YORKSHIRE BRANCH: ROTHERHAM DIVISION.

A GENERAL meeting of the profession was held at Rotherham, on December 23rd, 1919, when Dr. KNIGHT was in the chair.

The meeting having been called for the purpose of discussing the circular from the Council of the British Medical Association with reference to increased fees for medical attendance, the following resolution was passed unanimously:

That this meeting is in favour of the recommendations of the Council of the British Medical Association, and agrees to increase medical fees generally by 50 per cent. above the charges made before the war.

It was resolved that the Secretary (Dr. Lodge), in conjunction with Drs. Knight and Slack, should draw up a suitable notice of the proposed increase for insertion in the local press.

A copy of the minutes of the meeting will be sent to all practitioners in the Rotherham area.

The meeting then considered the scale of fees to come into

operation on January 1st, 1920, in order to secure the proposed increase of 50 per cent., and a scale of minimum fees was adopted.

Association Notices.

ELECTION OF REPRESENTATIVE BODY OF THE ASSOCIATION, 1920-21.

Constituencies in Representative Body.

THE list of the provisional **Home Constituencies** for election of the Representative Body, 1920-21, appeared in the SUPPLEMENT of January 24th, page 21.

As intimated to all the **Oversea bodies**, the Council has made each Oversea Division and Division-Branch, possessing an Honorary Secretary and the necessary organization, an independent Constituency.

Election of Representatives and Deputy-Representatives.

The Representatives and Deputy-Representatives in the Representative Body must be elected not later than May 28th, and their names notified to the Medical Secretary not later than June 4th.

The Council draws special attention to the fact that it is entirely within the discretion of each Constituency to decide whether the election of its Representative(s) and Deputy-Representative(s) shall be carried out **by General Meeting of the Constituency, or by postal vote.**

Motions for the Annual Representative Meeting.

Notices of Motion by Divisions, Constituencies, or Branches for the consideration of the Annual Representative Meeting, proposing to make any addition to, or any amendment, alteration or repeal of any Regulation or By-law, or to make any new Regulation or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, must be published in the JOURNAL not later than April 24th, and for this purpose should be received by the Medical Secretary **not later than April 10th.**

INSURANCE.

CORRESPONDENCE.

Limitation of Lists.

SIR.—May I raise the question of the limitation of lists in your columns?

After full discussion and some opposition our Conference of representatives agreed to a limit of 3,000. The 2,000 limit proposed by the Ministry was dropped later on, as our Insurance Acts Committee pointed out at the same time quite fairly, reminding us that power was retained by each Insurance Committee to fix a lower limit at anything it liked after conferring with the Local Panel Committee (whether the Panel Committee agreed or not).

The Northumberland Insurance Committee has now made a limit of 2,000 (as I expect nearly all Insurance Committees will), in opposition to the wishes of the Panel Committee, which proposed 2,500, and the question is now left by the rules to the arbitration of the Ministry. We know their wishes in the matter. Giving all credit to the Insurance Acts Committee for their difficult and arduous task (we owe them, I believe, a big debt of gratitude), have they done right in leaving a proposal disapproved of by the Panel Conference, where union was strength, to be decided in local areas, where the doctors will be overridden? The question is a national one, not local. The Insurance Acts Committee knew the probable course of events. Could they not have done something more to get a national settlement, and the power taken from local committees?

The limit may be fair enough, but it may only be the first step to a lower limit—perhaps 1,500—in other areas. Again, many doctors with public appointments, good class private practice, country district, etc., are less able to attend 1,000 than a man devoting himself solely to working class practice to attend 2,000. Why should limits be imposed on the one and not the other? Allowing that such limits should be and will be imposed later on, it is, of course, a full-time State service in disguise, which I understood the profession were against. Again, at the present time, with high salaries for assistants, housing difficulties, and scarcity of men, the latitude of one year allowed for getting an assistant is not enough.

I sum up: Granted that the limit of 2,000 is fair, is the Ministry's method of getting their point a fair and open one after what has taken place? Have we any safeguard

against lower limits or lower proportional limits after dependants come into the scheme?—I am, etc.,

W. I. GORDON,

Member, Northumberland Panel Committee
Blyth, Northumberland, Jan. 24th.

The Net Capitation Fee.

SIR.—On December 11th, 1919, I received from the Clerk to the Bedfordshire Insurance Committee a cheque for £5 16s. 8d. as a final payment for 1918. This makes the total amount paid to me for 1918 up to £43 5s. 7d. The Clerk tells me that the mean average number on my list was 139.25. Therefore I actually received about six shillings and two pence as a capitation fee.

Why (I do not dispense) do not I receive what I understood was the promised amount—namely 7s. 6d. for each person on my list? Why should 17.6 per cent. be deducted as the inflation of my mean average number, and 8.32 per cent. be added for unallotted persons? How are these figures arrived at?

If I remain on the panel is there any guarantee that I shall receive more than a proportion of the promised capitation fee, whatever it may be, under the new Regulations?—I am, etc.,

St. Neots, Jan. 7th.

EDWARD J. CROSS.

LOCAL MEDICAL AND PANEL COMMITTEES

COUNTY OF LONDON PANEL COMMITTEE.

Terms of Service for 1920.—At the meeting of the London Panel Committee on January 20th it was reported that the representatives of the Insurance Committee, who have been conferring with representatives of the Panel Committee on the proposed terms of service for practitioners, had agreed to support the demand of the Panel Committee that provision should be made in Article 34 for the supply free of cost of the necessary information for the investigation of excessive prescribing; to accept the suggestion that the special final certificate applicable to rural areas should be used in urban areas; and to insert a clause in the present agreement redefining the radius within which a practitioner is required to visit. The Panel Committee resolved to ask the Insurance Committee to agree to an arrangement whereby a practitioner entering into a written agreement with any insured person who desired to be placed on the practitioner's list, but who lived outside the customary radius, should be allowed to charge a special fee for visiting such insured person at his residence. It was stated that such an arrangement already obtained in the Middlesex area.

Model Scheme of Remuneration.—The Committee considered in detail the model scheme of remuneration, and suggested certain emendations. Acceptance of the new method of calculating the lists was made conditional upon the previous supply to the practitioner of the correct list by the Insurance Committee. It was agreed also that the fee payable to the practitioner responsible for providing the services of an anaesthetist ought to be fixed at one guinea; that the accounts for emergency treatment should be sent in by practitioners within forty-eight hours of the emergency (instead of seven days as on the original draft), and should be submitted on a form giving the name of the practitioner on whose list the name of the insured person appeared; that the gratuities in respect of temporary residents should be reckoned in the ratio of 2 to 1 to those in respect of permanent residents; and that the units credited to practitioners who had limited their lists should, in the case of practitioners in general practice, be reduced by 7½ per cent., and in the case of practitioners in institutions by 10 per cent. A scale of fees for emergency treatment was also laid down and agreed to. The Committee also made certain suggestions for incorporation in the model allocation scheme, and resolved with regard to both schemes to urge that they should be subject to revision at the end of any year if the Panel Committee deemed this to be advisable.

COUNTY PALATINE OF CHESTER.

The following resolutions were passed unanimously at a meeting of the County Palatine of Chester Local Medical and Panel Committee, held at Crewe on January 17th, 1920:

1. That this Committee expresses its most emphatic disapproval of the remuneration offered by the Government; and regrets that the Insurance Acts Committee thought fit to exercise its authorization to ask for arbitration when the Government's offer proved to be such a low figure as 11s.
2. This Committee notes with especial regret that the terms of service for which the remuneration is offered are "the proposed Medical Benefit Regulations, 1920, as published in December last," which regulations (a) retain the provision by which the Minister may be at one and the same time the accuser or complainant, and the judge or arbitrator (Regulation 57), the accused having no appeal—a provision which in the opinion of this Committee is contrary to the spirit of English law; and (b) introduce a new provision [16 (c)], detrimental to the transfer of practices, which greatly diminishes their capital value; and (c) impose a new obligation on practitioners (First Schedule, Part 1, 5 (c) and Model Allocation Scheme 5 (i.) and (ii.)), requiring them to attend any insured person on the list of another doctor, in an accident or sudden emergency if that doctor be not at the moment available, for a fee to be deducted from that doctor's remuneration.

With regard to (b) the Committee remarks that at the death of a doctor it is too often found that the goodwill of the practice is the chief and often the only asset which he has to leave to his widow and children, and that by this regulation this asset is, without compensation, greatly diminished or it may be abolished. With regard to (c) a

trying and uncertain and entirely new duty is imposed on a panel doctor in the shape of a legal obligation. When has it happened, the Committee asks, in the past, that doctors have ignored the claims of urgent illness? They have voluntarily dealt with such cases as they occurred, on their merits. They resent, however, being legally obliged to attend all and any who may demand their services on a plea of urgency; and they note that the reality or otherwise of the urgency is left to the decision of the patient.

WARRINGTON.

A meeting of the Warrington Medical and Panel Committee was held on January 17th, when Dr. FERGUSON was in the chair. Although the meeting was hastily convened there was a good attendance. It was decided to fall in with the Insurance Acts Committee's decision to abide by arbitration in the matter of the capitation fee, and also to form a subcommittee to co-operate with the Insurance Committee in formulating the allocation and remuneration schemes for the area under the New Regulations.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following announcements are notified by the Admiralty:— Surgeon Lieutenant Commander A. Simpson to the *Edmont* and for Malta Dockyard. Surgeon Lieutenant J. D. Ma phy to R.M. Division, Chatham.

ARMY MEDICAL SERVICE.

Temp. Colonel W. Hunter, C.B. (Captain R.A.M.C., T.F.) relinquishes his temporary commission on reposting.

ROYAL ARMY MEDICAL CORPS.

To be acting Colonels: Major (acting Lieut.-Colonel) G. W. Heron, D.S.O., O.B.E. (November 22nd, 1918), Lieut.-Colonel W. P. Gwynn, C.M.G. (from June 7th to October 1st, 1919).

Temp. Lieut.-Colonel H. J. Roberts (Lieut.-Colonel, T.F. Res.) relinquishes his temporary commission.

The following relinquish the acting rank of Lieut.-Colonel:— Majors and brevet Lieutenant-Colonels: D. S. Skelton, D.S.O., M. G. Winder, D.S.O., Majors A. W. Gater, T. B. Unwin, D.S.O., O. Ievers, D.S.O., R. A. Odium, O.B.E., W. J. Thompson, D.S.O., R. B. Hole, W. H. Forsyth, D.S.O. (October 18th, 1919, substituted for notification in the *London Gazette*, December 2nd, 1919). Captains G. H. Stacke, W. D. Anderton, M.C., A. J. Hickey, M.C., L. T. Poole, D.S.O., M.C.

To be acting Lieut.-Colonels: Major T. H. Scott, D.S.O., M.C., Captain C. H. K. Smith, M.C., temporary Captain A. J. Blake, M.C.

The following officers relinquish their commissions: Temporary Lieut.-Colonel J. F. Haswell. Temporary Major J. A. Devine, O.B.E., D.S.O., and retains the rank of Major. Temporary Captains and are granted the rank of Major: E. B. Gunson, I. Jooes, W. D. Cruickshank, V. L. Connolly, M.C. (January 18th, 1919, substituted for notification in the *London Gazette*, March 6th, 1919), C. N. Coad, M.C. (December 20th, 1919, substituted for notification in the *London Gazette*, January 13th, 1920), C. E. Walker. Temporary Captains and retain the rank of Captain: T. Howell, M.C., H. F. Ferguson, R. J. B. Leney, G. H. Fraser, R. M. de Mowbray, S. C. W. Iredale, J. Hill, M.C., E. W. L. Shrap, W. Duffy, R. C. Hewitt, M. K. Robertson, G. C. Hartley, M.C., W. Gemmill, T. F. Ryan, C. A. D. Bryan, C. H. G. Lyall, R. H. Fletcher, H. G. Baynes, E. U. Williams, O.B.E., F. A. Kerr, J. S. Prentice.

The notifications regarding the following officers in the *London Gazette* of the dates indicated are cancelled: Captain and Brevet Major L. Dunbar (July 1st, 1919), Temporary Captains Hubert Joslen (November 26th, 1919), R. Massie, O.B.E. (December 2nd, 1919), Sydney F. McDonald (October 15th, 1919).

DIARY OF SOCIETIES AND LECTURES.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Monday, 9 p.m., Lettsomian Lecture by Dr. Herbert Spencer: Tumours complicating Pregnancy, Labour, and the Puerperium; I. Fibroids.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.—Hunterian Lecture, Monday, 5 p.m., Sir Berkeley Moynihan, K.C.M.G., C.B.: Late Surgery of Gunshot Wounds of the Chest, Friday, 5 p.m., Professor V. Zachary Cope: Surgical Aspect of Dysentery.

ROYAL SOCIETY OF MEDICINE.—Section of Surgery, Subsection of Orthopaedics: Tuesday, 5 p.m., Cases. Paper: Mr. Max Page: Use of Pneumatic Pads. Section of Pathology: Tuesday, 8.30 p.m., Dr. Teale: Phagocytosis in Vitro. Section of Surgery: Wednesday, 5.30 p.m., Mr. Garnott Wright: Congenital Diverticulum of the Colon. Mr. R. H. Anglin White Locke: Appendice-

tony by a New Route. Section of Ophthalmology: Wednesday, 8 p.m.; Case, 8.30 p.m., Dr. S. H. Browning: Treatment of Gonorrhoeal Iritis. Section of Obstetrics and Gynaecology: Thursday, 8 p.m.: An abstract of a paper by Dr. Goodall on the Origin of Tumours of the Ovary. Dr. Gordon Ley: A Statistical Report of Carcinoma of the Ovary. Section of Laryngology: Friday, 4 p.m., Cases and Specimens. Section of Anaesthetics and Laryngology: 8.30 p.m., Discussion: Anaesthesia in Throat and Nose Operations, to be opened by Dr. F. S. Root.

POST-GRADUATE COURSES AND LECTURES.

BROMPTON HOSPITAL FOR CONSUMPTION, S.W.—Wednesday, 4.30 p.m., Dr. Punch: Morbid Anatomy of Pulmonary Tuberculosis.

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W.—Wednesday, noon, Dr. Jewesbury: Diet in Infancy and its Effects. Thursday, noon, Mr. H. S. Soutar: Painful Injuries of the Peripheral Nerves.

MANCHESTER ROYAL INFIRMARY.—Tuesday, 4.30 p.m., Dr. F. E. Tylecote: Some Features of Recent Epidemics of Pneumonia.

NEWCASTLE-ON-TYNE: ROYAL VICTORIA INFIRMARY.—Friday, 2.30 p.m., Professor R. A. Bolam: Venereal Diseases, 5.15 p.m., Professor W. E. Hume, C.M.G.: Clinical Aspect of Blood Diseases, 4.30 p.m. (College of Medicine), Dr. J. D. Lickley: Anatomy of Thorax and Abdomen.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.15.—Tuesday, 2 p.m., Mr. H. W. Carson: Hernia (demonstration), 4.30 p.m., Dr. F. G. Crookshank: Respiratory Disease in Childhood (lecture).

SALFORD ROYAL HOSPITAL.—Friday, 4 p.m., Dr. Heywood: Functional Nervous Disorders and Organo-therapy.

SHEFFIELD ROYAL HOSPITAL.—Monday, 3.30 p.m., Dr. Nutt: X-ray Examination of Bones and Joints. Tuesday, 4 p.m., Dr. Hay: Ocular Sequelae of General Diseases, Wednesday, 3.30 p.m., Dr. Wilkinson: Nasal Obstructions. Thursday, 3.30 p.m., Dr. Skinner: Inflammations of Skin. Friday, 4 p.m., Dr. Hay: Diseases of Eyelids.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith.—Saturday (January 1st), 10 a.m., Mr. Banks Davis: Throat, Nose, and Ear Operations. Monday, 5 p.m., Mr. MacDonald: Infections of the Urinary Tract. Tuesday, 2 p.m., Dr. Pernet: Skins. Wednesday, 5 p.m., Dr. Owen: Electro-cardiography. Thursday, 10.30 a.m., Dr. Simson: Gynaecology. Friday, 5 p.m., Dr. R. Hutclison: Functional Dyspepsia.

CURRENT NOTES.

The Arbitration.

In preparing the case to be submitted to the Board of Arbitrators on behalf of insurance practitioners, the Insurance Acts Committee has secured the assistance of the distinguished economist, Professor A. L. Bowley, D.Sc., F.S.S. Dr. Bowley is professor of statistics in the University of London, and has been for many years lecturer at the London School of Economics and Political Science. He is a member of council of the Royal Economic Society, and has twice served as vice-president of the Royal Statistical Society. He has published many authoritative works on mathematics and statistics, as well as on economics and related social questions. Professor Bowley will advise on the economic and statistical questions involved, and will, if necessary, appear as a witness. The Insurance Acts Committee has entrusted the conduct of the case to Dr. H. B. Brackenbury, Dr. H. G. Dain, and Dr. A. Linnell, with the Medical Secretary. They will attend before the arbitrators and support the written case that will be submitted. The preparation of this is in the hands of the Executive Subcommittee, which consists of Drs. Brackenbury, Ridley Bailey, H. G. Cowie, Dain, Fothergill, Fry, Wood Locket, Palmer, Panting, Crawford Treasure, and J. P. Williams Freeman.

Praise and Blame for the Insurance Acts Committee.

At its meeting on January 29th the Insurance Acts Committee received congratulations on its conduct of the negotiations with the Government with reference to the Regulations for 1920 and the capitation fee from a conference of the South-Western Group of Panel Committees (including Cornwall, Devonshire, Exeter, Plymouth, Somerset, Bath, Dorset, Isles of Scilly, and Wiltshire Committees); from Anglesey; from a conference of representatives of the North of England Panel Committees; from West Sussex; and from a conference of the Panel Committees of Lancashire. A typical resolution was that which came from the North of England Conference of Panel Committees:

"That the heartiest thanks of this conference be sent to the Insurance Acts Committee for the way they have conducted the negotiations with the Ministry of Health on behalf of the medical profession."

The Committee expressed its satisfaction at receiving these marks of appreciation, but was preserved from the fate of those of whom all men speak well by the receipt of a resolution from the Southampton Panel Committee, which, on January 19th, expressed the opinion that—

"The lamentable weakness in subjecting the irreducible minimum of 13s. 6d. to arbitration, if not acceded to by the Government, thereby converting it into a reducible maximum, has completely sold the pass."

The Medical Secretary reported that he had drawn the attention of the Southampton Committee to the resolution

of the Panel Conference, which authorized the Insurance Acts Committee to ask for arbitration in the event of the Government not offering the 13s. 6d., though Southampton had not agreed to it.

Acknowledgement of Assistance.

The Medical Secretary desires to take this means of thanking the numerous correspondents who have sent information bearing on the forthcoming arbitration on the insurance capitation fee. The tabulation and classification of this information is a task of considerable magnitude, and the Medical Secretary hopes that correspondents who have had no direct acknowledgement will accept his thanks hereby tendered.

The Medical Profession and Local Elections.

An instance of what can be done in the way of promoting the candidature of suitable medical men for seats on local authorities is reported by Mr. A. M. Webber, the Secretary of the Nottingham Division. There was a by-election for a vacancy on the Nottingham City Council, and Dr. F. H. Jacob was induced to stand as a candidate, with the support of both the Conservative and Liberal parties. A letter signed by most of the medical practitioners in the ward was circulated stating briefly Dr. Jacob's qualifications as a councillor from the medical point of view and the reasons why more medical men should be placed on the council. The letter was also inserted in the principal local papers, and the election agent considers that it was an important factor in the contest. The result was that Dr. Jacob was returned by a majority of 1,288 over the Labour candidate, and while, no doubt, this result was due very largely to the personality of Dr. Jacob, who is a well known and highly respected consulting physician in Nottingham, the action taken by his colleagues seems well worthy of notice and also of imitation. Dr. Jacob is physician to the General Hospital, Nottingham, and a former Secretary of the Nottingham Division.

Meetings of Branches and Divisions.

NORTH OF ENGLAND BRANCH: CLEVELAND DIVISION.

THE annual dinner of the Division was held in the Corporation Hotel, Middlesbrough, on January 29th, when fifty-one members and guests were present. The Chairman of the Division (Dr. A. BRYANS of Middlesbrough) occupied the chair, and was supported by the Mayor of Middlesbrough, the Coroner for Sunderland, the clerks to the Middlesbrough and North Riding of Yorks Insurance Committees, and other well known residents in the district. The toast of "The Cleveland Division" was proposed by Mr. JAMES WANDLESS, clerk to Middlesbrough Insurance Committee, and was replied to by the CHAIRMAN, who, in the course of his speech, strongly deprecated the attempt which was being made by other bodies of medical men to take over work which rightfully belonged to the British Medical Association.

DORSET AND WEST HANTS BRANCH:
WEST DORSET DIVISION.

At a meeting on January 31st it was decided to adopt the recommendation of the Council of the British Medical Association to increase medical fees by 50 per cent. over pre-war prices, it being always understood that the individual doctor will use his discretion when dealing with the individual patient.

SUFFOLK BRANCH: WEST SUFFOLK DIVISION.

At a meeting of the West Suffolk Division on January 27th it was resolved that fees for private clubs and non-insured members of friendly societies be raised to 14s. for members over 16, and 7s. for members under 16. These fees conform to the new rates to be instituted by the Suffolk County Medical Club as from April 1st next.

The Honorary Secretary was instructed to urge upon medical men in the area the desirability of amalgamating their private clubs with the County Club, as it was only by such means that uniform rates could possibly be obtained. Several medical practitioners in West Suffolk have already taken this step and have found it a great advantage. The office of the Suffolk County Medical Club is at 45, Princes Street, Ipswich.

Association Notices.

MEETING OF COUNCIL.

THE next Meeting of Council will be held on Wednesday, February 18th, in the Council Room, 429, Strand, London, W.C. 2., at 10 a.m.

ELECTION OF REPRESENTATIVE BODY OF
THE ASSOCIATION, 1920-21.*Constituencies in Representative Body.*

THE list of the provisional **Home Constituencies** for election of the Representative Body, 1920-21, appeared in the SUPPLEMENT of January 24th, page 21.

As intimated to all the **Oversea bodies**, the Council has made each Oversea Division and Division-Branch, possessing an Honorary Secretary and the necessary organization, an independent Constituency.

Election of Representatives and Deputy-Representatives.

The Representatives and Deputy-Representatives in the Representative Body must be elected not later than May 23th, and their names notified to the Medical Secretary not later than June 4th.

The Council draws special attention to the fact that it is entirely within the discretion of each Constituency to decide whether the election of its Representative(s) and Deputy-Representative(s) shall be carried out by **General Meeting of the Constituency, or by postal vote.**

Date of Annual Representative Meeting at Cambridge.

The Annual Representative Meeting at Cambridge will begin on Friday, June 25th, at 10 a.m.

Motions for the Annual Representative Meeting.

Notices of Motion by Divisions, Constituencies, or Branches for the consideration of the Annual Representative Meeting, proposing to make any addition to, or any amendment, alteration or repeal of any Regulation or By-law, or to make any new Regulation or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, must be published in the JOURNAL not later than April 24th, and for this purpose should be received by the Medical Secretary **not later than April 10th.**

ELECTION OF COUNCIL OF THE ASSOCIATION,
1920-21.

THE list of the Groups of Branches in the United Kingdom for election of twenty-four members of the Council, 1920-21, and **Nomination Form**, appeared in the SUPPLEMENT of January 24th, page 22. Separate Nomination Forms will, if desired, be forwarded on application by Branches, Divisions, or Members.

The list of the Groups of **Oversea Branches** was published in the SUPPLEMENT of October 11th, 1919, p. 79.

BRANCH AND DIVISION MEETINGS TO BE HELD.

ESSEX BRANCH: SOUTH EAST ESSEX DIVISION.—Mr. E. C. Hughes, F.R.C.S. (Surgeon to Guy's Hospital), will deliver an address on Gull Stones, on Thursday, February 12th, at the Victoria Hospital, Southend-on-Sea.

INSURANCE.

CORRESPONDENCE.

The Dispensing Fee.

SIR,—Below is a comparison of prices, pre-war and present, of a dozen drugs and dressings chosen indiscriminately from amongst those in everyday use:

	Pre-war.	Present.
	s. d.	s. d.
Acidi borici	per lb. 0 6	1 4½
Syrup. hypophosph. co. 1 6	2 9
Tinct. digitalis 3 6	6 3
Inf. gent. conc. 1 6	2 7
Potass. iodidi 10 3	26 8
Mist. expect. 2 0	3 6
Paraffinum molle flav. 0 6½	1 6
Sodii salicyl. 1 11	5 0
Morphin. hydrochlor.	per oz. 9 0	23 0
Quin. sulph. 1 0	4 8
Boric lint	per lb. 1 6	3 4
Bandages (2½ in.)	per doz. 2 6	6 0

In addition dispensers' salaries have risen and the prospect of a substantial rise in cost, especially of dressings, is imminent.

The chemist is paid for all drugs at 1920 prices and receives payment for dispensing at a rate approaching 5d. per bottle with the likelihood of an early increase. Yet the doctor who dispenses for his panel patient is to be offered the old 1913 rate of pay—namely, 2s. a head a year. There seems little need to emphasize the obvious injustice of this offer.

For the doctor not possessed of private means there is but one course—cheaper drugs and smaller doses.

If the interest of the patient is of any consequence, either to the Ministry of Health or to the medical profession, it is imperative that the dispensing practitioner should be encouraged, by proper payment, to give suitable medicines to his panel patients. He has the right to expect, moreover, a payment for his time and trouble at least equal to that received by the chemist.—I am, etc.,

Astley, Feb. 2ud.

S. H. RYAN.

Insurance Remuneration.

SIR,—I have just received from my Insurance Committee the terms of service which come into operation on April 1st of this year. The Government has offered a capitation fee of 11s. The Conference representatives have refused this, and asked that the question of remuneration be submitted to arbitration. I do not find fault with Dr. Addison, who is a servant of the Government, in taking up the attitude he did at the Conference negotiations, because it is up to him, in order to please his master (the Government), to make the best terms possible with the profession short of granting their actual demands—namely, 13s. 6d. Also I have not the slightest doubt that the Government give us the credit of being able to look after our own interests, and the whole question to be settled, in their opinion, was to be done by haggling until they get us to accept something less than we at first asked for.

They certainly have not given us credit for asking (as we have done when we fixed upon 13s. 6d.) what we, the general practitioners, considered an irreducible minimum, much lower than the present increased cost of living justified us in doing. The increased cost of living is undoubtedly 100 per cent. over pre-war level, and we would have had a perfect and justifiable right in asking for 15s. The Government is perfectly aware of this increased cost, and Sir Eric Geddes in dealing with the railway workers found that he was negotiating with a very different type of man than those with whom Dr. Addison conferred as our representatives, because he was compelled to give them an increase equivalent to 134 per cent. over pre-war rates.

A great mistake was made when our representatives desired to submit the question to arbitration, and I do not think the profession should consider themselves bound by them. The Government cannot work the National Health Insurance scheme without the services of the medical profession, and if we in a solid body refuse to accept less than 13s. 6d. we are certain to obtain it, but we must act every one of us in concert.

We should not allow the Government to dictate to us and tell us what they will give us. It is for us to prevent them exploiting our services, and to state clearly we will accept nothing less than 13s. 6d., a 60 per cent. increase, which really is not enough and does not represent the full increase in cost of living, but as it is the figure fixed upon by our representatives, we are willing to abide by it.

Moreover, the new Regulations under which we shall work, and which come into force on April 1st next, are much more onerous and exacting than the old terms. For example, very briefly, the new Regulations state:

1. The panel doctor is responsible for the treatment of a pregnant woman up to the end of twenty-eight weeks, and again the tenth day following labour.
2. He has to keep and furnish reports; to consult with the Government medical officer; to meet him when he so desires; to visit cases in consultation with him; to show him all records and to answer any inquiries by letter if desired.
3. He must pay out of his own pocket for an anaesthetist if one is required.
4. He must obtain the consent of his Insurance Committee before he can take a holiday extending over one week, and before he can employ an assistant. He must obtain the consent of the Minister of Health before he can employ two or more assistants.
5. He must treat any member of any society that the Insurance Committee may direct him to treat.
6. He must supply drugs, etc., required for immediate application if the chemist is closed.
7. He, when declining to accept an applicant to his list, must treat him if he requires it, and then instruct him how to proceed to get upon a neighbour's panel.

Those I quote as the most glaring and the most irksome of the new conditions under which we are to work in the future. Shall we be adequately paid if we accept 13s. 6d. per head per annum? I would unhesitatingly say "No," but as it is the figure fixed by our representatives I am willing to stand by it. The profession in one voice should request our representatives to withdraw their offer of arbitration, and let the Government understand at once that we can accept nothing less than 13s. 6d., and that no further negotiations are desired.

Why do we allow the Government to exploit our services? Is it because we have always done a very large amount of charitable work, and the Government now look upon it as a right? I am far from suggesting that we should discontinue to do charitable work, for I think there is nothing gives me greater pleasure than to return the fees in deserving cases, and the expressions of gratitude received are ample reward. But it is quite another thing for the Government to take advantage of this philanthropic trait of our character and ask us to work and render services of a very responsible nature for anything less than 13s. 6d. a head per annum. Any sum less than this will never give satisfaction, and the service will certainly suffer as a consequence. If you want the best service from anyone you should pay him well.

If we give this decision as our final and well considered ultimatum, and as coming as the voice of every *Division* and *Branch* of the *British Medical Association in England* I feel sure that the Government, recognizing the strong attitude we are taking up, and realizing that the insurance scheme cannot be carried on without our co-operation, and also after due consideration arriving at the fact that our demand for 13s. 6d. is equitable, fair and reasonable, they will, willingly I hope, and if unwilling be compelled to grant it.—I am, etc.,

THOMAS WRIGHT, M.B., C.M., D.P.H.

Greyholme, Aldershot, Jan. 28th.

Insurance Medical Records.

SIR,—Under the new Insurance Regulations record taking appears to be inevitable, and knowing as I do that the old method was cumbersome and unreliable from a statistical point of view, any suggestion likely to lead to ease, reliability, and usefulness should be welcomed by the powers that be, to say nothing of the record keeper.

It has been my custom ever since the Act came into force to paste a slip of paper inside the medical ticket, on which I record my attendance, particularly with regard

to diagnosis and treatment, the name and address of patient being first entered. The patient is instructed to bring the card every time he wishes to see me, or to have the card on the table when I visit him at home. I find this a great convenience; it saves time and leads to accuracy in certification and continuity of treatment, and I am convinced that a big panel cannot be satisfactorily conducted without some such method.

If this system were adopted, the profession would quickly realize its value, and the State might then expect to get a true record, which I have no hesitation in saying was next door to impossible under the old arrangement. All that is required is a new medical ticket with a plain interior, or simply ruled as the old record cards were, and issued every year. The collection of these cards, simultaneously with the stamp cards, ought not to be difficult. I hardly like to suggest that the fact that a patient's card could be inspected at any time, either by his society's representative or State official, might afford an inducement to the adoption of the plan.

As instances of usefulness I may mention the case of a girl who sometime last December wanted a certificate, for the unemployment bureau, of inability to work from June to September, 1915. I was able to satisfy her requirement on referring to her medical card, without having to draw upon my stock of credulity or good nature. In another case a man died suddenly in a tramcar, three miles away from home; the police found in his pocket a medical card, with my notes attached, showing my last attendance and indicating the disease from which he died.

The method is businesslike, and I am convinced that any medical man who tries it will in future keep the record for his own benefit.—I am, etc.,

H. C. CREW.

Wednesbury, Jan. 28th.

Limitation of Panel Lists.

SIR,—The action taken by the Ministry of Health, at the twenty-fourth hour, in issuing a circular letter—and accidentally emphasizing it by another the day following—advocating the limitation of panels below the maximum laid down in the Regulations, is highly discreditable. I feel sure that at the Conference

of Panel Committees none anticipated this, and to advise Insurance Committees to take action in this respect, when time was the main factor in hurrying the completion of the schemes, was most surely the best way of creating ill feeling and dissatisfaction.

"Give him an inch and he will take an ell" is an old saying, and this is the case with the Minister. The 3,000 limit is in the Regulations, but the future policy of the Ministry is that this is to be regarded as exceptional and far lower limits will be the rule.

In this county the Insurance Committee and the Panel Committee failed to agree upon a limit, and the matter was referred to the Minister, who has imposed a limit of 2,500 as a temporary measure, and it is added that such a limit cannot be regarded as an indication of the view of the Minister that so high a limit as 2,500 is appropriate for the rural parts of the area. (But no rural practitioner is ever likely to obtain this number locally.) The imposition of any limit does not in itself lead to greater efficiency, for the other duties of a practitioner must always be taken into consideration.

It seems illogical that, on the one hand, the Ministry recommends smaller panels, and then, under M.C. 3, we are advised to fine a practitioner who, for his own reasons, endeavours to limit his panel, and no points need be raised as to what other work he does.

In this county we endeavour to create a good standard

of service, and would deal with any panel if it were proved that the practitioner was not able to undertake his obligations, but the creation of limits is really artificial and serves no useful purpose.—I am, etc.,

SIDNEY CLARKE, M.D.,

St. Albans, Feb. 3rd. Honorary Secretary, Herts Panel Committee

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty:—**Surgeon Commanders:** H. C. Arathorn, E. B. Kenny, H. Spicer, and A. N. Lavertine to the *President*, additional, for recruiting duties at Manchester, Nottingham, Southampton, and Newcastle respectively; J. K. Raymond to the *Erin*. **Surgeon Lieutenants:** W. A. Jolliffe to the *Edmont*, additional; D. A. P. Clarke to the *Hercules*; W. J. McB. Allan to R.N. Hospital, Plymouth. **Surgeon Lieutenants (temporary):** W. O.G. Donoghue to the *Fembroke*, additional; H. S. Bryan to the *Victorious*.

ARMY MEDICAL SERVICE.

Major-General W. T. Swan, C.B., retires on retired pay.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel J. P. J. Murphy is placed on the half pay list on account of ill health.

To be acting Lieutenant-Colonels: Temporary Captain (acting Major) G. W. Rea (July 23rd, 1919), Major and Brevet Lieut.-Colonel B. A. Craig (August 20th, 1919).

Major A. B. Hinde, O.B.E. (ret. pay), is granted the rank of Lieutenant-Colonel on ceasing to be re-employed.

Major and Brevet Lieut.-Colonel D. S. Skelton, D.S.O., is seconded for service under the Colonial Office.

Major J. E. H. Galt retires on retired pay.

Temporary Major S. A. Smith, D.S.O., O.B.E. (Major C.A.M.C.), relinquishes his temporary commission.

The following relinquish the acting rank of Major: Captains T. P. Litt, T. F. Kennedy, O.B.E., G. E. A. Argo, M.C., F. G. Flood, M.C., G. G. B. Holroyde, M.C., S. J. L. Lindeman, M.C., F. R. H. Mollan, M.C., H. W. Browne, M.C., S. J. A. H. Walshe, D.S.O., A. G. Wells, D.S.O., E. G. S. Cane, D.S.O., E. A. Strachan, W. J. Tobia. **Temporary Captains:** R. A. Steven, R. W. S. Christmas, V. L. Connolly, W. C. Horton, R. Thomson, C. C. Harrison, M.C., A. Brown, O.B.E., A. M. Malcolmson, A. E. Quine, W. D. Cruickshank, R. S. S. Statham, C. N. Coad, M.C., A. Scott, F. C. Lees, M.C., W. Montgomery, S. J. W. Donald, F. De S. McMenamin, M.C., H. W. Turner, M.C., S. E. Picken, M.C., H. B. G. Russell, R. B. Blair (April 6th, 1919), substituted for notification in the *London Gazette*, June 27th, 1919; B. H. Woodyard, A. L. Robinson, H. H. Dunmere, M.C., W. C. Sharpe, A. S. K. Anderson, D.S.O., M.C., W. J. Macdonald, M.C.

Captain J. P. Quin, M.C., resigns his commission.

The name of Captain James R. Hill is as now described, and not as printed in the *London Gazette* of October 14th, 1919.

The notifications in the *London Gazette* of November 4th, 1919, and the substitution therefor in the *London Gazette* of December 30th, 1919, regarding Lieut.-Colonel Charles J. O'Gorman, D.S.O., are cancelled.

Temporary Lieutenant S. P. Hyam to be temporary Captain.

To be acting Majors: Temporary Captains C. D. Coyle (from February 2nd to October 10th, 1919) and S. W. Allworthy (from February 28th to April 7th, 1919), R. Scott, E. J. Maxwell, Captain M. Morris.

Captain E. G. H. Cowen retires, receiving a gratuity.

Captains R. M. Dickson, O.B.E., and R. O'Kelly relinquish the acting rank of Lieutenant-Colonel.

Temporary Captain J. F. O'Malley to be temporary Major, June 1st, 1918 (substituted for notification in the *London Gazette*, May 31st, 1918).

The notifications in the *London Gazette* of January 24th, 1920, regarding the relinquishment of the acting rank of Major and the pay and allowances of that rank by temporary Captain Alexander Scott are cancelled.

The notifications in the *London Gazette* of August 25th and September 30th, 1919, regarding temporary Captain John D. Gimlette are cancelled.

Lieutenant (temporary Captain) H. J. Beusted, M.C., to be Captain.

T. W. J. Childs to be temporary Captain.

The following officers relinquish their commissions: Temporary Lieut.-Colonel A. C. Suffera on ceasing to serve with the 1st Birmingham War Hospital, and retains the rank of Lieutenant-Colonel. Temporary Major (acting Lieut.-Colonel) W. de M. Hill, C.B.E., and is granted the rank of Lieutenant-Colonel. Temporary Major and retains the rank of Major: W. P. Yefts, O.B.E., Norfolk Roberts, O.B.E. (on ceasing to serve with the Horton—County of London—War Hospital). Temporary Captains and are granted the rank of Major: J. W. C. Gunn, W. J. Macdonald, M.C. (substituted for notification in the *London Gazette* of January 2nd, 1920). Temporary Captain J. Howells. Temporary Captains and retain the rank of Captain: G. M. Cameron, M.C., E. H. Cameron, J. R. Griffith, J. Geoghegan, B. M. Collard, T. E. George, S. B. Badley, A. C. Lambert, M.C., R. O. Whyte, A. E. Moore, J. D. Gimlette, E. Forbes, M.C., W. C. Morton, E. F. Buckler, R. Crawford, E. R. C. Cooke, M.C., J. Gray, R. L. Haines, K. D. Atteridge, D. I. Dakeyne, H. C. Martin, D. Rees, R. C. Walker, D. S. Clarke, H. W. Perkins, (acting Major) T. V. Somerville, M.C., G. J. C. Ferrier, M.C., R. H. Stoddard, G. A. Lamont, F. H. Cooke, J. F. Hoare, A. H. Huycke, M.C., F. T. D. Chodening, E. F. Wills, E. J. Peill, A. R. Leggate, J. P. McVey, M.C., C. Hunter, E. D. Parbury, A. L. Martyn, A. H. Wilson, E. A. Aylward, D. K. MacDougall, A. G. Alexander, J. C. Anderson, G. N. Braham, M.C., C. Loddiges, M.C., A. F. Miller. Temporary Lieutenant F. G. McGuinness, and retains the rank of Lieutenant (April 14th, 1919, substituted for notification in the *London Gazette*, July 9th, 1919). Temporary honorary Lieutenant C. H. Evans, and retains the honorary rank of Lieutenant.

ROYAL AIR FORCE.

MEDICAL BRANCH.

Transferred to unemployed list: Captains J. Paxton, J. H. M. Sandison. Lieutenant (acting Captain) C. Duggan, Lieutenant A. G. H. W. R.

The initials of Captain C. S. Clegg are as now described, and not as stated in the *London Gazette* of April 4th, 1919.

Flight Lieutenant J. E. Dunbar (Captain R.A.M.C. T.F.) relinquishes his temporary R.A.F. commission on return to army duty.

Acting Squadron Leader J. J. C. Hamilton to be acting Wing Commander whilst Wing Commander.

Flight Lieutenant H. Gardiner-Hill, M.B.E., to be acting Squadron Leader whilst Squadron Leader.

GENERAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Captain F. E. Bissell (late Captain, R.A.M.C. S.R.) is granted the rank of Lieutenant-Colonel on ceasing to be employed.

APPOINTMENTS.

Nicol, William, M.B., Ch.B. Glasg., Ophthalmic Surgeon to the Gloucestershire Royal Infirmary and Eye Institution, Gloucester.

ROYAL FREE HOSPITAL, AND LONDON (ROYAL FREE HOSPITAL) SCHOOL OF MEDICINE FOR WOMEN.—George Scott Williamson, M.B., Ch.B. Edin., M.C., to be Pathologist and Director of Pathological Studies. Mary Schofield, M.R.C.S., L.R.C.P. Lond., to be Clinical Pathologist and Assistant Director of Pathological Studies.

DISTRICT MEDICAL OFFICERS.—R. Aitken, M.B., Ch.B. (Norwich Parish); R. M. Barrow, M.B. (St. Thomas Union); H. E. Corhlan, M.B. (Andover Union); P. S. Duiganan, L.R.C.P. Edin., L.R.C.S.I. (Ashton-under-Lyne Union); A. E. McKenzie, M.R.C.S., L.R.C.P. (Prescot Union); A. Mackintosh, M.B., Ch.B. Aberd. (Sunderland Union); F. L. Newton, M.B., Ch.B. Vict. (Oulton-upon-Severn Union); J. H. Nixon, M.D. (Chippenham Union).

DIARY OF SOCIETIES AND LECTURES.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Monday, 8.30 p.m., The Clinical or Naked Eye Diagnosis of Diphtheria and other Infections of the Fauces, illustrated with the Epidiascope by coloured drawings and photographs, by Dr. H. Drinkwater. On Some New Methods of Illustration, illustrated by the Epidiascope, by Dr. T. B. Hyslop.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.—Hunterian Lectures: Monday, 5 p.m., Professor H. Tyrrell Gray: Influence of Nerve Impulses on Gastro-intestinal Disorders. Wednesday, 5 p.m., Professor James Sherrou, C.B.E.: Late Results of the Surgical Treatment of Chronic Ulcers of the Stomach and Duodenum. Friday, 5 p.m., Professor Walter G. Spencer: Historical Relationship between Experiments on Animals and the Development of Surgery.

ROYAL SOCIETY OF MEDICINE.—Tuesday, Occasional Lecture, 5 p.m., Professor A. D. Waller: The Measurement of Human Emotion and of its Voluntary Control. *War Section:* Monday, 5.30 p.m., Discussion on Gas Poisoning, to be opened by Sir Wilmot Herringham. Colonel Cummins, Dr. C. G. Douglas, Professor J. S. Haldane and others will speak. *Section of Bacteriology and Climatology:* Thursday, 5.30 p.m., Resolved Discussion on the Merits and Defects of the British Health Resorts. Dr. F. G. Thomson, Dr. J. Campbell McClure, and Dr. W. F. Kennedy will speak. *Section of Neurology:* Thursday, 8.30 p.m., Dr. Rows, C.B.E.: Anxiety States. *Clinical Section:* Friday, 5 p.m., Cases.

POST-GRADUATE COURSES AND LECTURES.

BROMPTON HOSPITAL FOR CONSUMPTION, S.W.—Wednesday, 4.30 p.m., Dr. Perkins: Ward Demonstrations.

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W.1.—Monday, noon, Dr. Eric Pritchard: Motor Functions of the Alimentary Tract in Infants. Tuesday, noon, Dr. F. Langmead: Congenital Pyloric Stenosis; 5 p.m., Dr. F. G. Crookshank: Handprints and Posture in Mongols. Wednesday, noon, Mr. W. M. Mollison: The Deaf Child. Thursday, noon, Dr. A. F. Hurst and Mr. Montagu Hopson: Medical Aspects of Dental Infection.

MANCHESTER: ANCOATS HOSPITAL.—Thursday, 4 p.m., Mr. Morley: Clinical Manifestations of the Mobile Caecum.

MANCHESTER ROYAL INFIRMARY.—Tuesday, 4.30 p.m., Mr. H. H. Rayner: Local Anaesthesia Technique (Practical Demonstration).

NEWCASTLE-ON-TYNE: ROYAL VICTORIA INFIRMARY.—Friday, 2.30 p.m., Dr. J. W. Smith: Post-Influenza Sequelae; 3.15 p.m., Professor W. E. Hume, C.M.G.: Clinical Aspect of Blood Diseases; 4.30 p.m. (College of Medicine), Professor Stuart McDonald: Morbid Anatomy of Blood Diseases.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.15.—Tuesday, 2 p.m., Mr. H. W. Carson: Hernia; 4.30 p.m., Dr. Arthur Giles: Gynaecological Fallacies.

SHEFFIELD ROYAL HOSPITAL.—Monday, 3.30 p.m., Dr. Nutt: X-ray Examination of Thorax. Tuesday, 4 p.m., Diseases of the Iris and Ciliary Body. Wednesday, 3.30 p.m., Dr. Wilkinson: Common Laryngeal Ailments. Thursday, 3.30 p.m., Dr. Skinner: Scleroderma, Alopecia, etc. Friday, 4 p.m., Dr. Hay: Diseases of the Lens, Glaucoma.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Saturday (February 7th), 10 a.m., Mr. Arthur Saunders: Medical Diseases of Children. Monday, 5 p.m., Mr. Addison: Appendicitis in Children. Tuesday, 5 p.m., Dr. Burnford: Clinical Lecture. Wednesday, 5 p.m., Mr. Orwee: Pneumothorax. Thursday, 5 p.m., Dr. Simson: Uterine Fibroids. Friday, 4.20 p.m., Mr. Hey Grove: Bone Grafting in Fractures.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 6s., which sum should be forwarded with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

BIRTH.

PINSON.—On January 30th, at 155, High Street, Chorlton-on-Medlock, Manchester, to the wife of K. B. Pinson, M.B., M.R.C.S., a son.

DEATH.

HAYES.—On January 24th, 1920, after a short illness, at her residence, 3, Marlborough Buildings, Bath, Miss Albinia Lenard Hayes, the beloved wife of Lieut.-Colonel E. C. Hayes, C.B.E., R.A.M.C. (retired).

CURRENT NOTES.

The Arbitration.

DRS. BRACKENBURY, DAIN, and COX, representing the Insurance Acts Committee, met the representatives of the Ministry of Health before the Board of Arbitrators on Friday, February 6th, to discuss the question of procedure. All the members of the Board were present. The Chairman, Mr. F. Gore-Browne, K.C., decided that the statement of the Insurance Acts Committee should be received by the Board and by the Ministry of Health not later than February 14th; that the Minister of Health's reply should be sent to the Board and to the Insurance Acts Committee by February 23rd; that the arbitration should commence on Wednesday, March 3rd, at 11.15 a.m.; and that the dates of future hearings, if any, should be fixed that day. The Executive Subcommittee of the Insurance Acts Committee met on February 10th, and considered the documents which it is proposed to submit in support of the case for the profession. These documents and the reply of the Ministry will be published in due course, together with an agreed report of the proceedings.

The Battle of the Lodges in Victoria.

In the JOURNAL of December 27th, 1919, p. 854, there was a note upon the latest phase of the long-drawn-out contest between the medical profession in Victoria and the friendly societies (or lodges) in that State. It appeared that an emissary of the lodges was then on his way to this country with the object of finding a hundred doctors to act as medical officers, and that the officials of friendly societies and "medical institutes" were pressing the Legislature to sanction the appointment of whole-time State or municipal medical officers, whose duties would include attendance upon friendly society members. In the SUPPLEMENT of the same date we printed a letter from the officers of the Victorian Branch of the British Medical Association giving the history of the controversy forced upon the medical profession in Victoria by a combination of the friendly societies and the State. The letter ended by asking the aid of the Central Council of the Association in preventing as far as possible "any influx of medical practitioners from England to these institutes, which are solely for commercially exploiting the labours of the medical men." In accordance with this request steps were at once taken by the Head Office to put medical men on their guard. Announcements have been inserted in the newspapers advising doctors before accepting any medical posts in Australia to apply for information to the Medical Secretary. As we said in a Current Note on January 10th, the loyalty and solidarity of the members of the Victorian Branch have been well shown throughout this struggle; and they may be sure that the Association in this country will

stand by them. In the *Medical Journal of Australia* for December 13th, 1919, there is a leading article reviewing the situation and expressing the hope that medical practitioners in Great Britain may be made aware of the history of the events, so that no one will accept the position of medical officer to one of the medical institutes in ignorance of all the facts. We think that all who have followed what has appeared lately in these columns must now understand what is at issue between our colleagues in Victoria on the one side and the lodge officials, abetted by some politicians, on the other.

Meetings of Branches and Divisions.

WILTSHIRE BRANCH.

A GENERAL meeting of the Branch, to which all non-members in the county were invited, was held at Trowbridge on January 25th, when the President, Dr. KEMPE, was in the chair.

The SECRETARY announced that he had sent a copy of the resolution passed at the last meeting regarding rates for medical attendance (SUPPLEMENT, October 18th, 1919, p. 36) to all club secretaries whose names he had received, and that it would be necessary to call another Branch meeting as soon as the National Insurance remuneration was fixed. The question of the minimum fee for examination of new members was deferred until that meeting.

A letter from the Medical Secretary was read urging Divisions to raise private fees at least 50 per cent. over pre-war rates. It was resolved:

That the medical men practising in the county of Wilts. at a meeting in Trowbridge, resolved to increase their fees at least 50 per cent. over pre-war rates.

An announcement to that effect was directed to be published in the local press.

Dr. LOCKET announced that the Government's offer for attendance under the National Insurance Acts was 11s. capitation fee, 2s. dispensing fee, and a mileage fund of £300,000. He stated that the Insurance Acts Committee had refused the offer and proposed arbitration, which the Government had accepted. A general discussion followed, and it was resolved:

That this meeting endorses the action of the Insurance Acts Committee, and thanks them for the large amount of work they have done on behalf of the profession.

Dr. FLEMMING briefly explained the need for maternity hospitals in the county, and the necessity that they should be under the control of the medical men. It was agreed that the report drawn up by the committee appointed at the annual meeting on June 21st, 1919, be circulated to medical men, and that they be asked to arrange public meetings to interest the public in the proposal.

WILTSHIRE BRANCH: TROWBRIDGE DIVISION.

A MEETING of the Division was held at Trowbridge on January 25th, when Dr. LAURENCE was in the chair. The question of raising fees for private practice was referred to the Branch.

Dr. STEELE (Devizes) produced a scale of fees paid to divisional police surgeons, showing that the fee paid for examination of recruits was 2s. 6d. The meeting considered this fee inadequate, and the secretary was instructed to forward the scale of fees to the Medical Secretary.

The revised ethical rules, as approved by the Annual Representative Meeting, 1919, were adopted.

Association Notices.

MEETING OF COUNCIL.

The next Meeting of Council will be held on Wednesday, February 18th, in the Council Room, 429, Strand, London, W.C. 2., at 10 a.m.

BRANCH AND DIVISION MEETINGS TO BE HELD.

EDINBURGH BRANCH.—Drs. John Stevens and John Eason, Honorary Secretaries, give notice that the Winter Clinical Meeting of the Edinburgh Branch will be held in the Royal Infirmary, on Friday, February 27th. All members of the profession are cordially invited. The Museum will be open from 11 a.m. Special Clinics will be held during the forenoon, and the Clinical Meeting at 3.15 p.m. At 5 p.m. Dr. Alexander Blackhall-Morison (London) will lecture on The Passive Mechanical Factor in Heart Disease: its Influence and Management. Dinner at 6.30 p.m. in the Hall of the Royal College of Physicians, 9, Queen Street; morning dress; dinner ticket, 10s. 6d. Members of the Branch are requested to notify, not later than February 23rd, whether or not they intend to be present.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following notifications are announced by the Admiralty:—**Surgeon Lieutenant Commander G. R. McCowen, O.B.E.**, to the *Excellent*, additional, for duty at Whale Island, and in Gas School on relief. **Surgeon Lieutenant H. L. Douglas** to R.N. Hospital, Chatham. **Surgeon Lieutenants (temporary) H. M. Scott** to the *Erin*; **H. A. L. Guthrie, A. M. McCallum, J. R. Brennan, E. S. Mellor, and T. N. D'Arcy**, transferred to the permanent list as Surgeon Lieutenants.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel G. S. Crawford, C.M.G., retires on retired pay. **Major and Brevet Lieut.-Colonel E. Ryan, C.M.G., D.S.O.**, to be acting Lieut.-Colonel from April 15th to October 28th, 1919. **Major M. G. Dill** retires on retired pay.

The following Majors relinquish the acting rank of Lieut.-Colonel: **G. R. Pattoo**, (Brevet Lieut.-Colonel) C. W. Holden, C.M.G., D.S.O. **Major W. Hyam, O.B.E.**, to be temporary Lieutenant-Colonel whilst specially employed.

To be Majors: **Captains and Brevet Majors H. H. Blake, O.B.E., A. Shepher, A. E. G. Fraser, Captains (acting Majors) F. Worthington, D.S.O., O.B.E., J. W. Houston, D.S.O., S. G. Walker, A. L. Foster, A. G. Wells, D.S.O., C. McQueen, M.C., Captains F. R. Coppinger, O.B.E., A. C. Hammond-Searle, M.C., J. E. Elcome, G. J. Keane, D.S.O., R. M. Dickson, O.B.E., A. L. Stevenson, B. Varvill, M.C., W. J. Dunn, O.B.E., F. B. Dalgleish, C. E. L. Harding, C. M. Rigby, W. H. S. Burney, T. B. Eves, D.S.O., L. Murphy, D.S.O., A. H. T. Davis, J. S. McCombe, D.S.O., W. J. Tobin, R. O'Kelly.**

Captain P. C. Field is restored to the establishment. **Captain J. E. Rusby, M.C.**, resigns his commission, June 20th, 1919 (substituted for notification in the *London Gazette*, June 18th, 1919).

Temporary Captain A. Jones, D.S.O., M.C., relinquishes the acting rank of Lieut.-Colonel on ceasing to command a medical unit, November 12th, 1918 (substituted for notification in the *London Gazette*, February 17th, 1919).

Temporary Captains relinquish the acting rank of Major: **P. J. Lane, M.C., D. B. Pascall, M.C., W. H. Alderton.**

Temporary Captain J. E. Thompson to be acting Major. The following Captains resign their commissions: **J. W. O'Brien, M.C., W. Moodie.**

The following Captains are seconded for service with the Colonial Office: **C. D. M. Buckley, M.C., W. C. Hartgill, M.C., T. J. L. Thompson, M.C.**

Lieutenant (temporary Captain, acting Major) J. La F. Lauder, D.S.O., M.C., to be Captain, February 8th, 1918, and to retain his acting rank (substituted for notification in the *London Gazette*, March 3rd, 1919).

Lieutenants (temporary Captains) to be Captains: **C. O. J. Young, M.C., R. N. Phense, C. B. C. Anderson, P. E. D. Pank, G. Moulson, W. J. F. Craik.**

Temporary Lieutenant H. Abernethy to be temporary Captain. The following officers have relinquished their commissions:—

Temporary Majors and retain the rank of Major: **A. T. Duka, D.S.O., E. Swainston** (on ceasing to be employed at the Brook War Hospital), **W. Pearson** (on ceasing to be employed at the Graylingwell War Hospital). **Temporary Captain and Brevet Major R. Bruce-Low** and retains the Brevet rank of Major. **Temporary Captain A. Jones, D.S.O., M.C.**, and is granted the rank of Lieutenant-Colonel, November 15th, 1918 (substituted for notification in the *London Gazette*, November 30th, 1918). **Temporary Captain (acting Major) H. B. G. Russell**, and is granted the rank of Major. **Temporary Captain M. Murphy, M.C.** (on transfer to the I.M.S.). **Temporary Captains** and retain the rank of Captain: **E. N. Glover, O.B.E., J. W. Robertson, M. J. Murray, J. D. Doherty, W. G. Macdonald, M.C., R. F. Lunn, A. S. Morley, C. R. Smith, S. W. Allworthy, A. H. D. Smith, M.C., H. W. Bennett, F. O. B. Ellison, J. R. O'Brien, W. J. Oliver, C. F. Constant** (on account of ill health), **A. V. Dill, W. Murphy, A. E. Clarke, H. F. Penman, A. M. Malcolmson, A. Trower, H. W. Hay, H. Coppock, H. A. Richards, G. Mallar, M.C., J. A. F. Hateb.** **Temporary honorary Captains** and retain the honorary rank of Captain: **A. H. Good, J. V. Ricci.**

ROYAL AIR FORCE.

MEDICAL BRANCH.

Captain F. C. Kempson to be acting Major whilst employed as Major. **Flight Lieutenant A. S. Glynn** to be acting Squadron Leader whilst employed as Squadron Leader.

The notification in the *London Gazette* of November 26th, 1918, concerning Captain C. Salkeld is cancelled.

Transferred to unemployed list: **Captains W. Enraght, J. E. Lascelles** (May 14th 1919, substituted for notification in the *London Gazette* of January 6th), **H. W. Pigeon, C. R. M. Pattison, J. Souler, S. R. E. Davies, T. C. Backhouse.**

INDIAN MEDICAL SERVICE.

Lieut.-Colonel L. J. M. Deas has been posted as Residency Surgeon, Jaipur, with effect from October 25th, 1919.

Major-General P. Hehir, C.B., C.M.G., C.I.E., M.D., has been permitted to retire from the service with effect from December 8th, 1919.

J. R. Kochhar has been permanently appointed to the service with effect from March 17th, 1919, and promoted to the rank of Captain with effect from September 16th, 1919.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Captain E. M. Cowell, D.S.O., relinquishes the acting rank of Lieutenant-Colonel.

The notification in the *London Gazette* of December 2nd, 1919, regarding the relinquishment of the acting rank of Major by **Captain Arthur F. L. Shields** is cancelled.

The following Captains relinquish the acting rank of Major: **D. Dougal, M.C., K. K. Druy, M.C., H. W. Hills, M. J. B. F. Burke-Kennedy, T. McEwen, M.C., K. W. Lewis, E. R. Lovell.**

The following Captains relinquish their commissions and are granted the rank of Major: **On account of ill health contracted on active service: M. W. Ruthven, H. C. Rook.** **On account of ill health caused by wounds: T. Lindsay, T. McEwen, M.C., A. G. S. Wallace, M.C.**

The following Captains relinquish their commissions and retain the rank of Captain: **G. E. Shand, W. C. Davidson, J. C. A. McCalden, R. Stewart, F. Balkwill, T. G. James, J. R. Cox, H. E. Bamber, W. Feldman.** **On account of ill health contracted on active service: N. S. R. Lorraine, J. Taylor, R. F. Pison, N. H. Harrison, J. Y. McLean, A. A. Fyffe, J. J. Landers, P. V. Anderson.** **On account of ill health caused by wounds: T. W. Wylie, M.C., R. A. Stewart, M.C., S. D. G. McEntire, P. MacCallum, M.C., J. R. John.** **On account of ill health: J. P. Charnock, J. P. Broom, H. M. Wharry, E. D. Roberts, H. J. Rice, M.C., D. M. Jones, W. H. Duff.**

Captain J. F. W. Meenan to be acting Major from January 15th to March 11th, 1919.

Captain I. Braun relinquishes his commission.

The notification in the *London Gazette* of December 2nd, 1919, regarding **Captain Thomas C. Storey, M.C.**, is cancelled.

GENERAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Late Captains R.A.M.C. to be Captains: **John E. Rusby, M.C.** (June 20th, 1919, substituted for notification in the *London Gazette*, June 18th, 1919), **J. W. O'Brien, M.C., W. Moodie.**

OVERSEAS CONTINGENTS.

SOUTH AFRICAN MEDICAL CORPS.

Temporary Major H. C. Baker, O.B.E., relinquishes his commission on completion of service, and retains the rank of Major.

Temporary Captain A. G. Forbes, M.C., relinquishes his commission on ceasing to be employed, and retains the rank of Captain.

BRITISH WEST INDIES REGIMENT.

Surgeon Captain A. G. Curphy, M.C., relinquishes his commission, and retains the rank of Surgeon Captain.

VOLUNTEER FORCE.

The following temporary Majors relinquish their commissions and are granted the honorary rank of Major: **County of London R.A.M.C.V.:—E. S. Tait, F. S. Barber, H. Webb, R. Chetnam-Strode, R. M. H. Walford, J. S. Goodall, P. G. Parsous, A. Allport, Sir J. Collie, C.M.G., T. E. White, F. C. Langford, E. G. Annis (Captain T.F.Res.), A. J. Swallow, H. Jackson.**

The following temporary Captains relinquish their commissions, and are granted the honorary rank of Captain:—**Anglesey R.A.M.C.V.: G. L. Jones.** **City of Bristol R.A.M.C.V.: G. G. D. Willett.** **Cheshire R.A.M.C.V.: M. Young, H. L. Pearson.** **City of Dundee R.A.M.C.V.: D. J. Forbes.** **Durham R.A.M.C.V.: J. C. French.** **Essex R.A.M.C.V.: J. H. Salter.** **Gloucestershire R.A.M.C.V.: T. C. Leman.** **Kent R.A.M.C.V.: J. Richardson, H. Brown.** **Lancashire R.A.M.C.V.: J. M. Ferguson.** **Leicestershire R.A.M.C.V.: J. A. H. Barnes, J. M. Lithgow, J. R. Foulds.** **Lincolnshire R.A.M.C.V.: T. Annington.** **City of London R.A.M.C.V.: D. McB. Greig, M. C. Sykes.** **County of London R.A.M.C.V.: F. J. Fielder, S. Peake, H. M. Wood, F. M. Turner.** **G. Pollock, E. E. Henderson, T. Wilson, R. E. T. Ingram, R. Lawson, H. J. Hillstead, J. Kennish, J. B. Wallace, H. J. Baumsted, C. T. Quilmer, M. A. Farr, J. G. McWilliam, W. J. Nolan, F. W. Warren, T. Pearson, H. Johnson, R. Ostlere, J. F. G. Bent.** **Norfolk R.A.M.C.V.: W. L. Cox, G. S. Keeling, L. H. B. Mills, F. Preston, A. Crook, C. B. Smith, W. J. E. Sumpter, C. W. Steel, R. Grant.** **Northumberland R.A.M.C.V.: J. G. Miller.** **Warwickshire R.A.M.C.V.: A. T. Holdsworth.** **West Riding R.A.M.C.V.: P. Macdonald.** **W. reestershire R.A.M.C.V.: H. E. Dixey, E. H. Alton, H. Smith.**

The following temporary Lieutenants relinquish their commissions, and are granted the honorary rank of Lieutenant:—**Buckinghamshire R.A.M.C.V.: H. Barrett, J. D. J. Harris, H. T. Wickham.** **Carnarvonshire R.A.M.C.V.: R. Rowland-Jones.** **Cheshire R.A.M.C.V.: L. C. A. Savatard, W. R. J. Garson, A. Banks, C. McA. Wilson, T. H. Smith, F. Cant.** **Derbyshire R.A.M.C.V.: S. J. Parkhill, W. A. Warters.** **Dorset R.A.M.C.V.: G. G. Morrice.** **City of Dundee R.A.M.C.V.: H. M. McHoul.** **Essex R.A.M.C.V.: G. P. Wilson, J. S. Brookfield.** **Gloucestershire R.A.M.C.V.: J. M. Martin.** **Hertfordshire R.A.M.C.V.: H. H. Thomson.** **Huntingdonshire R.A.M.C.V.: W. F. Fisher.** **Lancashire R.A.M.C.V.: R. C. Holt, J. Melvin, W. Stewart.** **Lincolnshire R.A.M.C.V.: R. Slocock, H. T. Benson.** **City of London R.A.M.C.V.: C. N. Foley.** **County of London R.A.M.C.V.: A. H. Gilbon, J. Norton.** **Northamptonshire R.A.M.C.V.: P. Parrott, J. S. Mackintosh, J. Daylan.** **Norfolk R.A.M.C.V.: L. P. Clements, J. T. Richards, S. W. M. Vyse, F. J. Eames, L. H. B. Miller, F. Preston, A. Crook.** **North Riding R.A.M.C.V.: J. Murray, J. C. B. Williams, and R. H. F. Bostock.** **Northumberland R.A.M.C.V.: J. M. MacLachlan.** **Nottinghamshire R.A.M.C.V.: A. Fulton and J. D. Willis.** **Somerset R.A.M.C.V.: J. M. H. Munro.** **Staffordshire R.A.M.C.V.: W. R. Souwester.** **Sussex R.A.M.C.V.: E. Fitzg. Frazer.** **Warwickshire R.A.M.C.V.: M. H. C. Atkinson and H. H. H. Addenbrooke.** **West Riding R.A.M.C.V.: K. H. Beverley and T. Chetwood.**

Northumberland R.A.M.C.V. (F.)—The surname of honorary Lieutenant **H. S. Craze** is as now described, and not as stated in the *London Gazette* of January 19th, 1920.

QUEEN MARY'S ARMY AUXILIARY CORPS.

Auxiliary Section, R.A.M.C. attached.—The following relinquish their appointments: **Medical Officers: R. E. Proctor, M.D., and A. F. Nash, M.B., F.R.C.S.** **Recruiting Medical Controller: C. A. F. Sturm, M.D.**

INSURANCE.

CORRESPONDENCE.

The Profession and Arbitration.

SIR,—I have read with dismay and disgust, which I imagine will be shared by many of the profession, the letter in your issue of February 7th by Dr. Thomas Wright, in which he advocates repudiation by the profession of the action of its properly elected representatives in the event of their full demands not being conceded by the arbitrators.

The representatives of the profession have acted throughout in accordance with the instructions given to them by the Panel Committees, which are the elected representatives of the panel practitioners as a whole, and to repudiate their undertakings would not only be an extreme dishonour to the profession, but would brand it at once as being on the same footing of morality and social and political intelligence as the least instructed trade unions, whose abrogation on recent occasions of contracts entered into after due consideration Dr. Wright would, I am confident, be eager to condemn.

It is agreed by all students that the highest development of the politico-social sense of peoples is shown by their readiness to accept loyally undertakings made by their accredited representatives, and it should be the endeavour of a learned and noble profession like our own in no way to fall short of this highest standard of political wisdom and conscience, and to spurn anarchy under whatever specious disguise it may present itself.

I urge, Sir, that it is our duty to abide faithfully by the decision of the arbitrators, whether that be for 13s. 6d., or 11s., or less, and to render to the insured persons under our care the best services of which we are capable on all occasions; for such is the only course consistent with honour, and, moreover, is the only method by which we can maintain in ourselves a high and advancing standard of professional ability, and by so doing construct a bulwark against a whole-time salaried State service, which is the alternative to the panel system, and is urged by eloquent and honest—though, I hold, misguided—reformers in many quarters.—I am, etc.,

A. E. HODDER,
Chairman, Mid-Staffs Division,
British Medical Association.

Stafford, Feb. 8th.

Remuneration and Rural Practice.

SIR,—Are panel practitioners as a body trying to arrive at an equitable arrangement with the Government? It is my belief that if this were the object in view a reasonable settlement would have been reached long ago. Can we expect any Government to grant a capitation fee of 13s. 6d. regardless of circumstances? Why do doctors refuse a limitation of numbers on a panel? Can anyone argue that it is reasonable to pay a doctor £3,370 per annum, if he has 5,000 on his panel, and still allow him to further increase his income by private practice, etc.

On the other hand, is it reasonable to expect any doctor to be satisfied that he is adequately paid if at the same rate he receives £540 for attending 800 panel patients *plus*, say, 10 per cent. mileage, making £594 per annum in a sparsely populated district where travelling expenses absorb half this amount and the loss of time is considerable? Again, in densely populated districts the doctor can, as a rule, hand over a patient who is dangerously ill to the care of a hospital, and he has no further trouble or anxiety, whereas the rural practitioner has to attend all

such cases from start to finish, operating upon his appendix patients, strangulated hernias, and all the rest of it.

Surely the equitable way of dealing with the question is to take into consideration what the doctors' duties are, what are the conditions of his locality, and what the density of the population, and so estimate what is a fair week's work for him, and arrange both the limitation of his panel and the scale of remuneration accordingly.

In estimating the number of hours constituting a fair week's work for a doctor, regard should be paid to the irregularity of his hours and the fact that no hour in the day or night can be called his own. A reasonable week's work might be fixed at forty-four hours. If a reasonable net income be considered to be £1,000 a year, and he has to work sixty-six hours a week, he should be entitled to receive:

1 year at 44 hours a week	£1,000
Plus 22 hours a week overtime (double rate)	1,000
Practice expenses, say	70
Total gross income	£2,700

Now, in my county the average panel is less than 800, and in my district considerably below this figure, the density of population being about 1 to 4 acres. I know not what is the average panel in a densely populated district; but assuming that it should be rather less than 3,000, and assuming also that in such a district 50 per cent. of a doctor's work is panel practice, and that in my district 25 per cent. of a doctor's work is panel practice, then in the densely populated district the panel should be limited to 3,000, and a doctor with a full panel should be paid 50 per cent. of £2,700—that is, £1,350—that is, at a rate of 9s. a head; while in a district such as this a panel practice should be limited to 800, and a doctor with a full panel should be paid 25 per cent. of £2,700 that is, £675—that is, at a rate of 16s. 10d. per head. Other districts should be graded according to density of population. If 9s. a head is too low a figure, both that and the 16s. 10d. should be raised proportionately.

In my opinion panel practice in the country from the business point of view is not worth touching for itself, but one has to take it as a part of the country conditions. The special allowance of £300,000 for mileage, which is to compensate the country doctor for increased travelling expenses and *loss of time*, does not touch the question; should the unit be valued at 2s. 6d. it would not benefit me to the extent of 10 per cent.

The rural practitioner's position has never been sufficiently represented, and the reason is obvious—we are a negligible minority and cannot be adequately represented on executive committees, etc., for the very reason that we are rural practitioners. I am on a Panel Committee, but when attending meetings I have to travel fifty-six miles at a cost of about 28s. a time and the loss of nearly three-quarters of a day's work.—I am, etc.,

Shaftesbury, Feb. 8th.

H. U. GOULD.

The New Regulations in Rural Practice.

SIR,—As one whose practice is partly urban and partly rural, I feel that the proposed Regulations have been strangely ignored in favour of the relatively less important capitation fee.

For myself, and I know I am also saying what most rural men would endorse, I feel that the Regulations will prove absolutely unworkable in a country practice. The points I particularly wish to draw attention to are:

1. That as the Regulations stand there is no obligation for messages to be delivered as early as possible. Rural men will appreciate the absolute impossibility of attending

British Medical Association.

OFFICES AND LIBRARY, 429, STRAND, LONDON, W.C.2.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 5 p.m., Saturdays 10 to 1.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on an application to the Librarian, accompanied by 6d. for postage.

- 18 Wed. London: Council, 10 a.m.
- 19 Thur. London: Dominion's Committee, 2.30 p.m.
- London: Territorial Force Subcommittee, 4 p.m.
- 20 Fri. North of England Branch, Royal Victoria Infirmary, Newcastle-on-Tyne, 1-5.15 p.m., Demonstrations (see Post-Graduate Courses).
- 27 Fri. Edinburgh Branch, Clinical Meeting, Royal Infirmary: Museum open 11 a.m.; Special Clinics during forenoon. Clinical Meeting, 3.15 p.m. Address by Dr. A. Blackhall-Morison: The Passive Mechanical Factor in Heart Disease: its Influence and Management, 5 p.m. Dinner, 6.30 p.m.

to a scattered country district, if they have to go twice a day to the same part of their district, especially when the second journey could have been avoided by a little earlier message being sent.

2. The question of the patient being apparently the judge as to the urgency or not of the case. I feel strongly that we should be safeguarded by some regulation about vexatious and unnecessary calls. We, if we do not go, are to pay for another man, if he can be found, to do the work. The patient, on the other hand, if he sends unnecessarily or late, is not to be penalized.

3. The hardship of having to undertake, apparently under penalty, other men's work.

In cases of emergency, in the past, we have always attended a *real* emergency if the patient's own doctor is out. True, we are to be paid by the unfortunate doctor whose patient we attend, but I object strongly to having to throw over my own work for the purpose.

Dr. Addison, I see, tells the public the panel patient is to have the same attention as a private patient. I do not know of any doctor who undertakes for his private patients to attend them whenever they send in to him, for any trivial trouble, for trouble which could have been notified to him days before, to go at all hours of the day or night, and to pay another man if he cannot go himself.

I feel strongly that the rural men, being in a minority in most Divisions of the Association, have not been sufficiently consulted, or they would never consent to accept Regulations which they know are unworkable and which can only cause unpleasantness and friction and which, if accepted, will most certainly not tend to cause a contented service.—I am, etc.,

Monmouth, Feb. 7th. P. G. HARVEY, M.D. Lond.

* * * We have referred this letter to the Medical Secretary, who suggests that Dr. Harvey's complaint as to insufficient consultation should be put before his Panel Committee. The Insurance Acts Committee kept these bodies fully informed of every move with regard to the Regulations, and it did not appear at the Conference in November last that representatives were ill informed as to the effect of the Regulations. Dr. Cox adds that the representatives who may be regarded as especially rural were well in evidence during the discussions, and all Dr. Harvey's points were thrashed out.

Transfer of Practices.

SIR,—We must now clearly envisage the present position in regard to this all-important matter. The Minister refuses all amendments, however moderate and equitable, and insists upon the clause abolishing the capital value of practices. In these circumstances it is the clear duty of the profession to proceed, through its representatives, to press the claim for compensation for the loss of the capital value of the practices of all those now on the panels, and who shall still be on the panels at the end of 1922, when their right of transfer ceases. Those, of course, who exercise their right to sell between now and 1922 will have no claim for compensation.

Meanwhile the profession should loyally accept the capitation award of the arbitrators, and diligently set about carrying out the new Regulations efficiently and honourably. But no step must be omitted that can legitimately be taken to establish this vital principle of compensation—the greatest matter of principle that has arisen since the Insurance Acts were passed.

As a first step in our constitutional struggle for our rights, I would suggest a representative deputation to the Prime Minister, to remind him of his speeches of 1912 and 1913, and the fair prospects then held out to us; and to call his attention to the manner in which it is proposed to fulfil those expectations.

Then every endeavour should be made to bring our case before Members of Parliament, with a view to amendment of Clause 16, when the Regulations are before Parliament.

Finally, appeals should be made to the sense of fair play of the public by making them acquainted, through the press, with the magnitude of the financial loss and the deprivation of legal rights with which we are threatened.

It is hard to conceive why these hardships should be inflicted upon a hard-working section of the community, who carried on under many and serious difficulties during the war and loyally refrained from embarrassing the Government by pressing their just claims until after peace was declared. Surely they have deserved better treatment at the end than to be given an increased capitation fee with one hand while being robbed of their capital with the other. I am, etc.,

Gloucester, Feb. 7th.

J. A. BELL.

BATH INSURANCE COMMITTEE.

At a meeting of the Bath Insurance Committee the following resolution was adopted unanimously and forwarded to the Ministry of Health:

That this Committee protests against the action of the Ministry in refusing after 1922 to allow insured persons on the lists of deceased practitioners automatically to be included in the lists of their successors, unless notice is given by the insured persons to the contrary in accordance with the existing provisions of the Medical Benefit Regulations.

APPOINTMENTS.

BROWN, A. Middleton, M.D. Aberd., D.P.H., Assistant Medical Officer of Health, City of Chester.
FENTON, James, M.D., D.P.H., Medical Officer of Health for the Royal Borough of Kensington.
MCMICHAEL, G. V. T., M.B., Ch.B., D.P.H. Edin., Medical Officer of Health for Paisley.
ROYAL FREE HOSPITAL, Gray's Inn Road, W.C.1.—Pathologist: G. S. Williamson, M.C., M.B., Ch.B., Assistant Physician: Hazell Howard Chodak, M.D., M.R.C.P.

DIARY OF SOCIETIES AND LECTURES.

LONDON HOSPITAL MEDICAL COLLEGE, E.—Friday, 4 p.m., Schorstein Memorial Lecture by Sir Archibald E. Garrod, K.C.M.G.: Diagnosis of Disease of the Pancreas.
MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Monday, 9 p.m., Second Lettsomian Lecture by Dr. Herbert R. Spencer on Tumours complicating Pregnancy, Labour, and the Puerperium; II, Ovarian Tumours.
ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.—Monday and Wednesday, 5 p.m., Professor W. G. Spencer: Historical Relationship between Experiments on Animals and the Development of Surgery.
ROYAL SOCIETY OF MEDICINE.—General Meeting of Fellows, Tuesday, 5 p.m., to consider proposal to constitute a Section of Urology. Section of Therapeutics and Pharmacology: Tuesday, 4.30 p.m., Discussion on the Value of Alcohol as a Therapeutic Agent, to be opened by Dr. H. H. Dale, and continued by Dr. A. F. Beddard, Dr. Langdon Brown, Sir William Hale-White, Dr. R. Hutchison, Dr. O. Leyton, Dr. E. Mellanby, Professor R. E. Wild, and Dr. W. H. Willcox. Section of Pathology: Pathological Laboratory, St. Bartholomew's Hospital, E.C.1: Tuesday, 8.30 p.m. Section of History of Medicine: Wednesday, 5 p.m., Dr. R. C. Buist: The Salernitan Verses and their English Versions. Section of Dermatology: Thursday, 4.30 p.m., Cases. Section of Otolaryngology: Friday, 5 p.m., Cases and Specimens.
SOCIETY OF TROPICAL MEDICINE AND HYGIENE, 11, Chandos Street, W.1.—Friday, 8.30 p.m., Discussion on Small-Pox, to be opened by Colonel W. G. King, C.I.E., I.M.S. (retired), Lieutenant-Colonel N. Hamilton Fairley, A.A.M.C., and Captain H. R. Dew, R.A.M.C.: Causes of Death from Malaria in Palestine: a Study in Cellular Pathology.

POST-GRADUATE COURSES AND LECTURES.

BRITISH MEDICAL ASSOCIATION, North of England Branch, Royal Victoria Infirmary, Newcastle-on-Tyne.—Friday, Demonstrations: 1 p.m. onwards, Pathological Museum; 2.30 p.m., Mr. A. M. Martin: Forms of Paralysis and their Treatment; 3 p.m., Dr. George Hall: Paralysis in Children; 3.30 p.m., Professor Stuart MacDonald: Pathology of Ulcerative Endocarditis; 4.15 p.m., Mr. R. J. Willan: Renal Tuberculosis; 4.45 p.m., Mr. C. F. M. Saint: Abdominal Injuries, with special reference to the Spleen.
BROMPTON HOSPITAL FOR CONSUMPTION, S.W.—Wednesday, 4.30 p.m., Dr. Hartley: Pneumothorax.
CHELSEA CLINICAL SOCIETY, Club Room, St. George's Hospital, S.W.—Tuesday, 8.30 p.m., Clinical Demonstration. Cases and Specimens.
FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W. 12 noon.—Monday, Mr. D. W. Roy: Prolapse and its Treatment; Tuesday, Dr. F. J. Poynton: Aortic and Mitral Disease of rheumatic Origin; Wednesday, Mr. G. E. Wangb: Appendicitis in Children; Thursday, Mr. J. F. O'Malley: Indications for Removal of Tonsils and Adenoids.
MANCHESTER ROYAL INFIRMARY.—Tuesday, 4.30 p.m., Dr. C. H. Mel'and: Polio-encephalitis and Lethargic Encephalitis.
NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.—Monday, 2 p.m., Dr. Collier: Out-patients; 3.30 p.m., Mr. Paton: Optic Atrophy. Tuesday, 2 p.m., Dr. Grainger Stewart: Out-patients; 3.30 p.m., Dr. James Taylor: Wards. Wednesday, 2 p.m., Mr. Arnour: Cerebral Tumours; 3.30 p.m., Dr. Grainger Stewart: Disseminated sclerosis. Thursday, 2 p.m., Dr. Farquhar Buzzard: Out-patients; 3.30 p.m., Intracranial Tumours. Friday, 2 p.m., Dr. Gordon Holmes: Out-patients; 3.30 p.m., Dr. Collier: Wards. Saturday, 9 a.m., Surgical Operations.
NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.15.—Tuesday, 2 p.m., Mr. Howell Evans: Demonstration of Cases illustrating Diseases of the Breast; 4.30 p.m., Dr. Metcalfe (lantern lecture): Examination of Diseases of Digestive Tract.
SALFORD ROYAL HOSPITAL.—Thursday, 4 p.m., Mr. Ollerenshaw: Common Injuries and their Treatment, from an Orthopaedic point of view.
SHEFFIELD ROYAL HOSPITAL.—Monday, 3.30 p.m., Dr. Nutt: X-ray Examination of Thorax. Tuesday, 4 p.m., Dr. Hay: Diseases of Iris and Ciliary Body. Wednesday, 3.30 p.m., Dr. Wilkinson: Common Laryngeal Ailments. Thursday, 3.30 p.m., Dr. Skinner: Seborrhoea, Alopecia, etc. Friday, 4 p.m., Dr. Hay: Diseases of Lens, Glaucoma.
WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Saturday (February 14th), noon, Mr. Souttar: Surgical Anatomy of the Abdomen. Monday, 5 p.m., Mr. MacDonald: Tuberculous Disease of Urinary Tract. Tuesday, 5 p.m., Dr. Burnford: Clinical Lecture, with Cases. Wednesday, 5 p.m., Dr. Beddard: Practical Medicine (Lecture 2). Thursday, noon, Mr. Sinclair: Surgical Demonstration. Friday, 5 p.m., Dr. A. C. Jordan: Radiography of Chronic Intestinal Stasis.

British Medical Association.

CURRENT NOTES.

The Annual Meeting at Cambridge, 1920.

The arrangements are steadily going forward for the eighty-eighth Annual Meeting of the British Medical Association, to be held in Cambridge on Tuesday, June 29th, Wednesday, June 30th, Thursday, July 1st, and Friday, July 2nd, under the presidency of Sir T. Clifford Allbutt, K.C.B., F.R.S., Regius Professor of Physic in the University. The Annual Representative Meeting will begin on the previous Friday morning, June 25th, at Cambridge. Notices with regard to the election of the Representative Body have appeared in several recent issues of the SUPPLEMENT. The statutory Annual General Meeting will be held at 2 p.m., on Tuesday, June 29th; on the same evening, at 8.30 o'clock, Sir Clifford Allbutt will give his presidential address to the Association. The scientific sections will meet on Wednesday, Thursday, and Friday, the mornings from 10 a.m. to 1 p.m. being set apart for discussions, and the afternoons from 3 o'clock for clinical and laboratory demonstrations. The sections this year are twelve in number. The Section of Medicine (President, Sir Humphry Rolleston), of Surgery (President, Sir George Makins), of Pathology and Bacteriology (President, Professor Lorrain Smith), of Neurology and Psychiatry (President, Dr. Henry Head), and of Physiology and Pharmacology (President, Professor F. G. Hopkins) will meet on each of the three days. The remaining sections, each meeting on one day, are as follows: Obstetrics and Gynaecology (President, Dr. Herbert Williamson), Tropical Medicine (President, Professor G. H. F. Nuttall), Electro-Therapeutics (President, Dr. A. E. Barclay), Medical Education (President, Sir George Newman), Medical Sociology (President, Dr. G. E. Haslip), Naval and Military (President, Colonel Joseph Griffiths), and Venereal Diseases (President, Mr. E. B. Turner). For the conduct of the afternoon demonstrations arrangements are being made in Cambridge by the following Directors of Demonstrations: Medicine, Dr. Aldren Wright; Surgery, Mr. Arthur Cooke; Physiology, Professor Langley; Pharmacology, Professor W. E. Dixon; Neurology, Dr. E. D. Adrian; Pathology, Professor Sir G. Sims Woodhead. There will be, in addition, a temporary Pathological Museum. The Secretaries' Conference and Dinner will be held on June 30th, and the Annual Dinner on July 1st. The popular lecture will be given on the evening of July 2nd by Dr. G. S. Graham-Smith. On Saturday, July 3rd, there will be excursions to places of interest in the neighbourhood. The honorary local secretaries of the annual meeting are Dr. J. F. Gaskell and Dr. G. S. Haynes.

Freemasons at the Annual Meeting.

The Freemasons of Cambridge are desirous of entertaining the brethren attending the annual meeting next summer, and Friday evening, July 2nd, has been suggested as a suitable date. We are asked to express the hope that any member of the Association who is a Mason and will be able to attend will intimate his intention of doing so at an early date to Dr. G. S. Haynes, New Medical Schools, Cambridge.

Rewards for Medical Discovery.

The Joint Committee of the Association and the British Science Guild has for some time past been considering certain proposals for the recognition and recompense by the Government of medical workers in the field of science.¹ The present position of persons engaged in scientific research in this country is very unsatisfactory. Their opportunities for continuous research are precarious, their salaries small, and their prospects uncertain. The present state of things is discreditably to the country, for the conditions under which they work are calculated to discourage rather than encourage those whose discoveries have been and may in future be of inestimable value to the community. The Joint Committee has issued a report on the "Need of Rewards for Medical Discovery," and this report has been forwarded to the Prime Minister, who has been asked to receive a deputation on the subject. The composition of the Joint Committee is as follows:

Representing the British Medical Association.

Sir T. Clifford Allbutt, K.C.B., F.R.S.
Dr. R. T. Leiper.
Professor Benjamin Moore, F.R.S.
Mr. E. B. Turner, F.R.C.S.
Professor J. S. Haldane, F.R.S.

Representing the British Science Guild.

Lieut.-General Sir Alfred Keogh, G.C.B.
Colonel Sir Ronald Ross, K.C.B., K.C.M.G., F.R.S.
Professor W. Bayliss, F.R.S.
Dr. D. Sommerville.
Sir Richard Gregory, F.R.A.S.
Lieut.-Colonel O'Meara, C.M.G., late R.E.

Election of Council.

Nomination forms for election to the Central Council of the Association can be obtained by members on sending a postcard to the Medical Secretary; they are returnable by May 17th at latest. A notice on this subject appears on page 38 of the SUPPLEMENT.

Colonial Medical Services.

Evidence will be given by the British Medical Association on Monday, February 23rd, before the Colonial Medical Services Committee appointed by the Secretary of State for the Colonies. It is hoped to publish the

¹ BRITISH MEDICAL JOURNAL, January 3rd, 1920, p. 25.

memorandum of evidence in the Annual Report of the Council, due to appear in the SUPPLEMENT on or about April 24th. In addition, separate copies of the memorandum of evidence will be sent in the near future to those Branches and members who have kindly communicated with the Medical Secretary on the subject of the colonial medical services, and also to any other Branches, Divisions, or members who intimate to the Medical Secretary a desire to be supplied with a copy.

Preferential Delivery of Motor Cars.

The Association has now for some months been offering assistance to its members in order to enable them to obtain early delivery of motor cars. At the last meeting of the Medico-Political Committee it was reported that a good many cars had been supplied through the efforts of the Association, and that a number of letters of appreciation had been received. In this connexion the Ford Motor Company announce that the two-seater model is no longer available, as production of this type of car has ceased for the time being; preferential delivery of the touring car or the chassis can still be made. Members requiring assistance should, in the first instance, apply to the Medical Secretary, 429, Strand, for a form on which to state particulars of their order.

Fees for St. John Ambulance Lectures.

The Medico-Political Committee at its last meeting considered the statement of a member that, having undertaken to give a course of St. John Ambulance lectures for a fee of five guineas, he found that the course had been extended from five lectures to six with no addition to the fee. The Committee gave instructions that a letter should be written to the Secretary of the St. John Ambulance Association asking whether the correspondent had been rightly informed and whether the central body was aware that no additional remuneration was being offered for the extra lecture. The Medical Secretary has been officially informed that the course has been extended from five lectures to six; that it was presumably due to an oversight that no alteration had been made in the fee; but that steps were being taken to amend the regulations. The official fee in future will therefore be at the rate of one guinea a lecture, which is in accordance with the approved policy of the Association. Members who have undertaken to give courses of lectures may think it well to call the attention of the local secretary of the St. John Ambulance Association to this fact.

British Medical Association Lecture at Edinburgh.

Dr. Alexander Blackhall-Morison will lecture to the Edinburgh Branch of the British Medical Association on Friday afternoon, February 27th, on "The passive mechanical factor in heart disease, its influence and management."

Meetings of Branches and Divisions.

HONG KONG AND CHINA BRANCH.

THE annual general meeting of the Branch was held on November 13th, 1919, when the following officers were elected:

President: Professor Earle. *Vice-President:* Professor Digby. *Honorary Secretary:* Dr. O. Marriott. *Honorary Treasurer and Librarian:* Dr. J. H. Sanders. *Council:* Deputy Surgeon-General Woodwright, R.N., Major Harding, R.A.M.C., Dr. W. W. Pearce, Dr. Strahan, Dr. Thomas.

It was decided to resume the monthly scientific meetings suspended during the war and to restock the library with works of reference.

It was resolved to enter into negotiations with the China Medical Missionary Association, with a view to holding a joint general and scientific meeting of the profession in Hong Kong in 1921.

STAFFORDSHIRE BRANCH: SOUTH STAFFORDSHIRE DIVISION.

A MEETING of the Division, to which all practitioners were invited, was held at Wolverhampton on February 3rd, when Dr. CRAIG was in the chair.

The revised rules governing procedure in ethical matters of a Division not itself a Branch were adopted.

The annual report and financial statement of the Division were received and approved.

Dr. RIDLEY BAILEY reported on the conference of Local Medical and Panel Committees. It was resolved:

That this meeting of practitioners in the area of the South Staffordshire Division of the British Medical Association resolves that all medical fees for private practice shall be increased by at least 50 per cent. on pre-war charges.

This decision was directed to be communicated to the local press.

The HONORARY SECRETARY brought up the question of action to be taken by the Association in cases of national emergency, and he was instructed to interview the Chief Constable.

The Executive Committee was requested to draft a scheme to allow of holidays for the practitioners in the area by arranging that those who were not on holiday should do the work of the practitioners who were away.

Association Notices.

ELECTION OF REPRESENTATIVE BODY OF THE ASSOCIATION, 1920-21.

Constituencies in Representative Body.

THE list of the provisional **Home Constituencies** for election of the Representative Body, 1920-21, appeared in the SUPPLEMENT of January 24th, page 21.

As intimated to all the **Oversea Bodies**, the Council has made each Oversea Division and Division-Branch, possessing an Honorary Secretary and the necessary organization, an independent Constituency.

Election of Representatives and Deputy-Representatives.

The Representatives and Deputy-Representatives in the Representative Body must be elected not later than May 28th, and their names notified to the Medical Secretary not later than June 4th.

The Council draws special attention to the fact that it is entirely within the discretion of each Constituency to decide whether the election of its Representative(s) and Deputy-Representative(s) shall be carried out **by General Meeting of the Constituency, or by postal vote.**

Date of Annual Representative Meeting at Cambridge.

The Annual Representative Meeting at Cambridge will begin on Friday, June 25th, at 10 a.m.

Motions for the Annual Representative Meeting.

Notices of Motion by Divisions, Constituencies, or Branches, for the consideration of the Annual Representative Meeting, proposing to make any addition to, or any amendment, alteration or repeal of any Regulation or By-law, or to make any new Regulation or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, must be published in the JOURNAL not later than April 24th, and for this purpose should be received by the Medical Secretary **not later than April 10th.**

ELECTION OF COUNCIL OF THE ASSOCIATION, 1920-21.

THE list of the Groups of Branches in the United Kingdom for election of twenty-four members of the Council, 1920-21, and **Nomination Form**, appeared in the SUPPLEMENT of January 24th, page 22. Separate Nomination Forms will, if desired, be forwarded on application by Branches, Divisions, or Members.

The list of the Groups of **Oversea Branches** was published in the SUPPLEMENT of October 11th, 1919, p. 79.

BRANCH AND DIVISION MEETINGS TO BE HELD.

EDINBURGH BRANCH.—Drs. John Stevens and John Eason, Honorary Secretaries, give notice that the Winter Clinical Meeting of the Edinburgh Branch will be held in the Royal Infirmary on Friday, February 27th. All members of the profession are cordially invited. The Museum will be open from 11 a.m. Special Clinics will be held during the forenoon, and the Clinical Meeting at 3.15 p.m. At 5 p.m. Dr. Alexander Blackhall-Morison (London) will lecture on **The Passive Mechanical Factor in Heart Disease: its Influence and Management.** Dinner at 6.30 p.m. in the Hall of the Royal College of Physicians, 9, Queen Street; morning dress; dinner ticket, 10s. 6d. Members of the Branch are requested to notify, not later than February 23rd, whether or not they intend to be present.

CONFERENCES OF VARIOUS MEDICAL BODIES.

APPENDED is a report of certain conferences which took place in May, June, and July last, between representatives of the following bodies: The Association of Panel Committees (on whose initiative the British Medical Association called the conferences), the Medico-Political Union, the Medical Parliamentary Committee (now the British Federation of Medical and Allied Societies), the Medical Women's Federation, the National Medical Union (whose representative was, owing to a postal mishap, only able to be present once), and the British Medical Association.

The report is agreed as being a correct version of the proceedings by all the bodies concerned except the Medico-Political Union, whose desire to secure certain alterations has materially delayed the issue of the report. The Secretary of that body said he considered the draft report submitted to him on October 9th, 1919, "miscading and conveying no information likely to assist the profession to form an opinion." The other bodies accepted the draft as an accurate record. On being pressed to state the alterations which his union desired, the Secretary asked that certain proposals put forward by Dr. Brackenbury should be stated in full. These proposals, as they emerged amended as resolutions of the Conference, are contained in paragraphs 6 and 7 of the report. The representatives of the British Medical Association in their anxiety to secure an agreed report took no exception to the setting out of Dr. Brackenbury's original proposals, though they considered it unnecessary because, as stated above, the practical outcome of them so far as the Conference was concerned, is already reported in paragraphs 6 and 7. They were, however, quite willing to consent to the publication of these suggestions as laid before the Conference. But they could not accept as a true statement the sentence which the Medico-Political Union desired to have inserted—namely, that the suggestions were "put forward by Dr. Brackenbury on behalf of the British Medical Association as alternatives to the suggestions made by the Medico-Political Union," because Dr. Brackenbury put his proposals before the Conference as a member of the Conference on his own initiative, and not speaking officially on behalf of the British Medical Association. Moreover, he made that position perfectly plain when he produced his proposals. The representatives of the British Medical Association objected therefore to any statement which would lead readers of the report to think that the line the Association proposed to take in the Conference had been laid down beforehand and was embodied in Dr. Brackenbury's proposals, when as a matter of fact the Association's representatives had been left by the Council with a free hand to do the best they could to achieve the objects for which the Conference was called—namely, "the discussion of common action and the possibility of securing the adherence of all medical organizations to the National Insurance Defence Trust." The representatives of the Medico-Political Union apparently could not believe that the representatives of the Association had been left to exercise their judgement as seemed to them best.

The Council considered the report on December 17th, 1919, and resolved that when it was published the following statement should accompany it:

(1) That in order to promote unity of purpose and common action, the representatives of the British Medical Association and of all the other organizations except the Medico-Political Union were willing to recommend for adoption a scheme for co-operation between medical organizations.

(2) That it was open to the Medico-Political Union to signify its adhesion to such a scheme.

(3) That as a condition of cessation of controversy with, and antagonistic action by, the Medico-Political Union, the Association's representatives at the Conference undertook to recommend to the Council that, subject to the working of the scheme, it be recognized as a possibility that in concerting common action in the case of a particular dispute with a Government department circumstances might arise which would justify such action being taken only by a professional organization registered as a trade union, and that the Medico-Political Union be recognized as the official body representing those members of the profession who wish to belong to a medical trade union. In view, however, of the fact that the Medico-Political Union

have officially intimated that these proposals would not satisfy them, and that they will not accept anything other than their own original proposals unaltered, the Council has not considered the recommendations of its representatives, and is of opinion that it would serve no useful purpose to take further action.

The last letters which passed between the Medical Secretary and the Secretary of the Medico-Political Union will show clearly the different conceptions which the two bodies held as to the spirit in which such a Conference should be conducted:

Medico-Political Union,
January 10th, 1920.

Dear Dr. Cox,

In reply to yours of the 6th inst., I would like to point out that the suggestions put forward by Dr. Brackenbury, a copy of which was handed to me, was headed "Suggestions for an arrangement between the British Medical Association and the Medico-Political Union." I was under the impression that Dr. Brackenbury was speaking on behalf of the Association. If I am now to understand that Dr. Brackenbury was on this Committee as an independent individual, making suggestions as such, I must admit that I was under a misapprehension. If such was the case, I fail to see why the Conferences were called. I certainly attended them as a representative of the Medico-Political Union and not in the capacity of a private individual. I clearly understood that the conclusions arrived at were subject to the approval or otherwise of our respective councils. Under the circumstances I fail to see where my alternative to paragraph 7 departs from the realm of fact.—Yours sincerely,

(Signed) A. WELPLY,
General Secretary.

British Medical Association,
January 13th, 1920.

Dear Dr. Welply,

I will make a final attempt to explain why I think your alternative to paragraph 7 would be misleading and untrue. On the instance of the Association of Panel Committees the British Medical Association called a conference to discuss certain suggestions which may be grouped under the head of the possibility of finding a basis for common action. It appointed certain representatives, leaving it to their judgement to act in the conference as seemed to them best. They had no detailed instructions, but were, of course, expected to report to the Association.

Dr. Brackenbury, in a desire to put down something which would serve as a basis for discussion, placed before the Conference (or rather the Committee which was appointed by the Conference) certain suggestions which he thought might meet the objects for which Dr. Stancomb had drafted certain propositions. Those suggestions were not put forward by him officially on behalf of the Association, but on his own initiative as a member of the Conference. Some of Dr. Brackenbury's propositions met with the approval of his colleagues, some of them did not, and in the discussion which occurred most of them were considerably modified.

We cannot be parties to any further delay, so I shall be glad to know whether you are prepared to accept the preamble to paragraph 7 as I stated it in the enclosure to my letter of December 23rd last; or whether we shall send the report enclosed in my letter of October 9th, and long ago agreed by all the other associations taking part in the Conference except your own, to those associations and to the profession, with a statement that it has been agreed by all the associations taking part in the Conference except the Medico-Political Union.—Yours faithfully,

(Signed) ALFRED COX,
Medical Secretary.

To this no reply was received.

REPORT AS TO THE RECENT CONFERENCES OF REPRESENTATIVES OF VARIOUS MEDICAL BODIES ON THE POSSIBILITY OF CO-OPERATION.

In accordance with a suggestion made by the Association of Panel Committees, the Council of the British Medical Association invited certain medical bodies to take part in a Conference for the following purposes:—

- (1) To discuss common action;
- (2) To endeavour to secure that the Advisory Council to the Ministry of Health should possess the confidence of general practitioners; and
- (3) To secure the adherence of the organisations taking part in the Conference to the National Insurance Defence Trust.

The following bodies accepted the invitation and were represented by the practitioners indicated:—

- | | | |
|----------------------------------|---|--|
| Association of Panel Committees. | { | Dr. H. J. Cardale.
Dr. Peter Macdonald.
Dr. B. A. Richmond.
Dr. J. P. Williams-Freeman. |
| Medico Political Union. | { | Dr. F. Coke.
Dr. G. A. Main.
Dr. E. H. Stancomb,
Dr. A. Welply. |

Medical Parliamentary
Committee (now British
Federation of Medical
and Allied Societies).

Medical Women's
Federation.

British Medical
Association.

Dr. C. Buttar.
Dr. A. Latham.
Dr. Jaue Walker.
Dr. A. S. Woodward,
C.M.G., C.B.E.
Dr. Dickinson Berry.
Dr. Janet Lane-Claypon.
Dr. Chalmers Watson,
C.B.E.
Dr. Ethel Williams.
Dr. J. A. Macdonald, LL.D.
(in his absence, Dr. G. E.
Haslip).
Dr. M. G. Biggs.
Prof. R. A. Bolam, O.B.E.
Dr. H. B. Brackenbury.
Dr. J. R. Drever.
Dr. T. W. H. Garstang.
Dr. Alfred Cox, O.B.E.

Owing to a mishap in the post the invitation to the National Medical Union was not delivered and no representative from that body was present until the last meeting, when Dr. R. Fielding-Ould attended.

There were three conferences, on May 6th, June 6th, and July 16th, 1919.

Dr. Garstang was appointed Chairman and Dr. Cox Secretary.

1. At the first meeting it was resolved that there should be an agreed report of the proceedings and that there should be no publication of the proceedings other than the agreed report, but that it would be open to every member of the Conference to report to the body appointing him, as he thought fit.

2. The Association of Panel Committees, as the body on whose initiative the Conferences were called, began by stating that they were anxious for united action in the profession and that there should be no waste of energy in internecine fighting. To this end they advocated the formation of a liaison Committee, and that in dealing with Government bodies and other important bodies joint deputations should represent the profession.

3. On behalf of the British Medical Association, it was pointed out that for years the Association had endeavoured, with considerable success, to bring about common action by including in its most important Committees, Sub-Committees and deputations representatives of various sectional organisations, such as the Medical Women's Federation, Society of Medical Officers of Health, Poor Law Medical Officers Association and others. The Insurance Acts Committee was a typical example of this policy of the Association.

4. The representatives of the Medico-Political Union stated that they wanted neither to injure nor to rival the British Medical Association, and submitted the following conditions by means of which they believed an understanding could be arrived at:—

(a) That there should be recognition of the trade union as a possible valuable adjunct in medical organisation.

(b) that the Medico-Political Union should be frankly recognised as the official body representing those members of the profession who wished to belong to a medical trade union;

(c) that the British Medical Association should recognise the Medico-Political Union as the agent for the profession in collective bargaining in the final resort, that is, if ordinary means of persuasion had failed and there was any question of refusing to accept or renew contracts or anything which might be construed as being "in restraint of trade," the matter should be dealt with by the Medico-Political Union;

(d) that further conferences be held to define limitations of work and prevent overlapping; and

(e) that there shall be mutual agreement in important matters before any action is taken by way of joint deputations.

5. At this point a Committee was set up to consider and report on the best ways of promoting common action, including the advisability of forming a liaison committee. The Committee consisted of—

Dr. Richmond (Association of Panel Committees).
Dr. Welply (Medico-Political Union).
Dr. Buttar (Medical Parliamentary Committee).
Dr. Jaue Walker (Medical Women's Federation).
Dr. Brackenbury } (British Medical Association).
Dr. Garstang

with Dr. Cox as Secretary.

6. The Committee met twice and presented the following recommendations to the Conference:

A. That the British Medical Association and the Medico-Political Union alike undertake that neither body shall attempt to dissuade any medical practitioner from joining the other body.

B. That the British Medical Association and the Medico-Political Union alike undertake each to communicate to the other any decisions of their Committees as to medico-political policy that may be arrived at, and to allow time for a reply before any public action is taken; that if such reply asks for a conference on any particular matter such conference shall be arranged with the Committee concerned.

C. That if the British Medical Association is arranging a deputation to a Government Department on any matter of medico-political policy, it shall invite the Medico-Political Union to send representatives on such a deputation; that if the Medico-Political Union desires that any deputation should go to a Government Department on such a matter it shall inform the British Medical Association, and shall wherever possible leave the British Medical Association to arrange such a deputation.

(Dr. Welply, on behalf of the Medico-Political Union, dissented to the last part of this recommendation.)

D. That the British Medical Association and the Medico-Political Union recognise that there is an important divergence of view between them on the subject of professional trade unionism; controversy on other matters of a medico-political character shall be avoided unless, after the procedure outlined in Recommendations B. and C. above an important divergence of view remains.

E. That if any question arises which involves a struggle between the profession and the Government or a Government Department, the mutual consent of the British Medical Association and the Medico-Political Union shall be required before such struggle is entered upon; measures for conducting the struggle shall be concerted between them and common action taken, as far as possible.

F. (i.) That the Association of Panel Committees should recognise the Insurance Acts Committee as a suitable body to represent the profession in negotiation with the Government on matters of Insurance Act administration, (a) so long as that Committee is appointed for this purpose by the Conference of Local Medical and Panel Committees, (b) so long as there is not less direct representation of Local Medical and Panel Committees than exist at present, and (c) if it be recognised as desirable that the work of the Insurance Acts Committee should be organised as far as possible as a separate department of the British Medical Association;

(ii.) That the Association of Panel Committees shall recommend its constituent bodies to support the National Insurance Defence Trust.

G. That in case of dispute between the profession and the Government or a Government Department, the British Medical Association and any other medical organisations that have accepted the arrangements set out in recommendations B and C as applicable to them shall concert measures for conducting the dispute and common action shall, so far as possible, be taken.

H. That the question of forming a liaison Committee be deferred until it be ascertained what medical organisations are willing to enter into the arrangements suggested in B, C and G above, and that if such a Committee be formed, its duty shall be to facilitate the working of such arrangements.

7. The Committee also recommended that the following suggestions, put forward on behalf of the British Medical Association as alternatives to the suggestions made by the Medico-Political Union (see par. 4), be reported in full to the profession:—

(i.) That the Medico-Political Union recognise the Insurance Acts Committee as a suitable body to represent the profession in negotiation with the Government on matters of Insurance Act administration so long as that Committee is appointed for this purpose by the Conference of Local Medical and Panel Committees;

(ii.) That if any question arises which involves a struggle between the profession and the Government or a Government Department, the mutual consent of the British Medical Association and the Medico-Political Union shall be required before such struggle is entered upon; measures for conducting the struggle shall be concerted between them and common action taken as far as possible;

(iii.) That the Medico-Political Union shall do nothing to dissuade Panel Committees or practitioners from supporting the National Insurance Defence Trust, and the British Medical Association will recognise that any levy which the Medico-Political Union may make on its members from time to time is, in the case of such members, fully equivalent to a subscription to the Trust.

The representative of the Medico-Political Union during the course of the proceedings of the Committee indicated that that body would be satisfied with nothing short of the proposals made on its behalf (par. 4), and withdrew from the meeting when it was found that these proposals were not acceptable.

8. The Conference met again on June 6th and July 16th to consider the recommendations of the Committee and passed the following resolutions:—

(a) That there should be recognition of the possible value of a trade union as an adjunct to medical organisation

(b) That the British Medical Association and the Medico-Political Union shall alike undertake that neither body shall attempt to dissuade any medical practitioner from joining the other body.

(c) That the Medico-Political Union should be recognised as the official body representing those members of the profession who wish to belong to a medical trade union.

(d) That if any question arises which involves a struggle between the profession and the Government or a Government Department there shall be consultation between the British Medical Association and the Medico-Political Union before such struggle is entered upon; measures for conducting the struggle shall be concerted between them and common action taken as far as possible.

(e) That further conferences be held to define limitations of work and to prevent overlapping.

(f) That in case of dispute between the profession and the Government, or a Government Department, the British Medical Association and any other medical organisations that have accepted the arrangements set out in Sections B and C of paragraph 6 above as applicable to them, shall concert measures for conducting the dispute, and common action shall so far as possible be taken.

(g) That this Conference, feeling that a Liaison Committee may be helpful in facilitating common action, resolves that the question of forming such a Committee be referred to the constituent bodies after the conclusion of the conferences, with a recommendation that they should consider whether the present conference might constitute such a Liaison Committee.

(h) That it be recognised as a possibility that in concerting common action in the case of a particular dispute with a Government Department, circumstances might arise which would justify such action being undertaken only by a professional organisation registered as a Trade Union.

9. The representatives of the Medico-Political Union stated that sub-paragraph (d) above, was not acceptable as the equivalent of their proposition (sub-paragraph (c) of paragraph 4 above) which expressed their conviction as to the proper way of conducting collective bargaining and that the following matters must be left to the Medico-Political Union (a) the steps taken in regard to practitioners who declined to take action in support of the professional bodies between which there had been consultation and (b) any question of breaking contracts. In these circumstances the Medico-Political Union held that the British Medical Association must stand aside.

10. On behalf of the British Medical Association the theoretical possibility that there might be a stage at which action could best be taken by a Trade Union was admitted, but the opinion was held that every case must be taken on its merits and that the Association could not tie its hands in advance.

11. On the discussion of sub-paragraph (h) of paragraph 8 above the representatives of the Medico-Political Union said that body could accept nothing less than their original proposition, namely:—

That the British Medical Association should recognise the Medico-Political Union as the agent for the profession in collective bargaining in the final resort, that is, that if ordinary means of persuasion had failed and there was any question of refusing to accept or renew contracts or anything which might be construed as being "in restraint of trade" the matter should be dealt with by the Medico-Political Union.

If this were not granted in principle the Medico-Political Union was not prepared to go further.

12. At this stage it was agreed that the members should report the findings of the Conference to the bodies they represented and that the calling of a further conference would depend on the attitude taken by these bodies.

13. The following correspondence with the Medico-Political Union has since taken place:—

Medico-Political Union,
September 27th, 1919.

Dear Sir,

I am instructed by my Council to inform you that they learn with regret that the British Medical Association refuses to accept the proposals for unity of action stated by Dr. Stancomb on behalf of the Medico-Political Union.

I am further to inform you that it is the wish of my Council that a full report of the negotiations be circulated immediately to every member of the profession.

Yours faithfully,
(Sgd.) A. WELPLY,
General Secretary.

Dr. Cox.

British Medical Association,
October 3rd, 1919.

Dear Sir,

I regret that your letter of the 27th ult. has not received an earlier answer, but it arrived at a time when I was hung up in Wales by the railway strike. I shall place it before Dr. Garstang, Chairman of the Conferences, as soon as possible.

Are we to understand that your Council has definitely decided to accept nothing less than Dr. Stancomb's original proposition? One can infer that it has done so from your letter, but I think it would be more satisfactory if we could be informed whether your Council declines to accept the suggestions for a working arrangement that we made in the Conference and adheres rigidly to the proposals put forward by Dr. Stancomb.

Yours faithfully,
(Sgd.) ALFRED COX,
Medical Secretary.

Dr. A. Welply.

Medico-Political Union,
14, Gray's Inn Square, W.C.1.
4th October, 1919.

Dr. A. Cox, O.B.E.

Dear Sir,

In reply to yours of the 3rd instant, my Council are not willing to accept anything less than Dr. Stancomb's original proposition.

Yours faithfully,
(Sgd.) A. WELPLY,
General Secretary.

INSURANCE.

SCOTTISH PANEL CONFERENCE.

A CONFERENCE of Representatives of Scottish Local Medical and Panel Committees was held in Edinburgh on February 11th. Of a total of fifty-six insurance areas in Scotland thirty-eight were represented. DR. CUTHBERT NALEN (Greenock), Chairman of the Insurance Acts Subcommittee, presided.

The Draft Regulations for Scotland (1920) were submitted, and the following resolutions were passed:

1. That this Conference do express a general approval of the New Regulations for 1920, and requests the Insurance Acts Subcommittee to endeavour to secure such emendations thereto as may be approved by this Conference.
2. That the decisions of the British Conference on matters of principle should be accepted by this Conference.

The arrangements for transfer of practices were accepted under protest, and objection was taken to Section 8 (4) of the Terms of Service, which provides that:

Such accommodation shall not, except with the consent of the Committee or, on appeal, of the Board, be in premises occupied by a chemist,

and

the practitioner shall not, in the matter of accommodation, discriminate between insurance patients and other patients.

It was also resolved to protest strongly against the proposal that a portion of the cost of the Central Checking Bureau may be charged to Panel Committees; and to ask that the words "and of his treatment of them" be deleted from Section 8 (11) of the Terms of Service, and the words "such diseases as may from time to time be prescribed" from 8 (12).

On the question of remuneration letters were submitted from the Board of Health, intimating their intention to postpone the introduction of the new Regulations in

Scotland until July 1st, and offering a capitation payment of 11s. to date from January 1st, pending the decision of the Arbitration Board, when the question will be reopened.

The Conference resolved:

That the Conference accept the proposal to postpone the date of operation of the New Regulations.

That the Conference accept the offer of a capitation fee of 11s. to date from January 1st, 1920.

That the Insurance Acts Subcommittee be authorized to negotiate for a new capitation rate from April 1st, 1920, and that they be authorized to accept on behalf of the profession any sum not less than that fixed by the Arbitration Board for England.

That in the event of a less sum being offered by the Board of Health, the matter be referred to the Panel Committees.

Considerable discussion took place on a motion dealing with mileage (that the mileage grant should be increased by not less than three times the present figure for those over three miles; and that, further, a new grant should be allowed for all insured persons between two and three miles), and it was finally resolved:

That this Conference express its sympathy with the rural practitioners, and that the Insurance Acts Subcommittee be asked to endeavour, by the procuring of statistics and facts and placing these before the medical board, to get an adequate mileage grant, failing which they place the whole matter before the Panel Committees.

LIMITATION OF LISTS.

THE following Circular Letter (I.C.L. 293) to Panel Committees and Insurance Committees, with regard to the limit of insured persons on doctors' lists under Article 15 (2) of the Medical Benefit Regulations, 1920, was issued by the Ministry of Health on January 19th, 1920:

I am directed by the Minister of Health to refer to paragraph 4 (b) of Memorandum 261/A.C., in which it is pointed out that while the limit of 3,000 persons in Article 15 (2) is a maximum limit which must in no case be exceeded, it is not in any sense to be regarded as a normal figure, and that it is for the Insurance Committee and Panel Committee to fix such maximum for the area as a whole, or for different districts within the area, as they may think fit.

The Medical Secretary of the British Medical Association on January 21st addressed the following letter to the Secretary of the Ministry of Health:

I beg to thank you for sending me a copy of your circular letter to Panel and Insurance Committees (I.C.L. 293). I must say I am surprised and disappointed that this letter should have been sent because, as might have been expected, it is being looked upon by the Panel Committees as an encouragement to Insurance Committees to reduce the limit of persons on doctors' lists to below 3,000, and I find from my correspondence that this is being strongly resented.

The normal maximum having been settled by negotiation, together with a regulation which gives Insurance and Panel Committees together the power to fix a lower maximum, it is felt that they might very well have been left to deal with this matter in their own way, without having received a circular which directs pointed attention to their power to fix a lower normal figure.

To this Mr. R. W. Harris, Assistant Secretary to the Ministry of Health, replied on January 22nd as follows:

With reference to your letter of yesterday's date with regard to the circular letter I.C.L. 293 on the subject of the limit of persons on doctors' lists, I am directed by the Minister of Health to remind you that, in the discussions last autumn with your Committee, it was made clear that the Minister had agreed to the insertion of so high a limit as 3,000 in the Regulations with some reluctance and on the understanding that it was in no sense to be regarded as a normal maximum. This was also made clear at the time of the issue of the advance copies of the Regulations by the insertion in the Regulations of the words "in no case" ("the limit shall in no case exceed 3,000 insured persons") in the proviso to Regulation 15 (2), and by the issue of the paragraph 4 (b) in Memorandum 261, issued on October 31st last, of which a copy was sent to you at the time, and of which a further copy is enclosed herewith.

In view of the lapse of time since the original Memorandum was issued, it was felt necessary to issue I.C.L. 293 as a reminder in order that the true position in regard to this important question, which was made clear in the earlier Memorandum, should not be overlooked.

In answer to this, Dr. Cox wrote on February 4th:

In reference to your letter of the 22nd ult., I am instructed to state that I laid it and my letter to which it was a reply before the Insurance Acts Committee at its meeting on Thursday last, and was directed to forward the following observations.

The Committee is aware that the representatives of the Ministry have always expressed a preference for a lower maximum than 3,000 where this could be brought about. The Insurance Acts Committee was of opinion that there are exceptional doctors, or doctors exceptionally situated, who are able to undertake a list of 3,000 or over and do their duty to

their patients, but it was quite willing that the power to fix a lower maximum should be left to local option. The Committee was, and still is, of opinion that the highest possible maximum having been laid down as 3,000, the question as to whether there should or should not be a lower maximum in any area might well have been left to the free determination of the local authorities concerned.

The Committee considers that the marked and repeated way in which the Ministry drew attention to the fact that a lower maximum might be fixed, and the action that it took in sending back schemes in which the 3,000 limit had been agreed upon was not consistent with the rights of self-government, within wide limits, which local authorities are supposed to exercise in this country.

CORRESPONDENCE.

Statistics of Panel Attendances in Manchester and Scotland.

SIR.—The figures produced by Dr. D'Ewart are so persistently brought by our Committee to the notice of the experts of the Health Ministry that some analysis of them in relation to other figures in possession of these officials may be of interest to readers of the JOURNAL.

The population of Manchester in 1913 numbered 730,976, of whom 255,000 were insured. The Insurance Act came into operation on January 15th, and by December 31st these persons, all between 16 and 65 years of age and capable of work recently, had received 1,500,000 attendances, or 6.12 per annum per unit. No other statistics on a similar scale having been published in this country, it is necessary for comparison to refer to those of Scotland, which were presented to Parliament in 1917. The attendances in twenty-five Scottish burghs in 1913 averaged 3.24 per annum per unit; in Glasgow, a town perhaps comparable to Manchester, but 3.15. When one comes to investigate causes of excessive attendance in Scotland, the counties of Linlithgow and Lanark are conspicuous with an average attendance, over three years, of 4.28 and 4.18 per annum. I have made inquiry in respect to Lanark. It is far the most densely populated county, with population in 1913 of 1,447,113 to but 562,821 acres; moreover, this population consists largely of miners, who take heavy risks. It is, further, the habit of doctors to visit miners' "rows" regularly and fairly often, and see all cases, including chronic ones, who cannot work. This is no doubt an excellent custom, but it raises the rate of attendances—and particularly of visits—notably, so that 150 such "visits" may be paid in a day by a single doctor. Probably similar conditions obtain in the adjoining county of Linlithgow, whereas in two other neighbouring counties—Dumfries and Renfrew—the rate was 2.36 and 2.76, and in the strictly rural districts of Ross with Cromarty and Inverness but 1.55 and 1.71, the average of all counties being 3.10. A point of great interest is the small difference between counties and boroughs in this respect, although the case-values indicate a far larger number of insured persons under treatment in the latter.

Two explanations are probable: first the depressing effect on the rural statistics of counties like Lanark and Linlithgow, with large mining populations, case-value of urban type, and altogether abnormal attendance rate; and secondly, absence of hospitals, so that cases however serious requiring many visits have nevertheless to remain at home. In such English counties (non-mining) as are well provided with hospitals, attendance rate will probably be lower than the average of Scottish counties for these two reasons, but unfortunately our attendance statistics are not available. In rural districts everywhere the proportion of visits is naturally far higher than in towns, and about equals the consultations.

As regards towns, Kirkcaldy heads the list with 5.16 attendances, contrasting with 1.96 in Edinburgh. An exceptional feature is that, in the former, visits exceed consultations, being in 1915 in proportion of 3 to 2, whereas in Glasgow 80 per cent. and, according to Dr. Hoffman, in Manchester 85 per cent. of attendances are surgery consultations. I have been unable to discover the cause of this anomaly, which must press very hardly on the panel doctors in Kirkcaldy. Speaking generally, I gather that a large proportion of textile workers brings up attendances in towns. Kirkcaldy, with the lowest case-value in Scotland, has perhaps excess of those. Nevertheless, the total of attendances in Kirkcaldy does not attain the level reached by Manchester in 1913, and whatever be the explanation of the latter, the sequel was noteworthy. In 1913 the case-value in Manchester stood high for a large town, namely, 90.76, as compared with 80.04 in Birmingham and 74.66 in Bristol. Scottish case-values commenced in 1914, and on the same scale Glasgow yields 80.52 and Kirkcaldy 62.34. Now case-value is obtained by dividing the Panel Fund of a district by the number of insured persons who receive treatment, and standardizing

the result to the average of 100, county values being generally over and borough under 100. Yet in 1914 the case-value of Manchester fell abruptly to 56.53, absolutely the lowest on record anywhere, also in Salford it fell from 90.76 to 64.73, and these two have remained at the bottom till records ceased in 1916, no other towns exhibiting similar misfortune—indeed, in neighbouring Liverpool, Rochdale, Bolton, Preston, and St. Helens, it rose conspicuously; in fact, a rise was the general experience.

These figures indicate that, not only did panel doctors in Manchester receive per attendance for 1913 but half what was obtained by those in Glasgow, and had to send in accounts for it too, but that, since that year, they have had to attend nearly double the number of patients to that attended in Liverpool, etc., for no larger total sum. They were, moreover, heavily mulcted to repair the great overdraft upon the drug fund created by their 6.12 per annum attendances of 1913. Those who consider that payment per attendance is much more advantageous than payment per capitation should take special note of this experience in Salford and Manchester. It is not surprising that some doctors have left the panel, nor that this district alone in 1917 advocated state rather than panel service.—I am, etc.

Chichester, Feb. 8th.

G. C. GARRATT.

Reduction of Panels.

SIR,—As a panel practitioner I have carefully read Circular M.C. 2 and the provisions as therein laid down for the reduction of redundant panels to 2,500 and the subsequent allocation of rejected persons. I can clearly foresee that a great amount of friction and considerable inefficiency of working will be the result if the methods as at present indicated are adhered to. I have no criticism to make of the regulation limiting panels to 2,500, but I have of the method of reduction and allocation for these reasons:

The Regulations enable the practitioner with a redundant panel to reduce it by rejecting persons of his own selection. Naturally he will select the old and chronic invalids, the troublesome and undesirable, he will thus (supposing he has a panel of 3,000) be able to reduce his list (and remuneration) by 17 per cent., and at the same time reduce his work by anything up to 40 per cent. or 50 per cent. On the other hand, the practitioner with a relatively small panel (say 1,000) may have 200 undesirable patients allocated to him—result, increase of remuneration by 20 per cent. and work increased by 60 per cent. I do not think I am understating the probable result of these two operations; at any rate I am sure that if I had to reduce my panel by 10 per cent. by relinquishing a number of selected persons I could reduce my work by 40 per cent. Ordinarily, no good insurance practitioner would wish to shirk attendance on a proper proportion of undesirable persons, yet it is manifestly unfair that the doctor with the large panel should perforce be made to relinquish a large part if not all of them and the doctor with the small panel be made to take them on. A vicious circle will soon be set up as the small panel doctor will in self-defence have to reject from his list twice yearly as many undesirables as he can. This can do no good to any one and will make for decreased efficiency and endless trouble and friction.

The remedy I would suggest and which will ensure a proper proportion of such persons on all doctors' lists and at the same time safeguard the principle of free choice of doctor by patient and patient by doctor is that redundant panels be reduced by closing the panel to all new patients and allowing it to diminish by a natural wastage (deaths, lapses, removals, etc.). This natural wastage is, I estimate, 12 to 15 per cent. per annum, and would in a year or two reduce a redundant panel to 2,500. If a panel does not thus automatically reduce itself within a reasonable time—say, eighteen months to two years—the procedure as laid down in paragraph 6 (5) might then well be carried out.

I am in hopes that it is not too late for the methods as now laid down to be revised by the Ministry of Health.—I am, etc.,

Derby, Feb. 14th.

H. G. W. DAWSON.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty:—Surgeon Commanders: G. Carlisle to the *Drogon*, E. L. Atkinson to the *President*, additional, for B.N. College, Greenwich; R. F. McMahon to the *Antrim*, on commissioning; J. C. Brangan, O.B.E., to R.N. Hospital, Malta; C. J. E. Cock to the *Vulcan*. Surgeon Lieutenants: G. L. Stanley to the *Yarmouth*, L. W. Gemmill to the *Merlin*, R. J. Inman to R.M.A., Eastney, H. F. Stephen to the *Castor*, W. G. Thwaytes to the *Fisgard*, Surgeon Lieutenant (temporary) J. Kirker to the *Petersfield*, on commissioning.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Temporary Lieut.-Colonel J. F. Haswell, V.D. (Colonel T.F.), relinquishes his temporary rank on ceasing to be employed in the Army Medical Service (December 2nd, 1919, substituted for notification in the *London Gazette*, January 22nd, 1920).

Lieut.-Colonel H. M. Nicholls retires on retired pay.

Major W. Tibbits is placed on retired pay.

Major R. G. H. Tate to be temporary Lieutenant-Colonel whilst specially employed.

The following Majors relinquish the acting rank of Lieutenant-Colonel: R. C. Wilson, H. W. Farebrother, G. A. K. H. Reed, (Brevet Lieut.-Colonel) G. W. G. Hughes.

The following relinquish the acting rank of Major: Captains W. E. Adam, M.C., J. C. Sproule, W. H. S. Burney, A. L. Stevenson, temporary Captain and Brevet Major R. Bruce-Low, temporary Captains A. W. Comber, J. R. Pate, R. Heaton, G. T. Foster-Smith, E. B. Barton, F. R. Barwell, A. G. Anderson.

Captains to be acting Majors: G. D. Harding (October 28th, 1918, substituted for notification in the *London Gazette* of October 27th, 1919), W. T. Graham, O.B.E. (from January 4th to June 13th, 1918), F. A. Robinson, M.C., and E. P. A. Smith, O.B.E., M.C. (from January 4th to August 13th, 1918), R. W. Viot (from February 4th to August 13th, 1918), T. Young (June 12th, 1919), H. A. Sandiford, M.C. (from July 12th to August 18th, 1919).

The notification in the *London Gazette* of January 23rd regarding Captain G. H. Stacke is cancelled.

To be temporary Captains: H. R. McNair and H. H. Perry, late C.A.M.C.

The following officers relinquish their commissions:—Temporary Majors and retain the rank of Major: R. H. J. Swan, O.B.E., S. M. Cox, R. L. Davies. Temporary Captain (acting Major) W. N. Parker, D.S.O., and is granted the rank of Lieutenant-Colonel (December 9th, 1919, substituted for notification in the *London Gazette*, January 15th, 1920). Temporary Captain G. L. Leggat, O.B.E., and is granted the rank of Lieutenant-Colonel. Temporary Captains and are granted the rank of Majors: H. H. Sampson, O.B.E., M.C., J. Porter (March 13th, 1919, substituted for notification in the *London Gazette*, April 14th, 1919), C. D. Coyle (November 11th, 1919, substituted for notification in the *London Gazette*, December 4th, 1919), J. Rodger, M.C., A. L. Lockwood, D.S.O. M.C., E. F. C. Dowding, W. H. Clements. Temporary Captains and retain the rank of Captain: P. Carroll, S. Forrest, N. F. Graham, M.C., H. M. MacKenzie, A. J. McCreadie, M.C., I. Feldman, F. C. Robbs, M.C., N. J. Judah, R. T. Todd, W. H. Osullivan, E. E. Lightwood, W. H. Sheffield (May 11th, 1919, substituted for notification in the *London Gazette*, June 20th, 1919), J. F. Allen, J. Caton-Shelmerdine, E. R. Griffiths, A. G. Price, O. D. Fairley, T. M. J. Stewart, B. V. Ward, J. R. K. The son, O.B.E., A. B. Hargreaves, C. K. Sylvester, E. A. Saunders, J. W. E. Cole, N. I. Sinclair, E. K. Gawn, N. B. Capon, R. C. Cooke, D.S.O., M.C., P. C. West, W. E. Fetherstonhagh, T. L. Clark, H. S. De Boer, M.C., G. W. Smith (on ceasing to serve with the Springfield War Hospital), C. E. Waldron, O. F. D. Airth, C. W. S. Davies-Jones, J. C. Waltham, J. McI. Falkiner.

ROYAL AIR FORCE.

MEDICAL BRANCH.

Flying officers to be Flight Lieutenants: T. Montgomery (August 19th, 1919), C. F. Eminson, R. D. Jones.

Transferred to the unemployed list: Captains S. J. Moore (February 12th, 1919), D. Guthrie (March 8th, 1919), Lieutenant J. Stark (February 13th, 1919).

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Captains relinquish the acting rank of Major: T. McEwen, M.C. (May 8th, 1919, substituted for notification in the *London Gazette*, January 24th, 1920), F. G. Lescher, M.C., J. Kennedy, G. T. Mulally, M.C.

Captain B. W. Jones relinquishes his commission on account of ill health caused by wounds, and retains the rank of Captain.

Lieutenants relinquish their commissions and retain the rank of Lieutenant: R. Graham (on account of ill health contracted on active service), C. L. Hewer (on account of ill health).

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Captains A. Mitchell and H. W. Read are seconded under paragraph 112 T.F. Regulations.

Captain G. A. Williamson is seconded for service with the Aberdeen University Continent, Senior Division, O.T.C., and is appointed to command a unit, February 9th, 1919.

Captains (acting Majors) relinquish the acting rank of Major on ceasing to be specially employed: C. G. Strachan, M.C., B. M. Footner, M.B.E., A. E. P. McConnell, F. R. Humphreys, M. Coplans, O.B.E., D.S.O., A. R. Muir.

Captain (acting Lieut.-Colonel) O. W. D. Steel, M.C., relinquishes the acting rank of Lieut.-Colonel on ceasing to be specially employed.

Captains F. Roberts, C. P. C. Sargent, and J. E. Lascelles are restored to the establishment.

Captain H. B. Porteus is seconded for service with the R.A.F. Lieutenant P. W. G. Sargent, C.M.G., D.S.O., to be Captain, with precedence next below Captain C. C. Fitzgerald, M.C., April 1st, 1915.

1st *London Sanitary Company*.—Captain A. G. Harrington is restored to the establishment.

2nd *London Sanitary Company*.—Lieutenant A. S. Reeves to be Captain.

1st *Southern General Hospital*.—Major (acting Lieut.-Colonel) W. Kirkpatrick relinquishes the acting rank of Lieutenant-Colonel on ceasing to be specially employed.

3rd *Southern General Hospital*.—Major L. M. Guilding is restored to the establishment. Captain (acting Major) R. Ritson relinquishes the acting rank of Major on ceasing to be specially employed, and is restored to the establishment.

2nd *South-Western Mounted Brigade Field Ambulance*.—Captain (temporary Major) J. M. Dupont relinquishes the temporary rank of Major on ceasing to be specially employed (July 19th, 1916).

2nd *Western General Hospital*.—Major (acting Lieut.-Colonel) A. Wilson relinquishes the acting rank of Lieutenant-Colonel on ceasing to be specially employed.

Attached to Units other than Medical Units.—The announcement regarding Alexander Stewart which appeared in the *London Gazette* of January 8th, 1916, is cancelled.

Superintendency for Service with Officers' Training Corps.—F. C. Purser (Major in Army) to be Captain for service with medical unit, Royal College of Surgeons, Ireland, O.T.C.

OVERSEAS CONTINGENTS.

SOUTH AFRICAN MEDICAL CORPS.

The following Lieutenant-Colonels relinquish their commissions on ceasing to be employed, and retain the rank of Lieutenant-Colonel: H. Usmar, O.B.E., G. R. Thomson, C.M.G.
Temporary Captain M. N. Adams relinquishes his commission on ceasing to be employed, and retains the rank of Captain.

DIARY OF SOCIETIES AND LECTURES.

HUNTERIAN SOCIETY, Apothecaries' Hall, Water Lane, E.C.—Wednesday, 9 p.m. Presidential Address by Dr. W. Langdon Brown: Hunter, Gaskell, and the Evolution of the Nervous System.
MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Monday, 8.30 p.m.: Surgical Treatment of the Later Stages of Gunshot Injuries of the Chest and of Empyema, by Sir Charters Symonds, K.B.E., C.B.; After-results of Certain Surgical Operations, by Percy Montague Smith, M.D., F.R.C.S.
ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.—Thursday, 5 p.m., First Milroy Lecture (Dr. Aldo Castellani, C.M.G.): Higher Fungi in relation to Human Pathology.
ROYAL SOCIETY OF MEDICINE.—Section of Otolaryngology: Monday, 8 p.m., Clinical Evening (Cases at 7.45 p.m.). Section of Medicine: Tuesday, 5.30 p.m., Early Manifestations of Scourvy, by Colonel Raoum Pickard and Dr. G. W. Lloyd. Some Deficiency Diseases and Leprosy, by Dr. S. Dutton. Social Evening, Tuesday, 8.30 p.m.: Mr C. E. Wallis will speak on the History of Artificial Teeth, including the gold bridge work of the ancient Etruscans. Objects of historical interest will be exhibited in the Library. Music and light refreshments. Section of Electro-Therapeutics with the Röntgen Society and the Institution of Electrical Engineers: Thursday, 5 to 6.45 p.m., High Tension Transformers and Alternating Currents, by Dr. Reginald Morton, Major C. E. S. Phillips, and Mr. R. S. Wright, M.L.E.; 8.15 to 10 p.m., Discussion. Exhibition of Apparatus. Section for the Study of Disease in Children: Friday, 4.30 p.m., Discussion on the Influence of Accessory Food Factors in Infant Feeding, to be opened by Dr. Mellanby; to be followed by Professor Noel Paton, Dr. C. J. Martin, Dr. E. A. Barton, Dr. Robert Hutchison, and Dr. E. Cantley. Section of Epidemiology and State Medicine: Friday, 8.30 p.m., Investigation of the Periodicity of Epidemics of Whooping-cough from 1870-1910 by means of the Periodogram, by Dr. Matthew Young. Members of the Section who wish to attend the dinner at the Welbeck Palace Hotel at 7 p.m. are requested to notify Dr. Major Greenwood, Lister Institute, Chelsea Gardens, S.W.1, not later than February 25th.

TUBERCULOSIS SOCIETY, 11, Chandos Street, W.1.—Saturday, 8 p.m., General Meeting. Discussion on the Need for a Diploma in Tuberculosis, to be opened by Dr. Halliday Sutherland.

POST-GRADUATE COURSES AND LECTURES.

BROMPTON HOSPITAL FOR CONSUMPTION, S.W.—Wednesday, 4.30 p.m., Dr. Beaumont: Influence of War on Respiratory Disorders.
FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W.1.—Tuesday, noon, Dr. Irwin Moore: Demonstration, Oesophagoscopy, Wednesday, noon, Dr. A. E. Giles: Uterine Displacements in relation to Pregnancy.
MANCHESTER: ANCOATS HOSPITAL.—Thursday, 4.30 p.m., Dr. Ward: Bronchial Affections of Child hood.
MANCHESTER ROYAL INFIRMARY.—Tuesday, 4.30 p.m., Dr. E. Bosdin Leech: The Use of Pilocarpic Preparations for Digestive Disorders.
NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.1.—Monday, 2 p.m., Out-patients (Dr. Collier); 3.30 p.m., Mr. Paton, Ophthalmoplegia, Tuesday, 2 p.m., Out-patients (Dr. Gunning Stewart); 3.30 p.m., Ward Cases (Dr. Risien Russell). Wednesday, 2 p.m., Mr. Sargent, Surgical Treatment of Spinal Curves; 3.30 p.m., Dr. James Taylor: Epilepsy. Thursday, Dr. Farquhar Buzzard, 2 p.m.: Out-patients; 3.30 p.m.: Intracranial Tumours. Friday, 2 p.m.: Out-patients (Dr. Gordon Holmes); 3.30 p.m., Ward Cases (Dr. Tooth). Saturday, 9 a.m., Surgical Operations.
NEWCASTLE-ON-TYNE: ROYAL VICTORIA INFIRMARY.—Friday, 2.30 p.m., Dr. A. Burkin: Diabetes. 3.15 p.m., Dr. George Hall, C.M.G.: Systematic Examinations of Nervous Diseases, together with Diagnostic Points. 4.30 p.m., Professor Stuart McDonald: Routine Post-mortem Examination.
NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.15.—Tuesday, Dr. R. Murray Leitch, 2 p.m.: Demonstration of Cases of Pneumonia. 4.30 p.m., Lecture: Complications of Pneumonia.

SHEFFIELD ROYAL HOSPITAL.—Monday, 3.30 p.m., Dr. Nutt: X-ray Examination of Gullet and Stomach. Tuesday, 4 p.m., Dr. Hay: Disorders of Motility of Eye. Wednesday, 3.30 p.m., Dr. Wilkinson: Dysphagia. Thursday, 3.30 p.m., Dr. Skinner: Eczema. Friday, 4 p.m., Dr. Hay: Diseases of the Optic Nerve.
WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Saturday (February 21st) 10 a.m., Dr. Arthur Saunders: Medical Diseases of Children. Monday, 5 p.m., Dr. Beddard: Practical Medicine—Tuesday, 5 p.m., Mr. Page: Spinal Anaesthesia. Wednesday, 5 p.m., Mr. Steadman: Dental Sepsis—Children. Thursday, 5 p.m., Dr. Grainger Stewart: Diseases of the Nervous System of Syphilitic Origin. Friday, 5 p.m., Special Lecture, Dr. J. S. Risien Russell: Diagnosis of Affections of the Cerebellum.

APPOINTMENTS.

FORSYTH, J. A. Cairns, M.Sc., M.B., Ch.B., F.R.C.S., Surgeon to Out-patients, Royal Waterloo Hospital for Children and Women.
SPOTT, Arnold, M.A., B.Ch.Cantab., M.R.C.P., Assistant Physician to the Westminster Hospital.
WOODFORD, A. W. G., M.B., B.S.Lond., Honorary Registrar to the Samaritan Hospital for Women, Liverpool.
MANOR HOUSE HOSPITAL, Hampstead.—Honorary Visiting Staff: Russell J. Howard, M.S., F.R.C.S. (Senior Surgeon), C. Jennings Marshall, M.D., M.S., F.R.C.S.
ST. THOMAS'S HOSPITAL.—Casualty Officers and Resident Anaesthetists: J. D. M. Cardell, M.R.C.S., L.R.C.P. (Ext.), A. F. Potter, M.R.C.S., L.R.C.P. (Ext.), H. G. Störmer, M.R.C.S., L.R.C.P. (Ext.), C. CURRENT NOTES.

Payment of Hospital Staffs for Treatment of Disabled Men.

THE Hospitals Committee of the British Medical Association has been considering the method and amount of payment which should be made to the medical staffs of hospitals for the treatment of discharged disabled soldiers and sailors. Conversations have taken place with the British Hospitals Association and with the Ministry of Pensions, and as a result of these deliberations the Hospitals Committee recommended to the Council the following:

That for all work for soldiers and sailors, whether discharged or not, for any disease or injuries connected with the war, undertaken at voluntary hospitals, the medical staffs should be adequately remunerated. In any case the remuneration should represent no addition of not less than 25 per cent. to the cost of maintenance of in-patients, and not less than 25 per cent. of the ascertained cost per patient per attendance for out-patients, the additional sum to be placed at the disposal of the medical staff; that in the case of special clinics (for example, aural and ophthalmic) the fee payable to the medical practitioner should not be less than the fee payable by the Ministry of Pensions for identical or similar services—namely, £2 2s. per session.

This resolution, adopted by the Council at its meeting on February 18th, will, of course, be placed before the Representative Body at the Cambridge meeting in order that it may become the recognized policy of the Association; but as the whole subject is one which has exercised the minds of medical men at present engaged in such work it has been deemed advisable to publish this resolution in order that any arrangements which are set up in connexion with this work may be of a uniform nature. The British Hospitals Association is understood to be in agreement with this resolution, and has placed the whole matter of hospital accommodation and treatment before the Ministry of Pensions, which in turn is awaiting the consent of the Treasury to the proposals.

Fees for Medical Examination for Life Insurance.

Apparently some Branches and Divisions are still endeavouring by local action to raise the rates for medical examination of candidates for life insurance. The Medical Secretary wishes to draw attention to the Current Note of January 3rd last, in which it was stated that the Council has come to the conclusion that this is pre-eminently a matter which should be settled by central action. Merely local action has broken down wherever it has been tried. The present position is that a body, representative of all British life offices, has met a deputation from the Medico-Political Committee of the British Medical Association,

and an agreed report of the suggestions put forward was before the Council at its meeting on February 18th, and will very shortly be sent to all the Divisions for discussion. Some insurance companies have apparently stated in letters to individual doctors that an agreement has been arrived at about the fee, but this is an error. The Association can arrive at no agreement until the matter has been discussed by the Divisions and Representative Body.

Arbitration on Disputed Medical Charges.

It must often happen that differences of opinion arise between patients and their medical attendants as to the reasonableness or otherwise of the doctor's charges. The medical man may meet his patient by making a quite uncalculated for reduction or he may refuse to modify his charges. It is, perhaps, not well enough known that the Medico-Political Committee of the Association is prepared to adjudicate in such cases, and has done so on several occasions. Both parties must agree to accept the Committee's decision and to furnish full particulars to the Medical Secretary, when the matter will be dealt with at the next meeting of the Committee.

Commuted Furlough in the I.M.S.

The following correspondence has lately passed between the British Medical Association and the India Office:

February 4th, 1920.

Sir,

The attention of the Association has been called by I.M.S. officers to a question affecting their position as regards leave pending retirement. The statement made is to the effect that they have been given to understand that they will not be allowed to avail themselves of more than eight months' leave prior to retirement, whereas the period they are entitled to, under Civil Service Regulations India, is two years. The Association would be glad to be informed whether this statement is correct. They can only hope that the I.M.S. officers are under a misunderstanding. An early reply will be considered a favour.

Yours faithfully,
ALFRED COX,
Medical Secretary.

The Secretary,
India Office, S.W.1.

India Office, Whitehall, S.W.,
18th February, 1920.

Sir,

In reply to your letter of the 4th February I am directed to inform you that it is not understood on what grounds Indian Medical Service officers can have concluded that they would be unable to avail themselves of more than eight months' leave prior to retirement if they retired from the civil side and subject to the Government of India's concurrence to their taking any period of leave that might be due to them. It is thought possible that the terms of commutation of civil furlough into leave on higher pay may have been misunderstood. A copy of the terms is herewith enclosed. Such commutation is, of course, optional.

Officers who retired from military employment, either on medical or private grounds, would not—following the ordinary military rules under which no leave is "earned"—be regarded

as entitled to any specific period of leave, but would be given any moderate amount of leave which the circumstances of an officer's particular case might make reasonable—for example, leave to enable him to complete a further year's service for pension.

If detailed particulars of a specific case could be furnished it might be possible to give a more satisfactory explanation of the point at issue.

I am, Sir, your obedient servant,

F. W. H. SMITH.

for Secretary, Military Department.

The Medical Secretary,
British Medical Association.

The £60 Gratuity.

Soon after the armistice the War Office found a difficulty in obtaining enough medical officers to meet its requirements. A new contract was therefore offered, the terms of which were more favourable than those of the old one. A number of officers who had already served some months of a new year on the old contract changed over to the new,

largely because the new contract promised certain demobilization at the end of six months. Under the old contract these officers were entitled to a £60 gratuity for satisfactory service for a year or any part thereof, even if only a day. But, on application to their agents for the payment of the gratuity, they were informed that they could only be credited with a *pro rata* gratuity of £5 per month. The War Office had apparently overlooked this point. Complaints that a breach of contract had been committed soon reached the British Medical Association, and the Naval and Military Committee decided to ask the War Office whether it intended to adhere to its decision; and then, if the answer were in the affirmative, to seek legal opinion thereon. A reply has now been received from the War Office that the full gratuity will be paid to all the officers in question who signed the new contract before December 6th, 1919, on which date the War Office appears to have realized that its attitude would have to be modified. The officers concerned who have only been paid *pro rata* should apply for the full amount.

INSURANCE.

ARBITRATION ON RATE OF MEDICAL REMUNERATION.

I.

Memorandum by the President of the British Medical Association, Sir T. Clifford Allbutt, K.C.B., Regius Professor of Physic, Cambridge.

THE President of the Association is unable to enter into any argument that implies a knowledge of the working of a general practice including Insurance Practice, or into any estimate of the several sources of income, of the outgoings, or of time required for its various departments. On these matters—fundamental as they are—he has no personal experience.

However, in the course of a long professional career he has formed certain general opinions, and received impressions that may not now be irrelevant. He desires to repeat what he has said before, that no calculation concerning modern Insurance Practice should be based, even remotely, upon the old apothecary and Club practice. Club practice was not business. Those doctors who made a living out of it, did so by conducting it penuriously and with gross inefficiency; more able and more honourable men carried on their Club practices, as others carry on hospital practice, at no inconsiderable pecuniary loss, and for other rewards. Let it not be said that all this is ancient history; for from this system, unfortunately if necessarily, the calculations of the Insurance Acts took their departure.

Moreover it is from the old Club practice that the new Insurance practice received its traditions. If four shillings a head failed to remunerate the Club doctor, and certainly it did fail, let us suppose that for the kind of Club practice of thirty years ago six shillings, or six and sixpence might have been less inadequate. Upon this amount seven and threepence is some advance, it is true; and at first sight might seem adequate, even generous, but only on condition that the services expected of the doctor, as a matter of business, were to be the same as of old. But were they to be the same; are they, ought they to be, the same? By no means; what society requires now is a far higher standard of care; far more time for each case—at least twice as much; time for higher skill and knowledge; for correspondence, and consultation lectures (the Club doctor always declined consultations, they were not in his bond); for many minor operations, such as laryngoscopy, ophthalmoscopy, and so on—not, of course, on the precise lines of the specialist but of ordinary competence; for subcutaneous and other injections; for lumbar puncture, &c.; for some familiarity with the proportion and potencies of special lines of therapeutics, as of X-rays, radiology, ionisations, vaccines and so on; methods the doctor himself cannot undertake to carry out, it is true, but the particular opportunities for which he should be able to recognise and on which he should be able to give competent and up-to-date advice to his patients; and last, not least, for the customs of private practice, namely, instead of eut and dictatorial visits, patient and explanatory conversations, such as to lift the patient out of the pill, plaster and bottle superstition, and up to a rational conception of the nature of the disease, its prognosis, and the means of its prevention. Now if this be attained, is it too much to reckon that at least twice the

time for each patient will be required? If then the old Club practice might have been decently paid for at about six shillings and sixpence, modern Insurance practice cannot work out at less than about thirteen shillings apart from any consideration of currency values. We have to contemplate not merely an extension of the old methods and ideas, but rather a multiplication and transformation of them; changes that call for a supply of new men, new notions and new resources. If such men are to be attracted to Insurance work as an honourable branch of private practice it will flourish; if not the whole scheme will be degraded or nullified.

When the pressing district need for laboratories and technical apparatus is supplied the claims upon the time of the doctor for consultations and correspondence will be still greater.

II.

Case presented on behalf of the Medical Profession by the Insurance Acts Committee of the British Medical Association.

POSSIBLE METHODS OF ARRIVING AT "FAIR REMUNERATION."

1. "Fair remuneration for the time and services required to be given by general practitioners under the conditions set out in the Medical Benefit Regulations, 1920, in connection with the medical attendance and treatment of insured persons" may be ascertained by considering the problem along two main lines:—

(A) The accepted pre-war remuneration may be taken as a basis and inquiry made as to how certain altered circumstances justify its variation.

(B) An appropriate total remuneration in present-day values for a skilled general practitioner doing a full year's work as such may be arrived at, and from this may be calculated a capitation fee which may be expected to produce an income in proportion to the work done in connection with the insurance service.

2. Whichever line is adopted it is necessary to take the average of many cases so that the inappropriateness of some statements or calculations in individual cases may not vitiate the result; but the main difficulties arise from the facts that (A) there is no agreement as to what constitutes "an appropriate total remuneration" or "a full year's work" on the one hand or the propriety of the "accepted pre-war remuneration," on the other; and (B) that some of the material factors are of an uncertain character or are insusceptible of mathematical proof.

GENERAL CONSIDERATIONS AS TO STANDARD OF REMUNERATION.

3. In either case there are some general considerations as to the standard of remuneration to be aimed at which are of fundamental importance.

(i) The general conditions of a practitioner's education and work all combine to justify a high scale of

remuneration. These are (A) the medical profession is the calling which has the longest and most expensive training and therefore the actual earning of income begins late; (B) income is more continuously dependent on personal health and exertion than in almost any other profession or branch of commerce; (C) there is no other calling in which a man is so continuously tied to work, and in which a break or holiday is so difficult to obtain; (D) it is a dangerous occupation involving exposure to many kinds of infection, and statistics show that the expectation of life is shorter than in any other profession; (E) it involves taking responsibility of the highest order and the exercise of the most skilful judgment.

(ii) The remuneration of insurance practice must not be based on the lowest level of private practice, but on a relatively high level; otherwise the better type of practitioner cannot but devote himself to other branches of practice, leaving only the relatively inferior for insurance work. This is not what the State wants. (See the *Memorandum by Sir Clifford Allbutt*.)

(iii) The remuneration of insurance practice is to be on a uniform basis; hence on the one hand it must have at least as much regard to the value of the best services as to the value of the less satisfactory, even if some doctors should be overpaid, and, on the other hand, it must have no regard to the economic position of the insured person since the State requires equal services for all.

(iv) The present distribution of doctor-power shows that the conditions of work both in the poor parts of industrial towns and in very sparsely populated places are unattractive, and that an adequate income in such conditions can be earned only either by taking charge of more persons than can properly be attended in the best way (other than by a few exceptional practitioners), or by obtaining large fees from a few to make up for the necessarily small fees for the bulk of the patients; this can be remedied only by a quite adequate level of remuneration for the ordinary patient.

(v) The capitation fee to be arrived at is such as will result in the provision of a Central Practitioners' Fund of an amount sufficient properly to remunerate the whole body of insurance practitioners for the work which they perform under their agreements. This involves the averaging of the differences which exist between various kinds of practice in various respects. The items which are separately assessed and have therefore nothing to do with the capitation fee, are the supply of drugs in rural areas and the cost and time of travelling beyond a radius of two miles in such areas. But such points, as, for example, the relatively greater proportion of visits to consultations in rural and semi-rural practices, the relative sparseness of the population even within a two-mile radius in such practices, the relative absence of available professional help in such practices, and the relatively large amount of surgical work in colliery and some other industrial practices all remain to be taken into the average.

(vi) The remuneration is not to be merely for the actual medical attendance on the insured persons on a practitioner's list, but for "the time and services required in connection with" such attendance. This includes everything that arises out of the fact that the practitioner has, on behalf of the community, accepted responsibility for the care of the health of a certain number of persons, as far as this is within the scope of a general practitioner of ordinary competence and skill.

THE FIRST METHOD.

4. Of the two methods mentioned in the first paragraph that based upon the remuneration fixed in 1912 naturally suggests itself as the most direct method of approaching the subject. This remuneration was really stated in two ways: first as a capitation fee with 7s. 6d. as a maximum; 7s. as a minimum, or, say, 7s. 3d. as an average; second as a scale of fees, supposed in result to correspond to this capitation fee, with 2s. for a consultation, 2s. 6d. for an ordinary visit, and higher fees up to 4l. 1s. for rarer services of a more special character. This remuneration, higher than that originally proposed by the then Government, was the lowest that a sufficient number of the profession were prepared to accept for an experimental period of three years, and this acceptance was mainly due to the fact that the remuneration was a manifest improvement on that secured from the then existing "club practice" which had hitherto been conducted either partly as a charity or on entirely unsatisfactory lines.

However the fact that this remuneration has been tolerated for seven years (with an obviously necessary "bonus" addition during the last two) may be taken to indicate that it was not *wholly* inappropriate in pre-war conditions. But it must be emphasised that almost from the beginning the bulk of insurance practitioners have regarded it as too low; that many general practitioners declined on this ground to enter the service; and, that this toleration of the fee has been largely due to patriotic motives—the desire to continue at work and create no unnecessary disturbance during the national emergency.

5. It is very important too, to note that the capitation fee of 7s. 6d. or 7s. 3d. has never (except possibly in the case of a few individual practitioners) corresponded to the full fees set out in the scale of remuneration for services rendered, and that a capitation fee such as would, in fact, have worked out in accordance with that scale, would have been considered by the profession to have been more nearly an adequate minimum. In the view of the profession, therefore, the pre-war remuneration postulated as a basis should be not less than a capitation fee corresponding to the sum arrived at by multiplying the scale fees by the number of services of each kind rendered in a year to each insured person on an average, as ascertained by the experience of the last seven years. The number of items of service per insured person is 3.8, and the proportion of consultations to visits is 3 to 1. This gives a capitation fee of 8s. to 8s. 6d.

MAIN FACTORS NECESSITATING REVISION OF FEE.

6. The main factors necessitating the revision of this fee may be grouped thus:—

(1) The altered value of money;

(2) Increased work and responsibility owing to the impaired health or disabilities of discharged or demobilised men, and to similar war effects among other insured persons;

(3) Certain modifications of service under the proposed new arrangements;

(4) Newly or increasingly recognised responsibilities of general practitioners in connection with public health and medical research.

7. As to the first point—the altered value of money—there are two factors to be taken into consideration (A) cost of living and (B) expenses of practice.

COST OF LIVING.

8. The question of the increase which ought to be made to cover the increased cost of living is a matter of considerable difficulty, not only because it is almost impossible to secure reliable and adequate data, but because even if we had these there is no generally accepted standard by which the appropriate degree of compensation for high prices can be measured. We have the Board of Trade figures which show that on January 1st, 1920, the rise in the price of articles consumed by the working classes was 136 per cent. for food, and 125 per cent. for food, clothing, rent, etc.—and apparently the rise is still going on. In the case of incomes practically the whole of which must be spent on necessities this might be a reliable standard. In this regard, the fact that persons with large incomes may be able to purchase certain necessary commodities to greater advantage than those with quite small incomes is balanced by the fact that many of the more essential articles of food can often be purchased by the latter advantageously at street and other markets, which are not available for the former. The difficulty of discovering an agreed standard arises with regard to that portion of the larger incomes which is spent on "comfort" and "luxuries," and which may be available for actual saving and investment. It is common ground that, in the case of incomes of a moderate amount, such as the professional classes may be regarded as receiving, an appropriate allowance should be made for at least the former of these forms of expenditure. In fact, in these classes, many things which are sometimes called "comforts" and "luxuries" are actually necessities, unless their standard of living is to be degraded in a way which would not be advantageous either to them or to the community. The difficulty is to combine these various factors so as to arrive at an appropriate assessment for a professional man.

EXAMINATION OF THE CIVIL SERVICE AWARD AS A
PRECEDENT.

9. The award of bonus made to the Civil Service cannot be regarded as adequate at the present time in its application to the medical practitioner, and its present adequacy even as regards the Civil Service is at least seriously disputed. To test this we may take the case of a practitioner with an income of £800 a year *net*, with no income other than his professional earnings, and with a wife and two children to support, the children being of school age. In this fairly typical case we must discover what is the actual increase of income which the bonus would give, and what is the actual necessary additional expenditure in respect of which the bonus is given. The bonus receivable under the award is £300, but from this has to be deducted (A) the income tax on this bonus at the rate paid before the bonus was granted; (B) the extra 9d. in the pound on £1,100 by reason of the total income having been brought into the higher-rated category; and (C) the loss of the allowance on one child from the same cause. These deductions leave the increase of actual income due to the bonus at about £209. The necessary additional expenditure in such a case is computed by Prof. Bowley, taking an extraordinarily low basis for the calculation, to be £414. (See the *Memorandum by Prof. Bowley, Table II.*) So that the net additional income produced by the bonus covers scarcely more than half the additional expenditure. The difference can be met only by severe economies in regard to those small comforts which, in a household of the type under consideration, are almost necessities, and in regard to the education of the children. This education ought to be of a character which will enable them to earn an income sufficient to maintain them in the same social or industrial scale as their parents. If the average practitioner is to be forced to economise on this item, not only will injustice be done to individuals, but in the long run the highest interests of the community as a whole must suffer.

10. Moreover, it must be remembered that the bonus given to Civil Servants covers only cost of living and includes nothing equivalent to the item of practice expenses; that it varies from 60 per cent. to the Civil Servant earning £200 a year to 33 1/3 per cent. to the man earning £1,500 a year; and that while the Civil Servant may economise by changing his residence or altering his standard of living, these economies are not open to the medical practitioner who would stand to lose materially in income by adopting them.

PROPRIETY OF REFERENCE TO INCOME TAX.

11. The propriety of any reference to income tax in this connection has been questioned. The Committee agrees that the income tax produced by any suitable capitation fee must contribute its proper share to public burdens, and it admits that if the present income tax presses with undue hardness on the professional classes (as it does) the proper remedy is to reform the incidence of the tax rather than to increase remuneration. At the same time it is to be noted that the manufacturers and merchants can, and usually do, fix the price of their commodities after taking income tax into consideration, thus in effect passing on their burdens to a considerable extent to the purchasers of those commodities. In the above examples, however, comparison is made not with pre-war income tax, but with the present tax payable had there been no bonus. The propriety of this comparison is evident when it is remembered that it would be possible to award a bonus which, by reason of the effect of income tax, would actually result in a decrease instead of an increase in spending power. The Civil Service Arbitration Board in its Award of November 11th, 1919, recommending an increased bonus to Civil Servants states "that the argument is not without force that, in determining the extent to which the different classes of Civil Servants should be called upon to share in the national burden by forgoing full compensation for the decrease in the purchasing power of money, the extent to which they are already sharing in that burden by paying increased income tax is a relevant consideration."

EXPENSES OF PRACTICE.

12. Particulars as to the expenses incurred in twelve each of rural and semi-urban practices were supplied in October, 1918, to the National Health Insurance Commissioners in connection with the application for a grant towards increased practice expenses. These showed:—

Expenditure.	1913 or 1914.	1917.
1. Drugs, instruments, professional books, etc., and general surgery expenses	£ 3,549 ...	£ 4,957
2. Travelling expenses	4,826 ...	8,420
3. One-third rent, rates, fire and light	891 ...	1,048
4. Salary, etc., of locum, assistant, and dispenser	849 ...	1,531
5. Telephone	178 ...	242
Total expenses	10,296 ...	16,198
Gross receipts	42,784 ...	47,135
Net earnings	32,488 ...	30,937

On these figures it is necessary to make the following comments:—

(A) In war time many cars were used which in normal times would have been replaced by new ones. If replacements had occurred with normal frequency, the increase shown in the above figures would have been greater.

(B) Figures for rents, etc., are too low in both years. When practitioners sending in returns owned their houses they frequently omitted to charge any rent for them. Rents must rise, and sooner or later higher charges will have to be incurred.

Examination of the figures also suggests that insufficient charges were made for wages and board of domestic servants.

(C) There can be no doubt that if figures could be obtained from urban areas, those practices would show a higher rate of costs, for not only would rent, rates and general practice expenses be higher than in the rural areas, but the cost of locomotion would be relatively higher owing to the more frequent stoppages leading to less economical consumption of petrol and more wear and tear.

(D) The above returns apply to 1917 (mid-year), since which time every item has increased in cost with the possible exception of drugs.

13. The table shows (A) an increase of expenses from 24 per cent. of the gross receipts in 1913 to nearly 35 per cent. in 1917; (B) an increase of 60 per cent. in the expenses themselves in 1917. These figures are almost certainly too low as applied to practices in general, as will be seen from the considerations set out in the preceding paragraph, and the last figure of 60 per cent. for mid-1917 becomes at least 75 per cent. for end-1919 if increased in accordance with the proportionate rise of prices between those periods. The practices from which the above table was compiled are accepted as being typical of rural and semi-urban practices. It is extraordinarily difficult to obtain useful returns of this character from medical practitioners, particularly those in urban practice, but further particulars have now been obtained from thirty-nine practitioners for expenses in 1913 and 1919. These practices are of a miscellaneous character, some of them urban, and they cannot be guaranteed as typical. As in some cases the returns required expert statistical interpretation they are not set out here, but are referred to in the accompanying Memorandum by Professor Bowley. They tend to confirm the above deductions from the previous table though the proportion of expenses to gross income is almost certainly too low to be regarded as typical of general practice. Moreover, the figures being for the whole year 1919 must be considered as relative to the average prices of that year and not to those obtaining at the end of it; and they necessarily have no reference to the quite recent large increase in the price of petrol. A consideration of all these facts leads to the conclusion that in order to produce a rise of not more than 55 per cent. in the net income over 1913 (this being the lowest percentage of increase on such income which, on the lowest reasonable basis can be regarded as approximating to the amount required to meet expenditure on food and other necessary items in a middle-class household if the standard of life is not to be seriously lowered) approximately 60 per cent. would have to be added to the gross income. To take this latter figure as the percentage of increase on the present capitation fee which is necessary in respect of the altered value of money is certainly not unreasonable, and probably leaves the actual income somewhat less than in 1913 for the same amount of work and responsibility.

14. In the above calculations the Committee has had in mind not urban practices only, but urban, semi-urban, and rural alike, in so far as the last two classes are conducted within the conditions regarded in the capitation fee, i.e., without dispensing and within a two-mile radius for travelling. The chief argument based upon the figures given as to expenses of practice, is not that the proportion of expenses to gross receipts has increased, but that the percentage of increase of the expenses themselves between 1914 and end of 1919 is considerably greater than the percentage of increase asked for on account of the cost of living; and that therefore the percentage of increase proper to the gross income should be greater than that that proper to the net income. The cost of drugs is the item which has increased proportionately least between 1917 and 1919; and whatever be the relative proportion of expenses to gross income in rural and in urban practices respectively, the Committee can have no doubt, for the reasons given above, that the percentage of increase of the expenses themselves has been distinctly greater in the latter than in the former. This is all that matters for the purpose of the immediate argument, but the figures seem to show also that percentages distinctly in excess of the 25% and 33 $\frac{1}{3}$ % which the Committee has later on taken as the proportion of expenses to gross income in non-dispensing and dispensing practices, would be quite legitimate.

INCREASE IN COST OF LIVING.

15. The Committee submits a separate Memorandum on the purely statistical side of this branch of the subject from Professor A. L. Bowley which deals in a more authoritative and detailed way with the facts and figures than the Committee is qualified to do. But in making what it regards as the very low estimate of 60% to be added to proper pre-war remuneration on account of the altered value of money, the Committee wishes to emphasise certain points:—

(A) That the basis taken as regards food is the official working class budget, and that this basis, in order to make it properly applicable to a middle-class family, would require variation in accordance with the customs of such a family. For example, such a family would certainly consume more fish and meat than a working class family was accustomed to consume, and probably less bread.

(B) No claim is made for any advance in the character of the way of living, such as has been made by other classes. Every possible allowance has been made for domestic economies and substitutions. It has been admitted that such portion of income as has been available for saving, even though this be but an ordinary prudential provision for the future, must suffer some diminution.

(C) In a comparison of pre-war "expenses of practice" with those of the present time, economies have in many cases been made by the practitioner and his family taking upon themselves tasks (such as the driving and cleaning of a car, and the personal waiting upon patients and cleaning of professional premises), or submitting to conditions (such as giving up a car or an assistant or secretarial help altogether) which cannot be continued for any length of time without serious detriment to health and efficiency. Such economies as these must inevitably be abandoned or relaxed as soon as possible and then there would at once be a greatly increased practice expenditure.

(D) In spite of the difficulty of exact calculation, it seems to the Committee impossible seriously to doubt the propriety of an increase of remuneration of 60% on the gross income, equivalent to 55% on the net income, on account of the altered value of money. Practitioners know from universal experience that the cost of food, clothing, fuel, light, cleaning materials, servants, and the education of their children has, on the average, increased to a far greater extent than this. Rates are materially higher, and now practitioners are experiencing, as their leases terminate, a very substantial raising of the rents of their houses or surgeries. Many of the less financially successful practitioners are now in very difficult economic circumstances, and even the more successful, in spite of economies carried to the extreme, are beginning to find the margin of income which enabled them to make some provision for the future disappear. The Committee is convinced by the experience of its own members, and by the expressions of opinion on this point which it has received from all parts of the country, that a greater increase

than the 60% suggested, could on economic grounds be justifiably asked for.

INCREASED DEMANDS BY CERTAIN CLASSES ON THE ATTENTION OF INSURANCE PRACTITIONERS.

(A) Discharged Disabled Sailors and Soldiers.

16. With regard to the increased work and responsibility involved in attendance on persons whose health has been impaired by the war there are three classes of persons concerned:—(A) discharged disabled men; (B) men "demobilised" in impaired health but not "discharged" on that account; (C) other insured persons whose health (nervous health especially) has been impaired by war strain.

17. Actual figures are available with regard to the attendance on the first of these classes only, and these figures refer only to 1918. These statistics show that the attendance required by discharged disabled men was approximately three times that of ordinary insured persons, and that at least 2 $\frac{1}{2}$ % increase in the capitation fee was needed at that time in respect of that class. This is certainly now much too small a proportion mainly owing to the following reasons:—

(A) The accounts rendered for these cases do not represent the whole of the attendances for (i.) a considerable proportion of discharged disabled men have not been placed on the special attendance system at all, but have been retained on the ordinary list; (ii.) a considerable number of practitioners have never rendered any accounts for the attendances given; and (iii.) in many instances the accounts rendered have been only for relatively serious attendances, while accounts for shorter attendances have not been sent in.

(B) Considerable numbers of disabled men were retained in the Army and have since the Armistice been demobilised instead of being discharged disabled, and have been left to get their pensions in the ordinary way.

(C) Many discharged disabled men (especially in towns) have been referred for treatment to institutions direct instead of being sent to insurance practitioners as should have been the case, and it must be assumed that in future, with the gradual closing down of military hospitals a more correct course will be followed.

(D) It is only now, or in the early future, that many disabled men properly referred to institutions, are completing, or will complete, their institutional treatment and will pass under the care of an insurance practitioner.

(B) Demobilised Men—Not Invalided.

18. Besides those men who come under the special arrangements for discharged disabled soldiers and sailors there are large numbers of others who have been demobilised in a state of impaired health (e.g. liable to attacks of malaria, dysentery and trench fever, or suffering from their after-effects). The experience of practitioners has led them to form the opinion that the effect of this class upon their work and responsibility is even greater than that of the discharged disabled men.

Information obtained by answers to questions in the House of Commons in August and in October last, shows that the number of discharged and demobilised men invalided or in impaired health is materially more than 8 per cent. of the total number of insured persons. More recent figures from Birmingham show 10 per cent., and from Brighton 21 per cent. Assuming that the percentage is only 8, and that the relative proportion of items of attendance on these men as compared with ordinary insured persons is the same as that found by the 1918 returns (11.5 to 3.8) it is clearly necessary to add more than 16 per cent. to the pre-war capitation fee to compensate for this increased attendance. It is true that a number of these men are insured persons for whose treatment insurance practitioners are not at the moment liable owing to their retention in institutions, but this number as compared with the total number of insured persons is comparatively negligible. It must be remembered that the liability of the insurance practitioner exists from the moment of discharge from an institution, which may take place at any time.

(C) Effect of War Conditions on Health of Other Sections of Community.

19. It is sometimes said that there are classes of insured persons or whose health war conditions have

had a beneficial effect. The evidence of the existence of such classes does not seem at all clear. It may readily be admitted that there are some individual former soldiers or other members of the community whose health may have benefitted directly or indirectly from military training or from special war conditions (such as more exercise or more and better food), but such are only those who were in training at the end of the war and had not seen any active service and the profession has not experienced any diminished call on its services on the part of any considerable number or any whole class of such persons. The deleterious effects of war conditions on many classes of insured persons are however undoubted and though the incidence of these may vary with locality to some extent, there is a widespread prevalence of certain war-produced conditions (e.g. delayed nerve disturbances) which in the aggregate have materially increased the work of insurance practitioners. There are many practices in which the effect of this class is at least equal to that of either of the classes considered in the previous paragraphs. This experience in general practice is reinforced by that of many hospitals (especially those for nerve diseases) and by that of Approved Societies in dealing with Sickness Benefit. Mr. A. C. Thompson, President of the Annual Conference of Industrial Approved Societies in his presidential address on October 29th, 1919, said "The effect of the war upon the health of the community, has been a matter for serious consideration by Approved Societies in many ways, not the least of which is its effect upon the payment of sickness and disablement benefits, not only to men who have been serving in the forces, but also to the general body of members, particularly perhaps to those women members who have been employed in ways to which previously they were unaccustomed."

Calculation of Increase of Remuneration Due to Increased Liabilities Detailed in (A), (B) and (C) above.

20. If then, an addition of 12½ per cent. were made to the capitation fee in respect of increased work and responsibility in consequence of the impairment of health due to the war, this would appear to be a very modest computation. In view of the absence or insufficiency of statistical data on some points, the Committee does not press for a larger percentage but it is of opinion that a greater increase might be justified, and regards the 12½ per cent. as an absolute minimum.

INCREASED RESPONSIBILITIES UNDER NEW REGULATIONS.

Definite New Liabilities.

21. There remain for consideration such actual modifications of service as are required by the new Regulations, and such increased duties and responsibilities of general practitioners (especially with reference to public health and medical research) as have become recognised by the State and public opinion since 1912. The new conditions of service impose at least two definite new liabilities which do not exist at all under the present contract, viz. (A) the provision of medical or surgical treatment in the case of accidents or other sudden emergencies to insured persons where immediate treatment is necessary and where the practitioner responsible for the insured person is not available, and (B) the making of additional reports in certain cases and the personal attendance at consultations in some of the cases. It is impossible at present to make any reliable estimate as to the amount of time and work which these additional liabilities will necessitate, but they are obviously of considerable importance and may easily so develop as to make appreciable additional call upon a practitioner's time and energy.

Increased Stringency of Conditions of Service.

22. In addition to imposing these entirely fresh responsibilities the future conditions of service are in several respects more stringent than in practice the old have been. Instances are the provisions with regard to (A) the transfer of practices in the case of death or retirement, (B) surgery and waiting room accommodation, (C) the employment of assistants and deputies, (D) the giving of services outside the contract (E) the number of insured persons who may be accepted, and (F) attendance for conditions arising out of labour after the tenth day. These are not mentioned here as being new liabilities at all comparable in this respect to those named above, nor is it suggested that their increased stringency is other than proper, but it is a fact to be noted in this connection as one which should be given

its due weight when considering any variations of capitation fee appropriate to modifications in the conditions of service.

23. It is recognised that under the existing conditions it is the practitioner's duty to give his best attention and exercise his highest skill towards the cure of those insured persons for whom he is responsible, and that to this end he should avail himself of such new or improved methods of diagnosis and treatment as are within his reach. This duty is not a new one imposed by the new conditions, but it is claimed that the recent advances in medical and surgical technique and the increased and increasing availability of improved methods do constitute a factor which is germane to the determination of the appropriate capitation fee governing the practitioner's remuneration; that is, that the fee ought to be fixed in view of the fact that he is expected to increase his knowledge and to use it appropriately in accordance with his best judgment.

THE RANGE AND STANDARD OF SERVICE UNDER THE NEW CONDITIONS.

24. In addition to this high standard of work in the case of the individual a further important consideration arises. It would be possible for a practitioner to perform his duty with great conscientiousness and efficiency in this regard, without doing anything material in the sphere of preventive medicine in the interests of the community as such, and without contributing anything to the furtherance of medical research on which all future progress depends. The importance of the general practitioner in both these respects is largely a new realisation and is, at any rate, becoming much more definitely recognised to-day than it was eight years ago.

Sir George Newman, Chief Medical Officer to the Ministry of Health, says in a recent memorandum to the Minister: "The acquisition of knowledge by research and investigation is not a function of a central department alone. The problems of medicine arise where the patient lives; his house and workplace are the fields of enquiry, and the medical practitioner is the man to carry out partly or wholly the investigations which are necessary. Harvey, Sydenham, John Hunter, were all practitioners, and in our day practitioners have repeatedly demonstrated their desire and capacity to undertake investigation work. The incidence of disease of the heart or respiratory system, digestive disorders, nervous maladies or incipient mental disease can be best determined by the practitioner This is the sort of work which lies before us, the comprehensive study of the facts as they are in daily life and environment and not only as they are in the laboratory. It is in the field, in general practice, in the workshop, in the home, as well as in the laboratory that truth is to be found." The Insurance service should be an important factor in these directions, and the Insurance practitioner will in future be expected, in proportion to his ability and opportunity, to do what he can in this respect.

25. The service expected under the new conditions is not such minimum service as will avoid an obvious breach of the agreement, but a service which at its best will include all the following matters:—

(1) Advice and treatment to insured persons when actually ill, with a view to relief and cure, if possible.

(2) Advice as to how treatment outside the scope of the practitioner's agreement can best be secured and such help as will enable the patient to take full advantage of any such treatment.

(3) Advice in matters of personal and domestic hygiene, where needed and as opportunity arises, with a view to the preservation and improvement of the health of the individual and family;

(4) Co-operation with Medical Officers of Health and others in matters of sanitation and public hygiene with a view to the prevention of disease in the community;

(5) Such investigation into the incidence, beginnings and source of disease as may assist medical research both in preventive and in clinical matters.

Up to the present time attention has been directed mainly to the first of these and almost wholly confined to the first two. It is true that it is difficult to control the carrying out of some of these duties by means of regulations, and that differences in a practitioner's education, personality and opportunities, affect considerably the degree of success with which he can carry on the last of these. There can be no doubt, however, that in the minds of both the profession and the public the conception of the sphere of work of a general practitioner

has now greatly widened, and that the performance of all the above functions must be encouraged if the Insurance Health Service is to be of proper value to the State. The performance of these functions necessarily involves the devotion of more time on the average to each case than has been customary in past years, and the recognition of an enhanced responsibility to the community as such, comparable to the long recognised responsibility to the individual patient. The action of the Ministry in connection with the settlement of the new agreement for service as from April 1st, 1920, emphasises this. Regulation 15 (2) prescribes that the number of patients that a practitioner working single handed may have on his list must not exceed 3,000. But this limit may be lowered by agreement between the Insurance Committee and Panel Committee, and, failing agreement by them, by the Minister. The Ministry has, by means of a circular, drawn pointed attention to the fact that the limit need not necessarily be as high as 3,000, and is exercising all its influence in favour of a lower maximum.

26. To arrive at the proper percentage of increase which is relative to the matters considered in the preceding four paragraphs—new liabilities and other modifications of the terms of service, increased expenditure of time and money in maintaining the highest skill and the most approved methods of treatment, and an appropriate relationship to preventive medicine and research—is obviously less a matter of mathematical test than in the case of the previous factors. Here it is a question of the profession's estimate of the value of these services, checked, of course, by such reasonable considerations as an intelligent public can bring to bear on the problem. To the Committee it seems that it would not be unreasonable to value these services collectively as one-tenth of the whole. An alternative valuation (a lower one certainly) would be, say, a one shilling capitation fee. This means that a practitioner with 600 insured persons on his list would receive only £20 per annum for all his services to those persons and to the community (present and future) properly coming under these heads. The Committee regards this as a very low estimate of the value of these services.

AN ATTEMPT TO COMPUTE A FAIR CAPITATION FEE IN VIEW OF PREVIOUS CONSIDERATIONS.

27. If now we take x as the fair pre-war capitation fee expressed in shillings, and y as the similar value of the services and conditions referred to in the preceding paragraph, we arrive at this formula for the new capitation fee:—

$$\frac{8x}{5} + \frac{x}{5} + y \text{ or } \frac{9x}{5} + y$$

the first item being the amount produced by an addition of 60% to x, and the second the amount produced by an addition of 12½% to this. If y be taken as 10% of the whole the formula becomes simply 2x. In the suggested alternative y=1.

If x be taken as 7/3 (the average capitation amount used in calculating the Central Practitioners' Fund hitherto)* we get 14/6 or 14/-.

If x be 7/6 (the maximum hitherto obtainable, and actually obtained in many areas)* we get 15/- or 14/6.

If x be 8/- (the lowest amount that can be held to approximate to the scale of pre-war fees)* we get 16/- or 15/5.

If x be 8/6 (the amount which the Committee believes most nearly to represent that scale)* we get 17/- or 16/3.

If it be agreed that some of the factors on which the above figures are based are of a temporary nature (e.g. the increased attendance on persons whose health has been impaired by the war), it might be fair to reduce the resulting fee by a few pence in each case; but it should be remembered (A) that it is not proposed now to fix the fee for any definite period of time and that no factor is of so temporary a character as to be likely to affect the calculations for 1920 at least, (B) that some of the factors (e.g. those included in y) are as likely to increase as others are to diminish in value.

If the number of items of service used in valuing x at 8/- or 8/6 be alleged to be excessive, it must be remembered (A) that no account is taken in the calculation of the rarer services of a much higher individual value; (B) that the length of time occupied by each item tends to increase as the number of items diminishes.

If the value put on each item by the scale fee be alleged to be excessive it must be remembered (A) that the fees

are those agreed as the working basis for temporary residents, travellers, and discharged disabled men; (B) that though they may be a little higher than the fees obtained in private practice in the poorer industrial neighbourhoods before the war the considerations set out in paragraph 3 show that the State fees ought to be on a decidedly higher scale than this; (C) that there are whole classes of insured persons (even though they may be a comparatively small minority of the whole number) for whom the fees named would have been considered low.

If the percentages added to x be alleged to be excessive, the Committee relies (A) on the considerations to which it has drawn attention in paragraphs 15-20; (B) on the fact that the profession has been obliged in private practice to take action as to fees which is intended to produce a result approximately equal to this increase.

28. The Committee submits (A) that though the highest of the above estimates is arrived at by adopting the higher rather than the lower limit of factors in which there is a margin of error, it can be justified; (B) that the estimate of 15/- to 15/5 is a reasonable estimate which can be fully justified at the present time; (C) that the estimate of 14/- is absolutely the lowest that can be considered to meet the necessities of the case in a minimum degree and for a service of a scope less satisfactory than that which ought to be provided.

EXAMINATION OF SECOND METHOD OF COMPUTATION.

29. The second method set out in paragraph 1 for ascertaining an appropriate capitation fee is, in the opinion of the Committee, less satisfactory for this purpose than that which has above been worked out in detail, mainly because the figures which must be postulated are even less susceptible to mathematical or statistical proof and because some of the fundamental assumptions must, within a wide margin, be matters of opinion rather than of fact. The value of the method seems to be rather as a test of the reasonableness of the conclusions reached by the former method than as an independent way of arriving at a definite result. The following observations are offered subject to this expression of opinion.

30. This second method for ascertaining the appropriate capitation fee may be stated in two forms:—

(i) The total gross annual income appropriate to a reasonable full year's work of a general practitioner as such, may be agreed; the proportion of this work which would, under the conditions contemplated, be required in connection with a given number of insured persons may be investigated; and the capitation fee may be determined from these data.

(ii) The fees (determined mainly by individual and traditional experience, but modified by recent and present economic conditions) appropriate to different items of general practitioner service may be agreed; an average fee per item of service may be gauged from these; the number of items of service required on the average by each insured person may be found from past records as modified by any relevant facts; and the capitation fee may be determined from these data.

These are merely two aspects of the same method, for doubtless all medical fees for particular services are ultimately regulated by the total annual income they may be expected to produce. There may, however, be some advantage in checking one form of calculation by another.

(A) Capitation Fee Computed from Total Gross Income.

31. Taking the first mode, it is suggested that the income factor may reasonably be placed at £1,800 for a recognised 2,400 hours' work, and that the proportion of such time appropriate to a list of 1,000 insured persons would be approximately three-eighths.

Time Factor.

32. It is necessary to examine carefully the exact meaning and propriety of these figures. First, take the hours. It will probably be unnecessary to prove that an 8-hour day for 300 days in the year is rather above than below what is coming to be regarded as ordinary full work for those classes whose work can appropriately be measured by time. No such measure (least of all a daily measure) can properly be applied to professional work, and, least of all, to that of a general medical practitioner. But the equivalent number of hours spread over the year may be taken as a reasonable datum for calculation as

* See paragraphs 4 and 5.

that beyond which the State should make no demands as a matter of course or at an ordinary rate of payment.

Income Factor.

33. Secondly, take the income. The sum mentioned is a gross amount at present day values. The amount of £1,800 gross would be received partly for attendance on private patients and partly as remuneration under the Insurance arrangements. If therefore 30% be taken as the proportion of working expenses this estimate would leave a net income of £1,260, or approximately £800 in pre-war money values, taking a very moderate view of the alteration in such values. Further, this figure is not taken as the commencing net income of a practitioner entering on practice or of one whose success is of an average character. It is not put forward as in any sense the average income of practitioners of all ages in town and country. It is on the contrary taken as the income of a man whose personality or opportunity or luck has, along with his professional ability and skill, resulted in his practice occupying his full ordinary time, and it may therefore be compared with the *maximum* salary of a whole-time medical officer of good standing in the public health service.

34. On the other hand the gross income named is not necessarily the largest amount that any general practitioner can expect to obtain as a year's professional income for (1) there are considerable numbers of general practitioners who are in some degree specialists and who therefore, in respect of part of their work, receive fees which it is customary to reckon on a higher scale (2) many practitioners possess professional skill or psychological characteristics which enable them to do more than the average in a given time; (3) many practitioners may choose, or may be compelled by circumstances, to work "overtime" and can do this effectively over a greater or less number of years. These facts do not affect the propriety, for the present purpose, of reckoning a reasonable income for work of what may be regarded as full ordinary duration.

Comparison of Income with that Earned in Comparable Circumstances.

35. How does such an income compare with the income of medical men doing work which can be more easily gauged on a time-money basis? The recognised present pay at school clinics, maternity and child welfare centres, and under the Ministry of Pensions, is a guinea and a half per session of 2½ hours, *i.e.*, £1,510 net for 2,400 hours. In the Navy or Army a successful officer of comparable age or position would be receiving with allowances and pension, approximately £1,400 net. The maximum salary of a medical officer of health in a large town should certainly under present conditions reach £1,500. The Committee is aware that these cases are not in every way comparable to that now under consideration, but the differences are not all in one direction. It can safely be said that if a medical man cannot look forward, if completely successful in his career, and devoting his whole time to the work, to earning in middle age a net income of between £1,000 and £1,500 (at present values) a year it is not financially worth while to enter the profession, and young men of good ability and education would be well advised to adopt some other career.

Proportion of Total Work Properly Assignable to National Insurance.

36. Thirdly, consider the proportion of such work properly assignable to the professional attention necessitated by a list of say 1,000 insured persons. Statistics of the work of insurance practitioners seem to show that this would involve somewhat less than 14 items of attendance per day, but the contemplated future conditions (*e.g.*, the inclusion of discharged disabled men and others of impaired health) will certainly necessitate a distinctly larger number of attendances, and these conditions will also entail a longer time on the average being given to each attendance than has usually been the case hitherto. We may safely assume not less than, say, four visits and ten or eleven surgery attendances per day. The time actually occupied in paying these visits and giving these attendances is not the only item to be taken into account. Within the total ordinary professional working time must be included (a) that occupied by professional correspondence, notes and records, and (b) that given to purely professional reading and study for the

benefit of the individual cases attended. A proper proportion of the time so occupied must therefore be assigned to attendance on insured persons, and if all these factors be considered three hours out of every eight may not unreasonably be taken as occupied by efficient attention to 1,000 of such persons. There will always be some practices more concentrated than others, and some practitioners who are able to work effectively for a longer time than others, but taking all practices and all practitioners into the average and taking account of all varieties of services, including minor operations under an anæsthetic, the Committee thinks that some four visits and ten or eleven consultations may well occupy almost or fully two hours and a-half, and that an extra half hour at least may be allocated to the correspondence, reports, notes, records, and professional reading necessitated by that number of patients.

37. The Committee believes this estimate to be approximately correct, and, in the conditions and kind of services contemplated, to be rather under than over what future experience will show, but there is still another important consideration which should materially affect the calculation. The *whole* of a practitioner's time is (or should be) at the disposal of his patients, and even if, in the case of a practitioner with 1,000 insured persons on his list, it may be expected that not more than three-eighths of his ordinary working time will, in fact, be occupied by, or in connection with, such persons, the conditions of the insurance contract really constitute a prior claim for such persons on the whole of his time. Such provisions as those relating to emergency attendances or the provision of a deputy do not become of no effect by reason of the fact that the practitioner was properly engaged in attending his private patients at the time the insured person required his services. If insured persons were to be placed in every respect on an equality with other patients and were to take an equal chance with them of being able to secure at any time the practitioner's services this would not hold good, but, in that case, several of the Regulations would require to be deleted or materially altered.

Calculation of Income to be Derived from Various Capitation Rates.

38. If, now, we have a successful practitioner devoting his full *ordinary* time to insurance work he may in an average case be assumed to deal with some 2,650 persons. At a capitation fee of 15/-, allowing for the necessary deduction for the administrative expenses of his Panel Committee, this would produce an income somewhat, but not greatly, in excess of the £1,800 stipulated. At 14/- the income would be almost exactly that named. The Committee, however, believes it to be fallacious to take as illustrations or tests large lists such as this. The total number of insured persons is approximately 14,000,000, and the number of doctors on the insurance panels approximately 14,000; the average list therefore consists of 1,000 persons. At present there are, in exceptional places and conditions, a number of practitioners with lists excessively large, so that the usual case is that of a practitioner with a list much below even this average. Steps are taken in the Regulations for 1920 to reduce these large lists; and partly by reason of this but mainly by reason of what it is hoped will be materially increased remuneration, there can be little doubt that during the next year or two additional practitioners will be attracted to the service so that the average case and usual case also, will be one of a list of moderate size. It must be remembered that in rural places, even where the population is not unusually sparse, it is almost impossible for a practitioner to have a large list, and it is the case of practitioners placed in such circumstances as these which deserves the most consideration. A list of 600 with a capitation fee of 15/6 would produce an annual income of £465, gross; at 15/- it would produce £450; at 14/- £420; at 13/6 £405. A list of 500 would produce at the same fees, £387, £375, £350, £337 gross. Some 20% to 30% of these incomes, in ordinary circumstances, would go in expenses. It would be quite wrong to assume that in such cases as these the practitioner's remaining time could be filled by attendance on private patients at corresponding or larger fees. Scope and opportunity are often wanting, even when there is no lack of professional ability or zeal. Ill-health or sheer misfortune destroys quickly a practice that has been built up by strenuous toil. It is quite incorrect to assume or to argue that such and such a capitation fee necessarily indicates a

total professional income of such and such a size in the absence of personal faults or lack of skill.

(B) *Capitation Fee Computed from Average Fee Per Item of Service.*

39. Passing to the alternative method of calculation mentioned in paragraph 30, items of service under the contract may be of several kinds, surgery attendances, certificates, visits, special or night visits, attendances on miscarriages, dislocations, fractures, minor operations, provision of an anaesthetist when required. Fees for these services in ordinary practice correspondingly vary. They are different, also, in different classes of practice, but professional experience has stabilised them within certain limits, and this experience, modified by a suitable allowance made for the present economic conditions, enables us to gauge a reasonable average fee for a practice conducted on such lines, as everyone would wish to apply to the insurance service. The Committee believes, that such an average fee is now at the lowest computation 3/6. This is a gross fee, the net remuneration per item of service being 25% to 33 $\frac{1}{3}$ % less.

40. Insurance statistics show an average of approximately 3.8 items of attendance per insured person per year. These statistics are not regarded by practitioners as very reliable, but statisticians may possibly be in a position to satisfy their doubts. In any case, the average number of items shown by these statistics must be increased in future by $\frac{1}{3}$, as suggested in paragraph 20, by the inclusion of discharged and disabled men and others. This would make 4.28 attendances and would result in a capitation fee of 15/-.

CONCLUSION.

41. The Committee is exceedingly anxious, and in this it is sure it represents the whole profession, to secure a service which will be worthy of the best traditions of medical practice, and which will be of the utmost advantage both to individual insured persons and to the community and State. To this end it has tried, in presenting its case to the Board of Arbitration, to have in mind throughout the kind of service which it believes the Ministry of Health desires to establish under the new Regulations and conditions, and which the profession itself wishes to see in being. The Committee has tried also to put forward its case on the financial side with studied moderation and on a minimum basis, being convinced that the case for the profession only needs to be stated adequately and temperately, to secure an award such as will bring about the willing co-operation of the profession in providing a service of the type indicated.

III.

Memorandum by Professor A. I. Bowley, Sc.D., F.S.S.

FOOD.

1. In Table I. an estimate is made of the increased cost of food since 1914 allowing for reasonable economies. Thus it is supposed that about one-twelfth of meat, bacon and tea is saved by mere avoidance of waste. The daily consumption of milk is reduced from 3 pints to 2 $\frac{1}{2}$ and finally to 2 pints, and the weekly consumption of eggs from 12 to 6 and finally to 4. This involves no serious loss in nourishment. The consumption of butter and fats is completely re-arranged so as to meet the supplies now available, 6 lbs. of butter, margarine, lard, suet or dripping is allowed throughout, but the cost is increased only from 5s. to 9s. In the case of meat it is supposed that in 1914 4 $\frac{1}{2}$ lbs. of British meat and 2 lbs. of foreign were used, while in 1919-20 this was replaced by 2 lbs. of British and 4 lbs. of foreign. Sugar is reduced to the ration of 8oz. As a result the percentage increases to June, 1919, and January, 1920 become 67 and 81.5 respectively.

2. These increases are substantially less than those shown for the same dates in the "Labour Gazette," viz. 104 and 136 per cent. In the calculation of the Ministry of Labour, it is assumed that the 1914 diet is preserved exactly, in spite of the rationing of sugar, the shortage of eggs and butter and the costliness of milk. In January 1920 on this method sugar, milk, eggs and butter shew together an increase of 210%, while the other commodities

together shew 100%. In the middle-class estimate of Table I., sugar, milk, eggs, butter and fats shew 81% in 1920, and other commodities 82%. In the other commodities the diminution is due to the economy in meat. The budget shown on Table I. is with the exceptions named substantially that of an average working class family (5-6 persons) in 1914 so far as the foods included are concerned, and gives only 4s. 2d. weekly per person, or about 5s. 2d. per adult male. The expenditure of doctors (to judge from 21 returns) on all foods was in 1913-4 about 10s. 9d. per person. The difference is due partly to the items omitted (tinned food, fish, jam, green vegetables, etc), and partly to a more liberal allowance of some of the items included. No details are available, but there can be little doubt that the *per capita* consumption of meat was greater than that shown in the budget; if we raise this item by one-third throughout, 22d., 38d. and 40d. are to be added to the first line of the table, and the mean percentage becomes 75 approximately.

3. An increase less than that so estimated could hardly be reached without a definite lowering of standard of nourishment so far as essential foods are concerned. It is of course possible to sacrifice semi-luxuries, but at the expense of amenity. Actually in the 10 doctors' households for which we have comparative returns the increase in expenditure on food is only 56%, and this indicates a very severe retrenchment.

TABLE I.

Estimated Middle-class Budget for Foods included in "Labour Gazette" Tables.

OTHER EXPENDITURE.

4. There is no published information, known to us, in any way sufficient to show the relative importance of different objects of expenditure in a middle-class household. To remedy this lack a questionnaire was sent to a number of doctors at the end of January 1920, asking among other things, for records of expenditure on certain items rent, rates, fuel and light, food, clothing, servants' wages, education, postage, tobacco) in 1913 or 1914. We obtained 21 records from men of different incomes and in different districts. These are summarized in Table II. The accounts used are consistent, appear to have been carefully kept, and are in accord with general experience. The records of sundry items were incomplete, and a rough estimate has been inserted for them in the Table.

5. The increases in wages, rates and fuel till 1919 are adequately stated in the returns. For food the 67 or 81.5% discussed in the previous paragraphs is taken. For clothes the "Labour Gazette" now estimates an increase of 300 to 400%; we have taken 100% as the lowest that can reasonably be assigned for replenishment on the most economical basis. It is evidence of strictest economy, necessarily leading to wearing out of existing clothes and making new purchases urgently necessary, that in the

* Other fats, except a very small amount of margarine, are not included in the official reckoning at all.

13 households for which comparative statements are made, the increase to 1919 was only 10%.

6. It is believed that it is not possible to reduce the figures shown in Table II., if the pre-war standard of comfort is to be preserved, since all reasonable economies have been assumed in food, clothing and all expenses; it would be very easy on the other hand to make a higher estimate. As regards the future, there seems to be no prospect of any material fall of prices, and we have still to take account of increased rent.

7. It is to be noticed that the details in 1913 are only used to supply weights to the percentages shown, and they can be modified considerably without affecting significantly the result.

8. The general conclusion is that the cost of living has increased 64% to 1920 after the strictest economy has been exerted.

9. If now we allow £100 for saving, and include income tax, it is found that the increase of expenditure is 50 or 54% of private income. It is doubtful whether as much as £100 was normally saved (or spent in insurance premiums) out of an income of £900, with two children to bring up; if a smaller sum is taken, the increase is more than 52%.

10. Apart then from any question of professional expenses, it appears that salaries and fees of the fairly well-to-do middle class ought to increase at least 52%, if their standard of life is not to be seriously lowered.

TABLE II.

Average family: Man, wife, 2.1 children, 2.6 servants.

	1913 or 1914.	PRESUMED INCREASE.			
		Percentage.		Amount.	
		June '19.	Jan. '20.	June '19.	Jan. '20.

" Personal	(70)	50		35	
Total Expenditure	670				
Income Tax at 9d.	30				
Saving & Insurance...	(100)				
Total (net) Income ...	£800				

*In the first column figures in brackets are estimated, others are the average of 21 households.

**In the second column figures thus marked are the averages shown in families where neither house nor number of servants has changed.

Mean £414 = 62% of expenditure, 52% of income.

11. Having estimated the necessary increase in private expenditure, we must next find what has been the increase in expenses, what their relation to gross receipts in 1913 and what part is attributable to panel practice.

12. In the Memorandum forwarded to the Ministry of Health on October 25th, 1919, par. 10, it is shown that in the experience of 24 practitioners expenses were 24% of gross receipts. Information from 3 other practitioners raises the percentage to 26. It is also seen that the expenses of the same 24 had increased 69% by 1917. We have now obtained particulars of expenses in 1913 and 1919 from 29 practitioners, which lead to the following table:—

	Percentage of Expenses in 1913.	Percentage Increase to 1919.
Surgery expenses	29	65
Travelling	51	85
One-third rent, rates, fuel	10	29
	100	71

13. The expenses of travelling appear to be rising still, so that the + 71% is probably an under estimate at present.

14. If drugs and surgery expenses are excluded, the increase becomes 75%, and this may be taken as a reasonable estimate of the increase in panel practice.

15. Take as example a practice in which the gross receipts are £1,200, of which £400 is from panel work.

	1913-14.	Total.	Private Practice.	Panel Practice.
Gross receipts	...	1,200	800	400
Expenses, Drugs and Surgery	...	122	120	2
Travelling and One-third Rent, &c.	...	190	127	63
Expenses	...	312	247	65

16. Here one-third of travelling and the rent, etc., allowance are debited to the panel, while the whole expenses and their separate parts bear the same proportion to gross receipts and each other, as already shown.

17. On this basis the expenses of panel practice were 16% of gross receipts from the practice.

18. We have then:—

PANEL PRACTICE.			
	1913-14.	Increase to 1919.	
		Percentage.	Amount.
Expenses	£65	75	£48
Net Income	£335	50 to 53½	167 to 179
Total	£400		£215 to £227
			= 54 to 57 per cent.

19. The 50 to 53½% on net income is the estimated increase in cost from Table II. Hence panel practice should yield 54 to 57% more than in 1913 to pay its own expenses and give a minimum increase in private income.

20. When it is considered how severely expenses have been written down throughout the estimations it may reasonably be held that the 60% in the B.M.A. Memorandum is a very moderate estimate.

MEETINGS OF THE PROFESSION.

BIRMINGHAM.

A MASS meeting of panel practitioners was held in Birmingham on February 10th. Dr. G. A. WILKES, who was elected Chairman, explained that the meeting had been convened to consider the terms of service issued by the Birmingham Insurance Committee under the new Medical Benefit Regulations. He briefly narrated the events that led up to the appointment of the Board of Arbitrators, whose decision would be binding. Dr. H. G. DAIN stated, in reply to a question, that the amount fixed under arbitration would come into effect on April 1st. The meeting passed a resolution agreeing to work loyally under the award of the Board of Arbitration set up at the request of the last Conference of Local Medical and Panel Committees.

The CHAIRMAN stated that every effort to get the Regulation relating to transfer of practices deleted had been unsuccessful. Unless, however, there was some good reason why the patients should not be transferred to an incoming practitioner they would probably be so transferred. Upon this subject he read extracts from correspondence between the Ministry of Health and the Insurance Acts Committee.

Dr. DAIN gave in brief outline the main points that had been gained by the Insurance Acts Committee during the negotiations preceding the issue of the new Regulations.

The following resolution was carried unanimously:

That this meeting appreciates the energy and skill with which the Insurance Acts Committee has furthered the interests of panel practitioners in the framing of the new Regulations and the demand for increased remuneration, and wishes to express its warmest thanks to the Committee for those endeavours which have been so persistently made on their behalf.

The CHAIRMAN said he would like, in moving this vote of thanks to the Insurance Acts Committee for the work done during the last three years, to mention specially the name of Dr. Dain, who he was sure had worked for the entire good of the profession.

Dr. DAIN replied thanking the meeting.

A vote of thanks was passed to Dr. Wilkes for acting as Chairman, and the meeting closed.

INSURANCE COMMITTEES.

COUNTY OF LONDON.

At the meeting of the London Insurance Committee on January 22nd it was decided that the payment to practitioners for the quarter ending March 31st should be in two instalments, the first to be calculated at the rate of 1s. for each insured person on a practitioner's list, and that the amount of the second

instalment should be left in abeyance. It was mentioned that this was the last time the Committee would be asked to pay the quarterly sum in two instalments. Under the new Regulations there would be one quarterly payment representing in each case a final settlement.

It was reported to the Committee that the Colindale Hospital, Hendon, formerly the City of Westminster Infirmary, was being opened for the reception of advanced cases of tuberculosis. The hospital would ultimately provide accommodation for approximately 300 cases. Dr. LAURISTON SHAW protested against the setting aside of any institution purely for advanced cases, on account of the hopelessness which admission to such a place was likely to induce in the patients.

A resolution was proposed by a representative of the approved societies on the Committee urging that the special clinics for venereal diseases should be greatly extended, and that panel practitioners should be empowered and encouraged to refer all cases of venereal disease, known or suspected, to these clinics. Dr. B. A. RICHMOND took exception to certain of the premises of the resolution which seemed to imply that panel practitioners were not instructed in the most modern methods of diagnosis and treatment, and mentioned that out of 1,300 panel practitioners in London, 670 had received certificates showing them to have undergone a special course of training in the treatment of syphilis. The motion was referred to a subcommittee to consider and report.

Association Notices.

ELECTION OF REPRESENTATIVE BODY OF THE ASSOCIATION, 1920-21.

Constituencies in Representative Body.

THE list of the provisional *Home Constituencies* for election of the Representative Body, 1920-21, appeared in the SUPPLEMENT of January 24th, page 21.

As intimated to all the *Oversea bodies*, the Council has made each Oversea Division and Division-Branch, possessing an Honorary Secretary and the necessary organization, an independent Constituency.

Election of Representatives and Deputy-Representatives.

The Representatives and Deputy-Representatives in the Representative Body must be elected not later than May 28th, and their names notified to the Medical Secretary not later than June 4th.

The Council draws special attention to the fact that it is entirely within the discretion of each Constituency to decide whether the election of its Representative(s) and Deputy-Representative(s) shall be carried out by *General Meeting of the Constituency, or by postal vote.*

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty:—Surgeon Commanders: C. H. L. Petch to the *Wildfire* for Sheerness Barracks and Yard, F. G. Wilson to the *Pembroke* for Medical Transport (Ambulance Train), P. M. Rivaz to the *Pembroke* for Royal Naval Barracks, J. H. McDowell to the *Alecto*, D. P. Chapman to the *Centurion*, F. P. Mahon to the *Malaya*, P. D. Ramsay to the *Coronant*. Surgeon Lieutenant-Commander J. H. Burdett to the *Hussar*. Surgeon Lieutenants: J. T. Wyles to the *Dolphin*, F. H. Vay to the *Espeyde* on commissioning, W. A. Sinclair-Loutit to the *Montrose*, T. Gwynne-Jones to the *Clematis*. Surgeon Lieutenants (temporary): E. C. W. Cooke to the *Europa*, A. G. Taylor transferred to the permanent list of Surgeon Lieutenants, seniority November 11th, 1915.

ARMY MEDICAL SERVICE.

Major-General James B. Wilson, C.B., C.M.G., and Colonel D. D. Shanahan, C.M.G., D.S.O., are placed on half-pay. Colonel T. H. M. Clarke, C.M.G., C.B.E., D.S.O., retires on retired pay. Temporary Colonel A. S. Woodwark, C.M.G., C.B.E., relinquishes his commission and retains the rank of Colonel.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel J. G. McNaught retires on retired pay. Lieut.-Colonel C. S. Smith is placed on the half-pay list on account of ill health.

Major and Brevet Lieut.-Colonel W. Benson, D.S.O., and Captain J. R. Hill relinquish the acting rank of Lieutenant-Colonel.

Major G. H. Stevenson, D.S.O., to be acting Lieutenant-Colonel. The following relinquish the acting rank of Major: Captain and Brevet Major W. E. Marshall, M.C.; Captains G. G. Collet and G. A. Bridge, M.C.; temporary Captains P. P. J. Stewart, O.B.E., H. M. Anderson.

Captain W. S. Martin, from unattached list T.F., to be temporary Lieutenant, October 5th, 1914 (substituted for notification in the *London Gazette*, October 14th, 1914).

Captain P. C. Field is restored to the establishment (November 23rd, 1919, substituted for notification in the *London Gazette*, February 3rd, 1920).

Temporary Captain H. A. Tillman to be acting Major whilst specially employed.

Temporary Captain (acting Major) R. G. Oram (Lieutenant 9th London Regiment, T.F.) relinquishes his temporary commission.

The notifications regarding A. S. Griffith and temporary Lieutenant A. S. Griffith in the *London Gazette* of September 24th, 1917, and August 28th, 1918, are cancelled.

The following officers relinquish their commissions:—Temporary honorary Lieut.-Colonel J. H. Nicholl, and retains the honorary rank of Lieut.-Colonel on ceasing to serve with the Red Cross Hospital, Bellahouston. Temporary Majors and retain the rank of Major: W. P. Yetts, O.B.E., J. R. Lee, O.B.E., E. B. C. White (on ceasing to be employed at the Welsh Metropolitan War Hospital). Temporary honorary Major A. M. Westwater, and retains the honorary rank of Major on ceasing to serve with the Red Cross Hospital, Bellahouston. Temporary Captains and are granted the rank of Major: W. V. Robinson, (acting Major) J. W. Jones (on account of ill health contracted on active service—April 2nd, 1919, substituted for notification in the *London Gazette*, April 1st, 1919), (acting Lieut.-Colonel) F. R. Fraser. Temporary Captains and retain the rank of Captain: G. M. Jones, T. W. Kelly, E. C. Black, A. A. Henderson, C. V. Walker, W. P. Cooney, C. E. Mervyn, A. C. B. McMurtrie, M.C., J. G. Jones, M.C., J. P. Bridge, H. M. Leathes, H. G. Steel, F. J. Fahy, J. B. Donaldson, R. H. Liscombe, S. P. McDonald, S. S. Rosebery, W. R. Reynell, F. M. Bishop. Temporary honorary Captain C. R. Bird, and retains the honorary rank of Captain.

ROYAL AIR FORCE.

MEDICAL BRANCH.

Flight Officer G. McK. Thomas to be Flight Lieutenant. Transferred to the Unemployed List: Captains G. Meadows, J. Gardner, V. Magee; Lieutenants T. E. Roberts, T. Acton.

INDIAN MEDICAL SERVICE.

Colonel R. C. MacWatt, C.I.E., M.B., F.R.C.S., Inspector-General of Civil Hospitals, Punjab, granted privilege leave for six months with effect from December 28th, 1919.

Lieut.-Colonel D. M. Davidson, M.D., appointed to hold charge of the office of Inspector-General of Civil Hospitals, Punjab.

Major H. Crossie was granted privilege leave from September 30th to November 26th, 1919.

Majors to be Lieutenant-Colonels: (Brevet Lieut.-Colonel) J. D. Graham, C.I.E., M.B.; C. A. Sprawson, C.I.E., M.D., F.R.C.P.; (Brevet Lieut.-Colonel) M. Mackelvie, M.B., F.R.C.S.E.; W. Lapsley, M.B.; W. H. Cazaly, M.B.; W. V. Coppinger, D.S.O., M.D., F.R.C.S.I.; A. Spitteler, M.B.; J. C. S. Oxley, F.R.C.S.E.; (Brevet Lieut.-Colonel) L. J. M. Deas, M.B., F.R.C.S.E.; W. M. Houston, M.D.; W. D. A. Reys, C.I.E., M.D.; G. J. G. Young, M.B.; J. Good, M.B.; A. Chalmers, M.B., F.R.C.S.I.; W. G. Hamilton; S. R. Godkin, D.S.O., F.R.C.S.I.

A. C. Chatterji, M.B., appointed permanently to the service with effect from March 17th, 1919, and retains the temporary rank of Captain.

Major F. A. Barker, M.B., O.B.E., to be Senior Medical Officer and Civil Surgeon, Port Blair.

Major J. A. Cruickshank, M.C., M.B., has been granted combined leave for nine months (December 19th, 1919).

Lieut.-Colonel J. W. Grant has been posted as Residency Surgeon, Western Rajputana States (December 16th, 1919).

Brevet Lieut.-Colonel T. S. B. Williams has been posted as Residency Surgeon and *ex officio* Assistant to the Resident in Nepal (December 20th, 1919).

Brevet Lieut.-Colonel R. McCarrison, M.D., F.R.C.P., has been appointed to be an Honorary Surgeon to His Excellency the Viceroy.

Lieut.-Colonel J. T. Calvert, C.I.E., M.B., has been permitted to retire from the service (October 6th, 1919).

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Captain W. McK. H. McCullagh, D.S.O., relinquishes the acting rank of Lieut.-Colonel.

Captains relinquish the acting rank of Major: H. W. Maltby, M.C., D. S. Badenoch, H. H. Brown.

Captain J. R. Caldwell resigns his commission.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Major A. M. H. Gray, C.B.E., is seconded for service with the London University Contingent, Senior Division, O.T.C.

Captain (Brevet Major) W. J. Wilson is seconded for service with the Belfast University Contingent, Senior Division, O.T.C.

Captains (acting Majors) relinquish the acting rank of Major on ceasing to be specially employed: J. G. F. Hosken, F. Arvor (March 28th, 1919, substituted for notification in the *London Gazette*, September 18th, 1919).

Captain J. M. Kirkness is restored to the establishment.

Major H. H. B. Cunningham, T.D., to be acting Lieutenant-Colonel whilst specially employed.

2nd *London General Hospital*.—Captain H. F. Lancaster is restored to the establishment.

3rd *Northern General Hospital*.—Captain (temporary Major) A. E. Barnes relinquishes the temporary rank of Major (January 4th, 1918).

1st *Southern General Hospital*.—Major (Brevet Lieut.-Colonel, acting Lieut.-Colonel) J. E. H. Sawyer relinquishes the acting rank of Lieutenant-Colonel on ceasing to be specially employed.

TERRITORIAL FORCE RESERVE.

ARMY MEDICAL SERVICE.

To be Colonels: Captain E. F. Buzzard, from 5th London General Hospital; Captain (Brevet Lieut.-Colonel) Sir H. J. Stiles, K.B.E., from 2nd Scottish General Hospital; Captain W. Hunter, C.B., from 4th London General Hospital; Captain D. W. C. Jones, from General List.

ROYAL ARMY MEDICAL CORPS.

Major Sir J. Rose Bradford, K.C.M.G., C.B., C.B.E., F.R.S., from 3rd London General Hospital, to be Major, and is granted the honorary rank of Major-General.

The announcements regarding the following officers which appeared in the *London Gazette* of the dates indicated are cancelled: Major P. G. Williamson (December 31st, 1918, and January 18th, 1919), Major C. S. de Segundo, O.B.E. (November 15th, 1917), and Captain P. W. Young (April 3rd, 1918), Captain (Brevet Major) A. Walker, D.S.O. (January 9th, 1919), Captain (acting Major) A. R. Muir and Captain N. T. K. Jordaa (December 31st, 1918).

VOLUNTEER FORCE.

County of London R.A.M.C.F.—Temporary Lieut.-Colonel B. Duke relinquishes his commission and is granted the honorary rank of Lieut.-Colonel.

The following temporary Captains relinquish their commissions and are granted the honorary rank of Captain:—Flintshire

R.A.M.C.V.: D. Fraser. Glamorganshire R.A.M.C.V.: J. Hartigao. Hampshire R.A.M.C.V.: P. E. Todd. Lancashire R.A.M.C.V.: D. Fenton. Leicestershire R.A.M.C.V.: F. S. Morrison. A. L. Macleod. County of London R.A.M.C.V.: E. A. Chill. C. W. Ensor. Middlesex R.A.M.C.V.: J. S. Crone. A. Wylie. R. W. Starke. A. E. Tngnan. J. O. Shemmonds; (Motor Ambulance Convoy); W. I. Atkinson. W. C. Davie. A. S. Powell. J. B. Johnson. C. G. Hare. A. Paull. L. H. R. Skaydon. R. S. Barnes. L. C. Hudson. Oxfordshire R.A.M.C.V.: J. O. Sankey. T. D. (Major ret. T.F.). Suffolk R.A.M.C.V.: A. Y. Pringle.

The following temporary Lieutenants relinquish their commissions and are granted the honorary rank of Lieutenant—Cambridgeshire R.A.M.C.V.: F. Robinson. F. W. Mawby. A. J. Laird. Cumberland R.A.M.C.V.: F. R. S. Anderson. Denbighshire R.A.M.C.V.: W. B. Russell. Derbyshire R.A.M.C.V.: W. E. Bond. East Yorkshire R.A.M.C.V.: H. Wales. Kent R.A.M.C.V.: H. O. Preston. F. R. B. Hinde. County of London R.A.M.C.V.: J. B. Howell. Middlesex R.A.M.C.V.: H. R. Bowtell. F. G. Hargraves. T. W. Hicks; (Motor Ambulance Convoy); H. G. Cottrell. R. B. Alaway. F. W. Clifford. F. Claridge. F. E. Bishop. P. Ferguson. F. Becker. L. D. Hughes. Suffolk R.A.M.C.V.: C. W. Biden. O. R. M. Wood. H. G. Toombs. T. H. Goodman. Warwickshire R.A.M.C.V.: J. Frew.

DIARY OF SOCIETIES AND LECTURES.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Monday, 9 p.m., Third Lettsomian Lecture by Dr. Herbert R. Spencer on Tumours complicating Pregnancy, Labour, and the Puerperium: III, Cancer.

RÖNTGEN SOCIETY, 1, Wimpole Street, W.1.—Tuesday, 8 p.m.: Silvanus Thompson Memorial Lecture:—Professor W. H. Ragg, C.B.E., F.R.S.: Analysis by X Rays.

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.1.—Tuesday and Thursday, 5 p.m., Milroy Lectures by Dr. Aldo Castellani, C.M.G.: Higher Fluog in relation to Human Pathology.

ROYAL COLLEGE OF PHYSICIANS, EDINBURGH.—Monday, Wednesday, and Friday, 5 p.m., Morison Lectures by Dr. Richard G. Rows, C.B.E.: Neonatal Illnesses.

ROYAL SOCIETY OF MEDICINE.—Section of Surgery, Sub-section of Orthopaedics: Tuesday, 5 p.m., Cases and Specimens. Section of Pathology: Tuesday, 8.30 p.m., Mr. A. H. Drew and Dr. J. A. Murray: Staining and Constitution of Mitochondria. Dr. E. H. Kettle: Experimental Aspergillosis in the Rabbit. Dr. De Fano: Disseminated Scleroderma. Section of Surgery: Wednesday, 5.30 p.m., Discussion on The Remote Results of the Surgical Treatment of Gastric and Duodenal Ulcers, with exhibition of specimens (on view from 4.30 p.m.), to be opened by Mr. Herbert J. Paterson, to be followed by the President (Sir John Bland-Sutton), Sir D. Arcey Power, Mr. W. G. Spencer, Dr. Robert Hutchison, Mr. James Sherrin, Dr. Chas. Bolton, Mr. G. Grey Turner, Mr. Garnett Wright, Mr. Cyril Nitch, Dr. A. F. Hurst, Mr. Chas. Ryall, Mr. Jocelyn Swan, Mr. H. W. Carson, Mr. Joseph Cuning, Sir Crisp) English, Mr. R. P. Rowlands, Mr. A. J. Walton. Section of Ophthalmology: Wednesday, 8 p.m., Cases and Specimens. 8.30 p.m., Mr. Leslie Paton: The Use of Cobalt Glass in estimating Refraction. Mr. Charles Goulden: Treatment of Prolapse of the Iris following accident, with a note on the removal of non-magnetic foreign bodies from the anterior chamber. Section of Bacteriology and Climatology: Thursday, 5.30 p.m., Dr. W. Edgecomb: Visceral Fibrositis. Discussion on Immunity and Mineral Water Treatment. Section of Obstetrics and Gynaecology: Thursday, 8 p.m., Specimen. Dr. Gordon Luker: (1) Rupture of the Bladder associated with Three Months Pregnancy; (2) Late Post-partum Haemorrhage treated by Blood Transfusion and Panhysterectomy. Mr. Gordon Ley: Htero-Placental Apoplexy (Accidental Haemorrhage), an analysis of 50 cases. Section of Laryngology: Friday, 4 p.m., Cases.

POST-GRADUATE COURSES AND LECTURES.

BROMPTON HOSPITAL FOR CONSUMPTION, S.W.—Wednesday, 4.30 p.m., Dr. Batty Shaw: Body Weight in Adult Consumptives.

MANCHESTER ROYAL INFIRMARY.—Tuesday, 4.30 p.m., Professor H. R. Dean: The Wassermann Reaction.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, QUEEN SQUARE, W.C.1.—Monday, 2 p.m., Dr. Collier: Out-patients; 3.30 p.m., Dr. Aldren Turner: Ward Cases, Tuesday, 2 p.m., Dr. Grainger Stewart: Out-patients; 3.30 p.m., Dr. Risien Russell: Out-patients. Wednesday, 2 p.m., Mr. Sargent: Injuries of Peripheral Nerves and their Surgical Treatment; 3.30 p.m., Dr. James Taylor: Subacute Combined Degeneration of Spinal

Cord. Thursday, 2 p.m., Dr. Farquhar Buzzard: Out-patients; 3.30 p.m., Dr. Bindu Howell: Synpitis of the Nervous System. Friday, 2 p.m., Dr. Gordon Holmes: Out-patients; 3.30 p.m., Dr. Collier: Ward Cases. Saturday, 9 a.m., Surgical Operations.

NEWCASTLE-ON-TYNE: ROYAL VICTORIA INFIRMARY.—Friday, 1 p.m., Mr. J. W. Leech: Operations. 3.15 p.m., Dr. G. Hall, C.M.G.: Systematic Examinations of Nervous Diseases with Diagnostic Points. 4.30 p.m., Mr. H. B. Angus: Diagnosis and Treatment of Fractures.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.15.—Tuesday, 2 p.m., Dr. A. J. Whiting: Demonstration on Early Diagnosis of Pulmonary Tuberculosis. 4.30 p.m., Lecture by Mr. J. Howell Evans: Septic Conditions of the Gall Bladder and Bile Passages.

SALFORD ROYAL HOSPITAL.—Thursday, 4 p.m., Dr. Ashby: Heart Disease in Children.

SHEFFIELD ROYAL HOSPITAL.—Monday, 3.30 p.m., Dr. Nutt: X-ray Examination of Intestinal Tract. Tuesday, 4 p.m., Dr. Hay: Hemianopia: Cerebral Localization. Wednesday, 3.30 p.m., Dr. Wilkinson: Minor Aural Cases and their Management. Thursday, 3.30 p.m., Dr. Skinner: Aene Vulgaris, Ringworm, etc. Friday, 4 p.m., Dr. Hay: Diseases of Retina and Choroid.

WEST LONDON POST-GRADUATE COLLEGE, Hammer Smith, W.—Saturday (February 23rd), 10 a.m., Mr. Banks Davis: Operations of the Throat, Nose, and Ear. Monday, 5 p.m., Dr. Robinson: Gynaecology. Tuesday, 5 p.m., Mr. Tyrrell Gray: Congenital Dislocation of the Hip. Wednesday, 2 p.m., Mr. Donald Armour: Special Surgical Cases. Thursday, 5 p.m., Mr. Paldwin: Lecture on Practical Surgery. Friday, 5 p.m., Special Lecture, Dr. Donald Hood: Clinical Aspects of Aortic Disease.

British Medical Association.

OFFICES AND LIBRARY, 429, STRAND, LONDON, W.C.2.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 5 p.m., Saturdays 10 to 1.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on an application to the Librarian, accompanied by 6d. for postage.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager. Telegrams: Articulate, Westrand, London. Tel.: Gerrard 2650).

MEDICAL SECRETARY (Telegrams: Mediceera, Westrand, London. Tel.: Gerrard 2634).

EDITOR, *British Medical Journal* (Telegrams: Aitiology, Westrand, London. Tel.: Gerrard 2631).

- 2 Tues. London: Ministry of Pensions Subcommittee, 5 p.m.
- 4 Thurs. Brighton Division, Sussex County Hospital, 4 p.m., Surgical Demonstration.
- 5 Fri. London: Library Subcommittee, 2.30 p.m.
London: Stewart Prize Subcommittee, 3.30 p.m.
London: Therapeutic Subcommittee, 4 p.m.
- 9 Tues. London: Standing Subcommittee of Central Ethical Committee, 2 p.m.
- 30 Tues. London: Organization Committee.

A. W. Lloyd-Davies, M.R.C.S., L.R.C.P. (Wolverhampton Union).
J. Wilson, M.D. (Cheltenham Union).

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 6s., which sum should be forwarded with the notice not later than the first post on Wednesday morning in order to insure insertion in the current issue.

BIRTHS.

WILLIAMSON.—On February 23rd, at "Thurstone," Kingston Road, Romford, to Dr. and Mrs. A. J. Williamson, a son.

MARRIAGES.

CLYNE—WALKER.—On February 11th, at St. Andrew's Church, Bombay, Charles Clyne, M.C., M.B., C.B., of Golaghat, Assam, to Violette Estelle Walker. (By cable.)

WESTBY—MCMULLEN.—On February 15th, 1920, at St. Ann's Church, Dublin, by Rev. Canon B. W. Keymer, C.F., R.A.F., assisted by Rev. Canon David, vicar, John Thorp, M.B., B.Ch. (T.C.D.), only son of the late Dr. A. J. Westby and Mrs. Westby, 32, Waterloo Road, Dublin, to Marjorie, L.R.C.P. and S.L., younger daughter of the late Robert B. McMullen and Mrs. McMullen, 2, Arranmore, Herbert Park, Dublin.

DEATHS.

YOUNG.—On the 19th inst., at Park House, Royton, Lancashire, Ralph Young, M.A., M.D., in his 69th year.

CURRENT NOTES.

Council Meetings.

The dates of the Council meetings were fixed last summer upon the assumption that the Annual Representative Meeting would be held as usual at the end of July, 1920. The special circumstances of the University of Cambridge made it, however, impossible to hold the Annual Meeting at the usual time of year, and it was accordingly decided that the Annual Representative Meeting should begin on June 25th at Cambridge. In consequence of this arrangement the dates of the April and June meetings of the Council have now been brought forward to April 14th and May 19th respectively.

Rewards for Medical Discovery.

The Right Hon. A. J. Balfour, Lord President of the Council, received a deputation from the Joint Committee of the British Medical Association and the British Science Guild at the Privy Council Office on Tuesday, March 2nd. Sir Clifford Allbutt on behalf of the Association, and Sir Ronald Ross on behalf of the Guild, put before the Minister the views of the Joint Committee as to the need for recognition and recompense by the Government of medical workers in the field of science. A report of the proceedings appears in the JOURNAL.

The Arbitration.

The arbitration on the question of the appropriate capitation fee for insurance practice during the coming year began on Wednesday, March 3rd, at 11.15 a.m., in a room at the Ministry of Health, before Mr. F. Gore-Browne, K.C., Sir Richard Vassar-Smith, Bt., and Mr. J. C. Stamp, C.B.E., D.Sc. The reply of the Government to the case put forward by the Insurance Acts Committee on behalf of insurance practitioners will be found at page 58. We hope to publish next week a report of the proceedings, with possibly the decision of the arbitrators.

Salaries of Medical Officers of Local Authorities.

In December, 1919, a circular letter, in the nature of a reminder, was sent by the British Medical Association to the Local Authorities throughout the country with regard to raising the salaries of their medical officers. Up to January 20th last 1,350 replies had been received. Of these, 621 stated that the salary had been increased by 33½ per cent. or more, 227 that the salary had been increased by less than 33½ per cent., 65 that the Civil Service bonus (Awards 84 and 101) had been granted; and 119 that no action had been taken. Of the remainder, 248 sent replies not falling under the above four headings, omitting, for instance, to state the exact amount of the salary; and 70 formal acknowledgements were received. The foregoing information was presented to the Council of the Association on February 18th by the Chairman of the Public Health Committee.

Temporary Officers and Permanent Commissions, R.A.M.C.

The Naval and Military Committee of the Association recently considered a letter written by a medical man who had transferred from a temporary to a permanent commission R.A.M.C., complaining that he was debarred from counting his period as temporary officer towards promotion, pension, and increments in pay. He pointed out that if this attitude was maintained he would derive no benefit from his three years of war service. It appears that Army Council Instruction No. 1310 lays down that such service should not count. The Naval and Military Committee decided to approach the War Office and ask its opinion on this question. In reply, the Medical Secretary has been informed that temporary officers who take up permanent commissions will reckon their service as temporary officers towards increase of pay, promotion, and retired pay, and that an Army Council Instruction will shortly be published to that effect.

Nurses' Registration.

At a general meeting of the members of the Society for State Registration of Nurses, held on January 8th, instructions were given that grateful thanks should be conveyed to the British Medical Association for the great services it had rendered to the nursing profession and the public in furthering the passage into law of the Nurses' Registration Acts. The secretary of the society in communicating this to the Association stated that the foregoing vote of thanks, carried with enthusiasm, was no formal expression of opinion, but embodied the very strong feeling which nurses desired to express to the British Medical Association of gratitude for its championship of their cause.

Meetings of Branches and Divisions.

METROPOLITAN COUNTIES BRANCH: NORTH MIDDLESEX DIVISION.

A MEETING of the North Middlesex Division was held at Wortley Hall, Finsbury Park, on February 25th, when Dr. GEORGE COHEN was in the chair.

It was decided that the next meeting should be clinical, that Mr. ALEXANDER FLEMING of St. Mary's Hospital be invited to lecture on "vaccine treatment," and that members of neighbouring Divisions be invited to attend the lecture.

Dr. BRACKENBURY reported the present position of the arbitration proceedings in regard to the new insurance capitation fee.

The honorary secretary was instructed to write to the clerk of the Middlesex Insurance Committee stating that it was the opinion of the North Middlesex Division that a revised and extended edition of the Middlesex formulary should be issued at an early date.

Dr. DISTIN opened a discussion on the inadequacy of the present average fees for life insurance examination.

It was resolved that the members of the Division should not conduct an exhaustive examination for life insurance for a fee less than one guinea, and that if the amount of insurance were £1,000 or over the fee should be not less than two guineas.

INSURANCE.

ARBITRATION ON RATE OF MEDICAL REMUNERATION.

Observations made on behalf of the Government on the Case presented to the Arbitrators on behalf of the Insurance Practitioners.¹

GENERAL CONSIDERATIONS AS TO STANDARD OF SERVICE.

1. With the general considerations set forth in paragraph 3 of the Case, and in Sir Clifford Allbutt's prefatory memorandum, in respect of the standard of service required of insurance practitioners, the Government are in general agreement, as is shown by the following observations of the Minister of Health, taken from the published report of his interview with the deputation from the Insurance Acts Committee (referred to in this Statement as "the Committee") on December 4th, 1919.

Dr. Addison recognized that there were increasing demands in the community generally for an improved standard of service, and that an impetus had been given to these demands by the illustration that had been afforded during the war of what could be done by medical science, and said that no service, however dressed up with clinics, laboratories, and other provisions, could be an efficient service unless there were an efficient and contented general practitioner service.

2. The maintenance in insurance practice of the best attainable standard of general practitioner efficiency has been the aim of the Government since the inception of the Insurance Medical Service. In a letter to the British Medical Association of November 6th, 1912 (Cd. 6520, page 17) the then Chancellor of the Exchequer, Mr. Lloyd George, stated:

The standard of service which it is hoped that the doctors attending insured persons will reach and maintain is that which the best opinion in the profession itself would expect from a general practitioner in his ordinary work.

The practitioner will be expected to avail himself of all such facilities in the shape of expert assistance in investigations useful for proper diagnosis and treatment as are placed at his disposal.

3. Every kind of work indicated by Sir Clifford Allbutt as necessary for an efficient service of high standard is intended (so far as it is within the ordinary competence of general practitioners) to be part of the service which insurance practitioners are to be under obligation to render to their insured patients when required. So far, therefore, as considerations of this kind must be taken into account in the evaluation of proper remuneration, it is not desired to minimize them in any way.

4. When, however, every effort has been made, by adjustment of the conditions of service, to encourage improved treatment and the development of the practitioners' efficiency, it must be recognized that such developments can only be brought about gradually; the mere payment of a relatively high rate of remuneration will not in itself alter the professional capacity of the practitioner receiving it. The present arbitration is concerned with the remuneration which will be paid to a general practitioner in the conditions obtaining in the year 1920.

5. When Sir Clifford Allbutt passes from general considerations affecting present day medical work to a question of the increase which ought to have been made in remuneration in 1912, to correspond with the difference in standard of service expected from the insurance medical service as compared with that of previous club practice, he must be deemed to be giving an expression of his personal opinion, not put forward by him as authoritative on this point, nor can his suggestions be accepted that the rate of remuneration originally offered for the insurance medical service was based in any way on previous club practice. (It should, however, be stated that, if any comparison is to be made on this basis, the insurance rate to be taken is 9s., and not 7s. 3d., since the club practice rate of 4s. was inclusive of drugs.)

Inherent Difficulties Attendant on a Flat Rate of Remuneration.

6. With respect to the considerations stated in subparagraphs (ii), (iii), and (iv) of paragraph 3 of the Case, due regard must be had to the inherent difficulties attendant on a flat rate of remuneration that must be paid

uniformly to practitioners of varying degrees of professional efficiency. The number of doctors necessary to attend the 14 million insured persons is so large that, even were selection practicable, it would be impossible to confine the choice to the best. Moreover, the Insurance Acts do not admit of any selection of practitioners, but give every registered practitioner a statutory right to take part in the work of the service, unless and until his continuance be found, as the result of a public inquiry, to be prejudicial to the efficiency of the service.

7. The Government desire the rate of remuneration, as well as other conditions of service, to be such as will attract to the work (as they have in fact in the past seven years been able to attract) general practitioners who will not only give good service, but will co-operate in promoting improved developments of the service. But it would be visionary and wasteful to base calculations on the assumption that the service would be of a high ideal type throughout. The remuneration of practitioners throughout Great Britain under the Insurance Acts for treatment (apart from drugs and maternity services covered by the maternity benefit) amounts, at 7s. 3d., to about £5,000,000; each additional 1s. represents £700,000; and doubling the capitation fee, as is in effect proposed in the Case, means a total charge of £10,000,000. The present financial position of the country precludes additional expenditure in respect of potentialities of service that are not likely to become realities within the immediate future, which alone is now in question.

*Methods of arriving at "Fair Remuneration."*²

8. The two suggested methods of arriving at the appropriate capitation fee will be examined in their due order as they appear in the Case, but it will be seen that the first method involves a mere summation of items of which the primary one (the 7s. 3d.) is not agreed on either side as a true measure of the proper remuneration under the former conditions of service, while some of the remainder are unsusceptible of precise evaluation. Any result, therefore, arrived at in this way must be checked by the second method, in which the main factors are more easily estimated by reference to common experience.

9. Before proceeding to examine the main contentions of the Committee on the first method of approach to the subject, exception must be taken to certain references in paragraphs 4 and 5 of the Case (as well as in paragraph 27), to the scales of attendance fees prescribed in the schedule to the old Regulations as the basis of calculation of remuneration by reference to services rendered. It might be inferred from these paragraphs that these fees were prescribed as definite payments which practitioners were entitled to receive in respect of services rendered by them, or that they must be regarded as affording an accepted measure of the proper money value of these services. Reference to the Regulations will show, however, at once that this was not the case. The aggregate remuneration of the doctors of an area was precisely the same, whatever method of distribution of that sum among them was adopted; the fees stated in the schedule were token fees only, their sole purpose being to establish ratios for the equitable distribution of the fixed amount available among the several doctors concerned, and the scale was only in fact adopted to a very small extent even for this purpose. (See paragraphs 7 and 20 of the Agreed Statement.) If it were the fact that the amount made available in any area, which was calculated on a fixed capitation basis, fell short of the aggregate sum to which the nominal fees amounted, the former and not the latter represented the money which the doctors were entitled to receive, and the monetary value which was (for the time being) agreed upon between the Government and the doctors engaged in the work as the proper value to be placed on the services rendered.

THE FIRST METHOD.

Circumstances in which 7s. 3d. was determined.³

10. The circumstances in which the 7s. 3d. (forming part of a total figure of 9s. for treatment and medicines) was

¹ BRITISH MEDICAL JOURNAL, Supplement, February 28th, 1920, p. 46 (referred to throughout as "the Case").

² Paragraphs 1 and 2 of the Case.

³ Paragraphs 4 and 5 of the Case, and paragraphs 15 to 18 of Agreed Statement.

determined must first be stated. The Insurance Act of 1911 came into operation on July 15th, 1912, and the medical benefit provisions were due to come into operation in January, 1913. During the spring of 1912 the prospective conditions of service in connexion with medical benefit were fully discussed with the Advisory Committee, including, in addition to representatives of insured persons and other classes interested, representatives of the medical profession, some of whom were named by the British Medical Association. The question of remuneration was also discussed by the Chancellor of the Exchequer with a deputation from the British Medical Association, as a result of which it was agreed that Sir William Plender should be engaged to carry out the investigation into the actual income of doctors referred to below. The British Medical Association, however, broke off negotiations with the Government in July, 1912, and withdrew their nominees from the Advisory Committee.

11. It had already been indicated that the profession generally regarded the amount provided in the finance of the Act (6s. including drugs) as inadequate. After careful consideration of such data as were available, the Government decided to offer a rate which would yield the doctors a capitation fee, on average, of 7s. 3d. (or 9s. including drugs). This was decided upon, not as a figure arrived at by precise evaluation, nor as the result of negotiation—negotiations having been broken off—but because the Government were under obligation by the provisions of the Insurance Act to provide a medical service for insured persons on certain lines, and felt compelled to offer a rate, demonstrably in excess of the average income per head of the population which the doctors of that day were receiving, in order to secure, beyond question, the medical service which they were pledged to provide for the insured.

12. If it is now to be alleged that the amount was inadequate, it must be pointed out that, although the British Medical Association, in November, 1912, expressed the view that the conditions of service were derogatory and the remuneration inadequate, and advised doctors not to offer their services, nevertheless at the commencement of medical benefit the number of doctors who were willing to undertake service on the terms offered was ample to provide a sufficient service in every part of the country; and (apart from the temporary depletion caused by the calling up of doctors for military service) that service has remained adequate, in respect of numbers, throughout.

13. The Report (Cd. 6305 (1912)) by Sir William Plender of an investigation which was made with the co-operation of the British Medical Association contained the results of the examination of the books of over 200 doctors in the five towns of Darlington, Darwen, Dundee, Norwich, and St. Albans. An analysis of those figures makes it clear that the doctors in the areas in question in the years 1910 and 1911 were receiving about 4s. a head of the total population for all services given by them, excluding specialist and maternity services, which are not included within the present range of insurance practice, and drugs and medicines. It is to be noted that the inferences to be drawn from the Report are inferences drawn very largely from the ordinary private practice of that day among all classes of the community, the proportion representing income from club practice being less than 7 per cent.

14. The capitation fee offered by the Government of the day was, therefore, far in advance of what they could have paid if no better service was to be secured (not by the club patient but by the average member of the community), and no greater demand made on the doctors' time than under the conditions existing prior to the Insurance Act, and, being experimental and subject to revision in the light of experience, it necessarily remains an experimental figure until it can be tested, as it was contemplated that it should be tested, in the light of the services actually secured under the conditions of the Insurance Acts. This would, of course, involve an investigation which is by consent excluded from the terms of this arbitration.

15. The mere adding to the experimental figure of 7s. 3d. of the appropriate figure for increased cost of living and increased practice expenses, and for extra services alleged to be required as a result of war conditions, obviously cannot constitute that revision of the basic fee of 7s. 3d. itself in the light of experience which was originally contemplated, and leaves the result subject to all the doubts inherent in the original figure.

16. With these most important reservations, the First Method of approach put forward in the Case may now be examined in detail.

Cost of Living.

17. With regard to the addition sought to be made to the pre-war remuneration in respect of the alteration in the value of money during the last few years, it is necessary

to introduce further considerations beyond those put forward in the Case.¹ If the basis to be adopted in this connexion were that of giving full compensation for the increase in the cost of living, there would be little difficulty in admitting Professor Bowley's estimate of 50 to 53½ per cent. on a net income of £800 per annum. But it is open to serious question whether such a basis can be accepted under present conditions.

18. The last few years have seen an enormous destruction of material wealth, and for many reasons the present production of wealth throughout the world must be much less than before the war. Political and economic disturbances of a greater or less intensity, and a general reduction in the hours of labour coupled with a lessened enthusiasm for work, have all combined to restrict the world production of wealth. As regards the distribution of this wealth between countries it is difficult to escape the conclusion that, as long as the supply of raw materials remain so much below the demand as at present, the countries producing such materials are in a preferential position, and that this country is correspondingly at a disadvantage.

19. Turning to the distribution of the share of the world's wealth accruing to this country at the present time, it is now generally admitted that the workers with incomes close to the margin of subsistence should be given not only full compensation for the increased cost of living but an improvement in their standard of life beyond their pre-war standard. But with a diminished total national wealth this necessarily entails that other classes of the community must suffer some diminution of the pre-war standard, and medical practitioners would hardly ask to be released of their part of the resulting economic burden.

20. The determination of the precise diminution of standard to be expected of any class is a matter of the greatest difficulty. The question was, however, fully considered by the Civil Service Arbitration Board as recently as November last in revising the Civil Service rates of war bonus, and the Government see no reason to think that the award then made did not hold the balance fairly between the taxpayer and civil servants.

21. Apart from the opinion expressed in the Case as to the adequacy of the award, the only grounds submitted for not applying it to the Case are (i) that a civil servant may, but a doctor cannot, economize by changing his residence and altering his standard of living, and (ii) that the capitation fee includes an allowance for expenses to which the Civil Service bonus award is not applicable.

22. The second ground may be a proper reason for some differentiation, and it is considered further below, but the claim that the doctor is entitled to better treatment than the Civil Servant on the former ground cannot be accepted.

23. Changes of residence as a means of economizing are of course out of the question for either class at the present time, and it will be some years before the shortage of houses is fully met. Other economies which might conceivably affect a doctor's reputation and income, if he alone practised them, are not likely to have any such effect when they are adopted by doctors generally, still less when economy is compulsory on the majority of persons of his social standing.

Civil Service Award and Increased Practice Expenses.²

24. The amount awarded by the Civil Service Arbitrators in the case of a civil servant with a pre-war income of £800, the figure used as representing a doctor's income in paragraph 9 of the Case, is £300, or 37½ per cent.

Practice expenses³ are stated to have increased by 75 per cent., and, on the assumption that practice expenses were one-sixth of the receipts, this would justify an increase in that fraction of the insurance receipts by 75 per cent.

25. If five-sixths of the insurance receipts (in other words, the net income) is increased by 37½ per cent. and one-sixth of the insurance receipts (in other words, the practice expenses) is increased by 75 per cent., the effect on the whole capitation fee would be an increase of about 44 per cent.; and 44 per cent. of 7s. 3d. is about 3s. 2d., which would raise the sum of 7s. 3d. to 10s. 5d.

26. It will be noted that the Case, so far as expenses of practice are concerned, rests largely on figures furnished for a limited number of rural and semi-rural practices, and that a very large part of the expenses consists of travelling expenses, which are obviously much heavier in rural than in urban areas. It is stated in paragraph 12 (c) of the Case that if figures could be obtained from urban areas certain

¹ Paragraphs 8-11 and 15 of the Case.

² Paragraphs 9, 10, and 12 to 14 of the Case.

³ Paragraphs 14 to 18 of Professor Bowley's Memorandum, *Supplement*, February 28th, 1920, p. 53.

results would appear. Considering the long period over which negotiations have extended, and the importance of this factor whether under the First or Second Methods in the Case, it is difficult to understand why the figures for a large number of urban practices have not been produced.

27. If, however, for the purpose of argument, the estimate of increased practice expenses and the cost of living remains at 44 per cent., the figure of 10s. 5d. must be subjected to a correction. It includes travelling expenses in rural and semi-rural, as well as in urban, areas. It therefore covers certain services, formerly covered by the 7s. 3d., which are now made the subject of a separate payment out of the Central Mileage Fund,¹ equivalent to a capitation fee of 5d. for the whole insured population. This 5d. must be deducted from the sum of 10s. 5d., leaving a net sum of 10s.

Effect of War Conditions on Health of Invalided and Demobilized Men, and Generally.²

28. The figures given in paragraph 17 of the Case, in regard to attendance on men discharged from the Forces, involve a fallacy, namely, that the additional medical attention which these men will need as a consequence of their military service can be measured by comparing the attendance that has, in fact, been given to certain of them with that required by ordinary insured persons. The Committee are doubtless unaware of the fact that a large proportion of the men who were discharged disabled (invalided) were always of inferior physique, and many of them in bad health before their military service began. They were taken for the Forces in a period of great national urgency, and while it is agreed that the disorders from which many of them were suffering were aggravated by their service, with resulting need for increased medical attention, the extent of that need can only be ascertained by reference to the attention they required before their military service began, and cannot be gauged by reference to the ordinary requirements of the general body of civilian insured persons.

29. The Committee refer to certain statistics as to attendances in the year 1918 on invalided men, and it is said that such men required approximately three times the attendances on ordinary insured persons. There is no direct evidence as to the extent to which such men required medical attendance while in civilian life before the war, but there is conclusive evidence that, as a body, they were below the general average of health. This evidence is supplied by certain data obtained some time ago for an administrative purpose having no relation to the present question, and subjected to actuarial analysis.

30. Two sets of figures were obtained. The principal of these came from a certain group of large societies, and shows that, in the years 1914-17, 78,999 members of the societies were discharged from the Forces; the actuarial investigation discloses the fact that the claims of these men for sickness benefit prior to their joining the Forces were 28 per cent. above the "expectation" of the Standard Tables. But the experience of these societies, as a whole, in the same period, appears to have been about 8 per cent. below the expectation, and it would therefore appear that, as compared with their fellow members, the discharged men in these societies experienced nearly 40 per cent. more than the general average of incapacity prior to their military service.

31. These figures are fully confirmed by the other body of data. This was supplied by a number of small societies selected for the same administrative purpose and without any reference to the question now under consideration. Among these societies, 9,566 men were discharged in the period 1914-17, and the claims of this group for sickness benefit in the period prior to enlistment were found to have been 33 per cent. above the "expectation," while the claims of the whole membership of their societies in the same period were well below the same standard. It is probable that, as compared with their fellow members in these societies, the men who subsequently joined and were discharged from the army had an excess of about 50 per cent. in their periods of incapacity for work when in civilian life.

32. Where there is such clear evidence of heavy benefits being claimed before enlistment, it is reasonable to assume that there was at least a correspondingly heavy demand for medical attention, and even if it could be shown, as stated in the Case, that in the period immediately following their discharge the attention required by these men was three times the average, the extra call which this might include compared with pre-war conditions would represent a very minute addition, if any, to the aggregate

amount of the services which the doctors had to perform under their contract for treating all insured persons.

33. But it is further to be noted that the increased proportion of attendances to these men to which the Committee calls attention refers to the year or two immediately following discharge, when, in the nature of the case, the men concerned would experience much more than their own average need for attention. The cost per head of treating invalided men did in fact fall from about 20s. for about 150,000 men in 1918 to about 15s. for about 300,000 men in 1919. It is a fair presumption that the majority of the invalided men have now reached their ordinary state of health, and in 1920 will require little, if any, more attention than they did before they joined the Forces.

34. In any case, the excess cost of treating the invalided men, during 1918 and 1919, if divided among the whole insured population, represents an addition of a mere 2½d. a person to the capitation fee. Even this small temporary addition must be nullified by what transpires in this document with regard to sickness experience as a whole.

35. The point sought to be made as to demobilized men is one presenting no greater substance. No evidence is submitted in support of the opinion of practitioners that the effect of military service in respect of this class is greater than in the case of men who are discharged disabled, but if there was now any large amount of illness among the millions of men who have been demobilized, it should certainly be discernible in the sickness claims upon approved societies. No such feature, however, is found on examining the experience of these bodies. The returns for 1919 are, naturally, not yet complete, but a sufficient number of them are available to enable this matter to be tested. Taking all the available societies, which include a male membership of about 2,000,000, or over 25 per cent. of all the insured men in England, it is found that while in 1914 these societies paid in sickness benefit £973,662, or an average of 10s. 6d. per civilian member (soldiers are not entitled to sickness benefit), the amount paid by them in 1919 was £723,642, or an average, as nearly as can be ascertained, of 8s. 4d. per civilian member, including the large number who had been demobilized. The fact that in 1919 a substantial proportion of the members, probably averaging at least one-sixth throughout the year, were still in the Forces, and that these of necessity were of lower average age and probably of better average health and physique than the general body, emphasizes the difference between these two amounts. It is certainly true to say that, if disturbing factors could be segregated a decline in the sickness claims of men, between 1914 and 1919, to an extent substantially exceeding 25 per cent. would be exhibited. In the face of figures such as these the suggestion which the doctors make that the aggregate amount of their attendances has been increased because a certain proportion of demobilized men have come to them suffering from the after-effects of war conditions would appear to be wholly without foundation.

36. It is not, of course, denied that the doctors have to deal with cases of the kind named. But it is suggested that these cases have been viewed without that regard to proportion which is essential if their relative importance is to be appreciated. In particular the doctors appear to have overlooked the fact that their attention is arrested only by the cases which come before them as due to war service, ignoring the probably much larger number of attendances they give to demobilized men for causes not connected with their military service, and the number of demobilized men who have had no need to come to them for attendance at all. The nature of the attendance required in a small proportion of the cases may and probably has varied as a result of the war; but the question at issue is the relative volume of the total attendance before and since the war. On this point the statistical evidence presented by the Department leads to conclusions directly opposite to those to which general observation and opinion have led the profession, but in support of which no evidence is adduced.

37. As to the cases of "after-effects" which admittedly have arisen, the further question might have to be considered as to how far these represent a persisting feature of medical services, or how far they also may be regarded as merely temporary *sequelae* of war conditions which with each succeeding month must become of dwindling importance. But, in view of the evident misapprehension by the profession of the whole position as to demobilized men, it is not thought necessary to elaborate this point.

38. In paragraph 19 of the Case the Committee raise the further presumption that war conditions have produced deleterious effects on the health of many classes of the community. They call in aid a statement made by Mr. A. C. Thompson, President of the Annual Conference of

¹ Paragraphs 16-20 of the Case.

² Paragraph 21 of Acreed Statement.

Industrial Approved Societies, but, on examination, it will be seen that this statement is made in the most general terms and includes no specific suggestion that approved societies have, in fact, suffered in the claims made upon them either by men or by women. Mr. Thompson could not, indeed, have made any suggestion that, as a result of the war, the claims upon the societies had increased, for such would have been contrary to the plain facts within his knowledge.

39. Great numbers of people admittedly had to work harder and more continuously during the war than previously, but these conditions are not necessarily detrimental to health. They may, indeed, in many cases have precisely the contrary effect, and when it is remembered that with such conditions were associated high wages, complete freedom from anxiety as to the continuance of employment, and good food, to an extent not previously attainable by the masses of the population, it may well be concluded that the general health of the people, so far from having suffered, improved during the war.

40. It will no doubt be agreed that the claims for sickness benefit made upon approved societies afford a very fair index to the physical state of the people. The general indications of the claim experience in respect of men having been shown, the facts as to the claims of women must now be stated.

41. The number of insured women in England is about 4,000,000, and the average expenditure per head in sickness benefit in each of the five years 1914-18 is calculated as follows:

	s.	d.
1914	10	4
1915	8	0
1916	6	8
1917	6	0
1918	6	10

The returns of all societies for 1919 are not yet available, but are forthcoming in respect of societies representing a membership of 1½ millions. In order to show how far these may be safely taken as a sample of the whole, their experience as a group has been taken out separately for each of the years 1914-18, and that of the year 1919 has been added. The results are as follows:

	s.	d.
1914	11	3
1915	8	8
1916	7	0
1917	6	1
1918	7	0
1919	6	0

It will be seen that the course of the claims in respect of the 1½ millions of women for whom returns are available for the whole six years is closely parallel, in regard to the first five of those years, with that of the whole body of insured women, and it may be concluded, therefore, that the remarkably low level touched by the claims in 1919 upon the smaller body will be found to have been universal. There are, doubtless, various reasons for this phenomenon, and while it is not made the ground for any such assertion as that the need for medical attendance has declined by nearly 50 per cent. since 1914, it seems conclusive in support of the view that, as a fact, the health of the insured community has substantially improved in the course of the last few years, with some resulting relief in medical services. If the doctors have really any reason to look for increase of responsibilities due to "delayed nerve disturbances," they have at least the expectation of contrary conditions resulting from the great improvement in the standard of life and consequent freedom from strain and anxiety which large sections of the insured community have secured for themselves in recent years.

42. On this part of the argument, therefore, it is submitted that no case for an increase of remuneration has been made out.

Liabilities under the New Regulations.

43. What are described as definite new liabilities under the new Regulations¹ are (a) the provision that treatment is to be given in an emergency where neither the practitioner responsible for the insured person nor his deputy is available, and (b) the making of additional reports in certain cases and the personal attendance at consultations in some of the cases.

44. The position with regard to (a) is that, under the old Regulations, a doctor responsible for the treatment of an insured person was under obligation to provide, to the best of his ability, the services of a deputy, on occasions when he was unavoidably precluded from giving

personal attendance. Cases arose, however, in which neither the doctor nor any deputy with whom he might have made arrangements to act for him, was immediately available in an emergency in which an insured person on his list was in urgent need of immediate treatment; and, in such cases, other insurance practitioners who might be available, but with whom the absent doctor had made no arrangements, were under no obligation to attend. The effect of the new Regulation is to place definitely upon any insurance practitioner who may be available the obligation of acting in such an emergency (when neither the responsible practitioner nor his ordinary deputy is available) and to secure that the practitioner so called upon to act in the emergency shall be remunerated for his services by the practitioner responsible for the patient's treatment, according to a scale of fees agreed by the practitioners of the area. In other words, the Regulations secure that, automatically and without the need of any special arrangements between the practitioners concerned, each insurance practitioner becomes, for certain purposes and under certain conditions, the deputy of every other insurance practitioner in the same neighbourhood. It will be seen that, as regards the practitioner responsible for treatment, this amounts only to making fully effective the obligation, which has all along rested upon him, of providing a deputy when he is unable personally to attend, while as regards the practitioner called in, in such a case, the extent of the new burden (he being paid for his services) is the onus of being liable to be called upon at possibly inconvenient times. (It must be borne in mind that attendance in a confinement is not within this obligation.) Since the obligation extends only to cases arising within the radius (usually of two miles) within which the practitioner undertakes to give treatment, the number of cases likely to occur in each practice is very small indeed.

45. The provision is in fact the necessary stopping of a small gap in the old Regulations. To the extent to which it could be measured as an additional liability in terms of remuneration, it is believed that the addition of a small fraction of a penny to the capitation fee would fully cover the liability.

46. The reference to reports and consultations is presumably intended to apply to provisions in the Terms of Service² under which a system of Referee-Consultants is contemplated. Here again, while it is agreed that increased demands will be made on the time of the doctors, for which theoretically some increase of remuneration might be assessed, it is believed that the actual new work will be of relatively so small an amount, and accompanied by such set-offs in other directions through the operation of the same scheme, that only a nominal increase, if any, could be justified. The main objects of the new system are to diminish the calls on the Sickness Benefit Fund of National Health Insurance, and to assist medical practitioners by giving them second opinions and advice on cases which they refer, and the system will fail in its objects if any appreciable addition to a doctor's work in the matter of furnishing reports is not accompanied by an ultimate diminution in other claims on his professional time.

General Effect of the New Regulations.³

47. As regards "increased stringency of conditions of services," it is observed (paragraph 22 of the Case) that the provisions of the new Regulations are not regarded by the doctors as involving new liabilities at all comparable, as regards the burden on the doctor's time, to those referred to in paragraph 43 above, and that it is recognized that the improvements which the Regulations comprise are right and proper.

48. The Committee ask that, in assessing remuneration, due weight should be given to the new provisions of the Regulations referred to in (A) to (F) of paragraph 22 of the Case. It is submitted, however, that these new provisions do not impose any obligation on the doctor, as regards expenditure of time, which was not imposed upon him under the old Regulations, although certain of them make more explicit obligations which arose equally under the old Regulations, or take greater security for the enforcement of those obligations. The claim, therefore, for any increase in remuneration in respect of these provisions is in effect a claim that the doctors should be more highly paid than heretofore for rendering services which they have always been under contract to render, and have presumably rendered.

49. Respecting the matters referred to in paragraph 24 and in subparagraphs (4) and (5) of paragraph 25 of the Case—co-operation by insurance practitioners with public

¹ Paragraph 21 of the Case.

² See Paragraph 40 of Agreed Statement.

³ Paragraphs 22 to 26 of the Case.

health authorities, and co-operation in medical research—it is recognized by the Committee that no obligation arises under the Regulations. In his insurance practice, as in his private practice—in which such work is not of less importance—the part played by the general practitioner in the furtherance of these great objects is, in the present state of public provision of health services, determined by his aptitudes, his professional zeal, and his sense of public duty, and not by legal obligation. If and when the services of general practitioners in these spheres are made a definite part of organized public provision, this may very well be done under arrangements applying to all kinds of general practice, and not to insurance practice only, and the remuneration provided would come from sources other than those (including contributions from insured persons and employers) which are earmarked for providing a service confined to insured persons. In the meantime, there being no obligation, there is no basis for assessing a specific increase of remuneration; and if it be suggested that it is nevertheless desirable to attract to and retain in the service those who possess the personal characteristics which are likely to lead to such work being done, the answer is that the necessary qualities (except as regards personal aptitude for research, which cannot be commanded) are those which are required also for the provision of good treatment. This part of the Case, therefore, is not distinguishable, as part of a claim for remuneration, from the parts already examined, and affords no ground for provision of remuneration additional to that provided in respect of treatment.

50. Before summarizing the results of the examination of the First Method, it may be observed that in the last subparagraph of paragraph 27 of the Case, it is stated that the profession has been obliged in private practice to take action as to fees which is intended to produce a result approximately equal to the increase asked for by the doctors. Detailed information with regard to this is not furnished; but if the reports in the public press correctly indicate that the rate of private fees has been increased by 50 per cent., it is not to be expected that this will result in a 50 per cent. increase in the doctor's actual income, and the argument does not, in any event, furnish support for demands on the Government of such magnitude as those as the doctors are now making.

Summary of Results of Examination of First Method.

51. Summarizing the considerations put forward as a result of the foregoing examination of the Case stated on the First Method, as to the appropriate remuneration on the basis of pre-war conditions and the changes that have now supervened, it is submitted:

- (a) That the original figure of 7s. 3d. was experimental—has not yet been investigated by reference to the services actually rendered—and was in excess of the actual earnings of the profession at the time when it was granted;
- (b) That if the basic figure proper to the pre-war conditions could be ascertained, the allowance to be made in respect of increased cost of living and increased expenses of practice should not exceed 44 per cent. of that figure;
- (c) That the available evidence tends to show that the amount of work required to-day of Insurance practitioners per insured person is more likely to have been diminished by the collective results of war conditions than to have been increased;
- (d) That changes made in the conditions of service by the new Regulations will not have increased the services which practitioners previously contracted to give, to a degree represented by more than a nominal increase in remuneration;
- (e) That the considerations advanced in the Case in reference to changed conditions as regards public health and research, so far as they are not already covered, are not relevant to this Arbitration; and
- (f) That therefore no case has been made out for a net increase of remuneration (after allowing for the additional remuneration already provided under the Central Mileage Fund in respect of services previously included in the 7s. 3d.) which would involve the payment of a higher capitation fee than 10s.

THE SECOND METHOD.

52. It is now proposed shortly to examine the second, and, as it appears to the Government in the circumstances, the more appropriate, method of ascertaining the fair rate of remuneration.¹ For the fairness of a capitation fee can only be adequately demonstrated by showing what rate of yearly income it produces for the time properly taken up by the duties involved. Before examining the capitation fee with this object it is, perhaps, again worth emphasizing that the system of remuneration by a uniform capitation fee has the serious defect that the fee is paid to all practitioners alike—good, bad, and indifferent; its fairness cannot be tested by the worth of the best general practitioner or by that of the worst. The measure of the value of a doctor's time and service must be that of a good average general practitioner.

53. It is stated that the claim can be examined by the Second Method in two forms. It is not, however, proposed to deal with the form of examination set out in paragraph 30 (ii) and paragraphs 39-40 of the Case beyond stating that to assume the value of an item of service, and to multiply that amount by the assumed number of services which ought to be given in a year to a body of persons is not a method of calculating remuneration which could properly be applied to a contract for the treatment of 14 million persons. The margin of possible error is too great. In any case, the problem being to find an appropriate fee for payment on a capitation system, it is not seen how this can properly be tested by ascertaining what income could be produced by taking an assumed value for each item of service and multiplying it by the number of services rendered. Admittedly, the object of the second method is to ascertain what is the rate of income for whole time work which a given capitation fee would produce.

Measurement of a Doctor's Whole-time Income on a Time Basis.²

54. The comparisons made, in paragraph 35 of the Case, with incomes from other sources are open to obvious criticism. Particulars should be furnished of the services required from the whole-time officers referred to; and, in any case, part-time rates given for services of special kinds are not comparable with the rate under computation.

55. The estimate of 30 per cent. for working expenses in paragraph 33 of the Case and the estimate of time in paragraphs 31 and 36 of the Case, that is, that 1,000 persons require three-eighths of a doctor's working day, also cannot be accepted.

56. As regards the working expenses, the illustration based on the experience of several practices, given at the end of Professor Bowley's Memorandum, shows that practice expenses of £65 out of gross receipts of £400 become £113 out of gross receipts of about £620. The latter figure of expenses is about 18 per cent. of the gross receipts. It may be said that this is an under-estimate, but it is again necessary to state that there really should be no difficulty in producing adequate and clear evidence on this part of the Case, and it is not understood why 30 should be put forward in paragraph 33 of the Case as the proper percentage of income which represents practice expenses.

57. It is, however, recognized that Professor Bowley assumes an increase of net remuneration by 50 to 53 per cent., and that if this increase is limited to 37½ per cent., as proposed earlier in this statement, the expenses would be represented in Professor Bowley's illustration by 22 per cent. of present day receipts. In view of this, and, making allowance for the fact that, for the present purpose, the special burden of the cost of travelling in rural areas, and the cost of drugs everywhere, have to be excluded in measuring a doctor's expenses, a general average of 25 per cent. is considered to be a reasonable estimate of the proportion of gross receipts absorbed in the other expenses of insurance practice.

58. With regard to the "time factor," objection must be taken to the contention that the conscientious care by an insurance practitioner of his insured patients will make it necessary for him to devote so much as three-eighths of his total working time to the medical attendance and treatment (and ancillary duties as regards correspondence, etc.), which the responsibility for a thousand insured persons, well and ill, would involve. Such an estimate appears to be based on the assumption of an ideal standard of service which it is not suggested exists in ordinary general practice.

59. It is apparent from the Committee's statement that their assumption that four visits and ten consultations

¹ Paragraphs 29 and 30 of the Case.
² Paragraphs 32 to 38 of the Case.

(together with the correspondence, etc., incidental thereto) will occupy three hours is based on a conjectural estimate and not on direct observation and experience. It is further observed that in making the estimate allowance is said to be made for the variety of services required, minor operations under anaesthetics being mentioned by way of illustration. But obviously the validity of such a method of estimation must greatly depend on assigning the proper weight in respect of the numbers of different kinds of services that are required. It would be in accordance with familiar experience that when an average is thus struck conjecturally, without reference to definite statistics of the frequency of occurrence of various elements, the exceptional or prolonged service should make an impression on the mind out of proportion to its actual frequency. It has, however, often been stated by insurance practitioners, and it is in accordance with what would be expected, that the main effect of the Insurance Acts, as regards the demands on their time, has been greatly to increase the number of surgery attendances, both in respect of trivial ailments and also on occasions in the course of more serious illnesses when very little time is required for proper attention. The following table, showing the frequency of services of various kinds paid for on an attendance basis in connexion with the treatment of invalided soldiers, will help to illustrate this point:

(Figures given are for the year 1918.)

Services.	Percentages of Total Services.
Visits 232,459	15.7
Surgery attendances 1,059,244	72.4
Spec. in visits 3,763	0.25
Night visits 1,743	0.12
Operations 602	0.04
Anaesthetics 87	0.006
Fractures 57	0.004
Dislocations 29	0.002
Certificates 167,245	11.4
Reports 510	

60. Assuming, however, that the data are not available for a direct calculation of the amount of time necessary for giving the treatment required by the patients from among, say, 1,000 insured persons, well and ill, there are certain facts which reveal the implied estimate made by the profession generally in another connexion of the number of persons whose care a doctor can safely undertake in his whole time. This evidence is afforded by the statements that have been made in connexion with the question of the imposition under the new Regulations of a limit upon the number of insured persons whose care a practitioner working single-handed may be allowed to undertake.

61. The imposition of any limit was accepted with considerable reluctance, and after protest, by the Conference of Panel Committees. The Minister, on the other hand, decided with some hesitation to fix so high a number as 3,000 to be the maximum limit in respect of any practitioner in any part of the country, and contemplated that a lower limit would be fixed by Insurance and Panel Committees, save in exceptional districts or in the case of exceptional practitioners, where it could be shown that the circumstances were of such a nature as to make it especially easy to cope satisfactorily with a relatively high number. His action, however, in specially calling the attention of those Committees to the fact that it was on this principle that the maximum of 3,000 had been fixed, and that the fixing of an appropriate limit was a matter for full and careful consideration locally, was stated to be strongly resented by the profession, and was the subject of a vigorous protest from the Insurance Acts Committee.

62. It is to be observed that this limit is not the limit of the practitioner's total work, and so of his total remuneration; it is the limit, only, of a part of his work—namely, that represented by the insured persons he may accept on his list, leaving him entire freedom as to the amount of other practice in which he engages. Almost invariably an insurance practitioner will attend the dependants and other members of the family of his insured patients, as well as a certain number of persons belonging to the non-insured class. But if regard be had to the dependants of the insured only the *clientèle* of non-insured persons ordinarily accompanying an insurance list of 1,000 would be about 1,300. A doctor, therefore, who had 3,000 insured persons on his list might well be, in effect, undertaking the medical care of at least 6,900 persons in all (well and ill). It may be said, however, that it is not, in fact, expected that any but a very exceptional practitioner would attempt to cope with such responsibilities. Let the case then be considered of a practitioner with 2,000 on his list. The total *clientèle* of such a practitioner, including dependants of insured persons, would be, ordinarily, at least 4,600, or possibly

5,000. If 3,000 is regarded as the figure that any practitioner is to be allowed to take on his list without question, if he thinks fit, and without restriction on the number of other persons whom he attends, it would appear to be a reasonable inference that, in the opinion of the profession, an ordinary practitioner can safely undertake in his whole time the care of between 4,500 and 5,000 persons. Making some allowance for the possibility that the standard of treatment of the uninsured (either as regards number of attendances or time devoted per attendance) may not be so high as that which it is hoped will obtain in respect of the insured, there still remains a margin from which it may be inferred that, in the opinion of the profession, a practitioner could safely undertake to give adequate attendance and treatment, of the good standard expected in the insurance service, to those who required attendance from amongst 4,000 persons (well and ill)—men, women, and children. This obviously leads to the conclusion that the conscientious care of 1,000 insured persons will not, in the opinion of the profession, absorb more than one-fourth of a doctor's total working time.

63. It is not desired, however, on behalf of the Government (so great is their anxiety to afford no pretext for supposing that they would be prepared to accept an inefficient service) to insist too rigidly on this inference. They are prepared to agree that, for a satisfactory service, something more than one-fourth of a practitioner's total working time might be required for the care of 1,000 insured persons, and for the purpose of the present case therefore they would be content that the Arbitrators should estimate two-sevenths as the proper fraction.

64. If, then, the care of 1,000 persons be regarded as absorbing two-sevenths of a doctor's time, and his remuneration in respect of that number be fixed at £500 gross (namely, at 10s. each) or £375 net (allowing 25 per cent. for expenses), this is equivalent to payment at a rate of about £1,300 a year net income. Even under the conditions of the present time it is submitted that this can hardly be regarded as an inadequate rate of remuneration for a good average general practitioner; it is a slightly higher rate than is suggested in the Case itself (paragraph 33) as the appropriate income of a man whose personality or opportunity and skill have resulted in his practice occupying his full ordinary time; and it is accompanied by the very substantial advantage of freedom from the contraction of bad debts and from the burden of collecting accounts.

Conclusion.

65. In conclusion, it is urged that, whether the question be approached by the first or second line of argument, there is adequate ground for holding that a capitation fee of 10s. a head would provide "fair remuneration" within the terms of reference of the Board.

In the course of the negotiations with the Committee, the Government were fully satisfied that this was the highest figure which could be shown, as a matter of demonstration, to be appropriate to the services to be rendered. But recognizing the difficulty of precise evaluation of certain elements of the calculation, and desiring to give to the profession the benefit of any doubts in order to secure their willing and zealous co-operation, the Government decided to offer a settlement on the basis of 11s.

This offer was, however, refused, and the Arbitrators are now asked to decide the doubtful points in the light of the considerations placed before them by both parties.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty:— Surgeon Commanders E. R. Townsend to the *Royal Arthur*, R. F. Clark to the *Crescent* as Health Officer, P. F. Alderson to the *Terror*. Surgeon Lieutenant Commanders: A. S. Paterson to the *Diad* additional, G. D. Macintosh to R.M. Division, Plymouth; P. B. Wallis to the *Endeavour* on recommissioning. Surgeon Lieutenants F. L. H. MacDowel to the *Harebell*, G. M. Graham to the *Truro*, T. N. D'Arcy to the *Ceres*, B. S. Collings to Gibraltar Hospital, W. A. Jolliffe to the *Egmont*, J. R. Brennan to the *Mars*, T. J. O'Riordan to the *Veronica* on commissioning. Surgeon Lieutenants (temporary) transferred to the permanent list as Surgeon Lieutenants: J. Kirker, W. E. Heath.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel L. Addams-Williams retires on retired pay. Major and Brevet Lieut.-Colonel R. A. Bryden, D.S.O., relinquishes the temporary rank of Lieut.-Colonel on ceasing to command a medical unit (May 20th, 1919; substituted for notification in the *London Gazette*, November 25th, 1919). Major V. G. Johnson is placed on the half-pay list on account of ill health. Major H. C. Sidgwick, O.B.E., relinquishes the acting rank of Lieut.-Colonel. Major I. A. O. MacCarthy retires on retired pay.

Temporary Major W. C. Bosanquet (Brevet Major R.A.M.C.T.F.) relinquishes his temporary commission on reposting.

Temporary Major J. C. Davies (Major 4th Royal Welsh Fusiliers T.F.) relinquishes his temporary commission on ceasing to be employed with the Field Ambulance of the 43rd Division (June 7th, 1919).

J. L. Dickie (late honorary Captain R.A.M.C.) to be temporary honorary Major whilst commanding the Star and Garter Hospital, Richmond, Surrey (January 12th, 1916).

G. W. Beresford, O.B.E., late temporary Captain, to be temporary Major with seniority from January 14th, 1916.

Captain J. W. C. Stubbs, D.S.O., M.C., is seconded for service with the Egyptian army.

Temporary Captain J. R. P. Allin, M.C., relinquishes the acting rank of Major.

Late temporary Captains to be temporary Captains: S. F. Cheesman (seniority December 15th, 1916); C. S. Stollerforth (seniority December 15th, 1917).

J. G. Shaw, late C.A.M.C., to be temporary Captain.

O. T. J. C. De H. Clayre to be temporary Lieutenant.

The following officers relinquish their commissions:—Temporary Majors, and retain the rank of Major: C. R. Nicholson, A. C. O'Sullivan, T. B. Morse. Temporary Captains, and are granted the rank of Major: C. C. Harrison, M.C. (December 8th, 1919, substituted for notification in the *London Gazette* of January 8th, 1920), P. K. McCowan, (acting

Major) J. T. Grant, O. R. L. Wilson, H. H. Hepburn, H. C. Dnmere, M.C., J. A. Paterson, B. Knowles, M.C. Temporary Captains, and retain the rank of Captain: A. R. Mitchell, W. H. Orton, A. J. R. Taylor, C. G. Lees, T. Kennedy, J. Williamson, J. A. Hladfield, C. L. Herklotz, W. W. Hals'ed, G. R. Spence, P. C. H. Ryan, G. E. Kinnersly, M.B.E., D. S. Cassidy, E. W. Hall, L. J. O'Donovan, S. E. Holder, J. Gameson, M. Dobbs, D. H. Vickery, J. F. Wolfe, T. F. Shackleton, J. L. Smith, W. H. Stott, O.B.E., J. Scott, F. E. McGee, E. G. D. Nilsom, G. M. Elliott, J. S. Byrne, E. H. Eastwood, N. Erlington, C. D. Walker, L. R. Pickett, A. F. Palmer, W. J. Moloney, F. J. Pierce. Temp. Lieutenants, and retain the rank of Lieutenant: D. C. Macaskill, D. I. McNaughton.

VOLUNTEER FORCE.

The following temporary Majors have relinquished their commissions, and are granted the hon. rank of Major:—City of Edinburgh R.A.M.C.(V.): W. G. Aitchison-Robertson, Lancashire R.A.M.C.(V.): T. B. Grimdale G. Stowell.

The following temporary Captains have relinquished their commissions, and are granted the honorary rank of Captain:—East Yorkshire R.A.M.C.(V.): E. W. Archer, Kent R.A.M.C.(V.): H. O. Preston, E. J. Wood, A. F. Street, Lancashire R.A.M.C.(V.): S. J. Yeates, H. E. Jones, J. Watson, M. Bannister, W. J. R. Dunn, W. A. Rice, S. Hodgson (Captain T.F.R.). Shropshire R.A.M.C.(V.): W. A. A. Lewis, H. C. Woodhouse, E. B. Kersley, J. McC. McCarthy, F. K. Pigott (honorary Surgeon—Colonel, ret. T.F.), Surrey R.A.M.C.(V.): H. S. Stone.

The following temporary Lieutenants have relinquished their commissions and are granted the honorary rank of Lieutenant:—Hertfordshire R.A.M.C.V.: W. Gruggen, Kent R.A.M.C.V.: E. St. C. Henriques, Lancashire R.A.M.C.V.: F. J. Atkinson, Shropshire R.A.M.C.V.: R. Gwynne, Surrey R.A.M.C.V.: C. H. McComas, Sussex R.A.M.C.V.: W. E. Grandy.

DIARY OF SOCIETIES AND LECTURES.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Monday, 8.30 p.m., Heat Hyperpnea: Clinical Aspect, by Dr. W. H. Willcox, C.B., C.M.G.; Physiological Aspect, by Dr. Leonard Hill, F.R.S.

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.—Tuesday and Thursday, 5 p.m., Goulstonian Lectures, by Dr. J. L. Birtley, C.B.E.: Principles of Medical Science as Applied to Military Aviation.

ROYAL SOCIETY OF MEDICINE.—Section of Surgery, Subsection of Proctology: Wednesday, 5.30 p.m., Cases. Thursday, 5 p.m., Occasional Lecture, by Sir Jagadis Bose, C.I.E., C.S.I.: Plant and Animal Response (with Demonstrations of Growth by the Magnetic Crescograph). Section of Neurology: Thursday, 8.30 p.m., Professor J. S. B. Spoford: Results of End-to-End Suture of Peripheral Nerves. Clinical Section: Friday, 5 p.m., Exhibition of Cases.

POST-GRADUATE COURSES AND LECTURES.

BROMPTON HOSPITAL FOR CONSUMPTION, S.W.—Wednesday, 4.30 p.m., Dr. Izbau: Laboratory Methods in the Diagnosis of Tuberculosis.

MANCHESTER ANCOATS HOSPITAL. Thursday, 4.30 p.m., Dr. Reid: Locomotor Ataxia.

MANCHESTER ROYAL INFIRMARY.—Tuesday, 4.30 p.m., Dr. A. E. Barclay: X-Ray Demonstration of Oesophagus and Stomach.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.1.—Monday, 2 p.m., Dr. Collier: Out-patients; 3.30 p.m., Dr. Saunders: Ward Cases. Tuesday, 2 p.m., Dr. Grainger Stewart: Out-patients; 3.30 p.m., Dr. Risien Russell: Out-patients. Wednesday, 2 p.m., Mr. Sargent: Injuries of Peripheral Nerves and their Surgical Treatment; 3.30 p.m., Dr. Hinds Howell: Syphilis of the Nervous System. Thursday, 2 p.m., Dr. Farquhar Buzzard: Out-patients; 3.30 p.m., Dr. S. A. Kinnier Wilson: Ward Cases. Friday, 2 p.m., Dr. Gordon Holmes: Out-patients; 3.30 p.m., Dr. Gordon Holmes: Ataxia. Saturday, 9 a.m., Surgical Operations.

NEWCASTLE-ON-TYNE ROYAL VICTORIA INFIRMARY.—Friday, 2.30 p.m., Dr. G. Hall, C.M.G.: Systematic Examination of Nervous Diseases, together with Diagnostic Points. 3.15 p.m., Mr. H. B. Angus: Diagnosis and Treatment of all Fractures. 4.30 p.m., Professor R. P. R. Lyle: Diagnosis of Uterine Diseases.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.15.—Tuesday, 2 p.m., Dr. A. J. Whiting: Demonstration, Pulmonary Tuberculosis. 4.30 p.m., Dr. Ernest Jones: Psycho-analysis.

SHEFFIELD ROYAL HOSPITAL.—Monday, 3.30 p.m., Dr. Nutt: X-ray Examination of the Urinary System. Tuesday, 4 p.m., Dr. Hay: Errors of Refraction. Wednesday, 3.30 p.m., Dr. Wilkinson: Suppurating Ears. Thursday, 3.30 p.m., Dr. Skinner: Lupus, Lichen Planus, etc. Friday, 4 p.m., Dr. Hay: Subjective Sight Testing.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Saturday (March 6th), 10 a.m., Mr. Banks Davis: Operations of the Throat, Nose, and Ear. Monday, 5 p.m., Mr. Donald Armour: Operations for Hernia. Tuesday, 2 p.m., Dr. Pernet: Demonstration of Skin Cases. Wednesday, 2 p.m., Dr. Morton: Demonstration of Radiography. Thursday, 2 p.m., Mr. Bishop Harman: Operation for Squint. Friday, 5 p.m., Sir A. Pearce Gould: An Old Clinical Lecture, New Edition.

British Medical Association.

OFFICES AND LIBRARY, 429, STRAND, LONDON, W.C.2.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 5 p.m., Saturdays 10 to 1.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on an application to the Librarian, accompanied by 6d. for postage.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager, Telegrams: Articulate, Westrand, London. Tel.: Gerrard 2630).

MEDICAL SECRETARY (Telegrams: Mediscera, Westrand, London. Tel.: Gerrard 2634).

EDITOR, *British Medical Journal* (Telegrams: Aitiology, Westrand, London. Tel.: Gerrard 2631).

SCOTTISH MEDICAL SECRETARY—6, Rutland Square, Edinburgh. (Telegrams: Associate, Edinburgh. Tel.: 4361 Central.)

IRISH MEDICAL SECRETARY: 16, South Frederick Street, Dublin. (Telegrams: Bacillus, Dublin. Tel.: 4737 Dublin.)

Diary of the Association.

MARCH.

- 5 Fri. London: Contract Practice Subcommittee, 2.30 p.m.
London: Stewart Prize Subcommittee, 3.30 p.m.
London: Therapeutic Subcommittee, 4 p.m.
- 9 Tues. London: Standing Subcommittee of Central Ethical Committee, 2 p.m.
London: Maternity and Child Welfare Subcommittee, 2.30 p.m.
- 11 Thurs. Brighton Division, Sussex County Hospital, 4 p.m., Clinical Demonstration (Medical).
- 12 Fri. London: Ministry of Health Committee, 2.30 p.m.
- 17 Wed. London: Propaganda Subcommittee, 2.15 p.m.
- 18 Thurs. London: Medical Research and Laboratory Workers' Subcommittee, 2.30 p.m.
- 23 Tues. London: Public Health Committee, 3 p.m.
- 24 Wed. London: Medico-Political Committee, 2 p.m.
- 30 Tues. London: Organization Committee.

HENDERSON, C. J., M.B. Durh., Assistant Medical Officer to the Royal Albert Institution for the Feeble-minded, Lancaster.

JONES, W. Howard, M.B., B.S. Lond., M.R.C.S. Eng., L.R.C.P. Lond., Honorary Surgeon Anaesthetist to Charing Cross Hospital and Lecturer on Anaesthetics in the Medical School.

WAYLEN, G. H. H., B.A., B.Ch. Cantab., M.R.C.S., L.R.C.P., Medical Officer to the Institution and District Devises Union.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 6s., which sum should be forwarded with the notice not later than the first post on Wednesday morning in order to ensure insertion in the current issue.

BIRTHS.

COCHRANE. On February 25th, to Dr. and Mrs. Andrew Cochrane, 572, Chorley Old Road, Bolton—a daughter.

ROPER SAUNDERS.—On February 5th, at 19, Devonshire Place, Josmond, Newcastle-upon-Tyne, to Dr. and Mrs. Roper Saunders—a daughter.

SHATTOCK.—On February 27th, at 38, Mecklenburgh Square, W.C., to C. B. Shattock, M.S., F.R.C.S., and Mrs. Shattock (F. Mackenzie, M.B., B.S.)—a daughter.

STEEL.—February 1st, 19.0, at Mahableswar, India, to Major R. F. Steel, I.M.S., and Mrs. Steel (*née* Maudo Allen)—a daughter.

DEATH.

BURGESS.—On Sunday, the 29th February, at the Red House, Lincoln, Dr. Andrew Burgess, of Canwick Road, Lincoln. Funeral at Canwick Church on Wednesday, 2.30.

CURRENT NOTES.

Preferential Delivery of Motor Cars.

WE regret to have to announce that the directors of the Ford Motor Company (England), Ltd., have definitely stated their inability to continue giving preferential treatment in delivery of cars to members of the medical profession. The letter states that this was looked upon as emergency work, and that all cases of medical men requiring cars after their return from active service should have been dealt with by now. An arrangement has been made with the Ford Company to deal with the applications which are already in hand, but it must be clearly understood that no further applications can be received. In view of the decision of the Ford Company it has been decided to discontinue the whole scheme of preferential delivery, as owing to the great volume of regular business manufacturers are showing more and more reluctance to give special terms or facilities to any branch of the community. It is desired to take this opportunity of acknowledging the kind and courteous manner in which Messrs. Ford have dealt with these special applications.

Ministry of Pensions.

The Medico-Political Committee, at its last meeting, decided to set up a special subcommittee to deal with medical matters connected with the Ministry of Pensions. As is well known, the British Medical Association obtained from the Ministry an undertaking that in making appointments it would give priority of consideration to those who had held commissions. Once this principle was recognized it follows that the actual selections must be left in the hands of the Ministry, which may be trusted to do what seems best in the public interest. It appears, however, that certain anomalies of selection do occur from time to time, and give rise to local dissatisfaction. Cases of this kind would be investigated by the subcommittee. If any practitioner who feels that he has a legitimate grievance will communicate the facts to the Medical Secretary, representations will be made to the Ministry, provided the subcommittee finds that a good case has been made out.

Admiralty Surgeons and Agents.

The British Medical Association has recently had under consideration the scale of fees paid by the Admiralty to its surgeons and agents. Evidently the Admiralty also had come to the conclusion that some increase in these fees was advisable, since it has addressed a letter to the Association asking for suggestions as to what increases would be considered reasonable. Certain proposals as to a suitable increase in the scale of fees have been submitted to the Admiralty, and it is believed that they are receiving the consideration of the Treasury. It is hoped that before

long an announcement may be made in these columns which will be satisfactory to those members who hold such posts.

The "New Poor."

At the meeting of the Council of the British Medical Association on February 18th the Chairman, Dr. J. A. Macdonald, reported that he had appointed the Treasurer and the Medical Secretary to attend a meeting, called by the Professional Classes War Relief Council, of representatives of organizations especially intended to cope with distress among the more highly educated classes, in order to consider the desirability of establishing some permanent form of co-operation between such organizations.

Newcastle Practitioners and a Garage Fire.

About twenty Newcastle practitioners lost their cars last month just when work was at its heaviest, through a fire at a local garage. Dr. James Hudson, the honorary secretary of the Newcastle-on-Tyne Division of the Association, immediately appealed to local car owners through the press for assistance in tiding over what might have proved a very serious crisis for those affected. His request for offers of cars on loan or hire, or for sale, met with a ready and generous response, for which he has offered the thanks of the profession.

SOME THOUGHTS ON THE ARBITRATION.

BY
H. B. BRACKENBURY, M.R.C.S.,
CHAIRMAN OF THE INSURANCE ACTS COMMITTEE.

WHEN the Insurance Acts Committee, on behalf of the profession and in pursuance of the instructions of the Conference of Local Medical and Panel Committees, suggested arbitration with regard to the capitation fee for insurance practitioners, an undertaking was of course given on both sides that the award of the arbitrators would be loyally accepted. The Government is now pledged to use every effort to get the House of Commons to pass estimates which will provide the money required; the Committee is pledged not to promote any organized effort to refuse service; and insurance practitioners are pledged to do their work honestly under the conditions of the award. These pledges are, however, not unlimited as to duration; it is understood that after the year 1920 a notice of not less than three months may be given to vary the terms and conditions of service, to alter the basis of remuneration, or to repudiate service altogether by organized effort.

Moreover, a loyal adherence to the terms of the award on this understanding does not mean that the award is accepted as being either just or satisfactory. To those who know the course of events when the Government was considering its reply to the demand of the profession for a capitation fee of 13s. 6d., and the pressure from various quarters which was then being brought to bear on the

Ministry of Health to resist any payment of more than 3s. or 10s. as an extreme limit, the extraction of the offer of 11s. from the Government appears something of an achievement. To have accepted this offer, however, at that stage might reasonably have been held to be an admission of its fairness and adequacy. To submit to the same basis of remuneration now at the hands of the arbitrators involves no such admission; it leaves the profession free to maintain its opinion that under present conditions no capitation fee of less than 13s. 6d.—or from that sum up to about 15s.—is fair or adequate for the kind of service which it had in contemplation, and free to take at the proper time any legitimate action that it thinks fit to carry that opinion into practical effect. Personally I am prepared to maintain this standpoint as strongly as ever.

To many of us the main disappointment in the matter is that the Government has missed a magnificent opportunity—one which is not likely to recur, at any rate in so favourable a form. At the present stage of national health developments the fundamental necessity has appeared to us to be the definition, the establishment, the encouragement of a "general practitioner service" (not with reference to the Insurance Acts only) of the best type, and with the widest outlook as regards its responsibilities towards both the individual and the community. In the case which the Insurance Acts Committee submitted to the arbitrators the outline of such a service is made quite clear, and the provision of such a service is offered. In the observations made on behalf of the Government—both printed and verbal—presented to the arbitrators, though some pen-service and lip-service is paid to the idea, there is a repudiation of this as a practical thing, and a belittlement of what is at present required or immediately contemplated. It has been understood by those representing the profession throughout all these discussions that the main object of the revision was to improve the present service and to provide one of a comprehensive kind which would expand and fit in with additional medical and accessory services. Yet we find the Government saying that "the number of doctors willing to undertake service on the terms offered was ample to provide a sufficient service in every part of the country, and that service has remained adequate, in respect of numbers, throughout." It is notorious that there are areas in which the inadequate number of doctors is the chief cause of some serious deficiencies in the kind of service rendered, yet the Government is satisfied with this. Again it is said "the number of doctors necessary is so large that it would be impossible to confine choice to the best," and "a relatively high rate of remuneration will not alter the professional capacity." Obviously, however, the capacity of the service is materially altered according to the number of individuals of higher or lower professional capacity who are attracted to it or retained in it, yet the Government appeals for an award of such remuneration only as will ignore this. Again, the Government states that the profession's estimate is based on "an ideal standard of service," that a "high ideal type" is "visionary," that it cannot afford to pay for "potentialities of service that are not likely to become realities within the immediate future," that "considerations advanced as regards public health and research are not relevant," that "no obligation arises under the Regulations" with regard to some professional work and responsibilities and, "there being no obligation," there can arise no question of remuneration in respect thereof. All this was not to be expected of the Ministry of Health or even of an intelligent Treasury; and it is profoundly disappointing to discover that at a time when a new era of health administration is supposed to be beginning, and when within the profession there is a spirit of eagerness to offer every service that can properly be asked from them, the Government should base its case on a repudiation of the conception put forward on the part of the profession, and should ask for an award on the assumption that these services are not required, or should not be encouraged, or would not be forthcoming. We must accept the lower level of service as what it is now proposed to pay for; we shall no doubt give good and honest value on that level; but once more it is proved that the profession is willing to give practical effect to ideals far in advance of those held by politicians and administrators—even those who are specifically charged with the care of the public health.

On such a level as that indicated it is possible to hold that a capitation fee of 11s. affords a fair basis for a minimum remuneration. The Insurance Acts Committee maintains that even on this level it is not enough. The reference to the arbitrators was so framed that they could discharge it by the mere mention of a figure as their award. This is what they have done, and it is therefore impossible to be sure how this figure was arrived at. To those of us, however, who through nearly eight hours were trying to follow the minds of the arbitrators, it seems not improbable that the final stage of the conclusion was something like this: "We will assume that 2s. 6d. out of any capitation fee is required for expenses. We will assume that a general practitioner can properly attend to 3,000 persons (not necessarily insured persons) in a 2,400-hour year. A net fee of 8s. 6d. will therefore produce an income at the rate of £1,275 net. This is approximately what both sides have said is not unreasonable for a general practitioner as such, working his ordinary full time." This is a supposition, but, in fact, the result may correctly be stated in that way.

Those who have conducted the negotiations on behalf of the profession have therefore accomplished this—that, on the new basis of remuneration, a practitioner who claims that he is able properly to attend to three thousand persons in all, will be paid in respect of those who are insured persons at the rate of £1,275 a year net, while he will be at liberty to cultivate any professional work of a more special character and to charge fees therefor at a higher rate, or to attend, if he can, a larger number of patients by working longer hours than those regarded as the normal. This is a very definite improvement on the existing state of affairs; to some members of the profession, and doubtless to many outside it, such remuneration will not appear unfair or inadequate for the kind of service postulated. If the profession determine—as I think it should—that this remuneration is still inadequate, it ought to show either (a) that £1,275 per annum is less than the proper value of a good general practitioner, or (b) that a higher sum than 2s. 6d. per person can properly be allocated to professional expenses, or (c) that the circumstances of the case or the capacity of a general practitioner do not permit of as many as three thousand individuals, *on the average*, being properly cared for, or (d) that the conception of a "general practitioner service" ought to be so enlarged as to necessitate a smaller number of persons being under the care of each practitioner without reduction of total income. Personally, I am prepared to maintain that every one of these propositions is true, and I fancy that nearly all practitioners will agree with this, with these exceptions—that some members of the profession who are not general practitioners may dispute the first, and that many general practitioners are still apt to deceive themselves about the third. We still need some clear thinking on this point, and I propose to conduct an inquiry as to the number of persons for whose health the State may properly require a general practitioner of ordinary competence and skill to be responsible, and I hope to put the result of such inquiry before the profession for discussion. In any case it is clear that, in order to secure a further revision of remuneration in the early future, it will be necessary on all the above points to obtain a large amount of statistical information from practitioners. The absence of this was our chief weakness before the arbitrators, and this lack was not the fault of the Insurance Acts Committee or its officers, who have appealed over and over again to the profession to produce such statistics. May we appeal once more, now that the need is demonstrated, for the immediate and careful keeping of the records and figures needed?

Experience teaches one thing more. If we are at the earliest possible time once more to raise the question, and to show once more, as we think, the complete reasonableness of our demands, should these demands once more be rejected by a short-sighted administration, the profession must be in a much stronger position with regard to unity of action and with regard to a defence fund than is now the case if action is to be effective. The present result is in many respects good; we had a right to expect it to be better. The machinery for negotiation has not proved to be at fault. The personnel is at any rate representative and very hard-working. But we shall never arrive at the full results we want to accomplish without the entire support, both moral and financial, of the whole profession.

INSURANCE.

ARBITRATION ON RATE OF MEDICAL REMUNERATION.

AWARD OF THE ARBITRATORS.

THE following is the award of the Board of Arbitrators, as announced by the Ministry of Health:

We, the undersigned, having taken upon us the reference to us by the Ministry of Health and the Insurance Acts Committee of the British Medical Association—namely, "To advise the Government what should be the amount of the capitation fee (per insured person per annum) on the basis of which the Central Practitioners' Fund under Article 19 (i) of the Medical Benefit Regulations, 1920, should be calculated so as to afford fair remuneration for the time and services required to be given by general practitioners under the conditions set out in those Regulations, in connexion with the medical attendance and treatment of insured persons," taking note of the agreement that "the capitation fee is not to include any payment in respect of the supply of drugs and appliances (such payments being met out of the Drug Fund under Article 22) nor any payments to meet those special conditions of practice in rural and semi-rural areas which are covered by the payments to be made out of the Central Mileage Fund under Article 19 (ii)."

And having heard and considered the statements of fact and arguments submitted to us *do hereby award, determine, and advise* that the capitation fee per insured person per annum defined as above should be eleven shillings.

As witness our hands this 5th day of March, 1920.

F. GORE-BROWNE.
R. V. VASSAR-SMITH.
J. C. STAMP.

REPORT OF PROCEEDINGS.

BEFORE F. GORE-BROWNE, Esq., K.C. (Chairman),
Sir R. VASSAR-SMITH, Bart., and Mr. J. C. STAMP, D.Sc.

Present on Behalf of the British Medical Association:—
Dr. H. B. Brackenbury, Dr. H. Guy Dain, Dr. A. Linnell, Dr. Alfred Cox, Professor A. L. Bowley.

Present on Behalf of the Treasury and the Ministry of Health:—Mr. Hurst, Mr. Strohmerger, Mr. R. W. Harris, Dr. Smith Whitaker, Sir Alfred Watson.

Mr. E. C. Bull (Secretary).

The following is the report of the arbitration proceedings on the rate of remuneration of Insurance practitioners.

The CHAIRMAN stated that the Arbitrators had read the documents sent in and were grateful to both parties for having made such clear statements. He called on the representatives of the doctors to make their reply to the statement put in by the Ministry.

Dr. BRACKENBURY emphasised the importance of the award upon which would depend not only the economic welfare of the 14,000 doctors but also the efficiency and adequacy of medical service for some 14,000,000 of the population. The profession had never been so eager to provide a service of high character for the welfare of the people as it was at present, and this ideal of service was fundamental to the consideration of the case.

The CHAIRMAN said that the Arbitrators would not concern themselves with the character of the service, but would assume

that a body of professional gentleman of high education were going to do their best to render medical service to the community. On that assumption the Board would say what to the best of their knowledge and belief would be a fair remuneration.

THE PROFESSION'S ARGUMENT.

Dr. BRACKENBURY said that though the Government in its reply paid tribute to the ideal service, yet in many parts of their Memorandum they seemed to belittle the character of the services which were going to be rendered, and treated the ideals of the profession as visionary. The profession, on the other hand, believed that the service required was one which would give the insured persons the fullest aid both in the prevention and treatment of disease, and that it should not be confined to the mere treatment of specific diseases in specific persons. Whether the service was looked at in that broad way or in the narrower view of merely contributing to the personal comfort of a certain number of persons made a considerable difference to the question of remuneration. The profession in consultation with the Ministry of Health had been considering for over 18 months what was the service to be aimed at and the improvements to be made in the existing service, and, having settled that, it did not seem to matter whether the payment for the service would work out at one million more or one million less in its charge upon the exchequer. The question was what was a fair remuneration for the services required. They did not suppose the Government would suggest that they had only a certain sum of money to give and that the Board had to find out what sort of service could properly be given for that sum of money. The character of the service to be provided had been agreed, and it remained to settle the fair rate of remuneration regardless of the total amount it would cost. It was first necessary to establish a suitable basic fee; and secondly, to settle certain suitable percentage additions to that basic fee in order to arrive at the proper remuneration. He contended that the basic fee should be somewhere between 7s. 3d. and 8s. 6d., and that properly it should be the higher of these amounts. The Government case set out that it was by no means certain that 7s. 3d. was the right basic fee and that it might very well be less, but adduced no serious arguments to show it should be less. The Committee had stated the remuneration in two forms, first as a capitation fee and secondly as a scale of fees. They had never said that that scale of fees of 2s. for a consultation, 2s. 6d. for a visit, a guinea for other things, and so on, was a scale that was actually intended to be paid; but they were certainly not token amounts, they were amounts set out as being approximate to those which were in fact being received by doctors at the inception of the Act and which according to expectation at that time the capitation fee might not unreasonably be expected to work out at.

In reply to questions as to what was his authority for making that statement, Dr. Brackenbury said the profession accepted the risk, believing there was a possibility that those fees would not be reached; but nobody knew at the time what demand would be made by insured persons or whether in fact a capitation fee of 7s. 3d. would work out, when translated into fees per item, at such and such a figure. The profession was aiming at not getting less than they could reasonably expect to obtain from the same sort of person in private practice for the same sort of services. If the fees mentioned in the schedule to the Regulations had been merely token fees it would have been quite easy to leave the

values out altogether and to use numerals or symbols; but in fact they were the fees actually being received by the greater body of doctors for services of this character, and the profession saw a reasonable chance of the capitation fee working out at something like the fees which they were in the habit of receiving.

The CHAIRMAN thought that a great deal was said at that time about doctors having smaller remuneration than that provided by the Insurance Act. Dr. Brackenbury replied that the Insurance Act was intended to do away with the unsatisfactory service given for the very small fees received by some doctors.

Dr. STAMP asked whether there was any kind of check in actual life on the theoretical scale or the scale that was generally adopted—whether it had been checked by finding out the total sum received as compared with the total services given, and Dr. Brackenbury replied that there had never been any such check on any large scale except in the Plender Report. The difficulty was that no agreement could be arrived at as to what was the extent of the service that would be required, and the total income produced depended not merely on the fee per item of service but also upon the number of items of service the doctor would be called upon to perform. If the profession at the time the Insurance Act came in had been told that a capitation fee of 7s. 3d. would work out on the average at something like 1s. 10d. or 1s. 11d. per attendance, as proved to be the case, they would have said then (as in fact many did say then, and many refused to come in because they believed it would work out in that way) that it was below their reasonable minimum expectation. They would have felt that the capitation fee ought to be in the region of 8s. 6d. rather than of 7s. 3d. in order that it might work out at something like the scale which the profession had in its mind from traditional experience.

In answer to questions by the Chairman and Dr. Stamp as to the recent income of doctors, Dr. Brackenbury pointed out that their income had not fallen off in late years because the work had been increased, but that all the considerations were vitiated by war conditions. Most doctors had been working for their colleagues as well as for themselves. The Plender Report showed that the items of service given by doctors in particular towns divided by the total population of those towns resulted in the number of items of service per person being 1·8, whereas under the Insurance Act the average of service for insured persons was 3·8. The figure of 1·8 could be accounted for in various ways. A large number of persons never got any attendance at all; a large number got what attendance they did from charitable institutions; and a large number got their medical advice, such as it was, from the chemist. It could be assumed that the private patient did receive a much more adequate attendance than the 1·8, and that that low average resulted from a very large proportion of the population receiving no attendance at all or an entirely inadequate attendance.

Dr. STAMP asked whether it would be safe to say that as to one-third of the insured population the service increased from 1·8 to 3·8 and as to the other two-thirds from 1·8 to 2, making an average for the whole population of from 1·8 to 2·6. Dr. Brackenbury thought that the ratio of the increase of attendance on insured would be vastly greater than the ratio on non-insured, but there was no statistical evidence. From 8s. to 8s. 6d. would be the fee which at the introduction of the Act would have produced that remuneration per item of service and that total income which the doctor would have considered fair remuneration for the services rendered; and anything like so low a figure as 7s. 3d. was not only considered then by a large number of the profession to be inadequate but had, as the result of experience, proved to be inadequate. He turned next to the propriety of the addition of 60 per cent. in consideration of the increased cost of living and increase in practice expenses.

He did not think it was necessary to deal at any length with the arguments in the Government Memorandum in paragraphs 18 and 19,* which dealt with the difficulty of finding the money to pay any considerable increase in the capitation rate.

The CHAIRMAN said those paragraphs appealed to him very much. Who was to pay for the war? They would all be delighted to put it on the war profiteers, but if they took every penny the profiteers had and brought them down to the same rate of income as the doctors were asking for there would still be an enormous amount left to pay.

Dr. STAMP thought the doctors would agree that finally wages and income were dependent upon the consumption of commodities, and that the present tendency of higher wages for the working class was that they wanted to have the same wages in order to consume the same commodities, not more; and if the commodities at any given moment became less than what they were before, the real wages might possibly be higher.

The CHAIRMAN said that the Arbitration Board agreed that the Civil Service would have to bear their share of the war burden. It had fallen on other professions, and the clergy in particular were very hard hit. Was it right to say that because the cost of living had risen x per cent. everyone should say that they must have their rate of remuneration increased x per cent.?

Dr. BRACKENBURY said that the medical profession would be the last to make any such claim. They had in their Memorandum discounted severely their claim on the ground of increased cost of living. They believed they had brought their claim down to an almost unreasonable limit in asking only for 60 per cent., not on expenditure but on income. The percentage of rise in the cost of food was 81. They were not asking for x (81) but for something materially less than 81. They had arrived at their 81 on extremely stringent lines; every possible substitution and economy had been allowed for. Had they claimed that the medical income should be raised by 81 it would be absurd because they would be claiming to be released from all the economic consequences of the war. Medical men along with other classes ought to suffer proportionately because of these consequences. If the cost of the necessities of life were raised in the proper proportion, which clearly they ought to be, then expenditure on those things which could be counted as comforts and luxuries and that portion which could be devoted to savings or investments must suffer materially when an increase of only 60 per cent. (or 55 per cent. apart from the cost of practice) was asked for instead of 81. With regard to the cost of carrying on practice he agreed that paragraphs 24, 25, 26 and 27 of the Government reply deserved consideration because the statistics of medical practice expenses were imperfect. He was sorry for it but the difficulties of obtaining figures from medical men in regard to these matters seemed to be insuperable.

Dr. STAMP asked from how many practices figures had been obtained. Dr. Cox explained that the profession had been urged to send in returns, that a very small percentage had replied, and that the percentage of adequate replies was still smaller.

In answer to the question how many replies were received altogether, Dr. Cox said that 500 would be the very outside, but a great many were not sufficiently detailed to be of any use for the purpose of the enquiry.

The CHAIRMAN was not sure he could agree that, taking the returns for what they were worth, doctors were entitled to the Government percentage of 25 for practice expenses; a doctor's expenses did not go up with his income but with the number of patients he had. Dr. Brackenbury objected that some of the largest practices had the largest proportion of expenses. The Chairman said that Professor Bowley's figures for practice in 1913-14, showed 1,200 panel patients at £400 with a deduction for expenses of £65; he worked out that in 1920 there would

* BRITISH MEDICAL JOURNAL, Supplement, March 6th, 1920, p. 59.

be a 75 per cent. increase, and that whether the remuneration was 7s. 3d. or 10s. or 15s. the expenses with regard to 1,200 patients would be £113, i.e., almost exactly 2s. a patient.

Dr. BRACKENBURY held that this must be modified because the great economy of expenses on which it was based could not be permanently kept up. The typical doctor had been cutting down expenses to the utmost limit. Dealing with the figures in paragraphs 25 and 26 of the Government case the symmetry of the 10s. now put forward by the Government was destroyed because the 5d. taken off in order to make the sum 10s. should not be deducted, as a considerable proportion of the practices to which the figures referred were urban practices to which the consideration of mileage allowance would not apply. As to the criticism that doctors were only raising their private practice fees by 50 per cent. while they were asking for 60 per cent. on the same grounds from the Government, the British Medical Association had asked doctors to increase their private fees by an amount which would apply to all classes of practice, not merely to general practice. It had asked all doctors to increase their fees by at least 50 per cent. and had not tried to differentiate between different classes of practice. The 50 per cent. was always a minimum. The action of the Association was intended to produce the same general effect on income from private practice as was now being sought to be produced by the increase of 60 per cent. on the insurance capitation fee. He then dealt with the proposed addition for the increased work due to war conditions. The contentions of the Government were that the disabled men were even before the war below the average condition as a class; that the effect of war was rapidly diminishing, and that the sickness benefit figures showed that medical attendance must have been lower. It was no new discovery that some of the disabled men were previously below the normal level, many of them got into the Army improperly. The Government stated that 79,000 members of certain societies were discharged and the sickness benefit question had been investigated to see how the pre-war figures compared with the average figures. No useful valuation could be made unless the total number of members of the Societies from which those 79,000 were taken was known. But applying the Government figures to the contention of the profession that some 8 per cent. of all insured persons had had their physical condition lowered, the conclusion was that the addition required was not "very small if any," but approximately 10 per cent. There were 1,120,000 such persons including wounded men who had lost limbs, men suffering from shell shock, malaria, etc. In answer to Dr. Stamp who asked whether any idea could be given as to the number of people whose claims had been dismissed on the ground that their health was not impaired, Dr. Brackenbury said that in reply to a question in Parliament in October last it was stated that of about half a million who had applied for pensions and whose condition had been adjudicated upon, 39,000 had been granted pensions and the others refused. Dr. Stamp asked what proportion of the total number of pensioners represented any increased demands on the doctor, to which Dr. Brackenbury replied that the whole number made an increased demand, though of course some would give less trouble than others. The increased demand on the doctors would ultimately be a diminishing one, but the statement in the Government case that it was a fair presumption that the majority of invalided men had now reached their ordinary state was most astounding. Every practitioner knew that it was not so; there were still persons who were finding out their disabilities and only now receiving pensions. In reply to a question by Dr. Stamp, whether doctors would not be able to do something more than merely keep these men as chronic invalids, Dr. Brackenbury said that ultimately no doubt a large proportion would become useful citizens, but it could not be truthfully said that they were rapidly improving, and as regards nervous complaints, such as shell shock, it was

not correct to say that these cases were rapidly disappearing. Moreover, there were large numbers of persons permanently affected with rheumatism, effects of gas and trench fever, heart strain and so forth, who could never approach their pre war ability though they would probably live the ordinary span of life. He emphatically disagreed with the statement in paragraph 40 of the Government's reply "that the claims for sickness benefit made upon Approved Societies afford a very fair index to the physical state of the people." The suggestion that there was a parallelism between sickness benefit and medical benefit must be strongly opposed. It was no more axiomatic than that there was a similar relationship between say sickness benefit and the death rate, which was demonstrably untrue.

This gave rise to a good many questions from the Arbitrators who suggested that there must be some connection because in order to get sickness benefit the patient must go to the doctor, and that the figures showed that a larger number were going to a doctor and getting a certificate in 1914 than in 1918; that the sickness benefit increases showed either more persons in bad health or the same number of people in bad health for a longer period of time. If the sickness benefit in 1914 averaged 10s. and in 1917 averaged 6s., it showed that people were drawing sickness benefit either in greater numbers or for a longer period in the earlier years than in the later years.

Dr. BRACKENBURY said it was fallacious to compare 1914 with subsequent years, and to ignore a very large number of persons who never claimed sickness benefit at all though entitled to do so. He did not agree that the figures showed that the persons required any less medical attendance. In answer to Dr. Stamp who suggested that he was establishing an inverse relationship between sickness benefit and medical attendance, he said it was quite possible by giving a greater number of medical attendances to bring about a reduced claim for sickness benefit in a proportion of the cases. Proper comparison would be with the year 1915. From that year there were two factors of increasing importance. First, the increased employment, and afterwards the rapid rise in wages made it not worth while for large numbers of persons to apply for sickness benefit. In addition, owing to imperfect administration, people who might have been content to take it, did not get their sickness benefit at all. When employment became better and wages began to rise it was not worth their while to go sick and claim sickness benefit at 7s. 6d. or 10s. a week towards which the first 3 days did not count. It was better worth their while, either to stick to work longer (in which case there would probably be more attendances on those persons in later years) or to take a few days off and not bother about benefit. There was a real enthusiasm during the war amongst all classes to do what they could to help the nation, and it was a common experience among doctors to be told by persons who, at an ordinary time would stay away from work, that they wanted to be patched up so as to carry on. It was true that that would not apply in 1919; but there was the unemployment dole in 1919, and many persons who in an ordinary way would have claimed sickness benefit claimed unemployment dole. The decreasing value of the sickness benefit was emphasised by the demobilised men's inability to claim their sickness benefit or, at the most, only able to claim half because they were in receipt of a certain pension. He agreed, in reply to Sir Alfred Watson, that that only applied to men with 100 per cent. pensions. Though there was no statistical evidence, the Insurance Act had induced people to go to the doctors in the early stages of disease as they had not done before. Hence they were made less liable to claim sickness benefit than they would formerly have been. If the Government figures were true, and the effect of the war had been greatly to diminish the need for medical attendance, the Ministry of Health could wish nothing better than a perpetual state of war. His contention was that the discharged disabled men and the men demobilised in impaired health were four times as numerous

as those to whom the 2½d. applied, and in addition there was the effect of the war upon civil population for the next few years. It would be a strange paradox if the effect of the attention of the profession to the health of the people were automatically to reduce the remuneration.

A Government representative suggested that the 300,000 were people who in fact presented themselves to doctors for medical attendance in the course of 12 months. 1,075,000 were people who were in fact receiving pensions on a particular day, 31st December, 1919. The number had been growing and was not the average number for the year.

Dr. BRACKENBURY said that his contention was that the 2½d. on 7s. 3d. necessitated an addition of 2½ per cent., this applied to the whole of the discharged, disabled and the demobilised impaired lives would necessitate an addition of 10 per cent. As for the effects of the War on the civil population, on this there was no statistical evidence, but in the mind of the profession there could be no doubt at all. In his own practice he felt the stress of that particular class more than that of the discharged or demobilised. The people whose nerves had been upset by overwork or domestic strain or air raids, had produced a far greater effect upon the total number of attendances. He was not concerned to prove that the profession would in the aggregate have more work to do in 1920 than it had had previously, but that the profession would have more work to do than it would had there been no war. Then as to the propriety of an addition for the altered requirements. The Government's reply rather suggested that these were of no account, but he regarded them as very real; the emergency attendance and the necessity for increased reports and consultations were two definite new liabilities. Their extent could not be gauged, but many doctors were very apprehensive about it.

Dr. STAMP suggested that the emergency attendance was largely a redistribution of attendances, and that the patients would have to be attended in any case by someone.

Dr. BRACKENBURY said that previously there was no liability to attend them at all; doctors could attend to them and charge for it. In the capitation fee two things were included beyond the ordinary practice expenses: the anaesthetist's fee and the fee to a fellow practitioner for attending in an emergency. Both were paid for out of the pool, and both needed the services of another doctor. The addition to be made to the total figure was believed by many members of the profession to be considerable. Personally he did not think it would be so large as many feared; but it was a new thing which might develop and might be a serious addition to the expenses a doctor had to bear.

Dr. COX remarked that the point was that the money formerly came out of the patient's private purse and now it was to come out of the limited pool which the profession shared locally.

Dr. BRACKENBURY expressed the hope that the effect of the new Regulations would be eventually to diminish the calls on the sickness benefit fund and to improve the health of the people; but they would not decrease the calls on the doctor; they would probably increase them. He would certainly have to write a good many reports he never had to write before, and he might have to set aside time for consultation with the referee. This would involve a good deal of extra work in the way of keeping records, and although the requirements were no doubt for the benefit of the service, they were really additions to the work and ought to be considered in the capitation fee.

With regard to the claim made to meet the increased stringency of the requirements some of the new Regulations had been objected to by the profession, but it might be taken for the purposes of this argument that they were accepted. Assuming that the increased stringency was necessary it nevertheless entailed additional work and compliance with additional requirements on the part of the great bulk of

doctors who would have done their work quite well without any such stringency. Then there was the increased time and energy needed to keep abreast of the advances made in medical science. More was required of the practitioner now in that respect than there was even six or seven years ago. The Government had stated in its memorandum that the consideration of the services to the community as apart from those to the individual was irrelevant. He did not think so. The duties to the individual could be discharged conscientiously without reference to the duties to the community, but the profession wanted to do something more than that. The results of such work could not be seen at once; probably not for many years; but the work had to be done at once; and they wanted to make clear that it was not some remotely ideal service they were driving at but a real thing, and if the right kind of spirit was to be infused into the service it would have to be recognised in the remuneration.

Asked whether the profession did not regard these particular duties as incumbent on them under the old Regulations, Dr. Brackenbury said the whole thing was largely a new conception in the eyes both of the profession and the public. It was a new consciousness of the importance of the relation of the general practitioner to the public health. He next dealt with the second method of computing the capitation fee. The Government had dismissed the second form of this method by saying it was based on a calculation of an assumption of what ought to be. This was not so at all. The value of each item of service was approximately known. The value of services varied in various practices and in different districts, but a quite ordinary fee now would be 3s. 6d., averaging up the different kinds of services required under the contract.

Dr. STAMP raised the question as to whether there was not too large a margin of error in a calculation of this kind—6d. too much or too little did not matter much in the case of an individual patient but it mattered a good deal when paying a bill for 14 million persons. Dr. Brackenbury agreed that the first method was the better because it offered fewer opportunities for varying opinions and margins of error. The figure for the average service was not an irresponsible guess; it was based upon the collection of scales in many parts of the country. It was not the result of exact mathematical estimation but of the traditional experience of the profession? The number of items was not a guess or an assumed number. The figure 3·8 was what had been arrived at by the experience of the insurance service, but in future the number would probably be higher. Taking the second method in its first form the net average income which it was desired to produce, namely, £1,300, did not seem to be seriously in dispute.

The CHAIRMAN and Dr. STAMP asked whether it was thought that the average general practitioner should have £1,300 a year giving his whole time, and how did that compare with any other profession? Dr. Brackenbury said that the income suggested was for the whole time of a good general practitioner. The corresponding figure before the war was about £800 to £900. He could not say the actual average income of doctors before the war. It had been variously stated, but the experience of the Central Medical War Committee showed that the average was higher than had often been stated. He agreed that the effect of the Insurance Act had been to raise the general average of medical incomes, but he could not say by what percentage. In some parts of Lancashire the doctors had said that their incomes were lowered by the Insurance Act owing to its interference with their method of charging for attendance. He was claiming an average income of £1,300 net for a good general practitioner, successful enough to have enough work to occupy his whole time, and filling up that time properly and conscientiously.

The CHAIRMAN asked whether if a man had 3,000 panel patients and he was attending the dependants (1,300 to every

1,000) and charging them 3s. 6d. for attendance, would that not bring him in a very substantial sum of money?

Dr. BRACKENBURY said that if the relevant paragraph made this suggestion it was absurd. It would require the population of the country to be at least doubled to make it work out that way. An ordinary practitioner with 3,000 insured persons, working under the present Regulations, not working overtime, would have no opportunity for private practice at all. The higher the number of insured persons the less proportionately was a man able to devote himself to any private practice. The profession was not in favour of these large panels. As a fact, in the districts where large panels were possible, the average fee for the dependants would be much less than the 3s. 6d. mentioned as the average fee per service throughout the country. He admitted in answer to Dr. Stamp that somebody had to attend the dependants in these crowded areas and in so far as they were not attended by hospitals and charities they were attended by the men with the large panels.

Dr. DAIN gave his own experience and that of other medical practitioners in Birmingham, which showed that the private practice of men with large panels had diminished.

Dr. BRACKENBURY was asked to address himself to the argument the profession had put forward that 1,000 insured persons would require more than one-quarter of a practitioner's total working time. He said he still thought that three-eighths was an extremely moderate estimate of the time required for one thousand insured persons. A doctor with a practice of 4,000 of all sorts (which would be about the full capacity of a good practitioner in favourable circumstances working his full ordinary time) would have, say, one thousand seven hundred and fifty insured persons. For the insured persons he would be spending seven-sixteenths of his time, which was above the three-eighths claimed. In paragraph 62 of the reply it seemed to be assumed that the profession had said that any practitioner was to be allowed to take three thousand on his list without question and without any restriction. The profession had not contended that. It had contended that it might be quite reasonable to make a special enquiry from time to time as to the way in which doctors with large lists were able, in conjunction with their private practice, to do their work, and if the doctor were not found to be doing justice to his patients to reduce his list. The profession had opposed the application of any limit of 3,000 because it was felt that there might be exceptional doctors with practices so situated as to produce all the factors which made for ease of work and which might allow them quite properly to take more than 3,000 but the balance was in favour of limiting the lists to 3,000. The protest of the profession on this point had been against the action of the Ministry of Health, who, after it had been understood that 3,000 was the maximum number and that local Committees were to be allowed to fix a lower maximum if they pleased, had stepped in and tried to force the local authorities to fix a lower maximum than they had asked for. The protest was not against the 3,000 but against a central government body interfering with a matter which was one for local arrangement. He wished to refer to the statement of the Ministry in paragraph 12 of their reply that there always had been adequacy of service. He thought it was agreed that it was not adequate in regard to the numbers of doctors. There were in some areas, notably London, fewer doctors than were necessary to give the service which was required. Adequacy in the strictly technical sense in the main there had been; there had never been such a shortage of doctors generally as to justify the Ministry in stepping in and closing the panel. One of the objects kept in view by both parties was to increase the number of doctors taking part in the service in order to make it more adequate. Even though the insured persons did not occupy the practitioner's whole time, they had a first claim on his time.

Averaging all the kinds of services together and all kinds of practices together—sparse rural and dense urban—and averaging all kinds of practitioners together, some of whom could work thrice as fast as others with equal efficiency, and limiting them to an ordinary working day, on that basis the three-eighths claimed as the proportion of time that ought to be devoted to 1,000 persons was within the mark.

To sum up he submitted that the basic fee from which the calculation should begin ought to be in the neighbourhood of 8s. 6d. rather than 7s. 3d.; that the 60 per cent. to be added on the actual value of money was a modest estimate and not open to the objections raised in the reply; that the more difficult question of the amount to be added in view of the conditions produced directly by the war among certain classes of persons was moderately stated, and whether the 12½ per cent. claimed was right or wrong he asked the Arbitrators to bear in mind that the number of admittedly impaired lives was very large; that the value of the entire services that were required of the profession by the community as well as the individual, the increased stringency of the service, the increased energy and time required by the necessity of the individual doctor keeping himself up to date were real things—all these went to enforce the contention that something in the neighbourhood of 15s. was a proper capitation fee; and that if that were tested in the light of all the facts adduced by the second method the result would be found not unreasonable. The profession was prepared to stand by the whole of the case submitted to the Board, and they did not believe that in any essential respect it had been shaken by the Government's reply.

Dr. DAIN dealt with the 7s. 3d. originally fixed, suggesting that the Plender Report proved that the fees on the schedule which had been referred to were such as were being received at the time of the Report and were such as the profession might fairly have expected the capitation fee to produce. That Report showed that the population was getting 1.8 services and was spending 4s. 2d. a head. Insurance Act experience increased the services to 3.8 which would bring the 4s. 2d. up to 8s. 11d. (if nothing were allowed for drugs), or something like 9s. 3d. if drugs were allowed for. It was therefore reasonable to consider that at that time 7s. 3d. was a proper fee from which the present argument might start. He did not agree that a fair comparison could be drawn between the amount of medical attendance required and the amount of sickness benefit claimed. The figures in the returns sent to the British Medical Association showed 3.26 for 1913, 4.06 for 1914, 4.05 for 1915, 3.96 for 1916, averaging over the whole period 3.82. In reply to Dr. Stamp, Dr. Dain stated that these figures were sent in by doctors in many areas, at the request of the British Medical Association. In 1913 there were only 106 returns, but in 1914 there were 366, including 90 from Birmingham. The figures for Scotland were all below the figures for England and Wales—3.09 in 1913, 3.32 in 1914, 3.05 in 1915.

In answer to a question by Dr. Stamp as to what was the proportion of visits to attendances at the surgery, it was stated on the Government side that the proportion of attendances to visits lay between 3 to 1 and 4 to 1 on 245,000 insured persons. On the records analysed in 1914 the proportion was 3.22 attendances to 96 visits, about 3½ to 1 for the whole country.

Dr. STAMP then put questions as to the relation between the fees charged for the different items of attendance. Dr. Cox said it was difficult to make any comparison because of the different customs in different areas. In the area in which he had practised for example the fee charged by most doctors was the same whether it was for a visit or an attendance at the surgery and whether medicine was given or not. In other areas there was a higher fee for a visit than for an attendance, and in others medicine was an extra in both cases.

Dr. DAIN agreed that the B.M.A. figures showed a slight fall in the number of attendances given, but the Government

figures showed a tremendous drop. In addition to the fallacies mentioned by Dr. Braekenbury he wished to point out that between 1914 and 1915 there were millions of women coming into Insurance who were not entitled to any sick pay until after the first six months and after that they came on reduced rates as being late entrants.

Sir ALFRED WATSON said there were only 4 million women in Insurance altogether and Dr. Dain corrected his figures as regards entrants to "hundreds of thousands." In his area practically every married woman went to work.

Sir ALFRED WATSON said that during the war the estimated number of women who came into employment was about 1,000,000.

Dr. DAIN said the Birmingham Pensions Committee had informed him that the number of men applying for pensions was still slightly increasing, so there was no evidence there at any rate that they had resumed their normal state of health. He gave the particulars of practices known to him which seemed to show that it would take at least three-eighths of a practitioner's time to give efficient service to 1,000 insured persons; and Dr. Braekenbury adduced evidence from a large urban practice in which a test had been taken over a week, in this it was found that there were 1,183 services given in the course of a week by three doctors in partnership, of which 936 were surgery attendances and 247 visits. The test was taken in January but not a specially busy week.

Dr. DAIN said that if the profession was satisfied with the remuneration awarded, two difficulties would be met—there would be the remedy of under-staffing in overcrowded areas, and the satisfaction of the practitioner in the more sparsely populated areas that he might expect to get remuneration which would make it possible for him to live decently. There were many areas in which country doctors had found it difficult to make both ends meet.

Dr. LINNELL emphasised the last remark. Many rural practitioners had been seriously considering whether it was worth while carrying on. They could do it in pre-war days because rents, service and living were cheap, and though the financial results might be poor as compared with the towns a country life had attractions for some men. But the war had changed conditions completely, and though there was to be a considerable increase in the mileage fund he was not sure that it would suffice to keep men in the more sparsely populated areas. The proportion of visits to consultations in the country was much higher than in the towns, being estimated at one visit to two surgery attendances. He himself paid as many visits as he had attendances at the surgery. He emphasised many of the differences between rural and town practice which made the provision of a good capitation fee essential quite apart from the mileage grant, if the country doctor was to be able to live under present conditions. It had always to be remembered that no country doctor could have a large panel.

THE GOVERNMENT'S ARGUMENT.

On the Government side, it was pointed out that, in the Statement which had been prepared in reply to the Case presented on behalf of the insurance practitioners, it had been necessary to deal fully, and perhaps somewhat critically, with the points raised in the Case, but that the Government always had in view the object that they desired to secure an efficient and contented general practitioner service. It had been suggested by Dr. Braekenbury that the references to the total cost of the scheme were wholly irrelevant, but this was a view which the Government, as trustees for the persons who find the money for the Insurance Scheme (whether taxpayers or insured persons) could hardly be expected to share. The inherent difficulties of a flat rate of remuneration had been emphasised in the printed observations, as it was necessary to point out that for every increase of sixpence or a shilling beyond the point which secured a fair remuneration to the great body of

insurance practitioners, a small additional number of men might be attracted to the service, but the additional fee would have to be paid equally to the whole body of practitioners, and, therefore, the question of the total cost was a very real consideration, as 1s. a head represented £700,000.

With regard to the First Method of dealing with the case, the Board were reminded of the limitations of this method of approach. No case had been definitely made out by the doctors showing that the 7s. 3d. was the appropriate initial fee; and still less was this the case with regard to the sum of 8s. 6d. introduced into the argument. If the figure of 7s. 3d. was assumed for the purposes of argument, and various amounts were added thereto for the considerations set out in the Case, it then became necessary to test the resulting figure and see what sort of income it produced, and whether that was a reasonable figure.

The Plender figures had been introduced into the Government statement not in order to show that 4s. a head was the proper rate of remuneration to pay for insurance practice under the conditions of 1912, but to show what sort of an income the doctors of that day were getting from an average general practice. It was not intended that the Arbitrators should infer that the Insurance Act had not brought an appreciable increase in the amount of work, but it was very difficult to measure that increase in terms of remuneration, unless not merely the number but the quality of services rendered, and particularly the time occupied, was made the subject of an investigation. A comparison of the average number of services of 1.5 in the Plender figures for private practice with the number of 3.8 under the Insurance Act could not be accepted as meaning that the same body of doctors had suddenly begun to devote two and a half times the amount of time to their attendance on a large part of the population, when compared with what had been given before the Act.

Professor BOWLEY's estimate of fifty to fifty-three per cent. as representing the increased cost of living for a man with an income of £800 a year was not questioned, and it was not proposed to examine Professor Bowley on the subject. The only question under this head for the Arbitrators was to what extent it was proper to approach full compensation for increased cost of living.

Some discussion ensued with regard to the question of the proper proportion of income to be taken for practice expenses, and the Government representatives agreed that for the purposes of the First Method the figure of increase of seventy-five per cent. in the practice expenses themselves need not be challenged, although the illustrations appeared to be largely derived from rural and semi-rural practices. For the second part of the Case, Dr. Braekenbury said that he was prepared to agree that twenty-five per cent. of the total receipts not unfairly represented the proportion of insurance receipts which would be absorbed in practice expenses, excluding the special travelling in rural areas and all drugs.

After making the necessary additions for increased cost of living and for increased practice expenses, to the 7s. 3d., a figure of 10s. 5d. was arrived at in paragraph 27 of the Government statement, from which 5d. was deducted as representing the difference between the pre-war Mileage Fund and the amount of the new Central Mileage Fund. The point of the argument under this head was that the sum of 7s. 3d. was the remuneration paid for certain services, and that those services were now proposed to be paid for by a general capitation fee, together with a Central Mileage Fund represented by a capitation fee of about 5d. for the whole population. The services covered by the 5d. were not a new creation; they were always there, and they were undoubtedly paid for and included the amount being part of the 7s. 3d., although it was, of course, a matter for argument whether they were adequately paid for.

The attention of the Arbitrators was drawn to that part of

the Case in which it was stated that the rates for private fees had been increased 50 per cent. It was open to question whether this would result in a 50 per cent. increase in the doctor's actual income; and this did not in any case furnish much support for the demand which the doctors were making in regard to their insurance remuneration.

Regarding the suggestion that the scale of fees in the Medical Benefit Regulations was supposed to correspond with the capitation fee, and that, therefore, pre-war remuneration could be tested by this scale of fees, the Government representatives pointed out that it was clear, as a matter of history, that this scale was not put forward as intended to produce a given capitation fee. At the time of its introduction in 1912 negotiations had been broken off by the profession. The question of putting symbols or having mere numbers so as to suggest ratios was considered at the time, and it was clear that that would have been a more scientific way of doing it, but it was believed that it would be better understood by the doctors if the scale were stated by way of fees of a kind with which they were fairly familiar. The fees, however, remained tokens, and the Government were unable to accept the suggestion that they could be regarded as a basis for calculating the true pre-war fee.

The CHAIRMAN at this point said that he assumed that the doctors, when they were offered 9s. including drugs, made a rough calculation of the resulting income and decided to accept it.

With regard to the provisions in the Regulations for emergency treatment, the Government representatives suggested that the minds of the Board should be directed rather to the actual definite new obligation which was laid upon doctors by the new Regulations than to any apprehensions which doctors might have on the subject. This newly defined obligation was designed to cover a weak spot in the old Regulations. It was an obligation laid on an insurance practitioner, within the radius in which he undertook to give treatment, to treat an insured person in an emergency when neither that insured person's ordinary doctor nor his deputy was available. The whole point was one of emergency deputising. Under the old Regulations, if a man had been from another doctor's area, the doctor in the area in which the emergency arose could have been compelled to attend, but if the man happened to be on the list of a doctor in the same area, the other doctor could not be compelled to attend. In other words, when a man was outside his own doctor's radius, the obligation to treat was always there, and now the Regulations made it clear that there was equally an obligation on another practitioner to treat the man in an emergency whether he was within or without his own doctor's radius.

With regard to the new requirements arising under the conditions relating to the work of referees and consultants, the Government did not in any way want to minimise the amount of work which might be imposed by the existence of the necessity for reports and consultations and the keeping of records in connection therewith. They suggested, however, that these new conditions, by shortening the periods of sickness and by getting rid of cases of malingering, were going to reduce the work of doctors in other directions.

Dr. COX interposed that the referees might make things more comfortable for the doctor and for the patient too, but he could not see in the least how they would relieve the doctor of any work. The appointment of additional staff enabled more work to be undertaken, but in his experience it did not lessen work for the individual.

Dr. STAMP asked whether the work would not involve the keeping of accurate records of the illnesses from which patients were suffering. The Government representatives pointed out that the question of the precise form of record which would have to be kept was at present the subject of a reference to a Committee upon which doctors would be fully represented. The obligation to keep records had always been there, and

it would remain to be seen whether the new records would entail as much clerical work as the old. At any rate they had not understood that stress had been laid on the subject of records generally as part of the doctors' case. In the first year in which the referee system was in operation it was difficult of course, to estimate, but it was generally considered that the number of cases requiring to be referred would probably not exceed about 200,000, or an average of some 14 cases per doctor, per annum.

On the question of the increased stringency of conditions of service, as on the more general considerations referred to in paragraphs 24, 25 and 26 of the Case, it was submitted that there was nothing which afforded justification for any increase in the remuneration.

With regard to the effect of war conditions on the health of the community, the figures and the relevant paragraphs set out in the case had been supplied by the Government Actuary, who had got out these figures for an entirely different purpose, and was in no way coerced to put the figures forward as an advocate for the Government side of the case, but merely as evidence having some real bearing on the question at issue.

On the question of the relevance of the sickness benefit figures, the Government in no way suggested that the curve of variation of medical attendance and the curve of variation of sickness benefit corresponded precisely; but they did say that, although the amount of sickness benefit was affected by other conditions, the question of the state of health of the patient was of such preponderating weight when considering both medical attendance and claims for sickness benefit that there should be, if not a rough parallelism, at any rate some correspondence and that it would be impossible for the sickness benefit experience to drop very substantially, with the amount of medical treatment increasing appreciably at the same time. There had been an abundance of employment with high wages and good food, and it was submitted with confidence that there had been sufficient amelioration of the general health of the people to counteract substantially whatever additional burden had been thrown on the medical profession by the increased attendance that they were called upon to give to discharged men with pensions for disability.

With regard to the disabled and demobilised men generally, the case on the doctor's side was almost entirely based on the personal impression of doctors as regards cases which they had seen, and it was perhaps difficult for them to have due regard to the relatively small proportion which these bore to the whole insured population. The 300,000 men who were given treatment on an attendance basis in 1919 were the men actually requiring treatment during that period, and did not represent the total number for whom the doctors were at risk. In other words, those who required no treatment were not brought into the calculation, and the cost of treatment per head indicated by the amount of treatment which these 300,000 people received would therefore be excessive if spread over the larger number. The cost, however, had in any case actually fallen from 20s. in 1918 to 15s. in 1919, and this suggested that the extra burden of treating these men was rapidly disappearing. It was further pointed out that the sickness benefit figures given in regard to 79,000 of these men indicated that, as a class, the 300,000 would largely be men who before they joined the Army were receiving considerably more than the average amount of attendance, so that it was not surprising that these same men had two or three times the normal amount of attendance for some time after their discharge.

A table was put in showing the various diseases and wounds for which men were receiving pensions and gratuities, and it was pointed out that a large proportion of the cases would be such as not to require abnormal treatment or prolonged treatment after discharge. It was the policy of the Pensions Ministry to extend rather than curtail the amount of institutional treatment which was being given, and which, of course,

relieved doctors of the more difficult cases. The Arbitrators were asked whether they desired evidence from the Ministry of Pensions as to this, and they decided that it was unnecessary.

In conclusion it was pressed upon the Arbitrators from the point of view of the Treasury that the doctors were, in effect, asking that the pre-war capitation fee should be doubled and that this would represent a total cost of some £5,000,000 over the pre-war figure; and the Board were asked to bear in mind that the existing financial state of the country imposed on them, when deciding what weight should be given to elements of doubt in the points that had been laid before them, a special responsibility to make sure that the facts upon which they proceeded were definite solid facts. There was unfortunately a surprising absence of evidence from the doctors' side in regard to their actual attendances, their average incomes, satisfactory figures of actual expenses, and so on; and it was important that the Arbitrators should have full regard to the meaning of the statistical evidence which was put in by the Government as against some of the more general impressions left on the minds of doctors by the particular cases coming under their notice. It was further urged by the Treasury that, in the circumstances in which the pre-war fee of 7s. 3d. was fixed, there was at that time no material for demonstrating that it produced a given rate of income, and the Government were forced to leave no shred of doubt as to the success of the Insurance Act. Examined by the test which could now be applied in the light of the number of services rendered, the fee produced a pre-war rate for whole-time remuneration of about £1,000 a year, a not ungenerous rate.

Some discussion ensued as to the relative values of various pre-war and present day public appointments, and the inferences to be drawn from them, and the Government representatives suggested that the rate of whole-time income of £1,300 a year net, which a capitation fee of 10s. would produce, was an adequate remuneration for a good average general practitioner fully employed.

The CHAIRMAN asked for what period the award would be supposed to stand, and the Government representatives said that, while the Government had hesitated to decide to offer a fee for a given term of years, they were quite prepared to say that the award should operate for at least a year from 1st April, and after that by consent from year to year. Dr. Brackenbury said that the doctors' representatives would regard with disfavour any doctor who did not adhere to the award and gave three months' notice immediately after its appearance, and that on their side they would accept the award as operating for a year at least. He repeated that there was at this moment a more eager desire on the part of the profession to give a good service than any of them had ever known within the profession before, but that of course to secure that service it must be adequately paid for and the doctors' case suggested in their view the right amount. The Government representatives for their part emphasised their desire that a good service should be forthcoming, and said that it was essential from the public point of view that a good service should be secured. It rested with the Arbitrators to fix a fair rate of remuneration.

The thanks of both parties were tendered to the arbitrators for the great patience they had displayed in listening to the arguments addressed to them, and the proceedings concluded.

NATIONAL INSURANCE BILL, 1920.

THE Government's Bill to amend the Acts relating to National Health Insurance was presented to the House of Commons by Dr. Addison, Minister of Health, on March 1st, and has now been printed.* The Bill consists of seventeen clauses, with four schedules. The Memorandum accompanying it is as follows:

1. The main object of the Bill is to provide for an increase in the rates of benefits under the National

Health Insurance Acts in view of the fall in the value of money. The Bill increases the normal rate of sickness benefit from 10s. to 15s. a week in the case of men, and from 7s. 6d. to 12s. a week in the case of women; the rate of disablement benefit from 5s. to 7s. 6d. a week for both men and women; and the amount of maternity benefit from 30s. to 40s.

2. The Bill retains the fundamental principle of the National Insurance Act of 1911, under which the cost of the benefits is met out of compulsory weekly contributions by workers and their employers together with a grant of a specified proportion from the Exchequer. In order to provide for the increased benefits the joint weekly contribution is to be increased from 7d. to 10d. in the case of men, and from 6d. to 9d. in the case of women, and in each case 2d. of the increase is to be borne by the employer and 1d. by the worker. The proportion of the cost of benefits to be contributed by the State is to be two-ninths in the case of men as at present, and two-ninths (instead of the present one-fourth) in the case of women, with an additional Exchequer contribution towards the cost of women's benefits in the form of an increase in the present Women's Equalization Fund.

3. In consequence of the present general increase in the cost of medical services the Bill provides for an increased contribution from insurance funds towards the cost of medical benefit and fixes the total charge upon those funds at 9s. 6d. per insured person per annum for medical benefit, including drugs as well as attendance, and a further sum for this purpose will be provided in the shape of a special grant out of public funds.

4. Sanatorium benefit is no longer to be provided under the scheme of National Health Insurance, except in Ireland.

Arrangement of Clauses.

Clause.

1. Provisions as to contributions.
2. Rates of sickness, disablement, and maternity benefits.
3. Power of Minister to withdraw certificates and determine schemes.
4. Sanatorium benefit discontinued except in Ireland.
5. Amendment of financial provisions.
6. Provision for cost of medical benefit and for administrative expenses of Insurance Committees.
7. Amendment as to administration of medical benefit.
8. Procedure on appeal against decision of Insurance Committee.
9. Power of inspectors to take and conduct proceedings.
10. Amendment as to benefit of persons in receipt of disablement pensions or allowances.
11. Amendment of S. 13 of 7 and 8 Geo. V, c. 62, with respect to persons receiving training.
12. Extension of power to make regulations.
13. Consequential and minor amendments.
14. Application to Scotland and Ireland.
15. Power to make arrangements with Isle of Man and Channel Islands.
16. Construction.
17. Short title, commencement, and repeal.
Schedules I to IV.

INSURANCE MEDICAL RECORDS.

APPOINTMENT OF ADVISORY COMMITTEE.

THE Minister of Health and the Scottish Board of Health have appointed an Inter-Departmental Committee to consider and advise them as to the form of medical record to be prescribed under the conditions of service for medical practitioners contained in the new Medical Benefit Regulations, having due regard to the clinical purposes (including the remedial value to the patient of maintaining a suitable record of his case) as well as to the administrative and the statistical purposes which such records may be adapted to serve.

The Committee consists of the following members:

- Sir HUMPHRY DAVY ROLLESTON, K.C.B., M.D., F.R.C.P. (Chairman), Emeritus Physician St. George's Hospital, President Royal Society of Medicine.
- D. B. BRACKENBURY, Esq., M.R.C.S., L.R.C.P., Chairman Insurance Acts Committee.
- J. BROWNLEE, Esq., M.D., Director of Statistics Medical Research Committee.
- H. G. DAIN, Esq., M.B., Chairman Birmingham Insurance Committee.
- J. R. DREYER, Esq., M.B., Scottish Medical Secretary British Medical Association.
- J. CRAUFORD DUNLOP, Esq., M.B., Superintendent of Statistics, General Register House, Edinburgh.
- C. E. S. FLEMING, Esq., M.R.C.S., L.R.C.P., Member Wiltshire Insurance Committee.
- A. FULTON, Esq., M.B., Vice-Chairman Nottingham Insurance Committee.

* Bill 11, H.M. Stationery Office, price 3d.

- M. GREENWOOD, Esq., M.R.C.S., L.R.C.P., Medical Officer (Medical Statistics) Ministry of Health.
 R. W. HARRIS, Esq., Assistant Secretary Ministry of Health.
 H. W. KAYE, Esq., M.D., Director of Medical Services Ministry of Pensions.
 J. C. McVAIL, Esq., M.D., Scottish Board of Health.
 H. MEREDITH RICHARDS, Esq., M.D., Welsh Board of Health.
 T. H. C. STEVENSON, Esq., C.B.E., M.D., Superintendent of Statistics, General Register Office.
 S. P. VIVIAN, Esq., Deputy Registrar-General.
 J. SMITH WHITAKER, Esq., M.R.C.S., L.R.C.P., Senior Medical Officer, Ministry of Health.

The Joint Secretaries of the Committee are G. F. McCleary, Esq., M.D., and A. E. Joll, Esq., of the Ministry of Health, Whitehall, S.W.1.

CORRESPONDENCE.

Small Urban Areas and the Mileage Fund.

SIR,—I should wish to point out what seems to me an unfortunate discrepancy between the instructions given to Insurance Committees in a circular letter from the Ministry of Health dated January 20th, 1920, and the recommendations in the report of the Mileage Committee which this circular is presumably intended to carry out.

The object of the circular (of four foolscap pages) is to obtain particulars from Insurance Committees of the debatable small urban areas whose population should or should not be included in the distribution of the Mileage Fund.

The report says (paragraph 37):

We think that the line should be drawn at a population of 10,000. We feel that it would be unsafe to exclude urban areas of a smaller population, since the conditions of small urban districts appear to approximate to that of the more densely populated rural districts.

and goes on to say (paragraph 38):

It is recognized, however, that the proposed line of demarcation which is necessarily arbitrarily drawn may result in the exclusion of some areas which should properly be included, and conversely in the inclusion of some that should be excluded.

The circular says:

Every urban district council area and municipal borough in the Committee's area should be excluded, except in cases where (a) the population of the area in question at the 1911 census did not exceed 5,000 . . . or (b) the Committee are prepared to substantiate a case for their inclusion for the purposes of the Central Mileage Fund.

By taking 5,000 as the normal line it seems to me the Ministry is doing precisely what the report says it is unsafe to do, and asking Insurance Committees to undertake the burden of proving that towns of between 5,000 and 10,000 *should* be included instead of, as the report suggests, showing that they should *not*.

The importance of the matter lies in this: there are many small towns and some larger ones where an appreciable number of the insured persons prefer to be attended by a doctor living in the country more than two miles away. If these towns of, say, 6,000 inhabitants are excluded the country doctor will get no expenses for attending patients residing in them, but the town doctor will be able to come out into the country and be paid mileage.

It is difficult to see why these towns should be excluded at all. If they are well provided with competent practitioners the demand for an outsider to come in will be small, and the call on the Mileage Fund correspondingly so; if, on the other hand, their insured inhabitants have reason to exercise their free choice in favour of a country doctor, why should he not be paid his travelling expenses as much as the townsman?

If I may venture to give advice to my fellow Panel Committeemen, it is that they should follow the recommendations of the report rather than the Ministry's circular, and include all towns of less than 10,000 population and exclude those of more, unless there are straggling suburbs, adjacent town areas, large rural areas within the municipality, arbitrary unnatural boundaries, or other special circumstances which call for special treatment in either direction.—I am, etc.,

Andover, March 9th.

J. P. WILLIAMS-FREEMAN.

Sickness Benefit Claims: A Fallacious Index.

SIR,—The case for the medical practitioners and the reply for the Government having been published, and the award of the arbitrators being apparently on the eve of publication, it is perhaps futile to comment upon either of the former. Nevertheless, in one particular the Govern-

ment's reply is so demonstrably based upon a misunderstanding of the facts that it may be useful to point to the error, in the hope at least of affecting any future negotiations. A feature of the case for the practitioners was the supposed increase of sickness incidence among disabled soldiers, demobilized soldiers, and the public generally, due to the war. The Government in combating this proposition (which is one well known and recognized by all practitioners, but difficult of proof without records), rely solely upon the returns of sickness benefit paid out by approved societies. They have apparently neglected the much truer index which a return of prescriptions issued would have given, and say that "it will no doubt be agreed that the claims for sickness benefit made upon approved societies afford a very fair index to the physical state of the population." With this axiom they go so far as to submit that on this part of the argument *no* case for an increase has been made out.

My contention is that, so far from being a fair index, the claims for sickness benefit under present conditions are no index whatever. I am not prepared with figures, but it is common knowledge that the ratio of wages earned during health to benefit paid in sickness has altered to an enormous degree. A man earning, say, 30s. per week before the war was paid, say, 10s. per week sickness benefit. He now earns some £3 per week, but his sickness benefit remains the same or is increased, perhaps, to 15s. The cost of living has increased somewhat in proportion to his wages; and, by the admission of the Government in another part of the document, his hours of work are shorter and the work, on the whole, lighter. It surely needs no documentary evidence to show that such a state of affairs has affected the ratio of claims to sickness benefit to medical attention required to an extent which entirely vitiates the former as an index of the latter.

Prior to the war the tendency was almost invariably for the worker to desire to claim sickness benefit earlier and longer than his medical attendant considered necessary. He was working hard, had little time to go to the doctor for trivial ailments, but when ill he desired to lay off work readily and to continue to receive sickness benefit so long as his finances would allow. It is now a very different story; he is getting big money for short hours; he has leisure to consult his doctor for trivial ailments; but when ill he simply cannot afford to cease work and claim sickness benefit unless absolutely necessary, and then for as short a time as may be. The obvious retort that it lies with the doctor to see that he is off work for so long as and only for so long as is necessary, will appeal to the bureaucrat who has stated in so many words that he expects our professional zeal and sense of public duty, but is not prepared to pay accordingly until he can gauge it with his (red) tape-measure; but it is beside the mark. The doctor with the best will in the world can have only a general influence in the right direction; very much must depend on the patient's point of view. Absolute malingering apart, the doctor is bound to rely in many cases upon information conveyed to him by the patient; and the difference in the aggregate between the sickness benefit claimed by a population desirous of claiming as much as possible, and that claimed by a population desirous of keeping at easy and remunerative employment as much as possible, may be anything from 50 to 100 per cent.

I hope that this view of the matter will have been already urged upon the arbitrators in the case.—I am, etc.,
 York, March 6th.
 J. C. LYTH.

The Regulations in Rural Practice.

SIR,—Permit me to bring before panel practitioners and the Committees concerned one or two matters affecting country practices which have been inadequately discussed and which ought to be amended before the new Regulations are finally settled.

Mileage.—It is agreed that payment should be made for extra time and cost in visiting distant patients. The limit of distance before such payment begins is at present two miles from the surgery. This means that the doctor has to cover an area of twelve square miles without extra pay. Is this area too much or too little? I assert that it is unreasonably large, and ought not to exceed three square miles, or one mile each way from the surgery. The true indicator ought to be the area a doctor can cover on foot. One mile each way (out and back) means eight miles' walking a day, or two and a half hours' work, after which the average man tires and cannot give his best attention. Beyond this limit a motor car is necessary. The expenses of the practice immediately jump up therefrom, at least £150 a year. Within the three square mile area a doctor may do his work on foot and economize; outside it he must have a conveyance, which simply eats up the fees

he makes, and often (as in my own case, for example) leaves him out of pocket. I should prefer 11s. within the one mile limit to 16s. or 18s. outside it. In the country there are no trams or cabs; one must have a car or walk.

Large Panels.—The average practitioner has been injured by the large panels of greedy men. It is now recognized that a limit should be imposed. I suggest that this limit should be one of area, as well as of numbers. The cutting down ought to be at the periphery where a man's area impinges on that of his neighbour, thereby recognizing areas as being to some extent parochial, and also recognizing the right of every panel practitioner to do his share of this national work, and incidentally to receive his pay for doing it. The popular practitioner would no doubt make good by private practice what he lost in area, and that without crushing out his neighbour by unlimited competition for panel patients.

Supply of Drugs.—In country places, where there is only one chemist, he has a monopoly of the drug supply. Doctors must not dispense for panel patients as they do for their private patients. The doctor may have, and usually has, a much better supply of drugs and special preparations—a variety which it would not pay any country chemist to stock. His patients on the panel may beg him to supply medicine and offer to pay for it rather than go to the chemist. He may be supplying the other members of a family with medicine, but the panel patient must go to the chemist or do without. If he goes, the results are not always satisfactory. Yet the doctor is responsible for the supply wherever the chemist fails, and for results. Would it not be better, in country places, to give the patient some option, or, better still, to credit the country doctor with drugs for all his panel patients and deduct all prescriptions dispensed by the chemist from the doctor's quarterly drug account, leaving to the patient the choice of going to the chemist if he wishes? By this arrangement the country panel patient would have no excuse for looking upon himself as ill-used or an outcast. The country doctor would also feel that he could treat all panel patients as private patients, a point on which so much stress has been laid in these negotiations. I suggest no limitation to the rights of the country chemist; what I do suggest is a little more liberty to the doctor and the patient.—I am, etc.,

Frizington, Cumberland, March 7th.

R. H. QUINE.

Publicity of Inquiries.

SIR,—The enclosed is taken from last night's *Manchester Evening Chronicle*.

The point I want here to draw attention to is the publicity of these inquiries, which destroys a man's character and livelihood whether he wins or loses.

Inquiries of this character should only be made public if and when heard before one of His Majesty's judges sitting in open court, who can clear a man's character from all stigma attached to the complaint if the occasion demands it.

This is a vital point for all panel practitioners.—I am, etc.,

Stalybridge, March 4th.

ADAM FOX.

* * * The newspaper cutting enclosed by our correspondent contains a report of an inquiry held that day by three commissioners, appointed by the Ministry of Health, into allegations against an insurance medical practitioner made by the local Insurance Committee. The doctor's name and address are stated, and the allegations of the Insurance Committee appear to be printed in full. The report gives a running account of the proceedings, and ends with the statement "The inquiry then closed." The commissioners' findings are not published.

Success and Freedom.

SIR,—In the case which the Ministry of Health recently placed before the arbitrators it is confessed that the rate of payment is not what the best general practitioners can earn outside the panel. One expects, therefore, that the best men will not go on the panel. What, then, is the basis of the Government anticipation that at some future time better work will be done on the panel than off it?

Success in practice is produced largely by qualities which cannot be acquired under Government tuition—for instance, sympathy, personality, keenness, and tact (how lacking are these in the officials of the post office, telephone service, etc.)—all of them flourishing best in the free state of man.—I am, etc.,

London, N., March 8th.

A. F. SHOYER.

* * * It is necessary to remind correspondents that no notice can be taken of communications which are not verified by the writer's name and address.

RANGE OF SERVICE BY PANEL DOCTORS.

THE referees appointed by the Scottish Board of Health have decided a question arising under the Medical Benefit Regulations (Scotland), 1913, between the Insurance Committee for the Burgh of Glasgow and the Local Medical Committee. The point in dispute arose out of a claim by a panel doctor for special remuneration for suturing finger tendons. The referees appointed by the Board were Mr. John Wilson, K.C. (Chairman); Dr. A. J. Campbell, Duns; and Mr. Frederick K. Smith, Surgeon to the Royal Infirmary, Aberdeen.

The witnesses examined were:—(a) *For the Local Medical Committee:* Sir Kennedy Dalziel, Lecturer on Clinical Surgery in the University of Glasgow; Professor Peter Paterson, Surgeon Glasgow Royal Infirmary; Mr. J. Battersby, Assistant Surgeon Glasgow Royal Infirmary; Dr. W. Lowson, Chairman Glasgow Local Medical and Panel Committee; and Dr. William Snodgrass. (b) *For the Insurance Committee:* Mr. W. Jones, Clerk of the Insurance Committee; Dr. D. H. Fotheringham; Dr. W. A. Caskie; Dr. J. R. Drever, Scottish Secretary British Medical Association; and the patient.

The Insurance Committee maintained that the operation of suturing tendons of fingers was not one requiring special skill, and that, in any case, the argument adduced by the Local Medical Committee was not wholly applicable in the special case.

In their report the referees state that they are satisfied on the evidence adduced that it cannot be affirmed as a general rule that in a case of suturing tendons of fingers the service is one which can consistently with the best interests of the patient be properly undertaken by a general practitioner of ordinary professional competence and skill. The following facts were established by the evidence—namely, that a distinction must be drawn between operations affecting tendons on the back of the hand and tendons on the front. (a) As regards the tendons on the front of the hand, the palmar or flexor tendons, there are special risks and difficulties. (b) As regards tendons on the back of the hand, neither the difficulty nor the risk is so great, but even in cases affecting these tendons, although occasionally appropriate enough for the ordinary general practitioner, no general or absolute rule that they are within his competence should be established.

The weight of the evidence was to the effect that in Glasgow in cases in which tendons of the fingers required to be sutured, the general practice over a long period of years has been for the patient to be sent to an infirmary to have the surgical operation performed there.

With regard to the particular case raising the present question, the referees are of opinion that there was not sufficient evidence to enable them to formulate a definite conclusion as to the exact nature of the operation performed. For the reasons set forth, the referees give as their decision: (a) That no general or absolute rule can be laid down to the effect that suturing of tendons of a finger is a service of a kind which can consistently with the best interest of the patient be properly undertaken by a general practitioner of ordinary professional competence and skill; and further (b) that in view of the inadequacy of the evidence relating to the particular case, the tribunal are not in a position to make any definite pronouncement as to its precise character or the skill which it entailed.

NOTIFICATION STATISTICS IN ENGLAND AND WALES.

THE statistics of the incidence of notifiable infectious diseases issued hitherto by the Local Government Board are of interest chiefly to local administrators, as information is given with regard to each sanitary district in England and Wales. A certain amount of information is, however, to be extracted. It appears for instance from the last reports, which deal with 1918, that the number of cases of tuberculosis notified was 92,132, equivalent to a rate of 2.75 per 1,000 of population. Of these cases 72,741 were pulmonary, giving a rate of 2.17 per 1,000. It is stated that the tables include a considerable number of duplicate notifications, the number varying in different areas but being particularly large in London. The value of the statistics is affected by this. The rate of notification of pulmonary tuberculosis declined from 3.03 per 1,000 in 1912 to 2.17 in 1918. The rate for non-pulmonary tuberculosis declined during the same period from 1.14 to 0.58. It is very doubtful whether these rates are of any value. The number of cases of measles and German measles was 414,346, giving a rate of 12.38. The next in order of frequency was scarlet fever and diphtheria, the former giving a rate of 1.44 and the latter of 1.31. Of enteric fever there were 4,306 cases, a rate of 0.13, and of typhus fever there were only eight cases in the whole country; these were curiously scattered—two occurred in Liverpool, one in London, one in Walsall, and the remainder in rural districts. The number of cases of ophthalmia neonatorum notified was 6,532, as compared with 6,716 in 1917, 7,613 in 1916, and 6,806 in 1915.

British Medical Association.

EIGHTY-EIGHTH ANNUAL MEETING, CAMBRIDGE, JUNE-JULY, 1920.

President: Sir T. CLIFFORD ALLBUTT, K.C.B., LL.D., M.D., F.R.S., Regius Professor of Physic, University of Cambridge.
Chairman of Representative Meetings: T. W. H. GARSTANG, M.A.Oxon., M.R.C.S.Eng., D.P.H.Vict. (Altrincham).
Chairman of Council: J. A. MACDONALD, M.D., M.Ch., LL.D., Hon. Physician, Taunton and Somerset Hospital.
Treasurer: G. E. HASLIP, M.D. (London).

PROGRAMME.

The President will give an address on Tuesday evening, June 29th, in the Senate House, followed by a reception in King's College by the Cambridge and Huntingdon Branch.

The REPRESENTATIVE MEETING will begin in the Examination Halls on Friday, June 25th, at 10 a.m.

The statutory ANNUAL GENERAL MEETING will be held at the Examination Halls on Tuesday, June 29th, at 2 p.m.

The Annual Dinner of the Association will be held in the Hall of St. John's College at 7.30 p.m. on Thursday, July 1st.

Religious services will be held in the University Church, Great St. Mary's, and in the Roman Catholic Church, at 5 p.m. on Wednesday, June 30th.

The Popular Lecture will be given by Dr. G. S. Graham-Smith, F.R.S., at 8.30 p.m. on Friday, July 2nd.

DEMONSTRATIONS.

Laboratory and clinical demonstrations will be given from 2.30 to 4.30 p.m. (Wednesday, Thursday and Friday). The Directors of demonstrations are:

Medicine: Dr. ALDREN WRIGHT, 2, Corpus Buildings, Cambridge.

Surgery: Mr. ARTHUR COOKE, M.B., B.Ch.Oxon., Grove Lodge, Cambridge.

Physiology: Professor J. N. LANGLEY, F.R.S., Physiological Laboratory, Cambridge.

Pharmacology: Professor W. E. DIXON, F.R.S., Pharmacological Laboratory, Cambridge.

Neurology: Dr. E. D. ADRIAN, Trinity College, Cambridge.

Pathology: Professor Sir G. SIMS WOODHEAD, Pathological Laboratory, Cambridge.

THE SECTIONS.

The Sections will meet from 10 a.m. to 1 p.m.

Sections meeting on three days: Wednesday, June 30, Thursday, July 1, and Friday, July 2.

MEDICINE.

President: Sir HUMPHRY D. ROLLESTON, K.C.B., M.D., F.R.C.P.

Vice-Presidents: THOMAS BEATTIE, M.D., F.R.C.P.; Professor JOHN B. BRADBURY, M.D., F.R.C.P.; Sir THOMAS J. HORDER, M.D., F.R.C.P.; F. W. BURTON-FANNING, M.D., F.R.C.P.; THOMAS LEWIS, M.D., F.R.S.

Honorary Secretaries: A. J. JEX-BLAKE, M.D., F.R.C.P. (13, Ennismore Gardens, London, S.W.7); W. E. HUME, M.D., F.R.C.P. (4, Ellison Place, Newcastle-on-Tyne); E. LLOYD JONES, M.D. (59, Trumpington Street, Cambridge).

SURGERY.

President: Sir GEORGE H. MAKINS, G.C.M.G., C.B., P.R.C.S.

Vice-Presidents: HARRY LITTLEWOOD, C.M.G., F.R.C.S.; Sir CUTHBERT S. WALLACE, K.C.M.G., C.B., F.R.C.S.; GEORGE EDWARD WHERRY, M.Ch., F.R.C.S.; DAVID PERCIVAL D. WILKIE, F.R.C.S.Edin.

Honorary Secretaries: WM. HENRY BOWEN, M.S., F.R.C.S. (24, Lensfield Road, Cambridge); G. E. GASK, C.M.G., D.S.O., F.R.C.S. (41, Devonshire Place, London, W.1); GORDON TAYLOR, O.B.E., M.S., F.R.C.S. (15, Harley Street, London, W.1).

NEUROLOGY AND PSYCHIATRY.

President: HENRY HEAD, M.D., F.R.S.

Vice-Presidents: GORDON M. HOLMES, C.M.G., M.D., F.R.C.P.; W. H. RIVERS RIVERS, M.D., F.R.S.; LEWIS E. SHORE, M.D.; T. GRAINGER STEWART, M.D., F.R.C.P.; THEODORE THOMPSON, M.D., F.R.C.P.

Honorary Secretaries: E. D. ADRIAN, M.D., M.R.C.P. (Trinity College, Cambridge); E. FARQUHAR BUZZARD, M.D., F.R.C.P. (78, Wimpole Street, London, W.1); GEORGE RIDDOCH, M.D. (10, Alba Gardens, Golders Green, London, N.W.4).

PATHOLOGY AND BACTERIOLOGY.

President: Professor J. LORRAIN SMITH, M.D., F.R.S.

Vice-Presidents: J. A. ARKRIGHT, M.D., F.R.C.P.; LOUIS COBBETT, M.D., F.R.C.S.; MERVYN H. GORDON, C.M.G., M.D.; T. S. P. STRANGWAYS, M.R.C.S., L.R.C.P.

Honorary Secretaries: A. E. CLARK-KENNEDY, M.R.C.S., L.R.C.P. (Corpus College, Cambridge); A. E. GOW, M.D.,

F.R.C.P. (37, Queen Anne Street, London, W.1); HELEN INGLEBY, M.B., M.R.C.P. (35, Welbeck Street, London, W.1).

PHYSIOLOGY AND PHARMACOLOGY.

President: Professor F. GOWLAND HOPKINS, M.B., F.R.S.
Vice-Presidents: H. H. DALE, C.B.E., M.D., F.R.S.; Professor J. A. GUNN, M.D.; Professor D. NOËL PATON, M.D., F.R.S.; F. RANSOM, M.D.

Honorary Secretaries: D. V. COW, M.D. (The Bridge House, Great Shelford, Cambridge); EDWARD MELLANBY, M.D. (32, Addison Mansions, Keusington, London, W.14).

The following Sections meet on Wednesday only.

NAYAL AND MILITARY.

President: Colonel JOSEPH GRIFFITHS, C.M.G., M.D., F.R.C.S.
Vice-Presidents: Lieut.-Colonel E. J. CROSS, R.A.M.C.T.; Lieut.-Colonel R. H. ELLIOT, M.D., D.Sc., I.M.S.(ret.); Surgeon Commander H. W. B. SHEWELL, R.N.; Surgeon Rear Admiral A. GASCOIGNE WILDEY, C.B., R.N.

Honorary Secretaries: Major S. M. MACGREGOR, O.B.E., M.D., R.A.M.C.T. (Sanitary Chambers, Glasgow); Major H. B. RODERICK, O.B.E., M.Ch., M.D., R.A.M.C.T. (17, Trumpington Street, Cambridge); Lieut.-Colonel F. E. APIHORPE WEBB, O.B.E. (Grafton House, Maid's Causeway, Cambridge).

OBSTETRICS AND GYNAECOLOGY.

President: HERBERT WILLIAMSON, M.B., F.R.C.P.
Vice-Presidents: FREDERICK DEIGHTON, M.B.; J. PRESCOTT HEDLEY, M.Ch., F.R.C.S.; FRANCES IVENS, M.B., M.S.
Honorary Secretaries: MALCOLM DONALDSON, M.B., F.R.C.S. (145, Harley Street, London, W.1); W. R. GROVE, M.D. (St. Ives, Huuts).

TROPICAL MEDICINE.

President: Professor G. H. F. NUTTALL, M.D., F.R.S.
Vice-Presidents: BREADALBANE BLACKLOCK, M.D.; Lieut.-Colonel S. PRICE JAMES, M.D., I.M.S.; P. H. MANSION-BAHR, M.D.

Honorary Secretaries: CHARLES FREDERICK SEARLE, M.D. (71, Bridge Street, Cambridge); J. GORDON THOMSON, M.B. (24, Herne Hill, London, S.E.24).

The following Sections meet on Thursday only.

MEDICAL EDUCATION.

President: Sir GEORGE NEWMAN, K.C.B., M.D., F.R.C.P.
Vice-Presidents: G. S. GRAHAM-SMITH, M.D., F.R.S.; Professor DAVID HEPBURN, C.M.G., M.D.; THOMAS W. SHORE, M.D.; S. SQUIRE SPRIGGE, M.D.; Professor PETER THOMPSON, M.D.

Honorary Secretaries: S. R. GLOYNE, M.D. ("Hatherley," Chalfont St. Giles, Bucks); Professor J. KAY JAMIESON, M.B. (Dean of Faculty of Medicine, Leeds).

VENEREAL DISEASES.

President: E. B. TURNER, F.R.C.S.
Vice-Presidents: Colonel L. W. HARRISON, D.S.O., M.B.; MORNA L. RAWLINS, M.B.

Honorary Secretaries: W. H. HARVEY, M.D. (The Dene, Great Shelford, Cambridge); OTTO MAY, M.D. (19, Well Walk, Hampstead, London, N.W.3).

The following Sections meet on Friday only.

ELECTRO-THERAPEUTICS.

President: ALFRED ERNEST BARCLAY, M.D.
Vice-Presidents: ROBERT KNOX, M.D.; ALFRED CHARLES JORDAN, M.D., M.R.C.P.

Honorary Secretaries: E. P. CUMBERBATCH, M.B., M.R.C.P. (15, Upper Wimpole Street, W.1); F. SHILLINGTON SOALES, M.D. ("Redcourt," Adams Road, Cambridge).

MEDICAL SOCIOLOGY.

President: G. E. HASLIP, M.D.
Vice-Presidents: H. B. BRACKENBURY, M.R.C.S., L.R.C.P.; ADAM FULTON, M.B.; C. O. HAWTHORNE, M.D.; Professor BENJAMIN MOORE, D.Sc., F.R.S.

Honorary Secretaries: S. MORTON MACKENZIE, M.B. (9, Rose Hill, Dorking); C. M. STEVENSON, M.D. (90, Chesterton Road, Cambridge).

The Honorary Local Secretaries of the Meeting are J. F. GASKELL, M.D., F.R.C.P., The Uplands, Great Shelford, near Cambridge, and G. S. HAYNES, M.D., 58, Lensfield Road, Cambridge.

Association Notices.

ELECTION OF REPRESENTATIVE BODY OF THE ASSOCIATION, 1920-21.

Constituencies in Representative Body.

THE list of the provisional **Home Constituencies** for election of the Representative Body, 1920-21, appeared in the SUPPLEMENT of January 24th, page 21.

As intimated to all the **Oversea bodies**, the Council has made each Oversea Division and Division-Branch, possessing an Honorary Secretary and the necessary organization, an independent Constituency.

Election of Representatives and Deputy-Representatives.

The Representatives and Deputy-Representatives in the Representative Body must be elected not later than May 28th, and their names notified to the Medical Secretary not later than June 4th.

The Council draws special attention to the fact that it is entirely within the discretion of each Constituency to decide whether the election of its Representative(s) and Deputy-Representative(s) shall be carried out by **General Meeting of the Constituency, or by postal vote.**

Date of Annual Representative Meeting at Cambridge.

The Annual Representative Meeting at Cambridge will begin on Friday, June 25th, at 10 a.m.

Motions for the Annual Representative Meeting.

Notices of Motion by Divisions, Constituencies, or Branches, for the consideration of the Annual Representative Meeting, proposing to make any addition to, or any amendment, alteration or repeal of any Regulation or By-law, or to make any new Regulation or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, must be published in the JOURNAL not later than April 24th, and for this purpose should be received by the Medical Secretary **not later than April 10th.**

ELECTION OF COUNCIL OF THE ASSOCIATION, 1920-21.

THE list of the Groups of Branches in the United Kingdom for election of twenty-four members of the Council, 1920-21, and **Nomination Form**, appeared in the SUPPLEMENT of January 24th, page 22. Separate Nomination Forms will, if desired, be forwarded on application by Branches, Divisions, or Members.

The list of the Groups of **Oversea Branches** was published in the SUPPLEMENT of October 11th, 1919, p. 79.

Meetings of Branches and Divisions.

WORCESTERSHIRE AND HEREFORDSHIRE BRANCH: WORCESTER DIVISION.

On January 21st, 1920, members of the Worcester Division entertained a number of their colleagues who had served in the forces during the recent war to dinner at the Lion Hotel, Kidderminster. The chair was taken by Mr. J. LIONEL STRETTON, Chairman of the Division.

A most enjoyable evening was spent. At the conclusion of dinner, the CHAIRMAN made an eloquent speech in proposing the toast of "Our Guests," and extended a warm welcome to the members who had served. "In the process of reconstruction," he added, "we are most interested in our own profession. Changes are foreshadowed which may revolutionize our calling. If they are for the benefit of the country by all means let us accept them, but it is our duty to resist any suggestions which are calculated to lower our prestige or impair our work. That you will assist us I am well assured, and in welcoming you home I must express our delight that you have all returned and that none of you has suffered serious injury. We thank you for the good work you have done in your various sections. I must especially refer to the conspicuous bravery which won the M.C. for my colleague Major Craig. I congratulate him, and am delighted that he is with us. I trust that you may be spared for many years to continue your peaceful work, and that you will derive comfort from the contemplation of your part in saving your country from defeat, and that you will also remember this evening's entertainment as an expression of the appreciation of your professional brethren, which is the highest tribute you can receive."

Colonel BLANDFORD, C.B.E., T.D., in reply, thanked the Chairman on behalf of the guests for the very kind way in

which he had proposed the toast and for the most enjoyable evening's entertainment by the hosts. Major J. R. CRAIG, M.C., also thanked the Chairman for his remarks and the members present for so kindly entertaining those who had been fortunate enough to be selected to serve.

Dr. O. C. P. EVANS proposed the toast of "The British Medical Association." He emphasized the importance of the Association, and enumerated some of the many advantages of being a member, and what the Association had done for its members.

Captain NEVILLE CROWE, honorary secretary of the Division, replied, and thanked Dr. Evans for the many kind things he had said in regard to the work that he had done as honorary secretary for upwards of ten years. There was, he said, the greatest need for missionary work by all the members of the Division, so that every practising medical man or woman in the area of the Division should become a member of the Association. He expressed his great indebtedness, and that of all the members of the Division, to the Chairman for the great interest and the work he had always done to forward the wellbeing of the profession.

Dr. H. E. DIXEY proposed "The Worcestershire and Herefordshire Branch of the British Medical Association." He reviewed the many changes in the Branch since he first became a member of it many years ago, and said that, although he was not in practice, he was proud to say that he was still a member of the British Medical Association. Dr. E. S. ROBINSON, president of the Branch, replied, and asked all members present to assist to make the Association an even greater power for the good of the profession.

Major BERTRAM ADDENBROOKE, T.D., conveyed to their hosts the thanks of all the service members present for a most enjoyable evening; especially did he wish to thank the Chairman, who was the moving spirit in getting the dinner up. Dr. HOLBECH and Dr. WILKINSON, in responding, said what a great pleasure it had been to entertain those who had been privileged to serve. The CHAIRMAN thanked the members present for their appreciation of his efforts on behalf of the Division. It had been suggested to him that there should be an annual dinner of the Division, and he strongly supported the idea, and expressed the opinion that it should be held in the town where the chairman of the Division for the year resided.

METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.

A MEETING of the Willesden Division was held at St. Andrew's Park Hall, Willesden, on February 10th, Dr. C. WHITEHALL COOKE presiding. It was reported that the recommendations in connexion with the 50 per cent. increase in fees had been generally adopted. It was resolved that, in the opinion of the Division, a medical referee [pensions] resident in Harlesden district should be appointed for that district and so establish a more satisfactory service.

An invitation from the Willesden Urban District Council Hospital Committee to the Division to hold a meeting at the Municipal Hospital and be entertained by the committee was accepted for June 11th.

Dr. G. F. BUCHAN, M.O.H. Willesden, gave an address on municipal hospitals and clinics. He said that municipal hospital and clinics were established by the will of the people, and not on the initiative of the M.O.H., who was, merely the technical adviser of the council. He gave an interesting account of the history of the movement. Willesden would require at least 1,700 hospital beds; at present it had only 684. He had prepared a plan for a municipal hospital where provision would be made for the general practitioner attending with his patients, or for instruction.

The CHAIRMAN thanked Dr. Buchan for his very interesting address, and said he could see that many questions would be asked, as obviously many of Dr. Buchan's statements were not acceptable to those present.

A long and spirited debate then followed. Owing to the lateness of the hour the meeting was adjourned in order that the discussion might be completed.

MEETINGS OF THE PROFESSION.

THE TRADE UNION QUESTION AT BRIGHTON.

ON March 2nd a largely-attended meeting of the medical practitioners of Brighton and district was held at the Old Ship Hotel, with Dr. H. H. TAYLOR in the chair. The object of the meeting was to discuss the following proposition:

In view of the changes in the medical service of the country, it is essential that the profession should be solidly organized on a trade union business to enable it to negotiate effectively with the Government; and that a Brighton branch of the Medico-Political Union be now formed.

A resolution upon these lines was moved by Dr. E. H. STANCOMB, who urged the necessity for the medical profession to combine as a trade union in face of the drastic changes that

were bound to come. If there was one class of the community that could not be accused of profiteering it was the medical profession, who had the power to raise the country from a C3 to an A1 class if they were not hampered or restricted. Speaking as its vice-president, he said that the Medico-Political Union did not contemplate any withholding of services from the community, because they realized that they must serve the country even if they struck against the Government. Dr. G. A. MAIN, organizing secretary of the Union, made a speech in support of the motion.

Dr. E. R. FOTHERGILL moved as an amendment:

That in the opinion of the meeting no useful purpose would be served by the development in Brighton and district of an organization of the profession on trade union lines.

This, however, was ruled out of order by the Chairman as a direct negative. Dr. Fothergill then argued that the idea of a medical trade union was a delusion. What power, he asked, had this trade union to compel the State to give way? If they decided to strike would they picket the house of a private patient, or the doors of a hospital? Although the union had been in existence five years it had done nothing for the medical profession. Dr. E. BURCHELL also spoke against the motion. They were told, he said, that if they struck they would be striking against the Government or the authorities, and that while they were striking they would still go on working, and therefore earning. But did anyone outside a lunatic asylum believe that to be a fact? Dr. V. T. GREENYER, speaking as a member of the National Medical Union, also opposed, describing the movement as medico-political selfishness. Every man should work with the idea always before him that he was living in a sensible relationship to the public. Dr. L. A. PARRY said that as a member of an honourable profession he would be very sorry indeed to degrade himself to the same level as some of the miners, ironworkers, and others of a like class, who were constantly letting the public down. Dr. A. A. HILL, being impressed with the advantages of trade unions, expressed the hope that a strong branch of the Medico-Political Union would be formed in the district. Dr. N. S. ALDER asked whether they were to choose their leaders from the advocates of trade unionism or from men who kept up the honoured traditions of the medical profession. Dr. H. GERVIS said he would join the trade union with pleasure if he thought it were of the least use, but from the medical point of view it seemed hopeless. Doctors could not strike. If they struck against the Government they would not hurt the Government. If anyone were in pain they could not strike, because they well knew they would do their best to relieve the pain. Dr. R. SANDERSON maintained that the medical profession ought to do everything in its power to assist the State in its efforts to improve the national health.

After Dr. MAIN and Dr. STANCOMB had replied to the criticisms, their motion was lost by an overwhelming majority, five only voting for it.

The *Sussex Daily News* concludes its report of the proceedings with the statement that immediately afterwards a number of doctors held a further meeting in the room, Dr. MAIN presiding, at which it was unanimously decided to form a branch of the Medico-Political Union for Brighton and district. Seven practitioners gave in their names as members.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty:—Surgeon Commanders F. J. Burke to the *Hood*, H. L. Penny to the *Hood* on commissioning and as Squadron Medical Officer, H. D. CURRENT NOTES.

Hospital Reconstruction.

THE meeting of the Ministry of Health Committee of the British Medical Association on March 12th was attended, by invitation, by Sir Hamilton Ballance (Norwich), Sir James Galloway (London), Mr. A. E. Morison (Sunderland); Sir John Rose Bradford and Dr. Raymond Crawford (representing the Royal College of Physicians of London); and Mr. Raymond Johnson and Mr. Charles Ryall (representing the Royal College of Surgeons of England). Mr. E. B. Turner was in the chair. At previous meetings the Committee had considered the question of the nature of the medical provision that should be made for the community, had reported on it, and had arrived at the conclusion that suitable residential accommodation should be provided in every area, by means of primary hospitals, where the medical attendance would be carried out by the general practitioners of the locality; that patients should be admitted to such primary hospitals on the recommendation of a general practitioner, and should pay an agreed sum for maintenance; but that the medical fees be a matter for arrangement in each case between the doctor and the patient. The Committee considered that the establishment of such primary hospitals was an urgent matter, and that in connexion with them provision should be made for maternity cases. It went on to express the view that hospitals for cases of a more special nature should be established in larger areas, to be linked up with the primary hospitals; that no patient should be admitted to such a hospital without the recommendation of a general practitioner, except in case of emergency; and that an agreed sum for maintenance should be paid to the hospital, either by the patient or from some other source. It was suggested that the provision of this hospital accommodation could be met to a large extent by utilizing the present voluntary hospitals and Poor Law infirmaries. It advised that the members of the staffs of these hospitals, who would be expected to attend for specific periods each week, should receive adequate remuneration upon a time basis. On March 12th the question of the remuneration of the staffs of these hospitals, and also of the teaching hospitals, was discussed. Those members of the staffs of such hospitals present for the most part expressed preference for the system under which their services are honorary. It was pointed out that at voluntary hospitals which had departments for pensioners and venereal disease payments were received and divided between the hospital and the medical staff; that in certain districts an important part of the income of the hospitals was derived from workmen's subscriptions; and that in them the voluntary subscriptions were looked upon as defraying the cost of the middle-class poor. There was general agreement that the accommodation now provided for in-patients was inadequate, but the contention that the extension should be made, in the first

place, in order to give better service to insured persons was not so generally accepted. The whole question as to the nature of the medical provision which should be made for the community or parts of it is at present being discussed by the Ministry of Health Committee, and proposals in connexion therewith will be submitted to the Divisions before discussion at the Annual Representative Meeting.

Territorial Force Medical Service.

The special Subcommittee of the British Medical Association has under consideration the question of the reorganization of the Territorial Force Medical Service, and hopes shortly to be in a position to make representations to the War Office. It would be of considerable assistance to the Subcommittee to have the benefit of the opinion of those who served in the Force during the war and who are acquainted with the defects of the old system, or who have definite ideas as to reconstruction. The Medical Secretary would be glad to receive any suggestions.

Postal Medical Service.

Although there have been two increments, of 1s. in each case, to the capitation fee paid to postal medical officers there still seems to be a considerable amount of dissatisfaction with the terms of the service. This is not surprising when it is remembered that National Insurance practitioners are getting 11s. per head a year without drugs while the Post Office expects its medical officers to find drugs, dressings, and bottles, to say nothing of delivery, for 10s. 6d. The Postmaster-General seems to be of opinion that the proper mouthpiece of postal medical officers is the Association of British Postal Medical Officers, and that body has apparently assured him that these officers are satisfied. The British Medical Association has no means of knowing which of its members are engaged in post office work, and it is essential that such information should be available without delay. All members who are postal medical officers are therefore asked to send a post-card to the Medical Secretary stating briefly that they are engaged in post office work, and saying if they are members of the Association of British Postal Medical Officers. Many efforts have been made to obtain the friendly co-operation of that association in an attempt to improve the service, but without avail.

Meetings of Branches and Divisions.

NORTH WALES BRANCH: NORTH CARNARVON AND ANGLESEY DIVISION.

Dinner and Presentation.

ON February 27th the medical practitioners of North Carnarvonshire and Anglesey entertained to dinner, at the Anglesey Arms Hotel, Menai Bridge, their colleagues who served with the Forces during the war. The chair was taken by Dr. R. M. Williams, chairman of the local Division of the British Medical Association, whose tragic death three days later was recorded in our last issue.

After the usual loyal toasts had been honoured, Dr. Rowland Jones (Bangor) proposed the toast of the Navy, Army, and Air Forces, and Captain Morris Jones (Colwyn Bay) and Dr. William Fox Russell (Holyhead) responded. Dr. T. W. Clay (Holyhead), in submitting the health of the guests, paid a tribute to the gallant memory of Captain J. Fox Russell, V.C., son of the previous speaker, who was killed in action on November 6th, 1917. Interesting speeches were made in reply by Colonel Mills Roberts, Colonel John Evans (Carnarvon), and Major J. R. Williams (Pennaennawr). The toast of the Ministry of Health was proposed by Dr. Lewys Lloyd (Towyn), and replied to by Dr. Parry Edwards, Medical Officer of Health for Carnarvonshire, and Dr. Arnold Davies, Medical Officer of Health for Anglesey. The toast of the British Medical Association was submitted by Dr. John R. Prytherch, who spoke of it as the one organization representing British medicine to-day. Dr. Alfred Cox, in his reply, urged the importance of doctors keeping the respect of the public. The long hours that doctors worked were the price of their unique relationship to the public, and he hoped the medical profession would continue to hold that its first duty was towards the patient. In the coming changes, he said, there would be more State interference with medical practice; that was part of the inevitable tendency of the present day, and they must take care that neither the public nor the doctors suffered. Dr. J. E. Thomas proposed the health of the Chairman, who had shown great enthusiasm for the dinner, and was himself mainly responsible for organizing it. Dr. Williams's reply was his last public utterance. During the evening a presentation of silver plate was made to Dr. Powell, the tuberculosis officer, and his wife, formerly tuberculosis nurse, on behalf of the medical men of the area.

Previous to the dinner a meeting of the Division was held under the chairmanship of Dr. R. M. Williams, which after the transaction of ordinary business was addressed by the Medical Secretary. He dealt with many matters of current interest and answered several questions.

NORTH OF ENGLAND BRANCH.

Post-Graduate Course.

A LETTER has been sent to all doctors in the North of England stating that a joint committee, comprising representatives of doctors in general practice, the Council of the College of Medicine, and the honorary staff of the Royal Victoria Infirmary, Newcastle-on-Tyne, have decided to carry on a further post-graduate class for twelve weeks during the summer, beginning on Tuesday, April 20th. The classes will not be held during race week or the following week.

The organization permits of forty practitioners attending each day. Each class is limited to ten graduates, and four classes of ten graduates will be held simultaneously. Every doctor will receive instruction in each of the subjects mentioned below on at least three class days, which will be run consecutively. Every Tuesday, from April 20th onwards, is arranged for the first class. Should a second class be necessary, it will be held every Thursday, from April 22nd. The inclusive fee for the course is £10 10s. For income tax purposes this can be reckoned in practice expenses. Those wishing to join the class are requested to send in their names, together with the tuition fee, before March 31st, to Mr. R. J. Willan, M.V.O., Honorary Secretary and Treasurer, 6, Kensington Terrace, Newcastle-upon-Tyne.

Subjects.

Anatomy of the arm and leg, particularly the blood vessels, the nerves and their distribution.
Physiology.
Pathology, including the examination of pathological secretions and collection of clinical material.
Bacteriology.
Medical clinical diagnosis.
Surgical clinical diagnosis.
Digestion from the medical aspect.
Digestion from the surgical aspect.
Diseases of the heart.
Injuries of the joints.
Skin diseases.
Diagnosis and treatment of syphilis.
Clinical aspect of blood diseases.
A series of clinical cases for diagnosis will be shown on each day.

THE Tasmanian Branch of the British Medical Association at its meeting on January 14th, 1920, resolved to request all Commonwealth, State, and municipal bodies dealing with medical appointments to arrange that when new appointments are made, all things being equal, preference is given in the first place to returned medical officers, and secondly, to those rejected as medically unfit.

Association Notices.

ELECTION OF REPRESENTATIVE BODY OF THE ASSOCIATION, 1920-21.

Constituencies in Representative Body.

The list of the provisional **Home Constituencies** for election of the Representative Body, 1920-21, appeared in the SUPPLEMENT of January 24th, page 21.

As intimated to all the **Oversea bodies**, the Council has made each Oversea Division and Division-Branch, possessing an Honorary Secretary and the necessary organization, an independent Constituency.

Election of Representatives and Deputy-Representatives.

The Representatives and Deputy-Representatives in the Representative Body must be elected not later than May 28th, and their names notified to the Medical Secretary not later than June 4th.

The Council draws special attention to the fact that it is entirely within the discretion of each Constituency to decide whether the election of its Representative(s) and Deputy-Representative(s) shall be carried out **by General Meeting of the Constituency, or by postal vote.**

Date of Annual Representative Meeting at Cambridge.

The Annual Representative Meeting at Cambridge will begin on Friday, June 25th, at 10 a.m.

Motions for the Annual Representative Meeting.

Notices of Motion by Divisions, Constituencies, or Branches, for the consideration of the Annual Representative Meeting, proposing to make any addition to, or any amendment, alteration or repeal of any Regulation or By-law, or to make any new Regulation or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, must be published in the JOURNAL not later than April 24th, and for this purpose should be received by the Medical Secretary **not later than April 10th.**

ELECTION OF COUNCIL OF THE ASSOCIATION, 1920-21.

THE list of the Groups of Branches in the United Kingdom for election of twenty-four members of the Council, 1920-21, and Nomination Form, appeared in the SUPPLEMENT of January 24th, page 22. Separate **Nomination Forms** will be forwarded by the Medical Secretary on application by Branches, Divisions, or Members. The Nominations must be in the hands of the Medical Secretary **not later than May 17th.**

BRANCH AND DIVISION MEETINGS TO BE HELD

LANCASHIRE AND CHESHIRE BRANCH.—The annual meeting for 1920 will take place at Southport on June 9th. The members will be entertained at lunch by the Southport Division, and after the President (Dr. Baildon, Southport) has given his address scientific papers will be read. A number of excursions are being arranged for the afternoon, and in the evening members will dine together. Members desiring to bring forward papers should communicate with the Branch Secretary, Mr. F. S. Heaney, F.R.C.S.I., 36, Rodney Street, Liverpool.

INSURANCE.

CORRESPONDENCE.

The Arbitrators' Award.

SIR,—I see that the arbitrators have unanimously decided in favour of the Government that the insurance capitation fee should stand at 11s., and not be increased to 13s. 6d. as the doctors claimed. Well, the award has gone against us, and, though we are not satisfied with it, we must loyally accept it and do our best to give a good and satisfactory service to those insured persons who are on our lists.

It will not do for our profession, as other workers have done, to treat our agreements as scraps of paper, only to be carried out when in our favour; they must be looked upon as binding us honourably to perform what we have promised to do.

I shall be very curious to know what the stalwarts of the Medico-Political Union will do under the circumstances, and how the "men of Kent," of Southampton, and of York will act. Will they carry out the orders of head quarters and strike, or will they quietly accept the "filthy lucre," and, like Brer Rabbit, "say nuffin"? I wonder.

At any rate, I am sure that the great majority of the profession will accept service, and will do their best for all those who are on their panels. We, Sir, who have any sense of gratitude, must at the same time thank the Insurance Acts Committee of the British Medical Association for the great and unceasing help which they have given not only to their fellow members but to the profession at large.—I am, etc.,

Steeple Claydon, Bucks, March 10th.

PHILIP L. BENSON.

An Appreciation and a Suggestion.

SIR,—Now that the apportionment is settled, at least for twelve months, the outstanding features of the whole proceedings are the tremendous work done by Dr. Braekenburg on behalf of panel practitioners and the debt of gratitude due to him from every panel doctor in the country. On two occasions I have been privileged to attend the Panel Conference as a Representative, and each time what impressed me most was the extraordinary knowledge of the medical aspects of the Insurance Act possessed by Dr. Braekenburg, chairman of the Insurance Acts Committee.

This grasp of the subject could only be acquired by an enormous expenditure of time and trouble, and I think the time has come when panel doctors should, in some tangible form, acknowledge their indebtedness to him. I write as a member of that class of panel doctor who has most complaints to make of insurance practice—the truly rural practitioner who spends most of his time motoring over surfaces flattered by the name of roads. But at last, after all these years, the claims of the rural man have been admitted, and, to pay for the time, trouble, and expense of travelling, we are told £300,000 will be substituted for £34,000. (Why £34,000 when the sum originally allocated by Mr. Lloyd George was £50,000 for "mountainous, moorland, and fen districts"?)

This substantial result is due largely to the indomitable perseverance and forcible augmentative power of Dr. Braekenburg, and if we had a few men with his enthusiasm and ability in Parliament we would be better served.

To prove that panel practitioners are not altogether devoid of a sense of gratitude for work well done on their behalf I beg to suggest that some form of testimonial to Dr. Braekenburg be initiated to which all panel doctors would be invited to subscribe, and I am sure the result would not be disappointing.

That we have not got all we wanted is certainly not the fault of the Chairman of the Insurance Acts Committee, and if, at some future time, we are to get all we demand, it will only be attained (in the words of Dr. Braekenburg) by "the entire support, both moral and financial, of the whole profession."—I am, etc.,

Rothbury, Northumberland, March 15th.

A. S. HEDLEY.

COMMITTEE ON MEDICAL RECORDS.

THE Minister of Health has added to the Committee, which, as announced in the SUPPLEMENT last week, has been appointed to deal with the subject of medical records, Mr. G. S. W. Epps, F.I.A., representing the Department of the Government Actuary.

GENERAL MEDICAL COUNCIL.

EXECUTIVE COMMITTEE.

A MEETING of the Executive Committee of the General Medical Council was held on February 23rd, when Sir DONALD MACALISTER, President of the Council, was in the chair.

Reciprocity with Alberta, Canada.

A communication was received from the Privy Council stating that an Order in Council, dated November 27th, 1919, had been issued, extending Part II of the Medical Act, 1886, to the province of Alberta. A communication was received from the Colonial Office transmitting an amendment of the Alberta Medical Profession Act, 1906, providing that corresponding action would be taken in the province. The Registrar has been instructed to register the holders of the L.C.P. and S. of Alberta on the British Medical Register.

University of South Africa.

A communication transmitting the draft of the complete curriculum for the degree of M.B., B.Ch., U.S. Africa, received from the School of Mines and Technology of the University of South Africa, was considered. It inquired what the attitude of the Council would be when the recognition of the degrees became immediate, and as to any features of the curriculum likely to prove unsatisfactory or inadequate. The President directed that the School be informed that Part II of the Medical Act must be extended to South Africa before any medical degrees or diplomas granted there could be registered by the

Council, but that the licensing bodies here might recognize *pro tanto* any part of the curriculum and examinations they approved other than the final or qualifying examinations. The action of the President was approved.

South Australia.

A copy of the South Australia Medical Practitioners Act, 1919, received from the Colonial Office, was entered on the minutes.

University of Wales.

The President was reappointed as representative of the Council on the Medical Board of the University of Wales for three years, from May 11th, 1920.

Inspection and Examination.

It was reported that Dr. R. Bruce Low, C.B., had accepted the post of inspector of D.P.H. examinations and had begun his duties. The question of the appointment of inspectors of examinations in medicine, surgery, and midwifery was considered, and names were suggested of gentlemen who might be invited by the President to act.

Nurses' Registration, Ireland.

THE PRESIDENT explained, with reference to a communication from the Privy Council, that in the opinion of the Minister of Health the Nurses' Registration Bills differed from the Midwives Acts in two respects: (1) Rules to be framed did not purport to regulate the practice of nurses; and (2) rules made had to be laid before Parliament before approval by the Privy Council; it was therefore deemed unnecessary to submit them formally to the General Medical Council. With regard to the nomination of registered medical practitioners on the first nurses' registration council, it was agreed that the General Medical Council should be asked to suggest names, and the Executive Committee had been consulted, as promised. The President reported that, in response to the request of the Ministry of Health, he had, after consulting the members of the Committee by correspondence, submitted on behalf of the Council the name of Sir Francis Champneys as a member of the council to be constituted under the Nurses' Registration Act.

Massage and Medical Gymnastics.

A letter from the Privy Council dated January 14th, 1920, transmitting a petition from a body to be known as the Chartered Society of Massage and Medical Gymnastics, was submitted, and the President's reply thereto approved. The President, in this reply, stated

that in his opinion the petition was submitted by all the leading medical and administrative authorities qualified to speak on the general subject of orthopaedics and massage treatment; that such incorporation would have the effect of prescribing a much needed standard of training and examination for masseurs and massensees; that the objections raised in the cross-petition are those of an obscure and unrepresentative local organization, whose possible interests are negligible in comparison with those of the national organization proposed; and that the reply lodged on the cross-petition is unanswerable, and should be regarded as conclusive in favour of the grant prayed for.

Society of Radiographers.

The Board of Trade had transmitted an application from the Society of Radiographers under Section 20 of the Companies (Consolidation) Act, 1908, together with the memorandum and articles of association; the Committee resolved to inform the Board of Trade that it took no objection to the application and memorandum subject to certain modifications, one of which was as follows:

No non-medical member—that is, no member who is without the qualifications entitling him to practise in Great Britain or Ireland as a physician or surgeon shall accept patients for radiographic, radioscopic, or therapeutic work except under the direction and supervision of a qualified medical practitioner, and any breach of this regulation shall be deemed conduct unfitting the member guilty thereof to remain a member of the society.

The Executive Committee requested that if in future any alterations should be made in the memorandum or articles of association, the Council should be afforded an opportunity of considering them.

Qualifications Restored.

It was reported that all the qualifications of Mr. William Dutton Akers have now been restored to him.

Dental Business.

Communications from the Colonial Office transmitting the British Columbia Dentistry Amendment Act, 1919, the Alberta Dental Association Amendment Act, 1919, Prince Edward Island Dental and Amendments Acts, and the Nova Scotia Dental Act Amendment Acts, 1919, were referred to the Dental Education and Examination Committee.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty:—Surgeon Commanders: F. C. Robinson to the *Cambrian*; J. A. L. Campbell, O.B.E., to the *Pembroke VIII*, for Immingham Naval Depot; J. L. Barford, to the *Actaeon*, Surgeon Lieutenant-Commanders: F. St. B. Wickham, O.B.E., to the *Ganges II*, for Shotley Sick Quarters; F. J. D. Twigg to the *Camellia*; H. C. Devas to Yarmouth Hospital, Surgeon Lieutenant: C. E. Greeson to the *Stuart*.

ARMY MEDICAL SERVICE.

Colonel A. G. Thompson, C.M.G., D.S.O., retires on retired pay (November 19th, 1919, substituted for notification in the *London Gazette*, November 21st, 1919).

ROYAL ARMY MEDICAL CORPS.

Major and Brevet Lieut.-Colonel A. W. Gibson relinquishes the acting rank of Lieutenant-Colonel.

Major J. E. H. Gatt retires on retired pay (January 20th, 1920, substituted for notification in the *London Gazette*, January 21st, 1920).

Temporary Captains relinquish the acting rank of Major: J. W. C. Gunn, L. R. Broster, J. Alexander, A. C. Bryson.

Captain S. Robinson, M.C., resigns his commission.

Temporary Captain G. Marshall to be acting Major.

The notification in the *London Gazette* of September 3rd, 1919, regarding temporary Captain William Tadhope is cancelled.

J. R. Mason, late temporary Captain, to be temporary Captain, seniority from September 7th, 1916.

Temp Lieutenant G. A. Fothergill to be temporary Captain.

G. R. Waller to be temporary Lieutenant.

The following officers relinquish their commissions: Temporary Major (acting Lieut.-Colonel) C. E. Ligertwood, D.S.O., and is granted the rank of Lieutenant-Colonel; temporary Captain (acting Major) H. Dudley on account of ill health (October 17th, 1918), and is granted the rank of Major (substituted for notification in the *London Gazette*, October 16th, 1918).

Temporary Captains and retain the rank of Captain: J. M. D. Scott, J. Manuel, M.C., J. D. Mackinnon, M.C., W. S. Ferris, R. Haslam, W. Gault, D. G. S. Gartshore.

ROYAL AIR FORCE.

MEDICAL BRANCH.

Flight Lieutenant H. W. Scott to be acting Squadron Leader whilst employed as Squadron Leader.

Transferred to the unemployed list: Captains: A. E. Collis, H. F. Squire, G. Dunderdale; Lieutenant: R. E. Burns.

GENERAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Captain S. Robertson, M.C., late Captain R.A.M.C., to be Captain.

POST-GRADUATE COURSES AND LECTURES.

BROMPTON HOSPITAL FOR CONSUMPTION, S.W.—Wednesday, 4.30 p.m., Dr. Burrell: Vital Capacity in Pulmonary Tuberculosis.

MANCHESTER: ANCOATS HOSPITAL.—Thursday, 4 p.m., Mr. Platt: Principles of Treatment of Fractures.

MANCHESTER ROYAL INFIRMARY.—Tuesday, 4.30 p.m., Mr. Charles Roberts: Chronic Inflammations and Cysts of the Breast.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.1.—Monday, 2 p.m., Out-patients, Dr. Collier: 3.30 p.m., Ward Cases, Dr. Aldren Turner. Tuesday, 2 p.m., Out-patients' Clinic, Dr. Grainger Stewart; 3.30 p.m., Fr. Tooth: Encephalitis. Wednesday, 2 p.m., Demonstration of Fraenkel's Exercises by Mr. Elmquist; 3.30 p.m., Dr. Collier: Aphasia and Apraxia. Thursday, 2 p.m., Out-patients, Dr. Farquhar Buzzard; 4.30 p.m., Ward Cases, Dr. Saunders; Friday, 2 p.m., Out-patients, Dr. Gordon Holmes; 3.30 p.m., Demonstration of Fraenkel's Exercises by Mr. Elmquist. Saturday, 9 a.m., Surgical Operations.

NEWCASTLE-ON-TYNE: ROYAL VICTORIA INFIRMARY.—Friday, 1 p.m., Mr. Grey Turner: Operations. 3.15 p.m., Mr. H. B. Angus: Diagnosis and Treatment of Fractures. 4.30 p.m., Professor R. P. R. Lyle: Diagnosis of Uterine Diseases.

Every Member is requested to preserve this "Supplement," which contains matters specially referred to Divisions, until the subjects have been discussed by the Division to which he or she belongs.

Matters Referred to Divisions.

FEES FOR MEDICAL EXAMINATIONS FOR LIFE INSURANCE.

THE Annual Representative Meeting, 1919, directed the Council to consider and report on the question of fees for medical examinations for life insurance, a subject which has engaged the attention of the Association on many occasions during the past eighteen years and on which it has always been found impossible to obtain anything like agreement on a policy.

The Medico-Political Committee has on this occasion fully discussed the matter with the Life Offices Association, a body representative of all British Life Insurance Companies. The agreed report of that discussion is appended, and it is hoped that it will receive the immediate and earnest attention of the Divisions.

Based on this report, the Medico-Political Committee has arrived at certain conclusions which will be submitted to the Council and will form part of the Council's Report to the Annual Representative Meeting, 1920. In addition to instructing their Representatives Divisions should also forward their opinions to the Medical Secretary in order that, if necessary, there may be a supplementary report on the subject.

RECOMMENDATIONS.

(a) *Industrial Offices*.—That the fee for medical examination for industrial insurance be 5s. (minimum) or 10s. 6d., according to the form of report asked for.

(b) *Intermediate Offices*—that is, the ordinary branch of industrial offices and ordinary offices which issue policies whose average amount is small (for example, ordinary branch of Prudential and the Provident Mutual Life): That the minimum fee for medical examination be 10s. 6d. for policies up to and including £100, and 21s. if over £100.

(c) *Ordinary Offices*.—That the fee for medical examination be 21s., whatever the amount of the policy.

(d) That the fee for a medical certificate (without medical examination) for children proposed for "thrift policies" remain at 10s. 6d.

(e) That in no case shall any reduction be made in any existing fee for medical examination for life insurance.

(f) That no attempt be made to standardize the guinea form of report, as there are only slight differences between the forms already in use in most British offices.

(g) That representations be made to the Life Offices Special Committee as to the modification of these forms which are objectionable from the medical examiners' point of view.

The above proposals represent considerable improvements on the present position. They are as follows:

(a) About 35 companies will pay a guinea for insurances of £100 which previously only paid 10s. 6d. Of these companies, 20 are still paying 10s. 6d. where the sum assured is under £300, and 7 pay 10s. 6d. where the sum is under £500.

(b) There will be no reduction in any of the existing fees, and some of the intermediate fees will be levelled up—that is to say, a 3s. fee would go up to 5s., and a 7s. 6d. fee would go up to 10s. 6d.

(c) The 2s. 6d. fee for small industrial insurances disappears altogether, and is replaced by a 5s. fee.

The Association has made strong representations in favour of a general increase on all the pre-war fees and suggested a 50 per cent. increase on the guinea fee, but this the life assurance offices have absolutely refused to accept. They consider that they have made a great concession by the raising of the 10s. 6d. fee to a guinea, and they will strenuously resist any attempt on the part of the profession to obtain a fee higher than a guinea for what they call a normal examination. They will in the future, as in the past, continue to pay higher fees for exceptional cases.

In discussing the matter the Divisions must remember that the life assurance offices have stated that they are prepared, if the offer now made is refused, to meet the situation by eliminating medical examinations in a large number of cases (as is already done by some companies) and by combining either to create whole-time examiners in the large towns, or to place a very considerable amount of work in the hands of two or three men in those towns.

APPENDIX.

Report of Conference.

Report of a Meeting of Representatives of The Life Offices Association the Associated Scottish Life Offices and the British Medical Association, held at the Offices of the Alliance Assurance Company, Limited, Bartholomew Lane, E.C., on Thursday, the 11th December, 1919.

PRESENT:—*The Life Offices Association*—Mr. A. Levine (in the Chair), Messrs. Besant, Conlts, Hovil, Laing, Thompson, and Mr. Humphry (Secretary).

Associated Scottish Life Offices—Mr. A. K. Rodger, M.P. *British Medical Association*—Drs. J. W. Bone, John Clarke, A. Fulton, R. Wallace Henry, R. E. Howell, H. C. Mactier, A. Cox (Medical Secretary) and Courtenay Lord (Assistant Medical Secretary).

The Chairman in opening the proceedings stated that the Meeting had been arranged to discuss informally the question of the Fees at present paid to Medical Practitioners by the Life Assurance Offices in respect of Medical Examinations and Reports and to consider the desirability or otherwise of their

revision. He suggested that it would be convenient to divide the Offices into three classes, namely, Ordinary, Industrial and Intermediate, and to deal with the matter separately in regard to each class. At the request of a representative of the British Medical Association the classes were defined as:—

Ordinary.—Offices in which the amounts assured by the policies issued range from £100 upwards and average perhaps about £500, and in which the premium is usually paid at intervals of not less than three months, and the first premium may average something like £15 to £20.

Industrial.—Offices in which the sums assured by the policies issued are very small and the premiums are collected by weekly instalments of a few pence.

Intermediate.—Offices in which premiums are principally paid at monthly or longer intervals but the average amount of the policies issued is approximately £120 to £125.

It was understood that the representatives present were not authorised to commit their respective Associations to any agreement.

A very full discussion ensued, during which attention was called to the desirability of examinations in all cases (with the exception of purely industrial assurances) being of a thorough character and to the great diversity of practice among the Offices in regard to the number of questions appearing on their forms. Reference was made to the strong feeling in the medical profession that the 2s. 6d. fee in industrial assurances should be abolished, and it was suggested by a representative of one of the Industrial Offices that it might be possible to dispense with examinations altogether in industrial and the smaller ordinary cases as the limited experience of certain Offices in this direction had been very favourable.

The doctors present reported that there was strong feeling on the part of the medical profession that insurance fees generally should be increased in view of the general rise in prices.

It was agreed that some revision of the existing fees and a standardisation of forms was desirable and that a reasonable basis for consideration would be:—

(1) *Ordinary Offices.*—A fee of £1 1s. for all examinations—the report being made in a standardized form to be agreed, or one of less complexity should any Office prefer remuneration for any supplementary report required by the Office to be arranged between the parties concerned.

(2) *Industrial Offices.*—A fee of 5s. to be allowed as a general rule in industrial proposals, the report being made in a standardized form to be agreed.

(3) *Intermediate Offices.*—Including the Ordinary Department of Industrial Offices. A fee of 10s. 6d. in all cases where the sum assured does not exceed £100, the report being made in a standardized form to be agreed. In cases where the sum assured exceeds £100 a fee of £1 1s. to be paid and the standardized form applicable to ordinary offices to be used.

(4) The fee to be paid in all cases for reports from the medical attendant of an applicant, where no examination is required, should not exceed £1 1s.

(5) No fee should be charged for a reply to the ordinary enquiries in cases in which the name of a medical practitioner has been given as a reference in his private capacity.

It was decided that an agreed report be prepared and submitted to the respective Associations, it being understood that, if the principle of standardized forms be accepted, the actual questions to be embodied in the forms should be decided in consultation.

The meeting then adjourned.

PAYMENT OF MEDICAL STAFFS OF HOSPITALS FOR PENSIONS WORK.

THE following resolution, which will be considered at the Annual Representative Meeting in June, has been passed by the Council:

That for all work for soldiers and sailors, whether discharged or not, for any disease or injuries connected with the war, undertaken at voluntary hospitals, the medical staffs should be adequately remunerated. In any case the remuneration should represent an addition of not less than 25 per cent. to the cost of maintenance of in-patients, and not less than 25 per cent. of the ascertained cost per patient per attendance for out-patients, the additional sum to be placed at the disposal of the medical staff; that in the case of special clinics (for example, aurial and ophthalmic) the fee payable to the medical practitioner should not be less than the fee payable by the Ministry of Pensions for identical or similar services—namely, £2 2s. per session.

So far as in-patients are concerned the resolution is self-explanatory.

As regards out-patients, it might appear that the amount which will be produced is very small, but careful consideration will show that it may in fact be a fairly substantial sum. Supposing the ascertained cost per patient per attendance were 2s., then 6d. would be the amount to be paid into the medical pool for each time the disabled person attends as an out-patient. Many of these cases are not seen by a medical man at all, as, for example, in the case of an orthopaedic out-patient, where the patient simply attends on many occasions for massage or other treatment given by masseur, masseuse, or nurse. It has been found by experience that the percentage recommended has made available an amount sufficiently large to remunerate to their satisfaction those of the medical staff who attend disabled persons in the hospitals.

The whole matter is being discussed by the Hospitals Committee of the Association, the British Hospitals Association, and the Ministry of Pensions, and the resolution which is to be submitted to the Representative Body has been favourably considered by these bodies and is awaiting the decision of the Treasury.

It is now desired that the Divisions will give the subject their consideration and send their views to the Medical Secretary, either in the form of suggestions for the Hospitals Committee, which could receive attention before the issue of the Report of Council, or in the form of a motion for the Annual Representative Meeting. It is hoped that the Secretaries of Divisions in which this pension work is being carried on will put the subject down on their agenda for the next meeting, and specially ask the doctors attached to the hospitals to attend.

TRAINING OF MIDWIVES.

ON September 19th, 1919, the Board of Education issued a set of draft Regulations for the training of midwives with most of which every member of the profession will be in entire agreement. Paragraph 3 of the memorandum, however, says:

Under modern conditions a midwife should be competent not only to attend confinements but to advise her clients in regard to ante-natal conditions (other than those requiring medical attention), and the care of the newly-born child. It follows that in accordance with the requirements of the Central Midwives Board the curriculum should provide not only for the training of the student to follow the profession of the midwife in its narrow interpretation, but also for giving her a satisfactory knowledge of such subjects as the hygiene of pregnancy, the care and management of the infant, the best methods of encouraging breast feeding, hand feeding of infants, and some practical acquaintance with elementary hygiene, personal, domestic, and general. The student should also be made familiar with the work of maternity centres, infant welfare centres, and other similar institutions.

The Medico-Political Committee, while agreeing that it is desirable that midwives should be instructed in the hygiene of pregnancy, is of opinion that they should be given no responsibility for ante-natal conditions, for which skilled medical advice should always be sought; that midwives should be instructed that in all cases of pregnancy in which they are engaged for the confinement they should advise the patient to consult a doctor before the event; and that a suitable fee for this ante-natal examination should be included in the fees prescribed by the Ministry of Health.

The Committee would be glad if the Divisions would consider this matter and favour it with their comments, and would urge that in discussing the matter the opinion not only of general practitioners but of those concerned in training midwives should be sought.

British Medical Association.

CURRENT NOTES.

British Medical Association Lectures.

A LECTURE on "Vaccine Therapy" will be delivered by Mr. A. Fleming, F.R.C.S., at the meeting of the North Middlesex Division on April 21st. Sir Frederick Mott, K.B.E., F.R.S., will lecture on "The Early Symptoms and Diagnosis of Diseases of the Spinal Cord" at the meeting of the Plymouth Division on April 28th. Lieut.-Colonel R. McCarrison, I.M.S., will lecture on "Deficiency Diseases" at a meeting of the South Wales and Monmouthshire Branch to be held next month.

Surplus Library Books.

Honorary secretaries of Divisions and Branches which have libraries are informed that surplus books in the Library of the Association may be obtained by them on application to the Librarian, British Medical Association, 429, Strand, W.C.2, who will supply a list of such books.

Income Tax of Civilian Doctors on War Work.

Owing to the difficulty in interpreting the exact meaning of what constitutes war work several cases have been submitted to the Association with a view to obtaining a ruling as to whether the lower rate of income tax applied to them. The following four specific cases were therefore put to the Commissioners of Inland Revenue:

- (1) A., a civilian practitioner, acts as a member of a recruiting board, practically to the exclusion of his private work.
- (2) B. attends at a V.A.D. hospital daily and is paid for his attendance.
- (3) C. attends daily at a war hospital and is paid a fixed sum per day.
- (4) D., a woman doctor on a whole-time contract with the War Office, is detailed to attend W.R.A.F. personnel.

The question was asked, "Can any or all of these examples claim the lower rate of income tax?" The answer of the Commissioners was to the effect that they would make no objection in the case of examples 2 and 3, but that examples 1 and 4 were not considered to be performing service of a naval or military character which would entitle them to the reduced rate of income tax. The reduced tax of course only applies to such part of the income as is paid by the Treasury. The reply as regards 1 and 4 is not considered entirely satisfactory, and further inquiries are being made. It appears anomalous, for example, that a woman doctor on a whole-time contract who happens to be detailed to attend W.R.A.F.'s and Q.M.A.A.C.'s should not be entitled to the benefits mentioned, whereas if she were attending soldiers in a military hospital she would be.

Scientific Meetings: North of England Branch.

It is gratifying to learn that the revival of scientific meetings of the North of England Branch of the British Medical Association, which were discontinued during the war, has been most successful. That these meetings have lost none of their former popularity is shown by the average attendance of ninety at the October, November, and December meetings. The success of these post-graduate demonstrations has resulted in their extension under the joint auspices of the British Medical Association, the Council of the University of Durham College of Medicine, and the honorary staff of the Royal Victoria Infirmary, Newcastle-on-Tyne. The new scheme, of which particulars were given in last week's SUPPLEMENT, provides for weekly classes lasting for three months.

Medical Cinematograph Films.

The question of making more effective use of existing medical cinematograph films, as well as that of arranging for the preparation of further medical films, is under consideration by the British Medical Association. The Medical Secretary would be grateful if members in possession of, or having the control of, any films of special medical interest would kindly send him information as regards the subjects dealt with and the number of films.

Association Notices.**MEETING OF COUNCIL.**

THE next Meeting of Council will be held on Wednesday, April 14th, in the Council Room, 429, Strand, London, W.C.2.

ELECTION OF REPRESENTATIVE BODY OF THE ASSOCIATION, 1920-21.*Constituencies in Representative Body.*

THE list of the provisional **Home Constituencies** for election of the Representative Body, 1920-21, appeared in the SUPPLEMENT of January 24th, page 21.

As intimated to all the **Oversea bodies**, the Council has made each Oversea Division and Division-Branch, possessing an Honorary Secretary and the necessary organization, an independent Constituency.

Election of Representatives and Deputy-Representatives.

The Representatives and Deputy-Representatives in the Representative Body must be elected not later than May 23rd, and their names notified to the Medical Secretary not later than June 4th.

The Council draws special attention to the fact that it is entirely within the discretion of each Constituency to decide whether the election of its Representative(s) and Deputy-Representative(s) shall be carried out by **General Meeting of the Constituency, or by postal vote.**

Date of Annual Representative Meeting at Cambridge.

The Annual Representative Meeting at Cambridge will begin on Friday, June 25th, at 10 a.m.

Motions for the Annual Representative Meeting.

Notices of Motion by Divisions, Constituencies, or Branches, for the consideration of the Annual Representative Meeting, proposing to make any addition to, or any amendment, alteration or repeal of any Regulation or By-law, or to make any new Regulation or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, must be published in the JOURNAL not later than April 24th, and for this purpose should be received by the Medical Secretary **not later than April 10th.**

ELECTION OF COUNCIL OF THE ASSOCIATION, 1920-21.

THE list of the Groups of Branches in the United Kingdom for election of twenty-four members of the Council, 1920-21, and Nomination Form, appeared in the SUPPLEMENT of January 24th, page 22. Separate **Nomination Forms** will be forwarded by the Medical Secretary on application by Branches, Divisions, or Members. The Nominations must be in the hands of the Medical Secretary **not later than May 17th.**

BRANCH AND DIVISION MEETINGS TO BE HELD.

GLASGOW AND WEST OF SCOTLAND BRANCH.—Dr. A. Kennedy Glen, Honorary Secretary (Glasgow), gives notice that the Annual General Meeting of the Branch will be held in the Faculty Hall, 242, St. Vincent Street, Glasgow, on Wednesday, March 31st, at 4 p.m., when Dr. William Snodgrass will preside. Business: Honorary Secretary's Report. Honorary Treasurer's Report. Election of office-bearers. Consideration of proposal to hold Annual Meeting of the Association in Glasgow in 1922. Votes of thanks to past president and office-bearers. Demonstrations will be given (1) by Professor Carl Browning, on The Significance and Method of Determining Acetonuria; (2) by Dr. G. Haswell Wilson, on The Isolation of Tubercle Bacilli from Human Lesions: an Investigation on the Types of Tubercle Bacilli responsible for Disease.

METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.—Dr. W. Paterson, Honorary Secretary (12, Craven Park Road, N.W.10) gives notice that a meeting of members and non-members will be held on Tuesday, March 30th, at 8.30 p.m., at St. Andrew's Parish Hall (Institute behind Church), High Road, Willesden Green. The business includes:—Agenda: Election of Representative for the Annual Representative Meeting, and consideration of the treatment of disabled soldiers as out-patients. The adjourned discussion on the general practitioner and municipal hospitals, clinics, etc. will be continued.

MIDLAND BRANCH: LINCOLN AND KESTEVEN DIVISION.—Dr. Godfrey Lowe, Honorary Secretary, Lincoln Division (42, Langworth Gate, Lincoln), gives notice that a meeting of members and non-members of the Lincoln and Kesteven Divisions will be held at Lincoln on Tuesday, April 27th, at 3 p.m. Dr. Alfred Cox, O.B.E., Medical Secretary, will attend and give an address, to be followed by a discussion. Further particulars will be announced later.

Meetings of Branches and Divisions.**GLASGOW AND WEST OF SCOTLAND BRANCH: GLASGOW EASTERN DIVISION.**

A MEETING of the Glasgow Eastern Division was held on February 26th, when Dr. GLAISTER, President, was in the chair. The HONORARY SECRETARY (Dr. J. Dunlop) reported with regard to the Conferences of Panel Committees held in London on November 23rd and 29th, 1919, and in Edinburgh on February 11th, 1920. Communications from the central body were read and discussed. The Secretary was instructed to sign the copy of Revised Ethical Rules and return it to head office. It was decided to make an effort to join up with the Eastern Medical Society and hold the meetings jointly. On the suggestion of Dr. McCUTCHEON it was decided to report to the Branch on the question of forming a medical club in Glasgow.

British Medical Association.

EIGHTY-EIGHTH ANNUAL MEETING, CAMBRIDGE, JUNE-JULY, 1920.

President: Sir T. CLIFFORD ALBURY, K.C.B., LL.D., M.D., F.R.S., Regius Professor of Physic, University of Cambridge.
Chairman of Representative Meetings: T. W. H. GARSTANG, M.A. Oxon., M.R.C.S. Eng., D.P.H. Vict. (Altrincham).
Chairman of Council: J. A. MACDONALD, M.D., M.Ch., LL.D., Hon. Physician, Taunton and Somerset Hospital.
Treasurer: G. E. HASLIP, M.D. (London).

PROGRAMME.

The President will give an address on Tuesday evening, June 29th, in the Senate House, followed by a reception in King's College by the Cambridge and Huntingdon Branch.

The REPRESENTATIVE MEETING will begin in the Examination Halls on Friday, June 25th, at 10 a.m.

The statutory ANNUAL GENERAL MEETING will be held at the Examination Halls on Tuesday, June 29th, at 2 p.m.

The Annual Dinner of the Association will be held in the Hall of St. John's College at 7.30 p.m. on Thursday, July 1st.

Religious services will be held in the University Church, Great St. Mary's, and in the Roman Catholic Church, at 5 p.m. on Wednesday, June 30th.

The Popular Lecture will be given by Dr. G. S. GRAHAM-SMITH, F.R.S., at 8.30 p.m. on Friday, July 2nd.

DEMONSTRATIONS.

Laboratory and clinical demonstrations will be given from 2.30 to 4.30 p.m. (Wednesday, Thursday and Friday). The Directors of demonstrations are:

Medicine: Dr. ALDREN WRIGHT, 2, Corpus Buildings, Cambridge.

Surgery: Mr. ARTHUR COOKE, M.B., B.Ch. Oxon., Grove Lodge, Cambridge.

Physiology: Professor J. N. LANGLEY, F.R.S., Physiological Laboratory, Cambridge.

Pharmacology: Professor W. E. DIXON, F.R.S., Pharmacological Laboratory, Cambridge.

Neurology: Dr. E. D. ADRIAN, Trinity College, Cambridge.

Pathology: Professor Sir G. SIMS WOODHEAD, Pathological Laboratory, Cambridge.

THE SECTIONS.

The Sections will meet from 10 a.m. to 1 p.m.

Sections meeting on three days: Wednesday, June 30, Thursday, July 1, and Friday, July 2.

MEDICINE.

President: Sir HUMPHRY D. ROLLESTON, K.C.B., M.D., F.R.C.P.

Vice-Presidents: THOMAS BEATTIE, M.D., F.R.C.P.; Professor JOHN B. BRADBURY, M.D., F.R.C.P.; Sir THOMAS J. HORDER, M.D., F.R.C.P.; F. W. BURTON-FANNING, M.D., F.R.C.P.; THOMAS LEWIS, M.D., F.R.S.

Honorary Secretaries: A. J. JEX-BLAKE, M.D., F.R.C.P. (13, Ennismore Gardens, London, S.W.7); W. E. HUME, M.D., F.R.C.P. (4, Ellison Place, Newcastle-on-Tyne); E. LLOYD JONES, M.D. (59, Trumpington Street, Cambridge).

SURGERY.

President: Sir GEORGE H. MAKINS, G.C.M.G., C.B., F.R.C.S.

Vice-Presidents: HARRY LITTLEWOOD, C.M.G., F.R.C.S.; Sir CUTHBERT S. WALLACE, K.C.M.G., C.B., F.R.C.S.; GEORGE EDWARD WHEERY, M.Ch., F.R.C.S.; DAVID PERCIVAL D. WILKIE, F.R.C.S. Edin.

Honorary Secretaries: WM. HENRY BOWEN, M.S., F.R.C.S. (24, Lensfield Road, Cambridge); G. E. GASK, C.M.G., D.S.O., F.R.C.S. (41, Devonshire Place, London, W.1); GORDON TAYLOR, O.B.E., M.S., F.R.C.S. (15, Harley Street, London, W.1).

NEUROLOGY AND PSYCHIATRY

President: HENRY HEAD, M.D., F.R.S.

Vice-Presidents: GORDON M. HOLMES, C.M.G., M.D., F.R.C.P.; W. H. RIVERS RIVERS, M.D., F.R.S.; LEWIS E. SHORE, M.D.; T. GRAINGER STEWART, M.D., F.R.C.P.; THEODORE THOMPSON, M.D., F.R.C.P.

Honorary Secretaries: E. D. ADRIAN, M.D., M.R.C.P. (Trinity College, Cambridge); F. FARQUHAR BUZZARD, M.D., F.R.C.P. (78, Wimpole Street, London, W.1); GEORGE RIDDOCH, M.D. (10, Alba Gardens, Golders Green, London, N.W.4).

PATHOLOGY AND BACTERIOLOGY.

President: Professor J. LORRAIN SMITH, M.D., F.R.S.

Vice-Presidents: J. A. ARKWRIGHT, M.D., F.R.C.P.; LOUIS COBBETT, M.D., F.R.C.S.; MERVYN H. GORDON, C.M.G., M.D.; T. S. P. STRANGEWAYS, M.R.C.S., L.R.C.P.

Honorary Secretaries: A. E. CLARK-KENNEDY, M.R.C.S., L.R.C.P. (Corpus College, Cambridge); A. E. GOW, M.D.,

F.R.C.P. (37, Queen Anne Street, London, W.1); HELEN INGLEBY, M.B., M.R.C.P. (35, Welbeck Street, London, W.1).

PHYSIOLOGY AND PHARMACOLOGY.

President: Professor F. GOWLAND HOPKINS, M.B., F.R.S.

Vice-Presidents: H. H. DALE, C.B.E., M.D., F.R.S.; Professor J. A. GUNN, M.D.; Professor D. NOËL PATON, M.D., F.R.S.; P. RANSOM, M.D.

Honorary Secretaries: D. V. COW, M.D. (The Bridge House, Great Shelford, Cambridge); EDWARD MELLANBY, M.D. (32, Addison Mansions, Kensington, London, W.14).

The following Sections meet on Wednesday only.

NAVAL AND MILITARY.

President: Colonel JOSEPH GRIFFITHS, C.M.G., M.D., F.R.C.S.

Vice-Presidents: Lieut.-Colonel E. J. CROSS, R.A.M.C.T.; Lieut.-Colonel R. H. ELLIOT, M.D., D.Sc., I.M.S. (ret.); Surgeon Commander H. W. B. SHEWELL, R.N.; Surgeon Rear Admiral A. GASCOIGNE WILDEY, C.B., R.N.

Honorary Secretaries: Major S. M. MACGREGOR, O.B.E., M.D., R.A.M.C.T. (Sanitary Chambers, Glasgow); Major H. B. RODERICK, O.B.E., M.Ch., M.D., R.A.M.C.T. (17, Trumpington Street, Cambridge); Lieut.-Colonel F. E. APHORPE WEBB, O.B.E. (Grafton House, Maid's Causeway, Cambridge).

OBSTETRICS AND GYNAECOLOGY.

President: HERBERT WILLIAMSON, M.B., F.R.C.P.

Vice-Presidents: FREDERICK DEIGHTON, M.B.; J. PRESCOTT HEDLEY, M.Ch., F.R.C.S.; FRANCES IVENS, M.B., M.S.

Honorary Secretaries: MALCOLM DONALDSON, M.B., F.R.C.S. (145, Harley Street, London, W.1); W. R. GROVE, M.D. (St. Ives, Hunts).

TROPICAL MEDICINE.

President: Professor G. H. F. NUTTALL, M.D., F.R.S.

Vice-Presidents: BREADALBANE BLACKLOCK, M.D.; Lieut.-Colonel S. PRICE JAMES, M.D., I.M.S.; P. H. MANSON-BAHR, M.D.

Honorary Secretaries: CHARLES FREDERICK SEARLE, M.D. (71, Bridge Street, Cambridge); J. GORDON THOMSON, M.B. (24, Herne Hill, London, S.E.24).

The following Sections meet on Thursday only.

MEDICAL EDUCATION.

President: Sir GEORGE NEWMAN, K.C.B., M.D., F.R.C.P.

Vice-Presidents: G. S. GRAHAM-SMITH, M.D., F.R.S.; Professor DAVID HEPBURN, C.M.G., M.D.; THOMAS W. SHORE, M.D.; S. SQUIRE SPRIGGE, M.D.; Professor PETER THOMPSON, M.D.

Honorary Secretaries: S. R. GLOYNE, M.D. ("Hatherley," halfont St. Giles, Bucks); Professor J. KAY JAMESON, M.B. (Dean of Faculty of Medicine, Leeds).

VENEREAL DISEASES.

President: E. B. TURNER, F.R.C.S.

Vice-Presidents: Colonel L. W. HARRISON, D.S.O., M.B.; MORNA L. RAWLINS, M.B.

Honorary Secretaries: W. H. HARVEY, M.D. (The Dene, Great Shelford, Cambridge); OTTO MAY, M.D. (19, Well Walk, Hampstead, London, N.W.3).

The following Sections meet on Friday only.

ELECTRO-THERAPEUTICS.

President: ALFRED ERNEST BARCLAY, M.D.

Vice-Presidents: ROBERT KNOX, M.D.; ALFRED CHARLES JORDAN, M.D., M.R.C.P.

Honorary Secretaries: E. P. CUMREBATCH, M.B., M.R.C.P. (15, Upper Wimpole Street, W.1); F. SHILLINGTON SCALES, M.D. ("Redcourt," Adams Road, Cambridge).

MEDICAL SOCIOLOGY.

President: G. E. HASLIP, M.D.

Vice-Presidents: H. B. BRACKENBURY, M.R.C.S., L.R.C.P.; ADAM FULTON, M.B.; C. O. HAWTHORNE, M.D.; Professor BENJAMIN MOORE, D.Sc., F.R.S.

Honorary Secretaries: S. MORTON MACKENZIE, M.B. (9, Rose Hill, Dorking); C. M. STEVENSON, M.D. (90, Chesterton Road, Cambridge).

The Honorary Local Secretaries of the Meeting are J. F. GASKELL, M.D., F.R.C.P., The Uplands, Great Shelford, near Cambridge, and G. S. HAYNES, M.D., 58, Lensfield Road, Cambridge.

INSURANCE.

CORRESPONDENCE.

Unity and Trade Unionism.

SIR.—At a meeting this week of the Cheshire Local Medical and Panel Committee a resolution was carried by a majority that the Committee should advise its constituents to join the Medico-Political Union.

That is a decision which it behoves the British Medical Association to note, for it was dissatisfaction with the British Medical Association which was its main cause.

Although I voted in the minority against the decision, being a convinced opponent of any attempt to apply the Trades Union Act to our profession, I feel strongly that the way in which the matter was presented to the consideration of the Cheshire Committee could have had no other issue than the decision taken, and that so much of it as concerns the Association and its members should be set out in a letter for their consideration.

The way in which the matter was presented was: That it was introduced in an able and temperate speech by Dr. Gough, and seconded by Dr. Wm. Hodgson of Crewe. Dr. Hodgson represented Cheshire and North Wales on the Insurance Acts Committee during the year in which "M.25" was in preparation. His speech, in seconding the resolution, recapitulated various stages in the evolution of that document. During the whole year that he sat on the Insurance Acts Committee, he said, he had been isolated. He was not *persona grata*. He was "out" to carry out the behests of those who had sent him there, and he always found himself against a wall of opposition. The central influences of the Association were too closely connected with governmental circles for independent action in the interests of the profession. He got no support for his protests against the curtailment of the freedom of our craft. He moved resolution after resolution and got no seconder. He wrote articles and letters to the JOURNAL, which seldom, hardly ever, saw the light. Even his speeches in the Conference received the scantiest mention, and no effective report of his views could reach the profession through that one great medical paper by which the Association lives, and which should be the fair medium of communication for all who follow medicine.

And his views were by no means singular or peculiar. They were subsequently endorsed in point after point by the Conference of Panel Committees, and the things against which in the Insurance Acts Committee he had protested were in the Conference struck out. In regard to the obligation to attend midwifery, the proposal to subsidize new panel practitioners on their entry into practice, the limitation of lists, the transfer of practices, and many other matters, the very opinions which Dr. Hodgson had previously and unavailingly urged upon the Insurance Acts Committee afterwards proved to be the views of the majority of the Conference and the profession.

In debate the relation of personal experiences counts for much, and no one who heard Dr. Hodgson and knew his years of devoted service to the public and the profession could fail to be a sympathetic listener.

"I don't want to compare the British Medical Association with the Medico-Political Union," he said, "except to show the direction of effective combination which should be followed to secure the objects which are desirable for the profession. . . . How are we going to organize? I don't care what body it is so long as it will get the profession together in effective support. . . . What can we do with the British Medical Association? They cannot conspire! If it came to a serious fight their funds would be confiscated. The Medico-Political Union's funds would not be confiscated."

"There always gathers round the official ring support which likes to be on the winning side." He would plead, he continued, with a panel doctor to belong to some democratic body which can organize so as to get what it wants—some bond of brotherhood which can energize our opposition. "If we get this strength we can get what price we want for our services, and what conditions. We shall not want conditions which are not honourable."

Such an argument, rooted in personal experiences and delivered by a past master of oratorical persuasion, carried the day. It brushed aside any legal scruples as to the applicability of the Trades Union Act to doctors. It fastened attention on the one factor that was wanted—an organization that would really voice the opinions of general practitioners.

I am an opponent of Dr. Hodgson in the matter of trades unionism; but I do most sincerely endorse his view that a medical association representative of the profession should give full weight and publicity, patient tolerance,

and consideration to all shades of medical opinion, both in the BRITISH MEDICAL JOURNAL and in the committees.

A little extra paper, Sir, spent in reporting opinions, even though they prove erroneous, will do much to increase the membership of the British Medical Association, and in the long run the unity of the profession for common action.—I am, etc.,

Holmes Chapel, March 20th.

LIONEL JAS. PICTON.

Two points in Dr. Picton's letter call for notice by us. During the past two years we can trace the receipt of two communications only for publication from Dr. William Hodgson. One was published in the JOURNAL of June 7th, 1919. The other (which reached us on Monday, August 25th, 1919) would have occupied two pages of the JOURNAL, and we were not at that time in a position to provide the necessary space; it was found that the letter had been published in full in another periodical dated Friday, August 29th. In the preparation of reports of the Panel Conferences, as of other meetings published in this JOURNAL, the intention is to give an impartial account of the proceedings. With regard to the particular charge which our correspondent informs us Dr. Hodgson made before the Cheshire Local Medical and Panel Committee, we find on examination of the facts that it is in our judgement entirely unfounded.

In view of the statements regarding the Insurance Acts Committee we have sent a proof of Dr. Picton's letter to the Chairman of that Committee, whose reply follows:

SIR,—Dr. Picton reports in some detail statements said to have been made by Dr. W. Hodgson of Crewe. I have no reason to doubt the accuracy of this report, but the expediency of answering statements made in this fashion is doubtful. Several of the statements, as reported, are however untrue, and I am anxious emphatically to repudiate the charge of unfairness which is made against the Insurance Acts Committee.

Dr. W. Hodgson, of Crewe, was a member of that Committee for one year. At the end of that time he offered himself for re-election, and his constituents preferred to vote for another candidate. This appears to be the reason why Dr. Hodgson considers the Insurance Acts Committee unrepresentative; but, in the present stage of the development of political institutions, this is the usual democratic machinery. While Dr. Hodgson was a member of the Committee he was zealous in attending the meetings and in expressing his opinions about the matters under discussion. It is true that on a number of points he was in a minority of one, but he was always given the fullest opportunity of making his ideas known. I should not myself have described him, as Dr. Picton does, as a "past master of oratorical persuasion," but in my experience, both in the Insurance Acts Committee and at the Conferences of Panel Committees, Dr. Hodgson's rhetorical efforts have always been listened to with patient appreciation, and have been reported with relative fullness by you and with rather more than this elsewhere. Here, again, the real grievance seems to be not that he was not heard, but that he failed to persuade. It is not true, except in one instance, that the points he vainly urged on his colleagues of the Committee were afterwards adopted by the Conference in opposition to that Committee, and in this one instance Dr. Hodgson was not the sole exponent of these views of the Committee but was only one of a large minority.

Every member of the Insurance Acts Committee will, with Dr. Picton, "endorse the view that a medical association representative of the profession should give full weight and publicity, patient tolerance, and consideration to all shades of medical opinion"; and, so far as Dr. Hodgson represents one such shade, I can only affirm that, in committee and in conference, he has had all these things.—I am, etc.,

London, N., March 23rd.

H. B. BRACKENBURY.

The Rural Mileage Grant.

SIR,—I think every rural panel doctor will have learnt with some dismay that the arbitrators' award is 11s. per head, and drawn cold comfort from the promise of mileage fees sufficient to balance the difference in cost between urban and rural panel work.

I am keeping records of mileage and of the number of visits to private and panel patients in my rural practice for the Ministry of Health. After reducing the number of my index cards by 16 per cent., the least average of inflation in the two county areas in which my practice lies, I find that the annual cost in mileage of each panel patient on my list is 1s. 4½d. per head taking all together.

far and near. I append the figures for February last, and it will be evident that the allowance I have made for expenditure in travelling by car is as low as possible, and is likely in many years, and in many practices, to be greater.

Dr. Addison has stated recently that the mileage fund of £300,000 equals 5d. per head of the total insured population of the country. If the whole fund is equitably divided between the various panel areas entitled to claim, and if the rural insured population represents a little less than one-third of the total insured population, then the central mileage fund will just cover the out-of-pocket expenses of rural and semi-rural panel doctors in doing their work under the Insurance Acts. If the fund is unequally divided some areas will not receive enough, and if the proportion of rural to urban parts is one-third or greater no areas will receive enough to pay actual costs of doing the work, to say nothing of the value of time expended in travelling in rural practices.

I write earnestly to beg rural panel doctors to keep records and work out their costs on the lines of these I append to this letter and to forward them to the Insurance Acts Committee of the British Medical Association.

It is only by accumulating a good body of really fair and unassailable statistics on this point that it will be possible for the Insurance Acts Committee to prove the necessity of an increased grant for mileage, in the event—which appears to me to be probable—of the present fund proving at the end of this year to be inadequate for the purpose it is claimed it will achieve, that is, of equalizing the payment for work done as between rural and urban panel doctors.

Records should be commenced at once, for summer figures alone will not give the annual average.—I am, etc.,

Tanworth-in-Arden, March 18th. J. HENRY STORMONT.

Insurance Index Cards (January, 1920):

Warwickshire	450
Worcestershire	136
Total	586

Of these, allowing for inflation, I am paid for about 500.

February, 1920:

Total miles travelled	1,058
Visits paid—Private	461
“ Insured	73
Proportion of private to insured	6 1/2 to 1.

Travelling Costs for annual mileage of, say, 10,000 with Ford car:

	£	s.	d.
Tyres, petrol, oil, grease (cost 3d. per mile)	125	0	0
Charges:			
Insurance	8	10	0
Licences	3	8	0
Repairs and spare parts	42	2	0
Proportion of boy's wages	26	0	0
Depreciation	50	0	0
	150	0	0
	255	0	0
Private mileage costs (per annum)	221	0	0
Insurance mileage costs (per annum)	34	0	0

Cost per head for 500 insured patients for whom I am actually responsible and am paid 11s. = 1s. 4 1/2d. per annum.

Insurance Remuneration.

SIR,—To those of us who have been able to read carefully the proceedings of the arbitration and Dr. Brackenbury's explanations of it two impressions stand out distinctly:

First, that the whole of the profession is deeply under an obligation to Dr. Brackenbury for so ably debating the point of view of the medical profession and for holding so high the aims of the profession at large and the standard of future panel work—far higher, apparently, than those held by the Ministry of Health.

Secondly, that if we are dissatisfied with the award of the arbitrators—as no doubt we justifiably are—we have no one to blame but ourselves, as the inability of the Insurance Acts Committee to convince the arbitrators that our claims were just was solely due to a want of reliable data to prove our case.

It is clear that if we are ever to obtain what we believe is fair and just payment for work done, we must keep such statistics now as will prove our just claims later on. Will the Insurance Committee now tell us what data they will require? They could be obtained each quarter by the Panel Committees—if practitioners prefer they could be rendered under a number or *nom de plume*—and it should be the duty of each Panel Committee to collect such data and place them at the disposal of the Insurance Committee. This scheme, if it is to be of any use, should

be organized forthwith if the evidence is to be available when the terms of service are next reconsidered.

I believe many curious phenomena would be discovered, such as the higher percentage per head of attendances in rural districts over those of urban districts, the decreased visits during periods of high-employment periods as against consultations in such periods, etc.—I am, etc.,

Langford, Somerset, March 15th. ERNEST D. PINEO.

Testimonial to Dr. Brackenbury.

SIR,—As a desire has manifested itself that the great services rendered to the insurance profession by Dr. Brackenbury and his colleagues on the Reconstruction Subcommittee of the Insurance Acts Committee should be recognized, the Standing Committee of Group K have resolved themselves into a committee for the purpose of meeting this desire. The undersigned have been appointed secretaries to the fund. A circular letter has been sent to the secretaries of all Local Medical and Panel Committees for issue to the practitioners of their areas in the following terms:

A widespread desire has manifested itself to acknowledge in a substantial manner the work done for the profession by the Reconstruction Subcommittee of the Insurance Acts Committee. In order to afford the profession an opportunity of gratifying this desire, a central committee, consisting of Drs. H. J. Cardale, J. A. Angus, G. Cohen, C. F. T. Scott, C. E. Brunton, H. R. Brown, F. H. Dayus, and H. S. Beadles, has been formed, with Drs. B. A. Richmond and R. J. Farman (secretary and assistant secretary of the London Panel Committee) as secretaries of the fund. It is, of course, impossible adequately to express the gratitude of the profession for the work accomplished by Dr. Brackenbury and his colleagues; even those who may be somewhat disappointed at the results will recognize the vast amount of time which these busy practitioners have bestowed upon a particularly thankless task. I do not apologize for asking you to send me your subscription of 10s., for I am sure you would wish to be associated with this movement, which is receiving the whole-hearted support of the panel profession. It is intended that Dr. Cox shall participate in the proposed recognition.

Dr. Brackenbury's work was of such an outstanding character that recognition in his case would be of a special nature. It is hoped that all insurance practitioners will support this fund by sending their subscriptions to the secretaries of their Panel and Local Medical Committees at as early a date as possible.—We are, etc.,

B. A. RICHMOND,
ROBT. J. FARMAN,
Secretaries, Panel Committee for the County of London.

Staple House, 51, Chancery Lane, W.C., March 23rd.

SIR,—I should like to express my entire agreement with Dr. Hedley's letter in the SUPPLEMENT to the JOURNAL (March 20th, p. 83) as to the immense work of Dr. Brackenbury for the profession as Chairman of the Insurance Acts Committee, and also the greatness of our gratitude for it. I am not now in practice, but I was on the Norfolk panel from the start, and was also a member of the Panel Committee. I claim, therefore, to know something of the working of the Insurance Act, and I know that the grasp of the whole affair shown by Dr. Brackenbury could only have been acquired by considerable effort and at the cost of much time. I shall be pleased to subscribe to a testimonial.—I am, etc.,

Cheltenham, March 20th. LEGGE PAULLEY.

Insurance Work in Rural Areas.

SIR,—Here with an interesting contrast. I am called to see a patient at the neighbouring village of N—. I get out my motor (it happens to be a sidecar, but let that pass). It is raining and blowing hard from the West. I grind 200 feet up out of the village on lowest gear (four right angled corners and a 12-foot road), sliether skidding down again to the head of the creek, across the bridge, up, with spinning wheel, another 200 odd feet above the water and down again to N—. At a modest estimate, say twenty minutes, and a cost of a shilling, and the same returning. It is just under 2 miles, so I get not one halfpenny as "mileage." True I could have got on oikskins, dragged down the dinghy and had a hard pull over against wind and rain. It would have taken longer, but I should have spent nothing except much physical energy and a bit more wear off the boat. Six hours out of every twelve, of course, the boat won't float! Still the tide might happen to fit.

A friend practising on the outskirts of a town some twenty miles away from here is called to a patient in a village three miles out. His practice is large enough for him to afford the protection of a car. He runs out along the main road, sees the patient, and is back inside twenty

minutes. He gets "mileage." In future, if the patient happens to be distant 0.01 over the three miles, he will get extra "mileage."

Let all practitioners in practices such as I have first hinted at do as I have done. When asked by their County Committee to give mileage distances, point out strongly in a covering letter that it is the nature and surfaces of the roads, not mere distance, that causes the expense of transport. It seems elementary to us, but we are ruled by town dwellers.—I am, etc.,

March 14th.

"TRULY RURAL."

LOCAL MEDICAL AND PANEL COMMITTEES.

COUNTY OF LONDON.

At its meeting on March 23rd the London Panel Committee by a standing vote expressed its great sense of loss at the death of Sir Robert Morant, who had always shown the greatest interest in the welfare of the medical profession and especially of insurance practitioners.

The Committee approved unanimously of the scheme prepared by the Standing Joint Committee for Group K for the recognition of the services rendered to insurance practitioners by Dr. H. B. Brackenbury and his colleagues on the Reconstruction Subcommittee of the Insurance Acts Committee, and pledged itself to do all in its power to make the scheme a success. Dr. Claude Taylor said that it was proposed to elicit a subscription if possible from all insurance practitioners and make a presentation to Dr. Brackenbury and his colleagues at a dinner to be held probably on the occasion of the next annual conference of Local Medical and Panel Committees. The Committee also passed a resolution regretting that Dr. Brackenbury had not been appointed a member of the Medical Consultative Council and hoping that this serious omission would be set right at the earliest opportunity. Dr. Coode Adams moved an amendment deleting the second part of this resolution on the ground that Dr. Brackenbury had not proved a successful negotiator in the matter of practitioners' remuneration and the new Regulations. The amendment found only two supporters. It was agreed to communicate the resolution to the Prime Minister, the Chairman of the Consultative Council, and the Minister of Health.

The Committee agreed upon the desirability of taking steps to secure an amendment to the clause of the Amending Act, 1913, providing for the administrative expenses of Panel Committees. It was urged that the Insurance Committee should be authorized to allot for the administrative expenses of the Panel Committee a sum not exceeding 1d. per annum in respect of each insured person, but that before any allotment exceeding the present 3d. was made a referendum should be taken among the insurance practitioners of the area, and no authority be given when more than 25 per cent. of the practitioners signified objection.

It was reported that the number of cases of complaints against practitioners dealt with by the Medical Services Subcommittee of the Insurance Committee during 1919 was 66, of which 42 were substantiated. Of these 42 the nature of the complaint in 14 was inability to obtain treatment; in 7, a charge made for treatment; in 6, refusal to treat; and in 5, neglect in treatment. Only 1 complaint was made by a practitioner against an insured person—for unseemly behaviour—and was substantiated.

EAST SUSSEX.

A WELL attended meeting of the Medical and Panel Committees for East Sussex was held at Lewes on March 16th. The scheme put forward by the London Committee in recognition of the services of members of the Reconstruction Committee of the Insurance Acts Committee in the recent arrangement of terms met with hearty approval, as also did a resolution of appreciation of the services of Dr. Williams-Freeman, the group representative in the same connexion. A number of practitioners were selected to keep the mileage accounts desired by the Ministry; and representatives and their deputies were appointed on the new Allocation Committee. A resolution was passed stating that the new record cards to be kept should be in the custody of the patient, whose duty it should be to produce them for entries when needed.

CERTIFYING FACTORY SURGEONS.

ABOLITION OF THE SIXPENNY FEE FOR EXAMINATION.

In a note on the report issued by the Association of Certifying Factory Surgeons, published on March 6th, it was mentioned that representations had recently been made to the Chief Inspector of Factories respecting the inadequacy of the fees paid for medical examinations when granting certificates of fitness. When the fee was fixed at 6d. by a schedule attached to the Factory Act of

1878 it was strongly criticized as inadequate by the British Medical Association and the Royal Colleges in London. We are now glad to note that an Order, dated March 9th and coming into force on March 22nd, has been issued by the Secretary of State which has the effect of abolishing the sixpenny fee. The new scale is as follows:

When the examination is at the factory or workshop, 1s. for each person examined, with a minimum fee of 2s. 6d. for any one visit; and also, if the factory or workshop is more than one mile from the surgeon's central point, 6d. for each complete half-mile over and above the mile.

When the examination is not at the factory or workshop, but at the residence of the surgeon, or at some place appointed by the surgeon for the purpose, and that place as well as the day and hour appointed for the purpose has been published in the prescribed manner, 1s. for each person examined.

Although this change in the scale of fees will be welcome by certifying surgeons and approved by the profession generally, the new arrangement does not fully meet the case, as recently presented to the Chief Inspector of Factories. The minimum fee of 2s. 6d. for a visit to a factory, which was established so long ago as 1836, as the proper remuneration at that time, has not been altered, so that there will be no material benefit to the surgeon unless more than two persons are examined on any single occasion. The feeling among certifying surgeons appears to be that the purchasing value of 2s. 6d. was much greater in 1836 than that of 5s. in 1920, and that their request for the minimum fee to be fixed at 5s. is very reasonable. Although when five or more are examined, the fee would be the same with either the 2s. 6d. or 5s. minimum, as the average number examined at each visit hovers between two and three, it does not appear that the new arrangement will increase the total earnings to any great extent. As we previously pointed out, the certifying surgeon has full power to arrange with the employer respecting the amount of fees to be paid, and we anticipate that he will continue to do so.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty:—Surgeon Commanders: C. J. O'Connell to the *Crescent*, for Lyness Naval Base (temporarily); W. N. Blatchford to the *Weymouth* on commissioning; J. P. H. Greenhaugh to the *Lion* (temporarily); J. D. Keir to the *Crescent III*, for Admiralty Experimental Station, Shepperton. Surgeon Lieutenant Commanders: A. J. Tozer to the *Hood*; J. H. Burdett to the *Surprise* on commissioning.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel and Brevet Colonel D. J. Collins to be temporary Colonel whilst an Assistant Director of Medical Services from July 22nd to August 31st, 1917, inclusive.

Lieut.-Colonel F. E. Guuter, D.S.O., relinquishes the temporary rank of Colonel.

Lieut.-Colonel W. J. Taylor retires on retired pay.

Temporary Lieut.-Colonel G. S. Jackson, C.B.E., D.S.O., T.D. (Major and Brevet Lieut.-Colonel, 7th Northumberland Fusiliers, T.F.) relinquishes his temporary commission.

Majors relinquish the temporary rank of Lieutenant-Colonel: D. Abern, D.S.O., A. C. Osburn, D.S.O.

Temporary Major C. E. F. Mount-Biggs to draw the pay and allowances of his rank from January 4th to 24th, 1920.

The following officers relinquish the acting rank of Major: Captain and Brevet Major T. A. Weston, Captains R. H. Lucas, O.B.E., M.C., S. H. Smith, W. T. Graham, L. S. C. Roche, M.C., temporary Captains N. McA. Gregg, M.C., F. O. Clarke, L. Anderson, D.S.O., C. B. Davies, M.C., R. B. Roe, E. J. Maxwell, P. McCord.

To be acting Majors: Captain and Brevet Major W. F. Christie, Captains F. R. Coppinger, O.B.E. (from June 1st, 1919, to January 3rd, 1920), W. B. Rennie, M.C., temporary Captain C. E. Jones.

Captain J. W. G. H. Riddell, M.C., resigns his commission.

Captain J. E. Hepper is seconded for service with the Egyptian Army.

Captain G. J. Keane, D.S.O., retires, receiving a gratuity, April 30th, 1919, and the notification in the *London Gazette* of February 4th, 1920, regarding this officer is cancelled.

Temporary Captain (acting Major) F. J. Fahy relinquishes the pay and allowances of his acting rank, April 16th, 1918, and his acting rank, April 18th, 1918.

To be temporary Captains: P. H. Shelley (late Surgeon Lieutenant, R.N.), M. J. Whelton.

The following officers relinquish their commissions:—Temporary Major J. L. Maxwell, on ceasing to be employed at the Graylingwell War Hospital, and retains the rank of Major. Temporary Captain G. W. Milne, O.B.E., on account of ill health contracted on active service, and is granted the rank of Lieutenant-Colonel. Temporary Captain H. C. Gibson, on account of ill health, and is granted the rank of Major. Temporary Captain A. C. Hancock, M.C., on account of ill health contracted on active service, and is granted the rank of Major. Temporary Captains, and retain the rank of Captain: T. W. Shaw (August 22nd, 1919, substituted for notification in the *London Gazette* of September 10th, 1919), J. K. Clarke, W. H. Swaffield, A. Leach, C. Dean, M.C., W. L. Locke, T. S. Goodwin, A. R. Jennings, W. Weir, H. M. Wilson, W. J. Thomas, R. K. H. Gillespie, W. C. Mayo, A. H. Manfield, Alfred Leitch, J. A. R. Thompson (on account of ill health caused by wounds), H. S. Sugars, D.S.O., M.C., R. A. C. Rigby, H. L. S. Griffith.

**ROYAL AIR FORCE.
MEDICAL BRANCH.**

Captain J. J. Sinclair relinquishes his commission on account of ill health contracted on active service, and is permitted to retain his rank. Transferred to the unemployed list: Captain W. H. Anderson. Second Lieutenant H. W. Boot.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Captain (acting Major) E. J. Bradley, M.C., relinquishes the pay and allowances of his acting rank, March 14th, 1919, and relinquishes the acting rank of Major. April 1st, 1919.
Captain A. W. Wells resigns his commission.
Captain D. McEachran relinquishes his commission.
Captain J. W. Mann relinquishes his commission on account of ill health contracted on active service, and retains the rank of Captain.
Captain W. B. Foley, O.B.E., relinquishes the acting rank of Major.
Captains O. S. Parker and P. A. O'Brien relinquish their commissions on account of ill health and retain the rank of Captain.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Captain (acting Lieut.-Colonel) J. M. A. Costello, M.C., relinquishes the acting rank of Lieutenant-Colonel on ceasing to be specially employed.
Captains (acting Majors) relinquish the acting rank of Major on ceasing to be specially employed: J. W. Dale, M.C. (December 28th, 1918, substituted for notification in the *London Gazette*, February 26th, 1919), J. St. G. Wilson, M.C., E. C. Hobbs, W. Appleard (March 3rd, 1919).
Captain (acting Major) M. Coplans, O.B.E., D.S.O., relinquishes the rank of Major on ceasing to hold the appointment of Deputy Assistant Director of Medical Services, October 18th, 1919 (substituted for notification in the *London Gazette* of February 11th, 1920).
2nd London Sanitary Company.—Captain D. Smith is restored to the establishment. Lieutenant J. Ogilvie to be Captain.
3rd Southern General Hospital.—Captain R. E. Humphry relinquishes his commission on account of ill health contracted on active service and is granted the rank of Major.
4th Southern General Hospital.—Captain (Brevet Major) E. G. Smith is restored to the establishment.
West Lancashire Divisional Sanitary Section.—Captain A. Reid is seconded under paragraph 112, T.F. Regulations.

**TERRITORIAL FORCE
RESERVE.**

ROYAL ARMY MEDICAL CORPS.

Major A. E. Hodder, D.S.O., from 3rd North Midland Field Ambulance, to be Major.
The announcements in the *London Gazette* of the dates indicated regarding the following officers are cancelled: (Captains W. M. Langdon (December 12th, 1918), D. M. Johnston, W. C. F. Harland (December 30th, 1918), W. Robertson, M.C. (January 7th, 1919), J. F. Ward and A. H. T. Andrew (December 18th, 1918), C. H. Bullen (January 15th, 1919), I. C. Keir and G. Candler (December 17th, 1918), H. L. Munro (January 22nd, 1919).

VOLUNTEER FORCE.

Temporary Lieut.-Colonels relinquish their commissions and are granted the honorary rank of Lieutenant-Colonel: Lancashire R.A.M.O.V.: E. Quayle, M.B.E. East Yorkshire R.A.M.C.V.: G. Easton (Honorary Colonel ret. T.F.).

Temporary Majors relinquish their commissions and are granted the honorary rank of Major:—Essex R.A.M.C.V.: J. White-Hopkins, K. S. Storr (Captain T.F.R.). Glamorganhire R.A.M.C.V.: A. W. Anderson. Hertfordshire R.A.M.C.V.: T. P. G. Wells, Kent R.A.M.O.V.: P. G. Selby, G. T. Giddings, W. H. F. Noble, E. C. Warren, F. Brightman, W. F. Unney, A. Tennyson-Smith, H. Porter, E. D. Fitz-Gerald, G. L. Bunting, J. Sterry. Middlesex R.A.M.C.V. (Motor Ambulance Convoy): P. G. Darvell-Smith. Northamptonshire R.A.M.C.V.: E. H. Harries-Jones, Shropshire R.A.M.C.V.: G. Holmes, J. Lytle. Somerset R.A.M.C.V.: H. C. Bristolow. Surrey R.A.M.C.V.: C. S. Crichton. Sussex R.A.M.C.V.: W. Conway-Cook, F. E. Richardson, A. C. Roberts (Lieut.-Colonel T.F.R.). East Yorkshire R.A.M.C.V.: A. H. Johnston, A. Wilson, H. D. Johns, A. T. Brand, V.D. (Surgeon Major ret. Vols.).

Temporary Captains relinquish their commissions and are granted the honorary rank of Captain:—Hampshire R.A.M.C.V.: F. C. H. Bottomley, A. C. D. Newton. Hertfordshire R.A.M.C.V.: P. G. H. Bayon. Kent R.A.M.C.V.: R. Wilkinson, H. W. Thomas, T. W. Hinds, R. M. H. Kendall, A. C. Haslam, J. P. Henderson, S. A. E. Griffiths, F. E. Nichol, W. R. Brunton, W. F. H. Coker, P. J. Curtis, C. D. Outred, R. G. Willis, R. A. Walter, J. A. Meeke, J. M. Bennion, C. J. Evers, F. W. Gange, P. N. Randall, F. Fraser, T. W. Bailey, W. J. D. Best, Suffolk R.A.M.C.V.: W. F. Fryer, H. P. Sleight, D. N. Seth-Smith, G. H. Ransome, M. H. Hannigan, G. I. T. Stewart, S. O. Pades, A. C. Young, G. R. Fox, F. C. Weatherell, E. A. C. Baylour, O. A. Clark, M. B. E., J. Ayles, E. J. C. Dickie. CURRENT NOTES.

Membership of the Association.

In the period January 1st to March 6th, 1920, 801 new members have joined the British Medical Association. The number of members at the latter date was 21,774, showing a net increase of 419 as compared with the membership figure on December 31st last.

Reconstruction of the Territorial Medical Service.

THE Territorial Force Subcommittee has now arrived at certain conclusions with regard to the reorganization of the Medical Service of the Territorial Force. Until the publication of the White Paper by Mr. Churchill it was impossible to know what the views of the War Office were likely to be, and the Association was, therefore, not in a position to make criticisms. The opportunity has been taken to compare the Association's suggestions with those put forward in the White Paper, and the conclusion has been formed that the time is now opportune to carry the work a step further by communicating with the Director-General, Army Medical Service. Accordingly a letter embodying the views of the Association is being sent to the Director-General intimating that the Association would welcome an opportunity to elaborate its views by means of a deputation.

Senior Surgeon Commanders R.N.

At a meeting of the Naval and Military Committee, held on March 19th, further consideration was given to the question of senior surgeon commanders R.N. who are adversely affected by the new regulations for retirement and retired pay of naval officers. The Committee decided to continue to press for a revision of the regulations, and is urging the Admiralty to receive a deputation on the subject.

Insurance Statistics.

The Insurance Acts Committee, at its meeting on March 25th, referred to the executive the question of issuing to insurance practitioners a form showing certain particulars as to practice income and expenditure which could be used for the purpose of collecting statistics that may be wanted in the future. Experience shows that the lack of reliable figures has been a great handicap to the Committee on several occasions, and a determined effort is to be made to induce a large number of practitioners to keep figures in common form, so that if and when they are required they can be called in.

Right of Appeal against Removal from the Panel.

The November Conference of Local Medical and Panel Committees instructed the Insurance Acts Committee to take action on the first appropriate occasion to secure the right of appeal to the High Court of any practitioner whose name has been removed from the list. The Committee,

taking advantage of the introduction of the National Health Insurance Bill, 1920, now before Parliament, has had an amendment drafted which it is asking Dr. A. C. Farquharson, M.P., to move. A notice as to the exact terms of this amendment and its place on the Order Paper will be given in a future issue, and those members of the profession who feel keenly on this subject should then write to their members of Parliament asking them to support the amendment.

Association Notices.

MEETING OF COUNCIL.

The next Meeting of Council will be held on Wednesday, April 14th, in the Council Room, 429, Strand, London, W.C. 2., at 10 a.m.

SCHOLARSHIPS AND GRANTS IN AID OF SCIENTIFIC RESEARCH.

SCHOLARSHIPS.

THE Council of the British Medical Association is prepared to receive applications for Research Scholarships as follows:

1. An *Ernest Hart Memorial Scholarship*, of the value of £200 per annum, for the study of some subject in the department of State Medicine.
2. *Three Research Scholarships*, each of the value of £150 per annum, for research into some subject relating to the causation, prevention, or treatment of disease.

Each Scholarship is tenable for one year, commencing on October 1st, 1920. A Scholar may be reappointed for not more than two additional terms.

The Conditions of the award of Scholarships are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

GRANTS.

The Council of the British Medical Association is also prepared to receive applications for Grants for the assistance of Research into the Causation, Treatment, or Prevention of Disease. Preference will be given, other things being equal, to members of the medical profession, and to applicants who propose as subjects of investigation problems directly related to practical medicine.

The Conditions of the award of Grants are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

Applications.

Applications for Scholarships and Grants for the year 1920-21 must be made not later than Saturday, May 29th, 1920, in the prescribed form, a copy of which will be supplied by the Medical Secretary on application.

Each application should be accompanied by testimonials, including a recommendation from the head of

the laboratory, if any, in which the applicant proposes to work, setting out the fitness of the candidate to conduct such work, and the probable value of the work to be undertaken. This is not intended, however, to prevent applications for Grants in aid of work which need not be performed in a recognized laboratory.

MOTIONS FOR THE ANNUAL REPRESENTATIVE MEETING.

Notices of Motion by Divisions, Constituencies, or Branches, for the consideration of the Annual Representative Meeting, proposing to make any addition to, or any amendment, alteration or repeal of any Regulation or By-law, or to make any new Regulation or By-law, or proposing material alteration of the policy of the Association in matters relating to the honour and interests of the profession or of the Association, must be published in the JOURNAL not later than April 24th, and for this purpose should be received by the Medical Secretary **not later than April 10th.**

PROPOSED FORMATION OF UGANDA AND EAST AFRICA BRANCHES.

NOTICE is hereby given to all concerned of a proposal made by the Uganda Division that the East Africa and Uganda Branch, and the East Africa and Uganda Divisions, be discontinued, and that new Division-Branches as follows be substituted therefor:

1. East Africa Branch,
2. Uganda Branch,

the areas of the new Branches to be co-terminous with the areas of the East Africa and Uganda Protectorates respectively.

The matter will be determined in due course by the Council. Any member affected by the proposed change and objecting thereto is requested to write, giving reasons therefor, to the Medical Secretary not later than July 31st, 1920.

BRANCH AND DIVISION MEETINGS TO BE HELD.

KENT BRANCH: MAIDSTONE DIVISION.—Dr. Arthur C. Black, Honorary Secretary (Strettit Place, East Peckham, Paddock Wood, Kent), gives notice that at a meeting of the Division to be held at the West Kent Hospital on April 8th at 3 p.m., Dr. N. Robertson, Superintendent of the National Sanatorium, Beenden, will read a paper on early signs of phthisis.

MIDLAND BRANCH: LINCOLN AND KESTEVEN DIVISIONS.—Dr. Godfrey Lowe, Honorary Secretary, Lincoln Division (42, Langworth Gate, Lincoln), gives notice that a meeting of members and non-members of the Lincoln and Kesteven Divisions will be held at Lincoln on Tuesday, April 27th, at 3 p.m. Dr. Alfred Cox, O.B.E., Medical Secretary, will attend and give an address, to be followed by a discussion. Further particulars will be announced later.

MEETINGS OF THE PROFESSION.

THE TRADE UNION QUESTION AT CHICHESTER.

A MEETING was held at the Dolphin Hotel, Chichester, on March 9th, with Dr. EWART in the chair, when Dr. Stancomb, Vice-President of the Medico-Political Union, and Dr. Main, its Organizing Secretary, met all the practitioners of Chichester and endeavoured to form a Chichester Branch of his union.

Dr. STANCOMB moved a resolution:

That, in view of the changes in the medical service of the country, it is essential that the profession should be solidly organized on a trade union basis, to enable it to negotiate effectively with the Government, and that a Chichester branch of the Medico-Political Union be now formed.

He spoke at some length, and argued that the great value of trade union registration consisted in the liberty it accorded to take certain lines of coercive and restrictive action that might be necessary to protect the efforts of a combination striving for better conditions, such as would, unless protected by the Trades Disputes Acts, be actionable under the common law dealing with conspiracy and libel. The necessity for taking action of this character to counter attempts to "blackleg" the medical profession had been only too painfully demonstrated. The extreme danger of applying such methods without legal sanction had been driven home by the "Coventry" disaster, and the resultant memorandum D 19 of the British Medical Association, which exposed a condition of pitiful impotence. The contention of Dr. Cox and others, based on erstwhile dubious legal opinion, that medical men were not "workmen" within the meaning of the Act, had since November, 1919, been settled on the highest authority, and no obstacle to a medical trade union could any longer be urged on this score. Medical trade unionism had the advantage of maximum power and minimum risk, in virtue of the highly technical and costly nature of a doctor's education, rendering "dilution" on a large scale

impossible, and by reason of the fact that in "withholding labour" there would not be, at any rate, entire cessation of income, such as would be the case with ordinary industrial trade unions; neither would there be the same danger of public obloquy, since doctors would not withhold their service from the community, but only from the conditions of some exploiting authority.

The registration of the British Medical Association (proceeded Dr. Stancomb) excluded all trade union action, and its Articles of Association were expressly drawn up to comply with this limitation. To state publicly, therefore, on behalf of the British Medical Association (as Dr. Cox had said at Newcastle and Bournemouth), "We have done, are doing, and shall continue to do, all that a trade union can do," was surely to boast of action both illegal and dishonourable. Dr. Stancomb complained of the action of the Insurance Acts Committee of the British Medical Association with regard to its fraternal relations with "the other side" in connexion with the new Regulations (M. 25), its strenuous efforts to get this jointly begotten child adopted by the profession, and its consequent hopeless position for taking up a strong attitude in defence of the profession against gross imposition and injustice—for example, transfer of practice. He would prefer a lawyer who did not evidently represent both parties and who conducted negotiation with the knowledge of a force behind him capable of redeeming such negotiation from the force of academic discussion. He was pleased to note that in palliation of their complete failure to move the Government on the vital point of transfer of practice the Insurance Acts Committee said, "The resources of civilization are not exhausted." Dr. Stancomb maintained that to constitute itself such a "resource" when everything else had failed was all the Medico-Political Union claimed in a conference with the British Medical Association on joint action. Readers of the report (SUPPLEMENT, February 21st, 1920, p. 39) might justly conclude that a working agreement came very near to achievement. About 70 per cent. of the members of the Union were also members of the Association. There was no question of rivalry or destruction. There was ample scope for both organizations, imbued with one policy—the best interest of the community and the medical profession. Dr. Stancomb believed that in the near future wiser counsels would prevail, the profession in times of great danger would not discard any constitutional advantage, and at long last the medical profession would be adequately equipped for its own protection, and that of the community which it served. Dr. MAIN seconded the resolution.

After a few questions had been asked and answered, and one doctor had said that, after hearing Dr. Stancomb, he was inclined to change his previously unfavourable opinion, Dr. GARRATT moved an amendment:

That this meeting of medical practitioners of Chichester entirely disapproves of the adoption by the profession of trade union practices, and considers that the best interests of their body will be better advanced by making use of their experience, education, and ability to educate lay opinion; and that measures in this direction should be taken by the British Medical Association.

Dr. Garratt combated, in turn, the various arguments of Dr. Stancomb. He said that the educated classes stated by him to have adopted trade unionism were the worst paid of all; and if this was the result of trade unionism he would have none of it. He quoted from the address of Dr. Kaye le Fleming (BRITISH MEDICAL JOURNAL, SUPPLEMENT, October 25th, 1919) extracts showing that, owing to their varied and diverse interests, individualistic habits and training, and general independence, doctors were the last people in the world likely to submit to trade union rule. As regards the alleged absence of necessity for any strike fund, he said that doctors entirely dependent on panel practice would lose at once payment for all not sick, including unallocated persons, and even the sick, having by their contributions earned the right to free treatment, and being generally out of work and without wage, probably would not pay. In fact, the entire panel income might be regarded as a dead loss. Strikes were not always successful as stated. While strikes of large powerful unions against small bodies of employers often succeeded, strikes even of combinations of such unions against the State and community never did. The employers of doctors were the State and community, and if the panel doctors struck, they—a pitifully small and inexperienced minority—must strike against all the resources of the Government, of the approved societies, and the working community at the same time. It was an entire delusion to suppose that doctors were one whit more essential to the community than the latter to the doctors, who were, in fact, daily dependent on the community for every necessary of life, and therefore such strike must fail. If picketing were practised it would not be of blacklegs by the doctors, but of doctors by the public. The fundamental error made by doctors from the first had been entire neglect to consider and win over lay opinion. The laity controlled votes, and nothing but votes were powerful with governments. Trained speakers like Dr. Stancomb should appeal to the laity. Dr. Garratt quoted an instance where doctors in West Sussex, by meeting a number of representatives of approved societies, had practically removed that iniquity of the 1915 regulations in regard to chronic cases, which the Association had then made no attempt to deal with but actually approved. If the Insurance Acts Committee had not been a success, the remedy lay in reform of that body. Dr. Stancomb had suggested that a trade union would have struck on the issue of a 17s. 6d. capitation fee. Dr. Garratt held that such action would have been a blunder of the first magnitude. Personally, he was entirely opposed to over-payment of panel work. It

could only, by discouraging consulting practice, research and public health work, lower the status of the profession. It would, moreover, tend to attract the wrong sort of men, and that in such numbers as would soon, by overcrowding and underselling, reproduce all those evils from which doctors were temporarily relieved, and which they most desired to avoid. As regards promoting fellowship as alleged, the doctors of Chichester, without the union, were as friendly as those of Southampton; and he feared that trade unionism would tend to introduce men with whom it would be less easy to be friendly. In conclusion, he expressed the opinion that trade unions were governed by extremists; their methods were crude and barbarous, the general public most thoroughly detested them, and he hoped that even the Labour Party, once it had learned wisdom by experience of office, would itself take measures to restrict such practices. It would be deplorable if the medical profession, with long and honourable traditions, going back ages before the birth of trade unionism, should then begin to take them up.

After short discussion, in course of which the Chairman expressed his admiration of the work of the British Medical Association, Dr. Garratt's amendment was seconded by Dr. Bestock, and carried. It was then put again as a substantive resolution and passed *nemine contradicente*.

The meeting closed with a vote of thanks to Dr. Stancomb for his trouble in coming, and for his able address.

INSURANCE.

DINNER TO DR. BRACKENBURY BY THE MEMBERS OF THE INSURANCE ACTS COMMITTEE.

ON March 25th the members of the Insurance Acts Committee entertained Dr. and Mrs. Brackenbury to dinner at the Grand Hotel, Charing Cross. The chair was taken by Dr. H. F. OLDHAM, one of the senior members of the Committee, and nearly the whole of the members were present. Letters of regret, expressing gratitude to Dr. Brackenbury for his services, were received from each of those who were absent.

The CHAIRMAN, in proposing the only toast of the evening, "The Chairman of the Insurance Acts Committee," said that the members of the Committee felt that the conclusion of the recent negotiations in respect of the new Regulations and remuneration was an appropriate time for them to express something of what they felt about Dr. Brackenbury and his work. As a chairman he was assiduous in his duties and always a master of his case, with the result that he had been a real leader of the Committee and of the profession. They recognized that Dr. Brackenbury, although a first-class fighting man, was much more than that. He was a statesman and he held the highest ideals as regards his profession. Nobody had put the claims of the general practitioner as the backbone of the medical service of the country more forcibly or more lucidly than Dr. Brackenbury had. The members of the Committee wished Dr. Brackenbury to have some tangible evidence of their admiration and on their behalf he presented him with a silver salver bearing the following inscription:

Presented to HENRY BRITTON BRACKENBURY, M.R.C.S., L.R.C.P., by the members of the Insurance Acts Committee, British Medical Association, March 25th, 1920, in grateful recognition and admiration of his work as Chairman during the years 1916-1920.

They welcomed Mrs. Brackenbury and desired to thank her for the way in which she must have helped her husband to enable him to sacrifice so much of his time and leisure in the interests of the profession, and he asked her to accept a silver card tray inscribed as follows:

To Mrs. H. B. BRACKENBURY from the Insurance Acts Committee, British Medical Association, March 25th, 1920.

Dr. J. A. MACDONALD, Chairman of Council of the Association, said that, having been Chairman of the Committee before Dr. Brackenbury, he knew something of the work which it entailed. Though he had not had many opportunities of taking part in the work of the Committee recently, he had seen a good deal of Dr. Brackenbury's work on the Council of the Association, and had nothing but admiration for it. He wished to thank Dr. Brackenbury for the fine services he had rendered to the Association, for his activities had not been by any means confined to the Insurance Acts Committee, but had been given freely to other important committees of the Association.

Brief speeches were also made by Dr. DAIN, Dr. RIDLEY BAILEY; Dr. LINNELL, who specially voiced the gratitude of rural practitioners for the work Dr. Brackenbury had done for them; Dr. HUGH JONES, who spoke also for rural practitioners, and especially for those in North Wales, who, he said, had as great admiration of and gratitude for Dr. Brackenbury's work; Dr. MABEL RAMSAY, the representative on the Committee of the Women's Federation, who spoke for the Federation as well as for her own Panel Committee; and the MEDICAL SECRETARY, who said he owed a deep debt of personal gratitude to the guest of the evening for the enormous amount of work he had done which usually fell on a Secretary and which had been done at a time of exceptional strain on himself and staff.

Dr. BRACKENBURY, in replying, said that good artists always embellished the subject they were painting, and he had not previously realized how many good artists there were on the Insurance Acts Committee, for, after listening to the description

of his character, he did not recognize himself. He had been gratified to hear that his fellow members proposed to entertain him at dinner, but he did not expect, and in fact was inclined to resent, the giving of a present to himself, for he had only been one of a band of workers, and if recognition were due at all it was due from the profession to the Committee as a whole. He was bound to say he had thoroughly enjoyed the work. In the course of considerable experience in public life he had always believed that the good committeeman was the man who brought his ideas into the common pool for the common good, and he had tried to be a good committeeman. He was very grateful for all that had been said about himself and his wife, and though the results of the negotiations they had carried on had not been all they had desired and expected, yet he thought the profession in general was satisfied that no effort on their part had been spared to place before the Government and the public the position of the general practitioner and his claims for recognition. He wished specially to thank Dr. Macdonald, who was Chairman of the Committee when he first joined it and had set an example there and elsewhere of chairmanship which was very difficult for any man to follow. The Committee was sorry that owing to the other claims on Dr. Macdonald's time they had not seen so much of him as they would have liked.

INSURANCE COMMITTEES.

COUNTY OF LONDON.

The late Sir Robert Morant.—The London Insurance Committee, at its meeting on March 25th, passed a vote of condolence with the relatives of the late Sir Robert Morant.

Large Panel Lists.—On the discussion of the new arrangements for the provision of medical benefit, Mr. P. ROCKLIFE complained that a list of 3,000, instead of being regarded as the extreme limit to be permitted only in very exceptional circumstances, was regarded as a normal figure, at all events for 1920 in London. Mrs. HANDEL BOOTH also complained that many doctors were not giving adequate service and were bringing the Act into disrepute. Mr. F. COYSH, chairman of the Medical Benefit Subcommittee, said that at the present time, out of 1,400 or more practitioners on the London panel, only seventy had lists of 3,000 or over, and, speaking generally, the men who had the largest lists were the most popular and efficient. Several of the medical members of the Committee pointed out that large lists had been forced on practitioners in crowded districts by penalizing those who limited their lists, and that the desirable thing was to induce the public to exercise more intelligence in the choice of doctor, instead of "running after" the man who had the largest list, with the idea that he was likely to be the best practitioner. Dr. LAURISTON SHAW said that with the present increase in numbers of medical students the position would adjust itself in the course of a few years.

Veneral Diseases.—A report was presented to the Committee surveying in a general way the position with regard to the treatment of venereal diseases. The Committee proposed to confer with the Panel Committee with a view to making joint representations to the Ministry of Health to secure that arrangements should be made for medical men and women with special gifts as public lecturers to deliver short addresses to carefully selected audiences on the health side of the question. It was agreed, with two dissentients—both of them medical members—that the Panel Committee should be asked to consider whether it was practicable and desirable that steps be taken to require all insurance practitioners to acquaint themselves with modern methods for the treatment of venereal diseases by post-graduate courses or otherwise; whether the surgeries of insurance practitioners were adapted for the adequate treatment of these diseases, and whether, under present conditions, an insurance practitioner had the necessary time to provide adequate treatment for these cases.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty:—Surgeon Commanders: C. H. Dawe to the *President*, additional, for W. T. Station, Bathurst; A. D. Spalding to the *Harebell*, Surgeon Lieutenant Commanders: C. M. R. Thatcher to the *Revenge*, for Physical and Recreation Training in First Battle Squadron (temporary); F. H. Stephens, O.B.E., to the *Calliope* on commissioning. Surgeon Lieutenants (temporary): G. B. Tarring to the *Douglas* on commissioning; J. A. Watson transferred to the permanent list (seniority October 20th, 1914).

ARMY MEDICAL SERVICE.

Lieut.-Colonel J. F. Martin, C.M.G., C.B.E., R.A.M.C., relinquishes the temporary appointment of D.A.D.G.
Major and Brevet Lieut.-Colonel H. V. Bagshawe, C.B.E., D.S.O., R.A.M.C., to be D.A.D.G.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel J. G. Gill, D.S.O., relinquishes the acting rank of Colonel.
Major C. R. L. Ronayne relinquishes the temporary rank of Lieutenant-Colonel.
Captain G. D'R. Carr, M.C., is seconded for service with the Egyptian Army.

The following relinquish the acting rank of Major: Captains O. B. Pratt, J. R. N. Warburton, M.C., E. C. Beddows, M.C., H. E. A. Boldero, temporary Captains J. Bamforth, G. F. Bird, M.C.

Captain E. W. Vaughan, D.S.O., M.C., to be temporary Major whilst specially employed.
A. T. Todd, O.B.E., late temporary Captain, to be temporary Major.
Captain T. J. Kelly, M.C., resigns his commission.

T. W. Smart to be temporary Lieutenant.
The following officers relinquish their commissions:—Temporary honorary Lieut.-Colonel W. R. Dawson, O.B.E., and retains the honorary rank of Lieut.-Colonel. Temporary Majors and retain the rank of Major: C. V. Mackay, H. D. Macphail (on ceasing to serve with the Northumberland War Hospital). Temporary Major H. H. Balfour, O.B.E. (Lieutenant-Colonel S.A.M.C.) on ceasing to serve with the South African General Hospital, Richmond. Temporary Captain Arthur J. Blake, M.C., and is granted the rank of Lieut.-Colonel. Temporary Captains and are granted the rank of Major: J. C. D. Allan, July 16th, 1919, and J. R. Pate, December 7th, 1919 (substituted for notifications in the *London Gazette*, August 16th, 1919, and January 19th, 1920, respectively), (acting Major) N. Dunn. Temporary Captains and retain the rank of Captain: W. H. Johnston, R. G. Smith, F. E. Webb, J. M. Morris (on ceasing to be employed with the Neath section 3rd Western General Hospital), W. G. Riley, J. P. Crawford, P. L. Hope, F. D. Johnson, J. N. G. W. McMorris, E. Hesterlow, W. J. Lascelles, F. W. Wat'yn-Thomas, R. G. Struthers, F. P. B. MacTavish, F. McG. Longhane, J. Butterworth, J. W. Simou, T. G. Dickson, T. D. Morgan, F. W. Jackson, A. D. Moffat, M.C., F. W. Stuart, W. S. Booth, H. Somerville. Temporary Captains: W. F. G. Scott, C. A. Mason (on account of ill health).

**ROYAL AIR FORCE.
MEDICAL BRANCH.**

Transferred to unemployed list: Captain (acting Major) H. Gardiner-Hall, M.B.E.; Captain (acting Lieut.-Colonel) W. Darling, M.C.

The name of Flying Officer J. C. Smyth is as now described and notes stated in the *London Gazette* of August 19th, 1919.

INDIAN MEDICAL SERVICE.

Major N. E. H. Scott, C.I.E., has been posted as Civil Surgeon, Hazara (January 14th).
Lieutenant-Colonel J. C. H. Leicester, M.D., F.R.C.S., appointed permanently as Professor of Midwifery, Medical College, and Obstetric Physician and Surgeon of the Medical College and Hospitals, Calcutta (September 5th, 1919).
Captain E. S. Phipson, D.S.O., M.B., has been confirmed in the appointment of Health Officer, Simla (October 13th, 1918).

Captains to be Majors (February 1st): R. Knowles, W. E. Brierley, M.B., F.R.C.S., J. B. Lapsley, M.C., M.B., J. A. Shorten, M.B., R. B. S. Sewell, C. H. Fielding, M.B., W. L. Watson, O.B.E., J. W. Barnett, M.B., M. L. Puri, S. C. Pal, R. S. Townsend, M.C., M.B., R. B. Lloyd, M.B., A. O. Muoro, M.D., A. G. Tresidder, M.D., G. G. Jolly, C.I.E., M.B., S. S. Yazifdar, J. J. H. Nelson, O.B.E., M.C., M.D., F.B.C.S.E., E. S. Phipson, D.S.O., M.B., F. F. S. Smith, M.D., T. C. Boyd, F.R.C.S.I.

Captain J. G. J. Green has been permitted to retire from the service on account of ill health (December 9th, 1919).

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.
Captain A. Bulleid to be acting Major.

The following Captains relinquish their commissions: F. Oppenheimer, H. B. Sherlock, M.C. (on account of ill health caused by wounds and retains the rank of Captain).
Captain J. E. E. de Robillard resigns his commission.

QUEEN MARY'S ARMY AUXILIARY CORPS.

Auxiliary Section, R.A.M.C. Attached.—Medical Controller G. E. Schau relinquishes her appointment.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Captain (acting Major) A. C. Walkin relinquishes the acting rank of Major on ceasing to be employed.

TERRITORIAL FORCE RESERVE.

The announcements concerning the following officers which appeared in the *London Gazette* of the dates indicated are cancelled: Captain N. F. W. Hoeddecker (January 3rd and 17th, 1919), H. N. Crowe (December 31st, 1918), J. H. Hunter, M.C. (December 9th, 1918, and February 6th, 1919), (acting Major) A. C. Walkin (January 15th, 1919), D. A. Wilson (January 9th, 1919).

VOLUNTEER FORCE.

Temporary Lieut.-Colonels relinquish their commissions and are granted the honorary rank of Lieutenant-Colonel:—Durham R.A.M.C.V.: T. E. Hill, Kent R.A.M.C.V.: J. H. Yolland, Norfolk R.A.M.C.V.: G. H. Thompson, Northumberland R.A.M.C.V.: C. B. Palmer, Suffolk R.A.M.C.V.: A. W. Addisell, Sussex R.A.M.C.V.: C. W. Owen, C.M.O., C.I.E. (Lieut.-Colonel ret. I.M.S.).

Temporary Majors relinquish their commissions and are granted the honorary rank of Major:—Durham R.A.M.C.V.: D. McF. Millar, M. Buchanan, J. T. Dickson, Hampshire R.A.M.C.V.: W. J. G. Cattell, W. J. Smyth, Lincolnshire R.A.M.C.V.: H. P. Berry (Major T.F. Res.), Norfolk R.A.M.C.V.: A. H. Meadows, J. K. Howlett, J. E. Linnell, Suffolk R.A.M.C.V.: H. G. Wood Hill, H. E. Barnea, R. W. Mullock, J. R. Dobbie, J. F. C. Hossack, A. M. N. Pringle, C. K. Moseley, D. A. Carruthers, West Riding R.A.M.C.V.: H. G. Frankling, A. G. Reid.

DIARY OF SOCIETIES AND LECTURES.

ROYAL SOCIETY OF MEDICINE.—*Section of Obstetrics and Gynaecology:* Thursday, 8 p.m., Specimens. Short Communications:—Dr. Williamson and Dr. Brockman: Extensive Fatty Change in Fibro-myomata. Lady Barrett: Case with High Ammonia Coefficient. Dr. Williamson: Value of Blood Transfusion before Operation in Severe Secondary Anaemia. Dr. A. C. Palmer: Rupture of the Vagina during Labour (with Specimens and Epidiascope Demonstration by Dr. Holland). Mr. T. G. Stovena: Sacculatation of Gravid Hornuate Uterus. Annual General Meeting, Friday, 8.15 p.m. *Section of Anaesthetics,* Friday, 8.30 p.m.: Discussion on Anaesthesia in Operations on the Thyroid Gland, to be opened by Mrs Dickinson Berry.

POST-GRADUATE COURSES AND LECTURES.

SHEFFIELD UNIVERSITY, PATHOLOGICAL MUSEUM.—Wednesday, 4 p.m. Professor Connell: Pathology of Bone Disease.

WEST LONDON POST-GRADUATE COLLEGE, HAMMERSMITH, W.

—Daily, 10 a.m., Ward Visits; 2 p.m., Clinics, Operations (Out-patient Department is closed from April 1st to Tuesday, April 6th). Tuesday, 10 a.m., Dr. McDougal: Electrical Department; 2 p.m., Dr. Pernet: Skin Diseases. Wednesday, 10 a.m., Dr. Saunders: Diseases of Children; 2 p.m., Mr. Gibb: Eye Disease. Thursday, 2 p.m., Dr. Grainger Stewart: Nerve Disease; 2 p.m., Mr. Bishop Harman: Eye Department. Friday, 2 p.m., Dr. Morton: X Rays; Mr. Banks Davis: Throat, Nose, and Ear Diseases. Saturday, 2 p.m., Dr. Owen: Medical Cases.

APPOINTMENTS.

HOWELL, B. Whitechurch, F.R.C.S., Surgeon to the Royal Surgical Aid Society.
LAIRD, A. H. M.B., Dub., Officer in Charge X-ray and Electro-therapeutic Departments of the Coventry and Warwickshire Hospital.

CERTIFYING FACTORY SURGEONS.—J. A. Andrews, M.B. Bovey Tracey District, co. Devon, H. A. C. Davidson, L.R.C.P. and S. Edin., L.R.F.P.S.Glas. (Coupar Angus District, co. Perth), H. D. Gasteen, L.R.C.P. and S.I., D.P.H. (Cambridge) District, co. Cambridge, R. T. Gilmour, M.R.C.S., L.R.C.P. (Maidenhead District, co. Berks), J. D. Hart, M.B., Ch.B. (North Walsham District, co. Norfolk), Dr. R. Miller (Stock District, co. Essex), F. H. Seal, M.B., B.S.Lond. (South Molton District, co. Devon), C. Tylor, M.D. Camb. (Long Melford District, co. Suffolk), C. M. Willmott, L.R.C.P. and S. Edin., L.R.F.P.S.Glas. (Leyland District, co. Lancaster); R. M. Yule, M.D. Aberd. (Lerwick District, co. Shetland).

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 7s. 6d., which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue.

BIRTHS.

HORTON.—On March 27th, at 29, Westbourne Gardens, W.2, the wife of R. Lister Horton, F.R.C.S., of a son.
ISAID.—At 2, Arkwright Road, Hampstead, on March 18th, to Dr. and Mrs. C. V. Isard, of North Tawton, Devon, a daughter.
REINHOLD.—At the Anglo-American Hospital, Cairo, on March 6th, 1920, to the wife of Major C. Reinhold, M.C., I.M.S. (née Hayward), a son.
RICHARDS.—On March 23rd, at Castle Green, Liansawel, Carmarthenshire, to Dr. and Mrs. W. G. Richards, a son.

DEATHS.

DANVERS.—On March 18th, at Mont-Boron, Nice, Herbert Danvers, M.D., formerly of Weymouth Street, London, W.

British Medical Association.

CURRENT NOTES.

The late Sir Robert Morant.

THE Insurance Acts Committee at its meeting on March 25th passed a vote of condolence with Lady Morant and family, and instructed its chairman to convey to her the deep sense of loss felt by all those who, like the Insurance Acts Committee, had come into close contact with Sir Robert Morant.

Part-time Prison Medical Officers.

THE present position of the negotiations is that, after several communications calling his attention to the urgent need for revision of the pay of the Prison Medical Service, the Home Secretary has replied that certain proposals regarding pay have been sent forward for the consideration of the Treasury, but that at present he is not in a position to make an announcement.

Special Reserve R.A.M.C.

THE Naval and Military Committee has recently been in correspondence with the War Office concerning the position of Special Reserve officers. These officers are debarred from signing temporary contracts, and are therefore at a great disadvantage in respect of pay as compared with officers serving on such contracts. Such being the case, the War Office was asked to demobilize all Special Reserve officers who wished for demobilization. The reply of the War Office was to the effect that such officers were liable to be retained in the army till the statutory date of the termination of the war, and that, owing to the exigencies of the service, it was not anticipated that it would be possible to demobilize all such officers at an early date. It is understood that the recent notice in the press concerning demobilization in the Special Reserve applies only to those officers who have already been disembodied, and that it does not affect those who are at present serving.

Association Notices.

MEETING OF COUNCIL.

THE next Meeting of Council will be held on Wednesday, April 14th, in the Council Room, 429, Strand, London, W.C. 2, at 10 a.m.

BRANCH AND DIVISION MEETINGS TO BE HELD.

MIDLAND BRANCH: LINCOLN AND KESTEVEN DIVISIONS.—Dr. Godfrey Lowe, Honorary Secretary, Lincoln Division (42, Langworth Gate, Lincoln), gives notice that a meeting of members and non-members of the Lincoln and Kesteven Divisions will be held at Lincoln on Tuesday, April 27th, at 3 p.m. Dr. Alfred Cox, O.B.E., Medical Secretary, will attend and give an address, to be followed by a discussion. Further particulars will be announced later.

NORTH WALES BRANCH: SOUTH CARNARVON AND MERIONETH DIVISION.—Dr. E. Lewys-Lloyd, Honorary Secretary (Gothic House, Towyn, Merioneth) gives notice that the annual meeting of the Division will be held at Barmouth on Wednesday, April 14th.

INDIAN MEDICAL SERVICE.

Consolidated Rates of Pay.

ON March 12th the British Medical Association received a letter from the India Office stating that, after careful consideration in communication with the Government of India, the Secretary of State in Council proposed to sanction the incremental scale (set out below) of consolidated pay for all European officers of the Indian Medical Service, in civil or military employ, except those holding administrative appointments carrying fixed rates of pay higher than are admissible under this scale. For purposes of comparison the table shows also the scale in force before December 1st, 1918, and the scale in force since that date. [A further column has been appended showing the scale asked for by the British Medical Association.] The letter added that Mr. Montagu, Secretary of State for India, would be glad to learn whether the British Medical Association agreed generally in the scale and had any observations to make upon it. The letter was immediately acknowledged, the statement being made that a meeting of the Naval and Military Committee would be held at the earliest possible moment to consider the matter, and it was added:

I note that there is no reference in your letter to the questions of passages and pensions, and should be glad if any indication of the India Office's intentions concerning these two questions could be given before the date of the meeting of the Naval and Military Committee, namely, Friday, March 19th.

The Under Secretary of State for India, in his reply, wrote as follows:

The questions of passages and pensions referred to in your letter have not yet reached the stage at which a definite decision could be communicated to the British Medical Association, and for that reason these subjects were omitted from my previous letter. It is impossible to consider them apart from the larger case of the Indian Army as a whole, although it does not necessarily follow that the final decision will be the same for both services. The Secretary of State is in constant telegraphic communication with the Government of India on both these subjects, and hopes to make an announcement on them in the near future. Meanwhile he is anxious that they should not retard or complicate the more urgent matter of the pay of the Indian Medical Service.

On March 22nd a letter was sent by the Medical Secretary of the British Medical Association to the Under Secretary of State for India, stating that although in certain instances the full demands of the Association had not been met, the Naval and Military Committee considered the scale to be, on the whole, satisfactory:

I am, however, to point out that on the civil side there are certain appointments in the medical colleges, and in the bacteriological and sanitary departments, as well as in the jails, which carry allowances with them. No new rates of pay could prove acceptable which did not safeguard the officers holding such appointments. The Committee feels very strongly that these allowances must be treated as something quite apart from the general question of allowances, the maintenance of a horse, or the collateral charge of a second regiment, etc., and that they must be continued and proportionately increased (that is, 50 per cent.). If this is not done, cases will arise where officers holding such appointments will find themselves worse off than they were before, in spite of the general increase of pay. Such a result is bound to render the scheme unacceptable.

Then, again, there is the question of allowances for the officers in charge of the station hospitals. The extra work and responsibility such charges involve make it necessary that these allowances should be continued. It is not suggested that the Secretary of State intended to take any other course, but it

is desirable to have these matters settled in advance, without the possibility of misunderstanding afterwards.

I am to make it clear (1) that what the Association has in view is a 50 per cent. all round increase on the pay officers drew before the war, and (2) that it is felt that this increase should be safeguarded from any deductions or alterations whatsoever.

I am to express the hope that you will be in a position to assure the Association that not only the pay, but the question of passages and pensions has been placed on a satisfactory basis in time for an announcement to be made to that effect at our Annual Representative Meeting, which is to be held on June 25th at Cambridge. Such an announcement made at that particular time would receive a peculiarly wide publicity, and would have a most desirable effect on the prospects of the recruitment of officers for the service.

INSURANCE.

CORRESPONDENCE.

The Proposed Testimonial.

SIR.—We are desired by the members of the Conditions of Service Subcommittee of the Insurance Acts Committee to thank Drs. Richmond and Farman and their colleagues for the good will and appreciation shown in their letter which appeared in the SUPPLEMENT of March 27th, but the Subcommittee hopes the scheme outlined in that letter will not be persisted in. If the appeal were a failure it would be mortifying to all concerned. If it were successful the result would be hardly less embarrassing to the recipients of the presentation, for it would entirely alter their relations to their constituents. At present the Insurance Acts Committee is a body of men voluntarily giving up their time and energies to the service of their fellow insurance practitioners. The members of the committee are independent in a way they could hardly be if they were made the recipients of such a handsome present as the proposed appeal might be expected to produce. Besides, the Conditions of Service Subcommittee does not wish to be distinguished from the other members of the Insurance Acts Committee. Where all are willing and anxious to serve it does not seem proper to single out those who undertook a special task.

The Subcommittee is deeply grateful for the kindness which prompted the appeal, but trusts that its promoters will appreciate the sentiments which lead the Subcommittee to ask them to drop the project.—We are, etc.,

H. B. BRACKENBURY,
ALFRED COX.

April 5th.

We are asked to state that Dr. Withers Green also spoke to the toast of the evening at the dinner given to Dr. Brackenbury by the Insurance Acts Committee (SUPPLEMENT, April 3rd).

British Medical Association.

CURRENT NOTES.

Visitation of Divisions.

The Medical Secretary has the following programme of visits to Divisions during the next fortnight:

- April 20. Furness Division at Barrow.
- April 21. Joint meeting of Kendal and Lancaster Divisions at Lancaster.
- April 23. Conference with the workmen, the doctors of the Ebbw Vale Workmen's Medical Association, and representatives of the Welsh Board of Health, with a view to endeavouring to settle the difficulties which led to the doctors under the Association giving in their notices.
- April 26. Great Yarmouth Division at Great Yarmouth.
- April 27. Joint meeting of the Lincoln and Kesteven Divisions at Lincoln.
- April 28. East Yorks Division dinner and meeting at Hull.

At each place, with the exception of Ebbw Vale, the Medical Secretary will deal with the current work of the Association, and questions are invited. Both members and non-members have been asked to attend the meetings.

Special Intermediate Insurance Certificate.

Rule 12 of the Certification Rules which govern the giving of certificates under the National Insurance Acts, provides for a special form of certificate to obviate the necessity for weekly certificates in chronic cases. Inquiries have been made as to when this new certificate will be available, and the Insurance Acts Committee wishes to remind practitioners that it was agreed with the Ministry of Health that this rule would not operate until the referees were in existence. It will be noted that subparagraph 2 of the rule says that questions in connexion with the certificate may be referred to the medical referee. The Insurance Acts Committee has been assured that the new certificate will be introduced as soon as possible after the new medical officers have got to work.

Postal Medical Officers.

Information has reached the British Medical Association that the Treasury has raised the capitation fee for postal medical officers to 13s. and that payment on this basis will be paid for the quarter ending March 31st, 1920. Thus the persistent efforts by the Association to improve this service are apparently bearing fruit. It is also stated that the fees for itinerants and emergency cases are under consideration. Some points will still remain for consideration, such as the proposed fees for inoculation against influenza and examinations for Civil Service candidates. These will be dealt with when the census of members of the British Medical Association who are postal medical officers has been completed.

Meetings of Branches and Divisions.

GLASGOW AND WEST OF SCOTLAND BRANCH.

At the annual meeting of the Branch, held in the Faculty Hall on March 31st, with Dr. WILLIAM SNOODGRASS in the chair, it was agreed to invite the Central Council of the Association to hold the annual meeting in 1922 in Glasgow, where it has not been held since 1888.

The secretary's report showed that 100 new members had been added in the course of the year. It was reported that the Overseas Club were co-operating with the Branch regarding the war memorial for members of the profession fallen on active service.

The following officers were elected:

President: Dr. Livingstone London. *President-elect:* Dr. Robertson. *Vice-Presidents:* Dr. J. Laurie and Dr. W. Snodgrass. *Honorary Secretary:* Dr. A. Kennedy Glen. *Honorary Treasurer:* Dr. J. Wishart Kerr. Dr. Wishart Kerr and Dr. John Goff were unanimously chosen as Representatives of the City and Counties respectively.

After the business meeting Professor CARL BROWNING and Dr. G. HASWELL WILSON gave bacteriological and pathological demonstrations.

GLASGOW AND WEST OF SCOTLAND BRANCH: GLASGOW EASTERN DIVISION.

THE annual general meeting of the Glasgow Eastern Division was held in Glasgow on March 30th, when Dr. GLAISTER, president, was in the chair. It was agreed to continue the scheme of holding joint meetings with the Eastern Medical Society.

The office-bearers for 1920 were elected as follows:

Chairman: Dr. P. McKellar Dewar. *Vice-Chairman:* Dr. Frank Martin. *Honorary Secretary and Treasurer:* Dr. James Dunlop. *Representative in Representative Body:* Dr. Thomas Russell. *Deputy Representative:* Dr. William Adam Burns.

NORTH OF ENGLAND BRANCH: DARLINGTON DIVISION.

A SPECIAL meeting of the Darlington Division was held at the Darlington General Hospital, Greenbank, on March 31st, 1920. There was a good attendance to hear an address by Dr. W. E. HUME, Physician to the Royal Infirmary, Newcastle-on-Tyne, on "Lessons learnt at the Pension Boards and their bearings on cases of heart trouble met with in private and insurance practices." Dr. Hume's interesting and practical address was the outcome of his four years' experience in France, during the last two of which he had charge of a large hospital dépôt set apart for heart cases only. At the conclusion of the address tea was provided by the medical staff of the hospital, and subsequently cases were shown and discussed.

SOUTHERN BRANCH: WINCHESTER DIVISION.

A MEETING of the Winchester Division was held at Winchester on March 17th, when Dr. J. LOCKHART LIVINGSTON, acting chairman, was in the chair. It was reported that invitations had been sent to all medical practitioners in the county of

Hampshire. On the motion of Dr. LOCKHART LIVINGSTON, seconded by Dr. BODINGTON, it was unanimously resolved that medical fees should be raised 50 per cent. above the pre-war standard.

SOUTH-WESTERN BRANCH: EXETER DIVISION.

THE annual meeting of the Exeter Division was held at the Royal Devon and Exeter Hospital on March 25th.

The HONORARY SECRETARY read the annual report and financial statement for the year 1919, together with the Representative's report with regard to matters on which he was instructed to vote at the last Annual Representative Meeting.

Dr. EAGER explained that, in accordance with instructions received at a previous meeting, he had been in communication with practitioners in areas of the Exeter Division from which no reply had been received to a letter sent to the local authority asking for a 33½ per cent. increase in remuneration to medical officers employed by them. A summary of the position, which had previously been drafted, was read by Dr. Eager, and he was requested to send a copy of the same to the Medical Secretary of the Association.

The following officers were elected for the ensuing year:

Chairman: Dr. M. Cutcliffe. *Vice-Chairman:* Dr. W. Gordon. *Honorary Secretary and Treasurer:* Mr. F. Norman Lock. *Representative in Representative Body:* Dr. F. Roper.

The CHAIRMAN expressed regret at Dr. Eager's resignation of the office of Honorary Secretary, and warmly thanked him for his services to the Division.

METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.

A MEETING of members and non-members was held at St. Andrew's Hall, N.W.10. Dr. WHITEHALL COOKE presided. Dr. Paterson (Honorary Secretary) was appointed Representative of the Division for the Representative Meeting, and Dr. C. T. F. Scott (Vice-Chairman) Deputy Representative. Dr. Scott was also appointed Representative on Branch Council. Dr. Philip Smith was nominated for the Central Council. The adjourned discussion on hospitals and clinics was continued by Drs. ACTY, EMLYN, GILLBARD, ANDERSON SMITH, the CHAIRMAN, and Drs. TRAYLEN, TURNEY, and SCOTT. Dr. PATERSON said the general practitioner would welcome extra hospitals and clinics provided they were conducted in such a way as to help and not to interfere with his work, and were used only for specialist work and cases and for the instruction of mothers.

Dr. LORD, Assistant Medical Secretary, made an interesting statement of the general policy of the Association, and thought the trouble was largely due to misunderstanding. He pointed out that great changes in the relationship of the general practitioner to public health services were taking place; that the Association was determined to safeguard his position as far as possible; but that it was essential that he should help by taking an active interest in what was going on. There never was greater need for unity.

Dr. BUCHAN, M.O.H., replied to the discussion, and asked the practitioner to co-operate and not oppose. It was agreed to ask Dr. Buchan to meet the committee, and try to formulate a scheme to put before the authorities.

A hearty vote of thanks was accorded to Dr. Lord for his address.

Association Notices.

ELECTION OF REPRESENTATIVE BODY OF THE ASSOCIATION, 1920-21.

Constituencies in Representative Body.

THE list of the provisional *Home Constituencies* for election of the Representative Body, 1920-21, appeared in the SUPPLEMENT of January 24th, page 21.

As intimated to all the *Oversea bodies*, the Council has made each Oversea Division and Division-Branch, possessing an Honorary Secretary and the necessary organization, an independent Constituency.

Election of Representatives and Deputy-Representatives.

The Representatives and Deputy-Representatives in the Representative Body must be elected not later than May 23rd, and their names notified to the Medical Secretary not later than June 4th.

The Council draws special attention to the fact that it is entirely within the discretion of each Constituency to decide whether the election of its Representative(s) and Deputy-Representative(s) shall be carried out by **General Meeting of the Constituency, or by postal vote.**

Date of Annual Representative Meeting at Cambridge.

The Annual Representative Meeting at Cambridge will begin on Friday, June 25th, at 10 a.m.

ELECTION OF COUNCIL OF THE ASSOCIATION, 1920-21.

THE list of the Groups of Branches in the United Kingdom for election of twenty-four members of the Council, 1920-21, and Nomination Form, appeared in the SUPPLEMENT of

January 24th, page 22. **Nomination Forms** will be forwarded by the Medical Secretary on application by Branches, Divisions, or Members. The Nominations must be in the hands of the Medical Secretary **not later than May 17th.**

SCHOLARSHIPS AND GRANTS IN AID OF SCIENTIFIC RESEARCH.

SCHOLARSHIPS.

THE Council of the British Medical Association is prepared to receive applications for Research Scholarships as follows:

1. An *Ernest Hart Memorial Scholarship*, of the value of £200 per annum, for the study of some subject in the department of State Medicine.
2. *Three Research Scholarships*, each of the value of £150 per annum, for research into some subject relating to the causation, prevention, or treatment of disease.

Each Scholarship is tenable for one year, commencing on October 1st, 1920. A Scholar may be reappointed for not more than two additional terms.

The Conditions of the award of Scholarships are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

GRANTS.

The Council of the British Medical Association is also prepared to receive applications for Grants for the assistance of Research into the Causation, Treatment, or Prevention of Disease. Preference will be given, other things being equal, to members of the medical profession, and to applicants who propose as subjects of investigation problems directly related to practical medicine.

The Conditions of the award of Grants are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

Applications.

Applications for Scholarships and Grants for the year 1920-21 must be made not later than Saturday, May 29th, 1920, in the prescribed form, a copy of which will be supplied by the Medical Secretary on application.

Each application should be accompanied by testimonials, including a recommendation from the head of the laboratory, if any, in which the applicant proposes to work, setting out the fitness of the candidate to conduct such work, and the probable value of the work to be undertaken. This is not intended, however, to prevent applications for Grants in aid of work which need not be performed in a recognized laboratory.

CHANGES OF BOUNDARIES.

AMALGAMATION OF SEVENOAKS WITH TUNBRIDGE WELLS DIVISION.

THE following change has been made in accordance with the Articles and By-laws, and takes effect as from the date of publication of this notice:

That the Sevenoaks Division of the Kent Branch be incorporated in the Tunbridge Wells Division of that Branch.

Representation in Representative Body.—Unaffected.

BRANCH AND DIVISION MEETINGS TO BE HELD.

LANCASHIRE AND CHESHIRE BRANCH.—The annual meeting for 1920 will take place at Southport on June 9th. The members will be entertained at lunch by the Southport Division, and after the President (Dr. Baildon, Southport) has given his address scientific papers will be read. A number of excursions are being arranged for the afternoon, and in the evening members will dine together. Members desiring to bring forward papers should communicate with the Branch Secretary, Mr. F. S. Heaney, F.R.C.S.I., 36, Rodney Street, Liverpool.

METROPOLITAN COUNTIES BRANCH: WESTMINSTER AND HOLBORN DIVISIONS.—A general meeting of the Westminster and Holborn Divisions will be held at the St. James's Vestry Hall, Piccadilly, on Thursday, April 29th, at 5 p.m. Agenda: Revised Ethical Rules; Election of (a) Representatives, (b) Members of Council; Increase of Fees; Subdivision of Divisions.

MIDLAND BRANCH: LINCOLN AND KESTEVEN DIVISIONS.—Dr. Godfrey Lowe, Honorary Secretary, Lincoln Division (42, Langworth Gate, Lincoln), gives notice that a meeting of members and non-members of the Lincoln and Kesteven Divisions will be held at Lincoln on Tuesday, April 27th, at 3 p.m. Dr. Alfred Cox, O.B.E., Medical Secretary, will attend and give an address, to be followed by a discussion. Further particulars will be announced later.

CORRESPONDENCE.

Appeals to the High Court.

SIR,—In the SUPPLEMENT to the BRITISH MEDICAL JOURNAL of April 3rd I notice that an amendment has been drafted, and that Dr. A. C. Farquharson, M.P., is being asked to move it, in connexion with the bill now before Parliament. The exact terms of the amendment are, however, not given.

I wish to emphasize the fact that not only must the right of appeal be given in case of removal from the panel list, but also in the event of heavy money penalties, for the one is not complete without the other.

I think a concise statement of the present position with regard to appeals to the High Court might here be given with advantage:

The Insurance Act of 1911 placed panel practitioners *unreservedly* in the power of the Commissioners, from whose decisions no appeal could be made to the High Court. The judges of the High Court could only hear a case if the Commissioners exceeded their jurisdiction, or, in other words, acted *ultra vires*, or if the procedure had not been correctly carried out. The Commissioners could, however, at any time introduce new Regulations, and which, if placed upon the table of the House of Commons for a brief period, became then, as it were, a part of the Act. In this way the Commissioners could very quickly convert points which were *ultra vires* into *intra vires*, and in this way panel men have been cut off from the High Court.

The principle here disclosed is fundamentally unsound, or as a judge would say, "bad in law." The British Constitution gives every man the inherent right to the Courts of Law, and, indeed, this is the only real safeguard which a citizen possesses.

These powers of the Commissioners are now vested in the Minister of Health, who has thus become an absolute autocrat where panel men are concerned. This autocracy is, however, contrary to the very spirit of the British Constitution.

It is interesting to note that the Minister of Health can be sued in court by any other citizen; but those whose characters and livelihoods are placed in his hands have no such remedy. It must be noticed also that this living of a panel doctor is not an appointment conferred on him by the State, but is the man's own practice, which he has either worked up with much labour or paid for by much capital. It should be noticed also that the break up of a doctor's panel would at the same time break up a very considerable portion of the private patients, for the two classes of patients are dovetailed in together.

No panel man in his right senses would waste his money in courts over trivialities, but at the same time it is absolutely necessary to keep a way open so that if real danger should beset him either by way of removal from list or by heavy money penalties, he can forthwith appeal on the merits of his case to the High Courts, like any other citizen.—I am, etc.,

Stalybridge, April 3rd.

ADAM FOX.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following notifications are announced by the Admiralty:—Surgeon Rear-Admiral G. A. Dreaper to R.N. Hospital, Chatham. Surgeon Commanders J. P. H. Preliminary.

CAMBRIDGE MEETING.

1. The Council in submitting its Report for 1919-20 feels that it is voicing the opinion of all members in rejoicing at the fact that the first Annual Meeting after the War is to be held in Cambridge, and that the members of the Association, are to have the long delayed opportunity of showing their President, Sir T. Clifford Allbutt, the esteem and affection felt for him by the British Medical Association.

ANNUAL MEETING, 1921.

2. The North of England Branch has invited the Association to hold its Annual Meeting at Newcastle-on-Tyne in 1921, and has nominated Dr. David Drummond as President-Elect.

The Council recommends:—

Recommendation.—That the Annual Meeting, 1921, be held at Newcastle-on-Tyne in July, 1921.

The Council recommends:—

Recommendation.—That David Drummond, C.B.E., M.A., M.D., D.C.L., F.R.C.P., Vice-Chancellor, and Professor Principles and Practice of Medicine, University of Durham, Consulting Physician Royal Victoria Infirmary, Newcastle-on-Tyne, be elected President of the Association for 1921-22.

ANNUAL MEETING, 1922.

3. The Glasgow and West of Scotland Branch has invited the Association to hold its Annual Meeting at Glasgow in 1922.

The Council recommends:—

Recommendation.—That the Annual Meeting, 1922, be held at Glasgow in July, 1922.

4. An invitation for 1922 was simultaneously received from the Dundee Branch, which, on hearing of the Glasgow invitation, placed itself entirely in the hands of the Council, stating that though it wished to have a visit from the Association it would be satisfied with whatever decision the Council arrived at. The Council has thanked the Dundee Branch for its invitation and its consideration.

HONOURS.

5. The Council has pleasure in announcing that during the present session honours have been conferred upon the following members of the Association:—

Peers.

Sir Bertrand Dawson, G.C.V.O., K.C.M.G., C.B.

Baronetcy.

Mr. Gilbert Barling, C.B., Birmingham.

K.B.E.

Lieut.-Col. E. N. Thornton, S.A.M.C., Cape Town.

Knighthood.

Dr. Robert Charles Brown, Preston.
 Dr. Josiah Court, Staveley, Derbyshire.
 Dr. Henry J. Gauvain, Alton.
 Dr. Fredk. J. Lister, Johannesburg.
 Dr. Joseph C. Verco, Adelaide.

C.B.E.

Sir James Barr, Liverpool (Ex-President).
 Dr. David Drummond, Newcastle-on-Tyne (President-Elect).
 Dr. T. A. Goodfellow, Manchester (former Member of Council).
 Lieut.-Col. H. S. Newland, D.S.O., Adelaide (former Member of Council).
 Dr. Dawson Williams (Editor *B.M.J.*).

O.B.E.

Dr. H. W. Langley Browne, West Bromwich (former Chairman of Council).
 Dr. E. J. Domville, Bridport (former Member of Council).
 Dr. G. K. Smiley, Derby (present Member of Council).

M.B.E.

- Dr. H. C. Mactier, Wolverhampton
(present Member of Council).
Dr. H. Falconer Oldham, Morecambe
(former Member of Council).

6. OBITUARY.

The Association has to deplore the loss of the following Members:—

Name.	Offices held.

Dr. Leslie Durno ---	A former Vice-President of the Metropolitan Counties Branch.
Dr. Robert Esler ---	At one time Member of the Parliamentary Bills Committee, and author of a "Guide to Belfast and the North of Ireland" for the use of the 1884 Annual Meeting.
Dr. T. M. Evans ---	Past President East York and North Lincoln Branch.
Dr. Frank Fowler ---	A Vice-President, and Secretary of the Dorset and West Hants Branch, and at one time a Member of the Central Council.
Mr. George Cooper Franklin, F.R.C.S.	President of the Association at the Leicester Meeting, 1905
Sir Thomas Fraser, M.D., F.R.S.	Secretary of Section Public Medicine, 1875; President of Section Pharmacology and Therapeutics, 1885; Address in Medicine 1898.
Dr. David Goyder ---	Former Member of Council and Public Health Committee; a former President of Yorkshire Branch.
Sir James Alexander Grant, K.C.M.G., M.D., F.R.C.P.	Was one of the few Honorary Members of the Association.
Dr. Henry Jones ...	Member of the Lancashire and Cheshire Branch Council.
Dr. Thomas Milne ...	A former President of the Aberdeen Branch.
Dr. Frank Nicholson, C.B.E.	President of the East Yorks and North Lincoln Branch.
Dr. John O'Keefe ...	Vice-Chairman of the Monmouthshire Division.
Dr. Thomas O'Neill ...	Secretary of the Bolton Division.
Sir William Osler, Bart., M.D., F.R.S.	At one time a Member of the Central Council, and gave the Address in Medicine at the Montreal Meeting in 1897.
Dr. T. H. Parkes Peers ...	A former Secretary and Representative of the Lambeth Division, and a Member of Central Committees.
Dr. William Powell ...	Vice-President of the Section of Medicine, 1907.

Dr. F. J. Smith ...	A former Member of the Central Council, and President of the Metropolitan Counties Branch; Secretary of the Section of Medicine, 1901, a Vice-President in 1912 and President in 1914.
Sir Edward Stirling, C.M.G., M.D., F.R.S.	President of the South Australian Branch in 1888.
Capt. A. C. Sturdy, M.C., R.A.M.C.	Honorary Secretary of the Horsham Division.
Dr. John Thomas Tibbles ...	Chairman of the Leicester Division and Vice-President of the Midland Branch.
Dr. C. R. Watson ...	Past Chairman of the Tunbridge Wells Division.
Dr. John Waugh ...	A former Chairman of the Belfordshire Division.
Dr. George F. Welsford ...	A former Member of the Insurance Acts Committee.
Dr. Samuel H. West ...	Vice-President of the Section of Pathology and Bacteriology, 1892, and Vice-President of the Section of Medicine, 1901.
Dr. D. J. Williams ...	At one time a Member of the Central Council, and a former President of the South Wales and Monmouthshire Branch.
Dr. Evan Williams ...	A former President of the North Wales Branch.
Dr. Robert Morris Williams	Chairman of the North Carnarvon and Anglesey Division.
Dr. Charles Workman ...	Vice-President of the Section of Pathology, 1908.

Dr. Mary S. Aeworth, Dr. James Adamson, Dr. T. G. Alderton, Dr. Charles Aldridge, Dr. Henry C. Allinson, Dr. C. Amarasriwa, Dr. William Angus, Col. Alfred Henry Anthonisz, R.A.M.C., Dr. Victor Asher, Dr. Thomas W. Atkinson, Capt. James Connor Maxwell Bailey, O.B.E., R.A.M.C., Fleet Surgeon G. A. S. Bell, R.N., Retired, The Hon. Sir John H. M. Beck, Dr. Maximilian R. G. Behrendt, Dr. A. B. Bennie, Dr. Charles M. Benson, Dr. Henry Keys Bentley, Dr. Guy Black, Dr. Cecil Blake, Dr. William T. Bolton, Dep.-Insp.-Genl. Walter Bowden, D.S.O., Dr. Cyril W. B. Bowdler, Dr. John A. Boyd, Dr. Michael A. Boyle, Major Richard James Bradley, I.M.S., Dr. Charles B. Braithwaite, Dr. Charles W. Bray, Dr. Alexander Bremner, Dr. William H. Brenton, Dr. James Broomhead, Dr. Forbes Brown, Dr. James E. M. Brown, Dr. Robert A. Buntine, Dr. Frederick J. Burge, Dr. Andrew Burgess, Dr. William Combe Burns, Dr. John Cabill, Dr. Hugh Logan Calder, Col. Robert Caldwell, A.M.S., Dr. William S. Carroll, Dr. A. W. Carter, Dr. John P. Cartwright, Dr. Robert Chalmers, Dr. Dorothy Chick, Dr. John Clare, Dr. Walter J. Clarke, Mr. Walter Thomas Clegg, Dr. Edward Francis Coghlan, Dr. Alexander R. Coldstream, Dr. Richard Mount Cole, Dr. Ashton N. Collier, Dr. William G. Coombs, Dr. William J. Corrigan, Dr. Ernest Tom Cox, Dr. Alexander David Crawford, Dr. R. Francis Craggs, Dr. Donald B. Crerar, Dr. William George Creswell, Major Howard Crossle, I.M.S., Dr. Edward Cuffey, O.B.E.; Dr. Ernest Nicholson Cunliffe, Dr. Lionel Braim Daly, Dr. Harrington Wyndham Darrell, Sir J. Mackenzie Davidson, Dr. Harold R. L. Davies, Dr. Henry David Davy, Dr. Meredith Dawson, Dr. T. V. De Denne, Dr. William Diamond, Major George Magill Dobson, R.A.M.C., Dr. Thomas Dow, Dr. William Campbell Downs, Dr. Thomas Drapes, Dr. John Duff, Dr. Mordaunt G. Dundas, Dr. Edwin Lindsay Dunn, Dr. William P. Dunsmore, Dr. Robert Dunsinnir, Dr. Francis Norman Victor Dyer, Dr. George K. Edwards, Dr. John Elliott, Col. Arthur Owen Evans, I.M.S., Dr. Sandbrook Falkner, Dr. Edward Fawcett, Dr. Henry Fawcett, Dr. E. G. Fearnsides, Surg.-Commander Frederick Fedarb, R.N., Surg.-Lieut. Edward Garlick Fisher, R.N., Dr. Denis L. FitzGerald, Dr. John C. Fox, Dr. Peter Fraser, Dr. Mendel Freedman, Dr. A. G. S. Friedmann, Dr. Andrew B. Fulton, Dr. John R. Gabe, Dr. William H. Gaunt, Dr. N. J. Gerrard, Dr. R. H. Gibbs, Dr. Elizabeth T. Gilchrist, Dr. R. F. Gill, Dr. Joseph A. Going, Dr. William B. Gordon, Dr. William R. Gould, Dr. George Richard Green, Dr. James Greensill, Major H. H. Griffith, S.A.A.M.C., Dr. William Growse, Mr. George Herbert Hamerton, Dr. Walter B. Hastings, Dr. David Harvard, Dr. Herbert Hawker, Dr. Hu Ruskin Hancock, Dr. George Thomas Hankins, Dr. Peter H. Haylett, Dr. Frederick Hazell, Dr. John William Hembrough, Dr. Joseph Henry, Dr. Charles H. Hibbert, Dr. George A. Hicks, Dr. R. R. Higinbotham, Dr. James Hinshelwood, Dr.

G. Hodges, Dr. William M. Hope, Dr. Godfrey C. Horsman, Dr. Daniel Lovett Hubbard, Dr. George Osborne Hughes, Dr. Laurence Humphry, Dr. James Hunter, Dr. W. H. J. Huthwaite, Dr. J. Innes-Stephens, Dr. Richard C. Irvine, Lieut.-Col. Thomas Jackson, I.M.S., Dr. Alexander Jamison, Dr. George Johnston, Dr. George J. W. Johnston, Dr. Peter Jones, Dr. Herbert Woodley Joyee, Dr. Daniel O. Kerr, Dr. Charles M. G. Kitching, Dr. Frederiek Knight, Dr. George H. Lang, Dr. Charles Robert Leader, Dr. Ralph Winnington Leftwich, Dr. James C. R. Lind, Dr. Arthur G. H. Lovell, Dr. Charles J. Lumpkin, Dr. George B. McCaul, Dr. T. W. McCubbin, Dr. William C. Macdonald, Dr. William E. Macfarlane, Dr. Thomas McGregor, Dr. John W. MacKay, Dr. Arthur Colin Mackenzie, Major Samuel Wilson McLellan, M.C., R.A.M.C., Dr. Peter McNabb, Dr. Archibald E. Malloch, Dr. John Marshall, Dr. Thomas Marshall, Dr. James Williamson Martin, Dr. William B. M. Martin, Dr. Edward Mathews, Dr. Paul Mathews, Dr. Thomas Graham Mathews, Dr. Henry Maturin, Dr. Gertrude E. Mead, Insp.-Genl. C. Adam Brunton Messer, R.N., M.D., Dr. David Melville, Dr. William J. K. Millard, Lieut.-Col. Grenville Edwin Moffet, Dr. Arthur R. Moody, Dr. Helen Moore, Dr. Robert A. Morton, Dr. George Murray, Dr. Wilfred Leech Myles, Dr. T. M. Nair, Dr. Richard W. Nesfield, Dr. Robert A. Nesham, Mr. Arthur Neve, F.R.C.S. Ed., Dr. Frederiek W. Niesche, Dr. Adam T. Nisbet, Dr. John D. Nisbet, Dr. Thomas Niven, Dr. Reginald Leslie Norman, Dr. R. W. C. Norman, Dr. Richard Hill Norris, Dr. William Patrick O'Meara, Dr. W. J. J. O'Reilly, Dr. E. K. Overend, Dr. Benjamin A. Palmer, Lieut.-Col. Francis M. Parry, R.A.M.C., Dr. Lloyd D. Parry, Dr. Thomas G. Paterson, Dr. Arthur J. Pedley, Dr. A. E. Perkins, D.S.O., Dr. George Victor Perez, Dr. Josiah N. Phillips, Dr. Frederiek K. Pigott, Dr. James Pinkerton, Dr. William A. Pitt, Dr. Rowland Pollock, Dr. George W. Potter, Dr. Thomas Proctor, Dr. Joseph Quirke, Dr. H. Rabl, Dr. Henry Ward Ramsay, Dr. Wyndham Randall, Dr. R. A. Reeve, Dr. James Crawford Renton, Dr. James Emerson Reynolds, Dr. William B. Robertson, Dr. Alexander Ross, Dr. Alexander M. Ross, Dr. Murdoch W. Ross, Dr. Simon Ryan, Dr. Thomas Ryan, Dr. John T. Samuel, Dr. Joseph Abraham Sanderson, Dr. Ernest Saxton, Dr. Aurel Schultz, Dr. Alexander Scott, Dr. Joseph S. Scott, Capt. Clement Perronet Sells, M.C., R.A.M.C. (T.F.), Dr. John D. Shapland, Dr. Harry Wynter Shettle, Dr. J. V. Shirgaokar, Dr. David Skinner, Dr. John F. Skrimshire, Dr. Charles C. Storach, Dr. David M. Smith, Dr. Eric M. Smith, Dr. Oliver C. Smithson, Dr. Gerald M. Soper, Capt. H. South, A.A.N.C., Dr. William Spooner, Dr. Gilbert Patrick Staunton, Capt. William S. R. Steven, R.A.M.C., Major Norman W. Stevens, R.A.M.C., Sir Thomas Anderson Stuart, Dr. Harold Swale, Dr. Arthur W. Taylor, Dr. Robert Taylor, Dr. William H. Te Water, Dr. Edward Thomas, Dr. G. B. Thomas, Dr. Hugh J. Thomson, Dr. Robert G. Thomson, Dr. C. G. Thorp, Dr. Edwin Tipple, Dr. T. R. Travell, Dr. Arthur H. Trevor, Dr. G. W. Van Twest, Fleet-Surgeon C. Lyon Vasey, R.N., Ret., Staff-Surgeon John Verdon, R.N., Dr. Frank Waddington, Dr. Charles Henry Wakeham, Dr. Alfred E. Walker, Dr. William Kay Walls, Fleet-Surgeon Henry W. D. Walsh, R.N., Ret., Dr. John Ward, Dr. J. King Warry, Dr. John A. Webster, Dr. Francis Henry Weekes, Dr. J. B. St. V. Welch, D.S.O., Dr. Henry F. L. White, Dr. Charles A. Whyte, Dr. George Thomas Whyte, Dr. Friedrich Adolf Wille, Dr. Norman S. Williams, Dr. William Jones Williams, Dr. C. S. Willis, Dr. James Leslie Wilson, Lt.-Col. Robert Wilson, C.A.M.C., Dr. Charles E. Winekworth, Dr. O. E. Bruce Withers, Dr. T. J. Withers, Dr. Thomas Woodman, Dr. Robert E. Woolnough, Dr. Cyril H. Wright, Dr. Robert B. Wright, Dr. Alexander G. Young, Dr. James Young, Dr. Margaret C. W. Young, Dr. Ralph Young.

THE LATE CAPT. N. G. CHAVASSE, V.C., M.C., R.A.M.C. :
GOLD MEDAL OF THE ASSOCIATION.

7. The Council, in 1919, decided to present the Gold Medal of the Association to the nearest relative of the late Capt. Noel Godfrey Chavasse, V.C., M.C., R.A.M.C., to whom the Victoria Cross and Bar were awarded in the following circumstances:—

"Victoria Cross.—For the most conspicuous bravery and devotion to duty. During an attack he tended the wounded in the open all day, under heavy fire, frequently in view of the enemy. During the ensuing night he searched for wounded on the ground in front of the enemy's lines for four hours. Next day he took one stretcher-bearer to the advanced trenches, and, under heavy fire, carried an urgent case for 500 yards into safety, being wounded in the side by a shell splinter during the journey. The same night he took up a party of twenty volunteers, rescued three wounded men from a shell-hole twenty-five yards from the enemy's trench, buried the bodies

of two officers, and collected many identity discs, although fired on by bombs and machine-guns. Altogether he saved the lives of some twenty badly-wounded men, besides the ordinary cases which passed through his hands. His courage and self-sacrifice were beyond praise."—(*London Gazette*, October 26th, 1916.)

"Though severely wounded early in the action whilst carrying a wounded soldier, Capt. Chavasse refused to leave his post, and for two days not only continued to perform his duties, but in addition went out repeatedly under heavy fire to search for and attend to the wounded. During these searches, although practically without food during this period, worn with fatigue, and faint with his wound, he assisted to carry in a number of badly-wounded men over heavy and difficult ground. By his extraordinary energy and inspiring example he was instrumental in rescuing many wounded who would otherwise have undoubtedly succumbed. This devoted and gallant officer subsequently died of his wounds."—(*London Gazette*, September 14th, 1917.)

8. The Council is pleased to report that the parents of the deceased officer—the Right Rev. the Lord Bishop of Liverpool and Mrs. Chavasse—hope to be present at Cambridge to receive the Medal.

MAJOR ARTHUR MARTIN-LEAKE, V.C., F.R.C.S., R.A.M.C.,
GOLD MEDAL OF THE ASSOCIATION.

9. It is hoped also that Major Arthur Martin-Leake, V.C., F.R.C.S., R.A.M.C., who is now in India, may be able to be present at Cambridge to receive the Gold Medal awarded to him in 1915:—

"Victoria Cross.—For great devotion to duty and self-sacrifice at Vlakfontein, February 8th, 1902, when he went out into the firing line to dress a wounded man under very heavy fire from about forty Boers only 100 yards off. When he had done all he could for him he went over to a badly wounded officer, and while trying to place him in a more comfortable position he was shot three times. He only gave up when thoroughly exhausted, and then he refused water until other wounded men had been served."—(*London Gazette*, May 13th, 1902.)

"Bar to Victoria Cross.—For most conspicuous bravery and devotion to duty throughout the campaign, especially during the period October 29th to November 8th, 1914, near Zonnebeke, in rescuing, whilst exposed to constant fire, a large number of the wounded who were lying close to the enemy's trenches."—(*London Gazette*, February, 1915.)

ATTENDANCES AT COUNCIL AND COMMITTEE MEETINGS.

10. The Council submits in Appendix I. a list of attendances at Council, Committee and Sub-Committee meetings from July 26th, 1919, to April 1st, 1920.

Finance.

11. The revenue of the Association for the year ending December 31st, 1919, shows a substantial increase on the previous year, but the expenditure has increased in like proportion. (For Financial Statement see Appendix I.) The accounts for the year show a balance to credit of £5,204 13s. 2d., but nearly the whole of this is accounted for by the Government contribution of £5,000 towards the expenses of the Central Medical War Committee. This Committee was established at the instance of the British Medical Association in order to ensure that the military forces of the Crown should be adequately supplied with medical officers with due regard to the needs of the civil population. The Committee sat for nearly four years and assiduously discharged the delicate and onerous duties imposed upon it by Parliament, by the authorities of the Navy and Army, and by the Ministry of National Service. The Association met the heavy expenses of the Committee from year to year, as has been duly reported. The sum of £5,000 received from the Government as a contribution towards these expenses, incurred mainly in previous years, has been credited to the receipts of 1919 as the only convenient method of dealing with it, but this procedure tends to obscure the actual results of the year's working. Deducting this amount, most of which strictly accrued in previous years, the balance of income over expenditure in 1919 was £204 13s. 2d.; this compares with an excess of expenditure over income in 1918 of £1,333 15s. 7d. This is a result upon which the Association may be congratulated, in view of the persistent depressing effects on business of the after consequences of the war, of the great increase in the price of labour and materials, and the serious rise in the cost of living which the Association, like all other employers, has been compelled as far as possible to compensate.

12. An inspection of the Balance Sheet will show that it has been found advisable, in view of the general fall in the market value of all securities acquired before the war, to write off £1,376. Though eventually the fall in value may be regained, the only prudent course is to recognise the actual position. The sum of £1,000 has been written off for depreciation of premises; they are in good general condition but minor repairs could not be made during the war. As has been customary £200 has been written off for depreciation of the library, but only £100 has been written off for depreciation of the printing plant and type. The smallness of this amount is due to the fact that the *Journal* is now printed from stereotype. The life of the type is thus greatly lengthened, but there is entailed the disadvantage that it is much more difficult to reproduce photographs and skiagrams in a satisfactory manner.

REVENUE.

13. The receipts from the subscriptions of members show an increase of £2,241. In its annual report for 1917-18 the Council had to record a diminution of £1,276 in receipts from this source in 1917. Last year it could record an increase in 1918 of £260. It may be interesting to add that the amount received in 1919 was more than £1,000 above that received in 1916. In the *Journal* Account for 1919 an increase of over £8,800 in revenue is shown; this, in view of the unfavourable commercial conditions during the year must be considered a very gratifying result of the year's working.

GENERAL ASSOCIATION AND CENTRAL MEETING EXPENSES.

14. The general Association expenses (Abstract A) amounted in 1919 to £1,539, as against £7,763 in 1918; the reduction is due in the main to diminution in legal expenses. Last year a sum of £6,500 had to be provided in connection with the Pratt case; after this amount has been deducted from the sum disbursed last year the expenses in this abstract still show a diminution of nearly £300. In this account members will notice a subscription of one hundred guineas to the Fund for a memorial to the late Colonel E. F. Harrison, C.M.G., who was for many years analytical chemist to the *Journal* and made the analyses for *Secret Remedies* and *More Secret Remedies*. The remarkable work he did during the war in devising means to protect our soldiers from the poisonous gases introduced into warfare by the Germans, won for him the public recognition which those who were acquainted with his character and attainments knew he so well deserved.

15. As is shown in Abstract B the expenses of the Representative Meeting, Council, and the Secretaries' Conference, are higher by £1034; the increase is distributed over each of the three subheads. The expenses of the Central Committees increased by £553. The work of the Central Medical War Committee was brought to an end in March 1919, and its expenditure therefore shows a large diminution on that of the previous year. As already mentioned, a proportional part of this is to be counted as covered by the sum received from the Government in reimbursement of the Association's expenditure. The expenditure of the Scottish Committee has increased from £192 to £1,057, owing to the establishment of Scottish Office, with a whole-time Scottish Medical Secretary. Considerable increases are also shown in the expenditure of the Insurance Acts Committee, and the Central Ethical, Medico-Political, Naval and Military, and Organisation Committees. All these Committees had to deal with an unusual number of difficult and complex questions. The expenditure of the Irish Committee does not differ much from that of the previous year.

CENTRAL STAFF, PRINTING AND POSTAGE EXPENSES.

16. Details of the central printing, stationery and postage expenses are given in Abstract D; they show an increase of £840, due to the higher charges for printing and paper. In Abstract C giving the central premises expenses, it will be observed that the payments for rates, taxes, insurance and electricity, increased by £260.

17. In the central staff expenses (Abstract E) is shown an increase of £2,000, due in the main to increases in salaries to meet the increased cost of living and also to the establishment of the Intelligence Department. The total expenditure under this head in 1919 was £8,695, of which £5,670 represents the remuneration of the secretarial and clerical staff of the Medical Department. The amount taken under this head for the Financial and General Business Department is £2,421, the remainder of the expenditure of the staff of this department (£1,776) being debited to the *Journal* account.

SALARIES OF CLERICAL, EDITORIAL AND SECRETARIAL STAFFS.

18. The Council has thoroughly revised the scale of payment of the Clerical Staff and in doing so has consulted (as mentioned in paragraph 4) a Committee representative of the whole of that staff. The new scale classifies the clerks in four divisions

in accordance with the responsibility undertaken and technical ability required, and consolidates the bonuses which have been paid during the past few years. It gives, approximately, an increase on the old scale of one hundred per cent. to the lowest class and fifty per cent. to the highest class, with a corresponding increase to the Head Clerk of each Department. The operation of the new scale dates back to January 1st, 1920.

19. In addition, a thorough revision of the Office Staff Superannuation Scheme is being made under Actuarial advice and in consultation with those concerned, and the Council hopes to be able to announce in its Supplementary Report that the new scheme has been established.

20. As regards the salaries of the Editorial and Secretarial Staff, the Council has, for the present, decided to continue the bonus system. As from January 1st, 1919, each official of the Association (that is those persons directly appointed by the Council with the exception of the Head Clerks) was given a temporary increase of twenty per cent. on his salary at that date, with the exception of the Editor who was given twenty-five per cent. The Council has decided to increase this bonus as from January 1st, 1920, to 33½ per cent. with the exception that the Deputy Medical Secretary and the Scottish Medical Secretary who only joined the staff in November, 1919, have been given as from April 1st, 1920, an increase of ten per cent. on the salaries at which they were appointed.

"JOURNAL" ACCOUNT.

21. In the paragraph under this heading in the Annual Report of 1918 it was stated that owing to the regulations of the Paper Controller and the high price of paper, the Council had found it necessary to reduce the total number of pages in the weekly issue of the *Journal* to 64, but that the number had been increased during the last five months of the year to 72. The number of pages in an issue was maintained at approximately this level for some months, but the situation having become somewhat easier, the number of pages in the weekly issues during the fourth quarter of 1919 was gradually increased, and several issues in that quarter contained 104 pages. This rendered it possible somewhat to increase the number of pages in the text and to make a larger increase in the pages allotted to advertisements. An upward tendency in the cost of production, however, became evident; the price of paper, which had declined, again began to rise, and all printing charges greatly increased. This increase included higher rates of wages to compositors and to all persons employed in the machine printing office. The increases varied, but may be taken to amount on the whole to at least 150 per cent. above pre-war charges. In these circumstances the Council at its meeting on December 17th, 1919, resolved that, save on exceptional occasions, the maximum number of pages in any issue of the *Journal* should not exceed 104. One effect of a weekly issue containing this number of pages is to increase the postal charges from the 3d. to the 1d. rate in the United Kingdom, and to cause a corresponding increase for copies sent to the Dominions, the Colonies, India, and foreign countries. In connection with this matter of the number of pages in the weekly issue of the *Journal* two considerations arise: the first is that the *Journal* has to take its share in discharging the two main functions of the Association—namely, on the one hand to promote the medical and allied sciences; and on the other, to maintain the honour and interests of the medical profession. In seeking to fulfil the one function the aim has been to supply members with a *Journal* which should present them with a current review of the progress of the science and practice of medicine. In the fulfilment of the other the Supplement is maintained in order to keep members informed of the course of the business of the Association and of the numerous directions in which it seeks to discharge its duties as the chief medico-political organisation of the profession. Much of this matter is of a character which would not be published so fully in a medical journal conducted purely as a commercial undertaking. The second point which has to be considered is the amount of space to be provided for advertisements. Much anxious consideration has been given to this subject by the Council, with the advice of the Journal Committee. The receipts from advertisements rose (in round numbers) from £17,760 in 1918 to £25,570 in 1919, an increase of £7,900. This, however, is not a net gain, since there must be set against it the cost of printing and paper; as a result of careful consideration it was determined to raise the scale of charges for advertisements as from the first issue of April, 1920. The effect of this decision cannot be wholly foreseen, but there is every reason to believe that it will result in a substantial increase in the net profit from this source. The Epitome of Current Medical Literature was restarted with the issue of September 27th, 1919. The number of pages of text, including Epitome and Supplement, in 1919 was 2,040, or rather less than two-thirds of the number published in 1914.

22. The proceedings of the Scientific Meeting in London arranged by the Association in 1919 were reported in abstract in the *Journal*; the full proceedings, together with information regarding the medical services in connection with the war, were issued in a separate octavo volume, which was supplied free to members on application; copies are still available. The price to non-members is 3s.

23. The cost of production of the *Journal*, including all printing charges, paper and postage, rose from £24,016 to £32,416, an increase of £8,400, to be accounted for partly by the larger number of *Journals* printed, but mainly by the increases in the cost of material and compositors' work, machining, etc. The total number of copies of the *Journal* printed during 1919 was over a million and a quarter. The stock of back numbers is very small; many are already out of print.

EDITORIAL.

24. The Editorial expenses were £5,919 or £900 more than in 1918. The increase is to be accounted for partly by increases of salary granted to meet the rise in the cost of living, and partly by increased expenditure on contributions, due to the reinstatement of various departments.

25. To meet the total cost of the production of the *Journal* £7,510 (curiously enough the same amount as last year) has been taken from members' subscriptions. This is a small decrease on the amount taken in 1917. From the apportionment of members' subscriptions printed below it will be seen that the amount with which the subscription is debited in respect of the production and delivery of the *Journal* is 7s. 7d.; out of this from three to four shillings are expended on postage. To non-members the charge for the same service in the United Kingdom is £2 16s. 0d. a year; outside the United Kingdom it is £3 0s. 0d. The receipts of the Association from the sale of *Journals* to non-members in 1919 amounted to £7,102, an increase of over £1,100 on the receipts from the same source in 1918.

26. The Council learnt with regret of the death, at the age of 70, on December 21st, 1919, of Mr. Charles Louis Taylor, who retired in April, 1917, from the position of Assistant Editor, which he had held since 1897. Altogether he had served for over 30 years on the editorial staff of the *British Medical Journal*. The Association was much indebted to him for his conscientious discharge of his routine duties and often brilliant writings on the history of medicine. Dr. W. E. Crowther, who was a Leeds student and was for some years engaged in general practice in Yorkshire, has been appointed Sub-editor. The indoor full time staff of the *Journal* is now restored to its customary strength, and consists of an Editor, Assistant Editor, and Sub-Editor.

APPORTIONMENT OF MEMBER'S SUBSCRIPTION.

27. The following tables show how the subscription of a member was apportioned towards defraying the expenses of the Association for the year ending 31st December, 1919:—

	£	s.	d.
General Association Expenses	1,539	8	10
Central Meeting Expenses	8,773	3	0
Central Premises Expenses	2,913		
Central Printing, Stationery and Postage	2,387	2	5
Account	8,695	8	9
Central Staff Expenses	497	6	
Library Account	7,564	7	7
"Journal" Account Expenses	1,057	1	1
Grant to Scottish Committee	853	10	
Grant to Irish Committee	3,072	3	1
Capitation Grants to Branches	2,676	2	9
Written off Premises, Investments, Plant and Type	1,531	1	7
Subscriptions written off			
	£2	2	0

ESTIMATE OF EXPENDITURE AND RECEIPTS FOR 1920.

28. The following figures represent an approximate forecast of the probable expenditure and revenue for the current year:—

	EXPENDITURE.		Estimate for 1920.
	1919	£	
General Association Expenses	1,539	2,561	Increase 4,200
Central Meeting Expenses	8,773	273	Decrease 8,500
Central Premises Expenses	2,913	337	Increase 3,250
Printing, Stationery, and Postage			
Expenses	2,357	113	Increase 2,500
Scottish Committee	1,057	443	Increase 1,500
Irish Committee	853	293	Increase 1,053
Central Staff Expenses	8,695	3,303	Increase 12,000
Capitation Grants	3,072	923	Increase 4,000
Arrears of Subscriptions	1,417	583	Increase 2,000
Reduction of Premises Account	1,000	—	1,000
Depreciation	2,676	1,076	Decrease 600
Library Account	500	—	500
"Journal" Account Expenses	41,015	4,985	Increase 46,000
Estimated Total Expenditure			87,103
Estimated Revenue, 1920			83,650

PROPOSED INCREASE OF SUBSCRIPTION.

29. The indications given in this report of the effect which the universal depreciation in the valuation of money is having on the Association, as on all other bodies and persons, together with a careful study of the Financial Statement and Estimate for 1920 will, the Council believes, convince members that ordinary prudence demands that the subscription to the Association be raised. During the coming year expenses of every kind, already abnormal, will almost certainly increase, and with an estimated deficit of over £3,000 on the year's working for 1920, it seems clear either that the subscription must be increased or that the Association must face the possibility of having to curtail its work. The latter alternative will, the Council is certain, be at once rejected by the members.

The Council therefore recommends:—

Recommendation.—That the A.R.M. 1920 amend By-law 11 of the Association to read as follows:—

SUBSCRIPTION.

Amount.

11 (1). On and after the 1st of January, 1921, and except as hereinafter provided, the Annual Subscription to the Association shall be:—

(a) For a Member resident in any part of the United Kingdom—Three Guineas.

(b) For a Member resident elsewhere—Two Guineas.

Provided as follows:—

(c) In the case of a Member resident in the United Kingdom and admitted before the expiration of two years from the date of his registration under the Medical Acts, the Annual Subscription shall be One and a-half Guineas until the 31st of December next occurring after the expiration of the period of four years from the date of such registration.

(d) A Member admitted on or after the 1st of July in any year shall pay half his current Subscription for that year.

(2). For the purposes of this By-law a Member shall be deemed to reside in that place in which his ordinary place of abode is situate at the time at which according to the Regulations his subscription is considered due.

ROYAL COMMISSION ON THE INCOME TAX.

30. The appointment of a Royal Commission on the income tax afforded an opportunity of bringing to notice the inconveniences, due to complicated procedure in making returns, and the injustice frequently suffered by medical practitioners owing to the methods of assessment. A special Sub-Committee of the Finance Committee was appointed, and at its suggestion the Council requested the Treasurer (Dr. Haslip) to give evidence before the Royal Commission. The evidence in chief which he gave on behalf of the British Medical Association on October 9th, 1919, together with a note of the cross-examination, was published in the *British Medical Journal* of December 13th, 1919, page 783.

31. After pointing out the complications in the return for assessment of income-tax due to the introduction at various times of innumerable accretions, legislative and administrative, Dr. Haslip directed particular attention to a series of points:—namely, the objection to taking a three years' average for professional income; the injustice of the Inland Revenue's refusal to recognise depreciation allowances for motor cars, x-ray and other apparatus; the absence of any provision for granting an allowance in respect of depreciation of wasting assets; the inequality of the deduction allowed in respect of the rent of a dwelling-house used partly for professional purposes; the inconvenience due to the joint assessment of partnerships; and the inadequacy of the relief in respect of children. The report of the Royal Commission deals with all these matters and it is apparent that the Commissioners attached great weight to Dr. Haslip's evidence and considered fully all the points he raised.

32. On the first point, relating to the three years' average, the Commissioners state that they have no hesitation in recommending that a change should be made and the three years' average replaced by an assessment based on the previous year's income. With regard to depreciation allowances for cars and apparatus, the Commissioners observe that while "a business man is allowed a deduction for the depreciation of a motor car employed in his business a doctor whose practice may equally necessitate the use of a car is not entitled in law to any such

deduction." They recommend that the allowance should no longer be restricted to traders. With regard to wasting assets, for which the present income tax law makes no allowance the Commissioners lay down the principle that an allowance should be made for "inherently wasting material assets" where the anticipated life of the asset does not exceed thirty-five years. With regard to deduction to be allowed from the rent of a house partly used for professional purposes the Royal Commissioners advise that the general limitation to a sum not exceeding two-thirds of the annual value or rent should be retained, but that the Income Tax Commissioners should be empowered to grant a larger allowance in special circumstances where the application of the general rule would result in hardship, as in cases where a medical man is compelled for the purposes of his practice to reside in an expensive neighbourhood. The Commissioners recognise the validity of the objections made to the joint assessment of partnerships; they express the opinion that while the profits of the partnership as a whole should still be returned in one sum by the precedent acting partner and that he should be responsible for showing how this profit is divisible among the partners, it should be open to any partner to claim that his share of the partnership profits should be separately assessed, so that his private concerns may no longer be known to his fellow partners. In this way the Association's objection is met in substance, although the Commissioners advise that the Crown should retain the right to recover from a firm tax due from an individual partner—a contingency not likely often to arise. With regard to the relief in respect of children, the recommendations of the Commissioners are in the direction desired by the Association. The income limit is to be abolished and the allowance to be treated as a deduction from the gross income so that the rate of tax would be determined by reference to the amount of income left after the allowances had been made. The recommendations would carry relief in respect of children to ranges of income to which it is at present denied.

33. The Association is much indebted to the Special Committee, which had assistance from the Editor, but especially to Dr. Haslip for the pains he took in preparing and presenting the case for the remedy of grievances under which members of the profession have long suffered. The profession as a whole is to be congratulated on the results of the action taken on its behalf by the British Medical Association.

MANAGEMENT OF THE HEAD OFFICE.

34. Last session the Council, taking advantage of many changes which were occurring in the staff of the Association, appointed a small Committee to consider and report on the possibility of improvement of the arrangements under which the work of the Association in the Head Office is carried on. As a result of the report of this Committee the Council has appointed a permanent Committee called the Office Committee for the general administration and co-ordination of the work of the office. It consists of the Chairman of Council, Chairman of Representative Meetings and the Treasurer, together with the Editor, the Medical Secretary and the Financial Secretary and Business Manager.

35. The Committee serves a double purpose. By meeting frequently and having on it the chief Executive Officers of the Association and the chief officials, it acts as a sort of Board of Directors, dealing with questions which require prompt action and cannot wait for the meeting of a Committee or the Council (a function formerly carried out by the Chairman of Council), and it co-ordinates the work of the different departments of the Office. In view of the special nature of this work the Council decided that those members of the Committee who are not members of the Staff should be paid £5 5s. for each attendance.

36. It began its operations on July 30th, 1919, and has already proved exceedingly useful. Amongst other things, it has dealt with the condition of the office building, and has recommended certain alterations and improvements which are being carried out. For example, a great improvement has been made in the lighting of the Council Chamber and proposals are now under consideration for improving the Entrance Hall and utilising a part of the basement which has hitherto stood empty, partly as a store room and partly as a canteen for the office staff. The Committee also, at the request of the Finance Committee, drew up the new scale of salaries for the clerical staff to meet the new economic conditions, which the Council has adopted, as previously described.

37. The Committee also arranged for the devolution of the work of the Medical Secretary, the necessity for which had been evident for some time but which it was not possible to carry out until the end of the War allowed the provision of a full staff. As a result of this scheme the whole of the Com-

mittee work in the Medical Department is now distributed among the Deputy and Assistant Medical Secretaries, except the Secretaryship of the Council and of the Office Committee, which remain in the hands of the Medical Secretary. Much of the routine work hitherto carried on by the Medical Secretary has been transferred to others, thus leaving him free for supervision and more outside work.

Appointment of Deputy Medical Secretary.

38. Dr. G. C. Anderson of Methil, Fife, Secretary of the Fife Branch and a very experienced and active worker for the Association, was in September last appointed Deputy Medical Secretary in the place of Dr. James Neal now Secretary of the Medical Defence Union.

INTELLIGENCE DEPARTMENT.

39. Arising out of the suggestions of the Committee referred to in paragraph 34, an Intelligence Department has been created which is under the control of the Office Committee. The duties of this department are (a) to collect, record and supply information affecting the work of the Association (other than scientific), and (b) to conduct inquiry and research on any subject indicated by the Council, or a Committee, or the Editor or Medical Secretary (always excluding scientific subjects). The collection of this information has entailed the setting up of a press-cutting agency, which is proving exceedingly useful in enabling the office to keep in much closer contact with the press on questions of medico political importance.

40. It is not intended that the Department shall supply information to individual members but only to the Editorial and Secretarial Staff, which, of course, will pass it on to the Council, Committees, or individual members as may be required. The Council believes that the new department will be of great service to the Association and, indeed, it has already proved its usefulness. The Council was fortunate in securing as head of the department Miss A. L. Lawrence, M.B.E., who had previously proved her suitability for the post by the excellent work she did in connection with the Central Medical War Committee.

STAFF COMMITTEE.

41. An interesting development is to be reported in the formation of a Staff Committee composed of representatives of the clerical and printing staff. It arose out of the desire of the Office Committee to ascertain whether the staff considered the proposals for a new scale of salaries satisfactory. The staff, on having this question put to them, with businesslike promptitude formed a Provisional Committee and presented a report which proved most useful, and the Office Committee was able to accept practically all its suggestions. The Provisional Committee suggested the formation of a permanent Staff Committee, which request the Council granted, as not only are there many domestic matters affecting only members of the staff which might usefully be dealt with by a representative Committee, but every now and then questions arise on which it is necessary or desirable for the Council to have the opinion of the staff, e.g., the new Superannuation Scheme and the establishment and control of the proposed staff canteen. The Council is glad to acknowledge the help it has had from the staff in dealing with matters in which their co-operation is so essential, and has every reason to believe that the new scale of salaries, the proposed new Superannuation Scheme, and the staff canteen, will all tend to make the staff more contented with their position and prospects and even more interested than before in the welfare of the Association.

Organisation.

SPECIAL SUBSCRIPTIONS TO BRANCHES NOT IN UNITED KINGDOM.

42. The Council has considered a request made by the Australian Federal Committee, which represents all the six Branches of the Association in Australia, for such an alteration of By-law 15 of the Association as would give to each Oversea Branch full power to determine for itself, independently of the Council, what the amount of any special Branch subscription, additional to the ordinary subscription to the Association under By-law 11, should be. Realising that in some cases the circumstances of the Oversea Branches, and the cost of their work, differ materially from those in the United Kingdom, the Council is of opinion that the proposal of the Australian Federal Committee is a right and proper one, and should be given effect.

The Council recommends:

Recommendation.—That the A.R.M., 1920, amend By-law 15 of the Association to read as follows:—

"SPECIAL SUBSCRIPTIONS TO BRANCHES NOT IN THE UNITED KINGDOM.

15 (1) It shall also be competent for any Branch not in the United Kingdom, by Rule (approved as hereinafter mentioned), to require each member of such Branch to pay (in addition to his subscription to the Association and to any such special subscription) an annual subscription of such amount as may be deemed by such Branch to be necessary for defraying expenses occasioned by the special circumstances of such Branch, and not capable of being defrayed out of any grant from the funds of the Association made in pursuance of the By-laws.

(2) No such Rule shall have effect unless and until it shall have been approved by the Branch in accordance with the following provisions.

(3) Approval by the Branch may be given by a majority of not less than three-fourths of the Members present and voting at a General Meeting of the Branch specially convened to consider the proposed Rule, of which Meeting not less than twenty-one days' notice shall have been given to all the Members of the Branch."

QUESTION OF POSSIBILITY AND DESIRABILITY OF TAKING FURTHER POWERS UNDER THE CONSTITUTION OF THE ASSOCIATION WHEREBY IT MIGHT BECOME IN PART A FEDERATION OF MEDICAL BODIES.

43. The question of the desirability of taking further powers under the constitution of the Association whereby it might become a federation of medical bodies has, within the last few years—

(a) been raised by or arisen in respect of certain Branches or areas of the Association.

(b) been raised independently by resolutions of the Representative Body.

(A) QUESTION AS RAISED BY CERTAIN BRANCHES AND AREAS.

(i.) *By certain Australian Branches and by the Australian Federal Committee.*

44. The Australian bodies which have raised the question have been:—the Victorian Branch in 1893, the New South Wales Branch in 1895, the South Australian Branch in 1913, the Queensland Branch in 1914, and the Australian Federal Committee (a body formed with the approval of the Council of the Association in 1914, representing all the six Branches of the Association in Australia), in 1918.

45. The question raised by the four Branches named was not specifically that of the Association becoming a federation, of which its Branches would become federating units, but the cognate question of these respective Branches becoming each an incorporated body. The New South Wales Branch did in fact, in 1894, incorporate itself under the law of New South Wales. Upon that fact coming to the knowledge of the parent body, the position thus created was made the subject of a special agreement between the new body and the Association.

46. The main reason put forward by the Branches for asking for the permission of the Association to incorporate themselves was, stated briefly, that they would, as incorporated bodies, be in a position to carry out with much greater convenience and efficiency the work of the Association in Australia. In each case the Branch in question desired, although becoming an incorporated body, to remain a Branch of the Association. Such has, for practical purposes, been the case as regards the New South Wales Branch, neither the activities, efficiency nor loyalty of which have been in any way prejudicially affected by the fact that the Branch is, and has long been, an incorporated body. Counsel consulted in 1915 by the Council on the subject pointed out, however, serious legal and other difficulties, not up to then appreciated, such as might easily arise where a Branch of the Association became an incorporated body and attempted to remain at the same time a Branch of the Association. The Council drew the attention of the Branches in question to these difficulties, and, as a result, the proposals of the other Branches of the Association in Australia to become incorporated bodies remained in abeyance until 1918.

47. In that year the Council, as a result mainly of representations made to the Council by the President of the Australian Federal Committee (Dr. W. T. Hayward, C.M.G.), who was at that time in the United Kingdom and a Member of the Council, came to the conclusion, approved by the Representative Body in July, 1918, that efforts should be made to bring about a still more intimate and effective co-operation between the Oversea Branches and the parent body, based on the closest sentimental relationship, but with the loosest administrative bond. The Council therefore invited all the Oversea bodies of the Association to express their opinions on the subject.

48. Among the replies received, all of them helpful, and which have received the careful consideration of the Council,

was an important reply by the Australian Federal Committee, on behalf of the Branches in Australia, in August, 1918, to the effect, *inter alia* :—

(a) That the Branches in Australia should be given as free a hand as possible in managing their own affairs; and that their affairs should cover the whole range permitted by the Memorandum of Association.

(b) That special Articles of Association and By-laws should be adopted, determining the position of the Branches in Australia, and in particular :—

(i.) Authorising the Branches in Australia to carry out any or all of the objects for which the Association is established, as set out in Clause 3 of its Memorandum of Association.

(ii.) That the Branches in Australia should, if they so desired, register conjointly as a Company under Federal Statute, or separately as Companies in their respective States, such Company or Companies to be limited by guarantee and not for profit, and to have all the powers necessary for giving effect to the objects of the Association, including, *inter alia*, power to sue and be sued, to purchase and otherwise acquire real and personal property and to dispose of the same, to establish and conduct (all the Australian Branches conjointly) a Journal to be the official organ of the Branches, and to invest and deal with moneys not immediately required.

(iii.) That the Branches in Australia should have power to determine by vote of their members, and without the approval of the Council of the Association, the amount to be paid by their members by way of annual subscription (including the sum prescribed by the By-laws of the Association to be paid to the latter).

(iv.) That there should be provision for a Federal Council of the Association in Australia, consisting of representatives of the Branches, to carry out on behalf of the Branches collectively in Australia the objects of the Association, and generally to have the powers and duties sought to be given by the Branches in Australia to the Australian Federal Committee of the Association.

49. In response, the Council informed the Australian Federal Committee of the difficulties above referred to, sending the Committee a copy of the opinion obtained by the Council on the subject from Counsel in 1915, and full and free interchange of views has taken place. On behalf of the Branches in Australia, the Federal Committee has reiterated the hope that all such steps as may be practicable will be taken by the parent Association to give the Branches in Australia the fullest possible freedom in managing their own affairs, the Committee giving at the same time to the Council gratifying assurances of the strong desire of the Association in Australia to co-operate in the most cordial and intimate way with the parent body.

50. In this connection the Council draws attention to the proceedings of a meeting in connection with the Empire Parliamentary Association, reported in the *Times* of December 16th, 1919, at which Mr. Balfour emphasised the importance of an imperial policy such as would "increase unity of action and unity of sentiment" and not interfere with the "absolute autonomy of the great constitutional elements of this great community of nations." At the same meeting the Speaker of the House of Commons stated that progress had been made with the question of devolution; that it was hoped soon to submit to the House of Commons and the Country an actual scheme; and that, if that scheme were adopted, it would be the first stage towards the object which many at home and in the Dominions had in view, namely, a federation of the Parliaments of the British Empire.

51. It appears to the Council that these considerations apply also to the relationship between the Association and its Branches in the great self-governing Dominions. The Council thus came to the conclusion that as the desires expressed by certain Oversea Branches could not be met without the establishment of their practical independence, provision should, if possible, be made in the constitution of the Association whereby Branches of the Association in the Dominions which desired independence might obtain it, and be enabled to affiliate with the Association for such purposes as might be agreed upon in each individual instance, and that provision should be made at the same time for similar affiliation of independent medical associations elsewhere.

(ii.) *Question as raised by the Case of Ireland.*

52. As a result of a meeting representative of the whole of the medical profession in Ireland, including both members and non-

members of the Association (see Supplementary Report of Council, 1918-19, *B.M.J.* Supplement, July 5th, 1919, p. 8; and paras. 198-201 of this Report), the Council has lately had before it a proposal for uniting the Irish medical profession in one representative organisation, including the following suggestions made by an Irish deputation received by the Council in November 1919:—

- “(1) One medical body for all Ireland.
 (2) The name to be the Irish Medical Union or Association.
 (3) The members of the Irish Medical Union or Association to be honorary members of the British Medical Association, with the following privileges:—
- (a) Attendance at scientific meetings of the British Medical Association, including the Annual Meeting.
 - (b) The *British Medical Journal* (Irish News).
 - (c) The right to be enrolled as an ordinary member of the British Medical Association on taking up residence in Great Britain or the Colonies.
 - (d) Representation, without the right of voting, at the Annual Representative Meeting, and two representatives on the Council.
 - (e) Participation in scientific grants.
 - (f) Payment *per capita* for privileges requested (e.g. 21s. per head per annum).
 - (g) The new body to take over the finances of its own Central Offices, and Branch and Division expenses.
 - (h) The medico-political policy of the Irish profession to be decided by representative meeting summoned under the auspices of the Irish Medical Union or Association.”

53. The Council came to the conclusion that whereas the desires expressed by the medical profession in Ireland could not be met except by formation of an independent Irish Medical Union or Association (probably a Limited Company), provision should, if possible, be made in the constitution of the British Medical Association whereby such Irish Medical Union or Association might be affiliated with the British Medical Association for such purposes, and upon such terms, as might be agreed upon.

(iii.) *Question as raised by the Case of South Africa.*

54. A similar question has been raised by recent proceedings of the Witwatersrand Branch of the Association. That Branch had under consideration about the beginning 1919 the question of the attitude of the medical profession in its area, and South Africa generally, towards contract medical practice. The Branch came provisionally to the conclusion that, to deal effectively with the evils of contract medical practice as affecting the profession, there should be in South Africa an association of medical practitioners of a national character; that the Articles of Association of such a body could be drawn up in such a manner as to include the objects of a definite trade union; that a national medical association could expect to include in its membership “every medical man practising in South Africa”; that the proposed South African Medical Association might both be a learned body, bringing together its members for interchange of professional and scientific views, and a union for protecting the interests of the profession; and that, if such a body were formed, it might be possible to arrange “some sort of affiliation with the British Medical Association, though at present there was no machinery for such a purpose in the British Medical Association Articles.”

55. The attention of the promoters of the proposed new body was drawn to the fact that the work for which the proposed powers were desired was already being done by the British Medical Association throughout the Empire. The new body has been formed, but it is understood that many members of the British Medical Association in South Africa are exceedingly doubtful as to the wisdom of this duplication of organisations, and by no means convinced that the new Association can do anything the British Medical Association cannot do. None the less the Council came to the conclusion that, if possible, provision should be made in the constitution of the British Medical Association whereby it would be possible for such an outside body to federate or affiliate with the Association.

(B) QUESTION AS RAISED INDEPENDENTLY BY RESOLUTIONS OF THE REPRESENTATIVE BODY:

56. On the initiative of the Brighton Division, the Representative Body already, in 1914 and 1915, had under consideration the question of the Association becoming also a federation for other medical bodies. Owing however to the War, effective consideration of the resolutions of the Representative Body on the subject had necessarily to be postponed. The Council has now given careful consideration to the broad principles involved therein. The resolutions in question were as follows:—

Annual Representative Meeting, 1914.

Minute 81.—Resolved: That it be referred to the Council to consider what alterations and additions to the Articles and By-laws and in the organisation of the British Medical Association in the United Kingdom would be necessary to allow of its becoming also a federation for other medical bodies formed to safeguard the interests of one or more sections of the medical profession, while allowing all such bodies to continue their separate existence, and to issue a report on the whole matter to the Representative Body.

Annual Representative Meeting, 1915.

Minute 47.—Resolved: That the Representative Body is of opinion, on the legal advice the Association has formerly received, that it is impossible for the Association so to extend its objects as to become in any manner a federation of medical societies.

Minute 48.—Resolved: That the Representative Body would welcome any constitutional method whereby the Association, without interference with its own self-government, could come into closer relationship with other societies formed to safeguard the interests of any sections of the medical profession.

Minute 49.—Resolved: That the Representative Body approve the principle of the Council adding to any Standing Committee of the Association a Member of the Association nominated by any society formed to safeguard the interests of any section of the profession which desires to become more closely associated with the Association and to work in closer co-operation with it, and instructs the Council to prepare drafts of the necessary alterations in the By-laws to carry this into effect.

Minute 52.—Resolved: That the Council be instructed to call into conference with itself certain other societies referred to in Minute 48 of this Meeting, with a view to determining how it might be possible to come into closer relationship with such other societies, and report to the next Annual Representative Meeting with drafts of the necessary alterations in the Articles and By-laws if any.

57. Minutes 47-52 of the Annual Representative Meeting 1915, quoted above, resulted from the consideration and approval by that Meeting of a report and recommendations of the Council as to the above Minute 81 of the Annual Representative Meeting, 1914. That report, and a previous report on the subject by the Representative of the Brighton Division, were published in the Annual Report of Council, 1914-15, (*B.M.J.* Supplement, May 8th, 1915, p. 198).

58. As regards the opinion stated in the above Minute 47 of the Annual Representative Meeting, 1915, the Association did not in 1915 take legal advice *ad hoc* on the question as then raised. In its recent consideration of the whole subject accordingly on behalf of the Council, the Organisation Committee, which has had the help of the Scrutiny Sub-Committee mentioned in para. 64 of this report, came to the conclusion that it was advisable to ascertain definitely from Counsel whether it was in fact “impossible” for the Association to become a federation of medical bodies.

59. It will be noted that the Minutes of the Representative Body, quoted above, raise the question of federation from a different aspect to that raised in Australia, Ireland and South Africa, for while as regards these areas the question is raised of the possible federation or affiliation of bodies representing the medical profession as a whole in parts of the British Empire overseas, the Minutes of the Representative Body raise the question of the possible affiliation of medical bodies representing the interests of sections of the profession, whether in the United Kingdom or elsewhere.

CASE SUBMITTED TO COUNSEL, FEBRUARY, 1920.

60. The Organisation Committee accordingly submitted to Counsel (Messrs. C. E. E. Jenkins, K.C., and T. R. Colquhoun-Dill), in February 1920, by instruction of the Council, a case dealing exhaustively with the question of federation, as the matter presented itself to the Association. Counsel were asked to advise as to what, if any, modification of the constitution of the Association could be made with a view to providing conditions, whether by “federation,” “affiliation” or any other method, whereby an Oversea Branch, an incorporated body such as the one in Australia, such a body as those suggested for Ireland and South Africa, a scientific society representing the medical profession, or a medical body representing the interests of a section of the profession, could retain or secure such an amount of connection with the British Medical Association as would on the one hand give such Branches or bodies the

power and prestige which come to them from a definite, even if loose, association with the Association, and on the other, not prejudice the position of the Association, the present organisation of which is co-extensive with the Empire. In the case forwarded to Counsel, the fact was emphasised that what was especially in the mind of the Association in raising the subject was the desirability, and indeed the urgency, of giving to such Oversea Branches as desired it the utmost freedom, consistently with that close and effective co-operation between the Oversea bodies and the parent Association which all desired to safeguard, of managing their own affairs.

OPINION OF COUNSEL.

61. As a result there has been received the appended joint opinion of the Counsel named, dated March 6th, 1920 (see Appendix III.). As will be seen therefrom, Counsel are of opinion that it is possible so to take further powers under the constitution of the Association that it would become in effect a federation of medical bodies without abandoning its present position as an Association of individual members of the medical profession. Counsel are of opinion that the change can be effected without alteration of the existing Memorandum of Association.

PROPOSALS OF THE COUNCIL.

62. It appears to the Council that the joint opinion thus received warrants the Association in taking steps for alteration of the Articles and By-laws of the Association accordingly. The Council therefore recommends that the Representative Body authorise that the proposal contained in the joint opinion of Counsel be carried out, in such a way as would enable the Association to welcome as members thereof, on the new basis, those Oversea Branches which have already expressed, or which may in the future express, by adequate majorities, a desire for the utmost possible freedom in managing their own affairs.

63. The Council also proposes that, at the same time, provision should be made in the Articles whereby certain other classes of bodies, such as those mentioned in para. 52 of this report, could similarly become members of the Association. Each case would necessarily require to be settled on its merits.

The Council recommends:

Recommendation.—That the Association take steps to obtain further powers under its constitution, on the lines indicated in the joint opinion of Counsel (Messrs. C. E. E. Jenkins, K.C., and T. R. Colquhoun Dill), dated March 6th, 1920, whereby the Association may, without abandoning its present position as an Association of individual members of the medical profession, become in addition a federation of medical bodies.

Recommendation.—That the Representative Body instruct the Council:

- (1) To arrange for there being held at an early date a conference of representatives of the Oversea Branches, especially the Branches in the Dominions, with representatives of the Association at home and with representatives of other bodies, if any, who in the opinion of the Council should be invited to such a conference, with a view to arriving, if possible, at a full agreement as to what should be the lines of the proposed new Articles and By-laws.
- (2) To report further as soon as practicable to the Representative Body on the subject, with, if possible, such draft alterations of the Articles and By-laws as the Council may suggest with a view to taking further powers under the constitution of the Association in the way proposed.
- (3) To arrange that the draft new Articles and By-laws shall *inter alia* :—

- (a) Define the classes of organisations to be admissible, whether directly or by means of nominees, to membership of the Association. Such classes to include any portion of the Association which may incorporate itself separately but also desire admission on the new basis; and to include also medical bodies outside the Association, and bodies representative of the allied professions, anywhere within the Empire.
- (b) Assign to the Representative Body the settlement of the general conditions of such membership, including decision as to what shall be the minimum numerical backing, within a body seeking to become such member of the Association, which shall render a request for such membership eligible for consideration.

- (c) Assign to the Council the duty of submitting to the Representative Body, with a view to such membership, the name of any body proposing, or proposed by the Council, to become such member of the Association.
- (d) Assign to the Representative Body the decision as to whether any individual body applying shall be admitted as such member of the Association, and if so upon what special conditions, if any, in the individual case.

MACHINERY OF THE ASSOCIATION.

64. The Council referred to the Organisation Committee Minute 167 of the Annual Representative Meeting, 1919, instructing the Council to make a scrutiny of the existing local and central machinery of the Association, with a view to discovery of any defects or deficiencies, and their correction, and to report with recommendations. Recognising the importance of the matter, the Organisation Committee has, with the approval of the Council, appointed a Special Sub-Committee to deal with it in the first instance. Sir Jenner Verrall, LL.D., who was a member of the Constitution Committee appointed by the Annual Meeting at Ipswich, 1900, is Chairman of the Sub-Committee. The Sub-Committee, which has already held 10 meetings, is reviewing systematically the constitution and machinery of the Association, and will in due course report to the Organisation Committee and the Council. The Council expects to report on the whole subject (which it will be observed is to a certain extent governed by any action that may be taken in regard to federation) to the Annual Representative Meeting, 1921.

MEMBERSHIP.

65. The following is a statement of the changes in the membership during the year December 31st, 1918, to December 31st, 1919, the figures for 1918 being given for comparison :—

(1918.)		(1919.)	
New members ..	703	New members ..	2,276

The Council regrets that through a mistake on the part of a temporary clerk, the membership figures given in the last Annual Report were overstated.

MACHINERY AS TO ARREARS OF SUBSCRIPTION.

66. The Council has given careful attention to the present By-law (13 (1)) dealing with the suspension from privileges of membership of members in arrears. At the present time a member who has not paid his subscription by the 31st December is, according to the By-law, suspended from all privileges of membership, and if at the end of the succeeding year his arrears are still unpaid, he ceases *ipso facto* to be a member. Members in arrears have in the past, however, been treated with a good deal of indulgence and have received the *Journal* and other privileges of membership for a good part of the second year of arrears.

67. The Council has come to the conclusion that the By-law had better be altered and, in its altered form, strictly carried out. The proposal is that a member whose subscription has not been paid on or before 31st December of the current year shall cease to be a member at the end of that year and that all privileges of membership shall be at once withdrawn; but that if he pays his arrears within three months he shall be reinstated without formal re-election.

The Council recommends:

That the A.R.M. 1920 amend By-law 13 (1) of the Association to read as follows:—

“Arrears of Subscription—Cessation of Membership.

- 13.—(1) If the subscription of a Member for any year shall not have been paid on or before the 31st of December in that year, he shall *ipso facto* (but save as otherwise provided by the Regulations and without prejudice to his liability to the Association) cease to be a Member as from that day. Provided that upon payment before the 31st day of March in the succeeding year of all subscriptions due from him he shall, if eligible, be restored to membership without re-election.”

"CURRENT NOTES."

68. The Council has arranged to include in "Current Notes" a larger number of the subjects being dealt with by the Association, whether locally or centrally. Members who wish to keep in touch with events in the medical world are recommended to look at the "Notes" each week.

HANDBOOK.

69. The Council is arranging that a fresh edition of the Handbook, to include the decisions of the A.R.M. at Cambridge, shall be published in October.

NEW DIVISIONS AND BRANCHES.

70. During the year, Essex, Norfolk and Suffolk Branches have, by request of the East Anglian Branch, been formed to take the place of that Branch. It is of great interest to note that the East Anglian Branch was the earliest Branch of the Association, having been formed in 1836. From first to last the Branch did a great work for the Association and profession, and has thus set an excellent example to the newly formed Branches. A Willesden Division of the Metropolitan Counties Branch has been formed. The Council has also formed a Nyasaland Branch of the Association, of area coterminous with the Protectorate of that name.

FREQUENT MEETINGS OF DIVISIONS.

71. The Council wishes to emphasise the importance of regular and frequent Division meetings, and urges that each Division should provide by its Rules for meetings being held at least every two months, on a fixed day (e.g. third Tuesday of each month, or of alternate months). The Council has prepared a Model Rule for the purpose. Copies will be sent to Division Secretaries on application.

VISITATION OF DIVISIONS AND BRANCHES.

72. Although it is not yet possible to give complete effect to the Council's instruction that a member of the central staff shall visit each Home Division at least once in two years, every effort is now being made to visit the Divisions frequently. Any Executive Committee desiring such a visit is cordially invited to communicate with the Medical Secretary, when every effort will be made to meet the convenience of the Division as regards date and other points.

DIVISION AND BRANCH REPORTS FOR 1919.

73. On April 1st there were 83 Home Divisions and 24 Home Branches which had not reported for 1919. The Council wishes to remind the Division and Branch Executives and the members generally, of the great importance of the Annual Reports, and to ask them to satisfy themselves that their Division or Branch is not a defaulter in this respect. Without such a report it is difficult, often impossible, for the Council to make a grant. The names of Divisions and Branches which have not reported by May 19th, will be published in the Supplementary Report of the Council.

GROUPING OF DIVISIONS FOR ELECTION OF REPRESENTATIVE BODY, 1919-20.

(a) Home Divisions.

74. The Council has grouped the Home Divisions in constituencies for election of Representatives, 1920-21, in the same manner as for 1919-20, except that the North Northumberland Division of the North of England Branch and the new Willesden Division of the Metropolitan Counties Branch have been made independent constituencies. The list of constituencies was published in the *British Medical Journal* Supplement of January 24th, 1920.

75. The Council desires to remind Members that it is entirely within the power of constituencies to elect their Representatives by postal vote.

(b) Oversea Divisions.

76. The Council has made each Oversea Division and Division-Branch an independent constituency in the Representative Body.

GROUPING OF BRANCHES AND CONSTITUENCIES FOR ELECTION OF COUNCIL.

77. Under the authority conferred upon it by Standing Order of the Representative Body (Annual Representative Meeting, Minute 149, 1919), the Council has grouped the Branches and Constituencies for election of the Council, 1920-21, in the same manner as for 1919-20, the new Essex, Norfolk and Suffolk Branches taking the place of the East Anglian Branch.

ANNUAL CONFERENCE OF HONORARY SECRETARIES OF DIVISIONS AND BRANCHES.

78. The Annual Conference of Honorary Secretaries of Divisions and Branches will be held at Cambridge, on Wednesday, June 30th, at 3.0 p.m. Honorary Secretaries have been invited to give notice of matters to be raised.

CONFERENCES WITH OTHER MEDICAL BODIES.

79. In response to a request by the Association of Panel Committees the Council invited the following bodies to a Conference to discuss common action:—the Medico-Political Union, the National Medical Union, the Medical Parliamentary Committee (now the British Federation of Medical and Allied Societies), the State Medical Service Association, the Medical Women's Federation and the Association of Panel Committees. Conferences were held of which a full report was published in the Supplement of February 21st, 1920.

80. The Council regrets that owing to the attitude taken up by the Medico-Political Union the Conferences were rendered futile and the results were very disproportionate to the time occupied. The report shows that the representatives of the Association went to the extreme limit of concession in order to try to arrive at some basis for common action, but the M.P.U. would be content with nothing short of what virtually amounts to the dropping by the Association of its medico-political activities, which it suggested should be handed over to the Union. The absurdity of such a proposal is manifest, seeing that the objects for which the Association was formed to promote include the maintenance of the "interests of the medical profession." The Council on receipt of the report decided that no useful purpose would be served by further action.

Science.

SCIENTIFIC WORK OF ANNUAL MEETING 1920.

81. Certain alterations have been made in connection with the arrangements for the scientific work of the forthcoming Annual Meeting of the Association at Cambridge. The Council has decided that the work of the Sections should be made more objective, clinical and laboratory demonstrations being made a strong feature of their programmes; that the Sections should work three hours in the morning and a minimum of at least two hours in the afternoon, the afternoon work being wholly demonstration as was the case at the meeting held in London in April, 1919; that any advance in specialties, especially those bearing on general medicine and surgery, and on general practice, should be brought to notice by way of demonstrations; that the three-day sections be limited to five, viz:—Medicine, Surgery, Physiology and Pharmacology, Neurology and Psychiatry and Pathology and Bacteriology; that single day sections be held in:—Obstetrics and Gynaecology; Tropical Medicine, Naval and Military Medicine, Electro-Therapeutics and Radiology, Medical Education, Medical Sociology, and Venereal Diseases. Encouraged by the experience of the Special London Meeting the Council believes that this new arrangement will infuse more vitality and actuality into the scientific proceedings.

B.M.A. LECTURES ON CLINICAL AND SCIENTIFIC SUBJECTS.

82. Advantage has been taken by several Divisions and Branches of the arrangements, inaugurated this year, whereby the services of skilled lecturers are provided at the cost of the central funds. Whenever a Division or Branch expresses a wish for a lecturer it is asked to state the name of the lecturer desired, and the subject it wishes the lecturer to deal with. These lectures are becoming increasingly popular, and the Council hopes therefore greatly to extend the system.

83. The following is the list of the lectures which have been given since the commencement of the scheme:—

Lecturer's Name.	Title of Lecture.	Division or Branch
Dr. T. Lewis, F.R.S.	"Remarks on the management of heart cases in general."	Sheffield Div.
Sir Thomas Horder.	"Preventive Treatment in Influenza."	Southern Br.
Sir Humphry D. Rolleston, K.C.B.	"The dyspeptic and other remote symptoms associated with the presence of gall stones."	Norfolk Br.
Dr. Bernard Hart.	"Modern Methods of Treatment in Functional Nervous Disorders."	Nottingham Div.
Dr. A. F. Hurst.	"New Views on the Pathology, Diagnosis and Treatment of Gastric and Duodenal Ulcer."	Tunbridge Wells Div.
Dr. T. Lewis, F.R.S.	"The nature and significance of Auricular fibrillation."	Greenwich & Deptford Div.
Dr. A. Blackhall- Morison.	"The Passive Mechanical Factor in Heart Disease: its influence and management."	Edinburgh Br.

Lecturer's Name.	Title of Lecture.	Division or Branch.
Sir Frederick Mott, K.B.E.	"The early symptoms and diagnosis of Diseases of the Spinal Cord."	Plymouth Div.
Lieut.-Col. R. McCarrison.	"Deficiency Diseases."	South Wales & Monmouthshire Br.
Dr. A. F. Hurst.	"Psychotherapeutics."	Bradford Div.
Mr. A. Fleming, F.R.C.S.	"Vaccine Therapy."	North Middlesex Div.

MIDDLEMORE PRIZE.

84. The Council has decided that the Middlemore Prize, the object of which is to promote the progress of Ophthalmic Science, shall be awarded this year for the best Essay on "Perimetry (inclusive of Scotometry), its Methods and its Value to the Ophthalmic Surgeon." The result of the competition will be announced in the Supplementary Report.

STEWART PRIZE.

85. The objects of the Stewart Fund, endowed by the late Dr. A. P. Stewart, of London, are, first and as a general rule the recognition and encouragement of important work already done, or of researches instituted and promising good results, regarding the origin and spread of epidemic disease; secondly, the periodic selection by the Council of the Association, or by a Committee appointed by it, of such person or persons as they shall consider exceptionally qualified to undertake and conduct the investigation of such question or questions connected with the subject of epidemic disease as shall appear likely to yield important results. The Prize usually takes the form of an Illuminated Certificate and a cheque for £50. The Council decided that the Stewart Prize shall be awarded this year, and it is hoped that the final decision will be made shortly so that it may appear in the Supplementary Report of the Council.

LIBRARY DEPARTMENT.

86. Arrangements have been made for the Library being kept open for an experimental period until 6.30 on ordinary week-days and till 2 p.m. on Saturdays. The Council is gratified to note the rapidly extending use which is being made of the lending department.

POLICY IN RELATION TO ADVERTISEMENTS OF DRUGS AND FOODS.

87. Important questions frequently arise as to the genuineness of the claims made on pharmacological and pharmaceutical grounds for preparations, advertisements of which are offered for insertion in the *B.M.J.* The Council has therefore arranged that all such questions shall be referred to the Therapeutic Sub-Committee, with power to carry out any needful investigations.

SALVARSAN, NEO-SALVARSAN AND OTHER ALLIED PRODUCTS.

88. The Council is of opinion that the position which obtains in this country, where no legal authority exists to enforce the testing of certain potent and dangerous chemical or biological products commonly used for hypodermic and intravenous injection, but not susceptible of standardisation by simple methods of analysis (e.g., Salvarsan and kindred products), is unsatisfactory. The Ministry of Health has accordingly been requested to rectify this anomalous position by such legislation or administrative action as will ensure for this country that control of these preparations which already exists in other countries, and which under special regulations existed during the war.

STATE GRANTS FOR SCIENTIFIC INVESTIGATION AND AWARDS FOR MEDICAL DISCOVERY.

89. A Conjoint Committee of the Association and the British Science Guild has for some time past been considering the whole question of rewarding discoveries in order to encourage medical and other scientific investigation, and to discharge a moral obligation incurred by the public which reaps the benefit of private effort. A deputation consisting of the members of this Committee along with the medical Members of the House of Commons were received by the Lord President of the Council, Mr. A. J. Balfour, M.P., on March 2nd, when the views of the Joint Committee were laid before the Minister by Sir Clifford Allbutt on behalf of the Association, and by Sir Richard Gregory and Sir Ronald Ross on behalf of the British Science Guild. The deputation was most sympathetically received (see Report in *Journal*, page 346, March 6th, 1920), and the Council now awaits the decision of the Government.

Medical Ethics.

PROFESSIONAL SECRECY.

90. The Council has given consideration to the question of professional secrecy, so far as this question relates to venereal diseases. It has been suggested that, so far as these cases are concerned, there is a certain shifting of opinion regarding the established ethical principle that a medical man must not disclose the nature of a patient's disease to anyone else, except with the patient's consent.

91. In 1915 the Council went fully into the general question of professional secrecy, and was informed by the solicitor that apart from State Officials, such as Ministers of the Crown, Judges of the High Court, and others placed in positions of more or less supreme importance, the only class of persons who were enabled to claim to hold as absolutely inviolable from obligation to disclose statements made to them involving matters of criminal import or otherwise, were solicitors and barristers and ministers of religion. The solicitor went on to say that so far as the medical profession was concerned no such universally recognised protection attached to statements made to them by a patient, but that there was admittedly a certain degree of professional secrecy recognised as being associated with such statements, although a conflict of authority upon the decided cases prevailed as to the extent to which this could be carried. As a result of its consideration of this subject at that time the Council expressed the opinion:—

"That a medical practitioner should not under any circumstances disclose, voluntarily, without the patient's consent, information which he has obtained from that patient in the exercise of his professional duties."

92. As regards the alleged shifting of opinion on the subject, the Council understands that some medical men hold the opinion that the above-named ethical principle does not apply to the same extent where the patient is suffering from venereal disease. For instance, it has been suggested that in the case of married people, when one partner is found to be suffering from venereal disease, the other has a right to be informed of the fact. Similarly, it has been urged that where a domestic servant in a household comprising children is found to be suffering from this disease the employer should be informed.

93. The Council is of opinion that, from the legal aspect, a claim could not be made that an obligation rests upon the medical man in such instances to disclose the confidence of his patient without the patient's consent, seeing that no protection is afforded him from legal consequences that may arise from his so doing. Apart from this, the Council is strongly against any relaxation of the immemorial tradition of the profession that the confidence of a patient must be regarded as sacred. Any relaxation of the kind, whether in respect of venereal disease or any other disease, must tend to deter the public from consulting medical practitioners in cases where it is necessary, in the interests of the community as well as of the individual, that they should do so.

94. The Council is of opinion that it would be advisable that the Representative Body should repeat the opinion expressed by it in 1915:—

Recommendation.—That the Representative Body express the opinion:

That having considered the question of professional secrecy, more particularly with regard to venereal disease, the Representative Body reiterates the opinion that a medical practitioner should not, under any circumstances, disclose, voluntarily, without the patient's consent, information which he has obtained from that patient in the exercise of his professional duties.

THE PROFESSION AND ITS ATTITUDE IN RELATION TO SECRET REMEDIES.

95. The Council has recently had reported to it the circumstances concerning a Patent Medicine, the composition of which was not disclosed. Investigation showed that the remedy had been tried and recommended by a large number of registered medical practitioners. It would appear, therefore, that the profession does not generally appreciate the principle that it should not prescribe or use remedies the composition of which is not known to them.

96. It is well to remember that a Select Committee of the House of Commons went carefully into this question in 1914, and, guided largely by the Association's evidence, and on the strength of the Association's two books "Secret Remedies" and "More Secret Remedies," made recommendations including *inter alia* (i) the compilation of a register of manufacturers of secret and proprietary remedies, every such person to file an exact and complete statement of the ingredients of these

remedies with the Department which is to be set up to control the traffic; (ii) the institution of a Special Court or Commission with power to permit or prohibit, in the public interest, the sale and advertisement of any patent, secret, or proprietary remedy; (iii) the empowering of a Department to require the name and proportion of any poisonous or potent drug forming an ingredient of any remedy, to be exhibited on the label and the advertisement; (iv) the prohibition of sale (except the sale by a doctor's order) of medicines purporting to cure certain diseases.

97. The Representative Body decided in 1915 that the Association should endeavour to get legislation introduced which would embody the recommendations of the Select Committee on Patent Medicines, and the Medical Committee of the House of Commons has already been asked for its assistance to this end. It is believed that the Ministry of Health will shortly introduce a Bill on this subject, and the Association will naturally take a prominent part in the campaign that will undoubtedly follow. The Council is of the opinion, therefore, that the attitude of the organised profession on this subject should be stated quite definitely, and made public.

The Council recommends:—

Recommendation.—That the Representative Body express the opinion:

That a registered medical practitioner should not make use of, or recommend, any remedy of the composition of which he is not aware.

REVISED ETHICAL RULES.

98. There is still a number of Divisions and Branches which have not adopted the Revised Ethical Rules, as approved by the Representative Body 1919. The Council desires to remind those Divisions and Branches which have not yet done so that, so far as ethical matters are concerned, they are quite helpless. They will not be able to make use of the "Important Notice" in the *Journal* if need should arise locally, they will be unable to deal with any ethical dispute which may arise locally, for the settlement of which members would naturally turn to the Division; and by not placing themselves in the same position as other Branches and Divisions as regards Rules, they create a breach in the solidarity of the Association which is to be deprecated. The Council urges those Divisions and Branches which have not yet adopted the Revised Rules, to do so as soon as possible.

POWERS OF DIVISIONS AND BRANCHES IN RELATION TO MEDICAL APPOINTMENTS.

99. The Council, in consultation with the Solicitor, has prepared and is issuing a Memorandum of Instruction to Divisions and Branches, as to the powers exercisable by them in relation to medical appointments, and the procedure to be adopted in connection with the insertion of an "Important Notice" in the *Journal*.

Ministry of Health.

APPOINTMENT OF COMMITTEE.

100. The Council reappointed a Ministry of Health Committee for the purpose of considering and reporting from time to time what should be recommended to the Minister of Health as being the ideal system of medical and allied services which would receive the support of the profession and towards which the Government should work. Subsequently all members of the Association who were members of the Medical Consultative Council of the Ministry of Health and not already members of the Committee, were invited to become members thereof. With one or two exceptions where pressure of other work prevented acceptance of office on the Committee, the invitation was accepted, and it is believed that the free exchange of opinion which has taken place has been very useful in the elucidation of the difficulties which present themselves in any discussion of the reconstruction of the health service of the country.

MEDICAL CONSULTATIVE COUNCIL.

101. Dr. Addison on July 7th asked the Association to nominate ten persons who would be specially suitable if appointed by him to serve upon the Medical and Allied Services Consultative Council of the Ministry of Health. The Council had, in anticipation of some such request as this, previously selected thirty names which were approved by the Council at its meeting on June 25th, 1919. It therefore became necessary to cut down the thirty to ten, and accordingly the names of the following ten practitioners were forwarded to the Minister of Health as those selected by the Association for appointment upon the first Medical Consultative Council under the Ministry of Health:—Dr. T. Ridley

Bailey (Bilston, Staffs.), Dr. H. B. Brackenbury (Stroud Green), Dr. C. Buttar (Kensington), Major-General Sir Bertrand Dawson, G.C.V.O., C.B., R.A.M.C., T. F. (Marylebone), Dr. C. E. S. Flemming (Bradford-on-Avon), Dr. T. W. H. Garstang (late Altrincham), Dr. G. E. Haslip, (Westminster), Dr. J. A. Macdonald, LL.D. (Taunton), Mr. E. B. Turner (Kensington), Sir T. Jenner Verrall, LL.D. (Bath).

102. At a later date the Chairman of Council decided that for the information of the Minister the whole of the 30 names originally selected should be sent in, accompanied by a full statement of the qualifications which led the Association to submit the names, and this was done.

103. The following is the list of the members of the Council of Medical and Allied Services which will deal with the extension of medical, nursing and midwifery work:—Lord Dawson of Penn (Chairman), Col. C. J. Bond (Leicester), (Vice-Chairman), Mr. Norman G. Bennett, LL.D.S., Eng. (British Dental Association), Professor R. A. Bolam (Newcastle-on-Tyne), Dr. Victor Bonney (Chelsea Hospital for Women), Professor T. E. Hill (Durham), Professor F. Gowland Hopkins (Cambridge, Official Analyst to the Home Office), Miss M. H. F. Ivens (Liverpool), Dr. Janet E. Lane-Clayton (King's College for Women, London), Dr. A. Linnell, (Northamptonshire), Dr. H. G. Dain (Birmingham), Dr. A. Fulton (Nottingham), Sir William S. Glyn-Jones (Secretary, Pharmaceutical Society), Dr. T. A. Goodfellow (Manchester), Dr. G. E. Haslip (Treasurer, British Medical Association), Dr. J. A. Macdonald (Taunton), Mr. E. W. Morris (Secretary, London Hospital), Dr. John Robertson (Birmingham), Dr. T. W. Shore (St. Bartholomew's Hospital), Professor Sir William Tilden, F.R.S.

Fifteen of the above are Members of the Association.

104. A communication was received from the Minister of Health dated 6th October, expressing his appreciation of the readiness with which the Association assisted him in the exercise of his responsibility for the appointments, and stating that the statements with which the Association had been so good as to furnish him had not only been of considerable value in enabling him to determine the original membership of the Council, but would also, he anticipated, be of service in the application of the provisions of Article 3 of the Order which relate to the periodical variation of the composition of the Councils, and of the provisions of Article 9, which enable Committees of a Council, including persons who are not members of the Council, to be appointed for the consideration of matters in relation to which it may prove requisite to supplement the special knowledge and experience possessed by the members of a Council themselves.

NATURE OF MEDICAL PROVISION TO BE MADE BY THE STATE.

105. The Committee has given considerable time and attention to the consideration of the question of the nature of the medical provision which should be made for the community or parts of it, and has had the benefit of the advice of various members of the teaching staffs of voluntary hospitals who attended one of its meetings to assist in the discussion of this subject. The President of the Royal College of Physicians, London, and the President of the Royal College of Surgeons, England, kindly assisted by inviting the attendance of certain hospital physicians and surgeons. It is not expedient to state the decisions of the Committee thus far arrived at, which of necessity are only of a provisional nature, and which will have to be considered in the light of the Interim Report of the Medical Consultative Council which is expected to be issued shortly; but it is hoped that a complete memorandum on this subject will be available for early issue to the Divisions.

Medico-Political.

TREATMENT OF SCHOOL CHILDREN AND MATERNITY AND CHILD WELFARE CENTRE FEES.

106. Arising out of consideration of the following Minute of the Annual Representative Meeting, 1919, and of requests from Divisions that certain fees should be fixed centrally, the Council is of opinion that the time has now arrived when the fees for the treatment of school children should be fixed centrally, and not locally as decided by the A.R.M., 1915.

Minute 93.—Resolved: That in view of the fact that the purchasing power of the sovereign has been reduced, and is not likely in the near future to be greatly increased, it be an instruction to the Council to reconsider the salaries and fees approved of from time to time by the Representative Body for medical services, and to take all possible steps to have these adjusted proportionately.

The Council recommends:

Recommendation.—That the following fees for the treatment of school children be approved:—

- (i) For treatment of minor ailments, two guineas per session of not more than 2½ hours;
- (ii) For private practitioners doing ophthalmic work involving refractions, 10s. 6d. per case, or where cases are seen at clinics, three guineas per session not exceeding 2½ hours, in which not more than eight new cases shall be seen;
- (iii) That a fee of not less than one-and-a-half guineas per case (including anaesthetist's fee) be paid for adenoid and tonsils operations, involving a general anaesthetic;
- (iv) That the fee for other operations on eye, nose, ear and throat cases should be specially arranged for at a higher remuneration;
- (v) That the fee for X-ray treatment for ringworm be three guineas per completed case where the practitioner provides his own apparatus, but where the apparatus is provided by the Local Authority, the fee to the practitioner should be two guineas;
- (vi) That the foregoing fees (i-v) be exclusive of any fee paid to institutions for maintenance, etc., of patients.
- (vii) That any local variation in the above terms, before being adopted, be submitted to the Council for approval.

CONTRACT RATES FOR UNINSURED PERSONS.

107. In view of the increase to 11s. per annum of the capitation fee payable to medical practitioners under the National Health Insurance Acts and the raising of the income tax limit for non-manual workers insured under the National Insurance Acts to £250, the Council is of opinion that the Representative Body should amend its Minute 141 of 1913.

The Council recommends:

Recommendation.—That Minute 141 of the Annual Representative Meeting, 1913, with regard to the fees for attendance on uninsured persons be amended by (i) the deletion of the words "that is 9s. per annum including medicines" at the end of paragraph (1) (b), and (ii) the substitution of £250 for £104 in paragraph I. (c), so that the resolution would then read as follows:—

That the Representative Body adopt the following principles as essential to the formation of any schemes for the provision of medical attendance and treatment of uninsured persons:—

- (1) That, in general in considering the necessity for obtaining the approval of the Council for schemes for the treatment of uninsured persons upon contract terms, the following principles and conditions must be adhered to:—
 - (a) Free choice of doctor by patient and of patient by doctor;
 - (b) Remuneration to be not less than that which is deemed by the Council to be equivalent to that paid in respect of insured persons;
 - (c) Persons with a total income from all sources of £250 per annum or upwards, or the dependents of any such person, not to be treated under contract terms at all.
- (2) That the Representative Body realises that the conditions in certain areas will not allow of the above terms being obtained, and that in these circumstances, the approval of the Council may be given provisionally to a scheme involving a less payment when the local profession can show that the economic conditions in the area demand it.
- (3) That one of the conditions necessary for the approval of schemes containing lower rates of payment shall be the inclusion amongst the rules, in a prominent position, of a statement that approval by the Association has been given to the rates only because of special economic conditions.

MINIMUM SALARIES FOR PUBLIC APPOINTMENTS.

108. In view of the depreciation in the value of money, which has led to the revision of salaries and wages in every branch of life, the Council feels that the time has come for the revision of the various minimum salaries laid down from time to time by the Representative Body. These salaries are for whole and part-time officers employed by public authorities, and their

reconsideration has been undertaken in co-operation with the Society of Medical Officers of Health. The result is the scale which appears below, and which demands very serious consideration by the Divisions and Representative Body.

109. The new scale is a great advance on the old minimum salaries approved by the Representative Body and on the salaries at present paid by most local authorities, but if carefully examined in the light of present-day conditions and compared with the salaries of other professional men employed by these authorities, such as lawyers, engineers, and surveyors, it will be found that they are not more than the doctors holding these positions have a right to expect if they are to maintain their professional position and bring up their families properly. Nor are the increases as great, proportionally, as have been given to some other municipal servants.

110. If this scale is approved by the Representative Body the Council proposes to ask a Joint Committee of the Association and the Society of Medical Officers of Health to take charge of the case for improvement in the salaries of medical officers in the Public Health services and to report to the parent associations as to any steps that may be necessary to this end.

The Council recommends:

Recommendation.—That the following scales of minimum salaries for whole-time Medical Officers shall include all emoluments attaching to the office and represent the value of the whole-time services of Medical Officers in the various classes indicated.

Recommendation.—That the following scales of minimum salaries are nett, any expenses necessitated by the duties being provided in addition.

Class I.—Whole-time Medical Officers of Health.

Recommendation.—That the minimum salary to be paid to any whole-time Medical Officer of Health be as laid down in the following scale:—

Population of Administrative Area.	Minimum Salaries.	
Up to 50,000 ...	£800, rising to £1,000 within a period of not more than 5 years	} With, in addition, Bonus according to the Civil Service Award in force for the time being.
50,001 to 100,000	£1,000, rising to £1,200 within a period of not more than 5 years	
100,001 to 200,000	£1,200, rising to £1,500 within a period of not more than 5 years	
200,001 to 500,000	£1,500, rising to £1,800 within a period of not more than 5 years	
Over 500,000 ...	£1,800	

Class II.—Whole-time Assistant Medical Officers of Health.

Recommendation.—That the following definition be adopted:—

Definition.—An Assistant Medical Officer of Health is a Medical Officer duly appointed as Assistant Medical Officer of Health by the Local Authority to assist the Medical Officer of Health in the general administration of the Health Department and the carrying out of the various Acts, By-laws, Orders, Rules, Regulations, etc., required to be or usually administered by the Medical Officer of Health; the title Assistant Medical Officer of Health to be limited to Medical Officers carrying out these general duties.

Recommendation.—That the minimum salaries of Assistant Medical Officers of Health be not less than £700, rising to £900 per annum within a period of not more than 8 years, with, in addition, a bonus according to the Civil Service Award in force for the time being.

Class III.—Whole-time Senior Medical Officers in Charge of Departments.

Recommendation.—That the following definition be adopted:—

Definition.—Senior Medical Officers in charge of Departments are Medical Officers directly responsible to the Medical Officer of Health or otherwise and having under their control one or more Medical Officers.

Recommendation.—That the minimum salaries of Senior Medical Officers in charge of:—

Port Sanitation,
School Medical Departments,
Tuberculosis Departments,
Mental Deficiency Departments,
Maternity and Child Welfare Departments,
Venereal Diseases Departments, or any other similar Department or combination of Departments,

be not less than £700, rising to £900 per annum within a period of not more than 8 years, with, in addition, a bonus according to the Civil Service Award in force for the time being.

Class IV.—Whole-time Medical Officers employed in Departments.

Recommendation.—That the following definition be adopted:—

Definition.—Medical Officers employed in Departments are Medical Officers without responsibility for the work of other Medical Officers.

Recommendation.—That the minimum salaries of Medical Officers employed in:—

Port Sanitation,
School Medical Departments,
Tuberculosis Departments,
Mental Deficiency Departments,
Maternity and Child Welfare Departments,
Venereal Diseases Departments, or any other similar Department or combination of Departments,

be not less than £500, rising to £750 per annum within a period of not more than 10 years, with, in addition, a bonus according to the Civil Service Award in force for the time being.

Class V.—Whole-time Medical Officers in Hospitals and Sanatoria.

(a) *Whole-time Medical Superintendent.*

Recommendation.—That the following definition be adopted:—

Definition.—A Medical Superintendent is a Medical Officer directly responsible to the Medical Officer of Health or otherwise and having under his control one or more Medical Officers.

Recommendation.—That the minimum salary be paid to any whole-time Medical Superintendent in charge of a Hospital or Sanatorium be as laid down in the following scale:—

No of Beds	Minimum Salaries per annum,	
Up to 250 ...	£700, rising to £900 within a period of not more than 8 years.	} With, in addition, Bonus according to the Civil Service Award in force for the time being.
251 to 500 ...	£900, rising to £1,100 within a period of not more than 8 years.	
Over 500 ...	£1,200.	

(b) *Whole-time Medical Officer.*

Recommendation.—That the following definition be adopted:—

Definition.—A Medical Officer employed in a Hospital or Sanatorium is a Medical Officer without responsibility for the work of other Medical Officers.

Recommendation.—That the minimum salary to be paid to any whole-time Medical Officer employed in a Hospital or Sanatorium of a Local Authority be £350 per annum, with, in addition, bonus according to the Civil Service Award in force for the time being.

Recommendation.—That where a number of Medical Officers are employed in a Hospital or Sanatorium, seniority be differentiated between any two successive medical officers by a salary difference of not less than £50 per annum, with, in addition, bonus according to the Civil Service Award in force for the time being.

Part-time Medical Officers.

Recommendation.—That part-time Medical Officers of Health be paid at the rate of £4 4s. per day according to the time devoted to their duties.

Recommendation.—That the remuneration of part-time Specialist or Consulting Officers be not less than £3 3s. per session not exceeding 2½ hours.

Recommendation.—That the scale of remuneration for part-time Senior Medical Officers of Clinics set up under schemes for the diagnosis and treatment of Venereal Diseases be the same as that laid down for part-time Specialist Officers.

Recommendation.—That the remuneration of all other part-time Medical Officers be not less than £2 2s. per session not exceeding 2½ hours.

General.

Recommendation.—That population means population at the latest Annual Report of the Registrar-General.

Recommendation.—That the number of beds be the number of beds for patients provided in the Hospital or Sanatorium.

Recommendation.—That no Medical Superintendent be rendered ineligible by reason of marriage and that sufficient room accommodation be provided.

Recommendation.—That existing Officers be placed according to the foregoing scales of Minimum Salaries as follows; (1) In the case of part-time appointments, the scale should be immediately applied in its entirety; (2) In the case of whole-time appointments the holder should immediately receive an increase of salary, and further increases should be arranged so as to place him in his appropriate place on the scale within a period of not more than three years.

Recommendation.—That no existing Officer be prejudicially affected by the operation of the foregoing scales of minimum salaries.

Recommendation.—That a conjoint Committee of the British Medical Association and the Society of Medical Officers of Health be formed to take charge of the case for improvement in the salaries of Medical Officers in the Public Health Services and to report to the Councils of the British Medical Association and of the Society of Medical Officers of Health as to any steps that may be necessary to this end.

FEEs FOR MEDICAL EXAMINATIONS FOR LIFE INSURANCE.

111. The Annual Representative Meeting, 1919 (Minute 180), directed the Council to consider and report on the question of fees for medical examinations for life insurance, a subject which has engaged the attention of the Association on many occasions during the past eighteen years and on which it has always been found impossible to obtain anything like agreement on a policy. The Medico-Political Committee has on this occasion fully discussed the matter with the Life Offices Association, a body representative of all British Life Insurance Companies. The agreed report of that discussion appeared in the B.M.J. Supplement, March 27th, 1920, and the Divisions have been asked to forward their opinions on it, in order that, if necessary, the subject may be dealt with in the Supplementary Report.

Industrial Offices.

Recommendation.—That the fee for medical examination for industrial insurance be 5s. (minimum) or 10s. 6d., according to the form of report asked for.

Intermediate Offices.

Recommendation.—That as regards Intermediate Offices, that is, the ordinary branch of industrial offices and ordinary offices which issue policies whose average amount is small (for example, ordinary branch of Prudential and the Provident Mutual Life), the minimum fee for medical examination be 10s. 6d. for policies up to and including £100, and 21s. if over £100.

Ordinary Offices.

Recommendation.—That as regards Ordinary Offices the fee for medical examination be 21s., whatever the amount of the policy.

"Thrift" Policies.

Recommendation.—That the fee for a medical certificate (without medical examination) for children proposed for "thrift policies" remain at 10s. 6d.

Existing Fees Not to be Reduced.

Recommendation.—That in no case shall any reduction be made in any existing fee for medical examination for life insurance.

Forms of Report.

Recommendation.—That no attempt be made to standardize the guinea form of report, as there are only slight differences between the forms already in use in most British offices.

Modification of Objectionable Forms.

Recommendation.—That representations be made to the Life Offices Special Committee as to the modification of those forms which are objectionable from the medical examiners' point of view.

112. The above proposals represent the following considerable improvements on the present position:—

(a) About 35 companies will pay a guinea for insurances of £100 which previously only paid 10s. 6d. Of these companies, 20 are still paying 10s. 6d. where the sum assured is under £300, and 7 pay 10s. 6d. where the sum is under £500.

(b) There will be no reduction in any of the existing fees, and some of the intermediate fees will be levelled up—that is to say, a 3s. fee would go up to 5s., and a 7s. 6d. fee would go up to 10s. 6d.

(c) The 2s. 6d. fee for small industrial insurances disappears altogether, and is replaced by a 5s. fee.

113. The Council has made strong representations in favour of a general increase on all the pre-war fees and suggested a 50 per cent. increase on the guinea fee, but this the life assurance offices have absolutely refused to grant. They consider that they have made a great concession by the raising of the 10s. 6d. fee to a guinea, and they state that they will strenuously resist any attempt on the part of the profession to obtain a fee higher than a guinea for what they call a normal examination. They will in the future, as in the past, continue to pay higher fees for exceptional cases.

DIAGNOSIS OF INFECTIOUS DISEASES.

114. Arising out of consideration of Minute 185 of the A.R.M. 1919, the Council recommends:

Recommendation.—That the suggestion in item 72 of the Agenda of the A.R.M., 1919, contained in the following Minute 185 of A.R.M., 1919, is not desirable:—

Minute 185.—Resolved: That the following items 71-75 of the Agenda be referred to the Council for consideration and action:—

72. Rider by Newcastle-upon-Tyne: That a fee of 2s. 6d. be paid for any specimens sent to bacteriological laboratories for diagnosis of suspected infectious disease, the above fee to include postage expenses.

DIRECT REPRESENTATIVES ON THE GENERAL MEDICAL COUNCIL.

115. The Council is pleased to report that the candidates selected by the Representative Body, namely, Prof. R. A. Bolam, O.B.E., (Newcastle-on-Tyne), Dr. J. A. Macdonald, LL.D., (Taunton), Mr. E. B. Turner, F.R.C.S., (London), and Sir Jenner Verrall, LL.D. (Bath), were elected as Direct Representatives on the General Medical Council. The Council, however, is not at all satisfied with the amount of interest taken in the election and with the want of appreciation shown by many members of the Association of the fact that the candidates were chosen by the Association and had a right to expect that the machinery of the Association would be used vigorously so as to secure a result creditable both to the Association and to the candidates. The Council has determined that in the next election the campaign of the Association shall be based more upon the methods by which Parliamentary elections are conducted, namely, the appeal to the individual voter; that more use should be made of meetings of electors to be addressed by the Association's candidates, and that more time should be taken over the campaign. At an appropriate time the new plan of campaign will be placed before the Representative Body.

INCREASE OF PRIVATE FEES.

116. Arising out of consideration of item 64 of the Agenda of the A.R.M., 1919, contained in the following Minute of the Annual Representative Meeting, 1919:—

Minute 180.—Resolved: That the following items 62-69 of the Agenda be referred to the Council for consideration and report:—

64. Rider by Sheffield and Rotherham, in connection with para. 102 of the Annual Report of Council (*B.M.J.* Supplement, May 3rd, 1919, p. 77): That owing to the increased cost of living and increased practice expenses this Meeting recommends that fees for medical atten-

dance should be raised by a minimum of 50% (fifty per cent.) on the pre-war standard and that the Divisions be notified to this effect.

the Council reports that in a circular dated November, 12th, 1919, it recommended the Divisions to urge the practitioners in their areas to increase their pre-war fees by at least 50 per cent. and it has reason to believe that this has been done in most areas. Opportunity was taken by the Head Office to promulgate the policy of the Association in the lay press, with very good results.

PART-TIME PRISON MEDICAL OFFICERS.

117. Representations have been made to the Home Secretary as to certain defects in the part-time Prison Medical Service. Officers in that Service have had no war bonus or improvement in their conditions and there is naturally great dissatisfaction among them. The Home Secretary was asked to receive a deputation, but declined to do so and asked for a statement of the grievances. A memorandum was accordingly sent containing the following suggestions for improvement: (a) that one guinea should be allowed for all reports as to the physical and mental condition of prisoners; (b) that a fee of two guineas should be paid for confinements in prison; (c) that there should be increase in pay, or at any rate a war bonus; (d) that provision should be made for someone to carry on the work during the annual holiday; and (e) that part-time Prison Medical Officers should have security of tenure. Several reminders have at last elicited the reply that the Home Secretary is in communication with the Treasury with reference to certain proposals regarding the remuneration of this Service and that he is not yet in a position to make a statement. The matter will not be allowed to rest.

REMUNERATION OF DOCTORS ACTING ON PENSIONS BOARDS.

118. Representations were made to the Ministry of Pensions (pursuant to Minute 147 of the Annual Representative Meeting, 1919), that the payment of doctors acting on Pensions Boards should be two guineas instead of one guinea per session, and a deputation saw the Minister on 4th September, 1919, as reported in the *B.M.J.* Supplement of 13th September, 1919. The Minister decided to increase the fee to 1½ guineas per session, with an additional fee of 5/3 per session to the practitioners acting as Chairmen of the Boards, but declined to seek authority for an increase in the fees payable to specialists. The Minister was thanked for the substantial advance in the fee to be paid to members of Pensions Boards, though it did not reach the figure which the representatives of the Association were instructed to ask for, and he was informed that the Association regretted the decision as regards the fees payable to specialists. The question of the fees to specialists has recently again been taken up and it is understood that the question of raising these fees is now under consideration.

FEES TO MEDICAL ASSESSORS TO MINISTRY OF PENSIONS.

119. As a result of representations made by the Association to the Ministry of Pensions the fee per session for Medical Assessors to that Ministry has been increased by 25 per cent. The Ministry justified the smaller increase (as compared with that given to the Pensions Boards) on the ground that assessors are virtually whole-time officers. The Sessional Medical Assessors have thanked the Association for the help given to them.

FEES FOR MEDICAL PRACTITIONERS CALLED IN BY MIDWIVES.

120. The Ministry of Health issued the following circular to Medical Officers of Health and to the Association for comments:—

"1. It has been represented to the Minister of Health that the scale of fees prescribed by the Local Government Board under Section 14 of the Midwives Act, 1918, for payments by local supervising authorities to doctors called in by midwives needs amendment in certain respects.

2. The present scale is as follows: £ s. d.

(1) Attendance at confinement requiring operative assistance and subsequent necessary visits during the first 10 days ... 2 2 0

(2) Attendance at confinement without operative assistance and subsequent necessary visits during the first 10 days ... 1 1 0

(3) Assistance for the administration of an anesthetic ... 1 1 0

(4) Any visit not covered by (1), (2) and (3), including any necessary prescription:—

Day (8 a.m. to 8 p.m.) ... 0 3 6

Night (8 p.m. to 8 a.m.) ... 0 7 6

with the addition of the mileage fee usual in the district.

3. The chief representations are (1) that it is undesirable to distinguish between operative and other confinements; (2) that a special fee should be prescribed for certain operations usually performed after the birth of the child for which the fees under (4) do not afford a sufficient remuneration, and (3) that in view of the rise in prices the fee for visits should be increased.

4. These points would be met by altering the scale to the following:—

	£	s.	d.
(1) Fee for all attendances at parturition (i.e. from the commencement of labour until the midwife leaves), whether operative interference or not is involved, including all subsequent visits during the period of confinement	2	2	0
(2) Fee for attendance of a second doctor to give an anæsthetic, whether at parturition or subsequently	1	1	0
(3) Fee for operative interference after parturition, i.e., suturing the perineum ...	1	1	0
(4) Fee for visits to mother or child not included in 1—3.			
By day	0	5	0
By night	0	10	0

The usual mileage fee of the district to be paid for all attendances under this scale.

5. Before proceeding to prescribe a fresh scale, however, the Minister would be glad to avail himself of the advice of Medical Officers of Health of local supervising authorities, who have now had a year's experience of the operation of the scale. I should be much obliged, therefore, if you would kindly furnish me with your observations on the scale proposed in para. 4, and at the same time with notes of any difficulties which have arisen in practice which are not met by this scale.

6. Any statistics which you are able to send for the year 1919 on the following points will also be useful:—

- (1) Number of cases in which a midwife has called in a doctor and total number of cases attended by midwives.
- (2) Causes for which a doctor has been called in in each case.
- (3) Number of cases in which the local supervising authority has recovered (a) the whole and (b) a part of the doctor's fee."

121. The following opinions were sent to the Ministry with a request that the Association would be glad to wait upon the Ministry by deputation in order to discuss the subject:—

(1) That the period of confinement should be considered to be ten days.

(2) That in para. 4 (1) the fee of £2 2s. is inadequate and should be £3 3s. to include the fee for suturing the perineum if the doctor has been called in during the labour.

(3) The visits for complications which extend beyond ten days but which have arisen during the ten days and out of confinement should continue to be paid for at the rates set out in paragraph 4 (4) and that the person responsible for paying those visits and attending the mother should be the doctor called in during the ten days on the advice of the midwife; but that if there has been no doctor during the ten days and the patient calls in her insurance practitioner, that practitioner should be responsible.

(4) If the patient is not an insured person, the patient should be responsible for the fees of the practitioner called in where the complication arises after ten days, and a doctor is called in and not the midwife; and that it be pointed out to the Ministry that there is apparently no State provision for this emergency.

(5) That the times inserted in paragraph 4 (4) should be:—

	s.	d.
By day (9 a.m. to 8 p.m.) ...	5	0
By night (8 p.m. to 9 a.m.) ...	10	0

(6) That in all cases it is desirable, where possible, that the fees should be paid directly by the patient to the doctor.

(7) That the fee for attendance at confinement should involve full medical responsibility for any attendance that may be necessary during ten days of the puerperium and that attendance at confinement should be interpreted to include cases where this begins for an immediately post-partum emergency.

The Council hopes that the deputation will be received in time for it to be reported upon in the Supplementary Report.

FEES FOR EXAMINATION OF RECRUITS FOR TERRITORIAL FORCE.

122. A considerable amount of correspondence has been received dealing with the question of the fee of 2s. offered for the examination of recruits for the Territorial Force. The Council has made representations to the Territorial Force Associations with a view to the fee for this examination being increased to 2s. 6d. per examination.

FEES FOR MEDICAL WITNESSES.

123. The Council has made representations that the fee for medical witnesses giving evidence in the Assizes, County Court and Petty Sessions, should be two guineas; that, where applicable, there should be an additional qualifying fee of £1 ls.; that medical witnesses should not be required to attend the opening of the Assizes but should, if possible, be given twenty-four hours' notice of the actual time when they would be required to give evidence. The fees for giving evidence in the High Courts are still under consideration.

SCALE OF DOCTORS' FEES IN WHITAKER'S ALMANAC.

124. The Council has considered the scale of doctors' fees which is published in Whitaker's Almanac, and is apparently often quoted as authoritative and has asked the publishers to amend that scale in accordance with the general increase in fees that has taken place.

WORKMEN'S COMPENSATION ACT.

125. Evidence was given by representatives of the Association before the Departmental Committee on the Workmen's Compensation Act on 22nd January, 1920. (See Appendix IV.) Arising out of the evidence given, the Departmental Committee asked for the opinion of the Association on the following matters:—

(1) Who should be responsible for the provision of specialist and institutional services for workmen under the Workmen's Compensation Act? Should the services be provided by the employer, by the Insurance Company, or by the State acting as agent for one or other?

(2) In what manner should the treatment of workers who are not entitled to medical treatment under the National Health Insurance Acts be provided?

In connection with the first question, the Council informed the Departmental Committee that it was of opinion that specialist services (that is those services which are outside the scope of ordinary competence and skill of a general practitioner) and further institutional treatment, should be provided for by the employer contracting through the State.

126. The reasons which influenced the Council in arriving at this decision, were as follows:—

(a) The provision of these extra services might be possible for a large employer of labour, but small employers would find it impossible unless by means of combination. It seems, therefore, to be more practicable for the State to set up some scheme whereby large and small employers alike could avail themselves of the opportunity of providing such services by contracting for these with the State.

(b) The provision of these extra services by the employer acting through an insurance company was not considered advisable, as the introduction of a party which must of necessity benefit financially by such provision cannot be in the interest of the employee.

(c) The State has already, through the Ministry of Pensions, set up a satisfactory scheme whereby such extra services and institutional treatment are provided in connection with the treatment of disabled soldiers and sailors.

127. The Council decided to take no action with regard to the second question asked by the Departmental Committee on the Workmen's Compensation Act. The subject is a complex one depending very largely on the proposals that may be made for reorganising the medical service of the country. It is felt that the question can best be discussed in connection with these proposals.

FEES PAID BY SEAMEN'S NATIONAL INSURANCE SOCIETY.

128. In response to repeated requests to raise their scale of fees in accordance with the general increase of private practitioners' charges, the Seamen's National Insurance Society agreed that all doctors attending its members should be paid a bonus, taking the form of an additional 20 per cent. on the total of their quarterly bills as from January 1st, 1919. The Society was informed that this was accepted under protest and without prejudice, but that a further addition for 1920 would need to be considered when the fee payable to practitioners under the National Health Insurance Acts as from April 1st, 1920, was settled. An offer has since been received of a 50 per cent. increase on the scale of fees, and this is now under consideration.

FEE FOR NOTIFICATION OF INFECTIOUS DISEASES.

129. The Ministry of Health in its circular No. 37 (dated 20th December, 1919) stated that the fee for notification of infectious diseases would revert to 2s. 6d. at the date of the termination of the war as fixed by Order in Council. The issue of that Order depends on many political considerations, some of an international nature, and no indication has yet been received when it is likely to be issued.

MOTOR CAR TAXATION.—MOTOR SPIRIT.

130. The Council is awaiting the issue of the proposals of the Government with reference to alterations in the method of motor car taxation, and will take whatever action seems to be necessary in the interests of the profession.

131. After consideration of the following rider by Cleveland Division, referred by the A.R.M. 1919 for consideration and action, the Council has found itself unable to take any action in the matter :—

74. Rider by Cleveland: That the Association take immediate steps to ensure that medical practitioners be able to obtain motor spirit at commercial rates.

STATE REGISTRATION OF NURSES.

132. The Council is glad to report that after many years of hard work a Bill for the State Registration of Trained Nurses has been placed on the Statute Book. The Bill promoted by the Central Committee for the State Registration of Nurses reached the Committee stage, but at this point Dr. Addison, in the hope of eliminating all opposition, took charge of the case and brought in an agreed Bill on behalf of the Government. The Council views with great satisfaction the successful issue of the prolonged labours of the Central Committee on which the Association has been represented since its inauguration. The Central Committee has passed a very cordial resolution thanking the Association for its assistance. In response to a request from the Minister of Health, the following names were submitted for consideration for appointment to the General Nursing Council set up under the Act:—Mr. G. H. A. Conynns Berkeley, Dr. E. J. Donville, O.B.E., Dr. E. W. Goodall, O.B.E., and Sir Jenner Verrall, LL.D.

POSTAL MEDICAL OFFICERS.

133. Consequent on representations made by members who are Postal Medical Officers that insufficient recognition of the altered value of money has been made to members of the Service, the Postmaster-General was asked to receive a deputation on the subject. He declined and said he was in communication with the Association of Postal Medical Officers. That body was approached with a view to co-operation, but received the offer of the Association in such a manner as to preclude any further attempts of the kind. This is not the first time that offers of the Association to co-operate with that body in assisting those whose interests it is supposed to protect have been declined. It has been found difficult to ascertain how far that body really represents Postal Medical Officers, but it is believed that it only represents a comparatively small number—less than does the British Medical Association. Steps have now been taken to ascertain the number of Postal Medical Officers who are members of this Association, and it is intended, if the response by these members warrants it, to approach the Postmaster-General again, pointing out the right of the Association to speak for its members.

134. The capitation fee for Postal Medical Officers has been increased by three instalments from 8s. 6d. per annum to 13s. (including drugs): thus the constant pressure of the Association has apparently, at last, produced the effect desired. The long standing grievance as to "itinerants" is also reported as being under consideration.

DOCTORS' MOTOR CARS.

135. The difficulty of obtaining motor cars has been felt with particular severity by the medical profession, and especially by those members who had disposed of their cars on going on Military service or during their service, and who found themselves on their return unable to do their work with efficiency and comfort. An attempt was made therefore to secure for members of the Association priority of delivery by the manufacturers many of whom were very helpful. The following firms deserve mention for this courtesy:—

Messrs. Ford Motor Co., Austin Motor Co., G.W.K., Ltd., Beardmore Motor Co., Morris Motors, Ltd., and G.N. Co.

The Ford Motor Company (England), Ltd., merit special mention in connection with this matter. They were most prompt and courteous and only withdrew the privilege of priority after a period of six months and when they found that they were inundated with orders from all sources.

It was then decided, owing to the growing reluctance of all manufacturers to grant or continue this concession, to discontinue this work.

DEATH CERTIFICATION AND REGISTRATION, CORONERS' LAW AND SALE OF PROPRIETARY MEDICINES.

136. Since 1909, the Association has been working at the questions of reform of the law of Death Certification, of Coroners' Law, and of the sale of Proprietary Medicines. On the first two questions, the Association gave evidence before the Departmental Committee on Coroners' Law in 1909. That body reported in favour of certain reforms which did not go far enough for the Association, and the Representative Body in 1910 instructed further action to be taken. A Bill was introduced, but it was considered to be quite inadequate and was opposed by the Association, and was ultimately withdrawn. In spite of repeated efforts to secure further legislation nothing was done and then the war intervened. This session the matter has been taken up with the House of Commons Medical Committee. Two interviews have been held and that Committee has promised its help in approaching the Home Secretary and the Minister of Health. The Council hopes to be able to report further in its Supplementary Report. On the question of Proprietary Medicines the Association gave evidence before the Select Committee of the House of Commons, which reported in 1914 in a manner which was strongly appreciated by the A.R.M. of that year. The war again prevented any action being taken until this session. The House of Commons Medical Committee has cordially promised its support. Dr. Addison is believed to have a Bill in preparation and steps are being taken to place the views of the Association before him. In connection with these subjects, and with others of a similar nature, the Council wishes to express its satisfaction with the attitude of the House of Commons Medical Committee, which, under the Chairmanship of Sir Watson Cheyne, Bart., K.C.M.G., C.B., M.P., has been most helpful in medical matters involving possible legislation. Its first Secretary was Dr. A. C. Farquharson, M.P., who has been succeeded by Capt. W. E. Elliott, M.C., M.P., to both of whom the Association is indebted for many courtesies and much help.

TRAINING OF MIDWIVES.

137. On September 19th, 1919, the Board of Education issued a set of draft regulations for the training of Midwives, with most of which every member of the profession will be in entire agreement. Paragraph 3 of the memorandum, however, says:—

Under modern conditions a midwife should be competent not only to attend confinements but to advise her clients in regard to ante-natal conditions (other than those requiring medical attention) and the care of the newly born child. It follows that in accordance with the requirements of the Central Midwives Board the curriculum should provide not only for the training of the student to follow the profession of the midwife in its narrow interpretation, but also for giving her a satisfactory knowledge of such subjects as the hygiene of pregnancy, the care and management of the infant, the best methods of encouraging breast feeding, hand feeding of infants, and some practical acquaintance with elementary hygiene, personal, domestic and general. The student should also be made familiar with the work of maternity centres, infant welfare centres, and other similar institutions.

138. The Council considered these draft regulations and the prefatory Memorandum thereto and decided:—

(1) That while agreeing that it is desirable that midwives should be instructed in the hygiene of pregnancy, they should be given no responsibility for ante-natal conditions, for which skilled medical advice always should be sought.

(2) That midwives should be instructed that in all cases of pregnancy in which they are engaged for the confinement they should advise the patient to consult a doctor before confinement, and that a suitable fee for this ante-natal examination should be included in the fees prescribed by the Ministry of Health.

These opinions were forwarded to the Ministry of Health and the Board of Education; also to the Divisions for their consideration.

ACTION BY ASSOCIATION IN NATIONAL EMERGENCIES.

139. The Council has circulated to Divisions and Branches suggestions as to schemes for concerted action in regard to first-aid treatment, etc. in the event of any national emergency that may arise.

CENTRAL EMERGENCY FUND.

140. This voluntary fund was created by the Council in 1905 to assist members of the profession in maintaining its interests against organised bodies of the community. For some time no grants have been made from it, but past experience shows how useful this fund can be in enabling individuals to face the financial difficulties that may be incurred by them when standing out for the policy recommended by the Association. The Council urges members to keep the fund well supported. An audited statement of the Fund appears among the financial statements in this report.

UNDER CONSIDERATION.

141. Question of income tax as affecting civilian medical practitioners and women practitioners employed on duties connected with the Admiralty, War Office, and Air Ministry.

142. Differences in war bonuses to male and female Assistant Medical Officers to the Metropolitan Asylums Board.

143. War Office fees for civilian medical practitioners attending soldiers.

144. Fees for Admiralty Surgeons and Agents.

National Health Insurance.

MEMBERSHIP OF INSURANCE ACTS COMMITTEE.

145. The new Constitution of the Insurance Acts Committee, adopted by the Representative Body in 1919, whereby non-members of the Association may be elected as a result of the voting by members of Local Medical and Panel Committees, has been well received by those chiefly concerned.

CONFERENCES OF REPRESENTATIVES OF LOCAL MEDICAL AND PANEL COMMITTEES.

146. A Conference of Representatives of Local Medical and Panel Committees was held on July 16th, 1919, under the Chairmanship of Dr. J. A. Macdonald, when instructions were given to the Insurance Acts Committee as to the conditions of service of Insurance practitioners for 1920, and the procedure to be followed in connection with the consideration of the question of remuneration. A full report appeared in the Supplement to the *B.M.J.* of July 26th, 1919.

147. A further Conference was held on November 27th, 1919, under the Chairmanship of Dr. H. G. Dain (Birmingham), when the Committee was instructed as to the views of insurance practitioners on the question of the remuneration, etc., for 1920, and certain outstanding points in the Regulations. A report of the proceedings of this Conference appeared in the Supplement to the *B.M.J.* of December 6th, 1919.

1920 REGULATIONS.

148. The views of the July Conference were conveyed to the Ministry of Health and three interviews took place between representatives of the Insurance Acts Committee and the Ministry with respect thereto. Subsequently the draft Regulations were issued and were considered by Local Medical and Panel Committees who instructed their representatives in view of the Conference in November, 1919. After that Conference a deputation from the Committee met and discussed with representatives of the Ministry of Health on December 2nd, 1919, the views expressed by the Conference. The result of the Committee's efforts to secure amendments to the Regulations as desired by the Conference was published in M. 37, dated January 16th, 1920.

149. The outstanding difficulty remaining at the close of the negotiations on the Regulations was the unwillingness of the Ministry to accept the suggestion of the Conference that the Regulation concerning the transfer of practices on death or other vacancies should be left as before. The Ministry insisted on an alteration which was considered by many practitioners seriously to interfere with their reasonable expectation of ability to transfer panel patients to a successor in practice, but accepted a suggested alteration which modified the procedure in the case of death vacancies. This action on the part of the Ministry caused great dissatisfaction in various parts of the country, and led two or three Panel Committees to call for resignations from the doctors on the local panel. The Insurance Acts Committee intimated to Panel Committees that such individual action was to be deprecated inasmuch as the Conference accepted the Regulations as a whole though instructing the Committee to endeavour to secure alteration in some of the Regulations, of which the one in question was the chief. The Conference did not indicate that failing these alterations being secured service was to be refused. The Committee has expressed the view that by judicious local action the Panel Committees may secure in practice their

main desire, that is, to preserve the reasonable expectation of transference of insured persons in the event of death or other vacancy, although this has not been secured by alteration of the Regulations. Time only can tell whether this view is correct, but all Panel Committees have accepted the situation, many of them, however, under strong protest.

REMUNERATION.

150. Following upon the discussion of this question which took place at the July, 1919, Conference of Representatives of Local Medical and Panel Committees, reasons were formulated as to why the remuneration of Insurance practitioners under the new conditions should be on a considerably higher scale than formerly, and the comments of Local Medical and Panel Committees were obtained thereon as well as their views as to what the new capitation fee should be. The figures so obtained varied from 30s. to 10s., and the Committee proceeded to discuss the remuneration question with representatives of the Ministry without mentioning any specific sum. As a result there was prepared and issued to Local Medical and Panel Committees in October, 1919, and published in *B.M.J.* Supplement of November 8th, 1919, a Memorandum (M. 22) being the case of Insurance practitioners for increased remuneration. On this followed an official reply from the Ministry (Supplement November 8th, 1919), and a rejoinder by the I.A.C. (Supplement, November 22nd, 1919).

151. These documents were discussed at the November Conference, when various instructions were given to the Insurance Acts Committee, the principal being to press for a capitation fee of 13s. 6d. In the event of the Government offer being deemed inadequate, the Committee was authorised to ask for an independent Arbitration Board to fix the capitation fee.

152. A deputation accordingly waited upon Dr. Addison on December 4th and placed before him the case of Insurance practitioners for increased remuneration. The proceedings of the deputation were reported in the *B.M.J.* of December 13th, 1919. On January 14th the Committee again met Dr. Addison, who offered on behalf of the Government a capitation fee of 11s. The whole day was spent on negotiations with the Minister upon the question. The result was stated in the letter from the Ministry dated 14th January, 1920, (M. 36), which appeared in the *B.M.J.* Supplement of January 17th, 1920. The report of the proceedings at the deputation on January 14th appeared in the *B.M.J.* Supplement of January 24th, 1920. The provisional settlement arrived at was that a capitation fee of 11s. should be paid during the period January to March, 1920, and that the question as to what should be the amount of the capitation fee under the new Regulations should be submitted to Arbitration.

153. The Arbitrators agreed upon were:—F. Gore Browne, Esq., K.C. (a Master of the Bench of the Inner Temple), Chairman; Sir Richard Vassar Smith, Bt. (President of the Council of the Institute of Bankers, Chairman of Lloyds' Bank, Ltd.), and J. C. Stamp, Esq., C.B.E., D.Sc., Fellow Royal Statistical Society (Secretary to Explosives Trades, Ltd., Member of the Royal Commission on Income Tax). They met on March 3rd. The case for insurance practitioners was stated by Drs. H. B. Brackenbury, H. G. Dain, A. Linnell and the Medical Secretary. The formal case presented by the Insurance Acts Committee (*B.M.J.* Supplement, February 25th, 1920) and observations by the Government thereon (*B.M.J.* Supplement, March 6th, 1920) were before the Board. The proceedings were fully reported in the *B.M.J.* Supplement, March 13th, 1920, and the Award, dated 5th March, was that the amount should be 11s., as offered by the Government.

APPRECIATION OF ACTION OF COMMITTEE AS REGARDS
REMUNERATION.

154. The Committee has received many resolutions from Panel Committees in all parts of the country, expressing approval of the way the negotiations have been conducted so far. A few contrary opinions have been expressed, but the Committee has reason to believe that, though the amount awarded was a disappointment, the general conduct of the case by the Committee has materially strengthened the confidence of insurance practitioners in the Committee and in the Association.

1919 WAR BONUS.

155. The Committee secured for insurance practitioners a war bonus for 1920 of 30 per cent. (up to a maximum of £150) on the insurance income of those practitioners whose net professional income did not exceed £500; 20 per cent. to those whose income did not exceed £1,200; and 15 per cent. to those whose income was beyond this, with a maximum of £300 in the two last-named classes.

DISTRIBUTION OF CENTRAL POOL: MILEAGE GRANT.

156. The Distribution Committee set up to deal with the question of the distribution of the Insurance Central Pool (which included four practitioners nominated by the Insurance Acts Committee, with two additional practitioners nominated by the Insurance Acts Committee to deal with the distribution of the mileage pool), has issued its report. The Committee, after having taken into consideration all the facts, figures and circumstances brought to its notice, has decided the proportions in which the Central Pool should provisionally be distributed for 1920 amongst the Insurance areas. When the balance of the fund is ascertained, the question of its distribution will, it is expected, be referred to the Distribution Committee with instructions to review the apportionment of the provisional Fund in the light of such later figures as may be available, and to arrange the distribution of the balance so as to give effect to such modifications, if any, in the previous apportionment as may appear to be desirable. The Committee also recommended, in connection with such review, that special attention be given to temporary residents.

157. Part of this Committee's reference was also to report upon the distribution of the Central Mileage Fund for England and Wales, which, it will be remembered, has been assessed at £300,000 (as against a previous total Fund of about £34,000 for England and Wales) with a proportionate increase for Scotland. Generally speaking, no mileage would be payable in respect of attendances upon insured persons residing in urban districts with a population of over 10,000. Returns are being obtained from practitioners showing the number of insured persons on their lists at January 1st, 1920, resident from the practitioner certain varying numbers of miles, one unit being assigned to each resident for two, but not more than three miles from the doctor, two units for each resident more than three but not more than four, and so on. When this information is obtained it is expected that it will be referred to the Distribution Committee, who will utilise it in the final distribution of the whole Mileage Fund between the different areas.

JOINT MEDICAL AND PHARMACEUTICAL COMMITTEE.

153. The Committee has arranged with the Pharmaceutical Society of Great Britain at the request of that body, to set up a small Joint Committee of insurance practitioners and insurance chemists for the discussion, as and when necessary, of matters of interest to both parties.

MEDICAL RECORDS.

159. The Ministry of Health and the Scottish Board of Health have appointed an Inter-Departmental Committee to consider and advise them as to the form of Medical Record to be prescribed under the conditions of service for medical practitioners contained in the new Medical Benefit Regulations, having due regard to the clinical purposes (including the remedial value to the patient of maintaining a suitable record of his case) as well as to the administrative and the statistical purposes which such records may be adapted to serve. (For full composition of Committee, see p. 74, *B.M.J.* Supplement, March 13th, 1920.)

NATIONAL HEALTH INSURANCE BILL—PROCEDURE ON APPEAL.

160. As a result of the following Minute 104 (a) of the November Conference of Local Medical and Panel Committees:—

104 (a).—Resolved: That any person aggrieved by the removal of his name from the list may, within three months after the date on which notice is given to him by the Minister that his name has been so removed, appeal to the High Court, and on any such appeal the High Court may give such directions in the matter as it thinks proper, including directions as to the costs of the appeal, and the order of the High Court shall be final and conclusive and not subject to an appeal to any other court,

an amendment to the National Insurance Bill 1920 has been drafted and Dr. A. C. Farquharson, M.P., has kindly consented to move it at the appropriate time. It is hoped that it may be possible thereby to remove a grievance which has been felt strongly by a certain section of the profession.

Public Health and Poor Law.

ROYAL SANITARY INSTITUTE CONGRESS.

161. The Council has appointed the following gentlemen, who have intimated their intention of being present at the Congress of the Royal Sanitary Institute, to be held in Birmingham 19th to 24th July, 1920, to act as representatives of the Association at that Congress:—Prof. Bostock Hill, Dr. Herbert Jones, Dr. E. Lewys-Lloyd, Dr. E. H. Snell and Dr. G. C. Trotter.

VACCINATION.

162. The Council has informed Dr. Drury, of the Jenner Society, that as that Society depends for its funds mainly on lay support and must continue to be largely a lay body if it is to exercise its due influence on the public, the Association cannot wholly identify itself with its management, but will continue to give it such active support as is possible in its working.

163. The Association has received a cheque for £22 2s. 1d., the balance of the funds of the Imperial Vaccination League, which is being held in reserve for any propaganda work that may be necessary in support of vaccination.

PUBLIC HEALTH AND POOR LAW APPOINTMENTS.

164. The Association has taken vigorous action in connection with numerous Public Health and Poor Law appointments in order that the policy of the Association in these matters should be carried into effect, and, with a few exceptions, its efforts have been successful.

SALARIES OF PUBLIC MEDICAL OFFICERS.

165. As a result of repeated circulars and letters from the Association to local authorities with a view to obtaining increases of the salaries paid to Public Medical Officers throughout the country, reports have been received that up to 4th March, 1920, action has been taken by local authorities as follows:—

(i.) Salary increased by 33 1/3 per cent. or over	... 667
(ii.) Salary increased by less than 33 1/3 per cent.	... 239
(iii.) Civil Service Bonus (Awards 84 and 101) granted	67
(iv.) No action taken	... 129
(v.) Miscellaneous (replies which do not fall under the above headings, i.e., where exact amount of increase is not stated, etc.)	... 271
(vi.) Formal acknowledgements	... 70

SUPERANNUATION OF HEALTH OFFICERS.

166. The Ministry of Health has been asked to receive a deputation from the Association, the Society of Medical Officers of Health, and the Sanitary Inspectors' Association, with a view to placing before the Ministry certain conclusions arrived at on consideration of the Report of the Departmental Committee on Superannuation. The Ministry has asked in the first place for a memorandum containing these views, and this is in course of preparation.

SECURITY OF TENURE OF HEALTH OFFICERS.

167. In 1915, certain promises on the subject of Security of Tenure of Health Officers, were made by the President of the Local Government Board to a deputation from the Association, and the Ministry of Health has been reminded of these promises, and asked what action it proposes to take in the matter.

Hospitals.

PAYMENT OF MEMBERS OF STAFFS OF VOLUNTARY HOSPITALS FOR THE TREATMENT OF DISCHARGED DISABLED SOLDIERS AND SAILORS.

168. The Council considered following Minute 195 of the A.R.M. 1919:—

That for all work for sailors and soldiers, whether discharged or not, for any diseases or injuries connected with the War, undertaken at voluntary hospitals, the medical staffs should be adequately remunerated, and has come to the conclusion that the method of remuneration suggested in the following recommendation will be satisfactory. Representations to this effect have been made to the British Hospitals Association and the Ministry of Pensions, and it is hoped that the recommendation will be accepted by the Treasury.

The Council recommends:—

Recommendation.—That for all work for soldiers and sailors, whether discharged or not, for any disease or injuries connected with the War, undertaken at voluntary hospitals, the medical staffs should be adequately remunerated. In any case the remuneration should represent an addition of not less than 25 per cent. to the cost of maintenance of in-patients, and not less than 25 per cent. of the ascertained cost per patient per attendance for out-patients, the additional sum to be placed at the disposal of the medical staff; that in the case of special clinics (e.g.,

Aural and Ophthalmic) the fee payable to the medical practitioner should not be less than the fee payable by the Ministry of Pensions for identical or similar services, viz., £2 2s. per session.

HOSPITAL MEDICAL OFFICERS TO THE MINISTRY OF PENSIONS.

169. The Council has had under consideration the question of the salaries and terms and conditions of service of the various posts of Medical Officers to Pensions Hospitals established under the Ministry of Pensions, and has made representations to the Ministry especially with reference to the necessity of increasing the lodging, fuel and light allowance from £100 to £150 per annum for whole-time officers of hospitals.

UTILISATION OF POOR LAW HOSPITALS FOR PAYING PATIENTS.

170. It was brought to the notice of the Council that the Guardians of a Poor Law Hospital have proposed that their institution might be used for the benefit of all classes, and that paying patients might be admitted for operation and nursing, each patient having his own surgeon and paying his fee. The Ministry of Health has ruled that operations must be performed by the appointed staff of the institution. The Council has expressed the opinion that there should be free access to such a hospital for all recognised surgeons in the district whether on the Staff of the hospital or not.

STATE-AIDED HOSPITALS IN TASMANIA.

171. The Government of Tasmania has for some time past been aiming at the nationalisation of hospitals and the admission of rich and poor alike, both classes thus having the benefit of the honorary services of the medical staff. The members of the profession in Tasmania took exception to the gratuitous treatment of well-to-do patients and approached the Government with reference to this question, but with no success. Considerable correspondence passed between the Tasmanian Branch of the British Medical Association and the Prime Minister and several Conferences were held, when the whole matter was discussed. Little or no success attended the efforts of the B.M.A. representatives and as a consequence of the refusal of the Government to introduce a clause in the Hospital Bill excluding well-to-do patients, it was decided to ask the honorary members of State-Aided Hospitals to resign. Resignations were accordingly lodged although it was intimated to the Boards of Management of the Hospitals concerned that the Staffs would continue to attend emergency cases until suitable arrangements could be made. The resignations were accepted by the Hospital authorities, who at the same time expressed high appreciation of the services which had been rendered by the honorary staffs.

172. The Tasmanian Government passed an Act of Parliament providing for the admission of rich and poor alike to general hospitals, and in order to overcome the difficulty of staffing such hospitals, passed a Medical Act permitting American medical practitioners to register. At the request of the Tasmanian Branch an "Important Notice" appeared in the *Journal* with respect to this question. Subsequently, however, the Tasmanian Branch requested that the notice be discontinued, owing to the fact that the State had passed an amendment to the Medical Act by which it is made illegal for any person, association, or company or body of persons to directly or indirectly prevent or endeavour to prevent or aid in preventing in any way whatsoever any medical practitioner, nurse, or other person, applying for and accepting or holding any appointment or position in any State-Aided Hospital or charitable institution. The Tasmanian Branch has been asked for a statement upon the whole subject, as the precedent established is considered by the Council to be very serious.

Naval and Military.

NOMINATION OF SERVICE MEMBERS TO SERVE ON THE COUNCIL.

173. The term of the present representatives of the Services on the Council expires at the end of the A.R.M. 1920. The Council therefore submits, in accordance with By-law 52 (2), the following nominations for election by the Representative Body of Members of Council representing the Services:—

Recommendation.—That the following representatives of the Services on the Council be appointed for the period 1920-23:—

- (a) Royal Naval Medical Service:—
Surgeon-Capt. E. H. Meaden, C.M.G., R.N. (ret.).
- (b) Royal Army Medical Service:—
Lt.-Gen. Sir W. Balfie, V.C., K.C.B., K.C.M.G.
- (c) Indian Medical Service:—
Col. Sir W. J. Buchanan, I.M.S. (ret.).

The Council will nominate a representative of the R. A. F. M. S. in its Supplementary Report.

PENSIONS OF SENIOR SURGEON-COMMANDERS, R.N.

174. On January 1st, 1920, the Admiralty introduced a new scale of pensions for retired medical officers, whereby, *inter alia*, officers of the rank of Surgeon-Commander are compulsorily retired at the age of 50, the maximum pension being £600 (representing an increase of about 10 per cent. on the old pension of Surgeon Commanders). The attention of the Association was drawn by Naval Members to the fact that a large number of senior Surgeon-Commanders were adversely affected by these new provisions. The officers so affected had, in fact, entered the Service on the understanding that they would be allowed to serve until they reached the age of 55. By the scheme for earlier compulsory retirement, therefore, these officers would lose the chance of promotion to the rank of Surgeon-Captain and an increased pension, as well as a period of five years service on their highest rate of pay.

175. This question was accordingly taken up with the Admiralty, and it was suggested that in order to remove the scheme for compulsory retirement should be postponed for a year, or that the maximum pensions should be abolished as a temporary measure for five years, *e.g.*, until the age of retirement nominally reaches 50. The Admiralty refused to do anything. They stated that it was recognised that in adopting the new regulation there must be cases of individual hardship, but it would not be practicable to legislate specially for such individual cases. The Council felt that it could not allow the matter to rest where it was, as there was a strong feeling among the officers affected that they were not being treated in accordance with the spirit of the Jerram-Halsey Report. The Council has therefore pressed that the Lords of the Admiralty shall receive a deputation on the subject.

PENSIONS OF RETIRED MAJORS AS AFFECTED BY THE NEW RATES OF PAY R.A.M.C.

176. In September 1919 a new Royal Warrant was issued laying down the pay and allowances for officers of the Regular Army. The fact that a medical officer had had a long and costly professional training previous to joining the Service was recognised so far as the full rates of pay were concerned. In the matter of half pay and pensions, however the rates of pay are practically uniform throughout the Army. It appears that a major of 20 years' service received £365 per annum under the old rates, whereas under the new he will only receive £321. The Council immediately drew the attention of the War Office to this anomaly, and pointed out that it regarded it as extraordinary that officers should be faced with a decrease in pension, whereas in view of the increased cost of living, a substantial increase could confidently have been expected. The War Office replied that the matter was receiving attention and that the Council's point would not be lost sight of. The Council has since pressed the matter for immediate attention in view of the dissatisfaction that exists among the officers concerned.

SERVICE OF TEMPORARY COMMISSIONED OFFICERS R.A.M.C. COUNTING TOWARDS PROMOTION, PENSIONS, ETC.

177. Under A.C.I. 1310, 1918, it was laid down that the service of temporary commissioned officers should not count towards promotion, pensions, and increments of pay, where such officers transferred to permanent commissions. The Council has obtained from the War Office a promise that this injustice will be remedied and an A.C.I. to that effect is shortly expected.

THE £60 GRATUITY.

178. The Council has also successfully taken up with the War Office a question connected with the £60 gratuity given to R.A.M.C. officers under temporary contract. Soon after the Armistice the War Office found a difficulty in obtaining enough medical officers to meet requirements. A new contract was therefore offered, the terms of which were more favourable than those of the old one. A number of officers who had already served for some months on the old contract changed over to the new, chiefly because the new contract promised certain demobilisation at the end of six months. Under the old contract these officers were entitled to a gratuity of £60 for satisfactory service for a year or any part thereof, even if only for a day. They were informed, on application to their agents, that under the new conditions, they could only be credited with a pro rata gratuity of £5 per month. Complaints soon reached the Association, and the Council decided to ask the War Office if

it intended to adhere to its decision; and, if the answer were in the affirmative, to seek legal opinion thereon. The Council was informed, however, that the full gratuity would be paid to all the officers in question who signed the new contract before 6th December, 1919.

THE ASSOCIATION AND MEDICAL SERVICES OF THE TERRITORIAL FORCE.

179. The Council has had under consideration Minute 63 of the A.R.M., 1919, concerning the question of the reorganisation of the Medical Services of the Territorial Force, which was necessitated by post-war requirements, and appointed a special Sub-Committee to deal with the subject. The Sub-Committee has given the matter very careful consideration and has dismissed many reforms that have been suggested to it both in correspondence and by its members. After careful consideration of the points referred to in the White Paper as to the future of the Territorial Army from the medical point of view the Sub-Committee decided to put before the D.G.A.M.S. considerations as to certain basic principles. A deputation has accordingly been arranged.

INDIAN MEDICAL SERVICE.

180. The Representative Body at its 1919 Meeting, gave instructions that the Association should use its influence in securing officers for the Indian Medical Service on being satisfied that satisfactory arrangements had been made as to increased pay and improved conditions of service.

181. At the time of the 1919 meeting although the Government of India had granted an increase of 33½ per cent. on grade pay, there was a widespread feeling amongst the officers of the Service that this was inadequate, seeing that the increase of pay was to a large extent neutralised by the abolition of certain allowances. The Council did not, therefore, feel justified in embarking upon a campaign to obtain recruits for the service, and sought a further interview with Mr. Montagu, which took place on October 30th, 1919. (A full report of the proceedings was published in the *B.M.J.* Supplement of November 8th, 1919.) The Secretary of State was asked for the following improved conditions:— (1) 50 per cent. increase of total pre-war pay; (2) increased pensions for retired officers to meet the present high cost of living; (3) steamer passages backwards and forwards to India for all officers of the I.M.S. going out, retiring or travelling on leave.

182. The Council endorsed the action of the Deputation and informed Mr. Montagu in December, 1919, that the Association could hold out no hope of even these terms being successful unless they were adopted within the next six months. On March 11th, 1919, Mr. Montagu intimated to the Council the rates of consolidated pay which he proposed to sanction for all European officers serving in the I.M.S. in civil or military employ, except those holding administrative appointments which carry fixed rates of higher pay than were admissible under the proposed scale. It was clear to the Council that the new proposals were a great advance, and were on the whole satisfactory, but it was not certain that such allowances on the civil side as those paid to Professors of Bacteriology, Pathology and Sanitation, etc., and officers in charge of jails, were to be continued. Without these allowances the officers concerned would find themselves worse off, in spite of the general increase.

183. The Council has, therefore, informed the Secretary of State that although it considers the scale to be, on the whole, satisfactory, it is of opinion that the above allowances must be continued and proportionately increased by 50 per cent. The Council has expressed the hope that the Secretary of State may be in a position to enable the Council to make an announcement, in time for the A.R.M. at Cambridge, that the question of pay, together with passages and pensions, has been satisfactorily settled, in which case, of course, the Association would encourage by every means in its power, members of the profession to seek admission to the Service.

SHORT SERVICE OFFICERS FOR THE I.M.S.

184. Owing to a great shortage of officers in the Indian Medical Service, many officers, long overdue for leave, were unable to obtain relief. The Council, therefore, suggested to the Secretary of State for India that a number of temporary commissioned officers should be appointed, and suggested terms which it thought would attract the right kind of applicant. A communique has since been issued by the Government of India offering a two year contract with pay at the rate of Rs. 700 per mensem, with free passage out and home, and an opportunity of joining the service permanently if found suitable—terms which the Council considered quite satisfactory.

ACTION TAKEN ON BEHALF OF INDIVIDUAL SERVICE MEMBERS.

185. Post-war conditions have brought about many difficulties affecting individual Service Members or small classes of such Members. The Council has given these difficulties full consideration, and has taken up many cases with the Authorities with no small amount of success. The following may be quoted as a typical instance of the action taken:—

A Lieut.-Colonel in the I.M.S. complained that under the new scale of Indian Medical Service pay he was actually receiving less than that which he received before the 33½ per cent. increase was granted. This was brought to the notice of the Secretary of State for India, with the result that the pay which this officer claimed was due to him has been conceded.

MEDICAL OFFICERS IN HOSPITAL SHIPS AND THE 1914-15 STAR.

186. Medical Officers who had served on Hospital ships in the Mediterranean during the period for which the 1914-15 Star was awarded were not originally awarded this Star. The Council therefore took the matter up with the War Office, and pointed out that these officers were entitled to the Star inasmuch as they were serving in the submarine zone. As a result of the Council's action the Star was awarded to the officers concerned.

DEMOBILISATION OF SPECIAL RESERVE OFFICERS.

187. The Council has been made aware of the dissatisfaction that exists among officers of the Special Reserve owing to the fact that they are unable to obtain demobilisation. Representations were made to the War Office, who pointed out that these officers are liable to serve till the statutory end of the war is declared.

Wales.

188. The Welsh Committee which was formed in 1913, was prevented by the War from commencing operations until this session. It has met twice and appointed Dr. W. B. Crawford Treasure as Chairman, and Dr. E. Lewys-Lloyd as Honorary Secretary.

WELSH CONSULTATIVE COUNCIL.

189. As there is now a Welsh Board of Health with a Consultative Council, there will doubtless be many matters of purely Welsh concern which will need consultation between the Board of Health and some body representative of the Welsh medical profession. The Board has already recognised the Committee by asking it to nominate general practitioners for the Consultative Council and two of its nominees (Dr. W. E. Thomas and Dr. Hugh Jones) have been appointed.

CONSTITUTION OF COMMITTEE.

190. The Council feels that the present position of the Welsh Committee is not entirely satisfactory so far as concerns its capacity for representing every part of Wales. It consists of the Secretaries of the two Welsh Branches; the two members of Council who represent Wales; one member appointed by the North Wales Branch; two appointed by the South Wales and Monmouthshire Branch; and one appointed by those members of the Shropshire and Mid-Wales Branch who are resident in Wales—a total (excluding the *ex-officio* members) of 8. The Council is of opinion that the Committee would be more directly representative if it consisted of those members of the Council who represent Wales or parts of it, together with one representative of each Division in Wales elected as the Division may choose. As there are at present 8 Divisions in Wales and it is probable there will shortly be another, the total membership of the Committee (excluding *ex-officio* members) would be 11 as against 8.

The Council therefore recommends:—

Recommendation.—That the Schedule to the By-laws as to the Welsh Committee be amended (1) by omitting in the second column ("Additional Members *ex-officio*") the words "The Secretaries of the North Wales and the South Wales and Monmouthshire Branches," and (2) by altering the fifth column ("Otherwise appointed") to read as follows:—"One member appointed by each Division wholly situate in Wales, including Monmouthshire."

REARRANGEMENT OF WELSH DIVISIONS.

191. There was a strong expression of opinion from all parts of Wales at the last Annual Representative Meeting in favour of a greater representation of Wales on the Council. At the present time Wales is represented by one member elected

by the North Wales, South Wales and Monmouthshire, and Shropshire and Mid-Wales Branches; and by another member elected by the Grouped Representatives of the constituencies comprised in the following Branches:—Birmingham, Staffordshire, North Wales, Shropshire and Mid-Wales, and South Wales and Monmouthshire. The Council has given careful consideration to this question and has decided that the first step must be the inclusion in a purely Welsh Division of those members in Montgomeryshire and Radnor who are at present attached to the Shropshire and Mid-Wales Branch. This will require some rearrangement of areas. The wishes of the members concerned are being ascertained on this matter. When it can be said that Wales and Monmouthshire form one complete unit it is hoped that the alterations in the composition of the Council, likely to be necessitated by changes in connection with Ireland, and by the general revision of the Articles and By-laws that is now going on, may make it possible to allocate two seats on the Council to Wales, one for North Wales and the other for South Wales including Monmouthshire.

PAID ORGANISER FOR WALES.

192. The Council has considered proposals from the Monmouthshire Division and the South Wales and Monmouthshire Branch suggesting that a whole-time medical organiser should be appointed for Wales and Monmouthshire, or in the alternative that some member of the Central Staff should give the most part of his time to organising work in Wales, though not necessarily residing there. The Council came to the conclusion that such a scheme was at present impracticable, as the number of members in Wales would not justify the expense, but in view of the special difficulties affecting South Wales and of the large experience the Medical Secretary has of those questions, the Medical Secretary has been asked to give as much of his time to Welsh affairs as he feels to be necessary.

MEDICAL SCHEMES IN SOUTH WALES.

193. Grave concern has been felt during the past year at the recrudescence of Medical Schemes in certain areas in South Wales. The Schemes vary in detail but possess one common characteristic, namely, the desire of the workmen to extinguish private practice and get the doctors under the control of a committee. To all such Schemes the Association is pledged to offer an uncompromising resistance, and the Divisions concerned with the help of the Head Office are doing all in their power to help the local profession to resist extinction as independent practitioners. The Welsh Committee has approached the Welsh Board of Health, and will, if necessary, apply to the Minister of Health to ascertain how far these bodies intend to encourage the promotion of such Schemes. There is a marked contrast between the encouragement which seems to have been given by Insurance Committees and the Insurance Commissioners in Wales to these Schemes and the way in which in England they have been kept severely to the provisions of the 1911 Act. The Council is convinced that such Schemes are detrimental to the interests both of the public and the profession, and will discourage them in every legitimate way.

Scotland.

194. Dr. John Goff was appointed Chairman for the session 1919-20, Dr. C. S. Young, Vice-Chairman, with Dr. R. C. Buist as Hon. Secretary.

DEVOLUTION OF SCOTTISH BUSINESS.

195. An important development falls to be recorded this year—the establishment of a Scottish Office and the appointment of a whole-time Scottish Medical Secretary. This step, decided upon by the Council in 1914, was postponed until the end of the War and taken up at the earliest possible date thereafter. Offices in every way suitable for the purpose were secured, and Dr. James R. Drever was appointed Scottish Medical Secretary, and took up his duties on 1st November, 1919. The Committee is assured that these arrangements have met with the general approbation of Scottish members. Careful consideration has been given to the question of further devolution of Scottish business, and the recommendations of the Council thereon are now before members (see below). The Committee wishes it to be clearly understood that this question has been brought into prominence by force of circumstances and not from any separatist movement on the part of either the Committee or the profession in Scotland. The Committee is not aware of any desire amongst members in Scotland for independence. The trend of recent legislation, however, and the tendency towards separate administration for Scotland, make it imperative that the Scottish Committee should have fuller power bestowed upon it, and this carries with it the

corollary that the Committee itself should be reconstituted on a more representative basis. It is quite certain that the various health problems which are calling for solution will be tackled separately in Scotland, and just as administration for existing Acts of Parliament is now separate, so also future legislation will be quite distinct, and may run on altogether different lines in the two countries.

196. The Scottish Board of Health has shown great willingness to consult with the Scottish Committee and its Sub-Committees, and it is necessary that the Scottish Committee should have somewhat full powers in order that its influence with the Board may have due weight. It is not to be expected that a Government Department will negotiate with a Committee, if every decision of that Committee must first obtain the approval of the Council before it can be presented to them. There will certainly be many occasions on which the Board will desire from the Scottish Committee a definite pronouncement of Scottish opinion on various problems. It is necessary therefore that the Committee should be in a position to provide this promptly and authoritatively. At the same time the Committee realises that it must be bound by the general policy of the Association, as expressed by the Representative Body, and that it must not be in its power to prejudice the general interests of the Association and of the profession by taking any action which might have its reflex effect elsewhere than in Scotland. The Council has been assured that the recommendations made in paras. 198 and 199 are sufficient to meet the requirements of the case.

197. Apart from this and from the question of the revision of terms of service under the National Health Insurance Acts which has absorbed so much attention during the past year, the Committee has dealt with many problems affecting the interests of members. In common with other representative bodies it was invited to submit names of persons suitable for election to the Consultative Councils (Medical and Allied Services, and Highlands and Islands). Of the 15 medical members of the former Council three were nominated by the Scottish Committee, and of the three medical members of the latter two were so nominated.

198. On the initiative of the Scottish Committee the Council has agreed that the Committee be given more power of initiative and of action, subject always of course to any policy laid down by the Representative Body. In order that the Committee may be placed in this position the Council makes the following recommendation:—

The Council recommends—

Recommendation.—That the A. R. M., 1920, amend the schedule to the By-laws, as to the Scottish Committee:

(1) By omitting, in the second column ("Additional members *ex officio*"), the words:—

"The Secretary of each Scottish Branch";

(2) By inserting, in the fifth column ("Otherwise appointed"), the words:—

"Members appointed by the Divisions in Scotland grouped in such manner as shall from time to time be prescribed by the Council";

(3) By altering the sixth column ("Duties, Powers, etc.," of the Scottish Committee) to read as follows:—

"To consider all matters specially concerning Scotland and, in conformity with the decisions of the Representative Body, deal with all such matters. It shall meet at such place and time as the Committee itself may direct. The Committee shall have power to add to its number not more than four Members specially qualified to assist in the business of the Committee."

199. The following is the scheme of election of the Committee which the Council, subject to the opinion of the Divisions and Representative Body, has approved:—

(i.) The Scottish Divisions will directly elect their representatives on the Scottish Committee.

(ii.) The Divisions will be grouped for the purpose as follows:—

	No. of Members.
Group I. The Divisions comprised within the Aberdeen and Northern Counties Branches	314
Group II. The Divisions comprised within the Dundee, Perth, Fifo and Stirling Branches	334
Group III. The Divisions comprised within the Edinburgh Branch... ..	400
Group IV. The Glasgow City Divisions	396

Group V. The remaining Divisions in the Glasgow and West of Scotland Branch, and the Dumfries and Galloway Division 472

- (iii.) One representative will be assigned to every completed 150 of membership, and this will give two representatives to each of the first four Groups and three to the fifth Group.
- (iv.) The election will be by postal vote, conducted by the Scottish Office after nomination by the constituencies.

The complete Committee will therefore consist of 25 members, i.e., 4 *ex officio* members; the 6 members of Council who represent Scottish Branches; 11 directly elected representatives; and not more than 4 members co-opted by the Committee as being specially qualified to assist in its business.

COLLIERY AND PUBLIC WORKS' SURGEONS' COMMITTEE.

200. This Committee, with which the Scottish Committee is in active co-operation, has concluded protracted negotiations with the Miners' Union, as a result of which:—

- (a) The Committee is recognised by the Miners' Union as representing all practitioners engaged in Colliery practice in Scotland.
- (b) A uniform flat rate, applicable to all areas in Scotland, has been agreed to, of 3½d. per week per worker, for medical attendance upon dependants, with an additional 1d. per week per worker where medicine is supplied.
- (c) Joint Committees—central and local—are to be set up.

HIGHLANDS AND ISLANDS SUB-COMMITTEE.

201. The Sub-Committee has put forward to the Board of Health representations for better terms and conditions of service for practitioners serving under the special Highlands and Islands Scheme, and for the removal of certain grievances under which the Committee is informed practitioners suffer. At the time of reporting, the reply of the Board had not been received.

FEES TO PRACTITIONERS CALLED IN ON THE ADVICE OF MIDWIVES.

202. The Committee has submitted to the Board of Health the following scale of fees:—

- (1) That the fee for attendance at confinement should involve full medical responsibility for any attendance that may be necessary during ten days of the puerperium and should be two guineas, whether operative procedure is or is not needed; that attendance at confinement should be interpreted to include cases where this begins for an immediate post-partum emergency.
- (2) That the fee for an anaesthetist when required should be one guinea.
- (3) That other attendance during pregnancy or the puerperium should be paid by fee according to scale.
- (4) That the responsibility of the local authority should be co-extensive with the responsibility of the midwife acting under her rules.
- (5) That the fee for attendance at abortion or miscarriage be two guineas.

Ireland.

CHAIRMAN AND VICE-CHAIRMAN OF IRISH COMMITTEE.

203. Dr. J. S. Darling, Lurgan, Co. Armagh, and Dr. Denis Walshe, Craigue, Co. Kilkenny, were re-elected Chairman and Vice-Chairman respectively.

ORGANISATION OF THE PROFESSION IN IRELAND.

204. A meeting of delegates, representative of the whole profession in Ireland, was held in Dublin on June 3rd, 1919. That meeting appointed a Joint Organisation Committee (Ireland), consisting of:—Five members of the Irish Medical Association, nominated by the Council of that Association; five members of the B.M.A., nominated by the Irish Committee of the B.M.A.; five members of the Irish Medical Committee (a body representing the whole medical profession in Ireland, including the medical schools), nominated by the Irish Medical Committee; together with the Irish Medical Secretary and the Secretary of the I.M.A.

205. The meeting of delegates gave the Joint Organisation Committee (Ireland) the following reference:—

- (1) To consider the question of uniting the Irish medical profession in one representative organisation, and the best method of attaining that object;

(2) To submit their recommendations and alternative minority suggestions to the entire profession in the form of a referendum;

(3) To take the necessary action to establish such representative body on the lines indicated in the referendum, suggest Articles of Association, etc., etc. The incidental preliminary expenses to be met by the body when established;

(4) That in such representative body as may be agreed on, Dr. Hennessy and Mr. Gick (Secretary Irish Medical Association) be respectively "Medical Secretary" and "Secretary" at rates of remuneration not less than they now receive from their respective Associations.

206. The Joint Organisation Committee (Ireland) was duly appointed in accordance with the instructions of the meeting of delegates held on June 3rd, 1919. The Committee held its first meeting in Dublin on July 29th, 1919, and unanimously agreed on the following headings:—

- (1) One Medical Body for all Ireland.
- (2) The name of the Medical Body to be the Irish Medical Union or Association.
- (3) The members of the Irish Medical Union or Association to be honorary members of the British Medical Association, with the following privileges:—

(a) Attendance at scientific meetings of the British Medical Association, including the Annual Meeting.

(b) The *British Medical Journal*—Irish news—in the form of a periodical Irish supplement.

(c) The right to be enrolled as an ordinary member of the British Medical Association, on taking up residence in Great Britain and the Colonies. *Note.*—This provision was chiefly meant by the Committee to help in recruiting the membership of the British Medical Association.

(d) Representation, without the right of voting, at the Annual Representative Meeting, and two representatives on the Council of the British Medical Association.

(e) Participation in scientific grants.

(4) Arrangement for the payment per capita for the privileges requested.

(5) The new body to take over the finances of its own Central Offices, Branch, and Division expenses.

(6) The medico-political policy of the Irish profession to be decided by representative meetings summoned under the auspices of the Irish Medical Union or Association.

207. The Council on November 15th, 1919, received a Joint Irish deputation which explained the position as regards medical organisation in Ireland. Arising out of the views expressed by the Council, a meeting of the Joint Organisation Committee (Ireland) was held on January 6th, 1920. The members of the deputation who were present and who had conferred with the Council of the B.M.A. stated the result of the conference with the Council. That the Council should hesitate to go to the expense of altering the Articles and By-laws of the Association without some guarantee as to what would be the action of the Irish profession towards affiliation on the terms proposed was considered reasonable by the Committee. In the circumstances it was decided that the Chairman, Mr. R. J. Johnstone, and Dr. J. M. Day should prepare a statement which would be embodied in a referendum submitted to the Irish profession with regard to the proposed new Medical Body and the conditions of its affiliation with the British Medical Association. It was, however, considered that it would be advisable to submit, in the first instance, the referendum and accompanying statement to the meetings of the profession summoned to meet to consider the Report of the Irish Public Health Council. That Report is expected at an early date, but until it is made available to the public it will not be possible to organise meetings of the profession in Ireland to consider it.

IRISH PUBLIC HEALTH COUNCIL.

208. The Irish Public Health Council has been meeting regularly for the past five months under the Chairmanship of Dr. E. C. Bigger. Judging from the summarised reports of the proceedings of that Council in the Press it would appear that the Council has done an immense amount of work and that there are good grounds for hoping for a valuable report, for the most part of an unanimous character.

IRISH MEDICAL COMMITTEE.

209. At the meeting of delegates, representative of the whole Irish profession, held in Dublin on June 3rd, 1919, a resolution was unanimously passed authorising the Irish Medical Committee, constituted under the various resolutions of meetings of delegates, to represent the Irish medical profession in regard

to proposed legislative measures affecting the interests of the profession, and in regard to the interests of the profession generally. Of the three medical members representing Irish medical interests on the Irish Public Health Council, two were selected from the nominations of the Irish Medical Committee in its capacity as representative of the Irish medical profession. The Irish Medical Secretary still continues to act as Honorary Medical Secretary of the Irish Medical Committee, through which, for reasons previously explained, most of the Irish medico-political work has been done in recent years.

POOR LAW MEDICAL OFFICERS' SALARIES.

210. For the past five years the Irish Committee of the Association has been urging the Local Government Board (Ireland) to exercise their statutory powers to fix salaries for Poor Law medical officers in those Unions in which the Board of Guardians had failed to give their medical officers adequate salaries. It is, therefore, a source of much satisfaction to the Committee and the Council to find that the Local Government Board has, within the past year, fixed salaries by Sealed Order for Poor Law medical officers in some of the more recalcitrant Poor Law Unions. The Irish Medical Secretary has been kept very busy attending meetings in different parts of Ireland urging the claims for improved salaries of medical officials. His efforts were invariably attended with almost unexpected success. In many Unions scales were passed with a minimal salary of £300, reaching, after ten or fifteen years' service, a maximum of £400 per annum, with retrospective application. It is to be regretted, however, that the Local Government Board has not, so far, sanctioned a higher initial salary than £250, or a maximal salary higher than £350.

Oversea Branches.

RELATIONSHIP BETWEEN THE OVERSEA BODIES AND THE PARENT ASSOCIATION.

211. As a result of valuable suggestions received from some of the Oversea bodies, especially the Australian Branches and their Federal Committee, in response to a letter addressed by the Council to the Oversea bodies on the subject, gratifying progress has been made as regards a preliminary survey of means whereby the co-operation between the parent Association and its bodies overseas could be made still more close and effective, the Oversea branches at the same time being placed in possession of full power of managing their own affairs. The Council reports the proposals on this subject in paras. 43-63 of this Report.

WELCOME TO OVERSEA MEMBERS VISITING THE UNITED KINGDOM.

212. The Council has arranged to make each year, in co-operation with the local Entertainment Committee and otherwise, provision for special recognition by the parent body, of prominent members of the Oversea Branches visiting this country in an official capacity, and that such special recognition shall include (1) invitations to such members, including the Oversea Representatives at the Annual Representative Meeting, to attend the Annual Dinner as the guests of the Association, and (2) any other special hospitality that can be offered.

VISITS OF REPRESENTATIVES OF THE ASSOCIATION TO THE OVERSEA BRANCHES.

213. As will be remembered, the Chairman of Council, in 1914, visited, on the invitation of the Branches in Australia and New Zealand, both these Countries on behalf of the Association. He was most hospitably received, met with a warm and cordial welcome, and the visit had the direct result of increasing the interest taken by those Branches in the work at home and by the parent body in the work and welfare of its fellow-members beyond the seas. The Council is gratified to have received from the South African Branches an invitation that a representative of the home Association should visit that Country, and the Council hopes that it may soon be possible to arrange for such a visit.

TERMS AND CONDITIONS OF SERVICE OF MEDICAL OFFICERS IN THE COLONIAL MEDICAL SERVICES.

214. In its Annual Report for 1918-19 (*B.M.J.* Supplement, May 3rd, 1919, p. 86), the Council drew attention to (1) the deep and widespread discontent prevailing among the medical officers of the Protectorates in East Africa as to the terms and conditions of service there, (2) the steps taken by the Association for redress of those grievances, (3) the increased rates of

remuneration authorised in Memorandum 99 of the Colonial Office of February, 1919, and (4) the still outstanding discrepancy between the remuneration of the medical officers of the East African Protectorates and those of the West African Medical Staff. The Council continued to press the matter upon the attention of the Secretary of State for the Colonies.

215. In November 1919, the Secretary of State appointed a Colonial Medical Services Committee, with the following reference:—

To consider the position of the medical services of the various colonies and dependencies, with a view to maintaining and increasing the supply of candidates and to securing contentment within the service; and to consider whether the principle of assimilating the medical service of neighbouring colonies may usefully be extended, and if so, how far, and by what means.

216. The Council arranged to place evidence before the Committee, and accordingly addressed, through "Current Notes," requests to the Oversea Branches, Colonial medical officers, and others interested, to send to the Council any further points which it was desired should be included in the evidence of the Association. In response, some 30 Branches and former and present medical officers, communicated with the Medical Secretary on the subject. Preliminary to settlement of the evidence to be placed by the Association before the Colonial Medical Services Committee, there was also held, on February 19th, 1920, a Conference of the Dominions Committee with as many Colonial medical officers (serving or retired), as were available in the United Kingdom, together with certain other members of the profession known to have special experience of the terms and conditions of the Colonial medical services. The Conference, believed to be the first conference held of representatives of the Colonial medical services generally, proved most valuable. As a result of its deliberations there was forwarded to the Colonial Medical Services Committee the appended Memorandum of Evidence (*see* Appendix V). Verbal evidence in support of the Memorandum was, on February 23rd, given before the Committee, on behalf of the Association, by Dr. J. H. Goodliffe, Medical Officer and Dr. R. L. Van Someren, Senior Medical Officer, Uganda Protectorate, the Medical Secretary, and the Assistant Medical Secretary (Dr. A. D. Macpherson).

217. In view of the strong consensus of opinion of the Conference in favour of a limited system of grouping of the medical services of the Colonies, the Council had no alternative but to abandon, as regards the representations being made to the Colonial Medical Services Committee, the proposal contained in paras. 226-8 of the Annual Report of the Council, 1918-19, (*B.M.J.* Supplement, May 3rd, 1919, page 86) and approved by the Annual Representative Meeting 1919, for establishment of a general medical service for the whole of the territories in Africa administered by the Colonial Office. The Council is convinced that, as matters at present stand, an amalgamated medical service for East and West Africa is impracticable. The grouping recommended by the Council, as an immediately practicable step, is set out in paras. 43-6 of the Memorandum of Evidence. As will be seen, the Council has pressed, *inter alia*, for formation of an East African Medical Service to include the whole of the Protectorates of that area (British East Africa, Nyasaland, Somaliland, Uganda and Zanzibar), and any contiguous territories ultimately absorbed. The case of the West African Medical Staff affords an example of the advantages to all concerned obtainable by the grouping system. In urging upon the Colonial Medical Services Committee, especially in the oral evidence submitted, the need for that reform, as well as for many other, the Council is confident that work of real value to both the profession and the public has been done. The Colonial Medical Services Committee has not yet reported, but developments will be watched with a view to further action.

PENSIONS OF MEDICAL OFFICERS RETIRED FROM THE COLONIAL SERVICES.

218. In view of the greatly altered value of money, the question was taken up with the Colonial Office of the urgent need for increase of the pensions of medical officers retired from the Colonial services. The Colonial Office has replied that the matter is under consideration and that it is hoped to arrive at a decision soon, but that that decision will affect all pensioners, medical and otherwise.

J. A. MACDONALD,

Chairman of Council.

April 14th, 1920.

APPENDIX III.

JOINT OPINION OF Mr. C. E. E. JENKINS, K.C., AND Mr. T. R. COLQUHOUN DILL ON QUESTION OF POSSIBILITY AND DESIRABILITY OF ALTERING THE CONSTITUTION OF THE ASSOCIATION SO THAT IT MIGHT BECOME, WHOLLY OR PARTLY, A FEDERATION OF MEDICAL BODIES.

1. On the main question on which we are asked to advise, we are of opinion that it is possible so to alter the constitution of the British Medical Association that it may become in effect a federation of medical bodies without abandoning its present position as an Association of individual members of the medical profession. And we are of opinion that this can be effected without any alteration of the existing Memorandum of Association, and therefore without any application to the Court.

2. It is hardly for us to express an opinion as to the desirability of taking the course suggested. But the facts placed before us afford considerable ground for supposing that the adoption of such a course would go far towards meeting the desire of certain Branches (particularly those in the Oversea Dominions and in Ireland) for greater independence and freedom of action, while at the same time preserving the status and prestige of the parent Association.

3. Subject to any restrictions imposed by its own Regulations, it is open to any Company registered under the Companies, etc., Act, 1908, to admit any individual or any other corporation to membership. There is nothing in the existing Memorandum of Association of the British Medical Association to prohibit this. It does not in any way deal with membership, and the objects stated in Clause 3 are quite compatible with the admission to membership of incorporated bodies connected with the medical profession or the medical and allied sciences, or of individuals who, although not qualified for membership under existing Article 3, might be considered as desirable members as nominees of or otherwise representing the interests of unincorporated Associations of a similar character.

4. If the proposal were adopted it would be necessary for the Association in general meeting to pass and confirm special resolutions making considerable alterations in the present Articles of Association.

Article 3 would have to be altered so as to provide for three classes of Members, viz.:-

- (I.) Medical Practitioners as at present, and
- (II.) Incorporated organisations having objects similar to those of the Association. The precise

definition of the classes of organisation admissible to membership would require careful consideration. We suggest that it should be wide enough to include separately incorporated Branches of the Association (whether within or without the United Kingdom) and other incorporated bodies (whether consisting of members of the Association or not) concerned with the welfare of the medical profession or of allied professions (such as nursing) or with the promotion of the medical and allied sciences. Approval by some body representing the Association (we suggest the Council) ought to be made a condition of admission to membership, and the approving body might be permitted to impose conditions of membership which might be either general or applicable to a particular organisation seeking admission. Of course the bodies so admitted to membership must be empowered by their own regulations to become members of such a body as the Association.

(III.) Individuals, not eligible for membership under (i.) but whom it might be desired to admit as nominees representing the interests of unincorporated associations of a similar character to the Corporations referred to in (ii.). In this connection it will be remembered that an unincorporated association cannot itself be a member of a company registered under the Companies Act. A member must be a legal entity, that is, an individual or a corporation.

Many consequential alterations of the Articles and the By-laws would be necessary. In fact there should be a separate set or separate sets of provisions applicable to classes (ii.) and (iii.) and dealing with subscriptions (which might be on a capitation basis), termination of membership, expulsion, rights of voting at meetings, and of representation on the Representative Body and the Council. Other matters as to which special treatment for classes (ii.) and (iii.) would be required would no doubt suggest themselves in the course of the revision of the Articles and By-laws.

It would also, we think, be desirable to insert in the Articles some provision as to the dissolution of Branches of the Association. The present Article 12 does not extend to this. In the event of a Branch becoming incorporated the new corporate body would be a member of the Association and would probably include amongst its own members the persons who were members of the Branch. These persons would pay subscriptions to the new corporate body, and would not be likely to pay an additional subscription to the parent Association. In such a case it would be unnecessary and probably impracticable to continue the organisation of the Branch and it would be desirable to dissolve it. But of course it would be open to the members of a dissolved Branch to remain members of the Association if they wished.

5. The alteration of the Articles and By-laws in the manner suggested is a domestic matter which would concern the members of the Association only. None of the bodies which have in the past opposed the efforts of the Association to obtain increased powers would have any voice in this matter or any power to oppose the change. The change does not in fact involve any increase in the existing powers.

6. The admission to membership of an organisation which was itself a trade union would not involve any breach by the Association of the proviso to Clause 3 of the Memorandum of Association. If the Articles were altered as suggested there would not, in our opinion, be any legal objection to such an organisation becoming a member.

7. We are strongly of opinion that the Association will best consult its own interests and those of the profession by remaining incorporated. As some of the advantages of incorporation we may point out that a Corporation is a legal entity with a recognised status, capable of holding property and contracting, suing, and being sued in its own name: its members and officers are not personally responsible for its acts or liable under its contracts, and the whole liability of any member is limited (in the case of such a corporation as the Association) to the amount of his annual subscription and the amount of his contribution (in the improbable event of a winding-up) as fixed by the Memorandum.

In the case of an unincorporated society property must be vested in a fluctuating body of trustees, and contracts must be entered into by trustees or officers or other agents who must necessarily incur personal liability in so doing. These disabilities must have the effect of hampering and restricting the operations of the Society.

For the Association to revert to the position of such a Society after having enjoyed the advantages of incorporation for many years would, in our opinion, be a retrograde step involving the abandonment of a large part of its dignity and prestige and the loss of many of its present facilities for carrying on its work.

6th March, 1920.

APPENDIX IV.

MEMORANDUM OF EVIDENCE GIVEN BEFORE THE DEPARTMENTAL COMMITTEE ON THE WORKMEN'S COMPENSATION ACT ON BEHALF OF THE BRITISH MEDICAL ASSOCIATION.

I.—THE POSSIBILITY OF INCLUDING IMMEDIATE MEDICAL AND SURGICAL TREATMENT AFTER AN ACCIDENT AS PART OF THE BENEFIT TO WHICH AN INJURED WORKMAN IS ENTITLED.

1. Immediate medical and surgical treatment is already provided for under the National Health Insurance Act. Under the new regulations which are expected to come into force as from April 1st, 1920, every injured workman will be entitled to medical or surgical treatment by any panel practitioner in an emergency, even although his own panel doctor is not available.

2. There are, however, certain juveniles who do not come under the scope of the National Health Insurance Act, viz.: those juveniles who are employed and who have not attained the age of 16. For immediate treatment for these cases the employer should be responsible.

3. There are numerous cases of injury the treatment of which beyond first aid is outside the scope of ordinary competence and skill of an ordinary panel practitioner, and therefore outside the agreement of an insurance practitioner with the Insurance Committee. These cases are, wherever possible, sent to some institution where the necessary treatment can be provided, and it is the duty of any panel practitioner to advise where such treatment can be obtained. It happens in many cases that the injured person objects to being sent to an institution rather than to his own home, and this matter is dealt with under III. B. para. 7.

4. It should be incumbent upon the employer to provide such first aid appliances as are necessary; and the arrangements in this connection should be under the direction and inspection of the medical referee. The employer should be compelled to put in charge of the first aid department someone who is trained in the subject. The onus of the provision of proper transport should be upon the employer.

5. In the case of big works where there are large numbers of employees it would be to the benefit of the employer to provide immediate medical and surgical treatment by appointing a suitable doctor or doctors to carry out this work.

II.—THE TREATMENT AND TRAINING OF THE WORKMAN WHO HAS SUFFERED SERIOUS INJURY AS THE RESULT OF AN ACCIDENT, WITH A VIEW TO HIS RETURN TO SUITABLE EMPLOYMENT.

A.—Treatment.

6. Adequate and efficient treatment of minor as well as serious injuries is essential in order that an injured person may be able to return to his former employment or to some other suitable occupation. Many minor injuries are inadequately treated because there are not at present facilities in every district for proper treatment. In many districts where there are hospitals for the treatment of serious cases, no provision is made for the treatment of minor cases, e.g., by massage, electricity, etc. There are many injuries which it is practically impossible to treat efficiently at home and which can only be attended to by persons trained in that particular work. For instance, a practitioner of ordinary competence and skill cannot be considered to have the necessary knowledge to enable him to treat certain injuries by massage and electricity. It is of course incumbent upon him to advise the injured workman where he can obtain such treatment, but it often happens that there are no facilities of the kind available within a reasonable distance.

7. There are many cases which would benefit materially if certain recommended treatment were accepted by the patients. Where such recommended treatment is not accepted by the patient the same should be referred to the medical referee whose decision (after consultation with the injured person's own medical attendant) should

be final. Compensation should be reduced if the injured workman unreasonably refuses to undergo such treatment. (Examples in explanation of this point will be given by the witnesses).

8. It should be the employer's duty to supply the necessary appliances such as artificial limbs, trusses, etc. which are considered to be necessary by the medical referee.

B.—Training.

9. Where a workman is permanently disabled from following his own occupation or so disabled that his earning power is permanently reduced the medical referee should certify to this effect and state for what class of work he is fit to be trained.

10. Use might be made of the institutions which have been set up by the Ministry of Pensions in order that the injured workman might be trained with a view to his return to suitable industrial work.

III.—THE PLACE OF THE DOCTOR OR SURGEON IN THE PROCEDURE FOR DECIDING DISPUTED CASES, WHETHER AS WITNESS, MEDICAL REFEREE, OR ASSESSOR.

A.—Medical Witness.

11. No attempt should be made to dispense with the evidence of the patient's own doctor.

12. In any disputed case (disputed owing to conflicting medical evidence) the medical evidence should not be heard in open Court but the whole facts of the case should be submitted to a medical referee appointed by the State and the medical witnesses should be summoned before the medical referee and speak to the facts of the case as they appear to them.

13. In a disputed case either party should be permitted to have the case discussed in this manner i.e. as far as the medical aspect of the case is concerned. The opinion of the medical referee might be final or an appeal could be allowed to a Board of Medical Referees. If the above procedure were adopted it would tend to prevent such circumstances as:—

(a) Unnecessary expenditure of money.

(b) Cases of neurasthenia the result of long drawn-out litigation on points of medical evidence alone. A Neurosis very often rests upon the idea of the injury rather than upon the injury itself.

(c) The eliciting of untrue opinions, the result of forensic craft.

(d) Distrust of the employer by the workman who imagines that the doctor who is engaged by the employer will always act against the interests of the workman.

14. Opportunity should always be given to a doctor representing the deceased's family or trade union and a doctor representing the employer to be present at a post mortem.

B.—Medical Referee.

15. Should be appointed by the State.

16. Should be thoroughly competent in this branch of work.

17. Should have the supervision and control of all first aid appliances and arrangements.

18. Should be available for consultation if required by the injured person's doctor.

19. Should decide all cases which are disputed on medical grounds, his decision in this case to be binding on either party, with the exception that an appeal might be allowed to a board of medical referees.

20. To decide in cases where pre-existing disease is a factor, and to assess the percentage of incapacity in connection with same.

21. Should have the power to enforce treatment after consultation with the injured person's own doctor and to reduce benefit if treatment is refused.

22. Should decide as to whether or not such appliances as artificial limbs, trusses, etc., are necessary.

23. Should advise as to the suitable treatment and training which he considers necessary in order to fit the injured person to return to suitable employment.

C.—Medical Assessor.

24. Would not be necessary if the procedure outlined above were adopted, but should present arrangements hold, whereby disputed cases are decided in open Court then the medical assessor should be summoned in all cases where medical evidence is to be taken.

25. It should not be optional for the judge to say whether or not the medical assessor is to be present.

26. It should be for the medical assessor to decide on points of conflicting medical evidence.

IV.—THE POSSIBILITY OF ESTABLISHING A PERCENTAGE SCALE OF INCAPACITY, COMPENSATING PHYSICAL INJURY ACCORDING TO NATURE OF INJURY, OCCUPATION, AND AGE OF INJURED PERSON.

27. Difficulties here are very great but the adoption of such a scheme might be possible in one or two specific instances such as loss of an eye, total or partial loss of a limb or some well defined injury but even in these cases the injured person's wage-earning capacity differs according to the nature of his work. The experience of the Ministry of Pensions might be useful.

28. The establishment of a percentage scale of incapacity would mean the cross-indexing of every bone and joint with every trade or vocation, for instance, by taking say, the right hand, the use of which in every trade would have to be gone into and a percentage value established on each digit.

29. Possibly the best plan would be to postpone such a scheme for a time, for, were treatment and training obligatory, there would later on be more satisfactory data which would serve as a guide in this connection.

V.—WHEN SHOULD COMPENSATION COMMENCE?

This is not primarily a medical question, but a few observations may not seem to be out of place.

30. The present method whereby compensation is not paid until the workman has been off work for 14 days is liable to misuse. Quite apart from any question of malingering, for in the Association's opinion there is no great amount of malingering, it is only in accordance with our knowledge of human nature to suppose that a workman who is able to resume his work on the 12th day will be tempted to make the most of his condition in order to receive compensation as from the first day of his accident.

31. It would be a benefit to employer and to employee alike if compensation were paid from the fourth day for the following reasons:—

(a) The injured workman who is tempted to make the most of his condition in order to come within the 14 days' rule will probably resume work much sooner.

(b) It would prevent the injured workman continuing his employment in the belief that his injury will not last long enough for him to obtain compensation under the 14 days rule. There are instances where this has happened with bad results. Had the patient been in a position to claim compensation earlier by stopping his work then he might have prevented a condition arising which would cause him to claim compensation for a longer period. In such a case both the employer and employee would benefit.

(c) Payment of compensation from the fourth day would obviously be of benefit to the employee as he would be in receipt of compensation sooner.

To pay compensation from the first day would cause endless clerical work and would be impracticable in view of the many trivial cases which last for one or two days.

32. Payment of compensation, no matter when commenced should not be held as an admission of liability. There may be many cases where medical evidence would prove that liability should not be admitted. If payment of compensation could be made without prejudice it would be an advantage.

APPENDIX V.

MEMORANDUM OF EVIDENCE PLACED BY THE BRITISH MEDICAL ASSOCIATION BEFORE THE COLONIAL MEDICAL SERVICES COMMITTEE (APPOINTED IN NOVEMBER, 1919, BY THE SECRETARY OF STATE FOR THE COLONIES), ON 23RD FEBRUARY, 1920.

1. The reference to the Colonial Medical Services Committee is:—

“To consider the position of the Medical Services of the various Colonies and Dependencies, with a view to maintaining and increasing the supply of candidates, and to securing contentment within the Services; and to consider whether the principle of assimilating the medical services of neighbouring Colonies may usefully be extended, and if so, how far, and by what means.”

2. The information contained in this Memorandum is mainly based upon information obtained from the Colonial Branches of the Association. The Committee will no doubt make due allowance for the way in which the information has had to be gathered—the difficulties and delays in communication, the fact that obviously it is very difficult to submit witnesses with firsthand evidence; and that it is in some cases impossible for the Association to give the names of those who have supplied the information.

3. The British Medical Association has approximately 6,500 members outside the United Kingdom, including a large proportion of the members of the Medical Services of the various Colonies and Dependencies, who look to it to voice their grievances and protect their interests.

4. The Association proposes to place before the Committee:

(i.) some points which according to information placed at the disposal of the Association, militate against contentment within the Service and make it unlikely that a proper supply of candidates will be maintained, with suggestions as to remedies;

(ii.) the opinion of the Association as to assimilation of the Medical Service of neighbouring Colonies.

I. DEFECTS LEADING TO DISCONTENT IN THE SERVICE.

5. These may be grouped under the heads:—

(A) The nature of the work and the conditions of service;

(B) Pay, allowances and pensions.

(A) NATURE OF THE WORK AND CONDITIONS OF SERVICE.

Need of Fuller and Clearer Statement of Conditions of Service.

6. The full nature of the contract made by entrants into the Service is often not understood by them. Many members of the Service are discontented because they now realise that the pensions attainable are not what they thought they would be when they entered, or because the opportunities for private practice are less than they expected.

7. Doubtless many of these impressions are due to want of proper care and foresight on the part of applicants, but the Association believes there is a need for a more careful statement in black and white of the exact terms, conditions and prospects of the Service, including all privileges to be enjoyed by the medical officer. In some cases there appears to be no formal written contract between the Secretary of State or Local Government and the Medical Officer. It should be impossible for this to happen.

INSUFFICIENT INSPECTION OF WORK, AND HELP BY SUPERIOR OFFICERS: WANT OF INTIMATE TOUCH WITH COLONIAL OFFICE.

8. *More frequent inspection* of the work of scattered officers is strongly recommended. More frequent visits by the superior administrative officers would be welcomed by the medical officers. At present there is perhaps a tendency to judge them too much by their reports. All officers are not equally good at making the best of themselves on paper.

9. In addition to this visitation, the Association strongly recommends the appointment of one or more *Inspectors or Travelling Commissioners* who should be officials of the Colonial Office and should spend part of their time travelling and part in the Colonial Office. They should be men with large tropical experience and outstanding reputation in the Service. These officers would be liaison officers between the Services of the different Colonies and the Colonial Office and its Advisory Committee; they would be able to take a wide view of the needs and possibilities of the Service and would be able to impress that view both at the centre and at the periphery.

10. The above considerations lead the Association to press for much wider publicity for the present *Advisory Committee to the Colonial Office*. The existence of that Committee seems to be scarcely known to officers in many parts of the Service; apparently its main dealings up to the present have been with the West African Service. The Association strongly recommends that the Medical Services in all the Colonies be kept in touch with the Committee and that its scope and influence be extended as widely as possible.

NEED FOR MORE HOSPITAL AND OTHER BUILDINGS AND EQUIPMENT, ALSO PATHOLOGICAL FACILITIES.

11. Before the war the Association was given to understand that in many areas the *hospital and dispensary facilities were insufficient*. That deficiency is now still more marked. The Association would urge that reports on this point be called for and given the most favourable consideration possible.

12. There is apparently need for *standardisation of the supply of equipment*, both drugs and appliances, and surgical instruments and hospital equipment. This matter should receive the attention of the Advisory Committee.

13. The need for *increased Pathological facilities and Pathological staff* is being more and more recognised in all countries. These facilities are deficient probably in every Colony.

OPPORTUNITIES FOR PRIVATE PRACTICE.

14. The offer of opportunities for private practice has played a great part in attracting medical men to some of the posts with the smaller salaries. But the Association has good reason to believe that this factor is losing its attraction because medical officers find that the private practice is often very small and sometimes it is limited by conditions which make it very unattractive. For example, in Grenada, the Government tariff of fees for attendance on "labourers," has tended to place a very low value on fees in private practice. Many who are better situated financially than the "labourer," regard the Government tariff as a standard of medical remuneration and demur to the payment of reasonable fees. The Government of Grenada not long ago appointed a Committee to formulate a tariff of fees for private practice. This tariff has not been officially enforced, but the Association considers that any attempt to regulate the fees for private practice is bound to lead to discontent and is a mistake, inasmuch as it interferes with that elasticity as regards charges which enables the doctor to attend the deserving at lower rates by charging people who are well able to afford a higher fee.

15. From the amount of correspondence which the Association has had on this subject, together with its experience in the kindred case of the Indian Medical Service, it believes that it is very important that no undue restriction should be put on the right of private practice. The public who are not entitled to the medical officer's services as a right, welcome the opportunity of access to a well qualified man, and the fact that the official income can be increased by private practice is a stimulus to good men to enter the Service and to endeavour to earn a reputation while in the Service.

16. The Association therefore recommends (a) that where private practice is allowed, it should not be whittled down by restrictions; (b) that official tariffs should not be framed for people who are able to pay for and look after themselves; and (c) that no objection should be raised to medical officers increasing their fees for private practice to meet the present economic conditions.

QUALIFICATION FOR SERVICE.

17. The Association is concerned to learn that in the West Indies vacancies are frequently filled by the appointment of holders of American diplomas. This procedure is not calculated to strengthen British influence in the West Indies.

STATUS OF MEDICAL OFFICER.

18. The Association believes that it is very desirable that in order to establish and maintain the status of the Service, the Director of Medical Services of a Colony or Protectorate should be *ex-officio* a member of its Legislative and Executive Councils, where such bodies exist.

RESTORATION OF PRE-WAR PERSONNEL.

19. No stone should be left unturned to restore, and, in many cases, increase the pre-war personnel. The difficulties of this are realised. There is a shortage in the supply of doctors which will continue for a few years, and there are plenty of posts available at home at salaries which are better than those offered for even more responsible work in the Colonial Medical Service. The consequence is a shortage of entrants which is very hard on the overworked members of the staff, and consequently prejudicial to the efficiency of their work, and makes them discontented. The knowledge that those in the Service are discontented, quickly spreads, and once a Service gets "under a cloud" it takes a considerable time, even after everything has been done to remove grievances, before it begins again to attract the right kind of recruit.

OPPORTUNITIES FOR SPECIALIZATION.

20. Specialization needs to be recognised in the Colonial Medical Services to a much greater extent than it is at present. There are few areas so small as to be able to do without Surgical Specialists, Pathologists, Radiologists, Ophthalmologists and Specialists in Venereal Disease. Officers should be encouraged to fit themselves by special study for such posts, which should carry with them extra pay.

HOUSING.

21. A scarcity of suitable houses is reported from many quarters. It is realised that this is inevitable in present circumstances, but the Association considers that all the Colonial Governments should make themselves responsible for providing houses for all their Medical Officers.

SANITARY DEPARTMENT.

22. The evidence at the disposal of the Association leads it to believe that the Colonial Office seems to attach insufficient importance to the Sanitary Department of some of the Services. There is evidence that in East Africa for example the *personnel* is inadequate, leading to the medical officers having to do work which could quite well be done by subordinates.

Strong complaints have been received as to the lack of qualified British Sanitary Inspectors in many Services. The Association believes a certain number of these inspectors to be necessary for the sake of discipline and example, and even where natives have been trained as inspectors. The British Sanitary Officers who are employed are believed to be very insufficiently paid, with poor prospects as regards promotion and pension, and overworked.

THE NURSING STAFF.

23. An adequate staff for this important auxiliary service is naturally a matter of great concern to those interested in the Services of the Colonies. The Association trusts that the Committee will report in favour of a considerable development of this Service in every Colony. The matrons and sisters should be thoroughly well trained British Nurses, with a salary and prospects of pension which will induce women of that kind to accept service. They should be given plenty of help from native sources.

STAFF OTHER THAN MEDICAL OFFICERS AND NURSES.

24. There is reason to believe that in many districts the native staff (other than nursing) for assisting the doctors is insufficient. The need for more adequate clerical assistance has frequently been mentioned to the Association.

LEAVE.

25. This importance question is bound up with the restoration of pre-war *personnel*. Until the cadre is complete there will be constant dissatisfaction in the Service owing to the inability to get leave.

26. The Association has abundant evidence that the opportunities for leave are at present insufficient. Its experience in regard to the Colonial Services in previous years, and the Indian Medical Service during the past year or two, has convinced it that there can be no contentment in any Foreign Service unless there are proper arrangements for local, home, and study leave.

27. The Association feels that there is no need to elaborate this point further, except to emphasize the growing importance which is attached to study leave as a factor in improving the status and efficiency of a Service.

PROMOTION.

28. There is much discontent caused by difficulties as regards promotion, and these seem to the Association to be inherent in a Service, most of the units of which are so small. The ideal way of getting rid of these difficulties would be by the establishment of one Colonial Medical Service, but the Association realises that this is, at present at any rate, unattainable.

29. A great deal of relief would be given by adopting the grouping system referred to in a later paragraph. Generally speaking, the Association believes there should be more interchange of medical officers wherever possible, and that the records and capabilities of individual officers should be brought regularly before the Advisory Committee, which might do much in the way of facilitating interchange and promotion.

30. If the Committee is not convinced of the practicability of the grouping system, the grievances connected with the lack of promotion must be met by more liberal salaries, with equitable grading.

31. Incidentally the Association would suggest that the Army System should be adapted to the Medical Service, and that the Annual Confidential Report of the Principal Medical Officer should be sent to the subordinate concerned for his information and initialling.

32. Attention is called to the delay which frequently occurs in filling senior posts. As an example, the P.M.O. of Uganda retired in February, 1918, with one year's leave on full pay due to him. During that year the D.P.M.O. did the work

of the P.M.O. without extra pay, and a S.M.O. did the D.P.M.O.'s work. The P.M.O. finally retired in February, 1919, and the post was not filled until July. The Deputy's post was not filled until December, and apparently the vacant S.M.O.'s post has not yet been filled, though the Governor and the Acting P.M.O. recommended a medical officer for the post in April, 1919.

(B.) PAY, ALLOWANCES AND PENSIONS.

33. The Association fully recognises the impossibility of fixing any scheme which would be appropriate to every Colonial Medical Service. It is convinced that the present payments are inadequate, even with the war bonuses that have been granted. The cost of living has mounted rapidly in practically every part of the world, and the Association is not aware of any place in which the bonus has placed the recipient even approximately in his pre-war position.

34. The Association recommends that the salaries of Colonial Medical Officers should be revised throughout and brought into line with those in the Army, Navy and Indian Medical Services, and would recommend that there should be at least a 50 per cent. increase on pre-war salaries (including emoluments).

35. The Association wishes to point out that the granting of bonuses, welcome as they have been, has led in the case of the Colonial Services to a new hardship. The war bonus is not pensionable and therefore an officer who retires now and has his pension based on pre-war salary, is placed in an almost impossible position.

36. In a later paragraph the Association refers to action it has taken in regard to pensions of men already retired, but it would strongly urge that steps be taken to prevent more persons being added to that aggrieved class. This grievance should be remedied by an all-round increase of salaries as above suggested. If this cannot be brought about immediately, war bonuses should at once be merged into salaries.

37. The pensions would of course increase with the salaries. On this point the Association would urge that all Colonial medical appointments filled from this country should be pensionable. It is understood that there are still some few non-pensionable posts in the Service. The Association is of opinion that all salaried members of a Foreign Medical Service, on whose time the Government has the first claim, should be entitled to a pension.

38. The question of gratuities should also be placed upon a firm basis. Certain anomalies at present exist which should be got rid of. For example, in Eastern Africa owing to the decision to postpone the operation of the gratuity principle until (at the earliest) 1921, a medical officer with service between twelve and eighteen years would receive no extra gratuity for the period he has served over twelve years, and has necessarily to serve until (at least) 1921 in order to be in a position to claim any gratuity.

39. The Association would suggest that gratuities be on the following scale:—After nine years' service, £1,000; after twelve years' service, £1,250; and for every year from twelve to eighteen years' service an additional £100 gratuity. (These amounts are stated in pre-war values. They should be increased on same scale as pensions to meet the de-valuation of money).

The pension should be capable of being claimed as a right after eighteen years' service, irrespective of age.

Existing Pensions of Retired Colonial Medical Officers.

40. The Association has for some time been urging upon the Colonial Office the need for increase of pensions of medical officers who have retired from the Colonial Service, in view of the greatly altered value of money resulting from the war. The Colonial Office replied that the majority of the Colonial Governments had replied to a communication addressed to them to the effect that they hoped a decision would be arrived at in the near future, but that as the decision would affect all pensioners, medical or otherwise, difficult questions of considerable complexity were involved in the case of the less opulent colonies.

41. The Association realises that this is a very wide-reaching and difficult question, but it comes within the purview of the Committee because the popularity of a Service depends largely upon its history. If a Service gets a reputation for behaving shabbily to the men in its service, the best men fight shy of entering it. If, on the contrary, the Service acts equitably or even generously to the men who have served it well, it can depend with confidence on a supply of the right men.

42. The Association would therefore be glad if the Committee could do anything to hasten the equitable settlement of this question, which is one of the deepest concern to many men who have served the Empire well and who have a right to

expect it to help them in economic circumstances over which they have no control.

II.—QUESTION AS TO ASSIMILATION OF MEDICAL SERVICES OF NEIGHBOURING COLONIES.

43. As previously stated, the Association considers that the ideal would be one general Colonial Medical Service, but as the difficulties seem at present to be insuperable, the Association would strongly recommend that there should be a system of grouping of the Services of Colonies working under similar conditions. Thus, for example, the East Africa, Uganda, Nyasaland, Somaliland and Zanzibar Protectorates, with any adjacent territories ultimately absorbed, would obviously form a suitable group.

44. The Association would point to the good example of what has been done in West Africa as a vindication of this suggestion. The advantages of such grouping are great, particularly as bearing on leave and promotion. Such a group would be large enough for the creation of an *esprit de corps* which cannot exist in very small Services.

45. The Association would advise a considerable extension of this grouping scheme. For example there might be a West Indian Group; a Mediterranean and Minor Colonies Group; a West African Group; an East African Group; and an Eastern Asia Group.

46. The Association attaches a good deal of importance to this suggestion, which it hopes will receive the earnest consideration of the Committee.

NOTICES OF MOTION BY DIVISIONS FOR THE ANNUAL REPRESENTATIVE MEETING, CAMBRIDGE, 1920.

By Uganda Division :

That the Representative Body, being of opinion that the time has come when officers of His Majesty's Colonial Services should be accorded the same privileges as other officers of His Majesty's Services, amend By-law 7 to read as follows :

7. Notwithstanding anything contained in either of the two last preceding By-laws, officers of the Navy, Army, Air Force, Indian and Colonial Medical Services on the Active List are eligible for election through the Council or a Branch without any such certificate as therein mentioned.

By Coventry Division :

That the Representative Body is of opinion that the suggested remedy for existing financial straits of hospitals, namely, to demand contributions in aid of their maintenance from the patients, fundamentally alters the basis of the relationship hitherto existing between the Honorary Medical Staffs and the subscribers; and refers the question to the Council for consideration and report.

By Willesden Division :

That the Representative Body instructs the Council of the Association to consider what steps can be taken to deal with the undue advertising of drugs in various forms, for self-medication.

By Nottingham Division :

1. That the time has arrived when the Association should deal with the question of the medical attendance on miners' families, and endeavour to establish a minimum uniform rate throughout the kingdom.
2. That the salary of the Medical Secretary be raised to £2,000 per annum, and that of his Assistants pro rata.

NOTICE TO DIVISIONS AND BRANCHES.

The Supplementary Report of Council to the Representative Meeting will appear in the SUPPLEMENT of May 29th, 1920.

Notices of Motion and Amendment by Divisions and Branches for consideration by the Annual Representative Meeting will be published in the SUPPLEMENT as they are received, but none can be published later than June 12th, for which purpose they must be received by the Medical Secretary not later than the first post on Monday, June 7th.

It will be possible, however, to include in the Agenda for the Annual Representative Meeting all Notices of Motion and Amendment which are received by the Medical Secretary not later than the first post on Monday, June 14th, 1920.

Association Notices.

MEETING OF COUNCIL.

The next Meeting of Council will be held on Wednesday, May 19th, in the Council Room, 429, Strand, London, W.C. 2.

ELECTION OF REPRESENTATIVE BODY OF THE ASSOCIATION, 1920-21.

Constituencies in Representative Body.

THE list of the provisional **Home Constituencies** for election of the Representative Body, 1920-21, appeared in the SUPPLEMENT of January 24th, page 21.

As intimated to all the **Oversea bodies**, the Council has made each Oversea Division and Division-Branch, possessing an Honorary Secretary and the necessary organization, an independent Constituency.

Election of Representatives and Deputy-Representatives.

The Representatives and Deputy-Representatives in the Representative Body must be elected not later than May 28th, and their names notified to the Medical Secretary not later than June 4th.

The Council draws special attention to the fact that it is entirely within the discretion of each Constituency to decide whether the election of its Representative(s) and Deputy-Representative(s) shall be carried out **by General Meeting of the Constituency, or by postal vote.**

Date of Annual Representative Meeting at Cambridge.

The Annual Representative Meeting at Cambridge will begin on Friday, June 25th, at 10 a.m.

ELECTION OF COUNCIL OF THE ASSOCIATION, 1920-21.

THE list of the Groups of Branches in the United Kingdom for election of twenty-four members of the Council, 1920-21, and Nomination Form, appeared in the SUPPLEMENT of January 24th, page 22. **Nomination Forms** will be forwarded by the Medical Secretary on application by Branches, Divisions, or Members. The Nominations must be in the hands of the Medical Secretary **not later than May 17th.**

SCHOLARSHIPS AND GRANTS IN AID OF SCIENTIFIC RESEARCH.

SCHOLARSHIPS.

THE Council of the British Medical Association is prepared to receive applications for Research Scholarships as follows:

1. An *Ernest Hart Memorial Scholarship*, of the value of £200 per annum, for the study of some subject in the department of State Medicine.
2. *Three Research Scholarships*, each of the value of £150 per annum, for research into some subject relating to the causation, prevention, or treatment of disease.

Each Scholarship is tenable for one year, commencing on October 1st, 1920. A Scholar may be reappointed for not more than two additional terms.

The Conditions of the award of Scholarships are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

GRANTS.

The Council of the British Medical Association is also prepared to receive applications for Grants for the assistance of Research into the Causation, Treatment, or Prevention of Disease. Preference will be given, other things being equal, to members of the medical profession, and to applicants who propose as subjects of investigation problems directly related to practical medicine.

The Conditions of the award of Grants are stated in the Regulations, a copy of which will be supplied on application to the Medical Secretary of the Association, 429, Strand, London, W.C.2.

Applications.

Applications for Scholarships and Grants for the year 1920-21 must be made not later than Saturday, May 29th, 1920, in the prescribed form, a copy of which will be supplied by the Medical Secretary on application.

Each application should be accompanied by testimonials, including a recommendation from the head of the laboratory, if any, in which the applicant proposes to work, setting out the fitness of the candidate to conduct such work, and the probable value of the work to be undertaken. This is not intended, however, to prevent applications for Grants in aid of work which need not be performed in a recognized laboratory.

THE SOUTH AFRICAN CONGRESS.

THE South African Congress of the British Medical Association will be held in Durban in October next, when the Natal Coastal Branch will be the hosts, and the officers and council will form the local organizing committee.

BRANCH AND DIVISION MEETINGS TO BE HELD.

EDINBURGH BRANCH: SOUTH-EASTERN COUNTIES DIVISION.—Dr. M. J. Oliver, Honorary Secretary, St. Boswells, gives notice that the annual meeting of the Division will be held in the Railway Hotel, Newton St. Boswells, at 3 p.m. on Wednesday, May 19th. Business: Annual report and accounts; Appointment of Officers; Medical Parliamentary Fund; Local Emergency Schemes; Life Insurance Fees; Instructions to Representatives to Representative Meeting; Fees of Medical Officers to Post Office; Election to Council; Recruitment of Members; Medical Staffs of Hospitals, Pension Work.

LANCASHIRE AND CHESHIRE BRANCH.—The annual meeting for 1920 will take place at Southport on June 9th. The members will be entertained at lunch by the Southport Division, and after the President (Dr. Baidon, Southport) has given his address scientific papers will be read. A number of excursions are being arranged for the afternoon, and in the evening members will dine together. Members desiring to bring forward papers should communicate with the Branch Secretary, Mr. F. S. Heaney, F.R.C.S.I., 36, Rodney Street, Liverpool.

METROPOLITAN COUNTIES BRANCH: WESTMINSTER AND HOLBORN DIVISIONS.—A general meeting of the Westminster and Holborn Divisions will be held at the St. James's Vestry Hall, Piccadilly, on Thursday, April 29th, at 5 p.m. Agenda: Revised Ethical Rules; Election of (a) Representatives, (b) Members of Council; Increase of Fees; Subdivision of Divisions.

MIDLAND BRANCH: LINCOLN AND KESTEVEN DIVISIONS.—Dr. Godfrey Lowe, Honorary Secretary, Lincoln Division (42, Langworth Gate, Lincoln), gives notice that a meeting of members and non-members of the Lincoln and Kesteven Divisions will be held at the Lindum Restaurant, Lincoln, on Tuesday, April 27th, at 3 p.m. Dr. Alfred Cox, O.B.E., Medical Secretary, will attend and give an address, entitled "Some reflections on what an organization of medical men should be and should do." A discussion will follow. Tea will be provided.

INSURANCE.

CORRESPONDENCE.

THE INSURANCE ACTS COMMITTEE.

Proposal for a Complimentary Dinner.

SIR,—The letter signed by Drs. Brackenbury and Cox published in the SUPPLEMENT to the BRITISH MEDICAL JOURNAL of April 10th, 1920, page 93, was discussed at a meeting of the Standing Committee of Group K on April 15th, 1920.

Regret was expressed that the Insurance Acts Committee are not willing to agree that the scheme for a testimonial to Dr. Brackenbury and his colleagues as outlined in our letter of March 23rd, 1920, should proceed on the suggested lines. Whilst fully appreciating the reasons why such a scheme should not be proceeded with, and having regard to the response already made to our appeal, it was felt that some representative means should be adopted whereby the feelings of the profession might find expression. It was decided not to proceed with any testimonial without the consent of the proposed recipients, but it was the opinion of the Committee that a dinner should be held on the night of the next Conference of Panel Committees and Local Medical Committees, and

that the Insurance Acts Committee and Dr. Cox should be entertained as guests. It was decided for this purpose to ask all Panel Committees to subscribe a sum equivalent to 1s. per insurance practitioner in each area.

It is hoped that Panel Committees will nominate their delegates to the Conference as their representatives at the dinner.

The probable date of the dinner will be October 21st, but as arrangements have to be made some time in advance we hope to hear from the secretaries to Panel Committees at as early a date as possible.—We are, etc.,

51, Chancery Lane,
London, W.C.2, April 20th.

B. A. RICHMOND,
ROBT. J. FARMAN,
Secretaries.

Register of Insured Persons.

SIR,—I make no apology for once more calling upon the authorities concerned to endeavour, on the lines indicated by me on several previous occasions, to get a correct register of insured persons. And may one express the hope that doctors on the panel will actively interest themselves in this subject? If they do not, they might find that the present capitation fee will be reduced to about 8s., for the middle in the matter of medical cards and "title to benefit" is more muddily than ever. It would be interesting to know the total of the numbers that have been taken off our lists in London under the Suspense Scheme. I estimate the number at not under 300,000. But, Sir, since the date those lists were compiled or sent out (October, 1918) the number of persons of whom there is no trace must have doubled. How could it be otherwise when, until quite recently—and in respect of a person removed from my list in October, 1918, because of his death—the Insurance Committee have continued to send me every three months the official form requesting a report as to the man's occupation, temperature, pulse rate, sputum, if any, etc., etc. Now, Sir, I, not being in partnership with Sir Conan Doyle, M.D., simply could not furnish the details. And I wish to suggest that if the facts asked for are considered important, the London Insurance Committee should create a post—a special one, with, of course, a specialist's remuneration—and invite Sir Conan Doyle to take on the job. We might then learn something about the "diseases" the departed suffer from—the ills we wot not of—and at least the unfortunate public would be spared the cost of paper, printing, postages, and clerks' wages, all of which are matters of moment in these times, and all of which in this connexion are now wasted.

I think this idea is good, and I make a present of it to the Ministry of Health and the London Insurance Committee; and I hope, Sir, that you will think it good enough to let it see the light in your columns.

One hears it rumoured that the "domiciliary" treatment of tuberculous people is to be done away with. We cannot too soon be rid of all tragic farces. But, should one be misinformed, I would like to make the suggestion that, instead of the doctor in charge of a case being asked to furnish three-monthly reports upon it, the health authority should require the patient to present himself to the doctor every three months for examination. Then the doctor would be in a position to send a report. Under the present conditions the doctor is often unable to say whether the patient is still alive, as the insured person under domiciliary treatment seldom goes near his doctor unless he "has got a cold or a touch of the 'flu.'" But my suggestion, were it adopted, requires a correct register, and a correct register can only be arrived at by the adoption of my other suggestion—namely, enforcement of those clauses of the Insurance Acts which lay obligations upon the approved societies and upon insured persons. Until these clauses are enforced there is one person in the community who will continue to pay for breach of the law, and that person is the panel doctor.—I am, etc.,

London, W. 1, April 18th.

A. R. EATES.

LONDON PANEL COMMITTEE.

Post-graduate Instruction.

For the benefit of London insurance practitioners it is proposed to hold a course of lecture-demonstrations on laboratory methods in connexion with the prevention, diagnosis, and treatment of disease at Charing Cross Hospital on Thursday in each week at 9.30 p.m. The lectures will be given during May, June, and July by Dr. W. W. C. Topley, Director of the Pathological Laboratories, Charing Cross Hospital. The fee for the course will be £3 3s., payable in advance to the Secretary of the London Panel Committee, Dr. B. A. Richmond, Staple House, 51,

Chancery Lane, W.C.2. A certificate of attendance will be given to those attending the class lectures. Negotiations are proceeding which it is hoped will result in other courses being arranged in the near future.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty:—Surgeon Commanders: J. G. Wallis to the *Improbable*, additional, for Technical Staff of Commander-in-Chief, Devonport, as Naval Health Officer; W. L. Hawkins to the *Canterbury*; P. T. Nicholls to the *Wildfire*, for Sheerness Barracks and Yard; W. L. Martin, O.B.E., to the *Falant*; G. G. Vickery, O.B.E., to Portland Hospital; W. R. Harrison, O.B.E., to the *Temeraire*; J. Bourdas to the *Curlew* on commissioning. Surgeon Lieutenant Commanders: H. E. Scargill to the *Ark Royal*; F. C. Wright to the *Erin* (temporary); H. E. Perkins to R.N. Hospital, Portland; Surgeon Lieutenant M. B. Macleod to the *Benbow*, for general duties and ophthalmic specialist duties as requisite. Surgeon Lieutenant (temporary) G. I. Ritchie transferred to the Permanent List, seniority January 8th, 1915.

ARMY MEDICAL SERVICE.

Major-General James Thomson, C.B., C.M.G., retires on retired pay. Major-General J. B. Wilson, C.B., C.M.G., from half-pay list, is restored to the establishment. Colonel W. E. Hardy is placed on the half-pay list.

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel and Brevet Colonel C. B. Lawson retires on retired pay.

Lieut.-Colonel F. F. Carroll, D.S.O., is restored to the establishment. Lieut.-Colonels A. J. MacDougal, C.M.G., and C. J. O'Gorman, D.S.O., relinquish the temporary rank of Colonel.

Lieut.-Colonel J. P. Silver, C.B.E., D.S.O., retires on retired pay on account of ill health contracted on active service.

Lieut.-Colonel H. A. Davidson, D.S.O., and Major and Brevet Lieut.-Colonel W. F. Tyndale, C.M.G., D.S.O., relinquish the acting rank of Colonel.

The following relinquish the acting rank of Lieut.-Colonel: Major and Brevet Lieut.-Colonel B. A. Craig, Majors R. N. Hunt, D.S.O., H. W. Russell, O.B.E., C. J. Wyatt, Captain and Brevet Major R. E. Bamsley, Captain F. W. M. Cunningham, D.S.O.

Majors to be acting Lieutenant-Colonel: G. B. F. Churchill from June 12th to November 23rd, 1919, T. J. Wright, D.S.O.

Temporary Captain (acting Major) F. R. Kirkham to be acting Lieutenant-Colonel.

The following relinquish the acting rank of Major: Captains C. Clarke, D.S.O., R. F. O'T. Dickinson, O.B.E., M. B. King, M.C., J. W. G. H. Riddell, V.C., A. L. Robertson, O.B.E.; temporary Captains P. K. McCowan, F. R. Brown.

To be acting Majors: Temporary Captains R. K. Paton (June 12th, 1919), C. H. Booth (April 2nd, 1919), S. Campbell (April 16th, 1919); Captains J. H. M. Frohisher (from January 4th, 1918, to October 15th, 1919), J. T. Scrogie (from February 10th, to October 15th, 1919), R. O'Kelly (June 12th, 1919), C. C. Jones (from July 5th to December 3rd, 1919).

Captain P. A. With is seconded for service under civil administration of Mesopotamia (January 1st, 1917, substituted for notification in the *London Gazette*, October 27th, 1919).

Captains F. C. Davidson, M.C., and R. B. Phillippis, retire, receiving a gratuity.

Captain R. H. Williams is placed temporarily on the half-pay list on account of ill health contracted on active service.

The notifications regarding Captain J. H. M. Frohisher and temporary Lieutenant G. A. Pothergill, which appeared in the *London Gazette* of February 11th, 1919, and March 9th, 1920, respectively, are cancelled.

The following officers have relinquished their commissions:—Temporary Lieut.-Colonel A. G. P. Gipps and retains the rank of Lieut.-Colonel. Temporary Majors and retain the rank of Major: T. W. Shaw, E. B. C. White on ceasing to be employed at the Welsh Metropolitan War Hospital, December 20th, 1919 (substituted for notification in the *London Gazette* of February 20th, 1920). Temporary Captains and are granted the rank of Major: J. Hewat (November 15th, 1919) (substituted for notification in the *London Gazette* of December 19th, 1919), W. V. Macaskie, M.C., T. M. Crawford, (acting Major) R. McRae, S. A. W. Munro, M.C., (acting Major) B. G. Brooke, Temporary Captains and retain the rank of Captain: J. Keay, G. A. Crowe, R. Svenson, D.S.O., M.C., R. T. St. J. Brooks, R. A. Wright, H. R. Souper, G. Bateman, W. H. W. Mewharter, M. Horan, F. B. Penfold, J. P. F. Waters, F. C. S. Bradbury, A. King, G. F. Hardy, M. C., J. G. Castellain, J. G. Ingouville, R. Lindsay, A. L. Robinson, F. Green, G. G. Old, A. Willatt, E. M. Balthaser, C. S. Wynne, M.C., J. White-side, A. H. H. Barclay, W. T. Munro, T. P. Hutchison, R. H. Rains, E. A. Gilkes, P. A. Dykes, E. D. Wellburn, E. Clarke, W. E. Stevenson, O. Carley, F. J. H. Begg, E. J. Blewitt, H. B. Waller, R. C. Macpherson, H. W. Bernard, E. S. B. Eames, T. W. Parry, S. Nockolds. Temporary Captain H. Gardiner-Hill on transfer to R.A.F. Temporary Lieutenant G. A. Pothergill and retains the rank of Lieutenant.

ROYAL AIR FORCE.

MEDICAL BRANCH.

Transferred to the unemployed list: Captains H. G. Anderson, M.B.E. (May 31st, 1919), L. W. Shelley, D.S.O. (July 1st, 1919).

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Major M. R. Taylor, D.S.O., relinquishes his commission on account of ill health caused by wounds, and is granted the rank of Lieutenant-Colonel.

Captain (acting Major) C. J. Rogerson, M.C., to be acting Lieutenant-Colonel.

Captains J. Swan, M.C., C. Armstrong, and A. F. L. Shields relinquish the acting rank of Major.

Captain W. U. D. Longford to be acting Major from June 24th to October 4th, 1919.

INDIAN MEDICAL SERVICE.

The services of Major R. E. Wright, M.D., have been placed at the disposal of the Madras Government.

Lieut.-Colonel H. Austen Smith, C.I.E., M.B., appointed to officiate as Inspector-General of Civil Hospitals, Bihar and Orissa.

Colonel P. C. H. Strickland granted combined leave for eight months with effect from December 19th, 1919.

Lieut.-Colonel J. Entrican appointed Inspector-General of Civil Hospitals, Burma, s.p.t. with effect from December 19th, 1919.

Lieut.-Colonel D. McCay, M.D., granted combined leave for eight months with effect from March 15th.

Major J. D. Sandes, M.B., appointed to officiate as Professor of Materia Medica and Clinical Medicine, Medical College, Calcutta, and second physician Medical College Hospitals during the absence of Lieut.-Colonel McCay.

Lieutenant P. J. Walsh, M.B. (deceased) has been promoted to the rank of Captain with effect from March 30th, 1915.

Lieut.-Colonel R. P. Wilson, F.R.C.S., D.P.H., appointed permanently to be Professor of Surgery, Medical College, Calcutta, and Surgeon to the College Hospitals, vice the late Lieut.-Colonel C. R. Stevens, M.D., F.R.C.S.

Lieut.-Colonel F. P. Connor, D.S.O., F.R.C.S., appointed to be Professor of Clinical and Operative Surgery, Medical College, Calcutta, and Surgeon to the College Hospitals, vice Lieut.-Colonel R. P. Wilson.

Captain G. F. Graham, M.D., to be Major (February 1st, 1920).

The services of Major S. W. Jones, O.B.E., have been placed permanently at the disposal of the Government of Bombay.

Lieut.-Colonel R. A. Needham, C.I.E., D.S.O., Deputy Director-General Indian Medical Service, granted eight months' combined leave, with effect March 19th.

Lieut.-Colonel H. Ross, O.B.E., Assistant Director-General Indian Medical Service (Stores), appointed to officiate as Deputy Director-General Indian Medical Service.

Lieut.-Colonel A. A. Gibbs, Medical Store Keeper to Government, Lahore Cantonment, appointed to officiate as Assistant Director-General Indian Medical Service (Stores).

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Major T. L. Feanell, T.D., to be acting Lieutenant-Colonel whilst specially employed.

Captain (acting Major) N. M. Fergusson relinquishes the acting rank of Major on ceasing to be specially employed.

Captain (acting Major) M. U. Wilson, M.C., relinquishes the acting rank of Major on vacating the appointment of D.A.D.M.S., August 27th, 1919.

1st London General Hospital.—Lieut.-Colonel Sir A. E. Garrud, K.C.M.G., F.R.S., is retired under paragraph 116 T.F. Regulations, and is granted the honorary rank of Colonel.

1st Western General Hospital.—Captain J. L. Roberts is restored to the establishment.

TERRITORIAL FORCE RESERVE.

ROYAL ARMY MEDICAL CORPS.

The announcements regarding the following officers, published in the London Gazette of the dates indicated, are cancelled: Captains (acting Major) N. M. Fergusson (December 17th, 1918), T. Higson (December 21st, 1918), J. W. M. Jamieson (January 18th, 1919), W. W. J. Lawson (January 14th, 1919), H. B. Low (February 18th, 1919), F. W. Schofield (January 15th, 1919), R. D. Cran (January 16th, 1919), A. C. Lawrance (January 15th, 1919), F. H. Lacey (January 3rd, 1919).

VOLUNTEER FORCE.

Temporary Captains and Adjutants relinquish their commissions and are granted the honorary rank of Captain:—Keot R.A.M.C.V.: G. R. P. Stillwell, Northumberland R.A.M.C.V.; C. A. Morton.

Temporary Captains relinquish their commissions and are granted the honorary rank of Captain:—Durham R.A.M.C.V.: A. Dongall, W. G. Thompson, Lincolnshire R.A.M.C.V.; D. J. M. Bone, V.D. (honorary Major retired T.F.).

Temporary Lieutenants relinquish their commissions and are granted the honorary rank of Lieutenant:—Devonshire R.A.M.C.V.: H. J. Edwards, Durham R.A.M.C.V.; N. Philipson, A. D. Kelly, S. G. Mostyn, M. Fletcher, R. Gardner.

DIARY OF SOCIETIES AND LECTURES.

ROYAL SOCIETY OF MEDICINE.—Section of Otolaryngology: Monday, 8 p.m., Mr. Gerald B. Ash: Pathology of Pyorrhoea. Mr. H. Stobie: Infection about the Apex of the Tooth. Section of Medicine: Tuesday, 5.30 p.m., Annual General Meeting.

POST-GRADUATE COURSES AND LECTURES.

MANCHESTER: ANCOATS HOSPITAL.—Thursday, 4.30 p.m., Dr. Renshaw: Chemical and Bacteriological Examination of the Urine in Disease.

MANCHESTER FRENCH HOSPITAL.—Thursday, 4.30 p.m., Dr. A. C. Magian: Hysterectomy after Specific Infection.

MANCHESTER ROYAL INFIRMARY.—Tuesday, 4.30 p.m., Mr. F. Westmacott: Early Diagnosis of Carcinoma of the Larynx.

SHEFFIELD ROYAL HOSPITAL.—Wednesday, 4 p.m., Professor Arthur Hall: Bacterial Endocarditis.

WEST LONDON POST-GRADUATE COLLEGE, HAMMERSMITH, W.—Daily, 10 a.m., Ward Visits: 2 p.m., In-patient, Out-patient Clinics and Operations.

Monday, 2 p.m., Mr. Bishop Harman: Eye Department; 5 p.m., Dr. Morton: CO₂ Snow, Tuesday, 12 noon, Mr. Tyrrell Gray: Fractures; 5 p.m., Mr. Banks Davis: Lecture, Wednesday, 2 p.m., Mr. Donald Armour: Surgical Cases; 5 p.m., Mr. Addison: Ventral Hernia, Thursday, College closed, Friday, 2.30 p.m., Dr. Pritchard: Medical Cases; 5 p.m., Dr. Burford: Lecture, Saturday, 10 a.m., Dr. Arthur Saunders: Diseases of Children; 2 p.m., Dr. Owen: Out-patients.

29 Thur. London: Insurance Acts Executive Subcommittee, 2.30 p.m.
Westminster and Holborn Divisions, St. James's Vestry Hall, Piccadilly, 5 p.m.
30 Fri. London: Organization Committee (provisional), Bradford Division: Lecture by Dr. A. F. Hurst: Psychotherapy.
17 Mon. Last day for receipt of Nominations for Council.
19 Wed. London: Council.
South-Eastern Counties Division, Edinburgh Branch, Annual meeting, Railway Hotel, Newtown St. Boswells, 3 p.m.

MAY.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 7s. 6d., which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue.

BIRTHS.

BUCHAN.—On April 14th, 1920, at 326, Brownhill Road, Calford, London, the wife of C. J. B. Buchan, M.B., Ch.B. Glasg., of a daughter.

CHESTERMAN.—On April 17th, at Esher House, Hechen Cliff, Bath, the wife of Clement C. Chesterman, O.B.E., M.B., B.S., M.R.C.S., L.R.C.P., D.T.M. and H., of a son.

JOLLY.—On April 18th, at the Dudley Nursing Home, Hyde Terrace, Leeds, the wife of R. H. H. Jolly, M.D., B.S. Lond., D.P.H., of a son.

PINNOCK.—On April 12th, the wife of Dudley Denham Pinnock, F.R.C.S., a son.

THOMPSON.—On April 17th, at Heysham House, Chorley Old Road, the wife of J. Hilton Thompson, M.D., of a son.

MARRIAGE.

MARSHALL-CREE.—On March 22nd, 1920, at All Saints' Garrison Church, Lucknow, India, by the Rev. Canon R. Irwin, D.S.O., M.C., John Stuart Marshall, D.S.O., Major 35th Sikhs, General Staff, Presidency Brigade, Calcutta, son of J. J. Marshall, Esq., J.P., of Yelverton, Devon, and Alice Deborah, only daughter of Major-General G. Cree, C.B., C.M.G., and Mrs. Cree.

DEATH.

ALLEN.—William Allen, M.D., who passed away on April 11th, 1920, at Derwent House, Shotley Bridge. Interred at the Friends' Burial Ground, Benfieldside, on Thursday, April 15th, 1920.

British Medical Association.

CURRENT NOTES.

Taxation of Motor Cars.

In the JOURNAL of April 24th, p. 576, it was stated that the Chairman of the Medico-Political Committee of the British Medical Association had requested the Chancellor of the Exchequer to receive a deputation with regard to the proposed changes in motor car taxation set forth in the Budget. The Chairman pointed out that the medical profession would be injuriously affected in several directions. Their cars are used exclusively for purposes of their practice, and many of them have cars whose power is much exaggerated by the R.A.C. formula. The calculation of horse-power on that formula is unfair because it ignores the length of stroke and relies upon the diameter of the piston and the number of cylinders. Moreover, medical practitioners in sparsely populated districts are often practically compelled to keep two cars to avoid risk of breakdown in one. A similar communication was sent also to the Secretary of the Committee of Medical Members of the House of Commons. The Parliamentary Subcommittee met the medical members of Parliament at the House of Commons on Monday evening, April 26th, in order to discuss this matter. It was most strongly represented that the new taxation would be extremely hard upon medical men, because whereas in the past they were given a rebate on the petrol tax and had only to pay half rates for motor cars, in the future, according to the new proposals, no such concessions would be made. The medical members of Parliament were most sympathetic and promised to support the views expressed in every way possible. The Chancellor of the Exchequer, in response to the request to receive a deputation to discuss the proposals, has referred the Association to the Minister of Transport, Sir Eric Geddes, and it is hoped, with the assistance of the medical members of Parliament, to arrange an interview with him at an early date.

Increased Postal Rates.

The new postal rates which are shortly to be brought into force in accordance with the announcement of the Chancellor of the Exchequer in his Budget speech will tend seriously to increase the current expenditure of the British Medical Association. The BRITISH MEDICAL JOURNAL is circulated to members by post and the increase of the minimum charge for postage on Journals sent to addresses within the United Kingdom will entail additional expenditure which may be estimated at not far short of £1,500 a year, if, indeed, it does not exceed that amount. The increase on the postage of letters will affect the departments of the Medical Secretary, the Financial

Secretary and Business Manager, and the Editor, taken together, probably to the extent of about £300 a year. The total increase of expenditure of the Association on postage will be therefore about £1,800 a year. The inland rates for printed papers will be increased so soon as the foreign rate can be increased, but this last increase will depend upon the decision of the International Congress which meets at Madrid in October. The charge for inland post-cards is also to be raised at the same time to 1½d. Altogether the changes foreshadowed will at a moderate estimate entail upon the Association increased expenditure of at least £2,000 a year.

Hospital Survey.

At the request of the Chairman of the Hospitals Committee, Sir Napier Burnett, K.B.E., Director of Hospitals Service to the Joint Council of the British Red Cross Society and Order of St. John, attended a meeting of the Hospitals Committee held on April 21st to explain the scheme of the British Red Cross Society for assisting the voluntary civil hospitals throughout the country. Sir Napier Burnett said that, as the essential step must be to ascertain the existing facts, he had been engaged upon a hospital survey (excluding London and Scotland) which he hoped to complete by the end of April. It would contain (a) data showing the volume of work done during the year 1919 in each individual hospital; (b) the financial position of each hospital, showing ordinary income and expenditure, invested funds, annual cost per bed, etc.; and (c) maps showing the hospital situation in each county, including the ratio of beds to population. The Joint Council proposed to assist by a public appeal through the press, by an appeal and personal canvass of business firms, through the great national collecting agencies known during the war as "Our Day" organization, by obtaining allocation of percentages wherever gate money is collected at football and cricket matches, race meetings, theatres, music halls, and cinemas. Other points dealt with included those set out in the original statement put out by the Council some months ago—namely, (1) co-operative buying of hospital commodities; (2) co-ordinating of hospitals into groups with a central "key" hospital and smaller county and cottage hospitals in each group, with a working arrangement as to transport of patients, distribution and selection of patients, and centralizing of bacteriological and pathological work; (3) the collection and circulation of statistical and other hospital information; (4) the establishment of pre-hospital and post-hospital convalescent homes.

Control of Salvarsan and Allied Products.

In connexion with paragraph 83 of the Annual Report of the Council, which appeared in the SUPPLEMENT last week, the following letter was addressed to the Ministry

of Health from the Medical Secretary's department of the British Medical Association:

I understand that during the war manufacturers and importers of such products as salvarsan, neo-salvarsan, and other allied products had to obtain a licence from the Board of Trade to suspend enemy patents covering them. In every such licence was a clause imposing the obligation to have every batch tested by an authority approved by the Board. With the signature of peace this power of control became doubtful, but for the time being the control remained effective on manufacturers other than the German patentees. Under the Sankey judgement the latter can now import their products without any obligation for an equivalent control.

The Council of the Association is therefore of the opinion that the position which obtains in this country, where no legal authority exists to enforce the testing of certain potent and dangerous chemical or biological products, commonly used for hypodermic and intravenous injection, but not susceptible of standardization by simple methods of analysis, is unsatisfactory; and urges upon the Ministry the necessity of taking steps to rectify this anomalous position by such legislation or administrative action as will ensure for this country the control of these preparations which already exists in other countries.

The Minister of Health has since appointed a committee "to consider and advise upon the legislative and administrative measures to be taken for the effective control of the quality and authenticity of such therapeutic substances offered for sale to the public as cannot be tested adequately by direct chemical means." The committee consists of the following members:

Sir Mackenzie D. Chalmers, K.C.B., C.S.I. (Chairman).
Dr. H. H. Dale, C.B.E., F.R.S., Head of Department of Biochemistry and Pharmacology under Medical Research Council.
Mr. G. F. McCleary, Medical Officer, Ministry of Health.
Dr. A. B. MacLachlan, Assistant Secretary, Ministry of Health.
Dr. C. J. Martin, C.M.G., D.Sc., F.R.C.P., F.R.S., Director, Lister Institute of Preventive Medicine.
Secretary: Dr. E. W. Adams, O.B.E., Ministry of Health, Whitehall, S.W. 1.

The Dispute at Ebbw Vale.

As a result of the conference at Ebbw Vale on April 23rd an agreement was arrived at between the local doctors and the Ebbw Vale Workmen's Medical Society. Practically all the doctors in the Ebbw Vale district are employed by this society, which is an approved institution under the National Insurance Acts. The doctors gave the society notice that their contract would cease on April 1st, 1920, unless the society before that time raised the capitation fee paid for dependants to correspond with the recent increase in the insurance capitation fee. The committee declined to consider the terms suggested by the doctors, who accordingly ceased work as they had said, promising, however, to give attendance in emergencies. The workmen's leader thereupon called the workmen out, as he did not consider they had a sufficient guarantee of attendance in case of accidents, and the consequent dislocation of industry in the neighbourhood aroused much interest throughout Wales. After a few days the doctors agreed to resume work for a month on the old terms, pending a round-table conference between the workmen's committee and the local practitioners, at which the Medical Secretary of the British Medical Association should be present to represent the doctors. It was also arranged that a representative of the Monmouthshire Insurance Committee and a representative of the Welsh Board of Health should be present, not officially but in a friendly capacity. The conference lasted for nearly four hours, and resulted in the following agreement:

All non-insured adult workers to pay 11s. a year instead of 7s. as before; boys between 14 and 16 to pay 7s. a year as before; a sum of 22s. a family a year to be paid instead of 17s.

It was also agreed that a small joint subcommittee, to which the Secretary of the Monmouthshire Insurance Committee would act as adviser, should be set up to work out a plan to ensure that the lists on which the doctors are paid shall be more accurate, and that the administrative arrangements shall not throw any more clerical work on the doctor than is absolutely necessary.

Payment of Medical Staffs of Civil Hospitals for Treatment of Disabled Soldiers and Sailors.

The Hospitals Committee of the Association has requested the Minister of Pensions, Mr. Ian Macpherson, to receive a deputation upon the above subject, when it is proposed to lay before him the views of the Committee as expressed in the following resolution which has been adopted by the Council:

That for all work for sailors and soldiers, whether discharged or not, for any disease or injuries connected with the war, undertaken at voluntary hospitals, the medical staffs should be adequately remunerated. In any case the remuneration should represent an addition of not less than 25 per cent. to the cost of maintenance of in-patients, and not less than 25 per cent. of the ascertained cost per patient per attendance for out-patients, the additional sum to be placed at the disposal of the medical staff; that in the case of special clinics (for example, aurial and ophthalmic) the fee payable to the medical practitioner should not be less than the fee payable by the Ministry of Pensions for identical or similar services—namely, £2 2s. per session.

General Association Expenses.

In paragraph 14 of the Annual Report of Council, printed in the SUPPLEMENT of April 24th, it was stated, under the heading "General Association Expenses," that after £6,500, in connexion with the Pratt case had been deducted from the sum disbursed in 1918, the expenses in Abstract A for 1919 still showed a *diminution* of nearly £300 as compared with 1918. As the figures in the abstract of accounts clearly show, there was in fact an increase of £276.

Council Attendances.

In the list of attendances of members of the Central Council of the Association appended to the Annual Report of Council Dr. H. C. Bristowe (Wington, Somerset) is shown as having attended three out of a possible five meetings. Dr. Bristowe was not a member of the Council at the time of the first meeting, and therefore attended three out of the four meetings to which he was called.

Association Notices.

MEETING OF COUNCIL.

THE next Meeting of Council will be held on Wednesday, May 19th, in the Council Room, 429, Strand London, W.C. 2.

REPRESENTATIVE MEETING.

DATE.

THE Annual Representative Meeting at Cambridge will begin on Friday, June 25th, at 10 a.m.

NOTICES OF MOTION AND AMENDMENT BY DIVISIONS AND BRANCHES.

The Supplementary Report of Council to the Representative Meeting will appear in the SUPPLEMENT of May 29th, 1920.

Notices of Motion and Amendment by Divisions and Branches for consideration by the Annual Representative Meeting will be published in the SUPPLEMENT as they are received, but none can be published later than June 12th, for which purpose they must be received by the Medical Secretary *not later than the first post on Monday, June 7th.*

It will be possible, however, to include in the Agenda for the Annual Representative Meeting all Notices of Motion and Amendment which are received by the Medical Secretary *not later than the first post on Monday, June 14th, 1920.*

ANNUAL GENERAL MEETING.

THE Annual General Meeting will be held at Cambridge on Tuesday, June 29th, 1920, at 2 p.m. Business: (1) Minutes of last Meeting. (2) Appointment of auditors. (3) Report of election of President.

BRANCH AND DIVISION MEETINGS TO BE HELD.

METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.—Dr. W. Paterson, Honorary Secretary (12, Craven Park Road, N.W.10), gives notice that the annual meeting of the Willesden Division will be held on Tuesday, May 4th, at 8.30, at St. Andrew's Parish Hall (Institute behind Church), High Road, Willesden Green. Agenda: Election of Officers; Fees for Life Insurance Examinations and other business in BRITISH MEDICAL JOURNAL SUPPLEMENT, March 27th; Report of Council.

MIDLAND BRANCH: LEICESTER AND RUTLAND DIVISION.—Dr. R. Wallace Henry, Honorary Secretary (6, Market Street, Leicester), gives notice that a meeting of the Division will be held in the new Medical Institute Rooms, Public Medical Service Buildings, Bond Street, Leicester, to-day, Saturday, May 1st, at 3.30 o'clock. Agenda: Election of Deputy Representative; Discussion on Appendicitis, to be opened by Dr. T. C. Clare and Mr. W. I. Cumberland; Consideration of (1) Fees for Life Insurance, (2) Payment of Medical Staffs of Hospitals for Pensions Work.

EDINBURGH BRANCH: SOUTH-EASTERN COUNTIES DIVISION.—Dr. M. J. Oliver, Honorary Secretary, St. Boswells, gives notice that the annual meeting of the Division will be held in the Railway Hotel, Newton St. Boswells, at 3 p.m. on Wednesday, May 19th. Business: Annual report and accounts; Appointment of Officers; Medical Parliamentary Fund; Local Emergency Schemes; Life Insurance Fees; Instructions to Representatives to Representative Meeting; Fees of Medical Officers to Post Office; Election to Council; Recruitment of Members; Medical Staffs of Hospitals, Pension Work.

Meetings of Branches and Divisions.

YORKSHIRE BRANCH: BRADFORD DIVISION.

Dinner and Presentation.

THE annual dinner of the Bradford Division of the Association was held at the Great Northern Victoria Hotel, Bradford, on April 16th. There was a good muster of the medical men of the area and, including guests, eighty-six sat down to dinner.

The chief guest was Sir W. Arbuthnot Lane, Bt., and the Lord Bishop of Bradford and the City Coroner (Mr. Hutchinson) were also present as guests. After the toast of "The King" had been honoured, Mr. BASIL HALL proposed the health of the chief guest in a felicitous and racy speech. Sir ARBUTHNOT LANE, in his reply, thanked the Division for inviting him to attend their dinner as chief guest and said how much pleasure it gave him to be present. In the course of the speech he made a very striking statement to the effect that whenever a certain dictum is universally accepted as being true, it most probably is not so, and he gave as an illustration the old universally accepted idea that cases of cleft palate should never be operated on under 4 years of age, or else the results would be catastrophic. Sir Arbuthnot pointed out that in the face of this he had operated upon infants of only a few weeks, and even days old, with very happy results.

During the course of the evening a presentation of a silver cigar and cigarette box was made by the members of the Division to Dr. J. Beattie Dunlop, the retiring honorary secretary, in recognition of his great services during ten years of office. Dr. OLIVER made the presentation and spoke of Dr. Dunlop's capabilities as a Secretary and of the wonderful fund of varied information which he had amassed. Dr. DUNLOP replied and expressed his gratitude and appreciation of the gift. Mr. COLIN MACKENZIE, O.B.E., sang a humorous song and Dr. H. P. SHACKLETON, O.B.E., gave an exhibition of legerdemain, both of which were greatly appreciated.

INSURANCE.

NEW TERMS AND CONDITIONS OF SERVICE FOR SCOTLAND.

THE following information has been issued to the Secretaries of Local Medical and Panel Committees in Scotland by the Scottish Secretary of the British Medical Association:

The Conference of Scottish Local Medical and Panel Committees authorized the Insurance Acts Subcommittee to negotiate for new terms of service as from April 1st, 1920, and to accept on behalf of the profession any sum not less than that fixed by the Arbitration Board for England. The Subcommittee met the Board on March 30th and were informed that the Board was prepared to accept the Arbitration Award of 11s., and, acting on the instruction of the Conference, the Subcommittee accepted that offer. The other resolutions passed by the Conference were also discussed with the Board and some of them were accepted by the latter. In respect of others, the Board gave assurances as to their interpretation and scope, which the Subcommittee regard as satisfactory. The points of difference between the Scottish and the English Regulations are few and comparatively unimportant, and, looking to the whole circumstances, the Insurance Acts Subcommittee feels justified in advising the profession to accept the terms and conditions now offered. The Regulations will shortly be available in their final form, and the draft Allocation and Distribution Schemes will be issued soon to Panel Committees by Insurance Committees, in time to allow for full consideration before the new Regulations come into force on July 1st.

Mileage.

A sum of £55,000 has been allotted by the Treasury in respect of mileage in the Lowlands of Scotland for 1920, and in addition the present "Necessitous Districts" Grant will also be continued. The Rural Practitioners Subcom-

mittee has discussed with the Board the various conditions under which the grant will be distributed, and has agreed to the following: Mileage will be paid for all distance beyond two miles; and the inter-areal distribution of the funds will be on a graded scale, allowing an increasing number of units for each mile beyond two. In order to obtain the necessary figures for the calculation, practitioners are to be asked to send in, as soon as possible, on a form to be supplied, particulars as to the distance from the doctor's residence of each insured person on his list. It is recognized that lists are inaccurate, but it may be presumed that the inaccuracy is fairly uniform, and no other basis for distribution is at present available. The Subcommittee therefore urges upon practitioners the necessity of sending in these returns.

With regard to the estimation of the amount of the grant for future years, it is proposed that practitioners participating in the Mileage Grant should keep a record of the miles actually travelled in visiting insured persons. It was originally proposed that these records should be kept by only 10 per cent. of the practitioners, but the Subcommittee, after careful consideration, came to the conclusion that it would be more fair, as well as according a better basis for estimation, to ask all practitioners concerned to keep records. Without some such record, it is quite impossible to base any exact claim for cost and time spent in travelling, and the Subcommittee hopes that practitioners will recognize the necessity of keeping the records carefully. The trouble involved will be compensated if it results in a really equitable mileage payment. It has been agreed upon also that mileage shall be paid on the basis of distance from the doctor of choice, not from the nearest doctor, as at present.

Scottish Office,
6, Rutland Square, Edinburgh,
April 2nd, 1920.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

THE following appointments are announced by the Admiralty:—Surgeon Commanders: W. Bastian to the *Victory* for R. N. Barracks, Portsmouth; C. H. Dawe to the *President*, additional, for Bathurst W.T. Station, in charge; M. T. Male, R. H. McGiffin, O.B.E., J. R. A. Clark Hall, H. M. Braithwaite, and G. D. Welsh to the *President* for R. N. College, Greenwich, for three months' senior officer's course; E. S. Miller to the *Warspite*; H. A. Kellard-Knight to the *Excellent* (temporary). Surgeon Lieutenant (temporary) E. C. W. Cooke to the *Sandhurst*.

ROYAL NAVAL VOLUNTEER RESERVE.

Surgeon Lieutenant Commanders promoted to Surgeon Commanders: R. J. Willan, O.B.E., M.V.O., V.D., A. R. Brailey, F. W. Smith, W. K. Wills, C.B.E., R. J. E. Hansop, O.B.E., E. J. Stegman, O.B.D., W. H. Betenson, W. D. Cowburn, H. Reah, W. E. Harker, O.B.E. Surgeon Lieutenants promoted to Surgeon Lieutenant Commanders: C. F. H. Atkinson, R. H. H. Jolly, C. S. McK. Morrison, T. D. McEwan, F. L. Ellis, G. H. S. Milla, D. A. Macpherson, W. E. Bleadon, L. S. Ashcroft, C. J. G. Taylor, W. P. Harrison, J. R. H. Torton, D. Lorimer, O.B.E., D. P. D. Wilkie, O.B.E., F. S. Hewitt, M.V.O., A. E. W. Hird, E. R. Sircorn, J. B. Ronaldson, C. O. B. Ryan, T. Turner, T. B. Dixon, H. Chitty, F. H. Watson.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Lieut-Colonel F. S. Penny, C.M.G., D.S.O., relinquishes the temporary rank of Colonel.

The following relinquish the acting rank of Lieut.-Colonel:—Major and Brevet Lieut.-Colonel C. R. Sylvester-Bradley. Temporary Major A. G. Aspland (on ceasing to command a medical unit). Captain and Brevet Major P. S. Tomlinson, D.S.O. Temporary Captain J. F. Robertson (March 2nd, 1919, substituted for the notification in the *London Gazette* of March 22nd, 1919).

Major E. B. Lathbury, O.B.E., and Captain and Brevet Major R. E. Barosley, M.C., to be acting Lieutenant-Colonels.

The following relinquish the acting rank of Major:—Captain and Brevet Major W. F. Christie. Captains: R. S. Cumming, M.C., H. Beddingfield, and W. B. Rennie, M.C. Temporary Captains M. Bates, O.B.E., Andrew Grant, O.B.E., F. K. Sturridge, M.C., H. G. Kilner, W. D. Cruickshank (November 20th, 1919, substituted for notification in the *London Gazette* of January 24th, 1920). A. E. Atkinson.

To be acting Majors:—Captains D. H. C. MacArthur, O.B.E., S. D. Robertson. Temporary Captain C. R. B. Von Braun.

Captain A. L. Aymer resigns his commission and is granted the rank of Major.

The following officers relinquish their commissions:—Temporary Major T. P. Devlin and retains the rank of Major. Temporary Captain and Brevet Major A. E. Boycott, January 7th, 1919, and retains the brevet rank of Major (substituted for notification in the *London Gazette*, June 20th, 1919). Temporary Captains and are granted the rank of Major: (Acting Major) J. A. Mackenzie, W. C. Sharpe. Captain W. Tudhope on account of ill health contracted on active service and retains the rank of Captain. Temporary Captains and retain the rank of Captain: M. A. Kirtou, D. A. H. Moses, M.C., A. G. W. Thomson, H. G. E. Williams, P. J. O'Brien, A. J. Chillingworth, E. W. Blake, J. J. H. Ferguson, M.C., H. E. Gray, S. Wyborn, J. Meaton, D. C. Norris, F. W. Rigby, R. B. Robson, D. M. Cox, G. H. F. Graves (on account of ill health contracted on active service), D. A. I. Hamilton (on account of ill health), J. S. Martin, W. L. Thomas, H. O. H. O'Neill, F. G. Cross, K. R. C. Hallows, E. G. Grove (on ceasing to be employed at the Lord Derby War Hospital), H. J. Knox, F. A. Ross, T. F. Lunib, E. Sakoschausky, E. Lewis, W. Bannatyne, W. Boyd.

ROYAL AIR FORCE.

MEDICAL BRANCH.

H. B. Porteous (Captain R.A.M.C.T.F.) is granted a temporary commission as Captain (October 1st, 1918), and to be acting Major whilst specially employed, October 21st, 1918 (substituted for notification in the *London Gazette*, December 3rd, 1918).

Transferred to the unemployed list:—Captains: P. E. Williams (June 13th 1919), H. S. Baker, J. B. Barnett, D. C. Farquharson, A. Thompson, A. St. J. Hennessy, A. J. Davoren, G. McK. Thomas, C. F. Eminson, H. L. H. Greer, W. Lumley, D. J. Cannon, M. Hyman, Lieutenant R. H. Parry.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Captains A. L. Giblin and C. A. Maguire relinquish their commissions on account of ill health contracted on active service, and retain the rank of Captain.

Captains relinquish the acting rank of Major: H. D. Rollinson, O.B.E., M. Stewart, G. H. Stevenson, O.B.E., M.C., J. A. Hill, J. A. Stewart, M.C.

Captain J. P. Broken to be acting Major from November 11th, 1919, to January 22nd, 1920.

Captain C. Lovell, M.C., relinquishes the temporary rank of Major on ceasing to command a medical unit.

OVERSEAS CONTINGENTS.

SOUTH AFRICAN MEDICAL CORPS

Temporary Captains relinquish their commission on ceasing to be employed, and retain the rank of Captain: F. J. Monaghan, H. J. Hollis.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Captain F. W. K. Tough, T.D., to be Major.

3rd London General Hospital.—Captain S. H. Warren relinquishes his commission on account of ill health contracted on active service and retains the rank of Captain.

South Midland Divisional Sanitary Section.—Captain (acting Major) W. H. Davison relinquishes the acting rank of Major on vacating the appointment of D.A.D.M.S., November 26th, 1918.

TERRITORIAL FORCE RESERVE.

ROYAL ARMY MEDICAL CORPS.

The announcements regarding the following officers, published in the *London Gazette* of the dates indicated, have been cancelled: (Captains: J. R. Chalmers and B. G. Ewing (December 31st, 1918); R. W. Nevin, G. Eustace, M.C., W. S. Forbes, J. D. Lieley, and J. Denton (January 14th, 1919); T. H. Peston, D.S.O., M.C. (January 16th and March 4th, 1919); A. H. Pinder (January 13th, 1919); T. J. Thomson, T. L. Ashforth, J. Gutch, and A. Mowat (January 9th, 1919); H. C. H. Eacey (January 16th, 1919); C. S. Brebner, D.S.O. (January 10th and February 6th, 1919), (acting Major) W. H. Davison (December 17th, 1918); N. Grubbie (January 23rd and February 5th, 1919); F. Harvey (January 16th, 1919); W. J. Lacey-Hickey, M.C. (January 22nd, 1919); W. Bailey-Thomson (April 22nd 1920), (acting Major) L. A. Dingley (January 11th, 1919); J. F. Dixon (May 11th, 1917).

INDIAN MEDICAL SERVICE.

The service of Major H. R. Dutton has been placed permanently at the disposal of the Government of Bihar and Orissa with effect from November 4th, 1919.

Captain R. B. Lloyd, M.B., appointed to officiate as Chemical Examiner, Bengal and Professor of Chemistry in the Medical College, Calcutta.

Major F. A. Barker, M.B., O.B.E., Senior Medical Officer and Civil Surgeon, Port Blair, appointed to hold charge of the office of Superintendent of the Cellular and Female Gaols, Port Blair.

Prevot Lieut.-Colonel T. S. B. Williams granted combined leave for eight months.

Major General P. Behar, C.B., C.M.G., C.I.E., M.D., F.R.C.S.E., permitted to retire from the service with effect from December 8th, 1919.

DIARY OF SOCIETIES AND LECTURES.

ENTOMOLOGICAL SOCIETY, 11, Chandos Street, W.1.—Tuesday, 8.15 p.m., Special General Meeting. Professor Sidney Russ: Some Problems in the Action of Radiation upon Tissue.

ROYAL SOCIETY OF MEDICINE.—Subsection of Orthopaedics (Section of Surgery): Tuesday, 5 p.m., Cases; 5.30 p.m., Annual General Meeting. Section of Surgery: Wednesday, 4.30 p.m., Specimens; 5.30 p.m., Annual General Meeting. Section of Obstetrics and

Gynaecology (conjointly with the North of England and Midland Obstetrical and Gynaecological Society): Thursday, 10.30 a.m., Discussion on Treatment of Ante partum Haemorrhage, to be opened by Dr. Hasting Tweedy; 2 p.m., Annual General Meeting, followed by discussion on Rupture of the Caesarean Section Scar in Subsequent Pregnancy and Labour, to be opened by Dr. Munro Kerr and Dr. Eardley Holland; 7.30 p.m., dinner at Great Central Hotel (tickets 10s. 6d.). Section of Laryngology: Friday, 4 p.m., Cases; 4.45 p.m., Annual General Meeting.

POST-GRADUATE COURSES AND LECTURES.

MANCHESTER FRENCH HOSPITAL.—Thursday, 4.30 p.m., Dr. N. C. Haring: Diagnosis of Pneumonia and Conditions Simulating It.

MANCHESTER ROYAL INFIRMARY.—Tuesday, 4.30 p.m., Mr. J. P. Buckley: Some Practical Points on Lower Limb Stumps and Artificial Limbs.

ROYAL EYE HOSPITAL, Southwark, S.E.—Tuesday, 5 p.m., Mr. Cargill: Syphilis of the Eye.

ROYAL HOSPITAL FOR DISEASES OF THE CHEST, City Road, E.C.—Tuberculosis: Monday, 5 p.m., Dr. H. E. Symes Thomson: Historical. Tuesday, Wednesday, Thursday, and Friday, 5 p.m., Dr. W. E. C. Dickson: Bacteriology and Pathology.

SALFORD ROYAL HOSPITAL.—Thursday, 4.30 p.m., Mr. Finlay: Examination of the Ear, Throat, and Nose in General Practice.

SHEFFIELD ROYAL HOSPITAL.—Wednesday, 4 p.m., Professor Arthur Hall: Gall Stones.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Daily, 10 a.m., Ward Visits; 2 p.m., In-patient, Out-patient Clinics and Operations. Monday, 2 p.m., Dr. Craner Stewart: Out-patients; 5 p.m., Dr. Morton: X-Ray Therapy. Tuesday, 10 a.m., Dr. Robinson: Gynaecological Operations; 5 p.m., Dr. Pernet: Lupus and Syphilis. Wednesday, 11.30 a.m., Mr. MacDonald: Cystoscopy; 5 p.m., Dr. Beddard: Practical Medicine. Thursday, 10.30 a.m., Dr. Simpson: Gynaecology; 5 p.m., Mr. Bishop Harman: Cataract. Friday, 2.30 p.m., Mr. Addison: Surgical Cases; 5 p.m., Sir R. Armstrong-Jones: Mental Disease. Saturday, 10 a.m., Dr. Arthur Saunders: Diseases of Children; 12 noon, Mr. Sinclair: Surgical Anatomy of Abdomen.

APPOINTMENTS.

BARLOW, H. Cecil, M.B. Lond., L.R.C.P., M.R.C.S., Honorary Physician to the Lincoln County Hospital.

COFFIN, S. W., M.R.C.S., L.R.C.P., Assistant to the Hospital for Diseases of the Throat, Golden Square.

DUPRE, Frances Jane (Mrs.), M.R.C.S., L.R.C.P. Lond., Assistant Medical Officer of Health for the County Borough of Oldham, Lancashire.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 7s. 6d., which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue.

BIRTHS.

BARCLAY.—On April 20th, the wife of J. Hamilton Barclay, M.S., F.R.C.S., 4, Jesmond Road, Newcastle-on-Tyne, of a son.

FARNFIELD.—On April 14th, the wife of J. S. Farnfield, M.R.C.S., L.R.C.P. Lond., 187, Ashburnham Road, Hastings, of a son.

ORR-EWING.—On April 17th, at Heathfield, Broad Clyst, nr. Exeter, the wife of Archd. Orr-Ewing, M.A., M.B. Cantab., of a son.

MARRIAGE.

SCUNDERLAND—BROWN.—At St. Leonard's Parish Church, Ayr, on April 14th, by the Rev. John Ellis, B.D., assisted by the Rev. A. S. Sunderland, Crawshaw, brother-in-law of the bridegroom, R. A. S. Sunderland, M.R.C.S., L.R.C.P., son of the Rev. S. Sunderland, Maswell Hill, to Annie Brown, daughter of the late John Brown of Rnglan, Kilkerran, Ayrshire, and Mrs. Brown, 8, Watfield Road, Ayr.

DEATHS.

GILL.—On April 16th, suddenly, at Shaftesbury House, Formby, near Liverpool, in his forty-second year, Eustace Stanley Hayes Gill, M.B., Ch.B. Liverp., the dearly loved husband of Edith Mary Gill, and the well beloved and only son of Dr. and Mrs. Stanley Gill.

SAUNDERS.—On April 19th, at 19 Devonshire Place, Jesmond, Newcastle-on-Tyne, the residence of his son, Dr. W. E. Roper Saunders, William Saunders, M.R.C.S. Eng., L.M.S.S.A. Lond.

CURRENT NOTES.

Motor Car Taxation.

A DEPUTATION from the British Medical Association on the taxation of motor cars was received at the Ministry of Transport on May 4th. It was headed by Mr. E. B. Turner, F.R.C.S., Sir Malcolm Morris, K.C.V.O., and Dr. T. Ridley Bailey; Dr. Nathan Raw, M.P. and Dr. G. E. Elliot, M.P., were also present. In the absence of the Minister, Sir Eric Geddes, who was detained, the deputation was received by the secretary, Sir Francis Dunnell, K.C.B., with whom was Sir Henry Maybury, K.C.M.G., chairman of the Taxation Committee.

Mr. Turner began by saying that the report of Sir Henry Maybury's committee appeared to those for whom he spoke to impose a heavy additional, and in some ways an unfair, burden upon the medical profession. He then gave details of the use of motor cars for professional purposes. From his experience as chairman of a section of the Central Medical War Committee, he found that the average yearly mileage of a practitioner, taking the country as a whole, was 7,500, which meant the consumption of 500 gallons of petrol a year. Hitherto a doctor paid three guineas for tax and £6 5s. duty for this amount of petrol. During the war many doctors ran their cars to destruction, and even at the present time matters in this respect were not normal. It was impossible during the war to buy English cars, and many doctors had to purchase cars from American manufacturers, who gave them priority in delivery. A doctor using one of these cars, of, say, 20 h.p., would pay £11 12s. a year more than he did before, and that was a big penalty upon a man the use of whose car was, as to 99 per cent., professional and essential to the community. Moreover, a great many doctors, especially in districts where roads were bad, had to have two cars, or even three, in commission. The new method of taxation would bear unjustly on the medical profession as compared with those who used their cars for pleasure. He pleaded for a return to the *status quo* so far as doctors were concerned. Sir Malcolm Morris raised the question of motor ambulances, but Sir Henry Maybury said that it was not proposed to place any tax at all on ambulances.

Sir Francis Dunnell said he would lay the views of the deputation before the Minister, but he was bound to point out that if any exceptions were made to the general abolition of rebates, other classes also would claim special treatment. Some discussion took place on the validity of the figures mentioned, and Mr. Turner agreed that he had not taken into his estimate any

concessions which petrol companies might make. Sir Henry Maybury remarked that when the rebate to doctors was first instituted no commercial car had to pay licence duty. Every commercial car was now laid under tribute, and the position had entirely altered with the wide development of motor transport. Under the new Budget the commercial motor car was estimated to yield a larger sum to the revenue by some £50,000 than the pleasure car would yield, so that a great part of the new revenue would come from commercial cars of every kind. He also suggested that a doctor with more than one car might reasonably be accounted affluent, but this was at once contested by the deputation. Dr. Ridley Bailey, in explaining the fallacy, gave an illustration of special hardship in the case of a Staffordshire practitioner. Sir Henry Maybury remarked that the Staffordshire roads were the worst in England, and that the new revenue from taxation would enable road improvements to be made, with consequent relief to motor car users. At the close of the proceedings Sir Francis Dunnell again undertook to lay the facts before the Minister.

Utilization of Poor Law Hospitals.

The Hospitals Committee of the Association is at present considering the question of the utilization of Poor Law hospitals to meet general needs, and is anxious to obtain information with regard to any schemes which are being formulated in connexion therewith. Members are invited to send to the Medical Secretary any particulars or suggestions which would help the Committee in its deliberations.

Individual Assistance.

An interesting gratuity case has just been decided in favour of a member as a result of representations made to the War Office by the British Medical Association. A Territorial Force medical officer who had been called up at the commencement of hostilities resigned after fourteen months' service in order to release his partner, a younger man, who was fit for general service. It was clearly understood by the War Office that this action was taken on the understanding that the junior partner would replace the officer who was resigning. The action was also taken on the advice of the Local Medical War Committee, which ruled that both these medical men could not be spared from the district. When an application for gratuity was made by the medical officer who had resigned it was refused on the ground that he had resigned voluntarily. The assistance of the Association was sought, with the result that the gratuity has been paid. This affords another instance of what can be done for individual members who seek the assistance of the Association when they are in difficulty.

TERRITORIAL MEDICAL SERVICE.

DEPUTATION TO DIRECTOR-GENERAL, ARMY MEDICAL SERVICE.

SIR JOHN GOODWIN, K.C.B., C.M.G., D.S.O., Director-General Army Medical Service, received at the War Office on April 15th a deputation from the British Medical Association with regard to certain questions relating to the reorganization of the Territorial Force.

There were present:

Lieut.-General Sir T. H. J. C. Goodwin, K.C.B., C.M.G., D.S.O., D.G., A.M.S.
Colonel Sir E. S. Worthington, K.C.V.O., C.B., C.M.G., A.M.S.
Lieut.-Colonel E. C. Montgomery-Smith, C.M.G., D.S.O., T.D., A.M.S.

Dr. C. Buttar, Chairman of Territorial Force Subcommittee.
Major G. Annis, R.A.M.C.(T).
Colonel L. Blandford, C.B.E.
Dr. J. A. Nixon, C.M.G.
Dr. C. Courtenay Lord, Assistant Medical Secretary.
Dr. N. G. Horner, Assistant Editor, BRITISH MEDICAL JOURNAL.

Dr. BUTTAR, introducing the subject for which the deputation had met the Director-General, explained that the Territorial Force Subcommittee of the Naval and Military Committee had under consideration the question of the reorganization of the Territorial Army for two reasons:

1. In the hope that the British Medical Association might be of help in the establishment of a satisfactory Force in peace time.

2. With a view to the civilian profession rendering proper assistance in the expansion of that Force which might be necessary should a national emergency arise.

Before dealing with the points which had been submitted in writing to the Director-General, Dr. Buttar said there was one question upon which the deputation would like information: "Was it intended that, in the event of an emergency, the Regular Army should be expanded at the same time as the Territorial Army, or would the expansion only take place through the latter?"

In reply, the DIRECTOR-GENERAL said that this matter was under consideration by the Army Council. It had been urged by his Department that this expansion should take place solely through the Territorial Army, but the Army Council held very strongly that the conditions for the Medical Department should not differ from those which obtained for the rest of the Army. The matter was therefore being considered by the Army Council from the point of view of the Army as a whole, and, of course, he was not in a position to state what decision would be arrived at. Dealing with the anomaly which had arisen during the late war, and which was the cause of such serious dissatisfaction—namely, the higher rates of pay for temporarily commissioned medical officers than those received by Territorial and Special Reserve medical officers—Sir John Goodwin said he had made recommendations to the Army Council that in future it must be absolutely assured that medical officers of the Territorial Force and Special Reserve must receive the same pay and allowances as officers of the Regular Army, and that temporarily commissioned medical officers (if such were appointed) must in no case obtain higher rates of pay and allowances. He had urged very strongly that the temporary commission system should be abolished, but here again the matter was under consideration, and he could not forecast the decision of the Army Council. The Director-General next took up one by one the suggestions submitted by the Subcommittee.

With regard to:

(1) That the Territorial Army should be represented on the Staff of the D.G., A.M.S., by a senior officer who should have the title of D.D.G., and should have the rank of not less than that of Major-General.

This immediately raised two difficulties. There was at present no officer of the Territorial Army in the War Office, with the exception of the Earl of Scarborough, who held the rank of Major-General. To carry this proposal into effect would entail an enormous increase of expenditure. Moreover, the idea would be running quite counter to the present view held by the Army Council, which was to avoid most strongly anything in the nature of water-tight compartments or duplication of staffs. This proposal would entail separate channels for both the Regular and Territorial Armies, and it would mean that the scheme

would have to be carried into effect throughout the whole of the War Office, from the Army Council downwards. It would be extremely difficult to carry this proposition into effect.

As to:

(2) That the Territorial Army should be represented on the different branches of the Medical Directorate by an adequate number of Territorial medical officers.

Here again a separate administration would have to be instituted for the Territorial Army, and this would raise insuperable financial difficulties. He had already decreased his directorate by 40 per cent., and was endeavouring to reduce it still further. If suggestion No. 2 were carried into effect, his staff would have to be brought up to pre-war strength.

As to:

(3) That the Territorial Army Medical Service should consist of two classes of officers: (a) Active List; (b) Reserve.

He was in agreement.

As to:

(4) That the medical officers on the active list should be carried on three general lists: (i) Field units; (ii) technical units; (iii) general hospitals.

This was already laid down. It was proposed that regimental medical officers, field ambulance, and casualty clearing station officers should be posted, on joining, to regiments, field ambulances, and casualty clearing stations. All regimental medical officers would be available for posting to field ambulances or casualty clearing stations as captains or majors, and would be shown in their proper seniority on the divisional list. They would all be available for selection to commands and higher ranks. Senior officers would be on a general list for all divisions showing ranks, stations, etc. For the staffing of general hospitals a special list by division areas would be maintained. Officers would be posted to the hospital in their area, and would obtain their promotion by time. Majors would be given posts in hospitals; if there were no vacancies they would go to the reserve as trained officers and be liable to recall for posts in hospitals or casualty clearing stations. These lists would also show officers of higher ranks available as consultants.

As to:

(5) That an age limit should apply to each rank.

This already applied, the age limit being 45, 50, and 55 for captains, majors, and lieutenant-colonels respectively.

As to:

(6) That medical officers of casualty clearing stations should be selected on a team basis, and arrangements should be made for training them in military duties.

This was being done.

As to:

(7) That all special medical officers, such as pathologists, x-ray specialists, and hygienists, should be carried on the technical units list, and medical officers on this list should be represented on the medical directorate.

This was either done or was in process of being carried out. The Director-General thought that the suggestion of the deputation, that the list should include all specialists, including those on the staff of hospitals, was a matter which could easily be met. Regarding the representation of these officers on the medical directorate, the same difficulty was encountered here as that of which he had previously spoken.

As to:

(8) That the *à la suite* system should be abolished.

A Committee had been appointed to go into this matter, for he recognized that the *à la suite* system contained grievous anomalies upon which marked improvements must be effected.

As to:

(9) That no medical officer should be placed on the General Hospital List under a given age, nor until he has reached the rank of Captain.

A general discussion took place on this proposal. The Director-General thought that the difficulties involved in the subject might be overcome, if the men who had done approved service in the war were to be regarded as being available for admission to the General Hospital List; thereafter appointments would only be made to this list from those officers who had done military training.

As to:

(10) That the training in Officers' Training Corps should be altered, and should be of a military rather than a professional character.

This was a question which had been studied and discussed by his Department for many months. There were many arguments both for and against the proposal.

Dr. BUTTAR, replying to the Director-General, said that what the Subcommittee had in mind with regard to proposals 1 and 2 was not that there should be two armies, for it recognized that that was quite impossible, but that service in the Territorial Army might be more attractive if Territorial officers felt they had a channel of their own which dealt with Territorial matters exclusively.

Sir JOHN GOODWIN said that the Territorial Army already had its own representative at the War Office in A.M.D., 1, and he hoped that this would meet the views of the officers concerned. He regarded it as essential that the Territorial Army should not be run entirely independently of his Department, as otherwise the Director-General would be quite ignorant of what was going on. There was nothing he himself was more anxious to secure than that the Territorial Army Medical Service should work smoothly and efficiently in every way. He was under the impression that a good deal of feeling had arisen in regard to the temporarily commissioned officers. Endeavours had been made at various times during the war to rectify anomalies on this point, but—as might be readily understood—it was difficult to alter policy while active operations were in progress. He had been considering this matter very carefully, and had put forward recommendations which he hoped would be approved by the Army Council.

Dr. BUTTAR raised the question of recruiting in times of emergency. The Director-General said he regarded this as a most important subject. He would be very glad indeed if the Subcommittee would consider this question and discuss it with him. He realized its enormous importance and the difficulties involved, and was in agreement that there should be some civilian professional organization by means of which the army could be furnished with doctors should the emergency arise. He would be very happy to have the Subcommittee's views.

After thanking the Director-General for the kind and sympathetic manner in which he had received them, the deputation withdrew.

Association Notices.

MEETING OF COUNCIL.

THE next Meeting of Council will be held on Wednesday, May 19th, in the Council Room, 429, Strand, London, W.C. 2., at 10 a.m.

REPRESENTATIVE MEETING.

DATE.

THE Annual Representative Meeting at Cambridge will begin on Friday, June 25th, at 10 a.m.

NOTICES OF MOTION AND AMENDMENT BY DIVISIONS AND BRANCHES.

The Supplementary Report of Council to the Representative Meeting will appear in the SUPPLEMENT of May 29th, 1920.

Notices of Motion and Amendment by Divisions and Branches for consideration by the Annual Representative Meeting will be published in the SUPPLEMENT as they are received, but none can be published later than June 12th, for which purpose they must be received by the Medical Secretary not later than the first post on Monday, June 7th.

It will be possible, however, to include in the Agenda for the Annual Representative Meeting all Notices of Motion and Amendment which are received by the Medical Secretary not later than the first post on Monday, June 14th, 1920.

ANNUAL GENERAL MEETING.

THE Annual General Meeting will be held at the Examination Halls, Cambridge, on Tuesday, June 29th, 1920, at 2 p.m. Business: (1) Minutes of last Meeting. (2) Appointment of auditors. (3) Report of election of President.

BRANCH AND DIVISION MEETINGS TO BE HELD.

NORTH OF ENGLAND BRANCH.—Dr. Jas. Don, Honorary Secretary (1, Grove Street, Newcastle-on-Tyne), gives notice that a meeting of the medical profession within the area of the North of England Branch will be held in Newcastle-on-Tyne on Thursday, May 13th, to initiate preparations for the annual meeting of the Association to be held in Newcastle-on-Tyne in 1921.

ESSEX BRANCH.—The spring meeting of the Essex Branch will be held at the Saracen's Head Hotel, Chelmsford, on Wednesday, May 26th, at 12 o'clock. Members wishing to show cases or read papers should communicate with Dr. B. W. Nicholson, East Lodge, Colchester.

SOUTH-WESTERN BRANCH; EXETER DIVISION.—Dr. Norman Lock, Honorary Secretary (5, Barnfield Crescent, Exeter), gives notice that a general meeting of the Division will be held on Friday, May 14th, at 2.30 p.m., at the Royal Devon and Exeter Hospital.

Meetings of Branches and Divisions.

NORTHERN COUNTIES OF SCOTLAND BRANCH: INVERNESS DIVISION.

A MEETING of the Inverness Division was held at the Northern Infirmary on April 3rd, when Dr. A. C. BALFOUR was in the chair.

The Division approved of the necessity for action in national emergencies, and a committee of the Division was appointed to confer with the local authorities in the area so as to formulate a scheme.

The terms submitted in the joint report on fees for life assurance (SUPPLEMENT, March 27th, 1920) were agreed to as a suitable basis for discussion at the Annual Representative Meeting, 1920.

It was resolved to ask Dr. Drever, Scottish Secretary British Medical Association, to lay before the Scottish Committee of the British Medical Association the necessity for approaching the Scottish Prisons Board to increase the salaries of prisons medical officers by 50 per cent. on a pre-war basis, and for taking up the same question with the respective authorities regarding the salaries of medical officers holding public health, Poor Law, and similar public appointments.

The honorary secretary was instructed to write to Dr. Drever, informing him of the great dissatisfaction of the doctors all over the Highlands, and especially in the multiple areas, with the remuneration received for attendance on patients and for mileage under the Highlands and Islands scheme, the sums received individually being quite inadequate to recompense the doctor for his work.

LANCASHIRE AND CHESHIRE BRANCH: ROCHDALE DIVISION.

A MEETING of all the medical practitioners in the Rochdale Division area was held at Rochdale on April 13th, when Dr. Alfred Cox, O.B.E., the Medical Secretary, gave an address on the British Medical Association and its work. Questions were invited and answered by Dr. Cox.

The annual meeting of the Division was subsequently held, when the annual report was read; the financial statement showed a balance in hand of £3 lls. 10d. at December 31st, 1919. The following officers were elected for the ensuing year:

Chairman: Dr. Bateman. Vice-Chairman: Dr. Geddes. Honorary Secretary and Treasurer: Dr. J. Melvin. Auditor: Dr. Harris. Representative in Representative Body: Dr. Lord. Deputy Representative: Dr. J. Melvin.

INSURANCE.

DISTRIBUTION OF MILEAGE GRANT.

IN reply to an inquiry by the Medical Secretary with regard to the delay in payment to rural doctors of sums on account of mileage for 1920, the Ministry of Health has replied as follows:

The position is that a circular letter was issued to Insurance Committees on January 20th requesting that certain particulars should be furnished which are essential before the distribution of the Central Mileage Fund can be proceeded with. The letter contained the following paragraph:

For the purpose of the distribution of the main portion of the Central Mileage Fund it will be necessary for committees to obtain, as soon as practicable, from the doctors practising in rural portions of the committee's area the statistics referred to in paragraph 35 of the report.

Certain other particulars were also required with regard to districts where the difficulties are of an exceptional character. Although this circular letter was issued over three months ago, we have only so far received the main particulars from less than one-third of the counties. It is important that the doctors who are concerned should realize that the distribution of the fund cannot be determined by the Distribution Committee, or any payments made by way of instalments, until the necessary particulars have been received from the several areas; and delay on the part of any doctors in sending in particulars is, therefore, reflected in a delay in the making of payment to rural practitioners generally. We are issuing the necessary official reminders, but you may consider it worth while to invite the attention of rural doctors generally to the subject. As soon as the particulars are received no time will be lost in laying them before the Distribution Committee for examination and for their recommendations.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following notifications are announced by the Admiralty:—
Surgeon Captains W. Belt, M.V.O., J. Shand and J. Chambers, C.M.G., promoted to the rank of Surgeon Rear Admiral. Surgeon Commanders A. J. Wernet to R.N. College, Greenwich, for three months' hospital course; W. P. Hingston to the *Coverity* as Squadron Medical Officer (on transfer of flag); A. Davidson to the *Curlew*; A. Gaskell, C.B., O.B.E., to the *President*, for duty with Medical Director-General Admiralty (temporary); W. P. Walker to the *Canada*; E. S. O. Sawdy to R.N. Hospital, Pembroke Dock (temporary). Surgeon Lieut. Commander H. H. Ormsby to the *Castor* (on transfer of flag). Surgeon Lieutenant G. A. M. Anderson, promoted to the rank of Surgeon Lieutenant Commander. Surgeon Lieutenants H. P. Stephen to the *Beaufort*; F. H. McCambley to the *Victory*, for R.N. Barracks, Portsmouth.

ARMY MEDICAL SERVICE.

Colonel W. E. Hardy retires on retired pay (April 12th, 1920)—substituted for notification in the *London Gazette*, April 14th, 1920.

Temporary Colonel Sir A. Chance, C.B.E., relinquishes his commission and retains the rank of Colonel.

ROYAL ARMY MEDICAL CORPS.

Lieutenant-Colonels retire on retired pay: J. H. Brunsell, D.S.O., O.B.E., H. A. Davidson, D.S.O., S. J. C. P. Perry, W. L. Baker, J. G. Churton, T. Biggan.

Lieutenant-Colonel B. Forde, C.M.G., is placed on retired pay.

Major Norman D. Walker, O.B.E., to be temporary Lieutenant-Colonel whilst specially employed.

Major M. P. Leahy is placed on retired pay on account of ill health caused by wounds, (August 26th, 1919—substituted for notification in the *London Gazette*, August 25th, 1919.)

The following officers relinquish the acting rank of Lieutenant-Colonel: Major T. J. Potter, O.B.E., Captain C. H. K. Smith, M.C.

Major L. A. A. Andrews relinquishes the acting rank of Lieutenant-Colonel. (September 23rd, 1919—substituted for notification in the *London Gazette*, December 2nd, 1919.)

DIARY OF SOCIETIES AND LECTURES.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.1.—Monday, 8 p.m., Annual Meeting; 9 p.m., Annual Oration by Sir D'Arcy Power, K.B.E., on The Rev. John Ward and Medicine. Presentation of Fothergillian Medal (1917) to Sir Leonard Rogers, C.I.E., M.D.

ROYAL SOCIETY OF MEDICINE.—*War Section*: Monday, 5.30 p.m., Annual General Meeting. Surgeon Captain Bassett-Smith, R.N.: Surgery, with special reference to prophylaxis in the Royal Navy. *Subsection of Proctology (Section of Surgery)*: Wednesday, 5.30 p.m., Annual General Meeting. *Section of Neurology*: Thursday, 8.30 p.m., Annual General Meeting. Dr. S. A. Kinneir Wilson: Decerebrate Rigidity in Man and the Occurrence of Tonic Pils. *Clinical Section*: Friday, 5 p.m., Cases; 5.30 p.m., Annual General Meeting.

SOCIETY OF TROPICAL MEDICINE AND HYGIENE, 11, Chandos Street, W.1.—Friday, 8.30 p.m., Dr. Edward J. Wood: Pellagra from the Standpoint of a "Deficiency Disease."

POST-GRADUATE COURSES AND LECTURES.

MANCHESTER FRENCH HOSPITAL.—Thursday, 4.30 p.m., Dr. A. C. Magian: Silver Salvarsan in the Treatment of Syphilis.

MANCHESTER ROYAL INFIRMARY.—Tuesday, 4.30 p.m., Dr. Donald E. Core: Hysteria and Certain Indications for its Treatment.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.15.—Daily, 2.30 p.m., Operations, Medical and Surgical Clinics, etc. Monday, 2.30 p.m., Mr. Hanister: Gynaecological. Tuesday, 9.45 a.m., Lieut.-Colonel R. H. Elliot: Selected Eye Cases and Operations; 2.15 p.m., Dr. Whiting: Selected Cases of Heart Disease; 3.15 p.m., Mr. Howell Evans: Feroal Tumours; 4.30 p.m., Mr. Carson: Lecture: Surgical Diseases of the Pancreas. Wednesday, 2.30 p.m., Dr. Oliver: Dermatological. Thursday, 2.30 p.m.: Eye Cases, Mr. Fleming; Pathology, Dr. Metcalfe. Friday, 2.30 p.m., Dr. C. E. Sundell: Diseases of Children. Saturday, 3 p.m., Mr. Carson: Selected Surgical Cases.

ROYAL EYE HOSPITAL, Southwark.—Wednesday, 5 p.m., Mr. Letchworth: Eye Diseases due to Nephritis and other Toxaemias.

ROYAL HOSPITAL FOR DISEASES OF THE CHEST, City Road, E.C.—Lectures on Tuberculosis, 5 p.m.:—Monday, Dr. W. E. C.

Dickson: Bacteriology and Pathology. Tuesday, Dr. H. Sutherland: Epidemiology. Wednesday, Dr. A. Abrahams: Etiology. Thursday and Friday, Dr. D. Barty King: Symptoms.

SALFORD ROYAL HOSPITAL.—Thursday, 4.30 p.m., Dr. Dyson: Tuberculosis of the Skin.

SHEFFIELD UNIVERSITY PATHOLOGICAL MUSEUM.—Wednesday, 4 p.m., Professor Connell: Pathology of Everyday Lesions of the Intestine.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith.—Daily, 10 a.m., Ward Visits; 2 p.m., In-patient, Out-patient Clinics and Operations. Monday, 12.15 p.m., Dr. Burnford: Pathological Demonstration; 5 p.m., Mr. Donald Armour: Cervical Ribs. Tuesday, 10 a.m., Dr. McDougal: Electrical Department; 5 p.m., Mr. Tyrrell Gray: Appendicitis. Wednesday, 2 p.m., Mr. Gibb: Eye Department; 5 p.m., Dr. Owen: Congenital Morbus Cordis. Thursday, 10.30 a.m., Dr. Simson: Gynaecological Demonstration; 5 p.m., Mr. Bishop Harman: Cataract Operations. Friday, 2 p.m., Dr. Pritchard: Medical Wards; 5 p.m., Sir Robert Armstrong-Jones: Mental Disease. Saturday, 10 a.m., Dr. Arthur Saunders: Diseases of Children; 12 noon, Mr. Sinclair: Surgical Anatomy of the Abdomen.

British Medical Association.

OFFICES AND LIBRARY, 429, STRAND, LONDON, W.C.2.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on application to the Librarian, accompanied by 6d. for each volume for postage and packing.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager. Telegrams: Articulate, Westrand, London. Tel.: Gerrard 2630).

MEDICAL SECRETARY (Telegrams: Medisecra, Westrand, London. Tel.: Gerrard 2634).

EDITOR, *British Medical Journal* (Telegrams: Aitiology, Westrand, London. Tel.: Gerrard 2631).

SCOTTISH MEDICAL SECRETARY: 6, Rutland Square, Edinburgh. (Telegrams: Associate, Edinburgh. Tel.: 4361 Central.)

IRISH MEDICAL SECRETARY: 16, South Frederick Street, Dublin. (Telegrams: Bacillus, Dublin. Tel.: 4737 Dublin.)

Diary of the Association.

May.

- 11 Tues. London: Standing Subcommittee, Central Ethical Committee, 2.30 p.m.
Buckingham Division, Aylesbury: Lecture by Sir James Galloway, K.B.E., C.B.
- 12 Wed. London: Finance Committee, 2.30 p.m.
- 13 Thurs. London: Naval and Military Committee, Territorial Force Subcommittee, 3 p.m.
North of England Branch, Newcastle-on-Tyne.
Exeter Division, Royal Devon and Exeter Hospital, 2.30 p.m.
- 14 Fri. Last day for receipt of Nominations for Council.
- 19 Wed. London: Council, 10 a.m.
South-Eastern Counties Division, Edinburgh Branch, Annual meeting, Railway Hotel, Newtown St. Boswells, 3 p.m.
- 21 Fri. Preston Division: 8.30 p.m., Lecture by Dr. W. Blair Bell: Ductless Glands.
- 26 Wed. Essex Branch, Saracen's Head Hotel, Chelmsford, 12 o'clock.

APPOINTMENTS.

BOURNE, Geoffrey, M.B.Lond., M.R.C.P., Physician to the East London Hospital for Children, Shadwell.

CANE, Leonard B., M.D. Cantab., B.C., M.R.C.S.Eng., L.R.C.P.Lond., Honorary Physician to Peterborough Infirmary.

D'EWART, John, M.B.Lond., M.R.C.S., Medical Superintendent, Booth Hall Infirmary for Children, Manchester, E.

EDGE, William, M.R.C.S., L.R.C.P., Assistant Medical Officer, Booth Hall Infirmary for Children, Manchester, E.

VINING, C. W., M.D., B.S.Lond., M.R.C.P., D.P.H., Assistant Physician in charge of Children's Department, General Infirmary, Leeds.

WILSON, A. H., L.R.C.S., L.R.C.P. Edin., D.P.H. Lond., M.O.H. and Assistant School Medical Officer, East Wilts Combined Districts.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 7s. 6d., which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue.

BIRTHS.

COX.—April 30th, at Hazeldean Nursing Home, Manchester, to George Lissant Cox, M.D. Cantab., of Preston, and Mrs. Cox, a daughter.

DICK.—On May 2nd, 1920, at 4, Fifeley Road, Scarborough, to Dr. and Mrs. J. R. Dick, a son.

KILNER.—On April 21st, at 15, Albert Crescent, Bury St. Edmunds, the wife of H. Goff Kilner (late Major R.A.M.C., Croix de Guerre), of a daughter.

MOFFET.—On April 30th, at 86, Manley Road, Whalley Range, Manchester, to Dr. W. P. and Mrs. Moffet, a son.

MARRIAGES.

COOPER—MACNIVEN.—At 13, Clunty Drive, Edinburgh, on April 30th, by the Rev. John A. Duke, B.D., Morningside, U.F. Church, Captain Duncan Gordon Cooper, M.B., Ch.B., Indian Medical Service, to Helen Gould Donaldson, youngest daughter of John Macniven.

EDEN—BARFORD.—On Wednesday, April 28th, at All Saints' Church, Lenington Spa, by the Rev. C. T. B. McNulty, M.A., Vicar of Holy Trinity, assisted by the Rev. Fredk. Feist, Dr. Louis T. Eden, Coventry, son of Mr. James R. Eden, Edinburgh, to Lillian Mary, eldest daughter of Mr. and Mrs. H. W. Barford, Coventry.

DEATHS.

CROMBIE.—At Park House, North Berwick, on May 1st, 1920, John Liddle Crombie, M.D., aged 77.

MARTIN.—On April 21st, at 45, Grange Road, London, S.E., F. G. Chilton Martin, M.R.C.S.Eng., L.R.C.P., L.S.A. Lond.

PARSONS.—On April 27th, Philip Harry Parsons, L.R.C.P., L.R.C.S., Edin., L.F.P.S. Glasg. (Melbourne University and R.C.S. Edin.), of 6, Poulis Terrace, South Kensington, S.W.9, aged 47, the beloved husband of Mary Parsons.

SMITH.—Jessie Irvine, aged 50, the beloved wife of A. G. I. Smith, M.R.C.S., L.R.C.P., at The Cabin, Crick, Rugby, April 27th, 1920. At rest.

The Supplementary Report of Council to the Representative Meeting will appear in the Supplement of May 29th. The Annual Representative Meeting at Cambridge will begin on Friday, June 25th, at 10 a.m. The Annual General Meeting will be held at the Examination Halls, Cambridge, on Tuesday, June 29th, at 2 p.m.

THE GENERAL PRACTITIONER AND THE HEALTH SERVICES.

At a meeting of the West Herts and Watford Medical Society, held on April 28th, Dr. H. B. BRACKENBURY (Chairman of the Insurance Acts Committee) gave an address on "The relation of the general practitioner to public health services."

Dr. Brackenbury said that by the public health services they were beginning to mean not merely the services which they had been accustomed to consider in the past as belonging to the sphere of preventive medicine, but all State-organized and supported services which had to do with the health of the community. They must not forget that they meant not only the preventive side but the clinical side, which was so rapidly developing. Because of that development the general practitioner was becoming more and more involved in those services, both with regard to his professional expert knowledge and in the effect which the extension of those clinical services might have upon his financial and economical well-being. They would have, in the course of the next few weeks probably, the interim report of the Medical Consultative Council to the Ministry of Health, which would outline a fairly complete scheme for the development of the public health services at the instance of the State for all sorts of people, of dental treatment, laboratory facilities, nursing and maternity services, and clinics of all kinds. He knew nothing of that report, except what he had been able to gather from the indiscretions, calculated or otherwise, of people on the Council, or from things they had said or refrained from saying in certain circumstances on various committees where they had been discussing cognate subjects.

It was of vast importance that the whole mind of the profession should be brought to bear upon the report, because it would gravely affect the future development of the public services and the relation of various interests thereto. As a help towards such consideration he intended to speak of the requirements which the general practitioner might reasonably ask from the community on the one hand, and the requirements which the community might reasonably ask from the practitioner on the other, and to embody these in a series of propositions with some comments thereupon. More and more the general practitioner was being taken out of what had been his almost traditional isolation, and was coming more and more into touch with his fellow practitioners and with the various administrative appointments made by the State. That was a modern tendency which was bound to grow, and when a scheme was put before them by a responsible body they must consider its essential points with fairness and concentration, and not waste their time in discussing details which did not matter so much.

His first proposition was that the practitioner was the essential agent in any complete public health service, and that domiciliary attendance and treatment was the only foundation on which the systematic provision of other kinds of treatment could properly be based. He had

known specialists and medical officers of health who a few years ago would have disputed that proposition, but it had now been completely and officially recognized. They had to have the proper type of general practitioner, the man who really felt what his position was, what his profession was, what his opportunities were, and who did the best he could to live up to them. Dr. Brackenbury quoted Sir George Newman's description of the practitioner, as appearing in his memorandum on medical education, and in his memorandum on the practice of preventive medicine. Such being the character and importance of the general practitioner as set forth in official memoranda by the chief medical officer of the chief departments of State concerned with public health, he thought they might congratulate themselves on the position and recognized importance of the general practitioner, and he thought they had a right to quote such high requirements when any question of the proper remuneration from the State arose. No public health services, preventive or clinical, could possibly get on without the practitioner's full co-operation, and the first thing that the State had to do was to provide general practitioner treatment for those persons who were unable to provide it for themselves, before it could with any propriety set up any other services of a different type wanting specialist attention or residential attention, of which the public might be allowed to take advantage.

His second proposition was that, speaking generally, and except in cases of emergency, it should be only on the recommendation of a general practitioner that any branch of the service other than domiciliary treatment should be available. Supposing they had all those other services, specialist and consultant services, laboratory facilities, and the public had free access to them without having to go by way of the general practitioner, what an enormous waste of public money there would be! It should not be merely a practitioner who was working under the Insurance Acts who might send his insured persons for these extra services, but *any* general practitioner. That would safeguard the position of the general practitioner very largely indeed; it would be an economy to the State, and a help to the patients. This gave rise to an important problem which the profession must face. There were three classes of the public who might want to take advantage of such further provision. There were the insured persons, about whom there was no difficulty; there was the fairly well-to-do person who could afford to have a family doctor; and there was the class of poor persons really in the same economical position as insured persons, but who did not happen to be technically employed, and who therefore at present had no State help towards domiciliary treatment. If they laid down the proposition, which he thought was vital, that no one should have access to these further services provided by the State except on the recommendation of a general practitioner, it involved their acquiescence in the further provision by the State of general practitioner services of some kind for those persons not already provided for by the Insurance Acts who were not in a position to provide their own practitioner—the dependants of many insured persons, and others.

There were other requirements which were reasonable on their part with regard to the various types of further provision that the State was going to make. His third

proposition was that if treatment of a non-specialist character at a clinic was provided by a public authority, that treatment should in all cases be carried out by, or under arrangements approved by, the general practitioners who were attending the patients or their families in their own homes; and that the ordinary treatment of tuberculosis, the ordinary work of a maternity and child welfare clinic, the treatment of minor ailments at a school clinic, should always be regarded as of a non-specialist kind. Such clinics were, of course, already established, and there would be a considerable extension of them. He said nothing about the administrative or inspectorial side, but if clinics were established of a non-specialist character, the practitioners of the locality should either do the clinical work themselves or have a paramount voice in determining the method by which the work should be done.

His fourth proposition was that where clinics of a specialist type were established four things were essential: First, the clinical medical staffs should, except in a few exceptional cases, be appointed on a part-time basis and remunerated on a time basis or on a case basis; secondly, a medical committee should take an important part in the selection of those staffs; thirdly, general practitioners, if possessed of the necessary qualifications, should be eligible for appointment on the staffs; and fourthly, all general practitioners should be given opportunities of taking some suitable part in the work. With regard to the first point, the limitations of time and place made it impossible to allow everybody to take part in the work, and this involved a selection by someone mainly on behalf of the persons who were paying the salaries. The comment upon that was that a medical committee should take a paramount part in the selection, which should not be entirely at the sweet will of a lay committee. On the third point, it was by no means difficult for a general practitioner to be largely competent in some specialty or other. It was quite common for a general practitioner to be a first-class operative surgeon: he had almost perforce to become a very expert obstetrician, and it was not difficult for him to become a specialist, not perhaps of the highest expert type, but of quite a high expert type in throat, nose, ear, and eye. Then, on the fourth point, in order that general practitioners might have an opportunity of developing this specialism and becoming competent, they should have full opportunities of taking part in the work of the special clinics.

As to residential institutional provision—hospital provision commonly so called—his fifth proposition was that when the State was providing that kind of treatment there should be local hospitals in which these three conditions prevailed: (1) the medical attendance would be carried out by the general practitioners of the locality, whether such treatment be of the ordinary or more specialist character; (2) the question of fees for medical and surgical treatment therein (whatever be the arrangements for maintenance) would be a matter of arrangement in each case between the doctor and patient; (3) some suitable provision would be made for maternity cases. If the State were going to make complete hospital provision for the whole of the population they said that the most urgent matter required, looking at the country as a whole, was the provision of local general practitioner hospitals. There ought to be an immense development of such hospitals in which any doctor of the locality would be able to send any of his patients, and be able to follow them in and treat them himself, or if the case was such that he did not feel competent to treat it himself, to have one of his fellow practitioners with him. There were general practitioners who were perfectly competent to undertake most cases, but did not undertake any sort of major surgery, and they could have colleagues, who were still general practitioners, to do the operations in the hospital for them, and make such arrangements as were suitable, quite privately, as to the medical fees that were paid for that attention inside the hospital. He did not touch upon the question of the cost of maintenance of the patient. In some cases the provision of maternity wards was most urgently required, and they could very well be established in a separate block in connexion with the local hospital of the type he had indicated.

His next proposition was that where more central hospitals for cases of a more special character were established, the staffing of such institutions (except in the case of teaching hospitals) should be arranged in the same way as in the case of the specialist clinics. The staffing should be done on exactly the same principles. They must select competent doctors to be on the staff part time, paid for the work they did on behalf of the community, whether part of a voluntary hospital or not.

A general practitioner, if he showed his competence to do that particular kind of work, ought to be eligible equally with the specialist for appointment on that staff, and all general practitioners ought to be allowed to take a suitable part in the work of the institution. What were the criteria by which the appointing committee, medical or otherwise, could judge of the eligibility of a general practitioner for such appointments of a special character, whether at the specialist clinics or at the central hospital? If a man had taken certain diplomas or done some work in certain specialties, either in the course of his university training or as a post-graduate matter, that by itself would not be considered qualification. There had been a good many complaints about newly qualified persons setting up in these appointments as specialists. He thought the biggest outcry had been at some of the tuberculosis appointments, where young men almost fresh from the hospitals had been appointed and regarded by the people who appointed them, and expected to be regarded by the practitioners of the neighbourhood, as specialists, when they were nothing of the kind. They should take into consideration special or post-graduate study if combined with some active practice of the specialties in question, and that would at once make eligible for appointment all those doctors who had held hospital appointments already. They must have, too, local recognition by the general practitioners of competence in a professional capacity. They would find that there were doctors who were quite competent in some of these specialties who had yet had no special post-graduate study, but who were, in fact, recognized by their local colleagues as being worthy of consulting in the capacity of specialists.

His next proposition was that on the staff of every medical school there should be at least one general practitioner for the purpose of giving instruction in the duties, opportunities and routine of general practice, and in medical ethics, and to review the whole field of medicine in its proper perspective. He did not believe that anybody could do that except the general practitioner. It was outrageous, as he looked upon medical education, that general practitioners should be, as a matter of course, ruled out from the teaching staffs of the big medical schools. He quite agreed that most of the teaching appointments ought to be held by the highly skilled specialists, but to have the whole of the staff without an experienced, able, and properly appointed and selected general practitioner to instruct the students in some of the things they ought to be instructed in seemed to be most improper, and they ought to insist that in future every fully equipped medical school should have on its teaching staff at least one such general practitioner.

His last proposition on this side of the case was that a sufficient number of post-graduate schools should be established entirely separate from the ordinary medical schools, and, beyond that, access for educational purposes of every practitioner to any institution of whatever kind which received public money should be secured.

Those were the things which he thought they as general practitioners had a right to look for in any complete scheme of State provision of a public health service. On the other hand, the community would say, "What are the things which the general practitioner himself must undertake to be aid to do?" The first thing he should say was that the general practitioner must be prepared to take reasonable advantage of such means as were provided to maintain and improve his professional knowledge and skill. If they had these post-graduate schools, all these institutions open for reasonable access for educational purposes, the general practitioner must be expected to take advantage of them. It would not do for him to sit still and stagnate, and expect to be treated as though he had not sat still and stagnated. There were a great many practitioners who did not do that, but who with acute minds, large practices, wide interests, a fair amount of reading, and conversation with their brethren at clinical meetings, did get on very well and did improve without actually undertaking a definite course of study. But he doubted if even that would be quite enough in future. He was inclined to think there would have to be some definite course of study undertaken by practitioners in order to keep themselves well abreast of the times.

His second requirement was that the general practitioner must be prepared to take a full and proper part in matters of public hygiene and preventive medicine generally. They did not want different classes of medical men, with a different kind of education in each given instance, largely separated from one another. They had to remember that the medical officer, the general practitioner, the specialist, had all gone through the same course

of training to become registered medical practitioners. Moreover, he thought that the community had a right to maintain that its idea of public hygiene was somewhat different than had been assumed in times past. They had not merely to prevent a healthy body deteriorating and acquiring disease, but they must help in keeping a healthy body up to the height of its possibilities. Every member of the community ought to be helped and taught and encouraged to make the most of his healthy body, not merely to be content not to be ill. They wanted to co-operate to a greater extent with those administrative officers who were actually appointed to look after the health of the community, and to be intimately concerned, not with personal and domestic hygiene only, but with public hygiene also.

His third requirement was that the general practitioner must be prepared to take such part in clinical research as his abilities and opportunities allowed, and to participate in any organized inquiry as far as might be required of him. It was beginning to be recognized that the only man really in a position to advance medicine much in future was the general practitioner. Research in laboratories and hospitals he would not say had done as much as it could do, but he thought had nearly carried matters as far as it could entirely by itself; and it was only by watching the beginnings and the whole course of disease in individuals and communities that we should advance much in medical research and knowledge. At the present time not everybody could do this or had the opportunity to do it. The way in which they were taught years ago was wrong; their medical outlook was improper in its direction. They were not educated to take full advantage of all the opportunities they had in the way of clinical research in their ordinary daily routine. But the opportunities were there, and they were of enormous importance from the point of view of the community, and this was a place that nobody else but the general practitioner could possibly fill. In so far as the general practitioner individually was qualified and had the opportunity of engaging in such research, he thought it would be reasonable of the State to expect it from him. There could be no satisfactory research without records of some kind, and if anything of that sort was to be done they would have to submit to the requirement that records of some kind or another might properly be asked from them in certain circumstances.

His fourth requirement was that the general practitioner must cultivate increasing co-operation with his colleagues, especially in team work, and work of various kinds in association with those administering public services. The general practitioner was losing his individualistic standpoint to a great extent, and was learning to consider the members of his profession not as rivals but as colleagues. By team work he did not mean the co-operation of the general practitioner with a series of specialists, all working together as a team, but a series of general practitioners working together. They could easily have a body of three or four practitioners doing practically the whole of the work of their practices between them, one specializing in one direction and one in another.

His last requirement was that the general practitioner must be prepared to accept some supervision in certain directions by an administrative service in those matters in which he was acting on behalf of the community. That went very much against the grain, perhaps, and it could be made to mean something which was objectionable. But if they were recognized by the State as doing this work, and if their demands as to the general conditions were granted, then so far as they were doing work on behalf of the community they must allow a professional administrator to be appointed who would say that the common work was adequately and properly done. He did not mean that there should be interference with the details of clinical treatment of an individual. It was possible to have a reasonable and proper general supervision of work done by practitioners on behalf of the State, by an administrative officer who would be, as a rule, the medical officer of the locality, with various subordinate whole-time officers. If such officers were entirely confined to administrative and inspectorial work, and if the clinical work was left absolutely in the hands of the practitioners, then he thought, as far as administrative supervision in a moderate and appropriate way was concerned, they would have to recognize it. If the State set up a public health service, and it did not comply with their main demands, they ought to oppose it for all they were worth as a united profession. On the other hand, they must say they were prepared to do all they could in encouraging the men who were in the service to maintain a high standard of professional work, with such restrictions and liabilities and calls upon them as the State might reasonably ask for.

Meetings of Branches and Divisions.

NORTH LANCASHIRE AND SOUTH WESTMORLAND BRANCH: LANCASTER DIVISION.

THE Medical Secretary (Dr. ALFRED COX) addressed a meeting of the medical men resident in the areas of the Kendal and Lancaster Divisions of the Association, held in the County Hotel, Lancaster, on April 21st, when Dr. OLDFHAM (Chairman of the Lancaster Division) presided, and there was an excellent attendance. About thirty gentlemen lunched with Dr. Cox, and at the meeting this number was augmented to fifty. The address dealt with the work done by the Association in recent years, and reference was made to the vital changes impending in the profession. Questions were invited and various topics of special interest to those present were raised and commented on. Adverse criticism came from one or two speakers, chiefly on the grounds that the British Medical Association was asking them to work the National Health Insurance Scheme, which they did not like. Others declared that the regulations and the amount of clerical work the panel system demanded were irritating and unnecessary.

Dr. COX answered his critics incisively, while his replies and comments on points raised by others met with general acceptance. A vote of thanks for the address was proposed by Dr. JOHNSON (Treasurer of the Branch) and seconded by Dr. McCALLUM (Chairman of the Kendal Division) in eulogistic terms. This was unanimously and most heartily passed.

MIDLAND BRANCH: LINCOLN DIVISION.

A WELL attended meeting was held at Lincoln on April 27th, when Dr. ALFRED COX, O.B.E., Medical Secretary, gave an address on "Some reflections on what an organization of medical men should be and should do." Dr. Cox raised many interesting points, and his address was listened to with the closest attention. A discussion followed in which a large proportion of those present took part. The members afterwards had tea together. Owing to the bad weather very few of the members of the Kesteven Division, which had been invited to join, were able to be present.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

ESSEX BRANCH.—The spring meeting of the Essex Branch will be held at the Saracen's Head Hotel, Chelmsford, on Wednesday, May 26th, at 12 o'clock. Members wishing to show cases or read papers should communicate with Dr. B. W. Nicholson, East Lodge, Colchester.

GLASGOW AND WEST OF SCOTLAND BRANCH: LANARKSHIRE DIVISION.—Dr. J. Livingstone Loudon, Honorary Secretary (Hamilton), gives notice that the annual meeting of the Lanarkshire Division will be held in St. Enoch's Station Hotel, Glasgow, on Wednesday, May 19th, at 3 p.m. Business: Secretary's and Treasurer's annual report. Election of (1) officers; (2) Representative to Representative Meetings. Matters referred to Divisions (see SUPPLEMENT, April 24th). Revised ethical rules procedure. Other business.

METROPOLITAN COUNTIES BRANCH: LAMBETH DIVISION.—The annual general meeting of the Lambeth Division will be held at the Bethlem Royal Hospital on Wednesday, May 19th, at 4 p.m.

INSURANCE.

CORRESPONDENCE.

The Capitation Fee.

SIR,—On p. 120 of Report of Council in the SUPPLEMENT of April 24th, referring to remuneration of panel doctors, it is stated, par. 152, that "the provisional settlement arrived at was that a capitation fee of 11s. should be paid during the period of January to March, 1920," and in par. 153, "The award was that the amount should be 11s."

As this is a matter of great importance to doctors on the panel I would take it as a favour if you or the Medical Secretary would in next week's JOURNAL plainly and unambiguously state whether this is correct. I ask for the publication in the JOURNAL as the matter does not seem clear to doctors whom I have discussed the matter with, and who remember the calculations put forth when the Act came in which never realized. Capitation, according to dictionaries, means each person on a list. I would be obliged for an answer to each question:

1. Is the 11s. to be paid for each person on one's list without deduction?
2. Are we to be paid for people over 70?
3. Are we to be paid 11s. for the incapacitated?
4. Are we to be paid 11s. a year for women who have married and have ceased to be employed, but who are eligible for medical attendance for a considerable time afterwards?

By inserting this letter and the answers you would confer a favour on many besides yours, etc.,
Chelsea, April 24th. (Signed) JAMES HAMILTON, M.D.

* * * The Medical Secretary replies as follows:

The general answer to the above letter is that the sum of 11s. is paid into the Central Medical Benefit Fund in respect of every insured person who is entitled to medical attendance and treatment under the Health Insurance Acts. With a view to being satisfied on this point the Conference of Representatives of Local Medical and Panel Committees appointed in 1918 an actuary of its own choice to inquire into the whole machinery of the constitution of the Central Fund. The actuary in question (Mr. S. G. Warner—then president of the Institute of Actuaries) reported that the profession might feel assured that the operations by which the Central Pool was instituted were actuarially sound and the results equitable, and this report was accepted and approved by the April, 1918, Conference. The answers to the specific questions are: (1) No. The list can never be taken as absolutely accurate. The payment to each doctor will be his share of the local pool estimated on the basis of the size of his list. (2) Yes. (3) Yes. (4) Payment will be made for the period during which they remain eligible for medical benefit.

THE INSURANCE ACTS COMMITTEE.

Proposal for a Complimentary Dinner.

SIR,—I believe the BRITISH MEDICAL JOURNAL is broad-minded enough to open its correspondence columns even to members whose views differ from those of the Standing Committee of Group K.

May I say that I think these complimentary dinners are a mistake? The profession as a whole has just sustained another disastrous defeat at the hands of a tyrannical Minister, who will not be slow to take further advantage of a helpless enemy. The Insurance Acts Committee no doubt did its best, but from the ordinary panel practitioner's point of view the results of its labours are, to say the least of it, disappointing.

It can scarcely be denied that the rank and file who work the Act are now in a very much worse position than they were before the war. They have more work, less liberty, and less pay. (The present capitation fee of 11s. is only equivalent to 5s. as compared with 7s. in pre-war days.)

This is a time of humiliation for the profession, when fasting rather than feasting should be the order of the day. Personally, I should strongly object to subscribing even so small a sum as 1s. towards a complimentary dinner which is nothing but a commemoration of our defeat.—I am, etc.,

Okehampton, Devon, April 27th. T. STRETHILL WRIGHT.

DIARY OF SOCIETIES AND LECTURES.

- LONDON DERMATOLOGICAL SOCIETY, 49, Leicester Square, W.C.2.—Tuesday, 4.30 p.m., Cases.

The Annual Representative Meeting at Cambridge will begin on Friday, June 25th, at 10 a.m. The Annual General Meeting will be held at the Examination Halls, Cambridge, on Tuesday, June 29th, at 2 p.m. The Programme of the Scientific Sections appears at page 161.

British Medical Association.

CURRENT NOTES.

Minimum Salaries for Public Medical Officers.

THE attention of practitioners who intend to devote themselves to the Public Medical Services is directed to the fact that at the present time no advertisement is accepted by the *British Medical Journal*, the *Lancet*, or the *Medical Officer* for an assistant medical officer of health, assistant school medical officer, assistant tuberculosis officer, or other similar post, at a salary less than £500 per annum, exclusive of all travelling and office expenses. The result of this decision has been that most local authorities are offering that salary for these posts; but some, regardless apparently of present economic conditions, are trying to induce practitioners to accept less, and for this purpose are advertising in the lay press. It cannot be too strongly impressed upon young practitioners that, speaking generally, any advertisement of a medical post which appears only in the lay press should be regarded with caution. Intending applicants are therefore advised to make inquiries of the Medical Secretary, 429, Strand, W.C.2, before applying for any post which they see advertised in the lay press and not in the medical press, and to assist the British Medical Association in its efforts to maintain the standard of medical remuneration by refraining from applying for any posts such as those specified above at a less net salary than £500 per annum.

Work of the Medico-Political Committee.

The Medico-Political Committee of the British Medical Association, at its meeting on May 5th, gave consideration to the following important matters: (1) Fees for medical witnesses at assizes: Efforts are being made to get these fees raised, and a report was received that a 50 per cent. advance became operative last March. (2) Pay and conditions of the Postal Medical Service: It was decided to approach the Postmaster-General again with a view to receiving a deputation. (3) Income Tax of women doctors giving whole-time service to the War Office and attending the W.R.A.F., etc.: It appears that the lower rate of income tax is only allowed to women doctors who attended soldiers, and steps are being taken to obtain it for those those who attended the W.R.A.F., etc. (4) Scale of fees for Seamen's National Insurance Society: After prolonged pressure by the Association this Society has offered to increase its fees by 50 per cent., and the offer has been accepted. (5) Part-time Prison Medical Officers: A report was received that

certain proposals as regards improvement of pay are before the Treasury, and that in these circumstances the Home Secretary is not yet in a position to make a statement; also that a prison medical officer on a salary of £80 per annum had resigned owing to inadequacy of pay, and that he had been offered £150 to stay on. (6) Dispute between the Gaslight and Coke Company's Employees Benefit Society and its doctors: Approval was given to the attendance by the Deputy Medical Secretary at a conference between the doctors and the Benefit Society representatives. (7) New motor car taxation: A report was received that the representatives of the Association had met the medical Members of Parliament to discuss what action should be taken, and that later the views of the Association had been laid before the Ministry of Transport by a combined deputation of medical Members of Parliament and representatives of the Association, as recorded in this column on May 8th. (8) Fees for medical men called in on the advice of midwives: A report was received that a deputation from the Association had interviewed Dr. Janet Campbell at the Ministry of Health on the subject of fees for medical men called in on the advice of midwives; that certain suggestions had been made by the Ministry of Health, some of which met with approval; that the deputation had pointed out that there would be considerable difficulty in persuading the medical men in all areas to accept a lower flat-rate fee than three guineas; and that the Ministry would consider the points raised by the Association's representatives and endeavour to come to a final decision in time for the meeting of Council on May 19th.

Insurance Practitioners' Right of Appeal to High Court.

In November, 1919, the Panel Conference resolved:

That any person aggrieved by the removal of his name from the list may, within three months after the date on which notice is given to him by the Minister that his name has been so removed, appeal to the High Court, and on any such appeal the High Court may give such directions in the matter as it thinks proper, including directions as to the costs of the appeal, and the order of the High Court shall be final and conclusive, and not subject to an appeal to any other court.

In December last the attention of the Ministry of Health was drawn to the above resolution when this and other matters arising out of the Conference were placed before it. It was pointed out, however, that legislation would be necessary to give effect to the resolution, and as the Insurance Acts Committee was informed that there

would probably be an Insurance Bill before the House in the near future, it was decided to have an amendment moved dealing with this proposal.

The National Health Insurance Bill, 1920, was introduced into the House of Commons on March 1st, and came before Standing Committee "A" on April 27th. Dr. A. C. Farquharson, M.P., at the request of the Insurance Acts Committee, proposed the following new clause which had been drafted by counsel:

Right of Appeal by Medical Practitioner.

(1) Any medical practitioner aggrieved by a decision of the Minister, or of any special body through which the powers and duties of the Minister, under Section 15, Subsection 2 (b) of the Act of 1911, are exercised, to remove his name from any list of medical practitioners, may appeal against the decision to the High Court within the time, and in the manner, and on the conditions directed by the rules of court.

(2) The costs of any such appeal shall be in the discretion of the court, and no appeal shall be allowed from any order or decision of the court in any such appeal.

The Minister of Health would not accept the amendment, and the proposal was negatived. A full report of the proceedings appeared in the JOURNAL of May 8th, p. 615. The bill has passed through Committee, and the Report stage was taken in the House of Commons on May 13th (see Parliamentary Notes on p. 717 of JOURNAL). The amendment was again proposed, this time by Captain W. E. Elliot, M.P. (Secretary of the House of Commons Medical Committee). The secretaries of all Local Medical and Panel Committees and of Divisions and Branches were asked by the Association to do their utmost to bring pressure to bear upon their local members of Parliament to support the amendment.

Pensions of Medical Officers retired from the Colonial Services.

As a result of representations made by the British Medical Association to the Secretary of State for the Colonies, as to increase of the pensions of medical officers retired from the colonial services, the Association has received from the Colonial Office particulars of the increases of pensions granted by various colonial Governments to retired officials, including medical officers, on account of conditions brought about by the war. In forwarding the memorandum, the Assistant Under-Secretary of State explained that the question of the increases to be granted was left to the several colonial governments to decide according to their varying circumstances. The substance of the information thus obtained will be published in the Supplementary Report of the Council (SUPPLEMENT of May 29th, 1920). A copy of the memorandum is being sent to each oversea Branch, as well as to each member of the Association who communicated with the Council in connexion with the evidence to be placed by the Association before the Colonial Medical Services Committee appointed by the Secretary of State. The memorandum will also be sent to any other member of the Association serving in or retired from the Colonial Medical Service who expresses a wish to have one. The whole matter is receiving the attention of the Council.

Panel Lists in Glasgow.

A bombshell has been dropped amongst Glasgow practitioners by the action of the Glasgow Insurance Committee in fixing the maximum number of insured persons to be attended by one medical practitioner at 1,500. Great indignation has been expressed by the Glasgow insurance practitioners, as a large number of them will be seriously affected by this drastic and arbitrary ruling. There are in all 343 doctors on the panel in Glasgow and 94 of these have lists of over 1,500. Indignation meetings have been held, and a committee has been appointed to interview the Scottish Board of Health in the hope that the Board may see fit to bring pressure to bear upon the Insurance Committee in this matter. There are a number of areas in Scotland where the Panel Committees and the Insurance Committees have agreed on a 2,000 limit, but we know of no instance where such a low limit as 1,500 has been agreed upon or even suggested. Any communications upon the subject should be addressed to the Scottish Medical Secretary of the British Medical Association, Dr. J. R. Droyer, 6, Rutland Square, Edinburgh, who, together with the Insurance Acts Subcommittee (Scotland), is assisting the Glasgow practitioners in this matter.

Individual Advice to Members of the Association.

At a meeting recently addressed by the Medical Secretary it was suggested that he and his colleagues should seek to serve the members of the Association as general advisers or "friends in need" in medical matters. Dr. Cox replied that this had always been their ambition, and that no day passed without interviews with members seeking for such advice as might be expected to be forthcoming from men whose experience in dealing with the medical profession was necessarily very large. Many of the letters received, both by the Medical Secretary and the Editor, ask for such advice, and much of the Librarian's time is spent in assisting on matters within his sphere. The officials of the Association look on it not only as part of their duty, but as a pleasure, to give any advice or assistance to members that is within their power.

Hours of Opening of the Library.

Members who use the Library of the Association should note that it is now open till 6.30 each evening, instead of till 5 p.m. On Saturdays it closes at 2 p.m. These extended hours are being tried as an experiment, and note will be taken as to whether, judged by the advantage that may be taken of them, the longer hours are desired by members generally.

Meetings of Branches and Divisions.

NORTHERN COUNTIES OF SCOTLAND BRANCH: CAITHNESS AND SUTHERLAND DIVISION.

First Annual Dinner.

THE first annual dinner of the Caithness and Sutherland Division of the British Medical Association took place at Thurso on April 1st. There was a large and representative gathering of the profession, and among the guests were Sir Archibald Sinclair, Lord Lieutenant of Caithness, Mr. D. Keith Murray, and ex-Provost Durran. The chair was taken by Dr. SIMPSON of Golspie. Mr. DAVID COGHILL proposed the toast of the Caithness and Sutherland Division of the British Medical Association, and Dr. ASHER, in reply, stated that the object of the gathering had been to get the medical practitioners of the northern counties to meet together in order to further their better acquaintance. He was particularly gratified by the presence of the Lord Lieutenant of the county, and Lady Sinclair. Dr. SLATER proposed the "Service members," and the CHAIRMAN and Dr. KENNEDY replied. The dinner was a great success, and the hope was expressed that it would become an annual event in the history of the Division.

LANCASHIRE AND CHESHIRE BRANCH: PRESTON DIVISION.

THE annual general meeting of the Preston Division was held on April 20th, when Dr. COLLINSON presided.

The financial statement and the Voluntary Fund Account were read and passed.

The following officers were elected:

President: Dr. Collinson (re-elected). *Vice-Presidents:* Dr. Duckworth (re-elected), Dr. W. H. Irvin-Sellers. *Representative in Representative Body:* Dr. W. H. Irvin-Sellers. *Deputy Representative:* Dr. W. H. Pimblett. *Honorary Secretary and Treasurer:* Dr. W. Sykes.

The ethical rules were unanimously accepted. In the main the meeting agreed with the recommendations as to fees for medical examination for life insurance, but considered that there should be a sliding scale for the larger insurance policies. The meeting, while in agreement with the outlined scheme for action by the Association in national emergencies, decided to take no local action. It was considered that some steps should be taken by the Association for remuneration in the event of practitioners being called upon. The meeting agreed with the resolution regarding payment of medical staffs of hospitals for pension work, and also with the Medico-Political Committee on the question of training of midwives. It was suggested that the Division should have a regular monthly meeting, either scientific or otherwise, during the next winter session.

METROPOLITAN COUNTIES BRANCH: NORTH MIDDLESEX DIVISION.

A MEETING of the North Middlesex Division was held at Wortley Hall, Pinbury Park, on April 21st, when Dr. GEORGE COHEN was in the chair. Non-members and also members of neighbouring Divisions had been invited to attend.

A highly interesting lecture was given by Mr. A. FLEMING, F.R.C.S., of the Inoculation Department, St. Mary's Hospital, Paddington, on "Vaccine therapy," which was requested to be forwarded for publication in the JOURNAL.

Dr. T. A. B. Barnes was nominated for a seat on the Council of the Metropolitan Counties Branch, and Drs. Brackenbury and Barnes were elected as Representatives of the Division on the Representative Body.

British Medical Association.

EIGHTY-EIGHTH ANNUAL MEETING, CAMBRIDGE, JUNE-JULY, 1920.

President: Sir T. CLIFFORD ALBUTT, K.C.B., LL.D., M.D., F.R.S., Regius Professor of Physic, University of Cambridge.
Chairman of Representative Meetings: T. W. H. GARSTANG, M.A. Oxon., M.R.C.S. Eng., D.P.H. Vict.
Chairman of Council: J. A. MACDONALD, M.D., M.Ch., LL.D., Hon. Physician, Taunton and Somerset Hospital.
Treasurer: G. E. HASLIP, M.D. (London).

PROGRAMME.

The President will give an address on Tuesday evening, June 29th, in the Senate House, followed by a reception in King's College by the Cambridge and Huntingdon Branch.

The REPRESENTATIVE MEETING will begin in the Examination Halls on Friday, June 25th, at 10 a.m.

The statutory ANNUAL GENERAL MEETING will be held at the Examination Halls on Tuesday, June 29th, at 2 p.m.

By kind invitation of the Master and Fellows of St. John's College, the Annual Dinner of the Association will be held in the Hall of St. John's College at 8 p.m. on Thursday, July 1st.

A service will be held in the University Church, Great St. Mary's, on Tuesday, June 29th, at 5 p.m. Mass will be celebrated in the Roman Catholic Church, Hyde Park Corner, at 9 a.m., on Wednesday, June 30th.

The Popular Lecture will be given by Dr. G. S. Graham-Smith, F.R.S., on "Flies," at 8.30 p.m. on Friday, July 2nd.

DEMONSTRATIONS.

Laboratory and clinical demonstrations will be given from 2.30 to 4.30 p.m. (Wednesday, Thursday, and Friday). The Directors of demonstrations are:

Medicine: Dr. ALDREN WRIGHT, 2, Corpus Buildings, Cambridge.

Surgery: Mr. ARTHUR COOKE, M.B., B.Ch. Oxon., Grove Lodge, Cambridge.

Physiology: Professor J. N. LANGLEY, F.R.S., Physiological Laboratory, Cambridge.

Pharmacology: Professor W. E. DIXON, F.R.S., Pharmacological Laboratory, Cambridge.

Neurology: Dr. E. D. ADRIAN, Trinity College, Cambridge.

Pathology: Professor Sir G. SIMS WOODHEAD, Pathological Laboratory, Cambridge.

THE SECTIONS.

The scientific business of the meeting will be conducted in twelve sections, which will meet on the days indicated.

The President, Vice-President, and Honorary Secretaries of each Section constitute a Committee of Reference for that Section, and exercise the power of inviting, accepting or declining, any paper, and of arranging the order in which accepted papers shall be read. Communications with respect to papers should be addressed to one of the Honorary Secretaries.

A paper read in the Section must not exceed fifteen minutes, and no subsequent speech may exceed seven minutes.

Papers are the property of the British Medical Association, and cannot be published elsewhere than in the BRITISH MEDICAL JOURNAL without special permission.

Demonstrations will take place on Wednesday, Thursday, and Friday (June 30th, July 1st and 2nd) afternoons from 2.30 to 4.30 p.m.

The following twelve Sections have been authorized by the Council:

The Sections will meet from 10 a.m. to 1 p.m.

Sections meeting on three days: Wednesday, June 30, Thursday, July 1, and Friday, July 2.

MEDICINE.

President: Sir HUMPHRY D. ROLLESTON, K.C.B., M.D., F.R.C.P.

Vice-Presidents: THOMAS BEATTIE, M.D., F.R.C.P.; Professor JOHN B. BRADBURY, M.D., F.R.C.P.; Sir THOMAS J. HORDER, M.D., F.R.C.P.; F. W. BURTON-FANNING, M.D., F.R.C.P.; THOMAS LEWIS, M.D., F.R.S.

Honorary Secretaries: A. J. JEN-BLAKE, M.D., F.R.C.P. (13, Ennismore Gardens, London, S.W.7); W. E. HUME, M.D., F.R.C.P. (4, Ellison Place, Newcastle-on-Tyne); E. LLOYD JONES, M.D. (59, Trumpington Street, Cambridge); J. ALDREN WRIGHT, M.D., M.R.C.P. (Director of Demonstrations, 2, Corpus Buildings, Cambridge).

The following programme has been arranged:

June 30th (Morning Session).—Discussion on the Diagnosis of Nervous Disorders of the Stomach and Intestines. To be opened by Dr. A. F. HURST, followed by Sir Clifford Allbutt, Dr. Charles Bolton (London), Dr. Langdon Brown (London), Dr. Maurice Craig (London), Dr. R. G. Gordon (Bath), Mr. H. Tyrrell Gray

(London), Dr. R. Hutchison (London), Dr. Craven Moore (Manchester), Dr. R. J. Buchanan (Liverpool), Dr. E. Hobhouse (Brighton), Dr. W. J. Tyson (Folkestone), Dr. J. A. Nixon (Bristol), and others.

In the afternoon Mr. J. Barcroft will demonstrate Methods of Analysing the Gases of the Blood and Alveolar Air.

July 1st (Morning Session).—Discussion on the Present Position of Vitamines in Clinical Medicine. To be opened by Professor F. G. HOPKINS, followed by Sir James Barr (Liverpool), Dr. S. M. Copeman (London), Dr. Corry-Mann (London), Dr. A. Croft Hill (London), Dr. C. J. Martin (London), Dr. Eric Pritchard (London), Dr. J. C. Drummond (London), Mr. A. Harden (London), Lieut.-Colonel McCarrison, I.M.S., Dr. R. L. Mackenzie Wallis (London), Dr. G. F. Still (London), Dr. W. H. Willcox (London), Dr. Leonard Williams (London), and others.

July 2nd (Morning Session).—Discussion on the Clinical Significance and Course of Subacute Bacterial Endocarditis. To be opened by Sir THOMAS HORDER, followed by Dr. Carey Coombs (Bristol), Dr. J. M. Cowan (Glasgow), Dr. H. S. French (London), Dr. A. G. Gibson (Oxford), Dr. A. E. Gow (London), Dr. A. J. Hall (Sheffield), Dr. J. Hay (Liverpool), Dr. F. J. Poynton (London), Dr. H. J. Starling (Norwich), Dr. W. E. Hume (Newcastle), and others.

An exhibition of specimens illustrating the subject of this discussion will be held in the Pathological Museum.

SURGERY.

President: Sir GEORGE H. MAKINS, G.C.M.G., C.B., F.R.C.S.
Vice-Presidents: HARRY LITTLEWOOD, C.M.G., F.R.C.S.; Sir CUTHBERT S. WALLACE, K.C.M.G., C.B., F.R.C.S.; GEORGE EDWARD WHERRY, M.Ch., F.R.C.S.; DAVID PERCIVAL D. WILKIE, F.R.C.S. Edin.

Honorary Secretaries: W. H. BOWEN, M.S., F.R.C.S. (24, Lensfield Road, Cambridge); ARTHUR COOKE, F.R.C.S., Grove Lodge, Cambridge (Demonstration Secretary); G. E. GASK, C.M.G., D.S.O., F.R.C.S. (41, Devonshire Place, London, W.1); GORDON TAYLOR, O.B.E., M.S., F.R.C.S. (15, Harley Street, London, W.1).

The following programme has been arranged:

June 30th (10 a.m.).—Discussion: Surgical Treatment of Gastric Ulcer. To be opened by Sir BERKELEY G. A. MOYNIHAN, K.C.M.G., C.B., and Dr. CHARLES H. MAYO. (12 noon).—Paper: Mr. FRANK KIDD, Treatment of Calculi of the Lower Third of the Ureter.

July 1st (10 a.m.).—Discussion: Surgical Treatment of Cancer of the Rectum. To be opened by Mr. W. ERNEST MILES and Mr. GRAY TURNER. (12 noon).—Paper: Lieut.-Colonel R. H. ELLIOT, Diagnosis of Glaucoma.

July 2nd (10 a.m.).—Discussion: End-Results of Injuries to the Peripheral Nerves treated by Operation. To be opened by Sir WILLIAM THORBURN, K.B.E., C.B., C.M.G., and Mr. PERCY SARGENT, C.M.G., D.S.O. (12 noon).—Paper: Mr. HERBERT TILLEY, Inflammatory Lesions of the Nasal Accessory Sinuses from the Standpoint of the General Physician and Surgeon.

Demonstrations will be given in the afternoons by Major Maurice Sinclair, C.M.G., on the Treatment of Fractures; by Mr. H. D. Gillies, C.B.E., and Mr. Percival Cole, on Plastic Surgery of the Face; by Mr. Herbert Tilley, on Endoscopy of the Lower Air Passages and Gullet, and by Mr. Arthur Cooke, on the Technique of Blood Transfusion.

NEUROLOGY AND PSYCHIATRY.

President: HENRY HEAD, M.D., F.R.S.

Vice-Presidents: GORDON M. HOLMES, C.M.G., M.D., F.R.C.P.; W. H. RIVERS RIVERS, M.D., F.R.S.; LEWIS E. SHORE, M.D.; T. GRAINGER STEWART, M.D., F.R.C.P.; THEODORE THOMPSON, M.D., F.R.C.P.

Honorary Secretaries: E. D. ADRIAN, M.D., M.R.C.P. (Trinity College, Cambridge); E. FARQUHAR BUZZARD, M.D., F.R.C.P. (78, Wimpole Street, London, W.1); GEORGE RIBDOCH, M.D., M.R.C.P. (10, Alba Gardens, Golders Green, London, N.W.4).

The following preliminary arrangements have been made:

June 30th (Morning Session).—Discussion on the Early Signs of Nervous Disease and their Interpretation. To be opened by HENRY HEAD, M.D., F.R.S.

July 1st (Morning Session).—Discussion on Dementia Praecox and its Relation to other Conditions. To be opened by BERNARD HART, M.D.

July 2nd (Morning Session).—Discussion on Psychotherapy. To be opened by T. A. ROSS, M.D.

Demonstrations are being arranged for two afternoons; particulars will be announced later.

PATHOLOGY AND BACTERIOLOGY.

President: Professor J. LORRAIN SMITH, M.D., F.R.S.

Vice-Presidents: J. A. ARKWRIGHT, M.D., F.R.C.P.; LOUIS COBBETT, M.D., F.R.C.S.; MERVYN H. GORDON, C.M.G., M.D.; T. S. P. STRANGEWAYS, M.R.C.S., L.R.C.P.

Honorary Secretaries: A. E. CLARK-KENNEDY, M.R.C.S., L.R.C.P. (Corpus College, Cambridge); A. E. GOW, M.D., F.R.C.P. (37, Queen Anne Street, London, W.1); HELEN INGLEBY, M.B., M.R.C.P. (44, Welbeck Street, London, W.1).

The following discussions have been arranged during the mornings:

June 30th.—Atrophy of the Liver. To be opened by Professor STUART McDONALD, M.D., F.R.C.P. (Newcastle-upon-Tyne).

July 1st.—The Present Position of Cancer Research. To be opened by J. A. MURRAY, M.D., Director, Imperial Cancer Research Fund.

July 2nd.—The Bacteriology of Cerebro-spinal Meningitis. To be opened by J. A. ARKWRIGHT, M.D., F.R.C.P., Assistant Bacteriologist, Lister Institute of Preventive Medicine. (A collection of specimens to illustrate the subject under discussion will be available.)

The afternoons will be devoted to meetings of the Pathological Society of Great Britain and Ireland, when papers will be read and demonstrations given.

PHYSIOLOGY AND PHARMACOLOGY.

President: Professor F. GOWLAND HOPKINS, M.B., F.R.S.

Vice-Presidents: H. H. DALE, C.B.E., M.D., F.R.S.; Professor J. A. GUNN, M.D.; Professor D. NOËL PATON, M.D., F.R.S.; F. RANSOM, M.D.

Honorary Secretaries: D. V. COW, M.D. (The Bridge House, Great Shelford, Cambridge); EDWARD MELLANBY, M.D. (32, Addison Mansions, Kensington, London, W.14).

The following provisional arrangements have been made:

June 30th.—Discussion on Acidosis in Disease. To be opened by Professor F. GOWLAND HOPKINS, F.R.S.

July 1st.—Discussion on the Physiology and Treatment of Denervated Muscle. To be opened by Professor J. N. LANGLEY, Sc.D., F.R.S.

July 2nd.—Discussion on Quinine and its Derivatives. To be opened by Professor W. E. DIXON, F.R.S.

The following Sections meet on Wednesday only.**NAVAL AND MILITARY.**

President: Colonel JOSEPH GRIFFITHS, C.M.G., M.D., F.R.C.S.

Vice-Presidents: Lieut.-Colonel E. J. CROSS, R.A.M.C.T.; Lieut.-Colonel R. H. ELLIOT, M.D., D.Sc., I.M.S. (ret.); Surgeon Commander H. W. B. SHEWELL, R.N.; Surgeon Rear Admiral A. GASCOIGNE WILDEY, C.B., R.N.

Honorary Secretaries: Major A. S. M. MACGREGOR, O.B.E., M.D., R.A.M.C.T. (Sanitary Chambers, Glasgow); Major H. B. RODERICK, O.B.E., M.Ch., M.D., R.A.M.C.T. (17, Trumpington Street, Cambridge); Lieut.-Colonel F. E. APHORPE WEBB, O.B.E. (Grafton House, Maid's Causeway, Cambridge).

The following programme has been arranged:

June 30th.—10 a.m., Discussion on the Army Medical Service and its Relation to the Education and Training of Newly Qualified Medical Men, to be opened by the PRESIDENT. Papers on interesting subjects relating to the war will be read, particulars of which will appear later. 2.30 p.m., The Naval, Military, and Air Force Medical Services will exhibit the new inventions and equipments that arose during the Great War. Each department will be fully represented, and each will be in charge of an officer who will be prepared to demonstrate and explain the exhibits.

OBSTETRICS AND GYNAECOLOGY.

President: HERBERT WILLIAMSON, M.B., F.R.C.P.

Vice-Presidents: FREDERICK DEIGHTON, M.B.; J. PRESCOTT HEDLEY, M.Ch., F.R.C.S.; FRANCES IVENS, M.B., M.S.

Honorary Secretaries: MALCOLM DONALDSON, M.B., F.R.C.S. (145, Harley Street, London, W.1); W. R. GROVE, M.D. (St. Ives, Hunts).

June 30th.—Discussion on Puerperal Sepsis. (1) Mr. VICTOR BONNEY (London): Introductory paper. (2) Mr. H. BECKWITH WHITEHOUSE (Birmingham): Surgical Treatment of Uterus in Puerperal Sepsis. (3) Dr. A. E. Gow (London): Intravenous Protein Therapy in Treatment of Puerperal Septicaemia. (4) Dr. LEITH MURRAY (Liverpool): Use of Scrums and Vaccines in the Treatment of Puerperal Sepsis.

July 1st.—At 10 a.m. there will be a joint session with the Section of Electro-Therapeutics to discuss the Treatment of Fibroids by X Rays.

Dr. J. Mackenzie Wallace will give a demonstration of the diastase reaction.

TROPICAL MEDICINE.

President: Professor G. H. F. NUTTALL, M.D., F.R.S.

Vice-Presidents: BREADALBANE BLACKLOCK, M.D.; Lieut.-Colonel S. PRICE JAMES, M.D., I.M.S.; P. H. MANSON-BAHR, M.D.

Honorary Secretaries: CHARLES FREDERICK SEARLE, M.D. (67, Bridge Street, Cambridge); J. GORDON THOMSON, M.B. (24, Herne Hill, London, S.E.24).

The following programme has been arranged:

June 30th (Morning Session).—Papers: (1) Problem of Filariasis, by Drs. STEPHENS and YORKE. (2) Role of *P. bancrofti* in the Production of Lymphatic Obstruction and a Consideration of

Elephantiasis from the Pathological Standpoint, by Dr. G. C. Low and Dr. P. H. MANSON-BAHR, D.S.O. (3) The Effects of Vitaminic Deprivation on the Endocrine Organs, with Special Reference to Wet Beri-beri and Epidemic Dropsy, by Lieut.-Colonel ROBERT MCCARRISON, I.M.S.

Demonstrations.—In the afternoon there will be the following demonstrations: (1) Parasitic Worms, by Dr. R. T. Leiper. (2) Exhibition Collection of all known species of Tsetse Flies, with demonstration dealing with the Morphology and Bionomics, by Professor Newslead. (3) Demonstration of the use of the Mobile Laboratory for Malarial Inquiries in England, by Colonel S. P. James. (4) Paintings illustrating the Treatment of Leprosy, by Lieut.-Colonel Sir Leonard Rogers, C.I.E., F.R.S., I.M.S.

The following Sections meet on Thursday only.**MEDICAL EDUCATION.**

President: Sir GEORGE NEWMAN, K.C.B., M.D., F.R.C.P.

Vice-Presidents: G. S. GRAHAM-SMITH, M.D., F.R.S.; Professor DAVID HEPBURN, C.M.G., M.D.; THOMAS W. SHORE, M.D.; S. SQUIRE SPRIGGE, M.D.; Professor PETER THOMPSON, M.D.

Honorary Secretaries: S. R. GLOYNE, M.D. ("Hatherley," Chalfont St. Giles, Bucks); Professor J. KAY JAMESON, M.B. (Dean of Faculty of Medicine, Leeds).

The following programme has been arranged:

July 1st (10 a.m. to 1 p.m.).—Address by the PRESIDENT. Discussion: Preliminary Scientific Education in the Medical Curriculum. Openers: Prof. S. J. HICKSON, D.Sc., F.R.S. (Biology); Prof. ARTHUR KEITH, M.D., F.R.S. (Anatomy); Prof. Sir ERNEST RUTHERFORD, D.Sc., F.R.S. (Physics); Prof. J. LORRAIN SMITH, M.D., F.R.S. (Pathology); Prof. A. SMITHHELLS, C.M.G., F.R.S. (Chemistry).

VENEREAL DISEASES.

President: E. B. TURNER, F.R.C.S.

Vice-Presidents: Colonel L. W. HARRISON, D.S.O., M.B.; MORNA L. RAWLINS, M.B.

Honorary Secretaries: W. H. HARVEY, M.D. (The Dene, Great Shelford, Cambridge); OTTO MAY, M.D. (19, Well Walk, Hampstead, London, N.W.3).

The following programme has been arranged:

July 1st (10 a.m.).—Discussion on Venereal Diseases in Women and Children: (1) Dr. MORNA RAWLINS: Treatment of Venereal Disease in Women. (2) Dr. LEONARD FINDLAY: Venereal Diseases in Children.

Demonstrations.—In the afternoon there will be a clinical demonstration at the Venereal Diseases Clinic, Addenbrooke's Hospital, and a laboratory demonstration in the Medical Schools under the direction of Mr. J. E. Barnard.

The following Sections meet on Friday only.**ELECTRO-THERAPEUTICS.**

President: ALFRED ERNEST BARCLAY, M.D.

Vice-Presidents: ROBERT KNOX, M.D.; ALFRED CHARLES JORDAN, M.D., M.R.C.P.

Honorary Secretaries: E. P. CUMBERBATCH, M.B., M.R.C.P. (15, Upper Wimpole Street, W.1); F. SHILLINGTON SCALES, M.D. ("Redcourt," Adams Road, Cambridge).

The following programme has been arranged:

July 2nd.—Presidential address by Dr. A. E. BARCLAY: Place of the Radiologist in Medicine. Discussion on the Diagnosis and Treatment of Paralysis caused by Nerve Injury, to be opened by Mr. H. S. SOUTTAR, F.R.C.S. Papers: Dr. ROBERT KNOX, Tumours of the Chest; Dr. HOWARD HUMPHREYS, Use of the Melted Paraffin Wax Bath and the Tungsten Arc Light; Dr. E. P. CUMBERBATCH, Treatment by Diathermy of Intra-vesical Growths and Ulcers of the Urinary Bladder; Professor J. GOODWIN TOMKINSON, M.D., X-ray Therapy in Oriental Sore; Dr. S. GILBERT SCOTT, Diagnostic Value of the Renal Outlines and the Method of Determining the Relation of Abnormal Shadows to them. Joint Discussion with Section of Obstetrics and Gynaecology, on Treatment of Uterine Fibroids, to be opened by Dr. ROBERT KNOX on July 1st at 10 a.m.

MEDICAL SOCIOLOGY.

President: G. E. HASLIP, M.D.

Vice-Presidents: H. B. BRACKENBURY, M.R.C.S., L.R.C.P.; ADAM FULTON, M.B.; C. O. HAWTHORNE, M.D.; Professor BENJAMIN MOORE, D.Sc., F.R.S.

Honorary Secretaries: S. MORTON MACKENZIE, M.B. (9, Rose Hill, Dorking); C. M. STEVENSON, M.D. (90, Chesterton Road, Cambridge).

July 2nd (10 a.m.).—Sir GEORGE NEWMAN, K.C.B., M.D., F.R.C.P., will open a discussion on The Future of Medical Practice, dealing with the subject from the point of view of the State. The discussion will be continued by Sir WILMOT HERRINGHAM, K.C.M.G., C.B., M.D., F.R.C.P., from the standpoint of the Consultant; Dr. ALFRED LINNELL from that of the General Practitioner; Professor F. GOWLAND HOPKINS, F.R.S., D.Sc., F.R.C.P., from that of Medical Research, and Mr. E. W. MORRIS, C.B.E., House Governor London Hospital, from that of The Hospitals.

PATHOLOGICAL MUSEUM.

Committee: Sir GERMAN SIMS WOODHEAD, K.B.E. (Chairman), Dr. L. COBBETT, Dr. G. S. GRAHAM-SMITH, Dr. W. H. HARVEY, Mr. T. S. P. STRANGEWAYS, and Dr. H. B. RODERICK, M.Ch. (Honorary Secretary).

The Pathological Museum arranged in connexion with the meeting will occupy a central position in two temporary buildings in the first court of the Medical Schools. It is proposed to arrange the material under the following heads: (1) Exhibits bearing on discussions and papers in the various Sections. (2) Specimens and illustrations relating to any recent research work. (3) Individual specimens of special interest or a series illustrating some special subject. (4) Instruments or appliances relating to clinical diagnosis and pathological investigation. There will also be a series of exhibits illustrative of war specimens, arthritis, cerebro-spinal meningitis, and parasitology. So far as practicable each section will be under the charge of a demonstrator, but exhibitors will have an opportunity of demonstrating their own specimens.

Communications regarding material for exhibition should be addressed to Dr. H. B. Roderick, at the Surgical Department, Medical School, Roderick.

ENTERTAINMENTS.

In addition to the reception given in King's College by the Cambridge and Huntingdon Branch of the British Medical Association on Tuesday evening, after the delivery of the President's address, the Vice-Chancellor of the University will hold a reception at Emmanuel College on Wednesday at 9 p.m. The Mayor of Cambridge will give a reception on Thursday afternoon at Christ's College at 4.30 p.m. On Friday evening, at 9 p.m., a reception will be given at Trinity College by the Master and Fellows.

EXCURSIONS.

On Saturday there will be an excursion to Newmarket, where the King's stables will be visited, a river expedition to the Fen, and possibly other excursions which will be notified in due course.

GOLF.

The Gog Magog Golf Club has made members of the British Medical Association honorary members during the meeting. An honorary member will be allowed to introduce other visitors, including ladies, on payment of the green fee. The competition for the Ulster cup will take place on Thursday, July 1st. Entries, with particulars of club and handicap, should be sent to the captain of the club, Dr. W. S. Cole, Latham Road, Cambridge. It is proposed to arrange a ladies' competition on Friday morning.

The Honorary Local Secretaries of the Meeting are J. F. GASKELL, M.D., F.R.C.P., The Uplands, Great Shelford, near Cambridge, and G. S. HAYNES, M.D., 58, Lensfield Road, Cambridge. Communications should be addressed to them at the Medical Schools, Cambridge.

Information regarding accommodation in Colleges, Lodging Houses, and Hotels was given in the SUPPLEMENT of May 1st.

Association Notices.

REPRESENTATIVE MEETING.

DATE.

THE Annual Representative Meeting at Cambridge will begin on Friday, June 25th, at 10 a.m.

NOTICES OF MOTION AND AMENDMENT.

The Supplementary Report of Council to the Representative Meeting will appear in the SUPPLEMENT of May 29th, 1920.

Notices of Motion and Amendment by Divisions and Branches for consideration by the Annual Representative Meeting will be published in the SUPPLEMENT as they are received, but none can be published later than June 12th, for which purpose they must be received by the Medical Secretary *not later than the first post on Monday, June 7th.*

It will be possible, however, to include in the Agenda for the Annual Representative Meeting all Notices of Motion and Amendment which are received by the Medical Secretary *not later than the first post on Monday, June 14th.*

ANNUAL GENERAL MEETING.

THE Annual General Meeting will be held at the Examination Halls, Cambridge, on Tuesday, June 29th, 1920, at 2 p.m. Business: (1) Minutes of last Meeting. (2) Appointment of auditors. (3) Report of election of President.

COUNCIL, 1920-21.

NOTICE is hereby given that nominations for candidates for election as Members of Council *by Grouped Representatives* for the year 1920-21, under By-law 46 (c), will be received by the Medical Secretary up to the end of the first hour of the proceedings of the Annual Representative Meeting on Friday, June 25th, 1920. Each nomination must be on the prescribed form (A.R.M. 10), copies of which will be forwarded by the Medical Secretary on application. The voting papers will be issued at the Representative Meeting.

ELECTION OF 24 MEMBERS OF COUNCIL BY BRANCHES IN UNITED KINGDOM.

THE following is a list of the nominations received:

Group.	Branches in Group.	Candidates nominated.	No. of Seats.
A	North of England. North Lancashire and South Westmorland	Professor R. A. BOLAM, O.B.E. (Newcastle-on-Tyne)	1
B	Yorkshire	Dr. A. FORRES (Sheffield) Dr. A. MANKNELL (Bradford)	1
C	Lancashire and Cheshire	Sir JAMES BARR, M.D., LL.D., C.B.E. (Liverpool) Dr. FRANK RATCLIFFE (Oldham)	2
D	East Yorks and North Lincoln. Midland	Dr. G. K. SMILEY, O.B.E. (Derby)	1
E	Cambridge and Huntingdon. Norfolk. Essex. Suffolk. South Midland	Dr. E. O. TURNER (Great Missenden) Dr. J. F. WALKER (Southend-on-Sea)	1
F	Birmingham Staffordshire	Dr. H. C. MACTIER, M.B.E. (Wolverhampton)	1
G	North Wales. Shropshire and Mid Wales. South Wales and Monmouthshire	Dr. W. B. CRAWFORD TREASURE (Cardiff)	1
H	Metropolitan Counties	Dr. J. A. P. BARNES (London, N.) Dr. H. S. BEADLES (West Ham) Dr. C. BUTTAR (Kensington) Lord DAWSON OF PENN, G.C.V.O., K.C.M.G. (Marylebone) Lieut. Colonel W. MCADAM ECCLES (Marylebone) Mr. N. BISHOP HARMAN (Marylebone) Dr. C. O. HAWTHORNE (Marylebone) Dr. HARVEY HILLIARD (Westminster) Dr. WM. PATERSON (Harlesden)	4
I	Bath and Bristol Gloucestershire West Somerset Worcestershire and Herefordshire	Dr. H. C. BRISTOWE (Wroughton, Somerset)	1
J	Dorset and West Hants. South-Western. Wiltshire	Mr. RUSSELL COCMBE (Sidmouth)	1
K	Oxford and Reading. Southern	Dr. D. A. SHEAHAN (Portsmouth)	1
L	Kent. Surrey. Sussex	Dr. E. R. FOTHERGILL (Hove) Dr. ARNOLD LYNDON (Hindhead)	1
M	Aberdeen. Northern Counties. Dundee. Perth	Dr. B. CRITCHSHANK (Nairn) Dr. DAVID LAWSON (Banchory) Dr. C. S. YOUNG (Dundee)	1

Voting papers will be posted on Saturday, May 22nd; they are returnable Monday, June 7th, first post. The result will be published in the JOURNAL of June 12th.

NOTICES OF MOTION AND AMENDMENT BY DIVISIONS FOR THE ANNUAL REPRESENTATIVE MEETING, 1920.

By Southport Division:

Publication of a History of the Association.

That the Representative Body instruct the Council to take steps to prepare a concise history of the Association, its foundation and past achievements, its present activities and aims, for issue to members and sale to the public.

By West Bromwich Division:

Minimum Salaries for Public Appointments.

1. That, until the scale of salaries for Health Officers, as recommended by the Council of the British Medical Association, is adopted generally by local Health Authorities, the Association should advise all Medical Schools to warn medical students as to the insufficiency of pay, promotion, etc., in the Public Health Service.

2. That the term of eight years recommended in the scale of fees for whole-time Medical Superintendents of Poor Law and other Institutions is too long.

3. That in the scale of fees recommended in the case of Medical Superintendents further additions be made for greater number of beds than 500.

By Willesden Division:

Salaries of Medical Secretaries.

That the Medical Secretaries be paid according to the following scale:

Assistant Medical Secretaries £800, with annual increase of £50 up to £1,250.

Deputy Medical Secretary £1,250, with annual increase of £50 up to £1,500.

Medical Secretary £1,500, with annual increase of £50 up to £1,750.

Present incumbents to be paid at the rate to which they would now be entitled had the scale been in force at the date of their appointment.

By Durham Division:

Fees for Medical Treatment of School Children.

That the fee for adenoids and tonsils operations (para. 106 (iii) of Annual Report, page 115, SUPPLEMENT, April 24th, 1920) should be in accordance with the number of cases done at a session.

Minimum Salaries for Public Appointments.

That the fourth Recommendation under "General" re Minimum Salaries for Public Appointments (para. 110 of Annual Report of Council, page 116) is not sufficiently explicit and that the following be substituted:

That existing officers be placed according to the foregoing scale of minimum salaries as follows:

(i) In the case of part-time appointments the scale should be immediately applied in its entirety.

(ii) In the case of whole-time appointments the holder should immediately receive an increase of salary which shall bring him up to the minimum, with further increases according to the length of service, which shall place him in his appropriate place in the scale recommended by the Association.

(iii) That the minimum salaries of Senior Medical Officers in charge of Departments (see para. 108 of Annual Report) shall, as in the case of whole-time M.O.H.'s, be graded in accordance with the population of the Administrative Area, and shall not be less than £700, rising to £900 by annual increments of not less than £75, with an addition of bonus according to Civil Service Award in force for the time being.

Fees for Medical Practitioners called in on the Advice of Midwives.

That in connexion with the fees for medical practitioners called in on the advice of midwives (para. 121 (3) and (4) of Annual Report), in all cases where complications arise after the tenth day, and where medical attendance is necessary, the fee for such treatment shall be paid to the doctor.

Fees for Medical Witnesses.

That the fees for Medical Witnesses set out in para. 123 of the Annual Report of Council should be 3 and 2 guineas respectively.

Fee for Notification of Infectious Diseases.

That the Representative Meeting instruct the Council to press for the immediate reversion to the 2s. 6d. fee for the notification of infectious diseases (see para. 129 of Annual Report).

By Aberdeen Division:

Fees for Medical Examinations for Life Insurance.

That in cases examined elsewhere than in the practitioner's consulting room, at the request of the Insurance Company or its Agent, a mileage fee be paid in addition to the examination fee. (Para. 111, Annual Report of Council.)

Ordinary Offices.

That as regards ordinary offices the fee for Medical Examination be 21s., except for policies of £700 and upwards, the fee for which ought to be on a higher scale, proportionate to the amount of policy. (Para. 111, Annual Report of Council.)

By Kensington Division:

Greater Prominence for Recommendations Involving New Principles.

That the Council, in cases where a new principle is involved, as in the case of payment of some of the members of the Office Committee, should put such proposed changes in a prominent part of their Report, where it would readily meet the eye, emphasizing their reasons for such new departure.

Railway Fares, etc., of Non-Members Serving on Standing Committees.

That the railway fares and other expenses of non-members of the Association who serve on Standing Committees should not be paid by the Association.

By South Essex Division:

Tuberculous Mortality; Inquiry into Effect of National Insurance Act on Nutrition of Poor.

That this meeting calls attention to the slackening of the fall in tuberculous mortality from 1896 onwards, culminating in an actual rise in the death rate after the Insurance Act; and resenting its enforced association with a measure which prima facie seems, and on strict investigation may be proved to be, prejudicial to the national health, and instructs the Council to institute an inquiry into the effect of the Act upon the nutrition of the poor.

By City Division:

Expenses of Divisions.

That it be an instruction to the Council to take steps for higher contributions being made to the Divisions.

By South-West Wales Division:

Unqualified Medical Practice.

That in the opinion of the Representative Body, serious steps should be taken in the public interest by the Association to bring to the notice of Parliament the injurious effects of unqualified practice in medicine and surgery.

By Belfast Division:

Federation or Affiliation.

That (in connexion with paras. 43-62 of the Annual Report), pending further particulars, no change be made so far as the present relationship of Ireland to the rest of the United Kingdom is concerned.

Minimum Salaries for Public Appointments.

That the minimum salaries of whole-time assistant medical officers of health (see Class II) be the same as those recommended for whole-time medical officers of departments (see Class IV).

That the definition of whole-time senior medical officers in charge of departments (see Class III) end at the word "otherwise."

That the definition of whole-time medical superintendent (see Class V) end at the word "otherwise."

BRANCH AND DIVISION MEETINGS TO BE HELD.

ESSEX BRANCH.—The spring meeting of the Essex branch will be held at the Saracen's Head Hotel, Chelmsford, on Wednesday, May 26th, at 12 o'clock. Lecture by Dr. Henry MacCormac, C.B.E., Middlesex Hospital, on "Some observations on the treatment of syphilis."

LANCASHIRE AND CHESHIRE BRANCH.—The annual meeting for 1920 will take place at Southport on June 9th. The members will be entertained at lunch by the Southport Division, and after the President (Dr. Baildon, Southport) has given his address scientific papers will be read. A number of excursions are being arranged for the afternoon, and in the evening members will dine together.

METROPOLITAN COUNTIES BRANCH.—Mr. N. Bishop Harman and Dr. J. A. Percival Barnes (Honorary Secretaries) give notice that the annual general meeting of the Branch will be held at 429, Strand, W.C.2, on Friday, June 18th, at 4 p.m. Business: (1) Report of scrutineers as to the election of new officers. (2) Annual report of Council. (3) President's Address, by Dr. E. W. Goodall, O.B.E.

NORTH LANCASHIRE AND SOUTH WESTMORLAND BRANCH.—Dr. J. Livingston, Honorary Secretary, gives notice that the annual meeting of the Branch will be held on Wednesday, June 9th, at 3.15 p.m., in the Furness Abbey Hotel, Barrow. Business: Report of Council. Election of officers. President's address, by Dr. A. F. Rutherford: "Experiences of an ambulance train commander." The President invites members to tea.

SOUTHERN BRANCH: SOUTHAMPTON DIVISION.—Dr. H. G. G. Nelson (20, London Road, Southampton), Honorary Secretary, gives notice that the annual meeting of the Division will be held at the Royal South Hants and Southampton Hospital on Wednesday, May 26th, at 9 p.m. Business: To elect (1) officers, (2) Representatives on Branch Council, (3) Executive Committee, (4) Representative in Representative Body. To receive annual report of Executive Committee. To consider business of Annual Representative Meeting and instruct Representative.

SOUTH MIDLAND BRANCH: BUCKINGHAMSHIRE DIVISION.—Dr. A. E. Larking (Castle Street, Buckingham), Honorary Secretary, gives notice that the adjourned annual meeting of the Division will be held on Tuesday, June 1st, at the Red Lion Hotel, High Wycombe, at 2.15 p.m. All medical men are invited. Agenda: Annual report of Council. Instructions to Representative. Resolution proposed by Dr. A. E. Larking:

That this Division learns with surprise and regret that, in spite of the efforts made by the British Medical Association to safeguard the interests of medical men who joined the R.A.M.C., several cases have come to notice in which patients attended whilst the medical man was away on service are still being retained by the practitioner who remained at home. This Division calls upon the Council to take the necessary steps in this matter, as the men concerned, although feeling deeply, are unwilling to make the first move.

Paper by Mr. C. A. Joll, Consulting Surgeon Royal Bucks Hospital, on "Diagnosis and treatment of abdominal emergencies."

MINISTRY OF HEALTH.

NEW MEDICAL APPOINTMENTS.

In pursuance of the decision of the Minister of Health to enlarge the scope of the medical side of the Ministry, especially in connexion with tuberculosis, general sanitation and epidemiology, venereal disease, international health work and administration generally in connexion with infectious disease and the work of port sanitary authorities, Dr. Addison has made the following additional appointments to the Medical Staff of the Ministry:

James Fairley, M.D., D.P.H.; J. Alison Glover, O.B.E., M.D., D.P.H.; F. W. Higgs, C.B.E., M.D.; A. A. Jubb, M.D., D.Sc.; R. Bruce Low (Junior), M.R.C.S.; A. T. McWhirter, M.B., Ch.B.; A. C. Parsons, M.R.C.S., D.P.H.; G. Raffan, M.D., F.R.C.S. (Ed.); A. B. Smallman, C.B.E., D.S.O., M.D., D.P.H.; P. G. Stock, C.B., C.B.E., M.R.C.S., D.P.H.; E. L. Sturdee, O.B.E., M.R.C.S.; P. N. White, C.I.E., M.D.; D. J. Williamson, M.D., D.P.H.; W. P. Yetts, O.B.E., M.R.C.S.

INSURANCE.

LONDON PANEL COMMITTEE.

Election of Panel Committee.—At the meeting of the London Panel Committee on April 27th it was stated that the London Insurance Committee had under consideration the question of reprinting and revising the London Insurance Pharmacopoeia, and the Panel Committee agreed to share the cost of the revised edition jointly with the Insurance Committee, provided that all insurance practitioners in the county received a copy free of charge.

LONDON INSURANCE COMMITTEE.

Remuneration of Medical Practitioners.—At the meeting of the London Insurance Committee on April 22nd it was stated that the Minister of Health had decided, in accordance with the appropriate article of the Medical Benefit Regulations, to make a provisional determination of the Central Practitioners' Fund, which would be subject to review at the end of the year, though it was added that it must not be assumed that the final determination of the fund would necessarily result in any additional payment to insurance practitioners. The amount of the Central Practitioners' Fund was provisionally determined for England for the whole year 1920 as £6,250,000, and after making reservation for the payment of accounts for the treatment of invalided sailors and soldiers, the net amount available for the first quarter for distribution amongst insurance practitioners was £1,500,000. This sum had been apportioned among Insurance Committees on the basis recommended by the Distribution Committee, and the proportion due to London was 13.93 per cent., or £209,250. From this amount payments made to the Panel Committee to meet its administrative expenses had to be deducted. The necessary work in connexion with the settlement of practitioners' accounts for the first quarter of the year was now proceeding, and it was hoped that the settlement would be made very shortly.

Pharmaceutical Service.—A scheme for securing a proper pharmaceutical service has been prepared jointly by the Insurance Committee and the Pharmaceutical Committee and approved by the Minister of Health. A joint subcommittee comprising members of the two bodies has been established, whose duty it will be to make arrangements to carry into effect a proposed scheme whereby the chemists will undertake that dispensary facilities at one or more shops shall be available in all districts in the county until the normal closing time (8 p.m.), and on Sundays and holidays for sufficient time and at such hours as the circumstances of the district require, having regard to the hours at which medical practitioners are necessarily occupied in seeing patients in such districts. A double dispensing fee is to be paid in respect of each prescription dispensed by the chemist outside the hours of service, if such prescription is marked "Urgent" by the doctor.

Limitation of Lists.—A motion was proposed by Mr. Harold Swann that when an insurance practitioner had obtained on his list, either by acceptance or assignment, the maximum number of 3,000 insured persons fixed by the allocation scheme, he should be precluded from undertaking private practice.

After some discussion the motion was withdrawn; but a motion by Mr. Rockliff was carried, instructing the Medical Benefit Subcommittee to bring before the full committee the subject of the renewal of the agreement with the Panel Committee as regards the limitation of numbers on the lists of insurance practitioners in ample time for an opinion to be expressed as to the terms upon which such an agreement should be renewed.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following notifications are announced by the Admiralty:—Surgeon Rear Admiral W. Bell, M.V.O., to R.N. Hospital, Haslar. Surgeon Captain W. H. S. Stalkart to R.N. Hospital, Plymouth. Surgeon Commanders: F. Cook to R.N. Sick Quarters, Shetley (temporary); H. R. H. Denny to Plymouth Hospital; B. R. Bickford, D.S.O., to the *Virid*, additional (temporary), for R.M. Camp, Renney, Wembury; A. F. Fleming, D.S.O., to H.M. Dockyard, Devonport (temporary). Surgeon Lieutenant Commanders: A. T. Rivers, C. J. Aveling, J. M. Hayes, P. B. Egan, F. H. Stephens, O.B.E., S. Bradbury, K. H. Holo, and G. F. Symes promoted to the rank of Surgeon Commander, Surgeon Lieutenants A. G. Taylor to the *Orion*, W. E. Heath to the *Argus*. Surgeon Lieutenant (temporary) J. L. Lamond to the *Greenwich*.

ARMY MEDICAL SERVICE.

Major-General L. E. Anderson, C.B., retires on retired pay. Colonel J. D. Ferguson, C.M.G., D.S.O., is placed on half-pay. Temporary Colonel Sir A. W. Mayo-Robson, K.B.E., C.B., C.V.O. (Major R.A.M.C.T.F.), relinquishes his temporary commission on reporting.

Colonel Lancelot P. More is placed on half pay, March 2nd, 1920 (substituted for notification in the *London Gazette*, April 7th, 1920).

ROYAL ARMY MEDICAL CORPS.

Lieut.-Colonel F. S. Walker, C.B.E., retires on retired pay. The following relinquish the acting rank of Lieutenant-Colonel: Major P. C. T. Davy, C.M.G., temporary Captain J. R. C. Greenlock, D.S.O. (April 19th, 1919), temporary Major W. E. Home, O.B.E. (December 30th, 1919), temporary Captain A. J. Blake, M.C. Major P. J. Marett to be temporary Lieutenant-Colonel whilst specially employed.

The following officers relinquish the acting rank of Major: Temporary Captains N. E. Kendall (September 23rd, 1919—substituted for notification in the *London Gazette*, December 2nd, 1919), C. D. Faulkner, B. Knowles, M.C., O. R. L. Wilson, D. Fisher, J. R. Griffith, C. L. Spackman, W. E. R. Dimond, N. A. A. Hughes, Captains A. E. Richmond, O.B.E., T. J. Hallinan, S. Fenwick, M.C. Captains to be acting Majors: P. J. Ryan, M.C., W. H. O'Riordan, M.C. (from February 10th to April 22nd, 1920).

Captain J. J. Molyneux is placed on the half-pay list on account of ill health. The name of temporary Captain C. G. Monro is as now described, and not as in the *London Gazette*, March 30th, 1920.

The notifications regarding the following officers which appeared in the *London Gazette* of the dates indicated are cancelled:—Major J. E. H. Gatt (January 21st and March 11th, 1920). Temporary Captains: S. W. G. Ratcliffe (May 1st, 1919), J. A. MacKenzie (April 23rd, 1920).

Captain W. T. Hare, M.C., resigns his commission, and is granted the rank of Major.

Captain J. S. McCombe, D.S.O., to be acting Major from February 25th to December 15th, 1918, inclusive.

Lieutenants (temporary Captains) to be Captains: G. H. Barry, M. McE. Russell, F. G. L. Dawson.

H. Bell, late C.A.M.C., and E. S. Joske, late Captain A.A.M.C., to be temporary Captains.

Late temporary Captains to be temporary Captains: G. Cook (seniority from January 14th, 1915); F. W. Mason (seniority April 26th, 1916).

The following officers relinquish their commissions: Temporary Majors and retain the rank of Major: H. E. L. Canney, W. S. Houghton, C. L. Williams. Temporary Captains and are granted the rank of Major: Andrew Grant, N. E. Kendall, C. C. de B. Daly, O.B.E., R. Massie, O.B.E., J. H. Peck, H. N. Webber, S. E. Picken, M.C., (acting Major) M. Fitzmaurice-Kelly. Temporary Captains and retain the rank of Captain: E. D. Heyliger, P. Black, W. Forsyth, W. N. H. Bell, D. J. Bedford, J. S. Williamson, J. Lascelles, T. D. Miller, J. L. Meynell, H. W. Hues, R. Hodson, M.C., E. G. B. Carpenter, E. R. Holbrow, J. J. Robertson, W. S. I. Robertson, M. Dockrell, C. L. Spackman, J. H. Marshall, W. G. Hopkins, T. R. Fulton, S. W. Milner, A. C. Meek, J. M. Anderson, D. O. Richards, H. S. Stockton, T. G. Elsworth, H. G. Parker, T. B. Vaile, W. J. F. Symons, N. B. Loughton, J. S. K. Smith, S. W. H. Stuart, A. F. Sanders, V. D. Pennefather, P. Shearar, G. B. Buckley, M.C., A. P. Mitchell, A. H. Holmes, J. P. O'Mahoney, R. G. Higgin, G. H. Winch, A. Hines, S. Broderick, H. Hannigan, C. C. Brewis, D. F. Brown, L. W. Evans, M.C., R. C. Poyser, R. B. Johnson, T. J. Colbe, B. C. Haller, L. O. Weinman, D. Miller, M. D'Alton, W. L. G. Davies, J. McGarity, R. Lawrence, J. Wyllie, M.C., G. W. Ronaldson, F. B. Macdonald, F. B. Pinniger, T. S. Allen, T. B. Banister, E. L. Hopkins, P. S. Baker, R. C. T. Evans, W. Fleming, R. W. D. Hewson, J. A. Ireland, J. A. Gilfillan, H. M. Drake, C. G. Whorlow, H. H. McClelland, P. C. Davie. On account of ill health contracted on active service: F. H. Sprayson, W. I. Adams, C. C. Okeil, M.C., R. L. Hughes, C. R. Macleod, M.C. Temporary Captain J. E. Ainsley on transfer to the I.M.S.

ROYAL AIR FORCE.

MEDICAL BRANCH.

Lieut.-Colonel G. N. Biggs (Major R.A.M.C. T.F.) relinquishes his temporary R.A.F. commission on return to army duty and is permitted to retain the rank of Lieut.-Colonel.

L. Game is granted a temporary commission as Flight Lieutenant. Flight Lieutenant T. D. J. A. Fuller relinquishes his commission on ceasing to be employed and is permitted to retain the rank of Captain.

Transferred to the unemployed list: Captains J. P. Hennessy, J. Ferguson, R. W. Pritchard, C. E. Thwaites, A. W. P. Pirie, Lieutenants E. L. Sergeant and G. G. Goury, V.C.

Captain C. P. V. MacGormack and Captain (acting Major) A. A. Atkinson, R.A.M.C. (S.R.) relinquish their commissions on account of ill health caused by wounds, and are permitted to retain the rank of Captain and Major respectively.

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

To be Lieut.-Colonels and to command the field ambulance shown against their names: Major J. M. G. Bremner, O.B.E. (2nd East Anglian), Major (Brevet Lieut.-Colonel) D. Rorie, D.S.O. (2nd Highland), Major (Brevet Lieut.-Colonel) E. B. Bird, D.S.O. (3rd Wessex), Major A. E. Kidd, O.B.E., T.D. (3rd Highland), Major A. Callam, D.S.O. (2nd East Lancashire), Major E. H. Cox, D.S.O. (3rd East Lancashire), Major J. W. Leitch, D.S.O. (1st Lowland), Major J. W. Keay (3rd Lowland), Major T. A. Barron, D.S.O. (1st North Midland), Major D. L. Fisher, D.S.O. (2nd Northumbrian), Major P. R. Ash (3rd Northumbrian), Major F. Whalley, D.S.O. (2nd West Riding), Major T. Donovan (1st Welsh), Major C. L. Isaac (3rd Welsh), Captain J. F. MacIntosh (1st Highland), Captain A. T. Falwasser, D.S.O. (1st Home Counties), Captain H. G. G. Mackerzie, D.S.O. (3rd Home Counties), Captain C. S. Bremner, D.S.O. (1st London), Captain R. E. Bickerton, D.S.O. (2nd London), Captain R. M. Vick, O.B.E. (3rd London), Captain J. MacMillan, D.S.O., M.C. (5th London), Captain H. K. Dawson, D.S.O. (6th London), Captain J. F. Dixon (2nd North Midland), Captain J. Miller, D.S.O., M.C. (3rd North Midland), Captain R. A. Broderick, D.S.O., M.C. (2nd South Midland), Captain T. A. Green, D.S.O. (3rd South Midland), Captain W. Lister (1st West Riding).

The following officers relinquish the acting rank of Lieut.-Colonel on ceasing to be specially employed:—Major (acting Lieut.-Colonel) T. L. Fennell, T.D., Captain (acting Lieut.-Colonel) W. Blackwood, D.S.O. (December 18th, 1918).

Lieut.-Colonel (Brevet Colonel) W. Howorth, T.D., resigns his commission and retains his rank with permission to wear the prescribed uniform.

Major C. J. Martin, O.B.E., to be acting Lieutenant-Colonel whilst specially employed.

Major W. G. Mitchell is restored to the establishment (July 16th, 1919).

Captains (acting Majors) relinquish the acting rank of Major on ceasing to be specially employed: D. E. Finlay (December 15th, 1918), T. P. Caverhill (December 26th, 1918), R. D. Langdale-Kelham, C. E. W. McDonald, A. Wilson, and L. N. Reece (August 13th, 1918), W. J. Purves, M.C. (December 14th, 1918), J. G. McKinlay (March 23rd, 1919).

Captains resign their commissions and are granted the rank of Major: G. B. Buchanan, A. Cambell, and C. E. H. Milner.

Captain R. Burgess, D.S.O., M.C., resigns his commission and is granted the rank of Lieutenant-Colonel.

The announcements regarding Captain (acting Major) A. M. Jones published in the *London Gazette* of October 29th and December 8th, 1919, are cancelled.

Captains resign their commissions and retain the rank of Captain: T. W. H. Downes, T. P. Edwards, and C. C. Philip.

Captain (Brevet Major) C. W. Rowntree resigns his commission and retains the rank of Captain and Brevet Major.

Captain F. R. Humphreys to be Major.

3rd London General Hospital.—Major Sir A. W. Mayo-Robson, K.B.E., C.B., C.V.O., is restored to the establishment on ceasing to hold a temporary commission in the A.M.S.

1st Northern General Hospital.—Major (acting Lieut.-Colonel) D. W. Patterson, O.B.E., relinquishes the acting rank of Lieutenant-Colonel on ceasing to be specially employed. Captain (acting Major) W. T. Harkness relinquishes the acting rank of Major on ceasing to be specially employed.

4th Scottish General Hospital.—Captain (acting Major) J. Henderson relinquishes the acting rank of Major on ceasing to be specially employed (December 17th, 1918).

5th Southern General Hospital.—Captain (acting Lieut.-Colonel) J. H. P. Fraser, M.C., relinquishes the acting rank of Lieutenant-Colonel on ceasing to be specially employed (December 19th, 1918).

1st Western General Hospital.—Captain T. P. McMurray is restored to the establishment.

3rd Western General Hospital.—Captain (acting Major) E. Reid relinquishes the acting rank of Major on ceasing to be specially employed (August 11th, 1919).

Sanitary Service.—Captain L. R. Tosswill, O.B.E., to be Major.

Tues., 10 a.m., Dr. Drummond Robinson: Gynaecological Operations; 5 p.m., Mr. Tyrrell Gray: Gastric Ulcer. Wed., 10 a.m., Dr. Arthur Saunders: Children; 2 p.m., Dr. Morton: X Rays. Thur., 2 p.m., Mr. Bishop Harman: Eyes; 5 p.m., Mr. Baldwin: Practical Surgery. Fri., 10 a.m., Mr. Steadman: Dental; 5 p.m., Sir Robert Armstrong-Jones: Mental Disease (Lecture III). Sat., 12 noon, Mr. Sinclair: Surgical Anatomy; 2 p.m., Dr. Owen: Out-patients.

APPOINTMENTS.

ALLAN, Francis J., M.D., Lecturer on Public Health, Westminster Hospital Medical School.

PARSONS-SMITH, Basil T., M.D., M.R.C.P., Assistant Physician to the National Hospital for Diseases of the Heart.

PYBUS, Frederick C., M.S., F.R.C.S., Assistant Surgeon to the Royal Victoria Infirmary, Newcastle-on-Tyne.

SPENCE, D. Leigh, M.A., M.B. Cantab., M.R.C.S., L.R.C.P., (1) Certifying Factory Surgeon for Melksham, (2) Medical Officer of Health, Melksham Urban District.

STLK, Miss Ellen, M.B., M.R.C.S., House-Surgeon at the Great Northern Central Hospital, Holloway.

VAILLE, T. B., M.R.C.S., L.R.C.P., Anaesthetist to the Cancer Hospital, Assistant Anaesthetist to the Italian Hospital, and House Anaesthetist, Royal Dental Hospital.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 7s. 6d., which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue.

BIRTH.

CASE.—On May 14th, to Dr. and Mrs. L. B. Case, Minister Preclnets, Peterborough—a daughter.

DEATH.

TRUVES.—On May 18th, at 49, Gloucester Terrace, W.2, Wilfrid Warwick, O.B.E., B.A., M.B., B.C. Cantab., F.R.C.S., late Major R.A.M.C., only son of the late Edward Truves, M.R.C.S., of Hove.

British Medical Association.

OFFICES AND LIBRARY, 429, STRAND, LONDON, W.C.2.

Reference and Lending Library.

THE READING ROOM, in which books of reference, periodicals, and standard works can be consulted, is open to members from 10 a.m. to 6.30 p.m., Saturdays 10 to 2.

LENDING LIBRARY: Members are entitled to borrow books, including current medical works; they will be forwarded, if desired, on application to the Librarian, accompanied by 6d. for each volume for postage and packing.

Departments.

SUBSCRIPTIONS AND ADVERTISEMENTS (Financial Secretary and Business Manager, Telegrams: Articulate, Westrand, London. Tel.: Gerrard 2630).

MEDICAL SECRETARY (Telegrams: Medisecra, Westrand, London. Tel.: Gerrard 2634).

EDITOR, *British Medical Journal* (Telegrams: Aitiology, Westrand, London. Tel.: Gerrard 2631).

SCOTTISH MEDICAL SECRETARY: 6, Rutland Square, Edinburgh (Telegrams: Associate, Edinburgh. Tel.: 4361 Central.)

IRISH MEDICAL SECRETARY: 16, South Frederick Street, Dublin. (Telegrams: Bacillus, Dublin. Tel.: 4737 Dublin.)

Diary of the Association.

MAY.

- 21 Fri. Preston Division: 8.30 p.m., Lecture by Dr. W. Blair Bell: Ductless Glands.
25 Tues. London: Serinity Subcommittee, 2.30 p.m.
26 Wed. Essex Branch, Saracen's Head Hotel, Chelmsford, 12 noon. Lecture by Dr. Henry MacCormac, C.B.E., on Some Observations on the Treatment of Syphilis. Southampton Division, Annual Meeting, Royal South Hants and Southampton Hospital, 9 p.m.

JUNE.

- 1 Tues. Buckinghamshire Division, Adjourned Annual Meeting, Red Lion Hotel, High Wycombe, 2.15 p.m.
9 Wed. London: Ministry of Health Committee. London: Propaganda Subcommittee, 2.15 p.m. Lancashire and Cheshire Branch, Annual Meeting, Southport. North Lancashire and South Westmorland Branch, Annual Meeting, Furness Abbey Hotel, Barrow, 3.15 p.m.
18 Fri. Metropolitan Counties Branch, Annual Meeting, 429, Strand, W.C.2, 4 p.m.

SPECIAL NOTICE TO MEMBERS.

Every Member is requested to preserve this "Supplement," which contains matters specially referred to Divisions, until the subjects have been discussed by the Division to which he or she belongs.

MATTERS REFERRED TO DIVISIONS.

British Medical Association.

SUPPLEMENTARY REPORT OF COUNCIL, 1919—20.

Preliminary.

OBITUARY.

213. The following is a supplementary list of members whose death the Association has to deplore:—

Name.	Offices held in the Association.
Dr. A. J. Chalmers	A former President, Secretary, and Representative of the Ceylon Branch and Vice-President of the Section of Tropical Medicine, 1912.
Dr. John Alfred Codé	A former President of the Staffordshire Branch, a former Secretary and Chairman of the South Staffordshire Division, and Vice-President of the Section of Electro-therapeutics, 1911.
Surgeon Herbert Danvers, R.N., Ret.	A Member of the Ship Surgeons Sub-Committee.
Sir Kendal Franks, C.B.	Vice-President, Sub-Section Laryngology and Physiology, 1894.
Dr. John A. Harrison, O.B.E.	Local Secretary for the Haslingden Area of the Bury Division, and a Member of the Division Executive Committee.
Dr. Joseph William Hunt	Vice-President of Metropolitan Counties Branch and Chairman of various Committees thereof.
Mr. Arthur George Wright... ..	President of the Section of Surgery in 1907, Vice-President in 1902, and Secretary in 1894.

Dr. Alfred Adams, Dr. Alex. S. Aitchison, Dr. Israel Allaun, Dr. Ernest J. Bray, Dr. James Crooks, Dr. Alex. Cruickshank, Dr. Thomas Sidney Davies, Dr. E. S. H. Gill, Dr. Claude P. R. Harvey, Mr. Thomas B. Henderson, Dr. Edward B. Holland, Dr. Duncan F. Hunter, Dr. Cottingham G. Johnson, Dr. Peter Lynch, Dr. Edwin A. Maling, Dr. Joseph Henry Marsh, Dr. Francis G. C. Martin, Dr. James Middleton, T.D., Dr. W. S. Morrow, Dr. John Morton, Dr. N. M. O'Donnell, Mr. George J. Saunders, Dr. William Saunders, Dr. Samuel H. Shaw, Dr. Charles C. Smith, Dr. William Stewart, Major Norman Wells, O.B.E., I.M.S., Dr. John C. Wright.

Finance.

OFFICE STAFF SUPERANNUATION SCHEME.

(Continuation of para. 19 of Annual Report, page 106.)

214. The new Superannuation Scheme, which supersedes the scheme begun in 1906, has now been approved by the Council after submission to the Staff Committee. The Council has every reason to believe that it will satisfy those chiefly concerned. It covers all present members of the clerical and superior printing staffs who care to join it, and the membership will be compulsory on all joining that staff in future unless the Council decides, for special reasons, to exempt any particular person. The annual contribution of the Council under the new scheme will be roughly £820 as against a previous contribution of £375. The staff will contribute about £420 as compared with about £160.

PROPOSED INCREASE OF SUBSCRIPTION.

(Continuation of para. 29 of Annual Report, page 107.)

215. It has been suggested that it would be helpful if the reasons for the proposed increase in subscription, which were stated broadly in the Annual Report, were given in more detail. The Council proposes to publish such a statement shortly in the Supplement and to include it in the documents for discussion at the Annual Representative Meeting.

Organisation.

DIVISION AND BRANCH REPORTS FOR 1919.

(Continuation of para. 73, p. 113, of Annual Report.)

216. Of the 187 Divisions and 38 Branches in Great Britain, 132 Divisions and 29 Branches have (up to May 19th) reported for 1919. The following is a list of the non-reporting Divisions and Branches:—

*Divisions:—*Argyllshire, Barnsley, Bishop Auckland, Blackburn, Bolton, Bristol, Cardiff, Chester, Croydon, Chelsea,

Denbigh and Flint, Dumfries and Galloway, Durham, East Cornwall, East York, East Herts, Folkestone, Finchley and Hendon, Gateshead, Great Yarmouth, Glasgow Southern, Guildford, Halifax, Hastings, Hartlepool, Hexham, Isle of Man, Islands, Isle of Wight, Mid-Essex, Monmouthshire, North Carnarvon and Anglesey, North Middlesex, North Northumberland, North-West Essex, Norwich, Richmond, Rochester, Chatham and Gillingham, Rotherham, Salford, Shetland, South Shields, Stockton, South Carnarvon and Merioneth, Swansea, South-West Essex, Tower Hamlets, Walsall, Warwick and Leamington, Wakefield, Pontefract and Castleford, Wandsworth, Wimbledon, Woolwich and Lewisham, West Norfolk, York. *Branches*:—Aberdeen, Bath and Bristol, Birmingham, Border Counties, East York and North Lincoln, North Wales, Perth, Surrey, West Somerset.

Science.

REMUNERATION OF LABORATORY AND RESEARCH WORKERS.

217. The Council has obtained a considerable amount of information from laboratory and research workers in various parts of the country as to their conditions of employment and remuneration received. The information so obtained points to the fact that in very many cases the salaries received by this class of worker are most inadequate. The Council feels that, in view of the importance of research work, efforts should be made to raise the rate of the minimum salaries for these posts so that fair opportunities of a career may be afforded to those desirous of becoming laboratory and research workers.

The Council recommends:—

Recommendation.—That the minimum commencing salary of a medically qualified laboratory or research worker, who is permanently employed as such, should not be less than £500 per annum.

STEWART PRIZE.

(Continuation of para. 85 of Annual Report, page 113.)

218. The Council has decided to award the Stewart Prize for 1920 to Miss Harriette Chick, D.Sc., in recognition of her own work and that of the band of scientific women associated with her in the investigations into the means of preventing Scurvy and Beri-Beri in armies and among populations suffering privations.

219. Dr. Chick has been an assistant in the Department of Experimental Pathology at the Lister Institute since 1906; her early researches were concerned with the theory of disinfection. When, towards the end of 1915, there were indications that our troops in certain theatres of war were suffering from Scurvy and Beri-Beri, Dr. Chick gave her services to the War Office and India Office; she instituted and directed a band of workers at the Lister Institute, and a number of facts were collected which afforded data enabling the military authorities to select the most manageable additions to the diet of the troops. Among other points elucidated was the fact that during the germination of seeds the anti-scorbutic principle is produced so rapidly that germination for twenty-four hours prior to cooking is sufficient. This observation was of great practical importance, as it rendered it possible to supply the anti-scorbutic element of diet to the troops without adding to transport. The addition of germination pulses to the diet was the only scorbutic element available to the troops at Archangel during the winter of 1918-19, and was completely successful. Observations were made also on the anti-scorbutic value, weight for weight, of food, fresh or dried, or otherwise preserved; they were of value not only in deciding what additions should be made to the diet of troops, but also those which should be made to the diet of infants reared on dried or preserved milk. Incidentally it was discovered that the lime was much inferior to the lemon as an anti-scorbutic; the good effects obtained in the navy in the early part of the nineteenth century was due to the use of lemon juice, not lime juice. In the autumn of 1919, Dr. Chick, accompanied by Miss Dalyell, went to Vienna to give assistance to the medical profession there in regulating diets, and the observations already made upon the relation of diet to certain diseases—rickets, scurvy and osteo-malacia—prevailing there, are throwing great light upon the subject. The feeding experiments on animals made by Miss Chick and her colleagues demanded minute care, and were often prolonged for five or six months. The information they have yielded is of permanent scientific value.

MIDDLEMORE PRIZE.

(Continuation of para. 84 of Annual Report, page 113.)

220. The Council has decided that the Middlemore Prize for 1920 be awarded to Harry Moss Traquair, M.D., F.R.C.S.E., D.P.H., of Edinburgh, for his essay on "Perimetry (inclusive

of Scotometry), its methods and its value to the Ophthalmic Surgeon."

Lt.-Col. R. H. Elliot, I.M.S. (ret.), and Sir George Berry, LL.D., M.B., were good enough to act as adjudicators in connection with the award of the prize, and they report as follows:—

"We have no hesitation in awarding the first place to 'Bee' (the nom-de-plume of Dr. Traquair), whose treatment of the subject is exhaustive; whose acquaintance with the various methods of perimetry is wide and practical; whose judgment is critical; and whose appreciation of the limitations of methods of subjective examination shows strong common sense.

At the same time, we should like to place on record our appreciation of the high value of the other three papers, all of which, in our opinion, reached prize standard."

CONTROL OF THERAPEUTIC SUBSTANCES WHICH CANNOT BE TESTED ADEQUATELY BY DIRECT CHEMICAL MEANS.

221. The Council has empowered Prof. W. E. Dixon, O.B.E., F.R.S., on behalf of the Association, to give evidence before the Committee appointed by the Ministry of Health to consider and advise upon the legislative and administrative measures to be taken for the effective control of the quality and authenticity of such therapeutic substances offered for sale to the public as cannot be tested adequately by direct chemical means.

Medico Political.

FEES FOR MEDICAL PRACTITIONERS CALLED IN ON THE ADVICE OF MIDWIVES.

(Continuation of paras. 120 and 121 of Annual Report, pages 117-8.)

222. A deputation from the Association, consisting of Dr. H. B. Brackenbury (Chairman, Maternity and Child Welfare Sub-Committee), Dr. C. E. S. Flemming, the Medical Secretary, and Dr. Lord (Assistant Medical Secretary), was received on 30th April, 1920, by representatives of the Ministry of Health with regard to the representations of the Association for the amendment of the 1915 scale of fees for doctors called in on the advice of midwives.

The following scale was presented to the Deputation as the Ministry's alternative to the Association's representations:—

1. Fee for all attendances of a doctor at parturition (*i.e.*, from the commencement of labour until the child is born), whether operative interference or not is involved, including all subsequent visits during the first ten days, inclusive of the day of birth £2 2s. 0d.
2. Fee for attendance of a second doctor to give an anaesthetic, whether on account of abortion or miscarriage, at parturition or subsequently £1 1s. 0d.
3. Fee for suturing the perineum or for the removal of adherent or retained placenta or for the treatment of an emergency arising from or subsequently to parturition, and including all subsequent necessary visits £1 1s. 0d.

This fee not to be payable when the fee under 1 is payable.

4. Fee for attendance at an abortion or miscarriage; including all subsequent necessary visits £1 1s. 0d.
5. Fee for visits to mother or child not included under 1-4:

Day (9 a.m. to 8 p.m.) ...	5s.
Night (8 p.m. to 9 a.m.) ...	10s.

6. The usual mileage fee of the district to be paid for all attendances under 1-5 of this scale.
7. No fee shall be paid by the Local Supervising Authority:—

(1) where the doctor has agreed to attend the patient under arrangement made by or on behalf of the patient or by any Club, Medical Institute or other Association of which the patient or her husband is a member.

(2) where the doctor receives or agrees to receive a fee from the patient or her representative.

(3) in respect of any services performed by the doctor after the expiry of one month after the day of birth.

8. The cost of the provision of medicine shall not be included in any fee payable under this scale and shall not be chargeable to the Local Supervising Authority.

223. The following alterations were provisionally agreed by both parties subject to subsequent approval by the Minister:—

Paragraph 1 was agreed to (subject to the reservation of the amount of the fee) with the substitution of "assistance" for "interference."

Paragraph 3. Objection was made to the footnote to this paragraph and the Ministry agreed to consider the possibility of the elimination of this footnote or the substitution of a uniform two-and-a-half-guinea fee.

It was pointed out by the Deputation that there would be great difficulty in getting the profession to accept the scale on any flat rate lower than three guineas.

Paragraph 4 was amended to read: "Fee for attendance at or in connection with an abortion or miscarriage, including all subsequent necessary visits during the first ten days one guinea."

Paragraph 7. It was agreed to omit sub-paragraph (3).

Paragraph 8. It was agreed to omit this paragraph.

224. The following proposed amended scale of fees has since been received from the Ministry (dated May 17th, 1920):—

1. Fee for all attendances of a doctor at parturition (*i.e.* from the commencement of labour until the child is born) whether operative assistance or not is involved, including all subsequent visits during the first ten days inclusive of the day of birth £2 2s. 0d.

2. Fee for attendance of a second doctor to give an anæsthetic, whether on account of abortion or miscarriage, at parturition or subsequently £1 1s. 0d.

3. Fee for suturing the perineum, for the removal of adherent or retained placenta, for exploration of the uterus, for the treatment of post partum hæmorrhage or for any operative emergency arising directly from parturition, including all subsequent necessary visits during the first ten days inclusive of the day of birth £1 1s. 0d.

This fee not to be payable when the fee under (1) is payable.

4. Fee for attendance at or in connection with an abortion or miscarriage, including all subsequent necessary visits during the ten days after and including the first visit £1 1s. 0d.

5. Fee for visits to mother or child not included under (1) & (4):—

Day (9 a.m. to 8 p.m.) 5s.

Night (8 p.m. to 9 a.m.) 10s.

6. The usual mileage fee of the district to be paid for all attendance under (1) & (5) of this scale.

7. No fee shall be payable by the Local Supervising Authority:—

(1) Where the doctor has agreed to attend the patient under arrangement made by or on behalf of the patient or by any Club, Medical Institute, or other Association of which the patient or her husband is a member.

(2) Where the doctor receives or agrees to receive a fee from the patient or her representative.

(3) In respect of any services performed by the doctor after the expiry of one month after the day of birth.

225. The Ministry has also stated that it cannot see its way to omit the footnote to para. 3 of the scale.

226. The Council recommends:—

Recommendation.—That the R.B. express the following opinions:—

(A) That the fee of £2 2s. 0d. suggested in para. 1 of the Ministry of Health's proposed amended scale of fees for medical practitioners called in on the advice of midwives is too small to enable the Association to urge practitioners to respond to these calls in areas or cases where they are unwilling to do so:

(B) That para. 7 (2) of the scale should be modified in the interests alike of the patient, the local authority and the practitioner, so as to provide that the difference, if any, of the fee agreed between the practitioner and patient as compared with that payable by the authority, should be paid by the authority: and

(C) That in connection with para. 7 (3), it would be preferable to limit the obligation not by a period of time but by a definition of the illness as one arising out of the confinement.

FEES FOR MEDICAL WITNESSES AT ASSIZES.

(Continuation of para. 113 of Annual Report, page 118.)

227. As a result of representations on this matter, the Lord Chancellor has stated (i.) that the costs which might be allowed for attendance of witnesses—whether professional or otherwise—in criminal cases are regulated by Orders made by the Secretary of State under Section 5 of the Criminal Justice Administration Act, 1951 and Section 10 of the Costs in Criminal Cases Act, 1908, and under these Regulations, until recently, the amount which might be allowed to a professional witness was a guinea: (ii.) that this amount had been increased by 50 per cent. as from March 25th last by Witnesses Allowance Order 1920, Statutory Rules and Order 1920, No. 354 L6; (iii.) that the Lord Chancellor had been in communication with the Lord Chief Justice and they did not consider that it would be possible to make rules whereby medical witnesses would not be required to attend the opening of the Court but would be given twenty-four hours notice of the time when they would be required to give evidence; (iv.) that the practice of judges on circuit is always to show great consideration for the convenience of medical witnesses and that it frequently happens that particular days are fixed for the trial of cases so as to suit the arrangements of medical witnesses; (v.) that it is the usual custom at most assize towns to take the pleas of guilty on the first day and it is, therefore, essential that all witnesses should be in attendance on that day; and (vi.) that the duty of giving notice to witnesses is presumably in the hands of those conducting the prosecution in each case and their Lordships have no jurisdiction to intervene in the matter.

SEAMEN'S NATIONAL INSURANCE SOCIETY.

(Continuation of para. 123 of Annual Report, page 118.)

228. The Council has to report that the Seamen's National Insurance Society has decided, subject to the approval of the Ministry of Health, to increase its scale of fees to medical practitioners by 50 per cent. as from 1st April, 1920, and the Society has been informed that the increase is considered by the Association to be acceptable.

TAXATION OF MOTOR CARS.

(Continuation of paras. 130 and 131 of Annual Report, page 119.)

229. Immediately the proposals contained in the Budget became known, steps were taken to bring to the knowledge of the Government the Association's views on the question of taxation of doctors' motor cars. A combined deputation of representatives of the Association and Medical Members of Parliament was received by the Ministry of Transport on May 4th, 1920, when representations were made that medical practitioners, in this matter, should be left *in statu quo*, namely, liable to pay only half tax.

230. The representatives of the Ministry stated that they did not think that the Minister of Transport would be able to recommend this concession to the medical profession, as it had definitely been decided that, except for motor ambulances and fire engines which would be exempted altogether, there should be no rebate in any case; that this was the first time commercial vehicles had been taxed and that if any exception were made in the case of medical practitioners it was certain that other classes of the population could and would make representations for similar concessions and in all probability would be able to put up as good a case as that which had been made out for the medical profession. This decision has since been confirmed by a letter from the Minister in which he declares his intention of making no concessions whatever, other than the two mentioned above.

231. The Minister in a reply (dated May 18th, 1920) states that he is unable to make any concessions in respect of such practitioners and that the necessity in certain cases of keeping more than one car is not confined to medical practitioners; that should a medical practitioner require to keep two cars, this must be regarded as a necessary part of his professional equipment, and the interest on his capital outlay, the cost of garage accommodation and the licence duty are all part of his professional expenses.

A strong plea was thereupon put in on behalf of doctors the nature of whose practices compel them to keep two cars, and who are by no means necessarily the best able to stand additional taxation.

STATE REGISTRATION OF NURSES: GENERAL NURSING COUNCIL.

232. The Council has to report that the following nominees of the Association have been appointed by the Minister of Health as members of the General Nursing Council set up under the Nurses Registration Act, 1919:

Sir Jenner Verrall, LL.D., and Dr. E. W. Goodall, O.B.E.

POSTAL MEDICAL OFFICERS.

(Continuation of paras. 133 and 134 of Annual Report, page 119.)

233. The Council has to report (i.) that in reply to a "Current Note," 102 Members of the Association reported that they were Postal Medical Officers; seven of them stated that they were also members of the Association of British Postal Medical Officers; (ii.) the analysis of complete lists of Postal Medical Officers shows (a) approximate total number of Postal Medical Officers, 2,500, (b) of these, 1,650 are Members of the British Medical Association; (iii.) information has been received (a) that the capitation fee for Postal Medical Officers has been increased to 13s.; (b) that the fees for the treatment of itinerants are under consideration with a view to increase, and (iv.) that certain points still remain to be considered of which the following are the most important:— (a) fee for examination of civil servants (at present 10s. 6d.); (b) fee for inoculation against influenza (present fee offered is 2s. 6d. to cover the two inoculations); (c) periodical examinations for cycling duties, and (d) fees for emergency visits.

234. The Council has again asked the Postmaster-General to receive a deputation.

LONDON COUNTY COUNCIL (GENERAL POWERS) BILL;

ESTABLISHMENTS FOR MASSAGE OR SPECIAL TREATMENT.

235. The L.C.C. (General Powers) Bill has been considered by the Council and representations were made to the L.C.C., that Clause 17 (Old Clause No. 24) of this Bill should be modified so as to remove therefrom certain objectionable features as to the certification of medical practitioners who desire to set up establishments for massage, etc., thereby to some extent duplicating disciplinary powers already exercised by the General Medical Council. The attention of the Committee of Medical Members of Parliament and the General Medical Council was also directed to this matter.

236. The L.C.C. agreed to amend the Clause so as to remove its most objectionable features, and the Association has accordingly withdrawn its opposition. The old Clause demanded that any practitioner desiring to carry on an establishment for massage or special treatment should obtain a certificate signed by two practitioners to the effect that the establishment would not be carried on for immoral purposes and that he was qualified to carry on an establishment for massage. Under the amended Clause all he will have to get is a certificate signed by two practitioners saying that he is a suitable person to carry on such an establishment at the premises used therefor.

GASLIGHT AND COKE COMPANY'S EMPLOYEES' BENEFIT SOCIETY.

237. The Medical Officers to the Gaslight and Coke Company's Employees' Benefit Society recently approached the Association with a view to obtaining an increase of their remuneration for work for this Society. On the advice of the Association, these officers applied for an increase from 7s. 6d. to 24s. per family, per annum, to include medicine and attendance, and decided that unless their demands were granted they would, subject to 80 per cent. of their number assenting, resign their appointments to this Society. 85 per cent. of the Medical Officers have signed forms of resignation. After a good deal of pressure the Society agreed to receive a deputation from its Medical Officers accompanied by the Deputy Medical Secretary, and this was received by representatives of the Society on May 17th, 1920.

238. The claims of the Medical Officers were stated and their intention to resign if the terms finally decided upon by them, after consideration of certain points raised by the Society (namely, 24s. per family), were not granted. The matter is being referred to the members of the Society.

Public Health and Poor Law.

BREAD AND FOOD REFORM LEAGUE.

239. The Council, on consideration of a request from the Bread and Food Reform League, decided to send resolutions to the Prime Minister and Minister of Health in support of the action of the League, urging that the existing laws against adulteration of food be carried fully into effect, and that if it is found necessary, further legislation be introduced to protect meal flour and bread from deterioration and adulteration.

SUPERANNUATION OF HEALTH OFFICERS.

(Continuation of para. 166 of Annual Report, p. 121.)

240. In response to the request of the Ministry of Health to receive a Memorandum of the views of the British Medical Association, the Society of Medical Officers of Health, and the Sanitary Inspectors' Association on the question of Superannuation of Health Officers formed after consideration of the Report

of the Departmental Committee on Superannuation, the attached Memorandum (see Appendix A) has been forwarded as embodying the views of the British Medical Association and the Society of Medical Officers of Health on this matter. The Sanitary Inspectors' Association have forwarded their Memorandum direct to the Ministry.

Hospitals.

PAYMENT OF MEMBERS OF STAFFS OF VOLUNTARY HOSPITALS FOR THE TREATMENT OF DISCHARGED AND DISABLED SAILORS AND SOLDIERS.

(Continuation of paras. 168 and 169 of Annual Report, pp. 121, 122.)

241. The Committee has been in communication with the Ministry of Pensions and the British Hospitals Association with regard to payment of members of staffs of voluntary hospitals for the treatment of discharged and disabled sailors and soldiers, and has ascertained that the following are the chief points which have been agreed upon between the Ministry and the British Hospitals Association:—

In-patients.

1. That for a general well-equipped hospital the Ministry of Pensions will pay 9s. per head per day. For all other hospitals it will pay 7s. per head per day.

2. In other hospitals which can show by their accounts that their expenses are over 9s. a day and who have medical schools attached or other educational facilities, the Ministry of Pensions will pay up to 11s.

Out-patients.

3. For ordinary orthopaedic out-patients where the Ministry of Pensions supplies medical supervision it will pay a rate of 1s. 6d. per attendance.

4. In cases where the hospitals supply medical supervision the Ministry of Pensions will pay 2s.

5. For special cases, for example, aural, ophthalmic, cardiac, tropical disease, etc., where it is necessary for the doctor to see the patient each time he attends, the Ministry of Pensions will pay a flat rate of 3s., which will cover all charges.

6. In cases where hospitals open a clinic (orthopaedic for officers, the Ministry of Pensions will pay 3s. per attendance with a separate arrangement to pay for medical supervision, which must not exceed the rate of 2s. per attendance.

242. The Committee asked the Ministry of Pensions to receive a deputation which was received on May 13th, 1920. The Minister stated that he had made a contract with the British Hospitals Association acting on behalf of the hospitals concerned, and could not deal with the medical profession direct. The Council is taking the matter up with the British Hospitals Association. As regards the allowance in lieu of lodging, etc., the Minister has increased it to £130 per annum.

243. The Council has authorised the Hospitals Committee to take action in negotiating with the British Hospitals Association in view of the reply of the Minister of Pensions to the deputation mentioned in the foregoing paragraph, and has also empowered the Committee to convene in various centres throughout the country, conferences of members of medical staffs of Voluntary Hospitals with a view to acquainting them with the position in regard to the payment of medical staffs of Voluntary Hospitals and the dangers of the continuance of the present unsatisfactory position.

Oversea Branches.

SOUTH AFRICAN MEDICAL CONGRESS.

(Continuation of para. 213 of Annual Report, page 126.)

244. In response to the invitation (since repeated) received from the last South African Medical Congress and the South African Committee in 1913, the Council has appointed Dr. J. A. Macdonald, LL.D. (Chairman of Council), to attend, as representative of the Home Association, the South African Medical Congress which is being held at Durban in October of this year, and has asked Dr. Macdonald to combine with that visit, visits to the South African Branches.

245. From the invitation received from the two bodies of the Association named, the Council knows that the representative of the parent body will have a warm welcome, both at the Congress and from the South African Branches and their Federal Committee, and the Council is confident that the attendance of the delegate of the Home Association in South Africa will help to make even more close and cordial the bond of fellowship and the mutual help and co-operation between the Association in South Africa and at home.

TERMS AND CONDITIONS OF SERVICE OF MEDICAL OFFICERS IN
THE COLONIAL SERVICES.

(Continuation of paras. 214-7 of Annual Report, page 136.)

246. The Council has reason to believe that the report of the Colonial Medical Services Committee, appointed by the Secretary of State for the Colonies, which completed some time ago its taking of evidence, may be published in June. All the questions raised by the Association in its evidence before that Committee are being carefully watched by the Council.

PENSIONS OF MEDICAL OFFICERS RETIRED FROM THE
COLONIAL SERVICES.

(Continuation of para. 218, page 136, of Annual Report.)

247. As a result of repeated representations made by it to the Secretary of State for the Colonies as to the need for increase of the pensions of medical officers retired from the Colonial Services, the Council has received from the Colonial Office particulars of the increases of pensions granted by various Colonial Governments to retired officials, including medical officers, on account of conditions brought about by the war. In forwarding the memorandum, the Assistant Under-Secretary explains that the question of the increases to be granted was left to the several Colonial Governments to decide according to their varying circumstances. There is appended to this report (*see* Appendix B) a brief summary of the increases so far given. Copies of the complete memorandum are being sent to each Oversea Branch, and to each member who assisted the Association in preparing the evidence placed by the Association before the Colonial Medical Services Committee. A copy of the memorandum will also be sent on application to any other member of the Association in, or retired from, the Colonial Medical Service. The Council is enquiring into the question of those Colonies and Protectorates where the increase of pension is small, as well as into the cases in which no increase has been declared.

UNDER CONSIDERATION.

248. Leave regulations and pay in the medical services of East Africa.

249. "Medical Farming" in the East Africa Protectorate.

250. Duty allowance of Colonial medical officers.

New South Wales Branch.

Membership.

251. The Branch membership is now 1,200, an increase of 64 as compared with 1919.

ROLL OF HONOUR AND ACTIVE SERVICE LIST.

252. The Roll of Honour contains the names of 33 practitioners whose deaths were directly attributable to their war service. The Active Service List contains the names of 518 members of the Branch.

253. Steps are being taken to establish a permanent memorial, which it is hoped will be worthy of the Association.

254. The list of honours received for war service has been prepared. The number of medical recipients for New South Wales is 152, including Order of the Bath, 3; Order of St. Michael and St. George, 8; Order of the British Empire, 13; Distinguished Service Order, 47; Military Cross, 73; Bar to Military Cross, 4; French, Italian and Serbian honours, 6.

WAR EMERGENCY ORGANISATION.

(a) *Protection of Practices of Members on Active Service.*

255. In only one case has there been resistance to the decision of the Branch Council under the rule made by the Branch in August, 1914. Under that rule, with a view to conserving the interests of members of the Branch on Active Service, the other members individually engaged, in the event of being called upon to fill their positions or attend their patients, to restore these to them upon their return to civil practice so far as in their power to do so. In the case referred to, the decision was against the intervening practitioner, a newcomer to New South Wales after the commencement of the war.

(b) *Medical Officers' Relief Fund (Federal).*

256. The amount contributed in New South Wales to the Medical Officers' Relief Fund inaugurated by the Australian Federal Committee is £5,268.

PNEUMONIC INFLUENZA EPIDEMIC.

257. Through the Consultative Council appointed from the membership of the Branch, and otherwise, the Branch assisted the authorities in coping with the severe influenza epidemic. The Branch arranged for advisory medical staffs for the Relief Depots in Sydney and its suburbs, and rosters of practitioners were also appointed for domiciliary attendance on patients both in the metropolitan area and throughout the State in connection with these depots. The services of the Association were also utilised in carrying on the work of Inoculation Depots, and in the stalling of the extensive system of Emergency Hospitals.

CONTRACT PRACTICE: FRIENDLY SOCIETY LODGES.

258. The approved common form of agreement with Friendly Society Lodges has continued to serve its purpose. Lodges which since the date of introduction of that form (1914) have administered their medical benefit independently of members of the Association have, in certain areas, now adopted the agreement.

259. During the year the Branch regulations in respect of contract practice and the Friendly Society Lodges have been amended to provide (1) that no member shall meet any depuration of Friendly Society Lodge members in regard to the common form of agreement, without first obtaining the consent of the Committee of the Local Association of the Branch, (2) that when a member has been approached by a Lodge to accept appointment as a Medical Officer, he shall apply to the Local Association, and (3) the form of contract medical certificate has been amended to provide for a signed declaration by the Friendly Society member to the effect that income does not exceed £208 per annum, and that if the income shall at any time exceed £312 per annum, the member shall thereupon cease to be entitled to the services of the Medical Officer.

BACTERIOLOGICAL PRODUCTS AND SERA.

260. At an extraordinary general meeting in December, 1919, the Branch protested against the Government prohibition of the importation of bacteriological products and sera, as being against the interests of the community and the profession. This protest has been endorsed by the Federal Committee on behalf of all the Australian Branches. Both protests have been conveyed to the Authorities.

J. A. MACDONALD,

Chairman of Council.

APPENDIX (A).

SUPERANNUATION OF MEDICAL OFFICERS OF
HEALTH.

MEMORANDUM OF THE VIEWS OF THE BRITISH MEDICAL ASSOCIATION, AND THE SOCIETY OF MEDICAL OFFICERS OF HEALTH, FORWARDED TO MINISTER OF HEALTH, MAY 4TH, 1920.

Conclusions arrived at by the British Medical Association after consideration of the Report of the Departmental Committee on Superannuation:—

(1) That it is desirable that a uniform Scheme of Superannuation should be introduced applicable to persons employed by the Local Authorities in England and Wales.

(2) That it be very strongly urged that Local Government Officers of 55 years and upwards should not be excluded from the provision of the Scheme; they have for years past been expecting the Government to provide them with Superannuation or Retiring Allowances; to exclude Local Government Officers of 55 years of age with nothing more than optional provision will have the effect of retaining in the Local Government Service the older officials. It is submitted that on economic grounds it would be better that the Fund should bear the cost of including these officers and securing earlier retirement in preference to the continuance in service for many years of a large number of officers who are beyond the high water mark of efficiency.

(3) That paragraphs 28 and 71 of the Report of the Departmental Committee on Superannuation of Persons Employed by Local Authorities in England and Wales are not reconcilable, paragraph 28 in the opinion of the Association being a statement of the very best reasons for the Superannuation Scheme, and paragraph 71 deliberately excluding officers who are 55 years of age at the commencement of the Scheme.

(4) That the Association strongly objects to the suggestion (contained in paragraph 33 of the Report of the Departmental Committee), that an officer should satisfy

the Local Authority that he has made adequate provision for old age and invalidity before he can "contract out" of the Scheme. The suggestion in the Report means that the Local Government Officer will have to disclose the whole of his private position. All that appears necessary is the inclusion in the Bill of the ordinary Contracting Out Clause whereby an officer may, within a specified time, say definitely whether he intends to take advantage of the Scheme or not.

(5) That in the event of the Scheme not applying to those over 55 years of age at its commencement, Local Authorities should be required to grant pensions at the full rate suggested in the Report (compulsory retirement at 65, after, say 20 years' service on the half-rate system, would leave many in financial difficulty) within certain limits to existing employees in respect of back service and in respect of future service rendered by employees who are over 55 years of age at the commencement of the Scheme. Such pensions in these circumstances should not be charged upon the Superannuation Fund, but should be paid out of current rates or revenue.

(6) That the Association has no knowledge of any Scheme of Superannuation which has been carried out in the same way as it is proposed this Scheme should be carried out, especially in regard to the age of participants in the Scheme and to the exclusion of the senior officers.

(7) That the Association urges that every Local Government Officer should be fully entitled to the benefits of the Scheme upon its inauguration, and that all back service should count in the officers' favour.

(8) That the Scheme should be compulsory upon all Local Authorities, and upon all persons employed by them in an established capacity, with the exception of the police, teachers pensionable under the School Teachers (Superannuation) Act, 1918, certain firemen, persons employed in asylums and certified institutions.

(9) That the Association disagrees with the following paragraph 4 of the Summary of Principal Conclusions and Recommendations of the Departmental Committee:—

4. A State-financed Scheme cannot be justified, but local authorities should receive State aid towards superannuation in respect of semi-national services. In such services the cost of superannuation should be included in the expenditure on which the grant is based. (Paragraphs 34-39.)

(10) That (with regard to para. 5 of the Summary of Principal Conclusions and Recommendations of the Departmental Committee) the Association considers that the Medical Officers of Health should be no worse off in respect of Superannuation than teachers and other classes who do not pay contributions towards Superannuation, and that the Superannuation Scheme, so far as it concerns Medical Officers of Health, should be on a non-contributory basis, and failing adoption of this, the Association considers that employees respecting whose salaries one-half is or can be paid out of State funds, should only be called upon to pay one-third of the contributions to the Scheme, the remaining two-thirds being found by the Local Authority and the State. The fact that all Local Authorities do not avail themselves of the power to obtain a refund from the Exchequer Grants of one-half the salary of a Medical Officer of Health does not affect the amount of service required of him by the Central Health Authority or the amount rendered by him. Further, that in the matter of contributions to the Scheme the medical employees should not be at a disadvantage when compared with Poor-Law and Asylum Medical Officers under their respective schemes.

(11) That the Superannuation Scheme should not be less favourable to Medical Officers of Health than the Schemes for other bodies of public employees.

(12) That officers should have the option of retiring at age 60, irrespective of length of service, and in support of this it is pointed out that several classes—for example, Medical Officers of Health—are unable to complete 40 years' service by the time they reach 60 years of age owing to their late entry into the service, and that they should not be compelled to continue beyond 60 years of age if they desire to retire on a pension in proportion to the actual number of years' service.

(13) That for the following reasons it is impossible for a Medical Officer of Health to retire on full pension at 60 years of age. He qualifies at 21 years of age at the earliest, he takes the D.P.H. (as required by law for certain M.O.H. work) at 22 years of age, then it is desirable that he should have at least two or three years' general experience before entering into Public Medical Service. This would make his age at least 25 before

entering the service, which, plus 40 years, makes 65 years the earliest age at which he could retire.

(The Society of Medical Officers of Health desire the following addition to paragraph (13):

"at which he could retire on full pension. In the circumstances the Society is of opinion that five years should be added to the number of years served by a medical officer subject to a maximum of forty years.")

(14) That retirement at 65 years of age should be made compulsory and without option to Local Authorities to continue service beyond that age. This would facilitate promotion, and would on the whole secure more efficient service.

(15) That the Association strongly opposes the closing of the Fund for 10 years, and urges the Government to provide for all existing Local Government Officers to retire on a pension according to their length of service.

(16) That the remaining suggestions in paragraph 42 of the Report of the Departmental Committee having reference to the benefits to be provided, should be supported.

(17) That provided the main recommendations of the Association be adopted, Schemes under Local Acts should cease to apply to new entrants, who should come into the general scheme. Existing employees, pensionable under Local Act Schemes, should have the option to transfer to the new Scheme on terms to be framed by the Local Authority concerned and approved by the appropriate Government Department.

(18) The Association desires to point out that every full-time State-paid doctor has superannuation except the Medical Officer of Health.

(19) Attention is also called to the fact that the period of earning capacity of Medical Officers of Health is shorter than that of other Municipal Officers owing to the longer period required for the completion of their special training.

(20) The average pre-war salary of a whole-time Medical Officer of Health was less than he could have earned in general practice and was not sufficient to enable him to make adequate provision for retirement in his own savings. This is especially the case as regards those Medical Officers of Health whose conditions of appointment require them to pay the expenses of their office, including travelling, office, clerical, postages, etc., which increase in amount almost year by year without corresponding increase in salary.

APPENDIX (B).

SUMMARY OF INCREASES IN CIVIL SERVICE PENSIONS NOW GIVEN BY COLONIES, AS CONTAINED IN MEMORANDUM, DATED APRIL, 1920, FORWARDED BY THE SECRETARY OF STATE FOR THE COLONIES TO THE BRITISH MEDICAL ASSOCIATION.

(Note.—In each case the larger percentage is on the smaller salaries.)

(I.) WEST INDIES :

- (1) *Windward Islands*: 10 per cent. to 25 per cent.
- (2) *British Guiana*: Up to 20 per cent.
- (3) *Falkland Islands*: 20 per cent. to 25 per cent.
- (4) *Leeward Islands*: No increase.
- (5) *British Honduras*: An increase up to 20 per cent. probable.

(II.) MEDITERRANEAN :

- (6) *Malta*: Home Civil Servants Award.
- (7) *Gibraltar*: Treasury Scale.
- (8) *Cyprus*: 10 per cent. to 40 per cent.

(III.) WEST AFRICA :

- (9) *Gold Coast, Sierra Leone and Gambia*: 15 per cent. to 25 per cent.
- (10) *Nigeria*: 15 per cent. to 25 per cent.

(IV.) SOUTH AFRICA :

- (11) *Basutoland, Bechuanaland, Swaziland*: 17.5 per cent. to 30 per cent. (but less for single officers without dependents).

(V.) EAST AFRICA :

- (12) *East Africa, Zanzibar*: 15 per cent. to 25 per cent.
- (13) *Nyasaland, Somaliland, Uganda*: Home Civil Service Award of December 19th, 1919; 30 per cent. to 40 per cent.

(VI.) EASTERN COLONIES :

- (14) *Hong Kong*: 10 per cent. to 33 per cent.
 (15) *Straits Settlements and Federated Malay States*:
 20 per cent. to 25 per cent.
 (16) *Ceylon*: Up to 33 per cent.
 (17) *Mauritius*: 15 per cent. to 60 per cent. to residents
 in the Colony. Position of pensioners in England
 under consideration.

Note.—In Colonies and Protectorates not mentioned above,
 no increase of pension granted.

British Medical Association.

CURRENT NOTES.

Motor-Car Taxation.

THE Medico-Political Committee, as recorded in this column has made representations to the Ministry of Transport on the subject of the new motor-car taxation. Special representations were made on behalf of the doctor with two cars. The reply of the Minister was to the effect that no concessions could be made to medical motorists as no preference was now being given to owners of commercial vehicles. He was also of opinion that a medical practice requiring two cars could easily bear the additional expense, and that the quarterly licence would provide adequate relief. Sir W. Joynson-Hicks has recently asked a question on the same subject in the House of Commons, and obtained a similar and very emphatic reply. The statement that the quarterly licence will compensate the user of two cars is not convincing, nor can it be accepted as a fact that the keeping of two cars denotes a lucrative practice, and this the Association has told the Minister in a final attempt to change his views on this subject. The matter is reported more fully in the Supplementary Report of Council published in this week's SUPPLEMENT.

Panel Lists in Glasgow.

We reported in this column last week the state of feeling among Glasgow practitioners at the action of the Glasgow Insurance Committee in fixing 1,500 as the maximum number of insured persons to be attended by one doctor. At the request of the Panel Committee the Scottish Medical Secretary prepared a reasoned statement of the case against the proposed limitation for submission to the Scottish Board of Health, and arranged for a deputation to meet the Board along with representatives of the Insurance Committee. At the interview the matter was fully discussed, and the Board advised the two committees to try to come to an understanding. As a result of this, the Panel Committee representatives agreed to recommend the acceptance of a limit of 2,000 net. This recommendation was considered at a meeting of practitioners held on May 24th, when it was resolved to "request the Board of Health to determine a figure not substantially short of the 3,000 which all the negotiations led them to expect." The Scottish Board of Health has intimated that it has fixed the limit at 2,000, the number on a practitioner's list being determined by dividing the total amount paid to him for a quarter by one-fourth of the annual capitation fee.

Senior Surgeon Commanders R.N.

On January 1st, 1920, the Admiralty introduced new regulations for pay and pensions of medical officers, R.N., whereby, *inter alia*, officers of the rank of surgeon commander are compulsorily retired at the age of 50, the maximum pension being £500—representing an increase only of about 10 per cent. on the old pension of surgeon commanders. The attention of the British Medical Association was drawn by naval members to the fact that a large number of senior surgeon commanders were adversely affected by these new provisions. The officers so affected had, in fact, entered the service on the understanding that they would be allowed to serve until they reached the age of 55. By the scheme for earlier compulsory retirement, therefore, these officers would lose the chance of promotion to the rank of surgeon captain and an increased pension, as well as forfeiting a period of five years' service on the highest rate of pay as surgeon commander. This question was

accordingly taken up with the Admiralty, and it was suggested that in order to mitigate the grievance the scheme for compulsory retirement should be postponed for a year, or that the principle of maximum pension should as a temporary measure be withdrawn for five years—that is, until the age of retirement normally reaches 50. The Admiralty's reply was to the effect that it was recognized that in adopting the new regulation there must be cases of individual hardship, but it would not be practicable to legislate specially for individual cases. The Council pressed the Admiralty to reconsider their decision, but this they absolutely decline to do, their policy in this matter being definitely fixed. This refusal on the part of the Admiralty to give a sympathetic hearing to officers who consider that they have a good cause for complaint has given rise to much dissatisfaction. There is a strong feeling among naval medical officers that they have not been treated in accordance with the spirit of the Jerram-Halsey Report, which inspired hopes of liberal additions to pensions. These have not been fulfilled, at any rate so far as the medical branch is concerned. Those who have been relegated to the retired list, anything from one to five years before they expected to be retired in accordance with the conditions on which they joined the service, feel that they have been unjustly treated; and the Admiralty will find that such incidents are not forgotten when efforts are being made to secure recruits. So far as the Association is concerned, the only prospect now of effective action is by approaching the Admiralty in cases of admitted individual hardship.

Colonial Commissions for Venereal Disease Propaganda.

We learn that the campaign against venereal disease is being extended to the Crown Colonies and Protectorates. It is known that the medical services so far have had a difficult task in dealing with this scourge, and that their difficulties have been intensified since the war. The authorities, recognizing this, have invited the National Council for Combating Venereal Diseases to dispatch two commissions under the aegis of the Colonial Office, one travelling east and the other travelling west. The object of the commissions is to take to the Colonial authorities information and materials for dealing with the question both from the medical and educational standpoint, so that the benefit of recent experience gained in this country may be made available to all interested in the medical and administrative efforts to reduce the incidence of these diseases. The commissions will consist of one lay and one medical member. The medical member is to give post-graduate courses to the local medical profession, under the auspices of the various Colonial Medical Services. On the Western tour the medical commissioner would be required to demonstrate the Wassermann technique; although desirable, this would not be absolutely necessary for the Eastern voyage. In addition to the technical medical instruction, the medical commissioner would be invited to give addresses of a more general character to lay audiences, and would therefore need to be in sympathy with the social and administrative policy of the National Council. We are informed that a selection committee is now considering the names of those who are willing to act as commissioners, and that the matter must be decided within the next few weeks. All travelling expenses and a small honorarium are offered; the commissioner would be absent from the country on one commission for six months and on the other for eight months, starting about September. The final selection of medical commissioners has not been made; names of applicants should be sent to the National Council for Combating Venereal Diseases, 80, Avenue Chambers, Southampton Row, London, W.C.1. The British Medical Association has been asked to facilitate the work of the commissions, and to invite the local profession to make the visits as useful as possible. The Oversea Divisions of the Association in the areas to be visited have accordingly been requested to do all they can to help the commissioners.

A Medical Officer of Health's Salary.

A medical officer of health recently sought the assistance of the British Medical Association with a view to obtaining an increase in his salary. His first application for an increase had been refused by his council. The Medical Secretary then wrote to the council, pointing out that the

application was quite justifiable in view of the present cost of living, and asked that it should be reconsidered. The reply was that as the doctor was only appointed for the duration of the war the question of salary would be gone into when a permanent appointment was made. The council was told that the explanation was very unsatisfactory and that no other local authority, so far as was known, had attempted to evade giving an increase of remuneration on the ground that the post was temporary. As the result of this letter the clerk has written to say that the salary has been increased by 33½ per cent.

Council Election.

Dr. C. S. Young of Dundee, who, together with Drs. B. Cruickshank of Nairn and David Lawson of Banbury, was a candidate for election on the Council by the members of the Aberdeen, Northern Counties, Dundee and Perth Branches, has withdrawn his candidature. The voting papers containing the names of the three candidates had, however, been posted prior to the receipt of the withdrawal, but, as the election is carried out on the system of the single transferable vote, the withdrawal will not necessitate a fresh election. All "first choices" for Dr. Young will be ignored in the count.

EIGHTY-EIGHTH ANNUAL MEETING

OF THE

British Medical Association,

CAMBRIDGE, 1920.

The Annual Representative Meeting will begin in the Examination Halls on Friday, June 25th, at 10 a.m. The statutory Annual General Meeting will be held in the Examination Halls on Tuesday, June 29th, at 2 p.m. Sir Clifford Allbutt will give his Presidential Address to the Association on Tuesday evening, in the Senate House.

The scientific work of the meeting will be conducted in twelve Sections. The Sections will meet in the New Museums on Wednesday, June 30th, Thursday, July 1st, and Friday, July 2nd. The mornings will be devoted to discussions, and the afternoons to laboratory and clinical demonstrations. The programme of proceedings in the Sections was printed in last week's SUPPLEMENT.

The Annual Dinner.

The Master and Fellows of St. John's College have very kindly invited members of the Association to dine in Hall at 8 p.m. on Thursday, July 1st, as guests of the College. As the seating accommodation is limited to 200 it will be necessary to ballot for tickets. Members who would wish to accept this invitation should therefore send in their names to the local secretaries before June 25th.

ARRANGEMENTS FOR ACCOMMODATION.

The arrangements are now complete for the accommodation of members of the Association for the Annual Meeting at Cambridge from June 25th to July 3rd. The authorities of each college have kindly placed at the disposal of the local committee a large number of undergraduates' rooms. The accommodation in hotels is already fully booked. A list has been prepared of a large number of lodgings usually occupied by undergraduates, only those situated within half a mile or so of the Reception Room (in the Guildhall) being included.

COLLEGES.

Only those members who are unaccompanied by ladies can be given rooms in a college. Each member will be assigned a set of undergraduate's rooms, with the services of a college bedmaker or gyp, and with breakfast, luncheon, tea, and dinner served in the College Hall at the inclusive charge of 14s. 6d. per diem.

An attempt will be made to assign to a particular college members who are specially interested in the work of the same Section, but it will not be possible to carry this out completely.

Those members who wish to stay in a college should address their applications to:

The General Secretaries, British Medical Association,
The Medical School, Cambridge,

not to a particular college, and they are invited to state, if they wish to do so, in which Section they are particularly interested. It is important they should give the date of their arrival. Cambridge men who desire to stay in their old college should apply without delay and state which is their college. The authorities of Newnham College have kindly offered to accommodate the lady members of the Association with rooms and meals at the inclusive charge of 10s. 6d. a day; application should be made only to the General Secretaries.

Rooms are still available in many of the colleges, but early application should be made.

LODGINGS.

Members who wish to stay in lodgings should write directly to the lodging-house keepers. The list of lodgings printed below will be revised and republished so that only those still available will appear in the list. When they have made their arrangements members are requested to inform the General Secretaries what their Cambridge address will be.

It will be noticed that many of the lodging-houses are unable to provide luncheon, and most of them unable to provide dinner. A few of the colleges will be able to admit to luncheon and to dinner members (and ladies accompanying them) staying in lodgings, but the number of seats in these college halls being strictly limited, tickets for these meals must be obtained beforehand. Details as regards the issue of these tickets will be given in the Reception Room during the meeting.

MEALS.

Meals may be obtained in the following hotels, restaurants, and cafés:

Hotels.—The University Arms: Lunch 3s. 6d.; dinner 6s. The Red Lion: Lunch 3s. 6d.; dinner 5s. 6d. The Blue Boar: Lunch 3s. 6d.; dinner 5s. 6d. The Bull.

Cafés.—The King's: Lunch 2s. to 3s.; dinner 4s. Matthew's: Lunch à la carte; dinner 5s. Livingstone: Lunch 2s. to 2s. 6d.; dinner 4s. Dorothy Cafés.

REVISED LIST OF LODGING HOUSES.

Practically all the lodging-house keepers will supply breakfast, most luncheon, and those marked with an asterisk dinner. It is particularly requested that when writing to engage rooms members will specify what meals they require to be provided. The prices in the following list generally refer to one person per diem; terms should be arranged definitely in advance.

	Sitting Rooms.	Single Bed.	Double Bed.
*Mrs. Bush, 16, Parker St. ...	2; 2/6	1; 2/-	1; 2/-
Mrs. Brown, 13, Emmanuel Rd. ...	1; 2/-	1; 2/6	1; 2/6

Association Notices.

REPRESENTATIVE MEETING.

DATE.

THE Annual Representative Meeting at Cambridge will begin on Friday, June 25th, at 10 a.m.

NOTICES OF MOTION AND AMENDMENT.

Notices of Motion and Amendment by Divisions and Branches for consideration by the Annual Representative Meeting will be published in the SUPPLEMENT as they are received, but none can be published later than June 12th, for which purpose they must be received by

the Medical Secretary not later than the first post on Monday, June 7th.

It will be possible, however, to include in the Agenda for the Annual Representative Meeting all Notices of Motion and Amendment which are received by the Medical Secretary not later than the first post on Monday, June 14th.

ANNUAL GENERAL MEETING.

THE Annual General Meeting will be held at the Examination Halls, Cambridge, on Tuesday, June 29th, 1920, at 2 p.m. Business: (1) Minutes of last Meeting. (2) Appointment of auditors. (3) Report of election of President. (4) Report of election of President-Elect.

BRANCH AND DIVISION MEETINGS TO BE HELD.

LANCASHIRE AND CHESHIRE BRANCH.—The annual meeting for 1920 will take place at Southport on June 9th. The members will be entertained at lunch by the Southport Division, and after the President (Dr. Baildon, Southport) has given his address scientific papers will be read. A number of excursions are being arranged for the afternoon, and in the evening members will dine together.

METROPOLITAN COUNTIES BRANCH.—Mr. N. Bishop Harman and Dr. J. A. Percival Barnes (Honorary Secretaries) give notice that the annual general meeting of the Branch will be held at 429, Strand, W.C.2, on Friday, June 18th, at 4.30 p.m. Business: (1) Report of scrutineers as to the election of new officers. (2) Annual report of Council. (3) President's Address, by Dr. E. W. Goodall, O.B.E.

METROPOLITAN COUNTIES BRANCH: STRATFORD DIVISION.—Dr. Harold S. Beadles, Honorary Secretary, gives notice that a general meeting of the profession will be held at the Educational Offices, Stratford, on Thursday, June 3rd, at 9 p.m., when the Right Hon. Lord Dawson of Penn. G.C.V.O., M.D., Chairman of the Medical Consultative Council, will open a debate on the Interim Report of the Medical Consultative Council, Ministry of Health.

NORTH LANCASHIRE AND SOUTH WESTMORLAND BRANCH.—Dr. J. Livingston, Honorary Secretary, gives notice that the annual meeting of the Branch will be held on Wednesday, June 9th, at 3.15 p.m., in the Furness Abbey Hotel, Barrow. Business: Report of Council. Election of officers. President's address, by Dr. A. F. Rutherford: "Experiences of an ambulance train commander." The President invites members to tea.

SUSSEX BRANCH.—Hastings: Dr. W. Langdon Brown will give a lecture on June 15th at 4.45 p.m. on Diabetes in Relation to the Quietless Glands.

INSURANCE.

CORRESPONDENCE.

Remuneration of Medical Practitioners.

SIR,—I desire to thank the Medical Secretary for his explicit answers to my queries (SUPPLEMENT, May 15th, p. 157). The short answer "No" to the question whether 11s. were paid for each insured person on a list proves the inaccuracy of the report of Council. The report of the London Insurance Committee on page 165 of last week's SUPPLEMENT shows how part of the pool is spent.

Two points of great interest arise out of Dr. Cox's answer. Was the actuary's report published, and can one get a copy of it? Secondly, as no stamped contribution cards are required for those over 70 or for the incapacitated, or for the married women who have ceased to contribute, from whence are their contributions to the pool derived?

I trust the Medical Secretary will oblige by clearing up these points. After seven years one would think Insurance Committees ought to be able to say with some degree of accuracy: "There are so many on your list at the end of each quarter for whose treatment you are responsible; you will be paid so much for each one, and besides at the end of the year your proportion for those who have not chosen a panel doctor." Hoping for a reply.—I am, etc.,

London, W., May 23rd.

JAMES HAMILTON.

The Medical Secretary replies as follows: Dr. Hamilton will find information on the points he raises in the Actuary's Report, a copy of which is being sent to him. It was circulated to every Local Medical and Panel Committee in 1918, and they were told that they could have as many copies as they wished for circulation to their constituents. It was announced in the SUPPLEMENT of April 20th, 1918, that copies could be obtained gratuitously on application.

Right of Appeal to the Courts.

SIR,—The Insurance Act of 1911 placed all panel practitioners unreservedly in the power of a Government department. Major Farquharson, M.P., on behalf of panel practitioners, moved an amendment to the Insurance Bill now before the House, as follows:

NEW CLAUSE.—(Right of appeal by Medical Practitioner).

"(1). Any medical practitioner aggrieved by a decision of the Minister, or of any special body through which the powers and duties of the Minister, under Section Fifteen, Subsection (2)(b) of the Act of 1911, are exercised, to remove his name from any list of medical practitioners, may appeal against the decision to the High Court within the time and in the manner, and on the conditions directed by the rules of court.

"(2). The costs of any such appeal shall be in the discretion of the court, and no appeal shall be allowed from any order or decision of the court in any such appeal."

This was refused by the Minister of Health, and was negatived.

On the report stage of the bill the amendment was again proposed, this time by Captain Elliot, M.P., Secretary for the House of Commons Medical Committee.

The case of the panel doctors is very similar in many ways to that of the De Keyser Hotel proprietors. The Government takes over for State purposes private enterprise and capital and denies compensation by right, and in the case of the doctors allows no appeal to the courts. If the Indemnity Bill had been passed the proprietors of De Keyser's Hotel would have had no appeal likewise. The Indemnity Bill would have placed them outside the law in the same way that the Insurance Act of 1911 placed panel practitioners outside the law—namely, by taking away their right of appeal to the High Court.

All citizens should watch very closely this insidious process going on in these times of tampering with the Magna Charta and undermining the ancient and inalienable right of every citizen to seek justice in the courts.—I am, etc.,

Stalybridge, May 16th.

ADAM FOX.

SIR,—Dr. Brackenbury, at the meeting of the Local Medical and Panel Committees held last November, explained very carefully and fully that service under the Commissioners was a special service into which a man entered of his own free will, and which he could resign when he chose; that the Commissioners were answerable for the efficiency of that service; that if the continuance of a certain practitioner in that service was detrimental to it the Commissioners had a perfect right to dismiss him; that any appeal to a court of law was unjustifiable. After such a strong direction the chairman had no alternative but to throw out the resolutions from Stockport, Portsmouth, and Cheshire, and to allow the senseless resolution from Brighton to pass.

The new clause as drafted by counsel, which we are urged to invite our members of Parliament to support, is, of course, a great improvement. But is it a question that matters? The Ministry of Health, as far as insurance practice is concerned, has virtually absorbed the disciplinary powers of the General Medical Council. We hear a great deal to-day about Magna Charta, but we know perfectly well that there is not, and that there never was, any appeal from the decisions of the General Medical Council. Why, then, all this talk to-day?—I am, etc.,

Exeter, May 23rd.

J. PEREIRA GRAY.

NATIONAL INSURANCE ACT, 1920.

The Ministry of Health makes the following announcement:

The National Health Insurance Bill, which has just received the Royal assent, makes important changes in the benefits and contributions under the Health Insurance Scheme to operate from July 5th next. The object of the changes is to provide for an increase in the rates of benefits in view of the fall in the value of money. The normal rate of sickness benefit will be raised from 10s. to 15s. a week in the case of men, and from 7s. 6d. to 12s. a week in the case of women; disablement benefit will be raised from 5s. a week to 7s. 6d. for both men and women; and the amount of maternity benefit will be raised from 30s. to 40s. In order to provide for the increase of benefits the joint weekly contribution is to be increased from 7d. to 10d. in the case of men and from 6d. to 9d. in the case of women, of which the employer's portion will normally be 5d. in each case. In certain cases where low wages are paid the employer will pay a larger and the worker a smaller portion of the joint contribution. The contribution cards from the week beginning July 5th next must in all cases be stamped at the rate of 10d. a week for men and 9d. for women; stamps of these values will be on sale at post offices.

Naval and Military Appointments.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

The following Lieutenant-Colonels and Brevet Colonels relinquish the acting rank of Colonel: J. C. Connor, C.M.G., J. A. Hartigan, C.M.G., D.S.O.

Major C. P. Thomson, D.S.O., retires, receiving a gratuity, January 1st, 1918 (substituted for the notification in the *London Gazette*, January 7th, 1918).

Major H. H. J. Fawcett, D.S.O., relinquishes the acting rank of Lieutenant-Colonel (February 8th, 1919).

Major T. E. Hart, D.S.O., to be acting Lieutenant-Colonel.

The following temporary Captains relinquish the acting rank of Major: C. C. Forsyth, M.C., J. E. Thompson, C. R. B. Von Braun, W. Gemmill, R. Millar (January 6th, 1919), H. T. L. Roberts (August 11th, 1919), A. H. MacMillan, O.B.E. (October 17th, 1919).

Captain E. A. Strachan to be acting Major, January 4th, 1918 (substituted for notification in the *London Gazette*, January 30th, 1919).

Captains H. J. Bower and G. Jackson, M.C., resign their commissions.

The name of temporary Captain Robert F. Higgin is as now described, and not as printed in the *London Gazette* of April 23rd, 1920.

J. P. Ponfield, M.C., late Captain C.A.M.C., and R. W. D. Hewson, late temporary Captain, to be temporary Captains:

The following officers relinquish their commissions:—Temporary Major R. H. Bremridge, O.B.E., and retains the rank of Major. Temporary Captain F. R. Brown, O.B.E., and is granted the rank of Major. Temporary Captains and retain the rank of Captain: J. P. Grainger, E. H. Dundy, C. R. B. Eyre, J. W. Steel, H. Daw, H. A. Lane, W. A. McLeod, J. W. Biddoch, M.C., C. K. T. Hewson, A. J. Beattie, R. Gellatly (on ceasing to serve with the Huddersfield War Hospital, March 19th, 1919—substituted for notification in the *London Gazette*, April 29th, 1919), G. V. Fiddian, T. Craig, H. F. N. Scott (March 20th, 1919—substituted for notification in the *London Gazette*, May 1st, 1919), H. G. Watters. On account of ill health contracted on active service: T. Ferrin.

ROYAL AIR FORCE.

MEDICAL BRANCH.

Transferred to unemployed list: Captains H. J. Levisseur, W. G. Robertson, and E. T. D. Fletcher.

Flying Officer J. Fanning to be Flight Lieutenant.

INDIAN MEDICAL SERVICE.

The promotion to the rank of Captain of the following officers has been antedated to March 30th, 1915: J. D. Wilson, M.B. (since deceased), L. A. P. Anderson, Brevet Major W. C. Pateo, M.C., M.B., J. B. Hance, M.B., S. Gordon, M.C., H. K. Rowntree, M.C., M.B., G. V. Thomson, M.B., B. F. Eminson, M.B., A. Kennedy, S. D. Ratnagar (since deceased), C. Melver, J. C. John, O.B.E., M.B., R. M. Porter, M.C., M.B., R. Sweet, D.S.O., M.B., E. Calvert, M.B., J. R. D. Webb, O.B.E., F. Phelan, A. C. Macrae, M.B., N. C. Kapur, A. H. C. Hill, J. F. Holmes, N. K. Bal, M.C., H. S. G. Haji, M.C., S. S. Sokhey, M.B., A. K. Sinha, M.B. (since deceased), S. Doraisamy, A. Seddon, M.B., J. Findlay, M.B., W. C. Spackman, M.R., J. C. De, M. B., N. M. Mehta, R. M. Easton, M.B., C. H. P. Allen, R. V. Martin, G. H. Mahony, M.B., G. Covell, M.B., Brevet Major W. R. Stewart, K. R. Rao, J. G. O. Moses, M.B., H. Chand, M.C., V. Mahadevan, A. C. L. O. Bilderbeck, M.B., J. W. Van Reeden, M.B., B. F. Beaton, M. J. Roche, M.C., M.B., N. D. Puri, P. C. Roy, M.B., M. Das, M.C., J. B. Vaidya, J. M. R. Hennessy, A. G. Cowper, W. M. Lupton, H. H. Brown, C. H. N. Baker, M.C., J. W. Pigion, M.L., Treston, P. Vicary, M.B., B. M. Mitra, P. Savage, A. Chand, M.B., R. Lee, M.B., N. S. Jatar, D.S.O., T. S. Sastry, M.B., Jamal-ud-din, M.B., F. B. Cheney (since deceased), S. B. Venugopal, C. de C. Martin, M.B., J. H. Smith, M.B.

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Captain P. S. Vickerman, O.B.E., relinquishes the temporary rank of Lieutenant-Colonel.

The following Captains relinquish their commissions: P. F. A. Graet, F. Griffith, L. K. Ledger, G. R. McRobert, E. W. Mann, and J. Lanigan, on account of ill health contracted on active service, and retain the rank of Captain.

Captains F. E. Feilden and J. I. Watson relinquish their commissions on account of ill health caused by wounds, and retain the rank of Captain.

16 Wed. London: Finance Committee, 2.30 p.m.

17 Thurs. Bedfordshire Division, Annual Meeting, Swan Hotel, Bedford, 3 p.m.; Luncheon, 1.30 p.m.

18 Fri. London: Central Ethical Standing Subcommittee, 2.30 p.m. Metropolitan Counties Branch, Annual Meeting, 429, Strand, W.C.2, 4.30 p.m.

APPOINTMENTS.

ADAM, James Robertson, M.B., Ch.B., D.P.H., County and District Medical Officer of Health, Orkney, and Medical Officer, Burgh of Kirkwall.

GUPTA, P. L., M.B., Ch.B., St. Aud., House-Surgeon to the Macclesfield Infirmary.

HANNAY, M. G., M.D., F.R.C.P.E., Honorary Assistant Physician to St. John's Hospital for Diseases of the Skin.

HUNT, E. R., M.D., B.Ch., M.R.C.P., Honorary Assistant Physician, Royal Sussex County Hospital, Brighton.

POOLER, H. W., M.B., Ch.B., M.R.C.S., L.R.C.P., Visiting Medical Officer to the Morton District Hospital.

SHARPE, F. A., M.D., D.P.H., Medical Officer of Health for Preston.

STUTCLIFFE, J., M.R.C.S. Eng., L.R.C.P. Edin., Resident Medical Superintendent of Cheshire Royal Hospital for Mental Diseases, Cheshire, Cheshire.

WILLIAMS, F. S., M.B., B.S. Lond., Medical Officer of Health for the Urban District of Wednesfield, Staffordshire.

ST. THOMAS'S HOSPITAL.—The following house appointments are announced:—Casualty Officers and Resident Anaesthetists: D. G. Churcher, M.R.C.S., L.R.C.P., R. M. Humphreys, B.A., M.B., B.Ch. Oxon., R. C. P. Whitecombe, B.A. Cantab., M.R.C.S., L.R.C.P., W. G. Woolrich, B.A. Cantab., M.R.C.S., L.R.C.P., Resident House-Physician: P. C. Brett, M.R.C.S., L.R.C.P., Resident House-Surgeons: A. H. J. Smart, B.A., M.B., B.Ch. Cantab., M.R.C.S., L.R.C.P., E. P. Brockman, B.A. Cantab., M.R.C.S., L.R.C.P., Obstetric House-Physicians: H. L. Garson, O.B.E., M.C., B.A. Cantab., M.R.C.S., L.R.C.P., R. C. Cooke, D.S.O., M.C., M.R.C.S., L.R.C.P., Ophthalmic House-Surgeons: J. D. M. Cardell, M.R.C.S., L.R.C.P., H. W. H. Holmes, B.A. Cantab., M.R.C.S., L.R.C.P., Clinical Assistants: Thront, C. H., C. Byrne, M.B., B.S. Lond., M.R.C.S., L.R.C.P.; Skin, W. A. Low, M.C., M.R.C.S., L.R.C.P.; Children's Medical, W. A. Low, M.C., M.R.C.S., L.R.C.P.; Electrical and X-Ray Department, F. G. Spear, B.A. Cantab., M.R.C.S., L.R.C.P., H. S. Le Marquand, M.R.C.S., L.R.C.P., E. E. Carter, M.R.C.S., L.R.C.P.; Tuberculosis Department, P. B. Hobbs, B.A. Cantab., M.R.C.S., L.R.C.P., A. C. V. Gossett, B.A. Cantab., M.R.C.S., L.R.C.P. Several other house officers have received an extension of their appointment.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 7s. 6d., which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue.

BIRTH.

NEWMAN.—On the 17th inst., at Lyndhurst, Willenhall, to Charles Frederick Newman, M.R.C.S., L.R.C.P., and Mrs. Newman (née Macculay), a daughter.

SUPPLEMENT

TO THE

BRITISH MEDICAL JOURNAL.

REASONS WHICH HAVE ACTUATED THE COUNCIL IN RECOMMENDING AN INCREASE OF THE ANNUAL SUBSCRIPTION.

1. In the Annual Report (SUPPLEMENT, April 24th, 1920, p. 107) the Council recommended the Representative Body to increase the present subscription by 50 per cent., giving as its reasons the general experience as to depreciation in the value of money and increase in practically all forms of expenditure, as shown in the Financial Statement for 1919 and the Estimate for 1920.

2. As there has been a request for more details, the following are offered for the consideration of members in general and the Representative Body in particular:

Estimated Expenditure for 1920	£87,103
Estimated Income for 1920	£83,660
Estimated Deficit	£3,443

Comparison of Financial Statements of 1918 and 1919.

3. Compositors' wages, machining, etc., increased nearly £4,000; the cost of paper went up about £3,500. Central Staff expenses were increased about £2,000, and the Capitation Grants to Branches increased from £1,861 in 1918 to £3,072 in 1919. Owing to increased Council and Committee activities after the war the cost of the meetings of those bodies increased by about £2,300. Against these increased expenses of roughly £13,000 there was an increase in subscriptions of about £2,000 and an increase from advertisements and sale of the JOURNAL of about £9,000, that is, £11,000 in all; otherwise there would have been a heavy deficit for the year. But even with these increases in income, had it not been for the Government donation of £5,000 in acknowledgement of the Association's expenditure on the Central Medical War Committee the balance in favour of the Association would only have been £204 13s. 2d. instead of £5,204 13s. 2d.

What is the Probable Expenditure for 1920?

4. The Council puts on one side as out of the question the possibility of curtailing the activities of the Association. All experience goes to show that members will continue to expect more work and better work, and this must be paid for. Let each member ask himself what source of expenditure he would suggest should be curtailed. Is it the size or efficiency of the JOURNAL? Everybody would protest against such a step. Is it the medico-political activities? Members have come more and more to depend on the Association as the one body capable of defending their interests and stating their point of view, and any falling off in this work would undoubtedly lead to loss of influence and membership. From all sides comes a demand for the development of the scientific and social side of the

work of the Association, which has for the last six years been largely in abeyance.

5. An examination of the estimate of expenditure and receipts, on page 107 of the SUPPLEMENT of April 24th, 1920, shows that on a conservative estimate almost every item of ordinary Association expenditure may be expected to increase—some of them heavily. There is as yet no prospect of a fall in prices—in fact, everything points to further increases in the cost of nearly everything the Association uses. Paper is now 7½d. a pound as against 1½d. in 1913, and the best judges think the maximum has not yet been reached. The new postage rates will hit the Association hard, and will very materially upset the estimated increase of only £113 in printing, postage, and stationery. There are, in addition, certain new items of expenditure for 1920, all of which have been incurred in direct response to the demands of our members. These are (a) the Scottish Office, with its whole-time Secretary, which will cost over £1,200 a year; (b) the Intelligence Department, costing approximately £700 to £800 a year; (c) the newly-established British Medical Association Lectures, which will cost probably £200 in 1920, a sum which will be increased as the demand for the lectures increases, as it seems likely to do. The increase in expenditure in 1920, estimated in the Annual Report as probably £11,500, may quite easily prove to be £14,000 or £15,000.

What Increases in Revenue may be Expected in 1920?

6. If the subscription be not raised we may fairly expect a net increase of 1,000 members in 1920, which at the present rates of subscription would bring an additional income of about £2,500. The rates for advertisements have recently been increased as far as was thought expedient. The full effect of this increase will not be seen in 1920 owing to the long contracts entered into with some of the advertisers, but it is hoped that the advertisement revenue may increase by nearly £5,500 in 1920. The sales of the JOURNAL and other smaller sources of revenue will, it is estimated, bring another increase of about £1,200. That is to say, that if the subscription be not raised and our anticipations as to the other items are realized we may expect to receive about £9,000 more revenue in 1920 than in 1919.

7. Comparing this with the estimate of expenditure it will be seen that unless we can find some new source of revenue, or can make considerable economies we shall be left at the end of 1921 with an adverse balance of at least £2,500, making no allowance for any further increase of prices that may occur.

Possible Economies.

8. As to possible economies, it is to be noted:

1. (a) During the past year great care has been taken in

fixing the size of the JOURNAL so as to save paper, machining, and postage. By keeping the number of pages as often as possible below 92, about £50 a week is saved in postage alone. (b) The free list of the JOURNAL has been greatly reduced. (c) The address bands used for the JOURNAL have been reduced in size, and this has saved about 100 per cent. in the cost of paper for that purpose. (d) The JOURNALS of members in arrears are now stopped much sooner than before, thus reducing the items of paper, printing, and postage.

II. (a) Free use has been made of duplicating machinery, thus saving a good deal in printing. (b) There will only be one issue of the Handbook for the Cambridge Meeting instead of a daily issue, and this will be a considerable saving. (c) Though the work of the office steadily increases, the number of the staff has increased but slightly, and every effort is made to keep this item of expenditure as low as possible consistent with efficiency.

What is likely to be the Effect of the Increase on the Funds and Membership of the Association?

9. The number of resignations of membership in the last nineteen years is as follows:

1901	344	1911	434
1902	603	1912	715
1903	538*	1913	2,675†
1904	460	1914	2,417
1905	477	1915	934
1906	485	1916	747
1907	1,050†	1917	457
1908	584	1918	251
1909	426	1919	301
1910	411				

* Subscription raised from 21s. to 25s.

† Controversy over application for Charter.

‡ Subscription raised to £2 2s.

It will be seen that, leaving out of account the years 1907 and 1912-15 inclusive, when, in addition to the rise in subscription, other abnormal influences were at work, the average number of resignations was 472. If all the resignations in 1913 above that average were ascribed to the increased subscription (which would not be in accordance with the facts), then it may be said that the last increase cost the Association 2,200 members. The membership of the Association is now well over 22,200; if we assume that 2,200 leave on this occasion we should be left with a membership of 20,000. Allowing 7,000 for oversea members and those who pay a reduced fee as junior members of the profession, the Association would have 13,000 guineas of additional income. A smaller increase would, of course, meet the immediate needs of the case, but the Council considers that the ambition of the Association should be not only to make ends meet, but to have a reserve for any contingency that may arise. Such a reserve would enable the Council to meet, without further increase of subscription, the inevitable demand on the part of members that their Association should undertake fresh duties and develop fresh methods for meeting the changing needs of the medical profession.

British Medical Association.

CURRENT NOTES.

Council Election.

The following have been elected to the Central Council as the result of the voting in the five contested elections of members of Council by the grouped Branches:

Metropolitan Counties Branch: Lord Dawson of Penn, Dr. C. Buttar, Dr. J. A. P. Barnes, and Lieut.-Colonel W. McAdam Eccles.

Cambridge and Huntingdon, Norfolk, Essex, Suffolk, and South Midland Branches: Dr. E. O. Turner (Great Missenden).

Kent, Surrey, and Sussex Branches: Dr. E. R. Fothergill (Hove).

Yorkshire Branch: Dr. A. Forbes (Sheffield).

Aberdeen, Northern Counties, Dundee and Perth Branches: Dr. D. Lawson (Banchory).

Particulars of the voting will be published next week.

Salaries of Medical Officers of Local Authorities.

In December, 1919, a circular letter, of the nature of a reminder, was sent by the British Medical Association to the local authorities throughout the country with regard to raising the salaries of their medical officers. Up to May 20th last 1,478 replies were received. Of these, 690 stated that the salary had been increased by 33½ per cent. or more, 244 that the salary had been increased by less

than 33½ per cent., 67 that the Civil Service bonus (Awards 84 and 101) had been granted; and 130 that no action had been taken. Of the remainder, 277 sent replies not falling under the above four headings, omitting, for instance, to state the exact amount of the salary; and 70 formal acknowledgements were received. In a good number of cases in which the application of the medical officer for the increase had been refused, pressure applied by the head office of the Association has brought about a reversal of the previous decision and an increase has been given. In the course of correspondence it came to light that some local authorities had taken no action on the circular owing to the fact that the medical officers themselves had not made an application. In such case the Authority would have some reason to assume that the medical officer was satisfied with his remuneration. Medical officers who have made no applications and have received no increase in salary may find this worth noting.

Assistants in Panel Practice.

The Insurance Acts Committee on May 27th considered the position brought about under the 1920 Regulations when the names of assistants employed by insurance practitioners are placed upon the Medical List, and the question of insured persons being accepted by assistants and placed upon their lists. The Committee was of opinion that these are not matters to be left to the ordinary professional agreement between principal and assistant, and it was felt that they should be discussed further with representatives of the Ministry of Health, and reported upon to the next meeting of the Committee.

NOTICES OF MOTION AND AMENDMENT BY DIVISIONS FOR THE ANNUAL REPRESENTATIVE MEETING, 1920.

By Bristol Division:

The Profession and its Attitude in Relation to Secret Remedies.

That the recommendation contained in para. 97 of the Annual Report be amended by the substitution of the words "the principal ingredients are not divulged" for the words "he is not aware."

By Mid-Cheshire Division:

Medical Practitioners and the General Medical Council.

That this meeting is of opinion that in the event of a personal complaint from an aggrieved member being received with regard to illegal interference by the General Medical Council, the Council of the Association shall take the matter up vigorously; and failing the receipt of such personal complaint the Council shall press for a decision on the general question of such illegal interference.

By Mid-Staffs Division:

Life Insurance Examinations.

That this meeting does not accept the principle of a modified examination for life insurance, seeing that the responsibility of the medical man in deciding the prospect of life is the same in all cases whatever the amount of the policy, and irrespective of the form or length of the medical report required; and that the fee for all such reports should be one guinea.

By Portsmouth Division:

Recovery of Arrears of Subscription.

That the Council be instructed to consider the advisability of By-law 13 (1) (as recommended in para. 67 of the Annual Report) being further amended so as to provide that in the event of a member's subscription being a year overdue, the Solicitor of the Association be instructed to take action to recover the same.

Professional Secrecy.

That the Representative Body express the opinion that the medical profession should be placed on the same footing as to professional secrecy as clergy, barristers, and solicitors, and that the Association take every means to bring this about (Amendment to Recommendation contained in para. 94 of Annual Report).

By Reigate Division:

Fees for Life Insurance Examinations.

That all insurance fees be increased by 50 per cent. That the fees for all Life Insurance Examinations should be proportional to the sums insured.

By Bournemouth Division:

Fees for Life Insurance Examinations.

That the minimum fee for medical examination for industrial insurance be 7s.

By Lambeth Division :*Payment of Medical Staffs of Hospitals for Pensions Work.*

That for all work for soldiers and sailors, whether discharged or not, for any disease or injuries connected with the war undertaken by Voluntary Hospitals the Medical Staffs should be adequately remunerated. In any case, the remuneration should represent an addition of not less than 25 per cent. to the cost of maintenance of in-patients and not less than 25 per cent. of ascertained cost per patient per attendance for out-patients, the additional sum to be placed at the disposal of the Medical Staff; that in the case of Special Clinics (for example, Aural and Ophthalmic) the fee payable to the medical practitioner should not be less than the fee payable by the Ministry of Pensions for identical or similar services, namely, £2 2s. per session.

By Glasgow Southern Division :*Payment of Medical Staffs of Hospitals for Pensions Work.*

That in view of the fact that the word "maintenance," as used in connexion with the treatment of in-patients, usually excludes the cost of drugs, dressings, nurses' salaries, etc., the words "and treatment (exclusive of medical salaries)" be inserted after the word "maintenance," and that the same principle be observed in calculating the cost of out-patient attendance.

By Exeter Division :*Proposed Increase of Subscription.*

That the subscription to the Association be increased to 2½ guineas.

Treatment of School Children and Maternity and Child Welfare Centre Fees.

That para. 106 (i) of the Annual Report of Council be amended to provide that a fee of one guinea be chargeable where the session or time involved is one hour or less.

By Southport Division :*Fees for Life Insurance Examinations.*

That the fee for medical examinations for policies of £100 in Intermediate Offices be £1 1s.

Fees for Medical Practitioners called in on the advice of Midwives.

That in cases where a practitioner is called in by a midwife the onus of payment should lie with the local health authority.

By West Suffolk Division :*Motor Car Tax.*

That the British Medical Association request the Government to provide that in the case of medical men who keep two motor cars tax should be paid on one car only, provided that an undertaking be given that only one car be used at any one time.

Arrears of Subscription.

That the Council be instructed to consider the advisability of members, whose subscription for any year is not paid, being given four weeks' notice that if their subscription for that year is not paid on or before December 31st of that year they will cease to be members of the Association.

Minimum Salaries for Public Appointments.

That part time medical officers of health be paid on the basis of area and population involved, and not by time, as suggested by Council. (Para. 108 of Annual Report.)

By Perth Division-Branch :*Motor Car Tax.*

That this meeting desires the tax on motors to be adjusted in the same manner as at present—namely, not more than 50 per cent. of the usual tax to be charged from doctors.

By West Herts Division :*Hospital Staffs and Coroners' Law.*

That the Association press upon the members of the House of Commons Medical Committee the injustice of the present state of the law which precludes the payment to the honorary medical staffs of hospitals of fees for giving evidence at inquests and making *post-mortem* examinations by order of the coroner on persons who are brought in dead or who die in hospital, and that they urge them to do their best to get the law amended. (Para. 135 of Annual Report.)

By Cardiff Division :*Motor Car Tax.*

That in the opinion of this meeting the fairest way to tax motor locomotion is by a tax on motor spirit.

That this meeting protests against the proposal to tax medical men on an additional car where more than one car is kept for purely professional purposes.

Payment of Medical Profession.

That the attention of the Annual Representative Meeting be directed to the fact that the 11s. per capita under the

National Health Insurance Acts brings the profession little more than the amount received when the profession received 7s. plus fees, for attending invalided sailors, soldiers, and marines.

By South Staffs Division :*Treatment of School Children and Maternity and Child Welfare Centre Fees.*

That "two guineas" be substituted for "one and a half guineas" (in connexion with para. 106 (iii) of the Annual Report).

By Mid-Cheshire Division :*Hospital Staffs and Coroners' Law.*

That the injustice, under which the honorary staffs of the hospitals are compelled to make *post-mortem* examinations, and give evidence in the coroner's courts without any fee, should be remedied by an alteration of the Coroners' Act, and that in any alteration of the Coroners' Act the Council be instructed to make representations that the fees for *post-mortem* examinations and evidence should be reconsidered, as at present they are entirely inadequate.

By Cleveland Division :*Supply of Motor Spirit.*

That the Council be instructed to approach the wholesale distributors of motor spirit with a view to securing that medical practitioners be supplied with motor spirit at the same rate as that charged to traders.

By Guildford Division :*Medical Certificate of Inability to Attend School.*

That where an Elementary School Authority requires a medical certificate of the inability of a child to attend school, the fee for such certificate shall be paid by the Education Authority.

Association Notices.**REPRESENTATIVE MEETING.****DATE.**

THE Annual Representative Meeting at Cambridge will begin on Friday, June 25th, at 10 a.m.

NOTICES OF MOTION AND AMENDMENT.

Notices of Motion and Amendment by Divisions and Branches for consideration by the Annual Representative Meeting will be published in the SUPPLEMENT as they are received, but none can be published later than June 12th, for which purpose they must be received by the Medical Secretary not later than the first post on Monday, June 7th.

It will be possible, however, to include in the Agenda for the Annual Representative Meeting all Notices of Motion and Amendment which are received by the Medical Secretary not later than the first post on Monday, June 14th.

CHANGES OF AREAS.**PROPOSED AMALGAMATION OF DOVER AND FOLKESTONE DIVISIONS.**

NOTICE is hereby given to all concerned of a proposal made by the Kent Branch for amalgamation of the Dover and Folkestone Divisions of the Branch, the new Division to be known as "the Dover and Folkestone Division."

The matter will be determined in due course by the Council. Any member affected by the proposed change and objecting thereto is requested to write, giving reasons therefor, to the Medical Secretary, 429, Strand, W.C.2, not later than July 5th, 1920.

SUGGESTED CHANGES OF AREAS.**PROPOSED ADJUSTMENT OF AREAS OF ROTHERHAM AND SHEFFIELD DIVISIONS.**

NOTICE is hereby given to all concerned of a proposal made by the Rotherham and Sheffield Divisions to adjust the common boundary of the two Divisions so as to include within the area of the Rotherham Division the following townships: Rawmarsh, Parkgate, Wentworth, Thrybergh, Goldthorpe, Kimberworth, Maltby, Templeborough, Dinnington, Thorpe Hesley, Whinney Hill, Kilnburst, Greasboro', Bramley, Wath, Laughton, and Wickersley.

The matter will be determined in due course by the Council. Any member affected by the proposed change and objecting thereto is requested to write, giving reasons therefor, to the Medical Secretary, 429, Strand, London, W.C.2, not later than July 5th, 1920.

BRANCH AND DIVISION MEETINGS TO BE HELD.

BORDER COUNTIES BRANCH.—The annual general meeting of the Branch will be held at the County Hotel, Carlisle, on Friday, June 18th, at 4.15 p.m. Business: (1) Election of officers; (2) Report of Branch Council; (3) Ethical Rules; (4) Presidential address by Dr. G. R. Livingstone, Dumfries.

EDINBURGH BRANCH.—The annual meeting of the Edinburgh Branch will be held in the Hall of the Royal College of Surgeons, Nicolson Street, on Friday, June 18th, at 4 p.m. Tea will be served at 3.45 p.m. Business:

Report of Branch Council. Treasurer's financial statement. Election of office-bearers for 1920-21. Election to annual vacancy on the Board of Management of the Queen Mary Nursing Home. Proceedings of Scottish Committee: (1) Proposed alteration of reference to Committee increasing its powers; (2) proposed reconstitution of Committee. (3) Annual Report of Council and Annual Representative Meeting.

KENT BRANCH.—The seventh annual meeting of the Kent Branch will be held at the Cliftonville Hotel, Margate, on Saturday, June 12th, at 2 p.m. Agenda: Receive (1) report of election of officers for 1920-21, (2) annual report and financial statement; appoint auditors; other business. The President-elect, Mr. W. G. Sutcliffe, O.B.E., F.R.C.S., kindly invites members to lunch at the Cliftonville Hotel at 1 p.m. The annual meeting will be held at 2 p.m., after which the President will give his inaugural address. A visit will subsequently be made to the Royal School for Deaf and Dumb Children, where tea will be provided. No dinner will be held, but there will be an opportunity to visit the various attractions in the town. Members intending to be present at the lunch are asked to notify Dr. H. M. Raven, Broadstairs, not later than June 8th.

LANCASHIRE AND CHESHIRE BRANCH.—The eighty-fourth annual meeting of the Branch will be held at the Prince of Wales Hotel, Southport, on Wednesday, June 9th. 12.30 p.m., luncheon (at the invitation of the Southport Division); 1.30 p.m., Branch Council meeting; 1.45 p.m., meeting. Presidential address by Dr. F. J. Baildon, entitled "The Status of the Medical Profession." After the transaction of business, communications will be made by: Dr. William Wilson, on national control of suppurative otitis media; Dr. J. C. Matthews, treatment of diabetes; Mr. Newbolt, complications of suprapubic prostatectomy; Dr. Robert Buchanan and Mr. Arthur Evans, diaphragmatic hernia of stomach; Mr. John Morley and Dr. J. M. Woodburn Morison, diagnosis and operative treatment of cancer of stomach; Dr. Walter C. Oram will give a demonstration of radiograms illustrating diseases of the stomach. 3.45 to 7 p.m., visits and excursions; 7.30 p.m., dinner at Prince of Wales Hotel (tickets, not including wines, 10s. 6d. each; morning dress).

METROPOLITAN COUNTIES BRANCH.—Mr. N. Bishop Harman and Dr. J. A. Percival Barnes (Honorary Secretaries) give notice that the annual general meeting of the Branch will be held at 429, Strand, W.C.2, on Friday, June 18th, at 4.30 p.m. Business: (1) Report of scrutineers as to the election of new officers. (2) Annual report of Council. (3) President's Address, by Dr. E. W. Goodall, O.B.E.

METROPOLITAN COUNTIES BRANCH: WILLESDEN DIVISION.—A meeting of the Division will be held at the Willesden Municipal Hospital, Brentfield Road (Dog Lane), on Friday, June 11th, at 3.30 p.m. The Health Committee of the Council has kindly thrown open the hospital for inspection, and will provide tea.

NORTH LANCASHIRE AND SOUTH WESTMORLAND BRANCH.—Dr. J. Livingstone, Honorary Secretary, gives notice that the annual meeting of the Branch will be held on Wednesday, June 9th, at 3.15 p.m., in the Furness Abbey Hotel, Barrow. Business: Report of Council. Election of officers. President's address, by Dr. A. F. Rutherford: "Experiences of an ambulance train commander." The President invites members to tea.

NORTHERN COUNTIES OF SCOTLAND BRANCH.—Dr. Munro Moir, Honorary Secretary (18, Ness Bank, Inverness), gives notice that the annual meeting of the Branch will be held in the Station Hotel, Elgin, on Saturday, June 12th, at 12.15 p.m. The Aberdeen, Banff, and Kincardine Branch will also meet there on the same day, and the members of the two Branches will have luncheon together after the business meetings.

SOUTH MIDLAND BRANCH: BEDFORDSHIRE DIVISION.—Dr. E. R. Fasnacht, Honorary Secretary (116, Hurst Grove, Bedford), gives notice that the annual meeting of the Division will be held on Thursday, June 17th, at 3 p.m., at the Swan Hotel, Bedford. Agenda: Receive the Annual Report. Election of Officers and Representatives. Mr. Victor Bonney, F.R.C.S., will read a paper on "Modern methods in the treatment of difficult labour." The chairman, Dr. W. G. Nash, invites the members of the Division to luncheon at the Swan Hotel, Bedford, at 1.30 p.m. Members who wish to accept Dr. Nash's invitation are asked to intimate their intention not later than Thursday, June 10th.

SOUTH WALES AND MONMOUTHSHIRE BRANCH.—The fiftieth annual meeting of the South Wales and Monmouthshire Branch will be held at the Y.M.C.A., Cardiff, on Thursday, June 10th, at 3.30 p.m. Mr. W. J. Greer, F.R.C.S., will give his Presidential address on "The first minute book of the Branch."

SUSSEX BRANCH.—A meeting of the Sussex Branch will be held at the Everstie'd Hotel, St. Leonards-on-Sea, on Tuesday, June 15th, at 4.45 p.m., when a British Medical Association

Lecture will be delivered by Dr. W. Langdon Brown, F.R.C.P., Physician to St. Bartholomew's Hospital, on "Diabetes in relation to the ductless glands." All members of the profession in Hastings and St. Leonards and members of the Sussex, Kent, and Surrey Branches of the Association are invited.

Meetings of Branches and Divisions.

LANCASHIRE AND CHESHIRE BRANCH: ST. HELENS DIVISION. The annual meeting of the St. Helens Division was held on May 11th.

The following officers were elected:

Chairman: Dr. C. H. Wild. Vice-Chairman: Dr. J. H. Dow. Honorary Secretary and Treasurer: Dr. F. J. Knowles. Representative in Representative Body (conjoined with Warrington): Dr. F. P. Bassett.

It was resolved:

That the best thanks of this Division be accorded to the Insurance Acts Committee and the officials of the British Medical Association for their strenuous work in connexion with the 1920 Insurance Act, and that they be congratulated on the satisfactory results attained.

The annual report of Council, 1919-20, was discussed and the Divisional Representative instructed thereon. The suggested increase of the members' annual subscription to £3 3s. received full support.

It was agreed that a local scheme for the transfer of practices could, and would, be formulated, as suggested in M. 21, 1919-20, which would meet the difficulties presented in the matter.

With regard to the right of appeal of practitioners to the High Courts (National Insurance Act, 1920) it was decided that the unanimous support of the Division should be given to the British Medical Association in dealing with this proposal in every way, and the Honorary Secretary was instructed to keep in touch with the local members of Parliament and endeavour to secure their interest and aid.

It was arranged that the annual conjoint meeting of the St. Helens and Warrington Divisions should be held on May 20th at the Town Hall, Earlestown.

LANCASHIRE AND CHESHIRE BRANCH: WARRINGTON DIVISION. The annual meeting of the Division was held on May 11th, when Dr. FERGUSON was in the chair.

The following officers were elected:

Chairman: Dr. Ferguson. Vice-Chairman: Dr. Naden. Representative on Branch Council: Dr. Bowden. Honorary Secretary and Treasurer: Dr. T. A. Murray.

Some discussion (preparatory to the joint meeting with St. Helens) in the report of Council took place. During the war, and since, the members of the Division living in the Widnes portion of the area have been unable to attend meetings owing to the train service being very much reduced.

SOUTH-WESTERN BRANCH: PLYMOUTH DIVISION.

At a meeting of the Plymouth Division, held on May 15th, the following business was transacted:

Dr. S. Noy Scott was appointed Representative in the Representative Body.

It was suggested that the annual subscription should be 2½ guineas rather than £3 3s. The report of Council on fees for examination for life insurance and fees for medical men called to aid of midwives was approved. The question of federation or affiliation was discussed, and it was resolved that the decision of the Annual Representative Meeting be accepted.

The Honorary Secretary was instructed to write to the three members of Parliament for Plymouth asking them to support the amendment of Captain Elliot regarding practitioners' right of appeal to the High Court of Justice. It was resolved that the annual payment for non-insured members of friendly societies be all raised to that paid for insured members. Cases were quoted in which some local districts had willingly agreed to pay 15s. and 13s. 6d. plus mileage in addition, per member.

The Honorary Secretary was instructed to write to the Town Council of Plymouth, expressing astonishment at the inadequate fee offered by them for the services of a temporary part-time school medical officer, which was at the rate of £32 per annum for each weekly session of two hours; and to point out that the meeting considered that no less than £2 2s. per session of two hours should be offered.

WILTSHIRE BRANCH.

A MEETING of the Wiltshire Branch was held on May 26th.

On the question of club fees the following amounts of remuneration were agreed upon:

Adults: 11s. and 2s. Drugs. Mileage 1s. per mile over two miles one way per visit, to be paid by patient at the time. Old age pensioners and necessitous persons (according to the opinion of the medical practitioner): 10s. inclusive of drugs and mileage. Children, at a flat rate (each child counting): 6s. inclusive of drugs; mileage same as for adults.

Dr. C. E. S. Flemming was reappointed the Representative of the Salisbury, Swindon, and Trowbridge constituency in the Representative Body.

GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION.

SUMMER SESSION, 1920.

Tuesday, June 1st, 1920.

Sir DONALD MACALISTER, K.C.B., President,
in the Chair.

THE one hundred and eleventh session of the General Council of Medical Education and Registration was opened on June 1st, at 2 p.m.

PRESIDENT'S ADDRESS.

Sir DONALD MACALISTER said:

Never before, I think, has the President had to record the retirement of so many as nine members of the Council in one year. Four, as I mentioned last November, left us after the summer session. I intimated also that two much-valued members, Dr. Langley Browne and Dr. Latimer, having decided not to stand for re-election, would retire at the end of 1919. To their names three others have now to be added. Dr. David N. Knox, of the Glasgow Royal Faculty, after more than ten years of loyal and effective service, resigns office on the ground, I regret to say, of his need for rest in order to the recovery of his health. Sir Bertram Windle has at different times represented two universities on the Council. His experience as an administrator enabled him to give valuable aid on more than one important committee, while his terse and incisive speech often gave point to our debates and clearness to our decisions. He has now been called to a responsible post in Canada. His letter of resignation contains expressions of regard for his colleagues of the Council and of regret for his severance from them, which will be echoed in this chamber. Sir Charles Tomes, our Treasurer since 1904, and our chief counsellor in matters of dental administration, retires from his place as a Crown Member, on the completion of an exceptionally prolonged term of twenty-two years. Members of the Executive, Finance, and Dental Committees know best the prudence, devotion, and goodwill which he brought to bear upon their work; but all of us must be aware of the debt the Council owes him for his wise management of its property and funds, and for the secure financial position to which he has guided it through difficult times. His colleagues of the Executive deemed it a privilege to entertain him at a complimentary dinner last February, and to express to him on behalf of the whole Council their grateful acknowledgements and good wishes on his retirement. Sir Almeric Fitzroy was present as Clerk to the Privy Council, and cordially joined in thanking Sir Charles for the manner in which he had fulfilled his commission from the Lord President.

New Members.

We have, however, to welcome the coming as well as to speed the parting guests, and in your name I offer a cordial greeting to the new members who join us at this time. The Royal Faculty sends us its ex-President, Dr. James A. Adams, long and honourably known as a surgeon and a surgical teacher in the Glasgow School of Medicine. Dr. R. A. Bolam, of Newcastle, and Mr. E. B. Turner, of London, have been elected by the practitioners of England and Wales to serve with our colleagues, Sir Jenner Verrall and Dr. Macdonald, as Direct Representatives. By their manifold activities on behalf of the profession in its public relations they have won for themselves the position of trusted leaders and advisers. They have wide knowledge of medical opinion and aspiration, and we shall count on profiting by it in our future deliberations.

The Crown has appointed Mr. Norman G. Bennett, M.A., M.B., and L.D.S., in place of Sir Charles Tomes. He has filled with conspicuous ability important offices in the British Dental Association and at the Royal Dental Hospital. As he is fully conversant with the questions that under impending legislation will have to be faced by the Council and by the dental profession, his accession to our body is timely and helpful. It gives me special pleasure to greet him as an old pupil of St. John's College, Cambridge.

Honours.

His Majesty has been graciously pleased to confer honours on several of our members, for services within

and without the Council. The Knight-Commandership of the Order of the British Empire has been bestowed on Sir James Hodsdon, C.B.E., and the Commandership on Colonel Waring, Dr. Caton, and Dr. Langley Browne. Mr. Cockington also, our Assistant Secretary, in merited recognition of the public work for the medical services done by him when he was Acting Registrar, during Colonel King's absence on military duty, has been appointed Officer of the same Order. Mr. Harold Griffiths, one of the Registrar's staff, has returned with the rank of sergeant, after serving for four years in Great Britain, Syria, and Egypt.

Ministry of Health.

Under the Ministries of Health Acts, Consultative Councils, for the purpose of advising the respective Ministers in regard to medical and allied public services, have been constituted in the three kingdoms, and are already at work. To all of them members of this Council have been appointed, and it will thereby be kept in touch with their activities. A number of draft and other Orders in Council under the Acts have been transmitted for its consideration to the Executive Committee; but so far none of these have dealt with questions other than administrative and formal. On May 17th, however, an Order in Council was issued, which gives effect to a suggestion of the Anatomy Acts Committee forwarded by the Executive Committee, and providing for the transfer to the Minister of Health of the duties performed in England and Wales by the Home Secretary in relation to the Anatomy Acts. It is confidently hoped that the new arrangement will lead to much-needed improvements in the provision made for the practical teaching of anatomy and surgery.

Nurses Registration.

Acting on your instructions, I was enabled by the courtesy of the Lord President to call the attention of the English Minister of Health to an apparent omission from the Nurses Registration Bill introduced by him. No provision was made, as in the Midwives Acts, for communicating the Rules framed by the General Nursing Council to the Executive Committee before approval by the Minister. Dr. Addison considered the point, but decided that such a provision was in this case unnecessary, as the rules in question, unlike those of the Central Midwives Board, do not purport to "regulate the practice" of nurses, but deal mainly with details of administration. Moreover, such rules have, unlike those for midwives, to be laid before Parliament prior to approval. The Minister accordingly did not favour any amendment of the bill in the sense suggested, and the Lord President concurred in his view. The point will, however, have to be kept in mind, should it hereafter be proposed to make rules, under statutory authority, for "regulating the practice" of nurses in surgical and medical cases, as that of midwives is regulated in obstetrical cases. Sir Jenner Verrall has been appointed a member of the General Nursing Council for England, and will no doubt keep us informed on the subject.

Date of Election of Direct Representatives.

The Right Hon. Sir Henry Craik, K.C.B., one of the members of Parliament for the Scottish Universities, has, with the approval of the Privy Council Office, reintroduced Lord Morley's Bill of 1912 for the purpose of extending the time allowed for proceedings in preparation for the election of direct representatives, and of providing that in general such elections shall fall to be held simultaneously. Should the measure pass into law considerable economies on the part of the branch councils and of candidates will be effected, and the convenience of the electors will be better served.

Proposed Amendment of Dentists Act.

The promised legislation for the amendment of the Dentists Act has not yet been initiated in Parliament, though it is stated officially that draft bills are soon to be introduced. It appears that one bill, made on behalf of the Privy Council, will be required to deal with dental registration, inasmuch as registration is common to the whole United Kingdom, and in a sense to the Dominions also; and that other measures, promoted by the several Ministries of Health, will be necessary to give effect, in their respective divisions of the kingdom, to such proposals for the improvement of dental service in relation to

the health of the people as are set forth in the Report of the Departmental Committee on Dental Practice. The Council has already considered these proposals and expressed its opinion of them in detail. It will be necessary to instruct either the Executive Committee, or a special committee appointed for the purpose, to watch the progress of legislation during the summer, and to take such steps as may be required to ensure that due account is taken of your conclusions.

Dangerous Drugs Bill.

The Home Secretary has brought up in the House of Commons a Dangerous Drugs Bill, intended to give effect to the International Opium Convention signed at The Hague in 1912. By the Treaty of Versailles this country bound itself to bring the Convention into force within twelve months. The bill imposes restrictions on the import, export, manufacture, and sale of opium, cocaine, etc., with the object of preventing dangerous abuse of these drugs in this country and abroad. Among other things it gives power to the Government to make regulations for the issue by medical practitioners of prescriptions containing any such drug, and for the dispensing of such prescriptions. During the war similar regulations were in operation, with the general approval of the profession. The question of their continuance has now assumed an international aspect. The profession, which best knows the nature and extent of the evil, will probably be the first to welcome wisely devised measures for checking it, even if these embody some restrictions upon professional freedom.

Standards for Drugs not Amenable to Ordinary Assay.

While the *British Pharmacopoeia*, 1914, was in preparation, the Pharmacopoeia Committee empowered me to approach the Government with the suggestion that a public national institute should be established for the purpose of testing and fixing standards in the case of therapeutic serums, vaccines, and other substances used in medicine and sold to the public, for which the ordinary methods of assay employed in the *Pharmacopoeia* were inapplicable. It was deemed at the time impracticable, without such official endorsement as a public institute might provide, to lay down "biological" or "physiological" tests in the *Pharmacopoeia* in addition to those which might be carried out by pharmacists and analysts under ordinary conditions. On inquiry in 1910 and 1911, it was ascertained that the Government departments concerned were not prepared to assume the financial and other responsibilities proposed. The Minister of Health has now, however, appointed a committee, under the guidance of Sir Mackenzie D. Chalmers, K.C.B., as chairman, to advise on the measures to be taken for the effective official control of the therapeutic substances in question. Last week I was called, as chairman of the Pharmacopoeia Committee, to give evidence on the subject before this committee. I explained the views held by us, and commended to the Government the provisions of the United States laws and regulations as a suitable model for this country in the matter. The *U.S. Pharmacopoeia*, 1916, with whose compilers we were in constant correspondence during its preparation, had been enabled, by the establishment of institutes authorized by the public health service, to include characters and tests for serums, vaccines, etc., which correspond to officially controlled standards.

The Number of Names on the Registers.

The new *Medical Register* confirms the forecast on which I ventured in November. On the Home List only 872 practitioners were registered in 1919, but no fewer than 450 were registered in the Colonial and Foreign Lists. The result is that the total number (1,322) of new names is higher than in any year since 1915.

The proportion of women practitioners increases, and is likely to increase rapidly during the next year or two. I learn, however, on good authority that their services are in less demand than during the war, and that newly-qualified women are finding difficulty in obtaining suitable opportunities for professional work. Supply and demand will no doubt adjust themselves in time; but, in view of the large entry of women students, it is proper to warn those concerned that, in the meantime, individual disappointments may be encountered. The women students

who are now well advanced in their curriculum may not all at once find openings for practice after attaining to qualification. The profession of medicine is, in regard to women, affected like other occupations by the return to civil life of large numbers of ex-service men as students and practitioners. To these men the country owes special consideration, and they ought to receive it. But inevitably they tend to displace a proportion of the women who so capably carried on the work of the profession during their absence abroad.

The *Medical Students Register* indicates that the depletion of our professional ranks by the wastage of the war will in a few years be much more than made good by the addition of newly qualified men. No fewer than 3,420 medical students (men and women) were registered in 1919, as compared with 1,600 in 1914. The number of registrations, indeed, exceed by over 1,000 the highest previously recorded—namely, in 1891, when for special reasons the number rose to 2,405. The sudden increase cannot at once be met by a corresponding expansion of our educational resources, and the strain thrown upon the medical schools of the country is therefore, for the time, excessive. There is reason to think that most of the schools would welcome an ebb in the tide of applicants for admission, until it is seen that the profession can absorb the large numbers aspiring to enter it, and until more adequate provision is made for their effective instruction and training. In the departments of anatomy and operative surgery, of midwifery, and of clinical medicine, the existing provision is no longer fully adequate to the new demands.

The *Dentists Register* is stationary. The figures for the last three years are respectively 130 (1917), 131 (1918), 128 (1919). But there is an assured prospect of an advance by the end of 1922, for the number of dental students entered on the *Register* in 1919 has risen to 612, as compared with 294 in 1914.

In order more clearly to mark the sources of supply, an improvement has been made in the *Medical and Dentists Registers*, whereby the numbers of practitioners added respectively to the Home, Colonial, and Foreign Lists are set forth in separate tables.

Inspection of Examinations.

The cycle of inspections of qualifying examinations, ordered by the Council, has been begun. Some of the reports have been already received, and will be considered by the proper committees during this session. For the public health examinations we have been fortunate to secure the services, as our inspector, of Dr. Robert Bruce Low, C.B., lately assistant medical officer of the English Local Government Board. For the final examinations for medical degrees and diplomas our inspectors are Dr. Howard H. Tooth, C.B., C.M.G., in Medicine; Sir Hector C. Cameron, C.B.E., in Surgery; and Sir William J. Smyly, in Midwifery. Members of the Council have also been good enough to act as visitors at one or more examinations, and as provided in the Standing Orders they will present their separate reports to the committees concerned. It is probable that these committees may think it desirable to postpone the presentation of full reports on the results of inspection and visitation until a number of the documents, sufficient for purposes of comparison, are in their hands. Meanwhile confidential copies of the inspectors' reports will be circulated, as soon as they are ready, to members of the Council for their information. In this way all members will have been placed in possession of the materials on which the committees' reports are based by the time that these are submitted for general discussion by the Council.

Medical Education and Examination.

The Education Committee will have reports to bring up on certain important subjects remitted to it. These include—the question of instruction in medical ethics and the relations of practitioners to the State, the teaching of practical midwifery, and the place assigned to the preventive aspects of medicine in the curriculum of professional study. The latter report must raise large questions, which affect every part of the curriculum. The indications are that, by general consent, the time is approaching for some "reconstruction" in respect of the extent and content of the several stages and departments of the five years' medical course. Many valuable memoranda on the subjects have been received from teaching

and qualifying bodies. When to these are added the reports on the inspection and visitation of examinations, the Council will have ample materials both for a survey of existing conditions and for a reconsideration of its own standing resolutions on professional education and examination.

The Examination Committee will submit analyses of the annual tables furnished by the licensing bodies. These latter, in order to save the heavy cost of printing, I have referred directly to the Committee. It may be that you will find the analyses sufficient for insertion in the Minutes, the actual returns being kept in the archives for the use of members and others who desire to refer to them. The Committee will also report on the practice of the licensing bodies in respect of teaching and examination in ophthalmology, with reference to the Council's resolution of last year.

Finance.

The Council's finances are in a better state than we had reason to expect. The treasurers were able to report for 1919 a surplus of income over expenditure of £874, due on the one hand to the increased return from registrations on the Colonial List and from the advantageous sale of property in Haover Square, and, on the other, to careful control of expenses, including those attending the recent elections. Expenses, however, in spite of the best of management, cannot fail to grow in these times. The exceptional charges due to the cycle of inspections will fall to be met in this and the succeeding year, and the expected dental legislation is certain to involve us in heavier administrative expenditure. For these reasons the treasurers, with the support of the Council and the co-operation of the staff, will still have to exercise the care and prudence in the management of our resources which were so constantly applied to it by Sir Charles Tomes.

Penal Business.

There is little business of a penal kind for this session, the cases for inquiry having for the most part been the subject of investigation by other tribunals. Thus, though very important educational and other matters will be brought up for your consideration, and must be properly and fully discussed, the whole sitting need not be a long one.

IRISH DISPENSARY DOCTORS AND THE PROPOSED NEW MOTOR TAXES.

We have received from Dr. C. H. Foley (Ardrahan, co. Galway) the following communication on the subject of the proposed new taxation of motor cars as this affects Irish dispensary practitioners:

Through your columns we would beg to draw the attention of Irish dispensary doctors to the fact that, as most of them, owing to the nature of their districts, use Ford cars and cars of high horse-power, the proposed taxation of £1 per horse-power will hit them too heavily. In some backward districts where hiring is not certain to be obtained, and where there are no facilities for repairs, some doctors have two Fords, a second car, or a motor cycle, the object being to have one always fit for the road, owing to the difficulty and delay in getting repairs effected; the proposed tax in such circumstances is a great injustice. For be it known that, owing to the increased cost of living, it is only by a speeding up unknown to a previous generation of medical men that a dispensary doctor in a large rural district can escape from being forced to a whole-time attention to dispensary work.

In asking for signatures to a protest against this tax being imposed on us, we do so for the following reasons:

1. Guardians are not taxed for motor ambulances; then the cars of dispensary doctors doing the same class of work as the ambulances should also be exempt.
2. The present average dispensary salary is, in gross income, £200; when to the new tax is added the cost of petrol and tyres and running repairs, the actual out-of-pocket expense to be incurred is really prohibitive.
3. It is anticipated, by the protest of English motorists against the new tax, that though the present tax of 6d. (and 1d. for collection) on petrol will be removed, the Oil Trusts will, according to their custom and owing to the cry raised about petrol scarcity, advance the price of petrol.
4. We point out that we consider it is no longer just that we should be forced to accept two standards as governing our salaries—namely, both by the Treasury and boards of guardians (to the latter there are some splendid exceptions), we must still accept as equitable and just the salary paid us in 1902 or in the

year known as the standard year. This is standard one. Both by the Treasury and boards of guardians it is not recognized that this standard salary if just and equitable in 1902 is no longer so, owing to the new standard in the cost of living created by the war, a standard met by a rise of wages in all spheres of labour and service. The Treasury, which under the Medical Charities Acts pays half the dispensary doctors' salary, still pays only the half of that salary as it stood in the standard year 1902. That payment averaged £60 to £70 per annum, but now it is proposed in new taxation to demand back from each dispensary doctor in difficult poor districts £20 to £44 of that grant, leaving the gross salary at the same standard.

5. In very many cases the gross salary is to-day the same as in 1898. In others—as to some of the undersigned—it is but £50 more; and boards of guardians have refused to make increases, though recognizing that the war standard now stands according to the Food Controller at 146 per cent. higher for cost of living than in the pre-war year. In other cases, owing to a higher intelligence, boards of guardians have increased, in 1919 and 1920, dispensary doctors' salaries by 50 per cent.

6. We ask whether it is just that the Treasury and Irish boards of guardians should maintain a medical service under two standards—a 1898 standard of salary and a 1920 standard cost of living—and force us to pay this new tax for the privilege of earning a salary not including expenses, based on the 1898 standard.

7. We point out that it is impossible to envisage this proposed tax except in the way we do, placing it in its proper position, towards our average salaries on the one side, and our work and expenses on the other.

8. The action of boards of guardians in refusing just claims for increase of salaries has placed on dispensary doctors an unjust burden, forcing them to make up the loss on dispensary work by recouping themselves at the expense of their private patients. In the present instance the putting of this tax on the doctors who cannot recover any of it on fixed salaries would mean another system of indirect taxation of the people.

9. We point out that while the Treasury keep their recompt fixed on the standard year of 1902, our working expenses should also be kept on the same standard year, and that the net income of 1898 in its cost of living value free of tax should be the equitable standard for us as public servants in 1920.

10. We protest against being taxed for services under the Medical Charities Act as long as the net income received for these services does not amount to the minimum income tax figure.

11. We claim that as dispensary doctors all our expenses in working the Medical Charities Act should be paid, half by the Treasury and half by the guardians, and a new standard net income salary based on the quality of our work fixed, as the present gross income is misleading. Or until such is done we should be allowed on taxes on motors in our possession; half the total assessment relief in respect of the Medical Charities Act, of the tax remaining. We who are not and cannot be whole-time private practitioners should be granted in common with whole-time private medical practitioners and veterinary surgeons a similar concession to that granted them.

12. At present we are the only public officials, not alone not granted travelling expenses, but subject to such travelling expenses and costs (which can be vouched for by each doctor's records) as fully fulfils that purpose of gross income to successfully hide from the public view and from that of recently qualified men the amount of net income thought equitable and just payment to trained medical men. Because of this cheapness the medical service is decried, and its individual units classed as they appear in those vehicles for conveying ideas to the general public—"The Irish Novel of the National Idea," by such writers as G. A. Birmingham, and in a still more recent work by E. E. Lysaght.

13. Against this unfair lampooning, against the cheapness, against this injustice, Irish medical leaders have striven and will strive, but the conditions are largely due to the apathy of the dispensary medical men themselves. Can they look to metropolitan medical men whose income arises from discontent with a local medical man who is denied those means of keeping abreast of medical progress by the very cheapness of his wage—less than a labourer's? Can they look to farmers' associations now forming a trade union so well represented on the various boards? Can they look to the friendly societies under the Insurance Act? Can they look to the Treasury with its standard year of 1902? Will they look to themselves?

Names of protesters should be sent to:

- C. H. FOLEY,
Ardrahan, co. Galway (Connaught).
- P. STEPHENSON,
Carrick-on-Suir, co. Tipperary (Munster).
- W. W. MURPHY,
Coolgreany, Inch, co. Wexford (Leinster).
- W. LYLE,
Stewartstown, co. Tyrone (Ulster).

CORRESPONDENCE.
Taxation of Motor Cars.

SIR.—The Chancellor of the Exchequer has definitely refused to grant any concessions to medical men in his new motor taxation measure.

Those of us who are engaged in panel practice, especially those in country districts, have a very legitimate grievance,

in that we have to use our cars for Government work and are to be made to pay a heavy tax for doing so.

Surely this is a proper time for us to make a definite stand and say to the Government, "Unless you give us the old concessions we shall refuse to carry on your National Health schemes."

Because the Government have defeated us in our legitimate request for a fair capitation fee for panel work, that is no reason why we should meekly accept every attempt to put us under their heel.—I am, etc.,

GEO. SMITH SOWDEN, M.A., M.B.

Kirkly Stephen, May 30th.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty:—
Surgeon Commanders F. Cook to the *Adamant*, J. St. J. Murphy and J. H. Lightfoot to the *Thunderer*. Surgeon Lieutenant Commander J. A. O'Flynn to the *Coventry*. Surgeon Lieutenant (temporary) A. Craig to the *Warspite* for dental duties in squadron.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Major and Brevet Lieut.-Colonel F. J. Brown, Reserve of Officers, and Major E. V. Ayles, D.S.O., relinquish the temporary rank of Lieutenant-Colonel.

The following relinquish the acting rank of Lieutenant-Colonel: Majors (Brevet Lieut.-Colonel) T. S. Coates, O.B.E. (February 17th, 1919), Norman E. Dunkerton (May 7th, 1919), (Brevet Lieut.-Colonel) H. V. Bagshawe, C.B.E., D.S.O. (February 3rd, 1920). Temporary Major J. J. Abraham, D.S.O.

Captain T. J. Hallinan is seconded for service under the civil administration of Mesopotamia, April 1st, 1920 (substituted for notification in the *London Gazette*, July 1st, 1919).

British Medical Association.

CURRENT NOTES.

Hospitals and Pension Work.

As a result of a conference between representatives of the British Hospitals Association and the Hospitals Committee, an agreement has been arrived at whereby the British Hospitals Association is to recommend to the governing bodies of voluntary hospitals, and the British Medical Association is to recommend to the medical staffs of voluntary hospitals, that payment to the medical staffs of these institutions for the treatment of discharged disabled soldiers and sailors should represent one-fifth of the total gross amount received by the hospital from the Ministry of Pensions. Although experience may show that a flat rate is not the most desirable method of payment for such services, the Hospitals Committee feels that this method should be adopted for a period, as it is eminently desirable that the principle of paying the medical staffs of voluntary hospitals should be firmly established in view of the probable extension of such work in connexion with the treatment of other patients for whom the State or some local authority is responsible.

Dr. Brackenbury as a Parliamentary Candidate.

The medical profession will be interested to hear that Dr. H. B. Brackenbury has been selected as the prospective Liberal candidate for the East Walthamstow Parliamentary Division, and all those who know of his great labours for the profession, his great capacity for work, and the efficiency with which he deals with any task that comes to his hand, will wish him success in his candidature. The Parliamentary Elections Committee, which acts on behalf of the Council of the British Medical Association as trustees for the Medical Representation in Parliament Fund, met last week and resolved that the support of the Fund should be given to Dr. Brackenbury. An appeal will shortly be made to the original subscribers to the Fund and to other members of the profession who are interested in securing suitable medical candidates for seats in Parliament.

Membership of the Association.

The members of the British Medical Association on March 6th, 1920, numbered 21,774: on June 5th, 1920, the number was 22,275. During the three months there was thus a net increase of 501 in the membership of the Association.

COUNCIL ELECTION.

The following is the detailed result of the voting in the five contests in connexion with the election of twenty-four members of Council by the grouped Branches. The names of those elected were given in a Current Note last week.

Metropolitan Counties Branch.

The voting paper contained the names of nine candidates for the four vacancies. The voting was on the single transferable vote system. Out of 2,719 voting papers issued, 694 were returned, of which 4 were spoilt. The quota was therefore 139, that is, 690 divided by 5—one more than the total number of seats to be filled. The result of the first count was:

Dr. J. A. P. Barnes... ..	81
Dr. H. S. Beadles	55
Dr. C. Buttar	132
Lord Dawson of Penn	172 Elected
Lieut.-Colonel W. McAdam Eccles	97
Mr. N. Bishop Harman	38
Dr. C. O. Hawthorne	65
Dr. Harvey Hilliard	22
Dr. W. Paterson	30
	690

Lord Dawson's votes exceeding the quota by 33, he was declared elected. It then became necessary to transfer Lord Dawson's surplus 33 votes. The whole of his 172 papers were examined, and the distribution of the 33 surplus votes, according to the second preferences indicated, resulted as follows:

Dr. Barnes	+ 2 ... 83
Dr. Beadles	+ 1 ... 56
Dr. Buttar	+ 4 ... 136
Lord Dawson	- 33 ... 139 Elected
Lieut.-Colonel McAdam Eccles	+ 13 ... 110
Mr. Bishop Harman	+ 6 ... 44
Dr. Hawthorne	+ 5 ... 68
Dr. Hilliard	+ 1 ... 23
Dr. Paterson	+ 1 ... 31
	690

No candidate having secured the necessary quota of 139 votes, the papers of the lowest candidate—Dr. Hilliard—were distributed. This third count resulted as follows:

Dr. Barnes	+ 4 ... 87
Dr. Beadles	+ 3 ... 59
Dr. Buttar	+ 6 ... 142 Elected
Lord Dawson	+ 2 ... 139 Elected
Lieut.-Colonel McAdam Eccles	+ 4 ... 112
Mr. Bishop Harman	+ 1 ... 48
Dr. Hawthorne	+ 1 ... 69
Dr. Hilliard	- 23 ...
Dr. Paterson	+ 2 ... 33
Non-transferable	+ 1 ... 1
	690

Dr. Buttar having received 142 votes was declared elected. His surplus of 3 being less than the difference between the votes of the next two lowest candidates (Dr. Paterson and Mr.

Harman) the papers of Dr. Paterson, the lowest, were distributed. The result of this count was:

Dr. Barnes	+ 16	...	103
Dr. Beadles	+ 4	...	63
Dr. Buttar	142 Elected
Lord Dawson	139 Elected
Lieut.-Colonel McAdam Eccles	+ 3	...	115
Mr. Bishop Harman	+ 6	...	54
Dr. Hawthorne	+ 3	...	72
Dr. Hilliard	—
Dr. Paterson	- 33	...	—
Non-transferable	+ 1	...	2

690

No further candidate having secured the quota, Mr. Bishop Harman's votes were distributed. The fifth count produced the following result, but still did not give any candidate the necessary quota:

Dr. Barnes	+ 9	...	112
Dr. Beadles	+ 4	...	67
Dr. Buttar	142 Elected
Lord Dawson	139 Elected
Lieut.-Colonel McAdam Eccles	+ 17	...	132
Mr. Bishop Harman	- 54	...	—
Dr. Hawthorne	+ 14	...	85
Dr. Hilliard	—
Dr. Paterson	—
Non-transferable	+ 10	...	12

690

Dr. Beadles's votes were then distributed, which gave Dr. Barnes and Lieut.-Colonel Eccles the necessary quota, and they were declared elected:

Dr. Barnes	+ 31	...	143 Elected
Dr. Beadles	- 67	...	—
Dr. Buttar	142 Elected
Lord Dawson	139 Elected
Lieut.-Colonel McAdam Eccles	+ 10	...	142 Elected
Mr. Bishop Harman	—
Dr. Hawthorne	+ 8	...	94
Dr. Hilliard	—
Dr. Paterson	—
Non-transferable	+ 18	...	30

690

Cambridge and Huntingdon, Norfolk, Essex, Suffolk, and South Midland Branches.

The two candidates for the election of one member of Council by the above group were Dr. E. O. Turner (Great Missenden) and Dr. J. F. Walker (Southend-on-Sea). Out of 797 voting papers issued, 206 were returned, one of which was spoilt. The voting was 127 for Dr. Turner and 78 for Dr. Walker. Dr. Turner was therefore elected.

Kent, Surrey, and Sussex Branches.

Dr. E. R. Fothergill of Hove, and Dr. A. Lyndon of Hindhead, were the candidates in the above group. Out of 1,042 voting papers issued 282 were returned, one being spoilt. Dr. Fothergill, securing 176 votes against Dr. Lyndon's 105, was elected.

Yorkshire Branch.

The candidates here were Dr. A. Forbes of Sheffield, and Dr. A. Manknell of Bradford. 419 voting papers were returned out of 885 issued. Dr. Forbes secured 219 votes against Dr. Manknell's 200 and is therefore elected.

Aberdeen, Northern Counties, Dundee, and Perth Branches.

The voting paper for this Group contained the names of Dr. B. Cruickshank of Nairn, Dr. D. Lawson of Banchory, and Dr. C. S. Young of Dundee. Dr. Young having withdrawn after the posting of the voting papers all "first choices" in his favour were ignored and the "second choices" taken. Out of 430 papers issued 178 were returned—two being spoilt. The voting was 108 for Dr. Lawson and 68 for Dr. Cruickshank, the former being elected.

NOTICES OF MOTION AND AMENDMENT BY DIVISIONS FOR THE ANNUAL REPRESENTATIVE MEETING, 1920.

By Dundee Division-Branch:

Reduced Subscription for Practitioners of Some Address.

That the Council be instructed to consider the advisability of making provision whereby, in the case of practitioners co-resident otherwise than in institutions, those other than the first may for membership pay a subscription of 2 guineas, and one copy only of the JOURNAL be sent to the common address.

Minimum Salaries for Public Appointments.

That the following words be added to the definition of whole-time senior medical officers in charge of departments:

"In Scotland this shall apply to school medical officers responsible directly to the Education Authority whether or not they have other medical officers under their control."

That the following words be added to the last recommendation of Council as to minimum salaries for public appointments:

"That the Conjoint Committee include representatives of the School Medical Officers' Associations of England and Scotland."

By Brighton Division:

Payments to Members of Office Committee.

That as the payment of £5 5s. per attendance to those members of the Office Committee who are not members of the staff (see para. 35 of Annual Report) does not appear to be sanctioned by the Articles of Association and By-laws, such payments be at once discontinued, and no such payments be made until the necessary alterations in the Articles and By-laws have been made, and the sanction of the Representative Body obtained.

By Denbigh and Flint Division:

Certificates for Non-attendance of School Children.

That the Representative Body is of the opinion that certificates for non-attendance of school children at school, required by school authorities, should be paid for at the rate of 1s. each by the local education authority, and instructs the Council to communicate with the Ministry of Education with a view to making this universal.

By South-Eastern Counties, Edinburgh:

Restriction of Expense.

That care be taken to restrict expense on the JOURNAL and circulars printed by the Association.

By Leicester and Rutland Division:

Portion of Grants to Divisions to be Earmarked for Social Work.

That it be an instruction to the Council when allocating grants to the Divisions to allocate a special amount per head which is to be earmarked for the development of the social side of the Association.

Work of the Association and the "Supplement."

That it be an instruction to the Council to ensure a more adequate setting forth of the current work of the Association in the SUPPLEMENT of the JOURNAL week by week.

By Liverpool Division:

Fees for Treatment of School Children.

That the recommendation of Council contained in para. 106 of Annual Report be amended—(a) by the insertion of the words "at Clinics or Welfare Centres" after "children", in the second line; and (b) by the deletion of the words "for at a higher remuneration" at the end of para. (iv).

By Maidstone Division:

Increase of Subscription.

That "2½ guineas" be substituted for "three guineas" in para. 1 (a) of the proposed amended By-law 11.

"Secret Remedies."

That the report on "Secret Remedies" be confined and brought up to date.

Capitation Fee and Conditions of Service under National Health Insurance Acts.

That, whilst conscious of and grateful for the labours of the Insurance Acts Committee, this meeting places on record its opinion that the British Medical Association authorities made a grave error in allowing the Health Minister to concentrate attention on the capitation fee and pass over the vitally important matter of conditions of service (see para. 154 of Annual Report).

By Edinburgh and Leith Division:

Proposed Increase of Subscription.

That this meeting approve of Clause (1) (a) of the proposed new By-law 11 being amended to provide for an increase of the annual subscription up to £2 10s., making, however, a strong recommendation to economy, especially in the matter of stationery; but in the event of the Insurance Acts Committee and the Insurance Acts Subcommittee of Scotland being financed from the Central Defence Fund, no increase be made in the annual subscription.

By English Division (Border Counties Branch):

Fee for Notification of Births.

That a fee should be paid to the medical profession for notifying births.

By Birmingham Central Division:

Fees for Medical Examinations for Life Insurance.

That the fee for medical examination and report in all ordinary cases of life insurance for £100 or over be not less than 1½ guineas. (Para. 111 of Annual Report.)

Payment of Members of Staffs of Voluntary Hospitals for Treatment of Discharged Disabled Soldiers and Sailors.

That this Annual Representative Meeting cannot approve of any scheme of remuneration for medical services which is based on the costs of maintenance or administration. (Para. 163 of Annual Report.)

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

BORDER COUNTIES BRANCH.—The annual general meeting of the Branch will be held at the County Hotel, Carlisle, on Friday, June 18th, at 4.15 p.m. Business: (1) Election of officers; (2) Report of Branch Council; (3) Ethical Rules; (4) Presidential address by Dr. G. R. Livingstone, Dumfries.

EDINBURGH BRANCH.—The annual meeting of the Edinburgh Branch will be held in the Hall of the Royal College of Surgeons, Nicolson Street, on Friday, June 18th, at 4 p.m. Tea will be served at 3.45 p.m. Business:

Report of Branch Council, Treasurer's financial statement. Election of office-bearers for 1920-21. Election to annual vacancy on the Board of Management of the Queen Mary Nursing Home. Proceedings of Scottish Committee: (1) Proposed alteration of reference to Committee increasing its powers; (2) proposed reconstitution of Committee. (3) Annual Report of Council and Annual Representative Meeting.

METROPOLITAN COUNTIES BRANCH.—Mr. N. Bishop Harman and Dr. J. A. Percival Barnes (Honorary Secretaries) give notice that the annual general meeting of the Branch will be held at 429, Strand, W.C.2, on Friday, June 18th, at 4.30 p.m. Business: (1) Report of scrutineers as to the election of new officers. (2) Annual report of Council. (3) President's Address, by Dr. E. W. Goodall, O.B.E.: The Report of the Consultative Council.

SOUTH MIDLAND BRANCH: BEDFORDSHIRE DIVISION.—Dr. E. R. Fasnacht, Honorary Secretary (116, Hurst Grove, Bedford), gives notice that the annual meeting of the Division will be held on Thursday, June 17th, at 3 p.m., at the Swan Hotel, Bedford. Agenda: Receive the Annual Report. Election of Officers and Representatives. Mr. Victor Bouney, F.R.C.S., will read a paper on "Modern methods in the treatment of difficult labour." The chairman, Dr. W. G. Nash, invites the members of the Division to luncheon at the Swan Hotel, Bedford, at 1.30 p.m.

SUSSEX BRANCH.—A meeting of the Sussex Branch will be held at the Eversfield Hotel, St. Leonards-on-Sea, on Tuesday, June 15th, at 4.45 p.m., when a British Medical Association Lecture will be delivered by Dr. W. Langdon Brown, F.R.C.P., Physician to St. Bartholomew's Hospital, on "Diabetes in relation to the ductless glands." All members of the profession in Hastings and St. Leonards and members of the Sussex, Kent, and Surrey Branches of the Association are invited.

Meetings of Branches and Divisions.

DORSET AND WEST HANTS BRANCH.

The annual meeting of the Dorset and West Hants Branch was held at the County Hospital, Dorchester, on May 19th, when Dr. E. KAYE LE FLEMING was in the chair.

The new officers took office as follows:

President: Dr. P. S. B. Wetherall. *Vice-Presidents:* Drs. P. A. Ross and N. Flower. *Honorary Secretaries:* Drs. Walter Asten and C. Grey-Edwards.

The revised ethical rules were adopted.

Dr. WETHERALL delivered the Presidential address on "Delirium tremens and the morphine habit: their treatment and after-care."

The following resolution was unanimously passed:

This meeting of the Dorset and West Hants Branch of the British Medical Association wishes to express its high appreciation of the work of the Insurance Acts Committee during the past year, and desires to place on record its deep sense of indebtedness and sincere gratitude to the Chairman, Dr. H. B. Brackenbury, for the conspicuous ability, strenuous devotion, and unflagging energy which he displayed in conducting the recent negotiations with the Ministry of Health and the Arbitrators on behalf of the whole profession.

EDINBURGH BRANCH: SOUTH-EASTERN COUNTIES DIVISION.

The annual meeting of the Division was held at Newton St. Boswells on May 19th, when Dr. LUKE was in the chair.

The Honorary Secretary and Treasurer presented the annual report and the financial statement for the year 1919.

The following officers were elected:

Chairman: Dr. A. D. Fleming. *Vice-Chairman:* Dr. P. Henderson. *Representative in Representative Body:* Dr. William Blair. *Deputy Representative:* Dr. S. Davidson. *Honorary Secretary and Treasurer:* Dr. M. J. Oliver.

Dr. A. D. FLEMING then took the chair vacated by Dr. Luke, and proposed a vote of thanks to the latter for his services during the past year, which was warmly accorded by the meeting.

The Medical Parliamentary Fund was discussed, and it was decided to let the fund drop, with the proviso that the Division should be prepared to support any particular candidate for Parliament when the time came. The Secretary was instructed to return the contributions which had been received.

The meeting agreed that the Representative should press for as high fees for life insurance examination as were consistent with not diminishing the amount of business to be done in providing insurance companies with medical reports on lives to be insured.

The meeting proceeded to consider the Annual Report of the Council. The Secretary directed attention to a number of paragraphs of the report. The Secretary was instructed to convene four meetings a year, two for business and two for clinical discussions, together with one social meeting, the Annual Meeting. It was unanimously agreed to adopt the ethical rules as approved by the Representative Meeting, 1919. The meeting approved of the proposals of the Council as stated in the report, and instructed the Representative to support these to the best of his ability.

It was unanimously resolved to send to Dr. Brackenbury and to Dr. Cox, Medical Secretary, an expression of appreciation by the Division of the work done by them in negotiating with the Ministry of Health in connexion with the rates of remuneration of panel practitioners.

ESSEX BRANCH: NORTH-EAST ESSEX DIVISION.

At a meeting of the North-East Essex Division held at Colchester on May 25th the annual report of Council was discussed and the recommendations approved. The revised ethical rules were adopted. Dr. Agnes Estcourt-Oswald was elected the Representative in the Representative Body.

METROPOLITAN COUNTIES BRANCH: GREENWICH AND DEPTFORD DIVISION.

The annual meeting of the Division was held on May 26th. The new ethical rules were adopted. The annual report of the Council of the Association, published in the SUPPLEMENT of April 24th, was considered and approved, and the Representative was instructed.

The following officers were elected:

Chairman: Dr. Charles Wallis. *Chairman elect:* Dr. Annis. *Secretary:* Dr. John Round. *Representative in Representative Body:* Dr. Bhabha.

SOUTHERN BRANCH: SALISBURY DIVISION.

The annual meeting of the Division was held at Salisbury on May 19th, when Dr. J. E. GORDON was in the chair.

The following officers were elected:

Chairman: Dr. Kempe. *Vice-Chairman:* Dr. A. W. K. Straton. *Secretary:* John Armitage. *Representatives on Branch Council:* Dr. Ord and Dr. Mareh. Dr. Fleming was nominated as Representative of the Division, Dr. Gordon as Deputy Representative.

The annual report was read and the balance sheet produced.

The matter referred to the Division were then considered, and it was decided to support the recommendations of the Council. Revised ethical rules were adopted. The question of raising the subscription to the Association was discussed, and it was decided that this Division did not approve of the proposed increase.

A vote of thanks to Dr. Gordon for his services as Chairman of the Division for the last six years was carried with acclamation. A resolution was passed recording the great loss the Division has sustained through the death of Drs. Browne and Henderson.

GENERAL COUNCIL

OF

MEDICAL EDUCATION AND REGISTRATION.

SUMMER SESSION, 1920.

Sir DONALD MACALISTER, K.C.B., President,
in the Chair.

THE TEACHING OF PREVENTIVE MEDICINE.

The Council on June 3rd and 4th discussed at great length a further report presented by the Education Committee on the teaching of the preventive aspects of medicine.

The report by the Education Committee was in continuation of an interim report presented at the last session. Appendices to the two reports contained replies from thirty out of thirty-eight teaching bodies to a circular letter on the subject addressed to them by the Council. The report now presented also made continual reference to Sir George Newman's *Memorandum on Medical Education in England*. It was explained that what the Committee had in view in their investigation was the education of the general practitioner, and the question had been approached from the point of view that it was possible that the future general practitioner was not receiving such a training as would qualify him to diagnose and treat disease in its very earliest manifestations, and that not sufficient importance was being attached to the recognition of what might be called the pre-morbid state and the necessity devolving upon the practitioner of taking measures to eliminate influences affecting individuals professionally under his care which threatened to produce disease. The replies received indicated in their general tenor that present-day training did not concern itself sufficiently with these important parts of the practitioner's duty.

The questions raised concerned practically the whole of the curriculum, its length, contents, the proper distribution of these amongst the several teachers, and the successive years of study, and the methods of teaching and examinations. As for the length of the curriculum, none of the replying bodies proposed that the teaching period should be extended, although many spoke of an overloaded curriculum. With regard to the co-ordination of studies, the Committee quoted with approval Sir George Newman's opinion that the anatomist, the physiologist, and to some extent the pathologist (who were not themselves dealing with clinical study and treatment) could not give the necessary clinical instruction—Sir George Newman was speaking particularly of obstetrics—and that the student was not fitted to appreciate the instruction unless he was actually in presence of the living clinical evidences; the Committee added that if this was true of obstetrics it was probably true of all the departments of clinical study. The importance of the proper co-ordination of studies was emphasized in many of the replies, and the consideration of the Council was invited to the general principles on which co-ordination of studies should be based. As to the contents of the teaching course, the vast increase of medical knowledge augmented the difficulties of the teacher, and now there was danger that the scientific spirit and scientific methods of instruction might be forgotten. The more serious difficulties might be overcome if it was generally agreed that from the teachers in the earlier sciences (meaning all except clinical subjects) no more was expected than that they should impart to their students an intelligent and scientific appreciation of the subjects they professed.

The Committee then went on to consider whether the teaching of the subjects preparatory to clinical study could be made lighter and less exacting on the student, and, at the same time, better adapted to his future needs. Advantage would be gained were the minimum age of entrance raised to 18. The last two years of the student's school life might be largely devoted to chemistry and physics, and a pass certificate in these subjects of the higher standard might be accepted for some portion of the work in inorganic chemistry and general physics in the school of medicine. This would lessen the pressure in the first year of the curriculum and increase the time available for the study of anatomy and physiology. The courses in the preliminary sciences must necessarily be general in their nature. Anatomy should be taught as a science, an end in itself, not as a clinical study, but as a preparation for such study. The teaching of anatomy could be simplified and improved. As for physiology, it could not be said that too much time was given to this subject, but a modification and rearrangement of the work might indirectly be of assistance. A practical course dealing with the employment of physiological methods in the study of the normal human being might be instituted with advantage. With regard to other subjects, the replies indicated an opinion that bacteriology was sufficiently taught, though in pathology some of the bodies admitted deficiencies, particularly as regards etiology and the recognition for preventive purposes of the earliest indications of disease. The Committee postponed a detailed consideration of the teaching arrangements in surgery, medicine, and midwifery, and asked for discussion on the principal matter as to whether or not the teaching of the earlier sciences could be so modified as to give the clinical teachers a more adequate opportunity than they possessed at present of satisfactorily overtaking their subjects.

Dr. MACKAY, Chairman of the Committee, in moving the adoption of the report, described the events which had led up to the reference of this subject to the Committee. The speaker reviewed the general character of the report, and said that his Committee was anxious to study further the methods whereby the whole curriculum might be revised in the light of this discussion. The Committee would be guided by the views expressed by the Council.

After Dr. McVAIL had seconded the adoption of the report, the Council resolved itself into Committee in order that the discussion might cover as wide a range as possible and be unfettered by rules of procedure.

Sir NORMAN MOORE said that the object of the whole inquiry was to lay down a course of study whereby in five years a man might become thoroughly qualified to practise his profession. It was important to remember that certain limitations were imposed by the time factor. Many people would favour a lengthening of the curriculum, but he did not think that, in the present state of the country and of practice, the medical student ought to be forced to undergo a longer training than five years. That being the period, what were the objects to be kept in mind during those five

years? It was sometimes said that the object of professional education was to enlarge the mind. Of course it enlarged the mind, but the problem in this case was to get the mind enlarged in a particular direction—that, namely, of medicine and its applications. Of each item in the curriculum they must ask, Will this, at the end of five years, enable a man better to practise his profession? The medical curriculum as it stood at present was divided into three stages, or four if the previous general education of the student were included. With regard to this previous general education, he thought that so long as the student was well educated it did not signify what elements his study had included. The thing that was important here was the opening of the mind to general knowledge. As for the earlier sciences—namely, chemistry, physics, and biology—he would like to hear a discussion on these from the point of view of what the mind retained of the teaching in these subjects. How much of these subjects remained in the mind of physicians and surgeons? It might be found that only slight traces of chemistry and physics so remained. Then anatomy and physiology ought to be taught so as to bring out in the mind of the student the relation of these subjects to the practice of his profession. The way in which anatomy had been treated had varied very much, and in particular the methods of studying anatomy had been changed by the extreme scarcity of bodies for dissection. But it was important that in both these subjects there should be not only a retention in the mind of what the textbooks said or what the experiments showed, but also a drawing out from the facts and observations of what might be called the scientific application. He believed that with the aid of good anatomists and physiologists a great saving of the student's time might be effected. It seemed so obvious when the subject was first taken up that physiology must be of the most profound service to every physician and surgeon that one was inclined to give it a greater relative part in the curriculum than was perhaps justified. In the third part of the curriculum the student came near the actual practice of his profession. The student felt when this period arrived that every day of his study was a day well spent; he was learning to observe, he was seeing the relation to practice of his previous study. The speaker wished to impress upon the Council the need for considering the whole subject from the point of view of producing a thoroughly trained medical man—a man capable of finding out about disease, and of treating it once it had been discovered.

Sir JAMES HODSDON doubted whether the fifth year was fulfilling the purpose for which it was intended. Upon that fifth year there had been a gradual encroachment. The tendency had crept in to teach in watertight compartments, and teachers in certain subjects in the earlier part of the curriculum were apt to teach as though their students were going to be specialists. As for the method of teaching, he thought there were too many lectures; what was wanted was more practical work. He thought also, with regard to examinations, that the way in which the student's work was done all through his course should be placed on record, and the record be available when he came up for examination. He also suggested that it might be possible to curtail the earlier subjects so as to give more time for the final, or at all events to arrange the earlier subjects so as to secure better co-ordination between these and the subjects taken later.

Sir JOHN MOORE said that he had felt in recent years that the five years' curriculum had been a retrograde step so far as the attainment of knowledge by the student was concerned. The great object in view in the mind of the student was to pass the next examination, and for the purpose of passing that examination the student was prepared to sacrifice a great deal of clinical learning. In his own hospital it was the rarest thing for a student other than the clinical clerk to take personal charge of individual patients, or to pay an afternoon visit to the patients he had seen in the morning. The multiplicity of examinations was essentially mischievous. When there were but two examinations—the half M.B. and the final M.B.—the running after special subjects was not known, and a great deal more time was allowed to the hospital. The place for ancillary sciences and scientific teaching was in the school. He would postpone entrance on the five years' curriculum at all events to the age of 17. That would be quite early enough for a man to enter upon the grave

responsibilities of the study of medicine, and it would enable him to qualify at 22. It was disheartening to a clinical teacher to be told morning after morning that the student must run away to learn vaccination or something else when he ought to be attending almost exclusively to his hospital work.

Sir GEORGE NEWMAN agreed with Sir Norman Moore that in considering the medical curriculum they should consider the product, and that the product should be a clinical product. It was necessary to face a new situation with regard to the demands which the State was making upon the medical man. Beginning with the Poor Law, the State had gone on to public health services, and from these to a whole group of specialized health services. The State was now making a demand upon between two-thirds and three-fourths of the profession, whereas formerly it made a demand upon perhaps one-fourth. These demands in the main were clinical. He would view with the greatest concern any attempt to divorce State medical work from clinical work. The true basis of State medical service was a sound clinical training. How was this clinical product to be secured? In the first place, he would put in a plea for the importance of the preliminary science subjects in relation to clinical medicine and surgery. He thought it desirable to strengthen these science subjects rather than weaken them. Chemistry, physics, and biology were continually becoming more closely allied to clinical work. Chemistry and physics during the last five or six years had taken a new place in this respect. Sir George Newman went on to lay down six points for consideration in connexion with that broad and generous revision—he would not say revolution—of the curriculum which the time was more than ripe for the Council to discuss. His six points were: (1) The curriculum ought to be lightened at both ends. We were not giving our students time to think or digest. True culture or learning was never forthcoming on the principle of the general scrimmage. (2) An endeavour should be made to co-ordinate the preliminary scientific and intermediate subjects with each other and with the clinical, and to make the preliminary scientific subjects much more applied. (3) The reorganization of clinical teaching must be considered. He was quite prepared to say that in America and Germany he had seen no clinical teaching to compare with the best in this country, but our clinical teaching wanted reorganization so that the clinical teacher was in a position to give his best, and not a mere residuum. (4) He would like to see the provision of ampler education in four or five particular subjects—namely, venereal diseases, tuberculosis, maternity and infant welfare, orthopaedics, and mental diseases. There was no solution of the venereal problem in this country unless the practitioners were equipped to handle it. Clinics were a palliative provision in the meantime. Venereal disease would never be eradicated until it was handled in private practice. Its roots were deep socially, and involved something far beyond the narrow medical factor. Hardly any problem gave him more anxiety in his official work than the problem of venereal diseases. But it all came back to the private practitioner. The same could be said of tuberculosis. The way out was not to create professorships of venereal disease or of tuberculosis. The students had got to be brought right up against fundamentals. (5) There must be some kind of post-graduate equipment, first for dealing with specialisms, secondly, for ensuring the continued education of the student. (6) He would put in a plea for a reform of the examination system. The examination system must follow the training, not lead it. It must include the preparation of the student, not exclude it. It must represent not a hazard but a certainty. It must be an instrument by which the centre of gravity was thrown upon the curriculum rather than upon the examination room itself. This would alter the whole outlook for the student. He would see that his education was not a scrimmage for an uncertain goal, but a course of study for a final destiny. And he would come to his cases in hospital with an entirely new spirit. (Applause.)

Sir GILBERT BARLING regarded the report as in some respects an accusation against the clinical teachers of this country that they had not taught their students on the lines of preventive medicine. But English clinical teachers had done preventive work, and the implication that they

had not done this kind of work was unfair. As for the curriculum, he thought that anatomy ought to have more time, and not less. Matters could be improved by giving more time to essential subjects. The students might acquire a certain knowledge of chemistry and physics before they came to them, but they would still require teaching in organic chemistry or biochemistry. Nothing could be cut out of the clinical curriculum, and whether they adopted the remedy now or not, the obvious recourse would be to a longer curriculum in the future than at present.

Dr. NORMAN WALKER described the conditions of medical education in the United States, from which he had lately returned. He said that there the student must have had four years' secondary school education and two years' collegiate education, which included chemistry, physics, and biology, and also a foreign language, and having passed this, he came under his medical curriculum, which lasted for four years. But he was not admitted to the examination of the National Board of America until he had done one intern year in hospital. The supply of bodies for dissection was ample in America for anatomical purposes, and all the students in the class were able to dissect the same part at the same time; also there were more reasonable laws regarding vivisection. A great amount of stress was laid upon embryology, and he was also struck by the emphasis upon neurology. All students in the first year began their instruction in neurology and carried it on sometimes into the second or third. Bacteriology was emphasized too, and much attention was given to biochemistry, in which subject most of the schools had a whole-time professor. The pathology he did not think was any better than in this country. The students in America were better organized than ours and they worked harder and for longer hours. From the clinical system in the States we had less to learn. In America there seemed to be subjects in which the number of lectures was overdone, but he came home more convinced that a certain number of lectures was essential in order to turn out good practitioners. Then, again, there was co-operation between the university and the city and state. The city supported the university and paid the salaries, and the university medical faculty was responsible for the treatment of the people in the city. He was told that there were no difficulties, and that all border-line cases were provided for in the agreement. He was much struck by the benefits of the clinic nurse and her staff, who went out among the patients in the city and saw that the prescribed treatment was carried out. On the general subject of the report Dr. Walker said that chemistry, physics, and biology ought to be done before the student began medicine. There was a way of lengthening the curriculum quite close at hand—namely, by increasing the period of study in the year. Thirty-two weeks out of fifty-two was not a very large proportion to ask of the student. In the University of Minnesota the sessions went on all the year round, and were so arranged that each student had seven weeks' holiday. There was no profession or trade in which the holidays of the apprentices were so long as in medicine. It was true that professors could not be always teaching, but more and better paid assistants to the professors were needed to take the extra classes. Some subjects might be spread over a longer time. In America the instruction went on continuously. As for graduate instruction, in one State the professors (who were appointed and paid by the State) made arrangements with the medical societies in the State—the professor in ophthalmology, for instance, making arrangements with the ophthalmological society—to go down to a particular centre on a given day and hold a clinic, to which all the doctors could bring their patients. That was part of his duties as professor in the university, and the plan had the advantage of diffusing knowledge among the country doctors and of benefiting the people immensely. There was no school in the world equal to the Mayo Clinic, Rochester, N.Y., where they had a system of post-graduate instruction covering three years, and the work was done in the most admirable and thorough manner.

Dr. RUSSELL WELLS said it was important that stock should be taken of the present position, its deficiencies and its excellences. He wondered whether it had occurred to the members of the Council on what an extremely low literary preliminary test a man could enter a hospital. Such a minimum was refused by the solicitors, the

accountants, the auctioneers and estate agents, and every other professional body, yet the profession on which the medical student entered was one requiring very considerable intellectual attainments. He thought that if chemistry, physics, and biology were to be transferred to a pre-medical period, a higher preliminary standard must be required to start with. He also raised objections to a system whereby the physiologist might be engaged at the same time in teaching students physiology for medicine and teaching other students pure physiology for a B.Sc. While the fundamental chemical facts might very well be taught in the first year, chemistry ought to run through the whole course, and he would like to see some form of biological chemistry in the final examination. Some form of physiology also might run through the entire course.

Dr. J. C. McVAIL pointed out that with regard to the lengthening of the curriculum the Council was in a curiously difficult position, because one set of facts held good in the case of dental education and another set in the case of medical education. The number of qualified dentists was not nearly large enough for the needs of the country, and therefore it was necessary to be very careful in adding at all to the dental curriculum, whereas in the case of medical education the schools were now overcrowded. From the Council itself an admirable committee of anatomists could be formed to go thoroughly into the teaching of anatomy, and similar committees might deal with physiology, surgery, pathology, and public health, and, with co-opted members, with chemistry and physics also.

Sir ARTHUR CHANCE thought that sufficient attention had not been paid in the report to the efficiency of the teachers. Teachers were apt to think themselves exempt from human frailties, but the fact remained that although they might know much about their subjects, they were not on that account competent teachers. He did not know in Ireland one competent professor who received half as much as he could make in practice, and evidently the provision of efficient teachers by encouraging and rewarding suitable men was a matter to be taken into consideration. As for the curriculum, he thought that if the preliminary sciences were to be put in the earlier stage, effective measures must be taken to ensure that the education then given was thoroughly sound.

Professor HARVEY LITTLEJOHN said that the General Medical Council itself was largely responsible for the present position of medical teaching, for during the last fifty years, instead of giving a lead as it had done previously, it had kept back the medical teaching bodies. The teaching bodies had been prepared for years for a change in the curriculum, but were bound down by the regulations of the Council, and in the opinion of many this had not been of advantage. It would be greatly to the good if they could get rid of watertight compartments in teaching. Anatomy, for instance, should not necessarily be finished by a certain time. With regard to what Dr. Norman Walker had said, the speaker hoped we were not going to sit slavishly at the feet of American educationists, as we had done in the case of German educationists; Professor Flexner in his report had pointed out many directions in which British methods of teaching were ahead of those in America. Even the co-operation of the city and the university, as Dr. Flexner had remarked, already existed here; while in Germany the *Praktikant* did not get his degree until he had served as an intern in the hospital, so that the idea of the inter-year was not peculiar to America.

Dr. J. A. MACDONALD spoke from the point of view of the general practitioner. It was difficult for him, without experience of teaching, to know where the fault lay, whether the examination was not severe enough to eliminate the incapable, or the education not sufficiently thorough to give the men required. In his own student days the teaching was not practical enough. He was taught physics and chemistry and anatomy and physiology, but the inter-relation of these subjects was not pointed out. At that time there were not enough teachers for the work, and this was still true, in his opinion; the education in the hospitals would never be brought to the height it should reach until the staffs were quadrupled, not necessarily by the multiplication of professors, but by the employment of competent assistants.

Professor H. R. DEAN spoke of the overcrowded curriculum. Discussions had taken place in Manchester

with the main result that many new subjects were put forward for a place, while the teachers of existing subjects had seized the opportunity, naturally, to extend their own claims. Something must be done in the way of omission and shortening. Those courses might be shortened which consisted exclusively or almost so of lectures. Useful textbooks were in existence, and what the student wanted was a great deal more time for practical work in the laboratory and the hospital ward. There was also much overlapping of subjects, and he would like to see a committee of co-ordination set up in each medical school in which the teachers could meet together and learn the field that each should actually cover. In many medical schools students were taught their physics and chemistry along with engineering students. What they should be taught was the kind of physics which would help them to understand medicine. Medical students should be taught in separate classes, and taught not, say, medical chemistry, but chemistry suitable for medical students—a very different thing. Chemistry and physics were more important in the first years than biology, because a great deal of biology could be got in the departments of anatomy and physiology. In the last year of the curriculum much time was apt to be frittered away by the competitive claims of certain special departments, such as diseases of the eye, or of the ear nose and throat. Given proper instruction beforehand, the students would come to these special subjects ready for a short practical course.

Professor ARTHUR THOMSON spoke of the futility of cramming. The cram work for the examination was forgotten in six months. It was not information that was needed, but knowledge. Lectures were helpful to the students, and the advantage of lectures was that non-essentials could be swept aside. He regarded the instruction given in physiology from the university standpoint as having its great value, not because it was physiology, but because it was a training in method.

Dr. RICHARD CATON said that more men than the profession could find room for were likely to be entering in the course of a few years. He lamented the almost entire disappearance of all classical studies, and hoped that an endeavour would be made as far as possible to frame the preliminary scientific education so as to make it really a part of the medical education.

Sir JAMES HOBSDON drew attention to the two forms of anatomical nomenclature in existence, and said it was very desirable that one or other should be adopted as the uniform nomenclature among English-speaking peoples. In 1917 the Anatomical Society of Great Britain decided that there was no reason to depart from the old nomenclature, but recommended that certain things in the old might be revised with advantage. In 1919 the American Association of Anatomists passed a resolution declaring the inadvisability of abandoning the Basle nomenclature, and recommended that a committee be appointed with a view to its revision. In May, 1920, the Council of the Royal College of Surgeons of England agreed with the Anatomical Society in deciding not to depart from the old nomenclature. It was essential, in the interests of medical students and medical men in general, that the nomenclature should be uniform. The Education Committee might, in the interests of medical education, take into consideration the desirability of conferring with the licensing bodies on the question of adopting a uniform system.

Professor A. F. DIXON thought that the teacher in anatomy, for instance, should be allowed to spread his net as widely as possible and be permitted to make reference to surgery. Also it might be hoped that teacher and student would look at their subject as a living and growing structure, and not as a jigsaw puzzle. With regard to one suggestion which Dr. Norman Walker had brought from across the Atlantic, at his own university (Dublin) they had succeeded in arranging that all their first-year students should be dissecting the same part at the same time, and all the second-year students another part at the same time.

Mr. E. B. TURNER referred to the need for attention to the preliminary education. He did not think it made much difference by what exercises the brain was brought to perfection. The need for true principles of education held good from beginning to end. For preventive medicine it was necessary to train not only the consultant but the rank and file of general practitioners. Unless such prac-

tioners were turned out, the fight against disease must fail. And the men coming out of the schools and entering general practice must be men who could think for themselves, not merely armed cap-à-pie with all sorts of appliances. He begged the Education Committee to lay particular stress upon the selection for entrance into the profession of really educated students, not merely men who knew things.

Professor T. W. GRIFFITH said he felt very strongly that the lecture had great value if the lecturer did not just read out of a book, but spread himself over his subject. The lecture ought to be something which could not have its place taken at all by any amount of textbooks. In Leeds they were going to reduce the number of systematic lectures on medicine to something like fifty, and a number of short, highly demonstrative courses were being arranged for students. Each member of the teaching staff would know eight or ten months beforehand that he would be called upon to take these courses, and would have opportunity to prepare for them by the collection of material and resort to graphic methods. His own view was that it was the duty of the teacher not to confine himself within the limits of his subject, but wisely to "kick over the traces." A certain amount of overlapping was necessary and useful, like the overlapping of the tiles on the roof.

Professor J. B. LEATHES said that in the University of Sheffield well considered discussions had taken place with a view to the more definite shaping of the courses. The teachers in anatomy and physiology had most generously offered to shorten the amount of time they took at the beginning of the course. One of the greatest needs in the medical education of this country was that the watertight separation between anatomy and physiology and chemistry and physics should be broken down. Students learned the sciences as if they had nothing to do with medicine. At Sheffield they had instituted a Chair of Pharmacology, which went with a position on the staff of one of the hospitals. The professor would be a whole-time occupant, except in so far as he might have duties in the hospital, and he would teach in the hospital the principles which he had demonstrated in the laboratory in his practical course.

Sir JENNER VEIRALL said that as educationists they should aim at a high order of results, but they must remember that it was of no use aiming at a level which the public at a given time were not prepared to accept. It was quite evident that the Council was in two difficulties, the difficulty of omitting anything from the curriculum, and the difficulty of keeping the curriculum within certain dimensions. They were not providing a curriculum for a standstill science, but for a science in which there would be a fresh outlook year by year. They had to decide what were the subjects and the kind of knowledge which the ordinary practitioner as distinguished from the specialists might be expected to learn. They had to train practitioners in such a way that they should be able to recognize what after all was one aim of education—the limitations of their own knowledge.

Dr. JAMES A. ADAMS expressed his cordial agreement with what had fallen from Sir George Newman about giving marks to students during their career, which marks would count in the examinations.

After a brief discussion on further procedure, Dr. MACKAY said he would place before his Committee the various suggestions which had been forthcoming.

The PRESIDENT said he must make one remark in defence of the General Medical Council—namely, that by its express regulations (which he read) the freedom of universities and medical schools was respected, and they were encouraged to make experiments, and nothing of a cast-iron character was imposed upon them by the Council. It was a mistake to imagine that the Council laid down a detailed curriculum at every point to which everybody must conform. The Council had never done that, and he did not think it ever would.

The Council then resumed its deliberations as a council (the debate having taken place in a committee of the whole body), and it was agreed that the report be received and adopted; and also that, as the questions raised in the report involved the revision of the whole curriculum in medicine, that the consideration of the methods by which the necessary revision might best be carried out should be remitted to the Education Committee for further report. It was also agreed that copies of the report should be circulated to the teaching bodies.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty:—Surgeon Commanders: H. A. Browning to the *Adamant*; H. M. Langdale to the *Ganges*, for Shotley Sick Quarters; H. L. Penny, O.B.E., to the *Lord*, and as Squadron Medical Officer. Surgeon Lieutenant Commander R. J. Barloe to the *Warspite*.

ARMY MEDICAL SERVICE.

Major G. A. D. Harvey, C.M.G., to be a temporary Deputy Assistant Director-General, vice Major A. B. Smallman, D.S.O., February 5th, 1919 (substituted for notification in the *London Gazette*, March 17th, 1919).

Colonel R. J. Blackham, C.B., C.M.G., C.I.E., D.S.O., is placed on half pay.

ROYAL ARMY MEDICAL CORPS.

Captain J. Y. Moore, O.B.E., retires receiving a gratuity, April 9th, 1920, and is granted the rank of Major (substituted for notification in the *London Gazette*, April 8th, 1920).

Temporary Captains relinquish the acting rank of Major: A. C. S. Courts (March 30th, 1919), J. H. Peek (February 3rd, 1920), D. B. L. Hallett, T. L. Hardy, M. C. Gardner, M.C., F. P. Joselyne, O.B.E., M.C., R. S. Morshead, M.C., J. W. McKiency.

A. W. D. Magee to be temporary Captain, October 7th, 1919 (substituted for the notification in the *London Gazette*, October 27th, 1919).

The following officers relinquish their temporary commissions: Temporary Lieut.-Colonel A. D. Reid, C.M.G. (Captain R.A.M.C.T.F.), July 17th, 1919 (substituted for the notification in the *London Gazette*, August 18th, 1919). Temporary Major F. R. Lucas, T.D. (Major 9th Royal Scots, T.F.). Temporary Captain F. E. Reynolds (Lieutenant, 2/1st Yorkshire Hussars Yeomanry, T.F.).

Lieutenants (temporary Captains) to be Captains: W. M. Cameron, A. G. Harsant, M. StC. Hamilton, A. Rodd.

J. S. F. J. Kerr to be temporary Lieutenant.

The following officers relinquish their commissions:—Temporary Major W. T. F. Davies, C.M.G., D.S.O. on account of ill health, and retains the rank of Major. Temporary Captains and are granted the rank of Major: W. J. Arnold, A. R. Green, H. H. Elliot, M.C., H. B. Woodlyatt. Temporary Captains and retain the rank of Captain: N. A. Hughes, March 15th, 1919 (substituted for notification in the *London Gazette*, April 11th, 1919), D. H. A. Galbraith, M.C., W. A. Coats, C. B. Titchhurst, G. A. Back, C. J. H. Aitken (on ceasing to serve with the South African Native Labour Corps), J. Elder, G. M. Coops, F. R. Stridger, M.C., J. T. McCullagh, W. G. Marsden (on account of ill health contracted on active service), F. H. Kilsoo, J. J. Reynolds, I. W. Jones, M. J. Kelly, J. R. Slack, C. T. Cheate, T. H. Thomas, T. F. B. Reid, E. G. Summers. Temporary Captain R. A. Warters, on transfer to the I.M.S. Temporary Captain J. F. Cooper, and retains the honorary rank of Captain. Temporary honorary Lieutenant A. H. Chu, and retains the honorary rank of Lieutenant.

INDIAN MEDICAL SERVICE.

Lieut.-Colonel B. H. Deare, Officiating Principal and Professor of Medicine, Medical College, Calcutta, and First Physician to the College Hospitals, and Lieut.-Colonel D. McCay, Officiating Professor of Clinical Medicine and Materia Medica, Medical College, Calcutta, and Second Physician to the College Hospitals, are confirmed in those appointments, October 6th, 1919.

Major J. A. Shorten, Officiating Professor of Physiology, Medical College, Calcutta, is appointed *substantively pro tempore* in that appointment, October 6th, 1919.

Temporary Colonel F. A. F. Barardo, C.B.E., C.I.E., to be Civil Surgeon, Simla (East), March 15th.

Lieut.-Colonel Sir Leonard Kozers, Kt., C.I.E., F.R.S., Professor of Pathology, Medical College, Calcutta, granted combined leave for twelve months, March 1st.

Major R. Koozies, Director of the Pasteur Institute and Clinical Research Laboratory, Shillong, appointed to officiate as Professor of Pathology, Medical College, Calcutta, March 1st.

Lieut.-Colonel R. F. Standage, Agency Surgeon, has been granted privilege leave for five months and twenty days, March 10th.

Major E. C. C. Maunsell, Staff Surgeon, Bangalore, appointed to officiate as Residency Surgeon, Mysore, in addition to his own duties during absence on privilege leave of Lieut.-Colonel R. F. Standage.

To be Captains: C. J. Lodge Patch (November 23th, 1919), A. C. Craighead (November 23th, 1919), M. Murphy, M.B., Ch.B. (February 9th, 1920).

To be Lieutenants: R. T. W. Stoney (January 21st, 1920), S. C. Mitchell (January 31st, 1920).

British Medical Association.

EIGHTY-EIGHTH ANNUAL MEETING, CAMBRIDGE, JUNE-JULY, 1920.

President: Sir T. CLIFFORD ALLBUTT, K.C.B., LL.D., M.D., F.R.S., Regius Professor of Physic, University of Cambridge.
Chairman of Representative Meetings: T. W. H. GARSTANG, M.A.Oxon., M.R.C.S.Eng., D.P.H.Vict.
Chairman of Council: J. A. MACDONALD, M.D., M.Ch., LL.D., Hon. Physician, Taunton and Somerset Hospital.
Treasurer: G. E. HASLIP, M.D.

PROGRAMME.

THE Annual Representative Meeting will begin in the Examination Halls on Friday, June 25th, at 10 a.m. The statutory Annual General Meeting will be held in the Examination Halls on Tuesday, June 29th, at 2 p.m. Sir Clifford Allbutt will give his Presidential Address to the Association on Tuesday evening, in the Senate House.

The scientific work of the meeting will be conducted in twelve Sections. The Sections will meet in the New Museums on Wednesday, June 30th, Thursday, July 1st, and Friday, July 2nd. The mornings will be devoted to discussions, and the afternoons to laboratory and clinical demonstrations.

By kind invitation of the Master and Fellows of St. John's College, the Annual Dinner of the Association will be held in the Hall of St. John's College at 8 p.m. on Thursday, July 1st.

The Popular Lecture will be given by Dr. G. S. Graham-Smith, F.R.S., on "Flies," at 8.30 p.m. on Friday, July 2nd.

DEMONSTRATIONS.

Laboratory and clinical demonstrations will be given from 2.30 to 4.30 p.m. (Wednesday, Thursday, and Friday). The Directors of demonstrations are:

Medicine: Dr. ALDREN WRIGHT, 2, Corpus Buildings, Cambridge.
Surgery: Mr. ARTHUR COOKE, M.B., E.Ch.Oxon., Grove Lodge, Cambridge.
Physiology: Professor J. N. LANGLEY, F.R.S., Physiological Laboratory, Cambridge.
Pharmacology: Professor W. E. DIXON, F.R.S., Pharmacological Laboratory, Cambridge.
Neurology: Dr. E. D. ADRIAN, Trinity College, Cambridge.
Pathology: Professor Sir G. SIMS WOODHEAD, Pathological Laboratory, Cambridge.

THE SECTIONS.

The scientific business of the meeting will be conducted in twelve sections, which will meet on the days indicated.

The President, Vice-President, and Honorary Secretaries of each Section constitute a Committee of Reference for that Section, and exercise the power of inviting, accepting or declining, any paper, and of arranging the order in which accepted papers shall be read. Communications with respect to papers should be addressed to one of the Honorary Secretaries.

A paper read in the Section must not exceed fifteen minutes, and no subsequent speech may exceed seven minutes.

Papers are the property of the British Medical Association, and cannot be published elsewhere than in the BRITISH MEDICAL JOURNAL without special permission.

The following twelve Sections have been authorized by the Council:

The Sections will meet from 10 a.m. to 1 p.m.

Sections meeting on three days: Wednesday, June 30, Thursday, July 1, and Friday, July 2.

MEDICINE.

President: Sir HUMPHRY D. ROLLESTON, K.C.B., M.D., F.R.C.P.

Vice-Presidents: THOMAS BEATTIE, M.D., F.R.C.P.; Professor JOHN B. BRADBURY, M.D., F.R.C.P.; Sir THOMAS J. HORDER, M.D., F.R.C.P.; F. W. BURTON-FANNING, M.D., F.R.C.P.; THOMAS LEWIS, M.D., F.R.S.

Honorary Secretaries: A. J. JEX-BLAKE, M.D., F.R.C.P. (13, Ennismore Gardens, London, S.W.7); W. E. HUME, M.D., F.R.C.P. (4, Ellison Place, Newcastle-on-Tyne); E. LLOYD JONES, M.D. (59, Trumpington Street, Cambridge); J. ALDREN WRIGHT, M.D., M.R.C.P. (Director of Demonstrations, 2, Corpus Buildings, Cambridge).

The following programme has been arranged:

June 30th (Morning Session).—Discussion on the Diagnosis of Nervous Disorders of the Stomach and Intestines. To be opened by Dr. A. F. HURST, followed by Sir Clifford Allbutt, Dr. Charles

Bolton (London), Dr. Langdon Brown (London), Dr. Maurice Craig (London), Dr. R. G. Gordon (Bath), Mr. H. Tyrrell Gray (London), Dr. R. Hutchison (London), Dr. Craven Moore (Manchester), Dr. R. J. Buchanan (Liverpool), Dr. E. Hobbhouse (Brighton), Dr. W. J. Tyson (Folkestone), Dr. J. A. Nixon (Bristol), and others.

In the afternoon Mr. J. Barcroft will demonstrate Methods of Analysing the Gases of the Blood and Alveolar Air.

July 1st (Morning Session).—Discussion on the Present Position of Vitamines in Clinical Medicine. To be opened by Professor F. G. HOPKINS, followed by Sir James Barr (Liverpool), Dr. S. M. Copeman (London), Dr. Corry-Mann (London), Dr. A. Croft Hill (London), Dr. C. J. Martin (London), Dr. Eric Pritchard (London), Dr. J. C. Drummond (London), Mr. A. Harden (London), Lieut.-Colonel McCarrison, I.M.S., Dr. W. L. Mackenzie Wallis (London), Dr. G. F. Still (London), Dr. R. H. Wilcox (London), Dr. Leonard Williams (London), and others.

July 2nd (Morning Session).—Discussion on the Clinical Significance and Course of Subacute Bacterial Endocarditis. To be opened by Sir THOMAS HORDER, followed by Dr. Carey Coombs (Bristol), Dr. J. M. Cowan (Glasgow), Dr. H. S. French (London), Dr. A. G. Gibson (Oxford), Dr. A. E. Gow (London), Dr. A. J. Hall (Sheffield), Dr. J. Hay (Liverpool), Dr. F. J. Poynton (London), Dr. H. J. Starling (Norwich), Dr. W. E. Hume (Newcastle), and others.

An exhibition of specimens illustrating the subject of this discussion will be held in the Pathological Museum.

SURGERY.

President: Sir GEORGE H. MAKINS, G.C.M.G., C.B., F.R.C.S.
Vice-Presidents: HARRY LITTLEWOOD, C.M.G., F.R.C.S.; Sir CUTHBERT S. WALLACE, K.C.M.G., C.B., F.R.C.S.; GEORGE EDWARD WHERRY, M.Ch., F.R.C.S.; DAVID PERCIVAL D. WILKIE, F.R.C.S.Edin.

Honorary Secretaries: W. H. BOWEN, M.S., F.R.C.S. (24, Lensfield Road, Cambridge); ARTHUR COOKE, F.R.C.S., Grove Lodge, Cambridge (Demonstration Secretary); G. E. GASK, C.M.G., D.S.O., F.R.C.S. (41, Devonshire Place, London, W.1); GORDON TAYLOR, O.B.E., M.S., F.R.C.S. (15, Harley Street, London, W.1).

The following programme has been arranged:

June 30th (10 a.m.).—Discussion: Surgical Treatment of Gastric Ulcer. To be opened by Sir BERKELEY G. A. MOYNIHAN, K.C.M.G., C.B., and Dr. CHARLES H. MAYO. (12 noon).—Paper: Mr. FRANK KIDD, Treatment of Calculi of the Lower Third of the Ureter.

July 1st (10 a.m.).—Discussion: Surgical Treatment of Cancer of the Rectum. To be opened by Mr. W. ERNEST MILES and Mr. GREY TURNER. (12 noon).—Paper: Lieut.-Colonel R. H. ELLIOT, Diagnosis of Glaucoma.

July 2nd (10 a.m.).—Discussion: End-Results of Injuries to the Peripheral Nerves treated by Operation. To be opened by Sir WILLIAM THORBURN, K.B.E., C.B., C.M.G., and Mr. PERCY SARGENT, C.M.G., D.S.O. (12 noon).—Paper: Mr. HERBERT TILLEY, Inflammatory Lesions of the Nasal Accessory Sinuses from the Standpoint of the General Physician and Surgeon.

Demonstrations will be given in the afternoons by Major Maurice Sinclair, C.M.G., on the Treatment of Fractures; by Mr. H. D. Gillies, C.B.E., and Mr. Percival Cole, on Plastic Surgery of the Face; by Mr. Herbert Tilley, on Endoscopy of the Lower Air Passages and Gullet, and by Mr. Arthur Cooke, on the Technique of Blood Transfusion. On Thursday afternoon, July 1st, Lieut.-Colonel R. H. Elliot will give a demonstration on the diagnosis of glaucoma.

Those who wish to take part in any of the surgical discussions are asked to send their names to one of the secretaries as soon as possible.

NEUROLOGY AND PSYCHIATRY.

President: HENRY HEAD, M.D., F.R.S.

Vice-Presidents: GORDON M. HOLMES, C.M.G., M.D., F.R.C.P.; W. H. RIVERS RIVERS, M.D., F.R.S.; LEWIS E. SHORE, M.D.; T. GRAINGER STEWART, M.D., F.R.C.P.; THEODORE THOMPSON, M.D., F.R.C.P.

Honorary Secretaries: E. D. ADRIAN, M.D., M.R.C.P. (Trinity College, Cambridge); E. FARQUHAR BUZZARD, M.D., F.R.C.P. (78, Wimpole Street, London, W.1); GEORGE RIDDOCH, M.D., M.R.C.P. (10, Alba Gardens, Golders Green, London, N.W.4).

The following preliminary arrangements have been made:

June 30th (Morning Session).—Discussion on the Early Signs of Nervous Disease and their Interpretation. To be opened by HENRY HEAD, M.D., F.R.S.

July 1st (Morning Session).—Discussion on Dementia Praecox and its Relation to other Conditions. To be opened by BERNARD HART, M.D.

July 2nd (Morning Session).—Discussion on Psychotherapy. To be opened by T. A. ROSS, M.D.

Demonstrations are being arranged for two afternoons; particulars will be announced later.

PATHOLOGY AND BACTERIOLOGY.

President: Professor J. LOBBAIN SMITH, M.D., F.R.S.

Vice-Presidents: J. A. ARKWRIGHT, M.D., F.R.C.P.; LOUIS COBBETT, M.D., F.R.C.S.; MERVYN H. GORDON, C.M.G., M.D.; T. S. P. STRANGEWAYS, M.R.C.S., L.R.C.P.

Honorary Secretaries: A. E. CLARK-KENNEDY, M.R.C.S., L.R.C.P. (Corpus Christi College, Cambridge); A. E. GOW, M.D., F.R.C.P. (37, Queen Anne Street, London, W.1); HELEN INGLEBY, M.B., M.R.C.P. (44, Welbeck Street, London, W.1).

The following discussions have been arranged during the mornings:

June 30th.—Atrophy of the Liver. To be opened by Professor STUART McDONALD, M.D., F.R.C.P. (Newcastle-upon-Tyne).

July 1st.—The Present Position of Cancer Research. To be opened by J. A. MURRAY, M.D., Director, Imperial Cancer Research Fund.

July 2nd.—The Bacteriology of Cerebro-spinal Meningitis. To be opened by J. A. ARKWRIGHT, M.D., F.R.C.P., Assistant Bacteriologist, Lister Institute of Preventive Medicine. (A collection of specimens to illustrate the subject under discussion will be available.)

The afternoons will be devoted to meetings of the Pathological Society of Great Britain and Ireland, when papers will be read and demonstrations given.

PHYSIOLOGY AND PHARMACOLOGY.

President: Professor F. GOWLAND HOPKINS, M.B., F.R.S.

Vice-Presidents: H. H. DALE, C.B.E., M.D., F.R.S.; Professor J. A. GUNN, M.D.; Professor D. NOEL PATON, M.D., F.R.S.; F. RANSOM, M.D.; Professor J. N. LANGLEY, Sc.D., F.R.S.; Professor W. E. DIXON, M.D., F.R.S.

Honorary Secretaries: D. V. COW, M.D. (The Bridge House, Great Shelford, Cambridge); Professor EDWARD MELLANBY, M.D. (32, Addison Mansions, Kensington, London, W.14).

The following provisional arrangements have been made:

June 30th.—Discussion on Acidosis in Disease. To be opened by Professor F. GOWLAND HOPKINS, F.R.S.

July 1st.—Discussion on the Physiology and Treatment of Degenerated Muscle. To be opened by Professor J. N. LANGLEY, Sc.D., F.R.S.

July 2nd.—Discussion on Quinine and its related Alkaloids in Pharmacology and Therapeutics. To be opened by Professor W. E. DIXON, F.R.S.

The following Sections meet on Wednesday only.

NAVAL AND MILITARY.

President: Colonel JOSEPH GRIFFITHS, C.M.G., M.D., F.R.C.S.

Vice-Presidents: Lieut.-Colonel E. J. CROSS, R.A.M.C.T.; Lieut.-Colonel R. H. ELLIOT, M.D., D.Sc., I.M.S. (ret.); Surgeon Commander H. W. B. SHEWELL, R.N.; Surgeon Rear Admiral A. GASCOIGNE WILDEY, C.B., R.N.

Honorary Secretaries: Major A. S. M. MACGREGOR, O.B.E., M.D., R.A.M.C.T. (Sanitary Chambers, Glasgow); Major H. B. RODERICK, O.B.E., M.Ch., M.D., R.A.M.C.T. (17, Trumpington Street, Cambridge); Lieut.-Colonel F. E. APHORPE WEBB, O.B.E. (Grafton House, Maid's Causeway, Cambridge).

The following programme has been arranged:

June 30th.—10 a.m., Discussion on the Army Medical Service and its Relation to the Education and Training of Newly Qualified Medical Men. To be opened by the PRESIDENT. Papers on interesting subjects relating to the war will be read, particulars of which will appear later. 2.30 p.m., The Naval, Military, and Air Force Medical Services will exhibit the new inventions and equipments that arose during the Great War. Each department will be fully represented, and each will be in charge of an officer who will be prepared to demonstrate and explain the exhibits.

OBSTETRICS AND GYNAECOLOGY.

President: HERBERT WILLIAMSON, M.B., F.R.C.P.

Vice-Presidents: FREDERICE DEIGHTON, M.B.; J. PRESCOTT HEDLEY, M.Ch., F.R.C.S.; FRANCES IVENS, M.B., M.S.

Honorary Secretaries: MALCOLM DONALDSON, M.B., F.R.C.S. (145, Harley Street, London, W.1); W. R. GROVE, M.D. (St. Ives, Hunts).

June 30th.—Discussion on Puerperal Sepsis. (1) Mr. VICTOR BONNEY (London): Introductory paper. (2) Mr. H. BECKWITH WHITEHOUSE (Birmingham): Surgical Treatment of Uterus in Puerperal Sepsis. (3) Dr. A. E. GOW (London): Intravenous Protein Therapy in Treatment of Puerperal Septicæmia. (4) Dr. LEITH MURRAY (Liverpool): Use of Serums and Vaccines in the Treatment of Puerperal Sepsis.

July 1st.—At 10 a.m. there will be a joint session with the Section of Electro-Therapeutics to discuss the Treatment of Fibroids by X Rays. The discussion will be opened by Dr. R. KNOX.

Demonstrations will be given on Wednesday, June 30th, by Dr. R. Mackenzie Wallace on diastase reaction, and by Mr. M. S. MAYON, F.R.C.S., on the treatment of ophthalmia neonatorum.

TROPICAL MEDICINE.

President: Professor G. H. F. NUTTALL, M.D., F.R.S.

Vice-Presidents: BRADALBANE BLACKLOCK, M.D.; Lieut.-Colonel S. PRICE JAMES, M.D., I.M.S.; P. H. MANSON-BAHR, M.D.

Honorary Secretaries: CHARLES FREDERICK SEARLE, M.D. (67, Bridge Street, Cambridge); J. GORDON THOMSON, M.B. (24, Herne Hill, London, S.E.24).

The following programme has been arranged:

June 30th (Morning Session).—Papers to be followed by discussions: 9 a.m.—(1) Problem of Filariasis, by Drs. STEPHENS and YORKE. 10 a.m.—(2) Role of *F. banerofti* in the Production of Lymphatic Obstruction and a Consideration of Elephantiasis from the Pathological Standpoint, by Dr. G. C. LOW and Dr. P. H. MANSON-BAHR, D.S.O. 11 a.m.—(3) Dietetic Deficiency and Endocrine Activity, with Special Reference to Deficiency Oedemas, by Lieut.-Colonel ROBERT MCCARRISON, I.M.S.

Demonstrations.—In the afternoon there will be the following demonstrations: 2.30 p.m.—(1) Parasitic Worms, by Dr. R. T. LEIPER. 3 p.m.—(2) Exhibition Collection of all known species of Tsetse Flies, with demonstration dealing with the Morphology and Bionomics, by Professor NEWSTEAD. 3.30 p.m.—(3) Demonstration of the Use of the Mobile Laboratory for Malarial Inquiries in England, by Colonel S. P. JAMES. Dr. Gaskell will demonstrate his malarial slides. 4 p.m.—(4) Paintings illustrating the Treatment of Leprosy, by Lieut.-Colonel Sir LEONARD ROGERS, C.I.E., F.R.S., I.M.S.

At 2.30 p.m. on June 30th Dr. W. HUNTER, C.B., will give a lantern lecture in the Zoological Lecture Room, entitled "Serbia under Typhus in 1915: The Story of a Great Epidemic and its Arrest."

There will also be an exhibition of Portraits of Parasitologists, collected by Professor Nuttall.

Lieut.-Colonel R. McCarrison will exhibit illustrations dealing with his paper on dietetic deficiency and endocrine activity, with special reference to deficiency oedemas.

The following Sections meet on Thursday only.

MEDICAL EDUCATION.

President: Sir GEORGE NEWMAN, K.C.B., M.D., F.R.C.P.

Vice-Presidents: G. S. GRAHAM-SMITH, M.D., F.R.S.; Professor DAVID HEPBURN, C.M.G., M.D.; THOMAS W. SHORE, M.D.; S. SQUIRE SPRIGGE, M.D.; Professor PETER THOMPSON, M.D.

Honorary Secretaries: S. R. GLOYNE, M.D. ("Hatherley," Chalfont St. Giles, Bucks); Professor J. KAY JAMIESON, M.B. (Dean of Faculty of Medicine, Leeds).

The following programme has been arranged:

July 1st (10 a.m. to 1 p.m.).—Address by the PRESIDENT. Discussion: Preliminary Scientific Education in the Medical Curriculum. Openers: Prof. S. J. HICKSON, D.Sc., F.R.S. (Biology); Prof. ARTHUR KEITH, M.D., F.R.S. (Anatomy); Prof. SIR ERNEST RUTHERFORD, D.Sc., F.R.S. (Physics); Prof. J. LOBBAIN SMITH, M.D., F.R.S. (Pathology); Prof. A. SMITHELLS, C.M.G., F.R.S. (Chemistry).

VENEREAL DISEASES.

President: E. B. TURNER, F.R.C.S.

Vice-Presidents: Colonel L. W. HARRISON, D.S.O., M.B.; MORNA L. RAWLINS, M.B.

Honorary Secretaries: W. H. HARVEY, M.D. (The Dene, Great Shelford, Cambridge); OTTO MAY, M.D. (19, Well Walk, Hampstead, London, N.W.3).

The following programme has been arranged:

July 1st (10 a.m.).—Discussion on Venereal Diseases in Women and Children: (1) Dr. MORNA RAWLINS: Treatment of Venereal Disease in Women. (2) Dr. LEONARD FINDLAY: Venereal Diseases in Children.

Demonstrations.—In the afternoon there will be a clinical demonstration at the Venereal Diseases Clinic, Addenbrooke's Hospital, and a laboratory demonstration in the Medical Schools under the direction of Mr. J. E. BARNARD.

The following Sections meet on Friday only.

ELECTRO-THERAPEUTICS.

President: ALFRED ERNEST BARCLAY, M.D.

Vice-Presidents: ROBERT KNOX, M.D.; ALFRED CHARLES JORDAN, M.D., M.R.C.P.

Honorary Secretaries: E. P. CUMBERBATCHE, M.B., M.R.C.P. (15, Upper Wimpole Street, W.1); F. SHILLINGTON SCALES, M.D. ("Redcourt," Adams Road, Cambridge).

The following programme has been arranged:

July 2nd.—Presidential address by Dr. A. E. BARCLAY: Place of the Radiologist in Medicine. Discussion on the Diagnosis and Treatment of Paralysis caused by Nerve Injury, to be opened by Mr. H. S. SOUTTAR, F.R.C.S. Papers: Dr. ROBERT KNOX, Tumours of the Chest; Dr. HOWARD HUMPHRIS, Use of the Melted Paraffin Wax Bath and the Tungsten Arc Light; Dr. E. P. CUMBERBATCHE, Treatment by Diathermy of Intravesical Growths and Ulcers of the Urinary Bladder; Professor J. GOODWIN TOMKINSON, M.D., X-ray Therapy in Oriental Sore; Dr. S. GILBERT SCOTT, Diagnostic Value of the Renal Outlines and the Method of Determining the Relation of Abnormal Shadows to them. Joint Discussion with Section of Obstetrics and Gynaecology, on Treatment of Uterine Fibroids; to be opened by Dr. ROBERT KNOX on July 1st at 10 a.m.

MEDICAL SOCIOLOGY.*President:* G. E. HASLIP, M.D.*Vice-Presidents:* H. B. BRACKENBURY, M.R.C.S., L.R.C.P.; ADAM FULTON, M.B.; C. O. HAWTHORNE, M.D.; Professor BENJAMIN MOORE, D.Sc., F.R.S.*Honorary Secretaries:* S. MORTON MACKENZIE, M.B. (9, Rose Hill, Dorking); C. M. STEVENSON, M.D. (90, Chesterton Road, Cambridge).*July 2nd (10 a.m.).*—Sir GEORGE NEWMAN, K.C.B., M.D., F.R.C.P., will open a discussion on The Future of Medical Practice, dealing with the subject from the point of view of the State. The discussion will be continued by Sir WILMOT HERRINGHAM, K.C.M.G., C.B., M.D., F.R.C.P., from the standpoint of the Consultant; Dr. ALFRED LINNELL from that of the General Practitioner; Professor F. GOWLAND HOPKINS, F.R.S., D.Sc., F.R.C.P., from that of Medical Research, and Mr. E. W. MORRIS, C.B.E., House Governor London Hospital, from that of The Hospitals.**PATHOLOGICAL MUSEUM.***Committee:* Sir GERMAN SIMS WOODHEAD, K.B.E. (Chairman), Dr. L. COBBETT, Dr. G. S. GRAHAM-SMITH, Dr. W. H. HARVEY, Mr. T. S. P. STRANGEWAYS, and Dr. H. B. RODERICK, M.Ch. (Honorary Secretary).

The Pathological Museum arranged in connexion with the meeting will occupy a central position in two temporary buildings in the first court of the Medical Schools. It is proposed to arrange the material under the following heads: (1) Exhibits bearing on discussions and papers in the various Sections. (2) Specimens and illustrations relating to any recent research work. (3) Individual specimens of special interest or a series illustrating some special subject. (4) Instruments or appliances relating to clinical diagnosis and pathological investigation. There will also be a series of exhibits illustrative of war specimens, arthritis, cerebro-spinal meningitis, and parasitology.

Communications regarding material for exhibition should be addressed to Dr. H. B. Roderick, at the Surgical Department, Medical School, Cambridge.

ACADEMIC DRESS OR UNIFORM.

In addition to the reception given in King's College by the Cambridge and Huntingdon Branch of the British Medical Association on Tuesday evening, after the delivery of the President's address, the Vice-Chancellor of the University will hold a reception at Emmanuel College on Wednesday at 9 p.m. The Mayor of Cambridge will give a reception on Thursday afternoon at Christ's College at 4.30 p.m. On Friday evening, at 9 p.m., a reception will be given at Trinity College by the Master and Fellows.

It is hoped that members will wear academic dress or uniform on the following occasions:

Tuesday, June 29th.

3.30 p.m.—Congregation for Honorary Degrees in the Senate House.

5 p.m.—Service in Great St. Mary's Church. Preacher, the Bishop of Ely.

8.30 p.m.—President's Address in the Senate House, and Branch Reception at King's College.

10 p.m.—Presentation of President's portrait.

Wednesday, June 30th.

9.30 a.m.—Mass at Roman Catholic Church, Hyde Park Corner.

5 p.m.—Free Church Service in Emmanuel Congregational Church, Trumpington Street.

9 p.m.—Vice-Chancellor's Reception at Emmanuel College.

Thursday, July 1st.

4.30 p.m.—Reception by the Mayor at Christ's College.

Friday, July 2nd.

9 p.m.—Reception in Trinity College.

Those desiring to have robes provided for them at Cambridge should communicate in advance with Messrs. Ede, Son and Ravenscroft, 93 and 94, Chancery Lane, London, W.C.; Messrs. Wm. Northam, 9, Henrietta Street, London, W.C.; or Messrs. Ravenscroft and Willis, 4, Hardman Street, Liverpool.

EXCURSIONS.

The following programme of local excursions has been arranged:

*Wednesday, June 30th.**Sawston Hall.*—For motorists using own cars: 2 to 5. Tea will be provided by D. L. Huddleston, Esq.*Saffron Walden.*—By motor, leaving the Guildhall at 2 p.m. Tea provided by the Mayor and a Committee.*Field Laboratories, Milton.*—By motor from Guildhall at 2 p.m. Dr. A. Stanley Griffith will give a demonstration of cultures, etc., and the Superintendent, Mr. C. Fox, will give a short account of administration and exhibit the buildings.*The Dykes.*—Prehistoric earthworks: The Devil's Dyke and Fleam Dyke. By motor from Guildhall at 2 p.m. Professor J. E. Marr and the Rev. Dr. H. P. Stokes will accompany the party. Picnic tea on the Fleam Dyke.*Ely.*—By train, 1.25 p.m. Canon Kennett will conduct the party over the Cathedral. Tea at the Palace, by invitation of the Bishop and Mrs. Chase.*Thursday, July 1st.**The University Experimental Farm.*—By motor, 2 p.m., Guildhall. Demonstrations by Professor R. H. Iffen, F.R.S., and the Director, Mr. K. J. J. Mackenzie, M.A. Tea at the Farm, by invitation of the University Board of Agricultural Studies and the Director.*Cambridgeshire Tuberculosis Colony.*—Papworth Hall. By motor, 2 p.m., Guildhall. The Resident Medical Officer, Dr. P. Varrier-Jones, will meet the party at Papworth; tea at Croxton Park, by invitation of Sir Douglas and Lady Newton.*Friday, July 2nd.**The University Experimental Farm.*—By motor, 2 p.m., Guildhall. Arrangements as for Thursday's excursion.*Hinchinbrooke.*—The Earl of Sandwich will entertain party to tea. By train, 1.31 p.m.*The Dykes.*—By motor, 2 p.m., Guildhall. Arrangements as for Wednesday's excursion.*Ely.*—By train, 1.25 p.m. The Dean will conduct the party over the Cathedral.*Saturday, July 3rd.**River Excursion.*—Wicken Fen. Motor launch leaves Victoria Bridge at 9 a.m. Miss E. R. Saunders and Dr. C. Searle will accompany the party. Lunch and tea on board.*Newmarket.*—The King's Stables, Egerton House. By motor, Senate House, 10 a.m. Lunch at Newmarket and visit to the Heath.**GOLF.**

The Gog Magog Golf Club has made members of the British Medical Association honorary members during the meeting. An honorary member will be allowed to introduce other visitors, including ladies, on payment of the green fee. The competition for the Ulster Cup will take place on Thursday, July 1st. Entries, with particulars of club and handicap, should be sent to the captain of the club, Dr. W. S. Cole, Latham Road, Cambridge. It is proposed to arrange a ladies' competition on Friday morning.

ARRANGEMENTS FOR ACCOMMODATION.

The arrangements are now complete for the accommodation of members of the Association for the Annual Meeting at Cambridge from June 25th to July 3rd. The authorities of each college have kindly placed at the disposal of the local committee a large number of undergraduates' rooms. The accommodation in hotels is already fully booked.

Colleges.

Only those members who are unaccompanied by ladies can be given rooms in a college. Each member will be assigned a set of undergraduate's rooms, with the services of a college bedmaker or gyp, and with breakfast, luncheon, tea, and dinner served in the College Hall at the inclusive charge of 14s. 6d. per diem. Those members who wish to stay in a college should address their applications to:

The General Secretaries, British Medical Association,
The Medical School, Cambridge,

not to a particular college. It is important they should give the date of their arrival. Cambridge men who desire to stay in their old college should apply without delay. The authorities of Newnham College have kindly offered to accommodate the lady members of the Association with rooms and meals at the inclusive charge of 10s. 6d. a day; application should be made only to the General Secretaries. Members who are going to stay in Cambridge are asked to remember that sugar is still rationed, and is difficult to obtain, and they should therefore bring their own supply.

Rooms are still available in many of the colleges, but early application should be made.

Lodgings.

Members who wish to stay in lodgings should write directly to the lodging-house keepers. A revised list of lodgings was printed in last week's SUPPLEMENT. When they have made their arrangements members are requested to inform the General Secretaries what their Cambridge address will be. Members who have found any difficulty in arranging lodgings should now apply to the General Secretaries, who will find accommodation for them.

Many of the lodging-houses are unable to provide luncheon, and most of them unable to provide dinner. A few of the colleges will be able to admit to luncheon and to dinner members (and ladies accompanying them) staying in lodgings, but the number of seats in these college halls being strictly limited, tickets for these meals must be obtained beforehand. Details as regards the issue of these tickets will be given in the Reception Room at the Guildhall during the meeting.

A lecture on Medical Missionary Work in China will be delivered on Wednesday, June 30th, at 4 p.m., by Dr. H. Gordon Thompson, C.M.S. missionary in China, at Queens' Lodge, by kind permission of the President and Mrs. Fitzpatrick. The chair will be taken by Dr. H. B. Roderick, O.B.E. Tickets can be obtained from Mrs. Knott, 8, Cranmer Road, Cambridge.

GENERAL COUNCIL

OF

MEDICAL EDUCATION AND REGISTRATION.

SUMMER SESSION, 1920.

Sir DONALD MACALISTER, K.C.B., President,
in the Chair.

THE TEACHING OF PRACTICAL MIDWIFERY.

DR. J. Y. MACKAY (Chairman of the Education Committee) moved the adoption of a report on practical midwifery.

The report contained the replies of teaching institutions to an inquiry addressed to them from the General Medical Council asking how far they had been able to carry out the Council's recommendations with regard to the midwifery practice to be required of candidates for a licence, and also calling attention to the report of the Section of Obstetrics and Gynaecology of the Royal Society of Medicine on the teaching of these subjects to medical students and graduates in London.

The recommendations of the Council referred to were that every student, before commencing the study of practical midwifery, should have held the offices of clinical medical clerk and surgical dresser, and should have attended a course of lectures on surgery and midwifery; and that he should be required to present a certificate showing that he had conducted twenty cases of labour under official medical supervision and subject to certain specified conditions.

The replies received showed that the principles of these recommendations were very generally complied with, but that difficulties in carrying them out centred around deficiency of lying-in beds and of lying-in cases. The Education Committee believed that the present difficulties might be greatly alleviated by the utilization of beds in Poor Law institutions under skilled instruction, and so far as deficiency of cases was concerned, by the limitation of candidates for the certificates of the Central Midwives Board to pupils who had given an undertaking to engage in practice as midwives for not less than three years after their qualification. It was explained that a large number of women who were trained for the examinations of the Central Midwives Board never intended to practise as midwives, and therefore the cases allotted to these women, so far as the primary requirements of the State for the care and safe delivery of mothers were concerned, were in a sense wasted. In some twelve years, according to Sir Francis Champneys, these "wasted" cases had amounted to more than 350,000. The Committee recommended that a communication be addressed to the Ministry of Health and the Boards of Health of Scotland and Ireland begging that steps might be taken in these two directions. The teaching of midwifery, added the Committee, could never be satisfactory until students received it at the bedside and until it was as thorough and practical as that of surgery, and such teaching would only be possible when large lying-in hospitals were rendered available throughout the country.

Sir FRANCIS CHAMPNEYS, who had prepared a special report on the subject which was embodied in the Committee's report, said that midwifery was more directly associated with preventive medicine than any other branch of medicine or surgery. Early obstetrics was concerned almost entirely with the removal of obstructions, and therefore was almost exclusively surgical, but the modern development of midwifery had been largely bacteriological and more a medical than a surgical development. This had come to the front very much in regard to the toxæmias of pregnancy. Gynaecology was largely in practice the clearing up of the débris of bad midwifery. If midwifery were good a great part of gynaecological practice would become unnecessary. A reduction of 50 per cent. in the cases treated in gynaecological practice would take place if the effects of bad midwifery and of gonorrhœa were excluded. With regard to the replies received by the Council, it was evident that the first necessity was a large increase in lying-in beds, without which adequate instruction at the bedside was impossible. Any reduction in the number of cases or relaxation in the requirements concerning the manner of their attendance by students would result in a lowering of the standard of obstetric education. The student must live in an atmosphere of obstetrics, and it was important that there should be enough beds to furnish a fair certainty of continuous cases being delivered. This practical instruction stood between the woman and puerperal fever. Between two-thirds and three-fourths of the women confined in the British Isles were attended by

midwives. An immediate provision of beds in sufficient numbers to supply the needs of medical students was probably impossible, though the utilization of beds in Poor Law institutions might help. Very small maternity homes could not be utilized for teaching. The lying-in beds now available at the London medical schools would not suffice for the complete education of all their students. The passing of the Midwives Act in 1902 was followed by a permanent drop in puerperal mortality, and improved practical teaching of midwifery to medical students might result in a further improvement in the puerperal statistics. He had tried to get the Registrar-General to give space in death certificates in cases connected with childbirth so as to show by whom the woman was delivered, but he was told there was no room for this, though he believed the matter was still under consideration. Some most useful data would be forthcoming if this could be done. He suggested a redistribution of beds in general hospitals, and a measure of pooling whereby students from smaller hospitals might receive their training at some of the larger institutions; besides this, the Poor Law institutions might be utilized, the teaching being put into the hands of experts.

Dr. DEAN said that in Manchester, where there was the largest lying-in hospital in the country, the recommendations of the Council had been for many years strictly carried out.

Mr. E. B. TURNER said that the practice of midwifery for normal labours was passing more and more into the hands of qualified midwives. The medical practitioner who practised among the lower middle classes and hand-working classes was becoming more and more a consultant so far as childbirth was concerned. The increasing disinclination of practitioners to interest themselves in midwifery might be due to the perfunctory and unsatisfactory nature of their instruction when students. No man should be trusted to look after a woman in this emergency unless he was really as much qualified to take part in it as to remove an appendix. He hoped that the provisions of the scheme outlined by the Consultative Medical Council might be utilized. The secondary health centres might have attached to them large and efficient lying-in wards, and there might also be out-patient provision for pre-maternity work.

Sir GILBERT BARLING hoped that reform in this matter would not have to wait until the millennium. The most hopeful note in the report was the statement that the Poor Law institutions were prepared to come to their aid. Poor Law authorities were most willing to promote what was desired, and he understood that they did this with the concurrence of the Minister of Health, so that it was an open door which was being pushed. The teaching of midwifery must not be divorced from the teaching of diseases of women. Most gynaecological work arose out of midwifery, and if these midwifery clinics were set up there would have to be gynaecological beds with them. It was not desirable to train midwives and medical students in the same institution; either one or the other suffered injustice.

Dr. MATTHEW HAY pointed out that women did not care to go to Poor Law institutions, and a certain stigma would have to be removed before this plan could be brought into operation. He thought that the recommendation might be widened to include maternity institutions generally which might be the recipients of grants.

Sir GEORGE NEWMAN said that many proposals came before the Ministry of Health for the establishment of maternity hospitals and homes, but the building of such institutions was likely to be postponed for some time until the building of dwelling houses was further advanced. It was therefore to be desired that institutions now available, or those which might be made available without any capital expenditure, should be used forthwith. Quite half the general beds in this country were in the possession of the Poor Law authorities. They numbered approximately 90,000, and of these, 30,000 were in institutions which might be available for hospitals; the remainder were scattered beds, not in hospital form, and not convenient for the purpose. There was an increasing demand by public opinion in this country for a greatly improved maternity and midwifery service. The two great requirements were, first, more beds, which they might hope to get along the lines of this report, and secondly, an improved use of the available cases. The 90,000 beds provided under the Poor Law were for persons receiving Poor Law relief. The Minister had in view certain measures which would have the effect of bringing about such changes as would lift the greater part, if not the whole, of the Poor Law stigma. The Ministry of Health had now before it various proposals, and he hoped it might be part of its policy to see that these beds were made available.

The PRESIDENT said that in Scotland the central Poor Law authority had no power to order that a given maternity hospital under the Poor Law should be made available for clinical instruction; that rested as to initiative with the local authority. He was informed that the central authority was most anxious that the Poor Law maternity institutions should be made available and that a change was coming over the local authorities, who were taking steps to secure the recognition of their institutions for clinical purposes. He had reason to believe that something of the same kind was true of England; of the position in Ireland he knew nothing. He understood that some of the maternity institutions administered under the Poor Law were admirably equipped, well built, and furnished, and in regard to their arrangement were not inferior to the best maternity hospitals, and, moreover, were constantly supplied with cases.

Dr. MAGENNIS said that in Ireland there was not a single Poor Law institution which would be a suitable place.

Sir NORMAN MOORE thought it very important that it should be brought before the public that some of these splendid hospitals which came under the Poor Law designation could be put to the very best use.

Ultimately it was agreed, on Sir John Moore's amendment, to leave out the reference to Ireland, and the recommendation read:

That a communication be addressed to the Ministry of Health and the Board of Health of Scotland begging that steps may be taken for the utilization of existing Poor Law lying-in institutions for clinical instruction, and that such instruction shall be placed in the hands of experts, and calling attention to the desirability of limiting the acceptance of candidates for the C.M.B. certificates to those who give an undertaking to engage in the practice of midwifery for not less than three years after their qualification.

The recommendation was adopted, as was a further recommendation that the attention of teaching institutions be again drawn to the recommendations of the Council issued in 1906 on the requirements with regard to midwifery practice, in the hope that when the present difficulties in training are alleviated all the institutions may be able to carry out the recommendations in their entirety.

REPORTS OF COMMITTEES.

Professional Examinations.

Dr. NORMAN WALKER moved the adoption of a report from the Examination Committee on the inspection of the examinations of the Apothecaries' Hall, Dublin, in 1919. This was a report by Dr. Finny, the Council's deputy, and was of a favourable character. The deputy commended the efforts of the Apothecaries' Hall to improve the scope of the Final Examination in Medicine by adding a special examination in medical methods for the first time. He felt sure that the high tone of the examiners would have the effect, if persevered in, of elevating the examination to the level of those of the Royal Colleges, and that no candidate would be placed on the *Register* who was not so qualified by professional studies and examinations. He objected, however, to the piecemeal methods by which some candidates became qualified, and thought it unfortunate that they did not take their examinations consecutively in the Hall, from the Primary to the Final.

The report was adopted.

Dr. WALKER then moved the adoption of a further report by the Examination Committee on the analysis of the annual tables of examinations for 1919, and on instruction in ophthalmology. It was recommended by the Committee (and endorsed by the Council) that on economical grounds the printing of annual tables of examinations should be discontinued, but that the respective Committees should report on them annually and that they should be accessible in manuscript.

The report stated that the Committee had noticed a tendency for the amount of information given by the licensing bodies under the three heads of Operative Surgery, Ophthalmic Surgery or Ophthalmology, and Mental Diseases to diminish. The returns showed that sixteen examining bodies did not allude to the first of these subjects, sixteen did not allude to the second, and nine did not allude to the third. Three stated that operative surgery was included under surgery, three that ophthalmic surgery was included under surgery, and five that mental diseases were included under medicine. One stated that there was no special examination in ophthalmology, and one that there was no special examination in mental diseases.

The Committee recommended, and the Council agreed:

That the licensing bodies which have not hitherto supplied in the return information as to whether they do or do not examine in operative surgery, ophthalmology, and mental diseases be asked to do so in future.

Dr. WALKER said that reports were still lacking from some licensing bodies to show how far their regulations

were in accordance with the Council's recent recommendation in regard to the teaching of ophthalmology—namely, that every student should be required to attend a course of practical instruction in ophthalmology of not less than ten weeks' duration and that no student should be admitted to the final examination unless he presented a certificate to the effect that he had attended such a course regularly and that his work in connexion therewith had reached a satisfactory standard. Replies on this subject from eighteen licensing and teaching bodies were given in an appendix to the Committee's report.

The Council agreed to the usual recommendation that the Apothecaries' Hall, Dublin, be requested to furnish tables of exemptions from and results of examinations as heretofore, and then the report of the Examination Committee as a whole was put to the Council and adopted.

Dr. WALKER stated that reports on the inspection of final examinations had been received from inspectors in regard to the examinations of the Conjoint Board in England on medicine, surgery, and midwifery, and the Apothecaries' Society of London on medicine and surgery, but it was decided to defer detailed remarks upon them until reports in regard to other bodies had been received so that a review of the examinations as a whole might be possible.

The Council then considered various matters *in camera*, and on the resumption of the public sitting a report by the Education Committee was adopted in which it was stated that replies had been received from twenty-six licensing and teaching bodies to the Council's inquiry as to the instruction now being given to students on the duties devolving upon practitioners in their relationship to the State, and on the generally recognized rules of medical ethics. In general the replies indicated that the recommendations of the Council were given effect to.

PUBLIC HEALTH COMMITTEE.

Sir JOHN MOORE moved the report of the Public Health Committee, which contained a reference to communications from the Director-General of the Medical Department of the Admiralty on the question of facilities for medical officers in the navy. The Director-General stated that the question of extended study leave to medical officers in the navy who desired to take the diploma in public health was under consideration, and he also forwarded a copy of the syllabus of instruction for two months at the Royal Naval Medical College, Greenwich, of medical officers before the promotion examinations.

The Council approved the instructions. It was also agreed that the course in hygiene at the Royal Medical School, Greenwich, required for promotion in the Royal Navy Medical Service be considered equivalent to the instruction given by a teacher or teachers in the department of public health of a recognized medical school under Rule 3, Note 1 (1).

The PRESIDENT said that the equivalent to this last proposal already held good in the case of the Army.

The report as a whole was then adopted.

STUDENTS' REGISTRATION COMMITTEE.

Sir NORMAN MOORE submitted the report of the Students' Registration Committee, which contained an exceptional number of antedated registrations, mainly owing to the interruption of the war and to exemptions granted in respect of preliminary examinations. The report was adopted.

DENTAL EDUCATION AND EXAMINATION COMMITTEE.

Sir JAMES HODSDON, in submitting the report of this Committee, said that the tendency was increasing throughout the Dominions to enforce total prohibition of dental practice except by registered persons.

The PRESIDENT said that a number of amending Acts had lately been passed in various Canadian provinces, and this country was fast being left behind by its dominions in the matter of prohibition.

The report, which contained various recommendations on applications for registration in exceptional circumstances, was adopted.

PHARMACOPOEIA COMMITTEE.

Sir JOHN MOORE moved the adoption of the report of the Pharmacopoeia Committee, which dealt with the sale of the *British Pharmacopoeia*, certain typographical corrections in its text, and the appointment of a special committee, now sitting, by the Minister of Health to advise on the control of such remedies as serums, vaccines, and other preparations which can only be assayed effectively by other than chemical and physical methods.

The report was adopted.

VOTE OF THANKS TO THE RETIRING TREASURER.

Sir NORMAN MOORE, in presenting a report from the Finance Committee, stated that the balance was on the satisfactory side, though this could not always be expected. Sir Norman moved the adoption of the report, and, this having been agreed to, he moved a special vote of thanks to Sir Charles Tomes for his services as treasurer. The proposer said that he himself had been an eye-witness of the assiduity with which Sir Charles had handled the financial position.

Sir JAMES HODSDON seconded, and the PRESIDENT, in putting it to the vote, said that the Council had benefited not only from Sir Charles Tomes's quite remarkable power of dealing with accounts, but from his general executive ability. If, owing to the successful realization of the property which the Council had left behind in the neighbourhood of Oxford Street, the Council could look forward to liquid assets in a way in which it had not been able to look forward to them for forty or fifty years of its existence, this was due chiefly to the business acumen of Sir Charles Tomes, his ability in handling property, and his insight into the psychology of buyers. The resolution of thanks was carried by acclamation.

ELECTION OF JUNIOR TREASURER.

The PRESIDENT reminded the Council that the Junior Treasurer should be resident in London, and should be a surgeon, the Senior Treasurer (Sir Norman Moore) being a physician. Mr. Waring was unanimously elected.

COMMITTEES.

The Committees of the Council are constituted as follows:

Executive Committee.—Sir Norman Moore, Mr. Waring, Dr. Macdonald, Dr. Norman Walker, Sir Gilbert Barling, Sir Arthur Chance, Sir John Moore, and Sir James Hodson.

Penal Cases Committee.—Sir Francis Champneys, Dr. Macdonald, Dr. Norman Walker, and Sir Arthur Chance.

Business Committee.—Dr. Norman Walker (Chairman), the President, Sir Francis Champneys, Dr. Macdonald, Dr. Magennis.

Pharmacopoeia Committee.—The President (Chairman), Sir Norman Moore, Dr. Hopkins, Dr. Russell Wells, Dr. Norman Walker, Sir John Moore, Dr. Kidd, Dr. Hay, and Dr. Caton.

Finance Committee.—The Senior Treasurer (Sir Norman Moore) (Chairman), the Junior Treasurer (Mr. Waring), the President, Sir James Hodson, and Sir Arthur Chance.

Dental Committee.—The President (Chairman), Mr. Waring, Sir James Hodson, Sir Arthur Chance, Mr. Bennett.

Dental Education and Examination Committee.—Sir James Hodson (Chairman), the President, Mr. Waring, Sir Arthur Chance, Dr. Coey Bigger, Mr. Bennett.

Students' Registration Committee.—Sir Norman Moore (Chairman), the President, Dr. Mackay, Mr. Littlejohn, Dr. Kidd, Sir Gilbert Barling, Mr. Sinclair.

Education Committee.—Sir N. Moore, Dr. Howden, Sir F. Champneys (by English Branch Council); Sir J. Hodson, Mr. Littlejohn, Dr. Mackay (by Scottish Branch Council); Sir A. Chance, Dr. Dixon, Dr. Sinclair (by Irish Branch Council).

Examination Committee.—Sir G. Barling, Dr. Caton, Dr. Macdonald (by English Branch Council); Dr. Russell, Dr. Adams, Dr. N. Walker (by Scottish Branch Council); Sir J. Moore, Sir A. Chance, Dr. Kidd (by Irish Branch Council).

Public Health Committee.—Sir G. Newman, Dr. Dean, Sir J. Yerrall (by English Branch Council); Mr. Littlejohn, Dr. Hay, Dr. McVail (by Scottish Branch Council); Sir J. Moore, Dr. Magennis, Dr. Bigger (by Irish Branch Council).

PENAL CASES.

The Council considered the following penal cases:

Manslaughter.

Pandit Devi Dayal Sasun, registered as of Brady Street, Bethnal Green, L.R.C.P. and S. Edin. 1902, L.F.P.S. Glasg. 1902, was summoned to appear on the charge that, being a registered medical practitioner, he had been convicted at the Central Criminal Court on April 13th, 1920, of unlawfully killing Elsie Maud Wright and sentenced to ten years' penal servitude.

Mr. Sasun did not appear and was not represented.

Mr. Harper, the Council's solicitor, laid the facts before the Council (see BRITISH MEDICAL JOURNAL, April 24th, p. 589, and May 29th, p. 7-4). He said that in December last Sasun was consulted by the woman Wright, who gave him £10 and asked him to perform an illegal operation, which he did. Sasun remained all that night at his surgery, and early next morning he directed a policeman's attention to the dead body of a woman lying under a railway arch near by. No doubt his idea in giving information to the police himself was that he would be asked to make the *post mortem* examination. In the result he was charged with murder and convicted of manslaughter. His appeal to the Court of Criminal Appeal was dismissed. In his safe were 116 documents, signed by as many different women, and in every case the woman had been traced and it was found that an illegal operation had been performed upon her.

The Council ordered that Sasun's name should be erased from the Register.

Adultery and Elopement.

Alexander John Wood, registered as care of a solicitor at Kirkealdy, M.B., C.M., 1883, U. Edin., was charged with committing adultery and eloping with a married woman named Harman, to whose family he was medical attendant. He was

found guilty of adultery by a decree of the Divorce Division dated October 18th, 1918, and made absolute on May 5th, 1919.

Dr. Wood was not present, and was not represented. Mr. Harper stated that Dr. Wood had now gone to live in Saskatchewan, whence he had written: "I have no defence to make, as the decision of the Divorce Court left me none." The Council's Solicitor put in the two decrees of the Court, and said that the divorce proceedings were undefended. It appeared that the adultery and elopement took place in 1912, and when the petitioner (Mr. Harman) was asked why he had not taken proceedings earlier, he replied that he had only recently been able to save enough money to do so. In 1912 there were no facilities whereby poor persons could obtain divorce. The judge had described the case as a very bad one.

The Council deliberated *in camera*, and on the resumption of the public sitting the PRESIDENT said:

I have to announce that the Council has judged Alexander John Wood to have been guilty of infamous conduct in a professional respect, and has directed the Medical Registrar to erase from the Register the name of Alexander John Wood.

Adultery.

Frederick Arthur Pring, registered as care of a bank in Victoria Street, S.W., L.S.A. Lond. 1883, M.R.C.S. Eng. 1884, L.R.C.P. Lond. 1885, was summoned on the charge of having abandoned his position by committing adultery with a married woman named Morris, with whom he stood in professional relationship. Of this adultery Dr. Pring had been found guilty by decree of the Divorce Division, dated November 5th, 1919, and made absolute May 17th, 1920, in the case of Morris *versus* Morris and Pring, in which he was co-respondent.

Dr. Pring did not appear, but he was represented by his solicitor, Mr. Hempson.

The Council's Solicitor pointed out that in these inquiries it had first to be established that there was adultery, and secondly, that the practitioner stood in professional relationship to the lady concerned or to her family. In the present case no point was made in the divorce proceedings about professional relationship; the court was concerned with the simple issue of adultery. Mr. Morris had brought divorce proceedings against his wife, citing Dr. Pring and another person as co-respondents. The case against the second person was not tried. The jury found adultery proved between Mrs. Morris and Dr. Pring. It appeared that Dr. Pring regarded himself as Mrs. Morris's guardian, and letters were read which showed that he had strongly objected to her marriage. Dr. Pring's reply to the notice of inquiry from the Council was to the effect that there was neither adultery nor professional relationship. But the fact of professional relationship, as brought out in evidence laid before the Divorce Court, was as clear as in any case of the kind of which the speaker had knowledge. He quoted from the evidence given before the court to show that for six weeks during her convalescence after an operation Mrs. Morris remained under Dr. Pring's medical care in his home at Streatham while her husband stayed at an hotel, and that Dr. Pring continually sent reports to Mr. Morris (which were read) with regard to her health and progress, and gave advice as to further treatment. There was also a receipt from Dr. Pring for £63 for professional attendance, with board and nurse for six weeks.

Mr. Hempson said that when the original defence was put in he was unaware of these letters. In view of them he could no longer contest the fact of professional relationship. That line of defence would be abandoned. The Council's Solicitor said that in that case there only remained the charge of adultery. He described the movements of the parties as given in the Divorce Court evidence, and quoted from the evidence to show that on many occasions the co-respondent had visited Mrs. Morris in the absence of her husband; letters were also read showing the co-respondent's affection for the lady, and the summing-up of the judge was read in which his lordship stated that in his view there was ample evidence on which the jury could find that the parties committed adultery.

Mr. Hempson said that his purpose in appearing was simply to see that the facts were properly put in Dr. Pring's interests, and to offer some sort of explanation to the Council for Dr. Pring's absence. Dr. Pring had not defended the proceedings in the Divorce Court for certain reasons into which he (Mr. Hempson) could not enter, but which he appreciated, and for the same reasons he did not appear before the Council. On the alleged adultery all the evidence was inferential. All that was shown was that there was opportunity for adultery and that there was affection between the two persons. Dr. Pring regarded this as the affection which might properly exist between a guardian and his ward, and there was nothing in the correspondence inconsistent with that view.

Major F. C. Bentley, who was second in command of the reserve battalion to which Dr. Pring was attached, gave evidence as to character, and said that in Dr. Pring's relationship to Mrs. Morris (who had a house near the camp to which the officers were invited) there was nothing to suggest anything more than the relationship of guardian and ward.

The Council deliberated *in camera*, and on the readmission of strangers the PRESIDENT said:

I have to announce that the Council has judged Frederick Arthur Pring to have been guilty of infamous conduct in a professional respect, and has directed the Medical Registrar to erase from the Medical Register the name of Frederick Arthur Pring.

Colonel N. C. King was re-elected Registrar, and the Council concluded its session with a vote of thanks to its President.

British Medical Association.**CURRENT NOTES.****Hospitals and Pension Work: Conference at Cambridge.**

WITH reference to paragraph 168 of the Annual Report of the Council,¹ it cannot be too strongly urged upon the medical staffs of voluntary hospitals that they should take action in this connexion at once. The Hospitals Committee suggests that this important matter should be discussed by the Branches of the British Medical Association as soon as possible after the Representative Meeting. A memorandum dealing with the whole history of the subject has been prepared, and copies are being forwarded to the secretaries of the staffs of voluntary hospitals and to the secretaries of Branches and Divisions. Further, it has also been decided to hold a special meeting at Cambridge on Thursday, July 1st, at 3 p.m., when the matter will be discussed in the light of the decisions of the Representative Meeting. Sir Cuthbert Wallace, K.C.M.G., will take the chair, and all members of the staffs of voluntary hospitals are invited. The subject is one that affects the whole profession, and not only the staffs of voluntary hospitals. If the staffs decline to take payment for this form of State medical treatment or accept inadequate pay, they will be letting down the profession as a whole, for it is a distinct encouragement to State exploitation of the profession. If the hospital physician and surgeon can afford to do this work for nothing, it may be asked, why should not the State, or local authorities, expect the rest of the profession to treat State-aided patients on a charitable or semi-charitable basis. The report of the Consultative Council to the Minister of Health is a sufficient indication that State-aided work in the hospitals will be greatly extended in the near future. The only policy which has been laid down is that submitted by the Council of the British Medical Association for the consideration of the forthcoming Representative Meeting at Cambridge. A policy of this kind requires the support of the whole organized profession, and it is hoped that the staffs of the great teaching hospitals will see, on reflection, that they cannot allow the tradition of honorary service for charitable purposes to be used as a reason for doing unpaid work for patients for whom the full responsibility has been taken by the State. It is hoped that the policy will receive strong support from the members of the hospital staffs at any meetings which are organized by the Branches throughout the country.

Medical Fees in Criminal Courts.

The Association has recently taken up the question of fees payable to medical witnesses in criminal cases. A letter was addressed to the Lord Chancellor asking that the fees for giving evidence at assizes and petty sessions should be doubled. At the same time he was asked if it could be arranged for the future that medical witnesses should only have to attend on the days on which the cases in which they were concerned were to be heard. In his reply the Lord Chancellor stated that by a regulation dated March 1st, 1920, the amount of these fees had been increased by 50 per cent. He stated also that on the question of attendance of medical witnesses he was in communication with the Lord Chief Justice, as the matter was one of considerable difficulty. In April the following letter was received:

"I am directed by the Lord Chancellor to state that he has been in communication with the Lord Chief Justice on the subjects mentioned in the second paragraph of your letter. Their Lordships do not consider that it would be possible to make any such rules as are suggested. The practice of the Judges on Circuit is always to show great consideration for the convenience of medical witnesses, and it frequently happens that particular days are fixed for the trial of cases solely to suit the arrangements of medical witnesses.

"It is the usual custom at most Assize towns to take pleas of guilty on the first day, and it is therefore essential that all the witnesses should be in attendance on that day.

"The duty of giving notice to witnesses is presumably in the hands of those conducting the prosecution in each case, and their Lordships have no jurisdiction to intervene in the matter."

The Council, when considering the replies of the Lord Chancellor, decided to report them to the Annual Representative Meeting, and instructed the Medical Secretary to convey to the Lord Chancellor the Association's appreciation of the consideration he had shown in the matter.

Statistics of Practice Income and Expenditure.

The Insurance Acts Committee considers that an effort ought to be made to secure that a large number of insurance practitioners should keep a standard form showing practice income and expenditure, both panel and private, for the purpose of any further claim that may be made in regard to remuneration. In all representations as to remuneration which have been made to the Insurance Commissioners or Ministry of Health, as well as in the recent arbitration proceedings, the weakest point in the case presented by the Insurance Acts Committee has been the absence of any trustworthy statistics in support of the claim put forward that a specified increase of remuneration was warranted by the increase in the working expenses of practices. It is probable that the Insurance Acts Committee may at some future date have to ask for increased remuneration or resist an attempt to lower the present fee, and it is therefore essential that the Committee should have in its possession the necessary data upon which to base its claims. With this object in view a tabular form has been prepared and has been forwarded to all Panel Committee secretaries in the hope that some effort will be made to secure that a large number of practitioners will supply the necessary information by using the form and making it as complete as possible for the six months July to December, 1920. Those who fill up and return the form to this office at the end of the year can be assured that the information supplied will be treated as strictly private and confidential. Any insurance practitioner consenting to use the form will have a copy sent upon application to the Medical Secretary, 429, Strand, W.C.2.

Medical Cinematograph Films.

A certain amount of interest has been expressed with regard to the application of the cinematograph for illustrating medical subjects, and the matter has been under the consideration of the Association centrally. Those who were present at the Special Clinical Meeting in April last will remember the film exhibited by Sir John Lynn-Thomas illustrating the re-education of limbless men as carried out at the Prince of Wales Hospital for Limbless Soldiers and Sailors at Cardiff, and some members may have visited a commercial exhibition on infant feeding at the same meeting. Dr. Arthur F. Hurst of Guy's Hospital employed the same method in illustration of the functional element in disease and the possibilities of psychic re-education, in an address which he gave during the past session to the Dundee Branch of the Association. Some members have already communicated with the Medical Secretary as a result of the previous inquiry in this column (SUPPLEMENT, March 27th, 1920, p. 87), and it is hoped that others who have had experience of these demonstrations will let the Medical Secretary know whether, in their opinion, such demonstrations, if arranged by the Association, would be likely to prove an attractive and useful feature in the scientific work of the Division and Branch meetings.

Panel Committee Expenses.

It will be remembered that doctors and pharmacists on the panel were authorized to ask the Insurance Committees to allow the sum of 1d. a patient per annum to be allotted towards the expenditure of the Panel and Pharmaceutical Committees. During the third reading of the National Health Insurance Bill, 1920, Dr. Addison moved the following amendment (in substitution for a somewhat similar proposal by Dr. Farquharson, made on behalf of the London Panel Committee) which was carried:

(6) Subsection (2) of Section 33 of the Act of 1913 (which makes provision for the administrative expenses of committees elected by medical practitioners and persons supplying drugs and medicines) shall have effect as though the words "such a sum as may be determined by the Insurance Committee, with the consent of the Minister, not exceeding twopence in all in respect of each year in respect of each insured person entitled to obtain medical attendance and treatment from the practitioners who have entered into agreement with the Insurance Committee," were substituted for the words "such a sum not exceeding one penny in all in respect of each insured person

entitled to obtain medical attendance and treatment from the practitioners who have entered into agreement with the Insurance Committee as may be determined by the Insurance Committee with the consent of the Commissioners."

The expenses of Pharmaceutical and Panel Committees have greatly increased, and it is satisfactory that this has been recognized by the Minister of Health; the thanks of the Association are due to Dr. Addison and to Dr. Farquharson, who introduced the subject during the debate on the third reading.

Fees for Juvenile Club Patients.

The fall in the purchasing power of money, coupled with the undoubted increase in the prosperity of the hand-working classes, is leading medical men all over the country to get the fees now paid for club patients (especially juveniles) put on a more equitable footing. In many areas these fees are still ridiculously low. The policy of the Association laid down in 1913 is that club patients should not be taken at a lower capitation fee than is accepted in respect of insured persons. Logically these persons should be charged as much as insured persons, because they are likely to require as much attendance. At the same time it was recognized by the Representative Body that in some areas this recommendation cannot, owing to certain special economic conditions, be carried out. In such cases the medical profession can always be relied upon to make due allowance. The advice of the Association has recently been asked in a case in which the secretary of a friendly society, in view of the fact that his society, under pressure, was about to pay 8s. for juveniles instead of 4s., had asked that the doctors should agree to a 10 per cent. deduction for collection. The Division concerned has been advised to resist strongly any such proposal, and to point out to the secretary that in taking these cases at 8s. instead of 11s. they are already giving the society's members a handsome rebate. Membership of these clubs enables people to insure against doctors' bills at a very reasonable figure, and it is contrary to all business methods that the doctor should be expected to bear any part of the cost of collecting payment in a collective bargain of this kind.

Meetings of Branches and Divisions.

LEINSTER BRANCH.

THE annual general meeting of the Leinster Branch was held in the Irish Offices, 16, South Frederick Street, Dublin, on May 27th, when Dr. W. V. FURLONG, outgoing president, was in the chair.

The following officers were elected for the ensuing year:

President: Dr. R. J. Rowlette. *President-elect:* Colonel Sir William Taylor, K.B.E., C.B. *Vice-Presidents:* Dr. A. R. Parsons and Dr. R. C. Peacocke. *Honorary Secretary and Treasurer:* Mr. W. Doolin. *Representative on Council of Association:* Dr. R. C. Peacocke. *Representative in Representative Body:* Dr. R. J. Rowlette. *Deputy Representative:* Dr. M. R. J. Hayos. *Representatives on Irish Committee:* Professor J. Craig, President R.C.P.I. (Dublin). Dr. R. L. Herd (Monkstown).

Dr. FURLONG vacated the chair in favour of the new President, Dr. R. J. ROWLETTE, and a warm vote of thanks to the outgoing President was passed.

Dr. ROWLETTE gave a very interesting presidential address in relation to the present medical situation in Ireland, including the work of the Irish Public Health Council, on which body he was selected to represent the Irish medical profession.

The question of increased pensions for superannuated Poor Law medical officers and others was considered, and it was decided to ask the Irish Medical Secretary to make representations to the Chief Secretary and to the Local Government Board urging the necessity for introducing a short bill into Parliament providing for increased pensions for superannuated doctors in the different Irish Medical Services.

With regard to the fees paid for medical examination for life insurances the meeting decided to ask the President of the Royal College of Physicians (Professor J. Craig) and the President of the Royal College of Surgeons (Mr. J. B. Story) to summon a meeting of the profession in the Dublin area to be held in the Royal College of Physicians to consider the question.

On the proposal of Sir C. A. K. BALL, it was unanimously resolved to ask Dr. T. Hennessy, Irish Medical Secretary, to make further representations to the Local Government Board that they should sanction the scales of salaries—£300 to £400—as passed by boards of guardians, and that

the Branch, whilst it was pleased to note that the Local Government Board had exercised their right to fix salaries for medical officers in some Poor Law unions it regretted that the amount fixed by the Local Government Board fell so much below the amount voluntarily given, in recent times, by many boards of guardians.

The salaries of prison medical officers, fees for medical witnesses, and taxes on doctors' motor cars, were also under consideration, and the efforts of the Council of the Association to have these matters remedied were approved.

CAMBRIDGE AND HUNTINGDON BRANCH: ISLE OF ELY DIVISION.

THE annual general meeting of the Isle of Ely Division, to which all non-members in the Division had been invited, was held at March, with Dr. H. CLAPHAM in the chair.

The following officers were elected:

Chairman: Dr. G. H. Lucas (Wisbech). *Vice-Chairman:* Dr. C. W. Howe (Haddenham). *Honorary Secretary:* Dr. A. C. S. Waters (March).

The new ethical rules were adopted.

Dr. P. A. Hendley (Littleport) was nominated for election to represent the Isle of Ely at the Annual Representative Meeting, and Dr. F. E. W. Rogers as Deputy Representative.

The following matters referred to Divisions were discussed, namely: Fees for medical examinations for life insurance; payment of staffs of voluntary hospitals for pension work; increase of fees for private practice; fees for uninsured members of friendly societies; salaries of medical officers of local authorities; fees in connexion with maternity work and the training of midwives. It was decided to approve the recommendations of the Council as set forth in the SUPPLEMENT of April 24th.

The remaining recommendations in the annual report of the Council under the heading "Medico-Political" were also approved.

With regard to the increase of private fees by 50 per cent., while agreeing to this in principle, it was recommended that any hard case met with should be left to the individual medical practitioner to use his judgement in dealing with it.

GLASGOW AND WEST OF SCOTLAND BRANCH: LANARKSHIRE DIVISION.

THE annual meeting of the Lanarkshire Division was held at Glasgow on May 19th, when Dr. J. B. MILLER was in the chair. Before beginning the business the Chairman made feeling reference to the death of Dr. John Fotheringham of Motherwell, who had long been a member of the British Medical Association and of the Lanarkshire Division, and the Secretary was instructed to record the regret of the Division in the minutes and to forward an excerpt therefrom to Mrs. Fotheringham and her family.

The Secretary and Treasurer's report showed a membership of 132 as compared with 116 last year.

The following officers were elected:

Chairman: Dr. Laird. *Vice-Chairman:* Dr. Lithgow. *Secretary:* Dr. L. Loudon. *Treasurer:* Dr. J. Murray Young. *Representative in Representative Body:* Dr. J. B. Miller. *Deputy Representative:* Dr. Hugh Miller.

The meeting then considered the matters referred to Divisions as embodied in the report of Council in the SUPPLEMENT of April 24th and instructed their Representative thereanent.

The revised rules governing procedure in ethical matters as approved by the Annual Representative Meeting, 1919, were adopted.

MALAYA BRANCH.

THE annual meeting and dinner of the Branch was held at Singapore on February 27th.

The following office-bearers were elected for the ensuing year:

President: Dr. C. L. Sansom, C.M.G. *President-elect:* Dr. F. B. Croucher. *Vice-Presidents:* (Singapore) Dr. W. Brookie Wilson, M.C.; (Penang) Dr. W. H. Fry, (Federated Malay States) Dr. G. B. McHutchison. *Honorary Treasurer:* Dr. Argyll Campbell. *Honorary Secretary:* Dr. Dexter Allen.

Discussion took place regarding the eligibility of Licentiate of the King Edward VII Medical School, Singapore, for membership of the Association and on the status of practitioners in the Straits Settlements and Federated Malay States not possessing qualifications registrable by the General Medical Council.

METROPOLITAN COUNTIES BRANCH: SOUTH-WEST ESSEX DIVISION.

THE annual meeting of the South-West Essex Division was held at Leyton, on May 11th, when Dr. AMBROSE (Loughton) was in the chair. The following officers were elected for the ensuing year:

Chairman: Dr. C. J. Horner. *Vice-Chairman:* Dr. G. H. Panting. *Honorary Secretary and Treasurer:* Dr. A. T. Todd-Whito. *Representative in Representative Body and Branch Council:* Dr. G. H. Panting.

Dr. WHEELER delivered a lecture on "The use of colloids in medicine," which was most interesting and instructive, and, judging by the numerous questions put to the lecturer by the members, was highly appreciated. A vote of thanks was unanimously accorded to Dr. Wheeler for his address.

METROPOLITAN COUNTIES BRANCH: WESTMINSTER DIVISION.

AT a general meeting of the Westminster Division, held at the St. James's Vestry Hall, the revised ethical rules were adopted. The recommendations of the Council regarding fees for insurance were approved. The increase of professional fees by 50 per cent. was approved. The recommendations as to the salaries of public medical officers was approved without any additional bonus. The increase of subscriptions to the British Medical Association was approved. It was resolved that the question of federation be left in the hands of the Council. A resolution was passed asking the Council to reconsider the question of appointing a separate Medical Secretary for Ireland, in view of the small membership. Dr. Haslip and Dr. A. E. Cope were re-elected as Representatives on the Representative Body.

MUNSTER BRANCH.

THE annual general meeting of the Munster Branch was held at Cork on May 15th, when Professor H. CORBY, M.D., was in the chair.

The following officers, Representatives, and Council were elected for 1920-21:

President: Dr. Morrissey. *Vice-President:* Dr. W. Rabilly. *Honorary Secretary and Treasurer:* Dr. Philip Lee. *Representative on Central Council:* Dr. J. Ginsani. *Representative in Representative Body:* Dr. W. Rabilly. *Representative on Irish Committee:* Professor Corby.

Fifteen candidates for membership were elected members of the Association.

The statement of accounts showed a balance in favour of the Branch of £10 ls.

The revised ethical rules were adopted. The proposed increase in members' subscriptions to the Association to £33s. was agreed to. After some further discussion on the suggestions from the Medical Secretary the meeting adjourned.

SUSSEX BRANCH: HORSHAM DIVISION.

THE annual meeting of the Horsham Division was held at Horsham, with Dr. M. H. H. VERNON in the chair.

The following officers for the year were elected:

Chairman: Dr. Vernon. *Vice-Chairman:* Dr. Matthews. *Secretary:* Dr. Dew. *Representative on Branch Council:* Dr. Dew. *Representative in Representative Body:* Dr. Millbank-Smith was re-elected to represent Horsham Division and Chichester and Worthing Division.

The Division approved the nomination of Dr. Fothergill as Representative of the grouped Kent, Surrey, and Sussex Branches. The question of fees for medical examinations for life assurance was discussed, and it was resolved that the fee for all examinations for industrial insurance should be at least 5s. and all other insurance examinations not less than £1 ls. The meeting very strongly endorsed the attitude of the practitioners of Chichester towards the Medico-Political Union, as shown at their meeting recently—an attitude of marked opposition.

SUSSEX BRANCH: LEWES AND EAST GRINSTEAD DIVISION.

AT the annual meeting of this Division, held on May 14th, the following officers were elected:

Chairman: Dr. Friend. *Vice-Chairman:* Dr. Loud. *Acting Honorary Secretary:* Dr. H. Vallance. *Representative in Representative Body:* Dr. Milner M. Moore.

The Representative was instructed, with two minor exceptions, to vote in accordance with the recommendations of the Council. It was thought that the increase in the subscription should be limited to 10s. 6d.

YORKSHIRE BRANCH: HUDDERSFIELD DIVISION.

THE annual meeting of the Huddersfield Division was held at the Huddersfield Royal Infirmary on May 20th.

The following officers were elected for the ensuing year:

Chairman: Dr. H. G. Tansley. *Vice-Chairmen:* Dr. W. H. Smailes, Dr. B. H. Rigby. *Honorary Secretary and Treasurer:* Dr. D. Wilson. *Representative in Representative Body:* Dr. E. Walker. *Deputy Representative in Representative Body:* Dr. W. H. Smailes. *Representative on Branch Council:* Dr. D. Wilson.

The revised ethical rules, as approved by the Annual Representative Meeting, 1919, were adopted by the Division.

It was decided to recommend the members to increase their fees for medical services by 50 per cent. on pre-war rates, and also that a copy of this recommendation be sent to all members and non-members in the area of the Division.

YORKSHIRE BRANCH: WAKEFIELD, PONTEFRAC, AND CASTLEFORD DIVISION.

THE annual meeting of the Division was held at Wakefield on May 7th, when Dr. G. B. HILLMAN (and subsequently Dr. R. MAY) presided.

The ethical rules approved by the Annual Representative Meeting, 1919, were adopted.

The following officers were elected for the ensuing year:

Chairman: Dr. R. May. *Vice-Chairman:* Dr. Rouston. *Honorary Secretary:* Dr. W. Eardley. *Treasurer:* Dr. W. Steven. *Representative in Representative Body:* Dr. W. Eardley. *Deputy Representative in Representative Body:* Dr. L. A. Johnson. *Representative on Branch Council:* Dr. W. Steven.

The annual report of Council was discussed, and the Representative was instructed to support the policy of the Council in the following matters:

- (a) Minimum salaries for public appointments.
- (b) Fees for medical examination for life assurance.
- (c) Payment of medical staffs of hospitals for pensions work (treatment of discharged disabled men).

The Executive Committee was instructed to consider and report upon measures to revive the interest of the local profession in the Division, and to consider the proposal for a visit from a member of the head quarters staff of the Association.

Association Notices.**BRANCH AND DIVISION MEETINGS TO BE HELD.**

KENT BRANCH: ISLE OF THANET DIVISION.—The annual meeting of the Division will be held on Tuesday, June 22nd, at 4.30 p.m., at the Royal Sea-bathing Hospital, Margate, with Dr. F. E. Nichol in the chair. Agenda: Election of Officers; Annual Report of Executive Committee, and Accounts for the Year; Annual Report of Council (SUPPLEMENT, BRITISH MEDICAL JOURNAL, April 24th), and Provisional Agenda of Representative Meeting. Adoption of Ethical Rules. Dr. Cholmondeley Webb will introduce a discussion on "Fees for Insurance Examinations"; a report on the subject will be found in the SUPPLEMENT of March 27th, 1920.

NORFOLK BRANCH.—The Honorary Secretary, Sir Hamilton A. Ballance, announces that the annual meeting of the Norfolk Branch will be held at the Norfolk and Norwich Hospital, Norwich, on Wednesday, July 7th, at 3.45 p.m. The following papers will be read: "Modern Methods of Diagnosis," by A. J. Cleveland, O.B.E., M.D., M.R.C.P.; "Surgical Experiences—A Retrospect of Twenty-five Years' Practice," by H. Muir Evans, M.D.

SOUTH WALES AND MONMOUTHSHIRE BRANCH: MONMOUTHSHIRE DIVISION.—The annual meeting of the Monmouthshire Division will be held on Friday, July 16th, at the Royal Gwent Hospital, Newport, Mon. An Address will be given by the Medical Secretary on "The Future of Medical Practice in the Mining Districts of South Wales and Monmouthshire—Servitude or Independence."

WORCESTERSHIRE AND HEREFORDSHIRE BRANCH.—The annual meeting of the Branch will be held at the General Hospital, Hereford, on Wednesday, June 23rd, at 3 p.m. Business: To elect officers. To receive the Branch Council's Report and Financial Statement. To consider and adopt, if approved, the Revised Branch Ethical Rules. To arrange for Meetings. At the conclusion of business, Dr. Robinson will vacate the chair and introduce the President-elect (Dr. Steed) as President of the Branch for the ensuing year. Dr. Parsons of Birmingham will read a paper on "Some Causes of Vomiting in Children: their Diagnosis and Treatment." The President, President-elect, Honorary Secretary, the Chairman of the Worcester Division, and the Chairman of the Hereford Division, cordially invite those members who propose coming to the meeting to lunch at the Imperial Café at 1.30 p.m., and the Mayor of Hereford (A. D. Steel, Esq.) hopes that the meeting will adjourn for tea at the Town Hall at 5 p.m.

CORRESPONDENCE.*Council Election.*

SIR,—Please allow me to convey to the electors in the Kent, Surrey, and Sussex area who supported my candidature my appreciation and thanks. Would that all took the same keen interest in these annual elections, as only thereby can we make sure that the interests of medicine and of our profession are upheld by the executive of the medical Parliament. Would my constituents individually and through their Branches and Divisions keep me constantly posted as to their views on all questions with regard to which it may be considered that I could be of use in pressing them on the attention of others? I would welcome such recognition of my official position and would be delighted to be "gingered up"!

The profession is faced at present, after ten years' comparative rest, with yet another attempt to bring medicine still further up to date; the British Medical Association is considering how, after eighteen years' use, its constitution can be extended further and made of more practical value throughout our Commonwealth. It behoves all of us to have wide vision; to be ready with constructive criticism, and prepared at all costs to act unitedly.—I am, etc.,

Hove, June 12th.

E. ROWLAND FOTHERGILL.

Proposed Increase of Subscription.

SIR,—The case for an increase of 50 per cent. on the subscription of members seems to me to be very feeble. As an old member, and one who is anxious to see every medical man a member of the British Medical Association, the project fills me with alarm. I look with a feeling of despair on the men who can view with equanimity the resignation of 2,000 of our members. This would be a catastrophe of the greatest significance, and would be viewed with delight by our adversaries. It would curtail our influence by more than one-tenth. Speaking as one who wants to see his expenses decreased instead of increased, it is a great injustice on the older men who have belonged to the Association for many years, and only continue membership out of *esprit de corps*. In my own Division there is a large proportion of retired medical men, and my fear is that they will all object to pay £3 3s. a year.

The Council views the matter entirely from the pessimistic side, and seems to forget the bright side. Will not the income from the National Defence Trust diminish the British Medical Association expenditure over the Insurance Acts? Are we likely to have any more such expenses as the War Committees, which cost us more than twice the £5,000 received from Government? In the next year or two there seems little likelihood of any new extra expenses; and, although the JOURNAL costs more, the advertisements and sales bring in more.

It turns out that the estimated expenditure is correct and there is a deficit of £3,000 at the end of the year, surely our credit is good enough to borrow this, and then will be the time to think of increasing the subscription. But I think that with proper oversight and desire for curtailment of expenditure we shall find the estimated deficit merely a device to cover up the reluctance of all our bodies to curtail expenses, from the Government downwards.

I should like to know who are the councillors advocating this step, and I should also like to know how others voted, and whether they gave the matter due thought or simply "followed their leader." There is, as a rule, too much apathy in the Divisions to go minutely into the matter, and my only hope is that Representatives will be left a free hand.

In my opinion a loss of two thousand members, or even half that number, would be a disaster, and the man who is willing to sacrifice this number of his colleagues to cover up a deficit of £3,000 ought never to sit on its governing body.—I am, etc.,

Buckingham, June 12th.

ARTHUR E. LARKING.

Medical Fees.

SIR,—I am instructed to inform you that at a general meeting of medical practitioners in this district, held on May 26th, 1920, the attached scale of minimum fees was determined on, to come into operation on July 1st, 1920.

A notice is also being inserted in the local press to the effect that medical fees in the district will be raised 100 per cent. over 1914.—I am, etc.,

J. C. LYTH,

Honorary Secretary, York Local Medical and Panel Committee;
Honorary Secretary, York Medical Defence Association.

Heworth, York, June 2nd.

Item.	Minimum Fee.	
	£	s. d.
Visit or consultation with or without medicine	0 5 0
Confinement	3 3 0
Vaccination	0 7 6
Ambulance lectures	10 10 0
Consultation with other doctor	1 1 0
General anaesthetic:		
Under half an hour	1 1 0
Half an hour and over	2 2 0
Extra certificates	0 1 0
Life insurance (£100 or over)	1 1 0
Report on secondary school pupils:		
First report	0 10 6
Second report by same doctor	0 5 0
National Deposit Friendly Society and similar societies (per attendance)	0 5 0
Certificates for applicants for pensions (each)	0 1 0
Lunacy certificates and mental deficiency certificates	2 2 0
Certificates of health for new members of clubs	0 5 0
Special certificates of health for prospective railway workers	0 5 0
Mileage (per mile both ways over two miles)	0 0 9

Panel Practitioners and Vaccination.

SIR,—Small-pox has become epidemic in Glasgow during the past month, and in connexion with this condition an acute question has arisen regarding the duties of the panel practitioners which affects Glasgow and district to-day, but which may arise to-morrow in other populous districts in London and the provinces.

The question, then, is, in such an emergency is it the duty of the panel practitioners to vaccinate and revaccinate

their insured patients as part of their present or past contract with the Insurance Committees?

The Scottish Board of Health has taken up the position that it is the duty of the panel practitioner to do so. On May 10th it issued the following circular to clerks of Insurance Committees:

"Small-pox.

"I am directed by the Scottish Board of Health to inform Committees that they have arranged for a free distribution of Vaccines Lymph to Local Authorities. I am, accordingly, to request that you will immediately notify all Practitioners and Chemists on the Committee's Lists that Calf Lymph may be obtained, free of charge, on application to the Local Authority."

On May 12th the Clerk of the Glasgow Burgh Insurance Committee sent a copy of the above to all the practitioners on the panel, with a circular letter stating that

"Practitioners should note that vaccination of insured persons is a service regarded as coming within the scope of the agreement between Insurance Committees and practitioners on the panel."

Following quickly on this, the medical officer of health placed placards on all the tramcars and otherwise notified the public that free vaccination would be available for all. In this intimation insured persons were advised to call upon their panel doctors. He also sent a circular to the profession in which it was intimated that a fee of 2s. 6d. would be paid by the Corporation for each uninsured person vaccinated. He also invited the profession to do a house-to-house canvass of the people, in the east end first, for the purpose of vaccinating them. A fee of 2s. 6d. was to be paid for each case done, but *if the persons were insured no fee would be paid.*

The Royal Faculty of Physicians and Surgeons interested itself in the question of revaccination and had a meeting of east-end practitioners with the medical officer of health present. It was pointed out to the latter that his scheme was not likely to meet with success. As a result of this a deputation of practitioners was asked to meet the medical officer of health and the convener of the Corporation Health Committee. The deputation pointed out the difficulties of getting practitioners to visit and vaccinate insured persons without fee or reward. It was also pointed out that, even granting that it was a duty incumbent on the panel practitioner to vaccinate all the persons on his list, there was nothing to compel him to work overtime to effect the operation. Our philanthropic corporation seemed to think that the men with small medical lists would be willing to visit and do the insured people on the big lists. However, the convener of the Health Committee frankly admitted that had he known the state of affairs he would have put different proposals before the Corporation. The deputation made an offer that the profession would vaccinate all insured and uninsured at a flat rate of 2s. a head, and would urge the practitioners to endeavour to accomplish the work quickly. It was expected that at the next meeting of the Corporation a move would be made to carry this into effect; but, influenced, I suppose, by the opinion of the Board of Health that no fee should be paid for insured persons, nothing was done.

The next step emerged when the Scottish Board of Health admitted in a letter to the secretary of the Local Medical and Panel Committees that there was nothing in the agreement to expect a practitioner to visit houses and vaccinate the people. Following on this a deputation was received by a full meeting of the Corporation Health Committee on May 30th. The views of the medical practitioners, panel and non-panel, were laid before them, and as a result new proposals were offered to the profession—namely, a fee of 2s. 6d. for each vaccination done at the person's house whether insured or uninsured; a fee of 2s. for each case done at the doctor's consulting rooms if the person was uninsured, or if insured was on another doctor's medical list; but nothing was to be paid if the insured person was on the doctor's own list. A further condition was that the doctor was asked to display at his rooms an intimation offering "free vaccination."

At a meeting of practitioners, panel and non-panel, held on June 3rd, this proposal was disapproved by a majority of fifty to ten. The practitioners are anxious to stay the epidemic and hurry on vaccination; and as proving this made an offer to vaccinate the uninsured at 2s. 6d. a case and all the insured, whether on their own medical list or not, at 1s. 6d. a head. As to whether this will be accepted by the Corporation time will tell. Meantime the panel practitioners are going on vaccinating on the terms first promulgated by the medical officer of health—namely, 2s. 6d. a case for uninsured persons; and, under protest, doing these on their own lists without fee.

Such is the history of the emergency that has come on the Glasgow panel practitioners; and, as I said at the commencement, it may be some other district's dilemma a few weeks or months hence. My reason in writing so fully is that this is a question that should at once be taken up by the Association's Insurance Acts Committee in England and by the Subcommittee in Scotland. There is no question of the practitioners saying that the operation is one that is not within the "ordinary professional competence and skill" which they are called upon to discharge by their agreement. It is a question of a huge piece of prophylactic medical work, which, if it is to be effective, must be carried out expeditiously. It is thus a piece of work which could not reasonably be imposed upon the profession as a part of their ordinary duties under the Insurance Act.

I feel certain that no practitioner ever contemplated that, in an emergency like a small-pox epidemic, he would be called upon to revaccinate all the insured persons on his list without further remuneration. In Glasgow it means that 400,000 persons (20,000 to 100,000 are supposed to be protected on account of recent army service) are entitled to be revaccinated—and that in a hurry—by some 340 practitioners. The thing is monstrous. I am also certain that the distinguished statesman, the author of the Act, and the members of Parliament who voted for the Act, never contemplated that such an important, urgent, and emergency piece of work would ever be imposed upon the medical men of the country. I feel strongly that I am expressing the opinion of the panel practitioners from Land's End to John o'Groat's when I call upon our leaders to raise this question at once with the Boards of Health and have it put upon a satisfactory basis. The local authorities who have power to rate for such emergencies should not be restrained by the Board of Health from doing what is good for their respective areas. I understand that the point on which the Board of Health in Scotland decided that this is a duty which the panel practitioner should carry out is that in the preamble of the Insurance Act it is stated to be an Act for the prevention and treatment of disease.—I am, etc.,

WILLIAM LAWSON, M.D.,
Chairman, Glasgow Local Medical and Public
Pollokshields, June 8th. Committees.

The Intermediate Certificate.

SIR.—The Medical Benefit Regulations, under the National Health Insurance for 1920, provide for the issue of a special intermediate certificate, which may be signed monthly instead of weekly, in cases where the incapacity is likely to continue for a long period. There is a proviso, however, which may easily be overlooked, that this rule shall come into operation only on such date as the Minister shall determine. Apparently, from pressure of work or for other reasons, the Minister has not yet had time to determine, and consequently a number of unfortunate people, who may or may not be able to do a little work in the remote future, are still compelled to go through the wearisome task of soliciting a continuation certificate every seven days. Is there any reason why the special monthly intermediate certificate should not be put in force forthwith?—I am, etc.,

E. F. O'FERRALL, L.R.C.P.Lond.
London, S.W., June 10th.

Naval and Military Appointments.

ROYAL NAVAL MEDICAL SERVICE.

The following appointments are announced by the Admiralty: Surgeon Commander A. T. Gailleton to the *Thunderer*, for voyage out and home. Surgeon Lieut.-Commanders H. C. A. T. Cannon to the *Widgeon*, J. A. O'Flynn to the *Commonwealth*.

ARMY MEDICAL SERVICE.

ROYAL ARMY MEDICAL CORPS.

Major and Brevet Lieut.-Colonel W. F. Ellis, O.B.E., relinquishes the acting rank of Lieutenant-Colonel.
Major R. V. Cowey, D.S.O., to be acting Lieutenant-Colonel.
Major H. G. Pinches relinquishes the temporary rank of Lieutenant-Colonel.

The following officers relinquish the acting rank of Major: Captain R. A. Flood, M.C. Temporary Captains J. P. Mathie, J. D. Hart, M.C., R. K. Paton, W. J. Oliver, C. Kingston, A. W. Rattrie, M.C.
Captain A. M. Pollard, D.S.O., to be temporary Major whilst specially employed.

Captain J. W. G. H. Riddell, M.C., resigns his commission, March 20th, and is granted the rank of Major (substituted for notification in the *London Gazette*, March 19th).

Captain N. T. Whitehead, M.C., is seconded for service with the Egyptian Army.

D. E. Carter, M.C., late temporary honorary Captain, to be temporary honorary Captain, seniority from April 18th, 1919.

The following officers relinquish their commissions: Temporary Major H. W. A. Burke, and retains the rank of Major. Temporary Captains, and are granted the rank of Major: F. G. Bell (February 23th, 1919), (acting Major) J. McF. Donnan (on account of ill health contracted on active service, April 6th, 1919—substituted for notification in the *London Gazette* of May 15th, 1919), J. Bamforth, P. P. J. Stewart, O.B.E. Temporary Captains and retain the rank of Captain: J. W. Clyne, O. S. Kellett, J. J. A. Sherry (on account of ill health contracted on active service), E. Reavley, A. H. Greg, O.B.E., J. Humphreys, G. G. Bruce, M. J. Houghton, L. H. Werden, B. N. Sinclair, P. R. Browning, A. H. Hall, J. Paterson, L. W. Howlett, C. B. B. Von Braun, J. G. Elder, H. V. Walsh, G. J. Fraser, F. G. Smyth, T. L. Harrison. On account of ill health: G. E. A. Petrie. On account of ill health contracted on active service: J. J. Sherry, M. E. Willcock. Temporary Lieutenant E. J. Hynes, and retains the rank of Lieutenant.

INDIAN MEDICAL SERVICE.

Lieut.-Colonel P. B. Haig, C.B., granted privilege leave for two months sixteen days, combined with commuted furlough for five months and fifteen days and ordinary furlough for ten months (February 23th).

Lieut.-Colonel L. J. M. Deas has been posted temporarily as Civil Surgeon of Ajmer and Chief Medical Officer in Rajputana (February 23th).

Major F. O'D. Fawcett has been permitted to retire from the service in consequence of ill health (February 23d).

Captain R. B. Lloyd appointed to officiate as Chemical Examiner, Bengal, and Professor of Chemistry, Medical College, Calcutta (March 15th).

Major H. H. Thorburn, C.I.E., has been posted as Civil Surgeon, Hazara (April 1st). Major N. E. H. Scott, C.I.E., has been posted as Civil Surgeon, Peshawar (April 5th). Major J. Anderson has been posted as Civil Surgeon, Hazara (April 9th).

Major A. G. McKeon, of the Bacteriological Department, has been granted privilege leave for six months, combined with furlough for two months (April 15th).

Captain H. H. King, of the Bacteriological Department, is employed under the Indian Research Fund Association (March 25th).

The undermentioned officers have been appointed permanently to the I.M.S. (March 15th): F. Griffith, J. H. Convala, V. R. Mirajkar, J. P. Canteenvala, B. Prasad, O. M. Ganapathy, M.C., N. J. Gai, E. W. Mann, A. B. Pestonji, R. A. Warters, J. E. Ainsley, G. A. Hildreth, J. S. Galvin, S. L. Bhatia, M.C., G. R. McRobert, S. M. A. Faruki, L. K. Ledger, P. F. A. Grant.

Captain J. J. Liston, M.B., resigned the service February 20th.

Lieut.-Colonel W. H. Cazaly, M.B., has retired, March 14th.

Lieut.-Colonel R. P. Wilson, F.R.C.S., D.P.H., Professor of Surgery, Medical College, Calcutta, and Surgeon to the College Hospitals, has been granted combined leave for eight months (March 23rd).

Major H. B. Steen, M.D., appointed to officiate as Professor of Surgery, Medical College, Calcutta, and Surgeon to the College Hospitals during absence on leave of Lieut.-Colonel Wilson.

Colonel G. J. H. Bell, C.I.E., M.B., Inspector-General of Civil Hospitals, Bihar and Orissa, has been granted combined leave for eight months (March 19th).

Major A. E. J. Lister, M.B., F.R.C.S., V.H.S., Professor of Physiology, King George's Medical College, Lucknow, has been granted combined leave for eight months (March 17th).

Major D. Sherston Baker, Staff Surgeon, Secunderabad, has been appointed to hold charge, temporarily, of the current duties of the office of Residency Surgeon, Hyderabad, in addition to his own duties (March 15th).

Lieut.-Colonel F. A. Smith, M.D., Residency Surgeon at Ladore and Administrative Medical Officer in Central India, has been granted privilege leave for six months (April 18th).

Major C. B. McConaghy, Agency Surgeon, Bhopal, has been appointed to hold charge of the duties of Administrative Medical Officer in Central India, in addition to his own duties (April 18th).

Major G. D. Franklin, O.B.E., M.B., has been appointed to hold charge of the duties of Residency Surgeon at Ladore, in addition to his own duties, with effect from April 18th, 1920.

Colonel P. Carr-White, K.H.P., M.B., has been promoted to the rank of Major-General (December 8th, 1919).

ROYAL AIR FORCE.

MEDICAL BRANCH.

Flying Officers to be Flight Lieutenants: J. Kyle, C. T. O'Neill. Transferred to the unemployed list: Captains J. W. Healy, F. L. Dickson, J. S. Prendergast and F. H. Bowen; Lieutenant F. Gill.

GENERAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Late Captains, R.A.M.C., to be Majors: J. W. G. H. Riddell, M.C., March 20th, 1920 (substituted for notification in the *London Gazette*, March 19th, 1920), J. Y. Moore, O.B.E., A. L. Aymer, April 24th, 1920 (substituted for notification in the *London Gazette*, April 23rd, 1920), W. T. Hare, M.C., May 4th, 1920 (substituted for notification in the *London Gazette*, May 3rd, 1920).

SPECIAL RESERVE OF OFFICERS.

ROYAL ARMY MEDICAL CORPS.

Captain W. F. McLeau, M.C., relinquishes the acting rank of Lieutenant-Colonel.

The following relinquish their commissions:

Captains and retain the rank of Captain: J. V. L. Grant, M.C., T. Mack Miller, M.C., M. Aven, B. Grelrier, M.C., C. H. Attenborough, H. J. S. Morton, E. S. Walls, J. P. Mitchell, O.B.E., J. P. Davies, S. W. M. Jones, G. N. Smyth, R. S. Woods, F. A. Bearn, D.S.O., M.C., J. W. Craw, G. W. Wood, J. P. Stallard, T. F. Hegarty, B. Murphy, P. W. Ransom, W. S. Haycock, F. R. Kerr, D.S.O., C. Jacobs, M.C., G. A. Hodgson, P. Thornton, M.C., J. E. Allan, J. Cowan, G. L. Jones, M.C., F. Sykes, L. H. W. Williams, W. H. Sheppard, F. V. Bevan-Brown, O. D. Child, O.B.E., H. Smith, J. A. Ryle, C. F. Hacker, M.C., J. K. J. Haworth, L. H. W. Iredale, M.C., G. M. Roberts, J. S. Robinson, G. D. Read, W. A. MacLennan, G. H. C. Mold, J. F. Hill, M.C., G. C. Dixon, J. N. McIntosh, G. F. Clifton, E. F. Guy, J. McKeercher, W. A. Elliott, T. B. Heaton, O.B.E., F. H. Kennedy, T. G. Sland, C. Grant, L. A. Lewis, J. S. Pooley, J. Kennedy, C. A. Mason, W. B. Wood, M. McKnight, A. L. Anthony, C. Gamble, H. L. Garson, O.B.E., M.C., W. K. Russell, J. H. Sewart, C. S. Waddington, G. W. Watson, W. A. Young, W. W. Phillips, W. M. Dickson, L. B. C. Markeman, T. Sheedy, O.B.E., J. L. McBean, F. N. Barnes, M.C., J. G. Bennett, M.C., T. P. Inglis, M.C., F. C. Lapage, H. M. Williams, F. A. Duffield, F. Sanders, M.C., J. W. Wood, G. M. Scott, M.C., J. O. Reid, S. W. Lund, P. B. Corbett, J. Lawson, N. B. Graham, M.C., R. O. C. Thomson, D. W. J. Andrews, J. G. Hendry, J. S. Armstrong, S. Brown, M.C., A. R. Lawrie, H. T. Chatfield, M.C., A. L. C. Mackenzie, W. W. Blair, T. R. Davies, I. P. Mackenzie, K. P. Brown, H. D. Wright, G. Morris, M.C., G. Irving, D. R. Jones, J. N. L. Blamey, C. P. L. Carrier, A. McL. Ferrie, M.C., M. Foster, W. N. Greer, I. MacKanzie, J. Mhae, C. P. Penberthy, B. J. Rylie, J. M. Smellie, W. L. Ingham, C. Ruda, E. W. Fish, H. C. Broadbridge, W. J. Vance, C. W. Dudley, G. S. Davidson, M. Dwyer, M.C., G. Lapage, E. B. Albaster, R. Colley, G. S. Brown, J. W. Dalglisli, M.C., J. F. Duthie, E. G. S. Hall, A. F. McMillan, R. Rodger, J. B. Stavau, R. W. MacDonald, J. A. Bnchaban, J. H. Albinson, D. D. Evans, M.C., H. S. Moore, M.C., R. B. Stewart, M.C., R. J. Staley, D. F. Standing, A. H. Craig, G. Ewan, G. J. Key, M.C., MacDonald, M.C., A. G. P. Wills, M.C., W. O. F. Sinclair, H. J. Wright, G. E. Kidman, J. J. Murphy, E. H. V. Hensley, A. B. Steven, W. A. Malone, A. Johnstone, M.C., G. S. Mather, J. Ross, F. B. Macaskie, P. B. E. Kirby, A. C. Dickey, T. P. Chapman (on account of ill health).

TERRITORIAL FORCE.

ROYAL ARMY MEDICAL CORPS.

Captain G. L. Thornton, M.C., to be Lieutenant-Colonel and to command 1st Wessex Field Ambulance.

The following officers resign their commissions: Major M. Dunning, D.S.O., and is granted the rank of Lieutenant-Colonel, with permission to wear the prescribed uniform. Majors and retain the rank

of Major: H. Halton, W. F. McAllister-Hewlings. With permission to wear the prescribed uniform: P. M. Dewar, P. McK. Terry, H. Waite, T. D. Captain A. L. Sharpin, and is granted the rank of Major. Captains and retain the rank of Captain: W. H. Armistead, A. E. Campbell, J. Dundas, S. Havelock, A. E. Huxtable, M.C., H. N. Kelly, A. M. Young, H. C. H. Racey, A. W. Hayward, J. S. Hopwood, M. U. Wilson, M.C., T. L. Ashforth, C. R. Woodruff, R. B. Reed, A. Greene, J. G. McKinlay, P. T. Catto, J. G. Hill, M.C., R. C. Smith, P. N. Creagh, S. Wyard, R. J. Chapman, M.C.; Captain A. G. Hebblethwaite, D.S.O., and is granted the rank of Lieutenant-Colonel.

Captains (acting Majors) relinquish the acting rank of Major: J. St. A. Titmas, J. H. Owens, and L. Milton, M.C., on ceasing to be specially employed; D. W. Berry, M.C., on vacating the appointment of D.A.D.M.S.

Captains to be Majors: W. C. Macanlay, J. H. Hunter, M.C., J. M. Smith, M.C., W. A. Valentine.

To be acting Majors whilst specially employed (June 12th, 1919): W. C. Gunn, W. A. Brechin, M.C.

Captains F. B. Julian, M.C., and G. L. Thornton, M.C. (late temporary Captains R.A.M.C.) to be Captains.

Captain W. Fitzpatrick relinquishes his commission on account of ill health and retains the rank of Captain.

Captains to be adjutants, School of Instruction: J. R. Hill (Lowland Division), J. H. Barry, D.S.O., M.C. (2nd London Division), O. W. McBeehy, D.S.O., O.B.E. (1st London Division), W. H. L. Allott (Highland Division), W. H. O'Riordan, M.C. (East Lancs Division), J. R. Yourell (North Midland Division), (Brevet Major) C. S. P. Hamilton, D.S.O. (Wessex Division).

1st Eastern General Hospital.—Captain S. W. Curl resigns his commission, and retains the rank of Captain.

2nd Eastern General Hospital.—Captain R. P. Nash, O.B.E., is restored to the establishment on ceasing to hold a temporary commission in the R.A.M.C.

DIARY OF SOCIETIES AND LECTURES.

ROYAL COLLEGE OF PHYSICIANS, Pall Mall East, S.W.—Tues., 5 p.m., Dr. A. F. Hurst, Croonian Lecture (IV): The Psychology of the Special Senses and their Hysterical Disorders.

ROYAL SOCIETY OF MEDICINE.—Section of *Laryngology*: Annual Summer Congress and Exhibition. Thurs., 2.30 p.m. to 5.30 p.m., Cancer of the Throat; 7.30 p.m., Dinner at the Café Royal. Fri., 10 a.m. to 1 p.m., Papers and Discussions; 2.30 p.m. to 4 p.m., Demonstrations; 4 p.m., Clinical Meeting.

POST-GRADUATE COURSES AND LECTURES.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.—Mon., 9.15 a.m., Dr. Theodore Thompson: Central Nervous System; 11 a.m., Dr. R. Hutchison: Digestion and Nutrition; 5.15 p.m., Mr. T. Higgins: Empyema. Tues., 5 p.m., Dr. D. N. Nabarro: Pathological Investigations. Tues. and Fri., 5.15 p.m., Mr. G. Waugh: Common Surgical Disorders.

LONDON HOSPITAL SURGICAL UNIT, Mile End.—Fri., 4 p.m., Mr. Russell Howard: The Acute Abdomen.

MANCHESTER FRENCH HOSPITAL.—Thurs., 5.30 p.m., Dr. A. C. Magian: Chronic Tubo-ovarian Inflammation and Venereal Disease.

MANCHESTER ROYAL INFIRMARY.—Tues., 4.30 p.m., Dr. E. M. Brockbank: Anaemias, and their Diagnosis.

NATIONAL HOSPITAL FOR DISEASES OF THE HEART, Westmorland Street, W.—Mon., 5.30 p.m., Dr. F. W. Price: Auricular Fibrillation.

CURRENT NOTES.

State-aided Patients in Voluntary Hospitals: Conference at Cambridge.

As stated in this column last week, the Hospitals Committee of the Association is issuing to the staffs of all the larger voluntary hospitals a memorandum showing the development of the practice of treating State-supported or State-aided patients at voluntary hospitals, and pointing out how seriously this practice affects the position of the honorary medical staffs. The question is raised more particularly in connexion with the treatment of pensioners, about which there have been recent negotiations between the British Medical Association, the Ministry of Pensions, and the British Hospitals Association. The importance of the precedents which have recently been created is strongly emphasized in view of the probable early developments in the use of the voluntary hospitals by the State and by local authorities; and the Branches of the Association have been asked to call meetings of the staffs of voluntary hospitals in their areas to discuss the question, and to arrange for common action as regards the treatment of pensioners. During the Annual Meeting at Cambridge a meeting will be held in the Small Examination Hall at 3 p.m. on Thursday, July 1st, with Sir Cuthbert Wallace, K.C.M.G., in the chair, and all members of staffs of voluntary hospitals and all Branch Secretaries who are present at Cambridge are invited.

A Development of Contract Practice in Scotland.

The Scottish Committee at its last meeting had under consideration a report by the Scottish Medical Secretary on several cases which had come to his notice from different areas where Labour representatives had made attempts to introduce a new practitioner in opposition to established practitioners. The cases all occurred in mining areas where the system of attendance on dependants by contract prevails, although there are no actual appointments, freedom of choice being the general rule. In the cases referred to certain Labour organizations advertised for a doctor to settle in a place and promised remunerative practice. The conditions of appointments were not stated, but the doctor "appointed" was to undertake attendance on dependants of workers at the accepted rate prevailing for miners' families. Here and there a certain amount of canvassing seems to have been done, and one case was reported to the General Medical Council by the Medical Defence Union. The Scottish Medical Secretary reported the steps he had taken in each case, and stated that he had been able to put a stop to the proposal in some instances and in others to make an arrangement satisfactory to the resident practitioners. In at least one instance, however, a man had been got to settle in spite of the representations made to him, but there was evidence that he had not been able to make much of the experiment. The cases reported are not confined to one area, and the movement seems likely to spread. The Scottish Committee decided to circularize

Secretaries of Divisions and Branches, and to warn them to take prompt and early action in the event of the tendency arising in their area. It was also resolved to ask the General Medical Council to consider the advisability of reissuing the notice as to canvassing.

MEETING OF SCOTTISH COMMITTEE.

THE Scottish Committee met in Edinburgh on June 10th, when Dr. GOFF presided, and various questions of importance were considered.

Salaries of Prisons' Medical Officers and Parochial Medical Officers.

It was resolved to communicate with doctors holding these appointments and obtain information as to the points in which improvements in the conditions of service were desired, with a view to taking action with the authorities concerned.

Medico-Legal Fees.

The question of increase in medico-legal fees was also considered and held over, pending the publication of the revised scale which, it is understood, will be issued by the Treasury authorities shortly.

Vaccination.

Reports were received from various areas as to the schemes for free vaccination during the present epidemic of small-pox. The schemes show great variation in conditions and rates of remuneration offered. The Scottish Medical Secretary reported that in cases where the fee offered was small, he had written to the authorities concerned, asking them to bring their fee into line with the rate usually charged in private practice in the district. It was reported that the Edinburgh authority proposed to appoint whole-time practitioners to do house-to-house visitation at a fee of £7 7s. a week, and also to establish centres for vaccination at which the fee would be £1 1s. per session extending to about three hours. The Committee resolved that the fee for whole-time service should be at the rate of £12 12s. a week, and for attendance at a centre £2 2s. a session of two and a half hours. The Secretary was instructed to intimate the resolutions to the authority concerned and to Division and Branch Secretaries. It was resolved to draw the attention of the Insurance Acts Subcommittee to the question of vaccination of insured persons.

Annual Meeting of Scottish Secretaries.

A proposal to hold an annual meeting of Scottish Secretaries of Divisions and Branches was remitted to the Chairman's Subcommittee.

ANNUAL MEETING AT CAMBRIDGE.

Naval and Military Section.

THE following is the full programme of the Naval, Military, and Air Force Section, which will meet on Wednesday, June 30th, in the Engineering Lecture Room:

At 10.15 a.m. the President, Colonel Joseph Griffiths, C.M.G., will open a discussion on "The medical service and its relation to the education and training of newly qualified medical men." Papers will be read on "The measures evolved to combat gas warfare," by Lieut.-Colonel P. S. Lelan, C.B., C.M.G.; "Professor of Hygiene, R.A.M. College;" "The regimental medical officer, his powers and duties," by Colonel R. J. Blackham,

C.B., C.M.G., C.I.E., D.S.O.; and "The teeth in the recruit," by Major J. V. Helliwell, C.B.E.

At 2 p.m. there will be the following exhibits and demonstrations in the Cavendish Laboratory:

I. R.A.M.C. Exhibits: Major C. M. Rigby, (a) mobile x-ray unit, (b) field x-ray equipment as used in a casualty clearing station, (c) electro-medical equipment; Lieut.-Colonel P. S. Lelean, (d) water purification, (e) methods adopted in the prevention of insect disease, (f) protection against poison gas, (g) museum miniature models of equipment in field sanitation; Major M. Sinclair, (h) surgical instruments, splints, etc.; Lieut.-Colonel J. P. Helliwell, (i) dental equipment of the new army.

II. R.A.F. Medical Service. Wing Commander Martin Flack, C.B.E.: The latest medical instruments and their uses in the direction of physical standards necessary in the Air Force Service.

Section of Venereal Diseases.

On the afternoon of Thursday, July 1st, there will be three demonstrations in the Medical Schools (not at Addenbrooke's Hospital as previously announced), one by Dr. Barnard upon dark-ground methods of microscopic diagnosis; one by Colonel Harrison upon the routine treatment of gonorrhoea in the male; and it is hoped that Dr. Morna Rawlins will be able to give a similar demonstration of gonorrhoea in the female.

Honorary Degrees.

The Congregation for Honorary Degrees will be held in the Senate House on Tuesday, June 29th, at 3 o'clock, not at 3.30 p.m. as announced last week.

Association Notices.

BRANCH AND DIVISION MEETINGS TO BE HELD.

NORFOLK BRANCH.—The Honorary Secretary, Sir Hamilton A. Ballance, announces that the annual meeting of the Norfolk Branch will be held at the Norfolk and Norwich Hospital, Norwich, on Wednesday, July 7th, at 3.45 p.m. The following papers will be read: "Modern Methods of Diagnosis," by A. J. Cleveland, O.B.E., M.D., M.R.C.P.; "Surgical Experiences—A Retrospect of Twenty-five Years' Practice," by H. Muir Evans, M.D. Dr. G. C. Anderson, Deputy Medical Secretary, will give an address on "The British Medical Association from Behind the Scenes."

OXFORD AND READING BRANCH.—The annual meeting of the Branch will be held at Newbury on Tuesday, July 6th, at 5 p.m. Dr. Victor Bonney will give a lecture on "Modern Methods in the Treatment of Difficult Labour."

SOUTH WALES AND MONMOUTHSHIRE BRANCH: MONMOUTHSHIRE DIVISION.—The annual meeting of the Monmouthshire Division will be held on Friday, July 16th, at the Royal Gwent Hospital, Newport. An Address will be given by the Medical Secretary, Dr. Alfred Cox, O.B.E., on "The Future of Medical Practice in the Mining Districts of South Wales and Monmouthshire—Servitude or Independence."

DIARY OF SOCIETIES AND LECTURES.

ROYAL SOCIETY OF MEDICINE.—Section of *Odontology*: Monday, 8 p.m. Discussion: "Pathology of Dental Cysts," to be opened by Mr. J. G. Turner, F.R.C.S., to be followed by Mr. F. Colman, Mr. E. D. Davies, Mr. Dolamore, Mr. F. N. Doubleday, Mr. M. F. Hopson, Mr. E. Hughes, Mr. T. B. Layton, and Mr. Herbert Tilley.

POST-GRADUATE COURSES AND LECTURES.

LONDON HOSPITAL SURGICAL UNIT, E.—Wed., 4 p.m., Mr. Russell Howard: Acute Abdomen.

MANCHESTER ROYAL INFIRMARY.—Thurs., 4.30 p.m., Dr. W. Dyson: Eczema.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, Queen Square, W.C.—Out-patient Clinics, 2-3.30 p.m. daily, excepting Wed. and Sat. Mon., 3.30 p.m., Dr. Saunders: Compression Paraplegia. Tues., 3.30 p.m., Dr. Risien Russell: Progressive Muscular Atrophy. Wed., 2 p.m., Dr. J. Taylor: Ocular and Visual Conditions in Nervous Diseases. 3.15 p.m. and Thurs., 3.30 p.m., Dr. Gordon Holmes: Cerebro-spinal Syphilis. Fri., Dr. Collier: Ward Cases.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.15.—Daily, 2.30 p.m., Operations, Medical and Surgical Clinics, etc. Mon., 2.30 p.m., Dr. Banister: Gynaecological. Tues., 9.45 a.m., Lieut.-Colonel Elliot: Eye Cases and Operations; 2.15 p.m., Mr. Gillespie: Dilatation of Colon; 3.15 p.m., Dr. Whiting: Sinus Irregularity; 4.30 p.m., Lecture, Dr. Banister: Ante partum Haemorrhage. Wed., 2.30 p.m., Dr. Oliver: Dermatological. Thurs., 2.30 p.m., Mr. N. Fleming: Ophthalmological. Dr. Metcalf: Radiology. Fri., 2.30 p.m., Dr. Sundell: Children. Sat., 3 p.m., Mr. Carson: Surgical Cases.

ROYAL EYE HOSPITAL, Southwark, S.E.—Wed., 5 p.m., Mr. Letchworth: Colour Vision and Colour Blindness.

WEST LONDON POST-GRADUATE COLLEGE, Hammersmith, W.—Daily, 10 a.m., Wards, 2 p.m., In- and Out-patients and Operations. Mon., 2 p.m., Dr. Simson: Diseases of Women; Mr. Harman: Eyes. Tues., 10 a.m., Dr. Robinson: Gynaecological Operations; 2 p.m., Mr. Davis: Throat, Nose, and Ear. Wed., 2 p.m., Dr. Owen: Out-patients; 2 p.m., Mr. Addison: Operations. Thurs., 2 p.m., Mr. Arnour: Operations; 2.30 p.m., Dr. Saunders: Wards. Fri., 2.30 p.m., Mr. Gray: Operations; Mr. Addison: Wards. Sat., 2 p.m., Dr. Beddard: Wards.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

1. Encephalitis Lethargica.

WEGEFORTH and AYER (*Journ. Amer. Med. Assoc.*, July 5th, 1919) report nine cases with five deaths, four of which came to autopsy. The cases showed involvement of several of the cranial nerves, notably the oculo-motor group and the facial, together with symptoms indicating involvement of the long projection tracts to the extremities—namely, ataxia, spasticity, Babinski's sign, and clonus. The course was mildly febrile, and was accompanied in the early stages by headache and nausea. Diplopia was complained of in seven of the nine cases, although oculo-motor palsy was seldom actually seen, doubtless owing to its transient nature. Weakness of the facial muscles, usually one-sided, was seen in five cases. Irregularity, inequality, and abnormality of the pupils in their reactions were common. Weakness of the jaw muscles was observed three times. Profound disturbance of respiration was twice noted. *Post mortem* all the brains appeared alike. There was a great degree of engorgement of all the vessels, and the brains were abnormally soft to the touch. In every case the chief seats of the lesions were the brain stem and basal ganglia, the principal lesions being perivascular exudation and diffuse infiltration of the parenchyma. Subsidiary lesions consisted of haemorrhage and meningitis. No bacteria were found in any case, and attempts to reproduce the disease by intracerebral or intraspinal inoculation of monkeys, rabbits, or guinea-pigs with filtrates from the spinal cords were ineffectual.

2. Intravenous Injections of Corrosive Sublimate in Severe Infections.

S. MELLO (*Il Policlinico*, Sez. Prat., October 26th, 1919) records three cases of severe infectious diseases (pneumotiphoid, puerperal fever, and an infection of uncertain nature) successfully treated by intravenous injections of mercury perchloride. In all the cases the injections were followed by a progressive fall of the temperature and improvement of the general condition. The largest dose daily was 8 mg., and though the treatment was continued for several days no toxic symptoms were observed except slight mercurial stomatitis in one case. The favourable action of the drug is to be attributed to its increasing the natural resistance either by neutralizing the toxins or by preventing the development of micro-organisms.

3. A Long Remission in Pernicious Anaemia.

C. G. STOCKTON (*Amer. Journ. Med. Sci.*, October, 1919) reports a case with the longest remission on record. It was first seen in 1899, when it was a typical case in all respects. There was an irregular improvement for six years, at which time, although there was a moderate anaemia, the blood lost all the characteristics of the pernicious type. In 1907 no abnormal cells were found and the blood was in every way satisfactory. The patient was considered to be well from 1907 till the beginning of 1918, when a sharp recurrence took place. There was a failure to respond to atoxyl and sodium cacodylate, which had formerly appeared to be of benefit. Improvement following transfusion was only temporary and death took place from lobar pneumonia, nearly twenty years from the recognition of the first attack of pernicious anaemia.

4. The Production of Epileptic Fits by Suprarenal Preparations.

SILVESTRI (*Gazz. d. Osped.*, October 5th, 1919) refers to a paper by Benedek, who by injecting 1 to 1.50 c.cm. of a 1 per cent. solution of tonogen succeeded in producing fits in 7 out of 19 epileptics, while the injections had no results in hysterical, psychopathic, and normal persons. Silvestri himself in 1913 published the results of a similar study of 23 epileptics, of whom 10 were women. The investigations were made in two successive periods, each consisting of fifteen days, the first being one of observation and the second of experiment, during which each patient was given 50 drops of paraganglin daily, with the following results: During the period of observation the male patients had 41 fits and 43 attacks of vertigo, and during the period of experiment 33 fits and 32 attacks of vertigo, whereas the female patients had 71 fits and 4 attacks of vertigo in

the first period, and in the second period 89 fits and 15 attacks of vertigo. Silvestri concluded that while in the male patients there was a slight diminution of the fits and attacks of vertigo, in 7 of the 10 female patients there was an increase in the number of both.

5. Frohn's Syndrome in Tuberculous Meningitis.

BAUZA (*Rev. méd. del Uruguay*, October, 1919) records the case of a boy, aged 4 years, who developed symptoms of meningitis. Lumbar puncture gave issue to a yellowish fluid, which coagulated *en masse* in a few minutes; it contained 25 cells per cubic millimetre, lymphocytes 100 per cent., normal and changed red cells, and an increase of fibrin. There were no tubercle bacilli, but a few meningococci. A second puncture yielded only a few drops of fluid, which set in a jelly. Inoculation of a guinea-pig did not produce tuberculosis. The case, however, was regarded as an example of tuberculous meningitis, owing to a positive intradermal reaction with a meningococcal association.

6. Hyperacute Intestinal Amoebiasis.

R. F. VACCAREZZA and R. FINOCHIETTO (*La Prensa Méd.*, Argentina, September 30th, 1919) report a case in a man, aged 50, who suddenly developed symptoms of colitis and proctitis, followed in the course of the next fortnight by evidence of peritonitis chiefly localized in the right iliac fossa. Death took place on the twentieth day from the onset from necrosis of the caecum and terminal portion of the ileum, in which a large perforation was found. Numerous amoebae were detected in the intestinal ulcers and gangrenous tissue.

7. Various Manifestations of Late Hereditary Syphilis.

M. R. CASTEX and J. PALACIO (*La Prensa Méd.*, Argentina, September 20th, 1919) state that hereditary syphilis may appear at a late stage, and even in adult life, in the form of glandular enlargement, which is chiefly situated in the neck. Its localization and character readily lead to confusion with scrofulous adenopathy, thus justifying the term of the "false serofula of hereditary syphilis." The diagnosis between heredo-syphilitic and tuberculous adenopathy is generally difficult. Only an approximate diagnosis can be made by a study of the personal and family history and by physical examination of the patient. The possibility of a hybrid or mixed adenopathy—that is, an association of tuberculosis and syphilis—should always be borne in mind. The prognosis depends on the stage at which the diagnosis is made and specific treatment instituted. When the diagnosis is made early and intensive treatment established the prognosis is good; otherwise the lesions become more or less refractory to treatment and leave indelible sequelae, such as ulcers or fistulae. Other frequent manifestations of late hereditary syphilis are chronic splenitis, which may give rise to various forms of considerable enlargement of the spleen, including Banti's disease, aleukaemic lymphadenitis, chronic infective splenomegalic jaundice, pernicious anaemia, and paroxysmal haemoglobinuria. In all these cases the prognosis is good if the condition is recognized in time and antisyphilitic treatment adopted.

8. Friedmann's Turtle Vaccine in Tuberculosis.

R. MÜHSAM and E. HAYWARD (*Deut. med. Woch.*, October 23rd, 1919) have re-examined 13 out of 15 cases of surgical tuberculosis treated with Friedmann's vaccine in 1914. Six of the 13 patients were dead in 1919, and in four of these a necropsy was performed, showing the cause of death to be extension of the tuberculous disease in every case. In two cases of tuberculosis of the lymphatic glands relapses had occurred since treatment with the vaccine. Recovery occurred in five cases, but only in three of these could the recovery be directly associated with the vaccine, the other cases having undergone treatment by other methods. Though the three recoveries thought by the authors to be directly traceable to the vaccine were made by patients with severe disease, and though other cases presenting signs of comparatively slight disease were refractory to the treatment, the authors yet believe that the explanation of such apparent successes as have been recorded after the use of this vaccine lies in the selection of early cases.

9. Calomel Inunctions.

COLE and LITTMAN (*Journ. Amer. Med. Assoc.*, November 8th, 1919), from observations on 54 patients treated intensively with calomel inunctions, advise against their use in the treatment of syphilis, as they found them to be almost totally ineffective against primary and secondary conditions, rarely producing salivation or gingivitis, and occasionally being followed by dermatitis. In nearly all the cases studied a 50 per cent. calomel ointment was used, always under the observation of an orderly or nurse, and in all routine Wassermann tests, and *Spirochaeta pallida* and spinal fluid examinations were carried out. In 35 per cent. of the cases the lesions became much worse; in 9 per cent. they grew worse; in 29.5 per cent. there was no change; in 9 per cent. there was slight improvement; in 5 per cent. marked improvement; and in 5 per cent. complete disappearance—showing a great preponderance in which the patients got much worse in spite of rubbings varying in number from twenty to forty. There was practically never any improvement in primary lesions, and in one case, after six inunctions, a generalized exfoliating dermatitis developed, with acute nephritis and general oedema, all of which cleared up rapidly after the discontinuance of the drug. The lack of salivation was in striking contrast to the results obtained by the use of unguentum hydrargyri, and it was entirely absent in 53.5 per cent., pointing to a very low grade of mercury absorption. Though cleanly and pleasant for the patient, calomel inunction cannot compare in efficacy with inunctions of unguentum hydrargyri.

10. An Unusual Case of Disseminated Sclerosis.

HILLEL (*Med. Klinik*, October 26th, 1919) records a case, in a girl aged 18, which was remarkable for the fact that for more than two months a unilateral choked disc was the only physical sign. The negative result of the Wassermann reaction and examination of the cerebro-spinal fluid, as well as the subsequent course of the disease in which the cranial nerves were not affected, were against the diagnosis of syphilis. Subsequently the diagnosis was established by the occurrence of Babinski's sign, horizontal nystagmus, and absence of the abdominal reflex. The occurrence of a unilateral choked disc is explained by morbid changes in the brain, causing a rise of cerebral pressure, but not of the intense and progressive character of that present in cerebral tumour.

SURGERY.

11. Local Anaesthetics.

EGGLESTON and HATCHER (*Journ. Amer. Med. Assoc.*, October 25th, 1919) studied the causes of acute intoxication from the use of local anaesthetics. The maximum toxicity of nine of the local anaesthetics was determined by rapid intravenous injection into cats, and it was found that these can be divided into two groups based on the difference in their rates of elimination. Alypin, apothetin, beta-eucaine, nirvanin, novocain, stovaine, and tropacocaine are all rapidly eliminated, so that several times their minimal fatal dose can be injected, either in fractions at intervals of from fifteen to twenty minutes, or slowly in dilute solutions, while cocaine and novocain, because of their much less rapid elimination, will cause death in much smaller total doses. The simultaneous injection of epinephrin delays absorption from the subcutaneous tissues, and the toxicity of the members of the first group is reduced thereby far more than members of the second group. The elimination of all the local anaesthetics is accomplished almost entirely by their destruction in the liver. They all kill by simultaneously paralyzing the heart and the respiratory system, and it was found that artificial respiration, even when combined with massage of the heart, was ineffectual as a resuscitative measure. The employment of artificial respiration, together with the stimulation of the heart by the immediate intravenous injection of epinephrin, enabled the majority of the cats to be resuscitated even after the rapid intravenous injection of doses up to twice the average fatal dose. If, therefore, the circulation and respiration can be maintained for even a few minutes the rapid destruction of the local anaesthetics by the liver will deal with amounts much in excess of those usually fatal, and it seems probable that in man the use of epinephrin with artificial respiration and cardiac massage will be effective in many cases of acute poisoning. In order to diminish the likelihood of intoxication from the subcutaneous injection of local anaesthetics epinephrin

should be added to the solutions, because by delaying absorption it increases the probability that the destruction in the liver can keep the amount present in the circulation at a point below that sufficient to cause intoxication.

12. Osteo-chondroma of the Stomach Wall.

L. E. ERKES (*Nederl. Tijdschr. v. Geneesk.*, November 29th, 1919) reports the case of a youth, aged 17, who had been admitted to hospital in an extremely emaciated condition. Since childhood he had suffered from stomach trouble, with longer or shorter intervals between the attacks, and recently the vomiting had been so severe that he had been unable to retain anything. The features were sunken, the pulse very small, and the skin dry. On examination of the abdomen the stomach extended down to the navel and exaggerated peristalsis was visible. Two fingerbreadths below the costal margin a movable tumour the size of an orange could be felt. There was much retention in the stomach, which contained sarcinae and free hydrochloric acid. On laparotomy the tumour was found in the anterior wall of the stomach close to the pylorus. The tumour, which could not be enucleated, was partially removed and gastro-enterostomy was performed. Examination showed that it was an osteo-chondroma. There were no metastases.

13. Flail Joints.

The treatment of flail joints at the shoulder and elbow is a difficult chapter in orthopaedic surgery. Wide excisions of joints for gunshot wounds have been carried out frequently as life-saving measures, and when the motive of the excision has been the tiding of a patient over an acute infective crisis little can be said against it. There is no doubt, however, that these excisions have been much more popular with some surgeons than with others. The functional result is, as a rule, disastrous, and one of the disadvantages of our own concentric method of working in France is here displayed, for those who made the excisions did not see the after-results, and so were not induced to reserve excision for the worst cases only. For those who performed secondary excisions in England to mobilize joints there are few extenuating circumstances. The difficulties of obtaining good functional results are discussed by PLATT (*Journ. Orthop. Surg.*, November, 1919). He confines his remarks to flail joints of the shoulder and elbow, and emphasizes the importance of a prolonged physio-therapeutic treatment first in correct position to increase the tone of stretched muscles and even cause actual shortening. In some cases no further steps are necessary, the power regained by the muscles being sufficient to stabilize the joint. Operative steps are, as a rule, necessary. Platt urges the two-stage operation, the first step being the removal *en bloc* of the scar, as previously advised by him for bone grafting. He finds that fewer disappointments through the recrudescence of sepsis attend fixation if this is done. It is very difficult to obtain actual bony union, even when the freshened bone ends are fixed together. Fibrous union is the rule, but is very firm and satisfactory. At the shoulder Platt is now lengthening the humerus by a bone graft, fashioned from the tibia in the shape of a mallet, the idea being to reconstruct the humeral head, which is always missing in flail cases. At the elbow he laces the bones together with strips of fascia lata pulled through holes drilled in the bone. These methods, though still on trial, have given satisfactory results.

14. Hysterical Hemiplegia.

DREYSDALE and GARDNER (*Journ. Amer. Med. Assoc.*, October 25th, 1919) report a case of hysterical hemiplegia resulting from a shrapnel wound of the scalp and presenting some confusing diagnostic symptoms. The history given was that of having received a wound on the left side of the head, causing brief unconsciousness, and being followed by paralysis of the entire left side of the body, including the face. During the whole of his treatment at hospitals in France, England, and Canada the condition was regarded as an organic disability following the wound, and therefore a total disability. When examined by the authors the patient showed a contracted left hand, weakness and limp of left leg, an apparently complete Babinski reflex of the left foot, and clonus of the left ankle and patella, all of which symptoms were also recorded when examined in Canada. X-ray examination of the skull and Wassermann tests of the blood and spinal fluid were negative, and these facts, together with the fact that the wound of the scalp was only a slight flesh wound followed by paralysis of the same side of the body and face, aroused a doubt as to the case being one of organic paralysis. After a month's observation and treatment by baths, galvanism, and exercises,

it having been explained to him that his trouble was functional and therefore curable, he showed such marked improvement by suggestive measures only as to confirm the diagnosis that the disability was entirely hysterical, after excluding the possibility of an admixture of hysteria and an organic lesion. The clonus of the ankle and patella frequently occurs in functional disorders, and is therefore worthless as a pathognomonic sign, and the Babinski response was regarded as a psychogenic movement of resistance rather than pathognomonic of an organic lesion. The case clearly shows with what degree of perfection hysteria may simulate organic disease, and also emphasizes the difficulties experienced in avoiding errors in diagnosis.

15. Ureteral Papillomata.

PAPILLOMATA of the ureter, whilst rare, are not altogether exceptional. MARION (*Journ. d'Urolog.*, September, 1919) gives an interesting account of two cases which he successfully treated by coagulation with a ureteral electrode. The brief and admirably written paper discusses the difficulty of diagnosing the condition. Marion lays stress on the following points as being of value. One ought to think, he says, of a ureteral papilloma in the case of a patient with haematuria, where one has found a vesical papilloma with the cystoscope and destroyed it, and where, in spite of this, the haematuria continues, blood being clearly seen to issue from the ureteral orifice. Further information is gained by ureteral catheterization. The catheter is pushed slowly in, and the flow of blood carefully watched. If there is at first blood, and then suddenly, as the catheter is pushed on, a stream of clear urine, the diagnosis of a papilloma in the ureter is almost certain. The observation is particularly valuable if a great quantity of urine escapes after the catheter has been coaxed past the tumour, evidence of a haemo-hydro-nephrosis above it. Two cases here recorded were treated by electro-coagulation, the relief in the second being temporary, due to the presence of a papilloma in the pelvis of the kidney. Nephrectomy was finally performed, and several small papillomata found in the renal pelvis. Both patients had previously had papillomata of the bladder.

16. Reconstruction and After-care of Old Unreduced Pott's Fractures.

SNEED (*Journ. Amer. Med. Assoc.*, November 1st, 1919) points out that in the reconstruction of old unreduced Pott's fractures the procedure varies in each case in accordance with what is necessary to establish the normal anatomy of the foot. In the case of a labourer, aged 35, there existed, ten months after the injury, an ununited fracture of the internal malleolus, rupture of the tibio-fibular ligament, fracture of the fibula $3\frac{1}{2}$ in. above the joint, displacement of the metatarsal bones, and posterior displacement of the foot. At operation the foot was forced round into varus, overcorrecting the pes planus, and re-establishing the normal relations of the tarsal bones as much as possible. Through an incision over the internal malleolus the fibrous tissue was removed, the fragments freshened, and a tibial inlay of bone was slid down and sutured into a groove in the malleolus. The fibula was divided about an inch above the ankle-joint, and the fibrous tissue and periosteum removed from the tibia and fibula from the ankle-joint to the fracture. The Achilles tendon was divided by the Z method and the foot forced into dorsal flexion to reduce the posterior displacement, and then pulled round into slight varus, approximating the fracture of the internal malleolus to the tibia, and forcing the raw surfaces of the tibia and fibula together. In this corrected position it was put up in plaster-of-Paris for six weeks, with excellent final result. After-care of these cases consists in continual support by plaster-of-Paris for eight weeks, followed by strapping for two or three weeks, and finally an arch support, with the shoe raised $\frac{1}{4}$ in. on the inner border of the heel and toe. It is essential that the normal mortise of the ankle-joint should be restored, otherwise there will be too much play, and the foot weakened.

17. Foreign Body Arthritis of Twenty Years' Standing.

COMMENTING on the tendency of practitioners to overlook the possibility of foreign bodies being responsible for obscure cases of arthritis, M. HIRSCH (*Wien. med. Woch.*, November 27th, 1919) records the following case. A married woman had suffered for over twenty years from pain in, and swelling of, the left knee. The beginning of the symptoms dated so far back and was so insidious that she could give no clear account of it. At first the attacks

of pain, swelling, and functional disturbances were marked by free intervals secured by resting the limb. Gradually the relapses became more frequent and prolonged, and their recurrence could not be traced to any special cause. After some time the swelling ceased to subside, and movements about the joint became very limited and painful. She could not stand on her left leg, much less walk. The outline of the knee was spindle-shaped, and there was considerable atrophy of the extensors of the thigh. Her medical attendants diagnosed tuberculosis or osteomyelitis, and she was urged to submit to resection of the joint or amputation above the knee. The boggy condition of the joint certainly suggested tuberculosis, but the history of intermittent hydrops early in the disease and the lack of fistulae and other signs of suppuration did not tally with this diagnosis. A foreign body being suspected, an x-ray examination was made, and part of a needle was detected in the joint. Accordingly the joint was opened, and the needle removed from its bed between the cartilage and the articular surface of the tibia. The needle was much eroded and broke on removal. The synovial membrane was very red, swollen, and spongy. The wound healed by first intention, and four months after the operation the knee was perfectly normal again; there was no pain, swelling, or limitation of movement, and the patient could walk and stand without discomfort.

18. Artificial Pneumothorax in Pulmonary Tuberculosis.

K. HENIUS (*Deut. med. Woch.*, October 23rd, 1919), whose experience of artificial pneumothorax in pulmonary tuberculosis is limited to twenty-four cases, finds the effect of this treatment extraordinarily beneficial, some of his patients with pulmonary cavities being restored to complete health and working capacity. He has found the following technical details of importance: The maximum intrapleural pressure should never exceed 15 cm. of water, and in no case should the pressure exceed 2 to 3 cm. in the early stages of the lung's collapse. The first injections should be limited to only 200 to 300 c.cm. of gas, given at intervals of only two to three days. Later these intervals may be extended to four to eight weeks. The treatment should be continued for one to two years.

19. Acute Suppurative Thyroiditis.

H. HÖPFNER (*Berl. klin. Woch.*, October 6th, 1919) contributes the following case to the literature of acute suppurative thyroiditis. A woman aged 25, who had previously been well, and who had not lived in a district where goitre was endemic, suddenly became febrile in the night, and complained of pain in the throat and dysphagia. Every movement of her neck excited pain, which radiated down to the left shoulder. Next morning her neck was swollen. Four days later she was admitted to hospital, where her temperature was found to be 37.8° C. There was a large, well-defined swelling in the position of the thyroid gland, and at one point, on the left side, the swelling was very tense and painful. Fluctuation was not demonstrable, but the skin over the swelling was red and hot. Swallowing was painful, and the speech was husky. Laryngoscopy revealed slight oedema in the region of the arytenoid cartilage. There were frequent paroxysms of cough. A blood count showed 22,000 leucocytes, of which 91 per cent. consisted of neutrophil, polymorphonuclear cells. After fifteen days in hospital, during which there was temporary improvement in the local condition, the swelling became fluctuating and was incised, a small quantity of blood-stained pus being removed. Gradual recovery ensued, but when the patient was discharged, a fortnight after the operation, the thyroid gland was still enlarged and abnormally hard. A curious feature of this case was the absent-mindedness and somnolence of the patient for a few days before the fulminating outbreak of local symptoms—a mental condition reminiscent of myxoedema.

20. Early Death in Burns.

ACCORDING to P. NEUDA (*Wien. med. Woch.*, November 1st, 1919), early death in burns is due to cardio-vascular paralysis, which is caused by the action of certain substances—in all probability cholin and its much more poisonous ester—which are produced by the destruction of the tissues. As the result of experiments on the frog's heart, Neuda found that the poisonous substance acts like muscarin and can be inhibited by atropine. He therefore treated five cases of very severe burns with atropine, with the result that in two cases recovery took place and in the rest life was prolonged for from 60 to 113 hours.

OBSTETRICS AND GYNAECOLOGY.

21. Retention of the Placenta by Bandler's Ring.

ALBECK (*Ugeskrift for Læger*, December 4th, 1919) records the case of an 8-para, aged 33, who gave birth to a male infant about a fortnight before term. The confinement was uneventful, but as the midwife could not remove the placenta, she obtained the assistance of a medical practitioner who attempted to express it. Having failed to do so, he followed the umbilical cord up through a ring that gripped his fingers so tightly as to numb them. As he could not extract the placenta, and as there was a certain amount of bleeding, he sent the patient to hospital forty-eight hours after the confinement. Here she was found to be anaemic, and blood was trickling from the vagina. There was slight albuminuria, the temperature was 37.8°C., and the pulse 132. Intrauterine irrigation was performed, and the cavity of the uterus explored. The lower portion was relaxed, and its walls were very thin. The exploring finger could pass through a narrow ring into the upper portion of the uterus, which was comparatively small, and which contained the placenta. Complete general anaesthesia having been induced, a couple of fingers, and then the hand, were passed through the ring while the fundus of the uterus was supported by the other hand. After the exploring hand had been introduced with comparative ease into the upper portion of the uterus, the ring gripped the wrist so forcibly as to render the hand numb. The placenta, which was partially adherent to the upper posterior wall of the uterus, was successfully detached and removed in its entirety. Intrauterine irrigation was repeated, and when the cavity of the uterus was again explored nothing could be found of the ring. The author finds this cause of retention of the placenta to be exceedingly rare, and he notes that only in one of the twenty-three cases of Bandler's ring recorded by Gammeltoft did the condition lead to retention of the placenta.

PATHOLOGY.

22. Primary Melanomas of the Male Breast.

FORGUE and CHAUVIN (*Rev. de Chir.*, Paris, 1919, xxxviii), after referring to the subject of primary malignant disease of the male mamma, of which Schuchard in 1884 collected 348 cases, deal with primary melanotic tumours of the breast in the male. Out of their 13 collected cases the age, given in twelve instances, varied between 10 and 69 years, with an average of 40 years, as contrasted with 52.5 years in Schuchard's cases of primary malignant disease of the male mamma. A primary melanoma may arise in the skin covering the mamma and form an ulcer, or it may originate deep in the substance of the mamma. The view is accepted that melanoma is a special form of tumour between carcinoma and sarcoma, and so may arise either from epithelium or from connective tissue, and show the structure of either carcinoma or sarcoma. Among 13 cases in which the histological details are available 8 were sarcomas, usually spindle-celled, and 5 carcinomas. The pigmented tumours of the mamma do not show the high degree of malignancy characteristic of melanomas in general.

23. Cholesterol in a Pleural Effusion.

A. BIGNAMI (*Il Policlinico*, Sez. Prat., October 26th, 1919) reported the case of a woman with a left pleural effusion which presented the same characters on removal in 1914, 1915, 1916, and 1919. Its specific gravity was 1030, and contained cholesterol 13.91 grams per litre and a few cells loaded with fat droplets. The colour was yellow. The nature of the disease was uncertain, but its course excluded the idea of a tumour of the pleura; no cholesterol was found in the blood. It will be recalled that H. Sharpe described two cases in the *BRITISH MEDICAL JOURNAL* of October 11th, 1919.

21. The Leucocytes in Influenza.

DOUGLAS (*Johns Hopkins Hosp. Bull.*, November, 1919) agrees with other observers in finding leucopenia to be the rule in epidemic influenza, although a few cases may give a normal count or even a slight leucocytosis. The leucopenia is frequently present on the first day of the disease, becoming more marked for a few days, and then tending to rise gradually to normal, even sometimes giving place to a leucocytosis during convalescence. Leucopenia usually persists when bronchopneumonia supervenes, and there is no constant relationship between the leucocyte count and the severity of the disease; differential counts show a relative decrease of the polymorphonuclears. Acute non-influenzal respiratory infections are generally accompanied by a leucocytosis.

25. Pfeiffer's Bacillus in the Accessory Nasal Sinuses.

In order to determine if *Bacillus influenzae* occurred more frequently in a series of infected maxillary antra examined immediately after an epidemic of influenza than in a series of infected accessory nasal sinuses examined during a non-epidemic period, CROWE and THACKER-NEVILLE (*Johns Hopkins Hosp. Bull.*, Baltimore, 1919, xxx) investigated 30 cases of infected maxillary antra during February, March, and April, 1919, and found *B. influenzae* in 8, or 26 per cent., as compared with 15, or 21 per cent., among 70 cases of various infected accessory nasal sinuses observed between 1912 and 1918. In both series the predominating organism was a streptococcus, which was present in 46 and 47 per cent. respectively. In 4 cases in the 1919 series *B. influenzae* was in pure culture. Clinically it is pyogenic. The writers infer that the Pfeiffer bacillus, like the streptococcus and pneumococcus, is a secondary invader, and not the primary cause of the disease known as influenza.

26. Affection of the Peripheral Vessels in Nephritis and Heart Disease.

J. WIESEL (*Wien. med. Woch.*, November 1st, 1919) in the course of the last two years has made a systematic examination of the peripheral vascular system in cases of nephritis and heart disease. Previous investigations had been confined to the largest vessels, such as the aorta, innominate, and carotid, and little attention had been paid to the smaller vessels. In 20 cases Wiesel examined arteries of all regions of the body up to the size of those of the palmar arch. The lesions were confined to the media, and were quite distinct from those of arteriosclerosis, with which they were occasionally associated. No fatty changes were found. Calcification might occur in the last stage, but the calcareous deposit was always in the media. The affection commenced with an oedema of the vessel wall, a serous infiltration of the media taking place. As the result of compression by the oedema the muscle fibres became atrophied, and the nuclei more or less completely disappeared. Repair was seen taking place, especially in the cardiac and renal vessels, with regeneration of muscle fibres, which, however, no longer took a circular but a longitudinal direction. Finally cicatricial tissue was formed, and occasionally calcification took place. The lesions were not confined to old persons but occurred at all ages, being found in children as young as 18 months. The lesions described were quite as frequent as arteriosclerosis. Etiologically toxic-infective processes were responsible, especially in the vasa vasorum.

27. Carcino-lytic Organic Acids.

FREUND and KAMNER (*Wien. klin. Woch.*, November 13th, 1919) have formed a theory from previous work that normal serums and tissues contain certain fatty acid compounds which have lytic properties for cancer cells. These normal acids are lacking from the tissues and serums of subjects with cancer, and their place is taken by unsaturated fatty acid compounds which are antagonistic to normal cells. The normal acids can be extracted only in minute amounts from large quantities of normal serum—for example, of the horse—but analysis has shown them to be saturated di-carbon acids of the aliphatic series. The authors have examined all the known acids of this series, and have found three of them to possess a lytic property for cancer cells *in vitro*, while other acids of the series, and of all other series examined, lack this property. The three effective acids all contain a C_9H_{17} group or a multiple of it, and the most active of the three is that with the greatest number, five, of these groups. The writers consider their results hopeful, but submit that no therapeutic result is to be looked for unless an acid can be synthesized with a larger number of C_9H_{17} groups and a molecular weight of about 500.

23. Leiomyoma of the Left and Endothelioma of the Right Pleura.

KORNITZER (*Berl. klin. Woch.*, November 3rd, 1919) observed, at a *post-mortem* examination on a man of 40, a malignant endothelioma involving the whole surface of the right pleural sac. It gave rise to a copious haemorrhagic exudate, and lymphatic metastases were present in thoracic and retroperitoneal glands. In the left pleural cavity a firm rounded tumour the size of an apple was discovered at the back of the lower lobe of the lung near the base. It was adherent to both layers of pleura and had evidently originated from one of them. On section it proved to be a leiomyoma. Kornitzer has found no previous record of myoma in this situation, and only one appears to have been recorded in the lung.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

29. Cerebro-spinal Fluid in Acute Diseases.

HERRICK and DANNENBERG (*Journ. Amer. Med. Assoc.*, November 1st, 1919), from a review of the literature and personal study of 76 cases of acute infections not resulting in meningitis, show that the cerebro-spinal fluid often gives evidence, by increased pressure, pleocytosis, and heightened globulin content, of a reaction on the part of the leptomeninges to the infective agents or toxins of many acute diseases, in which ordinarily true meningitis does not occur. Such diseases are lobar and bronchopneumonia, influenza, tonsillitis, scarlet fever, measles, variola, herpes zoster, parotitis, typhoid, sepsis, arthritis, pleurisy, migraine, and reaction to typhoid inoculation, etc., of which in about one-third of the cases studied the cerebro-spinal fluid varies from the normal. Most of the patients with subarachnoid reaction have clinical meningismus (meningitis serosa Dupré) though many cases of meningismus show no signs of pronounced changes in the cerebro-spinal fluid. Great caution must be exercised in diagnosing meningitis or poliomyelitis from fever, meningismus, and the changes in the cerebro-spinal fluid, and cases with less than 100 cells should be viewed with scepticism unless clinical, epidemiologic, or other laboratory evidence is decisive. While much has been stated of the dangers of lumbar puncture this is not borne out by an experience of 5,000 punctures, and in the absence of convincing clinical proof there need be no hesitation in removing 5 to 8 c.cm. drop by drop. The removal of larger amounts is unwise, except therapeutically, in meningitis. The increased pressure in the subarachnoid system may be a protective reaction in the early stage of infections, and care must be taken not so to reduce the pressure as to promote undesirable filtration from the blood stream. Clinical evidence tends to show that the meningeal-choroidal complex consolidates its defences after sepsis has existed for some time, and that the release of spinal fluid is less dangerous at a later than at an earlier period of sepsis.

30. Chronic Pancreatitis and late Hereditary Syphilis.

UDAONDO and CARULLA (*La Prensa Méd.*, Argentina, September 30th, 1919) report a case, in a man aged 26 who for a year had presented symptoms of pancreatic insufficiency, diarrhoea, and pasty stools, which was refractory to ordinary treatment. He had never had any venereal disease, but examination of the patient and one of his brothers showed certain stigmata of hereditary syphilis (unequal pupils, highly arched palate, irregular teeth, sclerotic otitis, and accentuation of second aortic sound). Mercurial treatment was adopted, and the diarrhoea was rapidly cured and the general condition improved. Inherited syphilis chiefly attacks the pancreas after the fifth month of intrauterine life and shortly after birth. Sclerogummatous forms are the least frequent, and extralobar and intralobar pancreatitis with hypoplasia of the glandular tissue has been found in almost all cases. No previous instance has been recorded of a patient who did not develop symptoms till adult life. The symptoms indicated functional insufficiency of the gland without obvious involvement of the internal secretion, as there was no glycosuria and no evidence of other glands of internal secretion being affected.

31. Skin Reaction in Quinine Idiosyncrasy.

O'MALLEY and RICHEY (*Arch. Int. Med.*, October, 1919) record two cases of idiosyncrasy to quinine in which Boerner's skin reaction was tried, and in which attempts at desensitization were made. The first case was a sailor, aged 22, who during convalescence from influenza was given a mixture containing quinine. Within a few minutes the eyes began to smart and itch, and photophobia and lachrymation followed. Soon afterwards the face, neck, chest, and hands became a "lobster red" colour with a rapidly generalizing erythema. There was intense pruritus, some headache, but neither vertigo nor tinnitus aurium. The erythema and pruritus disappeared in two hours and a half. Though the patient had had quinine during childhood without any untoward symptoms, he did have quinine reactions on one or two occasions within the last six years, but this sensitiveness had apparently passed off. The second case, also a sailor, aged 23, had had three

attacks of benign tertian malaria, the first two of which responded readily to 1 gram of quinine sulphate three times a day without any untoward effects. The third attack occurred some six months after the second. The first dose of quinine produced no ill effects, but the second dose a few hours later caused a blotchy diffuse rash, generalized pruritus, headache, tinnitus, photophobia, lachrymation, dyspnoea, nausea, and diarrhoea, the attack lasting several hours. Subcutaneous injections of quinine produced similar though milder attacks. Both men failed to react clinically with the other alkaloids of cinchona. Boerner's reaction was tried in both cases. This consists in scratching the skin with a needle on the flexor surface of the forearm after cleansing with alcohol. To one scratch quinine bisulphate (1 in 10) is applied; the other scratch, at a distance of three inches, is left untouched and serves as a control. The reaction begins with an itching, smarting, or burning sensation from four to five minutes after application, and is quickly followed by an irregular area of oedema on either side of the needle scratch. This oedema reaches its height in from fifteen minutes to an hour, and is surrounded by a bright red halo of erythema. The reaction seems to be specific to those who are hypersensitive to quinine. Both of the cases gave the reaction. Heran and St. Girons' method of desensitization successfully abolished the quinine idiosyncrasy in one case, and increased the tolerance in the other. The method consists in giving by mouth a desensitizing dose of 0.005 gram with 0.5 gram of sodium bicarbonate; in an hour and a half 0.1 gram of quinine bisulphate with the same dose as before of sodium bicarbonate is administered in cachets; the desensitizing dose remains constant each day, but the second dose is increased by 0.1 gram of quinine every day until 2 grams or more are tolerated.

32. Acute Aseptic Purulent Arthritis.

APERT and CABBASSÈDES (*Presse méd.*, Paris, 1919, 713) record two cases of acute aseptic purulent arthritis: a recent one in a child aged 5 years and one in a girl aged 12 years after scarlet fever, observed in 1895. They also refer to a case of aseptic purulent meningitis and arthritis of the elbow-joint recorded by Deléarde and Breton. Otherwise no similar cases have been collected by them, though aseptic empyemas reported by Widal and others are referred to. Widal suggested that the presence of polymorphonuclear leucocytes in serous cavities might be due to excessive hyperaemia of the underlying tissues set up by an inflammatory focus, although the infecting organism does not reach the surface. As regards the application of this hypothesis to their first case Apert and Cabbassèdes point out that there was no clinical evidence of osteomyelitis. The special features of acute aseptic purulent arthritis are: the small amount of pain, the contrast between the arthritic swelling and the absence of fever, and the rapid coagulation of the evacuated pus as a whole. This is explained in the following way: Micro-organisms destroy the fibrin and alter some of the leucocytes, whereas in the absence of bacteria the fibrin persists and the leucocytes are intact.

33. Diabetes in War.

MAGNUS-LEVY (*Med. Klinik*, November 9th, 1919) states that in the years immediately preceding the war the deaths from diabetes in Berlin remained constant, whereas during the last four years they had continuously fallen, being 202, as compared with 444 in the last four years preceding the war. The male sex showed a greater decline in the mortality than the female; 75 per cent. of the deaths occurred above 50 years of age. It was a remarkable fact that the percentage mortality among children had sunk as low as in adults. Mistakes in diagnosis could not account for the diminished mortality either in children or adults. It was rather more probable that the diabetes mortality was still lower, because patients who died of intercurrent diseases counted as diabetics, owing to their food cards, to the end of their life. The number of deaths from diabetic coma had considerably diminished. Cases of severe diabetes suffered most from the food restrictions, but Magnus-Levy's impression was that they did not die sooner than in peace time. Coma and acidosis were less frequent, while the development of tuberculosis was decidedly more common. The experience of a diminution in diabetes as the result of a blockade had already been made during the siege of Paris.

34. Treatment of General Paralysis by Tuberculin

BOULOS (*Journ. de méd. et de chir. prat.*, November 25th, 1919), in his Bordeaux thesis, reports twelve cases of general paralysis in which improvement followed from injections of tuberculin. He does not claim to have effected a cure, but he thinks that remissions of long duration were obtained by this method. The idea of using tuberculin in general paralysis was not due to a belief that the disease was of tuberculous origin, but was suggested by the fact that improvement in general paralysis has often been observed after an intercurrent febrile disease. Donath had previously produced an artificial fever by injection of sodium nucleinate, and Wagner and Pilez by injection of tuberculin. Boulos recommends that one should start with extremely small doses, which should be increased very gradually, and only if the temperature does not exceed 102.2° F. As a rule five injections were given—one every week—followed after an interval by another series. Tuberculosis in the patient is a contraindication, and the treatment should be at once suspended when signs of intolerance appear, such as hyperpyrexia, rapid loss of weight, and incontinence of urine and faeces. In favourable cases there is a slight or moderate reaction, and one to six weeks after the last injection improvement is shown by an increase in weight, improvement in the mental faculties, and return of memory, so that some patients can resume active work. But there is no change in the reflexes or cerebro-spinal fluid, in which the lymphocytosis and excess of albumin persist.

35. Salivary and Endocrine Glands.

P. DALCHÉ (*Journ. de méd. et de chir. prat.*, November 25th, 1919) records the case of a lady, aged 50, who had consulted him for enlargement of the thyroid gland. The menopause had taken place about five months previously. In addition to the goitre, she presented considerable swelling of both parotid and submaxillary glands, accompanied by profuse salivation. She stated that in the course of her two pregnancies, twenty-five and twenty-three years previously, she had had a similar enlargement of these glands and salivation, but without any affection of the thyroid. The symptoms had disappeared after delivery. Under treatment with haemato-thyroidin, not only did the thyroid diminish in size, but the parotid and submaxillary enlargement and salivation completely disappeared in about three months' time. Dalché concludes that the salivary, ovarian, and thyroid manifestations constituted a polyglandular syndrome, and suggests that a similar treatment might be adopted in Mickulicz's disease, which is probably also a polyglandular syndrome.

36. Is Normal Horse Serum as Effective as Anti-Diphtherial Horse Serum?

In two separate papers M. KLOTZ and K. DORN (*Berl. klin. Woch.*, October 20th, 1919) discuss Bingel's view that as good results can be achieved by normal as by anti-diphtheritic horse serum. Both authors refer to animal experiments which have shown specific serum to be far more effective than normal serum, and both suggest that this finding may not apply to the human organism. Klotz discusses the many failures following the use of specific serum, whether it be given for prophylaxis or treatment, and is inclined to admit, with certain reservations, that normal serum may be as effective. Dorn is also a half-hearted convert to Bingel's teachings, but neither author recommends the abandonment of specific for non-specific serum-therapy in diphtheria in general practice till hospital practice has decided the point.

37. Endemic Osteomalacic Disease.

FROMME (*Berl. klin. Woch.*, October 13th, 1919), whose original investigations into endemic osteomalacic disease in parts of Germany were published early in 1919, has collected much new material by circularizing several of his colleagues. At a meeting of the Medical Society of Göttingen he stated that the number of cases of late rickets or osteomalacia observed at his polyclinic had risen to 66. Thirty-two of his colleagues had sent him reports of 266 cases observed in adolescence or later in life. Of these 266 cases all but 12 were males. Of the 254 males 239 were adolescents, and only 15 were well advanced in years. Of the 12 females 4 were pregnant or suckling. Practically all these cases belonged to towns or to districts where the food shortage was specially acute. The disease resembled rickets in the case of adolescents, whereas among adults it assumed the character of osteomalacia. A doctor attached to a mine had examined all the insured workmen, and had found 8 out of 200 elderly men to be affected. Among 72 young employees there were as many as 27 found suffering from this disease.

A school medical officer reported several cases of rachitic deformity and spontaneous fracture among scholars between the ages 6 and 12. The greater the bodily exertion by adolescents the more serious was the bone disease.

38. The Pathogenesis of Disturbances of Micturition in Tabes.

A. FREUDENBERG (*Med. Klinik*, November 9th, 1919) remarks that it is generally supposed that the disturbances of micturition in tabes are due to a paralysis of the detrusor of spinal origin or to degenerative changes in its musculature. He regards both these views as incorrect, and maintains that the condition is to be explained by a lack of co-ordination between the detrusor and the sphincter vesicae internus when an effort is made to empty the bladder. The detrusor contracts and the sphincter, instead of being relaxed, also contracts to a greater or less degree. The grounds for this view are as follows: (1) The theory of a permanent paralysis of the detrusor or changes in its muscle is negated by the fact that the disturbances in micturition in tabes are an early symptom, and often the first serious symptom, in the disease. (2) Cystoscopic examination of the bladder in tabes always shows the presence of trabeculae, which could not occur if there was a paralysis or primary change in the muscle of the detrusor. (3) The remarkable variability in the bladder symptoms, apart from the development or aggravation of complications such as cystitis. Thus the amount of residual urine may vary from 400 or 500 c.c.m. one day to only 30 or 50 c.c.m. the next. (4) Urethroscopy frequently shows a contraction of the sphincter vesicae internus when the patient strains or when pressure is made on the bladder region. (5) Division of the sphincter internus, which Freudenberg carried out in some cases, completely cured the condition—the external sphincter, which was not divided, taking on the work of the sphincter internus.

SURGERY.

39. Internal Piles.

THERE are few conditions more common than internal piles, and few for which surgery holds out such fair prospects of cure. But it is essential that the operator should have knowledge of the arrangement of the vessels supplying the lower part of the rectum and anal canal, which follow a definite and constant order. MILES (*Surg., Gyn., and Obstet.*, 1919, 29) in a well-planned paper recapitulates his views on the vascular supply of the anal canal and its influence on the development of piles. He points out that the right and left branches of the superior haemorrhoidal artery ultimately divide into seven vessels which reach the anal ring at constant points. The maximum number of piles which can be present is therefore seven, and they will be found in definite positions (very rarely an eighth may be present). Of the seven possible piles Miles distinguishes three as primary, namely, the right anterior, the right posterior, and the left lateral. These correspond to the main trunks of the divisions of the superior haemorrhoidal artery. Besides these are four secondary piles, corresponding to the subsidiary branches of these trunks. These occupy the right lateral, posterior, left posterior and left anterior (with the rare anterior, an offshoot of the last) points on the anal ring, which Miles divides for recording purposes into four quadrants. The author points out that it is only by using such careful notation that one is able to apply ligatures or clamps intelligently and to be sure that a return of symptoms is due to development of a pile not previously present rather than to faulty treatment of an old one. Under the age of 40 one cannot be sure of permanent cure, as in the earlier decades of life it is uncommon for all seven piles to be developed. One must therefore warn the patient that symptoms may recur later, but that if they do they will be due to new piles, probably developing in the "secondary" positions. Miles distinguishes three stages of pile formation—primary, intermediate, and final—and points out that bleeding is a more constant feature of the first stage than of the last. As the piles present in any given patient are usually in differing stages of development it is important to establish the existence of and to treat those in the early stage, or a return of bleeding after removal of those more mature may lead to disappointment. Miles is a firm believer in the ligature operation, the haemorrhoids being powerfully strangulated with strong silk (No. 16 plaited). He believes that even in the severest cases three ligatures only need be applied, these being so placed that the primary and

secondary piles are included. The sites of application are right anterior, right posterior, and left lateral. Miles makes a point of dividing the "pecten band" with a knife, as after this is done no forcible dilatation of the sphincters is necessary. Full details are given of the pre-operative and post-operative management of these cases.

40. Treatment of Cancer of the Rectum.

P. BULL (*Norsk. Mag. for Lægvidenskaben*, December, 1919), who has observed 71 cases of cancer of rectum in the period 1897-1918, reviews the results achieved in the 44 cases that were operated on. The operation mortality was 11.4 per cent.—that is, five deaths. Of the 39 who survived the operation 17 were still alive, the average duration of life after the operation being eight and a half years. Twelve patients survived the operation more than three years. A permanent cure could thus be claimed in 12 (30.8 per cent.) out of the 39 cases surviving the operation. There were also three cases which survived the operation by more than three years, but which ultimately terminated fatally owing to a recurrence of the disease. The author notes with surprise that the ultimate results appeared to be little affected by the extent and localization of the disease—a finding which he interprets as an indication for attempting an operation even when the disease seems to be extensive. He qualifies this opinion with the reservation that when the inguinal glands are involved there is little prospect of a permanent cure by operation. With regard to choice of operation he is very catholic, insisting on the importance of suiting the operation to the needs of each case. He urges the adoption of an exploratory laparotomy in doubtful cases, as this often saves the patient from a futile radical operation.

41. Lane Plates.

SWETT (*Journ. Orthopaedic Surg.*, November, 1919) records his personal experience in the use of Lane plates in 28 fractures (femur 18, tibia and fibula 7, radius and ulna 3). Primary healing was obtained in all but two instances of compound fracture in which plates were used at the primary cleansing operation. In four cases sinuses developed at the end of from six to ten weeks merely as the result of foreign body irritation, and with one exception these healed directly the plates were removed after accomplishing the object of their use. The one case in which the sinus persisted after removal of the plates afforded a positive example of low grade osteomyelitis caused by the plate, and most probably set up by faulty technique in handling the plates and screws. There were no cases of delayed, vicious, or non-union, and patients were advised to have the plates removed as soon as strong union of the fragments was accomplished; in four cases in which removal took place no kind of abnormal soft tissue or bony reaction was present. In one case operated upon for non-union of the femur one and a half years after the injury a large six-screw plate was used with excellent result, explained by the fact that it was necessary to remove a considerable amount of bone on account of excessive overlapping; this resulted in the apposition of healthy non-sclerotic fragments. The two cases of infected compound fractures and the four of sinus discharge occurred in the radius and ulna or the tibia and fibula, there being never any trouble in any of the femur cases. Plating seems to be a much safer procedure in such cases than in other localities, probably because the greater depth and extent of muscle layers surrounding the femur provide a much stronger resistance than do the tight tissues in the leg and forearm. The application of Lane plates is particularly desirable in severely comminuted fractures, where they seem mechanically more efficient and where their introduction is less likely to increase the trauma than would be the case with other methods.

42. Cerebellar Abscess of Otic Origin with Complete Homolateral Hemiparesis.

R. DAMADE and J. BOISSERIE-LACROIX (*Gaz. hebdom. de sci. méd. de Bordeaux*, December 7th, 1919) quote Professor Sabrazès's statement that cerebellar abscesses may be impossible to recognize clinically owing to the absence of any characteristic symptom. Giraud has shown that there may be complete destruction of a large part of the cerebellum without any so-called cerebellar symptoms. In the fatal case reported by the present writers, which occurred in a man aged 56 who had suffered from right otitis for more than thirty years, there was complete hemiparesis on the same side as the ear affection, and this was the only sign which suggested a cerebellar abscess. *Pest mortem* the abscess was found in the most anterior part of the right cerebellar hemisphere. According to

Aeland and Ballance complete hemiparesis on the same side as the ear affection is pathognomonic of cerebellar abscess. It appears to be due to compression of the pyramidal tract below the decussation of the pyramids, hemiparesis on the opposite side to the cerebellar lesion being caused by compression of the pyramidal tract above the decussation. The occurrence of hemiparesis in cerebellar abscess is not frequent. Only 30 cases were collected by Aeland and Ballance in 1894, in 25 of which the hemiparesis was on the opposite side to the otitis, and in 5 on the same side. In the recent literature the present writers have found only two cases of cerebellar abscess or tumour accompanied by hemiparesis on the side of the lesion, reported by Macewen and by Chauvet and Vetter respectively.

43. Treatment of Flail Joints.

PLATT (*Journ. Orthopaedic Surg.*, November, 1919) discusses the treatment of flail joints of the shoulder and elbow resulting from actual loss of bone. In the shoulder-joint each case requires consideration as regards the functional capacity of the scapular and deltoid muscles, and the success of operation depends ultimately on the development of muscular sufficiency and co-ordination. Stability should be possible of attainment without producing ankylosis, but in all cases fixation of the joint should be aimed at, and an incomplete fixation allowing a small range of motion often gives a perfectly satisfactory functional result. Prior to operation the arm should be maintained on an abduction splint, and intensive training of the scapular muscles and deltoid carried out. Operation should be in two stages, adherent skin scars and all deep scar tissue of the glenoid fossa and upper end of the humerus being removed in the first stage for bacteriological examination, while actual reconstruction of the deltoid insertion can be effected, and the result of direct faradism noted for future guidance. In the second stage, operation for fixation may be either an arthrodesis, or a reconstruction of the head of the humerus, the latter of which procedures gave the better results. A large autogenous tibial graft, shaped like a wooden mallet, is brought into contact with the glenoid cavity, the handle of the graft having been driven into the medullary cavity of the humerus. To afford additional support a long fascia lata sling is carried through the upper end of the humerus and the upper margin of the glenoid and acromion process, and the limb is put up in 90 degrees abduction. In the elbow-joint ankylosis is generally the most desirable procedure, but true bony ankylosis is very difficult to obtain. Operations to obtain stability with retention of movement are of two kinds: (1) those in which simple approximation of the bone ends is obtained, and (2) those in which an increase in the length of the humerus is obtained by the insertion of a graft as described in the shoulder-joint operation. In the first type the bone ends are bound together by the insertion of one or two long stout slings taken from the fascia lata of the patient's thigh. The limb is slung up at 45 degrees flexion, active flexion within a small range is encouraged at an early stage, and a useful degree of stability has resulted. In connexion with the operative stabilization of the elbow-joint the end result depends entirely on the development of muscular control.

44. Congenital Absence of the Tibiales Antici.

H. A. LAAN (*Nederl. Tijdschr. v. Geneesk.*, November 29th, 1919) reports the case of a railway official, aged 42, who sought advice for a painful condition of the left foot which had lasted ten years. On contracting the leg muscles the extensor longus digitorum on each side stood out prominently, the extensor longus hallucis showed nothing abnormal, but the tibiales antici appeared to be entirely absent. All the movements of the feet were normal except dorsiflexion, which the patient was unable to effect. There was no history or sign of infantile paralysis, so that the condition was obviously congenital. It was a remarkable fact that it had remained unrecognized for so long and had caused such slight symptoms in standing or walking.

45. Primary Tuberculosis of the Kidney.

C. SOLINA (*Il Policlinico*, Sez. Prat., November 9th, 1919) records the case of a woman, aged 33, with primary tuberculosis and ptosis of the right kidney. A remarkable feature in her case was the occurrence of haematuria whenever the abdomen was palpated. Nephrectomy was followed by complete recovery, and when seen three years after the operation the patient, who was in the seventh month of pregnancy, was in excellent health.

OBSTETRICS AND GYNAECOLOGY.

46. Myositis and Meningitis in Puerperal Pyaemia.

L. CAUSSADE and R. SIMON (*Rev. méd. de l'Est*, December 1st, 1919) report a fatal case of suppurative myositis of the dorso-lumbar muscles, which by extension had given rise to cerebro-spinal meningitis. Small metastatic abscesses were also found in the base of the right lung. The source of the mischief was a portion of retained placenta, the retention being probably due to syphilis.

47. Sterility and Graves's Disease.

R. BLONDEL (*Bull. Soc. de Thérap.*, November 12th, 1919) states that the recent increase in the frequency of Graves's disease is one of the principal factors of sterility in French women, one of the effects of hyperthyroidism being atrophy of the uterine muscle. Local examination in such cases shows a small pyriform uterus. Owing to the antagonism between the thyroid and the thymus, Blondel recommends the administration of raw thymus in the form of lamb's sweetbread, in addition to local measures such as massage of the uterus and dilatation by tents.

48. Gonorrhoea of the Rectum in Women.

H. BOAS (*Hospitaltidende*, December 17th, 1919) has for the past two and a half years systematically examined the rectum for gonococci in every case of gonorrhoea in women. He found gonorrhoeal proctitis in 14 out of 88 cases, that is, in 16 per cent. Unlike other observers, he came to the conclusion that the disease is a comparatively benign complication of gonorrhoea, and that it responds readily to irrigation with a 1 in 3,000 solution of potassium permanganate at a temperature of 40° morning and evening. In a few cases that proved refractory to this treatment it was supplemented by irrigations with a 2 per cent. solution of protargol. As the proctitis often provokes no symptoms it is apt to be overlooked and untreated unless the rectum is examined in every case as a matter of routine.

PATHOLOGY.

49. Renal Glycosuria.

ALLEN, WISHART, and SMITH (*Arch. Int. Med.*, November 15th, 1919) have had the opportunity of making a careful study of three cases of so-called "renal glycosuria" occurring in a military hospital and of comparing the findings with those of 37 cases of true diabetes. The more frequently blood sugar analyses are made in glycosuric cases, the more commonly is this interesting anomaly found. In none of the cases studied was there any indication of nephritis or renal abnormality. The apparent absence of harm when the patients were allowed unrestricted diet during continuous sugar excretion agrees with the favourable prognosis of this condition according to the literature. On the other hand, there is a disturbance of health when the diet is restricted in an attempt to stop the sugar elimination. This is in marked contrast to what occurs in true diabetes. The authors failed to discover any fixed relations between the sugar in the blood and in the urine; the renal excretion did not serve to maintain a low level of blood sugar, and the output was not always higher with high than with low blood sugar. Nor were fixed relations found between sugar and water elimination. The sugar excretion seemed to be determined by the supply of available carbohydrate, and to a less degree by the potential carbohydrate of protein. No tendency to acidosis was observed. The excreted substance in one of the three cases seemed to be an unknown sugar, differing from glucose by the absence or incompleteness of fermentation; this observation suggests the desirability of closer examination of the fresh urine in such cases for accurate identification of the sugar.

50. Vaccination by Subcutaneous Injection.

GOODALL (*Amer. Journ. of Med. Sci.*, November, 1919), who has vaccinated 6,000 cases by hypodermic inoculation of calf lymph, claims that the procedure is devoid of untoward results if ordinary aseptic precautions are taken. From one-half to three-quarters of a tube of vaccine are used for each individual, sufficient sterile water being added to make the quantity up to 1 c.c. When several cases have to be vaccinated at the same time, as in the case of soldiers, a sufficient quantity can be taken up in a large syringe, the needles being changed for each case. The arm is sterilized with iodine, and the inoculation is performed in the same way as antityphoid inoculation.

A local reaction occurs in from two to four days, but in some cases may be delayed for a fortnight. It is variable in intensity, and consists in local swelling, heat, tenderness, slight pain, and redness: in a few cases the reaction is marked, causing swelling and oedema of the arm. After the seventh or tenth day the local swelling and induration subside, leaving a hard nodule in the subcutaneous tissues, usually ill defined at first, but later becoming more circumscribed and lasting for about a month. The advantage of the method is that no dressings are necessary, secondary infection is eliminated, the patients are not incapacitated, and the percentage of positive reactions is very high. Children undergo the hypodermic vaccination without any difficulty owing to the rapidity with which the injection is carried out.

51. Macrophages of the Loose Connective Tissue.

FOOT (*Journ. Med. Res.*, September, 1919), in a first paper on the study of endothelial reactions, endeavours to trace the origin of the "wandering connective tissue cell." He uses a combination of methods employed by other experimenters—the intraperitoneal injection of trypan blue, the intramuscular injection of sterile agar, and the intravenous injection of a colloidal lampblack-gelatin solution. By killing the animals at different periods he finds that the macrophages of the connective tissue spaces are of endothelial origin, and that they are not derived from the omentum or from lymphocytes. He thinks that they are probably derived from the proliferating endothelium in the immediate vicinity of the lesion which calls them forth rather than from the vascular endothelium in general. They do not appear to come entirely from the circulating mononuclear leucocytes.

52. A Third Form of Paratyphoid.

LEWY and SCHIEF (*Berl. klin. Woch.*, November 10th, 1919), in confirmation of observations by other workers in Syria, Palestine, Mosul, Albania, and Wolhynia, describe a febrile illness associated with infection by a bacillus of the paratyphoid group. The bacillus, which has been named *B. erzindjan* by Neukirch, and has been separately described by Weil, gives the cultural characters of *B. paratyphosus* B, but differs in agglutination reactions. The disease is sometimes associated with diarrhoea, but its most striking feature is the severity of toxicæmic symptoms. The temperature is high, sometimes simulating the curve of typhoid but not usually, the pulse is relatively slow, rose spots are not observed, the fever is commonly of long duration, and the mortality, except in natives of the districts, is high. The bacillus, it is said, can be cultivated from the blood with great ease and regularity. *Post mortem*, abscesses are commonly found in the skin and in the liver and kidneys, and there may be hæmorrhages in the serous membranes. The spleen is enlarged. Typical intestinal ulceration is not found. The disease is much more of a septicæmic type than is commonly seen in the enteric group infections hitherto described.

53. Changes in the Blood and Cerebro-spinal Fluid in Typhus.

ROTHACKER (*Muench. med. Woch.*, September 26th, 1919) has come to the conclusion that there are no demonstrable changes in the blood peculiar to typhus. In each of the three stages of the disease the blood picture was different. But these differences were not uniform, as they were profoundly affected by the severity of the disease and the patient's powers of reaction. From the first to the fourth day of the disease the blood picture was normal. When the rash had developed, the total number of leucocytes was still normal, but there was a comparative increase in the number of polymorphonuclear leucocytes. After the tenth day of the disease the leucocytes often ranged from 10,000 to 14,000, and seldom fell below 6,000. The polymorphonuclear leucocytes represented 95 to 97 per cent. of the total. There was little change in the number of the mature normal neutrophils during the disease. There were no eosinophils, and the lymphocytes were reduced to 3 to 6 per cent. The red cells often numbered 2 to 3 million, and the amount of hæmoglobin was normal. During convalescence there was often an appreciable rise in the number of leucocytes. Eosinophils reappeared, abnormal forms disappeared, and the number of lymphocytes increased. By the eighth to the tenth day of convalescence the blood picture was again normal. Not till the tenth day of the disease, at the earliest, was the blood picture of diagnostic value. As for the cerebro-spinal fluid, its pressure was seldom above 120 mm. of water. There was a slight increase of albumin, and a great increase of cellular elements of much varied forms. Lumbar puncture afforded no permanent relief.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

54. Erythema Nodosum and Tuberculosis.

STEFANO (*La Pediatria*, November, 1919) first discusses the various views as to the etiology of erythema nodosum, especially in relation to tuberculosis, and then describes briefly 23 cases in young children (3 to 12 years). The family history showed alcoholism twice, syphilis twice, and in 5 cases tuberculous meningitis or pulmonary tuberculosis. In 17 of the cases the erythema affected both lower limbs, in 2 cases one lower limb, and in 4 both upper and lower limbs were affected. In 7 cases there was enlargement of the bronchial glands, in 2 cases bony tuberculosis, and in one case marked enlargement of the cervical glands. The von Pirquet test was positive in every case and intensely marked in 15 of the cases. The author will not go so far as to say erythema nodosum is a definitely tuberculous affection, but in view of the von Pirquet results, he thinks there is some important relation between the two diseases. He suggests that erythema nodosum may be due to the entrance into the circulation of some special substances, analogous to tuberculin in persons affected with tuberculosis, which give rise to the formation of toxic products of digestion, that is, apotoxins. He draws attention to the marked similarity between the nodules of erythema nodosum and those produced by the von Pirquet test.

55. Treatment of Typhus.

COGLIEVINA of Trieste (*Il Policlinico*, Sez. Prat., November 9th, 1919) has found three drugs of value in the treatment of typhus—namely, urotropine, salicylsulphonic acid, and colloidal silver. The use of urotropine was suggested by the following considerations: (1) S. I. Crowe in his experimental researches succeeded in completely sterilizing the bile by 5 grams of urotropine daily; (2) Crowe showed that from half an hour to an hour after its administration urotropine or formaldehyde could be found in the cerebro-spinal fluid; (3) Heitmüller and Zak used urotropine with good results in the treatment of acute and chronic bronchitis and pneumonia. Urotropine was equally effective as an intestinal disinfectant according to Loebisch. The daily dose used by Cogliervina ranged from 5 grams to 8 to 10 grams (given by mouth). Although the drug was used in hundreds of cases of typhus he did not meet with a single case with urological complications, with one exception, in which there was transient haematuria accompanied by slight vesical tenesmus. The urine of each patient was examined daily. Salicylsulphonic acid was given either combined with urotropine in doses of 8 grams daily by mouth or in intramuscular injections (10 c.c.m. of a 4 per cent. solution); as a rule four or five injections were sufficient to curtail the disease, so that the duration of the fever was only seven instead of sixteen days. Intravenous injections of colloidal silver (5 c.c.m. of a 2 per cent. solution) for about seven or eight days appeared to have a good effect, but the duration of the disease was not shortened, as after the employment of the other two drugs.

56. Exophthalmic Goitre.

MEANS and AUB (*Arch. Int. Med.*, December 15th, 1919), who have done some important work on the basal metabolism of a large number of cases of exophthalmic goitre, and have followed several cases for years, state that in the majority of cases the results after two or three years are equally good with Roentgen-ray treatment as with surgery. After surgical treatment the metabolism shows a rapid preliminary fall, and then a secondary rise, followed by a final fall, whilst with x-ray treatment there is a gradual progressive fall. In securing the same end-results with surgery or with x-rays a lesser rest factor is necessary with the latter. With x-rays there is practically no mortality; with surgery there is a definite mortality. Patients treated surgically do better and the risk of operation is less if they have previously had their thyroid and thymus glands irradiated. The risk of operation is greater and the need for pre-operative x-ray treatment is greater in cases with a very high metabolism and moderate tachycardia than in those with an extreme tachycardia and moderate metabolism elevation. The authors consider that the safest course in the treatment

of exophthalmic goitre as a whole is the routine irradiation of thyroid and thymus glands, in all cases, with surgery held in reserve for patients who do not then do well. Surgery is contraindicated with patients whose metabolism is rising in spite of complete rest in bed, and also with patients of the type with moderate tachycardia and great metabolism increase, except when they have previously had x-ray treatment.

57. The Practical Applications of Ocular Compression.

Il Morgagni (November 25th, 1919), quoting Binet, says that by pressure on the globe of the eye one can derive help in the differentiation of organic from inorganic cardiac bruits, for in the case of inorganic murmurs the bruit disappears on ocular compression, whilst in the case of organic murmurs the bruit is accentuated. In the majority of cases ocular compression induces a slowing of the pulse rate, and may be useful in temporarily reducing attacks of tachycardia, making four or five strong compressions at intervals of fifteen seconds to one minute. The cerebral pulse is said to be diminished by the same manoeuvre. On the respiration ocular compression causes slight apnoea, and may therefore be of some use in asthma. It is also said to lessen shivering, the muscular tremors of exophthalmic goitre, and even epileptiform attacks. On the other hand, it is admitted that the proceeding is not absolutely devoid of risk.

58. Influenzal Pharyngodynia.

G. V. T. BORRIES (*Ugeskrift for Læger*, November 27th, 1919) has found that patients suffering from influenza sometimes complain of severe pain in the throat for which no cause can be found in spite of a thorough examination. He records the following illustrative case: A man aged 42 developed influenza with slight bronchitis. There was nothing unusual about the influenza apart from severe pain in the neck at the level of the larynx. He hardly slept for three nights on account of this pain, which was but slightly mitigated by morphine. He could swallow water only with great difficulty and in very small quantities at a time. Frequently he had to spit water out because he could not swallow it. He described the pain as resembling the pain he had experienced with a peritonsillar abscess from which he had suffered some time previously. On examination nothing could be found apart from slight catarrhal pharyngitis, acute laryngitis, and bronchitis (rhonchi over both lungs). The pain was probably due to neuralgia or myalgia of the wall of the pharynx, for there was no sign of tonsillitis, nor of abscess of the peritonsillar or retropharyngeal spaces. There was also no sign of phlegmon in this neighborhood. The author refers to a paper by Escat, published in 1910 in the *Revue hebdomadaire de laryngologie*, No. 51, with the title "Pharyngodynie grippale."

59. Reflected Sunlight in the Treatment of Whooping-cough.

G. GAERTNER (*Wien. med. Woch.*, October 11th, 1919) relates how he experienced the discomforts of "whooping-cough nights" after one of his children had contracted this disease. To mitigate the cough he instructed his child to sit with her back to the sun, with a laryngeal mirror held in front of her open mouth, reflecting the sunlight on the tonsils, the posterior wall of the pharynx, and the palate by turns while she inhaled the letter *a*. Each sitting lasted ten to twenty seconds, and was repeated ten to twenty times, so that the throat was exposed to concentrated sunlight for several minutes altogether. The effect of the sunlight on the interior of the mouth was not unpleasant, but a sense of heat was experienced when the reflected light struck the skin of the face. The course of the disease was at once altered by this treatment, and the patient, who had suffered from twelve to fifteen bouts of severe coughing every night, had only six bouts in the night after the first exposures, and only three to four bouts in the following nights. These bouts ceased altogether on the forty-second day of the cough. The author's second child, a boy of 10, contracted whooping-cough about ten days after his sister. He was at once treated with reflected sunlight, and the disease ran a very mild course, without the characteristic bouts of coughing at night. He ceased to cough in about three weeks. Another of the author's

patients was a child who had been subject to attacks of angina faucium, recurring at least four times a year. During, and for a long time after, an attack of whooping-cough, for which he was successfully treated with reflected sunlight, there was no recurrence of the angina. The treatment was therefore repeated once a week, and no recurrence of the angina was observed. The author suggests that reflected sunlight may be more effective in sterilizing the throat in diphtheria and angina faucium than gargles and painting the throat with disinfectants.

60. Post-Influenzal Suppuration.

S. MITTERSTILLER (*Wien. klin. Woch.*, November 20th, 1919) has observed five cases of influenza followed by abscesses in various parts of the body. One patient was a married woman, aged 49, who suffered from a severe attack of influenza in October, November, and December. The nervous and respiratory systems were involved. During convalescence both breasts became swollen and painful. After several weeks the swelling in the right breast became fluctuating, and when it was incised an abscess almost as large as an apple was found. The *Staphylococcus pyogenes aureus* was isolated from the thick pus. Another patient was a married woman, aged 42, who contracted influenza late in March. In the middle of May of the same year she consulted the author for a painful swelling of the right forearm, including the elbow-joint. There was no evidence of tuberculosis or typhoid fever, and Wassermann's reaction was negative. The x rays showed rarefying osteitis of the upper two-thirds of the radius. A fluctuating swelling formed, and the pus obtained by puncture was found to contain numerous small rods resembling the influenza bacillus. A week later the abscess was opened, and both Gram-negative and positive bacilli were found. In a second case of osteitis of the radius following influenza a bacillus conforming to the type of the influenza bacillus was isolated from the pus. In the two remaining cases suppuration of the thyroid gland occurred. In one case the pus contained numerous Gram-positive rods as well as streptococci and Gram-negative rods. The pus of the other case contained influenza-like bacilli.

61. Influenzal or Diphtheritic Paralysis of the Soft Palate?

G. KICKHEFEL (*Berl. klin. Woch.*, October 13th, 1919) has observed four cases of partial paralysis of the soft palate after a typical attack of influenza. The first case was that of a woman, aged 33, who in October, 1918, developed high fever which lasted three weeks. Her head and limbs ached, and she suffered from a severe cough and much catarrh of the throat, but she was not attended by a doctor. After the temperature had fallen her speech became nasal and slurred. On examination in hospital on January 16th, 1919, the movements of the soft palate were seen to be slow on both sides, and the occlusion of the rhinopharynx by the palate was incomplete. There was, however, no regurgitation of liquids by the nose. The quality of the voice was abnormally affected by closure of the nostrils (Gutzmaun's test). After giving details of his other cases, the author notes that the febrile illness preceding the paralysis of the soft palate was invariably characteristic of influenza; pain in the limbs, violent headache, great lassitude, pain in the eyes, and catarrh of the respiratory tract were uniformly present. All the patients denied the existence of a membranous deposit in the throat, of dysphagia or swelling of the cervical glands. Diphtheria could, therefore, be excluded. The paralysis was only partial in these cases, the subsequent course of which the author does not record. He remarks, however, that such cases often clear up spontaneously, and that when this does not occur the persistence of the symptoms may be due to functional disturbances having succeeded an organic lesion. A. PEYSER (*Ibid.*) expresses doubts as to the existence of a genuine influenzal paralysis of the soft palate, suggesting that undetected diphtheria might account for a proportion, at any rate, of the cases labelled as influenzal. In support of this view he recorded a case of paralysis of the soft palate with a recent history of influenza but not of diphtheria. He was about to demonstrate it as one of influenzal origin when he saw another case in which there was no history of diphtheria. But when the discharge from the right ear was examined typical diphtheria bacilli were found. FINDER's experience (*Ibid.*) also points to a diphtheritic origin of the so-called influenzal paralysis of the soft palate. One of his patients was a married woman, who complained that she had not been able to speak properly since a recent attack of influenza. Paralysis of the soft palate was diagnosed,

and, as she declared at first that she had not suffered from a sore throat, but only from such characteristic influenzal symptoms as fever and pains in the limbs, the existence of diphtheria seemed improbable. But on further investigation it transpired that she had experienced some difficulty in swallowing, and when a bacteriological examination was made diphtheria bacilli were found.

SURGERY.

62. Sarcoma of the Scrotum and Spermatic Cord.

P. ANDRÉ (*Rev. méd. de l'Est*, December 1st, 1919) records two cases of sarcoma of the cellular tissue of the scrotum and spermatic cord. In the first case the patient, a soldier aged 25, was supposed to be suffering from right tuberculous epididymitis. On operation nodules were found to be adherent to the vas deferens and to the extravaginal surface of the epididymis. The testes were removed, together with the spermatic vessels as far as the hilus of the kidney, and a chain of glands, 20 cm. in length, along the aorta, inferior vena cava, and iliac vessels. The growths in the cellular tissue of the cord were found to be round-celled sarcoma; it was impossible to determine whether the lesions in the glands were inflammatory or sarcomatous. The patient was in excellent health four weeks after the operation. In the second patient a mass the size of a Tangerine orange was felt in the left of the scrotum and there were several nodules in the cord. A large mass of glands could be felt beneath the ribs. Castration was performed owing to the violent pain in the left part of the scrotum. The new growth was found to be situated entirely outside the tunica vaginalis at the base of the cord; the testicle and epididymis were healthy. The interest of these cases lies in the fact that the sarcoma was localized in the cellular tissue of the cord and scrotum, whereas new growths in this region are usually situated in the testicle or epididymis.

63. Diaphragmatic Hernia.

A. COLARD (*Arch. méd. Belg.*, August, 1919) records two fatal cases of diaphragmatic hernia in soldiers in which death took place before operation could be performed. In the first case, in which the symptoms were those of a left pneumothorax, the autopsy showed a congenital opening in the diaphragm through which had passed the very dilated stomach, the omentum, splenic flexure of the colon, and spleen. In the second case, in which symptoms of intestinal obstruction were present, the autopsy showed that the upper part of the stomach and splenic flexure of the colon were fixed in a narrow opening in the diaphragm at the site of an old wound.

64. Sarcoma of the Stomach.

ACCORDING to KOETTLITZ (*Arch. méd. Belg.*, August, 1919) sarcoma of the stomach is a comparatively rare condition, only 171 cases having been collected by Gosset in 1912. The diagnosis has never been made during life without operation, except in Westphalen's case, in which microscopic examination showed the sarcomatous nature of a portion of the vomit. Gastric sarcomata have been divided by Lecène and Petit into two groups, according as they are exogastric or endogastric. The latter are subdivided into (a) tumours infiltrating the stomach wall at some definite point; (b) multiple nodular tumours disseminated throughout the gastric wall; (c) tumours infiltrating the whole extent of the wall, and consequently simulating plastic linitis. These three forms closely resemble epithelial cancer, whereas the exogastric tumours are generally large pedunculated or sessile masses situated on a limited area of the gastric wall. Metastases are comparatively rare. Ziesché and Davidson, who found them in only 37.5 per cent., say that they are most frequently met with in the liver and regional glands, then in the mesenteric glands, kidneys, ovaries, lung and skin. As regards the site of the tumour, according to Ziesché and Davidson, in 29 it was at the pylorus, in 22 on the greater curvature, in 18 it formed a diffuse infiltration, in 15 it was on the posterior surface, in 11 on the lesser curvature, in 6 on the anterior wall, once on the great cul-de-sac, and twice on the cardiac end. The symptoms are indefinite. The condition is often mistaken for simple dyspepsia. A differential diagnosis from carcinoma is hardly possible. There are usually anorexia, gastric pain, and always more or less considerable loss of flesh. Vomiting occurs in 20 per cent. Haematemesis is rare. Statements as to the gastric chemistry differ. According to Gosset there is complete absence of HCl, with or without the presence

of lactic acid. Monti, on the other hand, states that HCl does not disappear till later. The only definite symptom is the appearance of a tumour, which was present in 66 out of 72 cases (Ziesché and Davidson). Koettlitz records a case in a man aged 21, who died one month after an exploratory laparotomy. At the autopsy disseminated fibro-sarcomatosis of the stomach, pancreas, and mesentery was found as well as chylous ascites.

65. Treatment of Burns.

MCGEARY (*Minnesota Med.*, December, 1919) uses a waxy preparation, melting at 120° F., in the treatment of burns. The burned area is first gently cleaned with Dakin's solution and gross particles of debris removed. After drying with sterile compresses the wound is coated quickly with the paraffin by means of a two-inch camel-hair brush. A thin sheet of sterile wadding is then applied, and this is painted over with another layer of paraffin. The dressing is kept more firmly in place by an ordinary gauze bandage. The process is repeated daily, care being taken first to wash the area with Dakin's solution. The author finds that, although pain may be intense when the case is first seen, the pain is alleviated whenever the wax coating is applied, and it is absent in the daily changes of dressing. Pus may form under the dressing, but it rapidly decreases and new skin is quickly regenerated. The preparation is made up as follows: Resorcinol 10, eucalyptus oil 20, olive oil 50, petrolatum 250, paraffin 670. The petrolatum and paraffin are melted together, and the resorcinol, dissolved in alcohol, is added while these are hot, so as to drive off the alcohol; when the mixture is cool the eucalyptus and olive oil are added.

66. Hysterical Paralysis of One Leg.

N. SVITH (*Ugeskrift for Læger*, October 9th, 1919) records the case of a soldier, aged 25, who had suffered from inflammation of the left hip when he was 12. Complete recovery had followed after three months' treatment by immobilization, and he had never noticed that the left leg was smaller or weaker than the right. In 1915 he was wounded in the hand by a fragment of shell, and in order to delay his return to the front he practised various devices to prevent the satisfactory healing of this wound. The prospect of being sent back to the fighting line or of being detected as a malingerer reduced him to a state of great nervous depression; his left leg became weak, and he developed a limp. When seen by the author early in 1919 he could drag himself about only with the help of a stick. The left leg was much atrophied, the circumference of the limb both above and below the patella being 4 cm. less than that of the right leg. There was no abnormal restriction of passive movements, nor any tenderness over the nerves, muscles, or joints. The muscles were flabby, and the patellar reflex was much more lively on the left than on the right side. He was very nervous, and there was marked tremor of the hands and tongue. No sign of disease of the central nervous system could be detected. He returned cured a few months later. He could walk without a stick and without limping. On inspection no difference in the size of the two limbs could be noted, and measurements showed that the circumference of the left leg was only 1 cm. less than that of the right. The reflexes were equal on the two sides, and the tremor had vanished. His general condition also was excellent. On cross-examination it transpired that he had consulted a "wise man" who had assured him that in a day or two he would find his walking-stick superfluous. The patient had been sceptical, but the prophecy had come true.

67. Influenzal Tendovaginitis.

R. HANSON (*Hygiea*, November 30th, 1919) records the following case of acute serous tendovaginitis, the exciting cause of which was probably influenza. The patient was a workman, aged 40, whose father suffered from typical gout. The patient also was subject to attacks of arthritis. In October, 1918, his wife and daughter developed influenza, and a few days later he, too, suffered from attacks of shivering and pain throughout his body. After this condition had lasted a few days his left hand and forearm felt numb and weak, and a sensation of tingling was most marked in the third to the fifth fingers. After a couple of days the parts affected became very painful, and by the end of October they had also become much swollen. On examination, signs of an acute serous tendovaginitis were found in the neighbourhood of the left flexor digitorum communis. There were also signs of an acute polyneuritis. The appearance of the left hand and forearm was very suggestive of tuberculous disease, but the rapid onset and decline of the effusion did not tally with a diagnosis of

tuberculosis. The simultaneous occurrence of neuritis suggested syphilis, but Wassermann's reaction was negative. Besides, an acute serous tendovaginitis of syphilitic origin does not subside quickly without specific treatment. As for gout, the tendovaginitis it provokes is apt to run a chronic course, even when its onset has been sudden, and to be complicated by deposits of urates in the tissues, with occasional necrosis and perforation of the overlying skin. There was also no history of trauma in this case, and even if there had been, the tendovaginitis might be traumatic, but there would still be no explanation of the coincident polyneuritis. This is a common sequel to influenza. The author therefore comes to the conclusion, both by positive evidence and by the exclusion of other factors, that the tendovaginitis in his case was of influenzal origin. He notes that he could find no micro-organisms in the serous effusion in this case, although he usually found streptococci in the numerous cases of synovitis, infiltration and abscess formation arising in connexion with an attack of influenza.

68. Strangulated Obturator Hernia.

KLOPP records a case of strangulated obturator hernia in a woman 88 years old (*Ann. Surg.*, 1919, 70). The patient was seized suddenly with general abdominal pain, and signs of intestinal obstruction set in. She vomited fifteen to twenty times the next day; there was no result to enemata. On examination the abdomen was found to be moderately distended, soft, without abnormal masses. There was no external evidence of hernia. Diagnosis: Intestinal obstruction, cause unknown. Coeliotomy was performed, and a knuckle of bowel some 1½ in. long was found strangulated in the right obturator foramen. The hernial sac was removed and the ring closed. The patient did well for a time, but died suddenly on the eleventh day.

69. Abdominal Palpation.

BOERI (*Riforma Med.*, 1919, 35) calls attention to the method of abdominal palpation by superposed hands advocated by Campani of Modena. This method is particularly applicable to tense and rigid abdomens, the left hand being used as the palpating instrument, so to say, whilst the superposed right hand supplies the force. Campani calls this "indirect palpation" (*palpazione mediata*) by analogy with percussion. It is no doubt true that deep palpation depends on gentleness rather than force, yet experience has proved that the superposed hand method has a definite field of usefulness. There are some patients who are incapable of relaxing their abdominal muscles, and in these cases, as well as those with thick abdominal muscles, some force is necessary. This is especially the case if the posterior wall of the abdomen is to be palpated. If the force necessary to sink the hand into the abdomen is to be supplied by one hand only, the powers of perception of his hand are somewhat limited. Boeri analyses the various sensory and psychological elements which come into play in palpation. As to the actual methods of performance, individual clinicians will no doubt please themselves as to which hand they place uppermost, and whether they will work with closed or open (abducted) fingers.

70. Arthrotomy in Gonorrhoeal Arthritis.

H. KLOSE (*Berl. klin. Woch.*, October 20th, 1919) states that the war has greatly increased the incidence of gonorrhoea in Germany, and that articular complications occur in a much greater proportion of cases than before the war, when only 2 per cent. of all cases of gonorrhoea developed arthritis. This proportion has been altered to more than 10 per cent., and of all the cases of articular disease admitted to the surgical wards of the University Hospital in Frankfurt a. M. 95 per cent. in 1919 were gonorrhoeal. After discussing the factors responsible for this state of affairs, the author writes that since 1909 he has systematically performed arthrotomy in every severe case when (1) aspiration of fluid had been followed by a renewed effusion, with considerable distension of the capsule of the joint and with pain; when (2) signs of subluxation were becoming evident; when (3) the inflammation was phlegmonous and pain and sleeplessness were alarming; when (4) general gonorrhoeal infection started from an infected joint; when (5) severe complications interfered with the conservative treatment of the joint; when (6) many joints were involved, and their simultaneous treatment on conservative lines was not feasible; and when (7) three weeks of skilled conservative treatment had failed. The results of arthrotomy were instant relief of pain and consequent improvement in the general condition. In 14 per cent. of the cases operated on the disease had already progressed so far that ankylosis could not be

prevented. The benefits of arthrotoomy were most evident when the small joints were affected; the results in the case of the hip and knee must be considered in the light of the experience that, without operation, severe gonorrhoeal inflammation of these joints invariably leads to complete ankylosis. Treatment of such cases that restores the range of movement to 40 degrees to 60 degrees must therefore be considered as successful.

PATHOLOGY.

71. Osteopsathyrosis Idiopathica.

JULIUS HASS (*Med. Klinik*, November 2nd, 1919) describes a case of abnormal brittleness of bones in a young child not resulting from rickets, syphilis, or other known disease. The child was born healthy and showed no abnormality until 2 years of age. At this time fractures occurred in both femora as a result of very trifling injury, and during the next four years fracture occurred nine times in one or other femur and once in the left tibia. On each occasion the fracture healed rapidly and well, and later fractures seldom occurred at the site of previous lesions. On x-ray examination there was a notable eccentric atrophy of the cortex in the long bones, especially near the epiphyses. At the time of observation in hospital there was a very marked excess of calcium excreted in urine and faeces over that taken in the food. No certain therapeutic effect was obtained from administration of phosphorus, arsenic, and thyroïdin. Like other observers of this disease Hass noted a familial predisposition. The mother and an uncle suffered from spontaneous fractures. The mother's family was also peculiar in that several members had blue sclerae and were deaf from otosclerosis, while the maternal grandfather and seven of his family of nine suffered from heart disease.

72. Diphtheria Bacilli in the Lungæ.

LOMRY (*Rev. d'Hygiène*, November, 1919), engaged in a hygienic laboratory in Belgian Luxembourg, has been accustomed to examine all specimens of sputum, originally submitted for the diagnosis of tuberculosis, for the presence of other pathogenic organisms. Thus, out of 1,974 specimens of sputum he found the diphtheria bacillus in 59 cases, and proved it to be a true diphtheria bacillus not only by microscopic and staining reactions but also by its cultural characters and by animal test. He is of opinion that the sputum examination of many bronchitides might reveal a much higher incidence. Amongst these 59 positive cases the diphtheria bacillus was found in association with the tubercle bacillus in 16 cases, or 27 per cent. It is possible that the one germ might have prepared the soil for the other, but it is difficult to discover which was the first invader. Carriers of the diphtheria bacillus in their lower respiratory passages are naturally a source of danger to the community, all the more so as suspicion is unlikely to fall on them. The ordinary antitoxic serum does not easily dislodge bacilli so situated, but the author thinks that this might be effected by large doses of Martin's antimicrobial serum.

73. Danger of Anaphylaxis with Antitoxic Serums.

MARTIN (*Rev. d'Hygiène*, November, 1919), in an article dealing with the serum-therapy of diphtheria, states that before the war the fear of anaphylactic shock occurring with a second injection of antitoxic serums rather dominated the minds of medical men. However, the experiences of the war have considerably diminished, if they have not altogether abolished, such fears. The wounded received multiple injections of antitetanic serum, perhaps at long intervals, in countless instances without the slightest harm resulting. It has been an experiment on a large scale, and it has enabled one to form the firm conviction that repeated subcutaneous injections of serum never provoke those grave anaphylactic crises in man that have been experimentally produced in guinea-pigs.

74. Experiments on the Cervical Vagus and Sympathetic.

SCHAFER (*Quart. Journ. Exp. Phys.*, vol. xii, No. 3) could find no evidence of functional regeneration of the peripheral vagus of the cat as long after section of the nerve as two years and fifty days. Some incidental observations of importance were, however, noted. It was shown that death, which invariably occurs after double vagotomy, is due to laryngeal obstruction from paralysis of the laryngeal muscles, and that when this obstruction is avoided by extirpation of the cords, death does not occur. The slowing and depression of the respiratory movements,

hitherto regarded as an accompaniment of double vagotomy, was found to be a by no means constant effect, and was not observed if the laryngeal paralysis were neutralized by a previous tracheotomy. No regeneration of the sympathetic nerves in the neck was found either in dog or cat. A curious phenomenon noted was that if eight days after section of one cervical sympathetic the other were divided, the symptoms of sympathetic paralysis on the side of the original lesion disappeared for some time and were replaced by all the signs of sympathetic irritation—dilated pupil, exophthalmos, etc.

75. The Blood and Cerebro-spinal Fluid in Typhus.

ACCORDING to A. ROTHACKER (*Muench. med. Woch.*, October 17th, 1919) the blood picture of typhus is not typical, and varies in all stages of the disease. Even in the same stage entirely different appearances in the blood will be met with, according to the severity of the attack and the reaction of the patient. In the influenzal stage, which occupies the first four days, the blood picture is generally normal. In toxic cases the number of leucocytes as a whole is not increased, but there is a considerable rise in the number of the transitionals and large mononuclears. Eosinophils are scarce. In the eruptive stage—fourth to seventh day—the total number of leucocytes remains normal but the relative percentage of the polymorphonuclears is increased. Eosinophils are entirely absent. In the third stage of the disease the blood picture completely changes. The total number of leucocytes is raised to 10,000 to 14,000, of which 95 to 97 per cent. are polymorphonuclears and about 3 to 6 per cent. lymphocytes. The red cells, which have hitherto been normal in amount, fall to 2 to 3 million, while the haemoglobin content does not show much change. In convalescence the total number of leucocytes shows a marked increase. The eosinophils return, pathological forms disappear, and by the eighth to tenth day of convalescence the blood picture becomes completely normal again. Inclusion bodies are present as in scarlet fever in the polymorphonuclear leucocytes, but are not so large. The blood picture in typhus thus does not possess any diagnostic value before the tenth day, and it is impossible to make a diagnosis of typhus from the blood alone, as similar findings occur in many septicaemic diseases, especially small-pox, which is often very difficult to differentiate from typhus in the early stage. In most cases the pressure of the cerebro-spinal fluid is not raised above 120 mm. of water. The albumin content is only slightly increased. Nonne's reaction is almost always negative. There is always a great increase in the cellular elements, and a great variety of cells present, the mononuclear cells, large and small lymphocytes being predominant.

76. The Presence of Vitamines in the Urine.

G. GAGLIO (*Il Policlinico*, Sez. Prat., November 23rd, 1919) has found that the administration of small quantities of human urine (3 to 4 c.cm.) has a rapidly curative effect on the polyneuritis of pigeons. When the urine is given several times in the course of the day the bird shows a remarkable improvement and the following day is quite cured. Even when its condition as the result of a diet of polished rice has become very grave and contractures of the nuchal muscles and opisthotonos have developed, complete recovery has resulted from this mode of treatment. On continuing the diet of rice, together with the administration of urine, the pigeon continued in good health for some time and then the nervous symptoms reappeared in an attenuated form. If the diet was slightly modified by adding some other substance to the rice complete recovery took place. These experiments indicate that the kidneys eliminate vitamins which are formed in the organism or are brought to it in the food.

77. Resistance to Poisons according to Age.

E. LESNÉ and L. BINET (*Bull. Soc. de Théor.*, November 12th, 1919) showed by the following experiments that the young animal can resist certain poisons better than an adult one: (1) A new-born cat could resist an injection of 0.62 mg. of cocaine hydrochloride per kilo of body-weight, whereas half this dose killed an adult cat. (2) A mouse aged 9 days and weighing 5 grams could resist an injection of 0.5 mg. of cocaine hydrochloride, a dose which proved fatal to a mouse aged 14 days and weighing 10 grams. (3) Kittens aged 25 and 32 days could resist injection of 0.06 gram and 0.07 gram of morphine per kilo of body weight, whereas an adult cat was killed by an injection of 0.05 gram per kilo. The greater resistance of young animals to poison is attributed to the activity of their glands with an antitoxic function, the greater vitality of their tissues, and the integrity of their excretory organs.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

78. X-Ray Treatment of Graves's Disease.

IN 1918 S. NORDENTOFT published 50 cases of Graves's disease treated by the x-rays in the period July, 1915, to December, 1917. Since then his material has grown to 100 cases. He finds (*Ugeskrift for Læger*, July 17th, 1919) the results as reassuring for the latter as for the earlier series, but instead of giving a tabulated analysis of his achievements he indulges in a discursive account of his impressions. In some cases dramatically beneficial results were obtained by a single exposure, and this was so even in very severe cases. In other cases several exposures failed to effect a cure. But in every case great improvement was effected. Of the 100 patients only 8 were males. The area exposed was invariably confined to the region of the thymus, a practice marking the significance attached by the author to the thymogenic origin of Graves's disease. Discussing the recent publication of x-ray fatalities in cases of Graves's disease, he regards a certain number as inevitable in spite of, not because of, this treatment. Other fatalities are of thymogenic origin—the result of neglecting to submit the thymus to the x-ray treatment. Again, one large dose is much safer than several small doses. The author concludes that if x-ray treatment is prescribed early, and the system of single "massive" dosage be adopted, severe cases and deaths will become exceedingly rare.

79. Heat Sensation.

BARD (*Rev. de Méd.*, No. 3, 1919) discards the theory of specific nerves and nerve endings for heat and cold, and is completely sceptical of Goldscheider's demonstration of them. He considers that the fact that the two sensations are mutually exclusive shows that they arise from a common organ. The two opposite sensations of heat and cold arise from the necessity for warning the organism by means of pain of dangerous changes of temperature in either direction and of provoking the corresponding reflex action. The classical explanation of the separation of the two sensations by the existence of distinct points of heat and cold is in contradiction to the fundamental fact of the displacement of the physiological zero—that is to say, of the variability of the threshold separating the two sensations. The thermic corpuscles are sensitive to two physical modes of thermic change—the centripetal radiation from a body warmer than the skin and the centrifugal radiation from the skin to a cooler body, and it is to the orientation by the thermal corpuscles of the direction of radiation that the discrimination between heat and cold is due.

80. Alum in the Treatment of Whooping-cough.

WRITING with the perspective of a physician who has retired from practice, H. P. B. BARFOD (*Ugeskrift for Læger*, September 11th, 1919) maintains that since he began to prescribe alum for whooping-cough in the eighties he has found the disease run a uniformly mild course. The sponsors of this treatment in Sweden recommended a 2 per cent. solution of alum with a minute dose of opium. The author gives alum without any opium, a teaspoonful to a dessertspoonful of a 2 per cent. solution being taken every other hour. This treatment should be instituted as early as possible, and no change in the severity and frequency of the paroxysms of cough should be expected till the end of the second week. Then the attacks dwindle suddenly to half the previous number, and in a short time only one or two occur in the twenty-four hours. The severity of the attacks diminishes as they become less frequent, and they soon cease altogether. The drug does not cure the disease; it merely alters its character. Nor can it be claimed that the course of the disease is shortened, for if the drug is discontinued before the end of the ten to twelve weeks during which the paroxysms usually last, they recur with unabated violence. The drug is apt to be distrusted because its effects are delayed a fortnight. Accordingly the author prepares the relatives for this delay, and to encourage them in persisting with the drug he instructs the mother to record every paroxysm with a pencil stroke on a piece of paper and to draw a line across every four strokes. A great impression is made when, about the fourteenth day, the number of paroxysms falls suddenly from about forty to twenty. A. HALVORSEN

(*Ibid.*, October 2nd, 1919) endorses Barfod's advocacy of alum in whooping-cough, with this reservation, that he combines the alum with chloral hydrate, equal quantities of the two drugs being given. For this mixture he claims even better results than Barfod, having found it not only act as a palliative, but as an effective means towards shortening the attacks and the total duration of the disease.

81. Purulent Pneumococcal Meningitis in Influenza.

E. DUBOURG (*Gaz. hebdom. d. Sci. méd. de Bordeaux*, December 14th, 1919) records six fatal cases of this kind, which occurred among soldiers belonging to the French Army of the East at Salonica. The relative frequency of purulent meningitis as a complication of influenza in the Army of the East as compared with its rarity in France is attributed by Dubourg to the large proportion of native soldiers in this army, and to the preponderating rôle of the pneumococcus in the complications of influenza. The black races are peculiarly susceptible to pneumococcal infections, and of the six cases reported, only one occurred in a Frenchman and the others in negroes or natives of Madagascar. The susceptibility of black races to pneumococcal infections is not due to their sojourn in a cold climate, as the mortality due to this cause is very heavy in their own country. In Dubourg's cases the pneumococcus was frequently associated in the sputum with the pneumobacillus, enterococcus, *Micrococcus catarrhalis*, and Pfeiffer's bacillus. It was more frequently found in pure cultures in the fluid withdrawn by puncture of the lung, and was almost the exclusive factor in purulent pericardial and pleural complications. In 9 cases of purulent pleurisy, 8 were due to the pneumococcus, and only 1 to a haemolytic streptococcus. A blood culture which was made in 34 cases yielded 8 positive results, the pneumococcus being found in 7 cases, and the enterococcus in 1 only. *Post-mortem* examination in the 6 cases showed that the accessory sinuses and ear were always intact, so that the meningitis was due to septicaemia and not to propagation. In most of the cases the onset of the meningeal symptoms was very sudden and death was never later than four days after the appearance of the first signs. In one case it occurred a few hours after the onset. One form of pneumococcal meningitis is manifested by attacks of acute delirium and homicidal impulses. The temperature chart is not characteristic. Cases with sudden onset usually terminate by hyperpyrexia, but occasionally the fever is not high, and the meningeal symptoms set in without much rise of temperature. All treatment hitherto employed has been unsuccessful. The best course to pursue is to prevent the development of meningeal complications by the use of antipneumococcal serum, either subcutaneously or intravenously, in any severe case of pneumococcal infection, especially during an epidemic.

82. The Influence of Acute Infections on Hereditary Syphilis.

V. HUTINEL and L. NADAL (*Paris méd.*, December 6th, 1919) report several cases showing how meningeal or cerebral manifestations, such as hemiplegia or hydrocephalus, may be caused in subjects of hereditary syphilis by the supervention of an acute infection, such as measles, influenza, or cerebro-spinal meningitis. Epilepsy or chorea are also liable to develop in heredo-syphilitic children as the result of an acute infection. Other syphilitic manifestations, such as nephritis or anaemia, may develop from the same cause.

83. The Prophylactic Value of Gaseous Disinfectants and Fumigations in Infectious Disease.

A. ORTICONI (*Bull. Soc. de Thérap.*, November 12th, 1919), after alluding to Gregor's paper in the *BRITISH MEDICAL JOURNAL*, May 1st, 1919, on the immunity to influenza shown by those engaged in gas works, attributes the value of gaseous disinfectants partly to their bactericidal action and partly to their forming a sort of mask which protects the upper respiratory tract from the penetration of germs. He states that during the last epidemic in certain factories in the South of France where the workmen were exposed to the fumes of eucalyptus or products of eucalyptus, the number of those attacked was very small, and no severe form of the disease was observed.

84. Familial Icterus Neonatorum with Fatal Course.

G. A. PRINS (*Nederland. Tijdschr. v. Geneesk.*, December 6th, 1919) records the following fatal case of icterus neonatorum in one family. A woman whose first two children were healthy had a fall on her back, and her subsequent children, who were normal at birth, became very yellow on the third day. The first child born after the fall had severe icterus neonatorum, but recovered. The next child died a few days after the appearance of the jaundice. The same fate overtook the twins who were the next to be born. The following child, the first of the children seen by Prins, was a full-term well-developed infant, without any clinical evidence of syphilis, and with a negative Wassermann reaction. Sepsis was improbable, as there was no fever nor petechiae, and the umbilicus was completely normal. Death took place on the fifth day, two days after the appearance of the jaundice. On *post-mortem* examination the bile was extremely viscid, but otherwise nothing abnormal was found on naked eye or histological examination. Prins attributes the condition to a congenital familial deficiency on the part of the hepatic parenchyma, similar to that which occurs in the case of the thyroid, which is shown by a woman suffering from Graves's disease giving birth to one or more children with myxoedema.

85. Pharyngeal Spasm simulating Loss of Appetite in Children.

E. WEILL (*Paris méd.*, December 6th, 1919) has frequently found that a spasm of the pharynx is the cause of a child refusing its food. The condition is most frequent between the ages of 2 and 5 years, but it may occur as early as 18 months or as late as 9 years of age. It is found both in boys and girls. It is sometimes, but not always, associated with nervous antecedents. It may first appear after weaning or occur at a later stage when the child has been put on ordinary diet. Sometimes it develops at a relatively advanced age after an attack of influenza, whooping-cough or erythema nodosum. It is either continuous or attended with slight remissions. It may last for years, and prove intractable to ordinary treatment. Weill has found that the most effective cure is the passage of a rubber catheter down the pharynx. A single sitting may be sufficient, but in some instances the instrument may have to be passed two or three times at intervals of a few days. In cases where catheterization is refused, cold compresses should be applied to the front of the neck for thirty or forty minutes, the compresses being renewed every ten minutes, followed by massage of the floor of the mouth and suprahyoid region. During a meal, if the child is slow in swallowing, the finger should be pressed upon the trachea, when the sensation of impending suffocation provokes deglutition.

86. Swimming-Bath Conjunctivitis.

PADERSTEIN (*Med. Klinik*, November 23rd, 1919) states that the occurrence of infective conjunctivitis among a large number of visitors to swimming baths was first described in 1899 by P. Schultz, who regarded the cases as trachoma. In 1900 Febr, who made a close examination of some cases in Hirschberg's clinic, found that, though the condition closely resembled trachoma, recovery always took place, so that it could not be a true trachoma. From 1912 to 1914 Paderstein and Lebmann saw about forty cases of swimming-bath conjunctivitis. In the cases investigated by Hunte Müller and Heimann inclusion bodies were found, and Hunte Müller succeeded in transmitting the disease to the conjunctiva of a monkey, in which he found the inclusion bodies. Gradle in 1916 reported an outbreak of swimming-bath conjunctivitis at Chicago. Comberg reported about forty cases, which all came from the same swimming bath. In half the cases he had found inclusion bodies. In the discussion several Berlin ophthalmologists stated that they had seen cases of this kind, so that the disease is more widely spread than has been hitherto supposed. The condition consists in an acute conjunctivitis with much swelling and redness of the palpebral conjunctiva, only slight affection of the ocular conjunctiva, and well marked follicle formation. Febr's statement that, unlike trachoma, the lower conjunctival fold was usually more affected than the upper, was confirmed by several observers. The discharge was usually slight compared with the high degree of inflammation. The preauricular gland was swollen as a rule. A characteristic feature of the disease was that almost always one eye only was affected and that the disease in most cases remained confined to one eye. The course of the affection was usually tedious and was not much affected by treatment. The symptoms commonly lasted three to six weeks.

In some cases, however, swelling of the conjunctival folds, slight ptosis, and a suggestion of pannus was seen a year after the onset. Serious complications have not been observed. Treatment consisted in instillation of 1 per cent. silver nitrate, solutions of zinc sulphate, protargol, and other astringents. Collargol and an ointment containing copper sulphate were also recommended.

SURGERY.**87. The Serum Treatment of Haemorrhage.**

CERTAIN haemorrhages more or less inaccessible to surgical treatment have been treated, with only doubtful success, by various injections—for example, ergotin, pituitrin, emetin, adrenalin, calcium chloride, gelatin, horse serum, antitoxin. For each of these a certain amount of success has been claimed, but perhaps more often one has to record a failure. DUFOUR and HELLO (*Il Morgagni*, November 5th, 1919) say they have prepared and used a special serum which in their hands has been decidedly successful. They noted that in a case of purpura haemorrhagica where antidiphtheritic serum was tried, no effect on the blood coagulability was observed until a condition of anaphylaxis was produced. Acting on this hint they prepared an anaphylactic serum by injecting rabbits intravenously with a very small dose of antitoxin and twenty days later bleeding the animal. The results of injecting this serum in 16 cases are given. Most of the cases were examples of metrorrhagia—others were post-operative bleeding after removal of haemorrhoids, epistaxis, post-dental, haemophilia, etc. The authors conclude that their specially prepared serum is the most efficacious haemostatic preparation they have so far used.

88. Intramedullary Beef-bone Splints in Fractures of Long Bones.

RYERSON (*Journ. Amer. Med. Assoc.*, November 1st, 1919) recommends the use of intramedullary beef-bone splints in fractures of the long bones. The splints, in various sizes, are cut from the long bones of slaughtered cattle and then turned in a lathe, so as to be round or nearly so, and the ends rounded off with a hole bored near one end. After fractional sterilization these are kept in containers, and when required are boiled with the instruments. A long piece of heavy chromic catgut having been threaded into the eye of the splint, the latter is pushed into the longer fragment until it is completely within the bone, from the end of which the double thread of catgut hangs. A hole is drilled in the other fragment at a distance from the fracture about half the length of the splint, and slanting towards the fracture. A piece of wire bent at the middle is then passed through the hole and out at the fracture, and with this the catgut threads are drawn through the hole. The overriding fractured ends are then reduced and brought into apposition, when traction on the catgut thread will slide the splint half way from the one fragment into the other so as to be exactly at the proper point, and by sewing the catgut into the periosteum at its point of exit the splint is secured and prevented from sliding out of position. Splints for the femur should be about 5 in. long by $\frac{3}{4}$ in. wide for adults; for the humerus $\frac{3}{8}$ in. wide, and for the radius and ulna $\frac{3}{8}$ in. wide by 3 in. long. Should autogenous splints be required, as in old or long-standing ununited fractures, these can be made from the patient's own tibia.

89. Silent Renal Calculi.

E. L. YOUNG (*Boston Med. and Surg. Journ.*, 1919, 181) attacks the problem of "silent" renal calculi. He attempts to answer the questions: How long can a stone be safely left in a kidney without serious damage accruing? Can damage occur without showing signs in the urine? An analysis of 4,000 autopsies at the Massachusetts General Hospital revealed 45 cases with stones in the kidney or ureter or both. In 11 of these stones had been diagnosed clinically, in 34 not. Of these last cases in only one was the urine normal and the kidney normal. In 24 cases the clinical history was negative, whilst in only 4 cases was the urine negative, the majority having at least a trace of albumin and a few pus cells. In these "silent" renal calculi pathological changes in the kidney are the rule, abnormalities in the urine are the next commonest feature, whilst a typical history is not given. Young concludes that stones in the calices can do as much damage as stones in the pelvis, but that even small stones in the ureter are worst of all, as they most surely damage the kidney function. His first question is answered by the statement that there is no definite time that a calculus

can be left, but that signs of obstruction and infection of the kidney, apart from pain, call for the removal of the foreign body.

90. Thyroidectomy for Graves's Disease.

IN an interesting paper DUNHILL of Melbourne (*Brit. Journ. Surg.*, 1919, 7) describes the operative technique of thyroidectomy for exophthalmic goitre. The article is valuable in that it gives full details of many points on which the textbooks are vague or silent. The amount of gland tissue to be removed at any given operation is a difficult point to establish. This is chiefly because of the fact that a very small amount of thyroid tissue is sufficient to give rise to toxic symptoms. The amelioration following a first operation may be temporary only. This is no proof that surgery as a means of treatment is a failure, but is a clear call for further gland removal. Dunhill states that three operations may be necessary. At the first he removes the whole of the right lobe and part of the isthmus; at the second the remains of the isthmus and all of the left lobe save a portion at the upper pole. If functional disturbances continue or recur, a third operation is undertaken, and in these cases an unsuspected lobule of thyroid tissue will usually be found lodged well behind the larynx, having sprung from the postero-internal aspect of the left upper pole. Such an outgrowth may give no external indication of its presence, but the effects of its removal are striking and immediate. In favourable, moderately toxic, cases one operation may suffice, but Dunhill states that a hemithyroidectomy is rarely successful, most of the left lobe must be removed as well. If the condition of the patient warrants it this can be done at one sitting; if not, it is best done in stages, further removals being performed as the symptoms dictate. It is important to realize that more than one operation may be necessary, as many disappointments to patient, surgeon, and physician are thus avoided. Further, the technique of the operation must be so planned as to make subsequent operations as easy as possible, the chief enemy being scar tissue through unnecessary dissection. The paper will be found to be most instructive on these points. Dunhill is no believer in preliminary ligation of vessels, but in the hands of surgeons less expert than his the operation certainly has a place. As to anaesthesia, Dunhill believes in novocain helped out when necessary by a light ether inhalation. He finds that with scopolamine-morphine-novocain the patients are apt to be a little unruly, too stupid to keep still and too dulled to do what they are told. He refers to two deaths from rectal anaesthesia. The one cause of failure is, therefore, the leaving behind of too much toxin-producing gland. This may be in the form of a part of a thyroid lobe, or in the guise of hypertrophied lobules left behind by ragged dissection.

91. F. H. LAHEY (*Boston Med. and Surg. Journ.*, 181, 1919) is a strong supporter of preliminary ligation of the superior thyroid vessels as a first stage towards thyroidectomy for Graves's disease. Lahey believes that "to ligature when in doubt" is one of the soundest principles in the surgery of toxic goitre. In his hands the results of this step have been striking—an immediate gain in body weight, improvement in the nervous condition, a lowering of the pulse rate, and a general relative approach towards a more normal condition. The operation performed is that of ligation of the superior thyroid vessels through an incision placed over the upper pole of the gland, the site of the incision being determined by palpation. Ligation here serves three purposes: something less than one-half of the blood supply to the gland is cut off, the lymphatic drainage is interrupted, and the sympathetic fibres divided, so that in whatever way the thyrotoxin influences the organism, division of the vascular stalk of the upper pole greatly decreases its powers for evil. It is for this reason that ligation of the superior thyroid artery has definite advantages over ligation of the inferior thyroid artery at the posterior margin of the sterno-mastoid. Lahey uses a combination of scopolamine, morphine, novocain, and gas as his anaesthetic. He regards the operation as a life-saving measure. If the condition of the patient does not warrant ligation of both sides at one sitting, he allows two to three weeks to elapse between operations. It must be remembered that these ligations do not obviate the performance of a thyroidectomy, but render the performance of this safer when undertaken some two months later.

92. Adrenal Rests in Hernial Sacs.

MACLENNAN (*Surg., Gyn., and Obstet.*, 1919, 29) writes of adrenal rests in the walls of hernial sacs. He has seen seven, six of them in a series of 700 herniae in children

operated upon by him. They appear as minute, flattened, brownish-yellow particles an eighth of an inch in diameter, embedded in the wall of the sac near the cord. All the cases were males, but as only 40 of the 700 were females he cannot give the relative sex incidence. The interest of the condition lies in the support that it tends to give to the congenital origin of hernial sacs. The paper is illustrated with photomicrographs of these rests, showing the typical appearance of adrenal tissue.

93. Endocranial Complications of Acute Otitis Media.

J. JOANNOVITCH and H. MASPARINI (*La Presse méd. d'Égypte*, November 15th, 1919) record three cases of acute purulent otitis media in adults, two of which were fatal. Their conclusions are as follows: (1) In cases of acute otitis media, if the fever and headache persist after trephining the mastoid, there is reason to suppose that an endocranial complication is present. (2) In cases of extradural abscess which has been opened and drained, if the fever and headache persist, an intracranial or intracerebral complication may be assumed. (3) A tender spot is a valuable guide to an intracranial collection of pus. (4) The prognosis of the endocranial complications of acute otitis media is very grave.

94. Hypertrophic Pulmonary Osteo-arthritis.

A GOOD example of this rare disease is described and figured by ERDMAN and OSTENDORF (*Journ. Amer. Med. Assoc.*, 1919, 73). The patient was a male, 24 years old, with a chronic suppuration in the chest, which appears from the text to be a "post-tonsillectomy" lung abscess. The enlargement of the hands and feet began some six months after the onset of chest symptoms. X rays later on showed a definite striated production of new bone in the periosteum of the shafts of the metacarpals and first two rows of the phalanges and along the lower ends of the radius and ulna. There were similar changes in the lower extremity. Although the soft parts were much thickened there was no clubbing of the fingers, a feature present in many cases recorded. In the present case there were no headaches, disturbances, nor drowsiness. This is important, as it is alleged that Marie's first case turned out to be an acromegaly. He it was who first used the term "ostéo-arthropathie hypertrophique pneumique," and the French writers were equally the first to attribute the origin of the disease to septic absorption—usually from the lungs. One cannot help suspecting that the true story of this disease has yet to be told, and that changes will be found in the endocrine glands, changes perhaps the result of pulmonary toxins.

95. The Indications for Splenectomy.

ACCORDING to F. KLEEBLATT (*Muench. med. Woch.*, November 7th, 1919) splenectomy is indicated in isolated miliary tuberculosis of the spleen, in all processes with pronounced haemolysis such as haemolytic jaundice, in hypertrophic cirrhosis of the liver, in the first and second stages of Banti's disease, and as a last resort in the third stage. In pernicious anaemia the operation causes temporary improvement. On the other hand, splenectomy is contraindicated in portal thrombosis and in all processes caused by primary portal congestion, and in polycythaemia.

96. Chronic Lead Poisoning after a Bullet Wound.

H. CURSCHMANN (*Med. Klinik*, November 16th, 1919) reports a case of chronic lead poisoning in a sergeant, aged 28, which developed fourteen months after a bullet wound of the left trochanter and hip-joint. The patient had typical lead colic and constipation, general weakness, secondary anaemia, and paralysis of both deltoid muscles. There was a well marked blue line on the gums. No lead could be found in the urine. The colic was relieved by opium and belladonna, but the rapid increase of anaemia and polyneuritis were an indication for an operation to remove the bullet. This form of lead poisoning was described in the nineties by C. Lewin, who saw the first case of this kind (revolver shot in the lung). During the war Neisser and Schlosinger drew attention again to its not infrequent occurrence after bullet wounds. In a number of their patients, as in the present case, there was a relatively long "incubation period" between the reception of the wound and the outbreak of symptoms. Neu and Dennig have attributed this to an intermittent absorption and excretion of the lead from the bullet. The anatomical position of the bullet and its relation to the blood and lymph stream are probably the chief factors in the exacerbation and remission of the symptoms.

OBSTETRICS AND GYNAECOLOGY.

97. Treatment of Eclampsia.

R. T. VON JASCHKE (*Deut. med. Woch.*, December 11th, 1919) recommends the following scheme of treatment: (1) Subcutaneous injection of 0.015 gram morphine hydrochloride to reduce the reflex excitability. The patient's room is darkened, and noise of any kind is prevented. (2) About a quarter of an hour later light ether anaesthesia is induced in order to catheterize the patient and to determine the stage of labour by digital examination. If the child is alive with its head deep in the pelvis and the os dilated, deeper anaesthesia is induced and delivery effected by forceps. (3) Immediately after digital examination and catheterization venesection of 500 c.cm. should be performed. A removal of a smaller amount of blood is valueless. (4) Continuation of Stroganoff's method which began with the injection of morphine, as follows: One hour after the injection 2 grams of chloral hydrate in 300 c.cm. of milk are given per rectum. Three hours after the beginning of treatment 0.015 gram morphine subcutaneously. Seven hours after beginning of treatment 2 grams of chloral hydrate or dormiol in 300 c.cm. of milk per rectum. The same dose of chloral hydrate or dormiol is repeated thirteen to twenty-one hours after the beginning of treatment. (5) In severe cases with repeated attacks 500 c.cm. of Ringer's solution should be given subcutaneously or intravenously about twice in the twenty-four hours. If the eclampsia does not develop till after delivery the amount of blood lost will determine the amount of the venesection, otherwise the treatment will be the same as described above.

PATHOLOGY.

98. A Remarkable Case of Pulmonary Embolism.

J. F. O. HUESE (*Nederland Tijdschr. v. Geneesk.*, December 20th, 1919) reports the following case: A man who had fractured his fourth dorsal vertebra as the result of a fall developed a bed sore on the buttock followed by thrombosis of the pelvic veins, which subsequently extended to the inferior vena cava. A haemorrhagic infarct in the right lower lobe resulted from separation of portion of the clot, and six days later embolism of both pulmonary arteries occurred. In spite of the extensive character of the embolism, death did not take place until a full hour after its occurrence.

99. Hypertrophic Lymphangioma of the Aorta.

V. ARRIGO (*Il Policlinico, Sez. Prat.*, November 16th, 1919) records a case in a girl, aged 14, who had died of nasopharyngeal and laryngo-tracheal lupus. The anterior surface of the portion of the aorta within the pericardium showed two small tumours the size of a lentil which on histological examination were found to consist of newly formed lymphatic capillaries which had developed mainly round the vasa vasorum in the adventitia of the aorta. They were lined with cubical and cylindrical endothelial cells, and contained lymphocytes or a granular substance. Arrigo regards these small growths as hypertrophic lymphangiomas, closely allied to lymphangio-endotheliomas, especially to their perivascular form.

100. Chorion epithelioma in the Male.

LANGER (*Med. Klinik*, November 2nd, 1919) remarks that in the vast majority of cases of chorion-epithelioma in the male the primary tumour is a teratoma of the testicle. Of the few cases recorded where the primary focus appeared to have been elsewhere there is only one in which the possibility of a testicular origin could be excluded with certainty. In his own case a young man of 21 years had the right testicle removed on account of a swelling. On microscopic examination of portions of this it was found to be a teratoma, with cysts lined partly by squamous, keratinizing epithelium, and partly by columnar epithelium with goblet cells, while in its stroma cartilage was present. No chorion-epitheliomatous elements were observed in any of the sections examined. The patient died nine days after operation, and extensive deposits of typical chorion-epithelioma were present in his lungs and retroperitoneally between the kidneys. These tumours were believed to be derived from the teratoma of the testicle, probably from an undiscovered focus of similar

tissue there. In discussing the condition Langer agrees with most previous observers that chorion-epithelioma in a teratoma of the testicle is derived from an embryonic rest which has become segregated at a very early period in development, and probably from a cell with potentialities for development not far short of the impregnated ovum. As Dick has pointed out, the relation of chorion-epithelioma in man to its host is that of consanguinity, while the relation of woman to the usual chorion-epithelioma of women is that of mother to offspring. In women the tumour may develop from chorionic tissue of varying degrees of maturity and the tumour may accordingly show varying degrees of malignancy, sometimes not high. On the other hand, in the male the tumour grows from chorionic epithelium of the earliest type, and its malignancy appears to be invariably great.

101. The Sachs-Georgi and the Meincke Reactions in Syphilis.

MERZWEILER (*Deut. med. Woch.*, November 13th, 1919) has examined more than 700 serums by the original Sachs-Georgi method or by a later slightly modified procedure, and compared the results with those of the Wassermann reaction on the same samples. The serums were from syphilitic cases, treated and untreated, and from non-syphilitic diseases and normal people. The extract for the Sachs-Georgi test was cholesterolinated ox heart, and precipitation was looked for after eighteen hours by the agglutinoscope. In 85 per cent. of cases the results corresponded to those of the Wassermann reaction. A positive Sachs-Georgi reaction always indicated syphilis, and no positive result was obtained in the sixty-four non-syphilitic cases examined. A negative Sachs-Georgi reaction was just as insufficient proof of absence of syphilis as a negative Wassermann reaction. In clinical syphilis the Sachs-Georgi reaction gave 5 to 10 per cent. more positive results than the Wassermann reaction, but was negative in some cases where the Wassermann reaction was correctly positive. The precipitating property of the positive serums could not be relied upon after five days' storage, so that the method is only applicable in institutions where tests are done at least twice a week. Apart from this the method is as reliable as the Wassermann reaction for positive diagnosis of syphilis and for exclusion of non-syphilitic cases, and it may be used with advantage for further examination of serums which give doubtful results to the Wassermann reaction. Meincke's precipitation reaction was similarly tested on 366 serums, but was found to give erroneously positive results in 12 per cent. of cases, so that in its present form it has much less practical value than the Wassermann.

102. Myocarditis from CO Poisoning.

A RECENT publication by Zondek on the condition of the heart in coal gas poisoning has drawn from E. LIEBMANN (*Deut. med. Woch.*, October 23rd, 1919) the following account of a case in which severe interstitial and parenchymatous myocarditis was found. The patient was a woman, aged 38, who had previously been well, and who was found unconscious in her bathroom, the window of which was open. The source of the fumes detected in the room was a defective stove. Carboxyhaemoglobin was demonstrated both by the spectroscopy and the caustic soda test. Death occurred twenty hours after the patient's admission to hospital. At the necropsy the heart was found to be a little larger than the patient's fist, and in the pericardium there were numerous small haemorrhages. The muscles of the left ventricle were extraordinarily flabby, soft, and yellow; they looked as if they had been boiled, and they were suffused with blood. The valves of the heart were intact. Under the microscope the muscles of the auricles and of the right ventricle showed albuminous clouding, but stained sections betrayed no sign of definite disease. All the more striking were the morbid changes in the muscles of the left ventricle. Over wide areas the transverse striation of the muscle fibres had completely disappeared, their nuclei could not be recognized, and their broken-up protoplasm stained very intensely with eosin. Among the muscle cells were large and numerous collections of neutrophil leucocytes and of round cells, some of which had penetrated to the interstices between single muscle cells. The blood vessels were dilated, and at several points blood was effused. There were also multiple haemorrhages into the brain. The author, who has failed to induce similar changes in the hearts of guinea-pigs by coal gas poisoning, suggests that his findings may not be as unique as the lack of records of similar cases indicates. Probably profound changes in the muscles of the heart induced by coal gas poisoning are often overlooked.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

103. A Second Attack of Scarlet Fever.

OWING to the comparative rarity of a second attack of scarlet fever the case reported by M. W. MARSMAN (*Nederl. Tijdschr. v. Geneesk.*, December 13th, 1919) is of interest. In October, 1915, a girl, aged 6 years, had a typical attack of scarlet fever, followed by well marked desquamation and haemorrhagic nephritis. In August, 1918, she had another attack, which was followed by branny desquamation lasting for twelve days. The urine on this occasion remained normal. Erythema scarlatini-forme was excluded by the high temperature, constitutional disturbance, the transient nature of the eruption, and the relatively short duration of the desquamation.

104. Familial and Hereditary Graves's Disease.

P. HARVIER (*Paris méd.*, December 6th, 1919) records a case of inherited Graves's disease which had commenced in childhood in a man aged 19, whose mother, maternal grandmother, and paternal aunt were similarly affected. Tremor, which was the first symptom noted, appeared at the age of 3 years. The thyroid became enlarged at the age of 12, but the onset of the exophthalmos could not be determined. In some cases the symptoms develop much earlier. Schmauch reports the case of a woman, aged 35, who at the end of her first pregnancy developed a goitre, which increased in size with each subsequent pregnancy. During the fourth pregnancy she presented undoubted signs of Graves's disease, and was delivered of a child at seven and a half months, which presented some exophthalmos five weeks after birth. No mention, however, was made of the size of the thyroid, tremor, or state of the pulse, so that the diagnosis of congenital exophthalmic goitre is doubtful. Transmission is usually on the female side, but in some cases the father alone is the subject of Graves's disease. Inherited exophthalmic goitre occurs spontaneously without obvious cause or develops after an infectious disease or an injury. In some cases the symptomatology is complete, and in others, while the exophthalmos and tachycardia are more or less marked, tremor may be absent or disappear.

105. Scarletiform Erythema caused by Codeine.

ROUQUIER (*Rev. méd. de l'Est.*, December 1st, 1919) records the case of a soldier the subject of chronic bronchitis and emphysema who whenever he was given codeine developed a diffuse scarlatiniform eruption followed by desquamation. The eruption was much darker in colour after ingestion of 60 grams of the syrup, which contained 12 cg. of codeine, than after 30 grams, and was accompanied by the appearance of small bullae, which were not produced by the smaller dose.

106. Vaccine Treatment of Influenza.

INTRAVENOUS injection of a mixed influenza vaccine is recommended by D. ROBERTS (*Amer. Journ. Med. Sci.*, September, 1919), who found that good results were only obtained when the injection caused a definite reaction. The initial dose required to produce this reaction was 1,000 million organisms injected intravenously, and probably several times as much if injected subcutaneously or intramuscularly. The exact composition of the vaccine was regarded as unimportant. The injections were repeated every twenty-four hours until improvement took place. In a series of 200 cases of influenzal pneumonia treated by this method the mortality was 9.6 per cent., as compared with a mortality of 31.3 per cent. among 86 cases treated by an expectant plan.

107. A Constant Sign of Hyperthyroidism.

G. MARANÓN (*Rev. Espan. de med. y. cir.*, November, 1919) describes a sign which he found in 92 out of 100 cases of all forms of hyperthyroidism, consisting in an erythema caused by slight friction of the skin of the neck with the finger. The erythema so produced is more intense than in the neighbouring regions, and when a goitre is present may be confined to the skin over the tumour, or if the goitre is unilateral it may be more intense on the corresponding side. The erythema may be uniform or irregular, smooth or slightly raised. Marañón attributes the phenomenon to a hypersensitive condition of the vasomotor

nerves caused by the excess in thyroid secretion or a change in its quality. This action is probably effected by means of the hormones which are conveyed from the thyroid gland to the skin in the blood stream and not by the nervous system, as it is chiefly manifested in the region of the thyroid.

108. Meningococcal Septicaemia with Petechial Eruption.

VERATTI (*Il Policlinico*, Sez. Prat., November 16th, 1919) reports the case of a soldier who, shortly after coming from a district where typhus was prevalent, suddenly developed high fever and shivering, and a few days later presented a petechial rash closely resembling typhus. The Weil-Felix reaction was negative, as were also the agglutination tests for typhoid and paratyphoid A and B; but examination of the blood showed numerous organisms with all the characters of the meningococcus. The disease lasted for a long time, the fever persisting for about a month after the disappearance of the rash, and at a later stage signs of meningeal localization appeared; but on examination of the slightly turbid cerebro-spinal fluid it was impossible to isolate the meningococcus or any other germ.

109. Pituitary Dwarfism.

K. FABER (*Ugeskrift for Laeger*, December 11th, 1919) records two cases of dwarfism bearing out Hastings-Gilford's view that "pituitary deficiency does not lead to gigantism, but to defective growth, or infantilism." The first case was that of a lad, aged 17, whose height was 127 cm. The trunk and limbs were well proportioned, except for the limbs being a little too short in comparison with the trunk, and the head contributing to one-sixth of the total height. His features and the shape of his head were infantile, and there was no beard nor growth of hair on the pubes or in the axilla. The genitals were those of a little child; the scrotum was empty, the penis was only 2 cm. long. He was plump, the distribution of fat giving his body a feminine appearance. There was no oedema or evidence of myxoedema, and there was no glycosuria, but the total daily excretion of urine amounted to 2,000 to 3,000 c.cm. Examination of the eyes revealed atypical homonymous hemianopsia, suggesting a lesion near the chiasma. The second case—that of a lad also aged 17—presented so many points of similarity to the first case that the two might have been twins. In both cases the x rays showed a definite shadow just above the sella turcica, interpreted by the author as a sign of calcification of a benign tumour. Discussing the treatment of such cases, he finds an operation too dangerous, and he admits that though x-ray treatment is comparatively safe, the prospects of its proving beneficial are rather meagre.

110. The Mechanistic Classification of Neuroses and Psychoses.

KEMPF (*Journ. of Nervous and Mental Dis.*, vol. 50, 1919) puts forward a system of classification of neuroses and psychoses based essentially on the integrative functions of the nervous system, of which the psychoses are considered to be symptoms, and maintains that the same forces which build up a personality when harmoniously integrated cause its deterioration when inadjustable conflicts occur. Though any such system of classification can only be regarded as retrogressive by those who are endeavouring to establish clinical psychiatry on the basis of pathological physiology, it must be admitted that the time has not yet come when this possibility is even in sight, and meanwhile the system of the author furnishes a basis for psychological documentation of great interest and suggestiveness.

111. Subcutaneous Injections of Oil of Camphor in Sciatica.

S. JENSEN (*Ugeskrift for Laeger*, July 24th, 1919) has been so greatly impressed by the effect of subcutaneous injections of oil of camphor in other cases of neuritis that he has extended this treatment to cases of sciatica. In all the 13 cases of sciatica thus treated the pain disappeared completely within ten to twelve days, and in no case did it recur. The dosage was 3 to 4 cm. injected in the neighbourhood of the affected nerve. In severe cases this dosage was raised to 5 or 6 cm. daily.

112. Jaundice and Arsenobenzol

CHABROL and KHOURY (*Paris méd.*, December 13th, 1919) report several cases of jaundice occurring in patients treated by arsenobenzol in various stages of syphilis. The pathogenesis of the jaundice is not yet settled. According to some writers it is due to a reactivation of the syphilitic process, while others regard it as a simple toxic jaundice. Milian maintains that syphilis is alone responsible, and considers that as the result of the arsenical preparations a sort of Herxheimer's reaction takes place in the liver and the spleen, which are the sites of predilection for the *Treponema pallidum*, as well as the centres for haemolysis and the production of bile. According to this view, it is logical to continue the arsenical treatment in spite of the appearance of jaundice, and, as a matter of fact, in some cases this appears to hasten recovery. On the other hand, the hypothesis of a simple toxic jaundice is supported by the frequent occurrence of jaundice following other arsenical preparations, as will be found in textbooks on toxicology, and especially in the histories of celebrated poisoning cases. Clinical observations also are in favour of the toxic hypothesis, as it is difficult to explain otherwise the occurrence of jaundice after twenty years of syphilis on the day following a series of ten to twelve injections of arsenobenzol. The present writers agree with Ludelo in emphasizing the importance of a predisposition on the part of the liver in such cases. Queyrat has shown that alcoholic and tuberculous patients whose liver has undergone fatty degeneration are specially liable to develop jaundice after arsenobenzol, and in several of the present writers' cases pregnancy cholelithiasis and cholæmic heredity were important factors.

113. Diphtheria of the Nose and Ear in an Infant aged 30 Days.

L. SPOLVERINI (*La Pediatria*, December, 1919) reports a case of diphtheria of the nose and middle ear in an infant suffering from congenital syphilis. The nostrils were reddened, and there was a serous nasal discharge. There was purulent otorrhoea from the left ear. Diphtheria bacilli were found in the nasal discharge and in the pus from the ear in association with a few diplococci. Considerable improvement followed two injections of diphtheria antitoxin, the first consisting of 2,000 units and the second of 1,000 units, and syringing the nose and ear with a 1 per cent. solution of protargol. The child, however, was removed from hospital before complete recovery took place. The patient had probably been infected by a carrier, as there was no case of diphtheria in the family.

114. Adrenalin in Spastic Bronchitis.

N. JAGIC (*Wien. med. Woch.*, September 27th, 1919) found during the war that a considerable proportion of the soldiers admitted to hospital for wounds suffered also from a well defined type of bronchitis. The cough was intractable, and as it persisted after the wounds had healed, these patients used to be sent to the dust-free atmosphere of a convalescent home in the country. They returned some weeks later little better for the change. True bronchial asthma, as well as tuberculosis, could be excluded in these cases, the most striking features of which were dyspnoea on slight exertion, little or no sputum, harsh and prolonged expiration, and a limited excursion of the diaphragm, as observed by the x rays. The apparent kinship of this condition to true bronchial asthma led the author to give hypodermic injections of adrenalin. In many cases these injections were followed in fifteen to twenty minutes by less embarrassed expiration, diminution of the adventitious sounds, and by a marked increase in the range of movements of the diaphragm. These were often twice as great as before an injection. The author, who regards these cases as the result of a spastic condition of the bronchial system, attaches great importance to the diagnostic significance of an x-ray examination of the movements of the diaphragm.

115. Senile Osteomalacia.

WEIS (*Med. Klinik*, October 5th, 1919) records the case of a woman, aged 60, who had been operated on three years earlier for cancer of the uterus. She suffered from severe pain in the limbs and chest, and experienced increasing difficulty in walking. On admission to hospital she was practically incapable of walking, and her chest was very tender on pressure. In other respects the examination was negative. The diagnosis between secondary cancer or senile osteomalacia was settled by the success attending treatment with "phosphorobertran," the exact nature of which preparation is not stated by the author. Complete recovery was effected. Discussing the symptoms of senile

as distinct from puerperal osteomalacia, the author emphasizes the comparatively slow onset of the disease and the lack of marked morbid changes. In the early stages the disease is often confused with rheumatism, neuralgia, or hysteria. Chronic arthritis, diseases of the spine, and senile osteoporosis must also be considered in the differential diagnosis. Phosphorus acts almost as a specific.

SURGERY.**116. Thoracoplasty in Pulmonary Tuberculosis.**

P. BULL (*Norsk. Mag. for Laegevidenskaben*, November, 1919) has performed thoracoplasty in 37 cases of pulmonary tuberculosis, and he groups his cases in two series, according as they were operated on before or after 1916. This classification showed how greatly the results had improved by experience and changes of technique. In the first series of 11 cases there were 3 operation fatalities; in the second series only one. The mortality was thus reduced from about 30 to 4 per cent. The chief improvement in technique was the performance of the operation in two stages, with an interval of three to four weeks, instead of in one stage. Local anaesthesia was induced at the first stage; general anaesthesia, as a rule, at the second stage. Of the 33 patients who survived the operation, 7 succumbed to tuberculosis and one to influenza pneumonia. Of the 25 who were still alive, 11 were fit for work, were always afebrile, and their sputum no longer contained tubercle bacilli. Seven others still suffered from active tuberculosis. The remaining 7 had been operated on within a year, and no permanent result could be claimed, though there was every prospect of a permanent cure in several of these cases. This operation may, therefore, achieve a "cure" in a third of the otherwise forlorn cases found suitable for it. The author found the condition of the opposite lung often determined the ultimate fate of the patient.

117. Aneurysm of the Liver.

SUDECK (*Muench. med. Woch.*, November 17th, 1919) reports the first case on record of diagnosis during life and of cure of aneurysm of the liver. The patient had received a gunshot wound of the abdomen followed by haemothorax, which was successfully operated on. Subsequently hepatic colic and intestinal haemorrhage took place, for which laparotomy was performed in the belief that the condition was a subphrenic abscess. The gall bladder was found to be distended and the hepatic vessels enormously dilated. The gall bladder was stitched to the wound, and was opened later. Blood continuously escaped from the opening, so that an intrahepatic aneurysm communicating with the bile ducts was diagnosed. The hepatic artery was ligatured and recovery took place.

118. Bony Ankylosis after War Wounds.

U Morgagni (December 15th, 1919) says that the term "ankylosis" should be confined to true bony ankylosis as distinguished from fibrous ankylosis or ankylosis due to extra-articular lesions. In addition to the usual means of distinguishing bony from fibrous ankylosis, including the help from x rays, a valuable clinical sign may be looked for—namely, the pain elicited on movement of the joint; in true bony ankylosis there is no pain on attempted movement except such as may be due to direct pressure of the fingers, and the firmer and more bony the ankylosis the truer this is, whereas in fibrous ankylosis attempts at movement usually cause definite pain in the articulation itself.

119. Circumscribed Spinal Meningitis Cured by Operation.

At a meeting of the Jydsk medicinsk Selskab, Strandgaard (*Ugeskrift for Laeger*, December 25th, 1919) demonstrated a patient, a widow of 55, who for long had been the subject of many diagnoses and much varied treatment. At the age of 52 she was treated for haematemesis, at the age of 53 for gall stones, at the age of 54 for gastro-coloptosus and sciatica. About nine months before the demonstration she was admitted to hospital for gall stones, although the pain, supposed to be due to biliary colic, was chiefly situated in the back. Her movements at this stage were suggestive of spondylitis. This diagnosis was not, however, confirmed by any of the x-ray examinations made. In hospital several attacks of pain recurred, and as they were located under the right costal arch an operation for gall stones was undertaken. The gall bladder proved to be distended, and there were a few adhesions, but no gall

stones could be found. As the pain recurred after this operation, and radiated out to both sides from the spine, laminectomy for relief of spinal compression was performed. Under morphine-ether anaesthesia the laminae of the tenth thoracic vertebra were resected. Nothing abnormal was found till the laminae of the twelfth vertebra were removed. Here an encysted exudate was found in the pia. This pseudo cyst was easily removed, the wound was closed, and healing by first intention followed. At the demonstration the patient was not only perfectly free from pain, but she was in every other respect restored to complete health.

120. Post-operative Prognosis for Cancer of the Breast.

A. NEANDER (*Hygiea*, December 16th, 1919) has analysed the cases of cancer treated in his hospital in the period 1890-1914. The number undergoing a radical operation was 427. The immediate operation mortality was 2.1 per cent. In 97 cases the disease was found at the operation to have extended beyond the surgeon's reach, and these cases were therefore excluded, as the author's object was to ascertain the results of operative treatment when, at the time of operation, all the disease was apparently removed. Thus the number of patients was reduced to 320. Of these, 165 were found to have died of cancer, 23 of other diseases without any sign of cancer in the field of operation, 45 were still alive, and 85 could not be traced. The remaining 3 were still alive but were suffering from a recurrence of the cancer. The author found that after the age of 30 as high a proportion as 72 per cent. of all cases of chronic disease of the breasts were malignant. About 25 per cent. were inoperable, and of the cases undergoing a radical operation—that is, clearing out of the axilla as well as amputation of the breast—more than 70 per cent. terminated fatally with recurrence of the disease within three years of the operation. When he sorted his material according to Steintal's classification, he found that of 71 patients in the first class, with small, slowly growing tumours showing little or no signs of extension to the axilla, 32 had died of cancer of the breast, 3 of cancer of the stomach, and 6 of diseases other than cancer. Thirty patients were still alive and showed no sign of recurrence of the cancer, but all the 15 patients in the third class had succumbed to cancer although their enlarged supraclavicular glands had been excised at the time of operation on the breast. In two-thirds of the cases of recurrence the operation scar or its immediate neighbourhood was involved. The author interprets this as an indication for including more of the skin in the operation than heretofore, even though the wound may not heal as neatly by first intention as when accurate union of the margins of the skin is effected.

121. Extragenital Inoculation of Soft Sores.

C. MADERNA (*La med. Pratica*, November 30th, 1919) states that extragenital soft sores are extremely rare, being much less frequent than extragenital hard chancres. In Ricord's statistics of 343 soft chancres, only 28, or 8.10 per cent., were extragenital. Fournier had only 2 extragenital cases among 445 patients. Clerc had only 20 among 2,000 patients (1 per cent.), and Cheimre-see 5, or 0.11 per cent., among 3,956. The combined statistics of Ricord, Lelalage, Leford, Clerc, Millet, and Loharthe show a percentage of 2.53, and those of Petersen, relating to 9,000 cases of soft chancre, 5,363 of which had come under his own observation, a frequency of 0.30 per cent. The most frequent situation for extragenital soft chancre is the finger, of which 21 examples are on record. In 14 cases the cephalic region has been affected, in 5 the lower lip, in 3 the back of the hands, in 2 the tongue, in 2 the forearm, in 2 the chest, while the buccal cavity, pharynx, tonsil, conjunctiva, groin, and nipple have been affected in one case each. The frequency of extragenital soft sores is greater in women than in men. Maderna records 2 cases of extragenital inoculations of soft chancres on the thighs, abdomen, and buttocks secondary to infection of the penis in patients suffering from scabies.

122. A Case of Circumscribed Traumatic Serous Peritonitis.

G. ABOULARAGE (*Il Policlinico*, Sez. Prat., November 30th, 1919) reports a case, in a boy aged 7, following a violent blow in the epigastric region. The result was a contusion of the stomach and transverse colon without perforation, which was followed by adhesive peritonitis between the two viscera and finally perforation, which was favoured by the action of the gastric juice on the walls of the stomach and colon. Signs of intestinal haemorrhage, adhesive peritonitis, and circumscribed serous

peritonitis in the upper left quadrant of the abdomen set in, and finally a cystic cavity formed, which on laparotomy was found to be situated between the spleen, stomach, colon, and omentum. A post-traumatic gastro-entero anastomosis had obviously taken place, which accounted for the patient's rapid loss of flesh. Owing to his bad general condition further operation was not advisable; death took place one month after the operation.

123. Periosteal Tuberculoma of the Orbit.

CABANNES and DUPÉRIÉ (*Gaz. hebdomadaire des Soc. Méd. de Bordeaux*, December 21st, 1919) report a case in a woman, aged 25, who had a swelling over the outer part of the upper margin of the orbit. She was also suffering from chronic hydrarthrosis of the left knee and presented weakness of breath sounds at the right apex. The swelling, which was of a cartilaginous consistence, was adherent to the margin of the orbit, and was quite independent of the upper part of the tarsus. On removal it was found to consist of fibrous tissue with lymphocytes, groups of epithelial cells and giant cells. No tubercle bacilli were found. A tuberculoma in this position is liable to be mistaken for a dermoid cyst or a tumour of the lacrymal gland.

124. Intracapsular Extraction of Cataract.

BENEDICT (*Minnesota Med.*, December, 1919) gives an account of his modification of the intracapsular operation for cataract, together with statistics of twenty-four cases. Intracapsular extraction, it is well known, is being extensively practised in the United States. The theoretical advantages of such an operation are generally admitted, provided that it can be safely performed, and that no calamities happen during the performance. In this country, possibly owing to the fact that the number of extractions performed by most surgeons in the course of a year is not large, intracapsular extraction as an operation for cataract is hardly ever done. The majority of ophthalmologists consider that the possible dangers outweigh the possible advantages, and that having the safety of the eye in mind, the results with the old-fashioned extracapsular operation are likely to be better than those with this new method.

OBSTETRICS AND GYNAECOLOGY.

125. Wound of the Uterus in the Eighth Month of Pregnancy.

P. DE TOMMASI (*Il Policlinico*, Sez. Prat., December 14th, 1919) reports the following case: A woman aged 35, in the eighth month of her first pregnancy, was admitted to hospital with a wound in the epigastrium from which a little omentum was protruding. A median supra-umbilical laparotomy was performed and a little blood-stained amniotic fluid escaped. An examination of the uterus showed a wound 3 to 4 cm. long in the fundus to the right of the mid line, through which a part of the fetus could be seen. After deliberating whether he should perform Caesarean section or hysterectomy or suture the wound, De Tommasi decided on the last course. A few days after the operation labour pains set in, and the mother was delivered of a healthy child by forceps. Recovery took place.

126. Primary Abdominal Pregnancy following Caesarean Section.

M. RIVIÈRE and J. LACOUTURE (*Gaz. hebdomadaire des Soc. Méd. de Bordeaux*, January 4th, 1920) report a case in a woman who had undergone Caesarean section for contracted pelvis in 1918. In April, 1919, her period ceased without any other signs of pregnancy. In September she began to suffer from uterine colic twice a month with sudden increase in the size of the abdomen. The condition was first attributed to haematometra, but on vaginal examination the uterus was found to be small, retroflexed, and not to show any of the changes of pregnancy, and a median tumour was felt which suggested a malignant ovarian tumour of rapid development. On laparotomy, a five months old macerated fetus was found in the abdominal cavity wrapped up in an amniotic sac adherent to the intestine. The placenta, which was adherent to the right iliac fossa, was readily removed without haemorrhage and hysterectomy was performed. The uterus showed a median rent on its anterior surface, due to failure of the walls to unite after the Caesarean incision. The mucous membrane alone was intact. The Fallopian tubes showed considerable changes, the right being completely obliterated. The writers uphold the view of a primary abdominal pregnancy, for it was difficult to believe that at five months the

placenta could have been expelled from the Fallopian tube and have become adherent to the iliac fossa. The lesions in the tubes which allowed the spermatozoon to penetrate into the peritoneal cavity prevented the fecundated ovum from passing into the tube and thence into the uterus.

PATHOLOGY.

127. Antitoxic Chemiotherapy: The Phenololipoids.

PIAZZA (*Riv. Ospedali*, September 15th, 1919) gives an account of certain experiments in the production and therapeutic use of various compounds of phenol with different lipoids and camphor. The resulting product is not a mere mixture but a true chemical compound. These phenololipoids present certain general characteristics. In the majority of cases at ordinary temperature they are semifluid, pasty, and sometimes liquid; they are all soluble in ethylic ether, benzol, chloroform, ichthyol, olive oil, and the essential oils. With other solvents their behaviour varies according to the particular compound. Of the thirteen compounds tried by the author, that which gave the most constant chemical composition, complete stability, and precise chemico-physical property was a compound of phenol, cholesterol, and camphor. This proved to be antitoxic and antibacterial at the same time. The antitoxic action was tested on the toxins of tetanus, diphtheria, and typhoid anaphylotoxin and found to be of definite value. The antibacterial action was tested on *B. typhosus*, *B. paratyphosus* A and B, *B. coli*, Shiga's *B. dysentericus*, *Proteus* x 19, pneumococcus, and streptococcus. The best result was seen in the case of Shiga's bacillus. Locally no caustic or anaesthetic action was observed on the skin or mucous membranes.

128. Investigations on Spirochaeta ictero-haemorrhagiae in Buenos Aires Rats.

FROM September to November SPADA (*Rev. Sud-Americana*, November 15th, 1919) investigated twenty rats which had been caught in the neighbourhood of the Italian Hospital at Buenos Aires, but in none of the animals in which sections of the spleen, liver, kidneys, and suprarenals were examined was the *Spirochaeta ictero-haemorrhagiae* found. Inoculation of guinea-pigs was also negative. Spada does not regard these results as final, as it has been shown by some observers that while rats caught in one part of a town harbour the spirochaete, those caught in another are free from it. Thus Nicolle and Blanc did not find the spirochaete in 119 rats caught in the streets of Tunis, but found it in rats caught in the slaughterhouses of the town, and Lheritier in Algiers found 6 per cent. of the rats in the suburbs infected, and only 3 per cent. of the rats in the port. The season is also of importance. Lheritier found 3 per cent. of the rats infected in the spring and 6 per cent. in the winter, and Nicolle and Lebailly in Tunis did not find any infected rats in the winter, but found the spirochaete in rats caught in the autumn. The fact that the *Spirochaeta ictero-haemorrhagiae* has been found in rats in other parts of South America—for example, by McDowell in Rio de Janeiro, by Carini at San Pablo, and by Ribeyro at Lima—suggests that further investigations will show it to be present in Buenos Aires.

129. Vitamines and Growth.

As the result of experiments on chickens HOULBERT (*Paris méd.*, December 13th, 1919) found that when they were deprived of vitamins in their food the birds showed an arrest of growth and of the development of secondary sexual characters (spurs, comb, and tail feathers) and progressive anaemia. One bird was killed on the fortieth day and on *post-mortem* examination was found to be in a state of extreme emaciation. The skin was dry and scaly, the flesh flaccid and very pale. All the organs appeared normal except the testes, which were very small and on histological examination showed an arrest of the cellular divisions and metamorphoses which normally occur in the seminal tubules at the date at which the chicken was killed. The interstitial cells of the testes showed a very pronounced infiltration of pigment, which, as Bouin and Ancel have shown, occurs in the interstitial cells of glands whose endocrine activity is on the decline. Sections of the suprarenals showed an arrest of development of the chromaffin cells. On the other hand, Hembert found that the glands of internal secretion whose activity had been arrested by experimental avitaminosis resumed their normal evolution when vitamins were restored to the diet.

130. Morton's Method for the Rapid Diagnosis of Tuberculosis.

KÄTHE NAGEL (*Zeit. f. Tuberkulose*, November, 1919) refers to the paper published by J. Morton in the *Journal of Experimental Medicine*, October, 1916, in which he described a method of causing a more rapid dissemination of tuberculosis in the guinea-pig by reducing its power of resistance. The idea had been suggested to him by an article published by Murphy and Ellis in 1914 entitled "Experiments on the rôle of lymphoid tissue in the resistance to experimental tuberculosis in mice." These writers had found that repeated applications of small doses of x rays led to a general atrophy of the lymphoid tissue, without producing much effect on the other tissues or health of the animals, and that mice which had been exposed for twelve to fourteen days to a daily application of x rays and infected with tuberculosis succumbed much quicker than control animals. They concluded that lymphocytes played a considerable part in the resistance of the body to tuberculous infection. These experiments prompted Morton to subject guinea-pigs shortly before or after inoculation with tuberculous material to a single application of x rays with about two erythema doses. Seven to twelve days after inoculation the animals were killed. Morton concluded that it was possible to reduce the resistance of guinea-pigs to tuberculosis by a single exposure to x rays. It was possible to make a diagnosis of tuberculosis in x-rayed guinea-pigs in eight to ten days, whereas with normal guinea-pigs five to seven weeks were required. Nagel, however, found, in a series of experiments carried out to test the accuracy of Morton's work, that though it was possible to produce a considerable leucopenia in guinea-pigs by x rays, two exposures with two erythema doses could not reduce the resistance of the animals to tuberculosis. She attributes Morton's results to the fact that he either did not use any control animals or that he did not kill the control at the same time as the experimental animal.

131. A New Germicide: "Merurochrome-220"

YOUNG, WHITE, and SWARTZ (*Journ. Amer. Med. Assoc.*, November 15th, 1919) have prepared a drug, said to be non-toxic, that can be tolerated in the human bladder for several hours, but is of great germicidal strength. It is obtained by substituting one atom of mercury in the molecule of dibromfluorescein (a dye closely related to eosin), is chemically dibrom-oxymercuro-fluorescein or its sodium salt, and has been called by its originators "merurochrome-220." The free acid is a red powder insoluble in water, but readily soluble in sodium hydroxide solution with the formation of a deep cherry-red colour showing fluorescence on dilution. The dry salt forms iridescent green scales, slightly hygroscopic and readily soluble in water. The solution is stable and is not affected by moderate heat or exposure to the air. Strongly acid urine gives a slight precipitate of the free dye. No precipitate occurs when a 1 per cent. solution of the drug is mixed with an equal volume of medium rich in protein, such as hydrocele fluid. The solution stains the skin a bright red colour, but this can be removed by potassium permanganate followed by oxalic acid solution. Experiments on rabbits showed that the dye penetrated the epithelial layers of the bladder, sometimes the submucosa; in the kidney the pelvis showed staining of the epithelium and the dye was taken up by the cells of the collecting tubules. One per cent. solutions are not irritating to the eye, and this was the strength employed clinically in the genito-urinary tract. It would seem to be a very rapidly acting germicide—a point of considerable practical importance. In the treatment of infections of the renal pelvis urine was collected separately from each kidney by ureteral catheterization, centrifuged, stained, and examined microscopically; the kidney pelvis was then gently filled by syringe or the gravity method with a 1 per cent. solution and the fluid retained for five minutes. This was repeated twice a week. In the treatment of bladder conditions the urethra was first irrigated with sterile water, the bladder was washed clean, and then 1 oz. of the solution was injected through the catheter, the patient being instructed to retain it for at least one hour. The procedure was carried out twice or three times a day. Any slight burning or smarting sensation soon passed off. Cystitis and pyelitis of long standing, refractory to other treatments, soon cleared up. The rapidity with which in some cases old purulent cystitis disappeared (in a few days) was surprising. In gonorrhoea "merurochrome-220," like flavino, is of considerable value.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

132. Death following the Application of Sinusoidal Currents.

ACCORDING to GUNSETT and ZIMMERMANN (*La Presse m'd. d'Egypte*, December 15th, 1919), during the war several German writers reported fatalities occurring after the application of sinusoidal currents from pantostats or multostats. The first cases of the kind took place as the result of Kaufmann's method, which was employed for curing hysterical symptoms by the application of powerful sinusoidal currents. Boruttan pointed out that the method was particularly dangerous, as the current was not applied superficially but passed into the body and might easily affect the heart, which responded by very frequent and irregular fibrillary contractions followed by sudden death. The mechanism of death in such cases is similar to that caused experimentally by stimulating the exposed myocardium of the ventricle with a faradic current. Fatal cases have also been reported in German literature following the application of sinusoidal currents in which Kaufmann's method was not employed, but only an extremely weak current. In an autopsy in a case of this kind enlargement of the thymus was found.

133. Plastic Linitis.

P. CARNOT (*Paris m'ed.*, December 20th, 1919) describes three forms of plastic linitis according as the process affects the body of the stomach only or involves the orifices as well: (1) Gastric linitis without involvement of the orifices; (2) cardio-gastric linitis; (3) gastro-pyloric linitis. The characteristic features of the first form are microgastria, rigidity and thickening of the rigid wall. The symptoms are dysphagia and regurgitation resulting from the small capacity of the stomach, which becomes immediately filled, while the oesophagus becomes filled secondarily almost at the beginning of a meal. In cardio-gastric linitis there is a rigidity of the cardiac orifice, which is manifested by stenosis of the cardiac end of the stomach. The clinical picture is characterized by dysphagia and regurgitation of mucus and food. The oesophageal bougie is arrested at the cardiac orifice, or even higher up, at least 40 cm. from the teeth. A diagnosis of a new growth at the cardiac end of the stomach in such cases is therefore almost inevitable. In gastro-pyloric linitis there is a rigidity of the pyloric orifice giving rise to pyloric incontinence, which predominates over pyloric stenosis.

134. Ocular Changes in Encephalitis Lethargica.

HIRAM WOODS (*Arch. of Ophthalmology*, November, 1919) contributes an interesting account of seven cases of this disease which he has seen during the past year. The clinical histories of the cases are very complete; two of the cases gave histories of antecedent influenza, and in Woods's opinion the frequency with which lethargic encephalitis has followed an attack of influenza is due (1) to the high incidence of influenza at the time, (2) to the reduction in resistance of the individual due to a previous influenzal attack. In only one of his cases was optic neuritis present, and this was of very mild degree; in three cases serious impairment of accommodation was present, together with dilatation of the pupils; extrinsic ocular paralysis was the rule, the third, fourth and sixth nerves being affected in various cases, as well as the seventh in three cases. Paralysis of intrinsic and extrinsic ocular muscles tends to spontaneous recovery. Nystagmoid movements occurred in five of the seven cases; these movements as a rule bore no relation to the axis of voluntary movement of the eyes—that is, with lateral movements of the eyes there would be a rotatory or vertical nystagmus. Woods thinks that the ocular symptoms are obviously of antral origin. Only one of the seven cases died, and an autopsy was not allowed.

135. Goitre and the Psychoses.

PHILLIPS (*Journ. of Mental Science*, October, 1919) discusses a relationship between goitre and the psychoses. It has been observed that insanity is eight times as common among the goitrous as among the non-goitrous in an area where goitre is endemic. There is trustworthy evidence

showing that where an enlargement of the thyroid exists the amount of secretion is altered, producing signs of hypo- or hyper-thyroidism, or the two conditions alternating in the same subject—thyroid instability. Any marked alteration in the thyroid secretion produces disorder of the delicate hormonal balance of the body, a fact that creates readily an auto-intoxication, felt at once by the central nervous system. The author examined 200 cases of insanity, and found 24 with thyroid enlargement. A short clinical *résumé* of these cases is provided. Most of the 24 showed signs of hyperthyroidism. The cases are classified mentally, and the author found that 17 of them were of the manic-depressive type, while 4 were dementia praecox and 3 paranoia. On a comparison, the author claims that the cases of the emotional type corresponded with hyperthyroidism, while apathy and indifference, as in dementia praecox, were more often associated with hypothyroidism.

136. Diabetes Mellitus.

EDGAR (*New York Med. Journ.*, October 11th, 1919) considers that starvation is contraindicated in cases of diabetes mellitus when there is emaciation with lowered body resistance, and he has obtained good result from his rabbit serum. A married man, aged 35, with no family history of diabetes had received starvation treatment during four years whenever the urine showed sugar. With 8 per cent. sugar and slight traces of acetone and diacetic acid his weight was 115 lb., as against 165 lb. three years previously, and he was suffering from inanition due to frequent periodic starvations. By reducing the fats one-half and increasing the carbohydrates and proteins he gained 6 lb. in a month, the author's rabbit serum having been injected twice weekly for three months, during which time there were three starvation periods of thirty-six hours each. Upon discharge he was aglycosuric, eating about 2,500 calories daily of a mixed diet, and he had gained 30 lb. He has remained sugar-free for the past eight months. The disease is apparently arrested, but whether the serum was the active factor is not proved, though promising results are being obtained from its use in similar cases. In diabetes mellitus there appears to be a series of events in which the pancreas plays the dominant part; resistance of body function must be preserved and stimulated, while activation of liver, muscle, and pancreas is indicated, and specific serum therapy may be the key to successful treatment.

137. After-Effects of Gassing on the Respiratory Tract.

BERGHOFF (*Arch. Int. Med.*, December 15th, 1919), from an observation of 2,000 soldiers who had been gassed, 240 of these being by cloud or drift gases, such as chlorine, and the rest mainly by mustard gas, concludes that gas victims, irrespective of the type of gas and severity of attack sustained, show no marked predisposition towards active pulmonary tuberculosis or towards the reactivation of a healed or quiescent pulmonary lesion. He found little evidence of material destruction of lung tissue. Emphysematous cases have a more protracted convalescence than those of the bronchitic group.

138. Vaccine Treatment of Ozaena.

G. HOFER (*Wien. med. Woch.*, November 8th, 1919) records the case of a nurse, with marked atrophy of the turbinals, crust formation, intense fetor, dry pharyngitis, and a saddle nose. Vaccine treatment, on the Hofer-Kofler system, was instituted early in 1915. It was continued, with interruptions, till May, 1917. Within this period forty-eight injections were given of a vaccine containing 50 to 600 million micro-organisms to the cubic centimetre. No local treatment was prescribed. Since the termination of the treatment she had been symptom-free, and two years after its completion the right lower turbinal showed only slight atrophy, and the appearance of the middle turbinal was almost normal. On the left side the atrophy of the turbinals had given place to a compensatory vasomotor hypertrophy. The appearance of the pharynx was normal. There was no longer any nasal discharge or fetor. The author believes that the recovery in this case may be regarded as permanent and as the result of the vaccine treatment.

139. Intravenous Injections of Camphorated Oil.

ALEXANDRESCO-DERSCA (*Bull. et mém. de la Soc. Méd. de Bucarest*, November 6th, 1919) confirms the experience of preceding investigators regarding the immediately beneficial effects and the absence of danger attending intravenous administration of camphorated oil. It is especially indicated in conditions of shock and of heart failure. The oil must be pure and sterile, the solution containing 0.1 gram per cubic centimetre (that is, half the B.P. strength), and the dose injected should not exceed 2 c.cm. The injection into an arm vein should be done very slowly, taking three or four minutes, and should not be repeated under half an hour. The maximum quantity recommended is 4 to 6 c.cm. in the twenty-four hours. The author has used the method in a series of 22 cases of various cardiac affections with signs of myocardial failure. Immediately after the injection a diminution in the number of heart beats, from ten to twenty, occurs. From experiments with mixtures of camphorated oil in serum, defibrinated blood, and whole blood, it is found that the oil is emulsified with the corpuscles. Microscopically the oil may be detected in the circulating blood in the form of very fine droplets.

140. Anaphylactic Deaths in Asthmatics.

HARRIS BROUGHTON (*Journ. Amer. Med. Assoc.*, 1919, lxxiii) reports the case of a man, aged 29, who for ten or twelve years had been subject to asthma when in proximity to horses, and was anxious to have a desensitizing dose of horse serum. One minin of horse serum was given, and was followed within two minutes by a typical attack of asthma, and, in spite of repeated intravenous injections of adrenalin, by death in forty-five minutes. Both the gross and the microscopical appearances at the necropsy were like those of experimental anaphylaxis; there were enormous distension of the lungs, intense passive hyperaemia of the abdominal organs, and scattered subserous haemorrhages, with oedema, degeneration, and necrosis of the epithelial cells of the liver and kidneys. As compared with nine previously reported cases of anaphylactic death in asthma, this is the smallest dose that has proved fatal. Besredka's and other methods of desensitization are at best uncertain; asthmatics should be tested before serum is given by the cutaneous application of serum to see if they are sensitive to horse serum, and it might be advisable to prepare antitoxic serums from animals other than the horse for use in patients sensitive to horse serum. In Walker's analysis of 150 cases of asthma, 20 per cent. were sensitive to horse protein; but of these only 20 per cent., or 4 per cent. of the entire series, were sensitive to horse serum, the remainder reacting to horse-hair protein.

141. Heliotherapy and Blood Pressure.

A. STEVEN (*Zeit. f. Tuberkulose*, November, 1919) has examined the blood pressure of a large number of patients with surgical tuberculosis during heliotherapy, and found that in almost all there was a fall of 10 to 20 mm. Hg during the treatment. In most cases the pressure falls directly after the beginning of the treatment and remains at more or less the same level during the following hours. In the evening the blood pressure rises to its original height or slightly exceeds it. The fall of blood pressure is explained by the hyperaemia of the skin caused by the sun's rays, with subsequent reduction of the pressure in the internal vessels. It is also conceivable that the vascular system as a whole is affected, and that a reduction of tension takes place from the vasomotor centre. As a rule, the fall of blood pressure is accompanied by an increased pulse frequency. Steven therefore recommends that in patients in whose hearts there is little reserve power heliotherapy should be employed with caution.

142. Luminal in Epilepsy.

DERCUM (*Journ. of Nervous and Mental Dis.*, vol. 50, 1919) reported on the use of luminal (phenyl-ethyl-barbituric acid) and sodium luminal in cases of epilepsy. He found that in doses of $\frac{1}{2}$ grains luminal or 2 grains of luminal sodium given at bedtime the effect on seizures was remarkable even in confirmed cases. The seizures were usually promptly inhibited, and in a number of cases there had been abolition of attacks for months or several years. In some cases the drug seemed to be almost a specific. No ill effect was observed and the drug produced no habit or craving. Dercum attested D. Fagors's results in disturbed and excited states. In cases of chorea encouraging results were obtained by 3-grain doses of luminal sodium given hypodermically.

SURGERY.**143. Injuries of the Bladder and Urethra in War.**

STROZZI (*Riv. Osped.*, August 31st, 1919) reports 37 cases of injury of the bladder and 7 of injury of the urethra during the war. Of the bladder injuries 32 were wounds and 5 contusions—18 of these were extraperitoneal and 14 intraperitoneal. The bladder alone was affected in 17 cases and in 20 other adjacent organs were implicated. The chief symptom of bladder injury is haematuria, and this was constantly present; in the majority of cases retention of urine coexisted. It was not always easy to be sure whether the abdominal cavity was penetrated; this depended partly on the emptiness or fullness of the bladder at the time of injury, which determined the position of the peritoneal fold. In 18 cases where laparotomy was performed to settle this question the result was negative in 5 as regards penetration of the abdominal cavity; where suspicion of injury of the rectum arose, digital examination of the rectum was found useful. In extraperitoneal wounds the chief desideratum is to secure free drainage; in a very few cases the catheter in permanence sufficed, but as a rule it was necessary to drain directly through the wound either into a drainage tube or gauze. This could be discarded usually after ten or fifteen days. If attempts are made to drain through a tied-in catheter it is better to suture the bladder wound at once; in 4 cases where this practice was adopted filtration of urine and secondary abscess followed 3 times. Intraperitoneal wounds are far more dangerous; out of 13 cases operated on only 2 were cured. In slight contusions the catheter in permanence usually suffices. As regards urethral injuries, retention of urine is almost always present and great dysuria, with burning pain along the penis, especially at the glans. In complete rupture it is often very difficult to find the two ends, but wherever possible it is advisable to find and unite them; even in partial rupture, when the catheter is left in, urine usually trickles along the side of the catheter.

144. Parotid Fistula.

R. VILLAR (*Gaz. hebdom. d. sci. méd. de Bordeaux*, December 18th, 1919) records a case of parotid fistula in a man, aged 27, following a parotid abscess which was successfully treated by removal of the fistulous track and resection of the auriculo-temporal nerve. A remarkable feature of the case was that after incision of the abscess the wound healed and the fistula did not appear till some weeks later. After the second operation there was no further discharge of saliva, and the wound healed by first intention. As a rule a parotid fistula develops immediately after damage to the tissue of the gland, and a radical cure does not finally result for some time, during which a slight oozing takes place.

145. Surgical Treatment of Acute Empyema following Influenza.

WHITTEMORE (*Boston Med. and Surg. Journ.*, December 11th, 1919) urges early operation by a closed airtight suction technique, under local anaesthesia, followed by the use of Dakin's solution. The success of the method depends largely upon the individual after-care, irrigation with Dakin's solution every two hours when not asleep being carried out. The progress is determined bacteriologically, a smear from the pleural cavity and sinus being taken after the first week. The cavity is considered sterile when not more than one organism to three or four fields is present, or preferably when both cell count and cultures show that no organism is present. The method is based on five main points: Early operation, slow escape of fluid, the prevention of pneumothorax, sterilization of the pleural cavity with Dakin's solution, and suction to get rid of all the fluid. The operation is simple, taking not more than five or six minutes, and can always be done under local anaesthesia without shock and often without pain. In a series of 39 cases, 34 were operated upon by this closed method, and 28 recovered without further operation. Four needed a secondary operation, one had a recurrence, and one case died. This latter improved rapidly after operation, and at the end of ten days appeared well on the road to recovery, and the electrical suction apparatus was started on him and by an error allowed to run for an hour and a half, causing collapse, probably due to an obscure pleural reflex inhibiting cardiac action. Open operation was used in four cases, and should be resorted to only in small encapsulated empyemata when it is essential to be sure of finding the cavity. Of these four, one died in whom the closed operation would probably have been successful, as the patient was thought to be in a better condition for resection than he turned out to

be. In cases where the closed airtight suction operation cannot effect a cure it will often tide over an extreme septic condition for any needful operation to follow later.

146. Sarcoma of the Rectum.

SAPHIR (*New York Med. Journ.*, November 15th, 1919) records a case of large spindle-celled sarcoma of the rectum in a man, aged 65, operated upon to relieve the mechanical obstruction to defaecation and prevent undue straining at stool. About half an inch inside the anus was a pedunculated mass the size of a lemon, covered with mucous membrane, and originating in the sub-mucosa. There were three or four ulcerated patches with indurated edges on its surface from which a copious discharge of blood and mucus occurred. The patient was profoundly anaemic, breathing with difficulty, and complaining of general weakness and palpitation. Owing to his weakened condition a general anaesthetic was contra-indicated, and 0.25 per cent. quinine and urea hydrochloride were administered locally; the growth and surrounding tissues for an inch above and below were resected and four large internal haemorrhoids removed. He stood the operation well, and eight hours later was given a hypodermoclysis of 1,000 c.c.m. normal saline solution, followed in seven hours by transfusion of 500 c.c.m. of blood from a donor. Directly the transfusion began a sudden change in the complexion and activity of the patient took place, his ears and nose and cheeks becoming pink, and from semi-stupor he became talkative and interested in his surroundings. The next morning he ate a hearty breakfast, was placed on full diet, and the day after had a good normal motion, and his bowels have moved regularly since without any trace of blood or mucus.

147. Appendicitis simulated by Mesenteric or Retro-peritoneal Suppuration.

W. GOLDSCHMIDT (*Wien. Klin. Woch.*, January 1st, 1920) points out that though theoretically a differential diagnosis can be made, in actual practice a distinction between acute appendicitis and acute general or local peritonitis caused by disease of the lymph glands or vertebrae is in many cases impossible, especially if the morbid process is situated in the right iliac region. The predominance of the peritoneal symptoms, which are the same irrespective of their etiology, at once suggests the most frequent disease. An error of diagnosis, however, is not always followed by the wrong treatment. The indications for operation in acute peritonitis are the same, whatever the origin of the peritonitis may be. Goldschmidt records two cases in which the diagnosis before operation was appendicitis, and on laparotomy in one case a retro-peritoneal abscess, originating in the lumbar vertebrae, and in the other inflammation of the mesenteric glands, were found. In both cases recovery took place.

148. Treatment of Cavernous Sinus Thrombosis.

GILBERTI (*Il Policlinico*, August 15th, 1919) records a case of thrombo-phlebitis of the right cavernous sinus the result of a furuncle on the upper lip. The face was greatly swollen, the eye closed by oedema of the lids, and the buccal mucosa dotted with vesicles and pustules. The movements of the mandible were limited and painful. The patient was semi-comatose and complained of severe headache. The right eye showed partial external ophthalmoplegia, the pupillary reaction was absent, perception of light lost, and there was alteration of proportion of arteries and veins (no definite mention of engorgement). Next day the patient was worse, with intense throbbing pain in the head and pyrexia. Diagnosis: Thrombo-phlebitis of the cavernous sinus. The patient had four operations at intervals of a few days. First, the right internal jugular vein was exposed, aspirated, and encircled. Three subsequent operations were performed at short intervals for thrombo-phlebitis of the angular and facial veins, the facial vein in the neck, and the same at a different spot. In each instance the vein was incised and cauterized. At the same time anti-staphylococcal serum was injected. The patient finally recovered. Cavernous sinus thrombosis is generally such a disastrous condition that Gilberti is to be congratulated on the courageous manner in which he tackled each new focus as it appeared. He insists on the necessity for surgical interference in these cases, and points out that the prognosis is not necessarily hopeless, especially if the pathways of systemic infection are blocked. In the present case sight was completely destroyed, the papilla presenting signs of post-neuritic atrophy.

OBSTETRICS AND GYNAECOLOGY.

149. Radical Operation for Cancer of Cervix.

COBB (*Journ. Amer. Med. Assoc.*, January 3rd, 1920) has had a cure rate of no less than 57 per cent., judging by the five-year period of immunity from recurrence, with an operative mortality of 11.6 per cent. (in the last 30 cases this was reduced to 6.6 per cent.). The cases were not selected because they were early growths; some of them were, in fact, on the borderland of inoperability; 35 cases were operated upon previous to 1915; 5 died, 10 recurred, and the remaining 20 are still alive and well. His technique is as follows: In early cases the actual cautery is used to sterilize the cervix; in later cases with large fungations and foul discharge a thorough cauterization of the diseased area is done two weeks or more before the hysterectomy. A median incision is made from the symphysis to well above the umbilicus, and good exposure is gained by dividing transversely the anterior sheath of the rectus muscles, or, in the more difficult cases, their tendinous insertions to the pubis. Cobb regards the dissection and handling of the ureters, freeing them completely from the parametrial tissues, as the most important technical part of the operation; they should be so free that they may be lifted up and out of the pelvis. After the ovarian arteries have been ligated and the broad ligaments opened, the peritoneum being split well above the bifurcation of the iliac arteries, the ureters are exposed lying in their sheaths on the inner or posterior layers of the broad ligaments. The internal iliac arteries are then ligated, after which the posterior layers of the broad ligaments are incised below and parallel to the ureter, midway between the iliac arteries and the uterus, and through this slit tapes are passed, traction on which rolls a protecting cuff of peritoneum around the ureters. With such protection considerable traction can safely be made on the ureter. After the uterus and upper half of the vagina have been freed from the bladder and rectum, the ureters are lifted well out of the way, and the lateral parametrium from above the internal os well down the sides of the vagina is removed with scissors as close to the pelvic wall as possible. Cobb apparently removes the regional glands only when enlarged and palpable; in most of the cases where he removed the iliac and obturator glands they were found not to be malignant, but in those instances where they were malignant a cure was not obtained. The author does not seem to have appreciated the lesson that if a set of lymph glands are malignant the surgeon ought to remove the chain higher up; he ought to be at least a chain of glands ahead of his visible disease. Still, the results are exceptionally promising.

150. Rupture of Uterus with Peritoneal Encystment.

BLAKELEY (*Surg., Gyn. and Obstet.*, January, 1920) records a case in which, after numerous attempts at producing abortion, a traumatic rupture of the uterus occurred, accompanied by extreme abdominal pain and profuse flow. On admission to hospital the patient had a temperature of 101° and a pulse of 110, a hard distended tender abdomen, vomiting and retention of the urine—in fact, the signs of severe spreading peritonitis. She was at the point of death for a week, during which time she had been treated with antistreptococcal serum. By examination a hard tender mass was found in the lower abdomen, reaching to the level of the umbilicus, with the greatest pain and tenderness on the right side. A fortnight after the rupture of the uterus left femoral thrombosis and a profuse foul vaginal discharge occurred. At the end of a month the condition had steadily improved, though the vaginal discharge persisted and was found to come from a retrocervical sinus. X ray examination gave no information. After the lapse of six months the sinus was opened up, and revealed a thick-walled cavity with smooth interior lining containing, amongst debris, a fetal skeleton.

151. Complicated Twin Pregnancy.

L. HUGUET (*Rev. de med. y cir. de la Habana*, December 25th, 1919) records a case of twin pregnancy in a woman aged 36, who had borne seven other children by normal labour. The case was remarkable for placenta praevia with lateral insertion, a large quantity of albumin in the urine, and oedema of the legs and abdominal wall. Labour was induced in the eighth month, and the first fetus was delivered alive by version. The second was born dead. A mild attack of puerperal septicaemia was successfully treated by intrauterine douches of hydrogen peroxide and injections of antistreptococcal serum.

PATHOLOGY.

152. Blood Changes in T.N.T. Poisoning.

MINOT (*Journ. Indust. Hygiene*, October, 1919) finds that blood abnormalities are frequent amongst workers in trinitrotoluene factories. Of the individuals examined no less than 83 per cent. showed polychromatophilic cells in at least one in every six or seven oil-immersion fields. Altered haemoglobin, probably in the nature of varying mixtures of methaemoglobin and nitrous oxide haemoglobin, occurred in these individuals. The total red-cell abnormalities usually ran parallel to the degree of symptoms, though in some cases marked symptoms occurred with slight blood changes. These changes, in addition to alteration of the haemoglobin, are of at least two types—destructive action of the red cells with increased marrow activity, later followed in some instances by marrow inactivity. The finding of fragmented cells is important; all cases with large numbers were distinctly ill. With minimal amounts of T.N.T. entering the system there may be increased blood counts. When red cell destruction exceeds formation, anaemia ensues, and this is accompanied by polychromatophilia, fine stippling, reticulated cells, variations in size of cells, and elevated white counts with increases of polymorphonuclears, and probably by frequent increases of eosinophils to over 5 per cent. The evidence of marrow failure is first seen in relative increases of lymphocytes with absolute diminution of the polynuclears. Lymphocytosis by itself is to be regarded as a distinct abnormality, but is not necessarily of serious import unless there is a leucopenia. Further failure of the bone marrow is to be found in the diminution of the platelets. Blood changes of the more marked degrees indicate too severe a poisoning for an individual to be allowed to continue his given type of work. The author is careful to point out that blood examinations should not be the only criteria on which to decide.

153. Chronic Enlargement of the Kidneys in Chronic Malaria.

A. NAZARI (*Riv. Osped.*, October 15th–31st, 1919) shows that in addition to enlargement of the liver and spleen in chronic malaria the kidneys also tend to increase in size and weight. He records the notes of ten cases showing that the weight of these organs may be more than double in chronic malaria. The enlargement of the kidneys, like that of the liver and spleen, varies from one individual to another, but bears no relation to the size of either of these organs. The pathogenesis of the enlargement and the anatomical and histological features are the same. The kidneys, though increased in size, preserve their normal shape, and their consistency is not increased. The capsule can be stripped readily from the outer surface, which is smooth and of normal colour. On section, apart from increase in size of the various structures, there are no naked-eye changes of any kind. Microscopical examination merely shows a simple hypertrophy of the glandular tissue without any marked increase of the connective tissue or much dilatation of the vessels.

154. Association of Cancer and Tuberculosis.

HOFFMANN (*Deut. med. Woch.*, July, 1919) reports a case of tuberculosis developing in a recurrent cutaneous carcinoma. Histological examination revealed numerous characteristic giant cells, and a careful bacteriological search ended in the finding of the tubercle bacillus. Two neighbouring lymphatic glands were examined; one showed carcinomatous cells only, the other signs of old tuberculosis. Hoffmann interprets these findings as indicating the infection of the carcinoma by a latent tuberculosis in the glands, as no sign of tuberculosis was found in the primary growth. The author then raises the point of the possible association of tuberculosis and cancer. He considers that these pathological processes may coexist in one of three ways. In the first place, they may be present absolutely independently—for example, cancer of the stomach and pulmonary tuberculosis. Next, either tuberculosis or cancer may so lower the resistance of a patient that the other pathological process is more easily established or lighted up—for example, a cancer patient falls an easy prey to latent or previously benign tuberculosis. Thirdly, there may be a local secondary tuberculous infection of a carcinomatous growth, or, on the other hand, cancerous change may develop in old tuberculous lesions. Of these last two, the second is much the commoner. A good example is lupus carcinoma, or, again, the malignant changes not infrequently found in the multiple tuberculous ulcers of the intestine.

155. Growth Forms of the Pfeiffer Bacillus.

WADE and MANALANG (*Journ. Exper. Med.*, January 1st, 1920) are of opinion that the familiar Pfeiffer organism is but a simple form of an organism capable of complex development. Working with three typical strains of the bacillus, obtained at autopsies and twice subcultured, they found that by cultivating them in a specially prepared haemoglobin broth medium and on hot blood agar alternately they abandoned the usual bacillary form and grew as a frank fungus, morphologically of the *Discomyces* type. With variations of the medium they showed sometimes less modification, the most striking feature then being the production of conidiospores—bodies of a type not found in true bacteria. It is suggested that the experimental work with Pfeiffer's bacillus has hitherto been negative, as far as the production of true clinical influenza is concerned, probably because it has been carried out with the bacillary form exclusively, and that it may prove that the capabilities of the organism in another phase are different. It is possible that many bacteria have a wide range of morphological development, from the minute filter-passing extreme on the one side to the highly developed fungus stage on the other side of the usual mean, and that it may be the earliest stage which is pathogenic. We are familiar with the hypothesis in this country, but the difficulties of being certain of starting with a pure culture of any organism are very great.

156. Detection and Treatment of Pneumococcus Carriers.

DURING the winter of 1917–18 SAILER, HALL, WILSON, and MCCOY (*Arch. Int. Med.*, Chicago, 1919, xxiv) observed 1,311 cases of pneumonia, with 275 deaths, at the base hospital at Camp Wheeler, Ga., and from a survey of the tents as to the incidence of the cases found evidence strongly supporting the view that carriers play an important part in the spread of the disease. It therefore followed that if the number of carriers of virulent pneumococci in a command could be reduced there should be a corresponding fall in the incidence of pneumonia. The problem accordingly consisted in (1) the discovery of carriers, and (2) devising a means of rendering them innocuous. The recognized technique of detecting pneumococci by inoculation of mice not appearing applicable to large numbers of men, a method based on the fact that the pneumococcus develops a green colour when grown on a blood-agar plate, which enables the colonies to be picked out and typed by Avery's method, was employed. Swabs were taken from the nasopharynx of 700 men, and 111 carriers, or 16 per cent., were detected, 24 per cent. of the carriers, or 3 per cent. of the 700 men examined, showing the so-called fixed types of pneumococci. The authors believe that the contacts of pneumonic cases should be submitted to culture in the same way as contacts of cerebro-spinal fever, and that carriers of the same type of pneumococci as that causing the prevalent pneumonia should undergo vigorous antiseptic treatment, and such measures of isolation as the conditions permit. The carriers were isolated in the hospital, and various methods of disinfection tested on groups of the men, cultures being taken from time to time, and three negatives justifying discharge. Sprays and applications of eleven antiseptics were employed; oily solutions of carbolic acid and iodine, and dichloramine-T dissolved in eucalyptol gave good results; but chloramine-T, chlorine gas, and quinine were useless. The authors advocate this procedure in the presence of epidemics of pneumonia and of diseases such as influenza and measles complicated by pneumonia.

157. Leucocytes in Malaria.

STOSS (*Berl. klin. Woch.*, December 1st, 1919) investigated the quantitative and qualitative variations in the blood leucocytes in 53 cases of chronic malaria. In the majority of cases there was an increase in the total number of leucocytes. One of the most constant observations was an absolute and relative increase in the number of large hyaline leucocytes, commencing the day before an attack of fever. In patients who suffered from a series of attacks the neutrophils became temporarily diminished, but a slight neutrophile leucocytosis followed, usually two days after the last attack of fever. A slight absolute lymphocytosis occurred after attacks of fever, but did not last more than a week. Stoss discusses the somewhat contradictory results obtained by various observers in the leucocytosis of malaria. They may depend on observations made in cases of different duration and at different phases in the disease.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

158. Trench Nephritis.

BIANCHI (*Il Morgagni*, December 15th, 1919), discussing trench nephritis at the Medical Congress in Trieste, said all the armies suffered, and the longer the war lasted the more they suffered, which suggests that there was something in the prolonged strain and unusual conditions of war which predisposed soldiers to nephritis. Strictly speaking, trench nephritis is not a new disease, not a special form of nephritis peculiar to war, nor possessing well defined clinical and anatomical characters—it is a nephritis occurring in soldiers at war. The usual type was an acute diffuse glomerulo-nephritis, resembling a post-scarlatinal nephritis. No constant cause could be found and still less any specific germ. Some mild infective condition, perhaps most commonly a streptococcal infection, seemed to be a necessary condition for the development of the disease. Spirochaetes were frequently found as concomitant saprophytes. Clinically it was characterized by sudden onset, fever of short duration, early oedema, mostly confined to the face and limbs, dyspnoea and haematuria. Albuminuria was constant, but varied in amount. High pulse tension was slight, and an early symptom. The renal function was relatively only slightly affected. The immediate prognosis was almost always favourable and the mortality very low. On the other hand, the ultimate prognosis should be reserved, not only for fear of relapses, or persistent albuminuria, but chiefly lest the acute nephritis should become chronic, which happened in about 19 per cent. of the cases. How far cure is established can only be ascertained with certainty by testing the functional capacity of the kidney by the so-called concentration test, coupled with the elimination of water. More examination of the urine is not sufficient, as this leads to both negative and positive errors. The author also draws attention to the cases of nephritis which characterized the recent pandemic of influenza, of which there were two main types: (1) An acute glomerular nephritis, with scanty albuminuria, haematuria, cylindruria and renal desquamation; this type was almost always fatal. (2) Degenerative renal lesions, with much albumin, no haematuria, no cylindruria, hyaline casts, of prolonged course.

159. Pulmonary Fibrosis after Gassing: X Ray Evidence.

DENNIS (*Med. Journ. of Australia*, November 1st, 1919) records the x-ray findings in pulmonary fibrosis after gassing. No gross lesion was present and the apices lighted up evenly, but the whole chest showed diminished translucency. The diaphragmatic movement was greatly restricted on deep inspiration, and often absent, except on coughing, when free movement took place, proving that the restriction was functional. The hilus shadows were usually more evident than normally, often presenting patchiness due to glandular enlargement. The recognition of the fact that the condition is not a functional one, but is accompanied by definite lung changes, is of importance from the pensions department point of view, and because of the necessity of treating such cases under the most favourable climatic and occupational conditions.

160. Vaccination against Influenza.

STEWART (*Med. Record*, October 25th, 1919) considers the present position of vaccination against influenza. Whether the Pfeiffer bacillus is the primary infective agent or merely plays a secondary part in the complications is not settled, but the group of bacteria mainly responsible for the pneumonias and high mortality consists of the *B. influenzae* of Pfeiffer, different types of the pneumococcus, and varieties of the streptococcus, the *Staphylococcus albus* and *aureus*, and the *Micrococcus catarrhalis*. This group of bacteria is responsible for various infectious respiratory diseases—for example, coryza, cold in the head, influenza, tonsillitis, pneumonitis, lobar pneumonia, bronchopneumonia. From evidence accumulated during the war in the influenza epidemic in the army, the navy, great industrial institutions, and in private practice, vaccination against these respiratory diseases has proved of great value both for prevention and treatment. A highly multivalent mixed vaccine from numerous virulent strains

of all the bacteria of the group should be used, as it has been proved to be of greater efficacy and less liable to failure than a vaccine prepared from the Pfeiffer bacillus alone, or one from a combination of this bacillus with the pneumococcus.

161. The Treatment of Pylorospasm.

WITH an experience of twenty-four cases of pylorospasm, only one of which terminated fatally, A. LICHTENSTEIN (*Hygiea*, July 31st, 1919) deprecates operative treatment. All but five of his patients were males, and practically as many were breast-fed as artificially fed. He does not accept as true the common view that the subjects of pylorospasm are usually breast-fed, and he criticizes the teaching—a corollary to this view—that artificial feeding is indicated. But he admits the need for readjusting breast-feeding, and he favours the principle of frequent small feeds at short intervals rather than that of big feeds at long intervals. Thus he recommends eight to twelve feeds, each of 25 to 75 grams, and as the vomiting becomes less frequent, he lengthens the intervals and increases the quantities of the feeds. In some cases artificial feeding with human milk seemed to be better tolerated than sucking, which, the author suggests, may provoke pylorospasm. He attaches great importance to the early replacement of fluid lost by vomiting. He gives Ringer's solution, 100 to 200 grams being introduced into the rectum once or twice a day by the drop method. Still more effective is the subcutaneous injection of this solution once or twice a day in quantities of 100 to 150 grams. Not only was this treatment instituted early, but it was often kept up daily for several weeks. No ill effects resulted from this treatment, which was conducted on strictly aseptic lines. Another principle to which the author attaches importance is the consistent isolation of these patients, for the mortality of pylorospasm, variously estimated at 20 to 87 per cent., is largely due to intercurrent diseases, such as influenza, which are easily contracted by these debilitated infants.

162. A Familial Epidemic of Catarrhal Jaundice.

E. CHABROL and J. DUMONT (*Paris méd.*, January 10th, 1920) report three cases in sisters aged 8½, 11½, and 10 years, who in the course of three weeks successively developed a mild attack of catarrhal jaundice. Although spirochaetes were found in the urine in two cases, inoculation of guinea-pigs and the serum agglutination test were negative, so that spirochaetosis ictero-haemorrhagica could be excluded. The patients' serum was then tested with the various micro-organisms which may give rise to jaundice—namely, typhoid and paratyphoid bacilli, *B. coli*, and Gaertner's bacillus, but dilutions in 1 in 50 were negative in each case. Similar cases of familial icterus have been described by Merklen, and the writers have also observed two brothers, aged 10 and 11 years respectively, who developed jaundice within a fortnight of one another.

163. Angina Pectoris and Syphilis.

FROM a study of 100 cases of true angina pectoris GALLAVARDIN (*Lyon méd.*, January 10th, 1920) comes to the following conclusions: (1) True angina pectoris is incomparably more frequent in men than in women, 93 of his cases being in men, and only 7 in women. It is also much commoner in private than in hospital practice, only two of the cases being observed in hospital patients. (2) As regards age, the affection may, in exceptional cases (4 per cent.), occur below 40, 24 per cent. were under 50, 47 per cent. between 50 and 60, and 29 per cent. over 60. (3) Syphilis, though a very important cause of angina pectoris, is far from being the only factor. In 91 cases in which the presence of syphilis could be thoroughly investigated syphilis was certain in 32 per cent. and doubtful in 5 per cent., while there was no evidence of it in 63 per cent. Even allowing for errors it did not appear likely that syphilitic infection was responsible for more than half the cases of true angina pectoris. On the other hand, out of 14 cases in which angina pectoris was associated with aortic incompetence syphilis was certain in 13. Gallavardin concludes that, though true angina pectoris is not due to syphilis in more than half the cases, when associated with aortic incompetence it is almost always of syphilitic origin.

164. **Vaccine-therapy during the War.**

GASTAMINI (*Il Morgagni*, December 15th, 1919) draws the following conclusions from a review of the experience gained during the war: In prophylaxis the best vaccines are those which lend themselves to exact dosage and keep well. The efficacy of so-called atoxic (sensitized) vaccines has not been established. Lipo-vaccines merit further trial. In some infections polyvalent vaccines should be given the preference. The sero-agglutinant test in suspected typhoid, both in the vaccinated and in the unvaccinated, still retains its value. In estimating the state of immunity of an individual the bacteriolytic antibodies are more reliable than the agglutinins. The method of introduction of the vaccine (subcutaneous or intravenous) is almost more important than the quality or quantity. The intravenous route gives the best results. Bad results are rare if the usual technique is followed. Since the immunity conferred by vaccination is usually only temporary, revaccination is advisable. It is in typhoid that the statistics are largest, and the results obtained show that there is a reduction both in morbidity and in mortality amongst the vaccinated as compared with the unvaccinated. In vaccine-therapy the intravenous route often gives brilliant results, but it is not entirely free from risk. It is better, as a rule (at any rate in typhoid), to use a heterologous vaccine, as it is less toxic, more constant in its action, and easily dosed; vaccine-therapy does not prevent complications or relapses. In typhoid it sometimes brings about a rapid and definite cure (in about 30 per cent. of the cases with a homologous vaccine, and in 40 per cent. with a heterologous vaccine); reduces the mortality (from 30 to 5 per cent., from 12 to 5 per cent., from 9.7 to 3.9 per cent., from 12.3 to 2.9 per cent., from 22 to 2 per cent., according to different authors). The exact method of the cure by vaccine-therapy is not yet quite clear; probably it stimulates all those specific means by which the organism tries to protect itself against infections.

165. **Influenza in Children.**

DURING the epidemic of influenza in the autumn of 1918 about 200 children were admitted into the Children's Hospital in Rome; whilst the influenza was raging, measles, scarlet fever, and diphtheria seemed to disappear. MANCINI (*Il Policlinico*, July 20th, 1919) gives statistics of some 200 cases which died during the epidemic and discusses the facts found at the *post-mortem* examination. No case died from influenza pure and simple, but from some complication; encephalitis, meningitis and myelitis were very rarely seen. He refers to a possible case of encephalitis lethargica seen in private practice. Bronchopneumonia was the commonest cause of death, and the author describes six chief varieties: (1) A small nodular form resembling miliary tuberculosis; (2) a large nodular type; (3) pseudo-lobar; (4) haemorrhagic; (5) suppurative; (6) complicated with pleurisy, pericarditis, or endocarditis. There are many points of likeness between the bronchopneumonia of influenza and that of measles, but bronchiectasis is rare after influenzal bronchopneumonia. Otitis was common, but parotitis rare. The bronchopneumonia was frequently associated with or followed by colitis and other gastro-intestinal disturbances; about half the children showed signs of gastro-enteritis. Contrary to what one might expect, a certain degree of antagonism between influenzal pneumonia and tuberculosis has been described, but Mancini found that 30 to 35 per cent. of the children dying of influenzal bronchopneumonia presented preceding tuberculous lesions, especially in the hilus glands. The spleen was generally swollen and with softish pulp.

166. **Raynaud's Disease with Suprarenal Insufficiency.**

K. FABER (*Ugeskrift for Læger*, December 25th, 1919) records the case of a married woman, aged 47, who was childless and who had ceased to menstruate three years earlier. About seven months before admission to hospital she noticed that her hands and fingers easily became cold and numb, and that their colour changed from great pallor to striking cyanosis. This condition would last for a quarter of an hour to two hours, and could be banished by warmth. A little later the feet showed the same condition. It became steadily worse and was associated with increasingly severe pain. Small whitlows appeared on her fingers and herpes zoster broke out on her back and abdomen. On her admission to hospital in March, 1919, her nose was also cyanosed and the tip of one finger was gangrenous. The breasts and linea alba were slightly pigmented. Wassermann's reaction and an x-ray examination of the pituitary body were negative. After a month in hospital she began to suffer from nausea and vomiting, the temperature became subfebrile, and she felt very weak.

The pigmentation of the skin became more intense and widespread, and a trace of albumin appeared in the urine. The blood pressure was 155-120, the haemoglobin was 78 per cent., and the red cells numbered $3\frac{1}{2}$ millions. Death occurred in April after signs of restlessness and mental disorder. The necropsy showed the left suprarenal to be normal, but the right suprarenal was slightly enlarged, and, under the microscope, most of the gland was seen to be the seat of caseous degeneration. Outside the definitely caseous parts there were scattered typical tubercles. The thyroid and the pituitary body were normal, and the thymus was represented only by a little fatty tissue. The author notes as remarkable that disease of only one suprarenal was sufficient to provoke Addison's disease.

167. **Diphtheria in the Newborn.**

F. LONNE (*Med. Klinik*, November 23rd, 1919) states that diphtheria is a relatively common occurrence among the newborn, though it is often not recognized as such owing to the frequent absence of symptoms. In the course of the last ten years Lonne observed 35 cases of nasal or umbilical diphtheria, or both combined, among newborn infants in the Göttingen University obstetrical department, 20 of whom showed clinical symptoms and 15 none at all; 3 cases, or 8.6 per cent., were fatal. The prognosis of diphtheria in the newborn is good except when complications occur, such as bronchitis, bronchopneumonia, influenza, otitis, or nutritional disturbance, when it is usually unfavourable. Treatment consists in the intramuscular injection of 2,000 units of antitoxin and instillations of adrenalin in twice as much boracic lotion in nasal diphtheria, and the application of a mild disinfectant ointment when the umbilicus is affected.

168. **Blackwater Fever.**

ZLOCISTI (*Deut. Klin. Woch.*, December 8th, 1919) relates a case of a soldier, 33 years of age, who developed a first attack of malaria after seven weeks' residence in Anatolia in spite of regular prophylactic doses of quinine. When admitted to hospital three weeks after the onset of the illness he already had severe haemoglobinuria, and his blood contained enormous numbers of malignant malarial amoebulae with a few crescents. In spite of the urinary findings he was treated with vigorous doses of quinine, and in four days the symptoms disappeared and he made a good recovery. Zlocisti regards the case as one of blackwater fever, the cause of which was excessive destruction of red blood corpuscles by malarial infection. The exposure of the patient in a malarial district was remarkably brief for the development of this type of disease, and there is good evidence that quinine was not the causal agent.

SURGERY.

169. **Thoracic Fistulae.**

LILIENTHAL (*Ann. Surg.*, 1919, 70) describes his operation, which he calls "major non-collapsing thoracoplasty," for the treatment of chronic empyema. It is now well recognized that the operations of Schede and Estlander are unphysiological, being based upon an incorrect interpretation of the lung condition present in the ordinary unhealed empyema. It has long been known that the cause of the persistent cavity is the inability of the lung to expand. But it has only recently been widely understood that if the lung is sufficiently freed it will, as a rule, obliterate the cavity. Delorme stumbled on this truth and devised his sanguinary decortication operation. Schede's and Estlander's operations have their rationale in the belief that as the lung is incapable of expansion the chest wall must be collapsed upon the lung. Anyone who has freed the adhesions bounding a chronic empyema cavity knows that the apparently cartilaginous lung becomes soft and yielding the moment the adhesions are free, and that a decortication of thickened pleura is hardly necessary. The freeing of these limiting adhesions for the purpose of lung mobilization is open to the grave objection that it tends to spread infection into hitherto intact pleura. Lilienthal's operation avoids this. He uses either intrapleural gas or air bubbled through either as anaesthetic. He performs the ordinary wide thoracotomy, and spreads the ribs until the whole of the empyema cavity can be inspected. But instead of dividing the adhesions limiting this space, he incises the visceral pleura from top to bottom, and if necessary from side to side as well in crucial fashion. The lung can then be seen expanding through the cut pleura, and if the intrapulmonary pressure be increased the cavity may be entirely obliterated. This

expansion can be brought about, if ether is being given by the nasal tube, by the simple means of closing the patient's mouth and free nostril and increasing the inflow. As soon as the pressure is reduced—and of course it can only be kept up safely for a few moments—the lung collapses again; but the value of the step is that it shows whether the pleural incisions have been extensive enough. When satisfactory expansion is arrived at, the chest is closed with drainage through the original fistula. Expansion exercises and Carrel-Dakin instillation are instituted within twenty-four hours. Of ten patients operated upon by this technique six were healed in three weeks, the others convalescent at the time of writing. In a further series of thirteen cases there were two deaths, both from sepsis, but no detailed clinical records of any of the patients are given.

170. Parts of the Duodenum.

THE division of the duodenum into four parts, generally adopted, has not much to recommend it. VILLEMEN (*C. R. Soc. Biol.*, December 27th, 1919), as the result of anatomical studies in man and animals, shows that in those mammals in which the pancreatic and biliary ducts enter at the same level the duodenum may be divided into two parts. The portion superior to the ducts is dilated, has a thicker wall, and receives its blood supply exclusively from divisions of the hepatic artery, and it contains Brunner's glands. The inferior portion has the same morphological characters as the jejunum, and gets its blood supply from branches of the superior mesenteric artery, whilst it does not contain Brunner's glands.

171. Urethral Polypus.

G. O. E. LIGNAC (*Nederl. Tijdschr. v. Geneesk.*, December 27th, 1919) reports a case in a boy, aged 9 years, who presented a mushroom-shaped growth protruding from the urinary meatus. The patient suffered from frequent erections of long duration, and difficulty in micturition. On removal the polyp was found to be a fibroma. Death took place from septicaemia about a month after the operation.

172. Ether as an Anaesthetic for Short Operations.

TADDEI (*Rif. Med.*, November 1st, 1919) draws attention to a method of using ether for short operations, painful dressings, etc., which he has used successfully over 3,000 times. The method consists in the immediate application of not less than 50 grams of ether on a simple mask, applied firmly to the face so as to avoid entry of air. This makes the patient catch his breath, go red in the face, and perhaps slightly cyanotic. The operation or dressing should be started at once as the patient is analgesic in this early stage. As a rule, anaesthesia of this type lasts thirty to sixty seconds, which is sufficient for the purpose in the class of case the author is considering; if necessary, it can be prolonged by giving the ether in the ordinary way. No bad results have followed the use of ether in this way; it can be repeated several times—for example, in some cases it was given by this method fifteen times in 15 to 30 days. The author believes it acts as a sort of "psychic block," all the usual routes of painful sensation being temporarily blocked by the apnoea and respiratory shock caused by the sudden dosage of ether, just as a powerful emotion cuts off for the time painful feelings.

173. Rupture of the Biceps by Direct Force.

M. SCHÜLEIN (*Muench. med. Woch.*, November 21st, 1919) notes that subcutaneous rupture of the biceps by indirect force, as in the act of lifting a heavy load, is not very rare. In such cases the tendon of origin or insertion breaks, not the muscle itself. A case such as the following is exceedingly rare: A shunter aged 18 was struck by the platform of a railway carriage, which fell on his chest and right arm. He could not move this arm, which at once became much swollen. Examination soon after the accident showed that the arm was much swollen and very limp, but no injury to the bones or joints could be found. The skin also was intact, and the muscles seemed to have escaped injury. The patient was accordingly discharged from hospital a few days later. Eight months after the accident he was examined by the author, who found that when the flexors of the forearm were thrown into action a transverse furrow could be felt in the middle of the biceps. The overlying skin was intact and not adherent to the structures it covered. The range of movements about the elbow and shoulder joints was unimpaired, but the flexor function of the biceps was much weakened. The patient, who refused operative treatment, was recommended compensation equivalent to 15 to 20 per cent. of the maximum.

174. Congenital Cysts of the Neck.

ACCORDING to C. ROMANO (*La Pediatria*, December, 1919), who records six illustrative cases in children and adults, compound or multilocular serous cysts of the neck occurring in intrauterine life are more or less well developed at birth, and sometimes of an enormous size; whereas dermoid cysts do not appear until some years afterwards, as a rule not before puberty or adolescence, and sometimes even later. The site of predilection for serous cysts is the left side of the neck, where they develop often in the subcutaneous tissue and sometimes in the subaponeurotic tissue. As a rule they do not cause any inconvenience. The only rational treatment is removal, the operation usually not offering any great difficulties. In the case of multilocular serous cysts, extirpation is often impossible owing to their size and adhesions with the tissue and neighbouring organs.

OBSTETRICS AND GYNAECOLOGY.

175. Sterility.

COUDERT (*Journ. de Méd.*, December 10th, 1919) wisely points out that, as it is the man who is at fault in a quarter or a third of sterile marriages, it is necessary to have a microscopic examination of the spermatic fluid of the husband before embarking on what may prove to be a long course of treatment of the wife. The causes of sterility in the female are divisible into two main groups—septic and mechanical. Of the former, gonorrhoea plays far the most important part; it is in fact the chief cause of sterility. Localized in the testicle or epididymis of the male the gonococcus produces a disappearance or a diminution in number and vitality of the spermatozoa. In the female it lodges in the cervical canal, often ascending to the body, tubes, and peritoneal cellular tissue, in rarer cases constituting an extremely virulent infection with rapid supuration. However extensively the body of the uterus may be affected at the beginning, the disease generally tends to locate itself in the endocervix and causes sterility by producing an alteration of the mucous membrane whilst the purulent secretion and the resulting acidity arrest the access of the spermatozoa. Chronic gonorrhoeal cervicitis is insidious in its onset and is characterized by very abundant leucorrhoea, thick yellowish mucus (in which, except after menstruation, it is generally impossible to detect gonococci), swelling of the cervix, and ectropion of mucous membrane. Reinfection of the husband, and again of the wife after she is cured, constitute a common vicious circle. In treatment the author recommends gentle swabbing of the endocervix with silver nitrate, protargol, picric acid or formalin, avoiding the curette. In graver cases cauterization should be resorted to, four or five cauterizations at intervals of ten to fifteen days being generally sufficient. Sterility due to mechanical causes, such as malformations of the Müllerian ducts or infantile uterus, is much rarer. In stenosis Coudert advises dilatation by means of graduated tents, commencing the treatment two or three days after menstruation. Flexions by themselves are not responsible for sterility; here the responsible agent is the uterine or peritoneal inflammation, and to this the physician must address himself. Gynaecological uterine massage may work wonders in freeing a uterus from its adhesions. Tumours, especially uterine polypi, are not uncommon bars to conception.

176. Observations on 300 Cases of Sterility.

A. BRUN (*Il Policlinico*, Sez. Prat., December 7th, 1919) gives the following statistics of 300 cases of sterility observed by him at Trieste during the last ten years. Two hundred and thirty cases were examples of primary sterility—that is, the woman had never given birth to a child or had a miscarriage, and 70 cases were examples of secondary sterility following a period in which births or abortions had taken place. The cases of primary sterility were divided into four groups: I. Normal genital organs, 13 cases. II. Congenital defects, 107 cases: (1) deficient ovarian function with anaemia and uterine flaccidity, 9 cases; (2) deficient ovarian function with obesity, 13 cases; (3) severe degree of infantile uterus, 35 cases; (4) mild degree of infantile uterus, 10 cases; (5) rigid ante-flexion of the uterus, 21 cases; (6) retroflexion or retroversion of the normal uterus, 8 cases; (7) stenosis of the external os, 6 cases. III. Inflammatory processes, 102 cases: (1) chronic inflammation of the adnexa, 53 cases; (2) chronic perimetritis, 23 cases; (3) chronic perimetritis with fixation of the retroverted uterus, 11 cases; (4) granular vaginitis, 4 cases; (5) endometritis, metritis, and

catarrh of the cervix with erosions, 11 cases. IV. Fibroids, 8 cases. The cases of secondary sterility were divided into seven groups: I. Normal genitalia, 1 case. II. Hyperinvolution of the uterus, 3 cases. III. Deficient ovarian function from lead poisoning, 1 case. IV. Scarring of the uterine orifice after plastiooperation on the cervix, 5 cases. V. Chronic inflammation of the adnexa and perimetritis, 44 cases. VI. Metritis, endometritis, and cervical metritis, 14 cases. VII. Fibroids, 2 cases. These statistics give different results from those obtained by Bunn, who found two-thirds of his cases of primary sterility were due to an infantile uterus, whereas less than half of Brun's cases were due to this cause. The great frequency of inflammatory processes was doubtless due to the prevalence of gonorrhoea. Out of 102 cases the gonorrhoeal origin could be regarded as certain in 23, and as very probable in 64.

PATHOLOGY.

177. Atypical Dysentery Bacilli.

DUMAS (*C. R. Soc. Biol.*, December 27th, 1919) points out that there is no serum reaction that allows one to differentiate true dysentery bacilli from the atypical strains found during the course of an illness. Several observers have relied on the results of subcutaneous injections of bouillon cultures in doses of 10 to 15 c.c.m., and if a local abscess, from which the rabbit dies, is produced they have judged the particular organism to be pathogenic. Dumas thinks that the only way to establish the dysenterigenic rôle of an organism is to produce experimentally the same lesions as are found in the human subject. He makes the cultures in Martin's peptone broth, arranging the alkalinity so that the acidity of the medium after ten days' incubation is neutralized by a certain quantity of soda, and filters through a Chamberland F candle at moderate pressure. The filtrate injected subcutaneously into rabbits failed to produce any pathological condition. He therefore concludes that these atypical dysentery bacilli are avirulent and non-toxic. There is no doubt that such bacilli can be found in dysenteric muco-colitis in association with true dysentery bacilli, but the author says that they appear late, about the fourth day of the illness, and are to be regarded merely as saprophytes of the large intestine. In the course of bacillary dysentery a new intestinal flora appears at the ulcerated parts about the fifth day. It is a flora of secondary infection comparable to that found in open infected wounds, but it plays no part in the etiology of the disease. In his opinion the reason why these atypical bacilli have so often been held to be the cause of dysenteries is because the search for the authentic pathogenic germs (Shiga or Flexner) has been instituted too late in the disease, and they have therefore not been detected in the plates.

178. A Malignant Chordoma.

TUFFIER, GÉRY, and VIGNES (*Bull. de la Soc. Anat. de Paris*, No. 11, October-November, 1919) report one of those rare cases of tumours arising from remains of the notochord. The patient, a woman of 55, complaining of pain and a sensation of dragging in the anal region, was found by rectal examination to have a slightly movable, regular, non-fluctuating tumour in the middle line between the coccyx and the anus. It was not adherent to the surroundings. At operation a tumour of purple colour, studded with haemorrhages and encapsulated, was easily removed. It was of the size of a small orange. On section a gelatinous fluid escaped from the surface. Microscopically it consisted of strands of fibrous tissue between which lay masses of cells without intercellular connective tissue set in a granular or fibrillar ground substance giving the reactions of mucin. The outstanding characteristic of the cells was the almost universal occurrence in them of vacuoles, and there was an extreme variation in the size of the cells. In some cells the nucleus alone was several times larger than entire cells in the neighbourhood. The vacuoles existed not only in the protoplasm but sometimes also in the nucleus. Here and there the vacuoles showed the presence of mucin. Blood channels, few in number, seemed to be composed of tumour cells alone. Multi-nucleated cells with various nuclear degenerations were common. Mitotic figures were absent, the cells apparently dividing by direct nuclear division. The tumour recurred within a year of removal, but the second operation was not followed by recurrence. The most frequent site of these rare tumours is the sphenoid-occipital synchondrosis, which corresponds morphologically to an intervertebral

disc, and the next commonest situation is the sacro-coccygeal region. Undoubtedly derived from persistent remains of the notochord, they may arise between the bones in the intervertebral discs, or they may be wholly in front of the vertebrae. They are generally simple tumours, but in a very few cases, as in this one, they are locally malignant; no metastases have ever been described.

179. New Method for Staining Blood Films.

McJUNKIN (*Journ. Amer. Med. Assoc.*, January 3rd, 1920) describes a method by which the leucocytic granules are brought out as well as the polychrome staining of the remainder of the blood elements. It was found that methyl alcohol of 80 per cent. strength, made by adding 5 c.c.m. of distilled water to 20 c.c.m. of Merck reagent methyl alcohol, preserves the leucocytic granulation so that smears fixed in it may be stained by Wright's, Leishman's, or other polychrome stain, and the success of McJunkin's benzidine-polychrome method rests largely on this observation. He proceeds as follows: On the cover-glass film he places 4 drops of 80 per cent. methyl alcohol, to 25 c.c.m. of which there has been added 100 mg. of benzidine and 1 drop of hydrogen peroxide, and allows this to act for thirty seconds; this is diluted with 8 drops of distilled water, and the diluted solution is left for four minutes. After washing with distilled water and blotting between filter paper the film is stained with 4 drops of Wright's stain and 4 drops of distilled water which are allowed to act for four minutes; the film is then washed, blotted, dried in the air, and mounted in balsam. The granules of the neutrophiles, endothelial (large mononuclear) leucocytes, and eosinophiles stain dark brown, while all other blood elements are coloured exactly as they are in the simple polychrome stain. The basophilic granules are a rich purple; the large eosinophilic granules are brown, and have a ring-like appearance due to their refractive centres; the neutrophilic granules are dark brown, irregular in shape and thickly set in the cytoplasm, while the robin's-egg blue of the lymphocytes is entirely non-granular except for the characteristic bright reddish metachromatic granules present in some of them.

180. Regeneration of Striated Muscle.

NAGEOTTE and GUYON (*C. R. Soc. Biol.*, December 27th, 1919) found a curious appearance in the case of a piece of dead nerve which had been preserved in glycerin and employed as a graft. After fifteen days some striated muscle fibres in the neighbourhood of the suture were found to have insinuated themselves into the graft and penetrated it for a distance of a centimetre, growing finer towards the distal end. These fibrils possessed definitely striated fibrillae. As they had never seen a like phenomenon in the numerous nerve grafts preserved in alcohol with which they had experimented, they supposed that the glycerin might play a part in causing this muscular regeneration, and if so it might be a useful fact in surgery. By impregnating the grafts with various substances they found that glycol, galactose, maltose, and saccharose failed to attract the muscle fibres, whilst glycerin, glycogen, glucose, levulose, and mannite gave positive results. Farther, in a case where they inserted a glycerinated nerve graft in the ear of a rabbit and sutured a small portion of living muscle to the end of it, they found that in twenty-four hours prolongations of muscular fibres had penetrated the graft for a length of 5 or 6 mm. Whether the experiments will lead to facts of practical surgical importance or not remains a question for the future. Regeneration of striated muscular tissue has not hitherto been demonstrated.

181. Anglo-melano-sarcoma of the Leg.

R. VILLAR (*Journ. de méd. de Bordeaux*, January 10th, 1920) reports the case of a girl, aged 20, who presented pigmentary naevi on various parts of the body. None of them had been accompanied by any symptoms, except one which had been recently getting larger on the upper part of the inner side of the right leg. On examination a pedunculated tumour the size of a bean was found, resembling at first sight mollusum fibrosum. The neighbouring skin, however, was pigmented, and on palpation the pedicle was found to be firmly adherent to the deeper structures. An enlarged gland was found in the groin. The general health was excellent. The diagnosis was made of angio-melano-sarcoma developing on a pigmentary naevus, and was confirmed by histological examination. The tumour and glands in the groin were removed, but the prognosis was very grave owing to the youth of the patient, the rapid development of the growth, and especially the glandular metastasis.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

182. Scarlet Fever Complicated with Pneumonia.

LOBELL (*Med. Record*, November 8th, 1919) records a case of scarlet fever in which, among several other complications, the rare one of pneumonia developed, which for a time was difficult to diagnose. A girl, aged 4, had a typical onset of scarlet fever, the rash appearing the following day. The angina was pronounced and there was an exudate on the tonsils which gave a negative diphtheria culture, and subsequently there was free desquamation. Eleven days from the onset a purulent left otitis media developed which discharged for five weeks. The right ear showed signs of congestion which soon subsided. Three days later she began to cough and complained of pain in the back of the chest, and two days afterwards there was definite dullness over the lower lobe of the right lung. Vocal fremitus and vocal resonance were absent, except over one area about the size of a dollar between the eighth and ninth ribs. Aspiration twice showed no fluid, and x rays gave a diminished illumination at the right base, but were unable to settle the diagnosis as between lung abscess, sacculated empyema, or an irregular pneumonia. During the next three days the temperature fell by lysis, and the patient recovered completely in spite of developing an acute nephritis. Convalescence gave a gradual diminution of the dullness accompanied by return of the vesicular murmur, but no rates of resolution were detected, and the case was considered to be one of pneumonia in which a mucous plug obstructed a main bronchial branch, causing the anomalous physical signs.

183. Cicatricial Tuberculous Stenosis of the Trachea.

ACCORDING TO JOANNOVIC and MARASPINI (*La Presse Méd d'Egypte*, January 1st, 1920), tuberculous lesions of the trachea are not infrequently found at the autopsy of patients who have died of pulmonary tuberculosis. During life, however, the tracheal lesions escape notice, as the symptoms to which they give rise are attributed to the pulmonary or laryngeal involvement with which they are associated. The writers record the case of a woman, aged 43, who sought advice for difficulty in breathing which towards evening amounted to a slight attack of asthma. Examination of the larynx showed only some small granulations on the right vocal cord, but on tracheoscopy irregular scars were found at the level of the third and fourth tracheal rings, and on the anterior surface below the second and fourth rings was a longitudinal scar causing considerable stenosis of the lumen. After application of 30 per cent. cocaine, the stricture was dilated and a tube passed down to the bifurcation of the bronchi without meeting any other obstruction. The difficulty in breathing then subsided. Although many cases of syphilitic stenosis of the trachea are on record, the writers do not know of any instance of tuberculous stricture. In the present case there was no other evidence or history of syphilis, but the patient had been treated in her youth for laryngeal and pulmonary tuberculosis.

184. Statistics of Spina Bifida.

R. VAGLIO (*La Pediatria*, January, 1920) found 23 cases of spina bifida among about 10,000 infants, or 1 in 434; 13 were females and 10 males. Most of the children were brought to the hospital a few days after birth, less frequently in the first few months, and only 2 cases were not seen until they were 1 and 2 years old respectively. Apart from one case of double spina bifida, the tumour in 12 cases was in the lumbo-sacral region, in 3 in the sacral, in 3 in the lumbar, in 2 in the dorso-lumbar, and in 2 others in the lower dorsal and cervical regions respectively. The size of tumour varied as a rule from that of a large walnut to that of a large orange. In only one case was the tumour considerably larger, being about the size of a fetal head. The skin was almost intact in 8 cases, intensely reddened and vascular in 5, and ulcerated in 7; in 3 there was an escape of cerebro-spinal fluid. In only one case was there a tuft of hair present over the tumour. As regards the family history, syphilis was noted in only 3 cases, in another 6 cases its presence was shown either by the hereditary history and clinical evidence or the Wasser-

mann reaction. In only one case was the existence of other cases of spina bifida in the ascendants or collaterals noted. In one case the mother was tuberculous. As regards concomitant affections, 7 cases had hydrocephalus, 6 clubfoot, 4 paralysis of the lower limbs associated in 2 with clubfoot, 1 had Little's disease, 1 cleft palate, 1 multiple malformations of the anus and genitals, and 1 multiple small angiomas of the scalp.

185. A Case of Emetine Idiosyncrasy.

R. SAVIGNAC and A. ALIVISATO (*Paris méd.*, January 10th, 1920) report a case in a man, aged 42, suffering from amoebic dysentery, in whom urticaria developed after injections of emetine. The eruption, however, did not appear until after he had had four series of six injections, each consisting of 4 cg. of emetine hydrochloride. It was only during the fifth series, five months after the commencement of the treatment, that the rash first appeared, as if it required a certain accumulation of the drug for it to develop. The peculiar features of the urticaria were as follows: (1) It spared the face and trunk; (2) it was most marked, at least at first, in the neighbourhood of the injection site; (3) the lesions showed a certain symmetrical distribution on the limbs; (4) the eruption persisted for a long time, fresh crops appearing during the five months which followed the last injection of emetine.

186. Lumbar Puncture: a Warning.

WEGEFORTH and LATHAM (*Amer. Journ. Med. Sci.*, 1919, 158) adduce evidence that lumbar puncture may be an important factor in the production of meningitis, not by contamination of the puncture wound, but by causing organisms present in the blood to migrate into the cerebro-spinal fluid. If animals are given intravenous injections of an organism the pathogenicity of which for the meninges is known to be high, and then repeatedly punctured at the height of the septicaemia, meningitis invariably results. In control injected animals not punctured meningitis did not follow. These experimental results were borne out by clinical observations: 93 patients suspected of meningitis were punctured; of these 6 gave positive blood cultures and of these 6, 5 developed meningitis subsequent to the puncture. If, prior to the puncture, intravenous serum therapy is administered meningitis does not occur. Wegeforth and Latham emphasize the necessity of making sure that the blood is not infected before puncture is done, and insist that harm may follow if serum is not first given. Lumbar puncture should be avoided unless there are definite signs of meningeal irritation, and when performed large withdrawals of cerebro-spinal fluid should be avoided.

187. Site of Lumbar Puncture.

EVERYONE is agreed nowadays that the space between the neural arches of the third and fourth lumbar vertebrae affords the most suitable access to the spinal theca. On the finer points, such as the exact site for the introduction of the needle, and the angle at which it should be inclined, there is some conflict of opinion. REGAN (*Amer. Journ. of Med. Sci.*, 1919, 157) has made a detailed study of the anatomy of neural arches and their interspaces, with a view to establishing a sound basis on which to found practice. He comes to the conclusion that the median puncture is the best for people of all ages, and that as a general rule the needle can be pushed in perpendicularly to the surface. It will be remembered that this mode of introduction of the cannula has always been well supported in so far as it applies to the child. In the adult the obliquity of the lumbar spines has led many people to advocate a slightly lateral site for puncture and an upward inclination of some 45 degrees. Regan's researches have shown him that the perpendicular median puncture is as good in the adult as the child, provided that the spine can be well flexed. If flexion is limited, as in the elderly, a slight upward deviation is necessary. The objection to median puncture on the ground that the spinous ligaments are so tough is not a serious drawback. These ligaments consist of two parallel bands, and if one keeps strictly to the middle line one should be able to steer the needle between them. If one is successful in this aim the two bands are a help in preventing lateral deviation of the needle, which will slip on into the theca. The paper is illustrated by six drawings of the lumbar spines.

188. Thymus Stenosis In Children.

ACCORDING to H. KLOSE (*Med. Klinik*, November 23rd, 1919) the diagnosis of enlargement of the thymus rests on the presence of five principal symptoms: (1) Attacks of asphyxia are preceded by a prodromal stage known as stridor thymicus infantum or asthma thymicum. The infant has noisy breathing from birth or the first months of life, its intensity increasing at the end of inspiration and on excitement. Some cyanosis is always present. There is also inspiratory supra- and infra-sternal recession, indicating stenosis of the respiratory tract. The voice is clear. (2) The causes of the actual asphyxial attacks are generally to be found in external agencies. The thymus becomes enlarged in consequence of congestion or of lordosis of the dorsal vertebrae; thus asphyxial attacks may occur when the infant is put to bed with its head hyperextended. A meal may also cause an attack, as the full stomach presses up the diaphragm and impedes respiration. The attacks may result from a chill, because coughing causes congestion of the gland. (3) On expiration, and especially during an attack, a soft round swelling can be felt in the supra-sternal fossa. (4) On percussion dullness is observed behind the manubrium and extending over to the left border of the sternum, and becomes incorporated with the cardiac dullness. Three diseases in which the dullness is the same must be excluded, namely, aneurysm of the aorta, substernal goitre, and enlarged bronchial glands. (5) Radioscopy and radiography are indispensable for the diagnosis. An enlargement of the central shadow is characteristic; it may extend towards the left.

SURGERY.**189. Fracture-dislocations of Astragalus.**

DALE (*Arch. Radiol. Electrotherap.*, 1919, 187) records three cases of fracture of the astragalus. In two of these the large posterior fragment was dislocated backwards on to the upper surface of the os calcis. In one the anterior lip, in the other the posterior lip, of the lower articular surface of the tibia was broken off. Dale gives a brief but interesting account of the manner in which these injuries are brought about. The common cause is hyper-extension (dorsiflexion) at the ankle-joint, usually produced by falls from a height. The neck of the astragalus is broken by the anterior lip of the tibial extremity, which may itself give way. Should this latter accident happen further dorsiflexion is possible, and a continuation of the force causes the body of the astragalus to slip backwards between the now widened gap behind. If the amount of dorsiflexion attained is insufficient to allow of this, the backward-moving astragalus will break off the posterior margin of the tibia in order to effect its escape. The paper is illustrated by four clear prints.

190 Violent Attacks of Colic caused by Calcified Mesenteric Glands.

S. HANNEMA (*Nederland. Tijdschr. v. Geneesk.*, January 17th, 1920) records a case in a man, aged 51, who for two years had suffered at irregular intervals from violent attacks of colic independently of food. There was no family or personal history of tuberculosis. The attacks were not accompanied by jaundice and the urine was normal. A skiagram suggested calcified mesenteric glands, the presence of which was confirmed by an operation, which showed the whole mesentery to be strewn with calcified glands. The largest and most numerous were in the ileo-caecal region. Twenty-two were removed and the patient made an uninterrupted recovery. The cause of the pain, and especially of its paroxysmal character, was not obvious. Possibly owing to changes in the position of the mesentery the nerves were irritated by the calcified glands.

191. Appendicitis stimulating Strangulated Hernia.

R. VILLAR (*Journ. de méd. de Bordeaux*, January 10th, 1920) records the following case: A man with a right inguinal hernia suddenly developed severe pain suggesting that it had been strangulated. A diagnosis of hernial peritonitis was made. At the operation hernia of the caecum and appendix was found. The appendix, which was inflamed, was removed and a radical cure performed. Subsequent recovery was uneventful. On opening the appendix four trichocephali were found imbedded in the mucous membrane. The trichocephalus appears to be very prevalent in the Bordeaux district. On examination of the stools of 20 children without any abdominal affection Villar found this parasite in 7 cases.

192. Necrosis of the Clavicle.

APERLO (*Il Policlinico*, 1919, 26) describes a case of complete necrosis of the clavicle following an infection of the hand. A child, aged 7, had a septic scratch on the dorsum of the right hand; a local collection of pus formed with pyrexia and chills. Pain below the right clavicle was now complained of and a swelling appeared in this situation, with a fluctuating centre. This was incised and pus escaped. There was temporary improvement in the general condition, the abscess on the hand having by this time burst spontaneously. The temperature continued high, so the subclavicular wound was incised again, and a further collection of pus poured out. Spasmodic torticollis now made its appearance, and the child was sent to hospital, where it was first seen by Aperlo. An incision made along the clavicle disclosed the bone, denuded of periosteum, separated from its attachments at both sternal and acromial ends. A very slight degree of traction allowed the bone to be withdrawn, whereupon pus which had been pent up behind the clavicle welled up into the wound. The cavity was packed with iodoform gauze and healed rapidly. The child was discharged from hospital completely cured in ten days' time. Movements of the right arm and shoulder were perfect. The excellent functional results which follow excision of the clavicle are perhaps not generally known. Confirmation on this point will be found in Thorburn's case, where he removed the clavicle for a thyroid metastasis (reported by Radley and Duggan, *Brit. Journ. Surg.*, 1913-14). Aperlo believes that the cause of the infection of the clavicle was a direct extension of staphylococcal infection from the highest axillary lymphatic glands. The inner end of the bone was more extensively infected than the outer. The unusual feature of this case is the bone involved. The connexion between boils and acute osteomyelitis is sufficiently well known. It may be remembered that Pasteur was in the habit of referring to osteomyelitis as "bone furunculosis."

193. Torsion of the Omentum diagnosed as Appendicitis.

H. O. WILDENSKOV (*Ugeskrift for Læger*, January 8th, 1920) records the case of a business man, aged 30, who had suffered for thirteen years from bilateral inguinal hernia, easily reducible on both sides. Two days before admission to hospital, on lifting heavy weights the right hernia came down, and provoked such pain that reduction had to be done when lying down, and was only successful after some painful manipulation. During the following night he felt severe pain in the right iliac fossa, increasing next day, and his motions contained a little blood and mucus. There was no vomiting. On his admission to hospital with the diagnosis of appendicitis the temperature was 38.5°C.; the pulse was 90. The tongue was moist and slightly coated, the abdomen was not distended, but there was definite tenderness in the right iliac fossa, with rigidity on palpation. In this area there was an ill-defined prominence, which was dull on percussion. A rectal examination was negative and both hernial sacs were empty. Laparotomy, performed under general anaesthesia, revealed a little sero-sanguineous fluid in the peritoneal cavity. The appendix was normal apart from a kink at the junction of its middle and outer thirds. A very cyanosed oedematous lump of omentum was at once found in the middle line, and when it was pulled forward it proved to be secured by a pedicle, 20 cm. long and 2 cm. thick. As many as six complete turns of this pedicle to the left were counted. Detorsion was followed by resection and uneventful recovery. A month later, when both herniae were operated on, perfectly normal conditions were found.

193. Influenzal Metastatic Ophthalmia.

A. F. OSATE (*Rev. de méd. y cir. prat.*, December 7th, 1919) records a case in a woman, aged 26, who suffered from influenza complicated by bronchopneumonia. On the seventh day of disease there was slight inflammation of the eye and impairment of vision, which was treated by boracic fomentations. When seen by Osato the right eye protruded, the lids were inflamed, the conjunctiva chemotic, and there was a profuse lacrymal secretion and catarrhal discharge. The cornea was turbid, the pupils immobile and obstructed by purulent exudate. The eyeball was increased in size, hard, and immobile. Pain was absent at first, but in a few days became very violent. The temperature ranged from 99.4° to 100.4°. Cold compresses of cyanide of mercury (1 in 5,000) and inunction of collargol round the orbit were employed, followed by injections of the cyanide of mercury solution into the conjunctiva and vitreous, as recommended by Darier, but without effect. The eye was then enucleated and complete recovery took place.

195. Peripheral Nerve Injuries.

FRAZIER (*Annals of Surgery*, January, 1920) advises operation not earlier than three to six months after injury, as many cases show no sign of spontaneous recovery for six months, provided there is evidence of complete nerve interruption. The tourniquet is used only if much cicatrization is present; it is removed before resection or suture. Resection of a spindle-shaped neuroma and suture is justifiable if there are signs of total loss of function at the end of six months. Development of the spindle-shaped neuroma is not infrequent after suture or transplantation and in cases recovering spontaneously. No protective sheath is required for a liberated or sutured nerve, which should be placed in an intramuscular plane or between deep fascia and muscle sheath, or between deep and superficial fascia. "Implantation" suture may be used in certain cases of large defects in ulnar or musculo-spiral, sacrificing certain portions of the median with slight transient sensory loss. Nerve-stretching and posture may secure apposition in a defect of 7 to 8 cm. If necessary the nerves can be drawn as close together as possible, the joint flexed, and extended gradually over four weeks, when the segments are approximated after resection at a second operation. Nerve transposition can be applied to the ulnar, which is transposed to the flexor aspect of the forearm. Transplant is less successful than direct suture. Autografts are used, usually the musculocutaneous, radial, or internal cutaneous. Bones are shortened as a last resort. Tendon transplantation may be used for permanent foot-drop and paralysis of extensor communis digitorum. In suturing nerve segments slices are removed until healthy fasciculi project; one tension stitch of catgut is passed and four to eight silk epineural sutures, which are tied before the tension suture.

196. Indications for Operation in Acute Appendicitis.

E. VILLARD (*Lyon méd.*, January 10th, 1920), in a paper based on the study of 500 personal cases, discusses the indications for operation in acute appendicitis. In place of the formula "Operation is indicated when it is the only means of curing the patient" he substitutes the formula "Operation in appendicitis is indicated whenever it is the most likely method to cure the patient." In the stage of onset, which corresponds to the first forty-eight hours, operation, provided it can be carried out under suitable conditions, is indicated, as it is impossible to foretell the issue of the case. After the first forty-eight hours, when there is a diffuse or spreading peritonitis, as rapid operation as possible is indicated, for it is the only means of saving the patient. In encysted peritonitis with a collection of pus, although its necessity is disputed by some authorities, operation is nevertheless indicated, for it is the treatment which offers the greatest chances of recovery. After the acute attack has subsided appendicectomy should be recommended without being insisted upon, but the possible consequences of obstruction should be explained to the patient. In relapsing appendicitis, on the other hand, operation is formally indicated.

197. Studies in Bone Growth.

F. H. ALBEE (*Annals of Surgery*, January, 1920) has experimented with rabbits, by removing a portion of one of the bones of the limb and injecting a 5 per cent. solution of triple calcium phosphate between the bone ends. He concludes that callus formation in these cases extended far into the soft parts, apparently following the penetration of the solution. In some cases the callus protruded beneath the skin. Moreover, cases of fracture with loss of substance showed a much more rapid bone growth and union when triple phosphate was injected into the gap between the bone ends than did the controls without its use. No toxic or irritating effects were produced by the injection.

198. Infarct of Testicle in Gonorrhoea.

J. J. STUTZIN (*Med. Klinik*, December 14th, 1919) records the case of a chemist, aged 44, who had contracted gonorrhoea with prostatitis several years earlier. Early in June, 1919, the left and then the right testicle became swollen. The swelling of the right testicle soon subsided, but that of the left testicle persisted. Late in August the only sign of inflammation on the right side was enlargement of the epididymis, with induration most noticeable in the globus minor. On the left side the scrotum contained a swelling as large as a goose's egg. The upper part was translucent, and the diagnosis of hydrocele was confirmed by puncture. But the yellow fluid obtained was turbid, and the sediment contained many leucocytes. The small and indurated prostate contained a hard nodular swelling on the left side. There was also a stricture of

the urethra. Nine days after the puncture of the hydrocele it was opened under a local anaesthetic, and about 150 c.cm. of turbid yellow fluid were withdrawn. The tunica vaginalis was much inflamed, and, as the testicle felt tense and was considerably enlarged, it was incised. Testicular substance, mixed with dark blood clots, and fully two dessertspoonfuls of offensive smelling fluid escaped. Complete recovery ensued. There was no history of trauma, and it is improbable that the haemorrhage could have started in the epididymis, for it was not till the tunica albuginea was incised that the haemorrhage was found. The author suggests that the condition was due to a haemorrhagic infarct of the testicle itself, complicated by infection.

199. Examination and Massage of the Prostate.

PIRONDINI (*Riv. Osped.*, September 30th, 1919), in view of the difficulty of adequate massage of the prostate due to the absence of sufficient resistance on the bladder side, has devised a special form of catheter which he says facilitates this mode of treatment. The catheter is 26 cm. long, and at a distance of 16 cm. from the angle has a little notch corresponding to the average length of the male urethra. At one end of the catheter is fitted a tap, at the other end the concave face of the beak is flattened antero-posteriorly and perforated with numerous small oval holes 1.3 mm. in diameter, for a length of 3.5 cm. The most useful size is No. 26 on the Charrière scale. The patient is placed in the lithotomy position, with the bladder moderately full; the perforated part of the catheter is then brought into apposition with the prostate and massage per rectum carried out. Two photographs of the instrument above described are given.

OBSTETRICS AND GYNAECOLOGY.

200. Eclampsia.

HASTINGS TWEEDY (*Dublin Journ. Med. Science*, December, 1919) insists on the extreme value of starvation in cases of eclampsia and threatening eclampsia. He assumes that the antibodies in the serum are capable of dealing with food poisons and ovum poisons, separately but not together. When food is taken in excess or when ovum poisons, as in twins, are in excess, eclampsia results. He quotes a German source as instancing the fall in number of cases of eclampsia during the necessary starvation brought about by the war.

201. Menstrual Equivalents in Tuberculosis.

SABOURIN (*Paris méd.*, January 3rd, 1920) expresses the opinion that in tuberculous women the following partial or complete substitutes for menstruation are more common than in the healthy. 1. *Pulmonary congestion.* Every tuberculous patient whose periods are not absolutely normal has more or less congestion every month in the affected areas of the lung. In some cases the periods commence after the congestion has lasted for a few days. In others the uterine flow appears to be insufficient, and as soon as it has stopped the pulmonary congestion increases for several days, accompanied by a recrudescence of fever. In another group menstruation does not occur at all, and the pulmonary congestion and fever may last from ten days to a fortnight before resolving. 2. *Haemoptysis.* This is a very frequent occurrence, either as a total or partial equivalent of menstruation. It is a remarkable fact that a tuberculous patient may lose much more blood by the lungs at the time of menstruation than she would normally in her uterine flow. 3. *Epistaxis* is also very common, both as a total or partial substitute for menstruation, and may occur before, during, or after the monthly period. It is met with in patients of all ages. 4. *Haemorrhoidal flux.* This is almost entirely confined to constipated patients, many of whom have a history of hereditary hepatic disease. It is rare for menstruation to be completely replaced by haemorrhoidal oozing alone, but it is very common to find the latter associated with epistaxis and serous diarrhoea as a partial or complete substitute. 5. *Diarrhoea.* As a partial or complete substitute for menstruation this may assume a mild or severe course, but it is probable that it is only women with a more or less abnormal condition of the alimentary canal who suffer from menstrual diarrhoea in a marked degree. 6. *Leucorrhoea* as a partial or complete substitute for menstruation is frequent. 7. *Rhinorrhoea.* Though Sabourin has never seen rhinorrhoea alone replace menstruation in whole or in part, he has observed it in cases of menstrual disturbance in association with other menstrual equivalents, especially diarrhoea. 8. *Bronchorrhoea.* Sabourin saw one case in which it was exceptional for a period to

pass without an attack of bronchorrhoea accompanied by discharge from the eyes and nose. 9. *Perspiration* as a partial substitute for menstruation sometimes occurs. 10. *Bilious vomiting* is an occasional accompaniment of menstruation. 11. *Hepatic congestion*. Hepatic symptoms, especially biliary colic, is particularly frequent during menstruation in tuberculous patients with a hereditary history of hepatic disease.

202. Abdominal Pregnancy of Six Months.

MOURE (*Bull. de la Soc. Anat. de Paris*, October–November, 1919) reports a case of a woman, aged 32, whose periods had ceased for six months, and who had a violent metrorrhagia at three months, considered at the time to be a miscarriage. On examination an abdominal swelling was found reaching above the umbilicus, and giving the impression of a six or seven months pregnancy, but no heart sounds or fetal movements were detected, and on vaginal examination the tumour was found to be absolutely independent of the uterus. Laparotomy was performed under the diagnosis of ovarian cyst developing rapidly during pregnancy. A smooth round tumour with adhesions to the intestines and omentum was found lying behind and to the left of the fundus uteri, with the left tube merged into the front of it. The wall was ruptured in attempting to remove it, and a six months fetus, not dead but not viable, with various deformities escaped. The placenta was attached to the posterior surface of the left broad ligament, encroaching a little on the lateral wall of the pelvis, and when this was pulled upon there was a flooding of blood in the pelvis. The haemorrhage was controlled by pressure, and the placenta was removed without further trouble by clamping the uterine cornu and the utero-ovarian pedicle. The examination of the specimen revealed a tube, patent in its whole extent, lying in front of the placenta, but as the ovary could not be identified in the mass it was impossible to say whether the ovum had been originally grafted on the ovary or the neighbouring peritoneum. It is presumed that the patient had a tubo-peritoneal abortion at the third month, with an engrafting of the ovum on the peritoneum, or she may have had a double pregnancy—one uterine, the other peritoneal. In all such cases the alarming haemorrhage that occurs in attempts at removal of the placenta is the striking feature.

PATHOLOGY.

203. Lymphatic Foci in the Thyroid in Addison's Disease.

DUBOIS (*Berl. klin. Woch.*, December 15th, 1919) has observed a very extensive and striking development of lymphoid tissue, with typical germ centres, in the thyroids of four out of six cases of Addison's disease. This he regards as possessing considerable significance, depending on some alteration of the thyroid function which ensues when the gland is deprived of the stimulus normally communicated to it by the internal secretion of the suprarenals. It is also possibly related to the status lymphaticus constantly observed in this malady.

204. Practical Value of the Sachs-Georgi Reaction.

WOLFFENSTEIN (*Berl. klin. Woch.*, November 24th, 1919) has observed rather a large proportion of non-specific results with the Sachs-Georgi reaction, using an extract prepared by Sachs as well as several which he prepared himself according to the method described by Sachs. Two of his own extracts, which on preliminary testing appeared reliable, were submitted to a thorough comparative investigation on 1,000 cases. Occasionally it was observed that one or other of the extracts would give bad results on one day, while tested with the same serums on the following day it gave correct readings. This accidental variation appeared to depend on some slight difference in the method of preparing the emulsion, but the exact factor concerned could not be defined. In cases known to be syphilitic the Sachs-Georgi reaction was more frequently positive than the Wassermann reaction, the difference being especially marked in early primary cases, in latent cases, and in treated secondary syphilis. On the other hand, a positive Sachs-Georgi reaction was wrongly obtained in 22 out of 230 non-syphilitic cases, and in all of these the Wassermann reaction was negative. Non-specific results occurred, especially in febrile diseases. In view of this the author considers the test in its present form as of less practical value than the Wassermann reaction.

205. Comparison of Antigens in the Wassermann Reaction.

DURUPT (*C. R. Soc. Biol.*, January 10th, 1920), comparing the results obtained by identical technique with three different antigens—the Pasteur Institute antigen, Bordet's antigen made from calves' hearts, and an alcoholic extract of liver in congenital syphilis—finds that there are discordant results. Generally the two former run parallel, and disagree only in 2 per cent. of cases. The syphilitic liver antigen, however, gives 15 per cent. more positive results than the others, and, by taking into account feeble reactions, it gives 25 per cent. more positives. Any reactions given by either of the other two are confirmed by the liver antigen. The author raises the question as to whether we are to regard the increased positive results of this antigen as errors or as evidence of its greater sensitiveness.

206. Toxins of Shiga's Dysentery Bacillus.

OLITSKY and KLIGLER (*Journ. Exper. Med.*, January 1st, 1920) have succeeded in separating two different toxins from Shiga's bacillus, an exotoxin and an endotoxin. Grown in a favourable medium, such as bouillon mixed with egg albumen, the bacillus in the first days of culture, at the beginning of its alkaline phase of growth, and before the onset of bacterial disintegration, yields a toxic product found in the germ-free filtrate. This toxin is relatively thermostable, capable of exciting antitoxin formation, constant in properties no matter from what particular strain of organism obtained, and produces in rabbits, after a definite incubation period, typical lesions of the central nervous system, consisting in haemorrhages, necroses, and perhaps perivascular infiltration of the grey matter of the upper spinal cord and medulla. It is without definite action on the intestines; it is essentially a neurotoxin. In distinction to this exotoxin, an endotoxin of quite different properties may be prepared by suspending an agar growth of the organism in saline, incubating for two days, and filtering. Such a filtrate causes both nervous and intestinal lesions, because it contains both endotoxin and exotoxin, but the latter may be destroyed by heating the filtrate to 80°C. for an hour or by neutralizing with an anti-exotoxin. A filtrate so treated produces in rabbits intestinal lesions, such as oedema, haemorrhages, necroses, and ulcerations, especially in the large bowel, without any effects on the nervous system. Thus the results of injection of the endotoxin approximate those found in man in bacillary dysentery. In severe epidemics, it is true, paralysis and neuritis may occasionally be encountered, but generally the intestinal lesions predominate. It would therefore seem that in the serum-therapy of dysentery a potent antidyenteric serum should contain antibodies against the endotoxin as well as the exotoxin. The authors have succeeded in experimentally producing such a serum in horses.

207. Renal Calculus in Spinal Injuries.

HOLLANDER (*Berl. klin. Woch.*, December 1st, 1919), in describing a case in which multiple bilateral renal calculi developed rapidly after a spinal injury with paraplegia, refers to a number of similar cases observed by Kurt Müller. It is claimed that this association is not explained merely by the occurrence of ascending septic infection which is almost invariably present in cases of long standing. Where ascending septic infection occurs apart from paralytic lesions the development of renal calculi is much less common. Hollander dwells on the importance of the active ureteral peristalsis in maintaining the normal disposal of the urinary secretion, and maintains that the stasis in the renal pelvis which ensues from spinal paralysis is the essential factor in promoting development of calculi.

208. The Colloidal Gold Test in the Cerebro-spinal Fluid in Syphilis.

J. KYRLE, R. BRANDT, and F. MRAS (*Wien. klin. Woch.*, January 1st, 1920), as the result of the study of Lange's colloidal gold test in 720 cases of syphilis in all stages of the disease, came to the following conclusions: (1) The reaction is quite independent of the albumin-globulin test and the Wassermann reaction in the cerebro-spinal fluid, though it is often associated with them. (2) It is specific in so far as it is not so pronounced in other diseases as in syphilis with the exception of disseminated sclerosis. (3) It is much less likely than other tests, such as the Wassermann reaction, to fail or yield doubtful results. (4) A positive test indicates a considerable change in the cerebro-spinal fluid, even if this is not shown by other reactions.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

209. Pulmonary Sequelæ of Mustard Gas.

ACCORDING TO H. MALLIÉ (*Journ. de méd. de Bordeaux*, January 10th, 1920), the respiratory lesions caused by mustard gas are burns, like those of the skin and eyes, which rapidly become infected. Apart from numerous cases in which the lesions clear up without leaving any sequelæ, the subjects of mustard gas poisoning show a gradual tendency to develop pulmonary sclerosis, according to the gravity and extent of the lesions and the vitality of the organism attacked. Except during the attacks of acute bronchitis or pulmonary congestion to which the patients are subject, the symptoms are almost entirely subjective, and the physical signs are those of an ordinary case of emphysema. The most constant and persistent symptoms are dyspnoea and cough. The patients also complain of wandering pains which cannot always be explained by auscultation or radioscopy. Although systematic examination for tubercle bacilli was negative in all Mallié's cases, he was inclined to think that many of them would develop tuberculosis subsequently.

210. Angio-neurotic Oedema.

H. BOLTEN (*Nederland. Tijdschr. v. Geneesk.*, December 20th, 1919) records a case in a neurotic woman, aged 40, who presented the following series of symptoms: Acute attacks of headache with flickering before the eyes, congestion and gastric disturbance, associated with angio-neurotic oedema of sudden onset and equally rapid disappearance in the region of the neck, and colicky pains in the abdomen. The headache was of the nature of migraine, as was shown by the acute onset, ocular symptoms, and gastric disturbance. The angio-neurotic nature of the oedema was proved by its sudden onset and disappearance, and its association with an attack of migraine in a woman of a neuropathic disposition. The colicky pains are attributed by Bolten to an acute swelling of the mucous membrane in the neighbourhood of the caecum. The appendix was not responsible, and its removal caused no improvement in the symptoms.

211. Treatment of Urinary Bilharziosis by Emetine Hydrochloride.

DIAMANTIS of Cairo (*Presse méd. d'Égypte*, January 1st, 1920), who has treated about 150 cases of urinary bilharziosis with emetine hydrochloride, is firmly convinced that this drug is a true specific provided that the following method is adopted. It is important to realize that treatment can cure only pure bilharzial hæmaturia and has no effect on complicated cases. The drug is usually given intravenously, commencing with doses of 0.02 to 0.03 gram, and rapidly increasing them to 0.05, 0.07, and 0.010 gram. The injections are given at intervals of two or three days, and repeated until fifteen or twenty injections in all have been given, though some patients have been cured by only eight. If subcutaneous injections are preferred, the dose must be increased to 0.12 or 0.14 gram. The treatment does not require the admission of the patient to hospital. Diamantis has never had any relapses among his cases, but a few were refractory to the treatment.

212. Cutaneous Reaction to Quinine in Quinine Idiosyncrasy.

B. M. EDLAVITCH (*Journ. Amer. Med. Assn.*, 1919, lxxiii) confirms the observations of Boerner and of O'Malley and Richey that in persons hypersensitive to quinine a specific skin reaction can be obtained by applying a solution of quinine to a scarified surface. In his case the skin of the forearm was scarified in two places about three inches apart, and to the proximal abrasion 10 per cent. aqueous solution of quinine sulphate was applied, the distal abrasion serving as a control. Within a few minutes the patient noticed itching around the scratch into which the quinine solution had been rubbed, and a few minutes later there appeared an oedematous papule, reaching its maximum size, 0.75 cm. in diameter, in about half an hour. Around the oedematous area there was a patch of erythema measuring 3.5 cm. The reaction began to subside after the first half-hour and completely disappeared in a few hours. No similar reaction occurred in the distal or control abrasion. The test was again applied about a fortnight later with exactly the same result.

213. Artificial Pneumothorax with a Pleural Effusion on the Other Side.

E. ALS (*Hospitalstidende*, December 31st, 1919) can find no parallel to the following case: A man, aged 23, suffered from extensive pulmonary tuberculosis on the right side. The stethoscopic and x-ray examinations of the left lung were perfectly negative. Accordingly a pneumothorax was induced on the right side. Effective collapse of the right lung was achieved, but the sputum continued to contain tubercle bacilli, the cough persisted, and the striking general improvement effected in such cases by this treatment did not ensue. After a few months an effusion developed in the right pleural cavity, associated with fever. The fever lasted only a fortnight, but the effusion crept up to the level of the third rib. Nine months after the institution of this treatment, its comparative failure was explained by the occurrence of a large serous effusion in the left pleural cavity. The symptoms were alarming, but relief was obtained by aspiration of 1,000 c.cm. from the right side, and 2,000 c.cm. from the left. The patient improved rapidly, the pneumothorax was maintained on the right side, and the left lung showed no permanent ill effects from its temporary collapse.

214. Exophthalmic Goitre combined with Myasthenia Gravis.

RENNIE (*Med. Journ. of Australia*, November 15th, 1919) records the sequel to a case previously reported by him in the *Review of Neurology and Psychiatry* (vol. vi, part 4, 1908) of a man, aged 27, who, in 1907, presented the combined picture of exophthalmic goitre with myasthenia gravis. He was not expected to live, but in May last he reappeared seemingly in good health. He stated that on leaving hospital in 1907 he went up country and continued to take the mixture of strychnine and belladonna. The symptoms gradually disappeared, and at the end of a year he was able to do light work, becoming gradually stronger until about three years ago when he had a severe attack of typhoid fever. He could not do strenuous work for many hours together without getting pains in his back muscles, but he never got the condition of exhaustion he had previously. He had gained flesh and strength, and the symptoms of exophthalmic goitre and of myasthenia gravis had disappeared, though the eyes were not quite normal, paresis of the external ocular muscles, giving rise to occasional diplopia, being still present. No other muscles in the body appeared to be affected, and the cardiac muscle had not been involved, for, although the pulse was soft and the blood pressure low, there were no symptoms of cardiac weakness in spite of the fact that he had recently passed through an attack of typhoid fever.

215. Myositis Ossificans.

DRAGO (*La Pediatria*, November, 1919) records a case of multiple myositis ossificans, few examples of which have been recorded in Italy. The patient was a girl, aged 8 years, and the disease chiefly affected the muscles of the neck and shoulder girdle. Her attitude was very much like that of a case of spondylitis. In addition to the bony deposits in the muscles, there was marked microdactylism of the great toes. There was no evidence of heredity. The symmetrical character of the lesions is in favour of a nervous origin. A curious feature in this disease is the occasional regression of the process of ossification which has been noted by several observers. Many theories have been advanced as to the cause—for example, microbic (no organism has, however, been identified), traumatic (this case had a history of a blow in the axilla), toxic, transformation of hæmatomata into bone (but the frequency of hæmatomata and the extreme rarity of myositis is against this), retention of calcium (but no chemical evidence of this), congenital anomaly (inclusion of embryonic tissue and deposit of true bone in an area locally alkaline). After a careful discussion of these and other theories, Drago decides in favour of a combination of a trophoneurotic and embryonal hypothesis. The influence of the nervous system on trophoneurosis is well accepted, and it is possible to believe that under this influence areas of localized alkalinity may arise which, in the presence of included embryonic mesenchymatous tissue, may predispose to the formation of bone. In this case, as in others, the bone is true

normal spongy bone, exactly like normal bone elsewhere, and the distinction between the misplaced bone and the surrounding tissue is sharp and definite. Treatment by acids (to dissolve the calcium) is useless, and all the more since acids do not reach the parts as acid, but, if anything, determine an increased amount of ammonia. If the acid could be transported unchanged to the affected parts some good might be done, but this is impracticable. Thiosinamin and iodides were equally ineffective.

215. Intraspinous Treatment of Neuro-syphilis.

HUMBERT (*Med. Record*, November 1st, 1919) considers that the conflicting results reported in the intraspinal treatment of neuro-syphilis are due to failure to standardize methods along definite scientific lines. His method aims at giving massive doses of one drug with sudden shifts to others in order to prevent the organism from gaining a tolerance. With the patient on the table salvarsan is prepared and spinal drainage instituted. This decreases the already increased pressure in the cerebrospinal fluid, permitting both mechanical and physiological passage of the drug through the choroid plexus and meninges before it is taken up by the body cells. The salvarsan is then administered intravenously, and a reasonable time allowed for the "reaction." Whether this occurs or not the blood is drawn off and the serum is administered intraspinaly. Mercury by injection is then started and pushed to the limit of salivation, when the blood is drawn off and mercurialized serum administered. The procedure is repeated until desired results are obtained, if necessary giving iron, quinine and strychnine to ward off any bad effects. Throughout the course of treatment intraspinal injections are given as often as shifts to the other drug are indicated, provided the patient's physical condition permits. Although the cases treated so far are not ready for report, results are said to have been so satisfactory as to justify a preliminary statement.

217. The Pleuro-peritoneal Form of Chronic Tuberculous Peritonitis.

ACCORDING to J. HASSON of Geneva (*Presse méd. d'Égypte*, December 15th, 1919) the subacute pleural form of tuberculous peritonitis is generally described as a complication of chronic pulmonary tuberculosis, but in practice it not infrequently happens that symptoms of pleurisy and peritonitis develop simultaneously in a previously healthy individual who had apparently had no evidence of tuberculosis. Autopsies in such cases show that, apart from tuberculous lesions of the lungs which may sometimes be absent, there are numerous granulations scattered over the pleura and on the diaphragmatic area of the peritoneum. Sometimes the diaphragm itself is infiltrated with granulations, the lesions readily explaining the mechanism of the peritoneal infection. The disease runs its course in three stages: the first constituted by chronic pulmonary tuberculosis, which may occasionally be absent; the second, which may last two to four weeks, characterized by acute tuberculous pleurisy with effusion; and a third representing the peritoneal stage of the infection. As regards treatment, it is most important that the condition should be recognized at an early stage, and the pleural fluid evacuated before it gains the peritoneum. When peritonitis has developed, an ice-bag on the abdomen for four to six hours daily is the best method for reducing the peritoneal inflammation.

218. Control of Influenza in an Institution.

WOOD (*Med. Record*, October 25th, 1919) gives the experience at the University of Pennsylvania, which had a unit of the Students' Army Training Corps numbering about 2,500 men. Daily rounds were made of the dormitories, and any case of indisposition was sent to hospital, and the room he had occupied was thoroughly disinfected. Within forty-eight hours of starting this regime the admissions dropped from 12 to 4, whilst the epidemic in the surrounding city was increasing. Patients were kept in bed as long as they were febrile, and in hospital until their temperatures had remained normal for three days. They were then sent to a convalescent home for a week, reporting daily at the hospital for treatment. On admission a calomel purge was administered, and a semi-fluid diet ordered. Medicine consisted of from 20 to 30 grains of quinine, and from 25 to 40 grains of either strontium or phenyl salicylate daily. Quinine was regarded as a prophylactic against pneumonia, because in appropriate doses it is believed to render the blood germicidal to pneumococci. Nurses and attendants wore face masks of gauze soaked in 1 in 1,000 solution of mercury bichloride; and the hands, being regarded as an important means of conveying infection, were washed in antiseptic solution after touching anything pertaining to the patient.

SURGERY.

219.

Humerus Varus.

ANGELETTI (*La Chirurg. e. organi di movimento*, December, 1919) records six cases of this rare deformity. Niedinger in 1909 attributed it to a pre-existing arthritis of the shoulder-joint. Bircher in 1908 found a similar deformity in a cretin. The condition is in every way comparable to the much commoner adduction deformity of the hip-joint—coxa vara. The author divides his cases into three groups—traumatic, inflammatory, and cretinoid. (1) *Traumatic*: The four patients were aged 16, 12, 17, and 18 years, and exhibited conspicuous shortening of the upper arm with visible curvature of the humerus in the upper third, a limitation of true abduction at the shoulder-joint, and the absence of any muscular atrophy. In the radiograms the head of the humerus was displaced in relation to the shaft and neck, so that the angle was diminished to 85 degrees; the greater tuberosity thus surmounted the head, and the epiphyseal line or its remains was almost vertical. There was partial obliteration of the epiphyseal disc in two cases, and evidences of active growth limited to the outer part. The author considers that these cases were due to trauma, the site of the lesion being the metaphysis, with a consequent interference with normal growth. As this was asymmetrical the mechanical results are a short humerus, curvature of the diaphysis, and diminution of the angle of inclination between the head and the shaft. This conception is the exact counterpart of the accepted pathology of coxa vara in childhood. We note the difference that in the latter condition the shortening of the limb is only commensurate with the upward displacement of the trochanter; the maximum growth site is at the knee, whereas in the upper limb it is at the upper humeral epiphysis. In one case only was there a definite traumatic history—a fall in infancy followed by pain and swelling in the shoulder region. (2) *Inflammatory*: The single case recorded followed an acute juxta epiphysitis in infancy, there being an obvious partial destruction of the epiphyseal cartilage disc. (3) *Cretinoid*: The patient was a cretin aged 45, with a bilateral humerus varus, more marked on the right side. It is noteworthy that full mobility was present in the shoulder-joints. The deformity here could be explained by a combination of factors: (a) Congenital irregularity of epiphyseal growth; (b) bone softening; and (c) the static effects of crawling in infancy. Angeletti has had an opportunity of examining museum specimens showing the deformity under consideration. Mild degrees of the deformity were seen in rachitic humeri, and also in an achondroplastic skeleton examined by the author. As apparently there was very little functional disability in the cases reported no operative treatment was considered necessary. One patient sustained a fracture in the region of the surgical neck of the deformed humerus, which allowed a correction of the adduction deformity at this level but did not alter the varoid position of the head. From an inspection of the radiograms and the information that in all cases excepting the cretinoid the abduction of the shoulder was not greater than 45 degrees, an osteotomy of the humerus would seem not inapplicable. The author does not discuss this aspect of the subject, but, no doubt for good reasons, operative measures were ruled out.

220. Empyema in the First Year of Life.

G. LINDBERG (*Hygienica*, July 31st, 1919) has analysed the 15 cases of empyema in infants under one year treated at the Sachska Hospital in the period 1911-16. Of these cases only 4 were females. In 9 cases the empyema was secondary to inflammation of the lungs, in 6 it was a metastatic process. Nine of the 15 cases terminated fatally. The author notes as curious that all the 4 staphylococcal cases terminated in recovery. The 3 streptococcal cases, and 3 of the 4 cases in which pneumococci were found, terminated fatally. No uniform method of treatment was adopted in these cases, but it is significant that in 8 of the 9 fatal cases treatment was confined to puncture. The treatment responsible for two of the recoveries was permanent drainage effected by a catheter inserted through a trocar introduced through a small incision in the chest wall. This treatment involved the formation of a pneumothorax, which in one case provoked temporary collapse. Though the author is favourably impressed by this method he urges discrimination in the choice of treatment, and deplures the practice of confining treatment to puncture or rib resection.

221. Ventricular Puncture for Meningitis.

ZINGHER (*Amer. Journ. of Med. Sci.*, 1919, 157) advocates prompt ventricular puncture for meningitis. According to this author the method is of especial value in those cases where lumbar puncture gives a dry tap and little or no antimeningococcal serum can be injected. In such cases the intracranial cavity must be reached directly. In infants a ventricular puncture is no difficult feat and can be done without an anaesthetic. In the adult, of course, a small disc of bone must be removed or a small hole drilled. (Probably the method of tapping the cisterna magna through the occipito-atlantal ligament as elaborated at the Johns Hopkins Hospital is superior to ventricular puncture after the age of closure of the fontanelle.) Zingher believes in daily punctures of the ventricles and the withdrawal of 20 to 50 c.cm. of cerebro-spinal fluid, 15 to 30 c.cm. of serum being then injected. He records two cases in which this procedure was carried out. The first died on the thirtieth day of the disease after five ventricular punctures. The other made a good recovery after four punctures.

222. Ascending Ureteric-pyelitis.

MICHON (*Journ. de méd. et de chir. prat.*, December 25th, 1919) states that experimental work and clinical observation show that ascending ureteritis gives rise to stricture and sclerosis, but that these lesions are at first often unilateral and confined to a small segment of the ureter. It is then possible to dilate the strictures by intermittent or permanent catheterization, and it may also be possible by an operation to free the ureter from the sclerotic tissue.

223. Colles's Fracture.

COTTON (*Boston. Med. and Surg. Journ.*, December 4th, 1919) describes a method for the adequate reduction of Colles's fractures based on a reversal of the mechanism of production of the deformity. Recognizing that the condition is a rotation backward of the hand about the ulnar head as a fixed point—a rotation which tears the ulnar ligaments and also breaks the radius—reduction is made (after the obvious displacement of the radius has been corrected) by carrying the hand about the ulnar head as a fixed point into pronation and flexion. By traction and rocking, with the hand a little extended backward so as to free the displaced radial fragment and the dislocated ulna, the hand is then dragged down into pronation and flexion, keeping the thumb under the ulnar head in order to make it a fixed fulcrum, with force directed upwards. The joint should then be put up in flexion with strip splints of eight to ten layers of plaster-of-Paris bandage, the dorsal splint from elbow to knuckles and the palmar one from upper forearm to palm, and these are held *in situ* with a few turns of plaster-of-Paris bandage. The hand recovers function more quickly after such flexed fixation than after straight splints. The encircling plaster may be slit along one side after a day or two to ease circulation, as the position tends to impede the blood flow and requires watching. In not longer than a fortnight straight splints with exaggerated pads should be substituted and kept on for another week, followed by a supporting strap of adhesive plaster reapplied every three to five days until the hand is strong.

224. An Anomalous Case of Pott's Disease.

A. FISCHER (*Med. Klinik*, December 14th, 1919) confesses to diagnosing a malignant tumour of the cord in the following case. A soldier, aged 32, was admitted to hospital in April, 1918. Since March, 1917, he had been unable to walk, and for a fortnight before admission he had not been able to move his legs. Wassermann's reaction was negative, the patellar reflexes were exaggerated, his legs were somewhat rigid, and ankle clonus and Babinski's sign were demonstrable on both sides. Except for a small island, corresponding to the umbilicus, there was complete loss of sensation to touch, pin pricks, heat and cold from the xiphoid process downwards. The line of demarcation between anaesthetic and normal skin was sharp; traced round the body it was about one segment higher on the left than on the right side. There were patches of hyperaesthesia over both shoulder blades and the front of the chest. The *r*-ray examination of the spine was negative. In May retention of urine set in, and the patches of hyperaesthesia spread to the arm. In June the temperature became hectic, a tuberculous abscess formed in the right axilla, and a blood-stained effusion in the right pleural cavity. Late in June the spine of the seventh thoracic vertebra became prominent, and by the beginning of August the spastic paraplegia had given place to a flaccid paraplegia. The patellar and Achilles reflexes, as well as ankle clonus, could not be elicited. Bledsores and

cystitis supervened, and death occurred on August 16th. At the necropsy complete tuberculous destruction of the bodies of the sixth and seventh thoracic vertebrae was found. At the level of the exit of the sixth, seventh, and eighth dorsal roots the dura was plastered by a thick patch of granulations for a length of 7 and a width of $1\frac{1}{2}$ cm. When the dura was incised, the internal meninges showed no definite tuberculous disease, only slight thickening and cloudiness. The cord was not compressed, and its normal outline on section was retained. Tuberculosis of the lungs and neighbouring structures was also found. The author suggests that the transition from spastic to flaccid paraplegia must be correlated with the collapse of the bodies of the vertebrae which relaxed the pressure hitherto exerted on the cord by the extradural granulation tissue.

225. Inguinal Hernia.

TOREK of New York (*Ann. Surg.*, 1919, 70) reviews the 598 cases of hernia operated upon by him according to his own method. There were only two recurrences, a rate equal to one-third of 1 per cent. Of these two recurrences, one, a syphilitic subject, developed gangrene of the abdominal wall, the other was operated upon by a house-surgeon in Torek's absence. The author makes a great point of separating the vas deferens and the blood vessels of the cord from one another as well as from the sac. This allows one to see the vas coming out from the bottom of the opening in the transversalis fascia and the vessels coming out at the top, whilst the ligatured sac falls back between the two. Separation of vas and vessels is perpetuated by bringing the latter out at the external angle of the wound, inserting two or three sutures uniting the internal oblique and transversalis muscles to Poupart's ligament, and then bringing out the vas. The rationale of the separation of the vas deferens from the vessels of the cord lies in the observed fact that the hernial sac insinuates itself between the two. If, therefore, the whole cord is displaced either forwards or backwards as in the ordinary Bassini and Fergusson operations, the possibility of recurrence is not disposed of. Torek's method of introducing sutures between these two structures prevents any insinuation of a peritoneal diverticulum between them. The only place where recurrence can take place is in the lower angle (in the form, that is, of a direct hernia). This point is selected for the insertion of the silver sutures, which he used to employ in the whole length of the wound, but now reserves for the inner two or three sutures where greatest tension is. Torek's operation is ably planned, and the results, as may be judged by the figures given above, are better than most.

226. Treatment of Laryngeal Carcinoma by Radium and X Rays.

G. ALEXANDER (*Wien. klin. Woch.*, January 1st, 1920) records a case of epithelioma of the larynx which had invaded the pharynx in a man aged 62. Operation was refused, and the patient was treated by radium and *x* rays. When he was shown at the Vienna Laryngological Society after thirteen months' treatment, though the tumour had not got smaller, but had even slightly increased in size, there was no evidence of metastases, ulceration, infiltration, or cachexia. A biopsy of the accessible part of the tumour no longer showed any new growth, but only connective tissue. Apart from occasional slight local pain and difficulty in swallowing, there were no longer any symptoms present, and the general condition was excellent.

OBSTETRICS AND GYNAECOLOGY.**227. Influenza in Pregnancy.**

IN his thesis, which is based on the study of cases in the maternity department of the Lariboisière Hospital, GRILLET (*Journ. de méd. et de chir. prat.*, January 10th, 1920) records his experience of cases of pregnancy complicated by influenza in the epidemic of 1918-19. Four cases of pregnancy of less than six months' duration complicated by severe influenza all resulted in abortion about a week after the onset of the disease, and ended fatally within forty-eight hours. Thirty-seven cases occurred in women whose pregnancy was of more than six months' duration. In two cases death took place before delivery. In fifteen cases complicated by pneumonia or bronchopneumonia there was premature delivery and expulsion of a dead fetus, and, with three exceptions, rapid aggravation of the mother's condition and death. In twenty-five cases there was expulsion of a living fetus, but in only nine cases did the mother and child survive.

In no case did uterine infection take place. Labour was rapid in all, and the influenzal infection was the cause of death. Twenty-two cases occurred in women at term; 50 per cent. of the mothers died; the prognosis as regards the child varied according to the case. When influenza developed at the time of delivery the child was born healthy, but death occurred *in utero* if the influenza manifested itself a few days before birth. These cases show that influenza complicated by bronchopneumonia is very liable to be interrupted by abortion or premature labour, and that the prognosis of this complication is very grave.

228. Ovarian Residue.

GRAVES (*Surg., Gyn., and Obstet.*, December, 1919) considers that an extract of ovarian tissue made after ablation of the corpora lutea ("ovarian residue") is of greater therapeutic value than extracts of whole ovary or of corpus luteum, owing to the less rapid decomposition of the ovarian tissue than of the corpus luteum tissue. He advises preparations in ampoule form as less likely to decompose. "Ovarian residue" has been prepared as far as possible from pregnant animals. With regard to results, the author admits that he is entirely dependent on his patients' statements, and gives these for what they are worth. His results in cases exhibiting menopausal symptoms have been excellent, in cases of irregular menstruation and amenorrhoea sometimes startling but with many failures, and in cases of dysmenorrhoea encouraging.

229. The Diagnosis of Pregnancy.

BAR and ÉCALLE (*Rif. Med.*, November 15th, 1919), at the Gynaecological Congress recently held in Brussels, discussed recent biological observations in relation to pregnancy. Deviation of the complement was seen when the serum of a pregnant woman (under five months) was brought into contact with placental tissue below four months, but they describe the phenomenon as very rare, weak, and temporary. Abderhalden's dialysis method constantly gave a positive reaction. This reaction appeared in the first or second month of pregnancy, and disappeared in the majority of cases during the three weeks after delivery. In extruterine pregnancy the reaction was always positive as long as the ovum was alive. On the other hand, the serum of non-gravid women might also give a similar reaction. Methods based on increased antitryptic power gave no results of value; a similarly doubtful result followed experiment with cobra poison as a test of the activating power of the serum of pregnant women. Speaking generally these biological tests are so full of possible errors that at present they are of little clinical value, however much they may indicate methods which may be of scientific interest in the future when more is known of them.

PATHOLOGY.

230. Fatal Influenzal Myelitis.

I. HARBITZ (*Norsk. Mag. for Laegevidenskaben*, January, 1920) reports on the *post-mortem* findings of 75 persons who died between July, 1918, and 1919 of influenza or its sequelae. He classifies his material according to the organs affected, and shows that scarcely a single organ is immune to the complications of influenza. His notes on a case of myelitis and neuritis are of special interest because influenzal lesions of the nervous system are seldom seen in the *post-mortem* room, though influenzal neuralgia and neuritis are familiar to the clinician. The patient was a woman of 52. A few days after contracting influenza she developed headache with partial loss of vision, first on the left side, then on the right. Papillitis was diagnosed, and in a fortnight she was blind. Later, both legs below the knees became painful, anaesthesia was demonstrable up to the level of the axillae, and there was paresis of the muscles of the trunk and limbs. Death followed the development of pneumonia, more than two months after the onset of the influenza. Scattered over the inner lining of the dura of the cord were numerous white patches, from the size of a pin's head to that of a pea, about 1 mm. thick. Some of these patches were partially calcified—arachnitis ossificans. The cervical cord (second to third segment) was greyish-red, oedematous, congested; the boundaries between the grey and white matter were blurred. Traced downwards, the cord showed these changes with increasing distinctness, and at the level of the first dorsal segment was quite soft, and the normal

markings were obliterated. The microscope showed parenchymatous myelitis and neuritis, with degeneration of nerve fibres and ganglion cells in both the white and the grey matter.

231. Eosinophilous Myocarditis in Diphtheria.

F. NUZUM (*Journ. Amer. Med. Assoc.*, 1919, lxxiii) examined microscopically the heart in 29 children dead of diphtheria and found eosinophil cells in the myocardium, as Wulffins, Tanaka, and Liebman had previously observed, but he failed to detect them in fatal cases of scarlet fever, meningitis, poliomyelitis, and measles. The cells were polymorphonuclear in type with many granules, especially obvious with Wright's stain. They were not more frequent in hearts showing the most advanced degeneration, and did not bear any relation to the severity of the clinical symptoms, or to the amount of serum used in the treatment. The cells were never found in the specific conducting system of the heart—that is, the sinus node, Tawara's node, the His bundle, and Purkinje fibres. Various explanations of eosinophilous myocarditis, such as Schlecht and Schwenker's, that anaphylactic reactions and serum therapy play a part, are mentioned, and the author concludes that the most probable view is that it is due to positive chemotaxis, some substance being present in the myocardium in response to which eosinophils migrate from the capillaries. He also found moderate cloudy swelling in the bundle of His and in the special conducting system of the heart, and thinks that the various types of arrhythmia in diphtheria may be due to compression of the fibres in the bundle of His by the moderate swelling, or to degenerative changes in this system.

232. Blood Sugar in Nephritis.

GRIGAUT, BRODIN, and ROUZAUD (*C. R. de la Soc. Biol.*, January 24th, 1920), who have already shown that the glucose content of the blood in normal cases oscillates only within narrow limits in the neighbourhood of 1 gram per litre, found that hyperglycaemia was the rule in infectious diseases, and that it corresponded with the gravity of the case. In an examination of the blood of 19 cases of chronic nephritis there was always an increase of glucose, varying from 1.15 to 1.82 grams to the litre of whole blood. Renal impermeability with consequent retention only partially accounts for the hyperglycaemia.

233. Giant Cell Sarcoma of the Thyroid and Pancreas.

In examination of 650 bodies at the Utrecht Anatomical Institute since December 1st, 1915, E. C. VAN RIJSEL (*Nederl. Tijdschr. v. Geneesk.*, December 20th, 1919) found 7 cases of thyroid tumour. In 4 cases the tumour was an adenoma, in 1 a haemangioma cavernosum, in 1 a secondary growth from a renal carcinoma, and in 1 a giant-celled sarcoma. The rarity of malignant tumours of the thyroid is further illustrated by the following statistics: Among 6,400 autopsies performed at the Utrecht Anatomical Institute since 1883 there were 733 carcinomata and 105 sarcomata. In this number there were only 2 sarcomata and 1 carcinoma of the thyroid. Chiari, in 7,700 autopsies at Prague, found 11 carcinomata and 5 sarcomata of the thyroid. In 3,700 autopsies at the Binnen Hospital at Amsterdam De Vries found 2 thyroid carcinomata out of 320 carcinomata of all kinds, and in 4,728 at the Wilhelmina Hospital Scholte also found 2 thyroid carcinomata among a total of 420 carcinomata. Thus, out of a total of 1,473 cancers, there were only 5 cancers of the thyroid (0.33 per cent.). In goitre districts, however, the number is much greater. Thus the Swiss statistics of Langhans-Müller of Berne and of Kaufmann of Basle combined show that out of 1,599 cancers there were 63 cancers of the thyroid, or about 4 per cent. The literature shows that malignant tumours are of much more frequent occurrence in goitres than in ordinary thyroid glands. Of 41 cases of thyroid sarcoma collected by Carranza 25 occurred in goitres. Kaufmann collected 30 cases of malignant goitre, 23 of which were carcinomata and 7 sarcomata. All forms of sarcoma may occur in the thyroid, but the giant-celled, of which van Rijssel records 2 cases, are the rarest. The first case was in a man aged 70 with extensive metastases in the lungs. Death was due to bronchopneumonia, accelerated by dyspnoea from pressure of the growth on the trachea. The second case was in a woman aged 61 with metastases in the lungs, kidneys, mediastinum, brain, cervical lymphatic glands, myocardium, left suprarenal, pancreas, and stomach. Sarcoma of the pancreas is much rarer than that of the thyroid. Among the 6,400 autopsies performed at Utrecht there were 733 carcinomata and 105 sarcomata; the pancreas showed carcinomata in 24 cases and sarcoma in only one.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

234. Adrenalin in the Diagnosis of Latent Malaria.

A. DAZZI (*Il Policlinico*, Sez. Prat., November 30th, 1919) carried out the subcutaneous injections of adrenalin in 20 cases, as recommended by Schittenhelm and Schlect, and independently by Neuschlossz, for the diagnosis of latent malaria. He found that in doses of 1 mg. adrenalin did not provoke a typical attack of malaria, but was constantly followed by the appearance of plasmodia in the blood. The presence of the parasites was only transitory. It first appeared about twenty minutes after the injection, reached its height in about an hour, and after another twenty-four hours all the parasites disappeared. In cases in which the parasites were already present before the injection, their number was greatly increased. The adrenalin also caused considerable diminution in the size of the spleen, except in cases of advanced sclerosis of the organ. The change in size of the spleen began a few minutes after the injection and stopped in a few hours' time.

235. Treatment of Malaria.

T. SILVESTRI (*Il Policlinico*, Sez. Prat., November 30th, 1919) maintains that the only way in which a complete cure of malaria can be effected is by a mobilization of the plasmodia by various provocative methods, followed by buccal administration of quinine, which he prefers to any other form of administration. The simplest and best provocative method in his experience is the use of strychnine in doses of 1 to 3 mg. a day, and as a rule the attack appears within three to four days.

236. Toxicology of Hydrocyanic Acid.

As the result of experiments on dogs, CHELLÉ (*Journ. de méd. de Bordeaux*, January 10th, 1920) has found that hydrocyanic acid in ordinary circumstances disappears, or at least fails to give its ordinary reactions a short time after death, a fact which has been recognized by all authorities. On the other hand, contrary to what has hitherto been supposed, the acid is not irrevocably destroyed or transformed, but under the influence of the sulphur products which are formed in cadaveric putrefaction it becomes sulphocyanic acid, and can be reconverted into hydrocyanic acid by an appropriate oxidizing agent, such as chromic acid. In a case of poisoning by prussic acid the expert is thus enabled to find the poison which has hitherto escaped detection.

237. Intradermal Reaction with Extract of Tuberculous Urine.

ACCORDING to F. MICHE (*Rev. méd. de la Suisse rom.*, December, 1919), a practical application of the discovery by Marmorek and Maragliano of specific toxins in the serum and urine of tuberculous patients has recently been made by Wildbolz of Berne, who injects this toxic urine intradermally for diagnostic purposes. Wildbolz claimed that the great superiority of this reaction over the ordinary skin and intradermal reactions to tuberculin lay in the fact that it was positive in active tuberculosis and negative when the disease was quiescent. As the result of control experiments Miche came to the following conclusions: the method enables the practitioner who has no tuberculin to perform the reaction, but it is no more a guide than tuberculin as to the presence of active tuberculosis. The reaction with the urine is more pronounced in very active forms with much disintegration of tissue and in young individuals. In fibro-caseous forms of tuberculosis, unlike the skin reaction, it is doubtful or weak when the prognosis is good and well marked when it is bad.

238. Rupture of Aortic Aneurysm into the Superior Vena Cava.

J. B. HERRICK (*Amer. Journ. Med. Sci.*, 1919, clviii) collects 43 cases of this lesion, including a case under his care of rupture of the aneurysm into the left innominate vein less than a third of an inch from the superior vena cava. The symptoms and signs are reviewed mainly on the basis of Pepper and Griffith's paper in 1890 based on 29 cases; in 1906 Fussell added 7 cases, and Herrick has collected 8 more. There is first evidence of an intrathoracic

aneurysm, then sudden onset of symptoms attending rupture, with a feeling as if something had given way in the chest, rapid increase in the swelling and onset of cyanosis and dyspnoea. Thirdly, there is evidence of obstruction of the superior cava, such as cyanosis, oedema, coldness, distension of the veins: in Herrick's case there was a sharp line of demarcation between the bloated purple upper part of the body and the pale emaciated lower portion. Fourthly, there is a murmur at the base of the heart, most characteristically continuous through systole and diastole and thus comparable to the murmur of a patent ductus arteriosus. The diastolic portion of the murmur is due to the arterial systole. One of the collected cases is said to have been followed by recovery, but Fussell refers to a case in which, though sudden symptoms suggested this lesion, it was absent at necropsy.

239. Syphilis as a Factor in the Ocular Complications of Typhoid Fever.

A. T. ESTRADA, of Mexico (*El Observador Med.*, October 15th, 1919), reports six cases of ocular complications of typhoid fever, five of which were examples of optic atrophy and one of iridocyclitis. In three there was a history of acquired syphilis, two were obviously subjects of the hereditary disease, and in one no inquiry into syphilitic antecedents was made. Considerable improvement took place in one of the cases after treatment by mercury and potassium iodide. In the other cases the ocular condition was too advanced for treatment to be of any benefit. Estrada points out that the optic neuritis following typhoid does not differ from that occurring in syphilis either in its course, manifestations, or termination. In both there is an insidious onset and slow and progressive course, ending, after a varying period of time, in complete blindness. The same is to be said of the iridocyclitis met with in both diseases. Estrada emphasizes the importance of looking for syphilis in every patient with a post-typhoid ocular complication. Even if there is no history or clinical evidence of syphilis, the Wassermann reaction in the blood and cerebro-spinal fluid should be tested, or, if this is impossible, antisyphilitic treatment should be employed. It is very probable that if patients with post-typhoid optic neuritis or iridocyclitis become blind, this is due to lack of proper treatment or to their having been treated too late.

240. Secondary Pneumonia.

CHICKERING (*Boston Med. and Surg. Journ.*, December 11th, 1919) studied the bacteriology of the secondary pneumonia frequently occurring in influenza and measles, and more rarely as a terminal result of chronic constitutional or metabolic disease, in infants suffering from malnutrition, and in adults following surgical operation, in contradistinction to acute lobar or primary pneumonia. While the primary lobar pneumonia is almost always caused by the pneumococcus, the secondary pneumonias are associated with a variety of organisms, namely—pneumococcus, streptococcus, staphylococcus, *B. influenzae*, *Micrococcus catarrhalis* and *flavus*, Friedländer's bacillus, etc.; in primary pneumonia it is unusual for more than one organism to be present, whereas in the secondary pneumonias two or more are not uncommon. The types of bacteria and their percentage occurrence in secondary pneumonia compare closely with those commonly residing in the nasopharynx, and the strains isolated from the lungs showed no difference from those in the nose and throat. More attention must be paid to the care of the nasopharynx in acute infections; and though there is no ideal sterilizing agent for the upper air passages, much can be done by cleanliness, and the suppression of congestion of the mucous membrane. The violent paroxysms of non-productive coughing associated with measles and influenza may materially aid in the dispersal of the nasopharyngeal bacteria into the deeper air passages of the lungs, and the harassing cough must be controlled.

241. Round Worm Infection Clinically Simulating Pneumonia.

MCKIBBEN (*Boston Med. and Surg. Journ.*, December 4th, 1919) records a case of a boy, aged 2, who when first seen presented the typical picture of pneumonia—pulse 160, respirations 60, and temperature 104°. For a week or two

he had been passing stringy mucus, and during the last two days had developed a cough and coryza. Examination failed to give any positive physical signs. Three and a half months previously he had filled his mouth with some dirt from around a heavily fertilized shrub, and a week before being seen he passed a dead worm of the *Ascaris lumbricoides* variety. The severe toxæmia suggested a possibility of convulsions, and he was given a tablespoonful of castor oil followed in an hour by $\frac{1}{2}$ grains of santonin. Six hours later he passed a wriggling pinkish mass closely resembling earthworms, followed in two hours by a similar mass of *Ascaris lumbricoides*, totalling 78 in all, and varying in length from $\frac{1}{2}$ to 11 inches. One worm came upwards through the mouth. Many more were flushed out by intestinal lavage with four quarts of salt solution. The castor oil and santonin treatment was repeated morning and night for the next two days, bringing away a total of 370 worms, not counting those under $\frac{1}{2}$ inches in length. Blood examination showed no leucocytosis, but a marked eosinophilia of 40 per cent. The treatment was continued bi-weekly for a month, two to five worms resulting each time, after which occasional treatment showed that there were no more, and the boy soon regained perfect health.

242. Malaria Hemiplegia in an Infant.

L. SPOLVERINI (*Il Policlinico, Sez. Prat.*, December 21st, 1919) records a case of right hemiplegia preceded by epileptiform convulsions in a suckling infant aged 11 months. The liver and spleen were enlarged and malignant tertian parasites were found in the blood. Recovery took place under quinine treatment. Both the parents were also infected by malignant tertian. The hemiplegia is attributed by Spolverini to cerebral thrombosis, the vessels being blocked by spores, pigment masses, and endothelial cells.

243. Post-influenzal Dyspepsia.

ACCORDING TO G. DEUSCH (*Med. Klinik*, November 16th, 1919) the last epidemic of influenza at Rostock was followed by a number of cases of dyspepsia which lasted several months. None of the patients had suffered from any gastric trouble before their attack of influenza. The dyspepsia is attributed by Deusch to a hyperæsthesia of the mucous membranes of the stomach due to damage to the sensory nerve endings by the influenza toxin. Disturbances of the motor function of the stomach appeared to be fairly uncommon; on the other hand, most of the cases showed secretory disturbances. A diminution or complete absence of acidity was the principal finding, being probably due to a toxic involvement of the vagus.

244. Deep Irradiation in Leukaemia.

ROSENTHAL (*Berl. Klin. Woch.*, November 24th, 1919) has practised irradiation of the spleen in a number of cases over a period of two years, and has found that deep irradiation with heavy doses of rays gives a much more reliable result than benzol, or than ordinary exposures to x rays. The leucocyte count is invariably greatly reduced, sometimes even to normal limits, and the beneficial effect persists for about eight months. As it is unnecessary to repeat the exposures more frequently there is little risk of this therapeutic measure losing its effect. The process is not free from risk: in most cases there is a reaction during the first twenty-four hours afterwards, comprising nausea, anorexia, and weakness, and in some cases this is severe. In three cases out of twenty-five thus treated death occurred. The reaction is possibly referable, at any rate in part, to poisoning by nitrite fumes produced electrically by the apparatus.

245. Treatment of Chilblains with Diathermy.

WHILE treating two cases of severe vascular disease (Raynaud's disease and intermittent claudication) with diathermy, R. GRÜNBAUM (*Wien. Klin. Woch.*, January 1st, 1920) noticed that some severe and extensive chilblains on the fingers and toes considerably improved after the first thermo-penetrations and at length completely disappeared. These observations encouraged him to treat chilblains systematically with diathermy, which he found far superior to all other forms of treatment. He attributes the success of diathermy to its causing an active hyperæmia of the deep vessels. He also recommends it for severe forms of frostbite, which, owing to lack of fuel, are likely to be prevalent this winter in Vienna. The method serves a diagnostic purpose in determining the limits of the frozen parts, and helps to save those portions of the extremities which would otherwise certainly become gangrenous.

SURGERY.

246. Progressive Infective Perichondritis.

J. F. O. HUESE (*Nederland. Tijdschr. v. Geneesk.*, December 27th, 1919) records a fatal case in a man aged 53. The disease started in an abscess below the perichondrium of the eleventh rib, which then involved the wall of the stomach and gave rise to a gastric fistula. The infection showed a predilection for the cartilage, or rather for the perichondrium, as the rib cartilages themselves remained normal. When the cartilage was removed the abscess healed, but the process extended from rib to rib, invaded the sternum, and finally the lung. Death took place from cachexia. Similar cases have been recorded after typhoid, influenza, fracture of the ribs, and operation for gall stones. The cause of the infection in the present case could not be established and no specific organism was found.

247. A Sign of Acute Pancreatitis.

GREY TURNER (*Brit. Journ. Surg.*, 1920, 7) draws attention to a hitherto undescribed sign of acute pancreatitis. This consists of a bluish or dirty greenish discoloration of the skin of the abdominal wall. Turner has noted it in two instances. In the first case it was situated at the umbilicus; in the second there were two patches, one on either loin. In the latter case autopsy revealed direct continuity between a sloughed pancreas and the discoloured loin areas. Turner believes that the condition is due to the direct action of the pancreatic juice, which escapes via the retroperitoneal tissue, and passes by the most direct route to the surface. When situated at the umbilicus the secretion must have travelled along the ligamentum teres.

248. Causes of Delayed Union and Non-Union in Fractures of the Long Bones.

W. L. ESTES (*Annals of Surgery*, January, 1920) considers that the term non-union should be used for fractures which show abnormal mobility after six months. He recommends a routine Wassermann test in all cases of delayed union. Local causes which have to do with deficient blood supply, bone lesions or infection, account for the majority of delayed union cases. Plating in itself is accountable for delayed union in relatively few cases of simple fracture. Osteomyelitis plays a major rôle in the prolongation of the normal time of union. Compound fractures, in this observer's series of cases, showed delayed union in three out of every ten cases. In compound comminuted fractures delayed union occurred in three out of every four cases, and non-union in one out of eight. His statistics agree with Jones's, that the most common sites of delayed union in shaft fractures are the junction of the middle and upper thirds of the humerus, the middle of the femur, and the lower third of the tibia and fibula.

249. Tansini's Operation for Banti's Disease.

TANSINI, in a recent communication (*Rendiconti del R.I. di Sc. e Lettere*, vol. lii, fasc. 9-11, 1919; see *Riforma Med.*, 1919, 35), reviews the literature of cases of splenomegaly on which his double operation of splenectomy and omentopexy have been performed. Tansini first performed this operation in 1901 on a woman with an enlarged spleen, cirrhosis of the liver, and advanced ascites—that is, the third stage of Banti's disease. The result was a complete cure, satisfactory from every point of view. This operation has since been frequently carried out by Tansini and by many other surgeons, principally in Germany, France, and the United States. Rodman and Willard (*Ann. Surg.*, November, 1913) reported a number of cases, and came to the conclusion that Tansini's operation is especially indicated in the ascitic stage of Banti's disease. In the earlier stages splenectomy alone usually suffices. The operation recalls the Talma-Morison method of anastomosing the portal with the general systemic circulation, and the two afford methods—the one of cure, the other of relief—in two distressing diseases.

250. Contusion and Rupture of Spleen.

CAULI of Rome (*Riv. Osped.*, April 30th, 1919) discussed the clinical pictures presented by ruptures and contusions of the spleen. Slight contusions usually remain undiagnosed, for the signs of splenic injury do not brazenly disengage themselves from those of contusion of the abdominal wall and ribs. But, according to Verneuil and his pupil Mathon, in typical cases there are certain outstanding features. First, pain in the left hypochondrium, generally localized but sometimes radiating over the abdomen or

into the left lower limb. This pain is increased by manual pressure and by respiratory movements, and is explained by involvement of the pleura, diaphragm, peritoneum, or perhaps distension of the splenic capsule by haemorrhage. Secondly, there is fever of the remitting type, with evening rise. It will be recalled that a very slight trauma may suffice to rupture the malarial spleen. Thirdly, there is enlargement of the spleen, which may reach an enormous size from pure intrasplenic bleeding. These haematomata may take one of three courses—they may rupture into the peritoneal cavity, they may settle down with formation of a blood cyst, or they may become infected. As for rupture of the spleen, the symptoms and signs are due to shock in the first place and then to haemorrhage. Shock may be very severe. Cauli refers to a case of instantaneous death following a severe injury to the abdomen. At autopsy the spleen was found torn across, but there was no blood in the peritoneal cavity, owing to reflex spasm of the vessels. Following this initial shocked stage there is often a period of recovery, the so-called "latent period of Baudet," and this is usually a definite and characteristic incident. Finally, there is the period of haemorrhage. Cauli discusses the latest. He suggests that it depends on one or more of the following factors: With the state of shock there is a general fall in blood pressure which causes contraction of the splenic vessels and capsule, producing a partial or complete haemostasis. In rarer cases an intrasplenic haematoma forms, and this may easily be ruptured by a sudden movement or by internal pressure with signs of internal haemorrhage. Or again, during the period of shock there is a temporary haemostasis, due in part to vessel spasm, in part to the formation of clots in the lips of the tear. Any subsequent rise in blood pressure may suffice to dislodge these natural tampons, and violent haemorrhage set in. A very slow but constant haemorrhage would produce a latent period, the initial shocked stage being well passed before sufficient blood had been lost to make the signs of internal haemorrhage obvious. The diagnosis of rupture may be made upon pain in the splenic area, rigidity of the abdominal wall, signs of fluid in the peritoneal cavity with dullness on the left side. Cauli's paper is valuable in that it calls attention to the less severe injuries of the spleen, and to the pathogenesis of the variations in the clinical signs.

251. Hour-glass Bladder.

J. R. CAULK (*Annals of Surgery*, January, 1920) describes two cases of this condition, in one of which there was also hare lip and hypospadias. The cases showed a partition across the base of the bladder about 1 in. behind the interureteric bar with a physiological contraction of the bladder over the dome in the same segment with the transverse septum of the base. In one patient the right ureteral orifice was open and gaping, and there was hydronephrosis and hydro-ureter. In both cases suprapubic cystotomy was performed and resection of the base of the bladder containing the transverse band. The partition extended completely through the bladder wall, and was almost cartilaginous in density. In the history of the cases, one patient could urinate more freely lying down than standing, and at the operation the bladder wall in the segment behind the band was very redundant and freely movable, and could be carried over the bar and pressed into the neck of the bladder.

252. Pyelotomy versus Nephrotomy for Calculi.

NICOLICH (*Rif. Med.*, September 6th, 1919) discusses the relative merits of pyelotomy and nephrotomy as a means of dealing with renal calculi. The history of pyelotomy is one of ups and downs. First practised by Beck of London as long ago as 1831, it fell into disfavour, and as recently as 1907 Kummel (with an experience of one case only!) pronounced strongly against it, his fear being a persistent lumbar fistula. Since then the operation has gradually won its way back to favour, and this time seems to have come to stay. The chief disadvantage of nephrotomy is the haemorrhage which the incision of the kidney occasions—the "pluie d'orage" of Tuffier. Israel had 16 cases of haemorrhage, with five deaths, in a series of 99 aseptic nephrotomies. Mayo was forced for the same reason to perform nephrotomy in 4 out of 40 cases, and Nicolich removed four bleeding kidneys in his 36 nephrotomies. The time and cause of bleeding are discussed. Haemorrhage may occur in pyelotomy also, but is always due to an error in technique—that is, the prolonging of the incision in the pelvis too far towards the kidney. In this situation certain large vessels are invariably encountered. In two of the author's cases this mistake was made, necessitating the removal of the kidney. As for the fear of a renal fistula following pyelotomy, this undesirable result

never follows if the ureter is unobstructed. It is the urologist's business to make sure on this point beforehand. As for the risk of leaving stones behind embedded in the kidney substance, this may arise at either operation, and must be guarded against. The chief safeguard is reliable pre-operative radiography. The only times when nephrotomy must be employed are those when very large calculi are present, or when the kidney is bound down and cannot be raised up from its bed.

253. Severe Post-dysenteric Disease of the Rectum.

A. FOGES (*Wien. klin. Woch.*, December 25th, 1919) gives details of five cases to show that post-dysenteric disease of the rectum may closely simulate tuberculosis or cancer, and that though treatment with astringents and most other remedies is of little use, endorectal treatment with quartz light affords considerable relief. Of its ultimate effects and its ability to effect a radical cure he is uncertain. In four of his five cases the evidence of palpation was indicative of cancer. There was circumscribed infiltration of the mucosa, the surface of which was hobnailed, bleeding readily. The inflammatory character of the infiltration became evident when, on rectoscopy, a more diffuse distribution of the disease was noted than palpation had revealed. In the case of a soldier, aged 36, fifteen quartz light exposures, each lasting fifteen minutes, were given. This relieved the pain in his back and reduced the inflammation. After an interval of some weeks there was a relapse, but after twenty-five more exposures the infiltration had practically disappeared, and the haemorrhages, from which he had suffered, had ceased, but in none of his cases could the author claim a complete cure. One of his patients was a young married woman, the condition of whose rectum was so suggestive of malignant disease that an exploratory excision was made. The pathologist's report being indecisive, resection of the rectum by the sacral route was performed. The excised portion of gut showed signs of inflammation only, and one consequence of this futile operation was a recto-vaginal fistula.

OBSTETRICS AND GYNAECOLOGY.

254. War Amenorrhoea.

THE effects of the war on a neutral country involved in an industrial blockade are reflected in the figures given by G. HOLMBERG (*Svenska Läkaresälls. Förhandl.*, December 31st, 1919), who has investigated the incidence of amenorrhoea at a gynaecological clinic before, during, and after the war. Excluding cases of amenorrhoea due to tuberculosis, heart disease, and the like, as well as cases in which menstruation had never occurred, he found that among 1,356 patients seen in 1912 there were 12 cases (0.9 per cent.) of amenorrhoea of indefinite origin. In 1913 and 1914 the corresponding figures were 0.7 and 1.3 per cent. During 1915 and 1916 there was little change, the figures for the two years being 1.5 and 1.6 per cent. respectively. But in 1917 there was a sudden rise to 5 per cent., and in 1918 to 9 per cent. In 1919, up to November 1st, there was an abrupt fall to 1.7 per cent.

255. F. PINELES (*Wien. med. Woch.*, November 1st, 1919) states that the first appearance of war amenorrhoea on a large scale was noted in several places, including Berlin and Cologne, in 1915, but that it did not attract general attention till the autumn of 1916. The patients, who belonged to all classes of society, suddenly had a cessation of their periods; their last menstruation was of the same duration and character as the previous ones. The duration of the amenorrhoea varied, according to their statements, from two months to two years and longer. A characteristic feature was the absence of any symptoms in the majority of cases. A few patients complained of general fatigue, weakness, and pains in the back and legs. Hilferding found that among the working proletariat of Vienna amenorrhoea had increased from 0.5 per cent. in 1912 to 14 per cent. in 1917. The conditions were most unfavourable among the munition workers who had the hardest work and those who were on night duty. In club practice the frequency was 14 per cent., as compared with 5 per cent. in private practice. It is probable that the amenorrhoea cannot be attributed to a single cause. Most writers suppose that the primary factor was a disturbance of the internal secretion of the ovaries, and that the cessation of the menstrual periods and, frequently, uterine atrophy were connected with this disturbance of the ovarian function. Fischer attributed the amenorrhoea to a contamination of the flour with various substances, among which was ergot.

Now Kobert has found in the Hippocratic writings descriptions of epidemics characterized by sterility or abortions among women occurring at a time when the crops were being spoiled. This description suggested ergotism, and as Fischer in some cases of war amenorrhoea noticed symptoms of tetany, such as cramps in the calves and paraesthesia, he expressed the view that definite toxic influences, such as ergot, might explain, in part at least, the occurrence of war amenorrhoea.

256. Radium in Cancer of the Uterus.

J. HEYMAN (*Scenska Läkaresälls. Förhandl.*, December 31st, 1919) discusses the results achieved in 1914 and 1915, as tested by an observation period of five years. Of the 26 cases of cancer of the cervix treated in 1914, 7 survived the five-year test; of these 7 (26.9 per cent. of the total) 5 were inoperable in 1914, 1 was operable, and 1 was a borderland case. Of the 40 cases treated in 1915, 11 (or 27.5 per cent.) could be considered cured five years later. The similarity of the results achieved in 1914 and 1915 suggests that the figures were comparatively accurate. A comparison of radium treatment with operative treatment, which implies a high operation mortality and is assumed not to effect a radical cure in more than 20 per cent., is distinctly unfavourable to the latter. Of the cases treated with radium, as high a proportion as 94 per cent. were inoperable. The results of radium treatment in the 3 clinically operable cases, the 1 technically operable case, and the 5 borderland cases showed a radical cure in 44.4 per cent. On the evidence of these figures it was claimed that treatment with radium properly carried out is at any rate equal to operative treatment.

257. The Etiology of Mongolism.

W. STOELTZNER (*Muench. med. Woch.*, December 26th, 1919) reports the cases of three women who developed signs of hypothyroidism in pregnancy, such as loss of appetite, constipation, obesity, loss of hair, absence of sweating, drowsiness, and indifference, and all gave birth to mongolian imbeciles. On the other hand, in seven other cases of mongolism there was no history of thyroid insufficiency during pregnancy. Stoeltzner, however, has published the cases in the conviction that positive results are of more value than negative, especially for the purpose of practical therapeutics. If mongolism be due to hypothyroidism of the mother in pregnancy, thyroid operation will not only cure the mother, but will also prevent the birth of a mongolian imbecile.

PATHOLOGY.

258. The Fat-Soluble Vitamine in Rickets.

HESS and UNGER (*Journ. Amer. Med. Assoc.*, January 24th, 1920) doubt the recent theory of the vitaminic origin of rickets, more particularly the view that the disease is attributable to a lack of the fat-soluble factor. They point out that the negro infants living side by side with the white in the larger cities, and obtaining milk from the same source, often develop pronounced rickets, thus indicating that some other important influence, some prenatal factor, has to be reckoned with. Again, if rickets is compared with the well-recognized deficiency diseases scurvy and beri-beri, these latter are accompanied usually by weakness and malnutrition, and neither can be brought about by overfeeding, whilst rickets frequently develops in infants receiving too much milk rich in fats, proteins and salts. The authors' clinical studies satisfy them that infants develop rickets while receiving a full amount of the fat-soluble vitaminic, and further that they do not manifest signs, although deprived of this principle for many months, at the most vulnerable period of their life. The danger to infants of a diet deficient in fat-soluble vitaminic is slight, provided it includes sufficient calories and otherwise is complete. The results of their clinical tests are quite opposed to the conclusions arrived at by Mellanby from experiments on dogs, and they strongly combat the idea of Hopkins and Chick that "fat-soluble vitaminic" and "antirachitic factor" are synonymous terms.

259. Diphtheroid Bacillus Meningitis.

DICK (*Journ. Amer. Med. Assoc.*, January 10th, 1920) reports a case of meningitis in which lumbar puncture yielded a cloudy fluid containing 740 leucocytes per cubic millimetre, 54 per cent. being polymorphs and the rest lymphocytes.

The ammonium sulphate test for localin was positive, and the colloidal gold test indicated meningitis. The Wassermann reaction was negative, and no tubercle bacilli were discovered either by direct films or by guinea-pig inoculation. But the films showed Gram-positive short diphtheroid bacilli, frequently in pairs, and often within leucocytes. These organisms differed from the true diphtheria bacillus in the absence of polar bodies and in their failure to acidify maltose and dextrin. A guinea-pig inoculated with a large amount of culture showed the presence of the organism in its cerebro-spinal fluid. The same organism was also isolated from the patient's blood. The disease was fatal.

260. Acute Atrophy of the Liver: Pregnancy: Salvarsan Treatment.

V. SCHELL (*Hospitaltidende*, January 7th, 1920) records the case of a woman, aged 25, who was admitted to hospital in the third month of pregnancy suffering from syphilis. She received thirty-nine inunctions of mercury and three intravenous injections of salvarsan, 40 eg. of which were given on each occasion, the intervals between the three injections being ten and seven days. Gastro-intestinal disturbances began almost immediately after the last injection, and jaundice supervened about ten days later. She became delirious, and died about six weeks after admission to hospital. The necropsy showed typical acute yellow atrophy of the liver, which weighed 700 grams. The kidneys and heart had undergone fatty degeneration. The liver contained 4 mg. of arsenic to the kilo. Discussing this case, the author argues that, though syphilis and pregnancy may both be factors in the development of acute yellow atrophy of the liver, the salvarsan may also have played a certain part in this case, and may even have been the decisive factor; for not only has it been convicted of provoking transitory jaundice, but it has also been suspected of aggravating the effect of syphilis on the liver by the destruction of spirochaetes (Herxheimer's reaction).

261. Wound Diphtheria.

ACCORDING to A. WEINERT (*Muench. med. Woch.*, December 19th, 1919) recent articles on wound diphtheria show that it has occurred and is still occurring with varying degrees of severity in different places, in a way similar to faucial diphtheria. In many cases the diphtheria bacilli found on the wound are merely harmless saprophytes; sometimes, however, they are extremely virulent. Thus Laewen and Reinhardt have related the case of a young doctor who infected himself while looking after patients with wound diphtheria, and in a few days succumbed to a severe attack of faucial diphtheria; and the same fate overtook Professor Wilms of Heidelberg when the surgical clinic of which he was in charge contained numerous cases of wound diphtheria. Laewen and Reinhardt noted that 10 per cent. of the patients in whose wounds diphtheria bacilli were found had faucial diphtheria and 15 per cent. were carriers of diphtheria bacilli in their throat. These figures closely correspond with those of Weinert.

262. Arterial Disease in Syphilis and Tobacco Poisoning.

R. BENEKE (*Muench. med. Woch.*, December 19th, 1919) states that in all cases of recent syphilitic arteritis the absence of fatty degeneration as contrasted with sclerosis is a striking phenomenon. At a later stage areas of fatty degeneration may be found when the morbid process becomes complicated by degeneration of the media. When, however, fatty degeneration is the most prominent feature in diseases of the vessels, other etiological factors than syphilis must be sought for. Beneke has recently seen three cases of arterial diseases, which he attributes to nicotine poisoning. All three patients, soldiers, aged 42, 44, and 48 respectively, had been extremely heavy smokers. They had shown no signs of syphilis or alcoholism, and no history of any other infection was obtainable. In two cases death was due to disease of the coronary arteries and in one to suicide. In each case the necropsy showed a well marked fatty degeneration of the intima, especially in the coronary arteries, and more or less in the carotid, subclavian, axillary, mesenteric, and iliac arteries. The coronary arteries showed in places extensive areas of atheroma with a tendency to occlude the lumen, while other parts of these vessels were free from atheroma and distinctly dilated. In several places sclerosis of the intima was associated with the fatty degeneration, but it was never a predominant feature. Calcification was absent. In the aorta areas of fatty degeneration combined with a moderate degree of sclerosis were present throughout its whole length.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

253. Influenza and the Exanthems.

FRANCIONI (*Rif. Med.*, November 1st, 1919), from a study of the clinical manifestations of influenza, especially in its pandemic form, concludes that it should be grouped with the exanthemata. The extreme rapidity of its diffusion, its great contagiousness, especially in the early stages, make one think of diseases like small-pox and measles. Indeed, it presents certain points of resemblance with measles, spreading chiefly through mucous discharges, causing injection of the conjunctiva and nasal mucous membrane, often epistaxis, and laryngitis. Both are prone to be complicated with respiratory affections, presenting fulminating, septic, haemorrhagic types, and although there is no specific rash in influenza as in measles, Francioni points out that even in influenza the skin is often affected (apart from occasional rashes) by an initial flushing, especially marked in the face, and giving a sunburnt appearance, followed later by a dark discoloration and even pigmentation, and subsequently by desquamation. Indeed, the author looks upon this early facial flushing as almost diagnostic. Although the rash of measles is pathognomonic, it is not an essential part of the disease. *Morbilli sine morbillis* has been known for many years. It is true the incubation period of measles is much longer than that of influenza, but, on the other hand, the incubation period of scarlet fever is very short. The question of immunity after an attack is a little more difficult, for attacks of the usual exanthems generally confer a permanent immunity, although recurrences are not unknown. How far one attack of influenza confers immunity is disputed; the general opinion is rather against any such immunity, but the author quotes Bellis as saying that one attack of influenza confers a very long immunity.

264. Tonsils and Adenoids in Children.

P. J. MARTINO (*Anal. de la Facultad de Med.*, Montevideo, September and October, 1919) holds that medical treatment for adenoids is indicated under the following circumstances: (1) In moderate forms of hypertrophy with a good general condition. (2) When there is an absence of severe symptoms, except in acute attacks. (3) When there are no complications in the auditory, respiratory, or digestive systems. (4) In recent hypertrophy following acute infectious diseases. (5) When there are general causes, such as congenital syphilis, which can be modified by medical treatment. (6) When there are contraindications to operation, such as haemophilia. (7) When a constitutional taint is present, such as pulmonary tuberculosis, heart disease, albuminuria, diabetes, etc. (8) When the family is opposed to the operation. On the other hand, surgical treatment is indicated: (A) In the first two years of life (1) if there is much respiratory distress; (2) when lactation is impossible owing to difficulty in breathing; (3) if the ears show signs of being affected. (B) From 2 to 12 years of age (1) if the child is unable to breathe through the nose; (2) if there are changes in the ear, such as chronic or acute relapsing otorrhoea, frequent attacks of aural congestion, or catarrh and deaf-mutism; (3) changes in nasal phonation (rhinolalia clausa); (4) spread of inflammation to the respiratory system, giving rise to laryngitis, tracheitis, and recurrent bronchitis; (5) reflex affections of the respiratory system, causing spasm of the glottis, laryngismus stridulus, and paroxysmal cough; (6) gastro-intestinal changes resulting from the swallowing of nasopharyngeal secretion; (7) general disturbances, such as loss of appetite, pallor, fever, and interference with the skeletal development of the face and thorax. (C) After 12 years of age all cases of adenoids require operation if they cause any local or general disturbance which shows no tendency to subside. The following precautions must be taken when one is obliged to operate during infancy: (1) The cure of co-existent asthma should not be promised. (2) Relapses must be prevented, which are almost certain to occur if the general condition which gives rise to them is not modified. (3) The cure of the febrile condition accompanying adenoids should not be guaranteed. (4) Breathing exercises and general treatment should always be advised. As a general rule medical treatment for enlarged tonsils is indicated up to 12 years of age under the following conditions: (1) When the enlargement is moderate in degree and the tonsils present a healthy

appearance. (2) When the child is little if at all affected, however large the tonsils may be. (3) When there is little or no exudate in the crypts and everything shows that the function is active. (4) When removal of the adenoids, especially during the first two years of life, is sufficient to cause the tonsils to diminish in size. (5) When the enlargement of the tonsils is merely a secondary episode of a general morbid condition, in which case the effect should not be mistaken for the cause. (6) When there are nasal or dental causes to account for the enlargement. (7) When the enlargement is recent and secondary to an acute general or local infection and is liable to subside spontaneously. (8) Where there is a general contraindication to operation, such as haemophilia or a serious organic taint. (9) When the family are opposed to operation. (10) When there are no permanent symptoms or complications, but the hypertrophy is only manifested by attacks of congestion. Surgical treatment for enlarged tonsils is indicated after 12 years of age, and in exceptional cases before, when (1) the tonsils cause obstruction to breathing, phonation, and growth; (2) when they are a source of infection, giving rise to recurrent tonsillitis, chronic infection of the crypts, tonsillar and peritonsillar abscesses, etc.; (3) when they cause disturbances in the adjacent or distant organs, such as otitis and its consequences, affections of the respiratory tract, gastro-intestinal disorders, and septicaemia.

255. The Chlorotic Form of Trichocephaliasis.

G. MOURIQUAND and BERTOYE (*Paris méd.*, December 20th, 1919) record a case in a girl, aged 15, who was brought to hospital for persistent diarrhoea and increasing pallor. Numerous ascarides had been found by the mother in the stools, which were twelve to fifteen in number a day and haemorrhagic. Examination of the blood showed red cells 3,100,000, leucocytes 26,600, haemoglobin 20 per cent. Differential count: Polymorphonuclears 52 per cent., eosinophils 11 per cent., moderate sized mononuclears and lymphocytes, 32 per cent., large mononuclears 4 per cent., myelocytes 1 per cent. Ova of ascarides and trichocephali were found in the stools, but disappeared after treatment by santonin and thymol. Death was due to cerebral thrombosis. At the autopsy thirty ascarides were found in the small intestine and thousands of trichocephali and three ascarides in the large intestine.

266. Prophylactic Quinine in Malaria.

F. PAOLETTI (*Il Policlinico, Sez. Prat.*, December 7th, 1919) found from his experience in Albania that, in spite of the administration of 40 cg. of quinine hydrochloride daily, almost all the soldiers who had undergone this prophylactic treatment contracted malaria in the course of two months. On the other hand, no cases occurred among the officers who in addition to quinine prophylaxis lived in mosquito-proof dwellings and made use of mosquito nets. Paoletti does not refuse all value to quinine prophylaxis, and admits that it may be of use in malarial localities, where the anophelines are few and grave forms of malaria are rare. On the other hand, in places like Albania, where malignant forms are prevalent and anophelines are present in enormous quantities, mechanical prophylaxis is the only method of value.

257. The Pathogenesis of Influenzal Alopecia.

E. PULAY (*Med. Klinik*, December 7th, 1919) has observed that the course of influenza, in patients who subsequently developed alopecia, was characterized by abnormal activity of the sympathetic nervous system, and by signs of instability of the vascular system. He maintains that influenzal alopecia occurs only in patients with an excitable sympathetic system and an unstable vascular system. He explains the alopecia as one of several phenomena resulting from general paralysis of the vascular system and atony of the vasomotor nerves. The condition can therefore be controlled, if treatment is instituted early, by general measures aimed at raising the tone of the blood vessels. The drugs he recommends for this purpose are adrenalin, strychnine, arsenic, quinine, and, in some cases, atropine. Local treatment should provoke hyperaemia, and restore the tone of the vessels, and for this purpose he recommends quartz light and far. As to the former, it should be continued for weeks, and the exposures should be just stimulating, not irritating or intense enough to induce redness or vesication.

263. Syphilitic Stenosis of the Trachea.

CADE and BRETTE (*Lyon méd.*, January 10th, 1920) report the following case: A man, aged 37, who had contracted syphilis at 18, began to suffer from continuous dyspnoea with suffocative attacks at night. The voice was not affected. Signs of diffuse bronchitis were found in the lungs. He also presented an old iritis, orchitis, and perforation of the palate. No lesions were found in the larynx. A week after admission to hospital he had a violent attack of suffocation and died in less than thirty-six hours. At the autopsy the lungs showed bronchopneumonia; the larynx was healthy, but there was a tight stricture in the trachea 4 cm. below the cricoid. The lower part of the trachea and large bronchi showed much inflammation and numerous ulcers, so that no benefit would have been derived from tracheotomy.

269. Lupus Erythematosus and Tuberculosis.

A. L. FÖNNSS (*Hospitalstidende*, September 17th and 24th, 1919) has carried out a series of tuberculin tests in cases of lupus vulgaris and erythematosus at the Pinsen Institute in Copenhagen. He finds that the focal reaction to a subcutaneous injection of tuberculin is not sufficiently reliable to be a decisive test of the tuberculous character of any skin eruption. Among his 69 cases of lupus vulgaris there were nine which gave an atypical focal reaction, and four which gave no focal reaction, typical or otherwise. Out of a total of 64 cases of lupus erythematosus, representing his own material and that of Pick and Robbi, he finds that only in 6 per cent. was a focal reaction provoked by tuberculin, and in none of the four positive cases was the focal reaction strictly typical of a tuberculous reaction. After weighing all the available evidence for or against the hypothesis that lupus erythematosus is a tuberculous condition, the author concludes that in a few cases a tuberculous etiology is highly probable. But in most cases no definite relationship can be established, and the evidence of tuberculin injections points to the eruption being independent of tuberculous in the majority of cases.

270. Pulmonary Tuberculosis in War.

As the result of a study of 600 cases of pulmonary tuberculosis in soldiers, ZADEK (*Muench. med. Woch.*, October 17th, 1919) found that men who had formerly been vigorous and had had no pulmonary disease developed a malignant and progressive form of tuberculosis while on military service, whereas those who had formerly suffered from lung disease and again contracted tuberculosis while in the army did not show the same tendency to a malignant attack. The observations support the view expressed by Römer and Much, that infection with tuberculosis in childhood appears to present a more favourable prognosis than late infection in the adult.

271. Palpation of the Abdomen.

GOULSTEIN (*Med. Klinik*, November 30th, 1919) finds the best method for securing relaxation of the abdominal wall over the organ to be examined is to place the patient on his side, so that the organ under examination occupies a dependent position. Before palpating the liver, for example, he places the patient on his right side. Allowance must be made for the physiological displacement of the organs by this position. He notes as astonishing the degree of relaxation that can thus be achieved, even in the presence of great pain and muscular rigidity.

SURGERY.

272. Tuberculous Hip with Congenital Dislocation.

U. CAESARONO (*La Chirurg. d. organi di movimento*, December, 1919) records two examples of tuberculosis developing in congenitally dislocated hips after reduction. In the first case, a child of 2½ years with a double congenital dislocation, reduction was obtained at the first sitting but with some difficulty, more especially with the right hip. Six months afterwards it was noticed that the right hip had a tendency to redislocation, and two and a half months later the child had a painful swollen right hip and an abscess pointing on the lateral aspect of the joint. A radiogram showed partial destruction of the head of the femur, the stump of the neck being in contact with the acetabulum; on the left side the head of the femur was in position in the acetabulum and showed no abnormality. The abscess was aspirated; tubercle bacilli were found in

the thick pus. The right hip-joint was now immobilized securely in a long plaster-of-Paris spica. During the ensuing twelve months the disease became more quiescent. At the end of this period the right hip still showed a sinus in the region of the old abscess; the joint was mobile and the trochanter was elevated; in the radiogram complete disappearance of the head of the femur was evident. The left hip was mobile in all directions and the reduction of the dislocation had been maintained. The second case was also a child of 2½ years, but in this instance the reduction of a bilateral dislocation was effected with ease. After seven months walking was allowed, satisfactory evidence of stability being present. Soon afterwards a light celluloid apparatus was fitted to correct a tendency to anterior transposition in both hips. The patient was not seen again until nine years later. There was a history of a fall on the right hip some months previously and this joint was now painful and swollen. All movements were limited, and in a radiogram the right hip showed complete absence of the head of the femur, the neck being fused to the remains of the acetabulum; the pelvis was extremely atrophic, in striking contrast to the left side. The left hip-joint showed that reduction had been maintained, but was not concentric. An abscess appeared some months afterwards over the right hip; this burst spontaneously and left a sinus, which was unhealed at the time of reporting the case. The author states that out of 2,000 congenital dislocations of the hip-joint treated in the Instituto Ortopedico Rizzoli in Bologna these two cases are the only examples of tuberculous arthritis developing after reduction. He holds that the connexion between trauma and the local development of tuberculosis is firmly established and that the cases he reports offer convincing evidence of this causal relationship. In the first case the hip in which reduction was difficult, and therefore in which there was a considerable trauma, became the seat of the disease. In the second case long after reduction a definite external injury was the exciting cause.

273. Surgical Complications of Influenza in Children.

In addition to numerous cases of influenza complicated by empyema, perinephritic and osteomyelitic abscess, mastoid suppuration and purulent arthritis which required operation, BLAC Y PORTACIN (*Rev. de med. y cir. pract.*, December 14th, 1919) reports a case of generalized pneumococcal suppurative peritonitis in a boy aged 12, which developed on the fifth day of an attack of influenza. The writer records also several examples of the malignant course assumed by influenza in cases which had recently been operated on, death taking place within twenty four hours from the onset.

274. Kondoleon's Operation for Elephantiasis.

J. AKERMAN (*Svenska Läkaresälls. Forhandl.*, July 31st, 1919) has performed Kondoleon's operation for elephantiasis on a man aged 30 with the following history: At the age of 5 his left leg was badly burned. At the age of 15 he fractured his left femur just above the knee, and two months later he fractured it again. After these accidents the limb gradually grew larger. The swelling was greatest in the evening, but in spite of the increasing weight and stiffness of the limb, he could continue his work as a cab-driver. Apart from the elephantiasis he was perfectly well, and there was no family history of interest. The swelling, which extended from the inguinal region to the ankle, was doughy and tense, pitting on pressure. The skin was tense and elastic, and it showed no inflammatory or atrophic changes. Its colour was, however, more brown below than above the knee. A large scar, with irregular outlines, occupied a position on the inner side of the knee. The circumference of the right and left thighs was 43 and 51 cm. respectively, and below the knee the measurements were 23 and 40 cm. for the right and left leg respectively. The inguinal glands were not enlarged, and the x rays showed the old fracture of the left femur, which had healed with but slight deformity and shortening. On April 1st, 1919, the skin was incised from the internal malleolus to a point above the middle of the thigh. A large quantity of lymph-like fluid escaped, but there was little bleeding. Longitudinal strips of the deep fascia, to a width of 3 to 4 cm., were now excised throughout the length of the original incision, leaving the muscles exposed and bulging forward to a width of 5 to 8 cm. The great saphenous vein was not divided, and no strip of skin was excised. The wound was now closed, two small drainage tubes were inserted near the knee, and the operation was repeated on the outer side of the limb, from the external malleolus to a point a handbreadth below the great trochanter. The wounds healed by first intention, and a fortnight after the

operation the patient could get about. The circumference of the right and left thighs was now 42 and 43 cm. respectively, and that of the calves 29 and 30 cm. respectively. The author expresses satisfaction with this operation, the aim of which is to establish a connexion between the lymphatics of the skin and those of the muscles and deeper structures.

275. False Cancer of the Stomach.

BY false cancer of the stomach SOFRÉ (*Ref. Med.*, November 1st, 1919) means cases presenting the clinical symptoms of cancer of the stomach plus a definite tumour in the gastric region, but not due to malignant growths. He mentions three classes of case likely to lead to error: (1) Gastric ulcer, (2) syphilitic disease, (3) tuberculous disease. Most cases of gastric ulcer are unmistakable, but when there is much induration of the margins of the ulcer, perigastric adhesions causing a tumour, some doubt may arise, especially when the subject is young and the course of the disease rather protracted. Chemical examination of the gastric contents should solve the doubt, for although it is true free HCl may be found in gastric cancer, it is always in very small quantities, far less than is seen in simple gastric ulcer. "False" cancer due to syphilitic tumour is rarer, but the author quotes a case reported by Fournier in an old man of 70, sent to hospital for a supposed gastric cancer, which disappeared under anti-syphilitic treatment. Chemical analysis in these cases shows an absence or deficiency of free HCl and a large development of inorganic acids. These patients are as a rule not much emaciated, the course of the disease is protracted, and there is a history of antecedent syphilis. Tuberculosis may be either a tuberculous enlargement of glands pressing on the pylorus (but this is very rare), or an actual tuberculous stenosis of the pylorus. In this case the tumour is usually flattened and with ill defined edges; it is often painful on pressure, and there is generally some evidence of tubercle elsewhere.

276. Carcinoma of the Appendix.

BOBBIO of Turin (*Arch. Italiano di Chir.*, 1919, 1) makes a valuable contribution to the knowledge of carcinoma of the appendix. It is well known that this condition presents no definite clinical picture, and is therefore undiagnosable. The recorded cases are the result of fortuitous or routine microscopical examination of appendices removed at operation or autopsy. Bobbio's case is of this nature, for the specimen was found in the sac of a large inguinal hernia in a youth of 21. Apart from a thickening at the tip, there was nothing remarkable about this appendix. Under the microscope, however, numerous nests of epithelial cells were found, invading the muscular coat and penetrating through to the serosa. The author had an opportunity of again examining the ileo-caecal region of his patient when operating for a recurrence of the hernia some months later. Bobbio is impressed with the age-incidence of these cases, the majority having been found well below the "cancer age," and also with the clinically benign nature of the condition. He disagrees with Milner (*Deut. Zeit. f. Chir.*, 1909, 100), who regards these tumours as having no importance, as being merely endothelial cells, produced by previous inflammation, masquerading as cancer cells, and producing a pseudo-picture of malignancy. Bobbio agrees that inflammation plays an important part in the production of the condition, but believes the cells to be definitely epithelial. He concludes that there exist small tumours of the appendix which are of relative benignancy, although the histological picture is that of true cancer. These tumours are therefore to be considered as small neoplasms of epithelial origin, latent, circumscribed, and mute. It would be a valuable piece of work if the after-history of these cases were traced and recorded.

277. Elastic Closure and Systematic Paraffin Gravity Drainage for Wounds.

SORESÌ (*New York Med. Journ.*, November 8th, 1919) points out that in the immediate closure of clean wounds and the early closure of infected wounds it is essential to remove all foreign bodies, dead material, and tissues likely to die. The individual resistance of the patient plays a great part in the final result, especially in infected wounds, and perfect drainage is essential in order that any liquid which would prevent union may escape while it is forming. The paraffin gravity drainage depends upon the fact that neither tissues, nor blood, nor pus can adhere to the paraffin drains, which are prepared by dipping strips of gauze, silk, or linen threads into melted paraffin and allowing them to harden. Prior to closure of the wound the drain is placed in its most

dependent part and brought out through a small incision at a point lower than the lowest part of the wound. Such a drain acts perfectly, because between it and the walls of the wound there is always a space which cannot become occluded, and through which any secretion can leak into the outside dressing by gravity. For the elastic closure deep sutures are made with elastic threads of pure rubber of the size of a lead pencil, and these are passed through the deepest portion of the wound and tied at both ends on rolled gauze, the tension being gauged by gently pulling the elastic after it has been tied on one side until the tissues are approximated, and then tying the other end. Superficial closure is obtained by applying over it special strips made of two lengths of adhesive plaster joined together by rubber bands, one of the adhesive strips being placed on one side of the wound and the other strip on the other side of the wound, after gently stretching the rubber band joining them with sufficient tension to hold the wound together without undue strain. By this plan a greater number of wounds can be closed without danger because it does not interfere with the blood supply to the tissues, and appropriate drainage is obtained.

278. Recurrent Nephrolithiasis.

O. F. LAMSON (*Annals of Surgery*, January, 1920) considers that faulty and incomplete surgery may contribute towards recurrence of nephrolithiasis by leaving in the pelvis fragments of stones, or by injuring the ureter and causing ureteral strictures and (later) ureteral calculi. Post-operative preventive treatment is guided by examination of the urine and chemical analysis of the stone. Drinking freely of distilled water, he thinks, may help in the dislodgement and removal of any nucleus of future stones.

OBSTETRICS AND GYNAECOLOGY.

279. Double Ectopic Pregnancy with a Living Seven Months Fetus.

J. TORRE Y BLANCO (*Rev. de med. y cir. pract.*, December 21st, 1919) reports the following case. A woman, aged 30, in the third month of pregnancy, had a violent attack of pain in the right iliac fossa, with vomiting, fever, tachycardia and tympanites. The symptoms subsided with rest in bed and the pregnancy continued, the fetal movements being felt three months later. On examination the abdomen corresponded in size to that of a seven months pregnancy, and presented a swelling, slightly deviating to the right, reaching three fingerbreadths above the umbilicus. In the upper part of the swelling a living fetus could be felt. The lower part was the uterus, which was about the size usual for the fourth month of pregnancy. On laparotomy a living fetus was found in a cyst adherent to the abdominal extremity of the right Fallopian tube, and in the centre of the tube was another cystic swelling which, on being opened, showed a dead atrophied fetus with organized blood clots. The following explanation of the case was suggested: The patient had two ova fertilized at once. One of them became fixed in the abdominal end of the Fallopian tube and the other in the centre of the tube, where it was probably killed by tubal apoplexy about the third month of pregnancy, when the patient had a sudden attack of abdominal pain.

280. Aplasia of the Internal Genitals

J. G. DE GRAAF (*Nederland. Tijdschr. v. Geneesk.*, January 24th, 1920) records the case of a woman, aged 19, who consulted him because she was engaged to be married and had not yet menstruated. As her mother did not begin to menstruate till her twentieth year, the absence of periods had not caused her much anxiety. The patient presented all the outward appearances of a normal woman, including well developed breasts, normal pubic hair and external genitals. The urethral meatus was not dilated and the clitoris and hymen were present, but on passing the finger beyond the hymen only a cul-de-sac 1 cm. deep was found. On bimanual rectal examination nothing could be felt in the pelvis with the form or consistence of the uterus or adnexa, and when a sound was passed into the bladder it was separated from the finger in the rectum by tissue of not more than 2 mm. thickness. Operation was not considered advisable.

281. Conjugal Cancer.

GIROU (*Bull. et mém. de la Soc. de Chir.*, February 10th, 1920), in reporting a case of epithelioma of the penis in a man whose wife had advanced epithelioma of the vagina,

raised the question of contagion of cancer by direct contact. The statistics hitherto available do not lend any definite support to this theory. For example, Demarquay, in a study of 154 cases of penile cancer, found only one where the wife was afflicted with uterine cancer. If there were anything in the theory one would expect penile cancer to be fairly common seeing that uterine cancer is so prevalent, but in fact it is relatively very rare. Whilst auto-inoculation with cancer may be admitted—and even that is disputed by some—there is no proof whatever that it may be transferred to another person.

PATHOLOGY.

282 Liquefaction of Gelatin by Streptococci.

THOUGH streptococci do not liquefy gelatin in ordinary circumstances, yet, according to TISSIER and DE TRÉVISE (*C. R. de la Soc. Biol.*, February 7th, 1920), several strains do so if the acidity of the medium is favourable. Whilst they obtained only very meagre growths in neutral gelatin, they found, on the other hand, that if the acidity corresponded to 0.24 per 1,000 of sulphuric acid, a much better growth resulted. Still increasing the acidity, they succeeded in getting very pathogenic streptococci to liquefy the gelatin at 0.73 per 1,000; at 1.20 all pyogenic varieties liquefied; at 1.71 less virulent strains brought about liquefaction; with an acidity of 2.20 no growth resulted, because that acidity approached too close to the limits of arrest. Amongst the various strains of haemolytic streptococci tested only one failed to liquefy gelatin, and this was derived from a case of erysipelas; even 1 c.c.m. of a liquid culture of this did not succeed in killing a mouse. None of the saprophytic streptococci liquefied gelatin. The authors maintain that this proteolytic power is allied with the pathogenic power of the streptococci, and that organisms lying dormant may be stirred up into activity, in culture tube and in the body, by a slight modification of the medium.

283. The Chemotherapy of Tuberculosis.

P. RONDONI (*Lo Sperimentale*, February 2nd, 1920) has found that nickel and cobalt in the form of simple salts (sulphate and chloride) possess in a high degree the power of inhibiting the growth of cultures of tubercle bacilli. These metals do not possess this power over other bacteria, and therefore it cannot be an expression of a generic antibacterial and disinfectant action. Cobalt and nickel were found not to be very toxic for experimental animals (guinea-pigs and rabbits), and they differed from copper by having no necrotic action upon the tissues. It was possible to treat the animals for a long time with subcutaneous or intravenous injections of the simple salts of nickel and cobalt, only small quantities of which were subsequently recovered from the organs. An attempt to treat experimental tuberculosis in guinea-pigs and rabbits with these salts gave encouraging results. The possibility of increasing the efficacy of nickel and its affinity for tuberculous tissue in one of two ways occurred to Rondoni: (1) Combining it with a dye which stains tubercles deeply during life—namely, trypan-blue; (2) combining it in the form of a complex salt as the double cyanide of nickel and potassium. The results of nickel-trypan-blue were almost entirely negative in the tuberculosis of the guinea-pig. On the other hand, solutions of the double cyanide of nickel and potassium had a powerful inhibitory action on the growth of tubercle bacilli in cultures, and were well tolerated by the animals in subcutaneous and intravenous injections. The results of experimental tuberculosis were more definite and constant than those with the simple salts. Mild forms of the disease with a tendency to sclerosis were found in the animals treated as compared with the severer forms which were found in the controls.

284. Studies on Phagocytosis.

D. SIRCCI (*Lo Sperimentale*, February 2nd, 1920), as the result of three series of experiments, found that shaking the various constituents of a system composed of serum, leucocytes, and bacteria, modified leucocytosis as follows: (1) by a depressive action on the activity of phagocytosis; and (2) by a depressing action on bacteria. The shaking did not cause any change in the opsonins. In another series of experiments he found that the exposure of blood to the action of ultra-violet rays causes a distinct lowering of phagocytic value, which is almost exclusively due to the paralyzing effect which the ultra-violet rays exercise on the phagocytes. The substances in the serum with an

opsonic power were not affected by the action of the ultra-violet rays. Sircci concluded that the rays must cause such profound changes in the bacteria as to render their destruction by the leucocytes possible to a greater extent than in normal conditions.

285. The Causes of Oedema.

A. AZZI (*Lo Sperimentale*, February 2nd, 1920), as the result of experiments on *Rana esculenta*, came to the conclusion that the immediate causes of oedema were as follows: (1) Modifications even of a slight degree in the composition of the blood, which produce functional or structural changes in the endothelium coming in contact with the blood. (2) Asphyxia of the endothelium produced by stagnation of the venous blood, and especially by regurgitation of the venous blood into the capillaries. (3) Changes in the capillaries which take place in their outer surface, that is, through the tissues, as the result of toxic substances or physical agencies—heat, light. (4) Vaso-dilatation in general, including that of nervous origin, as occurs in neuritis, erythromelalgia, and paralysis. (5) Deficiency of adrenalin.

286. The Virus of Febrile Herpes.

LÖWENSTEIN (*Berl. klin. Woch.*, December 22nd, 1919) reports experiments on the transmission of the virus in herpes of the lips, cheeks, forehead, and ears of man to the cornea of rabbits. He succeeded in fourteen cases. The effect of this inoculation was noticeable forty-eight hours later, when a superficial ulcerating parenchymatous keratitis began to appear. Recovery followed, but a dense scar remained. Direct transmission of the virus from man to rabbit was invariably successful. Further transmission of the virus from the cornea of the first rabbit to another was successfully effected in seven cases. In three cases the virus was further transmitted from the second to a third rabbit, and in one case from the third rabbit to a fourth. Even when the original suspension was diluted with twenty volumes of normal saline solution, successful transmission of the virus was effected. The disease, as provoked in the cornea of the rabbit, closely resembled the keratitis herpetica of man. The instability of the virus was remarkable; its potency lasted about six hours in the incubator, and it ceased altogether in twenty-four hours, even when the virus was suspended in human serum. The appearance of the double bodies, seen in a smear, was like that of the bodies seen in molluscum contagiosum. They stained with Giemsa, and were barely visible under the most powerful lens. Every attempt to cultivate them on artificial media failed. The virus seemed to pass through a filter, but inoculation with the filtrate from a Berkefeld filter was never successful. Nor could the virus be obtained from the blood of patients suffering from herpes. The cornea in which experimental herpes had been induced was henceforth immune to further inoculation. The author concludes that in many respects the virus of febrile herpes resembles that of vaccinia.

287. Enumeration of B. coli in Water.

GRYSEZ and PIRRET (*C. R. de la Soc. Biol.*, January 31st, 1920) record their method for the bacteriological analysis of water. They use glucose bile in such a way that for each 100 c.c.m. of the mixture of medium and water to be analysed there are always 10 grams of bile and 0.5 gram of glucose. The tubes are always set up with a fixed amount of the medium, 10 c.c.m., but the concentration of this medium varies according to the increasing quantities of the test water added. The tubes are inoculated then and there and put in the incubator for forty-eight hours. At the end of this time those which have become turbid with evolution of gas are subcultured on differential media. The water to be analysed contains at least 1,000, 200, or 100 *B. coli* per litre according as the cultivations are positive with 1 c.c.m., 5 c.c.m., or 10 c.c.m. In 300 analyses done by this method in parallel with cultivation on carbolic media 70 per cent. of the results were identical by the two methods, in 18 per cent. the former was more precise, and in 12 per cent. the latter was more exact. The same comparison held with regard to MacConkey's method. The authors found that of all the bacteria in stock at the Pasteur Institute of Lille only six were capable of growth with gas formation in glucose bile. Of these the *Bacillus coli*, paratyphoid B, Gaertner's bacillus, and *B. pasteurii* equally indicate water pollution; the glanders bacillus can be put aside; the last of the six—Friedländer's bacillus—can be differentiated by the absence of indol in peptone water. Owing to the simplicity of the procedure the method economizes time and material, and allows of cultivations on the spot.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

288. Digitalis in Pulmonary Tuberculosis.

BURNAND (*Arch. des mil. de cour*, September, 1919) during the last five or six years has made a systematic use of digitalis at the Leysin Sanatorium in cases of pulmonary tuberculosis with a low blood pressure. The drug is indicated in cases with low tension and tachycardia, whatever the extent and quality of the pulmonary lesions. Although the treatment has little or no effect in the terminal stage of tuberculosis cachexia in which the cardiac tissue is irremediably degenerated, Burnand is convinced that phthisical patients treated by digitalis at a relatively early stage, when the myocardium still possesses a certain vitality, derive considerable benefit from this treatment. The dyspnoea and cyanosis disappear, the cheeks regain their colour, the patient recovers his strength, the pulse becomes slower and stronger, and the râles in the chest disappear. The cases in which a systematic examination with Pachon's oscilometer was made showed a definite rise in blood pressure during the treatment. The drug is administered in doses of 10 cg. of the powdered leaves on three out of every ten days—for example, on the first, second, third of each month, on the eleventh, twelfth, thirteenth, and on the twenty-first, twenty second, and twenty-third.

289. Slow Evolution of Peritonitis following Perforation of Typhoid Ulcer.

P. GAUTIER and P. BRUTSCH (*Rev. méd. de la Suisse rom.*, December, 1919) report a case of peritonitis following perforation of a typhoid ulcer in a man aged 26, in which an interval of a month occurred between the perforation and death. At the necropsy an adhesive peritonitis was found localized in the right iliac fossa, together with a collection of faecal matter. The intestine showed multiple perforations, including one in the large bowel. A striking feature in the case was the mild character of the onset, as the patient was able to continue his work for a fortnight, when signs of perforation suddenly developed. The peritonitis due to the perforation became rapidly localized, but from time to time an exacerbation of the symptoms occurred probably owing to a fresh perforation. Various haemorrhagic manifestations were observed—namely, intestinal, renal, and cutaneous haemorrhages—which seemed due not merely to the toxic character of the typhoid attack, but also to the superadded toxæmia caused by the peritonitis and the retention of faecal matter in the peritoneum. Lastly, the patient showed a considerable loss of flesh (two-fifths of his weight) during the month which elapsed between the perforation and his death.

290. Treatment of Influenza Pneumonia by Serum from Convalescent Patients.

REDDEN (*Boston Med. and Surg. Journ.*, December 11th, 1919), from an experience in the treatment of over 250 cases of influenza pneumonia by the use of pooled serum from convalescent patients, considers that both in hospital and private practice the course of the disease is decidedly shortened, the death rate halved in serious cases and reduced three-fourths in hospital cases seen early. Of 100 cases in private practice, in half the temperature became normal in twenty-four hours after the first injection, and in three-quarters it was normal within forty-eight hours. The average amount of serum given was 120 c.cm., which represents 100 c.cm. of serum, the remainder being made up of salt solution with 0.30 per cent. trikresol. Among pregnant cases the mortality was lowered to 23 per cent., as against 51 and 54 per cent. recorded by other observers. Of the rest, excluding those cases in which the serum was given too late in the disease and those dying from other complications, the mortality was 3 per cent., and in all probability a just estimate of the efficacy of the serum lies between 3 and 16 per cent.; 52 per cent. of the cases received only one injection, 35 per cent. two injections, and the remainder from three to five injections.

291. The Shape of the Stomach.

As the result of observations on dogs, E. H. VAN LIER (*Nederland. Tijdschr. v. Geneesk.*, January 10th, 1920) comes to the following conclusions: (1) The dog's stomach, when filled with ordinary food, has a saccular form and not a

tubular form. (2) The dog's stomach, when filled with an x-ray meal, has a saccular form and partly a tubular form. (3) The empty stomach lies in a shrunken state in the abdomen. (4) The shadow caused by an x-ray meal indicates the true boundaries of the stomach. Skiagrams are reproduced showing that a normal meal without bismuth or barium sulphate gives the stomach quite a different shape from that which it presents when these two metallic salts are given. The writer, therefore, does not agree with Groedel and Seyberth who hold that an x-ray meal does not differ in its effect on the form and position of the stomach from a meat meal of similar amount. On the other hand, the question as to how far the dog's stomach resembled the human one was less simple to answer. According to Schüller, Groedel, Seyberth, and Babkin, there was an essential agreement between the two. The skiagram, however, of the dog's stomach shows a different appearance to the human stomach. Also, at a necropsy on a dog after a meal the duodenum was found to be filled with undigested potatoes, whereas this does not occur in the human being, in whom the pylorus transmits the fluid chyme only.

292. Chronic Cholecystitis and Heart Disease.

R. H. BABCOCK (*Journ. Amer. Med. Assoc.*, 1919, lxxiii) points out that, although there is naturally a tendency to attribute all the symptoms presented by a patient with obvious cardiac disease to the effects of that lesion, infection and inflammation of the gall bladder, as he showed in 1903, may cause serious cardiac incompetence, which can be wholly or partially corrected by drainage of the gall bladder. The clinical manifestations of chronic cholecystitis are seldom prominent, frank biliary colic and jaundice being rare. The following points are valuable in distinguishing between the liver of chronic venous engorgement secondary to heart failure and cholecystitis: In passive stasis the liver, unless cirrhotic or prevented by adhesions, is uniformly enlarged and tender, the notch between the two lobes can be felt, and there is evidence of stasis elsewhere. The hepatic enlargement due to cholecystitis is a characteristic alteration in the right lobe, which may be very well marked in chronic inflammation of the gall bladder; this convex enlargement of the right lobe—Riedel's lobe—may be small and obscured by the right rectus muscle, or extensive and occupy most of the margin of the right lobe, but the left lobe is not palpable. In cholecystitis there is also often cutaneous hyperaesthesia behind, over the area of the tenth and eleventh dorsal nerves. Some illustrative cases are given, and the author insists that in every case of heart disease with the history or symptoms of abdominal disturbance minute attention should be paid to the gall bladder and appendix, the latter being in many cases the chief offender, as he hopes to show in a future communication.

293. Codeine Poisoning.

ACCORDING to L. BOISSONAS (*Rev. méd. de la Suisse rom.*, December, 1919), who records a case in a child aged 3, to whom 0.04 cg. of codeine was given instead of calomel, the symptoms of codeine poisoning consist in the rapid development of torpor which may end in complete loss of consciousness. The lethargy is accompanied by headache and occasionally by tinnitus and vertigo. This first stage, when it does not end by rapid collapse, is followed by a period of restlessness accompanied by vomiting and gastralgia and sometimes by convulsions. Exaggeration of the reflexes is constant. A rash, which has been observed even after small doses, appears to be due rather to an idiosyncrasy than to the drug itself. In most cases the pupils are dilated, but in some, including the writer's case, they are contracted.

294. Hysteria in Childhood.

MONRAD (*Ugeskrift for Læger*, January 1st and 8th, 1920) maintains that hysteria in childhood is often overlooked by medical men as well as by the lay public. Yet it is not rare, and it is probably on the increase, though this may perhaps be merely a reflection of the author's growing interest in the subject. He has collected about 200 cases during the past ten years. The disease was most common between 7 and puberty, but in 26 cases the ages ranged from only 4 to 7 years, and in 14 cases the patients were under 4. The sex incidence was equal under the age of 5.

After this age it was as much commoner in the female than in the male as it was in adult life, being in the ratio of 2 to 1. But the disease was more serious in the male: the "formes frustes" so common in girls approaching puberty were rare in males. Referring to the difficulties of diagnosis, the author confesses to having diagnosed hysteria in a boy of 7, who died a fortnight later with definite signs of a cerebral tumour.

295. Surgical Emphysema in Influenza.

SCHWENKENBECHER (*Munch. med. Woch.*, November 21st, 1919) has observed three cases of extensive surgical emphysema in conjunction with influenza. The first patient was a soldier suffering from double pneumonia. Surgical emphysema was demonstrable almost over the whole of his body. The patient died soon after admission to hospital. A few weeks later a woman of 48 was admitted to hospital with a puffy swelling of the face, neck, and chest. This swelling had begun in the face and neck, had spread thence to the chest, and had developed after a febrile attack of bronchitis accompanied by much cough. Influenzal tracheitis and bronchopneumonia were diagnosed, but no sign of a pneumothorax or of oedema of the lungs could be detected. The evidence of the x rays was uninformative. Death occurred suddenly. At the necropsy, twenty four hours later, the emphysema had vanished except in the neck. A few bubbles of air could, however, be detected just under the left pleura (parietal?). There was no air in the connective tissue of the mediastinum. Confluent bronchopneumonic foci on the verge of suppuration were found in the posterior half of the right upper lobe, but at no point could a tear in the lung be found. But as there was a small bronchopneumonic focus in the upper portion of the left lower lobe, and as there were signs of subpleural emphysema on this side, the author suspects that a small rupture of the left lung must have been responsible for the surgical emphysema. His third patient, a girl aged 7½ years, recovered, although the influenzal inflammation of the upper and lower respiratory passages was severe, and was accompanied by surgical emphysema, which took about four weeks to disappear.

296. The Diagnosis of Epilepsy.

S. JELLINEK (*Wien. med. Woch.*, November 1st and 8th, 1919) attaches most importance to two signs—namely, the presence of Babinski's reflex and the occurrence of petechiae and ecchymoses—neither of which is found in hysteria. Babinski's sign is not only present during the epileptic attack, but may persist from a quarter to three-quarters of an hour after termination of the fit. In many cases after Babinski's sign was exhausted, Oppenheim's sign could be obtained, especially after attacks of *petit mal*. Petechiae, though not found so regularly as Babinski's sign, are more frequent in epilepsy than is supposed. They occurred in nearly half of the 368 cases of genuine epilepsy observed by Jellinek. They were most frequently found in the upper lids, but in many cases both upper and lower lids were sprinkled over with countless petechiae, as well as the root of the nose and forehead, and even the frontal scalp and temples. Petechiae were rarely seen on the face below the zygomatic arch; ecchymoses were relatively uncommon on the conjunctiva, palate, and mucous membrane of the nose and throat. In the great majority of cases the haemorrhages were confined to the territory of the superior vena cava. They did not appear to have any relation to the age of the patient or the severity of the attacks.

297. The Combined Quinine and Methylene Blue Treatment of Malaria.

ACCORDING TO R. REITLER (*Wien. klin. Woch.*, January 10th, 1920), the value of methylene blue advocated by Ehrlich and Guttman in the treatment of malaria has been variously estimated by different observers. Ziemann's systematic investigations showed that it had no effect. Reitler, however, was induced to use it in a number of cases owing to its action in a case of quartan fever which was refractory to quinine. He found that though it was of little or no value by itself in the treatment of malaria, when given with or shortly after quinine it prevented any further attacks in cases supposed to be refractory to quinine. It also enabled the quinine to be considerably reduced below the ordinary therapeutical dose, a point of considerable importance in the treatment of patients who had an intolerance for the drug, or were in danger of developing blackwater fever.

SURGERY.

298. Tubed Pedicle in Plastic Surgery.

H. D. GILLIES describes from Queen Mary's Hospital, Sidcup, a new and most ingenious method of fashioning flaps for plastic work (*New York Med. Journ.*, 1920, 111). The method is specially applicable to cases where a long flap has to be cut—for example, chest flaps for closing facial defects. The edges of the graft, which is usually cut 2½ to 3 inches wide, are carefully sewn together, both ends being left attached. In this way a tube of skin is formed which heals by first intention, and in three weeks is so well vascularized that it can be twisted and even kinked without fear of necrosis. The lower end is now cut free and turned up to the face. The excess of tubed graft is either used locally or returned to the neck subsequently. In some cases flaps from the temple, including the temporal artery, may be used. In the intermediate stage these tubular flaps give the patients a most curious appearance, but the final results are admirable. The method is valuable, as the coaptation of the edges of the flap ensures absence of sepsis and an efficient blood supply. The ten illustrations (nine photographs) are a considerable help to the understanding of this manoeuvre, which seems to be of very general applicability.

299. Chemical Urethritis.

URETHRITIS following injections of chemicals into the urethra as a prophylactic against gonorrhoea is by no means uncommon. F. Kidd has recorded several examples in this country, whilst BARKER (*Journ. Amer. Med. Assoc.*, 1919, 73) records 28 cases occurring in a series of 500 patients with general urethritis. The etiological factor in all was an irritation of the urethral mucosa by the injection of the venereal prophylactic. This may very readily be mistaken for gonorrhoea. The "packet" used varied—some were British, some U.S.A., and some were improvised. A bacteriological synopsis is given by Barker—60 per cent. of the cases showed no organism in the smears, 50 per cent. were sterile on culture. Treatment is simple once the true diagnosis is established. All injections must be stopped, otherwise the urethritis will persist as long as the local treatment is kept up. Copious draughts of water and alkalis by mouth are all that are required.

300. Treatment of Ununited Fractures, with Special Reference to the Use of Bone Grafts.

HEY GROVES (*Bristol Med. Chir. Journ.*, December, 1919) discusses the problem of the treatment of ununited fractures following gunshot injuries. Non-operative measures, such as deep percussion, massage, congestion and active exercise, he regards as preventive rather than curative in dealing with non-union, their applicability being limited to the stage of delayed union. When there is a gap due to loss of substance or a definite pseudoarthrosis, non-operative measures are a waste of time. All operative treatment must necessarily be delayed until a safe stage has been reached, owing to the long persistence of latent sepsis in the tissues. Before any ambitious reconstructive operation is undertaken it is wise to replace cutaneous scars by skin flaps or grafts, to excise deep scar tissue, including the ends of the bone, and to postpone the actual restorative procedure until aseptic healing of the first stage operation has taken place. As in all cases the bone ends show either atrophy or sclerosis, both indicative of a diminished capacity for growth, refreshing must be generous in its extent. An ununited fracture may be treated either by some form of bone suture or by the insertion of a bone graft. In the former method the conventional plating and screwing has no place; the two essentials of successful bone suture are the removal of the devitalized bone ends and the close approximation of newly-cut bone surfaces. The step-cut operation popularized by the author has proved most efficient in suitable cases—namely, non-union of the humerus, femur, and both bones of the forearm. The repair of gaps by means of bone grafting is especially indicated in non-union of one of the forearm bones or of the tibia. In the forearm, particularly in the radius, a "cricket ball" graft removed from the tibia is the most efficient, as by its use the sagging of the fragments towards the fellow bone can be corrected. In the tibia, unless the skin is sound, grafting cannot be employed. The method devised by Hey Groves in suitable cases is to fill up the posterior part of the gap by pieces of bone taken from the shaft in preparing the bed for the future graft, and to fill in the anterior part by a wide inlay graft wedged firmly into a trench. When grafting is

impossible in this region, the limb can be shortened by resection of a portion of the fibula, which is then impacted into the proximal fragment of the tibia, together with the distal end of the deficient bone. With regard to the essential principles in bone grafting, he points out that the autogenous graft has a vitality of its own, but this is absolutely dependent upon rapid union with tissues of its own kind. In order to ensure rapid success in the use of a graft in the filling up of a gap in one of the long bones certain conditions must be fulfilled—the graft should have a periosteal covering, should have wide contact with a vascular bed, should be fixed securely, and should be strong enough to act as a skeletal strut.

301. Hour-glass Stomach.

In *Il Morgagni* (December 5th, 1919) it is pointed out that since the advent of radiography hour-glass stomach—meaning a stomach divided in two or more parts by a constriction—has been shown to be more often acquired than congenital. It usually originates from organic changes in the gastric walls or muscular spasm, secondary to ulcer or perigastric adhesions. The spastic type of the hour-glass stomach is seen most often in ulcer, but organic stenosis may also be increased by spasm. Congenital hour-glass stomach is distinguished by the fact that stricture is of minimum length, and does not present any pathological alteration in the serous or mucous coats. The width of the stricture varies. Acquired hour-glass stomach has not so typical a form, and is usually associated with cicatricial changes. Slight forms of hour-glass stomach do not produce clinical symptoms. When symptoms exist they usually consist of pain, sense of weight, vomiting, and, if continued, wasting. The two halves (especially after insufflation) may sometimes be seen on inspection. Occasionally by squeezing one can feel the gastric contents passing from one half to the other. Radiography gives the surest diagnosis. Organic hour-glass stomach cannot disappear, but that part of the condition which is due to spasm or ulceration may be improved by suitable medical treatment; atropin often relieves the spasm. When surgical treatment becomes necessary, an anastomosis between the stomach and bowel gives the best results.

302. Oxyurias Appendicitis.

A. LÄWEN and A. REINHARDT (*Muench. med. Woch.*, December 12th, 1919) examined 620 appendices removed at St. George's Hospital, Hamburg, since the spring of 1914, and found oxyurides present in 60, or 9.76 per cent.; 263 of the cases were in males and 357 in females. Oxyurides were found in 16, or 6 per cent., of the former and in 44, or 12.3 per cent., of the latter, so that the parasites were twice as frequent in the female as in the male appendix; 12 of the 60 cases were in children up to 14 years of age and 48 in adults. The oldest patients were aged 42, 43, 46, and 62, and were all women. The parasites were most frequently found in the second and third decennium. With the exception of 7 cases in which the operation showed abdominal affections, such as tubal pregnancy, cholecystitis, or tuberculosis, and the presence of oxyurides in the appendix was of secondary importance, the clinical picture was that of acute or chronic appendicitis. Severe attacks were rare. The writers accept the general opinion, which is that the worms penetrate the mucous membrane and so open up the way for a bacterial infection. It is probable also that the parasites cause by their toxins a superficial transient inflammation of the mucous membrane with symptoms of appendicitis. A certain diagnosis cannot be made, but relatively slight objective findings with fairly acute or chronic symptoms may indicate oxyurias appendicitis. The diagnosis is the more probable if oxyurides have already been found in stools several years previously. On opening the abdomen an abundant serous effusion is sometimes a sign of oxyuriasis of the appendix, and the serous coat of the appendix is often remarkably moist.

303. Penetrating Wounds of the Thorax.

DUCUING (*Il Morgagni*, November 15th, 1919, and *Presse méd.*, August 11th, 1919) says that most of the complications in these cases are due to bone injury, and might be prevented by early operation. Most surgeons look upon severe and persistent haemorrhage as the only indication for early intervention, but this is not enough, according to Ducuing. He has treated 138 cases of wounds of the thorax (90 within the first hour, 27 some weeks later, and 21 still later). He first discusses injuries to the bone without opening the thorax; 66 per cent. of this group are fractures of the ribs; the ends of the fractures were nearly always splintered and very seldom clear cut. He has found bits of rib in the diaphragm, the liver, and behind the great

omentum. Fracture of the scapula accounted for 13 per cent. of the cases; in 9 per cent. the clavicle was injured—often split into numerous fragments; in 8 per cent. the sternum was affected, and in 4 per cent. the thoracic vertebrae. The immediate complications of these injuries comprise rupture of adjoining blood vessels, and laceration of the lung. The secondary complications were infection at the seat of fracture, infection of the pleura, and infection of the lung itself. Later on come complications partly due to mechanical means—for example, pressure from callus—or to infection. The callus may interfere with free respiratory movements, or by persistent bony fistula interfere with free drainage, prolong a purulent pleurisy, set up intercostal neuralgia and permanent thoracic deformity. Many of the complications could be avoided by early operation on the affected bones. In severe cases with persistent haemorrhage, increasing pulse rate, and falling blood pressure, it is better to deal directly with the haemorrhage and leave the bony injuries to be dealt with later under local anaesthesia. In less severe cases if a fracture is diagnosed the author does not treat expectantly but advises costal resection of at least 7–8 cm. and removal of fragments. He says the immediate results of interference are good and the remote results most satisfactory. He treated 70 cases (16 with open thorax, 54 with closed). Of the 54, 33 had fractures, and in 27 of these he says most surgeons would not have interfered. Out of these 27, 14 were discharged well after three weeks, in 8 pneumonic complications set in, and one died from gangrene of the arm. In 3 slight pleural infection occurred, and in 2 empyema (with one death). He compares 21 similar cases treated on expectant lines, and in 12 of these chronic empyema set in and in 2 exuberant callus had to be removed.

OBSTETRICS AND GYNAECOLOGY.

301. The Treatment of Septic Puerperal Endometritis.

COVA (*Il Morgagni*, November 15th, 1919), in the treatment of septic puerperal endometritis, has abandoned copious douches or curettage, and gets better results with iodine painting, using the official tincture of iodine, and carefully swabbing the uterine cavity with this solution. If necessary he repeats the treatment every other day for three or four times; as a rule it is unnecessary after that time, as the patient is usually much better; if not, probably infection has become generalized and some local salpingitis has been set up; in either case, painting with iodine is of little use then. The danger of curetting a soft-walled uterus is well known and, in the author's opinion, seldom necessary if the iodine treatment is applied.

305. Erosivo Vulvitis.

DRISCOLL (*Arch. Derm. and Syph.*, February, 1920) calls attention to the fact that though erosive and gangrenous balanitis in man has been recognized for several years, the same disease in women is not generally diagnosed. He reports three cases that have come under his observation. The ulceration may extend the whole length and breadth of the pudenda, destroying the labia in its progress, affecting Bartholin's glands, and involving the anus. There is generally a large amount of discharge from the ulceration and from the vagina. The edges of the ulcer are everted and raised above the neighbouring skin. The pus, of a greenish-yellow colour, has the same foul odour as that of gangrenous balanitis. The lesion is dark-red, and when covered with the characteristic yellow pus it resembles the ordinary varicose ulcer of the leg. The inguinal glands are usually involved. In the author's three cases the Wassermann reaction was negative, and the condition did not respond to antisyphilitic treatment. In each case spirochaetes and fusiform bacilli were found. The spirochaete averages from 5 to 30 microns in length, is very motile, and takes the ordinary stains well. The fusiform bacillus, always found in association, is about 2 microns in length, takes the ordinary stains, but, unlike the spirochaete, retains the violet in Gram's stain.

306. Placental Tumour.

MARGESON (*Boston Med. and Surg. Journ.*, February 19th, 1920) gives notes of a case in which sharp cutting pains in the lower abdomen and back occurred at irregular intervals throughout the entire pregnancy. On examination at term, when irregular labour pains set in, the head was found above the pelvic brim and directed toward the right iliac fossa; no fetal part was in the pelvis, and the cervix was not drawn up. During the following twenty-four hours

there were good labour pains at intervals, but no progress whatever was made, and recourse was had to Caesarean section and a living child delivered. In removing the placenta, which was attached rather low down posteriorly and to the left side, a tumour measuring $10 \times 6 \times 3$ cm., resembling the normal spleen in shape and consistence, and attached to the placenta by a structure similar to the umbilical cord 6 cm. long and overhanging the left pelvic brim, was removed. As the pelvis was but slightly contracted and the fetal head was of good size, the tumour apparently added sufficient obstruction to prevent engagement of the head. The tumour, of which no microscopic examination was made, was completely surrounded by amniotic membrane, and seemed to be composed of placental tissue with considerable fibrous connective tissue amongst it. The tumour was possibly one of those rare cases of chorioma angiomatosa.

PATHOLOGY.

307. Sterilization of Lipo-vaccines.

THE use of oily suspensions of bacteria instead of saline solution in the prophylaxis of enteric fever and pneumonia has the advantage that one inoculation suffices instead of three. The available evidence shows that the protective influence of these lipo-vaccines is as good as that of the ordinary vaccines. As the methods of preparation of lipo-vaccines afford many opportunities for contamination, and as oil so interferes with the action of antiseptics that the latter cannot be depended on for a final sterilization, LEWIS and DOEGE (*Journ. Exper. Med.*, February, 1920) considered that the question of sterilization of lipo-vaccines needed further investigation. The finished lipo-vaccines were submitted to heat in order to render them sterile and then tested. The protective power of pneumococcus vaccine, as tested on mice, is not destroyed or apparently greatly diminished by heating to 130° C. for three hours or 120° C. for twelve hours. Typhoid lipo-vaccine, which gives rise to the formation of agglutinins in rabbits but to a less degree than saline suspensions, was found to have its antigenic qualities greatly injured by heating to 130° C.

308. The Cerebro-spinal Fluid in Multiple Sclerosis.

J. E. MOORE (*Arch. Int. Med.*, January, 1920) gives the results of examination of the cerebro-spinal fluid in 28 cases of multiple sclerosis, of which 20 were clinically certain and 8 doubtful. The Wassermann reaction was negative in all the cases. In the 20 cases of certain clinical diagnosis there was pleocytosis in 8 cases, a positive globulin reaction in 18 cases, and a paretic gold curve in 18 cases. The so-called "paretic" gold curve, at first supposed to be pathognomonic of general paralysis, at least within the group of syphilitic disorders, has since been obtained in a number of other conditions, such as lead poisoning, tuberculous meningitis, and multiple sclerosis. As the paretic gold curve was present in 90 per cent. of the cases of clinically certain multiple sclerosis and was negative in the 8 clinically doubtful cases, it is probable the diagnosis was at fault in the latter group. Excluding the cases of lead poisoning and tuberculous meningitis, in which a paretic gold curve is occasionally obtained, the only two diseases in which this curve occurs with constancy are parenchymatous neurosyphilis and multiple sclerosis. The Wassermann reaction should distinguish between them; for, as far as is known, whenever a paretic gold curve is found in syphilis, the spinal fluid Wassermann test is positive, with the exception of long-treated cases, in which the Wassermann reaction becomes negative before the colloidal gold test.

309. The Etiological Relation of Pyloric Obstruction to Gastric Tetany.

W. G. MACCALLUM, J. LINTZ, H. N. VERMILYE, T. H. LEGGETT, and E. BOAS (*Bull. Johns Hopkins Hosp.*, January, 1920) have investigated experimentally in dogs the way in which pyloric obstruction causes gastric tetany. Experiments by MacCallum in 1909 showed that when the pylorus is completely obstructed and the stomach frequently washed out, the animal wastes rapidly and dies in a few days, usually with violent convulsions, which are not precisely of the same character as the twitchings seen in parathyroid tetany. In the present investigation the stomach was cut through on the proximal side of the pylorus and closed so as to form a blind sac at the end of the oesophagus; the animal could then be given food through the distal end. Washings of the stomach show that the secretion of HCl continues and that the chloride content is rapidly

lowered, the gastric mucosa continuing to secrete acid even when the plasma content of chlorides is diminished. If the animal received only water, convulsions appeared in forty-eight hours, whereas, if food containing chlorides was introduced into the intestine, these symptoms were delayed. As the chloride content of the plasma fell, its carbon dioxide combining power and the alkali reserve, as measured by van Slyke's method, rose. Intravenous injections of sodium chloride when the symptoms were well developed caused disappearance of the convulsions and general improvement, with, for a time, a lowering of the electrical excitability. But the introduction of HCl did not have this beneficial effect, and calcium lactate failed to have the remarkable influence that it exerts in parathyroid tetany. Intravenous injections of sodium bicarbonate or carbonate in excessive quantities produce practically the same symptoms—twitching, convulsions, and opisthotonus—as those that result from removal of the chlorides. The authors, unlike Wilson, Stearns, and Janney, did not find any alkalosis in the tetany of parathyroidectomized animals.

310. Experimental Gastric Ulcer.

A. C. IVY (*Arch. Int. Med.*, January 15th, 1920) reports on a series of experimental observations on ulcer of the stomach and duodenum in dogs. Chronic ulcer of the stomach is most exceptional in dogs, and gastric carcinoma does not occur. Acute erosions usually heal, but in dogs ill with distemper or cachectic a chronic ulcer may be produced by feeding with streptococci, the necessary factors being a lowered resistance and temporary hypo-acidity or achylia. This conclusion is in opposition to the generally accepted view that acidity is the all-important condition in ordinary chronic ulcer; but the ulcers seen in certain cases of achylia gastrica are believed by some clinicians to be trophic in origin, and so etiologically different from the peptic ulcer. In order to obtain definite data as to changes of motility and emptying time of the stomach in ulcers of the fundus and pyloric end of the stomach, a number of experiments were carried out; ulcers of the fundus did not exert any influence on the motility of the empty stomach, except slight inhibition for two or three days after the ulcer was produced, and did not cause any retention of food in the viscus; ulceration of the pyloric portion increased the motility of the empty stomach, but did not interfere with the passage of food out of the organ; ulcer of the first inch of the duodenum increased the motility of the empty stomach and caused retention of food. Hypermotility and delay in emptying the stomach might be caused by either one or a combination of four mechanisms: (1) a long reflex to the spinal cord and medulla, (2) a short reflex to the coeliac ganglion, (3) a local intrinsic reflex, or (4) an altered metabolic rate. As a result of experimental section of both vagi and splanchnics and extirpation of the coeliac ganglion it appeared that the fundamental cause of the gastric hypermotility and retention of food is intrinsic, and that it is enhanced by the presence of the extrinsic nervous mechanism. But the nature of the intrinsic mechanism, whether increased irritability of the intrinsic nervous reflex or an altered metabolic rate, was not decided.

311. Diagnosis of Primary Syphilis by Culture.

BAESLACK and KEANE (*Journ. Amer. Med. Assoc.*, February 7th, 1920), in cases where owing to previous medication no spirochaetes can be discovered in the primary chancre, recommend cultivation of small pieces of the tissue in horse serum medium. The medium consists of normal horse serum, free from preservatives, diluted with sterile distilled water in the proportion of 3 to 1. The diluted serum is put in ordinary test tubes, which are closed with rubber stoppers previously sterilized. The tubes are filled to within an inch of the top, stoppered, and heated to 60° C. for an hour in a water-bath. Next day they are heated to 70° C. for an hour, and on the third day to the same temperature until the contents assume the consistence of syrup. This heating for three successive days, besides giving the medium a semi-solid consistence, drives the air from the medium, so that it is under a partial vacuum. The tubes are stored in the refrigerator and warmed when about to be used. Thin slices of the tissue are removed by means of a razor from the edge of the lesion and pushed into the medium from one-half to two-thirds of the length of the tube. The tubes are incubated at 37° C. from three to five days, and a few drops, removed by pipette from the vicinity of the tissue, are examined by dark-ground illumination. The culture, of course, will be impure, but sufficient spirochaetes will be found to give a ready diagnosis.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

312. Meningococcal Septicæmia.

RIBIERRE, HÉBERT, and BLOCH (*Ann. de méd.*, 1919, vi) record the details of 7 cases of meningococcal septicæmia either without meningitis or with its occurrence after a long interval; in 3 cases there was an absence of meningeal infection, and in the others it began on the thirtieth, forty-fifth, fiftieth, and eightieth day of fever respectively. In one of the cases death was due to anaphylactic shock after intravenous injection of serum, in spite of preliminary hypodermic injections to effect desensitization. The clinical manifestations show considerable variations, but the three cardinal signs are fever of a malarial type, skin rashes, and joint affections. The febrile rises of the intermittent fever may be daily, but they are often irregular. The spleen and liver may be, but are not constantly, enlarged. The commonest form of rash is papulo-nodular, and there may be a small vesicle on the summit; but the eruption may be macular only and of small size, or it may be hæmorrhagic. Arthralgia, arthritis, and muscle pains are, like the eruption, constant features. One of the cases showed malignant endocarditis. In 3 out of the 5 cases giving positive blood cultures the infecting organism was the parameningococcus. In 3 of the cases the cerebro-spinal fluid, though sterile, contained an excess of albumin and polymorphonuclear leucocytes a considerable time before symptoms of meningitis appeared. In 3 of the cases hypodermic injection of serum was without any effect, though intrathecal injections of small quantities were successful; this observation was thought to be compatible with the view that meningococci come to rest near, though not in, the meninges, which remain uninfected for a long time. The treatment should start with five injections of 40 c.c.m. of specific serum hypodermically or intramuscularly at a day's interval, a polyvalent serum being used until the type has been determined and the corresponding serum is available. If there is no improvement, serum should be given intravenously, with due precautions as regards desensitization. If this fails, intrathecal injection of serum, even in the absence of meningitic symptoms, is advisable. It is important not to regard the serum disease (seen particularly after intrathecal injection), when early and severe, as a relapse of the infection.

313. Erythema Nodosum and Tuberculosis.

K. HAUG (*Tidsskr. f. d. Norske Lægeforening*, January 1st, 1920) has investigated thirteen cases of erythema nodosum with reference to their relationship, if any, to acute articular rheumatism and tuberculosis. Only in three cases could he find no evidence of tuberculosis, either in the patients themselves or in "contacts." On the other hand, there were two cases in which, shortly after exposure of young healthy persons to infection with tuberculosis an eruption of erythema nodosum took place. In one case the rash did, indeed, appear a fortnight after the development of measles, but as the patient was living with a sister who was dying of tuberculosis, the author suspects that the measles was provocative of the rash by stirring a tuberculous focus into activity. In one case the outbreak of erythema nodosum was followed by acute articular rheumatism of a month's duration. The author, who refers to the work of Poncet and others on the relation of tuberculosis to rheumatism, expresses the belief that under certain conditions the toxins of the tubercle bacillus provoke erythema nodosum or an acute arthritis differing from certain other forms of acute articular rheumatism in its persistence for a considerable time and in its refractoriness to the salicyl radical.

314. Typhus in Rotterdam.

THE epidemic of typhus last year in Rotterdam is described by P. H. KRAMER (*Nederland. Tijdschr. v. Geneesk.*, February 7th, 1920). The disease broke out with great suddenness, and rapidly spread all over the city. In the week January 26th-February 1st, 6 cases were notified, and in the following weeks of February 126, 145, 17, and 119 cases respectively. As the result of the measures taken—including the conversion of two large schools into a hospital, observation of contacts, delousing and disin-

fection—the epidemic rapidly declined in March. In the first week of April only 3 cases were notified, and in the second week only one—the last case of the epidemic. Of 194 cases admitted, 141 were found to have typhus and the remaining 53 a variety of diseases, among which enteric held the first place with 21 cases. Of the 141 typhus patients, 60 were males and 81 females. The mortality among 130 cases admitted during the febrile period was 22 per cent. (29 cases); of these, 20 died in the acute stage—4 in the first week, 11 in the second, and 5 in the third; 2 died of pre-existing diseases—namely, chronic bronchitis with myocardial degeneration, and tuberculosis; and 7 of complications—namely, pneumoœmia, nephritis, and hæmatemesis. The comparative mildness of the disease in early life and its increasing severity as age advanced are shown by the following figures: Of 77 cases under 30, only 4 died—a mortality of 5 per cent.; between 30 and 40 the mortality was 18 per cent.; between 40 and 50, 45 per cent.; between 50 and 60, 57 per cent.; and between 60 and 70, 60 per cent. There was a distinct difference in the mortality in the two sexes above the age of 30, about half the cases in men being fatal as compared with one-third of the cases in women.

315. Atypical Forms of Typhoid Fever.

E. MONDOLFO (*Il Policlinico, Sez. Prat.*, December 14th and 21st, 1919) adopts the following classification of the atypical forms of typhoid fever: A, Anomalies in the onset of the disease—for example, sudden onset, early hæmorrhagic syndrome, "war typhoid." B, Cases characterized by the predominance of a symptom or group of symptoms in one organ or system, while the ordinary symptoms of typhoid remain latent (laryngo-typhoid, broncho-typhoid, pneumo-typhoid, pleuro-typhoid, appendicilo-typhoid, early typhoid cholecystitis, nephro-typhoid, meningo-typhoid, and early typhoid psychoses). C, Anomalies in the temperature chart (rapid rise, inverted type, remittent type, sudden defervescence, intermittent type). D, Larval forms (apyrexic typhoid and ambulatory typhoid). In cases with sudden onset the serum test is usually positive from the beginning of the disease, whereas in ordinary typhoid it is usually negative at this stage. The early hæmorrhagic syndrome is characterized by profuse epistaxis, hæmorrhages from the mouth, intestine, kidneys, lungs, uterus, and skin, accompanied by a state of profound prostration. In some cases, however, the hæmorrhages may be confined almost entirely to the skin. Frugoni has distinguished two special forms of war typhoid, namely, a bronchitic form characterized by an intense diffuse bronchitis, and a rheumatic form, with sudden onset, high fever, and diffuse pains in the joints and muscles. Three varieties of pneumo-typhoid are described by Mondolfo: (1) Pneumonia dominates the clinical picture at first; subsequently the characteristic symptoms of typhoid appear and the respiratory symptoms subside; (2) the symptoms of pneumonia and typhoid coexist from the onset; (3) the disease is dominated by the signs of pneumonia and the typhoid symptoms are latent. Appendicilo-typhoid is a form of the disease which commences with symptoms of appendicitis, while the ordinary manifestations of typhoid are absent. In such cases the following signs are in favour of typhoid as against appendicitis: indefinite localization of the pain in the right iliac fossa, absence of rigidity of the abdominal wall, a comparatively slow pulse in relation to the temperature, headache, stupor, albuminuria, and an enlarged spleen. The pain, which in appendicitis is spontaneous and most intense at McBurney's point, is more diffuse and less severe. Lastly, leucopenia is in favour of typhoid, while leucocytosis indicates appendicitis, though in exceptional cases appendicitis may not be accompanied by leucocytosis. The term "apyrexic typhoid" is used for cases of typhoid in which no rise of temperature has been observed throughout the disease, or in which fever has been absent during a certain time, or was so slight as barely to reach a subfebrile level. The other symptoms may appear and succeed one another as in ordinary typhoid, so that apyrexia is the only abnormal part of the syndrome. Sometimes the fever lasts only for a very brief period at the onset, and the disease subsequently runs its course without fever. The cause of apyrexic typhoid is not yet explained. The hypothesis of an attenuated infection may be rejected, or at least it does not explain severe or fatal

cases. The view which appears to be supported by experimental and clinical evidence is that the apyrexia depends in some cases on the gravity of the toxic infection. Thus, in Rolano's cases the apyrexia coincided with an aggravation of the disease, which ended fatally. Experimentally it has been shown that while moderate doses of the typhoid bacillus cause a rise of temperature, higher doses produce hypothermia.

316. Vincent's Angina Simulating Tonsillar Chancre.

G. CORNAZ (*Rev. méd. de la Suisse rom.*, December, 1919) reports the following case: A man, aged 26, developed an ulcer (the size of a five-franc piece on the inner side of the right cheek. The floor of the ulcer was sanious, its base infiltrated, and the corresponding submaxillary glands enlarged and tender. The temperature was normal. The ulcer healed in nine days with applications of tincture of iodine and hydrogen peroxide gargles. A fortnight afterwards the patient developed a similar ulcer on the right tonsil. On admission to hospital eleven days later the tonsil was red, infiltrated, and showed an ulcer, the size of a franc, covered with a diphtheroid deposit. There was a hard and almost painless enlargement of the submaxillary glands. The left tonsil was normal. Temperature 97.8°. The appearance of the lesion, its unilateral position, and the patient's history suggested at first a hard chancre of the tonsil. The *Spirochaeta pallida*, however, was not found on examination with the ultramicroscope, and the Wassermann reaction was negative; but a smear stained with carbol-fuchsin showed Vincent's fusiform bacilli and spirilla. The patient was given an intravenous injection of novarsenobenzol (0.45 gram), and the next day showed great improvement. Two local applications of arsenobenzol and a second injection (0.45 gram) were given, and in five days the ulcer completely disappeared.

317. Neo-salvarsan in Syphilitic Disease of the Heart and Aorta.

K. KOTHNY and A. MÜLLER-DEHAM (*Wien. klin. Woch.*, January 22nd, 1920) have studied the effect of neo-salvarsan in heart disease over a period of seven years, and have come to the conclusion that, provided the patient's general condition is sufficiently good, every case of syphilitic disease of the aorta should be treated with neo-salvarsan, the drug to be given at first in small doses only. They combine this cautious dosage of neo-salvarsan with mercury and iodides. The doses of neo-salvarsan which they recommend are as small as 0.05 to 0.075 gram. These minute doses are increased gradually, as they find the patient tolerates them satisfactorily. Except in the earliest series of cases, they gave the drug by intravenous injection, diluted in 4 to 10 cu. of freshly distilled water. The injections were repeated at intervals of three to four days, and the dose of a single injection never exceeded 0.45 gram. After a total of 1.6 to 2.4 grams of neo-salvarsan had been given, a course of mercury was prescribed, and this again was followed by another course of neo-salvarsan controlled by Wassermann tests. The authors' *casuistik* (16 cases) runs to several columns.

318. The Reinforcement of Quinine by Fluorescent Substances.

S. RUSZNYÁK (*Wien. klin. Woch.*, January 1st, 1920) states that various observers have shown that in the light different substances possess a well marked catalytic action or high degree of toxicity which in the dark is either completely absent or much less in degree. A peculiarity of these substances, to which quinine belongs, is the possession of fluorescence. Although Tappeiner and Ziemann independently found that fluorescein had no demonstrable action on the course of malaria, it occurred to Rusznyák that the action of quinine might be reinforced by fluorescent substances. He therefore gave 35 cases of malaria, which had proved resistant to quinine, subcutaneous injections of fluorescein or eosin (0.01 to 0.06 gram in saline solution). An immediate fall of the temperature to normal took place in 28, and out of 25 cases which had relapsed during quinine treatment 20 reacted in the same way, so that out of 60 cases only 12 failed to react. Rusznyák admits that these results must be taken with considerable reserve, partly owing to the small number of the cases and partly owing to the tendency of febrile paroxysms, especially in chronic malaria, to cease spontaneously. The fact, however, that the subsidence of the febrile attacks so frequently coincided with the injection of the colouring matter induced him to publish his observations, which were supported experimentally by the synergism shown *in vitro* to exist between quinine and eosin or fluorescein.

SURGERY.

319. The Treatment of Influenzal Empyema.

A. SABROE (*Ugeskrift for Læger*, January 15th, 1920) notes that influenza empyema differs in many respects from the ordinary pneumococcal empyema. The latter reacted satisfactorily to surgical treatment; the temperature fell to normal soon after drainage was established, and the further course of the case was uneventful. But the empyema of influenza ran an erratic and capricious course, the temperature exhibited fluctuations suggestive of new complications, and the duration of the fever was often protracted. In spite of this, the patient's appetite was often uniformly good; albuminuria, digestive disturbances, and the other common accompaniments of hyperpyrexia were conspicuous by their absence; and the cheerfulness of the patient was maintained to a surprising degree. All but four of 94 cases were operated on. In children simple pleurotomy was performed, and only in a few was this operation supplemented by resection of rib. In adults, however, resection of rib was the rule, the bone being removed without injury to the pleura. As the clumps of fibrin found in influenza empyema were often large enough to obstruct a catheter, a comparatively thick drainage tube, fitted with a cuff, was used and connected with the aspiration apparatus. All the 17 cases terminating fatally showed signs of bronchopneumonia, atelectasis, and degenerative changes in various organs.

320. The "Normal" Appendix.

WILLIAMS and SLATER (*Annals of Surgery*, 1919, 70) recount the condition of the appendix in 500 consecutive laparotomies on patients presenting no symptoms of appendicitis. One-third of these patients showed changes in the appendix although all the cases were clinically "mute." In about one-third of these diseased appendices there was inflammation in the adnexa, so that it is fair to assume that the pathological processes in the appendix were secondary—infection from without. In 100 cases there was no such trouble, and the appendicitis can be considered as spontaneous. The authors mention that pericaecal veils were common, and they evidently regard these as evidence of appendicular disease, a belief in which they will be joined by few. The only appendices which can be regarded as definitely diseased are those with round cell infiltration or fibrosis of their walls, complete or partial, or obliteration of the lumen. The absence of definite figures on this point detracts from the merit of their work. A more careful study of this subject would be most instructive.

321. Foreign Bodies in the Brain.

AFTER discussing this subject and illustrating it with several drawings, F. DEMMER (*Wien. klin. Woch.*, January 15th, 1920) concludes that it is exceptional for a foreign body in the brain to become firmly encapsuled in fibrous tissue. On the other hand, it is common to find cyst formation about an aseptic foreign body, an encephalomalacic focus about an irregular aseptic foreign body, and encephalytic softening about a septic foreign body. He regards as absolute indications for operation (1) a recent wound, with the brain exposed, and (2) alarming symptoms at a later stage. The indications for operation are uncertain when the manifestations of the injury are limited to purely subjective symptoms, and when these do not afford trustworthy data. In these doubtful cases the author recommends a variety of functional tests, which should not be carried out till six to nine months after the injury. These tests are both mental and physical, and, in conjunction with lumbar puncture, they may be reliable enough in some cases to convert an uncertain into a certain indication for operation.

322. Stimulation of Backward Growth by X Rays.

WHILE studying the relations of the growth in length and ossification of the bones of the hands to the age of the child, E. STETTNER (*Muench. med. Woch.*, November 14th, 1919) found that by deep irradiation it was possible to stimulate ossification even when it was very backward, and to reduce the difference from the normal from years to within a few months. The investigations suggested that the occurrence of centres of ossification bore a relation to the development in length of the child and to its social status. Within a definite group the sequence in the appearance of the centres of ossification was found to be so constant that variations might be regarded as pathological. In many cases the frequency of delay in growth may be attributed to constitutional anomalies, disease, or disturbance of the glands of internal secretion.

123. Perforation of Typhoid Ulcers.

U. ARCANGELI (*Il Policlinico*, Sez. Prat., January 5th, 1920) has collected 49 cases of typhoid fever which were operated on for perforative peritonitis, with a recovery rate of 38.7 per cent. Ten in whom the operation was performed within the first nine hours recovered; of 20 operated on within twelve hours 15 recovered; of 20 operated on between twelve and twenty-four hours only 2 recovered; and those in whom the operation was performed later all died.

324. Malarial Orchitis.

E. VECCHIA (*Il Policlinico*, Sez. Prat., January 5th, 1920) records a case of malarial orchitis in an Albanian native, aged 16, suffering from malignant tertian fever. All other causes of orchitis, such as gonorrhoea, mumps, syphilis, and tuberculosis, could be excluded, and immediate subsidence of the inflammation followed intravenous injection of quinine, the testis regaining its normal size in two days.

325. Chronic Appendicitis due to Small Shot.

M. GRAEFFE (*Muench. med. Woch.*, November 14th, 1919) records a case of a woman, aged 43, who had been married twenty years and given birth to two children. She had had attacks of what was supposed to be oöphoritis eighteen and nine years previously. When seen by Graeffe she presented symptoms of appendicitis. At operation an abnormally long and inflamed appendix was found. The right ovary had undergone cystic degeneration, and the corresponding Fallopian tube showed much inflammatory thickening. On opening the appendix twelve small shot were found. The husband was a hunter, and had been in the habit of bringing his wife game every year since their marriage. It seemed probable, therefore, that the shot had not entered the appendix all at once, but on several different occasions. Graeffe thinks that both the supposed attacks of oöphoritis from which the patient had previously suffered were really attacks of appendicitis caused by the entrance of the shot into the appendix.

326. Treatment of Affections of the Vitreous

ZUR NEDDEN (*Med. Klinik*, November 23rd, 1919) points out that infections of the vitreous following penetrating wounds are the most formidable of all eye diseases because they threaten the existence of the eye. Panophthalmitis, with shrinking of the eyeball, is usually the outcome of such cases. Pneumococcal or streptococcal infection, which forms the largest percentage of these cases, has hitherto defied all treatment. In experimental investigations on the presence of bactericidal substances in the eyes of non-immunized persons zur Nedden had found that the bactericidal substances in the blood, which normally are not present in the vitreous, pass into it after it has been punctured. Experiments on rabbits then showed that infection of the vitreous is sometimes cured if early and repeated puncture is performed. In the first trials of puncture of the vitreous in the human eye the infection had been present too long, and was so extensive that preservation of the eye was no longer possible. In two cases, however, in which the puncture was performed early the result was very satisfactory, very good visual acuity being recovered. In other affections of the vitreous which were not of an infective nature but the result of disease of the retina and choroid, and were manifested by dense opacities, excellent results were obtained by puncture. The effect of treatment was seen not only in the vitreous but also in the tissues which were the cause of the vitreous opacities. This is explained by the curative action of the hyperaemia of the uvea caused by the puncture.

327. Auto-Serotherapy in Cancer.

C. LEWIN (*Berl. klin. Woch.*, December 29th, 1919) records the case of a married woman, aged 44, who in the winter of 1915-16 noticed a swelling in the right axilla. Later, a swelling in the right breast was detected. In April, 1916, the breast was amputated, and the right axilla cleared of enlarged glands. The microscopic report was carcinoma simplex. In 1917 nodules formed in the operation scar. These were excised, and x-ray treatment was prescribed, but metastases developed in the right axilla and orbit. Late in 1918 ascites developed, the fluid being serous and clear. In May, 1919, auto-serotherapy was instituted, 10 to 20 c.cm. of the fluid being injected subcutaneously without complete withdrawal of the needle employed to aspirate the ascitic fluid. Later, the dosage was increased to 15 or 20 c.cm. given two or three times

a week. In June, 1919, as much as 3½ litres of fluid were drawn off, and tumours as large as a fist could subsequently be detected in the abdomen. By September fresh nodules had developed in the chest, but from this date definite improvement began. Early in October the ascites had disappeared, and the abdominal tumours could no longer be felt. Clinically there was no longer any sign of cancer, and the patient's appetite and general condition were excellent. Professor Lewin refers briefly to another case of cancer treated in the same way and with the same striking results.

328. Treatment of Lupus Vulgaris.

L. FREUND (*Dent. med. Woch.*, December 11th, 1919) recommends a combination of excision and x-ray treatment for lupus vulgaris. If the case is suitable for treatment—that is, if the focus is circumscribed and the disease has not invaded the adjacent mucous membrane—the affected area is excised under local anaesthesia, and one or two days later an erythema dose of x rays is applied to the wound. Irradiation of six minutes' duration is continued for seven or eight days in succession. As a rule it will be found that the skin wounds caused by excision heal more rapidly when treated by x rays than without this procedure. The method is simple and is stated to produce rapid and cosmetically satisfactory results.

OBSTETRICS AND GYNAECOLOGY.**329. Artificial Rotation of the Head in Persistent Occipito-posterior Positions.**

LAMOND LACKIE (*Edin. Med. Journ.*, March, 1920) considers that in four out of every five cases spontaneous rotation occurs and the labour terminates naturally, but in the fifth case the occiput does not rotate at all or does so into the hollow of the sacrum. For the proper management of occipito-posterior positions an absolutely accurate diagnosis must be made, and in some cases an anaesthetic is necessary for this purpose. As long as progress is being made, and not too slowly, the case may be left to Nature; but if hours pass and the head remains high up and the pains become weak, the whole hand should be introduced beyond the head, and, the membranes being ruptured, the fingers reaching a shoulder rotate the whole child on its longitudinal axis with the help of the left hand acting through the abdominal wall if necessary. After allowing a short time for moulding of the head, forceps are applied and easy delivery effected. The more frequent condition, however, is that in which the position is not diagnosed till the second stage of labour is entered upon, and the head is more or less fixed at the brim or in the cavity of the pelvis. The usually recommended treatment of promoting flexion by pressing up the sinciput during a contraction is useless. If the procedure recommended during the first stage fails to remedy matters the head must be rotated into an anterior position by one hand whilst the other, acting through the abdominal wall, attempts to rotate the shoulders. If this manipulation fails forceps should be applied, pushing back the head gently, and the handles should be carried round in a large circle. Once the occiput occupies an anterior position a little traction should be exerted so as to fix the head and prevent it returning to the original position. The forceps are then removed and recapped and traction is used. There must be no traction during rotation, and every possible manoeuvre should be adopted to rectify the mal-position before resorting to brute force in delivering the head. The author regards the method as a perfectly safe one, and considers that the results obtained from it are wonderful.

330. Oedema of the Larynx in Pregnancy.

S. PUSATERI (*Il Policlinico*, Sez. Prat., February 2nd, 1920) states that the prognosis of acute oedema of the larynx in pregnancy should be very guarded, and that the death of both the mother and the fetus is to be feared. He considers that in such cases it is justifiable to empty the uterus at once, with the double object of saving the life of the fetus and of improving the mother's general condition and laryngeal affection. He records a case of oedema of the larynx secondary to scarlatinal angina in a woman aged 30, in the ninth month of her third pregnancy. Induction of labour was refused until after the death of the fetus, when it failed to relieve the dyspnoea. Intubation followed, and tracheotomy was then performed, with some relief to the patient, but death took place the same day.

PATHOLOGY.

331. Spirochaetes in the Urine of Guinea-pigs.

R. SIGALAS (*Gaz. hebd. des Sci. Méd. de Bordeaux*, February 1st, 1920) recently found a spirochaete closely resembling the *Spirochaeta icterohaemorrhagiae* in the urine of a guinea-pig which had neither been inoculated itself nor in contact with inoculated animals. The organism was also obtained by direct aseptic puncture of the bladder after death. No lesions of spirochaetosis icterohaemorrhagica were found in the organs, and smears of the liver, kidneys, and suprarenals were negative. The presence of the spirochaete in the guinea-pig apart from inoculation shows that experiments made on this animal in the study of the spirochaetoses require careful interpretation.

332. Ictero-haemorrhagic Spirochaetosis and the Rat.

INVESTIGATIONS made in Japan, France, and elsewhere into the relation of the rat to ictero-haemorrhagic spirochaetosis have been supplemented by observations made by UHLENHUTH and ZUEZLER (*Med. Klinik*, December 31st, 1919). Among 89 wild rats (*Mus decumanus*) caught in different parts of Berlin they succeeded in demonstrating the *Spirochaeta icterogenes* in the urine or kidneys of 9. The rats were apparently healthy, and in 8 of the 9 infected animals no morbid changes could be detected *post mortem*. In the ninth case there were haemorrhages into the lungs—a condition already observed in rats in the trenches in France, where ictero-haemorrhagic spirochaetosis was epidemic. The immunity to this disease hitherto enjoyed by Berlin is, in the authors' opinion, more apparent than real, and they suggest that it has often been overlooked and diagnosed as simple catarrhal or other form of jaundice. Though the infection seems to be latent in rats the spirochaete is pathogenic to mice and guinea-pigs. Strains from the rat conformed in essentials to the characteristics of strains obtained from man, except that the latter were somewhat more virulent for mice and guinea-pigs. An immune serum, prepared from rabbits, protected the experimental animals from both strains—an observation pointing to the identity of the two strains.

333. The Streptococci of War Wounds.

PRUVOST (*Paris méd.*, February 21st, 1920) found that he could divide the streptococci found in wounds into two classes—(1) pathogenic streptococci from serious febrile cases, (2) streptococci that did not give rise to any untoward general condition. The former were generally but not invariably haemolytic; they occurred in regular chains with elements of uniform size. The latter were usually but not always non-haemolytic; they were composed of irregular chains the elements of which varied in size and shape, and were generally less fragile in culture. When a prompt opinion as to the nature of the streptococcus present was demanded in order to decide on the closure or otherwise of the wound, reliance could be placed on this irregularity in the size of the constituent elements of the non-pathogenic streptococcus. The latter organism may be regarded as an enterococcus. No reliance can be placed on the length of the chains, as this varies widely in a single culture.

334. Tissue Grafts from Immunized Animals.

MÜLLER (*C. R. Soc. Biol.*, February 21st, 1920) has sometimes succeeded in grafting pieces of normal tissue in other animals of the same species. Small minced fragments of various organs were injected intraperitoneally, and these in some cases survived and established vascular connexion with the host. Of particular interest are his experiments with the tissues of guinea-pigs immunized against sheep corpuscles. He injected into fresh animals portions of the spleen, omentum, bone marrow, or thyroid gland. Fifteen days afterwards the haemolytic power of the serum of the hosts was tested and was found to be quite appreciable, being about 1 in 80 in the case of the omentum grafts, 1 in 60 for the spleen grafts, and 1 in 25 for the bone marrow grafts. The acquired haemolytic power persisted for a considerable time, and when it diminished eventually it could be restored to more than its original titre by a single injection of sheep corpuscles. The author holds that there is a true secretion of antibodies by the organs transplanted.

335. Bacteria of the Conjunctiva in Dacryocystitis.

L. BETTI (*Il Policlinico*, Sez. Prat., January 12th, 1920) has studied the bacterial contents of the conjunctiva in 82 cases of dacryocystitis, and has come to the conclusion that while the microorganisms found in the conjunctiva of individuals with chronic suppuration of the lacrimal sac

are usually the same as those in the normal conjunctiva, the frequency with which they are present varies considerably. As a general rule, pathogenic micro-organisms—for example, the pneumococcus—are much more frequent in cases of dacryocystitis, while micro-organisms deprived of pathogenic qualities and saprophytes, such as the *Staphylococcus albus* and *Bacillus xerosis*, are more frequent in the normal conjunctiva.

336. Culture of Gonococcus.

MORINI (*Rif. med.*, January 3rd, 1920) speaks very favourably of a mixture of gelatin and yeast as a culture medium for the gonococcus. He says it is easy to prepare and gives certain results, and in it the gonococcus preserves its morphological characteristics in an accentuated form. It is prepared by adding the yeast dissolved in sufficient distilled water (a few cubic centimetres is enough) to 55 c.cm. of gelatin. The preparation is slightly acid. Good growth can be seen in three or four days. By occasional shaking of the tube and the addition of oxygen the growth can be preserved for a month. After an interval of thirty-six to forty-eight hours abundant typical diplococci can be seen when observed under the microscope. The presence of other organisms does not interfere with the growth of the gonococcus.

337. The Haemic Basophil Cell.

GRAHAM (*Journ. Exper. Med.*, February, 1920) reviews our knowledge of the basophil or mast cell of the blood, and describes his benzidine-thionin method of staining, which he employed in fresh films from a considerable series of cases of myeloid leukaemia. The haemic basophil cell is usually considered to be derived from the bone marrow, and to be the complete homologue of the neutrophil and eosinophil leucocytes, from which it differs only in the basophil staining reaction of its granules. These differences are that the basophil granules do not stain brown with benzidine, are soluble in water, and are resistant to drying, heat, and to the action of acids and alkalis. As compared with the neutrophil and eosinophil granules they are chemically more stable while biologically inert; and the basophil cells appear to be devoid of any functional activity comparable with that of the neutrophil and eosinophil leucocytes. All the stages of conversion of granules staining with benzidine into those incapable of so doing are seen, and the conclusion is reached that the basophil is a degenerated or degenerating cell, probably derived from the eosinophil, and perhaps in rare cases from the neutrophil cells.

338. Blood Platelets in Immunity.

GOVAERTS (*C. R. Soc. Biol.*, February 21st, 1920) found that in a mixture of physiological saline solution, bacteria, and washed blood platelets no precipitation occurred, but the mixture remained quite homogeneous. With fresh serum, however, instead of saline, the bacteria attached themselves to the platelets rapidly, precipitation occurred and the fluid cleared. If the serum was heated to 60° C. for half an hour no precipitation occurred. There must therefore be some thermolabile factor in serum which permits the attachment of the bacteria to the platelets, and consequent precipitation. If the bacterial emulsion is impregnated with fresh serum left in contact with it for half an hour at 37° C. and the bacteria are subsequently separated by centrifugalization, washed, and suspended in saline or heated serum, there is an immediate attachment of bacteria to platelets and a precipitation. Again, if the suspension of bacteria is left in contact with fresh serum for fifteen minutes and the mixture then heated to 60° C. the property of attachment of bacteria to platelets is still retained. The experiment proves that the attachment of bacteria is not due to the agglutination of platelets amongst themselves, and the conclusion is drawn that the rapid elimination of bacteria introduced into the circulation is brought about by the attachment of the organisms to the platelets, a phenomenon parallel to phagocytosis. This work would seem to supply an argument in favour of the rôle of blood platelets in natural immunity.

339. Presence of Certain Bodies in Typhus.

G. FICAI (*Il Policlinico*, Sez. Prat., February 2nd, 1920), on histological examination, found in the epithelial cells of the stomach of infected lice and in the brain of infected guinea-pigs and typhus patients round bodies of various sizes. The largest which were present in the human brain were extracellular, those of moderate size were in a few cases intracellular, pericapillary, and intracapillary. Examination of the brain of persons who had died of other diseases failed to reveal similar findings. Ficai regards any discussion as to the nature of these bodies as premature at present.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

340. The Prognosis in Influenzal Pneumonia.

V. BIE (*Ugeskrift for Læger*, February 5th, 1920) has investigated 1,653 cases of influenza, for the most part complicated by bronchopneumonia or bronchitis. He tabulates his material with a view to demonstrating the effect of heart disease on the course of influenzal pneumonia and the prognostic significance of the four most important criteria—urine, temperature, pulse, and respiration. Of the 96 adults dying of pneumonia on whom a necropsy was performed, 27 (or 28 per cent.) proved to have suffered from heart disease, which in 13 cases took the form of mitral insufficiency. There were also many cases in which heart disease was diagnosed before death, and in some of these the diagnosis was confirmed by necropsy. Altogether there were 55 cases of combined heart disease and pneumonia, the mortality being 55 per cent. The mortality among adults suffering from pneumonia without heart disease was only 21 per cent. Albuminuria occurred in 29 per cent. of the cases of pneumonia, and only in 4 per cent. of the cases without pneumonia. The mortality among the cases of pneumonia complicated by albuminuria was 35 per cent., uncomplicated by albuminuria it was only 12 per cent. This comparison would have been still more unfavourable to the subjects of albuminuria had all the patients who died soon after admission to hospital, before the urine could be examined, been included in the analysis. This also showed that the height of the temperature on the patient's admission to hospital is of no prognostic value. Nor could any clue to the prognosis be found in the relation of the morning to the evening temperature. The prognostic significance of continued or intermittent fever was also dubious. The pulse rate, however, proved of greater prognostic value; whatever the condition of the temperature a slow pulse was a good, a rapid pulse a bad, sign. Among the fatal cases the pulse was on the average 109–110 on the patient's admission to hospital, whereas the average among the recoveries was, on the patient's admission, 100 for those with a temperature of 40.5° C. or more, and 95 for those with a temperature of 38.9° C. or less. But the most trustworthy prognostic sign of all proved to be the respiration. If it was 40 or more it was bad, if it was 35 or less it was comparatively good.

341. Congenital Abnormal Mobility of the Heart.

C. HESSELGREN (*Hygiea*, 1919, lxxxix) records the case of an infant liable to attacks of dyspnoea and cyanosis, especially on emotion. These attacks were first noticed when the child was a fortnight old, but seem to have passed off at the age of 3½, by which time the boy presented a fairly normal colour; he became a little livid after a severe attack of coughing, but presented no detectable abnormality of the heart. Hesselgren first saw him when he was 8 months old. He was a small child, livid in colour and bronchitic, but with normal cardiac sounds and no cardiac murmur. Examination of the chest with the *x* rays showed that the heart readily shifted from side to side; skiagrams are reproduced to illustrate this, and exhibit about four-fifths of the shadow cast by the heart and aorta alternatively to the right or the left of the middle line. On one occasion when the heart was very much to the right, turning the infant on to the left side did not cause the cardiac shadow to move to the left. The lungs, diaphragm, and mediastinum showed no abnormality to account for the unusual mobility of the heart, which is attributed by the author to a persistence of the mobility normal during part of fetal life. He considers also that this heart doubtless suffered from some intracardiac congenital defect, undiagnosable for want of any abnormality in the cardiac sounds; the child's fingertips were normal in shape, and it is noted that the lungs were very prone to bronchitis throughout. Hesselgren believes that the abnormal mobility of the heart passed off during the child's second year, but this point is not made quite clear.

342. Pernicious Anaemia in a Child.

MARINUCCI (*La Pediatria*, November, 1919) records the case of a child, aged 17 months, whose illness started two months before with vomiting and diarrhoea, lasting about a fortnight and rapidly followed by increasing pallor. On

admission, the child was very anaemic, and showed the following blood condition: haemoglobin 20 per cent., red corpuscles 680,000, white 12,320, colour index 1.47, neutrophils 26 per cent., eosinophiles 4 per cent., lymphocytes 63 per cent., large mononuclear 3 per cent., myelocytes 1 per cent.; marked anisochromia, poikilocytosis, giant cells and microcytes. There was no enlargement of spleen or liver, and no other visceral change. Puncture of the tibia showed definite changes in the bone marrow. The Wassermann test was positive both in mother and child. In the author's experience most cases of pernicious anaemia in children occur in syphilitic or tuberculous subjects.

343. The Action of Hypodermic Injections of Sugar.

ZAGARI (*Rif. Med.*, November 3rd, 1919) gives the results of a series of experiments on thirty adults. He prepared an isotonic solution of glucose of the strength of 47 grams to 1,000 c.c.m. of distilled water and injected slowly into the subcutaneous tissue from 500 to 700 c.c.m., according to the tolerance of the patient. In a good many cases this caused a local erythema which was slightly painful, but passed off at the latest in two or three days. Occasionally it produced a general reaction with some pyrexia, appearing only after the first injection, and on the second day a decided increase in voluntary muscular work (as estimated by Mosso's ergograph) was observable after injection, becoming more marked after each injection, and disappearing ten days after injection. Reflex excitability was diminished and muscular tone increased; the muscular force was hardly affected, and the blood pressure only very slightly. Diuresis was notably increased; this diuretic effect could be observed for some days after the injections were discontinued.

344. Gastric Ulcer in Pulmonary Tuberculosis.

CORDIER and BARBIER (*Lyon méd.*, January 10th, 1920) record the case of a woman, aged 28, who had reached the last stage of pulmonary tuberculosis, when one morning she suddenly vomited nearly a litre of blood and died. *Post mortem* the lungs were full of cavities, but showed no haemorrhage. On examination of the stomach, however, a punched-out oval ulcer was found near the lesser curvature. The patient had never complained of gastric pain or digestive disturbance. The latent character of the ulcer suggested that it was tuberculous, but on histological examination no evidence of tuberculous formation could be found.

345. Vaccine as a Prophylactic against Influenza, and Local Reaction as a Guide to Immunity.

GREELEY (*Med. Record*, October 11th, 1919) records the effects of a vaccine made by him which included seventeen strains of the Pfeiffer bacillus from as many different cases. The vaccine was grown on blood-agar, washed off in saline, heated for an hour at 60° C., standardized at 2,000 million bacilli in each cubic centimetre, and preserved with 0.5 per cent. phenol. The dosage recommended was—first dose 0.25 c.c.m., second 0.5 c.c.m., and third 1 c.c.m. at intervals of from two to three days. From a large number of children and adults it was noted that the reactions, both local and general, were more severe in those who had not been already immunized by a recent attack of influenza bacillus catarrh, and no case of influenza occurred after the prophylactic vaccine had been given. By observing the local effects of a dose it was possible to determine whether the individual possessed any immunity against influenza, and the severity or otherwise of such reactions afforded an approximate guide to the degree of immunity. The experience showed that vaccine made of a mixture of different strains of the influenza bacillus had a definite protective value in those not already immune.

346. Abortive and Early Treatment of Influenza.

A. MAYER (*Med. Klinik*, December 28th, 1919) has found the following combination of drugs, given for two or three days, act almost as a specific in influenza: Equal parts of phenacetin, aspirin, and salipyrin (0.3 to 0.4 gram) and morphine 0.01 to 0.02 gram. To simplify the wholesale prescription of this combination in time of epidemic he gives it in tablet form according to the following formula: Phenacetin, acid. acetyl. salicyl., salipyrin, $\bar{a}\bar{a}$ 0.15 gram, morph. mur., 0.005 gram. Two tablets are given three times a day. Combined with frequent gargling with

hydrogen peroxide, this remedy soon provoked profuse sweating, fall of temperature, and disappearance of nervous symptoms. The common complications of influenza did not occur, or, if already present in the form of pleurisy and severe nervous prostration, they soon reacted satisfactorily to this treatment. The inclusion of morphine in the prescription proved of great value in respect of symptoms referable to the bronchi. The author admits that his cases were not numerous enough for the value of this treatment to be judged by a statistical analysis.

347. A Sign of Impending Death.

O. RÜDEL (*Munch. med. Woch.*, December 5th, 1919) has a note on the cadaveric odour in the expired air when death is impending. In order to detect it the observer must bend his head over the patient's chest as in auscultation, so as to come as close to his mouth as possible, as the odour is not perceptible half a metre away. It is not noticeable on inspiration. An exact description of the smell is difficult, but it most closely resembles that of bodies in which death has recently taken place. The interval between the time it is first noticed and the occurrence of death varies from a few hours to a day and a half. The sign is not present in all moribund persons, nor does it occur in any particular diseases or any particular type of patient, but it appears to be most frequent in suppurative processes. Rüdel found it in vigorous individuals in whom tuberculous meningitis or appendicitis was the cause of death, and often failed to find it in long-drawn-out agonies even twelve hours before death. He concludes that if the sign is present death is certain to occur within the next forty-eight hours, even if the patient's condition is apparently satisfactory, while if it is absent direct danger to life is unlikely within the next six to ten hours.

348. Inhibition of Diuresis by Digitalis.

A. JARISCH (*Berl. klin. Woch.*, December 29th, 1919) finds that though there are a few scattered and rather general observations published with regard to the inhibitory action of digitalis on diseased kidneys, the problem has not been exhaustively studied. It can best be elucidated, in his opinion, by meticulous care in studying every sign and symptom in isolated cases, and he proceeds to give a long account of a case in which these conditions were fulfilled. Summarizing, he notes that his findings coincide with those of A. W. Meyer, and that in the early stages of granular kidney therapeutic doses of digitalis inhibit diuresis, while minute doses promote it. He associates this phenomenon with an increased excitability of the vasomotor mechanism of the kidneys.

SURGERY.

349. "Silver Salvarsan" in Syphilis.

H. BOAS and A. KISSMEYER (*Ugeskrift for Læger*, February 5th, 1920) report on their experiences with "silver salvarsan." 400 tubes of which they received from Kollé, Ehrlich's successor, for clinical investigation. In their opening remarks they note that during the past year silver salvarsan has become very popular in Germany, where it is usually given without any mercurial treatment to supplement it. The arsenic content of this new preparation is barely two-thirds that of old salvarsan. The authors gave it in sixty-two cases of syphilis in every stage, but they did not trust it enough to dispense with a supplementary course of mercury. The drug provoked fewer complications than any other of the salvarsan group, and the high febrile reaction observed in only three cases did not last more than a couple of hours. The effect of the drug on the symptoms was greater than with intravenous injections of salvarsan, and was equal to that of intramuscular injections of salvarsan. Not infrequently Herxheimer's reaction was observed, the cutaneous manifestations showing an acute exacerbation a day after an injection. One patient, who gave a negative Wassermann reaction and who had received no mercury, exhibited a chancre in which numerous spirochaetes were demonstrable immediately before the injection of 15 cg. of silver salvarsan. Twenty-four hours later the spirochaetes had completely disappeared, a phenomenon observed also with other salvarsan preparations. The authors conclude that the action of silver salvarsan does not differ from that of the other members of this group; it is effective in early cases, comparatively inert in cases of old standing. They have seen no serological or clinical relapses, but they

admit that the observation period was too short for an opinion to be given as to the durability of their results. The greater solubility of silver salvarsan, as compared with old salvarsan, marks a definite advance.

350. A. KORSBJERG (*Ugeskrift for Læger*, February 5th, 1920) has given 310 injections of "silver salvarsan" in 32 cases of syphilis since July, 1919. He was so impressed by the results in his earlier cases that he abandoned the simultaneous administration of mercury, and in 29 of his cases no mercury was given. The effect of the intravenous injections on the patient's general health was excellent. None lost weight, and the average gain of weight was 2,320 grams. Though he selected chiefly severe cases with a variety of symptoms, so as to put the drug to a searching test, and though the disease was in its first stage in six cases only, yet practically every symptom had vanished after a fortnight's treatment. The serological results were also strikingly satisfactory. The author had originally intended to follow up the intravenous injections with a course of mercury, but their effect was so complete that he decided to dispense with the mercury. But as he cannot exclude the possibility of late nervous implication, he advocates the use of potassium iodide together with the silver salvarsan.

351. Surgical Renal Tuberculosis.

BRAASCH (*Amer. Journ. of Med. Sci.*, January, 1920), from observations upon 532 persons operated upon for renal tuberculosis, considers that the most important factors affecting prognosis are age, sex, coincident tuberculosis in other tissues, duration of symptoms, degree of involvement of bladder and kidney, and bilateral renal disease. Occurring most frequently between the ages of 20 and 40, males are affected twice as frequently as females, and the post-operative mortality is higher in males. In children the condition is usually part of a general tuberculosis rather than surgical. In about 75 per cent. of the patients, if not in all, evidence exists of tuberculosis in other tissues, but multiple lesions do not necessarily render the prognosis more unfavourable, and the post-operative mortality is not higher than the general average. In at least one-third of the patients there is evidence of healed pulmonary tuberculosis, and among these the percentage of recovery is above the average, indicating increased powers of resistance. Five per cent. showed coincident active pulmonary tuberculosis, more than 60 per cent. recovering after nephrectomy, and in at least 73 per cent. of the male patients the genitalia were involved, though this did not appear to affect the ultimate recovery. The spontaneous healing of lesions in the prostate and seminal vesicles contraindicates their removal by subsequent operation. Tuberculosis involving the bones and joints was noted in 6 per cent. of the cases, one-half of the lesions being active; the presence of such complications may be an index of increased resistance since the mortality was only 5 per cent., and the same applies to adenitis which was present in 6.4 per cent. of the cases. Active spondylitis while not favourable in prognosis does not contraindicate nephrectomy. The mortality among patients with marked bladder involvement is twice as great as with slight involvement. The degree to which the kidney is affected materially influences mortality, early lesions having the lowest and pyonephrosis the highest death rate.

352. Recurrent Dislocation of the Shoulder.

Il Morgagni (January 5th, 1920) discusses this condition, and refers to 187 cases collected by Seidel, in 30 of which a necropsy was allowed. Almost all the cases were subglenoid or subcoracoid. Most of the patients were middle-aged and had suffered many attacks, in some cases over a hundred times. The first was usually due to a fall. The chief pathological change found was dilatation of the capsule in the line of the dislocation. Probably the recurrence of the dislocations is partly due to weakness of the external rotators as a result of primary rupture, followed by subsequent distension of the capsule and a want of proper equilibrium between the various shoulder muscles. Attempts at cure have been made: (1) by limiting function; (2) by increasing mobility—for example, by excision of the head of the humerus; (3) by sowing up the capsule, advancing the external rotators, and division of the insertion of the subscapularis muscle.

353. Ocular Paralysis of Otic Origin.

CHÉRY (*Rev. méd. de l'Est*, February 1st, 1920) records a case of Bonnier-Gradenigo's syndrome, or ocular paralysis, following a lesion of the ear. The patient was a soldier, aged 30, who, as the result of a shell explosion, developed

a sero-purulent discharge from the left ear and severe left-sided headache. A radical mastoid operation was performed, but the headache persisted and the patient developed dimness of vision and diplopia. On examination he was found to have paralysis of the left sixth nerve and left optic neuritis. Gradenigo explains the occurrence of paralysis of the sixth nerve by the constant presence of basal meningitis, while the optic neuritis is readily explained by an infective origin. The occasional occurrence of paralysis of the superior rectus and other muscles supplied by the oculo-motor nerve is attributed by Bonnier to a relation between the oculo-motor and labyrinthine centres in the medulla in the region of Deiters' nucleus.

354. Hypertrophy of the Prostate.

N. CARRARO (*Il Morgagni*, Archivio, December 31st, 1919) summarizes as follows what every medical man should know about hypertrophy of the prostate: (1) The condition is not really a hypertrophy of the prostate but rather a tumour which originates in the subcutaneous glands in the urethra, and has only relations of contiguity with the prostate; (2) in prostatic subjects more attention should be paid to the severe renal lesions and symptoms of an infective character which inevitably occur than to the urinary symptoms; (3) the only method of radical cure is, he considers, Freyer's operation, which enables the bladder to be completely emptied, and ensures the proper working of the kidneys; (4) the operation is always indicated, and should not be postponed until the condition is too advanced, as the operative risk is always in proportion to the general condition of the patient.

355. Congenital Stricture of the Oesophagus.

J. LOVETT MORSE (*Amer. Journ. Dis. Child.*, February, 1920) records three cases of this condition. The first two were brothers, aged 6 years and 25 months respectively. The eldest child was breast-fed, and seemed well in every way until an attempt was made to feed him when he was 1 year old. It was then found that he could not take solids without vomiting. He was therefore nursed until he was 2½ years old. Since then he had been able to take liquids and soft solids but no solid food. Skiagrams showed an enlargement of the oesophagus at the level of the sternoclavicular joint, and on oesophagoscopy an obstruction was found 6 in. from the incisor teeth and another constriction at 7 in. The stricture was dilated and the vomiting ceased. Further dilatation was considered necessary. In the younger child the vomiting had occurred four or six times a day ever since birth. A skiagram showed a narrowing of the oesophagus at its lower third, with dilatation above. A stricture was found, on oesophagoscopy, 17.5 cm. from the incisor teeth. Dilatation was considered inadvisable and gastrostomy was done. Death took place a week later. The third case was in a girl aged 3 years, who began to vomit soon after birth. The vomiting occurred immediately after food. There were long intervals in which she did not vomit milk or any other fluid food, but she always vomited solid food. Oesophagoscopy showed a stricture 7½ in. from the incisor teeth. There was no marked dilatation above the stricture. After eight months' treatment with bougies no further symptoms occurred.

356. Traumatic Cerebellar Haemorrhage.

MOLIN DE TEYSSIEU (*Gaz. hebdom. des Sci. Méd. de Bordeaux*, February 15th, 1920) records a case in a man aged 39 who, a few days after a fall on the left side of the head, developed right hemiplegia, vertigo, and disturbance of equilibrium, with a tendency to fall to the left. Some improvement took place, and when the patient was last seen, six weeks after the accident, he was able to walk alone with the aid of a stick. This is apparently the first case on record in which cerebellar hemiplegia has been caused by traumatism, all the previous cases having been due to tumours or vascular lesions.

357. Recovery from Acute Haemorrhagic Pancreatitis.

L. MAYER (*Le Scalpel*, January 31st, 1920) records a case of acute haemorrhagic pancreatitis with necrosis in a man aged 53, in whom rapid recovery took place after operation. The diagnosis was facilitated by the following considerations: (1) Bulging of the epigastrium due to distension of the stomach, accompanied by a board-like resistance of the epigastric portion of the rectus muscles. (2) Infra-umbilical distension produced by distension of the transverse colon, which had been pushed downwards. A bilocular condition of the abdomen had thus been produced. (3) The extreme intensity of the pain, localized in the abdomen and radiating to the back and then throughout the abdomen. (4) The rapid occurrence of vomiting after the onset, associated with normal action

of the bowels, excluded intestinal obstruction and perforative peritonitis. (5) The absence of fever, accompanied by a rapid pulse and signs of peritonitis, differentiated the condition from acute cholecystitis. (6) The presence of blue spots, which were observed at the umbilicus, has been noted in other cases, and was probably a trophic phenomenon due, like the pain, to irritation of the coeliac plexus. (7) The absence of glycosuria was not surprising, as the preservation of even a minute portion of pancreas may be sufficient to prevent diabetes.

358. Abscess of the Lungs in Infants and Children.

II. WESSLER and H. SCHWARZ (*Amer. Journ. Dis. Child.*, February, 1920) record fifteen cases of abscess of the lungs in children aged from 6 weeks to 8 years. Three of the cases followed aspiration of a foreign body, five tonsillectomy, and seven pneumonia or other inflammatory lung conditions. The situation of the lesion varied with the etiology. In post-operative abscesses and in the aspiration type of post-pneumonic abscess the disease was usually situated in the upper lobes. On the other hand, abscesses due to the aspiration of foreign bodies and the chronic bronchopneumonic type of bronchiectasis were usually found in the lower lobes. In their experience of more than thirty post-operative cases in children and adults the writers found that in about one-third recovery took place spontaneously, about two months after the onset. The prognosis was bad in the post-pneumonic cases, in which spontaneous recovery was rare. In cases persisting beyond two months the question of operation should arise.

OBSTETRICS AND GYNAECOLOGY.

359. Changes in Uterine Muscle during Involution.

BOUGET and NOEL (*C. R. Soc. Biol.*, March 6th, 1920) have studied histologically the phenomena accompanying the involution of uterine fibres. It is generally taught that the retractility of each element is accompanied by a certain degree of fatty change; there is no destruction of the fibres, still less a transformation into connective tissue. Recently some American observers put forward the idea that the fatty change was the result of intracellular autolytic processes, and the fatty matters, becoming extracellular, were taken up by the interfascicular connective tissue cells and by the decidual cells. Bouget and Noel, having examined by appropriate stains pieces of uterine muscle obtained at Caesarean sections, could not find the slightest trace of fat in the muscular fibres, and only very few and very fine droplets of fat in the connective tissue cells; but when they examined uterine tissue from a fatal eclamptic case twenty-one hours after delivery they found that all the connective tissue cells, interfascicular and intrafascicular, as well as the endothelium of the blood vessels, contained numerous fat droplets. There were no extracellular fat droplets. In the muscle fibres there were extremely fine granulations in some, though not in abundance. These depositions occurred in the perinuclear protoplasm. Having submitted a piece of fresh uterine muscle from a Caesarean section to autolysis for forty-eight hours, they could find no trace of fat in the muscle fibres. The absence of fat in the cells immediately before delivery, coupled with the absence of fat in the autolyzing tissues, would seem to rule out the theory that autolysis plays any part in the changes of involuting uterine muscle.

360. Treatment of Gonorrhoea with Hot Baths.

KAPFERER (*Wien. klin. Woch.*, January 29th, 1920) commends the treatment advocated by Weiss, the principle of which depends on the facts that patients with high fever often make a remarkably good recovery from gonorrhoea, and that the gonococcus soon dies at a temperature of 40°C. or more. The author selected ten otherwise healthy women who were suffering from gonorrhoea for this treatment, which was supplemented by the usual local antiseptic treatment. They were immersed up to the chin in baths the temperature of which was gradually raised from 38° to 43°, and in a few cases to 45° or 46°. In several cases* he had to abandon the treatment early because of the alarming symptoms provoked. One patient was comatose for several hours after the bath, with a blood pressure of 40 to 50 mm. of mercury. Violent biliary vomiting was frequent, and in two cases herpes labialis developed. The blood pressure, which was raised by 10 to 20 mm. during the bath, usually fell 15 to 40 mm. after it. No compensating benefits resulted, and the author regards this treatment as both dangerous and futile.

PATHOLOGY.

361. An Inagglutinable Form of Shiga's Bacillus.

BENIANS (*Journ. of Path. and Bact.*, February, 1920), having injected an ordinary agglutinable strain of Shiga's dysentery bacillus into the flank of a guinea-pig, succeeded in isolating from the resulting lump, two months afterwards, two different kinds of colonies, one being in all respects the typical Shiga bacillus and the other an organism with similar biochemical reactions but quite inagglutinable. The latter, on subsequent subculture, threw off from time to time agglutinable strains. The inagglutinable strain usually sedimented both in broth and saline; it failed to absorb agglutinin from a standard serum, and it also failed to produce agglutinin when injected into rabbits. The agglutinable daughter strains that it threw off from time to time absorbed agglutinins from standard serum and also produced agglutinins on injection. Both strains were highly pathogenic for rabbits, the inagglutinable apparently more so than the other. Rabbits immunized against either strain were protected against a lethal dose of the other strain. The interesting point about the experiments is that the immunity established by the injection of the inagglutinable strain did not show itself by any production of agglutinins or any other demonstrable serum antibody. Taken in conjunction with Besredka's recently published experiments Benians's observation casts grave doubt on the prevalent theory that serum antibodies are an expression of immunity to bacterial infections.

362. The Testing of Renal Efficiency.

MACLEAN and DE WESSELOW (*Brit. Journ. Exp. Path.*, February, 1920) call attention to the fact that albuminuria is much more frequently met with than has hitherto been recognized. Maclean had found in the examination of 50,000 apparently fit soldiers protein present in the urine of nearly 6 per cent., well marked albuminuria in over 2 per cent., and in nearly 2 per cent. casts of various kinds as well. This had nothing to do with training, for the incidence was even higher in 10,000 recruits. Thus albuminuria is often not incompatible with perfect health even in certain cases where it is known to have resulted from a previous attack of nephritis. The presence of very large amounts of protein, together with granular and epithelial casts in the urine, though indicating involvement of the kidneys, gives no information as to the extent of the capability of the kidneys to perform their normal functions. In severe cases of course the clinical condition itself may give all the information necessary, but often some method is needed whereby the clinician can estimate the efficiency of the kidneys. The authors have tried various dyes and other tests so extensively used in America, but have not found them satisfactory. They discovered, however, that when a large dose of urea was administered to a patient with defective kidneys the patient was incapable of excreting urine with a high urea concentration, and that the degree of concentration appeared to be in direct relationship to the involvement of the kidneys. Having applied the method in over 1,200 persons suffering from the effects of war nephritis, they are highly satisfied with the results. The patient having emptied his bladder is given 15 grams of urea dissolved in 100 c.c.m. of water by mouth, and the urine is passed one hour afterwards. This sample, as well as one passed after two hours, is examined for its urea percentage by the ordinary hypobromite method. If the percentage of the urea exceeds 2, the kidneys may be taken as fairly efficient; if below 2, the condition is unsatisfactory, and the lower the concentration the more serious the lesion. Cases with a concentration lower than 1 per cent. are rare, but many moderately severe cases are unable to concentrate to more than 1.4 to 1.5 per cent.

363. Angioma of the Stomach.

LEMON (*Med. Record*, February 7th, 1920) records an example of this rare condition found in a patient who was operated upon under a diagnosis of cancer of the stomach. The tumour, lying in the fundus of the stomach, was irregular in shape, bluish-black in colour, rather soft in consistence, and measured 6 by 5 by 5 cm. It was surrounded by a fibrous capsule 1 to 2 mm. in thickness. The tumour lay between the mucosa and the serosa, but at places broke through the capsule and penetrated the surrounding structures. Bands of fibrous tissue split up the dark angiomatic areas and gave it an appearance not unlike an anthracotic lung. Microscopically it was a capillary haemangioma.

364. The Reaction of Culture Media.

MCINTOSH and SMART (*Brit. Journ. Exp. Path.*, February, 1920) draw attention to the extreme importance of a correct adjustment of the reaction of bacteriological media. The reaction of the medium in the case of pathogenic bacteria ought to correspond to that of the tissues. In titrating their media the authors have compared the readings of hydrogen-ion concentration obtained by using the hydrogen electrode method with those obtained by the colorimetric method in using certain indicators. They recommend specially thymolphthalein in preference to phenolphthalein in titration as it gives a sharp end point, and advise that four readings should be taken of the samples. Having obtained this point and corrected the reaction of the broth accordingly, the latter is brought to the boil to deposit the phosphates, which are filtered off, and the reaction again adjusted by the addition of hydrochloric acid in such quantity as will give the desired hydrogen-ion concentration. If, for example, the usual final reaction corresponding to that of plasma is desired—namely, $P_{H} 7.6$, 10 c.c.m. of normal hydrochloric acid are added. The authors find that a final test of the medium with cresol red and phenolphthalein will ensure a correct standardization in the latter cases. They give an excellent chart showing the relationship of the colorimetric readings to electrical estimations. The paper is well worth the study of all bacteriologists.

365. Septic Necrobiotic Infarct of the Lung.

ACCORDING TO A. BUSINCO (*Arch. per le Sci. Méd.*, Fasc. 5-6, 1919), who records four examples, septic necrobiotic ischaemic infarct of the lung is a very rare condition. The right lung is more frequently affected than the left. The condition is found in both sexes, but is most frequent in men. It is observed in young persons, and it is most frequent in advanced age. The predisposing causes are acute or chronic processes affecting the lung—for example, lobar pneumonia, pulmonary tuberculosis, and bronchopneumonia. The marginal coneiform or round central necrotic area is circumscribed by a zone of demarcation and develops a central non-putrid liquefaction, or in rare cases a marginal liquefaction, and finally undergoes repair by new formation and proliferation of young connective tissue, which retracts and is transformed into a sclerotic nodule.

366. The Temperature of the Expired Air in Febrile Patients.

A. AZZI (*Arch. per le Sci. Méd.*, Fasc. 5-6, 1919), as the result of examination of 12 cases, came to the following conclusions: (1) In febrile tuberculosis there are considerable variations in the temperature of the expired air, and these variations often exceed the oscillations observed in normal individuals. (2) There is a certain correspondence between the temperature of the body and that of the expired air, but this correspondence varies within fairly wide limits, and often does not occur at all. Thus at the onset of the fever, when there is shivering, vaso-constriction, and a sensation of cold, the temperature of the expired air may fall to subnormal, even when the fever is high. (3) The temperature of the expired air which was determined in a non-tuberculous subject with an intact respiratory system showed the same variations as in the previous experiments. Azzi, however, points out that definitive conclusions cannot be drawn from a single case, and proposes on a future occasion to study the temperature of the expired air in a variety of febrile types. His researches, however, confirm the fact, which had already been demonstrated by Galeotti, himself, and their collaborators, that there is a correspondence between the elimination of heat by the surface of the body and the elimination of heat by the lungs.

367. Subconjunctival Lipoma.

ACCORDING TO CABANNES and DUPÉRIÉ (*Journ. de méd. de Bordeaux*, February 25th, 1920), two forms of subconjunctival lipoma are described—(a) dermo-lipoma, (b) pure lipoma. Dermo-lipoma, which is congenital, may not appear till late, especially about the time of puberty. Its normal site is the upper cul-de-sac between the superior rectus and the lacrimal gland; more rarely it is situated in the outer part of the inferior fornix. Its pathogenesis is the same as that of sclero-corneal dermoids, which are also situated by preference on the outer part of the eyeball. The origin of pure lipoma is doubtful. The writers describe a case in a woman, aged 29, in whom the tumour was removed under local anaesthesia. It had apparently originated in the orbital cellular tissue.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

368. Action of Digitalis in Auricular Fibrillation.

ROBINSON (*Amer. Journ. of Med. Sciences*, January, 1920) records the rapidity and persistence of the action of digitalis in hearts showing auricular fibrillation. A series of 26 cases is reported in which the presence of either auricular fibrillation or auricular flutter with abnormally rapid ventricular rate was demonstrated by electro-cardiograms. Large doses, ranging from 15 to 25 c.cm. (15 c.cm. per 100 lb. of body weight), of standardized tincture of digitalis were given by mouth, and were found to affect the heart in a relatively constant time, from two to five hours after administration, indicating that the drug is absorbed from the alimentary tract at a fairly rapid and uniform rate. The maximum effect was considered to have occurred when the ventricles attained approximately their slowest rate, and when the pulse deficit had disappeared or reached its lowest count; this was usually obtained in about twenty-four hours, and generally continued to be effectual for an average of nearly ten days.

369. Spontaneous Rupture of the Abdominal Aorta.

BONNAMOUR and BERTON (*Lyon méd.*, February 10th, 1920) record the case of a woman, aged 49, admitted to hospital with heart failure. Syphilis was suggested by a history of two miscarriages, the death of a child in early infancy, the loss of the knee-jerks, and the presence of extensive vitiligo, although the Wassermann reaction was negative. Considerable improvement took place under cardiac tonics, when one evening during a meal she suddenly complained of precordial pain and died in two minutes. The necropsy showed a large rupture in the intrapericardial portion of the ascending aorta, and well-marked lesions of syphilitic arteritis in the rest of the vessel. The heart was enlarged, probably owing to the presence of chronic nephritis, and there was congenital malformation of the sigmoid valves, which were only two in number.

370. Intramuscular Injection of Diphtheria Antitoxin.

B. WEILL-HALLÉ (*Bull. et mém. Soc. Méd. d. Hôp. de Paris*, January 22nd, 1920) has entirely substituted intramuscular for subcutaneous injections in the treatment of diphtheria owing to the following advantages of the former method: (1) It does not cause the severe and prolonged pain provoked by subcutaneous injection. (2) It appears much less frequently to give rise to local complications, such as erythema, lymphangitis, and abscess. (3) It is superior to intravenous injection in being much easier to carry out, especially in children, in whom it can be performed by trained nurses. (4) It is decidedly more rapid in its action than subcutaneous injection. One large dose is preferable to a number of smaller doses. The writer's plan is to give 250 units per kilo of body weight in mild cases and 500 to 600 units in moderate and severe cases. The injections were made in the gluteal region, the total amount being divided between each side.

371. Action of Adrenalin in Old Age.

SCHLESINGER (*Wien. med. Woch.*, November 22nd, 1919) states that adrenalin given subcutaneously in elderly people may provoke attacks of stenocardia, which are probably due to the atypical reaction of atheromatous coronary vessels to the drug. Another atypical reaction is a fall of blood pressure. Though in healthy youth the drug raises the blood pressure for several hours, in about one-third of the elderly persons tested the injection induced a fall of blood pressure, either immediately or after ten minutes. This fall lasted up to two and a half hours, with a gradual return to the normal. There was no sign of collapse and no increase in the pulse rate; indeed, the rate of the pulse was apt to fall without any unpleasant sensations. Evidence of collapse being absent this reaction of elderly persons to adrenalin could not be regarded as the expression of cardiac insufficiency. Schlesinger's interpretation depends on the assumption that adrenalin stimulates both the vaso-constrictors and, to a less degree, the vaso-dilators. This vaso-dilator action is demonstrable in experiments on animals when the vaso-constrictor mechanism is put out of action. The small doses of adrenalin given to elderly persons probably acted principally on the vaso-dilator system, as shown by

the sensation of burning and warmth felt in the hands and feet. The lack of calcium in the system, as well as atheromatous changes, probably contributed to this atypical reaction in old age to adrenalin.

372. Vaccine Treatment of Mediterranean Fever.

G. DI CRISTINA and S. MAGGIORE (*La Pediatria*, January 15th, 1920) employed specific vaccines in the treatment of Mediterranean fever, with the following results: In some cases the influence of the vaccine appeared rapidly after a few injections; in a second group prolonged treatment was necessary until an effect was obtained; and in a third group vaccine treatment had no obvious effect. In successful cases the action of the treatment was shown (a) in the temperature, which after a certain number of injections fell by lysis or crisis; (b) in the general condition, which rapidly improved; (c) in the rapid or gradual disappearance of the various manifestations of the disease; (d) in the prevention of relapses, which are fairly frequent in this disease. The cases in which the treatment had no effect were generally patients with some hereditary or constitutional taint caused by other infections. In none of the cases were there any untoward results. The subcutaneous or intramuscular route was usually chosen. The doses were progressively increased, with more or less long intervals according to the reaction following each injection.

373. Quinine Dihydrochloride in Influenza.

BURROWS (*Med. Record*, February 7th, 1920), who has treated a large number of cases of influenza with injections of quinine dihydrochloride, speaks very highly of the method. He uses a 10 per cent. solution of the salt. For adults the dose is 15 to 22 grains given only once. At least one-third, often a half, and occasionally the entire dose is given intravenously; the remainder is injected into the biceps muscles. For young children 7 to 10 grains is the dose recommended. There may be a general tingling sensation and warmth during the injection; sometimes a slight chilly feeling, a transitory pallor if given too rapidly, or nausea. Influenza cases with temperatures ranging from 101° to 106° with a pulse rate up to 120, with headache and general prostration, responded almost immediately. Within a short time the headache and general pains disappeared, the facies improved, the tongue became moist, the temperature and pulse fell, and the sense of foreboding present in the most severe cases was lost. The earlier the injection is made the better, preferably on or before the third day. The quinine has no specific action in cases with secondary pneumonia.

374. The Tuberculous Psychoneurosis.

G. ICHOK (*Zeit. f. Tuberkulose*, February, 1920) states that while well marked psychoses following pulmonary tuberculosis are extremely rare, a psychoneurosis is often seen. Three forms of the disease may be distinguished according as it occurs (1) in cases with an hereditary history and in latent and abortive forms of pulmonary disease; (2) in chronic pulmonary tuberculosis; (3) in acute cases. This classification, however, must not be taken too rigidly, as a separation of the different forms is not always possible. Tuberculous intoxication may not play the chief part in all cases, because, on the one hand, the psychoneurotic symptoms do not always increase with the progress of the pulmonary lesion, and, on the other hand, the characteristic picture may be fully developed with very slight lesions, or with merely a disposition to tuberculosis. It is suggested that the chief cause of the psychoneurosis is the consciousness of an organic inferiority.

375. Decline of Congenital Syphilis during the War.

HOCHSINGER (*Wien. med. Woch.*, November 22nd, 1919) concludes, from a statistical study of private hospital cases, that there has been a considerable decrease in the incidence of congenital syphilis since 1915, a fact which was all the more striking as syphilis and other venereal diseases increased during the war. In his estimate of the syphilis coefficient in the newborn, which the author found to have fallen from 2.54 to 1 per cent., he accepts only clinical manifestations as evidence of syphilis. This decline of syphilis in the newborn was observed in every part of German Austria, with the exception of

Tyrol. Syphilis was comparatively rare there till it became a centre of belligerent activity. Discussing the possibility that the decline of the syphilis coefficient might be more apparent than real, and that the frequency of syphilitic abortions might even have risen, the author points out that syphilitic intrauterine death is usually deferred till the seventh month, and that the number of macerated fetuses has diminished equally with that of syphilitic infants born at term. He attributes the decline (1) to the inducement to accept treatment provided by the unwelcome alternative of service in the fighting line, and (2) to the prophylactic remedies administered under military control. The compulsory treatment of syphilis under army supervision undoubtedly exercised a powerful influence in preventing congenital syphilis.

376. The Diagnosis of Epilepsy.

S. JELLINEK (*Wien. med. Woch.*, November 1st and 8th, 1919) attaches importance to two signs of epilepsy—the presence of Babinski's reflex and the occurrence of petechiae and ecchymoses in the skin and mucous membranes. Babinski's reflex is not only constantly present during the attack, but may persist for three-quarters of an hour after the end of an attack. In many cases after Babinski's reflex was exhausted Oppenheim's sign could be observed, especially after attacks of *petit mal*. Petechiae, though not found so regularly as Babinski's sign, occurred in nearly half of the 368 genuine cases of epilepsy observed by Jellinek. They were most frequently found in the upper lids, but in many cases both upper and lower lids were sprinkled over with countless petechiae, as well as the root of the nose and forehead, and even the frontal scalp and temples. Petechiae were rarely seen in the face below the zygomatic arch. Ecchymoses were relatively uncommon on the conjunctiva, palate, and mucous membranes of the nose and throat. In the overwhelming majority of the cases the haemorrhages occurred in the region of the superior vena cava. The haemorrhages did not appear to bear any relation to the age of the patient or the severity of the attack. They were never found after hysterical fits.

377. Poisoning by Castor Oil Seeds.

M. GIOSEFFI (*Il Policlinico, Sez. Prat.*, January 12th, 1920) recalls two cases in twin brothers, aged 10 years, in whom symptoms developed two hours after eating castor oil seeds. The first symptoms were tremors of the hands and a burning sensation in the throat followed by a bitter taste in the mouth and severe colicky pains in the umbilical region, vomiting, diarrhoea, headache, and giddiness. Considerable improvement followed irrigation of the intestine and injection of caffeine, and by the third or fourth day the vomiting and diarrhoea ceased, but the weakness lasted another week. In neither case was there any sign of impaired function of the kidneys or liver.

SURGERY.

378. The Etiology of Arthritis Deformans in Children.

ACCORDING to A. H. BYFIELD (*Amer. Journ. Dis. Child.*, February, 1920), who reports 10 cases in children aged from 1½ to 12 years, arthritis deformans in children is chiefly due to infection situated in the tonsils and adenoids and in the accessory nasal sinuses. In children less than 3 years of age the portal of infection seems to be limited to the tonsils and adenoids. After this time their removal has no power to arrest the progress of the disease. A sinus infection should be suspected as an etiological factor if, after removal of the tonsils and adenoids, the temperature still remains raised, the joint condition does not subside, and there are leucocytosis and anorexia. The prognosis in uncomplicated cases is good as far as arrest of the disease is concerned, but the deformity and functional disability may persist for a considerable time. Although orthopaedic measures are helpful, Byfield considers that the surgical treatment of the nasal sinuses is the most important therapeutic measure indicated.

379. Cicatricial Laryngeal Stenosis in Children.

E. J. MOURE (*Journ. de méd. de Bordeaux*, February 10th, 1920) states that two forms of cicatricial stenosis of the larynx may occur in children. The first and rarest is the sequel of ulceration of the larynx and trachea following diphtheria, scarlet fever, measles, or typhoid. The second, which is much the commonest, is the result of a tracheotomy made through the thyroid, the crico-hyoid space, or the cricoid. In most of these cases laryngostomy, followed by clearing out the stenosed cavity, should not be

carried out before the age of 7 or 8 owing to the small size of the larynx and trachea in early childhood, the long duration of the treatment required, and the gravity of the pulmonary complications which may occur during this period. If the stenosis is the result of a bad position of the tracheotomy tube, no attention need be paid to the larynx, and a cure will be almost always effected by placing the tube in a proper position. During the period that the channel is becoming patent again care should be taken to prevent the formation of granulations about the tube by the use of the galvano-cantery or a 1 in 10 solution of zinc chloride. In no case should the tube be removed until the surgeon has satisfied himself by the laryngoscope of the patency of the larynx. The child should be trained to breathe through the natural channel by occluding the tube first by day and then by night.

380. Sudden Death from Intrapleural Perforation of the Stomach.

D. LEONCINI (*Il Morgagni, Archivio*, December 31st, 1919) records the following case in an Italian soldier who had been wounded some months previously—the exact date could not be determined—by a bomb in the left arm and thorax. Recovery took place without operation, and the soldier was able to take part in the severe fighting on the Piave in July, 1918. Two days before death, which took place suddenly, he complained of pain at the thoracic wound and vomited several times. The necropsy showed that the left pleural cavity contained a quantity of fetid greenish fluid, the great omentum and the stomach, which presented a large perforation. A fragment of metal was found in the spleen. The diaphragmatic hernia had taken place at the time of the wound, but no symptoms had arisen until the hernia had become strangulated. Leoncini has been unable to find any previous record of sudden death due to intrapleural perforation of the stomach. In the other cases of death due to this cause perforation gave rise to pyopneumothorax and death was due to septicaemia, whereas in the present case, after the ill-defined symptoms caused by strangulation of the hernia, gastric perforation caused sudden death from pleural shock.

381. Foreign Bodies in the Air and Food Passages.

E. E. GRAHAM (*Amer. Journ. Dis. Child.*, February, 1920) thinks that foreign bodies in the air and food passages in children are much commoner than was formerly supposed. The symptoms vary greatly. The peanut kernel immediately sets up severe laryngitis, tracheitis, and bronchitis. The older child may survive the acute symptoms, but is almost certain to develop pneumonia. Metal objects may remain in the lung for a very long time and do comparatively little damage. It is most important that a skiagram should be taken in every case of swallowing or inhaling a foreign body. In the case of a foreign body which does not cast a shadow on the plate its position can be determined by making the patient swallow a capsule filled with bismuth, when the x rays will show the position of the capsule held in position in the oesophagus by the foreign body. A foreign body may be suspected if the following conditions are present: An unexplained leucocytosis, localized symptoms in the lung which do not clear up under treatment, no tubercle bacilli in the sputum, and a gradual failure in health and strength. An asthmatic wheeze is a very important sign. Bronchoscopy, for which no anaesthetic is required, should be performed as soon as possible after the entrance of a foreign body.

382. Acute Typhoidal Cholecystitis in Children.

REID and MONTGOMERY (*Johns Hopkins Hosp. Bull.*, January, 1920) have collected 18 cases (6 previously unpublished) of enteric fever in children under the age of 15 years who died from, or were operated on for, complications of enteric fever arising in the gall bladder. In one case the acute cholecystitis did not occur until eight months after recovery from the attack of enteric fever. Eight cases, all reported before 1893 and none of them operated upon, proved fatal: since then 10 cases with one death have been treated surgically. The 6 cases from the Johns Hopkins Hospital all recovered. In cases with a pure culture of *Bacillus typhosus* the leucocyte count is relatively low—usually about 10,000. The statistics showing the incidence of typhoidal cholecystitis are reviewed, and it is pointed out that mild cases, as shown by slight pain and tenderness in the region of the gall bladder and some rigidity of the right rectus, are common, and in the vast majority subside without need for surgical measures. Before this paper appeared there were records of only 20 cases of suppurative cholecystitis from all causes in children.

383. Relapsing Myositis due to *Micrococcus crassus*.

Fog (*Hospitalstidende*, December 24th, 1919) records a case of exceptional bacteriological and clinical interest. The patient, a lad who had twice suffered from parotitis, but not from rheumatic fever, had received a slight bruise on the left leg when he was 10 years old. Next day the leg was swollen and painful, and every succeeding spring the muscles of one or other calf became swollen and tender, the attacks lasting for two or three months. When he came under the author's care he had considerable swelling of the left leg from the middle of the thigh to a little below the knee. On the outer aspect of the thigh the tissues were infiltrated and very tender, and the overlying skin slightly reddened. The knee-joint contained fluid, but there was no fluctuation demonstrable in the outer aspect of the thigh. Osteomyelitis was suspected, although the temperature was comparatively low, and the x rays showed no sign of this disease. An exploratory incision under general anaesthesia revealed a very oedematous, pale and transparent vastus externus protruding through the opening made in the fascia. A little fluid escaped, but no abscess could be found. The fluid and muscle gave pure cultures of the *Micrococcus crassus*. The patient was treated with an autogenous vaccine, and made a satisfactory recovery.

384. An X-Ray Sign of Perinephritic Abscess.

FUSSELL and PANCOAST (*Amer. Journ. Med. Sci.*, January, 1920) record a fluoroscopic finding observed in two cases of perinephritic abscess. Case I, male, aged 30, was operated upon for removal of a left renal calculus, and later developed a huge sac of pus within the capsule of the kidney. Fluoroscopic examination showed the presence of fluid which was demonstrated while the patient was standing in the fluoroscope, a distinct wave being noted when the patient's body was moved quickly two or three times from side to side. Case II, male, aged 46, developed an irregular septic fever with persistent slight pain over the region of the left kidney. In the recumbent posture, x rays showed gall stones, but did not reveal the presence of fluid, the diaphragm showing the normal arch. In the upright posture the left diaphragm was seen to be flat and immobile, and to have lost its normal arch. When the patient's shoulders and body were moved quickly from side to side, a distinct wave above the left renal region was seen. Although the local physical signs of fluid in that region were otherwise so slight, the left kidney was explored, and an abscess containing from 200 to 300 c.cm. of pus was found surrounding its upper pole. The patient made an uninterrupted recovery, but four months later developed marked symptoms of gall bladder disease; the gall bladder was removed with thirteen stones, and the patient is now well. This fluoroscopic sign is of value in certain obscure cases of fever with suspicious signs about the left kidney, though such signs of themselves are not certain enough to warrant an operation. Pus about the right kidney is not expected to give this sign owing to the intervention of the liver between the kidney and the diaphragm, and no such collections of pus between the liver and the diaphragm have been observed.

385. Prostatic Surgery.

DEAVER (*Amer. Journ. Med. Sci.*, January, 1920) considers that the success of prostatectomy depends more upon the preliminary treatment than upon the technical details of the operation, and that practically all prostatic patients require some such preliminary treatment. In certain cases of acute retention, in which unsuccessful catheterization may have injured the urethra, the bladder should be drained suprapubically, and, since the sudden relief of intravesical pressure may be dangerous, this should be done by the introduction, under local anaesthesia, of a female retention catheter so clamped as to allow of the bladder being emptied intermittently. If the urethra is patulous the indwelling catheter is usually preferable in the initial stages of treatment. Preliminary cystostomy as the first stage of a two-stage prostatectomy has reduced, more than any other single procedure, the operative mortality, but in the early stages of prostatic enlargement, where the amount of residual urine is small and the kidneys are functioning satisfactorily, the prostate may be removed without preliminary drainage of the bladder. Preliminary drainage of the bladder serves to relieve prostatic congestion, so that at the time of the second stage the gland has become reduced in size; this adds to the difficulty of enucleation, but minimizes post-operative bleeding.

386. Recurrent Dislocation of the Head of the Fibula.

F. TEILMANN (*Ugeskrift for Læger*, January 22nd, 1920) has found that obscure symptoms referable to the knee may be due to laxity of the ligaments of the superior tibio-fibular joint, which allows the head of the fibula to be dislocated in certain movements. This condition is rare, but it is very serious, as it may reduce the patient to a state of chronic invalidism. The pain may radiate up and down the leg from the knee, and be associated with atrophy of the muscles. The apparent discrepancy between the slightness of the dislocation and the severity of the pain may be explained by the intimate relations existing between the head of the fibula and the peroneal nerve. The surgeon is apt to overlook this condition in spite of a careful examination of the knee, unless he bears this possibility in mind, or is lucky enough, while palpating the joint, to feel the head of the fibula slip out of place. In one case Teilmann attempted palliative treatment, discharging his patient from hospital with a plaster-of-Paris splint, but a relapse soon followed the discarding of the splint, and the patient had finally to be operated on. No fluid was found in the joint, the ligaments of which were relaxed; nor was there any apparent communication between it and the knee-joint. The articular surfaces were removed, and a screw was driven through the head of the fibula into the tibia. Complete recovery ensued. The author concludes, from the failure of palliative treatment and the complete success of operative treatment in this case, that the condition calls for immediate arthrodesis.

OBSTETRICS AND GYNAECOLOGY.**387. Adenomyoma Invading the Ileum.**

CLARA STEWART (*Journ. of Path. and Bact.*, February, 1920) reports an interesting case of a woman who was operated upon for colicky pains extending across the abdomen below the umbilicus. Sickness was always worse during the menstrual period, and was aggravated by taking solid food. The patient was sterile and had had recent floodings. At operation there was found in the ileum, 3 in. above the ileo-caecal valve, a tumour projecting into the lumen of the bowel, and simulating an early intussusception. This on section seemed to be due to an infolding of the serous and muscular coats, the mucosa being normal. There was considerable matting of neighbouring tissues and dense adhesions, but the uterus was not involved in this old inflammatory process. Microscopically the tumour showed the typical appearance of a uterine adenomyoma, with glandular acini embedded in a stroma of short spindle cells. The author calls attention to the fact that the invasion of the gut was from without; though there were no adhesions between the tumour and the uterus at the time of operation, she considers that the case affords good support to Leitch's theory of the migratory nature of extrauterine adenomyomata, and suggests that if local hypertrophied areas of the intestines were systematically examined more of these lesions would be found.

388. Urethral Caruncle.

CRENSHAW (*Minnesota Med.*, 1920, 3) discusses the often unsatisfactory results of operation for urethral caruncle, the high percentage of recurrences, and the methods of treatment used at the Mayo clinic. These little tumours grow from the posterior or lateral walls of the urethra just within the meatus. Only one case in which a caruncle grew from the anterior wall has been recorded. Crenshaw believes chronic irritation or ulceration of the urethra to be the exciting cause. Recurrences are of two types: true recurrence, owing to incomplete removal; and a prolapse of the urethral mucosa, due to contraction of scar tissue. The latter is the commoner, and it is found that further operations on these cases result in a larger scar and a repetition of the prolapse. Cases have been seen at the Mayo clinic in which repeated removals of prolapsed urethral tissue have led to the trigonal mucosa being dragged down into the urethra and even protruded from the meatus. The method of treatment employed at the clinic consists in the clamping of the base of the caruncle with a special clamp applied in the long axis of the urethra. The growth is then cut off and the stump cauterized with acid nitrate of mercury. Care must be taken to remove all tags of caruncle. Among 118 patients operated upon only 4 recurrences were known. All caruncles are microscopically examined, as a certain proportion (not stated) are malignant.

389. **Aortic Compression for Haemorrhage.**

SUERKEN (*Zentralbl. f. Gynäk.*, February 28th, 1920) has written a short note on the use of Gauss's aortic compression apparatus, which for adaptability to various anatomical formations, ease and rapidity of adjustment, sureness of action, portability and price is apparently superior to other similar apparatus, such as those of Rissmann and Schvt. Gauss's instrument has been in use for ten years at the Obstetrical Institute at Osnabrück, and during this period packing of the uterine cavity for haemorrhage has never been necessary. Suerken, however, disagrees with Gauss's view that by aortic compression the number of cases requiring manual separation of the adherent placenta is decreased in number. According to the author, when a placenta is really adherent through disease (for example, tubercle), neither pains induced by compression of the aorta or injection of saline through the umbilical vein are of any avail. This view does not, however, affect his advocacy of the general use of Gauss's compression instrument. He lays stress on the necessity for careful observation of the mother, both for external and concealed haemorrhage. Concealed haemorrhage often escapes early recognition, and care should be taken to watch for abnormal increase in the abdominal circumference. When this precaution is taken, and the compression apparatus is used, unexpected floodings will not occur.

390. **Retained Placenta.**

BOTHO SCHWARZ (*Zentralbl. f. Gynäk.*, February 28th, 1920) strongly recommends the use of Gabaston's turgescence method for retained placenta. This method consists in injecting 300 to 400 c.cm. of sterile normal salt solution into the umbilical vein by means of a 50 to 100 c.cm. syringe. The injection is continued until a definite resistance to the pressure in the syringe is felt. If the fluid tends to drain away too freely, refilling of the placental vessels is indicated to maintain turgescence. Dr. Schwarz reports twelve cases, and four additional cases, of which the following are fair examples: *Case 1.* Primipara, aged 31. Natural delivery L.O.A. Post-partum haemorrhage 500 grams. Artificial turgescence of placenta by injection of 300 c.cm. salt solution. Two minutes later a strong afterpain, causing expulsion of the fully-filled placenta (partial adherence). *Case 3.* Primipara, aged 33. Natural delivery L.O.A. Half an hour later severe bleeding. Credé's method unsuccessful. Placenta filled by injection of 400 c.cm. NaCl solution. Immediately followed by strong afterpains and spontaneous delivery of the placenta (partial adherence). *Case 5.* Five-para, aged 31. Natural delivery L.O.A.; child dead. Half an hour later severe bleeding. Credé's method unsuccessful. Injection of 220 c.cm. salt solution. Credé's method essayed without and with anaesthesia. No success. Blood loss 1,500 c.cm. Manual removal of placenta, which was found to be tuberculous and strongly adherent. *Case 14.* Primipara, aged 26. Six months pregnant. Severe intertantal empyema. Premature birth of a fetus 31 cm. long. Brought to hospital six hours later for retained placenta. Catheterization and 1 c.cm. hypophysin. Filling of placenta with 250 c.cm. salt solution. Fifteen minutes later birth of placenta with slight Credé expression (retained placenta). It is worthy of note that the method is recommended both in case of severe haemorrhage due to partial adherence of the placenta and, as in the last case given, in cases of true retained placenta. No bad results have been known to follow its use, even though in specially abnormal cases success may not be obtained. In many cases Credé's method can be used to express the placenta after filling it with salt solution, where this procedure has been without result prior to the injection of fluid. Useful adjuncts to this treatment recommended by Schwarz are catheterization and the administration of 1 c.cm. hypophysin. Manual extraction of the placenta is resorted to only in very obstinate cases, and the percentage of these has been greatly reduced by the employment of the Gabaston method. The evidence appears to be strongly in favour of its more general introduction into midwifery practice.

391. **An Early Tubal Gestation.**

SAVARIAUD and JACOB (*Bull. et mém. de la Soc. Anat. de Paris*, January, 1920) give notes of a case of extrauterine gestation of fifteen days' duration with the typical symptoms of tubal rupture. The patient was so exsanguinated that 400 c.cm. of blood were transfused before operation was undertaken. An enormous quantity of dark blood escaped when the peritoneum was opened. In the isthmus of the tube, close to the uterine cornu, a swelling of the size of a cherry was found, the wall of which had given way.

PATHOLOGY.

392. **Toxicity of Haemolysed Blood.**

BAYLISS (*Brit. Journ. Exper. Path.*, February, 1920) while not denying the fact that injections of defibrinated or haemolysed blood in the rabbit produce intravascular clotting, holds that general conclusions should not be drawn from such experiments, as the rabbit is peculiar in that respect. He finds that, with extremely rare exceptions, defibrinated and even haemolysed blood from the same species are innocuous to the cat and dog. If by any means a fall of blood pressure is produced there may be a reduction of renal secretion, but this is restored by intravenous injections of gum saline. He has found that haemoglobin dissolved in the plasma is able to act as a carrier of oxygen, though whether it is as efficient a carrier as red corpuscles is not determined. It would appear that the serious results of transfusion of incompatible blood are not to be ascribed to haemolysis as such, but are rather an aspect of the action of foreign serum protein analogous to that responsible for anaphylactic shock.

393. **Primary Lymphogranulomatosis of the Intestine.**

C. GAMMA (*Arch. per le Sci. Med.*, Fasc. 5 and 6, 1919) records a case in a woman, aged 32, characterized by a relatively rapid course, severe loss of flesh, and painful diarrhoea. Examination of the blood showed secondary anaemia and a moderate degree of neutrophil polymorphonuclear leucocytosis. The necropsy showed lymphogranulomatous lesions which had originated in the mucous membrane, involving the greater part of the jejunum, with a slight and obviously secondary involvement of the mesenteric lymph glands. None of the other organs were affected. Only three similar cases of primary lymphogranuloma of the intestine are on record.

394. **Vital Staining of Diphtheria Bacilli.**

ARLOING and RICHARD (*C. R. Soc. Biol.*, March 6th, 1920), by adding to hanging drops of suspensions of diphtheria bacilli traces of Nile blue solution in such weak concentration that the tint is barely perceptible, found that after a lapse of five to fifteen minutes the bacilli took up the dye, being stained pale blue, whilst the granulations assumed a reddish or even violet colour, and retained this coloration for about an hour. In the case of a suspension in distilled water of a twenty-four hour culture in broth the staining was slow in appearing, the granulations were pink, with the rest of the bacillus unstained, and the bacillary body seemed to be swollen out by the granules. In a saline suspension the staining appeared quickly, the granulations were pronouncedly red with a more or less blue colour in the rest of the bacillus, and the granules appeared to be contracted. In hanging drops prepared from growth on a solid sugar medium by suspending in hypotonic saline, irregular forms with irregular granulations were seen; occasionally in these involution forms Brownian movement of the metachromatic granules was observed. The authors found that the diphtheria bacillus developed normally in bouillon faintly coloured with Nile blue, and cultures could be obtained from stained hanging drops, so that it really is a vital staining.

395. **Botulism.**

BITTER (*Deut. med. Woch.*, November 20th, 1919) observed three outbreaks of meat poisoning in Kiel between June, 1918, and June, 1919, and in each case was able to cultivate the *B. botulinus* from the infected foodstuff. Eight persons in all were affected, and of these three died. In two instances the source of the mischief was pickled herrings, and in the other ham. The cases were clinically typical of botulism, presenting ocular palsy, mydriasis, dry mouth, loss of speech, etc. As a result of investigation Bitter found that a concentration of 0.6 per cent. acetic acid in a medium did not prevent the growth of the bacillus nor the elaboration of a powerful toxin. Safety could be obtained, however, by employing acetic acid of 2.0 per cent. strength in pickling. Van Ermengem had shown long ago that 10 per cent. salt prevented growth and formation of toxin. Bitter gives statistics dealing with the occurrence of proved cases of botulism in Prussia from 1897 till 1913; 70 outbreaks were recognized during that period, involving 302 cases, of which 51 were fatal, a mortality of 16 per cent. The poisoning was conveyed especially by ham, sausage, blood-puddings, salted fish, and preserved beans. There is evidence that the toxin is not completely destroyed by cooking. In most cases the infected meat is recognizably rancid or even foul.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

396. Heredity in Cardiac Disease.

G. GALLI (*Il Policlinico*, Sez. Prat., January 19th, 1920) remarks that a knowledge of the inheritance of cardiac disease is not so widespread as it should be, although the older writers, such as Morgagni, Lancisi, Albertini, Corvisart, and others, drew attention to it. He publishes the genealogical tree of a family of four generations, consisting of twenty-four members, at least nine of whom were subjects of disease of the circulatory system. In addition to the transmission of actual disease there are two forms of cardiac inheritance, to which Galli in 1908 gave the names of "endocardismus hereditarius" and "myocardismus hereditarius." In such cases, though the endocardium and myocardium are not actually diseased and do not present any pathological changes on examination, their functional capacity and resistance are less than in normal persons, so that relatively slight causes, which would have no effect on the average individual, produce in them true cardiac disease. Galli has met with paroxysmal tachycardia in a father and his two sons. Wenckebach mentions a family in which the father, mother, and four children, although their cardiac functional capacity was above the normal, all had bradycardia, their pulse rate being often under 50 per minute. On examination the reason of these phenomena is obvious, the heart and aorta being small in proportion to the size of the body. The blood pressure in these cases is also subnormal. With a regular life and moderate and progressive physical exercise these hereditary defects may be corrected. On the other hand, an irregular life and excessive and prolonged exercise may give rise to severe and even fatal collapse. Such cases react badly to acute disease. From a military point of view they should not be exposed to the hardships and privations of life at the front, as they are sure to break down.

397. Intravenous Quinine in Malaria.

G. STRADIOTTI (*Riv. Osped.*, October 15th-31st, 1919) regards intravenous injection as superior to all other methods of administration of quinine in malaria, as it enables the exact quantity of the alkaloid to be introduced directly into the blood without dispersion of any kind. The fact that the intravenous method has been reserved for the severest cases, and that it represents the most powerful weapon in combating the disease, is, he holds, a clear proof of its superiority. Moreover, from the economical standpoint he notes that 1 gram of quinine injected intravenously is equivalent in its action to 3 grams given by mouth. Owing to the great difficulty in obtaining the drug, the price of which has increased tenfold since the beginning of the war, this should be another reason for preferring the intravenous method. The danger of air embolism can be avoided by using a suitable instrument and proper technique. Certain complications, such as collapse, are probably due to excessive rapidity of injection of small concentrated solutions. Nazari recommends that the intravenous method should be employed especially in hospital practice, even in ordinary cases, instead of being reserved for rare cases of pernicious malaria.

398. Infantilism—Intestinal and Pancreatic.

J. G. MOORHEAD (*Dublin Journ. Med. Sci.*, 1920, cxlix) records two cases of infantilism in girls aged 18 and 17 years, the first of intestinal, the second of pancreatic origin. That chronic diarrhoea may cause what is now known as infantilism was first pointed out by Eustace Smith, but in 1904 Byrom Bramwell suggested that some of these cases were due to pancreatic disease. Herter in 1908 found that chronic diarrhoea causing arrest of development in young children was associated with persistence in the stools of Gram-positive bacilli of the *Bacillus bifidus* type present in breast-fed infants, and comparative absence of *B. coli*. The absorptive power of the bowel for magnesium and calcium was deficient, and it was thought that there was chronic inflammation of the lower part of the small intestine, and perhaps of the adjacent part of the colon; but as his cases recovered, this could not be proved. Moorhead's case of intestinal infantilism died of influenza, and at the necropsy the pancreas was normal, there was a large but mainly fatty thymus, the small

intestine and colon showed chronic inflammation, thus confirming Herter's assumption; the uterus was but little larger than that of a full-time fetus, the nervous system was normal, but the pituitary showed some changes regarded as secondary. Clinically the patient had tetany in addition to the signs of infantilism, and the ova of *Trichocephalus dispar* were present in the faeces. His case of pancreatic infantilism rapidly improved on liquor pancreaticus, holadin, bile salt capsules, small doses of arsenic, peptonized and malted milk, rusks, jellies, and raw beef juice.

399. The Dietetic Treatment of Renal Insufficiency.

In a review of the modern treatment of renal insufficiency, K. MOTZFELDT (*Norsk. Mag. for Laegevidenskaben*, January, 1920) notes that the treatment of non-surgical diseases of the kidneys has hitherto centred about a milk diet. But the researches illuminating the significance of a milk diet belong to the present century, and great progress has been made since 1902. One of the most striking cases in the author's experience was that of a young man with acute nephritis. On a salt-free diet the oedema from which he suffered was banished in twenty-two days, and his weight was reduced by 27 kilos. The output of chlorides exceeded the intake by 250 grams. The author reproduces four charts showing the effect of a low protein diet on the urea in the blood and the phenolsulphone-phthalein output, as compared with the protein content of the food. A low protein diet influences in many cases the degree of nitrogen retention as well as such clinical symptoms as headache, nausea, vomiting, and general debility. Though the author advocates a milk diet, he does so with this reservation, that neither a strict salt-free diet nor a strict low-protein diet can be obtained by milk alone. The diet should be regulated with due regard to the functional tests in each case, and in the most serious cases it should be calculated with the same accuracy as in diabetes.

400. The Internal Secretion of the Pancreas.

ACCORDING to LAGUESSE (*Le Scalpel*, January 31st, 1920) starvation in animals causes a considerable increase in the growth of the islands of Langerhans in the pancreas, and consequently of its internal secretion. The indication, therefore, especially at the onset of diabetes and in cases of slow development, is to increase by this process the patient's internal secretion. Absolute starvation is not necessary, as it has been found that temporary suppression of meat and substitution of toast for new bread, associated with sodium bicarbonate, are enough to diminish the sugar in the urine or soon make it disappear entirely. On the other hand, this regimen diminishes the secretion of pancreatic juice. Laguesse notes that during the occupation of Lille by the Germans several practitioners found that many cases of glycosuria were improved or cured spontaneously as the result of underfeeding, which was the rule at that time.

401. Typhus Fever with Relapse.

ACCORDING to T. GANE (*Bull. et mém. Soc. Méd. de Hôp. de Bucarest*, May 28th, 1919) the occurrence of a relapse in typhus is not mentioned in modern textbooks. He describes a case in a man aged 21 who had a mild attack of typhus followed by a similar attack five days after the temperature had become normal. The eruption was typical of typhus in both attacks. The diagnosis of enteric or relapsing fever was excluded in both attacks by the negative result of examination of the blood. During the great epidemic of typhus which occurred in Moldavia in 1917 a few cases of relapse were reported but were not described in detail.

402. Abortive Forms of Lethargic Encephalitis.

J. SABRÈZES and C. MASSIAS (*Gaz. hebdom. d. Sci. Méd. de Bordeaux*, February 8th, 1920) record three more cases of this kind. In two the clinical picture was complete, but the symptoms were of very short duration. In the first the fever and ocular symptoms lasted only a few days and the attack generally was so mild that the patient did not even take to bed. The second was also an example of ambulatory lethargic encephalitis. In the third case fever and somnolence were present but there was no ophthalmoplegia; the disease lasted about a fortnight, leaving the patient in a debilitated condition.

403. Treatment of Haemophilia by Injection of the Mother's Blood Serum

J. CHALIER (*Rev. de méd.*, 1919, xxxvi), who in 1912 failed to benefit a haemophilic patient by injection of his own blood serum, reports the beneficial effect of intravenous injection of the blood serum of the mother in a severe and progressive case of haemophilia in a boy aged 18 years. The patient had several haemophilic joints, and had the aspect of chronic pulmonary tuberculosis. He had been unsuccessfully treated by subcutaneous injection of Witte's peptone and the oral administration of adrenalin. Blood removed by venipuncture took three hours to coagulate. The mother's blood coagulated in five minutes, and addition of her serum to her son's blood caused clotting in four minutes. Within the space of eight months Chalier gave the patient eleven intravenous injections of his mother's blood serum (25 to 40 c.cm.) without any untoward symptoms and with very great benefit. He advises that in other cases this treatment should be carried out every ten or fifteen days for two years. In his case the adrenalin treatment was continued for its vaso-constrictor effect, and calcium salts were also given.

404. Mongolian Idiocy in Brothers.

PARDEE (*Journ. Amer. Med. Assoc.*, January 10th, 1920) reports the occurrence of mongolian idiocy in two brothers, the youngest members of a family of eleven living children. The cases conform to the usual description, and support the theory that mongols are born from parents in whom the germ plasma has become defective through exhaustion. The history obtainable in over 50 per cent. of mongols is that the idiot child was the last one of a large family when the mother was far advanced in her reproductive life, or else that the child was the product of a marriage union consummated late in life. Pardee emphasizes the dissimilarity between the mongol and the myxoedematous cretin, but regards the condition as due to some endocrine dystrophy.

405. Methaemoglobinaemia due to the Bromoseltzer Habit.

W. S. MCELLEROY (*Journ. Amer. Med. Assoc.*, 1919, lxxiii) describes the case of a man who contracted the habit of taking bromoseltzer, which contains acetanilide, for headaches. The toxic effects were cyanosis, nervous symptoms, dizziness, delirium, shortness of breath on exertion, and persistent methaemoglobinaemia, as shown by spectroscopic examination. There was a very considerable difference between the haemoglobin as determined by the method of Palmer and as calculated from the oxygen capacity; this was apparently due to the methaemoglobin, which does not give up oxygen to the vacuum, but adds to the colorimetric determination.

406. Dissociated Biliary Retention.

BOUCHUT and LAMY (*Lyon méd.*, January 25th, 1920) describe two types of this condition. In the first, which is the more frequent, there is a retention of bile pigment only. This type is found in some cases of catarrhal and mild infective jaundice, in cirrhosis complicated by jaundice, as in a case reported by the writers, and in some cases of icterus gravis. In the second type there is retention of the bile salts only. In characteristic cases there is no retention of the bile pigment, and there is no bilirubinuria nor icterus. In some cases, however, the syndrome is less distinct. Not only is there complete retention of the bile salts, but there is also an incomplete retention of bile pigment as well. In other words, there is a slight degree of jaundice, the faeces are little if at all discoloured, and the urine is rich in bile salts and poor in pigment.

407. Morphine Poisoning.

REFERRING to a recent case of "suspended animation," reported by E. Rautenberg, where a patient took 1.7 grams of morphine plus 5 grams of veronal, and remained apparently lifeless for several hours, JOACHIMOGLU (*Deut. med. Woch.*, December 18th, 1919) suggests that the patient must have possessed an extraordinary tolerance of morphine, although she was not, apparently, addicted to this drug. To Rautenberg's query if it is possible for a person to live for more than twenty-four hours without respiration or circulation of the blood, the author replies emphatically in the negative. He believes that the examination of the body for signs of life must have been faulty, and that Rautenberg's assumption of complete absence of respiration and circulation for several consecutive hours was incorrect. Probably she breathed occasionally during the period of "suspended

animation"; otherwise the temperature of the body would have fallen to that of the surrounding air, and resuscitation would then have been impossible. This case, which has been the subject of sensational reports in the German lay press, shows that, in morphine poisoning, life may be restored by artificial respiration and other measures, even when there is practically no sign of life. In this connexion the author publishes the case of a chemist who took 1.5 grams of morphine hydrochloride by the mouth at 11 a.m. At 7 p.m. pulse and respiration ceased, and ten minutes later no reflexes were obtainable. Artificial respiration was begun at 7.15 and continued throughout the following night. This treatment, combined with an injection of 3 mg. of atropine sulphate and several injections of camphor, saved the patient's life.

SURGERY.**408. Results of Bridging Nerve Defects.**

H. PLATT (*Brit. Journ. Surg.*, 1920, 7) discusses the results of bridging gaps in injured nerve trunks by means of either autogenous nerve grafts or autogenous fascial grafts fashioned as tunnels. The paper is based upon 18 cases upon which careful and complete neurological examinations had been carried out before and after operation. In no case had any regeneration taken place. The average time elapsed since operation was seventeen months. Secondary exploration was carried out in 4 cases. In all cases the nerve trunks were silent to direct faradic stimulation. Partial or complete obliteration of the lumen of the fascial tube was noted and confirmed histologically. These findings are important, as nerve grafting still has an honoured place in general surgical textbooks. Both the nerve graft and fascial sheath have been regarded as valuable methods of treatment, but those who feel tempted to try them would do well to refer to Platt's paper beforehand.

409. Acquired Diverticula of the Large Intestine.

F. PARODI (*Arch. per le Sci. Med.*, Fasc. 5 and 6, 1919) reports two examples of this condition. In the first case, which occurred in a man aged 22 in whom death was due to cerebral haemorrhage, the sigmoid and first part of the rectum showed numerous diverticula 3 to 4 cm. long, with a maximum diameter of 2 cm. They did not contain any faecal calculi, and there was no trace of ulceration of the mucous membrane or loss of muscular substance. In the second case, which occurred in a man aged 60 in whom death was due to chronic tuberculosis, the sigmoid showed numerous diverticula of various sizes containing faecal calculi. Histological examination in both cases showed simple atrophy of the muscular fibres, with sclerosis from proliferation of the connective tissue.

410. Chronic Rheumatism with Dislocation following Acute Articular Rheumatism.

P. LEREBOUTLET and J. MOUZON (*Bull. et mém. Soc. Méd. d. Hôp. de Paris.*, January 23rd, 1920) report a case of chronic fibrous rheumatism following acute articular rheumatism in a woman aged 26, remarkable for the occurrence of dislocations at the metacarpo-phalangeal joints. The condition was apparently caused by the looseness of the capsules and ligaments of these joints due to some extent to the patient's work as a dressmaker.

411. Cholelithiasis and Achylia.

F. RYDGAARD (*Hospitaltidende*, January 7th and 14th, 1920) found that among 158 cases of cholelithiasis diagnosed by operation and not associated with malignant disease or gastric ulcer there were 18 with hypoachylia and 57 with achylia. The incidence of achylia was 25 per cent. among the patients whose gall stones were found only in the gall bladder, but achylia was more than twice as common when the gall stones were found obstructing one or more of the biliary passages. The incidence of achylia also increased with the size of the gall stones. Grouping his cases with those of his Danish colleague Wessel, he found that out of 64 septic cases there were 33 showing total achylia, and 42 showing either achylia or hypoachylia. Obstruction of the cystic duct alone is not enough to determine achylia; the additional factor is incontinence of the bile. If the mechanism for storing up the bile and periodically discharging it breaks down, the bile constantly escapes, and the unneutralized acid of the gastric juice stimulates the duodenum, starting a reflex which induces achylia.

412. Studies in Bone Growth.

ALBEE and MORRISON (*Amer. Journ. Med. Sci.*, January, 1920) record the results of their laboratory investigations into the etiology of pseudarthrosis or malunion, and of their experimental attempts to produce the condition. Of all the influences possibly favouring the production of pseudarthrosis the x ray is the only one which has notably increased within the last decade. Over eighty experiments were conducted on rabbits under careful asepsis, and in none was it possible to produce pseudarthrosis by repeated massive exposures to x rays, by removal of bone, or by various degrees of splinting. Even when portions of the radius were removed up to one-fourth of its entire length, early and rapid union of the fragments took place, bone growth in animals being much more rapid and constant than in the human subject. Frequent massive exposures of fractures to the x rays in no way inhibited callus formation, and from control experiments it seems that the x rays exert no appreciable influence upon bone growth. In cases of fracture of the radius with loss of bone, in which all the bone fragments were removed from the hiatus in the shaft, the average length of time for union was forty-two days. Cases of fracture in which the fragments were not removed from the hiatus showed much more rapid and complete union, and in one case with loss of bone, in which a fragment was left bridging the gap, remarkable osteogenetic activity was manifest, and complete restoration of continuity of the shaft occurred by the thirty-first day, thus showing the value of the osteo-periosteal or "sliver" graft as furnishing additional foci for bone growth.

413. Dakin's Fluid in Chronic Suppurative Otitis.

ACCORDING to A. R. ACOSTA (*Rev. de med. y cir. práct.*, January 28th, 1920), Dakin's fluid is an excellent remedy for cases of chronic suppurative otitis, especially for those of a very septic character with fetid discharge. The ear is first washed out with boracic lotion, and then 10 to 15 drops of Dakin's fluid are instilled into the ear, the head being kept in a horizontal position for five minutes. The process should be repeated as frequently as possible during the day. Cases which had been treated unsuccessfully by other methods for three or four months were cured as a rule by Dakin's fluid in eight to ten days, considerable improvement being noted in forty-eight hours. There is no contraindication to its employment.

414. Spina Bifida in Adults.

F. FERMI (*Il Policlinico, Sez. Prat.*, February 9th, 1920) has collected all the published cases of spina bifida in adults, which amount to forty-five, the affection being but rarely compatible with life. He records three cases of spina bifida in the lumbar or sacral region in patients aged from 16 to 17, in which a successful operation was performed. The more favourable prognosis of radical operation in adults is due to the occurrence of milder forms of the disease, which alone permit survival for any length of time, whereas in early life many severe cases (myelocystoceles and myelocystomeningoceles) are submitted to operation.

415. Osteitis Deformans affecting a Single Long Bone.

DE MASSARY and LECHELLE (*Bull. et mèm. Soc. Méd. d. Hôp. de Paris*, January 30th, 1920) report a case in a woman, aged 55, who at the age of 30 developed an arthritis of the left knee. Under local applications and sodium salicylate the symptoms disappeared, but at the age of 45 the patient noticed that her left thigh was larger than the right and had an anterior curvature. The x rays showed the characteristic appearances of osteitis deformans. The rest of the skeleton, especially the skull, face, hands, and long bones, showed nothing abnormal. There was no evidence of syphilis, Wassermann's reaction in the blood and cerebro-spinal fluid was negative, and no improvement followed antisyphilitic treatment. In the subsequent discussion, Oettinger reported a case of Paget's disease in which the lesions were confined to the left humerus.

416. Generalized Loss of Reflexes in Cranio-meningeal Wounds.

A. SOTQUES (*La Médecine*, February, 1920) in 5 cases of wounds of the skull and meninges found a generalized loss of reflexes. None of the symptoms which usually accompany the loss of the reflexes were present—for example, lightning pains, anaesthesia, Romberg's sign, hypotonus, or paralysis. Lumbar puncture showed the presence of an excess of albumin and definite hyper-

tension. The loss of reflexes was explained by a change in the posterior roots due to meningeal infection or hypertension.

417. Primary Sore of the Conjunctiva.

NADERNA (*La Med. Pratica*, January 31st, 1920) records the case of a washerwoman, aged 46, who suffered from a primary syphiloma of the conjunctiva, enlarged retroauricular and submaxillary glands; the cervical and epitrochlear glands on the same side were also affected. There was a papular syphilitic rash, with headache and joint pains, and a positive Wassermann reaction. Infection was thought to have occurred in the course of her occupation as a washerwoman. The author reports the case as such cases are extremely rare.

418. Anatomy of Snapping Hip.

WOOD JONES (*Journ. Orthopaed. Surg.*, 1920, 2) describes the anatomy of snapping hip. In this condition, when the patient stands and bears weight on one leg and then rotates the thigh in or out, a distinct snap can be felt and even heard over the region of the great trochanter. The condition has been variously ascribed to ligamentous and bone disease or abnormality. The author shows that the condition is due to the presence of a long tendon on the deep surface of the gluteus maximus. This is the means of insertion of the muscle into the gluteal ridge of the femur and is a structure of very variable length. When it is long and sickle-shaped—that is, when its insertion is comparatively low—the tendon rides backwards and forwards across the great trochanter and gives rise to "snap" as it frees itself. That this is the correct explanation of the condition was proved at operation. Ordinarily the muscular relaxation produced by the anaesthetic does away with any snapping. Wood Jones stimulated the muscle electrically during the operation, and was able to watch the play of the tendon on the trochanter. Treatment consists in suturing the tendon to the periosteum. The condition is essentially a congenital anomaly which may be exploited at will for military or compensation purposes.

419. Mesenteric Cyst.

WHITE (*Amer. Journ. Med. Assoc.*, 1920, 74) reports a case of mesenteric or enterogenous cyst, of which he gives three illustrations. These cysts in the majority of cases have a lining of mucous membrane closely resembling that of the intestine, even to the presence of villi. They are, however, entirely cut off from the bowel, lying between the layers of the mesentery. The commonly accepted view is that they are sequestration cysts and are invariably congenital. They present themselves clinically as movable tumours, and are not easy to distinguish from pedunculated fibroids, ovarian cysts, or even floating kidneys. The commonest complication is intestinal obstruction produced either directly by pressure on the contiguous bowel or indirectly by the tumour giving rise to a volvulus. White's case occurred in a boy of 4, who had suffered from several attacks of severe vomiting and pain. There was a palpable tumour, at first believed to be an intussusception. The attacks lasted a few hours and then were suddenly relieved. At operation White found a mesenteric cyst, and performed a resection of the portion of ileum implicated. The child recovered. Microscopically the cyst was found to present villi, crypts, and muscle.

420. Partial Resection of Motor Nerves in Spastic Hemiplegia.

VAN HÆLST (*Le Scalpel*, March 6th, 1920) records the case of a girl, aged 9, with spastic hemiplegia of the right lower limb, which showed extreme adduction and pronounced talipes equino-varus. A study of the case showed that the condition was due chiefly to spastic contraction of the adductors, gastrocnemius, soleus, and tibiales (anticius and posticus). An operation was therefore performed, at which the obturator nerve was exposed and 2-3 cm. of each of its branches resected. Through an incision over the lower part of the popliteal space two-thirds of those branches of the internal popliteal nerve supplying the inner head of the gastrocnemius and half those branches supplying the outer head were resected. A nerve trunk was then differentiated which supplied the tibialis posticus and part of the flexor proprius hallucis. After isolating the fibres supplying the latter muscle, the remaining two-thirds of the nerve trunk were resected. The result was most successful and all tendency to talipes disappeared. The patient began to walk eight days after the operation, and was soon able to walk and run in an almost normal manner.

OBSTETRICS AND GYNAECOLOGY.

421. Treatment of Puerperal Infections with Normal Serum.

FROM observations on a hundred cases O. CIGNOZZI (*Il Policlinico*, Sez. Prat., March 1st, 1920) concludes that normal horses' serum, and still more so normal asses' serum, especially when it is employed early, has a well marked beneficial action on those forms of intra-uterine infection which may subsequently develop into severe and incurable puerperal fever. The daily dose should be 60 c.c.m., and in mild cases two days' treatment is sufficient. In more severe and later cases injections should be given for from three to five days. Apart from a few cases of urticaria, no complications of any importance were observed. As a rule the fever disappeared in twenty-four to forty-eight hours, and in most cases did not return. Successful results were obtained in 90 per cent. of the patients, the action of the serum being most pronounced in cases following abortion. Involution of the uterus and adnexa took place rapidly, and parametritis and perimetritis were rare.

422. Malignant Myoma of the Uterus.

NEWTON EVANS (*Surg., Gyn., and Obstet.*, March, 1920) discusses the pathological characters of non-epithelial malignant tumours of the uterus. He agrees with most other observers in referring their origin to the muscular rather than to the connective tissue elements. The differentiation on histological grounds of simple and malignant conditions in suspicious fibroids is never easy, and the characters of the "fibroid undergoing sarcomatous degeneration" are rather nebulous. Newton Evans has examined 72 such tumours in a series of 4,000 operations for uterine fibromyomata in the Mayo clinic. He considers in detail the various characteristics on which stress has been laid by several authorities: (1) The increase in size of tumour cells as compared with normal muscle or benign muscle tumour cells; (2) shorter and plumper cells with nuclei more nearly oval than normal muscle or benign muscle tumour cells, rounded, and vesicular nuclei; (3) inequality in size and irregularity in shape and arrangement of the cells; (4) lack of differentiation of cells; (5) presence of very large cells, with hyperchromatic, single, or multiple nuclei (giant cells); (6) presence of mitotic figures, typical and atypical; (7) decrease or absence of stroma fibres between the cells; (8) thinness or absence of vessel walls. The only single constant microscopic evidence of definite malignancy is the presence of large numbers of mitotic figures. The author has been accustomed to count the number of mitotic figures seen in 100 oil-immersion fields, and, taking into account the thickness of the sections, he records the number in a cubic millimetre of tissue. He found that the tumours fell into three definitely delimited groups on this basis, and the subsequent history showed that those in which the mitotic figure count was above 2,000 were malignant. Another point brought out is that the presence, even in considerable numbers, of large giant cells without mitotic figures is not a sign of malignancy. The presence of cells showing direct nuclear division is compatible with the benignity of a tumour.

423. Omphalitis.

CREADICK (*Surg., Gyn., and Obstet.*, March, 1920), as the result of a microscopic investigation of the umbilical cord in 2,200 consecutive deliveries, has been able to find evidences of an inflammatory lesion in 43 cases. This consists in an extravasation of polymorphonuclear leucocytes into the wall of the umbilical vein, occasionally into the wall of one or both of the arteries, and into Wharton's jelly. These lesions vary in severity, implicating only a portion of the vein wall or involving all three umbilical vessels. Rarely thrombophlebitis exists. Usually the leucocytes are loosely disseminated, but occasionally may be so massed together as to resemble early abscess formation. The lesion is not pathognomonic of syphilis, for it was present in 40 cases in which there was no evidence of syphilis and absent in 29 cases of undoubted syphilis. The author is of opinion that it arises by the extension of bacterial infection from the placenta, and he was able frequently to demonstrate bacteria in the sections. The condition was usually associated with prolonged labour, after premature rupture of the membranes.

424. Reattachment of Fibroid.

DUJARIER and KHAN (*Bull. et mèm. de la Soc. Anat. de Paris*, January, 1920) record a case of a movable tumour in the pelvis of a woman of 40 years, which caused pressure symptoms. At operation it proved to be a

spherical fibroid of the size of two fists and was adherent to the sigmoid loop of colon by a pedicle. It had no attachment to the uterus or adnexa, though in all probability it was originally a pedunculated subserous uterine myoma, and having broken its connexion became secondarily adherent to the colon. Microscopically it was a myoma with advanced mucoid degeneration

PATHOLOGY.

425. Lethargic Encephalitis.

IN a paper recording several cases of lethargic encephalitis, K. GROSZ (*Wien. klin. Woch.*, February 26th, 1920) gives notes of a *post-mortem* examination of a patient, aged 35. The symptoms began with headache, giddiness, weakness, and paraesthesia of the right arm and leg, and paralysis of the left abduccens nerve. Ptosis and somnolence supervened, the latter growing more intense during an illness of four months. The necropsy showed marked infiltration of the blood vessels of the brain with mononuclear cells. In several places this infiltration had extended to the parenchyma which in some places was involved quite apart from the infiltration of the blood vessels. There were also signs of neuronophagia, and the ganglion cells showed severe degenerative changes; a few perivascular haemorrhages were present. The distribution of the morbid changes in the central nervous system was very irregular, and there was hardly any infiltration of the spinal cord. The author points out that all his cases showed symptoms conforming to the type of encephalitis lethargica as defined by Economo.

426. Sugar Content of the Cerebro-spinal Fluid in Lethargic Encephalitis.

NETTER, BLOCH, and DEKEUWER (*C. R. Soc. Biol.*, March 20th, 1920), who have examined the cerebro-spinal fluid in fifteen cases of encephalitis lethargica, have found that the quantity of sugar present is almost always distinctly higher than normal. In one case no increase was found, but there were signs of medullary localization, and in another the fluid was withdrawn when the patient was moribund; in the remaining thirteen the increase of sugar was on the average 0.78 gram per litre. The authors regard such findings as signifying a special affinity of the virus for the mesencephalon and as produced by irritation of the glycogenic centre. There is no hyperglycaemia in these cases, much less glycosuria. The observation has no absolute value in diagnosis, for equally elevated readings may be obtained in other diseases (notably pneumonia with meningeal symptoms) and even in tuberculous meningitis. But it is not without use in the diagnosis of doubtful cases, and it clinched the diagnosis in four of the authors' cases.

427. Metastatic Solitary Cerebral Abscess.

ACCORDING to A. MOCHI (*Presse méd. d'Égypte*, February 15th, 1920) who records an illustrative case, this is a very rare condition. In 1853 Virchow showed that the primary suppurative lesion in cases of metastatic cerebral abscess was almost always in the lungs, and a few years later Böttcher found lung pigment in a metastatic cerebral abscess. These observations have been confirmed by all subsequent writers, who are agreed that cerebral abscess is very rare in ordinary pyaemia, whereas it is a relatively frequent complication of pulmonary suppuration. Out of 93 cases of severe pulmonary suppuration collected by Nather 8 developed a cerebral abscess. The majority of metastatic brain abscesses are caused by chronic suppurative processes in the lung, such as purulent bronchitis, bronchiectasis, empyema and pulmonary gangrene. Although pneumonia is a much more frequent disease than purulent bronchitis or bronchiectasis, the latter supplied a contingent of 51 per cent., whereas pneumonia was represented in the etiology of metastatic abscess by only 4 per cent. of cases.

428. Renal Adequacy.

CASTAIGNE (*Rif. Med.*, January 24th, 1920) supports the value of the methylene blue test of renal adequacy, but finds that there is a limit to its value, which depends on the substance selected for trial; if this is one of those drugs or salts secreted without any limitation, then the blue test is strictly accurate. Urea is secreted without limitation; therefore the blue test can be absolutely relied on as far as urea is concerned. But it is not so trustworthy in regard to substances secreted with limitation—for example, sodium chloride.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

429. A Form of War Haematuria.

Under the title "Haematuria of unusual origin," BENNETT and FRANKAU (*Quart. Journ. Med.*, 1919-20, xiii) describe a series of sixteen cases (seen in a casualty clearing station) which, though differing considerably from war nephritis, have hitherto been grouped in that category. The most prominent features were fever and haematuria; the onset was usually sudden, with a temperature rising to 100° or 102° F., pain in the shins, along the radial border of the forearms, and in the back, followed sometimes on the same day and always within a few days by well-marked haematuria and perhaps slight dysuria. In several instances the haematuria was the sole reason for seeking medical advice. The obvious blood disappears from the urine in a few days, though microscopic examination shows the presence of disintegrated red blood cells, pus and epithelial debris, and the shin and lumbar pains become more troublesome. Herpes labialis may appear about the fifth day of the disease; the temperature falls, but after an interval of a few days fever recurs, and sharp spiky relapses resembling those seen in trench fever are common. The distinguishing points from war nephritis are the copious haematuria with relatively small amount (0.1 per cent.) of albumin, which corresponds to the quantity of blood; the rarity of casts; the absence of oedema, of dyspnoea, and of raised blood pressure, and the greater intensity of the pain. In fact, the only justification for the inclusion of these cases in the category of war nephritis is the occasional occurrence of casts in the urine. Cystoscopic examination showed the signs associated with infective pyelitis or pyelonephritis. Cultivations of catheter specimens of urine sometimes showed streptococci; otherwise they were sterile.

430. Metahepatic Pleurisy.

A. FURNO (*Rif. Med.*, December 20th, 1919) states that Grocco of Florence in 1901, and other observers subsequently, pointed out that in cholelithiasis, especially at the time of gall-stone colic, a pleural rub might be heard on one or both sides, and that sometimes a pleural effusion might occur which was almost invariably on the right side, rarely bilateral, and always due to the primary hepatic condition. Pleurisy is most frequent in cholelithiasis, but it also occurs in other diseases of the liver, especially cirrhosis, hydatid disease, and carcinoma. Furno records 3 cases of dry pleurisy secondary to syphilitic disease of the liver which were cured by antisyphilitic treatment, and emphasizes the importance of not mistaking such cases for primary tuberculous pleurisy. The frequency of pleurisy in hepatic disease, in contrast with diseases of the other abdominal organs, is due to the fact that four-fifths of the lymphatics of the liver pass into the thorax and communicate with those of the parietal and visceral pleura.

431. Treatment of Diarrhoea and Mucous Colitis by Zinc Oxide.

G. DURAND and H. DEJUST (*Bull. Soc. de Théor.*, January 14th, 1920) regard zinc oxide as preferable to the other astringents usually prescribed in acute diarrhoea, in which it exercises a precipitating action on mucin and serum albumin. It also possesses antispasmodic properties. It can be given in combination with small doses of opium when the colic is very severe or the diarrhoea excessive. In acute diarrhoea it is best to begin with 2 grams daily divided into ten pills of 0.20 gram each. The daily amount should then be reduced by one or two pills according to the rapidity of the results obtained. In chronic diarrhoea, in which the drug would have to be continued for a longer period, smaller doses would be required, for example, six pills daily, each containing 0.20 gram.

432. Arsenobenzol and Anaphylaxis.

To avoid the occurrence of anaphylaxis after injections of arsenobenzol, EMBERY and A. MORIN (*Paris méd.*, January 24th, 1920) recommend the administration of very small and progressively increasing doses at frequent intervals. The doses advised are 0.02 gram, 0.03 gram, 0.04 gram, 0.06 gram, 0.08 gram, and 0.10 gram, which should be repeated daily for five or six days, when the really curative doses may be given at the usual intervals.

433.

Central Pneumonia.

SOFRÉ (*Rif. Med.*, January 3rd, 1920) discusses the diagnosis of central pneumonia—that is, a pneumonia localized to the central part of one or other lobe of the lung and not spreading outwards. As is well known, the signs and symptoms of such a condition are often more conspicuous by their absence than their presence. According to Sofré, the most constant is cough, which symptom, when all else may fail, can usually be observed. There are two physical signs to which the author attributes great diagnostic significance: (1) Localized hyper-resonance; (2) weakened vesicular breathing in the same area. When these two signs are present, coupled with symptoms suggesting pneumonia—cough, fever, rusty expectoration, etc.—they may be looked upon as strongly confirmatory of the diagnosis. The hyper-resonance is due to a temporary compensatory emphysema, and the same cause accounts for the weakened vesicular breathing. As the patch of pneumonia resolves so these two signs slowly disappear.

434.

Aortic Disease.

G. HUBERT (*Muench. med. Woch.*, December 12th, 1919) classifies the physical signs of aortic disease into those obtained by percussion, auscultation, and x-ray examination. Changes in the vessel are not so frequently detected by percussion as is generally supposed, and the dilatation must be of considerable size before a distinct aortic dullness can be detected. In sclerosis of the aorta and also in uncomplicated aortic syphilis an increase of the normal aortic dullness is absent, although x-ray examination shows a definite abnormality. Dilatation of the descending thoracic aorta can never be detected by percussion, and even a considerable dilatation of the ascending part may escape notice if it is associated with pulmonary emphysema. Aortic sclerosis and aortic syphilis are most frequent in the fifth and sixth decades, when pulmonary emphysema is also very common. When there is a diffuse increase of the aortic dullness advanced disease is undoubtedly present, but whether it is due to sclerosis or syphilis cannot be determined by percussion. Auscultation is of much greater value. Accentuation or a ringing character of the second aortic sound may be found: (1) accompanying increase in the peripheral resistance without any disease of the vessel or valves, as in chronic renal disease; (2) as a transient phenomenon in excitable persons and in Graves's disease; (3) owing to disease of the vessel wall itself. A systolic murmur also possesses various degrees of significance: (1) It may be accidental and relatively unimportant. (2) It may be a sign of aortic stenosis. The diagnosis of this very rare valvular lesion, however, can only be made when a systolic murmur is associated with faintness or absence of the second sound, hypertrophy of the left ventricle, and an infrequent and slow pulse. (3) Another cause is disease of the aortic wall itself, due to syphilis or arterio-sclerosis, or a combination of the two. Lastly, x-ray examination is of the greatest importance in demonstrating pathological changes in the aorta—namely, abnormal width, increased pulsation, and abnormal depth of the shadow. The situation of the lesion is at once shown, and it is often surprising to find signs of a commencing aneurysm on x-ray examination when clinically there is no evidence of it. The increased pulsation is due to loss of elastic tissue in the aortic wall and to its replacement by connective tissue or to specific infiltration. Whether the increase in depth of the shadow is due to dilatation of the vessel, and therefore to the presence of a larger column of blood, or to thickening of the wall, cannot be readily decided, but in Hubert's experience thickening of the wall is the principal cause.

435.

Hysterical Vomiting.

HURST (*New York Med. Journ.*, January, 1920) considers that hysterical vomiting is much more frequent than is generally supposed. Consequently much of the persistent vomiting met with in practice can be cured by psychotherapy. Hurst classifies the causes of vomiting as follows: (1) Local, (2) reflex, (3) toxic, and (4) central. The first group includes vomiting produced by irritation of the stomach, causing gastritis and expulsion of the irritant. In military hospitals vomiting after "gassing" was produced by the swallowing of saliva in which "gas" was dissolved. In civil practice this form of vomiting is

commonly produced by food poisoning. In both cases if the vomiting persists after the relief of the gastritis, it is hysterical. The vomiting seen in young anaemic girls not infrequently arises from a food gastritis, and persists as hysteria. In persons who have had several operations, post-anaesthetic vomiting may be very severe, and is generally hysterical and the result of auto-suggestion. Reflex vomiting originates from some organ other than the stomach, and is commonly produced by abdominal diseases, as appendicitis, or by phthisis. Sea-sickness is another form of reflex vomiting. The passenger who prepares to be ill on crossing the Channel and the patient who, in phthisis, contracts the habit of vomiting after every meal, are both examples of hysterical vomiting caused by auto-suggestion. Toxic vomiting occurs in acute infections, as influenza or scarlet fever. The pernicious vomiting of pregnancy Hurst holds to be entirely hysterical, suggested by the normal period of either reflex or toxic vomiting in early gestation. He considers the urinary changes to be due to starvation. Vomiting of central origin due to tumours has no relation to hysteria. But vomiting as the physical concomitant of powerful emotion, as disgust or fear, is a fruitful source of hysterical persistence. The treatment consists in a confident and connected explanation to the patient of the circumstances producing his vomiting, and an immediate return to ordinary diet is usually tolerated.

436. Elimination of Acetone Bodies during Infectious Fevers.

B. S. VEEDER and M. R. JOHNSTON (*Amer. Journ. Dis. Child.*, February 20th, 1920), as the result of observations on forty-one children with scarlet fever, diphtheria, measles, and pneumonia, come to the conclusion that while an increased elimination of acetone bodies might occur in infectious diseases, this did not invariably take place. In the same patient it might occur during one infection and not during a second. It was not dependent on the severity of the infection or the degree of temperature, and its causation could not be explained by the decreased intake of food which is so constantly associated with an infectious process.

437. Atony of the Digestive Tract in Nervous Individuals.

ACCORDING to F. BARJON (*Lyon méd.*, February 10th, 1920), nervous individuals frequently show, on examination of their digestive tract, a characteristic radiological picture corresponding to a general atony of the entire system. This atony, which may be localized or generalized, is not, as a rule, accompanied by any symptoms, and is only detected by radiological examination. Every portion of the digestive system may be involved, separately or collectively. The most characteristic signs are found in the oesophagus, where the bismuth cachet, instead of descending regularly, makes a more or less jerky progress, with numerous stops. The characteristic appearances found in the stomach in these cases are ptosis and atony, with a slight delay in evacuating its contents. The passage of the bismuth meal through the small intestine is generally normal, but in a few cases there is a decided delay. In the large intestine pronounced ptosis is frequently observed, and there is an excessive delay in the passage of the bismuth. Surgical intervention is contraindicated in these cases.

438. Membranous Tracheo-bronchitis in Influenza.

DISCUSSING the pseudo-diphtheritic membranous tracheo-bronchitis of influenza, which has been described as a frequent and almost pathognomonic manifestation of this disease, HANSTEEN (*Norsk Magazin for Lægevidenskaben*, February, 1920) is sceptical about the diagnosis, suggesting that the omission of the qualifying term "pseudo" would bring this diagnosis more in line with the truth. Among his 250 necropsies on cases of influenza there were five in which this condition was found; on scrutiny these five cases of influenzal membranous tracheo-bronchitis could be reduced almost to *nil*, for many, if not all, were due to genuine bronchial diphtheria, the diagnosis of which was confirmed by bacteriological examination.

439. Tender Spots at the Root of the Neck in Abdominal Disease.

CADE and PARTURIER (*Rev. de méd.*, 1919, xxxvi) point out that tenderness on pressure between the two heads of the sterno-mastoid muscle may be due to abdominal as well as to intrathoracic disease. From examination of a number of cases they conclude that the presence of a tender spot confined to one side, or almost unilateral, is in favour of a visceral lesion in the upper part of the

abdomen: when on the right side the lesion is probably in the liver (especially perihepatitis) or in the biliary tract (particularly the gall bladder and cholelithiasis). When the left side is tender a lesion of the stomach or duodenum is probable. The presence of these tender spots is not any guide to the nature of the lesion; it may be present in gastric ulcer, in pyloric stenosis from adhesions, and in gastric carcinoma. In the cases of splenomegaly, movable kidney, colitis, and carcinoma of the colon examined the tender spots were absent. In neurasthenics and in cases of coeliagia with multiple painful points in the abdomen, the cervical tender spots were bilateral.

SURGERY.

440. Primary Sarcoma of the Stomach.

BOHMANNSSON reviews the subject of sarcoma of the stomach in a recent number of *Acta Chirurgica Scandinavica* (1920, 52). He records six cases from the Stockholm clinic and abstracts the literature of the subject. The stomach is an uncommon site for primary sarcoma, for whilst the general ratio of carcinoma to sarcoma, irrespective of site, is 95 to 5, the ratio as it affects the stomach is 99 to 1. These figures are based upon a collected series of 8,134 cases. Bohmannsson combats Fenwick's figures, which give to sarcoma the proportion of 5 to 8 per cent. of all gastric tumours, basing his opinion on a more thorough microscopic examination of the pathological material. It is noteworthy that metastatic, secondary, sarcoma of the stomach appears to be much rarer even than the primary. Sarcoma of the stomach has a later age incidence than is usual for that neoplasm elsewhere, the majority of cases falling within the fifth and sixth decades of life. Only in lymphosarcoma is the average age below 40 years. As to site, the majority occur in the corpus ventriculi, the posterior wall is affected ten times more commonly than the anterior, and pyloric stenosis is rare. Three varieties, differing in their method of growth, may be distinguished—diffuse infiltrating, endogastric, and exogastric. The first type are usually spheroidal-celled or lymphosarcomata, the endogastric usually myosarcomata, the exogastric invariably spindle-celled sarcomata. The one constant clinical feature is the presence of a palpable tumour. Cachexia, anaemia, and wasting are common in spite of the absence of pyloric obstruction, which last accounts for the rarity of vomiting of the retention type. Radiological examination is of little value in distinguishing between carcinoma and sarcoma, but is of course of decisive importance as regards the question, "tumour or no tumour?" Perforation is commoner in sarcoma than in carcinoma, presumably because of the greater tendency of the former to degenerate after extensive intramural penetration. Operative removal is more often possible in sarcoma than in carcinoma, but the results are bad. Of the six new cases reported by Bohmannsson, four are already dead and one has abdominal metastases.

441. Post-operative Prognosis of Cancer of the Breast.

S. F. HOLST (*Norsk Magazin for Lægevidenskaben*) has investigated the post-operative histories of 81 patients on whom operations for cancer of the breast were performed in Christiania between January 1st, 1907, and August 3rd, 1916. He reduces the number to 80 by withdrawing a case of Paget's disease, which had shown no relapse after operation. A comparison of the hospital cases with those seen in private practice showed that the latter included the highest proportion of early cases. The interval between the detection of the disease by the patient and its operative treatment was, on the average, over ten months, and in this connexion the author refers to the necessity for popular educational propaganda among women, who are often deplorably unobservant and negligent of painless swellings of the breast. A considerable portion of the 80 cases were inoperable, and, after an observation period of three years, only 16 showed no sign of relapse. The prognosis for cancer of the breast is still worse than these figures indicate, for they do not include cases remaining at home because they were too far advanced to be sent to a surgeon. Of the 21 cases in which there were no secondary deposits in the axilla at the time of operation, 66.7 per cent. were alive and well three years or more later.

442. Multiple Chancres.

R. BERNARD (*Le Scalpel*, March 13th, 1920) records two rare cases illustrating the coexistence of extragenital and genital chancres. In the first case the patient presented

a chancre of the cheek, the size of a five-franc piece, which also involved the tragus, antitragus, and lobule of the ear. It had been caused by the kiss of an infected woman on an abrasion due to a razor. The patient also had a chancre of the upper lip and of the penis. In the second case the patient presented a chancre of the penis and two extragenital chancres, one on each lip. He had been infected by his wife, who had condylomata of the vulva and thighs.

443. Dental Chancre.

GOODMAN (*New York Med. Journ.*, 1920, 111) reports a very interesting case of syphilitic infection of the gum. The paper is entitled "Unmerited dental syphilitic chancre," and refers to an officer who had a tooth extracted by a civilian dentist in Porto Rico. Some two weeks later an ulcer appeared at the site of extraction. An immediate Wassermann test was negative, but two months later was strongly positive. There were no signs of genital infection. Such infections with dirty dental instruments must be rare nowadays.

444. Polypoid Form of Tonsillar Chancre.

G. PORTMANN (*Paris méd.*, February 28th, 1920) describes a new form of tonsillar chancre. The tonsil is moderately enlarged and shows an extensive but shallow ulcer almost on a level with the surrounding tissue, its floor being the site of more or less developed polypoid growths.

445. Salvarsan Treatment of Syphilis.

FABRY (*Med. Klinik*, November 23rd, 1920) states that the arsenical compounds, "silver salvarsan" and salvarsan sulphoxylate, recently introduced by Kolle, represent a decided progress in the treatment of syphilis. By the use of silver salvarsan, described as the most powerful spirillicidal arsenical compound known, it is possible to reduce considerably the dose of arsenic, owing to the presence of the antisiphilitic silver constituent. The characteristic feature of salvarsan sulphoxylate, which is a convenient preparation of salvarsan in a soluble form, is that it remains for a long time in the body. Hence it is specially suited for chronic intermittent treatment and for the treatment of syphilis without symptoms. In view of the fact that a Wassermann reaction which is positive at the end of a salvarsan course may sooner or later become negative spontaneously, Fabry recommends that patients who have undergone a long and energetic treatment should have considerable periods of rest, during which the reaction should be frequently examined: in other words, the treatment should not be continued blindly.

446. Gradenigo's Syndrome.

E. H. WHITE (*Amer. Journ. Med. Sci.*, February, 1920) reports two cases of paralysis of the sixth cranial nerve due to acute otitis, and gives a synopsis of the description provided by Gradenigo, who has collected 57 cases, and explains the syndrome on the hypothesis of a localized meningitis from extension of the middle-ear suppuration through atypical pneumatic cells connected with the region of the Eustachian tube and extending more or less completely to the tip of the pyramid. The characteristic features of the syndrome are acute suppurative otitis, usually with retention of pus, either partial or complete, in the middle ear; severe pain in the temporal and parietal regions; and sixth nerve paralysis occurring suddenly and usually from three to six weeks after the onset. The 57 cases were divided into three groups: (1) 24 cases without any complication, except perhaps more or less inflammation of the mastoid—these cases ran a favourable course; (2) 29 cases complicated by other lesions, such as facial paralysis, labyrinth irritation, or optic neuritis; and (3) 4 cases in which, in addition to the lesions in the second category, there was fatal meningitis.

447. Primary Suture in Brain Wounds.

SPEAKING at a meeting of the Nordisk kirurgisk Forening in Christiania, R. BÅRANY (*Tidsskrift for den Norske Lægeforening*, November 1st, 1919) referred to his experiences in Przenysl during one of the sieges. At first he treated all wounds of the brain by the open method. Although all but one of his cases of abscess healed, the ultimate results were disappointing, and 30 out of 39 cases terminated fatally. Then he adopted the method of excision, thorough cleansing of the wound, and primary suture in every case of less than twenty-four hours' standing. Of 16 cases thus treated, 12 healed by first intention; the remaining 4 terminated fatally. He calculates that this method improves the ultimate results by 60 per cent., as compared with the open method. The saving effected in time, nursing, dressings, etc., is also enormous.

448. Haemorrhage in Urethral Stricture.

ACCORDING to A. PASTEAU (*Journ. de méd. et de chir. prat.*, March 10th, 1920), haemorrhage in the course of urethral stricture may occur (1) apart from any examination, (2) during or after intraurethral exploration. Spontaneous haemorrhage is very rare and slight in amount. It may take place either at the end of micturition, when it is due to cystitis, or at the commencement of the act, when it is due to urethritis. Haemorrhage during or after intraurethral exploration is much more frequent and may occur after a simple examination, after dilatation, or after a more serious operation, such as urethrotomy.

449. Treatment of Parotid Fistula by Resection of the Auriculo-temporal Nerve.

H. DE STELLA (*Le Scalpel*, March 6th, 1920) reports a case of parotid fistula following an operation on suppurating and caseous glands in the parotid region. After other methods had failed, de Stella resected the auriculo-temporal nerve. On the second day the salivary secretion was decidedly diminished, and about four weeks after the operation the fistula was closed. A similar case is reported by R. Villar (vide *Epitome*, February 7th, 1920, p. 22). The success of the operation is to be explained as follows: The auriculo-temporal nerve supplies the parotid gland with secretory fibres from the otic ganglion, to which they have been brought by the glosso-pharyngeal nerve via Jacobson's nerve and the lesser superficial petrosal. Resection of the nerve causes an arrest of the salivary secretion for a period sufficiently long to allow cicatrization of the fistula.

OBSTETRICS AND GYNAECOLOGY.

450. Ectopic Pregnancy.

STEIN (*Medical Record*, March 20th, 1920) records 43 operation cases, with 2 deaths. Sixty-eight per cent. occurred in multiparæ; in the great majority there had been no lengthy period of antecedent sterility. Infection played little part in the etiology. A correct diagnosis was made in 60 per cent. of cases; in 12 out of 43 there had been no cessation of menses; in 13 cases during the few preceding days vomiting had occurred—probably a concomitant of shock; the blood picture was not significant except in frankly haemorrhagic cases. Enlargement and softening of the uterus and cervix were detected in 11 cases; the mass felt was rarely sausage-shaped, usually tender and not movable. After rupture or tubal abortion occurred a peculiar boggy crepitating condition could be felt, difficult of description, but absolutely characteristic of the presence of free blood in the peritoneal cavity. In 32 cases bilateral salpingectomy was performed; in 9 cases unilateral excision. Posterior colpotomy was done on three occasions, twice for diagnosis, once for treatment. Stein believes that every patient who has missed her regular period should be examined for and suspected of ectopic pregnancy. Operative intervention should be undertaken as soon as the diagnosis is verified, whether the tube is ruptured or not.

451. Causes of Puerperal Septicæmia.

D. BERRY HART (*Edin. Med. Journ.*, April, 1920) quotes figures to show that the death rate per thousand from puerperal septicæmia was, in England, 1.39 in 1911-14, as compared with 2.56 in 1881-90. Considering the advances made in treatment, this is not a remarkable fall from Boër's statistics of 8.4 per 1,000 (Vienna, 1822). While conceding that much of the present mortality is due to imperfect asepsis and antiseptics, Berry Hart believes that the remaining cases may be traced chiefly to the general employment of Credé's method of expulsion of the placenta during the third stage of labour. This leads to retention in the uterine cavity of fragments of unseparated placenta and membrane, which form a nidus for bacterial growth.

452. Accidental Perforation of the Uterus.

FRANKENSTEIN (*Zentralbl. für Gyn.*, March 13th, 1920) advises immediate laparotomy after accidental perforation of the uterus, even by an aseptic instrument during curetting. This advice, admittedly opposed to the usual teaching, is based on the consideration of one case. A primipara of 27 consulted a physician, who, in passing a sound, caused an accidental perforation of the uterus. No untoward consequences occurred during the ensuing fourteen days' rest in bed, but during the next two months there were severe attacks of abdominal pain and vomiting. X-ray examination showed an obstruction in the small intestine. After a month's trial of conservative

treatment laparotomy was performed: Douglas's pouch was found to be occupied by adherent coils of the small bowel, which at one point showed an acute kink and firm adhesions to the pelvic floor and rectum. Resection of 10 cm. was performed; the adnexa showed inflammatory changes, but were left intact. The patient was well a month later.

PATHOLOGY.

453.

The Colloidal Gold Reaction

WARWICK and NIXON (*Arch. Int. Med.*, 1920, xxx, No. 2), who have employed Lange's "gold-sol" test in a large series of cases, agree with numerous other workers in America in regarding it as the most important reaction in routine examinations of cerebro-spinal fluid. Not only is it of value in syphilitic affections of the nervous system, but in the diagnosis of meningitis, disseminated sclerosis, myelitis, and brain tumours; it also furnishes important information such as is given by no other single test of spinal fluid. In the authors' cases parallel examinations were made of the cell count, globulin estimation, and Wassermann reaction. No alteration occurred in colloidal gold in the presence of spinal fluid if there was no syphilis and no involvement of the nervous system. All cases of general paralysis and tabo-paresis gave typical "paretic" reactions. In 74 cases of tabes the gold test was found to be the most valuable of all the spinal fluid reactions; in 9 cases it gave positive results when the other tests were negative, and in other 7 cases where only one other test was positive. Early cases gave well marked curves, but in 13 per cent. of clinically definite cases the reaction was negative. In cerebro-spinal syphilis 85 per cent. of the cases gave positive reactions, whilst only 48 per cent. showed a positive Wassermann reaction. Of the conditions other than syphilis and meningitis which gave well marked curves, disseminated sclerosis was the commonest; 55 per cent. of the authors' cases showed reactions either in the paretic or luetic zones, most frequently in the latter. Amongst 240 miscellaneous cases tested a few reactions were obtained in cases of syphilis. The paper is accompanied by a useful bibliography and a summary of previous work.

454. KELLFERT (*Amer. Journ. Med. Sci.*, 1920, elix, No. 2) says that with scrupulous attention to cleanliness of apparatus there is no difficulty in preparing suitable samples of colloidal gold. Slightly opalescent samples give more pronounced curves than perfectly clear red solutions. The curves found in tabes and in tuberculous and syphilitic meningitis agreed with those given by other workers. There appeared to be a distinct correspondence between the globulin content of the spinal fluid and the degree of reaction with the gold test. In syphilis the latter provided positive results in 6 per cent. of cases in which the Wassermann reaction was negative though clinically syphilis was evident. Correct readings were obtained in 88 per cent. of cases of tuberculous meningitis, and in 80 per cent. of cases of acute meningitis. The reaction was found very useful in distinguishing between (1) tuberculous meningitis, and (2) poliomyelitis in children and syphilis in adults. Contamination of normal spinal fluids with blood produced luetic reactions, and so confused the interpretation of the results. The author regards the colloidal gold reaction as a most useful confirmatory reaction, of greatest value in syphilitic lesions of the nervous system, and of considerable importance in differentiating tuberculous from other forms of meningitis. The reaction has not yet been extensively employed in this country by neuropathologists, though the American reports would seem to warrant a thorough trial.

455.

The Virus of Encephalitis Lethargica.

LEVADITI and HARVIER (*C. R. Soc. Biol.*, No. 11, March, 1920) inoculated an emulsion of the brain of a patient who died with the typical lesions of encephalitis lethargica into a monkey and two rabbits. One of the rabbits injected intracerebrally died on the eighth day with the symptoms and lesions of encephalitis (mononuclear meningitis, perivascular collections, and polymorphonuclear infiltration of the cortex). The monkey did not develop the disease. Once in possession of a virus active for the rabbit the authors were enabled to study its characters. It was found that the virus could be preserved through regular passages in the rabbit. It became a *virus fixe* producing death in these animals on the fourth, fifth, or sixth day, with symptoms of torpor, myoclonus, and meningeal irritation, and with the typical lesions of

encephalitis. After seven passages in the rabbit the virus became pathogenic for monkeys. The virus cannot be cultivated by ordinary methods; it retains its properties in glycerin; it is easily filtrable through Chamberland bougies. It may be inoculated into the rabbit either by the cerebral route or by the peripheral nerves. Subcutaneous inoculation is without effect. The virus is different from that of poliomyelitis, which is not pathogenic to rabbits.

In a subsequent communication to the Society (*C. R. Soc. Biol.*, No. 12, 1920) the same authors showed that the virus injected into the anterior chamber of the eye caused death after an incubation period of seven days with typical lesions of encephalitis. The guinea-pig also was sensitive to the virus, but the incubation period seemed to be longer. The authors mixed an emulsion of the virulent brains of the rabbits with equal parts of serum from convalescent patients, but were unable to find any evidence of neutralization of the virus.

456.

Kaposi's Sarcoma.

COLE and CRUMP (*Arch. Derm. and Syph.*, March, 1920), in reporting the clinical and histological details of two cases of the so-called idiopathic haemorrhagic sarcoma of Kaposi, one of which developed a lymphatic leukaemia in the course of the disease, record their attempts at transmitting the disease to animals. Justus in 1912 claimed to have produced multiple Kaposi lesions in a mouse by the injection of an emulsion made from the growing area of a case of the disease, and to have transmitted the disease through five generations of mice. Cole and Crump emulsified portions of tissue removed from their cases by grinding with sand and injecting the suspension into rats, guinea-pigs, rabbits, and cats. Transplants of tissue were also introduced subcutaneously, intraperitoneally, and into the testicle, but in no case was there the slightest trace of the disease in these animals. Confirmation of Justus's experiments is thus still lacking. Though the lesions of the disease are histologically unusual, Kaposi's sarcoma is probably an infectious granuloma, but experimental proof is much needed.

457.

Haemorrhagic Encephalitis in Influenza.

HANSTEEN (*Norsk Magazin for Laegevidenskaben*, February, 1920), who performed 250 necropsies on the subjects of influenza, found in six cases punctiform haemorrhages in the brain, indicative of the haemorrhagic encephalitis reported by German pathologists as a comparatively common sequel to influenza. In two of his cases these haemorrhages were very slight and were limited to the white matter of the brain, but in three cases they were numerous and were found also in the central ganglia and in the walls of the lateral ventricles.

458.

Comparative Investigations on the Wassermann Reaction in the Blood and Urine.

C. SIMON (*Bull. Soc. Franc. de Derm. et de Syph.*, January 8th, 1920) investigated the Wassermann reaction in the blood and urine of 166 syphilitic patients and of 35 non-syphilitic controls, and came to the following conclusions: (1) The urine of syphilitic patients, even when not albuminous, may yield a positive Wassermann reaction. (2) The reaction is not affected by the acidity or alkalinity, or hypotonic, isotonic, or hypertonic character of the urine, or the presence or absence of albumin. The quantity alone may have an influence, because the urine may contain non-specific anticomplemental substances. (3) The reaction appears late in the urine. It is usually negative in the primary stage, rarely positive in the secondary stage, and is most frequently positive in the tertiary stage or in hereditary syphilis. (4) In a little more than half the cases the result of the reaction is the same in the blood and in the urine. But in other cases the reaction may be positive in the blood and negative in the urine, or vice versa. In the majority of cases in which a difference is present the reaction is positive in the blood and negative in the urine, but in about one-fifth of the cases the reverse holds good. (5) This discordance, which is similar to that occurring between the blood and cerebro-spinal fluid, is difficult to explain in view of the close relationship between the blood and urine on the one hand, and on the other hand of the absence of renal alterations in most of the cases in which the reaction is positive in the urine only. (6) The discordance may have the same results from the diagnostic and therapeutic standpoint as in the cases of differences in the reaction in the blood and cerebro-spinal fluid. The Wassermann reaction should therefore be investigated in the urine as well as in the blood and cerebro-spinal fluid.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

459. Acute Myoclonic Encephalitis.

SICARD and KUDELSKI (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, January 29th, 1920) have recently observed 4 cases of acute encephalitis characterized (at their onset) by severe generalized shooting pains and a slight rise of temperature, and (at their height) by short rapid muscular jerks of the myoclonic type, affecting both upper and lower limbs as well as the face and diaphragm, with insomnia but without any ocular symptoms or modification of objective sensibility. The reflexes and sphincters were normal. The condition closely resembled Dubini's "electric" chorea. The cerebro-spinal fluid remained normal apart from a slight lymphocytosis and increase of albumin towards the close. The prognosis appeared to be very grave, as three of the four cases succumbed. The autopsy showed cerebral oedema, meningeal congestion, and inflammation of the choroid plexuses. In the subsequent discussion Netter expressed the opinion that these cases were due to the same cause as lethargic encephalitis; the symptoms were the result of the localization of the virus. In the following issue of the *Bulletin* the same authors recorded two fresh cases of the myoclonic type. In the first case the myoclonus was confined to the face and upper limbs, and was accompanied by a paresis of the extensor muscles of the arms, which was sometimes more marked on the right and sometimes on the left. In the second case the myoclonic jerks, which had been preceded by severe pain in the limbs, were most marked in the diaphragmatic and abdominal region. Both cases recovered. The syndrome was distinguished from lethargic encephalitis by the absence of lethargy and ocular symptoms. In the subsequent discussion Carnot and Gardin reported a case of progressive ascending myoclonus in a man aged 19, which began in the lower limbs, invaded the abdomen with paralysis of the bladder, then the upper limbs, and finally the face. There were labial herpes and pulmonary hepatization. Death took place after seventeen days' illness. The autopsy showed gross lesions of the nerve cells in the cortex and medulla, and extensive thrombosis of the meningeal veins, which extended to a large part of the spinal cord.

460. Epidemic Encephalitis Simulating Acute Abdominal Disease.

C. MASSARI (*Wien. klin. Woch.*, March 4th, 1920) has observed six cases of epidemic encephalitis in which the clinical picture was at first dominated by abdominal symptoms. Several of these cases were sent to hospital as abdominal emergencies requiring immediate operation, and in one case laparotomy was performed in order to relieve acute intestinal obstruction. Parts of the small and large intestine were found in a state of maximum contraction, and the circumference of the contracted small intestine was reduced to that of the little finger. The contracted sections of the intestine were very pale; the sigmoid flexure was almost white. The patient died five days after the operation, and the necropsy showed pneumonia and numerous punctiform haemorrhages into the brain. Discussing the differential diagnosis in such cases, the author draws attention to the curious flushed condition of the patient's face, the bradycardia, the comparatively low temperature, and the short interval between abdominal palpation and the response of pain. In true peritonitis palpation provokes instant pain. The author refers to a recent paper by Dimitz, who has noticed that an early sign of epidemic encephalitis may be twitching of the diaphragmatic and abdominal muscles, accompanied by severe abdominal pain.

461. Involuntary Movements following Influenza and Lethargic Encephalitis.

P. MARIE and G. LÉVY (*La Médecine*, February, 1920) record fifteen cases following influenza or lethargic encephalitis characterized by involuntary movements of the limbs, trunk, or face, which varied from one patient to another, but nevertheless preserved distinct resemblances. The phenomena were unilateral or bilateral, and consisted of choreiform movements, rhythmical convulsions, or a fine tremor resembling that of paralysis agitans. The autopsy showed lesions in the cerebral

peduncles, especially in the locus niger, similar to those found in cases of lethargic encephalitis.

462. Lethargic Encephalitis with Relapse.

SICARD and KUDELSKI (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, January 29th, 1920) record a case in a woman, aged 20, who presented typical symptoms of lethargic encephalitis which disappeared in a fortnight's time. Ten days later the somnolence and diplopia re-appeared, accompanied by paralysis of the Millard-Gubler type. The syndrome changed from one side to the other, the crossed paralysis being first localized in the right mesencephalon and then in the left. Complete recovery took place in about three months. No changes were observed in the cerebro-spinal fluid.

463. Meningeal Symptoms and Lethargic Encephalitis.

II. CLAUDE (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, January 29th, 1920) records three cases with meningeal symptoms and narcolepsy, which were of interest, first, on account of their rapid and mild course, and secondly, because they formed intermediate types between meningitis and lethargic encephalitis. Two of the cases developed meningeal symptoms and spinal rigidity, Kernig's sign, retention of urine, diminution of the reflexes, and excess of albumin and lymphocytes in the cerebro-spinal fluid. After a short febrile period recovery took place apart from slight atrophy, somnolence, and nuchal rigidity, which persisted. In the third case the disease began with headache, external strabismus, and inequality of the pupils, followed by somnolence. The cerebro-spinal fluid showed a great increase in albumin and cells. Subsequently slight spinal and nuchal rigidity developed. Gradual improvement took place, but a tendency to somnolence persisted.

464. Treatment of Lethargic Encephalitis.

PIERFRANCESCO (*Rif. Med.*, February 7th, 1920) reports 10 cases seen by him. The ages varied from 15 to 64. The incubation period varied from a few hours to five or six days, and in the majority of the cases presented influenza-like symptoms. In 2 cases the first symptom was diplopia, and in 2 others general choreiform movements. Somnolence usually appeared in the first week and lasted from a few days to several weeks—in 3 cases it failed altogether. Diplopia was present in 6 cases. The left elevator palpebralis was paretic in 5 cases, the right in 2. More or less marked paresis of the left facial nerve was noted in 6 cases. In one rapidly fatal case there was paralysis of the twelfth nerve. Where paralysis of the extrinsic muscles of the eye was present there was nearly always some affection of the external recti. True symptoms of meningeal irritation were never seen. Myoclonus and static tremor of the upper limbs was noted in 5 cases and 4 showed dynamic ataxia. The reflexes were abolished in 4 cases, normal in 3, rather active in 3. The pupils in 5 cases were small, in 3 dilated, and in 3 normal. No changes were seen in the fundus. Dermographism was marked in 4 cases, slight in 3. Lumbar puncture gave a clear fluid six times, the fluid was haemorrhagic twice, and in 2 cases the liquid had a dichroic appearance. In 6 cases it issued under weak pressure and in 4 cases under high pressure. The pulse and temperature were not specially characteristic. Death occurred in 6 of the cases—in 3 due to bronchopneumonia, in 2 from coma, and in 1 quite suddenly. Lumbar puncture, injections of colloidal silver, antistreptococcal serum, or phenol all gave equivocal results, but some advantage seemed to be gained from repeated hypodermic injection of iodine in small doses. Attempts to find the causative agent were not very successful, but in 1 case an organism was isolated a Gram-resistant diplococcus with rounded ends and a tendency to group in small chains of six or eight. J. SABRAZÈS and C. MASSIAS (*Gaz. hebdomadaire des Sci. Méd. de Bordeaux*, February 22nd, 1920) have successfully treated two cases of lethargic encephalitis by intraspinal injection of serum from patients convalescent from the disease. The first case, a youth aged 17, was given 35 c.c.m. of serum which had been taken from his father. The second patient, aged 23, when *in extremis* received an intrathecal injection of 20 c.c.m. of blood taken from the first case and two intraspinal injections of 40 c.c.m. of serum from the same source. Rapid recovery took place in both cases.

465. An Epidemic of Hiccough.

G. GOTTI (*Gior. di Clin. Med.*, March, 1920) records an outbreak of 7 cases of hiccough occurring near Ravenna. It appeared to be related to lethargic encephalitis for the following reasons: (1) The simultaneous occurrence of the two outbreaks; (2) their epidemiological character; (3) the presence in many cases of encephalitis of clonus of individual muscles comparable to the clonus of the diaphragm which characterized the outbreak of hiccough. The duration of the hiccough was three to four days on the average; in a few seven to eight days. It did not seem to be affected by sedatives, purgatives, or strict diet, but disappeared spontaneously without leaving after-effects of any kind.

466. Weakness of the Right Facial Nerve in Epileptics.

L. RONCORONI (*Il Policlinico*, Sez. Prat., January 3rd, 1920) has observed that a weakness of the lower division of the right facial nerve is a common occurrence in epileptics. The sign is best demonstrated by making the patient open his lips while keeping the teeth closed. It will then be found that the right labial commissure is less widely open than its fellow, the angle of the mouth more depressed and the naso-labial fold less distinct. The condition is not a true paresis but merely a diminution of functional energy. It occurs not only in fully developed cases of convulsive epilepsy but also in *petit mal*. It is often associated with left-handedness. Both phenomena may be attributed to abnormal action of the left cerebral hemisphere, which being the more highly developed is more susceptible to hereditary morbid influences such as occur in epilepsy.

467. Facial Paralysis in Influenza.

A. POROT and N. SENGÈS (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, January 29th, 1920) record 3 cases of facial paralysis in soldiers in connexion with influenza. In 2 the complication occurred during the acute stage and was of short duration; in the third it developed a week after the temperature became normal, but had not entirely disappeared eight months after the onset. As regards predisposing causes, one patient had had signs of tuberculosis the year before and some pain in the ear. The second had had actual otorrhoea two years previously, but on the opposite side to the facial paralysis; the Wassermann reaction was positive in the cerebro-spinal fluid, but there was no other evidence of syphilis. The third patient was a neuropathic subject, so that all the cases might be regarded as having a diminished general or local nervous resistance. But the complication was mainly due to an extension of the nasopharyngeal catarrh to the facial nerve via the Eustachian tube. Facial paralysis may thus be regarded as a local complication of influenza, which explains why it was less rarely met with than other affections of the peripheral nerves.

468. Influenza and Pulmonary Tuberculosis.

In a paper based on the study of 150 cases of pulmonary tuberculosis and 210 cases of influenza between December, 1918, and July, 1919, at the Sandhof Municipal Hospital at Frankfurt a. M., W. AMELUNG (*Muench. med. Woch.*, November 14th, 1919) comes to the following conclusions: The incidence of influenza among patients with pulmonary tuberculosis is slight. Only fifteen of Amelung's tuberculosis patients contracted influenza. The course of influenza is milder, especially in cases of slight tuberculosis than in the non-tuberculous. Persons who had formerly had no lung disease may develop pulmonary tuberculosis as a sequel of influenza, and in such cases the coincidence of the two diseases has a relatively unfavourable prognosis. The theoretical explanation of this action of the two diseases upon each other is that the tuberculous organism is in a state of constant defence, whereas the healthy organism succumbs to the sudden attack.

469. Primary Cancer of the Lung.

ROUBIER and BRETTE (*Lyon méd.*, January 10th, 1920) report the case of a syphilitic man, aged 51, who presented the following symptoms: (1) A mediastinal reaction shown by oedema of the face and arms, intermittent dysphagia, and dyspnoea without hoarseness. The apex beat was in the nipple line and the two pulses were equal. (2) Considerable enlargement of the liver with jaundice. (3) Dullness of the right pectoral region, due partly to a sero-fibrinous effusion, but mainly to a large non-pulsating mass sharply defined on radioscopy in the right side of the thorax. (4) A hard mass palpable in the supraclavicular fossa,

which did not appear to be a gland but a prolongation upwards of the thoracic tumour. At the necropsy a large tumour was found formed by the upper lobe of the right lung, and a mass involving all the mediastinal organs. A similar tumour was found in the pancreas compressing the bile ducts. The diagnosis of aneurysm was at first suggested during life, but the presence of a supraclavicular mass on the right side was in favour of mediastinal cancer. The signs in the mediastinum predominated over those in the lungs, as is characteristic of the mediastinal form of primary cancer of the lung. The jaundice might be attributed to arsenical treatment, rather than to compression of the bile ducts by a pancreatic nodule. Histologically the growth was an atypical epithelioma.

SURGERY.**470. Statistics of Parrot's Pseudo-paralysis.**

S. DE STEFANO (*La Pediatria*, February 15th, 1920) records 35 cases of Parrot's pseudo-paralysis: 18 were in males and 17 in females. The ages at which the condition began ranged from birth to 2½ months, 34.3 per cent. being found in the second half of the second month. In 9 cases the onset had not been determined as regards the family history; in 20 cases syphilitic infection of the parents was more or less certain: in 7 cases there had been one or more abortions, and in 7 cases only there was nothing suggestive of syphilis in the family history. Both upper limbs were affected in 15 cases, the right upper limb in 6, the left upper limb in 6, both lower limbs in 3, the upper and lower limbs in 4, and the left upper and lower limb in 1. In all but 7 cases other signs of congenital syphilis were present, especially rhinitis, enlargement of the spleen, and condylomata. The Wassermann reaction, which was tested in 23 cases, was positive in 16 and negative in 6, but in two of the latter the Luetin test was positive. As regards the issue of the cases, 17 were lost sight of; of the remaining 18, 4 showed considerable improvement and 14 made a complete recovery.

471. Acute Appendicitis with Ileo-caecal Ectopia.

CORNIOLEY (*Rev. méd. de la Suisse rom.*, February, 1920) records a case, in a boy aged 9, who presented all the signs and symptoms of acute appendicitis including tenderness at McBurney's point. On laparotomy the caecum was not in its usual position, but was found beneath the liver where it represented the whole of the ascending colon. Curled up beneath it was an inflamed appendix, which was removed. Ectopia of the caecum is not very rare. Sometimes it may be situated in the pelvic cavity, or, on the other hand, in the lumbar, perirenal, or subhepatic areas, as in the present case. All these positions indicate an excess or arrest of movement of this organ in fetal life or in the first few years of extrauterine existence. The occurrence of tenderness at McBurney's point and its absence in the subhepatic region are explained by supposing the existence of a cutaneous area supplied by a spinal segment in which the sensory nerves of a definite part of the alimentary canal terminate.

472. Rhinoscleroma in Egypt.

ACCORDING to JOANNOVICH and MARASPINI (*Presse méd. d'Egypte*, March 1st, 1920), who report a case of ten years' standing in a woman aged 42, rhinoscleroma is endemic in Egypt, though it is probably often mistaken for some other condition. The onset is insidious, the affection usually starting in the nasal fossae and still more frequently at the choanae. It remains confined to the nasal fossae and nasopharynx for one or two years before it becomes manifested by a deformity of the external part of the nose. At an advanced stage, as in the writers' case, ulceration occurs; this is contrary to what has been stated by others. The symptoms at first consist of a diminution of the nasal airway, and later nasal obstruction may be complete. The interference with respiration increases as the disease extends towards the nasopharynx, later to the oropharynx, larynx, and finally to the trachea and bronchi. When the pharynx is invaded swallowing is painful, especially in the case of alcoholic and acid drinks. The nasal secretion becomes mucopurulent and offensive. On examination in the early stage there is a diffuse infiltration of the pillars, uvula, and soft palate. At a later stage the nose becomes larger and presents projections, and finally the process invades the upper lip, cheeks, and lower lids. The duration of the disease is indefinite, and no treatment is of any avail.

473. Early Gastric Cancer and Generalized Pulmonary Cancerous Lymphangitis.

G. TURRETTINI and I. GERBER (*Rev. méd. de la Suisse rom.*, March, 1920) record a case of gastric cancer in a woman, aged 30, which was remarkable in that it never caused pain or vomiting except during a period of jaundice. The tumour was only manifested clinically by thrombosis of the right innominate vein and internal jugular vein, which gave rise to considerable oedema of the face and arm. A few days before death the patient was suddenly seized with progressive dyspnoea; there were definite signs in the lungs. The autopsy showed carcinoma of the stomach, generalized carcinoma of the pulmonary lymphatics and lungs, and thrombosis of the superior vena cava and internal jugular vein.

474. Some Clinical Forms of Pulmonary Hydatid Cysts.

GREYX (*Journ. de méd. de Bordeaux*, March 25th, 1920) draws attention to the protean nature of the symptoms of hydatid disease of the lungs, and records six illustrative cases. In the first case the disease was entirely latent, a large cyst being found at the necropsy on a fatal case of osteomyelitis. The second case, which recovered, resembled one of acute tuberculosis with haemoptysis. In the third case pleurisy with effusion was simulated; rupture of the cyst followed thoracocentesis; after threatened asphyxia recovery took place. The fourth case simulated an intrathoracic tumour; recovery followed an operation in which a cystic cavity in the lung substance was opened and drained. In the last two cases the cysts gave rise to pulmonary suppuration. One recovered after thoracotomy; in the other death was due to cerebral abscess and streptococcal meningitis. At the autopsy cysts were found in the left lung, liver, and sacro-lumbar muscles.

475. Injections of Cow's Milk in Eye Diseases.

ACCORDING to S. G. MANSILLA (*Rev. de med. y cir. pract.*, December 14th, 1919), injection of cow's milk was introduced by Müller and Thanner of Vienna in 1916 not only for the treatment of ocular disease but for various general infections, such as influenza, bronchopneumonia, acute rheumatism, etc. As regards eye diseases, injection of sterilized cow's milk has been used in acute iritis, infective corneal ulcers, post-operative infections, trachoma, and eczematous keratitis. In addition to the Viennese writers already mentioned, favourable results have been obtained by Dimmer, Domec, Darier, Walther, and others. The injections have been in some cases intravenous, in others subconjunctival. Mansilla records six cases treated by intraglaucomal injections; five were examples of traumatic or spontaneous corneal infections accompanied by iritis and hypopyon, and one was an instance of lymphatic vascular keratitis. In the last case no improvement was observed, and in the five cases of corneal infection the improvement was marked in three, and less marked in two. The improvement is attributed by Müller to an increase in the hyperaemia and transudation into the inflammatory focus. The action of cow's milk is analogous to the "paraspecific" action of antiphtheritic serum which Darier recommends in the treatment of acute infections of the eye, but the serum is preferable, as its injection does not cause any fever. On the other hand, sterilized cow's milk is always available, which is not the case with serum, especially in small villages. Moreover, milk can be used in cases in which anaphylaxis is likely to occur owing to the previous injection of serum. The injection of milk causes only slight pain, but four or five hours later there is a rise of temperature for ten to twelve hours. Improvement usually occurs after the second injection, and it is unnecessary to give more than six injections, the doses varying from 2 to 5 c.c.m.

476. Thrombo-phlebitis of the Upper Limb.

ACCORDING to F. M. CADENAT (*Paris méd.*, March 27th, 1920), who has collected 24 cases from literature, thrombo-phlebitis of the upper limb is rare. It is manifested by a syndrome analogous to phlegmasia caerulea dolens of the lower limb, but, unlike it, is most frequently situated on the right side. It varies in duration from fifteen days to several months. As a rule it terminates by complete restoration of the function of the limb, and embolism has never been noted as a complication. The pathogenesis is not yet settled. Apart from phlebitis due to the extension of a local infection of the upper limb, it may be observed as the result of a violent effort or of thoracic traumatism. Thrombosis due to effort is probably caused by injury to the internal coat of the vein giving rise to coagulation of the blood, the circulation of which is already slowed by the forced expiration characteristic of effort. Thrombo-

phlebitis of thoracic origin is probably secondary to a pleural infection. A number of cases of apparently spontaneous thrombo-phlebitis are due to a syphilitic lesion of the vein. The treatment consists in immobilization and suspension of the arm, followed by massage and mobilization after the third week.

477. Chancre of the Little Finger.

L. QUEYRAT (*Bull. Soc. d. Derm. et de Syph.*, January 22nd, 1920) records a case in a girl aged 18, who presented an extensive syphilitic eruption and mucous tubercles on the palate and vulva. No trace of a chancre could be found until it was noticed that the patient had a dressing on her little finger, on examination of which a small primary lesion was found on the palmar aspect at the second interphalangeal joint. The patient had cut her finger with a mandoline string, and before it healed had contaminated the wound.

OBSTETRICS AND GYNAECOLOGY.**478. Blood Transfusion in Obstetrics.**

LOOSEE (*Med. Record*, January 14th, 1920) records thirty-nine cases, with three deaths, of blood transfusion for acute haemorrhage—for example, placenta praevia, post-partum haemorrhage, ruptured ectopic gestation—and twenty-nine transfusions with no deaths for anaemia secondary to post-partum haemorrhage, with localized pelvic sepsis. The blood was usually obtained from professional donors, a list of whom (grouped according to their isohaemolysin and isoagglutinin reactions) has been kept for three years and is consulted when an emergency arises. If a donor of the same group as the patient could not be secured, the injection of blood from a Group 4 subject was found to be harmless. The donors were subjected to periodic Wassermann and agglutinin tests; the latter (and if time permitted the former) was repeated immediately before the transfusion, which sometimes amounted to 1,000 c.c.m. Unmodified blood was employed in preference to citrated. The successful results included cases in which, when the transfusion was begun, no heart sounds were audible, respirations were as few as six per minute, and the median basilic vein was empty. Loosee believes that many lives were saved which would otherwise have been lost, and says that obstetric institutions should be prepared to perform the operation instantly and at any time.

479. Rupture of the Rectum during Labour.

DORSETT (*Surg., Gyn. and Obstet.*, March, 1920) reports a case of this exceedingly rare occurrence. The patient, aged 37, was admitted to hospital in a condition of profound shock thirty hours after a low forceps operation had led to delivery, which had been immediately followed by severe pain in the left side. The abdomen was tympanitic except over the uterus, and so greatly distended that the skin was torn at several places. Vaginal and rectal examination failed to reveal anything other than the conditions usual after delivery, and twelve hours after admission the patient died. Pyrexia was present. The *post-mortem* examination showed acute diffuse fibrinous peritonitis and a rupture of the rectum at its junction with the sigmoid. Inside the rectum was an old (syphilitic) stricture.

480. Pelvic Septic Phlebitis.

NYULASY (*Surg., Gyn., and Obstet.*, March, 1920) states that the majority of fatal cases of puerperal infection fundamentally associated with the interior of the uterus have shown pelvic septic phlebitis, so that the importance of any surgical measure calculated to diminish the mortality from this cause cannot be too much appreciated. In cases with recurring rigors, in which the thrombosed veins can be palpated, excision or ligation of the infected veins had occasionally given good results. But in most cases such an extraperitoneal lesion is not discoverable. If in a case of puerperal infection connected with intrauterine disease such as polypoid decidua endometritis the polypoid decidua and any adherent placenta be removed from the subinvolved uterus at an early stage wherein fever, quick pulse, haemorrhage, or foul discharge are absent, the patient is practically certain to recover. But if, after some days, the patient continues to deteriorate from puerperal infection, a diagnosis of pelvic septic phlebitis may be arrived at by a process of exclusion. The author thinks that operation in such cases will save many lives, and he has been accustomed to open the abdomen as soon as he arrives at the diagnosis.

PATHOLOGY.

481. Morbid Anatomy of Lethargic Encephalitis.

P. GUIZZETTI (*Giorn. di Clin. Med.*, March, 1920) performed necropsies on 6 cases of encephalitis, aged 17 to 44, whose disease had lasted from six to thirty-five days. Macroscopically the case which died on the sixth day showed haemorrhagic encephalitis of the optic thalami and of the region round the aqueduct of Sylvius. The appearances were those of the polioencephalitis haemorrhagica superior of Wernicke with isolated or grouped punctiform haemorrhages. Two cases showed thrombosis of the posterior part of the superior longitudinal sinus, and in another two cases macroscopical examination of the brain and cord was practically negative. The microscopical changes in the three cases examined were as follows: (1) Collections of lymphocytes and pyronophilous cells in the lymphatic sheaths of the veins; (2) centres of inflammatory infiltration. These lesions were most marked in the mesencephalon, less frequent in the medulla, and rare or entirely absent in the cord. They were pronounced in the optic thalami and pes hippocampi. Endocranial inoculations of rabbits were negative, and cultures of the mesencephalon were inconclusive or negative. As regards the other organs, the rhinopharynx showed hardly any changes, in two cases the tympanic cavity was congested and filled with a clear fluid, and in four cases there was hypostatic pneumonia. In contrast with influenza, which was epidemic at the time, there was never any diffuse tracheo-bronchial inflammation or enlargement of the lymph glands at the bifurcation of the trachea. Sometimes a few pectiniae were found beneath the epicardium. The spleen was normal, and there were no changes of importance in the other organs.

482. The Etiology of Encephalitis Lethargica.

MAGGIORA and MANTOVANI (*Rif. Med.*, January 31st, 1920) found in blood broth cultures a small Gram-positive diplococcus; successive transplantations developed regularly both on human blood-agar and on Lubenau's medium. Cultures of the liquor gave negative results. Guinea-pigs injected with the blood died in five or seven days with symptoms of hypothermia, paresis of limbs, intense somnolence, and muscular tremors. Autopsy showed hyperaemia of all the organs and small punctiform haemorrhages of the brain, especially in the grey matter. In the blood of one animal injected with cerebro-spinal fluid a diplococcus like the one mentioned above was found. In serial passage through the guinea-pig the germ increases in virulence; it is anaerobic and very delicate, requiring special care in culture. It agglutinates in 1 per cent. dilution of the blood serum of the patient from whom it was isolated. It does not agglutinate with normal blood or typhoid blood. The Wassermann reaction was negative.

483. Congenital Absence of One Lung.

C. S. LEVY (*Amer. Journ. Med. Sci.*, February, 1920) records a case of congenital absence of the left lung, left bronchus, left pulmonary artery, and left pulmonary veins in a man aged 49 years. The right lung was very large, completely filling the right pleura and extending medially over the front of the mediastinum into the anterior part of the left hemithorax. The left primary bronchus was represented only by a small blind pouch. There was no left pulmonary artery, but the main trunk gave off three branches to the upper, middle, and lower lobes of the right lung. The left innominate vein opened direct into the right auricle. Among 22 collected cases of absence of one lung, 15 concerned the left and 7 the right lung. In 12 cases death occurred before the age of 1 year, and in 10 cases the age was between 8 and 70 years. In the previously reported cases the chest has been stated to be normal in contour, but in Levy's case it was asymmetrical, the left side being flat.

484. Parathyroid Epilepsy.

A. BISGAARD and J. NÖRYG (*Hospitalstidende*, January 23th, 1920) have carried out a series of investigations on the metabolism of epileptics, with special reference to the ammonia in the blood and the ammonia regulation in the body. They found that whereas the amount of ammonia in the blood in normal individuals is fairly constant, it shows wide ranges in epileptics. Shortly before an attack there may be three times as much ammonia in the blood as in that of the normal person. This rise is demonstrable three hours before an attack, and is very considerable two hours later. It is also demonstrable in what the authors term the "psychic equivalent" of an attack, which may

mature a day later. After comparing the calcium, ammonia, and albumin metabolism of hypoparathyroidism in animals with that of tetany and epilepsy in man, the authors maintain that the points of similarity are so numerous and striking that a convincing case can be made out for looking upon genuine epilepsy as related to faulty function of the parathyroids.

485. The Cerebro-spinal Fluid in Whooping-cough.

G. GENOESE (*Il Policlinico*, Sez. Prat., March 8th, 1920) examined the cerebro-spinal fluid of six whooping-cough patients, aged from 2½ to 6 years, with the following results: In every case it was perfectly clear, under increased pressure, with a normal albumin and chloride content and without a fibrinous reticulum. There was an absence of acetone, Boveri's reaction was negative, and there was no increase in the number of cells. The increase in reducing substances was thought to be mainly due to meningeal congestion caused by the violent and repeated attacks of coughing. Experimentally this view is confirmed by the fact that after spinal anaesthesia with stovaine or cocaine there is an increase in the sugar of the cerebro-spinal fluid without hyperglycaemia. In such cases there is a marked congestion from local irritation without inflammation, just as in whooping-cough, in which there is a disturbance of the cerebral circulation with subsequent stasis.

486. The Protein and Lipin Content of the Blood Serum in Nephritis.

IN normal persons the ratio of serum albumin to serum globulin in the blood serum is from 1.5 to 2:1, and some observers have reported a disturbance of this ratio in chronic nephritis. Freund reported diminution of the globulin, Erben found the serum globulin increased; Epstein, in addition to finding the serum globulin present in the blood serum of patients with chronic parenchymatous nephritis greatly increased, reported the presence of very large amounts of cholesterol. On these data he considers that these cases of parenchymatous nephritis are due to a constitutional disorder of a metabolic or endocrine nature, and that the renal or other manifestations are concomitant or secondary in point of development and importance. He also considers that the loss of protein through the continuous albuminuria causes a decrease in the osmotic pressure and so favours oedema, as does the marked increase in the lipin content of the blood. He therefore advises a diet rich in proteins and poor in fats. M. KAHN (*Arch. Int. Med.*, January, 1920) has examined the blood of 16 cases of chronic parenchymatous nephritis with well-marked oedema and of 7 with slight oedema, and has failed to find any case conforming to Epstein's endocrine nephrosis, which he therefore concludes must be very rare. A diet rich in protein and poor in fats failed to have any effect on oedema, and he considers it a rather risky undertaking. He also concludes that the albumin-globulin ratio in the blood serum is not markedly affected by various diseases.

487. Incidence of Protein Sensitization in the Normal Child.

H. M. BABER (*Amer. Journ. Dis. Child.*, February 9th, 1920) used the following method to determine sensitization. The inner side of the forearm was cleaned with alcohol and ether, and scratches were made two inches apart, the upper scratch serving as a control. One or two drops of protein in normal saline were placed on the scratch and the point of inoculation examined at five-minute intervals for half an hour. Positive reactions consisted of an urticarial wheal surrounded by an irregular area of redness. It was found that the incidence of sensitization in normal children was almost negligible, except in the case of salmon. In children presenting anaphylactic symptoms the articles of diet most commonly causing disturbance were oatmeal, potato, eggs, peas, rice, casein, beef juice, and chicken.

488. Spontaneous Rupture of the Abdominal Aorta.

E. DUHOT, M. PELISSIER, and P. MECQUET (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, February 5th, 1920) record a case in an alcoholic and probably syphilitic man, aged 32, in whom an attack of acute nephritis caused an increase of blood pressure followed by rupture of the abdominal aorta above the origin of the left renal artery. The vessel at this point showed a slight fusiform dilatation, but not of the size or character of a true aneurysm; in the intima were numerous patches of atheroma. Out of 103 cases of rupture of the aorta collected by Martin, in only 4 was the site of the rupture the abdominal aorta.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

489. Pericarditis with Effusion.

IN the absence of friction the diagnosis of pericardial effusion, notably from cardiac dilatation, is difficult. In order to determine the value of the diagnostic physical signs, especially Roteh's sign of dullness in the fifth intercostal space on the right side and Ebstein's view that the first evidence of a pericardial effusion is a rounding of the cardio-hepatic angle which is normally acute, C. S. WILLIAMSON (*Arch. Int. Med.*, February 16th, 1920) undertook an experimental study in thirty-three bodies. The pericardium was injected through the central tendon of the diaphragm with a mixture of gelatin and agar, which was perfectly fluid when warm but became hard in a short time. Careful percussion was carried out, and after twenty-four hours' interval the necropsy was performed so as to determine exactly the outline and position of the pericardium, which was then removed and frozen. The pericardium and heart as a whole, the heart alone, and the exudate alone, were next modelled and photographed. It was then found that the fluid first collects along the lower margin of the heart and about the apex, particularly on the diaphragmatic surface, and displaces the left lobe of the liver downwards. The only alteration in the position of the apex of the heart is a displacement downwards, which, however, is so slight as not to be detected clinically. The second situation in which fluid accumulates is over the great vessels, and the dullness thus produced is an important diagnostic sign. In no instance was there an obtuse cardio-hepatic angle or sufficient dullness in the fifth interspace to be of diagnostic value.

490. Hypertrophic Osteo-arthropathy in Carcinoma of the Pleura.

S. BAYNE-JONES (*Johns Hopkins Hosp. Repts.*, 1919, xviii) records a case in a negro, aged 16 years, whose clinical aspect was that of chronic intrathoracic disease of obscure nature with secondary hypertrophic osteo-arthropathy which began after the onset of the thoracic disease and progressed with it. The physical signs suggested an effusion in the left pleura, but no fluid was ever obtained by paracentesis; the patient had a raised temperature for months, and became much emaciated. The Wassermann and Calmette tests were negative. The necropsy revealed primary carcinoma of the left pleura, forming a large mass and enveloping the whole of the lung like a shell; this growth invaded the left lung, the pericardium, the diaphragm, the capsules of the liver, spleen, and left kidney; there were implantations of growth on the intestines and acute haemorrhagic peritonitis. Microscopically the growth was composed of large epithelial-like cells arranged in an alveolar or tubular manner with intervening fibrous tissue showing hyaline change and haemorrhages in parts. The nomenclature of a tumour arising from the mesothelial epithelium of the pleura is discussed, but the author considers the term "carcinoma" appropriate. The hypertrophic bone changes consisted of a regular deposit of new bone in a layer around all the bones of the skeleton; the layer of new bone was approximately of the same thickness on all the bones of the extremities. The periosteum was outside the most recently formed bone, and therefore apparently took an active part in the process. Microscopically the structure was that of normal bone without any evidence of inflammation, but was described as similar to that of the new bone formed in definite periostitis.

491. Preventive Inoculation against Rabies.

W. HAMBURGER (*Nederl. Tijdschr. v. Geneesk.*, February 18th, 1920) states that in 1919 nineteen persons received preventive inoculation against rabies at the Utrecht Serological Institute. All came from eastern provinces, and as Holland had been free of the disease within recent years it had probably been introduced from Germany. The results of the inoculation had so far been good. Of the 19 cases which had been inoculated from a few hours to twenty-nine days after being bitten none had contracted the disease. Paraplegia and rectal and visceral paralysis, which have been described after anti-rabic inoculation, were not observed.

492. Congenital Pyloric Stenosis.

Il Morgagni (January 15th, 1920), discussing congenital pyloric hypertrophic stenosis, says the only certain sign is the presence of a tumour; repeated examination is sometimes necessary to find the tumour, which often may be felt while the child is being fed, or soon after. It can usually be detected outside the edge of the right rectus, and feels like a marble, easily slipping from under the finger. Visible gastric peristalsis, unless associated with a tumour, is of little value in diagnosis, as it may be due to simple spasm. Vomiting (of the "shot-out" type) is often violent, but the vomit is never tinged with bile. Constipation, with hard small motions, is common. In male children pyloric stenosis and phimosis almost always occur together, but whether the phimosis by causing urethral spasm sets up a reflex pyloric spasm, or whether the two conditions are due to a common cause—for example, changes in the adrenal glands—is uncertain. Attention is directed to the gastric symptoms usually at four to eight weeks. It is much more common in the male than in the female. Spasm plays a large part in the symptomatology, for stenosis has been found *post mortem* when there had been no symptoms during life. If the child is artificially fed the milk should be peptonized, and the stomach washed out with a mild alkaline fluid. For the constipation, enemata are to be preferred to cathartics given by the mouth; males should be circumcised. If medical treatment is unsuccessful in ten or twelve days and the child is wasting, vomiting, and going downhill, surgical procedure is necessary.

493. Rules for Combating Diabetes.

OWING to the importance of early treatment in diabetes, W. HOOGSLAG (*Nederl. Tijdschr. v. Geneesk.*, January 24th, 1920) makes the following proposals: (1) Every family doctor, specialist, and dental surgeon should examine the urine of every patient, irrespective of age, sex, or complaint; (2) whenever a case of diabetes occurs in a family the doctor should insist on examining the urine of each member of the family each year; (3) life insurance societies should make arrangements for each policy-holder to have his urine examined free of charge annually.

494. Abdominal Enlargement in War Prisoners.

GUARINI (*Rif. Med.*, January 10th, 1920) reports 40 cases of "large abdomen" occurring in soldiers who had been badly fed as prisoners of war. There was no marked neuropathic history; when in prison they had suffered severely from gastro-enteritis, due to bad feeding. The chief symptoms now are enlargement of the abdomen, especially in the upper part, inability to do hard work or to walk much, shortness of breath, and constipation. The enlarged abdomen looks very much like that of a woman seven or eight months pregnant, and is very resistant to palpation; on percussion most of the cases show some tympanites. In addition to the abdominal symptoms a good many of the cases have signs of catarrh at the apex and some are definitely tuberculous. Radiological examination shows gastric ptosis and marked meteorism, especially of the colon. Some writers attribute the dyspnoea to partial paresis of the diaphragm, but Guarini can find no evidence of paresis or of spasm of the diaphragm, and points out that a good many of these cases had pulmonary lesions in addition to their gastric troubles.

495. The Syndrome of the Genuiculate Ganglion.

UNDER this title A. SOUQUES (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, February 5th, 1920) describes a rare symptom-complex characterized by herpes zoster of the external ear accompanied by facial paralysis and auditory disturbances on the same side. Several examples of the kind have been reported by J. Ramsay Hunt. The recognition of this syndrome, whether in its complete or incomplete form, that is, as auricular herpes alone or associated with facial paralysis, is of great importance, as it may explain the origin of certain obscure facial paralyses. In such cases, therefore, the possibility of this syndrome should be borne in mind, and the external ear carefully examined. The eruption may be very slight, and escape the notice both of the patient and doctor. Souques is of opinion that the prognosis of this form of facial paralysis is better than that of other forms.

495. Organic Hemiplegia after Poison Gas.

E. TERRIEN (*Paris méd.*, February 14th, 1920) records two cases of this kind. In the first a right hemiplegia developed six weeks after gas poisoning, was incomplete, and cleared up in a few weeks. In the second case complete left hemiplegia occurred three weeks after inhalation of the gas. Hysteria could be excluded in both cases, and the condition was probably due to embolism or arteritis of the Sylvian artery; but whereas in the first case the arterial lesions were slight, giving rise to a transient paralysis similar to that observed in other intoxications, such as Bright's disease and uraemia, in the second case the arterial lesions were more profound, causing necrosis of the corresponding nerve elements and degeneration of the pyramidal tract. The possibility of the hemiplegia being due to a haematoma in the Rolandic area is also suggested.

497. Albuminuria in Tuberculosis.

MAZZOLINI (*Riv. Osped.*, January 15th, 1920) is chiefly concerned with the albuminuria which occurs before the development of pulmonary tuberculosis. About half the cases of albuminuria occurring in tuberculosis are not directly due to tubercle, but to fever, gastric disturbance, or hepatic changes. Permanent albuminuria in tuberculosis without renal disease is very rare, but transitory forms are not uncommon. There is a group, called pretuberculous by Teissier, characterized by a moderate amount of albumin (mostly sero-globulin), often associated with much colouring matter and earthy phosphates, sometimes orthostatic in type, and commonly disappearing when the pulmonary localization has developed. This albuminuria is apt to be recurrent and excited by fresh outbursts of disease. Another form of albuminuria, described by Teissier as paratuberculous, differs in this respect, that if it is followed by phthisis the phthisis appears some considerable time afterwards, and not shortly, as in the pretuberculous cases. Usually there is a fairly well-marked tuberculous family history in these cases, and a good serum reaction can be obtained. Phthisis is much less likely to occur in the paratuberculous group of albuminurias than in the pretuberculous. The author goes on to discuss orthostatic types of albuminuria, and quotes some figures of Lüdke and Sturm, which showed that in sixty incipient tuberculous subjects fifty-three showed orthostatic albuminuria—that is, 88 per cent.—whereas in later stages of the disease it was 64 per cent. (second stage), and 56 per cent. (third stage). Other statistics are also quoted, tending to show the wisdom of considering the possibility of phthisis when orthostatic albuminuria is found.

499. Blood Pressure after Intravenous Novarsenobenzol.

L. DELL'AMORE (*Journ. de méd. et de chir. prat.*, January 10th, 1920) examined the maximum and minimum blood pressure before and after each injection during a course of novarsenobenzol given either in repeated small doses or in increasing doses. The instrument used was Pachon's oscillogometer. Contrary to what might have been expected, the two pressures fell progressively during the course of treatment. A few days after each injection the blood pressure tended to rise again slightly. These results were not affected by the previous administration of adrenalin by mouth. Novarsenobenzol therefore appears to be a drug which lowers the blood pressure. Patients whose tension was originally low appeared to be less susceptible than others to its depressing action.

499. Emetine in Urinary Bilharziosis.

E. DEBBAS (*Presse méd. d'Égypte*, February 1st, 1920) has adopted the following method in twenty cases of urinary bilharziosis. The patient is given ten intradeltoid injections of emetine hydrochloride, with four days' rest between each injection. The first dose consists of 0.08 gram, the second of 0.12 gram, the third of 0.16 gram, and the remaining seven of 0.20 gram each. All the patients recovered and none had a relapse. Apart from vomiting, which occurred in five cases after the fourth injection, none showed any signs of intolerance. Intramuscular injections are regarded as superior to the intravenous injections recommended by Diamantis for the treatment of bilharziosis, in that they do not require any previous preparation of the patient. They are also more efficacious and less painful than subcutaneous injections.

500. Clinical Varieties of Chronic Chorea.

ACCORDING to N. NICCOLAI (*Riv. Osped.*, November 30th, 1919), similar heredity does not appear to be a constant feature in the etiology of chronic chorea. Sometimes

there is a general neuropathic heredity or degenerative predisposition. Occasional cases are of very secondary importance. The anatomical lesions which give rise to the disease have not yet been determined either as regards their nature or their situation. Apparently, however, in the majority of cases they consist of irritative changes (degenerative or hyperplastic) of the lenticular nucleus and central cortex. Clinically Huntington's chorea does not differ from other forms of chronic chorea. Atypical varieties of chronic chorea occur which, however, cannot be grouped apart, since they present the fundamental characteristics—namely, heredity (in a wide sense), adult age of the patients, chronicity, and the frequent association of mental disturbance.

SURGERY.**501. Tuberculin Treatment of Bone Disease.**

KLEINBERG (*Journ. Orthopaedic Surg.*, 1919, 1) discusses the value of tuberculin as a method of treatment for bone and joint disease, and refers to the conflicting but mostly favourable reports given by different investigators. The author's thirteen cases were observed closely during long periods of time. He concludes that tuberculin is a failure as far as any intrinsic merits of its own are concerned; in so far as the treatment necessitates very careful supervision and attention it may have some value, but the administration of tuberculin has none. Kleinberg points out that it is incorrectly assumed by tuberculin enthusiasts that tolerance to pure tuberculin means immunity to tuberculous infection. Tuberculin produces tolerance for tuberculin; but this substance does not contain all the toxins of the tubercle bacillus. Most of the so-called cures by tuberculin of tuberculous hips occur in cases of unrecognized Perthes's disease. In Kleinberg's cases autogenous vaccines from the flora of discharging sinuses were employed, but without effect.

502. Congenital Orbital Cyst.

CAVARA (*Rif. Med.*, November 8th, 1919) records a case of orbito-palpebral cyst with anophthalmos in the lower lid of a child, aged 8 months. The father of the child suffered from double complete aniridia and partial congenital cataract. The child was well developed generally, but in the left eye there was complete aniridia and slight microphthalmos. In the right eye there was no trace of ocular globe, but a cyst in the lower lid. On removal histological examination showed that the cyst might be looked on as a rudimentary embryonic eye, due to disturbance in the growth of the primary optic vesicle. There was no trace of any of the elements of the secondary optic vesicle. The anophthalmos in this case was real and not apparent.

503. Oesophageal Diverticulum.

ARROWSMITH (*New York Med. Journ.*, 1920, 111) describes two cases presenting oesophageal diverticula. The first patient was a male, 76 years of age, who had suffered for several years from increasing difficulty in swallowing. Lately there was regurgitation. A radiogram showed the presence in the neck of a very large diverticulum, the inner opening of which could clearly be seen with the oesophagoscope. It was impossible to coax the endoscope into the oesophagus proper. A radical cure was performed by the Jackson-Gaub technique, but the patient died on the sixth day. The second case was a male of 44 years, presenting the very unusual anomaly of two distinct pouches, one above the other. As the case was not operated upon it was not clear that the lower pouch was a true diverticulum.

504. Prostatic Abscess.

A. RANDALL (*Annals of Surgery*, February, 1920) records a series of sixteen cases, eight of which were non-gonorrhoeal, being due to *B. coli*, *Staphylococcus aureus*, or other organisms. Of these eight cases some were latent and showed no symptoms pointing to the prostate. Randall believes that pus in macroscopic amounts is present in many of the acute gonorrhoeal cases, as in the cases of gonorrhoeal epididymitis, and advocates strongly, both in gonorrhoeal and non-gonorrhoeal cases, early and free incision into the prostate by a perineal operation. Drainage into the rectum is not advisable, owing to the tension of the parts. Spontaneous rupture into the posterior urethra, or rupture on a sound in the urethra, may be followed by persistent sinuses in the prostatic urethra and chronic prostatic infection.

505. A Case of Syphilitic Reinfection.

C. LAURENT (*Bull. de la Soc. Franc. de Derm. et de Syph.*, January 8th, 1920) records a case in a man aged 30, who consulted him for a chancre of the penis in January, 1914. Numerous treponemes were found in the lesion. The patient was treated with mercury and neo-salvarsan during the next five years, and when seen in April, 1919, the Wassermann reaction was negative. He consulted Laurent again in December, 1919, for two typical chancres, one on the lower lip and the other on the foreskin, which both showed numerous treponemes. The history of the infection explained their distribution. The presence of the treponemes excluded the hypothesis of tertiary chancreiform syphilides, which was also negated by the bipolar distribution of the lesions.

506. Inadequate Treatment and Meningeal Syphilis.

M. PINARD (*Paris méd.*, March 6th, 1920) records several cases to show how treatment which is not sufficiently vigorous may favour the development of meningeal syphilis. Equal danger attaches on this account to comparatively inactive drugs such as benzoate, biniodide, and mercury pills, small doses of active drugs, a single course of an active drug or several courses at too long intervals. At the onset of syphilis the treatment should be intensive and should be continued not only until all the clinical symptoms have disappeared, but also until the Wassermann reaction has become negative in the blood serum and cerebro-spinal fluid.

507. The History of Syphilis.

F. GRÖN (*Tidsskrift for den Norske Lægeforening*, March 15th and April 1st, 1920) has collected the evidence, brought forward of recent years, as to the existence of syphilis in the Old World. He refers to Iwan Bloch as having exploded the theory that syphilis was known to the Old World, and he maintains that Sudhoff has failed to prove the existence of syphilis in Europe before 1493. But, the author insists, this negative evidence does not prove that syphilis came from America. This theory has, however, survived recent criticism, and in the light of present knowledge it cannot be dismissed forthwith. The author does not commit himself unreservedly to this theory, but adopts an impartial attitude.

508. "Silver Salvarsan" in Syphilis.

LEVY-LENZ (*Deut. med. Woch.*, December 25th, 1919) agrees with many other writers in speaking highly of this new preparation. He has found that primary and secondary symptoms rapidly subside, and that no bad effects occur either during or after injection. Contrary to the method pursued by other authorities, who use 0.1 gram of silver salvarsan in 10 c.cm. of water and make the injection drop by drop, he gives 0.1 gram in 3 c.cm. of water and injects it in the ordinary way. In 62 cases in which he has employed this method he has seen no bad effects, apart from transient cerebral congestion in one case. Fever occurred in 3 cases, or about as frequently as after injection of ordinary salvarsan.

509. Hemiplegia Following a Wound of the Upper Thoracic Region.

P. LANDE (*Gaz. hebdom. des Sci. Méd. de Bordeaux*, March 21st, 1920) records a case very similar to those reported by Makins (*Lancet*, September 23rd, 1916). A man, aged 35, was wounded by a revolver in the upper part of the thorax on the left side. He was taken at once to hospital, where signs of right organic hemiplegia were found. Death occurred in thirty-nine hours. The autopsy showed a wound of the left carotid and recent softening of the left cerebral hemisphere due to embolism of the Sylvian artery. All the other organs, including the heart, were healthy.

510. Pseudarthroses of the Humerus.

DUJARIER (*Med. Record*, August 23rd, 1919) records 35 cases of pseudarthroses of the humerus, following wounds by projectiles. Two groups were recognized, in which the factors of loss of substance and infection were respectively predominant. Where there was much loss of substance the arm assumed an hour-glass contour, the bony defect being marked by a narrowing, so that the arm swung and could be twisted in all directions; the limb was useless, though the forearm and hand were normal. X-rays showed the fractured ends to be pointed; sometimes small discrete fragments were found between them. Where infection predominated separation between the fragments was absent or only slight, the arm was less flail-like and a

sort of callus was formed, the particular characteristic being the irregularity of the fragments, which appeared swollen and of indefinite contour. Intermediate fragments of variable form, size, and number were often present. Where regeneration had occurred the osseous remaining band was usually incomplete, fragile, and flexible. X-ray showed osteoporosis of variable extent. The adjacent articulations were often stiffened, but true ankylosis was not observed. The muscles were always injured and sometimes destroyed, but injury to the brachial artery was rare. The radial nerve was most apt to be injured. Generally it was found to be preferable to operate in cases where cicatrization had been complete for a certain time, though in sluggish fistulous cases suture might be carried out while suppuration was still present. Grafting with a full-sized graft, in order to restore the humerus to its proper length, was rarely indicated, since, even after successful grafting, the arm remained weak. The shortening did not give rise to any functional trouble, and in certain conditions rendered suture and repair easier. The following operative procedures were employed: (1) Plating in 16 cases (only suitable for those in which the fractured ends appeared to be sufficiently solid); (2) silver suture in 9 cases, resulting in 7 consolidations; (3) clamps were used in 2 cases, consolidation being obtained; (4) simple approximation without suture in 1 case in which a fistula was present and the condition of the fragments too bad for suture; (5) osteoperiosteal graft or grafts in 10 cases, with 2 failures; 25 consolidations were obtained in 33 cases, a percentage of 75.7.

511. Rare Herniae.

AT the Breslau Surgical Society GOEBEL (*Zent. f. Chir.*, 1920, 47) recorded examples of an obturator, an interstitial, and a lumbar hernia. The first presented a small loop of ileum in the left obturator foramen, discovered at laparotomy for obstruction. The foramen was nicked from without after cutting through the pectineus. The interstitial hernia occurred in a patient with double femoral hernia. During laparotomy for obstruction a loop of ileum was found in a hernial sac which led not only into the thigh, but also along the descending ramus of the pubes towards the true pelvis. It was in the latter portion that the bowel had become incarcerated, as, apparently, there was no external sign of hernia. The lumbar hernia was present in a miner who had had an injury to his back many years before. There was a reducible hernia just below the outer half of the twelfth rib, through the so-called trigonum lumbale superius.

512. Fibrous Tumours of the Hand.

R. DUCASTAING (*Paris méd.*, March 20th, 1920) describes three cases of this kind in which the lesions consisted of fibrous nodules which had developed insidiously without any accidental or occupational traumatism. There was no definite history of tuberculosis, but there were "arthritic and rheumatic" antecedents. Histological examination showed that the numerous newly formed vessels contained in the nodules were the site of an endo-vascular inflammation of the type described by Poncet, and that the centre of the nodules was infiltrated with very numerous granulations of haemoglobin. Clinically the condition was characterized by its insidious onset, almost complete painlessness, and slow course. In the first patient the nodules did not show any tendency to extend, in the second they were associated with camptodactyly, and in the third the condition was closely related to Dupuytren's contraction.

513. Urobilinuria and Gall Stones.

S. HANSEN (*Ugeskrift for Læger*, March 25th, 1920) has carried out a series of investigations at the new communal hospital in Copenhagen in order to establish the relation, if any, of cholelithiasis to urobilinuria. He found Schlesinger's test for urobilinuria unsatisfactory, and elaborated a new test, quantitative as well as qualitative. He reports that gall stones at rest in the gall bladder do not provoke urobilinuria, and biliary colic fails to induce urobilinuria if the common bile duct is completely blocked. Otherwise biliary colic is almost invariably associated with urobilinuria. The author examined 50 cases of gall stones and 210 controls recruited from surgical cases, including 35 cases of acute appendicitis. In most of the controls there was no urobilinuria. The author has found his test for urobilinuria useful in the differential diagnosis of gall stones and other diseases; in some cases exhibiting a clinically typical picture of gall stones there was no urobilinuria, and no gall stones were found at operation.

OBSTETRICS AND GYNAECOLOGY.

514. Vulvo-vaginitis of Children.

BROOKE BLAND (*New York Med. Journ.*, March 20th, 1920) considers that gonorrhoeal infection of female children is comparatively common, though the infection is seldom the result of rape. It may become epidemic in institutions for girls, in babies' hospitals, and in pediatric wards. In such places or in families stringent precautions should be taken to prevent the disease spreading. Immediate isolation is necessary and everything used in the treatment should be sterilized. Special care should be taken to prevent eye infection. Considerable difficulty is frequently experienced in instituting active treatment owing to the natural timidity of the child. If the first treatments are painful subsequent treatments are rendered almost impossible. The author's plan has been to use copious cleansings of the vagina and vulva with simple warm water through a soft rubber catheter for the first two or three days, and then, the child's confidence having been gained, to employ weak solutions of Lugol's iodine, starting with a quarter of a teaspoonful to two quarts of warm water and gradually increasing this to one teaspoonful. Irrigation is performed morning and evening for the first three or four weeks, and is accompanied once a day by the instillation into the vagina of 20 minims of 25 per cent. argyrol. A pad moistened with the same drug is applied to the external genitals. The irrigations after a month or six weeks can be diminished to once a day and discontinued when four successive smears are negative. Vaccines have never given favourable results.

515. Vaginal Myomectomy.

ACCORDING TO C. R. BELGRANO (*Il Policlinico*, Sez. Prat., March 22nd, 1920) vaginal myomectomy is indicated (a) for fibroids of the vaginal portion of the cervix, where it is easily performed; (b) for fibroids of the supravaginal portion of the cervix (transvaginal myomectomy of Czerny); (c) for sessile submucous fibroids of the body of the uterus; (d) in the case of certain readily accessible submural fibroids. The operation is all the more desirable when the tumour is infected or sloughing. Vaginal myomectomy may present serious dangers, such as haemorrhage which may require packing, inversion of the uterus, and perforation. Another danger consists in the fact that metrorrhagia may result owing to other fibroids being left in the uterus.

PATHOLOGY.

516. Specific Reaction of the Urine in Acute Peritoneal Infections.

O. SCAMBATI (*Il Policlinico*, Sez. Prat., March 1st, 1920) describes the following reaction which he regards as pathognomonic of acute peritoneal infections: 2 or 3 c.c.m. of fuming nitric acid are added to 8 to 10 c.c.m. of urine. If the reaction is positive, a more or less intense dark bluish-grey ring forms above the yellow ring of contact of the two fluids. This becomes more distinct if the test tube containing them is left for a time, when the colour becomes diffused and the urine assumes a dichroic appearance, being partly greyish-blue and partly reddish-brown. The intensity of the reaction is directly related to the severity of the infection. There is no relation between the presence of the reaction and that of the other chromogenic substances in the urine—for example, indol, skatol, or bile pigment. The reaction is usually an early sign of acute peritonitis, and often precedes any other sign. It rapidly diminishes as the general condition improves, and increases as it gets worse. It is therefore claimed to be of great prognostic value.

517. Ruoss's Test for Glycosuria.

ACCORDING TO A. DE MATTA (*Amazonas Medico*, April-June, 1919) Ruoss's agent is prepared as follows: Dissolve 3.50 grams of pure copper sulphate crystals in 10 c.c.m. of warm water. Allow it to cool and add 15 c.c.m. of pure glycerin and 23 c.c.m. of a solution of caustic soda (1 part of pure NaOH in alcohol with 2 parts of water). When the solution is cold add 5 c.c.m. of a watery solution of potassium sulphocyanide (30 per cent.), and make up to 100 c.c.m. with a 25 per cent. solution of sodium chloride. A fluid of a blue colour is obtained similar in appearance to Fehling's solution. The urino to be

examined is added to Ruoss's solution and the mixture is boiled. If reducing sugars are present the same change of colour takes place as with Fehling's solution. The advantages claimed for Ruoss's reagent are that it is rapidly prepared and that it is insensitive to the action of ordinary drugs.

518. The Significance of Hyperglycaemia in Diabetes.

S. LINDBLOM (*Hygiea*, September 31st, 1919) has been stimulated by Engstrand's recent investigations into the relation of hyperglycaemia to diabetes mellitus to an enunciation of certain hypotheses which are largely based on Engstrand's material, but which do not tally with his conclusions. The author notes that the subjects of diabetes are often discharged from hospital much improved, without sugar in the urine. But their hyperglycaemia still exists. In health the formation and destruction of sugar in the body are evenly balanced; there is a state of stable equilibrium. When over-production threatens, hyperglycaemia ensues because the kidneys are comparatively impermeable to sugar. This hyperglycaemia provokes the system to diminishing the production and increasing the destruction of sugar, and it thus restores the sugar equilibrium. But in diabetes this reaction of the body to hyperglycaemia is impaired; the sugar equilibrium cannot be restored without sugar escaping into the urine. In other words, before the sugar content of the blood has become great enough to provoke the system to restore the sugar equilibrium the kidneys have let some of the sugar escape. Hyperglycaemia is, in a sense, helpful—a stimulus to the system to restore the sugar equilibrium. When, in diabetes, the permeability of the kidneys to sugar is diminished by renal sclerosis, hyperglycaemia reaches such a height that even though the responsiveness of the system to the stimulus of hyperglycaemia is lessened, the production of sugar is diminished and its destruction increased. Hence a partial or complete restoration of the sugar equilibrium. The author compares this beneficial action of hyperglycaemia with that of increased blood pressure in arterio-sclerosis. The latter helps to drive the blood through rigid arteries, the former is required to supply comparatively powerful stimuli to the sugar-regulating mechanism which is incapable of responding to normal comparatively weak stimuli. But just as a high blood pressure ultimately aggravates arterio-sclerosis, so hyperglycaemia tends to lessen the irritability of the mechanism regulating the production and destruction of sugar. The author has noted that the constant passage of sugar through the kidneys diminishes their permeability to sugar, and he makes the suggestion that sugar disappears from the urine because of, not in spite of, the persistence of hyperglycaemia.

519. Classification of Influenza Bacilli.

RIVERS (*Johns Hopkins Hosp. Bull.*, February, 1920) records an attempt to make a biological classification of those Gram-negative, non-motile, haemoglobinophilic bacilli which belong to the indeterminate group of influenza bacilli. His paper, which briefly summarizes the previous contributions on the point, is meant as a preliminary in the hope that others will give further assistance. He investigated the cultural characters of 32 strains isolated from normal throats since the epidemic, 5 strains from influenza meningitis, 14 strains from epidemic influenza, and 2 strains of the *Bacillus pertussis*. With regard to the last, they were clearly separated from the other groups by the facts that after a period of artificial cultivation they could be grown on plain media; that they formed neither indol nor nitrites; and that they made milk very alkaline. Of course some of the influenza bacilli failed to form indol or nitrites, but none was found to produce such a high degree of alkalinity in milk. Rivers recommends that the following points should be considered when working with a suspected *B. influenzae*: (1) Determination of haemoglobinophilic qualities, (2) colony formation, (3) haemolytic test, (4) Gram's stain, (5) morphology, (6) motility, (7) indol formation, (8) reduction of nitrates to nitrites, (9) amylase formation, (10) reaction in blood-milk-broth. The reactions allow of subdivisions of the group. The author calls attention to a particular group of ten strains (two from the spinal fluid of patients with influenza meningitis, three epidemic strains, and two from normal throats) in which growth and morphological characters were identical; they all formed indol, reduced nitrates to nitrites, and made blood-milk-broth slightly acid in forty-eight hours. Another group of nine were characterized by amylase formation.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

520. Diphtheria Mortality.

DUBOURG and F. GUÉNARD (*Journ. de méd. de Bordeaux*, February 25th, 1920) give the statistics showing the mortality from diphtheria at the Children's Hospital at Bordeaux during the thirty years 1888-1917. In 1888 and 1889 the cases were nursed in a general ward, with an average mortality of 49 per cent. and a maximum mortality of 54 per cent. in 1888. From 1890 to 1893 the cases were put in a special block and there was a decided fall in the mortality, since it was 35 per cent. during this period. In 1894, with the creation of separate cubicles for each patient, it fell to 19.4 per cent., the lowest figure reached before the introduction of the serum. Since 1895, when serum was first employed, the average mortality has been 7.28 per cent., with a maximum of 15.5 per cent. in 1899-1900 and a minimum of 1.53 per cent. in 1907 (3 deaths among 195 cases). The number of operations for laryngeal diphtheria has also fallen considerably; in 1894 56 per cent. of the diphtheria admissions required tracheotomy. After the introduction of serum and before intubation became current the annual average of tracheotomies fell to 9.87 per cent. of the admissions. After the introduction of intubation the number of operations (intubations and tracheotomies) was 15.34 per cent. of the admissions.

521. Typhoid Meningitis.

G. LAROCHE and G. PEJU (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, February 5th, 1920) propose the following classification of meningeal manifestations in typhoid fever. (1) Meningeal syndromes with a clear fluid in which the cell and albumin content is little if at all affected and the culture is negative. This form is always mild and generally clears up rapidly without affecting the prognosis; it is most frequent at the onset. As a rule it is of short duration, but sometimes lasts several days or even weeks. (2) Typhoid meningitis, in which typhoid or paratyphoid bacilli are cultivated from the cerebro-spinal fluid (much rarer). The fluid is clear or turbid, but rarely purulent. The prognosis is grave, death being observed in about half the cases. (3) Suppurative meningitis due to secondary infection with staphylococci, pneumococci, streptococci, etc., with or without typhoid or paratyphoid bacilli. These forms of meningitis are always fatal. The writers record a case of mild typhoid meningitis in a man, aged 27, occurring during a relapse of typhoid septicaemia. The symptoms were slight and transient, but the cerebro-spinal fluid was tested and contained an extremely large number of typhoid bacilli, which disappeared after two lumbar punctures. Recovery was uneventful.

522. Late Epilepsy due to Endocrinic Disturbance.

G. ÉTIENNE and G. RICHARD (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, February 5th, 1920), who had previously recorded two cases of late epilepsy associated with disturbance of the glands of internal secretion, report another case in a woman aged 30, who eight days before the end of her second pregnancy was seized with a convulsive attack; no albumin was found in the urine. Eighteen months later symptoms of myxoedema developed, the menses became scanty, and convulsive attacks occurred. Suprarenal disturbance was indicated by adrenalectomy glycosuria, and *x* rays showed enlargement of the hypophysis. Treatment by thyroid and ovarian extract was instituted and no further attacks took place.

523. Congenital Cyanosis with Large Ductus Arteriosus.

In the course of ten days VARIOT and BOUQUIER (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, February 5th, 1920) observed four cases of generalized and pronounced cyanosis in newborn infants, which became worse during their bottle feeds. In no case was any murmur heard on auscultation in the precordial region. All the infants showed some degree of congenital debility, their weight ranging from 2,250 to 2,750 grams. On radioscopic examination two of them showed a widening of the cardiac area in the region of the right auricle. Three died in the first ten days, and the fourth at the age of 15 days. In all four cases a large patent ductus arteriosus was found *post mortem*, and almost identical pulmonary lesions, consisting

in congestion and considerable solidification of the largest part of the pulmonary parenchyma. The surface of the lungs showed patches of emphysema, which were as extensive as those met with in death from asphyxia.

524. The Sign of the Palato-glossal Arch in Influenza.

H. B. L. VOS (*Nederland. Tijdschr. v. Geneesk.*, February 21st, 1920) regards the following sign of diagnostic value in the sporadic cases of influenza which are liable to precede an epidemic. An erythema extends from both tonsils for a width of not more than 1 to 4 mm. over both palatal arches, while the rest of the soft palate may and usually does remain completely unaffected. The sign may be present when there is no visible catarrh of the nose or pharynx.

525. The Pleuritic Type of Aortic Aneurysm.

G. RUBINO (*Riv. Osped.*, November 15th, 1919) records a case of aneurysm of the descending thoracic aorta simulating pleural effusion, associated with congenital aortic incompetence, in a man aged 36. He points out that the diagnosis of the two conditions, pleurisy and aneurysm, cannot be made by the presence of pulsation. Exploratory puncture is invariably fatal sooner or later in the case of an aneurysm, and in the case of an echinococcus cyst is the cause of death in 50 per cent. of the cases. Examination by *x* rays is indispensable.

526. Tuberculosis Complicated by Hypothyroidism.

T. STEPHANI (*Rev. méd. de la Suisse rom.*, February 20th, 1920) records a case in a man, aged 24, the subject of pulmonary tuberculosis, who developed a dry papular erythematous eruption of the face, followed by a branny desquamation of the scalp and whole body, the temperature being normal. At the same time the patient showed an extraordinary increase of weight and complained of having persistently cold feet. The possibility of thyroid insufficiency suggested itself, and thyroid extract in doses of 20 cg. daily was ordered. The effect was remarkably rapid. Within three or four days the desquamation diminished, and within a week all the skin symptoms disappeared.

527. Eczema and Tuberculosis.

G. MILIAN (*Paris méd.*, March 6th, 1920) considers that vesicular eczema is due to tuberculosis in 80 per cent. of cases, perhaps more, the remainder being caused by other diseases, such as gout, or possibly syphilis, and occasionally staphylococcal infection. Although he has no statistics, Milian has always found some form of tuberculosis in eczematous subjects. Occasionally vesicular eczema develops around a tuberculous skin focus. Possibly some forms of acute eczema of drug origin are caused not by the tubercle bacillus itself but by its toxins. In conclusion Milian points out that the local and general treatment which is most successful in eczema is just that which is most suitable in tuberculosis.

528. Tuberculous Empyema.

DUBOFF (*Amer. Rev. of Tuberc.*, December, 1919) finds that the presence of tubercle bacilli in the exudate is the rule, that the exudate exerts a temporary favourable influence on the pulmonary tuberculosis, and may give rise to no symptoms for months. It tends to drain itself most commonly through the chest wall or bronchus, or both. Non-interference for as long as possible is the best treatment, with aspiration to relieve any pressure symptoms and prevent sinus formation. Thoracoplasty should only be performed when absolutely necessary to relieve fulminating symptoms.

529. The Diagnosis of Pulmonary Tuberculosis by Radioscopy.

A. DUMAS and A. CORONE (*Lyon méd.*, January 25th, 1920), who were in charge of the tuberculosis department in the French Army of the East at Salonica, state that in cases of confirmed tuberculosis radioscopy gives valuable information as to the extent, form, mode of onset, and course of the disease and the appearance of complications. In cases in which the diagnosis has not been confirmed bacteriologically, but where the stethoscopic signs are definite, radioscopy may confirm the diagnosis. In more doubtful cases it may render the diagnosis of tuberculosis probable, and in some instances facilitate an early diagnosis. In latent forms it may indicate an old lesion

at the apex, and so throw some light on the prognosis of subsequent attacks: but its chief value is shown in those cases in which the screen examination is negative. As compared with bacteriological examination, which decides what cases are definitely tuberculous, radioscopy in its turn decides which cases are definitely negative, provided that the *x*-ray findings agree with the clinical signs obtained by auscultation and examination of the general condition and weight of the patient.

530. The Blood Pressure in Pulmonary Tuberculosis.

P. J. L. DE BLOEMIE (*Nederland. Tijdschr. v. Geneesk.*, March 20th, 1920) examined the blood pressure by the auscultatory method with Riva-Rocci's instrument in 500 cases of pulmonary tuberculosis, and came to the following conclusions as regards its diagnostic and prognostic value: Cases with a blood pressure of 80 to 100 mm. could be recognized by other diagnostic methods, and estimation of the blood pressure was merely confirmatory. The cases of this kind which the writer saw died within six to twelve months, with the exception of a few patients who had a reading of 90 to 100 mm. (essential hypotonus). The most important group consisted of men who had a blood pressure of 100 to 110 mm. Sphygmomanometry in such cases was of value, as the gravity of the condition was much more readily recognized by this than by other means. The most favourable cases were the patients of both sexes who had a reading of 110 to 150 mm. In individual cases the writer found that patients with low blood pressure were more liable to relapse than others. Those who had had a relapse showed a low blood pressure even after the general and local symptoms had subsided. Considerable improvements were accompanied by a rise of blood pressure. A distinct fall of blood pressure in a case in which the local process was apparently only advancing slowly indicated a more unfavourable course than might otherwise be supposed.

531. Latent Cirrhosis in Tuberculosis.

ACCORDING to MOUISSET (*Lyon méd.*, March 10th, 1920) lesions of the liver are very frequent in tuberculosis. Tubercles are very often found on histological examination, but the usual lesions are cirrhosis and fatty changes. There is no doubt that tuberculous infection can produce these lesions, but other etiological factors must not be forgotten. It is not uncommon in tuberculous patients for the autopsy to show very pronounced hepatic cirrhosis, of which during life there has been no evidence, such as ascites or development of collateral venous circulation. On the other hand, tuberculous patients who did present such symptoms were, in Mouisset's experience, almost always alcoholic. It may therefore be said that though tuberculous cirrhosis is frequent, it is usually latent when alcoholism does not complicate the cases. An exclusively tuberculous cirrhosis is mainly of pathological interest.

532. The Renal Manifestations of Cardiac Failure.

O. JOSUE and M. PASTURIER (*Paris méd.*, March 13th, 1920) point out that asystole may give rise to defective elimination of water by the kidneys, even when the latter are not diseased. During the period of asystole and oliguria it is impossible to determine the extent of renal involvement. It is only after the re-establishment of diuresis, and when digitalis treatment has been instituted, that one can tell whether the symptoms are due mainly to the heart or to the kidneys. In such circumstances the ureo-secretory constant supplies definite information. In a large number of cases it will show that the kidneys are completely intact, contrary to what might have been expected from clinical examination alone. In other cases it will show that though the kidneys are slightly affected, urea can be eliminated during the period of cardiac compensation. Such patients should not be regarded as cardio-renal subjects.

533. Skin Disease caused by a Pediculoid in a Cargo of Barley.

LOIR and LEGAGNEUX (*Paris méd.*, March 6th, 1920) record an outbreak of a skin disease which occurred among workmen at Havre, two or three hours after they began to unload a cargo of barley from a boat which had come from Bizerte; sixty-three men were affected. The forearm and hand were spared, but the trunk was attacked by an eruption which seemed to have been produced by a blistering substance. The lesions did not show any definite character: in a few cases there were some vesicles, but no burrows. The irritation caused was extreme and produced insomnia. The handling of the barley gave rise to

a large amount of dust, on microscopical examination of which small acari were found, belonging to the family of *Tarsonemides* and the group of pediculoids. Rapid improvement followed the ordinary treatment for scabies. The hold of the boat was subjected to sulphur fumigation. Only a few men subsequently contracted a slight eruption.

SURGERY.

534. Ureteric Calculi.

A LARGE percentage of these stones pass spontaneously, and E. S. JUDD (*Annals of Surgery*, February, 1920) recommends expectant treatment in the early cases. Most small stones in the lower end of the ureter can be removed without a cutting operation by dislodging them with a ureteral catheter or small sound: this method is contra-indicated if renal infection is severe. In cases of chronic renal infection one may remove the stone and preserve the kidney, but in acute severe infection nephrectomy should be done before severe uraemia and toxæmia supervene. In cases of bilateral ureteral calculi open operation rather than intra-ureteral manipulation is advised: the side showing evidence of acute trouble is operated on first, but if there is no apparent difference the stone is first removed from the ureter on the side having the best renal function. In performing an open operation on the lower two-thirds of the ureter the straight rectus incision is used: after removing the stone the ureter is loosely sutured, the stitches not penetrating the mucosa.

535. Chondrodysplasia.

ACCORDING to H. L. DWYER (*Amer. Journ. Dis. Child.*, March, 1920), who reports four cases of this condition, three of which occurred in the same family, many variations of hereditary deforming chondrodysplasia may occur, ranging from multiple small cartilaginous exostoses causing the patient no trouble to great deformities with dwarfing, paralysis, and possible onset of malignancy. The disease manifests itself in infancy. One of Dwyer's patients, aged 20 months, is the youngest in whom the disease has been reported. It has much in common with chondrodystrophy of infancy and adolescence, and probably a close relationship exists between them.

536. Tuberculosis of the Appendix.

M. WARWICK (*Annals of Surgery*, February, 1920) states that this disease may be primary or secondary, and can often only be diagnosed after microscopical examination. It presents symptoms resembling very closely those of suppurative appendicitis, and may occur in ulcerative, hyperplastic, or miliary types. Infection occurs directly from the intestinal contents, from the blood, or by lymphatic routes.

537. Diagnosis of Arthritis by Microscopical Examination of a Regional Lymphatic Gland.

G. R. HULL (*Journ. Royal Naval Med. Service*, January, 1920) reports a case of arthritis of the wrist supervening four months after injury and of eight months' duration. The Wassermann reaction, examination of a prostatic bead for gonococci, and *x*-ray photograph of the joint for tuberculosis were all negative. Under local treatment there was temporary improvement, but subsequently four rather "elastic-feeling" glands above the internal condyle were noted, and microscopic examination of one of these, removed under novocain anaesthesia, showed histological evidence of tuberculosis.

538. Oxycephaly.

S. H. WATTS (*Annals of Surgery*, February, 1920) reports two cases of this condition, in one of whom (4 years of age) bilateral subtemporal decompression was performed. Marked optic atrophy was present in both eyes before the operation, after which, although the patient's vision appeared to be improved, the fundus oculi showed no change. Two years later there was almost complete ossification over the protruding brain. The increased intracranial pressure is apparently due to disproportionate growth of the brain and skull: internal hydrocephalus is rarely present in these cases. According to Watts, the cardinal signs of oxycephaly are (1) the unusual height of the skull, the apex being just behind the anterior fontanelle; (2) exophthalmos, due to the shallowness of the orbits; strabismus (usually divergent) and often nystagmus; (3) impaired vision, usually noticed between the second and sixth year of life, and possibly going on to complete blindness. The optic atrophy may be preceded

by "choked disc," but some observers consider it due to pressure on the nerve in the optic canal. There may also be headache and occasionally vomiting and fits. X rays show thinning of the skull, often wave-like depressions due to the convolutions, and premature synostosis of the parietal bones with the occipital and temporal bones; also compensatory enlargement in the frontal region and region of the sagittal suture. Watts recommends early decompression in these cases in order to prevent optic atrophy.

539. Non-Union in Compound Fractures.

DE FOREST WILLARD (*Annals of Surgery*, February, 1920) advises during the pre-operative period in non-union cases active and passive movements of the joints below the fracture, massage, and hot-bath treatment. A short course of deep heavy massage is used to determine whether or not the scar tissue in old infected areas is permanently healed. If the primary infection is mild and brief, operation is done four or five months after the sinuses have closed; after severe prolonged infection nine or twelve months are allowed to elapse. At the end of that time a ten days' course of heavy massage of the scar is carried out, and if it shows no reaction the scar tissue is dissected away from the soft parts and between the bones. A smear is taken from the deep tissues, and the wound is closed. If the smear is negative and the wound remains closed a second operation to repair the fracture is done within eight or ten days. Bone plates, which cause atrophy of bone, are not used. Heavy grafts are recommended for the femur and tibia; these grafts must reach the medullary cavity, must preserve their periosteum and endosteum, and must be of healthy non-sclerosed bone throughout. Hence sliding grafts are not recommended. Grafts $\frac{1}{2}$ in. thick, with a periosteal covering, laid subperiosteally in a shallow channel dug in the cortex of the bone, and held in place by suturing the periosteum of the bone over the graft, are recommended for smaller bones, such as the radius and ulna; they appear to stimulate repair more readily than the heavy graft.

540. Early Malignant Syphilis.

L. QUEYRAT (*Bull. Soc. Franç. de Derm. et de Syph.*, January 22nd, 1920) records two cases of this condition, which is distinguished from severe syphilis as follows: Severe syphilis is characterized by the coexistence of tertiary lesions (especially ulcers) and the macules, papules, and mucous tubercles of the secondary stage; in all these lesions treponemes can be found. In early malignant syphilis, on the other hand, a roseola and mucous tubercles are never seen; the condition usually but not invariably begins with an extensively ulcerated chancre, and in the secondary stage presents papulo-vesicular lesions, which subsequently became pustular, and finally ulcerated and encrusted. Treponemes can never be found. Other peculiarities of early malignant syphilis are the late date at which the serum reaction becomes positive, the failure to react to mercury and potassium iodide, its curability by salvarsan, the frequency of syphilitic fever, and the absence of visceral complications or nervous symptoms.

541. Sporotrichosis of the Genitals.

A. BRAINOS (*Paris méd.*, March 20th, 1920) records two cases of sporotrichosis of the penis in soldiers in whom the first diagnosis was chancre in the one and malignant ulcerative syphilide in the other. Local treatment had no effect, and it was not until bacteriological examination had shown the presence of *Sporotrichum beurmanni* and potassium iodide had been given that recovery took place. Brainos recommends that whenever an antisiphilitic test treatment is adopted for a local lesion of which the specific nature has not been confirmed clinically or by laboratory methods, potassium iodide should be associated with mercury or arsenical preparations.

542. "Vermilion" Proctitis in Secondary Syphilis.

ACCORDING TO P. CARNOT and G. FRIEDEL (*Paris méd.*, April 3rd, 1920), proctitis in secondary syphilis has not previously been described. They report a case in a married woman, aged 24, who sought advice for symptoms of acute proctitis—namely, dysenteriform diarrhoea, a sensation of weight in the perineum, and extremely violent pain in the anus. Examination showed a generalized erosive recto-sigmoiditis with much congestion, two papillomata at the margin of the anus, and a fissure on the perianal skin. The intense red colour of the mucous membrane recalled the erythematous sore throat of secondary syphilis to which Dienlaffoy had given the name of vermilion angina. A typical roseola was also present, and the Wassermann reaction was positive. Rapid

recovery took place under treatment by injections of mercury biniolide followed by intravenous injections of arseno-benzol.

543. Sarcoma of the Prostate.

F. C. HERRICK (*Annals of Surgery*, February, 1920) records a case of this disease in which the tumour was readily enucleated suprapubically, but rapidly recurred. The most common symptom is obstruction to miction and possibly to defaecation. Perineal fullness and tension are complained of, sometimes pain. Rectal examination reveals a tumour of uniform balloon-like consistency. Differentiation must be made from syphilis, tuberculosis, and cancer. A prostatic tumour in adolescence is probably sarcomatous, and in a man of less than 50 is possibly so.

544. X-Ray Carcinoma.

POTHERAT (*Bull. et Mém. Soc. Chir. de Paris*, 1920, 46) records a case of epithelioma of the right hand arising in the site of an x-ray dermatitis. This dermatitis, the result of fifteen exposures for warts sixteen years previously, led to much scarring, with deformity of the hand, the cicatrix frequently breaking down. Two years ago the scar, after giving way, failed to heal, and a deep ulcer formed, which proved to be a carcinoma involving not only the tendons but the metacarpal bones.

545. Value of Pyelography.

THE value of pyelography is emphasized by LEGUEU (*Bull. et Mém. Soc. Chir. de Paris*, 1920, 46), who records a case of hydatid cyst of the kidney, in which hydatids had been found in the mine. A pyelogram, made to establish the relationship of the cyst to the kidney, showed clearly a large rounded cyst opening into the superior calyx. Legueu judged from this plate that a conservative removal of the cyst might be effected without sacrifice of kidney substance; he performed a partial resection of the cyst, formalinization of the remainder, and closure without drainage.

OBSTETRICS AND GYNAECOLOGY.

546. The Ripe Human Graafian Follicle.

A. THOMSON (*Journ. of Anat.*, 1919, 54) records the result of his researches into the minute anatomy of the human Graafian follicle. He believes that the average size given in the textbooks is too large, 5 mm. being the largest size reached by any healthy follicle in his series, bigger sizes being degenerate. The discus proligerus may be situated at any point on the wall of the follicle and is by no means constantly placed at a point opposite that at which the follicle is to rupture. In many of Thomson's cases the discus was situated superficially—a position more advantageous than the deeper one to the escape of the ovum. The author gives photomicrographs of the origin of the so-called bodies of Call and Exner from the breaking down of follicular cells. The method of expulsion of the ovum from the ruptured follicle is critically examined. Thomson brings forward evidence in support of the theory that the ovum tends to become, if not free in the liquor folliculi, at any rate free from the membrana limitans externa. Thomson believes that ovulation may occur at other times than at menstruation. Under the influence of intense sexual excitement women are occasionally cognizant of strange internal happenings, which may be due to the rupture of a ripe follicle. The author has found smooth muscle not only within the stroma and mesovarium, where it was already well known to be present, but actually in the external theca of the wall of the follicle itself. Under the influence of adrenalin the ovary may be seen to contract, so it is presumably controlled by the sympathetic system.

547. Transvesical Suture of Vesico-vaginal Fistulae.

MARION (*Bull. et Mém. Soc. Chir. de Paris*, 1920, 46) describes a case of vesico-vaginal fistula cured by suture, a transvesical route being used. The woman had a large fistula following parturition, involving the inferior wall of the bladder and anterior vaginal wall. The neck of the uterus presented in the bladder. Five previous surgical interventions had been fruitless. Marion opened the bladder suprapubically and found a fistula 7 cm. long by 3 cm. wide, running from the neck of the bladder to the isthmus of the uterus. The two ureteric orifices were seen at the edges of the fistula, one on each side, and about half-way along it. The edges of the defect were freshened

and the vaginal wall was separated from the vesical. Three layers of interrupted sutures were placed in the vaginal wall and the bladder defect was closed with fine catgut. A Pezzer's catheter was introduced per urethram and the suprapubic wound firmly closed. The patient was nursed on the face and side for five or six days, and the catheter was removed on the sixteenth day. A perfect cure resulted, and cystoscopy showed the fistula to be firmly cicatrized. Marion has repeatedly insisted on the value of the trans-vesical route; of thirteen vesico-vaginal fistulae treated in this manner in 1918, he had thirteen cures.

548. Spinal Cord Tumour and Pregnancy.

CARL MEYER (*Zentralbl. f. Gyn.*, March 6th, 1920) refers to a case, reported in 1913 by Bogdanowitsch, of spontaneous labour in a woman suffering from complete paralysis of the body and lower limbs. This patient, a 13-para, showed from the third month of pregnancy symptoms of a tumour in the cervical portion of the cord. She was brought to hospital in a moribund condition, and preparations were made for Caesarean section. Before the operation could be started labour began spontaneously, and the child was born without artificial interference. The patient died two days later from involvement of the respiratory centre of the medulla. Meyer describes the case of a primipara, aged 23, who had been treated five years before for rheumatic affections with angina and bradycardia. In January, 1919, she began to complain of pains between the shoulders, to which were soon added pruritus of the arms, chest, and back, together with weakness of the right knee. Later pain was felt in the whole of the right leg. These symptoms appeared to coincide with the beginning of pregnancy, during the course of which there developed spasms of the lower limbs, especially the right. Abdominal reflexes were absent; speech remained unaffected, and there were no eye symptoms. A diagnosis of multiple sclerosis was first made, but later a tumour was suspected. The onset of labour was marked by severe vomiting; of the actual process of expulsion of the child the patient had little cognizance other than a sensation of stretching in the right half of the vagina; no pain was felt. Six weeks later she died, and a tumour of the cord was found at the level of the upper dorsal and lower cervical vertebrae; microscopic examination showed it to be a spindle-celled sarcoma.

PATHOLOGY.

549. The Anaphylactic Nature of Asthma.

PAGNIEZ (*Rif. Med.*, February 14th, 1920, and *Presse Méd.*, No. 7, 1920) assumes that true idiopathic asthma is due to a condition of anaphylaxis set up by various proteins in sensitized subjects. The particular protein concerned can sometimes be discovered by a cuti-reaction test, and the patient desensitized by a course of vaccines. Unfortunately a certain number of asthmatics do not appear to be sensitized, or at any rate the particular protein to which they react cannot be discovered. On the other hand, some asthmatics have received much benefit from suitable vaccine treatment, relief being obtained for quite two years. At present the results obtained are uncertain. Cardiac, renal, and emphysematous asthma belong to a different group.

550. Agglutinability of Micro-organisms Cultivated on Acid and Alkaline Media.

G. CAPONE (*Lo Sperimentale*, Fasc. v-vi, 1919) as the result of his investigations came to the following conclusions: (1) Cultivation in acid broth of bacilli of the typhoid and paratyphoid group was followed by a change into organisms which could be identified with Lingelsheim's Q form. (2) Organisms of the typhoid, paratyphoid, and dysentery groups grown on acid broths were more susceptible to the attack of agglutinins. (3) Organisms of the typhoid and paratyphoid group which had been grown for a long time in markedly alkaline broth lost to some extent their agglutinability.

551. Precipitin Reaction in Tuberculosis.

BRAND (*Rif. Med.*, November 29th, 1919, and *Tuberculosis*, vol. xi, f. 6, 1919) has examined 522 tuberculous patients (in 100 tuberculosis could not be established clinically) with regard to the serum-precipitin, agglutination, and deviation of the complement tests. The precipitin test was positive in definite acute tuberculosis; agglutination and deviation were less positive in severe cases;

agglutination and precipitation only exceptionally gave positive results in doubtful cases. In incipient or masked phthisis deviation of the complement proved the most useful for diagnosis. The serum-precipitin test has undeniable value in diagnosis, but is less valuable than agglutination, especially in early or suspected cases.

552. Resemblances between Oriental Sore and Epithelioma.

MACADAM (*Brit. Journ. Surg.*, April, 1920) describes the histological characters of seven cases of ulcerated oriental sores, sometimes called Delhi sore, Baghdad boil. A granulomatous form of lesion was found, with round-celled infiltration, the cells being mostly lymphocytes and large endothelial cells; no giant cells were present, as had been reported by previous observers, the surface epithelium showed much proliferative downward infiltration, with the presence of numerous cell-nests. The histological appearances presented considerable resemblances to those of squamous epithelioma, and it is suggested that difficulties of diagnosis may occur in the case of soldiers who have returned to civil life. The *Leishmania tropica* is present during the first few months, but disappears in old-standing lesions, from which a smear should be made by examining material removed by a spoon from the deeper layers of the ulcer. There is no record of an oriental sore having become carcinomatous; that of Macadam's cases which in its histological appearances most resembled a carcinoma was readily cured—as were all the others—by intravenous injections of antimony tartrate.

553. Detection of Glucose in Urine.

HAINES'S solution has previously been used for the detection of glucose in urine. HAINES, POND, and WEBSTER (*Journ. Amer. Med. Assoc.*, 1920, 74) have now devised a solution which can be employed as a contacting test. The solution consists of copper sulphate 5 grams, glycerin 250 c.c.m., potassium hydroxide 20 grams, distilled water to 1,000 c.c.m. The copper sulphate is dissolved in the glycerin and an equal amount of water, gently heated. Some makes of glycerin will cause a slight reduction of the copper, but after standing for forty-eight hours in a warm place the supernatant fluid can be decanted or filtered off. The advantage of the solution is that it keeps indefinitely, and will detect amounts of sugar higher than 0.03 per cent., which figure is about the highest limit of the so-called "normal" urine sugar. About 5 c.c.m. of Haines's solution should be heated to boiling in a test tube and then 10 to 20 drops of urine run down the side of the tube with a dropper. If sugar is present to a greater extent than 0.1 per cent., a brick-red or yellowish ring will appear at once at the junction of the two fluids. If the amount of sugar is less than this it is necessary first to precipitate the phosphates with a few drops of liquor potassii.

554. Unusual Variety of Hour-glass Stomach.

LAGOUTTE (*Bull. et Mém. Soc. Chir. de Paris*, 1920, 46) records a case of hour-glass stomach in which there was no sign of ulceration. The opaque meal showed on the screen a large proximal pouch; three hours later the distal pouch was partly filled. At operation a typical bilocular stomach was found, the two portions being joined together by a canal which was no wider than a pencil but quite supple, with no evidences of ulceration or of adhesions. A medio-gastric resection was performed, followed by end-to-end suture, without gastro-enterostomy. Histological examination of the part removed showed evidences of an old gastritis with some sclerosis but no fibrous stricture. It may be that such cases, of which Lagoutte has published another, are localized forms of linitis plastica, or even of tuberculosis or syphilis.

555. Frequency of Gall Stones.

E. and M. HESSE (*Russki Vrach*, 1914, 307, vide *Zentralbl. f. Chir.*, 1920, 47) have analysed the 17,402 autopsies carried out at the Obukhov Hospital, Petrograd, and found gall stones present in 4.75 per cent. of the female cases and 0.73 per cent. of the males, so that gall stones appear to be relatively rather rarer in Russia than in Western Europe. In women the stones led to complications more commonly than in men, although in 84 per cent. of the total cases they had given rise to no clinical signs. There is a possible fallacy in this last statement, as much depends on the care with which the clinical notes were made. One may assume, however, that in 84 per cent. of the gall-stone cases there had been no jaundice and probably no colic. The observers found a causal relationship between cholelithiasis and carcinoma of the gall bladder.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

556. Influenza and Lactation.

M. ROLLANDINI (*La Pediatria*, February, 1920), from his experiences at the university pediatric clinic at Turin, states that suspension of breast feeding when the mother has developed influenza and the establishment of artificial feeding is of no advantage to the infant, for the following reasons: (1) Artificial feeding diminishes the resistance of the infant to contagion. (2) Suspension of breast feeding in a sick woman is more likely to cause rapid and permanent cessation of the lacteal secretion than in health. (3) Sudden weaning facilitates the development of diseases of nutrition. Rollandini has seen a large number of cases of acute gastro-enteritis (some fatal). (4) Influenza is a disease which spreads with such rapidity that whenever it has invaded a family it does not usually spare anyone. Rollandini therefore concludes that it is the doctor's duty to encourage the continuation of breast feeding during the mother's influenza, except in cases of very severe complications, but that all possible precautions should be taken to prevent contagion. The child should be left in the mother's room as short a time as possible. The mother should not speak to or kiss the child, and refrain from coughing and, if possible, keep a handkerchief over her mouth while the child is at the breast.

557. Influenza Immunity.

H. C. HALL (*Ugeskrift for Læger*, March 4th, 1920) investigated the histories of 500 patients admitted to hospital with typical influenza. The criteria he adopted in ascertaining whether they had previously suffered from influenza or not were (1) a history of typical symptoms; (2) occurrence of these symptoms during the months of 1918-19 when the epidemic was raging; and (3) the simultaneous existence of other cases of influenza in the patients' neighbourhood. He found that only in 8.2 per cent. had reinfection occurred. The percentages of reinfection among fatal and non-fatal cases were practically the same, being 8.6 and 8.1 respectively. If it be assumed that 50 per cent. of the inhabitants of a town develop influenza during its first wave, these figures of the author's would suggest that influenza confers considerable immunity. In support of this view he also refers to the immunity shown by the staff of his hospital, whose infection with influenza was hardly ever followed by a second attack, although they were daily exposed to reinfection.

558. Influenza and Tuberculosis.

R. BURNAND (*Rev. méd. de la Suisse rom.*, March, 1920) discusses the action of influenza on pre-existing tuberculosis, and comes to the following conclusions: (1) A previous attack of tuberculosis does not convey any immunity to influenza. (2) In about 75 to 90 per cent. of cases of chronic tuberculosis in which influenza develops the acute disease runs its course as an intercurrent affection without having any effect on the evolution of the tuberculous lesions. (3) Fifteen to 25 per cent. of cases of tuberculosis undergo a considerable reactivation of their lesions as the result of an attack of influenza. This re-erudescence, however, if suitably treated, is generally mild and transient; cases of acute tuberculosis ending fatally as the sequel of influenza are rare. (4) It is the doctor's duty, however, in cases in which tuberculosis is suspected, to prevent the development of post-influenzal tuberculosis by ordering a change of climate or residence in a sanatorium immediately after convalescence.

559. Serum Treatment of Tuberculous Meningitis.

G. ÉTIENNE (*Rev. méd. de l'Est*, March 1st, 1920) records a case of tuberculous meningitis in a man, who was treated by lumbar puncture and intrathecal injections of Vallé's antituberculous serum. Although death occurred the results were encouraging. Decided improvement followed the injections at first, but the most striking results were, first, the disappearance of tubercle bacilli from the cerebro-spinal fluid, and secondly, the diminution of the meningeal reaction, shown by progressive fall in the number of the lymphocytes (from 8 to 4) and of the albumin content (from 0.80 to normal) in the cerebro-spinal fluid.

560.

Asthenic Tuberculosis.

PLICQUE (*Il Morgagni*, February 5th, 1920) says that patients suffering from asthenic tuberculosis, although having little fever, lose flesh, become anæmic, and show conspicuous failure of strength and appetite. Their blood pressure is low; they do not show the typical pigmentation of Addison's disease, but often develop little café-au-lait coloured spots. Contrary to what is noticed in the ordinary phthisic, these patients are very sensitive to cold and sudden changes in temperature, and hence not good subjects for routine open-air treatment. One can frequently observe on the skin of the abdomen the white line associated with adrenal insufficiency; this line can be brought out by drawing the finger over the skin. Polyuria is, as a rule, not present, but phosphates are increased doubly or trebly. This asthenic type of phthisis was common amongst the early prisoners of war. Some cases seemed to follow influenza, but it is very probable that in a good many cases the so-called influenza was really the beginning of the phthisis. In treatment adrenal gland given in powder is decidedly useful, 0.30 gram of the dried extract of the whole gland being given three times a day for ten days and then left off for an equal time. To lessen the phosphate loss it is useful to give calcium carbonate, calcium phosphate, sodium chloride, and magnesia.

561.

A Prodromal Sign of Tuberculosis.

AHN (*Le Scalpel*, February 21st, 1920) states that during the war examination of the lungs of children or adults debilitated by malnutrition or physical or mental strain often showed the existence of zones of impaired resonance which were regularly situated in the same positions, and formed a spiral line which was usually interrupted at definite points, but was sometimes continuous and quite distinct. The line starts at the spine of the third dorsal vertebra, and passes outwards to the upper and inner angle of the scapula, then downwards and inwards along its inner margin, and subsequently outwards, downwards, and forwards to the axilla. It then turns inwards and forwards parallel with the sixth rib, and ends at its cartilaginous extremity at a point which is usually specially tender. The line thus formed has the appearance of a capital S, which passes round the thorax describing a spiral curve, and practically corresponds to the course of the large interlobar fissure. It may be attributed to congestion of the areas separating the antero-superior from the postero-inferior lobes. As a rule the line is broken up into the following segments: (1) A juxta-vertebral segment corresponding to the origin of the fissure in the neighbourhood of the third dorsal vertebra; (2) a juxta-scapular segment at the edge of the scapula; (3) an axillary segment; (4) an epigastric segment at the anterior extremity of the sixth rib. The presence of this line or one of its segments indicates an enfeeblement of the organism, and shows that the individual is predisposed to acute or chronic bronchial affections, and in such cases tuberculosis is likely to develop when the general resistance is lowered.

562.

The Double Crural Murmur in Aortic Incompetence.

ACCORDING to C. PEZZI (*Arch. des mal. du coeur*, December, 1919) the double murmur described by Traube in 1867 in the femoral artery in cases of aortic insufficiency is a very inconstant phenomenon, although not so rare as was once thought. It occurs also in mitral disease, and does not, as Traube imagined, always indicate a very pronounced valvular lesion; it is not present in all cases of aortic insufficiency. Pezzi, who has never found it in patients with a perfectly compensated valvular lesion, believes that it only appears when more or less obvious signs of myocardial insufficiency exist.

563.

Functional Aortic Incompetence.

ACCORDING to J. BRET (*Arch. des mal. du coeur*, November, 1919) aortic incompetence not connected with a valvular lesion is a symptom of secondary importance in the course of chronic nephritis, whether associated or not with adherent pericardium; it may also be regarded as a fairly frequent manifestation of the cardiac disturbances seen in patients with hypertension. A case of Corrigan's syndrome in which there is not a true diastolic hypertension should suggest the diagnosis of functional disturbance. Bret states that the causes of functional

aortic insufficiency are as follows: (a) Lesions found at the origin of the ascending aorta, especially patches of hypertrophic aortitis projecting above the sigmoid valves and preventing their closure; (b) the well-marked projection of the interventricular septum into the aortic vestibule as the result of hypertrophy of the myocardium, sometimes increased by dilatation of the right ventricle.

564. Paraplegia in Malaria.

F. SABATUCCI (*Il Policlinico*, Sez. Prat., February 16th, 1920) records two cases in soldiers who, after contracting malaria in Albania, began to suffer from paraesthesia and weakness in the lower limbs. Intermittent claudication then developed, and finally complete paraplegia with sphincter disturbance, bedsores, and trophic ulcers. There was a loss of all kinds of sensibility, most marked in the distal segments. The paraplegia, at first flaccid, later became spastic, but under vigorous quinine treatment gradually improved, until only slight spastic paresis remained in one case; in the other the symptoms were a little more pronounced. The condition was probably due to malarial arteritis in the lower part of the dorsal cord and some of the lumbar segments.

565. Congenital Paralysis of the Right External Rectus.

GINESTOUS (*Gaz. heb. des Sci. Méd. de Bordeaux*, February 15th, 1920) reports a case in a girl, aged 7 months, who showed complete internal strabismus of the left eye. On ophthalmoscopic examination there was slight hypermetropia, as is the rule at that age, but no lesions were detected in the fundus. The infant's heredity and personal history were excellent, and no other abnormalities were present. Functionally strabismus could be excluded, and the condition was therefore congenital, being due to absence of the muscle, a vicious insertion, or a congenital abnormality of the centres of the external rectus.

566. Auriculo-ventricular Heart-block in Children.

J. A. E. EYSTER and W. S. MIDDLETON (*Amer. Journ. Dis. Child.*, February, 1920) have collected from literature twenty cases of heart-block in children, nearly all of which were definitely or probably of congenital origin or occurred during the course of severe and usually fatal diphtheria. They also record a personal case of partial auriculo-ventricular dissociation which developed in a child, aged 2 years, apparently in connexion with an acute nose and throat infection in which the cultures showed only *Staphylococcus pyogenes aureus*. The child, who was kept under observation for two years, developed normally, and was in apparently good health. At the time of writing the cardiac condition was that of a well-compensated mitral lesion associated with a 2 to 1 auriculo-ventricular block, with a ventricular rate between fifty and sixty.

567. Acute Meningococcal Meningitis with Multiple Arthritis.

M. PEHU and H. EPARVIER (*Lyon méd.*, February 25th, 1920) record a case in an infant, aged 4 weeks, admitted to hospital with swellings of the right great toe (resembling gout), and the metacarpo-phalangeal joints of three fingers. There was also a slight degree of nuchal rigidity and opisthotonos. On lumbar puncture a yellow fluid was obtained containing polymorphonuclears, but no organisms. Meningococci, however, were obtained from the left foot. In spite of serum treatment cachexia set in, and death occurred in four weeks' time. Although cerebro-spinal meningitis is relatively frequent in the child, it is rarely met with quite so early in life. As a rule, the joint manifestations are limited and discrete. In the present case, however, the arthritis was multiple and of various degrees, ranging from simple swelling to suppuration.

568. Lethargic Encephalitis.

P. NAUWELAERS and M. MEUNIER (*Le Scalpel*, March 27th, 1920) record two cases observed by them at the Hôpital St. Pierre, Brussels. The first case, which recovered, occurred in December, 1917—that is, before the epidemic of lethargic encephalitis developed in France or England. During the first stage of the disease three puzzling signs occurred—namely, intense salivation, tremor of the upper limbs, and profuse perspiration. The ocular signs were ill marked, consisting merely of unilateral paresis of accommodation. The peculiarities of the second case were the neuralgia accompanying the onset, slight contracture of the lower limbs, tremors of the upper and lower limbs during the first few days, and the rapid course of the disease, which ended fatally within a fortnight.

SURGERY.

569. Abdominal Migration of Testicle.

IT is well known that in childhood the cremasteric reflex is very active, and the testis is apt to be drawn up so as to enter the inguinal canal; among human beings, however, cases in which the testis periodically enters the abdomen, remains there for a space, and then appears again, are very rare. Such a case is reported by MURARD (*Lyon chir.*, 1919, 16). A boy, 16 years old, had suffered for many years from occasional violent pains; at the age of 13 these were found to coincide with the sudden disappearance of the left testis, which would remain inside the abdomen for five days until another violent, almost anginal, pain announced its return. These sudden disappearances occurred every month, but when Murard examined the boy the testis had been absent for fifteen days. At operation an open vaginal process was found, but the testis could not be felt through the ring. Traction on the cord, however, brought it to view, and it was easily replaced and anchored in the serotum. The epididymis was absent, the vas ending blindly.

570. Simple Ulcer of Colon.

PROUST (*Bull. et Mém. Soc. Chir. de Paris*, 1920, 46) reports a case, operated upon by Soupault, in which a simple ulcer of the colon perforated. The ulcer was situated 10 cm. above the tip of the caecum, and its rupture gave rise to symptoms hardly distinguishable from those of appendicitis. The report led to a discussion, during which Bazy and others reported similar cases. These ulcers are "simple"—that is to say, they are not the result of dysenteric or specific organisms, and have no dependence on disease of the colon or appendix, nor on distension of the gut above a stricture; their cause is unknown. They give rise to symptoms and signs of acute peritonitis, and are very fatal from the liberation of faecal material in the peritoneal cavity.

571. Pseudo-malarial Gonococcal Fever.

M. BLOCH and P. HÉBERT (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, March 4th, 1920) report the case of a soldier, aged 25, who contracted gonorrhoea in December, 1917, and in the following March at frequent intervals had sudden attacks of fever which were not affected by quinine, but were accompanied by severe pain in the joints and a generalized papular and purpuric eruption, most marked on the limbs. The condition exactly resembled certain cases of meningococcal infection which have been described by Netter and others, and the diagnosis could only be made by finding that the diplococcus isolated from the blood was not agglutinated by autimeningococcus serum; antigenococcus serum, however, was effective. Antimeningococcus serum, which some writers have found effective in the articular localizations of the gonococcus, proved useless, but an antigenococcus auto-vaccine cured at once the fever, arthralgia, and skin eruption, though it had no effect on the urethritis and epididymitis.

572. The Two-stage Operation of Partial Colectomy.

C. H. DOWD (*Annals of Surgery*, February, 1920) writes in favour of the two-stage or many-stage operation in certain cases of carcinoma of the colon from the hepatic flexure to the end of the sigmoid, where nearly 70 per cent. of carcinoma cases above the rectum are found. In order to carry out a one-stage operation successfully in this part of the colon the patients should be fairly strong, and the colon should be nearly empty and comparatively free from fat. The one-stage procedure has a mortality rate three times greater than the many-stage method. In performing the two-stage operation the portion of bowel and the adjacent glands must be freely mobilized. Mayo begins the clamping of the spur ten or twelve days after the primary operation; its division is complete in six more days. A few days later the colostomy is closed by an extraperitoneal operation. The only disadvantages of the operation are delay in healing, unpleasant convalescence, and the possible occurrence of hernia.

573. Cysts of the Thyroglossal Tract.

W. E. SISTRUNK (*Annals of Surgery*, February, 1920) considers it probable that in many cases the portion of the thyroglossal tract lying near the hyoid bone retains its epithelium and opening into the mouth through the foramen caecum. At some period infection occurs and closes the opening into the foramen caecum; the accumu-

lating fluid then travels downwards, following the track made by the thyroid during its descent, and appears as a tumour in the mid-line of the neck near the hyoid bone. The operation, as performed by Sistrunk, consists in freeing the cyst as far as the hyoid, removing a portion of the centre of that bone, and then, without any attempt to isolate the duct, coring through the tissues from this point to the foramen caecum, removing with the duct the surrounding tissues for about one-eighth of an inch on every side. This includes a portion of the raphe joining the mylohyoid muscles, a portion of each geniohyoglossus muscle, and the foramen caecum. The opening into the mouth is then closed and the edges of the hyoid are approximated by suturing the soft parts. In order to recognize any lateral branches the sinus may be first injected with methylene blue.

574. Surgical Treatment of Goitre.

Mode of Anaesthesia.

COTTIS (*Med. Record*, April 17th, 1920) advises as a routine anaesthetic ether given by the colon, the administration being begun while the patient is in bed. Local anaesthesia is indicated in old people, in cases of large goitres of long standing, and in extremely toxic cases; in the latter it permits one to observe how well the patient is standing the operation. If the patient becomes restless in such cases, it is best to discontinue the operation and to pack the wound with Dakin's solution. Cottis suggests that the occurrence of thyrotoxic symptoms during operations conducted under local anaesthesia is due to the injection of adrenalin; he has met the condition less frequently since he has omitted the use of this drug.

The Relation Existing Between the Amount of Gland Removed and the Permanence of Relief.

575. BEILBY (*loc. cit.*) points out that (1) removal of one lobe of the gland in exophthalmic goitre may give temporary relief but will not effect a cure; (2) if a portion only of one lobe is left and its blood supply is undisturbed, it hypertrophies and a recurrence of symptoms may be expected; (3) where sufficient gland tissue is removed the toxic symptoms frequently disappear; this relief is a permanent one if the remaining gland tissue is not left in a condition such that hypertrophy may take place. Experience has proved that patients derive little or no lasting improvement from operations in which one lobe only is removed; if improvement does occur it is only for six to twelve months, during which time hypertrophy of the remaining part of the gland takes place, and in the end the same amount of thyroid tissue is present as was there before the operation. He has found that when a portion of the gland is removed and the circulation of one lobe is left intact the reaction is more severe than when a subtotal resection has been done. The result of operation depends not so much on the total amount of tissue left as upon its distribution and blood supply. If one-third or one-fourth of the total amount of gland tissue remains and a portion of one lobe retains an undisturbed blood supply, hypertrophy and a return of toxic symptoms are likely to occur; if, on the other hand, some amount of gland tissue is left in the form of small scattered bits there is little likelihood of these pieces becoming hypertrophied. The general tendency of operations has been to leave too much rather than too little thyroid tissue.

576. Gunshot Wounds of the Bladder.

L. FRASSI (*Il Policlinico*, Sez. Chir., February 15th and March 15th, 1920) states that as compared with wounds of the abdomen wounds of the bladder are relatively rare. Clinically they may be classified as intraperitoneal and extraperitoneal. Isolated lesions of the bladder are very rare, and may be associated with retention of the projectile. In the majority of cases vesical wounds, both intra- and extra-peritoneal, are accompanied by lesions of the neighbouring organs, such as the small intestine, the rectum in its extra-peritoneal portion, the urethra, joints, vessels, and nerves. The bladder is usually wounded by the projectile penetrating the perineal, sciatic, or sacral region; less frequently by an anterior abdominal route. Vesical wounds are most frequently complicated by wounds of bone, which are liable to give rise to severe osteomyelitis. Sequestra are formed, and fistulous tracks develop which may open into the bladder and cause severe and obstinate cystitis, with formation of calculi requiring operative interference. Treatment of vesical lesions will in exceptional cases be non-operative—for example, when the wounds are small and there is no evidence of complications. The treatment of intraperitoneal wounds of the bladder is always laparotomy, which should be performed in order to determine what lesions have occurred, to repair

perforations of the intestines and bladder, to prevent the escape of urine and blood into the peritoneal cavity, and to establish free drainage. Expectant treatment—which consists in tying in a catheter and excising the wound—is sufficient in a large number of extraperitoneal wounds of the bladder, but such cases require to be watched, so that further operation may be carried out if necessary. Suprapubic lithotomy should be performed when there is (1) reason to suspect the existence of severe lesions of the bladder in its lower quadrant; (2) retention of the projectile; (3) a lesion of the rectum; and (4) continuous haemorrhage.

577. Blood Changes in Influenza.

KINSELLA and BROUN (*Journ. Amer. Med. Assoc.*, April 17th, 1920) studied the clotting time, the platelet count, the fragility of the red cells, and the number of leucocytes, in forty patients with influenza between the third and sixth day. With the method used the clotting time was longer than that of normal patients. Platelet counts were made in twenty-one cases; the reduction in the majority of the cases was very definite. As in the case of clotting time, the reduction of platelets was independent of the stage of the disease or of the presence of secondary infections. The reduction of platelets and the delay in clotting time took parallel courses, and were independent of the number of leucocytes present. In general, influenza was attended by an absence of leucocytosis, often extending to leucopenia.

578. Chronic Vesiculitis and Enlarged Prostate.

ACCORDING to G. MARION (*Journ. d'Urologie*, Tom. ix, No. 1, 1920), the presence of a painful swelling of the vesiculae seminales in patients with enlarged prostate should suggest the idea of cancer, whatever the characters of the prostatic lesion may be. The affection of the vesiculae should not be regarded as necessarily indicating extension of the growth; it may merely be a retrograde dilatation, the ejaculatory ducts being invaded by the cancer. In such cases removal of the new growth is by no means contraindicated, and removal of the vesiculae does not appear to aggravate the prognosis of prostatectomy.

OBSTETRICS AND GYNAECOLOGY.

579. Hypernephroma of Uterus.

HARTMANN and PEYRON (*Gynec. et Obstét.*, Revue Mensuelle, Paris, vol. i, No. 1, 1920) report a case of hypernephroma of the uterus. A primipara, aged 58, began in January, 1917, four years after the menopause, to suffer from irregular haemorrhages and abdominal pain. On January 9th, 1919, she was found to be very anaemic and to have a hard rounded tumour arising in the pelvis and reaching the umbilicus; the os was dilated and friable masses were becoming polypoid. After the uterus had been emptied by a vaginal operation, its cavity admitted the whole of the sound, including the handle; the uterus was continuous with the abdominal tumour. Microscopic examination of the fragments of tumour showed a structure resembling that of the glomerular and fascicular zones of the adrenal cortex. On March 11th, her general condition having improved, total hysterectomy was performed. The adnexa showed inflammatory changes only; the external appearance of the uterus suggested a fibromyomatous condition, and its cavity was occupied by a soft friable gangrenous mass arising from the left and posterior aspects of the wall, and showing histologically a structure resembling that of adrenal cortex. Twice during the ensuing eight months fragmentary non-ulcerated vaginal metastases of similar structure to the primary tumour were removed and 0.05 cg. of radium was applied for forty-five minutes; on December 20th she was quite well. Hypernephromata of the broad ligaments are not unknown, but the authors believe this to be the first recorded case of such a tumour of the uterus.

580. Bilateral Tubal Pregnancy.

BROSSMANN (*Zentralbl. f. Gyn.*, February 14th, 1920) alludes to the difficulty of determining whether cases of bilateral frequency occur simultaneously or by a process of superfetation, and refers to illustrative cases in the literature. His own case, he thinks, supports the possibility of a bilateral simultaneous tubal pregnancy. A woman of 37, who had already had seven normal pregnancies, was operated on for ectopic pregnancy with haematocele in Douglas's pouch; the right tube was found to be ruptured and contained an embryo 6 to 8 mm.

long, while the left tube, still intact, contained an embryo 16 to 18 mm. long. Sixteen days before operation, however, haemorrhage had occurred, and the death of the embryo in the right tube had presumably taken place, whereas that in the left tube had continued to develop. Both ovaries contained a corpus luteum.

581. Pregnancy and Body Weight.

MOMM (*Zentralbl. f. Gyn.*, March 6th, 1920) confirms the previous work of Zangemeister (*Zeitschrift f. Geb. u. Gyn.*, Bd. lxxviii, Heft 2), who investigated the changes in body weight during pregnancy. Zangemeister found that from the twenty-seventh week onwards there is normally a steady average increase of 58 grams a day until two days before the end of pregnancy, when the patient suddenly loses about one kilogram in weight. The amount lost varies with the size, age, etc., of the mother, whereas the increase in weight up to this date has depended on the increase in weight of both the fetus and the mother. It is true that the liquor amnii decreases somewhat in the last stage of pregnancy, but the sudden and considerable loss of body weight reported cannot be ascribed to this alone. The practical application is that the onset of labour at term can be readily predicted by a system of careful weighing of the patient during the later weeks of pregnancy, and thus time is allowed for the necessary preparations to be made. In Momm's clinic the weighing of in-patients took place daily at 6 a.m. for ten days before the expected date of confinement, and careful estimations were made of intake of food and drink for several hours beforehand; catheterization of the patient was also performed and a rectal injection given. Momm's results correspond approximately with those of Zangemeister.

PATHOLOGY.

582. Artificial Acquired Immunity to Influenzal Pneumonia.

J. BUCHHOLTZ (*Ugeskrift for Laeger*, April 8th, 1920) gave a polyvalent streptococcal and pneumococcal vaccine as a prophylactic against pneumonia to those of the nurses at his hospital who, early in January, 1920, had not hitherto contracted influenza. According to the scheme of dosage advocated by the Serum Institute which supplied the vaccine, three injections were to be given of $\frac{1}{2}$, $\frac{1}{4}$, and 1 cm. respectively at intervals of four days. But the local reaction to the second injection was usually so violent that the author dared not give more than $\frac{1}{2}$ cm. at the third injection. Of the 66 nurses inoculated, 18 were given only one injection, and of these 6 contracted influenza, complicated in 2 cases by pneumonia. Of the 27 who were given two injections 8 contracted influenza. None of these cases was complicated by pneumonia. Of the 21 who were given three injections only one developed influenza, and this case was uncomplicated by pneumonia. The author concludes that prophylactic inoculation against influenza pneumonia is shown by these figures to be of great value.

583. The Pathogenesis of So-called Ano-rectal Syphilloma.

JERSILD (*Ann. de Dermat. et Syph.*, vol. 1, No. 2, 1920) has made a careful clinical and pathological study of six cases of the condition to which Fournier gave the name *syphillome ano-rectal*. The condition is characterized by a peri-anal infiltration, consisting of firm rounded tumours following the radial folds, together with a constriction of the lower portion of the rectum. Very frequently the condition is accompanied by fistulae, which originate in the mucous membrane below the stenosis. In most cases there coexists a nodular indolent hyperplasia of the external genitals, especially in women, in whom the disease is more frequent. Against Fournier's idea that the condition was a tertiary syphilitic manifestation there have been brought forward several arguments: (1) a good many cases have neither a history nor clinical signs of syphilis; (2) the microscope does not reveal the characteristic lesions of syphilis; and (3) specific treatment produces no amelioration of the lesion. Some have attributed it to gonorrhoeal proctitis, or to inflammation of Bartholin's gland spreading to the rectum. The disease is of a very chronic indolent type, and there may or may not be definite ulcerations. Jersild gives the histories of two of his cases in which the condition had existed for several years, and both of

these cases presented recent syphilitic eruptions, which responded promptly to antisyphilitic remedies without any amelioration of the local disease. This would seem to rule out of court the syphilitic nature of the lesion. In another case the patient was clinically and serologically free, whilst two gave a history of syphilitic infection several years before the onset of rectal symptoms. The fixed localization of the rectal infiltration indicates some anatomical factor, and the frequent coexistence of vulvar elephantiasis leads one to believe that the same pathological process is at work in both. Jersild imagines that the condition originates from some peri-anal lesion (such as chancre, soft sore, wounds, etc.), with an arrest of the lymphatic circulation of the inguinal glands and their afferent vessels. An ano-rectal adenitis occurs, and, owing to the anatomical arrangement of the lymphatics of the anus and anal canal, there results a lymph stasis. The author proposes to designate the condition "ano-rectal elephantiasis." In this country it is often referred to as "chronic infective ulceration of the rectum."

584. Nerve Regeneration after Impregnation with Alcohol.

BARTHÉLEMY (*C. R. Soc. Biologie*, April 17th, 1920) has studied experimentally the effects of injection into nerves of certain fixation fluids. The intravenous injection of alcohol or osmic acid has been extensively employed in the treatment of intractable facial neuralgia; judging by the anaesthesia produced by this method it is believed that a physiological section of the nerve occurs. Usually the relief is temporary, and after a certain lapse of time the trouble recurs and there is a return of sensitiveness in the area of innervation. On the average, if the nerve trunk has been actually injected, the period of relief is eight months to a year. As this corresponds with the time necessary for nerve regeneration, it is supposed that the nerve injected first degenerates and then regenerates. Barthélemy has given experimental proof that this theoretical deduction is correct. By injecting alcohol or osmic acid into the sciatic nerve of dogs and rabbits he found that degeneration occurred and then regeneration, just as in section and secondary suture, but with the difference that in the former case the regeneration occurred in a more orderly fashion without exaggerated reaction phenomena and without the production of false neuromata. In secondary suture of nerves neuroma production is constant if the cut ends are placed in apposition, but if there be interposed between the ends a segment of nerve which has been fixed in alcohol regeneration occurs without neuroma formation.

585. Protein Sensitization in Asthma and Hay Fever.

SANFORD (*Minnesota Medicine*, April, 1920) records the result of 800 tests made during the last two years at the Mayo clinic. As a rule no patient was tested unless he was suffering from asthma or hay fever. More than 500 cases were entirely negative in their skin reaction, though tested with numerous proteins. Some eighteen or more proteins dissolved in decinormal sodium hydroxide were used. Sanford found that more than 200 cases gave definite skin reactions; 28 reacted positively to some of the animal emanations, the majority of these being to horse dander. No less than 100 cases reacted to one or several of the proteins derived from food, the greatest number of reactions being to egg white; 25 patients had marked positive reactions to grain—wheat, rice, and rye being the common kinds; 28 patients were sensitive to vegetable proteins. Fruit apparently had little to do with asthma, though in several instances banana gave marked reactions. In 365 tests with *Staphylococcus pyogenes aureus* and *albus* there was not a single reaction. The most interesting group, and one that gave very definite results, was made up of those persons sensitive to pollens. Persons sensitive to animal emanations may be desensitized for a considerable period by repeated injections of safe but increasingly large doses of the offending protein. In the case of persons sensitive to food proteins attempts at desensitization did not meet with marked success, and the careful elimination of the offending substances from the diet would seem to be the chief method of control. Patients sensitive to pollens offered much greater prospect of successful treatment; in such cases treatment was commenced at least twelve weeks before the earliest date of pollination, starting with a dilution less than that necessary to produce a positive skin reaction, the weekly injections being gradually increased until a few tenths of a cubic centimetre of 1 to 100 extract was attained. The history of the case enabled one to narrow down the list of proteins possibly responsible for the asthma or hay fever.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

583. Acute Suppurative Hypophysitis as a Complication of Purulent Sphenoidal Sinusitis.

T. R. BOGGS and M. C. WINTERNITZ (*Johns Hopkins Hosp. Reports*, 1919, xviii) are not cognizant of any reported instance of acute inflammation of the pituitary and therefore record such a case, arising by extension from purulent sphenoidal sinusitis, and exhibiting signs (hyperglycaemia and glycosuria) that the function of the gland was impaired. A woman, aged 43 years, was admitted to hospital with fever, albumin, casts, acetone and diacetic acid in the urine, and symptoms of intracranial inflammation, possibly abscess or encephalitis. Direct and endoscopic examination of the nasal and pharyngeal cavities showed that the external orifices of all sinus ducts were normal. The patient died two days after admission, and the necropsy proved that primary purulent inflammation of the sphenoidal sinus had extended through the sella turcica to the pituitary, which was dark red in colour and extremely friable; the demarcations of the gland were obscured by granulation tissue. There was subacute haemorrhagic basilar meningitis spreading to the right Sylvian fissure with acute encephalitis on that side. The pus from the sphenoidal sinus, from the base of the brain, and the blood from the heart contained *Staphylococcus aureus*. Microscopically the pituitary was acutely inflamed. Lumbar puncture immediately after death gave clear fluid with 450 cells per c.mm., of which 25 were white cells—namely, mononuclears 19, polymorphonuclears 6—and the rest red blood cells.

587. Dangers of Medication by Subcutaneous Injection.

O. THOMSEN (*Hospitalstidende*, March 18th, 1920) found that during the recent epidemic of influenza in Copenhagen at least 10 cases of gas phlegmon occurred as a direct sequel to the injection of drugs. Most of these cases terminated fatally, and several of them were investigated at the Serum Institute. The phlegmon originated in all cases at the site of injection of oil of camphor, caffeine, and other stimulants. The infecting organism was the Welch-Fraenkel bacillus or other members of a group possessing the common feature of spore formation. The author blames both pharmacists and the medical profession for these accidents. With regard to the former, their sterilization of drugs for injection is inadequate as far as spore-forming micro-organisms are concerned. As for the medical profession, the author suggests it is not generally realized that, under certain conditions, the introduction of pathogenic micro-organisms under the skin may be far more dangerous than into the peritoneal cavity. With regard to such drugs as cocaine, which cannot be boiled with impunity, Thomsen advocates filtration through a Chamberland or Berkefeld filter. He has analysed a variety of drugs, including preparations of morphine, cocaine, caffeine, etc., after their passage through filters, and has found that the Berkefeld filter transmits these drugs without loss. He concludes that the trouble and cost of securing absolute sterility of drugs for injection are not insuperable obstacles; and he recommends the adoption of definite rules for the preparation of these drugs by the Danish Pharmacopoeial Commission, advised by a bacteriologist.

588. Immunity and Bradycardia in Influenza.

REVIEWING the experiences of the Öresunds Hospital with regard to the epidemics of influenza in 1918 and 1919. V. FRIIS-MÖLLER (*Hospitalstidende*, January 21st, 1920) draws special attention to two points: (1) Not one of his patients had suffered from the epidemic of 1889 and 1890. Nine stated that they had suffered from influenza at some period between 1893 and 1918. Fifty patients had already suffered from one or more attacks during the present epidemic. These attacks dated back five weeks to several months earlier, and in the intervals these persons had been perfectly well. In these cases of relapse the last attack was the most serious, and was fatal in some cases. (2) Though it was commonly stated that bradycardia is peculiarly characteristic of influenza, the author found this symptom only in a few, most often in uncomplicated cases. As a rule the pulse was 110 to 120 during the first few days. It slowed down with the fall of the temperature, reaching normal in a few days. Then it fell for the

next two or three days to 40 to 60, after which it returned to the normal rate. The marked bradycardia occurring after the fall of the temperature was not peculiar to influenza, for the same phenomenon has been observed in several other infectious diseases.

589. The Action of Influenza on Tuberculosis.

IN a discussion on the relation of influenza to tuberculosis JÖRGENSEN (*Norsk Magazin for Laegevidenskaben*, February, 1920), judging by the notifications of tuberculosis and the death rate therefrom, found no evidence to show that influenza is responsible for any appreciable reactivation of tuberculosis. Indeed, in 1918, 82 fewer cases of tuberculosis were notified in Christiania than in 1917. The death rate from tuberculosis appeared to be unaffected by the influenza of 1889-90. TILLISCH (*Norsk Magazin for Laegevidenskaben*, March, 1920), on the other hand, has come to the conclusion that influenzal infection is a very serious factor in tuberculosis. In 223 out of 532 cases of tuberculosis the disease was complicated by influenza. Among these there were 57 in which the already active tuberculosis was aggravated. There were also 53 cases in which the tuberculous infection had been latent for a considerable period, and its recrudescence coincided with an outbreak of influenza. In nearly two-thirds of these cases the tuberculosis had been latent for six years or more. In another group of 69 cases the first sign of tuberculosis coincided with an attack of influenza; in these cases, too, the tuberculosis was no doubt of old standing though it had not been previously detected. Of six patients treated by artificial pneumothorax and contracting influenza only one escaped with impunity, the remainder being dead or dying. Tillisch also considers the rapidly progressive character of many cases of tuberculosis complicated by influenza to be a further proof of the sinister part played by this disease.

590. Treatment of Laryngeal Tuberculosis with Carbon Arc Light.

N. R. BLEGVAD (*Hospitalstidende*, February 11th, 18th, 25th, and March 3rd, 1920) gives an account of his experience, during the past two and a half years, of exposures of the whole body to carbon arc light in 74 cases of tuberculosis of the larynx. During the first week of treatment exposures to four powerful arc lamps (20 ampères) were given for fifteen minutes every day. Every week the duration of the exposures was increased by fifteen minutes, and finally each exposure lasted an hour. Most of the patients were in Turban's third stage of pulmonary tuberculosis, yet the laryngeal disease was arrested in 17 cases, and in 35 other cases definite improvement was effected. The disease was stationary in 6 cases and progressive in 16 in spite of this treatment. Local treatment with the galvano-cautery was found to be a useful supplement to this procedure; the combination of the two gave better results, in the author's opinion, than any other method. He finds that tuberculosis of the larynx frequently runs a course independent of that of the lungs, and it is therefore necessary for the larynx to receive special treatment.

591. Subcutaneous Injections of Sodium Bromide in Mental Disease.

C. JÖRGENSEN (*Hospitalstidende*, January 7th, 1920) has been very favourably impressed by the sedative action of sodium bromide injected hypodermically. At the Frederiksberg Hospital the results of giving sodium bromide by the mouth in psychoses with exaltation proved so unsatisfactory, even when as much as 24 grams were given in the twenty-four hours, that it fell into disuse. The introduction by Levison of subcutaneous injections of normal saline solution in phases of exaltation has proved a success, and this treatment is still practised at the author's hospital, for hallucinations and the toxic psychoses. He has, however, modified it by substituting sodium bromide for the sodium chloride in the saline solution, and he has found that 7 grams of sodium bromide given in the course of two hours were well tolerated. He has increased the dosage to 9 grams in 1 litre of water, so that if two injections be given in one day the patient receives as much as 18 grams in the twenty-four hours. He gives details of several cases to illustrate the efficacy of this treatment and its superiority over other remedies, such as chloral, veronal, opium

derivatives, and hyoscine; but as the administration of these is comparatively easy, he reserves the injections of sodium bromide for the most refractory cases, which the above drugs failed to control.

592. Rapid Institutional Treatment of Scabies.

M. OPPENHEIM (*Wien. Klin. Woch.*, January 29th, 1920) notes that of all the methods advocated during the war for the rapid treatment of scabies, only two have proved reliable for ambulant treatment. These are the modified Wilkin-on and the modified Hardy treatments. With an experience of over 20,000 cases, he has come to the conclusion that the modified Hardy treatment is perfectly harmless and absolutely reliable. He has seen barely half a score of relapses, and these were due to faults of the nurses, not of the treatment. In his advocacy of the establishment of centres for Hardy's rapid treatment, he observes that if the attendances at hospital for 1917 and 1918 be compared, a tenfold increase in the incidence of scabies in Vienna is revealed.

593. The Incubation Period of Typhus.

ACCORDING TO P. H. KRAMER (*Nederl. Tijdschr. v. Geneesk.*, March 13th, 1920) widely divergent estimates have been given of the incubation period in typhus. It is generally supposed to be nine to twelve days; in one of Kramer's cases, however, it was shown to be eight days only. At the beginning of the epidemic in Rotterdam (1918-19) contacts were isolated for fourteen days, but subsequently this period was extended to eighteen days, two suspects having developed the disease three days after release from quarantine.

594. Mixed Typhoid and Paratyphoid Infection.

A. PIRERA (*La Medicina Pratica*, February 29th, 1920) records a case in a man, aged 23, remarkable for the exceptional character of the temperature, which showed a well marked tertian type, exactly like that of malaria, except that the rise of temperature usually occurred during the day instead of the evening. Moreover the fever ceased without the aid of quinine, which was only given during the first few days of the disease and without any effect. Bleeding, on the other hand, proved remarkably successful, the temperature falling to normal after the second bleeding on the twelfth day.

595. Subarachnoid Meningeal Haemorrhage.

P. MAURIAC and E. FERRÉ (*Journ. de Méd. de Bordeaux*, March 10th, 1920) record three cases of subarachnoid meningeal haemorrhage in soldiers. In the first case the cause of the haemorrhage could not be determined; in the second the meningeal haemorrhage was associated with convulsive nraemia, and in the third case the haemorrhage followed extraction of teeth.

596. Primary Tricuspid Endocarditis.

RÉMOND and MINVIELLE (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, January 30th, 1920) record a case in a man aged 39 who had had four attacks of acute articular rheumatism and was admitted to hospital with signs of heart failure. On auscultation a presystolic rumble was heard, and a systolic bruit which was most distinct below the sternum-articulation. On radioscopia the cardiac shadow was increased in size in all its dimensions, especially on the right, where it presented a convexity most marked in the right auricle.

597. Yellow Fever in Ecuador.

C. A. ELLIOTT (*Arch. Int. Med.*, February 16th, 1920) describes the morbid appearances and clinical features of 70 cases of yellow fever observed between July and September, 1918, at Guayaquil (an endemic centre of the disease), where it is considered impossible that a native can grow to maturity without contracting the disease, and therefore, if recovery occurs, becoming immune. None of the houses from which the patients came were screened, and mosquitos, often in great numbers, were constantly present. The onset of the disease was rapid, and the fever was usually low and short, accompanied by slow pulse, congestion of the face, sclerae and gums, and followed by an afebrile period of apparent intoxication with increasing jaundice, haemorrhages and nephritis. Prompt death or rapid and complete recovery occurred. Death occurred most frequently on the eighth day. Out of 50 cases 19, or 38 per cent., proved fatal. Bad prognostic signs were rapid pulse, uraemic manifestations, such as air hunger, restlessness, coma, and delirium, with oliguria progressing to anuria. The greatest difficulty in diagnosis occurred in cases of malaria in which yellow fever supervened; and in

cases of cerebral malaria the diagnosis might be impossible except at necropsy. Clinically, yellow fever resembled infectious jaundice, the differences—the more prominent jaundice and slight degree of haemorrhage in yellow fever—being chiefly those of degree. Death was due to uraemia from intense degeneration of the cells of the convoluted tubes of the kidney, the glomeruli and collecting tubules being unaffected. The lungs nearly always showed haemorrhages, and hepatic changes—haemorrhages, fatty degeneration and necrosis of the cells—were prominent. The complete restitution of all the viscera was remarkable, no evidence of impaired hepatic or renal function appearing in those patients who recovered.

598. The Combined Method of Percussion and Auscultation for Detecting Enlarged Hilus Glands.

W. M. NAESSENS (*Nederl. Tijdschr. v. Geneesk.*, March 13th, 1920) describes the following method for detecting enlarged glands at the pulmonary hilus. The patient is examined in the sitting position, the head bent forwards; the doctor then percusses the back directly with the right middle finger, and at the same time places the end of the stethoscope about 5 cm. from the percussing finger, and auscultates, the percussion beginning at the lower border of the lungs, and working upwards about 2 to 4 cm. from the vertebral column. The percussive note over the lung containing air is loud, metallic, and high pitched, but over an enlarged bronchial gland it is duller, lower pitched, and not metallic. Care must be taken not to percuss a bone. Glandular swellings of any size are detected with certainty even when percussion or auscultation alone fails to do so, though small swellings may escape notice.

SURGERY.

599. Operations for Embolism.

IN a review of the literature of operations for embolism, not including embolism of the pulmonary arteries, H. SUNDBERG (*Hygiea*, January 16th, 1920) finds that only in six out of twenty cases was the operation a permanent success. Of these six successes four were achieved by Swedish surgeons. He contributes the following case to the list: A farmer of 63, suffering from heart disease, had been in hospital nine days, when he suddenly felt pain in his left foot. The pain extended up his leg, and was accompanied by numbness and weakness of the limb, which later became cold, white, and pulseless. About twelve hours afterwards the femoral artery was opened through an incision made under local anaesthesia just below Poupard's ligament. The upper end of the clot was about 2 cm. above the division of the common femoral artery into the deep and superficial branches. By gentle traction the author succeeded in pulling out the clot in its entirety; it measured 85 cm., the exact length of the limb from the site of the operation to the sole of the foot. The artery was closed with silk sutures passed through the outer and middle coats of the artery without traversing the internal lining. The patient wrote two months after his discharge from hospital that all was well with his leg.

600. Treatment of Tetanus.

A. MONTEFASCO (*La Medicina Pratica*, March 31st, 1920) treated seventeen cases of tetanus during the war, with eight recoveries and nine deaths, a mortality of 52.9 per cent. He employed either magnesium sulphate alone, or more frequently a combination of magnesium sulphate and antitetanic serum, which was given intrathecally or subcutaneously when the condition of the patients did not permit of lumbar puncture. Magnesium sulphate was always given subcutaneously in doses of 1 c.cm. of a 1 in 40 solution every three or four hours, and the serum in doses of 100 units for several days in succession.

601. Closure of Colostomy.

KIRSCHER of Kaiserlautern (*Zentralbl. f. Chir.*, 1920, 47) describes his method of closing colostomy wounds: the technique is entirely extraperitoneal. An incision is carried round the colostomy 1 cm. away from it, extending to but not opening the peritoneal cavity. The colostomy is temporarily closed with a stitch. The peritonium is now separated as widely as possible from the deep aspect of the abdominal wall, so that the colostomy opening is freely mobilized and can be drawn out of the wound; conversely, the colostomy can be pushed back into the abdomen and is then situated at the bottom of a peritoneal funnel. After this mobilization has been accomplished

the stoma is trimmed and carefully sutured. On replacing the bowel the peritoneum should be susceptible of approximation over it and may be held in position by a suture or two, though this is not essential. The abdominal wall is closed in layers with a strip of iodoform gauze for drainage.

602. Submucous Lipoma of the Caecum Causing Intestinal Obstruction.

L. LONGO (*Il Policlinico*, Sez. Chir., March 15th, 1920) states that benign tumours of the intestine (of which lipomata are the rarest) are very infrequent, and, as a rule, are only discovered at operation. In 1899 Hiller, one of the first to write on intestinal lipomata, found only 25 cases on record, and Hellstrom in 1907 collected only 45. In 1913 Cicala described a case of lipoma of the caecum which gave rise to intussusception, and collected 14 other cases of intestinal lipoma. The tumour may be situated in any part of the intestine; unlike other benign intestinal tumours it is usually single. Longo records a case in a woman, aged 47, who suddenly developed intestinal obstruction. At operation, in addition to a dilated adherent gall bladder, a submucous lipoma of the caecum was found; cholecystectomy and removal of the tumour resulted in a rapid recovery.

603. Annular Pancreas.

U. BENEDETTI (*Il Policlinico*, Sez. Chir., March 15th, 1920) records an example of this anomaly, of which only six cases have been previously recorded, four being discovered *post mortem* and two at an operation for intestinal obstruction. Benedetti's case occurred in a soldier who, while recovering from multiple gunshot wounds of the limbs, suddenly developed symptoms of intestinal obstruction. Examination of the urine and faeces showed nothing abnormal. Operation was contraindicated by the general condition of the patient. The autopsy showed the descending part of the duodenum to be encircled by the head of the pancreas. The oedematous condition of the pancreas suggested an inflammatory condition, but no histological examination was made. Benedetti points out that Giannelli has recently shown that in teleostean fishes the pancreas normally surrounds the intestine, so that the annular pancreas in man may be regarded as a vestige.

604. Plastic Repair of Urethral Stricture.

STERN (*Journ. Amer. Med. Assoc.*, 1920, 74) describes his method of treating urethral stricture by a plastic operation. The patient is placed in Macalpine's position so that the perineum is practically horizontal; this makes the operation much easier. The essential step of the procedure is the liberation of the corpus spongiosum from the triangular ligament, exposing the strictured urethra beneath it. This is excised and a plastic repair carried out, the defect being sutured in such manner that no constriction is left. A catheter is left in, and the wound closed in layers. No leak occurs, and in other respects Stern's results have been good.

605. Technique of Epididymectomy.

STERN (*Surg., Gyn., and Obstet.*, 1920, 30) describes a simple technique for epididymectomy. To remove the testis and leave the epididymis is easier than to perform the reverse; the essential of Stern's method is the separation of the body of the epididymis from that of the testis, which is effected by pushing a pair of scissors through from the outer to the inner side, the tips being inserted into the digital fossa. If the scissors are now opened the epididymis will be left attached merely by its upper and lower poles. These connexions may then be severed without any danger of interfering with the vascular pedicle of the testis. The vas, if extensively diseased, may be followed up to the internal ring.

606. Sodium Taurocholate in the Prophylaxis of Gonorrhoea.

CASTELLANI (*Ann. di Med. Navale Coloniale*, February, 1919), finding that bile and its salts inhibit the development of the gonococcus, recommends as a preventive solution 2 to 4 grams of sodium taurocholate dissolved in 30 grams of neutral glycerin. The author experimented on two subjects who volunteered; in one, pus rich in gonococci, after being mixed for three minutes with this solution, was instilled within the meatus; in the other a few drops of the solution were introduced, and three minutes afterwards pus containing gonococci was instilled. Five minutes later miction and soap and water lavage were performed; both subjects remained free from gonorrhoeal infection.

607. Hot Air Treatment of Naevi

MOUCHET and VIGNAT (*Bull. et Mém. Soc. Chir. de Paris*, 1920, 46) have previously demonstrated the excellent results obtainable in the treatment of cutaneous naevi by treating them with hot air. They have now applied the method to a subcutaneous naevus. A very small skin incision was made and the edges were widely retracted and protected with cold water compresses. A jet of air at a temperature of 75° C. was then projected upon the naevus. The coagulated material was scraped away and the jet once more applied, these steps being repeated until the whole angioma had been destroyed. The minute skin wound was sutured and healed by first intention; an admirable cosmetic result was produced.

608. Chorion-epithelioma of the Testis.

ACCORDING TO F. L. GRAPIOLO and C. SPADA (*Rev. Sud-Americana di Endocrinologia*, March 15th, 1920), chorion-epithelioma of the testis is very rare. Woglom, in 1917, recorded 2 cases of his own and collected 65 others from the literature. Hartman and Peyron, in 1919, recorded 27 personal cases. The present writers report the first case to be described in the Argentine Republic. The patient was aged 37, and the clinical course was suggestive of an acute infection. The appearance of jaundice on the seventh day, the enlargement of the spleen, and the remittent pyrexia suggested the diagnosis of spirochaetosis icterohaemorrhagica, but examination of the urine and inoculation of guinea-pigs proved negative. After a streptococcus had been isolated from the blood the possibility of streptococcal septicaemia was considered. It was only after death that the characteristic metastases in the liver and retroperitoneal tissues suggested examination of the testes, in one of which the primary tumour was found. It was remarkable that the tumour had developed, not in the right testis, which was retained in the inguinal canal, but in the normally situated left testis, and that there had been no signs of the disease in the testis during life although the tumour had undergone necrosis.

OBSTETRICS AND GYNAECOLOGY.

609. Tuberculosis of the Cervix

CHARLANNE (*Bull. et Mém. Soc. Anat. de Paris*, March, 1920) records the case of a multipara of 40, who had previously suffered from lupus of the face. Two years after an operation for prolapse (during which the cervix was found to be quite healthy) she complained of leucorrhoea and abdominal pain. Examination showed the presence of an excavated ulcer with diffuse infiltration of the cervix; microscopic examination of a portion which had been excised confirmed the diagnosis of tuberculosis. Giant cells but not tubercle bacilli were found. Ascites has since developed.

610. A Test of the Patency of Fallopian Tubes.

SEVERAL recent communications, especially in the American medical journals, have testified to the value of intraperitoneal injections of oxygen in conjunction with x-ray examination in the diagnosis of obscure abdominal conditions. No ill effects, as a rule, have attended the pneumoperitoneum produced by inflation of the abdominal cavity by the gas. It has occurred to RUBIN (*Journ. Amer. Med. Assoc.*, April 10th, 1920) to make use of this tolerance of the peritoneum for oxygen and the ability to detect the gas by radiography as a diagnostic procedure in determining the patency of the Fallopian tubes. If the gas injected into the uterine cavity under a certain pressure would pass into the Fallopian tubes it ought to reach the peritoneal cavity in patients with patent tubes, and set up an artificial pneumoperitoneum identical with that produced when injected by direct abdominal puncture. If, on the other hand, both tubes were occluded, no such condition could result. Preliminary experiments with extirpated uteri and adnexa showed that the gas readily escaped by the fimbriated extremity, but when the tubes were occluded by pathological processes or by ligation no gas escaped. The method was then applied to the living patient, and was successful in the first case in demonstrating the patency of the tubes. Altogether 55 cases of sterility with different clinical histories and physical findings were tested by means of oxygen insufflation of the uterus without any untoward symptoms or sequelae. All the patients, except two in the hospital wards, were allowed to go home within a few minutes of the examination; and all were followed

up and carefully examined for complications, none of which appeared. In some cases the results confirmed the clinical diagnosis of probably closed or patent tubes, but in others the test showed that the tubes were open where there were reasons to suspect that they were closed, and vice versa. The author claims that the method has practically the value of an exploratory laparotomy in determining the continuity of the lumen of the Fallopian tubes, and he dismisses the dangers of embolism and infection, at any rate in cases which are not acute, as hypothetical.

611. Cancer of Cervix: Implantation of Graft on an Intracorporeal Polypus.

CHAVIN and ROUX (*Bull. et Mém. Soc. Anat. de Paris*, March, 1920) record the examination of the uterus removed by operation from a case of squamous epithelioma of the cervix uteri. The growth, which was of a fungating type, did not extend beyond the internal os: above this level the endometrium was thick and congested. A small polypus growing from the fundus swung on a well-defined pedicle within the cavity of the corpus uteri. The extremity of the polypus was capped by a pale-coloured excavated ulcer, which microscopically presented the character of a squamous-celled epithelioma, with cell nests; histologically the endometrium showed glandular endometritis only. The occurrence of malignant implantation-grafts in the genital tract usually takes place in a direction towards the exterior: the appearance of retro-grade implantation, as in this case, affords an additional argument against the operation of simple amputation of the uterine neck for malignant disease.

612. After-results of Extended Hysterectomy.

FAURE (*Bull. et Mém. Soc. Chir. de Paris*, March, 1920) gives his results in about 80 cases of cancer of the neck of the uterus treated in the last fifteen years by extended hysterectomy, with an operative mortality of 10.84 per cent. Of 70 cases, 53 per cent. have been cured and 47 per cent. have had recurrences: of the latter, 3 cases lived between four and six years after operation. Of the 36 cases cured, 11 were operated on less than three years ago, 10 between three and six years ago, 7 between six and nine years ago, and 8 between nine and twelve years ago. Recurrences were commonest in the first year, and it was exceptional for them to occur two years after the operation. Faure believes that "proliferative" cases in which the vagina is occupied by exuberant vegetations come definitely within the operable category, and afford a much less grave prognosis than the infiltrating and ulcerating varieties. Discussing the part played by radium in treatment, the author says that its pre-operative application renders it difficult subsequently to perform a wide hysterectomy. He is strongly against the recently suggested abandonment of operation in favour of radium therapy. He recounts one exceptional case in which, at laparotomy in 1913, the uterus was found to be fixed and adherent, and the condition was judged to be inoperable; the patient received radium treatment and was in perfect health seven years afterwards. Comparing the subsequent results in those in whom after operation radium was and was not applied, Faure finds that 44 patients who received radium treatment furnished 50 per cent. of recurrences, and 23 who did not have this treatment showed 40 per cent. of recurrences.

613. Vaginal Dilatation by Champetier de Ribes's Bag during Labour.

SAXE (*Gynéc. et Obstét.*, vol. i, No. 1, 1920) records the results of eighteen years' employment of this method, proposed by Pinard in 1905. A bag of 400 to 600 c.cm. capacity was placed in the vagina and filled with sterilized water. In a series of 172 primiparæ, with 155 controls in which no bag was used, labour was shortened by thirty-five minutes on the average: perineal tears (never complete) occurred in 25 per cent. of cases, as compared with 40 in the control series. The fetal mortality was 1 in 21 as compared with 1 in 9.

614. The Wassermann Test in Pregnant Women.

H. GOODMAN (*Surg., Gyn., and Obstet.*, April, 1920) found that among 1,320 pregnant women 87 per cent. gave a negative Wassermann reaction. Only 6.7 per cent. gave a "4+" positive reaction, and in 2 per cent. more of the cases the Wassermann test was "3+." Of the Wassermann-negative multiparæ, 37 per cent. had suffered one or more miscarriages as compared with 52 per cent. of the "4+" cases. Only one woman among the 1,320 gave a history of having been known to be infected with syphilis, although approximately one woman out of each eleven gave a strongly positive Wassermann reaction.

PATHOLOGY.

615. The Etiology of Chronic Gastric Achylia.

K. FABER (*Geskrift for Læger*, April 1st, 1920) gives critical review of the literature of gastric achylia since 1892, when Einhorn first introduced this term. The author shows that the claims of conflicting theories to the origin of gastric achylia must still be regarded as unsettled. He believes, however, that in the overwhelming majority of cases the disease can be adequately accounted for by various toxic and catarrhal conditions of the stomach itself, but there are a certain number of cases in which it is at present impossible to correlate the achylia with any definite local disease of the stomach. As in the case of nephritis of unknown origin, it is probable that further research will reveal hitherto unknown exogenous causes. The author admits that congenital constitutional anomalies may possibly play a part, but he argues that in the past these endogenous factors have been accepted without sufficiently critical scrutiny.

616. Septicæmic Endocarditis.

ACCORDING to E. MÜNZER (*Zentralbl. f. inn. Med.*, April 17th, 1920) von Funke and G. Salus have recently described cases of mild endocarditis in a large proportion of which the *Streptococcus viridans* was isolated from the blood. Unlike the cases previously described by Münzer, there was no history of rheumatism; rigors, well marked tachycardia, and enlargement of the spleen were absent and all the patients without exception—thirty-eight in number—recovered. Münzer concludes that the presence of streptococci in the blood of patients suffering from endocarditis does not justify any prognostic conclusions. On the other hand, the occurrence of rigors and enlargement of the spleen are very unfavourable signs. In all cases of septicæmic endocarditis which can be detected at an early stage by examination of the blood, treatment by anti-streptococcal serum should be tried first, and should be followed by intravenous injections of collargol and salvarsan. Finally, removal of the spleen should be considered.

617. Experimental Haemorrhagic Pancreatitis.

BINET and BROCCQ (*C. R. Soc. Biologie*, March 20th, 1920) following up the previous experiments of Brocq and Motel, in which acute or subacute haemorrhagic pancreatitis was produced by the injection of bile into the cavity of Wirsung, have been able to obtain the same lesion in animals by the injection into the duct of intestinal juice obtained from a fistula of the small intestine in a human subject. The clear transparent fluid from this fistula was viscous and alkaline, was free from formed elements and was proved to contain enterokinase. Its injection into the pancreatic duct of a dog produced a typical haemorrhagic pancreatitis with fat necrosis. Evidently the enterokinase activated the trypsinogen *in situ*. Similar phenomena were brought about by the injection of calcium chloride, which also activates the trypsinogen, whilst no such results were obtained with physiological saline or with sodium fluoride, the latter of which inactivates the pancreatic reactions.

618. Primary Hydatid Cyst of the Spinal Meninges.

RAUZIER and GIRALD, in a paper read before the Société des Scientifiques Médecine et Biologie de Montpellier (*La Grèce Médicale*, April, 1920), record a case of primary hydatid cyst developing in the spinal dura mater and rupturing spontaneously into the subarachnoid space. The freeing of the daughter cysts gave rise to a chronic diffuse meningitis. Clinically the case was characterized by a progressive flaccid paraplegia. Lumbar puncture gave a clear albuminous liquid, poor in chlorides, containing 71.4 lymphocytes per cubic millimetre. The patient died, after four months' illness, from bronchopneumonia.

619. Cause of Epilepsy.

LALOR and HADDOW (*Med. Journ. of Australia*, March 20th, 1920) compare epilepsy with eclampsia and other toxicæmic conditions. They suggest that idiopathic epilepsy is a toxæmia, and emphasize the importance of the liver and kidneys in the etiology of idiopathic epilepsy. Preliminary investigations only have been made, but in *post-mortem* examinations of 25 epileptics they found an average ratio of brain weight to liver weight of 35 to 33 compared with the normal ratio of 12 to 15. Fatty or fibrotic changes or other morbid conditions of the liver were found in 40 per cent. Observation of patients showed that the fits occurred after a period of diminished nitrogen excretion. In two cases the administration of ammonium carbonate increased the number of fits.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

620. The Influence of Scarlet Fever on Vaccinia.

D. IONESCO (*Bull. et mém. Soc. Méd. des Ilôp. de Bucarest*, May 28th, 1919) records a case showing that scarlet fever not only does not prevent the regular development of vaccinia, but even appears to increase the receptivity of the organism for the vaccine virus. The patient was a woman who had been unsuccessfully vaccinated at the age of 1, 8, and 15, although vaccination of her brother at the same time and with the same lymph proved successful. At the age of 23 she was vaccinated at the end of the incubation period of scarlet fever, and three days later the vaccine lesions began to develop, and pursued their normal course with all the local and general symptoms of primary vaccination. The attack of scarlet fever was one of moderate intensity, without any complications, and convalescence was uneventful. It was therefore in no way affected by the concomitant vaccinia. On the other hand, the scarlet fever appeared to have rendered the organism more susceptible to the vaccine virus.

621. Renal Manifestations of Cardiac Failure.

O. JOSUÉ and M. PASTURIER (*Paris méd.*, March 13th, 1920) point out that asystole may give rise to renal manifestations, even when the kidneys are not damaged. During the period of asystole and oliguria it is impossible to determine the extent of renal involvement. It is only after the re-establishment of diuresis, when digitalis treatment has been instituted, that we can tell whether the symptoms are due mainly to affection of the heart or of the kidneys. In such circumstances the ureo-secretory coefficient supplies definite information. In many cases it will show that, contrary to what might have been expected from clinical examination, the kidneys are completely intact; in other instances, that although the kidneys are slightly affected, urea can be eliminated during the period of cardiac compensation. Such patients should not be regarded as "cardio-renal" subjects. Apart from cardiac oliguria the renal function is competent, and the renal symptoms are the result of cardiac failure.

622. Continuous Suppurative Acrodermatitis.

ACCORDING to E. BODIN (*Paris méd.*, March 6th, 1920), this name was given by Hallopeau in 1890 to a peculiar eruption affecting the extremities, and especially the hands, which was neither eczema, dysidrosis, nor an ordinary pustular infection. Bodin, who has seen six cases in the course of a few years, is of opinion that if the disease were better known more examples would be published. The onset usually occurs without any obvious cause, but sometimes the patient attributes the first lesions to an injury of the fingers or the hand. In some cases the characteristic eruption follows persistent erythematous and desquamating lesions, but as a rule the affection starts near the nails like an ordinary whitlow. The remarkable feature of the lesions is that, whether they remain localized in one or more fingers or extend to the hand, they continually relapse. The eruption is formed by pustules varying in diameter from 1 to 4 mm., each surrounded by a red areola. In three or four days' time the pustules break down and discharge their contents. There follows a stage of desquamation lasting from ten to twenty-five days, and attacks of pustular eruption and desquamation succeed one another for an indefinite period, at intervals varying from days to weeks. The general condition is not affected. Treatment of any kind is ineffectual.

623. Treatment of Secondary Meningitis by Intraspinal Injection of Autogenous Serum.

T. M. SANDERS (*Amer. Journ. Med. Sci.*, February, 1920) records a case of post-influenzal meningitis successfully treated by the intrathecal injection of the patient's own blood serum. When successfully combating pneumonia—with a falling temperature and a high leucocytosis—the patient showed signs of meningitis, and lumbar puncture yielded a turbid polymorphonuclear cerebro-spinal fluid. Cultures failed to establish the nature of the infecting organism. The patient's blood serum was injected intrathecally, on the ground that immune bodies exist in the

serum in practically all infectious diseases, and that thus the immune serum is brought into direct contact with the inflamed meninges and the micro-organisms there, the choroid plexus ordinarily preventing the free passage of immune bodies from the blood stream into the sub-arachnoid space. In addition the patient, who eventually recovered, was given intravenous injections of blood from convalescents from influenzal bronchopneumonia. The intrathecal injection of autogenous serum is advocated in cases of secondary meningitis when an efficient specific immune serum is not available.

624. Trophoedema in Chronic Mania.

E. COULONJOU, E. TERRIEN, and R. SAQUET (*Paris méd.*, March 13th, 1920) describe two cases of chronic mania in women, aged 45, complicated by trophoedema, which was neither familial nor hereditary. In one case the trophoedema affected the left leg and began at 16, in the other the right leg, beginning at 39. The writers suggest that the trophoedema and psychosis in each case were due to disturbance of the sympathetic nervous system and the glands of internal secretion.

625. Polycythaemia in Juxta-pyloric Ulcer.

H. I. BING (*Ugeskrift for Læger*, March 11th, 1920) has investigated the subject of polycythaemia in relation to duodenal ulcer. In 1914 Friedman found this combination in twenty-five cases. The same relationship has been observed in four cases by Danish writers, and in the first case of juxta-pyloric ulcer examined by the author for polycythaemia he found the red cells numbered 7 millions in the blood taken from the ear, and 8.2 millions in that taken from the skin of the abdomen. He does not, however, accept Friedman's view that this polycythaemia is due to an increased amount of adrenalin in the blood. The author suspects that the factors promoting polycythaemia in these cases are gastric hypersecretion, delayed passage of food from the stomach, and the frequent attacks of vomiting, which may be expected to reduce the amount of water in the blood. In support of his views he gives details of a case with analyses of the chloride content of the urine, blood, and gastric juice.

626. An Epidemic of Throat Disease due to the Pneumococcus.

A. HEINDL (*Wien. klin. Woch.*, March 18th, 1920) has investigated a recent epidemic of angina faucium caused by the *Diplococcus lanceolatus pneumoniae*. When this germ was found in pure culture the disease began on one side of the throat only, spreading to the other side at a later stage. The tonsils were covered by a white or whitish-green membrane, not unlike that of diphtheria, and though the rise of temperature was not great there was considerable dysphagia. There was moderate, almost indolent, swelling of the neighbouring lymphatic glands, as observed in diphtheria or Vincent's angina. The duration of the disease was four to eight days, during which there was progressive anaemia, with severe constitutional disturbances. The usual remedies proved useless; salicylic acid, tincture of iodine, hydrogen peroxide, diphtheria serum, and a polyvalent staphylococcal serum all failed. The administration in two cases of what the author terms "pneumonia serum" was strikingly successful.

627. Autohaemotherapy in Anaemia.

CRESPIN and ATHIAS (*Bull. Soc. de Thérap.*, March 10th, 1920) have treated cases of anaemia (in which administration of normal horse serum and other methods had failed) by subcutaneous injection of the patient's own blood. Considerable improvement occurred in forty-eight or even twenty-four hours, with a moderate and sometimes considerable increase of the red cells and occasionally of the leucocytes. Only a small quantity of blood was required—namely, 5 to 10 c.cm. in adults and 3 to 5 c.cm. in children. In most cases only a single injection was sufficient, and it was exceptional for a second or a third to be needed. In the case of anaemic infants whose blood could not be obtained, their mothers' blood was injected. It is remarkable that this "homotherapy" as it was called, was only successful when the mother was also in a state of pronounced anaemia. In cases where the mother was plethoric no results were obtained; in explanation it is

stated that the blood of anaemic persons contains active haemopoietic substances, the power of which is probably exalted by passage into the subcutaneous tissue.

628. Treatment of Cerebro-spinal Meningitis.

P. FOTI (*La Pediatria*, April 1st, 1920) treated with anti-meningococcal serum 22 cases in children aged up to 12 years. There were 13 recoveries, 5 deaths, and 4 cases in which the result was not ascertained. On subtraction of the latter the mortality was reduced to 22 per cent. In the majority of the cases the effect of the serum was immediate, the cerebro-spinal fluid becoming less turbid after the first few injections, and lymphocytosis replacing polymorphonucleosis, with simultaneous disappearance of meningococci. The serum was most beneficial when used early, but even in advanced cases in which it was not employed till the fortieth or forty-seventh day excellent results were obtained. The amount of serum injected varied from one case to another; as a general rule four to five injections of 20 c.c.m. were sufficient. The mortality was highest in infancy.

629. Oral Auscultation.

F. HAMBURGER (*Wien. klin. Woch.*, March 11th, 1920) maintains that listening for adventitious breath sounds by the open mouth is a valuable diagnostic method, frequently ignored by reason of its simplicity. He tells of a child whose father had recently died of pulmonary tuberculosis being brought to the clinic; examination of his chest was negative, and he had been dressed again when the author put his ear to the child's mouth and heard definite fine râles. The child was undressed, and after exhaustive examination a small patch of fine moist sounds was heard in the left scapular region. Oral auscultation is helpful as a rapid guide to active lesions of the respiratory system, but it should supplement, not supersede, the ordinary examination of the chest. When this shows adventitious sounds over the lungs, oral auscultation is seldom negative. On the other hand, adventitious sounds heard over the lungs may be so fine, faint, and few, that their existence is in doubt, whereas the sounds heard near the mouth are quite definite. In cases of central pneumonia the chest signs may be absolutely negative, while adventitious sounds may be clearly heard by the oral method, although they do not indicate the site of the lesion.

630. Transfusion of Blood in Pernicious Anaemia.

O. SCHEEL and O. BANG (*Norsk Mag. for Laegevidenskaben*, March, 1920) achieved success by the transfusion of large quantities of blood in a severe case of pernicious anaemia. The patient, a man aged 33, was admitted to hospital moribund. The red cells numbered 850,000, and the percentage of haemoglobin was 19. After 900 c.c.m. of blood, taken from four persons and treated with sodium citrate, had been injected into a vein there was an immediate improvement. The red cells rose at once to over two millions, and later to over three millions. The patient, who had been very weak and dyspnoic and only partially conscious, was up and about twelve days later.

631. Treatment of Influenza by Fixation Abscess.

L. PROBST (*Rev. méd. Suisse rom.*, March, 1920) recommends the use of Fochier's fixation abscess in all cases of severe influenza. The technique, which is very simple, is as follows: (1) Inject with aseptic precautions 1 c.c.m. of oil of turpentine under the skin of the front of the thigh. (2) Do not incise until there is fluctuation and the temperature has become normal. (3) Make a free opening and drainage. (4) If necessary, relieve by application of an ice-bag the local pain caused by the abscess formation.

632. Infantile Spastic Hemiplegia.

R. VAGLIO (*La Pediatria*, March 15th, 1920) records 46 cases of infantile spastic hemiplegia which were observed during the quinquennium 1913-1918 at the Naples University Paediatric Clinic. One was due to trauma at birth, in 25 syphilis could be established (in 19 with certainty, in 6 with great probability), in 3 the cerebral lesion was connected with measles, 4 were associated with pertussis, influenza, typhus, and empyema respectively, and in 12 the origin could not be determined. A certain proportion of the latter were possibly due to Heine-Medin's disease, and in others the possibility of a cerebral lesion of tuberculous nature could not be excluded. In 26 cases the paralysis was preceded and generally accompanied by

convulsive attacks often of a definitely epileptic character. The lesion affected the two limbs almost equally in 16 cases; in 22 it was most pronounced in the upper limb and in 8 in the lower limb. In 27 cases the right side was affected, and in 19 the left side. Only 6 cases were associated with mental disturbances, which varied from the severest forms of idiocy to a mere retardation in intellectual development. In 2 cases athetotic movements were present, and in 1 choreic movements of the affected limbs. In 2 cases there were ocular lesions. The onset was sudden in 29 cases and gradual in 16.

633. Dilatation of the Colon in Children.

A. E. MEYERS (*Amer. Journ. Dis. Child.*, March, 1920) believes that, in addition to muscular hyperplasia, there is another condition present in dilatation of the colon in children—namely, spasm due to an excess of starch in the diet. He reports six cases in children aged from 4 to 9 years, in whom the constipation was cured by a starch-free diet and the administration of atropine sulphate.

SURGERY.

634. Varicose Eczema and Perivenous Sympathetic Nerves.

R. LERICHE (*Lyon Chir.*, 1919, 16) describes a case of varicose veins complicated by severe and intractable weeping eczema of the ankle and lower two-thirds of the leg. Leriche, having seen removal of the perivascular sympathetic nerve fibres lead to intense contraction of the vessel wall, performed a femoral "sympathectomy" in the middle of the thigh, followed by removal of two groups of varicose veins, without interfering with the saphena. The operation resulted in the complete cure of the eczema. The author believes that in such cases eczematous troubles are due to interference with the perivenous sympathetic nerves by the swollen and distended veins.

635. Varices of the Upper Limbs.

BERSON (*Il Morgagni*, December 5th, 1919, and *Thèse de Paris*, 1919) has only been able to collect 14 cases of this rare condition. When present they are usually congenital, but may be traumatic. They are most often unilateral and confined to the superficial veins, but in some cases all the veins are affected. Secondary trophic changes may occur in the skin, muscles, or bone. Loss of power in the arm may be present; hyperaesthesia is not uncommon. The ordinary complications of varicose veins (haemorrhage, ulceration, phlebitis) are seldom seen in varix of the arm. No treatment, as a rule, is required.

636. Treatment of Varicose Ulcers.

STEARNS (*Journ. Amer. Med. Assoc.*, 1920, 74) describes a method of treatment for patients who refuse to "lie up." The first step is the cauterization of the ulcer with fused silver nitrate. The leg is then elevated for twenty-four hours and Unna's dressing applied (gelatin 2 parts, zinc oxide 1 part, glycerin 3 parts, water 4 to 6 parts, mixed in a water bath); over it a single layer of bandage is wound. The following day a window is cut out over the ulcer, and the slough cleaned away with a sharp curette until the surface is clean and bleeding; the edges, which will now be found somewhat undermined, are cut away by curved scissors and placed in normal saline solution. Firm pressure is made with dry gauze until the oozing is arrested. The excised skin margin is now coiled in the centre of the ulcer as a graft and oil-silk protective placed over it. A sterile dressing and a firm roller bandage are applied; the leg is elevated for three days longer, when dressings with scarlet-red ointment are commenced. In sensitive patients the area of the ulcer should be anaesthetized by injection of 1 per cent. novocain around it. The paste dressing is left on for a fortnight, when it can be reapplied if necessary.

637. Post-operative Tetanus.

TETANUS following a "clean" operation is rare. HUGGINS (*Surg., Gyn., and Obstet.*, 1920, 30) records the case of a woman of 48 who died eleven days after panhysterectomy. The wounds healed by first intention, and no tetanus organisms could be recovered from the operation field, nor from the catgut employed. The patient stated that she had had two previous attacks, lasting for some hours, on occasions when she had been nervous and overworked; this suggests that she may have been a tetanus carrier.

Only in one recorded case of post-operative tetanus has the catgut used been proved to be infected with the tetanus bacillus. Huggins suggests that it would be well to give prophylactic doses of antitetanic serum before all pelvic operations, as was ordered by the Surgeon-General U.S.A. during the war.

638. Subperitoneal Cholecystectomy.

TIXIER (*Lyon Chir.*, 1919, 16) presented before the Société de Chirurgie de Lyon a patient on whom he had performed subperitoneal cholecystectomy. Tixier propounded the method in 1903. The gall bladder is exposed in the usual manner, and the peritoneum on its inferior visceral surface incised longitudinally as far as the neck of that viscus. The flaps of peritoneum are dissected back until the junction of the cystic with the common bile duct is reached. The duct is incised, and the hepatic and common bile duct are explored. After ligation of the cystic artery the gall bladder is removed; a drain is placed in the bile duct and laid against the denuded gall bladder bed, and the previously reflected peritoneal flaps are accurately sutured over it. In this way the biliary drainage track is entirely extraperitoneal. Tixier admits that it is sometimes difficult, or even impossible, to perform his operation, but when it can be done it is "simple and elegant."

639. Plastic Surgery of Facial Burns.

H. D. GILLIES (*Surg., Gyn., and Obstet.*, 1920, 30) describes the various methods applicable to the treatment of severe facial deformities, especially those produced by burns, of which cordite burns are among the most disfiguring and most destructive. He discusses the technical value of flaps (including the tubed pedicle grafts), Wolfe whole-thickness skin grafts, and Thiersch grafts. The author is opposed to the method of cutting needlessly large flaps in order to allow for shrinkage. He believes that they should be cut the precise size of the area they have to cover; a little stretching of the graft seems to be beneficial. Close adherence of the graft to the bare area is obtained by moulded dental-impression wax. An outline of complete facial replacement is as follows: (1) The forehead is replaced by a Wolfe graft; (2) eyebrows are grafted from a strip of scalp from the mastoid region; (3) movable eyelids are provided by the Gillies-Essex graft; (4) the nose is renovated by a Wolfe graft; (5) the upper lip is replaced by a hair-bearing graft from the scalp; (6) cheek, chin, and lower lip are reconstructed by flaps (often tubed pedicle flaps) from the neck and chest.

640. Treatment of the Vascular Form of Tuberculous Keratitis.

BONNEFON (*Journ. de Méd. de Bordeaux*, April 10th, 1920) recommends the following procedure: After application of a 2 per cent. solution of cocaine a galvano-cautery provided with a platinum loop, or a single loop of platinum wire mounted on a glass rod, is brought to white heat and, without touching the cornea, is brought close to it several times for one or two seconds; atropine ointment and a dressing are then applied. The vascular elements are thus destroyed without damage to the eyeball.

641. Radiography of the Abdomen after the Introduction of Oxygen into the Peritoneal Cavity.

MALLET and BAUD (*Journ. de Radiologie et d'Electrologie*, No. 1, vol. iv, 1920) relate their experience of this method of x-ray examination in a comprehensive illustrated paper. The technique is fully described; drawings are given of the various instruments employed, together with detailed description as to their use. The authors lay stress upon the value of this method in abdominal cases in which the usual radiographic examination has proved inconclusive, and especially in certain conditions of the liver and kidneys, such as tumours, cysts, etc. Peritoneal bands and adhesions can be demonstrated by this proceeding, which appears to be devoid of danger if the necessary precautions are adopted. (See BRITISH MEDICAL JOURNAL, April 10th, 1920, p. 511.)

642. Intussusception in Typhoid Fever.

MORENO (*Brit. Journ. of Surg.*, April, 1920) records a case of acute intussusception occurring in the course of typhoid fever, and gives from the literature abstracts of ten other cases of this rare complication. A woman of 24 had an attack of typhoid fever the course of which was marked by constipation. On the forty-seventh day the temperature suddenly fell to 97.8°, and she had a severe attack of vomiting. The pulse rate was not raised, the abdominal distension was not increased, the liver dullness remained normal, and the abdomen moved well on respiration. Next

day the pulse rate rose from 120 to 140, the temperature remaining about the same, and colicky pain became localized in the right iliac fossa. Vomiting continued, and three small stools were passed; they contained no blood. There was slight leucocytosis, but there seemed to be no definite indication for operation. The next day there were acute pain and tenderness; an ill-defined resistant mass could be felt in the right iliac fossa. Operation showed this to be an entero-colic intussusception, which was reduced without difficulty. No localized swelling, such as an enlarged Peyer's patch, which might have been a causative agent, was found.

643. Treatment of Cystitis with Colloidal Silver.

KOLLER (*Korrespondenzblatt f. Schweiz. Aerzte*, 40, 1919) advocates for treatment of cystitis the injection into the bladder by Guyon's catheter of 1 or 2 c.c.m. of colloidal silver, which is retained for five hours; the injection is repeated every two days. Successful results were obtained in catheter cystitis following childbirth, and in paralytic stricture, and prostate cystitis, but not in cystitis due to tuberculous infection or to stone. Intravenous injections of silver are said often to be useful in pyelitis; albuminuria is not a contraindication.

OBSTETRICS AND GYNAECOLOGY.

644. Venous Thrombosis, Pulmonary Infarction and Embolism following Gynaecological Operations.

HAMPTON and WHARTON (*Bull. Johns Hopkins Hospital*, April, 1920), from an examination of hospital statistics, found that venous thrombosis occurred in 205 cases out of 21,000 perineal and abdominal operations; this incidence of about 1 per cent. corresponds closely with figures reported from other clinics. Of the 205 cases 81 per cent. followed abdominal operations, especially removal of large tumours of the uterus or ovary. The authors were unable to confirm, either by clinical examination or at autopsy, the existence of special changes in the cardiac musculature. In 66 per cent. the vessels of the left leg were affected, in 24 per cent. of the right, and in 9 per cent. of both legs. There were single cases of thrombosis in the left arm, in the superficial veins of the head and neck, and in the mesenteric veins respectively. In addition to these cases, in which the diagnosis of thrombosis was either clinically evident or confirmed *post mortem*, Hampton and Wharton believe that many cases, particularly those occurring during the second and third weeks of convalescence, were undetected. The most important etiological factors are infection and trauma. Practically all cases were associated with a slight rise in the temperature curve. Phlebitis and thrombosis of the leg veins when associated with pain and swelling were rarely followed by fatal embolism. During their clinical observation of cases of post-operative thrombosis the authors noticed that certain of the patients developed pulmonary complications—usually called pleurisy or pneumonia—which clearly seemed due to infarcts. Among 40 cases diagnosed as post-operative pleurisy, 80 cases as post-operative pneumonia and bronchopneumonia, and 50 cases as post-operative bronchitis, the authors found 34 cases of undoubted pulmonary infarction. Pulmonary infarction occurs most often in the same class of cases and during the same period of convalescence as femoral thrombophlebitis; it may precede pulmonary embolism. The clinical picture which results is stated to be characteristic: sudden sharp pain in the chest, increase in the pulse rate, elevation of the temperature, cough, dyspnoea, haemoptysis, friction rub, râles, local impairment of the percussion note, with changing breath sounds, and more especially cyanosis and shock; before the onset of infarction the temperature has nearly always been febrile. Haemoptysis is present in 36 per cent. only of cases. In 41 per cent. of the cases of pulmonary infarction there was venous thrombosis with pain and swelling of the leg; this clinical association is considered to be strong confirmatory evidence in diagnosis. In 10 per cent. of the cases the first infarction was followed by one or more others.

645. Turpentine Injections for Salpingitis.

FUCHS (*Zentralb. f. Gyn.*, January 10th, 1920) records his experience of thirty cases of inflammation in the uterine appendages, of which five were known to be of gonorrhoeal origin. In seven cases he had very marked success; the rest reacted to the treatment more or less favourably. The urine was carefully watched. The treatment consisted in

the injection of 5 c.cm. of a mixture containing 4 parts of ol. terebinth., 2 parts eucupin, and 16 parts ol. olivae every four days. After about three weeks the injection was given once a week only. The site selected was two finger-breadths below the crest of the ilium in the posterior axillary line, the needle pushed in deeply to the bone. Although in some cases pain was felt twenty-four to thirty-six hours after injection, no local abscess or serious inflammatory reaction resulted in a series of 200 injections. In many of the cases—acute and chronic—relief from pain was obtained from the time of the second injection, large pelvic masses rapidly diminished, haemorrhage was largely controlled, and the general condition of the patient improved.

646. Corpus Luteum in Pernicious Vomiting of Pregnancy.

CARDOT, in a thesis recorded in *La Médecine* (April, 1920), describes a case of uncontrollable vomiting in a woman two months pregnant, in whom examination showed the presence behind and to the right of the uterus of a small cystic mass. At operation there were found in the right ovary a small serous cyst the size of a walnut, and a larger cyst of the corpus luteum, which contained serous fluid and a concretion; pregnancy continued normally. The author suggests that ovariectomy is indicated in a woman suffering from hyperemesis gravidarum whenever examination reveals ovarian enlargement.

647. LACOURBE (*loc. cit.*) ascribes the condition to functional insufficiency of the corpus luteum of pregnancy, and recounts treatment of five cases by hypodermic injection of corpus luteum extract. He advocates that the same procedure be employed prophylactically in aggravations of the normal vomiting of early pregnancy when it is feared that the condition will become pernicious.

648. GROSSE (*Rev. Franç. de Gyn. et d'Obstét.*, November, 1919), from a consideration of 52 cases, concludes that the corpus luteum of pregnancy is not indispensable to the early development of the embryo: its removal does not necessarily lead to abortion. Double ovariectomy, however, is to be avoided in the first months of gestation. The value of many reports of ovariectomy which are to be found in literature is diminished by their omission to indicate whether the corpus luteum was preserved—wholly or partially—or removed.

PATHOLOGY.

649. Technique of the Colloidal Gold Reaction.

MARGARET WARWICK (*Minnesota Med.*, April, 1920) insists that the absolute purity of the water used in preparing the reagents is essential to success. The water should be trebly distilled in a glass still without rubber connexions, and as many drinking waters have undergone chemical purification these should not be employed. Spring water is recommended. All the glass utensils used should undergo a preliminary cleansing, being first thoroughly rinsed with equal parts of hydrochloric and nitric acid, washed in running tap water until all the acid is removed, and then washed with distilled spring water. Once this is done the process need not be repeated if the glass ware is kept specially for the reaction, simple rinsing in distilled water being sufficient. The gold reagent is prepared as follows: In a 2-litre flask 1,000 c.cm. of specially distilled water are heated slowly to 50 C., and then more rapidly to 60 C., when 10 c.cm. of 1 per cent. gold chloride and 7 c.cm. of potassium carbonate are added. At 80 C., 10 drops of 1 per cent. oxalic acid are added. At 90 C. the flask is removed from the flame and slowly, drop by drop, 5 c.cm. of 1 per cent. formalin are put in. The flask is shaken until a pink colour appears, slowly changing to violet and then to a deep dark red, clear to both direct and transmitted light, and occasionally with a light golden shimmer. Further, the proper solution must fulfil the following tests: (a) It must remain unchanged in the presence of a known normal spinal fluid; (b) it must give a typical curve with a known paretic fluid; (c) 5 c.cm. of it must be precipitated in one hour by 1.7 c.cm. of 1 per cent. sodium chloride, and, most important of all, (d) it must be neutral to 1 per cent. alizarin red in 5 per cent. alcohol. Slightly acid or slightly alkaline solutions will give untrustworthy results, so that it is of vital importance to have a neutral solution. In a rack there are set up eleven clean test tubes; in each is placed 1 c.cm. of 0.4 per cent. sodium chloride. To the first tube is added 0.8 c.cm. of the salt and 0.2 c.cm. of the

spinal fluid, making 2 c.cm. of a 1 to 10 dilution. From this tube 1 c.cm. of the mixture is transferred to the second tube, making a dilution of 1 to 20, and this is carried on to the tenth tube, which has a dilution of 1 to 5,120, the last cubic centimetre from this tube being rejected. Then to each tube is added 5 c.cm. of the colloidal gold solution. As the eleventh tube contains only saline and colloidal gold it serves as the control. A positive reaction, if present at all, begins at once, and then intensifies for several hours, being complete at eight to twelve hours. All syphilitic curves appear the same at first but differentiate later, so that they must not be read too early. On the other hand, a test which shows no commencing changes after half an hour should be discarded, as none will appear later. Colour reactions may be represented by numbers: thus an unchanged fluid is 0, a bluish-red colour 1, a reddish-blue 2, a deep blue 3, a grey-blue 4, and colourless 5. All readings must be done in daylight, holding the tube against the sky. The so-called paretic curves show the first few tubes completely precipitated, giving a colourless solution, while lesser changes may appear in the remaining tubes—for example, 5555431000. The syphilitic curve shows the first one or two unchanged with a maximum colour change (usually 3, seldom beyond 4) in the fourth or fifth tube—for example, 0023311000. This includes both tabes and cerebrospinal syphilis, as the reaction does not differentiate between them. The so-called meningitic curve, which does not distinguish between different types of meningitis and myelitis, consists of a curve showing colour change in the right half of the tubes with a maximum reaction in the seventh or eighth, as 00000133310. This gold sol reaction, while requiring careful technique, is now so much simplified as to be within the reach of any laboratory worker.

650. Glycogen in Diabetes following Extirpation of the Pancreas.

PAULESCO (*C. R. Soc. Biologic*, April 24th, 1920) examines the hypothesis that in this form of diabetes the liver and muscles have lost their power to fix glucose in the form of glycogen. He set out to find whether this incapacity of the tissues to form glycogen was absolute or relative, whether it was the direct effect of pancreatic insufficiency or only a secondary and contingent phenomenon. In the former case it might be the cause of the diabetes and in the second case it would be merely the consequence. To that end he practised total ablation of the pancreas in dogs, accompanied at the same time by the extirpation of a lobe of the liver, and at the autopsy he took the liver, myocardium, and muscles for analysis. He found that after total ablation of the pancreas the power of the liver to retain the glycogen was considerably reduced, but it was not annihilated, the quantity fixed being as much as from 0.8 to 2.985 grams per 100 grams of tissue and the same for the muscles. With regard to the myocardium, its power to fix glycogen remained normal. Consequently the power of the tissues to form and store glycogen is not abolished; the incapacity is only relative, and is a consequence and not the cause of the diabetes.

651. Tuberculosis of Ovarian Cysts.

FORGUE and CHAUVIN (*Revue de Chirurg.*, November and December, 1919) have collected thirty-five examples of this condition, which is relatively rare. Three forms are distinguished: (1) A tubo-ovarian form in which discrete lesions are found on the internal lining of the cyst; (2) a superficial form in which tuberculous deposits occur in the outer layers of the cyst wall; (3) an intraparietal form in which the lesions are seated in the interstitial remains of the cystic organs. Tuberculosis of ovarian cysts is always secondary; usually the primary seat is in the peritoneum or tubes. Tubercle bacilli are very rarely found; the etiological examination of the fluid shows a well-marked lymphocytic reaction.

652. Poisoning by Ripe Olives.

As a consequence of five outbreaks of olive poisoning (four of which were due to the toxin of *Bacillus botulinus*, Type A), DE BORD, EDMONDSON, and THOM (*Journ. Amer. Med. Assoc.*, May 1st, 1920) investigated bacteriologically 610 containers; from these samples many different organisms were isolated, among them was *B. botulinus*. In all the material which was found to be infected with *B. botulinus*, the odour from the container, or the odour of the olives when removed, was distinctly offensive. The authors urge that more efficient sterilization should be employed in order to prevent further outbreaks of botulism. Shipping or holding in brine solutions, if tolerated, should be so modified as to exclude any undesirable fermentations.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

653. Haemolytic Familial Splenomegaly.

BIFFIS (*Il Policlinico*, November 1st, 1919) reports eight cases of this disease, observed directly: the jaundice did not appear until 22 to 25 years of age, although usually in this affection it appears soon after birth. The absence of jaundice may make diagnosis difficult, but the acholuria and the fragility of the blood will help. In all the author's cases the jaundice was light, but varied in intensity; there was no inconvenience attached to it, the faeces were normal in colour, and bile pigment was absent from the urine. There was no true anaemia; the globular resistance was diminished in each case. The cervical glands were enlarged, and the patients could bear very little exertion and soon got tired. It is well to remember that jaundice is not an essential symptom; out of fifteen cases (including the present eight) it was absent in eight. Further experience of splenectomy in these cases did not substantiate the early hopes; even where it appeared successful at first permanent cure was rare. Probably the spleen is not the only haemolytic organ; the lymphatic glands, the liver, and the bone medulla have haemolytic powers. It is curious that after splenectomy the blood fragility in these cases is often unchanged; possibly the blood fragility may be the primary cause. The jaundice, when present in these cases, is not very easily explained; the author accepts the view that it is pleiochromic, but this does not explain why bilirubin is not present in the urine, nor why the common symptoms of cholaemia are not present. The degree of jaundice is not usually in proportion to the general symptomatology; this is true especially of the familial or congenital cases.

654. The Renal Function in Scarlet Fever.

B. S. VEEDER and M. R. JOHNSTON (*Amer. Journ. Dis. Child.*, March, 1920), from examination of seventeen cases of uncomplicated scarlet fever and two cases complicated by nephritis, found that though the functional changes occurred in nephritis and paralleled fairly closely the urinary changes, the albumin appeared in the urine before the changes in renal function took place. They conclude that as a routine measure the examination of the urine for albumin as usually carried out is of greater value than functional tests in announcing the onset of nephritis. The functional tests employed were phenolsulphonphthalein excretion and estimation of non-protein nitrogen for evidence of retention.

655. The Diagnostic Significance of Enlarged Intercostal Glands.

S. PLASCHKES (*Wien. med. Woch.*, March 18th, 1920) calls attention to enlargement of the intercostal glands in the mid-axillary line, notably in the fourth space on the left side, and the fifth space on the right. These enlarged glands occur singly or in chains, and their size varies from that of a lentil to that of a bean. Sometimes they form a single packet easily visible when the arm is raised and the chest is arched on the same side. They are usually freely movable and indolent, or only a trifle tender. In emaciated persons the lymphatic vessels communicating with these glands are also palpable. Discussing the significance of these glands, the author points out the comparative frequency with which they are found enlarged among soldiers on active service. In a skin hospital he has found them enlarged in more than half the cases of scabies, but he failed to establish any definite relation between this condition of the intercostal glands and pulmonary tuberculosis. *Post-mortem* examinations in a large fever hospital also showed no constant correlation of enlargement of these glands with morbid changes in the lungs, pleurae, diaphragm, or neighbouring structures. The author concludes that this enlargement is usually the result of affections of the skin of the lower part of the chest and of the epigastrium, but in certain cases it may be a response to chronic inflammatory changes in the peritoneum and pleura. He refers to a work published in 1907 by Hochsinger, who found this condition in 52 out of 1,540 necropsies on infants, and who interpreted it as an indication of tuberculosis of the lungs, or bronchial and mediastinal glands.

656. The Diagnosis of Metallic Rales in Infancy.

A. CAVAZZANI (*La Pediatria*, March 15th, 1920) has devised the following method for differentiating cavernous metallic rales in the chest from pseudo-cavernous sounds of gastric origin. The child is placed horizontally on its right side, so that the region of the stomach is uppermost; its lower limbs are then slowly raised so that the abdomen is above the thorax, and the air contained in the stomach is displaced towards the greater curvature. This displacement can be accelerated by moderate pressure over the lower ribs, on the left side, synchronously with the respiratory movements; the inversion of the gastric contents can be verified by percussion. On auscultation at the base of the thorax the metallic or amphoric character will be found to have disappeared in cases in which pulmonary cavities do not exist, and to persist in cases in which they are present.

657. The Regional Cuti-reaction in Children.

C. PESTALOZZA (*La Pediatria*, February 15th, 1920) states that in 1916 Pisani suggested performing the cuti-reaction at the site of the tuberculous focus, instead of on the arm, as is usually done, as he had observed that the reaction was usually more intense in the skin over the affected viscus than in the corresponding region on the opposite side or on the arm, and in many cases the reaction was positive over the diseased area and negative in the arm. In 1918 Pollitzer reached similar conclusions from a study of 40 cases in children. Da Gradi, studying the reaction in 75 adults, obtained less decisive results. Pestalozza performed the regional cuti-reaction in 72 children, using human tuberculin on the right arm, bovine tuberculin on the left arm, and both tuberculins at the tuberculous focus, about 4 cm. distance from one another. In 27 the reaction was negative, both over the focus and in the arm. In the other cases, though the regional cuti-reaction was often more intense than that performed at a distance, in none of the cases was the regional reaction positive and that taken at a distance negative, so that the absence of this finding deprives the regional cuti-reaction of much of the practical value which it appears to possess in adults.

658. Convalescent Serum in the Treatment of Influenzal Pneumonia.

O. BANG (*Norsk Mag. for Laegevidenskaben*, March, 1920) betrays no enthusiasm for this treatment which he tried in ten cases. Two cases terminated fatally, and another developed empyema in spite of the treatment. One patient became worse soon after an injection, and died a little later. The most successful cases were those in which small doses were given (7.5 c.cm. of serum).

659. Medical Treatment of Hepatic Abscess.

L. MANINI (*Il Policlinico*, Sez. Prat., March 15th, 1920) records a case of hepatic abscess following amoebic dysentery in a man aged 44. Bacteriological examination of the chocolate-coloured fluid withdrawn by an exploring syringe was negative, and only detritus was found, but, as Pontano has shown, the absence of the cellular elements found in ordinary pus is pathognomonic of amoebic hepatic abscess. The patient was given at intervals of from four to eight days four series of injections of emetine hydrochloride, each consisting of 12 cg., 3 or 4 cg. being injected daily for three or four days. The last two series were merely given as a safeguard; after the first two series the patient appeared to have recovered almost completely.

660. Epidemic Coma.

R. JAKSCH (*Zentralbl. f. inn. Med.*, March 20th, 1920) since the middle of last January has seen a large number of cases at Prague, characterized by fever and delirium, which recovered without any further nervous disturbances apart from transient ocular palsies and a certain degree of somnolence. In many cases, however, the course of the disease was quite different. After an initial stage of cortical irritation coma set in and lasted from eight to fourteen days, during which the respiration was unusually deep and laboured and all signs of meningeal irritation were absent. Bacteriological examination of the blood, cerebro-spinal fluid, urine, etc., was negative. Jaksch thinks that the condition is due to an influenzal toxin, as the literature shows that such cases repeatedly occur after epidemics of influenza.

661. Treatment of Lethargic Encephalitis by Neo-salvarsan.

M. FOURRIER (*Bull. Soc. de Thérap.*, April 14th, 1920) reports a case in a girl, aged 17, who showed typical signs of lethargic encephalitis. No benefit was derived from the administration of urotropine by mouth and injections of camphorated oil, but improvement immediately followed an intravenous injection of 0.30 cg. neo-salvarsan, and became more pronounced after two more injections. Complete recovery took place.

662. Typhoid Bacilli in a Fixation Abscess.

ACCORDING to R. DAMADE (*Journ. de Méd. de Bordeaux*, March 25th, 1920) the pus in a fixation abscess produced by oil of turpentine is generally sterile. Exceptions to this rule are chiefly found in typhoid fever, and have been reported by Carles and Lesieur. Damade records a severe case of this disease in which typhoid bacilli were isolated from a fixation abscess. The explanation of their presence is unknown.

663. The Prevention of Tuberculosis.

W. J. DOBBIE (*American Review of Tuberculosis*, 1920, iv, 23) discusses this subject. (1) In the case of infants under 3 years of age he says that the tuberculous mother should not be allowed to come in contact with her child; the tuberculous father should not be allowed to live in the house. (2) In children over 3 years of age infection is likely, but the resistance should be increased by giving good food, fresh air, and the like. (3) Infection of adults has in all probability occurred in childhood. The treatment should seek to increase the powers of resistance so as to prevent increase of the infection or a lighting-up of a dormant condition. Dobbie recommends institutional treatment for those who have no homes or bad homes, and for those who require education which cannot be given at home. Those consumptives who decline all precautions, and are thus a menace to others, should be made to go to a tuberculosis department in a penal institution.

SURGERY.**664. Compression Neuritis by First Rib.**

WHEELER (*Dublin Journ. Med. Sci.*, 1920, 66) describes an advanced case of compression of the lower cords of the brachial plexus by a normal first rib. The patient was an athletic male of 35 years who had suffered from painful cramps and whose right hand had become progressively weaker during the four past years. He had been treated for "writer's cramp" neuritis, and syringomyelia. The interossei were practically non-existent and the muscles supplied by the median as well as the ulnar nerve were weak; he could not fully extend the wrist or fingers. The patient volunteered the statement that the gripping power of the fingers depended greatly on the position of the arm. When it was raised above his head he could write on a blackboard steadily and with ease, but he could not pick up a tea-cup from the table. Wheeler resected the middle portion of the first rib; the case is too recent for any marked improvement to have occurred.

665. Sarcoma of the Small Intestine.

ACCORDING to A. CHARRIER (*Journ. de Méd. de Bordeaux*, April 25th, 1920), who records an illustrative case in a man aged 53, sarcoma of the small intestine is a rare event. Lecene, in his thesis published in 1904, could find only 75 cases in the literature, and even to-day there are hardly more than one hundred, the majority of which have occurred in adults. One of the most remarkable features of the tumour is that it runs its course with a minimum of clinical signs, especially at the onset, when its recognition is of so much importance. It does not as a rule produce stenosis, so that Koenig's sign (exaggerated peristalsis and attacks of severe colic followed by diarrhoea) is very seldom met with. In this respect Charrier's case was exceptional, as it gave rise to a gradual partial obstruction. Resection of the intestine was performed in two places. The patient recovered from the operation and remained in good health for three months, at the end of which time a relapse occurred. On laparotomy, the peritoneum was found to be studded with fine granulations, and the coils of the small intestine were adherent to one another. Death took place a fortnight later. Histological examination showed the growth to be a spindle-celled sarcoma.

666. Cicatricial Stenosis of the Oesophagus.

C. GORIS (*Le Scalpel*, April 17th, 1920) records 9 cases of cicatricial stenosis of the oesophagus due to swallowing caustic soda. He concludes that, however long and narrow it may be, a stricture is curable, provided that the lumen of the oesophagus is preserved; if the tube is no longer permeable, gastrostomy is indicated.

667. Vasostomy in Gonorrhoea.

BELFIELD, who believes that infection of the seminal vesicles occurs early and is a potent factor in prolonging discharge, describes (*Journ. Amer. Med. Assoc.*, 1920, 74) the technique of vasostomy for the treatment of vesiculitis. The vas is exposed through a short inguinal incision and punctured with a fine-pointed bistoury. A piece of silkworm gut is pushed down the lumen of the vas and over it, as a guide, a blunt hypodermic needle is made to enter. Ten c.cm. of methylene blue solution (1 in 25,000) are injected; the patient is requested to micturate. If the urine is tinged it is clear that the needle is correctly placed, and 20 c.cm. of collargol (5 per cent.) are injected. If the colour fails to appear in the urine the technique is faulty and must be corrected. Finally a silkworm gut suture is left in the vas to facilitate further injections. Indications for the performance of vasostomy are not given, but, according to Belfield, the injection of collargol into the vesicles is a cure for many gonorrhoeal conditions.

668. Primary or True Rhinoliths.

H. ABRAND (*Rev. de laryng., d'otol. et de rhinol.*, May 15th, 1920) records two cases of this condition. The first was in a woman, aged 65, who for thirty-five years had suffered from a purulent fetid nasal discharge following puerperal fever. The diagnosis of nasal polypus was made, but operation was refused. Later the condition was regarded as epithelioma of the nasal fossae, and owing to the unfavourable prognosis connected therewith palliative treatment only was instituted. On examination by Abrand an enlarged inferior turbinate bone was found and a rhinolith weighing 33 grams and shaped like an inverted molar was removed. Recovery took place. In the second case, which occurred in a man aged 60, the subject of chronic rhinitis and ethmoidal cellulitis of unknown duration, the head of the inferior turbinate was also enlarged.

669. The Germicidal Value of Potassium Mercuric Iodide.

MACFARLAN (*Amer. Journ. of Med. Sciences*, April, 1920) says that potassium mercuric iodide is a powerful germicide, acting in high dilutions; the presence of organic matter—for example, human serum-albumin—only diminishes its potency to a relatively slight degree. It is readily soluble in water, alcohol, and acetone, and is far less toxic and irritating than mercuric chloride.

670. Strangulation of Stomach in Hernia.

SPIEGEL of Buda-Pesth (*Zentralbl. f. Chir.*, 1920, 47) describes a case of strangulation of the stomach in the sac of a left femoral hernia. The subject, a woman 55 years old, had intestinal obstruction; there was a femoral hernia the size of a child's head. At operation a large part of the stomach, a portion of transverse colon and gastro-colic omentum, and a coil of lower ileum were found in the sac. The stomach was dusky in colour and dilated, but regained its normal colour when liberated. The patient, who recovered, had a severe dorsal kypho-scoliosis, so that the distance between the symphysis pubis and tip of the ensiform was only 7 inches. Spiegel states that only 1 case has been recorded in which the stomach was found in a femoral hernia; there are 8 cases of such discovery in inguinal herniae, of which 4 were incarcerated.

671. Treatment of Vincent's Angina by Chromic Acid.

W. DUBREUILH (*Journ. de Méd. de Bordeaux*, March 25th, 1920) has found the use of arsenobenzol (in local applications and injections) and methylene blue unsatisfactory in the treatment of Vincent's angina and allied conditions, and recommends the local application of a saturated solution of chromic acid on a swab. The patient should be made to gargle with hydrogen peroxide (1 in 10) so as to prevent the swallowing of chromic acid in the saliva; this gargling should be repeated frequently. As a rule the ulcer becomes clean the next day, and it is only rarely necessary to make a second application towards the fourth or fifth day. The same treatment may be employed for all lesions of the same kind due to the fusospirillar infection.

672. Serum Treatment of Ulcus Molle.

J. REENSTIERNA (*Hygiea*, April 30th, 1920) eulogizes the use of an antistrepto-bacillus serum, obtained from sheep, in the treatment of ulcus molle. One of his patients was a man of 37, whose ulcus molle on the penis was soon followed by a suppurating bubo in the left inguinal region. In spite of more than a year's energetic treatment with common remedies no improvement was effected. A few days after the intragluteal injection of 15 c.cm. of the serum rapid improvement began, and the ulcer quickly healed. More than two months later this recovery was maintained, and the large cavity formed by ulceration in the left inguinal region was not only obliterated, but was also covered by a new growth of skin.

673. The Thigh Rotation or Obturator Test.

COPE (*Brit. Journ. of Surg.*, April, 1920) records a diagnostic sign which may be of assistance in some cases of appendicitis in which the appendix is situated in the pelvis and lies against the upper part of the lateral wall, so that rectal examination may be negative. To perform the test the surgeon stands on the right of the patient and slightly flexes the thigh so as to relax the psoas muscle. By fully rotating the limb at the hip, first internally and then externally, the obturator internus is put through a full range of movement; the sign is present if the patient complains of hypogastric pain. Since the fascia covering the obturator internus is fairly dense, the sign is not obtained unless the inflammation is considerable. It has been found useful in pelvic conditions other than appendicitis, such as ruptured ectopic gestation.

674. Stenosis of Duodeno-jejunal Flexure by Ulcer.

GUÉRIN (*Lyon Chir.*, 1919, 16) reports a case of stenosis of the duodeno-jejunal flexure originating in adherence of a gastric ulcer. For the pancreas to be affected by a lesser curvature or pyloric ulcer is not uncommon, but the duodeno-jejunal junction usually escapes. Guérin's patient suffered two or three hours after meals from vomiting and epigastric pain radiating into the back. This state of affairs lasted with intermissions for twenty-six years. At operation an ulcer was found 2 in. below the cardia on the lesser curvature, adherent to the pancreas and mesocolon. Fuller exposure revealed an extrinsic stenosis at the duodeno-jejunal angle, due to extension of the ulcer. Posterior gastro-enterostomy was performed, a large button being used. The author believes that reflex pyloric spasm, preventing emptying of the stomach, played no small part in the case, for the stenosis was not complete.

675. Bullet in the Pulmonary Artery.

VIANNAY (*Lyon Chir.*, 1919, 16) remarks that observations have already been published on projectiles in great vessels such as the aorta and superior vena cava, but none (in France) on such foreign bodies in the pulmonary artery. In his case there was a large haemothorax and a haemopericardium, and x-ray examination demonstrated a bullet near the hilus of the left lung moving synchronously with the heart beats. Viannay operated twenty days after the date of wounding, and was able to control haemorrhage by compression of the root of the lung between finger and thumb; he clearly saw the tear in the pulmonary artery. After the compression was relaxed haemorrhage was so violent that he had to close the opening by haemostatic forceps, and then by ligature. He was unable at the time to be certain whether he had ligatured the whole pulmonary artery or only a branch; the subsequent occurrence of massive gangrene of the lung decided this point. Viannay thinks that it would have been better to have done a primary pneumectomy, but doubts if the patient would have recovered.

376. Rupture of Crucial Ligaments.

DUVAL (*Bull. et Mém. Soc. Chir. de Paris*, 1920, 46) describes a case in which the internal lateral and both crucial ligaments of the right knee were ruptured by the fall of a heavy case on the outer side of the limb. Seven days later Duval performed an arthrotomy, and finding both crucial ligaments torn across proceeded to repair them, basing his operation on the Allwyn Smith and Hey Groves technique. A pedunculated musculo-tendinous flap was taken from the thigh and carried through a hole bored in the internal condyle to the intercondyloid notch. Here the graft was sutured to the stumps of the two crucial ligaments. The internal lateral ligament was repaired with a strip of fascia lata. The wound healed by first intention, and gave an admirable result without lateral mobility or antero-posterior subluxation.

OBSTETRICS AND GYNAECOLOGY.**677. Round Ligament Tumours.**

MOENCH (*Med. Record*, April 17th, 1920) records the case of a three-para of 39, in whom during six months a lump in the right groin had increased from the size of a walnut to that of a grape fruit; there had been no pain. A hard, slightly nodular mass was felt over the ramus horizontalis of the right os pubis, extending downwards into the labium majus and upwards for 3½ in.; the skin was slightly reddened and adherent at the summit of the growth. At operation a very vascular tumour, together with the adherent portion of skin and several enlarged inguinal glands, was removed; the thickened round ligament passed directly into the growth. The patient refused to undergo x-ray treatment. At first she seemed quite well; but within four weeks she showed symptoms of metastases in the abdomen, lungs, and brain. Microscopically the main part of the tumour consisted of a myofibroma with hyaline degeneration. In some small areas the tissue had been replaced by a dense growth of small round cells with very dark nuclei showing frequent and often irregular mitoses; in some places these areas were necrotic. The stump of the round ligament showed hypertrophy and hyperplasia of its constituents but no appearances of malignancy.

678. J. DUCUING (*Gynéc. et Obstét.*, April, 1920) records the case of a girl of 5, who had on both sides a soft lobulated irreducible tumour, resembling in appearance a large inguinal hernia and obscuring the abdominal rings. At operation the external ring had to be enlarged, the tumours extending for some distance along the round ligaments. This is said to be the first recorded case.

679. Uterine Fibroids and X Rays.

CHIFOLIAU (*Bull. et Mém. Soc. Chir. de Paris*, 1920, 46) describes his findings at operation in six cases of uterine fibroids which had been treated previously by x rays. No diminution of the size of the fibroids was found, although haemorrhage had been arrested or diminished in five of the six cases. The two largest fibroids, previously treated with twenty-six and twenty exposures respectively, presented no unusual appearances. In three cases the uterus was hard and diffusely sclerotic, no definite fibroid tumour being present. Adhesions were also found in one case to the rectum and in another to cystic ovaries, the uterus itself being fixed. Chifoliau concludes that as a rule the use of x rays for uterine fibroids is ineffectual.

680. Ascaris lumbricoides in the Fallopian Tube.

NACKEN (*Zentralbl. f. Gyn.*, April 3rd, 1920) describes the case of a woman of 21, who complained of abdominal pain, and in whom there was a tender sausage-shaped tumour of the right adnexa. The diagnosis was made of pyosalpinx (probably gonorrhoeal, although gonococci were not found), and after two months' expectant treatment, during which pain and irregular haemorrhages ceased, the tumour became less tender and the abdomen was opened. The right tube, which was swollen and tense, was adherent at its free end to a loop of ileum, with which it communicated by a narrow opening; the adhesions were divided and the intestine sutured. Pus exuded from the tube, and the extremity of a round worm (which proved to be 25 cm. long) was visible. The worm was removed and the tube and appendix were excised.

681. The Permeability of the Placenta to Mercury.

SOLI (*Riv. Osped.*, February 15th, 1920) reports a case of acute mercury poisoning in a pregnant woman, causing premature birth. The child died fourteen days later from mercurial poisoning and bronchopneumonia; in addition to the pulmonary lesions, its kidneys showed tubular nephritis in process of cure, with almost complete restitution of the renal parenchyma. There were also some slight changes in the salivary glands, probably due to mercurial poisoning, and slight alterations in the intestine and liver.

682. Spinal Anaesthesia in Pelvic Operations.

MORGAN (*St. Bartholomew's Hosp. Journ.*, May, 1920) records 24 cases of hysterectomy (including four of the extended operation), twelve operations on the adnexa, and four Caesarean sections carried out under anaesthesia by

stovaine given intrathecally after preliminary subcutaneous injections of scopolamine and morphine. In 14 cases at the beginning or end a little general anaesthetic had to be given. In the majority of cases there was complete amnesia. Eleven cases had post-operative paresis of the bladder and rectum.

683. The Significance of Rieder's Cells in Gynaecology and Obstetrics.

ACCORDING TO F. MACCABRUNI (*Ann. di Ostet. e Ginecol.*, September-October, 1919), the presence in the blood of Rieder's cells—as certain atypical leucocytes with a malformed nucleus are called—does not possess great diagnostic value. A high percentage in carcinoma of the uterus appears to indicate a bad prognosis, only a small number being present in operable cases. In ordinary cases of fibroids, ovarian cysts, or endometritis the cells are absent. Maccabruni has found them in normal pregnancy in perfectly healthy women, especially towards the end of gestation. They may also be present in labour, especially in the last stage. In the normal puerperium they rarely exceed 1 per cent. of the total leucocytes, but in grave generalized puerperal infections their percentage may be increased. Maccabruni concludes that the appearance of Rieder's cells in the blood indicates an increased activity or a disturbance of the whole organism, including the blood-forming organs. The principal causes of their appearance are thought to be anaemia and intoxications generally.

684. Vaginal Cyst with Mixed Epithelial Lining.

J.-P. and G. TOURNEUX (*Bull. et Mém. Soc. Anat. de Paris*, March, 1920) record the removal from the lateral wall of the vagina of a cyst the size of a cherry. It contained viscous fluid and was lined by epithelium, which in various places changed abruptly from a pavement to a cylindrical or cubical character. The authors suggest that it arose from inclusion of an aberrant outgrowth from the primitive utero-vaginal canal in the region of the transition of its lining from squamous to cylindrical epithelium.

685. Epithelioma Developing in a Fibroid Polypus of the Uterus.

J.-P. and G. TOURNEUX (*Bull. et Mém. Soc. Anat. de Paris*, March, 1920) found on microscopic examination that a squamous-celled carcinoma had developed in a small fibrous polypus, which arose in the interior of the uterus and hung down into the vagina. The polypus had apparently been present for about three years.

PATHOLOGY.

686. Experimental Chronic Gastric Ulcer.

ALTHOUGH it is comparatively easy to produce acute ulceration and even perforation of the animal stomach by experimental means, it is well known that to produce a chronic ulcer resembling the callous gastric ulcer of man is very difficult. The only chronic ulcers of human type which have been found in animals have been formed accidentally; they are the ulcerations which commonly occur in the small isolated portions of stomach which Pavlov, in particular, has used for the investigation of the physiological properties of the gastric juice. Careful histological examination has shown that these ulcers closely resemble gastric ulcers in man. By giving alkaline washes and bismuth injections, and by frequent removal of the gastric juice from the pouches, the occurrence of these ulcers—which has been attributed to stasis of the secreted fluid—has been prevented. Experimental attempts to produce ulcers have given varying findings. Payr, noticing endarterial changes in the ulcers removed at operations in man, tried to produce ulcers by arterial injections of various kinds. According to the amount injected he caused perforation of the stomach or chronic ulceration, rarely adherent to the pancreas, and occasionally of "hour-glass" type. The lesions on the whole tended to spontaneous repair. Payr believes that the essential factor in the passage of an ulcer from the acute to the chronic state is alteration of vascular supply, and that an obliterative arteritis produces chronicity. He found that section of the nerves, vagus or sympathetic, might sometimes be followed by occurrence of an ulcer. Attempts to produce ulcers by traumatism have not been successful; large excisions or destructions of gastric mucosa heal very readily, leaving but a small scar behind. SANTY (*Lyon Chir.*, 1919, 16) has made some fresh observations on this point: he removed a circle of the whole thickness of the mucosa and submucosa 3 in.

in diameter; twenty-eight days later cicatrization was perfect, a small groove covered by mucous membrane marking the site of the extirpation. Santy criticizes the experiments of Katzenstein, who found that all tissues other than gastric mucosa were readily digested by the gastric juice, and claimed that by injection of dilute hydrochloric acid into the mucosa he was able to destroy the defensive antipepsin. Santy repeated these experiments, and found that the acid acted as a corrosive; in one cat perforation followed in forty-eight hours. In another experiment, one and a half months after the injection, only a small cicatrix showed the site of the injection. There can be little doubt but that it is the acid and not the pepsin of the gastric juice which leads to ulceration, for the vast majority of ulcers lie in the stomach and supra-papillary duodenum. Santy makes no mention of Roscnow's work on the elective action of streptococci—that is, the power of organisms cultivated from an ulcer to induce another ulcer in an animal into which they are injected.

687. Colloidal Gold Reaction.

NIXON (*Minnesota Med.*, April, 1920) considers that the colloidal gold reaction, which has been so simplified as to be within the reach of an ordinary laboratory, is unquestionably the most sensitive and valuable of the various tests used in the study of the spinal fluid. It does not replace other tests, but is of independent value; it is of special importance in the early diagnosis of neurosyphilis, and gives the first indications of involvement of the nervous system. Cases with no involvement of the central nervous system give no colloidal gold curves. Nixon has made a parallel examination of cerebro-spinal fluids with the gold sol test, with the Nonne test for increased globulins, with the cell count, and with the Wassermann reaction. In dementia paralytica a gold curve is obtained in 95 per cent. of the cases, a positive Wassermann reaction in 90, increase of globulin in 85, and a pleocytosis (that is, a cell count of 6 or more) in 75 per cent.; the average cell count lies between 35 and 40 cells per cubic millimetre in paresis. In tabes dorsalis a positive gold reaction was obtained in 80 per cent., a positive Wassermann reaction in 55, and a positive Nonne reaction and a pleocytosis in less than 50 per cent. Well-marked curves may be found in quite early cases, and the gold reaction is the first one to appear. In cerebro-spinal syphilis 85 per cent. of cases showed some reduction, 75 per cent. giving definite curves, whilst the globulin reaction was positive in 63 and definitely positive in only 41 per cent., and 45 per cent. gave a pleocytosis; in 18 per cent. the colloidal gold reaction was the only indication of abnormality of the spinal fluid. Of conditions other than neurosyphilis and meningitis giving a well marked curve multiple sclerosis was the one most frequently seen; about half of the cases gave definite reduction, whereas the Nonne test was positive in only 10 per cent. In disseminated sclerosis the average cell count was 14, in comparison with 1.6 in normal fluids—a point which is of interest as indicating a toxic etiological factor. In brain or cord tumours reductions were obtained in 50 to 60 per cent. of cases. The condition could be differentiated from that of meningitis by the fact that the Nonne test was usually negative or faintly positive and the cell count low or normal, whereas in meningitis the Nonne test was strongly positive and there was a high cell count. While emphasizing the non-specificity of the various colloidal gold curves, the so-called "paretic," "luetie," and "meningitic," Nixon is strongly of opinion that they are of definite diagnostic value when corroborated by other reactions or clinical findings.

688. Isolated Congenital Dextrocardia.

ACCORDING TO LAUBRY and ESMEIN (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, March 4th, 1920) isolated congenital dextrocardia is a rare anomaly, there being barely 60 cases on record, of which hardly 30 have been verified by autopsy. They record a case in a soldier aged 29 in whom the diagnosis was confirmed by radioscopic examination. The left side of the chest showed a remarkable congenital deformity, being hollowed out anteriorly into a large triangular depression, with its apex downwards, and with the atrophied nipple and a large hairy naevus in the centre. The pectoral muscles in the depressed area were atrophied. The writers, like Apert, attribute the dextrocardia to intra-uterine trauma, which had caused the deformity of the thorax, thereby producing displacement of the heart.

689. Juvenile Carcinoma.

HAGEDORN (*Zentralbl. f. allg. Path. u. path. Anat.*, Bd. 27, 121) gives a brief account of a very rapidly growing carcinoma of the stomach in a girl 13 years old. There were numerous metastases.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

690. Localized Forms of Vertebral Rheumatism.

A. LÉRI (*Journ. de méd. et de chir. prat.*, March 25th, 1920) states that vertebral rheumatism is most frequently localized in the lumbar spine, where it is characterized by lumbo-sacral pain, which frequently radiates to the buttocks, thighs and legs, and by a forward inclination of the trunk. The disease is not peculiar to old persons, nearly all Léri's patients being aged from 20 to 40. Lumbar rheumatism runs its course, like every other form of chronic rheumatism, with more or less prolonged paroxysms of pain interrupted by remissions. The disease is distinguished from camptocormia or hysterical bent back by x-ray examination, which shows various deformities of the vertebrae. Rheumatism of the dorsal spine is much more difficult to determine, because as a rule the x-ray pictures are indefinite. In a certain number of cases, however, Léri has been able to attribute obstinate intercostal or abdominal neuralgia or (in one instance) cranial monoplegia to chronic dorsal rheumatism. Cervical rheumatism may be manifested (1) merely by painful symptoms, with or without disturbance of objective sensibility and reflectivity, or (2) by amyotrophic paralysis simulating a primary amyotrophy or one due to paralysis of a peripheral nerve.

691. Transmission of Tubercle Bacilli by Table Utensils.

CUMMING (*Journ. Amer. Med. Assoc.*, April 17th, 1920) experimented with spoons used by patients suffering from pulmonary tuberculosis. He found that eleven out of thirty-one guinea-pigs inoculated with the water in which spoons had been washed died from tuberculosis: six out of twenty-four died after inoculation by the centrifuged deposit from the water in which the spoons had been rinsed. Three animals out of seven gave positive results after being injected with scrapings from the hands of tuberculous patients. Cumming believes that this mode of transmission is frequent.

692. The Treatment of Chronic Polyarthrititis.

A. FABER (*Hospitalsidende*, May 12th, 1920) has found that among cases of chronic polyarthrititis at the Silkeborg Bath the knee and ankle were concerned in 70 to 80 per cent. In his experience the traumatic factor in the causation of this disease is not adequately recognized; in many of his cases artificial supports of the instep, even when there was no flat-foot, afforded relief. In many cases cycling proved beneficial. One of his patients, aged 30, had suffered from hydrarthrosis and osteoarthritis of both knees, and, in spite of various forms of physical treatment, had been reduced to a state of invalidism for many years; he regained his mobility when he took to cycling. The author finds treatment by venous stasis effective in some cases, and points out that in polyarthrititis of the hand the ring finger sometimes escapes. Another remedy he has tried with some success is intramuscular injection of milk; every three to five days 5 to 15 c.cm. of boiled milk are injected. The ensuing reaction of articular pain and fever lasts about twelve hours. This treatment has also proved beneficial in gonorrhoeal arthritis, iritis, and conjunctivitis. In half the number of cases of chronic polyarthrititis in which he injected milk the author observed no beneficial result; in the remainder there was often great relief from pain, and the range of movement about the affected joints was increased. In one case this improvement lasted for a considerable time. The author considers this effect of injections of milk to be due simply to the rise of temperature provoked.

693. H. JANSEN (*Ugeskrift for Læger*, May 13th and 20th, 1920), writing from an experience of 333 cases treated during the last five years, states that, in prescribing massage, baths, etc., the stage of the disease and the patient's general condition and peculiarities must be studied. As a rule, Jansen begins with mud packs and baths, deferring the more intensive thermo-therapy and mechano-therapy till a later stage. Diathermy he considers of doubtful value and by no means safe. He considers a lacto-vegetarian diet to be harmful; the drugs he recommends are iron, arsenic, and small doses of a salicyl

compound given over a long period. He has found injections of collargol effective in some acute forms of the disease, but not in the chronic forms. Of physical remedies the Finzen light bath is, in his opinion, one of the most effective, but he thinks that radium emanations promise to be useful, provided the present timid system of dosage is revised.

694. Myotonic Form of Lethargic Encephalitis.

H. CLAUDE (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, March 4th, 1920) records three cases of a myotonic form of lethargic encephalitis in which the patients showed changes of muscular tonus independently of any involvement of the pyramidal system. In two cases the physiognomy was absolutely expressionless, although somnolence was not a pronounced feature. On attempting to move the limbs considerable muscular rigidity was encountered. One of the patients resembled a case of paralysis agitans owing to his mask-like expression, muscular rigidity, and tremor of the hands. Claude suggests that the peculiar appearance presented by the patients was due to changes in the locus niger.

695. Parotitis in Typhus.

BONNET and DE NABIAS (*Lyon Chir.*, 1919, 16) give an account of parotitis as seen by them during the outbreak of typhus in Rumania in 1917. This complication was frequent and severe; there were massive swellings of the face and neck, and sometimes deafness and discharge from the ears, caused not by otitis media, but by separation of the bone and cartilage of the external auditory meatus. This was brought about by the dissecting and softening powers of pus from the parotid, and led to dislocation of the aural cartilages from the head. The pus generally showed a mixed infection, the streptococcus predominating. The authors believe that the parotitis was the result of an ascending infection by Stenson's duct; in support of this view they state that they were always able to prevent or minimize the occurrence of parotid infection by the use of an iodized water mouth-wash. The authors distinguish three clinical forms: (1) A simple inflammation; (2) a phlegmon with general enlargement of the gland, little pus formation, and often the occurrence of a residual abscess; (3) a necrosing or dissecting type. The last variety causes more or less complete destruction of the gland, and after distending the parotid bed and sheath bursts through into fresh planes: thus the finger introduced into the sponge-like tissue would pass inwards to the pharynx, downwards into the neck, and upwards to the zygoma. Treatment by incision was the rule; Bonnet and de Nabias prefer a posterior incision, beginning at the mastoid and following the ramus of the jaw a finger-breadth behind it. Carrel-Dakin treatment was found valuable.

696. Recurrent Haematemesis in Chronic Obliterative Phlephlebitis.

P. CARNOT and J. LÉOBARDY (*Paris Méd.*, April 3rd, 1920) report the case of a soldier, aged 20, admitted to hospital with the diagnosis of gastric ulcer. In the course of two years he had shown evidence of various disturbances in the territory of the portal vein—namely, gastro-enteritis and a first attack of haematemesis in October, 1917; and indigestion, ascites, and severe haematemesis in September, 1918, and January, 1919. After admission to hospital in July, he had a fourth attack of haematemesis accompanied by splenomegaly and ascites in September, and a last and fatal attack of haematemesis in October. The autopsy showed thrombo-phlebitis throughout the portal system. The condition was probably caused by infective micro-organisms of intestinal origin.

697. Treatment of Leprosy.

SIR LEONARD ROGERS (*Indian Medical Gazette*, April, 1920) gave to the Calcutta Leprosy Conference an account of the recent use of chaulmoogra and other oils and their derivatives for the treatment of leprosy. Chaulmoogra oil itself has been used for many years, but is so nauseating that few patients can take it for extended periods. Heiser, in the Philippines, employed it by intramuscular injection. From 1915 onwards Rogers prepared and tested various chemical products from different varieties of chaulmoogra and hydnocarpus oils. In this way were obtained sodium gynecardate, a salt of the fatty acids having the lower

melting points, and sodium gynocardate A, more correctly named sodium hydnoicarpate, the corresponding salt of the higher melting point acids. The latter proved more useful, but when injected subcutaneously produced painful induration and was but slowly absorbed. More rapid improvement followed its intravenous injection, although the irritant effect of the drug on the vessel walls often caused inflammatory obliteration of the veins. As a consequence of its intravenous injection there ensued a local inflammatory action accompanied by pyrexia, absorption of diseased tissue, and disappearance of the leprosy bacilli. With the help of Dr. Sudhamoy Ghose a parallel preparation of sodium morrhuate was made from cod-liver oil. In a similar way the sodium salts of the unsaturated fatty acids of linseed and soya bean oils have been prepared and tried: the sodium salt of the acids contained in soya bean oil is less irritating than the hydnoicarpate, and its trial promises to give good results. Chemical experiments are being made by Ghose and others with other oils, and with the preparation of ethyl esters of unsaturated fatty acids. Ethyl morrhuate is being used with success, and Hollmann and Dean, in June, 1919, reported encouraging results from ethyl esters of different fatty acid fractions of chaulmoogra oil. The results of several series of clinical observations are tabulated by Rogers, Muir, Neve, and Cathew.

698. Clinical Notes on Influenza in 1918-19.

BERTOLINI (*Rif. Med.*, December 13th, 1920), in view of the belief that quinine prevents influenza and that malarial patients get influenza less frequently than others, refers to cases of malarial subjects who suffered from influenza even while the plasmodium could be found in the blood; also to 115 cases of influenza occurring among 118 malarial suspects. He states, moreover, that if malarial patients do contract influenza the mortality is above the average. Tuberculous subjects do not seem to catch influenza easily—for example, out of 43 tuberculous patients taken at one hospital, 26 had never suffered from influenza, and another series of figures gave out of 500 tuberculous subjects only 8 per cent. as attacked with influenza; but as usual there are figures pointing the other way. As a matter of experience tuberculous lesions are rarely found *post mortem* in those dying of influenza. Authorities differ as to the course of influenza in tuberculous subjects; the majority say that it is not severe. If influenza on the whole spares people already suffering from some other disease, its incidence is frequent among the young and healthy; in autopsies made on influenza patients it is rare (6 to 11 per cent.) to find any other lesion. The presence of another infection, by raising the defensive powers of the organism, may prevent the development of influenza germs. In healthy individuals the influenza germ causes a rapid production of defensive substances, especially bacteriolysins, which by dissolving many bacteria put into circulation endotoxins causing an acute intoxication.

SURGERY.

699. Magnesium Sulphate in Tetanus.

REVERDIN and BEUF (*Lyon Chir.*, 1919, 16) publish a brief account of the Blake method of treatment of tetanus. This consists in lumbar puncture, the withdrawal of 10 or 15 c.c.m. of cerebro-spinal fluid and the injection of 10 c.c.m. of warm sterile magnesium sulphate in 10 per cent. solution. The drug has anaesthetic and paralysing effects, so that the spasms and convulsions are largely or entirely controlled. The injection into the theca is made daily until recovery is sure; 90 c.c.m. was the largest amount administered to any of the cases in this small series. Treatment with antitetanus serum, morphine, and chloral was employed at the same time, for, although it would be interesting to compare the precise therapeutic value of different treatments, the authors considered that in so grave an affection all known means of attack should be employed. Of five cases treated without magnesium sulphate four died; of six cases treated with magnesium sulphate five recovered. Serum was not given in such large doses as Dean, for example, employed; 30 c.c.m. per diem, given subcutaneously, was regarded by the authors as high dosage.

700. Treatment of Spinal Injuries

H. W. MARSHALL (*Boston Med. and Surg. Journ.*, 1920, 182) discusses the conservative treatment of injuries of the spine. The paper refers particularly to the results of injuries and the capacity to work. Those vertebral lesions

only in which there is no cord injury are referred to. Radiography to-day allows a positive diagnosis of vertebral fracture to be made in cases which would formerly have been labelled "back sprain." Marshall concludes that such injuries are not permanently crippling, and that the patients frequently develop a high degree of physical efficiency, sometimes within a few months. Mechanical appliances are required very commonly for considerable periods of time, and indications are given as to the best kind of apparatus to apply. The author favours a very light flexible steel pelvic band with light steel uprights. He examines the credentials of the inlay bone graft, and concludes that it can have but little effect in relieving a crushed vertebral body from compression. Such operations are not uniformly beneficial, and fair or excellent recoveries are so common without surgical intervention in healthy young adults that bone grafts are not warranted in the majority of workmen's cases. These conclusions are based on a study of thirty cases of vertebral fracture.

701. Decompression of the Spinal Cord in Tuberculosis of the Spinal Column.

FLOECKINGER (*Amer. Journ. of Surg.*, March, 1920), discussing the treatment of tuberculosis of the spine, urges simple decompression to prevent complete destruction of the cord by pressure. If suspension only of function has taken place, without degeneration of the nerve fibres of the cord, the prognosis is good. Nothing more than simple decompression is necessary; there is no need to open into and scoop out the granuloma. These cases should not be drained. Should the granuloma be incised during the operation the debris should be carefully scooped out, the wound dried, mopped out with lysol or phenol solution, and then dried again and sprinkled with powdered iodiform. Closure of the wound can be effected by covering the cord with a strip of the erector spinae muscle. The fascia is then closed with figure of eight sutures obliterating all dead spaces; a plaster jacket is applied and tuberculin treatment is begun. Improvement is gradual, and the results of tuberculin treatment are most promising provided it is never given more often than once a week, the daily fluctuation of temperature being used as a guide to the opsonic index. Removal of the spinous processes and the arches of the vertebrae does not affect materially the strength of the spinal column.

702. Cauterization of Gastric Ulcer.

PAUCHET, who believes that in ulcers of the body of the stomach gastro-enterostomy is of little use, and reserves gastrorectomy for intractable cases—those with unrelieved pain or with large ulcers—describes (*Lyon Chir.*, 1919, 16) the operation that he performs for the treatment of gastric ulcer by Balfour's cautery method. He uses local anaesthesia with infiltration of the solar plexus. Balfour's technique is closely followed, including the dissection upwards of the peritoneal flap of the lesser curvature. Pauchet exposes the posterior wall of the stomach and separates adhesions to the pancreas by the route which he has previously described—that is, by "wiping" the great omentum off the transverse colon, and so entering the lesser sac of peritoneum between greater curvature and colon. After cauterization and suture of the ulcer he turns the omentum up over the stomach to reinforce the site of the ulcer. He concludes by performing posterior gastro-enterostomy.

703. Conservative Treatment of Sarcomata of Long Bones.

In a paper based on the study of 147 conservative operations, E. ESTOR and A. AIMES (*Rev. d'Orthopéd.*, May, 1920) state that in recent years, chiefly owing to the influence of the Lyons school, there has been a tendency to adopt a conservative treatment in operations for sarcomata in long bones. This tendency is based on the following observations: (1) The frequent discrepancy between the prognosis founded on histological appearances and the clinical course of the tumour; (2) the limitation of the lesions (in the early stages at least), sarcoma being at first an encapsulated tumour, which does not develop like carcinoma by infiltration, but by an eccentric displacement of the neighbouring soft parts; (3) there is rarely an invasion of the glands; (4) the patients refuse to undergo mutilating operations; (5) the functional results observed after conservative operations are good; (6) radical operations are "distressingly unsuccessful." Whatever method is employed nothing is of any avail against metastases, which are often clinically latent. Three conservative operations have been read, but simple removal of the tumour is only rarely indicated.

The choice usually lies between resection and amputation or disarticulation. If the operation is performed at an early stage good results will be obtained from resection, especially in the upper limb, where the results are even better than those obtained by radical operation. In the lower limb, where it is important to obtain a solid limb and avoid shortening, conservative treatment is open to discussion, but bone grafts, which fulfil these conditions, will enable resection to be carried out. Amputation and disarticulation are indicated in most round-celled sarcomata, in rapidly advancing tumours, and in those which have undergone ulceration or have invaded the soft parts to a great extent. Conservative treatment is indicated in myeloid sarcomata, in encapsulated spindle-celled tumours, sarcomata of slow development and recent growth, and cerebral sarcomata.

703. Tuberculosis of the Hernial Sac in the Child.

M. MUTEL and C. MATHIEU (*Rev. méd. de l'Est*, March 1st, 1920) state that out of 900 radical cures for inguinal hernia in the child performed by A. Broca up to 1897, tuberculosis of the sac was found in 15. Of 136 cases of tuberculosis of the hernial sac at all ages collected by Cotte 46 were in children under 10 years of age. By extending the age up to 15 the writers were able to find 56 cases, including those of Cotte. The male sex was by far the most frequently affected (in 53 out of 56 cases) probably because inguinal hernia is much more frequent in boys than in girls. Among 40 cases in which the date was available the writers found 26 in which tuberculous peritonitis existed before the hernial infection. In 9 cases the tuberculosis was secondary to lesions of the genital system, the disease having spread from the testis or epididymis. The tuberculous process might invade either the sac or its contents separately, or in some cases simultaneously. The organ most frequently involved was the omentum. The immediate prognosis in the child was less unfavourable than in the adult, as the hernial sac in the former is practically never occupied by intestine. Of the 56 cases collected by the writers 8 were fatal, most of the patients dying from two months to two years after the operation. This shows that the remote should be more guarded than the immediate prognosis.

705. Teeth Extraction and Heart Disease.

P. J. CALVY (*Journ. Amer. Med. Assoc.*, May 1st, 1920) cites cases in which an organic infection of the heart was made worse by extraction of teeth. He ascribes this to lack of drainage of the infected area, the tooth socket being filled with a firm clot of blood; septic absorption follows.

706. Experiments with Intraperitoneal Narcosis

P. PERAZZI (*Ann. di Ostet. e Ginecol.*, September-October, 1919) injected dogs and rabbits intraperitoneally with solutions of various narcotics, such as ether, veronal, chloral hydrate, and morphine, the best results being obtained with the last two drugs, which, in relatively small doses and diluted in saline solution, rapidly produced narcosis. Naked-eye and microscopical examination one or two days later showed that only slight and transient changes were produced in the peritoneum.

OBSTETRICS AND GYNAECOLOGY.

707. The Corpus Luteum and Pregnancy.

ROETTER (*Zentralb. f. Gynäk.*, March, 1920) records eight cases of early pregnancy (in all of which the last menstruation had occurred more than six weeks previously); after unilateral ovariectomy, even when the corpus luteum of pregnancy had been removed, the gestation continued. The presence of the corpus luteum graviditatis is not therefore, after the sixth week, indispensable in order that pregnancy may continue.

708. Haemorrhage from the Ovaries.

BAROLIN (*Med. Klinik*, January, 1920) refers to the conflicting views which are held as to the cause of haemorrhage from the ovary; the majority of authors believe it to originate in the follicles or corpus luteum cysts, but the opinion has been expressed that it is invariably due to early ovarian or tubal gestation. The author, from a study of four cases which came to operation, and in one of which serial sections were made, believes that in his cases the bleeding proceeded from the follicles and corpora lutea.

709. Uretero-Cervical Fistula after Forceps Delivery: Incision: Spontaneous Cure.

TOSSETTI (quoted in *Zentralb. f. Gynäk.*, March, 1920) records the case of a woman in whom, thirteen days after delivery by high forceps operation, a fistula of the ureter manifested itself by an extraperitoneal infiltration, causing swelling above the left side of the symphysis pubis. The tumour was not affected by catheterization of the bladder, but urine escaped from the vagina as a result of pressure upon the swelling. The patient's condition grew worse and the extravasation continued to increase. On the twenty-second day, the bladder having been pushed upwards, the swelling was incised from the anterior vaginal vault, and a large amount of foul urine thus evacuated. The wound was drained, and a catheter was allowed to remain in the bladder. The fistulous opening gradually closed, and on the forty-third day the dribbling ceased. Subsequent cystoscopy showed normal appearances in both ureteral orifices. Tossetti suggests that the fistula was not directly a result of injury to the ureter but a sequel of pressure-necrosis.

710. "Macération of the Living Child."

MEYER-RUEGG (*Zentralb. f. Gynäk.*, April, 1920) records another example of the condition described under this name by Lorenzen. Labour began in a 1-para aged 30 twenty-five days after the time as reckoned from the last menstruation, and after three days a very large child was delivered by forceps. The membranes ruptured on the first day; the total amount of liquor amnii appeared to be very small and throughout delivery it exhibited a bright yellow colour. Over the whole of the child's body were patches of exfoliated epidermis, some as long as 4 cm.; there was no erythema, vesication, or other eruption, but the hands had a sodden appearance. The stump of the umbilical cord showed an appearance of maceration. The child was healthy and vigorous, and the skin was clean after the fourth day. These conditions were attributed to the effect of meconium acting in considerable concentration in scanty liquor amnii. A similar case, in which the liquor amnii did not contain meconium, is described by Brauns (*ibid.*) under the name of "lamellar desquamation."

711. Radiography of the Third Stage of Labour.

WEIBEL (*Archiv f. Gynäk.*, March, 1920) has examined radiologically the expulsion of the placenta, and concludes that the frequently expressed opinion that the placenta becomes detached in the majority of cases during the second period of labour is incorrect; this does not occur even in semi-precipitate cases. Detachment may begin in the centre or in any portion; the loosened placenta always leaves the uterus with the edge first, and may or may not be folded. From the form and surface of presentation of the placenta no deductions as to the mode in which it became detached in the uterus can with justice be made. The author suggests that Schultze's and Duncan's modes of expulsion should no longer be described.

712. Bilateral Malignant Ovarian Cystoma and Pregnancy.

MASSART (*Bull. et Mém. Soc. Anat. de Paris*, March, 1920) records the case of a woman of 25, two months pregnant, in whom the size of the abdomen was unduly large, and masses the size of an orange were found on each side of the uterus. At operation the left ovary was found to be cystomatous, and on its surface were numerous vegetations; a small portion of the right ovary was unaltered, and lay between the two portions of a cystoma, the surface of which also exhibited vegetations. The adnexa were removed on both sides; the uterus was left, and the course of the pregnancy is being watched.

713. Puncture of the Uterus for Hydramnios.

E. WORMSER (*Zentralb. f. Gynäk.*, 1920, 44) reports a case of hydramnios unsuccessfully treated by uterine puncture. There had been five pregnancies, all except one being accompanied by hydramnios; in the two last the fetus was hydrocephalic. The Wassermann reaction was negative. In the seventh month of the sixth pregnancy an attempt was made to save the child by uterine puncture. The needle was inserted first to the left and then to the right of the umbilicus; 1,750 c.cm. of liquor amnii were withdrawn, and during the operation the height of the fundus diminished by 3 cm. Six days later fetal heart sounds and movements were absent; subsequently labour was artificially induced. It is stated that Bumm first performed this operation in 1900.

PATHOLOGY.

714. Experimental Meningitis.

WEED (*Arch. Med. Belges*, January, 1920) has carried out large series of experiments with a view to discovering the factors which determine development of meningitis from organisms circulating in the blood stream. It was first necessary to select organisms which, when introduced directly into the subdural spaces of experimental animals, could be relied on to cause typical generalized leptomeningitis. One of the most effective for cats (the animals chiefly employed) was *B. lactis aërogenes*: when introduced subdurally this organism was found to produce a leptomeningitis which would prove fatal in twenty-four to forty-eight hours. Doses of this organism and of others which had somewhat similar properties were next inoculated intravenously in cats, but were found to produce only a temporary bacteraemia, without usually any severe symptoms. In no case did simple intravenous injection give rise to meningitis. Weed's next step was to try the effect of puncturing the lumbar theca or the cervical dura through the atlanto-occipital space in animals which had received intravenous doses of organisms while the bacteraemia was still at its height, and withdrawing one or two cubic centimetres of cerebro-spinal fluid. In a considerable proportion of cases this combined procedure led to fatal meningitis. Further experiments proved that the part played by spinal puncture was not that the needle carried in organisms locally, but that the fall of pressure in the cerebro-spinal fluid caused stasis in the meningeal veins, which afforded facilities for infection of the meninges by the organisms in the blood stream. It was demonstrated, in fact, that in bacteraemic animals, in order to bring about generalized meningeal infection, it was sufficient to produce a temporary stasis in the cerebral vessels by compression of the jugulars. In conclusion, Weed expresses the opinion, backed to some extent by clinical observations, that the performance of lumbar puncture in human cases where bacteraemia is present is attended by the risk of producing fatal leptomeningitis.

715. Observations on Mexican Typhus.

WOLBACH and TODD (*Annales de l'Inst. Pasteur*, March, 1920) find that the vascular and cutaneous lesions of Mexican typhus are identical with those of European typhus. The lesion consists essentially in a proliferation of the vascular endothelium. The small vessels and capillaries may be completely obstructed by these cells, and the larger vessels have their lumen blocked by fibrinous and cellular thrombi. The authors are of opinion that the perivascular infiltrations, which in more advanced stages may be very pronounced, are composed of mononuclears derived from the vascular endothelium. The accumulation of the endothelial cells constitutes the first stage of the morbid process; then the thromboses supervene. Localized exclusively in the endothelial cells of the vessels, in large masses, were large collections of micro-organisms of the Rickettsia group (extremely small coccoid or bacillary forms, usually in couples, often lanceolated, and surrounded by a halo or clear zone). As these parasites were never found in other cells, and as they were arranged in large collections, they appear to be different from those of Rocky Mountain spotted fever. The authors propose the name of *Dermacentrorenus typhi* for these parasites.

716. Aseptic Renal Pyuria.

B. RUNEBERG (*Finska Läkaresällskapets Handlingar*, March and April, 1920) devotes 144 pages to a discussion of pyuria of renal origin in which bacteriological examinations prove negative. These cases have commonly been regarded as tuberculous—an attitude which the author considers unjustifiable. At a surgical hospital in Helsingfors in the period 1900-1918, there were 56 cases of aseptic renal pyuria in which there was no previous history of gonorrhoea. Of these, 30 were operated on and 26 were treated on conservative lines. In 11 of the operative cases the affected kidney was macroscopically tuberculous; this diagnosis was confirmed by microscopic examination. In 3 other cases there was no macroscopic sign of tuberculous, but careful microscopic examination proved the condition to be tuberculous. Thus, only in 14 of the 30 operative cases was tuberculous found. Among the 26 cases treated on conservative lines only 4 seemed to be definitely tuberculous. It would thus appear that tuberculous existed in barely a third of the cases of renal pyuria in which micro-organisms could not be demonstrated by direct examination or cultivation.

717. Tonsillar Abscess: Acute Mixed Leukaemia: Leukaemic Tubal Infiltration.

THALER (*Zentralb. f. Gynäk.*, April, 1920) describes the case of a nullipara of 22, who in the autumn of 1918 had influenza, and in August, 1919, began to have fever, headache, and debility. About this time it was noticed that bleeding did not cease after a menstrual period, and this haemorrhage persisted in uncontrollable form until the date of her death. An examination of the blood made on September 14th showed severe anaemia with haemoglobin 15 per cent., erythrocytes 1,004,000, leucocytes 35,000 (lymphocytes 65 per cent., monocytes 20 per cent., myeloblasts 6 per cent.). She died on September 18th. The autopsy showed profound anaemia, small multiple infiltrations in the kidneys and liver, slight enlargement of the spleen and cervical lymph glands, and a tonsillar abscess. On the peritoneum of both broad ligaments were semi-purulent exudations, and both the Fallopian tubes contained pus, from which a streptococcus was isolated. Histological examination of the tubes showed the existence of a leukaemic infiltration of their walls and lumen; the deposits exhibited both lymphocytic and myeloid elements. The uterus and ovaries were normal. The author discusses the bearing of this case on the view recently advanced that leukaemia is an abnormal reaction to septic infection.

718. Camphor Oil Tumours.

HOOKE and WANDER (*Arch. Dermat. and Syph.*, March, 1920) direct attention to a condition which may be puzzling unless the history gives a clue to its origin. They have had experience of six cases and they present them as evidence of the danger of indiscriminate use of camphor oil injections for collapse or in the treatment of very severe illnesses. In all probability the lesions are due not to camphor or to the vegetable oil (generally olive) in which it is dissolved, but to the liquid paraffin which has sometimes been used as a vehicle. The effect of paraffin injections has been investigated and it is probable that these camphor oil tumours are of the same nature as the so-called "paraffinomas." In all the cases the condition was first observed some considerable time after injection, in the earliest two weeks and in the latest eighteen months afterwards. They all gave the history that following the injection of camphor oil for a previous severe illness deep tumours appeared, generally on the outer aspects of the lower third of one or both arms, and occasionally in the shoulders, thighs, or breast. The tumours were of months' or years' duration. When not inflamed they showed a doughy or concrete-like infiltration, varying from the size of a walnut to that of an orange, and were generally lobulated. Instead of being rounded in outline they were linear, with definite sharp angles limiting them from the adjacent normal muscular tissue, and bead-like infiltrations of the same character, but smaller, could be traced toward the axilla or around the periphery, simulating secondary nodules of a malignant growth. The skin surface was sometimes elevated and discoloured. Some of the tumours were only discovered by palpation; they lay nearly always deep in the muscle or the connective tissue. The tumours might not be painful or even tender; when inflamed they were accompanied by colour changes of the skin from red to deep purple. Necrosis was not present in any of the tumours. Histologically they showed the appearance of fibromata of honeycombed appearance, the holes, of various sizes, representing globules of oil. Thickening of blood vessels was a noticeable feature in the tumours. No giant cells were found in the particular tumours examined, but examination of others might have been expected to reveal them in abundance. Indeed, in one case at least the pathologist reported the condition as tuberculous, presumably on account of the presence of these foreign body giant cells.

719. The Influence of the Ovaries on Adrenalin Hyperglycaemia.

BAILLOD (*Korrespondenzblatt f. Schweiz. Aerzte*, 50, 1919) has investigated the action of adrenalin injections (which normally produce hyperglycaemia) in women in whom ovarian function is in abeyance or diminished. After ovariectomy and x-ray treatment, and in those past the menopause, the effect of adrenalin injection upon the blood-sugar content is quicker and more pronounced, and is produced by smaller doses than in normal women; the alteration of effect is more conspicuous after ovariectomy with complete destruction of ovarian influence than after the diminution of ovarian influence which follows x-ray treatment or the onset of the climacteric. Similar findings resulted from experiments on rabbits.

EPITOME OF CURRENT MEDICAL LITERATURE.

MEDICINE.

720. Abscesses Caused by Typhoid Bacilli

F. RATHERY and BONNARD (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, March 4th, 1920) report two cases of severe typhoid fever in which abscesses containing typhoid bacilli appeared in convalescence at the site of a previous trauma—an operation sear in one case and a fixation abscess in the other. The time which elapsed between the trauma and the development of the abscess was twenty-one days in the operation case and twenty-seven days in the other. In the subsequent discussion WIDAL also reported three cases of abscesses containing typhoid bacilli which developed during convalescence from typhoid fever—in the first case at the site of injections of caffeine and normal saline, in the second near a tuberculous gland, and in the third in an ovarian cyst.

721. Encephalitis Lethargica in Austria.

ENCEPHALITIS LETHARGICA, which von Economo was the first in Austria to describe, has again appeared in epidemic form in that country. In the *Wien. Klin. Woch.*, April 1st, 1920, STIEFER, and also SZIGETI, give accounts of various types of cases seen during January and February of this year. The clinical features described do not differ greatly from those recorded over here. A relatively large proportion of patients showed choreiform or athetotic movements at some stage of the disease, and in two instances the involuntary muscular contractions resembled those seen in myoclonus. Delirium, amounting almost to mania, seems to have been common. Drowsiness occurred at one time or another in most of the cases, as did ocular palsies. Spinal forms of the disease were also noted; no late manifestations are recorded. The abdominal and muscular pains which in some instances were complained of suggest to Szigeti that a link exists between encephalitis lethargica and influenza—a theory which has found support in this country; he admits, however, that he is unable to furnish any proof for the hypothesis. The chief interest in the papers lies in the various forms of treatment adopted. Salvarsan and intravenous injections of antistreptococcal serum met with no success. One case, indeed, died shortly after intravenous administration of salvarsan. Szigeti, however, treats symptoms by the somewhat novel method of hypnosis. In his experience noisy delirious patients who are quite unaffected by drugs yield easily to hypnotic suggestion; sleep is induced, and on waking they show marked improvement. For drowsiness he recommends lumbar puncture with fairly extensive withdrawal of fluid. The patient is said to come out of his stupor, his tongue cleans, and he takes an interest in his surroundings. The improvement lasts two or three days, when the puncture has to be repeated.

722. Mental Disorders Associated with Old Age.

SAVAGE (*Journ. of Mental and Nerv. Dis.*, March, 1920) deals with the clinical aspects of mental disorders associated with old age, and their possible complications. The term "denudation" is used to illustrate the loss of memory for recent events which occurs very commonly in old age; the author shows that though a patient may be deficient in recent memory, he may be quite capable of realizing the extent and value of his property, and of giving instructions for its disposal. Loss of control occurs as the higher cerebral centres cease to function and the lower react too vigorously; this is very evident in the restlessness of old age. A familiar example is the old lady who is never satisfied with the tidiness of the house, but constantly rearranges the ornaments and dusts the rooms. Men, on the other hand, often develop grandiose ideas, and launch into extravagant schemes of business, or enter into marriage for a second or third time. Loss of higher control, leading to a feeling of well-being and of sexual potency, causes many old men to form associations with loose women, or to behave indecently towards young girls or boys; it is of considerable medico-legal importance. Frequent masturbation may be practised even by nonagenarians. Sleeplessness is a common accompaniment of senility, and the nocturnal insomnia is not affected in any way by the amount of sleep taken during the day. Depression, or senile melancholia, is a symptom of importance. The author emphasizes the fact that a senile melancholic is a

potential suicide, and the most suicidal in this class is the merchant who develops the idea that he is ruined. Another mental disorder of old age is hallucination; hallucinations of smell appear to be most common. The author quotes instances of old men who constantly complain of the drains or of the cooking in their homes, and cites one or two instances where the hallucinations have been strong enough seriously to influence conduct. Hallucinations of sight are nearly as common.

723. The Diagnosis of Malaria.

G. QUARELLI (*Il Morgagni*, Archivio, March 31st, 1920), reviews the literature and records the results of his observations on about 600 cases in which he had employed provocative injections. The drugs used were adrenalin 1 in 1,000 solution, strychnine 3 to 5 mg., 8 to 12 drops of a 1 per cent. alcoholic solution of nitroglycerin in 2 to 3 c.cm. of distilled water (given intramuscularly), emetine hydrochloride (intravenously or intramuscularly), arsenobenzol 0.8 to 0.10 gram (intravenously). The most effective means of producing an attack were nitroglycerin, in which positive results were obtained in 72 to 74 per cent. of cases; emetine hydrochloride, which gave positive results in 58 to 59 per cent., and strychnine, which gave positive results in 58 per cent.

724. Pulmonary Tuberculosis following a Chest Wound.

DAGUET (*Rev. Méd. de l'Est*, March 1st, 1920) maintains that before any causal relationship between a chest wound and pulmonary tuberculosis can be admitted the following conditions must be fulfilled: (1) The diagnosis of tuberculosis must be definitely established and the disease must be in an acute stage with tubercle bacilli in the sputum; (2) the pulmonary lesion must be situated on the same side as the wound and as far as possible in the same region as the wound itself; (3) the onset of the tuberculous process should occur as soon as possible after the wound. Daguet records a case in which these conditions were fulfilled. The patient was a soldier, aged 24, who received a penetrating shell wound in the anterior superior part of the left side of the chest on September 28th, 1918. The wound did not heal completely till August 15th, 1919. The patient began to cough and lose flesh in February, 1919. Examination in August, 1919, showed active tuberculosis of the left apex and numerous tubercle bacilli in the sputum.

725. Exophthalmic Goitre and Tuberculosis

GALLOTTI (*Rif. Med.*, January 24th, 1920) discusses the importance of signs of exophthalmic goitre in the early diagnosis and treatment of pulmonary tuberculosis. He says these signs not infrequently accompany pulmonary tuberculosis, both in the early stages and the course of the disease—sometimes they may be looked upon as a probable symptom of a latent phthisis. When enlargement of the thyroid is present in tuberculosis, the tuberculosis often pursues a mild course. In cases of phthisis complicated by exophthalmic goitre treatment of the thyroid may have a favourable effect on the pulmonary condition.

726. The Sham Feeding Test in Diseases of the Stomach.

DUPUY (*Paris méd.*, April 3rd, 1920) states that the test of sham feeding introduced by Pavlov in 1904 is the practical application of Pavlov's well known experiments. After preliminary catheterization of the stomach before breakfast to determine if there is any stasis (in which case the stomach is completely emptied), the patient is given an appetizing meal of ten minutes' duration, which he is told to masticate slowly without swallowing, the food and saliva being spat out (after mastication). He is then left for ten minutes, and is told not to swallow but to spit out any saliva secreted. At the end of that time the catheter is again passed. In normal cases 60 to 90 c.cm. of clear fluid, without any food particles, is withdrawn. The free hydrochloric acid varies from 1.64 to 1.80, and the total acid from 1.80 to 1.96 per cent. In 8 cases of cancer of the stomach Dupuy found that the total acidity was below 1 in seven cases, and that there was an absence of free hydrochloric acid in seven cases also. The peptic power always remained below normal, and the coagulation of milk was retarded. The quantity of gastric juice secreted after sham feeding was usually increased in cases of prepyloric or pyloric ulcer, and there

was always an excess of hydrochloric acid even after recovery. The total acidity was parallel with the amount of free hydrochloric acid. In duodenal ulcer the secretion was usually increased. In dyspepsia following gall stones there was an excess of secretion and of hydrochloric acid. In nervous dyspepsia the character of the secretion varied, being normal, exaggerated, or defective in amount and acidity. In tabes the secretion was often entirely absent. In alcoholism hyperchlorhydria was usually present in the early stage, but later the amount of hydrochloric acid diminished, falling in extreme cases as low as 0.365. In tuberculous patients with anorexia the quantity of gastric juice withdrawn after sham feeding was normal; the fermentation activity was more diminished than was its acid content.

727. Staphylococcal Meningitis Treated by Intrathecal Injections of Colloidal Tin.

ROCAZ (*Gaz. hebdomadaire des Sciences Médicales de Bordeaux*, May 9th, 1920) recounts a case of meningitis in a boy of 8 in whom lumbar puncture gave a fluid which showed polymorphonuclear leucocytosis, and from which *Staphylococcus aureus* was isolated; he rapidly became worse in spite of repeated lumbar punctures and intrathecal injections of antimeningococcal serum and of 5 c.cm. of collargol. After four intrathecal injections of 1 c.cm. of colloidal tin there was striking improvement, and he was discharged in a fortnight.

728. Influenza Masks.

IN support of his contention that the wearing of masks is an effective prophylactic against influenza, A. JOSEFSON (*Hygiene*, February 29th, 1920) records the results achieved during the recent waves of influenza in the medical wards of the Maria Sjukhus. The wearing of gauze masks, closed at the sides, was compulsory for all the hospital attendants. Only 2 of the 18 attendants in contact with cases of influenza contracted the disease. This comparative immunity was the more significant as the attendants on the surgical side of the hospital, where masks were not worn, showed no such immunity. Turning from statistics to isolated cases, the author mentions the experience of a medical superintendent who wore a mask during one wave of the epidemic and who escaped the disease till, during another wave, he dispensed with this precaution.

729. Psychoses following Influenza.

S. C. ROSSI (*Anal. de la Faculté de Médecine*, Décembre, 1919) records nine cases of manic-depressive psychosis in patients aged from 18 to 45, which developed during the period of asthenia characteristic of convalescence from influenza. He attributes the psychosis to suprarenal insufficiency (produced by influenza), on the following grounds: (1) Other observers have noted manic-depressive psychoses following influenza. (2) It is well known that influenza affects the suprarenals, and that adrenalin in small doses is one of the means of treating the infection. (3) Other patients with the manic-depressive psychosis under Rossi's care showed signs of suprarenal insufficiency without having had influenza.

730. Pulmonary Emphysema due to Syphilis.

EDELMANN (*Rif. Med.*, January 24th, 1920, and *Wien. Klin. Woch.*, No. 49, 1919) says that emphysema in comparatively young people may be due to syphilis. It is recognized now that changes in the ascending aorta, once thought to be arterio-sclerotic, are more likely to be syphilitic, whilst true arterio-sclerosis is localized more often in the descending and abdominal aorta—at any rate this is true of cases occurring before fifty years of age. Syphilis may produce emphysema by the destructive action of the syphilitic virus on the elastic fibres of the lung tissue, or by affecting the pulmonary capillaries and causing secondary atrophy of the alveolar septa. A similar pathological emphysema may be caused by tuberculous lesions of the alveoli and interbronchial vessels.

731. Rheumatoid Arthritis Treated by Autogenous Vaccine Prepared from the Endometrium.

ROBERTSON (*Edin. Med. Journ.*, May, 1920) records the case of a woman who had had rheumatoid arthritis for two and a half years. The existence of pathological symptoms of the urogenital organs was denied, but examination showed much creamy pus coming from the external os uteri. From a uterine swab was cultivated an anaerobic diphtheroid bacillus, vaccines of which (unlike those prepared from other sources) produced on subcutaneous injection a well marked reaction of pain. The rheumatoid condition was very greatly improved.

732.

Cardiospasm.

ARONSON (*New York Med. Journ.*, April 10th, 1920) considers cardiospasm from the medical viewpoint as a spasmodic contraction of the cardia without any underlying organic disease. Occurring at any age, and most frequently in females, it sometimes accompanies a functional disturbance, or it may result from swallowing hard and imperfectly masticated food, or from too rapid swallowing. Occasionally mental excitement is a cause, and it may follow habitual gas swallowing. It may be either acute or chronic. When acute, it is generally sudden in onset and of short duration; a burning sensation, substernal pain, and dysphagia are experienced. Pressure is required to force the accumulated food into the stomach; at times this is impossible, and regurgitation gives relief. In the chronic form the dysphagia may be marked, and diffuse dilatation of the oesophagus results from the continual efforts to force food into the stomach; owing to lack of nourishment the patient's general health suffers. Diagnosis is best made by means of x rays. Treatment in acute cases is directed to the nervous system and the nutrition of the patient; to overcome the spasm large bougies may be introduced and allowed to remain *in situ* for a considerable time. Hypnotic suggestion, sedatives, and injections of eucaïne have been recommended. In chronic cases careful feeding is necessary, and in some cases oesophageal lavage prior to feeding through a tube. Drugs are useless, and treatment by means of bougies and dilators has been successful in a large number of cases. The value of radical cure by operation is undecided, as the operations (other than plastic procedures and stretching from below after gastrotony) are too few for any conclusions to be drawn as to the superiority of surgical over medical treatment.

SURGERY.

733. Treatment of Compound Fractures: Standard Splints.

ORR (*Journ. of Orthopaedic Surg.*, April, 1920) emphasizes the points to be observed during the first ten days' treatment of compound fractures—namely, restoration of normal relationship of injured parts, and maintenance therein until healing occurs, the ultimate function being as carefully considered as final anatomical position; these points are said to be frequently disregarded in practice. With the Thomas splint properly applied, femur and leg fractures can be immediately adjusted and can be efficiently immobilized afterwards. In fracture of the neck of the femur plaster-of-Paris applied by the Whitman method will maintain immobilization in a proper line for sufficient time; it is often of use also in open fractures of the upper arm and elbow, the elbow being flexed and the hand—except in a few cases in which future employment requires it to be placed palm downwards upon a table—supinated or dorsiflexed. Weights and pulleys are rarely used for traction only, but are often of value (in the Balkan frame) for arm and leg suspension or as an aid to the patient in lifting himself from the bed. Any degree of traction needed, whether for the femur or other bones, can be obtained by the proper use of the Thomas splint, and it is important that everyone should unite in using methods which have been found universally applicable rather than any particular one which depends for its success upon the personal skill of a few surgeons. Anyone can be taught to use the Thomas splint properly in its application to all kinds of cases, and it is urged that the four or five standard splints used throughout the American Expeditionary Force should gradually come into general use, and that most of the other methods and apparatus should be discarded. Even individual modifications of these standard splints usually detract from rather than add to their utility.

734.

Double Ureters.

L. P. CARVE (*Anal. de la Faculté de Médecine*, January and February, 1920) states that Motzfeld, in 1916, found duplication of the ureters in only 23 out of 4,500 autopsies, or 0.51 per cent., whereas Foirier and Bostrom estimate its frequency at 3 per cent., and Weigert at 10 per cent. The duplication may be unilateral or bilateral, and coexist with malformations of other parts of the urinary tract or of other organs. In rare cases the upper ureter may have an abnormal opening—for example, into the vulva, vagina, rectum, urethra, vesicula seminalis, or ejaculatory duct; the opening in such cases is usually fliform or constricted. The lower ureter opens into the bladder in the usual position. The vesical orifice of the upper ureter, when it

does open into the bladder, is always smaller than that of the other ureter, and may be situated in various positions—for example, close to the lower orifice or at any distance between it and the neck of the bladder. The kidney in such cases is increased in size, is frequently lobulated, and always has a larger number of vessels than in normal conditions. Symptoms may be absent (in which case the condition is only discovered at autopsy) or they are of a vague character, in no way resembling those of renal disease, consisting in a sensation of weight in the epigastrium, continuous girdle pain, attacks resembling appendicitis, gastro-intestinal disturbance, and frequent micturition. The urine in such cases may be clear, with only a slight trace of albumin and without any other abnormal elements. The diagnosis can be made by cystoscopy; it is easy to recognize accessory ureteral orifices provided the urine is clear and the bladder normal, but their recognition is very difficult if an infective process exists, especially pyonephrosis and cystitis. Treatment depends on the degree and extent of the lesions discovered. It can only be palliative if the lesions are bilateral. If there is a stricture of the ureteral orifices and of the ureter itself with slight renal lesions, dilatation of the ureter or section of the meatus by diathermy is indicated. In other cases nephrectomy may be required.

735. A Peculiar Case of Foreign Body in the Throat.

D. J. DE LEVIE (*Nederland. Tijdschr. v. Geneesk.*, May 1st, 1920) records the case of a man, aged 58, who, directly after eating a pear, had violent pain in the throat, vomited blood, and had a choking attack. A skiagram of the lungs taken a few days later was negative. During the next three months he suffered from pain in swallowing and pain in the right occipital region and right ear. On examination by the writer the glands at the right angle of the jaw were enlarged, and there was tenderness to pressure at this spot. No signs of a foreign body could be seen in the mouth or throat, but the right pharyngo-epiglottic fold was swollen and tender. These symptoms, together with the history, suggested the diagnosis of a foreign body; this was confirmed by a skiagram, in which a needle was seen in the pharyngeal wall, its eye directed forwards and upwards. The following day, with the exception of 1 cm. which broke off, the needle was removed; subsequent recovery was uneventful. The needle had probably been accidentally driven into the pear by the saleswoman while polishing it with her sleeve.

736. Dorsal Juvenile Kyphosis.

H. SCHEUFERMANN (*Ugeskrift for Læger*, March 18th, 1920) has examined 105 cases of juvenile dorsal kyphosis, and in 60 of them he has found this condition practically uncomplicated by lateral curvature; in the remaining 45 cases there was a slight degree of lateral curvature. This dorsal kyphosis of puberty differs in certain essential features from other forms of spinal curvature; it is quite distinct from the round back due to relaxed muscles. Only in 12 per cent. of his cases were the patients females, and this sex disparity was the more striking as other deformities of the spine affect girls more often than boys. The determining factors in the kyphosis of puberty are the patient's age and occupation. A considerable proportion of the author's patients were lads of 16 employed on the land. But there was not in every case a history of heavy work with much weight-lifting; in one case the patient was a student working for his matriculation. The author's x-ray examinations have convinced him that the disease is analogous to the commonest spinal deformity in horses, and that the cause is deformity in the lines of growth between the bodies of the vertebrae and their epiphyseal rings. It is not, as commonly taught, due to insufficiency of the muscles of the back. Owing to its kinship to osteochondritis deformans juvenilis coxae, it should be termed "osteochondritis deformans juvenilis dorsi."

737. Disease of the Orbit Originating in the Nasal Sinuses.

S. H. MYGIND (*Ugeskrift for Læger*, March 4th and 11th, 1920) discusses in much detail the relation of orbital disease to inflammatory conditions of the nasal sinuses. He records 24 cases, in 8 of which there were endocranial complications, which proved fatal in 5 cases. Seven of the patients exhibited leptomeningitis, from which 3 recovered. Altogether there were 6 deaths—that is, a mortality of 24 per cent. This compares unfavourably with the combined mortality of 12.7 per cent. of similar cases published by other writers. The author suggests that this discrepancy is due to the tendency to publish

successful rather than unsuccessful cases. With regard to indications for treatment, he considers great protrusion of the eye as alarming, especially if it has developed rapidly. Other signs indicating a serious condition and calling for operation are violent pain, general malaise, albuminuria, rigors, severe headache, and vomiting. Severe oedema of the orbit and eyelids is less serious than rapidly progressive protrusion of the eye. The most slender evidence of endocranial complications warrants immediate operation; in the absence of the symptoms already referred to, operative treatment may be deferred, for as a rule a day's delay throws the required light on the subject. A disease with a mortality of 24 per cent. justifies an operation even on suspicion. The only operation advocated by the author is free exposure of the orbit and the affected sinuses. The mere incision of the orbit to empty an abscess is inadequate.

OBSTETRICS AND GYNAECOLOGY.

738. Conservative Operation for Chronic Pyosalpinx.

BREWITT (*Zentralbl. f. Gynäk.*, May 1st, 1920) records 12 cases of chronic pyosalpinx, in which the pelvic organs were found to be adherent to one another, there was evidence of congestion and inflammatory exudation in the pelvic peritoneum, and one tube was found to be distended with serous or purulent fluid. The operation performed was as follows: The patient being placed in the high pelvic position, the intestines were shut off by swabs. The pyosalpinx was punctured at its most prominent part by a thick cannula, and its contents were aspirated. Sterilized oil of turpentine, in slightly less amount than that of the fluid withdrawn, was now injected, and the site of injection sutured with fine catgut; 4 or 5 c.cm. of the same preparation were then introduced into the uterine and flumbrated extremities. Adherent coils of intestine were gently freed from the adnexa by means of a swab. The omentum was brought into the pouch of Douglas and sutured there by three or four catgut stitches with the object of shutting off the pelvic from the general abdominal cavity, and of bringing an increased blood supply to the pelvic organs. Bacteriological examination of the aspirated fluid was not undertaken, but in 10 of the 12 cases the gonococcus was found in the external genitals. No rise of temperature took place after the operation, and the after-history was uniformly good. The inflamed masses disappeared in the course of four to six weeks, when the uterus was found in all cases to be freely movable, and the adnexa were less, or not at all, tender. In three cases pregnancy followed within a few months of this treatment.

739. Prenatal Care.

HIRST (*Therap. Gaz.*, April, 1920) describes the following procedure as employed by the "best specialists": (1) Taking histories; (2) first vaginal examination during the third month; (3) giving advice to the patient as to the hygiene of pregnancy; (4) estimation of the blood pressure and weight every two weeks; (5) alternating with these, routine examinations of the urine every two weeks; (6) a thorough examination four weeks prior to labour, including pelvimetry, fetometry, palpation, and auscultation; (7) weekly examinations of urine and blood pressure alternating during the last month. In hospital practice Wassermann reactions should be examined and routine vaginal smears taken. The dependency of pregnancy should be remembered: allusion is made to thirteen cases of insanity recorded by Fordyce Barker, in which pregnant wives of doctors lost their wits by reading their husbands' textbooks on obstetrics.

740. Mammary Hypertrophy Treated by Subcutaneous Injections of Human Milk.

PATEL (*Gaz. hebdom. des Sci. méd. de Bordeaux*, May 9th, 1920) records the case of a woman of 22 who had been married but never pregnant, whose breasts became enlarged after an attack of influenza, and had an estimated weight of 5 kilograms each. The patient demanded amputation, but Patel treated her by subcutaneous injections, made at ten days' intervals, of 5 c.cm. of human milk. The organs began to grow smaller after the fifteenth day, and in a few weeks presented the appearance of deflated balloons. They have been stationary in size for four months, and do not show any alterations at the time of menstruation.

741. Bilateral Mammary Hypertrophy.

ZEPHIRINO DE AMARAL (*Bol. da Soc. de Med. e Cir. de São Paulo*, September, 1919) records the case of a 3-para Italian, aged 22, whose breasts had increased in size during five and a half months' pregnancy so as to be 70 cm. in circumference at the base and 83 cm. in maximum circumference, the nipple being 28 cm. from the sternum. The breasts were movable and exhibited no fluctuation nor induration; their weight caused dyspnoea. Treatment by thyroid extract, pluriglandular extract, and by iodine failed. The diagnosis had been made of simple hypertrophy, diffuse adenoma, or adenofibroma. De Amaral proposes to interrupt gestation, and, if this fails, to amputate.

742. Primary Cancer of the Ovary in a Girl of Thirteen: Ablation: Cure.

PELISSIER (*Bull. et Mém. Soc. Anat. de Paris*, March, 1920) records the case of a girl of 13 in whom in April, 1916, an abortive attack of appendicitis was thought to have occurred. Two months afterwards right ovarian cyst was diagnosed. At operation in July the right tube was removed, together with a kidney-shaped ovarian tumour the size of an ostrich's egg. The interior of the tumour showed much haemorrhage and necrosis; microscopic examination showed it to be carcinoma of pseudo-papillary character. No recurrence has occurred during the three and a half years which have elapsed.

743. Pessary for Cystocele.

REMY (*Rev. Méd. de l'Est*, April, 1920) has designed for cystocele a new pessary consisting of three concentric celluloid rings.

PATHOLOGY.

744. Experimental Gastric Ulcer.

K. NICOLAYSEN (*Norsk Mag. for Laegevidenskaben*, March, 1920) has investigated in rabbits the effects of subcutaneous injections of a 5 per cent. solution of pilocarpine hydrochloride, with special reference to the stomach. Altogether twenty-five animals were experimented on, and in every case a microscopic examination was made of the stomach. It was found that some of the animals were peculiarly sensitive to the drug—an observation suggesting that certain rabbits, like certain human beings, are "vagotonic." The eosinophilia observed in these hypersensitive rabbits confirmed this hypothesis as to their "vagotonic" disposition. Of 10 animals given from 10 to 35 mg. pilocarpine, administered in two or more injections of 5 mg. each, 9 showed morbid changes in the mucosa of the stomach. In 3 of these cases there were also erosions or ulcers of the duodenum. Discussing the possibility that pilocarpine may cause erosions of the stomach simply by increasing the amount of free hydrochloric acid in the gastric secretion, the author refers to investigations showing that these changes in the stomach occurred even when the amount of free hydrochloric acid was reduced below normal. On the other hand, in the total absence of hydrochloric acid no erosions developed.

745. The Urine in Tropical Climates.

W. J. YOUNG (*Annals Trop. Med. and Parasit.*, December, 1919) studied the urine of twenty-five white men during the hot months in North Queensland. The average volume excreted was 782 c.cm. daily; the daily excretion of sodium chloride was 7 grams as against 15 grams in Europe, and the total nitrogen showed a similar but not so pronounced diminution. Albuminuria was found among 11.7 per cent. of 360 men, and 4.9 per cent. of 303 women.

746. The Pathogenesis of Cerebral Haemorrhage.

PARILETTI (*Rif. Med.*, January 24th, 1920) throws doubt on the current views as to cerebral haemorrhage being exclusively due to changes in the blood vessels and increased endo-arterial pressure. He thinks we might go back to the ex-vacuo theory in a modern form. So far from bleeding people who suffer from cerebral haemorrhage he says it would be better, especially as a preventive, to increase the intracranial pressure by injecting artificial serum into the spinal canal. He believes that haemorrhage is induced by some enlargement of the space between the brain and skull, and subsequent distension of the veins and small arteries, until they burst, so that by injecting serum into the spinal canal the intracranial pressure would be increased and the tendency to haemorrhage checked. The premonitory symptoms of cerebral

haemorrhage (giddiness, headache, etc.) are, he believes, better explained by supposing that there is diminished endoarterial pressure and consequent expansion of the vessels, than by assuming that they are due to a permanently altered state of the blood vessels. Possibly in advanced age the cerebral fluid tends to diminish as part of the senile shrivelling of tissues.

747. Avian Leukaemia.

V. ELLERMANN (*Vgeskrift for Laeger*, February 26th, 1920) describes various forms of leukaemia in hens—that is, a lymphatic, a myeloid, and an intravascular lymphoid form—some of the cases in the last class including purely anaemic forms. In February, 1917, he acquired a live hen from which he has been able to reproduce the disease in twelve successive generations. It was found that the virulence of the disease, as shown by its increasing brevity, was augmented by successive inoculations. This increased virulence did not, however, affect the frequency with which inoculated hens proved immune; throughout these experiments 60 to 70 per cent. of them did not develop the disease. As with other strains he has experimented on, the author found that this strain, too, gave rise to more than one form of leukaemia; thus, myeloid and intravascular lymphoid disease were provoked, and in one case the disease assumed the lymphatic form. In the case of the intravascular lymphoid form, the haemolytic action of the serum on the erythrocytes of rabbits was reduced; this was not the case with the myeloid form. Immunity to the disease could not be induced by the subcutaneous injection of virulent material containing the filtrable virus. Inoculation of hens with the blood of human beings suffering from leukaemia gave negative results.

748. The Criminological Value of a Fourth Horizontal Frontal Convolution.

PITRES and LANDES (*Journ. de Méd. de Bordeaux*, April 10th, 1920) state that though Benedikt and several other writers attributed criminological importance to duplication of the convolutions of the frontal lobe, this anomaly has been found in a relatively high proportion of persons who are not criminals. They describe the autopsy on a man aged 25, who had been executed for the rape and murder of a girl aged 6, the findings being as follows: Thoracic and abdominal organs normal; a few slight stigmata of degeneration in the skull and face; weight of brain much below the normal (1,032 kg. as compared with the average 1,360 kg.), thickening and adhesions of the dura mater, and an incomplete duplication of the second frontal convolution on both sides. Examination of the brain was otherwise negative.

749. The Diazo Reaction in Epilepsy.

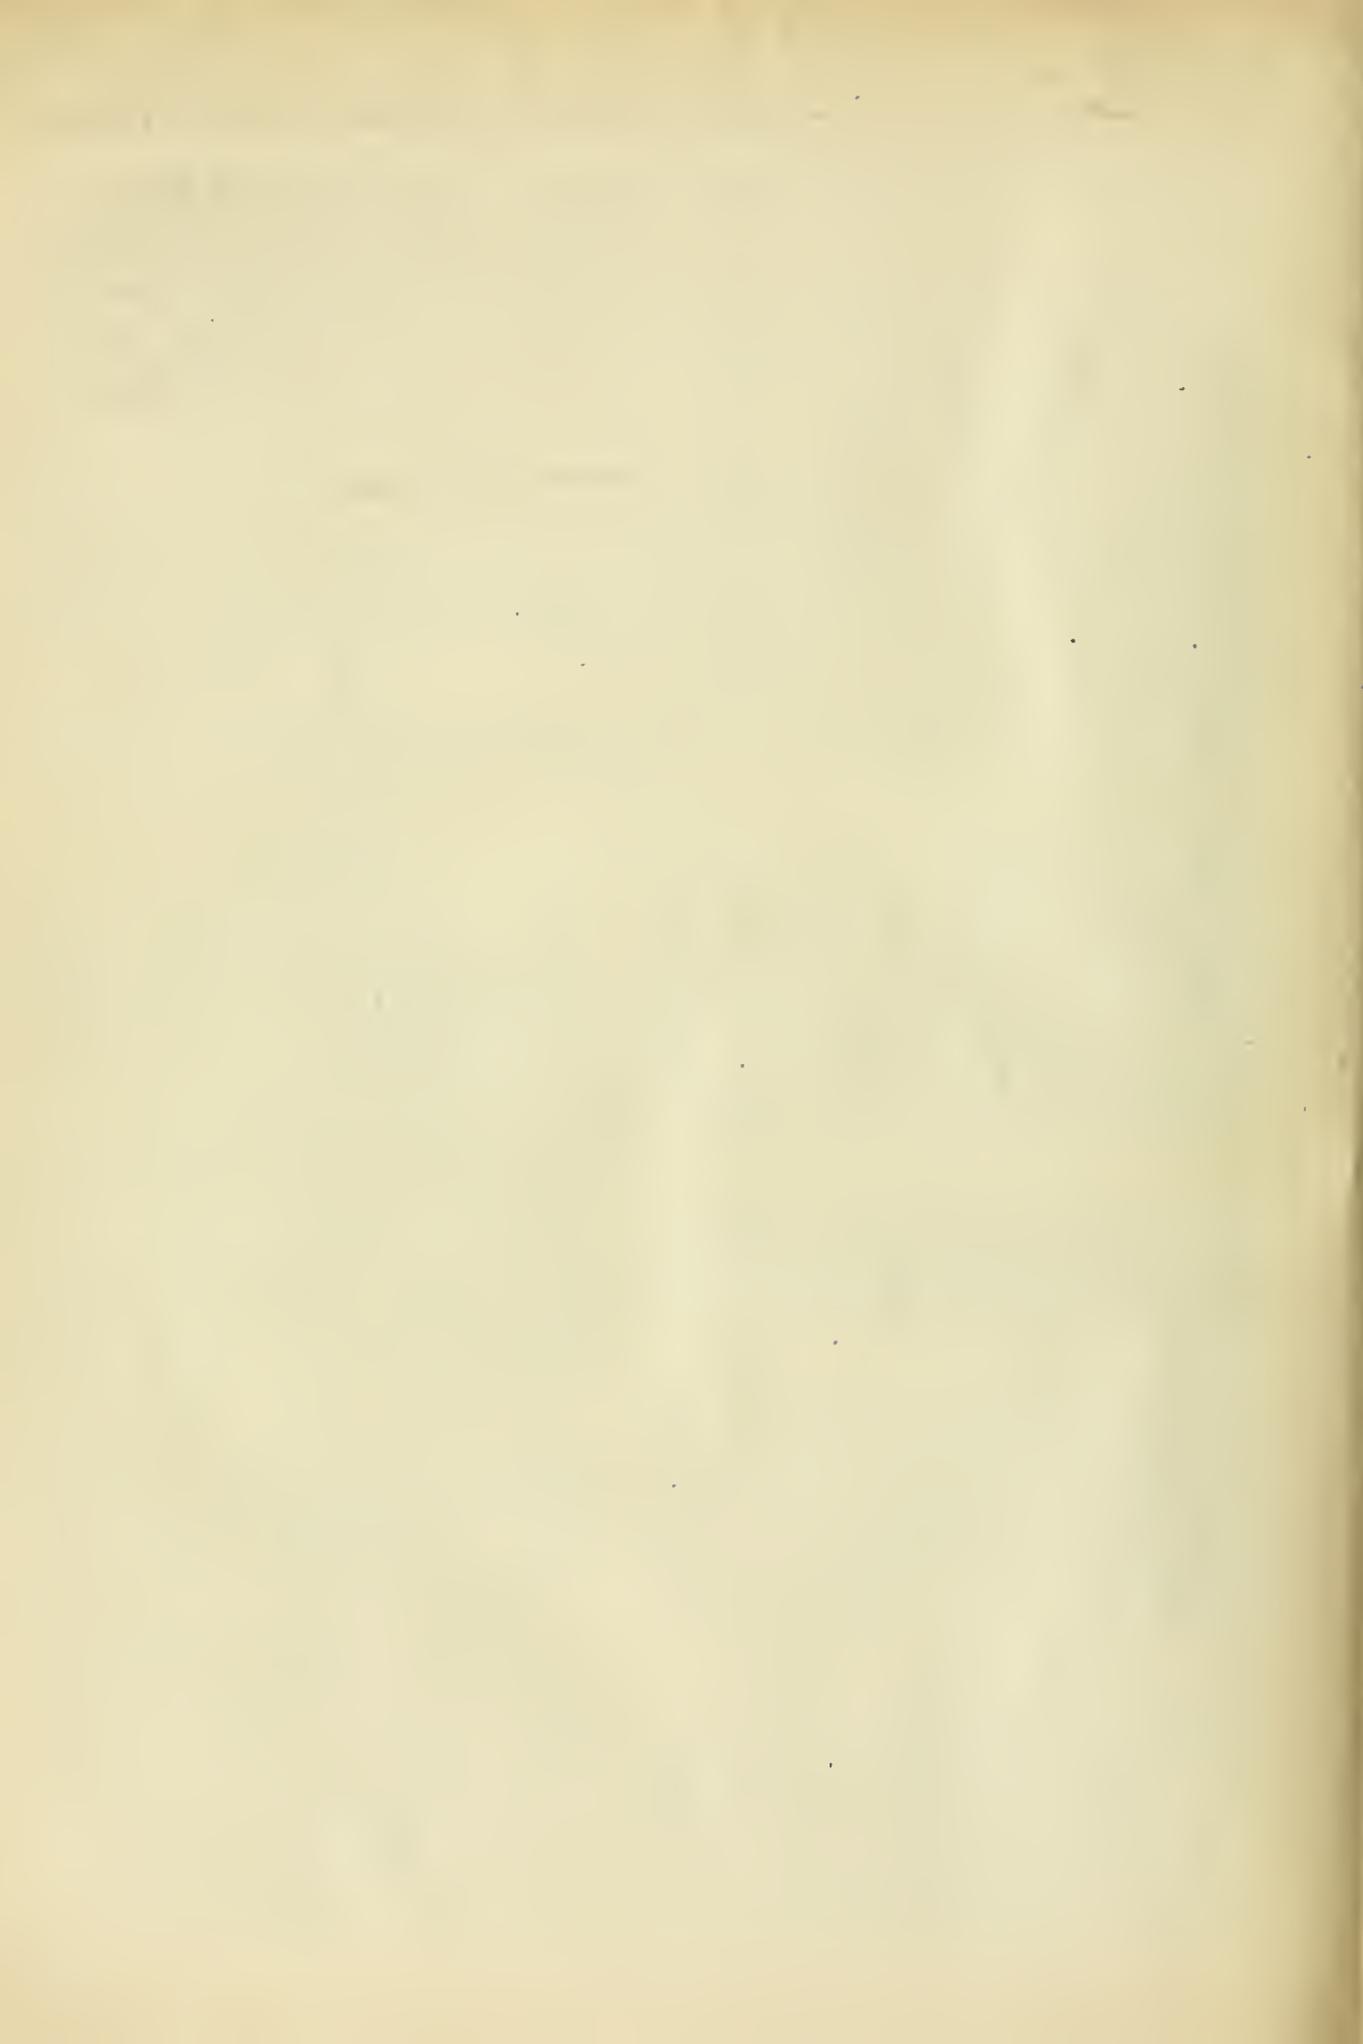

P. MASOIN (*Bull. de l'Acad. Roy. de Méd. de Belgique*, July, 1919) studied the diazo reaction of the urine in epilepsy. This reaction was not obtained in normal subjects. He concludes that the absence of a diazo reaction in epilepsy justifies a favourable prognosis; its presence implies a fatal prognosis in two-thirds of the cases, and is regarded as evidence of a state of metabolic derangement and auto-intoxication.

750. Acetonuria in Influenza.

G. IZAR (*Il Policlinico*, Sez. Prat., April 19th, 1920) in a large number of cases of influenza has found in the urine acetone and diacetic acid either separately or together. They were present not only in cases with visceral localizations but also in uncomplicated cases. Izar is inclined to the view that some of the symptoms of influenza, such as vomiting, somnolence, and dyspnoea, when this is not due to circulatory, respiratory, or renal disturbance, may be attributed, in part at least, to acetonæmia. Six illustrative cases in patients aged from 6 to 58 years are recorded.

751. The Luetic Reaction of Sachs and Georgi.

From examination of 705 specimens of blood and 103 of cerebro-spinal fluid, S. T. BOK (*Nederl. Tijdschr. v. Geneesk.*, April 17th, 1920) came to the following conclusions: (1) The luetic reaction of Sachs and Georgi requires a much shorter time to perform than the Wassermann reaction, and is more reliable owing to its greater simplicity; (2) it is more sensitive than the Wassermann reaction both as regards the blood serum and the cerebro-spinal fluid; (3) non specific positive results may occur with the reaction of Sachs and Georgi, but if the quantitative method is used, the index in such cases is usually only 0.1, and never higher than 0.2; (4) the reaction may enable one to obtain a deeper insight into the chemistry of syphilis than has hitherto been possible.
