables. The work of assembling the strands and binding the strands together is conducted from a temporary wooden foot bridge suspended in the vertical plane of each cable for its full length.

The contract for the steel approaches was awarded to the Pennsylvania Steel Co. There will be about 12,000 tons of steel in the Manhattan approach, and 6,000 tons of steel in the Brooklyn approach.

The bridge is 7,200 ft. in extreme length; 118 ft. extreme width; and the roadway is 135 ft. above mean high water at the center. The towers are 335 ft. above the water. It has accommodations for four surface railway tracks, two tracks for elevated trains, two roadways for vehicles, two footways for pedestrians and two bicycle paths.

---

#### ACCIDENTS OF THE MONTH.

Six persons were killed and several injured on December 23d on the trolley line between Allentown, Pa., and Coopersburg, by reason of an electric car jumping the track at a sharp curve at the foot of a steep grade. The accident was due to wet rails and snow. The motorman was unable to check the speed of the car on the steep grade and as it struck the curve it swung against a guy pole which tore off one side of the car and the car roof. The Coopersburg line on which this accident occurred was opened to the public only a few days previous to the accident.

A head-on collision occurred December 23d on the East Lake line of the Chattanooga Electric Ry. in which the two cars which came together were badly wrecked and a number of passengers received serious injuries none of which, however, proved fatal. One of the cars was heavily loaded with passengers and the other was running empty. There was a dense fog at the time of the collision and the accident occurred on a heavy grade while one of the motormen was running his car rapidly in order to make a switch ahead of the other car. As neither motorman was able to see the headlight of the approaching car they crashed together without warning.

---

The St. Joseph (Mich.) & Benton Harbor Electric Railway & Light Co., owing to the scarcity of coal, was for a few days last month put to the necessity of using old ties for fuel.

**TRACK CONSTRUCTION AT SCRANTON, PA.**

The Engineering News for December 26th contains a description of street railway track construction at Scranton, Pa., which has been carried out in a very substantial manner with the object of securing economy both in the maintenance of the track and of the adjacent pavements. This construction includes a concrete base, T-rails, steel ties and reinforced joints, with brick and asphalt paving.

This work was fully described and illustrated in the "Review" for November, 1899, page 744, but the present article includes the following data on cost which may be of interest to our readers. The statement was prepared by Mr. E. D. Reed, the engineer on the work, and represents the actual cost in one of the streets of the track laid with 65-lb. rails on a 6-in. concrete base and paved with vitrified brick.

**COST OF STREET RAILWAY TRACK CONSTRUCTION AT SCRANTON, PA.**

<b>Material:</b>	
1 ft. track rails (33 1-3 lb.) at \$42.10 per gross ton.....	\$0.8147
Joint plates, \$1.97 per 30-ft., per ft. track.....	.0660
Joint rail, \$1.73 per 30-ft., per ft. track.....	.0576
Tie rods, 34 cts. per 10-ft., per ft. track.....	.0340
Iron rivets, 2 cts. per lb., per ft. track.....	.0071
Copper rivets, 18 cts. per lb., per ft. track.....	.0060
<b>Total .....</b>	<b>\$0.9854</b>
<b>Labor:</b>	
Cost of tearing out old single track, hauling same away, hauling new material, drilling and punching all tie-rods and rivet holes, cutting and drilling steel ties, assembling work ready for concrete and bonding with copper rivets, complete, per ft. of track.....	0.4870
<b>Paving:</b>	
Cost of 1 ft. of track graded, rolled, concreted, and paved with brick, at \$1.97 per sq. ft.....	\$1.0933
Extra concrete at joints and ties, at 72 cts. per sq. yd. ....	.0746
<b>Total .....</b>	<b>\$2.6403</b>
Add 1.5 cts. per ft. of track for fuel, tools, etc.....	.0150
<b>Total .....</b>	<b>\$2.6553</b>

**Note:**  
 Average haul of material, 2 miles.  
 Brick next to rail is of a special grooved shape.  
 Measurements for pavement is taken from outside to outside of head of rail.  
 These figures include the installing of one turnout.  
 Extra concrete is as follows:  
 2 ft. x 5 ft. x 6 ins. under joints.  
 1 ft. x 6 ft. x 6 ins. under ties.  
 The steel ties are made of old 4-ft. girder rails, and no value is placed on them in these figures.  
 The cost of grading and rolling is included in cost of pavement.

**A NEW COAL BELT RY.**

The Coal Belt Electric Ry., which is projected to connect Herrin, Carterville, Carbondale and Johnson City, in Southern Illinois, has been in operation for about four months for a distance of eight miles out of Herrin. Thus far the business of the road has been confined to passenger service, a large per cent of the passengers carried being coal miners, but it is proposed to inaugurate a freight service in the spring and to make the transportation of coal a leading feature. Rails are being distributed for an extension to Carterville, and other extensions are under consideration which will give the road a total length of 20 to 25 miles, the route paralleling for a part of the distance the Chicago & Eastern Illinois and the Illinois Central Railroad.

The St. Louis & Illinois Suburban Ry., which was described in the "Review" for November, page 868, is now making surveys for an extension of its freight line through the coal belt to a point within eight miles of the Carterville, and it is thought that connections will eventually be made between the St. Louis & Illinois

Suburban and the Coal Belt Electric Rys., which will undoubtedly result to their mutual advantage. As yet, however, no steps have been taken toward the accomplishment of such an arrangement.

The Coal Belt Electric Ry. has its headquarters nominally at Herrin, its officers, however, being residents of Chicago. Mr. F. P. Read, of the Peabody Coal Co., 215 Dearborn St., is president, and Mr. Arthur W. Underwood, Marquette Building, secretary. Mr. Frank Peabody is also interested.

**ELECTRIC STORAGE BATTERY CO. SECURES INJUNCTION.**

In a suit recently brought by the Electric Storage Battery Co. against Eugene W. Belknap, the American Bicycle Co. and the National Battery Co., a decision was rendered by Judge Cox, of the United States Circuit Court, sustaining the validity of the Brush storage battery patent, owned by the plaintiff, and granting an injunction against the manufacture and sale by the defendants of the battery manufactured under a patent granted to Elmer A. Sperry. The Electric Storage Battery Co. is the owner of a patent granted to Charles F. Brush in 1886 for improvements in secondary batteries and the question before the court was solely one of infringement. At the argument it was conceded that if the complainant's affidavits correctly described the defendants' electrodes, infringement was established. The defendants, however, produced a number of affidavits contradicting those of the complainant, tending to show that their electrodes were made by the forming process described in an Italian patent granted to Brush, which has expired.

The decision states that the concessions at the argument limited the controversy to a single proposition, namely "Is the defendants' electrode the one described in the expired Italian patent?" The Brush invention covered by the patent in suit includes the supporting plate or grid the active material mechanically applied thereto, active material held to the plate by pressure or by sheets of porous non-conducting material.

The combination of these elements in the formation of the secondary batteries is the means by which Brush produced his first commercial storage battery. The claim of the defendants is that their plates after leaving the molds are put through a long preliminary forming process where the plates are formed similar to the Planté process, after the manner described in the Italian patent. The court holds, however, that this electrode has each of the features described in the complainant's patent and that the forming process of the defendants is simply an unnecessarily prolonged charging process. The defendants' electrode was declared to be a plain infringement than other types which have heretofore been held in the courts to be infringements. An order restraining the defendants from the manufacture and sale of the infringing plates was therefore made.

**AUTOMOBILES IN STREET RAILWAY SERVICE**

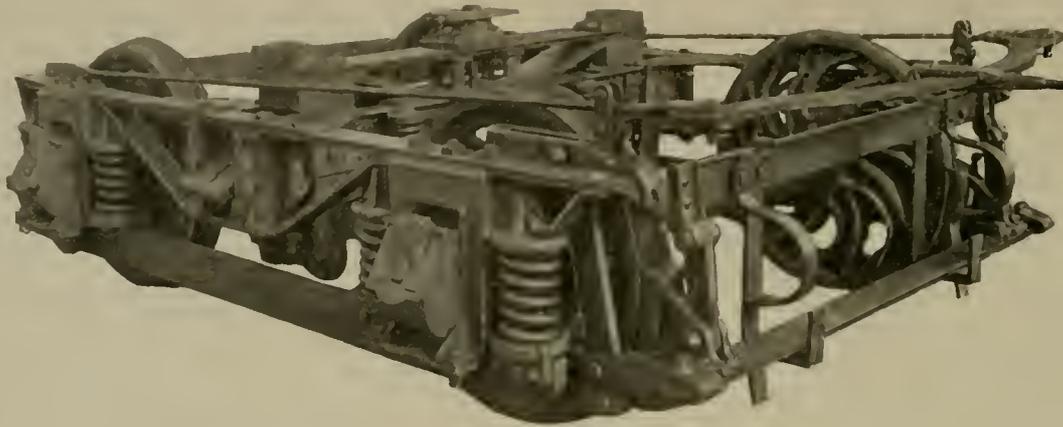

An injunction suit has been brought to stop the operation of the Millcreek Valley Traction Co. through the city of Hamilton, and Mr. Wagenhals, manager of the company, states that if the injunction is granted that preparations have been made to operate a line of automobiles through Hamilton to connect with the company's lines which reach the city limits. It is expected that the Circuit Court will hand down its decision in this case within a short time and if the decision is in favor of the company it will at once proceed to build its tracks and operate its cars through Hamilton. If the decision is adverse, an order for a large number of automobiles will at once be placed and the line will be put in operation within a very short time.

The Elgin (Ill.), Aurora & Southern Traction Co. has decided to manufacture its own cars in the future. A 40-acre site for a factory has been selected at Wayne.

The Montreal (Que.) Street Railway Co. distributed Christmas turkeys and plum puddings to its 1,500 motormen and conductors. The women clerks in the office of the company were also appropriately remembered on Christmas eve.

### NEW HIGH SPEED TRUCK.

Our illustration shows the improved pivotal motor truck "Criterion No. 18," which is offered by the Dörner Truck & Foundry Co., of Logansport, Ind., as the result of 15 years' experience in this business. The truck is heavy and strong, is designed for high speed and is built as near the M. C. B. specifications for steam railroads as it is possible to make a motor truck. The top frame is made of 4 x 1 in. iron and is continuous, having no splice. The ends of the frame are half turned making them vertical, this form being patented. The transom of the trucks is formed by two 1/2 x 8 in. steel plates reinforced by 3 1/2 x 2 1/2 x 2 1/2 in. angle irons extended across the truck and attached to the truck frame proper through the combined transom end and swing hanger pivot. This in turn is secured to the frame and arch bar by means of vertical bolts passing through it. The transom is further braced by gusset

"CRITERION No. 18" INTERURBAN TRUCK.

plates which are riveted to the frame and to the reinforcing angles of the transom. The lower swing hanger pivot rests under and is attached to the swing plank. Elliptic springs rest upon the bottom spring seat which is secured to the spring plank, and the top spring seat is attached to the iron truck bolster. The truck bolster supports the center plate and side bearings, the top spring seat forming a chafing plate to wear against the 1/2 x 8 in. plate which forms a part of the transom. The swing bolster and the brake rigging are secured by safety hangers to eliminate the possibility of accident.

The spring base of the truck is increased by hanging the equalizer bar underneath the box, thus enabling it to have double helical springs on each side, four more than are generally used. With a 6-ft. wheel base, brakes on the outside of the wheels and the swing hanger in front of the wheels, a large amount of space for the motors is secured. The brake head and shoe are attached by a key, making it a simple operation to remove the worn shoe. The brake leverage can be altered as desired, according to the power required. By removing the pedestal tie bar bolts the truck can be lifted away from the journal box, thus leaving the latter with the equalizer and equalizer springs in their normal position. The journal boxes are of large size, giving ample room for oil and packing, and will take a 4 3/4-in. journal. The axles are 5 in. in diameter. The total weight of the truck is 8,700 lb.

The company has lately made three large shipments of this type of truck and has several other orders under way at its works which have recently been built with special reference to this line of manufacture. Because of its substantial construction, its easy riding and the nominal cost of repairs required, this truck is particularly recommended by the makers for heavy interurban work.

Owing to the low water in the Mississippi River, the Twin City Rapid Transit Co. was unable during the first week in December to secure sufficient power from this source to operate its system between Minneapolis and St. Paul. The steam power houses were resorted to, and the interurban service between the cities was temporarily cut down.

### GROUND BROKEN FOR FT. WAYNE-DAYTON INTERURBAN.

The Ft. Wayne, Dayton & Cincinnati Traction Co. whose plans were outlined in the December issue of the "Review," started on the construction of its lines December 15th when ground was formally broken at West Elkton. The ceremonies were witnessed by about 2,000 people on which occasion Dr. S. F. George, president of the company, delivered an address in which he outlined the work undertaken by the company.

As previously described, the company's system embraces 400 miles through a section not reached at present by railways. The entire private right of way has been secured by this road from Ft. Wayne to Brighton, near Cincinnati. The company has recently secured the right of way for a new branch from Greenville to Chattanooga, where it will connect with the main line.

### OHIO TROLLEY STATISTICS.

The annual report of the commissioner of railroads and telegraphs, of Ohio, states that on May 1, 1901, there were 68 companies operating electric railroads in Ohio. The number of miles operated by these companies aggregated 1,818, which is about one-fifth of the main track mileage of all the steam roads in the state. Electric lines are being promoted with great rapidity in Ohio. As an evidence of this the commissioner shows that during the fiscal year ending Nov. 15, 1901, 96 electric railroad companies were incorporated in that state with a total capital stock of \$24,361,000. The gross earnings of the trolley lines of the state for 1901 were \$13,583,651, or more than 20 per cent greater than those of the year previous.

### BANQUET OF THE OHMER CAR REGISTER CO.

An elaborate dinner was given by the Ohmer Car Register Co. on December 28th to the managers of the various departments of the works and the company's traveling representatives. The occasion was also marked by the awarding of prizes to the employes for meritorious suggestions in regard to improvements in the manufacture of registers, a custom which has been practiced annually by the Ohmer company. Ten prizes were awarded ranging from \$2 to \$25 in value and the prize committee had in all 61 suggestions from the men to consider. Speeches were made by the heads of a number of the departments and after drinking a toast to the absent officers and traveling representatives, Mr. Ohmer concluded the ceremony with a few well chosen remarks. Most of the speeches were in the line of criticisms and suggestions in regard to the work of the company, many of which will, when adopted, prove of much practical benefit.

The Everett-Moore syndicate it is said, will shortly acquire the St. Thomas (Ont.) Street Ry., and extend it to London, Aylmer and Port Stanley. A grant for the proposed extensions is now pending before the Ontario legislature.

**NEW ST. LOUIS CAR.**

The accompanying illustration gives a general view of one of the new cars which is being built for the Metropolitan Street Railway Co., of Kansas City, Mo., by the St. Louis Car Co.; the order was for 50 closed motor cars. The details of the car are as follows: The length over the corner posts is 21 ft., and the extreme length of the platform, 4 ft. 6 in. The width of car over

ST. LOUIS CAR FOR KANSAS CITY.

the posts is 7 ft. 10 in., while its width over the widest part is 8 ft. 3 in. The platforms are built with permanent vestibules having five drop sash. The doors are of quartered oak 1 3/4 in. thick with drop sash in two lights; the outside is paneled with No. 16 steel. Double strength A glass is used in the sash and is fastened with bead moulding screwed to place. There are seven ventilator sash on each side of the car, and four guide pipes which run on the outside of the car, outside of the sash, the full length of the body. These window guards are of 1/2-in. seamless brass tubing; the curtains are hung on spring rollers. Seats are of the Hale & Kilburn spring cushion type with canvas back rattan covered with the best quality of Wilton carpet. The interior finish is in even color of quartered oak. There are two bevel edge plate glass mirrors set in each end of the car, and it is also provided with a Hunter illuminated sign, and du Pont trucks and fenders. The material and workmanship throughout is of the finest.

**A "UNIVERSAL" SAFETY TREAD.**

The "Universal" safety tread, as its name implies, is a design to insure an absolutely safe foothold for pedestrians, on stairway, sidewalks, street car steps, and in other places where there is a tendency for the footway to become slippery and therefore dangerous.

The "Universal" tread is a combination of lead and steel, but there are no continuous ribs of steel to wear smooth and counteract in whole or in part the clinging effect of the lead. The lead is held in an ingenious steel matrix, which in itself would prevent

UNIVERSAL SAFETY TREAD.

slipping, and which, when filled with the lead, gives a surface that is as safe to walk upon lengthwise of the ridges as transversely—a characteristic that suggested the name "Universal."

In its application to street car steps, the surface of the tread is usually made up in three divisions as shown in the cut. The central portion having the ridges running parallel to the edge of the step, is both renewable and renewable. That is when the outer edge where most of the wear comes is worn down, the piece can be turned end for end, bringing the inner edge to the front, thereby doubling the life of the tread.

The device which is made by the Universal Safety Tread Co., of 45 Broadway, New York City, has been endorsed by a large

number of street railway companies, and the makers are able to guarantee that the tread will last practically as long as the car step.

**VISITS FROM SANTA CLAUS.**

The Syracuse Rapid Transit Railway Co. distributed among its employes, Christmas presents which amounted to \$1,750 in cash.

The following notice signed by Mr. E. G. Connette, vice-president and general manager, was posted at midnight in the waiting room of the employes: "In recognition of the valuable and efficient service during the past year the company will give each of its employes a cash present. The foreman of each department will distribute the gifts on Christmas morning."

No one of the force was lost sight of in the distribution of the presents and from the office boy to the oldest man in the service each received a present of from \$3 to \$5.

Employes of the Schuylkill Traction Co., who number about 100, were presented with cash presents, aggregating about \$400 on Christmas. Mr. Clark Merchant, president of the company, announced that 10 per cent of the gross earnings of the road for the week previous to Christmas would be presented to the men as a Christmas gift. The

pay roll for the week was made the basis for the distribution of the Christmas money, each man's share being based upon the amount he received at his last pay day.

**EXTRA TROLLEY FARES LEGAL.**

A decision was rendered last month in the case of a suit brought against the Brooklyn Heights Railroad Co. to restrict it from collecting more than one fare for a continuous ride over its road and the roads operated by it. The decision pointed out that a street surface railroad incorporated under the street surface railroad act of 1884 is prohibited by statute from charging a passenger more than 5 cents for one continuous ride from any point on its road, or any road under its control, to any other point on such roads within the limits of an incorporated village or city. It is pointed out that the fact that a railroad company extends its road by acquiring the tracks of another railroad company having the right to charge a fare of 10 cents, for example, would not give the latter company the right to charge to cents. In the case of the Brooklyn Heights Railroad Co., however, this law does not apply, as the Appellate Court has already decided, that the statute provision does not affect roads acquired from steam railroad companies.

**TROY FRANCHISE IN DISPUTE.**

The United Traction Co., of Albany, N. Y., recently filed with the secretary of state a certificate of extension of its tracks in what was formerly the village of Lansingsburg which has since been consolidated with the city of Troy. The certificate filed shows that the consents of the village authorities and of property owners along the line was secured in December, 1900, but the city authorities deny that the franchise granted by the former village of Lansingsburg is valid since its consolidation with Troy. Engineers of the United Traction Co. have already commenced making surveys of the proposed extension but they have been notified by the police of the city not to break ground or tear up the road in any way without a permit from the commissioner of public works. The engineers will be allowed to make the survey, but may not do construction work.

The Bay Cities Consolidated Railway Co., of Bay City, Mich., has accepted a contract for heating the municipal building during the winter.

The Pennsylvania State Building at the Pan-American Exposition has been purchased by a syndicate which owns Flagstaff mountain, the highest point reached by the Mauch Chunk, Lehigh & Slatington Street Ry. The building will be placed on top of the mountain and used as a restaurant and cafe.

## THE FIRST CLEVELAND-DETROIT THROUGH CAR.

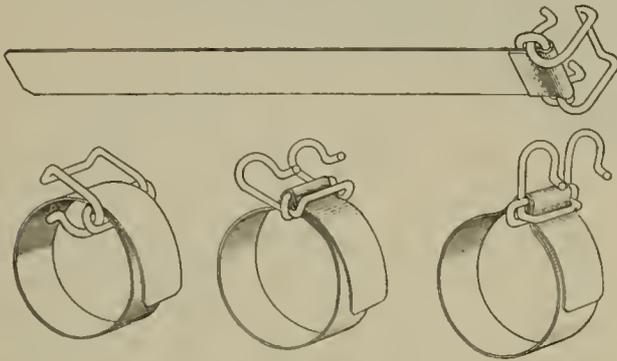

The first trolley car of the Everett-Moore syndicate to make a through trip between Cleveland and Detroit was run on December 23d and carried several officials of the Everett-Moore syndicate and the representatives of several eastern banking houses. The trip was made with the object of giving the eastern capitalists an opportunity of inspecting the system and also for getting data upon which to base a through running and traffic schedule.

It was expected that through cars between Cleveland and Toledo and probably Detroit would be in operation this month. The party made the trip from Cleveland to Toledo in less than six hours, which is excellent time considering the fact that the line is new and has not yet been properly ballasted at all points.

## THE BOSTON CABLE CLIP.

The Chase-Shawmut Co., of 300 Atlantic Ave., Boston, is making a specialty of a novel clip for supporting aerial feeder and other cables, wherever the cable is suspended from a guy wire. The device consists of two pieces of steel wire and a strap of sheet metal. There are no rivets, pins, or buttons, and it can be adjusted entirely by hand.

The clip can be quickly and easily adjusted to any cable that the strap will go around, and can be placed over a splice as well as on the regular cable. The metal strap is simply pulled tight

"BOSTON" CABLE CLIP

around the cable before it is passed through the hanger piece. Upon turning over the hanger the metal strap is bent down and locked in place, the lever action taking up all slack and binding the strap tight. The steps in the process of fitting the clip to the cable are set forth in the illustrations. Special consideration is directed to the firm gripping power of the clip, which will cause it to stay where it is placed and will not permit the cable to slip or sag on long spans where the dip is great, or where one end of the stretch is lower than the other.

## ELECTRICAL INDUSTRIAL RAILWAYS.

Electric railways have long been recognized as an important time and labor saving device in and about manufacturing plants, for use in mines and by contractors, and naturally the makers of railroad materials have given a great deal of attention to this field. Among those who have realized very good results in equipping roads of this type, as well as running them economically, is the well known firm of Arthur Koppel, of New York. This firm has built many electric roads for industrial purposes and has also developed portable electric railways, thus making electric railroads available for such as have to use them at different places, and at each place for a comparatively short time. All the parts composing these equipments are light and easily handled, and the roads can be rapidly laid down. Every detail is thoroughly worked out and even specially constructed and patented cars for stringing the trolley wire enter into the equipment.

Electric railways have been built by Arthur Koppel in many different countries, and for many different purposes, as for instance

factory roads bringing the raw material into the plant, carrying the different materials around, and finally taking the finished product to the station, for mines, for contractors, for plantations, and even for passenger traffic.

In order to give interested parties an opportunity to get acquainted with these industrial roads, their working and their equipment, the firm has erected in its New York office at 60 Broad St. an exact model of such an electric railroad in 1-10 actual size, equipped on the overhead system, with electric locomotive and coal flat, plantation, contractors, and passenger cars. The firm also publishes a special catalog on this subject.

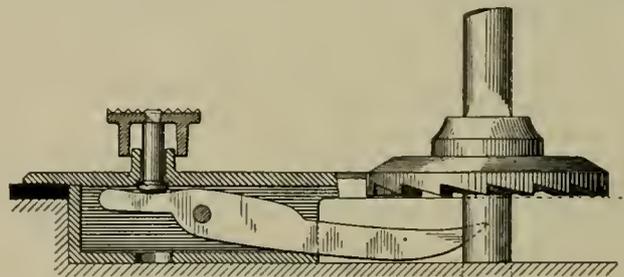

## GROWTH OF TROLLEY LINES IN PENNSYLVANIA.

A striking feature of the annual report of the Pennsylvania State Bureau of Railways is the growth of the street railways in that state during the past 14 years. In 1887 the capital stock outstanding of the street railways of the state was \$17,211,680. The figure for 1901 is \$108,676,774. In 1887 the length of all roads was 519.3 miles, during the past year the total length of all tracks operated has reached 2,167.91 miles. The increase during the past year was somewhat over 100 miles. The total number of cars owned in 1900 was 6,395 and in 1901, 6,618. The number of passengers carried during the former year was 538,196,532, and during the past year it was 560,654,629.

## NEW BRAKE RATCHET.

A new foot ratchet for holding the brake staff of an electric car in any desired position when the brakes are set has been invented by John C. Ernest, of 609 Peffer St., Harrisburg, Pa., and has been used with satisfaction for over a year by the Harrisburg Traction Co.

To the brake staff is secured in any desired manner, a crown-wheel, the face of which stands just above the surface of the platform, so that it may readily turn with the staff. In a mortised recess formed in the platform is a metal box, which contains a dog, mounted on a pivot, as shown in the cut, and having its front end curved and tapered to form a broad tooth adapted to engage the teeth on the under side of the crown-wheel. Bearing against the

ERNEST BRAKE RATCHET.

other end of the dog is a foot pin having an enlarged head at its lower extremity, and a foot piece or cap at its upper end.

The weight of the dog serves to raise the pin and its cap, and normally the engaging tooth is held away from the crown-wheel. When the brake is to be applied, the foot of the operator is pressed down on the cap, forcing down the pin, and raising the free end of the dog against the crown-wheel. To release the brake, the staff is given a slight turn letting the dog drop and permitting the staff to revolve and release the brake.

The top plate of the box at one end is elongated and a corner thereof is cut out on the arc of a circle, so that the periphery of the crown-wheel may be fitted nicely to it, thus excluding all dirt, snow, water and ice from the box.

The Union Traction Co. of Philadelphia has increased the wages of its 5,000 motormen and conductors from 18 to 19 cents an hour, the new scale becoming effective on January 1st. Eighteen months ago, the company voluntarily granted an increase in wages of 1½ cents an hour.

**DISASTER AT ITHACA.**

A hard rain which occurred December 14th and 15th in the neighborhood of Ithaca, N. Y., raised Six Mile Creek so rapidly that thousands of dollars worth of property along this stream were swept away in a few hours. One of the heaviest losers was the Ithaca Street Railway Co., a large part of whose plant was situated on the banks of this creek. All street car traffic was entirely suspended, as the railway power plant and lighting plant of the city were destroyed. The wreckage which blocked the channel of the

FIG. 1.

creek turned the stream from its course so that the whole lower part of the city was overflowed.

A sub-station which has recently been built by the street railway company is the only one of its buildings left intact. This station contains a storage battery plant which is capable of operating part of the lines, but nearly all the rest of the company's buildings as well as two cars, were entirely lost in the flood. One entire side of the car barn was torn out and the steel roof twisted and left hanging with but slight support. The dynamos, engines and boilers of the old power plant are in the bottom of the new channel formed by the creek. The blacksmith shop, paint shop, oil house, and the house in which the foreman of the machine shop lived were entirely washed away. There was no loss of life reported, although Mr. Graton, foreman of the paint shop, was supposed for some hours to have been drowned. He was seen at the shop a short time before it was washed away and had not been seen to come out, he escaped from the building, however, before the collapse occurred. It is estimated that the company's loss will reach nearly \$50,000, as in addition to the ruined buildings and machinery, long stretches of track on the Cuyahoga Lake division were undermined by the flood.

The part of the valley in which Ithaca is located is a mile and a half wide and although the city is about two miles from the lake, it is but a few feet above its level, so that Ithaca, which is sometimes called the "City of Seven Creeks," is subject to inundation. The hard rain which commenced on December 14th was sufficient to cause alarm and the climax was reached by the breaking away of the dam at the outlet of Dryden Lake about 10 miles away which lowered the lake six feet and precipitated this large body of water upon Ithaca, whose creeks were already full.

The accompanying illustrations, for which we are indebted to Mr. Louis Graton, give an excellent idea of the damage to the buildings of the Ithaca Street Railway Co. In one of these views, the gable of the wooden building which faces to the north indicates the points of the compass. The waters of the creek flow from east to west except at the point shown on the extreme lower right hand corner of the illustration, where they were deflected to the south for about 50 rods by wooden docking. An iron bridge spans the creek at a point directly opposite the car barn standing in front of the machine shop. Near this bridge was the 60-ft. paint shop and the oil house. The docking, bridge, paint shop, oil house and the dock at the end of the docking have all disappeared together with one or two acres of soil. At the point marked 1 there is a wall which once deflected the waters of the creek

west of the wooden docking. This has been brought to view for the first time since 1857, at which time another devastating flood occurred. At point 2 stood an almost new house that was occupied by the foreman of the machine shop and it was surrounded by a number of large trees, some of them being not less than 15 in. in diameter. As already stated, this house was entirely washed away, as well as all the trees surrounding it. The fallen roof near the derrick covered the building that contained the engine and dynamos. The engine is in sight, but the dynamos are under the roof. At point 3 is the north roof of the car barn. The long cupola of the sub-station receives the wires from the power house which is 2½ miles distant.

The other illustration gives a south view of the car barn with its south wall nearly all washed away. The ruined boiler and stack are also shown at the end of the frame building.

It is the intention of the company to refill and again occupy the place which was washed away by the flood. A contract has already been let for piling which will make a more effectual break-water than the former one. It is hoped that this prompt and courageous action by the management of the company in the face of such a disaster will be rewarded by the success it deserves.

It is estimated that the total loss to property holders in Ithaca reaches nearly \$500,000, and the loss to the city in ruined and damaged pavements alone will approach \$135,000. While the loss in Ithaca caused by the flood reached the largest figures, a number of other central New York cities received considerable damage at the same time. At Utica and throughout the Mohawk Valley the damage to railroads was serious. The Rome, Watertown & Ogdensburg and the Mohawk division of the New York Central were entirely tied up for several days. Near Rome, the latter road had three distinct washouts, all four tracks being swept away for a considerable distance. At Elmira about \$100,000 damage was done to houses and stores. A number of railroad bridges in this neighborhood were completely washed away and for 40 hours no mail from the east was able to reach the city.

Middletown, N. Y., was in a similar condition owing to land slides and washouts which occurred at a number of points. At

FIG. 2.

Wilkesbarre and Scranton, Pa., the washouts and land slides were so serious as to cut off the railroad connections entirely for some time. It was several days before the tracks were sufficiently repaired to permit trains from New York to reach the former place.

**THE CHICAGO & INDIANA AIR LINE.**

The Chicago & Indiana Air Line Co., which proposes to build an electric line from South Bend, Ind., to Chicago, is negotiating with the officials of the Indiana Railway Co. for rights to enter South Bend over the Indiana company's tracks as soon as the Interurban line is built. Agents of the new road have been actively engaged in purchasing rights of way for this line along the Chicago Michigan City wagon road. The company is paying at the rate of \$2,000 a mile for a 50 ft. right of way, and has secured a large number of options along the route.

## ELECTRICAL EQUIPMENT OF THE LONDON UNDERGROUND.

The decision of the London Board of Trade in regard to the recent arbitration between the Metropolitan and the Metropolitan District railways was based on the arbitrators' report to that body, which was as follows:

### ARBITRATORS' REPORT TO THE BOARD OF TRADE.

"The Metropolitan Railway Co. is owner of nine miles and the District Railway Co. is owner of four miles in length of that portion of the Underground Railway in London which is known as the Inner Circle, and are joint owners of the City Line and Extension Railways. Both companies have for some time concurred in the necessity of working these railways by electrical power, but have been unable to agree to adopt the same system, the Metropolitan company advocating what may be described as the "alternating" current system, the District company preferring the "continuous" current system of electrical traction. Under these circumstances in the summer of 1901 all necessary steps were taken by the companies to procure the appointment of a special tribunal under the Metropolitan District Railway Act, 1901, sec. 9, to hear evidence and to report to the Board of Trade with the object of deciding which of the two above-named systems should be adopted. A special tribunal was accordingly appointed, consisting of myself, as arbitrator, Mr. Thomas Park, engineer, of Wolverhampton, nominated by the Metropolitan Railway Co., and Mr. H. F. Parshall, engineer, of 8 Prince St., London, E. C., nominated by the District company, which heard the evidence of the two parties and the arguments and speeches of counsel on their behalf on the 7th October and eleven subsequent days.

"The position under consideration is novel, for Parliament has for the first time thrown on the Board of Trade the task of imposing on a railway company a system of working to which that company is opposed. The system to be adopted on the Inner Circle will have to operate on a circular railroad, in tunnel, through which a dense traffic is carried by trains frequently stopping, and rapidly succeeding each other, and where a large number of trains of foreign companies are at frequent intervals interjected. On such a road it is of vital moment that a service of precise and imperturbable regularity should be maintained. It is further requisite that the trains should be handy, i. e., should, without discomfort to passengers, quickly start, accelerate, retard and stop. It is above all essential that the system adopted should be safe to the public and the employes of the railway companies concerned. The "continuous" system, whereby an alternating current of high tension is first transformed, and then converted into a direct current of 500 volts, and collected from a third rail into the train motors, is very well known, and it was not seriously questioned by the Metropolitan company that it had been proved to satisfy the requisites above enumerated by long and well-tried experience on similar railroads, carrying similar traffic under similar conditions both in America and England.

The "alternating" system as carried out by Ganz & Co. of Buda Pesth, proposed by the Metropolitan company, abolishes the rotary converters employed in the "continuous" system and introduces into the tunnels where the trains run a current of 3,000 volts carried on overhead conductors and collected thence into the train motors by trolleys.

"It was admitted that no fully equipped railway in actual working used a current in the traffic exceeding a pressure of 750 volts, nor have any experiments been made of Messrs. Ganz's proposed system on railways presenting the peculiar features of the Inner Circle. It is true that certain experiments of this method of traction have been made in the yards of Messrs. Ganz & Co., and on the Sondrio & Lecco Ry. in Italy (not yet opened for traffic) of a very interesting and important character, but those experiments have not resulted in the proposal by the Metropolitan company for the Inner Circle system of the plant there tested. The motors, the trolleys, the controlling gear, the conductors, the safety devices described by Messrs. Ganz before us as those proposed to be used on the Inner Circle differ materially from those tested as before mentioned, and the maximum of acceleration for the motors was changed from 1-8 ft. to 2-6 ft. per sec. while the system originally a 15 cycle system was changed to a 25 cycle system.

"It is therefore accurate to say that the system tested at Sondrio

and at Messrs. Ganz's yards is still in the experimental stage, and that important departures from and amendments of that system were avowed as necessary before us for the Inner Circle.

"It will thus be seen that the Metropolitan company, who alleged in substance a superiority in economy only for the "alternating" system, seeks, against the will of its partner in ownership, to displace a well-tried and widely successful system, and to make an experiment under perhaps the most expensive and complicated conditions which could be found in Europe. Such an experiment may very possibly be made on a railway of a scale where considerations of safety are less vital—where if any loss ensues it will not be heavy, and will be borne by those only who are responsible for making it; but it is impossible to recommend its trial against the will of the District company on the Inner Circle.

"Many controversial matters of great interest from the point of view of electrical science were discussed before us. Upon these questions it is not necessary—and would probably be premature—to express an opinion.

"It is for the broad reasons already set forth in this report that I advise the "continuous" system should be adopted on the Inner Circle and on the City Lines and Extension Railways. In this advice Mr. Parshall concurs, Mr. Parker does not dissent, and does not desire to send in any separate report.

"I think it right to add that the manner in which the District company conducted the preliminary negotiations which took place between the two companies to determine the system of electrical traction was most embarrassing to the Metropolitan company, and fully justified that company in clearing the matter up by arbitration

(Signed) "Alfred Lyttleton."

Immediately following the decision of the Board of Trade, Mr. Yerkes awarded the contract for the electrical equipment of the Inner Circle to the British Westinghouse Electric & Manufacturing Co., whose new works at Manchester, Eng., will be in operation within a few weeks. A portion of the installation, however, will be built in the Westinghouse works, at Pittsburg, in order to hasten the construction of the road.

The generators will be of 6,660 h. p. each and will be driven by steam turbines which will be several times larger than any others heretofore built. The work will begin immediately and it is expected that within two years from January 1st, the Inner Circle will be operated with an up-to-date system of electric traction.

## WORLD'S FAIR EMBLEM PRIZE.

A competition has been inaugurated by the Louisiana Purchase Exposition for the design of a symbol or emblem to be used for the seal, the stationery and for the publicity material of every description for the exposition. An appropriation of \$5,000 has been made to meet the competition charges, divided as follows:

For the prize design, \$2,500. Honorarium of \$250 to each of eight selected sculptors. For the expense of the jury of selection, \$500. The jury is to be composed of two artists, two architects, two sculptors, and one historian. This jury is to choose eight sculptors or medalists which will be commissioned for the honorarium to design an emblem. But in addition to these eight, the competition is open to the entire world and all designs submitted, whether from outsiders or from the eight selected, are to be considered on a par in awarding the prize of \$2,500. No restrictions are laid down as to lettering, sentiment or style of the design, the only stipulation being that it shall be symbolic of the historical event which the fair is to commemorate.

The men who serve on the jury of selection are to be of national reputation, and an invitation will be sent to representatives of foreign governments at Washington requesting that they submit the plan of competition to interested parties in their respective countries. A period of six months will be allowed for the competition.

## FIRE AT LA SALLE, ILL.

The power house and car shed of the City Electric Ry., of La Salle, Ill., were destroyed by fire on January 15th. It is reported that only two cars of the entire equipment are still serviceable. The loss is estimated at \$60,000, insurance \$5,000. J. R. Burrows, of La Salle, is receiver and superintendent.

**DIFFICULT ENGINEERING IN NEW YORK SUBWAY.**

In the "Review" for last November, page 834, reference was made to a unique feat of engineering in connection with the New York rapid transit subway work.

At 135th St. and Broadway, where the viaduct, which is to carry the rapid transit road over the Manhattan Valley connects with the underground subway portion, it was found imperative to change the plans so as to give three tracks at this point instead of

CHANGE FROM 2-TRACK TO 3-TRACK CONSTRUCTION.  
Photo by P. P. Puffis.

two as called for in the original design. These alterations involved the shifting of two heavy retaining walls and the widening of a long section of the completed subway, so as to give room for the additional track.

The first block of this length of the subway, which comprises the inclined approach to the tunnel, involved the moving of two walls composed of concrete, heavy blocks of stone and pressed brick, each weighing about 200 tons. In the work of moving, wooden wedges were first placed at frequent intervals under the walls. On the bottom of the wall, thin strips of metal were inserted, the lower strip being fastened to the wedge and the upper one on which it was intended to slide. Grease was poured on these strips, and by means of hand jack screws applied simultaneously at short intervals along the base of the wall, the entire wall was shifted to a new foundation, a distance of 5 1/2 ft.

The second block comprised a section of the completed subway structure itself, which was shifted intact with the exception of the westerly wall.

Before the actual work of moving could be undertaken the subway had to be thoroughly braced to avoid possible wrenching or twisting stresses in the wall or roof. On either side of each of the central upright girders supporting the roof, were bolted heavy cross timbers, a short distance above the tunnel floor, these timbers forming practically a false or secondary floor framing.

On these floor timbers were carried timbers supporting the roof along both the westerly and easterly wall, and on the easterly side additional bracing timbers were carried diagonally from the lower corner at one side to the center line of the roof. Virtually all the load was thus taken from the steel girder members and transferred to the false timber work. Heavy timbers were then inserted at short intervals under the entire section to act as slide ways.

When all was in readiness the holding down belts of the central line of steel girders were withdrawn from the cement piers on which the girders rested, the roof was cut away from the westerly wall; the foundations of the easterly wall were cut through; and the entire structure was then forced over to the new foundations.

To give the desired additional width the westerly wall was forced

back in the same manner as were the walls on the first block. The roof was next pieced out with a new set of girders riveted to the ends of the old roof girders, in the manner indicated in one of the illustrations. As far as can be determined the new three-track subway is in as good condition as was the old two-track tunnel.

The actual work of building the entire rapid transit subway has now been in progress about 16 months, just one-third of the time allowance of four years stipulated in the contract, but in that one-third of the time almost 58 per cent of the earth excavation and a little more than 35 per cent of the rock tunnelling have been completed.

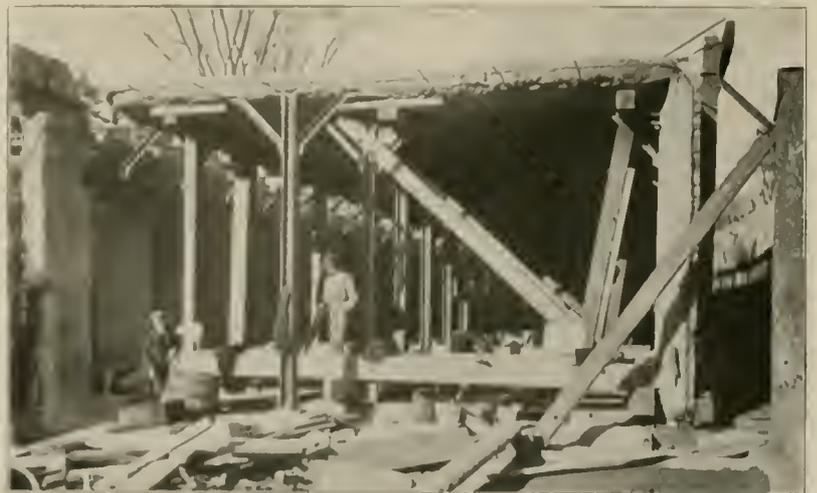

Including the estimate for December the contractor's requisition for pay for work done amounts to \$12,000,000, a little more than a third of the total contract price. If the present rate is kept up the subway will be practically completed by August, 1903, or about seven months ahead of time.

**NEW ENGLAND STREET RAILWAY CLUB.**

The second annual meeting and banquet of the New England Street Railway Club will be held at Hotel Brunswick, Boston, on Thursday, Jan. 23, 1902. An informal reception will be held from 5 to 6 p. m., followed by the banquet at 6 o'clock sharp. At the conclusion of the dinner the regular meeting will be called to order.

It is the aim of the entertainment committee to make this gathering of unusual interest and importance. The governors of the several New England States, the chairman of the railway commission and many of the prominent street railway men of New England have been invited as guests. Music will be furnished by the Hyde Park Glee Club of 23 male voices, accompanied by a full orchestra. The annual election of officers will take place at this meeting.

Tickets for the banquet will be \$2 each, and owing to the elaborate arrangements and expenses attending the gathering, it is requested that members apply at once for tickets, as the supply will be limited. Requests should be made to the secretary, Mr. J. H. Neal, 101 Milk St., Boston, Mass.

STEEL CONSTRUCTION AT 12TH ST. AND BROADWAY, SHOWING BRACING.  
Photo by P. P. Puffis.

The entertainment committee having arrangements in charge is as follows: Edward C. Spring (chairman), superintendent Newton & Boston Street Railway Co., Newtonville, Mass.; J. H. Neal, F. G. L. Henderson, superintendent Newton Street Railway Co., West Newton, Mass.; H. E. Reynolds, division superintendent Old Colony Street Railway Co., Quincy, Mass.; F. J. Stone, manager Electric Storage Battery Co., 60 State St., Boston.

## PERSONAL.

MR. T. C. RODERICK, formerly of Indianapolis, has been elected superintendent of the Owensboro (Ky.) City Railroad Co., to succeed Mr. E. C. Folsom who recently resigned.

MR. IRA A. McCORMACK and MR. C. W. WASON, of the Cleveland Electric Railway Co., returned to Cleveland December 17th after an extended tour of inspection of street railways in eastern states.

MR. WILLIAM PESTELL, superintendent of motive power and machinery of the Worcester (Mass.) Consolidated Street Rail-

W. PESTELL.

way Co., has had a long and valuable experience in electrical engineering work. Prior to 1890 he was engaged with a number of electrical enterprises, in which he was called upon to do considerable designing, building and repairing of motors and generators. In 1890 he went with the Sprague company in Boston. In 1893 he went to Salem to take charge of armature winding for the old Naumkeag Street Ry., and remained in this position until the Naumkeag road was absorbed by the Lynn & Boston. After the consolidation he was given charge of the electrical and mechanical departments of the new company. He subsequently moved to Lynn and after the Lynn & Boston road had been purchased by the Massachusetts Electric Companies he continued to serve as electrical engineer. He went to Worcester in the spring of 1901 and in the few months since assuming his new duties has made important suggestions regarding changes in the power house, track and repair departments, which have resulted in the introduction of a number of improvements and economies. Under Mr. Laffin, the general manager, he has general oversight of power houses, reform work, and all electrical matters.

MR. GODFREY MORGAN, formerly superintendent of the Niagara Gorge Railroad Co., Niagara Falls, N. Y., has been appointed general superintendent of the Youngstown (O.) & Sharon Railway & Light Co.

MR. C. F. MOORE, of Akron, secretary of the Northern Ohio Traction Co., has assumed the management of the Canton-Massillon lines of the Everett-Moore syndicate. Mr. Moore may determine to reside in Canton.

MR. EDWIN W. OLDS, superintendent of rolling stock of the Milwaukee Electric Railway & Light Co., was presented with a pair of otter driving gloves and a silk umbrella by the employes of his department, on Christmas eve.

MR. HAYES QUINCY TROWBRIDGE, on December 10th, was elected a director of the Fairhaven & Westville Railroad Co., of New Haven, Conn., to fill the vacancy in board occasioned by the death of his father, E. Hayes Trowbridge.

MR. GUY MORRISON WALKER has removed his office from the Electric Building, Cleveland, to No. 1017 Broad Exchange Building, New York, where he will represent the Everett-Moore interests as New York attorney and financial agent.

MR. F. F. BODLER who takes the place of master mechanic of the North Jersey Street Railway Co., vice Mr. H. H. Adams, resigned, was formerly with the Jersey City, Hoboken & Paterson Ry. He is a graduate of Lafayette University and has worked his way up through the various branches of electric railway service.

MR. CHARLES CURRIE, second vice-president and general manager of the Northern Ohio Traction Co., of Akron, O., on

December 14th assumed charge of the Canton-Massillon Electric Railway Co., of Canton, O., as general manager and treasurer, and henceforth will operate both systems which together comprise about 140 miles of road.

MR. H. H. ADAMS, master mechanic of the North Jersey Street Railway Co. has resigned to become superintendent of motive power for the United Railways & Electric Co., of Baltimore, Md. Mr. Adams is a graduate of Stevens Institute and has been with the North Jersey road for six or seven years. He is succeeded by Mr. F. F. Bodler.

MR. J. W. HANCOCK was elected vice-president and general manager of the Roanoke (Va.) Railway & Electric Co. at a meeting of the directors on December 20th. Mr. Hancock has been connected with the Roanoke company for several years, and for some time past has been acting general manager in which capacity his efficient service quickly won recognition from the company and its patrons.

MR. M. F. CONNETTE has been recently appointed roadmaster of the Syracuse Rapid Transit Railway Co. and has charge of the overhead construction. Mr. Connette formerly resided at Nashville, Tenn., where he had charge of the East Nashville division of the Nashville Street Ry. He removed to Syracuse in April, 1900, and prior to his present appointment has been superintendent of the Tallman St. car house of the Syracuse company.

MR. THOMAS C. BARR, of East Orange, N. J., has been elected president of the Elizabeth, Plainfield & Central Jersey Railway Co., to succeed Mr. David Young. Mr. Barr was formerly president of the Essex Passenger Ry. and had previously been identified with street railway interests in Philadelphia. Mr. John Ackerman was elected general manager, and Col. Edwin E. Hine, treasurer, of the Elizabeth, Plainfield & Central Jersey Company.

MR. BURT VAN HORN, who in December resigned as general manager of the International Traction Co.'s properties, will spend the winter on the Pacific Coast, taking a much needed rest. Mr. Van Horn became associated with Mr. W. Caryl Ely in the building of the Buffalo & Niagara Falls road, securing the franchise and serving as vice-president and general manager; after the organization of the International Traction Co. he became general manager of all the operating companies.

MR. THOMAS SMITH, who is about to leave his position with the Westinghouse company at Pittsburg to become assistant superintendent of the British Westinghouse Works near Manchester, England, was tendered a banquet on December 24th by all the subjects of King Edward employed in the Pittsburg manufactory. The banquet was a most enjoyable one and at the end of it the company presented Mr. Smith with a purse of money and a valuable watch was presented him by the British hosts of the evening.

MR. FRANK H. NEWCOMB has been appointed to succeed W. J. Taylor as assistant to George H. Roberts, jr., Postmaster, Brooklyn. Mr. Newcomb is well known to street railway men as the manufacturer of motormen's and conductors' caps. He was born at Easton, Mass., 43 years ago and came to Brooklyn in 1868. For 19 years he has been a latter in that city, his place of business adjoining the Flatbush Ave. postal sub-station of which latter he has had charge through three administrations, covering a period of 12 years. Mr. Newcomb is thoroughly familiar with the practical workings of the postal service, and his appointment as assistant postmaster is highly satisfactory to the officials at Washington. Mr. Newcomb assumed the responsibilities of his new position on January 1st.

MR. THOMAS E. MITTEN on Dec. 18, 1901, succeeded Mr. Burt Van Horn as general manager of the properties controlled by the International Traction Co., of Buffalo, and Niagara Falls. Mr. Mitten entered the electric railway field when in Denver in the early 90's, being then with the Denver & Rio Grande R. R. and equipping a steam line near Denver for electric traction. In

1895 he removed to Wisconsin and shortly afterwards became general superintendent of the Milwaukee Electric Railway & Light Co., which position he resigned in March, 1901, to become general superintendent of the Buffalo roads. Mr. Mitten went to Buffalo just as the company was making preparations for handling the Pan-American traffic, and during his superintendency made an enviable record, of which his promotion to general manager is an appropriate recognition. The office of general superintendent has been abolished.

MR. ROBERT ANDREWS, heretofore vice-president of the Safety Car Heating & Lighting Co., of New York, has been

ROBERT ANDREWS.

elected president of the company, vice Arthur W. Soper, deceased. Colonel Andrews is a native of Wilmington, Del., and is an expert on railroad operating and engineering matters. He graduated from the Polytechnic College in Philadelphia in 1854 and became assistant engineer of the State canals of Pennsylvania, in which capacity he served from 1854 to 1857, his next appointment being that of principal assistant engineer of the Sunbury & Erie R. R. He served that company from 1857 to 1860. From 1861 to 1864 he was staff officer in the army during the civil war. From 1864 to 1885 he was chief engineer of the Saratoga &

Hudson River R. R., and for the 20 years from 1865 to 1885 he served the Wabash R. R. as division superintendent, chief engineer and general superintendent. From 1885 to 1888 he was general superintendent and engineer of the Virginia Midland R. R. In 1889 he went with the Safety Car Heating & Lighting Co. and has taken an active interest in this company's affairs ever since that date.

MR. C. E. FLYNN, general manager of the Wheeling (W. Va.) Traction Co., was a caller on the "Review" when in Chicago recently.

MR. ROYAL HOLBROOK, manager of the Otumwa (Ia.) Traction & Light Co., was presented with a Christmas gift of a valuable ring by the conductors and motormen in his employ.

MR. CHARLES FITZGERALD, formerly general superintendent of the Consolidated Traction Co. of Pittsburg, has decided not to accept the position of division superintendent offered him after the merger recently effected by the Philadelphia Co.

MR. W. H. BROWN, formerly of Philadelphia, has been appointed superintendent of the Rapid Transit Co. of Chattanooga, succeeding Mr. King. It is understood that Mr. Brown will have enlarged power and will be virtually general manager of the road.

MR. V. C. STANLEY, formerly general passenger and freight agent of the Grand Rapids, Holland & Lake Michigan Rapid Ry., has been appointed superintendent of that road, succeeding Mr. M. J. Kimb. It is officially announced that Mr. Kimb will accept a position with the Grand Rapids Railway Co.

MR. CHARLES A. JEFFS, formerly of Brookfield, Mass., has been appointed superintendent of the Gardner (Mass.) Westminster & Fitchburg Street Railway Co., to succeed Mr. Frederick La Noue, resigned. Mr. Jeffs for the past five years has been superintendent of the Warren, Brookfield & Spencer Street Ry., and was previously in charge of the Leominster & Clinton Street Ry., which is now a part of the Worcester Consolidated system. Mr. Jeffs will assume the duties of his new position at Gardner on February 1st.

MR. FRANK J. DUFFY, formerly paymaster for the St. Louis Transit Co., has been appointed assistant superintendent of the Richmond (Va.) Traction Co. Mr. Duffy is a brother of Mr. C. N. Duffy, auditor of the Chicago City Ry.

MR. W. A. HELLER has resigned as manager of the Muskegon (Mich.) Traction & Lighting Co., and has removed to Cumberland, Md. On the evening of his departure from Muskegon, December 10th, Mr. Heller was given a banquet at Lake Michigan Park pavilion by the employes of the traction company, and was presented by them with a diamond-studded watch charm.

MR. H. N. RANSOM, purchasing agent for the International Traction Co. of Buffalo, has associated himself with Mr. F. C. Randolph, of New York, Eastern manager of the Christensen Engineering Co., and will hereafter devote all his time to the interests of the Christensen air brake. Mr. Ransom was for many years with the Consolidated Car Heating Co., prior to his going to Buffalo.

MR. F. J. BOWDEN, of Hancock, Mich., president of the Houghton County Street Railway Co., will soon sail for Cuba, where he purposes to inspect the street railway systems under construction by Stone & Webster, of Boston. Mr. Bowden is understood to be indirectly interested in the project. The Cuban lines are being built under the supervision of Mr. George C. Towle, formerly superintendent of the Houghton County Street Railway Co.

MR. GEORGE S. DAVISON, secretary and general manager of the Pittsburg & Birmingham Traction Co., gave a banquet on December 30th, to the 25 members of the board of trustees of the Pittsburg & Birmingham and Monongahela Street Railway Relief Associations, representing the employes of the two companies. Menu and decorations were elaborate, a strikingly appropriate feature of the latter being a floral trolley car in the center of the board, illuminated by diminutive electric lights.

MR. D. A. BELDEN, who for ten years was general manager of the electric railway systems in and around Aurora, Ill., last month succeeded Mr. Ernest Woodruff as president and general manager of the Atlanta (Ga.) Railway & Power Co. Mr. Belden entered into street railway work in 1891; he secured the franchises and rights of way and built the Aurora & Geneva interurban and later the Aurora, Yorkville & Morris line, both of which were controlled by the Aurora Street Railway Co. In connection with the building of the Aurora & Geneva line there arose a controversy as to the right of an electric railway to condemn a right of way through private property for the purpose of avoiding grade crossings; the suit was very bitterly fought and carried to the Illinois Supreme Court, the final decision being in favor of the Aurora & Geneva Company. Mr. Belden resigned as general manager of the Aurora property in May, 1901, when those roads were acquired by Cleveland interests.

MR. LOUIS R. ALBERGER, who was formerly connected with Henry R. Worthington, New York, and for 13 years was in charge of the condenser department of the business carried on under that name, announces that he has organized a new company, known as the Alberger Condenser Co., to make and sell condensing apparatus, vacuum pumping machinery and cooling towers, embodying novel and important improvements. The new house is prepared to build both surface and jet condensers of all sizes and having air and circulating pumps, either steam or electrically driven, in connection with electric lighting and railway power stations. Special consideration will be given to the needs of large and extended plants. The associates of Mr. Alberger in the new business have also had years of experience and are thoroughly familiar with the line of work undertaken. The vice president, Mr. George Q. Palmer, is also manager of the Quantard Iron Works, which company will attend to the making of the Alberger special machinery. The headquarters of the Alberger Condenser Co. are at 95 Liberty St., New York City.

### OBITUARY.

MR. J. A. BOWLES, roadmaster of the Seattle (Wash.) Electric Co., met with a fatal accident on December 4th in the company's Madison St. power house from which the cable line is operated. Mr. Bowles was in conversation with a friend when he attempted to step across the cable, and became caught in it. He was dragged against the flywheel and instantly crushed to death. The deceased leaves a widow and five children.

MR. BENJAMIN REECE, who for several years has been connected with the Diamond State Steel Co., died December 18th at Wilmington, Del. Mr. Reece was recognized as an expert on railway track maintenance in this country and has, at different times, published a number of articles on this subject.

MR. F. B. BROWNELL died on January 8th at the Battle Creek, Mich., sanitarium, where he went last September after a severe attack of grip which left him in a weakened condition. Mr. Brownell was born in Troy, N. Y., Dec. 20, 1851, his ancestors having been quakers descended from Thomas Brownell, of Darbyshire, England, who lived in Rhode Island in 1647. Mr. Brownell came to St. Louis in 1867 with his parents and soon after became associated with the Brownell Car Co., which was incorporated in 1875 with Mr. Brownell as president and Mr. M. B. Richardson, secretary. Besides being one of St. Louis' most prominent business men, Mr. Brownell was a member of the Merchants' League Club of that city and an active worker in the Republican party, having been vice-chairman and treasurer of the State Committee. His services to the party have

F. B. BROWNELL.

always been most valuable but he always steadfastly refused to be a candidate for any position, either elective or appointive, and never yielded but twice: once for school director and once for presidential elector. Mr. Brownell was highly respected both as a business man and a public worker, and his loss will also be mourned by a large circle of friends.

### A. S. R. A. OFFICIAL REPORT.

Secretary Penington's official report of the 20th annual meeting of the American Street Railway Association, held in New York in October last, was received December 17th, just too late for acknowledgment in our December issue. The secretary has shown great energy in issuing his report so promptly in view of the fact that it contains 340 pages and numerous drawings, being nearly twice as voluminous as the report of any previous meeting of the association. The New York convention papers were of practical value and Mr. Penington's report is in a form most convenient for reference; besides, it is the only report published which contains all of the diagrams submitted to illustrate Mr. Harrington's report on storage batteries located in power stations. This is also the only complete report of the banquet proceedings published.

New York promoters project an electric street railway system in Grand Forks, N. D. The line as planned will connect the state university, the suburban east side and the business and residence districts of the city, aggregating about 15 miles in length.

Devitt, Tremble & Co., who were prominent in financing the Youngstown-Sharon Railway & Light Co., report that the earnings of this property for December were largely in excess of any estimates previously made. The traffic of the Sharon and Wheatland line has grown to such an extent as to require the immediate double tracking of the road for its entire length, and cars are now operated through between Youngstown and Sharon. Prior to January 8th, passengers were required to leave the cars at McGuffey St., nearly two miles from the business center of Youngstown, owing to the delay in completion of the viaduct over the railroad yard at that point.

### ELECTRICITY ON NEW YORK ELEVATED.

The Manhattan Railway Co. of New York City formally started the electrical operation of its Second Ave. division on January 9th, at which time the first train ran from South Ferry to 129th St., carrying nearly a full load of the company's guests. The return trip was made as far as 80th St., at which point the guests were taken in automobiles to visit the new power house at 74th St. and East River. Among the officers and guests of the company to make the initial trip were Howard Gould, Edwin Gould, A. Skitt, John D. Rockefeller, jr., Joseph C. Hendrix, Samuel Sloan, G. P. Morosini, H. H. Vreeland and J. Arbuckle. A number of stops were made in the lower part of the city, after which the train made a quick run to Harlem. The whole run was made in less than half an hour, including stops, although no attempt at a record run was made. At one point the tram made a half mile in 45 seconds, which is equal to 40 miles an hour, the time which the electric trains are scheduled to make. At present both steam and electric trains are being operated on this division, but the latter will be constantly increased in number until the steam trains are entirely displaced. It is planned to run three-car trains of two motor cars and a trailer during the light hours of traffic and six-car trains with four motor cars and two trailers during the rush hours. The station platforms along the road are now being lengthened to enable the operation of six-car trains.

The party was shown one of the new summer cars which the company is going to put into commission next season. These are a little longer and wider than the old cars and each of the windows extends across two seats.

### JURISDICTION OF RAILROAD COMMISSION OVER TROLLEY LINES.

The railroad and warehouse commission of Illinois in an opinion filed December 12th assumes control over the crossings of electric with steam roads, and it may later claim the power to fix electric railway rates. The act empowering the board to prescribe the manner of crossing of two roads was passed when the first electric railroads made their appearance in this state and the companies operating electric lines have contended that the law was not intended to apply to them. The present decision was rendered in the case of the Chicago, Milwaukee & St. Paul Railway Co. vs. the Freeport General Electric Co. The latter company obtained a franchise for the extension of its line which carried it across the main track of the steam road. The latter objected to a grade crossing and asked the railroad commission to prescribe the manner of crossing. The electric railway company moved to dismiss the case for want of jurisdiction, but the commission overruled this motion and ordered the construction of an overhead crossing. The decision states that a railroad company organized for the purpose of transporting both passenger and freight is most certainly in the same line of business (that of common carrier) as any railroad company operated by steam power, and such a road within the meaning of the statute is a railroad. This opinion is construed as a declaration by the commission that electric railways as now commonly operated are railroads within the meaning of the statute creating the commission. If this view is sustained in the courts the commission will exercise the same general control over them as it does over steam roads.

The Freeport General Electric Co. will appeal the case so that ultimately the exact scope of the jurisdiction of the commission over electric railways will be defined by the Supreme Court.

The Ballston Terminal R. R., of Ballston Spa, N. Y., is said to have under consideration the construction of an electric line from Gloversville to Little Falls, where connections will be made with the Utica & Mohawk Valley lines.

The Brooklyn Rapid Transit Co., after a two-months' trial has discontinued its theater car service. Three parlor cars had been in commission to handle the crowds bound to and from Brooklyn theaters, a charge of 25 cents for a seat in the cars being made. The cars could not well be operated on schedule time, and as they were of course out of commission while performances were going on, the plan was abandoned as impracticable.

**OPENING OF THE AKRON-RAVENNA LINE.**

An extension of the lines of the Northern Ohio Traction Co. of Akron, O., to Ravenna which was commenced early last spring was completed on November 15th on which date the opening of the new line took place. The extension is about eight miles in length and connects Ravenna, a town of some 5,000 people, with Akron, and on the occasion of the opening of the road much enthusiasm was displayed by the citizens of the smaller town. A long car filled with the officials of the Northern Ohio Traction Co., and guests from Akron, Cuyahoga Falls and Ravenna glided into the latter town on the afternoon of Nov. 15th, accompanied by the roar of cannon and waving of flags. The car proceeded to the court house followed by a large part of the population of Ravenna where the Mayor and other citizens of that town received the Northern Ohio Traction Co. representatives and expressed their appreciation of the new line in a number of speeches. The accompanying illustration is from a photograph taken of the car and visiting party in

**HYDRAULIC PLANT NEAR YORK, PA.**

An extensive hydraulic plant is now in course of construction at York Haven, on the Susquehanna River, about 11 miles from York and 16 miles from Harrisburg. The object of this enterprise is to supply current to operate the street railway systems of York, Lancaster, Steelton and Harrisburg, all of which places are within a radius of 16 miles from the new plant. A new line, it is said, will be constructed from Cumberland to York, which will probably be the first portion of the system to be supplied with current from the new plant.

The York Haven Power & Water Co., which is building the hydraulic plant, will also furnish power for operating various industrial plants in the nearby towns as well as supplying them with current for lighting purposes. Maj. George B. Burbank, consulting engineer of the company, estimates that the falls will generate 25,000 h. p. The power house for this plant will be 478x51 ft. and will contain 40 turbine wheels of 600 h. p. capacity, 20 750-kw. alternating

GUESTS AT THE OPENING OF THE AKRON-RAVENNA LINE.

front of the Ravenna court house. Mr. Christy, vice-president of the railway company, and Mr. Currie, general manager, were among those who made addresses at the reception. They explained that the company would give a first class service between Akron and Ravenna and that 15 new cars had been ordered for this road. The service will be half-hourly throughout the greater part of the day.

**TUNNEL ACCIDENT IN LIVERPOOL.**

An unusual accident occurred in Liverpool, December 23rd, in which seven lives were lost on the overhead electric railway near Dingle station. A fuse which burned out set fire to a car just before the train entered the tunnel in which were stored stacks of creosoted railroad ties. These ties caught fire from the train and the tunnel was soon enveloped in flames, which were extinguished with the greatest difficulty. The accident occurred at six o'clock in the evening and the train had been crowded, but the majority of the passengers had alighted at the previous station.

Owing to the volumes of dense smoke which issued from the tunnel it was several hours before an entrance could be effected. Many passengers jumped from the burning train and ran out of the tunnel, while a great many were nearly suffocated by the smoke and were dragged out by their fellow passengers.

Messrs. Schoepf, Foraker and McGowan, of the Cincinnati Traction Co., recently spent two days in Chicago looking at the plans for the new building which the company will erect at Fifth and Walnut Sts., in Cincinnati.

The Chicago Union Traction Co. has 165 new cars under construction at its shops. One hundred are for summer service, and will be put in commission on the north and west side lines. The remaining 65 are to replace those recently burned in the Lincoln Ave. car house.

current generators and 2 turbines of 250 h. p. each will operate the exciters.

From this building to the falls there will extend a granite wall 3,500 ft. long and from 28 to 38 ft. high. This will enclose a race of 375 ft. in width and 16 ft. in depth connecting with the dam at the head of the falls. The foundations of the power house have been excavated in solid rock and the masonry work is well under way. The entire electrical equipment of this plant will be furnished by the Stanley Electric Co. and the turbines by Robert Poole Sons, Baltimore, Md. Mr. H. B. Montgomery is the general manager of the new plant.

The company is capitalized at \$3,000,000 and has issued \$1,500,000 of bonds. The officers are: President, Henry L. Carter; vice-president, W. F. Bay Stewart; treasurer, Henry W. Stokes, New York; secretary, William Mason, Philadelphia.

**W. B. AUSTIN & CO.**

The firm of W. B. Austin & Co., one of the leading electrical supply houses of Chicago will enter the street railway field, making a specialty of electrical wires and cables. Austin & Co. are western agents for the Holmes, Booth & Haydens Co. and the Safety Insulated Wire & Cable Co. which are among the largest wire makers in the country. Safety underground cables exclusively have been used by the North and West Chicago systems and the Chicago City Ry. has also been an extensive purchaser.

W. B. Austin & Co. has been in the general electrical supply business for eight years and now that more particular attention will be given to the new line, the firm may be expected to become an important factor in the street railway field. Mr. Austin, the senior partner, has been identified with electrical interests for 16 years.

The Saginaw (Mich.) Suburban Railway Co. has received a new franchise from the Mt. Morris village council.

FINANCIAL.

NORTHWESTERN ELEVATED RAILWAY CO.

The Northwestern Elevated Railroad Co., Chicago, shows passenger receipts for December 17.8 per cent greater than for the corresponding month of 1900. The yearly average for 1901 was 55,000 passengers carried daily, as compared with 47,594 in the seven months during which the road was operated in 1900. The following table gives the monthly traffic for the year 1901:

	Whole No. Passengers.	Daily Average.
January	1,612,677	52,022
February	1,547,218	55,256
March	1,772,004	57,193
April	1,758,702	58,023
May	1,760,900	56,900
June	1,607,707	53,574
July	1,505,316	48,559
August	1,542,889	49,770
September	1,621,050	54,065
October	1,830,366	59,014
November	1,795,710	57,875
December	1,964,611	63,375

Year ..... 20,326,600 55,600

The comparison for the seven months during which the road was in operation in 1900 shows the following figures:

	1901.		1900.		Increase.	
	Whole No.	Daily Av.	Whole No.	Daily Av.	Daily Av.	Per Ct.
June	1,607,707	53,574	1,259,100	41,972	11,602	27.7
July	1,505,316	48,559	1,265,206	40,816	7,743	18.9
August	1,542,889	49,770	1,303,752	43,002	5,778	13.1
September	1,621,050	54,065	1,412,760	47,002	6,973	14.8
October	1,830,366	59,014	1,575,017	50,807	8,237	16.2
November	1,795,710	57,875	1,602,330	53,345	6,512	12.2
December	1,964,611	63,375	1,667,742	53,798	9,577	17.8

Seven mos. .... 11,968,540 55,928 10,196,645 47,648 8,279 17.3

It is estimated that its traffic for the year will give about \$1,050,000 gross earnings. Operating expenses, rental and taxes amount probably to \$575,000, leaving \$475,000 for bonds and stock. Applications for the company's new \$4,000,000 4 per cent bonds offered pro rata to the stockholders at 96 flat closed December 28th. The 5 per cent bonds are being paid off as rapidly as possible but a good many holders of these are reinvesting in the 4 per cent bonds which has made the demand for the latter strong. The original subscribers to the 5 per cent bonds bought them in February, 1900, at 99. They are now redeemed at 105, giving 6 per cent profit in two years, in addition to the 5 per cent interest, and the original holders have been able to secure the ten-year 4 per cent bonds at 96.

SOUTH SIDE ELEVATED RAILROAD CO.

The South Side Elevated Railroad Co., of Chicago, shows a gain of 8.6 per cent for the month of December over the corresponding month of 1900. With the single exception of August, every month of 1901 showed an increase over the corresponding month in 1900. The following table shows the traffic by months with a comparison with that of the previous year:

	1901.		1900.		Increase.	
	Whole No.	Daily Av.	Whole No.	Daily Av.	Daily Av.	Per Ct.
January	2,205,247	71,137	2,154,625	69,504	1,633	2.3
February	2,086,700	74,525	1,961,400	70,050	4,475	6.4
March	2,364,339	76,269	2,240,184	72,264	4,005	5.5
April	2,333,160	77,772	2,140,950	71,658	6,114	8.5
May	2,300,355	74,205	2,117,176	68,266	5,900	8.6

\*Decrease.

The gross passenger receipts for the five years are as follows: (11 Mos.)

1901.	1900.	1899.	1898.	1897.
\$1,316,510	\$1,249,544	\$1,131,404	\$944,926	\$611,875

This shows an increase of \$66,066 over the receipts for 1900.

METROPOLITAN WEST SIDE ELEVATED RAILWAY CO.

The Metropolitan Elevated of Chicago made the largest gain in passenger traffic in December of any month in 1901, and also showed the largest business of any month in the history of the road. The average number of passengers carried daily exceeded 100,000. The following table gives the traffic by months with a comparison of 1901 and 1900:

	1901.		1900.		Increase.	
	Whole No.	Daily Av.	Whole No.	Daily Av.	Daily Av.	Per Ct.
January	2,780,669	89,699	2,756,136	88,585	1,114	1.2

EVERETT-MOORE RAILWAY HOLDINGS.

The following statements were recently issued by the Everett-Moore syndicate showing the results of the operation of the company's roads for 11 months of 1901.

The Cleveland Electric Railway Co. has \$13,000,000 capital stock, operates 136 miles of track and shows gross earnings of \$2,088,012, leaving a surplus for stock of \$716,501.

The Cleveland, Painesville & Eastern Railway Co. has a capital stock of \$1,500,000, operates 41 miles of track and shows gross earnings of \$153,051, and a surplus for stock of \$6,172.

The Cleveland & Eastern Railway Co. has a capital stock of \$1,200,000, operates 45 miles of track and shows gross earnings of \$82,916.

The Cleveland & Chagrin Falls Electric Railway Co. has a capital stock of \$300,000, operates 15 miles of track and shows gross earnings of \$43,670, with surplus for stock of \$1,445.

The Detroit United Ry. has a capital stock of \$12,500,000, and operates 356 miles of track. Its gross earnings were \$2,647,730 and its surplus for stock \$613,873.

The Detroit Port Huron Shore Line Ry. has a capital stock of \$2,000,000 and 89 miles of track. Its gross earnings were \$355,195 and surplus for stock, \$42,980.

The London (Ont.) Street Railway Co. has a capital stock of \$400,000, operates 28 miles of track and had gross earnings of \$128,808, and surplus for stock of \$28,645.

The Northern Ohio Traction Co. is a consolidation of the street railway lines in Akron with suburban lines to Ravenna, Kent, Barberton, Cuyahoga Falls, Bedford and Cleveland. It is capitalized at \$3,500,000, operates 89 miles of track and showed gross earnings of \$563,625, and surplus for stock of \$74,914.

The Toledo Railways & Light Co. has a capital stock of \$12,000,000, 110 miles of track and gross earnings of \$1,184,706 with a surplus for stock of \$294,575.

In the reports mentioned above the Cleveland & Eastern Railway Co. is the only one which showed no surplus for stock. The nine companies embrace a little over 900 miles of track with \$46,400,000 of capital stock.

MASSACHUSETTS ELECTRIC COMPANIES.

The second annual report of the Massachusetts Electric Companies covering the operations for the year ending Sept. 30, 1901, has been published. The organization of this corporation, which con-

trols ten companies operating street railways in the vicinity of Boston, was fully described in the "Review" for May, 1901, page 207. The corporation controls 819½ miles of track in 22 cities and 66 towns, having an aggregate population of 1,000,000 people outside of Boston. The total stock of the underlying companies amounts to 134,622 shares and of this number 134,077 are in the possession of the trustees. The gross earnings from operation for the year amounted to \$5,778,134 and the operating expenses were \$3,915,485, leaving net earnings of \$1,862,647. The fixed charges were \$937,206 and dividends \$779,462, leaving a surplus for the year of \$145,979. The companies' total surplus is \$466,286. The organization has \$15,857,400 preferred and \$12,293,100 common stock.

During the year the trustees were authorized to issue 4½ per cent notes for five years, amounting to \$3,500,000, the proceeds of which were used for the acquisition of more stock; \$2,700,000 of this amount was issued. The sum of \$1,339,436 has been expended for improvements and reconstruction during the last year. A large amount of construction work has been in progress during the last two years, but this is now practically completed and its cost has been charged against the surplus account. The incomes of the operating companies show an increase of nearly 5 per cent in the gross earnings and nearly 7 per cent in the net divisible income for the year.

SYRACUSE RAPID TRANSIT RAILWAY CO.

The increase in the amount of business done by the Syracuse Rapid Transit Railway Co. in 1901 over that of the previous year has been creditable. The gross earnings for the year 1901 were \$662,868, and for the year 1900 they were \$590,032, making an increase of \$72,836. The following table shows comparative figures of the number of people carried for the last four fiscal years.

	1898.	1899.	1900.	1901.
Revenue passengers carried . . . . .	9,220,110	10,226,125	11,253,876	12,608,372
Transfer passengers carried . . . . .		1,076,386	2,448,297	2,735,278
Car miles run . . . . .	2,942,242	2,756,023	3,303,126	3,409,411

MARKET STREET RAILWAY CO

The purchase of the Market Street Railway Co. by an eastern syndicate concludes negotiations which have been in progress for about a year. The first road to be absorbed by this syndicate was the San Francisco & San Mateo line, which was purchased early in the year for approximately \$1,300,000. The Sutter Street and the Sutro lines were next purchased for about \$2,000,000. The most important step in the negotiations, however, was the purchase of the Market Street system with its branches running all through the heart of San Francisco and reaching the outskirts in all directions. This road is capitalized at \$18,617,000 and the syndicate has purchased three quarters of the stock for which it paid \$14,000,000 at par.

Improvements are to be made which will cost in the neighborhood of \$4,000,000, so that the syndicate's entire investment in California will reach the sum of \$21,000,000. The total mileage of the railroads acquired is 238.

Among the improvements contemplated by the company is the extension of the San Mateo line as far as San Jose. Electricity is to be substituted for the Market St. cable if the necessary consent can be secured from the city authorities. On the lines where steep grades occur the cars will be equipped for both electrical and cable propulsion.

NEW ORLEANS STREET RAILROAD CO

The statement was given out by Mr. H. H. Pearson, of the Pearson syndicate of Philadelphia, that 50,000 out of the 75,000 shares of common stock of the New Orleans Street Railroad Co. had been secured by the syndicate and that a lease of the road would be taken by January 15th. A pool of common stock was formed in the latter part of 1899 and a committee appointed by the stockholders with full authority to conclude negotiations with the Pearson syndicate. The stockholders forming the pool authorized the committee to sell the stock in the pool for \$35 per share cash or to agree to a lease or other plan by which the stock should be guaranteed as follows: \$2 per share until July 1, 1905, the first

semi-annual payment to be July 1st, 1902, for the period beginning Apr. 1, 1902, and thereafter semi-annually on January 1st and July 1st; \$2.50 per share from July 1, 1905, to July 1, 1907; \$3.00 per share from July 1, 1907, until the expiration of the existing charter of the company; the person or persons so guaranteeing, to have the right of purchase of the stock at any time at \$35 per share.

While no details of the lease have been made public, it was probably based upon the lines laid down by the committee of stockholders.

CONSOLIDATED TRACTION CO.

The following comparative statement for the months ending Nov. 30, 1900-01, has been issued by the Consolidated Traction Co. of Pittsburg, Pa.:

	1901.	1900.
Gross earnings from operations . . . . .	\$266,839.09	\$235,545.40
Operating expenses . . . . .	126,214.87	106,588.47
Net earnings from operations . . . . .	140,624.22	128,956.93
Total net earnings and other income . . . . .	170,372.40	156,951.81
Total deductions . . . . .	62,648.79	63,049.55
Total income . . . . .	107,723.70	93,902.26
Fixed charges . . . . .	86,143.33	86,475.82
Net income . . . . .	21,580.37	7,426.44

MILWAUKEE ELECTRIC RAILWAY & LIGHT CO.

The statement of the business done by the Milwaukee Electric Railway & Light Co. and the Milwaukee Light, Heat & Traction Co., which is controlled by the former for the year ending December 6th shows the gross cash receipts of the Milwaukee Electric Railway & Light Co. to be \$2,388,524 and the gross cash receipts of the Milwaukee Light, Heat & Traction Co. to be \$321,335. The increase in the earnings of the two companies over the previous year amounts to \$226,681.

FOND DU LAC ELECTRIC LIGHT & RAILWAY CO.

The report of the Fond du Lac Electric Light & Railway Co. for the year 1901 shows gross earnings of \$69,285, of which \$34,627 are for the street railway. The company operates about five miles of railroad in the city of Fond du Lac and the license fee paid to the city is 2 per cent or \$602.

WINNEBAGO TRACTION CO.

The Winnebago Traction Co., of Oshkosh, Wis., has filed its annual report of gross receipts for the year ending Dec. 5, 1901. The total receipts for that year are \$93,357, and show a marked gain over those of the year previous, the amount for the year 1900 being \$88,859. These figures include the receipts on both the urban and interurban lines. The license fee to be paid by the company this year in lieu of the taxes is \$1,876 as against \$1,777 paid for 1900.

ST. LOUIS TRANSIT CO.

The gross earnings of the St. Louis Transit Co. for month of November, 1901, and for the 11 months of the year, taken in comparison with the corresponding periods of last year, show a steady increase and an estimated total of over \$1,500,000 for the past year is indicated. The first 11 months of last year show earnings of \$5,322,793 against \$4,001,928 in 1900. The earnings for November, 1901, were \$479,399 as against \$436,762 last year. Comparisons of the different months of 1900 and 1901 show a steady increase of earnings throughout the year.

The United Traction Co., of Albany, N. Y., for the four weeks ending December 28th reports the following: Receipts from operation, \$100,089; for the corresponding period in 1900, \$104,351. This shows a gain of \$4,737 for that period. It made a gain of \$3,321 on the Albany division, and \$1,413 on the Troy division.

The Schuylkill Traction Co. reports gross earnings for November of \$11,382, an increase of \$3,666 over November, 1900. For the 12 months, from November 30, 1900, to Nov. 30, 1901, the gross receipts reached \$141,677. From May to November, 1901, the

gross receipts showed an increase of \$16,351 over the corresponding period of 1900.

The Madison Electric Railway Co., of Madison, Wis., reports gross receipts for the year ending Dec. 1, 1901, to be \$68,593. The receipts for the previous year were \$60,780 and for 1899 \$52,657. These figures show an annual increase in receipts of about \$8,000 per year for the last three years.

The Newport News & Old Point Railway & Electric Co. reports for the eight months from March 1st to Oct. 31, 1901, as follows: Gross earnings, \$470,034; operating expenses, \$308,131; net earnings, \$161,903; fixed charges, \$108,228; surplus, \$52,674.

The Boston Elevated Railway Co., according to its last annual report, carried during the year 1901, 213,703,983 passengers, which was an increase over the year 1900 of 12,579,273.

### TROLLEY SPRINKLER AT COLORADO SPRINGS.

The Colorado Springs & Suburban Railway Co. on December 1st began using a new sprinkling car in Colorado Springs. In general appearance it is similar to the usual street car, the exterior being finished in the company's standard colors, and when not sprinkling it is not particularly noticeable except that shutter windows are used instead of glass. There is a full glass vestibule at each end of the car in which the motorman operates. The car body is mounted on a single truck which is equipped with two G. E. motors of 60 h. p. capacity each. A steel tank of 2,600 gallons capacity is enclosed in the car, leaving a passageway on each side between the tank and the car side. The spray is delivered from two sprinkling heads located on either side of the car in the center of its length. The water is forced from these heads by two force pumps run by a 30 h. p. motor located at one end of the car. The amount of water thrown as well as the width of the spray is regulated by levers at either end of the car. An emergency brake is also supplied for quick work in passing a moving vehicle or running at high speed. The sprinkling apparatus as well as the car can be operated from either end. A third sprinkling head is located in front of the truck beneath the car for flushing the space between the tracks.

### PRESIDENT WINTER AS A PHILANTHROPIST.

The Grand Rapids, Holland & Lake Michigan Rapid Railway has for some time had considerable trouble in the city of Holland owing to having a hostile council to deal with. The council has been threatening the life of the company with unnecessary restrictions and refusing grants which were essential to the company's continuing in business. Recently Mr. Winter, president of the company, appeared before the council and offered to give the city of Holland the street railway line provided the city would operate it for two years. Just as the aldermen were about to accept the gift, Mr. Winter stated that the company had lost \$40,000 in operating expenses in the past two years. The gift was immediately declined and the franchises for which the company asked were at once granted. The company is now only required to pave between its rails and has the privilege of hauling freight over the city almost as it pleases. President Winter is now considered a philanthropist in Holland.

Owing to the scarcity of coal, the Dayton (O.), Springfield & Urbana Electric Railway Co. was put to the necessity of burning wood in its Glen Echo power house; and on the night of December 20th the interurban service was temporarily suspended.

The parties interested in the building of the Columbus, Delaware & Northern Ry. and the Columbus, Delaware & Marion Ry. recently held a meeting at which the two projects were consolidated, thus avoiding the building of two rival lines between Columbus and Delaware. The new company which is to be formed to operate this road will have the same members as the two old companies and their holdings in the new company will be proportional to the investment made by them in the two old roads.

### PERMANENT ARBITRATION BOARD FOR LABOR DISPUTES.

A number of conferences have been recently held between representatives of capital and labor under the auspices of the National Civic Federation in New York City, and as a result of these deliberations a permanent committee has been appointed consisting of representatives of organized labor, of the general public and of organized capital. The motion for the appointment of this committee was made by Mr. F. P. Sargent, grand master of the Brotherhood of Locomotive Firemen and was seconded by Senator Marcus A. Hanna. A committee of 37 men was subsequently appointed which contains the following names:

#### ON BEHALF OF THE PUBLIC

Grover Cleveland.  
Cornelius N. Bliss.  
Charles Francis Adams.  
Archbishop John Ireland.  
Bishop Henry C. Potter.  
Charles W. Eliot, President Harvard University.  
Franklin MacVeagh, Chicago.  
James H. Eckels.  
John J. McCook.  
John G. Milburn, Buffalo.  
Charles J. Bonaparte, Baltimore.  
Oscar S. Straus.  
Ralph M. Easley.

#### REPRESENTATIVES OF ORGANIZED LABOR.

Samuel Gompers, president of the American Federation of Labor.  
John Mitchell, president of the United Mine Workers.  
F. P. Sargent, grand master of the Brotherhood of Locomotive Firemen.  
T. J. Shaffer, president of the Amalgamated Association of Iron, Steel and Tin Workers.  
James Duncan, secretary of the Granite Cutters' Association.  
Daniel J. Keefe, president of the International Association of Longshoremen.  
Martin Fox, president of the National Iron Moulders' Union.  
James E. Lynch, president of the International Typographical Union.  
Edward E. Clarke, grand conductor, Brotherhood of Railway Conductors.  
Henry White, secretary of the Garment Workers of America.  
Walter MacArthur, editor of The Coast Seaman's Journal, San Francisco.  
James O'Connell, president of the International Association of Machinists.

#### REPRESENTATIVE EMPLOYERS.

Senator Marcus A. Hanna, Cleveland.  
Charles M. Schwab, president United States Steel Corporation.  
S. R. Callaway, American Locomotive Works.  
Charles Moore, president National Tool Company.  
J. D. Rockefeller, jr.  
H. H. Vreeland, Metropolitan Street Railway Co.  
Lewis Nixon, Crescent Shipyard, Elizabethport, N. J.  
James A. Chambers, president American Glass Co., Pittsburg, Pa.  
William H. Pfahler, president National Association Stove Manufacturers, Philadelphia, Pa.  
E. P. Ripley, president Atchison, Topeka & Santa Fe Ry.  
Marcus M. Marks, president National Association Clothing Manufacturers.  
J. Kruttschnitt, president of Southern Pacific Railway Co.

The general sentiment was that a way out of the labor difficulties could be found by amicable discussions of the questions at issue between employers and employes. It was also thought that these ends could best be served by a standing committee on which both sides should be represented. A number of speeches by representatives of labor and others were made and the hope was unanimously expressed that hereafter labor troubles might be settled by peaceable means and without resort to strikes and their attending violence.

### HALF FARES.

The Pottsville (Pa.) Union Traction Co. has notified its employes that hereafter none of them will be allowed to hold municipal offices.

The Indiana Railway Co. has financed its project and will soon begin the construction of the proposed electric railway from South Bend to St. Joseph, Mich.

W. R. Todd & Co., of Cincinnati, are organizing a company of local capitalists for the purpose of buying the Everett-Moore holdings in the Detroit United Ry.

It was announced December 21st that the Berlin Electric Elevated Ry., the first of its kind on the continent of Europe, would soon be opened for general traffic.

Rapid progress is being made in the construction of the electric line between Augusta, Ga., and Aiken. An extensive power plant is in course of erection at Clearwater.

An attempt to boycott the interurban line between St. Joseph, Mich., and Benton Harbor was recently made by employes of St. Joseph factories who reside in Benton Harbor.

The Union Traction Co. of Indiana is about to extend its freight and express service on interurban lines. A number of cars for this service are being built and will soon be put in commission.

The Toledo, Fostoria & Findlay Electric Railway Co. has leased its right of way for a quarter of a mile through the richest oil territory in Ohio to J. W. Kirkbride, a prominent oil producer.

New Year's day established a record in the history of the Montreal Street Railway Co., the number of fares collected being more than 125,000. Seventy-one special cars were put in service.

The Northern Texas Traction Co., which has nearly completed an electric line between Fort Worth and Dallas, received 15 new cars, on December 14th, for use on the urban lines in Fort Worth.

A third-rail electric line has been put in operation in Paris. The road connects the new station of the Invalides and the Normandy and Brittany lines of the Chemin de Fer de l'Ouest. The power is generated at Issy.

The Compressed Air Co., of New York, has closed a contract to equip the Minneapolis & Amoka Ry. with compressed air cars. The equipment includes a compressing plant and eight motor cars similar to those used by the Rome (N. Y.) Street Railway Co.

The Cleveland Electric Railway Co. has requested a number of leading factories and stores to dismiss their employes in blocks of from 50 to 100 every evening, instead of letting them all out at once, in order to obviate the over-crowding of cars during rush hours.

The Boston Christian Endeavor Society has decided to use street advertising space for putting cheering words from the Scriptures before the eyes of the public. It is proposed to make a trial of a few street cars for displaying texts at first and later to extend the system.

An electric railway in Plattsmouth, Neb., is proposed by a company of which J. F. Riley is at the head. The plans include interurban lines to Weeping Water, Louisville and Nebraska City, and are reported to be contingent upon the success of the Platte River canal project.

The promoters of the proposed electric line from Gorham, N. H., to Berlin, have awarded the contract for construction to H. I. Coe of Berlin. Mr. Coe has placed orders for a 200-kw. generator, 20,000 lbs. and eight miles of rails. The car house will be located at Gorham.

Cars are now running over the greater part of the new road between Toledo, O., and Adrian, Mich., and it is expected to have the entire line in operation in the spring. The traffic, both passenger and freight, is large. Mr. A. P. Southworth is superintendent of the company.

The striking employes of the Sattley Manufacturing Co., Springfield, Ill., on the evening of January 3d attempted to wreck a street car which contained 35 substitutes from the Sattley works. Dynamite was used and the car was badly damaged, the passengers, however, fortunately escaping injury.

The Lake Shore Electric Railway Co. ran the first car over the newly completed line between Lorain, O., and Vermilion, on December 9th. The party making the initial trip included F. W. Coen, R. E. Danforth, G. A. Resek, W. H. Stout, E. S. Smith, Thomas Mackall and Thomas Wood.

The new extension of the Metropolitan underground road at Paris will be retarded owing to a difficulty encountered in tunneling under the catacombs from the Etoile to the Place du Rhone. The tunnel will necessarily be built much lower than at first projected, in order to secure a firm roofing.

The Hartford (Conn.) & Springfield Street Railway Co. celebrated the official opening of its road for through service between Hartford and Springfield with appropriate exercises on January 13th. Cards of invitation were issued, and special cars were provided for the accommodation of the company's guests.

The construction of a third track for the Lake Street Elevated, Chicago, was begun December 2d. The third track construction is for an express service from 52d Ave. station to the heart of the city. There will be scarcely any modification of the structure necessary as the third track was arranged for from the beginning.

The Citizens' Land Co., of Pine Bluff, Ark., has been incorporated by members of the local street railway company, and proposes to improve a tract of 60 acres near the city as a suburban park, containing race track and summer theater. An extension of the street car line to the park site will be opened for traffic before February.

A Baltimore syndicate which has recently purchased the Market Street Ry., of San Francisco, proposes to construct a large gymnasium fully equipped with every form of modern apparatus for the use of its employes. A library, billiard hall and a large reading and lounging room are included in the employes' headquarters.

Lima Center, a hamlet in Michigan on the route of the Hawks-Angus electric line from Jackson to Ann Arbor, enjoys the distinction of having been moved, church, school house and all, to make way for the interurban. The buildings were safely deposited a few yards distant from their former sites in order that the road might be constructed without making a curve.

The Pittsburg, McKeesport & Connellsville Railway Co. expects to have its entire system of 130 miles in operation by April 1st. Twenty-five new cars will soon be put in commission on the lines between Fairchance, Masontown and Duquesne. It is proposed to locate a number of pleasure resorts along the route, and the principal of these will be Olympia Park, near Versailles borough.

The Utica (N. Y.) & Mohawk Valley Railroad Co., which has been organized with a capital of \$3,500,000 to control a 37-mile system of electric railways extending from Rome to Little Falls, has under consideration the election of the following officers: Horace E. Andrews, president; John J. Stanley, vice president and general manager, and George H. Radcliffe, general superintendent.

The London press has lately given much space to the alleged superiority of the Briton over men of other nations in point of chivalry toward women, as evidenced especially in their deportment on street cars. In this connection the recent appeal to the

county council to establish a street car service for women only. In London, is funny, as the applicants claim that, during rush hours, a woman has little chance of getting a seat on London cars.

### SIGNALING CAR WITH LIGHTED MATCH.

The Kansas City-Leavenworth Railroad Co., operating an inter-urban electric road between Kansas City and Leavenworth, Kan., at one time received numerous complaints from its patrons that cars did not stop when signalled, especially at night. The road passes through many lonely and sparsely settled districts and the cars frequently run at speeds approaching 50 miles an hour. Upon investigation it was determined that the complaints were well founded, but the trouble was discovered to be not due to the negligence of the motormen, but to the difficulty of seeing intending passengers in time to stop the car when running at these high speeds.

As a solution the manager hit upon the scheme of instructing the public to use a lighted match or piece of paper as a signal at night. At first thought this idea would seem to be impracticable owing to

the winds and the smallness of the light, but the manager, Mr. Herbert W. Wolcott, advises us that the scheme is working to the entire satisfaction of the public and the company. He states that while riding on the front platform at night he has seen a lighted match held at a distance of 1,500 ft. in front of the car, and the light from a match or small piece of paper is frequently visible at a distance of half a mile.

On all its folders and time tables the company now shows the cut that is reproduced herewith, with the following inscription underneath: "Parties desiring to take a car are requested to signal the motorman when he is at a distance of 5 or 10 pole lengths so that the car can be easily stopped. At night a lighted match should be used. When the signal is seen the motorman will indicate the fact by two short blasts of the whistle."

### THOMSON ELECTRICAL COMPANY.

Mr. D. Thomson, who for the past 16 years has been identified with the management of street railways in the western states and in Canada, has organized the Thomson Electrical Co. to handle electrical supplies and to finance and build complete railway, light and power plants. General offices have been opened in suite 631-632 Manhattan Building, Chicago, and the business experience of the new company thus far indicates a pronounced success.

In addition to the business of promoting street railways, the

Thomson company will make a specialty of handling the Thomson incandescent lamp and the Thomson friction tape. It is also agent for the Piqua trolley car, the Gore track drilling machine, the Burnham track drill, and the Lincoln Electric Co. and the Tripartite Steel Pole Co.

Mr. Thomson, president and manager of the company, is a native of Philadelphia, and began his career in the electrical field in 1886 as manager of one of the departments of the Royal Electric Co., of Montreal, Que. After remaining with the Royal company for nearly seven years, Mr. Thomson severed his connection to become manager of the Hamilton Light & Power Co., of Hamilton, Ont. Later, he was assistant manager of the Ithaca (N. Y.) Street Railway & Light Co., a position which he resigned after three years to become president and manager of the Hannibal (Mo.) Railway Co. Before removing to Chicago, Mr. Thomson was for one year manager of the Dubuque (Ia.) Street Railway Co. He is a brother of Prof. Elihu Thomson of the old Thomson-Houston Company, and is well known to street railway men throughout the United States and Canada.

### NEW TRUCK COMPANY FOR TROY.

It has just been announced that the Powell & Turner Truck Co. is to establish a factory at Troy, N. Y., for the production of trucks for the use of electric street railways. The truck which is to be made by this company has been tested on the street railways of Troy and was pronounced highly satisfactory by a number of railroad men and capitalists who watched the results of the tests. The company has recently placed a sufficient amount of its stock to warrant the immediate commencement of manufacturing operations, and a meeting of the stockholders is to be called in a few days at which officers will be elected and the committee on site and manufacture will make its report.

### TANGENTIAL TRACTION.

A translation of an article from the Madrid Mining Review on a so-called new and ingenious system of electric traction has been transmitted by Consul Ridgely of Malaga. The translation of the description of this system credits this invention to Messrs. Dulant, Rosenfeld and Zelenay and also states that it is a clear and precise resumé of the system. As far as we have been able to understand the subject, however, the scheme seems to be one of the wildest ones which has ever been foisted upon the public. Quoting from the circular we find that "tangential traction is based upon the application of polyphasic alternating currents and the most characteristic feature lies in the complete absence of a rotating motor in the carriage and in the absence of obstacles to currents between the vehicle and the source of electric energy."

The circular then goes on to explain that in a polyphase motor there is no electrical connection between the rotor and stator. "If we develop upon a plane the inductor of such a motor and suspend above the apparatus inducted by it, and similarly developed, the rotary movement is transformed into rectilinear motion." The invention consists therefore in fixing between the developed stator and suspending beneath the vehicle the developed rotor. And having thus expounded the principle of the new system the article proceeds to meet the objections which it is admitted immediately present themselves to the mind. The distance between the rotor and stator, which must evidently be very largely increased in this system above that usually allowed in practice, has been overcome by a new arrangement which is not described but which it is stated makes a considerable reduction in the copper to be employed. The expense of laying down a stator over the whole length of the road is also considered and has been overcome by another invention not described. It is called, however, a discontinuous stator and is said to render the application of the system economical. The description states that it will be sufficient to furnish the line with stators "at about every fifth of its length." It is not stated whether or not the car is supposed to coast over the other four-fifths of the road.

The remainder of the circular is devoted to a number of other equally lucid explanations, but we think this description of tangential traction will be sufficient to give a fair estimate of the value of this invention.

## ECHOES FROM THE TRADE

THE HAZARD MANUFACTURING CO., of New York City, received an order last month for all of the galvanized steel rigging to be used on the German Emperor William's yacht, which is being rigged by Flynn & White, of New York City.

THE WHEEL TRUING BRAKE SHOE CO., of Detroit, Mich., is mailing a postal advertisement which is to be commended for a number of novel and striking features. The whole story of flat wheels and their remedy is told in an ingenious illustration.

THE OHMER CAR REGISTER CO., of Dayton, O., is now installing its equipment upon 135 cars of the Union Traction Co. of Indiana, a fact which will undoubtedly be of interest to many companies, which might have had the idea that Ohmer registers are not adaptable for large systems.

THE HEIL RAIL JOINT WELDING CO., of Milwaukee, has recently completed an addition to its plant which more than doubles the capacity of the works. The company has the welding of a large mileage under contract and designed a new joint particularly adapted for interurban roads.

THE BURT MANUFACTURING CO., of Akron, Ohio, announces recent orders for very large "Cross" oil filters from the Government Printing Office at Washington, from McIntosh, Seymour & Co., Auburn, N. Y., and from the De Beere Consolidated Mining Co., Ltd., Kimberley, South Africa.

THE JOHN STEPHENSON CO., Elizabeth, N. J., has received a new order for 100 additional cars from the Brooklyn Rapid Transit Co. The Stephenson company is making several changes at its works and is putting in a new building to be used as a restaurant for the employes and officers of the company.

THE ARNOLD POWER STATION CO., of Chicago, last month elected the following officers: President, B. J. Arnold; vice-president, W. L. Arnold; secretary and treasurer, R. G. Arnold. The board of directors have appointed W. L. Arnold general manager and George A. Damon managing engineer.

THE WESTINGHOUSE ELECTRIC & MANUFACTURING CO. has recently issued its Circular Index No. 4 giving a list of the circulars now in force, Circular No. 1028 on "Rotary Converters" a revision superseding the edition of July, 1901, and Circular No. 1058 on "Westinghouse No. 76 Railway Motor."

THE IRONSIDES CO., of Columbus, O., purveyors of wire rope fillers and shields, boiler scale solvents and cylinder and engine oils, is presenting its patrons and friends with a souvenir matchbox of appropriate and striking design. One side bears a colored reproduction of an iron clad bark on the port tack.

THE ELECTRIC STORAGE BATTERY CO., of Philadelphia, has issued its bulletin No. 68, describing the application of storage batteries to railway plants and the operation of the "Chloride" accumulator by the Hamilton (Ont.) Electric Light & Cataract Power Co. The bulletin is well illustrated with half tones and diagrams.

THE FRANK RIDLON CO., of Boston, is enjoying a very heavy business for this time of the year. The demand for the Ridlon specialties continues to increase, as the facilities of this company for filling orders, coupled with the good serviceable qualities of the products which it handles, makes this a very satisfactory route to do business with. The new bearing babbiting device brought out by the Ridlon company and described in the "Review" for last November, page 857 is evidently something for which managers have been looking as inquiries and orders have

come in from parts of the country as far away as Texas and California, and although the machine has been on the market but a few months several companies have already filed duplicate orders.

THE B. F. STURTEVANT CO., of Boston, Mass., has issued a small catalogue describing the Sturtevant forges which are the natural outgrowth of the manufacture of the well known Sturtevant blowers. The company is prepared to take contracts for the complete equipments of blacksmith shops and will forward its large catalog on forges upon application.

"GRAPHITE," the monthly publication of the Joseph Dixon Crucible Co., Jersey City, N. J., in the interest of Dixon's graphite productions, contains for January four pages of wit, wisdom and pictures. The company announces through this medium that it has begun the erection of extensions of its factories. The new buildings will cover an area of 100 x 200 ft.

THE CENTRAL ELECTRIC CO., of Chicago, is distributing a new bulletin on D. & W. telephone protectors. This protector which embodies all the necessary elements of such a device combines a high tension fuse, a zinc cell, and a lightning arrester, all arranged on one block, making an instrument of neat and compact design. A descriptive bulletin of the material will be sent free to anyone upon application.

THE G. C. KUHLMAN CAR CO. is dismantling its old plant and is rapidly completing the equipment of the new works. By finishing the cars now in hand at the old shops and commencing all new work at the new plant the company will be able to make the change with practically no interruption. The company is to be congratulated on the rapid progress made with its new shops, which were only commenced in September last.

THE GENERAL ELECTRIC CO. has issued: Bulletin No. 4207, "Low Energy Arc Lamps." Bulletin No. 4268, "Brush Arc Generator." Bulletin No. 4269, "Direct Driven Revolving Field Alternators for Electric Lighting." Bulletin No. 4270, "Type C R Feeder regulators." Flyer No. 2087, "Double Push Button Flush Pocket Switch." Flyer No. 2088, "Enclosing Globe Breakage." Flyer No. 2089, "Flexible Insulating Couplings."

THE KNELL AIR BRAKE CO., of Battle Creek, Mich., is out with its 1901-2 catalog describing its latest models of axle driven compressors and air brake parts. Considerable space is devoted to "Style B" axle driven compressor, which is a new form recently placed upon the market in response to the demand for a light, simple and efficient air brake for use on cars mounted on maximum traction trucks. This compressor was described in the "Review Daily," for Oct. 10, 1901, page 686.

THE STERLING-MEAKER CO. reports a number of good orders for the Sterling double register, which is a neat looking piece of mechanism and is earning an excellent reputation in service. The Meaker "94" which has long been used by some of the largest roads, also has an active sale. It is but 9 in. square and the figures, both trip register and totalizer are an inch high; a new "back" has been lately designed, fitting it for either rod or cord ringing, and the "in" and "out" signs have been put into the face, both changes being considered marked improvements. The Sterling-Meaker Co. also makes three other types of registers, the Sterling safety brake, the Sterling sand box, and the Sterling fender.

THE CREAGHEAD ENGINEERING CO., of Cincinnati, O., advises us that it has recently been awarded the contract for reconstructing and extending the Camden Interstate Railway Co. of Ironton, O. The extension will give this road a total length of

nine miles. The Creaghead company is also at present constructing an interurban road between Parkersburg, W. Va., and Marietta, O., a distance of 13 miles. The overhead construction of this line includes No. 0000 round trolley wire and 10 ft. flexible Creaghead brackets.

B. F. STURTEVANT CO., Boston, Mass., has issued its catalog No. 114, describing Sturtevant dry kilns and steam hot blast apparatus with various attachments. The progress made by the Sturtevant company since 1860 in adapting hot blast drying to practically all classes of material and the perfection and enlargement of its apparatus are described. The catalog contains 86 pages and is well illustrated.

THE BULLOCK ELECTRIC MANUFACTURING CO., of Cincinnati, and the Wagner Electric Manufacturing Co., of St. Louis, on January 1st established a foreign sales department with headquarters at Cincinnati. Hereafter all foreign business, except in Mexico and Canada, for the two companies will be handled by this new department which will be under the management of Frank G. Bolles. The work of the advance department will continue under the direction of Mr. Bolles, under whose charge it has been for the past three years.

THE AMERICAN BRAKE SHOE CO. has issued a bronze medal recording the fact that the company has received the highest awards for brake shoes made under its patents at Chicago in 1884, at Chicago in 1893 and at Paris in 1900. On the obverse are reproductions of the three medals received at the expositions, and on the reverse are the names of the licensees of the American Brake Shoe Co., the Sargent Co., the Ramapo Foundry Co., the American Steel Casting Co., Ross, Meehan Foundry Co., Parker & Topping, Eureka Foundry Co.

THE C. W. HUNT CO., of West New Brighton, New York City, is sending out a series of special catalogs covering the distinctive features of its coal and ash handling machinery and industrial railways. The subjects treated recently include steam hoisting engines, electric hoists, electric locomotives and coal conveyors. Pamphlet No. 111 is of special interest to street railway engineers, as it describes in detail the apparatus employed at the Lincoln power station of the Boston Elevated Ry., for handling coal from the ship to the furnace.

THE W. T. VAN DORN CO. reports 1901 as its banner year. During the year the company received an order for equipping 1,450 cars of the Manhattan Ry., New York, with the Van Dorn automatic draw bar with complete draft rigging and the delivery of this order is almost completed. Other orders are on hand which will keep the company's plant running at its full capacity for the next three months. This work includes several orders from foreign countries. The Van Dorn couplers are now in use on all of the elevated roads in this country.

SHERBURNE & CO., of 53 Oliver St., Boston, Mass., report an excellent business record for 1901. This company handles construction tools, rail benders, hand cars, track drills and a full line of supplies needed in the building of steam and electric railroads. Mr. Frank O. Nourse, the energetic selling representative of Sherburne & Co., states that Sherburne tools have been used in constructing many of the prominent roads of New England. The company's voluminous catalog lists over 800 separate items which can be supplied at short notice.

THE CROCKER-WHEELER CO., of Ampere, N. J., reports that the past year has been a most prosperous one; the company reports a record-breaking midwinter business, and finds it difficult to keep the production up to the demand. Among recent shipments are: Two 400-kw. generators to the Vandergrift Construction Co.; one 300-kw. generator to Stetson & Co., Philadelphia; one 150-kw. generator to the D'Olier Engineering Co., West Camp, N. Y., and one 40-kw. generator and 28 motors to the Smith-Brooks Publishing Co., Denver. The United States Tube Co., of Buffalo, has been supplied with a motor equipment, and the electrical equipment of the Con. P. Curran Printing establishment

in St. Louis, Mo., which takes the place of line shafting, has been completed. Orders for a large number of motors have been received from Armour & Co., the American Bridge Co. and the Marion Steam Shovel Co. An order for a 30 kw. special generator has been received from the Sultan of Linga. The machine is to be installed in the royal palace, which is on an island near Singapore.

THE LUDLOW SUPPLY CO., of Cleveland, advises that Mr. W. E. Ludlow, who has been manager of the railroad department of The Chisholm & Moore Mfg. Co., of Cleveland, severed his connection with that company on January 1st, and will be actively connected with The Ludlow Supply Co. as president and treasurer. The later company, however, will act as general sales agents for The Chisholm & Moore Mfg. Co. for its railroad specialties, which consist of rail joints, rail braces, rail chairs, chain hoists, cranes, etc. Col. Ludlow will be able to assist materially in making The Ludlow Supply Co. the success that its position as the only street railway supply house in Cleveland would warrant. This company has secured the agency for the "Wilson" trolley catcher from the Frank Ridlon Co., Boston, which is one of the best known devices of its kind on the market, and it has also secured the agency for the Gore track drill, which is one of the fastest drills known, having, in actual construction work, been known to drill 24 holes an hour, through a 5/8-in. web in steel rails, including the moving and placing of the drill.

#### RAILROAD COMMISSIONERS' CONVENTION.

At the San Francisco convention of the National Association of Railroad Commissioners, held in June, 1901, the Street Railway Accountants' Association was elected to honorary membership to be represented at the meeting by a committee of the members. The next meeting of the Railroad Commissioners' Association will be held at Charleston, S. C., Feb. 11, 1902, and the Street Railway Accountants' Association will be represented at this meeting by Messrs. H. C. Mackay, W. F. Ham and C. N. Duffy.

The Railroad Commissioners have appointed Judge Lavant M. Reed, of Bellows Falls, Vt., Ashley W. Cole, of Albany, N. Y., and George W. Bishop, of Newtonville, Mass., to co-operate with H. L. Wilson, Boston, Elmer M. White, Hartford, and W. F. Ham, Washington, of the Accountants' Association, in the preparation of a standard form of report for electric railways.

A meeting of this joint committee was held in New York on January 10th and it will report at the convention.

The Erie R. R. projects equipping its line between Dunkirk and Salamanca, N. Y., at present operated by steam, for electric traction.

The striking employes of the Scranton (Pa.) Railway Co. on December 18th attempted to demolish four of the company's cars with dynamite, and another car was stoned. The passengers escaped without serious injury.

The Tokyo Tetsudo Kubushiki Kwaisha, projecting an extensive system of electric railways in Tokyo, has arranged through Mitsui & Co., of New York, to purchase American equipment to the amount of \$800,000. The General Electric Co. will furnish three 1,200-kw. generators; Babcock & Wilcox, eight water tube boilers aggregating 4,400 h. p.; the Peckham company, 250 car trucks, and the Morgan Engineering Co., of Alliance, O., will build a 20-ton electric traveling crane.

#### PITTSBURG SPECIAL FOR PITTSBURG TRAVELERS.

Leaves Chicago 7:30 p. m. every day, arrives Pittsburg 7:45 next morning. In addition to vestibule coaches this train carries sleeping cars from Chicago to Pittsburg. One car has buffet serving breakfast, and passengers can get off train at Pittsburg refreshed and ready for business. Its counterpart, the Chicago Special, leaves Pittsburg 6:30 p. m., and brings passengers to Chicago next morning. Arrange with H. R. Dering, A. G. P. Agt., 248 South Clark St., Chicago, for your next Pittsburg trip on this train.

PUBLISHED ON THE 15TH OF EACH MONTH.

**CORRESPONDENCE.**

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

**DOES THE MANAGER WANT ANYTHING?**

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. XII. FEBRUARY 15, 1902. NO. 2

The street railway manager is constantly striving to increase the efficiency of his employes, fully realizing that as the discipline approaches nearer the ideal, the company will directly benefit in many particulars. Two of the things sure to follow a betterment of the personnel are reduced expenditures for accidents and damage claims which is a direct money gain that can be readily appreciated and more cordial relations between the company and the public, this latter being even more important, though not so easily shown on the balance sheet.

In the past we have described various plans which companies have adopted with the idea of making conductors and motormen more careful in the discharge of their duties, by encouraging the well-don ones and marking the bad ones, and the subject has been before recent street railway conventions. In this issue will be found details concerning two systems recently adopted by the street railways of Detroit and Buffalo, respectively.

The Detroit United Ry. has adopted the Brown system of discipline, well known among the steam railroads, according to which trainmen are given marks of merit or demerit, as their conduct in the service deserves. On the record thus made depends each man's standing with the management, and the injustice often resulting from suspensions for misconduct is avoided. Bulletins issued at frequent intervals keep the entire personnel advised as to the acts that the management considers praiseworthy or reprehensible and thus serve as a stimulus.

At Buffalo the International Traction Co. has in effect a premium system, whereby trainmen who avoid accidents receive compensation in addition to the scheduled rate. This plan, during the short time it has been in service has resulted not only in a decreased number of "accidents," but in far better accident reports. The men feel that they have a direct personal and financial interest in protecting the company from accident claims and damage suits, and use every effort to secure the names of proper witnesses, and in cases where no damage or only trivial injury results, usually return with the report of the occurrence a duly executed release

or a signed statement that the company was not negligent. This result is due in a large measure to the fact that when patrons understand that the loss because of "fake" accident claims will fall, in part at least, upon the employe, instead of wholly upon the company, their attitude is greatly changed, and they willingly give their names as witnesses, or, if the victims of a harmless fall, will sign a release, when otherwise evil-minded attorneys might persuade them to sue for damages.

Managers will differ as to the efficacy and desirability of various plans such as these, but, entirely aside from their relative merits, it is gratifying to know that so many different ones are being given practical trial, and we may be certain that good to the whole industry will result.

Apropos of accidents and accident reports, it has at times been suggested that the practice of requiring trainmen to make reports on all accidents out of the ordinary occurring on their cars might have its disadvantages. It is argued that if at the slightest mishap, such as a passenger falling in the car, the conductor draws out a formidable-looking note book, asks everybody for their names and addresses and anxiously inquires if the passenger has been hurt, it is probable that by the time he is through the unlucky person has received the impression that the company considers the matter a very serious one. He may thus be led to believe that he must have good grounds for a claim, whereas, if nothing had been said the passenger would probably forget all about the incident.

A case in point occurred in New York. Two women boarded a car and before one of them could get to a seat the car started and she fell to the floor, sinking backward as easily as if she were lying down on a couch. She rose and took her seat, chatting with her companion and laughing heartily at her predicament. It was not until the conductor came and asked her name and the name and addresses of all the witnesses that the expression on her face changed from a smile to one of intense pain.

"I'm terribly hurt—on the side," she said in answer to his inquiry, "and it was all the motorman's fault. I'll see my doctor and then I'll go to a lawyer." When the conductor had gone she could not repress a smile and, turning to her companion remarked, "I can't feel it, but I guess the company will have to pay me a couple of hundred dollars, as long as they think it is so serious." If the conductor had taken no notice of the incident after assuring himself by the actions of the parties concerned that no actual damage had been done, the case would never have been heard of again.

The manager who has had to defend a suit for damages where the plaintiff really stumbled against the street curb after leaving the car—and there have been such cases—will undoubtedly urge that no incident that may possibly be made the basis of a damage suit is too trivial for a report.

To give the conductor entire discretion as to what incidents to report would be dangerous, but there may be room for improvement in the manner of collecting data. Let the men be instructed to avoid all excitement and display of anxiety in trivial cases.

There are spots in the United States and Canada where the way of progress has been made unusually difficult for the electric railway by the opposition to operating cars on Sunday. Those well-meaning but over-zealous advocates of strict Sunday observance will probably feel that their cause has received a serious setback when they learn the news from Edinburgh, where for centuries the inhabitants have done their daily toil on six days of the week and walked to church on the seventh.

The Edinburgh city corporation owns the cable tramways, but leases them for operation to a private company. Cable trams are expensive to run, and the company sent a delegation to America for a few pointers on tramway matters. Among other things the delegates reported that in several cities in the United States cars are run on Sundays, and they were told the companies derive considerable revenue from that source. Application to the city council was made by the tramway company for permission to run the trams on Sunday. This application was refused, but the company needed the money, and in the absence of specific agreement insisted on its right to handle the property in its own way. In consequence a few weeks ago the people found the cars running on Sunday morning, and they were well partitioned.

The city council has commenced proceedings against the company to stop further operation on Sundays, but the public at large

has presented a very emphatic endorsement of the innovation, and it is probable that old fogysm will have to give way to conceptions and ideas better suited to the twentieth century times.

The tramway company compels none of its employes to work on Sundays, but leaves the matter to their own choice. So far it has had more applications for Sunday runs than it can fill.

The question of equipping long roads for electrical propulsion has been before electrical engineers for several years, and while considerable progress in this direction has been made, such as equipping branch lines, elevated roads and a few experimental lines with electricity, the management of our leading railroads as well as those in foreign countries are entirely too conservative to undertake the expense of electrically equipping main lines with heavy freight and passenger service as long as any doubt whatever exists as to its being profitable. This subject, however, is one which is forcing itself more and more strongly upon the attention of electrical engineers and railroad men, and we believe that the time is not far distant when electric traction for long railroads will be an accomplished fact.

The greater portion of the inaugural address of Mr. William Langdon, president of the Institution of Electrical Engineers, deals with this subject, and it is a significant fact that Mr. Langdon, who is himself a steam railroad man, believes that the steam locomotive has seen its best days and that it will be replaced in the comparatively near future by the electric motor.

It can readily be seen that the building and consolidation of short electric lines in different parts of the country have inaugurated a competition which will prove more and more disastrous to steam roads as the growth of the electric systems continues. The building of high speed electric railways between important commercial centers is bound to take place, and unless these lines are undertaken by the steam roads themselves they must prove a source of considerable loss to older roads by diverting a very profitable part of their business. An example of this is pointed out by Mr. Langdon in the case of the Manchester and Liverpool mono-rail line, which has recently been sanctioned by Parliament. Connection between these two cities is already made by three lines of railroads, all of which provide good and apparently ample service. At least a part of whatever success may be attained by competitive electric roads must be drawn from the traffic of the steam systems; although to some extent the electric lines have created a traffic which did not exist previous to their operation. The conclusion may be reached that if the existing systems of railroads do not avail themselves of electrical propulsion, that electrical railways of considerable magnitude will be built independently and in competition with the existing roads. Mr. Langdon makes the suggestion that it would be worth the while of the companies threatened with competitive electric roads to combine to carry out experiments in this direction at their joint expense. If electrical operation over a considerable distance did not offer the advantages claimed for it the companies could then tell where they stood. There is very little question in the minds of electrical engineers that electricity is particularly well qualified for this work, but there is undoubtedly much experimental work to be done before the most desirable system of long distance working can be determined upon. Theoretically, at least, the alternating current seems best adapted to this work, and while no scheme of alternating current propulsion for railways has thus far been perfected to an extent which would warrant its adoption on a line of any considerable size, we believe that this is simply because there has been no demand heretofore for such a system. When the demand arises no one who is familiar with the subject of electric traction doubts but that the system will be forthcoming. Mr. Langdon believes that for the electric service the difference in speed between passenger and freight trains which now exists is entirely too great; he advocates breaking up freight trains into smaller units which can be operated at higher speeds and which can alternate between short, high speed passenger trains. At any rate short high speed passenger trains at frequent intervals would render slow freight trains an impossibility, and on a road having only two tracks it is impossible for the full benefits of electric operation to be secured unless the speed of the freight traffic is correspondingly increased. The capacity of a road working under such conditions would unquestionably be very largely increased, as there would be less switch-

ing of trains and the number of them could be doubled if the time were halved without increasing the labor charges.

The lamentable accident which occurred last month in the New York Central tunnel, and which resulted in the death of 17 persons and the serious injury of 34 others, forcibly emphasizes the fact that steam locomotives cannot be used with safety where the ventilation is inadequate to prevent clouds of smoke from obscuring visual signals. In the tunnel in question the signal system installed is probably as perfect as any which can be devised for use with steam locomotive systems, as in addition to the visual signals both a system of gongs is rung and torpedoes are automatically placed on the track in case a train runs past a signal, but in spite of all these precautions this accident, as well as the one of last year, proves that the use of steam locomotives is undesirable, at least in situations of this kind.

The public, as well as the majority of railway engineers, now recognize the superiority of electric propulsion for tunnel work, and ever since the adoption of electric locomotives by the Baltimore & Ohio in 1895, there has been no question of the ability of an electric system to handle the heaviest train without difficulty. Apropos of this subject, a letter from Mr. George Westinghouse which was recently published in the daily press has elicited considerable comment, as at first glance the reader might easily assume it to contain an argument against the safety of electric traction. Mr. Westinghouse states that as a matter of fact, with an electrically operated train the risk of accident will, judging by experience, be increased rather than diminished, because of the presence of the heavy electrical machinery which it is proposed to attach to every car of each train. He cites several accidents where cars have been destroyed by fire resulting from some derangement of the electrical apparatus, and argues that the electrical energy required to operate a heavy train is sufficient to melt a considerable bar of iron if anything goes wrong upon a car of ordinary combustible construction. The remedy suggested in his letter for this trouble is the use of cars built of metallic or other incombustible material. At the time of its publication Mr. Westinghouse's letter was understood generally as an argument against electric traction, and the surprise at this was the more marked as the Westinghouse company has been one of the most prominent in introducing and equipping electrical systems. His criticisms called forth a number of comments from prominent engineers which were so antagonistic as to elicit a second letter from Mr. Westinghouse describing his stand on this question more explicitly and emphasizing the importance of the non-combustible construction of cars. While Mr. Westinghouse, as was to be expected, explicitly denies any antagonism to the system of electric propulsion, it would appear that in his desire to be cautious he considerably overestimated the danger of electricity, which certainly in the case of most accidents which can be mentioned has been due to faulty construction rather than to any inherent shortcomings in the system. While no one can doubt the wisdom of taking every possible precaution to avert railway accidents, the use of a car made entirely non-combustible is an extreme which will appear over-cautious to most railway men. While the use of electricity can be made dangerous through ill-advised or faulty construction, there is no agency which can be made safer by adopting sound engineering principles.

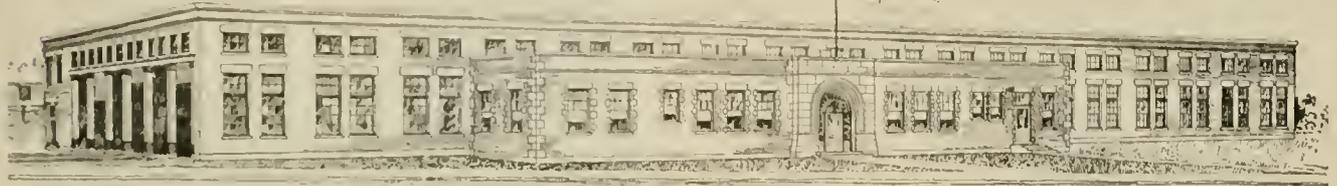

While heavy currents such as are required to handle heavy trains are sufficient to melt bars of iron and set fire to woodwork, these currents are so easily controlled, and may be automatically limited to the working capacity of the conductors, that the chance of such a fire occurring is practically nil. Electricity also lends itself with the utmost facility to automatic regulation, and if a section of electric road be divided into blocks, arrangement can easily be made so that if one train is upon the block, the second train attempting to enter the same block will be totally cut off from a supply of current, making collisions practically impossible. The discussion on this subject in the daily press may have proved useful as a warning against the use of carelessly constructed or equipped electric systems, although it is perhaps unfortunate that the public should have its confidence shaken in its belief in the safety of electricity through its misinterpretation of Mr. Westinghouse's letter or his over-cautionsness.

## New High Alternating Current Installation of the Berkshire Street Railway Co., at Pittsfield, Mass.

"Through the heart of the Berkshires," aptly describes the route over which the Berkshire Street Railway Co. is now building an electric railway, that according to the prophecies of those interested, is to become one of the finest interurban properties in New England. As far as location is concerned these assurances would scarcely seem to be exaggerated.

Starting in the town of Cheshire, Mass., where connection is

where connection will be had with the line of the Albany & Hudson Railway & Power Co., running from Albany to Hudson, N. Y. A connection will be made with the Western Massachusetts Street Railway Co., which is to build a line from Lee to Westfield, connecting with a line running to Springfield, Mass. Franchises have also been asked and partially secured for locations on several streets in the city of Pittsfield, these grants forming a valuable

EXTERIOR OF POWER STATION, PITTSFIELD, MASS.

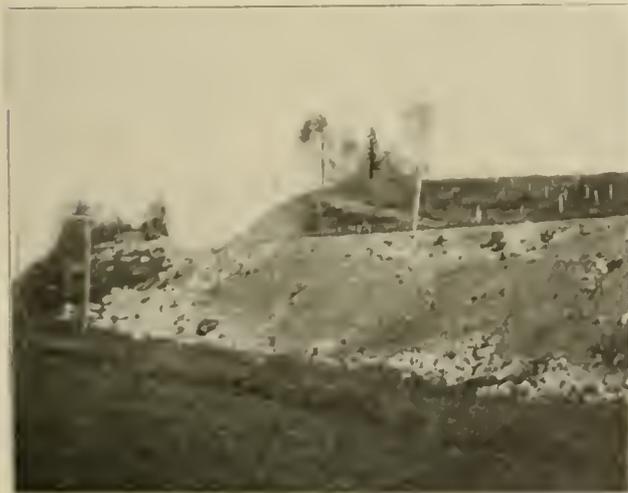

made with the Hoosac Valley Street Ry., of North Adams, the Berkshire Street Ry. runs south through the towns of Cheshire and Berkshire to Pittsfield, a city rejoicing in the euphonious title of the "Haven Amid the Hills." From Pittsfield the line strikes south again, touching the towns of Lenox, Lee, Stockbridge, Great Barrington and Sheffield to the Connecticut state line, forming in its entirety practically a continuous electric railway from the state line of Vermont to the state line of Connecticut traversing the extreme western end of Massachusetts. It is estimated that in this strip of territory there are more magnificent hotels and fine

asset as they will enable the company to give its passengers transfers to points in and near Pittsfield.

In arranging the power scheme consideration was given to the general territorial layout as well as to the present and probable future demands of the service. Decision was finally made in favor of a central generating station containing generators of the revolving field type, giving 3-phase current at 13,300 volts. This current is transmitted directly to the transmission line without the use of step-up transformers. From this line, step-down transformers are used, transforming the voltage from 13,300 to 380 volts for use at the rotaries, of which there are two 300-kw. machines in the main station and two 250-kw. machines in each of the two sub-stations. The rotary converters change the alternating current of 380 volts to direct current at 600 volts. By using generators of 13,300 volts step-up transformers are avoided, thus, it is claimed, increasing the efficiency. By the use of revolving fields there are no high potential revolving parts; the revolving fields are excited by 110 volt, steam-driven exciters.

### Power House.

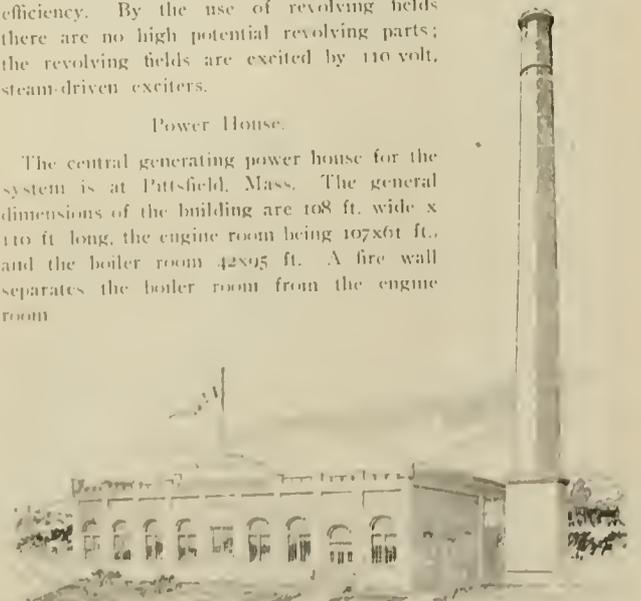

The central generating power house for the system is at Pittsfield, Mass. The general dimensions of the building are 108 ft. wide x 110 ft. long, the engine room being 107x61 ft., and the boiler room 42x95 ft. A fire wall separates the boiler room from the engine room.

LONG CUT AND FILL AT LANESBORO.

cottage that in any section of equal extent in New England. It forms the summer outing place for New York's and Boston's most exclusive society, and Lenox and Lee are said to be fast outrivaling Newport and Saratoga in favor with the wealthy classes of New York and Massachusetts, especially those desirous of finding rest and quiet during the summer months. In addition to the large and more fashionable hotels a multitude of cottages and boarding houses for six months in the year shelter a host of tourists and eating parties who are drawn by the clear invigorating air, the fresh spring water and the far reaching and inspiring scenery of the Berkshire Hill.

The road at present determined upon is 20 miles long, of which distance 15 miles are practically completed and will be running in the spring. Franchises have been asked and partially granted for extensions from Pittsfield to the New York state line

EXTERIOR OF CAR HOUSE AND OFFICE BUILDING, PITTSFIELD, MASS.

The building is of brick with granite trimmings. The roof framing consists of steel trusses, there being eight of these trusses in the engine room and seven in the boiler room. Each of the two main rooms has a monitor roof with steel framing. The roofing is of 1 in. plank covered with a 5 ply asphalt roof covering. The roof is drained by four inside conductors. The stack is 175 ft. high with 7 ft. 6 in. core.

In the engine room will be two 1200-h. p. cross compound engines with cylinders 22 and 44x48 in. These are each direct connected to a 750-kw. triphase revolving field Westinghouse generator with independent 110 volt steam driven exciter. As before stated current will be generated at 13,300 volts and passes direct to the transmission line at that pressure.

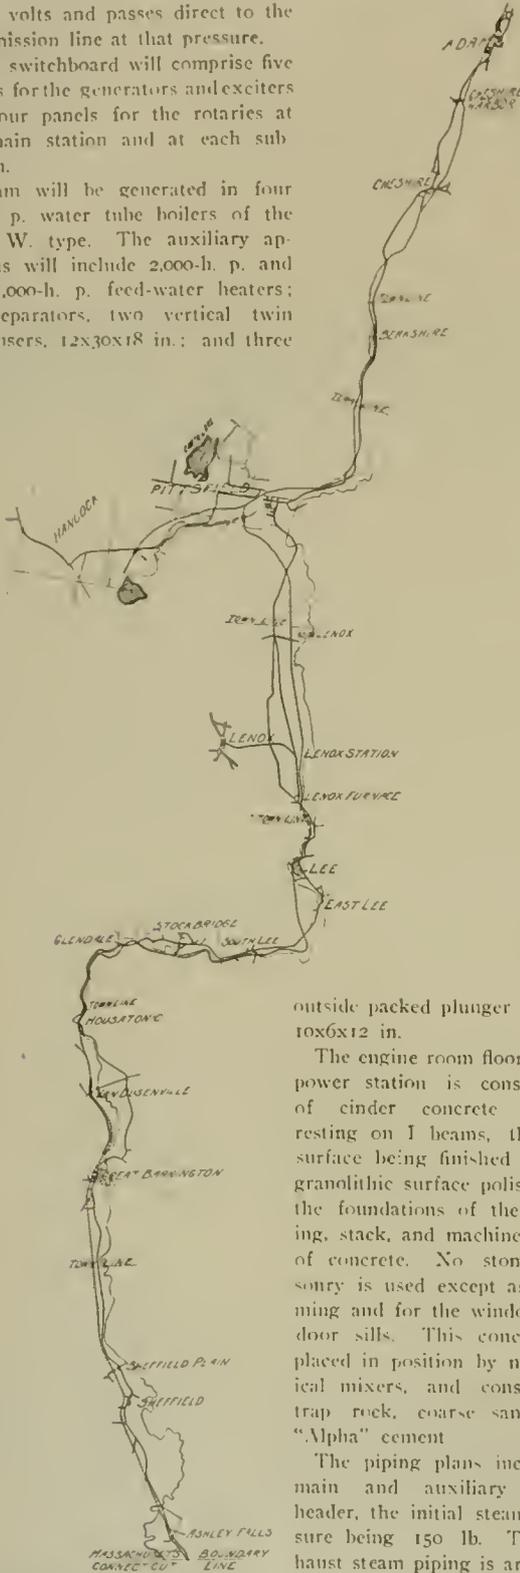

The switchboard will comprise five panels for the generators and exciters and four panels for the rotaries at the main station and at each sub station.

Steam will be generated in four 380-h p. water tube boilers of the B. & W. type. The auxiliary apparatus will include 2,000-h. p. and two 1,000-h. p. feed-water heaters; two separators, two vertical twin condensers, 12x30x18 in.; and three

All live piping is extra strong with extra heavy wrought iron bends. The Holly system of drips is used, as is also a complete system of oiling under air pressure, and a system of compressed air is in use for blowing off the electrical machinery and furnishing air for the oiling system.

Sub Stations and Overhead Construction.

There are two sub-stations, one at Lee and one at Housatonic, and in addition there are two 300 kw. rotary converters at the main power house at Pittsfield for feeding direct current to the terri-

MAP OF BERKSHIRE STREET RAILWAY SYSTEM.

outside packed plunger pumps, 10x6x12 in.

The engine room floor in the power station is constructed of cinder concrete arches, resting on I beams, the top surface being finished with a granolithic surface polish. All the foundations of the building, stack, and machinery, are of concrete. No stone masonry is used except as trimming and for the window and door sills. This concrete is placed in position by mechanical mixers, and consists of trap rock, coarse sand, and "Alpha" cement

The piping plans include a main and auxiliary steam header, the initial steam pressure being 150 lb. The exhaust steam piping is arranged in duplicate, the two exciter engines, the two condensers, and two pumps exhausting into the

open heater. The exhaust steam from the main engines can be condensed in either condenser, first passing through closed heaters. The water supply is taken from the Housatonic River or city service as desired.

LOOKING SOUTH AT LANESHORO.

tory immediately adjoining the station and to the northern end of the line.

The sub-station at Lee is ten miles from the Pittsfield plant and is housed in a frame building, which is virtually a two-story cottage, having rooms and chambers for the sub-station attendant and his family. The converters and transformers are in a one-story addition adjoining the cottage at the rear. The equipment consists of two 250-kw. rotary converters with static transformers of 600 kw. capacity.

The sub-station at Housatonic which is 20 miles from the Pittsfield plant is located in the rear of the car house and contains identically the same electrical equipment as the sub-station at Lee.

The alternating current circuits from the main station in Pittsfield are in duplicate, that is, there is one circuit from Pittsfield to the Lee sub-station, and one circuit from Pittsfield to Housatonic sub-station. In case of accident to either circuit the other can be

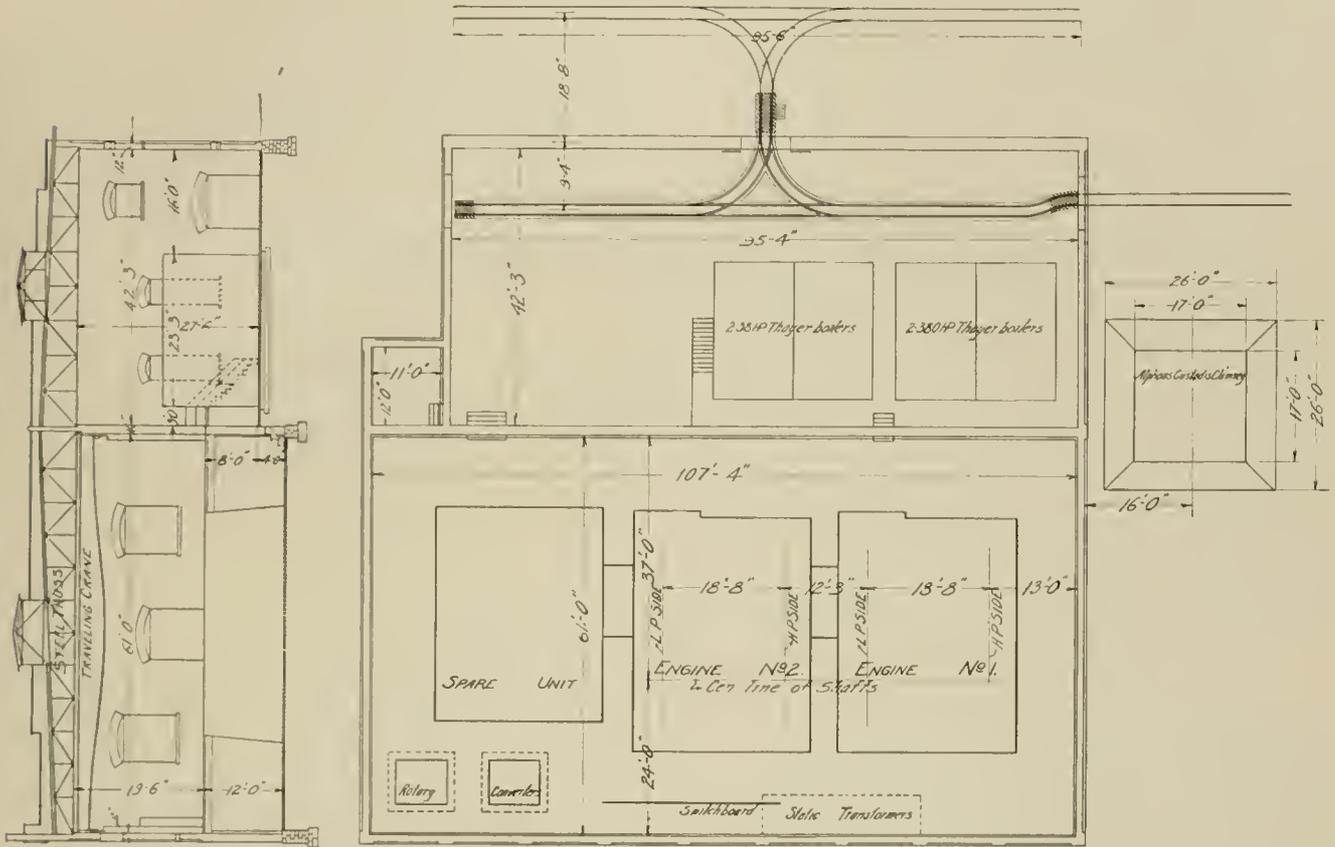

TRESTLE AT CHESHIRE.

cut in. By this method the liability from accident is reduced to a minimum. The transmission line does not follow the line of the street railway for the entire distance, the town of Pittsfield being cut out by a high tension line around the city, and the town of Lee is also avoided by a similar line running over the turnpike. This avoids running the high tension currents into the towns and also shortens the transmission distance considerably.

The over-head construction consists of two No. 0000 grooved trolley wires for the entire length of the road. The wire is carried on 35-ft. poles with Creaghead flexible brackets.

One of the accompanying diagrams gives the distribution of feeders and transmission lines. The transmission lines which are bare

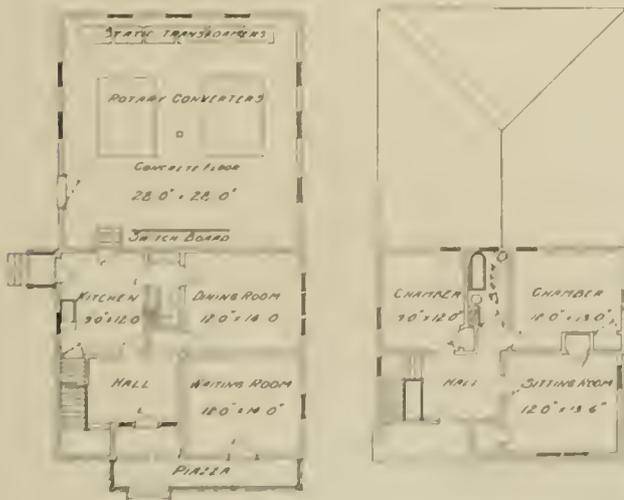

The insulators for the high tension line are of glass purchased from the C. S. Knowles Co., of Boston. They have 7½-in. petticoats and are supported on steel pins with glass sleeves. Lightning protection is afforded by a regular 4-joint barb wire strung along the tops of the poles and grounded every fifth pole. On the

PLAN AND CROSS SECTION OF POWER HOUSE, PITTSFIELD, MASS.

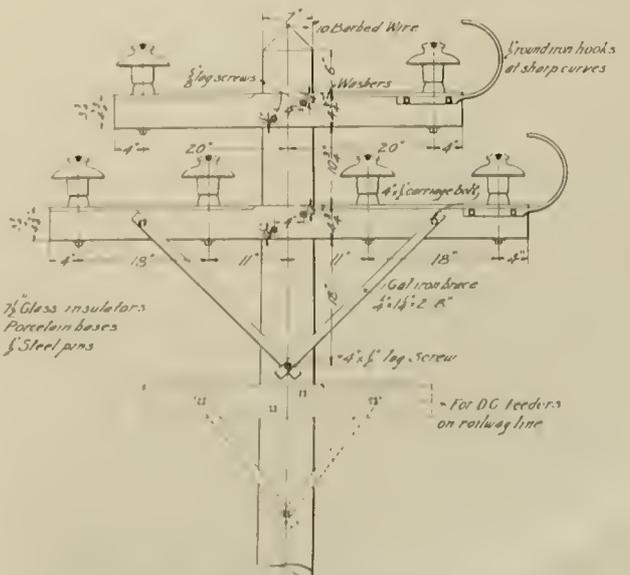

copper wire are carried on two cross arms, one circuit to Lee on one side of the pole; the other to Housatonic on the other side. Each circuit is arranged in the form of an equilateral triangle with

transmission line no poles are guyed. The sharp turns at poles are braced by stubs set on the inside of the curve. The direct current feeders are carried on a cross arm which is below the

PLANS OF COTTAGE AND SUBSTATION.

sides 18 in long. The pole top as presented herewith is the form used, both where the transmission pole line follows the track, and also where it cuts across country.

ARRANGEMENT OF OVERHEAD LINES.

transmission arms, the direct current feeders being tapped to the trolley wires every mile.

### Organization.

The Berkshire Street Railway Co. was incorporated in June, 1901, with capital stock authorized and issued of \$550,000. The officers of the company are: President, R. D. Gillett, of Westfield, Mass.; vice-president, B. D. Rising, of Springfield, Mass.; treasurer, A. W. Eaton, of Pittsfield, Mass.; electrical and mechanical engineer, Charles K. Stearns, No. 93 Federal Street, Boston, Mass.; general contractors, Fred T. Ley & Co., of Springfield, Mass.; attorney, Charles E. Hibbard, of Pittsfield, Mass.; consulting engineer, Gilbert Hodges, of Boston.

The specifications for the engines, boilers, electrical machinery and auxiliary apparatus, the plans and specifications for the power house and sub-stations, specifications for the transmission lines and feeders and also for the piping were drawn up in the office of Charles K. Stearns, of Boston, and all the work with the exception of the track, bridges, and main car house is being carried out under his direction.

### CHICAGO SITUATION.

The street railway franchise situation in Chicago appears to be slightly improving. The mayor has abandoned his plan of passing mandatory ordinances, having reached the conclusion that the only immediate effect would be litigation. He is now suggesting that the overhead trolley be temporarily admitted to the down-town district and urges that the City Railway and the Union Traction companies rearrange the down-town loops and use them jointly.

### THE EVERETT-MOORE SYNDICATE.

During the past month there have been a great many rumors in circulation to the effect that the Everett-Moore syndicate was in negotiation with various parties, among them the Widener-Elkins syndicate, for the sale of the whole or portions of the Everett-Moore properties. It can be stated, however, that as yet nothing definite has been determined upon. The two traction companies most embarrassed are the Lake Shore Electric R. R. and the Detroit & Toledo Shore Line R. R., both of which are in process of construction.

Albion E. Lang is receiver for the Lake Shore property. Allan F. Edwards, general manager of the Detroit & Toledo Shore Line, is now receiver for that company, the suit of W. B. Strang, at whose instance D. B. Cunningham and the Ohio Savings had been named as receivers by the state court, having been settled. Mr. Strang will complete the road.

There is considerable competition for both of these lines and though the syndicate is very desirous of keeping the system together, favorable offers for the Lake Shore and Shore Line roads may lead to their sale so that the proceeds may be devoted to protecting the other properties.

Some changes have been made in the officers of the Detroit United Ry; J. C. Hutchins, succeeds H. A. Everett as president; George H. Russell succeeds Mr. Hutchins as treasurer, and Mr. Everett succeeds Mr. Hutchins as vice-president. With the acquiescence of the bankers' committee the execution of a \$25,000,000 mortgage was authorized. The proceeds of this bond issue are to be used to take up underlying securities of the Detroit United Ry and the suburban companies whose lines are now a part of the Detroit system, and there will then remain some \$6,500,000 of bond to be used to acquire new properties or build extensions.

The suburban companies incorporated with the United railway include the Detroit & Northwestern; Detroit & Pontiac; Detroit, Rochester, Romeo & Lake Orion and Wyandotte & Detroit River.

The Twin City Rapid Transit Co. will expend larger sums for paving in St. Paul, this year than it has spent in any one year of its history. City Engineer Claussen is quoted as stating that the paving laid by the Twin City Company costs a third more than that laid by the city. St. Paul pays \$2.25 and \$2.50 for sand and stone, while the company uses granite for which it pays \$3 per sq. yd.

### BRIBERY CHARGES AT ST. LOUIS.

January 27th warrants were issued for the arrest of two ex-members of the St. Louis city council and one ex-member of the house of delegates, who were charged with being implicated in an illegal scheme of bribery in connection with a franchise ordinance granting the St. Louis & Suburban Ry. an extension through Forest Park. The allegations are that the company placed \$135,000 in two safety deposit vaults, \$75,000 for members of the house of delegates and \$60,000 for members of the council.

The house of delegates was enjoined from passing the ordinance, which had passed the council; the case being appealed, the Supreme Court held that the municipal assembly could not be enjoined, but by that time the term of the assembly has expired, and the ordinance was never passed.

The grand jury has since examined witnesses and returned indictments against several other members or ex-members of the municipal assembly and directors of the Suburban company.

January 30th, ex-Governor Johnson, attorney for Pres. Charles H. Turner of the Suburban company, was quoted in an interview as follows: "Mr. Turner told me that it was almost impossible to secure the passage of any kind of measure in the municipal assembly without putting up large sums of money. Mr. Turner said that he was asked for a certain sum of money and he put it up. He does not deny that he put the money in the safe deposit boxes for the purpose of securing the passage of the bill. He thought that the passage of the bill would not only be a benefit to the suburban company, but to the people of St. Louis as well. It was necessary, Mr. Turner told me, to pay money to secure the passage of the bill. There was no other way to deal in the matter except to pay the money. I believe every large corporation in the city has been compelled to act in a similar manner whenever it has wanted legislation. The St. Louis corporations, I have been given to understand, have become accustomed to being held up by the municipal assembly."

### BIRMINGHAM, ALA., NOTES.

The relaying of the East Lake line of the Birmingham Electric Railway, Light and Power Co. with 70-lb. rails is well under way and is progressing as rapidly as practicable, notwithstanding the inclement weather. The East Lake road is one of the few double-track electric lines of its length in the south. It is seven miles in length and much frequented in the summer time by pleasure riders.

The reconstruction of the Bessemer and Birmingham line is also being pushed and the new track, laid with 70-lb. rails, has been carried as far as the Fair Grounds, almost half way. Each day that passes draws nearer to a close the era of the steam dummy, which has been operating on this line for many years. With the conversion of this line into an electric road the dummy becomes a thing of the past in Birmingham.

A contract is being closed with the Ohmer Car Register Co. of Dayton, O., for the equipment of nine cars on the Bessemer and Birmingham line with its new style of registers. Six classes of fares are used on this road, and the register not only shows the number of each class, but prints the day card for the conductor. This is the only style register that can properly take care of as many different kinds of fares. These registers are rented at so much per day and are not sold.

Several minor changes in the cross-town routes are contemplated, and to this end a petition is pending before the mayor and aldermen for franchises. Should the board report favorably on this petition the changes that follow will greatly facilitate the downtown lines in handling the crowds.

The shops are all very busy at present overhauling, repainting and canvassing the roofs of the summer cars so that when the warm weather arrives the summer equipment will present a very neat and jaunty appearance.

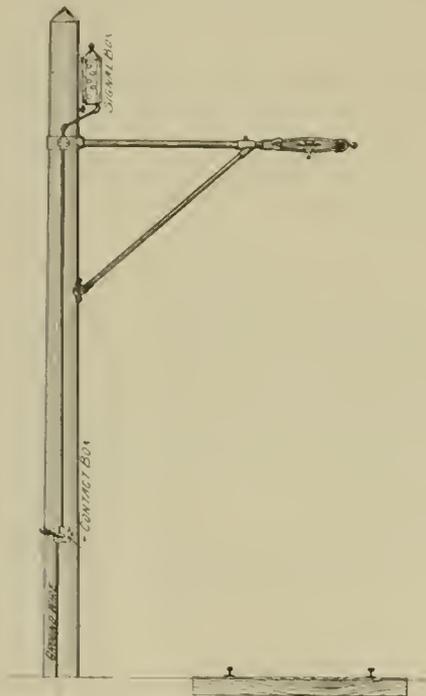

The Colorado Springs Rapid Transit Railway Co. is installing machinery in its newly completed power house on Las Animas St., adjoining the tracks of the Denver & Rio Grande. The company is grading and relaying with heavy rails a large part of its system.

## CORRESPONDENCE

### SIGNALLING INTERURBAN CARS AT NIGHT.

Editor "Review": I suppose that the question of the relative merits of a lighted match and a regular signal box for the purpose of signalling interurban cars at night comes under the head of new business, and as the "Review" is always first in describing these little schemes that follow in the wake of the interurban railway, I wish to explain how we have overcome the difficulty prospective passengers formerly had in stopping cars at cross-roads out in the country after dark.

Our friend the Kansas City-Leavenworth Railroad Co. advises its patrons to strike a match to signal the car, as illustrated in the "Review" for January, page 60. This is all very well if the intended passenger is of the masculine persuasion, but in a case of a woman, how! Oh! how can she strike the match? The writer saw this difficulty when our interurban line from Mansfield to

SIGNAL FOR INTERURBAN LINES.

Shelby was put in operation last summer, and your readers will doubtless be interested in a description of our mode of signalling.

We put five lamps in series. These are enclosed in a neat iron box, and are fed from the trolley. The ground wire is brought down the pole in a gas pipe into another small contact box which is supplied with a neat lever. The lamp box and all connected with it are waterproof and so arranged that no part can be tampered with or get out of order. All that the passenger has to do is to hold down the lever, and this throws on the light that can be seen any distance and the motorman has lots of time to stop without skidding wheels or straining the posts of his car, which always happens with very quick stops. When the signal is seen the lever is released and the lights are out.

The box and combination therewith will last for years and the amount of current consumed is one-half ampere for, say, one-fourth minute, and this is so trifling as not to be taken into account. These boxes are made by the Century Machine & Manufacturing Co., Mansfield, O. Patents on the combination described are pending. Yours truly,

ARTHUR J. HAYCOX, RY. SUPT.,

Mansfield, O

Citizens Elec. Ry., Lt. & Power Co.

### PENSION FOR EMPLOYEES.

Editor "Review": It was with pleasure I read your article in the January "Review" on our pension system. Our employes are all well pleased with the association, and we now have over 1,000 members. During the short time it has been organized, about two months, some of the members have drawn as much as \$75, and it will take several years, at 20 cents per week, to pay this amount. We have four members on the pension list and they seem to be well pleased with their situation. Yours truly,

A. T. POTTER, Gen. Mgr.,

Providence, R. I.

Union Railroad Co.

Editor "Review": Replying to your inquiry as to the most satisfactory scheme for caring for superannuated employes, I believe that the moral obligation of the company to care for such employes depends largely upon the conditions in each individual case. As a broad principle, it seems to me that any effort to better the condition of employes will result in better service from them. If the company has a sufficient number of employes, I believe that a mutual benefit society, with pension provisions, to which both employer and the employes contribute, would be a strong factor in keeping the employes devoted to the best interests of their employer and themselves.

At the present time we are about to erect a building for our motormen and conductors, wherein the men will have many conveniences, such as a reading-room, dining-room, baths and a large assembly hall, with stage. When this is completed we hope to organize a benefit association for the employes, but have not decided yet the details of operation. Yours truly,

J. K. NEWMAN, Pres.,

New Orleans & Carrollton Ry., Lt. and Power Co.  
New Orleans, La.

Editor "Review": Replying to your recent letter asking my views on pensions for street railway employes, I will say that it seems to me there is a moral obligation resting on employers to care for superannuated employes who have given faithful service for 25 years or more, although I do not think the advantage of making the personnel more permanent is sufficient to justify the cost of a pension system.

In my opinion the most practical, all things considered, for a street railway company would be a pension paid wholly by the employer. One reason for this would be that an employe having been in the company's service for a number of years may be able to better himself considerably, in which case it seems arrangements would have to be made for the withdrawal of any contributions he had made to a pension fund, as in justice he would be entitled to them. In case an employe should remain the allotted time with the company, I feel that he deserves a pension without expense on his part.

I have always favored a mutual benefit or insurance organization among the employes of a street railway company, and we are now endeavoring to form such an organization, so that in case of illness, accident or death to an employe a fund will be available to be used something in the manner set forth in the plan adopted in Providence; that is, we have offered to make a donation to our employes with the understanding that they contribute, say 25 cents a month each, and in case of illness or injury they would receive \$4.00 per week from this fund, and in case of death about \$100 from this fund. Yours truly,

C. E. FLYNN, Gen. Mgr.,

Wheeling, W. Va.

Wheeling Traction Co.

### GREETINGS FROM NEW SOUTH WALES.

We received too late to acknowledge last month a card artistically printed in colors from the New South Wales Government Tramways, bearing the New Year's compliments of the officers of the tramway department. The New South Wales tramways now comprise 145 miles of track, and for the year 1901 carried 93,703,685 passengers and ran 6,835,926 tram miles.

The new electric railway system in El Paso, Tex., has been put in operation, and is reported to be one of the finest in the state.

top, permitting the tower to be swung back so as to lie flat upon the roof platform mentioned. When the tower is in its upright position it is held securely by two chains attached to upper opposite corners and extending diagonally down and hooking into eye bolts in the platform as indicated. An iron ladder at one end gives access to the roof.

This car is used to advantage for a variety of purposes. It par-

SNOW PLOW AT TAUNTON, MASS.

tially fills the place of a tower wagon, and with it the company does all kinds of overhead repair work. Salt and sand bins are carried inside the car, the sand being fed directly to the rail through spouts. The car is also provided with jacks and sundry tools likely to be required in breakdowns and other emergency cases.

In winter a portable sheet metal nose is fastened to one end and the car does duty as a snow plow in light snows. The weight of the nose in this case is supported on stanchions from the platform. The car is equipped with two G. E. 800 motors.

## WRECKING CAR AND PIT HOIST IN PASADENA.

The accompanying illustration, for which we are indebted to Mr. W. H. Smith, general manager of the Los Angeles & Pasadena Electric Ry., shows two auxiliaries of the mechanical department, each of which has been found highly useful in its special field. Fig.

1 represents a wrecking car which is used both for repair work on the tracks and in case of accident to any of the rolling stock when in service.

The car is arranged for only one man in the cab and has but one controller. It is equipped with both hand brakes and independent motor compressor air brakes, Anderson-Smith arc head lights and an arrangement for carrying wrecking materials of every description in a small space. The general dimensions of the car are as follows: Length, 19 ft.; width, 7 ft. 6 in.; height of body, 9 ft. 3 in. It is mounted on a McGuire truck having a 7-ft. wheel base and 30-in. wheels. The brake equipment was made by the Christensen Engineering Co. Hunter fenders are used, one under each end of the car, and the power is supplied by two Westinghouse No. 49 motors. This gives the car a working capacity of about 80 h. p., and it has handled a 15-ton car heavily loaded with passengers up a  $7\frac{1}{2}$  per cent grade.

A number of doors will be noticed in the side of the cab shown in the illustration, and there is a corresponding number on the opposite side. These are for different compartments which are used to store away wrecking materials such as frogs, wedges, jacks, crow bars, chains, block and tackle, blocking, etc. There is a large door at each end of the cab which closes two large compartments. Just beneath the floor of the cab a four-wheel dolly is carried to be used in case of broken axles occurring on the road. It is arranged that this dolly can be taken out from either end of the cab and run down on skids immediately under the disabled car.

Fig. 2 shows a general view of a new hydraulic and compressed

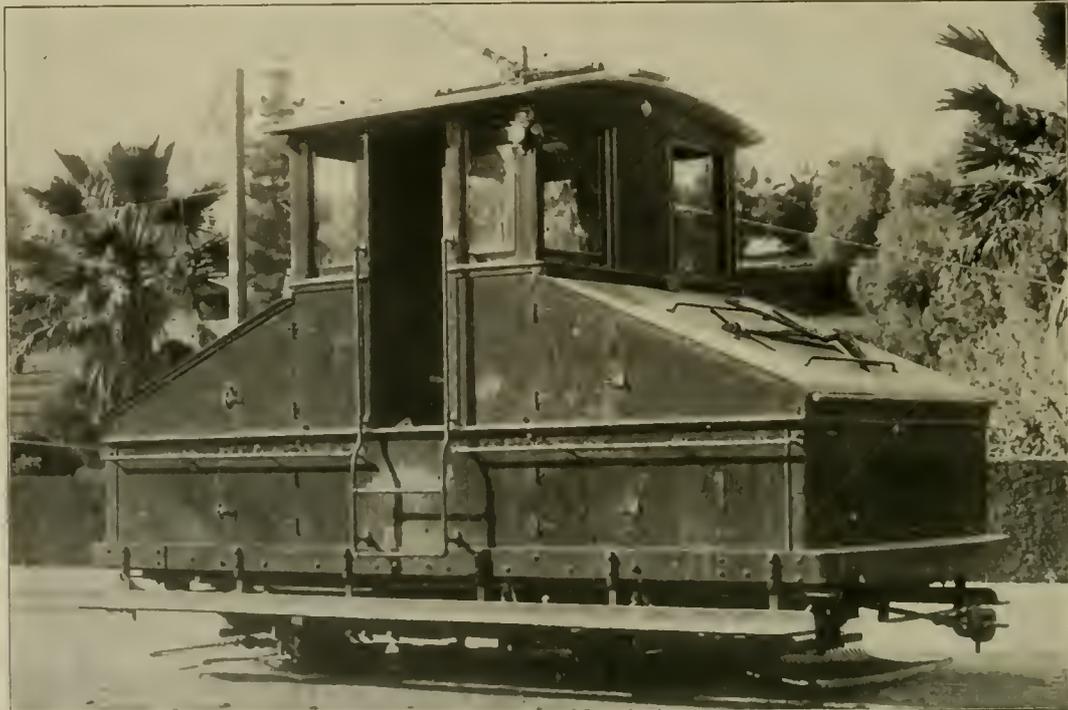

FIG. 1. WRECKING CAR—LOS ANGELES.

For work in heavy snow this division owns several old Rounds plows that have been remodeled and strengthened. New sills have been put in, extension pieces added to the noses, and truss rods extending from the ends of sills up over the side door posts have been provided to aid in carrying the weight of the noses. The plows are provided with two G. E. 1,000 motors

air pit jack which is used in the car house pits for numerous purposes. The general dimensions of the pit jack are: gage, 2 ft.  $2\frac{1}{2}$  in.; wheel base, 3 ft.; length of car, 4 ft. 6 in.; diameter of cylinder,  $7\frac{1}{8}$  in.; length of lift, 40 in.; diameter of piston rod, 3 in.; width of table, 2 ft. 9 in.; length of table, 4 ft. 6 in. This is operated from an 8 x 8 in. double stroke air compressor together with a storage

water tank. This apparatus has been found almost invaluable in making car house repairs such as changing wheels under the cars, changing motors and handling any heavy pieces. The illustration here shows the table raised to its full height. By means of this device a pair of wheels have been changed under a car, taking one

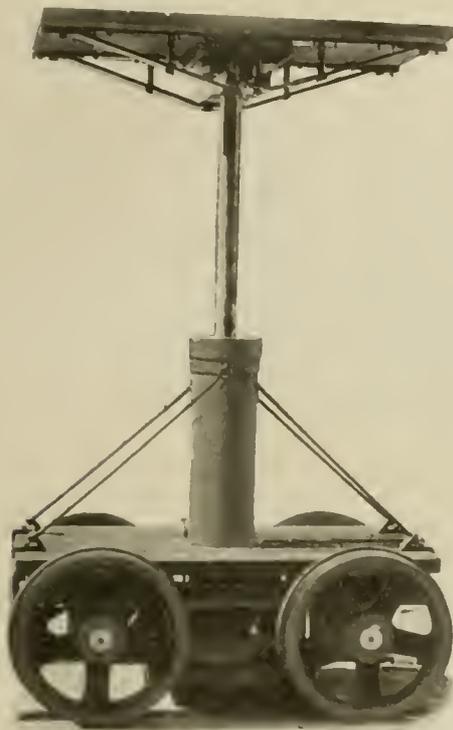

FIG. 2. PIT HOIST—LOS ANGELES.

pair out and putting another pair in, in 14 minutes. This, however, was done merely as an experiment and was on a car equipped with trucks of the company's own pattern, which are especially adapted to easy handling of such work.

## VARNISH.

BY LOUIS GRATON.

Varnish, as far as its quality is concerned, may be considered an unknown quantity until submitted to test at the hands of an experienced manipulator. The varnisher is by no means a cleanly looking person as might be judged from the neatness of the work he produces. If we observe him in a carriage or sleigh factory he is generally smirched from head to foot and the floor of his work room needs to be occasionally scraped with a shovel, but it is often by such a dirty man under such dirty conditions that the best results with varnish are obtained. It sometimes seems that in the varnish room the longer the experience the more there is to learn.

Varnish comes under three heads, viz., good, bad and indifferent, the former being the rare sort. If you listen attentively, as you should, to the friendly chat of the varnish agent you will easily conclude that there is but one make of reputable varnish. It is only when you try to apply the stuff that your conclusion is apt to be modified. Generally, however, these varnish agents are good, gentlemanly fellows, possessed of a rich store of intelligent information which they seem glad to impart, and I doubt not all varnishers are glad of their periodical calls. It seems to me that we of the brush should not be too chary of any valuable experience we may possess. Recently one of the representatives of one of our best varnish houses told me the following incident to prove the superiority of his goods over others. He had called at a certain carriage shop during the last working hour of the day and found that the painter, who had been induced to buy some of his goods on a previous call, was not very enthusiastic over them. The agent asked him then and there to varnish a body that was just ready for this operation, under his instructions. The painter consented, but

through force of habit failed to put on as much varnish as the agent desired. So he told the painter to immediately give the surface another application. The painter did so with somewhat of trepidation, and the agent confessed to me that he had some anxiety in regard to the result. On the following morning he hastened to the shop, where it was found that the varnish had leveled itself into a perfect mirror-like surface, the only evil result of such an application being a row of beads on the lower edge that was easily removed with a putty knife.

I put this lesson in practice on the very next day not, however, with his varnish, but with our usual goods that are good enough for our purpose. Neither did I apply one coat after another but I did put on more varnish at one operation than I ever had before, and to my delight it proved a success. I give this instance to emphasize the fact that a progressive man, though his hair be turning gray, is always willing to learn. I know that the successful varnisher will smile at this story, but I also know that to many faithful fellow craftsmen this is not a matter for laughter.

Different varnishes require different manipulation, and a change of varnish necessitates getting acquainted with the new article. I once rejected a very heavy rubbing varnish that required a great deal of brushing to keep it in place. On complaining of this to the agent he suggested the addition of turpentine to it. This should never be done if durability is desired. If the varnish maker is up to the demands of his business he will make known in one way or another the requirements of his goods, such as length of time required to dry, etc. But the one thing he will not advise is the tinkering of his varnish especially by the addition of turpentine.

The chief virtue of a good varnish, aside from brilliancy, is elasticity. It is this that gives it tenacity and durability, and as durability and luster are paramount requirements it is apparent without long argument that the addition of the turpentine, which renders the varnish more siccative, hence more brittle, will defeat the two-fold object of longevity and brilliancy. The force of this argument will not be so apparent, if it applies to rubbing varnish, which is supposed to be covered soon by an elastic and slow drying varnish. Yet it is well known by men of the craft that a brittle varnish in conjunction with a kind that is elastic is likely to produce disastrous results, such as checking and cracking. Hence two varnishes used on a surface should be of one make (from one maker) and should approximate each other in point of tenacity and elasticity.

The elasticity of the varnish can be said to be its life, and the process of drying, or indurating, may take months and even years. Whenever it is absolutely dry then disintegration and decay begin. This drying process is long or short in proportion to the ingredients that have been employed to dissolve the gums that enter into the composition of varnish. It is true that a comparatively quick drying varnish may be preferable for architectural work or for a certain class of furniture but this article is concerned only with carriage or car varnish, or work that is subjected to the changes of the weather. It is also true that with street cars which are exposed to extremely hard conditions, a middle ground might be advocated, that is, the employment of a varnish that is medium in its drying. In the first place the cars to be repainted or revarnished cannot for reasons that are self-evident be held indefinitely in the paint shop, and in the second place, as the management usually desires its cars to look tidy, it becomes necessary to varnish them at least once a year; so that for reasons of economy (as the slow-drying varnishes are usually the most expensive) we are justified in employing a medium grade of varnish.

As I have stated in a former article, varnish should be kept in a warm dry place, as equable as possible in temperature, which should be about 70° F. Though it has been my privilege to apply varnish in a railroad round-house, with locomotives going in and out, big doors opening and shutting on all sides, and the temperature at zero, yet the result was first rate. But such result could have been obtained only with the very best varnish, and should not be expected even then.

And I will again emphasize what I said in the former article in regard to ordering during the warm weather the varnish necessary to use in the cold months. The chilling which it would doubtless receive in transit during winter would cause the gum to separate in fine granules that are not pleasant to the eye and that also interfere with the durability of the varnish.

Untold gallons of poor stuff that is labelled "varnish" is on the

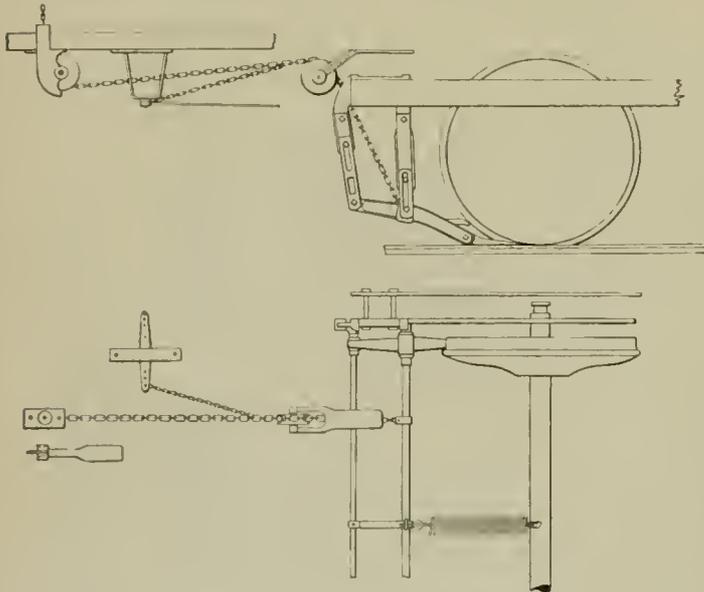

market today, yet I believe that as good varnish can now be bought as ever was made. Not long ago I chanced to talk on this subject with a very intelligent man, though he was a little pessimistic in regard to varnish. He wondered why it is so difficult, if not altogether impossible, to buy good varnish these days. He told of a wonderful buggy that his grandfather once had. This buggy was retouched and revarnished at intervals of five or six years only, and yet it always looked well and bright.

I asked him if he did not think that the carriages and cars of today, would give similar results if treated similarly. Our grand fathers considered it a sin to take out the carriage in bad weather or on muddy roads, and often the carriage was only out a dozen times a year. These ancient vehicles were carefully cleaned, properly sheltered and nearly always covered with a generous cloth. But now our vehicles are in almost constant use in all kinds of weather, on all kinds of roads and often with no care worth mentioning. Street cars, for instance, are in use 16 or 20 hours a day or even longer for seven days of each week. Is it any wonder that they need frequent attention from the painter?

While it must be confessed, that it is a difficult problem to select a good one from the innumerable mixtures that have the dignified name of varnish, nevertheless such can be had. And my parting advice to the user is patronize a reputable maker and, when you do strike the right stuff, stick to it.

### THE FLOOD EMERGENCY BRAKE.

Patrick Flood, of Albany, N. Y., is the inventor of an emergency track brake that has been in service since 1895 on cars of the United Traction Co. running over heavy grades in Albany, Troy and Cohoes, N. Y. As an emergency brake it can be applied either from the front or rear platform for bringing the car to a stop, and it also acts as a holding brake when necessary to stop for passengers while going up grade. In the latter case the motorman releases the brake, turns off the power, and when the car loses its momentum it slides back on to the track shoes and makes a very easy stop without the application of the wheel brake. The ad-

FLOOD EMERGENCY BRAKE.

vantage of not having to start up hill with the wheel brakes on will be readily seen.

The details of the mechanism will be understood from the drawings. Normally the track shoes are carried away from the wheel and track. When the motorman or conductor releases a lever on the dash the shoes are forced under the wheels by a spring attached to a cross bar. It is claimed that wheels can not be flatted for the reason that the shoe goes under the wheel and prevents the wheel from sliding on the rail.

The brake is in use on the lines of the United Traction Co., of Albany; the Lowell, Lawrence & Haverhill Street Ry., Haverhill,

Mass.; Amsterdam (N. Y.) Street Ry., Schenectady (N. Y.) Street Ry.; Ithaca (N. Y.) Street Ry., and the Troy & New England R. R.

### CONSOLIDATION IN NEW HAMPSHIRE.

An important merger of street railway interests in southern New Hampshire and northern Massachusetts will soon be perfected.

A new company incorporated as the New Hampshire Traction Co. is to absorb and operate as one system the following street railway properties: The Dover, Somersworth & Rochester Street Ry.; the Exeter, Hampton & Amesbury Street Ry.; the Amesbury & Hampton Street Ry.; the Seabrook & Hampton Beach Street Ry.; the Haverhill, Plaistow & Newbury Street Ry.; the Haverhill & Plaistow Street Ry., and the Portsmouth & Exeter Street Ry.

The new company will control in all about 86 miles of track. This will all be operated eventually from one alternating current station now being built by the Rockingham County Light & Power Co. Power for the street railway lines will be transmitted at high voltage to converter and transforming stations located at various points. The firm of Thompson, Tenney & Crawford, of New York, bankers, is managing the deal, and inform us that all details will be arranged before the coming summer.

### THE AMERICAN EXHIBITION IN LONDON.

The American exhibition at the Crystal Palace, London, in 1902, is expected to be the largest and most important exhibition of exclusively American products ever seen in the United Kingdom. Most of the preliminary work in regard to the exhibition has now been completed and the allotment of space for the various classes of exhibits in the Crystal Palace has been determined.

The exhibits have been divided into eleven classes, including machinery and mechanical industry; natural and agricultural products; prepared fruit products; pharmaceutical and kindred preparations; carriages, vehicles, harness, etc.; hygiene; lighting, heating and ventilating textiles; fabrics, clothing; musical; photographic and optical instruments; education and science; naval and military; arts, painting, sculpture, etc.

Mr. Ernest Schenk, chairman of the Crystal Palace Co., recently visited this country where he spent five weeks in connection with the business of the exposition. His visit was with a view of obtaining the co-operation of the United States government in the way of making government exhibits and he states that his mission here was most satisfactory in its results. A number of representative American firms have already applied for space.

Perhaps the most important feature in connection with the exhibition will be the establishment of a commercial bureau under the direction of a committee of representative American and British firms. This committee will undertake to furnish exhibitors with all necessary information in regard to the channels of trade and the placing of goods on the British and continental markets.

The commissioner for the United States is Mr. Alfred H. Post, Produce Exchange, New York City, and the assistant commissioner for the commercial section is Mr. W. B. Baneroff, 20 Victoria St., London, S. W. Applications for plans and particulars of space, etc., should be forwarded to either of these gentlemen or to the general manager, Crystal Palace, London, S. E.

### IMPROVEMENTS ON PEORIA & PEKIN TERMINAL RY.

The Peoria (Ill.) & Pekin Terminal Ry., operating 10 miles of electric railways and a 21-mile steam line, held its annual meeting January 21st, at which its board of officers and directors was re-elected, and a number of important improvements of the properties were discussed. It was decided to add to the passenger equipment, and to purchase two locomotives for handling freight traffic. Yards with a capacity for storing 500 and 150 cars per day respectively, will be opened in Peoria and Pekin, and a part of the electric railway system, it is expected, will be double tracked this year. The company's passengers receipts up to the date of the meeting were reported as 38 per cent in excess of the receipts for the corresponding period last year.

**HANDING EXPRESS MATTER IN ELECTRIC CARS IN NEW YORK.**

In the "Review" for July 15, 1901, page 407, extended notice was given of the inauguration of an express, freight and baggage service in special express cars to be operated over the lines of the Metropolitan Street Ry. system, of New York, including the Union Ry. lines in the Bronx. The idea was put in effect last June and in these six months the business has developed to a degree almost beyond the expectations of the promoters.

Through the courtesy of Mr. George W. Slingerland, general manager of the Metropolitan Express Co., we are able to publish herewith considerable information concerning the methods adopted for carrying on the details of the business. In view of the heavy traffic conditions in New York these methods for giving a frequent and satisfactory express and freight transportation service without interfering with the passenger traffic should be suggestive to other managers having or contemplating express or freight carrying facilities. In particular attention is directed to the company's new receipt form which embodies in one blank, (or rather an original and duplicate copy of one blank) consignor's receipt, way-bill, bill of lading, tracer, consignee's receipt, auditor's check, and in truth is the only blank used in the entire transaction of receiving, forwarding, transferring, recording and delivering express packages.

The express business is handled by a separate company known as the Metropolitan Express Co., which uses special express cars running on regular schedules and at frequent intervals over the various owned and controlled lines of the Metropolitan Street Ry from the Battery on the lower end of Manhattan Island, through the wholesale and shopping district, to the east and west uptown resident districts to the north, including the entire Bronx district, and the towns of Yonkers, Mount Vernon, New Rochelle, etc.

To expedite the express matter the territory covered is divided into about 43 districts with numerous main central distributing depots from which deliveries are made and where transfers are attended to. Deliveries and collections are made by messenger boys, by horse and wagon and by electric automobiles, this branch of the business being transferred in accordance with the demands of the service. For instance where long heavy hauls away from the street railway lines are necessary wagons are used. In the retail dry goods district boys collect the packages from the stores and markets. For covering a thickly settled section close to a distributing depot or for running from the town depots to the ferries, automobiles have proved very advantageous.

In many instances also the street railway express is being used as a sort of intermediary in the handling of large quantities of heavy goods. For instance many wholesale groceries and breweries in the downtown districts bring their daily consignments to the car depots in their own wagons. The goods are loaded into

ling of their city and northern suburban deliveries. For this work the express company maintains a large force of collection messengers who call at the retail stores from 7 to 10 times a day and make collections. These boys take the packages to certain specified points on the car routes where the packages are put in baskets and transferred to the first express car that passes. The messengers on the cars sort the bundles en route and deliver them in baskets at the distributing depot nearest the destination to which the packages are addressed. From the depots the bundles are immediately despatched by wagon, automobile, or foot messenger depending upon which way will secure the quickest delivery. The stores by this means secure nearly a dozen deliveries a day and if

MAIN EXPRESS DEPOT AT BAYARD ST. AND BOWERY.

necessary can guarantee the delivery of packages within an hour or two, and this without the risk and expense of maintaining a large force of teams, wagons and employes.

At the present time the express company has 20 cars in daily operation. These run on regular schedule starting from the battery at intervals of about an hour during the day on two of the main north and south lines, namely 3rd Avenue on the East Side and 7th Avenue on the West Side. In dispatching it is always arranged to have an express car follow a regular passenger car and the express motorman is instructed to make the same time as the regular. There is no delay therefore to passenger traffic. The collection points along the route in the department store district are located at points where all cars are required to come to a full stop. While the regular car is stopping at the far corner for passengers the express car stops at the near corner and receives whatever bundles and packages may be waiting. When necessary to transfer goods from car to car or do considerable loading the express is run from the main line into one of the depots. There is no hindrance to the regular passenger traffic or sidewalk travel in any way. The depots are arranged to permit the express cars to run along side of the platform while the wagons and electric vehicles drive up to the other side, thus reducing to a minimum the time necessary to transfer goods.

When this express service was first proposed the company announced it had no intention of antagonizing the old wagon express companies and the belief was expressed that the old companies and the new could work together in harmony to a great extent. This has proven to be true and in fact the United States Express Co. has appointed the Metropolitan Express Co. its sole carrying agent in the city of New York above 50th Street.

The service was started with 10 cars made over from old mail cars, but the company has recently found it necessary to purchase 20 new 8 wheel 37 ft. express cars from the J. C. Bull Co. An unusual feature about these is the fact that they are provided with overhead trolley, with electrical plow for conduit contact, and with storage batteries, permitting them to be used on the conduit lines, the overhead trolley lines in the Bronx, and the horse car lines on the cross town street. The change from underground to overhead traction is made by drawing up the plow and forcing it under the car.

The storage battery on each car is composed of 100 cells of the Electric Storage Battery Co.'s E. F. type and having a rating of 24 amperes for three hours and a momentary output capacity of

BAGGAGE CAR, METROPOLITAN EXPRESS CO.

cars and taken to the upper portions of the city and suburban towns where they are turned over to the shippers' own delivery wagons. This leaves the delivery of their goods principally in the hands of the merchant themselves, but saves them the long wagon haul through the city. Thus a large grocery house or brewery in Manhattan can mount one delivery wagon in Mount Vernon for instance to make frequent trips around that city where previously the wagon would have to drive 12 to 15 miles into New York for one load. A number of special express cars are assigned to this class of business. The facilities work both ways for a number of breweries and factories in the northern section of the city are utilizing the cars for sending goods to their city customers.

The delivery of packages for the large retail department stores has grown to enormous proportions and a number of prominent houses have turned over to the express company the entire hand-

have batteries rated at 36 amperes for three hours and the long distance wagons have batteries capable of giving 37 amperes for four hours.

To facilitate the handling of all classes of business with economy the company has adopted entirely new clerical methods eliminating a considerable amount of the clerical work incident to way-billing, tracing, etc.

This end is gained by a new form of receipt which the company has termed a "Transit Record" in place of the term way-bill or receipt.

The transit record is made out in duplicate by means of carbon paper. To the original copy, which is left with the shipper, are attached two coupons which are detached by the employe signing them. One of these coupons is called the auditor's check and is sent at once to the auditor's office. The other is the forwarding office coupon showing destination and other important information and is kept on file at the forwarding office.

The duplicate of the original receipt is also taken by the collecting employe and this form must accompany each individual shipment through to destination, no matter how many hands the shipment passes through, but each employe who handles the goods en route must endorse his name and check number on the back of this duplicate. This enables forwarding to proceed without interruption and the shipment is not stopped at any point to be way-billed, or for the receipt to be re-written. The man who makes the actual delivery of the goods secures the consignee's signature on the duplicate receipt and this form is then returned to the auditor's office and with the original auditor's check already on file constitutes a complete record of the shipment with information as to all charges collected or prepaid.

The original, the duplicate, the auditor's check and the forwarding office coupon are all stamped in one corner with the same number and much of the recording is done by the use of this num-

ber. The auditor's check enables the auditor to vise the entire business of the company including revenues and disbursements and by this means again much bookkeeping and clerical work is eliminated. To regular shippers books containing

AUTOMOBILE DELIVERY WAGON.

original and duplicate receipts or transit records are furnished already stamped with consecutive numbers, the series for each customer of course being regulated to avoid conflict.

## TRANSIT RECORD.

*Every Messenger and Transferman through whose hands this Transit Record passes must stamp his Name and Check-mark in regular rotation, hereon.*

Messenger or Transferman.	Check-mark.

5	
6	

FORM ON BACK OF DUPLICATE RECEIPT

ber. For instance the agent in charge of a distributing depot does not have to enter on his daily distribution sheet a long description of the goods, but merely enters the number of the transit records turned over to each man for delivery. Tracing is accomplished by simply asking the responsible employe where is No. so and so. In this way a vast amount of entry and clerical work is avoided.

The auditor's office also has charge of the tracing department and by means of the original auditor's check which it receives is enabled to keep tab on every shipment until the duplicate transit record comes in, thereby showing that the entire transaction has

## MEETING OF SOUTHWESTERN ASSOCIATION.

The fourth annual meeting of the Southwestern Gas, Electric & Street Railway Association will be held in San Antonio, Tex., April 18-21, 1902. The programme in detail will be announced later. The following papers will be prepared and read before the meeting:

- "Progress Clubs in Texas," E. H. Jenkins, San Antonio, Tex.
  - "Fuel Oil," H. F. MacGregor, Houston, Tex.
  - "Flat Rate Evil," Thos. D. Miller, Dallas, Tex.
  - "Office Management of Street Railways," T. H. Stuart, Waco, Tex.
  - "Inspection of Inside Wiring," Warren B. Reed, New Orleans, La.
  - "How to Increase Your Business," A. E. Judge, Tyler, Tex.
  - "Injury and Damage Cases," Frank E. Scovill, Austin, Tex.
  - "The Past and Future of Electric Lighting," by J. F. Strickland, Waxahachie, Tex.
- A very successful meeting is anticipated. Hotel accommodations had best be secured in advance, and the secretary will take great pleasure in answering communications upon this or any other subject.
- T. H. STUART, Secy.

## ELEVATED LINES ARE RAILROADS.

The elevated railways of Chicago, having been assessed for taxation by local boards as street railways, and by the state board of equalization as railroads, suit was brought by the South Side Elevated R. R., as told on page 81 of this issue of the Review, to determine whether the elevated lines were railroads or street railways under the law. An opinion has since been rendered in which the circuit court ruled, February 8th, that the elevated lines are railroads within the meaning of the revenue act and are subject only to the jurisdiction of the state board of equalization. The case will probably be carried to the supreme court.

The City & Suburban Railway Co., of Portland, Ore., has completed an addition to its car house. The new structure is 100x200 ft. in dimensions, of corrugated iron, and has a capacity for housing 25 cars.

### PREMIUMS FOR TRAINMEN AT BUFFALO, N. Y.

By courtesy of Mr. F. E. Mitten, general manager of the Buffalo Railway Co. and the allied companies controlled by the International Traction Co., we have been advised as to the details of a premium system recently made applicable to the trainmen on these lines, and which, so far as we know, has never before been tried in just the same manner.

Briefly stated, the plan is to fix the wages of all trainmen at a fair and reasonable rate and then, at the end of every six months, to pay to each conductor and motorman who has not had an accident for which the company has been required to pay during the intervening period a premium of one cent per hour for actual platform time during the whole six months.

Prior to the opening of the Pan American Exposition the trainmen of the International Traction Co. received 16, 17 and 18 cents per hour, depending upon the term of service, but at the opening of the exposition the street railway company, realizing that the work and strain upon the men during the period of the Pan-American travel would be unusually heavy, voluntarily increased the scale of wages two cents an hour, making the maximum rate 20 cents an hour.

In November last, after the fair was over, the rate was reduced one cent an hour, fixing the scale at 18 cents per hour, platform time, for the first year's service, and 19 cents per hour, platform time, thereafter, this rate applying only to city lines. On international lines a flat rate of 20 cents per hour was put in force. However, with the bulletin announcing the reduction, notice was given that on Jan. 1, 1902, and on the first day of each succeeding July and January, a premium of one cent per hour for all time actually worked would be paid to all motormen and conductors who had not cost the company anything in accident claims. Stipulation was made that if the total amount paid for any one man's accidents should be less than the amount of his possible premium, he should receive the difference.

On Jan. 1, 1902, the company paid \$3,500 in these premiums. As the plan was made effective on Nov. 23, 1901, the month of December, 1901, as against December, 1900, presents the first comparative test, but for that month the results show a decrease of 42 per cent in the number of accidents occurring. Mr. Mitten informs us that the improvement in the work of the men is not confined alone to the decreased number of accidents. The manner in which reports are made out and witnesses secured is far better than ever before, conductors taking particular pains to give the location of witnesses and expressions used by them at time of accident, from which the company is able to judge of their value as witnesses. Many of the reports of minor injuries are accompanied by slips signed by the injured person to the effect that neither the conductor nor the company was to blame. As the men almost invariably explain at the time of the mishap that they are personally interested in clearing the matter up, the passenger is usually much more inclined to be reasonable and absolve the employe from responsibility for the accident. The employes are instructed to make every effort when an unavoidable accident does occur to secure witnesses to prove the trainmen were not to blame.

On each premium day the general manager issues to each man in the employ of the company a personal letter. To those who have gained the premium through freedom of accident he encloses pay check for the amounts of extra remuneration and thanks the men cordially for their careful service.

To those that have failed to keep a clean record he sends the following letter:

"Dear Sir—I sincerely regret that it has been found necessary to deny you your premium on account of the accident, concerning which an account will be found on the enclosed card. I trust that you will not lose heart, but, on the contrary, will endeavor during the coming six months to use such care in the performance of your duties as to insure your receiving the premium check in July. I take this opportunity of saying that the management will continually strive to better the condition of its men, making both its rules and remuneration with a view of bringing out your best efforts and most careful work; the undersigned being willing to remove any just cause of complaint, expects to both merit and receive your loyal support."

With the letter is enclosed a card giving the nature of the accident for which the man is held responsible, the date it oc-

curred, and a statement of the expenses incurred by the company in defending the claim. For convenience in keeping records and making out these cards, the following classification has been adopted:

ACCIDENTS		
A—Collision with vehicles		P—Ejection from car
B—Collision with persons		Q—Frightened horses
C—Collision with animals		R—Electric shock to persons
D—Collision with bicycles		S—Electric shock to animals
E—Collision with cars		T—Electric Heaters
F—Cars leaving track		U—Miscellaneous
G—Employes injured when on duty.		
H—Center pole accidents.		EXPENSE.
I—Alighting or boarding moving car.		1. Witness fees and expenses
J—Alighting or boarding stationary car.		2. Expert testimony
K—Fell in, on or off car.		3. Medical expense
L—Fell off car on curve.		4. Special service
M—Trouble on account of fare		5. Incidentals, office expenses, etc.
N—Disturbance on car.		6. Salaries
		7. Salaries of Attorneys.
		8. Court fees and legal expenses.

### LEGISLATIVE ACTIVITY IN NEW YORK.

Among the bills that have been introduced in the New York Legislature are the following:

A no-seat-no-fare bill, by Senator Sullivan of New York City. Concerning this bill the leading New York papers take a reasonable view, the Sun saying:

"On the Broadway line at night the crowds are crushing; but the railroad company would be deserving of indictment if it put on any more cars. It has already twice as many cars as ought to be on the tracks, when the rights of general traffic are considered. If the Sullivan bill ever went into effect and the public found themselves prevented from boarding the cars to the limit of their capacity, the result would be a revolution."

A bill with several good features permits one domestic corporation to guarantee the bonds of another domestic corporation in the same general line of business. This bill was passed and will make possible a closer affiliation of street railway properties controlled by the same interests.

J. H. Fitzpatrick has a bill in the assembly requiring a third employe on all cars in New York City, to aid the conductor in the performance of his duties.

A bill introduced by Senator Wagoner makes the head of a street railroad corporation directly responsible for the violation of the law prohibiting street railway employes to be compelled to work more than 10 consecutive hours in one day.

Assemblyman Kelsey has prepared an act amending the New York rapid transit law. This is designed to remove any legal hindrance to the subway contractor, Mr. McDonald, turning over the rapid transit road when completed to another corporation already formed or to be organized to operate the road. Under the present law the contractor is not only to build the subway, but to operate the road. The statement is made on authority that a new company, with capital stock of \$25,000,000, has already been organized by Mr. August Belmont to take over the underground road as soon as it is completed.

Another bill just introduced is in the interests of the Pennsylvania in its plan to tunnel under the Hudson and East Rivers, in order to secure terminals on Manhattan and Long Island. The bill amends section 73 of the New York city charter, which limits the terms of franchises to 25 years, and authorizes the Board of Aldermen of New York to grant in perpetuity a tunnel franchise of the desired under certain restrictions as to conditions and compensation.

Senator Bedell will endeavor to pass a measure compelling all street surface railway cars outside of the boroughs of Manhattan and Brooklyn to be vestibuled in the winter months.

The Richmond (Va.) & Petersburg Electric Railway Co. has been obliged to delay the construction of its line between Richmond and Petersburg on account of a pit of quicksand directly in its right of way.

**MOUNTAIN PARK CASINO AT HOLYOKE, MASS.**

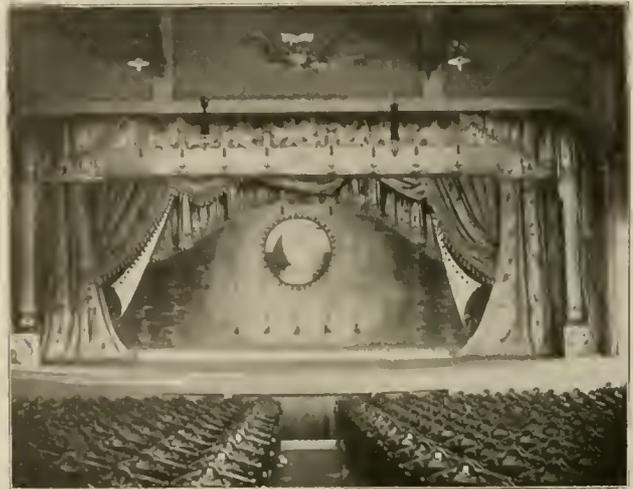

Through the efforts and activity of the Holyoke Street Railway Co., Mt. Tom in Central Massachusetts has come to be widely known as one of the most delightful mountain resorts in America, and as a center for tourists and visitors it is as popular as Mt. Lome in California or Pike's Peak in Colorado.

As described in previous issues of the "Review," the summit of Mt. Tom is reached by an incline railway operated on the balance system with two cars connected by a cable passing over an 8-ft. sheave at the top. On the summit, over 1,200 ft. above sea level, is a costly pavilion and hotel overlooking a wide sweep of country for 50 miles in all directions. This Summit House was illustrated in the "Review" for October 15th last.

The Holyoke Street Railway Co. also owns 400 acres of property located at the foot of Mt. Tom, about four miles from the center of Holyoke and six and a half miles from Northampton, Mass. This tract is known as Mountain Park, and here the company has established a spacious and finely arranged park and pleasure ground, with deer and other wild animals, a covered merry-go-round, scenic railway, and casino as side attractions. The park is reached by cars of the Holyoke Street Ry. in twenty-five minutes from Holyoke and thirty minutes from Northampton.

Entertainments were first given in Mountain Park in 1897, when an open air stage, 25x30 ft., was utilized for the performances, the spectators occupying about 400 seats in the open air arranged around the stage. This open auditorium, with additions and increase in seating capacity up to 1,000, remained until the past sum-

fore embodies the latest ideas in buildings for street railway park entertainments, and although it is somewhat more elaborate than

DROP CURTAIN IN THEATER.

many roads of the same size could afford, the plans are well worthy of study on the part of other managers.

Until the summer of 1901 vaudeville alone had been given, but

Casino in foreground. Merry-go-round and Scenic Railway in center. Summit House and Pavilion on Mt. Tom in distance.

mer when the new casino herewith described was erected at a total cost of \$10,000. The building has been designed by experts in this line, and before the final details were decided upon an examination was made of the summer theaters at Fitchburg, Mass.

this last summer an opera company of twenty-five people was engaged for twelve weeks and presented a different opera each week. Vaudeville, minstrels and troubadours were given four weeks, making sixteen weeks of entertainment in all. The street railway management states that the season as a whole was quite satisfactory and justified the investment of \$10,000 expended in building the casino. The price of admission for evenings and holidays is placed at 15 cents for reserved chairs, and 10 and 5 cents for other chairs at the side and back. Matinee prices are 10 and 5 cents for single seats. Opera will be given again this coming summer for twelve weeks.

An examination of the engravings will make clear the arrangement of auditorium and stage. The dimensions of the casino on the ground line are: Length from front to back, 152 ft.; width of building, 110 ft.; length from front doors to curtain line, 115 ft. At both sides of the building are platforms 10 ft. in width, on which during holidays or when necessary additional seats can be placed.

The auditorium proper contains 2,400 seats, 1,200 of which are iron frame opera chairs numbered at the back for reserving, and 1,200 are folding wooden chairs. The platform just outside the building gives facilities for about 500 additional sittings, making a grand total of 2,900 seats. The roof is supported from the side and end framing with only four posts in the auditorium to obstruct the view of the stage. The auditorium floor beginning at the stage line rises at a pitch of 1 ft. in 100 ft., so that there is a clear un-

CASINO—SIDEN OPEN

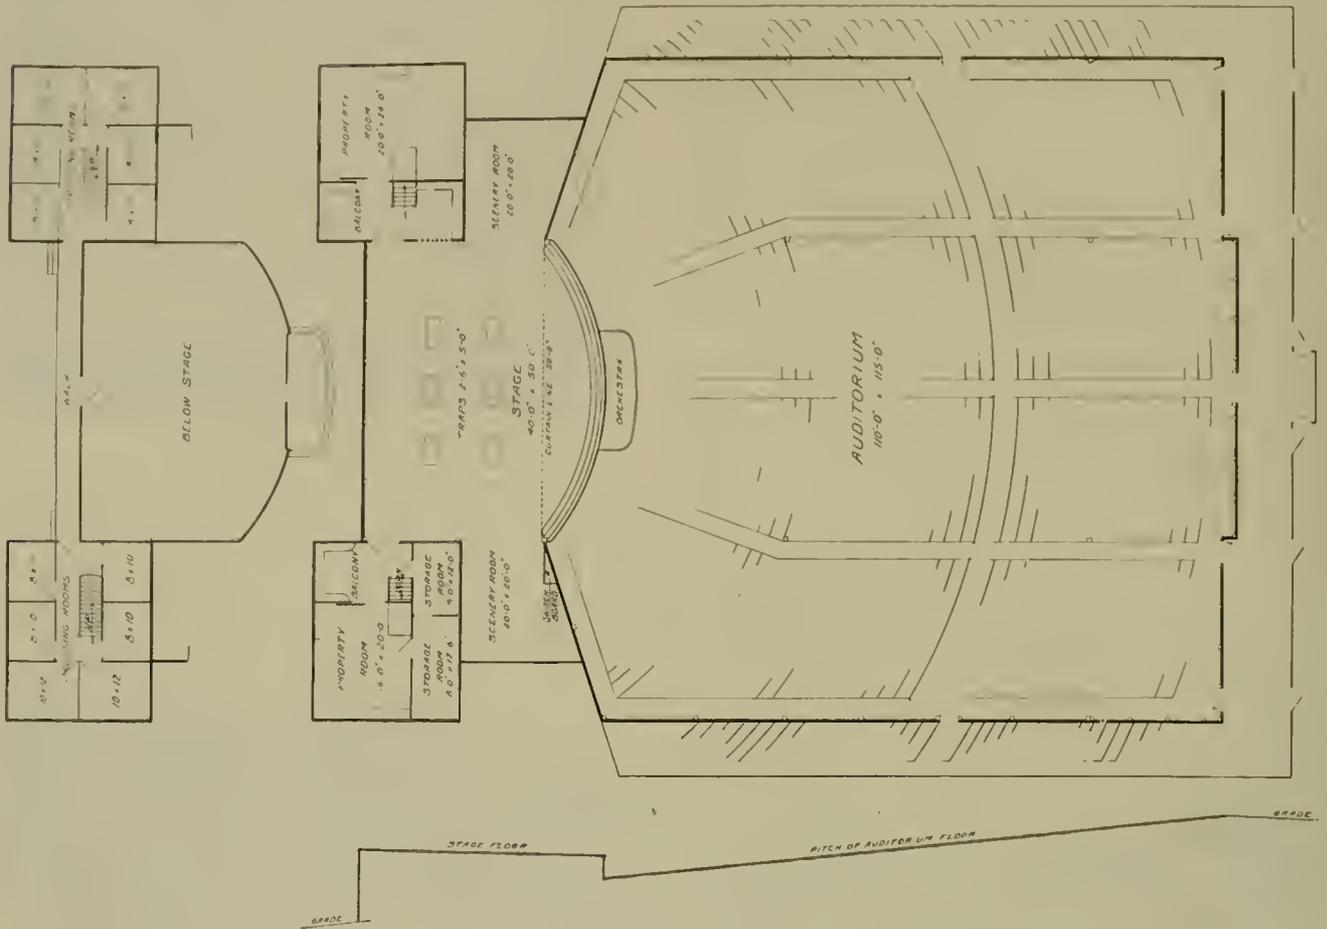

(Illustrated in the "Review" for Oct. 15, 1901, page 740; a Street Railway Illustrated in the "Review" for Aug. 15, 1900, page 478 and March 15, 1901, page 189, and in other issues. The casino there

obstructed view from practically every seat in the house. Considerable grading was avoided by locating the casino on a natural slope

The stage is 50 ft wide by 40 ft. deep from the foot lights to back wall. The height from stage floor to the stage roof is 36 ft., giving ample clearance for scenery, curtain, etc. The scenery rooms

can close all the shutters in fifteen minutes in case a storm arises. The switchboard for controlling lights is located in the usual place on the stage floor at the left of the curtain. It is fully equipped with switches, dimmers, etc., to regulate all house, stage and foot lights as in all first-class theaters.

The lighting of Mountain Park and the casino, and also of the

FLOOR PLAN OF CASINO—MOUNTAIN PARK.

at either side of the stage are 20 ft. square and 25 ft. high. In these rooms are placed the scenery wings and paraphernalia to be used in the different acts during each performance. The property rooms on the stage level are 24x30 ft. There are six trap doors in the stage floor, each opening being 2 ft. 6 in. x 5 ft.

Below the stage is a room 8 ft. high, and having the same length and breadth as the stage floor above. At either side of this lower

pavilion and hotel at the top of Mt. Tom, is accomplished in a somewhat unusual way. Current for this purpose is furnished by an alternating generator set located at the street railway power house in Holyoke, five miles distant from the foot of the mountain. This set consists of one 110-h. p. direct current motor, one 100-h. p. alternating current generator of 1,000 light capacity, and a small exciter motor, all mounted on a single shaft, and running at 600 r. p. m. The 110-h. p. motor takes current direct from the main station bus bar at 550 volts. From the generator alternating current is taken at 3,450 volts, and at this pressure is transmitted over a pair of No. 0 aerial insulated wires to Mountain Park at the base of Mt. Tom. Here the current passes through two 300-light transformers, one for the casino and one for the park, and is changed to 104-volt alternating current for the incandescent and enclosed arc lamps. A third transformer is placed at the summit of the mountain for lighting the buildings at the top.

To avoid fluctuations in the lighting current, due to fluctuations in the load at the main station, a potential regulator, furnished by the Tirrell Regulator Co., of Concord, N. H., is connected with the generating set. This instrument by regulating the fields of the lighting machine compensates for variations in the main station voltage, and insures steady lights at the park and casino. The lighting set, which rests on one foundation bed, covering floor space less than 6 ft. wide by 6 ft. long, was furnished by the General Electric Co., and is said to be the first set ever furnished for service of this nature.

The building of the casino, the installation of the lighting set, and the management of the opera company has been under the direction of William R Hill, secretary and treasurer of the Holyoke Street Railway Co.

CASINO—OPENINGS CLOSED BY SHUTTERS.

room, and beneath the property rooms, are the dressing rooms, twelve in all, ranging in size from 4 ft. 10 in. x 12 ft., to 8 ft. 8 in. x 10 ft., those on the right being for women and those on the left for men.

As shown in the reproductions from the photographs, the sides of the auditorium are open, but these openings can be closed in case of storm or wind by wooden swinging shutters. Two men

### IMPROVEMENTS IN KANSAS CITY.

About two years ago the stockholders and directors of the Metropolitan Street Railway Co., of Kansas City, Mo., undertook to reconstruct a large part of its system and to apply electric traction to a number of the roads which were operated by cables. The year 1901 was a busy one for the company, as in the neighborhood of a million and a half dollars has been spent for improvements which had been planned. The decision to change the motive power on its lines to electricity meant the tearing up of construction which originally cost \$11,000,000 and was yet good for several years of service. About nine miles of new track has been laid and a new power plant at 18th and Olive Sts., has been completed and put in operation. The machinery has also been purchased for the new plant which is to relieve the present Riverview plant which is inadequate to meet the present requirements. The new plant is to be situated as near the load center as possible, which will be in the heart of the business center of the city, and its cost when completed will be about a million and a half dollars. Work on this is to be commenced in the early part of this year. The building is to be 200x300 feet in area and will contain machinery capable of generating 35,000 h. p. The company is also building extensive car shops at 19th St. and Lister Ave., which cover 13 acres of ground and when finished will give employment to 350 men. The paint shop is already finished and the blacksmith shop, electric shop and a small steam plant are nearly finished. The company expects to build all its own cars, and repaint and repair them at its own shops. The construction both of the new shops and power house as well as the reconstruction of the company's lines will be continued throughout this year and will be pushed with the utmost rapidity.

A company has been organized in connection with the street railway company to charter special cars and run them past the principal hotels and over different lines through the interesting parts of the city. A party can charter a car and go everywhere its members may desire, switching from one line to another, as all of the lines in town will be electrically equipped. These excursions are expected to become very popular as it is a pleasing and inexpensive way of giving visitors a good idea of the city.

The street railway company for the past year has employed an average of 3,000 men, the construction force ranging from 800 to 1,000 men and the operating force exceeding 2,000 men. The company ordinarily operates from 275 to 300 cars which make the equivalent of about 4,500 round trips a day.

### TAXATION OF CHICAGO "L" ROADS.

The question whether the elevated lines of Chicago are street railways or steam railroads came up for legal adjudication last month in connection with assessment of these roads for the purpose of taxation. Two assessments were made, one by the Cook County Board of Review and the other by the State Board of Equalization. The Board of Review claimed the right to assess on the ground that the elevated roads are in the same category with the surface lines of the city, and the State Board of Equalization took jurisdiction on the theory that the elevated roads are similar to steam railroads which under the statutes are assessed by the State Board. The roads elected to stand by the figures of the State Board and a suit to test the matter was brought by the South Side Elevated in which the other roads subsequently joined.

### OHIO CENTRAL TRACTION CO.

The extension of the Ohio Central Traction Co.'s line from Bayview to Crestline was opened to the public on Christmas day and since that time has enjoyed a most satisfactory patronage. The cars are operated on a regular hourly schedule between Crestline, Bayview and Galion starting at 6:30 a. m. and running to 12:30 p. m. The line is well and substantially built and as soon as the winter has thoroughly settled it is expected to make high speed over the portion of the road. The road is to be extended to Mansfield, O., and as the question of the manner of transferring the traffic of the Pennsylvania Railroad can be settled.

The road is in charge of Mr. Wm. E. Haycox, general manager, who has been identified with the street railway business for many years. An Englishman by birth, he came to this country in 1874 and began his street railway work with the Euclid Ave. line in Cleveland as a conductor. In 1881 he was made assistant superintendent of the East Cleveland line where he remained until 1888, when he was made general manager of the Utica Belt Line of Utica, N. Y. After converting that road to electricity the company changed hands and Mr. Haycox returned Cleveland where he engaged in manufacturing business. Seeing the possibilities of an electric line between Galion and Bucyrus he secured a franchise for this road and interested the eastern capital to build it. This was subsequently bought by the Pomeroy-Mandlebaum syndicate, who at once secured Mr. Haycox as its general manager, and it has been under his supervision that the extensions of the line have been carried out.

### TWIN CITY COMPANY REFUNDS DEPOSITS.

The Twin City Rapid Transit Co. has decided to abolish the custom of requiring a \$25 security deposit from conductors and motormen in its employ, and during the month of January each man who had made this deposit had it refunded. Since the days of horse cars in Minneapolis and St. Paul when devices for registering fares were unknown a rule has been in force requiring conductors and drivers to deposit \$25 as a guarantee against loss to the company through carelessness or negligence. Some of the employes who received this money back had had it tied up in this way for the last fifteen years.

With the growth of the railway system it has been found that the detail of bookkeeping and other work necessitated by the deposit plan was more trouble than the system warranted. With modern cars and appliances and the excellent class of employes now on the company's pay roll the officers believe that there is little reason to require a deposit and with this understanding, as well as through a desire to avoid much troublesome detail, it was decided to return the deposits and abolish the system. The men are much pleased at the decision as they feel that they are practically \$25 ahead. While the deposit always represented something coming, none of the men expected to realize except through leaving the service of the company.

### TROLLEY CARS TO MOUNT SINAI.

It is stated that Cleveland and Chicago capitalists have been successful in securing concessions for electric railway lines from Cairo, Egypt, to Mount Sinai and thence through Syria and Arabia to Mecca. A branch is to connect Damascus with the system at Mount Sinai. The company securing these privileges has been incorporated under the name of the Cleveland Construction Co. and it is estimated that the business during a single year of the annual Mohammedan pilgrimages to Mecca, to which place it is the duty of every Mohammedan to go, would pay a handsome profit on the cost of construction of the road, as the number of pilgrims is enormous. Trolley cars are already running from Jerusalem to Galilee. It is stated that the Sultan of Turkey has granted the greater part of the concessions for the proposed system.

### NORTH AUGUSTA ELECTRIC & IMPROVEMENT CO.

One of the first interurban roads in the South of any considerable length is now being built by the North Augusta Electric & Improvement Co. of which Mr. Walter M. Jackson is general manager. The line is being constructed from Augusta, Ga., to Aikin, S. C., and connects several thriving towns. Its total length between Augusta and Aikin will be about 22 miles. About 8 miles of this has already been built and the company is pushing the construction of its power house as fast as possible. The road runs through Clearwater, Bath Longley, Warrentonville and Graniteville, all of which are manufacturing towns with large cotton mills already established.

### TRAMWAYS IN NANTES.

A brief account of the tramways in Nantes was recently forwarded by United States Consul Brittain. The street railway company is called Compagnie des Tramways de Nantes and has its main offices in Paris. It is capitalized for \$380,000. The first part of the system was constructed in 1878-79 and was about  $3\frac{3}{4}$  miles long. Subsequent additions have brought its length up to nearly 12 miles at present, and there are under construction lines which will cover four miles more.

The Nantes system comprises 54 tram cars propelled by means of compressed air, known as the Mckarsky method. The cylinders under the cars carry an air pressure of 60 kg. to the sq. cm. The cars cost \$4,535, and the operating cost of the line per mile is 8 cents. The cars with full equipment weigh 10 tons each. The motors rest upon the two axles, which are about 5 ft. 11 in. apart. The diameter of the wheels is 27.50 in.

There are nine compressed air reservoirs, which are divided into two groups of unequal volume, and the reservoirs of each group are connected to each other by means of tubes. The first group, called "batterie," is composed of seven reservoirs used in running at ordinary speeds. The other two, called "reserve," are used for hill climbing or extra heavy work. The air coming from these reservoirs passes into an upright cylinder filled with water heated to a temperature of 356 degrees F. The air enters at the bottom, passes through the hot water to the top and after becoming thoroughly heated, enters the motor cylinders by means of a regulator operated by a motorman who stands on the front platform of the car.

### NOVEL RAILWAY BRIDGE.

The following illustration shows the details of the new street railway bridge which is being erected on the Sea Beach line of the Brooklyn Rapid Transit system and which was mentioned in the "Review" for September 15. The bridge is of novel construc-

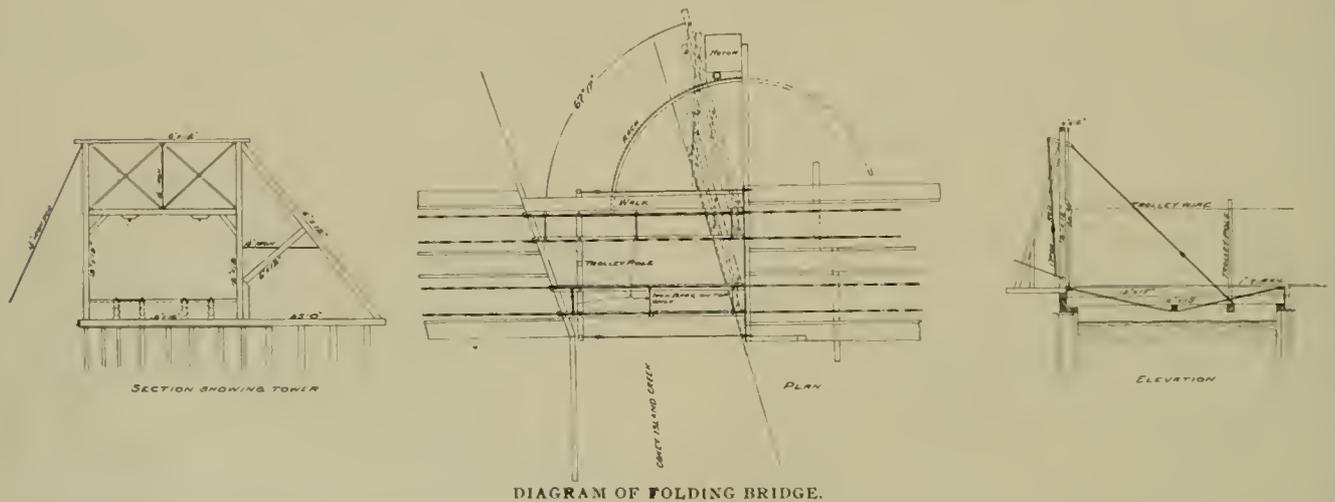

DIAGRAM OF FOLDING BRIDGE.

tion, as the rails are not laid upon the floor system as usual, but each one is laid upon an independent girder which is hinged at the gallows frame end and which swings in a horizontal plane with the hinge as a center when the bridge is open. As shown in the illustration these longitudinal girders on which the rails are laid fold back upon each other practically close together. The bridge may be said to fold like a fan, and there can therefore be no rigid lateral members. The cables for unlocking the bridge pass over the top of the gallows frame to the far end of the girders and are led down to a hand lever on each side. When the bridge is to be opened the bridge tender pulls down these levers, which raise the far end of the girders sufficiently to unlock the rails. The locking of the rails is effected by allowing them to fall into socket joints when the girders come in line. There is a circular arc, on which is bolted a casting with teeth, which leads from the far end to engage a gear wheel on a motor at the anchorage side. When the current is turned on this motor the revolution of the armature draws the toothed arc towards it and with it the bridge.

### WIDE-AWAKE RELIEF ASSOCIATION AT NEW BEDFORD, MASS.

The employees of the Union Street Railway Co., of New Bedford, have a relief and social association that is conspicuous in showing the good to be derived by both employer and employes from an organization of this kind properly managed and financed. The

INTERIOR OF CLUB ROOM NEW BEDFORD.

society has been in existence about ten years and at the present time has a balance in the treasury of nearly \$5,000. Each member pays dues of 25 cents per month, and in case of sickness receives the attendance of a nurse and \$7.00 per week. In case of death \$100 is paid to the man's family for burial expenses.

The organization confines itself strictly to benefit and social

features and discussions on politics, trade unions and other topics likely to cause dissensions are not permitted nor encouraged by the men themselves. The street railway company is in full accord with the objects as declared in the by-laws, and furnishes free a commodious club room, light, heat, and a good library, including files of the "Street Railway Review" and other leading trade papers and dailies. The club provides for the care of the room and janitor duties. The furnishings include pool and billiard tables, card tables, and other games.

Once a year the members give a theatrical entertainment in the city opera house, and shortly after Easter time give a ball.

In speaking of the advantages of an employes' association from the standpoint of the company, Mr. E. E. Potter, superintendent of the Union Street Railway Co., emphasized the point that the men have an attractive place to spend their spare hours when off duty, and the street railway management can rely on being able to find a number of men on short notice should an emergency of any kind arise.

## CAUSES OF FIRES.\*

Fire occurs from all but incredible causes. The most common to railroad properties are: Sparks from locomotives, spontaneous combustion, defective chimneys, faulty electric wiring, carelessness, kerosene oil lamps, gasoline, fuel oil, sparrows nests, sawdust spittoons, surreptitious smoking, improper setting of stoves, steam pipes, air pipes, movable gas and lamp fixtures, hot bearings, matches, accumulation of rubbish. With many of these causes the mention of them suggests methods of avoiding the effect. Comment is made for the purpose of emphasis, as well as that through a fuller knowledge of them we may be enabled to make our fire service more efficient.

**Spontaneous Combustion**—A scientific study of this subject cannot be attempted within the limits of this paper. We will consider it as it commonly affects the fire risks of railroads. That vegetable oils when minutely divided, as on waste, rags or sawdust, ignites spontaneously is an accepted fact. Car oil, kerosene, gasoline, benzine, or any mineral oil will not ignite spontaneously. The dangers from oily waste, carelessly scattered about a round-house or shop, is not only that it assists the rapid spread of fire, but you cannot tell when there may be mixed with it waste or rags saturated with an oil that will ignite spontaneously. In nearly every shop and round-house paint materials are used, and the linseed oil used in mixing it is the incendiary material. Special precautions should be taken in paint shops to avoid accumulation of oily waste, old overalls or junk of any description. Discharge a foreman who, after receiving instructions to the contrary, permits the practice. It is not necessary. Do not permit a locked cupboard in your paint shop or painting section of round-house. Require regular inspection of the cupboard by the foreman. Require that overalls and jackets be hung up where air can circulate freely about them. Do not permit oil barrels to be set upon boxes or other raised support that is boxed in; the arrangement should be such that inspection can be readily made under and around them, and so that you can see what becomes of the drippings. The following are within my own experience: Painter had been rubbing up engine cab with oil; left waste which he had used in his jacket pocket. Hung jacket up against a wood partition at half-past five. Fire occurred before seven. Linseed oil barrels were upon support boxed in. Drip pans were provided for oily waste and emptied every night. Pails of sand provided for fire extinguishing. Rats made a nest from clean waste within the concealed space under the barrels. Oil dripped from the waste. The miracle in this case is that the building did not burn. Bituminous coal, carrying excessive quantities of sulphide of iron, will ignite spontaneously when stored away wet. The best way to handle it is to shovel out the heated mass. Do not put water on it if it can be avoided. Have your storage sheds well ventilated. Do not store in piles over seven feet in height without providing for ventilation through center.

Powdered charcoal will ignite spontaneously when in large masses.

Calcium carbide, while it will not ignite spontaneously, will, when brought into contact with moisture, give off very rapidly a very inflammable and explosive gas—acetylene. It should have a separate building for its storage and be kept dry. Mention is made of this, as some railroad companies are now using acetylene gas for headlights and in cars. The heating of unslacked lime, when wet, is well known. Keep it in a dry place.

**Defective Chimneys**—Chimneys should be inspected at least once a year. The danger from defects is greatest at the point where the chimney passes through the roof. If it sets over onto the roof, as is sometimes done to save flashing, or if any of the roof timbers are set into the chimney for purpose of support, any settlement of the building cracks the chimney directly under the roof boards. It is therefore essential that depot chimneys be inspected in the attic. Cut away all wainscoting or other woodwork six inches from pipe and soot pan openings, and bring to a flush finish with cement or mortar. See that all unused pipe openings are closed with a metal stopper—not with a board or stuffed with paper. Require brick chimneys for your round-house. They are safest and eventually cheapest. It may seem in some cases that the value of the building is not sufficient to warrant the expense of a brick chimney; but keep in mind that engines are worth from seven

to ten thousand dollars each, and that they are greatly discouraged by having even a worthless house burn over them. Do not run a stove pipe into an engine jack, as is sometimes done in small engine houses. It is particularly dangerous. Do not have your stove pipe enter a chimney vertically; always use an elbow. This avoids the danger of burning soot falling from the chimney, also back drafts from blowing fire from an open stove door.

**Faulty Electric Wiring**—This subject cannot be here treated exhaustively. If the installation is over five years old, or if you have had grounds or short circuits which you cannot locate, or any other trouble for which you do not know the cause, refer the inspection to an expert. He may make you more trouble, but you will feel safer. Almost all causes of fires from electricity are short circuits and grounds; but the number of causes for short circuits and grounds are many. Insulation and fuses are extra precautions, but there is no reason why the installation should not be perfect without them. Because a boiler has a safety valve is no reason why it should not be otherwise safely built.

In making your inspections consider the electric current as a heat producer. The heat is most intense where the current encounters the most resistance. It is the resistance of the carbon filaments in the lamp that gives you the light, because of the heating power of the current. Next treat the wires as bare; the insulation is simply an additional precaution. A great deal of trouble—most of it, in fact—is caused by poor workmanship. Pay especial attention, therefore, to the mechanical execution of the work—careful and neat running of wires, connecting, soldering and taping, and attaching of fittings. Do not call upon your tinsmith or boilermaker to install your electrical equipment, or to make extensions or changes to the one already in. Have it done by an electrician who knows his business. Rules have been formulated for safe wiring, and tests made of materials at a great expense by the National Board of Fire Underwriters. These rules and reports of approved materials are distributed gratuitously, and are obtainable by any electrician. Do not assume the wiring is all right because it works well. Look it over. See that it is kept clear from all other wires, pipes, metal, nails and injury. That it is tight enough to prevent swaying. That it is supported upon porcelain cleats or knobs. That where it passes through floors, joists, partitions or sides of buildings it is protected by porcelain tubes. Have wires looped downward where they enter buildings, to prevent water entering along the wires. Look out for wet places. See that staples are not used to fasten the wires. The wires should run clear in the air. Keep lamp cords clear of wires or metal. Be particular about this in your shops. Do not permit the ornamentation of your lamp cords or lamps with tissue paper. Keep lamps clear of woodwork or other combustible material. Within my own experience a 10-candle power lamp set fire to a varnished partition with which it was in contact. All cut-outs and fuses must be on a porcelain base and covered. If you have devices of this kind on wood bases, have them removed at once. When a fuse blows, try and find out what caused it. Do not have it replaced by a heavier plug; this is serious, as it destroys the safety of the fuse. Wooden switchboards are dangerous. If you cannot have it replaced by a slate one, you should at least see to it that the arrangement is such that the burning of the board will not set fire to the building. Keep your machines clean. When new work is installed by contract, stipulate that it shall be in accord with the rules and requirements of the National Board of Fire Underwriters. Then take the usual precautions to see that the work is up to contract.

**Carelessness**—The prevention of fires from carelessness is largely a matter of discipline. Look out for it in your tin shop—to my mind one of the most dangerous departments of railroad plants. See that proper care is taken of gasoline and charcoal fire-pots—that they are not carelessly set away in closets before cool. Notice how your men dispose of their torches, particularly in round-house.

I have noticed many wooden cupboards, the inside of which have been charred by hot torches. Note what disposition is made of hot ashes. Note the general order and cleanliness of the building. Be particularly careful in the shops where you have not had a fire for thirty years or more. You may be that number of years nearer one. Long immunity from fires seems to have a tendency towards carelessness.

**Kerosene Oil Lamps**—Require that these be filled and trimmed by daylight only. Provide facilities for this, and the storage of

\*Extracts from a paper on "Fire Risks of Railways," read before the Western Railway Club, by W. B. Workman, fire inspector C. & N. W. Ry.

the oil supply, in a separate building if practicable. Provide dry sharp sand to take up oil drippings. Have the stand where lamps are filled and trimmed set out at least six inches from any woodwork. It is the usual custom of employes who care for switch lamps to leave the fonts of a number of the lamps burning on the stand while he is out distributing the others. Keep all oil cans securely corked. Do not allow accumulation of materials or rubbish around or over the stand where lamps are cared for. Provide an iron can to keep the oily waste in. Take the trouble to inform yourself how this feature of your fire risk is cared for. Empty kerosene and gasoline barrels are sometimes productive of fires. They are nearly always full of an explosive vapor, especially after standing in the sun.

**Gasoline.**—Gasoline gives off an explosive gas at an ordinary temperature. Great care must be exercised in handling it in buildings. Require separate, well ventilated buildings for its storage. Buildings should be ventilated at the floor as well as the roof. The gas is heavier than air. Be careful with your gasoline tire heaters. Place a check valve on both the inlet and outlet pipes. Require entire disconnection from air when not in actual service. When gasoline gas is used, as in car shops, see that air pressure is relieved every night. Have cut-off valve in gas pipe outside of but near to the building. Of course, have a cut-off at the carburettor also. Ascertain how much gasoline is kept in cans in your tin shop, and benzine in your paint shop; how it is cared for; whether the keeping of more than one day's supply in the building is avoidable. You will probably find much more of the stuff than you expected. If you discover any of the cans uncorked, or gasoline or benzine in open vessels—for washing brushes or other purposes—give the foreman the benefit of your professional advice, and his shop the benefit of a further inspection, because of having a careless man to deal with. Gasoline is always ready for business, and performs it promptly when the conditions are right.

**Fuel Oil.**—Much that has been said of gasoline applies with equal force to fuel oil. When it is inside the building you have a very inflammable, and when heated, explosive agent to help you along the wrong road in the event of fire accident. Arrange your apparatus to avoid the possibility of flow of oil into the building except as used. Do not pin your faith entirely upon one valve, especially if it is in close proximity to the burner. Do not feed by gravity pressure. Do not feed direct from a main supply tank of large capacity under air pressure. Have a supplemental tank outside the building, but near to if you please, where oil is used; the supplemental tank to be filled from the main supply tank. Feed the burners from the supplemental tank. Lay the pipes to the burners so they will drain back to the supplemental tank. Have a cut-off valve outside. Relieve the pressure from the supplemental tank every night. Be particular about this, or you will have the dangers of a gravity tank. Look at the location of your main supply tank, and consider whether in case of accident or leakage there is danger from the flow of oil towards your buildings.

**Sawdust Spittoons.**—Do not permit their use anywhere. If you must have spittoons, fill the boxes with sand.

**Smoking.**—This is a matter of discipline. Better prohibit it in your shops at least. It is probably the best you can do anyway. Do not allow the men to "light up" in the building before starting for home. The danger, of course, is in proportion to the laxity of discipline, and arises from smoking surreptitiously.

**Improper Setting of Stoves.**—Stoves should be free from cracks and have perfect doors over the ash pit as well as the fire pot. Floors should be protected by zinc, or an iron pan with an air space under it. Brick are not so safe. Should not be nearer unprotected woodwork than two feet. Protect exposed woodwork with bright tin or zinc which reflects heat. It is better than iron. If you use stoves in any of your woodworking shops, look out for the dust that settles on the upper surface of the stove pipe. Pipes should be riveted at joints and well supported. See that there is no woodwork within six inches of them where they pass through partitions. Do not run a stove pipe through a window, the roof, or the side of a building. Where wood is used for fuel, the pipes should be cleaned at least once in three months.

**Steam Pipes.**—There is considerable skepticism as to the danger from steam pipes, but the danger is there just the same. While steam pipes will not always set fire to boards or clothes carelessly laid upon them, they will heat and char such material, and it is only a question of confining the heat when fire will ensue. It is

an erroneous idea that a high degree of heat is necessary under all conditions to ignite ordinary combustible materials. The inspection of this hazard of your plant you will find laborious, but that of convincing your workmen of the dangers more so. The number of well authenticated cases of fires originating from steam pipes are numerous, and no argument should be necessary to convince you of the dangers of fires from this source. Keep the pipes free from woodwork, allowing an air space where they pass through floors, walls and partitions. Do not permit accumulation of material or dust on the pipes or on or behind the radiators. Do not permit the pipes or radiators to be used as drying racks—in fact, treat them as a stove. When a pipe is hot enough to be uncomfortable to the bare hand, it is dangerous to have combustible material in contact with it. Steam pipes are particularly dangerous where they pass between floors or through hollow partitions out of sight. Mice and rats build their nests of waste and rags near them, and if the pipes do not actually fire the mass, they are an active factor in promoting spontaneous combustion. Have your steam pipes in plain sight.

**Air Pipes.**—Your air pipes, particularly in close proximity to the compressor, may become as dangerous as steam pipes. Examine them and determine whether they are safely arranged. Keep in mind they have the additional power of spreading fire because of their oiliness. The following, within my own experience, is a curious instance of fire from this cause. A battery of pipes used for distributing air for operation of switches became coated on the inside with oil from the cylinder of the compressor. The pipes became sufficiently hot to ignite the oil inside the pipes, although the battery was over one hundred feet from the compressor. As the pipes were attached to the exterior of a brick wall in open air, no damage resulted other than the destruction of the iron pipes and disablement of the switching apparatus. In another case, however, the pipe became red hot at an elbow in close proximity to the compressor, and set fire to the surrounding woodwork.

**Movable Gas and Lamp Fixtures.**—Protect these with stops, to prevent swinging under or against inflammable material. This is a quite common cause of fires.

**Hot Bearings.**—While these may not be entirely avoided, the bearings can at least be kept free from oily accumulations, which spread a fire rapidly. Bearings in your woodworking shops should be examined every night after shutting down.

**Matches.**—The old "seven-day" match, or those that light only on the box, are the safest. It is dangerous to permit workmen to keep the ordinary parlor matches in the drawers of their work benches, the sliding motion of which, in opening or closing, frequently ignites them. They should be kept in metal boxes in your store rooms.

**Accumulation of Rubbish.**—Do not permit it in any of your buildings. Look out for it, particularly in your freight houses. It has a bad moral effect. If you must preserve your junk, build a shed for it; but usually, if material is usable, there is or should be a proper place for it; if it is not, it should go to the scrap pile. If there is anything in the shop or depot building, or freight house, that is not necessary in the conduct of the business carried on in the building, get rid of it. The trouble is, if you allow the accumulation, although it may at first look innocent, the corner or out-of-the-way place in which the pile starts, soon becomes the dumping ground for anything the workmen may want to get rid of handily. You cannot keep the locality clean, and, sooner or later, you will have conditions ripe for spontaneous combustion.

### LAKE STREET EXTENSION PLANNED.

The Chicago Lake Street Elevated officials are considering an extension of the road to Wheaton and the plan is to be discussed at the meeting of the directors which will take place in the near future. The refusal of River Forest to allow the Lake Street company to go through that suburb unless a 5-cent fare to Chicago was granted is said to have kept the company from pushing this plan for an extension in the past. The company, however, has possession of the Chicago & Harlem tracks running from the western terminus of the elevated at 52nd Ave. to Oak Park and to the Harlem race track. If the plan for the line to Wheaton is carried out it will be an extension west of the present Oak Park surface tracks.

**CAR HOUSE AT WORCESTER, MASS.**

In the accompanying drawings is illustrated a car house now in course of construction for the Worcester Consolidated Street Railway Co., at Worcester, Mass. From the plan and sketch it will be noted that the designs call for several particulars which are rather out of the ordinary but are believed to be in the line of general improvement.

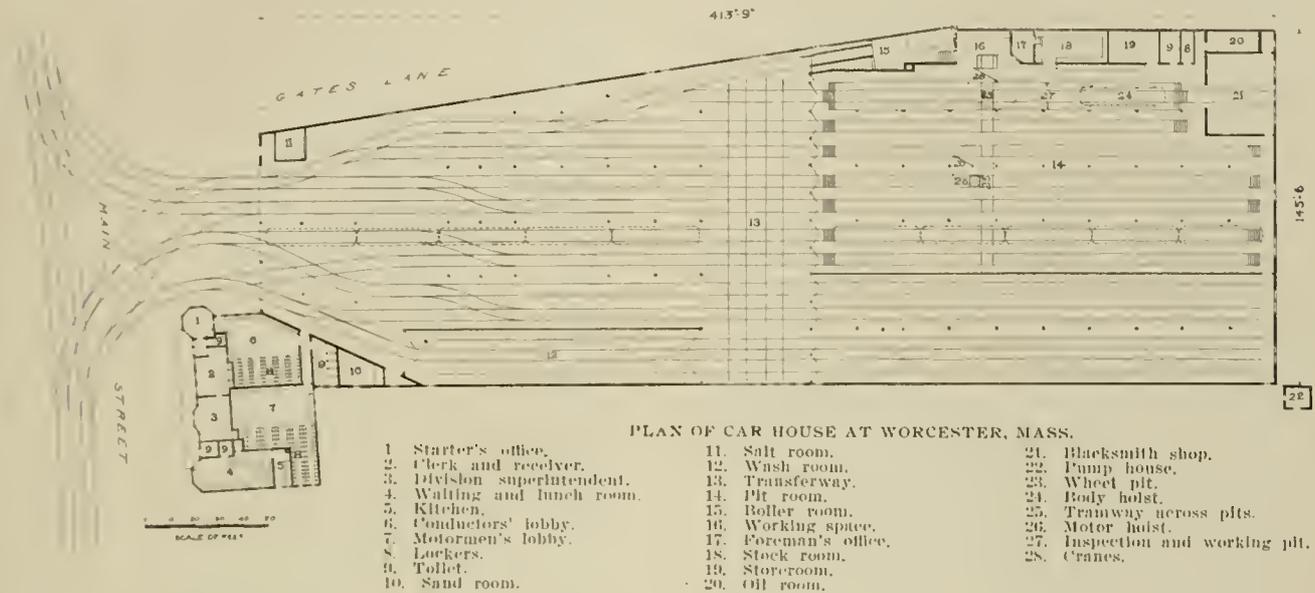

This car house covers about 11-3 acres and has capacity for

the foreman's office. At the lower end of the inspection pit is the car body hoist, with the blacksmith shop just beyond. In this way a car body can be raised and the truck or wheels rolled direct into the blacksmith shop for repairs.

Ample toilet and locker rooms are provided for the pit men.

A fire proof oil room is partitioned off from the main room for the storage of oils.

The pit, wash room and lobby building are heated by steam from the boiler room, located on one side near the center of the

PLAN OF CAR HOUSE AT WORCESTER, MASS.

100 35-ft. cars. The lobby building at the front, beside having locker accommodations for about 350 men, contains an office for division superintendent, clerk, receiver and starter, a large waiting room, and lunch room.

The layout of tracks at the entrance is such that each track in the house has virtually an individual connection to the main line, the entering tracks being so arranged in pairs that cars coming in and going out will not interfere with each other. This feature would greatly facilitate running cars out in case of fire.

A large sand room and a salt bin are provided for in the front portion of the house, with a long wash room along the side.

A transferway across the center of the house makes possible greater dispatch and freedom in moving cars.

**PITS.**

Nearly the entire rear half of the house is arranged with pits. These pits as a whole, do not differ greatly from ordinary pits, but some features are combined to considerably expedite repair work on car bodies, trucks and car equipment.

First in importance is the inspection and working pit which is novel inasmuch as the floor on each side of the track, as shown in the sketch, is dropped a little over one-half the depth of the pit. This allows an employe, without being forced into a cramped position, to get at the side of the car for renewing running boards, tightening nuts, and doing any other work that has to be reached from the sides of the car. The arrangement also gives the maximum amount of light around the lower parts of the car. Under the car house floor and running crosswise of the pits is a set of tracks giving communication from one pit to another. A four wheel truck or carrier runs on these tracks, and the rails are sunk below the pit floor level so as to bring the platform of the carrier flush with the pit floor.

Along the line of the cross tracks are arranged the wheel pits and motor hoist. Wheels and motors can be dropped on the carrier, taken to the side of the pit, and hoisted out for repair, with the least amount of work and without moving the car. Over one end of the cross track or tramway and on the same level as the car house floor is a large space fitted with work benches and tools for making various car and truck repairs, giving a working space convenient to the point where the bulk of the work is to be done. This space is located near the stock room and is in plain view from

building. As will be seen, the coal pocket is arranged so that the coal car can run in over and dump its load directly into the bins.

The main water supply for washing and plumbing comes from a small pond on the premises. The water is to be pumped to a 30,000-gallon tank on the roof and distributed by pipes to all parts of the building.

The interior of the house is well lighted by monitors on the roof, the sashes of which are glazed with ribbed glass.

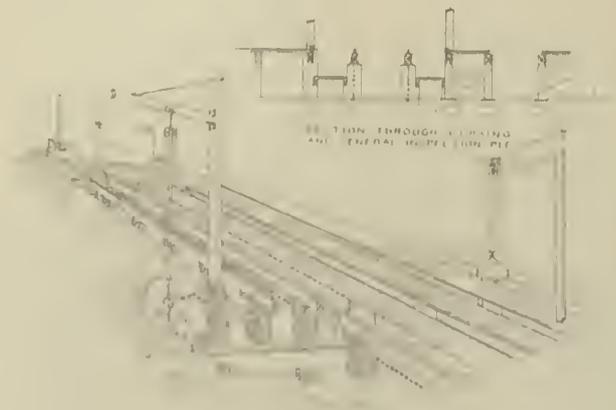

DIAGRAM OF CAR PITS.

We are indebted for the accompanying drawings to Mr. Frederic F. Low, architect, of 101 Milk St., Boston, Mass. Mr. Low has done a large amount of architectural work for the Boston Elevated Ry., and is an authority on designing tower and car houses and general street railway work.

The St. Louis Transit Co. has ordered 100 new cars for the Broadway line to be put in commission May 1st by which time the new power house on Salisbury St. shall be completed. General Manager de Pont is quoted as stating that the Broadway line will be the latter branch of the company's system.

## ELECTRIC TRACTION ON RAILWAYS.

Is electric traction, which is being so rapidly developed in towns, to prove of service to our railway (steam railroads) systems?

With the economies which might be fairly anticipated, were our main lines of railway operated by electrical energy instead of by numerous steam units as at present, I have, to some extent, dealt previously. The conservation of our coal; the greater purification of the atmosphere; the increased cleanliness of all things forming part of or bordering upon the railway, are natural advantages contributing to the welfare of the community at large.

If such a change could be effected at once, very many improvements in the mode of dealing with the traffic would appear feasible. Thus trains might be despatched at more frequent intervals—trains of lesser magnitude, capable of traveling at a higher rate of speed. It is obvious that this might also, to some extent, be accomplished by the steam locomotive, but to do so would mean a large increase in the number of engines and tenders, increased engine shed accommodation, and all attendant expenses.

In my official capacity it is not my duty to determine the speed at which trains should travel, but I cannot refrain from expressing my conviction that if it were possible to lessen the enormous difference which now characterizes the speed of passenger and goods trains great advantage would follow. This can only be accomplished by lessening the mass of the goods and mineral trains, and bringing it more under the control of the brake—a result which probably will never be attained under the steam locomotive regime.

The advantages that would accrue from a facilitation of the traffic scarcely call for demonstration. Wherever the traffic is of a mixed character, involving the movement of trains at speeds varying from, say, 20 to 60 miles an hour, time must, even where scheduled time is observed, be sacrificed; and this loss must be greatly aggravated by the shunting of the heavy trains for the passing of those of a preferential character. The magnitude of the results arising out of this is not, perhaps, fully appreciated, for the existing mode of working the traffic scarcely admits of its consideration. But let us assume that in shortening these slow and heavy trains we are able to run them at a speed of not less than 40 miles an hour. As there would be no shunting for the reason that, with the exception of the express trains, all would be moving at about the same speed, it is clear we should practically double the capacity of the line, and that without increasing the labor charges, because, although we double the trains, we halve the time. The number of trains that would come under this category would probably be 75 per cent of the entire number, and if the method would admit of the acceleration of the expresses also, it may well claim an increased capacity of 100 per cent. In other words, such a result would avoid that duplication of lines which is now unavoidable, and which is adding so many millions, year by year, to the capital account.

The operation by electrical means of the passenger traffic, as it is conducted to-day, would appear to present no difficulty, for if necessary, each carriage could be provided with the necessary motors for its propulsion; but to work a railway economically—to reap the full advantages of an electrical service—it is necessary that the entire traffic of the line, goods as well as passenger, should be worked by the same means. To work one class of traffic by electricity, and the other as at present, by steam units, although such a course is quite practicable, would involve a large increase in both capital and current charges; for the cost of establishing and operating electrical working for the passenger traffic would be very little less than it would be if dealing with the entire traffic, and there would still remain the cost attending that portion worked by the steam locomotive. Such a course appears to me impracticable. Therefore, in considering the initiatory stage of replacing the steam by the electric locomotive, we have to face the present condition of traffic—to deal with the trains as they are made up for the former type of motor. Assuming it were determined to test the possibilities of electricity on a given section of a line of railway, whatever that section might be—whether terminal or intermediate—the electric motor would require to haul the trains that might reach that section of the line as they were handed over from, or required to be carried forward by, the steam locomotive. It would, in fact, have to take the place of the latter, and do its work. It may be said its capabilities to do this under all conditions have not been

proved. It will, however, be clear that, assuming one electric locomotive incapable, there is no reason why two should not be coupled together in the same manner that steam locomotives are coupled. And in doing so, it is worth while noting that we should reap some advantage, for not only would it be possible for the two to be controlled by one man, or one set of men, but in distributing the weight over a great wheel base, we should, to that extent, reduce the impact on bridges and other structures over which the vehicles pass. The importance of this will be apparent when we realize that the total weight of a modern locomotive and tender loaded exceeds 100 tons; that of this weight some 34 tons is comprised within a wheel base of 9 ft. 6 in.; 26 tons and 24 tons each within 5 ft. 6 in. The tendency of the day is to increase the speed of passenger trains and the load of the goods and mineral trains, and to this end to employ larger and more powerful engines. In either case this course must involve greater stress on both permanent way and structural works; and to this extent it would appear that the two electric locomotives would be more acceptable to the engineer of the line than would the steam locomotive.

Much interest no doubt attaches to those railway conversion problems in hand here and in other countries; but assuming them proved—assuming them to be a success, would that success be deemed sufficiently definite to lead to its adoption on main lines generally? I scarcely like to commit myself to that opinion. I have full faith that our railways will be worked by electrical agency, but I want, with you, to look the probability squarely in the face. Every line of railway has its own mode of dealing with its traffic, and the character of the traffic is not the same on all lines. The only satisfactory way to prove the power of electricity to meet existing conditions is to impose upon it the work to be done. To do so on a suitably selected section of line would not be a great tax upon the resources of any one of our great railway companies, especially as it need not in any way, for the time being, derange the steam-worked traffic passing over that section of line.

Now let us look at the subject from another point of view. Electricity is credited with the power of accomplishing greater speed at a less cost than steam. An impression is abroad that greater facilities for rapid transit between large centers of commerce are a necessity of the day. If it should transpire that electrical propulsion is inapplicable to main line traffic as a whole—a conclusion which few would, even at the present moment, accept—it will unquestionably lead to the establishment between the chief commercial centers, of high speed passenger electric traction on independent lines. Communication between Manchester and Liverpool has, so far, been met—and one would say, amply so—by three lines of railway, all running a good train service, yet the construction of an electric line on the mono-rail system has received Parliamentary sanction. It is an object lesson, and tempts me to ask whether the requisite powers would not have been preferably granted to one of the existing lines of railway—a line of railway capable of interchange of stock and of connection with other lines—to employ electrical agency as its motive power, had powers for that purpose been sought.

Nothing could be more disastrous than that competition of such a character as, for instance, that thus initiated between Liverpool and Manchester should arise. Whatever success may attend competitive electrical enterprise in this respect must be, to some extent, prejudicial to the established systems. If the former should prove a pecuniary success, the reverse must be the condition of the latter. The capital invested in existing railways exceeds thirteen hundred million pounds. The wholesale depreciation of such a vast sum, the interest of which forms the income of numerous families and annuitants, would be little short of a national calamity. Naturally, were independent electric lines of railway to be established between the chief centers of commerce it would still leave a large mileage of the existing lines of railway unaffected by them, but is it from those parts of a railway system that the earnings come? The consequence must be, at the least, a decreased dividend, and probably in the end an enforced establishment on the older lines of a similar electric service between large towns.

The work of the railway engineer is to construct railways; and if the opportunity arises he will not be deterred from doing so by any consideration of the injury his work may inflict upon existing interests. The way to prevent him from doing so is to make it clear that there is no profitable need for any such addition; and this can only be accomplished by the existing system showing that they are

\*Extract from the inaugural address by W. Langdon, president of the Institution of Electrical Engineers.

prepared to avail themselves of the same means—to afford as far as possible the same facilities and advantages as are to be derived from independent electrically worked lines.

It has been advanced that the existing lines of railways are unsuitable for higher speed; that the stock is cumbersome, and that the system is generally unsuitable. This has to be proved.

Railways have to face the fact that electricity as a motive power is before them. That if it is not applied to the existing systems—if they do not elect to avail themselves of it, it will come independently, and in competition with existing interests.

To attempt to approach the subject in a piecemeal fashion by dealing with a branch line here or there may be of service, but it can scarcely affect the main issue. While a small branch line is being converted, new lines between important centers will be constructed, and the passenger traffic between those centers will at least be split between the old and the new service. No one doubts the ability to apply electrical energy to branch lines, but many will doubt whether the traffic of a branch line can be so regulated as to form a continuous and remunerative service throughout the day. With main lines there can be no doubt of a regular demand, while most branch lines can with convenience be dealt with from the main line power station. Manifestly, however, if the trunk lines are eventually to be operated electrically, whatever may be done in relation to branch lines should be done with a view to harmonize with that system which will be ultimately employed on the main lines. I do not presume to indicate what that system may be—whether alternating or direct current—but it is clear that for main lines an overhead electrical service is inadmissible; and equally, to my mind, is a rigid or semi-rigid rate of speed. With a line carrying one class of traffic this latter question may not be so important, but on lines carrying a mixed traffic this cannot be so, for the power to vary the speed is a factor which must have an important bearing upon the working of the line. The speed, subject to a maximum limit, must be in the hands of the driver.

To those with whom may rest the privilege to establish electrically worked lines I would, with all respect, venture to say: Be careful that you do not retard that great work which sooner or later must invite attention. In the establishment of light high-speed point-to-point passenger lines, little difficulty may be encountered. It is not with them, however, that the interest of the country needs your aid so much as in the conversion of those lines which are already established. It is where competition of a fruitless character—fruitless in that it will not prove productive of a return to the shareholder of the new more than to the shareholder of the old—steps in that capital will be squandered.

#### LOCATING FAULTS IN UNDERGROUND DISTRIBUTION SYSTEMS.

A paper on the subject of locating faults in underground cables was read by Mr. Henry G. Stott at the November meeting of the American Institute of Electrical Engineers, in which he pointed out a number of the difficulties as well as the advantages of several systems commonly used in underground cable testing. He pointed out that, as a matter of fact, it is impossible to use a sensitive galvanometer in any test involving the use of the earth as a part of the circuit owing to the leakage of street railway currents from the rail through the earth.

The distance between manholes is evidently the practical degree of accuracy essential to any successful method. These distances will average about 350 ft. Assuming that 25 ohm is the limit of accuracy obtainable in the loop test, this means that the method is not applicable to any conductor larger than No. 9 B & S gage. It is therefore of no practical value for lighting and power purposes.

The resistance measurements being eliminated there remain three other methods, which are called the "cut-and-try" method, the "smoke" method and the "compass" method. The cut-and-try method is dismissed with a few words as being too bad to merit much description. It simply means cutting the cable into as many sections as is necessary until the fault is located in the length between manholes. This is a slow and very expensive method and should only be used as a last resort. A three conductor high-tension cable joint costs from \$5 to \$10 and a joiner and helper cannot make more than two joints per day, so that if the cable is

long it may take several days to put it into service after removing the fault by the cut-and-try method.

The smoke method is also crude and simply consists of putting a current of sufficient magnitude into the cable through the fault to burn the insulation and give out volumes of smoke by which the location of the fault may be discovered upon opening up the manholes. The method is more rapid in attaining results than the former one as no unnecessary cuts are made in the cable, but it may give rise to serious trouble to other cables especially if the fault be in a manhole, as the flames would burn not only a large length of the cable itself but also other cables, or cause explosion due to the ignition of gases ever present in city conduits. The compass method in the writer's opinion is the only practical and safe means of quickly and accurately locating the grounds in large cables. This method consists briefly in sending a constant, continuous current of about 10 amperes into the cable through the ground. The current is first passed into an automatic reverser which reverses the direction of the current flow every 10 seconds. A manhole is then opened near the center of the cable length and a pocket compass laid on the lead sheathing of the faulty cable and observed for say, a half minute. If the ground is farther from the source of the reversed current the compass needle will swing around approximately 180 degrees, upon every reversal at the end of each 10-second interval. The manhole is then immediately closed and another one opened say a mile farther away from the source of test current, and if no motion of the compass needle occurs then the fault has been passed, and another manhole is opened between the first two positions and so on until the fault is finally located in the section between two manholes. It will be noticed that by this method the cable is not cut, thus causing no delay or expense in rejoining; the number of manholes opened is a minimum and the time spent in each is only about one minute; the amount of current used is so small that no arcing or burning occurs and no explosions.

Before putting on the reversed current to make these tests it is advisable to break down the fault resistance by the application of a high potential testing transformer to the cable for a few seconds.

#### FROM THE MEDITERRANEAN.

The accompanying illustration is reproduced from a photograph for which we are indebted to Mr. John T. McCutcheon, the artist-correspondent, whose cartoons and letters from the Philippines are

A STREET CAR IN PORT SAID.

doubtless well known to our readers. This photograph is a snap shot, taken in Port Said at the entrance to the Suez Canal by Mr. McCutcheon when he was heading for the Pacific on board the McCulloch—to join Dewey as events turned out.

A French syndicate is reported to project a new system of electric railways in Mexico City. Capital to the amount of \$16,000,000 has been subscribed for the purpose.

### MAIL ON STREET CARS.

Mr. George B. McAllister, who we believe is the originator of the street car mail service in the United States, has proposed a new plan for improving the efficiency of post offices in large cities by utilizing the entire electric railway service for the constant collection of mail and, in a measure, for its distribution. The system proposed has been tried to a certain extent in Grand Rapids, Mich., and is considered a success in that city. The plan is to have a long slot on the side of every car into which letters may be dropped while the car is in motion. This will be provided with a special mechanical device to insure protection against rain. In this way it is expected that mail matter will be taken into the main office in a steady stream and never too much at a time to prevent the quick sorting and redespach to its destination again by trolley car to its proper sub station. The mail collectors will pass over their route continually without the necessity of going to the post office with their collections, as wherever they cross a car line they would drop their letters in the slot on the car going towards the post office.

The letter boxes on street corners would not be abolished by this system, but collections from them could be made at short intervals, their contents being deposited in the most convenient car by the postman as often as he happens to pass the box.

It is believed that this arrangement would avoid the congestion and rush at the distributing centers with each delivery of the collection there, and that the mail matter reaching the post office in a steady stream would greatly simplify the work of the sorters. The scheme is a modification of the arrangement which Mr. McAllister has employed in the Grand Rapids system of electric mail car service.

### SNOW PLOW USED AS LOCOMOTIVE.

The Saratoga division of the Hudson Valley Railway Co. tried an experiment in handling its heavy traffic last season which worked very successfully. The accompanying illustration tells the whole story. Taking the nose off its snow plow, which is equipped with two G. E. 57 motors, the company replaced it with a crude fender

UTILIZING SNOW PLOW FOR SUMMER SERVICE—HUDSON VALLEY RAILWAY CO.

and pressed the plow into service as a locomotive. Five trail cars loaded with about 600 passengers were made into a train and hauled to and from Saratoga Lake with comparative ease and without accident by this locomotive. Six empty trailers have frequently been handled in the same way, and the innovation has proved very satisfactory. This division of the road reported one-third better business for last season than in any previous year.

### REBUILDING OLD ROADS.

BY J. A. P.

When one starts to build a new electric road he can figure very closely and with comparative ease just how much it should cost and what material he will require, but when he starts with an old road which has run down until little is left of it that hangs together, it becomes a different matter.

If the road is still in operation you can form a better idea of it because then you can tell about what condition your machinery, roadbed and rolling stock are in. If, on the other hand, such road has been shut down for several years appearances may be very deceptive, and what may look to be in good condition may turn out absolutely worthless.

To estimate the cost of reconstructing such a road a fixed plan of procedure should be adopted. Start out by making a thorough examination of the engine and dynamo room. See what condition everything is in. If the road has been shut down for some time, don't take somebody's word for it that the machines were in perfect condition when the road was closed. Perhaps they were, and yet you may find on starting up that your engines will need rebuilding, valves leak, pipes out of repair, etc. The dynamos may look and test out satisfactory, but will the insulation stand a continuous and heavy load? Sometimes defects will not show for some time after you have started.

In the boiler room the pipes, pumps, valves, flues, walls, etc., should receive careful attention and be thoroughly tested, otherwise a bad leak may be found where least expected after you start up, and then it means either a shut down or costly overtime work to repair it.

If the line is equipped with old open motors the sooner you scrap them and put in iron-clad motors the less expense and annoyance you will have. It hardly pays to repair such old motors, as the parts may be exceedingly hard to get and as a rule are far more expensive than those of later pattern.

You may attempt to start with such old motors, but if they have been standing idle, perhaps in a damp car barn, for any length of time, the chances are very much in favor of the insulation being

rotten. The motors may run for a short time and then comes a time when you want every car, and at this time your troubles commence and you wonder when burn-outs and short circuits will ever let up.

My experience has been that when such old motors once commence breaking down the sooner they are discarded the cheaper it will be for the company; the better plan is not to waste money or

time on them, because to rewind and generally overhaul them will cost more than buying a modern enclosed motor, even though it is second hand.

On track rebuilding, if a majority of the ties are rotted out, it does not pay simply to put in a few ties here and there to hold the track together until some future time. This may work for a few months, but if you stop to figure up the time it then takes to put the track in proper shape you will find you are paying double for the work. If it is a buried track you will be obliged to open up spaces which have been filled in in order to put in new ties, bolts, plates, etc.

Old poles are even more deceptive than ties. In rebuilding a road last summer I found the poles set 6 ft. in the ground, with 1 ft. of concrete at the base, then filled in with dirt, and another foot of concrete just around the pole 4½ ft. from the base. This left a 6-in. dirt fill at the top where the concrete had acted as a basin for water, and every pole, no matter how good above the ground between the concrete fillers, was rotted to such an extent at the surface of the ground that it required only a slight pull to break it off. Poles were found with but 2 or 3 in. of solid wood in this 6-in. space. Had this top filler of concrete been placed on a level with the ground, or slightly above the ground, it would have accomplished what had been desired, namely, to keep the water from soaking into the poles near the surface. In regard to bonding, I have found that bonds covered by cinders are rapidly eaten away. This action seems to vary, however, in different localities, and is perhaps due to the acids or other substances in the cinders.

Cinders taken from glass plants have a decided tendency to burn off bond wires, and also where bonding is defective to quickly burn or eat half oval spaces out of the rails around the spikes.

In rebuilding a road a thousand and one things come up which a person does not have to contend with when constructing a new line. When building new you know just how much and what kind of material you want; but when rebuilding an old road you have to contend with what you have to match, and this is often as difficult as matching a ribbon. Then there are little things here and there which require attention, and these soon run up into money.

Then perhaps a line was originally laid out to sell real estate, and you may have dead lines to contend with. In such cases it is advisable to "make haste slowly" and thoroughly study the conditions of the town and locate your lines where it is evident people will patronize the cars.

This is not always in the most densely populated districts, as the class of residents, occupations, etc., must be studied before one can determine whether they will patronize a line or not. Some may do so on Saturdays or Sundays, but the balance of the week your cars may run empty. The people to reach are those who are most apt to be regular passengers every day in the week.

All these matters must enter into the consideration for rebuilding such roads, and it is evident, therefore, that it is no easy task to decide on what is best to do in all cases and yet keep the cost down as low as possible.

### THE CABLE IN EDINBURGH.

The municipal cable system which was installed in Edinburgh in 1847 has proved a costly failure to the city both financially and mechanically. In 1892 the municipality acquired the horse tramways for the sum of \$1,070,000. The council decided that the citizens would not permit the streets to be disfigured with the overhead trolley system and the underground trolley system was considered too expensive, so the cable was finally adopted although it was pointed out at that time that cables were being abandoned all out of date in the United States. It was estimated that a cable plant could be put in operation for about \$3,000,000, but the expense has already reached \$5,840,000 and the system is not yet complete. A number of costly mechanical devices for conducting cars around complicated curves have been tried and abandoned. Following these mechanical failures comes the failure of the company which leased the tramways to pay the agreed 7 per cent on the capital expenditure, which amounted to about \$200,320 a year, and which the leasing company declares it cannot pay out of the earnings. It has therefore applied to be relieved of its lease, and the city is suing for a large amount of arrears.

### McKINLEY AT AUSTIN, TEX.

The accompanying illustration is from a photograph which was received through the courtesy of Mr. Frank E. Scovill, superintendent of the Austin Rapid Transit Ry., and was taken at Austin at the time President McKinley passed through that city on his trip to California. On that occasion he was entertained at Austin for about six hours, in which time he made one speech at the State University and another at the Capitol, where the ladies of Austin entertained the ladies of the Presidential party.

The photograph shows Joseph D. Sayers, governor of Texas, with Mr. McKinley, and was taken at the foot of the Capitol walk. The city was handsomely decorated, and as Mr. McKinley was the

McKINLEY AT AUSTIN, TEX.

first president to visit it, the entire country tributary to Austin turned out to do him honor. The arch shown in the picture was erected at the foot of the Capitol walk and in the circle above were the words "Our President" shown in electric lights, while at the depot there was an arch of the same size and style containing the words "Welcome to Austin" on one side. The reverse was in electric lights spelling the words "Au revoir." Every span wire on the line of the Austin Rapid Transit Ry. for 12 blocks on Congress Ave. supported a row of 15 incandescents lamps and there were four flags between each two suspension poles, the latter being handsomely decorated.

### STREET RAILWAY ACTIVITY IN CANADA.

The Canadian Legislature has recently been asked to charter 1,046 miles of track by 12 different companies. The territory in which these companies are interested extends from Cornwall to Windsor and if all the lines were built there would be a continuous line between these two points with the exception of a short stretch from Glencoe to Tecumseh. On the north another system is being promoted which will reach from London to Owen Sound, skirting the shore of Lake Huron.

The following list gives the names of the companies and the length of roads for which franchises are desired: Ontario Electric Co., 321 miles; Hamilton Suburban Ry., 76 miles; St. Thomas Street Railway Co., 33 miles; Aylmer, St. Thomas & London Electric Ry., 33 miles; London Railway Co., 114 miles; Sandwich, Windsor & Amherstburg Ry., 16 miles; Morrisburg Electric Ry., 20 miles; Petrolia Rapid Railway Co., 18 miles; Goderich Radial Lines, 270 miles; Hamilton Radial Electric Railway Co., 6 miles; Rapid Electric Railway Co., 40 miles; Toronto & Hamilton Electric Ry., 40 miles.

The Fairhaven & Westville Railroad Co. has put six new double truck cars, manufactured by J. G. Brill & Co., in commission on its lines in Fairhaven, Conn.

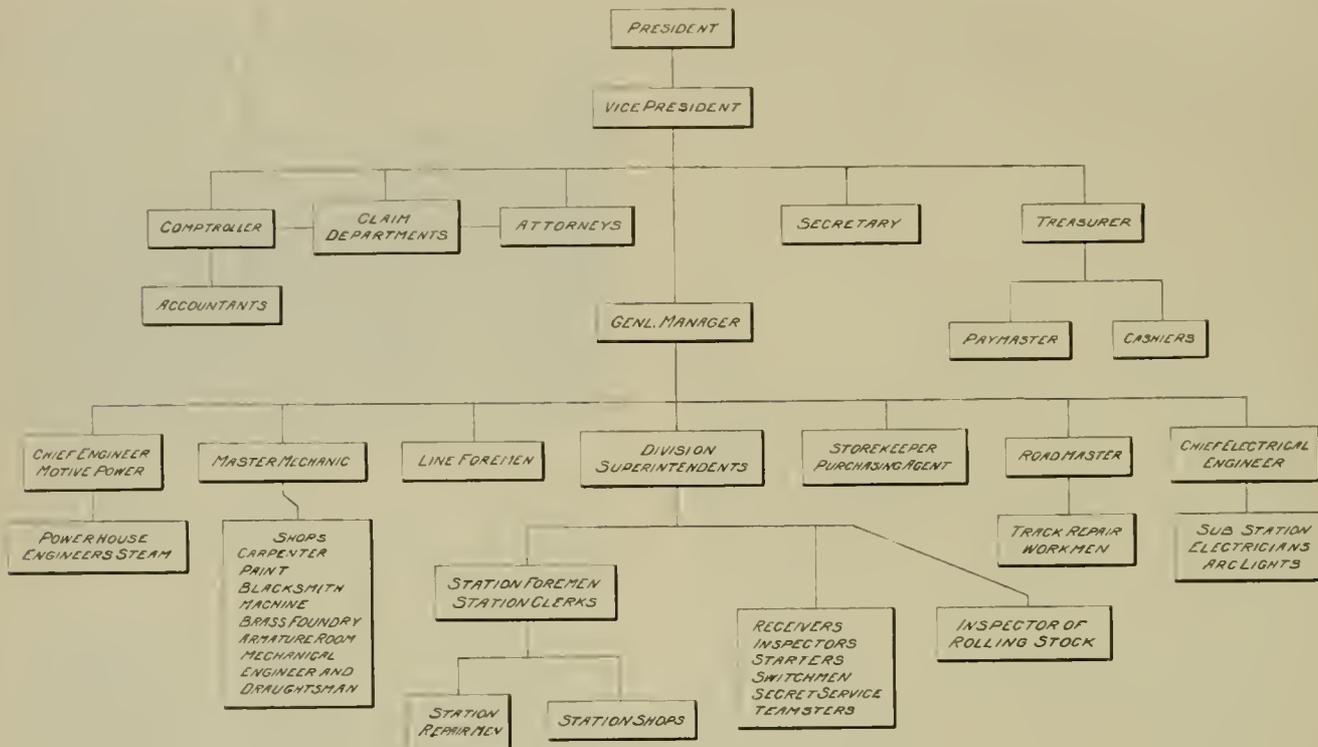

January 6th the Cleveland council passed an ordinance granting a franchise to promoters of a street railway to be operated on a 7-cent fare basis in Cleveland. Mayor Johnson is interested.

**ORGANIZATION OF THE TWIN CITY RAPID TRANSIT CO.**

We have received through the courtesy of Mr. J. F. Calderwood, comptroller, the following diagram which represents the relations of the various officers and employes and shows the distribution of authority which has been established in the management of the Twin City Rapid Transit Co. The president is the executive head of the company, the vice-president being the only officer reporting directly to him. Each principal department head of the company reports directly to the vice-president, including the general manager, who, as the diagram shows, stands in the same relation to the operating and construction departments as the vice-president stands to the legal financial departments. The relations of all the different employes and

**CONSOLIDATION IN SAVANNAH.**

The Savannah Electric Co. has assumed charge of all the electric railway, light and power interests in the city of Savannah, and the operation of the trolley lines will hereafter be in the hands of the new company. By the terms of the consolidation the Savannah Electric Co. becomes the owner of the real and personal property rights and franchises of the Savannah, Thunderbolt & Isle of Hope Railway Co., the Savannah & Isle of Hope Railway Co., the City & Suburban Railway Co. and the Edison Electric Illuminating Co. The officers of the new company are: President, George J. Baldwin; treasurer, J. H. Johnston; secretary, Edward J. Thompson. George O. Nagle, formerly superintendent and assistant general manager of the Chicago City Ry., has been appointed general manager, and C.

ORGANIZATION OF TWIN CITY RAPID TRANSIT CO.

officers is clearly shown in the accompanying diagram, from which it will be seen that the men employed in each department are controlled by the head of that department, who alone reports to his superior officer.

**STREET CAR TELEPHONES.**

A street car telephone has been recently invented by Mr. Benson Bidwell and has been given a test on the lines of the Muskegon Traction & Electric Co., which it is said resulted to the entire satisfaction of the inventor. For use on an electric road with an overhead trolley, the latter is used as a portion of one side of the telephone circuit. A second wire is strung on blocks which are attached to the poles along the road. This wire is parallel with the other and a few inches distant from it. To the trolley pole of the car is attached a second metal pole and this makes contact with the second wire by means of a revolving wheel with deep flanges. Two ordinary telephone wires are connected to the trolley poles and these wires are run through the roof of the car and attached to the transmitting and receiving instruments. Two cars equipped in this manner were used in the test and with either one or both of them at rest or in motion the passengers were able to call up and talk to each other in an ordinary tone of voice. It is stated that an effort will be made to organize a company for the manufacture of telephones to be used on street cars and railroad trains.

B. Kidder assistant manager. T. P. Keck is superintendent of power stations and transmission lines.

A circular addressed to the employes was issued by Mr. Nagle in which he stated that there would be no present change in the personnel of the inferior officers and employes of the old companies. President Baldwin also stated that it was the wish of the company to retain in their present positions those of the employes of the old companies who are competent and faithful, and dismissals will only be made for cause.

The company has arranged for an issue of \$3,500,000 of 50-year gold bonds; \$1,250,000 of this sum will be used for acquiring properties and making improvements; \$250,000 more will be used to take up the bonds of the Edison Electric Illuminating Co., and \$1,000,000 of the remainder for the bonds of the Savannah, Thunderbolt & Isle of Hope Ry. The remaining \$1,000,000 of bonds are to be turned over to the company by the trustee from time to time as required under the condition that no part of the bonds is to be paid over until the company has made permanent improvements to the property, and then the bonds turned over shall not represent more than 80 per cent of the value of these improvements. The company agrees to spend each year, beginning with 1906, for permanent improvements, exclusive of the cost of operation, not less than \$20,000. The first extension to the present line of the company to be considered is from the present terminus of the company's line to the manufacturing district west of the city. It will be the policy of the company to do everything possible to develop the suburbs of the city to the greatest extent.

## RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

### ABUTTER MAY ENJOIN BUILDING OF ELEVATED TRESTLE UNTIL HE IS COMPENSATED.

State ex rel. Smith v. Superior Court of King County (Wash.)  
66 Pac. Rep. 385. Oct. 14, 1901.

This suit was brought to enjoin the Seattle Electric Company from building a trestle and elevated railway in a public street in front of the relator's property. The trestle was to be constructed at a height of about 25 feet at one end of his property, and 15 feet at the other end thereof, above the grade of the street, and to occupy about 25 feet in the middle of the street, which was 66 feet wide. He averred that this would cut off the access to his property and interfere with his light and air. A temporary injunction was granted, with a proviso that it should cease to be operative upon the company's executing a bond for \$30,000 conditioned that it would pay him any damages which he might suffer by the construction of the trestle and railway tracks. But the supreme court of Washington holds that it was error to attach this proviso, and that it had jurisdiction to issue a writ of certiorari or review, under the constitution and statutes of the state. It holds that through this proviso the relator was denied the constitutional guarantee that "no private property shall be taken or damaged for public or private use without just compensation having been first made or paid into court for the owner." It also holds that the remedy by appeal, which he had, was not adequate, because by the time the appeal would be reached in the ordinary course of law the structure would be completed, and the damage worked.

### LIABILITY FOR ASSAULTS OF EMPLOYEES AND OTHERS—DUTIES IMPOSED BY CONTRACT OF CARRIAGE—ON EMPLOYEES—WHEN CONDUCTOR MAY USE FORCE.

Birmingham Railway & Electric Co. v. Baird (Ala.), 30 So. Rep. 456. May 31, 1901.

The law is well settled, the supreme court of Alabama says, that for torts, such as assaults and the like, committed by the agents or employes of a common carrier upon persons who are not passengers the employer is not liable, unless the act was in a sense in the line of duty imposed by the employment.

But as between the carrier and its passengers an entirely different rule prevails. As to them the contract of carriage imposes upon the carrier the duty not only to carry safely and expeditiously between the termini of the route embraced in the contract, but also the duty to conserve by every reasonable means their convenience, comfort and peace throughout the journey. And this same duty is, of course, upon the carrier's agents. They are under the duty of protecting each passenger from avoidable discomfort, and from insult, from indignities, and from personal violence. And it is not material whence the disturbance of the passenger's peace and comfort and personal security or safety comes or is threatened. It may be from another passenger, or from a trespasser or other stranger, or from another servant of the carrier, or from the particular servant upon whom the duty of protection peculiarly rests.

In all such cases the carrier is liable in damages to the injured passenger. And it is of no consequence, when the wrong is committed by the carrier's own servant—even that servant particularly charged with the duty of conserving the passenger's well-being en route—that the act bears no connection or relation with or to the duties of such servant to the carrier, and is not committed as an incident to the discharge of any duty; but is utterly violative of all duty, and apart and away from the scope of employment as that term is understood in the class of cases first above referred to. The carrier is liable in such cases because the act is violative of the duty it owes through the servant to the passenger, and not upon the idea that the act is incident to a duty within the scope of the servant's employment; and it is manifestly immaterial that the act may have been one of private retribution on the part of the servant, actuated by personal malice towards the passenger

and having no attribute of service to the carrier in it. It is wholly inapt and erroneous to apply the doctrine of scope of employment, as ordinarily understood, to such an act. Its only relation to the scope of the servant's employment rests upon the disregard and violation of a duty imposed by the employment. This is, beyond question, the court thinks, the true doctrine or principle; and while there are adjudications against it, the great weight of authority supports it.

Of course, the court further says, a conductor has the right of self-defense against the assault of a passenger; but the right is the same in this connection as in criminal law. He must be imperiled, and he must be without fault. To be sure, he need not retreat from his car. And he may assault a passenger when necessary to protect other passengers from assault, using no more than necessary force, and this may become a duty—indeed, it is a duty whenever it is a right. But he cannot assault a passenger in retaliation for an assault committed upon himself or upon another passenger, and, all the more, he cannot assault a passenger for abusive words, or in revenge or punishment, under any circumstances. And if he does assault a passenger otherwise than under a necessity to defend himself or a passenger from battery, or in rightfully ejecting a passenger, who, by his conduct towards other passengers, has forfeited his right of carriage, the carrier is liable. The fault of the passenger, short of producing a necessity to strike in self-defense, will neither justify the conductor in striking, nor relieve the carrier from liability for his act. Possibly, such fault could be considered in mitigation of damages.

### CONTRACT SATISFIED AS TO THE TIME OF BEGINNING OPERATION OF ROAD—MAY DIG DITCHES ON RIGHT OF WAY TO RAISE ROADBED—POWER TO RECEIVE CONVEYANCE OF RIGHT OF WAY NOT DECIDED.

St. Louis & Belleville Railway Co. v. Van Hoorebeke (Ill.), 61 N. E. Rep. 326. Oct. 24, 1901.

For \$1 in hand paid, and the benefits to be derived from the construction and running through their land of a double track electric railway, and for the further consideration of the performance of certain conditions set forth, the owners of a tract of between 70 and 80 acres of rather low land contracted to convey a right of way 100 feet wide through said land. One of the conditions of the contract was that on or before May 1, the company should construct and operate continuously, regularly, and daily a double track electric railway on said right of way. It was conceded that the road was finished and in operation May 20. Moreover, the evidence showed that the road was operated as early as May 1, and before that time, by the running of one or more construction cars upon the track, which construction cars also carried passengers. Yet, on May 15, the landowners gave notice declaring the contract void. But the supreme court of Illinois, after a careful examination of the evidence, thinks that the company complied with the terms of its contract. It says that these parties permitted the company to take possession of the ground, which they agreed to convey to it for a right of way, and to spend an immense amount in grading the road, in laying rails, in building a power house, in erecting poles necessary to hold the wires used in the construction of an electric railway, in stringing the wires, and in otherwise perfecting the construction of the road. They permitted the company to do this for 15 days after they knew of what they claimed to have been a default on its part. Under these circumstances, it certainly would be a great wrong and injustice to the company to enforce a forfeiture of the contract.

Nor does the court think that there was any excuse for the landowner refusing to comply with their contract to convey the right of way by the manner in which the company had constructed the road thereon, or by its having so made use of that portion of the right of way lying outside of the railroad bed, by making excavations or digging ditches to get dirt for the construction of the roadbed, as to injure the balance of the tract of land. That is to say, it is of the opinion that the elevation of the roadbed from two to four feet above the surface of the ground, in this case, and the

settling of water in the places where the excavations for dirt to do this with were made, were not circumstances which would justify the landowners in refusing to comply with their contract. It accords to the company the same rights in this respect that it would grant to any railroad company.

The court wants it understood, however, that it was assumed by counsel on both sides that this company had power to receive a donation or conveyance of a right of way, and to condemn land for such right of way, and that it passes no opinion upon that subject, as it was not a contested question, but when a disputed question arises as to the existence of such power, it does not intend to be cut off from considering it by anything here said. It merely holds that, assuming such power to exist, because counsel on both sides seemed to concede it in this case, it does not think that the company had so failed to perform its contract, or had performed it in such an improper manner, as to justify the landowners in refusing to execute a deed to it. The corporation was organized, under the general railway act of Illinois, for the purpose of building and operating a double track electric railway between the cities of East St. Louis and Belleville.

#### INJURY OF PASSENGER BY ELECTRIC SHOCK—EVIDENCE OF SAME—OF NEGLIGENCE.

*Buckbee v. Third Avenue Railroad Co.* (N. Y. Sup.), 72 N. Y. Supp. 217. Oct. 4, 1901.

A shock occasioned by contact with an electric current, the second appellate division of the supreme court of New York holds, must be regarded as a direct physical and personal assault, for which a negligent defendant may be held liable. And it affirms in this case a judgment for damages for injuries alleged to have been sustained by a passenger in stepping on or over the metal door sill at the rear of the car as she left the same on becoming alarmed at the sight of flames shooting from the controller box. The car was operated by electricity communicated from underground, and one witness testified that the flames extended beneath the car its entire length. The appearance of the flames was preceded by a loud report or explosion. Another witness testified that the flames started in front, and went underneath the car, burning a long while. The plaintiff herself testified that she received an electric shock, and described the sensations she felt indicating it. At the time, she was in perfect health and vigor, and a physician who examined her within two hours of the occurrence, after stating her condition then, testified that an electric shock received as claimed would be an adequate cause for it, although he admitted that a blow or any injury in the lumbar region might also be an adequate cause, but said that he found no evidence of such injury. Two other physicians, who made examinations, gave evidence of the existence of a permanent injury, which they said an electric shock received as claimed would be sufficient to produce. The court holds that this was abundantly sufficient to establish a prima facie case of injury resulting from electric shock. Then, it holds that the company's negligence was not only established by this evidence, but also by proof that the phenomenon described could not have existed if the electrical appliances of the car were in proper shape. It is true, there was evidence that the car, after the accident, was used the same day on four through trips without further harm; but there was no evidence of any subsequent inspection, and no direct evidence that it was not out of order. Under these circumstances the positive evidence was not sufficient, the court holds, to justify the assumption that the company was free from blame as matter of law.

#### LIABILITY FOR DAMAGES OF POWER HOUSE TO ADJOINING PROPERTY—AS TO ITS BEING A NUISANCE.

*Chicago North Shore Street Railway Co. v. Payne* (Ill.), 61 N. E. Rep. 467. Oct. 24, 1901.

The supreme court of Illinois affirms here a judgment for \$2,000 damages to property from the establishment on adjoining premises of an electric power house for the operation of this railway. It says that such structures of a railroad company, erected in pursuance of lawful authority for the uses of its road, are permanent structures. This company, acting within its charter, had a legal

right to maintain its power house at that place, and the party suing had no lawful right to interfere or compel a change. In such a case, in legal contemplation, all damages which will be sustained as the effect of the act are sustained immediately, and the measure of damages is the depreciation in market value. If the president or some other individual had built the power house, and operated it himself, and sold the power to the company, the use would have been a private one, but the thing would have been a nuisance, and the owner of it liable as an individual. At common law the power house and the business carried on adjoining the dwelling house of the party suing would be such a nuisance as could be remedied by an action on the case for damages, or, perhaps, by an injunction against its continuance. If, however, the erection and maintenance of the power house were things which the company's charter authorized it to do in the operation of its road, and they were performed in a reasonably skillful and proper manner, although of such a character as to injure and annoy the party suing as the adjacent property owner, they would not constitute a nuisance, and could not be abated as such. Nevertheless, the company would be liable for the damages to the same extent and under the same rules as though the power house were a nuisance. The charter of the company does not, under the present state constitution, take away from the adjoining owner the right to recover for the noise, jarring, smoke, and disturbance resulting from the power house.

#### DUTY TO PERSONS ON PRIVATE RIGHT OF WAY WHEN THROWN OPEN TO THE PUBLIC.

*Liekens v. Staten Island Midland Railroad Co.* (N. Y. Sup.), 72 N. Y. Supp. 162. Act. 4, 1901.

People making use of thoroughfares which are thrown open to the public, and upon the surface of which street railroads are being operated, the second appellate division of the supreme court of New York holds, may properly assume that the way is a public highway, and that it is subject to the same rules of law, in so far as the active duty of the street railroad company is concerned, as though in fact it were a public highway. They may use such public way in the manner customary upon other highways similarly situated, in the absence of notice to the contrary by the owners of the fee or legal title; and the street railroad company is bound, as in the case of other highways, to exercise a reasonable degree of care to prevent injury to persons so using such ways. The company, owning the way, as where it is on its purchased right of way, may protect its right of way for its cars by fencing it in, or by erecting barriers of any kind; but so long as it presents to the public an open street, differing in no essential particular from any other public highway, it cannot, consistently with law, be relieved of the duty of exercising the same degree of care which would be incumbent upon it if the way was in fact a public highway. Here was a passenger in a coach, which was traversing what the court says the company held out to him as a public thoroughfare, and which it admitted he had a right to travel, except that it undertook to say that, inasmuch as it was on a right of way which it owned leading to a summer resort, in so far as its tracks were concerned, its right was exclusive, and that upon that portion of the way it owed him no duty, or at least none other than not to wantonly, willfully, or intentionally injure him. But such a rule the court declares would be shocking to the sensibilities of the community, and would permit transportation companies to invite people to public resorts upon the private property of the corporations, and to slaughter them without any adequate responsibility. This party was not a mere licensee upon the private premises of the company.

#### RIDING ON REAR BUMPER—WARNING AND PERMISSION OF CONDUCTOR.

*Nieboer v. Detroit Electric Railway* (Mich.), 87 N. W. Rep. 626. Oct. 22, 1901.

A man desiring to take a car at about 6 o'clock p. m., under the plea that it was crowded, climbed upon the rear deadwood or bumper. Two others also got on it. Then, the car stopping at a point evidently not anticipated by the motorman of the car behind it, the latter struck it. The blow was not a severe one, and no one in either car was injured but this man, who in some way had his ankle hurt, the other two referred to saving themselves by

jumping from the car. He obtained a judgment for damages, but the supreme court of Michigan reverses this, ordering no new trial. It says that he was not invited to ride upon the deadwood. No custom was shown permitting him to ride there. The company had instructed its employes not to permit it. It was not intended or sanctioned for the use of passengers. It needs no argument to demonstrate that the position was a dangerous one, and never intended as a place for passengers to ride. There was neither an express nor implied assent for him to ride in this dangerous position. The conductor advised him not to ride there, by telling him that he better get off and wait, or get inside. This language cannot be construed into an invitation. It was a busy time. The conductor was not called upon to stop and put him off. He had done all that was required in warning, if, indeed, he needed any warning. He knew that, if the car was crowded, others were coming within two or three minutes, which he could have taken, and the testimony showed that there was room on the next car. He voluntarily, and without invitation or permission, chose to ride in a dangerous place, rather than attempt to get inside or wait a few minutes for another car. His negligent act was a continuing one, and directly contributed to the injury. When a place is one not provided or intended for passengers to ride upon, and is in itself dangerous, the employe who assumes to permit a passenger to ride in such a place acts without authority, unless such authority be shown expressly or by common custom.

INJURY OF DEAF-MUTE WALKING ON TRACK ON PRIVATE RIGHT OF WAY—DUTY OF MOTORMAN—DECLARATION OF AS EVIDENCE.

Floyd v. Paducah Railway & Light Co. (Ky.), 64 S. W. Rep. 653. Oct. 17, 1901. "Not to be officially reported."

A deaf-mute was run down by a car on a street railway track built on a strip of land at the side of the highway. It appeared from the evidence and admitted facts that the motorman saw the man when 150 yards from him. He repeatedly and continuously sounded his gong, but the man walked on, paying no attention. He then blew his whistle repeatedly, and still the same result. Yet, the court of appeals of Kentucky says, he set no brake, and did not get his car under control, though he could not reasonably expect his continued soundings of the gong and whistle to be more effective than the signals he had given. When he saw the man in front of him on the track he had the right to suppose he would get out of the way, but when he saw he was unaware of the approach of the car, and that the sound of neither the gong nor the whistle affected the man, it was his duty to know what was apparent to a person of ordinary care, situated as he was, and he should have taken such steps as ordinary care required to get his car under control; for after he saw the man on the track, and perceived this, or in the exercise of ordinary care should have perceived it, after seeing the man on the track, and being aware of his danger, he could, by the exercise of ordinary care, have avoided the injury. The question of contributory negligence on the part of the man should also be submitted to the jury. Proof offered to the effect that the car track was much used by persons walking between the suburb and city which it connected the court holds was immaterial, and properly excluded, as the car track was not in the highway, and such use gave the public no right to it. A declaration made by the motorman at the scene of the injury, just after the wounded man was got from under the car, the court holds was a verbal fact directly growing out of the transaction and a part of it, and should have been admitted in evidence.

CARE REQUIRED OF PERSONS CROSSING TRACKS—WHEN MUST "STOP, LOOK, AND LISTEN"

Tacoma Railway & Power Co. v. Hays (U. S. C. C. A.), 110 Fed. Rep. 466. Aug. 19, 1901.

It was contended here that the rule usually applied to the conduct of persons crossing the tracks of steam railroads is applicable to street railroads as well, and that the omission of the party suing to "stop, look, and listen" before crossing the track of the electric street railway was negligence as a matter of law. But the United States circuit court of appeals, ninth circuit, says that the rule, even in the case of steam railroads, is not inflexible, but is dependent upon the surrounding circumstances to a greater or less

degree, and is only applicable to street railways where the attending conditions are such that reasonable care and prudence would dictate such precautions. The duties of persons with respect to steam railroads and street railroads are not so analogous as to be governed at all times by the same rule. The rights of the person are greater, and the dangers less, in connection with the latter; the rights of street cars, no matter by what power impelled, not being superior to those of other vehicles, save in the one instance where a vehicle is bound to get out of the way, and not to obstruct the passage of the car, owing to the inability of the car to travel in any other part of the street. The element of trespass is entirely absent in the case of a person crossing a street railway at any point, and the only care required of him is that which a reasonably prudent man would exercise, having due regard to the rights of others, and assuming that others (including the street car companies) will exercise the same care in fact, knowing that such care is imposed by municipal regulation upon the persons operating the street cars. This assumption does not, of course, warrant such a reliance upon it as to neglect means of self-preservation, but is an element of consideration in arriving at the standard of care to govern the particular case. Here, a man, with a double team attached to a farm wagon covered with canvas, closed behind, looked up the street just as he left the grocery, but could see no car on the track for a distance of a quarter of a mile, and, after proceeding along the line of the track at a moderate speed for 400 feet, turned to cross the track, without again looking for a car, not having heard any warning signal of the approach of a car, and not believing that a car could overtake him in that length of time if running at the rate of speed (limited to 12 miles an hour) required by municipal ordinance. Under these circumstances, the court holds that the question of contributory negligence was for the jury, and affirms a judgment for damages.

INJURY OF PERSON ATTEMPTING TO BOARD CAR WHEN IT FIRST REACHES A CROSS STREET—TIES IN STREET—NORMAL STOPPING PLACE—MOTORMAN AND NEGLIGENCE—INCREASE OF SPEED.

Schmidt v. North Jersey Street Railway Co. (N. J. Sup.), 49 Atl. Rep. 438. June 10, 1901.

The evidence showed that at the lower corner of a street, intersecting that on which ran the line of the railway, a group of intending passengers stood awaiting a car; that the plaintiff crossed to the upper corner, and stood there with others, as a car was approaching; that he waved his hand towards the car, which slackened its speed, but did not stop; that two passengers got safely on the car; that the plaintiff seized the hand rail, and placed one foot on the step, and, with the other on the ground, was dragged along until he came in contact with some railroad ties near the track, in the middle of the intersecting street, when he lost his hold, and received severe injuries. He and one witness testified that the speed of the car increased after he had taken hold of the railing; another witness for him and several witnesses for the company testified that there was no increase, but instead a decrease of the speed of the car. No proof was offered that the motorman in any way indicated that he meant to stop at the upper corner, and he testified that he did not notice any one there. Under these circumstances, the supreme court of New Jersey holds that a verdict in favor of the company should have been directed, (1) because, on the facts stated, a jury could not fairly find negligence chargeable to the company; and (2) because, with the railroad ties in full view, the plaintiff assumed all risk of injury from them when he attempted to get on the moving car.

The court says that if the company could, for any purpose, be held responsible for the maintenance there of the ties, it was quite clear it could not be chargeable with negligence towards an intending passenger; for they were not at a place where it could reasonably be supposed by any one that a car would stop to receive or discharge passengers. In the absence of any contrary indication, the place for a car to stop at an intersecting street is opposite a sidewalk. It is almost common knowledge that the normal stopping place of an electric car at an intersecting street is after crossing the roadway of that street. And the court holds that it is too much to expect that in the operation of stopping a car where there may be a miscalculation as to how far the mo-

mentum will carry it, or it may be necessary to check, and then accelerate, the speed on account of the movement of persons or vehicles in the street, that the motorman must always anticipate that persons standing on the upper corner of the street might be expecting to board the moving car.

While it is not necessarily a negligent act to get on or off a slowly moving street car, yet, in order to charge negligence upon the person controlling the propulsion of the car, some affirmative act of his, showing a lack of due care for the probable contingency of passengers so getting on or off, must be proved. In this case, for example, it would have been necessary to prove that the motorman increased the speed of the car when he had reasonable cause to suppose that a passenger might be in the act of getting upon it.

Then, the court says that there was hardly enough proof to go to the jury of an increase, after slackening, of the speed of the car. It says that the plaintiff's belief that the car did go faster is easily understood by any one who has ever tried to board a moving car propelled by electricity. It is very easy to underestimate before the act the rate of speed which is found to exist after the attempt is made.

#### OPERATION OF CARS DURING STRIKE.

Fewings v. Mendenhall (Minn.), 86 N. W. Rep. 96. May 17, 1901.

The question as to when and under what circumstances street railway companies will be held, as to passengers, guilty of negligence in attempting to operate their cars at all during a strike of their employes, is, the supreme court of Minnesota says, an important one to them, and to the public as well. To the former, for, if they are to be held guilty of negligence in attempting to operate their cars whenever force and intimidation are used by their striking employes to compel them to suspend the running of their cars, then they must submit to such unlawful force and cease to discharge their duties to the public, or yield to the demands of the strikers, whether just or unjust. Especially important is the question to the public, for the uninterrupted operation of an efficient street car system has become a practical necessity to a large number of our urban population. They have established their homes, arranged their business and work with reference to it, and their comfort, convenience, and pleasure are largely dependent upon it. Therefore those who are charged with the public duty of operating street cars, in consideration of valuable franchises, cannot be permitted to omit the duty for any cause save the most pressing, such as the practical impossibility of discharging the duty, consistent with the further duty to exercise the utmost vigilance and care in guarding their passengers against violence, from whatever source arising, which may be reasonably anticipated or naturally be expected to occur, in view of all of the circumstances of each particular case. It then necessarily follows, the court holds, that a street railway company is not guilty of negligence, as to its passengers, in attempting to operate its cars during a strike of its employes, unless the conditions are such that it ought to know, or to reasonably anticipate, that it cannot do so and at the same time guard from violence, by the exercise of the utmost care on its part, those who accept its implied invitation to become passengers.

Again, it was contended in this case that, because the stone which injured the plaintiff, a passenger, was thrown by a third party, who was not one of the strikers, the defendant, who was operating the road as receiver, was not in any view of the case responsible for the resulting injury; that the defendant had a right to assume that all persons, except the strikers, would not only refrain from any acts of violence or lawlessness, but, on the contrary, would use their best efforts to suppress them, and hence the defendant had no reason to anticipate the act which injured the plaintiff, and therefore could not be charged with negligence for not guarding against it. But this course of reasoning the court says ignored the actual conditions existing at and before the time of the injury. If the conditions had been normal, if there had been no strike, no mobs, no excitement, and no resentment on the part of the strikers and the many who sympathized with them, the contention would be correct. The evidence, however, tended to show that the actual conditions were the reverse of those sug-

gested, and that lawlessness, not order, reigned in and near the place of the injury. It was therefore, upon the evidence, the court holds, a question for the jury whether the defendant ought not, under the circumstances, to have reasonably anticipated violence from persons not directly connected with the strikers, and to have exercised due care to protect his passengers therefrom. Furthermore, the court holds that evidence tending to charge the defendant with notice of the conditions existing and events occurring before the plaintiff was injured was properly received.

#### RIGHTS OF CLAIMANT WITH DISTORTED EVIDENCE—DIRECTING VERDICT—RUNNING OF CHILD ACROSS STREET—DUTY TO CHILD CLINGING UPON STEP TO AVOID INJURY—FAILURE TO SOUND GONG WHEN TURNING INTO STREET.

Aiken v. Holyoke Street Railway Co. (Mass.), 61 N. E. Rep. 557. Oct. 18, 1901.

The supreme judicial court of Massachusetts says that every one is aware that among the many suits brought to recover for personal injuries there are cases, of which, however, it does not mean to intimate that the present one was an instance, in which unjust claims are sought to be sustained by testimony which, if not wholly false or manufactured, is so colored and distorted as to tend to mislead juries and judges and to pervert justice. Yet the plaintiff in such a suit has the right to have his alleged cause of action determined by a jury, if upon any reasonable view of the conflicting evidence it can fairly be found as a fact that he was hurt while in the exercise of due care, and by the defendant's fault. If in any jury trial there seems to be danger that the jury will give an unjust verdict upon evidence which in law ought to be submitted to its decision, the proper course is to take the verdict, and then to set it aside as against the evidence, or the weight of the evidence, rather than to order a verdict. There is no justification for the latter course in a suit in which it does not appear that any wrong verdict has ever been taken.

The court further maintains that it cannot be held, as matter of law, that for a child of six or seven years to run across a street on his way home from school is of itself negligence. Here the boy in question was about six and one-half years of age, and testified that his attention was attracted by the whistle of steam cars which were crossing the same street at a more distant point; and the court holds that neither the fact that he was running, nor that he did not see the electric car, precluded a finding that he was in the exercise of such care as might be expected from an ordinarily prudent child of his years.

Again, the court holds that while at play he carelessly ran into the car, and if in attempting to save himself from the consequences of such a collision he found himself upon the car, the company could not rightfully disregard his peril, if informed of it, and run its car as if nothing had occurred. There was abundant testimony that before the boy was finally thrown from the car he was upon the step, in a place of comparative safety, very near and in full view of the motorman, and requesting the motorman to let him off, and that the motorman, instead of stopping or attempting to stop the car, increased its speed, and so caused him to be thrown to the ground and run over. To be sure, this testimony was contradicted. But whether it was true or not was a question for the jury. If it was true, and if the boy was not a trespasser attempting to steal a ride, to disregard the peril of a child of less than seven years of age, who by his own careless collision with a street car was clinging, frightened, upon the step and to the handle of the car, instead of attempting to comply with the child's request, was a course of conduct of such a clear and direct tendency to inflict serious injury as to be actionable, when practiced by one traveler towards another in a public street, where both were lawfully present.

Then there was evidence which would justify a finding that the car turned into the street across which the boy was running without sounding the gong, and at a speed variously estimated at from two to five miles an hour. Whether due care on the part of the company would require it to give warning of the entrance of the car into the street by ringing the gong, the court holds, was a matter peculiarly within the province of the jury to determine. It could not be said, as a matter of law, if the gong did not sound, that the omission was not negligent.

**THE FT. WAYNE-CINCINNATI INTERURBAN.**

The accompanying map shows the system of the Ft. Wayne, Dayton & Cincinnati Traction Railroad Co., which was described in the "Review" for December, 1901, page 926. The heavy lines on the map show the proposed divisions of this system, which includes about 400 miles and connects cities between its terminals aggregating about 1,000,000 inhabitants. Ground was broken at

vided for and ground for freight and cattle yards has been secured in all of the principal towns along the line.

**HARTFORD-SPRINGFIELD INTERURBAN.**

The opening of the interurban trolley line between Hartford and Springfield, Mass., occurred on January 13th, under the auspices of the Hartford & Springfield Street Railway Co. The first cars over the line left Hartford having on board a number of the officers of the road and officials of the two terminal cities and intervening towns who were guests of the company. When the car reached Warehouse Point the party stopped at the power house which they inspected and lunch was served in the car barn. The trip over the remainder of the road was then resumed. The building of a small stretch of road four miles long from Warehouse Point to connect with the South Windsor branch of the Hartford Street Ry. supplies one of the missing links of an almost complete trolley line between New York and Boston. This gap has been built by the company which controls the portion of this line between Hartford and Springfield.

**ST. LOUIS CAR SHEDS BURN.**

January 11th the St. Louis Transit Co.'s Bellefontaine car barn at 19th and Farragut Sts. was burned, together with over 50 open electric cars which were stored there. The fire entailed a loss of \$65,000 which was covered by a blanket insurance policy carried by the company. The power house and other property of the company adjoined the burned building, but were not damaged to any extent. Traffic was not delayed, as it was not found necessary to shut down the engines while the fire was in progress. The origin of the fire is unknown, but it made such rapid headway after it was discovered that when the firemen arrived the building was beyond the hope of saving and the attention of the men was turned to the more valuable property adjoining which escaped any damage.

**SNOW FIGHTING EQUIPMENT AT WORCESTER, MASS.**

The Worcester Consolidated Street Railway Co., with 130 miles of track to cover, owns the following snow fighting equipment: One Peckham rotary plow, fitted with two independent 40-h. p. motors for driving the fan; three Smith & Wallace double truck plows; three Wason double truck nose plows; and two Wason single truck shear plows.

With the Peckham rotary plow it was found that sometimes when working in very hard snow the four motors on the plow would drive it faster than the fan could eat its way into the drifts with the result that there was danger of overloading the fan motors. To avoid any chance of this an ammeter is placed in the fan-motor circuit enabling the operator to tell just what load the motors are carrying and he can regulate the speed of the plow to correspond with the speed with which the fan is cutting into the snow. A heavy red line on the scale of the ammeter designates the danger point above which the fan-motors will be overloaded.

**INCIVILITY.**

The New York, New Haven & Hartford R. R. prints on its time tables the following suggestion:

"Passengers are respectfully requested to report to the general passenger agent any instance of incivility on the part of employes of this company. While it is the aim of the company to redress just grievances, it is suggested that courtesy is equally commendable, whether practiced by the railroad employe or the passenger."

This ought to make a good notice to post in street railway cars.

Service on the Metropolitan West Side Elevated Ry., Chicago, was suspended from nine till eleven o'clock on the evening of January 12th, owing to a fire in the controlling tower at the railroad bridge from which the switches on the approach to the bridge are operated

ROUTES OF THE FT. WAYNE-CINCINNATI INTERURBAN.

West Elkton, O., Dec. 15, 1901, for the construction of this road which the company states will be pushed ahead as rapidly as possible. Two important features of this system are that the lines do not parallel any existing railroad and that a private right of way will be used throughout. It is to be operated on the third rail system and the conditions favor running at high speed. The train service is promised to be thoroughly modern in every respect and to include vestibuled express trains between the terminals. It is expected to conduct the road on the basis of a main line railroad and an extensive freight and cattle transportation is being pro-

# IN THE POWER HOUSE

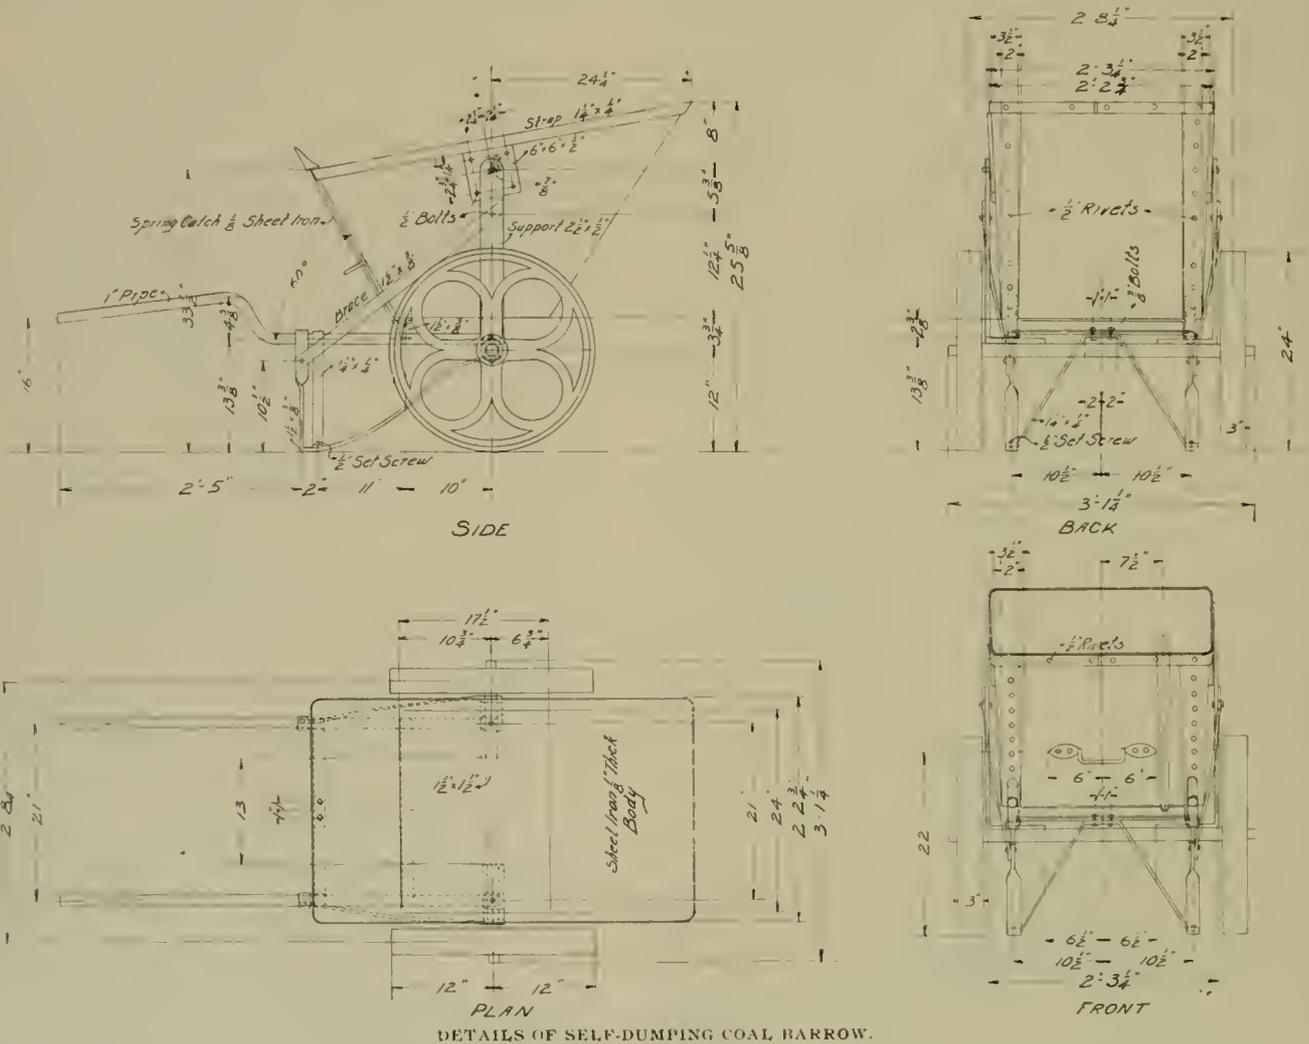

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

## TELL-TALE ATTACHMENT FOR CIRCUIT BREAKER.

A small device that will tend to relieve the power station engineer of some of his care and worry is an arrangement for automatically giving notice when a switchboard circuit breaker goes out. An attachment of this kind is used at the power house of the Union Street Railway Co., at New Bedford, Mass. In this particular

brass knob on the handle. The collar on the handle and the brass strip on the bolt are each connected by wire with a small cell-battery, the two wires constituting when the breaker is closed a normally open circuit.

It will be understood that as long as the breaker remains closed the local battery circuit will be open but when the breaker goes out the handle will fly upward, bringing the knob against the projecting strip, closing the battery circuit and thereby causing a bell or

DETAILS OF SELF-DUMPING COAL BARROW.

instance the device is applied to a breaker of the G. E. type but the idea can be carried out with almost any type of circuit breaker on the market.

To the handle of the breaker is fitted a 1/2-in. collar or ring, this collar carrying a brass knob or projection that may be a nut or any other small piece of metal that can be conveniently attached to the collar. The nut or knob is placed so that when the breaker is in the "open" position the knob will press against a small brass plate spring fastened to the lower right hand bolt that helps to secure the circuit breaker to the switchboard panel. The plate spring is merely a strip of brass placed under the nut of the bolt and having one end bent forward to come in contact with the

buzzer to signal the fact that the breaker has been actuated. The bell may be placed at any advantageous point in the station and will continue to ring until the offending breaker has been reset.

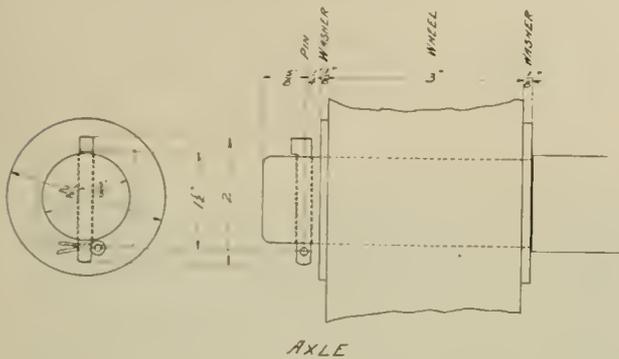

In the "Review" for June, 1901, page 360, a device for accomplishing the same result was described and illustrated. In that arrangement a small metal pin is attached to the toggle arm of each breaker on the board so that when the breaker goes out the arm will carry the pin into contact with two wires stretched along the face of the switchboard and thus close a bell circuit.

Five thousand employes of the Brooklyn Rapid Transit Co. were vaccinated, January 12th, by the company's physicians.

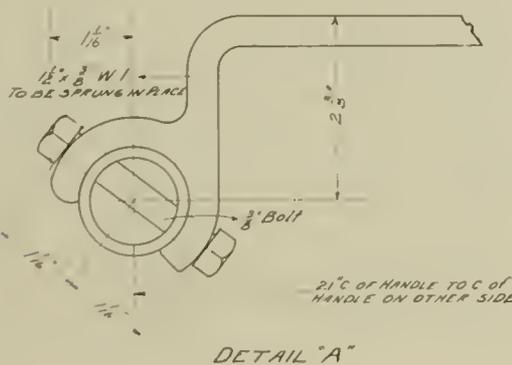

**SELF DUMPING COAL BARROW.**

To more easily handle coal from the coal bins to the furnace door, the Union Traction Co., of Philadelphia, provides at its power houses self-dumping wheelbarrows which have been devised by its engineering department. Mr. W. S. Twining, chief engineer of the company, has kindly furnished us drawings of this barrow and states the company has found the dumping feature quite an improvement over the ordinary hand wheelbarrow.

These barrows are designed to hold 600 lb. of coal each, and one man handles a load of that size without difficulty. The body,

which is made of 1/8-in. sheet iron, has a long projecting lip and is hung upon the frame with the pivots so located with reference to the center of gravity that the body when empty will remain in its normal position, but when filled with coal will have a strong tendency to tip forward and dump. It is prevented from doing so by a spring catch at the back consisting of a strap of 1/8-in. sheet iron rigidly fastened at its lower end to the frame, and having a projection at the other end, which is designed to hook over the top edge of the barrow. When the barrow is full and the attendant wishes to dump the coal he jerks this spring strap backward. The weight of the coal causes the body to tip forward and dump, but

as soon as it is empty the body automatically returns to the horizontal position and the spring snaps into place, securely holding the body.

The two iron wheels are 24 in. in diameter and have flat tires 3 in. wide. The handles are made of 1-in. pipe. The details and dimensions of the spring catch, the bearings, and the bracings, are set forth in the drawings.

The Chicago City Railway Co. has ordered five 500 h. p. Babcock & Wilcox water tube boilers which will be installed at its 22d St. and Walsh Ave. station; these boilers will all have B & W chain grate.

A street railway company in New England utilized a lot of old 3 1/2 and 4 in. axle that had been discarded, by cutting them in two and turning the pieces down for armature shaft. The key bolts in the original axle were eliminated by mounting each axle in the lathe sufficiently off center to bring the key seat within the portion of metal to be cut away.

**TESTS OF TEXAS OIL.**

A series of tests has recently been made under the direction of Prof. J. E. Denton, of Stevens Institute of Technology, on the comparative fuel value of coal and Texas crude oil. Tests were made under a boiler in the plant of the American Ice Co., of New York, which has been fitted for the use of oil about a year and a half ago by the National Gas & Fuel Co., of Chicago. The burner used was the Williams patent oil burner which has three supply openings, oil entering at the top, steam at the second opening and hot air from the ash pit through the third opening; thus a gaseous mixture of oil, steam and air is blown through the forward end of the burner into the furnace and meets with partly heated air drawn from the ash pit through the forward part of the grate which is left open.

The tests of the oil were made at boiler capacities varying from 112 to 220 h. p. which was the limit of satisfactory air supply for the chimney draft with wide open dampers. At this rate of working no smoke was shown at the top of the chimney, but by forcing the boilers beyond this streams of smoke were formed at the edge of the flame and a light vapor was shown at the chimney top.

The tests with coal were made at from 93 to 119 h. p. the former being the demand on the boiler for regular work and the second the greatest amount that could be obtained with dampers wide open. The boiler was under test with oil for fuel from November 25th to December 5th. Starting with the boiler setting cold and the water in the boiler at 64 degrees F. the time required to raise steam to 85 lb. pressure was 50 minutes with oil and 1 hour and 17 with coal, the fire being started in the latter case with a very liberal amount of dry wood.

For the range from 112 to 120 h. p. the total evaporation from and at 212 degrees per pound of oil varied from 15.71 to 15.29 lb. of dry steam and the burner consumption varied from 3.1 to 4.8 per cent of the boiler output. This gives the net evaporation from 14.74 to 15.16 lb. of water per pound of oil. The combustion of the oil by the burner was practically perfect. The boiler utilized about 78 per cent of the heat of the fuel which represents the best average boiler practice and the percentage of steam consumed by the burner is a minimum for steam jet burners.

The comparative fuel costs of oil and coal under the conditions at the factory where the tests were made are as follows:

For producing the horse-power required by the factory, or 1 horse-power per about 20 square feet of heating surface, with the moisture and ash as found:

1. Moisture in coal per cent.....	6.2
2. Ash, per cent.....	16.2
3. Weight of oil per gallon, pounds.....	7.00
4. Weight of oil per barrel of 42 U. S. gallons, pounds.....	322
5. Evaporation per pound of wet coal from and at 212 degrees, pounds.....	9.17
6. Net evaporation per pound of oil from and at 212 degrees, pounds.....	15.1
7. Ratio of oil to coal.....	1.65
8. Number of barrels of oil equivalent to 2,240 lbs. of coal.....	4.23
9. Price of coal per 2,240-lb. ton, without cartage and cost of ash removal.....	\$3.00
10. Equivalent price oil per barrel of 42 U. S. gallons.....	\$0.71

For producing horse-power upon the commonly guaranteed basis of 1 horse-power per 10 sq. ft. of heating surface, and with an average percentage of moisture and ash in the coal:

1. Moisture in coal, per cent.....	3
2. Ash, per cent.....	17
3. Evaporation per lb. of wet coal from and at 212 degrees, pounds.....	8.75
4. Net evaporation per lb. of oil from and at 212 degrees, pounds.....	14.8
5. Ratio of oil to coal.....	1.60
6. Number of barrels of oil equivalent to 2,240 lbs. of coal.....	4.12
7. Price of coal 2,240 lb. ton, without cartage and cost of ash removal.....	\$3.00
8. Equivalent prices of oil per barrel of 42 U. S. gallons.....	\$0.73

Considerable saving in labor is noticed with the use of oil. It is probable that one fireman can attend to 30 oil burners of 100 h. p. each. There is also a saving in ash handling labor and helpers in the fire room and the cost for handling oil will probably be less for machinery than with coal.

## ELECTRICAL EQUIPMENT OF THE MANHATTAN RY.

The operating of the Second Ave. line of the Manhattan Elevated in New York City by electricity marks the opening of the largest electric generating plant which has been built up to the present time in this country. The substitution of electricity for steam locomotives involved the building and equipment of a generating plant of enormous size, the building of sub-stations for transformers and rotary converters, the installation of an elaborate transmission system, the equipment of the cars with electric motors, the construction of a lighting system for the trains, yards, platforms, offices, etc., and the use of electric motors in the company's repair shops.

The building for the central generating station is a substantial structure situated at 74th St. and East River, and was described in the "Review" for September, 1901, page 545. It will be remembered that the plant is arranged in eight generating units, each consisting of an engine and an alternator, all the units being practically independent.

The boiler equipment comprises 64 Babcock & Wilcox boilers, of 525 h. p. each, tested to carry 200 lb. working steam pressure. Roney mechanical stokers are used. Green fuel economizers, and Sturtevant blowers to furnish forced draft when needed. The most notable feature of the installation is the generating machinery, comprising eight 5,000-kw. Westinghouse alternators direct connected to Allis-Corliss engines. The accompanying illustration, Fig. 1, gives a general view of one of these units, two of which are now in operation. Each of these units has a maximum capacity of 10,000 h. p. and the electrical generators are the largest ever erected.

The steam engines, which are built after the design of Mr. Edwin Reynolds, of the Allis-Chalmers Co. consist of a pair of compound engines working upon a single shaft. The high pressure cylinders are horizontal and the low pressure vertical. The high and low pressure piston rods at each end are connected to one crank pin. The principal dimensions of the engines are as follows: Diameter of high pressure cylinders, 44 in.; diameter of low pressure cylinders, 88 in.; stroke of all pistons, 5 ft.; revolutions, 75 per minute; piston speed, 750 ft. per minute; diameter of piston rod, 8 in. The cranks are set 135 degrees apart. With this location of the crank pins the shaft receives eight impulses per revolution which makes the turning force so uniform that the revolving field of the generator suffices to take the place of the fly-wheel. This arrangement also avoids any dead center, and the engine may be started from any point without any attention being paid to the position taken by the cranks in stopping. Steam jackets are not used but the placing of the valves in the heads of the low pressure cylinders make a partial jacketing effect in these heads. The ordinary Reynolds-Corliss valve gear is employed, with a single eccentric on each high pressure cylinder and separate eccentrics for the steam and exhaust valves of each low pressure cylinder. The two sides of each unit are entirely distinct, and one can be run with the other uncoupled without reducing its efficiency. The high pressure cylinders admit steam at 150 lb. gage pressure, and from these cylinders the steam passes to receivers which are prolongations of the steam chests of the low pressure cylinders. The receivers on each side of the engine contain 773 sq. ft. of re-heating surface composed of 2-in. copper pipe through which steam at boiler pressure circulates. From the low pressure cylinder the steam exhausts through 30 in. pipes into

a 40 in. main leading to the condensers, one of which is provided for each unit.

The Westinghouse alternating current generators deliver three-phase currents at 11,000 volts which if desired, may be raised to 12,000 volts. The wave form generated is practically a true sine curve under all conditions of load and power factor, and the regulation from no load to full load is guaranteed to be within 6 per cent. The rise in temperature under full load for 24 hours is not to exceed 35 degrees C., and at 50 per cent overload it is not to exceed 55 degrees C. The efficiency at full load is 96½ per cent. The revolving parts of the dynamos are particularly designed to secure unusual strength, so as to resist the tendency to burst in case of temporary abnormal speed. The hub of the revolving field is of cast steel and the rim is carried by two webs of rolled steel. The field is 32 ft. in diameter and at 75 r. p. m., its peripheral speed equals 7,540 ft. per minute. Its weight is 370,000 lb. The machine contains 40 field poles built up of laminated steel. These are wound with copper strap on edge, one layer deep, and the insu-

FIG. 1—GENERATING SET—MANHATTAN RY.

lating material is cemented in place between the turns. The edges of the copper windings are exposed in order to facilitate the dissipation of the heat developed.

The exciting current of each alternator field is approximately 225 amperes at 200 volts and the excitation can be increased to provide for an overload of 50 per cent. These field windings are held upon the poles by copper wedges driven between the pole tips which serve to prevent the shifting of the magnetic lines of force and hence preserve constant the wave form generated. The armature consists of six castings bolted together to which a core is attached. The core is a built up ring of thin, soft steel plates with slots on the inner surface in which are placed insulated copper bars which, with their end connectors, constitute the armature coils. The plates of the armature core are separated at intervals by spaces in order to permit of thorough ventilation.

In order to produce a wave form free from irregularities at different loads a distributed winding with four armature slots per

phase per pole was adopted. This tends to avoid the production of harmonics which is of importance in view of the large capacity and self induction of an extensive system of cables and transmitting apparatus, especially where a large number of rotary converters are to be employed. Each slot contains three bars securely fastened to the end connectors. Any of these bars may be removed without disturbing the others and without moving the frame of the machine. The armature conductors are built to withstand a puncture test of 25,000 volts alternating current for 30 minutes.

Special freight cars were required for hauling the parts of these generators to New York where they were assembled for the first time. The weight of the completed machine is 900,000 lb. and its height 42 ft.

The exciting current is supplied by a battery of four 250-kw excitors of the engine type, the armature and commutator of each machine being bolted together upon a ventilated cast iron sleeve pressed upon the engine shaft. The current generated at the central station is to be distributed over the entire system of the Manhattan Ry., consisting of 37 miles of road in the boroughs of Manhattan and the Bronx. It is distributed to eight sub-stations along the road where transforming apparatus is installed to reduce the voltage to the proper pressure for use in connection with rotary converters. The sub-stations are all built upon a uniform plan

kw. and a maximum of 2,250 kw., or 3,000 h. p. Each converter is a self-contained unit, the two bearings and the lower half of the field frame being mounted upon a common base. The field frame is divided in a horizontal plane. The machine has 12 poles and if

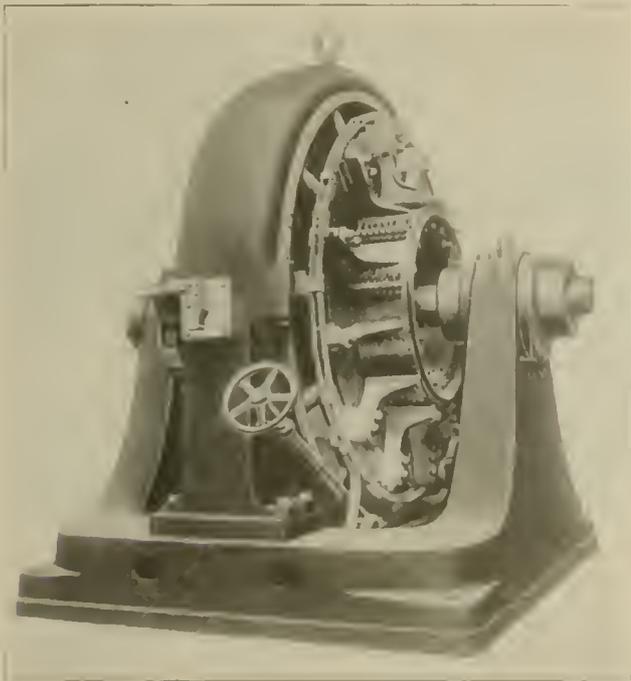

FIG. 2 ROTARY CONVERTER MANHATTAN RY.

and the general arrangement of the apparatus in all of them is similar, so that an operator familiar with one station can go on duty at any other one if required, without any special training. The rotary converters are arranged in two parallel rows and the transformers are located in groups of three upon galleries along the sides of the building. There are 26 rotaries and 78 transformers in the eight sub-stations, each rotary receiving current from a group of three 550 kw. step down transformers connected in delta, at a potential of about 390 volts.

The sub-stations are located at unequal distances from the power stations and, as they are all to be supplied with power from alternators operated in parallel, the potentials delivered by the high pressures distributing cables to the several sub-stations will differ. In order that the potential of the direct current delivered by the rotary converters should be equal, provision for changing the ratio of transformation of the step down transformers is made by means of loops brought out from the primary windings. The transformers are of the air-cooled, Westinghouse type, and motor-driven blowers are installed in each sub-station for supplying the necessary air. The guaranteed efficiency of these transformers at full load is 97 1/2 per cent. The rotary converters have a nominal capacity of 1,500

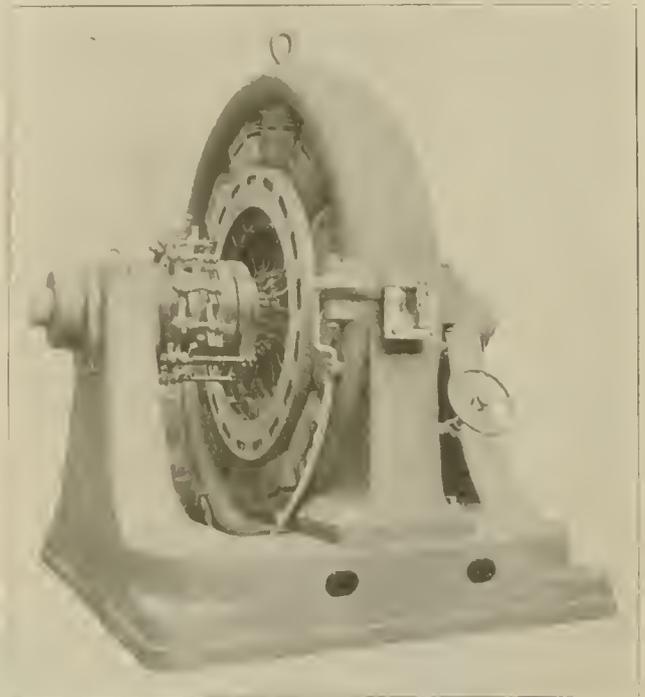

FIG. 3 ROTARY CONVERTER MANHATTAN RY.

supplied with alternating current of 25 cycles per second will operate at a speed of 250 r. p. m. The output of the converter has a normal pressure of 725 volts and the efficiency of the machine at full load is 95 3/4 per cent. The direct current and alternating current sides of this machine are shown in Figs. 2 and 3 respectively.

The converters occupy a floor space of 10x13 ft., are 13 1/2 ft. in height and weigh about 5,000 lb. each. The converters are started by means of a motor generating set one of which is installed in each sub-station and which is illustrated in Fig. 4. The method of starting by direct current derived from these starting sets rather than direct current taken from the main bus-bars at the sub-stations

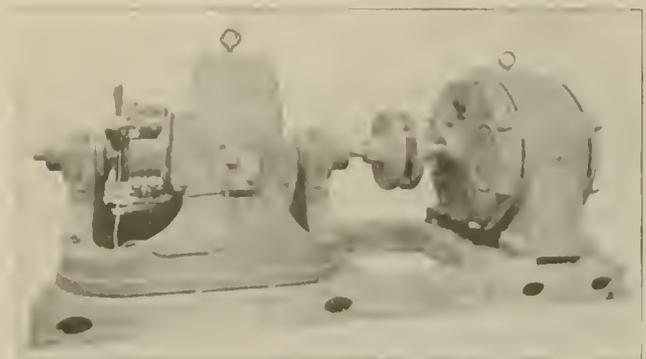

FIG. 4 MOTOR GENERATOR MANHATTAN RY.

was determined upon to avoid undue magnetic and electrical strains in the converters which may easily result from a slight mistake of the operator, such for example, as closing the synchronizing switch when the machine are not exactly in step.

The equipment of this immense plant has been accomplished without the least drawback or mishap, and the generators, which were the first of their size ever built, were assembled for the first time in New York and put into commercial service immediately, without

the slightest hitch. The installation of these large units for the Manhattan Ry. has been followed by the adoption of 5,000 kw. Westinghouse alternators for the New York subway and for Mr. Yerkes' London underground lines.

### STEAM TURBINE PLANT FOR LONDON UNDERGROUND LINES.

The largest steam turbine plant ever erected is designed for the use of the Metropolitan District Railway Co.'s station at Chelsea. These machines, which will be of the Westinghouse-Parsons type, will be of 7,000 h.p. each, and as 10 of them are to be installed, the station will have a maximum output of 70,000 h.p. Owing to the large size of these machines the very high speeds usually associated with turbines will not be required. The speed of these machines will be but 750 r.p.m. Three-phase generators of 5,000 kw. capacity each will be mounted on the turbine shafts, and these dynamos will be much smaller than would be possible if slow speed reciprocating engines were employed. They will require to have but four poles each and will be about 9 ft. in diameter.

Recent tests of steam turbines of large size show a great economy in steam consumption over engines of the reciprocating type. The economy of space, absence of vibration and absence of oil from the exhaust steam are very important advantages of these ma-

### ST. LOUIS WATER WORKS RAILWAY.

A unique electric railway, for the use of its employes only, has just been built by the St. Louis Water Works. It is a little over four miles in length and runs from Baden to the Cham of Rocks pumping station. The road is of single track construction. It is practically level, its maximum grade being but seven tenths of one per cent and about three hundred twenty five feet long. The track is laid with 60-lb. T-rails, on oak ties 18 in. between centers. The joints are of the ordinary fish-plate type. The road bed is formed of macadam and the track is ballasted with cinders. There is no pavement, and the rails are bonded with "Protected" rail bonds.

The power house is constructed of hard brick with granite and sandstone trimmings, the inside dimensions being 30 x 50 ft. The floor is laid with hexagonal silver gray encaustic tiling. This power house supplies current for the general lighting system of the three water works stations and for the machine tools in the machine shop and the cranes in the Baden pumping station as well as for the electric railway. A general view of the engine room is shown in the accompanying illustration.

The engine room contains three steam engines and one Pelton water wheel. One of the engines is a 150-h. p. single cylinder Straight Line engine made by the Straight Line Engine Co., Syracuse, N. Y., and is direct connected to a 100-kw. direct current Westinghouse generator; this is used entirely for operating the

POWER STATION AND CAR OF ST. LOUIS WATER WORKS RY.

chines, but a point of the highest importance is that with the use of three-phase currents and rotary converters at sub-stations there should be as little variation as possible in the angular velocity of the engine throughout each revolution. The phases are disturbed when this occurs, as it must to a certain extent with reciprocating engines, however carefully balanced and however heavy the fly wheels. With the turbine the shaft is turned continuously with an even force of steam acting upon its numerous blades, and for this reason variation in angular velocity is practically non-existent. The benefit of this is particularly noticeable when running alternators in parallel.

It is claimed that the speed regulation of these turbines with a fluctuating load is governed very accurately. The admission of steam is governed by a fly-ball governor in connection with a set of levers, and when running light the steam is admitted in separate puffs at distinct intervals, while under full load the steam is admitted in an almost continuous stream. It is also possible to maintain the vacuum much higher than with the reciprocating engine so that the steam works down to the extreme limit of expansion.

If the turbine should prove a success for large units a considerable change may be expected in the design of alternators, as at higher speeds the number of poles and the diameter of the machines will be greatly diminished.

The Lake Shore Electric Railway Co. will run special cars to Toledo and Cleveland to accommodate theater parties from intermediate towns. A trial of this plan has been made with satisfactory results, four special cars from Clyde, Bellevue, Fremont and Gibsonburg in one evening carrying 250 people to Toledo theaters.

electric railway. The other two engines are made by the A. L. Ide & Sons Co., of Springfield, Ill. One of these engines is a 150-h. p. tandem compound direct connected to a 100-kw. alternator. This generator is used entirely for carrying the lighting load at night, lighting all the pumping stations and water towers. The other engine is a 35-h. p. single cylinder engine direct connected to a 25-kw. direct current General Electric generator. This generator supplies current for the machine shop and the electric travelling cranes at the Baden pumping station. Direct current is generated at 575 volts and 110 volts and alternating current at 1,150 volts. The Pelton water wheel is connected directly to a 20-kw. Westinghouse alternator which supplies current for the day lighting load, which is comparatively small to the night load, as there are only a few lights used in the pump pits, basements, etc. The engines are operated condensing. They exhaust into a 12-in. vacuum oil separator, which is connected to the condenser. Each engine is supplied with a Sweet's Steam separator made by the Direct Separator Co., of Syracuse, N. Y., which company is represented in St. Louis by the Laufketter & Bendit M. E. Co.

In addition to the generators installed at Baden station, each of the other water works pumping stations are provided with an engine and generator for furnishing current for their electric travelling cranes and machine shops, and these generators are connected to the secondary wires of the lighting system and therefore can be used in case of necessity to light their respective stations and act as a relay for the main station at Baden.

The converters used are of the Westinghouse make and consist of two 15-kw. oil filled transformers, one 7.5-kw. oil filled transformer, one 5-kw. oil filled transformer and four 1-kw. and one 5-kw. dry transformers.

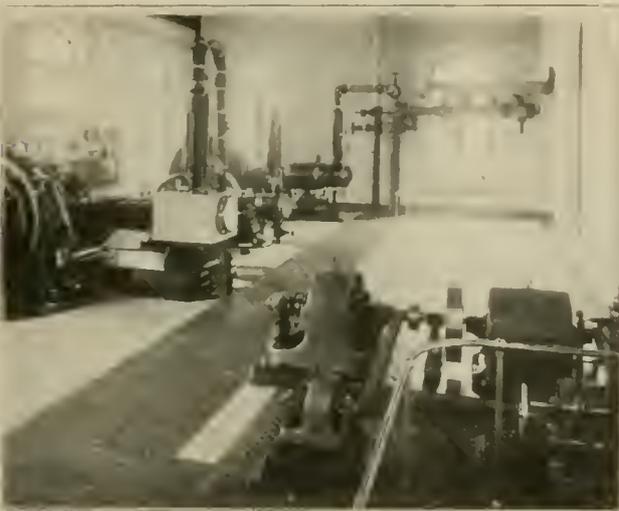

The steam for the engine in the generator house at Baden is supplied from the boiler house of the Baden pumping station. This boiler room is 60 x 167 ft., and contains eight boilers aggregating 2,400 h. p. These boilers are operated at 140 lb.

One passenger car, made by the St. Louis Car Co., is operated. The car is 43 ft. over all; inside it is 32 ft. 8 in. by 9 ft. 3½ in. and 8 ft. 2 in. high. It is mounted on the St. Louis No. 23 trucks and has M. C. B. couplers. The car has two G. E. 57 motors, Johns electric heaters, Johns and Christensen air brakes.

One conductor and two motormen are employed and are paid \$90 per month. The car travels an average distance of 42½ miles per day, and its maximum speed is 25 miles per hour. It is provided with an arc headlight, air whistles and a locomotive pilot, and has a seating capacity for forty-eight passengers. At present no persons except those connected with the water department are allowed to ride on this car without a special permit from the water commissioner, who, however, hopes to obtain authority ere long to operate the road for the benefit of the general public and to charge fares for all passengers except water works employes.

The district traversed by the road is very much in need of transportation facilities.

The car operates on a regular schedule beginning at 7 a. m., and makes five trips every day in each direction. On the two morning

INTERIOR OF ENGINE ROOM.

trip the car leaves Baden at 7.00 and 7.30, and in the afternoon at 1.45 and 4.40 and on the evening trip it leaves Baden at 9.45.

As the plant is operated in connection with the water works station, it is impossible to give any data as to the cost of operation. As no additional firemen or engineers are required, the expenses are correspondingly reduced. No repair shop is maintained exclusively for the electric railway, as the pumping station is provided with a regular machine shop where all repairing will be done.

There is one car house, which is a temporary wooden building, in which, however, no men are especially employed, as the motorman and conductor have charge of the general cleaning and care of the car.

The entire water works system of the city of St. Louis to which this road belongs is in charge of Mr. Edward Flad, water commissioner. The construction department, under supervision of which the line work of the railway was done and the engines, piping, etc. installed is in charge of Mr. Nils Johnson, mechanical engineer, Mr. S. B. Russell, in charge of the water works extension department, attended to the design and construction of the station building.

The Belpre, Delavan Lake & Janeville Electric Railway Co. has completed a bridge across the Rock River at Janeville. A similar bridge is in course of erection at Beloit; the grading for the electric line between Janeville and Rockford is finished and it is expected to have the road open for traffic by April 1st.

## MERIT SYSTEM IN DETROIT.

Jan. 1, 1902, the merit system of disciplining trainmen was put in force on the Detroit United Ry.; this is what is well known, by name at least, to the majority of our readers as the Brown system. The object is to avoid so far as possible suspensions with consequent loss of pay, which so often work a severe hardship to well-meaning employes, in administering discipline, and substitute marks of merit and demerit which will stimulate and encourage the employes in the faithful and intelligent performance of their duties, while the record shows the company how each individual is doing.

The Detroit United Ry. is, we believe, the first street railway to adopt this system, though it is in force on some of the large steam railroads. Naturally the time is too short for the Detroit company to pass definitely on the value of this system, but the general superintendent, Mr. A. H. Stanley, informs us that so far it has exceeded his best expectations. Almost without exception the men started at the first of the year with the determination to try to keep a perfect record and it is believed that a large per cent of them will succeed in doing so.

The general idea of the system is to give merit marks to the men for rewards and demerit marks by way of punishment. One of these marks offsets the other, as for example, a man receiving one or more demerit marks for some infraction of the company's rules can clear up his score by good conduct which entitles him to an equal number of merit marks. A special record of all conductors and motormen is kept and all discipline imposed is shown thereon and credit given for excellent conduct, deeds of heroism, loyalty, etc., and these credits are given full consideration in connection with charges entered against any conductor or motorman. This record is a private one and is not open to any one except the man concerned.

For every 12 consecutive months of service free from demerit marks or free from the necessity of imposing a reprimand 10 marks will be deducted from any that may have previously been entered against an employe's record. When 60 marks are entered against the record of any employe his services will be dispensed with. On January 1st of each year the names of each conductor and motorman who has gone through the previous year with a perfect record will be posted at each of the car houses. Each employe will be afforded an opportunity for appealing against the decision regarding the number of demerit marks imposed, but such appeal must be made to his division superintendent within 10 days after receipt of notice. These notices are sent out on a printed blank addressed to the conductor or motorman stating the number of merit or demerit marks which have been entered against him and the reason therefor. The notice is signed by the general superintendent, and each one contains a serial number. At the bottom of this form is a perforated strip on which the recipient of the latter acknowledges the receipt of the notice and then forwards it to the company. These notices insure that each employe is kept correctly informed of the condition of his record.

Record bulletins are issued weekly, and are posted at all of the car houses on special bulletin boards, giving a brief account of each case which has resulted in discipline or commendation, giving the number of marks assigned but omitting all reference which would identify the person in question. These bulletins are educational in effect as they point out the acts of the employe which the company either censure or blame. The following items are taken from bulletins issued during January and serve to illustrate the manner in which the merit system is carried out.

"A motorman on the Jefferson division has been given 10 merit marks for excellent work in bringing his car to a stop to avoid colliding with a wagon which was carelessly driven on the track directly in front of him."

"A motorman on the Michigan division has been given 10 merit marks for turning into the office a \$10 bill which a passenger dropped in the vestibule of his car."

"A motorman on the Sherman division has had 5 demerit marks taken from his record which were given him for sliding onto a street railway crossing. He made a satisfactory explanation."

"A motorman on the Jefferson division has been given 20 demerit marks for colliding with a Jefferson car at the water works. He came to a stop at the switch, closed the same and started up at a good speed, paying no attention to a Jefferson car which was just

crossing the tracks ahead of him. He collided with the car, badly damaging both."

"A conductor on the cross town division has been given three demerit marks for neglecting to get a supply of transfers and borrowing some from another conductor."

"A motorman on the Brush division has been given five demerit marks for not coming to a stop before running over a street railway crossing."

The items quoted herewith serve to show the employes what actions and line of conduct will be approved by the company and also what they should avoid. These bulletins teach the men how, by a little judgment and forethought, immeasurable benefit results to the service. The system also teaches the men that their positions depend entirely upon themselves, as every one is given an opportunity to redeem himself any time he gets into trouble through negligence. By this system the man is either kept continuously in service or dropped entirely and it prevents what has sometimes been the case in the past, namely, a good man developing into a roustabout by hanging around saloons during a period of suspension varying from 30 to 60 days.

### ANNUAL MEETING AND DINNER OF NEW ENGLAND STREET RAILWAY CLUB.

The second annual banquet of the New England Street Railway Club, held at Hotel Brunswick, Boston, Thursday evening, Jan. 23, 1902, was attended by nearly 300 guests and members, including railroad commissioners of several states, the governor of Rhode Island, the lieutenant-governor of Massachusetts, senators and statesmen, electrical engineers, and street railway men in the foremost rank of electric transportation affairs in New York and New England.

The gathering began at 6 o'clock in the parlors of the hotel, where an informal and very delightful reception was held until 7:15. The members and guests then started for the banquet hall, where the 20 or more invited guests were escorted to the head table and enthusiastically cheered by the long rows of members lined up along the several tables.

When the excellent menu had been thoroughly discussed and approved the chairs were pushed back, and while the cigars were going around President H. E. Bradford called for order and opened the business meeting. Reports of the secretary and treasurer showing the affairs of the club to be in excellent condition were accepted and approved; 19 new members were voted to membership; and the annual election of officers was then held, resulting as follows:

President, Edward C. Spring, superintendent Newton & Boston and Wellesley & Boston Street Rys., Newtonville

Vice-president, E. E. Potter, general superintendent Union Street Railway Co., New Bedford.

Vice-presidents for states—C. A. Bodwell, Sanford & Cape Porpoise Railway Co., Sanford, Me.; H. A. Albin, superintendent Concord Street Railway Co., Concord, N. H.; A. J. Crosby, superintendent Springfield Electric Railway Co., Springfield, Vt.; W. D. Wright, superintendent of equipment, Union Railroad Co., Providence; J. S. Thornton, superintendent People's Tramway Co., Putnam, Ct.

Secretary and treasurer, J. H. Neal, chief of department accounts, Boston Elevated Ry.

Executive committee—E. C. Spring, Newtonville; E. E. Potter, New Bedford; H. O. Farrington, master mechanic, Boston & Northern Street Ry., Chelsea; E. J. Rauch, master mechanic, Old Colony Street Ry., Brockton; A. J. Purinton, manager Springfield & Eastern R. R., Palmer; W. F. Ellis, civil engineer, Boston; J. F. Stone, manager Boston office Electric Storage Battery Co., Boston

Finance committee—J. F. Wattle, secretary, Rand Avery Supply Company, Boston; William Pestell, superintendent motive power, Worcester Consolidated Street Ry.; Paul Winsor, Boston Elevated Ry.

The officers elect thanked the members for the honors conferred and Mr. E. E. Potter, of New Bedford, Mass., was introduced as toastmaster for the evening. Governor Kimball, of Rhode Island, the first speaker, put the club in good humor with a witty speech in which he took occasion to criticize in a friendly way some of the practices of street railway managers. Senator Blodgett, of Leominster, followed and said he believed the street railway interests

have done more to develop the resources of the state of Massachusetts than any other one interest. Mr. Henry M. Putney, of Manchester, N. H., Railroad Commissioner E. L. Freeman, of Rhode Island, and others, told some good anecdotes, and the toastmaster then called upon several of the street railway men present for remarks. Among the speakers were Col. N. H. Heft, H. H. Vreeland, of New York, A. D. Claffin, G. W. Bishop, C. Tracey Rogers, of Binghamton, N. Y.; Daniel Brady, and others.

The Hyde Park Glee Club, composed of 24 singers, and an orchestra rendered catchy and popular selections between the speeches.

Mr. Edward C. Spring, the new president of the club, is superintendent of the Newton & Boston Street Ry. and Wellesley & Boston Street Ry., and has held similar positions with the Norfolk Suburban, Norfolk Western, and Medfield & Medway street railways. His experience in electric work, extending over 15 years, starting with the Thompson-Houston Company, has brought him in close contact with the electric fraternity in the East. Mr

J. H. NEAL.

Spring has developed a successful scheme for rewarding faithful employes, which was outlined in the "Review" for Dec. 15, 1901, page 901.

Mr. James H. Neal, who has been re-elected secretary and treasurer of the club, has been associated with the transportation system of Boston since 1888. He is the inventor of the Neal headlight and the Neal brake and is also an expert accountant, having given special study to the problems arising in street railway accounting work.

### BRIDGE FALLS AT INDIANAPOLIS.

January 16th the center span of the iron bridge over White River on Washington St., Indianapolis, gave way, and a street car, filled with employes of the road, and four two-horse gravel wagons were precipitated into the river 30 ft. below the level of the bridge. The car fell in about 5 ft. of water on one of its sides and the men inside broke out the window lights and crawled to a position of safety on top of the car. Two of the horses were drowned and two of the others so badly hurt that they had to be killed. Fortunately none of the passengers or drivers was seriously injured.

The bridge was pronounced unsafe about a month previous to the accident and the city commenced repairs. It was opened for traffic on the day of the accident at which time the city engineer examined it and stated that it would last for 10 years. Three hours after this the center span collapsed.

### NEW COMPANY TO OPERATE NEW YORK SUBWAY.

A new company has just been organized to operate the New York Rapid Transit subway now under construction, and the organization of the company has been completed with the exception of filing the corporation papers. Its capital stock will be \$25,000,000. It is necessary to obtain the consent of the legislature to permit Mr. John D. McDonald to transfer his contract to operate the tunnel to the new corporation. Mr. August Belmont, who has been prominent in financing the subway, will be at the head of the new corporation.

### FIRE AT PATTERSON, N. J.

In the early hours of Sunday, February 9th, the city of Paterson, N. J., was visited by fire which swept over 20 city blocks in the heart of the business and residential districts, destroying six bank buildings, six churches, many public buildings, including the city hall, the public library and several schools, nearly a dozen important office buildings, the two largest department stores in the place, the car barns of the Jersey City, Hoboken & Paterson Street Ry., and over 500 private residences and smaller buildings. Conservative estimates made two days after the disaster place the total loss at approximately eight million dollars; a large percentage of which is covered by insurance.

As is frequently the case in widespread conflagrations of this kind, the exact cause of the fire is not definitely known. The flames were discovered shortly after midnight of Saturday, and, according to all newspaper accounts, originated in the car barns of the Jersey City, Hoboken & Paterson Street Railway Co. on Broadway, which are used for storing cars and making light repairs. President David Young, of the street railway company, strongly doubts the truth of this, and on last Monday made the following statement: "From the investigations I have made I understand that the fire did not start in the car sheds. In the first place, there is no wiring of any kind in the sheds and no cars

RUINS OF CAR BARNS—PATERSON, N. J.

are run into the sheds with fires going. The fires are always dumped before they are run into the sheds. Besides, the place where the fire was first seen in the car sheds was occupied by cars that have been there for several weeks awaiting repairs. The attention of our night dispatcher was called to the blaze first, and it came at that time from a building adjoining the car sheds."

Before the dispatcher could send the alarm the south end of the building was all aflame. Seven double truck cars and two sweepers were destroyed, but the men at the barns succeeded in saving part of the rolling stock. The fire at first did not seem to be a serious one and was confined to the car barn property, but a high wind which increased in intensity toward daylight carried sparks and firebrands in different directions and soon a dozen fires had broken out within a radius of two or three blocks. The city fire department found itself unable to make any headway with the flames, and fire companies and apparatus were summoned from Jersey City, Newark, Passaic, Rutherford, Hoboken and other nearby cities, but before the flames were finally subdued a tract of land nearly a mile long and two blocks wide had been devastated.

A somewhat remarkable feature of the catastrophe is that it was singularly free from loss of life. No one perished in the flames and comparatively slight injuries and burns to firemen were the only casualties reported.

The Jersey City, Hoboken & Paterson Street Railway Co., in addition to its car house and rolling stock mentioned, lost a quantity of feed and trolley wire and most of its line poles in the district burned. It was able to maintain its service on parallel lines, however, and a line crew was at work erecting new poles before the ruins on either side of the street had ceased to smoke. The company's total loss is estimated at about \$60,000. The accom-

panying half-tone is from a photograph taken the morning after the fire and shows all that was left of the car house.

January 15th, fire destroyed the power house and car barns of the City Electric Railway Co., of La Salle, Ill., together with 12 of the company's cars. The loss approximated \$60,000.

The car house of the Indianapolis Street Railway Co. and 10 cars were destroyed by fire, February 4th, entailing a loss of \$30,000.

### MARINETTE AND MENOMINEE LINES CONSOLIDATE.

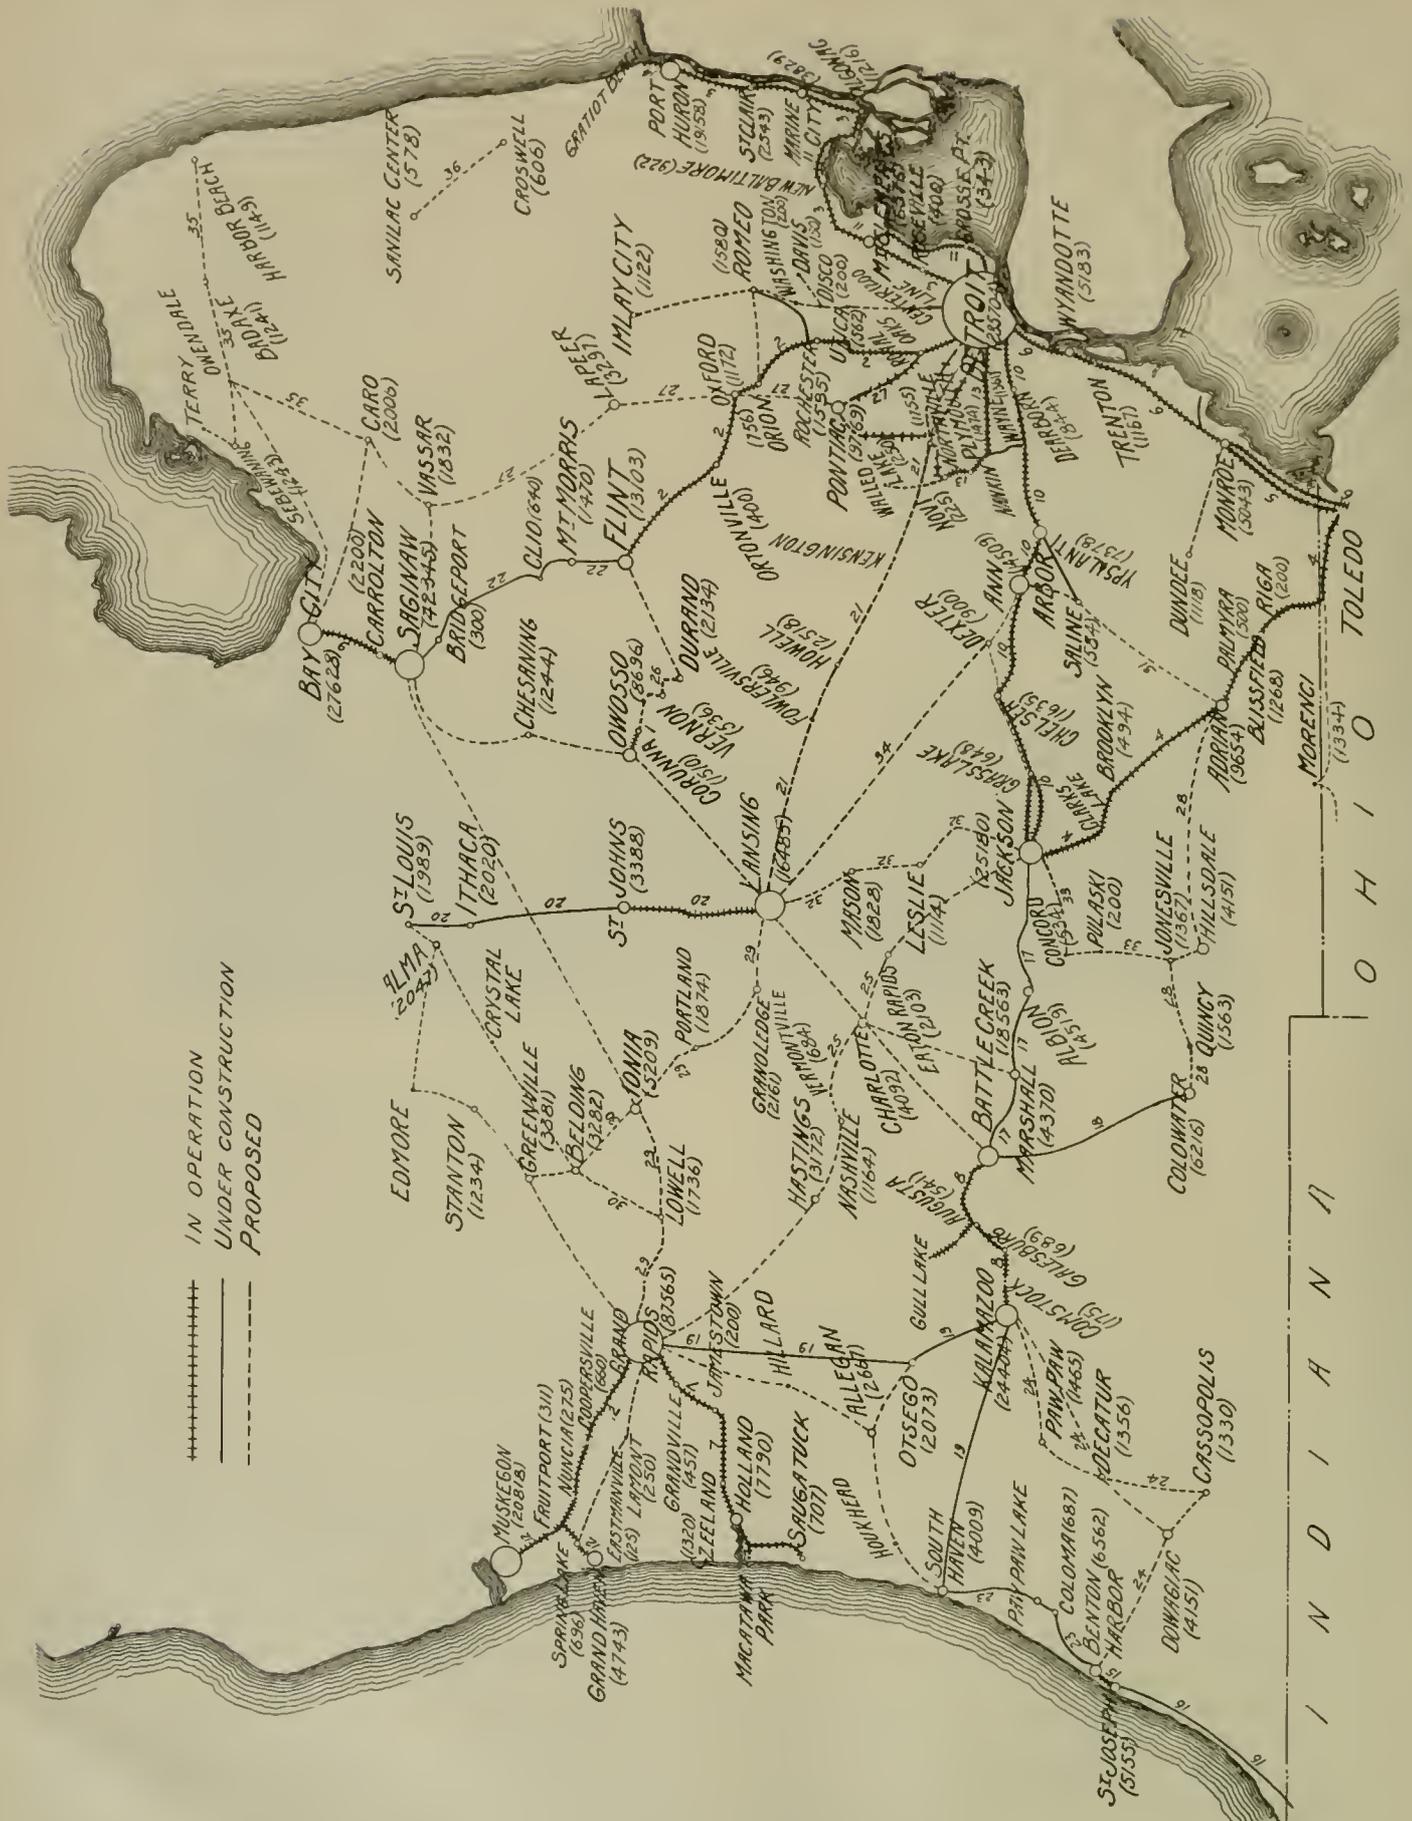

The consolidation of the Marinette and Menominee street railways was effected early this month by the purchase of the majority interest of the Marinette lines by parties already controlling the Menominee road. Mr. Edwin Daniell, general manager of the Menominee company, will be made general manager of the consolidated companies. It is probable that two months will elapse before cars will run from one city into the other, as some new track will have to be laid, but a one fare rate will go into effect at once on the two street railway lines and transfers will be used at the bridge connecting the two cities. The new company expects to spend

about \$100,000 in improvements this year. New track will be laid and new cars added to the systems, and ultimately both lines will be run by water power from Chappie Rapids. Work will be commenced this spring on construction of a belt line around the two cities.

### WORN NICKELS HELD TO BE GOOD.

A passenger on the St. Louis Transit Co.'s line was ejected from a car, arrested and locked up over night because he tendered a worn coin in payment of his fare. He subsequently brought suit against the company for damages and was awarded \$2,000. Judge Ryan in the circuit court in reviewing this case stated that there was no such thing as assumed by the defendant as a nickel of less than full face value. A gold coin might be worth less than its face value because of abrasion and loss of weight, but this is not true of the nickel. It is better that the conductor, if in doubt, should receive the coin than to establish a rule which would permit him to eject the passenger who tenders a good coin and then plead as an excuse that he thought it was bad. In this case the plea does not go so far, as the conductor only rejected the coin because it was smooth. His act is considered merely capricious, and the amount of the verdict was not considered excessive in view of the hard treatment of the plaintiff.

The Michigan West Shore Traction Co. has obtained an extension of its franchise through South Haven until July 1, 1902, by which date the road is expected to be completed to Benton Harbor and St. Joseph.

ELECTRIC RAILWAYS OF SOUTHERN MICHIGAN.

**INTERURBAN ROADS IN SOUTHERN MICHIGAN.**

The remarkable growth of electric railways in the southern part of the state of Michigan is illustrated in the accompanying map, which shows the lines already in operation, those under construction and those which are proposed and for which franchises have been secured. The various roads on the map may be identified by their respective numbers, and the populations of the cities through which they pass are also shown on the map. The towns are shown by circles, the area of which is proportionate to the population. The following suburban roads are in operation:

1. Owosso & Corunna Electric Ry. This road goes to the cities named and an extension is proposed to Flint via Vernon and Durand.
2. Detroit, Rochester, Romeo & Lake Orion. (Detroit United Ry., Everett-Moore.)
3. Rapid Railway Co. (Detroit United Ry.)
4. Toledo, Adrian & Jackson Ry.
5. Toledo & Monroe Ry. (Everett-Moore.)
6. Detroit & Toledo Shore Line Ry. (Everett-Moore.)
7. Grand Rapids, Holland & Lake Michigan Electric Ry.
8. Michigan Traction Co. (From Kalamazoo to Battle Creek.)
9. Saginaw and Bay City Interurban. (Saginaw Valley Traction Co.)
10. Detroit, Ypsilanti, Ann Arbor & Jackson Ry. (Hawks-Angus.)
11. Detroit, Mt. Clemens & Marine City. (Detroit United Ry.)
12. Grand Rapids, Grand Haven & Muskegon Ry.
13. Detroit, Plymouth & Northville Ry. (Detroit United Ry.)
14. Port Huron, Gratiot Beach & Electric Ry. (Detroit United Ry.)
15. St. Joseph & Benton Harbor Electric Street Ry.

**ROADS UNDER CONSTRUCTION.**

16. Indiana Railway Co., South Bend, Ind. (From South Bend, Ind., to St. Joseph, Mich.)
17. Calhoun County Ry. (From Battle Creek to Jackson.)
18. Battle Creek & Coldwater.
19. Grand Rapids, Kalamazoo & South Haven Traction Co.
20. Lansing, St. John & St. Louis Electric Ry. This road is now operated by steam power temporarily between Lansing and St. Johns.
21. Detroit, Howell & Lansing Ry.
22. Saginaw Suburban Ry. (To run between Saginaw and Flint.)
23. Michigan West Shore Traction Co. This road extends from Benton Harbor to South Haven.

**PROPOSED SUBURBAN ROADS.**

24. Kalamazoo Traction Co. To run from St. Joseph to Benton Harbor and Kalamazoo
25. Central Michigan Traction Co. To run from Vermontville to Charlotte and Eaton Rapids.
26. Corunna & Durand This is an extension of the present line between Owosso and Durand.
27. Detroit, Pontiac, Lapeer & Northern Ry.
28. Adrian & Coldwater Ry.
29. Lansing & Grand Rapids Ry.
30. Grand Rapids to Belding, Lowell and Ionia
31. Detroit, Ann Arbor & Adrian.
32. Jackson & Lansing
33. Jackson to Coldwater
34. Dexter to Lansing.
35. Caro to Lake Huron.
36. Detroit, Le Roy & Samlar Center

**CHASE-SHAWMUT CO.**

We are very glad to be able to announce that while the recent fire in the factory of the Chase Shawmut Co., 390 Atlantic Ave., Boston, was a serious one, the company is rapidly getting affairs into shape again and is filling orders for Shawmut face and flexible road bonds. The branch of the business was not greatly interfered with and bond orders can be filled at short notice.

**FINANCIAL.**

**METROPOLITAN STREET RAILWAY CO.**

It is announced that a new company with which Messrs. Whitney, Widener and Elkins are prominently identified has been formed to lease the Metropolitan Street Railway Co., of New York. The new organization will be incorporated so as to permit it to hold the stock of any corporation. Its capital will be \$30,000,000, which may be increased as required. According to current reports it is not the purpose of the company to attempt to effect a consolidation of the other New York systems, such as the Manhattan and the Brooklyn Rapid Transit, but such a merger is hoped for ultimately. The money raised will be used to convert 100 miles of horse railway lines to the interurban trolley system to conform to the construction of the greater part of the city's lines. An annual dividend of 7 per cent on the Metropolitan stock will be guaranteed by the new company and the present Metropolitan stockholders will have a right to subscribe \$20,000,000 of the new capital at par to the extent of 45 per cent of their present holdings. It appears, therefore, that the object of the new company is to lease the Metropolitan so as to enable the present interests to retain control of the property without making very heavy outlays on their part, as if new Metropolitan stock were issued for \$30,000,000 the controlling interests would have to take their share of it or stand in danger of losing their control. It is announced that the entire new issue of capital has been underwritten by Kuhn, Loeb & Co., of New York.

**BROOKLYN RAPID TRANSIT CO.**

The comparative statement of operation for the months of November and December, 1901 and 1900, given herewith, show an increase in operating expenses of the company which is said to be due to the policy of using net earnings to pay the cost of improvements on the road.

	Nov. 1901.	Nov. 1900.	Dec. 1901.	Dec. 1900.
Gross receipts.	\$907,812.74	\$642,018.06	\$9,534,045.05	\$6,137,956.45
Expenses . . . . .	730,839.79	627,959.44	4,515,871.12	3,902,051.76
Net receipts . . . . .	266,972.95	314,058.62	2,018,173.93	2,235,904.69

The gross receipts are increasing at a satisfactory rate and while the policy of the company has disappointed those who were expecting dividends it will inspire confidence in the ultimate value of stock as an investment providing that the gross earnings continue to show a gain. The annual meeting of the company was held January 31st, but was entirely uneventful. The retiring board of directors was re-elected.

The Brooklyn Heights Railroad Co., of which Mr. C. D. Meneely is secretary and treasurer, requests us to make the following announcement:

Beginning with the month of February, 1902, the Brooklyn Heights Railroad Co. until further notice will guarantee Brooklyn Union Elevated 4 and 5 per cent bonds and Kings County Elevated 4 per cent bonds on three days in each month.

Bonds will be guaranteed on the following dates: February 24, 1902; March 7, 17 and 28, 1902; April 4, 14 and 25, 1902; May 2, 12 and 23, 1902; June 3, 13 and 23, 1902; July 1, 11 and 21, 1902.

**THE TWIN CITY RAPID TRANSIT CO.**

The annual report of the Twin City Rapid Transit Co. for 1901 was issued January 17th last, and shows the company to be in a most prosperous condition. The physical condition of the property has been greatly improved as evidenced by an increase of 41 per cent in the cost of maintenance of way and 2 per cent in the cost of equipment. The gross earnings for the fiscal year ending Dec. 31, 1901, were \$3,173,975, an increase of 11.79 per cent and the net earnings were \$1,758,524, or an increase of 14.59 per cent over the year 1900. The operating ratio for 1901 was 48.35 per cent of the gross earnings as compared with 49.16 per cent for the preceding year. This covers all charges, including taxes, except interest. On May 1, 1901, the company cancelled \$20,000 of the \$270,000 7 per cent first mortgage bonds of the Minneapolis Street Railway Co. by the issue and sale of \$20,000 5 per cent consolidated bonds of the same company.

The company has expended during the year \$646,746 for various improvements. It has built forty 44-ft. cars each equipped with four motors. It has also increased the equipment on forty other 44-ft. cars and has expended \$185,322 in paving streets in connection with its tracks in both Minneapolis and St. Paul. The following table shows the statement by months of the gross earnings of the company.

	Passenger Earnings.	Miscellaneous Earnings.	Total Earnings.
January	\$234,445.95	\$1,828.65	\$236,274.60
February	213,883.95	1,695.68	215,579.63
March	240,637.35	1,576.27	242,213.62
April	230,454.00	1,789.87	232,243.87
May	249,862.80	2,082.71	251,945.51
June	276,614.35	2,661.76	279,276.11
July	288,336.00	2,312.72	290,648.72
August	281,224.05	2,364.98	283,589.03
September	306,469.70	1,923.80	308,393.50
October	269,193.35	1,759.60	270,952.95
November	266,800.05	1,717.00	268,517.05
December	292,576.30	1,764.06	294,341.26
<b>Total</b>	<b>\$3,150,497.85</b>	<b>\$23,478.00</b>	<b>\$3,173,975.85</b>

The tabulated statement of receipts and expenditures for the year 1901 are as follows:

Passenger earnings	\$1,150,497.85
Miscellaneous	23,478.00
<b>Total earnings</b>	<b>3,173,975.85</b>
Total operating expenses	1,415,451.70
<b>Net earnings from operation</b>	<b>1,758,524.15</b>
Interest on debt and taxes	666,537.75
<b>Surplus applicable to dividends</b>	<b>1,091,986.58</b>
Total dividends	810,400.00
Transferred to surplus	281,486.58
Operating ratio	44.60
Operating ratio (including taxes)	48.35

**NORTHWESTERN ELEVATED RAILROAD CO.**

The annual report of the Northwestern Elevated, Chicago, as published February 17th, shows the road to be in excellent financial condition. The earnings applicable to stock amount to \$159,287, or 3.18 per cent on the preferred stock. The increase in taxes amounting to \$50,000 over the previous year and the expenditure on the property reduced the net earnings considerably. The income account is as follows:

Passenger earnings	\$1,016,186
Other earnings, including loop net earnings for 4 months	84,676
<b>Total earnings</b>	<b>\$1,100,863</b>

**Operating Expenses.**

Maintenance of way and structure	\$*26,747
Maintenance of equipment	28,993
Conducting transportation	267,578
General expenses	52,820
	<u>376,140</u>

**Total net earnings** .....\$ 724,723

**Charges.**

Loop account	\$101,635
Taxes	78,580
Interest on bonds	385,220
	<u>565,435</u>

**Surplus for year**.....\$ 159,287

Ratio of operating expenses to earnings, including maintenance reserve .....36.26 per cent  
 Ratio of operating expenses, maintenance reserve, loop account, and taxes to earnings.....53.64 per cent

President Buckingham in his report to the trustees stated that the management has been engaged in planning for the proposed extensions to Ravenswood and Evanston. Negotiations have been

\*Includes \$15,000 which has been set aside in monthly installments, in cash, for betterments and maintenance of structure.

under way for some time with the St. Paul road for its Evanston branch but no basis for final settlement has been reached as yet. Regarding the Ravenswood branch the management has made estimates of the cost and has gone over the ground thoroughly. From some figures which have been given out recently it appears that to improve the St. Paul's Evanston branch on the elaborate scale proposed some time ago would involve an expense of at least \$3,500,000. While final statements are still lacking, it appears improbable that the management will undertake so great an increase in the road's capital investment at this time, particularly in view of the fact that elevated railroad property will be taxed pretty heavily in the future. Instead of operating an elevated track for this extension it seems much more probable that when this Evanston branch is secured that an incline to the present elevated structure will be built similar to that on the Lake Street road at a comparatively moderate outlay.

**SOUTH SIDE ELEVATED RAILROAD.**

The annual report of the South Side Elevated, of Chicago, for the year ending 1901 shows the net earnings were somewhat less than the previous year owing to the larger taxes due, to the settlement of an accumulation of damage cases and the cost of maintenance of storage batteries. The policy of the company has been to keep the structure, roadway and cars in the best state of repairs. A mile of new rails was laid during the year, nearly three miles of guard rails have been renewed and a large number of ties replaced. About one-third of the structure was painted. The company desires to extend its lines into the southern wards of the city and the first and essential step towards this development is the third track on the north half of the road, without which the cars employed on the new lines could not be handled satisfactorily. Progress has been made toward obtaining authority to construct this track.

The comparative statements of earnings and expenses for the years 1901 and 1900 are as follows:

Total operating earnings	\$1,362,231
Less operating expenses	844,960

**Net earnings** .....\$ 517,271

Deduct interest on bonds	\$ 33,750
Deduct dividends on capital stock	357,955
	<u>391,705</u>

**Surplus for year 1901**.....\$ 125,566

**Earnings.**

	1901.	1900.
Passengers	\$1,316,000	\$1,249,543
Other earnings	45,646	35,560
Miscellaneous	576	1,524
	<u>\$1,362,231</u>	<u>\$1,286,638</u>

**Expenses.**

Maintenance of way and structure	\$ 74,498	\$ 44,844
Maintenance of equipment	105,279	106,684
Conducting transportation	361,619	333,113
General expenses	141,201	100,188
Loop rental and expenses	162,360	163,571
	<u>\$ 844,960</u>	<u>\$ 748,402</u>

**LAKE STREET ELEVATED RAILROAD.**

The annual report of the Lake Street Elevated R. R., Chicago, for the year 1901 was presented at the annual meeting of the stockholders held January 14th and showed a gain of \$28,508, or about 4 per cent in the gross earnings of \$18,370 or nearly 5 per cent in net earnings. The charges, however, were somewhat increased so that the surplus over all was only \$6,204. A number of valuable improvements in the property were made during the year, but the cost of these improvements, of course, increased the indebtedness of the road, which is not in a satisfactory condition. Its first mortgage and debenture bonds draw 5 per cent interest, while the other Chicago elevated roads have put their funded debt on a 4 per cent basis, leaving the Lake Street at a disadvantage in this respect.

The comparative statement of earnings for several years is shown in the following table:

Year ending Dec. 31.	1901.	1900.	1899.	1898.
Whole number passengers..	15,304,038	14,017,343	.....	.....

\*Decrease.

TORONTO RAILWAY CO

The annual meeting of the stockholders of the Toronto Railway Co. was held on January 15th and the financial statement for the year was considered highly satisfactory. The report shows that the gross earnings amount to \$1,661,017 as compared with \$1,501,001 of the previous year, making an increase of \$160,016. The statement shows net profits of \$510,726, out of which two quarterly dividends of 1 per cent each for the first half and two quarterly dividends of 1 1/4 per cent each for the last half of the year were declared, aggregating \$270,000, thus leaving a surplus of \$172,726

after deducting pavement charges paid to the city. The comparative statement of earnings of 1900 and 1901 is as follows:

	1901.	1900.	Increase.
Gross earnings .....	\$1,661,017.50	\$1,501,001.28	\$160,016.22
Operating expenses .....	857,612.10	775,980.82	81,631.28
Net earnings .....	803,405.40	725,020.46	78,384.94
Passengers carried .....	39,848,087	36,061,867	3,786,220
Transfers .....	13,750,938	12,579,704	1,179,334
Operating ratio .....	51.6 per cent	51 per cent	0.6 per cent

WOODSTOCK, INGERSOLL & THAMES VALLEY ELECTRIC RY.

The board of directors of this road held a meeting January 18th, after 6 months' operation of the road to Ingersoll, and the treasurer's report of operation during this time shows that the road has been successful beyond the expectation of its promoters. After setting aside the money to pay interest on the bonds for the 6 months out of the net earnings from operation, the directors declared a dividend of 2 1/2 per cent on the \$100,000 of preferred stock for the past 6 months. A considerable balance out of the net earnings still remains in the treasury and the showing is considered remarkable, as no special efforts to attract traffic were made. The company is looking forward to a very successful summer season, as the best attractions are to be offered at its summer park at Beachville, and it is expected that the receipts will be very materially increased. The officers of the company are: J. G. Wallace, president; W. H. Armstrong, secretary and treasurer, and Mr. Ickes, general manager.

WAUPACA ELECTRIC LIGHT & RAILWAY CO.

In accordance with the requirements of law upon which the taxation of property in Wisconsin is based, Mr. Irving P. Lord, general manager of the Waupaca Electric Light & Railway Co., has filed sworn statements of the gross receipts of the company for 12 months immediately preceding Dec. 1, 1901. The total gross receipts of the company amount to \$15,778 as against \$12,756 for the year preceding, making an increase for the past year of \$3,022. The gross receipts for the railway department for 1901 were \$8,416 and for the year 1900, \$6,115. It is stated that the operating expenses have been decreased about 10 per cent during the past year.

SCHUYLKILL TRACTION CO.

The annual meeting of the Schuylkill Traction Co. and its underlying street railway companies were held January 13th, at which its first detailed annual report was presented. The report was as follows:

Cash January 1, 1901.....	\$ 5,012.00
Gross income from operations.....	140,006.93
And from all other sources.....	63,147.95
	\$208,257.87

Total expenditures:	
Operating expenses, including interest on loans, etc. ....	\$ 60,748.84
Maintenance and repairs.....	13,724.27
Betterments and new equipment.....	56,398.80
Interest on bonds.....	32,286.50
Reduction of loans.....	18,129.30
Reorganization expenses and payment of tax arrears....	12,773.77
Cash balance December 31, 1901.....	5,196.30
	\$208,257.87

The net income from operation after payment of operating expenses and maintenance of property was \$56,623, leaving net, after the payment of all interest, \$623,337. These are the largest gross receipts in the history of the company, while at the same time they are the largest expenditures for improvements and the largest net earnings heretofore made.

Mr. E. W. Farnham, president and general manager of the Rapid Traction Construction Co., Marquette Bldg., Chicago, has recently returned from New York, and reports that he is negotiating for the equipment of some 800 miles of track with the Farnham third rail system.

### HALF FARES.

Nineteen cars on the interurban line between Muskegon, Mich., and Fruitport have been equipped with Westinghouse air brakes.

The Union Traction Co. of Indiana is erecting a bridge between Jonesboro and Gas City. The structure will rest on the abutments of the bridge that was burned some time ago.

The Des Moines (Ia.) City Railway Co. has installed a new Allis-Corliss 2,400 h. p. engine at its power house and has completed a number of improvements of its property at a total cost of \$270,000.

Mr. S. W. Owen, of Norwalk, O., is interested in organizing a company to build the long contemplated electric line between Norwalk and Tiffin. Arrangements for financing the project have been effected.

T. M. Solomon, an American citizen, and J. Santos Ramirez, of Nicaragua, have been granted by the government of Nicaragua a concession for installing electric lighting systems at Managua, Masaya, Granada and Leon.

The case of the Mechanics' Saving Bank of Providence, R. I., against the Lincoln (Neb.) Traction Co. to restrain it from selling six street car tickets for 25 cents, will come up for trial in the Federal Court within 90 days.

Work will be begun, March 1st, on the Cincinnati Traction Co.'s, 14-story office building which will be one of the handsomest and most modern in Ohio. It is expected to be completed by January next at a cost of \$700,000.

The Colorado Springs Rapid Transit Railway Co. has completed a number of extensions of its system in Colorado Springs, and begun the erection of a new station at the Dixon Park terminus of the line to North canon.

The Schenectady Railway Co. is building a new iron bridge across the Mohawk River in order to run its cars to Sciota. The old bridge has been moved four ft. four inches to make room on its abutments for the new structure.

The Connellsville (Pa.) Suburban Street Railway Co. has sold its buildings to the Pittsburg, McKeesport & Connellsville Railway Co., the purchase including a three-mile line, a power house and lighting plant and a pleasure park.

The electric railways of El Paso and Juarez were opened to the public on Saturday, January 11th, with an appropriate celebration. Cards of invitation were issued by the company and a large number of guests made the initial trip in special cars.

A plan for equipping Chicago street cars with firebox keys in order that the conductor, motorman or any passenger may in an emergency turn in a fire alarm with all possible dispatch, is under consideration and meets the approval of the fire marshal.

The Houghton County Street Railway Co. of Hancock, Mich., has experimented satisfactorily with the construction of portable fences along its right of way for the purpose of keeping the snow from the track. The fences proved particularly serviceable in the cities.

The Oakland (Cal.) Transit Co. has reduced the fare between Oakland and San Leandro from 15 cents for a single trip or 25 cents for a round trip to a 10-cent fare in each direction. Important changes have also been made in the system of commutation fares.

There was a bad accident on the line of the Lake Shore Electric Ry., near Fremont, O., on January 22d. One of the freight and baggage cars on this line was closely following an east-bound passenger car. The latter stopped to permit a passenger

to alight and the freight car coming behind it at a rapid rate crashed into the passenger car, badly injuring the conductor and motorman of the former. None of the passengers were fatally injured.

Grading is under way for the new electric line between Herkimer and Little Falls and foundations are being laid for a power house at Small's gulf. The current will be received from Trenton Falls at a voltage of 22,000 and will be reduced to 500 for use on the line.

The Natchez (Miss.) Electric Street Railway Co. opened its new lines to the public on February 5th. Four cars have been received from St. Louis and 3½ miles of track completed. E. H. Ratcliff is president, and E. H. Jackson, general manager, of the company.

The Galveston (Tex.) City Railway Co. voluntarily increased the wages of its motormen and conductors, on January 1st. The employees' union appointed a committee to draft suitable resolutions of thanks to Major Baer, president and manager of the company, for his action.

An overheated stove in one of the cars of the Chicago Union Traction Co., on January 4th caused the second fire which has threatened the company's equipment within the last few weeks. In the second instance the damage did not exceed \$1,000 and is covered by insurance.

It is again reported without confirmation that the Northwestern Elevated Railroad Co., of Chicago, is about to acquire by lease the Evanston branch of the Chicago, Milwaukee & St. Paul Ry. It was expected that the L road would begin operations on the surface line north of Wilson Ave. on February 1st.

The Worcester (Mass.) Consolidated Street Railway Co. has notified its conductors and motormen whose homes are in Marlboro, Northboro and other suburban towns, that they will be expected to remove to Worcester for the sake of convenience, as all the company's cars are to be quartered in that city.

Members of the American Society of Civil Engineers who held their 49th annual meeting in New York City last month listened to a lecture by Mr. William Barclay Parsons, chief engineer of the Rapid Transit Commission, of New York, on the progress of the work of excavating the rapid transit subway. The lecture was illustrated by stereopticon views and following this, the party under escort of Mr. Parsons was taken through several portions of the tunnel. One of the points visited was at Broadway and 57th Sts. The under-ground work here was well lighted, especially the station at 50th St., directly underneath the Columbus monument.

### SALE OF CANTON-AKRON LINE.

We are advised that the original owners of the Canton-Akron Ry., which was acquired by the Everett-Moore syndicate a few months ago, have repurchased the property and also taken over the Canton-Massillon Electric Ry. which the Everett-Moore syndicate had a contract to buy. Messrs. P. L. Saltonstall, of Boston, and L. E. Myers, of Chicago, were principally interested in the Canton-Akron line, and we understand that these interests contemplate extensive additions.

### NEW MANAGER AT LOS ANGELES.

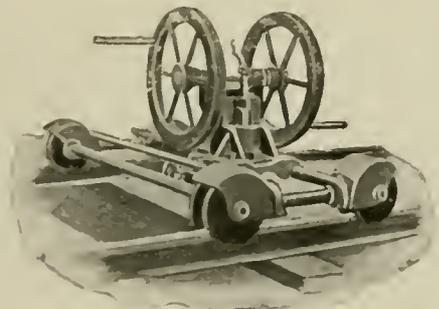

President Huntington, of the Los Angeles Railway Co., on February 7th published the following order: The conflicting interests of the Los Angeles Railway Co. and the Pacific Electric Railway Co. render necessary separate managements of these properties. Effective February 15th, Mr. J. A. Muir is appointed general manager of the Los Angeles Railway Co., vice Mr. Epes Randolph, retiring for other service.

### PROVIDENCE-WORCESTER INTERURBAN.

The preliminary work of organizing an electric railway to run between Worcester and Providence is being pushed very actively by the promoters of the plan. The road is to be called the Worcester & Providence Street Ry., and the right of way is being rapidly acquired. According to the present plans the new road will connect at Providence at the terminus of the Branch avenue line of the Union Railroad Co., and from this point will run through the towns of North Smithfield, North Providence, Smithfield and Burdville. At the state line it will join with the tracks of a company incorporated under the laws of the State of Massachusetts, which will carry the road into the city of Worcester. The length of the proposed road is estimated at 135 miles, and the fare is said to have been set at 45 cents. As the present fare is \$1.10, it is expected that the road will handle a large part of the traffic between these two cities. It is proposed to run both freight and passenger cars. The capital stock of the company will be \$750,000, and it is stated that as soon as the charter has been obtained work will begin on the road and will, it is expected, be completed during the present year.

### GORE TRACK DRILL.

The accompanying illustration represents the Gore track drill mounted on a carriage designed for it by the Ludlow Supply Co., of Cleveland, O., which is the agent for this drill in the central states. This is specially adaptable to construction work, and is said to be one of the most efficient hand drills on the market. It has been in use for about two years, and has proved itself to be a thoroughly reliable machine. It is possible to drill a 7/8-in. hole through the web of a 70-lb. T-rail in from 40 to 45 seconds. With this drill,

GORE TRACK DRILL ON CARRIAGE.

when mounted as shown in the illustration, from 40 to 50 holes per hour can be drilled. When once adjusted it remains in the right position for work, and can be moved rapidly along the track. It is easily operated, and can be readily taken from the track if necessary.

The Ludlow Supply Co. has also secured the agency of the Simplex Electrical Co., Cambridgeport, Mass., which manufacture enamel and coil spring car heaters under the patents of the American Electric Heating Corporation.

### COMPENSATION FOR FRANCHISES.

An important suit has been settled in Toledo, O., in which Judge Barber, in his exhaustive opinion handed down January 30th, held that the city has a right to exact compensation for its franchises. The case was a suit in equity brought by the city against the Toledo Traction Co. for the receipt of the Robinson lines, as an ordinance gave the city one per cent per annum of the gross receipts, which has never been paid. The argument was made that the city cannot lawfully speculate in the use of its franchise, nor in the dispositions of the use of its public streets can it derive private advantage to itself. Counsel agreed that the only question before the court, however, was the right of the city to sell its franchise. The court held, however, that the statute provides that the council has power to

fix the conditions upon which street railways may be constructed and operated, and hence this confers ample power to exact one per cent unless the contract is immoral and against public policy.

### MISUSE OF SCHOOL TICKETS.

The pupils of the public schools of Lowell, Mass., have been abusing the privilege of the school tickets which were issued to them by the street railway company in books and which were sold at half price. Recently the street railway company found that the children were selling tickets from their books and charging 5 cents each for them, thus making 100 per cent on the transaction. The books did not last as long as they were supposed to and an investigation which was undertaken brought these facts to light. The street railway company has now called in all the special ticket books which were issued and is substituting therefor slip tickets on which are ten fares which are just the number required for the pupil for a week. These slips will be issued to the pupils each week and the new arrangement will not permit of any speculation.

### TROLLEY EXCURSION TO FLINT, MICH.

January 6th, by courtesy of the Detroit United Ry., the city officials of Pontiac, Mich., and a large party of guests were invited for a trolley ride to Flint. The party was escorted by Mr. A. H. Stanley, general superintendent of the company, James Bullon, division superintendent, G. W. Parker, general passenger and freight agent, A. Eastman, assistant general passenger and freight agent, and John Kerwin, superintendent of tracks. A pleasant trip was made to Flint via Royal Oak, about three hours being consumed on the trip. A committee of the business men's organization of Flint escorted the party to the Elk's club rooms where refreshments were served, addresses of welcome made and toasts responded to.

A number of the leading manufacturing establishments of Flint were visited by the party and at four o'clock, by invitation, the guests were driven to Oak Grove sanitarium where they were handsomely entertained. The party returned to Pontiac about 10 o'clock in the evening after having made a most enjoyable trip.

### A COLLISION IN CHICAGO.

A collision between a Kedzie Ave. electric car and the Pioneer limited train of the Chicago, Milwaukee & St. Paul Ry. at Chicago Ave. on the evening of January 27th, resulted in injuries to 12 passengers in the electric car. The responsibility for the accident proved a difficult matter to determine from the evidence available. None of the injuries resulted fatally, and though the motor car was demolished and its trailer badly damaged, parts of the wreck being afterwards found at a distance of 200 ft. from the scene of the accident, the majority of the passengers escaped unharmed.

The Louisville (Ky.) Anchorage & Power Valley Electric R. R., which has been in operation only about three months, is paying running expenses and making more than enough to meet the interest on its bonds. The road's bonds are already in demand.

A bill has been introduced in the Ohio Legislature providing that all companies operating interurban lines running for more than five miles out of any municipality shall equip their cars with toilet rooms before Jan. 1, 1903.

The Dayton & Xenia Traction Co. carried 38,000 passengers into Dayton during the month of December.

The Phoenix (Ariz.) Railway Co. has constructed a short loop which affords easier access to the pleasure park at the end of one of its branches. The loop gives the company a total of 11 miles of track. An artificial lake will be an additional feature next season to the park's attractions.

**LANSING, ST. JOHNS & ST. LOUIS RAILWAY.**

The informal opening of the part of this road between Lansing & St. Johns which took place recently, marks the beginning of interurban transit in the central part of the state of Michigan, and this road will eventually form a division of a vast net work of lines which are either proposed or under construction throughout the central and southern part of the state. The contract for building and equipping the road complete was awarded to the Arnold Electric Power Station Co., of Chicago, which has handled all the engineering details.

The 20 miles of road between Lansing and St. Johns is about one-third of the ultimate length of the line which is to extend to Alma and St. Louis, a distance of 60 miles. The towns of DeWitt and Maple Rapids, as well as a number of smaller places, will be included in its route. None of these towns has direct communication with each other nor any convenient way of reaching Lansing, the capital city.

The road is being built in a very substantial manner and a number of engineering difficulties were encountered upon the route. Two miles from DeWitt the road passes over what is called Clayton's cut. This is the largest cut on the line, being 2,000 ft. long

to greatly simplify the method of electrical distribution. The system in this case does away with rotary converter sub-stations and uses the alternating current system throughout from the station generators to the motors under the cars, static transformers being placed on the cars. As this plan involves several entirely new features the operation of the road, which will commence regularly within a short time, will be watched with the greatest interest by electrical engineers throughout the world.

**AUDIT COMPANY OF ILLINOIS.**

The importance of auditor's reports as a basis of credit for partnership and individuals as well as for large corporations is becoming more widely recognized in this country, and there are now a number of companies making a specialty of accounting and auditing. Among these is the Audit Company of Illinois, which extends its operations to the examinations of all legitimate enterprises, auditing the accounts, examining the financial standing of clients and the physical condition of their properties, due regard being had to the confidential nature of the work.

The equipment of this company for handling accounts and reporting on the financial and physical condition of railway, gas and

BRIDGE OVER LOOKING-GLASS RIVER—LANSING, ST. JOHNS & ST. LOUIS RY.

and 13 ft. deep. The excavation was made in heavy yellow clay, which was removed with great difficulty. Three miles north of DeWitt the road passes over a sink hole which also caused trouble for the engineers. An eighth of a mile from the right of way lies a small shallow lake. The field through which the right of way passes was found to be a comparatively thin layer of soil covering the concealed extension of this lake. A temporary track was laid around this place and the process of filling in was begun. After many car loads of earth were put down rails were laid across this spot, but in a short time the ground broke away and the road bed was found to be practically afloat. A steam shovel was then put to work and 3,500 carloads of sand and gravel were used in filling up the hole.

The new road will handle passengers, mail and freight in the same manner as steam roads except that it will make much more frequent stops and thus come into close touch with all classes of its patrons. The road bed is well ballasted and solid, the bridges have been very substantially built, the marshes occurring at frequent points have been converted into substantial ground and the right of way is enclosed by a wire fence.

The unique feature of the Lansing, St. Johns & St. Louis Ry. is the electric system which has been adopted for operating the road. The system was worked out by Mr. Bion J. Arnold, and is intended

electric lighting companies is unusually strong and effective. Expert accountants and engineers experienced in the construction and operation of similar properties enable such work to be handled in the most satisfactory manner.

The headquarters of the Audit Company of Illinois are in the New York Life Bldg., No. 171 La Salle St., Chicago. The officers are: President, L. A. Walton; vice-president, F. W. Little; secretary and treasurer, C. D. Organ; manager, H. J. D. Wodrich

**WASHINGTON TRACTION LINES COMBINE.**

Deeds have been placed on record conveying to the Washington Railway & Light Co., formerly the Washington & Great Falls Co., the entire properties of the Metropolitan and the Columbia Street Railway Cos., of Washington. The new company has also absorbed the suburban lines of the Washington Traction Co. The movement is in accordance with an act of the last congress giving authority for the consolidation of the street railway properties operated by the Washington Traction Companies.

A boiler in the power house of the Ithaca (N. Y.) Street Railway Co. exploded, January 23d, injuring three employees.

## CANADIAN NOTES.

W. B. Rankine, vice-president of the Canadian Niagara Power Co., announces that work on the plant of the company in the Queen Victoria Falls Park will be prosecuted with dispatch. The construction of the Canadian works will take two years. The company has now awarded contracts aggregating one and three-quarters millions of dollars, including the tunnel which A. C. Douglas is constructing, 2,200 ft. through solid rock, and the circular coffer dam nearly completed along the shore line of the river, by James Barry of Niagara Falls, Ont. The proposed power transmission line from Niagara Falls to Toronto can be ready to supply power for operation by October next, getting the electric current from the power plant of the Niagara Power Co. on the American side until the Canadian works are completed. A bank of eleven transformers has been ordered from the Canadian General Electric Co. A contract just awarded to Dawson & Reilly is an important one. It provides for a wheel pit 175 ft. long, parallel to the river, 160 ft. deep, and 20 ft. wide. The intake canal will be 600 ft. wide where it comes from the river, and 14 ft. deep. The first installation provides for three 10,000-h. p. turbines and dynamos.

The Canadian Court of Appeals has recently decided the snow case of the city of Montreal against the Montreal Street Railway Co., which the city had appealed from the Superior Court. The decision sustained the company's contentions as to its duties and privileges, holding (a) that the company is bound to keep its tracks clear from ice and snow, but not to remove or cause to be removed from the streets and convey elsewhere the snow so cleared from its tracks; (b) that the company, without the permission of the city council, may use, for the purpose of clearing snow or ice from its tracks, electric sweepers, rotary brushes or other similar apparatus, which sweeps snow or ice from its tracks into the street. The city had the right to remove all the snow from curb to curb, including what was shoveled from the sidewalks or fell from the roofs of houses, and charge half the cost to the company.

Although the Montreal Terminal Railway Co. has gained an entrance to the city for its electric cars, there is little probability that any transfers will be issued or accepted by the Montreal Street Ry. lines, this being optional with the latter.

The total earnings of the Hamilton (Ont.) Street Ry. for the year 1901 were \$152,519.

The excellent natural water power at Lachute (Que.) is attracting the close attention of American capitalists, as well as those of Shawinigan, and Lachute was recently inspected by Messrs. A. E. Doucet, of Quebec; E. V. Kane, Robert C. Cookman, H. E. Mitchell, of Philadelphia; H. E. Gill, of New York; H. H. Melville, of Boston; H. Kingbolt and F. D. Enick, of New York.

The Ottawa council proposes to water the streets of the city by means of sprinkling cars operated by the electric street railway, as well as in Toronto.

The International Rapid Transit Co., composed largely of New York financiers identified with the International Traction Co. of Buffalo, is endeavoring to secure a controlling interest in the Hamilton, Grimsby & Beamsville Electric Railway Co. Individual shareholders in the latter company have been offered \$200 for their stock, on the understanding that the Hamilton, Grimsby & Beamsville Ry. shall liquidate every liability. It is understood that the International Rapid Transit Co. is negotiating for the Niagara, St. Catharines & Toronto Electric Ry., which controls the Niagara Falls, Wesley Park & Tramway Co., the Port Dalhousie, St. Catharines & Thorold Electric Ry., and the charter for the built electric railway from Queenstown opposite Lewiston, N. Y., so that it would only have to build a twelve mile extension of the Hamilton, Grimsby & Beamsville Railway from Beamsville to St. Catharines to have a continuous electric railway from Hamilton to Niagara Falls, where the Niagara, St. Catharines & Toronto Railway connects with the various electric railways under the control of the International Traction Co.

Application has been made for the incorporation of the London (Ont.) Railway Co. to build an electric railway from Ingersoll to London. F. G. Rumball and J. H. Purdom, of London, are among the promoters, and T. H. Innes is solicitor for the company.

The citizens from Notre Dame de Grace and Montreal West have forwarded a petition to the Montreal Street Railway Co., asking for a new line from Westmont to Rockfield.

A meeting of the executive committee of the Canadian Electric Association was held on January 10th for the purpose of arranging the preliminary program of the annual convention, which will take place next June in Quebec. It was announced that Mr. Fred Nicholls, manager of the Canadian General Electric Co., had offered \$500 to the association for the purpose of stimulating study and research. This sum will probably be disbursed in the form of prizes for papers on electric subjects.

A syndicate headed by Major J. K. Leslie has, it is stated, bought the charter for an electric railway from Hamilton, through Ancaster, to Brantford. The charter was held by Jacob Shaver, J. Henderson and E. Kendrick, and J. V. Teetzel, solicitor for the Toronto syndicate, is authority for the statement that application would be made at once to the Legislature to amend the charter, and that the work of construction would be started early in the spring.

Notice has been given that at the next session of the Quebec provincial Parliament application will be made for an act to incorporate the Shawinigan Terminal Railway Co. with power and authority to lay out, construct and operate an electric railroad of standard gage over the existing electric railway and tramway lines in the present village of Shawinigan Falls and in the parish of St. Boniface, and from a point in or near the said village of Shawinigan Falls, to any points in the neighboring counties of St. Maurice and Champlain.

Westmont has, it is reported, extended the franchise of the Montreal Street Railway for 50 years. In view of the new franchise being granted for 50 years, instead of 10 years, as in the original proposition, the town will make one payment of \$4,500, in place of \$2,000 per annum, for 10 years. The route will extend from the Guy St. line, Cote des Neiges, to the boulevard and western limit of Westmont, with connections later with the center of the town.

The Velvet Mines of Rossland, B. C., intend applying at the next session of the House of Commons for a charter to build and operate a railroad with either steam or electric motive power, between Rossland and the Red Mountain railroad. The line, if put through, will be about 30 miles long.

Montreal has experienced one of the worst snowstorms known here in years. Seventeen electric sweepers were kept busy on the lines of the Montreal Street Railway Co. for nearly three days, and nearly all the lines were kept open. It is now the city's turn, and thousands of men and as many teams as can be hired will be necessary to remove the snow from the sides of the street, where it is piled up to the height of many feet.

## CHANGES IN WESTINGHOUSE COMPANY.

At a meeting of the directors of the Westinghouse Electric & Manufacturing Co., held in New York, January 23d, the resignation of Mr. B. H. Warren, second vice-president, was accepted. Mr. Warren still retains his connection with the company as a director. The retirement of Mr. Warren brought about the following changes in the officers of the company.

Mr. Frank H. Taylor, until recently fourth vice-president, has been advanced to the position of second vice-president and will be in charge of the sales of the company and have a general supervision over its affairs.

Mr. L. A. Osborne, manager of works, has been made fourth vice-president, in which capacity he will have charge of the engineering and producing operations of the company.

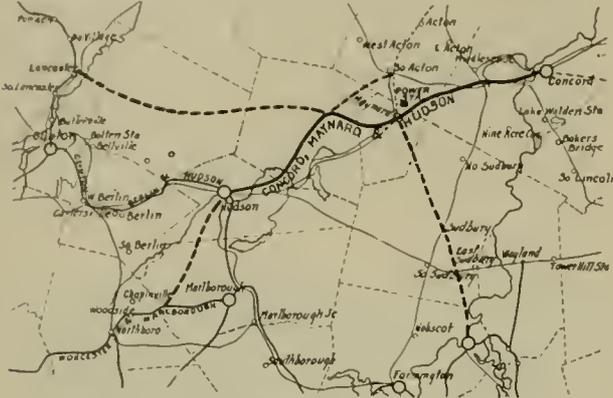

Mr. Arthur Hartwell has been advanced to the position of sales manager in charge of the sales organization. Mr. Hartwell was formerly manager of the Chicago office of the company.

Mr. Philip A. Lange, formerly general superintendent, was made manager of works, in which position he will have charge of the manufacturing departments of the company. The officers in other respects remain as heretofore.

An order has been introduced in the Chicago council appointing the mayor, corporation counsel and commissioner of public works as a special committee to open negotiations with the officials of the Union loop in regard to the extension of the loop as far south as Polk St., the removal of all unused stairways and the eventual installation of elevators in place of stairways at all loop stations on the elevated lines.

## THE CONCORD, MAYNARD & HUDSON STREET RAILWAY.

The completion of the Concord, Maynard & Hudson Street Ry. forms an important connecting link between a number of heretofore isolated systems and opens up a wide extent of rich farming and manufacturing districts in eastern Massachusetts. This road joins the Lexington & Boston Street Ry. at Concord, with the Clinton, Leominster & Fitchburg and Worcester & Marlboro electric lines at Hudson. The system presents an example of a medium-size, up-to-date, modernly equipped interurban electric railway. Considerable revenue will be derived by transporting the employes of several large factories along the way. At Hudson are large

MAP OF CONCORD, MAYNARD & HUDSON SYSTEM.  
Proposed Extensions in Broken Lines.

rubber works and boot and shoe factories. At Maynard is the extensive plant of the American Woolen Co., to which additions are at present being built. The line passes other important shoe and leather plants, rubber factories, and at Acton runs past a large powder mill.

The road as now completed is 14 miles long, single track with turnouts. The roadbed is well constructed with 60-lb. T-rails on chestnut ties spaced 24 in. c. to c. The joints are bonded with 9-in. American Steel & Wire bonds. Extensions are to be built to South Acton, Saxonville and Northborough.

The power and car houses located at Maynard are simple and solid in construction and well adapted to the purposes for which they are designed. The power house is 48 ft. x 120 ft. 4 in., built of brick with iron trusses and gravel roof. The engine room which is 42 ft. 8 in. x 45 ft. 4 in., contains two 350-h. p. cross com-

room and well equipped machine shop. The office is fitted up with every convenience necessary to the quick transaction of the work of the company. The room for the motormen and conductors is 20 x 40 ft. and contains 20 lockers for clothes, lavatory, set bowls, pool table, card and writing tables; also a large graphophone with over a hundred records. The room is well lighted and heated and it is found the men spend most of their leisure time here instead of on the streets or in saloons.

The grounds about the buildings have been greatly improved, and where once were only an ugly and unsightly ledge and rocks will soon be a well kept lawn and artistic flower gardens.

The equipment consists of six closed motor cars built by the Laconia Car Co. Works, and eight open cars built by the Wason company, all mounted on Bemis double trucks. The cars are fitted with Christensen air brakes and Gold electric heaters.

The officers of the company are: President, W. R. Dame; secretary, M. J. Buckley; treasurer, W. S. Reed; superintendent, John W. Ogden; general contractors, Marcus A. Coolidge, of Fitchburg, Mass.

Mr. John W. Ogden, superintendent of the Concord, Maynard & Hudson Street Ry., was born in Fitchburg, Mass., 45 years ago. He was educated in the public school, entering the high school at 12 years of age, but was obliged to leave in two years on account of the death of his father. He then took up the printing business and afterwards began the study of medicine at the College of Physicians and Surgeons in Boston. For several years he was in business in Fitchburg. He held a city position for two years and for twenty-two years was constable. He was appointed a justice of the peace by Governor Grenhedge and later by Governor Crane. He was identified for about 15 years with steam railroads, in the meantime taking up the subject of electric roads and working up through the several departments to the position of superintendent. He opened the Worcester & Clinton road December 10, 1898, and the Clinton & Hudson road Apr. 18, 1900, both of which he successfully handled as superintendent until their consolidation with the Worcester Consolidated Street Railway Co., when he was appointed assistant superintendent of the third division from Worcester to Fitchburg, which position he resigned to accept the present one. He is a Knight Templar and 32d degree Mason, as well as a Shriner, and is identified with several other societies.

### SUIT FOR ALLEGED FALSE ARREST.

The Brooklyn Rapid Transit Co. has been made defendant in a suit brought by one Francis Keegan, a former employe of the company, to recover \$10,000 for alleged false imprisonment at the time

POWER HOUSE AND CAR BARN AT MAYNARD, MASS.

pound condensing engines made by the Slater Engine Co., of Warren, Mass. These engines have cylinders 14 and 28 x 36 in. Each engine is direct connected to a 250-kw. Westinghouse generator. The boiler room contains two 264-h. p. B. & W. type boilers. All valves are of the Crane make.

The car house is built of brick and is 51 ft. x 204 ft. with annex 35 x 100 ft. It contains four tracks, office, large stock room, men's

of the big street railway strike in Brooklyn in July, 1899. While the strike was at its height the railway company received information of a plot to blow up a section of the elevated with dynamite, and upon advice caused the arrest of Keegan and 20 other employes. Keegan was subsequently discharged for lack of evidence and now brings suit, claiming that his reputation was injured and his prospects in life seriously affected by his arrest and imprisonment.

### KEYSTONE CAR WHEEL CO.

The accompanying illustration gives a general view of the factory of the Keystone Car Wheel Co., of Pittsburg, which is located at West Homestead, Pa., a short distance outside the city limits. Mr. Charles V. Slocum is president of the company and previous to its organization was manager and treasurer of the Penn Car Wheel Co. and before that he was secretary of the New York Car Wheel Works, thus having had an extensive experience in this business.

The Pressed Steel Car Co. bought out the Penn Car Wheel Co. and had use for the entire product of the foundry; this left an opening for a new car wheel foundry which Mr. Slocum at once recognized. With his accustomed energy and ability he at once organized a new company which, though but one year old, already occupies a prominent position among car wheel works.

The new shop was at first built for a capacity of 300 wheels per day, but the business of the Keystone company soon outgrew this output and last October the factory was enlarged to produce 500 wheels per day.

The company's shops are very favorably located on three lines of railroads, the Pennsylvania, Baltimore & Ohio and the Pittsburg, Bessemer & Lake Erie, being the only factory in the Pittsburg district with such extensive shipping facilities. The company makes a specialty of wheels for electric railway service and

adverse conditions, the motorman being able to bring it to a full stop on any portion of the grade in less than a car's length, notwithstanding that the track was muddy and slippery because of the falling snow. The car was gotten under full headway and stopped short repeatedly, the brakes fulfilling every requirement. They were accorded the highest praise by the company's engineers as well as the laymen who watched the test. It is hoped that the exhibition will restore the confidence of the street railway patrons in the safety of the car service.

### NOTES FROM KANSAS CITY.

The Metropolitan Street Railway Co. of Kansas City has about completed the installation of machinery at the new Olive Street station from which power will be generated for the operation of lines in the south part of the city. The equipment comprises two G. E. 750-kw. rotary converters which will be used as direct current generators until the new high tension power house is completed. The machines are driven by a 2,000-h. p. engine, rope transmission being used.

The Metropolitan's moderate investment in equipping a three-acre pond on its Northeast division with accommodations for skaters has resulted on many days in increasing the receipts by

WORKS OF THE KEYSTONE CAR WHEEL CO.

has met with gratifying success in this line of work. Large orders have been recently received from the street railways in Baltimore, Cleveland, Pittsburg and other prominent cities.

The secretary of the company is Mr. John Howard Yardley who maintains headquarters for the company in Philadelphia. Mr. Yardley was formerly connected with the New York Car Wheel Works and also with the Penn Car Wheel Co., and is widely known in the street railway field.

### MAGNETIC BRAKES FOR AMSTERDAM.

A serious accident, involving the wrecking of two electric cars on the Market St. line of the Amsterdam Street Railway Co. recently, led the management to make a careful examination of the brake systems now employed for street railway service. As a result of this investigation the magnetic brake of the Standard Traction Brake Co. was selected, and, after thorough tests under the most difficult conditions and in the most exacting service, it was finally adopted for the entire system. Car No. 15, one of those which was in the wreck, was entirely rebuilt and fitted with Standard magnetic brake equipment. The first public demonstration was given recently when a trial trip was made over the line with officers of the road and guests. The car was taken up Market St. hill, and allowed to descend, the operation being watched with considerable interest by many pedestrians as well as those on board. The magnetic system proved all that was claimed for it under the most

65 per cent. Five arc lamps were placed around the pond and a comfortable shelter erected.

The council recently passed an ordinance requiring the company to put flagmen at all its railroad crossings, but the company contends that fewer accidents have occurred since the flagmen were dispensed with, and will, if necessary, contest the case in the higher courts.

An ordinance has also been introduced in the council requiring that the gates on electric cars be removed, on the ground that the gates prevent passengers from getting out of a car quickly when a collision is imminent.

February 1st a strike was inaugurated by the employes on the Kansas City, Leavenworth Electric Ry., who demanded the reinstatement of a number of men who had been discharged for neglect of duty. Superintendent DeCoursey and his assistant procured a sufficient number of substitutes during the first day of the strike to man most of the cars on all the company's divisions, and the service has not been crippled to any extent by the demonstrations of the strikers, although, on several evenings, it was thought prudent not to run cars after dark. The strikers' attempt to operate a bus line in opposition to the cars has resulted in signal failure, and Manager Wolcott of the company reports that he has had many more applications for work than vacancies.

The Northern Ohio Traction Co. has declined to accede to the demand of the Akron, O., council for a 3 cent fare in that city.

## PERSONAL.

MR. H. A. EVERETT has been re-elected president of the Cleveland Electric Railway Co.

MR. ANTON G. HODENPYL, of King, Hodenpyl & Co., of Chicago, has been elected a director of the Rochester (N. Y.) Railway Co.

MR. JAMES DAWSON CALLERY, the recently elected president of the Pittsburg Railways Co., controlling all the lines in that city, Allegheny and vicinity, has the distinction of having been the president of the pioneer electric line in Pittsburg. Mr. Callery's first experience in street railway work was in connection with the Second Avenue Co., operating a local horse car line.

J. D. CALLERY.

He so well demonstrated his ability in a subordinate capacity in this company that he was elected president. Directly after this, in 1889, Mr. Callery converted the road for electric operation, the first in Pittsburg to be put on a paying basis and established permanently. Extensions were made in all directions; theretofore inaccessible tracts of land were connected with the city and developed as residential suburbs. By connecting many towns along the Monongahela River between Pittsburg and McKeesport, Mr. Callery soon made the Second Avenue system one of the largest in the country at that time. In 1897 he effected the organization of the United Traction Co., which brought about the consolidation of the Pleasant Valley and Manchester systems in Allegheny City with the Second Avenue lines in Pittsburg. Mr. Callery was made president of the United company. Two years later the West End system in Pittsburg, in which Mr. Callery was also interested, was purchased by the Southern Traction Co., and he was elected president. The Pittsburg Railways Co. was formed last December to take over all the Pittsburg and Allegheny lines, including the United, the Southern, the Consolidated, the Monongahela, the Birmingham, the Suburban and other systems. Mr. Callery's accession to the presidency of all these roads is but the logical event. Mr. Callery was born in Allegheny City 40 years ago. He is the son of James Callery, a prominent business man of Pittsburg, now deceased, who was best known as being the organizer of the Pittsburg & Western R. R., running from Allegheny to Akron and now operated as an important division of the Baltimore & Ohio system. His son is an officer or prominent stockholder in a score of Pittsburg's leading business institutions, and is vice-president of the Philadelphia Co., which controls the gas and electric companies in Pittsburg.

MR. GEORGE M. SARGENT, president of the Sargent Co., Chicago, and his wife, left February 8th for an extended trip in the Mediterranean.

MAJOR EVANS, of Lorain Steel fame, was at the dinner of the New England Street Railway Club. The major has as many friends in the business as any other one man in the trade.

MR. C. E. DONNATIN has been appointed superintendent of the mechanical department of the Los Angeles Railway Co. In this position he will have charge of the company's rolling stock, car and machine shops and store room.

MR. JOHN HARRIS, superintendent of the Cincinnati Traction Co., on February 14th, completed the 35th year of his service with the street railways of Cincinnati. Mr. Harris was born in Lancaster, O., in 1841, and went to Cincinnati, taking horses for the market there; he commenced business, caring for horses, on the site of the present federal building and within 200 ft. of

the office now occupied by him. During the last 40 years Mr. Harris has been kept away from his office but a single day by sickness.

MR. L. J. WOLF has been elected president of the Aurora, Elgin & Chicago Railway Co., succeeding Mr. B. Mahler; and Mr. Myron H. Wilson has been elected vice-president, succeeding Mr. Wolf in that capacity.

MR. JOHN A. GRANGER, whose name is familiar to old-time railway men, has accepted an important position with the Burnet Co., of 121 Maiden Lane, New York City, a new firm organized to deal in railway and electrical supplies.

MR. I. A. SWEIGARD, of Philadelphia, has been elected president of the Ambler & Jenkintown, the Montgomery, Doylestown & New Hope, and the Center & Clearfield Street Rys. The three companies elected Mr. T. F. Durham, secretary and treasurer.

MR. JOHN G. WEBB has been elected vice-president, and Mr. F. J. Green, secretary, of the Columbus, London & Springfield Railway Co. Mr. Webb and Mr. Green formerly occupied the positions of treasurer and vice-president, respectively, of the company.

MR. FRANK L. BROWN has been appointed agent of the J. G. Brill Co. for the Pacific Coast territory, succeeding Mr. F. A. Lawson, who resigned January 1st. Mr. Brown's office will be in San Francisco. Mr. Brown formerly represented the Shelby Steel Tubing Co.

MR. JOHN MURPHY, general superintendent of the Pittsburg Railways Co. under Mr. Callery, is a native of Ireland and 40 years of age. Mr. Murphy came to America in his early youth and devoted himself diligently to obtaining a thorough education. His home was in central Pennsylvania. After leaving school he obtained employment as an engineer on a steam railroad, and in this connection improved his opportunity to study the mechanical construction of the road and locomotive, all of which prepared him for his subsequent success in the economical construction and management of electric lines. When the Second Ave. horse car line in Pittsburg was converted into an electric system, he was chosen superintendent. In 1898 he was made general superintendent of the United Traction Co. Since his recent appointment as general superintendent of all the trolley lines in Pittsburg and Allegheny he has actively engaged in effecting practical improvements of the system which include the changing of routes and building of short loops to relieve the congestion of cars in Fifth and Sixth Aves. During his busy and practical career Mr. Murphy has found time to study electrical engineering as a science. He is, as well, an inventor of ability, being the inventor and patentee of the Murphy car wheel truing machine.

JOHN MURPHY.

MR. A. H. RUTHERFORD has been elected vice-president of the Knoxville (Tenn.) Traction Co. in the place of Mr. C. C. Howell, who has resigned on account of ill-health. Mr. E. C. Hathaway, general manager of the Railways & Light Company of America, will succeed Mr. Howell as general manager of the Knoxville Traction Co.

COL. C. C. HOWELL, formerly vice-president and general manager of the Knoxville (Tenn.) Traction Co., received many tokens of esteem from his friends on retiring from his dual capacity with the company on January 24th. The employes of the road presented him with a gold-headed cane. In the afternoon of the

same day, a hundred of his friends came to his house with valuable gifts for Col. and Mrs. Howell. At a meeting of the hospital board that evening he was presented with a silver dish by the gentlemen members, and a loving cup by the ladies of the board.

MR. HAROLD W. CLAPP, manager of the Brisbane Tramways of Brisbane, Australia, is in this country and attended the New England Street Railway Club dinner last month. His father has been associated with the Brisbane Tramway & Omnibus Co. for many years. Mr. Clapp is about to take a course at the shops of the General Electric Co.

MR. S. LA RUE TONE will be associated with Mr. Callery in the management of the Pittsburg Railways Co., in the capacity of assistant to the president. Mr. Tone was born in Cincinnati in 1864. He graduated from the Rensselaer Polytechnic Institute,

S. LA RUE TONE.

in Troy, as a civil engineer, and entered the service of the Pennsylvania R. R. He resigned to accept a better position with the Philadelphia Traction Co., controlled by the Widener-Elkins syndicate, and when the latter bought the old Pittsburg, Oakland & East Liberty Passenger Ry., in 1887, Mr. Tone was employed to effect its conversion into a cable system, a work which was successfully accomplished in the winter of 1888. The name of the company was changed to the Pittsburg Traction Co., and Mr. Tone remained with it for two years. Later, he became identified with the Duquesne Traction Co., and in 1892, entered the service of the West End Traction Co., as chief engineer. Mr. Tone has acted as chief engineer in charge of the construction of lines in Connellsville, Kittanning and Rochester, Pa., and Steubenville, O. When the United Traction Co. was organized he was made chief engineer of all the lines it controlled, a position which he retained until the recent merger, when he was appointed President Callery's assistant.

MR. ROBERT A. DUNLAP, assistant treasurer of the Cincinnati Traction Co. has resigned that position, and retired for the present from active service on January 16th. Mr. Dunlap has been in the street railway field for more than 40 years, and was associated with the promoters of the first system in Cincinnati. In accepting his resignation the company voted him a life pension of \$100 per month.

MR. CHARLES FITZGERALD, formerly general superintendent of the Consolidated Traction Co., Pittsburg, and Mr. W. C. Smith, formerly superintendent of transportation of the company, were presented with handsome gifts by the employes of the railway, on retiring from office. The presentation was made in the Empire Theater, January 11th, and was followed by a cheerful demonstration of good will.

MR. A. K. DETWILER, formerly president of the Toledo & Maumee Valley Railroad Co., Mr. C. A. Denman, the former manager of the company, and Mrs. Phelan, the latter's assistant, on retiring from office, were presented with especially handsome gifts by the employes of the road as a testimonial of the regard which the employes bear to the officers with whom they have been associated for more than six years.

MR. BION J. ARNOLD, president of the Arnold Electric Power Station Co., of New York and Chicago, has been appointed consulting electrical engineer of the New York Central & Hudson River R. R. In connection with his new position Mr. Arnold is developing a project for the construction of an underground loop for the tracks entering the Grand Central station in New York and converting the service on these lines from steam to electric traction.

MR. WILLIAM C. WHITNEY, the veteran financier, capitalist, horse-lover and street railway man, has announced his intention to retire from all the many business interests with which his name has been associated, and devote the remainder of his life to travel, recreation and his racing interests. It is stated that with the possible exception of one other, Mr. Whitney has more money invested in racehorses and homes for them than any man in the United States. Speaking of his connection with the Metropolitan Street Ry., of New York, the New York Sun quotes a prominent New Yorker as follows: "It is not generally known just how intimately William C. Whitney has been connected with the development of the Metropolitan Street Railway system. Many persons think that Mr. Vreeland is responsible for it. That is not so. Vreeland has perfected in a superb way Whitney's plans. But Whitney planned to control the street railway business of New York so long ago as when Jacob Sharp was laying the rails of the Broadway road. And from his brain the system has developed. As an illustration of the details which he looks after, I may tell you that the entire system of transfers now used on all the lines was thought out, improved and perfected by Mr. Whitney."

MR. TRUMAN P. GAYLORD has been appointed manager of the Chicago office of the Westinghouse Electric & Manufacturing Co., of Pittsburg, succeeding Mr. Arthur Hartwell, who has been advanced to the position of sales manager at the Pittsburg office. Mr. Gaylord is 31 years of age and was born in Shelby, Mich. He entered the University of Michigan with the class of '93, on a course of electrical engineering, but in 1892 removed to Chicago, where he was engaged as engineer of subways and underground construction for the World's Fair, under Frederick Sargent and later under R. H. Pierce. In October, 1893, Mr. Gaylord became associate professor of electrical engineering at the Armour Institute of Technology and in accepting this position was prevented from returning to complete his course at the University of Michigan. In recognition of his services in building up the electrical engineering department of the Armour Institute, the trustees awarded Prof. Gaylord the degree of electrical engineer. In 1898 he severed this connection to accept a position with the Chicago Edison Co., in which latter he remained a year, organizing, during that time, the testing department, which was at once recognized by the company as a most important innovation. Mr. Gaylord entered the Chicago office of the Westinghouse company in July, 1899, in the capacity of engineer, from which position he was soon promoted to that of general salesman.

MR. W. ELWELL GOLDSBOROUGH, director of the School of Electrical Engineering of Purdue University, has been appointed chief of the Department of Electricity of the Louisiana Purchase Exposition. Mr. Goldsborough's career in the electrical field has been a conspicuously active one since his graduation from Cornell University with the degree of M. E., in 1892. He was for a year professor of electrical engineering at Arkansas University, Fayetteville, Ark., and resigned this position to become associate professor of electrical engineering at Purdue University. In 1897 he was elected director of the School, a position which he still retains. Prof. Goldsborough came prominently before the public in connection with a series of tests at the Plant St. Station of the Edison Electrical Illuminating Co., of Baltimore, his ideas being embodied in the reconstruction of the plant and his report published in the transactions of the American Institute of Electrical Engineers. The scope, conduct and results of the tests were reported as ideal in their proportions by the committee which passed upon that paper. Prof. Goldsborough has been a frequent contributor to technical literature. He is a member of numerous engineering and scientific societies, among them, the American Institute of Electrical Engineers, the Institution of Electrical Engineers of England, the Franklin Institute, the American Association for the Advancement of Science, and the Society for the Promotion of Engineering Education. Prof. Goldsborough had made a special study of electrical features at expositions. He was a member of the international electrical congress at Chicago, and attended similar gatherings at the Omaha and Buffalo expositions, serving as a juror of awards at the latter. He was appointed as

a delegate of the American Institute of Electrical Engineers to the Paris Exposition and now holds the office of manager in the Institute.

### OBITUARY.

MR. MICHAEL MURPHY, president of the Van Brunt St. & Erie Basin Railroad Co., of Brooklyn, N. Y., died of pneumonia, on January 21st, at his home in Brooklyn. He was born in Ireland about 60 years ago. Mr. Murphy was a well known hotel man. The Van Brunt St. & Erie Basin R. R., of which he was president, is a short independent electric line in South Brooklyn, about 2½ miles long, that has never been consolidated with the Brooklyn Rapid Transit system.

MR. SAMUEL ELMER, president of the Mountain Lake Electric Railroad Co., of Gloversville, N. Y., died suddenly on Sunday morning, January 26th. Mr. Elmer was a native of Ashfield, Mass., and was 53 years of age. Prior to 1890 he was a prominent business man of New Haven, Conn., but in that year removed to Gloversville, where he became the holder of large real estate interests and the promoter of the electric lines connecting Gloversville, Fonda and Mountain Lake.

Mr. FREDERICK G. FRESE, vice-president of the Richmond & Petersburg Electric Railway Co., died at his home in Richmond, Va., January 24, of pneumonia, after a three-weeks' illness. Mr. Frese was a native of Ohio, and 36 years old. For the greater part of his life he was a resident of Akron, from which city he removed to Richmond last June to accept the vice-presidency of the Richmond & Petersburg company and to become the local representative of the Cleveland Construction Co. Previously, he had been interested in the building of inter-urban electric railways and telephone lines in Ohio, and was at one time connected with the Western Union Telegraph Co., and later general manager of the Akron Telephone Exchange.

### ELECTIONS.

THE TOLEDO & WESTERN RAILWAY CO. has elected the following officers: Luther Allen, president and treasurer; F. E. Seagraves, secretary, and C. E. French, auditor.

THE DETROIT UNITED RY. has elected the following officers: J. C. Hutchins, president and general manager; Henry A. Everett, vice-president, and George H. Russell, treasurer.

THE PHILADELPHIA, MORTON & SWARTHMORE STREET RAILWAY CO. has elected the following officers: Louis J. Levick, president, and E. J. Hasse, secretary and treasurer.

THE LAKE ERIE, BOWLING GREEN & NAPOLEON ELECTRIC RAILWAY CO. has elected the following officers: L. Black, president; W. M. Tuller, vice-president; E. M. Friess, secretary, and A. Froncy, treasurer.

THE MEDIA (PA.), MIDDLETOWN, ASTON & CHESTER ELECTRIC RAILROAD CO. has elected the following officers: F. W. Hammett, president; B. Griffith Jones, vice-president, and E. J. Hasse, secretary.

THE XENIA (O.), CEDARVILLE, JAMESTOWN & WILMINGTON ELECTRIC RAILWAY CO. has elected the following officers: J. E. Lawes, president; W. H. Manning, vice-president and manager, and R. R. Grieve, secretary and treasurer.

THE LANSING (MICH.), ST. JOHNS & ST. LOUIS RAILWAY CO. has elected the following officers: John Mills, of Port Huron, president; Isaac Hefett, of Maple Rapids, vice-president; M. W. Mills, of Port Huron, treasurer, and F. L. Dodge, of Lansing, secretary. The new directors elected to the board are: F. C. Norris and E. F. Percival, of Port Huron, and Stiles Kennedy, of St. Louis.

THE COLUMBIA (PA.) & MONTOUR ELECTRIC RAILWAY CO. has elected its president and directors as follows: B. F. Meyers, of Harrisburg, president; and Joseph Ratti and E. B. Tustin, of Bloomsburg; B. F. Crispon, of Berwick, and L. S. Hart, W. N. Myers and E. R. Sponsler, of Harrisburg, directors.

### RAPID TRANSIT SUBWAY EXPLOSION IN NEW YORK CITY.

At noon on January 27th, by an explosion of a large quantity of dynamite intended for blasting purposes in the Rapid Transit subway at 41st St. and Park Ave., New York City, two hotels, a hospital, the Grand Central Station and other buildings in the immediate neighborhood were badly wrecked, five persons were killed and over a hundred men, women and children were so badly bruised and cut by flying glass and debris as to require the attention of ambulance surgeons and doctors. Terrible as the catastrophe was it is worthy of note that this is the first serious accident of any kind that has occurred in connection with the subway work, although thousands of pounds of explosives have been used in all parts of the city, and for a portion of the time half the streets in the borough of Manhattan have carried their normal vehicular, street car and pedestrian traffic with an open trench from 15 to 40

SCENE OF EXPLOSION IN PARK AVENUE, NEW YORK.

ft. deep, and from 15 to 30 ft. wide along one side of the street. We believe the record has never been duplicated on any undertaking of equal magnitude.

The explosive that caused the accident was stored in a shed or shanty located on the street near the corner of 41st St. and just in front of the Murray Hill Hotel—which will be remembered as the headquarters of the American Street Railway Association during the convention in New York last fall. The amount and exact nature of the explosive have not been officially determined and will be a subject for investigation before the February Grand Jury in General Sessions. The law permits the storage of but 62 lb. of dynamite at any one point within the city limits but also sanctions it is claimed, delivery of a sufficient quantity of explosives each morning for the work to be done during the day. Both John B. McDonald, general contractor for the subway, and Ira A. Shaler, sub-contractor for this section, deny that any violation of law existed.

The powder shanty stood at the opening of a small shaft running down to the level of the subway tunnel which at this point is 20 ft. below the Park Avenue tunnel of the Metropolitan Street Railway Co. Sectional drawings showing the relative positions of the tunnels or subways at this point will be found in our convention issue for last September, page 542. The shanty was just at the foot of the derrick shown in the accompanying engraving, which is reproduced from a photograph taken immediately after the explosion. The exact cause of the accident is still the subject of investigation but from reliable testimony thus far submitted it appears that the explosive, which was kept in cartridges in boxes,

was ignited through the falling of a lamp set on a shelf in the powder shed.

The greatest damage was to the Murray Hill Hotel. Every pane of glass in the structure was broken and on the side facing the tunnel the walls were badly injured. The cafe, the lobby and all the front rooms on the lower floors were absolutely wrecked by falling walls and ceiling. One guest occupying the corner suite on the first floor was killed in his room, and two employes of the hotel were killed in the lobby. The zone of broken glass extended for two blocks up and down Park Ave., the Grand Central Depot and the Grand Union Hotel on 42d St., suffering great damage in this respect.

In the Metropolitan tunnel immediately adjoining the scene of the explosion cars were delayed for about three hours by debris thrown on the tracks, but no serious damage occurred, although the escape of cars not 50 ft. from the powder shed seems miraculous.

Sub-contractor Ira A. Shaler, also the superintendent of the section on which the explosion occurred and the watchman of the dynamite house have been held responsible for the accident by the coroner's jury.

### YORK COUNTY TRACTION CO.

The annual meeting of the York County Traction Co. was held last month and the following directors were chosen: George S. Billmeyer, Judge W. F. Bay Stewart, John W. Stacey, Grier Hersh, George P. Snysler and W. A. Himes. This board of directors serves for the York & Dallastown Street Railway Co., York & Dover Street Railway Co., York & Hanover Street Railway Co., Red Lion & Windsor Street Railway Co., York Haven Street Railway Co., Wrightsville & York Co., Colonial Street Railway Co. and Penn Park Street Railway Co.

Mr. W. H. Lanius, president of the company, stated that the York County Traction Co. had been organized chiefly for building suburban electric railways, and noted the addition to the company's property during the past year of the suburban lines operating from York to Dallastown and from York to Dover. Partial surveys have been made to Wrightsville, Hanover and York Haven, and the road to the former place will be built in the early spring and all of the contemplated roads in 1903. It was also stated that these lines will in the future be extended to connect with those at Baltimore.

The station of the Electric Light Co., which furnishes current for the railway company, has been greatly enlarged and improved during the past year by the addition of new machinery and a storage battery. A new car barn 50x232 ft. has been built and the present trackage of the company's barns is now 2,200 ft. A large repair shop has also been built.

The company contemplates extending its Dover line to Dillsburg, a distance of 12 miles. This line will include the towns of Wellsville and Franklintown. Additions and improvements have also been made in the electric light plant, including a 600-h. p. engine and two 300-h. p. dynamos for incandescent lighting. The plant has a boiler capacity of 2,000 h. p. and a 2,400 h. p. engine capacity. The York Haven Power & Water Co., which is now constructing a water power plant, will eventually furnish the current for these railway lines and the company's present plant will then be utilized as a storage plant, from which the current will be distributed.

### USING INSULATING VARNISHES.

The Standard Varnish Co., of 29 Broadway, New York City, gives the following suggestions for securing the best results with insulating varnishes. Part of the recommendations applies to its own varnishes but much of the advice is good no matter what make of varnish is used.

It is important that the varnish be applied at the proper consistency. In many cases it may be used thinner than applied by the dealer, but in no instance should it be used heavier. It is not practical to furnish a dipping varnish of the exact consistency to meet all requirements, as the gravity of all varnishes is affected by changes of temperature. It is therefore suggested that for dipping purposes the varnish be kept at nearly 75 degrees F. as possible, and the gravity reduced by thinning with benzine to suit the

requirements of each case. When the proper consistency is secured, the gravity may be taken with a hydrometer and the exact degree of thinning thus established.

While the gravity of the varnish when exposed in the dipping tank becomes lower in hot weather, it is necessary to thin with benzine before each dipping, on account of undue evaporation of solvent. On the other hand, in cold weather the gravity becomes abnormally heavy in consequence of contraction, and the varnish should be kept in a warm place, so that the temperature is in the neighborhood of 75 degrees F. when used; otherwise it will be too heavy and consequently require considerable thinning with benzine.

It can be applied by dipping the work into the varnish or with a brush. When applied by dipping, the varnish should be frequently thinned with benzine to replace the solvent that has evaporated. The varnish should be kept in tightly closed vessels to prevent evaporation as much as possible.

For highest insulation, two applications of the varnish may be employed, receiving treatment as aforesaid. In thinning, benzine should be added to the varnish slowly and thoroughly stirred in. It is recommended that 63 degrees benzine be used for this purpose.

When varnish is applied by dipping, best results can be obtained by placing armature and field coils in an oven for two to four hours before immersing same in the varnish. After this preliminary baking, the coils should be taken from the oven and dipped at once in varnish, allowed to drip over the dipping tank and again placed in the oven and thoroughly baked. In following this method the first cost of treating coils is slightly increased. The value of this treatment, however, is apparent. The moisture is driven out, the air in the coil expanded, allowing proper penetration, and the coat of varnish given the coil immediately upon taking from the oven, effectually prevents further absorption of moisture. The life of apparatus thus treated is considerably lengthened.

The oven in which the work is baked should be ventilated at the top to permit the escape of gases which form while the varnish is in process of drying. Provision should also be made for the ingress of air at the bottom of the oven, thus permitting free circulation of fresh air with its accompanying oxygen over the work to be dried. In this manner more thorough and quick drying results can be obtained. Uniformity of heat throughout the oven is essential, and this is accomplished by placing the pipes which carry the heat near the floor and on all sides of the oven. Steam or electric heat is best suited for drying the varnish on account of the dry quality of same. Care should be exercised not to overbake the varnish, otherwise its elasticity will be destroyed.

It is recommended that a hydrometer and a thermometer be used, the former to determine the specific gravity of the varnish, and the latter as a precaution against overbaking.

### CONSOLIDATION IN ATLANTA.

The Georgia Railway, Gas & Electric Co., which is a consolidation of the Georgia Electric Light Co., the Atlanta Railway & Power Co., and the Atlanta Rapid Transit Co., has been incorporated by H. M. Atkinson, P. S. Arkwright, R. E. Cullinane, S. J. Bradley, M. B. Lipscomb, F. M. Sisk, J. G. Rossman, J. R. Hunter, and W. B. Stovall, all of Atlanta.

The new company is to have a capital stock of \$3,000,000 of which \$300,000 is to be preferred. The length of track over which this company is to operate is about 140 miles.

The city council of Atlanta made a vigorous protest against the granting of this charter but the secretary of state was advised by the attorney general that under the law he could not refuse to issue a charter if it had been applied for in a legal manner and if it complied with the provisions of the general law. One of the particular objections urged against the charter was that the term of 101 years applied for is too long, but this term is permitted to all companies applying for a charter in that state.

A car containing 15 passengers, on the innerurban electric line between East Liverpool and Wellsville, O., on January 28th narrowly missed being demolished by an avalanche of boulders, trees and earth which buried the track to a depth of 50 ft. The car missed the full force of the land-slide by only a few feet.

**PROPOSED TUNNELS FOR NEW YORK.**

New York City has waited long and patiently for adequate transportation accommodations but now with the rapid transit subway well on toward completion, \$30,000,000 of new securities in sight for equipping the remaining 100 miles of horse railways for electric traction and the elevated roads in process of change to electric operation, it appears that the desired era is close at hand.

This is true not only of the carrying facilities within the city limits but also applies to the means of communication with other places outside the city.

Nearest in point of completion are the plans of the New York Central management for equipping electrically its tracks entering New York from Mott Haven to 42nd St., through the Park ave. tunnel. The unfortunate collision in the tunnel last month has hastened action on this matter and we are informed by Mr. B. J. Arnold, who has been retained by the New York Central as consulting electrical engineer, that complete plans have been prepared for operating at least the two outer tracks of the tunnel section by electricity. It is also stated that suggestions have been made and are under consideration for running and lighting the entire tunnel section, including the two inner as well as the outer tracks with electricity.

The New York Central management has authorized the following statement:

"The company now confirms the statements made from time to time in the public press that it has been preparing plans for the enlargement of the facilities of the Grand Central Station and changes in the methods of using the Park Ave. tunnel so as to meet the demands of a constantly increasing traffic, and provide for the convenience of the traveling public. The best method of improvement, and one which the company desires, would be the abolition of the tunnel and making in its place an open cut, similar to that south of 56th St., but this, on account of the opposition it has encountered, has been impossible of attainment up to the present time, and therefore, after a thorough investigation of the subject, it was determined that the most practicable plan for caring for the enormous passenger traffic concentrated in the Grand Central Station would be the construction of a loop station under the present terminal, so that the suburban trains could be operated by electricity through the existing side tunnels, to be equipped with the most modern appliances for underground traction, and to the accomplishment of this plan the efforts of the company have for some time past been directed. In this way the passenger facilities of the present station would be nearly doubled, and, with the suburban business thus provided for, the through passenger and mail business can be moved through the center tunnel with promptness and regularity, which is very important to the traveling public, the city and the railroad.

Before determining that electrical or some other power shall be substituted for steam on all trains entering the Grand Central Station, it must be demonstrated that the business can be safely and promptly handled in that way; therefore it is contemplated to make the experiments in the side tunnels and the underground station."

Of other schemes for connecting New York with New Jersey and Long Island, reference has been made in previous issues of the "Review."

The most important of these is the proposal of the Pennsylvania Railroad Co. to build a tunnel under the North and East Rivers New Jersey with a mammoth union station to be built in the heart of Manhattan Borough and also affording an entrance for the Long Island R. R., which is controlled by the Pennsylvania company, into Manhattan. In reference to this President Cassatt, of the Pennsylvania R. R., has said: "After years of exhaustive study the conclusion has been reached that a tunnel line, operated by electricity, is in every way the most practical, economical, and the best both for the railroad company and of the city. The line, as adopted, will traverse the city of New York from the Hudson River to the East River, and be underground throughout, and at such depth as not to interfere with the future construction of subways by the city on all its avenues, similar to the one now building along Fourth Avenue."

There is a well established rumor that the Pennsylvania's plans for subterranean railroading include a second tunnel under the East River from Long Island to the mainland north of Manhattan for the purpose of connecting the Long Island R. R. with the New York, New Haven & Hartford road, thus giving the Pennsylvania R. R. an outlet to New England. This scheme as yet lacks official confirmation.

Still another tunnel under the Hudson River, is promised within two years, this one to join the lines of the North Jersey Street Railway Co. at Jersey City, with the Metropolitan lines on Manhattan Island. Work on a tunnel of this nature was commenced in 1874 but was abandoned in 1892. The Metropolitan Street Railway Co. has purchased property near the Hudson River front at 13th and 14th Sts. and it is believed this purchase has been made for terminal purposes and that all the cars of lines in the northern counties of New Jersey Street Railway Co. will soon have entrance direct into New York.

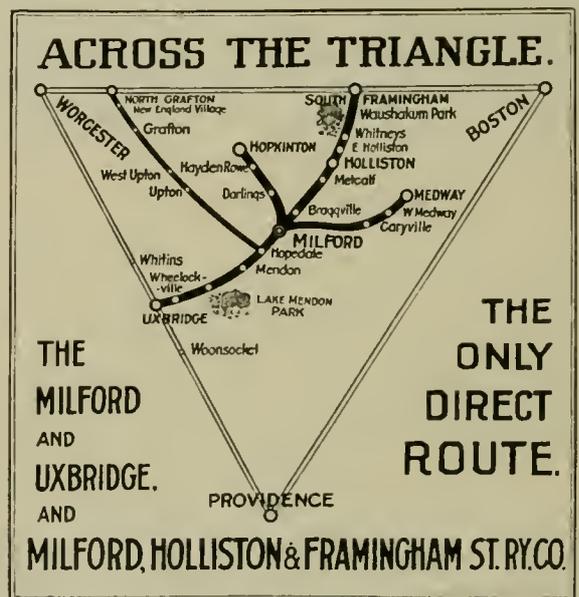

The Broadway extension of the New York Rapid Transit Subway which is to run from the Manhattan City Hall, under Broadway to the Battery, and under the East River to the Brooklyn City Hall, has received full legislative sanction and will be in operation, it is officially stated, by the time the main underground road is completed.

Apropos of this subject the new East River Bridge with its double set of electric railway tracks within two years or less should be carrying its share of the daily rush between Manhattan and Brooklyn.

And finally comes the statement of Bridge Commissioner Lindenthal that the old Brooklyn Bridge is to be practically rebuilt by constructing another deck of tracks over the existing roadways.

**ATTRACTIVE TIME TABLE FROM MILFORD, MASS.**

Following the example of many other electric roads, the Milford, Holliston & Framingham Street Railway Co. has issued a series of time tables closely resembling the form usually adopted by steam railroads. The names of stations, and arriving and leaving times

for all cars are given in vertical columns, together with the connections that can be made with intersecting steam roads and other electric lines for prominent near-by points. The folder contains two maps, one showing on small scale the territory covered, and the other on a larger scale and giving all the stations on the road with the principal connections.

The Brooklyn Rapid Transit Co. proposes to expend \$15,000 before May 1st in furnishing club rooms for its employes in the large depot building at Ridgewood.

**BOSTON TRANSIT COMMISSION.**

The seventh annual report of the Boston Transit Commission for the year ending August 15th, 1901, has just been issued. The work of this commission previous to the present year has been described in the "Review" for February, 1900, page 96, March, 1900, page 121, and February, 1901, page 113. The following summary gives a condensed statement of the expenditures of the commission from the beginning of the work to the close of the last fiscal year. The term of office of the commission will expire July 1, 1902, but the East Boston tunnel will not be completed at that time. June 15, 1903, is the date fixed by contract for the completion of the section under the harbor; other sections still remain to be contracted for.

The East Boston tunnel was begun in May, 1900, and about one-fifth of it is now substantially completed. The walls of this tun-

**SUMMARY.**

	From beginning of work to Aug. 15, 1900.	Aug. 15, 1900, to Aug. 15, 1901.	Total.

nel, including the upper arch and the invert, have been made of fresh concrete resulting in a monolithic structure. This is believed to be the first successful example of walls made of fresh concrete in connection with shield tunneling. The accompanying illustration shows a view in section A of the East Boston tunnel under Maverick Square. The shield used for boring this tunnel was brought to the work in two sections in such shape that they could be easily lowered into position and assembled on top of the finished side walls in the shaft. When the shield was assembled and riveted, 16 hydraulic jacks were placed in the openings prepared for them and connected with pumps which were placed in the shield. The latter rests on 16 iron rollers, 8 on each side, which in turn rest on steel plates placed on top of the side walls. These plates are

flanged to act as a guide to the shield when moving. The rollers are 8 in. in diameter and 16 in. long.

The shield was moved to the bulkhead, the latter was removed and the shield forced into the bank by the jacks thrusting against 12-in. square timbers arranged so that the pressure was transmitted directly to the arch of the completed section A. The shield was forced into the bank its full length, the interior earth being removed as the shield advanced. The excavation of the core is done at the same time the arch is being built. The invert is excavated and concreted in 10 ft. sections at a distance of about 20 to 30 ft. back of the shield. The side drifts and walls are kept uniformly about 100 ft. in advance of the shield. These methods of operation have been maintained with but little change from the beginning.

When the shield had been advanced about 230 ft., work was suspended for two weeks to put in three air locks. These are vestibules through which men and materials must pass in coming from the free air to the compressed air and in returning. One of the two doors of the lock must always be closed to prevent the escape of compressed air. During the operation of coming in, both doors are for a time tightly closed, and by means of valves the air within the chamber is gradually brought to the pressure of the compressed air when the inner door may be opened. In coming out the reverse process is followed. The time usually taken by the men in passing through the lock is about one minute. The air pressure used in this work at first was only 5 lb. per sq. in. above the atmosphere. This pressure was gradually increased each day until 18 lb. was reached, and a still greater pressure will doubtless be required later.

As was expected, the use of compressed air lessened the settlement of buildings and of the street. It also lessened very appre-

EAST BOSTON TUNNEL UNDER MAVERICK SQUARE.

ciably the stress on the drift timbers caused by the surrounding earth. As soon as compressed air was used the temperature inside advanced to 82 degrees at about which point it has since remained. Another feature intending to increase the warmth inside the tunnel is the heat produced by chemical action in the concrete. The rise in temperature in the middle of the walls two days after the concrete sets is 40 degrees above that of the air in the tunnel. About 12 days after setting the temperature recedes to that of the air.

At the time for which the report is issued (Aug. 15, 1901), 636 ft. of the masonry structure was completed. Some changes were made during the year in the subway near Pleasant St. As originally built, the southern end of the subway was an open four-track inclined bridge which permitted the street surface cars to descend to and into the subway and vice versa. The change in this locality was made for the purpose of enabling trains from the elevated railway to go under Pleasant St., and enter the subway. The change consisted in lowering the grade of the extreme easterly and westerly inverts so as to connect them with the lower end of the incline bridge leading from the elevated structure to the subway; and building an island platform for the use of the elevated roads between the two tracks. The use of the two inside tracks has been abandoned.

The Seattle Electric Co. has opened its new Fremont Ballard division for general traffic.

### NILES CAR WORKS.

The Niles Car & Manufacturing Co. of Niles, O., now has its plant in operation and announces that it is prepared to bid upon and furnish all classes of rolling stock for electric and steam railways. Some interesting particulars concerning the company's plant, which has an aggregate floor space of seven acres, were given in our issue for June, 1901, page 305. The officers of the company are: President, George B. Robbins; vice-president, A. B. McCorkle; secretary, C. P. Souder; treasurer, William Herbert; general manager, W. C. Allison; assistant general manager and contracting agent, George E. Pratt; general superintendent of works, A. L. Jacobs.

The management has made a point of securing for assistant superintendents and foremen men who have had extensive experi-

NILES CAR WORKS.

ence in large car manufacturing plants. Thus, A. W. Scholl, assistant superintendent, was with Jackson & Sharp for 11 years and with the Pullman company for 11 years; Fred McBrien, mill foreman, has for years been with the Pullman and the American Car and Foundry companies; John Meek, foreman of the paint department, and W. F. Ray, foreman of the construction department, have both had long experience in such work.

Among the orders the company now has in hand are the following: Aurora, Elgin & Chicago, 30 motor cars; Western Ohio Ry., 20 motor cars and 4 work cars; Wisconsin Construction Co., 6; Alliance (O.) Electric Ry., 6; Toledo Railways and Light Co., 20; Detroit United Ry., 45; Louisville, Anchorage & Pewee Valley Electric Ry., 15 ten and twelve-bench open cars, for early spring delivery.

### MOTORMEN ON LOUISVILLE RAILWAY CO.

The selection and training of motormen on the Louisville Railway Co., of Louisville, Ky., is carried on under a rigorous system in regard to which Mr. J. T. Funk, superintendent of the company, has furnished us with the following particulars. The rules governing the positions are stringent and competition for the places is so keen that only well qualified men have a chance. When a man presents himself for the position of motorman he is first interviewed by Mr. Funk, who judges from his personal appearance and intelligence whether the applicant will be considered or not. If his application is taken into consideration he first must furnish references. These must be good ones for steadiness of character, sobriety and honesty. The next step in his selection is an examination by the company's doctor to determine whether he is physically fitted for the duties of a motorman. The regulations in this respect are even stricter than in the army. The applicant must be at least 5 ft. 8 in. in height and not over 6 ft. His weight must be between 155 and 190 lbs., which limit is occasionally extended to 200 lb. in the case of a heavily built but well proportioned man. His sight and hearing are also subjects of special attention. The applicant must be over 21 and under 35 years of age, and his temperament is also taken into account. If he be excitable or nervous he will not be passed by the examiners.

After passing these requirements the applicant is taken to one of the car barns and started to work in the car pits. He is instructed by the inspector about the care of the cars and machinery, how to dismount and put the motors together, how to replace fuses, to operate switches and all of the practical work of managing the controllers and brakes. His apprenticeship in this work lasts from

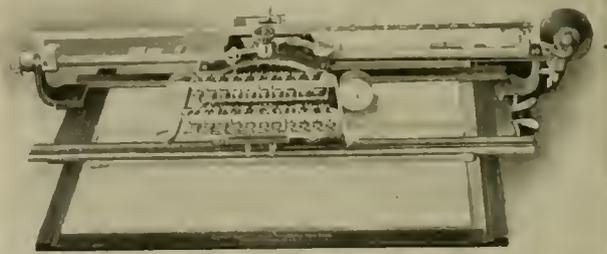

ten days to three weeks, according to his ability, and he is then put upon a car under the guidance of an experienced motorman, who stands beside him and teaches him exactly how to operate. When he is reported competent by his instructor on the car he makes a trip under the supervision of one of the head motormen or superintendents and if he shows proficiency in handling his car he is given a place on the extra list and his pay begins. There is always a long extra list at the car house, but this list is constantly changing, as when one of the regular men is, for example, two minutes late he is dropped from the regular list to the bottom of the extra list and is replaced by the man at the head of the extra list, so that a man starting on the extra list with a number ahead of him may, in the course of a few weeks, be assigned to regular duty on a car. He must always be on time but never ahead of time, for that means dismissal.

Under these stringent conditions it is readily seen that the fact that a man has obtained a position on the Louisville Railway Co. is a certificate as to his good references, sobriety, fair education, punctuality and honesty.

### THE TYPEWRITER IN ELECTRIC RAILWAY WORK.

During recent years the increase in clerical work incident to all departments of the street railway business has developed a demand for more improved methods of preparing and handling pay rolls, mileage records, way and freight bills on roads that do a freight and express business, and the numerous other forms and statements incidental to railway requirements. For the purpose of filling these particular needs the Elliott & Hatch Book Typewriter Co., of 256 Broadway, New York, supplies a typewriting machine claimed to meet all the requirements of ordinary correspondence or commercial work and in addition having certain simple attachments which will reduce to a minimum the labor and time necessary to making tabulated statements, reports and records of almost any conceivable nature. It will accommodate a sheet of any width without the paper being folded and will write a line from 1 to 21 in. long. It will also write on the pages of a book as easily as it does on a detached sheet, and will accommodate any sort of blank or record book regardless of binding or size. This is accomplished by using a special self-adjusting table for the machine so that the book will always rest with the page to be written upon perfectly flat.

By a scheme for holding a roll of carbon paper manifold copies of all writing can be taken with minimum labor and 15 to 20 legible copies may be secured at one time. Ordinary letters in this way can be copied directly into a copy book at the time they are

BOOK TYPEWRITER.

written and all the work and annoyance of press copying letters, way bills or other records is entirely obviated. A dozen or more envelopes may be placed in the machine at one time, or cards of any dimensions or thickness may be written upon to the extreme top or extreme bottom.

Among the companies using the Elliott book typewriting machine are the following: United Traction Co., Pittsburg, Pa.; North Jersey Street Ry., Jersey City; North Hudson Ry., Hoboken; Pennsylvania Steel Co., Steelton; Consolidated Traction Co., Pittsburg; Union Traction Co., Philadelphia, Pa.; Manhattan Ry., New York City; American Steel & Wire Co., Chicago, Ill.; Westinghouse Companies, Pittsburg. The makers will send catalog on request.

## OHIO NOTES.

One of the recent electric railway corporations is the Wooster & Mansfield Electric Railway Co., of Shreve, O. The capital stock is \$30,000.

In the case of the Mill Creek Valley Electric Railway Co., which has been seeking entrance into the city of Hamilton, and which company had bought a number of consents from property owners, the circuit court of that district holds that such consents when purchased are not legal and that the withdrawal of consents just before the passage of a franchise is legal. Both of these charges against the company have been sustained and the road can not get an entrance into the city at present.

The Columbus, New Albany & Johnstown Electric Railway Co. is now operating its cars out as far as Gahanna, about eight miles from the center of Columbus. It has also secured the contract for the delivery of the mail along the route and the intervening hamlets are now enabled to enjoy a mail service that is a great improvement over the old order of things.

The Columbus, Newark & Buckeye Lake Company has completed the laying of ties and rails. A good part of the wiring is also up. The authorities are now promising the completion of the road from Columbus to Newark by the middle of May. The Swick House at the Licking Reservoir has been leased and about \$15,000 in improvements will be expended on the building and other improvements will be made in order to make it a fine summer resort.

At a recent meeting in Cleveland of the directors of the three electric railways known as the Cleveland & Eastern, Cleveland & Chagrin Falls and Chagrin Falls & Eastern, it was decided to merge the properties into one company to be known as the Eastern Ohio Traction Co., capitalized at \$2,500,000.

The Toledo, Fostoria & Findlay Electric Railway Co. has made an application to the city council of Fostoria for a franchise for lighting the city and for the establishment of a steam heating plant.

The Columbus Street Railway Co. has just recently put in service the last five of the twenty new cars ordered for winter use. The company has ordered twenty new summer cars which are to be delivered by the middle of May; these will be the long pattern with vestibules and are made to seat 60 passengers. They will have double trucks.

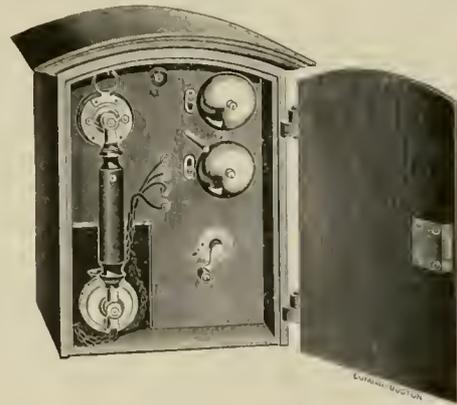

At the annual meeting of the stockholders of the Dayton, Springfield & Urbana Electric Railway Co., it was decided to double track the road between Dayton and Springfield in accordance with the plan to operate through cars between Columbus and Cincinnati. The directors of the road elected were F. J. Green, C. A. Alderman, Adolph Newsadt, John S. Harshman, John G. Webb and A. E. Appleyard. John S. Harshman was elected president; John G. Webb, vice-president; A. E. Appleyard, treasurer, and John G. Webb, secretary.

### EXTENSION OF THE HAROLD P. BROWN FACTORY.

Harold P. Brown is building a large brick extension to his factory at Montclair, N. J., in order to keep pace with the increasing demand for the Edison Brown rail bonds. He is also putting in a new boiler and engine, which will increase the power capacity 100 h. p., and a lot of new machinery, which will permit the output to be doubled for the coming season. Mr. Brown advises us that the reports which have been made of the recent tests of the 7 $\frac{1}{2}$ -in. "Plastic Plug" bond upon the test bond track of the Baltimore & Ohio belt line, from Mt. Royal station, have been surprising. This is the portion of the track having the severest service, since it is up hill and around several curves, and hundreds of freight cars pass every day, and the return current varies from 1,200 to 2,800 amperes. The conductivity of the plastic plug bonds averaged more than half that of a 60 lb steel rail, and was more than five times that of the flexible copper bonds on the remainder of the track, which were 300,000 c. m. in section with two bonds per joint. In spite of the severe weather and heavy traffic, none of the plastic plug bonds has given trouble. This type of bond is being very largely used both for new work and for rebonding, and even at the present low price of copper it is cheaper than any other type of bond of even half the conductivity.

## STREET RAILWAY TELEPHONES.

On suburban and interurban railways where many of the lines are single track the telephone has become almost indispensable. These are placed at each turnout or instrument are carried in each car which can be connected with the line parallel with the roadbed either by plug boxes located at intervals on the poles or by a jointed pole which connects with the overhead wires. In order that the telephone may be of value for street car work it is absolutely essential that the transmitters used for this purpose be entirely reliable. If a single instance occurs where the telephone fails to work

at a critical moment the whole telephone system is condemned by the entire force from the superintendent to the motorman.

The accompanying illustration represents a transmitter made by the Ericsson Telephone Co., of 296 Broadway, New York, which, it is claimed, will avoid any chance of failure. This transmitter is proof against moisture, dust, etc., and it is also one that will not pack when left undisturbed for a considerable space of time. The Ericsson telephone is used extensively on account of the latter quality and the company invites the investigation and inspection of this apparatus by all persons interested.

### SILLS-EDDY MICA CO.

The mica products made and handled by the Sils-Eddy Mica Co., of 31 Broad St., New York City, have steadily gained in favor until now they are used exclusively by several hundred street railway companies and manufacturing houses. This company sells India and amber mica in practically every conceivable form, in cut and uncut sheets, thick and thin, stamped, powdered, for all purposes and in segments of all shapes and sizes.

Powdered mica will be found useful for making lubricants, foundry facings, linings, etc.

The Sils-Eddy company makes a specialty of selecting from sheet mica pieces that will cut specified or special sizes with the least waste, and sells solid mica rings, solid mica segments, mica washers, mica disks, etc.

It also handles insulation material in various forms as, commutator rings, washers and tubes, paper and cloth, and similar sundries used in the electrical trade. All its insulation is stamped with the name of "Micabeston," which name the company holds is a guarantee of strength, finish and adaptability.

The company in addition to its New York offices has offices and warehouses at 31 Clark St., Chicago, and factories in Newark, N. J., and Ottawa, Ont., Canada.

### NEW YORK STATE BLIZZARD.

A blizzard which swept northern, western and central New York, Feb. 3d and 4th, resulted in tying up both steam and street railway traffic in many places. In Albany, trolley wires were torn down by the wind; in Ithaca, street cars were blocked for several hours and the whole city was in darkness, and in Utica, cars were operated at irregular intervals during the storm. The Dunkirk & Fredonia Railroad Co. abandoned its cars and used covered sleighs for the accommodation of passengers. The wind's maximum velocity was 52 miles an hour and it blew at an average rate of 40 miles for 30 hours.

### INTERURBANS TO ENTER CINCINNATI.

A bill providing for common terminals for interurban roads within cities has been introduced in the Ohio legislature which has for its object the admission of interurban traction lines into Cincinnati. The bill authorizes the incorporation in any city of Ohio of a company for the purpose of building stations, switches, tracks, subways, elevated ways, power plants and other equipment upon the streets, alleys and public places of any such city, for the use of interurban roads. The company must make application to the governing power of the city for a franchise and such a franchise can only be granted after competitive bidding. The franchise must fix the terms upon which the interurban roads can use these tracks, and the revenue to the city. The bill also provides that the franchise shall limit the occupancy of streets and other public property so as to avoid interference as far as possible with the operation of any street railway in actual operation at the time of granting the permission. Companies organized under the bill shall have power to enter upon and appropriate rights of way over private lands in the same manner as this power is exercised by steam railroads. In almost all of the cities of the state except Cincinnati, the connecting interurban lines already have admission to the city. Cincinnati is peculiarly located and the situation there has been kept well in hand by the railroad interests at present in control. There are comparatively few entrances to the city on account of the hills, and all of the entrances available are pretty well covered by the local street railway lines.

One of the greatest difficulties that interurbans have in entering Cincinnati is the fact that the local lines are of the 5 ft. 2 in. gage while the outside lines are all standard gage. This precludes an entrance into the city over the existing lines. The only alternative under these conditions is to make arrangements by which transfers can be effected with the local lines at the city limits.

The interurban lines desiring an entrance into Cincinnati are united in their desire to have the bill passed. The roads that will be affected by the bill if it becomes a law are the Southern Ohio Traction Co., the Cincinnati & Eastern Electric Railway Co., the Suburban Traction Co., the Rapid Railway Co., the Cincinnati & Columbus Railway Co., the Cincinnati, Lawrenceburg & Aurora Electric Street Railway Co., and the Ft. Wayne, Dayton & Cincinnati Traction Co.

### PENNSYLVANIA REPORT.

The annual report of the Bureau of Railways of the Pennsylvania Department of International Affairs for the year ending June 30, 1901, gives the following data on electric railways: Total length (single track) of lines in the state, 2,167 miles. Passengers carried during the year, 580,654,629. Cost of roads and equipment, \$94,616,246. Total earnings from operation and income from other sources, \$27,308,143; and total disbursements \$26,042,617. Number of cars owned by street railway companies, 6,618. Number of persons employed, nearly 16,000, receiving a compensation of \$8,745,024. The number of passengers killed was 33; injured, 1,050, and the number of employes killed, 14, and injured, 129. The roads carried 42,460,997 more passengers in 1901 than in 1900.

### A PECULIAR ACCIDENT.

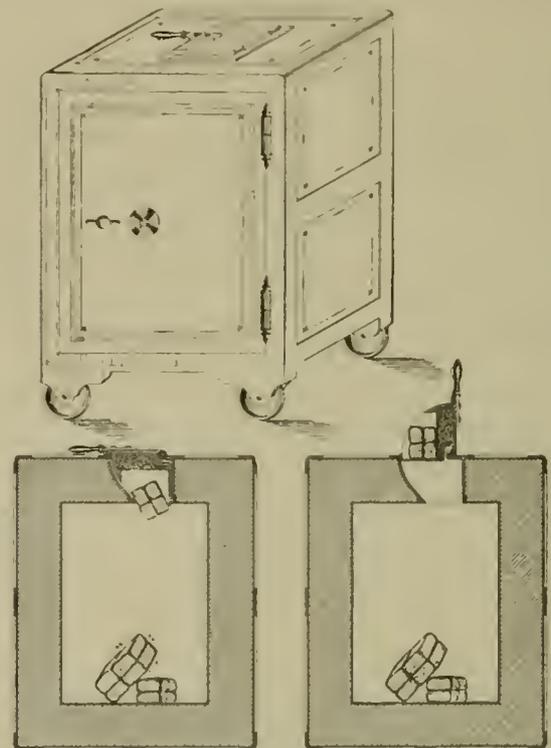

Two fatal accidents on electric cars happened within a few minutes of each other on the evening of January 29th between East McKeesport and Wilmerding, Pa. There is a hill a mile and a half in length between these places, and a car which became unmanageable on this grade ran down it at a high speed, jumped the track and crashed into the Wilmerding station of the Pennsylvania railroad. The platform of the station was torn up and the side of the building smashed. While the crowd was gathering about the wreck a second car, twelve minutes later, rushed down the same hill, beyond control, and crashed into the first car and the crowd surrounding it. Three people were killed and seven seriously injured, some of them being passengers and the others simply onlookers at the station. On its way down the hill the second car wrecked a carriage, fatally wounding the driver.

### FIRE-PROOF CONDUCTORS' SAFE.

A strong fire and burglar-proof receiving safe for the daily receipts of a street railway company would seem to be an absolute necessity and it is somewhat surprising that this matter is so frequently neglected. An ordinary tin box with perhaps a small chain running to the cashier's window is all too often made to do duty as depository for the conductor's daily cash.

To meet the special needs of street railway companies in this direction the Morris-Ireland Safe Co., of 64 Sudbury St., Boston, has perfected a receiving safe having a device which readily opens to receive the cash, but which prevents the money from being withdrawn except by one who knows the unlocking combination.

The money, which is put into small bags and tied up by the conductors, is deposited through the top of the safe in a small box or compartment that is first lifted by means of a handle. When the handle is released the weight of the cash carries the box down, allowing the bag to drop through an opening in the bottom of the box to the bottom of the safe. The dimensions

CONDUCTORS' SAFE.

and arrangement of the receiving box are such that even if a bundle of the money were drawn to the top by means of a wire or other implement it could not be drawn through the opening.

The safe has all the recent improvements found on regulation office safes. It has combination lock, eight flanges, angle front and back, patent inside bolt-work, tongue and groove malleable hinge, and other appliances to make it fire and burglar-proof. It can be supplied in several sizes.

The company has furnished these safes to over one hundred city and interurban roads, including the United Traction Co., of Albany, the Boston Elevated, the Milwaukee Electric Railway & Light Co., the Metropolitan of New York, the Holyoke (Mass.) Street Ry., the Bridgeport (Conn.) Traction Co., the Springfield (Mass.) Street Ry., and other roads both large and small.

The Central Traction Co., which is building an electric line from Noblesville, Ind., to Indianapolis, has completed grading for a distance of 12 miles. Contracts for ties have been awarded and specifications are being prepared for the large power house to be erected at Noblesville.

### SIGNAL DEVICE FOR SUBURBAN LINES.

An automatic signal device has just been built by the Michigan Electric Co. for Capt. C. P. Bass, of Portland, Ore., which has a number of commendable features. The device consists of electric switches which are worked automatically by the trolley and which are contained in two wooden boxes about 1 ft. long, 8 in. high and 6 in. thick. There is also a relay, or counting box as it is called, and a signal board containing six red incandescent globes and the necessary wiring.

If it is desired to operate the signals between two switches on a suburban line one of the boxes is placed near the trolley wire just beyond the junction of each switch. When the car passes the trolley strikes a small iron lever extending from the bottom of the box which is thrown upwards and throws the current on a pair of lamps attached to a pole near the next switch, which may be a long distance away. This is a warning to any car approaching in the opposite direction that another car is between the two switches. The motorman of the former car will stop on the siding until the second car passes which, striking a second box extinguishes the light. If a second car should come before the first car reaches the meeting place, another pair of lamps would be lighted and the motorman waiting on the switch would know that he had to wait for two cars. In the same way the approach of a third car would be announced.

A somewhat similar system but on a smaller scale, has been used in Portland, Ore., and other western cities for some time. The new system will be submitted to a test as soon as possible.

### CONSOLIDATION IN KENTUCKY.

The Blue Grass Consolidated Traction Co., of Lexington, Ky., has been organized under the laws of Kentucky, with a capital stock of \$7,000,000, and to be bonded for \$7,000,000, \$4,000,000 for construction and \$3,000,000 for taking over plants already constructed and in operation. The company proposes to own and operate all of the electric roads in the "Blue Grass" country, connecting with Lexington by suburban roads, Frankfort, Versailles, Richmond, Nicholasville, Paris, Georgetown, Winchester and Mount Sterling. Also to light by electricity all of these towns, and all of the blue grass country, and to make the artificial ice and supply all of this territory. Also to make sterilized water and sell it in connection with ice, to have and own its own coal mines and transport its own coal. One central power house will be located in Lexington with sub-stations at the different towns. It is also expected to furnish power for manufacturing plants. The company has been organized, the state franchise fee paid, and the franchises secured, which are very liberal and give three years for building. Options have been secured on nearly all of the plants to be taken over, which consist of railways, electric lighting and ice plants. This company will serve some 200,000 people.

The officers are: Geo. B. Davis, president and general manager, 622 Hammond Bldg., Detroit, Mich.; M. C. Alford, vice-president, Lexington, Ky.; H. C. Beatty, secretary, Lexington, Ky.; Paul Sheldon, treasurer, 44 Wall St., New York.

### LOUISVILLE RAILWAY RELIEF ASSOCIATION.

The Louisville Railway Relief Association, which has for its object the payments of sick and death benefits to its members, has issued its annual report for the year ending Dec. 31, 1901. This association has steadily grown both numerically and financially since its organization and the good that it has achieved during the past year will be appreciated when it is considered that more than \$1,300 have been paid in sick benefits and \$600 in funeral benefits. The perpetuity of the institution is now well assured and it has long since ceased to be regarded as an experiment. The cost to individual members has been but small, but at the same time the relief afforded has been very great. The total receipts of the association during the past year, including interest, amounted to \$2,788. The total disbursements for benefit, including general expenses, amounted to \$2,305, leaving a surplus of \$483. This, in addition to the surplus at the beginning of the year, \$1,040, leaves \$2,423; with which the association begins a new year.

### NEW INTERURBAN AT NASHVILLE.

The Suburban Street Railway Co. which recently obtained a charter for electric railways through West Nashville, Tenn., and other suburban towns, has elected the following officers: T. J. Felder, president; D. C. Buntin, vice president, and Thomas Taylor, secretary and treasurer, and these, with John M. Gray, Jr., B. F. Wilson, L. K. Whitworth, S. J. Keith and A. H. Robinson, directors. The company is capitalized at \$50,000. Surveys for the proposed lines are under way and contracts will soon be awarded.

### ROCHESTER-SYRACUSE ROAD PROGRESSING.

The Rochester, Syracuse & Eastern Railroad Co., which was incorporated November 7th last, was given a hearing before the railroad commissioners on February 6th and expects to proceed at once with the construction of its line for which preliminary surveys have been completed, and which will approximate 100 miles in length. The majority of the company's capital stock of \$3,500,000 is said to be owned by Syracuse business men, and it is stated that the management and headquarters of the company will be permanently located in Syracuse. The officers are as follows: Lyman C. Smith, president; Willis A. Holden, vice-president; Albert K. Hiscock, treasurer; Charles A. Lux, of Clyde, secretary, and C. D. Beebe, general manager. The route includes Fairport, Macedon, Newark, Palmyra, Lyons, Clyde and Savannah, and will open a rich agricultural territory of over 75 miles' extent which has had heretofore not even a promise of electric railway service. Exclusive of its terminal cities, the interurban will traverse a district with a population of 600,000 inhabitants. It is expected to have the road in operation for the entire distance between Rochester and Syracuse by the spring of 1903. Cars will be operated at the rate of 50 miles per hour.

### JOLIET-LA SALLE INTERURBAN.

The Illinois Valley Traction Co. has been granted a charter to build electric railways connecting Joliet, Princeton, Ottawa, Streator and La Salle, and has filed petitions for franchises in La Salle and Bureau Counties. The company has a capital stock of \$500,000, of which all but \$5,000 is owned by T. G. Woods, who with W. B. McKinley recently purchased the two gas plants at La Salle and will consolidate them. Mr. McKinley, George T. and N. W. Duncan, W. B. Brinton and E. Woodman are principally interested in promoting the Illinois Valley company and have announced that they expect to have the road in operation within six months. General offices will be located for the present in La Salle.

### DAVENPORT-MUSCATINE INTERURBAN.

A new interurban railroad company has been organized to build an electric line between Davenport and Muscatine, Ia., a distance of 29 miles. The new road will also include a local line in the city of Davenport. The company has a capital of \$500,000 which has been subscribed by local capitalists and is now busy securing its franchises. Private rights of way in the country are also being purchased. The line has already been surveyed and the steepest grade on the route is 5½ per cent.

The officers of the company are: President, Edward Doherty; vice president, C. G. Whipple; general manager, D. A. McGugin; treasurer, August Steffen; secretary, A. Afterhaddy. Mr. McGugin is an experienced contractor and railroad man and has been connected with the building of a number of electric roads in Michigan and elsewhere.

### TROLLEY BRINGS CROWDS.

The application of the Nyack (N. J.) Electric Railroad Co. for rights to build an electric line from Nyack to Sparkill has been indefinitely held up. The district is settled by wealthy families, and many people appeared at the hearing to oppose the application because they fear it would bring too many excursionists to the place in the summer.

### KITTANNING & COWANSHANNOCK VALLEY STREET RAILWAY CO.

This company has been incorporated in Pennsylvania to build and operate an electric railway connecting Forge City, Kittanning, Greendale, Yatesboro, Rural Valley, Meredith and Plumville, Pa., three of which places are towns of considerable size. The lines will be 14 miles in length, of which two miles will be city track and 12 miles interurban line.

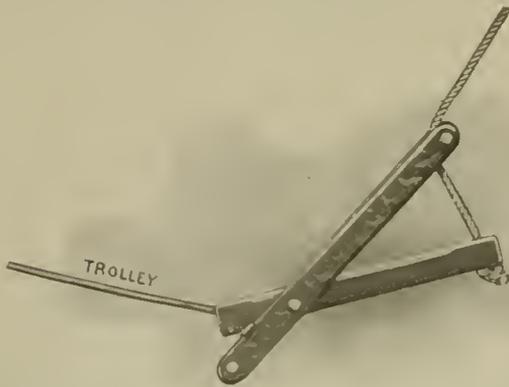

The officers of the company are as follows: President, Charles Dunbar, Allegheny, Pa.; vice-president, Henry Schill, Rural Valley, Pa.; secretary and general manager, George S. Caruthers, Standard Building, Pittsburg, Pa.; treasurer, Charles Colwell, Kittanning, Pa. The capital stock is \$75,000, issued in shares of \$50 each. There will probably be a bond issue of \$225,000. The contract for the new road is to be let about March 15th. The company proposes to operate four closed and four open cars, which will be from 40 to 50 ft. combination freight and passenger cars, and the line will be operated from one power house, the location of which has not been decided.

It is also proposed to establish an up-to-date park for picnic and summer amusement purposes and if possible, traffic rates will be secured from the Pennsylvania R. R. for picnic parties and for transfer of freight.

The project is being backed chiefly by local parties and the stock will be subscribed and paid up by residents along the proposed road. The road opens up a new territory hitherto shut off from railroad service and will serve a large population without competing with the steam roads in its neighborhood. It is expected that the road will be completed and in operation within the present year.

### THE "G.-D." TROLLEY PICK-UP.

The accompanying illustration shows a new device recently put upon the market by the Garton-Daniels Co., of Keokuk, Ia., for temporarily suspending trolley wires in case of a break on the line. As will be seen from the illustration, the device forms a pair of wooden tongs by which the end of the trolley wire may be grasped, and by means of the cord attached to the other end of the tongs the

wire may be elevated with the broken ends suspended in the air, thus opening the circuit and permitting the operation of cars. The method by which the wire is grasped by the tongs is clearly shown in the illustration. The rope is fastened securely to one handle and passed through a loop in the other handle, and by throwing the rope around a pole or over a guard wire and pulling the broken wire taut the handles of the tongs are pulled together, securely grasping the wire in the jaws at the opposite ends, which are notched to receive it. The device folds up, measuring but 18 in. in length and 4 in. in diameter when folded. Its weight is but 3½ lbs., so that one or more may readily be placed under the car seats or elsewhere on a car out of the way.

All the horse car lines in Vienna, Austria, have been converted into electric railways. The change was completed January 28th.

The San Diego (Cal.) Electric Railway Co. has repaired its tracks and completed a number of improvements of the system. A new car, made by the American Car Co., of St. Louis, has been put in commission on the San Diego lines.

### STREET RAILWAY PATENTS.

This list of patents is furnished by T. Reed Clift, patent attorney, Washington, D. C., from whom copies of patents can be obtained.

No. 600,421, January 7, Edwin B. Green, Whiting, Ind. Railway switch.

No. 600,630, January 7, Fred P. Crockett and Osro P. Johnson, Kalamazoo, Mich. Trolley-harp.

No. 600,674, January 7, John H. Surtin, St. Louis, Mo. Car fender.

No. 600,742, January 7, George Kovacs, Trenton, N. J. Snow melter for railroad switches.

No. 600,757, January 7, Morris M. Nash, Lowell, Mass. Sleet cleaning device for trolley arms.

No. 600,760, January 7, Stephen H. Pocock, Hamilton, Canada. Car-brake.

No. 600,818, January 7, Andrew Ambuhl, Decatur, Ill. Ice cutter for trolley wires.

No. 600,922, January 14, Wm. F. Bossert, Utica, N. Y. Three-way railway switch.

No. 601,008, January 14, Wm. E. Schilling, Laporte, Ind., and Orville M. Ridgway, Kansas City, Mo. Device for operating street railroad switches.

No. 601,010, January 14, Carl Schwarz, Hancock, Mich. Automatic railway switch.

No. 601,086, January 14, John N. Valley, Jersey City, N. J. Elevated railroad.

No. 601,201, January 14, Henry S. Stier, St. Louis, Mo. Car brake.

No. 601,263, January 7, Albert W. Ham, Lausenburg, N. Y. Trolley tender.

No. 601,275, January 14, Washington H. Kilbourn, Greenfield, Mass. Trolley pole controlling device for cars.

No. 601,315, January 14, Edmond W. Jeter, Atlanta, Ga. Car fender.

No. 601,351, January 21, John A. Brill, Philadelphia, Pa. Convertible car.

No. 601,358, January 21, John L. Creveling, New York, N. Y. Means for driving dynamos from car axles.

No. 601,359, same.

No. 601,381, January 21, Appolinaris Hrebicek, Bingerbruck, Germany. Subterranean current transmission for electric railways or tramways.

No. 601,473, January 21, Claude M. J. Limb, Lyons, France. Electric traction system.

No. 601,625, January 21, Eugene Haywood, Chicago, Ill. Means for propelling cars.

No. 601,781, January 28, Charles J. Kintner, New York, N. Y. Means for automatically operating switches.

No. 601,808, January 28, Wm. B. Potter, Schenectady, N. Y. Collector for surface contact railways.

No. 601,820, January 28, Wm. F. Weiss, Camden, N. J. Car fender.

No. 601,848, January 21, Jas. D. Edwards, St. Louis, Mo. Brake.

No. 601,895, January 21, Arthur D. Coon, Ballston Spa, N. Y. Folding car step.

No. 602,046, January 28, Richard Bischoff, New York City, N. Y. Brake for street cars.

No. 602,050, January 28, Wm. A. N. Dorland, Philadelphia, Pa. Automatic switch controller.

No. 602,118, January 28, Arthur S. Clift, East Orange, N. J. Reversing device for overhead carriers.

No. 602,136, January 28, H. M. Harding, Englewood, N. J. Means for regulating speed of cars on overhead electric railways.

No. 602,137, January 28, H. M. Harding, Englewood, N. J. Support for controller or brake wires.

No. 602,187, January 28, Robert Smith and Henry W. Leonhard, St. Louis, Mo. Fender.

The Electric Railways Corporation, capitalized at \$100,000, has been incorporated in New Jersey, by Louis S. Phillips and Horace B. Hord, of 52 Broadway, New York City, and Suydam F. Wheeler, Commercial Trust Building, Jersey City, to examine and report on questions arising in connection with the organization, location, character, construction, traffic, etc., of electric railways.

#### CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

#### DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. XII.

MARCH 15, 1902.

NO. 3

The "Review" is on record in regard to the question of forming an association of the street railway manufacturers and supplymen who exhibit at the annual conventions of the American Street Railway Association, but in view of the action taken by the executive committee of the A. S. R. A., in disapproving a plan for an exhibitors' association recently laid before it the time is opportune for further discussion of the subject. The A. S. R. A. executive committee at its meeting in Detroit last month voted to make no change in the manner of handling exhibits and we understand that this vote was intended as a rejection of a proposal made to it. We do not know on whose behalf the plan was brought before the committee for action, but we understand that the scheme was in substance, as follows: That the entire matter of the exhibits and convention entertainments, aside from the banquet, be turned over to the supplymen, who acting through an association or a committee, would provide an exhibit hall at their own expense and also bear the cost of the various excursions and other entertainments, as is done by the supplymen at the annual conventions of the two steam railroad associations—the Master Car Builders' and the Master Mechanics'.

We are of the opinion that both the American Street Railway Association and the exhibitors will heartily approve of the action taken by the executive committee in regard to this proposal. This plan would have deprived the A. S. R. A. of an important source of revenue, that derived from the rental of space for exhibits, which is needed by the association and being a nominal charge, is not a burden on the exhibitors. The supplymen would also have the additional responsibility because of the general entertainments when the demand upon their time because of individual entertaining are already large. There is a difference in the conditions which should be borne in mind when drawing analogies between the methods of handling exhibits at the street railway and the steam railroad conventions. At the latter, usually held at summer resorts, Saratoga or Old Point Comfort, the hotels which are chosen as the convention headquarters, have halls suitable for the exhibits

or a sufficient shelter can be improvised with some lumber and canvas. On the other hand the street railway conventions are in large cities where finding an exhibition hall with the requisite space is more difficult and more expensive. Probably no body of street railway supplymen, as informally organized as such an association would naturally be or so few in number as its executive committee, would care to assume the financial responsibility of engaging the Coliseum in Chicago or Madison Square Garden in New York, for a week.

As was pointed out when the "Review" in the "Daily Edition" for Oct. 20, 1900, urged the advantages of a supplymen's association the function of the organization would be the handling of the details in connection with the exhibition, which until last year have always been put in charge of an official of the street railway company acting as convention host. This cannot but be recognized an imposition for we all know that street railway men have plenty to do without undertaking such additional work.

Everyone who attended the New York convention last October certainly appreciated the fact that the general arrangement at the hall and for the handling of exhibits were never before so satisfactory to all concerned. It was an object lesson as to what could be done by securing the services of an experienced man as director of exhibits, and one result was that the exhibitors at that meeting appointed a committee comprising representatives of a number of leading manufacturers and large exhibitors, to formulate a plan for a "Street Railway Manufacturers' Association." This committee has recently addressed a circular letter to the persons interested and will, we believe, be entirely successful in effecting a permanent organization at the Detroit convention.

To quote the committee: "The working committee of this association could confer with the executive committee of the American Street Railway Association, also with the committee in charge of the exhibits at the convention city. It is believed that arrangements could be made whereby a committee of this association could have full charge of installing exhibits, handling freight, decorating the hall, and all other matters pertaining to the exhibits. An experienced man could be engaged to go to the convention city some time in advance of the convention and make all necessary contracts and arrangements for the exhibits, engage carpenters, attend to the building of booths, put up signs, handle freight, etc. This manager would also remain after the convention to see that all goods were reshipped, and close up all matters pertaining to the exhibits." It is proposed to leave the matter of apportioning the expense for settlement at a meeting to be held in Detroit in October next.

Stress should be laid on the fact that this plan for a Manufacturers' Association does not contemplate any change from the present method of assigning space to exhibitors nor is it proposed to divert the revenue received for exhibit space from the treasury of the A. S. R. A. Space in the hall would be paid for as heretofore, the new association merely assuming the work of the director of exhibits.

Therefore we can see no reason why the Manufacturers' Association should conflict in the slightest degree with the A. S. R. A.; on the contrary the latter and the railways of the convention city would be relieved a great lot of detail work.

Elsewhere in this issue will be found part two of an article by Mr. W. E. Partridge on "California and Combination Cars." This article contains a very complete sketch of the various styles of cars containing both open and closed compartments, and shows that the use of this type is gradually spreading from California, where it was first put into operation, through the eastern part of this country, as well as to a number of places in foreign countries. The desirability of a car equally adapted to summer and winter use is entirely obvious from the standpoint of the railway company, but the discussion on the most desirable form of car for city service, following the paper on that subject by Mr. Chamberlain, read at the A. S. R. A. convention last October, emphasizes the fact that it is extremely difficult to establish any single standard type of car which is equally suited to all climates and all the dissimilar conditions and tastes throughout the different parts of the country.

The use of the convertible or combination car means a saving in the work of changing trucks and equipments from one style of car to another or of maintaining a double supply of equipments. Fewer

cars would suffice for the road, and the storage capacity of the barns could be considerably decreased. All these advantages would effect considerable economy in the original outlay for rolling stock as well as the labor account, and are therefore, much to be desired from the standpoint of the railway manager. But the ordinary style of open car with running boards along the sides is probably one of the most popular cars with the public during hot weather which has ever been produced, and it is questionable if any other style of combination or convertible car will ever attain the same degree of popularity for city service where only ordinary speeds are permissible. For high speed interurban work, however, the partially closed car has been found preferable, as the velocity and sweep of the wind in the open country makes a certain amount of shelter desirable, even in the hottest of weather.

The metric system is once more exciting considerable comment in this country. Bills are now before Congress providing that after a certain date the use of the metric system of weights and measures shall be compulsory in all departments of the Government and in all matters connected with construction or commercial operations other than those relating to public lands and surveying, and one of these bills provides that the metric system shall be "the" legal system of weights and measures recognized in the United States. The word "the" in this connection can only be considered as meaning "the only legal," inasmuch as the metric system was legalized in 1866 by act of Congress, and were the pending bills to become laws the present standard would become illegal. The bills in question have, we believe, received the approval of a committee of the Franklin Institute; on the other hand they have been strongly condemned by a committee of the American Society of Mechanical Engineers who say the measure involves "changes that will inconvenience and hinder trade and manufacturing, and require an expenditure of time and money that cannot be expressed in figures, sweeping away as it does the advantages accruing from the numerous established standards now recognized and universally adopted throughout the country." For our part we are heartily in accord with the view expressed by the Mechanical Engineers' Committee.

We recommend that those of our readers who are interested in the metric system consult the paper by Mr. George W. Colles, read before the American Society of Mechanical Engineers in 1896 and printed in the Society's "Proceedings," vol. xviii, p. 492 et seq. This paper is far too long to abstract and to give even the briefly stated conclusions would require over a page of the "Review," but it is well worth the reading for one who wishes to familiarize himself with the futile efforts which for over a century have been made to impose the metric system upon the world in general.

In 1821 John Quincy Adams, to whom in 1817 as Secretary of State had been delegated the work of investigating the metric system, made an elaborate report to Congress. One paragraph from this report is as follows:

"From the verdict of experience, therefore, it is doubtful whether the advantage to be obtained by any attempt to apply decimal arithmetic to weights and measures, would ever compensate for the increase in diversity which is the unavoidable consequence of change. Decimal arithmetic is a contrivance of man for computing numbers; and not a property of time, space, or matter. Nature has no partialities for the number ten; and the attempt to shackle her freedom with them will forever prove abortive."

On another page will be found an article entitled "Operating Notes on High Speed Electric Railways" in which are discussed several points in regard to high speed electric roads that are in a number of ways different from the ordinary street car system as well as from the main line railroads. There is a certain type of electric railroad now being put in operation for which no distinctive appellation exists. As pointed out by the writer, the name "interurban railway", as generally understood, is hardly applicable to the steam road which has discarded steam locomotives and adopted electricity as a motive power. A number of so called interurban systems which now cover 150 or more miles of roadway are in fact, similar in almost every respect the motive power to main line railroads. The construction of these roadbeds is of the best, and we may add parenthetically that we believe the time has come to abandon the expression "equal to the best steam railroad practice" in describing electric railways. Undoubtedly there have been electric roads constructed which were "built to sell", but

there are now in operation enough well-built electric lines to render "the best interurban practice" a sufficiently high standard of excellence.

Insofar as steam railroad organizations and methods are applicable to electric roads they have been very largely adopted by the latter. The present tendency is towards a more extensive organization such for example as has recently been introduced by the Buffalo company, where there are superintendents of transportation, of rolling stock and buildings, and of construction and maintenance of way; the motive power being under another superintendent who has the title of electrical engineer.

Some method of train dispatching is now used on all interurban electric roads and the experience gained by the steam roads in this respect has proved useful to electric railways although the system on the two classes of road cannot be carried out in exactly the same manner. The telephone is largely replacing the telegraph in this department and in this respect we believe some of the steam railroads of the country will follow the example of electric railroads. The telephone seems far better adapted to the purpose of dispatching where the number of train units is large. With the telephone the dispatcher speaks directly to the motorman, who can take down his instructions in duplicate, keeping one copy for himself and giving one to his conductor the message can also be repeated back so that no excuse whatever can exist for a mistake in orders. The telegraph is not at all suitable for single track electric interurbans where it is desirable that the train men report at every passing point. The protection of trains by signals is a subject to which the managers of electric interurbans are keenly alive, and steady progress is being made in this direction, although the block system is seriously handicapped because the rails being utilized for the power return circuit are not available for the signal circuits.

Two serious criticisms of present interurban practice are made by the author of the "Notes." One is that the sub-stations are too often located only with regard to the electrical engineering features of the system, when with only slight disadvantage electrically they could be placed at sidings and the sub-station attendants would then be available as signalmen. The second criticism is that too much is expected of sub-station men, the stress under which they must work not being appreciated; and the writer states that as the result of his experience he believes that where the man in charge of the apparatus at a rotary converter sub-station is expected to act as ticket agent and agent for the dispatcher also, an eight-hour relief is absolutely necessary to secure satisfactory service. Where men have attempted to fill such positions and stand a 12-hour shift seven days per week they have broken down under the work; this being the case, the sooner managers recognize the conditions, the better will be the result for all concerned.

The question of whence the trainmen for the high speed electric interurbans are to be drawn is also discussed by the author, who says the management may take steam railroad men who are trained to obey dispatcher's orders but do not know how to handle the electrical equipment of their cars, or it may take street railway men who know all about the electrical apparatus but are not sufficiently imbued with the importance of strictly obeying train orders. This it appears to us is purely a matter of expediency. Both steam and electrical roads have to break in new trainmen, and the high-speed interurban must expect to do likewise, save that if it takes employes from one of the other class of roads the work of teaching them is already partly done. If recognition of the importance of train orders is more to be desired than familiarity with electric cars choose the steam road man and teach him the other part of the work.

It is perhaps true that the discipline on street railways is inferior to that on steam roads, but as for the men themselves we believe that the character of these employes at the present time compares very favorably with that of any similar body on steam roads. The discipline on any road depends entirely upon its management, and the difficulty of obtaining men suitably discipline for this work which existed a few years ago is now rapidly disappearing owing to the more stringent rules under which most of the electric railways are now operated. The lack of experience in operating under steam road conditions is undoubtedly a serious disadvantage when a "street" railway employe enters the service of a high speed interurban line, and it is this inexperience that has caused some of the accidents to which reference has been made. But as stated in the preceding paragraph the manager may choose either one of two classes of men and supply the deficiency.

## The Grand Rapids, Holland & Lake Michigan Rapid Ry.

From a paper read before the Chicago Electrical Association, March 7, 1902, by George A. Damon\* and William D. Ray.†

The Grand Rapids, Holland & Lake Michigan Rapid Railway Co. was incorporated Feb. 24, 1900, to construct and operate an interurban electric railway from Grand Rapids, Mich., the second city of the state, to Holland, and there connect with the Holland & Lake Michigan Railway and the Saugatuck, Douglas & Lake Shore Railway.

Grand Rapids has long been known as the "Furniture City," the majority of its factories being engaged in furniture manufacturing. The city, including the suburbs, has a population of nearly 100,000, and the last census shows a growth in the past ten years of 45 per cent. Besides being the greatest furniture manufacturing city in the country, Grand Rapids has other industries of importance and its factories are busy the year round and employ thousands of people. An interurban road, nowadays, to promise success, must have a large city as a terminal, to which the people can be carried from many small towns, which it serves. Grand Rapids

numbers that hotels could hardly be built fast enough to accommodate them. The boats of the Graham & Morton Transportation Co. come twice each day to Holland, with excursionists, who usually take the local Holland road for Macatawa Park. The new management has arranged for cars to meet the boats at the wharf. The lake trip is short from Chicago and quite attractive in many ways. The interurban railway company does not expect large profits from this transient population but depends upon Grand Rapids' patronage, that city heretofore having had no electric line running to nearby summer resorts. The Holland, Saugatuck & Douglas line passes through a rich fruit belt and terminates in Saugatuck, which has for the most part a summer population, with but few winter residents. The Saugatuck and Douglas resorts have not been frequented as much as Macatawa, but as their beauty becomes better known patronage will increase each year.

The summer business on the interurban line, it is expected, will

VIEW OF LINE SHOWING CROSSING SIGN AND SHELTER.

was wisely chosen. The Grand Rapids, Holland & Lake Michigan Rapid Railway was the first interurban line to be admitted to the city. From Grand Rapids, the eastern terminus, the road passes through the towns of Grandville, Jenison, Hanley, Jamestown, Vriesland and Zeeland; all these long settled villages are thrifty and their merchants prosperous.

A good farming country, an old and thickly settled rural community, peopled by industrious Dutch and Germans and given over to cultivation of acreages and fruit culture almost entirely, lies between Grand Rapids and the lake. There are several small towns and trading places, located from one to three miles distant from the company's tracks, which are tributary to the road. Holland, which is practically the western terminus of this new double track interurban road, has trebled its population in ten years, as shown by the last census, and now has 10,000 inhabitants.

The Holland & Lake Michigan Railway and the Saugatuck, Douglas & Lake Shore Railway were lines constructed for summer excursion business. The eastern shore of Lake Michigan has for years been a favorite with residents of Chicago who have visited Macatawa, Ottawa Beach, South Haven and other points in such

be enormous. The Pere Marquette Railroad runs excursion trains during the summer to Ottawa Beach, opposite Macatawa Park, which is the terminal of the electric road, and carries a large number of passengers, trains of 16 cars frequently being loaded to the platforms. The advantages that will accrue to the pleasure riding public of Grand Rapids, from the improved service offered by the electric road, are apparent, and it is safe to conjecture that this pleasure riding public will furnish the greater portion of the summer traffic. The amount of traveling throughout the winter months, as shown by the daily receipts, is gratifying.

The fruit business on the west side of Michigan is also very large, and Grand Rapids is the acknowledged center of the fruit belt, from which immense shipments are made each summer.

Holland is the junction point of the Pere Marquette and the Chicago & West Michigan railroads. The Holland & Lake Michigan and the Saugatuck & Douglas electric lines operate over private rights of way for a distance of 16 miles, except for three miles through villages. The aggregate length of track of the combined roads is 71 miles. The total distance covered is 45 miles, 19 miles of this comprising the two roads running from Holland to the lake, acquired by the company. Twenty six miles of double track road have been laid by the new company, to reach Grand Rapids from

\*Managing engineer, Arnold Electric Power Station Co., Chicago.

†Consulting electrical and mechanical engineer, Detroit, Mich.

these lake resorts. Cars are operated on a headway of one hour and require at the present time one hour and thirty minutes for the trip from Grand Rapids to Holland, or three hours for the round trip. This time is to be reduced as the roadbed is bettered, and later, during the summer months, a maximum speed of 45 miles per hour will be realized, with an average speed of 26 miles per hour, including stops.

The running time between Holland and Macatawa Park is about 30 minutes. The interurban cars, run on Grandville Ave. in Grand Rapids to the down town loop. While for some distance double track is used, single track with turn outs prevails. This spring a

sinkhole encountered just at the limits of Holland. After bringing the surface to grade with gravel the tracks were laid, but it was only a short time until track and fill dropped out of sight and only a pond remained in their place. It was then realized that a sink hole, nearly 700 ft. in length, had developed; an attempt was made to fill it with sand and gravel, but the bottom seemingly could not be reached and this method was abandoned. On the surface there was a firm crust covering some 40 ft. of muck. By drilling test holes a stratum of gravel about 10 ft. thick was penetrated and below this was found another layer of muck. After the top crust had given way as mentioned, the track was relaid temporarily on

SINK HOLE NEAR HOLLAND.

double track road from the terminal of the electric line to the loop down town is to be constructed.

The population served by this road is shown by the following table:

Grand Rapids .....	90,000
South Grand Rapids .....	500
Grandville .....	1,200
Jenison .....	200
Jamestown .....	150
Vreesland .....	200
Zeeland .....	2,000
Holland .....	10,000
Saugatuck .....	800
Douglas (opposite Saugatuck) .....	700

Total population of villages.....	15,750
Townships outside of villages, 3 miles on each side of line, and all tributary to line, estimated from reported population of entire townships .....	15,000

Total estimated winter population outside of Grand Rapids .....	30,750
Summer population 3 to 4 months (from outside of this district) at Macatawa Park and Ottawa Beach. ....	3,000
Ditto at Saugatuck and Douglas .....	1,000

Additional summer population .....	4,000
Total outside of Grand Rapids .....	34,750

The general character of the territory between terminals is rolling, with some steep hills. Several wooden bridges for spanning creeks, were required, the longest being that over the Lake Shore railroad near Grand Rapids, which is 750 ft. in length, and 24 ft. in height at the apex, with grades 1:59 and 3 per cent.

The road was prohibited from crossing through tracks of steam railroads at grade, and bridges and subways were consequently built. Grade crossings, however, were permitted over switch tracks, spurs and sidings, when protected with derauling devices, inserted in the interurban tracks. The private right of way is four rods wide and fenced in; it is protected by cattle guards and danger boards at all highway crossings.

An unexpected expense in building the roadbed resulted from a

long timbers placed side by side while a permanent track was built on a foundation of piles driven end on end till the gravel stratum had been penetrated to a depth of 4 ft. This construction was expensive and more work on the sink hole will be necessary from time to time.

Fills are made with a slope of 1 vertical to 1½ horizontal; cuts have a slope of 1 to 1. On the double track portions of the lines the width is 28 ft. at sub grade on fills and 30 ft. in cuts.

Near Jenison is to be found the biggest fill; this is 500 ft. long,

ROUTE OF GRAND RAPIDS, HOLLAND & LAKE MICHIGAN RAPIDRY.

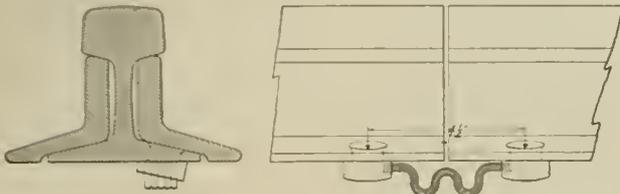

154 ft. wide at the base and some 42 ft. in depth, requiring 35,000 cu. yd. of fill, and costing over \$5,000.

It is exceptional to find double tracks provided for in the original construction plans of an electric interurban. In this case such provision was wise forethought, rather than compulsory afterthought. The company's single track steam railroad competitor, the Pere Marquette, parallels the double track interurban, from Grand Rapids to Holland. While trains on the former road may be seen

waiting on a siding for a passing train, the cars of the interurban go whizzing past, giving an interrupted service by virtue of the double track feature.

By glancing at the map it will be seen that the two roads are nominally parallel; their greatest distance apart is in the vicinity of Jamestown; at other points there is only a few rods between them. A desire to reach the centers of populous districts and communities and to build the road where the least expense for cuts and fills would be necessary is responsible for the divergence from an air line; however, no sharp curves exist and the grades are few and light.

The two subways in Holland, comprising three separate railroad crossings, are of steel and concrete construction. The trestles and bridges on the road are all of oak. The ties are spaced 2 ft.

RAIL BOND AS ATTACHED TO FLANGE.

between centers and are of hewn cedar, 8 ft. x 6 in. x 8 in. except on switches where oak ties 8 ft. x 8 in. x 8 in. are used. The track is of standard gage and laid with 30 ft., 65 and 67-lb. rails of the A. S. C. E. standard T-section; the ballast consists of 10 in. of coarse gravel tamped 4 in. under the ties, and where required is well drained with vitrified tiling 12 in. to 36 in. in diameter.

The sharpest curve is 6 degrees and the maximum virtual grade 3 per cent, except at the subway in Holland which is 5.56 per cent.

The bonding of the rail joints was done very thoroughly. Two types of bonds were installed,—a foot bond on relaying rail where angle bars did not permit the usual web bond, and on all new rail a web bond. These bonds were No. 0000, 6 in. long and crimped to 5 in. between centers, of the "Protected" type furnished by the J. M. Atkinson Co. The drilling of rails, for receiving bonds was done by a special machine which consists of a gasoline engine, tank and batteries, transmission and speed regulating devices, mounted on a special car equipped with drill stocks. This outfit paid for itself, many times over, in

all switches and frogs were well bonded and cross connected. Where the tracks crossed a creek, the rail circuit was grounded by sinking a metal plate into the flowing water below.

Loops are placed at all terminals and Y's are installed at the two car barns and at Zeeland sub-station. All switches are protected with indicating switch stands and signal lamps. All the special work was supplied by the Paige Iron Works and the Cleveland Frog & Crossing Co.

Substantial depots for the small villages and shelters at highway

STANDARD CAR.

crossings, have been placed where warranted and are greatly appreciated by the patrons.

The sub-station buildings at Zeeland and Macatawa are combined with a waiting room and freight office. The attendant for the electrical machinery looks after the selling of tickets, handling of freight, etc. The sub-stations are of white brick and stone construction, with high elevation.

Power Plant Building.

The selection of the exact location of the power plant was the result of a desire to have the plant in or near the village of Jenison, and at the same time upon a site convenient to railroad facilities, and to a supply of water for condensing purposes. It was also desirable to secure a site upon an elevation with a grade line sufficiently above high water mark to insure a dry basement during the spring of the year, without losing sight of the necessity of a firm sub-soil to support the machinery foundations. After some investigation a satisfactory site was selected at no great distance from the right of way of the electric road. The relative location of the power plant property with respect to the Pere Marquette R. R. tracks, and the fact that provision for extending the station was to be made on that side of the plant farthest from the electric car line, determined the relative position of the boiler and engine room.

In the power plant building itself, and, in fact, in the general design and selection of the entire equipment, an effort has been made to follow the best engineering practice and yet accomplish the result at minimum cost. The plant as completed, therefore, is thought to be a good example of a station thoroughly in keeping with the commercial character of the enterprise which it serves. There is in the plant no waste space, but at the same time crowding has been avoided. There is nothing about the equipment which may be termed a "frill," and yet everything which would pay an interest on the investment, either by reason of more convenient operation or of fuel economy, has been included in the plans. It will be interesting, therefore, to examine the plant with a view to learning the various considerations which entered into the selection and arrangement of its equipment.

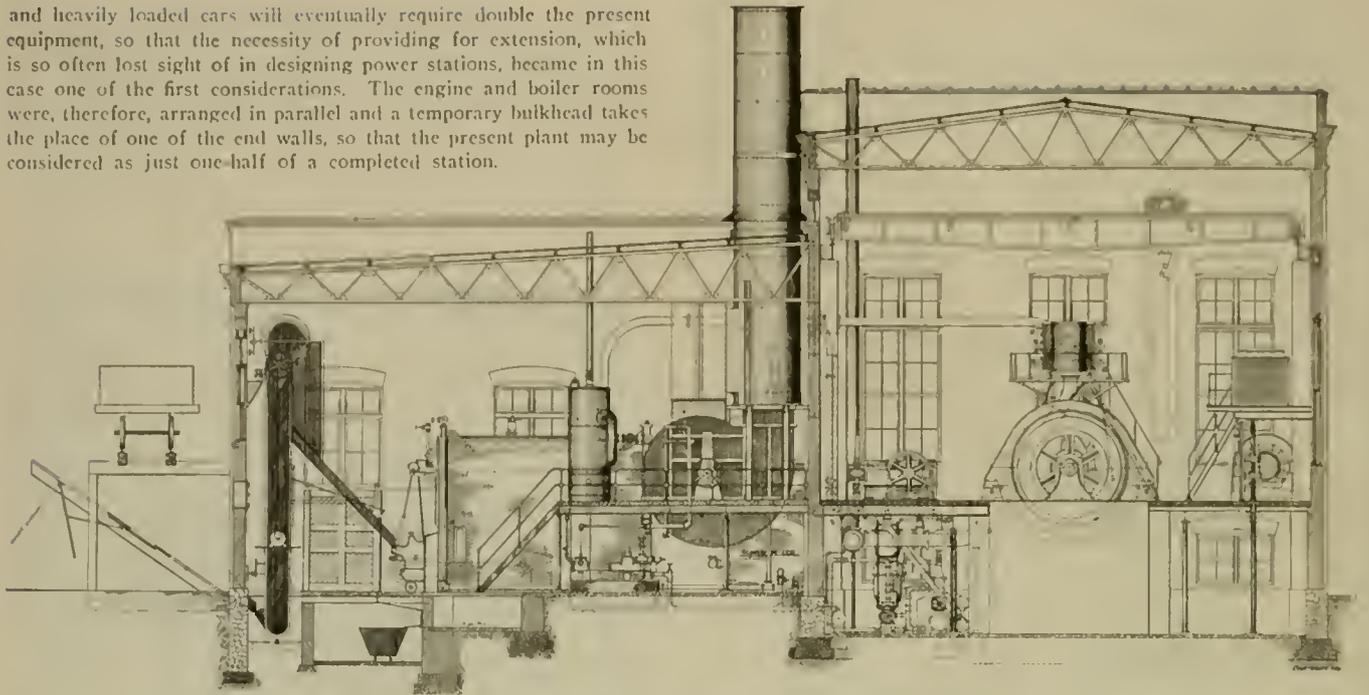

The general arrangement is shown in section and plan. The plant at present contains but two generating units. To furnish power for the operation of the road up to its full capacity with frequent

INTERIOR OF SUB-STATION.

the saving effected. The engine gave but little trouble and the outfit worked otherwise satisfactorily, requiring only one mechanic for both engine and drills. A combination drill was used, which not only drilled the foot of the rail, but also countersunk the hole. A screw compressor, operated by two men, was used in compressing bonds. The rail circuit was cross connected every twelfth pole, by a No. 0 tinned copper wire, and connected with a good ground;

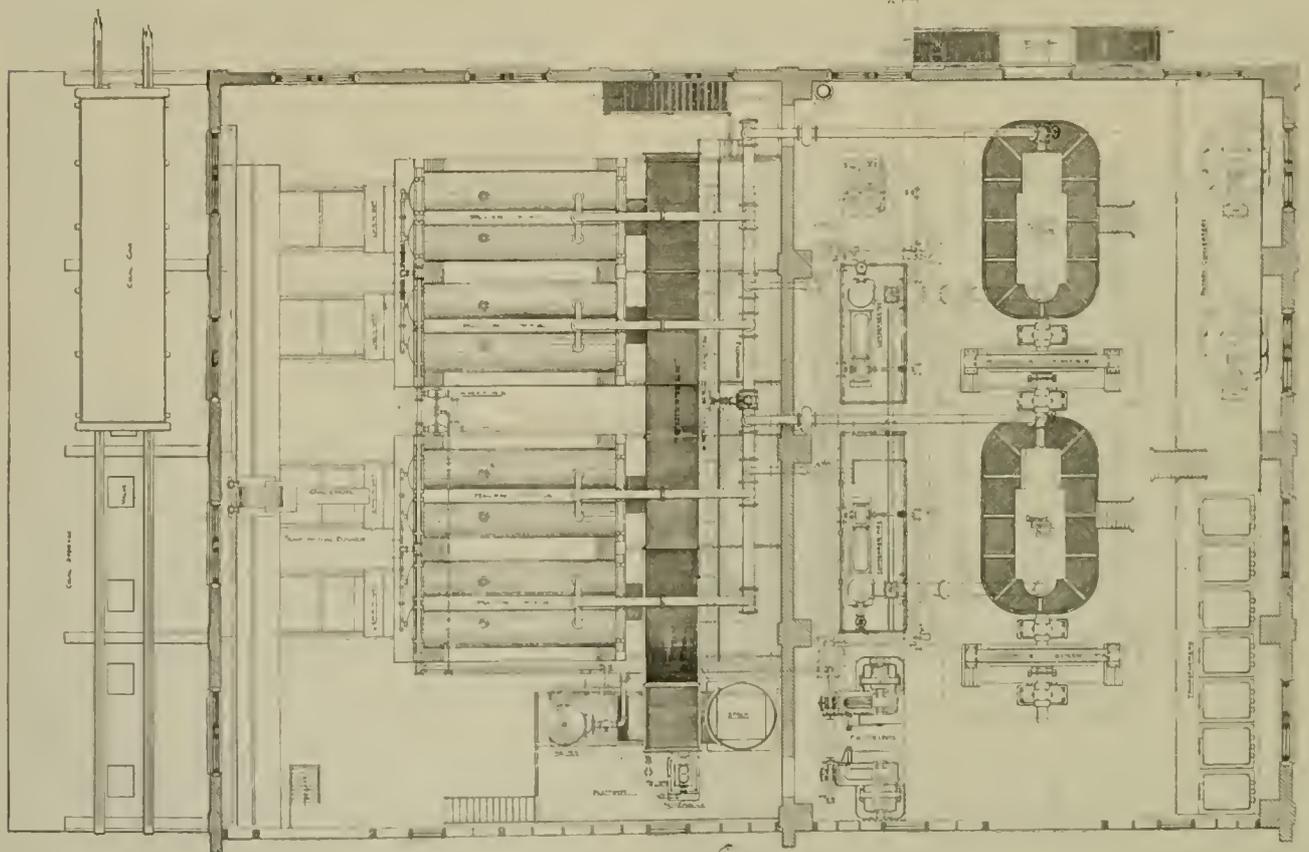

and heavily loaded cars will eventually require double the present equipment, so that the necessity of providing for extension, which is so often lost sight of in designing power stations, became in this case one of the first considerations. The engine and boiler rooms were, therefore, arranged in parallel and a temporary bulkhead takes the place of one of the end walls, so that the present plant may be considered as just one-half of a completed station.

CROSS SECTION OF POWER STATION.

The engine room is 32 ft. high from floor line to the lower chord of the roof truss. It is 47 ft. wide inside and at present 72 ft. long. The engine room floor is 9 ft. above the natural grade of the ground, while the boiler room floor is at grade. The engine room has a basement 12 ft. high for the accommodation of the condensers, and much of the steam piping; this basement is 4 ft. below the boiler room level. The boiler room is 54 ft. wide, 28 ft. high and

the same length as the engine room. There are four openings in the fire wall which divides the two rooms, two for doors between the engine and boiler room and two to provide access to the condenser basement from the boiler room floor. These openings are closed by means of metal covered sliding doors. The condensers can be reached from the engine room floor directly by means of a stairway landing midway between the steam connections to the two con-

PLAN OF POWER HOUSE.

densers. These stairs, as well as all other stairways about the plant, are made of iron with diamond tops and convenient railings. The main entrance to the engine room from the exterior is gained by means of a double stairway leading to a large door in the middle of the permanent end wall of the engine room. The location of this stairway on the outside of the structure saves considerable valuable space inside the building without detracting from its external appearance.

The building itself is made of cream colored local brick, and has large windows giving plenty of light and ample ventilation. The roof trusses are designed to secure a comparatively flat roof having a dip of  $\frac{5}{8}$  in. to the foot. The trusses are tied together by channel iron purlins to which are bolted nailing strips for the matched roof boards which are covered with a four-ply gravel composition. The down-spouts are on the outside of the building. Neither the engine room nor the boiler room roofs have monitors, but instead 36 in. galvanized iron ventilators of the "Star" pattern are provided to allow the escape of heated air, and the results are satisfactory.

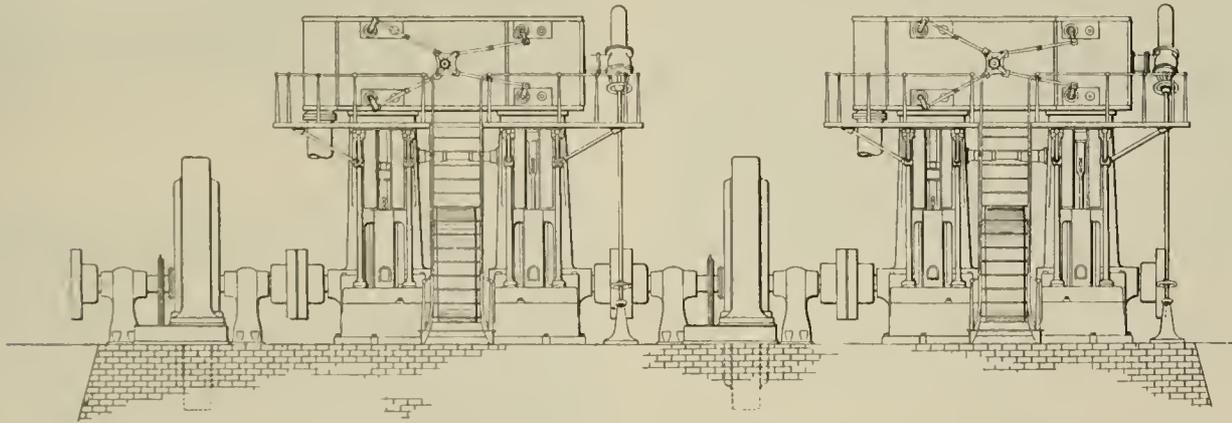

The floors of the boiler room and of the engine room basement are of concrete with a cement top. The engine room floor is supported by an iron structure and is independent of the main engine and generator foundations. This floor is made up of corrugated sheet steel plates, made by the Berger Manufacturing Co. The corrugations in the plate used are  $2\frac{1}{2}$  in. high, and the vertical sides are separated by three small half-circle arches. The upper portion of the manifolds are filled with concrete which extends above the

The condenser outfit fits in nicely between the engines and boilers while the switchboard and high tension apparatus is located on the floor and gallery on that side of the engine room from which the distribution and transmission wires can conveniently leave the building. The travel of raw material and finished product is thus reduced to a minimum.

#### Coal Handling Apparatus.

The fuel is slack coal which is received from cars delivered upon a trestle alongside of the boiler room by the railroad company; so that the first movement of the coal is secured by gravity. The next operation is to transfer it from the coal pockets to the boiler furnaces. The plant was not large enough to justify an investment in an elaborate system of coal and ash handling apparatus and storage bins and yet the fact that the station was to operate nearly 20 hours each day for every day in the year made it desirable to adopt some method of doing away with hand firing. The coal handling device indicated on the cross section of the power house was selected as combining the advantage of small first investment with the ability to reduce the coal handling cost. This apparatus has not yet been installed but the fact that at present the coal and ashes are each handled at least twice only emphasizes the importance of an investment in this part of the plant.

The apparatus shown consists of a traveling bin carried upon an elevator leg which rests directly upon and travels along a track parallel to the boiler room wall. At frequent intervals along this wall

ELEVATION OF GENERATOR UNITS.

plate a sufficient distance to hold the 2x4 in. nailing strips for the hard wood floor.

All of the foundations are made of concrete with Portland cement and gravel from a pit near the power plant site. The foundations are faced with a layer of gypsum and present a neat and finished appearance. The main engine and generator foundation is a monolith.

The building is divided into bents with trusses spaced on 18 ft. centers. At each division point a pilaster 3 ft. wide, extending 2 ft. into the engine room, is carried 23 ft. above the floor to support the beams for the crane runway. The distance between these rails is 45 ft., and the lifting capacity of the crane is 15 tons. This crane has been a great convenience in the erection of the engine room equipment. The crane is operated by pendant chains, the transverse motion being secured by means of a chain hanging directly in front of the gallery which extends the entire length of the plant. There are two hoisting speeds, a slow speed for heavy loads, and a fast speed for overhauling the empty hook and for light loads, and each speed has a separate chain.

Attention should be directed to the effort which has been made in this plant to secure the simplest and the most efficient arrangement of the equipment. A power plant is a large factory in which the raw material is fuel and the finished product is electrical energy, and the problem is to transform the raw material into the finished output with the minimum amount of loss, labor and investment consistent with reliability.

It will be noticed that the plant is built up of a series of units. The two boilers of capacity equal to the demands of one engine are of about the same width as one engine and its contiguous generator.

cast iron pockets with sliding gates are placed ready to deliver the coal from the bunkers directly into the bottom of the elevator the bucket system of which is operated by an electric motor, allowing the bin to be filled from any point of the coal storage. The coal hopper can be moved along by this same motor until it is brought directly before the furnace to be supplied with coal which is delivered through an extended spout by gravity. The hopper of each furnace holds a supply sufficient for an hour's run, so that the operation of the boiler room becomes a "one man" job, and it would be hard to reduce the labor item below this point.

#### Stokers.

From the furnace hopper the coal drops on to a Green chain-grate, made by the Green Engineering Co. of Chicago. The links forming the grate can be inspected as the grate makes each cycle and each link is removable in case repairs are necessary. Each boiler is fitted with a grate having an area of 53 sq. ft., which is at the ratio of five boiler horse power per square foot of grate area, and as the boilers are rated at ten square feet of heating surface per horse power the ratio of grate surface to boiler heating surface is one to fifty. The grates are guaranteed to handle successfully from 30 to 50 lb. of coal per sq. ft. per hour. The regulating devices include an adjustable gate to fix the thickness of the fuel upon the furnace,—a speed adjusting mechanism to determine the rate of the grate movement, and a system of dampers, both to vary the amount of air through the grate itself, and to shut off the upflow of air back of the grate in front of the bridge wall. The ashes are delivered by the moving grate to a pit beneath the boilers, which in this case is

designed to hold the amount produced by a day's run at full load, and it is therefore necessary to take out the ashes only once in 24 hours.

#### Boilers and Draft.

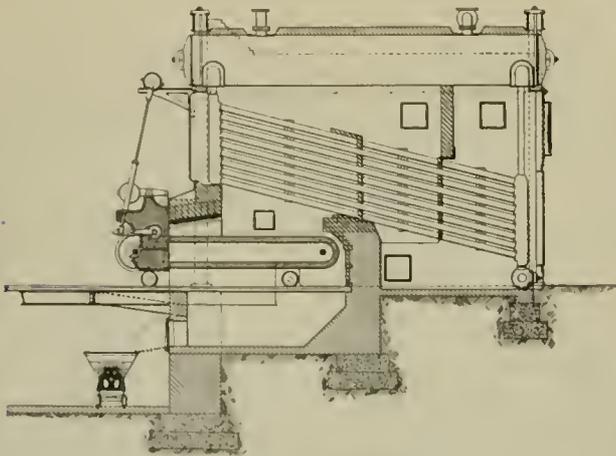

The boilers are of the "Cahall" sectional water tube type made by the Aultman-Taylor Co.; one of the illustrations shows a section of the boiler and furnace. There are four boilers each having 2650 sq. ft. of heating surface, made up of two steam and water drums 30 in. in diameter and 20 ft. long, and 126 four-inch tubes, 18 ft. long. The tubes connect vertical iron headers, and are arranged in staggered sections fourteen tubes wide by nine tubes high.

These boilers and furnaces are guaranteed to transform at least 70 per cent of the heat units of the fuel into energy in the form of dry steam at 150 lb. gage pressure and under full load conditions will probably do even better.

The fact remains, however, that 20 per cent of the heat energy originally contained in the fuel escapes from the smoke connection at the rear of the boilers. The plant is planned to eventually intercept much of this latent heat energy and transform it back into the boiler system by means of an economizer, and this desirable adjunct will probably be installed at the time the station is completed. At present, however, the hot gases are conducted by means of a sheet steel breeching directly to the intake of a Sturtevant induced draft fan. This fan has a wheel 9 ft. in diameter by 4 ft. wide and is mounted on an iron platform located at one side and toward the rear of the boiler settings so that the breeching outlet discharges directly into the fan intake without making any turns or bends.

The fan discharges into a stub stack 5 ft. in diameter, made of sheet steel, and mounted directly over the fan outlet. A by-pass is provided with suitable dampers so that the fan inlet and outlet can be closed and the gases passed directly to the stack. The top of this stack is only 40 ft. above the grates, but this height has proved sufficient to operate the plant upon light loads without the use of the fan.

The speed of the fan determines the force of the draft, and this speed can be adjusted either by hand or by an automatic valve connected to the main steam header in such a way that as soon as the steam pressure drops, the fan engine is speeded up. The draft, therefore, becomes a function of the demand upon the boilers. A draft gage is mounted in a location convenient for the fireman, and the behavior of this part of the plant is under constant supervision. Ordinarily the fan engine turns about 100 r. p. m., but it may be increased to 250 r. p. m. or more, and if occasion should arise

SECTION OF BOILER SETTING.

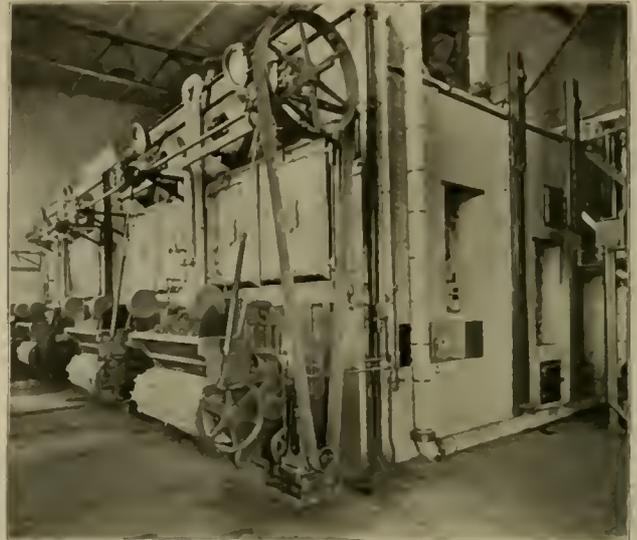

to force the boilers to their limit for a period it is possible, by means of the fan and engine which has been installed, to get a draft equal to two inches of water.

The mechanical draft equipment cost much less than a steel stack, and up to date has given practically no trouble. It is designed with sufficient power to eventually draw the gases through an economizer. This economizer is to be placed back of the boilers and just sufficient distance above the floor to allow a by-pass flue to be located beneath. A runway between the back of the boiler and brick economizer flue allows a space for getting at the rear of the boiler tubes, at the blow-off valves, and at the economizer header.

#### Heater and Pumps.

The fan engine, it is true, requires a certain amount of steam, but at the same time this engine, in common with other auxiliaries about the plant, exhausts into an open heater, and a good share of the heat of the steam used is returned to the boilers through the feed water.

There are several paths for the feed water to reach the boiler. It may be taken directly from the outside source of supply by a tank

BOILERS WITH GREEN CHAIN GRATES.

pump in the engine room basement, and delivered either directly to the pumps or to the feed water heater. This same tank pump may also receive its supply from the discharge main of the condensers from which it will receive the water at a temperature of about 110 deg. F. It is also possible by closing a gate valve in the condenser discharge pipe to raise this water to a pressure sufficient to deliver it either to the boiler feed pump or even to the elevated heater, and there is a pipe connection provided for this purpose.

After leaving the pumps the water will eventually be passed through the economizer before it reaches the boilers, and here it will be heated to nearly 300 deg. F. At the present time it leaves the heater at about 200 deg. F. and enters the boilers through a connection at the front part of the upper drums after passing through a quick opening valve, a check valve and a globe valve, all within reach of the fireman. An auxiliary safety connection is made between the pump discharge header and the boiler blow-off headers, so that in case of a serious accident at the front of the boilers it would still be possible to supply them with water. In addition to all these precautions two Penberthy injectors are placed between the two batteries, so that cold water can be lifted from the source of supply and injected directly into the feed water supply system without the use of any of the pumps or condensers. With the addition of a reserve supply of water in an elevated tank, which is to be added when the car barns are built, it is hard to see how the boilers will ever suffer from a water famine.

#### High Pressure Steam Piping.

The steam, on its way from the boilers, passes first through an automatic valve which is mounted directly on the boiler outlet. In order to open this valve the steam in the boiler must reach a certain pressure, and the valve will immediately close again if the steam pressure drops below this point. This valve is intended as a precaution in case of the failure of any one of the boilers through any cause as in such an event it automatically cuts itself out of service. From this automatic valve a full sweep half-circle bend delivers the steam to the top of the header through a gate valve. This header is 12 in. in diameter and parallels the dividing wall between the engine and boiler room at a short distance above the boilers. It is supported on roller brackets with two sets of rollers at right angles, which allow for movements in two directions. The header gallery, which is provided for convenient access to any of

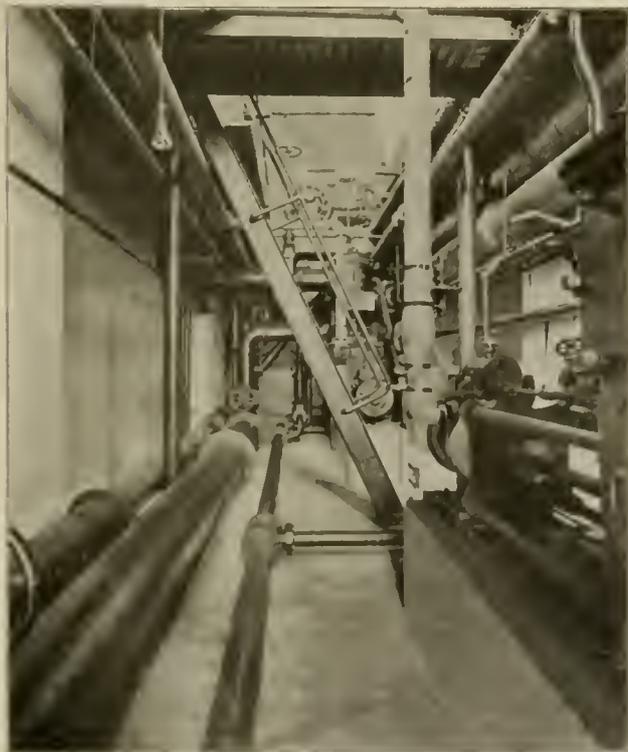

the valves, can be reached from both ends of the plant. The header is divided in the middle by a by-passed valve, so that in case of accident either half of the plant can be run independently of the other half. All valves in the plant are of Crane make and all high pressure piping 4 in. in diameter and over is flanged. All live steam and hot water piping is covered with heat insulation, made by the Manville Covering Co.

An auxiliary header supplies the steam to the exciter engine to the condenser pumps, to the boiler feed pumps, to the air compressor, and to the fan engine. It is paralleled by the auxiliary exhaust pipe, and by the main exhaust, all of which are located underneath that part of the floor which forms a runway on the wall side of the condenser pit.

#### Engines and Connections.

There are two engines rated at 750 h. p. each. They are of the vertical cross-compound condensing type and run at 150 r. p. m. The cylinders are 21½ and 45 by 24 in. Each engine has a fly-wheel 96 in. in diameter and weighing 16,000 lb. Both high and low pressure cylinders are jacketed and the receiver has reheating surface.

Both engines and generators are of the direct connected type, but the method of connection departs somewhat from standard practice. The engine shaft extends beyond the main bearings a distance sufficient to receive the hub of a flanged coupling. The revolving fields of the generators are carried on an independent shaft resting in two adjustable bearings through which the generator shaft extends to receive the other half of the flanged coupling. The halves of the couplings on the engine and on the generator are thus in position to be connected by means of three taper bolts. In this way the generators are built and installed entirely independent of the engines without the usual delay resulting in an effort to secure co-operation between the engine and generator builders. The generators being independent of the engines it is possible to shift the generators from

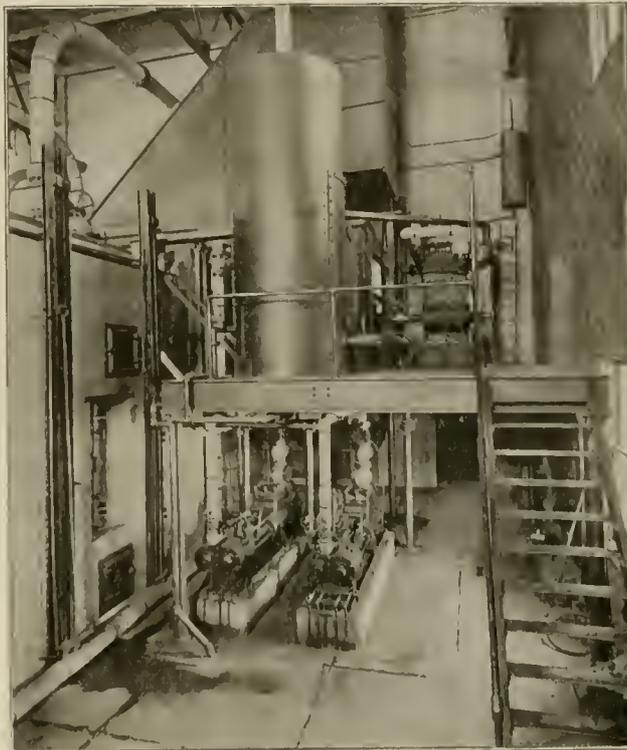

CONDENSERS AND PIPING.

one engine to another in case of accident to either the engines or the generators. This arrangement gives a certain amount of reliability greater than is found with the ordinary independent unit plan, in which the breaking down of an engine or generator cripples the entire unit.

The connecting system described has proven to be a particularly fortunate one for this plant, as it developed in buying the electrical equipment that it would be impossible to secure shipment of the

generators inside of eight months, whereas the road itself would be ready to operate inside of five months. To overcome this difficulty the engines were installed without waiting for the permanent generators, and a temporary belt pulley on an independent shaft was put in place in the bearings of one of the generators, a belt being run through a window to a belted double current generator installed in a lean-to shed. The consequence has been that the road

HEATER, PUMPS AND FAN ENGINE.

has been independent of the serious delay in starting usually encountered with enterprises of this character.

#### Condensers.

The water for condensing and boiler feed is taken from Rush Creek, some 225 ft. from the power house. The water enters through a crib, constructed of 2 x 8-in. timber, properly cribbed and filled with cobble stones to prevent displacement, then passes through two 18-in. vitrified tile to an intake well, intercepted by settling basins.

The intake well is 12 ft. in diameter. From this supply two cast iron injection mains of 10 in. diameter, and one 6 in. boiler feed water main run directly to condenser pit of power house.

The discharged water mains from condensers are two 12 in. cast iron pipes until the intake well is reached, when from this point to creek vitrified pipe 24 in. in diameter were used. Should the creek ever "dry up" or the stream decrease in volume, a self-cooling tower can be placed over intake well with but little additional expense.

A marble board containing the steam, vacuum and air gages, as well as a clock, is mounted in a central location on the steam side of the station and indicates the operating conditions of steam pressure and vacuum. The air compressor for the car brake system is located on an elevated foundation in one corner of the basement, and in line with the condensers.

#### Electrical Equipment.

The alternators are of the three-phase, 25-cycle rotary field stationary armature type, of 500-kw. capacity, made by the Westinghouse Company, and are provided with armature sliding frame to permit access to all windings for repairs without requiring use of a crane. They have 20 poles and operate at a speed of 150 r. p. m. The rating is 722 amperes per terminal. The two exciter dynamos are 125 volt 30-kw. each and either is sufficient for supplying full field current for the two 500-kw. alternators. The separately excited fields require 120 amperes at 100 volts at full rated current

output per terminal, at 380 volts, working on 100 per cent power factor. With an 80 per cent power factor, on full load, an increase of 20 per cent in field current is required. The alternator armatures are star connected and of the slotted drum type. The armature has large ventilating ducts and is substantially constructed.

The direct current exciter generators are direct connected to horizontal simple engines running at 300 r. p. m. These exciters are set on concrete foundations, built directly on the floor beams, with the result that no space is taken up in the basement by auxiliary foundations. The exciters and draft fan engine are located on a level and in the same part of the plant, thus reducing the work of the operator to a minimum. The steam reaches the exciter units through pipe bends connected to the auxiliary steam header.

The switchboard consists of 10 panels, all of blue Vermont marble, mounted on the usual framework of angle irons, distributed as follows:

and the usual delta connections are made. These transformers on both primary and secondary windings are arranged for cutting in or out coils or sections for voltage adjustment.

Two 300-kw. rotary converters are installed in the power house, for handling the sections of the line adjacent to the power house. The rotaries are started by an induction motor direct connected to the armature shaft, and synchronized by means of lamps connected on one side to bus bars and on the other to the alternating current side of the rotaries. The switch controlling the starting motor is of the double throw type, arranged for high and low voltage connections to transformers. Consequently, with one position of the switch the motor develops a speed slightly in excess of the synchronous speed and with the other position, a speed below it. This permits of the proper speed being reached as indicated by the synchronizing lamps.

Each governor arm of the 750 h. p. engine, driving the alternator,

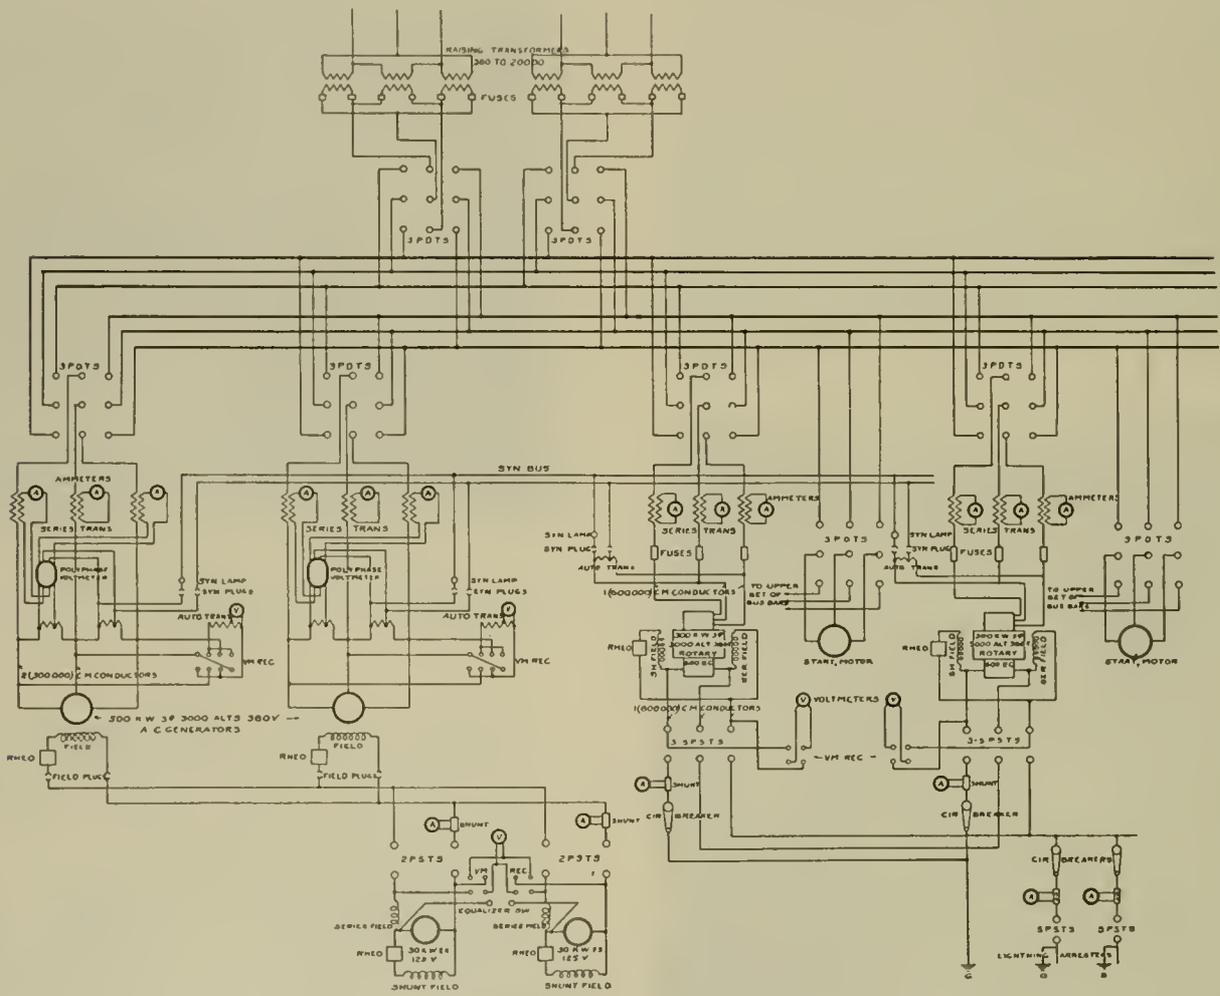

DIAGRAM OF STATION WIRING.

One exciter panel (two exciters), 2 alternator panels, 2 transformer panels, 2 alternating current rotary panels, 2 direct current rotary panels, 1 direct current trolley double feeder panel.

This switchboard is of the Westinghouse standard pattern. The principal features of the boards are a totalizing, integrating wattmeter, placed on each alternator panel; a double, low tension bus bar arrangement for flexible manipulation of alternators with transformers and rotary converters, and separate ammeters for each phase reading to 1200 amperes.

Synchronizing lamps and shunt transformers are used, when machines are to be synchronized with bus bars.

The step-up static transformers, which are located in a gallery, are of the Westinghouse oil cooled type, and are seven in number (two sets of these each and one spare), each being of 200 kw. capacity. The ratio of conversion is one to fifty. Two fuse cut-outs are placed on the low tension, or machine side of each transformer,

is equipped with a series wound 1/4-h. p. 125-volt, Sprague electric motor, for controlling the speed of the engine in synchronizing generators. The control of this motor is from special switches and rheostats on the switchboard.

Lead encased cables are used for connecting the alternator units with the switchboard and transformers and these are carried under the engine room floor on wooden brackets fastened to the I-beams. The two rheostats for the generator fields rest on suspended shelves in basement.

For some months past, a 1000-kw. rotary converter has been in operation, pending the delivery of permanent alternators. This machine is belted to special pulley fly-wheel on the engine shaft and runs at 300 r. p. m. A 5.62-kw. 500-volt exciter dynamo is belted to the shaft of the rotary and supplies the fields with current. A three-phase alternating current of 380 volts is delivered to static transformers and a direct current, approximating 600 volts, or such

voltage as follows the departure of the generator from a true sine wave, is delivered to the trolley wire of the line sections adjacent to the power house.

This temporary arrangement has worked well, excepting for the regulation, which has been poor at times, occasioned by the reactive effects.

The station lights, consisting of some 65 lamps, are operated off of a special transformer of 125 volts secondary and 400 volts primary. After the shut down of the plant at night, should light be required, the exciter dynamo is started and switches transfer this duty to the exciter.

The six high-tension wires after leaving the step-up transformer are interrupted at the high tension board, by six single pole combination fuse switches or circuit breakers.

In the station low equivalent arresters are mounted on a marble panel 24 in. x 65 in. One single pole arrester is used on each end of each transmission line.

Static interrupters which resemble transformers in external appearance take the place of the choke coils commonly used, and are much more effective. On high tension circuits, switching, grounds and short circuits may produce static effects similar to those of lighting. The static interrupter protects the transformers against sudden static disturbances. The interrupter includes a choke coil in series with the line and the condenser connected between line and the ground,—nearer the transformer than the choke coils. The choke coil and condenser are placed in a self-cooling tank. The base dimensions are approximately 20 x 27 in. Three leads are brought through the top of the case through insulating bushings for connection to line, to transformer and to ground.

The interrupters are single-pole and three are used for each group of three transformers, the interrupters being placed in the leads of the delta. No switching of live high tension wires is permissible within the interrupters, except that a transformer may be cut in or out when its high tension voltage is maintained interchangeable by potential on the low tension winding. In this case the high tension switching is not dangerous because it produces no change of potential.

It will be noted that the arresters which serve to prevent an abnormal rise of potential due to lightning are placed on the line wires where they enter the stations and that the interrupters whose function it is to prevent short circuits from static disturbances are placed between the transformers and the transmission line switchboard, so that no switching of high tension circuits will be done within the interrupters. These lightning arresters are of the most approved pattern, made by the Westinghouse company and known as the low-equivalent type.

The wiring for this station consists of rubber covered wires placed on brown porcelain insulators, supported by standard oak pins. A well seasoned wooden frame work, carries the high tension switches and lightning arresters.

Six aluminum wires of 52,630 circular mils each leave the Jenison power house, carrying current at 20,000 volts, and follow along the railway tracks easterly to the Zealand sub-station, 15 miles distant, and at this sub-station, these six wires pass through the building and continue on to Macatawa sub-station 10½ miles, from Zealand. The six high potential wires comprise two circuits. Although one circuit would suffice for the operation of the two sub-stations, it was deemed best to split or divide the three conductors of the 105,500 c. m. of aluminum required, into six wires of 52,630 c. m. each, allowing both circuits to be normally run in multiple. In the event of accident by grounding or the breaking of a single wire or wires of one circuit, the other is in readiness to carry the load. Although effecting a greater drop in voltage by this make shift, the cars would be kept in continuous operation with speed slightly impaired. Other combinations of the three wire circuits are as follows:

Of the two alternators installed at the Jenison power house, one may deliver current over one circuit to the Zealand sub-station, and the other alternator over the second circuit, may operate the Macatawa sub-station, or circuits and sub-stations may be put in multiple with the alternators. Again one of the circuits can be and the multiple combination continue between Zealand and Macatawa, or vice versa. This arrangement permits of great flexibility, made inoperative or dead, between the power house and Zealand, with but comparatively slight increased cost. The two, three-wire three-phase, alternating current circuits have the wires 24

in. apart at the corners of an equilateral triangle. All joints on these circuits are made with McIntyre connectors and the joint has been found very satisfactory. High tension wires are tied to number two Provo glass insulators, weighing six pounds each, with a diameter across the base of 7½ in.

The bottom of the insulator is fully 5 in. above the cross arm. Glass was preferred to porcelain and has worked effectively. The line received its first current of high voltage in a downpour of rain and no trouble was given by a single insulator, in fact no part of the equipment gave any trouble whatsoever. The glass insulators are believed to be much superior to porcelain, and the lower cost is not the least thing to be considered. They do not require a test before being placed in service and the life without deterioration is longer.

Insulators are placed on special oak pins, 14 in. long which have been boiled in paraffine oil. These pins are socketed in cross arms, 6 ft. and 8 ft. long and are held firmly in place by plugs, made of

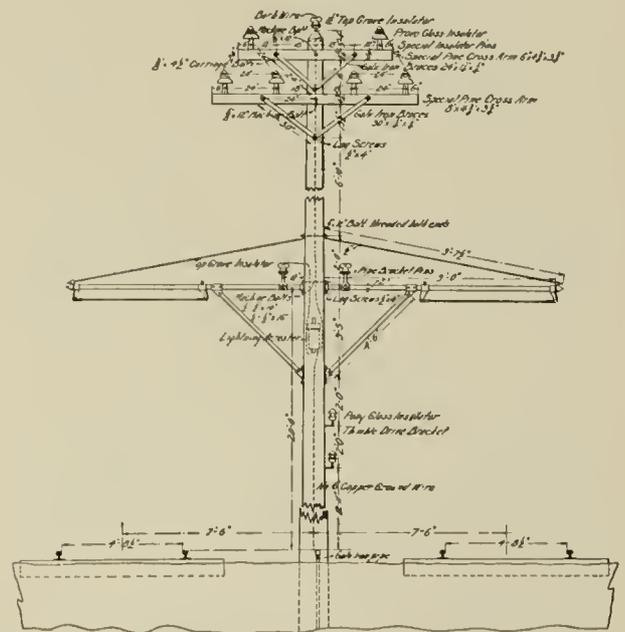

DIAGRAM OF POLE.

¼-in. round maple dowelling stuff, which is driven through holes in the cross arm and pin. This method is used in preference to nails. The usual braces, bolted to cross arms and lagged to pole, hold the cross arms in position. The illustration showing the pole with cross arm and bracket construction gives other measurements in detail. The poles are 40-ft. and 30-ft. lengths with 7 in. tops and 13 in. in diameter, 6 ft. from the base and were shipped from L'Anse, a northern Michigan timber point.

Considerable difficulty was experienced, in securing poles that would pass inspection and the writer's experience the last year with this part of overhead construction, indicates that Michigan will soon be barren of suitable timber for 30-ft., 35-ft. or 40-ft. poles. Already the telephone companies are using the Washington and Idaho cedar, and the increased freight charges make the poles from the latter states cost more than those that Michigan can furnish, though the latter are much superior in every way. Poles are spaced 100 ft. apart and are midway between tracks which are 15 ft. between centers, and are placed on an average of 7 ft. in the earth. All poles are tarred on the butts and painted from ground line to roof. Where poles were set in marsh or swampy ground, they were well barreled. At the side of each sixth pole is driven a 12 ft. section of galvanized iron pipe to which is connected a No. 6 copper wire, leading directly to the top of pole and tapped into a barb wire carried on a top-groove glass cable insulator. These pipes form a good earth connection for lightning discharges that may strike the high tension circuits. The barb wire is of large size and composed of two No. 9 B. & S. wires; this was used in the belief that there would be less danger of breakage, than with a smaller size, which in falling would menace the high tension wires. The top groove insulator, on which the barb wire rests, is not used for

insulation, but after some investigation, it was found that this form of support for barb wire was the cheapest and most substantial, consequently it was used in preference to a more simple arrangement.

The first circuit runs continuously without transposition, from the power house to Macatawa, while the second circuit receives one complete turn or twist between the power house and the Zeeland sub-station and between the latter and Macatawa. Direct current feeders of aluminum are also used and these were supported on the trolley brackets, rather than upon an additional cross arm. This method is not only neat and substantial, but less expensive than additional cross-arms. The trolley bracket used was of a special pattern made by the Ohio Brass Co. of Mansfield, O., 2-in. steel tubing being used with heavy re-enforced castings. These brackets were fastened to the pole by lag screws and machine bolts, the latter being used where extra strength was required. The brackets are very strong and are specially adapted to interurban high speed work. It will be noticed that this bracket is braced both from above and below the horizontal arm. Brackets are placed 20 ft. above the rails and 8 ft. 10 in. from the lower cross arm. On the 40-ft. high-tension poles, a distance of 5 ft. 5 in. is maintained below the telephone circuit and horizontal arm of brackets, with a separating distance of 20 in. between the two No. 10 copper telephone wires. Steel thimble, angle, drive-brackets are used for supporting the pony glass insulators. The transpositions of the telephone wires occur every four poles and a straight drive-bracket with a transportation glass insulator is used. The transpositions are made, by soldering No. 12 weatherproof insulated copper wire across incoming wires. Thus far the telephone circuit has been very sensitive and worked well, but as soon as a ground occurs, the circuit is then too noisy to hear ordinary speech. Telephones are installed at the power house, turn outs, sub-stations, offices, and car barns. A dispatcher is employed to direct the movements of the cars by the medium of the telephone line.

The General Electric M. D. type of lightning arrester is installed and four of these are placed to the mile, giving the most efficient lightning protection for the direct current circuits.

The trolley wire used is No. 000 figure 8 section supported by the type W. cap and cone hangers made by the Ohio Brass Co. A lock washer is inserted between the stud of the hanger and the clincher ears attached.

Taps, from direct current feeders to trolley wire, are made on every twelfth pole and consist of a special mechanical aluminum clamp joint soldered to No. 0 insulated stranded copper cable. This is supported along the horizontal arm of trolley bracket by special insulator clamps, and then passes into feed-in ears attached to the hangers. The direct current aluminum cables, are connected by mechanical joints, the receptacles being compressed on the cable and joined by a lock nut, with right and left hand threads. The usual strain guys are used where necessary, always broken by globe strain insulators. Through several villages that the road passes span construction is resorted to.

Section insulators in both trolley wires bridged by 800-ampere circuit breakers, are placed between power house and Zeeland and the latter sub-station and Macatawa. The normal position of these breakers is closed, causing all sub-station rotaries to be in multiple on their direct current side. Should a heavy short circuit come upon any section the circuit breakers immediately open, lighting a bank of signal lamps. As a car approaches, on the section not affected by the short circuit, the lighted lamps are observed by the motorman, who stops his car, opens the line switch, closes the circuit breaker, and then closes the line switch. If the circuit breaker does not open again, it is understood that the trouble is removed and the car proceeds. Should a disablement or break down of machinery occur at any sub-station, it is possible to continue operation of cars at reduced speed as before mentioned.

The old steam power plant at Macatawa, of 500-kw. capacity has not been dismantled, but will be used during the summer months, when excessive loads on the Holland terminal require its operation.

The main sub-station room at Zeeland has interior dimensions of 39 ft. 8 in. x 27 ft. and contains two 300-kw. Westinghouse rotary converters, seven 120-kw. step-down oil-cooled transformers, six static interrupters and lightning arresters and six combination fuse switches, also emergency switches, for putting the high tension circuits in multiple. At Zeeland switches for controlling the lines to Macatawa sub-station are provided. A seven-panel switch-

board is installed and all wiring under the floor was done with lead encased cable.

In the gallery, some seven feet above the floor, are placed the static interrupters, combination fuse switches, and emergency switches. The switches controlling the Macatawa sub-station, are located on the opposite wall and are reached by ladder.

The switchboard consists of 2 transformer panels, 2 alternating current rotary panels, 2 direct current rotary panels and 1 direct current double feeder panel. A swinging bracket holding 2 direct current voltmeters is attached to the latter panel.

All transformers are earthed and are piped up, with individual valves on each transformer, for draining oil from the cases.

#### Car Equipment.

Six closed passenger cars 47 ft. long length and four closed passenger cars 41 ft. long, with motorman's cab on one end only, are already in operation. These cars with trucks, brakes and motors, weigh 23 tons and 25 tons respectively, and with the passenger load 4 tons more. The cars were furnished by the Jewett Car Co. and the G. C. Kuhlmann Car Co. They are finished in cherry and oak; a smoking compartment is provided on part of the cars. Where a baggage compartment is used, small folding seats are distributed about the enclosure, for smokers. The windows have very low sills and are of the Pullman type.

The trucks are of the Peckham 14 A. extra strong type with outside hung brakes, and are equipped with four Lorain Steel Co's. No. 34 motors of 50 h. p. each with inside hung rigid suspension. The current required to start car is 175 amperes, and the normal running current is 135 amperes at 500 volts. These motors are protected by "A-P" circuit breakers. The trolley base installed is of the Bleasdale & Holland type. The cars are heated by the Peter Smith hot water heaters; some are placed with sheet iron partition, back of the rear seat, in the rear end of the car, and others are located in a separate enclosure, adjoining the toilet room. All cars are equipped with the storage air brake system furnished by the Magann Air Brake Co. The air reservoirs are charged from a large storage tank, set between the two tracks, at Jenison, 900 ft. from the power house. The air compressor is of the Hall Steam Pump Co's. manufacture, and a part of the power house equipment. An additional air compressor, of the belt driven type and of same make, is placed in the Macatawa sub-station and operated by a series electric motor. Ham sand boxes are on all and cars work effectively. The Beverly wheel hand brake is also provided. The car seats are from the Hale & Kilburn Manufacturing Co. and are of the well-known high back, "walkover" type. The short cars (41 ft.) are provided with rattan seats and the long cars (47 ft.) have a handsome plush covering. The shorter cars seat 46 people and have wide aisles. The company has recently ordered five 50-ft. passenger cars, which is proof that the long cars are considered best suited for its interurban business. It is confidently expected that trains of two cars will be necessary for handling the summer business. Ultimately, the shorter cars will run during that part of the day when travel is light. The road also has in addition to this car equipment, three 35-ft. closed passenger cars and seven 35-ft. 12-bench open passenger cars, equipped with two 35-h.p. motor Walker equipments. These cars are mounted on maximum traction tracks.

A terminal barn and shop are located at the Macatawa sub-station, and another will be built in the spring at Jenison. A feature of the latter barn is, that the main tracks pass through barn and are provided with inspection pits. Every car will receive an inspection of motors, wheels and trucks, every round trip. Adjoining these tracks are two car storage tracks, also one pit tracks for repairs.

The freight equipment consists of three 35-ft. closed cars, similar in exterior appearance to those used for passenger purposes. Oil headlights are used and cars are equipped with fenders. The company has six 26-ft. box cars and six 30-ft. gondolas, also one combination freight locomotive and nose snow plow and one Ruggles rotary snow plow. These snow plows have done excellent work during the past winter.

The rates for freight are low, ranging from 2½ cents to 23 cents per 100 lb., dependent upon distance rate basis and classification. The express rates vary from 20 cents for a package weighing not more than 10 lb., to 45 cents for packages weighing from 50 to 100 lb. Over 100 lb. a rate of 45 cents per hundred is made. These

rates, however, vary somewhat, dependent upon the distance, classification and risk. While on the Grand Rapids Railway Co.'s tracks freight cars operate on a mileage basis.

Village franchises call for a rate not to exceed  $1\frac{1}{2}$  cents per mile, for carrying passengers, with no fare accepted less than 5 cents, but the steam railroad competitor has recently reduced its rates, and as a result the interurban company is making special rates during certain hours of the day, when the steam road has trains moving between terminal points. For track privileges in Grand Rapids, the interurban company receives 2 cents on every fare in either direction on local or interchanged traffic, free transfers being given and the local Grand Rapids road provides train crew and power, furnishing and maintaining the track.

The Grand Rapids, Holland & Lake Michigan Ry. was financed and built by the Detroit Construction Co., of Detroit, of which John Winter is president and B. S. Hanchett, jr., vice-president. The electrical and mechanical engineering work was under the direction of W. D. Ray, at that time electrical engineer for the Detroit Construction Co. L. B. Wilson was the civil engineer.

The contract for the complete power plant including the building was awarded to the Arnold Electric Power Station Co., of Chicago, and this part of the work was done in accordance with plans and specifications submitted by the Arnold company.

### CONVENTION OF RAILWAY COMMISSIONERS.

The National Association of Railway Commissioners met at Charleston, Feb. 11-12-13, 1902, this being the 14th annual convention of the railroad commissioners of the United States. The Association of American Railway Accounting Officers and the Street Railway Accountants' Association of America are each represented in the commissioners' association by a committee of three, and on the occasion of the Charleston meeting the latter association sent as its committee, H. C. Mackay, of the Milwaukee Electric Railway & Light Co.; C. N. Duffy, of the Chicago City Railway Co., and W. F. Ham, of the Washington Traction & Electric Co. Mr. Duffy had also been appointed as a member of the Railway Commissioners' committee on statistics.

It will be remembered that at the San Francisco meeting of the Railway Commissioners a committee consisting of L. M. Read, of Vermont, Ashley W. Cole, of New York, and George N. Bishop, of Massachusetts, was appointed to confer with a committee of the American Street Railway Accountants' Association and prepare a form of "Report for Electric Roads." H. L. Wilson, of the Boston Elevated Railway Co., W. F. Ham, of the Washington Traction & Electric Co., and Elmer M. White, of the Hartford (Conn.) Street Railway Co., were appointed on behalf of the Accountants' Association. These committees met in New York Jan. 10, 1902, and it was decided to lay a prepared form before the Street Railway Accountants' Association at its Detroit meeting, and then present a report at the 1903 convention of the Railway Commissioners.

The next meeting of the National Association of Railway Commissioners is to be held in Maine July, 1903. Mr. B. F. Chadbourne, of Maine, is president, and Mr. E. A. Moseley, secretary of the Interstate Commerce Commission, Washington, D. C., secretary.

### TRANSFER SYSTEM IN COLUMBUS, GA.

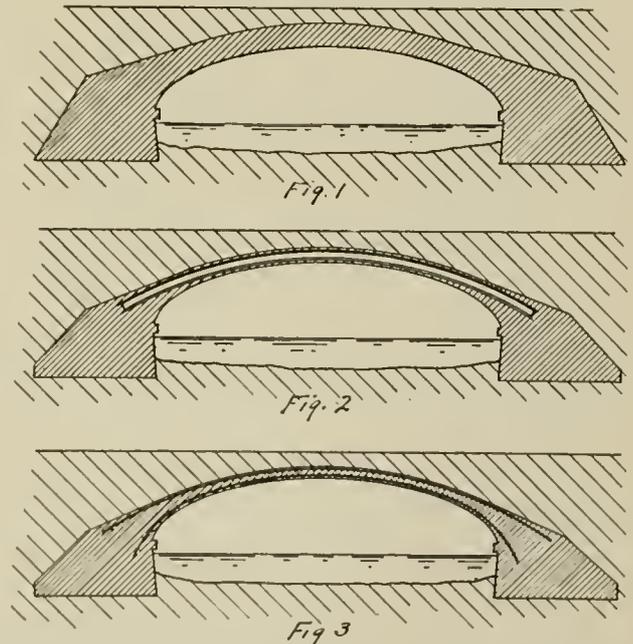

A complete transfer system has been devised for the Columbus Railway Co. which will be put into operation within the next few weeks. An ordinance is now pending in the council preventing the sale or giving away of transfers, and as soon as this is adopted the Columbus Railway Co. will put on transfers. Several years ago this company gave transfers, but the privilege was abused to a considerable extent, as the system was a rather loose one, and for this reason the transfers were subsequently abolished. With the new system about to be put into effect the officers of the company claim that while transfers will be granted to every line, the system is such that it cannot be abused.

The Eastern Indiana Traction Co. is making rapid progress in securing rights and franchises for the proposed line from Upland to Gas City. The project has been financed, and it is expected that cars will be in operation over the entire route within six months.

### CONCRETE-STEEL BRIDGES FOR INTERURBAN RAILWAYS.

BY DANIEL B. LUTEN, LA FAYETTE, IND.

Concrete has had so many adaptations to bridge abutments and arches in the past few years, and has so cheapened this kind of construction, that many engineers have overlooked the fact that still more efficient structures may be constructed of concrete reinforced with steel. Concrete-steel is, in fact, as much more reliable and efficient than concrete as steel is than wrought-iron. And just as steel has almost entirely superseded wrought-iron in bridge construction, so concrete-steel will, when better understood, replace concrete, except for members that are perhaps entirely in compression. At present prices, concrete is a more economical material than steel for transmitting compressive stresses, but steel is much the more efficient material for transmitting tension. In combinations of the two materials then, the greatest efficiency will in general be secured by placing the steel so as to resist the tensile stresses, while the concrete is relied upon to resist the compressive stresses and to act as a protective coating for the steel; such a combination for example as is used for flat floor arches or girders

where the steel is embedded in the concrete in the form of suspension cables.

Figs. 1, 2 and 3 are arches of the same span and rise designed according to the more popular methods of concrete and concrete-steel construction. Fig. 1 is of an arch of concrete alone, that is with no steel reinforcement whatever. The thickness of the arch at the crown and abutments was determined by Trautwine's empirical formulas for highway bridges of first-class masonry. The curvature of the intrados is approximately that of a transformed catenary, the curve of equilibrium for a loading of earth filling.

Fig. 2 is a concrete-steel arch, designed according to the Melan system, which consists in embedding steel ribs in the concrete of the arch ring, the beams being curved to follow the central axis of the ring. The steel beams are usually I beams, with web placed vertically, and spaced at intervals of three or four feet. This method of construction relies mainly upon the steel ribs to support the loading, the concrete acting as a protective coating to prevent corrosion of the steel. It is therefore not a very effective arrangement of steel reinforcement. A much more effective device is the Thacher type of arch illustrated in Fig. 3, in which the concrete rib of the arch is reinforced by bars in pairs, one bar of each pair being placed close to the inner edge of the arch rib, and the other close to the outer edge. The pairs of bars are placed at intervals of three or four feet. The bending moments produced in the arch rib by concentrated loads are resisted by the bars, one bar of each

pair being in tension and the other in compression at any given section of the rib. Since the bending moments in an arch rib differ in kind, a bar may be in tension at one point and in compression at another. To prevent the bar from slipping in the concrete under these variations of stress, ribs, or corrugations, are rolled into the bars, or rivets are driven at intervals of six or eight inches, the heads projecting into the concrete. The new Y bridge at Zanesville, O., having eight spans, of which the largest is 122 ft., is of the Thatcher type. So also are the concrete steel arch bridges form-

are in compression, retaining only those parts that are in tension, the condition shown on the right of Fig. 4 would obtain. The parts of rods may easily be made continuous by filling in the portions shown in dotted lines on the left of the same figure. In an arch of this kind, the loads may of course be concentrated at points other than the crown, but when the arch supports a considerable load of earth filling, the loads near the crown are the only ones that produce appreciable moments in the rib. Hence an arch of the type shown in Fig. 5 is an effective structure when supporting

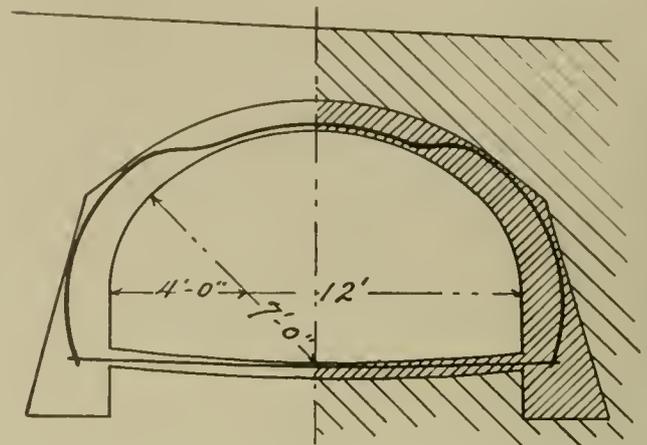

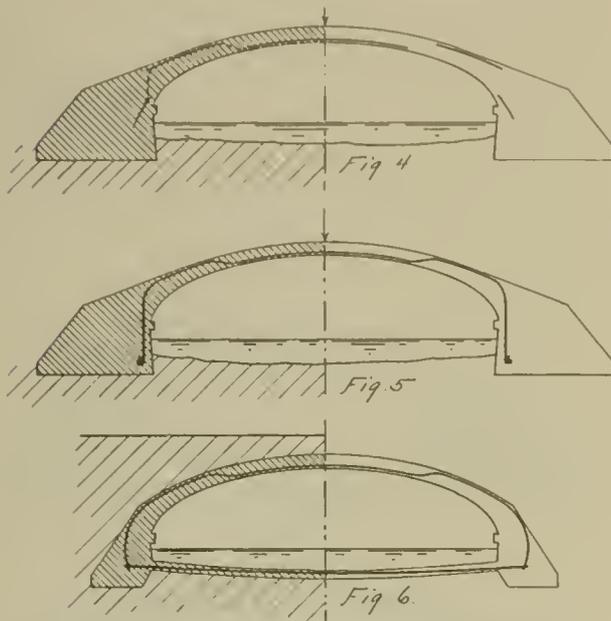

FIG. 8.

ing the islands in the river immediately above Niagara Falls. The Topeka (Kan.) bridge was erected on the Melan system, and consists of five spans, the maximum being 125 ft. The two concrete steel bridges at Indianapolis, Ind., on Meridian and Illinois streets, are of this latter type.

Another rather novel type of concrete-steel arch has been developed by the National Bridge Company, of Lafayette, Ind., and has been applied in numerous small structures, some of which are illustrated in Figs. 7, 9, 10 and 11. The type of construction, which consists of a single series of steel rod or bar reinforcement, is

an earth filled roadway, and requires but one reinforcing rod. Moreover, since this rod will be in tension throughout its entire length, the variations in stress will be much less, and corrugations or rivets are unnecessary.

In Fig. 6 a desirable addition is shown for bridges spanning shallow streams, where the difficulties of construction are not too great. The horizontal thrust of the arch against the abutments which ordinarily is resisted by making the abutments very massive, is in this type resisted by steel tie rods from abutment to abutment beneath the bed of the stream. These rods are joined to the upper reinforcing rods in the abutments. In order to prevent the tie rods from rusting, they may be embedded in a pavement of concrete six or eight inches thick. Such a pavement also renders the structure flood-proof, and for this purpose aprons of concrete may be provided at upstream and downstream ends, dipping two to three feet

FIG. 7—CONCRETE ARCH ON MT. LOWE ELECTRIC RY.

FIG. 9—CULVERT ON BIG FOUR RAILROAD.

shown in Figs. 5 and 6. If the Thatcher arch of Fig. 3 be subjected to concentrated loads at or near the crown, as in Fig. 4, bending moments will result that will produce tension in the lower rod near the crown, in the upper rods at the haunches, and in the lower rods again near the springings. The remainder of these rods will be in compression; if, then, on the principle that steel is not economical in compression, we reject those parts of the rods that

into the bed of the stream. The pavement also provides a very satisfactory foundation for the support of the forms for the arch ring.

The amount of material that may be saved by these two devices of a steel rod reinforcement and steel ties, is considerable. After making allowance for the steel, the arch of Fig. 6 contains but 60 per cent as much material as that of Fig. 1, and the former

is a much stronger and more reliable structure, since it is designed without the doubtful assumptions that are necessary in the other arch as to resistance of the abutments, stability of foundations, and pressure of earth backing.

Fig. 7 is a photographic view of a 12-ft. arch erected for the Mt. Lowe Electric Ry., near Pasadena, Cal. It is shown in section in Fig. 8. By making the curve of the intrados three-centered a much better appearance is secured than would have been possible with a full-centered arch of the same span and rise. In this bridge the reinforcing rods and the ties were 3/4-in. round steel rods.

FIG. 10—CULVERT FOR INDIANAPOLIS & MARTINSVILLE TRACTION CO.

smooth, and spaced at intervals of 16 in. The concrete was mixed in proportions of one portland cement, three sand and five gravel.

Fig. 9 is a railroad culvert of 18 ft. span, on the Big Four railroad, 13 miles southeast of Indianapolis. In this arch the thickness at crown was 17 in., base of abutments 7 ft., and thickness at springing 30 in. The steel rods were 1-in. smooth, round, spaced 2 ft. on centers. This bridge, as well as two others of the same type in use on the Big Four, have carried the heavy traffic of that road, including 150-ton locomotives, without showing cracks or flaws of any kind.

Figs. 10 and 11 are of a small full centered culvert on the electric road built by the Indianapolis & Martinsville Traction Co. near Friendswood, Ind. The culvert is intended mainly as a cattle pass, is of 4 ft. span and 6 ft. clear opening. On account of the

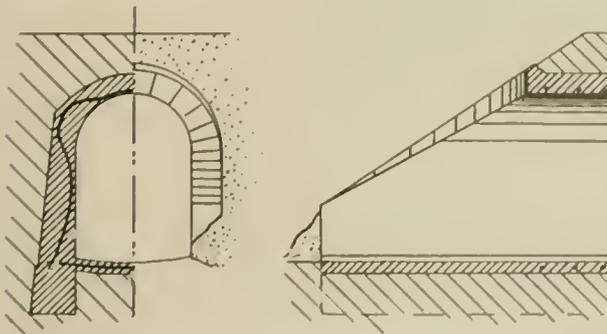

FIG. 11.

pressure of the earth filling against the high bench walls, the reinforcing rods return to the inner edge of the walls, and the ties are of little use except to reinforce the concrete of the pavement which here acts as a butt between the two bench walls. For economy of material this arch has warped ends, instead of the usual parapet and wings. The form of this end will be readily made out from the photograph and sections. Two of these arches, each 30 ft. from end to end, were completed in seven days after the award of the contract. The contract price for each of these two culverts was \$230.

PROFIT SHARING AT COLUMBUS.

In the "Review" for August, 1890, page 526, we published the announcement of the Columbus (O.) Street Railway Co. that on and after August 1st the company would, at the end of each quarter, pay to each employe the same percentage on the wages or salaries received by him during that quarter that the stockholders of the company received as dividends on their stock. This plan has now been in operation for 2 1/2 years and the 10 quarterly "so-called" dividends paid to the employes aggregate \$40,000, a quarterly average of \$4,000. Concerning the effect of this, we understand that it has been most satisfactory in promoting harmonious relations between employes and the management.

We quote the following from a recent issue of Public Policy, which commented on the Columbus road's plan of profit sharing:

"We have never known of a profit-sharing experiment in this or any other country which has not been broken up or attempted to be broken up by a class of labor agitators whose socialistic theories and incendiary occupation is destroyed by any arrangement that brings contentment and thrift to wage-workers. In the opinion of these false friends, the worst of all crimes is committed when workmen become small capitalists. These agitators thrive on the discontent and poverty of their dupes. Contentment and thrift spells death to their propaganda of hatred, malice and prejudice against employers and capitalists. The usual method followed by these false friends of workmen is to get some of their emissaries employed wherever a profit-sharing experiment is instituted and then to use every means possible to poison the minds of the workmen, with whom they are thus enabled to associate, against some rule, officer, or superintendent, inveigle the men into a union under by-laws requiring them to strike without cause when ordered to do so, and then create a disturbance on any pretext that will answer the purpose and declare a strike. This was the way the great Pullman strike was initiated. It was entirely due to the designing work of emissaries who were never regularly employed in the Pullman shops.

"A coal mining company in Kentucky has been operating for some time on a profit-sharing basis. Several unsuccessful attempts have been made to induce the men employed at these mines to go on a strike. No opportunity is lost to condemn these workmen for becoming partners with capitalists. The Rev. Herbert S. Bigelow of Cincinnati is reported on Jan. 6, 1902, in the Columbus (O.) Evening Press to have said:

"What can striking miners do when capital has a monopoly of the mines and is in league with the railroads? And suppose mine-owners should decide upon the policy of giving the mine operators a larger share of the profits? They might thus avoid a strike, but they would thereby make their operators partners with them in their conspiracy and the public would be at their mercy, as before."

"To such agitators wealth is a crime, poverty the only virtue. Every workman who finds a fair employer and reciprocates fair treatment received by giving fair treatment in return, and thus becomes contented and thrifty, is held up to scorn by these false friends as a criminal.

"But all honest and intelligent men know that the conditions of life are made better for everyone only by making poor men richer, not by making rich men poorer. We hope the employes of the Columbus Street Railway Co. will never permit its profit-sharing system to be broken up, but will encourage it until they secure an arrangement by which they can buy the stock of the company on favorable terms and then keep at it until they own the company. Regeneration will come through a correct use by workmen of the resources that are their own, their power to labor and save, not by beneficence conferred by a socialistic state."

STORAGE BATTERY PATENT DECISION.

We are informed by the Electric Storage Battery Co., of Philadelphia, that a decision has just been rendered which again sustains the validity of the Brush storage battery patent owned by this company. The decision was rendered by Judge Lacombe of the United States Circuit Court and an order is granted restraining the Porter Battery Co., from the further manufacture or sale of secondary battery elements which infringe this patent.

### BION JOSEPH ARNOLD.

The selection by the New York Central Railroad Co., of Mr. Bion J. Arnold to design a feasible system for electrically operating its trains (about 600 per day) in and out of New York, as well as his notable work in connection with electric railway developments in recent years, has made him today one of the most prominent figures in the field of electrical engineering, and at this time a biographical sketch is of particular interest.

Mr. Arnold was born in Grand Rapids, Mich., in 1861 and three years later his family removed to Ashland, Neb., where his father, who was a lawyer, became a member of the Territorial Legislature of Nebraska which framed its constitution prior to its admission into the union. Mr. Arnold received his early education in the public school of the latter town and commenced his course in engineering at the University of Nebraska in 1879. After one year at this institution he entered the scientific course at Hillsdale College, Mich., from which he was graduated with the degree of B. S. in 1884. Here he took a mathematical prize for a six year's course and three years later received the degree of M. S. In 1899 the same college conferred the degree of M. Ph., upon him in recognition of the engineering work done by him subsequent to his graduation. In April, 1899, Mr. Arnold finished a post graduate course in electrical engineering in Cornell University and in 1897 he received the degree of E. E. from the University of Nebraska.

From his school-boy days Mr. Arnold evinced a decided taste for mechanical pursuits and when a mere boy much of his time was spent in the construction of small engines, electrical machinery and other mechanical appliances. His proficiency in this respect was the more marked for the reason that there were no machine shops or railroads anywhere near his home and his devices were produced from crude materials with such tools as are found in a country blacksmith shop. When 15 years of age he began to spend his summers running traction engines doing threshing work on farms, from which he acquired a certain amount of skill in handling machinery. His vacations while at college were spent traveling as a representative of several engine building companies, and one summer was spent with a surveying party in the field. In 1884 he engaged as general agent for an engine for two years in order to gain business experience, and then went with the Edward P. Allis Co., of Milwaukee, as a draftsman. He was next engaged as the chief designer for the Iowa Iron Works, of Dubuque, and subsequently with the Chicago Great Western road as a civil engineer. He was also employed as mechanical engineer on this road after it was taken over by the operating department, but resigned this position in 1888 when he entered upon his graduate study in Cornell. His next engagement was with the Thomson-Houston Electric Co., as agent and engineer in charge of its St. Louis office and after two years he was made consulting engineer for the Chicago office of the same company, where he remained for two years after the consolidation of this company and the Edison company into the General Electric Co. He then started for himself as a consulting electrical engineer and since 1893 has been identified with many notable electrical enterprises and has made a number of inventions and improvements in engineering methods which have given him a wide reputation.

A feature of Mr. Arnold's work is that much of it has been in advance of the profession and his engineering work, therefore, has often been carried through in the face of considerable opposition. The almost general system of operating long distance electric railways by means of high tension currents with rotary transformers and storage battery sub-stations was first introduced by Mr. Arnold, in connection with the Chicago & Milwaukee Ry. The opposition to these methods was such that Mr. Arnold in order to demonstrate the advantage of the plans which he had advocated as consulting engineer of the company, contracted to build and equip the road, guaranteeing its successful operation. As the designer and builder of the Intramural Railway power plant at the World's Fair in Chicago, 1893, he gained an international reputation by embodying many new ideas in its construction which have since become common practice. The use of direct connected units for this power station was an important innovation, but realizing that independent direct connected sets may often be at a disadvantage he designed what is known as the Arnold system by means of which several direct connected machines are so ar-

ranged that by means of clutches and an auxiliary shaft two or more generators may be driven by any one of the engines. This system has been installed in many of the largest plants within the past few years, and its practicability has been fully demonstrated. In regard to storage batteries, also, Mr. Arnold was one of the pioneers and well in advance of his contemporaries; he early advocated the installation of storage batteries for regulation and peak work in electric light and power stations.

Another important invention of Mr. Arnold's is a magnetic clutch which has been made in sizes up to 3,000 h. p. capacity and which is used for throwing one dynamo out and another in its place without stopping the driving engine. The ordinary friction clutch was not considered reliable for this and his invention of the magnetic followed the demand for such a device, and it is being rapidly applied for various classes of work.

Mr. Arnold's professional work now requires him to maintain offices both in New York and Chicago and he has become largely interested in numerous engineering and industrial enterprises. He is president and mechanical director of the Arnold Electric Power Station Co., which has attained a notable success in designing and constructing large electrical power station properties. He is president of the Kenosha Street Railway Co., vice-president of the Kentucky Western Railway Co., consulting electrical engineer for the Chicago, Burlington & Quincy Railroad Co. and for the New York Central & Hudson River Railroad Co. He is a member of the American Institute of Electrical Engineers and was one of its five representatives at the Paris International Electrical Congress. He is a trustee of the Western Society of Engineers and was a charter member and director of Technical Club of Chicago. He is also a member of the Union League Club of Chicago, of the American Association for the Advancement of Science, of the American Society for the Promotion of Engineering Education, of the board of governors for the Chicago Automobile Club and a member of the Transportation Club of New York.

Mr. Arnold is in demand as a lecturer on engineering subjects and in this capacity has addressed the students of the University of Illinois, the University of Michigan and Purdue University. He also delivered a course of lectures at the University of Nebraska on the design and construction of electrical power plants, his work being recognized by the faculty of that institution by the honorary degree of E. E. which was conferred upon him. He was awarded a gold medal at the Omaha Exposition in 1898 for his personal exhibit which consisted of some of his crude models of earlier years and devices he had built when a boy in conjunction with the drawings of his electrical inventions and engineering works. His natural ability has been supplemented by habits of industry and perseverance and a mature judgment so that at an unusually early age he has achieved a success which has won him the highest respect and esteem for his valued work in the engineering field.

### FREIGHT ON ROCKFORD-BELVEDERE LINE.

The Rockford-Belvedere Electric Ry., which has been in operation but a few weeks, is about to put on a number of freight cars for hauling freight on certain trains only which will make stops at all farms between the two terminal points. The experiments in freight hauling which have been made by the company have proved very successful and new cars for this service are being built at its shops at Rockford. The tariff has been placed at about 12 cents per 100 lb. on the class of freight under which most farm produce is shipped. The farmers along the road are well pleased with the service and have already done considerable shipping in the freight compartments of the passenger trains.

The company is also building a private telephone line along the right of way and arrangements for making connections on poles at convenient intervals are also being provided. All the cars on the road will be equipped with telephone instruments so that they can make connections at any of these points and communicate with a number of telephones on the line.

The Columbus (O.) Railway Co. has installed four new boilers of 400 h. p. each, and this is said to be the initial move in the reconstruction of the company's electrical system.

*Brong F. Arnold*

## California and Combination Cars.—II.

BY W. E. PARTRIDGE.

Some years elapsed after the introduction of the California car on the Pacific Coast before it was built by any of the eastern car shops. This was not remarkable perhaps because the car was supposed at that time to be adapted exclusively to the western part of the country on account of its mild uniform climate. Cable roads worked their way east, though somewhat slowly. With them came, either the open independent grip car, or the open compartment at the end of a closed car.

When the builders east of the Rockies began to turn out California cars they usually introduced decided modifications in both

FIG. 1—CALIFORNIA CAR BUILT IN THE EAST.

design and construction. Of all the photographs and plans which have come into the author's hands from car builders east of the Rocky Mountains, showing California cars, that shown in Fig. 1 by the St. Louis Car Co. is the only one that closely follows Mr. Hammond's plans in all its essential features. It has the longitudinal seats coming close to the edge of the car leaving a space between them for the motor or gripman. The roof framing and the posts are light at the open part. Stiffness for the posts is obtained by ornamental brackets of considerable depth. The sills are plated and there are double steps. The bulkheads at the ends of the open parts have drop sash. The whole car follows the original pattern very closely except in the arrangement of the life guards and fenders.

The next car of which photographs and description came to hand is by the American Car Co. of St. Louis, and is shown in Fig. 2.

FIG. 2—MODIFIED FORM OF CALIFORNIA CAR.

Here we have an important modification of the original design. The car was one of a lot built for the Phoenix Railway Co., of Phoenix, Ariz. The seats in the open section instead of being longitudinal are transverse, but the aisle in the center of the open part is retained, or perhaps it would be more correct to say that the space between the seat backs which in the original design was used for the motorman is here turned into an aisle. The completely open end of the original car is retained and motorman and passengers are entirely without protection in front. The cross seats have an important advantage, because this construction enables curtains to be used at the side. These come down to the floor. This is a step towards gaining protection, in case of storm, for the open end. The curtains are only possible by the use of cross seats, they are practically out of the question with the longi-

tudinal seats as they could hardly be placed on the slender posts of the original design. The placing of the seats transversely makes it convenient to place a metal panel at each post. In this way the posts instead of being mere hood supports are part of the car frame and stiffen the roof, and additional strength is imparted to the structure. The roof design is materially changed by carrying the letter board out to the corner posts, or the posts that stand at the ends of the roof. It must be noted that in this car the roof is not carried out to the dasher. Its framing extends only to the front posts, which are connected at the top by a heavy bow carlin and the end frame of the monitor deck. The end of the roof is finished by an ordinary clam shell hood carried by two hood supports at the ends of the dasher. The body of the car is of the usual box car type with plated sills and truss rods extending from bolster to bolster. The grab handles are of the eastern pattern. In fact the whole car has been modified, and on the whole the modified form should be stronger than the first form supposing the workmanship to be equal.

One important point in this design deserves attention. By retaining the central aisle between the cross seats, passengers when

FIG. 3—CALIFORNIA CAR FOR ISLAND OF TRINIDAD.

entering or leaving do not, or need not disturb those remaining seated. The aisle also gives ample standing room, which however is greatly increased by the space inside the dasher. The entrance guards are a good feature since they tend to reduce the number of accidents by making it difficult to enter the car on the wrong side. Usually when they are used a chain to close the space between the corner post and the dasher is provided.

Another car by the American Car Co. makes some further alterations in the California type which are interesting. It is shown in Fig. 3. This was one of a lot which was built for the Island of Trinidad. These cars were finished complete and then knocked down and shipped in boxes. They have some of the leading features of the car just described, such as roof construction, absence

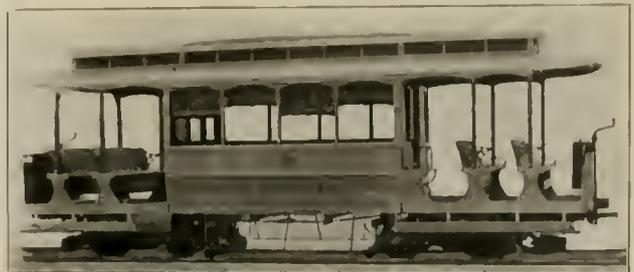

FIG. 4—MODIFIED CALIFORNIA CAR BUILT IN THE EAST.

of an end bulkhead and of a buffer beam. The seats are transverse in the open ends but are entirely without an aisle. This arrangement gives the open ends a seating capacity for 20 persons, but it provided little or no standing room. At least there can be no standing except behind the seats next the door and dasher without great discomfort for those who are seated. The

entrance and exit from the open seats is not easy being no better than that of any open car. However the car has great seating capacity, carrying 38 persons on a length of but 26 feet over the corner posts, the closed part of 12 ft. seating 18 persons and the open seats 20. Like the last mentioned car it is mounted upon double trucks. In the eastern built cars it is quite rare to find wheel guards protecting the spaces between the wheels.

This car has one feature to be commended and which is rather unusual. Each of the openings is closed by a folding gate which reaches from the floor within a couple of feet of the tops of the

FIG. 5—SIX-BENCH CALIFORNIA CAR.

windows. These gates completely close one side of the car making entrances on that side practically out of the question. Curtains, steps and other details are the same as in the last described car.

The Brill company has built a number of varieties of the California type, of which Figs. 4 and 5 are two that were built for the Pacific coast. Fig. 4 is one of a lot that went to Spokane. Although carried on double trucks, the body is brought low enough so that only single steps are needed. There are two long transverse seats and in each open end one short seat. The roof is of the Brill standard form though the corner post appears lighter than would be used by the company at the present time. As a whole the car was a close adherence to the early California design with the exception of the arrangement of the seats. The second car, Fig. 5, was an enlargement of the other. The seating capacity of the open ends was increased so that there were accommodations for 30 persons. That it was one of the early cars is easily seen from the carriage curtains which were used to close the sides. The type was even then undergoing changes, and improvements were evidently in mind. The next car of the kind which the Brill company produced was one of the most remarkable which has been built on the lines of original California pattern. This car is shown in Fig. 6. It was for the San Diego Railway Co. and has a double deck as well as the open ends with cross seats. The seats on the upper deck were longitudinal and placed back to back. There was ample standing room on the lower deck. For the size of the car the platforms were of unusual length while the closed body was rather short. The car was mounted on a single truck. It appears to be admirably adapted to the warm climate in which it was to be operated.

The California type has appealed strongly to foreign railway managers. Not only in Europe but in South Africa and Australia these open cars seem to meet the wants of the street railway companies as well as of the passengers. This seems somewhat strange when the cool damp climate of England is considered on the one hand the the heat and dryness of South Africa on the other. The fact however remains and shows that the type is one which has a much wider range of uses than we have generally considered possible. This point may be profitably considered by those who have expressed the opinion that the California car is not suited for operation in the extreme eastern portions of the United States.

Some of the English car shops have taken up the construction of cars of this type and have produced interesting designs

The writer has received from Mess. George F. Milnes & Co., Ltd., of Hadley, England, blue prints of California cars which they have built for Wolverhampton and for Middlesboro. The first of these is a four-wheel car. In Fig. 7 are given side elevation, cross sections plan and end elevations of this car. The closed compartment accommodates 16 persons and the open ends 8 persons each or 32 in all. This seemingly small seating capacity is due to the fact that the cars are for a narrow (3 ft. 6 in.) gage road and are but 6 ft. 2½ in. wide at the sills and only 6 ft. 6 in. long and the whole length over the platform 26 ft. The height inside is 7 ft. 9 in. In spite of the narrow space into which it was necessary to compress the design a very satisfactory result has been accomplished.

In looking over the details of construction one distinctly English feature is noticed in the excessive size of the sash. Large glass is very attractive no doubt to the passenger, but a car of this kind needs a larger number of posts in the body. Built in this way with but three posts the racking strains are not sufficiently resisted and the durability is sacrificed to appearance. Many American roads have followed this style and the early breaking up of the frame showed that the design was faulty. To make this form of framing strong enough to endure hard service the letter board should be increased in thickness and width and ought to be halved upon the posts.

The central post also needs to be much larger than shown, in fact a narrow central panel with double posts would be better. For durability of the structure the posts ought to be quite as large as those on the platform or at the corners of the body.

The steps are within 16 in. of the head of the rail and are brought within the outside width of 6 ft. 6 in.

The mounting of the car needs a word of notice. The wheel base is 6 ft. 6 in. The journal springs are of the half elliptic pattern. They are used in this position to overcome the tendency of four-wheel cars to gallop or pitch. This advantage is neutralized to some extent by the helical springs which are used to carry the body.

These cars are handsomely finished inside in quartered oak, birch veneer head linings and beveled edge mirrors in the ends. The floor is covered by loose rugs, which have the corporation initials woven in the centre. At the end of the cars there are three drop

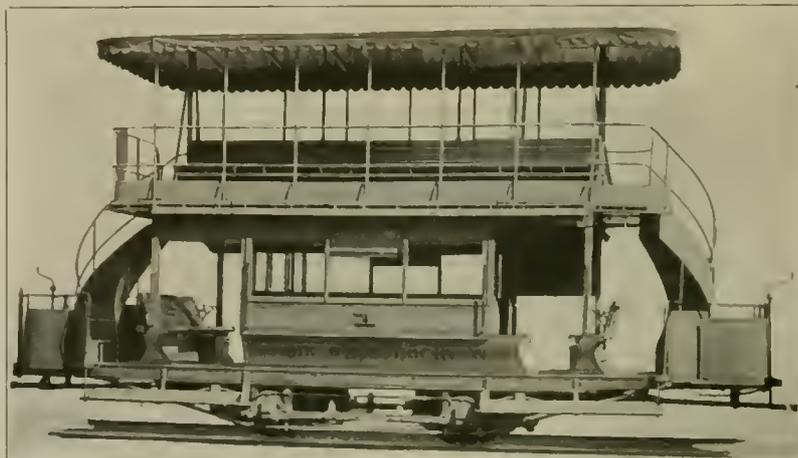

FIG. 6—DOUBLE-DECK CALIFORNIA CAR FOR SAN DIEGO.

each platform. The specification received from the company calls for three windows on a side of quarter inch polished plate glass. From this we judge that this is standard construction rather than that shown in the engravings.

Incidentally it is interesting to note that drapery curtains are used instead of those on spring rollers. Evidently the curtain is more of an ornament than in America, where it has to perform hard service in keeping out the sun. In England with less sun to trouble them the drapery curtain is much liked.

Another feature of English practice is worth consideration. The ventilators are glazed to receive advertising transparencies. This in effect doubles the advertising space within the cars.

The second car from the George F. Milnes company is shown in the California pattern would have been more economical in construction. The seating capacity would have been the same and by making a bulkhead at the end of the car, the whole platform could have been protected by the curtains.

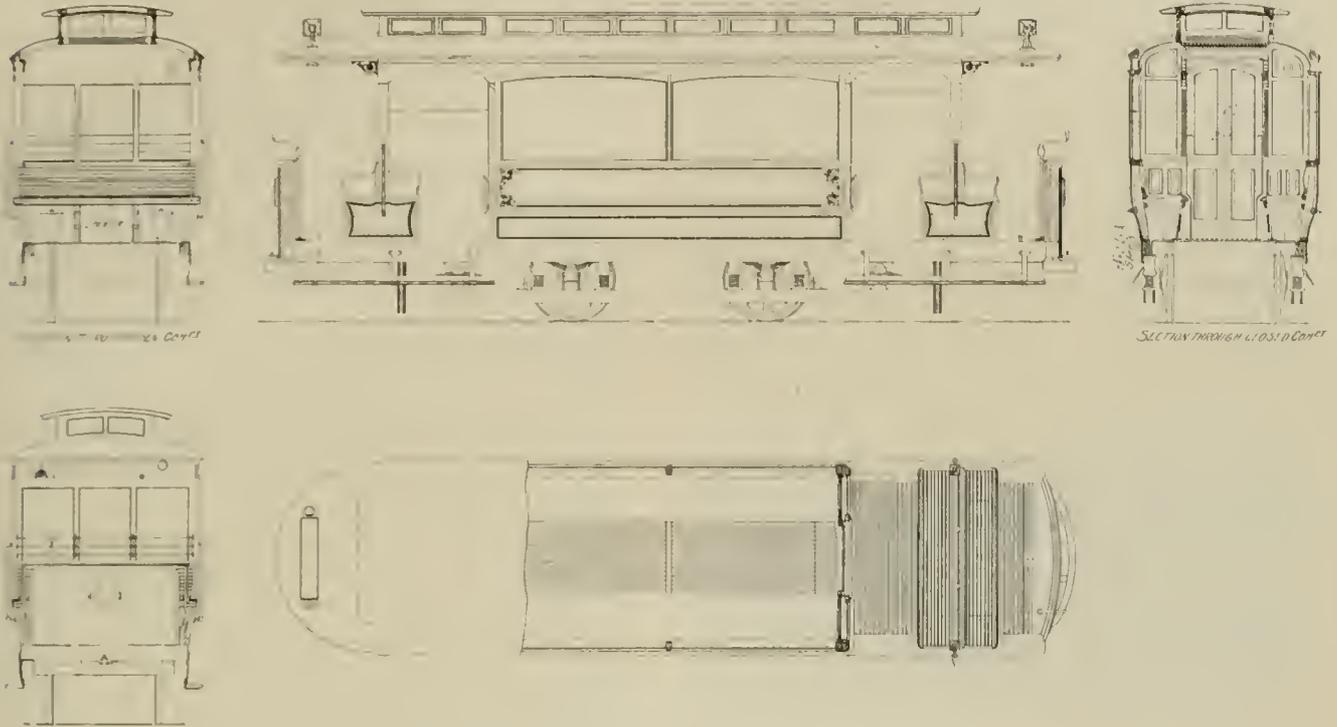

FIG. 7 - DIAGRAMS OF 4-WHEEL CALIFORNIA CAR BUILT IN ENGLAND.

in Fig. 8 and is mounted on eight wheels (two maximum traction trucks). This car is for the 3 ft. 6 in. gage and in most of its details is similar to the one previously mentioned. The steps, however, are carried some inches lower making access to the car much easier.

In considering the strength of this car, it should be noted that the posts in the open part are greatly aided by the framed panels at the ends of the seats. Iron panels at the same points however would have been better as they are stronger and more durable.

One feature of construction of the car shown in Fig. 7 should be copied by American car builders. Instead of using a simple

On the open ends of the car an extra seat is placed, so that the

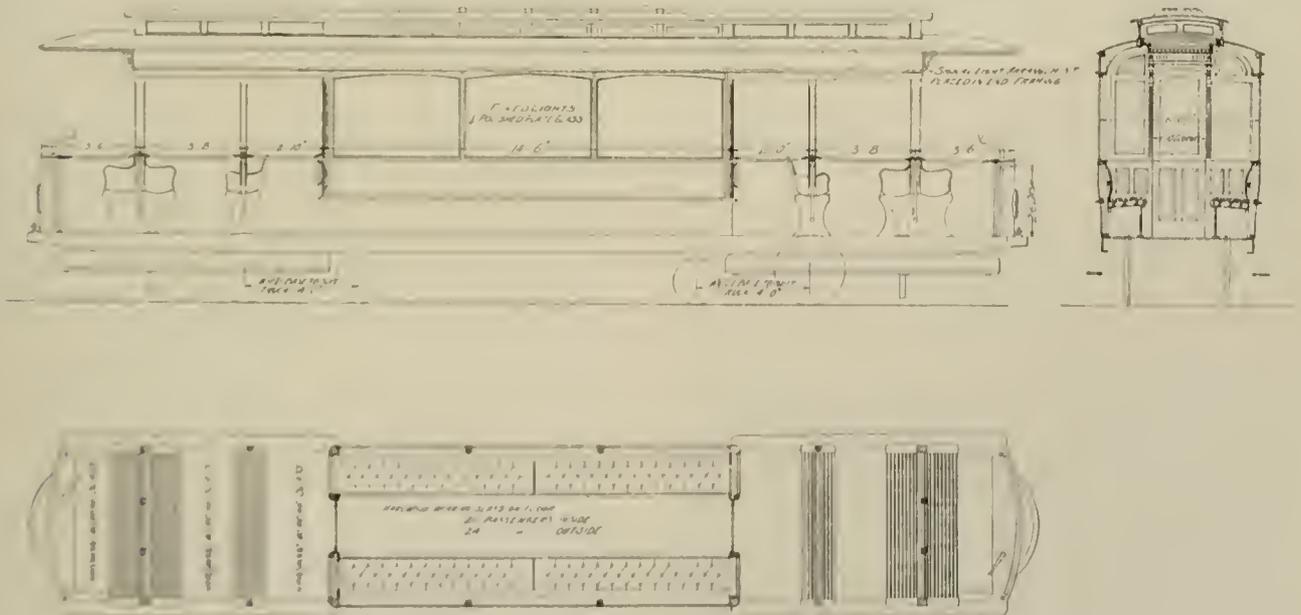

FIG. 8 - DIAGRAMS OF 8-WHEEL CALIFORNIA CAR BUILT IN ENGLAND.

entire seating capacity of the platform becomes 44. The body is 14 ft. 6 in. long and seats 20 per ton, making a total of 44. Most of the details of construction are similar to those of the car just described. In the case longitudinal seats after the original Cali-

plated sill, which is heavy and does not use the metal to the best advantage, a deck beam or its equivalent is employed. This has a web only 3/8 in. thick, but it is 7 7/8 in. deep and has a horizontal flange practically 3 in. wide. A timber filler, or sill, is used inside

of it and also a small rider of wood in order to get a suitable attachment for the posts and ribs. This construction produces great strength with a small expenditure of material and consequently small weight.

In the large car the sill is of channel iron. It has a small rider of wood but is without a filler. This is very fair construction and is lighter than that which is common in this country. Where suitable pockets are employed to hold the cross timbers the floor is both stiff and light.

An important and valuable improvement was made in California cars about six years ago by the Brill company. This consisted in dropping the platforms or open ends of the cars so that a single step was within easy reach of the ground. The support of the dropped end is accomplished in a very neat manner by using a subsill of angle iron under the closed body. At the end this subsill is offset, or bent, so as to carry the platforms. The car illustrated has two stationary seats at each end with a three sash bulkhead between them. A number of variations of this style have been made. Sometimes the bulkhead is omitted and a single seat with a reversible back used. In the car shown in the illustration the curtains come all the way to the floor, which makes their protection quite perfect. An aisle is sometimes added. These cars

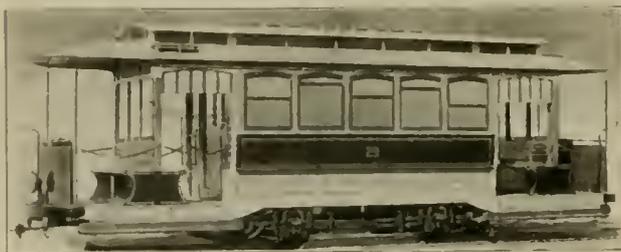

FIG. 9.—BRILL TYPE OF CALIFORNIA CAR.

have been received with great favor. Many have been built for various roads in South Africa where they are peculiarly adapted to the service. They have also gone to England and many of them of slightly modified forms are in operation on the Pacific Coast.

This type mounted on double trucks and having a vestibule front instead of a bulkhead ought to make rather a popular car in many towns where the summers are short and much interrupted by fogs and cold winds. It would seem after an experience with Boston east winds or Portland fogs that such a car would be highly desirable for lines near our eastern sea coast, where after a hot blistering day the late afternoon becomes so cold and fierce that winter overcoats are comfortable.

Probably there are few lines in the Atlantic states which operate open cars that do not find that a closed body would be appreciated during the evenings of half the open-car season. There are certainly many arguments in favor of the open and closed body combined which are worth consideration.

#### WATER FRONT PURCHASED BY BROOKLYN RAPID TRANSIT.

A large water front property belonging to the South Brooklyn Terminal Co. was purchased last month by the Brooklyn Rapid Transit Co. for a sum reported to be in the neighborhood of \$1,000,000. The property covers two city blocks, from 37th to 39th street, on the water front, and for a long time past has been leased by the Brooklyn Rapid Transit Co. It contains a large building 700x200 ft. in dimensions, which has been used for the storage of cars. The property also contains in the neighborhood of 50 three-story tenements. The object of the purchase at the present time has not been announced, and President Greatsinger states that it is too early to give out the plans in regard to the projects of the company at present. It is generally considered that this neighborhood is destined in time to become one of the greatest commercial districts in Brooklyn.

The Columbus (O.) Railway Co. is making rapid progress in the erection of additional sub-stations. New switches are being laid in the down town district.

#### OPERATING NOTES ON HIGH SPEED ELECTRIC RAILWAYS.

BY E. G.

The development of interurban railways has received an impetus which is too recent to need comment. We are at present at what may be termed the interurban stage of railway development, but in fact, the industry already seems to have put a foot forward into a still larger and more important field. Just what shall be the name of this new form of development is not yet quite clear. It is hardly correct to designate a railroad which has discarded steam locomotives and substituted electricity as an "interurban railway" as that term is usually understood. It retains all its distinctive operating features as a steam railroad, changing nothing except its motive power, which on the grand scale on which the business of steam railroading is conducted, must always remain a minor detail. Such a change of motive power in an already existing, or new road on the same lines, brings with it many new conditions in the matter of operating and equipment details, which are radical departures from existing standard methods of interurban railways. There is a merging of identity between the "interurban" and "steam" road somewhere in the present stage of developments.

For a number of years there has been much talk at street railway conventions and other places where electric railway men gather about dispatching systems and standard steam railroad methods and their adaptability to electric railway conditions. Indeed many electric roads have adopted the very latest improvements in the line of operating details from steam road practice with results advantageous to themselves and passengers. It is quite obvious that the organization of "street" railways has undergone a vast change during the past ten years, and little by little we see the art being revolutionized by the introduction of men and methods from other and hitherto more highly organized industries. Such men as hold over from old horse-car days are those, who prove by their capacity in new surroundings the principle of the survival of the fittest, and would have been a success under any circumstances. The growing tendency of all electric railways to introduce steam railroad methods, if not actually steam railroad men, calls attention to the fact that American railroads are without doubt the best and most highly organized industrial bodies in the world. One is reminded that there is considerable resemblance between the make-up of a railroad system and the organization of an army of soldiers, and that the latter, with their centuries of experience of what is best in organization and discipline, have no doubt been the preceptors of many a famous railroad organizer, who has obtained there many cues and ideas, which have become incorporated in every day operation. The class of electric railways which have come to be known as "high speed" certainly deserve to have bestowed upon them the attention of the most expert of railway organizers, especially so, since in most cases their operation is much more difficult than it would be, were they operated by steam.

Suppose the superintendent of a single track branch of, say the New York Central, were asked to operate over his branch line trains at 15 minute intervals in each direction, making meets at out of the way switches where no agents or operators are stationed, also sandwiching in a freight "extra" or two running on no particular schedule and switching loaded cars whenever there is an opportunity. He might undertake to do this, and he might not. If he did, he would have a condition which is being paralleled every day in electric railway operation, and that at schedule speeds fully as high as those of the above mentioned example would be capable of. Apropos, it may be mentioned that the superintendent of said branch line is no doubt receiving a salary much larger than that of the man who is doing this difficult thing every day. It is clear that the position of superintendent is no sinecure on a railway of the kind under discussion and will require the full and undivided attention of an exceedingly capable and experienced operating man. It is at this point, however, where in electric railway practice there is often retrogression to the old horse car day ideas of organization, in which the superintendent was also responsible for motive power, track, maintenance, purchases, repairs, etc. Many a man's ambition prompts him to accept such responsibilities, and in most cases the trust is faithfully administered with no more serious result than an early grave for the holder of the office. Our steam railway friends have a somewhat different standard and one it

would be well to adopt. In so doing, however, it should be borne in mind that we cannot revolutionize the system of operating electric railways by borrowing one of their men and putting him at the head of such a railway. The problem must be approached and the system built from the ground upward to the conditions which have been found best in operating steam roads most closely akin to electric high speed roads.

Unfortunately there is no source from which may be drawn a sufficiently skilled corps of trainmen experienced in handling electric cars, and drilled in the system of train orders in use on steam railroads. Roads of the sort under discussion must obtain their train crews from either existing street and elevated railways, or from steam railways. If the first course is decided upon, a corps of men may be secured well trained in the handling of controllers capable of remedying on the spot many minor defects liable to develop in the electrical equipment of the car, and accustomed to operate their cars in the crowded streets, which are apt to be the termini of such roads. Men from elevated roads will usually lack the latter requisite, but, on the other hand, have a thorough acquaintance with block signals and many other valuable operating details in use on "L." roads. This class of men will usually fall short, however, in the matter of dispatcher's orders, failing to comprehend their importance, and under no circumstances are they accustomed to the discipline and the operating rules of the steam road.

Suppose again that the superintendent of the above mentioned branch lines were asked to employ men as locomotive engineers who had served their time and become fully capable of operating steam trains on, say, the Manhattan Elevated. No doubt the men are fully as capable and intelligent as the best class of steam railroad employes, but their training has been in a different direction entirely.

To become a locomotive engineer or conductor on a railroad means several years of patient labor, thorough drilling in discipline, and familiarity with train dispatching orders. When an employe is appointed to either of the above positions he has had in addition sufficient experience to enable him to keep a cool head in emergencies. There is no valid reason why the same standard of excellence should not be maintained in the personnel of high speed electric railways, and at present this can only be accomplished by drawing on steam railways for experienced train crews and make the handling of a new form of motive power a matter of special instruction. Secondary in importance only to their ability to carry out the train dispatcher's orders and understanding of the signs and rules of the road.

The dispatching systems of electric roads have recently experienced some very marked improvements. There are few modern electric railways which do not employ an experienced train dispatcher, and do not use at least the rudiments of the modern dispatching systems. The telephone has been a great aid, enabling the dispatcher, as it does, to be in direct communication with his train crews. Recently there has been some discussion of the telephone versus the telegraph for train dispatching, and the argument has been made repeatedly that the telegraph is to be preferred to the telephone because the latter leaves no record of its message. Such an argument we can well afford to smile over, for what is the telegraph, as used in this country, but an oral transmission of a message? The writing of a telegraphic dispatcher's order is done by an intermediary, and there is a chance for a mistake both in the receiving of the message and in writing it down. It is certainly more simple to let the dispatcher talk directly with his train crews, letting the man in charge of the train write down the orders, giving a carbon copy to the motorman. This corresponds to the system of giving copies of orders to conductors and engineers of a steam train. The only argument which may be brought against the system is that it consumes the time of the train crew while they are receiving such orders. One must be prepared, however, to expect such small delay, unless one is willing to maintain station agents every few miles along the road. The delay in receiving the orders will never seriously affect the schedule, and a large saving is made by the abolition of salaried men at stations.

Almost all recent high speed railways of any length have been designed to use alternating multiphase currents, feeding direct currents from sub-stations placed at regular intervals along the road. Unfortunately there is not always proper checking of plans between the operating force and the electrical designers of the system, or perhaps more correctly the latter consider solely the proper feed-

ing points, and electrical features of the system, without regard to the fact that the sub-station may also serve the operation of trains and be fully as useful as an adjunct to the dispatcher's office as it is to the power house. To fully realize its proper value it is often necessary to place the sub-station some little distance away from what would theoretically be its correct position. As an example may be mentioned the case of a road where a sub-station is placed about  $\frac{1}{2}$  mile away from a siding which is a regular meeting point for trains on a single-track road. Electrically the sub-station is correctly placed, but its value might be doubled were it located immediately at the passing switch, where it could be used to operate signals, issue orders, etc., to passing trains, which are all obliged to stop at this siding, but do not regularly stop at the sub-station. If orders are to be given to passing trains, they must be flagged to stop for such orders under the present arrangement. The proposed change of the sub-station might slightly unbalance the symmetry of the electrical distributing system, but this disadvantage is doubly counterbalanced by the advantage gained in the operation of trains.

In order to fully take advantage of sub-stations for assisting the operating of electric trains, it is necessary to have a properly trained corps of attendants at such stations. These positions are probably the most difficult to fill of any on a railway of this character. The salaries of the places are not unusually very high, and this is all the more reason why the utmost care is necessary in choosing men for them. Somehow an illusion has gained prevalence among engineers and managers that it is a "snap" to operate a sub-station, and the salaries are therefore small and the hours long. One engineer of standing expressed himself once within the writer's hearing that all a sub-station attendant had to do was to occasionally "close the circuit breaker." Needless to say, that engineer never, himself, operated a road equipped with rotary connected sub-stations. If sub-station duties are compared with those of the power station, there is less manual labor, no doubt in the former, but in case of emergencies there is always present a skilled and experienced man in an authoritative position at the power house, while the sub-station attendant has to fall back entirely upon his own wits and experience, supplemented perhaps by a little telephonic advice from his superior, if the latter can be reached. It seems self-evident that a considerable amount of judgment and self-reliance is required for such work, and if, in addition, we add to these duties the responsibilities of receiving and delivering train orders, the operation of signals, sale of tickets, collection of freight bills, handling of baggage, etc., the position becomes one which is not to be filled by any man presenting himself and willing to accept the wages. The writer's experience has been that it is quite impossible for men to attend to these duties and do so for twelve hours each day, and seven days per week. Every man who has attempted it, to the writer's knowledge, has in course of time failed; either his health succumbed or his duties were neglected, mostly the latter. An eight-hour relief for sub-station men whose duties include those of station agents plus the attendance of electrical rotary apparatus seems to be the only solution of the question. There is too large an amount of property at stake, as well as the lives of employes and passengers to make the practicing of too much economy at this point good business judgment, all the more so when it is considered that the sub-station as a rule is much less fool-proof and accident-proof than the power station. It should not be necessary to mention that the cost of sub-station attendance and maintenance should not be charged against the cost of motive power entirely, in the cases above cited or assumed. From one-third to one-half this cost is properly chargeable to the cost of train operation.

Considering all the devices for the safe operation of trains on single and double track steam railroads, it is remarkable that such devices have not yet come into general use on electric roads of similar character. With the latter's frequent train service, the block system of signals would seem almost a necessity. Unfortunately the bonding of the track necessitated by electrical operations spoils the beautiful simplicity of the block signal system as applied on steam railroads. What is there more solid and simple than a pair of rails for a circuit, and a pair or several pairs of car wheels and axles to act as a circuit closer or switch? Until we attain such simplicity on a bonded track, the block system will always be handicapped for electrical service. Overhead devices and "track boxes" are too unreliable. Some genius who will devise a system overcoming these objections will no doubt reap a rich reward.

The number of high speed electric railways is steadily increasing and the tendency is unmistakably towards steam railroad practice. Already many such roads designate their trains by numbers which are marked on time tables, and are also conspicuously marked on the front of trains or cars. Classification signals are in use for designating extra trains, second sections, etc. Markers, switch lights, whistle-signals, etc., follow standard steam railroad practice. Cars are provided with flags, fuses and torpedoes, and trainmen required to protect their trains in case of stops. In many cases the train dispatching system is quite as complete, and discipline as strict, as on the best of steam railroads. Yet all these precautions will avail nothing if the personnel of the operating department are novices in the art of railroading. As an illustration may be mentioned the case of a splendidly equipped high speed railway, which adopted steam railway standards throughout, and had an expert steam railway train dispatcher organize the operation of trains. The management and heads of operating departments to a man were former steam railroad men of the most splendid experience and capacity. Train crews were recruited partly from the street railway field, and partly from steam railroads. This road had one serious collision costing six lives and several hundred thousand dollars in damage claims. There were also some minor accidents and a few hair-

**POSTING SCHEDULES ON INTERURBAN ROADS BY MEANS OF DIAGRAMS.**

The practice of announcing the daily runs of car crews by the aid of diagrams possesses several advantages over the more common methods of posting runs by chalking up a column of figures on the bulletin board, or by verbal or written instructions, just as a map of the road presents the routes in a form more easily and quickly understood than does a written description. The practice is especially applicable to posting schedules on single track interurban electric roads.

The Worcester (Mass.) Consolidated Street Railway Co. uses diagrams for announcing runs at all its dispatching stations and the system will be made clear by describing it as applied to the Fitchburg division of the Worcester company. This division is about 30 miles long and is in charge of Mr. George H. Burgess, division superintendent.

After the schedule for the season has been determined (in this case a half-hour service is given between Worcester and Fitchburg) the superintendent plots all the runs on a sheet as shown in Fig. 1, using cross-section paper with 1/4-in. rulings for the purpose. The vertical lines designate intervals of time (in this case intervals

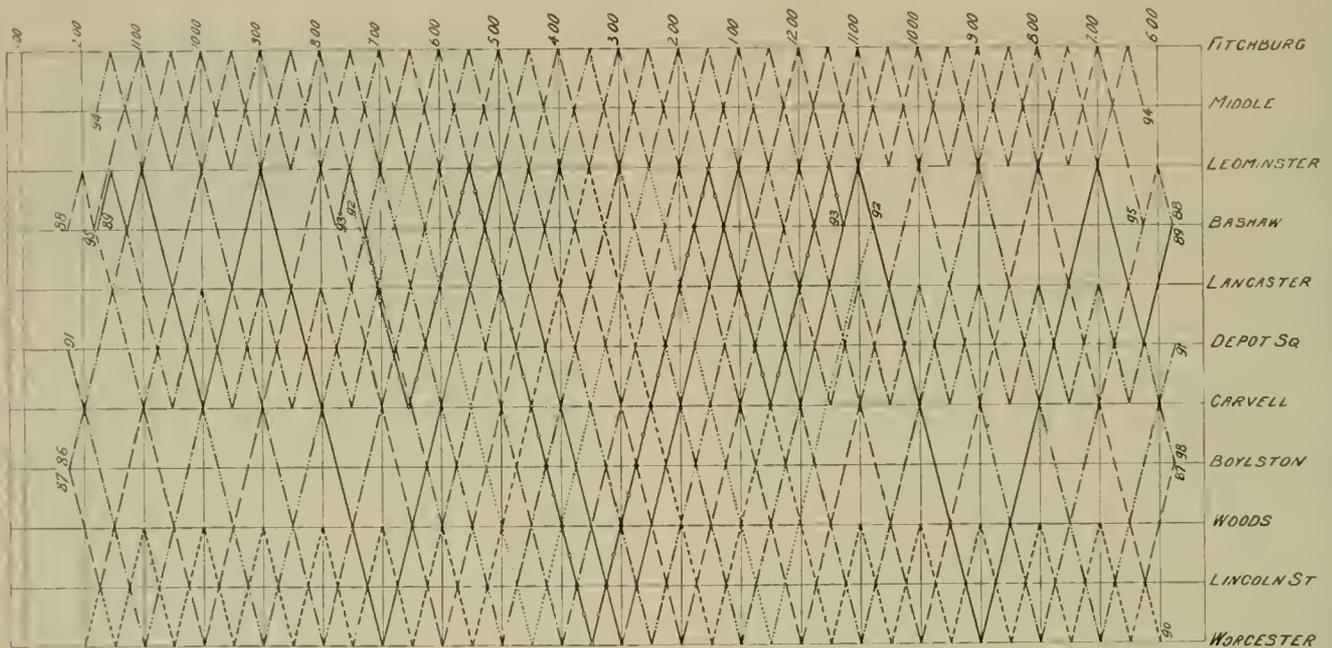

FIG. 1—SUPERINTENDENT'S RUN SHEET.

breadth escapes from what might have been even more serious accidents than that first mentioned. In each and every case it was men from the street railway field who were the offenders and their ignorance or disregard of the rules the cause of the accidents. Yet these men were carefully selected from a large number of applicants and in intelligence were much above the average found in street railways. Furthermore they had been carefully drilled and instructed and passed an examination by the above named expert dispatcher in the rules.

**NEW CASTLE & LOWELL ROAD OPENED.**

The New Castle (O.) & Lowell R. R. was opened for traffic February 15, four cars being put into service. The line has since been in regular operation and cars are run from Youngstown at intervals of one hour, the last one arriving at 10:30 in the evening. The trip to New Castle is made in 1 1/4 hours, but the schedule will be faster when the special cars are put in service. The present local cars stop at all street corners in the cities and towns through which they pass to take up passengers, but the specials will stop only at certain points. As a large portion of the company's tracks are laid on a private right of way the special cars will be enabled to make fast time without difficulty.

of 1 hour) and certain of the horizontal lines designate turnout points.

The runs are numbered and for convenience in distinguishing intersecting lines on the diagram each run is plotted with a different colored pencil. (In the accompanying engravings reproduced from the diagrams the runs are shown in different symbols.) Referring to Fig. 1, a single example will suffice to explain the diagram. The car moving on run No. 88, for instance, will leave the operating barn at Bashaw's turnout at 5:45 a. m., run to Leominster and then turn and make the through run to Worcester, arriving at Worcester at 8:00 a. m. It will immediately turn and run to Leominster and so on as indicated until turned into the barn at 12:15 at night.

This large sheet is for the use of the superintendent only. For the information of the employes small diagrams of each run are posted on the bulletin board each morning. In Fig. 2 for example is shown run No. 88 for the entire day. The crew that has been assigned to this run takes the car out 5:45, makes the run to Leominster and back to Worcester, and then back to Leominster, arriving Leominster at 10:00 a. m. On the next trip instead of running straight through to Leominster they run only to Carvell's turnout and "swing" with the crew running on run No. 87, that is, the two crews change places, the cars proceeding on the trips in the direction in which they are headed, but the crews doubling back so as to reach their respective stations in time for their mid-day relief. Un-

der this schedule the crew on run No. 88 are due at Bashaw at 11:45 a. m., and are not posted to make another trip until 1:45 in the afternoon, giving them two hours' relief. They go to work again at 1:45, making the trips as indicated, and arriving at Bashaw at 5:45 p. m., when they are through work for the day, having performed 10 hours' actual work within 12 consecutive hours. The lower half of the diagram, Fig. 2, indicates run No. 88a, which is the relief run on run No. 88.

TROLLEY EXPRESS IN ENGLAND.

The subject of conveyance of freight on electric trolley lines was recently discussed by Mr. A. H. Gibbings, of South Lancashire, before the Liverpool Engineering Society. Mr. Gibbings gave an outline of the proposed scheme for carrying merchandise on electric tramways between the Liverpool docks and some of the important manufacturing towns in the South of Lancashire. There is no doubt that such a scheme would be highly beneficial particularly to the manufacturers, and it is believed there would be no difficulty in laying electric lines on the dock sides in order that the cars can be loaded direct from the ships or depots. As each car was loaded it would proceed directly to its destination with an average speed, including stops, of 6 miles an hour. The form of car proposed is one having a detachable top with facilities for removing by means of cranes. In some cases it will undoubtedly be advantageous to lay special tracks and sidings to the warehouses, mills, etc., which are some distance away from existing railways, but in other cases the author suggested that steam road wagons or other form of automobile might be used to reach isolated places. Careful calculations had been made regarding the question of charges and the author stated that it was found possible to charge for carload lots only 50 per cent of the present railroad charges and still leave a sufficient profit. The principal public benefit which would be attained would be the great relief of the streets from heavy trucking. The author believed that the alleged difficulties of collecting merchandise at the docks and delivering it from the lines to the various mills and warehouses were problems which could be readily solved.

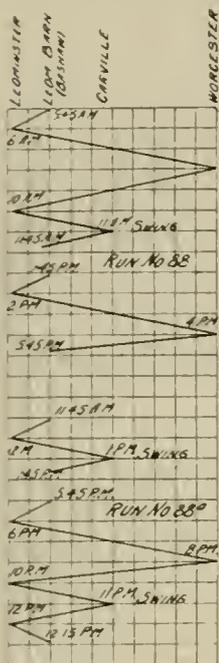

FIG. 2.

A diagram similar to Fig 2 is prepared for each run on the division.

In connection with these diagrams we reproduce a portion of the printed schedule which the company causes to be posted in public places along the division for the convenience and information of the public. By referring to this table and to diagram Fig. 1, it will be noticed that certain cars are assigned to shuttle service exclusively between certain towns. Thus a half-hour service is maintained by this means between Fitchburg and Leominster, between Lancaster and Clinton (Carvell's turnout), and between City Line (Wood's turnout) and Worcester, these shuttle cars serving the purpose of filling out the half-hour schedule which at certain hours of the day is not provided by the

through cars, as will be seen by reference to Fig. 1.

The conductors and motormen are required to familiarize themselves with all meeting and passing points and are instructed to

COST OF ELECTRIC MOTIVE POWER.

BY ALTON D. ADAMS.

(Copyright, 1902, by Alton D. Adams.)

Electrical energy may be delivered to the lines outside of different generating stations at an almost uniform cost per unit, except as to differences due to the prices of fuel, where outputs are equal. With stations of different capacities there is a possible decrease of cost per unit of energy output until a certain point is reached, but thereafter expense goes up at the same rate as the amount of energy supplied. Line and track losses, the efficiency of electric motor equipments, the sizes and weights of cars, the construction and profile of the track, and the average number of passengers carried all enter to determine the cost of electric motive power per car-mile.

It is intended here to discover to what extent differences exist as to the cost of electric motive power per car-mile on different roads, and whether these differences are due to special locations and conditions of service, or to causes under the control of street railway companies. For present purposes the average cost of electric motive power per car-mile on all the street railways of the state of Massachusetts, and also on each of the more important systems is considered. During the year ending Sept. 30, 1900, operation on all street railways of Massachusetts amounted to 81,750,768 car miles at a total cost of \$1,672,252.08 for electric motive power, or an average of 2.04 cents per car-mile. The Boston system dominated the situation with a record of 38,171,984 car miles at an expense of \$519,955.07, or an average of 1.36 cents per car mile. Deducting the car-miles for the Boston Elevated from the total for the state leaves 43,578,784, and the expense of electric motive power outside of the Boston system, when divided by this last number, shows an average of 2.64 cents per car mile for all of the remaining roads. This figure of 2.64 cents is 1.94 times as great as the cost per car-mile of the Boston elevated system, and obliged the other roads of the state to pay out for the year \$559,626.45 more than their electric motive power would have cost at the Boston rate. Reasons for any such difference in the cost of motive power per car mile between the Boston and the other systems are hard to find in the conditions of service for the various roads. Obviously more power is required to propel a given car the greater the load which it is carrying, so an increase in the number of passengers per car-mile must raise the cost of motive power. In this particular the Boston system had to meet conditions more exacting than those outside its limits. For the entire state the average number of passengers per car mile during the year was 18

FIG. 3—DIVISION TIME TABLE.

follow closely the running time schedule and never under any condition to run ahead of the schedule time

The Granville (Vt.) & Poultney Electric Railroad Co., which was recently organized with William Nathaniel, president, expects to begin the construction of its proposed line from Granville to Poultney, with a branch to Lake Saint Catharine, in the early spring

A part of the machinery has been removed from the power house of the Marion (Ind.) Railway Co. to Richmond, where it will be installed in the plant of the Richmond Street and Interurban Railway Co. The Marion line is now operated from the new power house at Anderson

On the Boston system alone the average number per car-mile was 5.26, while the remaining roads carried only 4.44 passengers per car mile on an average. As the Boston road carried 18 per cent more passengers per car-mile, its cost of motive power should have been greater, other things being equal. The profile of the tracks of the Boston system seems to involve as much up-hill work as do those for the remaining street railways of the state on an average, so far as a somewhat extended observation indicates. Of the remaining inherent conditions that determine the cost of motive power per car-mile, the only one subject to important variations for different roads is the extent of operation, measured in car-miles for each system.

It may be at once suggested that the great excess in the amount of operation for the Boston system over that of any other road, its number of car-miles being about fifteen times as great as that of the next largest system, is sufficient to give it the superior economy shown as to cost of electric motive power per car-mile. With a view to test the soundness of this position, the cost of motive power per car-mile has been determined for each street railway system of the state that operated more than 200,000 car-miles during the fiscal year of 1900. In the table the railways are arranged approximately in the order of the number of car-miles operated, to facilitate comparisons. In order that due allowance may be made for passenger loads, the number of passengers per car-mile of operation has also been determined for each road. The street railways included in this table number 43 out of the 118 systems in the state at the beginning of the year named. These 43 roads operated 74,011,315 car-miles during the year or 90 per cent of the operation for all the systems.

The most notable feature of the table is the great variation presented in the costs of electric motive power. Extremes of this variation are seen for the Newton & Boston road where the cost was 1.31 cents per car-mile, and for the Worcester & Webster where this cost was 5.71 cents, an increase over the former of 335 per cent. On eight roads the cost of motive power was less than two cents and on five roads it was more than four cents per car-mile. It appears at once that a low cost of electric power is not confined to the largest systems, nor is an excessive cost peculiar to the smaller roads. The Newton & Boston Ry., which enjoyed a lower rate for motive power than the Boston system, operated only 534,676 car-miles during the year, or less than two per cent of the car travel on the Boston system. The Lowell & Suburban road with 2,031,777 car-miles to its credit, or less than 6 per cent of the distance covered at Boston, had a rate of 1.49 cents per car-mile for electric power, which is not quite ten per cent more than the like rate for the Boston system. For the Leominster & Clinton road with 263,892 car-miles the cost of motive power was only 1.79 cents per unit of car travel.

This last case represents an increase of about 20 per cent in the power rate with a decrease to less than one per cent of the car travel on the Boston road. Turning to the higher power rates, it seems that the figures for the larger roads are often higher than the rates for many of the smaller systems. Six roads that operated more than 1,000,000 car-miles each show a rate of more than two cents for motive power per unit of car travel, and in three of these cases the rate was more than three cents. For the Worcester system, the fourth in extent of operation for the entire state, where the car travel was 2,653,952 miles, the motive power cost 3.61 cents per car-mile, or nearly three times the rate on the Newton & Boston where the car travel was less than one-sixth as great. The South Shore & Boston road, with 1,346,167 car-miles to its credit, was obliged to pay for motive power at the rate of 3.89 cents per car-mile. The highest rate for the cost of electric motive power was that of the Worcester & Webster road at 5.71 cents per car-mile, where there were only 238,791 miles of operation, but the next largest rate, that of 4.88 cents per car-mile was the cost on the Interstate Consolidated road where the operation went up to 693,171 car-miles. Of the twelve systems each of which operated more than 1,000,000 car-miles, six had a power rate of less than two cents, three systems a rate between two and three cents, and three systems a rate between three and four cents per car-mile. Eight roads operated more than 500,000, but less than 1,000,000 car-miles each, one of these at an expense for electric motive power of 1.31 cents, five roads at between two and three cents, one road at between three and four cents, and one at between four and five cents per car mile.

Of twenty-three systems that operated from 200,000 to 500,000 car-miles each, one expended less than two cents, eight expended between two and three cents, ten expended between three and four cents, three expended between four and five cents, and one system expended between five and six cents per car-mile for electric motive power.

From all this it is evident that the low cost of electric motive power at Boston is not a result peculiar to the great size of its street railway system, since the Boston rate is higher than that of the Newton & Boston road, and only a little below the cost per car-mile of motive power for the Lowell & Suburban, Holyoke, Springfield, and the Leominster and Clinton systems. True, a low rate of cost for motive power is more frequent among the larger roads.

Cost of electric motive power per car-mile, and number of passengers per car-mile on street railways of Massachusetts, year ending August 30, 1900:

Name of Railway.	Total Car Miles Operated.	Cents Per Car Mile.	Passengers Per Car Mile.
Boston Elevated	38,171,984	1.36	5.26
Brockton	2,565,023	2.32	4.67
Fall River	1,441,527	1.93	5.79
Holyoke	1,268,961	1.74	3.88
Lowell & Suburban	2,031,777	1.49	4.50
Lowell & Haverhill	1,921,815	2.83	5.73
Lynn & Boston	7,508,170	2.01	5.16
South Shore	1,346,167	3.89	3.62
Springfield	3,586,242	1.80	3.83
Union New Bedford	1,088,803	1.98	4.21
West Roxbury	1,055,972	3.41	4.28
Worcester Consolidated	2,653,952	3.61	5.38
Fitchburg & Leominster	800,785	2.65	4.21
Interstate Consolidated	693,171	4.88	5.01
Milford & Framingham	531,583	2.84	4.73
Newton	529,714	2.60	4.64
Newton & Boston	534,676	1.31	3.47
Northampton	583,287	2.32	3.58
Quincy & Boston	622,662	2.44	4.62
Worcester Suburban	698,492	3.37	5.02
Newburyport	342,789	3.17	4.39
Commonwealth Ave.	426,560	3.00	3.00
Gardner & Fitchburg	275,155	3.80	3.27
South Middlesex	282,683	2.66	4.47
Wellesley & Boston	260,810	3.42	5.01
Woonsocket	360,180	2.71	4.49
Natick & Vochitute	405,654	2.08	3.76
New Bedford & Brockton	306,501	4.50	3.19
Newton & Taunton	381,681	2.78	2.54
Pittsfield	354,947	2.62	4.48
Haverhill & Amesbury	474,690	4.38	4.20
Hoosac Valley	490,450	3.18	3.80
Leominster & Clinton	263,892	1.79	3.78
Worcester & Clinton	266,059	3.30	4.28
Worcester & Marlboro	318,215	3.26	4.07
Westfield	366,408	2.20	2.97
Warren & Spencer	380,291	3.01	3.27
North Woburn	201,185	3.61	4.96
Palmer & Monson	221,465	3.64	3.15
Plymouth & Kingston	224,832	4.25	3.88
Wakefield & Stoneham	226,287	2.42	2.64
Worcester & Webster	238,791	5.71	3.95
Lexington & Boston	248,893	2.53	4.73
All street railways in the state	81,750,768	2.04	4.8
All street railways except Boston Elev.	43,578,784	2.64	4.44

This fact, however, seems to show simply that the larger systems more frequently adopt methods of construction and operation that lead to high efficiency than do the smaller roads.

Comparison of the costs of motive power per car with the average passengers per car mile shows that heavy passenger traffic cannot account for the great differences in the power rates. Of the eight roads with power rates of less than two cents per car mile, two carried more than five passengers per car mile, two carried more than four but less than five passengers, and four roads carried between three and four passengers per car-mile on an average. On sixteen street railways the costs of electric motive power were

between two and three cents per car-mile. Of these sixteen roads, two carried between five and six passengers per car mile, nine carried between four and five passengers, two carried from three to four passengers, and three carried two to three passengers per mile of car travel.

Expenses for electric motive power were at rates between three and four cents per car mile on fourteen roads. Among this number three had an average of more than five passengers, five had between four and five passengers, and six had between three and four passengers per car mile. Of the four street railways that paid out between four and five cents per car mile for motive power, one carried over five passengers, another carried between four and five passengers, and two carried between three and four passengers per car-mile. A single road expended more than five cents per car-mile on motive power, but carried less than four passengers per car-mile. From the foregoing it appears that the roads with low power rates had as large or larger passenger traffic per car-mile than the roads with higher power rates.

Costs of electric motive power per car mile on roads of different car travel:

Car Miles Operated.	No. of Roads.	Between 1 and 2 Cents.	Between 2 and 3 Cents.	Between 3 and 4 Cents.	Between 4 and 5 Cents.	Between 5 and 6 Cents.
Over 1,000,000..	12	6	3	3		
Between 500,000 and 1,000,000	8	1	5	1	1	
Between 200,000 and 500,000	23	1	8	10	3	1
Totals of all Roads.....	43	8	16	14	4	1

The table shows the number of roads of each class that had each rate for motive power per car mile. Considering all the roads, the number operating at a cost of motive power between 1 and 2 cents 2.1 per cent of the total number. Dividing the entire number 3 and 4 cents 32.5, between 4 and 5 cents 9.3, and between 5 and 6 cents 2.1 per cent of the total number. Dividing the entire number of roads into groups according to the number of passengers carried per car mile, it seems that 18.6 per cent carried 5 to 6 passengers, 39.5 per cent 4 to 5 passengers, 34.9 per cent 3 to 4 passengers, and 7 per cent 2 to 3 passengers per mile of car travel.

Number of roads with each power rate carrying the stated number of passengers per car mile:

Number of Roads.	Cost of Power Per Car Mile.	Roads with 5 to 6 Passengers Per Car Mile	Roads with 4 to 5 Passengers Per Car Mile	Roads with 3 to 4 Passengers Per Car Mile	Roads with 2 to 3 Passengers Per Car Mile
8	Between 1 & 2	2	2	4	
16	" 2 & 3	2	9	2	3
14	" 3 & 4	3	5	6	
4	" 4 & 5	1	1	2	
1	" 5 & 6			1	
43		8	17	15	3

**ELECTRIC TRACTION IN SWEDEN.**

A report from Mr. R. S. S. Bergh, U. S. Consul at Gothenburg, states that the problem of employing electric power instead of steam on railroads in Sweden is receiving constantly increasing attention. He states that the managers of the state railroads are making investigations in this direction and that a number of private concerns are also interested in the matter. A Gothenburg newspaper reports that a number of managers for the Falun-Vesterdalarnes Railroad Co. has sent to the government a petition for the gradual adoption of electrical locomotives instead of steam engines throughout the whole country, and the utilization of water power. The petition mentions that a manufacturing company in Switzerland has made a proposition to use the Huber system by which an electric current can be generated by a train passing down inclines which current can be utilized by other trains on the same road. A Swiss firm proposes to furnish the necessary rolling stock, a Swedish company the electrical power and the railroad company is to furnish lines for the experiment. About \$27,000 is needed for building transformers, for the equipment of the road with electricity, bonding the rails, etc. The government is asked to furnish the money for the electrical apparatus and construction.

**MAGNETIC TRACTION.**

Reports from Seattle, Wash., state that recent tests of a device invented by Mr. A. A. Honey for increasing traction on locomotives and street cars by means of magnetism, have shown remarkably successful results and that the increase in tractive effort on an electric car equipped with this device amounted to over 300 per cent. These tests were held at the barn of the Jackson St. car line, at Seattle, on a double truck car 35 ft. long. Around the axle of each wheel is wound a coil of wire, through which current is passed by means of a switch. The car is equipped with two motors of 40 h. p. each and during the tests stood on the rails within the car barn. One end of the car was attached by means of a cable to a dynamometer which registered the tractive power of the motors. The dynamometer used is the invention of Mr. H. H. Walker, master mechanic of the Northern Pacific, and it registered the pull in tenths and twentieths of a ton. Several distinct tests were made both with and without the magnetic device. Without this device the dynamometer showed the pull of the car to be less than half a ton, while after the application of the current to the magnetic device the pull jumped to somewhat over 2 tons, and on one test as high as 2 1/4 tons. Practically similar results were obtained at each of the different tests.

By means of this device magnetism is substituted for increased dead weight and to increase tractive force. By the use of magnetism to create adhesion between the drive wheels and the rails nothing is added to the weight of the vehicle and consequently no extra power is required for propelling the extra weight.

Another device which is being prepared for test by Mr. Honey is claimed to be a considerable improvement over the present one. A locomotive and one or two street cars are to be equipped with it at an early date. It can be attached to any vehicle of this kind without making any changes whatever in the running gear. Instead of using the driving wheels as magnetic poles, an independent helix is constructed with small wheels about 1 ft. in diameter which run on the rails as close as possible to the driving wheels. This closes the magnetic circuit through the rails, drive wheels and axles, thus giving an uninterrupted metallic circuit. Any number of these independent magnets may be used in connection with the train to multiply the tractive effort to any desired extent.

**PROPOSED NASHVILLE INTERURBAN.**

Two extensive interurban lines are being projected in the neighborhood of Nashville, by Messrs. C. W. Ruth and Frank Haskell, Pittsburg, Pa. It is planned to connect Nashville with Gallatin, Franklin, Columbia, Mt. Pleasant and a number of intermediate towns. Two separate lines are planned, one running to Gallatin, a distance of 30 miles and the other directly through to Mt. Pleasant via Franklin and Columbia, a distance of about 55 miles. Charters for these companies have been applied for under the names of the Nashville & Gallatin Electric Ry., and Nashville & Columbia Electric Ry. Mrs. F. P. Bond, attorney for the companies, states that the roads will be built speedily if the rights of way are granted through the city of Nashville. The capital to be expended is Pittsburg money and the parties behind the enterprise do not ask for any local help. All that is required is the good will of the people of Nashville and those along the route and reasonable aid in the matter of right of way. Power for operating these roads is to be secured from Scroggins Falls, in Cumberland County, and the same water power will be utilized to furnish light and power in the city of Nashville and the towns along the lines of the railways.

The Newcastle (O.) & Sharon Electric Railway Co. has expended approximately \$60,000 for rights of way in Lawrence County. The road will extend from Newcastle to Hubbard, where connections will be made with the Sharon & Youngstown line.

The St Charles Street Railway Co., of New Orleans, recently sold \$300,000 of 4 per cent, 50-year gold bonds, the proceeds of which are to be used in construction of its new lines. The bonds were largely over-subscribed and good premium was secured on them. The bids accepted ranged from 101.35 to 107.25.

# IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

## NOTES ON THE CARE OF THE POWER HOUSE.

BY ARTHUR B. WEEKS.

It sometimes occurs that repairs on station circuit-breakers are necessary, hence the following notes will be of value to the practical man.

The type K circuit breaker herewith described is built for several different capacities, that illustrated being 800 to 1,200 amperes. Before putting a breaker of this style into service, first remove the front blow-out yoke, the top fiber piece called "fiber cap for arc

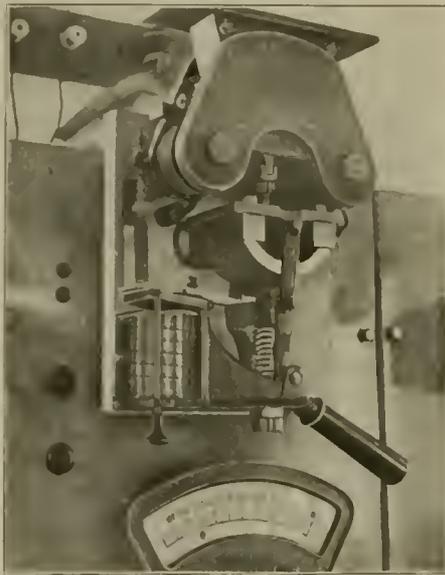

FIG. 1—TYPE K CIRCUIT BREAKER.

deflector," and the fiber front piece for the arc deflector, in order to gain access to the shunt connections where the arc is ruptured.

While the breaker is open, note the opening at the main contacts, also the shunt, or secondary opening. This secondary opening should be about 1/4 inch when the main contacts are open 3/4 inch. This allows the shunt, or secondary contacts, to make a firm contact before the main circuit is closed; and, naturally, as the circuit breaker opens, the main circuit is broken considerably in advance of the secondary contacts. This is to prevent an arc on the main contacts.

This breaker should be inspected occasionally to maintain the secondary heads in good condition. Sometimes copper heads will form on these heads, preventing a good contact. Again, they will burn away and out of shape, when it will be necessary to remove and touch them up with a smooth file, or, if too badly burnt, to replace with new parts which should be kept in stock. A material alteration in adjustment is at no time necessary. It sometimes occurs that the main contacts become badly burned. They must be smoothed up before putting into service again, and can be done as local conditions of service permit.

If it becomes necessary to replace the blow-out spools, when ordering from the manufacturers designate them as right-hand and left-hand blow-out spools, giving also the number of the breaker. If wound at some local works, see that the winding is exactly like

the original, and that the free ends are brought out properly to make the connections. It is easy to make a mistake here, if one is not familiar with the principle upon which the spools blow upward and rupture the arc. It is possible to so connect the spools as to cause the arc to blow down, which of course is to be avoided. The following sketch will illustrate the connections, as well as the path for the shunt circuit.

In adjusting the contact heads, try each to be sure that there is no binding which will cause them to "hang fire." The flexible springs are liable to cause this trouble if not properly set, especially if the springs are twisted sidewise.

If necessary to remove either the right-hand or left-hand main contact, it will of course be necessary to disconnect them at the back of the panel, and ordinarily it will be more convenient to remove the breaker itself to a bench where every part can be gone over thoroughly. To remove a main contact stud, take out the cap screws that secure the fiber separator to the studs. The particles of copper which fall from the secondary contacts due to the rupturing of the arc lodge here.

There is a fixed core centrally located inside the flat spiral of copper through which the main current passes. Above it is pivoted a flat piece of iron, called an armature, which is drawn down

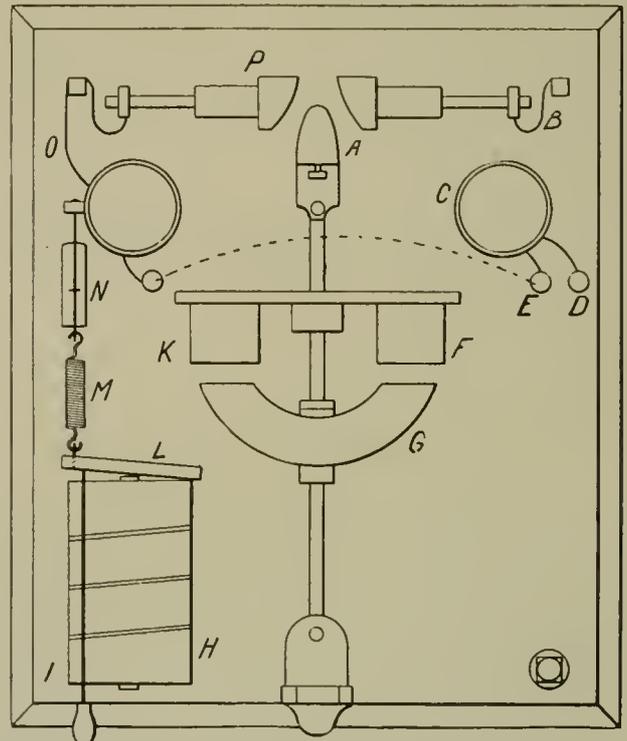

FIG. 2—DIAGRAM OF CONNECTIONS—TYPE K CIRCUIT BREAKER.  
A, P, secondary contact heads; B, flexible copper spring; C, blow-out spool; D, inside wire; E, O, outside wire; G, main contact; F, K, main contact stud; L, armature; H, solenoid; M, calibrating spring; N, scale.

against the action of a coil spring called a calibrating spring. This spring contains twenty-seven turns of .205-in. steel wire. A calibrating rod secured to the upper end of the coil spring has a washer indicating upon a scale opposite the amperes for which the breaker is set. This amount is determined by the tension upon the coil spring.

If this breaker is in use for a 500 kilowatt generator, 500 volts,

the normal current is 900 amperes. Should the maximum load occasionally reach 1,200 amperes, if the breaker is properly adjusted and in good condition it will rupture the arc if set at 1,200.

The generator will stand a considerable overload for a short period, but one should be governed largely by the heating and local conditions regarding the length of time the generator can carry such a load. Such a generator is guaranteed to run at 50 per cent overload for short intervals only.

It sometimes follows, after a railway switchboard has been erected for a certain duty on its feeders, that conditions unexpectedly arise bringing about results which were not anticipated. For example,

FIG. 3—LEAF SPRING CIRCUIT BREAKER.

the load on a certain feeder was suddenly greatly increased, and its breaker consequently very frequently opened. When it came out, the current jumped across to an adjoining breaker. On another occasion, the breaker failed to rupture the arc, and not until the machine circuit-breakers were opened by the electrician did the arc cease. In this case the breaker was entirely ruined.

There was no time for delay, being an especially busy day with the street railway company, so a trolley line jumper was put on at the trolley line section insulator, connecting that trolley section with another feeder which was able to carry the load for a short time. It tided things over until midnight, when the circuit-breaker shown in the accompanying illustration was secured to a block of wood, and set up temporarily at one side of the switchboard, out of the way, until the other panel could once more be put into proper condition.

The cables were disconnected from the burnt out circuit breaker and transferred to the temporary one, using the old switch as it was unharmed. When emergencies of this kind arise, the handy man, ready on all such occasions, proves himself invaluable. Many plants have such a man, who is often remarkable in improvising devices to tide over troubles.

The circuit-breaker illustrated is thoroughly reliable, of the leaf contact type. The main contact is through the leaf springs. In opening, the leaf springs leave their seat first, then the flat carbon, as shown in the upper part of the illustration (Fig. 4), separate and receive the arc as intended, preventing any arcs upon the leaf contacts. Its action is like that of any circuit-breaker, though dissimilar to the styles with which street railway men are most familiar. The lower part is a modified horse-shoe magnet, and when an excessive current passes, its armature is drawn up, releasing a trigger which trips the breakage. The coil springs illustrated then throw it into the position as shown. It can be adjusted for more or less load, as may be necessary. This is indicated by the scale at the lower extremity of the breaker.

To close the breaker, pull down insulated handle of the long

lever, when it is again reset. If insulated upon a panel, or in use as above mentioned, the feeder switch is of course opened before the breaker is closed, and the switch closed last.

This breaker also gives most excellent results when used on alternating circuits, being designed especially for severe duty. It is a familiar breaker in heavy power work for A. C. current. The illustration (Fig. 4) shows another form of this breaker in service upon a two-phase alternating circuit of 2,200 volts. There is still another similar type of breaker which has a time element attachment, set to open on a short circuit after a predetermined number of seconds.

In connection with the station in question I recall the case of a rotary converter whose armature had been taken out of its bearings but once in five years. It was due to hot bearings that it became necessary at that time. Some of the oil ways were completely filled with sediment, and the babbitt considerably scored.

To test re-babbitted or scraped boxes before putting the rotary into regular service, run it as a direct current motor for a time if direct current is available, and the alternating current motor not large enough to propel it without overheating. But if run as a direct current motor, should the machine circuit-breakers open, do not close its breaker until the other breakers have been closed and this one again brought up to the bus-bar voltage.

The oil should be renewed before it has become thick with accumulated sediment. Clean out cavities thoroughly, using coal oil for the purpose. Steam, if it can be procured, will give best results. A mistaken idea frequently obtains, that, since it is no longer necessary for a man to go around with an oil can filling oil cups every half hour or so, as was once the case, the automatic oiler with revolving rings can be depended upon indefinitely. The time will always come when a cleansing of the oil cavities and renewal of oil will be imperative.

If a bearing allows the oil to run down upon the rocker arms of the brush-holders, saturating everything in its wake and fre-

FIG. 4—2,000-VOLT CIRCUIT BREAKERS.

quently working over on to the commutator, hunt a remedy for it for it will surely give trouble in time. Oil spattered over the floor under a commutator looks careless and untidy, to say nothing of the waste bunches of waste wedged between cross-connections of the brush holders below a bearing also have a bad appearance. A leaky glass gage for an oil bearing is another nuisance.

To sandpaper a rotary converter commutator, run the armature with alternating current, with direct current switches open.

Without apparent cause, a case occurred in which the mica between different commutator segments  $\frac{1}{4}$  in. deep and  $\frac{5}{8}$  in. long burned away. When first discovered, a flash at the brushes caused a serious buck, which opened all the machine circuit breakers. In

vestigation disclosed these burnt places. A test with a volt-meter from bar to bar revealed no defects. An insulation test proved it sound in that respect. But the bucking was caused by local short-circuits from copper and carbon-dust which had collected in the cavities, and was remedied by cleaning them out thoroughly and filling with a stiff paste of pulverized mica and shellac, thoroughly dried.

The burning away of the mica might have resulted from soft mica, which arcing at the brushes finally loosened and started an opening. Again, it might be but the beginning of more serious trouble, that of a grounded commutator, which will eventually burn through to the iron core, as was the case several months ago on another rotary converter which came under my notice. But it was not due to loose or broken connections, as all were found intact; furthermore, in that case, the mica would have been affected the entire length of the bar.

**POWER STATION DAILY REPORTS.**

The value of a certain class of records such as power house, repair shop and mileage reports is not infrequently greatly reduced by reason of the fact that when most wanted they have to be rooted out from a mass of papers and books by a clerk, and it often happens that the particular record desired by the manager is not on file at his office, but for some reason is held at another part of the system.

**Power Station Daily Report.**

 Date ..... 19

necessitating a considerable amount of telephoning or correspondence before the information wanted can be placed on the manager's desk. This delay is avoided somewhat by having heads of departments make reports each day on properly prepared blanks, but here too the end sought is often defeated by trying to have these reports too elaborate. Daily reports from all branches of the service have been found to be of the greatest value for comparison and checking purpose, but if insisted upon should be more in the nature of preliminary statements to be followed later by more elaborate and permanent records.

For daily reports from the power house the accompanying blank used by a prominent road in New England is suggested as giving in condensed and convenient form a complete record of power station performance for each day. The engineer of the station just before going off duty fills out the blank, partly from his own readings and partly from data furnished by the traffic department, and this record is laid on the general manager's desk each morning. As

the blanks are printed on slips 5x3<sup>3</sup>/<sub>8</sub> in., they take up but little room, and are filed daily on a filing standard within easy reach. Examination of the blank will show that although general it is an exceedingly comprehensive history of each day's operation and presents in "get-at-able" shape data that can be used to very good advantage. Sudden increases in coal consumption can be detected and checked; kilowatt output checked with car mileage; and car miles run referred to the schedule and operating departments for explanation or revision. The blank is one furnished us by Mr. Horace B. Parker, general manager of the Lexington & Boston Street Ry., of Lexington, Mass.

**TAKING SAMPLES OF WATER.**

The first preliminary to treating boiler water is to secure a chemical analysis of the water, and as the analysis of water involves considerable time, labor and expense and if the sample is not properly taken the results of the analysis are valueless and misleading, the following instructions for sampling water which are published by Kennicott Water Softener Co. will be of interest. About two gallons of water should be submitted for a complete examination and this is best done in demijohns enclosed in wicker. If these cannot be obtained glass bottles will do, but jugs or tin cans should not be used; likewise vessels that have previously held vinegar, oils, spirits, molasses, etc., are not to be used, as the vessels must be absolutely clean. Clean new corks should also be used. The vessel in which the sample is enclosed should be rinsed several times with the water to be sampled and then be filled only within two or three inches of the cork, leaving space for expansion with change of temperature. If the sample is from a running stream or pond it should be taken from near the center. The surface of the water should be avoided and also the sediment at the bottom. If the sample is taken from a tap or pump let the water run for some time before filling the vessel. Care should be taken in each case to get a sample that will represent fairly the average of the water. The cork should be rinsed in the water that is being sampled, the vessel tightly corked and sealed with sealing wax. Each vessel should be plainly labeled giving the source of the sample and the date when taken.

**FIRE ON THE BROOKLYN ELEVATED.**

February 21st the shops and car barns of the Brooklyn Rapid Transit Co., at 5th avenue and 37th street, were destroyed by fire, together with 25 cars. The total loss is estimated by the officers of the company at \$100,000. The fire started shortly after 11 o'clock in the evening in the work shop, which is a frame building on the elevated structure. Before the first engine arrived it was apparent that the work shops must be destroyed and the firemen and those of the railroad company's employes who were present, directed their attention to the saving of the barn and its contents. Fifty-five cars were stored in the barns, but through the persistent efforts of some of the motormen 30 of them were taken out. The cars were brought out in trains, but many of the rear cars were in flames as the trains passed out of the barns. The origin of the fire is unknown, but it is thought to have started in a motor car as the result of an overheated heater.

**JIMCROW CARS IN VIRGINIA.**

A bill which has recently been introduced in the Virginia Legislature provides for separate street cars for white and colored passengers and the street car employes of Richmond, who have a strong association, are making a fight to prevent the passage of the bill. The reason given by the men for opposing this measure is that it will be the means of deteriorating the personnel of the men engaged in operating street cars throughout the state either by having negro motormen and conductors or by bringing a tough element into the business. They assert that no men of the class now available would want to take the position of motorman or conductor on a jimcrow car.

Canadian capitalists have formed a company to build an electric line from Toronto to Cornwall, with a branch from Brockville to Ottawa.

## RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

### LIABILITY FOR WILLFUL MISCONDUCT OR NEGLIGENCE OF EMPLOYEES.

Hart v. Metropolitan Street Railway Co. (N. Y. Sup.), 72 N. Y. Supp. 797 Nov. 15, 1901.

Once the relation of carrier and passenger is entered upon, the carrier, the second appellate division of the supreme court of New York holds, is answerable for all consequences to the passenger of the willful misconduct or negligence of the persons employed by it in the execution of the contract which it has undertaken towards the passenger.

### ALL INTERSECTIONS OF STREETS ARE CROSSINGS UNDER ORDINANCE REQUIRING SOUNDING OF GONG.

Schneider v. Market Street Railway Co. (Cal.), 66 Pac. Rep. 734 Nov. 9, 1901.

A city ordinance requiring a bell to be rung or gong sounded as a car approaches the limit of 25 feet from a street crossing, the supreme court of California holds applies where the intersecting street does not pass beyond that on which the car is running, but terminates it. In other words, a junction of two streets is a street crossing under such an ordinance, the term, according to its common use, including, the court says, all intersections of streets, and applying equally though one of them may terminate at the point of intersection.

### FRANCHISE PART OF REAL ESTATE AND NOT TAXABLE SEPARATELY.

Dallas Consolidated Electric Street Railway Co. v. City of Dallas (Tex. Civ. App.), 65 S. W. Rep 201. Oct. 23, 1901. Rehearing denied Nov. 27, 1901.

The franchises of a street railroad appurtenant to the use of its property, the court of civil appeals of Texas holds, are a part of its real estate and not subject to a separate tax. Moreover, here it thinks was an especially strong case for the application of this doctrine because not only was the whole of the property, real and personal, owned by the street railway company, taxed, but, in addition for the very privilege sought to be taxed, a large "bonus" or "franchise tax" was being annually paid, independent of what the privilege to operate the railway might be worth.

### INJURY BY JERK OF PASSENGER GOING ON STEP TO ALIGHT WITHOUT KNOWLEDGE OF CONDUCTOR.

Sims v. Metropolitan Street Railway Co. (N. Y. Sup.), 72 N. Y. Supp. 835. Nov. 15, 1901.

Before an agent of a company can be said to be negligent in not stopping a car at a crossing, the first appellate division of the supreme court of New York thinks that the passenger must in some way indicate to the agent that he wishes to stop. Nor can it see that where the conductor was collecting fares, and had his head turned away when the passenger stepped down on the step, that this action of the conductor would justify an inference of negligence. And it holds that if a passenger voluntarily places himself upon the step of a car approaching a crossing when the car is in motion, and is thrown off by the increase of the speed of the car, which happens before he has indicated to any of the agents of the company that he intends to alight, such a starting of the car, unaccompanied by any other fact, cannot be the foundation of a charge against the company of negligence.

### LEAVING SIDE BAR UP ON OPEN CAR

Whitaker v. Staten Island Midland Railroad Co. (N. Y. Sup.), 72 N. Y. Supp. 814. Nov. 15, 1901.

An instruction given the jury in this case left it free to find that the company could be deemed negligent simply because it did not have the side bar or guard rail on the left side of the open

trolley car in which the party suing was standing as a passenger lowered at the time when she fell off or was thrown off the car at or near an abrupt curve, since it was tolerably plain that she could not have fallen off if the bar had then been down. This, the second appellate division of the supreme court of New York says, would have been correct if the purpose of providing the bar had been to guard against the falling out of passengers. But, in view of the uncontradicted evidence that such was not the purpose, it was error, the court holds, to tell the jury, as it was told, in substance, that it might infer otherwise, and hold the company responsible for the passenger's fall solely because the bar was up, instead of down.

### INJURY OF WORKMAN IN TRENCH ALONG TRACK, FROM PUTTING HIS HAND UNDER CAR.

Nolan v. Metropolitan Street Railway Co. (N. Y. Sup.), 72 N. Y. Supp. 501. Nov. 8, 1901.

A bricklayer while engaged in laying terra cotta conduit pipes for electric wires in a trench about four feet deep along, and extending partially under, certain street railway tracks, put one of his hands on one of the rails of the track as a car was passing, and a portion of the car ran over it. This, however, the first appellate division of the supreme court of New York holds did not render the street railway company liable. It points out that the man was in a place of safety when the car commenced to pass over him; that he was familiar with the character of the work, and of the risks incident to it; that he had been engaged in the same kind of work before, and had observed the passing of cars on that very day; that, if he had not, it must have been obvious to him that, if he placed his hand upon the rail while a car was passing, he would sustain injuries; and it says that the rule is well settled that one who, knowing and appreciating a danger, voluntarily assumes the risk of it, has not, if injured, a just ground of complaint.

### PRESUMPTION OF TRACKS BEING IN PUBLIC STREET—RIGHTS OF COVERED WAGON ON TRACKS.

Vincent v. Norton & Taunton Street Railway Co. (Mass.), 61 N. E. Rep. 822. Nov. 25, 1901.

The suggestion that there was no evidence that the place where the accident in question, the running down of a wagon, happened was a public way, the supreme judicial court of Massachusetts says was plainly a mere afterthought, and discredited the company's whole case. The court assumes that tracks might be laid over private land belonging to the company so that it would be a trespass for others to drive upon them, but of course, it continues, such a case is very unusual, and in the absence of special evidence a jury would be warranted in presuming and finding that street railway tracks were laid in a public street.

The wagon was a covered baker's wagon, and the rear of it was closed with drawers and boxes. It was not negligence, the court holds, to drive such a wagon in the public streets, even those containing street railway tracks. It was not negligent or unlawful to drive upon the tracks. The fact that the horse was walking made the case no worse. As against a car coming up behind him the driver would have done his duty by getting off the track when he knew of its approach. But the driver did not know of it. If the bell was rung those in the wagon testified that they did not hear it. They were not bound to keep an impossible watch upon the rear. The company could not run them down from behind under any ordinary circumstances without negligence or willful wrong, and this they may be supposed to have known.

### BOY KICKED OFF CAR BY MOTORMAN KILLED GOING ON OTHER TRACK.

Pinder v. Brooklyn Heights Railroad Co. (N. Y. Sup.) 27 N. Y. Supp. 1082. Nov. 22, 1901.

Apparently without any justification, a motorman kicked off the car a bright boy of fourteen who was riding on the front platform. The boy fell, screaming, upon his back; then picked himself up,

turned, and walked slowly and lamely across the other track, where he was struck by a car coming from the opposite direction without warning and at a very high rate of speed, receiving fatal injuries. The second appellate division of the supreme court of New York holds that a nonsuit based chiefly upon the ground that there was no evidence given to prove that the boy looked or listened before he attempted to cross the track was erroneous, and that the question of contributory negligence should have been submitted to the jury. It says that if the act of the motorman, in the opinion of the jury, created a condition by which the boy was caused to walk at once in front of the oncoming car, without realizing what he was doing, or appreciating the danger he was incurring, the effect would be quite similar in principle as if the motorman had kicked him over to the other track, and directly in front of that car. It was apparent that practical men might reasonably conclude that the boy exercised all the caution which was to have been expected of him under the circumstances created by the company's wrongful act of violence, and that therefore contributory negligence could not be predicated as matter of law. If he was blameless, in a legal sense, for his act in stepping in front of the oncoming car, then the jury might properly determine, under suitable instruction, that the act of the motorman in kicking him off the first car was negligence imputable to the company, wholly independent of any question of negligence in the operation of the car by which he was killed.

#### CONSENTS CAN BE USED BUT ONCE AS A BASIS FOR MUNICIPAL ACTION.

State (Currie, Prosecutor) v. City of Atlantic City (N. J.), 50 Atl. Rep. 504. Nov. 15, 1901.

Under the acts regulating the construction and maintenance of street railroads in New Jersey, approved, respectively, May 16, 1894, and April 21, 1896, before a railway company can lay its tracks in the streets of a municipality it must have the municipal consent and also the consent of a majority in lineal feet of the abutting owners. Before the municipal permission can be obtained by the passage of an ordinance expressing its consent, there must be on file with the clerk of the municipal body the required consents of such majority in interest of the abutting owners. And the court of errors and appeals of New Jersey holds that when upon the filing of the necessary consents of the abutting owners the city council or other governing body has once regularly acted thereon, by the passage and approval of a valid ordinance or resolution giving or refusing such municipal consent, the council or other governing body becomes functus officio, or as having fulfilled its office, so far as the pending application is concerned, and the consents of the abutting owners, thus acted upon, cannot be the basis of further municipal action upon a second application. Upon the question as to whether the consent of an abutting owner, after being once filed, can be withdrawn or revoked before final action the court expresses no opinion. It observes, too, in passing, that the consents which it had been considering were, as it appeared, recorded in the county clerk's office soon they were obtained; but this, it says, was not a statutory requirement, and such recording could give to them no additional force or validity.

#### INJURING CHILD OF POOR PARENTS.

Cotter v. Lynn & Boston Railroad (Mass.), 61 N. E. Rep. 818. Nov. 26, 1901.

A child three years and ten months of age, whose parents lived in a tenement house on a street in which there was a line of electric cars, having been allowed to go down into the yard to play, where the gate was always open, and left unattended and unobserved by the mother for an hour or more, the supreme judicial court of Massachusetts holds that, there being no pretense that the child herself was using the care of a prudent adult, she could not recover for injuries sustained in being run down by a car, while trying to run across the street directly in front of it.

There being no evidence that the child used the care that would be expected of an adult, the court holds that, therefore, if there was negligence on the part of her parents in allowing her to be where she was she could not recover damages. While the limited powers of the poor must be taken into account as a general fact in drawing the line at which the company's responsibility shall begin, still, the court says, the other side must be considered also

before it, a third party, is made responsible for an accident, and this responsibility does not follow of necessity from the fact that the parents did the best they could. There is a certain minimum of precaution against the dangers into which infants will wander, which must be taken if another is to be made to pay.

Of course when the case gets near the line which divides those instances in which it can be ruled as matter of law that the parent was negligent from those in which it can be ruled that due care was shown, it is left to the jury. But in the cases most like this in which a jury has been called, the court says the precautions were greater, or the danger was less obvious and not so great, and the time shorter during which the child was left to itself.

#### PARK OWNER HAS NO RIGHT OF ACTION FOR DAMAGES FOR REMOVAL OF EXTENSION

Barney v. Indiana Railway Co. (Ind.), 61 N. E. Rep. 194. Oct. 3, 1901.

An owner of a driving park having advanced the money to buy the rails, and made a donation of \$500 out of the money so advanced, to secure an extension of a street railway line to his park, the company agreeing to "place said rails, lay said track, and operate it and have it ready for operation as early as" a certain date, the supreme court of Indiana holds that such park owner had no cause of action for damages for the subsequent removal by the company of said extension, as the right to determine how long it should operate the road remained with the company, so far as he was concerned, the contract not fixing any definite time during which the company should operate the road.

#### CATCHING HOSE TO WHICH MEN ARE HARNESSSED FLUSHING PAVEMENT.

Lasehinger v. St. Paul City Railway Co. (Minn.), 87 N. W. Rep. 836. Nov. 8, 1901.

Three city employes were harnessed to the nozzle end of a 5-inch hose 200 feet long used in flushing asphalt pavement. Their duty was to pull the hose, which was placed upon rollers, and handle the nozzle. A fourth employe was to keep the hose as straight as practicable, and in from the street car track. But a bolt under the rear step of a passing car caught one of the rollers at a point some 40 feet from the three men mentioned, whereby they were thrown into the air and to the ground, and injured. There was evidence on their behalf tending to show that this result was due to negligence in running the car along the street at a dangerous rate of speed, while the company, on the other hand, offered evidence to the effect that the car was going at a rate of speed not to exceed four to six miles an hour—a safe rate of speed. The supreme court of Minnesota holds that the evidence presented a question for the jury and sustained a verdict for damages in favor of each of the three men.

#### DUTY TO LOOK AND LISTEN FOR CAR DEPENDS UPON CIRCUMSTANCES—UNFAMILIARITY WITH STREET OF PERSON INJURED—PEDESTRIANS NOT ALWAYS TO BE DEEMED IN PERIL.

Russell v. Minneapolis Street Railway Co. (Minn.), 86 N. W. Rep. 346. May 31, 1901.

The supreme court of Minnesota says that it is not, as a matter of law, negligence for a pedestrian to cross a street railway track (at least, within the populous part of the city) without looking and listening for an approaching car. Whether the failure to look and listen be an act of negligence must be determined from all the circumstances of each particular case, guided by the rule of ordinary care and prudence. If a person by the exercise of such care could have discovered an approaching car and avoided the accident, and he failed to do so, he cannot recover. So the question in every case is one of ordinary care. Failure to look and listen might be conclusive, or at least very strong, evidence of negligence in one case, and in another of no particular controlling force at all. The ultimate determination of the question must depend largely in each case on the surrounding circumstances.

The mere fact that the plaintiff in this case was not familiar with the location of the street car lines in Minneapolis, and did not know at the time whether a line was located and in operation upon the

street she was crossing, the court holds, was not conclusive that she was not negligent. It says that whether an injured party is familiar with the location where an accident happens, and with the particular danger, is always an element to be considered in determining whether he was guilty of negligence, but it is not conclusive one way or the other. The rule is that if the person have no actual knowledge of the danger causing his injury, and could not by the exercise of reasonable care have discovered it, he cannot be said to be guilty of contributory negligence. But if ignorant of the danger, and the exercise of reasonable care would have made it known, and there be a failure to exercise such care, he is chargeable with negligence, and to the same extent as though perfectly familiar with it.

Furthermore, the court hold that the mere fact that a person is upon a street upon which runs a street car line is no evidence that he is in a position of peril. The motoneer in charge of a street car has the right to presume that pedestrians will exercise due care for their own safety and protection, and is not required to assume that every person in front of his car, at a considerable distance, will fail to exercise that care, or is in a position of peril.

#### DUTY TO STOP AT REGULAR CROSSINGS AND ON OCCASION TO BACK UP TO SAME FOR PASSENGERS.

Jackson Electric Railway, Light & Power Co. v. Lowry (Miss.), 30 So. Rep. 634. Oct. 28, 1901.

A street railroad company, the supreme court of Mississippi holds, is under a duty to the public to stop at its regular crossings, on a reasonable signal, to receive those desiring to take passage. It cannot avoid this duty by any practice or rules of its own. Its rules must be reasonable, and an absolute contrary rule would be unreasonable. It is unreasonable for it to have a rule that where its cars stopped beyond the crossing, they should not be backed to the proper place, in order to receive the person signaling, under all circumstances. Where the distance is short, and the road good, and no inconvenience given the proposed passenger, it is not meant to hold that such a rule might not be held proper. But it is highly improper for it to be made, or obeyed, to apply in a case like this one. Here it was a rainy night, and the road very muddy, and the stop 20 or 40 feet beyond the brick crossing, and the passenger, as known to the operatives, with 7 blocks to walk unless he got passage. As to damages, the court holds that this case was one in which exemplary damages could be recovered, it further appearing that when the car was on its return trip the passenger boarded it and paid his fare to get the names of those in charge of it and was treated insolently by the conductor and made sport of by him when he alighted.

#### DUTY OF EMPLOYEES TO REMOVE YOUNG CHILDREN FROM PLATFORM—WAYS TO DO IT—FORMER LANGUAGE EXPLAINED.

Levin v. Second Avenue Traction Co. (Pa.), 50 Atl. Rep. 225. Nov. 8, 1901.

The supreme court of Pennsylvania says that when this case was up before (194 Pa. 156, 45 Atl. 134) it held: "When the motorman discovered the boy on the platform of the car, it was his duty to stop, and take him inside, or put him off." This simply followed Railway Co. v. Caldwell, 74 Pa. 421, and what the language clearly means is that when a child of years so tender that negligence cannot be imputed to it is found by a conductor or motorman on the platform of his moving street car, his duty is to remove it from its peril. This can be done by stopping the car, and putting it off, or by taking it inside. In saying, "The youth of the boy exempted him from the charge of being a trespasser, in the legal significance of the word (Barre v. Railway Co., 155 Pa. 176, 26 Atl. 99), and no negligence was imputable to him," in 194 Pa. 45 Atl. above the word, mean that the boy was not a trespasser to whom no duty was owed, and they ought to be so understood. In Enright v. Railroad Co., 198 Pa. 106, 47 Atl. 938 cited by counsel for the traction company, while it is true the boy was held to be a trespasser upon the train of the railroad company, the court also decided that its employe could not eject him, or cause him, by fright or fear, to leave the train, while in rapid motion, so as to endanger his life; and that it was the duty of the defendant company and its employe not to eject him. The duty of a street railway company's conductor or motorman is to refuse to permit a child five years old to be on the platform of

his moving car, and, if it gets there without permission, through the oversight of the company's employe, the duty of the latter, as soon as it is discovered, is to remove it from its position of danger. Failure to do so is negligence.

#### MALICIOUS ASSAULT OF CONDUCTOR ON PASSENGER HELD TO JUSTIFY EXEMPLARY DAMAGES.

Lexington Railway Co. v. Cozine (Ky.), 64 S. W. Rep. 848. Oct. 23, 1901.

A passenger requested to be left off at a certain place. As the car approached the place, he signaled to the conductor to stop. Failing to attract his attention, he reached up to pull the bell cord, but by mistake got hold of the wrong cord, and rung up a fare. The conductor thereupon went back and asked what he rang the bell for, and said, "You owe me a nickel." The passenger responded, "I have already paid you, but I will give you another nickel," and shoved it along the seat, and at the same time arose for the purpose of alighting. The car, however, did not stop, and he remarked to the conductor, "If you do not stop the car, I will ring the bell again." At the time he said this he was holding to the side of the car with both hands, and standing on the footboard. The conductor responded, with an oath, "No, you won't," and immediately struck him twice in the face, bruising one eye and cutting a gash in his face. The passenger was a cripple, and partially paralyzed in both legs from the knees down, and was making no effort at all to assault or otherwise injure the conductor. The jury was instructed that, if they believed from the evidence that the assault made upon the passenger was inspired by malice on the part of the conductor towards the passenger they might allow the latter punitive damages, by way of punishment. This meets with the approval of the court of appeals of Kentucky, which affirms a judgment against the company. It says that while there was nothing in the record to show that the company either authorized or approved the conduct of the conductor in this matter, yet he was clearly acting in the line of his employment at the time of his brutal and unjustifiable assault upon a passenger who was entitled to his care and protection, and the case was clearly brought within the rule of law authorizing the instruction.

#### COLLISION WITH PATROL WAGON AT CROSSING.

Decker v. Brooklyn Heights Railroad Co. (N. Y. Sup.), 72 N. Y. Supp. 229. Oct. 11, 1901.

A policeman in charge of a heavy patrol wagon, which another policeman was driving, was injured in a collision with a car at an intersection of streets. The patrol wagon was going at a brisk trot, one of the horses galloping, down grade, the ratchet bell ringing. When the horses reached the curb line, the car was near the crossing, perhaps from 30 to 100 feet away, running at about the usual rate of speed, and the driver of the patrol wagon whipped up his horses, and attempted to pass in front of the car. The result was the collision, the car striking the patrol wagon back of the rear hub. Upon this evidence, the second appellate division of the supreme court of New York affirms a judgment for damages against the company. It says that this accident occurred at a street intersection, where the rights of the parties were equal. The driver of the patrol wagon, whose negligence might, perhaps, be imputed to the policeman suing, was bound only to the exercise of that degree of care which a reasonably prudent man would or should have exercised in like circumstances; and it is of the opinion that the evidence supported the conclusion that the one suing did exercise the degree of care which was fairly to be expected of the driver of a patrol wagon. He was ringing the ratchet bell. He was driving in response to a call, and he had a right to assume that approaching street cars would be under control at street intersections. The jury had a right to take into consideration that the patrol wagon was acting in a public emergency; that it was, as is customary, being driven at a high rate of speed, and going down grade; and the fact that the driver used the whip, instead of attempting to stop the horses before they reached the track. It may have been prudent for the driver to attempt to pass over the tracks rather than to try to bring the team, with its heavy wagon, to a standstill within the few feet which intervened between the tracks and the horses at the moment of

discovering the approaching car, and it was for the jury, with all the evidence before them, to determine whether the driver was exercising that reasonable degree of care which the circumstances demanded.

FAILURE TO LOOK FOR CAR—CARE REQUIRED OF MOTORMAN—WHAT MAY BE ASSUMED OF VEHICLES MOVING TOWARDS TRACK.

*Cowden v. Shreveport Belt Railway Co. (La.), 30 So. Rep. 747. June 3, 1901. Rehearing denied Nov. 18, 1901.*

Not to look to see if a car is coming before attempting to cross the track of an electric car, the supreme court of Louisiana holds, is negligence such as will preclude recovery for injuries caused by a collision with the car, in the absence of proof that the persons in charge of the car by the use of ordinary diligence might have avoided the collision. But ordinary care for a motoneer, it holds, comprehends utmost vigilance. And it doubts whether a car with a speed of 10 miles an hour could be stopped in five seconds.

Then the court says that the motoneer in question could not be supposed to have been looking in the direction of an intersecting street. He must be supposed to have devoted his entire attention to the street on which his car was running. The side streets being opposite to each other, he could not turn his face in the direction of one without turning his face away from the other. He had, therefore, to divide his attention between the two, which meant that he had to devote his entire attention to the street he was traveling on. In other words, he, unlike the occupants of the wagon approaching the crossing from the side street, could not keep a sharp lookout at the corner.

And, even after the horses had fairly emerged from behind the corner building,—say when their heads had reached the sidewalk line,—he was not bound, the court holds, to divine the intention of the wagon to make straight for the track, and, so divining, to have recourse at once to heroic measures for stopping the car. The natural assumption in such a case was that the wagon would stop or turn aside. If a motoneer must, under penalty of negligence or worse, assume that every vehicle or every pedestrian he sees moving towards the track will keep on the even tenor of their way, and acting upon such assumption, must at once put on brake and reverse current, what becomes of rapid transit in cities?

DUTY OWED TO EMPLOYEES IN FURNISHING APPLIANCES—DEFECTIVE BROOKLINE—RELYING ON MANUFACTURER FOR INSPECTION.

*Murphy v. Coney Island & Brooklyn Railroad Co. (N. Y. Sup.), 73 N. Y. Supp. 18. Nov. 22, 1901.*

A lineman engaged in fastening span wires into a brookline or turn-buckle received a severe shock of electricity. Subsequent to the accident it was found that the brookline had leaked, and thereby had become defective, though there was no evidence that the defect was visible. At the close of the testimony it was held that there was not sufficient preponderance of any violation of duty upon the part of the company to justify a verdict, and that as it had bought the brooklines from a reputable manufacturer, who assumed the duty of inspection, the company was not negligent in failing to make another test. The second appellate division of the supreme court of New York holds that this was error, and reverses the judgment rendered in favor of the company, granting a new trial, upon the ground that the testimony required the submission of the case to the jury, but with the statement that it expresses no opinion as to the liability of the company.

The obligation of the company, the court holds, was to furnish its employees good and suitable appliances, and to use reasonable care to keep them so. The master's duty in choosing materials for his servants is to use care similar to that which a man of ordinary prudence in similar business, acting for his own safety, would use in choosing such materials for himself, were he doing the work. The rule is the same whether the master buy the appliance ready-made, cause it to be made, or purchase the materials and make it. Of course, it says, it does not hold that the obligation upon the master requires him always to inspect appliances, so that proof of omission to inspect is proof of negligence. But there were two features in the testimony in this case which in its opinion, made the question one for the jury: First. There was no proof what-

ever that the manufacturer ever made any tests of the brooklines. The testimony only went to show that the manufacturer made a verbal promise that he would test them. Second. There was testimony that practicable tests could be made by the company of the brookline in its finished form, which would have revealed the defect in question, and that the defect was not inherent in the material of construction, but was due to a leakage from the appliance. It was necessary for the lineman to connect the brookline with the span wires, and he had a right to rely upon the fact that the master had used due care in furnishing an apparatus the very purpose of which was insulation.

SUFFICIENCY OF COMBINED CONSENTS OF COMPANIES THAT MERGE—NATURE OF CONSENTS—EFFECT OF SALES OF PROPERTY.

*Adee v. Nassau Electric Railroad Co. (N. Y. Sup.), 72 N. Y. Supp. 992. Nov. 15, 1901.*

Two different companies having each obtained a number of consents for the construction of a street surface railway on a certain street, but neither company alone having sufficient, the second appellate division of the supreme court of New York holds that, on the merger of one of the companies into the other, the latter, with the combined consents of the two companies, which were from different parties, and were in the aggregate prima facie sufficient, was, upon the face of the papers, justified in entering upon the street and laying down its tracks. Nor does it consider that in this case, an action brought by an owner of property abutting on the street to enjoin the construction and operation of the road on the ground that the required consents had not been obtained, that conformity of the merger to law could be inquired into, that being a question to be dealt with in an action brought for that particular purpose, if at all. Neither does it consider that the rights of the surviving company were prejudiced in the matter because it had pending in the courts an action which it brought before the merger to get the authority through commissioners to construct the road on the ground that it was unable to secure the necessary consents.

Furthermore, the court says that if it reads and catches the spirit of the state constitution and statute aright, these consents are not mere licenses to be revoked at will, or by the transfer of the property before the construction of the railroad; nor do they contemplate a conveyance of real estate. If either of these two companies failed to record the consents it obtained, the sale and conveyance of the properties on which these consents were based did not invalidate the consents. The most that could be claimed would be that the new owners, having purchased without notice, would not be estopped to assert any property rights which might have come to them under their deeds as against the company. Continuing, the court says that if the surviving company had neglected to record its consents until the rights of third parties had intervened, it had only itself to blame, and it might not complain, perhaps, if it was called upon to pay for the property rights of subsequent purchasers in good faith without notice; but the fact that parties, strangers to the record in this case, might have a cause of action against the company for taking their property for a public purpose without just compensation, could not give the party suing in this case any rights in an action brought to restrain the company from constructing its railroad under the consents which had been given in writing by the property owners. In other words, the party suing could not be permitted to deprive the company of its property rights in these consents, which the statute declares "shall be effectual for the purposes therein mentioned," because some one else may have been deprived of his property in the highway.

The consent, if valid when made, is the consent of the owner of the property, and, in contemplation of law, vests a certain property right in the company to which the consent is given, which cannot be divested by any subsequent transfer of the property, although the purchaser without notice may acquire the full right to demand compensation for any injury to his rights which may follow from the construction of the road. So, the party suing, never having consented to the construction of the road, assuming him to be the owner of the fee (title) of the street in front of the premises, might maintain an action to compel the payment of damages, but he had no right to prevent the construction of the road under the consents given by the owners of one-half in value of the abutting property.

## The Operation of Street Railway Parks.

Some Experiences at Birmingham, Binghamton, St. Louis and Elsewhere— Suggestions for 1902— A Novel Plan for Overhead Lighting.

### SUBURBAN GARDEN, ST. LOUIS.

The St. Louis & Suburban Railway Co., of St. Louis, is interested in an amusement park which has proved to be very popular and consequently has been successful from a financial standpoint. The resort which is known as Suburban Garden, is operated by the Suburban Garden Amusement Co., which is controlled by the railway company.

Suburban Garden is situated on an eminence at the western terminus of the company's main line, and is by all odds the coolest and most attractive resort of the many in St. Louis and its suburbs, although its area, while ample is not as great as that of one

been made an attractive place for equestrians and drivers of pleasure vehicles by affording ample carriage sheds and accommodations for horses.

Benefitting by the experience of its predecessors at this garden and that of its competitors the company eschewed all other classes of attractions in favor of high-class vaudeville and found that the higher the class of the attraction the more popular the resort became and the better the audiences were pleased. So gratifying was the experience in this direction that the one certainty about the future of the Suburban Garden, for the present year at least, is that high-class vaudeville will constitute the offerings to patrons.

SUBURBAN GARDEN, ST. LOUIS.

or two other St. Louis gardens. In addition to the theater which is fitted up with light veneer orchestra seats, arranged in sections and sold by chart numbers, the attractions include a scenic railway, an electric fountain, two pavilions, one containing a first-class cafe (conducted last year by Louis Caesar, one of St. Louis' fore-

By courtesy of Mr. T. M. Jenkins, general manager of the St. Louis & Suburban Ry. and president of the Suburban Garden Amusement Co., we are enabled to show here two illustrations of Suburban Garden.

### EAST LAKE PARK, BIRMINGHAM, ALA.

A park at the terminus of a railway line has always proved a paying investment provided something was offered in the way of amusements to induce the people to patronize the resort. The Birmingham Railway, Light & Power Co. has controlled and operated a beautiful little park called East Lake at the terminus of its line of that name for seven years with varying success. A number of views taken at this park were published in the "Review" for July, 1898. The first year of its opening the railway company assumed complete charge of the amusements, building an enclosed theater and booking attractions for it in the usual manner. A coupon ticket, consisting of two street car tickets and an admission ticket to the theater was sold by conductors for 10 cents each, but this system was abandoned after the first season, as it only served to reduce the price to a certain number who attended regularly, and did not serve to increase the attendance. The attraction was a stock company playing light comedies interspersed with vaudeville numbers. This proved a good drawing card in itself, besides which there was the lake where those who cared to do so might boat, fish or swim and for the more indolent, an electric launch plied from one of the lakes to the other carrying passengers for 5 cents for the round trip. This was very largely patronized by the children.

The next season the same form of amusements were presented except that instead of booking independently the company joined a circuit of several other Southern cities, thinking thereby to secure the services of the theatrical people much cheaper, but this proved a failure for the reason that when an inferior actor was billed to

LIVING PICTURES AT ST. LOUIS.

most restaurateurs), and numerous attractions which have come to be known as "midway" shows, merry go rounds, etc.

It has been the object of the management to provide a high-class resort, catering only to the better classes and all the appointments were made with that idea in mind. While, naturally, it is primarily intended to be a "feeder" for the street railway it has

appear for a two weeks' engagement there was no remedy but to let him continue until the end of his engagement and until the next company was due to arrive. This of course was detrimental to good attendance and the company withdrew from the circuit as soon as practicable.

Subsequent seasons the railway company leased the Park to individuals or companies who agreed to assume entire charge of the theatrical attractions for the door receipts, while the railway company got the car fare. The bill was the usual summer park theatrical production changed twice weekly and was presented with varying success, according to the class of performances playing.

On Sunday afternoons a band of ten pieces dispensed popular airs from 3 to 6 p. m. The band was transported to the park on a special car built for the purpose, first riding around in the heart of the town playing inspiring music, and was closely followed by the regular passenger cars loaded to the guards. The band on Sunday afternoons has always proved itself a drawing card.

While the attendance was at all time very good the management thought that if there were other attractions besides theatrical ones that the attendance would increase accordingly and to that end for the ensuing season the park has been leased to Mr. W. H. Pickens, a popular salesman for Robert Johns, of Chicago, and an old theatrical and park manager. Mr. Pickens is going to build a "Shoot the Chute" of the latest improved plan, install a merry-go-round of large proportions and introduce such other attractions as may seem advisable later in the season. He has under consideration the erection of a "Loop-the-Loop" should the other features draw well.

A very attractive inducement to park patrons will be the excellent refreshment booths which will be located in desirable places about

CASINO PARK—BINGHAMTON R. R.

the park and in the center will be a large dance and refreshment hall. The service and the ices will be of the best. It is proposed to use the main refreshment hall for a roller skating rink, which should prove a good idea as the roller skating fad has seized Birmingham with a firm grip and to keep up with the crowd now one must be an expert on rollers.

The railway company is having plans prepared for an open air theater of 2,000 seating capacity. This is to be built after a rustic design out into the lake and is to be lighted with 500 incandescent lamps. The form of amusement is to be varied; for instance one week, vaudeville will be presented, the next melodrama, and the next light opera, thus avoiding a surfeit of one particular kind of theatrical attractions. Every evening before the performance in the theater a band, employed for the season will render a concert and on Sundays there will be no performance in the evening, but the band will present two concerts, one in the afternoon and one in the evening.

It is anticipated with such increased attractions at this park that the travel this summer will be very heavy and to that end the construction department is hurrying the work of relaying the double track with 70-lb. rails. With a heavy rail, double track and plenty of cars it is believed that unusually large crowds may be handled with comparative ease and dispatch, making East Lake Park one of the most desirable resorts to be found in which to spend an evening.

#### BINGHAMTON, N. Y.

The plans of the Binghamton (N. Y.) Railroad Co. for the ensuing season at Ross Park, Binghamton, and the Casino, Endicott (the new village recently established directly opposite Casino Park), the two summer resorts controlled and operated by this

BRIDGES IN CASINO PARK.

company, will be very similar in character to those in vogue heretofore.

Ross Park, Binghamton, is the public park, for which the railroad company control the amusement and refreshment privileges. The Casino and Casino Park are the property of the Binghamton Railroad Co. and controlled and operated by it. High class vaudeville entertainments are provided at both resorts, the company conducting the various privileges, refreshment and otherwise, in connection therewith.

By courtesy of Mr. J. P. E. Clark, general manager of the Binghamton Railroad Co., we are enabled to show here a number of views taken in these parks, and those of our readers who are interested in the details of the street railway park business cannot do better than refer to the "Review" for April, 1899, page 228, where we published an article on "Parks and Free Amusements as a Means of Stimulating Street Railway Traffic," by Mr. Clark, who has been most successful in making parks profitable for his company.

Among the principles for the conduct of such parks laid down in that article, are the following: No liquor must be sold. Keep your resort clean, wholesome and respectable. Use care in selecting entertainments. Keep within bounds as to expense.

#### SOUTH BEND, IND.

Mr. J. McM. Smith, general manager of the Indiana Railway Co.,

CHILDREN'S CORNER AT ROSS PARK—BINGHAMTON R. R.

of South Bend, Ind., in response to an inquiry advises us that the company is undecided as to the operation of its park during the coming season. The city has annexed part of the park and the company's track running to the park, so that it now becomes

necessary, in accordance with the terms of the franchise, to issue transfers to passengers returning from the park, which the company claims it cannot do because the distance is so short that conductors barely have time to collect fares. The company has before the council a proposition, which if adopted, will relieve it of the necessity of furnishing transfers, and in that case it will go ahead with its amusements; otherwise it will be obliged to close the park for the season.

NEW BEDFORD, MASS.

The Union Street Railway Co., of New Bedford, Mass., is operating one park, known as Lincoln Park, located about seven miles from the center of New Bedford and about the same distance from Fall River on the line of Dartmouth & Westport Street Ry. The

FOUNTAIN IN CASINO PARK, BINGHAMTON.

park is not on any body of water but depends for its attractions on a beautiful pine grove. It is supplied with the regulation park amusements, such as free dancing under certain restrictions, which is that perfect order must be preserved, a free Punch and Judy show for the children, free vaudeville shows, except that 5 cents is charged for a few of the most desirable seats, the show being given from the stage 30 ft. square, but the audience see the show from the open air. There are located on the grounds the ever present merry-go-round and toboggan slide for the use of which a charge of 5 cents is made. Clam bakes are served several times each week in a building built exclusively for the purpose and the bakes are well patronized. The main building is what is known as the casino and is supplied with a first-class restaurant and ice

WAITING FOR THE MATINEE BINGHAMTON.

cream parlor. There are many other small attractions and the grounds are well looked after so far as being kept clean. The grove is supplied with free swings and rustic seats and slight attempt is made at decoration in the way of flower beds and rustic vases, but nature needs little assistance to make the place very attractive. This park is probably the pioneer of suburban parks

operated by car lines in eastern Massachusetts, having been operated for about eight years. The company does not anticipate making any decided changes from its past method of operating or of introducing any new features. In addition to the attractions named free open air band concerts are given evenings and afternoons on Sunday.

MULTIPLE SERIES FOR PARK LIGHTING.

BY GEORGE K. HYDE.

The Park at Savin Rock, New Haven, Conn., containing about 3¼ acres is lighted by about 500 electric incandescent lamps arranged to give a canopy effect. The current for these lamps is taken from the trolley circuit, and as putting the lamps in series of five each would make too many wires overhead, I devised the multiple-series system here described, which will doubtless be of interest to others having similar work to carry out.

In the center of the park four poles were set at the corners of a 100-ft. square surrounding the electric fountain; these poles were 45 ft. above the surface of the ground. Poles 15 ft. above the ground were set at the outer corners and 100 ft. apart along the outer edge. Iron wire was run to connect the tops of the four

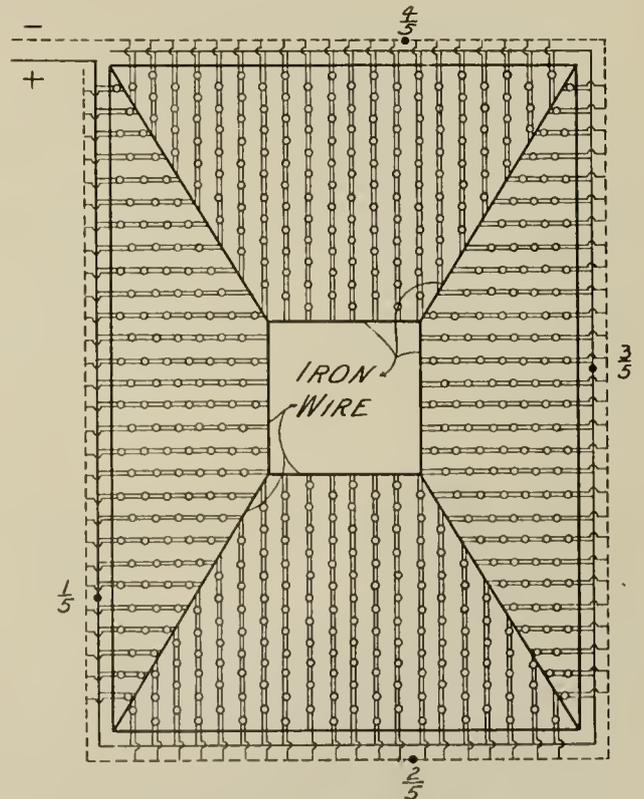

DIAGRAM OF PARK WIRING, NEW HAVEN.

poles forming the center square, around the outer edge of the grounds, and to connect the corners of the center square to the corresponding corner of the park boundary. These wires were to carry the circuit wires.

Fifteen feet from the corner two wires were fastened to the outside iron wire with insulators and were run, at right angles to the outside wire, until they touch the diagonal wire where they were dead-ended with insulators.

Fifteen feet from these wires, two more were run, parallel, till they met the diagonal wire, and so, every 15 ft. around the edge; these wires, of course, being different lengths, according to their distance from the corner, and, as the lights were to be 15 ft. apart, this distance was taken for a standard.

Starting on the first pair of parallel wires, a light was connected across the two 7½ ft. from the outside wire; on the second pair the light was connected 15 ft. from the outside, and so on, alternating. The number of lights on each pair of wires varied from one to eleven, according to their length.

All these parallel wires were connected in multiple to the two circuit wires around the outside. This method put all the lights in multiple. To get the series connections, a wooden insulator was cut in the top or portion of the outside wires, so as to have one-fifth of the total, being 104 lamps in this case, in multiple. Another insulator was cut in this wire, after two-fifths more or three-fifths of the total number from the starting point, and the wire dead-ended after the last light on the same pole from which it starts.

The bottom or negative of these two wires has an insulator after four-fifths of the total number, bringing the insulators on this wire half way between those on the positive, putting each multiple of lights in series with the next one, and so on through the five multiples, this negative wire also being dead-ended on the pole from which it starts.

Owing to the various lengths of the parallel wires it was not possible to get the multiples exact, but there being so many lights in each multiple, one or two more or less did not make any difference.

The advantage of this system, aside from the saving of wire, lies in the fact that when a light goes out, from any cause, that is the only light affected, and not five, as in the straight series.

**CARD LEDGER SYSTEM ADOPTED BY BROOKLYN RAPID TRANSIT CO.**

In the issue for Oct. 15, 1901, the "Review" published the first authorized description of the method of purchasing and storeroom accounting on the Brooklyn Rapid Transit system. In January of the present year the jurisdiction of the general storekeeper of the Brooklyn roads was extended to include certain other departments and as a result of the increase in the number of separate accounts to be carried under the new conditions the management has authorized the adoption of the plan by which the stock ledger is kept on cards, and which will supersede the book ledger described in the article referred to.

Under the new order the general storekeeper in addition to the accounts previously handled by him, will assume the custody and issue of all the stores for the track and power house departments

The new stock ledger card is 7 1/4 in. long by 5 in. high and is ruled (on both sides) as shown in the sample reproduced on this page. As has been told in the "Review," the Brooklyn company keeps a daily ledger with each class of material, as "Line," "Track," etc. This ledger is kept on sheets bound into book form and gives a daily balance for all material and supplies in store. This "daily" ledger sheet system will be continued as before. The cards displace the general supply ledger which is a book made up from the "daily" sheets giving "monthly" balances of quantity, unit, price, and total value of each item of material on hand and issued. The column headings on the card are self explanatory. A double set of columns is provided for the "credit" entries as goods are usually given out in smaller quantities than they are received and there are therefore a larger number of entries on the credit side than on the debit side.

**D. L. & W. PENSIONS ITS EMPLOYEES.**

In addition to the railroads making a practice of pensioning their employes, which were mentioned in the "Review" for January, 1902, announcement has just been made by the management of the Delaware, Lackawanna & Western Railroad, that a pension system for the benefit of the employes of the road was put into effect March 1st. The adoption of such a system has been under consideration by this company since 1899, and the plan finally accepted has been the subject of careful study to insure the inclusion of the best features of the systems in use by other large corporations. In the system adopted any employe engaged for 25 years in any capacity, who has faithfully performed his duties, is to be retired at the age of 65 and to receive thereafter a monthly allowance depending on his pay and length of service. The amount of the pension is gaged by the average monthly pay received for the ten years preceding retirement as well as by the actual time of service for the company. For example, if the monthly pay was equal to \$60 a month, and the time of service 30 years, the pension will be \$18 per month, equal to one per cent a year for 30 years, or an average monthly wage of \$60. If the employes from the ages of 60 to 64 years have served the company for 25 years or more, and have

RULING FOR STOCK LEDGER CARD.

(except coal for fuel), of the freight and express carrying department and of all the company's extensive dock properties. He will also assume supervision of the department for transporting all material and supplies from the general storehouse to all points of the system, having direct charge of all flat cars and other equipment detailed to this work. Hereafter when any department needs material moved or emergency work done in transporting material and supplies, application is to be made direct to the general store-keeping department. The general storekeeper will also engage and discharge all stevedores, laborers and helpers employed at the docks and depots for loading, unloading and transporting material and supplies. General charge of the supplies required at the company's stables is also to be delegated to the general storekeeper. This will give this official the custody and issue as well as the transportation and distribution of all the stores required in every department of the Brooklyn Rapid Transit Co.

At the present time the company has on hand nearly \$600,000 in stock, having recently taken advantage of a low market to purchase extensively of certain classes of material, particularly copper. It is estimated that the interest on the investment tied up in stores is more than offset by the saving in prices at the present markets. As a result of the extended scope of this department it became necessary to add over 1,000 new accounts to the general stock ledger. It was determined that the ledger system in book form would not be sufficiently elastic to afford means for rapidly charging stores in and out and striking balances and the card ledger has therefore been selected to take the place of the book.

become physically or otherwise incapacitated they are either retired voluntarily or by a decision of the board, and pensioned. In case of injuries the board has jurisdiction in regard to awarding pensions.

The fund from which payments will be made is appropriated each year by the company. Employes are not required to contribute to it. For the remainder of 1902 an appropriation of \$50,000 has been made. The company does not consider the pension as a favor but as a permanent annuity earned by faithful and loyal service.

**AMMETERS ON ROTARY PLOWS.**

Mr. William Pestell, superintendent of motive power and machinery for the Worcester Consolidated Street Railway Co., writes us that the plan of placing an ammeter in the fan motor circuit of the Ruggles rotary plow, as described in the "Review" for February, page 95, is working very satisfactorily. It had been found that sometimes when working with the rotary in very hard snow the four motors on the plow would drive it faster than the fan could cut its way into the drifts and there was danger of overloading the fan motors. An ammeter was therefore placed in the fan-motor circuit enabling the operator to tell just what load the motors are carrying and aiding him in regulating the speed of the plow in accordance with the speed with which the fan is cutting into the snow. The fan on the plow is driven by two independent 40-h. p. motors.

## New Work in 1902.

### New Electric Railways, Extensions Proposed, Track to Be Rebuilt, Increase in Equipment, Additional Building Contemplated, Etc.

The following list of the electric railway companies which contemplate building or rebuilding tracks, erecting new buildings, increasing equipment, etc., has been compiled from divers sources and is believed to be correct for the companies named.

Those items which are followed by a date only are taken from statements sent us direct by the company. Where the information has been published in the "Street Railway Review Bulletin" that fact is denoted by the word Bulletin and the date.

#### ALABAMA.

Anniston Electric & Gas Co. Will build  $\frac{3}{4}$ -mile extension, for which material has been purchased. H. W. Sexton, general manager, Anniston, Ala.

Warrior River Power Co., of Ensley, Ala. Recently incorporated to build an electrical plant on the Warrior River for the operation of the proposed Steel Cities Ry. between Birmingham and Ensley. J. S. Kennedy, of Ensley, is interested. Bulletin, Feb. 13, 1902.

#### ARKANSAS.

Citizens' Electric Ry., Eureka Springs, Ark. Will build new car house with capacity for storing 8 cars. The company recently purchased trucks and 8 car motors. M. D. Jordan, manager, Eureka Springs. Feb. 5, 1902.

Fort Smith Traction, Light & Power Co. Will build 2 miles of new track and buy 2 new cars. A. N. Sicard, manager, Fort Smith, Ark. Feb. 5, 1902.

#### CALIFORNIA.

Los Angeles & Redondo Railway Co. Will build 17 miles of new track and rebuild 19 miles of present system. Will build new car houses with capacity for storing 16 cars; will build 10 new cars and buy 40 car motors. H. B. Ainsworth, manager, Los Angeles, Cal. Feb. 11, 1902.

Redlands Street Railway Co. Will build one mile of new track, and increase capacity of power station 200 kw. Will buy one new car and two car motors. C. W. A. Cartledge, vice-president, Redlands, Cal. Feb. 14, 1902.

Market Street Railway Co., San Francisco, Cal. Planning a new power house of 2,500 kw. capacity.

Bakersfield & Kern Electric Ry. Projects an interurban line to be under construction this spring. M. H. French, Los Angeles, Cal., may be addressed. (Bulletin, Jan. 23, 1902.)

Oakland & San Jose Railroad Co., of Oakland, Cal. Recently incorporated to operate an 84-mile electric railway system connecting Oakland, San Jose, Los Gatos and Santa Clara, a 50-mile portion of which is now in operation. Will construct remainder of system this year. W. F. Kelly, general manager, Oakland. (Bulletin, Dec. 4, 1901.)

North Pacific Coast R. R., San Francisco, Cal. Recently purchased by John Martin, R. B. Colgate and E. J. de Sabla, jr., of the Bay Counties Power Co. Line between San Francisco, Sausalito and San Rafael at present operated by steam will be converted into an electric system. (Bulletin, Jan. 16, 1902.)

#### COLORADO.

Colorado Springs Rapid Transit Co. Will build 5 miles of new track, and rebuild 20 miles of present system. Will increase capacity of power station 2,100 kw. and build 3 car houses, 80x100 ft. and 60x100 ft. The company has bought 15 new cars and will buy G. E. 67 car motors. D. L. Macaffree, superintendent, Colorado Springs. Feb. 5, 1902.

Denver & Northwestern Railway Co. No definite information to give at this time, but contemplates extensions of its system in near future. William G. Smith, general manager, Denver, Col. Feb. 5, 1902.

Denver & Northwestern Ry., of Denver, Col. Grading under way for a 30-mile electric line to connect Denver, Lafayette and Boulder. S. M. Perry, Denver, president. (Bulletin, Jan. 2, 1902.)

#### CONNECTICUT.

Torrington & Winchester Street Railway Co. will build three miles of new track. Charles Alldis, superintendent, Burrville, Conn. Feb. 7, 1902.

Watertown & Litchfield R. R., Litchfield, Conn. Will build 12 miles of new track. T. H. McKenzie, secretary, Southington, Conn. Feb. 6. (Bulletin, Jan. 30, 1902.)

New London Street Railway Co. Will build annex to car house to accommodate 8 cars. Will buy 2 double truck 13-bench cars and G. E. 67 motors for same. L. Bentley, superintendent, New London, Conn. Feb. 6, 1902.

Norwich Street Railway Co. Will rebuild  $2\frac{1}{2}$  miles of present system and enlarge its car house to accommodate 8 additional cars. W. L. Adams, superintendent, Norwich, Conn. Feb. 6, 1902.

#### DISTRICT OF COLUMBIA.

Capital Traction Co., Washington, D. C. Will renew rails for distance of 3 miles. D. S. Carll, chief engineer, Washington. Feb. 5, 1902.

Washington & Annapolis Electric Railway Co. Has 46 miles of street railway under construction to be completed by May 1, 1903. James Christy, general manager, Bond Bldg., Washington. (Bulletin, Feb. 13, 1902.)

#### FLORIDA.

Palatka & Heights Street Railway Co., Palatka, Fla. Will build 16 miles of new track and 19 miles of transmission line. Will purchase some equipment. W. P. Craig, treasurer, East Orange, N. J. Feb. 11, 1902.

An electric railway from Tampa, Fla., around Old Tampa Bay to St. Petersburg is projected by a syndicate of which John P. Martin, of Xenia, O., is at the head. Entire system will aggregate 100 miles. Jewett Car Co. will furnish 40 cars; boilers will be supplied by the Aultman-Taylor company. (Bulletin, Dec. 12, 1901.)

#### GEORGIA.

Augusta Railway & Electric Co. Will rebuild 3 miles of old track; also new car house with capacity for storing 10 cars. Will increase capacity of power station 1,000 kw. W. E. Moore, general superintendent, Augusta, Ga. Feb. 7, 1902.

Augusta & Aiken Railway Co. will build 20 miles of new and rebuild 2 miles of old track; will also build new power house and a car house with capacity for 10 cars. Cars and motor equipment have been bought. Walter M. Jackson, general manager, Augusta, Ga. Feb. 7, 1902.

Macon Consolidated Street Railroad Co., Macon, Ga. Has no construction plans under consideration, and expects to make no purchases. E. E. Winters, general manager, Macon, Ga.

Georgia Railway & Electric Co., Atlanta, Ga. Estimated expenditure for new tracks and equipment, \$500,000. H. M. Atkinson, Atlanta. (Bulletin, Feb. 20, 1902.)

#### HAWAII.

Manoa & Palolo Land Co., Honolulu, H. I. Has increased capital stock from \$40,000 to \$200,000 and will build an electric railway from Kapiolani Park to connect with a route already surveyed in Manoa and Palolo valleys by this company.

#### ILLINOIS.

Aurora, Elgin & Chicago Railway Co., Chicago, Ill. Now in course of construction. F. B. Bicknell, manager. Feb. 12, 1902.

St. Louis, Belleville & Suburban Railway Co., Belleville, Ill. Will build 15 miles of new track and rebuild 5 miles of present system. Will increase capacity of power station 1,500 kw., and purchase 15 new cars and 50 car motors. J. M. Bramlette, general manager, Belleville. Feb. 6, 1902.

Bloomington & Normal Ry. Will build six miles of new track. Will buy six new cars and three double car motors. J. Eddy, manager, Bloomington, Ill. Feb. 13, 1902.

People's Traction Co., Galesburg, Ill. Will build 10 miles of

new track; also new car house 40 x 100 ft. Will build 4 new cars and 16 car motors and equipment. F. W. Latimer, manager, Galesburg, Feb. 12, 1902.

Kankakee Electric Railway Co. Will increase capacity of power station 100 kw. and will buy 2 new cars and 4 car motors. C. H. Cobb, general manager, Kankakee, Ill. Feb. 12, 1902.

Macomb & Western Illinois Railway Co. Will build 95 miles of new track and buy a number of new cars. William A. Compton, president, Macomb, Ill. Feb. 7, 1902. (Bulletin, Nov. 28 and Dec. 19, 1901.)

Interstate Railway, Light & Power Co., Paris, Ill. Is securing franchises preliminary to proceeding with construction work. A. J. Hunter, president. (Bulletin, Feb. 14, 1902.)

Quincy & Southeastern Electric Railway Co. Has received a franchise through Calhoun County, and expects to receive franchises through Brown, Pike, Schuyler and Hancock Counties in 60 days, at which time the work of surveying will be begun. James E. Adams secretary, Quincy, Ill. Feb. 21, 1902.

Rockford Railway, Light & Power Co. Will build 1 mile of new track and rebuild 2 miles of old track; will build new car house with capacity for storing 36 cars. Will buy 8 new cars and 8 motor equipments. F. M. Ellis, general manager, Rockford, Ill. Feb. 14, 1902.

People's Light & Railway Co., Streator, Ill. Will build an 18-mile interurban line and rebuild 3 miles of its present system. Will also build new power station of 3,000 kw. capacity, car house with capacity for storing 18 cars, and new repair shops. Will buy 6 large and 8 small cars, 36 motors, controllers, etc. Six of the new cars are to be equipped with air brakes. J. A. Paul, manager, Streator. Feb. 12, 1902.

Galesburg & Oneida Electric R. R. Proposes 30-mile line with northern terminus at Kewanee, Ill. Rights secured between Galesburg and Oneida, 16 miles. Date of charter, December 1, 1901. Officers H. W. Crane, Oneida, Ill., president; P. F. Brown, Galesburg, Ill., vice-president; F. W. Emery, Knoxville, Ill., secretary, and H. C. Lucas, Galesburg, treasurer. Capital stock issued for preliminary work, \$10,000. Date of information, Jan. 11, 1902.

Local promoters contemplate an electric railway from Litchfield, Ill., to Coffeen, by way of Hillsboro. Franchises secured. Line is estimated to cost \$350,000. Six cars will be operated. O. W. Atterberry, Litchfield. Date of information, Nov. 2, 1901.

Olney, Lancaster & Mt. Carmel Electric Ry., Mt. Carmel, Ill. Will build 42-mile interurban line. Date of charter, June 19, 1901. Capital stock authorized, \$50,000. Officers: A. Knoph, Olney, Ill., president, and Robert Parkinson, Mt. Carmel, secretary. Date of information Nov. 27, 1901.

Rockford & Freeport Electric Railway Co. Has private right of way for proposed line between Rockford and Freeport, and surveys have been made. Construction work to be begun in early spring. T. M. Ellis, superintendent, Rockford, Ill. Date of information, Dec. 23, 1901.

Aurora, De Kalb & Rockford Electric Traction Co. Incorporated to build a line from Aurora to Rockford. W. P. Kopf, Chicago, is interested. (Bulletin, Dec. 12, 1901.)

Aurora, Elgin & Chicago Railway Co. Proceeds of bond issue of \$3,000,000 to be expended for the construction of extensions in Cook County. L. J. Wolf, president, Garfield Bldg., Cleveland, O. (Bulletin, Feb. 20, 1902.)

Illinois Valley Traction Co. of La Salle, Ill. Recently incorporated to build an electric line connecting La Salle, Ottawa, Peru and Spring Valley. W. B. McKinley, Champaign, Ill., is interested. (Bulletin, Jan. 23, 1902.)

Rockford & Freeport Electric Railway Co., of Rockford, Ill. Has completed surveys and is soon to begin construction of an electric line between Rockford and Freeport. T. M. Ellis, superintendent, Rockford, Ill. (Bulletin, Dec. 26, 1901.)

#### INDIANA.

J. S. Crump's Electric Street Railway, Light & Power Co., of Columbus, Ind., has not definitely determined what new construction it will undertake. R. F. Gottschalk, manager, Columbus, Ind. Feb. 8, 1902.

Indianapolis, Greenwood & Franklin Railroad Co., Columbus, Ind. Will build 21 miles of new track; also new power station and new car house. Will buy 8 new cars and 8 car motors. W. G. Irwin, general manager, Columbus. Feb. 8, 1902.

Evansville & Mt. Vernon Traction Co. Will build 16 miles of new track; also power station of sufficient capacity for the operation of its 16-mile road, and car house with capacity for storing 12 cars. Will buy 12 new cars and 8 car motors. A. D. Jones, secretary, Evansville, Ind. Feb. 4, 1902. (Bulletin, Nov. 14, 1901.)

Indianapolis & Western Traction Co. Will build 20 miles of new track. Charles F. Smith, president, Indianapolis. Feb. 7, 1902.

Jeffersonville, New Albany & Sellersburg Rapid Transit Co. Projects 20-mile interurban line. George H. Holzbog, secretary and treasurer, Jeffersonville, Ind. Feb. 4, 1902. (Bulletin, April 4, 1901.)

Lafayette Street Railway Co. Will build 4 miles of new track. C. D. Emmons, superintendent, Lafayette, Ind. Feb. 7, 1902.

Logansport Railway Co. Will build 4¼ miles of new track and increase capacity of power station 650 h. p. Will build new car house with capacity for storing 6 cars, and will buy 4 new cars and 4 car motors. George J. Marott, president, Logansport, Ind. Feb. 9, 1902.

Chicago & Indiana Air Line Railway Co., South Bend, Ind. Will build 70 miles of new track also car house with capacity for storing 30 cars, and power station of 4,000 kw. capacity. Will buy complete equipment. W. O. Orton, South Bend, Feb. 20, 1902. (Bulletin, Jan. 30, 1902.)

Indiana & Ohio Traction Co., Cincinnati, O. Now operating 40 miles of track. Will build 103 miles additional. Capital stock authorized, \$100,000. Officers: George M. Shirk, Brookville, Ind., president; Alfred A. Beard, Mt. Carmel, Ind., vice-president; John C. Shirk, Brookville, secretary and treasurer; Weston Brothers, Chicago, consulting engineers. George M. Shirk, Brookville, Feb. 25, 1902.

Evansville, Mt. Vernon & New Harmony R. R. Projects 35-mile electric line. Company recently organized, with Frank B. Posey, of Evansville, president, and A. D. Jones, of Howell, Ind., secretary. Date of information, Nov. 9, 1901.

Fort Wayne Dayton & Cincinnati Traction Co., of Fort Wayne, Ind. Will soon begin grading on proposed third rail system between cities named in the title. Road when completed will comprise 300 miles of double track. Samuel F. George, Dayton, O., president and general manager. (Bulletin, July 4, Oct. 22, Dec. 12, 1901, and Feb. 6, 1902.)

Fort Wayne & Southwestern Traction Co., of Fort Wayne, Ind. Will complete 46-mile electric line from Fort Wayne to Wabash, 20 miles of which are in operation. S. L. Nelson, Fort Wayne. (Bulletin, Feb. 6, 1902.)

Kokomo Railway & Light Co., of Kokomo, Ind. Recently consolidated with local lines in Logansport, and projects interurban line between the two cities. T. C. Reynolds, manager Kokomo Railway & Light Co. (Bulletin, Feb. 6, 1902.)

Muncie, Hartford City & Fort Wayne Railway Co., of Muncie, Ind. Projects a line to connect Muncie, Eaton, Hartford City, Montpelier and Fort Wayne. Will erect a power house at Eaton at a cost of \$125,000. E. P. Roberts & Co., Cleveland. (Bulletin, Dec. 12, 1901.)

Chicago & Indiana Air Line Railway Co., of South Bend, Ind. Projects an electric line from South Bend via Michigan City to Chicago. W. O. Orton, South Bend, is interested. (Bulletin, Feb. 6, 1902.)

Wabash River Traction Co., of Wabash, Ind. Present system to be extended from Peru to Logansport. Blakeslee & Co., 58 Waverly Place, New Haven, Conn., managers. (Bulletin, Jan. 2, 1902.)

#### IOWA.

Creston Electric Railway, Light, Heat & Power Co. Will build 40 miles to new track, and increase capacity of power station to suit the requirements of the same. Will build car house with capacity for storing the 25 new cars which the company expects to purchase. Lyman Waterman, general manager, Creston, Ia. Feb. 3, 1902.

Davenport & Western Electric Railway Co. Will build 25 miles of new track; also new power station and car house with capacity for storing 100 cars. Will buy 50 new cars. W. E. Snider, secretary, Davenport, Ia. Feb. 14, 1902.

Toledo Electric Railroad Co., Toledo, Ia. Will build 76 miles of new track, and buy cars and car motors. W. C. Walters, general manager, Toledo, Feb. 20, 1902. (Bulletin, Jan. 2, 1902.)

Ottumwa Traction & Light Co. Has ordered material for build-

ing 4 miles of new track and for rebuilding part of present system. Expects to buy 4 or 6 new cars and equipment for same; to build a new car house and increase capacity of power station. J. F. Springfield, general manager, Ottumwa, Ia. Feb. 7, 1902.

Oskaloosa & Tama Railroad Co. Expects to begin work June 1st on proposed 100-mile electric railway system. The company was organized in November with the following officers: Dr. S. W. Clark, Oskaloosa, president; Hon. E. G. Penrose, Tama, vice-president; U. C. Blake, Cedar Rapids, secretary, and John Hall, Montezuma, treasurer.

Waterloo & Cedar Falls Rapid Transit Co. Now operating 40 miles or urban and interurban street railways. Projects 35 miles of new track. The company has an authorized funded debt of \$700,000, of which \$350,000 has been issued. L. S. Cass, president, Waterloo, Ia. Nov. 23, 1901.

Charles City, Cresco and Eldora, Ia., will be connected by a proposed electric line, 58 miles in length, in which D. A. Lyons, of Cresco, is principally interested. Construction work will be begun in the spring. (Bulletin, Dec. 12, 1901.)

Davenport & Western Electric Railway Co., Davenport, Ia. Recently incorporated to build a 78-mile interurban line. Work to be begun at once. Robert Kercheval, president and general manager, Davenport. (Bulletin, Feb. 13, 1902.)

#### KANSAS.

Atchison Railway, Light & Power Co. Will increase capacity of power station 200 kw. and install 500-h. p. boilers. C. M. Marshall, general superintendent, Atchison, Kan. Feb. 6, 1902.

Fort Scott Consolidated Supply Co. Will build 1 mile of new track and rebuild 6 miles of present system. Will buy 4 new cars. E. T. Selig, superintendent, Fort Scott, Kan. Feb. 7, 1902.

Iola Electric Railroad Co. will increase capacity of power station 300 or 400 h. p. Expects to buy new cars. F. W. Crouch, president and general manager, Iola, Kan. Feb. 8, 1902.

Wichita Railroad & Light Co. will build new car house with capacity for storing 20 cars. Will buy 6 new cars. M. Morrison, superintendent, Wichita, Kan. Feb. 7, 1902.

Mineral Cities Electric Railway Co., of Pittsburg, Kan. Recently incorporated to build an interurban line between Joplin, Iola, Chanute, Pittsburg, Columbus and Fort Scott. Frank M. Moon, of North Orville, Pa., is principally interested. (Bulletin, Feb. 13, 1902.)

Topeka Railway Co., of Topeka, Kan. Entire system will be relaid with new rails, and other improvements effected. J. M. Patten, general manager, Topeka. (Bulletin, Jan. 2, 1902.)

#### KENTUCKY.

Blue Grass Consolidated Traction Co. Will build more than 100 miles of new track and erect new power houses. M. C. Alford, manager, Lexington, Ky. Feb. 17, 1902. (Bulletin, Dec. 12, 1901, and Jan. 16, 1902.)

Georgetown & Lexington Traction Co., of Lexington, Ky. Proposes to complete at once an electric line between the cities named in the title. Will purchase or erect a power house and car house. H. P. Montgomery, of Georgetown, is interested. (Bulletin, Dec. 4, 1901.)

#### LOUISIANA.

St. Charles Street Railroad Co., of New Orleans. Has issued bonds to the amount of \$300,000, and will expend the proceeds for improvements of the street railway system. Albert G. Phelps, president and superintendent, New Orleans. (Bulletin, Feb. 13, 1902.)

#### MAINE.

Penobscot Central Ry., Bangor, Me. Will build 9 miles of new track; also new car house with capacity for storing 10 cars. Will buy several new cars and car motors. F. A. Beal, president, Bangor, Me. Feb. 8, 1902.

Berwick & South Berwick Electric Ry. To be practically an extension of the Berwick, Eliot & York. Work not to be begun within a year. John P. Hill, Augusta, Me. Nov. 23, 1901.

Augusta, Hallowell & Gardiner Railroad Co. Will enlarge its power house at Hallowell and install additional equipment. G. E. Macomber, manager, Augusta, Me. (Bulletin, Jan. 9, 1902.)

#### MARYLAND.

Hagerstown & Boonsboro Railway Co. Has completed 5 miles of new track and will build 5 miles more. Will increase capacity

of power station 200 kw. The company is building 12 freight and passenger cars, and will buy two 2-motor equipments and one 4-motor equipment. W. C. Hepperle, secretary and superintendent, Hagerstown, Md. Feb. 6, 1902.

United Railways & Electric Co., of Baltimore. Contemplates building several miles of double track. W. A. House, general manager, Baltimore. (Bulletin, Jan. 30, 1902.)

Maryland Electric Railway Co. Has petitioned for franchises in Baltimore, projecting a 50-mile interurban between that city and Sparrows Point, St. Denis and Catonsville. R. S. Carswell, president. (Bulletin, Feb. 13, 1902.)

Frederick & Jefferson Electric Railway, Light & Power Co., of Frederick, Md. Has applied for incorporation, to build an electric line through Frederick County. Milton G. Rice is interested. (Bulletin, Feb. 13, 1902.)

Hagerstown, Smithburg & Pen-Mar Railroad Co. Has applied for charter for an electric line from Hagerstown to Rouzerville, Pa. James E. Hewes, engineer in charge of construction, may be addressed at Hagerstown. (Bulletin, Feb. 6, 1902.)

#### MASSACHUSETTS.

Martha's Vineyard Street Railway Co., Vineyard Haven, Mass. Will build a short extension of present system. John A. Duggan, 89 State St., Boston, Mass., manager.

Greenfield & Deerfield Street Railway Co. Will build 7 miles of new track; also new car house with capacity for storing 10 cars, and will buy 10 new cars. D. P. Abercrombie, Greenfield, Mass. Feb. 7, 1902.

Westborough & Hopkinton Street Railway Co. Will build 3½ miles of new track. G. L. Hemenway, Hopkinton, Mass. Feb. 7, 1902.

Concord, Maynard & Hudson Street Railway Co. Will build 20 to 25 miles of new track; also a car house with capacity for storing 20 cars. Will increase capacity of power station 400 to 600 kw., and buy 10 open and 7 closed cars and 4 motor equipments for same. John W. Ogden, superintendent, Maynard, Mass. Feb. 7, 1902.

Middleboro, Wareham & Buzzards Bay Street Railway Co. Will extend road from Onset Bay to Falmouth, 11 miles. The company has purchased new cars and equipment. Charles H. Cox, superintendent, Middleboro, Mass. Feb. 12, 1902.

Boston & Worcester Street Railway Co. Has 45 miles of new track under construction, to be completed in 1902. Thirty-two 4-motor equipments will be purchased by the General Electric Co. which will also furnish the generators. Two Rice & Sargent engines of 1,000-h. p. and 1,500-h. p. respectively will be installed. Three boilers of 500-h. p. each will be furnished by Thayer & Co. One power house 2 sub stations and 2 car houses under construction. Officers: W. M. Butler, Boston, president; H. Fisher Eldredge, Portsmouth, N. H., vice-president, and George A. Butman, Boston, secretary and treasurer. General contractors, Jas. F. Shaw & Co., Boston; consulting engineer, E. H. Kitfield, Boston. Date of company's charter, November, 1901. Capital stock authorized, and funded debt to be authorized, \$750,000. Date of information, Dec. 11, 1901.

Chicopee Falls & Ludlow Street Railway Co. Recently organized to build a line from Chicopee Falls to Ludlow. T. C. Page, of Chicopee Falls, is interested. (Bulletin, Feb. 6, 1902.)

North Attleboro & Cumberland Electric Street Railway Co. Has secured franchises for a line between the cities named in the title and Woonsocket, R. I. Theron T. Smith, of North Attleboro, is interested. (Bulletin, Feb. 6, 1902.)

#### MICHIGAN.

Detroit, Howell & Lansing Ry., Detroit, Mich. Will build 82 miles of new track; also power house and car house, 24 new cars and equipment for cars. A. L. Parker, second vice-president, Detroit. Feb. 6, 1902.

Escanaba Electric Street Railway Co. Will build 1 mile of new track; also addition to car house to accommodate 4 cars. Will buy 2 new 38-ft. cars and 4 car motors. A. R. Moore, manager, Escanaba, Mich. Feb. 7, 1902.

Grand Rapids Railway Co. projects no construction work this season beyond ordinary repairs. G. S. Johnson, general manager, Grand Rapids, Mich. Feb. 7, 1902.

Lansing, St. Johns & St. Louis Railway Co. Will build new track between St. Johns and St. Louis, 35 miles, and erect new

power station at Lansing. Will buy several new cars. F. H. Dodge, secretary, Lansing, Mich. Feb. 10, 1902.

Ludington & Northern Railway Co. Will build 1 mile of new track. Frank P. Dunwell, Ludington, Mich. Feb. 7, 1902.

Menominee (Mich.) Electric Light, Railway & Power Co.; Menominee River Gas Co., and Marinette (Wis.) Gas, Electric Light & Street Railway Co. Will build 2½ miles of new track; will buy 5 new cars and 10 car motors. Contemplate increasing capacity of power house. Edward Daniell, general superintendent. Feb. 7, 1902.

Saginaw Valley Traction Co. Will build 1 mile double track and rebuild part of present system. Will buy 2 new cars. P. P. Crafts, general manager, Saginaw, Mich. Feb. 7, 1902.

Trans-St. Mary's Traction Co., Sault Ste. Marie, Mich. Plans for new construction not yet complete. Trans-St. Mary's Traction Co., per secretary, Sault Ste. Marie, Mich. Feb. 8, 1902. (Bulletin, Oct. 31, 1901.)

Grand Rapids, Kalamazoo & South Haven Traction Co. Construction just begun on 110 miles of new road, to be completed by Sept., 1902. Date of company's charter, Aug. 27, 1901. Officers: John J. Patterson, president; W. H. Patterson, vice-president and general manager; F. H. Williams, secretary; J. G. Zook, treasurer; M. Van Harlinger, chief engineer. General offices, Grand Rapids, Mich.

Southern Michigan Traction Co. Date of charter, July, 1901. Organized with nominal capital stock of \$50,000 to procure rights of way, franchises and contracts. Company owns private rights from Grand Rapids to Kalamazoo and has been granted franchises in towns on route. Will build 44 miles of interurban railways and 4 miles of city lines. Expect to open for traffic in September, 1902. George T. Bishop, president; Frank H. Ginn, secretary and treasurer; E. P. Roberts & Co., Cleveland, consulting engineers. Date of information, Nov. 30, 1901.

Michigan West Shore Traction Co., of South Haven, Mich. Line under construction from South Haven to Benton Harbor and St. Joseph. To be running by July 1st. S. B. Downer, engineer, South Haven, Jan. 1, 1902.

Bay City, Harbor Beach and Lake Huron will be connected by a projected electric line for which stock to the amount of \$50,000 has been subscribed. Rights secured and surveys under way. F. A. Little, Cleveland, is interested. (Bulletin, Feb. 20, 1902.)

Michigan Traction Co., of Kalamazoo. Has awarded contracts for the equipment of the 32-mile line now under construction between Battle Creek and Kalamazoo. One power house, 6 substations and 2 car houses will be erected. D. A. Hegarty, purchasing agent, may be addressed in care of the Railways-Company General, Philadelphia. (Bulletin, Jan. 2, 1902.)

Saginaw Suburban Railway Co., of Saginaw, Mich. Grading under way for electric line between Saginaw and Flint. Proposed equipment to include 12 passengers and 30 freight cars. George Silsby, Saginaw, president. (Bulletin, Feb. 6, 1902.)

Minnesota & Iowa Electric Railway Co., of Preston, Minn. Recently incorporated to build a line from Decorah, Ia., to St. Paul, by way of Preston. H. R. Wells, of Preston, is president. (Bulletin, Jan. 16, 1902.)

#### MISSISSIPPI.

Vicksburg Railroad, Power & Manufacturing Co. Will increase capacity of power station 500 kw. and build new car house with capacity for storing 20 cars. Will buy ten 35-h. p. car motors. James George, general manager, Vicksburg, Miss. Feb. 14, 1902.

St. Louis, Kirkwood & Manchester Railroad Co. will build 13 miles of double track, and erect new power station. Will buy new equipment. D. C. Taylor, president, Manchester, Mo. Feb. 7, 1902.

Kansas City & Olathe Electric Railway Co., of Kansas City, Mo. Projects 18-mile interurban line. Will erect 2 power houses. F. C. Goodwin, president, Kansas City, Nov. 27, 1901.

#### MONTANA.

Helena Power & Light Co. expects to buy 2 second-hand double truck open motor cars. W. L. Walker, receiver, Helena, Mont. Feb. 6, 1902.

Citizens' Electric Co. of Billings, Mont. Recently incorporated to build local electric street railway. Christian Yegen, of Billings, may be addressed. (Bulletin, Feb. 20, 1902.)

#### NEBRASKA.

Nebraska City Street Railway Co. Will soon convert horse car line into electric system. A. M. Munn, engineer in charge, Nebraska City, Neb. Feb. 7, 1902.

Nebraska City Street Railway Co. Will convert its 3¼-mile horse car line into an electric system. H. H. Bartling, Nebraska City, Neb. (Bulletin, Jan. 16, 1902.)

#### NEW HAMPSHIRE.

Laconia Street Railway, Laconia, N. H. Expects to extend lines to Franklin and Penacook. Will relay local lines to standard gage. L. S. Pierce, superintendent, Laconia, Feb. 7, 1902.

Manchester Street Ry. Co., Manchester, N. H. Has petitioned for authority to increase its capital stock, proposing to use proceeds to extend its system. J. B. Smith, manager, Manchester. (Bulletin, Feb. 13, 1902.)

#### NEW JERSEY.

Camden & Suburban Railway Co. Will build 8 miles of new track and rebuild 3 miles of present system. Will increase capacity of power station 800 kw. and buy 10 new cars. W. E. Harrington, manager, Camden, N. J. Feb. 9, 1902.

Columbia Traction Co., Carlstadt, N. J. Will build 8 miles of new track; also a new power house and a car house with a capacity for storing 10 cars. The company expects to buy 8 new cars. E. F. Foote, president, Carlstadt. Feb. 10, 1902.

Delaware River & Atlantic Railroad Co., Atlantic City, N. J. Will soon begin grading 40 miles of road between Atlantic City and Camden. Site for terminal station and power house purchased. James B. Reilly, Atlantic City. (Bulletin Feb. 20, 1902.)

Elizabeth, Perth Amboy, Newark and Rahway will be connected by projected electric line which Governor F. M. Voorhees, Senator John Keane and Frank Bergen, all of Elizabeth, are promoting. Plans include a bridge across the Raritan River, estimated to cost \$150,000. (Bulletin, Jan. 2, 1902.)

Burlington County Traction Co., of Mt. Holy, N. J. Recently incorporated to build an electric line from Mt. Holly to Moorestown. Edward B. Jones, of Mt. Holly, is interested. (Bulletin, Feb. 13, 1902.)

New Jersey & Pennsylvania Traction Co. Recently incorporated to build an electric line in Trenton. J. J. Coleman, of Trenton, and Charles M. Bates, of Allentown, Pa., are interested. (Bulletin, Dec. 4, 1902.)

Las Vegas Electric Railway & Power Co. Has purchased site for new power house. Will build 40 miles of new track. George W. Baumhoff, Las Vegas, N. M. (Bulletin, Feb. 13, 1902.)

#### NEW YORK.

Buffalo, Attica & Arcade Railroad Co., Arcade, N. Y. Operates a steam road but has under construction a branch to be operated by electricity from Java Center to Buffalo. Electric line will also be extended 7 miles south of Arcade. Contemplates eventually installing electric traction over entire system, 65 miles. S. S. Bullis, president, Arcade, N. Y. Dec. 4, 1901.

Binghamton Railway Co. Will build 6 miles of new track; also new car house with capacity for storing 30 cars. The company has bought 4 new cars. J. P. E. Clark, manager, Binghamton, N. Y. Dec. 4, 1901.)

Buffalo, Springville & Cattaraugus Railway Co., Cattaraugus, N. Y. Will build 38 miles of new track; also a power house of 700-kw. capacity, and car house with capacity for storing 12 cars. The company will buy 6 passenger and 10 freight cars, 2 motor locomotives, and passenger car motors. U. L. Upson, Cattaraugus, N. Y. Feb. 8, 1902. (Bulletin, Nov. 21, 1901.)

Elmira & Waverly Railway Co., Elmira, N. Y. Will build 18 miles of new track, a power station of 500 kw. capacity, and a car house with a capacity for storing 15 cars. The company will buy 10 new cars and 8 car motors. H. B. Rhymer. Feb. 10, 1902. (Bulletin, Nov. 7, 1901.)

Jamestown Street Railway Co. Will rebuild 2½ miles of old track and increase capacity of power station 500 kw. Will buy 2½ miles 6-in., 60-lb. T rail and a 30-ft. baggage car on single truck. G. E. Malthy, manager, Jamestown, N. Y. Feb. 12, 1902.

Orange County Traction Co. Has recently bought 4 passenger and 1 freight cars. W. H. Pouch, purchasing agent, Newburgh, N. Y. Feb. 15, 1902.

Newark & Marion Railway Co., Newark, N. Y. Line under construction. Inquiries may be addressed to Syracuse Railway Construction Co., Syracuse, N. Y. F. D. Burgess, secretary, Newark, N. Y. Feb. 12, 1902. (Bulletin, Dec. 26, 1901.)

Mountain Lake Electric Railroad Co., Gloversville, N. Y. Will build 1½ miles of new track with extra turnouts, and increase capacity of power station 150 kw. Will buy 2 new cars. H. W. Shaw, president, 115 Broadway, New York City. Feb. 17, 1902.

Perry, Castile, Silver Springs & Pike Electric Railroad Co. No arrangements for building as yet. J. M. Duncas, Silver Springs, N. Y. Feb. 6, 1902.

Syracuse Rapid Transit Railway Co. Will build 3½ miles of new track. E. G. Connette, general manager, Syracuse, N. Y. Feb. 12, 1902.

Watertown & Carthage Traction Co., Watertown, N. Y. Will build 18 miles of new track. Mason M. Swan, Watertown, Feb. 6, 1902. (Bulletin, June 13, 1901.)

Whitehall & Granville Railroad Co., of Whitehall, N. Y. Sixty miles of new track projected, 22 miles of which is now under construction. Contracts to be awarded for power house equipment. C. B. Story, general manager, Whitehall, N. Y. Dec. 17, 1901.

Albion Electric Railway Co., Albion, N. Y. Recently incorporated to build local street railway system. George B. Church, Albion, may be addressed. (Bulletin, Jan. 16, 1902.)

Alexander Bay & Redwood Railway Co. Has line under construction between the cities named in the title. Construction contract has been awarded to W. F. Pascoe, of Easton, Pa. Jacob Amos, of Syracuse, is interested. (Bulletin, Feb. 6, 1902.)

Balston Terminal Railroad Co., Balston Spa, N. Y. Will build extensions to Amsterdam and Gloversville. J. H. Norris, superintendent, Balston Spa, N. Y. (Bulletin, Feb. 6, 1902.)

Binghamton Railroad Co. Will use proceeds of bond issue to the amount of \$1,500,000 to extend and improve system. Lines to be built to Vestal and Owego, N. Y., and Hallstead and Great Bend, Pa. J. P. E. Clark, Binghamton, N. Y. (Bulletin, Jan. 9, 1902.)

Beacon Mountain Railway Co., of Fishkill, N. Y. Projects a 5-mile line to summit of North Beacon mountain. Charles F. Mairs, of New York City, is interested. (Bulletin, Feb. 13, 1902.)

Newark & Marion Railway Co., of Newark, N. Y. Has secured funds for an extension of its lines to Williamson. F. D. Burgess, secretary, Newark. (Bulletin, Dec. 26, 1901.)

Rochester & Eastern Electric Ry., of Rochester, N. Y. Has applied for authority to proceed at once with the construction of its proposed line between Rochester and Syracuse. John Winter, Detroit, Mich. is interested. (Bulletin, Jan. 23, 1902.)

Troy Terminal Railway Co., Troy, N. Y. Recently incorporated to build a local line. Edward F. Murray, of Troy, is interested. (Bulletin, Feb. 13, 1902.)

Erie R R Contemplates converting its steam road between Dunkirk and Salamanca, N. Y., into an electric system. Plans call for a large power house at Salamanca. E. B. Sheffer, purchasing agent Erie R R., New York City. (Bulletin, Dec. 26, 1901.)

#### NORTH CAROLINA.

Durham Traction Co., of Durham, N. C. Ten miles of track under construction. Power house and car house in course of erection. Eight closed and 8 open cars will be operated. H. T. Brown, manager, Durham. Nov. 15, 1901.

#### OHIO.

Pennsylvania & Ohio Railway Co., Ashtabula, O. Will build 10 miles of new track; also a new car house with capacity for storing 6 cars. The company will buy 4 new cars and 4 car motors. Feb. 7, 1902.

Lake Erie, Bowling Green & Napoleon Railway Co., Bowling Green, O. Will build 11 miles of new track this year; also new car house with capacity for storing 8 cars. The capacity of the power station will be increased 800 kw.; 2 new cars will be purchased and 6 car motors. L. Black, president, Bowling Green. Feb. 5, 1902.

Cleveland City Railway Co., Cleveland, O. Will buy 35 new cars. Feb. 8, 1902.

Cincinnati, Georgetown & Portsmouth Railroad Co. Will build 60 miles of new track and rebuild 45 miles of present system. Will increase capacity of power station 1,200 kw and build new car house with capacity for storing 15 cars. Will buy 10 new cars

and 15 car motors. A. W. Comstock, president, Cincinnati, O., Feb. 14, 1902. (Plan to convert this steam road into an electric system noted in Bulletin Nov. 21, 1901.)

Urbana, Mechanicsburg & Columbus Electric Railway Co., Columbus, O. Will build 50 miles of new track; also a power house of 1,500 kw. capacity and a new car house with a capacity for storing 10 cars. The company will buy a full equipment of rolling stock. H. A. Axline, president, Columbus, O. Feb. 3, 1902. (Bulletin, June 28 and Nov. 22, 1901.)

Columbus, New Albany & Johnstown Traction Co., Columbus, O. Now operating 9 miles of track and will build 15 miles additional. Will build car house with capacity for storing 8 cars, and will buy 4 new cars. Daniel J. Ryan, president, Columbus, O. Feb. 6, 1902.

Dayton & Northern Traction Co. Will build 46 miles of new track; also new car house with capacity for storing 10 cars. Will buy 10 new cars and 40 car motors. J. E. Feight, secretary, Dayton, O. Feb. 11, 1902.

People's Railway Co., Dayton, O. Will build 8 miles of new track, and rebuild 3 miles of present system. H. S. Johnson, manager, Dayton. Feb. 11, 1902.

J. E. Lowes, Dayton, O. Will build 46 miles of new track, and erect power house, car houses, etc. J. E. Lowes, Dayton. Feb. 17, 1902.

Dayton & Xenia Transit Co. Contemplates extensions of its lines this summer, but details are undecided as yet. A. W. Anderson, superintendent, Dayton, O. Feb. 13, 1902.

United Electric Co., Dennison, O. Will build 1½ miles of new track; will buy 1 new car and motor equipment. O. B. Welch, manager, Dennison. Feb. 12, 1902.

Sandusky, Clyde, Tiffin & Southern Railway Co. Will build 28 miles of new track, a large power house, and a car house with capacity for storing 10 cars. The company will buy 10 new cars and equipment for same. J. C. Parker, president, Sandusky, O. Feb. 13, 1902. (Bulletin Nov. 28, 1901.)

Tiffin & Southern Railway Co. Will build about 46 miles of new track and rebuild entire present system. Will build new power station at Upper Sandusky, and car house with capacity for storing 8 or 10 cars. Will buy 10 or 12 new cars, and complete equipment of new car motors. Allen Smalley, Tiffin, O. Feb. 13, 1902.

Toledo & Indiana Railway Co., Toledo, O. Will build 30 miles of new track during 1902. Power station capacity will be increased, though to what extent is not yet determined. Company undecided as to purchases of rolling stock and equipment to be made. Charles P. Griffin, president, Toledo. Feb. 11, 1902.

Toledo, Columbus, Springfield & Cincinnati Railway Co., Toledo, O. Will build 250 miles of new track. Ellis Bartholomew, president, Toledo, O. Feb. 11, 1902. (Bulletin Aug. 22, and Sept. 19, 1901.)

New Castle & Lowell Railway Co. Projects 10½-mile interurban line between New Castle, Pa., and Lowell, O. Ten closed Brill cars will be operated. Power house at Edenburg, Pa. Three 280-h. p. Westinghouse engines; two 325-h. p. B. & W. boilers, and three 250-kw. G. E. generators. A. A. Anderson, general manager, Youngstown, O. Nov. 28, 1901.

Dayton & Kenton Railway Co., Dayton, O. Proposes to complete its 121-mile interurban line in 1903. B. H. Rannels, Dayton, general managers. (Bulletin, Feb. 13, 1902.)

Dayton & Xenia Traction Co., of Dayton, O. Contemplates extending its line 28 miles. M. J. Murphy, Dayton. (Bulletin, Feb. 6, 1902.)

Michigan & Ohio Belt Line Railway Co., of Defiance, O. Will expend the proceeds of bond issue of \$50,000 for construction of line which will eventually connect Hillsdale, Mich., and Defiance and Fostoria, O. J. W. Boynton, Defiance, president. (Bulletin, Feb. 6, 1902.)

Bucyrus, Upper Sandusky & Lima Railway Co., of Lima, O. Recently incorporated to build an electric line between the cities named in the title. Charles L. Schaber, of Lima, is interested. (Bulletin, Feb. 6, 1902.)

#### OKLAHOMA.

Oklahoma City & Canadian Railroad Co., of Oklahoma City, Okla. Recently incorporated to build a 5-mile local electric line, and a 27-mile interurban. Construction work to be begun this

spring. Guy E. Blackwelder, Oklahoma City, is interested. (Bulletin, Dec. 10, 1901.)

## OREGON.

Ashland Electric Railway Co., Ashland, Ore. Will build 5 miles of new track; also new car house with capacity for storing 5 cars. Will increase capacity of power station 50 h. p. and purchase 5 new cars and 5 car motors. M. L. Hawley & Co. Feb. 20, 1902.

Astoria Electric Co. Will build 1½ miles of new track, and rebuild 1 mile of old track. Will increase capacity of power station 200 kw. and build new car house with capacity for storing 12 cars. C. A. Coolidge, Astoria, Ore. Feb. 7, 1902.

## PENNSYLVANIA.

Berwick & Nanticoke Street Railway Co., Bloomsburg, Pa. Contemplates building 20 miles of new track. Not certain how soon work may be begun. C. W. Miller, president, Bloomsburg. Feb. 10, 1902.

Bloomsburg & Millville Street Railway Co. Expects to build and equip 10 miles of new street railways during the coming season. C. W. Miller, president, Bloomsburg, Pa. Feb. 10, 1902.

Harrisburg & Mechanicsburg Electric Railway Co. Will build 5 miles of new track. G. H. Bartle, superintendent, Harrisburg, Pa. Feb. 17, 1902.

Kutztown & Fleetwood Street Railway Co., Allentown, Pa. Will build 13 miles of new track also car house with capacity for storing 30 cars, and will increase power station capacity 400 kw. Will buy 10 new cars and 8 car motors. J. S. Ruth, superintendent, Allentown.

Latrobe Street Railway Co. Will build 5 miles of new track and rebuild, present system to be all new. Will buy 2 new cars and 4 car motors. J. B. Anderson, president, Latrobe, Pa. Feb. 13, 1902.

Lewistown & Reedsville Electric Railway Co. Will build 1 mile of new track, and install one 250-h. p. B. & W. boiler at power station. Will buy 1 or more Brill semi-convertible double truck cars fully equipped. W. G. Barlow, manager, Lewistown, Pa. Feb. 12, 1902.

Meyersdale & Salisbury Street Railway Co. Will build 9 miles of new track, erect new power station and car house and install new equipment. A. O. Lorentz, manager, Meyersdale, Pa. Feb. 12, 1902.

Wilkesbarre & Wyoming Valley Traction Co. Will build 3 miles of new track. F. L. Fuller, general manager, Wilkesbarre, Pa. Feb. 14, 1902.

Fairmount Park Transportation Co., Philadelphia, Pa. Will build annex to car house with capacity for storing 10 cars. Will buy ten 45-ft. Brill cars. A. E. Meixell, superintendent, Philadelphia. Feb. 26, 1902.

Lehigh Valley Traction Co., Allentown, Pa. Will erect power house of 4,000-h. p. capacity at Sellersburg. S. Harris, general manager, Allentown. (Bulletin Jan. 23, 1902.)

Elizabeth & Monongahela Street Railway Co. Has been granted a charter to build a 7-mile line in Pennsylvania. Charles F. Moore, McKeesport, is interested. (Bulletin, Feb. 6, 1902.)

Kittanning & Cowanshannock Valley Street Railway Co., of Kittanning, Pa. Recently organized to build a 14-mile electric line which is to be in operation within a year. George S. Caruthers, 421 Standard Bldg., Pittsburg. (Bulletin, Feb. 6, 1902.)

Meyersdale & Salisbury Street Railway Co. Will proceed at once with construction of proposed road between cities named in the title. A. O. Lorentz, general manager, Meyersdale, Pa. (Bulletin, Jan. 23, 1902.)

Youngstown-Sharon Railway & Light Co., of Sharon, Pa. Will expend part of proceeds of bond issue of \$1,000,000 for improvements of system. L. Calkins, 30 Broad St., New York City. (Bulletin, Feb. 6, 1902.)

## RHODE ISLAND.

Union Railroad and Rhode Island Suburban Railway Cos. Will build 10 miles of new track, and rebuild 5 miles of present system. Will buy 40 new cars. A. T. Potter, general manager, Providence, R. I. Feb. 10, 1902.

## SOUTH DAKOTA.

Sioux Falls Suburban Traction Railway Co. Will build an interurban electric line from Sioux Falls to Madison. J. E. Colton, manager, Sioux Falls, S. D. Date of information, Nov. 27, 1901.

Dakota Electric Railway Co., of Woonsocket, S. D. Recently

incorporated to build a 16-mile line. D. R. Brewster, of Woonsocket, may be addressed. (Bulletin, Feb. 13, 1902.)

## TENNESSEE.

North Side Consolidated Street Railway Co., Chattanooga, Tenn. Will rebuild 4 miles of old track and increase capacity of power station 600 kw. N. H. Brown, general manager, Chattanooga, Feb. 8, 1902.

Rapid Transit Company of Chattanooga. Will build 3 miles of new track and rebuild 5 miles of present system. Will increase capacity of power station 600 kw and buy 4 new cars. N. H. Brown, general manager, Chattanooga. Feb. 8, 1902.

Nashville & Gallatin Electric Railway Co., of Nashville, Tenn. Application for charter has been filed. Electric line projected to connect Nashville, Gallatin and Mt. Pleasant. J. H. Conners, Wilcox Bldg., Nashville, represents the promoters. (Bulletin, Feb. 13, 1902.)

## VERMONT.

Granville & Poultney Railroad Co., Poultney, Vt. Will build 10 miles of new track for which preliminary surveys have been completed. Will also build power house of 500-kw. capacity. C. B. Story, vice-president, Poultney, Feb. 11, 1902.

## VIRGINIA.

Berkley Street Railway Co. Has completed 3½ miles of double track, and bought 8 new cars. Projects no new construction. H. C. Tunis, manager, Berkley, Va. Feb. 10, 1902.

Charlottesville City & Suburban Railway Co. Will extend lines less than a mile; also, increase capacity power station 150 kw. Expects to buy more new cars or car motors. R. P. Valentine, president and manager, Charlottesville. Feb. 8, 1902.

Lynchburg (Va.) Traction & Light Co. has just completed 3½ miles of new track and proposes to install a 550-kw. lighting generator. The company has bought 6 new Brill convertible cars, and 6 G. E. 67 double motor equipments, and will buy 6 Peckham 8 A extra strong trucks. R. D. Apperson, president and manager, Lynchburg. Feb. 8, 1902.

Hampton Roads Railway & Electric Co., of Newport News, Va. Has 32 miles of track under construction. Capital stock authorized, \$500,000. W. J. Nelms, president, Newport News, Va. Nov. 30, 1901.

## WASHINGTON.

Seattle Electric Co. Will build 10 miles of new track and rebuild 4 miles of present system; also new car house with capacity for storing 40 cars. Will increase capacity of power station, and buy 48 new cars and 130 car motors. G. W. Dickinson, general manager, Seattle, Wash. Feb. 10, 1902.

Citizens' Electric Railway Co., Moundsville, W. Va. Will build about 4½ miles of new track; also new power house, new rolling stock and equipment. J. A. Ewing, Moundsville. Feb. 17, 1902.

## WEST VIRGINIA.

Moundsville, Benwood & Wheeling Railway Co. Will rebuild 3 miles of old track. C. E. Flynn, general manager, Wheeling, W. Va. Feb. 7, 1902.

Wheeling Traction Co. Will increase capacity of power station 1,200 kw., and is building car house with capacity for storing 125 cars. Will buy ten 10-bench open cars and 20 motors of 35-h. p. C. E. Flynn, Wheeling, W. Va. Feb. 7, 1902.

Sheboygan Light, Power & Railway Co. Will build about 10 miles of new track, and increase capacity of power station from 300 to 350 kw. Expects to buy 3 double truck cars. H. J. Pagel, jr., general superintendent, Sheboygan, Wis. Feb. 7, 1902.

## WISCONSIN.

Fond du Lac & Oshkosh Electric Railway Co. Contract for the construction of proposed line between cities named in the title awarded to the Columbia Construction Co., of Milwaukee. Line will be 12½ miles long including feeders, and 2 power houses will be built. Rails have been ordered. Date of information, Dec. 2, 1901.

The Sunbury (Pa.) & Northumberland Electric Railway Co. has not yet decided upon the equipment to be purchased for its proposed interurban line. W. L. Keplinger, of Sunbury, is general superintendent of the company.

# MECHANICAL DEPARTMENT

## MONOGRAMS.

BY LOUIS GRATON.

The monogram here presented stands for Ithaca Street Ry. but any combination of letters may occupy the center of the scroll. The cars of this company are painted a rich red (Willeg's Agostein red.

Fig. 1 is the chuck or body casting which is threaded at A to fit the spindle of the lathe on which it is mounted. Its internal diameter is made of sufficient size to contain the largest bushings to be handled. Fig. 2 shows an end view and explains the uses of the clamping screws which draw the two sides of the chuck, divided by a longitudinal slot, together, thus clamping the shell or bearing securely inside. Fig. 3 is an end view of a sleeve or bushing which

dark shade) and in the scroll and monogram herewith reproduced gold is used for the letters and silver for the scroll, all being outlined in black. This produces an excellent effect and, in fact, gold and silver ornaments make a good appearance on almost any background. In monogramic combinations of letters the important or principal letter should occupy the central position, the other letters intertwining with it in their original order, that is, from left to right. A good arrangement may be effected by placing the secondary letters from top to bottom, especially if the implied wording contains letters that would not permit of proper balancing, as for example, P and B or B and R or D. In case a given letter must be repeated it is allowable to reverse it in one case, making it read backwards for the symmetry of the combination. Where the abbreviation of company, "Co." is desired, it is best to give this third place in importance. While its position should be central, it need not have great prominence. In the twining of letters conformity to the rule of alternating over and under should be kept in view, although this cannot always be carried out. The panel scroll shown herewith comprises two designs, either of which will harmonize with the central scroll and with the monogram.

is cut through on one side to be used for small sized bearings. The length of the chuck as well as that of the bushing, Fig. 3, is made to suit the type of bearing used. Fig. 4 shows the end of the lathe spindle with bushing B inserted in place in the lathe spindle for

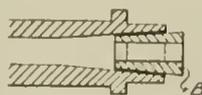

FIG. 4.

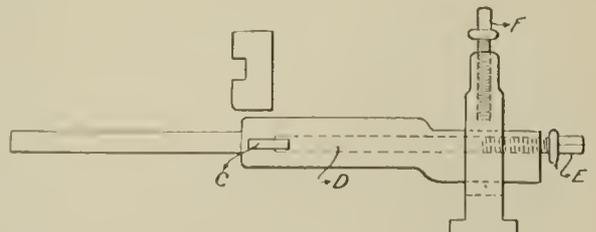

FIG. 5.

FIG. 6.

supporting the end of the boring bar shown in Fig. 6. One end of the bar is reduced to fit the bushing B, and the other end is supported in the tool post and is fed by the regular tool carriage feed.

FIG. 7.

Fig. 5 is a double end cutter which is fitted into the slot C of the boring bar, Fig. 6, and is held in place by the rod in hole D, which is forced against the cutter by the screw E which, for convenience, should be a duplicate of the tool post screw F. Fig. 7 is a mandrel for finishing the outside of the bearing shells before boring.

## DEVICE FOR BORING MOTOR BEARINGS.

We have received through the courtesy of Mr. W. W. Annable, master mechanic of the Grand Rapids Railroad Co., the following

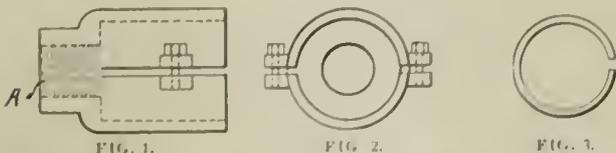

FIG. 1.

FIG. 2.

FIG. 3.

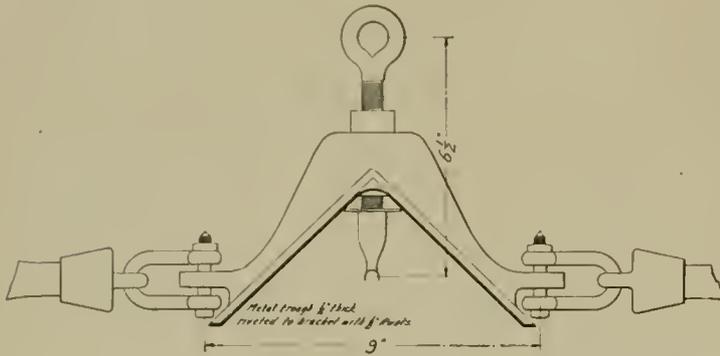

description of a device used in the shops of that company for the production and boring of motor bearings. The use of this device we are informed has proved very satisfactory

The Chattanooga Electric Railway Co. has erected a bridge over the Southern Ry. crossing, and has completed the grading of the proposed extension to East Avondale. The new line to Sherman Heights will soon be put in operation.

**TROLLEY TROUGH OVER RAILROAD CROSSINGS.**

Over all the steam railroad crossings on the lines controlled by the International Railway Co., of Buffalo, N. Y., there are suspended metal troughs which serve the purpose of catching the trolley wheel and preventing a car from becoming stalled on a crossing in the event of the wheel leaving the trolley wire.

The general features of the trough are illustrated in the drawings for which we are indebted to Mr. T. E. Mitten, general manager. The body of the device is a malleable iron casting held in place by the span wires with clevis and regulation strain insulators in the manner indicated. The inside of the casting is an inverted

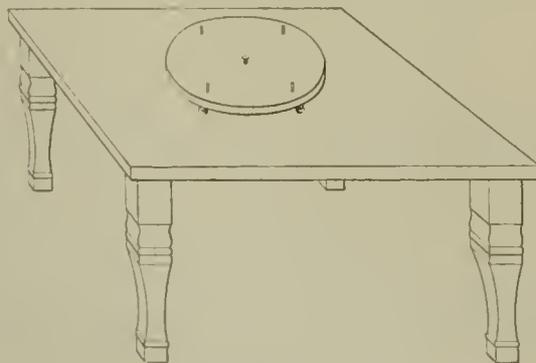

OVERHEAD CROSSING TROUGH.

V in section and is lined with sheet metal 1-16 in. thick which is insulated from, but riveted to, the body with 1/8-in. rivets. The trolley wire is carried by ordinary hanger ears which are held in place inside the trough by 5/8-in. eye-bolts screwed down through the top of the casting and into the hanger. The length of the trough varies according to the number of tracks over which it is suspended, and ranges from 10 ft. for a single track to 200 ft. for a complicated crossing. If deemed desirable guy wires can be strung from the eye-bolt to the side poles to further steady the trough.

**VARNISHING CAR WINDOW SASH.**

Mr. J. H. McMullin, former painter of the Worcester (Mass.) Consolidated Street Railway Co., has devised a clever arrangement for holding window sash while they are being varnished. It comprises a piece of 1/2-in. board circular in form and about 18 in. in diameter. To one side of this are fastened four small chair casters and in the other side are inserted four small wooden pegs projecting upward about an inch. This circular piece is mounted upon a common table by means of a bolt passing loosely through holes bored in the center of the circular board and the top of the table. The pieces rests upon the four casters and is free to revolve about

SASH VARNISHING TABLE.

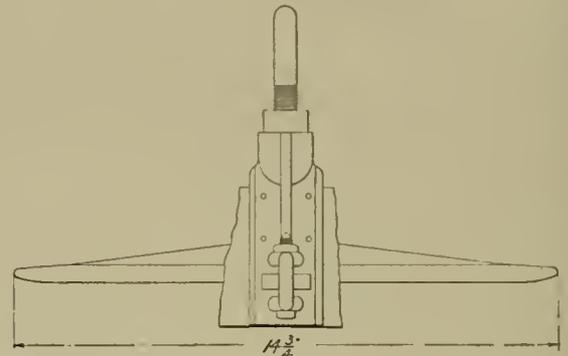

the bolt at the center. When a sash is to be varnished it is laid with the glass resting upon the four pegs. The painter stands at one side and as he varnishes each edge of the frame he turns the circular rest to bring the work immediately in front of him and

does not to have move from his first position. This not only saves time but is much more convenient for the painter and also assures better work with less risk of marring or scratching the side freshly painted.

**MOTOR LIFT FOR CAR PITS.**

A motor lift with which one man can, unaided, remove a motor from beneath a car and transport it to any point in the shop is made by Paul B. Patten, of Salem, Mass.

The machine is mounted on flat-tired wheels and does not require a set of tracks to travel on. The top platform is 3 ft. 5 1/2 in. x 24 in. The screw that supports the platform is of steel 2 1/2 in.

in diameter and is cut with a V-thread. The large gear has 56 teeth of 1/4-in. pitch and is fitted with a composition nut which engages the screw thread. The pinion at the end of the crank shaft which engages the large gear has 16 teeth, giving a ratio of 3 1/2 to 1. The large gear runs on hardened steel plates cut with 72 1/2-in. rack teeth. The leverage is ample and the lift is built to

PIT HOIST.

withstand any load that would be put upon it in ordinary pit work.

The machine illustrated is for use in pits measuring 4 ft. 6 in. from top of rail to bottom of pit, which is the usual depth found in car houses.

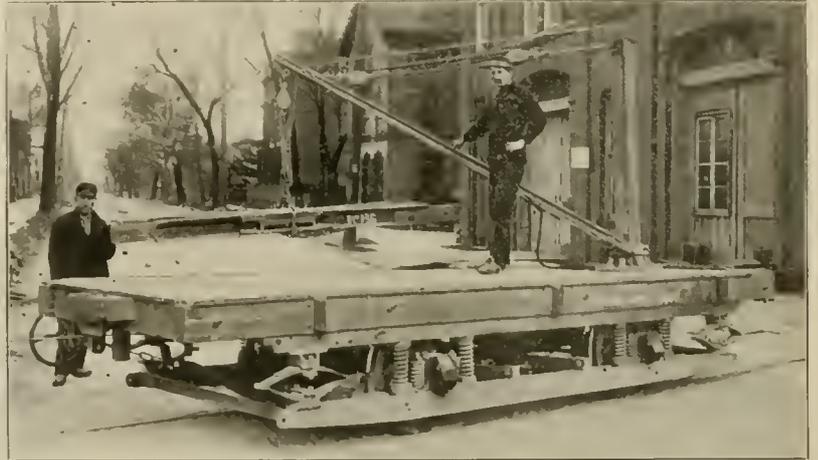

In service the necessary blocking is placed on the table or platform and the machine is run under the car. The table is elevated to engage the motor, the motor bolts are loosened, and the parts are lowered to clear the axle. The motor or amature can then be drawn to any part of the pit for inspection or repair without additional handling. The machine is in use by the Lynn & Boston system the Brooklyn Rapid Transit Co.; the Albany & Hudson Ry., and others.

### SPECIAL CONSTRUCTION CARS IN DETROIT.

The accompanying illustrations represent two special work cars used on the Detroit United Railway, for which we are indebted to Mr. J. Kerwin, superintendent of tracks. One of these cuts represents a track spiker by means of which the tracks are spiked to the ties without the use of hand labor. This car is provided with a boiler, two steam hammers, and a pair of tongs opposite each hammer which are used for picking up the tie and holding it firmly against the rail to be spiked. The ties are held in position under the rail with a pressure of four tons and each hammer drives two spikes at the same time. The rail is held to the gage by a cross bar in front of each hammer with a roller in each end of it. This gage must be very accurate or the hammers will not hit the spikes. The two spikes at each end of the ties are driven home by two blows of the hammer when cedar ties are used. Two men with this machine can spike 1,200 ties per day, which amounts to a saving of \$15 per day over hand labor.

The other illustration represents a derrick car, which, Mr. Kerwin informs us, has given the most satisfactory results of any machine employed in the track department. It will be noticed that the boom swings all the way around so that this car can be run up alongside a steam railroad car and the derrick will lift the heaviest special work or girder rail and place it on the derrick car itself or on a car standing at the end or at the opposite side of it. The derrick car has no windlass or power of any kind of itself. The cable for hoisting runs down the post of the derrick and goes out under the draw head so that any motor car on the same track to which the cable can be attached can do the hoisting. As an example of what can be accomplished by the use of this car, the company had 70 tons of rails which were to be removed from one yard to another to clear a space for building a new car house. All of this rail was removed by two men, while the ordinary method of handling it would have

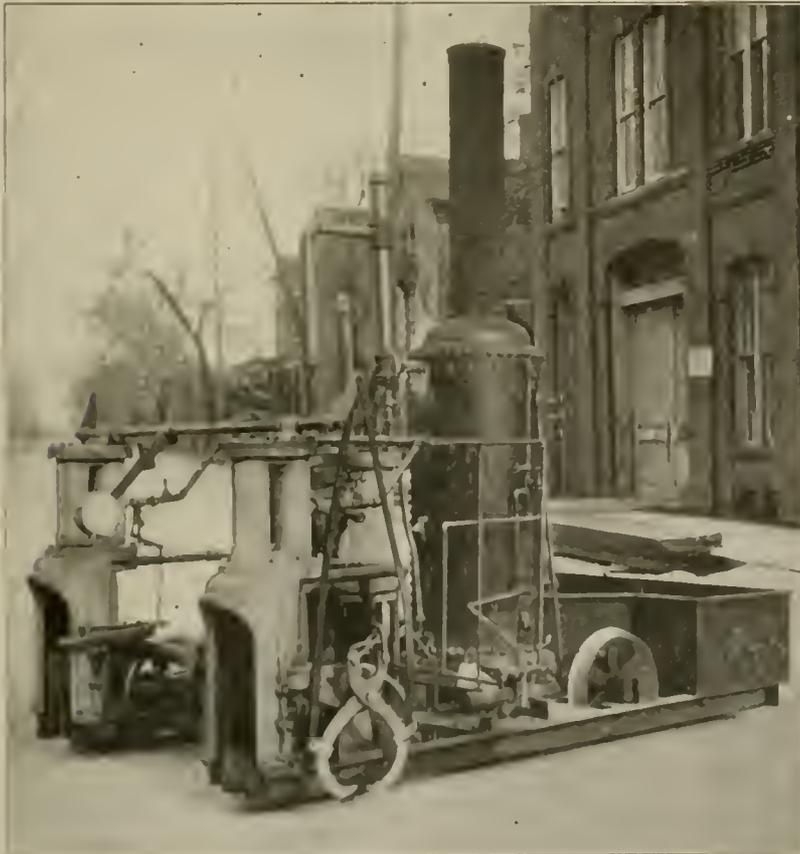

required a gang of not less than ten men and would have cost \$80 more than with the derrick car. This car has been found useful in so many ways that it has not been idle four hours a week since being put in service.

DERRICK CAR—DETROIT UNITED RY.

### IMPROVED STREET CAR SERVICE FOR CINCINNATI.

At a meeting held by the board of public service of Cincinnati last month the question of improving the street railway service of that city was taken up and a bill was drawn up which, if passed, will undoubtedly improve the service. Mr. W. Kesley Schoepf, lately elected president and general manager of the traction company, was present in the interests of his company and stated his positive intention to do everything in his power to improve the service in the city and to give prompt attention to all complaints that are not anonymous. Mr. Schoepf stated that the only solution of the problem would be to pass a law authorizing a change of routes so that all the cars in the city would not have to run on 5th and Walnut Sts. The congestion of cars resulting from this, he stated, was to blame for delays, and if more cars were added to each route, the congestion would be only so much worse and the delays greater than before. The company has ordered larger cars, which will relieve the overcrowding somewhat, but the only method of securing uninterrupted street car traffic is to have a number of turning points down town instead of only one, as at present. At his suggestion, a bill authorizing the necessary change of routes was prepared and will be presented to the Legislature. The material for 50 new cars, which will be 10 ft. longer than those at present in use, has been ordered and the cars will be built at the company's shops in the immediate future.

TRACK SPIKER—DETROIT UNITED RY.

February 23d the first trip was made over the new interurban line of the Northern Texas Traction Co. between Fort Worth and Handley, a distance of six miles. The car carried a number of city officials and Manager Haines and Superintendent Renfro, of the company. The installation of machinery in the power house at Handley is nearly completed, and work is being rushed on the extension that will afford connections between Fort Worth and Dallas.

It is announced that a street railway mail service will be put in effect on the interurban line between Oshkosh and Omro, Wis., May 15th.

### A. S. R. A. CONVENTION.

The executive committee of the American Street Railway Association met in Detroit on February 24th to decide upon plans for the 1902 convention. Those present were: H. H. Vreeland, New York, president; Charles W. Wason, Cleveland, E. C. Foster, Boston, and H. M. Sloan, Chicago, vice-presidents; T. C. Penington, Chicago, secretary and treasurer; Walter H. Holmes, Kansas City; David B. Dyer, Augusta, Ga.; T. J. Nicholl, Rochester, N. Y.; George W. Dickinson, Seattle, Wash. John A. Rigg, of Reading, Pa., was prevented from attending and was the only absentee.

The business transacted was as follows: The secretary and treasurer's report showing the finances to be in good condition, and the present membership of the association to be 187, was approved. There have been 25 new members admitted during the past year and 17 retired, leaving a net gain of 8.

It was decided to continue the old method of handling exhibits.

After inspection of the building, the Light Guard Armory in Detroit was chosen for the convention hall.

The convention was fixed for Wednesday, Thursday and Friday, Oct. 8, 9 and 10, 1902, the second day, Thursday, October 9th, being set apart at exhibitors' day, no meetings of the association being held on that day.

The Hotel Cadillac was chosen as the headquarters hotel and the banquet will be held there Friday evening.

It was decided that a standing committee on rules be appointed by the president.

It was also decided that hereafter subjects of reports should be assigned to companies, who are members of the association, and not to officers of the companies. The subjects assigned were as follows:

"Settlement of Damage Claims," Chicago City Railway Co., of Chicago.

"Benefit Associations," Metropolitan Street Railway Co., of New York.

"Discipline of Employes by the Merit System," Metropolitan Street Railway Co., of Kansas City, Mo.

"Transportation of Light Express and Parcels," Detroit United Railway Co., of Detroit, Mich.

"Registration of Transfers," Cincinnati Traction Co., of Cincinnati, Ohio.

"Steam Turbines and Rotary Engines," Boston Elevated Railway Co., of Boston, Mass.

"Signals for Urban and Interurban Railways," Old Colony Street Railway Co., Boston.

The first four of these assignments have already been accepted.

The secretary was instructed to write to the membership urging that the delegates be sent to the convention with instructions that their presence at the meetings is obligatory.

When the members of the executive committee reached Detroit they were met by J. C. Hutchins, president, A. H. Stanley, general superintendent, and Irwin Fullerton, auditor, of the Detroit United Ry., who discussed the plans for the convention with the committee. After the business meetings Mr. Hutchins entertained the committee and other visitors at the Detroit Club, and later in the evening the Vontodago Club. On Tuesday the Detroit United Railway Co. provided a special car to Mt. Clemens and the party enjoyed a delightful outing.

### LOW FARE LEGISLATION IN BALTIMORE.

A bill has recently been introduced in the Maryland Legislature requiring the United Railways & Electric Co. to sell six tickets for 25 cents. A board of prominent financiers of Baltimore appeared before the city delegation to whom the bill was reported, in order to oppose its passage. The opposition came not only from the railway company, but from a number of bankers who opposed it on the ground that its passage would affect the securities which are largely held by banks and savings institutions. The most important testimony was given by Mr. House, general manager of the company, who showed that with tickets at six for 25 cents the company would have to carry over 50,000 additional passengers per day, or 10 per cent of the entire population of the city of Baltimore and its suburbs, in order to take in the same amount of cash as was received in 5-cent fares.

The company's present equipment is taxed to its full capacity and should it secure additional riders on the low fare basis it would be obliged to provide increased car equipment and power house capacities as well as additional force in the transportation department and clerical branch without additional revenue. The amount carried to the surplus account last year was but \$32,118, and it is feared that a reduction of fares such as proposed would considerably affect the company's securities.

### W. D. RAY.

Mr. Wm. D. Ray, electrical and mechanical engineer, has opened an office in the Chamber of Commerce Bldg., Detroit, Mich., where

W. D. RAY.

he will carry on a general consulting business in electrical and mechanical engineering. Mr. Ray has had 15 years of professional experience, having occupied the position of electrical engineer of the Detroit Construction Co.; electrical engineer of the Motor Vehicle Co., Chicago; general manager of the Magann Air Brake Co., Detroit, general manager and superintendent of the Everett Railway & Electric Co., etc. He is a member of the American Institute of Electrical Engineers, the Chicago Electrical Association and the Detroit Engineering Society. His most recent

engineering work has been in connection with the interurban railways of southern Michigan having been identified with the Grand Rapids, Holland & Lake Michigan Rapid Ry., the Detroit, Lake Orion & Flint Ry., the Detroit, Rochester, Romeo & Lake Orion Ry., the Orion Light & Power Co., and the Rochester Light & Power Co. He will maintain a competent and efficient corps of engineers and specialists for engineering work of any nature or magnitude.

### HOUSE MOVING ACROSS ELECTRIC RAILWAYS.

An injunction was asked last month by a firm of house movers to restrain the Chicago City Railway Co. from interfering in moving a building across its railway track at Halsted and 29th Sts. The injunction was denied on the grounds that the house mover should pay the cost of cutting and splicing of electric wires when he desires to have them removed in order to allow the passage of the building. According to the permit granted to house movers by the city, they are held liable for all cutting and splicing of fire alarm and other wires and for all damage done to shade trees, curb stones and curb walls. The court held that inasmuch as the city permitted the railway company to string its wires in the streets it should afford them protection from unnecessary damage and that it was only reasonable that the house mover pay the cost of cutting and splicing wires. The counsel for the house movers state that the case will be appealed.

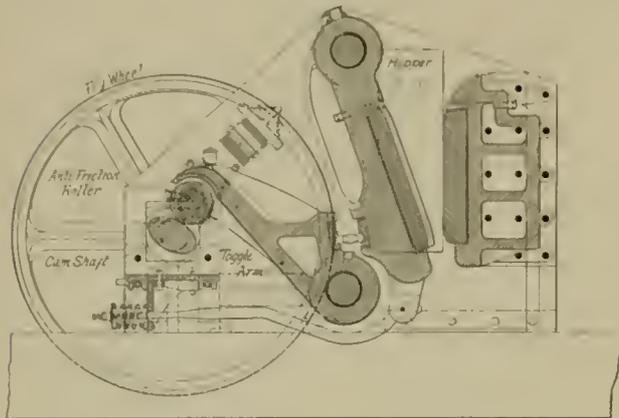

### SALE OF THE LA SALLE-PERU LINE.

January 15th the power house of the City Electric Railway Co., operating in La Salle and Peru, Ill., was burned down and for five weeks the people of these cities have been without street railway facilities. On February 27th Mr. J. R. Borroughs, receiver of the company, sold the road to the Illinois Valley Traction Co., which started to work immediately to resume the service. The required repairs were completed in 11 days and the line was again put in operation. The appearance of the first car after the long shut down was greeted with great enthusiasm by inhabitants all along the line. For the present the cars are being operated without conductors and are supplied with fare boxes in which the passengers put their fare.

**CHAMPION STEEL ROCK CRUSHER.**

As track standards in street railway work have approached heavier, more expensive, and more durable forms, there has been a corresponding call for heavier and improved road working tools and devices. The American Road Machine Co., of Kennett Square, Pa., which has for 25 years been prominent as a maker of road and street working machinery, contractors' tools and supplies, early recognized this demand for "practical" machinery and it has constantly endeavored to perfect its line of specialties accordingly. Its list includes road graders, road rollers, rock crush-

CROSS SECTION OF CRUSHER NO. 5.

ers, elevators, conveyors, dump carts and cars, road plows, culvert pipe, etc.

The Champion steel rock crusher made by this company is furnished in three sizes, known as No. 3, No. 4 and No. 5. Nos. 3 and 4 are portable machines that can be readily mounted on wheels and transported from place to place with the aid of horses, and No. 5 is intended for contractors and companies desiring a machine of large output for permanent location.

The maker especially emphasizes the statement that the main shaft of the "Champion" crusher is elliptical in shape and thus one revolution of the flywheels produces two movements of the jaw, permitting slower initial speed and therefore minimum wear resulting from friction and heating of bearings. The frame of the crusher is of the best rolled steel and braced to withstand the tensile or pulling stresses to which it is necessarily subjected. The swinging and stationary jaws are of cast iron, this material having been selected as better fitted to withstand compression stresses. The cam shaft, anti-friction roller, toggle seats, and all shafts from which castings are suspended are of steel forgings of high quality. The dies or crushing plates are special chilled rectangular castings and are reversible in four different positions, permitting their use until the corrugations are worn flat over the whole face of the die.

The frame of the crusher is thoroughly bolted with double nutted bolts, but as added security against shearing or hulging at joints, the frame plates are tongue and groove fitted. The stresses are all taken up by the metal and the office of the bolts is merely to hold the parts in position.

The accompanying table gives sizes, capacity and driving power required for the "Champion" crushers.

	No. 3.	No. 4.	No. 5.
Size or receiving capacity of jaws—inches	7 x 13	9 x 15	11 x 26
Product per hour in tons when machine is closed to 2 in.....	8 to 12	12 to 18	24 to 30
Weight approximated .....	6,000	8,500	19,000
Speed—Revolutions .....	170	155	140
Driving pulleys, diameter and face.....	44 x 8	50 x 8	60 x 10
Horse power required .....	12	15	25

Mayor Johnson, of Cleveland, in company with the officers of the Lehigh Valley Traction Co., of Allentown, Pa., recently made a tour of the proposed new routes in and about Trenton. Mr. Johnson is reported to be perfecting plans to join the interurban systems in which he is interested in the east, crossing the Delaware and running through to New York.

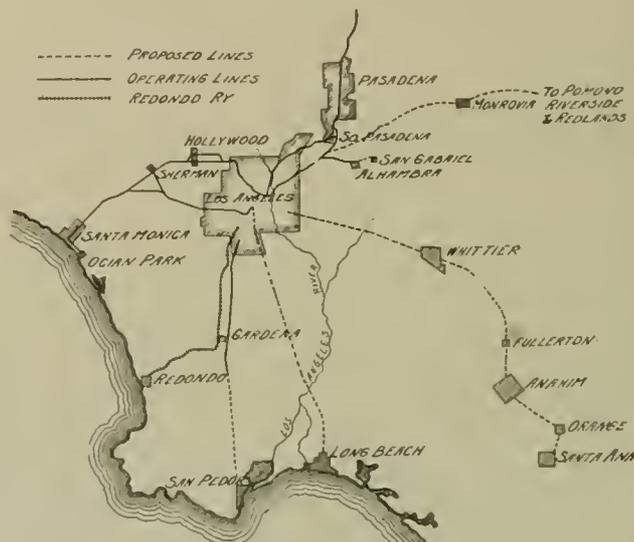

**LOS ANGELES INTERURBAN LINES.**

There are two great systems of electric railways which are operated inside the city limits of Los Angeles which pretty well grid-iron the entire surface of the city, but in addition to these, an extensive system of interurban lines is in operation which connect this city with a number of neighboring towns. The accompanying map shows the interurban lines both proposed, under construction and in operation, but not the urban lines. The Traction Co. has nearly completed the line from Los Angeles to San Pedro. The Los Angeles Railway Co., which operates the greater part of the lines in Los Angeles has an affiliated company known as the Pacific Electric Railway Co., which is now engaged in building a line to Long Beach and another to San Gabriel, Sierrre Madre and Monrovia. The same company has acquired the street car lines in Santa Ana and Orange and will, at an early date, build a line from this place to Whittier, Fullerton and Anaheim. Eventually, this company proposes to extend the Monrovia line eastward via Azuas to Pajona and ultimately to Riverside, San Bernardino and Redlands.

Another contemplated line parallels the Southern Pacific Railroad running through Ventura to Santa Barbara. The length of these contemplated roads are respectively, 30, 60 and 90 miles.

The Los Angeles Railway Co. operates 250 cars on its lines within the city. The company is now awaiting new cars which were ordered long ago and are far over due. The additional cars are greatly needed as the present service is inadequate. The number of men regularly employed by this company is about 1,250 and the pay roll amounts to about \$80,000 per month. The two affiliated companies which are now building the interurban lines have a large force of men employed and the construction department pay roll amounts to about \$25,000 per month. The shops which are now being erected for this company are very extensive in size and are being elaborately equipped. The amount of street railway travel in and about Los Angeles is very large, even for a city of 120,000 inhabitants.

The Los Angeles & Pacific Railway Co. operates a line to Santa Monica with branches via 16th St., and the southwestern corner of the city, also the northwestern route, via Hollywood and Colgrove. The latter line operates 80 cars a day and 120 on Sundays. It employs 200 men and has a pay roll of about \$10,000 per month.

LOS ANGELES INTERURBAN SYSTEM.

The Los Angeles & Redondo Railway Co. is about to convert its system to electric traction. The line is 38 miles long and the cost of the electrical equipment will be \$500,000.

A contract has been secured by Mr. Robert Sherer for the grading of the Huntington-Hellman Long Beach electric railway. This work will extend over a line of 17 miles in length. The specifications provide that it shall be completed 60 days from February 1st. The entire road will be built upon a private right of way, and the contract for the bridge work has been let to Mr. J. D. Mercereau.

The most important bridge on the line will be the one over the San Gabriel River, three miles from Long Beach. The tracks will be laid as soon as the grading is completed and material is constantly arriving for the equipment of the road. It is expected the line will be ready for traffic about July 1, 1903, and when completed, the system will represent an outlay of about \$1,000,000. The road is to be laid with 60-lb. T rails, 60 ft. in length. Mr. Huntington and his associates are expending in the neighborhood of \$500,000 a month in the construction of interurban roads. The total expenditure in interurban roads since the Huntington-Hellman syndicate was organized has exceeded \$1,000,000. About 500 men are employed in addition to the regular operating force of the Los Angeles Railway Co., and the operation of the Long Beach line when completed will require the employment of about 100 more men. The road is to begin its service with 20 cars.

This syndicate expects to invest about \$10,000,000 in interurban railways during the next four years, which expenditure is already arranged for. In addition to this the Kern River Power Co. will provide a total of \$5,000,000 for developing power for the use of the railway lines and other purposes.

The Los Angeles Railroad Co. has just received 30 cars from the St. Louis Car Co. The accompanying illustration shows the general appearance of one of these cars. It is the typical California

makers have cited to us some 40 British tramway companies as customers.

"Socarbolate" is handled in this country by the Frank S. DeRonde Co., 46 Cliff St., New York City, sole agent for the United States and Canada. The DeRonde company says concerning this fluid: "We claim that 'Socarbolate' is the only soap of its kind worth using, that is now on the market. It is a strictly first-class washing fluid and if used according to directions will wash varnish or paint work for any length of time without injury to the surface. It has a very agreeable odor, which while not too pronounced, or suggestive of infection, is a very excellent disinfectant. Its use is absolutely harmless either to the individual who may be using it or to the article that it may come in contact with. It is very easily soluble especially in hot or tepid water. It is recognized throughout England and the Continent to be absolutely the best material of its kind that has ever been produced. This valuable product is manufactured in Scotland and is now in use by the principal street railways, and other transportation companies throughout Europe."

The DeRonde company carries a large stock of the goods prepared for immediate shipment and is willing to send to all those who may be interested, a sample one gallon drum free of charge, so that a careful trial may be made and thus demonstrate the value of this high grade product.

LOS ANGELES CAR-ST. LOUIS CAR CO.

combination design with open compartments at both ends and a 15-ft. closed compartment in the center. The car is of handsome design and is said to be one of the most elaborately finished cars which has been shipped west. It is 39 ft. over bumpers, its outside width 8 ft. 2 in. and its height, from under part of the sills to top of deck, 9 ft. 1 in.

The open compartments at each end each have six walk-over slat seats and the closed compartment has longitudinal seats which are upholstered. The ceiling and interior linings are of mahogany with solid bronze trimmings and the outside of the car has concave and convex panels covered with No. 12 sheet steel. The cars are fitted with four double tread Stanwood steel steps and there is one St. Louis Car Co.'s arc headlight in each car. The trucks on which these cars are mounted are made by the St. Louis Car Co., and are known as the Los Angeles type having a gage of 3 ft. 6 in. wheel base of 5 ft. 3 in. The axles are 4 1/2 in. in diameter and the wheels 33 in. These cars are for city service and are equipped with two Westinghouse No. 38 B motors.

◆◆◆  
**CLEANING CARS.**

Not the least among the troubles incident to the street railway business are those of the car cleaner and our readers will welcome information concerning "Socarbolate," otherwise known as the "perfect cleaner," for washing inside and outside of street cars, omnibuses and railroad cars. For outside use the recommended proportions of the washing mixture are one-half pint "Socarbolate" to three gallons of tepid water, and for inside spraying one-half pint of 1 1/2 gallon tepid water. The fluid is extensively used by European transportation companies and the

The DeRonde company makes the widely used "Lythite" fire-grade armature and shellac varnishes, P. & B. tape Ruberoid motor cloth and similar goods.

◆◆◆  
**NO LARGE BUNDLES ON CARS.**

In view of the crowded condition of its cars the Brooklyn Rapid Transit Co. has issued orders prohibiting the carrying by passengers of packages or bundles that can not be held in the lap or placed under the seat without inconvenience to other passengers. Persons with large bundles will not be permitted to board a car.

The order provides that a person with a cumbersome bundle and holding a transfer from another line must be accepted as a passenger but the conductor must turn the transfer into the office with a report of the matter and the conductor issuing the transfer will be discharged.

◆◆◆  
**NO FUNERAL CARS IN SPRINGFIELD, MASS.**

The Springfield (Mass.) Street Railway Co. denies the report published in several papers that funeral cars were to be instituted on that road. Mr. Geo. W. Cook, superintendent of the company, writes us that this is a business the road does not care for and has refused with very few exceptions.

◆◆◆  
McGowan and conductors in the employ of the Omaha & Council Bluffs Railway & Bridge Co. are now entitled to wear service bridges, one gold star on the coat label signifying five years' service, two stars in years' service, etc.

## PERSONAL.

MR. C. D. BROWN, formerly electrician of the Binghamton Railroad Co., has resigned to become wire chief for the Binghamton Telephone Co.

MR. WILLIAM H. SAVERY has been appointed superintendent of the Woronoco Street Railway Co., of Westfield, Mass., succeeding Mr. R. P. Lee, resigned.

GENERAL JOHN M. HOOD has been elected president of the United Railways & Electric Co. of Baltimore, succeeding Mr. George R. Webb.

MR. J. W. PATTERSON, who was for 17 years with the Adams & Westlake Co., has recently been appointed general sales agent of the Central Union Brass Co., of St. Louis.

MR. J. B. HICKS, who is favorably known in the street railway and steam railroad fields, has been appointed manager for H. M. Shaw & Co., with offices at 115 Broadway, New York City.

MR. F. G. L. HENDERSON has retired from the active management of the Newton (Mass.) Street Railway Co. to assume the position of superintendent of the Boston Suburban Electric Railway Co., which is a consolidation of all the Newton roads and the Lexington & Boston Street Railway Co. As the senior superintendent Mr. Henderson's duties will connect him directly with all the roads in the consolidation. Just before Mr. Henderson left his old office at Newton to take his new headquarters at Newtonville he was called from his house late one night on the pretext that a break had occurred at the power house. On the way to the power station he was intercepted and led into the principal restaurant of the town, where to his entire surprise he found all the employees of the company assembled around a banquet table. Amid cheers and enthusiasm he was presented with a handsome gold watch by the men as a token of their respect and esteem. Speeches and dinner followed the presentation.

F. G. L. HENDERSON.

MR. J. F. DUSMAN, who for the past year has been manager of the Edison Electric Light Co., of York, Pa., was last month appointed general manager of the York County Traction Co.

MR. P. T'SERSTEVENS has been appointed secretary general of the Permanent International Tramway Union to succeed Mr. Nonnenberg. The headquarters of this association are at No. 6 Impasse du Park, Brussels, Belgium.

MR. L. E. TROXLER, formerly connected with the Louisville (Ky.) Railway Co., has been appointed superintendent of equipment and construction of the Louisville, Anchorage & Pewee Valley Electric Railway Co., succeeding Mr. W. G. Hesser, resigned.

MR. E. A. CUNNINGHAM, formerly superintendent of the Fort Dodge Light & Power Co., has been appointed superintendent of the Des Moines (Ia.) City Railway Co. Mr. J. E. Welch has been appointed superintendent of road bed and track of the Des Moines company.

MR. JOHN MARKLE, president of the Sprague Electric Co., and Lieut. Frank J. Sprague, technical director of the same company, were included among the "Captains of Industry" who gave the luncheon in honor of Prince Henry at Sherry's, February 26th.

MR. S. W. GUNSALUS will succeed Mr. C. E. Baker as superintendent of transportation of the Southwest Missouri Electric Railway Co. at Webb City, Mo. Mr. Gunsalus was formerly chief dis-

patcher of the system. Mr. Baker will go to Beaumont, Tex., to take charge of the construction of a new electric line in that city.

MR. F. NONNENBERG, who for several years has been secretary general and treasurer of the Permanent International Tramway Union, has by reason of the pressure of his other work been obliged to resign the secretaryship of the association, but will continue to serve as treasurer.

MR. JULIAN L. YALE has been made vice-president of the American McKenna Process Co., with headquarters in the Rookery, Chicago. Mr. Yale will supervise for the company the purchase and sale of rails and other materials and make contracts for removing rails. This company has re-rolling plants at Joliet, Ill., Kansas City and Tremley Point, N. Y.

MR. THOMAS P. FOWLER, representing English capital in the project of extending the Metropolitan Street Ry. of New York City, has been elected president of the Metropolitan Securities Co. and the Interurban Street Railway Co. Mr. Fowler is also president of the New York, Ontario & Western Railway Co.

MR. JOHN SPEER, of the Speer Carbon Co., St. Mary's, Pa., was recently a caller at the office of the "Review." Mr. Speer represents a firm which has made remarkable progress in the business world since its establishment in 1899, and he reports that the prospects of the Speer company for the coming year are better than ever.

Mr. CASSIUS M. WICKER, president of the Zanesville & Ohio R. R.; vice president of the Brooklyn, Queens County & Suburban Railroad Co.; president of the North Shore Traction Co., and a director in several other corporations with headquarters in New York, has been elected president of the New York association of former Chicagoans which was recently organized in New York City by 50 prominent ex-Chicagoans.

MR. R. LANCASTER WILLIAMS, treasurer of the Richmond (Va.) Traction Co., who is also interested in several other street railways in the south, is about to go to England to investigate the electric traction systems in that country in the interest of the Great Britain Railway Development Co., which was recently incorporated at Trenton, N. J. It is stated that the future investments of the Great Britain company depend largely upon Mr. Williams' report.

MR. D. H. LAVENBERG, superintendent of the Norwalk, O., division of the Lake Shore Electric Ry., has accepted the superintendency of the Northern Texas Traction Co., which controls electric lines in Dallas and Fort Worth, as well as an interurban partly completed between those cities. Mr. Lavenberg was formerly chief dispatcher of the Wheeling & Lake Erie R. R. and has many years' experience with both the steam and electric roads. He is succeeded at Norwalk by Mr. Smith, superintendent of the Cleveland division of the Lake Shore railway.

MR. T. P. AGNEW, superintendent of the Citizens' Street Railway Co., of Vincennes, Ind., died at his home in that city recently, of paralysis. Mr. Agnew was born in Coshocton County, Ohio, in 1842. Much of his active and successful business career was in connection with the steam boat business on the Wabash, Ohio, Cumberland and Mississippi Rivers, but in 1896 he settled in Indiana, and became superintendent of the Vincennes electric lines. A wife and several children survive him.

MR. WILLARD A. SMITH, publisher of the Railway & Engineering Review, Chicago, has been appointed director of transportation exhibits at the Louisiana Purchase Exposition. Mr. Smith filled a similar position during the World's Fair at Chicago, in 1893, and in 1900 was head of the department of transportation and engineering exhibits for the United States government at the Paris Exposition. He was also the official representative of the State Department of the government at the International Railway Congress in Paris, and subsequently received the decoration of the Legion of Honor from the French government.

### ELECTIONS.

THE LA CROSSE (WIS.) & EASTERN RAILWAY CO. has elected the following officers: Joseph Roschert, mayor of La Crosse, president; Dave Palmer, vice president; J. P. Reeve, secretary, and J. B. Taylor, treasurer. The company proposes to build an interurban railway between La Crosse and Viroqua.

THE GRAND RAPIDS (MICH.) RAILWAY CO. has elected the following officers: C. M. Clark, of Philadelphia, president; Lester J. Rindge, first vice president; G. Stewart Johnson, second vice president and general manager, and Benjamin S. Hanchett, jr., secretary and treasurer. Mr. Clark succeeds Mr. Anton G. Hodenpyl as president, the latter desiring to retire from the duties of the office owing to his recent removal to New York. He was re-elected as a director of the company.

MR. JOHN F. BEGGS was elected president and general manager of the Milwaukee Electric Railway & Light Co. at a meeting of the board of directors in New York City on February 20th. Other officers were elected as follows: William Nelson Cromwell, first vice president; Charles W. Wetmore, second vice president; George R. Sheldon, treasurer; Charles A. Spofford, secretary, and George O. Wheatcroft, assistant secretary and assistant treasurer at Milwaukee. The same gentlemen were elected to corresponding offices in the Milwaukee Light, Heat & Traction Co., which operates the interurban lines between Milwaukee, Racine, Kenosha and Waukesha. Mr. Beggs succeeds Mr. Cromwell as president of the Milwaukee Electric Railway & Light Co., and Mr. Cromwell as vice president, succeeds Mr. Payne in that capacity.

### SALE OF THE CLEVELAND ELECTRIC CO.

The transfer of the Cleveland Electric Railway by the Everett-Moore syndicate to the syndicate organized by Mr. Horace E. Andrews, took place March 8th. A certificate for 43,000 shares of stock of the Cleveland Electric was transferred to Mr. Andrews for the sum of \$3,545,000, a check for this amount being signed by Mr. Andrews as syndicate manager. A special meeting of the directors of the company was held immediately after the sale, at which Mr. Andrews was elected president of the company. Mr. Henry J. Davies, who was formerly assistant secretary of this company, was elected secretary to succeed Mr. Fred Borton. No other changes were made in the officers of the company. The resignations of Messrs. Henry Everett and Charles W. Wason as directors, were accepted but their places have not yet been filled. President Andrews at once took charge of the company.

### TRUSTEES FOR AMERICAN CAR CO.

The American Car Co., of St. Louis, on February 19th transferred all its property to William B. Thompson and Henry B. Denker, trustees for the company's creditors. The company is not insolvent, but has been seriously hampered by want of sufficient working capital, and the trust has been created to better secure the creditors, while the business is continued as heretofore. An examination of the books made recently by Jones, Caesar & Co. shows assets in excess of \$500,000 and liabilities less than \$400,000; a conservative estimate places the value of the property at about \$125,000 over all liabilities.

### NEW ENGLAND STREET RAILWAY CLUB.

The regular meeting of the New England Street Railway Club was held at Wesleyan Hall, Boston, February 27th. The paper of the evening was "Four-Motor Equipments and the Possibilities of Alternating Currents for Street Railway Service," by Albert H. Armstrong, consulting engineer of the Railway Department of the General Electric Co.

The Mono-Rail Co., which was recently organized in Baltimore with William T. Levering as president to introduce the mono-rail traction system invented by Howard Tunis of that city, will erect an experimental track about one half mile in length at Windsor Hills, Walbrook, in order that the merits claimed for the new invention may be demonstrated by a practical test.

### FAST SERVICE TESTS ON THE LAKE SHORE.

As a preliminary to choosing the car equipment for the fast through electric service between Cleveland and Toledo experiments will be made with four-motor equipments of the General Electric, Westinghouse and Lorain Steel companies. Early this month some trial tests were made with a 51-ft. car mounted on Barney & Smith M. C. B. trucks and equipped with four G. E. 66 motors. The time from Norwalk to the city limits of Toledo, a distance of 62 miles, was 2 h. 16 min. Deducting 25 minutes for stops made on sidings the average speed was about 33½ miles per hour, the maximum being about 60 miles per hour.

### SLEET, SNOW AND FLOODS.

According to statements made public by the official weather bureau the winter just past has been an unusual one in the number and severity of its rain, sleet and snow storms. The storm area has extended very generally over the country east of the Mississippi, but New York, New Jersey and Pennsylvania have received seemingly more than their share of unpleasant weather or at least have been the greatest sufferers from the effects of rain and snow. The comparatively high temperatures that have accompanied most of the recent storms has been exceptionally disastrous to all forms of overhead wires in that the rain has speedily turned to sleet, which is always more to be dreaded by the street railway manager than snow. From all parts of the East come dire tales of woe of wires down and feeder systems crippled through the overweight of sleet. Added to this, all the watersheds in this part of the country have been swollen to a degree almost unprecedented. During the latter part of February over a dozen street railway companies within 200 miles of New York had to suspend business utterly for from one to three days owing to the presence of flood water in their power stations and some of the boiler furnaces were two feet under water.

On an interurban line running out of Philadelphia the sleet and high water together brought the cars to a standstill late one afternoon and not a car was moved for over 48 hours. The motormen and conductors were instructed to remain with their cars to prevent boys or vandals from breaking the windows or doing other injury, and oil cooking stoves, food, playing cards and cigars were distributed to the men by the company and by kindly neighbors. The men slept on the slats and took the matter as considerable of a lark, as they were drawing double pay for very little work.

The lines at Albany, Rochester, Harrisburg, Wilkesbarre and other leading cities report heavy damages. Mr. E. G. Conette, general manager of the Syracuse Rapid Transit Co., writes that while the floods did considerable injury in Syracuse and the suburbs, his lines fortunately escaped any great damage, although the company was put to much extra expense to keep the routes open. While referring to this subject too much credit can not be given to employees and employers alike all over the afflicted sections, many of whom worked uncomplainingly for days at a stretch with but little rest and sleep, in the efforts to keep the cars moving at a time when the public most needed transportation conveniences.

It might be added that those street railway companies who were forced to shut down for a brief period may take consolation from the fact that the Empire State Express on the New York Central for the first time in its history had to be temporarily abandoned and reached Buffalo two days behind its schedule time. The telephone and telegraph companies also suffered severely and for many hours the only telegraphic communication between New York and Philadelphia, Baltimore and Washington was by way of New Orleans and Chicago. One bunch of important telegrams was sent to Philadelphia by messenger by train as the surest method of getting the dispatches through.

Benson and Charles F. Bidwell, whose tests of their method of telephoning from moving street cars have been previously mentioned in the "Review," are reported to have performed another thorough and entirely satisfactory test on the Grand Rapids Ry., March 6th. Three cars were equipped with long distance telephones, the state line was brought into service, and connections were successfully made and communication held with several distant cities.

### THE MALTBY LUMBER CO.

The Maltby Lumber Co., of Bay City, Mich., is mailing to its customers and friends a small pamphlet containing the rules of the northwestern cedarmen in regard to poles for electric railway, telephone and telegraph purposes, which contains some interesting information in regard to the selection and inspection of this class of lumber. This company, which deals in Michigan white cedar both for poles and ties, has a number of large yards for sorting poles, the principal ones being located at Boyne Falls on the Grand Rapids & Indiana Railroad; at Pinconning where there are two connecting railroads to furnish cars; and at River Rouge, a suburb of Detroit reached by a number of trunk lines. The company maintains a corps of competent and trained inspectors who select and count every car of stock shipped and the inspection as well as the tally as invoiced, is guaranteed to be in accordance with the rules laid down. Michigan white cedar has been in use in Michigan and Wisconsin for ties on steam roads for the last 20 years and as it is becoming better known its use is constantly increasing. For straight line work it is said to be unsurpassed but on very heavy curves trouble with them is said to have occurred on account of spikes pulling. On sharp curves many roads now use harder timbers such as chestnut and oak. The chief value of Michigan white cedar ties however is for very heavy traffic where it is undesirable to disturb the road bed more than is absolutely necessary. With the use of tie plates, cedar ties can claim records of 12 to 15 years. The saving in the labor of replacing alone amounts to a large sum and at the same time the price of cedar is still below that of oak.

### LONDON STREET RAILWAY EMPLOYEES' ANNUAL BALL.

The first annual ball of the employees of the London (Ont.) Street Railway Co. was held on the evening of February 21st, and proved a most enjoyable occasion. The dance was held in the employes' hall at the car barns, and the number of people participating approached close upon 300. The ceremony began at 9:30 o'clock with the grand march, led by Mr. Thomas H. Smallman, vice-president of the company, and Mrs. Thomas Reycraft. Other guests of honor were Mr. and Mrs. J. Smallman, Mr. and Mrs. P. W. Broderick and General Manager and Mrs. Carr. Letters of regret were received from Mr. Henry A. Everett, president, and Messrs. Wason and Holt, directors of the company. Special cars were used to transport the numerous company of guests to a downtown cafe. All branches of the service were represented at the gathering, and every man who could be spared from the operation of the road was present at the occasion. The party dispersed at 3:30 o'clock in the morning, and special cars were run in all directions to convey the guests home.

### THREE-CENT FARE ROADS IN CLEVELAND.

The Peoples Railway Co., of Cleveland, was incorporated last month with \$1,000,000 capital stock, the incorporators being E. J. Blandin, W. L. Bice, John M. Garfield, A. E. Green and E. G. Harte. This enterprise, which is popularly known as Mayor Johnson's 3-cent fare road, has been organized to build a system of street railways in the city of Cleveland on all the streets not at present occupied by other companies, according to an ordinance recently passed in that city. Seventeen routes were specified in this ordinance and franchises for six of these have been asked by Mr. John B. Hoefgen on behalf of the new company. The six routes designated include the best ones of the 17 mentioned in the original ordinances. The request for franchises was referred to the board of control, the committees on judiciary and railways and the corporation council.

The attempt to secure franchises brought about considerable trouble in regard to the consents of property owners and culminated in an injunction granted February 28th restraining the two old street railway companies in the city from interfering in any way with the efforts of the new company to establish its 3-cent fare line. Mr. Hoefgen received the necessary consent of property owners for his franchise, but later some of the property owners withdrew their consents, and it was claimed that the old street railways

had been instrumental in having these consents withdrawn. Two suits were filed to enjoin the old companies from interfering with the efforts of the new company to procure consents, one of the suits being filed on behalf of the city and the other on behalf of Mr. Hoefgen. The two suits were practically identical.

### BROOKLYN EXTENSION OF THE NEW YORK SUBWAY.

The detailed plans for the Brooklyn extension of the New York subway are now so far completed that it is thought that it will be possible to advertise for proposals for its construction and operation in about two months. The special contract committee of the Rapid Transit Commission has been studying the problem and drawing up a satisfactory form of contract and the question involves difficulties which may make a satisfactory solution troublesome.

The Brooklyn extension is not a system by itself but a very necessary link in the whole system included in the boroughs of Manhattan, the Bronx, Brooklyn and Queens. Public sentiment strongly favors a single fare for the entire route and this is the most difficult question the commission has had to meet. Mr. McDonald, the contractor, who is building the Manhattan and Bronx portions of the system, has contract with the city permitting him, when the road is completed, to charge a 5-cent fare down to the city hall terminal. This contract can only be modified with Mr. McDonald's consent, and is binding for 50 years. Holding this contract, Mr. McDonald is by far the likeliest competitor for the extension to Brooklyn, but it is not expected that he will care to build and operate three miles additional road and receive no extra fare for the increased haul. No other contractor can take the Brooklyn extension under agreement to carry passengers from Brooklyn to any point in Manhattan or the Bronx because in order to do so a traffic agreement with Mr. McDonald would be necessary and it is thought unlikely that Mr. McDonald would cut down his revenues from operation by giving up part of his receipts to a rival contractor. If the Brooklyn extension should be operated in connection with the Long Island road thus extending the continuous route to Jamaica, a still more difficult problem is presented in connection with the single fare.

In a recent report of Chief Engineer Parsons to the Rapid Transit Commission, he disapproves the four-track tunnel to Brooklyn which has been urged in some quarters. The cost of the four-track road would exceed the appropriations for this work. Bridge Commissioner Lindenthal also favors the double track tunnel to Brooklyn at present and believes that the congestion of traffic would be better relieved by ultimately building other connecting tunnels to the different parts of Brooklyn Borough.

The proposition for a two-track extension to Brooklyn, however, is meeting with considerable opposition. Mr. John De Witt Warner and President Swanstrom, of Brooklyn, have strongly advocated a four-track road, and the latter in a recent communication to the Rapid Transit Commission states that this is the only plan which will be approved by the people of the borough of Brooklyn. He states that for many reasons the proposed plans do not satisfy the existing conditions and that if carried into effect they will not remedy the congestion which is now a feature of the Brooklyn Bridge during the rush hours. In elaborating his argument President Swanstrom states that Brooklyn is bound to grow faster than any of the other boroughs and that its building up will solve the tenement house problem. He claims that Mr. Parsons has made an error in his calculations that from four to five times as many people will use the Manhattan underground road as will use the Brooklyn extension. He asserts that while 100,000,000 people cross the Brooklyn Bridge every year only 50,000,000 passengers are carried yearly by the railroads in Manhattan and the Bronx.

While the court has already approved of the two track plans of the Rapid Transit Commission this body is authorized by statute to present such modifications of the plans as it may deem advisable, and such amendments, it is stated, will not invalidate the approval already given by the court.

The electric line in Gainesville, Tex., has been abandoned and its franchise forfeited. Local traffic is accommodated only by a mule line, and it is said that there is a desirable opening in Gainesville for prospective street railway investors.

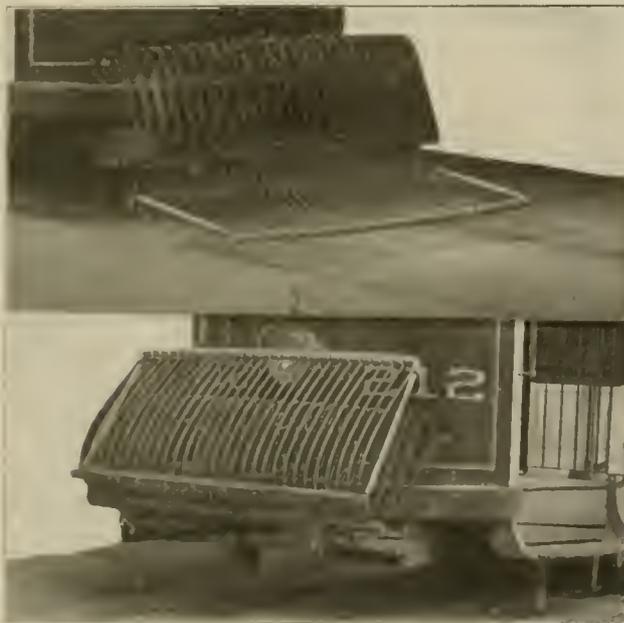

### NEW ROLLING STOCK FOR BROOKLYN RAPID TRANSIT.

The Brooklyn Rapid Transit Co. has been making extensive additions to its rolling stock in order to better handle the enormous increase in its traffic, especially during the morning and evening rush hours. The new closed cars are the semi-convertible type described by the company's master mechanic, Mr. Eugene Chamberlain, at the New York meeting of the American Street Railway Association last October, and published in the "Review Daily" at that time. Of these cars 200 were built by the Laclede Car Co., of St. Louis, and 50 by the Stephenson Company, of Elizabethport, N. J. The Stephenson Company is also building a number of open cars for Brooklyn.

The seats in the closed cars are the Chamberlain individual revolving seat, made by the Heywood Brothers & Wakefield Co., of Wakefield, Mass., and also described in the "Review Daily." Mr. Chamberlain has recently devised a heater to be placed on the cross arm of this type of seat and which it is believed will affect a considerable saving in the cost of electric heating.

### NEW MODEL PROVIDENCE FENDERS.

The Consolidated Car Fender Co., of 39 Cortlandt St., New York City, has added a new model to its well known line of life-saving car fenders. This is named style "C" and embodies all improvements made by the company in life-saving devices up to the present time. The shape of the fender proper, or basket, is such that when it picks up a person it holds the body without

PROVIDENCE FENDER MODEL C.

injury until the car can be stopped. When not in use on the back end of the car it can be turned up and fastened to the dash board, taking up less than 12 in. of space.

This fender has been approved and specified for all cars on some of the largest electric roads in the United States. Col. Woodworth reports business in fine condition.

### CONSOLIDATION IN PHILADELPHIA.

February 28th it was announced that the terms of the lease of the property of the Union Traction Co., of Philadelphia, to the Consolidated Traction Co. had been agreed upon. The new company guaranteed Union Traction stockholders 3 per cent for the first two years, 4 per cent for the third and fourth years, 5 per cent for the fifth and sixth years, and 6 per cent for the remainder of the term of 99 years.

The Consolidated Traction Co., will be capitalized at \$30,000,000 in 600,000 shares of a par value of \$50. The Union Traction Co. stockholders will have the right to subscribe to one share of new stock for each four of present holdings. It is stated that the control of the Union Traction Co. will remain in the hands of those who exercise it at the present time.

### FIRE AT INDIANAPOLIS SWITCH & FROG CO'S. WORKS.

A fire occurred at the East St. plant of the Indianapolis Switch & Frog Co., at Springfield, O., on February 10th, and it was at first reported that the works had been destroyed. We are glad to announce, however, that the company's loss was confined to a portion of its offices, and new quarters have been established at 76 Eastern Ave., where its business is being conducted as heretofore, and all orders can be promptly attended to. The company states that its file of manufacturers' catalogs was entirely destroyed and it would be pleased to receive catalogs from the various manufacturers of materials and supplies in its line in order to renew its files.

### PACIFIC ELECTRIC RAILWAY CO.

Official announcement was made under date of Feb. 25, 1902, that the Pacific Electric Railway Co., organized under the laws of California, had acquired the railroads and property of the Los Angeles & Pasadena Electric Railway Co., the Pasadena & Mt. Lowe Railway Co., and the Pacific Electric Railway Co., of Arizona. Possession of these properties was taken by the new company Feb. 24th, on which day all officers and employes of the several companies were ordered to report to and be governed by orders issued by the officials of the Pacific Electric Railway Co.

The officers of this company are: H. E. Huntington, president; Epes Randolph, vice-president and general manager; W. H. Smith, manager; George E. Pillsbury, chief engineer; S. C. Baxter, auditor; C. E. Donnatin, superintendent of mechanical department; J. R. Atchison, superintendent of power department; and S. H. Anderson, chief electrician.

### INTERURBANS TO ENTER CINCINNATI.

An agreement has been reached between the Cincinnati Traction Co. and the Cincinnati & Eastern Electric Ry., whereby the cars of the latter company will enter the heart of the city. The details of the plans for the entrance of the interurbans into the city have not been worked out but the negotiations have been brought to a satisfactory conclusion. As an agreement has been reached in Cincinnati on this subject the bill recently introduced into the Legislature, providing the privilege of entrance into the cities by interurban cars is now of little value and it is thought it will probably be withdrawn.

### NEW PUBLICATIONS

CORNELL UNIVERSITY REGISTER, for 1901-1902, has been issued. The Register contains a calendar of the courses for the ensuing year and historical account of the foundation and endowment of the university together with complete information as to the various courses of instruction which it includes.

THE WORKINGMAN'S COLLEGE, Melbourne, Australia, has issued its prospectus for 1902. This is a technical college and school of mines as well as an elementary school for the working men and the classes are conducted in the evening. The courses are designed for carpenters, joiners, masons, brick layers, machinists, cabinet makers, carriage builders, plumbers, painters and decorators, electricians, lithographers, photographers, etc. The various courses cover two and three years of instruction and are thoroughly practical in methods of teaching.

Five burglars raided the office of the Northampton (Mass.) Street Railway Co. on the night of February 16th, blew open two safes with dynamite, and secured \$750 in cash and a check for \$300.

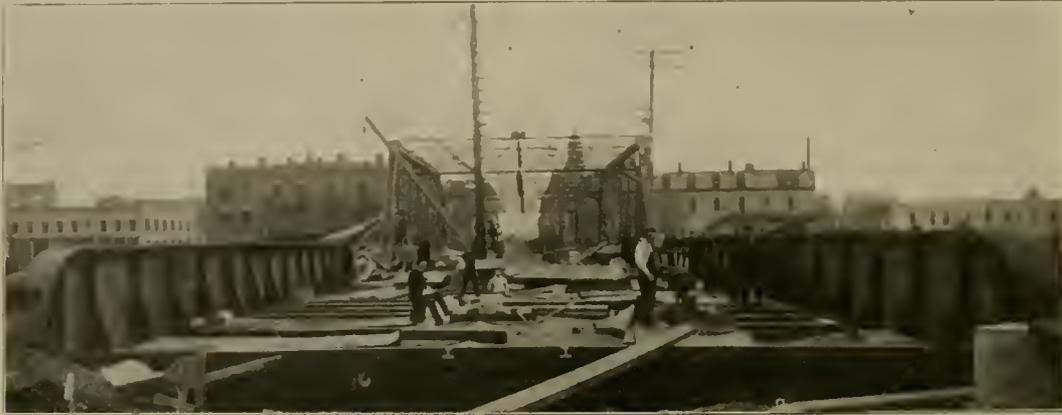

### JOLIET BRIDGE & IRON CO.

The Joliet Bridge & Iron Co., of Joliet, Ill., makes a specialty of building railway and highway bridges, but is also equipped to do all kinds of structural iron work on power houses, car barns and factories. The company was organized in 1896 with a capital of \$10,000 and since its start has had a steady growth, its capital being now \$100,000. It has a large amount of business on hand which makes it necessary to keep in stock all sorts of bar and structural iron, enclosed beams, etc., and thus enables it to turn out work on short notice. Its location on the outer belt railroad line enables it to make direct connections with all railroads running into Chicago, ensuring prompt shipments and low rates. The company's work at present covers bridge and structural work extending over a large

blocks. Its length is 76 ft. and the roadway is 42 ft. wide with a 12 ft. sidewalk on each side.

This company also builds steel culvert pipes, many of which have been placed on street railways and highways and have been found very satisfactory. In many places these pipes save the building of bridges and as they can be put in place more readily than other culverts, their use has been found very desirable for street railway work. The accompanying cut shows one of these culverts the diameter of which is 16 ft. and length 140 ft. This culvert was erected in 1898 in the Illinois-Michigan canal at Marseilles, Ill. The company is prepared to build these culverts in any sizes from 18 in. in diameter up.

The president of the Joliet Bridge & Iron Co. is Mr. Robert C. Morrison.

BRIDGE OVER DES PLAINES RIVER—JOLIET BRIDGE & IRON CO.

territory including the states of California, Montana, Dakota, Michigan, Wisconsin, Oklahoma, Illinois, Minnesota, Iowa and Nebraska.

While this company's annual capacity at starting was but 10,000 tons of product its growth has reached a present capacity of 50,000 tons of finished product per year. Among its contracts which are now being filled may be mentioned the public market sheds of St. Paul, Minn.; the postoffice at Los Angeles, Cal.; the postoffice at Helena, Mont.; the factory of the Peerless Portland Cement Co., of Union City, Mich., the buildings of the Economy Light & Power Co., of Joliet, and the three-span bridge over the Fox River at

### UNIFORMS.

There can be no doubt as to the benefits which have followed the practice of uniforming street railway employees. In the early horse car days the question of uniforms was not appreciated, but with the introduction of electric cars of handsome design and finish the roads of today are generally prescribing neat and attractive looking uniforms for their operating forces which are in harmony with the general improvements in the service which have taken place in late years. The subject is aptly presented in a recent publication of the Pettibone Brothers Manufacturing Co., of Cincinnati, makers of uniforms.

"While street railway managers are devoting a great deal of attention to equipping their lines with large, handsome cars containing the latest appliances for speed and for the comfort of passengers, the matter of uniforms is not always given the attention it deserves. No matter how elaborate and comfortable a car may be a conductor with a soiled or patched coat or worn trousers destroys the general good effect. There is no excuse for this, as these employes receive salaries that justify the purchase of at least one suit of clothes a year, and with proper care a summer and a winter suit would last two seasons, if they are of a good material and make.

"If the earnings of a road will not justify a uniform inspector, this duty should be added to those of the stable superintendent or other official, and he should see that both conductors and motormen keep their clothes looking fresh and clean. It is no hardship to compel the men to do this. It will give them more self respect and will materially improve their conduct toward passengers. A suit to wear and look well for two seasons must be made of strong cloth, and pure indigo dyed. The coat must be well made and properly stiffened so as not to break down in front. With a suit of this kind and a cap to correspond the employe presents a well dressed appearance in every way suitable to his surroundings."

16-FT. CULVERT AT MARSEILLES, ILL.

Oswego, Ill., for the Aurora, Elgin & Chicago railway. It is also building a bridge over the Illinois-Michigan Canal at the Des Plaines River, a view of which is shown herewith. Several bridges built by this company for the Chicago & Joliet Electric Ry. were illustrated in the "Review" for January last. This bridge which is nearly completed, is built of plate girder spanned across, it has a buckle plate floor, cemented on top and paved with 5-in. oak

The Lake Shore Traction Co. of Westfield, N. Y., was recently organized to build a 28-mile electric line from Westfield to Silver Creek. Among the principal stockholders are: Arthur C. Wade and A. N. Broadhead, of Jamestown, N.Y., and F. R. Green and Harry D. Kirkover, jr., of Fredonia.

FINANCIAL.

METROPOLITAN STREET RAILWAY.

The Metropolitan Street Railway Co., of New York, on Feb. 28th made public its report for the quarter ending December 31st. The report shows net earnings of \$2,010,000 as compared with \$1,939,290 for the corresponding period of the previous year. The surplus after deducting all charges was \$902,823, an increase of \$44,910.

The Third Avenue road for the quarter ending December 31st reported net earnings of \$187,830 which was a decrease of \$36,300 compared with the last quarter of 1900, due to the increase of \$68,023 in expenses. The gross earnings increased \$31,633. The deficit for the quarter after paying all charges was \$217,837. The accompanying table shows the income account for these roads for the last quarter and the changes over the corresponding quarter for the previous year.

METROPOLITAN STREET RAILWAY CO.		
	1901.	Changes.
Gross earnings .....	\$3,754,400	Inc. \$98,460
Operating expenses .....	1,723,972	Inc. 24,323
Net earnings .....	\$2,010,428	Inc. \$74,137
Other income .....	133,536	Dec. 16,554
Total income .....	\$2,143,964	Inc. \$57,573
Charges .....	1,151,140	Inc. 12,973
Surplus .....	\$992,824	Inc. \$44,910
Cash on hand \$4,595,763; profit and loss surplus \$5,452,525.		

THIRD AVENUE RAILROAD CO.		
	1901.	Changes.
Gross earnings .....	\$583,368	Inc. \$31,633
Operating expenses .....	395,531	Inc. 68,023
Net earnings .....	\$187,837	Dec. \$36,390
Other income .....	35,477	Inc. 29,584
Total income .....	\$223,314	Dec. \$6,866
Charges .....	441,152	Inc. 328
Deficit .....	\$217,838	Inc. \$7,134

THE METROPOLITAN SECURITIES CO.

The Metropolitan Securities Co., which, it was announced in our last issue is to control the Metropolitan Street Railway system has been incorporated and its list of directors is a strong one and represents large financial interests. It consists of W. H. Baldwin, jr., representing subway affiliations, G. G. Haven, A. D. Guilliard and James H. Hyde, representing Mutual and Equitable Life Company affiliations, Mortimer L. Schiff of Kuhn, Loeb & Co., the banking firm with which the new plan originated; Thomas P. Fowler of the Ontario & Western and Atchison railroads, probably representing English capital, and E. J. Berwind and Paul D. Cravath. These are all new interests in the Metropolitan company and the reason for their connection with the company remains to be seen. It is generally considered that they have acquired control of a very large property on very easy terms as they subscribe at par for the remaining issue of Metropolitan Securities Co. shares not offered to the old Metropolitan interest. The suggestion that the old stockholders will remain in control of the properties carries but little weight as the new company is a close corporation in which the Metropolitan share holders will have no active voice. The plans now formulated provide for the lease of the Metropolitan company by the Interurban Street Ry. Co. on the basis of 7 per cent on the present outstanding \$2,000,000 stock. The Interurban Street Ry. has practically no property aside from franchises in the Bronx district. Its capital is \$20,000,000 and the company can issue more. The guarantee of this company naturally adds nothing to the value of Metropolitan securities. The Interurban Street Ry. is in turn controlled by the Metropolitan Securities Co.

MARKET STREET RY.

February 21st a syndicate of eastern capitalists consisting of Brown Bros. of New York and a number of Baltimore people obtained an extension of 30 days on an option previously held on the

Market Street Railway Co., of San Francisco, Cal., for \$13,500,000. The sale of the property to the syndicate was subsequently concluded. Since the extension of time was granted the Market Street Railway Co. resumed operations on a number of improvements which had been suspended since the negotiations began. It is now preparing to construct and equip a large power house on North Beach. The new power house will be equipped with boilers and engines of 3,000 h. p. capacity. The boilers will utilize oil for fuel, and will be of the Babcock & Wilcox type. These have already been ordered. The electrical machinery throughout is to be supplied by the General Electric Co. and will include two 1,250 kw. generators and three 750 kw. rotary transformers.

March 5th the United Railroads of San Francisco was incorporated with a capital of \$4,000,000 of which \$200,000 was subscribed by the incorporators who are merely agents. The properties to be taken over by the new company are the Market St. Ry., the San Francisco & San Mateo, the Sutter and the Sutro companies. The lines on California, Geary and Union Sts. are not included. It is stated that the issue of securities at present contemplated will be \$20,000,000 in 4 per cent 20 year bonds, \$15,000,000 in preferred stock and \$10,000,000 in common stock. The Baltimore syndicate is represented by Mr. J. M. Duane, of New York, and the transfer will be made March 28th.

BROOKLYN RAPID TRANSIT CO.

The announcement of the Brooklyn Rapid Transit Co., of the contemplated issue of \$150,000,000 of bonds for refunding, additions, betterments, etc., has been explained by Mr. Greatsinger, president of the company, who states that while the plan of mortgaging the property for \$150,000,000 has been determined upon, it is not contemplated to issue bonds for the whole amount, but instead to issue them for amounts of \$5,000,000 or \$7,000,000 from time to time as needed. The company has not planned to spend the money in any particular manner nor has it decided to absorb any other street railway line, however, it is probable that it may do so in the future. The new bonds will bear interest at 4 per cent. There has been considerable speculation as to what new interests will be acquired as the result of the new bond issue, but all information on this point has been withheld. It has been denied, however, that the issue was in connection with the pending changes in the Metropolitan Street Ry., in Manhattan.

Over \$60,000,000 of the total will not be issued for a number of years to come, as this will be required to refund or take up bonds that will not fall due for from 10 to 50 years. The remaining \$90,000,000 will only be issued as needed. These bonds will be used for paying off additions and improvements to the property the money for which for some time past has been paid out of the earnings. The company is steadily increasing its gross earnings and the net earnings have been decreasing simply because the surplus has been used for improving the property.

METROPOLITAN ELEVATED, CHICAGO.

The Metropolitan Elevated of Chicago completed its fiscal year on February 28th, and the traffic statistics show a decided gain over the previous year. The daily average traffic for the year was 92,006 passengers compared with 86,731 for the previous year, an increase of 7.12 per cent. The total number of passengers carried for the year was 33,910,799, which was a gain of 2,253,818 over the previous year, which would make a gain in passenger earnings of about \$112,000. The traffic increase for the fiscal year, in comparison with those of the previous year is shown in the following table:

	1901 02.	1900 01.	Inc.
March .....	98,338	94,568	3,830
April .....	97,018	90,130	6,588
May .....	92,572	86,288	6,284
June .....	86,178	82,206	3,973
July .....	70,310	73,790	5,512
August .....	81,256	78,468	2,788
September .....	88,226	82,000	6,266
October .....	96,020	86,786	9,234
November .....	97,337	80,822	7,515
December .....	100,770	90,100	10,670
January .....	98,029	89,699	8,330
February .....	100,466	97,659	2,807

NORTHWESTERN ELEVATED, CHICAGO.

The Northwestern Elevated Railroad Co., of Chicago, continues to keep up its remarkable increase in the number of passengers carried. In February it handled the largest daily average number of passengers that it ever carried; the daily average was 64,760, the best preceding average being 63,375, which was reached in December. The increase of the past month over February last year was 9,504 or 17.2 per cent.

CHICAGO CITY RAILWAY CO.

The report of the Chicago City Railway Co. for the year 1901, which has just been issued, shows a good gain in gross receipts and a small increase in net profits, resulting from the large increase in operating expenses. President Hamilton stated that to improve the present service and to add to its efficiency, 150 large electric cars have been purchased and are now being put in commission. Negotiations for 150 more are also in progress. A new car house is nearly completed and extensive additions are being made to the present boiler plants and generating machinery and a storage battery has been installed to supply current at the time and place of greatest need. Every effort has been made by the management to furnish the public with the best service possible under existing conditions but the lack of proper terminal facilities on the Clark St. line and the breakages of the Wabash Ave. and State St. cables which are greatly overtaxed have prevented a strictly reliable and satisfactory service. Large expenditures have been made during the year in reconstructions and maintenance of the property and its physical condition is good.

The entire bonded indebtedness of the company which matured July, 1901, was paid at maturity. The following tables embody the financial statements to the stockholders.

TOTAL GROSS EARNINGS.

	Year 1901.	Increase over 1900.
Passenger Receipts .....	\$5,856,386	\$350,072
Receipts from other sources.....	43,884	7,018
Gross earnings .....	\$5,900,271	\$357,091

TOTAL EXPENSES.

Operating expenses, taxes, reserves for replacements and renewals and damages.....	\$3,869,173	\$214,171
Interest on bonded indebtedness.....	103,938	*103,938
Depreciation .....	180,000	180,000
Net income .....	1,747,159	66,858
Dividends .....	1,620,000	45,000
(12 per cent on \$13,500,000 for 6 months of 1901, and 9 per cent on \$18,000,000 for 6 months of 1901.)		
Surplus for the year.....	127,159	21,858

\*Decrease.

1901, per cent. Increase.

Ratio of operating expenses, taxes, and reserves to total gross earnings.....	.6558	*.0036
Ratio of operating expenses, taxes, and reserves to passenger receipts.....	.6607	*.0031
Passenger receipts per day.....	\$16,044.89	\$959

\*Decrease.

The miles of single track operated by each class of motive power is as follows:

	1901.	1900.
Electric (82.95 per cent of total).....	178.14	173.20
Cable (16.18 per cent of total).....	34.75	34.75
Horse (.87 per cent of total) .....	1.87	1.87
All .....	214.77	209.82

CAR MILES RUN.

	1901.	Increase.
Electric (54.59 per cent of total).....	16,727,540	1,025,160
Cable (45.07 per cent of total).....	13,809,620	384,600
Horse (.34 per cent of total).....	106,000	1,130
All .....	30,643,250	1,410,890

PASSENGERS CARRIED.

Fare passengers .....	117,863,000	7,020,788
Transfer passengers .....	49,415,733	3,207,720
Fare and transfer passengers.....	167,278,723	10,318,571
Percentage of transfer passengers to fare passengers.....		41.93

EVERETT-MOORE PROPERTIES.

The earnings of the several railroad properties controlled by the Everett-Moore syndicate for the month of January show decidedly satisfactory gains. In each case the gain over the corresponding month of last year has been considerable.

The Detroit United Ry. made an increase in its gross earnings of \$35,479 and in its net earnings of \$13,175. The increase of surplus for stock was \$6,302. A quarterly dividend of one per cent was declared last month.

The Detroit & Port Huron Shore Line showed an increase in gross earnings of \$4,364, while the increase in net earnings is \$3,551. The net earnings in January this year were \$1,122 greater than the fixed charges, while for January, 1900, the fixed charges were \$1,700 greater than the net earnings.

The Northern Ohio Traction Co. made an increase of gross receipts for the month of \$2,656, while the expense and taxes showed a reduction of \$2,547, giving a net increase in earnings of \$5,203. The net increase of surplus for stock was \$3,120.

The Toledo Railway & Light Co. made a gain of \$12,981 in gross earnings and the gain of \$5,832 in net earnings. The fixed charges showed an increase of \$13,557, making the surplus available for stock \$7,725 less than in January, 1901.

The London (Ont.) Street Railway Co. had gross earnings increased by \$861 and an increase in surplus for stock of \$171. The ratio of operation to the gross income was reduced 1.25 per cent.

The Cleveland, Painesville & Eastern Ry. shows the gross earnings for the month to have gained \$1,560, while the gain in the net earnings is \$5,542. The deficit after the fixed charges are provided for is \$2,553, a decrease of \$252.

The controlling interest in the Cleveland Electric Ry. has been sold to the syndicate represented by Horace E. Andrews, as mentioned on another page.

The bankers' committee in charge of the Everett-Moore properties has given a 20-day option on the Toledo property to parties whose names are withheld, and it is believed will soon be able to offer for sale a controlling interest in the Detroit United Ry.

A plan for financing the Lake Shore Electric Ry. is under consideration and it is probable that the receiver can be discharged within 60 days.

The Canton-Massillon and the Canton-Akron roads, as mentioned last month, have reverted to their former owners and have been reorganized. The officers of the Canton-Massillon Electric Ry. are: President, P. L. Saltonstall, Boston; general manager and treasurer, Chauncey Eldredge, Boston; secretary, Charles A. Kolp, Canton. The officers of the Canton-Akron Ry. are: President, Charles A. Kolp, Canton; secretary, A. M. Synder, Cleveland.

LOUISVILLE RAILWAY CO.

The annual report of the Louisville Railway Co., Louisville, Ky., for the year ending Dec. 31, 1901, showed the property to be in a prosperous condition. The gross receipts of the company for the year were \$1,617,059. The operating expenses, including taxes, were \$1,024,036, and fixed charges \$445,934, total deductions from earnings \$1,469,970, leaving net earnings of \$147,088. A dividend of 4 per cent on the common stock was declared, which leaves a net surplus of \$7,088.

The directors of the company have arranged to improve the equipments of the road during the coming year by the purchase of 75 large cars containing all modern improvements at a cost of about \$300,000, and also to add vestibules and heaters to a sufficient number of present cars to provide for the regular winter schedule. In April last the directors sold \$200,000 out of the 4½ per cent second mortgage bonds, the proceeds of which were used, together with the surplus available, in betterments and improvements, the total cost of the same being \$338,914.

CINCINNATI, NEWPORT & COVINGTON RAILWAY CO.

The annual meeting of the stockholders of the Cincinnati, Newport & Covington Railway Co. was held February 19th, at which the directors and officers of the previous year were re-elected. The financial reports showed the operation of the system for the year 1901 to have been highly satisfactory to the stockholders and the comparison with previous years made an excellent showing. The business of the year was as follows: Gross earnings \$819,206, operating expenses \$485,263, net earnings \$333,924, fixed charges \$188,362, the net profits \$145,580. The net profit was almost 5 per cent on the total outstanding stock. The total number of passengers carried during the year was 16,681,60, an increase of 901,837 over the previous year. The car-miles for the year were 3,310,345. This statement shows the car-mileage to have decreased, and there was an increase in the cash receipts and in the number of passengers carried. The operating expenses show a material decrease while the average earnings show a good increase.

The Newburgh Electric Railway Co., of Newburgh, New York, reports that during the year ending June 30, 1901, it carried 1,723,386 passengers and 5,739 tons of freight. Its earnings were \$76,927, of which \$9,976 was for freight and \$600 for mail, \$1,013 for express and the balance for passengers. The surplus for stock was \$7,264.

The Union Traction Co. of Indiana, operating about 110 miles, reports gross earnings for the year 1901 as \$743,403 for earnings, \$320,726 other income, \$9,116 interest charges, \$224,429 taxes and licenses, \$15,645. The company has \$5,000,000 of 5 per cent bonds, \$4,500,000 of common stock and about \$500,000 of preferred stock. The net surplus for paying interest on the bonds or 5 per cent on the preferred stock was \$24,604.

The Cohoes City Ry. has filed its report for the quarter ending Dec. 31, 1901, and the following table shows its financial statement for the comparison of the same period in 1900:

	1900	1901.
Gross earnings .....	\$6,141	\$6,018
Operating expenses .....	4,756	5,641
Net from operation.....	1,385	376
Fixed charges .....	1,650	1,800
Net deficiency .....	264	1,423
Cash on hand.....		1,360
Profit and loss (deficiency).....		34,481

The Rome (N. Y.) City Railway Co. has filed its report for the quarter ending Dec. 31, 1901, which shows as follows: Gross earnings, 2,584; operating expenses, \$4,725; net loss, \$2,141; other income, \$187; gross loss, \$1,953; fixed charges, \$1,628; net loss, \$3,572.

United Traction Co., of Albany, N. Y., made large gains in its earnings for the month of February, the aggregate receipts for that period being \$166,645, as compared with \$96,256 for the same month last year. This shows a gain of \$10,388, and is thought to be mainly due to the fact that owing to the completion of the Waterford bridge the company's cars now run through in both directions from Troy to Waterford.

The Twin City Rapid Transit Co. has issued its report for January as follows:

	1902	1901	Increase
Gross .....	\$272,158	\$236,274	\$35,884
Operating expenses ..	132,419	115,223	17,196
Net .....	139,739	121,051	18,688
Surplus .....	63,723	50,222	13,501

Mr. S. Bamberger, president of the Salt Lake & Ogden, and the Nevada Midland Railway Co., has just returned to Salt Lake City from New York. He states that the Salt Lake & Ogden road will at once be changed into an electric line, will be immediately completed to Ogden, and eventually to Brigham City, Utah. Mr. Bamberger states that work will begin as soon as the necessary franchises are obtained.

KANSAS CITY NOTES.

Mr. E. E. Grebill, who has been appointed superintendent of the 12th St. division of the Metropolitan Street Ry. has been in the employ of the company for 14 years and his promotion is a result of the policy of the company to advance the men who have served it faithfully. Mr. Grebill is a very energetic worker and has already made several improvements in the service on his division.

February 26th the Metropolitan company let a contract for \$100,000 worth of No. 0 and No. 00 triple conductor, lead-covered underground cable. This will be used to carry the 6,600 volt alternating, three-phase current to the various transforming sub-stations where it will be converted into continuous current at 575 volts. The contract was awarded to the Standard Underground Cable Co.

Mr. Walter Simmons, formerly assistant electrician for the company, has been appointed chief electrician on the U. S. S. Rainbow, now on its way to the Philippine Islands.

Kansas City has been especially favored this winter, as up to the present time not a single had storm has visited it. It is as unusual as it is agreeable for the city to pass a whole winter without a delay to a single car from snow or sleet storms.

The street railway mail cars have all been repainted white, which has added greatly to their appearance. They are painted pure white.

Mr. E. Lefler, the oldest conductor on the 12th St. division in point of service, has been appointed secretary to the assistant superintendent, Mr. J. W. Carter. Mr. Lefler made an enviable reputation as conductor and was one of the most popular men on the road, but continued service on the cars was impairing his health, hence his promotion.

The contract for an addition to the 18th and Olive Sts. car barn was let March 1st. The building will be of brick 80 ft. wide by 50 ft. long and will cost in the neighborhood of \$5,000. It is to be used for a car storage house. Mr. Becker, master mechanic of the company, is very busy preparing to occupy the new shops at 19th and Lyster Sts., on May 1st. The cramped condition of the present shops seriously interferes with needed repairs. The new shops have every modern convenience for doing all classes of work expeditiously and at minimum cost. They will contain a brass factory where all the brass work of the company will be done, a blacksmith shop, paint shop, machine shop, woodworking shop and electrical shop. In order to do away with much of the manual labor in the shops they are so designed that electrical traveling cranes will carry parts of cars, machinery, etc., from one department to any other.

NEW TERRITORIAL AGENTS FOR CHRISTENSEN CO.

The Christensen Engineering Co., of Milwaukee, makers of air brakes for electric cars, has increased its staff of selling agents and traveling erecting engineers with the view of perfecting a selling organization thoroughly competent to attend to the growing demand for high class air brakes. Mr. F. C. Randall who has heretofore been manager of the eastern department, will assume charge of all sales matters of the company, including the oversight of all agents, the quoting of estimates, etc. Mr. Randall will continue to have his headquarters at 135 Broadway, New York City, but will probably increase his suite by taking in adjoining rooms in order to properly handle the increased business of the New York office. The staff of territorial representatives acting under Mr. Randall will include the following: For New England and Canada, J. T. Cunningham, with headquarters in Boston; for Eastern Pennsylvania and the South, W. W. Power, with headquarters in Philadelphia, but both Mr. Cunningham and Mr. Power may be addressed at the New York office, 135 Broadway; for Western New York, Western Pennsylvania and Ohio, Harry Ransom, with offices in the Markeen Building, 1391 Main St., Buffalo; for Illinois, Indiana and the Middle West, William A. Grauten, with headquarters in St. Louis. A representative for the extreme West will soon be appointed, with offices in San Francisco.

The foreign agents will remain as heretofore, namely: W. A. Parker, 59 City Road, London; R. W. Blackwell & Co., London, Brussels and Paris; Henry Pels & Co., Berlin; Edge & Edge, Sydney.

### THE STRIKE SITUATION.

The strike of the employees of the Kansas City, Leavenworth Electric Railway Co. took an original turn, February 17th, when Manager Wolcott and Superintendent de Coursey were arrested and arraigned in the city court on complaints sworn out by leaders of the strike. The charge trumped up against Mr. Wolcott was that of having violated a state law by allowing street cars to be operated without vestibules and that against Mr. de Coursey, that of unlawfully discriminating against labor organizations in the dismissal of one of his employees. The strikers have withdrawn a number of the demands originally made, and state that their terms of settlement will be the reinstatement of all striking employees and the granting of a dinner hour.

The Terre Haute Electric Co. continues to operate its cars despite occasional riots. The strikers have on several occasions stoned cars filled with passengers, and made other ineffective efforts to interrupt the service. A speedy settlement of the labor difficulties at Terre Haute is, however, expected.

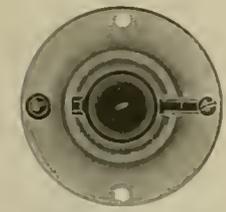

One hundred and fifty employees of the Norfolk (Va.) Railway & Light Co. went out on strike March 1st, exception being taken to a rule of the company requiring conductors and motormen to give bonds. A mob gathered in the streets to prevent the operation of cars, and obstructions of various kinds were placed at frequent intervals upon the tracks. An attempt was made to cut the trolley wires, but this was promptly frustrated by turning on a 10,000 volt current. The police being entirely unable to preserve order, an attachment of militia was procured, March 3d, to guard the company's cars, and irregular runs were thus made. Hand to hand conflicts between the soldiers and the strikers were of such frequent occurrence that there was some discussion as to the advisability of calling for a battery of artillery to assist in securing order.

Dispatches from Ponce, Porto Rico, February 21st, reported a serious riot of the striking laborers on the electric line in that city. The trouble is said to have been caused by the employment of 17 Italian tracklayers, whose presence aroused the animosity of the native laborers.

### CAR-BARN AND OTHER FIRES AND THEIR PREVENTION.

The importance of discovering a fire before it has had a chance to do any serious damage cannot possibly be overestimated; an ounce of prevention always has been and always will be worth many pounds of cure.

The large number of serious car barn fires which have occurred recently will incline our readers to note with interest the fire warning device illustrated in the accompanying engraving and known as the "Copenhagen" thermostat. It consists of a copper disk and a concave silver plate, or diaphragm, the two, when hermetically sealed, forming a capsule about the size of a dime, mounted on a small porcelain base with necessary electrical connections.

"COPENHAGEN" THERMOSTAT, 1/2 SIZE.

In the capsule is enclosed a volatile liquid, which at a certain temperature forces the diaphragm with a positive snap from concave to convex, thereby closing the electric circuit and causing one or more bells to ring an alarm, at the same indicating on an annunciator the exact location of the trouble. As soon as cooled off, the diaphragm snaps back to concave, and is in readiness to be snapped out again as soon and as often as the necessary degree of heat is applied. This construction enables any person to test the thermostat as often as may be desired. The simplicity of the device gives it a long life. In connection with the "Copenhagen" is usually installed a circuit tester, by means of which any break in the wires may be readily detected.

A few of these instruments placed on the ceiling or under the roof of car-barns and other buildings will unfailingly give an alarm the moment a predetermined degree of heat is reached, thereby enabling one to nip the fire in the bud. The "Copenhagen" is also used to give notice of overheated journals, and it is reported that thousands of them are in use in the large terminal grain elevators of the country. The "Copenhagen" thermostat is manufactured by the Copenhagen Automatic Fire Alarm Co., of Sheboygan, Wis.

### CANADIAN NOTES.

The bill to incorporate the Ontario Electric Railway Co., with power to build a line from Cornwall to Toronto, passing through or touching at any or all of the incorporated cities, towns or villages lying on its route, with a line also from Ottawa to Brockville, and power to build branches not exceeding 30 miles in length, has been passed by the railway committee. The promoters of this company include Sir Richard Cartwright, Ottawa; G. C. Smith, Boston; A. A. Jewell, of Boston.

The annual statement of the Halifax Electric Tramway Co. shows the earnings for the year 1901 to have been \$79,232, as compared with \$74,632 for the previous year. There have been four quarterly dividends of 1 1/4 per cent, amounting in all to \$40,000, leaving a surplus of \$39,232.

The bill to incorporate the Toronto & Hamilton Electric Ry., over which there has been a very stubborn fight in the railway committee of the Legislature, has been disapproved by the subcommittee to which it had been referred.

The Toronto Railway Co. will appeal from the decision of the county judge in the application of the company to have the assessment of cars and other rolling stock classed as personalty and not realty, as the city assessment rules them. The amount involved is something like \$450,000.

The Cataract Power & Conduit Co. has awarded to the Westinghouse company the contract for transformers for its station. There will be seven of these, each of 2,500 h. p., oil insulated and water cooled. These transformers will be wound for 2,200 volts two-phase to 1,100 or 2,200 volts three-phase, and will duplicate the present equipment in the transformer house at Niagara Falls.

The appeal of the Hull Electric Co., which claimed a 35-year monopoly for lighting and power supply in Hull, against the decision of the Supreme Court has been dismissed by the Privy Council.

The Lachine Rapids Hydraulic & Landy Co., Montreal, is preparing plans for a large sub-station, including an auxiliary steam plant of about 3,000 h. p. Mr. R. S. Kelsch, chief engineer, has the matter in hand.

The earnings of the Toronto Railway Co. continue to show a satisfactory increase. The January earnings were \$137,135, being \$15,478 more than in January, 1901.

Application has been made for incorporation by the Petrolia Rapid Railway Co., with power to construct an electric railway from Sarnia to Corunna, Courtwright, Petrolia, Dresden, Florence and Thamesville, where connections will be made with the Canadian Pacific Railway. At Courtwright connections will be made with the Detroit boats, and with the Rapid Railway of Detroit, and at Sarnia connection will be made with Port Huron. The plan is to handle freight and express, and if possible secure mail contracts. The districts through which this road proposes to run is now practically devoid of transportation. If incorporation is granted the intention is to construct the line between Corunna and Petrolia this spring, together with power house and sub-stations. Mr. S. A. Armstrong, of Sarnia, is one of the promoters of the subject.

The Ontario Legislature has authorized the incorporation of the Morrisburgh Electric Railway Company, with power to build an electric railway from Morrisburgh to Winchester. The application of the company for permission to generate and sell electricity for lighting and power purposes was refused.

The Hamilton & Caledonia Electric Railway Co. is trying to arrange with the various municipalities for right of way.

The Halifax Tramway expended a considerable amount during the past year on its plant and equipment, and is contemplating extensive improvements during the coming season.

Premier Ross has introduced in the Legislature a bill entitled "An Act Respecting Electric Railways," which provides for a railway committee, consisting of the Commissioner of Public Works, the Attorney-General, and the Commissioner of Crown Lands, to whom shall be delegated certain powers in regulating the powers and privileges of railways on public highways, and constituting an appeal court for the settlement of disputes between companies and municipalities.

The corporation of Port Arthur, Ont., expects to build about two miles of new road during the coming spring. It will also be in the market for open and closed cars, motors and transformers.

The Berlin & Bridgeport Electric Railway Co. has elected Mr.

W. H. Breithaupt (president of the Berlin & Waterloo St. Ry. Co.) as president of the new company. The company proposes building an electric railway to connect Berlin and Bridgeport, the line to be completed this year.

It is stated that the bankers' committee having charge of the Moore-Everett interests are considering the question of disposing of the London Street Railway, which is one of the syndicate properties, in order to provide funds for the Federal Telephone Co. Two months ago an offer of \$180 per share was made to the syndicate for the London Street Railway Company's property. This was refused at the time, but it is said that the committee are now willing to accept this figure. The road has a capital stock of \$400,000, and is bonded for a similar amount, and is 28 miles in length.

At a meeting of the board of directors of the Montreal Street Railway Company it was decided that in pursuance of a resolution adopted at the special meeting of shareholders held in July last the company issue \$1,500,000 of 4½ per cent bonds, for the purpose of providing for the purchase of the Montreal Park & Island Railway securities, the same to be offered to shareholders at par pro rata to their holding of stock.

Mr. J. Butzen, manager of the British Columbia Electric Ry. has returned from California where he has been inspecting various water powers, with a view of adopting the most advantageous methods for the development of power at Coquitlam Falls for the Vancouver Power Co.

### NEW STUART-HOWLAND CATALOG.

The Stuart-Howland Co., of Boston, reports a remarkable growth in all departments of its business. The company's sales in the last year show an increase of 120 per cent over the previous year. The street railway department has been particularly prosperous, having furnished in the season of 1901, in addition to the general supply business, the entire overhead and pole equipment (excepting wire) for over 500 miles of new road. The company now makes this complete line and has several large orders booked for delivery the coming spring. It also carries a very complete stock of all kinds of electrical supplies, except heavy machinery, and has now 10 salesmen on the road.

The Stuart-Howland Co. has recently issued a 332-page, 6x8 in. general electrical supply catalog, handsomely bound in cloth, in which everything is listed alphabetically, and very generally illustrated. It is printed on 70-lb. coated natural tint paper. Both print and illustrations are unusually distinct, and as practically everything is shown which contractors, supply dealers, street railways, telephone companies, central stations and isolated plants have to purchase, it must prove decidedly popular in the purchasing departments of the various branches of the electrical trade.

### MERGER OF NIAGARA FALLS FRONTIER LINES.

The merger of all the lines on the Niagara frontier with the exception of two roads has just been completed. The name of the new company is the International Railway Co., of Buffalo, of which a certificate of incorporation was filed February 19th. The companies included in this consolidation are as follows: The Buffalo Railway Co., the Buffalo & Niagara Falls Electric Ry., the Buffalo, Tonawanda & Niagara Falls Electric Ry., the Niagara Falls & Suspension Bridge Ry., the Buffalo & Lockport Ry., the Lockport & Olcott Ry., the Niagara Falls & Suspension Bridge Railway Co., and the Niagara Falls Suspension Bridge Co.

The capital stock of the company is \$10,120,500. The directors include Francis Lynde Stetson, James P. Ord, Daniel S. Lamont, W. Caryl Ely, Burt Van Horn, William B. Rankine, and Thomas De Witt Cuyler. Mr. Ely is president, and T. E. Mitten, general manager. The company's main offices will be in Buffalo. It is stated that the company has formulated plans for the betterment of the service throughout the entire system which will be put into effect this spring.

April 1st the Wheeling Traction Co. will put a new wage scale in effect, increasing the wages of its employes from 19 to 20 cents an hour.

### PENSIONS FOR THE METROPOLITAN OF NEW YORK.

The announcement was made March 6th that the Metropolitan Street Railway Co., of New York, had adopted the policy of pensioning its superannuated employes, making it the second street railway company to do so, the first having been the United Traction & Electric Co., of Providence, R. I., whose pension plan was described in our issue for January, page 14.

The Metropolitan plan is applicable to all employes who have not received more than \$1,200 per year from the company. The scheme provides for voluntary and involuntary retirement of all employes so included, between the ages of 65 and 70, after 25 years' service in the Metropolitan Street Railway Co. or any of its constituent companies. Employes benefited by the system will be of two classes:

First—All employes who have attained the age of 70 years who have been continuously in such service for 25 years or more preceding such date of maturity, and,

Second—All employes from 65 to 69 years of age who have been 25 years or more in such service, who, in the opinion of the trustees of the pension, have become physically disqualified.

The pension allowance to such retired employes is upon the following basis:

A—If the service has been continuous for 35 years or more 40 per cent of the average annual wages for the ten previous years.

B—If service has been continuous for 30 years, 30 per cent of the average annual wages for the ten previous years.

C—If service has been continuous for 25 years, 25 per cent of the average annual wages for the ten previous years.

It will be remarked that the pension proposed under the Metropolitan scheme are considerably less for long service men than was provided for by the Providence road. Thus the Metropolitan pension is 1 per cent of the average annual wages during the last 10 years for each year of continuous service between 25 and 40 years, while in Providence the pension is 1 per cent of the average wage for 10 years for each year of service up to 20 years, and for longer terms of service increases till for 35 years or over the rate is 2 per cent for each year of service.

### ACCIDENTS OF THE MONTH.

A cave-in on the new electric line between Beloit, Wis., and Rockford, Ill., February 20th, resulted in fatal injuries to two persons.

A heavy fog caused two collisions between street cars, in Pittston and Wilkesbarre, Pa., February 24th. In the first instance the cars were wrecked, while passengers and crew escaped injury. At Wilkesbarre the damage to the cars was light, but the motorman and one passenger were slightly injured.

An unusual accident occurred on the Hawks-Angus line between Ann Arbor, Mich., and Jackson, just within the limits of the latter city, February 24th. The car was making a sharp curve when the car body left the trucks, and with 20 passengers inside, rolled over several times before stopping. Only two of the passengers were seriously injured.

### INDIAN TERRITORY TRACTION CO.

The Indian Territory Traction Co., of South McAlester, I. T., has been organized to build an interurban road connecting that city with a number of the adjoining towns. The officers of the company are: President, Luke W. Bryan, president State National Bank, South McAlester; vice-president, Lawrence P. Boyle, 804 Tacoma Bldg., Chicago; secretary, M. M. Lindley, and treasurer, A. M. Thomas, of South McAlester. The present line is 16 miles in length and runs from South McAlester to McAlester, Krebs, Anderson, Batch, Dow, Buck, Cherryville, Hartshorn and Haleyville. The total population to be served by this road numbers about 35,000. Mr. Smith, city engineer of South McAlester, is making the surveys for the new road. The line is to be operated on the overhead trolley system, and there are coal mines along the route whose pay rolls for miners average \$150,000 per month.

The Knoxville (Tenn.) Traction Co. has donated \$250 to the fund for building an auditorium in that city.

**“ALL WIRE” RAIL BOND.**

The “All Wire” rail bond, which is shown in Fig. 1, is made entirely from one piece of flexible copper cable, and is presented as one of the most perfect types of a “one-piece” bond now on the market. The conducting strands and terminals are made from a single piece of cable and there are no cast or welded joints in the bond to become loose or interpose additional internal resistance,

FIG. 1.

due to imperfectly cast or welded joints. The conductivity of the “All Wire” bond is given as that of commercially pure copper, and it is claimed that this conductivity is maintained throughout the entire length, including the terminals, and that when compared with other types of bonds having terminals connected to strands by either cast or welded joints, the “All Wire” bond shows superior conductivity.

The bond is intended for use under the fish plate, in which position it is perfectly protected from injury from outside causes, as well as from theft, and a variety of styles are manufactured for

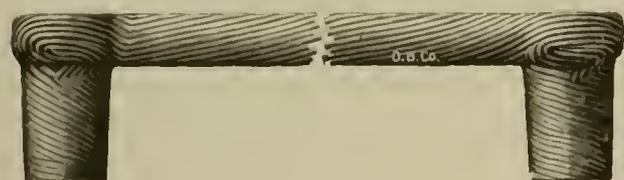

FIG. 2.

such use. It may also be used around the fish plate or under the base of the rail, if desired, special types of bonds are furnished for this purpose, as well as for cross-connecting and underground bonding.

This bond is applied by means of a compressor, designed to insure a perfect contact between the terminals of the bond and the rail ends. The terminals are so shaped that a large contact surface is presented to the rail, a contact of extremely low resistance is secured. The rails may be bonded to their full carrying capacity.

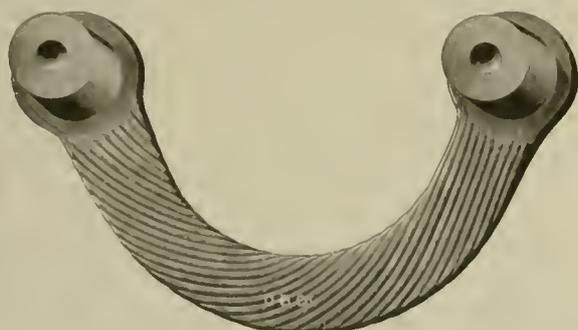

FIG. 3.

Being made from stranded cable, the bond is very flexible, and can successfully withstand the jar and vibration of the rails, as well as their expansion and contraction.

This bond is made entirely from one piece of flexible copper cable, which is cut to length and placed in a forming machine, in which the ends of the cable are cold pressed into shape for the terminals, as illustrated in Fig. 2, the size of the terminals, however, being considerably larger than in the finished bond. The ends are then heated almost to the melting point and forged accurately to size in a steel die. In the latter process the size of the terminals is considerably reduced, the strands of wire composing them being perfectly welded together, and forming a mass of solid copper. Fig. 3 shows the appearance of the finished bond and illustrates the man-

ner in which the strands of cable are gradually merged into the solid copper terminal.

The “All Wire” rail bond is made by the Ohio Brass Co. of Mansfield, O.

**NEW CONTRACTING FIRM IN INDIANAPOLIS.**

A partnership has recently been effected between Messrs. J. J. Brennan and I. R. Nelson, Franklin Block, Indianapolis, contractors for street railway, electric light, telephone and telegraph lines. Both members of the firm have had extensive experience in electrical construction. Mr. Brennan has been engaged in line work both in telephone, telegraph and street railway construction and has worked his way up through the business to superintendent of overhead construction which position he has held with the Indianapolis Street Ry. Mr. Nelson worked as a boy with the Brush Electric Co., of Cleveland, and afterwards spent a number of years in the west setting up and operating electric lighting plants. He started into street railway work with the Cleveland Street Ry., at the time that company changed from horse to electric power. He has filled a number of positions in street railway work including that of electrician to the Indianapolis Street Ry. The new concern starts out with the best wishes of its many friends and acquaintances and is already bidding on about 30 miles of interurban road which is to be built this summer as well as on a number of smaller jobs.

**CHANGES IN THE WORKS OF THE HOOVEN, OWENS, RENTSCHLER CO.**

We are informed by an official of the company that the Hooven, Owens, Rentschler Co. of Hamilton, O., builders of Hamilton corliss engines, will soon bring out a complete new line of vertical engines in sizes up to 7000 and 8000 h. p. for all grades of service in which vertical engines can be utilized. Heavy vertical engines for direct connected street railway work will form an important branch of the company's business.

To give facilities for turning out this large work the company has made plans for a new foundry and shops that will treble the output capacity of the present plant. The foundry will occupy an entire new building, 100 x 400 ft. with two long bays to be utilized as machine shops. The present building will also be remodeled and rebuilt. The execution of these plans will commence this spring as soon as frost is out of the ground.

Mr. W. B. Mayo, of 30 Cortlandt St., New York City, eastern manager of the company, reports a satisfying condition of business. The New York office has closed orders for Hamilton engines in the new Perth Amboy plant of the American Smelting Co.; large electrolytic works at Quincy, Mass.; air-compressing plants and several electric railway stations in the east.

**REORGANIZATION ON STATEN ISLAND.**

A receiver has been appointed for the New York & Staten Island Electric Co., the Staten Island Electric Railroad Co., and the New Jersey & Staten Island Ferry Co. All three companies have physical interests in common but heretofore have been under separate managements. It is officially stated that the receivership is a preliminary step toward a consolidation of the three properties. The New York & Staten Island Electric Co. furnishes power for electric lighting and owns the stock of the Staten Island Electric Railroad Co. The Staten Island Electric Railroad Co. owns 31 miles of track forming a belt line around the island and also owns one-half the stock of the Rapid Transit Ferry Co., whose line of ferry boats plies between the northern end of the island and the southern end of New York City. The stockholders in the railroad company and the lighting company have the controlling interest in the New Jersey & Staten Island Ferry Co. Mr. J. H. Swinarton is president of the electric railway and the ferry company, and vice-president of the lighting company. Mr. John Greenough was named as receiver.

There is one other electric railway company on Staten Island called the Staten Island Midland Railway Co., of which Robert Wetherill, of Chester, Pa., is president. It owns 28 miles of track.

### HALF FARES.

The promoters of the proposed electric line between Aberdeen and Hoquiam, Wash., announce that the road will be in running order by June 1st.

The Homestead (Pa.) & Mifflin Street Railway Co. has decided to increase its capital stock by \$25,000 and employ the proceeds in building an extension to Lincoln Place.

The Michigan Suburban R. R., "the Lansing, St. Johns and St. Louis line," has issued its time table No. 1, effective Sunday, February 16th, over its lines between Lansing and St. Johns.

Among the promoters of the Chicago & Indiana Air Line R. R., a projected electric line to connect South Bend, Michigan City and Chicago, is Russell B. Harrison. Mr. Harrison is reported to have recently become financially interested in the project.

A plan for doubling the capacity of the Union Elevated loop in Chicago by constructing a second superstructure above the one at present used, has been evolved by a member of the Board of Local Improvements, and is said to have been endorsed by local engineers.

The St. Louis Transit Co. has issued orders to conductors to accept without question bent or worn small coins tendered for fare; nickels or coppers that have been clipped or punched will be rejected, and gold coins will be not accepted unless in good condition.

The Richmond (Va.) & Petersburg Electric Ry., connecting the cities named in the title, was opened for traffic between Petersburg and Manchester, February 9th. The wife of Superintendent Felt of the company acted as motoneer of the first car that was run over the road.

A bill has been introduced in the Maryland Legislature to incorporate the Frederick & Jefferson Electric Railroad, Light & Power Co. of Jefferson, Md., which projects a new interurban line over the route indicated in the title. L. O. Whip will be president of the company.

The Chicago Union Traction Co. has made a regular 5-cent fare between Austin and the city on all surface cars west of 48th Ave., connections being made with the Lake St. Elevated. Formerly, a 5-cent fare was granted only on one car which ran on a 40-minute schedule.

The Butte (Mont.) Electric Railway Co. projects a number of improvements at Columbia Garden this season, which will include a large base ball ground with grand stand, and hand ball and tennis courts. Ten thousand dollars will be expended in equipping this park with facilities for games and sports.

General Manager Mitten, of the International Traction Co., Buffalo, has agreed to transport free all the fish fry obtained by the Niagara County Anglers' Club from the state hatcheries. Four million white fish fry and lake trout will be carried from Lockport to Olcott on trolley freight cars, for planting in Lake Ontario.

The Youngstown Sharon Railway & Light Co. has purchased a site for a passenger and freight depot in Sharon, Pa. It is announced that a five-story brick building will be erected by the company, the upper floors of which will be used as offices. The company is also preparing to push work on its extension to New Castle and expects to have the branch open for traffic by June 1st. The route includes New Bedford and other thriving towns.

The chief of the Chicago fire department favors motor cars equipped with a truck and hose apparatus to be used, in emergency, as the superstructure of the elevated railways. The plan would entail a device for shutting off the current of the trolley in any block desired, and a general system of fire mains and standpipes with high pressure which would be an expensive but commendable innovation.

### NEW TERMINAL FOR METROPOLITAN "L" ROAD.

The Metropolitan West Side Elevated Railroad Co., of Chicago, announces that it has acquired a strip of property to provide extra terminal facilities in the down town district. The property has been purchased with the object of handling the increasing traffic of this road and to avoid in a measure the overcrowded condition of the Union Loop. The property acquired extends from the east side of Market St. about 100 ft. south of Jackson boulevard to the west side of Fifth Ave. An extension of the road will be built on this strip giving an independent line to the junction with the Union Loop on Fifth Avenue in addition to the privileges which the road now has on the loop. The aggregate cost of the property was \$771,000. The work on the extension will be commenced as soon as the company can take possession of the property which the officers of the company state will be very soon. It is understood that one of the principal objects of the new terminal will be to provide accommodations for express trains on the several divisions of the road, especially during the morning and evening rush hours.

### THE GENERAL ELECTRIC RAILBOND.

The General Electric Co. is now manufacturing a bond which was brought out last year by the American Railbond Co., of Chicago. The head of this bond is made of a solid piece of copper in which is cast a steel spool having hardened heads and a soft shank. This bond was illustrated and described at length in the issue of the "Review" for March 15, 1901. In applying the bond to the rail the heads of the spool, which extend about  $\frac{1}{8}$  in. above the surface of the surrounding copper of the head of the bond, are compressed causing the softened shank to bulge out and a consequent flow of the copper which completely fills the hole in the rail forming a joint which is entirely impervious to moisture.

### OBSERVATION CARS.

A company, named the American Sightseeing Car & Coach Co., was formed sometime ago for the purpose of instituting in a number of cities a special observation car service. The company is now running these observation trips in Washington, D. C., Charleston, S. C., and other southern cities. In these cases the street railway companies merely rent the necessary rolling stock to the "Seeing" company which furnishes the guides and assumes all the responsibility in connection with the trips. The arrangement of distance covered, time and fare is practically the same in each city. The special cars are termed "Seeing Washington" or "Seeing Charleston" cars and make daily and Sunday tours, affording visitors a comfortable, inexpensive and quick means of seeing the principal points of interest in and about each city, including the public buildings, the boulevards and parks, residences of prominent men, the monuments and other historic spots. These trips are run daily, cars in Washington for example leaving the centre of the city at 10:00 a. m., 12 noon, and 2:00 p. m., the round trip requiring about two hours. The total distance covered is about 25 miles.

Each "seeing" car has an expert guide in attendance who points out the places of interest along the route and gives a sketch of their history. Tickets are sold at 50 cents per person for the round trip. These special cars do not stop to take on passengers except at a few prominent points, but passengers may leave the car at any time upon request to the conductor. Observation cars may be secured by parties numbering 40 or more to meet them at any depot or hotel, the price for this special service, including expert guide, being the regular charge of 50 cents for each person.

For the observation tours long open cars are assigned in summer and comfortable, well-heated closed cars in winter.

It is announced that the electric railway which the Boland syndicate is building from Detroit to Chicago will be open for traffic from the former city to Kalamazoo, by July 1st. The promoters contemplate an extension from Kalamazoo to Benton Harbor, which is to be completed in time to accommodate Chicagoans going East for the summer.

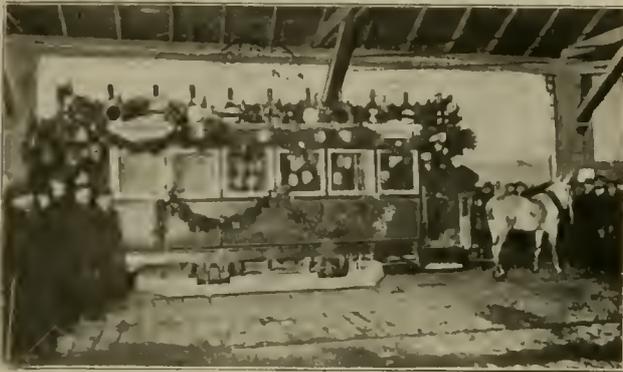

### WAGES INCREASED AT CAMDEN, N. J.

Editor "Review": We beg to advise you that we have decided to increase the wages of our conductors and motormen from 15 cents an hour to 17 cents an hour, to begin March 6, 1902. This rate of wage, with a premium of 10 per cent paid monthly for freedom from accidents and general good deportment, will make the wages of these men participating 18.7 cents per hour, and the men who have been in our employ for over five years will receive their uniforms as usual, which will make the rate somewhat in excess of that paid by other roads in this vicinity. Yours truly,

The Camden & Suburban Railway Co.,  
W. E. HARRINGTON, V. P. & G. M.

### LAST VIENNA HORSE CAR.

The accompanying engraving is from a souvenir postal card mailed us by the Wiener Tramway Gesellschaft, of Vienna, Austria, and shows the last horse car operated in Vienna, which made the

final trip Jan. 28, 1902. This company formerly had 600 horse cars and is now operating 825 electric cars.

### PROPOSED BALTIMORE INTERURBAN.

Messrs. Carswell & Sons, of Baltimore, Md., have secured from the Legislature of that state a charter for an interurban line running from Baltimore through five of the neighboring villages having from one to three thousand population each. This charter is the only one in Baltimore that is not owned by the United Railways & Electric Co. and the promoters of the new road have secured rights of way through sections where there are at present no railway facilities. The lines pass a large steel works where nearly 3,000 men travel back and forth night and morning. Several summer resorts are located on the bay near by which will undoubtedly add greatly to the business of this road. The work of construction has been delayed by the withdrawal of two members of the syndicate on account of not getting the legislation desired, but as soon as these vacancies have been filled the work on this road will be put under way.

### MAYOR'S CERTIFICATE PROPOSED IN ALBANY.

The United Traction Co. of Albany has refused to honor certificates issued by the mayor of that city to the city employes which were tendered in lieu of car fare. Two employes of the city police and fire department carrying these certificates were ejected from one of the company's cars upon their refusal to pay their fare. It is the purpose of the mayor to test the constitutionality of the law of 1895 giving permission to the mayor of any city of the state or president of any village "to issue with the seal of his office, a certificate of appointment of police and firemen; and it shall be the duty of any surface or elevated road to furnish free transportation to police and firemen while traveling on the cars in the performance of duties."

### MUNCIE, HARTFORD, CITY & FT. WAYNE INTERURBAN.

The Muncie, Hartford City & Ft. Wayne Electric Railroad Co., which is to build an interurban line between the places named, has ordered a large amount of its material and equipment and expects to commence the construction of the road immediately. The new company has placed an order for over 50 miles of copper wire and has also ordered several thousand poles and 25,000 ties. The ties are now being received and distributed along the right of way. Eight new passenger cars and one construction car have been ordered from the John Stephenson Co. which will cost about \$6,000 each. The cars will be 44 ft. in length, of handsome appearance and, according to the contract, must be delivered not later than July next.

### IMPROVEMENTS AT MINNEAPOLIS.

The Twin City Rapid Transit Co., Minneapolis, has awarded contracts aggregating \$350,000 for the equipment of its new power stations. The Allis-Chalmers Co., Milwaukee, has been awarded the contract for engines; the Babcock & Wilcox Co. will furnish boilers; the General Electric Co., the electric generators; the George F. Blake Co., the condensers and pumps, and the Jones Underfeed Stoker Co., the mechanical stokers. At latest reports contracts for the coal handling machinery, feed water heaters, purifiers, traveling cranes, etc., which may aggregate an equal amount, had not been awarded.

### "WONDERLAND" FOR 1902.

This is the title of a publication presented by the passenger department of the Northern Pacific Railway Co., a most artistically decorated book of some 110 pages containing descriptive articles of all the western country tributary to the Northern Pacific lines. The publishers have surpassed their previous efforts in making the annual "Wonderland" both instructive and beautiful. The cover designs and chapter headings, by Alfred Lenz, are engraved from modeled designs in plastique, appropriate to the text. The other illustrations comprise views of the scenery and cities en route, and the important industrial institutions in the flourishing towns of the West. The leading feature of this number is a chapter on mining in Montana from the early days to the present, and other chapters describe the northern Cheyenne Indians, Yellowstone Park and the Puget Sound country. Wonderland, from its genuine literary and artistic merit, is now generally welcomed in the library, school room and home. The book will, as heretofore, be sent to any address upon receipt of six cents, the price of postage. Inquiries may be addressed to Charles S. Fee, general passenger and ticket agent, St. Paul.

The Ripley, Georgetown, Hillsboro & Columbus Railway Co., of Hillsboro, O., has not yet begun the construction of its projected line between the cities named in the title.

The Austin (Tex.) Rapid Transit Railway Co. projects a considerable amount of construction work this season.

The Rapid Transit Co. of Chattanooga, Tenn., has completed its line to Lookout Mountain. The company's system now embraces all the suburbs of Chattanooga.

The Philadelphia Co., which controls the Pittsburg Railways Co., has acquired the charters for elevated roads in Pittsburg which have been granted during the past year.

The Cumberland (Md.) Electric Railway Co. expects to increase the capacity of its power station by 200 kw. The generator will be installed by the Edison Electric Illuminating Co.

### THE SHADE OF THE PALM.

Music of this beautiful piece as sung by the Florodora Opera Co. will be mailed on receipt of 15 cents in silver or stamps. Address "Music," Advertising Department, C. H. & D. Ry., Cincinnati, O.

## ECHOES FROM THE TRADE

ARTHUR W. FIELD, 53 State St., Boston, dealer in street railway specialties, is presenting friends and patrons with an artistic calendar of convenient size for office use.

THE MORDEN FROG & CROSSING WORKS, Chicago, Ill., has just let contracts for an addition to its plant, the building to be 120 x 120 ft. The new plant will be equipped and operated by electricity. The additional machinery has been contracted for.

HARTSHORN'S ROLLER, published by the Stewart Hartshorn Co., East Newark, N. J., in the interest of the company's shades, for February contained an announcement of Hartshorn's annual banquet, and the usual quota of humorous articles, stories, jokes and pictures.

THE ALLIS-CHALMERS CO., of Milwaukee, has received an order for six additional engines of a maximum 12,000 h. p. each, to be furnished the New York Underground Railway Co. The contract with this company now calls for 12 engines, and aggregates \$1,305,000.

THE J. G. BRILL CO., of Philadelphia, has received an order for 50 cars of a type which originated with the president of the Union Traction Co., of Philadelphia, Mr. John B. Parsons, and has proved very popular. They will be mounted on the Chicago Truck Co.'s type "D" trucks.

THE C. H. WORCESTER CO., of Marinette, Wis., dealer in white cedar products, has published a code by means of which the buyer can order any kind of cedar supplies by the use of a few words. The pamphlet also contains inspection comments from the Northwestern Cedar Men's specifications and information as to the method of shipping its materials.

THE J. T. SCHAFER MANUFACTURING CO., of Rochester, N. Y., has moved to a new factory which is much larger than the one which it has operated for the past few years. The new factory is at the corner of Circle & East Main Sts., and contains ample room for machine shops and foundry. The business of the company has recently far outgrown the facilities of its old factory.

FRED M. LOCKE, of Victor, N. Y., maker of porcelain insulators for high tension service, now has his new factory in full operation. The old shop burned down on January 5th and on March 1st the new plant was completed and started working on orders. This factory contains all the latest clayworking machinery for the manufacture of porcelain insulators and has about three times the capacity of the old plant.

THE OHIO BRASS CO., Mansfield, O., has issued bulletin No. 8, entitled "Third-rail Insulator." The pamphlet is a highly creditable production from a typographical standpoint and contains numerous illustrations of various types of third-rail insulators, a sketch of the development of these appliances and a brief description of the insulator being installed for the system of the Aurora, Elgin & Chicago Ry., now in course of construction.

THE FIRM of Alfred M. Lamar & Co., of 60 Broadway, New York City, dealers in investment securities, makes a specialty of interurban traction securities. The members of the firm have been well known in New York financial circles for some years and the new traction department starts with a select clientele. Mr. H. D. Reynolds, who has charge of this department is well qualified to conduct it and has surrounded himself with a staff of capable and experienced aids.

THE FRANK S. DE RONDE CO., of 46 Cliff St., New York City, sells a cold water paint for application to wood, stone or brick surfaces and which is said to be an excellent substitute for oil paints at about one-half the cost. It is sold under the trade name of "Lythite" and comes in dry powder form. By the addition of cold water it is all ready for use. The paint is furnished in many colors for inside or outside application. This company also makes a red brick stain for permanently coloring brick a rich red hue.

P. W. CHAMBERLAIN, an American engineer, has closed a contract with the Nicaraguan government for 300 tons of steel rails and other fixtures to be used for the Atlantic Railroad which is now under construction. It is stipulated in the contract that the material is to be purchased in the United States. Mr. Chamberlain is now pushing the completion of work on that part of the road connecting the Indio River with the San Juan River at San Francisco, from which point there is steamboat navigation.

THE H. W. JOHNS-MANVILLE Co. has been formed by the consolidation of the H. W. Johns Manufacturing Co., of New York and the Manville Covering Co., of Milwaukee, which was effective January 1st. The new company is prepared to furnish a complete line of all grades of steam pipe and boiler coverings, and asbestos goods of all descriptions. Offices will be located in New York, Milwaukee, Chicago, St. Louis, Boston, Philadelphia, Pittsburg, Columbus, New Orleans, and London, England. The company's factories are at Brooklyn and Milwaukee.

THE GOULD STORAGE BATTERY CO., of New York City, has just completed the installation of a plant at Easton, Pa., for the Easton Power Co., which is subsidiary to the Light, Heat & Power Corporation, of Boston. The new plant consists of 255 cells of the Gould company's type S 011, in lead-lined tanks, having a capacity of 408 kw. hours, and a Gould patented C. E. M. F. regulating booster. This equipment is to be used in regulating the fluctuations of the street railway load and replaces a plant of half its size.

THE LUDLOW SUPPLY CO., of Cleveland, agent for the Gore track drill, which was illustrated and described in the February issue of the "Review," reports that it is having good success with this machine and is receiving almost daily inquiries regarding the working of this drill. Since the rail mills have been charging \$1.00 per ton for drilling bond holes in the rails, there has been an increased demand for track drills, by the use of which, not only a great saving can be made, but the bond holes, being drilled on the ground, do not require reaming as they do when drilled at the mill.

THE GENERAL ELECTRIC CO. has recently issued the following: Bulletin No. 4271, "Isolated Plant Switchboards." Bulletin No. 4272, "Small Direct Coupled Generating Sets." Bulletin No. 4273, "The GE-66 Railway Motor." Bulletin No. 4274, "Magnetic Separators." Catalog and Price List No. 7552 (superseding No. 7549), "Parts of U. S. Trolleys." Flyer No. 2090 (superseding No. 2060), "Pendant Push Button Switches." Price List No. 5090, "Parts of Form 2 Direct Current Multiple Arc Lamps for 220 Volt Circuits."

THE AMERICAN BLOWER CO., Detroit, Mich., has issued its illustrated sectional catalog No. 134, descriptive of "A. B. C." steel plate fans for heating, ventilating and drying plants, forced and induced draft apparatus, etc. Thorough descriptions, diagrams and illustrations of the various types of full housed and three-quarter housed fans are given, together with statistical tables, price list and other useful data. Attention is called to the importance, in ordering fans, of distinguishing the hand of the fan so as to designate on which side the pulley desired, as they are built either right or left hand.

THE WABASH RAILROAD CO. and the WHEELING & LAKE ERIE R. R., anticipating the early completion of the connections of the Wabash line into Pittsburg, which will bring that city into close touch with Wheeling, Cleveland, Toledo, Detroit, Chicago, St. Louis, Kansas City, Omaha and Des Moines, have issued a handsomely illustrated booklet containing announcements apropos of the event. The passenger station will be located at Ferry and Liberty Sts., and will be a commodious structure, modern in its appointments. It will be reached by elevated road leading from the bridge, which is to cross the Monongahela River.

THE FALK CO., of Milwaukee, Wis., is engaged in making a large amount of special work and its 400 employes are being kept very busy. The sales in the gear and pinion department are extremely brisk and the outlook for business during the coming season is exceptionally good. The fact that this company makes its own steel for the manufacture of gears and pinions appeals very strongly to street railway managers for the reason that they get metal of the desired analysis. A number of contracts for welding tracks have been closed already this season which is considerably ahead of the record in point of time.

O. D. TRANSFORMERS, is the title of an illustrated catalog published by the Westinghouse Electric & Manufacturing Co., in which this type of transformer is illustrated and described in detail. The pamphlet also illustrates the method of grouping single phase transformers for polyphase work and contains curves showing the efficiencies of these transformers under various loads. Aside from the descriptive features the catalog contains much useful information in regard to transformers which will prove of service to engineers in connection with alternating current work.

THE CHASE-SHAWMUT CO., of Boston, Mass., has published a small pamphlet of convenient size to be carried in the pocket, which is entitled "Electrical Data." It is designed for the use of electrical workers and contains wire tables and formulae for determining the size of wire, tables of equivalent sections of different gages, the ampere per generator and per motor of machines of various horse power capacities, definitions of electrical units and much other useful information. It also contains descriptions of a number of this company's specialties including fuse wire, enclosed fuses, switches, switch boards, motors and generators, conduit, rail bonds, etc.

BULLETIN NO. 69, of the Electric Storage Battery Co., of Philadelphia, contains an article on "The Distribution of Electrical Energy in Large Cities," by Louis A. Ferguson, which was read at a recent meeting of the American Society of Electrical Engineers. The article contains a description of the installation of chloride accumulators in the service of the Chicago Edison Co., and points out the saving in operating expenses which is secured by means of properly installed accumulator plants. Aside from the economy gained in operating expenses, perhaps the greatest value of the storage battery lies in its ability to carry a plant through an emergency which as a rule, comes with but little warning and at the time of heavy load. A fully charged battery floating on the system responds automatically to every call, keeping the pressure constant, despite breakdowns in machinery or on sub-station transmission lines.

THE SARGENT CO., of Chicago, heretofore operating an open hearth steel plant at 59th St. for the manufacture of draw bars, knuckles, coupler parts for repairs, and a plant at Chicago Heights, Ill., for the manufacture of "Tropenas" steel castings and steel and iron brake shoes, has transferred the plant at Chicago Heights, together with the classes of business done there, to the American Brake Shoe & Foundry Co., which company will hereafter conduct the business of this department from its offices at Chicago Heights. The Sargent Co. will continue the operation of the open hearth steel plant at 59th St., where its general offices will be located. Plans are being made for enlarging the Sargent Co.'s works to three times their present capacity.

THE TAUNTON LOCOMOTIVE MANUFACTURING CO., which makes the Wainwright even-flow feed water heater, has pub-

lished a small folder describing its apparatus and also a reprint from Power on "The Transfer of Heat from Steam to Water Through a Partition." The efficiency of the feed water depends upon the readiness with which heat may be transferred to the feed water through the walls of the tubes. The tubes in these heaters are of pure copper and are corrugated in order that the water passing through them may be agitated in its flow so as to bring every part of it into contact with the walls of the tubes. The reprint gives a report of tests made on these heaters which show an excellent efficiency.

THE NICHOLS-LINTEN pneumatic track sander is in use or is specified upon cars being built for the following roads: Cleveland, Elyria & Western Railway Co., Elyria, Crafon & Southern Railway Co., Cleveland & Chagrin Falls Electric Railway Co., Cleveland, Medina & Southern Railway Co., Cleveland & Eastern Railway Co., Toledo & Western Railway Co., Western Ohio Railway Co., Union Traction Co. of Indiana, Indianapolis, Greenwood & Franklin R. R. Co., Indianapolis & Martinsville Rapid Transit Co., Omaha & Council Bluffs Railway & Bridge Co., Toledo, Fremont & Norwalk Railway Co., Canton & Akron Railway Co., Hamilton, Glendale & Cincinnati Traction Co., Lorain Street Railway Co., Aurora, Elgin & Chicago Co., Chicago, Harvard & Geneva Lake Railway Co., Little Miami Traction Co., Muncie, Hartford & Ft. Wayne Railway Co., Louisville, Anchorage & Pewee Valley Railway Co., Ft. Wayne & Southwestern Traction Co., Brooklyn Heights Railroad Co.

THE STERLING-MEAKER CO., on another page of this issue, shows working drawings of the Sterling brake and invites attention to some salient points of the mechanism. The steady progress made by this brake in the favor of railway men for five or six years constitutes a really remarkable history. The market has been invaded by scores of inventions of great apparent merit, but the Sterling has kept right on broadening its field and doing satisfactory work day after day and year after year under all the most trying and danger-breeding conditions known to street rail-roading. Clearly this brake must have the solid qualities claimed for it—quickness, power, smooth operation and economy—or it could not have held its own so sturdily, to say nothing of making new friends constantly.

THE LIBERTY MANUFACTURING CO., Pittsburg, Pa., reports the following recent sales of the well-known "Famous" oil filter and refiner: New York Athletic Club Building, New York City; Onondago Lake Railway Co., Syracuse, N. Y.; L. M. Ramsey Manufacturing Co., St. Louis, Mo.; Berliner & Son, New York City; Southern Elevator, East St. Louis, Ill.; The Grand Leader, St. Louis, Mo.; Iron River Water, Light & Power Co., Iron River, Wis.; The Arcade Building, East St. Louis, Ill.; Ashburn Mining Co., Folsom, Cal.; City of North Vernon, Water & Light Department, North Vernon, Ind.; Commercial Building, St. Louis, Mo.; Cannonsburg Electric Light, Heat & Power Co., Cannonsburg, Pa.; Colorado Ice & Cold Storage Co., Kansas City, Kas.; Pitcher Lead Co., Joplin, Mo.; Peper Tobacco Co., St. Louis, Mo.; Firth Carpet Co., Firth Cliffe, N. Y.; John Schroder Lumber Co., Milwaukee, Wis.; Armour & Co., Sioux City, Ia.; George I. Roberts & Bros., New York.

THE WESTERN ELECTRICAL SUPPLY CO., of St. Louis, reports that it is receiving some very good orders for the "Lawton Peerless" fender, and that it has equipped a number of roads throughout the south and west with this fender. The company claims to have a fender which will absolutely do its work, and do it every time; that it is strong and durable and can be furnished in either wood or steel. It is so made that it can be put either under the platform or on the front end of the car, and will not interfere in dash signs. It has no bolts to hother with and can be removed instantly and is easily adjusted to any height from the rail. It is instantaneous in its action, and can be dropped by either hand or foot. This fender appears to possess unusual merit and those contemplating purchasing equipment of this kind would do well to examine thoroughly into this fender before placing their orders. The company issues a pamphlet fully describing same, which will be mailed on application.

THE STANDARD UNDERGROUND CABLE CO. announces that on and after Mar. 1, 1902, its Boston office will be at No. 101 Milk St., the Converse Building. This removal has been made to secure larger quarters and a more central location.

THE JOSEPH DIXON CRUCIBLE CO., of Jersey City, has issued its automobile circular No. 5 in the interests of Dixon's automobile graphites. "Graphite", published monthly in the interests of Dixon's graphite productions, contains for March a number of interesting articles.

THE CHASE SHAWMUT CO., Boston, Mass., announces that it has secured commodious quarters and is now making a full line of fuse wire, fuse links and enclosed fuses, rail bonds, junction boxes, nipples, couplings and cable clips. The company is in a position to make prompt deliveries of all of the above lines of goods.

WM. B. M'VICKER, eastern manager for the Dearborn Drug & Chemical Works, reports business in excellent condition. Mr. M'Vicker has offices at 120 Liberty St., New York City, where he will be pleased to hear from any one in the East who is having trouble with boiler scale or deterioration of boiler tubes through the action of injurious ingredients in the feed water. His company does not sell a cure-all compound for preventing scale but makes a business of analyzing the troublesome feed water in each individual case and prescribing those chemicals that will neutralize the scale forming properties.

THE HEIL RAIL JOINT WELDING CO., of Milwaukee, Wis., has issued a descriptive pamphlet on the Heil improved cast welded rail joint and complete welding outfits. This company has perfected the cast welded joint to a degree that will bear the most minute scrutiny of engineers. The company claims that rails connected with these joints will have a life at least 50 per cent longer than with the ordinary fish plate joint, also, that by using these cast welded joints a 66-lb. rail may be used which will save the cost of the joint in first construction. The results have proved that a uniform and durable fusion of the two metals can only be obtained by an accurate temperature in heating the rail ends while the pouring is in operation.

PAWLING & HARNISCHFEGGER, of Milwaukee, Wis., have issued a bulletin No. 5, dated January, 1902, descriptive of the hand traveling cranes built by them. While their electric traveling cranes and electric hoists constitute the principal features of their business, the making of hand traveling cranes has recently attained great prominence. The latter are made of the best material and are well built in every respect. These are made in two types, called type A and type C, the former being built in capacities from 3 to 10 tons and the latter in capacities varying from 10 to 40 tons. The bulletin contains many illustrations of these hand cranes and a list of prominent manufacturers and other companies for whom they have been installed.

THE KELLOGG SWITCHBOARD & SUPPLY CO. is in receipt of a great many inquiries relative to cedar poles, and the indications are that the business will be very brisk and even greater than last year. This company entered the field about January, 1901, and secured from the producers in the vicinity of Escanaba, Mich. a large stock of white cedar poles, with the idea of furnishing them to telephone companies in connection with its switchboard and telephone business. It supplied a large number of poles for the independent plants at Jackson and Detroit, Mich.; Columbus, Alliance and Canton, O.; Iowa, Indiana, Illinois and the southwestern states also purchased a large portion of the stock. It was, of course, an experiment for a telephone manufacturing company to take up a distinct branch, such as the pole business, but the results were so satisfactory, and worked in so well with its general business that the company has decided to continue for another year. It is stated that poles have advanced this year, but the company is said to have quite a number of poles that were bought last year, and is able to make very attractive prices on them. The company has a very complete assortment of poles and in yards the shipping facilities of which can not be equalled. It had several large yards on the C

& N. W. Ry., the Escanaba & Lake Superior Ry., and the same on the D. S. S. & A. Ry., also a large yard at Ontonagon, Mich. on the C., M. & St. P. Ry.

C. J. HARRINGTON, formerly with the Morris Electric Co., F. H. Lovell & Co., and H. M. Shaw & Co. has established a new supply business at 15 Cortlandt St., New York City, under the style of C. J. Harrington where he will be pleased to meet all his former friends. This is a new concern but is thoroughly equipped to transact business in electric railway, electric lighting and telephone material; also machinery and general supplies for the trade. Mr. H. J. Newkirk, formerly with Wendell & MacDuffie, is associated with Mr. Harrington. The firm has secured a number of good agencies, among which are the Heil Rail Joint Welding Co., of Milwaukee; the General Equipment Co., of Camden, N. J.; the United States Fender Co., of Camden, N. J.; and the New Century Car Heater Co., of Jersey City.

THE W. T. VAN DORN CO., Chicago, reports that the new year has started out with excellent prospects for new business. The company has recently booked the following orders: 220 couplings for the J. G. Brill Co., for the Baltimore Traction Co.; 30 couplings for the same company for the Colorado Springs Rapid Transit Co., Colorado Springs, Colo.; 20 car equipments for the Boston Elevated and also equipments for all of the rolling stock of the Asheville & Craggy Mountain Railway Co. The Brill company has also ordered 11 car equipments for the Providence, Warren & Bristol branch of the New York, New Haven & Hartford road and the Cincinnati Traction Co., has given a large order for No. 11 couplers. An order received through the Peckham Truck Co., calls for 20 car equipments of the ball joint, No. 5 couplings for Yokohama, Japan. The company has also booked recently a large number of smaller orders.

THE CROCKER-WHEELER CO., of Amper, N. J., has recently received a large number of new orders for its engine-type generators which gives assurance of the high regard in which the machines are held throughout the country. It has been the company's aim to reduce its generators to standard sizes that will give a wide range of outputs and still maintain speeds corresponding to those chosen by most prominent engine builders. Among others the following companies have recently placed orders for Crocker-Wheeler generators: Pittsburg Reduction Co., New Kensington, Pa.; National Mining Co., Sagan, Pa.; Lake Shore & Michigan Southern Railroad, Collinwood Shops, O.; Federal Lead Co., Alton, Ill.; Farrand Organ Co., Detroit, Mich.; Snellenberg & Co., Philadelphia, Pa.; Harrisburg Pipe & Pipe Bending Co., Harrisburg, Pa.; American Bridge Co., New York; Allis-Chalmers Co., Milwaukee, Wis.; Hawley & Hoops, New York; Hall of Records, New York.

THE ELECTRIC STORAGE BATTERY CO., of Philadelphia, Pa., is engaged in building and installing a large number of railway and lighting battery plants that will be put into operation within the next few months. In addition to three large batteries for the Twin City Rapid Transit Co., the following orders may also be mentioned: West Hampton Park Ry., Richmond, Va., 250 cells of 480 ampere hours capacity; St. Albans Street Railway Co., St. Albans, Vt., 316 cells; Indianapolis & Eastern Traction Co., Indianapolis, Ind., 230 cells for regulation and emergency work; San Juan & Santa Clara Railway Co., San Jose, Cal., 264 cells which will furnish power during periods of light loads when the generator plants will be shut down; Trenton Street Railway Co., Trenton, N. J., 264 cells of 200 ampere capacity; Chippewa Valley Electric Railroad Co., Eau Claire, Wis., 264 cells of 200 ampere capacity; The Virginia Electric Railway & Development Co., Richmond, Va., a battery of 1,440 ampere hours capacity of which the 280 cells comprise tanks of sufficient size to allow of an increase of 25 per cent in capacity. This battery is divided into two sections of 140 cells each to operate on each side of the three wire system. The company also has under construction a battery of 134 elements for the Washington Arcade building, in Detroit, to regulate the fluctuations caused by elevator service and for night lighting. Another plant is being installed for the Pennsylvania Epileptic Hospital, at Oakbourne, Pa. for lighting purposes. An-

other battery of 160 ampere hours is being placed in the private yacht *Helenita*, owned by Mr. Frank J. Gould, and five new yachts now in course of construction are each being equipped with batteries of chloride accumulators.

THE ELECTRICAL INSTALLATION CO., of Chicago, has been awarded the contract for the entire construction of the inter-urban line between Cambridge, O., and Byesville. Work has been commenced and material is arriving daily.

THE WESTINGHOUSE ELECTRIC & MANUFACTURING CO. has recently issued the following publications: Bulletin No. 4275, "The C E Motor." Bulletin No. 4276, "Small Continuous Current Stationary Motors, Type C A." Bulletin No. 4277, "Automatic Circuit Breakers, Type C, Form D." Bulletin No. 4278, "Horizontal Edgewise Instruments." Supply Department Flyers Nos. 2001, 2002, 2003, "Radial Fan Motor," "Snap Switches," "Blue Printing with Enclosed Arc Lamps." Price Lists Nos. 5091, 5092, 5094, 5096, "Porcelain Cut-outs for 125 and 150 Volts," "Principal Parts of Power Circuit Enclosed Arc Lamps Form 2," "Principal Parts of Form 5. Direct Constant Current Series. Enclosed Arc Lamps," "High Tension, Quick Break Form B. Switches."

PAWLING & HARNISCHFEGGER, of Milwaukee, Wis., publish a general description of their products in catalog L, which is a large book containing 131 pages of illustrations and descriptions of numerous styles of cranes made by this firm. This concern has made many improvements in both standard and special cranes during the past 12 years and it devotes its entire shop equipment to this line of work exclusively. Its shops are equipped with the finest tools and every facility for turning out work of a thoroughly high grade and no expense is spared in securing the best results in the design and operating qualities of every part of the apparatus. The catalog contains an excellent series of photographs of the Pawling & Harnischfeger shops as well as a very large number of views of the cranes installed by this company in numerous manufacturing plants, central stations, etc. Besides its standard cranes, this company builds many of a special character for handling material in situations where a crane of the usual type would be out of the question.

THE UNDER-FEED STOKER CO., of America, which manufactures the Jones under-feed stokers, has recently closed a number of excellent contracts among which the following may be mentioned: Twin City Rapid Transit Co., Minneapolis, Minn.; Amoskeag Manufacturing Co., Manchester, N. H.; Gund Brewing Co., Cleveland, O.; Van Camp Packing Co., Indianapolis, Ind.; Theodore Hamm Brewing Co., St. Paul, Minn.; Reed House, Chattanooga, Tenn.; Stepiens Bldg., Detroit, Mich. The contract with the Twin City company calls for the equipment of boilers in its new power house now in the course of erection which is among the numerous improvements now being undertaken by that company at an outlay of \$1,250,000. The plant of the Amoskeag Manufacturing Co., is operated by a battery of Manning boilers under which these stokers will be used. Mr. W. H. Van Sickle, formerly connected with the Chicago office of this company has recently assumed charge of the company's New York office, 1011 Singer Bldg., Broadway, New York. The growth of the company's business has recently necessitated an increase in its office space and on March 1st, rooms 837 and 838 were added to the suite formerly occupied by the company in the Marquette Bldg., Chicago.

MR. ELMER P. MORRIS, treasurer of the Morris Electric Co., of 15 Cortlandt St., New York City, reports some good shipments of material to foreign countries, including a lot of wire to Lisbon, Mexico, etc. His company has just shipped 50 additional Monarch fare registers to the tramway company in the city of Mexico, this making a total of 100 registers recently sold to that company.

Rapid progress is being made in the construction of the inter-urban electric line between Jackson, Mich., and Battle Creek. It is said that cars will be running between these cities this summer.

## STREET RAILWAY PATENTS.

This list of patents furnished by T. Reed Clift, Patent Attorney, Washington, D. C.

No. 692,271, Feb. 4. Dee T. Granbery, Memphis, Tenn. Railway switch and mechanism for operating it.

No. 692,271, Feb. 4. Dee T. Granbery, Memphis, Tenn. Railway switch and mechanism for operating it.

No. 692,272, Feb. 4. Gideon Grazier, Tyrone, Pa. Combined spike puller and car mover.

No. 692,422, Feb. 4. Seth J. Buckland, Springfield, Mass. Water shed or deflector for trolley poles or ropes.

No. 692,423, Feb. 4. Conrad Budhe, Jr., St. Louis, Mo. Electric signal.

No. 692,499, Feb. 4. Wm. S. G. Baker, Baltimore, Md. Car truck.

No. 692,513, Feb. 4. Charles E. Gierding, Westhaven, Conn. Fare register.

No. 692,691, Feb. 4. Clifton M. Moore, Monroe, Me. Car fender.

No. 692,747, Feb. 4. Wm. H. R. Welton, Akron, O. Switch throwing device.

No. 692,259, Feb. 4. Lester H. Bayne, Washington, Pa. Tramway switch.

No. 692,817, Feb. 11. Daniel S. Bergin, Chicago, Ill. Electric system for railways.

No. 692,938, Feb. 11. Abraham L. Sprague, Milton, Mass. Car track sanding device.

No. 692,974, Feb. 11. Daniel S. Bergin, Chicago, Ill. Combined underground and overhead trolley railway.

No. 692,985, Feb. 11. Nicholas H. Colwell, Pawtucket, R. I. Folding car gate.

No. 693,185, Feb. 11. Peter I. Swank, Conemaugh, Pa. Switch throwing device.

No. 693,351, Feb. 11. Bert D. Gibson, Alexandria, Ind. Overhead trolley electric railway.

No. 693,384, Feb. 18. Matthew S. Farmer, Washington, D. C. Railroad switch.

No. 693,603, Feb. 18. Chas. M. Hobbs, Baltimore, Md. Third rail insulator for electric railways.

No. 693,611, Feb. 18. Peter M. Kling, Elizabeth, N. J. Car.

No. 693,762, Feb. 18. Wm. J. Ward, Pittsburg Pa. Car fender.

No. 693,786, Feb. 18. Nicholas H. Colwell, Pawtucket, R. I. Folding gate for electric railway cars.

No. 693,935, Feb. 25. Chas. A. Willard, St. Louis, Mo. Switch attachment for cars.

No. 693,944, Feb. 25. Walter J. Bell, Los Angeles, Cal. Street railway switch.

No. 693,960, Feb. 25. Albert Fisher, Detroit, Mich. Car fender.

No. 693,988, Feb. 25. Eugene W. Taylor Spokane, Wash. Trolley for electric cars.

No. 694,020, Feb. 25. Foshier H. Lippincott, Philadelphia, Pa. Trolley pole support.

No. 694,058, Feb. 25. David J. Griffiths, McKeesport, Pa. Railway switch.

No. 694,114, Feb. 25. Wm. T. Shryock Allegheny, Pa. Car track

The Louisville (Ky.) Street Railway Co. and the Louisville, Anchorage & Pewee Valley company have effected an arrangement whereby the cars of the latter will enter the city over the tracks of the Louisville company.

Owing to the blizzard which swept over New Jersey on February 17th, cars on the lines of the North Jersey Street Railway Co. out of Jersey City were operated irregularly, and the entire force of snowsweepers was in demand.

February 17th the board of supervisors of San Francisco passed the following resolution: "Resolved, That the board of supervisors hereby declares its determination to commence and complete, as soon as the law will permit, the necessary proceedings to construct and operate a modern municipal electric railway system on Geary street and Point Lobos Ave. covering the present Geary Street, Park and Ocean Railroad franchise, the terminal of the completed system to be the ferry, foot of Market street and Golden Gate Park."

CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, penning either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. XII.

APRIL 15, 1902.

NO. 4

The decision in the Detroit 3-cent fare case rendered by the United States Supreme Court last month affirmed the decision of the United States Circuit Court rendered a year ago, and is a victory for the street railway. The Detroit case is, we believe, the only one of the 3-cent fare cases which has been carried to the Federal Supreme Court, but the result was no surprise to those who have followed the course of similar litigation in the lower courts.

It may now be taken as settled that an ordinance fixing a maximum rate of fare which was as an inducement for the company to build its street railway, constitutes a contract that cannot be impaired by the council under a power to "regulate" which may have been reserved.

We notice that in the assignment of papers to be read at the coming meeting of the American Street Railway Association that a change has been made by giving the subjects to the railway companies instead of to individuals as has formerly been done. We believe this change will be a beneficial one to the association as well as to those who prepare the reports. Most all of the men holding active positions on street railways are very busy men and would naturally hesitate to devote many of their business hours to work not directly concerning the company by which they are employed. By assigning the papers to a certain company, however, the officers of that company are obliged to put the preparation of the papers into the hands of one of its employees best qualified to handle it and such employee will feel far more at liberty to take the time required for the preparation of the paper when authorized by his own company to do so than he would at the request of the organization without the direct sanction of his employers. The officers of the road, accepting assignments of papers will also take a greater interest in their preparation and to a certain extent they will feel a greater responsibility in their preparation than if they were simply the expression of the personal opinion of the single employe.

In this issue is presented a description of the chief physical characteristics and some of the operating details of the Hudson Valley Railway Co. To one who finds interest in studying "possibilities" in transportation enterprises this Hudson Valley property affords rare opportunities for conjecture. Here is an instance of an electric road, having a tributary territory 100 miles long and 50 miles wide, and a resident population of 100,000 along its lines with 250,000 more within 10 miles of its southern terminal, which proposes, in competition with a steam road and a canal, to do for the section served all that a steam railroad could do, and moreover it proposes to do it at far less cost to itself and to its patrons.

While the growth of the trolley freight and express business is generally welcomed as an advantageous addition to the transportation facilities of suburban communities we occasionally find people who can only see disaster to country merchants as a result of the trolley invasion.

An editor in Jersey City, N. J., where a bill authorizing the carrying of freight and express by trolley has been introduced, states that the trolley freight bill may be a good thing for rural and suburban sections but it will not be a good thing for country stores because all manner of goods will be ordered from the large cities and shipped by trolley freight. He believes it will also be a bad thing in large cities because there is no more room on the streets for any more cars. This same complaint has been heard repeatedly in nearly every place where improved transportation facilities have been proposed, but we believe the place still remains to be found where the establishment of trolley lines or trolley freight has proved anything but a benefit to the country stores which it reaches. The trolley has proved to be in every instance a most important factor in building up suburban communities, and in spite of the fact that some few orders may be transferred from the country stores to the larger cities, the country merchant within a short time will have several customers where he previously had one, owing to the colonizing effect of the trolley. There is also no reason why the country merchant should be less wide awake and progressive than his city competitor and with the natural increase in his business which follows the increase in population he is placed in a position to buy more extensively and consequently at better prices. His rent is proportionately much smaller than that of the city merchants as are also his running expenses, and in addition there is the cost of delivery from a larger city, so that there seems to be no reason why he cannot compete with his city rivals with entire success. In looking over the communities where the trolley has been introduced we find that in almost every case he has done so. We have yet to hear of a single case of business failure due to the introduction of trolleys or trolley freight lines.

Elsewhere we print an article by Mr. H. M. Sloan, general manager of the Calumet Electric Street Ry., on "Municipal Ownership and Operation of Street Railways." The subject is a live one in Chicago at the present time owing to the attitude of many of the city officials who are advocating the purchase by the city of the Chicago street railways as soon as their franchises shall have expired. While the arguments for and against municipal ownership are almost inexhaustible and the subject has been thrashed out many times over, Mr. Sloan presents a number of facts which are practical rather than theoretical and which should appeal to every one who seriously considers this question.

One point alone which he brings out is in reality, sufficient to dispose of the question of municipal ownership, that is, what advantage can there be to the municipality in owning or operating the street railways when the city is already in a position to make any terms and to exact any compensation it deems adequate from the lines owned by private parties? In either case the city is really the master of the situation and by granting franchises to the private concerns it cannot only demand whatever compensation for the same it sees fit but it avoids all the details and political machinery which would be involved in municipal ownership or operation.

One of the methods mentioned in this paper is to grant the franchise on a percentage basis, and provide that all net earnings over and above a certain percentage on the capital made by the lessee to revert to the city. This method of securing compensation to the city has been tried in various places and while it has

generally proved a failure as far as cash returns are concerned, it is indirectly a most beneficial arrangement for both parties to the contract. Under these conditions the company is pretty sure to take care that its net earnings do not exceed the maximum above which it pays a portion to the city, but in keeping its net earnings down to this figure its surplus is spent in betterments of the system and improvements in the service, so that while the city treasury benefits but little if any in cash receipts, the traveling public who patronize the car lines is considerably benefited by the improvements both in the service and the equipment of the road.

These considerations apply of course only to where the city's compensation is fixed as an amount over and above certain net earnings. If a certain percentage of the gross earnings of the road revert to the city a considerable cash income may result, but such a percentage must be conservatively estimated or it may result in gross injustice to the stockholders if the compensation demanded be excessive.

Appropos of municipal ownership and operation the recent action of the Montreal Street Railway Co. in asking that it be permitted to remove the snow from the streets now occupied by it, deserves attention. The work is now done by the city the street railway company paying a share of the cost, and the company claims it can do the work in one-fourth the time and at one-half the cost as compared with city supervision. Here is an object lesson as to the relative efficiency of public and private employes and the relative cost of public and private administration.

At the municipal election held in Chicago April 1st the electors were invited to give an expression of opinion on the desirability of the city acquiring ownership of the street railways. The total votes cast for aldermen was 204,379, this number being less than 57 per cent of the votes cast in the city at the presidential election in 1900, 364,545. On the street railway referendum the total of votes was 150,581; of these 124,594 were for and 25,987 against municipal ownership, a majority in favor of the proposition of 98,607. Only 73 per cent of those who voted at the election voted on the municipal ownership question, and those in favor of the city owning the street railway constituted but 34 per cent of the number voting in 1900.

The question submitted was purely an academic one, because the city has not power to acquire street railways nor is it at all probable that the legislature will ever grant the necessary power to the municipality. The only effect of the vote on this question has been to lead the mayor of Chicago to take the position that discussion of the terms on which the existing street railway franchises are to be extended should be postponed until the Illinois Legislature has had another chance to refuse to give the city the right to own the railways.

The Chicago Tribune takes the position that the city of Chicago is utterly unfit to operate a street railway. The city has been extremely slow in repairing some of its bridges and the Tribune says: "If it takes a municipal corporation fifteen days or more to make bridge repairs which ought to be made in three days, how long would it take a municipal corporation operating a street railroad to make repairs which a traction company rushes through in from one to three hours." And in conclusion: "A municipal corporation which never is able to make bridge repairs promptly is not to be trusted with the operation of an electric street railway."

We believe that the conditions which would make the city unsatisfactory as an operator also would limit the efficiency of the service were the lines owned by the city. A public corporation is always slow to install new devices, and is wasteful in its administration.

Elsewhere we print an abstract of a paper recently read before the Western Railway Club on "Vision, Color Sense and Hearing" which describes the tests of these senses to which applicants and employes of the best managed steam railroads are submitted. The subject is one, however, which will be of interest to street railway managers and more especially to those operating long distance high speed roads.

While few of the electric companies have as thoroughly organized operating department as the older steam roads, the tendency to improve the operating departments is distinctly marked at the present time, and on a number of the more thoroughly organized electric railways cars or trains are run according to the dispatcher's orders and are governed by semaphore or other visual methods

of signalling. This requires that motormen should be as thoroughly tested for vision, color blindness and hearing as are locomotive engineers, and the necessity for this is perhaps more pronounced in the former than in the latter case as the motorman operates his car or train at speeds often approximating those of the steam railroad trains and upon public highways and other streets often thronged with pedestrians. On a number of street railways the motormen are now tested for defects of this nature, and we believe the time will come when such tests will be generally required for the operating departments of street railways.

Several years ago, the employes of the Twin City Rapid Transit Co. were submitted to similar tests and quite a number of men were found who possessed various ocular defects which totally disqualified them for operating cars. These men were subsequently given employment in other departments of the company and their places filled by men who could pass the required tests.

Another point which may be mentioned in connection with this subject is the favorable impression which is created by such examinations in case of an accident involving litigation of questions where hearing or color sense are in issue. The court, the jury and the public will be far more favorably impressed by the knowledge that the company had been sufficiently thoughtful of the public welfare to compel examinations for sight and hearing than were no such records on file. There are many well authenticated cases of accident caused by nearsightedness of motormen which have cost street railway companies many thousands of dollars.

The committee which has in charge the preliminary organization of the "Street Railway Manufacturers' Association" is much gratified by the keen interest shown in the proposed association by the firms and individuals which exhibit at the A. S. R. A. conventions. Replies have already been received from a large percentage of those to whom announcements were sent by the committee, and these are practically unanimous in regard to the advantages of a plan such as proposed. Some express a desire to know definitely what will be the cost of membership and the scheme of organization; these questions it is of course impossible to answer at this time because no action will be taken until the meeting of supply men to be held in Detroit on October 8th next.

The development of manufacturing industries in America to their present state, where there is in all foreign lands a well defined fear of "peril" of American competition, has been very largely due to the adoption of certain fundamental principles on the part of shop and mill owners. These are first, the use of special and automatic machinery whenever possible; second, the immediate adoption of improvements, even at the cost of scrapping the older equipment; third, the use of every means to encourage workmen to push the output up to the limit of the existing tools, and to suggest improvements in machinery and methods whereby a saving either in time or labor can be effected.

The most effective method of securing the efficiency of the manufacturing plant is recognized to be a system wherein the compensation of the workmen is based upon the amount of work turned out, and not solely upon the time. The various plans which have been adopted are sufficiently well known to our readers under the names, piece work, premium system, differential rates, etc. The principal difficulty in applying these scales of wages has been that too often not sufficient care was exercised in establishing the rates for piece work in the first place. If amicable relations are to exist between employer and employe there cannot be continual cutting of piece work rates, unless the cut is justified by the introduction of improved machinery; consequently, the rates should be determined in the first place only after the most careful consideration and experiment.

While the advantages of piece work for manufacturing plants are recognized, it has not generally been considered that the system could be successfully applied in shops devoted to repair work, and therefore the article on the "Repair Shops of the North Jersey Street Railway Co.," on page 223 of this issue will be particularly interesting to master mechanics. In these shops all repair work is done by the piece with most satisfactory results, and the scale of prices which is given on page 228 will be of the greatest assistance to others who are desirous of adopting a similar system.

Interesting data on the economy of painting cars by piece work were given in the "Review" for November, 1900, page 649.

# The Hudson Valley Railway.

Articles of Incorporation—Territory Traversed—Track and Line Construction—Bridges and Masonry—Power Generation and Distribution—Car Houses—Freight and Express Business—Park System—Personnel.

By an act of incorporation passed in 1901 there were merged into a single corporation six street railway companies owning lines in eastern New York and there was formed thereby the longest interurban electric road in New York, and one of the longest in the United States. The companies consolidated were: The Glens Falls, Sandy Hill & Fort Edward Street Railroad Co., the Warren County Railway Co., the Greenwich & Schuylerville Electric Railroad Co., the Saratoga Traction Co., and the Saratoga Northern Railway Co. These properties were first individually acquired by what is known as the Powers-Colvin syndicate and were then transferred to the new operating company.

The corporate title of the company has been fittingly chosen for the consolidated lines with such extensions as have been added under the new management form a continuous electric railway system through the upper valley of the Hudson River from the head of navigation at Troy and Albany to Lake George and into the foot hills of the Adirondacks, 70 miles to the north—a territory unusual in its historic, scenic, agricultural and commercial aspects. For most of the distance the road parallels the Delaware & Hudson R. R. by a route some nine miles shorter and the Champlain Canal.

Topographically the Hudson Valley forms a natural aisle from the sea to Lake George and Champlain, and into this aisle opens the natural outlet to the western country—the valley of the Mohawk River which joins the Hudson near Cohoes. In colonial and pre colonial times the valley was the hunting ground as well as the trail path for the white trader and Indian alike, and later became the battlefield and war path for the Five Indian Nations, the French from Canada, the Dutch at Albany and Ft. Orange and the English from New England. Still later the strategic situation of the tract made it famous as the stage for many of the most stirring

actions of the Revolutionary war. It is said that this valley has been debatable ground in no less than nine important wars. As can be easily imagined these strenuous deeds and incidents have left almost innumerable landmarks, battlefields, and points famous in history and tradition, which have become places of pilgrimage for tourists and sightseers and will have an appreciable influence on the earning power of the electric railway.

Added to this pleasure travel the new consolidated system will enjoy a large part of the excursion and tourist travel to Lake George and Saratoga and still in addition to these attractions the company has established three important parks of its own.

Commercially the Hudson valley is the site of hundreds of mills and factories attracted by the abundant water power afforded by the upper Hudson and its tributaries. The products are chiefly paper, wood pulp, lumber, wall paper, collars and cuffs, machinery, farming utensils, cement and cotton cloth. Some of the largest mills in the world in these lines are located in this valley. As stated at greater length elsewhere, the Hudson Valley Ry. is already hauling much of this outgoing freight in carload lots.

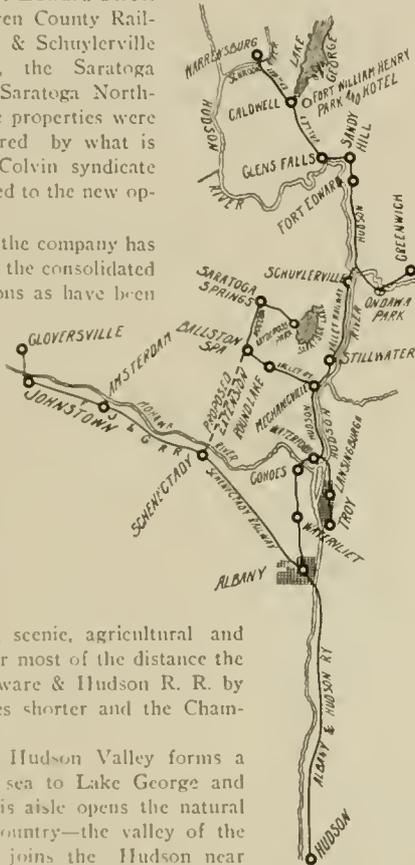

The territory covered is rich in productive farms and the freight business will include the transporting of all kinds of garden truck, dairy products and farm produce to Albany and by railroad and steamboat connections from there to New York.

A considerable source of revenue will be the carrying of the employes of the mills and factories to and from their work, and for this class of patrons the company provides workingpeoples' tickets at 33 rides for \$1.00 for certain local fares and half-fare for longer distances. Upon the city lines of Glens Falls which form part of the Hudson Valley property these tickets are especially in demand.

At Albany connection is made over the lines of the United Traction Co., with the Albany & Hudson Ry. running down the Hudson River to the town of Hudson; with the Schenectady Ry. running to Schenectady and there connecting with the electric division of the Fonda, Johnstown & Gloversville R. R. With the exception of the Albany & Hudson road there is a community of interests among all the systems just mentioned.

## TRACK AND OVERHEAD DEPARTMENT AND SAFETY SIGNALS.

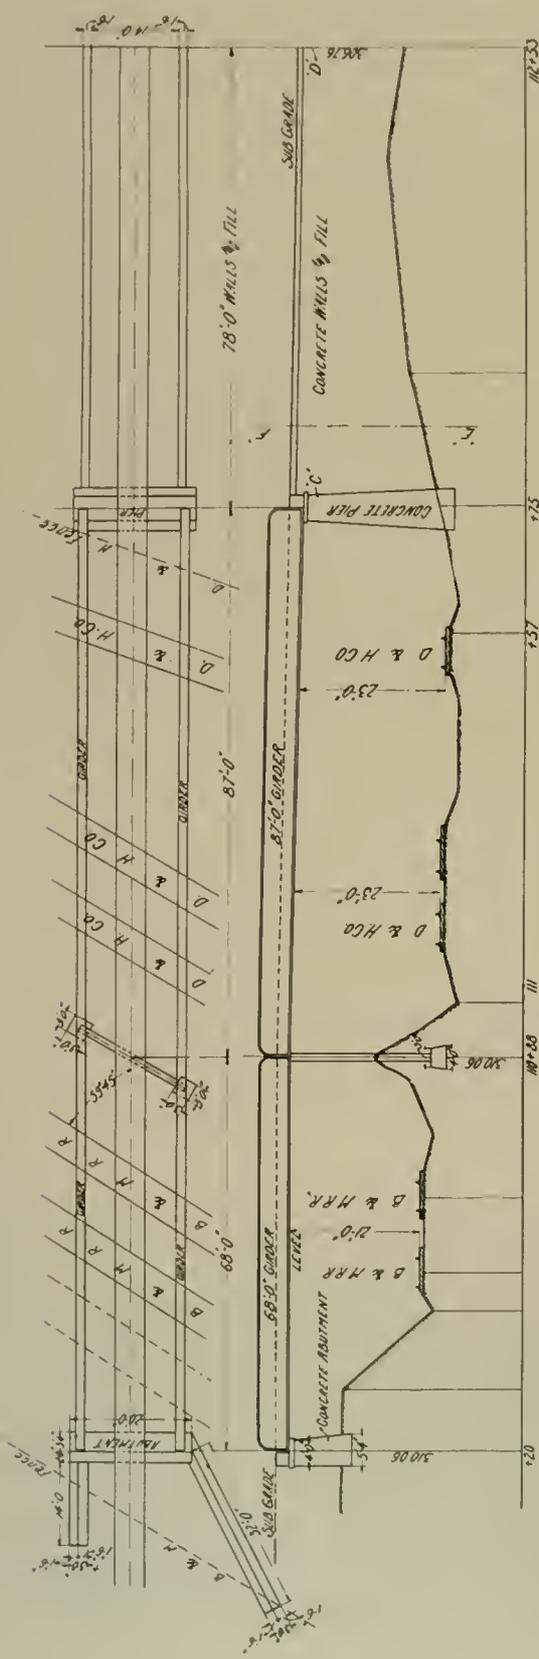

The total main track owned by the company including the branch to Greenwich and the branch to Saratoga Lake is 103 miles. With the exceptions of short stretches of girder rails in Glens Falls and Saratoga, the track is laid with 60 or 70-lb. T-rails on ties 6 x 6 in. x 8 ft. The road bed is gravel ballasted and in all new work grades are limited to 2 per cent, and no curves are to exceed 5 degrees. The roadbed is 14 ft. wide and in heavy fills is 16 ft.

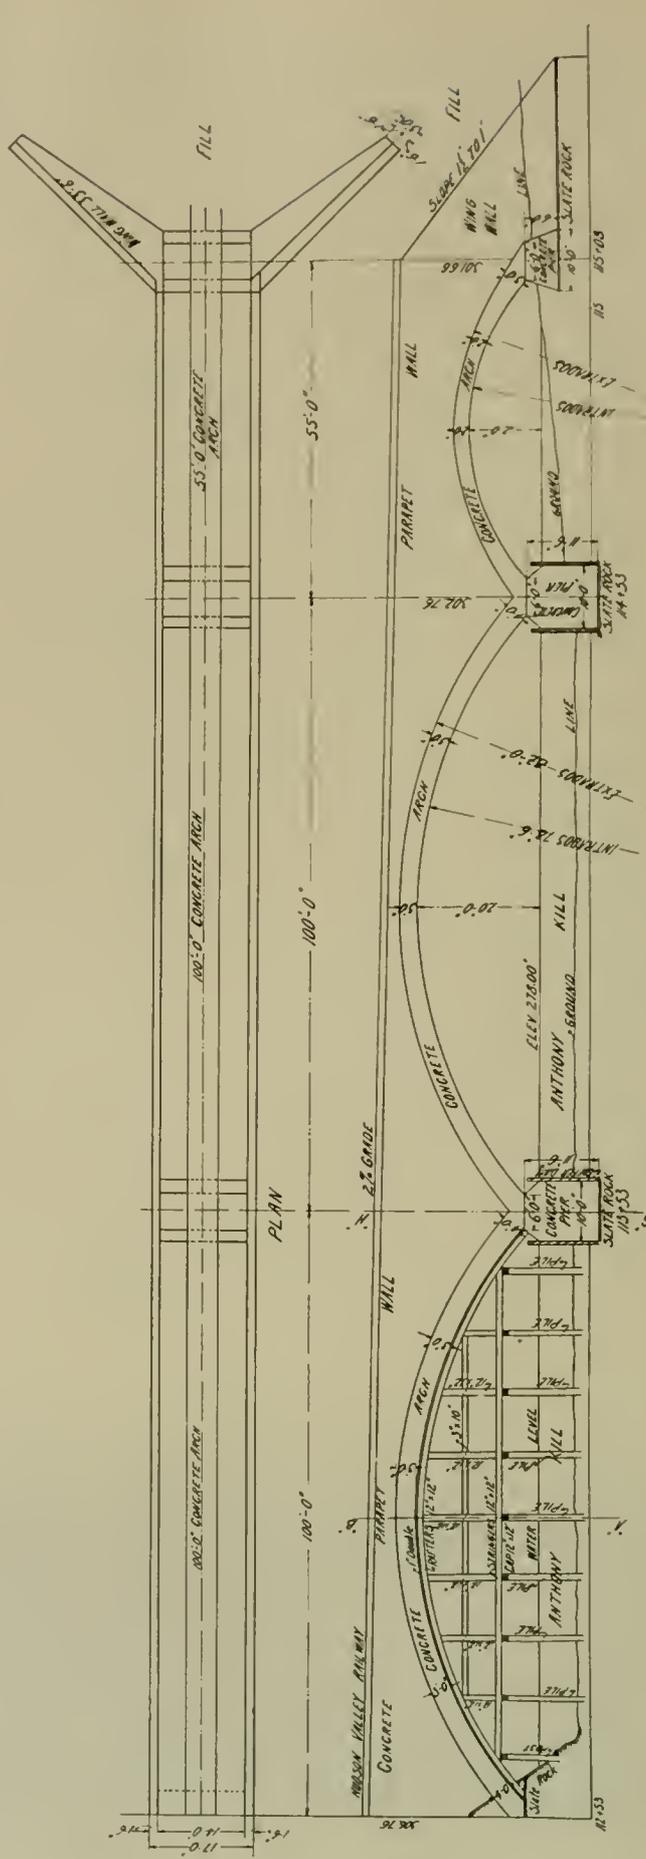

VALLEY OF THE HUDSON RIVER FROM THE BATTLEFIELD OF REMIS HEIGHTS.

wide. Cuts are 22 ft. wide. In most of the track work the slopes at the sides are 1 1/2 to 1, except in clay work where they are made about 1 3/4 to 1. In fills up to 12 ft. in depth vitrified pipe is put in for drainage, but in deeper fills cast iron pipe is used. There are a few concrete culverts.

The rails are bonded with a new style of rail bond which was devised by Mr. J. A. Powers, general manager of the road. This

OVERHEAD CROSSING FILL WITH RETAINING WALLS.

PLAN AND ELEVATION OF CONCRETE ARCHES OVER ANTHONY KILL.

comprises a set of tinned copper leaves 1-100 in. thick, the number used depending on the conductivity desired, and held in place by two 1/2-in. copper rivets driven in the end of the rail 1 in. from the end. Corrugation in the leaves between the rivets make the necessary provision for expansion. The rails are drilled and the surface faced off under the rivet head and the rivet driven by steam or hydraulic pressure.

The trolley wire is No. 000 copper of figure 8 section and two wires are strung the whole distance thus avoiding overhead switches and lessening the chance of a total breakdown through the snapping of a trolley wire. The wires are suspended from home-made brackets carried on 35-ft. chestnut poles having not less than 7-in. tops. Overhead material was supplied by the Ohio Brass Co.

About 85 miles of the road are on private right of way most of which is 50 ft. wide or over, making it possible to double-track the road when the increase in traffic demands it.

To the matter of a reliable signal system the company has given considerable consideration. As the first precaution a private tele-

phone line has been installed with telephones in booths at turn-outs and instruments in all the company's offices, car barns and power houses. The dispatching of cars is done by telephone. Car reporting and regular orders are verbal but variation from the regular schedule are only made by using a triplicate train order ticket. The motorman receives the order over the telephone, it is repeated back by the conductor and checked by the dispatcher, the conductor punching an order slip in triplicate, one copy to be taken by the conductor, the second by the motorman and the third is deposited in a box kept for the purpose so that there is always a means of checking or verifying the orders. The system is found to be a trifle cumbersome but is believed to be reasonably safe.

more than one car in a block, the practice is to allow the conductor of the first car to unlock the block and hold the switch over until all the cars have entered, the last car to carry the staff, and all the cars carry the regular "car following" signal, lights by night and flags by day, as is done on steam roads.

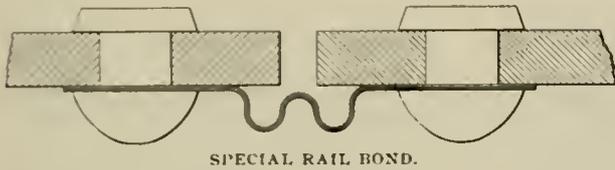

Mr. Powers is still giving this matter of protective signals close study and is of the opinion that the successful signal system of the future will be one in which the stationary block will be eliminated, and the automatic indicator on the car itself substituted therefor. He believes it is not impossible to arrange a circuit whereby an incandescent lamp in the motorman's vestibule will light up when another car approaches from either the front or rear say within a distance of a thousand feet. He thinks perhaps something, like the system employed in tall office buildings for signalling the operator and also for indicating the approach of the elevator car, can be applied to the problem of signalling on electric roads.

In times of fog or storm it is the practice on the Hudson Valley road to forbid any car to leave its switch except after it has met and passed the regular car going in the opposite direction, and the rule is adhered to even if it ties up the road indefinitely. It is believed that absolutely no chances should be taken in mist or fog when operating a single track road at high speed.

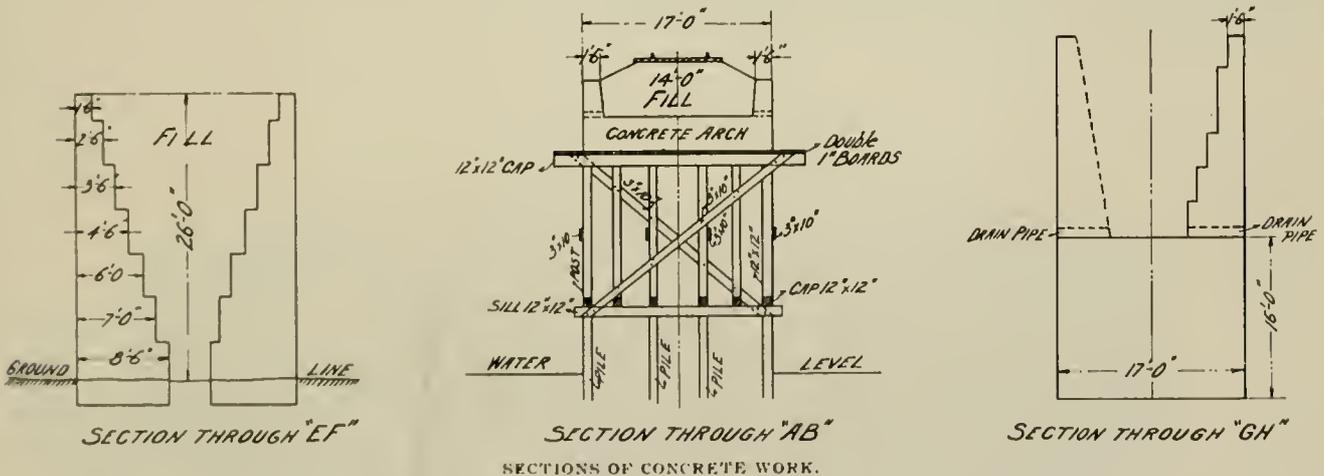

Wherever necessary to put in bridges or trestles the company has adopted the policy of using concrete arch masonry bridges. Mr. Powers informs us that the cost of this concrete arch work is practically the same as steel truss bridges with the required masonry abutments and is believed to be more durable, less expensive to maintain, and more satisfactory in every way. The concrete arches on the road range from 20-ft. spans upward, and there are two spans of 100 ft. each with 75 ft. of concrete viaduct.

The plans which we reproduce on page 194 show an over crossing structure on the Hudson Valley Ry. between Mechanicsville and Ballston. It carries the electric railway over the tracks of the Boston & Maine and the Delaware & Hudson railroads, and will be completed by May 1st, when connection will be made between Mechanicsville and Saratoga.

There will be two steel girder spans over the railroads, one of 68 ft. and the other 87 ft., the sub-structure for these is to consist of concrete abutments, pier and pedestal. On the "hog's back"

phone line has been installed with telephones in booths at turn-outs and instruments in all the company's offices, car barns and power houses. The dispatching of cars is done by telephone. Car reporting and regular orders are verbal but variation from the regular schedule are only made by using a triplicate train order ticket. The motorman receives the order over the telephone, it is repeated back by the conductor and checked by the dispatcher, the conductor punching an order slip in triplicate, one copy to be taken by the conductor, the second by the motorman and the third is deposited in a box kept for the purpose so that there is always a means of checking or verifying the orders. The system is found to be a trifle cumbersome but is believed to be reasonably safe.

As an insurance of safety on portions of the road having sharp curves where cars can not be seen for any great distance in advance and where the danger is necessarily greatest, the movable staff system has been tried with satisfactory results. On the sections so protected a spring derail is put at each end of the block and is locked with a duplicate padlock, the key to which is attached to the staff. The motorman can get his car out of the block, but he cannot enter a block without having possession of the staff and the attached key. When a car enters a block the conductor takes the staff with him and delivers it to the opposing car at the other end of the block. The system is not adapted for protecting an entire road as the chances for delay would be too great but for short sections of crooked track it has many points to recommend it. If the travel becomes heavy enough to require

between the pier and the beginning of arch span, there will be concrete retaining wall and fill in center. The Anthony Kill is crossed with three concrete arches, two spans of 100 ft. each and one span of 55 ft. The rise of the former is 20 ft, and the latter 12 ft.

The false work consists of piles driven down to rock and timber bents spaced 10 ft. apart. The covering consists of double 1-in. boards.

The concrete is made and laid according to the following specifications:

Cement.—Must be of best quality of freshly burned and ground hydraulic cement, and be equal in quality to the best brands of cement. It will be subject to test made by the engineer or his appointed inspector and stand a proof tensile of 50 lb. per sq. in.

of sectional area on specimens allowed a set of 30 minutes in air and 24 hours under water.

Concrete.—Concrete shall be composed of fragments of hard, sound and acceptable stone or clean gravel, broken to a size that will pass through a 2 in. ring in any direction, thoroughly clean and free from mud, dust, dirt or any earthy admixture whatever. It is to be mixed in proportion of two parts in bulk of the broken stone and clean gravel, to one part of fresh made cement mortar of the quality described, and is to be quickly laid in sections and in layers not exceeding 9 in. in thickness, and to be thoroughly

will be stepped up to 22,000 volts for transmission to the converter and transformer sub-stations. The transmission line will be No. 3 copper wire supported on poles having two cross arms. The high-potential wires will be carried on the outside of the poles leaving the inside pins for such use as may arise.

The five direct current stations now owned by the company were taken over with the individual companies at the time of the merger and are more or less antiquated as regards equipment. Much of this apparatus is still doing good work, however, and it would almost seem that there are lessons that could be learned from the

FALSE WORK FOR CONCRETE ARCH HUDSON VALLEY RY.

rammed until the mortar flushes to the surface; it shall be allowed at least 12 hours to set before any work is laid on it.

Stones not more than a cubic foot can be placed in the heart of piers, abutments and wing walls where the wall is over 4 ft. wide. These stones are to be placed so that there will be at least 1 ft. of concrete to cover them and 6 in. of concrete between them.

One of the illustrations shows the false work and molds for springing the concrete arches into place.

#### POWER GENERATION AND DISTRIBUTION.

At the present writing it is not possible to give all details for the permanent power scheme. Broadly the plan is to do away with the five power houses owned by the company and substitute a

designs of these early machines. Mr. Powers states as a curious fact that two of the small generators in the Glens Falls power house which were installed by the United States Electric Co. in 1891, and which have run on an average of 20 hours a day since that time, are still running with the same brushes, armatures and commutators that they had when first installed, the commutator wear for 11 years not exceeding 1-16 in. He attributes this long life to the unusually large and heavy brushes used and to the comparatively slow speed at which the machines are run. The commutators are built up with hard fiber insulation between the bars.

It is proposed to eventually shut down these stations with the exception of the combined water and steam plant at Stillwater

STANDARD CLOSED CAR J. M. JONES SONS.

three-phase 22,000-volt transmission system with sub-stations of 300 kw. rated capacity placed at intervals of approximately 10 miles; current to be generated in two water-driven plants of large capacity, one near the northern terminus and one somewhere near the southern terminus of the road. The upper water power, where about 3,000 h. p. is available, will be developed first and the second one in the future, the final plans calling for an aggregate of 8,500 h. p., including the two water power plants now in use. The new stations will probably contain 650-kw. turbine-connected units generating alternating three-phase current of 40 cycles at 390 volts, which

where the economy of operation will always insure that the station be kept in service. The other plants will not be dismantled but will be held in reserve for emergency duty.

As a temporary resource or until the larger water power stations are available, it is proposed to install at once at the present power houses and at the rotary sub-stations the rotary converters that will be used under the new alternating system of distribution. For the immediate future and at least for the coming summer the power house will be reversed, converting direct current to alternating from the direct current machines and transmitting the al-

ternating current after passing through the transformers to the nearest rotary sub-stations at 22,000 volts.

The Hudson Valley Railway Co. owns 130 cars, of which over half are double truck. Most of the cars were built by the J. W.

PARLOR IN HUDSON VALLEY CAR.

Jones' Sons Co., of Watervliet, N. Y., and are said to be the finest ever turned out by that concern.

The closed cars which have 31-ft. bodies represent the Jones standard high speed car, which is 8 ft. wide and has 4 ft. 3 in. vestibules at each end. The cars have center sills, side and end sills, and are reinforced by steel plates. It will be noticed that the car is somewhat high on the trucks, thus dispensing with traps in the floors and allowing of motor inspection from underneath the car. The front platform is provided with controller, air-brake, switches, etc., and the rear platform has a Baker heater installed, the car being piped for and heated by that system. The interior is divided into smoking and passenger compartments, the smoking compartment being in the forward end. The seats are made and arranged so as to be easily removed, and carpet, chairs, card tables and tapestry, arranged as shown in one of the illustrations for use as a chair car. The interior finish is of mahogany, with plate glass in sash and doors.

The 15-bench open car is also the Jones standard high speed car of that type. The extreme length is 41 ft. 5 in.; width, 7 ft. 9 in. over seats. The ends are of extra strong buffer construction,

STANDARD FREIGHT CAR J. M. JONES' SONS.

reinforced by steel plates which continue around front and along sides. The cars are equipped with double steps on one side (the lower tread may be folded if desired) and on each side are wooden guard poles.

The freight cars are 40 ft. long over platforms, and 8 ft. wide over siding, they are made strong and serviceable, the capacity being 40,000 lb. The tracks are arranged with Y's at the terminals and at stated intervals, and cars run the same end on at all times. One side of each platform is permanently enclosed.

The standard equipment for all double truck cars is the standard wing motion extra heavy double trucks made by the Taylor Elec-

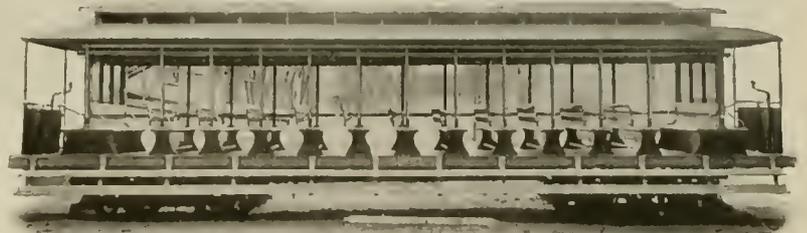

tric Truck Co., of Troy, N. Y. There are four Westinghouse No. 56 motors to each closed car and two on each open car, but both motors are carried on the forward truck, the rear truck running as a trailer. It is held the motors work better when thus mounted and the arrangement greatly facilitates the changing of trucks from open to closed car bodies and vice versa.

All double truck cars are fitted with Westinghouse standard automatic air brakes. The air supply is carried in a storage tank at about 300 lb. pressure and from this is reduced through valves to a working pressure of about 75 lb. in the brake cylinder. The cars are all provided with Baker hot water heaters made by W. C. Baker, of 143 Liberty St., New York City.

The company owns two electric locomotives that are utilized for hauling standard steam railroad freight cars from the mills and factories on the route to steam railroad connection with the Delaware & Hudson and the New York Central railroads. The locomotives were assembled in the company's own shops. The bodies were built by the J. M. Jones' Sons Co., and are mounted on Taylor trucks. Each locomotive has four Westinghouse No. 56 motors.

CAR HOUSE STANDARDS

The company has operating barns and repair shops at Glens Falls and Stillwater and storage barns at advantageous points. In all power house and car barn construction a standard style has been adopted and most of the buildings have been rebuilt to conform to the new standards. These include brick walls, steel I-beam roof construction with flat roofs covered with 3-in. planking with loose tongue and groove matching, and protected with tar and gravel roofing. In building car barns the interior is divided into compartments with not more than three tracks in a compartment. The partitions are heavy brick walls and are carried 4 ft. above the roof. There are no doors or openings of any kind in

STANDARD OPEN CAR J. M. JONES' SONS.

these fire walls, the only communication with different compartments being around through the front doors. It is believed the little additional inconvenience occasioned in this way is more than offset by the security against the destruction of any large portion of the rolling stock by fire. Pits in the barns have been done away with entirely and instead, the barn floor is dropped 4 ft. at either side of each rail. It is found this arrangement not only insures better light for the truck repair men but also renders all parts of the truck and motors more readily accessible.

THE HANDLING OF FREIGHT AND EXPRESS MATTER.

All of the franchises of the company give it the right to carry freight and express in connection with its passenger traffic. This department has steadily widened in scope and the traffic increased in volume but is expected to reach greater proportions during this year. Not only is small freight handled but the company also owns, as stated elsewhere, two heavy electric locomotives, that haul trains of steam railroad cars to and from the railroad connections. Many of the larger plants along the route have sidings and switches from the electric road into their yards and make all their shipments in freight cars which are delivered and taken away by the electric locomotives with less delay and annoyance than would be the case if they had to depend upon steam locomotives. The facilities of the company will soon be taxed to the utmost to care for all the business of this nature presented.

The handling of packages, farm produce and other small freight within the territory directly served is also to become a valuable

source of income. Four box express and freight cars are making regular trips at present but this number is to be increased. The company has an agreement with the United Traction Co., of Albany, whereby the freight house of the latter company at Troy will be used jointly by the two roads for the handling and transferring of express and freight matter.

#### SYSTEM OF PLEASURE PARKS.

As has been intimated, the Hudson Valley Railway Co., aside from the excursion travel naturally gravitating toward the famous resorts of Saratoga Springs and Lake George, has endeavored

where is had a commanding view of the Hudson Valley, the lake, and the Adirondacks.

The second pleasure ground owned by the Hudson Valley Railway Co. is Oudawa Park, 30 miles from Waterford and 20 miles from Glens Falls, on the branch from Schuylerville to Greenwich, in the heart of the pine forest. The place has all the charms of the woods and has been fitted with facilities for picnic parties and excursionists, including dancing pavilion, restaurant, bicycle track and base ball field. The car stops at a little rustic station that adds to the charm of the surroundings. At the upper end of the park is the celebrated gorge of Dionondchawa, whose cliffs are

THEATER IN KAYDEROSS PARK—HUDSON VALLEY RY.

to encourage and create pleasure riding by developing a system of parks and pleasure resorts arranged with proper regard to the facilities at hand for rapidly moving large crowds.

The most northerly of these resorts is Fort William Henry Park, at the extreme southern end of Lake George and about 53 miles from Waterford or 65 miles from Albany. In this park which borders the lake stands a splendid hotel that is also owned and managed by the railway company. The house is called Fort William Henry Hotel, and has earned a reputation which makes it one of the chief hostelries in the Adirondack region. The house contains 300 rooms, has a broad attractive piazza commanding a fine view of the lake and mountains, and is fitted with all the appurtenances of a first-class hotel. The property cost over half a million dollars. It may be well to note here that the railway management does not intend to run the Fort William Henry House as a large dividend payer in itself, but the hotel is to be managed with the interest of the railway primarily in view to the extent that excellent accommodations and cuisine will be furnished at reasonable rates with the view of keeping the house filled with a desirable class of guests and thus increasing the number of possible and probable patrons for the road. As further inducement the company will arrange to run special cars from Albany to Fort William Henry for the accommodation of private parties going to and from the hotel, and it is believed this trolley ride lasting about four hours will be not the least interesting and enjoyable feature of an outing in this region.

Near the hotel is an artistic casino built at a cost of \$10,000. The architecture is Spanish in style. The casino is fitted with stage and dressing rooms for out-of-door theatrical and vaudeville entertainments, and is also arranged for dancing and for the use of conventions. There are bath houses below on a sandy beach and along the lake is an evergreen walk which has been a favorite spot with amateur photographers. Near the park is Prospect Mountain, up which runs an inclined cable road to the summit

115 ft. high and covered with shrubbery and ferns. At the foot of the cliffs runs a picturesque stream making the spot one of unusual beauty and attractiveness. The company's railroad crosses this gorge on a steel span 180 ft. long.

Kaydeross Park, near Saratoga Lake, on the Mechanicsville-Saratoga branch, is the third park in the series. The pleasure

KAYDEROSS PARK.

grounds extend for half a mile along the lake shore. In a natural hollow has been arranged a rustic stage and dressing rooms of logs with none of the bark removed. The seats for 1,200 people are placed around three sides of the amphitheater, and at irregular intervals are small platforms on which are comfortable wicker chairs, these constituting the boxes for this unconventional thea-

ter. Back of the stage is a shadowy pool which with its surrounding trees forms part of the scenery for the performances on the stage. There is a restaurant here, a merry-go-round, and a conservatory, and on the rise from the shore is a casino, set with the water and hills forming a charming and effective background. The

excursions if desired. Sacred concerts are held on Sundays during July and August. A specialty is made of elaborate displays of fireworks at frequently recurring intervals and the company has a standing contract with the Payne Fireworks Co. for a certain number of fireworks displays during the season.

HOTEL, BOAT HOUSE AND CASINO AT FT. WILLIAM HENRY.

stage has foot lights across the front and electric lights on poles and among the trees furnish adequate illumination at night. The paths which lead to the theater also communicate with a shaded grove where there are swings and other outdoor attractions for the children and rustic seats and shady nooks inviting repose.

The three parks mentioned are the chief recreation points on the road but there are also camp meeting grounds and numerous lesser resorts and pleasure grounds on the many small waterways and mineral springs with which the territory abounds.

In the handling of excursion crowds on its cars the company has had considerable experience and has been very fortunate in this traffic, always having in mind that the crowds are to be started moving and to be kept moving with all possible dispatch, but without personal risk to any individual making up the crowd. As pointed out in a recent issue of the "Review" the experiment of hauling cars in trains with a heavy snow plow as the locomotive has been tried. This worked satisfactorily and 600 passengers have been carried in a single train of five trail cars without accident. During the coming season the new electric locomotives built by the company will probably be utilized in this service.

DISTANCES, FARES AND TICKETS.

From Albany, Watervliet, Troy and Cohoes to Waterford (via lines of United Traction Co.), distance Albany to Waterford, 12 miles; running time, 60 minutes; fare, 15 cents.

Waterford to Fort Edward, distance 36 miles; running time, 1 hour and 50 minutes; fare, 75 cents.

Fort Edward to Glens Falls, distance 7 miles; running time, 35 minutes; fare, 12 cents.

Glens Falls to Warrensburg, distance 16 miles; running time, 60 minutes; fare, 25 cents.

Through tickets are sold Albany to Glens Falls, for \$1; round trip, \$1.90. The total distance is a trifle over 70 miles, and the running time about 5 hours.

The Saratoga branch from Mechanicville to Saratoga Lake is 18 miles long. The fare between these terminals is 50 cents, and the running time 55 minutes.

The Greenwich branch is 6 1/2 miles long. The fare from the main line to Greenwich is 10 cents and the running time 25 minutes.

In the general interests of its patrons the company makes a number of combination rates of fare to suit different classes of riders.

In caring for the ordinary transient passengers riding from any town to any other on the route and paying fare to the conductor in accordance with the established tariff, the company employs the form of ticket reproduced here. The ticket is on the duplex system and after punching the name of the station from which and to which the passenger is going, the total fare collected, and the direction, the conductor tears the two halves of the ticket apart,

DUPLIX TICKET.

To all the company's recreation points special rates are offered to Sunday schools, labor organizations, fire companies, and all organized bodies able to guarantee a reasonable number of attendants. This traffic is especially sought. First-class musical concerts, comic opera, or object vaudeville performances are provided at all the parks and special events are prepared in connection with

## NEW ORLEANS STRIKE AVERTED.

In June, 1901, the employes of the four street railway companies operating in New Orleans made a request for higher wages and shorter working hours. In response to this request the wages of conductors and motormen were raised from 13 to 18 cents per hour and the day's work was shortened to ten hours of platform work. These concessions were brought about largely through the efforts of Mayor Capdevielle and the agreement was accepted by the men as absolutely satisfactory. For some time past, however, there has been considerable agitation among the street railway employes for further concessions from the company. A union was formed among the men and W. D. Mahon, president of the Amalgamated Association of Street Railway Employes of America, came to New Orleans at the request of the union and a number of meetings were held at which demands were formulated to be presented to the street railway companies. Before these demands had been presented the officers of the four street railway companies addressed a joint letter to Mayor Capdevielle in regard to the subject as follows:

"Dear Sir—As you exhibited your care for the public welfare last year by lending your kind and able assistance to the settlement of a pending controversy between the undersigned street railway companies and their employes, we take the liberty of addressing you this communication, because we are informed by the public prints that a nonresident, not in any way connected with this city, or interested in its peace, comfort and well being, is now here conferring with our employes and organizing them for the purpose of formulating and presenting, in the near future, demands upon us, the central and principal one of which is that these companies shall recognize a labor union composed of these employes.

"We understand that what is meant by the term 'recognition of the union,' which this nonresident is formulating for presentation to us is:

"1. That we shall not have the right to employ, and that we shall not employ in our service any person who is not a member of such union in good standing.

"2. That we shall not have the right to discharge and shall not discharge any employe without the consent of said union.

"We are further informed that an all-night meeting of our employes will be held this very night, under the leadership and auspices of this nonresident to agree upon the demands to be presented to us.

"If we are right in our understanding that the principal point to be presented to us is 'recognition of the union,' and that this recognition means what we have stated above, then we feel compelled to make to you, and through you to the public and to our employes, the announcement that, under no circumstances whatever and under no pressure or persuasion, will we accede to this demand. We cannot and will not consent to surrender control of properties like these, affected with a public interest, standing in such vital relations to the business, the safety, the comfort, the health and the happiness of the community, representing such large investments of capital and contributing such large sums to the support of the public functions of this municipality, into the hands of our employes, among whom discipline is necessary and over whom discipline can never be enforced under such circumstances.

"In our judgment the granting of any such demand would impair our ownership, cripple our control, and ultimately result in the destruction of our properties and the grievous injury of the public.

"If our employes have any grievance as to hours, wages or rules, we individually and collectively stand ready at all times to confer with them, to discuss and adjust amicably and fairly all differences thereto pertaining, and in proper cases to submit our differences to arbitration.

"We feel confident, Mr. Mayor, that if any struggle is to come over these matters, we shall have your support and countenance, and the good will and backing of the community at large."

On March 19th a mass meeting of the union employes of the various roads was held at which the men decided on the demands to be made upon the company. This demand included recognition of the union, shorter working days and higher wages. The following resolutions were adopted by the men at this meeting:

Section 1. The workday for motormen and conductors shall be nine hours, to be completed made of eleven consecutive hours, with the single exception of swing and tripper runs, swing and tripper runs to be completed inside of fourteen consecutive hours, and no run to work over seven hours without a relief for meals.

Sec. 2. The wages for all motormen and conductors to be twenty cents per hour.

Sec. 3. Where men are laid off to look up evidence in the case of accidents, and so on, they shall be paid the same rate of pay they would receive had they been operating their cars.

Sec. 4. All employes to be promoted to the best runs in accordance with their continuous age in the service of the company.

Sec. 5. This section included the rules and penalties in regard to the men missing their cars.

Sec. 6. All motormen and conductors are to be members in good standing of this association. This section to in no way interfere with the company in their selecting or hiring employes, the rule to be that where the company employs new men, these men shall work sixty days, and if at the end of that period they are satisfactory to the company, they then shall become members of the association. Any motorman or conductor at the present time in the employment of the company, and not a member of the association, shall become a member within the next sixty days from the date of this agreement.

Sec. 7. All business arising between the parties hereunto shall be transacted through the properly accredited officers of the company and the properly accredited committees of the association, with the exception of the cases or complaints that might arise over conductors who have been discharged for missing or other irregularities in the collection of fares. It being understood that the committee to treat with this company shall be selected from the regular employes of the company.

Sec. 8. For the purpose of hearing and deciding any contention that might arise over the discharge of conductors for missing or other irregularities in the collection of fares, there shall be selected a committee of two members of the association, the members of this committee to be mutually agreed upon by the officers of the company and the accredited committee of the association. It shall be the duty of this committee to investigate any case of this kind that may arise. They shall treat confidentially all information and evidence that is submitted to them, and they shall have full power to decide these cases without any further consideration on the part of the organization. This committee is to be selected and to serve the same period that the other officers of the association serve, vacancies to be filled as heretofore prescribed.

Sec. 9 fixed the wages of pitmen, helpers and washers and prescribed the hours of work and the pay for overtime.

Sec. 10 related to the settlement of disputes between the men and the companies by a board of arbitration.

As was to be expected the companies refused to treat with the union, and on this point the companies were all in accord. The following letter, which was signed by the presidents of all the street railway companies, was sent in answer to the demands of the Amalgamated Association:

"Gentlemen—We have received, from persons stating themselves to be your subcommittee, a 'memorandum of agreement' which you propose shall be entered into between your association and the street railway companies of this city.

"This suggested contract provides that the railway companies, among other things, are to obligate themselves to retain in their service no motormen or conductors not members in good standing of the association, and that all business arising between the parties to said contract shall be transacted through the properly accredited officers of the companies and of the association, with the exception that conductors discharged for dishonesty shall have their 'contention' tried and decided by a committee to be composed of two members of the association.

"And this suggested contract provides that these, among other obligations, are to be assumed by the street railway companies in consideration of the association 'continuing the operation of the said (companies') street railways for one year from the first day of April, 1902.'

"That is to say, your association proposes not only to interpose itself in all matters of management between these companies and their employes; to restrict them in their right to employ men outside of that association, or to discharge a conductor, even if convicted of embezzling fares, but it arrogates to itself the power to continue, or inferentially, to discontinue the operation of these railways.

"These pretensions are an insult to these companies and to this community, and your association, in making them, openly proclaims itself an enemy alike to private and to public rights.

"We decline, therefore, to recognize your association and to discuss with it the affairs of these companies, or the relations existing between them and their employes."

This refusal on the part of the companies to treat with the Amalgamated Association created considerable excitement among the men and a number of meetings were held not only by this union, but by a number of other trade and labor unions of the city, at which resolutions were passed promising moral and financial assistance to street railway men in case of the strike which threatened.

March 25th a modified form of the demands already mentioned was adopted by the men and submitted to the company. These were however, essentially the same as the previous demands and were unanimously rejected by the officers of the street railway companies. The relations between the employes and the companies had become greatly strained but Mr. Mahon, who was the leading spirit in the negotiations apparently became convinced that a strike at this time would prove disastrous to the men, as Mayor Capdevielle and public opinion were opposed to the demands of the men. Instead of a proposition to strike therefore, Mr. Mahon submitted a proposition to the vote of the men which had been arranged at a conference with Mayor Capdevielle. This agreement provided for the continuance of the arrangements under which the men had been at work. It was voted upon by the members of the union March 27th, and while the more radical of the men were eager to precipitate a strike, the conservative element prevailed at the election and the proposition of Mayor Capdevielle was carried by a very large majority of the votes.

The agreement which the mayor submitted and to which the companies agreed in a written communication was as follows:

"Should the present demands of the men be withdrawn or not insisted upon, we do not hesitate to give you our assurance that:

"1. We are willing to sign with our employes a renewal of the agreement of last June for one year from date.

"2. We are willing to discuss with the pitmen, carhelpers, etc., the question of their wages whenever they themselves approach us regarding same.

"3. If not already provided, we will provide sufficient and proper accommodations for the use of our men.

"4. We will so adjust matters as to allow our men sufficient stand time to make use of the accommodations provided in paragraph 3.

"5. The rules for missing to be: When a man misses his car, for the first offense he shall serve three days on the extra list; should he miss his car a second time in thirty days, he shall serve five days on the extra list; and for missing his car the third time inside of thirty days, he shall lose his run and be placed at the bottom of the extra list. Men missing their cars shall report in time for the next relief. Should a man miss any relief while serving on the extra list, an additional day to be added for each miss."

### CLEVELAND THREE-CENT FARE ROADS.

The organization of the Peoples Railway Co., of Cleveland, to build 3-cent fare roads in that city was mentioned in the "Review" for March, 1902. At that time Mr. Hoefgen, one of the principal promoters of the new lines, had secured an injunction against the Cleveland City Railway Co., preventing it from interfering with the efforts of the new company to secure the consents of the property owners. March 20th the circuit court dissolved this injunction after the city council had granted franchises to the new company. The Cleveland Recorder states that Mr. Hoefgen will begin operations on the building of the 3-cent fare lines just as soon as the ordinance becomes operative, and that it will be but a few months until the roads will be completed and running. The lines are to be built where there is need of railway facilities and the company will be able to secure considerable business even in case the existing lines in the city should reduce the fares to the same figures.

April 7th an interlocutory injunction restraining Mr. Hoefgen and his associates from proceeding with the work was granted, it being alleged in the bill that the ordinances were illegal. The hearing on the merits of the case was set for April 14th.

The first passenger train was run over the new third-rail system on the Third Ave. Elevated road, New York, March 23d. Fifteen or 20 trains of the new type will be put in commission in April.

### THE CHICAGO STREET RAILWAYS.

At the meeting of the Chicago City Council March 18th, a resolution was unanimously passed requesting the traction companies of Chicago to present by June 15th proposals for renewals of their franchises. The preamble stated that as important street railway franchises are to expire within 18 months the discussion of the terms of their renewal at the last moment would put the city at a disadvantage, as the terms of the new ordinances could not be satisfactorily discussed without perhaps a temporary cessation of transportation facilities. The resolution concluded that even in the event of the failure or refusal of the old companies to begin such negotiations by June 15th the city, through an appropriate committee, should ask for bids from outside parties.

It was announced that the Union Traction Co. was preparing to meet the terms of this resolution and is engaged in preparing a proposition to submit to the council on the date specified. Counsel for the company stated that the cost of carrying out the improvements discussed by the directors of the company will approximate \$20,000,000 and the company is prepared to spend this amount if a long term franchise is granted.

The debate on the report of the committee of transportation in the city council in regard to the proper form of franchise extension ordinance has been postponed until the new aldermen elected April 1st shall have taken their seats.

Immediately after the city election, which showed a majority of some 125,000 votes in favor of municipal ownership, the mayor asserted that he would veto any franchise extension ordinances passed before the legislature passes municipal laws for the city. As the legislature does not assemble until next winter it is thought that the mayor will probably postpone the consideration of the traction franchise question until next year. The City Council, however, has gone on record demanding that the traction companies present propositions for new franchises by April 15th.

In the "Review" for November, 1901, page 830, we noted the decision of the Illinois Supreme Court in the mandamus proceeding brought by the Chicago Teachers' Federation to compel the State Board of Equalization to increase the assessment for 1900 of 23 corporations doing business in Chicago, including 20 street railway, 1 telephone and 2 lighting companies. In accordance with this ruling the Board reassessed these properties fixing the value as stock market value of the capital and indebtedness of the several companies on Apr. 1, 1900.

The companies interested filed a bill in the United States Circuit Court praying an injunction to prevent the collection of taxes based on the reassessment, and this court rendered its decision April 4th.

In its decision the court said in part after comparing the assessment of seven companies for 1900, which was about 42 million dollars, and for 1901, which was about 26 million dollars: "These assessments, widely divergent, were upon the same properties, substantially by the same board, entered almost on the same day.

"In the very nature of things one or the other has been made up under some species of mistake, fraud, or coercion, and a few pregnant circumstances convince us that whatever may be said of the assessment for 1901, the reassessment for 1900 cannot be accepted as the independent judgment of the state board. One of those circumstances is this: The reassessment of each of the complainant corporations for 1900 is a close approximation to the aggregate of its indebtedness and its stock value as measured by the stock market quotations for April 1, 1900. The board seems to have adopted as its own standard in the making of these reassessments the Stock Exchange records for that one day of the 365, and to have restricted its function to the mere arithmetic of adding up the figures of that day's record.

"It goes far towards convincing us that the objective of the board was not the real value of the properties as entireties, but simply what the stock market for one day indicated such value to have been.

"What was the real value in fact of the property reassessed? To arrive at such value we have looked into the earnings of the several companies for the year 1900. An annual reduction equal to 6 per cent of the current value of cars, tracks and machinery has been allowed.

"Several other elements in a fair calculation, beside the net earnings, have raised questions to which we have given careful consideration. The first of these is upon what rate of true net earnings the

aggregate value of the property should be capitalized? We have fixed the rate at 6 per cent. It is less than the rate that some advanced advocates of municipal ownership are willing to guarantee to investors upon any securities of this character. The rate as adopted is, we think, justified by the consideration that usually attend a real investor's purchase of stock.

**Uniformity Over the State.**

"Another element entering into the calculation is this: Should the capitalization thus arrived at be equalized to the assessment on the other property of the state? The record before us convinces us that the assessment on other property throughout the state, including railroads, for the year 1900, as finally equalized by the State Board of Equalization, did not exceed 70 per cent of the cash value, and that such standard was not adopted by the state board unintentionally or through inadvertance, but deliberately as a means of arriving at an equalization of taxable values generally throughout the state.

"In our opinion uniformity is still the statutory policy of the state in the laying of taxes with respect to franchise corporations as well as other property; accordingly it was imperative that before the reassessments for 1900 were entered there should have been such deductions as would have equalized the valuation adopted with the valuation placed upon the other properties of the state.

**Must Pay to Get Benefit.**

"Before an injunction issues we shall require the payment to the proper officers by the complainants of the taxes of the year 1900 according to the following rule: The basis shall be the true net earnings of the several complainants for the year covering April 1, 1900, proper allowances being made for depreciation and replacement, but not for extensions, and reduced further by the amount of additional taxes that the enforcement of this rule produces. Upon this basis the value of complainants' capital stock, including franchises and tangible property, shall be capitalized at a rate of 6 per cent, this equalized by reduction of 30 per cent, and then divided by five. The sums thus produced will be regarded as the true assessments for the year 1900. Upon this the taxes will be extended at the true rate for 1900 exclusive of interest and penalties not to exceed 8.37 per cent, from which will be subtracted the taxes already paid, and the balance will be the sum required. We allow 30 penalties, for the reason that the reassessments complained of are in our judgment void."

As a guide to the masters the judges gave estimates of the decrease their rule would make in the valuations of the capital stock of the seven companies parties to the suit, the figures being:

Company.	State board value.	Court value.	Decrease.
Union Traction . . . . .	\$14,013,000	\$7,763,000	\$6,250,000
Consolidated Traction . . . . .	3,821,000	621,000	3,200,000
People's Gas . . . . .	12,631,000	8,501,000	4,130,000
City railway . . . . .	6,023,000	4,015,000	2,108,000
Telephone . . . . .	2,600,000	1,850,000	750,000
Edison . . . . .	2,400,000	1,800,000	600,000
Totals . . . . .	\$41,488,000	\$24,550,000	\$17,038,000

**CHICAGO FRANCHISE TAXES HELD VALID.**

A decision was rendered March 28th in the case of the city of Chicago against the Union and Consolidated Traction companies which upholds the levy made by the Illinois State Board of Equalization for 1901 on the capital stock and franchises of these two companies. The decision holds that these taxes are not only valid but the amount, \$350,000, must be paid in cash to the county treasurer.

The traction companies allege that the State Board of Equalization had not the right to levy taxes against them to be used for local purposes only, but the Circuit Court holds that the state legislature had the right to delegate to a state taxing body the power to levy taxes to be used for local purposes, provided such taxes were levied in a uniform manner and according to law. The companies will appeal the case, and according to the decision, if they pay the tax they can recover by suit if the reviewing court reverse the present decision.

Another decision of interest was that rendered March 19th in the case of the city against the Union Traction Co. and the Consolidated Traction Co., which compels each of these companies to recognize transfers from the other company. It was claimed that the

two corporations were separate and therefore could not be compelled to issue transfers to each other's lines. The decision, however, states that both corporations are in charge of Mr. J. M. Roach and that since the operating agreement between the two roads went into effect in 1890, the two companies have been practically one. The final decision was that upon lines owned by practically one company one fare must prevail. This means that the citizens of Austin and the northwest suburbs will be carried into the business center of Chicago for a 5-cent fare if the decision is sustained by the supreme court to which it was appealed. The ordinance passed by the city council in 1897 requiring 5-cent fares to all points within the city limits was also declared valid.

**ELECTROLYSIS CASE AT DAYTON, O.**

The case of the city of Dayton, O., against the City Railway Co. was decided in the Court of Common Pleas on Apr. 5, 1902, the summary of the findings being as follows:

"This court has no authority in law to compel a change in the system from the single trolley to the double trolley, and, if the same was warranted by the law, the facts would not justify such a change.

"The defendant has been, and is, operating its road in a negligent manner, causing continual damage to the water pipes of the plaintiff, for which the plaintiff has no adequate remedy at law, and cannot by any practical method prevent such damage.

"It is no excuse in law, and the facts would not justify the defense that other electric lines in Dayton are contributing to this or doing like damage.

"It is therefore the duty of the court to enjoin the defendant from so operating its railway and to compel it, within a reasonable time, to introduce such improvements in the system, in order that the operation of the single trolley system authorized by the franchise and contract, will be in accordance with the present standard of the art of operating single trolley roads. The plaintiff shall co-operate to that end.

"All matters of detail can be arranged between counsel and the court in the final order.

"The costs will be adjudged against the defendant."

**ELECTRIC LINE FOR LAKE COUNTY, ILL.**

Messrs. R. D. Wynn, David T. Webb and John M. Gray, of Waukegan, Ill., have secured franchises for an entrance into Waukegan and options on private rights of way from Waukegan to the Fox Lake region that give them the key to what should be a profitable electric interurban line in Lake County, Ill. There are in Lake County, which lies just north of Cook County, over fifty lakes, the greater number being in the northern part of the county.

The route chosen by Mr. Wynn and his associates is the most advantageous one that could be chosen through this territory; the proposed 25-mile line from Waukegan to Adrian, via Gurnee, Milburn, Lake Villa and Antioch reaches 17 of the lakes direct and as many more are easily accessible by buses. At the present time there are hundreds of hacks and buses which regularly meet trains to serve this lake region during the summer season.

Waukegan is connected with Chicago by the Chicago & Milwaukee Electric Ry. and the Chicago & Northwestern Ry., and is the first harbor out from Chicago on the west shore of Lake Michigan. The winter populations of the towns in the region are small, but the country is well settled and in summer the town populations are doubled and a large number of people resort to the Fox Lake district, Lake Villa and Grays Lake; the last named it is intended to reach by a 3-mile branch line. A conservative estimate places the summer "lake population" at 70,000.

While the Waukegan franchise secured by the promoters gives them until Nov. 1, 1903, to commence building and the options on the rights of way are for the same term, it is Mr. Wynn's intention to push the construction this season as soon as he can arrange for the capital needed.

The Burlington (Ia.) Railway & Light Co. has granted a liberal increase in wages to conductors and motormen in its employ, the new scale being as follows: 12½ cents per hour for a 12-hour day for the first six months of service; \$1.65 per day after the first six months, and \$1.80 per day after the first year.

## PROTECTION FOR SINGLE TRACK CITY ROADS.

The task of finding a signal system for properly protecting single track electric roads has proved to be difficult in the extreme, although committees appointed by the American Street Railway Association, by the New York and other state associations, and by individual companies have spent much time, money and effort in endeavoring to find a system that would be reliable under all conditions.

The problem is one that confronts not only the builders of new interurban lines, but also forces itself upon the owners of city systems built in the earlier days of the art. In fact, difficulties not encountered on straight-away interurban roads are introduced by the complicated nature of many of the smaller city systems, including as they usually do several single track lines converging at some prominent center, with irregularly spaced sections of double track combined with long stretches of single track and with switches not always placed to the best advantage.

Mr. John Daly, the superintendent of the Yonkers (N. Y.) Railroad Co., has devised two or three ingenious schemes for affording protection at several of the more complicated points on the system in his charge. The Yonkers company is now controlled by the Metropolitan Street Railway Co., of New York, through the latter's lease of the Union Railway Co., which some time ago purchased control of the Yonkers Railroad Co., but the Yonkers road is still operated practically as an independent system. The company has 25 miles of track and about 32 cars. The road is a typical small city line with double tracks on a few of the main streets, and single track branches reaching out to several nearby points of local attraction. One line runs to Hastings, which is six or eight miles to the north; one out Park Ave., for five or six miles through a residential section, and one runs to Mount Vernon, about four miles to the west. These and other lines converge on the main streets, and all of them run on different schedules which have to be frequently changed upon short notice to accommodate extra heavy travel on holidays and evenings. The situation is further complicated by a large number of excessive grades and sharp curves on all of the outlying lines and also upon several of the business streets.

Mr. Daly has taken the individual lines separately, and also the two or three points in the city where the congestion and delay has been the most annoying, and has endeavored to find a solution for each particular situation, as it was feared no one system or regulations could be found to cover the requirements for all the lines. In proof of the efficacy of the rules adopted it might be stated that prior to their enforcement about seven months ago, the company was having a serious head-on collision at least once a month,

## YONKERS R. R. COMPANY.

### First Car to Receive Instructions.

#### OUT.

Leave Depot at 6:30 P. M. on 4 car time

2nd trip out meet at Getty Square, Ashburton and Lake Avenue, then to end of line.

#### IN.

On 4 car time and lays at Depot until 7:15.

2nd trip in meet at Club House, Ashburton Avenue, and go to Depot.

After that on 3 car time.

#### INSTRUCTION CARD FOR MOTORMAN.

to say nothing of vexing delays and congestion. During the past seven months not a single collision has taken place.

One of the serious difficulties on the single track lines was the necessity of changing the schedule every morning and evening. For instance, the line to Mount Vernon for several hours of the day is run on what is called 4-car time; that is, four cars fill the line between Yonkers and Mount Vernon, there being always two going in either direction. As the traffic increases during the rush hours in the evening, the schedule is changed to 6-car time, and sometimes to 8-car time. Of course, this changes all the meeting

points en route, and introduces a much to be dreaded opportunity for the motormen to forget what schedule they are operating under, and so "run" their switch. Similar conditions are found to a large degree on the Park Ave. line, where the schedule changes from 3-car to 4-car time.

As the New York railroad commissioners have always looked with more or less disfavor on automatic mechanical safety signaling devices, Mr. Daly concluded to do away with mechanical expedients as far as possible, and rely solely on the responsibility of his car crews. To this end, the utmost care is taken in the selec-

SIGNAL BOX—YONKERS RAILROAD CO.

tion and training of the conductors and motormen, and inasmuch as the number of men required is not excessive, the superintendent is able to give his personal attention to this matter. He selects only the best men and then takes care that their instructions shall be in such form as to leave no excuse whatsoever for neglect of duty. The regulations on the Park Ave. line will illustrate this point.

During the regular 3-car schedule for the most part of the day there is very little difficulty, as the men become thoroughly familiar with the 3-car passing points. In the late afternoon when the extra car is put on, the first motorman out under the 4-car schedule is handed a little cardboard folder, about  $4\frac{1}{2}$  in. wide by  $4\frac{1}{4}$  in. high, folded down the center so that it will slip into his vest pocket. This notifies him of the increased schedule and gives him full instructions. The inside of the folder is illustrated herewith. Likewise the motorman on the second car starting out on the changed schedule is handed a similar folder with his passing points clearly stated, and so on with the third and fourth cars. The men are required to read these instructions each day and to keep them about their persons for instant reference if any doubt arises as to the proper meeting point. As soon as the running time is changed again the cards are collected by the dispatcher as each crew comes in.

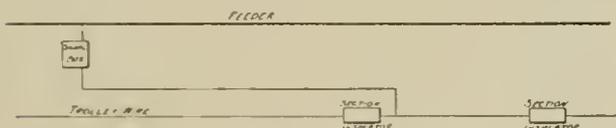

As an additional check each motorman as he starts, hangs up a small number under the hood over his platform. The number is painted in white on a small metal disk and serves the purpose of identification for the crews of passing cars. The numbers for this line are 1, 2, 3 and 4, each crew keeping the same number for the day's run. The car starting out first in the morning takes No. 1, the second No. 2 and the third No. 3, No. 4 being reserved for the extra car that goes on during the rush hours. This scheme of hanging up the numbers has been instrumental in preventing one or two accidents at least, as it enables every employe of the company who may see the number to check the car and determine whether or not it is at its proper place on the line.

In the case of non-arrival of an opposing car the crews are instructed to wait at the switch for five minutes, and then to proceed cautiously, ringing the bell and flagging around curves.

Another expedient is in force to prevent accidents and delays at the entrance to a long loop running around several city blocks in

the business district. Two or three lines of cars use this loop and congestion was caused through the inability of the motormen to tell after they had run around the loop whether or not the single track at the entrance was clear for them to proceed on their outward trips. The running times were such that certain cars should reach the entrance and pass into the loop at just about the time that opposing cars were scheduled to pass out of the loop at the same point. To avoid misunderstanding at this place, a small wooden box was hung on a pole at the point where the cars turn off to run around the loop. This box has a small compartment for each separate line using the track, and is fitted with a glass door. In the bottom of each compartment are several numbered metal disks corresponding to the numbers carried on the cars. When a car enters the loop the conductor jumps off and places the disk bearing his car's number in an upright position so that it will be visible through the glass door. The motorman of the car coming in the opposite direction can thus tell at a glance what cars have entered the loop and whether the track is clear for him to proceed on his outward run. Of course each conductor after completing the run around the business district turns the number down in the box as he passes the point on his outward trip.

The only mechanical signal on the Yonkers system is one on a principal street where a very severe grade combined with a sharp compound curve prevents motormen from seeing but a few feet

WIRING FOR SIGNAL BOX.

ahead. At the foot of the hill is a complicated set of crossings and switches and it is desirable to have but one car on the section at a time. A tell-tale signal was therefore arranged to indicate at one end of the section whether or not a car had entered the section from the other end. The section in question is about 1,000 ft. long. The diagram and half tone engraving will give an idea of the device which is very simple. A section of the trolley wire about 400 ft. long was insulated by section insulators and the current for this stretch of 400 ft. is taken by means of an auxiliary wire through a signal apparatus placed at the other end of the 1,000 ft. section. The signal apparatus is housed in a wooden box hung on a pole and consists of a solenoid which when actuated moves a semaphore arm. It will be evident that current will flow through the coil only as long as there is a car on the insulated section. The fact that the insulated section of trolley wire is only 400 ft. long is explained by the statement that a car on this stretch is obstructed from view by the sharp curve and as soon as it has passed through this 400 ft. it is visible from the top of the hill and the signal is not needed.

**ANTI-SMOKE LAW IN WASHINGTON, D. C.**

A determined effort is being made in Washington to enforce the anti-smoke law at the various factories and warehouses in that city, and the first of 35 suits against Mr. L. L. Sinclair, general manager and superintendent of the Washington Traction & Electric Co., for violating this law was tried last month. The suit relates to the alleged omissions of dense black smoke from the stack of the United States Electric Lighting Co's. plant, and the case is being vigorously contested. It is claimed by the company that full compliance with the anti smoke law is a physical impossibility, and it is said that in case a verdict is rendered against the company in any of the pending suits the higher court will be resorted to.

The Union Electric Co., which operates the street railway and electric plant at Dubuque, Ia., will build a car house 108x250 ft

The local street railway system in Logansport, Ind., has been sold by George J. Marott to the Wabash River Traction Co. for a price which is reported to approximate \$150,000. The Wabash company now operates 18 miles of railways between Wabash and Peru and projects a 14-mile line from Wabash to Logansport. D. A. Blakeslee, 28 Waverly Place, New Haven, Conn., is president of the Wabash company.

**CONSOLIDATION IN PENNSYLVANIA.**

Negotiations for the merger of the Pittsburg, McKeesport & Connellsville Ry., and the Pittsburg, McKeesport & Greensburg Ry., are stated to have been closed, and arrangements for operating the lines by the new interests were expected to be completed about April 1st. The company running through Connellsville is building its line through the coke region at this point with Mansontown as its objective point. A number of branch lines are to be built to run through important towns in the counties through which this road operates.

To furnish power for this system a large plant is to be built at New Haven, directly across the river from Connellsville. The company running to Greensburg is building a line from that place to Irwin with an extension recently opened to Youngwood. This company has also secured franchises for two extensions west from Lima. One is via North Irwin to East Pittsburg and the other is to McKeesport via Jacksonville and Stuartsville. The extension to McKeesport is to be built at once. In addition to these traction interests the new consolidation also includes the purchase of the Westmoreland Light & Power Co., which operates several electric lighting plants. The consolidation represents a total capitalization of nearly \$5,000,000.

**THE RHODE ISLAND LEGISLATURE.**

In the closing days of its last session the Rhode Island Legislature passed three important bills affecting the electric roads of the state.

One known as the "Merger Bill" makes possible a consolidation of the street railway interests controlled by the United Traction & Electric Co., of Providence, with the Providence Gas Co. and the Narragansett Electric Lighting Co. It is said that all these properties will be taken over by a new company incorporated as the Rhode Island Co.

Another bill provides for a universal transfer system among the roads operating in Providence.

A third bill provides that a day's work for all conductors and motormen in the state shall not exceed ten hours' work, to be performed within 12 consecutive hours.

**PROPOSED BOSTON-PROVIDENCE INTER-URBAN.**

A plan is being promoted to furnish a through line of electric cars from Providence to Boston in which five or six different companies are interested. It is thought by the promoters that all the street car companies between these two points will derive considerable benefits by inaugurating a through system. The lines of the Boston Elevated extend through Hyde Park and a continuous line extends through Providence and Attleborough. It is proposed to build a connecting link between Attleboro and Hyde Park by means of which cars from Providence to Boston can make a through trip in about three hours. The fare will be about 60 cents, which is 40 cents less than the regular fare on steam roads. The length of the through electric road will be about 45 miles. It is thought that through electric cars will be run over this route without change within a short time.

**NORTH JERSEY STREET RAILWAY EXTENSION.**

The North Jersey Street Railway Co. has formulated plans for building a belt line 17 miles in length to run between Jersey City, Greenville and Bayonne. The new line will connect the Pennsylvania Ferry at Jersey City with Bergen Point and Bayonne. The company's engineers have made the surveys and mapped out the line to be followed. The only requirement now necessary is to secure franchises which it is expected will be readily granted as the improvements would be of great benefit to the section covered by the contemplated road. The property owners are joining heartily in the plan, as the trolley line is needed to develop the section west of Greenville which has not improved as rapidly as that on the east side because of the trolley line already there.

### JACOB LOWMAN GREATSINGER.

One hears so much nowadays about the potent influence exerted by the electric railway upon the lives, habits, customs and conditions of the people that the expression has become hackneyed and fails to make the impression it once did. But in speaking of the transportation conditions of the city of Brooklyn it becomes a necessity to repeat the statement and with emphasis.

It may be said without fear of contradiction that the future growth of Brooklyn depends solely upon the facilities for crossing the East River. If these accommodations are enlarged to meet the requirements of the city's progress, real estate values will advance, new property will become available and more people will go to Brooklyn not only to live but to build factories and transact business.

The Brooklyn Rapid Transit Co. from the nature of its franchise holdings controls, with the exception of a single steam road doing business on Long Island, every avenue of approach to all the present facilities in operation for carrying passengers from Brooklyn to Manhattan, and the situation is such that it must necessarily control the travel to any other facilities that may be offered in the future for crossing the river, in the form of new bridges, tunnels other than private enterprises, or additional ferry routes. It will be seen therefore to what degree the welfare of the city has been entrusted to this company.

The man who directs the policies of the Brooklyn Rapid Transit Co. and the constituent companies which it controls, is Mr. J. L. Greatsinger, who was elected its president on March 20, 1901. And he it said that no man appreciates better the responsibilities that go with this office.

Under the skillful and able management of Mr. Greatsinger the Brooklyn Rapid Transit Co.—notwithstanding ill-informed and prejudiced newspaper criticism to the contrary—is doing everything possible to meet the requirements put upon it. In fact it is probably doing more for its patrons than any other road in the United States. For instance by operating the tramways of the Brooklyn Bridge at an annual expense of nearly \$700,000, it is saving the people of Brooklyn \$2,500,000 every year by carrying free 100,000,000 passengers over the bridge who otherwise would have to pay at least 2½ cents each or walk. Moreover the saving in time is in itself important inasmuch as the company now lands its passengers in the central portions of both Brooklyn and Manhattan, where they are in direct touch with radiating lines to all city and suburban portions of the metropolitan district. These very concessions in the interests of the people are largely responsible for the present congestion and thus we have the anomaly of the company bearing harsh criticism for conditions brought about by its own efforts to meet the demands for better and cheaper transit.

In transfer regulations the management has almost gone to excess in its liberality. There are several possible continuous rides of over 12 miles in one direction for a single fare, and by taking transfers a passenger may ride 24 miles in the same general direction. As a matter of fact a person could ride all day for 5 cents if he so desired. Taking the number of transfers issued the company computes that the fare of each person is brought down to practically 3.56 cents per ride.

Since Mr. Greatsinger assumed the presidency arrangements have been made and are in process of execution for securing additional equipment, new tracks, and more available motive power. The number of closed cars has been increased 50 per cent, and the number of open cars 25 per cent, the design of the new rolling stock providing increased passenger capacity per car as well. A new combined alternating and direct current power house is nearing completion and will soon enable the company to make needed increases in car mileage and improve the service on certain lines hitherto hampered by insufficient supply of power.

Mr. Greatsinger was born July 1, 1849, in Elmira, N. Y. His father, John S. Greatsinger, was a New York farmer of German and Scotch parentage. His mother, Aurelia C. Greatsinger, is a Pennsylvanian of Irish parentage. Both parents are still living in Chemung County, N. Y.

Jacob Lowman Greatsinger received his first education in the district schools of Chemung County, and later attended the Elmira free academy. While attending school in Elmira he was employed as clerk in a hardware store. He was afterwards in the Bank of Chemung for a short time. Later he entered the wholesale and

retail coal business in Elmira. The desire for railroad work was evidenced while engaged in the coal and agricultural implement business and he frequently took a hand at firing the 6-ft gage Erie R. R. switch engine in his coal yard. He subsequently sold his interests in the coal and agricultural implement business and secured a position with the Utica, Ithaca & Elmira R. R. as fireman. He subsequently became machinist, station agent, roadmaster, locomotive engineer, train dispatcher, master mechanic and superintendent in quick succession. The road expanded and when he severed his connection with it in 1886 it comprised five lines, including the Elmira, Cortland & Northern R. R., all of which have since been merged with the Lehigh Valley System.

In 1886 Mr. Greatsinger left New York State and entered the employ of the Chicago & Eastern Illinois R. R. as master mechanic with headquarters at Brazil, Ind., and later at Danville, Ill. In 1888 he was transferred to the Duluth & Iron Range Railroad Co. in Minnesota as master mechanic. In 1890 he was appointed general superintendent, and in 1891 he was elected president and general manager of the Duluth & Iron Range Railroad Co. On Mar. 20, 1901, he was elected president of the Brooklyn Rapid Transit Co., the Brooklyn Heights Railroad Co. and constituent companies.

Under Mr. Greatsinger the Duluth & Iron Range road was one of the first railroads in the country to introduce heavy locomotives and 70-ton cars. In point of number of trains per mile and tonnage moved the road ranks high among western steam railroads.

In the matter of considerate and fair treatment of employes Mr. Greatsinger has always taken a decided stand. He early recognized the value of the Railroad Young Men's Christian Association work among railroad men and encouraged the formation of branch associations among the men on his road. He provided rooms for this purpose properly equipped for the comfort and entertainment of members, including reading, reception, smoking and class rooms, baths, locker boxes for the men's clothing, bowling alleys, billiards and other games, gymnasiums, etc. As stated elsewhere in this issue he is carrying out the same idea among the employes of the Brooklyn Rapid Transit Co., with mutual insurance and benefit funds added.

During his career in the west as a railroad man Mr. Greatsinger has also been president of the Minnesota Iron Co. and its constituent companies, a director of the First National Bank of Duluth, and president of the Kitchi-Gammi Club.

In 1872 Mr. Greatsinger married Catherine F. Dailey, who died in 1882. He has one daughter, Edna, who married Dr. P. J. H. Farrell and now resides in Chicago.

Upon leaving the Duluth & Iron Range R. R., as attesting Mr. Greatsinger's popularity with his employes, a souvenir photograph album containing about 500 photographs of his employes, which includes office clerks, engineers, firemen, brakemen, train dispatchers, switchmen and others, has been presented him, together with framed resolutions from the Brotherhoods of Locomotive Engineers, Firemen and Conductors. He has also been the recipient of other testimonials.

Mr. Greatsinger is affiliated with the Kitchi Gammi Club of Duluth, the Minnesota Club of St. Paul, the Chicago Club of Chicago, the Brooklyn, Hamilton, Marine and Field, Crescent, Montauk, and Riding and Driving Clubs of Brooklyn, and the Metropolitan Club of New York City, besides numerous railroad, engineering and mechanical associations.

### YERKES' LONDON RAILWAY PROJECTS.

---

After long negotiations, Mr. Charles T. Yerkes has completed an arrangement with the Baker St. & Waterloo Ry. which gives him control of four different underground lines. This road is about half built and a new contract has been signed for its completion. The old contractors will finish it and it is expected that it will be ready to operate as soon as the power house can be built, and the Metropolitan District road is ready to run. The four roads owned by Mr. Yerkes will form a system connecting with the Metropolitan District railway. The latter will act as a terminal for the others and it is intended to build connecting lines and transfer stations for the other roads. The contracts for most of the work have been let to British companies. The first engine is to be in operation 18 months after December, 1901, and the last engine six months later.

*J. L. Greasinger*

NEW CAR HOUSE OF CHICAGO CITY RY.

By courtesy of Capt. Robert McCulloch, general manager of the Chicago City Railway Co., and Mr. Richard McCulloch, assistant general manager, we are enabled to present some of the details concerning the new car house the company is now building at 77th St. and Wentworth Ave. The company owns the entire block bounded by 77th and 78th Sts., Wentworth Ave. and

the idea was to have nothing combustible about the house except the cars themselves.

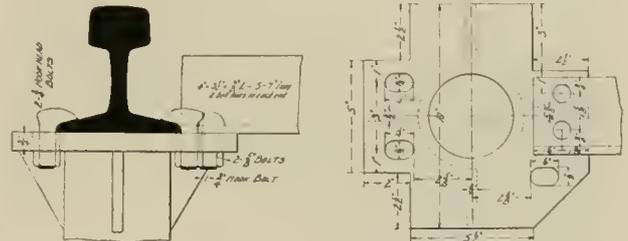

A section of one bay is shown in the line drawing. Each bay contains five tracks, which are spaced 11 ft. from center to center, making room for 34 of the large double truck cars such as are used on the Wentworth Ave. division, and giving a total capacity for the house of 204 of these cars. The grade of the lot was below the street track level and the track rails, which are 100-lb. T section, in the car house are therefore carried on cast iron columns spaced 6 ft. between centers longitudinally. This gives a pit extending over the entire area; the pit floor is concrete and well drained to a sump from which the water is taken by a motor driven pump.

The spaces between the tracks, the rails of which are 4 ft. 6 in.

INTERIOR OF CAR HOUSE.

Vincennes Road, a location which is convenient to the Wentworth Ave. and Halsted St. lines, two of the largest divisions of the system, and in event the State St. line is converted for electrical operation cars for that division would also use this barn. The building now under construction is 353 ft. 4 in. long, from east to west, and 348 ft. 8 in. wide, and is at the northeast corner of the lot. A structure of like capacity will later be erected west of this barn, leaving a space for a possible street, and the tracks extended clear through both buildings. The entrance to the second house will be on Vincennes Road.

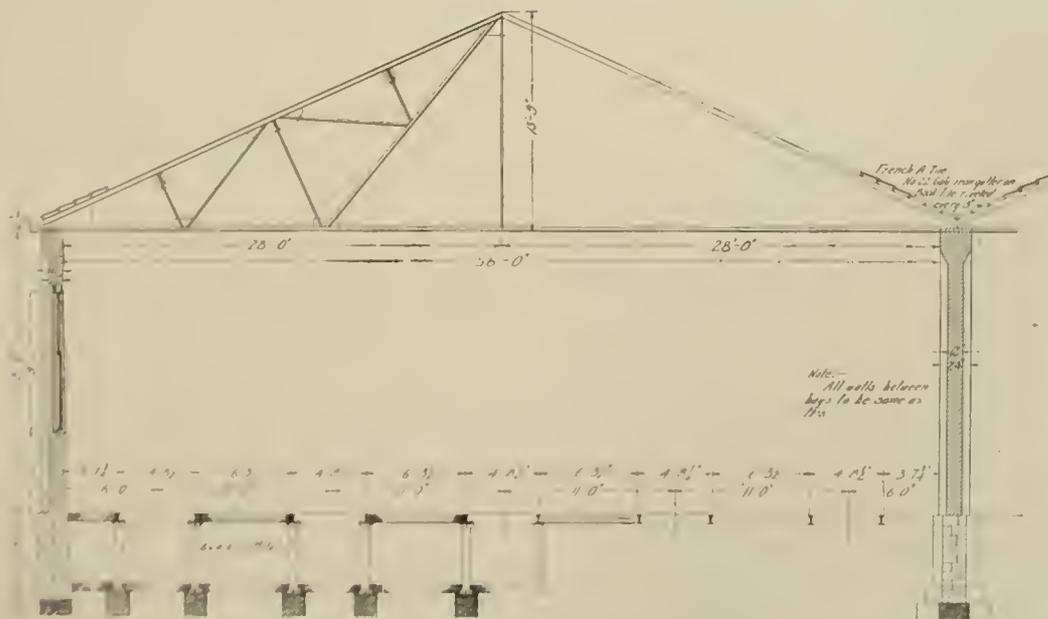

DETAIL OF TOP OF SUPPORTING COLUMN.

above the pit floor, are floored with concrete laid in arches with a sheet of wire netting in the center. The rails between which the arches are laid are kept from spreading by transverse angles bolted to the supporting columns. The methods of attaching these angles and of securing the track rails to the posts are shown in the detail of the post top.

At the front or Wentworth Ave. end of the house each bay has two 27 ft. 5 in. doors; at the other end there are five 10-ft. doors per bay, one to each track. All of these are of the steel rolling lift type furnished by the Kinnear Manufacturing Co., of Columbus, O.

The building is 52 ft. from the center of the track in Wentworth Ave. from which the entrance curves branch. The middle track of each bay is not entered directly but is reached from a cross-over connecting just inside the building with one of the adjacent

CROSS SECTION OF CHICAGO CITY RY. CAR HOUSE.

The present building is divided into six bays, separated by 17 brick walls in each of which there is but one small door for the use of workmen. The roof is of tile laid on a steel frame work, glass tile being used for roof lighting, the floors are all of concrete, and the doors are all of the Kinnear rolling type;

tracks; this leaves four curves entering the house for each bay, and these are brought together in pairs making only 13 branches from the main track in Wentworth Ave. for the entire house.

Each bay is to be provided with one or more sets of hydraulic jacks for lifting car bodies from the trucks. The arrangement

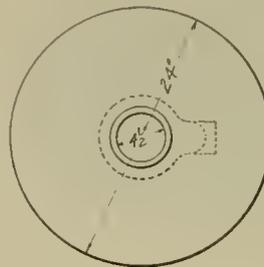

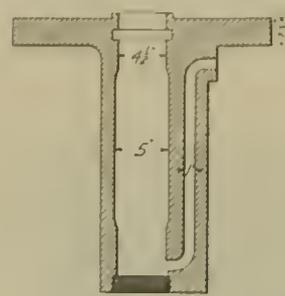

of the piping for the jacks is shown in one of the line drawings, and another of the illustrations shows the jack cylinder in plan and section. The lifting pistons in this mechanism are  $4\frac{1}{2}$  in. in

the admission of oil to the two pairs of cylinders, and the third for opening a passage to the oil reservoir when the jacks are lowered. Ft. Zero oil is used in the jacks.

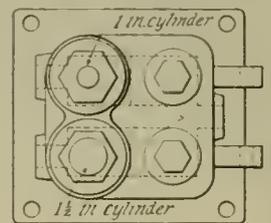

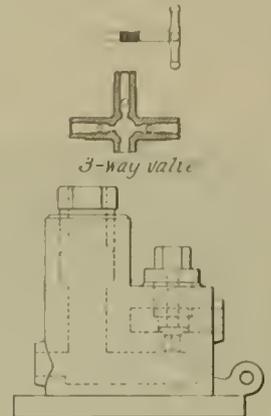

CAR BODY ON JACKS.

diameter and 7 ft. long, made of cold rolled steel. Bearings for the pistons are furnished by the upper and lower portions of the jack cylinder casting which is extended below by a section of piping long enough to accommodate the pistons when lowered. In this case the cylinder castings are supported on the tops of

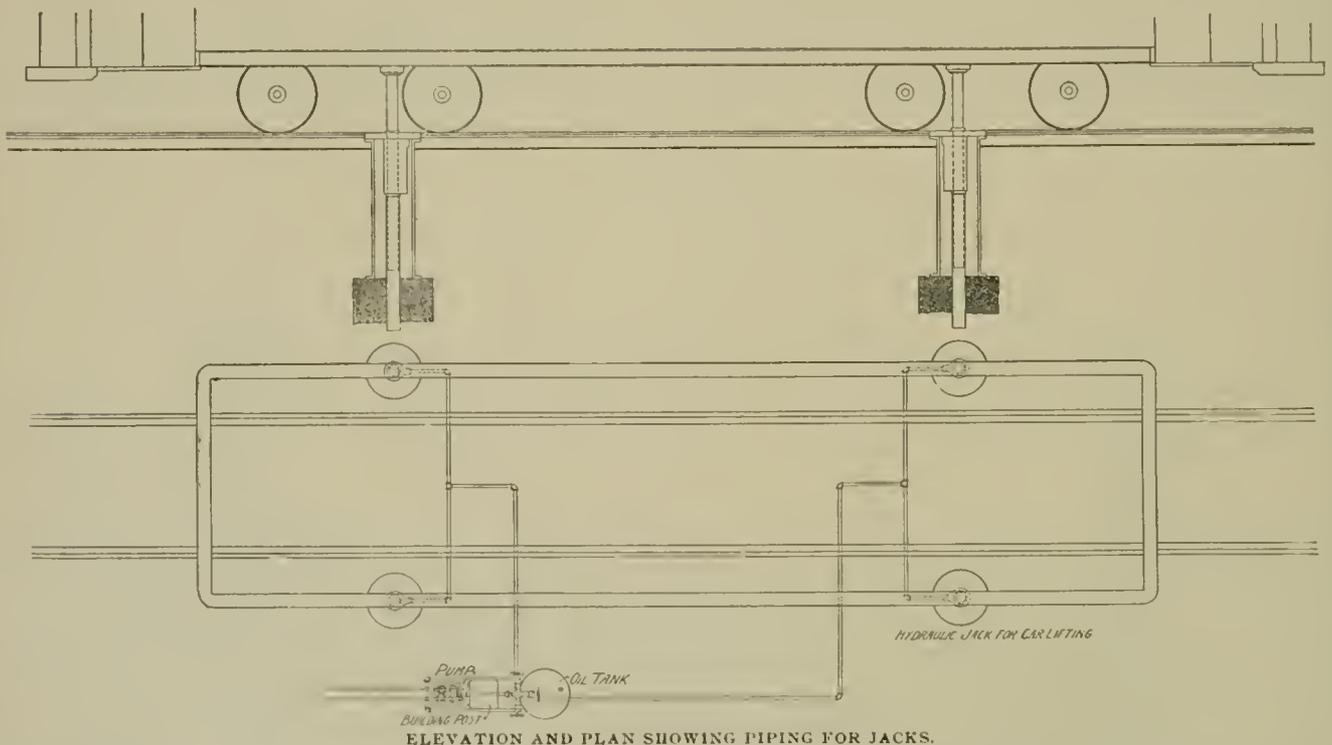

CYLINDER CASTING.

HAND PUMP.

At the 77th St. house motor-driven pumps will be used for operating the jacks but our drawings show a hand pump, which is used in connection with similar installations at other of the com-

ELEVATION AND PLAN SHOWING PIPING FOR JACKS.

columns which rest on concrete foundations which are flush with the pit floor.

It will be remarked from the piping plan that the two cylinders at one end of the car are fed from one supply pipe which has branches of equal length so that the oil pressure is as nearly as possible the same in both. A special fitting, shown in detail in one of the drawings, has three valves in it, two for regulating

pany's car houses. This pump has two cylinders each operated separately by independent handles. One is  $1\frac{1}{2}$  in. in diameter and is used in pumping up the pistons to a position ready to take the load. The smaller piston is 1 in. in diameter and is used after the load comes on the jacks. The jacks were designed and built in the company's shops under the direction of Mr. M. O'Brien, master mechanic.

## VISION, COLOR-SENSE AND HEARING.

A paper on this subject was read at the meeting of the Western Railway Club by Charles H. Williams, M. D., of Boston, Mass., in which he considered some of the examinations which are needed to secure reliable results and which are fair to both the employes and the company. To those who are skeptical as to the necessity of such examinations, the experience of one railroad running out of Chicago should be convincing. On this road, from June, 1899, to Nov. 30, 1901, there were rejected 1,888 men applying for work who could not pass the test for acuteness of vision, and 441 who were defective in their color perception to a dangerous amount. These figures also show that defects of vision are more frequent than those of color sense. For many years it was supposed that tests with Holmgren's colored worsteds was sufficient to detect all dangerous forms of defective color perception, but reports of cases are beginning to accumulate where it has failed. Some times the man who can without hesitation pass the worsted test will make many mistakes in naming the color in a distant green or red signal.

The Pennsylvania Railroad and New York, New Haven & Hartford Railroad adopted methods of examination about three years ago which extend to the whole system of employes. Each examiner of the company is appointed by the division superintendent, subject to the approval of the general superintendent, and the examiner is himself first examined as to his vision, color sense and hearing by an expert oculist, and when found qualified for the position is supplied by the company with the following outfit:

A set of standard test letters on cards, including cards on which semaphore signals are printed, for testing the acuteness of vision.

A set of cards with reading matter in print of various standard sizes and some train orders written on a manifold copying sheet for the reading test.

A set of approved Holmgren's worsteds (125 colors, each with numbered tags) and a standard testing lantern with 13 glasses of different colors and smoked glasses for testing the color sense.

A ratchet acoumeter for the hearing test.

Two pairs of spectacles, one with plain glass and the other with a convex lens of two diopters for each eye.

Blank forms of certificates for noting the results of the examination.

An experience of three years with this outfit has not suggested any change except that the lantern at first used has been replaced by an improved form showing one or two lights at a time of different colors or of the same color.

The tests are made in a well lighted room in which a distance of 20 ft. can be measured from the test type to the person to be examined. Dark shades or shutters should be provided to darken the room for the lantern test.

### Acuteness of Vision.

The person to be examined is placed so that he will not face a strong light and one eye is completely covered by holding a card over it. One of the 20-ft. cards is hung at a distance of 20 ft. from him in a good light and if he can read the letters correctly another 20-ft. card is held up. If the second one is read correctly the examiner notes on the form the distance at which the different letters were read and underneath it the number of the smallest line of test type read correctly; in this case 20/20, or normal vision. If he cannot read the letters on the 20-ft. card at 20 ft. hold up a 30 ft. card or a 40 ft. card and so on until letters are found that he can read. If the letters on the 40-ft. line are the smallest that can be seen with his eye at 20 ft. his vision will be noted at 20/40 of normal. The numerator of the fraction being the distance at which the letters were read and the denominator being the number of feet printed above the smallest line that can be read. This test is repeated with the other eye, the first one being covered.

A position signal test is made by placing one of the cards with semaphore at a distance of 20 ft. as in the first vision test and with each eye separately, having the applicant read the signal beginning at one end of the card with one eye and the other end of the card with the other eye. The test is repeated with another of the semaphore cards with both eyes open and the distance in

feet is noted at which the signals can be read correctly without glasses. The reading test is made by noting the smallest size of print read correctly at the ordinary distance of about 18 in. either with or without glasses. Also it is noted whether manifold train orders can be read correctly at that distance. The latter is intended both as a test for acuteness of vision as far as concerns the size of type which can be read and also as to the test of the ability to read both printed and written cards. A case was found at one time where a man had learned the alphabet and could sign his name but was unable to read and for years had depended upon his fireman to read to him every order he received. In case of men making applications to enter the engine service a test with glasses is also prescribed. Place one pair of test glasses in spectacle frames before the eyes of the applicant and if he reads one of the 20 ft. cards at 20 ft. then try the other pair of glasses. If he can read the letters through the plain glass but cannot read them through the convex, or magnifying glasses, enter on the form, "Test with Glasses Satisfactory" but if the letters can be read through both pairs of glasses enter "test with test glasses not satisfactory." If engineers and firemen have 20/20 or 20/30 vision, with both pairs of glasses they will be examined yearly for vision. The object of these tests is to ascertain, when a man applies for work, whether his eyes are in such shape that when he is 45 years old or sooner, he will be unable to read distant signals without glasses.

### Color Sense.

The whole number of colored worsteds are placed on the table in good clear daylight. The light green test skein A, is placed at a little distance from the others and the person examined is asked to select from the heap of colors all that look to him like the test skein and place them opposite it. He is not expected to find an exact match for the test skein but it is explained to him that he is to choose all the colors that appear to him of the same general color as the test skein, both those that are lighter and those that are darker in shade. If he does not understand what is wanted the examiner himself selects the colors, then having returned them to the general heap and mixed them with the rest, the person examined is called on to repeat the selection. This demonstration will not enable the person who is defective in his color perception to select the colors correctly. He will pick out as looking like the green test skein, some green and also some of the gray or brown confusion colors which will appear to him of the same general color as the test skein, only varying from it in shade. The numbers on the tags of the colors selected are noted on the form. Also, whether the selection is prompt or hesitating. All the colors are returned to the heap and mixed together and the rose test skein is placed apart from the rest and the applicant selects as before all the colors that look to him like this skein. The numbers on the colors so chosen are also noted on the form. In the first case if the person examined selects any of the grays and browns as looking like the green skein it shows that he is defective in his color perception either for red or green, if in the second test he selects some blues or violets as looking like the rose skein he is defective in his color perception for red, or if he selects for the rose colors some of the greens or blues, he is defective in his perception for green. The test with the green skein shows the existence of defective color sense and the test with the rose skein shows whether the defect is more for red or for green.

For the lantern test the room is darkened and the lighted test lantern is placed 20 ft. from the person being examined, and about level with his eyes. Different colors are shown which the applicant must name, the colors being shown two at a time or two of the same color at once. This test is repeated with a diaphragm showing the color through only a small opening. In case there is any question as to color perception other tests are made by combining smoked glasses with the colored glasses. No person can be considered to have satisfactory color perception who calls a red light green, and vice versa, under any of the conditions of the lantern tests.

### Hearing Test.

The person examined is placed at a distance of 20 ft. with one ear toward the examiner and his other ear stopped by placing the finger over it. He then repeats aloud words and numbers spoken by the examiner in a conversational tone, and the distance in feet

at which they can be repeated correctly is noted. The test is repeated with the other ear.

With one ear closed as above, the greatest distance in feet is noted at which the ticks of a ratchet acoumeter can be counted correctly with each ear. The advantage of the second test with the acoumeter in addition to the test with the voice is that it prevents a man being rejected on account of a low tone of voice or indistinct speech of the examiner.

**PROPER DRAINAGE AT CROSSINGS.**

Mr. John Kerwin, superintendent of tracks of the Detroit United Ry., has kindly furnished us the following particulars concerning his practice in laying crossings with steam railroad track. The steam tracks are never paved and if excessive maintenance charges are to be avoided proper drainage must be provided.

For this purpose a line of ordinary red or unglazed drain tiling is laid under the center line of each steam track. These empty

no little difficulty in maintaining track at road crossings arises from the practice of some engineers who grade highways up to a point higher than the roadbed outside the ends of the ties, thus forming an obstruction which prevents the water from draining freely away from the track. The method of drainage adopted by a vote of the meeting is as follows: "Approaches of highways at crossings should be dug out 5 ft. from the ends of the ties, to a depth of one foot below the bottom of ties at the ends of the same, and 18 in. below bottom of ties 5 ft. from the ends of the same, this space to be filled in with cobble stones.

To show clearly the method decided upon in this important matter the reader is referred to the two accompanying sketches. Sketch "A" shows the mistake sometimes found, where the track and ballast are made to lie in a trench of earth formed by grading the road up to the level of the top of the rail. From this trench there is no side drainage. Sketch "B" shows the method adopted by the society, the space for a distance of 5 ft. outside the ends of the ties, excavated to a slope starting 12 in. below the ties at their ends and running to a depth of 18 in. in the distance of 5 ft., being filled in with cobble stones, permitting not only the drainage of surface water sinking into the track, but also catching and diverting water which otherwise might run upon the track. It would seem that the latter method should afford efficient drainage at road crossings."

**MUNICIPAL OWNERSHIP IN COLOGNE.**

The Belgian company which built the first street railway system in Cologne in 1878, obtained concessions which would not have expired until 1924 had not the municipality come into possession of the lines on the following terms: the city of Cologne was to pay the street railway company the equivalent of \$238,000 per annum from January 1, 1899, to June 30, 1913, and the sum of \$5,950 each year from 1903 to June, 30, 1913, making a total, inclusive of the cost of buildings subsequently taken over, of \$3,927,000. An appropriation amounting to \$4,284,000 was granted by the city for the conversion of existing lines into the overhead trolley system and the construction of two new lines. The installation was made by Siemens & Halske, of Berlin, and a section was opened for traffic on October 15.

The management of the railways is in the hands of the municipal council, an actual manager being appointed by that body. Motormen are paid 83 cents and conductors 71.4 cents per day of 10 hours. Profits to the company are said to have increased regularly.

**COST OF REMOVING SNOW IN MONTREAL.**

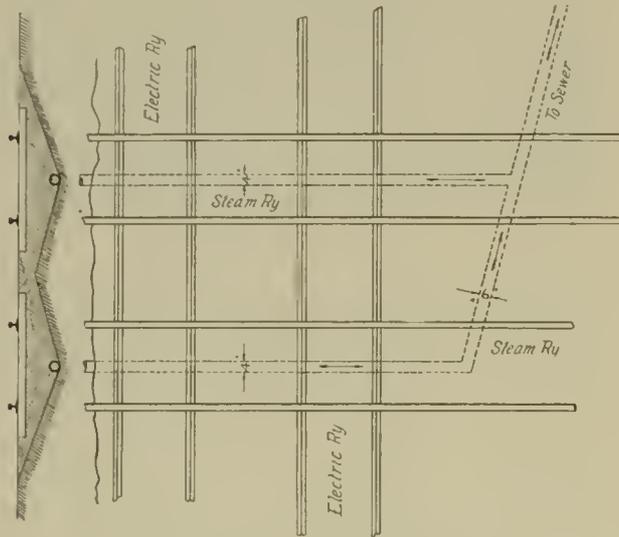

The following table shows the cost of removing snow from those streets in Montreal which are occupied by street railway tracks and also the amount of this which is borne by the company. The proportion paid by the company has varied under different agreements between the city and the Montreal Street Railway Co. At present the city removes the snow and the company pays two-thirds of the cost.

Winter.	Total Cost.	Paid by Company.
1893-94 .....	\$89,029.38.....	\$57,101.18
1894-95 .....	75,532.35.....	44,200.00
1895-96 .....	71,975.87.....	52,470.00
1896-97 .....	52,367.98.....	49,457.87
1897-98 .....	102,416.10.....	59,131.66
1898-99 .....	90,608.00.....	60,456.00
1899-00 .....	126,384.00.....	84,256.50
1900-01 .....	118,757.45.....	79,171.65

The street railway company is now asking that it be allowed to do the removing of the snow, claiming that under the city supervision this work is costing altogether too much. The company claims that by the use of an equipment consisting of electric shovels, and self-dumping cars, it could do this in a much more thorough manner, in about one-quarter of the time, and at about one-half the cost.

The Clinton (Mo.) Street Railway Co., of which H. P. Faris is president and manager, contemplates converting its horse car line into an electric railway.

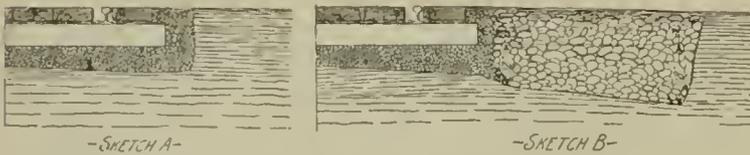

METHOD OF DRAINING CROSSINGS.

into a main which is led to the nearest sewer. In some cases three lines of tiling are laid for a double steam track. The minimum distance below the grade for the tiling is 18 in. and where the level of the outlet to the sewer is such as to permit the fall is made 1 in 18.

The red tiles are 4 in. or 5 in. in diameter while the main is larger, for which glazed or sewer tiles are used. The sketch shows a tiled crossing in plan and section. In excavating the undisturbed earth is shaped to give drainage to the tile as indicated in the section.

The Railway and Engineering Review recently reported a meeting of an association of section foremen on the Chicago, Milwau-

kee & St. Paul Ry., where the subject of draining road crossings was discussed. We reproduce two sketches and the following extract from this report:

"One remedy proposed was to lay tile drains parallel with the track, outside the ends of the ties and between the tracks on double track, where the crossing comes in a cut or where water is liable to settle around the crossing. In the case of double track the tile in the center space is to be turned under one of the tracks into the ditch. The remarks of a number of the speakers were directed to the great difficulty of maintaining track surface at undrained road crossings in wet places. It also appeared that

## MUNICIPAL OWNERSHIP AND OPERATION OF STREET RAILWAYS.

By H. M. Sloan, General Manager Calumet Electric Street Ry., Third Vice-President American Street Railway Association.\*

There are a great many people who believe that public ownership, and even public operation of street railways, would be beneficial to the people, but I am inclined to the belief that a great majority of those who would recommend such action on the part of the city have not given the subject the thought it deserves, or perhaps have not had the opportunity to thoroughly understand both sides of the controversy.

To unthinking people the idea of public ownership and operation is no doubt very enticing. They look only at the rosy side, without stopping to figure, or may be to understand the difficulties lying in the way, which would make it not only unadvisable, but impracticable.

As a relative question, which it is admitted does not bear on the matter in its entirety, but in which the principle is identical, the query might be made, "Why should not the city obtain enabling acts and build upon its school land?"

There can be no doubt but that large revenues result from this class of property. Presuming the municipality had the power, would it be justified in tearing down existing buildings, as is now being done by lessees of school property in Chicago? Would there not be opportunities for jobbery and speculation? Keep in mind that the men who speculate with the people's money have nothing to lose, and this kind of speculation is very attractive. This, of course, is not a parallel case, but it is merely desired to bring out the thought that there are large profits made by lessees of school lands. The fact remains, however, that the city is much better off in leasing the ground than in attempting to build, and this same idea is carried out by individual owners, for a great proportion of the valuable inside property is let on ground rent for long terms, not only in this, but in every large city in this country as well as in Europe. The collecting of ground rent involves but little detail, and the security is enormous.

Practically without any further legislation the city possesses all the functions of ownership that a safe business man would care to have, with the full knowledge that his estate could be increased at any time, for franchises granted or renewed must carry with them such terms and conditions as the city chooses to impose, and these conditions and terms could be so onerous that no individual or corporation could possibly bear. The query then arises, Why does the city want ownership with all its attending responsibilities, when it can obtain better results either by taxes on the gross receipts, or to the citizen with reduced fare, than could be realized by owning the property and renting it on a percentage, or any other basis?

In this connection the claim will doubtless be made, that the street railways of Chicago are financed beyond their legitimate limit. Whether they are is not a question of this paper, but upon any basis the conditions set forth remain the same.

To own the property, the city would have to pay some price. Say it would pay what it would cost to renew the tracks already laid. Now, then, the municipality would have entered into ownership assuming the responsibility of defalcation and leakage of all kinds in the collection of the revenue and all other burdens which ownership implies. The contract, to whomever given, would require among other things that the property should be kept in repair, but notwithstanding the contract there would naturally result a general running down from the condition at the beginning. To keep up railway property involves an enormous expenditure of money, so a struggle to make the original track last with as little outlay as possible might be expected.

There would be supervisors of course, but would supervisors always supervise? Do street inspectors at the present under civil service inspect as you would have them?

Among other suggestions advanced is the proposition to rent the railway tracks on a percentage basis, and all over and above a certain percentage earned by the lessee to revert to the city. As an example of how this scheme works may be cited the case of the New York, New Haven & Hartford R. R. Incorporated in

their charter is the provision that all over and above a stipulated percentage of earnings on a prescribed security issue is to revert to the state. I am not positive as to the results within the last two or three years, but up to a very few years ago the road had not earned anything over the stipulated percentage.

The reader's attention is called to the workings of municipal ownership in the city of Edinburg, Scotland.

"The municipal cable system was installed in this city in 1897 and has proved a costly failure to the city both financially and mechanically. In 1892 the municipality acquired the horse tramways for the sum of \$1,070,000. The council decided that the citizens would not permit the streets to be disfigured with the overhead trolley system and the underground trolley system was considered too expensive, so the cable was finally adopted though it was pointed out at the time that cables were being abandoned in the United States. It was estimated that a cable plant could be put in operation for about \$3,900,000, but the expense has already reached \$5,840,000, and the system is not yet complete. A number of costly mechanical devices for conducting cars around complicated curves have been tried and abandoned. Following these mechanical failures comes the failure of the company which leased the tramways to pay the agreed 7 per cent on the capital expenditure, which amounted to about \$389,320 a year, and which the leasing company declares it cannot pay out of the earnings. It has therefore applied to be relieved of its lease, and the city is suing for a large amount of arrears."

Incidentally, a word in this connection might be said of the fares charged on the street railways of Glasgow, the much-vaunted city of municipal ownership. While it is true that short distance passengers ride for less than a nickel, yet at the same time it must be remembered that a ride such as the Chicago City Railway Co. gives, for instance, from Clark and Washington to 79th and Halsted Sts. for 5 cents, would cost in Glasgow nearly 11 cents, notwithstanding the fact the cost of operation is much cheaper than in this country. Glasgow has one mile of street railway for about every 10,000 inhabitants; Chicago one mile for about every 2,500.

The demand in this country is for cheap transportation reaching limits from the crowded centers to homes which are at once healthful and economical, and cheap transportation is the only avenue by which the desired end can be accomplished.

Ten years ago street cars were operated by horses and cable, all of which have become obsolete and their replacement by cars propelled by electricity has become necessary, running into an expenditure involving millions, and which will cost many millions more before completion.

While at present electricity is wonderful in its performance, the best minds in the profession are a unit in the conclusion that it is in but its swaddling clothes compared with its possible developments.

So the great probabilities are that in a few years the present methods will become obsolete and new ones will materialize which at once will demand recognition and adoption because of their utility and greater economy.

As it is with the school lands, so it is with the street railways, buildings that were once modern become old and past their profitable use and have to make way for new and more modern structures. The land becomes more valuable and the city's interests are enhanced, and that which today is modern in street railway practice, in time will become worn and antiquated, and will have to make way for something that is better fitted and up to date.

It is argued that if the city owned the street railways it would be in better position to enforce regulations. This is a weak argument, for like the laws which are oftentimes said to be inadequate, the thought occurs to most all that the trouble is not with the laws, but with their enforcement, and it is maintained that any condition imposed on street railways could be enforced just as rigidly under an ordinary license or franchise as could be the conditions imposed on a lessee under municipal ownership.

Of what can be said antagonistic to municipal ownership, much weightier objections can be cited as to the inadvisability and impracticability of municipal operation. The most prominent trouble that would in fact arise and make the whole undertaking a failure would be the condition that is best described by the word "graft"

\*From an article published in the "Calumet Record."

If it were not financial, then it would be political, or a mixture of both, and there can be no doubt but that the whole structure of municipal operation would be doomed at an early stage of its history to disappointment and utter failure.

The opportunity for political manipulation is a grave matter to consider. You can only guess at its possibilities, and no one can prophesy its development.

As party affiliation in municipal politics is becoming a bugbear, at each successive election party preference would be less potent, and it would logically follow that party lines would be entirely obliterated with street car employes, for their interests would lie directly with the "powers that be."

The politician would appeal to the employe's hope of personal advancement; he would promise him larger wages and shorter hours, and in time it would result in an obligation far beyond the possibility of a nickel fare to meet. This with other forces to hold men together would result in a political organization that would relatively be far more powerful than Tammany. There would arise a boss and you would have a political condition that would be almost impossible to overthrow.

Municipal operation would be the victim of the selfishness of every citizen who might have a purpose to serve, frequency of cars would be demanded and put in service that would be totally unjustified by the business, surrounding farms would be subdivided, a few cottages run up, and then would come the clamor for unprofitable extensions; the track force would be augmented; additions made in car repair and line repair gang; inspector's checking clerks, and all the safeguards in the way of superfluous men that governments surround themselves with in the manipulation of their business detail.

#### CITY CANNOT OPERATE AS CHEAPLY AS PRIVATE COMPANIES.

It easily follows that the present force employed in operating the roads today could and would be swelled at least one thousand men, and at a conservative figure of \$60 a month, would aggregate a yearly sum that would be sufficient nearly to meet the interest charges on practically half the present bonded debt of the Chicago street railways. It can not be argued that a municipality can operate a utility as cheaply, or manage it as wisely, as an individual or a company. The street railway business is one of vast detail, and the city is no more fitted for municipal operation of railways than to manage a large department store.

Governmental operation is notoriously lax and expensively cumbersome in its business methods, and the many leaks that exist in conducting the affairs would, under private ownership, pay a big dividend on the money invested in any commercial enterprise. It would be necessary by the very nature of things, for the purpose of a reasonable safeguard, to employ men to watch others, thus adding to the pay roll unnecessarily.

As an exemplification of the foregoing, the chief naval constructor a short time ago appeared before the committee of naval affairs, and advised that all warships be given out on contract, as it costs the government from 50 to 100 per cent more to build the vessels in the navy yards of the government than they would cost by contract to private builders.

When you consider with municipal operation that the conductors of the cars are the cashiers of the business, you may imagine what a force of clerks would be necessary to see that the receipts reach the treasury.

And then what about the accidents? As a conservative estimate the street railways of Chicago pay out over a million dollars a year in satisfying judgments and settling accident claims.

Contemplate for a moment the graft possible in disbursing the money to satisfy personal injury cases, for a great many threatened suits are settled out of court, both for the city and the street railways. At least three-fourths of the money thus paid by the street railways of the city of Chicago is in personal injury cases that are either fraudulent or unjustified. If street railways were managed by the city, attorneys elected to office or appointed through political influence would have the handling and disbursement of all this money, and what an opportunity it would be for dishonorable men.

The attorneys who take care of the business for street railways are men selected for their qualifications as trial lawyers; citizens

could not exercise such discretion in selecting their candidates, besides which, as it would take a great number of them, the city would not pay the fees that street railways pay their lawyers. The companies are compelled to have the very best legal advice, for the claims are in a great many instances fraudulent, and, of course, it takes the brightest minds to combat this element. Juries are just as heedless of justice in personal injury suits against the city as they are against any other corporation. As an example I quote from the Chicago Tribune, Saturday, Jan. 18, 1902:

"After the jury had been selected in Judge Hutchinson's court Saturday to try the case of Dominico Rosse for damages against the city on account of personal injury, Maurice Barnett, one of the twelve, asked the judge to excuse him on the ground that some of the members of the jury were prejudiced.

"'Before the jury was formed,' said Barnett, 'I heard a number personal injury cases, and that they were in favor of soaking the city every time.'

"The judge excused Barnett, and gave the lawyers permission to re-examine the other jurors."

This exemplifies the justice that the city may expect in its numerous personal injury cases if it were operating the street railways.

As a matter of fact, the treasuries of corporate bodies, whether city or individual, are objects of public plunder. With individual corporations these marauders get at the treasury only through accidents and alleged injuries. With the city other methods besides injury cases are used to get at the funds.

In prosecuting and persecuting corporations through their accidents there has arisen a class of "shysters" who give themselves the title of lawyer. They employ procurers, who are technically termed "ambulance chasers," and who earn a livelihood in running after and inflaming the minds of individuals who may be slightly injured with the idea that they can obtain thousands of dollars as damages. These parasites frequently create criminals by holding out the alluring promise of large results, and consequently tempting claimants otherwise honestly inclined to perjure themselves. In many instances, if they have not the evidence they create it. In a word, they are a disgrace to their profession. They prey like hungry wolves around corporate bodies and their game is just as toothsome, whether it be just or unjust. With them ends justify means. They are a menace to society, for their work is far-reaching in its effects.

It is by no means meant to imply that every lawyer who handles a personal injury case is necessarily of the class described. When a client goes to an attorney who cares for his reputation, with a trumped-up case, or one with no merit, he will tell him at once that his plea will have no standing in court, and will not stoop for a moment to the methods that the "shyster" is not only willing but eager to undertake.

The city of Chicago is robbed of vast sums yearly by the means that have been enumerated, and in this connection it would be well to state, that the city has standing against it \$3,300,000 in unpaid judgments, and \$800,000 unadjusted; 80 per cent of these are personal injury judgments. To combat this, requires the most watchful, sagacious management, as well as honest and faithful service to the principle.

The class of dishonorable lawyers referred to will sue a company with the idea of settlement, knowing that it costs the corporation, let it be the city or individual, a considerable sum to try a case, hoping to bleed it to avoid the cost of suit. All this in turn involves a great deal of business before the courts, that has in justice, absolutely no place there, consequently swelling the city's expenses and necessarily its taxes.

The civil service is the landing net used by the advocates of municipal operation for their argument. Some of the more conservative believe that while at present it is not in the desired condition that it may be brought to, but by better methods it can reach a more perfect standard. The civil service is undoubtedly a grand thing and all good citizens should be in favor of it, for its mission is to prevent corruption in public office. It can very successfully select mail carriers and clerks, but nevertheless, it is practically a machine, pure and simple, and never can successfully pick out the most efficient men to manage a street railway, or any other business involving voluminous detail.

The man who rises from the ranks is the man of selection. He

is picked out from a minor position and placed in one of greater responsibility. The great chances are that many in the ranks from which he rose could pass a much more successful civil service examination, but the man promoted has been carefully watched; his work has been satisfactory, and the chances are the confidence placed in him will be verified; if not, he will be relegated to his former position and another selection made. The successful one possesses judgment, executive ability, honesty, perseverance and application. These factors can be known only by those who are in constant and daily touch with him. Upon the degree of these qualifications depend his further advancement.

The human mind, with all its cunning, could not possibly develop a machine that would bring out these traits. It is very frequently the case that the poorest mechanic makes the best foreman; that he is a poor mechanic is possibly the fault of his birth, but he has that something about him that keeps his men not only in good spirits, but inspires them to perform their duties willingly and cheerfully.

Glance for a moment on the methods used by the civil service in the selection of a candidate from the ranks. He will be interrogated as to his knowledge of geography, arithmetic, history and in the main, of course, questions appertaining to his business. It is very possible that the one passing the best examination would be the man least fitted for the position. He might in the performance of his duties exercise all the prudence and ability he possessed, but he might not fill the bill by a good deal. All of us see examples of this class of men, of which all we are able to say about him is, that he is not the man for the place. Under civil service, charges would have to be preferred against him. Civil service could not find anything particularly against him, and if the charges were sustained he would have recourse to the courts, and they would have less opportunity to discover his shortcomings, and the result is possible that he would be reinstated.

The writer looks at this whole matter purely from a business standpoint, with all sentiment left out; but if the chief desire is ownership merely, without any regard for results, then it is a different matter and all this argument is useless.

But it is supposed, however, that the city desires to obtain the best results in the better way, and if the city can get as much revenue out of street railways without owning them, it must follow that it is much more desirable that the roads should be owned by private interests. There can be no doubt but that the city can accomplish this by taxing the gross receipts on a sliding scale, so that when receipts increase the city's revenue will increase proportionately.

Peculiarly situated as the city is to realize any tax it chooses to impose, it leaves the proposition of ownership ill-advised and unprofitable.

Ownership would necessitate the exploration in a new field that may prove disastrous, and if there is nothing to be gained, what is the use of assuming the responsibilities?

Arguments are advanced that municipal ownership is successful in other countries. This has by no means been proved. It is new, and much is still left in doubt, and, while it may be in some locations an apparent success, it certainly has been a failure in others. But that which is possible in Africa is not possible in Europe and that which is possible in Europe is wholly unfitted for this country. Take as an example, no-seat-no-fare proposition. The strongest advocates of this scheme have abandoned it as impossible in Chicago, though it is a well-known fact that it is strictly enforced in some cities of continental Europe.

Our faults and shortcomings are too much in the way of the successful handling of utilities by municipality. The moral standard of the average citizen as to corporations is far below par. You can get an ocular demonstration of this on any crowded street car. Rarely does a passenger go to very much trouble to proffer a fare that has been missed. Well-dressed, prosperous-looking business men can be seen any day on the suburban trains industriously hiding behind their newspapers to avoid the clipping of their commutation ticket. A great many of these very same people would not for a moment think of cheating an individual. It seems to be in the air that looting corporations is one of the vested rights of human nature, and if the charge be true that corporations rob the people it might naturally be expected that the inherent inclination to get even is as strong with the corporation as with the individual.

There is no doubt but that the question of municipal ownership

has been and is being debated in the minds of a great many thoughtful and prudent men, and some, influenced by what they consider violations of their ideas of what street railway corporations should do, have concluded that municipal ownership is the better thing.

But the advocates of municipal operation are in the main politicians who have personal ends to gain; or social revolutionists whose dreams bear the relative relation to sound business principle that perpetual motion does to mechanics, and the other class who know absolutely nothing about the subject.

To those who are in favor of the municipal operation it might be suggested they are beginning at the wrong end of the subject; that when we can educate out of human nature all selfishness, all acquisitiveness, all covetousness and general cussedness then and not until then we will be fit for municipal operation and all attending socialistic ideas.

Over and above all the subjects here treated comes the demand for the referendum—a strong argument against municipal control, for it is but a confession that the people do not trust the men they elect to attend to their interests, and if the citizens lack confidence in their officers to make a contract how can the referendum be brought to bear in the case of ownership in all the detail that may go to make up a ruinous whole? The referendum is all right and self-satisfying if care is taken to thoroughly educate the public, but to call on them to vote on a subject when their prejudice only and not their intelligence has been appealed to may result in an evil to the community that would take years to correct.

In preparing this article the writer has not drawn on his fancy, but merely fitted cold, existing facts to conditions sure to arise with municipal ownership and operation.

#### UNLOADING PASSENGERS FROM MOVING TRAINS.

A novel patent for loading and unloading passengers from rapidly moving trains without making any stops or reductions in the running speed has recently been granted to Mr. John W. Jenkins of New York City. The prominent feature of this invention consists of what is called a saddle car, one of which is placed at each station on the line and is picked up by the moving train and carried along to the next station where it is dropped. The railroad cars are supposed to be of the usual pattern with the exception that each car is provided on its roof with a pair of rails which project over the hoods so as to form a continuous track along the whole length of the roof of the train, and the ends of the rails on each car are bent laterally so as to preserve the continuity of the roof track when the train is on a curve. The saddle car consists of a narrow compartment to which is connected an iron truss frame under which the train runs. Normally this saddle car stands upon auxiliary track laid just outside of the regular tracks and rests upon four flanged wheels, two of which are under the passenger compartment and the other two being under the iron lattice which spans the train. The auxiliary tracks for the saddle car extend only a short distance either side of the station and are raised at one end and depressed at the other. When the train passes under the frame of the saddle car four broad faced wheels of the latter rest on the roof tracks of the train and the saddle car is slightly raised from the depressed portion of the auxiliary track and is carried along on the roof of the train.

When it leaves the train the saddle car runs upon the elevated end of the auxiliary track which takes its weight and allows the train to pass out from beneath the upper broad faced wheels. The saddle car would be of course provided with a set of brakes to check its motion at the desired point. By this means the invention anticipates running trains over long distances without making any stops whatever, meanwhile unloading and loading the train between each two stations by means of the saddle car.

The inventor also believes that this system will be applicable to street railways to a limited extent. Of course, he says, it would be impossible of application in narrow streets but on broad streets under certain conditions the system would save considerable time.

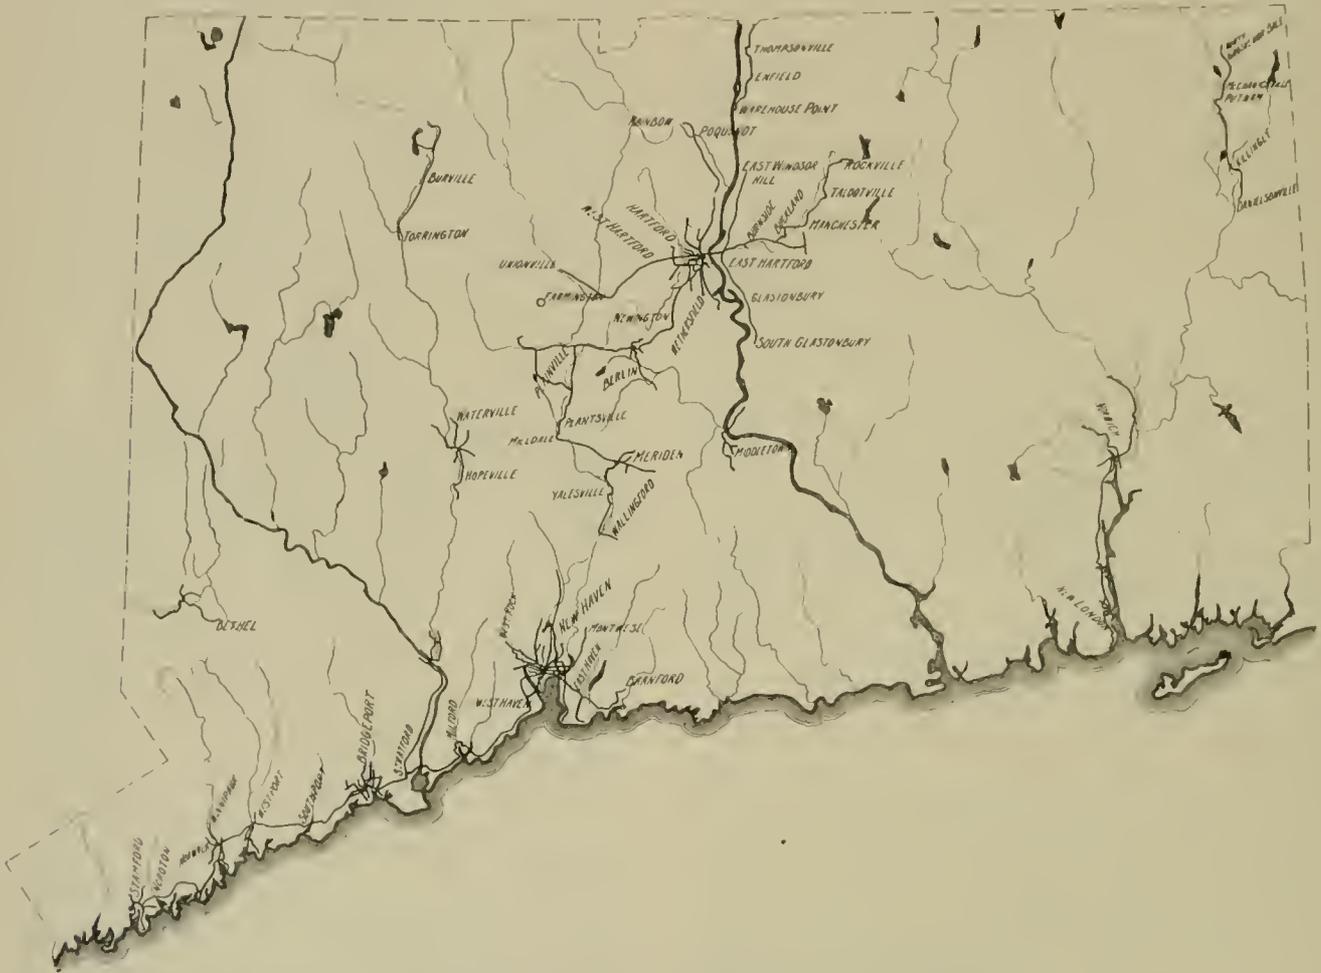

Two difficulties may be pointed out, however, in regard to the street traffic which are namely, that teams could not be allowed to use the street car tracks and that the trolley poles on the cars would have to be switched onto an auxiliary trolley wire stretched inside of the saddle car.

**CONNECTICUT STREET RAILWAYS.**

In 1901 the Connecticut Legislature extended the supervision of the Railroad Commissioners over the street railroads and the report of the commission for 1901 which has recently been published includes statistics of all of the street railway companies of that state. These are shown on the accompanying map which is redrawn from a map included in the general report. No Connecticut street railway can now be opened for public traffic until it has been examined by the Railroad Commissioners and a certificate issued that it is in a suitable and safe condition. They are required to examine the street railways once in each year or oftener when they deem that public safety so requires. The examination of these roads during the past year showed them to be in good condition generally and the commissioners had but a few suggestions to make in the line of improvements. On some of the roads the trolley poles

The companies having the largest mileage are the Connecticut Railway & Lighting Co., owning and operating 152.172 miles, the Hartford Street Railway Co., with 73.085 miles and the Fairhaven & Westville with 68.020 miles. The Winchester Avenue Railroad is owned and operated by the latter company which brings its mileage up to 80.000 miles.

The financial statement made up from the reports of the various companies is characterized as to a certain extent unsatisfactory and indefinite in so far as it relates to capitalization, construction and equipment, on account of the fact that some of the companies are engaged not only in operating street railways but also in operating gas and electric lighting properties. The capital stock, bonds and floating indebtedness are chargeable upon the property and consequently the amounts shown under these accounts are not all applicable to the street railway business. As far as the gross receipts and operating expenses are concerned,

MAP OF CONNECTICUT SHOWING TROLLEY ROADS OF THE STATE.

have been placed nearer the tracks than was considered safe for the operation of open cars with running boards. It has been recommended that poles be placed not less than 5 ft. from the nearest rail and changes in the location of poles were generally voluntarily made at the time of the inspection. It was also recommended that all the large double truck cars should be furnished with power brakes in order to be controlled with safety. This is considered essential on roads with steep grades and it is a wise precaution in thickly settled cities where prompt stopping of the cars may avert an accident.

The total mileage of the street railways in operation in Connecticut reporting for the year ending June 30, 1901, is 492.227 miles exclusive of sidings, and 515.835 miles including sidings, making the length of the latter 23,608 miles. This shows an increase during the year of 21,257 miles in the length of main tracks and the decrease of 5,153 miles in the length of sidings reported. No new companies were added to the list of operating roads except the Connecticut Railway & Lighting Co.

however, the street railway departments have been kept separate and distinct, and are correctly shown in the reports.

The capitalization and construction equipment accounts of the Connecticut Railway & Lighting Co., including its subsidiary companies, are as follows:

Capital stock, \$15,000,000; bonded debt, \$9,350,000; floating indebtedness, \$75,000. Total, \$24,425,000. The construction and equipment accounts of this company are as follows:

Capital stock, bonds and properties purchased, \$21,220,034; bet- terments on gas and electric properties, \$32,207; expenditures dur- ing six months, \$153,248. Total, \$24,405,525.

The capital stock of the other street railway companies of the state comprising 340.055 miles of road, is \$8,137,044, being \$23,931 of capital stock per mile of road.

The bonded debt of all other street railway companies is \$6,008,000, being \$20,314 per mile of road.

The floating indebtedness of all other companies is \$822,593, being \$2,419 per mile of road.

The cost of installation and equipment of all other companies is \$15,816,288, being \$46,510 per mile of road constructed, excluding siding.

The gross earnings of all the street railway companies for the year were \$3,629,783, being \$7,162 per mile of road operated, and \$0,2001 per mile run.

The operating expenses of all the companies were \$2,298,063, being 62.11 per cent of the gross earnings. The average expense per mile operated was \$4,554, and the expense per mile run \$0.1266.

The net earnings for the year have been \$1,333,976; the net earnings per mile operated were \$2,627, and per mile run \$0.0735.

Eleven of the 27 operating roads paid dividends amounting to \$383,300, upon a total capital stock of \$6,005,000. No dividends were reported as paid on \$2,132,048 of capital stock. The number of miles run was 18,138,124. The approximated cost of operating per mile run was \$0.1266, and the gross earnings per mile run were \$0.2001. The total number of passengers carried was 78,222,462 as compared with 54,235,707 carried by the steam roads of this state. The number of cash passengers per mile of main track operated was 136,137, and the number of cash passengers per mile run was 3.8.

There were 225 persons injured on the street railways during the year, 15 being killed. Of those killed 3 were passengers, one was an employee and 11 were persons on the street.

The railroad commissioners for Connecticut during the past year were Washington F. Wilcox, William O. Seymour and Orasmus R. Fyler.

### THE BROWN SYSTEM OF DISCIPLINE AT BIRMINGHAM, ALA.

Mention was made in February issue of the "Review" of the Brown system of discipline in effect since Jan. 1, 1902, on the Detroit United Railway. The Birmingham Railway Light & Power Co. inaugurated this system on July 1, 1901, and has found its results highly satisfactory. Previous to its adoption when it became necessary to discipline an employe he was suspended from work for a specified number of days and on account of this suspension of work it was necessary to maintain an excessive number of extra men in order to have enough crews to operate the cars. With the adoption of the merit system this extra list was reduced to a large extent. Instead of merits and demerits "Debit days" and "Credit days" are the terms used in this connection. A book called the "Suspension Book" is kept in the general office and when an infraction of rules occurs a bulletin order is sent to all the bulletin boards relating the circumstances, place, etc., but withholding the name of the one who violated the rule. A copy of this bulletin is mailed him in an envelope and in the lower left hand corner the words "You are the man" are written. When a man gets as many as thirty days on the debit side of his account he is called in the office and the suspensions are discussed. If the previous good conduct of the employe justifies it a credit is placed to his account and he is allowed to continue in the service of the company, if not he is dismissed. It is believed that the system is productive of more efficient service and stricter adherence to rules than the suspension with loss of time, as in that case when a man wanted a vacation and thought it would not be granted him an infraction of a rule would place the coveted leave of absence in his way.

The "Suspension Book" in which the records of the men are kept is a large volume with pages measuring 8x13½ in., each two facing pages having the same number. The left hand pages contain at the top blanks for the name of the employe, his address and number, whether married or single, age, previous experience and date of entering service. These blanks are repeated four times at the top of each page in order to allow entering a new name on the page in case the man formerly entered leaves the service before the expiration of a year. In the case of employes remaining but a short time with the company the use of several names on a page successively economizes considerable space in the book. Below these blanks the page is divided into 25 vertical columns, the left hand one being for the day of the month and the remaining 24 a debit and credit column for each month. The total debit and credits and the balance is footed up at the bottom of the columns for each month.

The facing page is headed "Explanation" and the description of the accident or occurrence for which the employe is disciplined is entered under the subheads "line," "car," and "place." By this method a complete record of each employe's conduct is displayed for a year, or any portion thereof, in concrete form on a single page of the suspension book.

### SURFACE CONTACT SYSTEM AT WOLVERHAMPTON.

The first surface contact system to be used in the United Kingdom has been installed in Wolverhampton, the system employed being that of the Lorain Steel Co., of Johnstown, Pa. Two miles of this system have been installed, and will be tested for a period of 30 days. If the results of this experimental line are deemed satisfactory, the balance of the system is to be similarly equipped and the entire installation must be completed by May next, at which time an exposition is to take place in Wolverhampton. The total length of the line to be equipped is 11 miles.

There are two general classes of surface systems, namely, those in which the switch mechanism is actuated by solenoids, or electromagnetic devices, one in each contact box, or a number grouped together in a manhole in the street; and second, those which carry the magnets underneath the car, with a switch in each contact box, which is actuated by the magnets carried on the car. The Lorain system is of the latter class, of which the only prominent examples are two systems operating in Paris. One of the claims of superiority made for the Lorain method over the French system is the absence of vapor of mercury in the switches. Some years ago the Lorain company carried out a series of experiments, employing a switch consisting of an iron sphere floating in mercury. It was found, however, that the results were disastrous, on account of the vapor of the mercury collecting on the interior surface of the insulated cup. This so reduced the insulation that the contact plates would become charged sufficiently to injure horses and other animals coming in contact with them. The present system has the advantage that a defect in the magnetic coil cannot under any possibility leave a contact plate charged in the street. The switch, which is the only moving part of the system below the ground, is enclosed in a cup of insulating material and hermetically sealed against all moisture. In this system a minimum number of cables is required for connecting the contact boxes with the current supply main, and no T joints are required in any of the cables.

The parts are all accessible for replacing or repairs without disturbing any of the paving. By removing two nuts holding the cover of the contact boxes, the latter may be lifted up, and with it the switching mechanism in the cup of insulating material. The replacing of this can be done in two or three minutes. The contact box cover is 12¾ in. by 6¾ in. wide, the upper surface being convex and projecting a fraction of an inch above the surface of the paving. The vacant space in the contact box is filled with oil to prevent the possible creeping in of moisture, and if such should occur, the moisture will naturally rise to the top of the oil, where it does no harm. A special oil is used, which does not thicken in cold weather and does not oxidize or deteriorate. A long collector shoe is provided under the car, which is durable and said to be noiseless in its operation. The collector consists of a phosphor bronze strip 2x¼ in. in section, which is carried by a 2 in. rubber hose, which in turn is carried by a wooden piece attached to the magnet. The rubber hose gives the necessary insulation and flexibility. The 30 days period of trial has been entered upon, and at the present time there appears to be no doubt as to its successful issue. The system has been developed by Mr. W. M. Brown, chief electrical engineer for the Lorain Steel Co., and it is regarded as a practical substitute where overhead wires are objectionable. The Lorain company expects to enlarge its plant at Johnstown for the purpose of manufacturing the new appliances.

Swedish engineers project converting all the railroads of Sweden, comprising some 7,500 miles, into electric lines, to be operated from 12 power stations of 3,000 h. p. each, in various parts of the country. Estimates of the power required and the cost of consummating the project have been prepared by one of the prominent electricians of Stockholm. The cost is placed at \$10,000,000.

## BERLIN ELEVATED AND UNDERGROUND RAILWAY.

BY FRANK C. PERKINS.

The recent equipment of the elevated and underground electric railways in Berlin, is particularly interesting at this time on account of the activity in this line of railway practice in the principal American and European cities. The Berlin railways are operated by the Gesellschaft für Elektrische Hoch- und Untergrundbahnen in Berlin, and the electrical equipment was installed by Siemens & Halske.

The subway system, together with the elevated road, extends from the Warsaw bridge to the Zoological Garden, a distance of nearly 7 miles, and runs approximately east and west through the central portion of the city. A branch line about half a mile long runs to Potsdamer Platz and ends there in an underground terminal.

The road descends 13 ft. below the surface from the junction of this line first passing over a bridge spanning the Landwehrkanal and then running down to the Droschkenplatz at the Potsdam railroad station. The underground tunnels are excavated in the main streets and the subways constructed, concrete arches being used at the

Great care has been taken to avoid vibration of the elevated structure and a sort of pumice cement and gravel is used for ballast and to deaden the sound. This ballast is clearly shown in the accompanying illustration. The third rails for supplying the current are well insulated and mounted inside the track. They are constructed of iron, and copper feeders are used for supplying the current at a potential of 750 volts. Part of the track consists of rails weighing 80 lb. per yd. and some of 56 lb. per yd., while the distance between the ties is 28 in. in the latter case and 39 in. in the former case. These are fastened securely to the iron work.

The trains of three cars weigh about 80 tons, carry 22 passengers and have a 5 minute headway. Each of the motor cars runs on two bogies, and four single reduction motors are mounted on the two trucks. The current consumption varies from 1,000 to 1,400 amperes at 750 volts. The normal speed is 18 to 25 miles per hour and the stations are about 2,000 feet apart. The wheels of the motor cars are 33 in. in diameter and the weight of the car about 24 tons. The motor cars are 10½ ft. high and 7 ft. 10 in. wide, while the total length between buffers is 41 ft. 7 in. The cars are divided into two parts, one for the driver or motorman and the other for the passengers. The motor cars are arranged for third class passengers

VIEW OF BERLIN ELEVATED RAILWAY SHOWING LIGHT STONE BALLAST.

crown 8½ in. thick, the surface of the street being 2 ft. above. The distance between the transverse girders is about 5 ft., the rise of the arch 8 in. and the total width of the subway is 21 ft. 3 in. Water tight asphalt sheathing and cement is used in the trenches, side walls and ceiling which insures a dry subway. The floor of the tunnel consists of concrete about 3 ft. thick and the rails have a gage of 4 ft. 8 in.

Iron pillars are used as supports between the tracks on account of the width of the tunnel. The underground portion of the line starts at the west of the city, north of Charlottenburg, near the Zoological Garden and terminates at Nollendorf Pl. Electric trains consisting of three coaches, the two end ones being equipped with motors, pass from the underground subway to the elevated structure illustrated herewith.

The elevated part of the line is supported on uprights, free to swing, as they are set in globular foundation shoes. Much of the work on this structure needed the highest engineering skill, particularly in places where the tracks were carried over streets, the canal and railway lines and in passing the Potsdamhof, some of the spans being nearly 400 ft. long. At several points the line cuts directly through houses. These are known as "slit-houses," part of the walls being removed and the buildings strengthened.

and the center car is used for second class passengers, no first class compartments being provided.

Air brakes are provided for all of the cars, which also have hand brakes for emergency. Forty-one motor cars and 21 second class cars are required to make the schedule trips.

The power house is located near the center of the line and at a point where the greatest consumption of energy takes place. This is near the triangular junction illustrated, where the line meets the Ringbahn at Potsdam bahnhof. The station is built with the coal bunkers at the top of the building, and just below them are the boilers which supply the superheated steam at 135 lb. pressure to the 900-h. p. vertical engines located on the floor below.

There are three generating sets, each having a normal capacity of 900 h. p., but capable of standing an overload of 1,200 h. p. The engines are of the vertical cross compound type and are directly coupled to compound wound direct current generators of the inner pole type with ring armatures. The firm of Siemens & Halske designed a special dynamo for this plant, the combined armature and commutator type not being adapted to it, but a very large commutator is used, which does not, however, form the actual surface of the armature winding. The generators are 80-kw. machines and have 10 poles, and in addition a large fly-wheel weighing 33 tons

is mounted on the engine shaft, and a 20-h. p. electric motor is arranged for turning over the engine and fly wheel when desired. There are six tubular boilers each having a heating surface of 2,480 sq. ft., the pressure being 135 lb. and superheating 230° C. The feed water is supplied by two steam pumps having a capacity of 21,000 gallons per hour. The coal is hoisted by automatic conveying apparatus. The chimney is 262½ ft. high and has a diameter of 11 ft. 9 in. at the top, only 216 ft. of the height being available for draft on account of the boilers being located at the top of the

SUBSTRUCTURE OF BERLIN ELEVATED RAILWAY.

building. The lower portion of the chimney is fitted up for closets, wash rooms and bath rooms.

The engine room is supplied with two traveling cranes, one of 15 tons and the other of 20 tons capacity. The power house was designed by Mr. D. Wittig, director of the company.

### A PICKPOCKETS' UNION.

As a result of a sudden increase in the number of robberies occurring on street cars in the lower East Side of Manhattan, the police claim to have unearthed a perfectly organized pickpockets and sneak thieves' syndicate, with established offices and regularly appointed officers.

The association has two classes of members, the "workers," who do the actual stealing, and the "honest" members, whose part is to pose as respectable citizens. The city is divided into districts, and certain pickpockets are assigned to each district, street cars being the particular field chosen for activities. Each member pays into the general fund a percentage of his "takings."

Some original methods are introduced in the way of doing business. One successful plan has been as follows: Two men board a crowded car and at the first opportunity one of them takes a diamond stud, or watch, or a pocketbook, as the case may present itself, and immediately passes the booty to the other, who jumps from the car with the least possible delay and without attracting attention. If the article is missed the taker will probably be the one suspected, but when searched of course no trace of the stolen property is found.

If the victim insists on pressing the charge, or if either man is caught with the goods on him, the "honest" members of the association play their parts. The victim is waited upon by a well dressed citizen, who represents himself as a friend of the unfortunate thief who has been forced by want to take what does not belong to him. The gentleman offers to have the stolen property returned, and if necessary agrees to pay a small sum if the prosecution is dropped. In this case out of ten this proposition is accepted and the thief goes free. The expense, of course, comes out of the syndicate's fund. When the pickpocket is brought to trial the organization pays the expenses of a lawyer to defend him.

### FIRE PROTECTION.\*

**Fire Extinction**—It is better to prevent a fire if you can, but it is good to have facilities to extinguish one if it occurs. For depot buildings, coal houses and freight houses, my practice is to have each building equipped with at least one barrel of salted water and a bucket. Three pails of salt should be dissolved in each barrel of water. This will keep it from freezing in the coldest weather when inside a building, but you must see to it that the salt is dissolved. Locate the barrel near the door and keep it free from accumulations of freight or other material. A round bottom bucket is recommended. It is not so likely to be stolen and it cannot be used for ordinary purposes—two features tending towards its being where it ought to be when wanted. Paper buckets of this design are made especially for this purpose. Instruct agents that this equipment is just as much an important part of their station supplies as their stove or safe, and must receive as much care. If they ever need a pail of water for fire extinguishing purposes, they will need it very badly and very quickly. Excellent results have followed this practice. Where water tanks are at a station, an inside hydrant will answer the purpose of a barrel of water, providing you have a fire bucket, and also providing it does not freeze up in the winter. Do not permit the agents to empty the barrels in summer and use them to catch rain water in for scrubbing purposes. The barrel of water and bucket, although one of the simplest, is one of the best equipments for small stations. You can furnish it for all kinds of buildings, it is cheap, it requires the minimum amount of care, is not patented, and every one of your employes knows how to use it. Do not despise it because it is homely. It holds the record. For large freight houses the fire pail pump is an excellent hand apparatus. This is nothing more than a large tin pail (holding about five gallons of water) with a small submerged pump in it, with a short hose. Its advantages are that it requires no skill to operate it; can throw water overhead, which is very important, is easily transported through a yard to burning cars; does not corrode and is not patented. They are used quite extensively. Cost about \$5.00 each. The fire hazard of freight houses is low, should not be greater than a dwelling house, and there is no excuse for so many of them burning.

**Shop Plants**—The protection of large shop plants is not only a very important, but is also a very broad and difficult proposition. It is dependent upon many circumstances—location, character of construction of buildings, their exposure to each other, water supply, contiguity to a first class fire department, and willingness of the company to spend money for protection. In general, there should be both inside and outside protections. For inside protection, assuming you have plenty of water and power, I like 1½-in. hose connections, with 50 ft. or less of linen hose at each upon a reel, and attached ready for instant service. Connections should be so made that all parts of the building can be reached by a stream of water. The connections should not be upon a pipe smaller than two inches. The hose and valve thread of this size is standard, and there is no difficulty in buying the equipment, including the reels. Do not spend your money for this equipment, however, unless you have a constant pressure of not less than 20 lbs. upon the pipes. The equipment must be ready for business at all times, and the workmen impressed with the knowledge that it can be depended upon. If conditions are such that you cannot get the hose service, do not forget the barrels and buckets. Some chemical extinguishers are very good, if taken care of and the men trained how to use them, but my experience is that they are shamefully neglected, as a rule, and that the men are often afraid of them. Hand grenades are not as good as a bucket of water. In your paint shop, oil room and parts of your plant where oil is stored or drawn, be sure to have pails of dry, sharp sand. Paint the pails red, and mark them: "For Fire Purposes." Then tell the men that sand is one of the best things you know of for extinguishing fires. Design your inside equipment with the idea of immediate use on incipient fires.

**Apparatus for Outside Use**—If you have not a good permanent water supply, do not spend much money on it. The best thing to do is to buy a chemical engine and drill your men how to use it. If you have a good water supply, see if your pump and steam plant

\*Extracts from a paper on "Fire Rules of Railways," read before the Western Railway Club by W. S. Worman, fire inspector, C. & N. W. Ry.

are so housed that it will not be involved in the burning of the building or buildings you are aiming to protect. Keep in mind that when a fire gets to a stage where you must fight it from the outside, you have a very serious proposition on your hands. Probably the most you will be able to accomplish will be the protection of adjacent property. Assuming that you have the water and power, have your yard mains of ample size. I will not take your time discussing the necessity of having piping of sufficient size more than to say that in no department is more care needed in this regard than in your fire department. Where a plant is self-dependent in the matter of a heavy hose service, a fire pump of the "Underwriter's" pattern, or one equally as good, is a necessity. A 14x7 $\frac{1}{4}$ x12, or 500 gallon pump, throws two good hose streams. A 16x9x12, or 750 gallon pump, throws three good hose streams. An 18x10x12, or 1,000 gallon pump, throws four good hose streams. A 20x11 $\frac{1}{2}$ x15, or 1,500 gallon pump, throws six or seven good hose streams. As stated, conditions so vary that full rules cannot be given. A 6-in. yard main for a small plant is good, but an 8-in. main is better. After getting a yard main, a 4-in. pipe is large enough to branch to a yard hydrant, if not more than 75 ft. from the main. Place your hydrants sufficiently remote from buildings to be free from danger of falling walls. Place them near roadways. Outside hydrants are usually double, 2 $\frac{1}{2}$  in., with frost case, and 4-in. or large ground connection. Have cut-off valves near the yard main on all pipes leading into buildings, and have the valves boxed so that you can get at them. Your hose for outside use should be 2 $\frac{1}{2}$ -in. cotton, rubber lined. There is no standard 2 $\frac{1}{2}$ -in. thread, so be sure that your hose fits your hydrants. Also see that you have facilities for utilizing the city or town service, if the thread of its fire hose differs from your own. Get first-class hose. It is cheapest. Rubber hose for fire protection purposes is cumbersome, and apt to crack near couplings. Have the couplings put on by the makers. The hose may be kept upon a cart, or may be attached to each hydrant and covered by a house about 6 ft. square. The house plan is best, when plant is of moderate size. Have the house weather tight, with big doors, well-ventilated. Do not coil the hose, but keep it on a slatted shelf, raised from the floor of the house, and piled in a zig-zag fashion. Do not forget spanners, wrenches and nozzles. These tools are needful to work the hose. Do not attach the hose to both sides of the hydrant. Keep the cap on one of the butts of the hydrant. Take good care of your hose. The chief cause of rotting is from water remaining in it. See that it is properly drained after use, also that the hydrant does not leak into it. When hose is kept on a reel, it should be taken off and aired occasionally, particularly during the summer months. When replaced on the cart, reel it up the opposite way.

**Private Organization**—This is a vexed subject. You certainly cannot train all of your help, and yet it is clear that your protective apparatus is useless unless some concerted use can be made of it. It seems reasonable, however, that every shop should have some one, the foreman or his assistant, who shall know what fire apparatus there is, and shall keep it in good condition. He should also select some of the men from each department and drill or instruct them as to action in case of fire. The following are general suggestions:

Select men likely to be permanently employed—active, sober and intelligent. It will be found that a few men who know where to find and how to work the apparatus will be able to control the balance of the men.

Take those whose homes are in closest proximity to the plant when practicable.

Always take the watchmen.

Organize your night force. This is very important.

Distribute the selection as greatly as possible over your entire department.

Do not give the men the idea that you are trying to make firemen of them.

Do not permit any horse-play in the handling of the apparatus or at drills.

Drills should be simple, consisting principally of the running out of a length of hose from a hydrant to the building where the men being drilled are employed, and the opening up of a stream through one or two of the inside connections. Use different hydrants and different connections at each drill. Give the men time enough to

require them to take care of the hose properly after the drill. It must be thoroughly drained and dried and returned to its reel.

It is, perhaps, more satisfactory that the men be remunerated for drills than that their services be voluntary—say time and a half during one hour's drill. The remuneration is a useful lever for the maintenance of proper discipline and is in many ways more efficient than a voluntary one combined with some special benefit.

Every selected member should be made acquainted with the working of all the different appliances, etc. The drills should have special reference to the buildings they are primarily expected to protect.

The inspections by the chiefs, or such selected men as they may designate from time to time to make inspections, should not be of a perfunctory nature, but a thorough examination of all hydrants, valves, hose, etc., in his jurisdiction, and any defect should be repaired promptly.

Do not provide the chiefs, their assistants, nor the selected men, with any distinctive badge or paraphernalia; educate them to the idea that the best results are obtained while the fire is young, and that quickness, without demoralization, is the very essence of the best service; that when an alarm of fire is given, they are expected to get there quickly, but quietly and coolly, and be able to handle the apparatus to the best advantage.

Particularly, drill the night watchmen in the quick handling of the inside hose and the location of the fire alarm boxes.

Do not permit any racing at drills, nor competition between selected men of different divisions or departments.

Furnish each chief and each of his assistants with blue prints, showing water system, hydrants and fire alarm boxes, to be framed and hung in the office of each.

**General Order and Cleanliness**—The only general rule is not to have anything about that cannot show some good reason for its presence.

Ordinarily dirt and accumulations are not always inflammable or liable to spontaneous combustion, but you never can tell what day something may be mixed up with it that is.

The value of cleanliness in preventing fires applies to every part of the plant; it not only removes nearly all the causes of spontaneous combustion, but brings about a double inspection service, first from the sweepers, and second from the foreman, who sees that the shop is clean. As a moral effect, cleanliness improves the pride and caution of employes. It is a matter of habit and men disciplined to it will do better and more work.

#### COMPLAINT CLERK AT MEMPHIS, TENN.

The Memphis Street Railway Co. has introduced an innovation in employing a complaint clerk whose duties are solely to listen to the troubles of dissatisfied passengers. Mr. Frank Smith, superintendent of the company, stated that the purpose of the company is to look carefully after the rights of its patrons. The company intends to give the people a good service, to correct the defects which may be made apparent in the service and to guarantee courteous treatment of its passengers. All these matters will hereafter be attended to by the complaint clerk.

It would undoubtedly surprise many people to know the number of letters received by a street car company daily relating to various complaints. One person is easily kept busy answering these communications and attending to the little details which they involve. The company will consider it a favor if any patron sends in a report of any lost article or of any dereliction in the conduct of its employes. The company hopes, through the establishment of this office, to give its patrons the very best service possible.

#### AN ATTRACTIVE FOLDER.

The New Orleans & Carrollton Railway, Light & Power Co., has issued a handsomely illustrated folder, entitled "Around the St. Charles Belt." This describes a trip over the company's lines, and points out the numerous monuments and buildings of interest which are passed on this route. A map of the road is also printed on the back of the folder, which is as handsome as well as a useful souvenir, and will prove of value to visitors desiring to reach the prominent points of interest in the city.

## RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

### DUTY OF MOTORMAN SEEING CHILD AHEAD ON OPPOSITE TRACK.

Jones v. United Traction Co. (Pa.), 50 Atl. Rep. 826. Jan. 6, 1902.

Where a child not quite two years old was walking on one track, the motorman of a car coming from the opposite direction on the other track, the supreme court of Pennsylvania holds, was bound to know that in her childish caprice she was as likely to cross over in front of his moving car as to go back to the pavement; and his duty, the instant he saw her, or, if exercising proper care and watchfulness, he ought to have seen her, was to stop or to so absolutely control his car as to avoid the risk before him.

### FAILURE TO STOP THE CAR WHEN FIRST REQUESTED NO EXCUSE FOR GETTING OFF WHILE IT IS IN MOTION.

Campbell v. Los Angeles Railway Co. (Cal.), 67 Pac. Rep. 50. Dec. 21, 1901.

While it says there might be cases in which, by reason of a condition brought about by the negligence of the carrier, where great danger was apparent, or where the passenger was told by the person in charge of the car to jump off, or other peculiar circumstances, it would not be negligence in a passenger to alight from a car while the car was moving, the supreme court of California holds that because a motorman did not stop his car when first requested furnished no excuse for a passenger getting off while it was in motion, especially when the motorman did finally stop it in a careful manner, and with due caution to the passenger not to get off till the car stopped.

### WALKING ON TRACK AT NIGHT TO AVOID MUD IS CONTRIBUTORY NEGLIGENCE.

Penman v. McKeesport, Wilmerding & Duquesne Street Railway Co. (Pa.), 50 Atl. Rep. 973. Jan. 6, 1902.

A man walking on an electric street railway track at night to avoid the inconvenience arising from the muddy condition of the paved portion of the street, wherein he could have walked with perfect safety, was run down and injured by an electric car coming up from behind him. He said that he looked back several times, the last time just before he was struck; and the testimony tended to show that the bell on the car was not rung until just about the time he was struck, and that the motorman was looking back in the car at the time. The testimony in the case, the supreme court of Pennsylvania holds, clearly showed the negligence of the man, and fully justified the direction of a compulsory nonsuit, on the ground of contributory negligence, and a refusal to set it aside.

### INJURY TO PASSENGER BY FALL OF FIRE EXTINGUISHER.

Allen v. United Traction Co. (N. Y. Sup.), 73 N. Y. Supp. 737. Dec. 31, 1901.

A passenger was injured by the fall of a metal fire extinguisher. The third appellate division of the supreme court of New York says that had this extinguisher been securely fastened, the passenger would not have suffered injury. Its fall must have been due either to negligent fastening originally or to a negligent maintenance of a fastening originally sound. The fastening was beyond the reach of ordinary interference by those going to and from the car. That an outsider should have interfered and rendered insecure this fastening was most improbable. Wherefore, without deciding the degree of care required of the company in securing this extinguisher, the court is clearly of the opinion that the circumstances surrounding the happening of the accident pointed to some negligence on the part of the company which called for its explanation and holds that it was error to dismiss the passenger's complaint.

### LIABILITY TO ASSESSMENT FOR STREET IMPROVEMENT OR REPAVING NOT IMPOSED.

State (Dean, Prosecutor) v. Mayor, Etc., of City of Paterson (N. J. Sup.), 50 Atl. Rep. 620. Nov. 29, 1901.

While the ties, rails, and other equipment of a street railway may partake of the nature of real estate, and be liable to general taxation as such, and may be benefited by a street improvement such as the repaving of a street, still, whether it is liable to assessment for such benefits the supreme court of New Jersey says, must depend upon the fair meaning of the governing statute. It thinks it clear, for example, that, under the act of June 13, 1898, which directs the assessment to be made in proportion to the benefits acquired by lands and real estate bordering on the street so improved, an assessment upon a street railway for benefits would be without authority.

Moreover, under the provisions of an ordinance requiring a street railway to keep and maintain the portion of a street inside its rails and for two feet outside of them in good and sufficient repair, the court holds that the company is not bound to repave within those limits with a new and different material selected by the city, nor is it liable to the expense of such repaving when laid down by the city.

### RIGHT OF ABUTTER TO INJUNCTION AGAINST CONSTRUCTION OF ROAD.

Peck v. Schenectady Railway Co. (N. Y. Sup.), 73 N. Y. Supp. 704. Dec. 31, 1901.

The third appellate division of the supreme court of New York holds that the appropriation by a street railroad company of a street in which the abutting owner has the fee or title is the taking of private property, within the settled law of that state, and that such owner is entitled to an injunction against its construction, without his alleging damage. Nor does it consider that it is rendered otherwise by the offer of the company that the court should estimate the damage which such abutting owner would suffer by reason of its appropriation of any property rights which he might have, and also offering to give any undertaking which the court might require to indemnify him for any damages he might suffer by reason of the company's appropriation of his land. To hold that the court should, against his protest, assess the damage and grant an alternative judgment, it says, would practically deprive him of his constitutional right in that state to the assessment of such damage either by a jury or by a commission of not less than three persons. Furthermore, where it is not shown that the company has taken the preliminary steps required by the statute to authorize the condemnation of private property, and it is not already in possession, the court holds that the injunction should not be denied because of the company's offering to give adequate security for the payment of any compensation which might lawfully be found to be due the owner by reason of its appropriation of the land.

### COMPANY NOT INSURED AGAINST LIABILITY FOR PASSENGER BEING INSTANTLY KILLED.

Worcester & Suburban Street Railway Co. v. Travelers' Insurance Co. (Mass.), 62 N. E. Rep. 364. Jan. 3, 1902.

The street railway company was insured "against loss from liability to every person," who might, during a period of twelve months from a time named, "accidentally sustain bodily injuries while traveling on the railroad of the insured, or while in the car or upon the railroad bed or other property of the insured, under circumstances which shall impose upon the insured a common law or statutory liability for such injuries." The question arose whether the terms of the policy were broad enough to cover the case where a person who was a traveler on this road died instantly, and without conscious suffering, in consequence of an acci-

dent for which the company was responsible. The supreme judicial court of Massachusetts says that the diligence of counsel furnished it with no case in which a policy in the terms of this one had been construed, and it was obliged to consider the case mainly upon general principles. Its decision is in favor of the insurance company. It says that the liability insured against was that to a person who sustained bodily injuries, and such person must have a right of action therefor, either at common law or by statute. The policy could not include the case of death, for which the person never had a right of action. In that commonwealth there is no common-law liability for death. Nor is there any statute which gives a right of action for the death of a person to his executor or administrator as an asset of the estate. In all the statutes which have allowed an executor or administrator to bring an action on account of the killing of a person by the negligence of a corporation or its servants the action is for the benefit of the widow, children, or next of kin.

#### LIABILITY FOR SAFETY OF STATION PLATFORMS.

Indianapolis Street Railway Co. v. Robinson (Ind.), 61 N. E. Rep. 936. Nov. 22, 1901.

In this case the supreme court of Indiana affirms a judgment for damages for permanent personal injuries sustained by a woman stepping upon a rotten board that broke under her, or into a hole in it, as she was crossing a platform at one of the company's stations on her way to its cars. The court says that if the situation at the time of the accident was such that the woman could not see the hole, or if there was nothing in the appearance of the decayed plank to indicate that it was liable to break, she was not negligent in stepping into the hole or upon the plank. By reason of an effort to shift the responsibility for the accident from the company to the crowd which pushed the woman into a place of danger, or prevented her from avoiding the place by the exercise of ordinary care, the court says that the company was bound to know that crowds might congregate upon its platform, and that injury to its intended passengers might result from defects in its platform under such circumstances. The presence and struggle of the crowd to get upon its cars only increased the danger of accidents from the unsafe platform. It did not relieve the company from responsibility for such accidents. It is settled by numerous decisions that railroad companies must provide means by which their passengers may safely enter their cars at stations, and must keep their platforms provided for that purpose in a safe condition. They are bound to know that if platforms become unsafe the lives and limbs of passengers are put in peril. Failure to keep such platform in a safe condition for the use of passengers entering or leaving their cars is a neglect of duty which makes the company liable to persons injured without fault on their part by reason of such defective platform.

#### MOVEMENT OF CAR BACKWARD FROM SLIPPING OF TROLLEY WHEEL.

Campbell v. Consolidated Traction Co. (Pa.), 50 Atl. Rep. 829. Jan. 6, 1902.

In front of a man seated in a wagon standing on a street railway track were two cars, the nearest being about 10 feet in advance of his horses, and a car was back of him, close to his wagon. On another track a car stood to his left, and to his right the street was crowded with people, so that he was completely hemmed in. As the second car in front of him moved ahead on an ascending grade, the trolley wheel slipped from the wire, and the car stopped, and then slipped backward about 60 feet, and struck the car back of it. Either the force of the collision drove the rear car against the man's horses and wagon, or the motorman of that car moved it backward to avoid a collision.

In affirming a judgment for damages in the man's favor, the supreme court of Pennsylvania says that the proof of the foregoing facts established a prima facie case for him. He was not bound to go further, and slow, by affirmative evidence, that the accident was an unavoidable one. He was in a place of apparent safety, and had no reason to apprehend danger from a backward movement of the cars. In the ordinary course of events such a movement was not to be expected. No extraneous cause interfered with

the company's control of its cars. The loss of control may have been a pure accident, or the result of mismanagement, or of defective appliances. If the slipping of the wheel was an accident which could not have been guarded against, the question would arise whether proper means had been provided to arrest the movement of the car in such an emergency; and, if so, whether proper use had been made of them. The case was one in which the proof of the accident and the attendant circumstances gave rise to a presumption of negligence, and made it incumbent on the company to show that due care had been used. Whether this was shown was necessarily for the jury.

#### OWNER OF TRACK NOT LIABLE FOR A USER'S PASSENGER BEING STRUCK BY TREE.

Sias v. Rochester Railway Co. (N. Y.), 62 N. E. Rep. 132. Dec. 20, 1901.

A passenger on a car of a suburban electric trolley road which used the tracks of another company in the city while standing upon the platform and projecting his person beyond the side of the car was struck upon the head by a tree standing within one foot and seven inches of the rail, receiving fatal injuries. This was in the city. There was no lease of either road, and each company operated and managed its own trains of cars. And notwithstanding that the contract of the passenger for his carriage was with the suburban company, it was sought to make the other company liable for the results of the accident, the negligence relied upon to create the liability consisting in the construction of its railway in such close proximity to a tree. But the court of appeals of New York does not think that the company sued was chargeable, upon the proofs, with the neglect of any duty owing to this passenger on the other company's car, and it holds that for that reason the dismissal of the complaint was proper. It says that the company sued sustained no contractual relations to that passenger, and none such could be predicated upon a mere traffic arrangement between the two companies, which permitted the suburban company, for a compensation, to run its cars over the tracks of the company sued. The company sued had the right to construct its tracks as and where it did, and what duty of care and precaution it was under for the safe operation of its cars it owed to its passengers. How it performed its duty, the court was not informed, and it says it was immaterial here. It knew that cars could pass the tree. If there was any negligence, from which the passenger in question suffered, it could only have been in the manner in which the suburban company operated its cars upon such a track. If the construction of its cars was defective, or if their operation and management were such as not to furnish adequate security for passengers, then that company would be at fault.

#### WHERE DUTY IS TO KEEP IN REPAIR SURFACE OF STREET ALONG TRACKS.

Leary v. Boston Elevated Railway Co. (Mass.), 62 N. E. Rep. 1. Jan. 1, 1902.

Section 32 of chapter 113 of the Public Statutes of Massachusetts provides that a street railway corporation shall keep in repair, to the satisfaction of certain officers therein named, simply "the paving, upper planking or other surface materials" of the part of the street covered by its tracks, and, in the case of an unpaved street, an additional space of 18 inches upon each side of its tracks. Under this statute the railway corporation, the supreme judicial court of Massachusetts says, is no longer required, as formerly, to keep in repair the whole of that part of the street covered by its tracks, but only the surface thereof. This limited liability cannot be construed as imposing upon the corporation the duty of filling an excavation from the bottom. It is only when the excavation has been so filled by the municipality or other party upon whom rests the general responsibility for the safety of the street as to reach the plane where surface material is required that the duty of the railway company begins, and it is only when its duty begins that it can be held answerable for the condition of the street and then only to the extent of that duty.

In this case, it appeared that the corporation in question owned and operated a street railway with tracks in a street which the

court assumes was unpaved. A trench was dug so as to come within 18 inches of the track, by a party, under a permit, it was said, from the city, for the purpose of constructing a sewer in the street. If so, then the opening, the court holds, was legally made, and the corporation had no authority to close it; and while the trench was legally there it was not charged with the duty of keeping in repair the portion of the street within the lines of the trench until the latter had been so far filled as to call upon it to fix the surface. Until that time arrived, there was no surface to be cared for by the corporation, and the responsibility for the condition of the street and the duty of protecting travelers, either by guards or otherwise, were upon the city.

**BICYCLIST BOUND TO LOOK AND LISTEN BEFORE CROSSING TRACK—DOMINANT RIGHT OF COMPANY—GETTING ON OR OFF MOVING CAR.**

McCracken v. Consolidated Traction Co. (Pa.), 50 Atl. Rep. 830. Jan. 6, 1902.

The supreme court of Pennsylvania says that in this case both a bicyclist and the company attempted to use one particular place on the track at the same instant of time. The dominant right to the track was in the company. That right must be conceded and deferred to by all of the public who have a right to cross. When about to cross they must use ordinary prudence to ascertain whether the owner of the track is about to use it. This bicyclist was bound to look and listen before crossing. A bicyclist is not exempt from observing the caution imposed upon all others of the public about to cross railway tracks. To hold otherwise would be to give the bicyclist a right on the tracks superior to that of the railway company. As a necessary preventive of accident, the court would be compelled then to hold that the motorman must stop and look out for the bicyclist. In passing on the question as to whether the bicycle is a vehicle chargeable with toll on turnpikes, this court has held that it was; therefore in propelling his vehicle the rider was bound to exercise in some degree the care of a driver of a team.

Again, the court says that it is per se negligence, or negligence in and of itself, to get on or off a moving car, yet we see usually prudent and careful men every day commit that act, and comparatively few are injured; but nevertheless it is negligence. Many persons usually careful attempt to cross in front of a moving car; many do not stop, look, and listen when about to use the crossing of a steam railroad. While the fear of death or mangling ought to prompt care, this court knows from long observation of the appeals in it that in very many cases it does not. The court cannot, therefore, assume that it is incredible that this bicyclist attempted to cross in front of a rapidly moving car in full view. It is possible, but not probable, that when he made up his mind to cross the car was 100 or 200 feet distant; but where was it just as he approached the first rail? He was then bound to look. It was then just about one second in time distant, about the time it took him to cross the roadbed. If he then looked, as he was bound to do, he saw it, and was negligent in attempting to cross. If he did not look, it was negligence in him not to do so. There was no imperious necessity dictated by hastily formed judgment impelling him to go straight on, as in cases where a man by no fault of his own is in peril. He was then still in a place of safety. He could have stopped and dismounted, or he could have kept outside of the rail on the same side of the road. To argue that he could not cross because a car, when he saw it, 500 feet off, with out fault on his part ran him down, is at war with every man's senses and experience derived from observation. The car obviously had only to traverse as many feet on the rails as would equal his time in the 17½ feet crossing them.

**CARE REQUIRED FOR PROTECTION OF PERSONS AT RETURN STATIONS IN PARKS.**

Mehlhouse v. Monongahela Street Railway Co. (Pa.), 50 Atl. Rep. 937. Jan. 6, 1902.

A carrier, the supreme court of Pennsylvania holds, must furnish a safe and efficient means of ingress to and egress from its trains. It is likewise incumbent upon it to exercise ordinary care in protecting from danger persons assembled at its stations,

intending to depart by its trains. Rudeness and bad manners of strangers and intending passengers, resulting in injuries, will not convict a carrier of negligence. Such conduct is not to be anticipated, and the carrier is not required to provide against it. But when a street car company invites the public to use its line to visit a park or other public place of amusement or recreation, and thereby induces large crowds of people to assemble at its stations in such place, the corporation must use reasonable care in handling the people and in protecting them from injuries arising from the conduct of the crowd in entering and leaving its cars.

That many people will collect at the stations on such occasions, the corporation must anticipate, and it is obligatory on it to see that its station accommodations and means for assuring the safety of its intending passengers are commensurate to the crowd which is likely to assemble. It is the experience of every one, and especially of those who operate street cars, that large bodies of people awaiting transportation rush on the car to secure seats immediately on its arrival at the station, regardless of consequences to individuals; and this is true of all classes of people. This fact the corporation is presumed to know, and to use proper care in controlling the crowd and guarding against the dangers arising from its probable conduct. What means shall be employed to insure the safety of persons on such occasions must be left to the corporation, subject, however, when the question is raised, to the approval or disapproval of the proper legal tribunal.

In this case, a boy standing one Sunday evening, at about three feet from the track in an inclosure for taking cars in a park was knocked under the car wheel by the crowd which rushed for a car hanging on it and projecting from the running board striking his sister, causing her to fall against him. In affirming a judgment in his favor for damages, the court points out that large crowds were attracted to the park by the advertisements and inducements held out by the company, whose street car lines furnished the means of transportation to and from it, and whose cars and stations were crowded on such occasions, on this one not in excess of other similar occasions, and it says that it was therefore clearly the company's duty to anticipate the size of the crowd that would assemble at the station on the evening of the accident, and to make suitable arrangements for its control and management. The case it says was necessarily carried to the jury on the question of the company's negligence by evidence that there were 150 to 200 people at the station, ready and anxious to board the first departing car, when but a single open car entered to carry them to their destination, and this at an excessive rate of speed, much beyond what the safety of the people awaiting it permitted, and that there was no person in charge of the gateway used as an entrance to the station, nor was there any officer or person at the station to control or direct the movements of the crowd.

**CROSSING DIAGONALLY IN FRONT OF CAR TO TAKE SAME—CAR NOT STOPPING—HEARING RUMBLING AND NOT LOOKING SECOND TIME.**

Copeland v. Metropolitan Street Railway Co. (N. Y. Sup.), 73 N. Y. Supp. 856. Jan. 10, 1902.

A woman started diagonally across a street crossing to be in position to take a car. Before proceeding, she had observed the position of an approaching car, which, when she was near the track, she saw half a block away, and observed at that moment that her son, who was with her, gave a signal to stop it. She, no doubt, thought that the signal would cause the car to slow down or to stop, and it would seem that in such event she would have crossed in safety, because without the motorman having done anything, so far as appeared, to check the speed of the car, she had almost reached the sidewalk, and was in the act of placing her left foot thereon, when she was struck by the rapidly passing car, which did not stop after the accident occurred until it had gone two lengths further on. Under these circumstances, the first appellate division of the supreme court of New York thinks that the question of contributory negligence, as well as that of the company's negligence, should have been submitted to the jury, and that the dismissal of the complaint at the close of the plaintiff's case was error, for which the judgment should be reversed, and a new trial ordered.

The woman's judgment that she could cross in safety, the court thinks the foregoing showed, was in fault only because of the fact that the motorman had decided not to stop, and did not, in answer to the signal, slow down; nor did he, by the ringing of the bell, notify her of his intentions. Had he rung the bell, thus indicating the nearness of the car, she could have accelerated her steps and reached a point of safety. It could not be said that, as matter of law, she was guilty of contributory negligence, since it appeared she had seen the car at a distance which she thought sufficient to enable her to cross in safety, and her judgment was at fault only because the unusual and exceptional thing occurred,—of the motorman, after the signal was given him to stop, and while she was in plain sight, crossing the track, failing to stop or slow down at the crossing, or to give warning, by ringing the bell, of his intention to proceed at undiminished speed.

There were two circumstances which would, no doubt, the court goes on to say, have some weight with the jury, namely, that after seeing the car when near the track, and starting to cross it diagonally, the woman did not again look, and that during such time she heard the rumbling of the wheels. The rumbling, in itself, however, would not be a warning, because she had heard this when the car was half a block away, and she expected such sound to continue until the car stopped at the crossing. And, as to her failure to look at the car, she could not very well do so, considering the direction in which she was walking, without turning nearly around; and not only would this have been difficult, but it would have tended to retard her progress, and thus increase the risk of reaching the sidewalk in safety. These circumstances, as stated, were to be considered by the jury; but they were not, in the court's opinion, sufficient to justify the inference, as matter of law, that the woman was guilty of contributory negligence.

#### DUTY TO PASSENGER TO SOUND GONG AND TO TRY TO AVOID COLLISION WITH VEHICLE.

*West Chicago Street Railroad Co. v. Tuerk* (Ill.), 61 N. E. Rep. 1087. Dec. 18, 1901.

This action was brought to recover for personal injuries which a passenger on a cable train sustained in a collision of the latter with a buggy. It appeared that the buggy had been driven several blocks along the same avenue that the train was running; that it would sometimes be behind the train, and sometimes ahead of it; that most of the time it was out of the track; that it was driven rapidly, and sometimes passed the train and sometimes was passed by the train; and that shortly before the accident, because of obstructions in the street, it had to be driven on the track along the street. Now, if the driver of the buggy, instead of a passenger on the train, had been suing the company, it might be, the supreme court of Illinois says, that there was such knowledge brought home to him that he would have been deemed, in law, to have not exercised ordinary care for his own safety, because of his knowledge of the presence of the train, or its proximity to him, and, under such state of the case, would not have been in a position to insist that the mere failure of the company to sound the bell was negligence, inasmuch as he might be deemed to know just what the sounding of the bell would inform him.

The duty of the company in this case, however, was not to be measured by the relative rights of the driver of the buggy and the company, but by the rights arising from the relation existing between it and the passenger. There was no pretense that she was not using all the care she could use for her own safety, and the question that was presented to the jury was, did the company use all the care for her safety that it was its duty under the circumstances of the case? While it might be that it could say to the driver of the buggy, "You have no right to complain. You knew our train was running on this track at that particular time, and near to you; and ordinary care required that you use reasonable effort to avoid injury, and that reasonable effort would have required you to have driven off our track, or, when off, to have remained off until we passed with our train." Yet the passenger had the right to demand and rely upon the company exercising every act that human care, vigilance and foresight could reasonably do, consistent with the operation of its road, to avoid injury to her; the court declares that it is unable to say that the judge should

have instructed the jury that it was not the company's duty to ring the bell, or to do any other and every other act that was calculated to avoid this injury. This was especially so in view of the fact that the train was running at full speed, and that it was not pretended that the company's servants in charge of the train did not know that the buggy was on the track, or that they did not see it.

Wherefore, the court holds it was not error to refuse an instruction in this case that, because the driver of the buggy knew that the train was traveling in the same direction he was driving, it was immaterial whether the bell or gong on the train was sounded or not, which meant the same as to say that the failure to ring the bell was not negligence. The declaration contained a general charge of negligence, and it was a question of fact for the jury to determine whether, under all the facts and circumstances, the company was guilty of such negligence as made it liable. Judgment against company affirmed.

#### VALIDITY AND EFFECT OF ORDINANCE REQUIRING REPAIR OF PAVEMENT—EVIDENCE OF NEGLIGENCE—NOTICE IMMATERIAL—INJURY OF PASSENGER PASSING BEHIND CAR.

*Fielders v. North Jersey Street Railway Co.* (N. J. Sup.), 50 Atl. Rep. 533. Nov. 11, 1901.

A city ordinance, passed under due legislative authority to regulate street railways, that require operating companies to repave and keep in repair, to the satisfaction of the proper city authorities, in any paved street of the city in which their tracks are or shall be laid, a space between lines one foot outside of their outer rails, under penalty that, on default after notice, the city may repair at the company's cost, the supreme court of New Jersey holds, is a valid police regulation, creating a duty towards the traveling public, and is evidential in an action for negligence brought against such a company by a passenger who is injured through a defect in that part of the street pavement while passing from car to sidewalk. In such a case the ordained duty is absolute, and not dependent on notice. It is immaterial whether the defective pavement was laid under the ordinance, or previously laid and fallen into repair.

In this case, there was evidence that the passenger alighted at the only place afforded for that purpose from a car which was stopped for her at a crosswalk. By direction of the conductor, she passed behind the car towards her destination, pointed out by the conductor, on the opposite side of the street. In so doing she was injured through a defect in the pavement adjoining the cross walk, at a place where it was the duty of the company to keep the pavement in repair. The defect had existed for upwards of two months. She did not see, and had no warning of, the danger. Under these circumstances, the court holds that it would not have been lawful for the trial judge to have held either that no negligence chargeable to the company had been proved, or that the negligence of the passenger indisputably contributed to her injury. The case, in both aspects, was for the jury.

As to the company, the court says, negligence was fairly inferable from a management of affairs that permitted the passenger, without warning, to alight from and pass behind the car when so overhanging the cross walk as to make her encounter a dangerous defect long existent in the pavement. When to this was added the ordained duty of the company to have kept the pavement in repair, negligence was hardly disputable. With regard to the contention that a passenger alighting from a street car should be held to take the risks of defects in the highway, the court says that depends upon circumstances, a most important one in this case being that the defect was a result of the carrier's breach of duty. Where a duty is imposed by law to keep a highway in good condition, an action lies for injury sustained by reason of the neglect of that duty. That the fulfillment of the requirement to repair was to be measured by the satisfaction of the board of street and water commissioners, the court says, was immaterial, as was also a provision for the city's making repairs at the company's cost on default after notice. The failure of the board to act would not be proof that it was satisfied with the condition of the pavement, nor did the provision for notice imply that no repair need be made except upon notice.

## Repair Shops of the North Jersey Street Railway Co.

Describing Machines and Devices for Facilitating Repairs—Wire Cleaning and Coil Winding Machine—  
Device for Testing Armatures—Special Armature Pit Truck—Special Car Hoist—  
Complete List of Prices for All Street Car Repair Work.

We are indebted to the officials of the North Jersey Street Railway Co. for the privilege of inspecting the repair shops of the company at Newark, N. J., where practically all the repair and maintenance work on some 800 cars is done. Many of the records of the company have been placed at our disposal and we are able to present in this article statements of cost in detail of the various classes of equipment, together with other records, statistics and data, never before published to our knowledge.

The repair shops occupy a group of buildings with considerable yard space on the Plank Road near the center of Newark. The company is somewhat cramped for room, and this has necessitated the placing of the machine shop, armature department and storeroom on the second floor of the main building. To overcome this difficulty, electrically operated elevators are placed at convenient points and by means of the excellent shop methods employed, labor saving devices and good management, work is pushed through without interruption or delay.

All repairs to rolling stock, including painting and carpenter work, are under the supervision of Mr. F. F. Bodler, master mechanic. The shops are divided into five departments, namely, motor and truck department, armature department, machine shop, carpenter shop and paint shop. Each of these divisions has its own foreman, who reports directly to the master mechanic. The black-

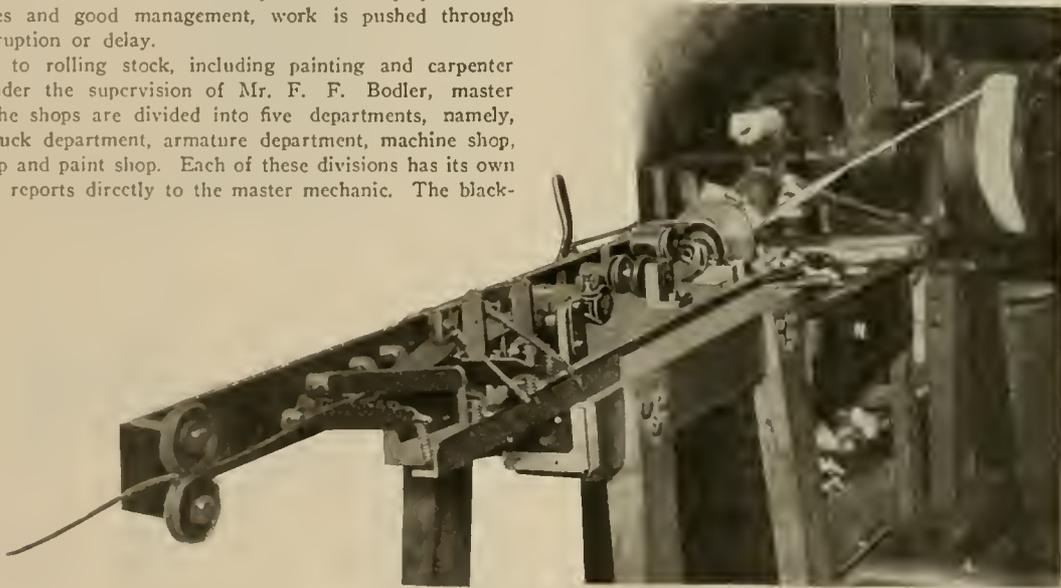

smith shop is under the foreman of the carpenter shop. In the motor repair department, in addition to the foreman, there are three inspectors, two assigned to house work and one to road work. It is the duty of this road inspector to take each car after it has been through the shops and give it a thorough running test on a spur track about a mile in length. He makes a final inspection of the controllers, switches, motors, wiring, etc., and he must give each car a clean bill of condition, as it were, before it goes back into service.

The company's system of keeping repair records is unique in many respects, and is exceedingly thorough and minute.

Much of the data desired from the master mechanic's department naturally centers about the car-mileage records. The mileage made by each car is entered in a large book ruled with columns about 1 1/2 in. wide. These columns are numbered consecutively at the top and the number for each car and the mileage figures are entered monthly from data furnished by the auditing department, the car-miles run being computed from the conductor's train sheets. From this car mileage book, all other mileage figures for separate portions of the equipment are made up. Every armature, all wheels, controllers, truck gears and pinions, registers and other parts are stamped with individual numbers, and by means of these numbers records are kept of the car on which each part of the equipment is running, together with the date it was placed in the car and the date it was taken off. The "miles run" for any part for any particular period are therefore easily determined by reference to the large book. Supplementing this, a separate book is kept for arma-

tures and also for car wheels, in which a complete history of each armature and wheel is entered, making it an easy matter to determine for instance, when an armature was purchased, what cars it has run in and the length of time, how often it has been in the shop, and what repairs have been made upon it.

The master mechanic keeps in close touch with the men under him, and with all work passing through the shops by means of daily reports from his department foremen. For instance, the foreman of the repair shop sends to the office before 10 o'clock in the morning of each day, a report covering the previous day, and giving the total number of men on duty, the total number of men off duty and the number of men on each class of work classified as painters, machinists, tinsmiths, register repairers, electricians, winders, etc.

MACHINE FOR CLEANING AND RETAPING WIRE.

He also gives a list by number, of the cars in his department for the day, the number of men that work on each car and the nature of the repairs. This enables the master mechanic to keep track of each car in the shop as the work progresses from day to day and if the work is taking too long in view of the repairs required, he is enabled to make inquiries and determine the cause of the delay.

Another report that greatly facilitates the work at the shops is one made by the motor shop foreman. This gives a list of crippled cars at the shop, the cars in the paint and carpenter shops and the crippled cars reported the previous day from each of the different divisions but not yet at the shop, and the crippled cars reported during the morning of the current day. The report is made on a blank 14 1/2 x 7 in. with 2 columns for each division of the system, one column for the car number and one for the cause of the disability. The foreman obtains this information by calling each morning by telephone the superintendent of each division and asking him what disabled cars are at the division barns and what cars will probably need repairs during the next day. It will be seen that this information enables the master mechanic to arrange his working forces, floor space, etc., in accordance with the work that may be expected for the following 24 hours. From this report he is enabled to give intelligent orders as to what cars shall be ordered into the shops and if his space is limited what cars may properly be continued in service for a few hours longer, or until he can provide for their reception at the repair shops. He is also in a position to engage help in advance and lay off men when necessary, thus distributing his forces to the best advantage. The value of this feature cannot

FORM 1- REPAIR CARD.

be over-estimated, although it is one that is very frequently neglected by street railway companies.

When a car comes into the shop for any repair work whatsoever, the shop foreman makes out a card similar to the form reproduced in Form 1. The face of this card shows the nature of the work to be done. The foreman then writes sub-orders upon the foremen of each of the other departments for the work to be done upon the parts coming under the several departments of the shop, whether armature, machine shop, carpenter shop, etc. The sub-orders are made upon cards exactly similar to the one reproduced in Form 1, but of different color. After each class of work is completed, the foreman enters in the column at the right, under "Amount" the cost for labor on each job. On the reverse side of the card he enters the quantity of material and the cost of same. All the cards for each job bear the same serial number. The cards are sent to the office where they are assembled by job numbers, and the complete set of five cards (one for each department) gives the history of each job, including the amount paid for labor, and the amount for material. After entry in the proper book, each set of

the cards is filed in a cardboard filing case, about 9x4 1/2 in. x 1 in. thick. These boxes are set on edge in filing cases, and each one bears a separate car number. The box for each car therefore contains a record of all the repairs that have been made on that particular car.

The column headings of the book in which entries are made from the shop cards are shown in Form 2. As will be seen repairs are divided into electrical maintenance, maintenance of trucks and maintenance of bodies, with sub-headings for each of the various parts of the equipment.

In one of the tables accompanying is given the cost of repairs for two years on all cars of the North Jersey system. The equipment is divided into classes according to the type of motors, trucks and bodies. It will be understood in examining these records that the combination of trucks, electrical equipment and length of body will have considerable influence upon the cost of repairs. For instance, certain types of motors are better fitted for service with certain types of trucks, and so on. The number of the class indicates to some extent the relative age of the equipment and it is interesting to trace the influence of age upon the cost of maintenance.

These shops are somewhat unusual in that all repair work is done upon the piece work system and the foremen are practically the only employes of the shop who have a fixed salary. This piece system has given results satisfactory alike to the company and the men, as the employe finds that he makes more per week in the aggregate, and the company finds that it is able to accomplish more work with the same force of men than would be the case if the men worked on stipulated wages. The company also finds it possible to hold the men more thoroughly responsible for their work as when they are working on their own time they are required to remedy defects on their jobs due to carelessness or poor workmanship. For the information of officials who are consid-

ering the advantages of the piece system, we give in this article a detailed schedule of prices paid by the North Jersey Company for all classes of car repair work. This schedule will also contain information of interest for comparison purposes to companies that hire their men at stipulated rates per day or per hour. In Form 3 is given the time card, which is made out by the men for each job that they do. These cards are approved by the foreman, and from them are made out the weekly payrolls. The paymaster vis-

ARMATURE TESTING DEVICE.

its the shop once a week and each man is required to sign his name on the payroll as receipt for wages paid him.

APPARATUS AND METHODS FOR TESTING.

The shops are equipped with a number of novel testing devices, both for insuring good work and also for securing data from which to determine the comparative merits of various supplies brought to the attention of the company.

A testing device for determining the condition of the armatures is illustrated. Briefly this consists of a magnetic core, formed of segments of sheet iron or steel, having wound about its center a coil consisting of about 1,200 turns of No. 19 B & S double covered cotton wire. The face of the laminated core is curved to fit roughly the contour of the armature. As shown, the core is mounted on a frame with screw attachment giving it considerable range of motion. The device is for locating short circuited coils in the armature and employ what has been termed the alternating-current method. That is, an alternating current of about 250 volts with a frequency of 60 is passed through the coil making a strong magnet of the laminated core. When the face of this core is brought in close proximity to an armature, an induced current will be caused in any coil or set of coils that may form a closed circuit. By slowly revolving the armature in this magnetic field the defective coils may be readily determined by holding a small strip of iron just above the surface of the armature. When the short circuited coil passes beneath the iron strip, the induced current will cause the iron piece to vibrate rapidly in synchronism with the alternations of the current.

The current for the testing apparatus is secured from an old S.

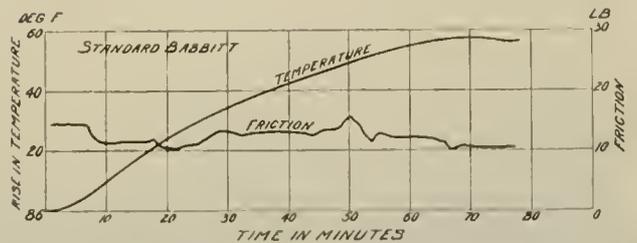

R. G. 30 direct-current motor rewound to act as a converter giving from its alternating current side, as stated, a 250-volt alternating current. Close to this motor are placed two small transformers with which it is possible to secure a 1,700-volt current for making ground tests. The iron frame carrying the magnetic core described is mounted on wheels and can be moved to any bench or lathe in the shop as desired. The upright rods upon which the core slides are of brass for the reason that brass will not conduct the magnetic lines of force and these are therefore concentrated on the core. The wires carrying the alternating current are suspended from the ceiling and have leads off at frequent intervals connecting to the machine by means of an ordinary lamp socket. Armatures are tested with this apparatus after winding, after soldering and after the commutator bars have been turned down.

The armatures are also put through a running test in which they are mounted by pairs in motor cases and made to run, one as a motor and the other as a generator for about 20 minutes. The connections are then reversed at the switchboard so that the relation between the machines is changed, the motor then running as the dynamo and vice versa.

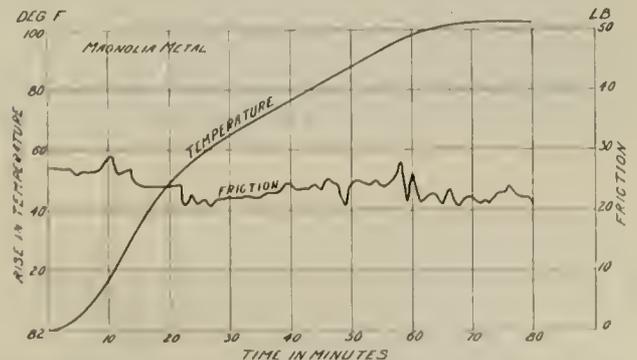

TESTS OF BABBITT METAL.

Mr. Bodler some time ago carried out a very interesting series of tests on babbitt bearings made from different compositions. For carrying on these experiments the bearing to be tested was mounted on a shaft and by means of levers similar to a "walking beam" weighing machine, about 300 lb. pressure was brought against each half of the lower side of the bearing. The relative frictional properties of the different metals was determined by the weight it was necessary to add to one of the levers in order to preserve an equilibrium between the two 300 lb. weights when the shaft was rotated. It will be understood this is not an accurate determination of the co-efficient of friction of the metals, but it is a fairly accurate comparative test of the frictional properties. The rise in temperature was determined by pressing the bulb of a thermometer on to the bearing metal through a small hole in the shell. Three of the curves secured are illustrated herewith. The curve for "Standard" babbitt is taken from the metal now used exclusively by the company for all armature and motor bearings. This metal is made from the following formula:

- Tin .....80 per cent.
- Antimony .....15 per cent.
- Copper .....4½ per cent.
- Lead .....½ per cent.

Hegerty summer motor grease. Copper feeder. Grease cup freshly filled. "Standard" Babbitt 2½-in. bearing. Load, 600 lb. Av. speed 524 r. p. m. Temperature at start 86° F.

Grease cup freshly filled (same as with "Standard"). Magnolia metal 2½-in. bearing. Load, 600 lb. Av. speed 524 r. p. m. Temperature at start 82° F.

TESTS OF BEARING METALS.

G. E. Babbitt. Load 600 lb. Av. speed, 520 r. p. m. Temperature at start, 53° F. TEST OF BEARING METAL.

Babbitt bearings are cast in iron moulds, it of course being necessary to have a different mould for each type of motor in service. After pouring the bearings are bored in a small lathe. The experiment is being tried of boring the bearings just a trifle off center, thus securing a greater thickness of babbitt in the lower half of the bearing where the greatest wear takes place. Shells so treated have not been in service long enough to determine the success of the idea, but no trouble is anticipated and it is believed the bearings will run a greater mileage without repouring. The oil grooves are cut with a pneumatic gouging tool.

WHEELS AND WHEEL RECORDS.

The North Jersey company has been giving especial attention to the subject of wheels in response to the demand made by certain "public improvement" officials of Newark, who have succeeded in having an ordinance passed fining the Street Railway Co. \$50 per car for each day it permits the car to run with a flat wheel. The effort of these guardians of the public welfare to abolish the flat wheel would be amusing if the matter were not so serious, and we could suggest no better method of convincing them of the difficulties in the way of solving this flat wheel problem than to invite them to take charge of a street railway repair shop for about a week. However, it is the desire of the company to do all in its power to improve its service and to this end very careful wheel records are being kept and the subject of proper dimensions and compositions for wheels, the advantages of grinding wheels and other matters in this connection have been carefully considered.

The company is now using three types of wheels: a 400-lb. New York Car Wheel Works chilled wheel with 2¼ tread and ¾ in. flange; a 7-spoke cast steel wheel, and the St. Louis Car Wheel Co's. re-enforced spoke wheel.

We append some of the wheel records:

From Jan. 3, 1901, to Jan. 1, 1902, 1,764 chilled iron wheels were shipped back to the makers for cause. These made an aggregate

or broken tread, 1 had loose spoke and 2 had cracked hub. Several of these wheels made individual records of over 80,000 miles.

The wheel shop is equipped with 1 wheel press, 1 boring machine, a Springfield wheel grinder, 1 lathe, 1 keyseating machine and 1 axle straightener. It is customary to regrind wheels whenever it

ARMATURE PIT JACK.

is thought the prolonged life so gained will justify the trouble involved.

CAR HOIST.

There has been in use at these shops for some time a hoist for raising car bodies for the purpose of removing wheels and trucks. Recently plans have been prepared for an improved form of this hoist and these plans appear in this article. With the aid of these drawings it will be seen that the device consists of a frame suspended from the ceiling girders over the car pits. The frame

WHEEL PLATFORMS.

of 63,982,731 miles or an average of 36,271 miles per wheel. Of the wheels making the highest individual records, one wheel made 92,346 miles and was removed as practically worn out; one made 91,669 miles, worn out; one made 91,688 miles and was removed on account of cracked hub; one made 90,143 miles and was removed on account of double flange.

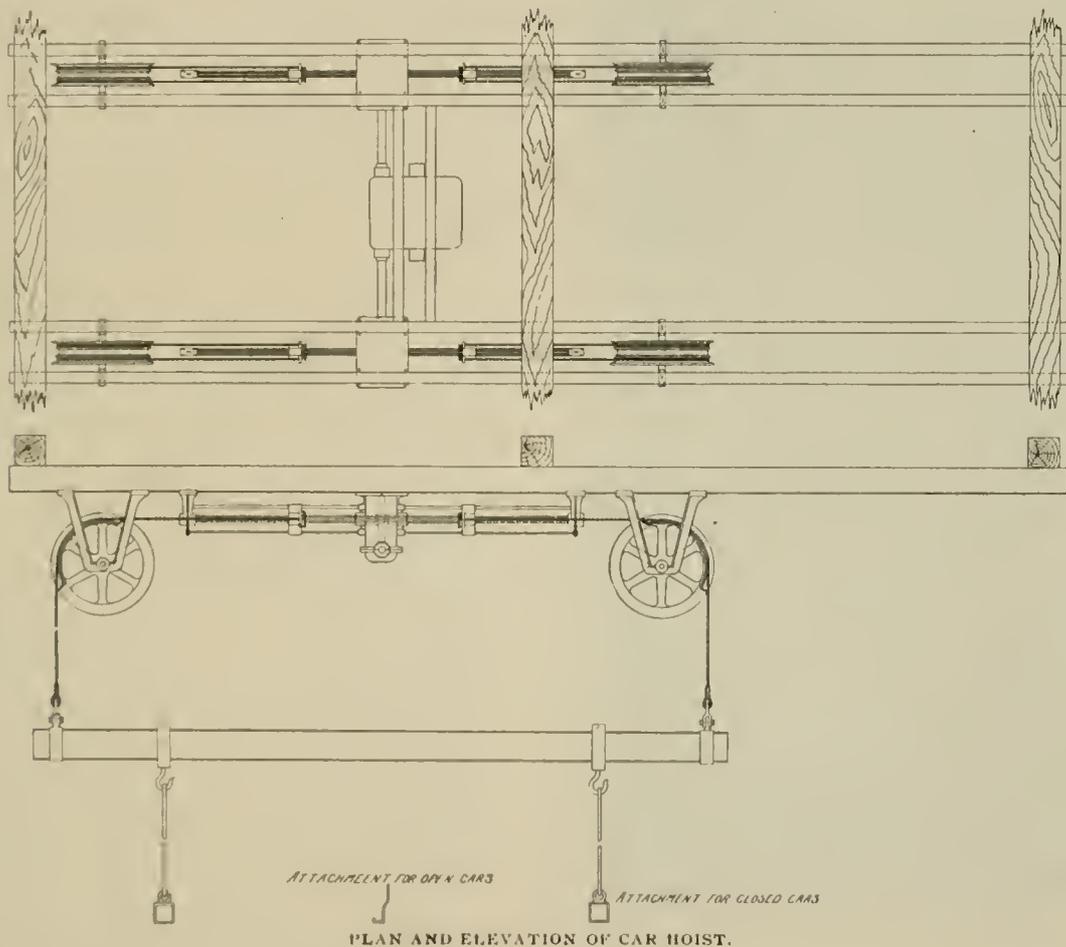

Of 143 steel wheels removed for causes, 1 was broken, 14 were small diameter, 32 had thin flange, 46 developed blow holes, 24 had double flange, 4 had broken flange, 1 had soft spot, 18 had cracked

work consists of four 12-in. I-beams about 25 ft. long and the two inside beams spaced far enough apart to clear widest car body. At the center of these are cross I-beams supporting the direct current railway motor, which drives a shaft about 11 ft. long by 3 in. in diameter. The two ends of this shaft are provided, one with right hand worm and the other with left hand worm, these worms being 5½ in. in diameter by 1½ in. pitch. These worms engage the worm wheels which are about 18 in. in diameter, 2½ in. face and 1½ in. pitch keyed to the shaft as shown in sketch. Running from each

worm wheel is a screw shaft 13 ft. long and 3 in. in diameter, cut with right hand thread at one side of the wheel and left hand thread on the other, the outer ends of these shafts being carried in bearings suspended from the main I-beams by special castings. Travelling upon the screw shafts are special carriers provided with nuts which engage the threads of the screws. These carriers slide upon stationary guide rods and to them are attached the ends of the hoist ropes. The rope used is a  $\frac{5}{8}$  in. wire rope and about 215 ft. are required for the hoist. The rope passes over sheaves of 36 in. pitch diameter built to support a weight of 5 tons. At the lower ends of the rope are attached 10-in. I-beams and to these I-beams in turn are fastened the attachment for engaging the car body. When raising closed cars it is customary to place beams or sections of T-rails under the body at each end and these rails are carried in small square castings suspended as shown. For open cars the cross

are held against the wire by helical springs attached to the outer ends.

After leaving the scrapers the wire passes through a series of tension wheels mounted on the frame and which serve to straighten out the kinks in the wire as well as aiding in the cleaning process. After passing under the last tension wheel the wire leaves the machine through the center of a flat disk which carries near its outer edge a frame for receiving the roll of new tape. This disk is driven by a small belt from the shaft of one of the tension wheels and as the wire travels forward the disk revolves carrying with it the roll of tape and in this manner tapes the cleaned wire as it passes to the new field coil. The new core or field frame is mounted on a revolving shaft and draws the wire through the machine on to itself, the whole operation requiring the services of but one man to guide the wire on to the new coil and insure even winding. At

pieces are not required, and hooks are used which engage the lower edge of the main car sills.

Current for the motor is taken from the line current and is controlled by a rheostat box or controller on the car barn floor. The worm gearing gives a very powerful quick acting hoist. The whole arrangement, including everything except the motor, will cost, if built by an outside contractor, about \$1,000, but could probably be built in the company's own shops for considerably less than this, especially if timbers were substituted for the I-beams.

WIRE CLEANING AND RETAPING DEVICE.

The wire in burnt out or otherwise defective field coils is utilized by the aid of a machine which automatically takes the wire from the old field, scrapes off all the old insulation, retapes it with new insulating tape, and feeds it directly onto a new field.

The machine is mounted on a rigid stand. The wire as it leaves the old field first passes between two guide wheels and then comes in contact with a series of nine scraping knives set at different angles to insure that the old insulation will be broken off all the way around the wire. These scrapers are hinged at one end and

two points in its passage through the cleaning device the wire enters sleeves of felt which effectively remove any particles of insulation or dust that may escape the knives or tension wheels.

The tape used is a special make having an adhesive coating on one side.

A machine for doing about this same kind of work has been in use in Detroit and was described and illustrated in the "Review" for Mar. 15, 1900, page 175. The device at the Newark shops is believed to have fewer moving parts, requires less hand adjustment, and the scrapers come in contact with the wire at a greater number of points than in the Detroit machine.

HANDLING ARMATURES.

The shops are equipped with several pneumatic hoists running on overhead tracks which are found of great assistance in moving armatures from place to place about the rooms.

For removing armatures from under cars the master mechanic has devised a lifting contrivance for use in the pits. A regulation Barrett lifting jack, made by the Duff Manufacturing Co., of Pittsburg, Pa., was fitted with an elongated rack bar to give longer

range of action. The rack is mounted upon an iron pedestal as shown in one of the illustrations, and this pedestal is bolted to the platform of a low truck.

The upper end of the rack bar carries a cradle to receive the armature, comprising a frame supporting two rollers made of steel pipe upon which the armature rests.

DIPPING FIELD COILS

The scheme for dipping field coils is ingenious and effective and will be understood from one of the engravings. A short section of

ARRANGEMENT FOR DIPPING FIELD COILS.

single track is suspended from the ceiling and on this are placed a number of small trolleys having hooks at their lower ends. Passing up over the top of the track runs a rope one end of which winds upon a spindle, the other end carrying a large hook. The procedure is to hang the coil to be dipped upon this large hook. Then by means of the spindle and crank the field coil is lowered into the tank of insulating compound. When sufficiently covered with the compound the field is raised and transferred to one of the trolley hooks, where it is allowed to hang and air dry for a short time. A tin trough placed under the row of coils catches all excess of insulation that may drip from the fields and leads it back into the tank.

PRICES PAID FOR PIECE WORK AT REPAIR SHOPS OF NORTH JERSEY STREET RAILWAY CO.

CONTROLLERS.

General overhauling including replacing cylinder-wipers, spring caps, covers and handles, blowing and inspection of controllers,

canopy switches, fuse boxes and cut out box, \$35, for either Westinghouse or General Electric make.

Exchanging various parts, paid for according to regular schedule—ranging from \$.01 for changing a contact finger to \$.30 for changing cylinder.

- Assembling G. E. K. 10 controller \$2.40 each
- Winding and taping spark coil, complete, \$.60 each.
- Putting contact points on G. E. reverse cylinder \$.20 each.
- Wiring K. 10 connection boards, \$.90 each.
- Stripping and covering G. E. spark coils \$1 to each.

The Mahoning Valley Railway Co., Youngstown, O., on February 15th opened a new extension of its lines to New Castle, Pa., the first trip being made by President Miles, of Cleveland, Manager A. A. Anderson and a party of guests. The company now has a continuous route from Warren by way of Youngstown to New Castle, a distance of 32 miles, and expects soon to extend the route to Leavittsburg.

### BROOKLYN COMPANY MAY MANAGE ITS OWN AFFAIRS.

An important decision as to the rights of a street railway company to determine for itself the routes and time-tables for the operation of its cars has been rendered by the Appellate Division of the Supreme Court of New York, Second Judicial Department. The title of the case is *People, on the relation of Linton, versus Brooklyn Heights R. R.*

An alternative writ of mandamus having been granted at the instance of Linton, the jury found that "public necessity or convenience require that the defendant operate its elevated road system from and between the termini at Brooklyn Bridge and Broadway Ferry and the terminus at Cypress Hills in the manner the same was operated prior to Apr. 1, 1900," and an order of court in conformity with this finding having been issued it was for the Appellate Division to determine whether there was a specific legal duty on the Brooklyn Heights Railroad Co. to operate its road in the manner prevailing prior to Apr. 1, 1900.

It is well settled that a writ of mandamus to compel a railroad to do a particular act in operating its road can only issue when there is a specific legal duty on its part to act and a breach of that duty; and if no such duty has been imposed by common law or statute it is not within the province of the courts to direct in what manner a quasi-public corporation shall serve the public. Such direction is the province of the legislature, and is always the proper subject for legislative consideration unless prevented by some charter contracts. With these propositions, and the fact that the court is not clothed with legislative power in mind, the court proceeded to consider some of the provisions of law in relation to corporations of this character.

It is found that subject to the limitations of the railroad law to run its cars at regular times, to be fixed by public notice, and to furnish sufficient accommodation for all intending passengers presenting themselves at the starting point, railroad junctions or regular stopping places, and to take, transport and discharge such passengers at, from and to, such places on the due payment of fare legally authorized, the legislature has specially delegated the power to regulate the time and manner in which passengers and property shall be transported.

The case of *Commonwealth v. Fitchburg R. R. Co.* (12 Gray 180) was cited with approval where it is said "the power to judge of what is necessary or reasonable in the premises is, except in those cases where the legislature has expressly intervened, in the first instance in the corporation. \* \* \* It would seem to be therefore not only its right but its duty to exercise a sound discretion in the use of its capital, lest by exhausting it in running trains that were not required by the public wants, it should deprive itself of the means of running at reasonable rates those that were. \* \* \* We cannot see that a beginning to run these trains rendered their continuance, at whatever cost or sacrifice, a legal duty. It might be more plausibly said that it was the duty of the corporation to make the trial of running regular trains for passengers and freight. \* \* \* but when the trial had been fairly made and had proved disastrous, the duty would have been discharged."

The court says in part:

"Taking the facts to be as stated by the relator, he has been a resident of the 26th ward of the borough of Brooklyn for thirty years. During that time elevated railways have been constructed in Brooklyn by the Brooklyn Elevated Railway Co., the Union Elevated Railroad Co. and the Sea Side & Brooklyn Bridge Railroad Co.

In February, 1899, the system of elevated roads in the borough of Brooklyn passed to the ownership and control of the Brooklyn Union Elevated Railroad Co., and on or about April 1, 1900, the Brooklyn Union Elevated Railroad Co. leased all of the said railroads belonging to the system, with all of the structures, etc., to the Brooklyn Heights Railroad Co., the appellant in this proceeding. At this time there were two distinct and continuous lines which had their termini at Cypress Hills. One started from the Brooklyn Bridge and ran through Fulton St. to East New York, thence to Cypress Hills; the other started at the Broadway Ferry, ran through Broadway to Crescent St. and through Crescent St. to Cypress Hills. On both of these lines a continuous service from terminus to terminus was maintained up to about Aug. 15, 1900, when the de-

endant inaugurated a new system. The old station at Manhattan Crossing was torn down or remodeled, and a new station, known as the loop, was erected in its stead, and the arrangement was such that the two lines of railroad were connected at this point, trains being enabled to pass from one road to the other. On Aug. 15, 1900, the Brooklyn Heights Railroad Co. discontinued the direct service between the Brooklyn Bridge and the Broadway Ferry with Cypress Hills on Sundays and holidays, and upon week days between the hours of 10 a. m. and 4 p. m. and between the hours of 8 p. m. and 5 a. m. That is, during the days and hours named the trains of the Brooklyn Heights Railroad Co. ran only from the bridge or the ferry to the loop, and returned thence to the place of starting, passengers for Cypress Hills being transferred, without extra cost, to the street surface cars of the company, which are operated directly underneath one of the elevated lines, and by this surface line carried to their destination. The distance from the loop to Cypress Hills is about two miles, the surface line is operated by electricity, and there is no allegation that the defendant has not provided a sufficient number of cars to carry the traffic in a reasonable manner, or that it has not operated such cars upon a published schedule and in a regular and orderly manner. The effect of this arrangement is that at a point where the old lines converged, and from which they were closely paralleled to the terminus at Cypress Hills, the Brooklyn Heights Railroad Co. operates but one line of elevated railroad instead of two, and that during certain hours of the day and night it does not operate its cars over this one line, but transfers its passengers to the street surface railroad without extra charge; and the question presented is whether this is such an abandonment of the road, or such a misuse of its franchise, as to warrant the court in directing that the defendant shall go back to the system prevailing prior to Apr. 1, 1900. We are clearly of the opinion that it is not. There is nothing in the Railroad Law which makes it the duty of the defendant to operate its trains over the entire system during all hours of the day and night, nor yet upon Sundays and legal holidays; it is specially given the power to regulate the time and manner in which passengers and property shall be transported (subdivision 8, sec. 4, Railroad Law), and it is not disputed that during the "rush" hours it does operate its trains between the Brooklyn Bridge and Cypress Hills, as well as between Broadway Ferry and the same point, upon regular schedules, while at all times it operates an electric car, with free transfers, to connect with the trains at the loop. It operates its entire system, between all of the terminal points, so far as we are able to discover, in entire good faith, and with a view to an economical management of the property, and as the legislature has delegated the power to determine when passengers and property shall be transported over all railroads to the corporations owning the same, we are unable to discover any proof in the court to order the defendant to do any differently than it is now doing."

It was held in *People v. R., W. & O. R. R.* (103 N. Y. 95, 109) that where a railroad owns by consolidation two lines of road, and can substantially accommodate the people of the state by operating one line between the same points, it should not be compelled by mandamus to operate both lines at a great sacrifice of money upon the fanciful idea that the sovereignty of the state is wounded by its omission to operate both lines.

The court further says in discussing the Linton case, "we are convinced that no interest of the public requires the economic waste incident to the operation of two closely paralleled railroads, where one is abundantly able to take care of all the traffic."

A careful examination of the authorities discovers no case in which the courts have, in the absence of a specific legal duty, undertaken to prescribe the manner in which a railroad shall be operated.

The order should be reversed with costs.

### TAPES AND WEBBINGS.

Companies that do their own coil taping and armature repairing will be glad to know that the Hope Webbing Co., of Providence, R. I., supplies tapes and webbings of any width, thickness or quality for this special class of work. The company has spent years in the making of fabrics needed in the construction and repair of motors and dynamos, and its plant is fitted with special machinery of its own design for turning out this class of goods. Samples and prices will be sent on application.

## CANADIAN NOTES.

During the recent session of the Quebec Legislature, the following bills have been passed, and the companies authorized to commence operations in that province: St. Francis Water Power Co., Matane & Gaspé Railway Co., North Shore Power Co. (Montreal), Levis County Railway Co. (A. Collyer, Montreal), Canadian Electric Light Co., Beauharnois Light, Heat & Power Co. (W. L. Morency, Montreal), Beauharnois Light, Heat & Power Co. (W. L. Morency, Montreal), Provincial Light, Heat and Power Co., Kamoutem Littoral Electric Co., Shawinigan Falls Terminal Railway Co. (J. E. Aldred, Montreal), Sorel Electric Co., Power Pulp & Paper Company of North America, St. Lawrence & Megantic Railway Co.

The Toronto Suburban Electric Railway Co. (controlled by the Toronto Railway Co.) has secured a franchise from the township authorities of Etobicoke, to extend the line to Summerville, with the right to carry freight and passengers. The work on this new extension will be put in hand early this summer.

Capitalists interested in the Toronto electric railways and lighting companies have formed a company to build a transmission line from Niagara Falls to Toronto. As soon as the power is available, the existing electric lines will be extended along the lake shore from Toronto to Hamilton, a distance of about forty miles. Mr. William Mackenzie, president of the Toronto Railway Co., and Mr. Pellate of the Electric Light Co., are the chief promoters.

A very peculiar accident happened recently in Toronto. A motor car with trailer attached, was turning the corner of one of the busiest thoroughfares at a fair rate of speed. The motorman, endeavoring to stop suddenly at the corner, caused the trailer to bump into the motor car with such force that the drawhead broke, and one piece weighing several pounds flying to the sidewalk, seriously injured a pedestrian.

The Toronto Street Railway Co.'s assessment on rolling stock, tracks, etc., has been compromised, the company agreeing to an assessment of \$450,000.

The promoters of the new Hamilton & Caledonia Railway Co. have agreed on the terms under which they will construct the road. Among other things they are to provide street lights for the lighting of the village of Caledonia. It is expected that the council will, under these circumstances, grant the franchise.

Mr. James Battle of Thorold, and Mr. William M. German, M. P., of Welland, have secured a charter for the Niagara District, Wellandport & Dunnville Electric Railway Co., with power to operate an electric line between Thorold and Dunnville. Work on the construction of this road will be put in hand this summer.

Permission has been granted by the legislature to the Middlesex & Interurban Railway Co. to construct an electric line between Aylmer, St. Thomas and London.

The St. Thomas Street Railway Co. has been refused permission to extend its lines.

A franchise has been granted the Huron, Bruce & Grey Electric Railway Co. with permission to construct an electric line in the townships of Huron, Grey and Bruce.

The Paris Electric Railway Co. will commence construction of its proposed lines without delay. The line from Paris to Galt will also be built. Dr. Ickes of the Woodstock & Ingersoll Electric Railway Co., is the prime mover in this project.

The Sandwich, Windsor & Amherstburg Electric Railway Co. has secured privilege from this government to increase its bond issue by \$350,000, the money to be used in constructing the uncompleted portion of its road. Fifteen miles of road is to be built, the legislature stipulating that it must be completed this summer, or the charter will be revoked.

Power has been granted the Essex & Kent Radial Railway Co. to issue bonds to the amount of \$25,000 per mile for the purpose of building an electric railway from Windsor to Wheatley, and from Essex to Chatham, with the understanding that construction work will be commenced not later than May 1st.

Mr. T. A. Nelles of Hamilton is negotiating with the city council of Windsor for a franchise for the Windsor, Essex & Lake Shore Ry. Mr. J. W. Burke of New York, the owner of the Sherbrooke, Que. Electric Railway, is interested in this project.

The South Western Traction Co., of London, has been granted a franchise by the Ontario Legislature for the purpose of operating an electric railway in that vicinity.

Mr. Conmee, M. P., of Port Arthur, has secured a franchise for the construction of an electric railway from Wabigoon to the west end of Lac Seul, in the Rainy River District.

A franchise has been granted to the Huronian Mining Co. for the construction of an electric railway connecting the mines with the Canadian Pacific and other railways, within a radius of one hundred miles from the company's mines. The franchise also grants power for the construction of telegraph and telephone lines. The postmaster of Copper Cliff, Nipissing, Ont., has the matter of construction in charge.

A company is being formed at Rat Portage, Ont., to build an electric railway from the town of Rat Portage to English River, a distance of 40 miles.

A company is being formed at Winnipeg for the purpose of building an electric railway from the city of Winnipeg to Lac Bonnel, a distance of 58 miles. Mr. H. Burkholder of Chicago is the prime mover, and has just completed the survey, and estimates for the construction.

Permission has been granted for the construction of an electric railway between Winnipeg and Headingly, Man. The promoters have secured right of way from the various municipalities, and the line will be constructed this year as far as Sturgeon Creek.

The Velvet Mines, of Rossland, B. C., have applied for a charter to construct and operate an electric road from Rossland to connect with the Red Mountain railroad, a distance of 30 miles.

Mayor McGaw of Vernon, B. C., is promoting an electric railway between the towns of Lumby and Vernon, a distance of 16 miles.

The Dominion Statistics for the year ending June 1, 1901, show the following particulars regarding the electric railway companies operated in Canada: Miles of track operated, 675; capital invested, \$39,076,019; gross earnings, \$5,768,283; gross expenses, \$3,435,163; net revenue, \$2,333,120.

## STERLING-MEAKER CO. AT NEWARK.

For several months the Sterling-Meaker Co. of New York City, has been looking for a factory site where increased space could be had with quick shipping facilities and all the requirements for growing and economical manufacture. A site was finally chosen on Ogdan St., Newark, N. J., close to the Lackawanna R. R. and on the Passaic River. The Pennsylvania, Erie, Lehigh Valley and Jersey Central roads are conveniently near, while two steamboat express lines connect daily with all points in New York.

A four-story brick factory, 47 x 145 ft., is being erected on the site and fitted up for the needs of the company, which will occupy the building on May 1st and be prepared by its enlarged and improved facilities to handle its growing business more promptly than heretofore. The city of Newark possesses many advantages and is rapidly becoming a great center of industrial and financial activities.

The Sterling-Meaker Co. makes the Sterling safety brake, six types of fare registers, the Sterling sand box and fender and the Earll trolley retriever.

## IMPROVEMENTS IN FLOOD EMERGENCY BRAKE.

Mr. Patrick Flood, of Albany, N. Y., inventor and maker of the Flood emergency brake, which was described in the "Review" for last February, has brought out a new form of track shoe to be used with his braking device. The shoe is intended for roads having very steep grades or where quick stops are wanted and comprises a body of soft metal having in its face an insert of carborundum. There has also been added to the track shoe a lug along the side which will prevent possible derailment of the car when the brake is applied.

Mr. Flood states he has received several inquiries in relation to his device one of them from Paris, France.

The Baton Rouge (La.) Electric & Gas Co. has opened a new pleasure park on its street railway line in the outskirts of the city. One hundred and twenty trees of several varieties have been transplanted to this resort by a new method and are promising well. A music pavilion, baseball grounds and other attractions will be added.

## PERSONAL.

MR. GEORGE J. KUHETS has been appointed chief engineer of the Los Angeles Railway Co., vice F. W. Skinner, deceased.

MR. GEORGE A. STANLEY has been appointed purchasing agent of the Cleveland Electric Railway Co., succeeding Mr. C. W. Wason.

MR. GORDON CAMPBELL, master mechanic of the Washington (D. C.) Traction & Electric Co., will add the duties of purchasing agent to those of his other position.

MR. A. G. MAISH, formerly secretary of the Des Moines (Ia.) City Railway Co., has been appointed superintendent, succeeding Mr. W. G. Owens, who has resigned to engage in stock raising.

MR. A. E. DAVIES, formerly superintendent of the Chicago Electric Traction Co., has been appointed general manager to succeed Mr. E. R. Gilbert; the appointment is effective April 15th.

MR. J. F. DUSMAN, who was recently elected general manager of the York County Traction Co. and of the Edison and Westinghouse lighting companies of York, Pa., was born in York county, near Hanover, in 1865. His connection with electrical work began in 1891 when he secured a position in the shops of the Baxter

Motor Works, of Baltimore; later he was with the Ries Electrical Specialty Co., of that city.

At this time the electric railways in and around Baltimore were being opened, and men experienced in repair work were in demand. Leaving the Ries company, Mr. Dusman was employed by the General Electric Co. to take charge of the repairing of the railway equipments during the trial period. His duties also included the direction of the same line of work at Washington.

While in this position Mr. Dusman had his headquarters at the Lake Roland Railroad Co.'s

shops. He remained nearly two years at the Lake Roland shops, at first as electric repairman, later as general foreman of all repairs, until the sale of the road to the City & Suburban Railway Co., of Baltimore. Feb. 1st, 1895, Mr. Dusman was re-engaged by the General Electric Co. to assist in installing the plant and equipment for operating the Baltimore Belt Line Tunnel. The work was completed in about six months, and he remained with the company for four years, first as operator of the power house, later as foreman of the electrical department of the company. Aug. 1, 1899, Mr. Dusman became general foreman for the United Electric Light & Power Co., of Baltimore. March, 1901, he became the general manager of the Edison and Westinghouse Electric Light Co., of York, and on February 10th last the management of the York County Traction company was given to him in addition.

MR. GEORGE R. SIKES, of Buffalo, N. Y., has been appointed chief engineer of the Buffalo-Rochester extensions of the Williams-ville Electric Ry. Mr. Sikes' office is at 895-897 Ellicott Square, Buffalo.

MR. ANTHONY N. BRADY has been elected a director of the Sea Beach R. R., one of the lines operated by the Brooklyn Rapid Transit Co., filling the vacancy in the board created by the death last fall of Major John D. Keiley.

MR. E. R. GILBERT, who for several years has been general manager of the Chicago Electric Traction Co., popularly known perhaps as the "storage battery road" until the overhead trolley was substituted in 1900, has been appointed general manager of the Miami & Erie Canal Transportation Co. with headquarters in Cincinnati, the appointment taking effect April 16th. The Miami & Erie company expects to have its electric line in operation along

the bank of the Miami & Erie Canal from Cincinnati to Dayton by July 1, 1902, and contemplates an extension across the state to Toledo.

MR. E. C. FOLSOM, of Indianapolis, has been appointed manager of the Indianapolis & Logansport Traction Co., and will have charge of the extensive improvements which the owners of the interurban road contemplate making this spring.

MR. THOMAS FITZGERALD, JR., has tendered his resignation as manager of the Fairmont (W. Va.) & Clarksburg Street Railway Co., to accept a position as general manager of the Norfolk & Newport News Railway Co. of Norfolk, Va.

MR. J. C. WHITRIDGE, who for the past five years has been associate editor of the Railroad Gazette, on April 1st resigned that position and is now in the engineering department of the Buckeye Malleable Iron & Coupler Co., of Columbus, O.

MR. A. E. W. WELCH will be secretary and treasurer of the South Western Traction Co., which projects a system of electric lines radiating from London, Ont., to Ingersoll, Glencoe and Strathroy. Mr. Welch's office will be in the Masonic Temple, London.

MR. BAILEY WHIPPLE, recently connected with the Buckeye and Jandus Electric companies, of Cleveland, O., is now associated with the Sawyer-Man Electric Co., with headquarters at the general offices and works of the company, West 23d St., New York City.

MR. F. N. BAYLIES, who was formerly connected with the Metropolitan Elevated Railway Co., Chicago, has been appointed superintendent of the Rockford Railroad, Light & Power Co., and the Rockford & Belvedere Railway Co. The appointment took effect March 15th.

MR. E. KESSLER, who has been general manager of the Richmond (Ind.) Traction Co. and superintendent of the Richmond Street & Interurban Railway Co. for the last nine years, tendered his resignation to take effect April 1st, and will engage in the banking business at Milton, Ind.

MR. MARTIN KNAPP has resigned as general superintendent of the Wheeling (W. Va.) Traction Co. to accept a position as superintendent of construction with the Penn State Construction Co., of Philadelphia, which at present has a line under construction from Cumberland, Md., to Westernport.

MR. JOHN W. ALVORD has his office at 127 Hartford Building, Chicago, where he will continue his consulting practice in matters pertaining to water powers, water supplies and appraisements, sewerage, sewerage purification, and financial examinations and reports. By mutual consent the engineering firm of Alvord & Shields, sanitary and hydraulic engineers, was recently dissolved.

MR. AUGUSTUS M. MOORE has been appointed chief engineer of the Georgia Railway & Electric Co., which was recently organized to effect the consolidation of the street railway systems in Atlanta. Mr. Moore was formerly master mechanic of the Atlanta Rapid Transit Co. In his new position he succeeds Mr. Thomas Elliott, who resigned to accept a position with the Pittsburg, McKeesport & Connellville Street Ry.

MR. W. P. COOKE, chairman of the Port Arthur Electric Street Ry., has been identified with the rapid growth of that city since he first made it his residence in 1873. He has almost continuously served in the council, and has held several offices of public trust. The first telephones to be installed in Canada outside of Brantford were put in by Mr. Cooke in 1877; he also opened the pioneer office of the Canadian Pacific telegraph, and was the projector of the first street railway in Port Arthur.

MR. ALBERT E. McREEL has resigned as manager and superintendent of the Exeter (N. H.), Hampton & Amesbury Street Railway Co., a position which he has held for five years, and will remove his residence from Exeter to Boston. Mr. McReel was for the 10 years prior to his coming to Exeter engaged in the electrical

J. F. DUSMAN.

business at Athol, Mass. The assistant superintendent, Mr. Everett P. Weeks, will assume the management of the Exeter, Hampton & Amesbury road until Mr. McReel's successor shall be appointed.

MR. WALTER J. BRADY has been appointed superintendent of the Hudson County division of the North Jersey Street Railway Co., Jersey City, succeeding the late William W. MacCormack, who died last month. Mr. Brady was born in Jersey City 40 years ago, and has been in the service of the North Jersey company or its predecessors for 19 consecutive years, first as conductor, later in the capacities of starter, claim agent, and chief clerk in the division superintendent's office. In his new position Mr. Brady will have charge of all the company's lines in Hudson County.

MR. LOUIS MILTON ZAPP, a senior of Purdue University, is engaged in the performance of important tests which are being made by the Union Traction Company of Indiana with a view to determine the commercial efficiency of its system under ordinary operative conditions. The part of the work which has been entrusted to Mr. Zapp comprises tests to determine the essential factors in the rating and operating of the motor equipment. Mr. Zapp is a graduate of the Louisville (Ky.) Manual Training High School and will soon be graduated from Purdue with an enviable record.

MR. H. A. NICHOLL has resigned as superintendent of power of the Rochester Railway Co., to become assistant manager and treasurer of the Ithaca Street Railway Co., the Brush-Swan Electric Light Co. and the Cayuga Lake Railway Co., all of Ithaca, N. Y., and all operated under one management. Mr. Nicholl was formerly superintendent of construction of the Rochester & Sodus Bay Ry. and has held positions with electric railway companies in Chattanooga and other cities of the south, beside which he has had an extended experience in connection with the operating department of steam railroads.

MR. F. L. DAME has been chosen general manager of the Union Railway Co., of Dubuque, Ia., succeeding Mr. W. J. Brown, resigned. Mr. Dame assumed charge April 1st. Mr. Dame in 1890 was the engineer of the Portland, Ore., office of the Westinghouse company, and afterwards was with the Thomson-Houston and General Electric companies. From 1896 until Mar. 1, 1901, he was general superintendent of the Tacoma Railway & Power Co.; from that date till his appointment as general manager at Dubuque Mr. Dame was in charge of improvement work and the operation of the railway department of the company.

MR. JOHN DALY has been superintendent of the Yonkers (N. Y.) Railroad Co. for seven months. The Yonkers system, as stated elsewhere in this issue, is an extremely difficult one to operate, owing to the many grades and sharp curves, but thus far Mr. Daly has not had a single accident. He has been with this system for nearly ten years, first as line foreman, then as assistant superintendent and recently as superintendent. Mr. Daly has had a very substantial experience in both track and overhead work, having worked for some time with the Metropolitan Telephone Co. in the line department and with the West Shore R. R. in track work.

MR. J. L. MATSON, until of late assistant master mechanic of the Union Traction Company of Indiana, has been appointed general master mechanic, which office was recently vacated by Mr. J. S. Hamlin. Mr. Matson has had a varied experience in steam and electric railways, dating back as far as the early eighties, he having served his apprenticeship in the Chicago shops of the Illinois Central Railroad Co. He also served several years in an official capacity with the South Side Elevated Railway Co., Chicago, helping in 1896 to change the entire equipment from steam to electricity. He remained with the latter company until June 1, 1901, when he resigned to become Asst. Master Mechanic of the Union Traction Co.

MR. S. J. DILL, who for the past five years has been connected with the operating department of the Metropolitan Street Railway Co., of New York City, in the capacity of superintendent of the Forty-second Street, Manhattanville & St. Nicholas Avenue division, has resigned his position to accept that of assistant general manager of the Detroit, Ypsilanti, Ann Arbor & Jackson Railway

Co. Mr. Dill has always held a high place in the esteem of his employes and business associates, who heard with regret of his intended departure. In leaving New York he takes with him the best wishes of many friends both in the business and social worlds. A farewell reception was given Mr. Dill on the evening of March 12th, at which time his friends presented him with a fitting token of their regard for his business principles and good fellowship.

## OBITUARY.

MR. R. R. SWEPSON, who had owned the street railway system in Richmond, Va., during the civil war, died at Knoxville, Tenn., March 23d, aged 77. Mr. Swepson was a native of Virginia.

MRS. JOHN I. BEGGS, wife of the president of the Milwaukee Electric Railway & Light Co., died on March 13th at the family home in Harrisburg, Pa. Mrs. Beggs had but a short time previous returned from Europe, where she had traveled for the last five years in the hope of regaining her health.

MR. WILLIAM L. ELKINS, JR., a son of Mr. Elkins of the Widener-Elkins syndicate, died March 13th at his country home near Philadelphia, from a cerebro-spinal trouble with which he had been afflicted since last October. The deceased was president of the Pennsylvania Iron Works Co.; the Otto Coke & Chemical Co.; the Pittsburg Gas & Coke Co.; the United Coke & Gas Co.; the Hygeia Hide & Cold Storage Co.; the McKeesport Gas Improvement Co., and the New England Gas & Coke Co., and a director in the Allis-Chalmers Co. He was also a member of numerous clubs and fraternal organizations. He was 38 years old.

## NEW PUBLICATIONS.

ENGINEERING PRACTICE AND THEORY FOR STEAM ENGINEERS, by W. H. Wakeman, New Haven, Conn., cloth, 180 pages, published by the author. The second edition of 1,000 copies of this book has just been published. It is written for the benefit of engineers in charge of steam plants who wish to improve their knowledge of engineering in order to pass examinations where a license is required. It is divided into 18 chapters devoted to the study of the various apparatus and machinery in use in steam plants and it is written in a simple style entirely within the scope of the average engineer. All the calculations in this volume are simple arithmetical ones, the use of higher mathematics being entirely avoided. The book is supplemented by a number of questions divided into groups, each group pertaining to a certain chapter, which the reader or student is supposed to answer after mastering the contents of each chapter. It also contains a well arranged alphabetical index of subjects. The contents of this book are too elementary to be of service to a technical student, but it contains considerable useful information for men engaged in the practical operation of a steam plant.

SPECIFICATIONS FOR ELECTRIC RAILWAY BRIDGES, by C. S. Davis, 48 pages, paper, published by the author, Toledo, O., price 50 cents. This work, which will prove a valuable aid to street railway engineers engaged in the design and construction of street railway bridges, contains a general form of specifications to be filled out for any particular case. The book opens with a description of street railway bridges which are classified in accordance with their capacities. The best type of bridge for various spans is prescribed as well as the kind of material desirable, the method of building, plans, stress sheets and other data. The book also contains some excellent tables and formulae for determining the strength and proper dimensions of the various members of a bridge for both wrought iron, soft steel or medium steel. The work is very complete in every respect and includes all the important points which should be considered in specifications for such work.

The Western Illinois Traction Co., projecting an electric line in Monmouth and interurban lines radiating from that city through the county, has applied for a charter, the incorporators being: W. W. McCullough, W. B. Young and S. S. Hallam. A franchise in Monmouth has been secured.

### FINAL DECISION IN DETROIT 3-CENT FARE CASE.

During the first half of 1899 a very determined effort was made by the late Hazen S. Pingree to secure municipal ownership and operation of the street railways of Detroit, and the campaign was not abandoned until the Michigan Supreme Court on July 6, 1899, rendered its decision (St. Ry. Rev. 1899, p. 452), holding the McLeod act under which the Detroit Street Railway Commission was created, to be unconstitutional. July 14, 1899, a 48-year franchise was granted to the Detroit Municipal Railway Co. which was to purchase the existing lines for \$16,800,000 in 4 per cent gold bonds, and reduce rates to 6 rides for 25 cents and 8 rides for 25 cents during certain hours. Four days later the council reconsidered the passage of the 48-year franchise, and the interests controlling the railways thereupon withdrew their offer to sell.

The city council on August 8th passed an ordinance requiring all street railways (except the Detroit Railway Co., the 3-cent line) to sell tickets at the rate of 8 for 25 cents, good at all hours and entitling the holders to universal transfer privileges. This was approved by the then mayor, Mr. Maybury, Aug. 16, 1899. On the same day the Detroit Citizens Street Railway Co. filed a bill in the United States Circuit Court for the Eastern District of Michigan for an injunction restraining the city of Detroit, the mayor and the corporation counsel from enforcing this ordinance.

Mar. 19, 1900, the case was decided in favor of the company and a permanent injunction granted. This decision was published in full in the "Review" for April, 1900, page 218.

The city appealed to the United States Supreme Court and on Mar. 3, 1902, this court affirmed the ruling of the Circuit Court, leaving the outcome of the Detroit 3-cent fare case a complete victory for the company.

The principal points of the decision are:

Where the legislature authorizes a municipality and a railway company to agree upon rates of fare and other terms of a franchise and an ordinance is subsequently passed by the city council fixing the rate of fare the general power "to prescribe from time to time rules and regulations for the running and operation of the road" does not include the right to prescribe a lower rate of fare without the consent of the company.

Such an ordinance fixing the fare is a contract within the meaning of the Federal Constitution, and the obligations of this contract may not be impaired under the guise of regulations.

Equity has jurisdiction (in such a case as this) on the ground that if the company be left to its remedy at law, a multiplicity of suits would result from the attempt to enforce the low-fare ordinance.

place the company's securities as they need to be sold. The demand for such agents has of course led to the organization of firms which engage exclusively in the handling of public securities, and one of the well-known Chicago houses in this line, Stephen D. Demmon & Co., is making a specialty of street railway investments, while also acting as fiscal agent for municipalities, gas, electric light, and railroad companies, and private corporations engaged in manufacturing.

### BRILL CARS FOR WESTERN AUSTRALIA.

The J. G. White Co., of London, which is largely interested in electric tramway systems in the rapidly growing cities of Western Australia, is sending to Kalgoorlie 25 cars built by the J. G. Brill Co. of Philadelphia. Situated about a hundred miles inland from Perth, in a rich gold district, Kalgoorlie has lately become one of the most important cities in the colony.

As will be seen by the accompanying illustrations, the cars are of two types; 10 of them are 41 ft. long over the crown-pieces, and 8 ft. 2 $\frac{3}{4}$  in. over the sills; the rest are 28 ft. long over crown-

SINGLE TRUCK BRILL CAR FOR AUSTRALIA.

pieces, and 7 ft. 9 $\frac{1}{2}$  in. over sills. The windows in both types are extra large and the window rails low, with the intention of making the cars suitable for summer, as well as winter, service. The upper sections of the windows are made stationary, while the lower portions slide into pockets in the walls. This arrangement includes end windows.

The large cars have a seating capacity of 52, there being 13 reversible-back seats to a side. The sides of these cars are of straight up and down construction, giving space for the sash-pockets, without much lessening the floor width. The shorter cars are seated

DOUBLE TRUCK BRILL CAR FOR AUSTRALIA.

### FISCAL AGENTS FOR CORPORATIONS.

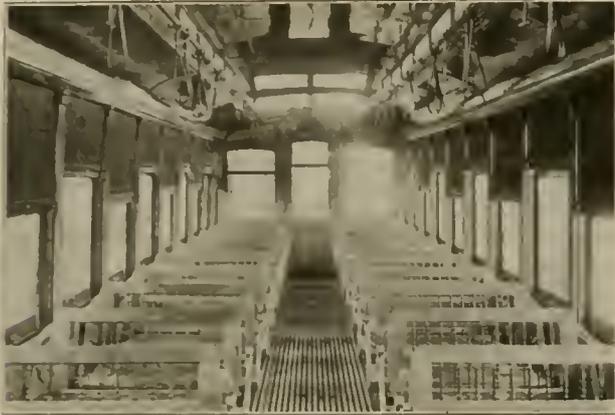

The modern method of building railways is to do the work piecemeal, only sufficient capital being provided at the start to build a short section of the line. Then follow successive sales of bonds which are salable by reason of there having already been work done, and the proceeds of each block of bonds thus sold are used to build the next section of the road. It is quite apparent therefore that after getting its franchises a company needs the services of fiscal agents who by reason of their business connections can readily

for 28; these have curved side panels, protected by a metal-shod guard rail.

The interiors are finished in natural ash, with white birch ceilings handsomely decorated. The windows are provided with roller curtains, the rollers of which are concealed.

The platforms, besides having supports re-enforced with angle irons, are strengthened and protected with Brill patent angle iron bumpers. Among other patented specialties which make the Brill cars singularly complete, are radial draw bars, "Dedenda" gongs and ratchet brake handles.

The long cars are mounted on Brill No. 27 trucks, for which it is claimed there is practically no limit as to the speed capacity, and their absorption of shocks and vibration and the well-cushioned

INTERIOR OF CAR FOR AUSTRALIA.

side motion in rounding curves, add greatly to the comfort of the passengers.

The four-wheelers have Brill 21-E trucks. Both of these Brill trucks are well known on account of their original and distinctive features; solid forged frames, spring arrangement and brake system.

#### EMPLOYEES' ASSOCIATION IN CONJUNCTION WITH Y. M. C. A.

The Brooklyn Rapid Transit Co. is carrying out a plan for organizing a mutual benefit and social association among its employees, but is going about the matter in a little different way than has usually been followed in other cities. After consultation with the officers of the Railroad Branch of the Young Men's Christian Association the officers of the street railway company have decided that better results can be obtained by availing themselves of the wide experience and facilities of the Y. M. C. A. workers in movements of this kind and the details of forming local branches, fixing up libraries, reading rooms, gymnasiums, etc., and arranging social features will be left largely in the hands of the older association, always of course under the supervision and with the co-operation of the street railway company. The mutual benefit features such as sick, accident and death funds, will be kept separate and directly under the jurisdiction of an Employees' Mutual Association, the secretary of which will be paid by the street railway company. The scheme has not as yet been worked out in detail, but it is believed that by working along these lines as indicated several advantages will accrue. By working with the Railroad Branch of the Y. M. C. A. the men will secure all the benefits of the facilities of that organization. They will at the same time retain control of all insurance and benefit funds, while the street railway company will have as it were parental oversight over the whole movement to prevent possible carelessness or mismanagement. The movement will be entirely unsectarian in character.

#### A NEW ELECTRIC CLUB.

The Electric Club is the title of a new organization composed of employees of the Westinghouse Electric & Manufacturing Co. A general meeting of the apprentices and members of the testing and engineering departments of this company was held March 19th to organize a new club of which Mr. C. F. Scott was one of the principal promoters. A committee of which Mr. Scott was chairman called upon the management of the company, who greatly favored the plan and stated that the company would actively co-operate by paying the rent and further assisting financially and otherwise in establishing and conducting the club. The constitution was considered and adopted at this meeting and the members who voted in the affirmative for it constituted the charter members of the club. The list of charter members includes 150 names.

According to the Constitution of the club its purpose is for social recreation, mutual benefit and improvement, and more particularly for the dissemination of electrical and engineering knowledge among its members. Reading rooms, class instruction and small societies or sections for the presentation and discussion of electrical engineering subjects, general lectures by engineers, and excursions to places of interest in and around Pittsburg will be within the scope of the club.

Three of the members of the board of directors are to be designated by the Westinghouse Electric & Manufacturing Co., and the remaining six members will be elected by the members of the club, two of which shall be selected from the permanent engineering staff, two from the apprentices who have been with the company for one year or upwards, and two from other departments. The six members shall hold office for two years, one man of each class retiring at the end of each year.

The headquarters of the club are at Hammett Hall, Wilkensburg, Pa., and the following officers have been elected: E. M. Olin, president; E. D. Townsend, vice-president; C. E. Downton, secretary; L. A. Osborn, treasurer.

#### NEW LINES IN PENNSYLVANIA.

The York County Traction Co. is planning to connect all towns and hamlets within a radius of 25 miles of York, Pa., by electric railways. The company's line will first be extended east to Wrightsville via Hellam and Stony Brook. The present line to Dover, 7 miles, will be extended to Mechanicsburg, via Rossville, Wellsville and Dillsburg. Another proposition is the extension of the North York line through Emigsville, Manchester, York Haven, and Goldsboro to Lewisberry, where connection will be made with the New Cumberland & Lewisberry Electric Ry. and thus an outlet from that section of the Cumberland Valley secured.

The Harrisburg & Mechanicsburg Electric Ry. is now operating to New Cumberland and it is reported that this company will make arrangements to use the new steel bridge to be built over the Susquehanna River between Steelton and New Cumberland.

The Harrisburg and Mechanicsburg electric railways are already operating a line to that town, and they are planning to improve their line. There are reports current that the Harrisburg Traction Co. is also making arrangements to use the new steel bridge to be built over the Susquehanna River between Steelton and New Cumberland, thus giving direct connection for five cents to Harrisburg.

The Cumberland Valley Traction Co., which has built from Carlisle to Shireman's Town, through Boiling Spring and Carlisle, has projected a line to New Cumberland, over a new route, parts of which will be over private rights of way. At New Cumberland the cars will meet those from Lewisberry and the New Cumberland Railway, which was chartered last year. This will also connect with the system of electric railways in York County, touching York Haven and intermediate points.

There is a movement on foot in connection with these projected railways to open a large park near Lewisberry.

Another branch of the York County system will be that west to Hanover, over the Gettysburg pike, taking in a number of the smaller towns and villages on the way, and connecting with the Baltimore, Westminster and Gettysburg electric railways.

#### SEATTLE-TACOMA INTERURBANS.

It is expected that the interurban railway line between Seattle and Tacoma will be put in operation about July 1st. This road is being built on the third rail system except where it lies within city limits and at grade crossings along the country highways. The road is to operate large coaches similar to those on most of the steam roads, which are to be equipped for high speed service. The company's right of way has been fenced in with especially strong fencing on account of the use of the third rail system.

Mr. P. A. B. Widener proposes to establish a home for crippled children at Logan, Pa., with an initial endowment of \$2,000,000. It will be not only a home, but an educational institution, and is designed to be a memorial to Mr. Widener's wife.

## AMERICAN STREET RAILWAY ASSOCIATION.

A supplementary notice in regard to the Detroit convention of the American Street Railway Association has been issued by Secretary Pennington under date of April 1st.

The exposition will be held at the Light Guard Armory, Detroit, where all light, heat and power required can be furnished. The convention will also be held in the Armory, thus assuring the attention of all the delegates and visitors to the exhibits.

Applications for space should be made to Mr. John H. Fry, Detroit United Railway, 12 Woodward Ave., Detroit, Mich., who is chairman of the committee of exhibits. Applications for space should state the length and width of the space desired and the committee on exhibits will comply with the demands if possible. All articles intended for exhibition should be delivered at the Light Guard Armory by the agent or owner at his own expense, but the local committee have made arrangements with the Riverside Storage & Cartage Co. to haul all shipments made to the building if desired, at low rates. Goods should be addressed to the name of the exhibitor, care of the Riverside Storage & Cartage Co., accompanied by bill of lading or advice of shipment, and charges should be prepaid. Articles will be placed in exhibitors' space in the hall if the number of such space is marked on the boxes. Exhibitors will be advised of these numbers in ample time for shipment.

Space should be applied for by August 1st. Assignment will be made as promptly as possible and exhibitors will be notified of their location. Exhibits of like character will be grouped and space will be assigned in the order of application. The committee on exhibits will make contracts with carpenters, electric workmen and laborers at regular prices so that the exhibitors will not be overcharged for lumber, labor, etc.

Thursday, October 9th, has been set apart by the executive committee for the examination of exhibits. No session of the association will be made for that day and no entertainments of any kind will be given by the local committee, so all delegates will have ample time to call on exhibitors and examine the goods displayed.

The railroads will sell tickets on the certificate plan. Certificates should be left with the clerk on the first day of the convention at the time of registration. The certificates will be signed, vised and ready to return to members October 9th.

## SOUTHWESTERN ASSOCIATION.

We have received from Mr. T. H. Stuart, secretary of the Southwestern Gas, Electric & Street Railway Association, a program of the convention which is to be held at San Antonio, Tex., April 18th to 21st. A good business program has been arranged and after this has been carried out the delegates will be presented with the social side of the program, a prominent feature of which is a trip to Mexico including visits to the principal cities of interest in that country. The itinerary for the Mexican trip contemplates leaving San Antonio at 9 o'clock on the morning of April 22d by special train, reaching Mexico City on the afternoon of April 25th. Stops will be made at Laredo, Monterey, Saltillo, San Luis Potosi, San Miguel, Toluca, Toluca. Two days will be spent in the City of Mexico and the return to San Antonio will be made on April 29th.

The approximate cost of the trip of seven days in accordance with this itinerary, including railroad fare, Pullman, hotels and meals will be \$50.00. An opportunity will be offered to those desiring to make the trip to Monterey only to return from this point to San Antonio. The cost of the latter trip will be about \$18.50.

## ST. LOUIS TRACTION COMPANY PROVIDES FOR AGED EMPLOYEES.

A new rule has recently gone into effect on the St. Louis Traction Co., which provides for the employment of the men who have grown old in its service. The rule which was conspicuously posted in the different buildings of the company recently read as follows:

"Motormen or conductors will not hereafter be discharged on account of old age, but will be given other places as watchmen, switchmen and trolley holders, and will be required when on duty to wear full uniform. The rate of pay will be continued the same as if they continued in the service as motormen or conductors."

## REPORT ON LIVERPOOL TUNNEL ACCIDENT.

A report on the fire which occurred in December, 1901, in the tunnel of the Liverpool Overhead Ry. has been made to the British Board of Trade by Colonel Yorke and Mr. A. P. Trotter, experts representing the Board of Trade.

Mr. Trotter's report states that from the evidence it appears that the insulated covering of one of the cables on a motor near the rear end of the train had become deteriorated, and broke down when there was an extra heavy demand for current. An arc formed and the excessive current caused the circuit breaker to open, stopping the train. The driver reset the circuit breaker several times and it is probable that he held it in place; the arc set fire to the woodwork of the car and the strong wind caused the flames to spread. The driver is censured for not having cut out the motor affected when the trouble developed. While the motor was an old one care had been taken to keep it in repair, and a motor of the modern iron-clad type would not have made an essential difference in this case.

Mr. Trotter's recommendations are as follows:

Flexible cables covered with india rubber or other combustible material are used unnecessarily in many cases in electrical work. They are used from habit and for convenience. This mode of construction does not commend itself to mechanical engineers. Combustible insulating materials should not be used in the main current conductors of electric trains, particularly in tunnel railroads. These conductors should be rigid, and might be bare, or enameled, or protected by incombustible ferrules in iron pipes. Flexibility should be restricted to necessary joints, and not used for convenience in arranging the conductors. Flexibility should be provided by pinned hinge or knuckle joints shunted by bare flexible links of wire gauze, or cable braided with wire, or by some other sound mechanical mode of construction. Little or no woodwork should be used in the construction of electric locomotives, or of the driver's cabs of motor coaches, and in the latter, the resistances and the controlled switches should be placed, if possible, in front of and outside the cab.

## TROLLEY MEN APPEAR IN VAUDEVILLE.

The employes of the East New York division of the Brooklyn Rapid Transit Co., entertained their families and friends with a unique vaudeville performance on the evening of March 26th. The affair was given in the repair shops of the depot building on Jamaica Ave., which was temporarily transformed into a theatre, and the success of the occasion is generally ascribed to the harmonious relations existing between them and the superintendent of the division, Mr. John E. Webb. Music was furnished by an orchestra of railway men, and several of the men proved to be as clever and amusing as many of the entertainers on the professional stage. Refreshments were served after the performance and the employes were highly complimented by the guests on their skillful performance.

## RAILWAY EXTENSION IN SEATTLE.

The Seattle Railway Co. intends to extend its line to the top of Queen Anne Hill, forming a new route which will do away with the counter-weight system at present employed. It will be a surface line for part of the distance, but near the top of the hill the grade rises so rapidly that it will be necessary to tunnel the hill reaching the level plateau on top by means of an underground route. After emerging on the plateau the line will traverse that district on a level grade and give service to a section covering an area of about three square miles which now lacks transportation facilities. The lines will run circuitously up the hill and at no point will the grade exceed six per cent. The line will be double tracked. The plans for the extensions have been completed and have been placed before the city council for its consideration. It has been understood between the members of the council and the management of the company that in the near future this line to the top of the hill would be constructed so as to do away altogether with the counter-weight system, and permission to construct the road will undoubtedly be granted.

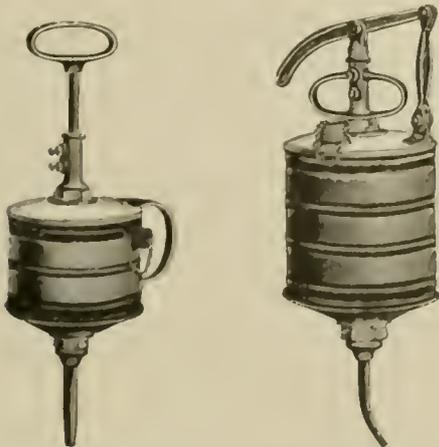

## PENNSYLVANIA RAILROAD PENSION SYSTEM.

President Cassatt in his annual report for the year ending Dec. 31, 1901, gives some figures in regard to the voluntary relief, pension and employers' savings departments of that company. The total receipts of the employes' beneficial relief department for the year were \$1,176,206 which, added to the balance of \$337,331 from the previous year made an aggregate of \$1,553,537. Out of this, death benefits of \$376,274 were distributed and \$590,362 were paid out for cases of disability arising from sickness and accident. After meeting all obligations for the year there remained to the credit of the fund a balance of \$357,269, and in addition to this balance there is an accumulated surplus of \$751,256.

The employes' savings fund at the close of the year amounted to \$3,219,908. There were 229 employes retired during the year under the pension stipulations of the company. The amount paid these pensioners was \$236,648, and the total number of pensioned employes of the road is 1,105. It is the policy of the company to pursue a liberal course toward the employes between 65 and 70 years of age who are incapacitated for active service, and this, together with the extension of benefits to the Buffalo & Allegheny Valley division, which has become part of the Pennsylvania system since the pension department was first inaugurated, has considerably increased the demand upon this fund. For this reason an increase in the appropriation from \$230,000 to \$300,000 per year was asked.

### TO SAVE OIL.

Engineers of power plants are quick to appreciate the waste of lubricating oils which follows the injudicious use of ordinary oil cans as well as some special forms of which the "squirt gun" type is a common one for a variety of applications, and they will be interested in the accompanying illustrations which show two forms

of a device for economically applying oil to the working parts of machinery. This is known as the Ironsides improved Tormay patent oiler, and was first designed for oiling of mine car wheels; when used for this purpose its advantages were so apparent that it was adopted in other operating departments, and the report is that a saving of 50 per cent in the oil used has resulted from the use of the device by some of the larger coal mining properties.

The oiler consists of a central working barrel containing a plunger and surrounded by an oil reservoir; openings in the working barrel, sealed or unsealed, according to the position of the plunger, communicate with the oil reservoir. The adjustability of the stroke of plunger governs the quantity of oil forced at each operation. When not in use the contents are not only preserved from leakage, but are also protected from dust and other impurities. The Ironsides Co., Columbus, is the maker of this oiler.

The People's Traction Co., Galesburg, Ill., has purchased two large interurban cars to be put in commission on its new extension to Abingdon. The cars were made at Niles, O.

## PACIFIC COAST NOTES.

Mr. R. R. Colgate, one of the largest owners in the North Shore Railroad Co., is now in New York, completing arrangements for the conversion of this road to electric traction. The road at present consists of about 100 miles of narrow gage and is operated by steam locomotives. This is to be transformed into a standard gage electric line. A part of the equipment has just been ordered. Twenty-one cars have been purchased in the east and the 16 cars now in use will be remodeled into electric cars. The cars are to be run in trains of 4, 5 or 6 cars on a high speed schedule. The current for operating the road will be supplied either by the Bay Counties Power Co., or the California Central Gas & Electric Co.

The McAllister St. cable road, one of the recently acquired properties of the United Railroads of San Francisco, is being changed into an electric line. The new owners contemplate changing a number of cable lines into trolley roads.

The annual stockholders meeting of the Oakland Transit Co., which operates all the street railways of Alameda County, Cal., was recently held in Oakland. The old board of directors was re-elected and it was announced that the work of reconstructing the track of part of the company's lines would be commenced at once. The company will also begin work within a short time on three extensions of its lines in Berkeley, Cal., for which franchises have just been obtained.

March 25th the Merchants' Association of San Francisco addressed a communication to the board of supervisors asking that in all street railway franchises hereafter granted the stipulation should be made that within a prescribed area only grooved girder rails should be used, and that when any existing roads are reconstructed, grooved rails should also be used.

The Alum Lake Railway Co., operating between San Jose, Cal., and Alum Lake Park, is now transforming its steam line into an electric railway. All the poles are in place and it is expected that the road will be in operation within two or three weeks.

The Northern California Power Co., has been incorporated with a capital of \$2,000,000 for the purpose of consolidating several electrical properties in Shasta County, Cal. The company will control a large amount of power and it is stated that an electric railroad between Redding on the Sacramento River and Keswick in the copper mining district will be constructed within a short time.

### IMPROVEMENTS IN WHEELING, W. VA.

The Wheeling (W. Va.) Traction Co., has been doing considerable reconstruction and general overhauling of its property. It has recently purchased fifteen 10-bench open cars from the St. Louis Car Co., which are to be mounted on McGuire trucks. It is also installing two 550 h. p. Stirling boilers, two 1,000-h. p. C. and G. Cooper engines and two 600-kw. Bullock generators with switchboards, new pumps, motors, etc., in its power house in 42d St. This plant will have a capacity when completed of about 3,000 kw. A new power house is also being built at Brilliant, O., which will be equipped with three 500-kw. generators and 1,000-h. p. engines with the necessary boilers, pumps, etc. This machinery has all been purchased. It is expected to deliver power from the new station in about 90 days. In the recent flood the company suffered considerable damage, having its tracks in some places 8 ft. under water.

### STRIKERS MAY BE HELD RESPONSIBLE.

A precedent has been established by Judge Braley in the Supreme Court of Suffolk County, Mass., in the case of the R. S. Bryne Transportation Co., of Boston, against the Brotherhood of Teamsters and Helpers. The members of this brotherhood tried while on strike recently to interfere with the business of the plaintiff. The court made permanent its previous restraining orders preventing members of the union from interfering with the business of the transportation company by threats or violence. He also has established a precedent by ruling that the strikers' organization can be held responsible for the damage done by its members to the property of the plaintiff. The question of damages is to be heard by a referee.

### NEW WORK OF THE COLUMBIA CONSTRUCTION CO.

The Columbia Construction Co., of Milwaukee, Wis., has received contracts for much new work which is to be undertaken during the coming season. This company is now completing the work on the Oshkosh & Omro Ry., and is about to commence on an extension for the Winnebago Traction Co., of Oshkosh, Wis., of 1½ miles. The new extension will reach the Northwestern railroad station and the Lake Shore Park. The rails are to be of the Shanghai type, 6 in. high and in 60-ft. lengths. The special work will be furnished by the Falk Co., of Milwaukee, Wis. Part of the line is to be paved with asphalt. This company is also prepared to commence work on the construction of the Fond du Lac & Oshkosh Ry. All the deeds for the right of way of this line have been obtained and the road parallels an existing steam line. The right of way is 50 ft. wide throughout. The road is to be built under the general law of the state which does not require a franchise from township boards. Four double-truck cars have been ordered for this line of the same type as are now in use on the Clark St. line of the Chicago City Ry., with the exception that a steam coach roof and a smoking compartment will be used. They will be mounted on St. Louis Car Co. 23 A trucks with 5-in. axles. The bodies are 34 ft. long and the platforms 5 ft. 6 in. long. The cars are to be equipped with Westinghouse No. 56 motors and geared to run at 45 miles an hour. The power for the road will be furnished by the Fond du Lac Street Railway & Light Co.

March 27th the Columbia Construction Co. began the work of rebuilding the 10th St. and Brooklyn Ave. line of the Metropolitan Street Railway Co., of Kansas City. This was formerly a cable road which is now operated electrically. The rails are to be 6-in. girders laid on standard white oak ties 8ft. long and the roadbed will have a foundation of 5 in. of crushed rock. The entire line will be paved with brick or asphalt.

This company is also about to begin the rebuilding of the Prospect Ave. and 19th St. lines of the Metropolitan company. The former line is 4 miles in length and the latter is 1½ miles; they will be laid with 106-lb. 9-in. girder rails and the Prospect Ave. line is to be paved with asphalt and brick. The 19th St. line will be paved with asphalt. All the rails on both of these lines are to be cast-welded by the Falk Co.

### CONVICTION IN ST. LOUIS BRIBERY CASE.

Émil A. Meysenburg, an ex-member of the St. Louis City Council, has been convicted of accepting a bribe of \$9,000 from Philip Stock, financial agent in charge of the Suburban railway bill. A check for \$9,000 drawn by the president of the St. Louis & Suburban Railway Co., was paid to Meysenburg for 200 shares of stock in an old company, alleged to be absolutely worthless. The contention of the state was that this \$9,000 was paid to Meysenburg for his vote on the Suburban bill. Although the instructions of the judge were favorable to the prisoner, and the jury was instructed that unless it was satisfied that the defendant made an express agreement to vote for the traction bill he must be found not guilty, the jury returned a verdict of guilty as charged, and the punishment was fixed at three years in the penitentiary. A motion for an appeal was filed.

### CEDAR OF THE GREAT LAKES DISTRICT.

The total number of telegraph, telephone, electric light and trolley poles now standing in the United States has been estimated by competent authorities as exceeding 20,000,000. Assuming that the life of these poles averages 15 years, it is estimated that the repair work necessary to maintain these lines, taken in connection with new construction, represents a total annual consumption of poles of over 2,000,000. Chestnut, red cedar, cypress and juniper are used to a limited extent, but chiefly in sections where these trees are indigenous, which comprises a comparatively small area. The territory east of the Rocky Mountains is being supplied principally from the white cedar swamps of the Great Lakes district, which comprises parts of Michigan and Wisconsin and the islands of the lakes. The Valentine-Clark Co., 234 La Salle St., Chicago, has its

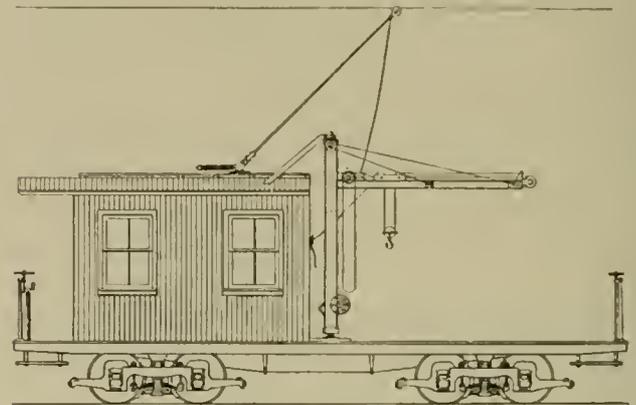

main yards throughout this region, and makes a specialty of cedar poles.

There has been a moderate movement of cedar from Idaho and Washington to the territory east of the Missouri River during the last few years, but owing to excessive freight charges this movement has been largely confined to poles 50 ft. and upward in length.

The value of the cedar stumpage now remaining is rapidly increasing in proportion to the decreasing supply and constantly increasing demand.

### CONSTRUCTION CAR.

The accompanying illustration shows a general utility car, designed by the Ludlow Supply Co., 313 Electric Bldg., Cleveland, O., for use on trolley roads. The crane has a lifting capacity of from 5 to 20 tons, and can be built for operation by hand, electric or pneu-

CONSTRUCTION CAR.

matic power. The boom of the crane is about 10 ft. in length. The load is supported on a trolley and can be moved to any point on the boom, by the hand chain which hangs near the mast. The company is prepared to furnish cranes of any capacity or design, but does not furnish the cars.

### A LIVE ELECTRIC RAILWAY SUPPLY HOUSE.

Porter & Berg, 309 Dearborn St., Chicago, carry a complete line of street railway supplies comprising nearly every article from a rail bond to a working set of United States electric signals. The firm has opened a new ware-room at 47 Plymouth Place, Chicago, in the building which after May 1st will be the home of the "Street Railway Review," and this in addition to its spacious offices and sample rooms on Dearborn St. gives it every facility for handling its increasing business promptly and conveniently. Porter & Berg represent the Ohio Brass Co., manufacturer of pole brackets, overhead material, rail bonds, etc.; the Cutter Co. of Philadelphia, I-T-E circuit breakers; the United States Electric Signal Co., Watertown, Mass.; Frank Ridlon Co., Boston, Mass.; Wilson trolley catchers; Ham Sand Box Co., Troy, N. Y.; New Haven (Conn.) Car Register Co.; Speer Carbon Co., St. Marys, Pa., manufacturers of carbon brushes; the Trolley Vestibule Shade Co., Bridgeport, Conn.; American Brake Shoe & Foundry Co., Chicago, and the Hunter Illuminated Car Sign Co., Cincinnati, O.

### FIRE AT ANDERSON, IND.

March 14th a fire of unknown origin almost totally destroyed the machinery supply house and temporary machine shops of the Union Traction Co. of Indiana. None of the company's cars was burned but the fire interfered temporarily with the operating of the line. The loss in supplies and machinery is about \$15,000 and on the building \$5,000. This was partially covered by insurance. The building was erected by the Anderson Street Railway Co., and used as a power house previous to the purchase of this company by the Union Traction Co.

### RIDLON'S REPRESENTATIVE.

The Frank Ridlon Co., of Boston, Mass., has always been a staunch believer in good advertising and its attractive displays in the "Review" have always occasioned attention and favorable comment. In the direction of supplementing and increasing the value of its advertisements in the trade papers the company has commenced publication of an interesting little pamphlet which is designed to give information concerning its many well-known specialties in greater detail than can be done in its monthly announcements in the paper.

The publication has been styled "Ridlon's Representative," and the issue for March contains among other things descriptions of the "New England" motor, the Weld babbiting device, and other of the Ridlon supplies.

Some of the "editorials" are worth quoting. The following are a few: A Wilson trolley pole catcher is better than an accident policy. Your conductor would collect more fares if he didn't have to watch his trolley. Lightning never strikes twice in the same place, because nobody can find the place. Sometimes it is worth more to keep down expenses than it is to increase your earnings. The nickel you get as fare is worth no more than the nickel you cut off from the expense account.

### TICKET FRAUDS IN PHILADELPHIA.

A number of employes of the Union Traction Co., of Philadelphia, were arrested last month charged with using the mails to defraud the company. The plan of the men has been to trade exchange tickets in large bundles which were forwarded by mail between different conductors. The question of fraud hinged upon the trading of exchange tickets through the mails with a consequent loss of money to the company. The offense lies directly in the fact that the men used the mails in the furtherance of their scheme, which was fraudulent only because of their being employes. The trading of exchanges among passengers of the various lines is a common practice and one that meets with no protests from the railway company. Mr. James Bricker, superintendent of transportation of the Union Traction Co., testified that on an average of 250,000 exchange tickets changed hands each day. He stated that while the company had been victimized by employes on many occasions the present plan was the first one discovered in which the mails had been used. The general trading of exchange tickets keeps an enormous number of the slips in circulation and so long as the tickets are purchased by passengers there is no serious objection on the part of the company to their being exchanged, but when the conductors trade whole packages of tickets and turn them in as cash fares it nets them a profit of one cent on each ticket which the company loses.

### SHADE ROLLERS FOR STREET CARS.

Among the many articles used in car building, one of nearly absolute necessity is the spring shade roller which finds its use for all fabrics from the lightest silk or bunting shade up to the heaviest rain curtains on open cars. This article has been steadily improved both in construction and form in the factories of the Stewart Hartshorn Co., whence it originated and attained under that make its reputation for being a standard article.

The latest change in Hartshorn shade rollers for cars is in the spring end bearing or spear which is now made of steel instead of malleable iron. The chief advantages of this spear are that it does not break as a defective casting sometimes will, and, being always of exact size and form, it obviates the irregularity or roughness which occurs in castings. With this spear the lengths of shade rollers from end to end of bearings are not subject to slight variations as heretofore, a fact of importance in car work, as there can be but a very small allowance for inaccuracy in the width of windows. All of the 1-in and 1¼ in. Hartshorn rollers which are used on closed cars have for some time been furnished with this new steel spear and now that they have been found to give satisfaction, the company has decided to put the same improvement on the 1½ in and 1¾ in rollers which are designed with extra strong parts in order to handle the long and heavy shade cloth used on open street cars.

The old form of round groove tin roller has also undergone improvement in the method of mounting, which consisted first of hemming wires or cord in the narrow strip of shade cloth sewed at the top of car curtains and then drawing them from end to end of the roller. The two chief dangers of this method consisted in the difficulty of hemming the cord or wire at right angles to the curtain so that it should roll up straight, and of sometimes tearing the cloth while pulling it into the groove. These disadvantages have been cleverly overcome in the Hartshorn "New Groove" tin roller. To mount a curtain on one of these rollers the strip sewed at the top of the shade must first be perfectly squared with the sides of the cloth as in any other method of mounting, then one of the fasteners furnished with the goods is placed upon it and pressed down perpendicularly into the groove until it turns under the fingers. It is only necessary to repeat this operation about every six inches along the roller barrel when the curtain will be rigidly fastened to it and still can easily be removed by pulling it out of the groove at either end. When once understood this way of mounting car curtains is even simpler than the description and in many cases operatives who at first could see no advantage in it have by its use increased their speed in turning out accurate work. The reasons are logical, for in the first place the tedious operation of hemming wires or cord at the top of the curtain and getting them square with the sides is eliminated, while again there is no danger of tearing the top strip while pulling it through the groove. Another thing claimed for the "New Groove" tin roller is that in shops which are in any way crowded, the shade mounting bench room can be reduced one half by the use of this form of roller, as the cloth is directly inserted into the groove by the use of fasteners instead of being first spread out with its width added to the length of the roller and then drawn into its place.

### BRAKE SHOE COMPANIES CONSOLIDATE.

Announcement was made March 18th that the American Brake Shoe & Foundry Co., with temporary offices at 26 Cortlandt St., New York, had assumed control of the brake shoe output of the following plants:

Ramapo Foundry Co., Mahwah, N. J.; Sargent Co., Chicago; Lappin Brake Shoe Co., Bloomfield, N. J.; Corning Brake Shoe Co., Corning, N. Y.; Streeter Brake Shoe Co., Chicago. These concerns manufacture the following well known types of brake shoes: The Sargent skeleton steel, the "Diamond S," the skeleton steel insert, the Lappin steel back, the Streeter steel hack, the Corning and the Ross-Meehan.

### CHANGES AT WAUPACA, WIS.

Mr. W. B. Baker, formerly secretary and a large stock holder in the Waupaca Electric Light & Railway Co., of Waupaca, Wis., has sold his interest to Mr. Irving P. Lord, the president of the company, and John D. Caughell of Embarrass, Wis. Mr. Caughell has been elected secretary and a member of the board of directors, and Mr. William Dressen, cashier of the National Bank of Waupaca, has been elected treasurer. Mr. Lord owns a majority of the stock, and will continue his duties as president and general manager.

The company is in most excellent condition, not owing a dollar to anybody outside of its bonded indebtedness of \$36,000. The capital stock is \$75,000, fully paid in, and the original bonded indebtedness three years ago was \$42,000, but the bonds are being retired at the rate of \$2,000 per year.

The Waupaca Electric Light & Railway Co. has a modern lighting system, and one of the best five mile electric railways in the west. The whole is operated by water power, of which there is an abundance, and those who are in a position to know state that the condition of the company is a very prosperous one.

The Western Ohio Electric Railway Co. ran its first car over the newly completed interurban line between St. Mary's and Lima March 9th. It was the first car ever run in Auglaize County.

The Manitowoc (Wis.)-Two Rivers Interurban Electric Ry. will be put in operation about May 1st. The power house at Little Manitowoc is nearly ready for the installation of machinery; the company contemplates a new bridge in the city of Two Rivers.

### THE STRIKE AT SCRANTON, PA.

Under date of March 20th, Mr. Frank Silliman, Jr., general manager of the Scranton Railway Co., writes us as follows concerning the strike and boycott:

The strike is still nominally in force, although all that remains of it is a partial boycott which is still officially in force and affects a part of our business. The boycott, however, is lifting itself.

On March 12th inst., there was an outbreak of violence in Minooka, a village in Lackawanna Township, next south to Scranton, which resulted in driving the crew from their car, and the subsequent setting fire and total destruction of the car. Now and then other slight outbreaks of violence occur, which consist principally of stoning the cars. The strike has been on since Oct. 1st, 1901.

### AMERICAN POLES FOR EGYPT.

W. C. Sterling & Son, of Monroe, Mich., have just heard from their first consignment of poles to Alexandria, Egypt; the company was well pleased and the second consignment will soon be shipped. Sterling & Son are probably the oldest cedar pole, tie and post firm in the United States, and are certainly one of the largest.

At the present time they have their cedar stock well out of the swamps and there are now at the main yard nearly 100,000 poles sorted and piled ready for shipment. The firm's tie business is also a very large one, and there is kept at all times a stock of 100,000 ties on hand notwithstanding continual shipments. The firm prefers that purchasers visit the yards and make their own selections, as they then can make sure of getting just what they want, although in most cases the buyer who takes the dealer's inspection gets the best inspection. The large stocks kept on hand gives time for the timber to dry and permits lighter shipping.

Sterling & Son report that the outlook for the coming year is good and as there will probably be a shortage in all cedar stocks because most of the producers were caught by the early spring with about 25 per cent of their stock still in the swamps and will be unable to get it out. Customers are therefore advised to place orders as early as they can.

### MISUSE OF TRANSFERS IN KANSAS CITY.

The officers of the Metropolitan Street Railway of Kansas City are seeking to have a new ordinance passed making it a misdemeanor for any one to ride on a street railway transfer which has been secured by another. Mr. Saterlee, general superintendent of the company, explains that there are men in the two Kansas City who make a business of misusing street railway transfers. News dealers and newsboys have been in the habit of giving a transfer together with a morning newspaper for five cents.

Another practice which has been discovered is the exchange of transfers by working men in the wholesale houses and other establishments in the center of the city. A man who is living on the east side for example, goes to work in the morning getting off near the center of the city. He gets a transfer to the west side, and another man living on the west side procures a transfer to the east side. These two men exchange transfers during the day and ride home on them in the evening. Although the transfers have morning and evening sections which are punched the cars are so crowded during the morning and evening hours that in most cases the conductors overlook the fact that the transfers are intended for a morning ride instead of an evening one.

While the law would hardly be sufficient to stop this practice the officials of the company believe it will be the means of frightening many of those who misuse transfers, and a section is to be included in the new ordinance governing this point.

### NEW ELECTRIC LINE FOR UTAH.

The Salt Lake & Utah Valley Railroad Co., has been incorporated to build a system of electric roads running from Salt Lake to Bingham and Provo which will pass through a number of intermediate towns between these places. The new company is a Colorado corporation and is headed by L. L. Munn, of Telluride, Col., manager of the Telluride Power Co.

Mr. Munn at present controls the West Side Rapid Transit Co., of Salt Lake City, which will eventually form part of the new road. The first work to be undertaken is to be the extension of these lines to Bingham. It will touch the suburbs to the South of Salt Lake and reach the different smelters in this neighborhood so that freight as well as passenger business can be built up. The directors of the new company are L. L. Munn, Trinidad, Col.; J. J. Munn, Provo, Utah; Wm. Story, jr., and A. M. French. The capitalization is \$250,000, but this amount will eventually be increased. There will be a bond issue to provide funds for the project.

### NEW OHIO INTERURBAN OPENED.

Another link in the chain of interurban railways which is being built to connect Cincinnati and Toledo was completed last month and about 100 miles of new road belonging to the Western Ohio Traction Co. was put into operation. The portion of the road opened runs between Lima, Wapakoneta, St. Marys and Minster. The other extensions of this line are well under way, one being the northern extension from Lima to Findlay and the other the southern extension from Wapakoneta to Troy. When these are completed a continuous line between Cincinnati and Findlay will be formed, as Troy and Dayton are connected and Dayton and Cincinnati are connected by the Southern Ohio Traction Co. All of these lines largely represent the same financial interests, and while they have not been consolidated up to the present time it is generally admitted that a consolidation will be brought about when the other service is ready to be established.

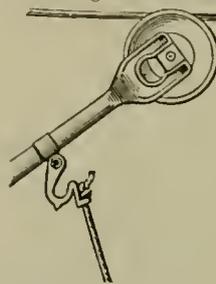

### BUFFALO, SPRINGVILLE AND CATTARAUGUS.

The Buffalo, Springville & Cattaraugus Railway Co., of Cattaraugus, N. Y., has secured the necessary franchises and is now at work getting rights of way. The company will have 34 miles of its line through or over private property and will have to erect a bridge 209 ft. high and 666 ft. long, and it is not contemplated to have the line in operation before the summer of 1903. The contract for construction has been let and calls for 70-lb. rails and bridges to carry 700 tons. The equipment will comprise 6 passenger cars, 10 freight cars and 2 electric locomotives of 40 tons each.

The officers of the company are: President, H. L. Moench; vice-president and general manager, U. L. Upson; secretary, Theodore Truby; treasurer, W. A. Oakes.

### INGENIOUS WATER SHED.

The American Street Railway Paving & Improvement Co., Springfield, Mass., has recently placed upon the market a device for deflecting water from trolley ropes. This is the invention of

TROLLEY WATER SHED.

Seth J. Buckland, of Springfield, and is well shown in the accompanying illustration. The advantages claimed for the water shed or deflector are that it will prevent water containing rust from the pole from coming down the cord and thence being thrown over signs, windows and passengers' clothing, and that the oil from the trolley wheel is prevented from reaching the car and causing it to drop off at the end.

The Twin City Rapid Transit Co. is remodeling its principal car house in Minneapolis, and will build an addition to the present structure, 123x330 ft., at a cost of \$60,000. Beside accommodations for new cars the addition will include bath rooms and lockers for employes.

Citizens of Washington have submitted a bill to the District Commissioners providing that no street railway company operating within the city limits shall be permitted to run cars exceeding 10 tons in weight; a restriction as to the fares and a provision requiring that schedules, routes and transfer arrangements shall be submitted to the Commissioners are contained in the bill.

**FINANCIAL.**

**METROPOLITAN STREET RAILWAY.**

The stockholders of the Metropolitan Street Railway Co., of New York, approved the proposed 999 year lease of that company's properties, rights and franchises to the Interurban Railway Co., by more than two-thirds majority. The stockholders also approved the proposed issue of \$65,000,000 to take up the \$54,000,000 of bonds outstanding and to pay off certain indebtedness connected with the equipment of the Third Avenue road. There was a strong minority opposition to the leasing of the property and immediately after the meeting of the stockholders Mr. Isidor Wormser, jr., filed a suit for an injunction on the ground that the lease and merger proposed was unlawful. In the brief submitted by defense in the Wormser suit the statement was made by the company that the Metropolitan Street Ry. could not earn the 7 per cent dividends paid last year which was to be guaranteed by the lease during the time that the reconstruction of its 100 miles of horse railway was taking place. The company claims that with accruing dividends on the Third Avenue road and increased charges, only the proposed 7 per cent guaranteed protects the present dividend rate. A temporary injunction which was granted preventing the consummation of the lease was discontinued April 8th by Judge Gildersleeve in the Supreme Court and the lease of the Metropolitan to the Interurban company was executed and filed immediately after the decision was rendered.

**BROOKLYN RAPID TRANSIT.**

At a meeting of the stockholders of the Brooklyn Rapid Transit Co., on March 20th, the raising of \$150,000,000 by mortgage on the franchises and property of the company was authorized. This was in accordance with the unanimous recommendation of the directors who some time ago recommended the issue of bonds to that amount. The report of the operations of this company for the months of January, 1902 and 1901, and for the seven months ending January 31st has been published, as follows:

	1902.	1901.	Increase.
Gross receipts .....	\$996,824.71	\$917,750.17	\$ 79,074.54
Expenses, including taxes.....	784,350.90	663,893.13	120,457.77
Net receipts .....	212,463.81	253,857.04	*41,393.23
For Seven Months Ending January 31.			
	1902.	1901.	Increase.
Gross Receipts .....	\$7,533,752.43	\$7,955,706.62	\$498,045.81
Expenses, including taxes..	5,300,232.02	4,565,944.80	734,287.13
Net receipts .....	2,233,520.41	2,489,761.73	*256,241.32

\*Decrease.

It will be seen from these figures that the gross earnings are steadily increasing which clearly indicates the steady growth of the company's business. The net earnings, however, show a decrease because of President Greatsinger's policy of spending every possible surplus dollar in improvements and equipments. It is probable that hereafter the cost of extraordinary improvements will not appear in the monthly statements and the new bond issue will supply ample funds for all charges outside of those that legitimately come under operating expenses. This will make a great difference in the company's financial reports as it will then be able to show a fair dividend earned.

**METROPOLITAN ELEVATED, CHICAGO.**

The annual report of the Metropolitan Elevated of Chicago, presented by President McAllister at the annual stockholders' meeting held April 4th shows that the increased taxes and accidents during the severe fog of last November decreased the net earnings quite materially for the fiscal year ending February 28th. The company's taxes payable this year amounted to \$149,335 and the cost of an accident on November 19th was \$17,976. The gross earnings for the year were \$1,753,313, as compared with \$1,628,737, an increase of \$124,576. The payment of this extraordinary expense made the net earnings less than the dividend requirements on the preferred stock and as a result the company was forced to draw on its surplus, reducing that item by \$22,251. The cost

of the accident, however, is considered properly chargeable to the surplus and if so charged the earnings would show 3.17 per cent on the preferred stock.

The traffic reported for the year is as follows:

Number of passengers carried for the fiscal year ending February 28, 1902 .....	33,910,790
Number of passengers carried for the fiscal year ending February 28, 1901 .....	31,656,972

Increase.....	2,253,818
Per cent of increase.....	7.12

During the year the company carried on the construction of two extensions, the Douglas Park and Garfield Park branches. These two extensions will add 2.35 miles to the lines. There are seven additional stations on the Douglas Park branch and one on the Garfield Park branch at 52nd Ave. with improved terminal loops at the end of both lines.

The financial statement for the fiscal year is as follows:

Earnings.	
Passenger .....	\$1,695,243
Miscellaneous .....	58,069
Total.....	\$1,753,313
Expenses.	
Maintenance of ways and works.....	\$ 45,931
Maintenance of equipment .....	80,057
Conducting transportation .....	527,086
General expenses .....	84,135
	737,209
Surplus earnings.....	\$1,016,103

**Income Account.**

Credits.	
Balance from previous year.....	\$ 54,089
Surplus earnings .....	1,016,103
Interest on balances and other credits to income.....	4,640
	\$1,074,833

**Charges.**

Rental, Pennsylvania Company (crossing).....	\$ 11,900

Unearned passenger balances (tickets sold, not used) ..	671
	<hr/>
	\$27,037,662

The only change in the board of directors of the Metropolitan was the election of Frederick A. Delano, general manager of the Burlington road, to succeed President George B. Harris of that road. The Burlington is still keeping its representative on the Metropolitan board which indicates that arrangements will be made eventually for handling the Burlington's suburban business over the elevated line.

#### MONTREAL STREET RAILWAY CO.

The statement for the Montreal Street Railway Co. issued for the month of February shows the total earnings for the month to be \$133,644, an increase of \$6,032 over the same month last year. The comparative statement of earnings and expenses for February, 1902 and 1901, is as follows:

	1902.	1901.	Increase.
Passenger earnings .....	\$132,159.00	\$126,998.82	\$ 5,160.18
Miscellaneous earnings .....	1,485.69	613.44	872.25
Total earnings .....	133,644.69	127,612.26	6,032.43
Operating expenses .....	103,915.30	87,854.48	16,260.82
Net earnings .....	29,729.39	39,357.78	*10,228.39
Fixed charges .....	14,580.68	8,774.27	5,806.41
Surplus .....	15,148.71	31,183.51	*16,034.80
	<hr/>	<hr/>	
Operating ratio .....	78.63	68.94	9.69

\*Decrease.

The decrease in the earnings for the month are attributed to the excessive amount paid for the removal of snow from the tracks.

#### PHILADELPHIA CO., PITTSBURG.

The report of the Philadelphia Co. and its affiliated corporations among which are the street railways of Pittsburg and the surrounding district, has been issued for the month ending Feb. 28, 1902. The report is as follows:

	1902.	1901.
Gross earnings from operation.....	\$1,150,514.61	\$1,008,124.02
Operating expenses and taxes.....	532,134.55	485,067.68
Net earnings from operations .....	627,380.06	523,056.34
Other income .....	287,917.93	227,853.09
Total earnings and other income.....	915,297.99	750,910.33
Deductions from income .....	68,903.18	32,564.15
Total income .....	846,394.81	718,346.18
Fixed charges .....	321,287.14	263,797.11
Net income .....	525,107.67	454,549.07

#### ST. LOUIS TRANSIT CO.

This company which is the operating company of the United Railways Co., of St. Louis, held its annual meeting March 12th at which the officers and board of directors of the previous year were re-elected. The president's report showed that the power houses of the different companies had an aggregate capacity of 24,000 h. p. On the completion of the new station of the St. Louis Transit Co., it will have a total capacity of 150,000 h. p. and the total mileage of track operated is 361.7 miles. The financial statement for the year was considered very satisfactory and is as follows:

Gross earnings for the year 1901, \$5,777,599; increase over last year of \$1,314,705; operating expenses and taxes, \$3,692,400; increase, \$45,913; net earnings, \$2,085,199; other income, \$6,313; total, \$2,091,512, or an increase of \$1,268,792 for the year. Interest and dividends, \$2,617,142; deficit, \$525,630. Percentage of operating expenses and taxes to gross earnings, 63.91, a decrease of 8.69 per cent.

#### Assets—Securities Owned.

Common stock .....	\$17,261,300
United Railways .....	2,852,158
Preferred capital stock .....	3,137,233
Capital stock Louisiana Purchase Exposition company ..	210,000
	<hr/>
Total .....	\$23,360,692

#### Current Assets.

Cash, \$123,696; securities due from United Railways company, \$263,535; Transit company 5 per cent notes reserved for future requirements, \$1,392,000; discount on bonds sold to be proportional over term of lease, \$275,000.

#### Liabilities.

Interest on funded debt .....	\$1,767,541
Dividends on preferred capital stock.....	576,210
Collateral trust note interest .....	18,560
Organization expenses .....	1,000
Miscellaneous interest .....	253,830
	<hr/>
Total fixed charges .....	\$2,617,142

#### Construction Expenses.

Track and roadway .....	\$ 680,512
Equipment .....	401,039

The report showed that the total number of passengers carried during the year was 117,546,811, an increase of 26,920,430 or 29.1 per cent over the previous year. A feature of the report was the material decrease in the operating expenses which had occurred under the management of General Manager Du Pont.

#### NORTH JERSEY STREET RAILWAY CO.

The annual stockholder's meeting of the North Jersey Street Railway Co., which controls the trolley lines in northern New Jersey, was held March 24th, at which the old board of directors and officers of the company were re-elected. The president's report for 1901 shows the receipts from passengers were \$4,151,410, and from other sources \$21,235. The operating expenses were \$1,994,987, making the net earnings \$2,177,658. From this was deducted \$2,063,899, leaving a surplus of \$113,768. President E. F. C. Young also announced that the company proposed to spend \$1,000,000 in improving the property within the next 12 months.

#### ALBANY & HUDSON RAILWAY & POWER CO.

The Albany & Hudson Railway & Power Co. is to be reorganized under a committee consisting of Clinton L. Rossiter, of Brooklyn; Foster M. Voorhees, of Elizabeth, N. J., and Horace Andrews, of Cleveland. The plan calls for a deposit with the Colonial Trust Co. of its existing securities and the creation of the following new securities: First, a new series of bonds aggregating a total authorized amount of \$1,800,000 of 4½ per cent 40-year gold bonds of which \$1,500,000 par value are to be issued for the purpose of this plan and the remainder to be reserved for future extensions and betterments.

Second, the capital stock now \$2,500,000 par value, all of which is common stock, is to be divided into approximately \$1,800,000 of 5 per cent non-cumulative preferred stock and \$700,000 of common stock.

Third, the \$700,000 in common stock to be divided pro rata among the holders of the present capital stock. In case the new bonds are not marketed by the committee the present stockholders will receive in new bonds 57.92 per cent of their present holdings. Payment for the remaining 48.08 per cent being in preferred stock. In case the bonds are marketed by the committee the present bond holders will receive for each \$1,000 principal of old bonds \$487 cash and \$522 preferred stock. This agreement will become operative when in the judgment of the committee, enough bonds and shares of stock shall have been deposited.

The United Railroads of San Francisco have been organized following the purchase of the Sutro, Sutter St. and San Mateo car lines by the Baltimore syndicate. The purchase price, \$17,599,675, was paid by Brown Bros. on March 18th. The sale was authorized under the civil code of California and passed March 22, 1899, authorizing the sale of any railroad company owning any railroad company in that state of its property and franchises to any other railroad company whether organized under the laws of

that state or any other state. The purchasing syndicate did not expect to take possession of the property for some time, but a clause in the act which provides that such lease conveyance and transfer shall be made within three years from the date of the act left only a few days in which to make the conveyance legal.

The Capital Traction Co., of Washington, D. C., has issued its annual report showing gross earnings for the past year to be \$1,231,863; operating expenses, \$560,171; net earnings, \$671,512; total net, \$691,189; surplus for charges and 4 per cent dividends, \$99,389.

### MASSACHUSETTS STREET RAILWAY ASSOCIATION.

The regular monthly meeting of the Massachusetts Street Railway Association was held at Young's Hotel, Boston, Wednesday, April 9th, and was largely attended.

Ex-President John R. Graham, now fully recovered from his recent severe illness, was present and gave an interesting account of his experiences in Mexico, where he spent the greater part of the winter.

Mr. George B. Francis, chief engineer of the Union Railroad Co. of Providence, R. I., was the guest of the evening, and read a paper on "Improvements in Street Railway Construction."

Mr. Francis was formerly resident engineer of the Boston Terminal Co., and went with the Union Railroad Co. after an experience of more than 15 years in steam railroad engineering, and it was especially interesting to street railway men to learn how the problems which always confront them, were worked out by a steam railroad man.

Since Mr. Francis has been with the Union Railroad Co. much important work has been done, much new track has been built, and old track rebuilt in the most approved manner. The Cranton St. repair shops and the Elmwood Ave. carhouse, both of the most substantial character, have been completed, and a new power station is well under way.

The improvements in track, under way or contemplated, include the following: Placing concrete beams under the rail and thus avoiding of ties altogether, in some instances. Placing at least a foot of gravel ballast under the ties in all track work, instead of using any convenient material. Decreasing the spacing of ties to possibly 22 in. c. to c. Increasing width and length of ties, to not less than 7 in. in width and 8-ft. length. Placing guard rails on all curves of less than 600 ft. radius. Placing the switch tongue on the opposite side from usual practice, in a good many cases, so that the main track will be free from the tongue. The adoption of a lock for switch points as soon as a suitable method can be found for the various conditions.

Some peculiarities of street railway work which impress a steam railroad engineer, were these: The greatest cost of street tracks per mile, under city conditions. The fact that under street railway charters tracks are laid under the supervision of highway surveyors who are generally quite unfamiliar with the requirements. The elevation of outer rail; street conditions sometimes require a depression instead of an elevation. Loose switch points; nothing of this kind is found in steam railroading and it will be a relief to street railroad men when a reasonable method is found to fasten the points while they are run over. The small flanges in street car wheels and the trouble had with chipped flanges due to running over special work.

Mr. Francis also described the car house and repair shops recently completed and the power station now building, and exhibited blue prints and photographs showing the construction.

Mr. Elwin C. Foster, of the Massachusetts Street Railway Association, and Mr. Charles S. Clark, 70 Kibby St., Boston, secretary.

The Youngtown (O.) Park & Falls Street Railway Co. has increased the wages of its employes from 18 to 20 cent an hour. The new scale was effective April 1st.

A bill has been introduced in the Massachusetts Legislature requiring all double truck cars more than 20 ft. in length to be equipped with automatic brakes before Oct. 1, 1902.

### TOUR OF NEW YORK RAPID TRANSIT OFFICIALS.

A tour of inspection was recently made by a number of officials of the New York Rapid Transit Subway Construction Co., which included Chicago, Milwaukee and Pittsburg, for the purpose of inspecting railroad shops, materials, methods of operation, etc., preparatory to installing the system in New York. The party included Messrs. August Belmont, president of the company; E. P. Bryan, general manager; George Gibbs, consulting engineer; S. L. F. Deya, chief engineer; L. B. Stillwell, J. Van Vleck and W. Scott Bryan. The party spent considerable time in investigating the systems of the Chicago elevated roads and at the close of their visit were entertained at an informal dinner at the Auditorium Annex, given by the officers of the local transportation companies.

### NEW CANADIAN CAR SHOPS.

The British Columbia Electric Ry. announces that it will soon commence the erection of car shops at New Westminster, B. C., and all of this company's cars will be built here in the future. The company operates lines in Vancouver, Victoria and New Westminster as well as a large interurban system at Vancouver. The company recently secured an important water concession from the government at Coquitlam Lake and intends to generate power for the road by means of the water falls at this point.

### MAGNETIC BRAKES IN ENGLAND.

The corporation of Huddersfield, Eng., which operates the street railway there has been making a test of the Westinghouse magnetic brake, which has been found entirely satisfactory. This form of brake is automatic and the power is applied both to the shoe on the car wheel and to a slipper brake resting on the track. The brake acts automatically so that the power is always proportional to the speed of the car and the pressure on the track is applied so that the weight of the car on the wheels is not reduced. The car on which this brake was tested was allowed to descend a steep grade, the power being turned on until it attained a good speed; it was then allowed to run away and the brake was applied, after which it was stopped in a remarkably short distance. The grade where this test was made was about 10 per cent. The brake was also tested with the trolley pole taken from the overhead wire, and under these conditions the brake showed equally good results.

The tests were watched by a number of members of the city council, some of whom stayed upon the car and others watched the tests from the sidewalks. The experiments were entirely satisfactory to the members of the council and it is probable that all the cars of the company will be equipped with these brakes.

### ELECTRIC STREET CAR SPRINKLER.

For rapid and economical sprinkling of streets nothing can surpass electric cars fitted with a tank and sprinkling device. In the "Review" for November, 1901, page 851, there was described and illustrated a combined track and street sprinkling car built by the Studebaker Brothers Manufacturing Co., of South Bend, Ind. Two very similar cars have been built by this company for the Colorado Springs & Suburban Railway, Denver, Col. The spray is thrown from two sprinkling heads located on either side of the car near the center of the truck and the water is forced from these heads by two force pumps run by a 30 h. p. motor which is located at one end of the car. The amount of water used as well as the width of the spray is governed by levers on either end of the car. An emergency brake is so supplied for quickly stopping the spray in case of passing a vehicle.

A third sprinkler head is located at the front of the car for flushing the tracks and space between them. In a test with the car standing still, a spray of water was thrown from both sides of the car covering a width of 120 ft., from "curb to curb." The tanks located on these cars are made either of wood or steel and of any capacity desired. This company also furnishes gravity sprinkling cars depending upon the pressure of the water for the width of the spray. These cars flush the rails and from 12 to 15 ft. on either side of the track.

**THE "PERFECTION" RAIL BOND.**

Our readers will be interested in a new rail bond known as the "Perfection," which has just been placed upon the market. This bond has been designed upon the principle that in order to make a perfect contact between the terminal and the rail, the terminal must be expanded from its center towards its surface, and the pressure be uniform throughout the entire length of the hole. The

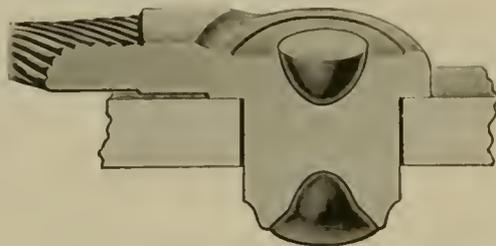

FIG. 1—"PERFECTION" BOND IN PLACE.

"Perfection" bond is made by casting into each terminal two hardened bronze plugs, P, P, in Fig. 2, the one on the inside having a flange which when the plug is pressed home turns over the protruding end of the terminal.

When the bonds are in place the two plugs are pressed towards each other preferably by a hand compressor of convenient size. A movement of the plugs  $\frac{1}{4}$  in. nearer together enlarges the bond

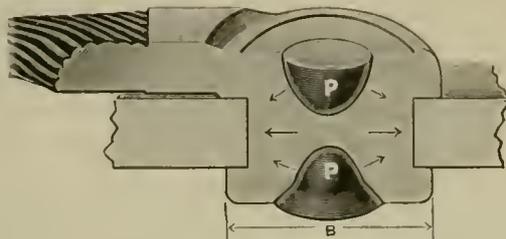

FIG. 2—"PERFECTION" BOND AFTER COMPRESSION.

terminal 3-16 in. and forms a rivet head on the terminal projecting  $\frac{1}{8}$  in.

The claims of superiority made for the "Perfection" bond are: Greatest possible pressure between rail and bond; best rivet head formed on the bond terminal; elimination of electrolytic action between the bond and its plugs; elimination of electrolytic action between the bond and the rail (no air space exists after the plugs are pressed home); ease of application; attainment of perfect contact even if the hole is considerably larger than the bond terminal; limited pressure required in applying the bonds; the bond cannot be turned after being pressed in position; it cannot be driven out

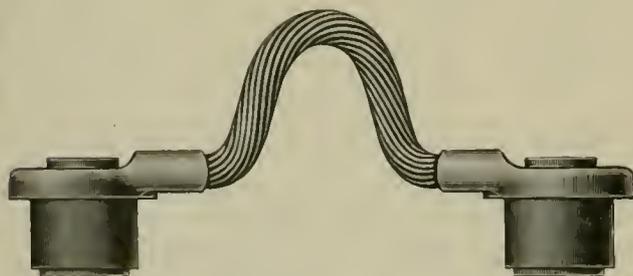

FIG. 3—"PERFECTION" ELEVATED.

after being pressed in place; long life due to great flexibility of the connecting cable and freedom from crystallization.

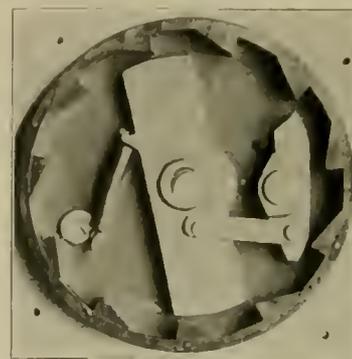

The connections between the two terminals of a bond are made by flexible copper cable specially designed to meet the requirements of strength, elasticity and carrying capacity, and which are made integral with the terminal by a special process, giving a point of ample carrying capacity to conduct the current for which the bond is intended.

Fig. 3 shows a 4-in. bond now ready for the market. The "Perfection" is made in any length from 4 in. up, and the standard cross-sections for  $\frac{7}{8}$ -in. terminals are No. 00, No. 000, and No. 0000. Special sizes of greater section or with larger terminals are made in order.

The "Perfection" elevated bond is shown in Fig. 3; other styles are straight, with two cables parallel, waved, or bent to form short or long eyes. These bonds are made by the Protection Rail Bond Co., for which F. B. Badt and G. M. Willis are general sales agents, with headquarters at No. 1504 Monadnock Block, Chicago.

**HAM TROLLEY CATCHER.**

The accompanying illustration shows the arrangement of the locking device which is used on the Ham trolley catcher to catch and hold a trolley rope when the trolley jumps from the overhead wire. The device consists of a drum on which this rope winds and unwinds automatically as the position of the trolley requires, and no change in its position or rate of speed will cause the bar and pawl

LOCKING DEVICE—HAM TROLLEY CATCHER.

shown in the cut to change their positions, but a jerk of the trolley rope will lock the reel against rotation. The spring shown in connection with this device is not under tension except when the rope reel is locked against rotation, as for instance when the trolley jumps from the overhead wire. There is no adjustment of the spring required and it is loosely connected and inoperative when the trolley catcher is working normally. The use of the spring in this manner was designed to overcome the trouble and annoyance liable to occur in spring operating devices that require a certain strain to which they must be adjusted. This device is made by the Ham Sand Box Co., of Troy, N. Y., and is said to be very effective for preventing damage to trolleys and overhead wires in case the trolley jumps the wire.

**TRADE PAPERS AT THE AMERICAN EXPOSITION IN LONDON.**

The American Exposition which is to take place in London next summer and which has been previously announced in the columns of the "Review" will undoubtedly be the largest and most important exposition of exclusively American products, arts and industries which has ever been seen abroad. One of the interesting features to be shown at the exposition is a collection of American class publications which have developed remarkably in the past few years. As the difficulty and expense of properly exhibiting such papers individually would be prohibitive, the Le Roy Publishing Co., of New York, has rented a large space at the exposition hall and the commissioner for the United States has given this company entire control of the exhibit of American trade journals which will form a composite exhibit in charge of this company. Mr. Dyett of this company will go to London early in May to take charge of this exhibit and all papers represented will be exhibited under his care without favor. He will take subscriptions and contracts for advertising, make reports of all business done and of all moneys collected and will forward lists of those to whom sample copies have been given and any other information which may be desired.

**A MODERN AIR BRAKE EQUIPMENT.**

The introduction of heavy cars and high speeds made an imperative demand for power brakes and one of the remarkable things in connection with electrical railway development is the extent to which air brakes have been applied in this service. Various forms of friction, hydraulic, electric and air brakes, many of which had been tried and discarded by the steam roads, were tried on electric cars. Few of these reached the stage of extensive use in service.

A number of different forms of air brakes, in which the axle driven compressors were used were brought out between 1880 and 1895, including the one invented and patented by Mr. N. A. Christensen. The Christensen equipments were installed and operated with entire satisfaction on cars of the Citizens Railway Co., of Detroit, Mich., in the summer of 1893, and, later, on cars of other roads. Mr. Christensen believed that something better than axle driven compressors were necessary and in April, 1896, his first independent motor driven air compressor was put in operation on one of the cars of the Metropolitan West Side Elevated Railway Co., in Chicago. An automatic governor was also supplied which was arranged to open the circuit of the motor as soon as the pressure reached a predetermined maximum and to close it when the pressure was reduced to a predetermined minimum. This first equipment was a complete success and other installations of similar apparatus were made in various parts of the country.

The Christensen Engineering Co. was organized in 1897 and it found it necessary to increase its manufacturing facilities from time to time. Finally in 1899 the company decided to secure a new site and erect a complete new plant. The works are located near River Park, Milwaukee, between the Milwaukee River and the Chicago & Northwestern Ry., affording convenient facilities for shipping. No expense was spared in installing the most modern equipment obtainable and the plant is such that the constantly increasing demands can be promptly met.

The Christensen Engineering Co. states that over 95 per cent of all the electric roads that have adopted power brakes of any kind, are equipped with the Christensen apparatus, and that there are now over 5000 equipments in daily service.

The following detailed description of the compressor used with these equipments will be of interest to many of our readers. The motor and compressor combined, as shown in Fig. 1, consists of a series wound motor and a duplex, single acting compressor

armature bearing at the pinion end is so arranged that it is constantly lubricated by the oil within the casing of the compressor and is provided with an automatic overflow arrangement. The brush holder of the motor is of the simplest possible construction and is provided with an instantaneous adjustment. The armature bearings are so designed that it is impossible for oil to get into the armature. The combined machine is of extreme simplicity, and there are only two places for oiling, one being the main casing of

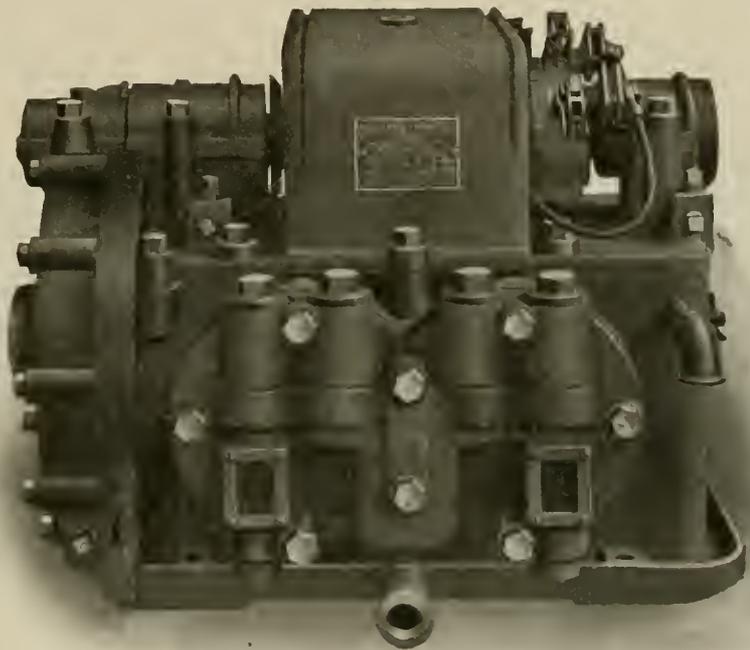

FIG. 1—CHRISTENSEN MOTOR DRIVEN COMPRESSOR.

the compressor and the other being the oil well on the armature bearing at the commutator end, both of which need replenishing only at long intervals. The helical gear is very much more durable than ordinary gears and practically eliminates noise.

The Christensen governor, shown in Fig. 2, consists of an ordinary Bourdon pressure gage mechanism with a special hand, which upon coming in contact with a conducting stud at the position of minimum pressure, allows current to flow through a magnet coil which is provided with a plunger, to which the contact pieces for the motor circuit are attached, thereby starting up the motor. As soon as the hand strikes the maximum stud, current will pass through a second solenoid magnet, thereby pulling the magnet plunger in the opposite direction and opening the motor circuit. By this mechanism it is possible to get a close margin between maximum and minimum pressures. This margin is readily adjusted by moving the contact studs away from, or towards each other.

The details of the accessory apparatus have been as carefully designed and accurately constructed as the compressor and governor.

To show the economy of the air brakes the company cites a test made upon two cars of equal weight and size, operating on the same road, at the same time under similar conditions, excepting that one was equipped with a Christensen motor driven compressor air brake and the other with hand brakes only. The result showed that the former used from 10 to 18 per cent less power than the latter. This was caused by the motorman dragging his brake shoes and was due to the almost universal practice of motormen holding their brake handles in such a position that they can quickly apply the brake when approaching curves or running through crowded streets.

The policy of the Christensen company has been not to place any device upon the market until it has been perfected and proved to be reliable and durable by long and severe tests under the conditions to be met in actual service; in other words the company and not the customer has paid for the experimental work.

It is reported that since the first of the present year orders have been received for more than twice as many Christensen equipments

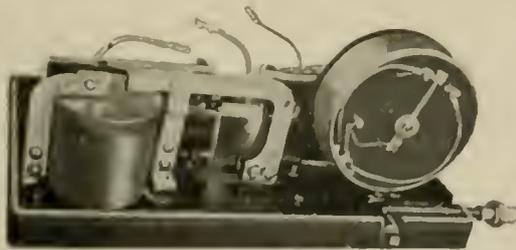

FIG. 2 GOVERNOR

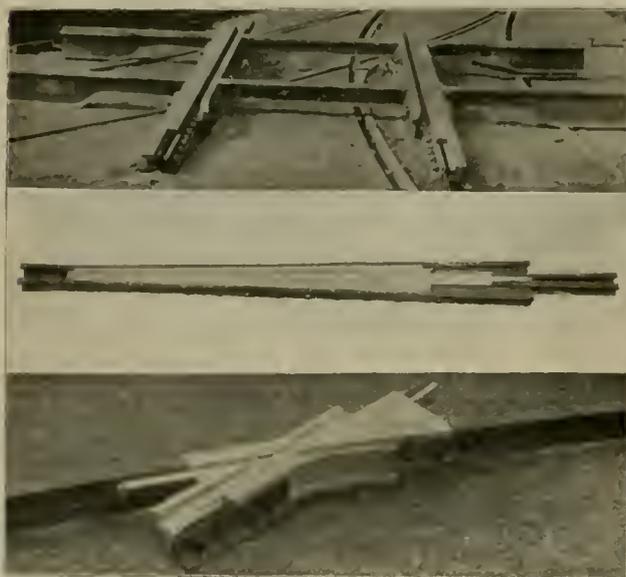

provided with two pistons which are connected by wrist pins to the connecting rods engaging with the crank shaft. This crank shaft is mounted in bearings provided in the case, the extended end of the crank shaft carrying a helical gear which engages with a helical pinion mounted on the extended end of the armature shaft of the motor. The latter is mounted directly above the compressor, the motor lobe forming a top cover for the compressor. This arrangement enables all the working parts to be run in oil. The suction and discharge valves are of the seamless cold drawn steel and are interchangeable one with the other and separately accessible. The

as were ever sold before in an equal period of time. The Christensen equipments are in use in England, France, Germany, Sweden, Norway, Russia and Africa. One of the orders recently received was for 50 motor-driven equipments to be installed on cars belonging to the Government Tramways in Sydney, Australia; previous to this the same road had 127 Christensen equipments in operation.

### INTERESTING MANGANESE SPECIAL WORK.

The accompanying illustrations show some interesting examples of special track containing parts of manganese steel, with which William Wharton Jr. & Co., Inc., has had great success. The company has overcome the difficulties of casting this metal in complicated shapes and can therefore use it more extensively in T-rail work.

The top view shows a steam and street railway crossing made by the Wharton company under the Nichols patents, in which the usual combination of running rail, case rail, guard rail, and filler on the steam railroad track has been united into one single manganese steel casting, which is usually made 16 ft. long overall. The illustration shows a good end view of this rail and shows also how the connection is made with the steel rail in the steam railroad track. The street railways rails in this crossing are made of

MANGANESE SPECIAL WORK.

ordinary steel castings of the height corresponding to the steam railroad rail, where they rest on the ties of the steam railroad and shaped on the extreme ends to match the girder rail of the street railways track, thereby avoiding the usual combination joints. As the steam railroad rail with the cross grooves of the street railway is all of manganese steel, the points of greater wear are protected by this metal, and there is a further advantage in the reduction of the number of pieces and number of bolts which are usually found in steam railroad crossings of ordinary types. The remarkable ductility of manganese steel, although at the same time it is very hard, permitted the introduction of this material into steam tracks. The skepticism of the steam railroad engineers in that respect was easily overcome by the Wharton company by a number of very severe tests on manganese steel castings, of the character used, under drop weights, etc., before engineers of the Pennsylvania R. R. and Philadelphia & Reading Ry., and many of these crossings are now in use in places where street railways cross the tracks of these two roads and also several others, where they are subjected to the heaviest traffic with trains running at high speeds.

The company is also at present doing a large business in manganese steel frogs for steam railroad tracks proper, after having demonstrated through several years' tests the ultimate economy of the use of this expensive metal in place of ordinary steel rails.

We are told that the company has had some of these frogs in use for over two years in places where ordinary frogs used to wear out in three months. The second view illustrates one of these frogs, with a very long angle, made for the Pennsylvania Railroad Co.

For street railway special work in T-rail track the Wharton Company usually furnishes frogs cast solid out of manganese steel as illustrated in the lower view. The demand for first class work in T-rail track of electric roads is constantly increasing and the Wharton company is furnishing large amounts of this solid work to all parts of the country. Where tongue switches and mates are used in this class of work, the mates and the tongues are also solid manganese steel castings.

The main products of the Wharton company is of course still the regular girder rail special work for electric roads with manganese steel centers, the value of which seems to become more and more appreciated.

### TO RELIEVE THE CHICAGO UNION LOOP.

In addition to the purchase of a new down town terminal for the Metropolitan Elevated, the South Side Elevated has taken 14 trains a day off the Union Loop during the rush hours in order to avoid the congestion of traffic upon the loop. These trains are now being diverted to the old Congress St. terminal station, which has not previously been used for several years. The lease of the Union Loop with the connecting roads provides that if cars or trains do not enter the loop because they cannot be accommodated the charge of  $\frac{1}{2}$  cent a passenger for every one in the cars so excluded shall be waived. Whether the capacity of the loop has been reached is a question which will probably have to be arbitrated. The Northwestern Elevated, which now owns the loop, claims that its capacity has not been reached within 25 per cent. The traffic on the loop, however, is very much congested at times and much time is lost if any of the outlying roads are late in delivering their trains to the loop. The lease provides that this question shall be settled by arbitration.

### NILES CAR WORKS BUSY.

One result of the opening of the car works of the Niles Car & Manufacturing Co., at Niles, O., has been a great demand for dwelling houses on the part of workmen engaged in the plant, and the Niles Board of Trade has decided to at once build 50 new houses. The Niles Car company is extremely busy and is confining its work to steam passenger cars and heavy cars for suburban and inter-urban electric railways; orders are now in hand for several months ahead.

### NEW POWER PLANT FOR MILWAUKEE.

The Milwaukee Electric Railway & Light Co. is preparing plans and specifications for the erection of a large new power house in the city of Milwaukee. It is the intention to furnish power from the new plant for the operation of the entire street railway system in Milwaukee, Racine and Kenosha. The street railway power plant in Racine will be abandoned for the use of the railway company, but the boiler plant will be kept intact and the company will seek a franchise from the city for public steam heating for both business houses and private residences.

### MARCH ACCIDENTS.

March 16th, at 8:30 p. m., a Howell Ave. car on the lines of the Milwaukee Electric Railway & Light Co. was struck by the Pioneer limited train at the Kinnickinnie Ave. crossing and slight injuries and bruises to several of the passengers in the electric car resulted. It is alleged that the engine of the train had no headlight burning.

A head-on collision between a passenger car and a work car on the Chicago & Joliet Electric Ry. occurred at 7 a. m., March 28th, near Sag Bridge, resulting in the death of three persons and injuries to several others. The accident was due to the dense fog and the fact that one of the two tracks was damaged by a washout so that all cars were using the same track and a failure to obey orders by the crew of one of the cars.

**BOCH'S "GLAZE-FILLED" INSULATORS.**

In comparing the relative merits of porcelain and glass insulators for high-tension transmission lines it is generally conceded that the former is the stronger mechanically, and the efforts of manufacturers have been to secure porcelain insulators uniformly free from flaws.

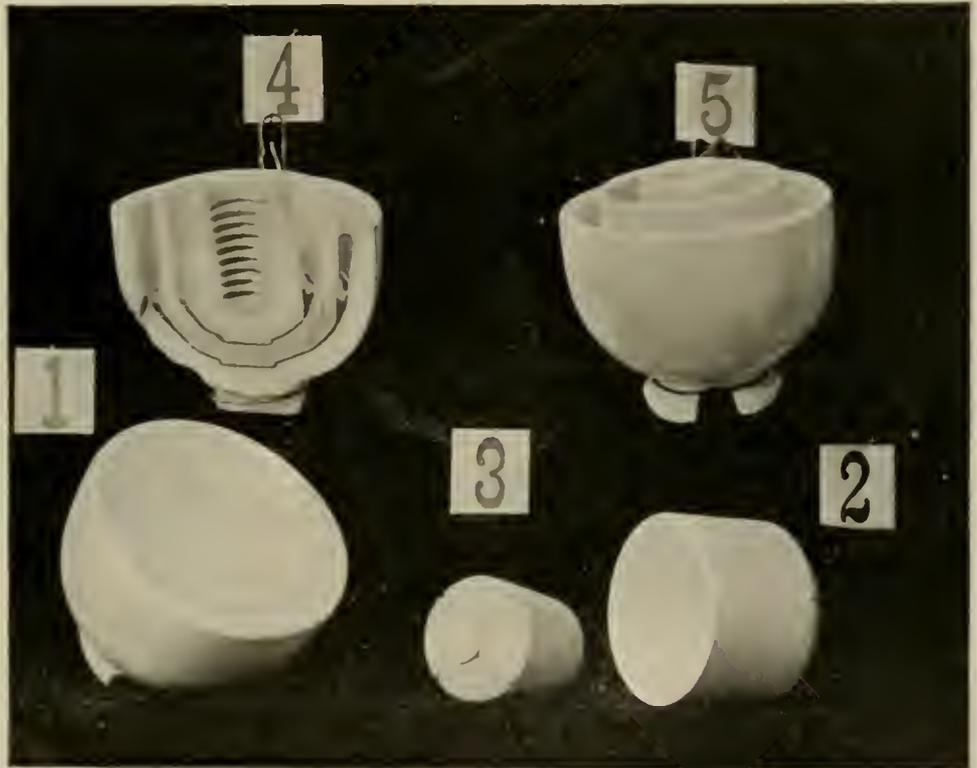

The R. Thomas & Sons Co., of East Liverpool, O., is making a "glaze-filled" insulator, for which the two advantages of great strength and superior insulating qualities are claimed. This insulator is made under a patent issued to Mr. J. W. Boch, superintendent of the company, and the success met with by the insulator during the past few years has led to litigation recently decided in favor of the Boch patent.

A thin piece of clay will mold and vitrify better than a thick one, and in consequence the Boch insulator is built up of two or more shells nested together.

The engraving shows separately at 1, 2 and 3, the three shells of the triple petticoat insulator. The inner piece 3 is moulded with a suitable threaded socket (see 4) for the usual pin. The outer shell 1 is provided with the usual notched head for the conductor and like the intermediate part 2 is made bowl-shaped, so that the three are relatively thin shells, to be nested into each other.

In the practice usually followed by the R. Thomas & Sons' Co. in making these insulators, these separately-molded parts are first dried out separately, preferably in an oven or kiln in the usual manner of drying clay articles by the process known as "biscuit firing." The separate parts are then coated with glaze all over, as by dipping into liquid glazing material, and they are then fitted into each other and stood upside down, that is, petticoat uppermost, as in the position shown at 5. Extra glazing material is supplied at the joints, that is, in the annular channels between the petticoats.

The parts thus put together and supplied with extra glaze at the joints are then put in the sagger with the petticoats of the insulator uppermost and placed in a kiln, in which under great heat the clay shrinks and becomes vitrified as usual and the glazing material melts and becomes of a glass-like character, flowing down into and filling all the space between the parts, such spaces either being there by lack of correct fit of the parts or arising during the shrinkage of the clay by the vitrification. The separately molded shells are thus welded together by seams of glass-like glaze, and this welding has been found to be of so tenacious a character that the insulators can be broken less easily along the lines of the "glaze-filled" seams than elsewhere. The completed insulator is shown at 5, while at 4 it is shown cut in two. This section clearly illustrates the three shells and the intermedate "glaze fillings," which, besides to say, add to the electrical insulating qualities of the insulator as well as its mechanical strength.

**THE STRIKES.**

The strike at Norfolk, Va., was settled March 29th. The militia guarding the property of the Norfolk Railway & Light Co. were withdrawn March 12th and there followed many acts of violence, car crews being assaulted by the strikers, cars derailed, etc. On the 29th 97 of the 162 strikers petitioned for reinstatement, the arbitration committee having ruled that the men should work with non-union men; the 97 were placed at work and the strike declared off.

The Terre Haute (Ind.) Electric Co. has continued to have trouble with its striking employes, and on the Brazil line found it necessary to place an armed guard of five men on each car.

The strike against the Kansas City Leavenworth Railway Co., of Leavenworth, Kan., was settled March 28th, the outcome being a complete victory for the company. A serious incident of this strike was the attempt to blow up two cars with dynamite on March 14th.

**GERMANTOWN-FRANKFORD INTERURBAN.**

A new line has been built between Germantown and Frankford, Pa., near Philadelphia and the opening of the road occurred on March 16th. Previously the only connection between the two places was only possible by a very circuitous route, but with the new line the round trip between these places can be made in an hour and a half.

The Birmingham Railway, Light & Power Co. is considering proposals for twenty seven 20 ft. closed cars. These cars are to be used on the city lines and are to have double trucks and two motors. It has not yet been announced to whom the contract will be awarded. When these 27 cars have been received, with the 20 large double truck, four motor cars recently built, the company will be well equipped with rolling stock as it was two years ago when it sustained a disastrous fire in which over forty cars were burned.

### STREET RAILWAY PATENTS.

This list of patents furnished by I. Reed Clift, Patent Attorney, Washington, D. C.:

No. 604,346, March 4, Wm. N. Best, Los Angeles, Cal. Coach equalizing suspender.

No. 604,359, March 4, Hiram G. Farr, Winchester, Mass. Device for reducing noise in elevated railroad structures.

No. 604,483, March 4, Wallace M. Kelch, Dayton, O. Fare register and recorder.

No. 604,741, March 4, George G. Guenther, Los Angeles, Cal. Automatic switch operating device.

No. 604,825, March 4, Sanford S. Boyd, Laurens, S. C. Speaking tube for trains.

No. 604,843, March 4, Leon Dion, Boston, Mass. Electric traction road.

No. 604,883, March 4, James J. McGarity and George R. Hoff, Pittsburg, Pa. Car fender.

No. 605,144, March 11, Frank E. Case, Schenectady, N. Y. Electric brake.

No. 605,355, March 11, Charles A. Wheeler, Harlesden, Eng. Washing apparatus for railway or tramway carriages.

No. 605,277, March 11, Walter L. Clark, Everett, Mass. Overhead switch.

No. 605,340, March 11, William Philipson et al, Bolton, Eng. Life saving mechanism for tramways.

No. 605,498, March 18, Laurent Semat, Cairo, Egypt. Means for operating signals automatically at level crossings, etc.

No. 605,908, March 18, John W. Cap, Newark, N. J. Revolving indicator.

No. 605,953, March 25, Cyrus E. Smith, Fall River, Mass. Electric trolley.

No. 605,997, March 25, Arthur D. Barton, Ravenna, O. Trolley wheel retainer.

No. 606,248, March 25, Wm. H. Martin, San Francisco, Cal. Life saving device for street cars.

No. 606,313, March 25, Robert V. Cherthan, Louisville, Ky. Electrically controlled railway switch.

### NEW RIDLON CATALOG.

The new catalog of the Frank Ridlon Co., of Boston, Mass., is now ready for distribution, and this edition surpasses in value, size and typographical appearance anything ever before attempted by this company, which is saying a great deal. The new edition contains 432 pages, and is bound in vellum de luxe. It is devoted exclusively to street railway supplies and its a useful working catalog, as it contains only such articles as are made by the Ridlon company or controlled by it as agent, and purchasing agents may rest assured that practically anything found in the catalog is carried in stock and can be furnished on telegraphic order if necessary. The work is printed on heavy book paper and is fully illustrated. A valuable feature is the carefully prepared index with cross references which enables any article to be found easily and quickly.

The Wilson trolley tender, which has become such a necessary part of the up-to-date street railway equipment, is of course given a conspicuous location in the catalog.

### DEMAND FOR PROVIDENCE FENDERS.

The Consolidated Car Fender Co., of 39 Cortlandt St., New York City, had one of the busiest months during March that it has ever had in its history. During that period it finished fenders for 27 different electric roads and in addition filled orders from several of the car builders.

To take care of the growing business in France, Germany and Austria, Mr. Leo Linder has been appointed representative for these countries and will carry a large stock of Providence car fenders. Mr. Linder will make his headquarters at 6 Rue Boudreau, Paris, France.

Among other large companies, the St. Louis Transit Co., St. Louis, Mo., is making a thorough test of the "Providence" new model "C" fender which is claimed to be the best fender ever

attached to an electric car. The Consolidated Car Fender Co. is also doing a large business in the sale of the Millen car step lifter, which it makes in large quantities.

### COPPER CASTINGS.

The users of copper castings will be interested in the work of the Sterion Copper, Brass & Bronze Co., of Chicago, which has made a commercial success of the manufacture of pure copper castings, and whose leading specialty is known as "Sterion" copper.

These castings are being largely adopted by the leading manufacturers of electrical instruments and street railway companies. The "Sterion" castings are guaranteed absolutely solid and free from blow-holes and other imperfections so common to cast copper; chemical analysis shows the metal is 99.6 per cent pure, and it has from two to three times the conductivity of ordinary cast copper.

The company's specialty is the manufacture of different electrical castings such as terminals, contact nuts and copper castings used

by manufacturers of switches, circuit breakers and switchboards. It carries a complete line of standard terminals and contact nuts, and also manufactures copper splicing sleeves and contact fingers for street railway controllers and copper rivets for special bonding purposes.

The accompanying illustrations show the malleability and toughness of "Sterion" copper; these rivets were forged cold under a drop-forge hammer. The copper can be forged hot or cold into shape without cracking or splitting off on the sides.

The company also manufactures commutator bars rolled by special machinery to an accurate taper and gage. The bars being harder, wear evenly with the mica insulation and prevent the high ridges so common in commutators. The office and plant of the Sterion Copper company are at Nos. 63-67 N. Ashland Ave., Chicago.

### THE FOUR-TRACK NEWS.

"The Four-Track News," an illustrated monthly magazine of travel and education published by the passenger department of the New York Central & Hudson River R. R., compares to its advantage with many of the best modern periodicals of a purely literary character. The March issue contained 30 articles, departments and poems, and a full quota of charming half-tone illustrations. Among the features of this number were articles entitled: "The Three Oregons," by Alfred Holman, of the Portland Oregonian; "The Botanical Bronx," by Dr. N. L. Britton, director-in-chief of the New York Botanical Garden; "Midst Peaks and Chasms," by Col. P. Donan, and "The Up-to-Date Locomotive," by A. M. Waitt, superintendent of motive power and rolling stock of the New York Central R. R. There were beside poems and sketches of a high order of merit, and a general fund of information regarding lake and mountain resorts, railroads, new books of the day and affairs theatrical. "The Four-Track News" is edited by John K. Le Baron; its price is 50 cents per year. Sample copies may be had for five cents by addressing George H. Daniels, G. P. A., Grand Central Station, New York.

## ECHOES FROM THE TRADE

THE J. G. BRILL CO. is now building 50 cars for the Union Traction Co., of Philadelphia; 35 of these cars will be mounted on Brill No. 27-G trucks.

A. O. SCHOONMAKER, dealer in mica, will remove on May 1st from 158 William St., to 221 Fulton St., New York City, where he will have more room for handling his increasing trade.

THE STERLING-MEAKER CO. will on April 30th remove its office and factory to Nos. 420-422 Ogden St., Newark, N. J., and all mail and shipments should then be directed to this address.

THE WESTINGHOUSE ELECTRIC & MANUFACTURING CO. is mailing a post-card bearing on the reverse side a half-tone illustration of the Westinghouse polyphase induction motor operating a 122-in. lathe in the works of the Westinghouse Electric & Manufacturing Co.

THE MCGUIRE MANUFACTURING CO., 122 North Sangamon St., Chicago, presents its friends and patrons with a calendar of an original and appropriate design. The reproduction in gold and several colors of a motor starting box makes an effective decoration for a calendar.

THE CENTRAL ELECTRIC CO., of Chicago, is distributing among its customers attractive pamphlets, descriptive of the Wurts and Garton lightning arresters. Those interested can obtain this printed matter upon request, from the above company, who will also be pleased to quote prices.

THE CENTRAL ELECTRIC CO., 264-270 Fifth Ave., Chicago, has published an illustrated folder giving a list of revised prices on its H-G pull sockets and a description of the different patterns, including the pendent pull socket, fibre lined, 250 volts, and the pull wall socket, fibre lined, 250 volts.

AMONG the recent installations of the Gould Storage Battery Co., 25 West 33rd St., New York City, is that of the Amherst & Sunderland Street Railway Co., Amherst, Mass., which consists of 216 cells, type O 513, in lead lined tanks, having a capacity of 100 kw. to be used as a floating battery on the system.

"GRAPHITE" for April contains a number of good technical articles, an interesting description of the mills and mines of the Joseph Dixon Crucible Co., and a word to the wise concerning the merits of Dixon's graphite productions. "Graphite" is published monthly by the Dixon company at Jersey City.

THE CRANE CO., of Chicago, owing to an increase of business has found it necessary to establish a branch office at Duluth, Minn., known as the Crane & Ordway Co., and another office at Seattle, Wash., known as Crane Co. A full stock of Crane goods, plumbing supplies, wind mills and pumps, are to be found at these branches.

THE CHASE SHAWMUT CO., of Boston, has been awarded the contract for rail bonds for the entire system, 27 miles, of the Wilkesbarre & Hazleton R. R., of Wilkesbarre, Pa. As this road is being constructed in an exceptionally substantial and efficient manner, the selection of the Chase Shawmut flexible bond must be regarded as a high tribute to its efficiency.

THE ELECTRIC STORAGE BATTERY CO., Philadelphia, manufacturer of chloride accumulators, has published its bulletin No. 70 for February, 1902, concerning the application of storage batteries to railway plants. The bulletin contains diagrams showing a comparison of results obtained on lines with and without fine batteries for voltage regulation; and a half-tone cut showing the Chestnut Hill battery of the Union Traction Co., Philadelphia; 248

cells, type G 13, operating as a line battery. This plant, which was installed in July, 1896, is one of the six batteries of chloride accumulators in use on the Union Traction Co.'s system. Upon request, the Electric Storage Battery Co. will submit a report showing results to be obtained from the operation of a battery of chloride accumulators.

THE GREEN FUEL ECONOMIZER CO. will install a large Green economizer in the new power house of the Boston & Worcester Street Ry. now building at South Framingham, Mass. The Benedict & Burnham Manufacturing Co., of Waterbury, Conn., has also ordered the Green economizer in connection with 4,000 h. p. of boilers which are to be put in its new boiler house.

THE BULLOCK ELECTRIC MANUFACTURING CO., Cincinnati, O., has issued a new folder containing two half-tone illustrations, one showing the company's 5-kw. type "N-1" generator and gas engine; the other, the finely appointed lunch room in the works at Cincinnati for the use of heads of departments. A complete list of the domestic and foreign branch offices of the Bullock company is also given.

THE SILLS EDDY MICA CO. is sending out a folder containing a sample of new Imperial varnish cloth which it makes by an improved method. The insulation is made up either with varnish or linseed oil as desired. The sheets are coated with two coats applied lengthwise of the sheet in a manner insuring absolute uniformity in thickness. This material may be had in any length desired or cut in strips of any width.

THE MAYER & ENGLUND CO., of Philadelphia, has taken the agency in its territory for the "Universal" safety car tread, a device for application to car steps, stairways and any place where it is desirable to have an absolutely safe and reliable foothold for pedestrians or passengers. The construction is such as to positively prevent persons from slipping in rainy or snowy weather. The device was described in the "Review" for January, 1902, page 47.

B. M. JONES & CO., of Boston, announce the removal of their office to 159 Devonshire St., where they will be ready in future to welcome their friends and business acquaintances. They are the sole representatives in the United States of Samuel Osborne & Co., Sheffield, Eng., and Taylor Brothers & Co., of Leeds, Eng. Their specialties are Mushet's special and titanic steel and Osborne's crucible spindle steel, stay bolts, iron axles, piston rods, crank pins and other forgings.

THE NICHOLS-LINTERN CO., of Cleveland, O., has met with marked success in introducing its pneumatic track sander. This sander is used by the Cleveland, Elyria & Western; Elyria, Grafton & Southern; Cleveland & Chagrin Falls; Cleveland, Medina & Southern; Cleveland & Eastern; Toledo & Western; Western Ohio Traction Co.; Union Traction Co. of Indiana; Chicago, Harvard & Geneva Lake, and numerous other interurban roads and on several large city lines.

THE ELECTRIC STORAGE BATTERY CO., of Philadelphia, will, within a few days, ship to Seattle, Wash., four batteries of "Chloride Accumulators." One of these will be installed in the power station of the Seattle Electric Co. for use with the railway machinery as a regulator of the fluctuating load and as a reserve. The three remaining batteries are for use on the Seattle & Tacoma Interurban Ry., and are to be used for regulating the great variations in load on this system.

THE BUDA FOUNDRY & MACHINE CO. is making a specialty of automatic gates for interurban and other railway crossings as well as highway crossings. These gates are one of the most

effective protections at crossings and they may be made so as to interlock with the switches and signals thus insuring their always being in the proper position. The ease with which they are operated makes their use very economical, as one or several pairs of gates may be operated from a conveniently located tower at a considerable distance if necessary. They also have the advantage of occupying a minimum of space when raised to the normal position.

C. J. HARRINGTON, of 15 Cortlandt St., New York City, dealer in machinery and general supplies for electric and steam railways, telephone and electric lighting companies, reports that his firm has made arrangements and purchased facilities for making a complete line of overhead railway line material. Factory sites have been secured in New Jersey and in Connecticut, and the firm will keep a large stock of overhead material, cars, pull-offs, insulators, etc., at its New York office.

AJAX PLASTIC BRONZE, which the Ajax Metal Co., of Philadelphia, began marketing about two years ago, is meeting with most widespread approval, as shown by orders now in hand amounting close to 2,000,000 lb. of finished bearings. This bronze is guaranteed to give longest life and fullest satisfaction. It is used by many of the largest steam and electric roads. The company states it is receiving most flattering reports from all sides, relative to performance of these brasses in service.

THE GOULD STORAGE BATTERY CO., of 25 West 33d St., New York City, reports the following among recent contracts: An installation of 255 cells, with a capacity of 100 kw., and a tank capacity of 140 kw., for the Kutztown (Pa.) & Fleetwood Street Railway Co., the battery is on a line fed by a booster from the power station; also a battery of 244 cells, having a capacity of 100 kw., with a tank capacity of 125 kw., to be used as a floating battery for the Allentown & Kutztown Street Railway Co., of Allentown, Pa.

THE LUDLOW SUPPLY CO., 313 Electric Bldg., Cleveland, O., advises us that it receives the following orders for Gore track drilling machines, mounted on carriages manufactured by it, during the month of March: Cleveland Construction Co., 6; Springfield & Xenia Traction Co., 1; Indianapolis, Greenwood & Franklin Ry., 1; Townsend, Reed & Co., 1; Worcester & Southbridge Street Ry., 1 carriage. Also that it has a great many inquiries for drills and that the prospects are good for a large number being sold in April.

THE GARTON-DANIELS CO. has issued its catalogue No. 35, dated Mar. 15th, 1903, which describes the latest models of the company's well known lightning arresters. It contains also a practical statement of the methods in use today for the protection from lightning, of electric railway, light and power circuits. It is the most complete publication of this character that has been issued in the history of the electrical business, and should be in the hands of every one interested in the subject. It will be mailed without charge, on request to Garton-Daniels Co., Keokuk, Ia.

SALES OF GARTON LIGHTNING ARRESTERS are reported to be 40 per cent greater this year than ever before, and to accommodate its rapidly increasing business the Garton-Daniels Co., of Keokuk, Ia., has secured the building next adjoining its present location, and is now occupying this in addition to the old quarters. With such largely increased facilities the company expects to be able to handle orders more promptly than ever, which is saving a good deal, as it claims never to have had an order cancelled in its ten years of business on account of delay in filling it.

THE GENERAL ELECTRIC CO. has issued the following new publications: "Small Motors"—a handsomely printed and artistically illustrated pamphlet of 64 pages showing the construction and application of small motors. "Fan Motors"—a 50-page booklet on fan motors. Bulletin No. 4270—illustrating the General Electric rail bond. Bulletin No. 4280, "Two-Rate Meter." Bulletin No. 4281, "The General Electric Type M Control System." Bulletin No. 4282, "Thomson Polyphase Recording Wattmeters." Bulletin No. 4283, "The Box Frame Type of Railway Motors." Flyers Nos. 2004-5-6, "Direct Constant Current Enclosed Arc Lamps." "Rack

Insulators, Form B," "60-Ampere Plug Cut-Outs." Price List No. 5097, Thomson Recording Wattmeters.

THE GREEN ENGINEERING CO., Chicago, reports having recently received orders for its traveling link chain grates from the following concerns: the American Tin Plate Co., 6,000 h. p.; the Union Steel Co., 6,000 h. p.; the American Steel Foundry Co., St. Louis; Crane Co., Chicago; Ballard & Ballard Co., Louisville; Emery, Bird, Thayer & Co., Kansas City; Cleveland Worsted Mills; the Norwood Water Works, and Armour & Co., at Kansas City, East St. Louis and Chicago. Repeating orders have been received from the Cudahy Packing Co., of South Omaha, and the Danville (Ill.) Street Railway & Light Co.

THE THOMAS S. CLARKSON MEMORIAL SCHOOL OF TECHNOLOGY, Pottsdam, N. Y., has issued a catalog for 1901-1902 giving the history of the foundation of this school, a description of its equipment and the organization of its courses. Especial attention is called to the announcement of the course in electrical engineering which has been extended to include telegraphy, telephony, alternating current machinery, electrical distribution, transmission, lighting, traction, power plants and electric design. The course is also supplemented by special experimental study in the electrical engineering laboratory, which is equipped with every facility for testing and experimental electrical work. The school is under the direction of Prof. William S. Aldrich, M. E.

THE LIBERTY MANUFACTURING CO., Pittsburg, reports a wonderful increase in recent sales. In addition to its regular trade, one firm has ordered 42 of the company's turbine cleaners; another 100; another 180, and one company has just placed on order for 500 cleaners to be used during the current year, this last being doubtless the largest order ever placed for cleaners of any kind for water tube boilers. The company also reports heavy sales for the "Famous" oil filter and refiner. This is claimed to be because the "Famous" is the cheapest for the same size, weight, filtering and storage capacity, and because it is sent on approval, or in competition with the understanding that the customer keeps whichever best meets his requirements.

FRANCIS BEIDLER & CO., who are well-known in Chicago as among the largest producers and wholesalers of lumber, lath and shingles in that city, and one of the largest in the world, prior to Apr. 1, 1901, confined their business to the product of saw mills, leaving the white cedar to be taken up later. On that date, however, the firm added a cedar department under the management of Mr. M. B. Cross. The success of the first year's business was so gratifying that last fall arrangements were made to double their output of cedar trolley poles, street railway ties, piling and fence posts, and they are now prepared to fill orders promptly and satisfactorily from their yards at Cloquet, Minn., Escanaba, Mich., and Menominee, Mich.

THE ELECTRIC STORAGE BATTERY CO., of Philadelphia, has within the last few weeks closed the following contracts for storage batteries to be used for trolley regulation: The Altoona & Logan Valley Railway, Altoona, Pa., Allegheny County Light Co., Pittsburg, Pa., Pittsburg Railway, Pittsburg, Pa., Sandusky, Monroeville, Bellevue & Norwalk Traction Co. (2 batteries), Sandusky, Ohio, Parkersburg & Interurban Railroad, Parkersburg, W. Va., United Electric Co., Newark, N. J., Pueblo Traction & Lighting Co., Pueblo, Col., Boston & Maine Railroad, Concord, N. H., Camden Inter-State Railway (2 batteries), Huntingdon, W. Va., Seattle Electric Co., Seattle, Washington, Seattle & Tacoma Interurban Railway (3 batteries), Seattle, Washington.

ARNOLD BULLETIN NO. 5, has just been published by the Arnold Electric Power Station Co., of Chicago, and contains a description of the track work of the Lansing, St. Johns & St. Louis Ry., which was built by this company. The bulletin is well illustrated with views along the line showing apparatus and various incidents in connection with the construction work. The bulletin also announces a new engineering feature which has been adopted on this road and which was designed by Mr. Bion J. Arnold. This feature consists in the use of alternating current throughout from the power station to the motors under the car, and while no details

of the system have yet been published the operation of the line under this new system gives the road a special interest to electrical engineers.

THE STANDARD TRACTION BRAKE CO., of 120 Liberty St., New York City, is establishing branch offices in all the leading cities of the United States. Among the places where branch agencies have been or are about to be appointed are Buffalo, Boston, Cincinnati, Chicago, St. Louis and Pittsburg. These offices acting in conjunction with the home office at New York will give exclusive attention to the interests of the Standard Traction Brake Co., which company attends to the sales department of all power brakes made by the Westinghouse Air Brake Co. for electric traction cars. The types handled include straight and automatic air brakes and magnetic electric brakes. After May 1st, the main offices of the Standard Traction Brake Co. will be in the Havemeyer Bldg., 26 Cortlandt St., New York City.

DETAIL CATALOG NO. 300 is the title of a new catalog for 1902 just published by the Westinghouse Electric & Manufacturing Co., of Pittsburg, Pa. The work consists of a well bound volume in leather and cloth, containing 650 pages of illustrations, descriptive matter and price lists. The work covers all kinds of auxiliary apparatus, switches, instruments, etc., required in electrical installations of every character and is supplemented by excellent indices of headings and materials as well as of style numbers by which orders should be designated. Many of the individual types of apparatus are more fully described in separate circulars, which are furnished upon application, as the scope of catalog No. 300 precludes an elaborate description of the numerous articles which it includes. The typographical style of the book is thoroughly in keeping with all publications of this company.

"ARTISTIC ADVERTISING" may well be applied to the new souvenir mailing card, issued by the Joseph Dixon Crucible Co., Jersey City, N. J. The ability of the American engineer to design steel structures of great strength and pleasing architectural effect is well illustrated in the eight half-tone engravings on this folding card, and at the same time the good qualities of Dixon's silica-graphite paint which protects these structures from corrosion, is pointed out. This paint has been very extensively used in the South, West and sea-coast sections of the United States, also in Mexico, Australia, China, Japan, India, West Indies and Philippine Islands, and has proven its protective and wearing qualities in all climates. The card referred to will be mailed free of charge to anyone mentioning the Street Railway Review in writing the Joseph Dixon Crucible Co., Jersey City, N. J.

FRANCIS C. GREEN, general superintendent of the Consolidated Car Heating Co., of Albany, N. Y., has just returned from Europe and reports that "Consolidated" apparatus is meeting with much favor both in England and on the Continent, particularly in Scotland and the North of England, where the rigorous weather makes a good electric heater almost a necessity. A year ago this company furnished the French Thomson-Houston Co. about 400 electric equipments which are giving excellent satisfaction, and numerous orders have been received as a result of the advertisement thus obtained. The Consolidated company has shipped more than a freight car load of heaters per month for the Manhattan Elevated contract and has to date shipped something over a car-load of equipments for the new cars of the Brooklyn Rapid Transit Co. The company's new catalogue will be sent on request.

THE H. W. JOHNS-MANVILLE CO. has recently issued a complete set of bulletins on Sach's "Noark" enclosed indicating fuses. These bulletins describe and illustrate "Noark" fuses and cut-outs for 500 volt circuits, "Noark" car cut-out equipments, various types of contact in which "Noark" fuses are furnished, fuse and service boxes and special fittings for mounting the fuses on switch boards or panels. The company reports several thousand installations of "Noark" car cut-out equipments and an increasing demand for fuses of all voltages which recently necessitated doubling its manufacturing facilities. Fuses for all potentials can be promptly furnished and the company will be glad to take up any special protective problem presented. The main office of the company is at New York, with branches at Milwaukee, Chicago, St.

Louis, Boston, Philadelphia, Pittsburg, Cleveland, New Orleans and London, Eng.

THE JOHN A. MEAD MANUFACTURING CO., of New York City, is engaged in filling a number of important contracts for coal and ash conveying machinery. This company has just completed and turned over to the government a complete coal and ash handling plant for the Bureau of Engraving and Printing at Washington. Among other orders in hand are conveying plants for the St. Louis, Belleville & Suburban Street Ry.; the Cleveland City Railway Co. for its old Viaduct power house which is being remodeled and enlarged; the Sandusky (O.) Portland Cement Co., this being a duplicate order for machinery installed by the Mead company some time ago. The Edison Electric Illuminating Co., of Topeka, Kan., has also ordered a complete coal and ash plant of the latest Mead design. One of the engineers of the Mead company is now in Sydney, Australia, erecting a complete conveying plant at the power house of the New South Wales Tramway & Power Co.

THE PROTECTED RAILBOND CO., 10 South 10th St., Philadelphia, announces that the J. M. Atkinson Co., Chicago, has withdrawn as western agent for the "Protected" bond and that this territory will hereafter be in charge of the Mayer & Englund Co., Philadelphia, thereby making the Mayer & Englund Co. general sales agents for the entire United States. Arrangements will be made within a very short time for the establishment of sales offices at various points in the western territory, and in the meantime orders should be sent to Philadelphia. The volume of the company's rail bond business during the past year was double that of any previous year, and this, the company believes, shows conclusively that it makes the best rail bond in the world, and one that meets with the approval of all high class engineers and railway managers. A new, complete catalog of bonds and bonding tools is in the hands of the printer and will be ready for distribution early in April.

THE UNDER-FEED STOKER CO. OF AMERICA, with general offices in the Marquette Building, Chicago, was recently awarded a contract to supply Jones under-feed mechanical stokers aggregating 15,600 h. p. to the Citizens' Electric Lighting & Power Co., of St. Louis. The merits of the Jones stokers were recognized and the award of the contract made against the strongest competition. Within the past 30 days Jones under-feed mechanical stokers have been installed as follows: in the Arcade, Permanent and New England Buildings, Cleveland, and by the Cleveland Crane & Car Co. and the Muncie, Hartford & Fort Wayne R. R. The Ohio Farmers' Fertilizer Co., of Columbus, and the Superior Steel Co., of Carnegie, Pa., have also installed Jones stokers. Second orders have been supplied to the La Grange (Ill.) Light & Water Works Co., the Montreal Mining Co. of Hurley, Wis., and the Niles & Scott Co., of La Porte, Ind. In addition, sales of Jones stokers aggregating 7,450 h. p. have been supplied to Canadian patrons through the Toronto office of the Under-Feed Stoker Co.

THE SPRAGUE ELECTRIC COMPANY reports among very recent sales the following orders for split-pole generators: E. L. Epperson Construction Co., St. Louis, 200-kw. engine type, 200 r. p. m., 550 volts; Chillicothe Street Ry., Chillicothe, O., 300-kw. belted type, 450 r. p. m., 550 volts; Cosmopolitan Power Co., Chicago, 75-kw. belted type, 600 r. p. m., 250 volts; Ohio Powder Co., Youngstown, O., 100-kw. belted type, 585 r. p. m., 500 volts; Keystone Leather Works, Camden, N. J., 200-kw. engine type, 200 r. p. m., 230 volts; Providence & Danielson Ry., Providence, 400-kw. belted type, 400 r. p. m., 575 volts; Board of Education, Chicago, two 150-kw. engine type, 225 r. p. m., 115 volts; E. W. Bliss Building, New York, four 150-kw. engine type, 225 r. p. m., 250 volts; Lackawanna Iron & Steel Co., Buffalo, 500-kw. engine type, 100 r. p. m., 250 volts; St. Joseph Railway, Light, Heat & Power Co., 150-kw. engine type, 150 r. p. m., 200 volts; Otis Elevator Co., Yonkers, 50-kw. engine type, 290 r. p. m., 250 volts; Wm. Tod Co., Youngstown, O., 175-kw. engine type, 200 r. p. m., 230 volts; Railroad Construction Co., Princeton Junction, two 400-kw. belted type, 400 r. p. m., 575 volts; Sturges, Cornish & Burns, Chicago, 200-kw. belted type, 425 r. p. m., 250 volts; American Electrolytic Co., Rock Glen, N. Y., 200-kw. belted type, 550 r. p. m., 250 volts; Alfred F. Moore,

Philadelphia, 75 kw. belted type, 600 r. p. m., 125 volts; Arlington Co., Arlington, N. J., two 75-kw. belted type, 460 r. p. m., 230 volts; one 62½ kw. belted type, 470 r. p. m., 230 volts, and one 37½ kw. belted type, 500 r. p. m., 230 volts; Adams & Westlake Co., Chicago, 125 kw. engine type, 250 r. p. m., 250 volts.

THE MICA INSULATOR CO., of New York, Chicago and London, is now putting on the market its well known "Empire" brand of oiled cloths and papers in rolls of 50, 100 and 500 yards length. It is also prepared to furnish it in any length desired. An entirely new and original process enables the manufacturer to coat the material with two very evenly distributed coats of pure linseed oil. Experience has proved that pure linseed oil refined and treated by the M. I. C. process is far superior as a coating for cloths and papers, than any linseed oil substitutes, which usually contain adulterations, and which in a very short time will harden and crack. "Empire" cloth will retain its high finish and rubber like flexibility indefinitely and may be kept in stock a long time without any deterioration either mechanically or electrically. It is thoroughly dried before leaving the factory, and does not contain nor does it need any wax paper between the sheets to prevent them from sticking together. The manufacturer will be pleased to furnish samples, circulars and prices to any who may be interested.

MR. HAROLD P. BROWN, of New York, informs us that the Baltimore & Ohio R. R. Co., has recently placed additional orders for plastic plug bonds to be used in re-bonding joints on its belt line. This is doubtless the severest electric service in the world, as hundreds of heavy trains, including freight service, are handled by electric locomotives every day, and the return current varies from 1,200 to 2,400 amperes. The track is new 100-lb. T rail with very heavy angle plates and the joints have to be very carefully maintained. Some time ago plastic plug joints were put in on several sections of the Baltimore & Ohio belt line in competition with ordinary copper bonds. When first applied the plastic plug bonds had a conductivity equal to one-half that of a 100-lb. rail, and Mr. Brown states these still hold the same as when put in, without a single failure. The new plastic plug bonds that are being installed are 1½ in. in diameter, which will give practically the full conductivity of the rail. The experience of this road clearly indicates that the Brown plastic plug bond is extremely well suited for heavy traffic and tunnel work. Mr. Brown has found it necessary to put in new boilers and engines at his plant in Montclair, N. J., and also to add new buildings in order to meet the increasing demand for the Edison-Brown bonds.

TRAVELING ELECTRIC HOISTS, is the title of a bulletin which is about to be published by Pawling & Harnischfeger, of Milwaukee, Wis., makers of traveling cranes, etc. This bulletin, No. 7 L, contains 28 pages and 14 half-tone illustrations of hoists in service which are both of standard and special designs. It also contains a number of drawings which indicate clearance dimensions and tables of speeds, etc. The method of splicing I-beams is shown and the several types and sizes of hoists made is given. The bulletin also contains a concise description of the mechanism. These hoists are built to operate on either straight or curved I-beam run-ways which permits service to any part of a plant or central station. As these hoists travel as well as do hoisting they differ from many electric hoists which operate a hoisting drum only. They contain many of the features that appear in this company's traveling cranes and the utility of the hoist and cranes is about the same except that the hoists are naturally built for smaller capacities. Among the users of these hoists may be mentioned the Carnegie Steel Co., of Pittsburgh, Pa.; Allis Chalmers Co., Milwaukee; Jones & Laughlin, Pittsburgh, Pa.; American Bridge Co., Milwaukee, Wis.; New York Ship Building Co., Camden, N. J.; Robert W. Blackwell & Co., Ltd., London, Eng., and American Tin Plate Co., Newcastle, Pa.

PAWLING & HARNISCHFEGER, Milwaukee, Wis., advise us that the demand for electric traveling cranes continues satisfactory in every way. They have recently booked orders for 45 cranes and hoists, among which are those from representative firms as follows: Henry Vogt Machine Co., Louisville, Ky., one 5-ton, two 10-ton, one 15-ton; Oil Well Supply Co., Oil City, Pa., one 2-ton; Wheeling Steel & Iron Co., Wheeling, W. Va., one 7-ton; Allis-

Chalmers Co. (Fraser & Chalmers plant), Chicago, one 20-ton, with 5-ton auxiliary; Allis Chalmers Co. (Gates plant), Chicago, one 50-ton with 5-ton auxiliary; Bradley Manufacturing Co., Allegheny, Pa., one 6-ton; Fairbanks, Morse & Co., Beloit, Wis., one 15-ton; Colorado Fuel & Iron Co., Bessemer, Col., one 10-ton, one 20-ton; Newport News Shipbuilding & Dry Dock Co., Newport News, Va., two 20-ton; Whitney Iron Works Co., New Orleans, La., one 10-ton, one 20-ton; American Bridge Co., Philadelphia, one 20-ton, double trolley; Pittsburg Plate Glass Co., Pittsburg, two 3-ton; American Sheet Steel Co., McKeesport, Pa., two 5-ton; Structural Steel Car Co., Canton, O., one 12-ton; American Well Works, Aurora, Ill., one 10-ton; Norton Emery Wheel Co., Worcester, Mass., one 10-ton; Lackawanna Iron & Steel Co., West Seneca, N. Y., one 3-ton; Follansbee Bros. Co., Pittsburg, one 5-ton, one 10-ton, with 3-ton auxiliary, and one 25-ton; Vulcan Works, Chester, Pa., one 15-ton, with one 5-ton auxiliary; Northern Central Railway, York, Pa., one 25-ton; Midvale Steel Co., Philadelphia, Pa., one 10-ton jib; Standard Steel Works, Burnham, Pa., five 5-ton and one 15-ton; American Sheet Steel Co., Wellsville Works, Wellsville, O., one 30-ton with 5-ton auxiliary; Trenton Iron Co., Trenton, N. J., one 3-ton; Wm. B. Pollock & Co., Youngstown, O., one 20-ton riveter with 5-ton auxiliary.

THE GOULD STORAGE BATTERY CO., 25 W. 33rd St., New York City, has recently installed a storage battery plant for the Amherst & Sunderland Street Railway Co., of Amherst, Mass., consisting of 216 cells, type O. 513, in lead lined tanks. The battery has a capacity of 100 kw. and is used as a floating battery on the system.

THE AMERICAN BRAKE SHOE & FOUNDRY CO. has appointed Mr. Joseph D. Gallagher, formerly president of the Lappin Brake Shoe Co., second vice-president, and Mr. Joseph B. Terbell, formerly president of the Corning Brake Shoe Co., general sales manager.

#### EXHIBITS AT THE MAINTENANCE OF WAY MEETING.

The exhibits at the convention of the American Railway and Maintenance of Way Association were shown on the parlor floor of the Auditorium Hotel and were more extensive and complete than at previous meetings of the association. There were nearly 80 firms represented and many of the exhibits were of unusual interest. Among this number may be mentioned the following:

American Steel & Wire Co., represented by George P. Rider. Samples of fence.

Atlas Railway Supply Co., Chicago, represented by J. G. McMichael, R. B. Kent, C. D. Porterfield and B. H. Rogers. Atlas rail joints.

Buda Foundry & Manufacturing Co., Harvey, Ill., represented by F. A. Ingalls, J. McKinnon, and E. S. Nethercut. Buda and Paulus track drills, Wilson track drills, wheels and crossing gate models.

Continuous Rail Joint Co. of America, Newark, N. J., represented by L. F. Braine, S. P. McGough, and H. M. Montgomery.

Joseph Dixon Crucible Co., Jersey City, N. J., represented by D. M. Howe.

Kinnear Manufacturing Co., Columbus, O., represented by A. S. Beymer. Steel rolling doors.

Ludlow Supply Co., Cleveland, O., represented by W. E. and James B. Ludlow. Rail joints, rail braces and tie plates.

Paige Iron Works, Harvey, Ill., represented by F. A. Ingalls, John McKinnon and E. S. Nethercut. Photographs of frogs, crossings, switches and other track material.

Ramapo Iron Works, Hillburn, N. Y., represented by F. W. Snow and Arthur Gemunder. Models of frogs, switches and automatic switch stands.

Scherzer Rolling Lift Bridge Co., Chicago, represented by E. H. Heald and C. L. Keller. Photographs of bridges in use.

Taylor Signal Co., Buffalo, N. Y., represented by W. W. Salmon, H. G. Groce, W. G. Hovey and L. Thomas. Sixteen-lever interlocker, complete switch and lock movement, switch boxes, dwarf signals and single arm high signals.

Weber Rail Joint Manufacturing Co., New York, represented by F. A. Poor and W. T. Smetten. Insulated, compromise and standard Weber rail joints.

PUBLISHED ON THE 20TH OF EACH MONTH.

CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. XII.

MAY 20, 1902.

NO. 5

The Windsor & Kenfield Publishing Co. has removed its general offices and printing plant from their former location to Nos. 45-47 Plymouth Place, Chicago, to which address all future communications for the company should be addressed.

Beginning with this number the regular publication date of the "Street Railway Review" will be the 20th of the month instead of the 15th as heretofore.

Practically no progress has been made towards a settlement of the street railway franchise question in Chicago. On May 8th the United States Circuit Court sustained the demurrer of the City of Chicago to the bill brought by Mr. Elkins, as stockholder of the Chicago Union Traction Co., to determine the validity of the "99 year act." The court held that the complainant had not show facts sufficient to give the court jurisdiction, and its rulings did not go to the merits of the case at all. Permission was given to file amended bill, and it is possible that the Federal courts will pass upon this act. Some decision must be had on the "99 year act" before the negotiations for franchise renewals can be carried to a successful conclusion—that is, unless the city should adopt a more equitable basis of settlement than that heretofore proposed.

From a report of Consul General Mason, printed elsewhere, it appears in the absence of any official information that the high speed electric railway experiment between Berlin and Zossen have fallen considerably short of the expectations of the company which was organized to carry on this work. It is a significant fact that after a lapse of five months, no official report of these experiments has been published and what has come to light in regard to them has been gathered from private sources. It may be readily surmised, however, that as the avowed object of these experiments was to reach a speed of from 125 to 150 miles an hour they were not a success, as at the time the experiments ceased, a speed of somewhat less than 100 miles an hour was the highest that had been

attained and at this speed the side motion of the cars became very uncomfortable, and the tracks needed repairs at the close of each run.

As far as the question of building a car capable of reaching the speed desired is concerned, there was very little question in the mind of electrical engineers that this could be easily accomplished. The weak point in these experiments appears to have been the track, which is laid with rails weighing less than 70 lb. per yard. The practice in electric railway work in this country has tended constantly towards the use of heavier rails and on many suburban roads where comparatively high speeds are attained the practice is to lay rails weighing in the neighborhood of 100 lb. per yard.

The stability and rigidity of the roadway practically limits the speed which may be attained upon it and for this reason it seems strange that experiments of this character should have been undertaken upon any except the most solid and perfect roadbed which can be built. While these tests have proved that the speeds desired are impracticable for adoption on the German state railway lines they are by no means conclusive as to the inability of the electric motor car to reach the speed desired. The entire trouble appears to have been with the track and roadbed and had this been constructed of heavier rails, with a firmer foundation, better joints, etc., there is little question but that the cars could have considerably surpassed the record made.

The value of the rolling lift type of draw bridge in preventing a very serious class of railway accidents was most forcibly demonstrated in Chicago on May 15th, when a train on the Metropolitan elevated collided with the bridge over the Chicago river while the bridge was being opened for a passing boat. The train had run past the danger signal and the front end of the motor car ran some distance up the bridge in its inclined position; the only damage resulting was to the projecting roofs of the first and second cars in the train, these coming in contact when the front of the motor car ran upon the incline. With a draw bridge of the swing type the train would undoubtedly have gone into the river; as it was the delay to traffic was but twenty minutes.

To realize how serious the results might have been on the Metropolitan one has only to recall the other fatalities due to electric cars running through open draw bridges, four of which have occurred during the last ten years. At Portland, Ore., in 1893, 6 persons were drowned; at Milwaukee in 1895, 3 persons; at Cleveland in 1895, 17 persons, and at Saginaw, Mich., in 1897, 7 persons were drowned. In each of these cases only one car went into the river.

The United Traction & Electric Co., of Providence, was called upon, a few weeks ago, to consider a proposition presented by a number of its employes, which contained several unusual provisions in addition to the ones ordinarily included in agreements as to the terms of employment. The draft of the agreement submitted by the men called for a recognition of the labor union with all the restrictions incident thereto, such as membership in the union being made compulsory after 30 days' service with the company, questions as to the discharge of men being submitted to arbitration and suspension by the company of men under discipline by the union.

Besides these there was a clause given that would give the men practical supervision of the time-tables and schedules, and a stipulation that with every complaint filed against any motorman or conductor there should be deposited an amount equal to the man's pay for one day, to be paid to the man if the complaint proves ill-founded.

The company declined to consider these proposals on the broad ground that if accepted they would place the operation of the road in the hands of the labor union. The objections to giving the two agencies by which a street railway is operated—the time tables and schedules and the trainmen—into the control of any persons or association who are responsible to neither the public nor to the stockholders are of course vital, and could not be accepted, but the minor point of requiring deposits when complaints are made against employes is also worthy of notice.

Such a regulation, if adopted, would do a company more harm in the way of antagonizing the public than almost anything else that could be imagined. If any doubt is entertained as to how the public and the daily press would look upon a rule requiring de-

posits when complaints are made, reference may be made to the "Review" for December, 1901, page 888, where are given some examples of the abuse directed at the Rochester Railway Co., because a similar request for such a rule by the employes had been taken under advisement by the manager.

The adaptability of trolley lines for handling both freight and passenger business in suburban districts is so well known that it is not surprising to hear from time to time, reports of the competition which is gradually increasing between the steam and electric roads for traffic of this character. While in many places the suburban service of steam roads does not reach paying proportions there are many cases where, by reason of their far more economical rates of fare, the trolley lines have made serious inroads upon the business of their rivals.

Numerous instances of severe competition of this kind can be mentioned and a number of rate wars have recently been inaugurated between steam and electric railways in which, however, the latter have a very decided advantage. As an example, trolley competition between New Castle, Youngstown and Sharon, Pa., has driven the railroads connecting the places to consider the reduction of local fare. The distance between Youngstown and New Castle is 21 miles and the steam road fare is 65 cents. The electric railway which recently began operating between these cities charges a fare of 20 cents. The Detroit, Ypsilanti, Ann Arbor & Jackson Ry. has increased its freight business to such an extent that the Michigan Central, which heretofore monopolized the business in this territory, has cut its freight rates 50 per cent. The competition for freight between the Hudson Valley Ry. and the Boston & Maine Railroad Co., sometime ago became so keen that the steam road refused to receive freight from the trolley company. The Hudson Valley, Ry., however, appealed to the courts with the result that the steam road was obliged to accept freight from the electric lines.

These examples are sufficient to show the feeling with which the electric lines are regarded by many of their steam competitors. On the other hand, investigations by a number of Chicago railroads as to the effect of trolley competition have developed the fact that strictly suburban business has been practically lost by steam roads, but for longer distances the trolley lines have served to build up hitherto struggling suburbs and the business of the steam roads has been considerably increased. The Chicago, Burlington & Quincy has decided to abandon the greater part of its Chicago suburban service as soon as the extension of the Douglas Park branch of the Metropolitan Elevated, of Chicago, is completed. The short distance suburban traffic of this road for some time past has hardly been sufficient to pay the running expenses of the suburban trains.

In some places the policy of the steam roads has been to improve their suburban service by putting on additional trains and reducing fares with a view to either forcing their trolley competitors out of business or making them glad to sell out to the steam roads. The fact is that from the very nature of their equipments the steam railroads are not in a position to compete with the trolleys for short distance runs where frequent train service is required. It is not entirely a question of the relative cheapness of operation of steam and electricity, as the difference in cost of the two motive powers, even if considerable, would be but a comparatively small item of the total cost of operating the cars or trains. The real difference between the two systems is the cost of train service. The electric car is operated by a crew of two men, a motorman and conductor. The steam railroad train on the other hand engages the services of an engineer, a fireman, a conductor, a brakeman and a baggage man. Not only is there this great discrepancy in the number of employes, but the wages of the steam railroad crew are very considerably larger than those of the motorman and conductor. This high cost of train service on a steam road necessitates the number of trains being kept down to a minimum, especially on lines of comparatively light traffic, and the infrequent running of these trains naturally causes passengers to patronize competing electric lines on which the cars are run at far shorter intervals.

A number of attempts to provide self-propelled cars suitable for frequent service on interurban and branch lines has been made at different times but these cars have never met with any great success and have practically all been abandoned after various periods

of trial. One car of this character was built for a division of the New York, New Haven & Hartford; an old 60-ft. dining car was used and one of the trucks was removed. The body was altered so as to receive a "steam truck" and one end of the car was partitioned off to form an engine room; the passenger compartment had a seating capacity for 60 passengers. This car was put in service in December, 1897, and was used in several places. It was recently, however, taken out of service for the purpose of being repaired and will probably never again be used. It soon became apparent that the car was not a success in the service for which it was designed, and it was used for the greater part of its life for switching and transferring over a two-mile branch.

Another car of this general description was built for and operated by the Erie Railroad. This car was only 50 ft. long and had a baggage compartment and accommodations for 30 passengers. It made 14 trips a day over a four-mile run for about three months. It was found to be unsuitable for passenger service for the reason that when the engine was in operation the jar transmitted to the passenger compartment made it so uncomfortable as to be quite impracticable in operation. The capacity of the boiler was also insufficient to propel the car for any great distance and this defect has been common to all cars of this type. In order to economize space a vertical boiler is required, as the use of a horizontal boiler leaves but little room for passengers on a car of ordinary length, and the size of vertical boilers for this use is practically limited on account of the minimum height which must be observed in order to pass under bridges and through tunnels, etc.

Another self-propelled car was built for the Cincinnati, Hamilton & Dayton Ry. It had an engine room at the front end, a baggage room 6 ft. long and a passenger compartment seating 24 passengers. On a trial trip the machine made a run of 38 miles at from 30 to 40 miles per hour carrying a loaded box car and the fire was given no attention during the trip. The fuel used for this car was anthracite coal which was fed from a hopper on the car by means of the jarring of the engine. The feed was facilitated by a vertical rod passing up through the center of the fire box, which was operated by a lever. The roof of the car contained a surface condenser for disposing of the exhaust steam when running over city streets. This car made 168 miles a day for a few months, but like its predecessors proved unsatisfactory and its use was soon discontinued. The car had neither boiler or water capacity sufficient for the service required and the loading of the coal magazine through the roof was a source of considerable trouble.

A car similar to this was built for the Detroit Southern Railway and also one for the Pittsburg, Cincinnati, Chicago & St. Louis, but in both of these cases the boilers proved deficient as the steaming capacity was entirely insufficient to meet the requirements.

The foregoing examples are sufficient to show the difficulty of producing a suitable self-contained motor for this class of service and it may be mentioned that in most cases where cars of this character have been operated the companies running them were obliged in order to avoid labor troubles to pay the wages of a fireman who merely rode on the car with the engineer but performed practically no service whatever. It would seem, therefore, that in the special field of suburban and interurban work that it is impossible for the steam road to compete with any degree of success with trolley lines as the latter can be operated at a profit on passenger traffic only at rates which the steam roads cannot possibly afford to adopt even with the help of their freight and express traffic.

We believe, however, that there should be no feeling of animosity between these two classes of railroads for the reason pointed out, that what the steam roads lose through short distance trolley competition they undoubtedly more than make up by the increased volume of traffic which results from the building up of the neighborhoods through which the trolleys operate. There can be no defence for the rate wars which have been inaugurated in several parts of the country for the reason that such action merely reduces the profits of both parties and is felt much more by the steam roads than by the trolley. It is probable that in some cases where rate cutting has been resorted to it has been with the ultimate object of absorbing the trolley lines by the steam roads which cannot fail to recognize in the former not only highly desirable properties from the standpoint of an investment, but useful auxiliaries as feeders to steam trunk lines.

## New Repair Shops at Providence, Rhode Island.

Details of Building Construction—Application of the Card Index System to Keeping Shop Records—Some Shop Methods—Armature Oven—Methods in Vogue for Making Paint and Painting Cars.

By far the greatest proportion of the total street railway mileage in the state of Rhode Island is controlled by the United Traction & Electric Co., of Providence, which is not an operating company but controls, through stock ownership, the Union Railroad Co., of Providence, the Pawtucket Street Railway Co., the Rhode Island Suburban Railroad Co. and the Interstate Consolidated Street Railway Co. These properties are at present in independent operation, but will undoubtedly be brought together under one operating company some time in the near future.

All the repairs to equipment for the properties controlled are made at the recently equipped shops on Cranston St., in Providence. These shops are the third or fourth largest street railway repair shops in this country.

The buildings occupy a triangular tract and have a frontage of 390 ft. on Cranston St. and an extreme depth of 370 ft. The general layout of the yards, tracks, pits and various shop departments is shown in one of the accompanying illustrations. The buildings are entirely of brick, with stone trimmings. The roof is steel girder

The apparatus and ducts for the indirect hot blast heating system were furnished complete and installed by Westinghouse, Church, Kerr & Co.

The boilers are located near the rear of the building and the fans and radiators, which are of cast iron, are on the second floor, near the center of the shop. The fan apparatus is in duplicate, and the fans are driven by electric motors wound for efficient operation at two speeds, and thus four variations in the intensity of the heat are readily made. The galvanized iron pipes for distributing the hot air vary in diameter from 5 ft. near the heaters to 6 in. at the outlets. This piping is carried under the roof trusses, where it is out of the way of the shop work, and the outlets are arranged about 12 ft. apart and 7 ft. above the floor.

The fact that there are four virtually independent companies having repairs made at these shops introduces a number of complications in the accounting and storekeeping methods, as all labor or material has to be charged to the separate company for which it is intended. The records and bookkeeping system are therefore more

EXTERIOR VIEW OF NEW SHOPS UNITED TRACTION & ELECTRIC CO., PROVIDENCE.

construction throughout, with monitor roof down the center of the main bay, giving ample light in all parts of the building. The front part of the building has no basement, but the general grade of the property gives a good sub-cellar at the back of the plant, which is utilized to excellent advantage for storing heavy stock and other supplies.

Everything is as nearly fireproof as modern building material and method can afford. The floors are of granolithic. The pits are constructed of brick piers on concrete footings with a 4 in. brick arch between the pier as shown in the cross section. The pit tracks consist of 60-lb. T rails, A. S. C. E. standard, laid on 8x12 in. stringers, reinforced by channel irons along the inside of the stringers with 7/8 in. tie rods about every 6 ft. The stringers rest upon brick piers with granite blocks 1 ft. 4 in. square between the top of the piers and the stringers. The pit floor has a 6-in. bed of portland cement concrete. The tracks in the general equipping shop are continuous for the full length of the shop, but there are cross tracks in the center upon which travels a Taunton transfer table with apron approaches. The paint and carpenter shops are unusually well lighted and ventilated and are connected with each other by curves and switches, so that a car from the carpenter shop or wood working shop passes directly into the paint room, and when painted and varnished goes directly into the equipping room, where the final equipping and inspecting are done. The entire plant is protected by an automatic sprinkling system in addition to numerous fire hydrants and stand pipes and is heated and ventilated by an elaborate system of blowers and piping.

complicated than would be required were there but one operating company.

Much of the difficulty arising from this source is met by the application of a card indexing system, and as a matter of fact the cards have almost entirely supplanted book accounting in these shops.

When the stock is received into stores it is immediately entered in the daily receiving sheet, and from these sheets is entered on cards 4 in. by 6 in., which are filed alphabetically. These cards give the dates and the quantity of each lot of each material as it is ordered and received, and the amount used for a given period, which information is of value in placing new orders.

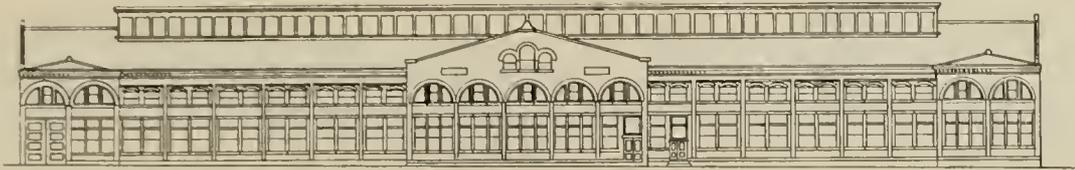

The stores are kept in bins, which are unusually well arranged. These bins are placed in sections at either side of the aisle and the material is classified as far as possible according to the work for which it is to be used. The bins are in two tiers, access to the upper tier being had from an iron grating floor reached by a stairway. The floor is made of open iron grating work so that no dust will accumulate. This brings all of the bins within reach of a man of ordinary height. The bins are not numbered, but, as before stated, are classified, so that any stock can be readily found. The arrangement for lighting the store room is interesting. The incandescent lamps are arranged in different circuits so that the storekeeper as he enters the store room first turns the switch which lights the main aisle but none of the side aisles. As he enters the side aisle in which is the particular stock he desires, he turns a switch and lights the lamps in that one section. There is therefore no needless burning of lamps.

The materials are charged out of stores at the price at which the purchase was made, and for determining this amount a separate index of price cards is maintained. Another set of cards, called the stock record, has spaces for each day for 40 weeks, and gives the amount charged into stores and the amount charged out, and also

repairs for each of the four companies, requiring that a large number of the different forms be always kept on hand. If the companies are merged under one operating head this branch of the business will be greatly simplified.

Exact account of all scrap material is kept, and the price obtained

CRANSTON ST. ELEVATION.

the balance on hand at the end of each week. These cards are watched by a clerk and when the amount of any material on hand drops to a certain predetermined minimum he makes a note of the fact for reference to the purchasing agent, who immediately orders a new supply of the stock required; at the same time the amount in the stock room is checked with the card.

When goods are received they are all charged to the Union Rail-

road for it as scrap is credited back to the account to which the material was originally charged. Portions of the price and stock cards are reproduced on pages 258 and 259.

Records of all cars, trucks and snow plows, with the sub-equipment on each, and the repairs made during their life, are kept on cards 5x7 $\frac{1}{8}$  in. These cards are four in number, Equipment Record, Repair Record, Truck Record, and Snow Plow Record.

INTERIOR OF WINDING ROOM.

road Co. and when used for any of the other companies the fact is noted on what are termed credit slips, from which the proper charges to the individual companies are made up. The goods are delivered on requisitions which are 5 in. by 6 in., these requisitions comprising the storekeeper's receipt. The requisitions are made up in pads, there being a separate form for each of the different classes of

equipment the four cards are of different colors. The Equipment Record card is orange, that for the Repair Record straw color, the Truck Record drab and the Snow Plow Record card blue.

The headings for these cards are given in the tables which follow on page 258.

TIME KEEPING.

The time of all employes in the shops is kept by means of a recording system furnished by the Simplex Time Recorder Co., of Gardiner, Mass. There are five recording instruments in the different parts of the building, on which the men check themselves in and out for both morning and afternoon hours.

USE OF COMPRESSED AIR.

The shops are fitted with a complete air compressing plant, consisting of a Christensen water-jacketed combined pump and storage tank having a capacity of 75 cu. ft. of free air per minute. The air is piped to all parts of the building and is used in pneumatic tools, pneumatic hoists and pneumatic jacks; also for cleaning cars and in combination with a gas jet for burning off cars. This use of compressed air is found to be of the utmost convenience and it is believed has resulted in reducing the expense of all classes of repair and cleaning work. For cleaning cars a nozzle is placed at the end of the lead from the compressed air main and cushions, curtains and mats are thoroughly cleaned by this air blast in one-fourth the time it formerly took several men to do the work. It is also found

SHOWING HEATING PIPES.

that the dust can be kept out of corners and inaccessible places in a car with much less effort than by any other means.

One of the novel applications of compressed air is made in the painting room. By the use of a special nozzle a jet of compressed air is combined with a jet of gas from the city gas mains, and the blow torch so formed is used with the most satisfactory results for burning off cars, trucks, etc., prior to repainting. The nozzle is made of brass and consists of a 1/4-in. tube inside of a 1/2-in. tube, the smaller pipe being for the gas and the larger one for the air.

The air pressure and the supply of gas are regulated by stop cocks, giving any intensity of flame desired. The one possible objection to this is the lack of flexibility, as the air and gas pipes are necessarily limited in length and the car to be burned off has to be brought to one place in the shops. This difficulty is overcome by reserving one

the supervision of the company's master painter. The colors are bought in bulk and are made up as required. For this purpose there are two grinding mills and four 80-gallon mixers driven by a small motor. The master painter uses his own formulas for mixing paint. From records kept for several years it is estimated that by

track for this one purpose. The same form of burner is also used in the winding room.

PAINT SHOP METHODS.

These shops are somewhat unique, in that all the paints and insulating compounds are ground and mixed on the premises, under

making its own paints in this way a great saving in cost has been gained by the company, with the added advantage that the painter knows just what he is getting in his paints. The body colors are usually mixed by hand in comparatively small quantities in order to keep them from becoming tough or stale. Paints of which large quantities are used are mixed in the 80-gallon mixers and com-

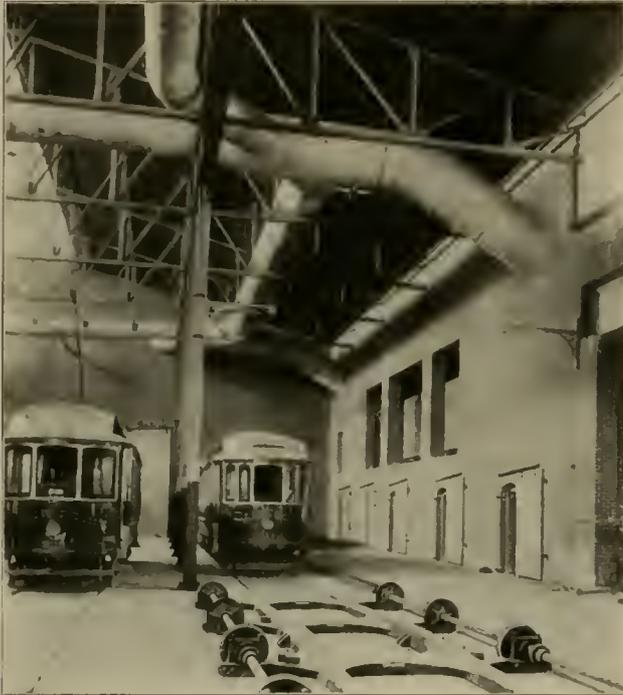

PLAN AND SECTION SHOWING DETAILS OF PIT CONSTRUCTION.

paratively large quantities are kept on hand, especially of white paint for roofs and metallic paint for poles, floors, etc.

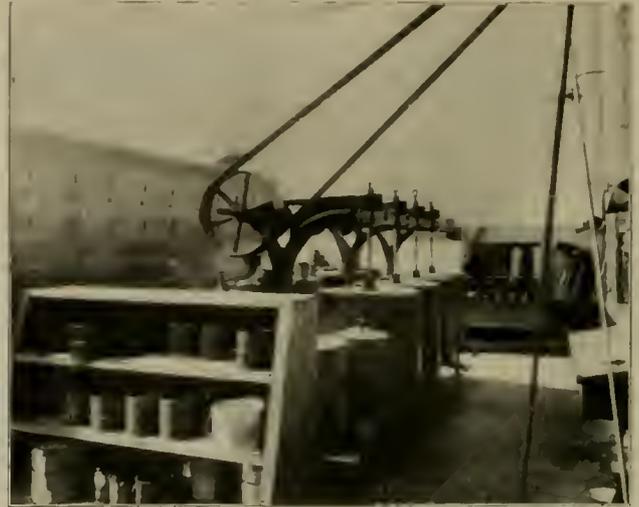

Speaking of the comparative cost of making paints over the cost of buying them ready made, it is pointed out that, although the regular paint dealers may be able to buy their rough colors at a better figure than the smaller consumer, the street railway company can effect a saving in the cost of labor, as the men who do the mixing and attend to the mixing apparatus can put in their spare time setting glass (all the glass setting is done in this room), keeping charge of the paint store room, etc., and are men who would probably be required any way to take care of this work. The cost of power for operating the apparatus is small, as a 2-h. p. motor taking current from the trolley circuit is all that is required. Only the best oils and colors are purchased and the formulas are made by an experienced paint mixer, so that a high grade of paint is assured. It is estimated that a saving of practically 20 per cent is effected over

pulled forward. This is done not only to give access to the contents but also to enable the space behind the barrels to be kept clean and free from rubbish.

It is the custom in these shops to save all scraps that result from burning off cars, and this scrap finds a ready sale to jewelers for

INTERIOR VIEW.

PAINT ROOM.

the sake of the particles of gold leaf contained therein. All paint skins and residue paints are also kept for use on floors and other odd jobs.

Car signs are painted with the aid of perforated patterns made of manila paper and the use of pounce for outlining the letters. The colors are then filled in by hand. These patterns are perforated by the use of a tracing wheel, similar to the small wheel used by harness makers for making perforations. Stencil designs are used to

the cost of the same grade of paint if bought from the regular dealers.

The company also makes insulating compounds and shellac, using for this purpose a churn which consists of a 50-gallon barrel fitted with castings at the ends to receive the bearings.

The paint shop and store room, which are under the charge of Mr. H. Arnold French, master painter, are models of cleanliness and neatness. In the store room everything has its proper place and must be kept therein.

For taking care of brushes long, shallow, copper-lined tanks are used. Ordinary brushes are kept in water and are suspended in racks placed across the tops of the tanks. A simple device keeps these tanks free from paint scum. The water enters the tank from the bottom and passes out through an outlet pipe which has its opening at the surface of the water, so that the circulation in the tank is always from the bottom to the top, and all scum or other accumulations on the surface immediately pass out through the outlet pipe. At the back of the brush tank are fastened sheets of iron, which are used for rubbing purposes, and it is against the rules to clean out brushes anywhere except on these sheets. The sheet iron is in sections, held in place by screws, and can be taken down and readily cleaned by means of the gas blower pipe already described. The varnish brushes are kept in varnish in a large tin box having nails projecting on the inside for holding the brushes at the proper height. Camelhair brushes for the body colors are kept in a mixture of oil and turpentine in separate cans. All barrels of powdered colors, etc., are mounted on small wheels so that they may be easily

LADDER WAGON IN USE.

some extent for decorating, but these are always finished up by hand, giving a peculiar shaded effect that cannot be gained by hand alone or by stencils alone.

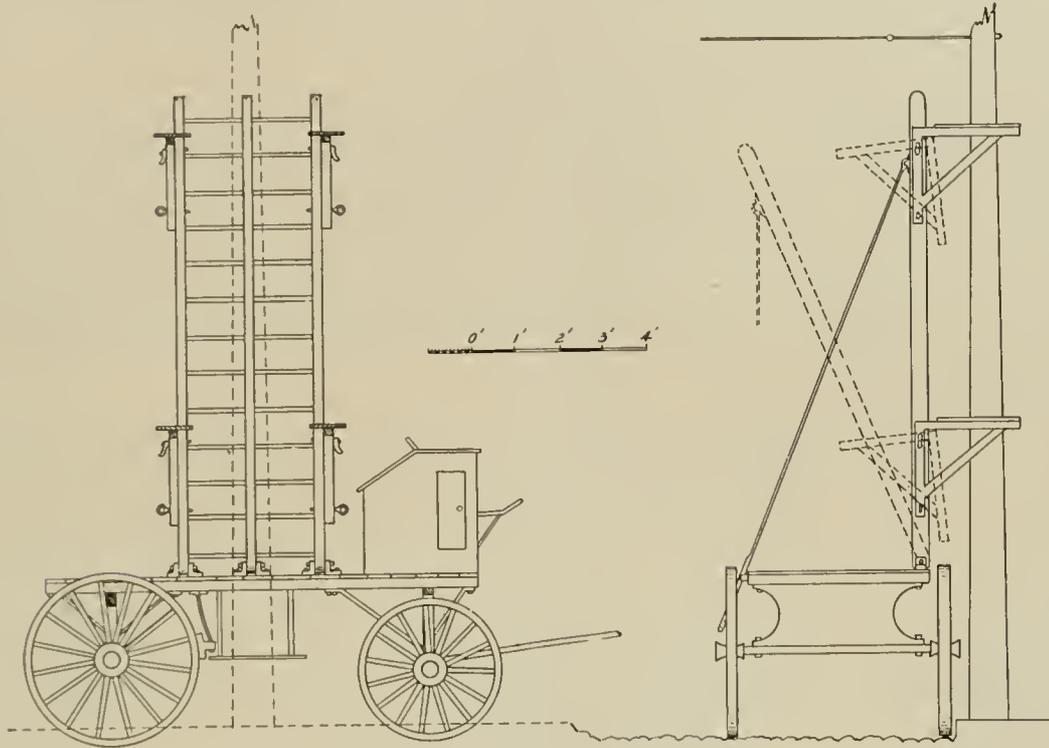

The amount of care exercised in all parts of the paint room is illustrated by the fact that even the sand paper is cut into con-

venient lengths and kept in a rack according to grade. These pieces of sand paper are given out by the store keeper just as any of the more expensive materials.

Old glass is cut up and utilized for putting into headlights. The

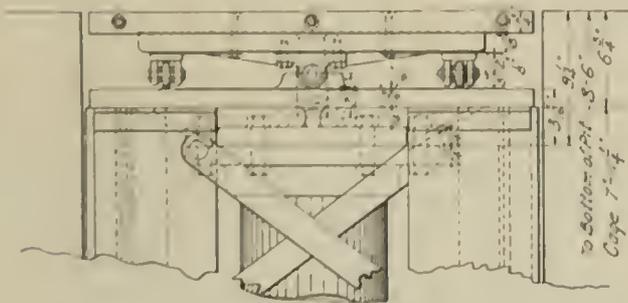

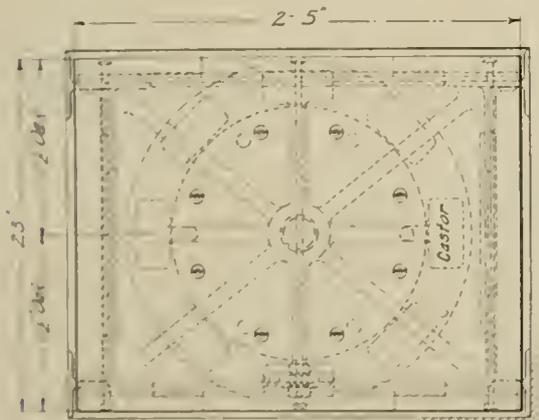

scratch the glass. The diameter of the disk is regulated by placing the cutter at any desired position on the swinging arm.

Window sash are painted on a revolving table which has raised bevelled edges, so that but one edge all the way around the sash

disks of glass are cut to the proper size by means of a small steel wheel cutter mounted on an arm which swings from a small wooden pedestal. The base of the pedestal is lined with felt and cannot

TOP OF LIFTING JACK.

ELEVATION OF JACK.

by the dotted lines, where they are out of the way. If desired the whole ladder can be thrown back by means of a connecting rod which has holes spaced at different intervals in its lower end where it is attached to the wagon platform.

A large box at the front of the wagon is used as a receptacle for paints, brushes, etc. The time required in painting poles has been reduced about one half by using this wagon. It formerly cost 32 cents to paint a pole, including labor and material, but this figure has now been reduced to 10 cents per pole. A metallic paint made in the company's shops is used.

CAR BODY HOISTS.

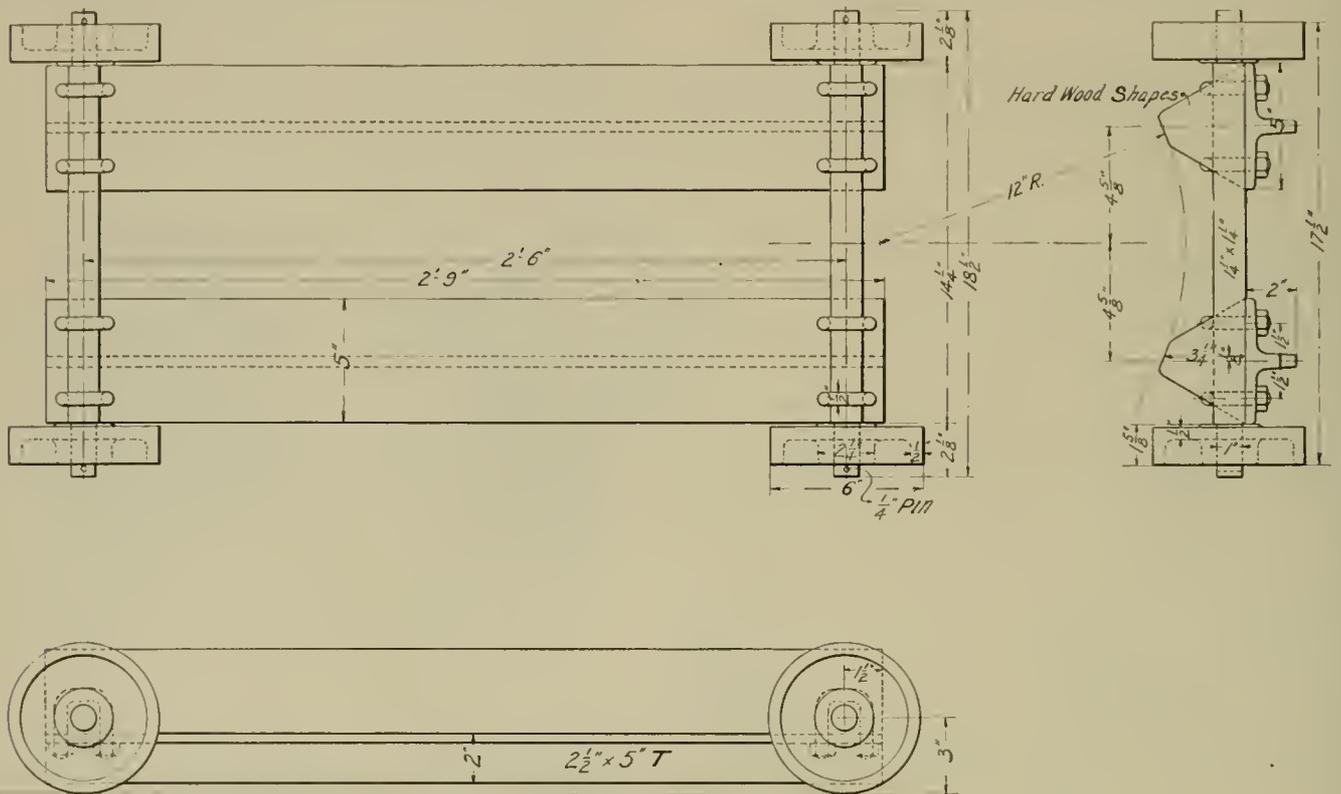

For hoisting car bodies two cranes run on overhead tracks are in use. These cranes have a capacity of 8000 lb. each and are operated by a piston air motor geared to a shaft running lengthwise of crane. Keyed to this shaft are two drums on which are wound steel cables dropping down each side of the car. These are attached to beams placed under the car body near the ends, thus ensuring to the car an even hoist, free from any twisting strains. Another air

The water after having been used in operating the jack returns to a discharge tank, from which it is drawn by the pump and is forced under pressure back into the pressure tank. The pump is automatic in action and starts itself whenever the pressure on the tank drops below the predetermined point.

In using the lift a suitable cradle is placed on the table to receive the pair of wheels that is to be removed. Water is then admitted to the cylinder and the plunger is raised until the axle rests in the cradle. The section of rail immediately beneath the wheels is removed and the plunger lowered. Just before the lowest point is reached the pair of wheels is given a quarter turn so that they will rest upon tracks laid on the pit floor level and at right angles to the tracks on the car barn floor. New axles and wheels are put in place by reversing the process. The jack is found useful in changing armatures, motors and heavy truck parts.

BAKING OVENS.

For baking rewound armatures electrically heated ovens are provided, and working drawings of these are also given with this arti-

ARMATURE TRUCK.

motor operates an elevator from the first floor of the machine shop to the basement.

HYDRAULIC LIFTING JACK.

There is in use in the equipping shop a convenient hydraulic pit jack, drawings of which will be found herewith. The jack is used particularly for removing and replacing wheels and motors or motor parts under cars.

The jack consists of a 9 1/2-in. cylinder let into the pit floor and resting on a concrete footing, the top of which is 9 ft. below the bottom of the pit. The piston has a travel of 4 ft. 5 in. Upon the top of the plunger rests a circular table 22 in. in diameter, which is free to revolve on bearing plates and also upon a series of small rollers or castors. To steady and strengthen the plunger when it is in the raised position it is surrounded by a steel lattice work frame or cage, which slides up and down in guides as the plunger moves. The dimensions and details of the frame and table are shown on the drawings.

The hydraulic pressure is furnished by a motor-driven Quimby pump. The pressure tank from which the water passes to the jack cylinder has a capacity of 500 gallons and carries a pressure of 90 lb.

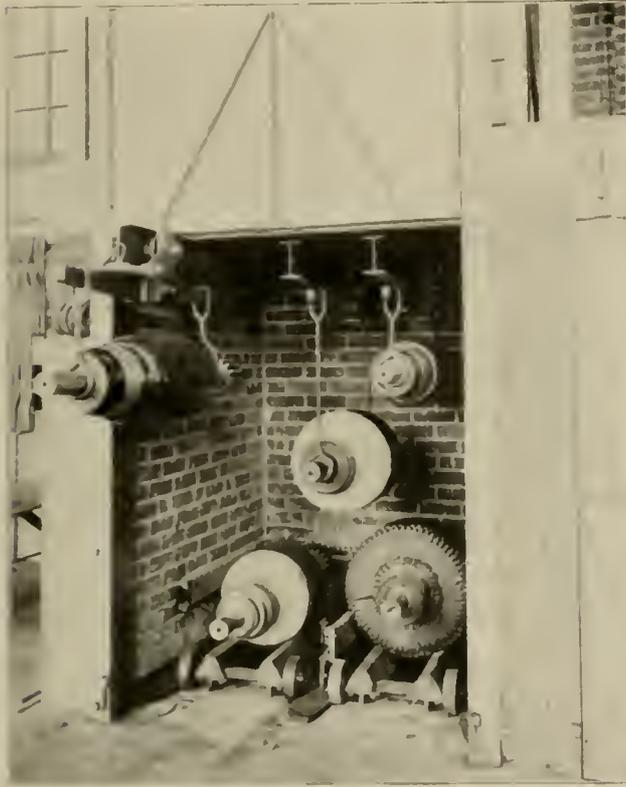

ele. The ovens are built with 12-in. brick walls and brick partitions between the compartments. The back walls are re-enforced with frame work of iron channels. The roof is formed by 7-in. channels on which is laid 1/8-in. sheet iron, and on this a layer of asbestos filing, with a layer of bricks on top of the non-conducting material.

The doors are formed of sheet iron strengthened with T and angle irons and have asbestos filling. The doors slide upward on channel uprights and are balanced with counterweights suspended from ropes passing over the top of these uprights and pulleys at the back of the ovens.

Armatures are run into the ovens on low four-wheel trucks and are also suspended from the ceiling by means of novel trolleys. This trolley arrangement consists of a 7-in. I beam fastened to the ceiling of the oven. Suspended from this beam by rollers is a 5-in. I beam which is free to move on the larger beam and may be drawn forward to project 25 in. outside the front line of the ovens. The armature is suspended in a sling from a special casting having rollers which may be slipped over the lower flanges of the 5-in. I beam mentioned. The casting is provided with an eye by which the casting and the armature may be picked up by a pneumatic hoist and carried about the shops. When an armature is to be baked it is

brought to the oven by the hoist and the casting mentioned is slipped over the 5-in. I beam, after which both the beam and the casting are pushed back until the armature is wholly within the oven and the sliding door may be closed. Each compartment has three of these overhead trolleys and space on the floor for two armatures on trucks, making room for five armatures in each compartment.

There are three "Simplex" electric heaters in each division, one on each of the sides. It is found possible with a 525-volt current to

BAKING OVEN FOR ARMATURES.

maintain a temperature of 160 degrees F. with 3.2 amperes of current, or a temperature of 180 degrees F. with 4.75 amperes of current.

All the departments of these shops are in general charge of Mr. W. D. Wright, superintendent of equipment, and many of the devices and methods in vogue were devised under his direction.

#### THE LANCASTER RELIEF ASSOCIATION.

The Lancaster County Railway & Light Co.'s Relief Association, comprising employes of the Lancaster, Pa., electric lines, held its annual dinner and reception at the Eagle Hotel, Mechanicsburg, April 22d, the trip from Lancaster being made in a special car, with Frank S. Given, general manager of the company; H. B. Riddle, superintendent, and S. I. Charles, superintendent of transportation, among the guests. After an enjoyable repast Mr. Given addressed the diners, promising them the support and co-operation of the company in the fraternal and charitable work of the association. Mr. B. F. Zook, financial secretary, read the report for the year ending April 1st, which showed \$8,146.00 to have been paid out for sick benefits and \$200.00 for death benefits, while the association has the sum of \$911.00 securely invested. The organization has 161 members and is rapidly spreading its influence. The entertainment included with a musical program and the return to Lancaster. Mr. Zook invites correspondence from similar associations of other companies.

The Grand Rapids (Mich.) Railway Co. expect to be in possession of its new office in the Godfrey Building, 38 North Iowa St., Grand Rapids, by June 1st. The new executive quarters are centrally located and are large and commodious.

#### EFFECT OF THE BOSTON ELEVATED ON TRAFFIC.

The elevated railway in Boston has now been in operation a sufficient length of time to make it possible to form a reasonably accurate estimate of the value of the service, and to demonstrate in what particulars it may be regarded as an entire success, as well as to indicate what further improvements are necessary in order to attain the perfection in operation at which the management aims. The service upon that portion of the elevated system extending along the water front is not as yet completely installed owing to the heavy demand of the subway traffic, which is so far in excess of the volume of business anticipated that nearly all of the elevated cars at present owned by the company are required on this main line, which is partly elevated and partly underground.

Perhaps the most striking feature of the situation, and one that causes the operating department serious concern, is the unanimity with which those passengers who have a choice between the surface and the elevated lines for reaching their destinations, forsake the slower going surface cars, which are seldom overcrowded on lines that parallel the elevated, and pack themselves into the overburdened elevated trains which are so densely filled with passengers that, during the rush hours, it is frequently difficult to close the platform gates. If patronage is a fair gage to popularity, the elevated road may be set down as the most popular institution in the city.

In the first estimate of the number of cars needed for the service, 60 cars were thought to be an ample provision for all the business that could reasonably be expected to seek the elevated lines, but in order to provide abundant accommodation for any travel in excess of the estimate, 40 additional cars were ordered, making a total equipment of 100 cars at the time of opening the road. It was very soon demonstrated that nearly all of these cars would be required for the service on the main line alone, running between the terminal by way of the subway, and 50 more cars were ordered, some of which have been received and will shortly be placed in commission, which will enable the company to install an additional through service by way of the water front, as originally intended.

From the standpoint of the public, the most important result which the elevated has accomplished has been the reduction in the running time into or through the city. Upon the surface lines 45 minutes were allowed for a trip between Dudley St., Roxbury, and Sullivan Sq. in Charlestown, the terminal points of the elevated road, and it was frequently impossible for the cars to make their trips within a quarter of an hour of this time. The running time between the same points on the elevated is 21 minutes, or less than one-half the former running time, and the trip from the center of the city to the suburbs has thus been shortened by ten or fifteen minutes. In effect it has brought the suburban territory two or three miles nearer to Boston with all of the incidental advantages accruing therefrom.

Another important benefit to the city has been the removal from Washington St. of the congestion of cars and people that formerly blockaded the street and sidewalk of that main thoroughfare. In order to fully appreciate the extent of the improvement and the methods by which it has been accomplished, it should be called to mind that all the surface traffic through the city is necessarily borne by Washington St., there being no other thoroughfare available for that purpose. Into this single main artery it was formerly necessary to pour all the cars from the northerly and southerly suburbs.

At the Dudley St. station on the south, and the Sullivan Sq. station on the north, the suburban lines diverge in various directions, connecting with numerous places beyond. Upon these radiating lines trips are frequent and cars are numerous. Before the elevated was put into operation it was necessary to run all suburban cars into or through the business center, and as a result the number of cars was disproportionately greater than the number of passengers. There were so many cars that they were in each other's way and progress was slow. Added to the congestion of cars was a congestion of people occasioned by large numbers of persons standing upon the sidewalks waiting for their particular cars to arrive.

It was largely the purpose of the elevated road to provide a service that would overcome this situation, and supply, as a substitute for many of the surface cars, a means more speedy and certain of covering that portion of the trip included between the two points at which the suburban business radiates from the main line

of travel. This was accomplished by making these two points the terminals of the elevated line and by running a large portion of the surface cars between the outlying districts and these elevated terminals, instead of running them into the city. Universal free transfers are given between the elevated and surface lines, and, to make the transfer as convenient as possible, surface cars are run upon inclines to the elevated level at the terminals, so that transfers are made at the same level. The effect of this change in the service has been to remove from Washington St. the surplus cars, and render it unnecessary for passengers to wait at street corners for the arrival of out-of-town cars.

Incidentally the construction of the elevated road has resulted in a very large financial revenue to the cities and towns in which it operates its elevated and surface lines. The elevated road pays nearly \$400,000 in taxes of various kinds upon its own capital, earnings and property in addition to that paid on the leased surface lines. Under the Massachusetts law this company, which is the lessee of the extensive West End Street Railway system, pays in taxes upon both systems, and for use of the subway, more than \$1,000,000 a year, or more than one-tenth of its entire income, which is distributed among the cities and towns in which it operates in proportion to the number of miles of track which it operates in each of them, except that the entire subway rental is paid to the city of Boston.

While upon the subject of taxation it may be well to state what these taxes are. A heavy corporation tax is assessed upon the market value of the stock of both the Elevated and the West End roads; a compensation tax in payment for its privileges is levied upon the volume of business which it transacts; the ordinary property tax is paid upon all property owned by both companies. It is also required to pay \$213,205.18 for the use of the subway, and, in addition, must divide with the public its earnings above 6 per cent, if it is ever so fortunate as to be able to pay annual dividends in excess of that amount.

Besides these taxes upon investment, income, property and profits, there are numerous equivalents of taxes such as the paving of a considerable portion of all of the streets in which its tracks are located; the removal of snow and ice, the expense of which some years run into hundreds of thousands of dollars, and other obligations, all of which constitute a heavy burden upon the revenues of the company, and make it practically impossible for the company to earn more than a small dividend.

### IMPORTANT CONSOLIDATION AT RICHMOND, VA.

By purchase on April 24th of the property of the Richmond Traction Co., the Virginia Electrical Railway & Development Co., and the Westhampton Park Railway Co., the interests controlling the Richmond Passenger & Power Co., took control of all the electric railway, power and lighting properties in the city of Richmond and the suburban territory tributary thereto.

The Traction Co. and the Passenger & Power Co. have for some time been vigorous competitors for the street railway business of Richmond. They both had lines on the main business streets and so sharp had the competition for traffic become that both companies were running cars under less than five minutes headway during the entire day, resulting in an enormous and unprofitable car mileage for both roads. By the consolidation much of this useless mileage will be avoided. The Traction company owns 18 miles of track, and the Passenger & Power company, 68 miles. The new owners also control the Richmond & Petersburg Street Ry., 22 miles, and the Petersburg (Va.) Street Ry., 6 miles, making a total mileage controlled of 115 miles.

The Virginia Electrical Railway & Development Co. owns a 5,000-h. p. water-driven plant on the James River. This plant has an ultimate capacity of 15,000-h. p. and supplies direct and alternating current for traction, power and lighting. The new owners have also acquired rights to the water power of the old upper Appomattox canal, near Petersburg, and are now working on a 20,000-h. p. electrical development plant on the Appomattox River.

These interests will all be controlled by a new company called the Virginia Passenger & Power Co., with a nominal capital of \$3,000,000, which will be increased. The new owners are Baltimore and New York parties acting through Mr. Nelson Perrin and

Mr. Winslow Williams of Baltimore, Md. The president of the Virginia Passenger & Power Co. is Mr. Fritz Sutterding.

The properties taken over by the deal were formerly owned largely by what is known locally as the Williams syndicate, which included E. L. Bemiss, former president of the Richmond Traction Co., E. Randolph Williams, R. Lancaster Williams and others.

It is announced improvements and betterments of an extended character will be made, not only in the street railways, but also in the power and lighting properties. The plans for the Westhampton Park Railway Co. provide for a well regulated pleasure resort with a villa settlement and country club.

### ONE WAY OF AVERTING A STRIKE.

A manager in conversation recently told a good story of how a superintendent of a road employing about 40 men broke up a threatened strike among his employes. It appears the company made a new rule in regard to an unimportant detail of operation but one which did not meet with the approval of the conductors and motormen. The superintendent knew there was some kicking going on but as there was no vital question involved did not believe the men would be foolish enough to strike. He thought the matter had been dropped until one night as he was riding on the last car out at night to his home which was about half way between the city and the car barn he learned that a meeting had been called for that night. The men had agreed to gather at the car barn after the last car had been pulled in and arrange a strike for the next morning. He quickly determined to remain on the car and attend the meeting although he had not been invited. Arriving at the barn he found about half the men gathered together and somewhat surprised to see him. He spared no time in telling the employes that they were trespassing on the company's property and requested them to disband and remove themselves from the premises. This they refused to do, whereupon the superintendent, who is something of an athlete, pulled off his coat and made a short but very vigorous speech to about the following effect: "Now, boys, you have got to get out of here. I can't whip you all together but you must either leave or come up here singly and be whipped or whip me. Who is the first one?" This was an appeal the men were not exactly prepared for but one which raised the superintendent a good many points in their estimation. They evidently had too much respect for themselves to join together and throw the superintendent out of the barn, which they easily could have done, and after a hurried consultation they walked up to him in a body, shook him by the hand one by one and quietly dispersed to their homes. This was over a year ago and not a word has been heard since in the way of objection to any of the company's rules.

### ELECTROLYSIS CHARGE IN ST. PAUL.

The St. Paul board of water commissioners in a bill of complaint against the Twin City Rapid Transit Co., alleges that the mains and underground pipes are affected by electrolysis, caused by the return currents of the company using the waterpipes for a conductor. The water company asks to have the street railway company restrained from making such use of the water mains, and alleges damages to the amount of \$500,000.

In its answer to the complaint the Twin City company denies responsibility for any damages except such as may attach to it as a stockholder in the St. Paul City Railway Co., and, on behalf of the latter, asserts that the city of St. Paul and not the board of water commissioners, is the real plaintiff. In connection with this contention the company alleges that the laws and ordinances under which it was granted the use of the streets, under the restrictions and regulations made from time to time, amount to a contract between the city and the company. It is further alleged that if the courts decide that the street railway company shall provide other means of returning the currents, it will be changing the terms of the contract between the city and the company.

Work will soon be begun on an 11-mile electric line to the summit of Pike's Peak, to be known as the Seven Lakes-Pike's Peak Ry. Connections will be made with the Cripple Creek Short Line at a point near Clyde. H. C. Hall, of Colorado Springs, is one of the directors of the company.

## HIGH RAILWAY SPEED IN GERMANY; ELECTRICITY OR STEAM?

A report to the State Department by Frank H. Mason, U. S. Consul General at Berlin.

It is now five months since the close of the experiments in high-speed electrical traction over the specially repaired and prepared railway line between Berlin and Zossen, and yet no official report of the attained results has been published. Individual experts, more or less directly interested in or connected with the trials, have contributed to various technical magazines here, in England, and in America long and highly interesting reports of the equipment and methods employed. They have described with elaborate detail the motors, the construction of the cars, and the system of transmission employed, but nowhere in any of these reports does the writer venture to state his conclusions as to what the experiments have proved that was not known before, and what immediate effect they are likely to have upon railway progress. From all that can be ascertained, even the "Studien Gesellschaft," or specially organized company under whose management and support the experiments were conducted, has not prepared an official report for the information of its own members, nor has it yet been decided when, where, and under what new conditions, if at all, the trials shall be resumed. It will be remembered that in former reports of this series (Advance Sheets Nos. 1103, 1154 and 1206), the experiments were described as being made by a society specially organized for that purpose, which included as members the General Electric Co. of Berlin, and Messrs. Siemens & Halske, each of which firms furnished a motor car of its own construction, and several associated banks, which contributed the necessary capital; that the trials were made after long and careful preliminary study and experiment, and with the expectation of accomplishing a speed of 125 to 150 miles an hour. The trials finally took place during the latter half of October last year, beginning at 40 miles and gradually increasing in speed until on the 3d and 4th of November, a speed of 150 kilometers (93.2 miles) an hour was attained. Then the experiments abruptly ceased, for the reason, as it was understood, that at the latter pace, the strain on the track and roadbed was so great that they had to be repaired at night, and it was found that the limit of practical utility and safety had been reached with the facilities which were then at command.

The nearest approach to an official verdict on these trials which has yet been made was a paper read last month before the "Verein für Eisenbahn Kunde" (an association of railway experts) by Geheimrath Baurath Moritz Lochner, an eminent engineer belonging to the Prussian State Railway Administration, and who in the experiments represented the Government, which had furnished the stretch of military railway line over which the tests were made. The address is withheld from publication, but, in substance, it confirms the conclusions of the other experts and may be summarized as follows:

The line, 28 kilometers (17.4 miles) in length, was laid with rails of the old Prussian standard, weighing 33.4 kilograms (70.14 lb.) per meter (39.37 in.), resting on metal ties. The track had been in use for a number of years, but prior to the experiments it had been put into perfect repair. At ordinary speeds, everything worked perfectly, and no trouble was experienced with rails or motor cars. The side swaying of the cars was scarcely noticeable, not sufficient to cause the slightest inconvenience to passengers. But as a speed of 130 kilometers (81 miles) was approached and exceeded, new and serious conditions were encountered. The rails and ties both proved too light for such a strain, the track began to give way, and the side swaying of the cars increased seriously. The highest speed attained was 160 kilometers (99.4 miles) per hour on two occasions, and as a result of the conditions then developed, the experiments were discontinued, the net result being that up to a speed of 81 miles an hour, they had been successful and satisfactory.

But as the pronounced purpose of the trials had been to make tests of speed up to 125 and 150 miles an hour, the actual result spread a chill of disappointment among electricians in this country. The trials had, indeed, shown that a polyphase alternating current, carried on triple overhead wires and taken off by trolleys, could be introduced as high potential into the rapidly moving car, and there reduced by portable converters to a safe and effective working pressure. The trolley and the motor—one of which was hung on

springs, the other set solid on the axle—worked to perfection. There was left no longer a doubt—if, indeed, any existed before—that, given a sufficient voltage, the current could be "got into the car" for any speed that might be desired. From the standpoint of the electricians, therefore, the experiments were technically successful.

The disappointment lay in the demonstrated fact that a large portion of the German railways could not, even if it were desired, be adapted to high-speed electrical traction without being practically rebuilt. While some of the leading lines have been relaid with rails of the new Prussian standard, 44 kilograms (97.4 lb.) to the meter, many of the principal and all the secondary railways are built with rails of the old and lighter standard, which failed so conspicuously at Zossen when the motor car surpassed the speeds which have been approximated in other countries by steam. They are laid to a large extent on metallic ties, which have not proved satisfactory under the severe test of high speed or heavy trains, and the rail joints likewise leave something to be desired from the standpoint of modern improved construction. The Prussian State railways are conservatively and economically managed; they yield a large and steady revenue, which the royal treasury needs from year to year, and it is clearly seen that any scheme of rapid, long-distance transit which would require the State lines to be torn up, their curves straightened, and their tracks relaid with heavier rails will have long to wait. In fixing a definite limit of safety and utility to the present track system, the Zossen experiments have helped to relegate the hourly high-speed electric express cars from Berlin to Hamburg, Liepzig, and Breslau—which had been so confidently predicted by amateurs here and in America—to a remote and somewhat indefinite future.

It is, perhaps, as a more or less direct corollary to all this that the German Society of Mechanical Engineers has again taken up the problem, and at a recent meeting voted a series of prizes, viz., 5,000, 3,000 and 2,000 marks (\$1,190, \$714 and \$476), for the first, second, and third best designs for a steam locomotive and train which will be designed to form a unit in a scheme of rapid long-distance passenger service. The prizes are of merely nominal value, but the honor and prospective profit of winning one of them will be worth any and everything that the competitive effort may cost. The proposed locomotive and train are to be adapted to the Prussian railways as they now exist. The engine must be capable of hauling a train weighing 180 tons over a straight, level track at a speed of 120 kilometers (74.5 miles) per hour, and must be able upon trial to maintain this pace for three hours without stopping. Troughs for automatically replenishing the tank of the locomotive while in motion are to be provided at intervals of 75 miles. The cars are to include in their plan and construction all modern improvements and to be so designed as to form trains of three or four carriages, each capable of carrying one hundred passengers and their baggage, with full provision for their food, drink, and every necessary comfort during a journey of from five to ten hours. The cars must be so built that they can be run safely over a good track at a speed of 150 kilometers (93.7 miles) per hour. The cars must be planned and built of such material as to minimize the danger to passengers in case of derailment, collision, or other accident. Especial importance is attached to safe, effective, and easily controllable lighting and heating facilities. The drawings and specifications—which are to show clearly every detail of construction, weight, cost and material used—are to be delivered to Mr. F. E. Glaser, secretary of the Association of German Mechanical Engineers, before noon of December 1, 1902, the plans of each competitor being marked with a cipher for identification after the awards have been made. The competition is restricted to German subjects and to locomotive and car builders of other nationalities who are permanently domiciled in this country.

Although it can not be ascertained that the State railway authorities are officially or directly connected with this enterprise, many of them are members of the Society of Mechanical Engineers, and it is well understood that the competition has been decided upon as a reach in a new direction toward improvement in railway service. Four large and important cities—Hamburg, Leipzig, Dresden and Breslau—besides several smaller towns like Hanover, Brunswick, Halle, Magdeburg, Chemnitz, Gortitz and Stettin, are within a run of four hours by ordinary express trains, of which there are three or four daily in both directions. If, instead of, say, four daily trains of ten or twelve cars each, running from 30 to 40 miles an hour, the service were divided by day into hourly trains of three cars, carrying

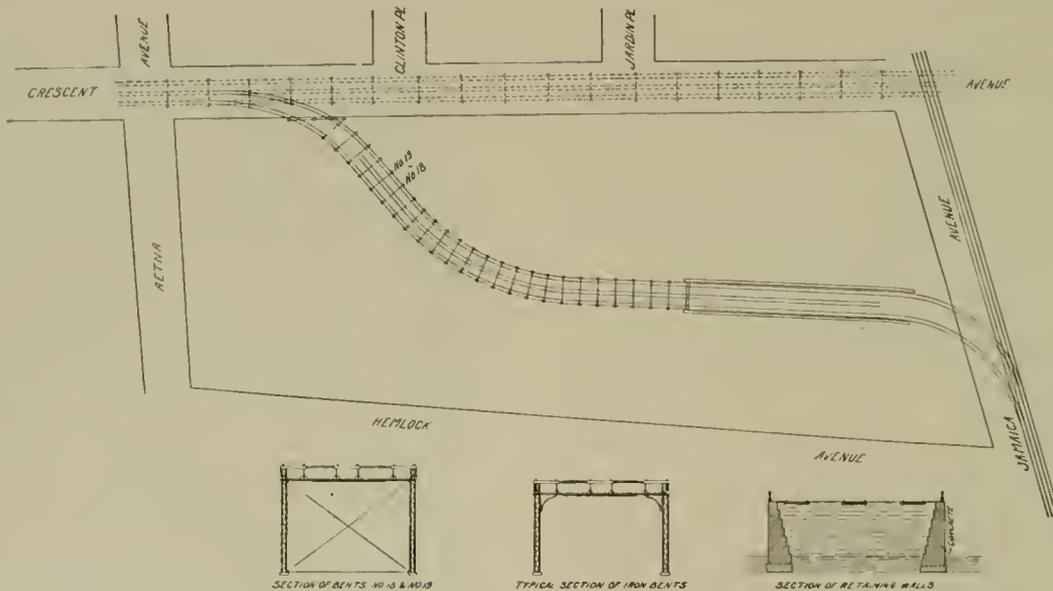

100 passengers, and running 50 to 60 miles an hour, it is clear that the public would be far better and more conveniently served. This much, at least, would be done with comparatively small expense and with but little change in the existing lines, which are generally well surfaced and in good condition. Northern Germany is, for the most part, a vast level plain only a few feet above the level of the North Sea. Over this area, railway grades are generally slight and tracks for the most part straight, level, and well adapted for much higher rates of speed than have yet been undertaken. It is generally assumed and understood that, by one method or another, the facilities for travel between Berlin and the other large cities are to be improved in respect to both speed and convenience. It now remains to be seen which direction—whether through the use of electricity or steam—these improvements will take.

**NEW TRACK WORK IN BROOKLYN.**

The Brooklyn Rapid Transit Co. is preparing to do considerable work this spring in the direction of rebuilding some of the older track, building needed connections, constructing certain new lines and generally inspecting and overhauling the entire track system in anticipation of the heavy summer business. Taking into con-

crete beam construction, with the view of testing the wear, life, and general adaptability of concrete track work for excessively heavy traffic. Mr. Packe states that the results thus far have not been altogether favorable to the concrete beam track. The line and surface remain perfect, but under the constant wear of the heavy rolling stock, which, incidentally, is constantly tending towards heavier types, the rail itself wears out in a far shorter time on the unyielding concrete foundation than it does on the less rigid tie construction. (For additional data in this regard see Mr. Packe's paper referred to.)

Pursuing the plan of thoroughly welding into one connected system the various properties controlled by the Transit company, inclines have been built at various points connecting the elevated roads with the surface tracks and elevated trains are now run to Coney Island and other outlying points. For this purpose many of the electrically equipped trains are provided with overhead trolley for operation on the surface tracks as well as with contact shoes for the third rail on the elevated. The last connection of this kind to be built is at Cypress Hills, where the Brooklyn Union Elevated line is joined with the surface tracks on Jamaica Ave. by means of an incline about 1,200 ft. long. The layout at Cypress Hills is illustrated on this page. The grade is gradual, not exceeding 2 per cent. About one-half of the incline is masonry work, consist-

PLAN AND SECTION OF INCLINE IN BROOKLYN.

sideration the enormous car mileage of the Brooklyn Rapid Transit Co. the track as a whole is in exceptionally good condition, far better than would be supposed after a superficial examination of the volume of traffic passing over some of the lines during the rush hours. But little will have to be done in the way of repair to the track laid subsequent to the time at which the Transit company took control except on the Brooklyn Bridge and at the bridge terminals and most of the work will be confined to the older lines and to extensions and additions.

The standard construction in Brooklyn where the pavement is granite blocks on concrete is a 9-in. girder rail on ties 6 x 8 in. x 7 ft. laid with sand foundation tamped into place. Weber joints are used with brace tie plates every third tie. After the rails are spiked down, surfaced and lined, portland cement concrete is rammed in between the ties and around the ends of ties, forming a solid bed of 6 in. above the subgrade between the tracks and rails and 2 ft. outside. On this is laid 1 in. of sand in which to bed the paving. Hemlock rail fillers are placed between the flange and head, and flange and tram of the rail, and the granite blocks are then put in place. The joints are filled with heated gravel and hot pitch to occupy all voids. (For details and illustrations of track standards in Brooklyn see paper by E. C. Packe, engineer maintenance of way, before New York State Street Railway Association, September, 1901, and reprinted in the "Review" for Sept. 15, 1901.)

In the summer of 1890 the company put in considerable track on

ing of concrete retaining walls, with dirt and cinder filling. The balance of the incline is carried on steel girders.

The company has always recognized the advantages of terminal loops at termini where the traffic is dense. All the lines running to Coney Island, Bowery Bay Beach, Brighton Beach and other resorts have these terminal loops, in addition to those on both elevated and surface lines at the Manhattan end of the Brooklyn bridge. The new work to be carried out this spring includes the building of four new surface loops outside of, and in addition to, the four loops now in use at the Manhattan Bridge terminal. These additional tracks will increase the number of cars that can be moved across the bridge at rush hours by at least 35 per cent, and it is believed will relieve much of the present congestion. The distance between each of the loops will be twice that of the space between the four loops that are now in use, and will permit the dispatching of about 350 cars per hour, instead of 280 cars, the present capacity.

The Louisville Railway Co. has sold \$250,000 second mortgage bonds out of a total issue of \$600,000. The average price of the entire issue was \$1.084 per bond and the entire issue brought \$271,170. The subscriptions amounted to several times the amount to be subscribed. The company cannot sell more than \$200,000 of the total \$600,000 of bonds per year, except that if less than that amount is sold one year the difference can be added to the \$200,000 sold the next year.

### California and Combination Cars.—III.

BY W. E. PARTRIDGE.

The California type of street car, with its open ends and closed central body, as has been explained previously, was a development, or modification, of the cable car with an open compartment at one end for the gripman. As there was more space about the grip levers than was required by the gripman, this space was utilized for seats for passengers. The car thus constructed formed a combination car pure and simple. Such cars were used in San Francisco and Chicago and in some other cities where the cable was early introduced. It was not, however, until the California car had become pretty well established that the advantages of a car having a closed body at one end and an open compartment at the other were appreciated. Then there was a reversion to an earlier type, so that the car, which was first designed and used, appears in actual service later than the car which was designed or developed from it. Grip cars with open ends of considerable length were in use in Chicago for some years before combination cars attracted any attention. They were pretty generally considered as one of the freaks that went along with the cable.

The next combination car of which the author can find any record was by the same builder and was a wonder in every way. It was a double decked dummy with a closed compartment below and two open sections on the upper deck. The closed passenger compart-

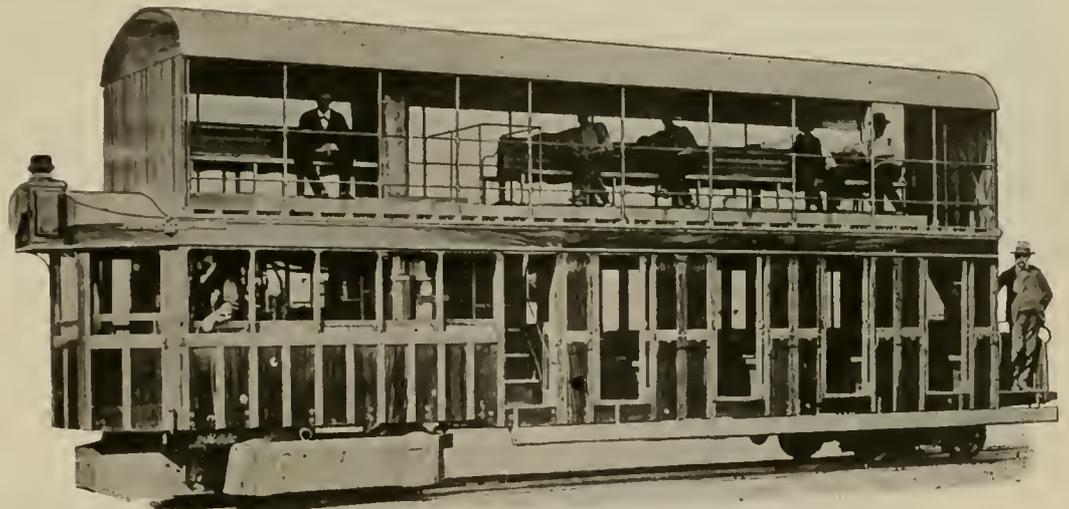

FIG. 2—EARLY COMBINATION CAR—A STEAM DUMMY.

ment had four side entrances. In front of this was the cab, which was also boiler and engine room as well. Between these compartments was placed a stairway by which the upper deck was reached. This deck had a roof and bulkheads at each end. It was divided into two portions by means of the stairway and the smoke stack of the boiler. The upper seats were all longitudinal, while those below were transverse. This car is shown in Fig. 2.

About this time, perhaps a little later, the Brill company built the two styles of grip cars shown in Figs. 3 and 4. These cars were about 37 ft. long over the dashers. One of them had the original style of open end first put in service in San Francisco and the other, Fig. 4, had transverse seats with a center aisle. In one of them a bulk-head for the protection of passengers was used at the open ends. Upon the other carriage curtains furnished the only protection. At that time the spring roller curtain was not generally found on street cars, in fact had scarcely been introduced at all into this form of service. Several modifications of this style of car were used in Chicago. As the cars were operated on loops and consequently always ran in one direction, the open platform was needed at one end only.

In spite of the prejudice of managers against cars of this class their popularity has grown. Even in the East, where open air riding is not comfortable in winter, these cars are found useful. In most of our cities in the northern states riding in an open car is not comfortable through the whole of the summer. The closed

In street car construction it is quite difficult to assign dates at which different forms of construction were first introduced. The records of many builders are not at all accessible. It is frequently the case that there are no photographs of early work to be had. For these reasons the author cannot speak definitely in regard to the first appearance of this type. To the best of his knowledge and belief the earliest combination cars which were not also grip cars were built by the J. G. Brill Co. The first of these shown in Fig. 1 was built about 1883 for a horse railroad, or rather a mule road, in one of the Spanish American countries.

It had a platform in front of the standard horse car type, but the rear entrance was the usual omnibus broad step. The closed body was for the first class passenger, while the open portion was for the second class. The roof was of the "lard cage" or Rowley pattern. The ventilators, however, covered only a portion of the closed body. The curtains were of the old carriage style. From these primitive features one would be almost tempted to assign the cars to a date ten years earlier.

FIG. 3—EARLY COMBINATION CAR FOR CABLE ROAD, CHICAGO.

compartment therefore has its advantages. It especially appeals to railway men in those cities where the Board of Health orders that one car in every three or four shall be a closed car no matter what the season of the year may be. This is the case in some of our larger cities, notably New York and Brooklyn.

FIG. 4—COMBINATION CAR FOR CABLE ROAD, CHICAGO.

The writer has been unable to locate dates of construction beyond those already given and can arrange his material merely in the order in which it has been received.

In Fig. 5 is given a side view of a combination car built by the American Car Co., of St. Louis, for Sidney, New South Wales. It

FIG. 5—LARGE COMBINATION CAR FOR NEW SOUTH WALES.

was one of a large order. The body measures 28 ft. 6 in. over the corner posts, while the closed portion is 11 ft. and the open portion a little over 17 ft. in length. The seating capacity is large, there being places for 51 persons, 35 in the open body and 16 in the closed portion. Two of the seats are placed back to back with the bulkhead between them. When the bulkhead windows are closed and the curtains are down only one seat is unprotected. The sills run through from end to end of the car and are plated with steel. The step or running board also extends the whole length of the car, without any break at the closed body. It is in two sections, however, as is usual in such long cars. The posts are carried in metal panels at the seat ends. This greatly increases the strength and stiffness of the post and the durability of the car. From the arrangement of the trolley board it is seen that the cars run in one direction only, with the open section ahead. This leaves the platform in the rear free from obstruction. As the practice is to haul trailers an opening is left in the rear dasher, so as to permit passage from car to car. The practice of running small trains on streets has been discouraged in many cities in the Atlantic states on the ground that it is unsafe. There are, however, many cases when the public would be greatly accommodated by such trains. The safety is a thing which depends upon proper management, rather than the number of cars which run together in a train.

The Wason company built a lot of combination cars for the Worcester & Suburban road, of Worcester, Mass., of the type shown in Fig. 6. It has side sills running straight through from dasher to dasher. The two sections are of about equal length. The platform at the forward end is very short, giving only sufficient room for the motorman and there is no seat outside the bulkhead. The roof is of the steam car pattern, and as the car runs in both directions there are two trolley boards and poles, one at each end. The step of the usual open car pattern is carried along the open part of the car and another step of the same kind placed at the vestibule which is completely enclosed. In many respects the design is a good one, but there are some points which could be changed advantageously as affecting a reduction of cost. Since the car runs in both directions a completely enclosed vestibule at one end is a rather unnecessary expense, the other end being entirely unprotected. A more economical method of building would have left both platforms entirely open. This would have been justifiable because a car of this kind is fit only for summer or autumn service. It could not be profitably operated the year round. A saving could have been effected also by using a common street car hood instead of the more expensive type.

In the construction of a combination car one important detail should always receive attention. As the open body is always carried high and the step or running board is also high, entrance for old persons, children and those below the average height is difficult.

The platform at the end of the closed body can be dropped and in this way the step may be brought within easy reach of the ground.

For safety and to make stops as short as possible this is an important matter. It is also a question whether two steps are not

FIG. 6—COMBINATION CAR—WORCESTER & SUBURBAN STREET RY.

safer, better for the passenger and quicker for loading and unloading than a single step 18 or 19 in. above the head of the rail.

The Denver Tramway Co. has some combination cars in operation which are especially interesting to railway men. They are

novel in both construction and design. These combination cars are shown in Figures 7 to 15. They are made up of a closed body trailer car and an open grip car joined so as to form a single car. The utilization of the old cable cars was a commendable piece of

work tied together at the ends by both end and cross sills. They have bolsters over the trucks and are fastened by wood cross ties. At the corners they are stiffened by angle plates. The I-beams have wooden fillers on the outside so as to give them a smooth surface.

FIG. 7.

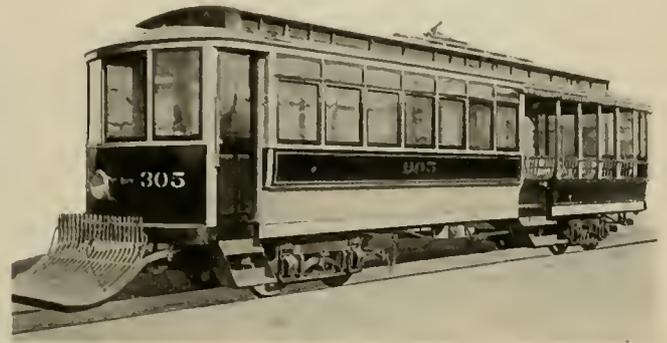

FIG. 10.

economy which gave the road 80 effective motor cars at a comparatively small outlay. There are now many large systems in the East having considerable numbers of good cars, which are now too small for the service, which might be utilized in this way. The

The frame work for mounting the two car bodies extends clear to the end of the platforms so that no platform timbers are needed. This construction, where the sills run through from one buffer timber to the other, makes a most effective car frame and

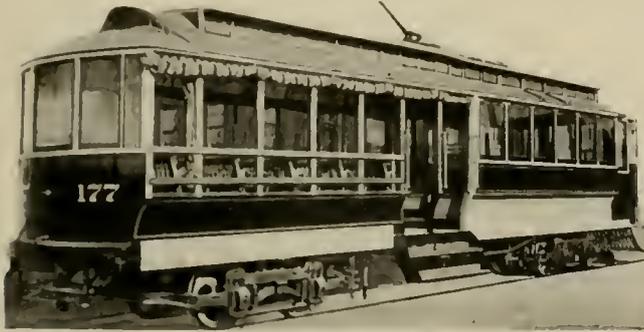

FIG. 8.

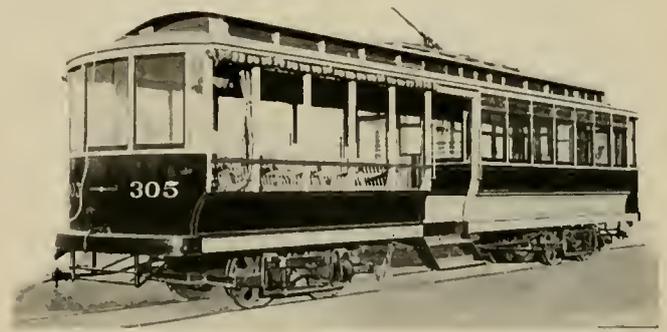

FIG. 11.

writer knows of hundreds of old horse cars now used on motor trucks which are too small for the service. By combining them with the short open cars operated on the same roads, and following the style shown in the figures, fine combination cars would be obtained. The framework of all these old small cars is admira-

ble gives a strength which is not obtainable in any other way. This will be seen by a glance at Fig. 14. The whole body frame is carried high enough to clear the truck wheels, but by using two steps the lower one is brought within 12 in. of the ground. This step has an 11-in. riser, and the one above it 10 in., so that an

FIG. 9.

FIG. 12.

FIG. 13.

ble. They are strong and light and will still wear for years. Probably these Denver cars will show as large a service if not greater than many larger cars which are built at the present day.

In splicing, they were mounted upon a frame of 6 in. I-beams entrance to the car is gained with the least possible effort. These steps are 5 ft. 6 in. long and the gangway between the open seats and the end of the closed body is 4 ft. 10 in. wide.

In splicing, they were mounted upon a frame of 6 in. I-beams

In Fig. 15 the open section car with two entrances only is shown.

In most respects the construction is the same as that of Fig. 14, but by closing the center entrance on one side considerable additional seating capacity is obtained. In both designs the bulkhead is placed at the extreme end of the open section. The plans are similar with the exception of the entrances. The use of a closed

seats are transverse on one side of the open portion. There is then a 28-in. aisle and on the opposite side there is a longitudinal seat extending (in Fig. 15) from the bulkhead to the closed body. In Fig. 14 it is somewhat shorter. One unusual feature of this design is an iron support in the open portion of the car which is

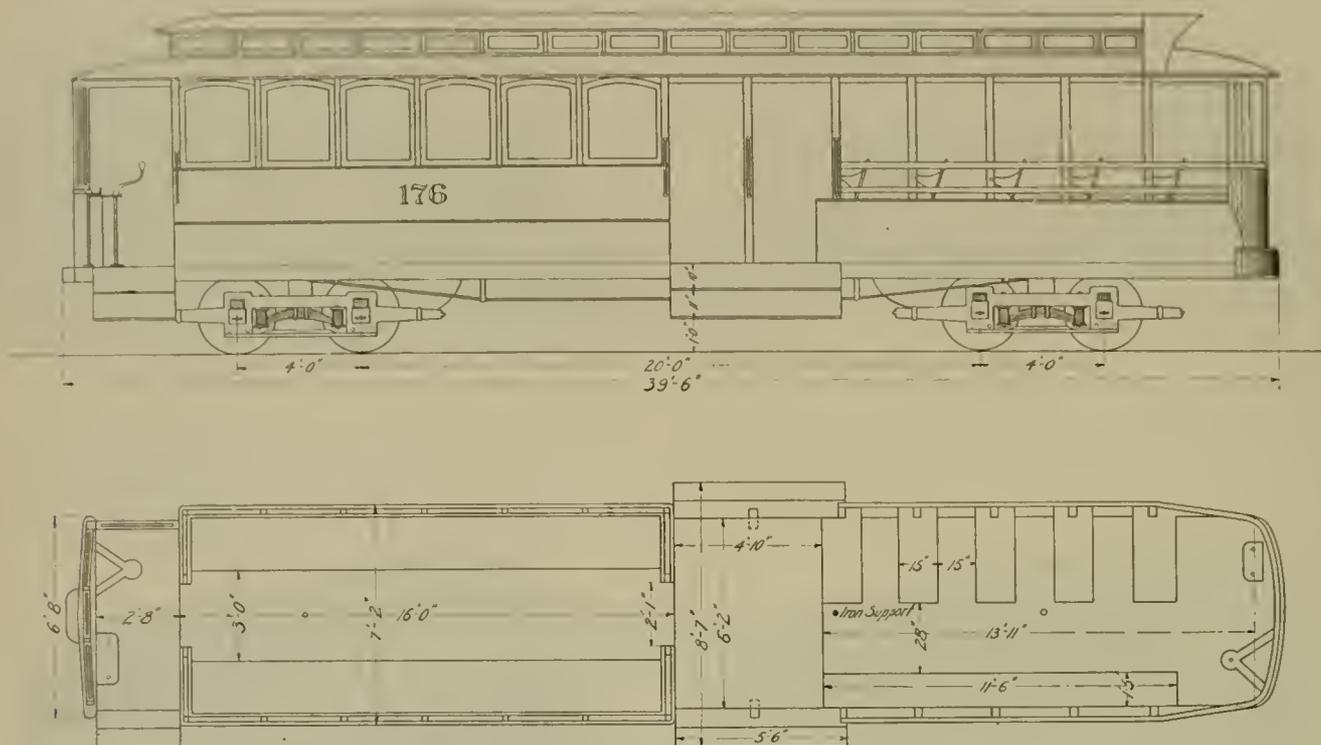

FIG. 14—PLAN AND ELEVATION OF DENVER CAR WITH THREE ENTRANCES.

side to the level of the seats is a feature which adds much strength to the body. The interior arrangement of these cars is a decided novelty. In some of the designs the closed body is furnished with longitudinal seats, as in Figs. 7, 9, 14 and 15. In the new cars,

placed near the seat end and extends from the roof to the floor. This is shown in the plans, also in Fig. 9. These designs, although very peculiar and entirely unlike anything which has been in use in the East are well worth study. They show a long car which has a large amount of standing room and which can be easily loaded and unloaded, yet they are so arranged that the conductor has the entrance platform within easy reach. While these cars measure about 40 ft. over the dashers they are in capacity somewhat more than the equivalent of two cars having 20-ft. bodies, and they occupy considerable less space than two cars measuring 20 ft. over the corner posts.

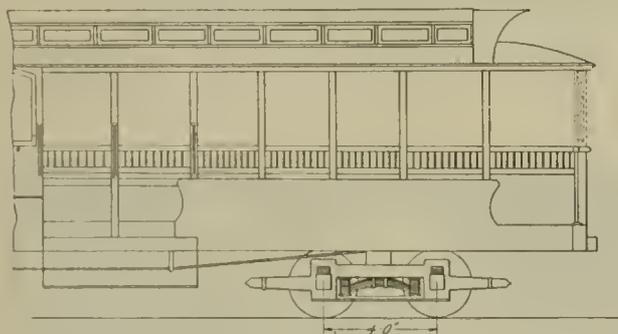

FIG. 15—DENVER CAR WITH TWO ENTRANCES.

The space which the length of the car body takes in a street is not considered of much importance in this country but in many parts of Europe not only is the width of the car restricted but rules and regulations make it necessary to confine the length of the car to that of a double truck with its team of horses. For this reason cars mounted upon pivotal trucks have been barred from many cities. Some years since the Brills built some combination cars for England where it was necessary to make them as short as possible while retaining a large seating capacity. As a matter of fact they had to be equivalent to double deck cars. This was done as is shown in Fig. 16. The platforms were made so short that there was not sufficient room for the motorman. He was therefore placed as it were in the doorway and the door and the partition made an angle inside the car.

The side sills were cut entirely in two and united by a heavy U-shaped iron which dropped below the steps. The entrance was at the center of the car and from both sides. To gain seating capacity a movable seat was placed in the entrance space. It had a reversible back. In Fig. 16 it is shown pushed toward the side from which the picture is taken, the entrance being on the opposite side. Owing to the narrowness of the car all the seats were made longitudinal.

In the last mentioned car there were no curtains to the open portion. In the Denver cars the old fashioned carriage curtains are employed. In the closed portion we understand that drop blinds of wood are used to exclude the sun. Generally in the

however (see Fig. 12), transverse seats finished with spring cane are used. In the open portions of all the cars the transverse seats have spindle backs, and in the later cars (see Fig. 13), the aisle is in the center with seats on each side. In Figs. 14 and 15 and also in Fig. 9, an entirely different arrangement has been adopted. The

East wood blinds are gradually being pushed out of service by the lighter and more convenient spring roller curtain. The latter by reason of the closeness with which it can be made to fit is a much better protection against storm than the carriage curtain as commonly used. The chief advantage, however, is the ease and speed with which it may be drawn down or raised.

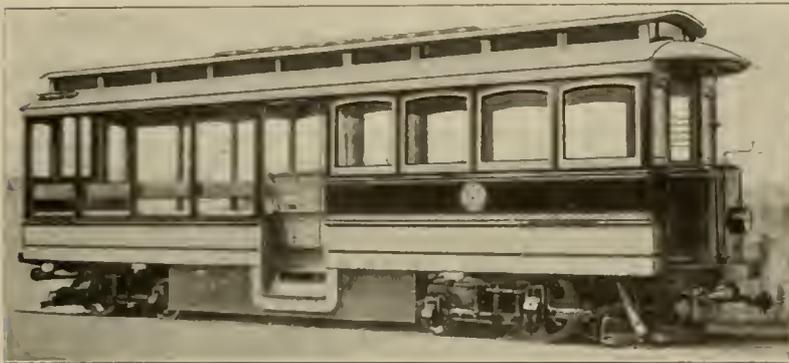

FIG. 16—COMBINATION CAR WITH SHORT PLATFORM.

Perhaps the oddest affair in the way of a combination car which has ever been put in service was one built by the Brill company for the Mount Lowe Ry. It was a motor car with a closed body and platforms without hoods. The body was short and the platforms long. It was mounted on a four-wheel truck. As the entrance was always at stations with elevated platforms steps were not necessary. Even stirrups were omitted since it was not desirable that there should be any entrances or exits except at the ends of the runs. All the seats were longitudinal, both on the platform and in the body. For the sake of gaining space the backs of all the seats were placed outward, and in addition to this there were seats at the entrances. Glancing at Fig. 17, the gates will be seen opened out against the platform side. The top of these gates when closed form the back of a seat. The seat itself fills the entrance opening when in place. Referring again to the engraving, it will be seen on the right hand side how the seat is cut and hinged so as to fall back over itself and leave a passage through which people may enter. The construction gave two large observation platforms with seats on both sides. It made entrance or exit from the car out of the question except at stations. The closed body was short but a very necessary feature. The omission of hoods is a thing not likely to be understood by those who have not made an ascent of a steep grade where there was a distant view. On such a grade the hood standing at an angle with the horizon cuts off a large portion of the view and is entirely a nuisance. On open cars for a mountain railway a roof in like manner spoils the view for a large number of the passengers.

In cars of this class a closed body is extremely necessary, because fogs, snow or rain storms of great severity are to be expected at almost any time and a secure protection from them is absolutely necessary. On account of the great fall of temperature which accompanies fog, rain or snow, curtains usual in open car construction become entirely inefficient. The open car roof, too, as we have seen, is objectionable, so that the short closed body with long and entirely open ends appear to fill the conditions better than any other form of car. The arrangement of the body between two open platforms might seem to put this car into the California class, though it hardly belongs there on account of the absence of the hoods. In fact it is so peculiar that it may well be said to form a class by itself.

It may well be doubted whether for mountain work an 8 wheel car would not be safer. Longer platforms would then be available, while the riding would be much more steady and comfortable for the passengers.

WATER POWER FOR SWISS RAILWAYS:

The fact that Switzerland is dependent on foreign countries for all the coal which is consumed there, as none whatever is produced in that country, has drawn attention to the great amount of unemployed water power and has given rise to many propositions tending to promote the country's independence in traffic and industry. A few months ago an interesting study was published by L. Thormann, a Zurich engineer, on the possibilities of substituting electricity for steam on the Swiss railways. While this idea is not new it has never before received such expert investigation. Mr. Thormann shows that it is quite possible to utilize sufficient water power to operate all the Swiss railways, but he also shows that it is a mistake to believe that the expense of the traffic would be decreased by this means to any considerable extent. United States Consul, H. H. Morgan, has forwarded some of the data presented by Mr. Thormann, showing the amount of water power easily available and giving some figures as to the cost of the electrical construction and equipment of the railroads of the country.

The five principal Swiss railroad lines require about 30,000 h. p. for their operation. To guarantee this 60,000 h. p. at high tension, alternating current stations would be required to which the necessary reserve would have to be added. The question whether the available water power of the country would be capable of supplying this amount is answered in the affirmative. Mr. Thormann, without taking into consideration the greatest water falls, gives a list of 21 plants which are either in the course of construction or design. The total output of these plants amounts to 86,000 h. p., and as this would be more than sufficient for the use of the railroads a surplus would be available for industrial purposes.

The cost of establishing this system would be very great; it is roughly estimated at \$31,073,000 divided as follows: Rolling stock, \$7,720,000; transmission cables, etc., \$13,510,000; and converter sub-stations, \$9,843,000. The author points out that although the direct saving would not be important the country will profit greatly by the change, as the commercial balance of Switzerland would become more favorable and the vast amount expended for coal would remain in the country. The general utilization of water power throughout the country would also mean favorable encouragement for other industries. The project is considered entirely practicable and has been brought into prominence by the fact that the electrical works at Oerlikon have made an application to the Federal government for a concession to establish a road of 12 1/2

FIG. 17—A COMBINATION CAR FOR MOUNTAIN SERVICE.

miles of standard gage electric railway for experimental purposes. There is no doubt but that this concession will be granted.

It is estimated that by the year's end all the important cities in Northern Illinois will be connected by electric lines, representing in new construction an expenditure of \$3,000,000.

## AMERICAN RAILWAY ENGINEERING AND MAINTENANCE OF WAY ASSOCIATION.

The third annual convention of the American Railway Engineering and Maintenance of Way association was held in Chicago March 18th to 20th, and which a number of reports of the standing committees of the association were read. While many of the committee reports referred to subjects exclusively of interest to steam roads there were a number of papers which included suggestions of value to electric railways and we present herewith, abstracts of several of these reports which embody information relating to the maintenance of way of any railway irrespective of its motive power.

### REPORT OF COMMITTEE ON BALLASTING.

A material suitable for performing the functions of ballast must be in smooth angular pieces hard enough to resist the load and tamping without material injury; must be free from decay and unaffected by water; it must permit of easy handling and provide good drainage. The materials which have been found to fulfill these conditions more or less perfectly are broken stone, gravel, coarse sand, burnt clay, partially disintegrated rock, slag, cinders and various products such as chatts, Joplin gravel, etc. The report then considers the qualities of the different materials best suited for ballast and describes the method of preparing the sub-grade and applying the ballast. The necessary depth of ballast below the tie is determined by several conditions. The condition usually ruling is that the load should be distributed by means of ballast so that the weight on the ties distributed to any part of the sub-grade would not be above its sustaining power.

Materials which will stand at approximately a one to one slope like crushed stone will distribute the load with reasonable uniformity at a depth not less than the distance between the bearing surfaces of the ties. With other material which will stand at a lesser angle a greater depth would be required. The report recommends that 8 in. under the ties be the minimum total depth for any class of ballast. The following recommendations as to ballast cross sections are presented:

Rock Ballast—Depth below tie 8 in. to 12 in.; top surface of ballast, top of tie. Slope of ballast, from top of tie at the ends to sub-grade at the rate of  $1\frac{1}{4}$  or  $1\frac{1}{2}$  to 1.

Gravel—With gravel containing an appreciable amount of clay and not too easily drained under all conditions—Depth of tie from 8 in. to 12 in.; top of ballast between rails, top of tie; top of ballast at end of tie, bottom of tie; slope to sub-grade two to one. The report considers that there is no cross section which can be used for all classes of gravel ballast to advantage. When it drains very poorly it will be necessary to leave the end of the tie open to avoid churning, as it becomes more and more pervious it may be brought up on the ends of these until, in light sand ballast having usually worn particles and draining very freely, it will be necessary to bring it above the top of the tie and even carry the top of the ballast some distance beyond the end of the tie before starting the slope. Among some ballasts of this nature better results are obtained by raising the top of the ballast between the rails above the top of the tie. For crushed and washed gravel the cross section for stone may frequently be used.

Chatts, disintegrated stone and coarse sand, which should thoroughly drain—Depth of ballast below tie 8 in. to 12 in.; top of ballast from 1 in. to 2 in. above top of tie; top of slope 6 in. beyond end of tie and even with the end thereof; slope  $1\frac{3}{4}$  to 1 to sub-grade. It is believed with this class of ballast, particularly the lighter varieties that the tie should be buried in the ballast or it will blow out, and only under these conditions, where it becomes self tamping, can the line and surface be satisfactorily maintained. Tracks in this kind of ballast are frequently knocked out of line unless the tie is buried and the slope begins some distance beyond the end of the tie.

There are some deposits of partially disintegrated limestone, flint and granite which can be given a cross section closely approximating that of crushed stone. The conditions which determine the proper figure of the cross section depend more than anything else on the draining qualities of the material used, and also as to whether the pieces are angular or jagged or more or less light and smooth. Angular pieces will soon embed them-

selves into the surface of the tie and will hold it firmly so that it is only necessary to carry the natural slope of the side of this ballast a short distance beyond the end of the tie. The questions of quarrying, washing, loading and distributing ballast and the manner and time of putting it in the track were not touched upon in the report.

### REPORT OF COMMITTEE ON TRACK.

In the report of the committee on track five subjects were considered which were—maintenance of line, maintenance of surface, maintenance of gage inspection of track and track tools. Under the first head the committee recommends that tangents should be adjusted by throwing the tangents between summits; between curves; or by throwing curves to meet tangents; or by partially throwing curves and partially throwing tangents as may produce the least work. Centers should be set with transit to insure accurate line. For the adjustment of curves the report recommends easement curves should be as follows: For roads not exceeding speed of 30 miles per hour, on all curves exceeding 2 degrees. For roads not exceeding a speed of 60 miles per hour, on all curves exceeding 1 degree. For roads where higher speed is attained on all curves exceeding 30 minutes. Easement curves should be used between curves of different degrees in the same way that they are used between curves and tangents.

For ordinary practice a chord length equivalent to 100 ft. for each degree of variation in curvature is recommended. Where the distance between curves will not allow this or for other reasons, a chord length of 25 ft. to 30 ft. may be used. For very high speed roads a chord length equivalent to 150 ft. or more per degree of variation is recommended. To secure and maintain perfect line it is recommended that permanent witnesses should be placed at points of tangent, points of spiral, points of change of curvature, summits and other points, so as to enable the alignment to be identically reproduced with the transit. Under maintenance of service the elevation of curves is considered with reference to the amount and beginning and end of elevation as modified by the location of curve and condition of traffic. The inner rail should be maintained at grade and the following formula is advised for determining the elevation of the outer rail:

$$E = G V^2 \div 32.16 R$$

in which E = elevation in feet, G = standard gage, V = velocity in feet per second and R = radius of curve in feet.

This formula is recommended for ordinary practice, but must be modified to suit special conditions. Since the elevation required is a function of, and depends upon the train speed, this speed is the first element to be determined. As a matter of safety the preference should be given the fast passenger traffic, the slower freight traffic, however, must also be considered and it often happens that on freight lines the correct elevation for passenger service would be so excessive for freight service that the train resistance would increase enough to greatly reduce the tonnage hauled.

Vertical curves are recommended to be used wherever changes occur in the rate of grade. The proper method of tamping the various kinds of ballast is also considered in regard to the maintenance of surface. In maintenance of gage the methods of spiking are important. The gage should be a wooden bar with circular metal arcs fastened rigidly to it for gaging surfaces. This should be used whenever a spike is driven. Outside spikes should be started straight with the base of spike in contact with base of rail. The spike should never have to be straightened while being driven. Outside spikes of both rails should be on the same side of the tie and the inside spike on the opposite side of the tie. The inside and outside spikes should be separated as far as the face of the tie will permit. The ordinary practice is to drive the spike  $2\frac{1}{2}$  in. from the outer edge of the tie. The widening of gage as an allowance for curvature is a matter of importance which the committee desired to investigate further before submitting recommendations.

Except in cases of roads with very light traffic, all the main track should be inspected each day by the section gang or track walker. The track walker should be sent out over territory not covered by the section gang in a day's work and also in case of heavy storms, washouts, etc. The track walker should be provided with spike maul, spikes, wrench and train signals. He should in-

spect the track, roadway, fences, bridges and culverts, and in case of trouble should put out torpedoes or other danger signals and notify the officers from the nearest possible point. In regard to switches, frogs, crossings, derailing points, interlocking plants, etc., a section foreman or track walker should make a close daily inspection of them on the main line, and in case temporary repairs cannot be made the employe discovering the defect should be held responsible for the protection of trains until the defects can be remedied. The report concludes with a complete description of all the tools necessary for use in the maintenance and repair of track.

#### REPORT OF COMMITTEE ON IRON AND STEEL STRUCTURES.

This report chiefly covered the general practice of placing railroad bridge work under contract. The two features to be considered are as follows: First, the degree of completeness of plans and specifications that the railroads should furnish for the purpose of informing the bidder what is wanted, and second, the best manner for the railroad to select the proper builder to construct its work. As to the degree of completeness of plans and specifications furnished by railroads there are three general plans open. First, the plan of giving sufficient data to allow the bidder to figure the weight correctly, and if awarded the contract to at once place the mill orders for material. Second, giving general outline drawings showing composition of members but no details of joints and connections. Third, a full specification with survey plan only, leaving the bidder to submit a design of his own. A large majority of engineers and bridge companies favor the making of detailed plans, and it would seem a plain business axiom that the buyer of a bridge should know what he wants before asking for bids, and in order to enable bidders to make close prices he should furnish such drawings and descriptions as will leave no question as to what is required either in the structure, in materials or the method of doing the work. If plans are complete enough for listing the mill orders, which must be considered the minimum requirement covered by this method, they would show the bidder nearly what the character of the shop work will be and enable him to compute the weight with precision. If a large quantity of work is wanted when it seems probable that prices will advance it may be advisable to get it under contract at once before drawings can be made. In this case a description of the work wanted with approximate weights may be sent to bidders and price obtained per pound, the detail plans to be made later. Most of the railroads responding to inquiries on this subject favor letting bridge work by the pound. It relieves the estimator from much responsibility when figuring up the weight of the bridge for the purpose of making a bid and it allows changes to be made in the design without hardship to any one. It is the only proper basis for bids when a specification only is furnished. Asking bidders to submit plans with their tenders leads to practical difficulties of several kinds. If five bridge companies are invited to bid a lump sum on a piece of work and are required to submit strain sheets, etc., with their bids, the same work is done five times and four-fifths of this work is wasted. Every bridge company includes the cost of this work in its estimate of costs, charging a higher price for lump sum jobs with which strain sheets and designs have to be submitted with a bid than for jobs on which the pound price only is required. Only those concerns which would be acceptable as contractors should be asked to bid on bridge work. The report concludes with specifications for rolled steel and the method of testing specimens, etc.

#### REPORT OF COMMITTEE ON SIGNS, FENCES, CROSSINGS, ETC.

The report of this committee is limited to the consideration of the subject of highway crossings, especially surface crossings and crossing gates. The most common methods employed for the protection of grade crossings are gates operated by watchmen, alarm bells operated mechanically and watchmen or flagmen. Of these methods gates are the most effective, flagmen without gates next, and automatic alarm bells the least so. The best service is considered to be obtained from the use of pneumatically operated crossing gates. These give but little trouble from various climatic conditions, are simple, cheaply maintained, and several sets can be operated by one man from a tower if so located as to get the proper view. The cost of one set of gates is given at \$475, or with a

tower, \$575. The cost of operating per year figured on 10 hours per day is \$480 and the cost of repairs per year about \$60. Where electric railway lines cross the steam road tracks at grade derails can be placed in the electric line tracks and be operated pneumatically with the gates, adding materially to the safety of the crossing.

Of the method of protection by flagmen little can be said that is not well known. The degree of safety secured depends upon the reliability of the man employed. The cost of protecting the crossings in this manner is estimated at \$500, including flags, lanterns and other supplies for the flagman.

Of alarm bells, those operated by electricity and actuated by the track circuit are recommended. The gong should not be less than 12 in. in diameter and the track circuit distance such as to allow the bell to ring at least 45 seconds before the train reaches the crossing. For a train speed of 60 miles per hour this would require 4,000 ft. of track circuit, which is a greater distance than can be considered advisable with any of the bells now on the market. A light showing red each way on the crossing while the bell is ringing is a useful adjunct. The average cost of an electric alarm bell installed is \$275 and the cost of maintenance about \$25 a year.

The proper construction and care of crossings is also included in this report. This consideration will necessarily vary with conditions but it is divided into four general classes: first, where paving is required to conform to street specifications; second, crossings of streets where no paving is required; third, crossings of public roads or highways outside of towns and cities; fourth, crossings of private or farm roads. For class one the cross ties should be treated chemically, to prolong their life to the greatest possible limit, and laid on a bed of stone or slag ballast not less than 12 in. in depth, or in an 8 in. bed of Portland cement concrete. Porous tile drains not less than 6 in. in diameter should be placed at intervals leading to the nearest point from which efficient drainage can be secured. On long stretches of track laid in streets paved with stone blocks, the use of a special rail section not less than 9 in. in depth is advisable, thus avoiding the use of chairs. Street crossings where no paving is required may have planking laid on the entire surface of the crossing or plank may be laid only next the rail and the space between filled with suitable material. The width of highway crossings should not be less than 18 ft. Crossings of farm or private roads should be built by filling in with suitable material to the level of the rail head, leaving the proper flangeway inside the rails.

#### REPORT OF COMMITTEE ON MASONRY.

This report deals largely with the classification of the different kinds of masonry with a view to leading to uniformity of practice in so far as it is desirable. Standard specifications and other data in regard to their practice were received by the committee from about 70 railroads in the United States, Canada and Mexico. A review of the best of these specifications showed considerable agreement in numerous main points and it therefore seemed advisable to the committee to secure substantial agreement on some classifications that could be made to apply to general practice throughout the country. Before giving a suggestion for description of the several classes of stone masonry a general definition was submitted as follows:

"Masonry in its widest sense includes all constructions of stone or of kindred substitute materials in which the separate features are either carefully placed together with or without cementing material to join them, or, if the pieces are not separately placed with care, are encased in a matrix of firmly cementing material."

The three divisions into which masonry is divided are stone masonry, brick masonry and concrete masonry.

Stone Masonry—All stone used in masonry shall be sound, durable, not liable to be affected by the weather, from sources approved by the engineer, and shall be laid on their natural beds. Mortar shall consist of one part of approved portland cement to four parts of good sharp sand, or one part of approved natural cement to two parts good sharp sand, all to be carefully moistened and mixed and to be used within one hour after mixing. Mortar for pointing shall consist of one part portland cement to one or two parts of sand.

The following specifications give briefly the main points recommended in the committee's report for various classes of stone masonry:

First Class Masonry—First class masonry will be laid in port-

land cement mortar in regular courses, each stone being carefully cleaned and dampened if desirable before setting. The beds throughout and the edges for 12 in. back from the face shall be dressed to lay to half-inch joints. No course shall be less than 12 in. nor more than 30 in. in thickness. Headers must not be less than 4 ft. long except where the wall is not over 5 ft. thick, when they shall extend entirely through the wall. Headers shall extend at least 20 in. beyond the width of the adjacent stretchers. The backing shall consist of large, well shaped stone laid in full mortar beds and breaking joints so as to bond the work together.

**Second Class Masonry**—Second class masonry shall be laid in cement mortar. The face stones shall be rock faced, edges pitched to a straight line, shall have parallel beds and rectangular joints. The beds and joints for 8 in. back from the face shall be dressed to lay not over  $\frac{3}{4}$  in. joints. The stones need not be laid in any regular course, but shall be laid level on their natural beds, shall be well bonded, having at least one header  $3\frac{1}{2}$  ft. long to every three stretchers. The backing shall consist of well shaped stone not less than 6 in. thick and of which at least half shall measure 3 cu. ft. To be all in full mortar beds with joints well broken, well bonded together and with the face stone. All spaces to be thoroughly filled with smooth stone and cement mortar.

**Third Class Masonry**—Third class masonry shall be laid dry or in mortar according to the direction of the engineer. It shall consist of good quarry stone laid upon natural beds and roughly squared on joints, beds and faces, the stone breaking joints at least 6 in. The wall shall be bound together by headers occupying 1-5 of the area of the face of the wall front and rear and extending 3 ft. or less in thickness.

**Concrete Masonry**—Cement concrete may be described as formed of broken stone or brick, gravel and kindred materials, cement and sand. The combination of the best materials in the best preparations thoroughly prepared and erected will result in a structure which may be considered nearly, if not quite the equal of the best stone masonry in respect to its stability and durability. In proportion as any of the parts are of inferior quality or the workmanship and care deteriorate the resultant will be of inferior quality as to appearance, strength or durability.

The report then gives an outline specification for cement concrete, giving the quality of cement to be used, the preparation of the different materials, the directions for mixing, etc., which practically coincides with the standard specifications generally used. The report contains an appendix on Railroad Concrete Masonry, by W. A. Rogers, which covers the whole subject very thoroughly and includes reports on a number of tests.

#### REPORT OF COMMITTEE ON RAILS.

The report of this committee was made in regard to the subject of rail sections and processes of manufacture. In its report for the previous year reference was made to some difficulties which were encountered at the mills due to finishing rails at low temperatures and it was then suggested that it might be necessary to modify the heavier sections in common use, especially the A. S. C. E. sections, which have come into wide use. In the opinion of the committee some changes would have to be made sooner or later either in sections or in the mill practice of rolling. It is known that there is no use in trying to make a good rail by means of the chemical composition alone. Evidence clearly points to the fact that much better rails can be made from the steel now in use provided it receives the proper treatment in rolling.

The committee strongly advocates the use of uniform specifications and uniform methods of testing. Details of process of manufacture have generally been neglected except in the one aim of the mill to turn out the largest tonnage in the shortest time at a minimum cost. No fault can be found with this, as it has enabled the railroad companies to buy rails at a lower price, even if they do not wear as well as desired. But if the demand is to be made for better rails some attention must in future be paid to the details of manufacture. The quality of rolled steel depends upon its composition and the heat treatment it receives in connection with the work of rolling. And in order to get the best results, steel of good uniform chemical composition should be used and rolled at a uniform low temperature. The work at higher temperatures merely changes the form of the iron without changing its structure. The bad effects of the high finishing tem-

perature are fully recognized by the rail manufacturers, some of whom are now rolling their heavier rails at a much lower temperature than formerly. There is no use advocating any change of section or method of rolling unless some reliable assurance may be had that the rails are being rolled at the proper low temperature. It has been suggested that the amount of shrinkage in the rail after it has been cut at the hot saw is the best and easiest method of checking the finishing temperature.

The specifying of a drop test seems to be almost universally regarded as essential and yet, unless the portion of the ingot from which the test piece comes is known, the drop test may be quite misleading. The test piece should be taken from some designated location, preferably from what was the top of the ingot for then it is reasonably sure that all the rails represented by that test piece are at least equal to, and probably better than the test piece. It is also recommended that the following simple test be made by those interested in the wear of rails of different compositions and manufacture: Take a curve where rails are found to wear rapidly and lay the different kinds of rails alternately. The rails are then acting under precisely uniform conditions and it will take but a few months to determine what rail is giving the best results. If this experiment were made anew each year for a few years the road making such a test would have valuable information which would help to decide on the kind of rail which will give the best results in actual service.

A proposed standard for specifications for steel rails was submitted by the committee which related the process of manufacture, chemical properties, heat treatments, and other principles in regard to the manufacture of rails.

#### REPORT OF COMMITTEE ON TIES.

The report of this committee was devoted to two subjects, namely, timber supply and culture and timber preservation. The vastness of the supply of timber has not been so much in evidence of late as an apparent shortage which has resulted in changes in the selection of tie material and the sources from which it is drawn. Of a large number of roads reporting on the kind of ties used and their source of supply, 18 roads representing a mileage of 17,500, secured all their ties from along their own lines and have a supply in sight for the next ten years. On half of these roads pine ties were the standard.

On a number of other roads it is reported that the supply of ties along their own lines is equal to from 10 to 50 per cent of their requirements and the supply in sight will last for from 2 or 3 to 10 years. Regarding supplies of inferior kinds of wood 13 roads reported none available, while all the rest reported supplies sufficient for from 3 to 30 years. Some of the lines are now using treated pine ties and in consequence of the treatment they do not rate as inferior ties such as are usually so considered.

In regard to the preserving methods, experience is perhaps still too recent in this country to provide accurate data as to their value. A record of treated pine ties which has been filed by one railroad company shows their life to have been from  $10\frac{1}{2}$  to somewhat over 11 years. Treated Colorado pine ties have a maximum record of about 15 years. On the roads where preserving methods for ties are employed the best process, so far as the life of the tie is concerned, is creosoting, but it is necessary to use a heavy oil which is rich in antiseptic substances such as carbolic acid, naphthalene, etc. The information supplied by the different railroad managements says that the best process on the market is creosoting. The average life of creosoted ties is about as follows: Creosoted pine on main lines 15 years, on sidings 5 years, total 20 years. Creosoted oak on main lines 18 years, on sidings 7 years, total 25 years. Creosoted beech on main lines 20 years, on sidings 10 years, total 30 years.

Under the auspices of the United States Department of Agriculture an experiment was inaugurated in 1901 to test the relative merits of the different methods of treating ties of various kinds of timber. A total of 5,850 ties consisting of oak of various kinds, hemlock, beech and tamarack have been treated in different lots by the zinc-tannin, the zinc chloride, the Allardice and the Hasselmann processes, also with Beaumont petroleum and zinc chloride, with carbolic acid and spiritine.

A very noxious place has been selected for testing these ties in Texas where unprepared pine ties generally decay in 12 to 14

months. The results are to be watched and reported upon year by year by the commissioners of the Bureau of Forestry.

Most of the roads applied to for data are yet unable to furnish statistics relative to the life of treated ties, but records are now being kept on a uniform basis and it is hoped before many years to have some reliable data on this point.

The report concludes with a number of tables of statistics of a few roads which have experimented in this direction.

### SPECIAL READING FOR STREET RAILWAY MEN.

In the Saturday Evening Post for Mar. 15, 1902, was an interesting article on "Chances for Street Railway Men" from the pen of Gen. William A. Bancroft, president of the Boston Elevated Railway Co., in which he discussed the opportunities offered to young men who are willing to begin at the bottom in street railway service. In concluding General Bancroft makes the following statement as to the special reading and study that should be undertaken:

"To such a young man, rightfully ambitious for the future, some preliminary special reading and study will not come amiss. The almost universal use of electricity as the motive power of the modern street railway clearly calls for a more scientific training, on the part of all who would rise in the service, than was formerly required; and the man on the platform who knows something of natural science, other things being equal, is the one most likely to be in demand when the question of promotion to a higher position comes up. A good book on the general problems of electricity will be the natural beginning of a course of reading; though unfortunately not many such, adapted to the comprehension of young men with no previous technical education, have been published. Electricity Made Easy, by Edwin J. Houston and A. E. Kennelly, may be recommended, however, as being on the whole satisfactory. The same authors have written a series of 'leaflets'—as they are entitled, in spite of their containing some 300 pages each—on Electrical Engineering, which in the opinion of many electrical students are among the best books of the kind on the market. They come in three grades—elementary, intermediate and advanced—only the first of which, of course, can be recommended to the novice. The object throughout is to present the fundamental principles of electrical science; and the first volume is especially intended to give just such instruction as the motorman, or the electrical workman generally, with slight scientific knowledge of electricity, needs for a more intelligent performance of his daily routine work. Two other books that may be suggested have to do specifically with electric railway service—Electric Railway Motors: Their Construction, Operation and Maintenance, by N. W. Perry; and Electric Railway Motors, by George T. Hanchett. Both are sound, and not too difficult.

"There are two periodicals covering the street railway field, one or both of which might well be read by every one in the business, from conductor to president—the Street Railway Journal and the 'Street Railway Review.' No scientific or technical periodical, of course, should be regarded from the same point of view as a book, where the intention is to be definite and final in statement and conclusion; a magazine of this sort is to a considerable extent a record of current theory, opinion and experiment, leaving to the reader much of the burden of responsibility for sifting the wheat from the chaff of contemporary practice. With this caution—which applies to every publication of the kind aiming to present impartially the news of its special field—both journals may be unhesitatingly recommended, giving as they do, from issue to issue, a full account of the latest developments in every branch and department of the street railway business all over this country and abroad. Among electrical magazines the Electrical World and the American Electrician are excellent, but rather hard reading for beginners; however, if they are conveniently accessible to a young man they might often prove suggestive. During the last few years a number of 'correspondence schools,' so called, have been started in various parts of the country, some of the courses in which, I am informed, are admirably adapted to the needs of a young man who intends to enter or has already entered the street railway business. Though it is true that all companies undertake to give their men such in-

struction as may be necessary for the performance of their duties, it is equally true that one who, by additional study and reading, has gained a fuller knowledge of the theory and nature of electricity as well as of its practical application, stands in a more favorable position than one who has not."

### THE COLOR LINE IN VIRGINIA.

On May 1, 1902, there went into effect a very radical law enacted by the General Assembly of Virginia authorizing the Washington, Alexandria & Mount Vernon Railway Co., and certain other street railway companies in the State to separate the white from the colored passengers and to set apart or designate a portion of each street car, or certain seats, which are to be occupied by white passengers and also a certain portion or seats for colored passengers.

It is provided that the companies shall make no difference or discrimination in the quality and convenience of the accommodations provided for the two races, but that the conductor, manager or other person in charge of any car shall have the right at any time, when in his judgment it may be necessary or proper for the comfort and convenience of the passengers so to do, to change the said designation so as to increase or decrease the amount of space or seats set apart for either race or he may require any passenger to change his or her seat when and as often as he may deem necessary.

It is further provided that all persons who shall fail to take and occupy the seats so assigned to them, or fail to obey the instructions and directions of the conductor or manager of the car as to the seat or space to be occupied by such passenger shall be deemed guilty of a misdemeanor and upon conviction shall be fined not less than \$5.00 nor more than \$25.00. And any person refusing to obey the conductor's instructions may be ejected from the car and in case the passenger has paid his fare he shall not be entitled to a return of any part of said fare. It is further specifically stipulated that the companies nor any of their employes shall in any case be liable for damage to any one for such ejection.

By the provisions of the act all conductors and motormen are made special policemen and have all the powers of conservators of the peace while upon the cars in the enforcement of the provisions of the act, and in the discharge of the duties of special policemen in the enforcement of order upon the cars and right of way of the company.

It is provided that the act shall not apply to employes engaged in running or operating the cars, nor to persons employed as nurses nor to officers in charge of prisoners.

### WAGES INCREASED AT OAKLAND, CAL.

April 26th the following general order to motormen and conductors was issued by the Oakland Transit Co., W. F. Kelly, general manager:

"One year ago, on the first of May, we considered that the conditions warranted an increase of wages, and accordingly the present rate was announced. Since that date we have been pleased to note that you have been careful and diligent in the discharge of your duties undisturbed by the clamor of agitators or the strife of others. Another May 1st is now near, and in appreciation of the loyal, faithful men who have operated our cars skillfully and conscientiously we take pleasure in advising you that on and after May 1st, all motormen and conductors will be paid at the rate of 24 cents per hour. Trusting and believing that each and all of you will take a personal interest in the faithful discharge of his duties to the end that it may be a pleasant and prosperous year for us all, and with cordial good wishes for your personal success in your respective duties, we remain, etc."

Mr. Thomas Lowry has made a tour of inspection of the street railways in Duluth and West Superior with a view to deciding what improvements shall be made this year. It is announced that new and permanent tracks will be put down on the streets where new paving is laid, and a part of the system will be practically rebuilt. An extension to West Duluth is also contemplated.

### DRAINAGE WATER WRECKS MASONRY BRIDGE.

The heavy waterfall of early March caused the partial destruction of a comparatively new brick and stone masonry bridge which carries Warburton Ave. and the tracks of the Yonkers Street R. R. over Rowley Brook just north of Yonkers, N. Y. Although it should not be necessary to wreck a bridge in order to determine whether or not it is properly built and maintained, disasters of this kind when they do occur usually have lessons to teach.

In the case of the Yonkers bridge it does not appear that charges of carelessness or incompetence can be brought against anyone.

YONKERS BRIDGE AFTER THE WASHOUT.

As far as can be determined the washout was caused not by the volume of water passing under the bridge but by the drainage water passing through the gutters in Warburton Avenue.

The bridge has about 50 ft. span and consists of a 36 in. brick arch on concrete foundations with stone retaining walls and facing—a type quite generally followed for country and town bridges in this part of the country. The structure was finished in May, 1899, and cost originally \$24,000. It was built by the county, but is understood to be under the charge of the town of Greenburgh, which is responsible for its proper maintenance. The sides of the gulch are extremely sandy and somewhat treacherous. The design provided for carrying the street drainage water in gutters to the center of the bridge where it passed through culverts to the brook below.

The first signs of the failure appeared at the base of an electric light pole that had been recently placed in the sandy soil about

VIEW OF WASHOUT FROM ROADWAY.

4 ft. south of the southeast abutment of the bridge. During the heavy rains the drainage water settled around the pole and soon developed a large hole at the base. This rapidly enlarged until the pole fell, starting at the same time the entire southeast corner of the bridge, and material amounting to about 10 per cent of the masonry structure slid down the banks into the stream. The remaining parts stood intact with the exception of a broad crack that developed longitudinally through the center of the brick arch.

The car tracks on the surface undoubtedly served as a tie for the span and aided in preventing the total collapse of the structure.

The commissioner of public works of Yonkers, who was also one of the engineers in the construction of the bridge, made the following statement concerning the matter: After investigation we find that for some time a great volume of water from Warburton Avenue has not been passing along the gutter to the culverts provided on the bridge, because of the fact that the gutter was obstructed by snow or ice or dirt. The water was directed out of the gutter across the sidewalks and down along the masonry at the southeast corner of the bridge to the brook below. Following the thaw of Thursday and Friday, February 27th and 28th, a hole about 3 ft. square developed in the gutter opposite the recently erected electric light pole at the outside edge of the sidewalk a few feet south of the bridge abutment. There is no doubt but that the great volume of surface water from rain and melted snow which swept down the hill side into the gutter burrowed an underground water course starting at the break in the gutter and undermined the corner of the bridge."

The Yonkers Railroad Co. had nothing whatever to do with the construction of the bridge or its maintenance.

### INDIAN TERRITORY COAL FIELDS.

In the "Review" for March mention was made of the organization of the Indian Territory Traction Co., of South McAlester, I. T., to build a road passing along the route of a number of coal mines. This coal field is discussed by Mr. Joseph A. Taft in the 22nd Annual Report of the United States Geological Survey, now in the press. The Indian Territory coal field is directly connected with the Kansas coal field on the north and the Arkansas on the east. The northern and extreme western parts are undeveloped and little known. The area of this coal field approximates 20,000 square miles. There are several beds of coal in the Indian Territory field thick enough to be commercially workable, besides others which may be of equally workable thickness. The McAlester coals appear in three districts in the southern part of this field. This coal is mined most extensively at Carbon, Dow, Anderson, Krebs, and McAlester, and varies in these mines from 3 to 4 ft. in thickness. The above towns are all upon the route of the new line which is to be built by the Indian Territory Traction Co., and a considerable revenue will result in carrying miners to and from the mines. The coal is successfully coked and ranks as a high grade bituminous coal.

Commercial coal mining in Indian Territory began near McAlester with the erection of the Missouri, Kansas & Texas Railroad in 1872. In 1900 Indian Territory produced 1,922,298 tons of coal the shipment of which is made entirely by rail, and the development of the mines had depended directly upon railroad building. Four railroads reach the Indian Territory field, the Missouri, Kansas & Texas, the St. Louis & San Francisco, the Memphis & Choctaw and the Kansas City Southern.

### FURTHER EXTENSION OF WESTINGHOUSE WORKS.

The Westinghouse Electric & Manufacturing Co. will begin immediately the construction of new buildings at East Pittsburg, which will greatly increase the size of the works. The new buildings will be known as the East Extension, and the plans for them were made two years ago, when it was seen that the natural development of this company's business would, about this time, make the additions necessary. The plans also require the building of a river wall along the banks of the Turtle Creek from a point near Turtle Creek Station to Brinton Station, below the works of the Westinghouse Machine Co. Arrangements have also been made with the Pennsylvania Railroad whereby a special railroad line will be built from East Pittsburg to the new Westinghouse foundries which are now being established at the town of Stewart, several miles to the east. This railroad will be built for the exclusive use of the Westinghouse companies. The construction of this large undertaking has been entrusted to James Stewart & Co., of Pittsburg, St. Louis and New Orleans, whose remarkable achievements in erecting, in record time, the new Westinghouse Electric Works at Manchester, England, have for several months been the theme of general attention in the English and American press.

## RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

### DUTY TO KEEP PLATFORMS AND STEPS OF CARS IN SAFE CONDITION IN ALL WEATHER.

Herbert v. St. Paul City Railway Co. (Minn.), 88 N. W. Rep. 996. Jan. 31, 1902

A street car company, the supreme court of Minnesota holds, is required to exercise the highest degree of care to keep its platforms and steps in safe condition for use in the season when operated, so far as it practically can do so, in consideration of the climate, temperature, and condition of the air with respect to snow, moisture, and frost. And it affirms in this case a judgment for \$1,000 damages for injuries sustained by a passenger who, when alighting from a street car, slipped and fell from the same by reason of ice and snow alleged to have been negligently permitted by the carrier to be and remain upon its steps and platforms.

### DUTY WHEN CAR APPROACHES WHERE ONE ON OPPOSITE TRACK IS STOPPED—UNREASONABLE SPEED EVIDENCE OF NEGLIGENCE—FAILURE TO LOOK FOR APPROACHING CARS.

Bass' Administrator v. Norfolk Railway & Light Co. (Va.), 40 S. E. Rep. 100. Dec. 5, 1901.

A passenger on alighting from a car went around it onto the other track, where he was struck by a car coming from the opposite direction. The supreme court of appeals of Virginia holds that it was the duty of the company not only to give notice or warning of the approach of its car, but as it neared the crossing, where its first-mentioned car had stopped to let off and take on passengers, to run at such a rate of speed as to have the car under control, and be able to stop it readily. Unless unusual speed is expressly permitted by law, the speed of a car, it says, ought to be no greater than is reasonable and consistent with the customary use of the street by the public with safety. Any speed in excess of that rate is at least evidence of negligence.

Failure to look for approaching street cars by a person about to cross a street railway track, especially at a street crossing, ought not, the court thinks, upon principle, to be held to be negligence, as a matter of law. It says that the authorities upon this question are conflicting, but that its conclusion is sustained by some of the ablest text writers, and by many, if not by a majority, of the decided cases.

### RISKS ASSUMED BY EXPERIENCED CONDUCTOR LEARNING DUTIES ON ANOTHER ROAD.

Ladd v. Brockton Street Railway Co. (Mass.), 62 N. E. Rep. 730. Feb. 27, 1902.

A man who had acted as conductor on other roads and considered himself an experienced man, was struck by a trolley post at a place where the track ran along the side of the road for about 1,000 feet on a line that he was engaged in learning the duties of conductor upon in anticipation of being employed on. He began learning those duties two days before the accident, but had not worked on that part of the road before that morning, though on that morning he had made two or more trips by the place where the accident happened before it occurred. He testified that he knew that it was common in country towns to have tracks run on one side of the road, and that he knew that in such cases there were posts for the trolley wires. He also testified that he did not observe whether the car was on the side of the road or in the center, and paid no attention to that fact, or to the post or poles or track. And there was nothing to show that as he stepped down onto the running board he looked to see if there were any obstructions, or exercised any precautions. It also appeared that the running board on the opposite side of the car would have been entirely safe, and that there was nothing requiring him to use the running board on one side of the car rather than the other. Under these circumstances the supreme judicial court of

Massachusetts holds that, at the close of his evidence, a verdict was properly directed for the company.

The court says that it thinks it plain that the risk was an obvious one, which the man must be held to have assumed, and that he was not in the exercise of due care. The situation of the posts and tracks was manifest, or, so far as appeared, was not unusual. There was nothing in the nature of a trap. The man was familiar with the duties of a conductor. The company owed him no duty of warning or instruction in regard to dangers that were obvious, and it owed him no duty to change the arrangement of the track and the posts. Upon entering the employment of the company, he must be held to have contracted with reference to those as they were. Moreover, in view of the fact that he had been sent out upon that portion of the company's road where he was when injured to learn the conditions attending its operation there, it seems to the court that to step down onto the running board as he did without looking to see whether there was any obstruction in the way or whether it was safe to do so was negligence on his part.

### INABILITY TO STOP A CAR ON STEEP GRADE BETWEEN CROSS STREETS—RIGHTS AND DUTIES OF PEDESTRIANS.

Burian v. Seattle Electric Co. (Wash.), 67 Pac. Rep. 214. Dec. 14, 1901.

A cable car ascending a hill where the grade was about 20 per cent, with the cross streets level, was apparently stopped as quickly as possible after it reached the level of a crossing upon which there was a pedestrian, but before it had safely landed upon the level its front end struck him. It was urged in defense that the car could not, with safety to its passengers, be released from the cable until it had cleared the incline of the hill, and stood upon the level of the crossing, since if a gripman should release a car from the cable at any point on the incline it might not be possible by means of brakes to prevent the car from retreating down the hill, while the speed of the car could not be checked, since it must follow the speed of the running cable at that point. Therefore, it was insisted that no negligence could be attached to the company for not checking the speed, or for not stopping the car. But the supreme court of Washington says that it is not prepared to state as a matter of law that the company's rights were such as might authorize it to maintain a system of operating cars that would prevent it from safely stopping the cars at any point within the distance of an entire block, or at a point where they were in the act of entering upon the level of a street crossing.

The obligations of a street railway company and of other travelers along the street, the court says, are mutual, and each must exercise care to prevent collisions and accidents. This mutual obligation is as binding between the operator of the cars and pedestrians at a street crossing as it is between the operator and drivers of vehicles at other points along the streets. The car track is as much a part of the street as any other portion of the traveled way, and pedestrians have a right to cross the track, and particularly at street crossings they must of necessity cross it. If the apparatus used in the operation of cable cars renders the street crossing more hazardous to other travelers than under ordinary conditions, then the street car company should take every reasonable precaution to protect the public from that additional danger. Other travelers having knowledge of these extra hazardous conditions are also under obligation to exercise reasonable care and caution to avoid the danger.

Wherefore, the court holds that it was not within its province to say as a matter of law that no negligence was shown in this case on the part of the company in the fact that the speed of the car could not be checked, or that it could not be stopped before it reached the point where it did stop. This was a question to be submitted to the jury, that it might determine whether, under all the surroundings, the conditions which created the facts as stated constituted negligence.

### USE OF COUNTRY HIGHWAYS.

*Farmer v. Myles* (La.), 30 So. Rep. 858. Nov. 18, 1901.

Police juries have no legal authority to grant a right to construct, own, and operate a line of railway over and through the public roads in the parishes, the supreme court of Louisiana holds, under section 2750 of the Revised Statutes, which authorizes them to pass all such ordinances as they may deem necessary relative to roads, etc. It says that the grant of power for this purpose must be specific, and not implied. Country roads cannot be occupied by street railway tracks without legislative sanction. The authority must be granted by the legislature directly or through the authorized action of the municipality. It is generally conceded that country roads cannot be used for such purpose, even by legislative consent, without compensation to the adjoining landowners. Any legislative permission to use public roads for such purposes would be subject to the rights of the adjoining landowners in the premises. The right could not be exercised under the permission, unless the owners should have given their voluntary consent, or their forced legal consent had been obtained under expropriation proceedings. A landowner has the right to resist the unauthorized diversion of a country road over his property to any other than its usual and legitimate use.

### CONSENTS ASKED FOR MUST BE FOR POWER AUTHORIZED BY COMMISSIONERS FOR REFUSALS TO BE COUNTED SUCH.

*In re Kingsbridge Railway Co.* (N. Y. Sup.), 73 N. Y. Supp. 440. Dec. 6, 1901.

The first appellate division of the supreme court of New York holds that where the state board of railroad commissioners has authorized the operation of a proposed road by electricity, it cannot be said that the abutting property owners have refused to consent thereto where the request made to them which was refused was a consent to "construct and operate a street surface railroad to be operated by electricity or any motive power other than locomotive steam power that may be approved by the state board of railroad commissioners," and hence that an application for the appointment of commissioners to determine whether the road should be constructed notwithstanding a refusal of the abutters to consent thereto must be denied. In other words, the court holds that the refusal of the property owners to consent to another and entirely different road than that authorized to be constructed—a road to be operated by a motive power of an entirely different character—is no evidence of a refusal of the property owners to consent to the construction and operation of a railroad authorized and which the railroad company proposed to construct.

### LIABILITY FOR INJURY OF PASSENGER UNDER OPERATING ARRANGEMENT BETWEEN TWO COMPANIES.

*Richard v. Detroit, Rochester, Romeo & Lake Orion Railway* (Mich.), 89 N. W. Rep. 52. Feb. 11, 1902.

This was an action for personal injuries alleged to have been sustained by a passenger through the negligent starting of a car when she was alighting therefrom. The company sued had an arrangement with a connecting electric line for cars to be run through by both companies jointly between their joint terminals. The contract was that each company should remain in full control of the operation and management of the cars while on the tracks, and the ownership of the tracks should determine the responsibility of the respective parties to the public. Each party should have the right to replace the employes of the other at the junction point, so that its own employes might operate the cars while on its own tracks. Each company should pay to the other, for the use of double-truck passenger cars two cents per car mile. The fares should belong to the company owning the tracks, for a ride over which they were collected.

The accident in question occurred near the switch where the car of the company sued, on which the passenger had ridden over the other company's line, left the latter's track. The company sued claimed that the passenger was hurt before the switch was reached,

while the car was on the other company's tracks, and while the conductor and motorman were under the control of that company's superintendent; that while these employes were primarily paid by the company sued, it was reimbursed by the other company, and, if there was any liability at all, it was the other company which was liable, and not the company sued. The record disclosed that, upon the fare paid by her, the passenger would have been entitled to ride at least a block further than where she got off, and over a portion of the road of the company sued. It also showed that the conductor had thrown the switch belonging to the company sued before the car was started.

In affirming a judgment against the company sued, the supreme court of Michigan states that whatever might be said of this contract, between the parties thereto, it was very clear that it was to the mutual advantage of both the companies to have the cars of the company sued pass over the track of the other company, and to have passengers ride in the cars of the company sued. The fare which this passenger paid entitled her to ride over the tracks of both companies, and, according to the contract, each company was receiving a good and valid consideration for her ride. One received a five-cent fare; the other received a rental for its cars, the privilege of through car service, and all the benefits which such service brought, by giving the company sued a terminal where it did. Then, under the most favorable construction which could be given to the contract, the company sued and the other company were jointly operating the car on the night in question, and were jointly and severally liable for any tort or wrongful act which may have been committed by their servants. And, the court adds, it is a well-settled principle of law that, where more than one party is guilty of a negligent act, the party injured may proceed against them jointly or severally.

### IMPLIED DUTY AS TO REMOVAL OF SNOW FROM STREET.

*Gerrard v. La Crosse City Railway Co.* (Wis.), 89 N. W. Rep. 125. Feb. 18, 1902.

The complaint in this case set forth in detail the requirements of the city ordinance granting to the company its street franchises that it should not allow snow or ice to accumulate upon its tracks in such quantities as to obstruct travel, nor deposit snow upon the street in such manner as to obstruct travel or render the same unsafe, and charged their violation. Moreover, by the last clause of the third subdivision of the complaint it was charged, in substance, that the company negligently caused the snow and ice on its track to be excavated and removed in such manner as to leave a deep ditch, rendering the street unsafe and dangerous for public travel. The supreme court of Wisconsin says that it can construe this as meaning nothing more or less than a breach of the common-law duty not to render the street unsafe for travel, which is manifestly wholly independent of the provisions of the ordinance. It was argued, however, that there was no such common-law duty; that the company's obligations to the public were measured by the requirements of the ordinance. But with this contention the court says that it cannot agree.

Even in the absence of any requirements in the ordinance upon the subject, the court says it must be held that when the company received its franchise to operate a street railway upon the streets for its private gain, as well as the public convenience, it at the same time assumed a duty to the public not to unnecessarily render ordinary travel on the street dangerous. It must exercise its rights with due deference to the rights of the general public. It had no license to build and operate its tracks with total disregard of the rights and safety of the man with the horse and wagon, or the woman with the horse and cutter.

On this subject, the court quotes from Elliott on Roads and Streets (2d Ed., sec. 764), "A street railway company which accepts a grant or a license impliedly agrees that it will use due care not to unnecessarily impede travel or to make the use of the street hazardous. The burden which it assumes in conjunction with the benefit which it obtains is a continuing one, and it must bear it, though to do what due care and diligence requires may sometimes entail considerable expense. \* \* \* Where the track is cleared for its own convenience, it must do what is reasonably necessary to make the part of the street not occupied by its tracks reasonably safe, for it cannot for its own accommodation obstruct it so as to endanger trav-

clers." The court says that it accepts these propositions as correctly stating the law.

It was said that to require the company to remove any part of the snow from the street outside of its tracks was an undue burden, involving, perhaps, great labor and expense; but, as pointed out above, the court says, the company by accepting its franchise, assumed a duty to the public and any disposition which it is obliged to make of falling snow in order to run its cars must be such a disposition as preserves the rights of the public to have a reasonably safe street for ordinary travel. If the public right can be preserved by simply brushing the snow to one side, well and good; but if the snow is so deep that the right can only be preserved by removing the snow from its tracks and from such additional space outside thereof as is necessary to prevent the formation of a dangerous declivity, then the company must make such removal. Any disposition which it makes of the snow must be made with due deference to the rights of travel upon the highway.

CONSTRUCTION AND OPERATION OF ROAD WITH  
CURVES—SWAYING OF CARS MUST BE EX-  
PECTED—CONTRIBUTORY NEGLIGENCE OF  
PASSENGER ON RUNNING BOARD OR  
FRONT PLATFORM.

Bruce v. Brooklyn Heights Railroad Co. (N. Y. Sup.), 74 N. Y. Supp. 324. Jan. 17, 1902.

The second appellate division of the supreme court of New York says that it apprehends that it is not the law of that state that a street surface railway must be built upon a straight line, after the manner said to have been directed by the Czar of Russia in the construction of a transcontinental railroad or that in the practical operation of the cars they shall be so handled as never to sway or vibrate. It says that it shall assume that such corporations may construct their lines upon approved engineering plans, with such grades and curves as shall be necessary in the practical accomplishment of the purpose for which they are created; and that in the operation of the cars they may, subject to the liability for the negligent injuring of passengers or persons lawfully upon the highway with their property, run them in such a manner as to meet the requirements of transportation. In other words, it is not required that in the operation of street railway cars there shall be no swaying of the cars, no jars or jolts. These are reasonably to be expected in the practical discharge of the duties which are assumed by the corporation in accepting its franchise, and it is the duty of passengers to take notice of the obvious fact that a car weighing from 4 to 10 tons, running at a practical rate of speed, will be subject to the laws of applied mechanics, and will be swayed with greater or less violence in passing around curves, and will be jolted to some extent in passing over other tracks at street intersections.

This, the court continues, does not give the street railway company a license to operate its cars without regard to the safety of passengers. It owes them the duty of carrying them in safety over its lines, provided, always, that the passenger has been guilty of no neglect contributing to the accident. For instance, if a passenger is occupying a seat in a car, and voluntarily leaves that seat, and steps down upon the running board of an open car, and, without taking hold of anything, relies upon his being able to keep his balance, and the car, in passing around a curve, should throw him off, the company would not be liable, even if it were negligent in the operation of the car, and the burden of proving lack of contributory negligence is upon the plaintiff at all times. It is true, of course, if the injury happened to the passenger while occupying a seat provided by the company, the presumption of lack of contributory negligence would at once arise; but it is none the less proved by the plaintiff by establishing the facts which made it impossible for the passenger to contribute to the accident, as in the case of a collision or the derailling of a car.

In this case, all that was established by the evidence was that the passenger (a policeman) thrown from a car at a curve had left the interior of the car, where it was not to be doubted he was perfectly safe, and took a place upon the front platform. Conceding that it was not negligence per se, or in and of itself, to occupy a place upon the front platform of a car, it is equally certain, the court says, that it was not evidence of lack of contributory negli-

gence. No legitimate inference may be drawn from the fact that a man leaves the interior of the car where he is not crowded, and where the company has afforded accommodations for its passengers, and goes out on the front platform, that he is free from contributory negligence at a time when he reaches the platform. Here it was undisputed that the passenger gave no sign to the motorman that he was present upon the platform until just at the moment of entering upon the curve; and, if it be held that it was negligent upon the part of the company not to operate its cars in such a manner as not to injure one who had quietly taken a place upon the platform without the knowledge of the company's servants, the court holds that it could not be said that it was evidence of a lack of contributory negligence on his part, and without such evidence there could be no recovery of damages.

VALIDITY OF LICENSE TAX.

Newport News & Old Point Railway & Electric Co. v. City of Newport News (Va.), 40 S. E. Rep. 645. Jan. 23, 1902.

The question in this case was as to the authority of the city to levy a license tax as follows: "On each and every street railway company twenty-five dollars each for the first ten cars, and ten dollars on each car in addition thereto used in the city, and an additional tax of fifty cents on each and every pole owned by said company in this city." The charter of the city provided that, "For the execution of its powers and duties the council may raise taxes annually by assessments in said city on all subjects taxable by the state, such sums of money as it shall deem necessary to defray the expenses of the same, and in such manner as it shall deem expedient, in accordance with the laws of this state and of the United States." This language, the supreme court of appeals of Virginia holds, conferred upon the city council general powers of taxation, including all persons and subjects of taxation, except only as it might be limited by the laws of the state or of the United States. And, upon the whole case, the court is of the opinion that the ordinance in question was not in conflict with the constitution and laws of either the state or the United States, but was a legitimate exercise of municipal power.

It was contended that this ordinance was invalid, because in violation of the provision of the state constitution securing equal and uniform taxation, and was also obnoxious to the provision which authorizes the general assembly to levy a tax upon certain licenses named, and all other business which cannot be reached by the ad valorem system. The argument was that, inasmuch as no license tax was imposed by the state upon the company bringing this action, its property being reached by the ad valorem system for purposes of state taxation, no license could be imposed by the city until the state abandoned its method of taxation, and declared that the property could not be reached by the ad valorem system. But the court points out that the property used in conducting the company's street railway business was taxed by the city upon the ad valorem basis, as it was by the state, the ordinance in question imposing, in addition, a license tax upon the privilege enjoyed of conducting the street car business. That the privilege of running street cars through the crowded thoroughfares of a city is, in the discretion of the council, a legitimate subject upon which to impose a license tax, either for the purposes of raising revenue under its general powers of taxation, or in the exercise of its general police power, the court says, cannot be seriously questioned.

The license tax required was not unequal taxation, the court holds, because the ordinance imposing it applied alike to all street railway companies. Nor is it a double taxation to require a street railway company to pay a license tax for the privilege of conducting its business, and at the same time to impose a tax upon the property used in carrying on that business.

Neither does the court consider the position tenable, that because street railways were not mentioned in the section of the city charter which authorizes a license tax upon certain pursuits therein stated, they were therefore excluded from such taxation, it being clear that the legislature did not undertake to enumerate all the subjects and classes upon which a license tax might be imposed. Likewise, it pronounces unsound the contention that the right to assess a license tax upon the company, in order to be exercised, should have been reserved to the city in the ordinance granting the company the right

to construct its tracks and operate its cars on the streets. It says that the right to levy taxes does not arise out of contract. Exemption from taxation is never to be presumed. It has been repeatedly held that a municipal ordinance granting to a street railway company a franchise to construct its tracks and operate cars upon the streets of the city, and which is silent upon the question of taxation, cannot be construed as conferring immunity from the payment of a license tax in the absence of an express stipulation to that effect. The company took its charter subject to the same right of taxation in the city that applies to all other privileges and to all other property. If it wished or intended to have an exemption of any kind from taxation, it should have obtained a provision to that effect in its charter.

Because the company's street railway extended beyond the corporate limits of the city, through the county, to certain adjacent towns, it was suggested that a railway company is an entirety, and cannot be spoken of as actually located in any county, city, or town which it traverses. Granting this to be true, still, the court says, it may be taxed by the city, the streets of which are traversed by it, upon the business done in such city, although its lines extend beyond the city limits.

RISKS ASSUMED BY EMPLOYEE GOING IN SEVERE  
WEATHER INTO OPEN COUNTRY TO REMOVE  
SNOW FROM TRACKS—WHEN COMPANY  
LIABLE FOR INJURIES THEREFROM.—  
TRANSPORTATION OF EMPLOYEE.

*King v. Interstate Consolidated Street Railway Co.*, 51 Atl. Rep., 301. *Carl v. Same*, 51 Atl. Rep., 305. (R. I.) Feb. 12, 1902.

In the first-named case it was alleged in the first count of the declaration that the party suing was employed by the company to help remove snow from its tracks in very cold weather, the work to be done over a wide tract of open country, remote from dwelling houses and other habitations; that the company knew that the work was very trying and dangerous to those engaged therein, and that it was its duty to furnish the party suing sufficient food and shelter during the continuance of the work, and to provide for his safety while so employed, and to carry him to his home when returning from the work; that he was ignorant of the danger attending the work, and that while engaged for 24 hours therein, and while in the exercise of due care, and in ignorance of the peril to which he was exposed, both of his feet were frozen, of which fact he informed the company's agents and servants, and requested them to carry him to his home, but that the company, its agents and servants, well knowing the premises, carelessly and negligently failed to provide food and shelter for him; and that the freezing of his feet was due to the failure of the company, its agents and servants, to supply him with food and shelter while so engaged; and that they had to be amputated. The second count differed from the first in that it alleged that, without fault on his part, both of his feet were frozen, of which fact he informed the company, its agents and servants, and requested them to carry him to his home, which they carelessly and negligently refused to do, and being unable to procure passage to his home, he was obliged to make his way there on his hands and knees, and was engaged in making said journey from 7 o'clock in the evening until 8 o'clock the next morning. And he averred that in consequence thereof, and without fault on his part, his feet were so badly frozen that they afterwards had to be amputated, and that it was the duty of the company, under the circumstances set forth, to provide him with food and shelter and transportation as stated.

The supreme court of Rhode Island holds both counts demurrable. The first, in failing to allege that the company either expressly or impliedly assumed the duty of furnishing the party suing with food or protection from the cold. That one of the risks incident to long-continued outdoor employment in the winter time in this climate is that one's feet or hands may be injured by freezing, the court says, is so clearly within the rule of assumed risks on the part of the servant as to require no argument. The furnishing of food and clothing, the proper care of oneself in the doing of his work, the recognition of the existence of well-known physical laws,—these duties, in the absence of some custom, rule, or understanding to the contrary, are clearly devolved upon the servant; and for any failure to observe them he alone must suffer the consequence. In order therefore, to cast such a duty upon the company as that which was here relied upon, it must appear from the facts and circumstances

set forth in the declaration that the party suing was led to neglect or omit to provide for himself by reason of the fact that the company had assumed the duty of providing for him. Likewise, with reference to the second count, the court says that it was not alleged that the company conveyed the party suing to his place of work, or that it promised, either expressly or impliedly, to carry him back to his home; and it was not, and could not successfully be, contended that it is any part of the duty of an employer to carry his employees to or from their place of work, in the absence, at any rate, of some custom, understanding, or agreement to that effect.

The second named case, like the first, was one of trespass on the case for negligence, as it is called. But there was a material difference between the two cases in at least two respects, viz.: The declaration in the second case set out that the party suing was taken and conveyed by the company to the place where he suffered his injuries before being set to work, and that after he began to suffer from the cold, and was unable to work any longer, and requested to be permitted to leave off work, and being refused, he was ordered to enter and permitted to remain in one of the company's cars, and that the company wholly neglected to take care of and provide for him for a long time, while practically in a helpless condition. In view of these allegations, the court holds that the demurrer in this case should be overruled. It says that, if the company directed the party suing in this case, after becoming disabled to work, to go into one of its cars, and permitted him to remain there, as alleged, it cannot say, under the circumstances, that it would not be competent for the jury to find that the company assumed upon itself the duty of taking reasonable care of him while there, and of seasonably conveying him to his home, or to some place where he would be taken care of.

CARE REQUIRED IN SELECTION OF PLACE FOR PAS-  
SENGER TO ALIGHT.

*Foley v. Brunswick Traction Co. (N. J.)*, 50 Atl. Rep. 340. Nov. 15, 1901.

A passenger, in alighting from a street car at a point of transfer, or temporary terminus selected by the company, stepped upon a stone in the highway, and sustained injuries for which she brought suit. The jury was instructed that she could recover damages if the place selected by the company for her to leave its car was not a safe one for that purpose. The court of errors and appeals of New Jersey holds that this instruction was erroneous, because it did not submit to the jury the question of the company's negligence, which was the gravamen or vital point of the action.

The gravamen of the action, the court says, was the failure of the company to use reasonable care for the woman's safety as a passenger; hence the correct instruction would have been that the company was liable for her injuries if it failed to take reasonable precautions to see that the place provided by it for her discharge was a safe one for that purpose. If this language be transposed so as to read that it was the duty of the company to see that the place where it discharged her was a safe one if reasonable precautions would make it so, the court says the doctrine will receive an apparent emphasis, although upon analysis each statement will be found to be the legal equivalent of the other. Whatever the form of words employed, the idea expressed should be that the guilt of the company is to be measured by the degree of care it has put forth for the passenger's safety, and not by the degree of success attendant upon its efforts.

There was, doubtless, a degree of circumspection, the court goes on to say, that would have discovered the stone in the highway, whatever its size or location might have been, and a degree of caution that would have prompted either its removal or the selection of some other place as a temporary terminus; but whether such circumspection and such caution were required of the company depended upon the reasonableness of its exercise, and that question was not left to the jury. It might be that the jury, notwithstanding the undisputed fact that the woman fell while alighting upon the highway, would have found that the stone that caused her to fall was so small in size, and so concealed from view, or was so connected with the roadway, that the company, in the exercise of reasonable care, would not have noted its presence, or have foreseen the danger of failing to remove it. It was the company's right to have that question submitted to the jury.

# MECHANICAL DEPARTMENT

## THE REPAIR AND IMPROVEMENT OF A TYPE K CONTROLLER.

BY L. A. S.

Most of the older street railway companies have in service some of the type K controllers which have vulcabeston insulated controlling cylinders. The segments of these cylinders as they wear down become too low for the contact tips and new tips or new cylinders have to be purchased. It is cheaper to buy new cylinders, since the shaft wears fast where the controller handle goes on, as does the star wheel.

In buying new cylinders one can get a K-10, and by altering the

steel tubing, and this is a good thing to do when putting in new cylinders.

The diagram shows the connection board and wires of the K, K-10, and K-10 Special controllers.

To change a K into a K-10 Special proceed as follows:

Change 19-R-3 jumper to 19-R-5.

Cut 19 wire two segments.

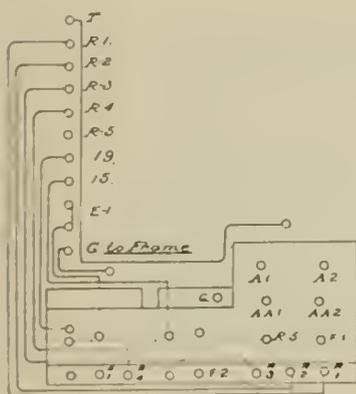

Cut 15 wire two segments.

Cut E-1 wire one segment.

New wires for R-3 and R-4.

Take out L-1 and L-2 wires.

The reverse wires are similar for all three controllers, as shown in diagram for K.

K-10.

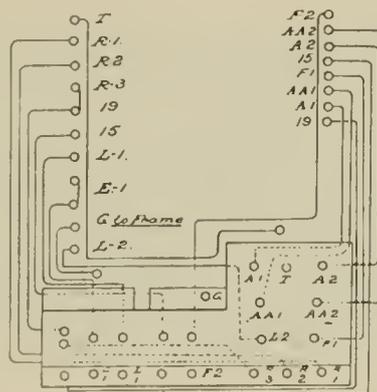

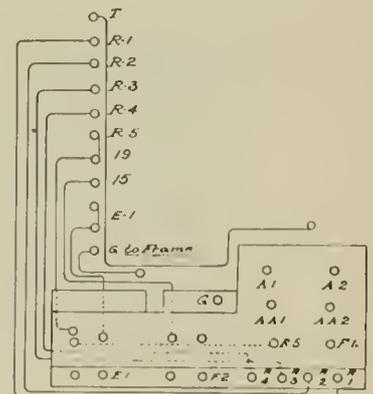

DIAGRAM OF CONNECTIONS OF K CONTROLLER.

K-10 SPECIAL.

wiring between the connection and the finger board made a more modern controller and also one better adapted to handling a crowded car and saving motors from the rough usage they sometimes get with a K controller and only one resistance box.

In making over a K into a K-10 it can be done in two ways. One is to buy a K to cylinder, a K to controller top and a K-10 water cap and pointer. By turning down the water guard around the reverse cylinder on the controller top the same cylinder may be used, and by a little cutting, the same reverse handle also. Then changing the wires gives what may be called a K-10 "Special" to keep it distinct from a regular K 10. The terminals on the cable leads can remain and be used as before with the regular K landing post.

The fibre insulated K reverse cylinders cause some trouble by the screws becoming loose and segments short circuiting and in some cases have to be replaced. In this case, in changing from a K to a K 10, it would be best to purchase a K 10 reverse cylinder and water cap and by changing the connection board terminals (besides doing the same as in case of a K-10 Special) make a regular K 10 controller.

It is a good plan to complete the change by rewinding the magnet speed and making the trolley landing post fixed to the magnet. This removes it from the connection board where it causes trouble from short circuiting.

If this change is made a 3-panel resistance box is needed and the old shaft frame may be used by changing the filling.

Of course in making this change five resistance wires in stead of three are required and the L1 and L2 wires in the cable may be used for R4 and R5, thus saving the running of any new wires.

In old frame the top bearing of the controlling cylinder becomes worn and may be repaired by boring out for a bushing of

## SPLICING ARMATURE SHAFTS.

Street railway men having motors of the old Sprague type may be interested in knowing of a method of repairing broken armature shafts for these motors. Electrically these Sprague motors have always given good results but the long projecting shaft at the pinion end gives a leverage that has resulted in an unduly large number of broken shafts. The break usually occurs close up to the commutator collar and makes necessary an entire rewinding of the armature at a cost of something like \$25 or \$30.

As a means of repairing the shafts when they do break the Bing-hamton Railroad Co. uses a piece of steel shafting forced into the broken end of the old shaft.

The procedure is as follows: The commutator is first removed from the damaged armature. The broken end of the shaft is cut off close to the collar and with a 1/4-in. twist drill a hole is bored into that end of the shaft to a depth of 4 in. A piece of steel shafting about 12 in. long and perhaps 3 in. in diameter is put into the lathe and turned down for a distance of 4 in. from one end to a diameter just large enough to make a very close fit in the hole in the armature shaft. With a hand screw press rigged up on the shop bench the piece of shafting is pressed into the hole as far as it will go. The whole shaft, armature and all, is then put into a lathe and the added piece turned down and cut off to the proper diameter and length. It is not claimed the spliced shaft is any stronger than a new one would be, but this method of repair avoids disturbing the armature coils. If the shaft breaks a second time the hole is merely drilled out again and a new piece of shafting inserted as before. The new shaft may be part of an old wheel axle or a steel shaft or bar rescued from the scrap heap.

When the idea was first suggested some doubt was felt as to

whether the added piece would work loose or not and it was thought it might be necessary to key the piece into place. This would have increased the cost materially and after experimenting it was found a key was not essential. The company has a number of armatures in service repaired in this way.

**GREASE AND OIL RECORDS IN MAINTENANCE OF ROLLING STOCK.**

Although grease and oil do not constitute an exceptionally large account in the maintenance of cars and trucks, they are important items and unless their distribution is carefully supervised the waste and loss through careless handling may easily reach unwarrantable proportions.

As a check against thoughtlessness and extravagance in this particular, the accompanying report blank as adopted by a former su-

Form D-46.—7-2-1900—500.

Foreman Barn.

perintendent of the United Railways & Electric Co., of Baltimore, is suggested. The blank is filled out monthly by the foreman of each barn and not only gives the superintendent and manager a check on the foreman but also enables him to keep tab on the supplyman, as the quality of the brand of oil or grease will be quickly reflected in the quantity needed to maintain a certain number of cars.

In the latest catalog of the Mayer & Englund Co., of Philadelphia, we find the following as to the proper spacing of rails when laying track:

"A careful investigation of the best practice suggests the following rule:

Temperature, Degrees Fahrenheit.	Space between Rails.
80 to 100 .....	None.
60 to 80 .....	1-16 in.
40 to 60 .....	¼ in.
20 to 40 .....	3-16 in.
Zero to 20 .....	¼ in.

The Northern Ohio Traction Co. has opened offices in Toledo, and the office at Cleveland has been closed.

**TRUCK FOR HANDLING ARMATURES.**

A convenient truck for picking up and transporting armatures about the shops is in service at the shops of the Capital Traction Co., Washington, D. C.

The arrangement is a wooden frame 8 ft. long mounted on two wheels, 20 in. in diameter, having tires 1½ in. wide. From the

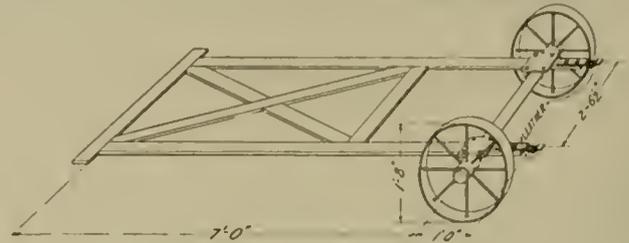

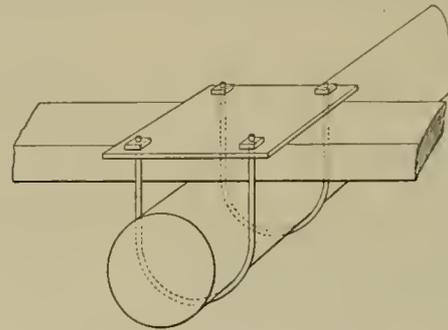

DIAGRAM OF ARMATURE TRUCK.

sketch it is seen the frame comprises two long side pieces joined by cross bracing and having at the ends two metal pieces designed to form rests for the armature shaft. These end pieces are forgings bolted to the frame and having linings of leather attached to the inside of the cup-like portions for the purpose of preventing injury to the armature or its shaft.

The frame is attached to the axle by four U bolts passing under the axle and through a bearing plate resting on the top of the

DETAIL OF AXLE CONNECTION.

frame side pieces. The axle is placed about 1 ft. from the free ends, thus giving sufficient leverage effect to the handle to enable the operator to lift an armature with but slight effort. It will be evident that with the truck an armature resting upon the floor may be picked up and moved about without further handling.

The Danville (Ill.) Street Railway & Light Co. observed its annual "Charity day" May 1st, donating the proceeds from the operation of its lines on that day to the local hospitals and Children's Home.

The Georgia Railway & Electric Co., operating the consolidated street railways in Atlanta, will effect a general change of routes when the physical combination of the properties shall be complete. Under the new regime there will be 15 city and 5 suburban divisions.

The Wichita (Kan.) Railroad & Light Co. is reported to have abandoned for the present its project of opening a popular resort at College Hill this summer, owing to the difficulty of securing a sufficient number of new cars to handle the expected increase in traffic.

An unsuccessful attempt to wreck a car on the Louisville, Anchorage & Pewee Valley Electric R. R. was made on the evening of April 10th. The car in rounding a curve struck a heavy timber which had been placed across the track and fastened to the rails. The force of the collision, however, was sufficient to hurl the obstruction out of the way and the car passed in safety.

**NEW CARS FOR THE HAMILTON, GLENDALE & CINCINNATI TRACTION CO.**

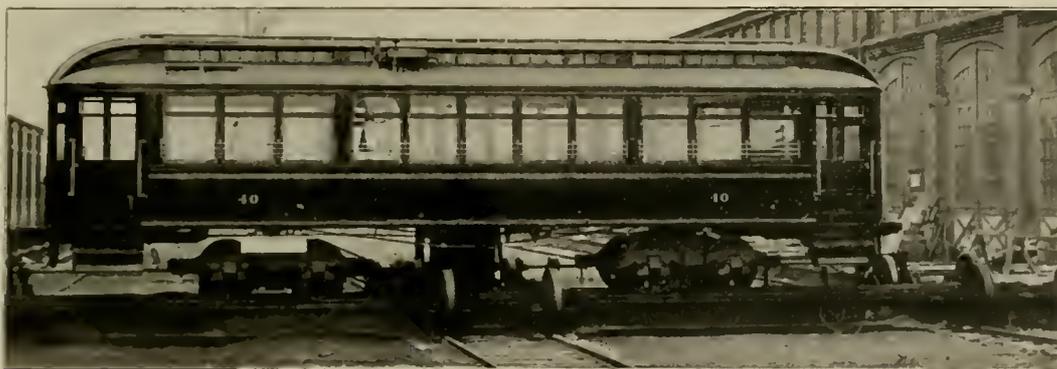

The accompanying illustration shows a large car of the type built by the John Stephenson Co. for the Hamilton, Glendale & Cincinnati Traction Co. The car was designed for suburban or interurban service primarily and is equipped to work on fast lines, but it can also be operated within the city limits without difficulty. The body of this car is 31 ft. 10 in. in length and it has vestibules 4 ft. 8 in. long, making the length over the dashes 41 ft. 2 in. Its greatest width is 8 ft. 4 in. and the height from the under side of sills to the top of the trolley board is 9 ft. The buffers have a 12-in. extension and are solid on the platform timbers. They are composed of 6-in. steel  $\frac{1}{2}$  in. thick.

The car is provided with all the modern conveniences, including baggage, passenger and smoking compartments, toilet room and Baker hot water heaters. The baggage and smoking compartments are usually combined in this type by fitting the room with folding seats. This makes it easy to handle freight or baggage while giving smokers ample accommodations. In the passenger compartments there are 15 seats of the walk-over pattern. Over the windows there is a continuous parcel rack extending the whole length of the car. The windows have three bar guards which are hinged so they can be lifted out of the way when the windows are cleaned. The

lighting and power. In many instances the trolley feeders themselves could be employed to convey energy for lamps and stationary motors. This last is true even where these feeders are fully loaded with the current for car motors, because the maximum demands of these motors are made during only a small part of each 24 hours, and at times when the requirements of lamps and stationary motors are below their highest points.

Aside from legal restrictions on the general supply of electrical energy by street car systems, which restrictions of course vary with the laws of different states, questions connected with insurance rules and certain technical considerations must be met, before traction plants can engage in the commercial distribution of light and power. The almost exclusive use of the single trolley system, with rails and other return conductors in direct contact with the earth, renders it unsafe, as a matter of life and fire risk, to put the wiring of buildings generally into electrical connection with the dynamos at the power houses of street railways. Insurance rules, in recognition of these conditions, prohibit the introduction of circuits from street railway lines into insured buildings, except those used for street car purposes.

The vast majority of electric traction systems in the United States operate with direct current dynamos at 500 to 600 volts, connected one terminal to the trolley wire feeders and the other terminal to the rails. Two wire circuits directly from these dynamos

INTERURBAN CAR FOR CINCINNATI COMPANY—JOHN STEPHENSON CO.

seats in the smoking compartment are longitudinal and built of spring cane. In both compartments the interior finish is of inlaid mahogany. The designs used in the panels over the doors are quite elaborate and all the moldings are also inlaid.

**ELECTRIC LIGHTING BY STREET RAILWAY SYSTEMS.**

BY ALTON D. ADAMS.

No less than five bills are now before the Legislature of Massachusetts, granting powers to certain street railways to do electric lighting in the cities and towns through which they pass. There is also a bill before the same body, giving the privilege in general terms to all street railways of the state to do electric lighting in towns where electric lighting systems do not exist.

The movement in Massachusetts is simply an instance of the larger one throughout the United States, looking to the supply of electric light from street railway stations.

From the standpoint of the general public, electric lighting by street railway systems is certainly desirable, as these systems pass through many towns and into many suburbs where there is no public electrical supply. A load of lamps and stationary motors would obviously be of great advantage to many street railways, because it would afford a source of large income at a comparatively small increase of fixed charges. Periods of maximum demand for energy in street car service and to electric lamps and stationary motors do not coincide. A surplus capacity is thus available at the generating stations of street car systems that may readily be devoted to street lighting, or to commercial electric service.

In almost every case the pole lines that carry feeders for the trolley wire, could also be used to support conductors for general

would be as dangerous in buildings as wires brought from trolley wire feeders and the rails, when the dynamos were connected to the traction system. In either case the insulation of wires in the buildings supplied would be subject to an electrical strain corresponding to the entire voltage of the system, not only as to each other but also as to any grounded metallic structures, such as gas and water pipes. Any person making bodily contact with such pipes and that side of the electrical circuit connected to the trolley wire, either directly or at the dynamo, would be subject to the pressure of 500 to 600 volts. Any plan for the general supply of light and power from existing street railway systems must evidently avoid these dangers.

The generating stations of electric traction systems have enjoyed from their inception the great advantage of multiple working for all their dynamos, in marked contrast with stations for electric lighting. This advantage will hardly be given up by the introduction of dynamos different from those used for traction purposes, in order to do electric lighting. Taking the present generating equipment of street railway systems, general demands for electric light and power may be safely supplied in either of at least two ways. If the terminals of each 500 volt direct current dynamo are brought to a double pole switch, trolley feeders and track may be connected to one side of this switch and an entirely independent set of circuits for general light and power service to the other. With this arrangement a single throw of the switch for any dynamo connects it to either the traction or the lighting system. In this way any of the station dynamos may be operated singly or in multiple on either the lighting or the traction load. As each dynamo is entirely disconnected from the trolley and track when supplying commercial circuits, dangers incident to the ground connection of the rails is entirely avoided. With this arrangement, direct current at about 500 volts pressure is available for general distribution from the generating plant. This current is at once suitable for stationary

motors and can readily be used in enclosed arc lamps, connected four or five in series. Some plan must be provided for the supply of incandescent lamps, and for this a three-wire system will usually be found most suitable. Incandescent lamps for pressures of 225 to 250 volts are now regularly on the market, and a three-wire system for these lamps can be readily supplied from a 500-volt generator. To regulate this supply a motor generator should be so connected to the two 500-volt mains and to a third or neutral wire, that the pressures between this neutral wire and each of the mains will be kept equal to each other by the automatic action of the motor-generator, whatever the loads of lamps or motors between the neutral wire and each of the mains. The capacity of a motor-generator for this purpose need only be 5 to 10 per cent of the capacity of the connected dynamo. Other means instead of a motor-generator may be employed, if desired, to maintain the balance of the three-wire system from the 500-volt dynamo. On this three-wire system 225-volt incandescent lamps can be distributed in multiple, and enclosed arc lamps can be connected two-in series between either main and the neutral. Three-wire Edison systems with about 250 volts pressure between the outside mains are able to distribute energy economically to a distance of three-fourths mile from the generating station. With 500 volts between the two outside mains the radius of distribution for a given load, fixed per cent. of loss in conductors, and constant weight of conductors, is multiplied by four, compared with the radius of the 250-volt system. It follows that the 500-volt three-wire system can economically distribute energy for lighting and power purposes to a distance of at least three miles from generating stations.

The plan just suggested, while making use of standard 500-volt generators, such as are in general use in street railway plants, does not bring existing circuits and feeders into lighting service. This latter is often very desirable, as where the circuits of a traction system pass through one or more towns at distances of several miles from the generating station, so that a separate set of conductors for lighting purposes would require a large increase of investment. The limits of 0.75 mile for 250-volt, and of three miles for 500-volt three-wire systems, in distribution for electric lighting, are imposed in large measure by requirements for regulation of pressure at the lamps. For distribution to motors only the economic radius is much greater than these figures, because the demands for regulation at motors are much less exacting than those at lamps. This is illustrated in many traction systems where lines extend from a 500 or 600 volt station to distances of five and ten miles.

To make use of existing 500-volt dynamo and of feeder circuits in traction systems for electric lighting, at any points to which these circuits extend, small sub-stations at these points are necessary. Such a sub-station should contain one or more motor-generators and a storage battery. The motor-generator should draw energy from the traction circuits and deliver it to the storage battery and to the local lines, for electric lighting and service to stationary motors. Energy should be taken from the trolley feeders only at times when the demands of car motors are comparatively small, or when cars are not in operation.

In this way a large amount of energy can be distributed from sub-stations without increase of either the dynamo equipment at the generating station or of the traction circuits. The local lines from sub-stations will usually be required to cover only a moderate area, as these stations require very little space and may be located in the centers of lighting districts. The fact that one side of the traction circuits is grounded creates no serious risk in connection with the service from sub-stations, because the lighting circuits from the motor-generator and batteries have no electrical connection with the traction lines. The voltage at which the supply from a sub-station shall be carried out may be freely selected without regard to the pressure of the railway circuits, but a two-wire system at 225 to 250 volts will probably be most suitable in the majority of cases. Such a system will supply lamps and motors over such areas as will usually be necessary at a very moderate outlay for conductors and with the utmost simplicity of circuits. In the newer class of street railway work that is now being done from stations that supply alternating currents, the problems of lighting service are easily solved. From such stations alternating lines at high pressure may be run for lighting purposes to any sections where such service is wanted, and energy there distributed from local transformers in the usual way. Either at the generating station or the sub-stations of such an alternating system transformers and rotary converters may

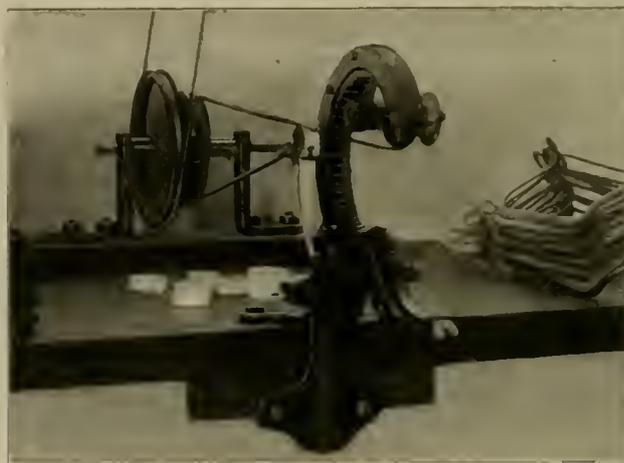

be operated exclusively for general lighting and power service, in addition to the transformers and rotaries devoted to traction work. With this arrangement, as before, there would be no electrical connection between the lighting circuits and those joined to the trolley wire and track. Evidently no especial technical difficulty will be encountered by street railways that enter the lighting field.

### TAPING ARMATURE COILS.

A simple device for taping armature coils has been used at New Bedford, Mass., for some time. It is the invention of J. A. Webber, armature winder for the Union Street Railway Co., who has patented the device.

The machine consists of a circular casting with base attached to fasten to the bench. Around the inside of the casting is a recess in which is set a brass ring having gear teeth cut on the inner surface, and held in position by projections at either side. This ring is driven by a pinion and grooved pulley belted to a counter shaft.

A section of the casting and ring at the front is hinged at its

COIL TAPING MACHINE.

lower end and swings out and down to admit the coil that is to be taped. When the coil is in place within the ring and casting, the section is closed and fastened by a thumb screw so that the continuity of the ring and casting is not broken.

The tape is not fed continuously from a reel but is cut into suitable lengths, each piece being sufficient to tape one coil. Each piece is wound on a separate bobbin by an attachment at the right hand side driven by a belt from the counter shaft, which also drives the gear ring.

In taping a coil a hobbin is placed in the stud projecting from the gear ring, the stud having a slight offset to give the tape the proper pitch as it winds on the coil. The tape passes through a clamp attached to the stud, permitting any desired tension to be put upon the tape as it leaves the bobbin. During the winding, it will be understood, the coil is held in the hands of the operator, who moves it to the right as the gear ring carries the tape hobbin around. A winder after short experience will learn how to handle the coil to secure uniform and smooth taping. Mr. Webber states he has taped 500 coils a day with this machine.

### TROLLEY FREIGHT SERVICE IN OHIO.

The Toledo & Western Railway Co. has put in commission a number of box cars and flat cars of the type used for freight service on steam roads, and this, in addition to its packet freight service, will make the 60-mile interurban electric line a formidable competitor of the steam roads as a freight carrier. An electric locomotive capable of hauling eight or ten loaded cars will be used, and to obviate the difficulty of running such trains through the streets of Toledo, yards have been established at West Toledo, where goods can be transferred from the regular packet cars that run through the urban districts.

## Southwestern Gas, Electric Light and Street Railway Association.

Fourth Annual Meeting Held at Dallas, Tex., April 18-22, 1902—Street Railway Subjects Discussed Were: Fuel Oil—Injury and Damage Cases—Street Railway Management in Texas—Selection of Street Railway and Motor Equipments.

The fourth annual meeting of the Southwestern Gas, Electric Light & Street Railway Association was held in San Antonio, Tex., April 18-21, 1902. There was a large attendance of members as well as supply men and visitors and both the business and social parts of the program were successfully carried out. The association was called to order on the morning of April 18th, by the president, H. F. MacGregor of Houston, Tex., who introduced Mayor Hicks, of San Antonio. Mayor Hicks welcomed the delegates and visitors to the city in a most cordial manner and his address was responded to by Mr. Thomas D. Miller of Dallas, and Alderman Fred Terrell of San Antonio. Then followed the annual address of President MacGregor who stated in part that the Southwestern Association was the "progress club" of the gas, electric and street railway business of the state. Its functions are to better equip the active members for a more perfect performance of the duties of quasi-public service and to teach them how to accomplish the most at the smallest cost. The year that has elapsed has been one continued round of prosperity, in which the gas, electric and street railway plants have participated. The special features of the year affecting the interests represented by the association was the discovery of oil in various sections of the state. This has reduced the fuel expense in the entire southwest territory from 1-3 to 2-3 in proportion to the distance from the base of supply.

President MacGregor then reviewed the various subjects on which papers were to be presented and admonished the delegates to the convention that the object of the meeting was primarily to attend to business and requested that the social side of the program be postponed until after the business sessions had been closed. Friday evening the delegates and ladies to the number of 60 were taken for a ride about the city in a private excursion car of the San Antonio Traction Co., and after visiting the principal points of interest in and about the city the party was taken to the Menger Hotel where the annual banquet of the association was served in the evening.

Among the papers read bearing upon street railway subjects were "Fuel Oil," "Injury and Damage Cases," "Street Railway Management in Texas," and "Selection of Street Railway and Motor Equipments."

### FUEL OIL.

A paper on this subject was read by Mr. W. W. Reed, Houston, Tex., who stated that the subject was such a broad one that he felt obliged to limit his paper to the consideration of the commercial side of the question of utilizing oil as fuel for steam purposes. "The discovery of oil at Beaumont in apparently inexhaustible quantities will doubtless mark the opening of a new era of employment for Texas and the Southwest. With such a cheap fuel at our very doors the immense advantages to manufacturing enterprises must be clearly seen. Fuel oil has already displaced in a large measure the use of coal in many sections of Texas. The immense saving to be accomplished through the use of oil will in a short time, pay for the investment of the oil burning equipment, and while oil will never entirely replace coal, its use in the Southwestern sections of the country will be very extended. Oil makes an ideal fuel, and aside from its low cost there are many other advantages to be gained by its use. It is more easily handled than coal or wood and its use cuts down in a large measure the amount of labor necessary to be employed.

Probably one of the best equipped fuel oil burning plants in Texas is that of the Houston Lighting & Power Co., a brief description of which was given by the author. Oil is delivered on the spur track in front of the plant in tanks from about 6,000 to 9,000 gallons capacity. It is unloaded by gravity into the station storage tanks. There are three of the latter, which are of steel and have a capacity of 12,000 gallons each. They are situated in an underground water proof brick vault over which is a galvanized iron roof. The storage tanks are provided with heating coils to heat the oil in cold weather so that it will not become too viscous to flow freely and be handled

by the pumps. From the storage tanks the oil is pumped into a small receiver where it is heated to a high temperature by the exhaust steam from the pumps. It is then forced to the burners under pressure, the pump being automatic in its action and maintaining a constant pressure of oil regardless of how much oil is being used. The amount of oil consumed is registered by a meter in the oil feed line. Before getting to the nozzle of the burner the oil comes into contact with live steam from the boilers which exhausts and atomizes it. In some burners the atomization of the oil is accomplished in the burner itself while in others it takes place practically in the fire box. The former method appears to be the most effective.

### RELATIVE HEAT VALUES OF OIL AND COAL.

Prof. Phillips gives in his report on "Texas Petroleum" the following values. For petroleum from 17,000 to 20,000 per cent B. T. U., and the value of 18,500 B. t. u. may be assumed as the average. For Alabama coal he gives 13,000 B. t. u., McAlester coal 13,500 B. t. u., New Mexico coal 12,000 B. t. u. and lignite 9,900 B. t. u. On this basis one barrel of crude petroleum weighing 320 lb. is equivalent to 438 lb. of Alabama or McAlester coal, 492 lb. of New Mexico coal and 598 lb. of lignite. From these values the number of barrels of oil to equal one ton of coal would be: One ton Alabama or McAlester coal equals 4.56 barrels of oil, one ton of New Mexico coal equals 4.06 barrels of oil and one ton of lignite equals 3.34 barrels of oil. In actual practice the value of oil as compared with coal depends on a number of factors, such as the grade of coal, the efficiency of the burners or atomizers, the furnace construction, etc. Results based on actual practice range from 2½ to 4 barrels of oil to a ton of soft coal.

### REDUCTIONS IN COST OF HANDLING FUEL.

With fuel oil the cost of handling fuel is greatly reduced. The oil is usually unloaded by gravity thus doing away with the cost of unloading coal. It is fed automatically to the furnace so that the stokers and coal passers may be done away with. All the labor required is that of one man in the boiler room to look after the water level and the general operation of the system. There is no special skill required to operate an oil burning system, but a great deal depends upon the careful adjustment of the burners so as to insure a proper amount of steam and air supply for the amount of oil consumed. A blue transparent flame which completely fills the fire box gives the best results. The use of fuel oil increases the steaming capacity of the boilers in the neighborhood of 35 per cent. At the plant of the Houston Lighting & Power Co., with a given load on the generators, one boiler using oil now does easily what formerly required two boilers using coal.

### CLEANLINESS AND SAFETY.

In using fuel oil the boiler room and premises can be kept tidy and clean, as there is no coal pile, no dust, ashes or clinkers.

Insurance companies will not allow a gravity system of feeding the burners so that there is no oil above the level of the burners. Recent fires, so near to the oil tanks that this oil was heated to a very high temperature, have shown that there is little or no danger to be feared on that score, as the oil did not explode or even ignite and burn.

Other advantages in the use of fuel oil are that the fires may be regulated from a low to an intense heat in a very short time. The fire box with the proper use of oil will last much longer than with the use of coal and there are no repairs and maintenance of fire tools. The fire doors not having to be opened, cold air is not admitted into the combustion chamber to cool down the gas and cause unequal expansion and contraction of the tubes and boiler sheets.

### TESTS OF OIL FUEL.

The author gave the results of two evaporation tests made with Beaumont oil. One of these was made by the Houston Electric Co., on two Babcock & Wilcox boilers and an evaporation of 13.48 lb. of water per pound of oil was obtained from and at 212 deg.

F. The oil weighed 7.43 lb. per gallon. The other test was made at the plant of the Houston Water Works Co., where an evaporation of 14.71 lb. of water per pound of oil was obtained from and at 212 deg. F. No evaporation tests have been made by the plant with which the author is connected and he considers that such a test is not a fair one so far as actual results are concerned unless the steam used to operate the atomizers is deducted from the amount of water evaporated. This is particularly true where two burners are to be compared, as to the amount of steam required to operate different burners varies considerably.

In the plant of the Houston Lighting & Power Co., it was found by comparative tests on coal and fuel oil that one ton of Montreal run-of-mine coal was equal to 3.6 barrels of oil. A number of tests were also made at this plant to determine the relative efficiencies of the various forms of burners. The efficiencies were taken in gallons of oil consumed per kilowatt-hour output at the switchboard. This method is not entirely accurate since it takes into consideration the efficiencies of steam and electrical machinery but the conditions governing the tests were, however, as nearly as possible the same in all the tests, and the tests all covered the same length of time. Of the four burners tested, No. 1 used .713 gallons of oil per kw. h.; burner No. 2 .667 gallons per kw. h.; burner No. 3 .606 gallons per kw. h., and burner No. 4 .575 gallons per kw. h. It will be seen from this that burner No. 2 effected a saving of 6.4 per cent over No. 1, No. 3 a saving of 15 per cent over No. 1, and No. 4 a saving of 19.3 per cent over No. 1, which shows that much depends upon the construction of the burner. The high efficiency of the latter burner is believed by the author to be due to a device used whereby the oil and steam are very intimately mixed, and also to the fact that highly superheated steam is employed to atomize the oil, thus bringing the mixture up to a very high temperature. The nozzle of this burner is also proportioned so that the flame completely fills the firebox. A great deal depends upon the construction of the firebox. Of course, what is suitable for one might not suit another kind and in any case it is necessary to determine by experience the best arrangement of fire box and burner.

When grate bars arranged for burning coal are left in place and covered over with a layer of fire brick the furnace can be adapted for the use of coal again in a few minutes time in case the supply of oil runs out or anything happens to the system. With this construction the air is also heated when passing through the hot bricks and the temperature of the gas in the firebox is not cooled off. The amount of air for complete combustion can be regulated by opening or closing the ash pit doors.

#### SULPHUR IN OIL.

When Beaumont oil first began to be used for steam purposes, much was said about the destructive effects of sulphur in the oil. It was claimed that the large quantity of sulphur in the oil would soon ruin the tubes and sheets of the boilers, but time has proved that there is nothing to fear on this score. The percentage of sulphur in Beaumont oil is placed by different analyses at from 1.33 to 2.04 per cent. After the use of oil in the Houston plant for over 10 months no injurious effect on the boilers could be detected.

A communication from Mr. C. F. Bitgood, chief inspector of the Hartford Steam Boiler Inspection & Insurance Co., was also read concerning the experience of this company with fuel oil on steam boilers. The communication was in part as follows:

The use in this territory of crude oil as fuel began in April, 1901, and our observations cover the periods since then. At the outset, our inspectors received special instructions concerning the new fuel, and were cautioned to use special vigilance to the end that its effects on the boilers under our charge might be ascertained as quickly as possible. Thus far the closest scrutiny has failed to reveal any deleterious effects where proper care is exercised in installing and operating the oil burning apparatus. In some instances, tubes have been bent and shell plates overheated by reason of undue concentration of the oil flame on certain exposed portions of the boilers, but these troubles have uniformly disappeared when the faulty conditions were rectified. Some apprehension was felt at first that the amount of sulphur contained in the crude oil might be sufficient to cause more rapid deterioration by pitting and corrosion than had been experienced with coal. The fear has so far proved groundless. No extraordinary pitting of tubes and shells has been noted since introduction of oil as fuel. This may be accounted for

by the fact that the amount of sulphur liberated per thousand heat units is less with oil than with coal.

The wear and tear upon the boiler structure is probably less with oil than with coal. Much of the wear and tear with coal is due to strains produced by the sudden and frequent inrushes of air against the hot plates and heads while furnace doors are opened for firing, resulting often in leakage at seams and tube ends and small fractures of the boiler plates. These are almost entirely avoided by using oil for fuel. The doors are never opened and the temperature remains practically even. In some cases where constant trouble had been experienced with coal from the above mentioned causes there was a marked improvement when oil was introduced.

This company's experience with oil would indicate it as an ideal fuel if used with proper precaution. There should always be such number and arrangement of burners as will secure thorough diffusion of the heat liberated over the entire fire surfaces of the boilers. Once an installation is properly made, its operation is quite simple.

Probably the association will appreciate a word of warning on one or two points in particular. One of these is haste in raising steam from cold or cool boilers. Oil is rich in heat units and a large amount can be burned in the furnace in a short space of time. This makes it easy to get up steam too quickly.

Another danger lies in forcing the boilers too much. Oil lends itself readily to forcing the boilers away and beyond their rated capacity and there are frequent temptations to do this. Much caution will have to be exercised in these respects, if undue wear and tear is to be avoided, to say nothing of the liability to dangerous explosions.

#### INJURY AND DAMAGE CASES.

This subject was assigned to Mr. Frank E. Scoville, superintendent of the Austin Rapid Transit Railway Co., who opened his paper by reciting in part the experience for the past nine years of the road with which he is connected. During the first year that this company operated as an electric road it did not keep a separate accident account. The second year, 1893, it had such an experience that for the following year it insured with a liability insurance company, paying for that year \$1,200. There were two serious accidents during that year both of which might have been settled had the company been free to do so, but the liability company refused the compromise presented and suits were brought in both cases in which judgments were rendered much larger than the amounts specified in the compromise agreement. Meantime the liability company failed and the judgments had to be paid by the street railway company. From January, 1893, to March, 1896, the company paid out \$10,746 on account of accident and \$1,200 for interest, making a total of \$11,948 or an average of \$3,875 a year. Owing to this experience the company now settles its own claims. In the first six years these have amounted to \$5,708, or \$951 a year, showing much in favor of the present method. The main object of the company is to gain the confidence of the public, which has rights that should be respected. There are many ways of making a friend of the public. Accommodations that cost little or nothing make friends. Should anyone have a complaint to make listen to him, do not let him go away with the idea that you think your men can do no wrong. If the person makes an unreasonable or unjust complaint and abuses the employes, a motorman or conductor can hardly be blamed for talking back, still it is a poor policy to allow it under any circumstances. Give the men to understand that all controversies will be settled at the office. In many cases people get angry and say things that if not taken up by the employes would never be heard of again. When a complaint does come to you, do as you have promised, investigate it and see where the fault lies. Should the employe be in the wrong, explain the situation to him and give him to understand what is required in such case. Should the passenger be wrong, listen to him patiently, but it does little good to try and convince him that he is in error. The best way is to keep all your friends and give no cause for complaint against your men. With the public as your friend and the friend of the employes it will feel much more kindly towards you when an accident does occur.

One point to be kept before the employes all the time is to avoid accidents. When one does occur however, the men on that car are relieved at once and required to make a full detailed report giving names of witnesses, what they said, their addresses and all informa-

tion it is possible to obtain. Blanks for this purpose are furnished and also blanks for witnesses on which to make their statements. Witnesses will readily give a motorman or conductor a statement to help them where gross negligence does not show. These statements are used to determine the company's liability in the case or submitted to its attorney for opinion. The company believes in keeping out of the courts if possible, but does not believe in submitting to a hold-up. These attorneys are paid by the year and when a case cannot be settled out of court it is the company's policy to go into court to win. In many instances street railway companies are blamed for very thoughtless and careless actions of passengers. Passengers frequently attempt to jump off a car while in motion without giving the motorman time to bring it to a stop and if they happen to be injured their first thought is to sue the company, no matter whose fault it may have been. There are also a great many lawyers throughout the country who are only too anxious to take this class of work on contingent fees. A law has been passed in Texas regarding the solicitation of cases of this character on contingent fees. This law should be kept in mind. A few prosecutions for this offense will result in the loss of a lawyer's license to practice and will have a tendency to stamp out at once a part of this evil.

It is not to be understood that all cases against street railways are wrong, as this is not so. There are many instances where the employes do not have the interests of their employers at heart; they are impudent and careless in their work when they think they will not be found out. Then there is in new men a period of over confidence after they learn to handle a car during which accidents can be looked for. Besides the accidents caused by over-confident men there is another class of accidents that from force of circumstances are unavoidable. There is much agitation in the East concerning plans to prevent accidents and one which the author especially commended is that of the International Traction Co., of Buffalo, which was described in the "Review" for February, 1902, page 78. The author believes that the question of accidents is one of the most important with which street railway managers have to deal and at the same time one that does not receive the attention it should in many cases.

---

### STREET RAILWAY MANAGEMENT IN TEXAS.

---

A paper on this subject was read by Mr. T. H. Stuart, of Waco, Tex., who said in part: In the Southwestern territory similar conditions prevail as to the management of street railway properties, and these conditions bear such a kindred relation to each other that we can very satisfactorily pool our experience and knowledge. We have about the same class of labor to handle, the same character of maintenance, of track, trolley and train and practically the same public. The street railway is a necessity to a growing town and the town is a necessity to the street railway. In other words, the street railway was born of the wants of the city, and the growth and development of the one is closely associated with the growth and development of the other. For this reason, the street railway manager cannot be too zealous or active in all public enterprises calculated to stimulate the growth of the city or the comfort and welfare of the citizens, and on the other hand the citizens should take as much pride and interest in the street railway as in any other enterprise within its boundaries. The obligations of the street railway and those of the people should be reciprocal. It has been stated that the best way to gain success is to attend strictly to business and to choose as a motto, "equal rights to all, special privilege to none." Assume an even tenor, upright dealing, courteous and proper methods of handling people and the consequence will be friendly relations between the street railway and the public with the ultimate result of good patronage and satisfactory receipts. The public is generally appreciative and the street car manager must learn what they appreciate and act accordingly.

It is astonishing how people can be trained when the task is undertaken and pursued properly. In most cities within the bounds of our association the distance are not so great, but that if the road displeases the public the public will walk and the road will suffer. The most important feature in street railway management is to keep the public posted as to what minute it can expect a car. This should be done in practice, not in theory. Posting a printed schedule as to when the cars are to be expected at a certain place

and having them there at that time are two entirely different propositions, and the man who follows the latter course is the one most likely to succeed. As a rule people are restless and when they have waited for the schedule time of the car to arrive and no car appears, they generally decide they had best walk. There are other ways, which I might call artificial methods, of inducing people to ride, one of the most successful ones being to induce riding by affording places of amusement. It has been conclusively proved that a pleasure resort operated in conjunction with a street railway will prove a benefit both to the patron and the railway. The character of amusement offered may vary considerably, but whether it is in the nature of a park, lake, theater or what not, it should be conducted in a clean, respectable and attractive manner. The predominating rule in furnishing these attractions seems to be that they should be free to the patrons of the street railway line. Where a theater is the attraction, which requires the use of a performing company and where seats are required, a charge for seats is usually made which in most cases covers the expense of the theatrical company, thus making a net gain to the railway company of all fares collected for transportation to and from the park. This in my opinion has proved a very satisfactory plan. Another important factor in inducing people to ride is a liberal transfer system which will land them at their points of destination for a fare of five cents. A good transfer system will undoubtedly greatly increase travel and if properly guarded from fraud will pay the manager who adopts it.

The success and reputation of a road depends to a large extent upon the treatment the passengers receive at the hands of the motorman or conductors. These employes should possess the traits of uniform civility, honesty, good judgment and tact, the latter most especially. While a manager should, of course, lay down rules for the government of his men with certain instructions to be followed, considerable latitude should be left the men in the handling of exceptional cases with which they are bound to be confronted. Many costly errors have been made by the poor judgment of conductors accompanied with stringent and ironclad rules with which they are often burdened. Accidents continually arise in which no general instructions can be given and when these occur it is expected that the employes will use good judgment. In selecting men for street railway service it is not always best to rely altogether upon the application blank. The usual questions are all good and necessary, but it is well for the manager to study the applicant to see if he has the proper mettle to take all kinds of abuse and petty annoyances which will continually fall in his way; whether he possesses good judgment and would sacrifice his personal feelings and resentment for the benefit of the company. Even if these decisions have been made by the manager and the applicant placed in the employ of the company, it still devolves upon the manager to study the man's predominating traits of character.

It is a question worthy of discussion whether motormen or conductors should be expected to have a sufficient technical knowledge of electricity to make repairs on their cars in case of breakdowns during a run. It is my opinion that a man cannot have too much knowledge, but it is my firm belief that if he possesses enough knowledge of electricity to entrust him with the making of repairs he is best fitted for the line, shed or power house. A motorman after long service may become proficient in all branches of the service, but his prime duty is to learn to start and stop a car, especially the latter. If he does this successfully and keeps clear of all vehicles and pedestrians and keeps his time, he has his hands pretty well filled.

The subject of accidents has already been well handled, but I will simply touch upon one point which is expected of the motorman or conductor in the case of accident. Too often the motorman or conductor, either by poor judgment or faulty instructions, goes about taking statements in a manner which makes a very bungling job of the whole affair or leaves it in a very awkward condition to be handled by the claim agent. It is a very common thing, especially in a new motorman, to excuse himself to any injured party by stating that if the brakes had been in working condition he could have avoided the accident. Such a man's head should come off at once. He should have simply stated the truth and we all know the truth under such circumstances is that none but the latest and most improved appliances are in use. Other motormen perhaps show too much concern over a trivial accident, and this often causes a damage suit where if the concern had not been shown the matter would have passed over unnoticed.

## SELECTION OF STREET RAILWAY MOTOR EQUIPMENTS.

By F. A. JONES, M. E., HOUSTON, TEX.

From the nature of my subject you will undoubtedly expect of me a paper somewhat technical, for it is my business to deal with the technical side of electrical interests. I shall endeavor to point out some of the problems that arise in handling any electric street railway service and then show the difference in cost of power, and hence, economy of operation, for different methods and equipments. I am going to make a statement that I know will be a matter of surprise to you, perhaps be doubted by some, but it is based on a study of the condition of a large number of roads, and I believe would be well within the bounds of what actually is the case if a thorough canvass and investigation were made. Fifty per cent of the electric roads of the United States are consuming at least 40 per cent more power than is necessary to operate their cars and make their schedules; another 25 per cent are consuming 20 per cent more power than is necessary; 15 per cent are using 10 per cent of needless energy, and the remaining 10 per cent of the systems have been thoroughly analyzed and are operating on the best possible economy. This statement would be endorsed by engineers in the East, older in the electrical fields than I am, so that there is a vast field opened up for effecting a saving in cost of operation of the majority of railway systems, if only this one item of saving in energy, by reason of adaptability of equipment, is considered. Besides the saving in energy consumption, by reason of the nature of equipments, there are other problems of expense constantly before the street railway superintendent that I shall not attempt to treat, among these might be mentioned cost of labor and maintenance, and under these items would come the arrangements for handling at the car barn, the economy of the power plant, the difference in fuels, closeness of inspection, the energy lost in the line, the rail bonding, etc.

My subject deals only with the railway motor equipment, and what should enter in when making its selection. In the first place the rating of the railway motor is a matter of temperature; the horse power is purely nominal and really indicates the commutating capacity of the machines. It means that if the motor is placed upon the stand and run at a current and voltage necessary to give its rated horse power for one hour the temperature rise will be about 65 degrees C. A motor on any railway service, if the cycle of events is steadily repeated, has a certain fixed rise in temperature, with small variation from this temperature. For example, if we have a ten ton car making a round trip of five miles in 30 minutes, with an average of five stops per mile, and including five minutes in lay overs and each stop an average of ten seconds in duration, and the average passenger load is included in this ten tons, then, for a certain motor, with a certain gear and pinion, there would be a certain rise in temperature which can be correctly calculated by knowing the characteristics of the motor. As you well know the smaller the pinion the lower the speed of the equipment, and the larger the pinion the higher the speed; for the distance between centers of gear and pinions cannot be changed for any one motor design; so that with any motor low or high speed gearing may be furnished, and as a matter of fact, eight or ten different sizes of gears are manufactured for each standard motor by the large companies. The speed of a motor may also be increased by decreasing the number of turns per coil of the armature. Thus we have one turn, two turn, three turn, four turn, five turn and six turn machines, and a few with even a greater number of turns. Very large motors have only one turn per coil when used for elevated railway service. Each manufacturing company gets out a line of railway motors ranging from 20 horse power to 250 horse power rating and each size of motor may have different sized pinions and gears and a different number of turns per coil in the armature; so that in making a selection of the proper motor equipment to handle any service we have three or four hundred different equipments to select from. Some engineers, and some of the best engineers, have specified a high maximum speed for every condition that would stand it. This necessitates high speed gearing, which means a lower tractive effort; that is, a greater current is required for obtaining the same tractive effort with high speed gear than with a low speed gear. Where the stops are few, for example, once every two miles, as in interurban or suburban service this may not be so

important, but in heavy city service where the stops are six and seven per mile, for low energy consumption, the equipment must be low speed, and at the same time nothing is lost in time, for the low speed equipment will accelerate more rapidly than the high speed equipment.

There is a method of representing pictorially the service conditions of any railway line, and this is called a service characteristic. It is based upon the fact that a motorman will repeat the same cycle of events very closely on going over the same ground and in the same time. If we represent as abscissae or in a horizontal direction, time, and as ordinates, or in vertical direction, speed, and plot the cycle of a car from start to stop, first accelerating and then running on the motor curve, free, running at a uniform rate, coasting, and then breaking, we can draw this service characteristic and the area of the figure will be the distance covered.

Thus by going over a service, averaging the distance between stops, and the time per stop, taking the number of passengers at 10 o'clock in the morning, about the lightest service, and 6 o'clock in the evening, about the heaviest service, and thus getting the average load; if necessary dividing the line up into sections, especially where part of the running is in the city and part suburban, we might get very closely to the conditions of operation.

Now it is very important that the temperature rise of the motor shall not be excessive. It is estimated that if the rise in temperature is 100 degrees C. the motors will begin to burn out after one year's service, and will give probably a great deal of trouble the first year. If the temperature rise is 90 degrees the probabilities are that no trouble will be experienced the first year, the second year there will be some trouble, and the third year new coils will probably be required for all the motors. With 65 degrees rise the motor should last seven years, so that it is very important that the rise in temperature should not exceed this amount, and it is important to determine the expected rise before the motor is bought. This may be done very closely if each motor is tested over a wide range of services and the temperature is accurately taken. It is not probable that any service condition in practice would be identical with the conditions of one of these tests, but this is provided for in the following manner. If the degree rise is divided by the number of watts lost in the field, and also by the number of watts lost in the armature, we get a series of values giving degree rise per watt lost for both field and armature for different ratios of distribution of losses. The ratio of distribution means the watts lost in the armature, divided by the watts lost in the field, and for every service there is a certain distribution of losses to be expected. The armature loss of the motor is made up of the core loss (which includes the eddy currents in the iron and copper) and the  $C^2 R$  loss,  $C$  representing the current through the armature and  $R$  the resistance of the armature. The field loss is entirely a  $C^2 R$  loss, the current of the field being the same as that of the armature, as railway motors are series motors, but  $R$  representing in this case the resistance of the fields.

Now, if by our analysis of the service condition we can determine the ratio of distribution of the losses to be expected from the tests of the motor itself, we can determine the temperature rise, and this rise can be determined within three or four degrees. The motor that has high core loss cannot be used for high speed work and long distances between the stops, for the core loss increases with the speed; but it is not so essential to have low core loss for a large number of stops per mile.

The best motor for interurban work is one with high resistances, and low core loss; for city work low resistances and as high core loss as is necessary. It is not possible to reduce the core loss below a certain point, for in intermittent work low armature reaction and high flux are necessary, and with high flux comes naturally high core loss.

I have tried to point out how the question of temperature primarily affects the selection of the equipment. Almost as important is the question of energy consumed, which is generally calculated in terms of watt hours per ton mile. The watt hours per ton mile for a 14-tooth pinion would be less than for a 17-tooth pinion, using the same motor and making the same schedule, with all other conditions the same, but the maximum speed would be less, and it might be that not quite as fast a schedule could be made by it. If it is possible to make the desired schedule however with a 14-tooth pinion, it would be much preferable to use it in spite of the fact of it not giving as high maximum speed as would be reached on a level.

One of the elevated railway companies in the North could undoubtedly save 10 per cent of the money expended for power by reducing the number of teeth of their pinions by two, and still make the same schedule that they are now making.

I will close with an explanation of what is proposed by the two largest electrical manufacturing companies in regard to approximating service conditions in making tests on railway motors.

The Westinghouse company proposes to run at such a voltage and current as will give the losses met with in practice with the motor mounted upon a stand. This is undoubtedly the most convenient method of testing, but I do not believe it approaches near enough to service conditions. The method of the General Electric Co. of actually running the motors at a voltage at which they will be used in practice on an experimental railway and obtaining in this manner the motor characteristics, seems to me to approach nearer the absolute conditions in practice. I know from experience that there is a difference in the way the motors act when stationary and when on a car, as to ventilation, heating and general operation.

### PROGRESS CLUB OF TEXAS.

A short paper in regard to the Progress Club of Texas was read before the convention by Mr. E. H. Jenkins, president of the San Antonio Traction Co. Last fall when a New York delegation composed of the representatives of the principal business organizations of New York visited Texas, many important features looking to the development of Texas were considered not only by the New York delegation but by the representatives of the business interests in the various cities of Texas. It was evident during this meeting that there was a great lack of knowledge in regard to the resources as well as the laws of the State of Texas. This lack of knowledge was not confined to the representatives of foreign states but was shown to exist to a large extent among the citizens of Texas. Realizing how serious was this lack of knowledge on the part of all concerned, Mr. Edwin Chamberlain, who was of the reception committee in charge of the New York delegation, commenced the organization of what has since been named the Progress Club of the City of San Antonio, and it is aimed to have similar organizations in a large number of the prominent cities of Texas. The objects of the organizations are to direct political activity along business rather than political lines with the intent of fostering the commercial interests of the state and developing its natural resources. While this organization has no direct interest in the special business represented at the Southwestern Association, yet everything that pertains to the betterment of the State of Texas reflects in a greater or less degree upon the business of the gas, electric light and street railway companies and it is believed that these various companies will be interested to help forward any movement having such an object in view.

### OFFICERS.

The officers elected for the ensuing year were as follows:

President, E. H. Jenkins, San Antonio, Tex.; first vice-president, C. F. Yeager, Laredo, Tex.; second vice-president, E. Dysterud, Monterey, Mex.; third vice-president, A. E. Judge, Tyler, Tex.; treasurer, Thomas D. Miller, Dallas, Tex.; secretary, H. A. Evans, San Antonio, Tex. Directors: The president, the vice-presidents, the treasurer and H. F. MacGregor, Dallas; T. H. Stuart, Waco; S. A. Spencer, Jennings, La.; H. T. Edgar, El Paso; W. A. Guthrie, San Angelo, Tex.; J. R. Ward, Beaumont.

It was decided to hold the 1903 meeting at Dallas, Tex., the date to be fixed later.

The San Antonio meeting of the Southwestern Association was a success in point of attendance, there being 32 representatives of members and 39 visitors present.

The Michigan Traction Co., of Kalamazoo, began tracklaying on its interurban line between Battle Creek and Marshall, May 1st, and expects to complete the work in six weeks, though the road will not be put in operation before September. The line between Albion and Jackson is nearing completion, and a 1,000 ft. bridge across the Michigan Central and Lake Shore railroads and the Kalamazoo River at Albion is in course of erection.

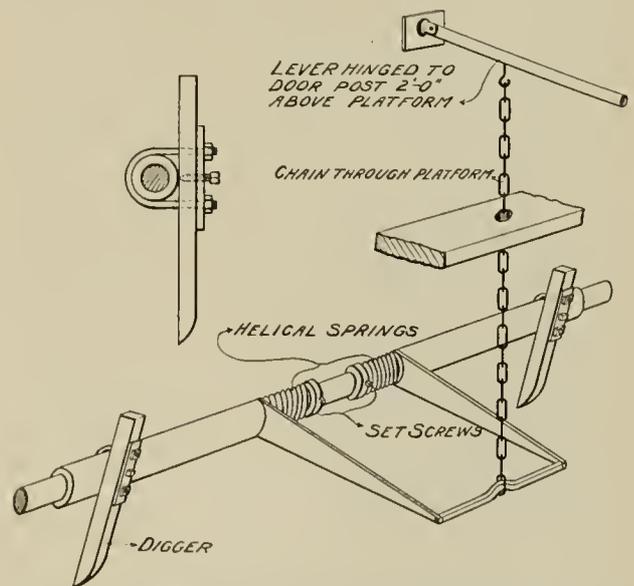

### DIGGER FOR CLEANING GROOVED RAIL.

The chief objection to the grooved rail has always been the tendency which it presents for dirt, ice, stones and other material to collect in the groove, thereby increasing the loss of power through increased friction and poor contact. For keeping the groove of the rail clean in city streets where its tracks are laid with grooved rail, the Washington (D. C.), Alexandria & Mt. Vernon Ry. uses a digger devised by Mr. J. Colvin, the superintendent.

The form of the device as used with maximum traction trucks is illustrated in the sketch on this page. Modifications of this form are necessary with different types of trucks to suit the amount of space available.

The essential parts of the contrivance are the two digger pieces which are carried, one on either side, just above each rail and immediately in front of the forward wheels. The diggers are iron bars 1x1½ in. and 2 ft. long, having at their lower ends a piece of steel welded to the bar and made plow shape. When the device is in use these steel ends travel in the rail groove and throw all dirt from the groove toward the center of the track.

The digger pieces are carried on a frame comprising two pieces of 2½-in. iron pipe through which is passed an iron bar 1½ in. in

FOR CLEANING GROOVED RAILS.

diameter. The bar extends the full width of the truck and is rigidly fastened at both ends in properly shaped castings which are bolted to the truck frame. The shape of the castings will depend upon the style of truck. The digger pieces are attached to the iron pipes by U bolts as shown in the detail sketch, a set screw serving to permit proper adjustment.

At their outer ends the two pieces of pipe bear against the special castings mentioned and at their inner ends come in contact with helical springs which in turn bear against two collars held in place on the iron bar by set screws. This spring bearing gives flexibility and is essential to prevent the digger pieces from being broken by reason of inequalities in the track or other causes.

To the inner ends of the two pieces of pipe are rigidly fastened two arms which are joined by a cross piece and to which is attached a chain that passes up through the car platform and engages an iron lever hinged at one end to the door post. It will be evident that the motorman by raising this lever causes the pieces of pipe to rotate about the iron bar, thus bringing the digger arms down into contact with the rail. When running over T rail or where the digger will not be required the digger pieces are held back from the rail by chains to the truck frame and these chains must be disengaged by the motorman or conductor before the device can be brought into action.

A new electric line has been opened between Harrisburg, Pa., and Mechanicsburg. The first trip was made April 17th.

## MASSACHUSETTS LEGISLATURE.

This year the Massachusetts Legislature has inaugurated a somewhat new policy in street railway matters. Heretofore the policy has been to keep the street railway business confined to strict lines, the paralleling of lines of existing railroads has been allowed in but very few cases, the carrying of freight has not been permitted and the lighting of streets is a privilege that has been withheld. In fact, all outside tendencies that would establish a precedent for future conflict with other vested interests, have been considered an illegitimate field for the street railway.

As mentioned elsewhere in this issue the granting of lighting franchises to street railway companies is under consideration, both street railway and lighting committees having bills under consideration.

The privilege of carrying United States mails and small parcels has been extended in a number of instances to include baggage and farm products on lines that practically parallel existing steam roads, though, of course, these old lines did not pass the farmer's door as do the electrics. In one or two cases, full freight carrying privileges have been allowed, though these have been where the electric roads were at right angles to the railroad, and are supposed to act as feeders for the latter, and the grants were not opposed by the railroad's attorneys. In these cases physical connections of the rails of the two companies are to be made and foreign freight cars are to be hauled up into country districts.

Another innovation is requiring street railways to pay a portion of the cost of abolishing railroad grade crossings where the street railways have locations. Up to the present time the railroads have paid 65 per cent of this cost, the state 25 per cent and the city and towns the remaining 10 per cent. The state has already expended \$5,000,000 in its share, and this year another loan of the same amount is about to be authorized. As a means of making the money go further, it is proposed to have the railroad's proportion remain the same, the street railway to pay 15 per cent and the state, city and town divide the remaining 20 per cent.

A question has arisen late in the session, which the street railway association proposes to fight to the bitter end. This is the matter of paying street paving assessments. In Pittsfield there has arisen a great demand for the paving of the main streets. The local street railway invokes the excise law passed in 1898, which it claims is a special tax by which the companies pay for the use of streets and the repairs thereof, and so should be exempt from further assessments for street improvements.

Another new proposition is to permit consolidation of a street and a steam railroad. In the towns of Grafton and Upton is a small railroad of something under ten miles in length that has now been paralleled by an electric line. Capitalists have obtained control of both and also of some connecting electric lines and want to consolidate and divide up the freight and passenger business.

In connection with this a bill was introduced to allow railroad companies to purchase stock in street railway companies that is about to be reported by the committee. It provides that after the railroad company has acquired two-fifths of the stock of a street railway company the railroad commissioners may fix a price at which owners of the balance of the stock may sell.

The Stoughton & Randolph Street Railway Co., which is in the hands of a receiver, is a petitioner for rather odd legislation. It seeks to clear up some of the legal entanglements hanging over the property by asking the Legislature to authorize it to give a clear title to the purchasers, the property being about to be sold by order of the court.

The Legislature is also considering a bill based on a recommendation of the governor that locations granted by boards of aldermen and selectmen be approved by the railroad commissioners. The bill will probably pass.

A bill defining the expenditures for which street railway companies may get authority to issue bonds or stock has been passed, on the advice of the railroad commissioners, who, heretofore, have been left to their own judgment to decide what was a legal expenditure to be met in this way.

The law authorizing street railway companies to carry road-making materials for cities and towns has been extended so that one company may transfer such loaded cars to another line in cases where one company's line does not extend from the city or town through to the quarry.

The street railway committee is about to report a bill to incorporate a company to build a line from the New York State line to Springfield through an extremely sparsely settled locality, and in doing so will grant unusual privileges in the way of carrying freight, etc. It is the longest line under consideration this year, but a great many people have grave doubts if the road will be built even with the extraordinary privileges allowed. ROB.

## THE SPRAGUE COMPANY'S NEW BOSTON OFFICE.

The Sprague Electric Co. has found it necessary to move its Boston office into new and larger quarters to enable it to handle the increasing business in the New England district. The company has taken a suite of offices in the Weld Building, 176 Federal St., which is one of the most desirable office buildings in Boston. The location is extremely good and is convenient to the South Terminal Station which is almost opposite. The Weld Building is a new and modern office building with well lighted offices and the fastest running elevators in the city. Mr. H. C. Farnsworth continues as manager of the Boston office. He has recently added to his staff Mr. George D. Simmons, who was formerly superintendent of the Hawks Electric Co.

## DAVENPORT & SUBURBAN RY.

April 12th, the Davenport & Suburban Ry., was granted a franchise for the construction and operation of street car lines in the city of Davenport, for a period of 25 years. The franchise provides that the company shall pay to the city the sum of \$2,000 per year as a bonus, commencing August, 1905, shall commence work within 90 days of the acceptance of the franchise, and shall allow the Davenport & Western Ry. the use of the Fourth St. tracks for one train an hour on the annual payment of 2 per cent of the cost of construction of the track so used. The Davenport & Suburban accepted the franchise as soon as it was granted by the council and deposited the \$10,000 forfeit provided for in the ordinance.

## BULLOCK ANNOUNCEMENT.

The Bullock Electric Manufacturing Co., of Cincinnati, makes the following announcement in regard to matters concerning which it states false reports have been circulated, much to the annoyance of the company:

The Bullock company is not and does not contemplate negotiating the sale of its plant; the company is a close corporation and none of its stock is owned by its competitors; the controlling interest is owned by the officers of the company; the company is now building machines up to 3,200 kw. and has under construction a new shop which will give facilities for making units up to 10,000 kw. capacity; the only patent suit now pending is in relation to Tesla induction motor patents; the company has not been sued on its direct or alternating current generators, rotary converters or transformers, and it thus far won all the patent cases in which it has been involved.

## INTERURBAN TERMINAL AT CINCINNATI.

The Interurban Terminal Co., of Cincinnati, which is capitalized at \$100,000, was incorporated May 2d for the purpose of providing terminal facilities for the entrance of interurban railways into Cincinnati. The incorporators of the company are G. R. Serugham, George H. Worthington, J. M. Kennedy, Lee H. Brooks, W. E. Hutton, C. H. Davis and Guy W. Mallon. A deal was recently closed for the purchase of a large tract of ground on Sycamore street for this company. The depot which is to be erected on this site will be six stories in height and will contain trackage on the ground floor to accommodate a number of cars. The depot will not be exclusively for the lines of the suburban syndicate, but if any other interurbans entering Cincinnati desire to have a terminal at the depot they will be accommodated.

The Georgetown & Lexington (Ky.) Traction Co. put three new cars in commission on its interurban line May 1st.

**ALL YEAR ROUND CARS.**

Open cars for the summer season are demanded by the public on small as well as large roads, and where there are interurban connecting lines, amusement parks, or where the roads run far into the suburbs, it is almost impossible to operate successfully without them. On the warm days of spring and autumn the receipts are usually substantially increased by their use.

On the other hand, open cars eat up their profits during months of idleness in the car barns. The expense of a double equipment

BRILL SEMI-CONVERTIBLE CAR FOR BEAVER VALLEY.

of cars, trucks, and motors, and the consequent enlargement of car barns, is heavy. A double equipment of merely the car bodies reduces the initial expenditure, but is seriously objectionable on account of the time and labor required in changing. The popularity of the open car, from the standpoint of the manager, is further diminished by complaints from the public if it is not taken off the street on the first chilly day, or put in service on every unseasonably warm day.

The public makes no allowance even if it considers that to meet its wishes would require a double equipment instantly available at
