During the year about 2½ miles of highways were surfaced with tarred Kent ragstone. This proved very satisfactory on the very heaviest trafficked roads. Mr. Harris states that he used a carpet of tarred granite of 1-in. grade, supplied by the Tarred Granites Company, this being laid on a 3-in. sub-crust of tarred ragstone. The road is giving splendid results under motor-bus traffic, and he proposes to extend the system in the future. Mr. Harris has also laid the tar-carpeting 1-in. thick on old tarred rag surfaces. The results of this have been good, but he finds that, owing to the old surface being impervious, care must be taken to carry out the carpeting in dry weather, otherwise the water has difficulty in drying out. In all cases he recommends the final sealing by tar-painting.

Mr. Harris' experience leads him to believe that for country roads with traffic of any consideration an impervious and permanent sub-crust constructed of tarred macadam or pitch grout is essential. With a subsoil so constructed he finds attrition reduced to a minimum, if not altogether absent. The top or wearing surface requires renewing from time to time, and this can be done by the use of grouted chippings, tarred granite carpeting, or the use of large grade granite chippings after tar dressing. For ordinary trafficked district roads, the use of a good hard stone tar-painted is for the present all-sufficient.

"I find," adds the surveyor, "that with a somewhat liberal use of Tarvia—say 4½ to 5½ super. yds. to the gallon and spreading a coat of ¼-in. to ⅜-in. grade granite chippings, the chippings to be as cubical as possible, practically a tarred granite dressing is made in situ, a steam roller, if available, being run over the surface, or the traffic allowed to compress it. With a road of any degree of traffic, it is surprising how soon the chippings are consolidated with the tar. The system adds a wearing crust to the surface, and at the same time corrects all depressions and holes, an impervious and to all intents a tarred macadam surface being eventually built up."

Carshalton's Proposed New Park.—The General Purposes Committee of the Surrey County Council recommend the council to make a grant of £1,000 towards the purchase of 7 acres of Carshalton Park as an open space.

ELGIN'S FERRO-CONCRETE RESERVOIR.

The accompanying view shows a new reservoir which will supply the higher parts of the burgh of Elgin, N. B., with water.

The reservoir is constructed entirely of reinforced concrete, and has a capacity of 220,000 gallons. It is 90 ft. long, 45 ft. wide, and 10 ft. high to the surface of the water. The foundations are sunk 5 ft. into the ground, and a flat roof has been provided in 4-in. slabs, supported on two rows of columns and lateral beams.

The engineer was Mr. C. C. Dong, of Elgin, and the contractor was Mr. James Lawrence, of Craigellachie.

The designs were carried out on the system of the

Indented Bar and Concrete Engineering Company, Limited—from whose "Bulletin" for January we extract these details—and indented bars were used as reinforcement throughout.

Town Planning in Renfrewshire.—At a recent meeting of the First or Upper District Committee of the county of Renfrew, it was agreed that the local authority should make an application to the Local Government Board for authority to prepare a town planning scheme, with reference to the area which is in course of development, or appears likely to be used for building purposes, within the portion of the Renfrew parish and county on the north of the river Clyde.

Ilkeston Gas Supply.—As the result of the disaster at Ilkeston gasworks two years ago, it has been necessary to remove and re-erect the Loder damaged by the explosion. No fewer than 280 new plates have been used in the work, the storage capacity being 500,000 ft. A great change has been effected by the substitution of a brick and puddle tank below ground in place of the steel tank (which collapsed at the disaster) above ground. The cost of the work will be approximately £5,000.

Cornwall County Council and Motor Vehicles.—The Finance Committee of Cornwall County Council on Tuesday adopted the following resolution: "That representations be made to the Prime Minister and the President of the Local Government Board, asking for powers to levy and retain a tax on motor lorries and other mechanically propelled vehicles, the proceeds to be expended on the maintenance of local roads, and that a copy of this resolution be sent to the County Councils Association with a request for their co-operation."

The Surveyors' Institution.—The council have decided to fall in with representations which they have received from mining surveyors in different parts of Great Britain in favour of an additional sub-division of the institution examinations being established to meet the requirements of that branch of the profession. They have reason to believe that by thus enabling mining surveyors to possess the qualification attaching to membership of a professional society, obtained after a searching examination test, they will meet a want which has long been felt. The drawing up of the syllabus has been referred to the Education Committee of the institution, and in addressing themselves to their work they will endeavour to set up an examination which will be accepted by the Home Secretary as satisfying the requirements of secs. 20 and 21 of the Coal Mines Act, 1911.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COEKRILL, M.INST.C.E., A.R.I.B.A.,
Borough Surveyor, Great Yarmouth.

MANCHESTER MEETING.

A meeting of the institution will be held in the North-Western District at the Town Hall, Manchester, on Friday and Saturday, February 20th and 21st.

PROGRAMME.

Friday, February 20, 1914.

- 12.30 p.m.—Meeting of District Executive Committee.
- 1 p.m.—Members of District Executive and members of council attending the meeting will lunch with the Lord Mayor and the chairman of the Improvement Committee and of the Town Planning Committee.
- 2.15 p.m.—The members will assemble in the Manchester Town Hall, where they will be received by the Lord Mayor (Alderman McCabe) and Alderman Frowde (chairman of the Rivers Committee).
- 2.30 p.m.—North-Western District meeting in the Town Hall, Manchester.
Minutes of the previous meeting.
Any other district business.
- 3 p.m.—Description of some of the municipal works of the city of Manchester (illustrated by lantern slides) by Mr. T. de Courey Meade, M.INST.C.E., city surveyor of Manchester.
Drawings and photographs will be exhibited in the Lord Mayor's Parlour showing the works described and intended to be inspected.
A short paper on "The Future Government of Great Cities" (illustrated by lantern slides), by Councillor Joseph Swarbrick, M.INST.C.E.
- 6.30 p.m.—Dinner will be provided in the town hall at the invitation of the Lord Mayor and the Rivers Committee.

Saturday, February 21, 1914.

- 9 a.m.—Meet at Town Hall. Special tramcars (provided by the Tramways Committee) will leave Albert-square at 9.15 a.m. to convey members to any or all of the following works they may desire to inspect—viz.:—
Tramway ear repairing works and permanent way depot, Hyde-road.
Intercepting sewers at Withington and Didsbury.
Outfall sewers in Stretford and Davy-hulme.
Stuart-street subway and Coal Railway.
Lakes in Platt Fields and Heaton Park.
- 1 p.m.—Luncheon, at the invitation of the Tramways and Improvement Committees, at the Grand Hotel, where members will be received by the respective chairmen: Alderman Bowes, J.P. (chairman of the Tramways Committee), and Alderman Wilson, J.P. (chairman of the Improvement Committee).

A. W. BRADLEY, M.INST.C.E.,
Hon. District Secretary

St. Helens, Lanes.

NORTH-EASTERN DISTRICT.

A meeting of the North-Eastern District will be held at Wakefield on Saturday, March 21, 1914.

SOUTHEND MEETING.

A meeting of the institution will be held in the Eastern District at Southend on Saturday, June 6th.

THE ANNUAL MEETING.

The date for the annual meeting of the Institution of Municipal and County Engineers at Cheltenham has been fixed definitely for June 24th, 25th, 26th and 27th next. It has been decided to make a special feature of town planning and of roads, and, if possible, to arrange for an exhibition of town plans.

THOMAS COLE,
Secretary.

92 Victoria-street, S.W.

Yarmouth Bridge Scheme Vetoed.—By 4,327 votes to 2,342, Yarmouth ratepayers on Tuesday decided against the promotion of a Parliamentary Bill to build a new Haven Bridge at a cost of £113,000. The scheme was approved by the town council. Half the electorate voted.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

EASTERN DISTRICT.

A meeting of the Eastern District of the institution will be held at Oundle on Saturday, February 21st.

PROGRAMME.

- 2.10 p.m.—Assemble at Oundle Railway Station and proceed to inspect the widening of the North Bridge (adjoining the station), under the direction of Mr. J. H. Dyson, clerk of works to the Northants County Council, who will give a brief description of the works.
- 3 p.m.—Visit of inspection to the schools of the Grocers' Company, by kind permission of the head master, Mr. F. W. Anderson, M.A.; also the new science and engineering block in course of erection by Messrs. Thompson & Sons, of Peterborough.
Time permitting, visits will also be paid to the Oundle Urban District Council's sewage disposal works, waterworks, cemetery, &c., under the direction of Mr. G. Belson Chilvers, surveyor and water engineer to the council.
- 4.45 p.m.—Meeting at the council offices.
Election of chairman and hon. district secretary.
Forthcoming meetings.
Paper, "The Municipal Undertakings of the Oundle Urban District Council," by Mr. G. Belson Chilvers.
- 5.30 p.m.—Tea at the Talbot Hotel.

P. S. BENNETT,
Hon. District Secretary.

Ramsey, Hunts.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District of the Institution of Municipal Engineers will be held at Manchester to-morrow (Saturday).

Portland's New Waterworks.—Erected at a cost of £15,000, making a total of £60,000 spent on water, the new works at Upwey, which supply Portland with water, were formally opened on Wednesday by the chairman of the Portland Urban District Council.

Paris Housing Scheme.—In the course of the next eighteen months cheap and hygienic dwellings are to be erected in Paris for 60,000 persons who are at present living in insanitary houses. The municipality has borrowed £800,000, and has already purchased 36 acres of building land for £433,222, an average cost of 5s. 6d. per square foot. At a cost of £2,600,000 it will be possible to build 11,000 lodgings, each capable of accommodating at least five persons. These dwellings will, it is hoped, be ready for occupation in June, 1915.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

CLERK.—January 31st.—Surveyor's department, Gellygaer Urban District Council. £80—£100.—Mr. F. T. James, clerk, Hengoed.

INSPECTOR OF NUISANCES.—February 1st.—Faversham Rural District Council. £145 per annum.—Mr. Guy Tassell, clerk.

WATERWORKS INSPECTOR. — February 2nd.—Corporation of Scarborough. 34s. per week.—Mr. W. Millhouse, water engineer, Town Hall.

SANITARY INSPECTOR.—February 2nd.—South-wark Borough Council. £150—£180 per annum.—Mr. P. H. Gray, town clerk.

INSPECTOR OF NUISANCES.—February 2nd.—Blyth and Cuckney Rural District Council. £130 per annum.—Mr. J. S. Whall, clerk.

INSPECTOR OF NUISANCES.—February 4th.—St. Columb Major Rural District Council.—Mr. C. E. Whitford, clerk.

ASSISTANT SANITARY INSPECTOR.—February 4th.—Southend Town Council. £100—£150.—Dr. C. G. Pugh, medical officer of health.

ROAD AND GENERAL FOREMAN.—February 5th. Corporation of Gravesend. 45s. per week.—Mr. H. H. Brown, town clerk.

CLERK OF WORKS.—February 7th.—Sussex County Council. £3 per week.—Mr. F. J. Wood, county surveyor, County Hall, Lewes.

INSPECTOR OF NUISANCES.—February 7th.—Hull and Goole Port Sanitary Authority. £150—£200 per annum.—Mr. J. Davie, clerk.

ASSISTANT SANITARY ENGINEERS.—February 7th.—Government of India. 800, 1,000, 500—700 and 460—620 rupees a month.—Secretary, Revenue Department, India Office, London, S.W.

BRIDGE AND MAIN ROAD SURVEYOR.—February 9th.—Devon County Council. £400 a year, with £200 a year for expenses.—Mr. F. Bailey, clerk, The Castle, Exeter.

GAS ENGINEER AND MANAGER.—February 9th. Swinton and Mexborough Gas Board. £200 per annum.—Mr. J. W. Hattersley, clerk, Mexborough, nr. Rotherham.

SURVEYOR'S ASSISTANT.—February 9th.—Corporation of Luton. £80 per annum.—Borough Surveyor, Town Hall, Luton.

SURVEYOR'S GENERAL ASSISTANT.—February 10th.—The Maldens and Coombe Urban District Council. £100—£150 per annum.—Mr. J. W. Johnson, clerk, New Malden, Surrey.

COUNTY SURVEYOR.—February 10th.—Queen's County Council. £350 per annum.—Mr. J. Carey, secretary, Maryboro'.

QUANTITY SURVEYORS.—February 11th.—Metropolitan Water Board.—Chief Engineer, Savoy-street, Strand, W.C.

HIGHWAY SURVEYOR.—February 12th.—Witney Rural District Council. £140 per annum, with £35 for a motor bicycle.—Mr. H. T. Ravenor, clerk.

SURVEYOR'S CLERK.—February 12th.—Corporation of St. Alban. £70 per annum.—Mr. E. P. Debenham, town clerk.

BOROUGH SURVEYOR'S CHIEF ASSISTANT.—February 12th.—Corporation of Stockport. £200—£260.—Mr. John Atkinson, borough surveyor.

ASSISTANT BOROUGH SURVEYOR.—February 13th.—Corporation of Guildford. £120—£150.—Mr. A. D. Jenkins, town clerk.

BOROUGH SURVEYOR AND INSPECTOR.—February 16th.—Dunstable Town Council. £225 per annum.—Mr. C. C. S. Benning, town clerk.

SUPERINTENDENT OF FIRE BRIGADE.—February 23th.—Municipality of Karachi. 200 rupees per month, with free quarters.—Mr. Measham Lea, chief officer and chief engineer.

ASSISTANT ENGINEERS.—April 1st.—Indian Public Works and State Railways Departments.—Secretary, Public Works Department, India Office, London, S.W.

ASSISTANT ENGINEERS AND DRAUGHTSMEN.—Public Works Department of Sierra Leone. Engineers, £300—£400; draughtsmen, £300—£350.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

TEMPORARY ASSISTANT.—Erith Urban District Council.—Mr. H. Hind, surveyor.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

FARNBOROUGH.—February 11th.—Designs for three types of artisans' dwellings, for the urban district council. Premium, 20 guineas.—Mr. J. E. Hargreaves, surveyor.

IIENDON.—March 2nd.—Designs for public baths, for the urban district council. Premiums £100, £75, and £50.—The Clerk.

TWRCELYN.—March 9th.—Plans and specifications for a water supply and drainage scheme for Cemaes.—Mr. T. H. Hughes, clerk, Fir-grove, Menai Bridge.

BELFAST.—March 20th.—Designs for an art gallery and museum, for the corporation.—Mr. R. Meyer, town clerk.

LONDON.—May 4th.—Designs from British architects for the architectural treatment of the new St. Paul's Bridge, for the City Corporation. Premiums, £300, £200, and £100.—Town Clerk, Guildhall, E.C.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

Buildings.

YORK.—February 2nd.—For piling and laying out the west bank of the river Ouse, between Lendal Bridge and Scarborough Bridge, for the corporation.—Mr. F. W. Spurr, city engineer.

NORTON (Malton).—February 2nd.—For the supply and laying of cast-iron mains and hydrants, for the rural district council.—Mr. G. S. Cattle, clerk.

WARRINGTON.—February 2nd.—For the erection of boiler-house, chimney, and alterations at the baths, for the corporation.—Borough Surveyor.

SOUTHEND.—February 2nd.—For the erection of a pavilion at the sanatorium, for the corporation.—Mr. E. J. Elford, borough engineer and surveyor.

WEST HAM.—February 2nd—16th.—For the erection of a school, for the Education Committee.—Mr. W. Jacques, architect, 2 Fen-court, Fenchurch-street, E.C.

WATH-UPON-DEARNE.—February 2nd.—For the construction of reservoirs, sand filters, and regulating chambers, for the urban district council.—Mr. J. H. Drew, engineer.

MERTHYR TYDFIL.—February 2nd.—For the erection of buildings for manual instruction and domestic subjects, for the corporation.—Borough Architect.

TODMORDEN.—February 3rd.—For the erection of a bandstand, three shelters, and bowling-green pavilion, for the corporation.—Borough Engineer.

LONDON.—February 3rd.—For the supply of building materials and tools, for the Prison Commissioners.—Prison Commission, Home Office, Whitehall, London, S.W.

SWANSEA.—February 3rd.—For the erection of an electric power sub-station, for the corporation.—Mr. E. Morgan, borough architect.

BRADFORD.—February 4th.—For the erection of superintendent's house, waterworks depot, for the corporation.—City Architect.

WILTS.—February 4th—25th.—For extensions to the asylum, for the county council.—Messrs. G. T. Hine and H. C. Pegg, architects, 35 Parliament-street, Westminster, S.W.

SCUNTHORPE.—February 4th.—For the sinking of a pump well, 12 ft. clear internal diameter by about 60 ft. deep, driving adits and sinking boreholes, for the urban district council.—Mr. C. Curtis Gray, engineer and surveyor.

HESTON AND ISLEWORTH.—February 4th.—For the erection of schools and caretaker's cottage, for the Education Committee.—Mr. J. G. Carey, architect and surveyor, Council House, Hounslow.

HOVE.—February 4th.—For additions to police station and the construction of underground lavatories, for the corporation.—Mr. H. H. Scott, borough surveyor.

BECKENHAM.—February 5th—18th.—For the erection of a school, for the urban district council.—Messrs. A. Boxall & Son, 8 Adam-street, Adelphi, W.C.

ST. THOMAS.—February 5th.—For the erection of six houses, for the rural district council.—Mr. E. E. Ellis, architect, Polsloe-road, Exeter.

RHONDDA.—February 6th.—For constructional works at the gasworks, for the urban district council.—Mr. O. Thomas, engineer and manager of gasworks.

SWAFFHAM.—February 6th.—For the erection of three pairs of cottages, for the rural district council.—Mr. S. Matthews, clerk.

EAST WESTMORLAND.—February 6th.—For excavating for, providing and laying cast-iron pipes for water supply, and constructing reservoir, for the rural district council.—Mr. Alfred Knewstubb, engineer, St. Andrew's Chambers, Penrith.

PONTYPRIDD.—February 9th.—For reservoir construction, for the Joint Water Board.—Mr. W. P. Nicholas, clerk, 49 Mill-street, Pontypridd.

HENDON.—February 9th.—For the erection of fifty dwellings, for the urban district council.—Mr. G. Hornblower, 2 Devonshire-terrace, Portland-place, London, W.

ATHERSTONE.—February 9th.—For the construction of a service reservoir in reinforced concrete, for the rural district council.—Mr. R. Fielders, clerk.

SWINDON.—February 9th.—For constructional work at electricity works, for the corporation.—Mr. A. Dimmack, borough electrical engineer.

NEWTON ABBOT.—February 10th.—For extensions to hospital, for the Hospital Committee.—Mr. J. C. Beare, architect, Newton Abbot.

SPALDING.—February 10th.—For the erection of cottages, for the rural district council.—Mr. W. H. A. Davis, architect and surveyor, 6 Double-street, Spalding.

STOKE NEWINGTON.—February 11th.—For the erection of public wash-houses, for the borough council.—Town Clerk.

CAMBRIDGE.—February 11th.—For the erection of wards and pavilion at hospital, for the corporation.—Borough Surveyor.

YSTRADGYNLAIS.—February 11th.—For the erection of eighteen houses, for the rural district council.—Mr. J. C. Rees, architect, Parade Chambers, Neath.

DEVON.—February 11th.—For rebuilding two bridges in reinforced concrete, for the county council.—Mr. F. Bailey, clerk, The Castle, Exeter.

NORMANTON.—February 12th.—For the erection of seventy-six houses, for the urban district council.—Mr. A. Hartley, architect and surveyor.

BEACONSFIELD.—February 14th.—For the erection of thirty-four cottages, for the urban district council.—Mr. H. Sargeant, surveyor.

MILFORD (Ireland).—February 14th.—For the erection of forty-two labourers' cottages, for the rural district council.—Mr. S. Watters, clerk.

MONMOUTH.—February 14th.—For the erection of new schools, for the county council.—Mr. J. Bain, County Council Offices, Newport.

LOWESTOFT.—February 16th.—For extensions to sanatorium, for the corporation.—Mr. G. H. Hauby, borough surveyor.

WARMINSTER.—February 20th.—For the erection of an isolation hospital, for the Joint Isolation Hospital Committee.—Mr. C. H. Lawson, architect, 32 High-street, Warminster.

WEST RIDING.—February 20th.—For the erection of a school, for the county council.—Education Architect, County Hall, Wakefield.

LANCASHIRE.—February 21st.—For the erection of a tuberculosis sanatorium at High Carley, for the county council.—Mr. Dean J. Brundritt, architect, County-square, Ulverston.

FEATHERSTONE.—February 28th.—For the erection of 149 working-class dwellings, for the urban district council.—Mr. S. Chesney, architect.

Iron and Steel.

EGREMONT.—February 2nd.—For the supply of unclimbable iron fencing, for the urban district council.—The Surveyor.

SHEFFIELD.—February 3rd.—For structural steel-work at power-house, for the Electric Supply Committee.—Mr. S. E. Fedden, general manager and engineer, Commercial-street.

URMSTON AND FLIXTON.—February 4th.—For supplying and fixing an oil engine, or alternatively a gas engine and pump, for the pumping alternatively of sludge and supernatant water at the outfall works, for the Drainage Joint Committee.—Mr. J. P. Wilkinson, engineer, 301 Cathedral-street, Manchester.

SOUTHEND.—February 6th.—For the supply of steel tramway rails, for the corporation.—Mr. E. J. Elford, borough engineer.

WARSAW.—February 16th.—For the supply of two vertical compound engines, with plunger, piston, or differential pumps, or of two turbines, with centrifugal or turbo pumps, for the Municipality.—Sir William H. Lindley, 29 Blittersdorpherplatz, Frankfurt-on-Maine.

WALLASEY.—February 19th.—For the supply of 20 tons of rails, creosoted sleepers, and the construction of short railway siding, for the corporation.—Mr. J. H. Crowther, engineer.

Roads.

BROMLEY (Kent).—February 2nd.—For the execution of sewerage, levelling, paving, metalling, channelling and making good portion of a road, for the rural district council.—The Surveyor, Maulden House, Sidecup-hill, Sidecup.

BLYTH AND CUCKNEY.—February 2nd.—For road widening, for the rural district council.—Mr. F. Hopkinson, surveyor, Worksop.

EAST GRINSTEAD.—February 2nd.—For the supply of 400 cub. yds. of fine compo sand, flint grit, or other material for the surface-tarring of roads, for the rural district council.—Mr. Francis S. White, clerk.

YORK.—February 2nd.—For the supply of Portland cement, pitch and creosote oil, stoneware pipes, building and sewage lime, Yorkshire stone flags, kerbing and edging, broken and rough whinstone, broken and rough slag and limestone chippings, for the corporation.—Mr. F. W. Spurr, city engineer.

DROXFORD.—February 2nd.—For the hire of steam rollers and scarifiers, for the rural district council.—Mr. A. V. Carter, surveyor, Droxford, Hants.

HENDON.—February 2nd.—For making up certain roads, for the urban district council.—Mr. S. S. Grimley, engineer and surveyor.

POOLE.—February 2nd.—For the supply of granite, for the corporation.—Mr. S. J. Newman, borough surveyor.

PORT GLASGOW.—February 2nd.—For paving, tar-macadam and other work, for the corporation.—Mr. A. Paton, town clerk.

WORKSOP.—February 2nd.—For the supply of slag, for the urban district council.—Mr. G. Featherstone, clerk.

SUTTON-IN-ASHFIELD.—February 2nd.—For the supply of tar-macadam and broken slag, for the urban district council.—Mr. W. Burn, surveyor.

LEWISHAM.—February 3rd.—For making up Grove Park-road, for the borough council.—Borough Surveyor.

CHINGFORD.—February 3rd.—For the supply of granite, stone ballast, hoggins, and boiler clinker, and steam roller and scarifier, for the urban district council.—Mr. L. C. Bowen, clerk.

MIDDLESBROUGH.—February 3rd.—For the supply of whinstone and tarred slag, for the rural district council.—Mr. W. H. Dixon, district surveyor, Kirkby-in-Cleveland, near Stokesley, Yorks.

WEALDSTONE.—February 3rd.—For making up certain roads, for the urban district council.—Mr. H. Walker, surveyor.

NORTHAMPTON.—February 3rd.—For the supply of granite, slag and gravel, for the rural district council.—The Surveyor.

BARNESLEY.—February 4th.—For making up a street, for the corporation.—Mr. J. H. Taylor, borough surveyor.

ROTHERHAM.—February 4th.—For the supply of granite, slag, and team labour, for the rural district council.—Mr. R. Bradbury, district surveyor.

MIDDLESEX.—February 4th.—For the supply of about 12,000 tons of 2-in. and 1½-in. hand-broken basalt for road construction, and 2,000 tons of ½-in. chippings, for the county council.—Mr. H. T. Wakelam, Middlesex Guildhall, Westminster, S.W.

HERTFORDSHIRE.—February 5th.—For the supply of broken granite, slag and tar-macadam required for the main roads during the year ending March 31, 1915, for the county council.—Mr. Urban A. Smith, county surveyor, Hatfield.

OLDHAM.—February 5th.—For making up certain streets, for the corporation.—Borough Surveyor.

ELY.—February 5th.—For the supply of broken materials, for the county council.—Mr. H. F. Simpson, county surveyor, Wisbech, and Mr. R. S. W. Perkins, county surveyor, Ely.

LINTHWAITE.—February 5th.—For work of street construction, for the urban district council.—Mr. D. J. Bailey, clerk.

CUDWORTH.—February 5th.—For the supply of a 10-ton road roller fitted with an approved scarifier, for the urban district council.—Mr. W. E. Raley, clerk, Regent-street, Barnsley.

WORCESTER.—February 5th.—For the construction of roads, drains and entrance gates at the Fort Royal recreation ground, for the corporation.—Mr. Thomas Caink, city engineer.

SUTTON (Surrey).—February 5th.—For tar-spraying various roads, for the urban district council.—Mr. H. Hedley Grieves, surveyor.

STOKESLEY.—February 5th.—For the supply of whinstone, limestone, and tarred slag and whinstone, for the rural district council.—Mr. W. H. Dixon, Kirkby-in-Cleveland, near Stokesley, Yorks.

NEWTON ABBOT.—February 6th.—For the supply of macadam, carting and horse hire, for the urban district council.—Mr. C. D. White, surveyor.

SPALDING.—February 6th.—For the supply of granite, slag and gravel, for the rural district council.—Mr. H. S. Maples, clerk.

STOCKPORT.—February 6th.—For the supply of materials and manual and team labour, for the corporation.—Mr. J. Atkinson, borough surveyor.

OXENDEN.—February 6th.—For the supply of road materials, for the rural district council.—Mr. W. J. Smith, surveyor, Rothwell House, Market Harborough.

PAIGNTON.—February 6th.—For work of road widening, for the urban district council.—The Surveyor.

CRICK.—February 7th.—For the supply of granite, for the rural district council.—Mr. J. W. Pendred, clerk.

HORNCASTLE.—February 7th.—For the supply of granite and slag, for the rural district council.—Mr. J. E. Chatterton, clerk.

PENGE.—February 7th.—For the supply of granite macadam, cement and lime, Kentish flints, gravel, shingle, tarred paving and tarred macadam, for the urban district council.—The surveyor, Town Hall, Anerley, S.E.

GLAMORGAN.—February 7th.—For the supply of material and haulage for the county council.—Mr. G. A. Phillips, county surveyor, County Hall, Cardiff.

WELLINGBOROUGH.—February 7th.—For the supply of granite, for the rural district council.—The Clerk.

HAVANT.—February 7th.—For the supply of road materials, for the rural district council.—Mr. W. L. Hibberd, surveyor.

NORTHAMPTONSHIRE.—February 9th.—For the haulage of granite by motor wagons, for the county council.—Mr. C. S. Morris, county surveyor, Northampton.

NORTHAMPTONSHIRE.—February 9th.—For the supply of broken granite, for the county council.—Mr. C. S. Morris, county surveyor, Northampton.

HENDON.—February 9th.—For the supply of artificial stone, for the urban district council.—Mr. S. S. Grimley, engineer and surveyor.

SOUTHAM.—February 9th.—For the supply of granite, for the rural district council.—Mr. H. Pickering, surveyor.

NEWARK.—February 9th.—For the supply of 850 tons of granite, 1,900 tons of slag, and 250 tons of tar-macadam, for the rural district council.—Mr. R. Oakden junr., 27 Winchelsea-avenue, Newark.

BEVERLEY.—February 9th.—For the supply of about 3,000 to 4,000 tons of stone for macadamising, for the rural district council.—Mr. E. Pickett, surveyor.

APPOINTMENT OF HIGHWAY SURVEYOR.**

Applications are invited for the appointment of Highway Surveyor for the Eastern Division of the above District.

Applicants must not exceed the age of 40 years, have had previous experience in the repair and maintenance of roads, and a thorough knowledge of modern methods of construction.

Salary £140 per annum, and £35 per annum for the provision and upkeep of a motor bicycle.

Applications are to be made on printed Forms only, which will be sent on receipt of a stamped addressed foolscap envelope.

These must be returned to the undersigned not later than 12 noon on February 12th, 1914.

Canvassing in any form will be deemed a disqualification.

H. T. RAVENOR,

Solicitor.

Clerk to the Rural District Council.

Witney.

January 29, 1914.

(1,225)

**KARACHI MUNICIPALITY.
APPOINTMENT OF SUPERINTENDENT OF
FIRE BRIGADE.**

Applications are invited for the post of Superintendent of the Municipal Fire Brigade. Salary Rs.200/- per mensem, with Free Quarters, unfurnished.

The Superintendent will be a full-time Officer, and, in addition to taking charge of a Motor Fire Engine at fires, will be required to organise the Brigade, to conduct fire drills regularly, and to see that all fire appliances are always in good working order, and generally to act under the orders of the Chief Engineer of the Municipality.

Preference will be given to a young, active man, with experience in a properly organised Brigade, used to obeying and enforcing discipline.

The selected candidate will be subject to all the Municipal Rules, including Leave and Provident Fund Rules, and the appointment may be terminated at any time by three months' notice on either side.

Single second-class fare will be paid to enable the candidate to join his appointment.

Applications, stating age, nationality, qualification and experience, will be received up to 28th February, 1914.

MEASHAM LEA, ASSOC.M.INST.C.E.

Chief Officer and Chief Engineer,
Karachi Municipality.

(1,138)

THE MALDEN AND COOMBE URBAN DISTRICT COUNCIL.

SURVEYOR'S GENERAL ASSISTANT.

A General Assistant is required in the Engineer and Surveyor's Department, who must have had previous experience in the routine duties of such an office, be a good Surveyor and Draughtsman, used to taking levels, and have a thorough knowledge of building construction. It is desirable that he should also have a knowledge of the principles of town planning.

Candidates should be not less than 24 years of age, and preference will be given to those who have obtained the testimonial of the Institution of Municipal and County Engineers.

Salary, £100 per annum (payable monthly), rising by annual increments of £10 to £150.

Applications, on the form to be supplied by me upon receipt of a stamped and addressed foolscap envelope, accompanied by copies of three recent testimonials, are to be delivered at the Municipal Offices, New Malden, on or before 10th February, in envelope endorsed "Surveyor's Assistant," and addressed to the undersigned.

Canvassing, directly or indirectly, will be a disqualification.

JAMES WM. JOHNSON,
Clerk of the Council.

Municipal Offices,
New Malden, Surrey.
January 27, 1914. (1,218)

EAST SUSSEX COUNTY COUNCIL. RECONSTRUCTION OF MONK BRETTON BRIDGE, RYE.

Wanted, a thoroughly capable man as Clerk of Works. Preference will be given to one experienced in Ferro-concrete construction.

Salary, £3 per week.

Applications, accompanied by three references, to reach the undersigned on or before Saturday, February 7th, 1914.

F. J. WOOD, ASSOC. M. INST. C. E.,
County Surveyor.

County Surveyor's Department,
County Hall,
Lewes. (1,203)

CITY OF ST. ALBAN. APPOINTMENT OF SURVEYOR'S CLERK.

The Council invite applications for the above appointment. Applicants must have had experience in a Municipal Surveyor's Office, including the keeping of all the various books, and be an efficient Short-hand Typist.

The salary will be at the rate of £70 per annum.

Applications, in candidate's own handwriting, stating age and qualifications, to be addressed and delivered to the undersigned, accompanied by copies of three testimonials, not later than Thursday, the 12th February, endorsed "Surveyor's Clerk." Canvassing will be deemed a disqualification.

E. P. DEBENHAM,
Town Clerk.

Town Clerk's Office,
St. Albans.
January 21, 1914. (1,192)

BOROUGH OF GRAVESEND. The Corporation invite applications for the Appointment of Road and General Foreman.

Applicants must possess a thoroughly practical experience in the control of Men, the making of Macadamised and Flint Roads, General Mason's and Paving Work, Drain and Sewer Work, Tar Paving and Tar-macadam work, and Scavenging of a district, and must be able to keep Time Books, &c.

Wages 45s. per week.

None but thoroughly competent men need apply, and canvassing is strictly prohibited and will disqualify.

Applications, in candidate's own handwriting, giving full particulars of age, qualifications, previous experience and present employment, and accompanied by copies of not more than three recent testimonials, to be sent to my Office not later than Thursday, February 5th, endorsed "Road Foreman." Applications must be made on a Form which will be supplied on application to the undersigned.

H. H. BROWN,
Town Clerk. (1,178)

COUNTY BOROUGH OF STOCKPORT. CHIEF ASSISTANT—BOROUGH SURVEYOR'S OFFICE.

The Highways and Sewers Committee of the County Borough of Stockport invite applications from qualified persons from 30 years to 35 years of age, for the position of Chief Assistant in the Borough Surveyor's Office. Salary £200 per annum, rising to £260 by annual instalments of £10.

It is essential that each candidate should be a fully qualified Civil Engineer, and have had the necessary Education and Municipal Training of a Borough Surveyor's Office, to fill the position—including actual experience in the design and supervision of Tramways and Bridge Construction, Sewage Works, Private Street Improvement Works, &c.—and sufficient Architectural knowledge to design Buildings in connection with Engineering Works.

Full particulars of the duties and conditions relating to the appointment, together with Form of Application, can be obtained on application to the undersigned.

Applications to be on the pre-scribed Form (no other will be considered), and addressed to the Borough Surveyor, endorsed "Chief Assistant," and must be delivered not later than Thursday, 12th February next.

JOHN ATKINSON, ASSOC. M. INST. C. E.,
Borough Surveyor.

Town Hall,
Stockport.
January 21, 1914. (1,191)

BOROUGH OF GUILDFORD. ASSISTANT BOROUGH SURVEYOR.

The Corporation of Guildford invite applications for the appointment of Assistant Borough Surveyor. Salary £120 per annum, rising, subject to satisfactory service, by annual increments of £10 to a maximum of £150 per annum. The person to be appointed must be a good Draughtsman and Surveyor, and possess a thoroughly practical knowledge of the work of a Municipal Engineer's Department. He will be required to devote the whole of his time to the duties of the office. Applicants must state age, present and previous employment, and the date on which the applicant can take up the duties. Applications, accompanied by copies of not more than three recent testimonials, must be sent to me, the undersigned, not later than Friday, the 13th February, 1914, endorsed "Assistant Surveyor."

Personal canvassing will disqualify.

A. D. JENKINS,
Town Clerk.

Town Clerk's Office,
Bridge-street,
Guildford.
January 28, 1914. (1,223)

THE GOVERNMENT OF INDIA have four vacancies for Assistant Sanitary Engineers, two on salaries of Rs.800 a month, rising by annual increments of Rs.50 to Rs.1,000 a month; one on a salary of Rs.500 a month, rising by annual increments of Rs.50 to Rs.700 a month; and one on Rs.400 a month, rising by annual increments of Rs.40 to Rs.620 a month.

Candidates for the two last-mentioned posts must not be above 33 years of age, and should either have passed the qualifying examination for A.M.I.C.E., or should hold such other engineering degrees, diplomas or certificates as are sufficient to show that they have attained the requisite standard implied by the above examination. They must also have had considerable practical experience both in the design and execution of works of water and sanitary engineering.

For the two other posts there is no fixed upper limit of age, but preference would be given to candidates not above 33 years of age, if highly qualified in all respects. Candidates must have a sound knowledge of modern methods of construction of water-works installations, and long—in one case not less than ten years'—practical experience of the working of such installations. Some drainage experience will be regarded as a strong additional qualification.

Further particulars and Forms of Application can be obtained from the Secretary, Revenue Department, India Office, London, S.W., to whom applications should be submitted not later than 7th February.

The Surveyor

And Municipal and County Engineer.

Vol. XLV.

FEBRUARY 6, 1914.

No. 1,151.

Minutes of Proceedings.

Society of Engineers: Presidential Address.

Among the many unwritten laws which govern civilised mankind is one which exempts from discussion a presidential address. It is one of those things which has to be listened to and endured, and no matter what storm of protest, indignation or amazement it may call up in the breasts of an audience, none would so transgress "good form" as to give speech to his feelings. Even favourable comment and earnest inquiry are denied, and it is fortunate therefore that the Press are free to deal with an address on its merits, untrammelled by any bogey of bad form or impertinence. Presidential addresses almost invariably take the shape of either a quasi-historical review and forecast, or a dissertation upon some particular branch of knowledge. In the case of the latter the subject matter is more suitable for a "paper" than for an inaugural address, while the former type is not usually of interest to others than the members of the particular society before which it is delivered. In the address delivered by Mr. H. C. H. Shenton before the Society of Engineers on Monday, we have a happy combination of the two. It may well be divided into distinct portions—the one professional, the other technical—and we intend to deal with it in this manner. As will be known to the bulk of our readers, Mr. Shenton specialises in water supply and sewage disposal, and as he is one of those few men who very rightly believe in "sticking to their last," he treats technically only of these subjects. To use his own words in speaking of the profession of engineering, "if the profession is to be properly organised the consulting engineer ought not to undertake personal work for which he does not specialise." We have no intention in the present article of dealing with the technical portion of the address, as the many points there raised call, we consider, for isolated treatment.

Among the many matters of vital importance in the address, that of the necessity for the organisation of the profession stands in strong relief. It is patent that "the well-being of the engineer" can be secured only by combined effort on the part of the members of all branches—civil, mechanical, illuminating, municipal, and sanitary—of the profession. Mr. Shenton rightly terms "individual and spasmodic" the efforts which have so far been made in this direction, but progress of every kind is inevitably, in its earlier stages, open to the charge. Before there can be effective combination of existing engineering societies, there must be some uniformity in their separate working. There are societies which admit by examination, and societies which admit without. There are others in which an examination is compulsory only in the case of those

seeking admittance to the lower ranks, the favoured ones going direct to the highest class without examination. There are still others in which examinations are quite optional, and have no bearing either one way or the other upon the question of admittance. Every engineering society necessarily admits engineers, but the best of engineers may be excluded if the requisite "influence" cannot be obtained, while a relatively inferior man, if well backed, may aspire to council honours in a twelvemonth! Any "controlling body" which might be elected now would, we fear, so far as the examination question alone goes, have a very sorry task before it. And the very word "engineer" yet awaits precise definition. The unnecessary waste of public money, due to the engagement of unqualified persons, is another matter of considerable importance, and Mr. Shenton suggests that "engineers should combine in the endeavour to make it impossible that their work should be given to persons outside the profession." We are rather inclined to think that for a great deal of the waste persons *in* the profession are responsible; indeed, Mr. Shenton is of our opinion himself to some considerable extent, since he deplors the number of engineers who have not specialised knowledge on the work in which they are engaged. "It," he says, "the list of failures in sewage disposal works and in water supply works were recorded, together with the names of those responsible for the work done, the result would be very instructive." And the result would, we are confident, reveal the fact that the greater number of failures lay at the door of those in the profession. Mr. Shenton is perhaps obsessed by the idea that the municipal engineer does much engineering work that belongs of right to the consultant; but even if he does, that fact in itself is a proof of his competence rather than of his incompetence. Local authorities are not prone to betray the trust reposed in them merely for the sake of obliging the surveyor.

Press censorship is one of those subjects that is scarcely to be looked for in a presidential address delivered before a body of engineers, and we had serious misgivings when we read, "It seems as if some sort of Press censorship is desirable." Here was Mr. Shenton in quite a new line, and we read on expecting every moment to find him advocating the censoring of *THE SURVEYOR* by the Society of Engineers. Happily, Mr. Shenton puts forward nothing so drastic as that; indeed, his suggested Press censorship is not Press censorship (as generally understood) at all. What he hits at is the ease with which a man may pose as an authority on a subject, if only he compiles a book upon it. As he points out, there are numbers of technical books which are full of errors, and serve but to bewilder and

lead astray the student. "It seems," says Mr. Shenton, "as if all that is required at the present day is for a person to make an assertion. The assertion goes forward, frequently without comment, as a fact, and becomes a source of error." He would have a department "for the careful reading of new books written by unknown authors, with a view to their inclusion in a list of text-books suitable for students preparing for examinations." We are with him all the way, but we would include known authors and old books, for it would be manifestly ridiculous to allow either old errors to continue or new ones to arise simply because they came from a "known authority." There are men who are famous owing mainly to a large output of purely mediocre works. The manufacturer's "ghost" in authorship certainly requires "laying." There is not the least objection to manufacturers writing books and advocating their own methods, appliances, and materials, but such works should carry the name of the manufacturers on the title page, and not that of some engineer employed for the purpose of puffing the contents. Equally to be deplored are the free designs (even up to a specification and full drawings) supplied to engineers by manufacturing and contracting firms. If an engineer is not capable of preparing his own designs, he should certainly not be allowed to obtain them elsewhere. It places him in an awkward position, since the contractor will almost inevitably have to be allowed what amounts to a free hand. "If," says Mr. Shenton, "this system of obtaining designs free of charge from manufacturers is to be admitted as being in conformity with the rules of the engineering profession, it follows that any person of organising capacity, however limited his knowledge of engineering may be, may carry out very large works which are really designed by other people, and about which he is quite incompetent to express an opinion, and to charge the full fees of a consulting engineer for doing so." This is precisely what does happen only too frequently, and the matter is one which calls for the earnest consideration of the profession. The manufacturer would, we think, be the first to welcome the extinction of a system which hits him most unfairly.

Space does not allow us to comment further upon the professional portion of Mr. Shenton's striking address. Many columns would be necessary to do full justice to it, and other matters claim their share of attention. In our next issue we shall deal with the technical portion, and say what we have to regarding his views upon water supply and sewage disposal. Mr. Shenton will, during the next twelve months, have full scope for his activities, and if an angury may be gathered from the reception he received on Monday when he took the chair, he will have substantial and whole-hearted support in that arduous labour which is the reward of high offices such as the one he now holds.

Skidding Vehicles in London Streets. While much of the criticism of road surveyors and their works which appears in the lay Press is of little or no importance, it is necessary from time to time to pay attention to the more conspicuous or more plausible of the attacks directed against the profession. The public is beginning to understand some of the difficulties which confront the country road surveyor, but in the case of criticisms of the work of the highly qualified engineers employed by the road authorities of the greatest city in the world, an attack upon the work done is obviously directed against the responsible official. The statements that "the shape of our streets is too often unsuited to modern traction," and that "the camber or slope is excessive, and is apt to cause slips," appeared in a recent issue of the *Daily*

Mail, and, having regard to the general tenour of this leading article, we are surprised to find it in so conspicuous a position. The heading was "Unsafe London Streets," and the article was written by way of comment on an accident—the overturning of a motor omnibus. In view of the circumstances of other accidents, it is, perhaps, of some significance that the vehicle was taking a private party to a football match, and the majority of the passengers were travelling outside. The ultimate cause of the skidding, our contemporary states, was "the bad condition of the road surface," but in view of the unsatisfactory nature of some of the features of the present type of motor omnibus, this opinion cannot be accepted as necessarily correct. Both sideslip proper and the skidding of braked wheels are influenced by the diameter of the wheels, and those of motor omnibuses are much too small, while the design of the brakes themselves is defective. It may be noted in passing that the braking arrangements of some other motor vehicles are also defective, and dangerously so. Our contemporary further contends that "London needs not only better surfaces, but also far wider streets, and a far more stringent regulation of vehicles," but there is nothing to show whether the regulation of vehicle design is referred to, or traffic regulations only. How far wider streets can be obtained is left to the imagination of the reader, but this is another matter. It may be pointed out, however, that some important London streets are less congested than they used to be.

It is well known that the great influence of the *Daily Mail* is often exerted in favour of the motor omnibus, and our own appreciation of this useful vehicle has been expressed often enough to make any further reference to it unnecessary in the present connection. We trust that our powerful contemporary will reconsider its attitude towards certain enthusiasts on the one hand and highway engineers on the other hand, and will consider the expediency of including in criticisms of the work of surveyors such reservations and courtesies as are employed by the entire Press in references to professional and technical matters in which architects or members of the medical profession are concerned. We feel sure that the editors of influential newspapers will not like to realise too late that under new conditions of highway administration the status of official engineers is lower and their remuneration less than should be the case as a result of their unfair treatment in the Press for a number of years preceding the changes.

* * *

America's First City Manager.

The system of municipal administration by a select commission, which finds favour in America, is something quite foreign to our notions of local self-government in this country, which is established upon the basis of wide popular election. That the American plan works satisfactorily on the whole is to be inferred from the fact that it has been subjected recently to an interesting development in Dayton, Ohio. Here there is offered the first example of a large city trying the experiment with the City-Manager plan of municipal government. The gentleman appointed to this position is Mr. Henry M. Waite, who has for some time past held the office of chief engineer of the Cincinnati department of public works. The City Commission, from which Mr. Waite has received his appointment, consists of five members elected for four years. The mayor is the commissioner who receives the largest number of votes, and along with the other commissioners he is paid a salary—the mayor £360 a year, and the others £220. The commission thus constituted is a legislative body which has no executive authority, and as regards the administrative work of the city, the city manager runs what in familiar language would be termed a one-man show. He is the

administrative head of the municipal government, responsible for the efficient working of all the departments. He has the power of appointing or removing all subordinate officers, and, in fact, exercises universal control, including the duty of advising as to the financial condition and needs of the city. Nothing is stated as to the amount of salary Mr. Waite is receiving, but we should imagine that to be commensurate with the extent of the responsibilities of his office it ought to be ambassadorial or vice-regal in its proportions. The experiment, we gather, is being watched with considerable interest in municipal circles in America. It is something of a novelty, even in the States, to find one individual charged with the direction and control of a whole city. We have every expectation and hope that Mr. Waite will be quite equal to the occasion.

* * *

"Controlling" the Municipal Engineer.

The letter from "Togun" which appeared in our issue of December 26th under the heading "Controlling the Municipal Engineer," refers to a subject which, although in part treated with good-humoured banter by the writer, is of very real importance. The tendency to supersede the municipal engineer in regard to the administration of matters which come within his legitimate sphere, and with which he is specially qualified to deal, is one which has never commended itself to our judgment. The undue multiplication of central authorities—which, too often, are apt to lose touch with public opinion—is in itself undesirable as leading to unnecessary complication and expense in the practical work of administration. Further, where such bodies are set up, their function should be to guide and direct rather than to control. In the matter of town planning, to which "Togun" specifically refers, we have always taken a strong view that no body of men are more fitted, alike by training, experience and knowledge of existing conditions, to advise upon and carry out schemes under the Act of 1909. The co-operation of the architect, the social expert and others is no doubt necessary, but when all is said and done, the improvement and development of towns is in its essence purely a matter of municipal engineering. Water supply is on rather a different plane, because of the keen competition for sources of supply which has been taking place recently. To this extent the problem appears to us to be a national one; but once the source has been allotted its utilisation for the needs of a particular town or district is a matter for purely local control. We followed with much amusement the "exclusive information" outlined in "Togun's" letter in regard to the proposed Ministry of Refuse Removal, and the newly formed Sewers Improvement Association. The whole question of outside control, however, is a very important one, and is worthy of the close attention of the professional institutions and of all municipal engineers.

* * *

A Council's Liability.

The case of *Papworth v. The Battersea Borough Council*, in which judgment was recently given by Mr. Justice Horridge, is of great interest as illustrating the principles on which the liability of a local authority for street accidents rests. The plaintiff alleged that while she was cycling in Lombard-road in January last year she rode over a sewer gully which was in a dangerous state of repair, and because of this she was thrown from her bicycle and a car passed over her, inflicting such injuries as to prevent her permanently from following her employment. The jury found, in the first place, that the gully, which had originally been constructed by the old Wandsworth District Board of Works, had been negligently constructed, and that the accident was primarily due to this fact. On this finding the learned judge held that the Act which constituted the Battersea Vestry successors of the Wandsworth District Board of Works did

not operate to transfer pre-existing liabilities, and that consequently the defendants, being the successors of the vestry, were not liable on this head. The jury, however, further found that the defendants were guilty of negligence in not having repaired a broken frame, and that this broken frame was a contributory cause of the accident. Upon this finding it was argued for the defendants that they were not liable for mere misfeasance in suffering the frame to get out of repair, but that their liability only extended to acts of nonfeasance, and the cases which establish a similar principle in regard to the repair of highways were cited. It was held, however, that the defendants were liable upon the principle that if a duty is undertaken and improperly performed, and actual damage is occasioned thereby, the person injured has a good cause of action. Judgment was consequently given for the plaintiff for the amount assessed by the jury—viz., £1,961 with costs.

* * *

Rectifying a Contract.

The order of Mr. Justice Sargant made in the Chancery Division last Friday for the rectification of a building contract between H.M. Commissioners of Works and Messrs. William King & Son is of considerable interest to surveyors and engineers. The contract in question, which was for the erection of a post office, was for a fixed sum of rather more than £20,000, and there was appended to it a schedule of prices according to which variations were to be valued. Among the items in this schedule was "reinforced concrete," which, by a typist's error, appeared at £3 12s. 6d. per foot cube, instead of per yard cube. According to the evidence, both parties intended the price to be per cube yard, and after the contract had been signed neither of them had any idea that the word "foot" had been substituted. The contractor did not become aware of the mistake until after the completion of the work, when he admitted in correspondence that it was an obvious error. Nevertheless, he set up a claim based on the price quoted per cubic foot, because he conceived himself to have been treated unreasonably in respect of some other matters. The learned judge expressed the opinion that this claim was extravagant and exorbitant, and rectified the contract by substituting the word "yard" for "foot." In the circumstances the decision appears to have been quite equitable, but it must be remembered that it was given in regard to a schedule attached to a lump sum contract, and not with reference to a priced bill of quantities.

* * *

The Manchester Meeting.

As will be gathered from the published programme, the meeting of the Institution of Municipal and County Engineers which is to be held at Manchester on Friday and Saturday, the 20th and 21st inst., will be of an exceptionally attractive character. The Lord Mayor and those committees of the corporation who are most closely concerned with the municipal engineering work of the city appear to be doing all that is possible, both in regard to hospitality and arrangements for the instruction of the members, and a large and highly successful gathering should be assured. Ample time has been allotted to business, and it is likely that not the least interesting part of this will be the description which Mr. T. de Courcy Meade, the city surveyor, will furnish of the numerous and important undertakings for which he is responsible. A record, we have reason to believe, mainly of original investigations, his address should be one of a most valuable nature, and may be expected to afford considerable pleasure—apart from the information it will provide—to all who are privileged to hear it.

The Design of Plain and Retaining Walls.

By F. NOEL TAYLOR, M.I.MUN.E.

The design of walls forms an important item of the civil engineer's practice. By walls is meant those structures which have to sustain a pressure, usually on one side, of either earth, water, or wind, and in a lesser degree pressure from above in the form of superincumbent loads. To start with, we have the ordinary garden wall, which sustains a wind pressure only; secondly, the house wall, which sustains a superincumbent load. These two forms of wall do not usually demand any special calculations, yet at the same time they are worthy of the few remarks which will be made upon them. Far more important to the engineer is the proper understanding of the stresses in and the design of walls which have to withstand thrust, known usually as retaining walls, and when the thrust of water, dams. Not only must these walls be designed so as to be entirely free from any liability to fail under ordinary conditions, but the engineer must so thoroughly understand the principles of design that the material put into the wall will be so disposed of as to render the cost as low as possible, compatible with safety. As the literature having direct bearing on the subject is not too abundant, and also very widely scattered over numerous textbooks, the writer has aimed in the following article at bringing together the essential principles as concisely as possible.

Now, the essence of the problem of the stability of walls is based on the following facts: The material of which they are built exerts a downward pressure, varying according to its mass, due to the effects of gravity. The earth or water which they retain, or the simple wind pressure to which they are subjected, exerts pressure against the sides of the wall. In the case of water and wind this pressure is horizontal, but with earth it will usually be inclined at an angle to the horizontal, which will vary according to the nature of the earth and its consequent angle of repose. It is reduced to horizontal and vertical components by calculations. Hence we see that there will be two pressures to contend with, one vertically downwards, known as the passive force or resistance, and the other horizontal, called the direct pressure. But the forces alone are not considered. It is the moment of the forces which we proceed to investigate—that is to say, the passive force is considered to act vertically through the centre of gravity of the wall, and its moment is the distance from the point where a perpendicular dropped from the centre of gravity of the wall cuts the base to the outer edge of that base; while the pressure, if it be water or earth, is considered to act at a point one-third the way up from the base of the wall (or that part exposed to the water) to top-water level, which point is known as the centre of pressure; while if only wind is under consideration the centre of pressure is taken halfway up the exposed face of the wall. Bearing in mind, then, the foregoing rules, the reader should be able to understand the sequel.

CASE I.

The simplest case that could be presented to the reader is that of the ordinary brick garden wall. In practice such walls are not usually subject to much

FIG. 1.

FIG. 2.

calculation, because the practical thickness of the brickwork is usually ample to supply a resisting moment greater than any overturning moment.

Knowing the force of the wind, say, 40 lb. per square foot, which in Britain is more than enough, and the height of our wall, the thickness would be t

$$t = \sqrt{\frac{ph}{w}} \dots \dots \dots 1$$

where p —the wind pressure on a strip of wall 1 ft. wide, and w the weight of the wall per foot-run, while if t is limited the greatest safe value of h will be

$$h = \frac{wt^2}{p} \dots \dots \dots 2$$

Now, to illustrate the above reasoning, the reader is referred to Figs. 1 and 2.

P is the pressure and t its moment
 W = weight of wall, and y its moment
 CG = centre of gravity of the wall.

In Fig. 2 we have the parallelogram of forces applied to the wall, a diagram which has universal application in problems of this sort. For instance, let

p = wind pressure in lb. per square foot
 w = weight of brickwork in lb. per cubic foot
 h = height of wall in feet
 x = leverage of wind to toe of wall
 y = leverage of weight to toe of wall
 P = total wind pressure on a strip of wall 1 foot wide = ph
 W = total weight of 1 foot run of wall of thickness t and height h
 $P = ph$, $W = w h t$, and for equilibrium
 Px = must be equal to or less than* Wy , or, say, $w = 110$,
 $h = 10$, $t = 1$, and $y = 5$, $P = 40$, $x = 5$.

We have ratio of stability = $\frac{wt h y}{Px} \dots \dots \dots 3$
 $= \frac{110 \times 1 \times 10 \times 5}{40 \times 10 \times 5} = \frac{5.5}{20}$, which is not satisfactory.

Trying equation 1 we have

$$t = \sqrt{\frac{ph}{w}} = \sqrt{\frac{40 \times 10}{110}}$$

$= \sqrt{3.636} = 1.905$, say the wall was made 2ft. thick, in which case equation 3 will give $\frac{110 \times 2 \times 10 \times 1}{40 \times 10 \times 5} = \frac{11}{10}$ which is quite satisfactory.

It must be remembered in designing a wall as above that there will always be a tendency for it to slide upon its bed joints, and this tendency is directly proportional to the coefficient of friction of the mortar, and in calculations is written μ .

CASE II.—SIMPLE RETAINING WALL.

Referring now to the diagram in Fig. 2, from the centre of gravity of the wall a perpendicular is dropped. To a certain scale of tons, pounds, &c., the value of W is set off along it from the point where the line of pressure cuts it, while a horizontal line passes through CG , which in the case of a wind pressure is also the centre of pressure, and along it is set the value P to the same scale as W . The parallelo-

FIG. 3.

FIG. 4.

gram is completed and the diagonal drawn, and if this diagonal falls outside the middle third of the base, as shown, something is wrong. The diagram refers to the unsafe wall which was worked out, and the wall would tend to topple over.† If the diagonal cuts the base within the middle third, the wall will be safe against failure from this cause; but, although there

* In practice considerably less than according to the factor of safety employed.
 † The value of P is exaggerated for clearness.

may be no resulting tension on the inner joints, there may be too much compression on the outer ones.

Let us see how this is investigated. In Fig. 3 we have a diagram showing the reaction with the resultant acting through the centre of the wall; Fig. 4 shows it acting through the middle third of the wall. But such diagrams have only a limited application, and when any wall has been calculated upon, it is very useful to check the calculations by a very well-known formula which has a very universal application. It is written:—

$$\frac{W}{A} + \frac{M}{Z} \dots\dots\dots 4$$

and is explained as follows. The wall is subject to a longitudinal thrust *W*, producing a bending moment *M* at any section.

Let *I* = moment of inertia of the section.

For a rectangular section = $\frac{BD^3}{12} \dots\dots\dots 5$

For a rectangle of breadth *B* and depth *D*

y = distance of extreme fibre of cross section from the neutral axis (which passes through the centre of gravity of the section)

p = unit stress at the extreme fibre produced by the bending moment.

Then $p = \frac{M}{I} y \dots\dots\dots 6$

And as *A* = area of cross section

*p*₁ = unit stress produced by $W = \frac{W}{A} \dots\dots\dots 7$

∴ Total stress at the given point in section

$$= \frac{W}{A} + \frac{M}{I} y \dots\dots\dots 8$$

and $\frac{I}{y}$ is usually written *Z*; hence our formula No. 4.

Adding up the two quantities, we have the compression on the outer joints, and subtraction the tension on the inner ones. For instance, take the following case of a wall so loaded, bearing in mind at the same time that it is not designed as a retaining wall, which we shall consider later on.

CASE III.

A common case would be the thrust of a roof. We will assume the loads on the roof worked out in the ordinary manner, and a value for *W* = 150. The trusses are 10 ft. centre to centre, and the wall 9 in. thick.

$$\therefore \frac{W}{A} + \frac{M}{Z} = \frac{150}{10 \times .75} + \frac{150 \times 5}{\frac{1}{8} (10 \times .75^2)} \dots\dots\dots (9)$$

= 20 + 80 = 100 ÷ 20 = 5 tons per square foot compression and 60 ÷ 20 = 3 tons per square foot tension.

The tension is too much for a mortar joint, and the compression rather high; but if the above calculation is repeated for a 14-in. wall, it will prove safe. The moment of *W* for use in the top line of the equation is scaled off from the ordinary stress diagram, and is

Fig. 5.

the distance from the point where the resultant cuts the base of the wall to the centre of that base.

The use of buttresses and counterforts on walls exposed solely to wind pressure is very usual. They add a certain amount of strength to the wall, and enhance their appearance when used with retaining walls. They both add to the stability and reduce cost, and will be discussed in that connection later; but with ordinary boundary walls it is usual to make them twice the thickness of the wall in width, and half the thickness of the wall in depth. They should

be spaced 12 ft. to 15 ft. apart. The difference between a buttress and counterfort is this: A buttress is a projection on that side of the wall away from the pressure or, in the case of a boundary wall, the leeward side, while a counterfort is placed on the pressure or windward side, as shown in Fig. 5.

Walls may also be built as panelled walls, shown in Fig. 6, and a certain saving of material effected, while another construction effecting the same end is shown

FIG. 6.

in Fig. 7; but in most cases the saving of actual cost will be only small owing to the expense of the moulded cornices. Their use is mostly for artistic effect. Finally, we may say a word on ordinary house walls. Their thickness is usually left to the discretion of the architect, and is generally the multiple of a single brick. A general formula for arriving at an economical thickness has, however, been deduced, which stands as follows:—

if *t* = thickness in feet
L = length in feet
H = height in feet

$$c = \text{a constant} = \frac{H}{20} \text{ for ordinary houses and } \frac{H}{12} \text{ for big warehouses,}$$

$$\text{Then } t = \frac{Lc}{\sqrt{H^2 + L^2}} \dots\dots\dots (10)$$

We now pass on to a much more important question—that of retaining walls for earth and small depths of water.

The stability of a retaining wall depends on—

- (a) The heaviness of the material composing it.
- (b) The breadth and height.
- (c) The square of the thickness.
- (d) The inclination of the bed joints to the horizontal.

FIG. 7.

FIG. 8.

FIG. 9.

(c) The distance of the centre of resistance from the centre of gravity of the wall (measured horizontally).

- (f) The angle of slope of the earth backing.
 While failure may be produced by—
 (1) Shearing.
 (2) Toppling over (turning on the outer joints).
 (3) Crushing of the outer joints and consequent separation of the inner ones.
 (4) Sliding on the surface.
 (5) Sliding on the bed joints.

Stress diagrams are very useful in the design of retaining walls, but it is also a good plan when plotting a proposed section for calculation by diagram to have some idea of the approximate thickness. For this purpose we must first ascertain the weight per cubic foot of the wall (according to the material of which it is to be built), also the weight per cubic foot of the earth backing, and its actual angle of repose. The following is a table of the usual materials employed in building:—

TABLE I.

Portland cement concrete	125	5
Stock brick in cement ...	115	6
Stock brick in lias mortar	112	5
Stock brick in lime mortar	112	3
Blue brick in cement ..	120	9
Sandstone... ..	130	12
Portland stone... ..	135	13
Hard limestone	140	14
Granite	160	15
	Weight in lb. per ft. cube.	Safe load tons per sq. ft.

The following is a table of the earth backing usually found:—

TABLE II.

Dry sand	21
Clay (dry)	36
Clay (damp)	40
Clay (wet)	15
Mixed earth	23
Gravel	40
	Angle of repose θ

CASE IV.—EARTH RETAINING WALL.

Then let H be the height of the proposed wall in feet.

W the weight of material from Table I.

w " " earth

T = mean thickness of wall in feet

a = angle of slope of earth, Table II.

The quantity $\tan \frac{a}{2}$ will of course vary, and in practical calculations it is usual to take it as a mean of .5, and when water pressure is under consideration 1.0.

Then

$$T = .7 H \tan \frac{a}{2} \sqrt{\frac{w}{W}} \dots \dots \dots (11)$$

a formula which, of course, applies to those walls of which the backing is trimmed off on a level with the top in a horizontal plane. When, however, as is very often the case, the backing slopes upwards and away from the top of the wall, a modification has to be introduced, as shown in Fig. 8, in which D is set off equal to H and H₁, as scaled off substituted for H. Such walls are termed revetment walls, while if the earth comes right over to the front face (as shown by Fig. 9), D must be measured from the point x, as shown. This wall is known as a surcharged revetment. Having then calculated the mean thickness of our wall, as shown, we proceed to test its stability by means of diagrams, bearing in mind, however, that the value of T given applies to walls with a plumb face. If the face has a batter the following values of T are used:—

TABLE III.

Batter 1-12	T = .86 of value found
" 1-8	T = .80 "
" 1-6	T = .74 "
" 1-5	T = .72 "
Internal face stepped	T = .85 "

Referring to Fig. 10, AW to scale represents the

weight of 1-ft. run of the wall (Table I.), plus the weight of the earth (Table II.) contained in the irregular space MOL.

FIG. 10.

But in Fig. 11, which represents a sloping wall, the space BOL is considered equal to the weight of that quantity of material forming the wall, less such a quantity of earth.

FIG. 11.

The pressure AP is always parallel to the slope of the earth. Its value $\frac{w}{2}$ (12)

and when multiplied by the perpendicular distance from F to PH will give us the overthrowing moment of the wall M. The advantage of the wall, as shown in Fig. 11, is that the slanting face reduces the obliquity of pressure, and allows of the condition of frictional stability being fulfilled.

The centre of gravity of the triangle of earth is then found, also the centre of gravity of the wall. Through the latter is dropped a perpendicular, and through the former is drawn a line parallel to the natural slope (HAP in the diagram). Where it cuts A on the perpendicular is the point from which the parallelogram of forces is set out as before explained in order to ascertain if the resultant falls in the middle third of the base.

CASE V.

Let us consider what happens in a wall under water pressure. Referring to Fig. 12, we suppose the wall AB subject to water pressure all the way up. The water is assumed to weigh 62.5 lb. per foot-cube = w.

Set off $BD = AB$, then the pressure over 1-ft. run of the wall is equal to

$$P = \frac{BD \times AB \times w}{2} \dots \dots \dots 13$$

which, however, acts at the centre of pressure, which is one-third the way up from B. We then have an overturning moment equal to

$$\frac{wh^3}{6} \dots \dots \dots 14$$

which must be equal to or less than the resisting moment of the wall. Say, for instance, the wall was 10 ft. high, overturning moment would be equal to $\frac{62.5 \times 10^3}{6} = 1,040$ lb.-ft. If the mean thickness of the wall was equal to

$$7 \times 10 \times 1 \times \sqrt{\frac{62.5}{125}} = 7 \times 10 \times 1 \times .7 = 4.9, \text{ say } 5 \text{ feet,}$$

the wall would be safe.

CASE VI.

In case, however, the wall was subject to pressure on both sides, the thrust will, of course, be materially reduced according to the difference of levels of water

FIG. 12.

FIG. 13.

on each side. For instance, the total pressure on a wall of breadth b is equal to

$$P = h_1^2 - h_2^2 \left(\frac{bw}{2} \right) \dots \dots \dots (15)$$

where h_1 and h_2 are as shown in Fig. 13. But this pressure will no longer act at a point one-third the way up the wall, but at a distance from the base equal to

$$\frac{\frac{1}{3}(h_1^3 - h_2^3)}{h_1^2 - h_2^2} \dots \dots \dots (16)$$

which, of course, will alter the circumstances considerably.

CASE VII.

But when a retaining wall has been designed, and the pressure worked out as shown, and a diagram

FIG. 14.

plotted showing the position of the resultant, it is necessary, as we pointed out with the ordinary garden

wall, to find if we have a safe tension and compression by equation 9. For instance, in the wall shown in Fig. 14, which is drawn to scale, we find the pressure is equal to $\frac{1 \times 12^2}{2} \times 62.5 = 4,500$ lb., the wall being 12 ft.

to top-water level, and the amount equal to $4,500 \times \frac{12}{3} = 18,000$ lb. Attention is also drawn to the dotted lines as a means of finding the centre of gravity of the wall. This is done by setting out AB, CD, each equal to FG and EF, GH each equal to BC, and joining the diagonals. The centre of gravity is at their intersection. Proceeding, we find the resisting moment of the wall, if built of 6-1 concrete at 130 lb. per foot cube = $5 \times 130 \times 15 \times 1 = 9,750$, from which we find

$$\text{a value for } x = \frac{18,000}{9,750} = 1.84, \text{ say.}$$

$$\text{Then } Z = \frac{6d^2}{6} = \frac{1 \times 5 \times 5}{6} = 4.166. \text{ Now } 9,750 \div 2,210 = 4.35 = W. \quad M = 4.35 \times 1.84 = 8.0.$$

$$\text{Hence } \frac{W}{A} + \frac{M}{Z} = \frac{4.35}{5} + \frac{8.0}{4.166} = .87 + 1.92 = 2.79 \text{ tons}$$

per square foot compression and 1.05 tons tension, both within safe limits.

CASE VIII.

Now, previous mention has been made of battering walls; we proceed to investigate how this batter is most economically laid out. First set out a preliminary rectangular wall by means of equation 11, and find its centre of resistance F (Fig. 15). Set out the point f vertically below g , the centre of gravity of the irregular space OE/N. Now make QN equal to three times Ef, and join EQ, and the irregular prism so enclosed is the safest and most economical deduction we can make from the rectangular section. The same reasoning applies to the curved wall shown in Fig. 16; but while the foregoing method

FIG. 15.

FIG. 16.

of finding the centre of gravity is applicable to Fig. 15, in Fig. 16 we must find the centre of gravity of the complementary rectangular wall g , and then make the distance gG equal to

$$\frac{1}{3} QN \dots \dots \dots (17)$$

The curve EN may be either circular or parabolic.

CASE IX.

Counterforts are often used in retaining walls; they, of course, strengthen them, and somewhat reduce the

FIG. 17.

total quantity of material; but their special efficiency is in their bending effect which they exert on the

earth backing. Referring to Fig. 17, let x , T , t and y be as shown.

Then the moment of stability of that wall between the counterforts will be

$$S_1 = gwh \cdot t^2 \dots \dots \dots (18)$$

$$\text{and at the counterforts } S_2 = gwh \cdot y \cdot T^2 \dots \dots (19)$$

Then the mean stability of the wall per unit length is equal to

$$gwh \frac{x t^2 + y T^2}{x + y} \dots \dots \dots 20$$

whence, by transposing, we have

$$t_1 = \sqrt{\left(\frac{x t^2 + y T^2}{x + y} \right)} \dots \dots \dots (21)$$

Hence, if we design a wall with a safe value of t , the value of t_1 found as above should show a saving of material which, however, will sometimes only be very small, because the ratio of masonry in the plain and counterforted wall is as

$$x t + y T \text{ is to } (x + y) t_1 \dots \dots \dots (22)$$

It is usual to step out the base of retaining walls in front, as shown in Fig. 15. It tends to bring the resisting moment towards the middle of the base.

CASE X.

Another form of construction found in high-class work is that shown in Fig. 18, in which arched re-

FIG. 18.

cesses are formed in the wall, using the notation in the figure

$$L = T \times \frac{\sqrt{D}}{B} \dots \dots \dots (23)$$

$$\text{and } B = D \times \frac{T^2}{L^2} \dots \dots \dots (24)$$

T being found by equation 11

Under the heading of retaining walls will come bridge abutments.

CASE XI.

Let us consider an ordinary girder bridge first. Referring to Fig. 19, the abutment would first of all be

FIG. 19.

set out approximately by first ascertaining, by any usual methods, the live and dead load likely to come

on it. This would then be distributed according to the safe load on the material of which it is going to be constructed. The foundations would be stepped out to distribute this load over a sufficient area according to the bearing power of the soil, and the wall would either be sloped or stepped out behind, as shown. At ground level the angle of slope is set up and bisected so as to get the level of rupture; we then have the wedge of earth XYZ. Find the centre of gravity g in the usual way, and drop gB , a perpendicular, through it to any suitable scale equal to the weight of that wedge plus the greatest live load on the bridge. Divide this quantity by the distance between the wing walls. Now draw gD parallel to the line of rupture, cutting g_1E in D . BD will be the total thrust on 1 ft. of the abutment. Let AX be the ground line, and of that part of the abutment above AX find g_1 , the centre of gravity, and drop a perpendicular to meet GB in D . Let DE = weight of wall between wing walls plus half the dead and live loads on the bridge, and divide this by the distance between the wing walls. Make $FG = DE$, and complete the parallelogram, and then DF is the resultant, which, of course, should fall within the middle third of the masonry.

CASE XII.

The abutments of arches are treated somewhat differently. We consider half the arch, and find the

FIG. 20.

greatest load likely to come upon it in cwt. We then consider this equivalent live and dead load as so much masonry, and plot according to 1 cwt. per foot cube in the form of a rectangle (Fig. 20). Find the centre of gravity of this rectangle, and also of half the arch; drop the perpendicular AB , and from the top of the middle third at crown draw a horizontal line to cut AB in C . Join C to bottom of middle third at the abutment. From C set off CB weight of arch and load above. Complete the parallelogram $DCEB$. From the centre of gravity of wall set up a perpendicular cutting CD in F , and from F set off the weight of the wall FG , and thrust at the skewback FH , and complete the parallelogram $FGJH$. We then combine the resultant FJ with the thrust of the earth, and get the parallelogram $KLMN$. Find the value of the resultant,

and the distance at which it cuts the ground line from the centre of the wall, and finally test by the

equation $\frac{W}{A} + \frac{M}{Z}$ in the usual way.

TOWN PLANNING INSTITUTE.

INAUGURAL DINNER.

Formed to advance the study of town planning and civic design and generally to promote the artistic and scientific development of cities, the above-named body held its inaugural dinner—with Mr. John Burns, President of the Local Government Board, the guest of the evening—on Friday last at the Connaught Rooms. Among those present were Sir Aston Webb, F.R.I.B.A., in the chair, Sir George Gibb, chairman of the Road Board, Sir Laurence Gomme, clerk to the London County Council, Sir Alexander Stenning, Prof. S. D. Adshhead, F.R.I.B.A., Prof. P. Geddes, Captain G. Swinton (Road Board), Messrs. T. Adams (Local Government Board), H. R. Aldridge, J. W. Cockrill (president of the Institution of Municipal and County Engineers), R. Collins (surveyor to the Enfield Urban District Council), E. G. Culpin, W. R. Davidge, F.S.I., ASSOC.M.INST.C.E. (district surveyor, Lewisham), C. J. Jenkin, M.INST.C.E. (surveyor to the Finchley Urban District Council), F. O. Kirby, M.S.C. (borough surveyor, Doncaster), G. L. Pepler, F.S.I., J. S. Pickering, M.INST.C.E. (president-elect of the Institution of Municipal and County Engineers), H. E. Stilgoe, M.INST.C.E. (city engineer, Birmingham), Raymond Unwin, F.R.I.B.A., and L. Vigers, past-president of the Surveyors' Institution.

In proposing the health of Mr. John Burns, Sir ASTON WEBB spoke of the President of the Local Government Board as "the father of town planning." It was to him they owed the foundation of the institute, composed as it was of engineers, surveyors, architects, lawyers, and administrators.

Mr. JOHN BURNS said that town planning meant the adoption of the environment and amenities of the people to the needs of that community. "I agree with the futurists to this extent," said Mr. Burns, "that a nation cannot live on the beauty of the past. It is our business to see that, while incorporating everything which we have derived from the great civilisations of the past, we put into the organisations of city life the same forethought, order and design, the same skill, and the same labour conscientiously applied, not to repeat in modern times mere slavish replicas of classical examples, but to produce cities adapted to modern needs." In the four years since the Town Planning Act was passed 200 local authorities, mainly large towns and cities, had moved definitely in the matter of town planning. Fifty with a population of over 5,000,000, not including London, had so far applied to the Local Government Board for authority to prepare schemes. In two cases schemes had been finally approved and three were before the board for final approval. Other cities had been authorised to prepare schemes, and about 150 cities were at work on the preliminary stages. Mr. Burns, defending his department in the matter of the charge of undue slowness in approving schemes, said that it was much more important to have the ground carefully prepared and surveyed—what he called "pegging out the whole of the country for posterity"—than to accelerate with undue haste the final stages of the scheme. They were told that town planning ought to be made compulsory, but he thought that the result of that would be the creation of stereotyped plans and chess-board schemes, and he was convinced that for the moment it was neither practicable nor desirable. He did not think that an amendment of the Act was possible for some years, but short of that it would be possible to improve and simplify the regulations and procedure and to give relief wherever necessary, and he hoped that shortly these improvements in procedure would be submitted, and that as the result the movement would progress more rapidly.

"The Town Planning Institute" was proposed by Sir LAURENCE GOMME, and responded to by Mr. RAYMOND UNWIN and Mr. J. W. COCKRILL.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier*.

THE WATER SUPPLY OF BERLIN.

FIGURES FOR THE YEAR 1912.

An official report, recently issued, contains interesting figures relating to the supply of water to Berlin in the year 1912 (or April 1, 1912, to March 31, 1913), with, in some cases, the corresponding figures for preceding years. The information here given is taken from an extract from the report, appearing in a recent issue of the *Zeitschrift für Transportwesen und Strassenbau*, the British equivalents for metric quantities being added in most cases.

Since the rainfall over the area served, and the distribution of that rainfall throughout the year, considerably affect the consumption of water for some of the purposes of a town supply, the conditions at Berlin in this respect are of some importance in the present connection, and the monthly rainfalls for the year 1912 are therefore given in the following table, together with the monthly averages for a period of sixty years.

	Measured rainfall in inches.	
	1912	Averages 1848-1897.
April	1.32	1.43
May	1.37	1.83
June	1.94	2.49
July	0.39	2.87
August	3.51	2.24
September	1.31	1.63
October	1.22	1.83
November	2.04	1.68
December	2.33	1.78
January	1.01	1.46
February	1.02	1.49
March	1.37	1.67
Year	18.83	22.40

The rainfall for the year was less than the sixty years' average by 3.57 in., the chief defect being in July. The figures for the sixty years show that the average annual rainfall is not much less than that of a considerable portion of England. The distribution is favourable, being notably regular, with the largest totals in the three summer months, and the next largest in May, when the sun exerts nearly its greatest direct effects.

Another table in the report shows that the population of the area served has increased but little during the past five years. Beginning with 1908, we find that there was a decrease of 0.25 per cent in 1909, followed by increases of 0.59 in 1910, 0.59 in 1911, and 0.50 in 1912, when the population was 2,085,473. The consumption of water increased by 3.76 per cent in 1910, and by 7.30 per cent in 1911, but decreased by 1.58 per cent in 1912 (compared with 1911). Of the total supply just over 92 per cent was through meters, of which, on March 31, 1913, there were nearly 32,000 in service. More than 11,000, or over 35 per cent of the meters were changed during the year from all causes.

Of the total supply, less than 1 per cent was used in the watering of open parks and pleasure grounds in Berlin, about 1.88 per cent in street sprinkling, about 2.3 per cent in flushing the sewers, and a little more than 0.04 per cent in watering the trees in the streets of the city.

The total quantity of water supplied was 73,879,605 cubic metres, or about 16,254 million gallons; but certain losses and allowances reduce the figure for statistical purposes to about 72,700,000 cubic metres, or nearly 16,000 million gallons.

The average consumption per head per day was 91.20 litres, or about 20½ gallons. The maximum consumption per head per day (on July 13th) was 135.46 litres, or nearly 29.8 gallons, and the minimum (on April 8th) was 60.89 litres, or 13.4 gallons. The proportions of maximum, mean and minimum were, therefore, 1.49:1.00:0.67, or, on the slightly larger full total of the supply, 1.478:1.000:0.663. These figures can conveniently be kept in mind, since the maximum day's draught was nearly 1½ times the average, and the minimum nearly ⅔ of the average.

While the maximum days' draught is a matter of importance with respect to the capacities of the mains, the maximum draught for a whole week is a more important matter as regards the storage capacities of

the service reservoirs, or the capacity of a principal main or aqueduct "upstream" of these. In Berlin, in the week of maximum draught, 1,880,398 cubic metres were supplied to the distribution system, and, assuming that this corresponds to the supply, the total of which was 72 millions odd cubic metres, we have nearly the proportion of 188 to 140 maximum week to average week, or 1.34 to 1.00. A proportion of 1½ to 1 for the day of maximum draught is reduced, therefore, to little more than 1½ to 1 for the week of maximum draught, which, it may be noted, began two days later.

In the week of least draught the consumption was 1,152,633 cubic metres, or about 0.82 of the average.

For nearly the whole area—that is, for Berlin itself the consumption per head per day was less than in 1911, being 92.21 litres against 93.90 litres, the figure for 1910 being 88.27 litres.

The cost of the water is given for every year since 1905, the term used being "selbstkostpreis." It increased from 9.12 pfennig in 1905 to 10.59 pfennig in 1909, was somewhat less in 1910 and 1911, and was 10.826 pfennig in 1912. Taking a mark as 1s., this is equivalent to a cost of nearly 5.9d. per 1,000 gallons.

The position as regards various new works now in progress is stated in the report, and it is expected that some addition to the present supply will be available by next summer.

MUNICIPAL WORK AT CLACTON.

SEA FRONT IMPROVEMENTS.

Clacton-on-Sea Urban District Council are carrying out this winter a handstand colonnade scheme, in the cliffs on the Marine Parade East, at a cost of £12,000. This will give seating accommodation for 3,900 persons, of whom 1,500 will be sheltered from rain, and 2,500 from rough winds. The surveyor, Mr. D. J. Bowe, is carrying out this work entirely by administration. A bathing chalet is also being provided on the east cliff for the accommodation of eighty persons at one time, the cost of this being £850.

The whole of the shops forming Pier Gap have been demolished, and in their place planted terraces leading to the pier are being formed. A ferro-concrete bridge of ornamental design, with a span of 60 ft., and a width between the parapets of 20 ft., is also in course of erection in connection with this scheme. These improvements, including the purchase of property, is costing the town some £7,000.

The protection of the foreshore and accretion of beach is being continued in view of the great improvement shown during the past two years, and two additional concrete groynes, each 400 ft. in length, will be proceeded with during the summer, at a cost of £3,500.

The scavenging and watering of the main roads is being transferred by the county council to the urban district council, and the roadway at the junction of Pier-avenue and Marine-parade will be widened. Additional shelters on the sea front are in contemplation, while a public highway widening scheme is being prepared, and several private streets will be made up. The electric light station is being enlarged, and new workshops and stores built in the town-yard, and a convenience for both sexes erected at Magdalen-green.

Royal Institute of British Architects.—The annual exhibition of designs and drawings submitted for the Institute Prizes and Studentships 1913-1914 is now open at the R.I.B.A. Galleries, 9 Conduit-street, W. The exhibition will be open each day from 10 a.m. till 8 p.m. (Saturdays till 6 p.m.), and will close on Monday, February 9th.

Refuse Disposal in London.—Reporting upon the disposal of refuse, the Westminster Highways Committee state that some 115,000 tons of refuse have to be disposed of each year by the council, and the cost of disposal is a very heavy item of expense. The question, the committee say, is one which affects all the districts of London, and they think it would be mutually advantageous to the metropolitan local authorities to confer on the matter. The following recommendation is appended to the report: "That a conference of representatives of the Corporation of London and the metropolitan borough councils be convened at the City Hall to consider the whole question of the disposal of refuse; that each authority be invited to send three delegates, one to be the engineer or cleansing superintendent, and that it be referred to us to make the necessary arrangements."

SURVEYORS' INSTITUTION.

PRELIMINARY EXAMINATION, 1914.

The following candidates have satisfied the examiner in the above examination:—

Messrs. T. E. Arnistead, Bradford; R. D. Badoock, Lynton; F. Barnes, Herne Hill, S.E.; R. H. Barnes, Leyland, near Preston; W. J. G. Beach, Street, Somerset; G. T. Beale, Streatham Common, S.W.; W. H. Bennett, Stamford Hill, N.; A. E. Boucher, Lutterworth; R. W. Bright, Bushey; G. B. Brown, Watford; H. H. Buckle, Lichfield; H. V. Budgen, East Grinstead; K. W. Calvert, Bath; J. L. Charles, Leeds; S. J. Chittenden, Hove; C. H. Collins, Handsworth, Birmingham; J. H. Collins, Little Horton, Bradford; E. L. Colston, Gerrard's Cross, Bucks.; E. T. Covington, Clapham Common, S.W.; F. M. Craston, Withington; L. Dallow, Rowley Regis; N. H. N. Darley, Newton Abbot; A. J. Davis, Highbury, N.; A. H. Dawes, Wellingborough; H. Digby, Woodford Green; V. C. Donaldson, Upper Clapton, N.; A. Donn, Maida Vale, W.; L. F. Dunbar, Hemel Hempstead; G. E. Edwards, Arley, near Bewdley, Worcestershire; C. E. Elliott, Southbourne, Bournemouth; H. M. Enderby, Skegness; E. M. Evans, Aberystwyth; J. E. V. Evans, Llanelly; R. C. Evans, Wrexham; G. F. Fisher, Moseley, Birmingham; A. H. Fisk, Bushey; A. E. P. Grant, Llanidloes; R. J. Gratton, Ashbourne; A. F. Greenwood, Bradford; T. C. N. Hall, Shrewsbury; S. J. Hannaford, Chulmleigh, N. Devon; E. A. Hardman, Enfield; A. Hinxman, Winchester; W. S. Hobson, Disley, Cheshire; K. S. Holland, Bishop's Stortford; C. J. Homer, Birmingham; G. H. A. Hughes, Luton; F. Jenkins, Keynsham, near Bristol; A. S. Jennings, Worcester; D. S. Jones, Llangennech, Carmarthenshire; H. A. R. Jones, Carreg Llwyd, Oswestry; R. O. Jones, Carnarvon; G. A. Joy, Witchampton, near Wimborne; E. R. Lake, Brockley, S.E.; F. Lamberth, Cricklewood, N.W.*; P. L. L. Lea, Moseley, Birmingham; K. Liell, Purley, Surrey; K. H. Limmer, Cromer; H. K. Liversedge, Great Crosby, Lancashire; H. Makinson, Leigh, Lancashire; E. P. Miles, Guildford; W. Minifie, junr., Bridgnorth; H. Norman, Hasland, Chesterfield; B. Oliver, Walton-on-Thames; H. J. T. Paige, Heage, near Belper; G. O. W. Palmer, Cambridge; R. H. Parkins, Barnet; A. C. Patching, Worthing; K. L. M. K. Pierson, Shoreham; J. L. Porter, Colwyn Bay; J. L. Postlethwaite, Doncaster; G. P. Price, Birmingham; N. F. Proctor, Chiswick, W.; R. J. Prydderch, Leeswood, near Mold; J. W. A. Pyper, Bath; D. Rayner, Cambridge; R. G. Redington, Great Ryburgh, Norfolk; J. C. Roberts, Carnarvon; H. P. Ruthven, Aldershot; E. M. Sant, Stansted, Essex; T. A. Sims, Salisbury; G. A. M. C. Smales, Whitfield, Dover; P. G. Sneath, Hampstead, N.W.; A. Stocker, Fulham, S.W.; C. A. E. Stredder, Acton, W.; R. E. Symonds, Norwich; T. O. Teasdale, Carlisle; N. Thacker, Lypiatt, near Stroud; T. H. Walter, Forest Hill, S.E.; P. L. Ward, Bere Alston, S. Devon; W. C. G. Warne, Faringdon, Berks; N. A. C. Weir, Old Trafford, Manchester; G. Weston, Bedford; H. E. Whorwell, Dover; L. O. Wilkes, Redditch; H. C. Williams, Harborne, Birmingham; F. G. Wilsher, Brighton; A. F. Wyeth, Epsom.

SCOTTISH CANDIDATES.

Messrs. T. Craig, Cross-hill, Glasgow; T. Fulton, junr., Kilbarchan.

The Expenses of Delegates.—The Finance Committee of Kensington Borough Council recently addressed to the Local Government Board a letter inquiring whether the council were legally entitled to defray the reasonable expenses of the chief sanitary inspector if he attended the Royal Sanitary Institute Congress as their delegate. The board replied stating that they are not aware of any provision in the general law enabling the council of a metropolitan borough to defray out of general rate the expenses of any person appointed to attend as their representative at the congress in question. Feeling that the position in this matter is an extremely unsatisfactory one, the council agreed to bring it before the Metropolitan Boroughs Standing Joint Committee to see whether some concerted action could not be taken with a view to securing amending legislation to allow of the metropolitan borough councils defraying the reasonable expenses of members or officers who may be appointed to act as delegates at conferences or congresses.

* Head of list.

Society of Engineers.

PRESIDENTIAL ADDRESS OF MR. H. C. H. SHENTON.*

It is necessary for me, in the first place, to express my sincere thanks to the society for electing me as their president for this year, and to state my great appreciation of this kindness and also of the responsibilities which attach to the position.

A society like our own, which, if we consider the age of the two amalgamated societies, has been in existence for sixty years, and which is open to all engineers, whether civil or mechanical, has evidently a good reason for its existence, and has a great work to do—viz., to consider and promote the welfare of all engineers, irrespective of their exact calling or rank. It is a question whether the growth of a large number of new engineering societies is for the ultimate good of the profession. Indeed, unless they co-operate they must inevitably tend to reduce each other's vigour

MR. H. C. H. SHENTON.

and consequent usefulness. Greater co-operation and more friendly intercourse is, therefore, very desirable, for it is perfectly obvious that the energy of each individual is limited, and that, with the multiplication of societies and their meetings, the attendance at each meeting must be less, and that mediocre and indifferent results will be produced unless there is some sort of combination. Friendly intercourse is, therefore, desirable and essential.

THE ORGANISATION OF THE ENGINEERING PROFESSION.

There are many signs that there is need for better organisation in the profession. This is to be observed both in England and in America, and a great deal of consideration has been given to the matter; but at the present time many of the efforts made are individual and spasmodic, the work done by the largest body of all—viz., the Institution of Civil Engineers—being, in a great measure, unknown to the vast body of engineers. Some societies make such work the nominal object of their existence, and incidentally it may be observed that the mere existence of any society of engineers should tend in the direction of proper organisation of the profession, for the first rule of that society should be that its members shall be engineers.

Engineering is an honoured profession, and good engineers receive quite as much consideration and respect from the general public as they either desire or deserve. No better organisation of the profession

will increase the respect with which a properly trained and qualified engineer is regarded at the present time. There is nothing in the profession as it stands which makes it in any way less honourable than the highest professional calling. The trouble is that the general public often regard persons as engineers who have absolutely no claim to the title, such persons being allowed to call themselves engineers without hindrance.

The Society of Engineers is at the present time devoting considerable attention to the subject referred to—viz., the organisation of the profession, and the well-being of the engineer—and will spare no pains in the future to promote this object. Such work is being considered not as an isolated effort in opposition to what is being done in the same direction by other societies and institutions, but is taken up with the object of ultimately securing a combined effort of the whole profession, and the formation of a controlling body representative of every branch of the profession, which would thus be in a position to accomplish effectively the reforms which are generally admitted to be necessary. This is not a selfish undertaking done simply for our own honour and glory, neither are we arrogating to ourselves a right which belongs equally to other societies, but it is a genuine effort to increase the interest of engineers in a movement to their own advantage, and to support loyally any satisfactory effort that may be made by others.

Although there is nothing wrong with engineering as a profession, there are a great many difficulties with which the engineer has to contend which come under consideration. The employment of persons who are not engineers to do engineering work is one of them; the employment of engineers at an improper rate of payment is another—to give only two instances. In the legal profession no unqualified person may practise as a solicitor under a penalty, yet in the engineering profession, where human life is sometimes dependent upon the work, no such safeguard is to be found. It is quite a common thing to find an over-worked surveyor in a rural district receiving a salary of perhaps £60 or £70 a year, dealing with the spending of very large sums of money on purely engineering work. If the profession were properly organised such a person could not be found. If he were competent he would not be allowed to work for insufficient pay, and if he were not an engineer he would not be allowed to do the work.

I would therefore urge that all engineers, whether they are members of this society or not, should regard the serious effort that is being made for the better organisation of the profession, and that they should assist us by bringing matters pertaining to the subject to our notice and by working in friendly conjunction, and should remember that we, as a society, are anxious to assist them in anything that can have a useful bearing on the subject.

WASTE OF PUBLIC MONEY.

Much public money is wasted owing to these causes, and taking only one expense—viz., that of the work done for local authorities by persons who are not engineers—the fact is perfectly plain, and it is therefore necessary in the public interest that engineers should combine in the endeavour to make it impossible that their work should be given to persons outside the profession. Again—and here I speak on my own subject—it is equally important that such works as those of sewerage, sewage disposal, and water supply should be carried out by engineers who have special knowledge and experience of these particular subjects. At the present time this country is full of instances where the public money has been wasted by the construction of works which are quite unsuitable for their purpose. If the list of failures in sewage disposal works and in water supply works were recorded, together with the names of those responsible for the work done, the result would be very instructive.

Again, this appears to be an age in which any person, without respect to his qualifications, may pose as an authority, and write a text-book for the use of students. There are to hand at the present time examples of recently published books on engineering matters, and especially upon the subjects of water supply and sewage disposal, which are full of obvious

* Delivered on Monday evening last.

errors. Such books may be useful enough to the engineer of experience who can discriminate between right and wrong, but it is grossly unfair to the student to put into his hands a text-book calculated to lead him astray. It seems as if all that is required at the present day is for a person to make an assertion. The assertion goes forward, frequently without comment, as a fact, and becomes a source of error. The authority is generally unquestioned. This is an unreasonable attitude on the part of the public, including sometimes engineers. If a great engineer of world-wide reputation makes an assertion, that is merely his opinion, but we have it on good authority, and it is therefore of great value; but if an unknown person of inconsiderable attainments writes a book and makes various hard-and-fast rules and assertions, these ought not to be allowed to go forward for the guidance of students without proof. It seems as if some sort of Press censorship is desirable. A department might be formed for the careful reading of new books written by unknown authors, with a view to their inclusion in a list of text-books suitable for students preparing for examinations. Naturally, when a student visits such a library as that of the Institution of Civil Engineers, he is inclined to regard the books in that library as having received the approval of the institution, whereas such libraries receive books both good and bad. I have certainly come across books and writings recently which bear traces of the mental aberration of the author, but such books frequently receive no proper criticism in the engineering press, and may be accepted as among the number of ordinary text-books.

Again, some of these books are written, if not by manufacturers themselves, by those who appear to be willing to advertise the goods of a special manufacturer. A book upon water supply, for instance, may, under the heading of "Water Purification," speak of a certain make of mechanical filter as if that filter were the only one of its kind, and may entirely omit to mention the large number of other methods which exist for the purification and treatment of water.

WATER SUPPLY.

At the present time there are certain definite lines of policy that are observed in connection with water supply, and certain principles have also been accepted which will have a far-reaching effect upon engineering work in the future. These are of various kinds, and are the outcome of general experience, research work, the work of the Royal Commissions, and other causes. It has been established within the last few years, and has been definitely confirmed by the Fifth Report of the Royal Commission on Sewage Disposal, that water authorities must be responsible for purifying waters drawn from a river, while the local authority discharging sewage into a river need only purify that sewage to such a degree as to prevent actual nuisance. Considerable doubt existed not so very long ago as to whether it would not be incumbent upon the local authorities to purify sewage to such a degree that all possibility of disease germs entering the river was removed. There was a feeling that an authority like the Metropolitan Water Board ought to pay part of the cost of the works of local authorities in the Thames and Lea valleys discharging effluents above the Water Board's intakes, and claims were made by local authorities who considered that such assistance should be given them. In particular, the author had some experience with regard to this matter in connection with the works for the Sawbridgeworth Urban District Council, in Hertfordshire, where such a claim was actually made, which became a test case, and where much consideration was given to the matter before it was finally decided that the Metropolitan Water Board should not contribute to the cost of the works.

It is also now generally acknowledged that there is need for the collection throughout the country of data as to sources of supply. A systematic hydrographical survey is required. We need to have fuller particulars with regard to rainfall, the run-off of the land, and the yield of streams and rivers. The formation of a central authority and of water boards is required so that the national supply shall be considered as a whole, and although legislation is slow, there can be no doubt that we shall ultimately obtain what is required, and that eventually the whole matter will be administered much more satisfactorily and economically than is at present the case; for it is obviously very wasteful when one large community, which happens to be divided into two or more districts, is allowed to spend money upon two or more

separate schemes, when one large scheme would have met the requirements of the case much more satisfactorily. The combination of districts is to be desired; the appropriation of the sources of supply and gathering grounds by one water authority to the detriment of others is to be deprecated, and the enormous expenditure of money, owing to the conflicting interests that takes place whenever any scheme is brought forward, ought to be avoided. As things stand at present it is generally acknowledged that reform is required.

ECONOMY OF SCIENTIFIC TREATMENT.

Another even more important point that has not yet received the general acceptance that it will receive in the future, is the absolute need of water supply problems being placed in every case in the hands of those who can deal with the matter scientifically, making use of the most recent knowledge and experience on the subject.

It is becoming more and more evident that the engineer must work with the chemist and bacteriologist. To give a few instances: If the water supply of London had not received this thorough attention we should long ago have had to abandon our present sources of supply, and enormous expense would have been incurred in bringing water from a source further afield, but owing to the fact that the whole question has received the very best attention, we have a combination of districts, a reduction of waste, a water drawn from sewage polluted rivers rendered fit for drinking purposes, and what would at first sight appear to be quite impossible brought to successful fulfilment. The same thing applies exactly in other cases. For though the smaller works are of less importance, regarded collectively, from a national standpoint, they are of greater importance even than the supply of London. It is not sufficient for the engineer to obtain a supply of water free from disease germs, obvious pollution, discoloration or objectionable mineral constituents. A water which is apparently desirable in every respect may yet cause very serious corrosion in mains, and algal troubles in the reservoirs, may be productive of animal and vegetable growths in the mains, and may clog the filters. The conditions need to be much more carefully considered than has formerly been usual, and in this the engineer needs very considerable assistance from the chemist and bacteriologist. We are well aware that hard water may be softened, and the fact that plumb-solvent waters may be treated with lime so as to remove this quality is fairly well known, but it is quite a new idea and one that was only recently brought forward in a paper read before this society by Dr. Eric Rideal, that a water may be treated in such a manner as to provide a protective coating to the interior of an iron main, so that corrosion shall not take place. In a report issued by the Institute of Metals such treatment of water was recommended in connection with boiler tubes, but it did not appear that anyone had suggested that it could be applied satisfactorily in the case of water mains. The protection of the interior of water pipes is not an easy matter, and if it can be effected by the treatment of the water it is clear that there will be a saving of expense, because this treatment would only be required at long intervals of time.

The manufacturers and patentees of various processes act upon scientific advice in many cases, but they are naturally special pleaders for their own particular systems, and as commercial men cannot be expected to give the disinterested advice that is given by the private engineer. Unfortunately it is quite a common thing for work to get into the hands of persons who, possessing insufficient knowledge, rely entirely upon advice obtained from manufacturers. This is particularly so in the case of water treatment, and it is also true to some extent in the case of other matters, such as reinforced concrete, which matters will be again referred to.

It has hitherto been generally taken for granted that if a certain water produces corrosion or clogging of iron mains, the only cure for the difficulty would be to put in mains which are of such a character that they will not corrode. Thus pipes are coated with preservative solutions, sometimes with Portland cement, metallurgists seek to find a metal which will not corrode, reinforced concrete pipes, wood stave pipes, and so forth are suggested, but all recent experience tends to show that it is not so much the pipe which is at fault as the water, and that if the matter is dealt with scientifically the corrosive qualities can be removed. This is but one example

of the importance of the question being dealt with as a whole, carefully and separately in each case, by the best scientific advisers, including engineers, chemists and bacteriologists. In cases where underground supplies are in question it goes without saying that the assistance of the geologist is also required.

THE CONSULTING ENGINEER.

On small works the work of the engineer-specialist, the consulting engineer proper, ought to be very carefully distinguished. It certainly seems that the use of the consulting engineer on such work is not properly understood by his clients. Such an engineer is called in to prepare a scheme, and to advise as to the expenditure of a large sum of money to the best advantage. Unless he has considerable knowledge and experience he cannot do such work. It is work of the first importance, and should be highly paid. On the other hand, when the works have been designed, when all the difficulties of the preliminary investigations have been settled, the constructional work does not necessarily require this degree of knowledge. A man of very average attainments can look after the laying of a good many miles of water main quite satisfactorily, and supervise the construction of works which have been properly designed and specified. Such work does not deserve payment at the same rate as that of the consulting engineer, but if we look at the facts of the case we see that, whereas the consulting engineer is expected to prepare his preliminary report and scheme at a very low fee, that he generally has no difficulty in obtaining a fairly large one—viz., 5 per cent upon the cost of the constructional works—in carrying them out. Thus, local authorities have adopted the plan of asking a number of engineers to state the fee at which they are willing to prepare a scheme, and accept the lowest bidder, or at any rate they haggle over the cost of the preparation of the most important part of the work. They refuse to pay the fees of other scientific advisers, and, as a consequence, the best engineers cannot take up such work, and those who do take up the work have to obtain their fee later from the commission on the money paid for its construction. The folly of this generally accepted method is so great that it ought to be the work of engineering institutions and societies to educate the public to a better sense of its duties. If a consulting engineer were employed at a proper fee—and it would certainly have to be a large one—to prepare a scheme of water supply, sewerage, or sewage disposal, the actual construction of the work might very often be left with advantage to the district surveyor under the guidance of the consulting engineer in case of any particular difficulty. To expect a great consulting engineer to be able to give much personal attention to the laying of long lines of small-sized water main or pipe sewer, the construction of man-holes and such-like, is quite as foolish as expecting a consulting physician to make pills with his own hands. He can, of course, employ competent assistants to do the work, but seeing that the consulting engineer is capable of giving advice upon matters of high importance where his opinion is of the greatest value, he should be properly paid for his legitimate work, and the practice of local authorities in endeavouring to cut down his fees or to eliminate them altogether is wasteful in the extreme. More money must be spent in the future upon obtaining the best possible scientific advice, and this will result in a very great economy in the cost of the works, whereby the money spent on the specialist will be saved many times over.

It is also entirely wrong, especially in the case of smaller works, that the more expensive the scheme the greater should be the fee of the engineer, and that the more personal attention he gives to the scheme the less will be his rate of payment, for it is certainly possible, by giving one's best work, to devise a scheme which will be very economical. Thus the careless or incompetent person who designs works of an unnecessarily expensive character will receive a much larger fee than the better engineer who works out a thoroughly economical scheme. It is the duty of a society like our own to take steps to educate public opinion in this matter. It is not to be supposed that such work can be done quickly; it will undoubtedly take many years, but those who have the welfare of the profession and the general public welfare at heart will see the necessity of working on these lines.

As a striking example of the folly of approaching waterworks problems unscientifically may be instanced the large number of dams which have failed in America and elsewhere. In most cases these failures have been due to lack of geological knowledge.

The dams themselves have been quite strong enough to withstand the water pressure, but the water has managed to find its way underneath them. We have many instances in this country as well as abroad of the difficulties which have occurred owing to the particular geological conformation of the ground.

It is wrong to take the view that the engineer can be a specialist in all subjects, and it is perfectly correct, for instance, for the municipal engineer to call in the consultant to advise him or his council in case of need, in the same way as the town clerk will require to have counsel's opinion upon any difficult point of law, and it is also perfectly correct for the consulting engineer to require the advice of other engineer-specialists, of chemists, geologists, bacteriologists, and so forth, as the case may require. If the profession is to be properly organised, the consulting engineer ought not to undertake personal work for which he does not specialise. It will at once be urged that under such conditions it might be impossible for him to earn a living; but this is not so, for if each man undertook to do only the work for which he was specially fitted, and if other engineers refused to do that work, it stands to reason that he must of necessity receive a great deal more of his proper work, and that he would do this with greater advantage to himself and to his clients than could possibly happen in the case of work that rightly belonged to some other engineer. He would have to pass on such work as he was not personally well qualified to do, and for which he has even now to pay away the bulk of his profits to skilled assistants, if he carries it out properly. It is still worse for an engineer to take up work which he does not understand, and to obtain advice from manufacturers who, in some cases, even go so far as to call themselves consulting engineers.

ADVICE GIVEN BY MANUFACTURERS.

These manufacturing firms employ expert assistants, but they give designs and advice free of charge in order to sell their appliances, and although they, the manufacturers, may receive disinterested advice from the engineers whom they employ they must recoup themselves, and if they, as commercial men, do not give disinterested advice they cannot be blamed. This is particularly the case with regard to reinforced concrete. Many persons, having a reinforced-concrete structure to build, obtain their designs free of charge from the manufacturers of reinforcing material. If they possessed the knowledge required they would design their own structures, and if they cannot do this they ought to consult a specialist and work with him, and pay him for his advice. The Local Government Board have very properly raised very serious objections to the reinforced-concrete designs brought forward by the officers of local authorities when it was perfectly clear that such officers had a very imperfect knowledge of the subject, and relied entirely upon advice given by manufacturers.

Similarly in water purification or sewage disposal there are many instances of persons obtaining direct from manufacturing firms designs which may or may not be the best for the purpose, but which of necessity are designed by the manufacturers in order to sell their particular appliances. If this system of obtaining designs free of charge from manufacturers is to be admitted as being in conformity with the rules of the engineering profession, it follows that any person of organising capacity, however limited his knowledge of engineering may be, may carry out very large works which are really designed by other people, and about which he is quite incompetent to express an opinion, and to charge the full fees of a consulting engineer for doing so. Moreover, the system is most unfair to the manufacturers, who, in order to keep their trade, must prepare a very large number of designs which are never used, without making any charge for them, such designs frequently being required merely for estimating purposes. If the profession recognised its responsibility in such matters, and could educate public opinion in the right direction, there would be a great saving in time and money to the manufacturer, and only the properly qualified engineer would be able to take up work.

It may be urged that these ideas are impracticable, but if we cannot attain our ideals within a lifetime we may yet work towards them. We have not to consider what is easy of accomplishment, but what is right.

RECENT DEVELOPMENTS IN WATER ENGINEERING.

Of recent developments in water engineering the various methods for the treatment and purification of water are very remarkable. The possibilities seem almost infinite, as if there were no water, however

impure, which could not be raised to a high standard of purity by adequate treatment. The growing practice of purifying swimming bath water, and using it over and over again for months demonstrates extraordinary possibilities. It has been found that, after many months' use, water so treated is quite equal in quality to the ordinary town supply. The use of the mechanical filter, together with chemical treatment, has increased enormously, and there are many instances of the employment of such filters dealing with several million gallons a day, some of them being in this country. There are also many other filters of various types which have their uses according to special conditions, and the slow sand filter is still very largely employed. Sterilisation of water by means of hypochlorite has been very generally adopted in America, and also, to some extent, in this country, notably as an after treatment with the mechanical filter, and there is abundant evidence to show that the typhoid death-rate has been lowered, and sometimes lowered to zero, as the result of this treatment. Ozone sterilisation is in use on the Continent at a good many large installations, and the ultra-violet rays have also been applied to the sterilisation of comparatively large town supplies in France. It cannot be said that these methods have made much headway in this country, the reason being that our supplies as a rule are not open to the objection of gross pollution. It is, however, notable that Dr. Houston has advised the Metropolitan Water Board to sterilise the flood waters flowing into the storage reservoirs by means of an overdose of lime, and it is also notable that the ordinary lime treatment seems to include sterilisation apparently unsuspected hitherto, at any rate in some cases.

REPLENISHMENT OF UNDERGROUND SUPPLIES.

A recent Memoir of the Geological Survey, dealing with the wells in the London district, contains the suggestion that the water-bearing stratum—viz., the chalk under London—should be replenished artificially with water, and it is suggested that the water falling upon the impervious stratum surrounding London should be drained into dumb wells carried down to the level of the Thanet sands. An enormous quantity of water which now runs to waste would thus be collected. This would be stored in the fissures of the chalk, and would raise the level of the water throughout the London district, which level has fallen 100 ft. or more within recent times, owing to the enormous amount of water which is pumped therefrom. The advice is based upon Mr. Bryan's experiment at Lea Bridge, where a large quantity of filtered Lea water was run into the wells, with the result that the well supply was materially improved during the drier periods of the year. This is certainly a very interesting suggestion, and the principle probably has many other applications.

THE WORK OF STATE DEPARTMENTS.

The value of hydrographical surveys and of State consideration of water supplies is shown at present chiefly by the work done abroad. The work in America is well known, while in our own Colonies we have such examples as the case of Western Australia, where the State engineer, having reported a large sub-artesian basin existing under the drier districts, boreholes were sunk throughout the sandy plain, with the result that good supplies were secured at depths of from 20 ft. to 100 ft. The good work was assisted by the Government, who lent the settlers hand-boring plant. Thus great advantages were derived and many wells and reservoirs were made. It is questionable whether the same degree of praise is to be given to the German Government, who recently sent a water diviner to South Africa "to practise under State patronage the cult of the divining rod."

PUMPING.

One of the most important changes in connection with water engineering has been in pumping. The use of the high speed engine, the steam turbine, the internal combustion engine, and the electric motor has resulted in the development of the rotary pump. Centrifugal pumps are now largely used, and by running in series are found to be efficient and useful for very high lifts. Producer gas is found to give economical results for large and small powers, and its application is very marked. Further, we have the Humphrey explosion pump, which does away entirely with the engine and most of the working parts of the pump, of which the Chingford installation provides an example near to hand. This pump is also being used for sewage lifting, and apparently has an appli-

cation for both small and large supplies where a moderate lift is required.

WATER WASTE.

An interesting point relating to some of the older systems supplied from new sources under great pressure is the effect which a largely increased pressure has upon the old mains, services, valves and fittings. This is particularly the case with regard to New York, where it is feared that the increased pressure may lead to a considerable loss of water from various causes. It is certainly a point to be borne in mind where a new supply at a higher pressure is provided. In London we have a splendid example of what may be done by careful inspection and scientific management in reducing the loss of water due to waste, but such methods are not by any means universally adopted. In American cities the waste is apparently enormous, and a great deal of interesting work is being done in order to reduce this waste. The pitometer is a simple instrument which has been proved to be exceedingly useful in measuring the flow in water mains, and by its use a great deal of waste has been discovered. Great carelessness is sometimes shown in this country with regard to waste. In one instance within the writer's experience a small town whose population had not increased in any marked degree since the waterworks were constructed, found it necessary to duplicate its well, reservoir and pumping to the insufficiency of the supply. It was clear, however, that enormous waste was taking place, and eventually a 4-in. main was discovered at the lowest part of the system broken in half, discharging into the river, but the great point is that this discovery was not made until the works had been duplicated.

WATER MAINS AND RESERVOIRS.

The use of steel mains is largely on the increase, and although the Local Government Board will sanction only a short-period loan for them, they appear to be taking the place of cast-iron mains in a great many cases.

With regard to reservoirs, the chief advance is in connection with reinforced concrete, which is undoubtedly a very economical and useful material, and it is evident that a large number of reinforced concrete reservoirs, some of them of large capacity, are being built in this country. In this case, again, the Local Government Board will not sanction a loan for a long period, but the saving which accompanies the use of this material is so great in some cases as to do away with the inconvenience that would otherwise be experienced from the repayment of a loan during a short period, that is to say, the annual payments are sometimes found to be very little larger in the case of the short loan for the reinforced concrete than for the long period loan with a masonry structure.

One of the most noteworthy features of recent practice is the increased use of cement injection. We see, for instance, in the case of the Catskill aqueduct, that the pipes were made of concrete, and that these were made watertight by systematically injecting cement grout under pressure behind the walls of the tunnels. There are several instances where extensive fissures causing leakage under reservoir dams have been satisfactorily filled with cement grout forced in under pressure through borings. The same method is sometimes adopted in order to form masses of concrete for foundations where clean gravel exists under water. Some interesting experiments have recently been carried out with regard to this matter. The rendering of surfaces by means of the cement gun, wherewith cement is thrown out under pressure from a nozzle and applied to the surface to be treated is worthy of note. The method has also been used for lining large pipes.

With regard to the storage reservoirs and the construction of dams, recent progress shows that very much more attention is being given to geological considerations than was formerly the case, and that it is worth while to give very much greater attention to preliminary investigations with regard to the site of the reservoir, and to prove by every possible means its suitability before starting the work. Sir Alexander Binnie, in his recently published book, has laid the greatest stress on this point.

Dr. Houston has shown in the case of London that storage reservoirs may be used for water purification, it being found that a few weeks' storage is sufficient to kill or to devitalise harmful germs. The method is hardly likely to be very generally applied, because the water probably does not need such purification, and,

moreover, the cost of constructing the reservoirs makes the system prohibitive in the majority of cases. There are also possibilities of trouble with regard to algal growths in the water.

PRIVATE SUPPLIES.

One of the most remarkable points that may be noted regarding our present system of water supply in this country is the manner in which, in the middle of a water district, the private individual is at liberty to make his own well and obtain his own private supply. The fact that in London there are a very large and increasing number of wells supplying works, institutions, offices and the like, in the middle of the district of the Metropolitan Water Board, suggests that there is something amiss. It seems as if there is a waste of energy in this duplication of works, and while the private owner relies upon the public mains for the protection of his building in case of fire, he appears to be exempt from his responsibility of paying for it if he has his own private wells. Interesting as all these private supplies may be, there seems to be something amiss in the general control of affairs that they should be necessary.

SEWERAGE AND SEWAGE DISPOSAL.

With regard to sewerage and sewage disposal, we are in a much more satisfactory condition than was the case only a few years ago. The first reports of the Royal Commission on Sewage Disposal were certainly open to criticism, but there is no doubt that their work has been an education to the officers of the commission, and consequently the later reports have been of much greater value, and have removed many misconceptions. It has been found that there are a number of methods of sewage disposal, none of which are applicable to all conditions, but which have each their special uses. Sewage can be certainly purified to any required degree, and the Fifth Report of the Royal Commission dealt very fully with the various possibilities. However, the existing conditions throughout the country still gave rise to very great dissatisfaction. It was seen that purification works were demanded for various towns regardless of the local conditions. There were instances such as that of Erith, where an effluent of a high standard of purity was made to discharge just below and within sight of the Barking and Crossness Metropolitan outfalls, where sewage of very much greater volume is discharged in a very impure condition. Practically no attention was paid to the question of whether a nuisance was caused by the discharge of sewage or not. The publication of the Eighth Report of the Royal Commission, however, shows that this matter has received considerable attention. The officers of the commission, as will be seen in the Appendix to the Eighth Report, suggested that the quality of the sewage discharged was not the chief matter to be considered, but that the stream itself ought to be the ultimate arbiter in the case. Thus, if a stream or river, after the discharge of sewage or effluent into it, were found to be unharmed—that is to say, if it showed no signs of nuisance, and if it retained a certain degree of dissolved oxygen—this should be taken as proof that the sewage required no further treatment. Further, experiments carried out with great care showed that if sufficient dilution were given to screened sewage entering a river, purification was effected by this dilution. The commissioners did not actually adopt this suggestion made by their officers, but advised that the law should be altered so that a person discharging sewage into a stream should not be deemed to have committed an offence, provided that the sewage conformed to a certain standard. They suggested for this general standard that the sewage discharged should not contain more than 3 parts per 100,000 of suspended matter, and with its suspended matters included should not take up at 65 deg. Fahr. more than 2 parts per 100,000 of dissolved oxygen in five days; but they also advised that special standards, demanding either a higher or lower degree of purity, should be made applicable as local circumstances might require or permit. Thus, if the dilution afforded by the stream were very low, the standard would have to be raised, but if the dilution were very great the standard might be relaxed or suspended altogether, and that if the dilution should be over 500 volumes all tests might be dispensed with, and crude sewage from which the solids had been removed might be discharged. These are most important recommendations, and will no doubt be acted upon at some time in the future. It must not be thought that there is any probability of persons or authorities being allowed to discharge unscreened crude sewage into rivers which serve as sources of

water supply, though it is quite conceivable that in some cases where the dilution is sufficient filters may be omitted.

BACTERIAL POLLUTION OF RIVERS.

Experiments in the Great Lakes of America have shown that harmful bacteria from sewage may be carried out for several miles from the shore, and may contaminate water at intakes situated in places which one would imagine to be in absolutely safe positions. The Royal Commissioners do not say anything about the possibilities of bacterial pollution in their Eighth Report, but it is probable that in the case of the American outfalls the reason why harmful bacteria are carried to such great distances in the water is because the sewage is unscreened; for it is certain that with floating solid matters there is no limit to the distance to which disease germs may be carried, and this may account for the many serious typhoid epidemics in America, while we in London, drinking water which is admittedly sewage polluted, apparently suffer no ill-effects, and typhoid germs are not found even in the raw waters. If even a small proportion of the sewage passing into the Thames and Lea were unscreened, there is very little doubt that conditions would be very different.

STAND-BY TANKS.

One of the most useful recommendations contained in the Fifth Report of the Royal Commission was that referring to the use of stand-by tanks for storm water at the disposal works. In the older works filters were generally designed to deal with a certain volume flowing down at a certain rate, and every time this rate of flow was exceeded the sewage escaped over the storm overflow. Now all such sudden rushes are either dealt with partly on the filters, and any excess is intercepted in the stand-by tanks for further treatment.

GENERAL PURIFICATION.

The usual principle at the present time is that of keeping back the sludge by screening, settlement or precipitation assisted by the use of chemicals, so that an effluent containing as little suspended matter as possible has to be treated by the filters. The treatment of this liquid is a matter which has been brought to perfection. It can be filtered and treated till it conforms to any required standard of purity, the degree of purity being limited only by the degree of treatment given. If, owing to exceptional conditions, it is necessary to sterilise the effluent, this can be done without any great trouble, as is practically demonstrated by various works where it has been adopted. It may be added that, although when the sterilisation of sewage was first suggested the idea was ridiculed, the process is now among generally accepted methods, although it is very rarely that there is any need to apply this process. It has been found possible to construct filters of various types in such a manner that they do not clog up. The black, earthy matter that forms in a well-designed filter which has been properly worked is discharged with the effluent, and can be intercepted in settling or humus tanks, which tanks, if properly designed, are very effective in clarifying the liquid. Indeed, it is to be noted that in the case of Hertford, where it was proposed to use sand filters for the final purification of the effluent, the Metropolitan Water Board, who were the party chiefly concerned in the matter, and the Local Government Board decided that it would be better to use humus tanks instead of sand filters.

SLATE BEDS AND CONTACT BEDS.

The value of the Dibdin slate bed has been proved, as may be seen in the Seventh Report of the Royal Commission on Sewage Disposal. It is there shown that such beds dealing with crude sewage will, if properly worked, retain their original capacity for an indefinite period, provided that the sludge is regularly and carefully run off. The slate bed thus answers the purpose of the settling tank; but it does more, for, putting aside the question of the reduction of the sludge in volume, it is found that the slate-bed sludge "possesses only a slight odour," and this statement is quoted from the Royal Commission Report. It is much to be regretted that, owing to the simplicity of the principle upon which they work, the slate bed and the contact bed have very often—one might almost say generally—been badly constructed and improperly worked. Thus bad results have been produced, and discredit has been thrown upon a system which should be of very great value to the engineer. The author having constructed many contact beds in different parts of the country, and carried out a considerable number of experiments both in working and construc-

tion, during the last ten years, has found that with proper working contact beds will give excellent results, and are specially useful for the treatment of sewage containing a large proportion of brewery refuse. Further, it is possible to fill the beds in such a manner that no crude sewage or effluent likely to cause a smell is exposed to air, and thus one of the chief troubles of the sprinkler filter is overcome. It is not suggested that contact beds are better or more economical in construction than sprinkler filters, but it is suggested that under many conditions, especially at small works, they will be found to give very much more satisfactory results. This presupposes that the same amount of care as is generally given to the construction and working of the filter is given to the contact bed. The nuisance from smell experienced with the sprinkler filter is in the majority of cases not very great, and, as a rule, freedom from smell may be attained by careful preliminary treatment.

TANKS.

It would seem that, having regard to the recommendations contained in the Eight Report of the Royal Commission, the settlement of sewage and various methods for the elimination of sludge will receive even more consideration in the future than they have done in the past, and that filtration may not always be required. Tanks of many kinds are in use, such as the septic tank, the continuous flow sedimentation tank, the quiescent sedimentation tank, chemical precipitation tanks, the hydrolytic tank, and a large number of others too numerous to mention, and it seems probable that, in the future, tanks of the Imhoff type will be largely used. In this type of tank the object is to allow the fresh liquid sewage to pass through rapidly so as to avoid septic action, while the solid matters are retained and held in a separate chamber, where they remain for some time, being drawn off, without emptying the tank, at convenient intervals. It is found that the sludge, after retention in such a tank for a certain time, loses much of its offensive character, and is thus comparatively inoffensive when it is drawn off; but here, again, the whole process is dependent upon careful management.

THE SEWAGE WORKS MANAGER.

The calling of sewage works manager is one of growing importance. The Association of Managers of Sewage Disposal Works is doing excellent work in bringing together a number of men of superior knowledge and experience whose practical work is of such a character that they have earned the highest respect of the engineers whose works are put in their charge, and of all others who have to do with the question. It cannot be urged too strongly that the whole success of sewage disposal works depends upon the employment of the right men to look after them.

SLUDGE TREATMENT.

Several processes are in use for the treatment of sludge, and great attention is being given to the matter. Dr. Bostock Hill and Mr. J. D. Watson, of Birmingham, have each recently dealt very fully with the subject in presidential addresses delivered respectively before the Association of Managers of Sewage Disposal Works and the Institute of Sanitary Engineers. Owing to the pressing need for fertilisers on the one hand, and to the sludge nuisance on the other, there is a growing feeling that the hopes of the idealist may yet be realised, and that this matter, which is now a waste product, a nuisance and an expense, may become a source of income to local authorities.

SEWAGE LIFTING.

The lifting of sewage is also a matter in which considerable interest is displayed. The centrifugal pump has been improved to such a degree that it will lift even large blocks of stone. Naturally, the efficiency is not very great under such circumstances, but attention is drawn to the matter in order to show that there is every reason for the growing practice of employing centrifugal pumps for sewage lifting. The use of the small electrically driven centrifugal pump is also noticeable in isolated positions where it performs the work of an ejector, being automatically controlled. This electrical arrangement has been much improved, and it is rather remarkable that so little is heard of it having regard to the remarkable activity upon the part of manufacturers of sewage ejectors. The automatic sewage lift is, under the right conditions, by far the most economical appliance in use.

The Parsons stereophagus pump, a centrifugal pump designed especially for sewage lifting, is also worthy of note.

SEWER VENTILATION.

The report of the Local Government Board on the intercepting trap tended to demonstrate the comparative harmlessness of sewer gas in general. If the teachings of this report, which has been much criticised, are accepted, it appears that very little more is required in the ordinary system of sewers than to arrange that there may be no pressure of gas in the sewer, which, as a matter of fact, is really all that is done as a rule in any ordinary town system. It does not justify any relaxation in the efforts made to ventilate sewers, but it is some consolation to be told that the dangers of an ill-ventilated sewer are not so great from a health point of view as was generally believed. The abolition of the intercepting trap suggested is an accomplished fact in some places, which seem none the worse for the change. Whether the principle is of universal application is another matter.

EFFECT OF TRAFFIC.

The altered conditions of road traffic and the enormous loads which now come upon road surfaces, and upon manhole covers in particular, should be taken into careful consideration by engineers. There is increasing need for soundness of construction of sewers and manholes and for strength in manhole covers.

PRESENTATION OF PREMIUMS.

At a meeting of the Society of Engineers at which the foregoing address was delivered the premiums awarded for papers published during 1913 were presented.

The immediate past-president, Mr. Arthur Valon, M. INST. C.E., presented the premiums as below:—

The President's Gold Medal to Dr. Eric K. Rideal for his paper on "The Corrosion and Rusting of Iron." [THE SURVEYOR, December 5, 1913.]

The Bessemer Premium, value £5 5s., to Mr. Bernard L. Rigden for his paper on "The South-Eastern Coalfield."

The Clarke Premium, value £5 5s., to Mr. Gerald O. Case for his paper on "Accretion at Estuary Harbours on the South Coast of England." [THE SURVEYOR, November 7, 1913.]

A Society's Premium, value £3 3s., to Mr. Wm. Yorath Lewis for his paper on "The Tram r. 'Bus Controversy." [THE SURVEYOR, February 14, 1913.]

Dampness in Rough Casting.—Rough casting seems to be particularly liable to the penetration of dampness, so much so that many architects are specifying the powder Pudlo to be incorporated in the cement for this class of work. One of the latest users is the architect for the Middleton Sanatorium, near Wakefield. We understand that the architect specified it for the Bradley new schools.

British Appliances in Canada.—As suggesting interesting possibilities, we note that in the city of New Westminster, British Columbia, British goods have been largely used, and may instance Messrs. Ham, Baker's horse brooms, tumbler carts, mud scrapers, &c.; Messrs. Ruston & Proctor's steam roller; and Foden steam wagons (two). Messrs. Glenfield & Kennedy's valves were used throughout on the 25-in. water main, and from the same firm have been ordered four 48-in. sewer sluice valves.

Roads in Jamaica.—The roads of Kingston, Jamaica, states Dr. Angus Macdonald, medical officer of health for that city, in a paper which he contributes to the current issue of the *Journal of State Medicine*—the official journal of the Royal Institute of Public Health—are mainly laid with the local yellow limestone which is an abundant formation in the island. It quickly disintegrates under the tropical sun (and perhaps more rapidly on watered streets), yielding a fine grey dust that is widely distributed and penetrating. Certain city streets are laid with firebrick, which wears well under the comparatively light traffic of the city. Some of the macadamised roads have been finished off with coal tar produced at local gasworks, poured cold, sand-sprinkled and rolled in. Tared surface makes a fairly durable road and a street moderately free from dust, and if the spreading ulcers into which it wears were methodically patched it gives evidence of preserving a good surface with comparative economy. The roadways in the main, however, contribute considerable dust for daily removal.

WORKING-CLASS DWELLINGS IN ATHERSTONE.

By H. J. COLEBY,

Engineer and Surveyor to the Rural District Council.

Owing to the congestion which exists in the courts and yards of the town of Atherstone, some of which have a density of population of over 500 persons per acre, a housing scheme has become imperative, and as a first instalment the Atherstone Rural District Council have just completed ten houses, particulars of the actual cost of which are given below.

ATHERSTONE WORKMEN'S DWELLINGS.

The land for these ten houses cost 3s. per square yard, or at the rate of £726 per acre, but as it abuts on a new road, recently made and sewered by the vendors, the cost of the land really includes the cost of street works.

The site has a rather big fall from front to back.

Back Elevation.

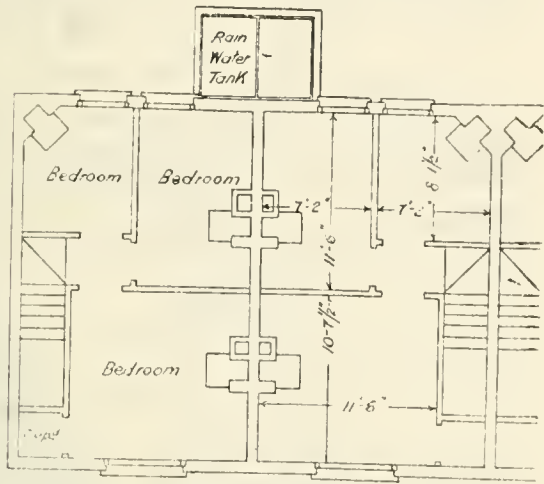

Front Elevation.

built in a continuous row, broken only by a covered entry in the middle. There is, however, ample space in the rear for gardens, and the houses number just over twenty-two to the acre.

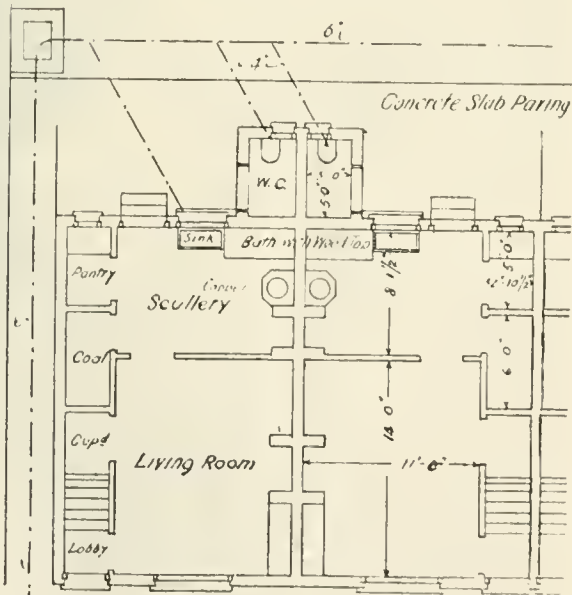

The planning calls for no particular remark, except

Section

Bedroom Plan.

Ground Plan.

SCALE

ATHERSTONE WORKMEN'S DWELLINGS.

necessitating deep excavations for the footings of the walls, and for this reason was not an economical site for building purposes.

As the frontage was restricted the houses had to be

that an effort has been made to include under the main roof all the domestic offices except the water-closet.

The houses are of the five-room type, each contain-

ing a front living kitchen with range, a scullery at the back containing sink, copper and a bath (with a hinged wooden cover), and three bedrooms.

Water is laid on from the town mains to the sinks and water-closets, and large rain-water cisterns, having a draw-off tap over each sink, are provided.

The walls are built with local pressed bricks, faced in front with Haunchwood Reds up to the string-course, the part above this being rendered in cement and dashed with white spa chippings.

The walls internally have been plastered, except those in the scullery and offices, which have been lime-washed; but no papering or distemping has been done.

The actual cost of the ten houses is as follows:—

	£	s.	d.
Builder's contract price	1,395	0	0
Additional work	8	12	7
Firegrates	33	10	6
Water services	16	4	0
	£1,453	7	1
Fencing	36	8	0
	£1,489	15	1

Cost per house = £148 19s. 6d

This works out at 3·945d. per cubic foot.

The houses are let at a rental of 5s. per week each, and from the balance-sheet given below it will be seen that, after allowing 7½ per cent for empties and losses, there will be only a small margin of £7 5s. 6d. per annum for repairs.

BALANCE SHEET.		Annual Receipts.		Annual Expenditure.			
	£	s.	d.		£	s.	d.
From rents of 10 houses at 5s. per week each = £13 per annum	130	0	0	Repayment of principal and interest at 3½%			
Less allowance of 7½% for empties and losses	9	15	0	(a) In respect of land, &c., £330 for 80 years	12	6	9
	4120	5	0	(b) In respect of buildings, £1,489 7s. 1d. for 60 years	58	5	4
				(c) In respect of fencing, £36 8s. for 15 years	3	3	3
				Rates	23	12	6
				Taxes	6	6	8
				Water-rate	1	10	0
				Insurance	1	5	0
				Collection of rents	6	10	0
					4112	19	6
				Balance for repairs, &c.	7	5	6
					4120	5	0

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times*.

Thrust Bearings.—“The Problem of the Thrust Bearing” was the title of a paper read on Tuesday evening by Mr. H. T. Newbigin, ASSOC. M. INST. C.E., at a meeting of the Institution of Civil Engineers. The inefficiency of thrust bearings as compared with journal bearings was pointed out by the author, together with its disadvantage, especially in high-speed machinery. A comparison was made between Coulomb's laws of friction and the late Prof. Osborne Reynolds's hydrodynamic theory of lubrication, and coefficients of friction in bearings of various forms were given. The way in which the friction in a journal bearing changed from dry or greasy friction to perfect lubrication as the speed increased was discussed, and the late Mr. Beauchamp Tower's discovery of liquid pressure in the oil film was described. Viscosity was defined, and the resulting general formula was compared with the results of Mr. Tower's and Prof. Goodman's experiments. The conditions necessary for the maintenance of liquid pressure in an oil film were examined and defined. The subsequent developments of Reynolds's hydrodynamic theory of lubrication were referred to, and Mr. A. G. M. Michell's formulæ for the resistance of lubricated plane surfaces were cited, and the paper concluded with descriptions of thrust bearings constructed on Michell's principle, with illustrations and the results of tests.

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

INSTITUTION OF MUNICIPAL ENGINEERS.

NORTH-WESTERN DISTRICT MEETING AT MANCHESTER.

A meeting of the North-Western District of the Institution was held at Manchester on Saturday last. Mr. Horace Boot, president of the institution, was in the chair, and the members present included Messrs. A. R. Bleazard (chairman of the District), T. Fogg (Heywood), J. W. Wiles (Manchester), A. Elder (Oldham), Wilson Briggs (Stockport), K. Grimshaw (Stockport), S. R. Aspinall (Manchester), P. Morris (Doncaster), John T. Shield (Blackburn), R. J. McKenn (Heywood), E. Walker (Stretford), A. Foster (Salford), A. Dempsey, junr. (Eccles), John Liddell (Furness Vale), James T. Davies (Little Hulton), G. H. Hopkinson (Chorley), J. W. Sunderland (Norden), J. W. Gleave (Heywood), and B. Wyand, secretary of the institution.

The first business on the agenda was the election of district officers. Mr. Fogg proposed that Mr. Bleazard continue his office of district chairman, and that Mr. McKenn be elected hon. district secretary, in the place of Mr. Gleave, who had been compelled to resign owing to pressure of work. Both propositions were carried unanimously, and the proposer expressed the hope that Mr. Bleazard would see his way to hold the office for a still further period. A vote of thanks to past hon. district secretaries—Messrs. Thos. Green, Geo. Hayes and J. W. Gleave—was passed.

It was decided that meetings should be held at Leeds, Chester, Oldham and Halifax, the Leeds meeting, in view of the fact that arrangements were already being made for it by the Northern District, being a joint one of the two districts.

A district committee, consisting of the district chairman, hon. district secretary, and Messrs. W. Briggs, A. Dempsey, J. W. Gleave, G. H. Hopkinson, E. Walker and J. W. Wiles was appointed, such committee to meet monthly, and its duties to include the arrangement of meetings and visits. The question of local Yorkshire meetings was brought forward by Mr. Percy Morris, and it was decided that it should be deferred until the Leeds meeting, when a number of Yorkshire members would be present.

The president, in replying to a cordial vote of thanks, said that he was only doing his duty in coming North among the members, and he felt himself specially fortunate in having the opportunity of meeting them there that day. As regards the profession which they followed, it had, he was afraid, to be regarded largely as a labour of love. Other walks of life held out great rewards. Given the same expenditure of talent, resource and hard work in the cotton industry, say, or stockbroking, and a fortune might be realised; but municipal engineers were much in the position of doctors in that the compensation given them for their work was utterly inadequate. Happily, the municipal engineer was a man whose interest lay in his work, and that in itself was no mean satisfaction. All around the engineer was actual evidence of what he had accomplished, and among the many things that this institution (or any similar body for the matter of that) had to do was to bring home to the public the fact that for its comfort and well-being it depended very greatly indeed upon the municipal engineer. The institution which he had the honour to serve as president was the first to move on really progressive lines, and if imitation was really a form of flattery their efforts had been recognised in the most striking manner elsewhere. The institution would still progress, both as regards usefulness and numbers. Life was a stern problem, and only by mutual sympathy, fellowship and assistance could its burden be lightened for the many; and he hoped that the members of the institution would agree with him that such a body as theirs should aim at becoming a real brotherhood.

At the conclusion of the business meeting the members visited the Stuart-street station of the Manchester Corporation electricity works, by kind permission of Mr. S. L. Pearce, the chief engineer. The whole of the work and processes were explained to them by Mr. J. H. Baxter, under whose able guidance they went round.

COUNCIL MEETING.

At a meeting of the council held in London on January 28th, two of the applicants who had been recommended for admission to membership were elected.

ASSOCIATE CLASS.—The report of the scrutineers of

the postal vote was received, and the council have to report that the affirmative votes fell short by one of the three-fifths required by the by-laws. The proposal to form the new class was therefore not carried.

HIGHWAY ENGINEERING.—It was decided that a delegate be appointed to represent the institution on the committee of the Roads Improvement Association.

ARCHITECTS' REGISTRATION BILL.—This Bill is under consideration by the General Purposes Committee, who will present their report at an early date.

CORRESPONDENCE

*Sir, though I would persuade, I'll not constrain,
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii., 2.

ROAD DIRECTION SIGNS.

To the Editor of THE SURVEYOR.

SIR,—It is with much pleasure that I have read the remarks contained in the various articles that have appeared on the system of road direction signs that, in conjunction with my assistant, Mr. Bowen, I have designed. One owes much to critics, and these signs could have no better recommendation than that they

turnings; they also indicate those turnings which can be easily rounded, so that much skidding that now takes place would be avoided; (5) by means of signs placed on the direction arms, the necessity for the ordinary Automobile Association signs is obviated; (6) by a simple method of signs on the arms, the distance to the nearest doctor, garage or hotel can be shown.

If a post and direction arms be removed and placed face upwards at the centre of the intersection to which it relates, the arms and post will point in the direction of each of the roads indicated; in fact, the sign is practically a rough plan of the intersection. In working at these signs on the 11th ultimo, it occurred to me that if plans of the intersection were substituted for arms, far better information would be afforded approaching traffic. Thus, a plan 3 ft. diameter, to a scale of 8 ft. to 1 in., will embrace 288 ft.; on this a 40-ft. road appears 5 in. in width, and allows 4-in. letters, easily readable at a distance of 200 ft. Where a post could be observed from each road, plans can be placed on such post facing these roads, and so avoid a multiplicity of posts. If transparent faces are used with a light, these plans might be illuminated at night.

I give an illustration of such plan signs applied to Whatton Bridge, Notts, where Mr. and Mrs. Sansom and Mr. F. W. Holden were killed in December last.—Yours, &c.,

C. H. COOPER, M. INST. C. E.,
Borough Engineer,
Wimbledon.

February 2, 1914.

JOURNAL OR VOLUME?

To the Editor of THE SURVEYOR.

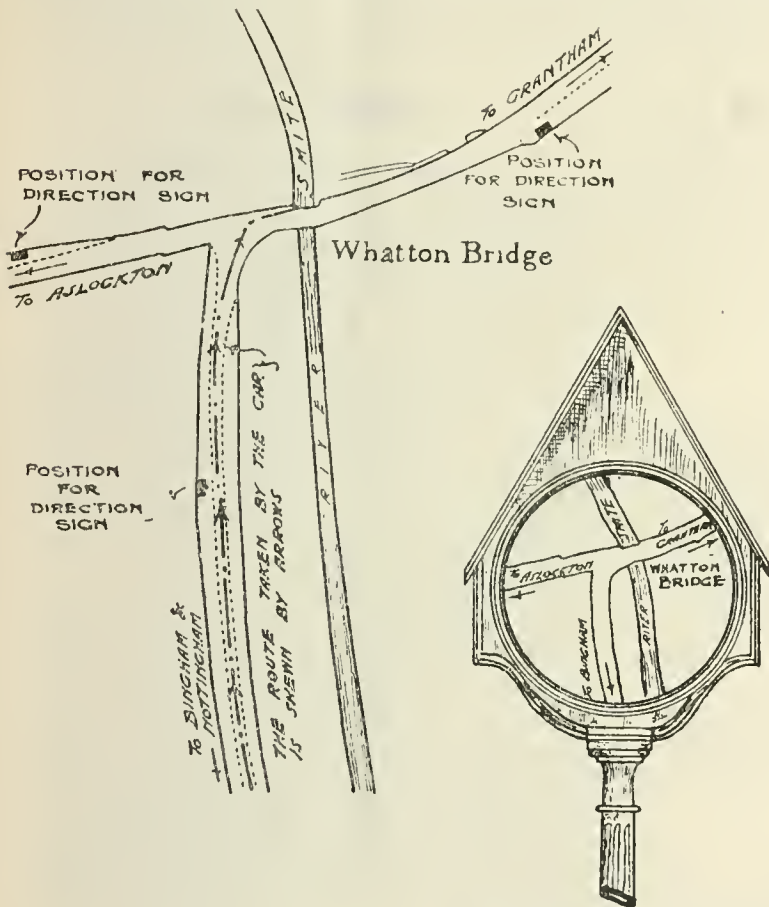

SIR,—I am entirely in accord with the reasoning of your correspondent in your last issue.

We are still obtaining more news from your paper about our institution, and much earlier than the "Journal" can give us—as, for instance, the question of the retiring allowance to be paid to Mr. Cole and the handsome salary to be paid to the new secretary. I wonder why this was never inserted in the "Journal"?

I know that the general feeling among the members is that the clock has been put back at least ten years by the reversal to the "Journal," and I hope at the next annual meeting the council will receive further instructions to reinstate the valuable and good old volume which has been, and would continue to be, a credit to everybody concerned.—Yours, &c.,

A. ROTHERA.

Council Offices,
Liversedge.
February 4, 1914.

DIRECTION SIGN

MR. C. H. COOPER'S PLAN ROAD DIRECTION SIGN.

are "for the convenience of the scorching motorist," admitting that my signs can be read from the most rapid traffic. That such signs would entail unnecessary expense to the ratepayer is, however, not a fact, unless the present unsatisfactory system is allowed to remain. The arrangement of arms is cheaper than that proposed in any of the published designs submitted for competition at the late Road Congress, and as regards the efficiency of the system, none of the designs provided the following, which are essential for rapid traffic: (1) That approaching traffic should have a maximum opportunity of obtaining full information as regards road intersections before reaching same (this is afforded by a direction post placed in each road 100 ft. from such intersection); (2) the arms are applicable to any junction, no matter how intricate it may be, and to parallel intersections; (3) as the direction arms are all placed in one plane directly opposite approaching traffic, they can be easily read; (4) the angles at which the arms are fixed indicate acute, or what are commonly termed "concealed,"

Commercial Motor Vehicles.—The latest information with regard to the construction, use and cost in service of commercial motor vehicles is to be found in the special overseas edition of the *Commercial Motor* for 1914 (price 6d.). For convenience and ready reference the issue is divided into six broad sections dealing, respectively, with steam goods transport, petrol goods transport, passenger transport, fire engines and municipal motors, wheels and tyres and components, accessories and plant. As a reference book to the particular industry with which it is concerned, it is probably unique, and a production which users of commercial motor vehicles should find of the utmost value.

Our 1914 Annual Issue: An Example to Others.

—A county surveyor writes, under date January 31st: "I am in receipt of the twenty-third annual issue of THE SURVEYOR, which is undoubtedly an excellent edition and contains some most useful information. Will you please send me five additional copies, and charge them on your account? The copies are for the chairman of the county council, the chairman of the Highways Committee, and three other influential members of my committee, all of whom will, I am sure, be greatly interested in the matter contained in this excellent issue."

REFUSE DISPOSAL IN THE WEST INDIES.

[The following notes are extracted from an interesting paper on sanitary conservancy in Kingston, Jamaica, by Dr. Angus Macdonald, the medical officer of health for that city, which appears in the February issue of the *Journal of State Medicine*—the official journal of the Royal Institute of Public Health.]

In bygone years disposal of refuse took place on waste ground where accumulation has raised a mound covering a few acres and some 50 ft. in height. This is now more or less surrounded by property, and has been abandoned in recent years. The refuse deposited here during different *regimes* was either fired where deposited or deposited without being fired. Until recently, also, the deposit of nightsoil took place in deep pits dug in this old refuse mound.

A few years ago, with the view of reclaiming swamp land, a commencement was made of depositing the refuse in swamps to the west of the city. The refuse was here deposited without any treatment, and the result was an unsightly area of fetid, decomposing vegetable *debris*, and masses of paper blowing about, and heaps of broken bottles, kerosene tins, milk cans and old iron scattered irregularly through the mass. The unsatisfactory result of this procedure and the ulterior danger of offence in years to come from gases given off by the decomposition of so much organic *debris* in the swamp caused the writer to consider the advisability of erecting destructors to incinerate the refuse.

It was agreed that high-power destructors . . . were at once ruled out of court because of the great expense of importation and erection, but chiefly on account of the needlessness of these to deal with the type of refuse handled. Probably 90 per cent of the household refuse is readily inflammable, and with a little skill and orderliness the inflammable can be collected separately from the non-flammable; besides which, rain is, unfortunately for other reasons, so rare and so seasonably restricted when it comes, that the combustibility of the material is rarely interfered with.

Experiment was made with

A SMALL INCINERATOR

built after a simple type suggested by Sir Robert Boyce, who had witnessed its use in West Africa.

It consisted in a single brick cell, length and breadth and height about 8 ft. internally, and domed over on top to a chimney fitted with baffles designed to prevent dispersal of burning material. The floor of iron bars had a slight slope from back to front, where there was a folding iron door and rake hole. The grated floor was raised a foot or more off the ground to admit of draught and form an ashpit. Rubble and refuse was embanked to allow approach to the back, where feeding was accomplished through a door in the domed roof. Combustion was satisfactory; feeding was disturbed by emission of smoke and flame; the ash was cumbersome to cope with, owing to the admixture of a certain amount of incombustible street sweepings.

The incinerator was tested for some weeks, and in the result the following conclusions and action were come to:—

Combustion in the incinerator was little more complete than could be obtained in the open.

Firing in the open could be carried on more expeditiously; labourers with pitchforks could readily fling aside the combustible material, most of the incombustible earthy matter falling out during the process of turning over.

Labour engaged on deposit and firing in the open was less than that required for feeding and raking and clearing up around the incinerator.

Ready sale for ash was not to be had, and the initial expenditure of building several incinerators and accommodation for dealing with the ash, together with the cost of labour, was not sufficiently justified.

Besides, for the purpose of mosquito limitation there were the swamps to fill up.

PRESENT METHODS.

The question of incinerators has been for the present abandoned, and the result of the system of disposal now adopted is so far freedom from nuisance, economy and satisfactory mosquito limitation. The method of disposal is simply the orderly filling up of the swamp with the combusted refuse, and is proceeded with as follows:—

The mass of incombustible material—chiefly trade refuse, old iron, tin cans, bottles, brick rubble, &c.—is roughly sorted out at the edge of the swamp and dumped first. Next the combustible material of all sorts is fired on the edge, and as it is fired the ash

deposits on the layer of incombustible rubbish. The surface is next covered over with incombustible street sweepings, mainly limestone dust, and whatever brick rubble and building refuse is brought to the dump.

In this way an irregular and unsightly surface is avoided by deposit of the gross incombustible refuse in the bottom of the swamp. The great bulk of the organic matter undergoes combustion, and future nuisance from decomposition should be averted.

A finished surface is left covered with dust, and freed from the dismal tin can, broken bottle and old iron accumulations that are a frequent unsightly accompaniment of city deposit grounds. The burial of all tin cans removes possible breeding places of *steomyia*. The smoke of the burning material blows daily and a little by night between the swamp and the city, and may prove a barrier to the flight of, at any rate, some mosquitoes.

The reclamation of swamp is less rapid than it was without combustion, but the reclamation of a few acres each year with safety and satisfaction is better than the filling in of three times as much with uncertainty of result. The land will never be used for residential building without the consent of the Health Authority; some of it may come under cultivation, and the seaboard will no doubt in time be utilised in the construction of wharves, piers and store premises. Not a fly is to be seen on the deposit ground—a great advantage seeing that the average dumping grounds of city refuse swarm with myriads of flies.

CONCRETE INSTITUTE.

A STANDARD METHOD OF MEASUREMENT.

The forty-third ordinary general meeting of the Concrete Institute was held at Denison House, Westminster, on Thursday, January 29th, when the following reports were submitted by Mr. S. Bylander, as vice-chairman of the Reinforced Concrete Practice Standing Committee of the Concrete Institute:—

(1) Draft report of the Joint Committee of Representatives of the Quantity Surveyors' Association, the quantity surveyor members of the Concrete Institute and the Reinforced Concrete Practice Standing Committee of the Concrete Institute on a "Standard Method of Measurement for Reinforced Concrete."

(2) Draft report of the Reinforced Concrete Practice Standing Committee of the Concrete Institute on a suggested "Tabulated Form for Preparing Quantities for Reinforced Concrete."

The reports were submitted in the draft form in order that criticisms might be received before the final reports were issued.

The first-named report gave a number of headings consisting of a list of parts of construction, classified under the three main headings of (a) concrete, (b) centering, shuttering, &c., (c) reinforcement—the unit of measurement to be employed for each being set out together with the manner of measurement. Generally, it was proposed that the work on each floor should be kept separate, stating the height from the ground to the several floors. The concrete, centering and reinforcement for each floor should be kept together. No reinforcement should be deducted from the concrete, otherwise all measurements to be net unless stated, and notwithstanding any trade custom to the contrary.

With a view to simplification and convenience, it was proposed that the units of measurement throughout should be the foot and the cwt. This basis is not departed from by the recommendation that centering for large areas should be measured "per square," for that conforms to the decimal system, being merely a decimal multiple of the foot.

The report also included a suggestion for the manner in which, in cases in which the working details were not complete, engineers should indicate (by drawings) for the guidance of their surveyors when preparing the quantities, the thicknesses and weights of reinforcements.

The reports now revert to the committee for reconsideration. Final reports will be issued in due course.

Roads in Ontario. During 1913 £150,000 has been expended on the roads of Ontario, and 220 miles of highways have been added to the transportation facilities. The style of road (says the *Contract Record*) is macadam and gravel, of a type which is giving satisfaction to the provincial highway engineer, Mr. W. A. McLean. The share borne by the Government in the construction and supervision of the work is one-third.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words, as *noms de plume*. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

RIGHTS OF RIPARIAN OWNERS.—"Q" writes: A large weir attached to a disused corn mill has recently been washed away, and the river now flows on its original bed, as it used to over 100 years ago. The water in the river was held up at the weir about 12 ft., and the water level tailed out to 2 ft. 1½ miles up stream. Half a mile up stream, above the old weir, is a soapworks, the proprietors of which turn a filthy liquid into the river 7 ft. below the water level. The owner of the disused corn mill does not intend to rebuild his weir, and the proprietors of the soapworks are commencing to build a weir in the stream 400 yds. below the pipe which discharges the filthy liquid from their works into the stream. The proprietors of the soapworks are owners of the lands on both sides of the river where they are constructing their weir. On the banks of the stream, between the soapworks and the old weir, there is a village of 1,000 inhabitants, who looked upon the washing away of the old weir as a godsend, because in summer time, when the water in the river became stagnant, the stench arising from it became abominable. Now the proprietors of the soapworks intend to perpetuate the nuisance, and the villagers are up in arms, and have called upon my council to prevent the erection of a new weir. The proprietors of the soapworks have been approached by the council, and they contend (a) that, as riparian owners, they have a right to use the water in the stream for manufacturing purposes; (b) that they have now acquired a prescriptive right to maintain the water opposite their works at the level it was at before the old weir was washed away, and (c) that they have a right to construct a weir in the stream for this purpose. It is a well-known fact that the proprietors of the soapworks do not use the water from the stream for manufacturing purposes, and that they wish the stream to be again dammed up to enable them to discharge their filthy liquids gradually, or as opportunity arises, into a big bulk of water 7 ft. below water level, and thus avoid detection. My council have longed to deal with the public nuisance which has existed for the past forty years, but they have been advised that they could not proceed against the owner of the weir, as he did not create the public nuisance, nor could they take action against the proprietors of the soapworks owing to the difficulty of proving that they polluted the stream. My council wish to know (1) whether the proprietors of the soapworks can be restrained from erecting a weir in the stream by my council or by riparian owners immediately above the soapworks whose lands are damaged by floods (in consequence of the weir) when the river rises; (2) whether the proprietors of the soapworks have acquired a prescriptive right to maintain the water at the level it was at before the old weir was washed away; (3) what remedy the council or the riparian owners above the soapworks have against the proprietors of the soapworks when their new weir is completed.

(1) Unless the proprietors of the soap works (hereinafter referred to as "S") have acquired a prescriptive right (as to which see answer to No. (2)), any riparian owner who is prejudiced can bring an action to restrain them from building the weir. And if the river is navigable at this point the erection of the weir would be a public nuisance, in respect of which the council, with the concurrence of the Attorney-General, could take action. A right to commit a public nuisance cannot be acquired by prescription. (2) In my opinion they have not. The mill owners (or their predecessors in title) presumably acquired a prescriptive right to maintain the weir at the mill. But such a right was adverse to the right of S (or their predecessors in title) as riparian owners, and in my opinion could not and did not confer any rights upon S. But even assuming (for the sake of argument only) that this view is wrong, and that S have acquired some right to maintain the water at the old level, they could not (in my opinion) exercise such right in such a manner as to place any other riparian owner in a worse position than he was in before the destruction of the mill weir. (3) Any riparian owner who is prejudiced can bring an action for an injunction. And if the river is navigable the council, with the concurrence of the Attorney-General, could bring a similar action.

SEWAGE FARM: FAULTY CONVEYANCE OF LAND.—"V. L." writes: Some thirteen years ago a rural district council purchased from an owner two plots of land, A and B, for the purpose of a sewage farm. The conveyance for the plot A contains the following clause: "Together with the free right of passage and running of water from the said piece of land hereby assured through the drain or watercourse shown on the said plan, and thereon coloured blue, the council, their successors or assigns cleansing and repairing or renewing the same whenever necessary, and using the same so as not to create a nuisance to the vendor or his tenants. . . ." In the conveyance of plot B no provision of any kind is made for the passage of the effluent, which, as counsel said at the trial, must be due to a slip. The land can only be used for a sewage farm, and the original owner has an option to buy the land back on terms when the land ceases to be used for this purpose. The land has been used for the past ten years as a sewage farm, but the present owner issued a writ against the rural district council for using his ditch for their effluent. The judge has held that the rural district council have neither an express nor an implied grant to use the ditch for their sewage effluent, and that the ditch is not a public sewer or watercourse. He decided against the rural district council, and gave the owner his costs, an injunction, and trivial damages. The rural district council has charged the costs of the action against the parish, for which the sewage farm is used, and a rate has been laid to raise the whole costs of the proceedings. Various points might be raised, and you are asked to give your opinion on the following points: (1) Is the rural district council entitled to charge the whole costs of the case against the contributory parish? (2) Is the rural district council responsible for the omission from the conveyances of proper provision for carrying the effluent away? (3) If so, what is the proper procedure for making the rural district council personally responsible for the cost?

(1) Under sec. 229 of the Public Health Act, 1875, these costs will not be "special expenses" chargeable against the contributory place unless so determined by order of the Local Government Board. (2) In my opinion the council are not responsible, assuming that they employed a properly qualified practitioner to prepare the conveyance and gave him proper instructions. (3) If the amount is allowed by the auditor any ratepayer can test the matter by appealing to the Local Government Board or applying for a writ of *certiorari*.

HIGHWAY: REPAIR.—"L. C." writes: My council have received applications from two ratepayers to effect certain repairs to a road which, up to the present, has been regarded as a right of way only. The road is about 1½ miles long, and connects two main roads. At one end, for a distance of about 340 yds., repairs are carried out, but nothing has been done to the other portion that the council are aware of. A statement has been made, however, that stone was spread and certain repairs were done about thirty years ago, but the council have, up to the present, been unable to verify this. About half way along the road is a very bad and dangerous spot, a drain at one time having been broken in and never repaired. This spot makes it impossible for carts to pass along the road. (1) The road being a right of way to the public, have the council power to repair the drain and make good the road where dangerous? (2) If this can legally be done, does this make the council responsible for the whole of the road, and for any future repairs that may become necessary? (3) If the dangerous spot is not repaired, are the council liable for damage or injury to the public? No evidence can be found that the road was ever dedicated formally to the public, and in three places there are remains of gates that were formerly fixed across the road.

(1) If the road was made and dedicated to public use before August 31, 1835, it is repairable by the inhabitants at large, and in that case the council are bound to repair it. If made after that date, and if there was never any formal dedication, then it would appear that the council have no power to repair it, except as follows: (a) If sec.

150 of the Public Health Act, 1875, or the Private Street Works Act, 1892, is in force in the district the council can make up the road, at the expense of the frontagers, in accordance with the section or Act in force; (b) or if sec. 19 of the Public Health Acts Amendment Act, 1892, is in force urgent repairs can be enforced at the like expense. As to the drain, the powers of the council depend upon the nature of the drain. Unless it is used for the drainage of one building only or premises within the same curtilage it is a "sewer," and in that case unless it falls within one of the exceptions specified in sec. 13 of the Public Health Act, 1875, it is vested in the council, and they have not only power to repair it but are bound to do so. (2 and 3) No.

REDUCING WIDTH OF FOOTWAY.—"Brixton" writes: An urban district council proposes to reduce the width of a footway in an adopted street, as shown in the accompanying sketch. Will you kindly say if the

council have power to do so without the consent of the owners of the property fronting on the footway, and if so under what Act?

Where the relative proportions of the roadway and footways have been intentionally determined by the owners of the soil, the local authority cannot alter the relative widths thereof in the course of making up the street under sec. 150 of the Public Health Act, 1875 (*Robertson v. Bristol Corporation*, 1900, 2 Q.B., 198). But they can do so where such relative positions have not been so determined (*Stretford Urban District Council v. Manchester, &c., Railway Company*, 68 J.P., 59).

These decisions, it will be seen, apply where the local authority are making up a private street under their statutory powers. Where a street in an urban district has been adopted and become a highway repairable by the inhabitants at large, the street and the pavement stones and other materials thereof are vested in the urban district council under sec. 149 of the Act. In the course of the arguments in the Bristol case (*supra*) it was suggested that after the corporation had taken over the street under this section they could alter the width of the footpaths, subject to paying compensation under sec. 308 to any one sustaining damage. It was not, however, necessary to determine this point for the purposes of the case, and it was not referred to in the judgments, nor does it appear to have ever been decided. Seeing, however, that the street and its materials become vested in the urban district council under this section, and that they are thereby expressly authorised to cause the street to be "altered," as occasion may require, in my opinion they can reduce the width of the footpaths of a street vested in them under the section subject to making compensation as above.

PRIVATE STREET WORKS: PUBLIC FOOTPATH.—"Mere" writes: An urban district council is about to make up a private street in their district under the Private Street Works Act, 1892. At present there is only one footpath in the street, and this is a means of access to a footbridge which crosses the railway close by. The path is a public one, and has been repaired by the district council. I should be glad if you would inform me how this affects the apportionment of the cost of making up the road. (1) Would the district council be legally bound to contribute any sum in respect of the kerbing and making up of the path, or can the whole cost of this be levied on the frontage owners? (2) Do the properties abutting on the path front, adjoin or abut on the private street within the meaning of the Act? If there are any decided cases on this point I shall be glad if you would refer to them.

(1) If the footpath is a highway repairable by the inhabitants at large the cost of making it up cannot be charged to the frontagers. (2) Not if the path is a highway repairable by the inhabitants at large. Under the last clause of sec. 150 of the Public Health Act, the frontagers on the path would have been liable (*Evans v. Newport Sanitary Authority*, 24 Q.B.D., 264); but there is no corresponding clause in the Act of 1892.

We have to draw the attention of querists to the directions laid down for their guidance in regard to the preparation of diagrams. Rough sketches obviously cannot be made use of, and we should be obliged if correspondents would therefore send only carefully-prepared drawings, preferably about 6 in. in width, and without colouring or wash of any description. Failure to observe these rules will involve the risk of queries remaining unanswered.

INSTITUTE OF SANITARY ENGINEERS.

THE ANNUAL DINNER.

The annual dinner of the Institute of Sanitary Engineers took place on Wednesday night at the Holborn Restaurant, and was attended by a large company, including many ladies. The president, Mr. John D. Watson, M.INST.C.E., F.R.SAN.I., who took the chair, was supported by Sir William Ramsay, Prof. H. Adams, Mr. H. Percy Boulnois, M.INST.C.E. (past-president), Mrs. Boulnois, Prof. H. Kenwood, Dr. Wynter Blyth, Mr. T. W. Aldwinckie, Mr. H. C. H. Shenton, Mr. H. T. Wakelam, M.INST.C.E. (county engineer of Middlesex), and Mr. E. H. Blake, F.R.SAN.I. (chairman of council).

Mr. H. PERCY BOULNOIS proposed "Our Public Health Authorities," and in doing so said he ventured to think he was the right man for the post. He would tell them why. He had been associated with public health authorities all his life, and beyond that had made his living out of them; and beyond that again he hoped to continue to make his living out of them. As some of them knew who heard his reminiscences a few weeks ago, he started life as a pupil of Sir Joseph Bazalgette. Then he became city surveyor of Exeter, afterwards borough engineer of Portsmouth, and next city engineer of Liverpool. There his direct association with municipalities ceased, and he went to the Local Government Board. He had been a poacher all his life, then he became a gamekeeper. (Laughter.) He would ask them to believe that the public health authorities were not as black as they were painted. They heard more of what they did not do than what they did; but his experience was that the majority of the authorities were there for the purpose of improving the human race; that their whole purpose was to keep the town or district in a thoroughly healthy and sound condition. There might be some members who were grinding their own axe; if so it was the fault of the ratepayers for sending them where they wore. There were a great number of health authorities. On the last occasion when he proposed virtually the same toast as this he mentioned the number, and Prof. Bostock Hill took exception to his figures, and told him that certain authorities were not health authorities. As his figures were criticised he looked up the matter, and he gave it them as he found it, excluding Scotland and Ireland. As a matter of fact, he did not know what might happen in the latter country in a few years. There were 335 municipal corporations, 28 metropolitan boroughs, 809 urban district councils, 658 rural district councils, and 61 port sanitary authorities, making 1,891, or in round figures nearly 1,900 authorities looking after the health of this country. With all that municipal machinery looking after our public health we ought to be an exceedingly clean and healthy nation. Carlyle divided the human race some years ago into anvils and hammers. He (Mr. Boulnois) did not know which of these he was. He had tried to be a hammer all his life, but he had sometimes been an anvil. But he thought they might divide the human race into inspectors and the inspected. There he was more at home, for all his life he had been an inspector, and he was now one of the inspected. He forgot to mention when quoting his figures that there were 650 boards of guardians. He did not know whether these would be called health authorities, or whether the 300 parish councils would be placed in that category. It would be admitted, he thought, that they were well looked after; but, in spite of that, people were not healthy, and had vague ideas of what health meant. Their past-president, Mr. Martin, who, he regretted exceedingly, was unable to be with them that night through illness, suggested the great boom of Health Week, and he believed it would be a great success this year. The Royal Sanitary Institute and the Agenda Club had taken the matter in hand, and he must say that there was great need for such a movement. He read in the papers not long ago about a man who pasted up all the windows and stuffed the chimneys with straw to keep the measles out. Then there was the story of the woman who wrote to the school authorities that she did not want her Tommy to have no bath, as she had sewn him up for the winter." (Laughter.) Only that morning he read in the *Daily Mail* an interview which one of their peripatetic and ubiquitous reporters had with a hygienic hawkler in the Strand, who had enclosed the sweetstuffs he was selling in a glass-covered case in

order to keep out the microbes. The hawker probably did not care twopence about these microbes, but he knew that people wanted their sweets clean, and he resorted to this expedient in order to push his trade. When the lower orders were beginning to wake up to the importance of these matters it was manifest there was something in sanitation. In conclusion, he had great pleasure in proposing the toast.

Dr. H. R. KENWOOD, in responding, said he believed the local authorities had done great work in the past, were doing greater work now than they did in the past, and were destined to do greater work yet in the future. All things considered, they had done this work with clean hands.

Mr. H. T. WAKELAM, who also acknowledged the toast, remarked that he did not agree with the suggestion that there were too many local authorities. Indeed, he thought there should be more, because they would find more work for the members of the professions he saw around him. He had had a great deal to do with public authorities, and he confessed it was sometimes rather difficult to keep one's temper. He was once interviewed by members of a local authority with respect to a proposed contribution towards a wood-paving scheme. "Don't you think," one of them said, "if we put our heads together we could get some wood blocks?" He (Mr. Wakelam) answered that he thought they would. (Laughter.) Adverting to the speech of Mr. Boulnois, he recalled that when he was a young man seeking promotion, as all young men should, he asked that gentleman to support his application for a certain position. Mr. Boulnois replied that he would be very happy indeed to do so, and he was quite sure it was owing a great deal to his recommendation that he succeeded in obtaining the appointment. The recollection of that incident was very pleasant to him, and he should always remember it as long as he lived. Mr. Wakelam, in conclusion, reverted to the difficulty sometimes of getting on with members of local authorities, and told of an official who, after a brief experience, was asked how he was getting on. He replied that "as one half of the council would not speak to him, and he would see the other half further before he spoke to them, he was getting on very well indeed." (Laughter.) In conclusion, he expressed a cordial hope that the public authorities would prosper, and that they would in the future do more than they had done in the past for the maintenance and improvement of public health.

Sir WILLIAM RAMSAY next proposed "The Institute of Sanitary Engineers." In the course of his remarks he said it appeared to him that the members of the Institute of Sanitary Engineers had a very difficult task. They had to know something of everything. They might, perhaps, be likened to the physiologist,

who had not only to be an anatomist, but something of a chemist and something of a physicist. Another and very difficult task was that they had to keep on good terms with a number of public bodies. In general terms, they laid themselves out to better the health of the whole community. They had to look after sanitation—not merely defending the public from the attacks of disease germs, but also making things more convenient in all sorts of ways. After commenting upon what he termed the "coddling" of people by the State, and the feeding and clothing of school children, Sir William asked: "Where is it going to stop? And are we going to stop the production of these children? That is the kind of question which will face us some day or other. Thinking these things over, however, it seems to me that the solution is to be found, as usual, in a happy medium. It wants a great deal of judicious handling." Sir William coupled with the toast the name of the chairman, Mr. John D. Watson.

The PRESIDENT, in reply, said that, as institutions went, theirs was comparatively young and vigorous. It had between 500 and 600 members, all active exponents of that branch of applied science which related to public health works. The importance of their work a few intelligent people failed to appreciate, and a great many more did not appraise it at its true value. As sanitary inspectors it was their duty to be in the van of progress. Considerable responsibility rested upon them, individually and collectively. The lead they gave to public opinion might create the driving power required to convert a public health measure into an Act of Parliament; or it might take another direction and tend to educate the people to form habits which were even more powerful than Acts of Parliament. Nothing was so much required in this country as healthy dwellings for workmen. Every sanitarian had been of that opinion for years, and yet their efforts to enforce their convictions upon the Legislature had been feeble, and almost calculated to make them ashamed of their power. Their influence was less than it ought to be, and their aim should be to increase that influence as much as possible with a view to forwarding the objects for which they stood.

The toast "Kindred Institutions" was submitted by Mr. E. H. BLAKE, and acknowledged by Mr. E. T. HALL and Mr. H. C. H. SHENTON, the latter of whom advocated professional unity. The Society of Engineers, he added, was doing what it could to organise the profession, and they hoped to get engineers of all kinds to help them in an effort that was directed to the formation of a controlling body from all the engineering societies.

Prof. H. ADAMS proposed "The Visitors."

Mrs. H. PERCY BOULNOIS, in reply, urged that women were now called upon to take upon themselves responsibilities, and to take an intelligent interest in the questions of the day. Among other things, they were called upon to be articulate, and put their thoughts into words just as men did. There was, perhaps, a disadvantage in this inasmuch as if they said silly things it was said "Oh, it's only a woman." That was the sort of comment she wished to object to. There was, in fact, no difference between the two. They were, both men and women, persons, and as persons they had an equal right to be suitably trained as citizens. Women could give sanitarians trouble, or take trouble away from them. They were the house-keepers, and had to see that the refuse was put in its proper place, and not left to accumulate in the wrong place. It was no use their arranging for septic tanks if the women kept the refuse in and about their kitchens. Women were, therefore, real sanitarians. Sir William Ramsay had objected to the feeding of school children and giving boots to them. [Sir William was understood to dissent.] It had to be borne in mind that the object was to grow suitable citizens. It was all very well to talk about parental responsibility. She was a strong Conservative politically, but she was anxious to see children grow up healthy citizens, and if boots were requisite it would be all the better for them. Personally, she liked the Scottish fashion of children going barefooted, but she would not deny boots and warm clothes in the interests of the national physique. Mrs. Boulnois advised women to interest themselves in questions of the day, and added that, in her opinion, nothing in life would be complete unless they all worked together as their capabilities enabled them to do.

Sir WILLIAM RAMSAY also acknowledged the toast in a brief speech.

The programme of music and recitations was carried out by Miss Mabel Abbott, Miss Minnie Blake, Mr. John Higgs and Mr. Cyril Dexter.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

The premium for January is divided between

Mr. W. H. HALL,
Town Hall,
Southwark,

and Mr. T. W. PHILLIPS,
Town Hall,
Bexhill-on-Sea,

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

This week answers are invited to the following questions:—

370. Temporary Building Design.—A temporary building is required, 50 ft. long, 30 ft. wide, and 10 ft. to eaves. Design a suitable structure, with steel trusses and stanchions, to be covered with corrugated iron on boards and felt, the bays to be filled in with 4-in. reinforced brickwork. (J. M. N., *Hitchin*.)

377. Machine Shop.—An electric crane is to be fitted in a machine shop on existing piers, as shown in sketch. The piers are bonded into the wall, and about

VERTICAL SECTION THROUGH WALL AND PIER.

12 ft. centres. Assuming the foundations are good, and the work is in Staffordshire brick set in cement and sand, what is the safe load these piers will withstand? (H. W., *Cradley Heath*.)

378. Cost of Running Steam Engine.—Compare the cost of running a steam engine with that of an electric motor in the following circumstances: The horsepower required is 30; electricity costs 1d. per unit, coal (best steam) costs 18s. per ton delivered; the engine is required to drive a stone crusher working an average of eight hours per day for five days per week. (Crusher.)

379. Testing Pipes.—What tests should stoneware pipes be subjected to before they are accepted for use? What defects are often thereby disclosed? (B. W., *Tadcaster*.)

380. Belt Gearing.—A belt running at 1,500 ft. per minute transmits 80-horse power. Find the difference of tension of the two sides of the belt. (T. R.)

REPLIES TO QUESTIONS.

375. Working-class Dwellings.—Twenty working-class dwellings have been built at a cost of £3,500 for the buildings and £250 for the land. What must the rental be to ensure that the income will defray

all loans, &c., charges? Give details as to how the allowances for empties, taxes, insurance, repairs, &c., are arrived at in the estimate. The money has been borrowed from the Public Works Loan Board at 3½ per cent for the usual periods. The poor and district rates are 6s. 8d. in the £ per annum. (Togun.)

The appended balance-sheet is to show how the scheme can be made self-supporting, the figures being based on actual practice in Cornwall, where wages are low. Taking the rental of each house at 5s. per week, we get a total rental of £260 per annum for the twenty houses. The allowance of £10 for empties and loss is taken as being sufficient to meet the case.

The sums of £3,500 and £250 are borrowed for periods of sixty and eighty years respectively, these being the maximum terms allowed by the Local Government Board for repayment of loans on houses and land. This on being worked out shows an annual repayment of £140 and £9 6s. 8d. respectively.

The rateable value of £8 is arrived at as follows:—

	£	s.	d.
Gross rent	13	0	0
Less rates paid by owners	3	0	0
Gross estimated rental	10	0	0
Less 20 per cent for repairs, insurance and other expenses	2	0	0
Rateable value	£8	0	0

The general district rate is taken at 3s. 2d., leaving 3s. 6d. for the poor rate; therefore assuming this to be the case we get the general district rates to be:—

Number of houses	20		
Rateable value per house	£8		
		£	s. d.
		£160	at 3s. 2d. = 25 6 8
Less the usual 50 per cent allowance to owners (Sec. 211, 1 (a), P.H.A. 1875)...		12	13 4
		£12	13 4

Similarly we get the poor rates to be £22.

The property tax, water rate, maintenance, and collection of rates are taken at the usual rates in this part.

ESTIMATED BALANCE SHEET. COST OF HOUSES, £3,500; LAND, £250.

	£	s.	d.	£	s.	d.
Rents. 20 houses at 5s. per week	260	0	0			
Less allowance for empties and losses...	10	0	0			
Repayment of loan at 3½ per cent in equal half-yearly instalments						
(a) In respect of land (£250 for 80 years)				9	6	8
(b) In respect of houses (£3,500 for 60 years)				140	0	0
Rates. — Compounded rateable value £8.						
District rate at 3s. 2d. (less 50 per cent allowance to owners)				12	13	4
Poor Rate at 3s. 6d. (less 25 per cent allowance to owners)				22	0	0
Property Tax at 1s. 2d. on £166 13s. 4d.; gross estimated rental (i.e., £260 less 10th for repairs)				9	14	5
Insurance on £3,500 at 1s. 6d. per cent				2	12	6
Water Rate at 10s. per house				10	0	0
Repairs and maintenance at 7½ per cent on £260				19	10	0
Supervision and collection of rents at 6 per cent				13	0	0
Contingencies				11	3	1
	£250	0	0	£250	0	0

(H. B., *Falmouth*.)

The question is not complete for a full reply, owing to no mention being made of the sewers and roads. Assuming that no portion of the money has been expended on roads or sewers (as shorter periods of repayment are granted for them), and that the

(G. H. T.)

RAPID DRILLING WITH A PERCUSSION OUTFIT.

We have received from the Perkins Macintosh Petroleum Tool and Boring Company, Limited, of St. Albans, Herts, a short report of the drilling operations for water this firm have undertaken for the Sheerness Council under instructions from Mr. F. W. T. Stanton, Assoc.M.Inst.C.E., to augment the water supply of the town. The firm are using a rig and derrick built on the Canadian-Galician pole percussion system, such as they supply for the prospective drilling for oil; and the drilling is being conducted under the personal supervision of Mr. Cyrus F. Perkins, a director of the firm.

The drilling was commenced on November 26th last with a bore sufficiently large to take 16-in. i/d tubing, and by December 13th had reached a depth of 322 ft. 6 in. On December 15th, 16th and 17th the drilling operations were suspended for the purpose of overhauling the boiler and inserting 320 ft. of tubing, and drilling was resumed on the night of December 17th, and by December 31st had reached a depth of 691 ft., with a 14-in. hole. Since that date up to January 29th a further 405 ft. have been drilled, making a total depth of 1,096 ft., the hole being still 14 in.

The engineer to the council has expressed his astonishment at the rapid manner with which the work is being carried on, and states that it reflects great credit upon the contractors, a remark which, in view of the anxiety of the council to obtain a large supply of pure water, was endorsed by the council at a recent meeting. The drilling from 950 ft. has been in a very difficult formation, consisting of chalk intermixed with hard flints, and as the bore becomes deeper the difficulties of drilling are naturally increased and the rate of progress is retarded. Notwithstanding this, the drilling operations are being carried on with rapidity.

In view of the high price now charged for water, it is somewhat surprising that firms who are large users of this essential commodity do not more often sink their own wells and obtain their own supplies; for,

although the first cost might be heavy, this would soon be recouped by the saving made between the price of water ordinarily supplied and that obtained from a well.

It is not generally known that this firm, in addition to manufacturing their well-known oil well drilling outfits, make a speciality of deep drilling for water in this country, and have put down a number of wells, including one at Shoeburyness for the War Office, and one which reached 2,225 ft. We understand that the well at Sheerness is to be ultimately carried to a

CANADIAN-GALICIAN RIG AND DERRICK FOR DRILLING TO DEPTH OF 6,000 FT.

depth of 1,400 to 1,500 ft., and at the present rate of drilling the result should easily constitute a record for this country.

The accompanying illustration shows a heavy Canadian-Galician rig and derrick used for deep borings up to 6,000 ft., and presents the view of the draw works. The derrick is 56 ft. high from base to crown. The outfit used by the firm at the boring at Sheerness is of lighter construction, but is built upon the same principle.

Doncaster Water Supply.—The poll of Leeds rate-payers on that portion of the Corporation Bill giving the necessary authority for the Doncaster water scheme has resulted in the rejection of the scheme.

Bound Volumes of "The Surveyor" for the six months ended December last can now be obtained from the publishers, The St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, E.C. The contents, as usual, are made easy of reference by an exhaustive index, and comprise nearly 1,000 pages of matter of the greatest interest and value to municipal and county engineers and surveyors. The price of the volume is 16s. 6d.

Models of Old London.—Mr. John B. Thorp's models of old London are becoming so well known that it is not surprising to find further additions being made from time to time; but his latest production—a model of the Tower of London as it appeared in 1600—is certainly one of the finest pieces of work that he has executed. The model, which is being presented to the London Museum by Mr. J. G. Joicey, has been built to a scale of one-hundredth full size, and covers an area of nearly 150 sq. ft. It will be first seen by the public when the museum is opened in the early spring at its new quarters at Stafford House.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Dulverton R.D.C. (January 28th. Mr. P. M. Crosthwaite).—£770 for proposed sewage disposal works at Brushford. Mr. R. Sowton Barrow, for the council, said within the past nine years eleven new cottages, a villa residence, and a large motor garage had been erected over a small area adjacent to the railway station. The population of this was estimated between sixty and seventy, and before long other houses would probably be erected on the sites near.

Hatfield R.D.C. (January 5th. Mr. F. H. Tulloch).—£2,200 for works of private street improvement in Cooper's-road, Frampton-road, and Thornton-road, Little Heath.—The surveyor, Mr. H. T. Sidwell, said he proposed that the roads should be made up with 4 in. of brick foundation, 2 in. of gravel rolled, and 3 in. of granite. The kerbing would be 12-in. by 6-in. granite, and the channelling would be 10 in. by 5 in., with a 6-in. concrete foundation.

Holywood (Ireland) U.D.C. (January 14th. Mr. P. C. Cowan).—£4,500 for the purpose of providing an additional storage reservoir and other works in connection with the district waterworks.—Mr. James A. Hanna, surveyor, of Holywood, said there was only one objection to the site, and that was not a serious one. It was of such a flat nature that the water spread over a larger area, and the amount of land necessary to be taken was greater than he would have liked. Consequently the reservoir in parts would be comparatively shallow, but to get over this difficulty he had planned a reservoir of greater capacity than the immediate requirements demanded, and one that could easily be increased at any time. The provision of an additional filter almost similar to the existing two filters had become necessary. The new reservoir would hold 22,000,000 gallons with top water fixed at 500 ft. above ordnance datum, and when raised to 505 ft. above ordnance datum for future requirements it would hold 36,000,000 gallons.

Hursley R.D.C. (January 20th. Mr. A. G. Drury).—£10,000 for drainage works at Chandler's Ford. Mr. Weston, engineer, Southampton, stated that the main scheme provided for 340 houses, and a secondary one for the fifteen on Mount Pleasant. He explained his proposals with the aid of his plans, and expressed the opinion that when the sewerage was carried out the population of Chandler's Ford would grow. Since 1912 nine houses had been built.

Sheffield T.C. (January 29th. Mr. M. K. North).—£2,100 and £5,000 for works of street improvements, and £10,093 for paving works.—Alderman H. P. Marsh, chairman of the Improvement Committee, stated that it is proposed to widen Waingate to 80 ft. from Exchange-street to Lady's Bridge. Alderman Marsh also explained the scheme for widening Chesterfield-road to 80 ft. for a length of 590 ft., at an estimated cost, including price of land and street works, &c., of £5,000. Councillor Gainsford, chairman of the Highway and Sewerage Committee, gave evidence on behalf of the council with respect to the application for a paving loan of £10,093. He stated that it has been, and is, the policy of the committee to repave bouldered streets as quickly as possible, and to substitute a modern and more satisfactory form of paving. In the case of nine of the streets included in the application there was bouldered paving, which had become very unsatisfactory. The remaining street—St. Thomas'-road—is paved with gritstone, which is now worn out. All the streets are satisfactorily sewered.

APPLICATIONS FOR LOANS.

Bromley T.C.—£766 for a new fire alarm system.
Carlisle T.C.—£7,050 for a new school.
Chorley T.C.—£10,582 for gas extensions.
Durham C.C.—£18,903 for alterations to school premises.
Finchley U.D.C.—£93,443 for 300 workmen's dwellings.
Haslingden T.C.—£7,200, in respect of the electricity undertaking.
Holland (Lincs) C.C.—£2,700 for the erection of police cottages.
Lancaster T.C.—£1,120 for the public baths.
Lowestoft T.C.—£400 for additions to a school.

Newton Abbot R.D.C.—£1,500 for a new water supply.

Peterborough T.C.—£5,700 for electricity purposes.

Riccall R.D.C.—£3,000 for a water supply scheme.

Southgate U.D.C.—£350 for a bath attendant's cottage.

Staffs C.C.—£5,390 for the erection of a police station, and £2,175 for a new school.

Todmorden T.C.—£3,900 for paving works.

Walthamstow U.D.C.—£26,900 for resurfacing certain roads, and £4,888 for a storm-water tank and filter bed.

Walton-on-the-Naze U.D.C.—£200 for the purchase of land for a depot.

LOANS SANCTIONED.

Fareham R.D.C.—£11,725 for sewage disposal works at Lee.

Iford U.D.C.—£21,598 for a refuse destructor.

Lymm U.D.C.—£254 for the purchase of land for an ash tip.

Oldham T.C.—£3,300 for the erection of public washhouses.

Penge U.D.C.—£800 for street improvements.

FORTHCOMING INQUIRIES.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Housing and town planning—Hereford; roads and materials—Wandsworth; sewerage and sewage disposal—Birmingham £41,260, Skelmersdale £12,250; water, gas and electricity—Bradford £180,000.—Particulars of other works projected will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Edinburgh T.C.—It has been agreed to construct four houses for corporation employees at the Braid Hills. The plans have been prepared by the superintendent of works, Mr. J. A. Williamson, and the estimated cost of the houses is £1,250.

Exeter T.C.—The infectious diseases hospital is being supplied with Shorland's double-fronted patent Manchester stoves, with descending smoke flues and special inlet ventilators, by Messrs. E. H. Shorland & Brother, Limited, of Failsworth, Manchester.

Nottingham T.C.—It has been agreed to provide a movable floor at the public bath at Swinton; also a cinematograph operator's chamber at a total cost of £1,000.

HOUSING AND TOWN PLANNING.

Hereford T.C.—The council on Tuesday decided to erect sixteen cottages on a part of the Eign Mill site, the cottages to be let at not more than 4s. each per week inclusive; also to erect four cottages on the Crozens site, to be let at 5s. per week.

PARKS AND OPEN SPACES.

Grompton (Lancs) U.D.C.—The council have approved the plans of the surveyor, Mr. F. F. Gartside, for a bowling green, bowls house, shelter and tools house at Dun Wood, at an estimated cost of £170.

REFUSE COLLECTION AND DISPOSAL.

Risca (Mon.) U.D.C.—It has been agreed to invite tenders for the scavenging of the district. The surveyor, Mr. A. J. Dardis, replying to criticisms with respect to the cost of cleansing (£10 17s. 6d.) per week, said he considered the council were at present doing the cleansing work very cheaply. The outlay included four horses and the wages of four hauliers, and two men employed in sweeping the roads. He did not wish to say a word against contractors, but if they engaged contractors they would not have the work under their own supervision to the same extent as to-day, when they had the yard and stables adjoining the council offices. The council nevertheless decided, as already stated, to invite tenders, and the surveyor was asked to prepare a statement of what he required.

ROADS AND MATERIALS.

Abergele and Pensarn U.D.C.—It has been agreed to construct an asphalt path 2 ft. wide in the centre of the promenade footway.

Birmingham T.C.—At the council meeting on Tuesday it was agreed to proceed with the scheme for widening the Pershore road between Edgbaston-road and Pebble Mill-road, at an estimated cost of £1,864.

Chertsey R.D.C.—The tender of Mr. Warren Parker has been accepted for the kerbing of Byfleet.

Cookstown R.D.C.—The Road Board have promised a grant of £250 for road improvement.

Croydon R.D.C.—The tenders of Mr. E. Yewen, Croydon, at £1,085 and £131, have been accepted for making up and the construction of surface-water drainage in Warren-road, Coulsdon.

Hampstead B.C.—The Works Committee have had under consideration the question of the special paving works which it is desirable should be executed during the financial years 1914-15 and 1915-16. In several cases the works it is proposed to carry out are rendered necessary on account of the damage caused to the roads by fast and heavy motor traffic, and the council have decided to approach the Road Board with a view to obtaining their assistance towards the execution of the works. The total expenditure involved is £10,206 for the year 1914-15, and £8,097 for the year 1915-16.

Hereford T.C.—It was agreed on Tuesday last to construct a new road from Monkmoor-street to Barr's-court railway station.

Kensington B.C.—An application has been received for permission to suspend certain advertisements from the projecting arms of the council's street lamps in the more important thoroughfares, but the council have endorsed the opinion of the Works Committee, which has previously been expressed by them, that the street lamps should not be used for advertising purposes.

Kirkcaldy T.C.—It has been resolved to proceed with the scheme for the Kirkcaldy extension of the foreshore, leaving the eastern portion for future consideration. The main object is the provision of a marine esplanade.

North Riding C.C.—The Road Board have agreed to make a grant of £475 towards the cost of the proposed diversion of the Scarborough and Filey main road at Caton Bay.

Stepney B.C.—The tender of Mr. George Battersley, at £2,640, has been accepted for the squaring and redressing of old paving material. Mr. J. J. Prior, of Limehouse, has secured the contract, at £3,013, for the supply of ballast and shingle. The contract for paving material, at £10,953, has been given to Messrs. W. Griffiths & Co.

Stoke Newington B.C.—The purchase of the several interests acquired by the council for the Church-street widening, between Park-street and Lordship-road, has been completed, and the council have formally decided to proceed with the widening, at an estimated cost of £550.

Wandsworth B.C.—The council have under consideration a road paving scheme estimated to cost £30,512. Towards this it is proposed to ask the Road Board for a grant of £10,000 and a loan of £10,000, free of interest.

SEWERAGE AND SEWAGE DISPOSAL.

Belper R.D.C.—For the construction of the sewers and sewage disposal works for Openwood Gate, in the parish of Denby, the surveyor, Mr. Robert C. Cordon, has received instructions to carry out the works of section No. 1 departmentally, at an estimated cost of £350.

Berkhamsted R.D.C.—Messrs. Wilson & Raikes have received instructions to prepare a sewerage scheme for Long Marston.

Birmingham T.C.—It has been decided to proceed with a sewerage scheme for dealing with the area of the Hall Green and Yardley Wood district lying between Titterford Mill and the city boundary. The cost is estimated at £24,400. It has also been agreed to proceed with a sewerage scheme for the area between Bournville and the valley of the Griffin's Brook, at an estimated nett cost of £16,860.

Chertsey R.D.C.—The surveyor, Mr. H. Beeney, at the recent council meeting, called attention to the presence of petrol in the Byfleet and Pyrford sewers, which was strictly prohibited under the council's regulations. It was not only detrimental to the disposal works, but exceedingly dangerous to the health of the men working in the sewers, while there was also the danger of explosion and fire. He recommended that a legal notice be served on all the engineering firms in the district calling attention to the danger resulting from the practice, and giving warning that proceedings would be taken against any person offending in future.

Elland (Yorks) U.D.C.—Under pressure from the West Riding Rivers Board steps are under consideration for the improvement of the effluent from the sewage works.

Skelmersdale U.D.C.—The council have accepted a scheme of intercepting sewers and sewage disposal works, estimated to cost £12,250. The works will be on the bacterial system, and thoroughly up to date. The engineers are Messrs. Taylor & Wallin, of Newcastle-upon-Tyne and London. The plans have been sent to the Local Government Board, and the council are now awaiting the inquiry.

WATER, GAS, AND ELECTRICITY.

Belper R.D.C.—The council have accepted the tender of Messrs. Ookes & Co., Alfreton Ironworks, for the supply of 6½ tons of cast-iron water mains.

Bewdley T.C.—It was reported at a meeting of Bewdley Town Council on Monday that the new bore-hole had been completed, and had proved that there was an abundance of water of excellent quality. The council decided to apply to the Local Government Board for sanction for the remainder of the loan of £3,000 for the carrying out of the necessary work with as little delay as possible.

Bradford T.C.—The Waterworks Committee have decided that the inverted syphons on the line of pipes from the Nidd Valley should be doubled, at a total estimated cost of £180,000.

Builth Wells U.D.C.—The clerk has received instructions to obtain particulars in the matter of the proposed purchase of the gasworks.

Burton T.C.—The Gas and Electricity Committee have decided to advertise for tenders for a new alternator at the generating station. The electrical engineer, Mr. Hall, in reporting upon the matter, said it was very necessary that the purchase and erection of a duplicate turbine alternator should be proceeded with as soon as possible, as, owing to the large amount of business done, the available spare plant was rapidly being overtaken. He estimated that the cost would amount to £6,000.

Dundalk U.D.C.—Mr. P. A. Spalding, chief electrical engineer, last week submitted his first annual report dealing with the progress of the council's electric lighting undertaking for ten months prior to March 31st. The total revenue earned during the period which came within the financial year was £2,491. The gross profit was £1,224, while the nett deficit, after meeting all capital charges of interest and sinking fund, was £162. The result was very satisfactory, and for the present year he anticipated that the undertaking would show a nett profit.

Lampeter T.C.—The Local Government Board have, subject to certain minor modifications, sanctioned the scheme for a water supply.

Millom U.D.C.—It has been agreed to purchase Knott End Farm for the sum of £1,750 for water supply purposes.

Redditch U.D.C.—The council on Tuesday resolved that a consulting engineer be appointed to report upon the position of the electricity undertaking, and make recommendations for its development.

Stafford T.C.—The tender of Messrs. C. & W. Walker, at £11,841, has been accepted for the construction of a gasholder and tank of 1,000,000 ft. capacity, and the tender of Messrs. F. Espley & Sons, at £896, for the construction of the foundations.

Stepney B.C.—In answer to a question at a recent meeting of the council, it was stated that the cost of lighting the public highways was £187 per street mile, while in Poplar and Bethnal Green it was £107 and £165 respectively.

Tuam U.D.C. The tender of Messrs. Crossley Brothers, at £272, has been accepted for the erection of an oil engine at the waterworks.

MISCELLANEOUS.

Birmingham T.C.—The General Purposes Committee recommend that the several committees of the council should be instructed to pay a minimum rate of 6½d. per hour to all navvies employed direct by the corporation as from January 1, 1914.

Edinburgh T.C.—The question of acquiring the site of the old gasworks for a wholesale fruit and vegetable market has been referred to a sub-committee to act in conjunction with the Lord Provost's Committee, and to bring up a report.

Devonshire Park, Eastbourne.—The poll of the Eastbourne ratepayers on the question of the purchase of Devonshire Park for £100,000 has resulted in the opposition increasing the majority they obtained exactly a year ago.

Association of Consulting Engineers.—A report of the inaugural dinner of this body, which took place on Monday evening at the Whitehall Club, Westminster, under the presidency of Mr. G. Midgley Taylor, is unavoidably held over owing to pressure on our space.

PERSONAL.

Mr. V. Turner, surveyor to the Bilston Urban District Council, has been voted an increased salary of £25 per annum.

Mr. O. G. Laban, Loughborough, has been appointed surveyor to the Leake Rural District Council at a salary of £90, rising to £110.

Mr. H. J. Hawkins, borough electrical engineer of Salford, has resigned. The corporation have decided to offer a salary of £1,000 to his successor.

Mr. W. J. B. Leech, Hunslet, has been appointed manager of the Leeds city gasworks, in succession to the late Mr. Townsley, at a salary of £800 a year.

Mr. G. Gregson, surveyor and inspector to the Durham Rural District Council, has had his salary increased by £50 per annum to enable him to keep or hire a motor car.

Mr. Fred Hatcher, deputy borough and water engineer of Neath, has been granted an increase of £40 in his salary, £20 from the sanitary department and £20 from the water department.

Mr. A. W. Humpherson, borough surveyor of Bewdley, has had his salary increased by £35 a year, and has also been voted a grant of £25 for extra work done in connection with the water supply.

Mr. G. T. Forrest, architect to the Northumberland Education Committee for the last eight years, has been appointed county architect for Essex. Prior to going to Northumberland, Mr. Forrest was with the West Riding Education Committee at Wakefield.

Mr. Ernest Ridsdale, deputy chief inspector of nuisances to the York Corporation, has been recommended by the Sanitary and Sewage Committee of the Margate Town Council for the post of chief inspector of nuisances to that council. The salary commences at £200 per annum, rising to £250. There were 261 applicants for the post.

Mr. H. C. H. Shenton, who on Monday evening delivered his inaugural address as president of the Society of Engineers, is the senior partner in the firm of Messrs. Shenton & Easdale, civil engineers. He was born in 1870, and was educated at private and public schools and at the Crystal Palace School of Practical Engineering. He was articled to the late Sir William Shelford, and worked afterwards with him as an assistant. He also worked in the capacity of an assistant for eighteen months in the Works Department of the Admiralty at Portsmouth Dockyard, and four years with Mr. Frederick H. Anson, of Westminster; also for eighteen months in the Admiralty Works Department at Chatham Dockyard. In the year 1900 he entered into partnership in private practice with Mr. Frederick H. Anson, engineer to the Herts and Essex Waterworks Company (now retired), and since that time Mr. Shenton has worked in private practice in Westminster, dealing chiefly with waterworks and with sewerage and sewage disposal works, both at home and abroad. A portrait of Mr. Shenton appears on another page with the report of his presidential address.

CHANGE OF TELEPHONE NUMBER.—Readers are requested to note that "The Surveyor" telephone number is now City 1046.

FOR OTHER ADVERTISEMENTS

See End of Paper.

WANTED, at once, for a period of about 12 months, a Junior Assistant in the Surveyor's Department of an Urban District Council. Salary £54 12s. per annum. Works in hand: Extension of Sewage Disposal Works, Extensions of Sewers, Private Street Works, Road Improvements, &c. Applications, stating age and experience, with two recent testimonials to be sent in not later than Friday, the 13th inst. Box 1,377, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,264)

WANTED, for Municipal Office, a Competent Draughtsman who has had a good theoretical training, and is capable of working out details of Sewers, Roads, Quantities, &c. One who has had actual experience on such works preferred. Address, stating age, experience and salary required, to Box 1,378, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,265)

METROPOLITAN BOROUGH OF ISLINGTON.
INSPECTOR OF ROADS.

The Works Committee of this Council are prepared to receive applications for the Appointment of an Inspector of Roads.

Candidates must have practical experience in, and a thorough knowledge of, the following subjects: Levelling, masons' and paviors' work, the selection of materials, setting out and measuring up works, making estimates and sketches, squaring dimensions, and in making, maintaining, cleansing, and watering roads. None but those who have been engaged in a similar capacity need apply. The person appointed will be required to devote the whole of his time to the duties of the situation, particulars of which can be obtained on application to the Borough Engineer, Mr. J. Patten Barber, at the Town Hall, Upper-street, N., and will be required to pass a medical examination as to his constitutional fitness for the appointment. Salary to commence at 50s. per week, rising by two annual increments of 5s. a week to a maximum of £3 per week.

Application, in the handwriting of the candidates, stating age, which must not exceed 36 years, past and present employment, and accompanied by copies of not more than three testimonials of recent date, must be delivered to the undersigned, endorsed "Roads Inspector," not later than 12 noon on Saturday, the 21st February, 1914.

WM. F. DEWEY,
Town Clerk.

Town Hall,
Upper-street, Islington, N.
February, 1914. (1,258)

ASSISTANT (22) desires appointment in Surveyor's Office. Experienced in surveying, levelling, construction and maintenance of roads, building construction and draughtsmanship. Moderate salary. Free immediately. Excellent testimonials.—Apply Box 1,376, office of THE SURVEYOR, 21 Bride-lane, Fleet-street, E.C. (1,257)

COUNTY BOROUGH OF BELFAST.
WORKS DEPARTMENT.

TENDERS FOR STORES, WORK, AND UNIFORM CLOTHING.

The Works Committee are prepared to receive Tenders for the supply of the following Stores, Work, and Uniform Clothing for a year, commencing on 1st April, 1914.:

Earthenware Sewer Pipes.	Shovels, Spades, Graipes and Buckets.
Timber.	and Buckets.
Slates.	Scavenging Brushes.
Hardwood.	Glazed Bricks.
Iron Castings.	Artificial Flags.
Plumbers' Work.	Lime.
Nails, &c.	Pitch, Felt, Tar, &c.
Iron and Steel.	Sea Sand, Sea Gravel, and Lough Neagh Sand.
Paints, Oils, &c.	Cement.
Glazing.	Uniform Clothing & Hats.
Mill Furnishings.	

Forms of Tender and particulars may be obtained from Mr. Hector F. Gullan, M.A.S.T.C.E., Superintendent of Works, City Hall.

Sealed Tenders, on Official Forms only, endorsed "Tender for—," to be lodged in my Office before 11 a.m. on 18th February, 1914.

The Lowest or any Tender will not necessarily be accepted.

A Tender, if sent by post, must be registered; if delivered by hand, an Official receipt must be obtained for it; otherwise the undersigned will not be responsible.

R. MEYER,
Town Clerk.

EAST SUFFOLK COUNTY COUNCIL.
MAIN ROADS.

TENDERS FOR TAR FOR SURFACE TARRING.

The above Council invite Tenders for the supply of Refined or Dehydrated Coal Tar, delivered to the various railway stations, wharves, docks, &c., within the county, in such quantities and at such times as directed during the year ending 31st March, 1915.

Specification and Form of Tender can be obtained on application to the undersigned, and applicants are requested to state for which grade of Tar they wish to tender.

The Council does not bind itself to accept the lowest or any Tender, and reserves the right to accept Tenders for any portion of the requirements.

Tenders, endorsed "Tar," must be delivered at the County Hall, Ipswich, on or before the 14th day of February, 1914.

W. JERVIS,
County Road Surveyor.

County Hall,
Ipswich.
February 5, 1914. (1,271)

COUNTY BOROUGH OF STOKE-ON-TRENT.

The Council invite Tenders for the supply of Materials and Goods for the year ending March 31st 1915, as under:—

1. Portland Cement.
2. Blue Paving Bricks and Common Bricks.
3. Sanitary Pipes and Gullies.
4. Kerbs and Setts.
5. Macadam and Chippings.
6. Pitch and Oil.
7. Cast-iron Work.
8. Picks, Shovels and General Ironware.
9. Paints and Oils.
10. Soap, Soda, &c.
11. Brooms and Brushes.
12. Bath Towels, Dusters, &c.
13. Ironmongery and General Stores.
14. Disinfectants.

Specifications, Conditions and Forms of Tender may be obtained on application to the Borough Surveyor, Town Hall, Stoke-on-Trent, and Tenders, sealed and endorsed, must be delivered to him on or before 20th February, 1914.

E. B. SHARPLEY,
Town Clerk.

Town Hall,
Stoke-on-Trent.
February, 1914. (1,261)

CITY OF LEEDS.
ANNUAL CONTRACTS FOR STORES.

The Sewerage Committee invite Tenders for the Supply of the following Stores during the twelve months ending March 31st, 1915:—

- Cement.
- Earthenware Drain Pipes, &c.
- Sewer Ironwork.
- Galvanised Dirt Boxes.
- Sewer Ventilating Columns.

Forms of Tender, Schedules, and all particulars may be obtained at the Office of the undersigned.

Tenders must be on the Official Forms, properly endorsed, and delivered at the Town Clerk's Office, Great George-street, Leeds, not later than 10 a.m. on Thursday, February 26th, 1914.

The Corporation do not bind themselves to accept the lowest or any Tender.

W. T. LANCASHIRE,
City Engineer.

Municipal Buildings,
Leeds.
February 4, 1914. (1,269)

EPSOM RURAL DISTRICT COUNCIL.

The above-named Council invite Tenders for—
(a) Flints, Fine Gravel, Sand, Coal, Coke, Cement, Stoneware Pipes and Granite Kerb.

(b) For Carting of Materials, and

(c) For Watering during the year ending 31st March, 1915.

Particulars and Forms of Tender may be had on application to Mr. T. E. Ware, Surveyor to the Council, Watertoo-road, Epsom.

Sealed Tenders, endorsed "Tender," must be received by the undersigned not later than 10 o'clock a.m. on Monday, the 23rd day of February, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

ARTHUR R. COTTON,
Clerk to the Council.

Gynsdale,
Watertoo-road,
Epsom.
February 4, 1914. (1,268)

EPSOM URBAN DISTRICT COUNCIL. TENDERS FOR STORES.

The Council are prepared to receive Tenders from persons willing to enter into Contract for Work and for the supply of Stores, &c., for the period of one year or under, commencing 1st April, 1914—viz.:

Sewerage Ironwork.
Gully Gradings.
Shovels, Picks, Brooms, Forks, Dust Skeps, &c.
Disinfectants.
Portland Cement.
Stoneware Pipes and Gullies, &c.
Kerbing and Channelling.
Setts.
Broken Granite, Chippings and Limestone Dust.
Tar Paving and Tarred Macadam.
Coal and Coke.
Hay, Corn, Bran and Straw.
Bricks.
Paraffin.
Artificial Stone Paving.
Thames Ballast and Thames Sand.
Veterinary Surgeon's Services (inclusive).
Tar, Pitch, &c.
Team Labour.

Forms of Tender, with Schedule, may be obtained, and Specification seen, upon application to the Office of Mr. Edward R. Capon, Surveyor, Bromley Hurst, Church-street, Epsom, between the hours of 9 a.m. and 5 p.m., Saturdays excepted, when the hours will be 9 a.m. till 1 p.m. Sealed Tenders, addressed to the Clerk of the Council, and endorsed "Tenders for Stores," to be delivered at the Clerk's Office on or before 5 o'clock p.m. on Tuesday, March 3rd, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

E. G. WILSON,
Clerk to the Council.

"Duncannon,"
Church-street,
Epsom. (1,262)

ALFRETON URBAN DISTRICT COUNCIL.

The Alfreton Urban District Council invites Tenders for the supply of a 10-ton Compound Steam Road Roller fitted with Scarifier, Water-spraying Apparatus and Canopy.

Every Tender must be accompanied by a Specification of the machine to be supplied, stating the time required for delivery.

Sealed Tenders, endorsed "Roller," must be delivered to the undersigned on or before Monday, February 16th.

The Council does not bind itself to accept the lowest or any Tender.

R. F. WARD,
Surveyor to the Council.

Council Offices,
King-street,
Alfreton. (1,266)

CITY OF WESTMINSTER. BARGING.

The Westminster City Council invite Tenders for Barging Refuse from the Council's Wharves during one year, or two years, or three years, from the 1st April, 1914.

The Council are prepared to consider Tenders for Barging Refuse from any one Wharf only, as well from all three of the Council's Wharves.

Form of Tender, with General Conditions of Contract, Specification, and Schedule attached, may be obtained on application at the City Hall, between 10 a.m. and 4 p.m. (Saturdays 10 a.m. and 12 noon).

The Contractors will be bound by the Contract in the case of all workmen employed by them to pay wages at rates not less, and to observe hours of labour not greater, than the rates and hours recognised by the Associations of Employers and Employees, and in practice obtained in the district where the work is to be executed.

Tenderers are prohibited from directly or indirectly canvassing Members or Officials of the Council in reference to any Tender, and the Tender of any person who does so canvass will be rejected.

Each Tender, on the Official Form Supplied, is to be delivered at the City Hall in a sealed cover addressed to the Town Clerk, and marked "Tender for Barging." Tenders may be placed by, or on behalf of tenderers, in a locked box at the City Hall provided for the purpose.

No Tender will be received after 9.30 a.m. on Friday, the 20th February, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

JOHN HUNT,
Town Clerk.

Westminster City Hall, W.C.
February 4, 1914. (1,270)

CITY OF WESTMINSTER.

The Westminster City Council invite Tenders from persons willing to Contract for the Execution of the undermentioned Works and the Supply of the undermentioned Materials, Articles, &c., for the 12 months ending the 31st March, 1915:—

1. Ballast and Sand.
2. Barging (one, two, or three years).
3. Boots, &c. (new and repairs) (one year or three years).
4. Bricks.
5. Brooms and Brushes.
6. Carriageway and Footway Repairs (asphalt).
7. Carriageway Repairs (macadam).
8. Carriageway Repairs (granite sett pavement).
9. Carriageway Repairs (wood pavement).
10. Cement and Lime.
11. Christchurch-yard Garden Maintenance.
12. Coal and Coke (three months only, ending 30th June, 1914).
13. Disinfectants.
14. Drysaltery, Soaps, and Sundries.
15. Dust Baskets (new and repairs).
16. Flags (sandstone and artificial).
17. Footway and Channel (masons' work).
18. Gas and Hot-water Fittings.
19. Granite (broken).
20. Granite Setts, Kerb and Channels.
21. Gullies (stoneware) Construction.
22. Harness (new and repairs).
23. Hats, Caps, &c.
- 24.
25. Horse Hire and Cartage Work.
26. Hose Pipe (new and repairs), Leather.
27. Iron Castings.
28. Petroleum Spirit.
29. Painters' Materials and Miscellaneous Oils.
30. Pitch and Creosote Oil.
31. Plates, Sheets, Bolts, &c., Tree Guards, and Sundries.
32. Retyring Wheels, Repairing Springs, &c.
33. Rubber and Waterproof Goods.
34. Sewerage and Drainage (minor works).
35. Shovels, Picks, Sewer Implements, and Edge Tools.
36. Stencil Paper, Ink, &c., for Duplicating Machines.
37. Stoneware Goods.
38. Street Name-plates (supply and fixing).
39. Tarpaulin.
40. Timber.
41. Tool Handles.
42. Towels.
43. Uniform Clothing (one year or three years).
44. Wood Paving Blocks.
45. Washing Towels.

Specifications and Forms of Tender may be obtained on application at the City Hall between 10 a.m. and 4 p.m. (Saturdays 10 a.m. and 12 noon). Each Tender on the Official Form supplied is to be delivered at the City Hall in a sealed cover, addressed to the Town Clerk, and marked with the name of the Tender. Tenders may be placed by or on behalf of tenderers in a locked box at the City Hall provided for the purpose. No Tender will be received after 9.30 a.m. on Friday, the 20th February, 1914.

The Contractors will be bound by the Contract, in the case of all workmen employed by them, to pay wages at rates not less and to observe hours of labour not greater than the rates and hours recognised by the Association of Employers and Employees, and in practice obtained in the district where the work is to be executed.

Tenderers are prohibited from directly or indirectly canvassing Members or Officials of the Council in reference to any Tender, and the Tender of any person who does so canvass will be rejected. The Council do not bind themselves to accept the lowest or any Tender.

JOHN HUNT,
Town Clerk.

Some Recent Publications.*

THE CONSTRUCTIONS OF ROADS AND STREETS. By Henry Law and D. K. Clark, M.M.INST.C.E. Revised, with additional chapters, by A. J. Wallis-Taylor, ASSOC.M.INST.C.E., M.S.A. (Eighth Edition.) Price 6s. London: Crosby Lockwood & Son.

In the preface to the sixth edition (1901) of this well-known work the following sentence occurred: "The earlier portion of the work is mainly historical, or else concerned only with principles of road construction, and has therefore not required revision except on one or two minor points; but Part II., which deals with later practice, has been subjected by Mr. Wallis-Taylor to careful revision throughout. He has rewritten (wholly or in part) those of the original chapters which needed such treatment, and has added several new chapters dealing with the latest developments of the subject." The work was thus enlarged by about 120 pages. In the preface to the eighth (1913) edition it is pointed out that the changes which have taken place in traffic conditions have rendered it advisable "again to revise this book for the eighth edition, and to bring it more up to modern requirements." Mr. Wallis-Taylor has, accordingly, added a new chapter on roads for modern traffic—forty-five pages—has added to one of the chapters on wood paving matter relating to preserved wood paving in the United States, and to wood paving in Germany, and has included some account of certain kinds of wood paving blocks. Descriptions of road rollers driven by internal combustion engines, and of a stamping machine for consolidating broken-stone roads, have been inserted in the appendix, and Road Board specifications have replaced other matter of less importance. "In addition to this," it is stated, "the other portions of the book have been subjected to careful revision," and several illustrations have been added.

A quite wrong impression of the result would be formed if the word "revision" above were understood to imply that notes are added throughout, at important places, in order to bring the matter up to date. The bulk of the work is either such as is fairly described in the first passage quoted above, or that which was brought up to date in 1901. The operation performed in 1901 was not, however, repeated in 1913, and the reader must realise that the really new matter is almost entirely confined to those portions added in the lump. The least satisfactory parts of the book, therefore, are those dealing with matters which were in process of development in 1901, and it may as well be said at once that the space allotted to more recent matter is not sufficient to render this part of the work so valuable or so important as are those portions which deal with principles of road construction, and details relating to the making and maintaining of water-bound broken-stone road crusts. The value of some of the chapters would have been greatly increased by the addition of a few notes, but in view of the probability that a further edition of the work may be prepared, it is only fair to point out that some of the chapters might well be replaced by entirely fresh matter, leaving the really classic part of the book untouched, or expanded at suitable intervals by new matter clearly distinguished from the old, and dated. Perhaps it would be better still to present the volume in two parts, the new portion being written, as it were, parallel with the old up to a certain point, and thereafter devoted to modern developments. This amounts, it is fully realised, to an adverse criticism of the present edition, and it may be stated, therefore, that the new matter is, on the whole, well selected, and is in itself of direct value.

The nature of the contents of the whole volume may briefly be indicated as follows: It begins with an historical sketch—twenty pages—chiefly relating to English roads and streets in the early part of the nineteenth century. In Chapter I. some of the elementary considerations to be taken into account in laying out a road are considered, and the manner in which plans and sections are prepared is explained. Chapter II.—twelve pages—deals briefly with earthwork and drainage; some of the measures recommended are now practically obsolete, and the chapter is not important. The facts and opinions relating to resistance to traction in Chapter III.—fourteen pages—form a part of

a complete study of this subject, and are by no means to be passed over as though they bore no relation to the problems of the present day. Chapter IV.—fourteen pages—is mainly devoted to a study of the width and transverse section of the road. The views herein expressed as to excessive camber have now been generally accepted, but in some districts only very recently. On an important point, however, practice of to-day is still behind the advanced thinkers of two or three generations ago, as is shown by the following extract from "The Practice of Making and Repairing Roads," by Thomas Hughes, 1838. This passage runs: "I have never been able to discover why the sides of the road should be at all inferior to the middle in hardness and solidity." At the present day it is sometimes an advantage to use harder material for the middle than that which is employed for the sides of the road crust, chiefly on roads in the open country, and subject to a considerable amount of long-distance motor traffic. The necessity for having the sides at least as good as the middle as regards their "solidity" is, however, as great to-day as it ever was; but the idea that a road crust may be thinner towards the edges than it is in the middle has not yet died out in this country, and is widely prevalent in the United States. Chapter V.—fourteen pages—relates chiefly to the materials of the road crust, and contains a number of suggestions of value at the present day. The use of lime in making up a water-bound crust is recommended, for instance (by Charles Penfold and Mr. Walker), and the use of iron filings was recommended by Mr. Walker in 1819, the object being to make the binder ferruginous. Chapter VI., on "Repairing and Improving Roads," consists of only eleven pages, partly taken up with descriptions and illustrations of instruments and tools. Some useful hints are, however, to be found in this chapter. About four pages are given to hedges and fences, the author associating himself with the almost fanatical views usually held on this subject in the nineteenth century. Five pages on paved roads and streets may be considered as obsolete, though not misleading, the subject receiving consideration further on, and some seven pages, including a two-page table, are devoted to estimates of quantities of earthwork, this matter being sufficient as a brief introduction to the subject. This concludes Part I.

In Part II. the first chapter is on "Materials Employed in the Construction of Roads and Streets"—that is, in actual fact, the materials of the road crust and of the paving. The descriptive matter relating to road stones is somewhat lacking in method, and the tables of crushing strengths, &c., might well have been supplemented by more recent data. The note on woods is quite obsolete, both as regards the species used and their relative importance. Chapter II. consists of four pages of considerable historical interest on macadam roads. The following chapter, twelve pages, on the wear of macadam roads, is well worth study. Chapter IV., on the cost of macadam roads, relates, apparently, to no date later than 1876, and with a short chapter of two pages on concrete roads, may be considered as of merely historical interest. The next four pages, with three cross-sections of French and Belgian roads, are, however, of considerable interest at the present day, the types shown being very good ones. The next three chapters on stone pavements in London, Liverpool, and Manchester, and the following chapter on the wear of granite pavements, are of some technical importance as well as of historic interest, the data relating chiefly to the middle of the nineteenth century, with nothing of recent date. Chapter XI., on stone tramways in streets, is worth attention, for the advent of the wire-bus renders the adoption of such a system at least possible under modern conditions, apart from its use under special circumstances in various countries. In Chapters XII. to XVII., fifty-six pages, wood pavements are described, the matter being largely taken from papers and reports published between 1840 and 1900, and more especially between 1870 and 1896. There are nine pages of technical interest describing methods employed in Germany and in the United States. Some four pages of fresh matter are devoted to descriptions of the "Acme sectional" paving and the "Shuman" wood paving, and Valles expansion plug; but these additions do not affect the general character of this part of the book, which stops short of what is of live practical interest as regards

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

practice in Great Britain and with reference to the value of different kinds of wood paving at the present day. The matter is, of course, interesting to those who make a special study of wood paving, and the consideration applies also to Chapter XVIII., on the cost and wear of wood pavements, the data relating chiefly to the period between 1871 and 1901. The figures for the period from 1881 to 1901 are, of course, of practical value; but it is unfortunate that the opportunity to supplement this material with data relating to the last twelve years has not been taken, since great developments have taken place in the use of soft wood paving in that period. In Chapter XIX., twenty-six pages, an account of asphalt pavements is given, including an interesting description of early efforts to use this material, and of the development of sound principles in its application in London and in the United States. A table, occupying nearly four pages, presents traffic statistics of 1872 and 1873, and notes on the condition of asphalt pavements which had been laid for periods ranging up to three years and nine months. There are other tables relating, apparently, to no date later than 1877. A chapter of nine pages on "Brick Pavements" brings the subject up to 1901, it seems; and in view of the lack of any important development of this paving in the United Kingdom, it was perhaps unnecessary to extend the chapter in the present condition. It should be remembered, however, that in matters of detail some advance has been made in the United States during the past few years. In Chapter XXII., forty-two pages, the costs of different pavements are compared, but there seems to be nothing relating to practice of a date later than 1901 (or perhaps 1894). Chapter XXIII., on footpaths and crossings, contains a good general description of the principal materials and methods of the present day, employed in the construction of footpaths and of kerbing, and it forms one of the most practically useful parts of the work. Chapter XXIV., eighteen pages, on the cleansing of pavements, is worth study, for it contains data of considerable importance, the value of which is but little affected by recent changes in the conditions of street traffic, and such matter as has no direct bearing upon modern practice forms a part of the history of civic development. Chapter XXV., consists of eight pages of well-selected text and illustrations relating to mountain roads, and the grand trunk road of Northern India. The data obtained from classic experiments on the resistance to traction on common roads are given in Chapter XVI., after a brief introductory study of the mechanics of the subject.

The remaining forty-five pages, exclusive of appendixes, are devoted to the editor's contribution on the subject of "Roads for Modern Traffic." Much of the space is usefully devoted to a consideration of facts and figures set forth in papers read before the Institution of Civil Engineers, and especially in the contributions of Colonel R. E. Crompton, Mr. J. Walker-Smith, and Mr. H. P. Maybury; and use has also been made of articles and papers recently published in America and on the Continent. The matter is well selected, but the lack of any attempt to summarise the views of road engineers of the United Kingdom is noticeable. In his own observations Mr. Wallis-Taylor seems to have been influenced rather by the opinions of irresponsible critics than by those of experienced road surveyors. He has, however, noted a number of points of considerable significance, and has on the whole made good use of the space devoted to this review of recent developments. As regards the appendixes, it may be remarked that the old matter contains passages of considerable practical interest at the present day, as well as passages of historical importance, and they contain four pages of recent data relating to the cost of steam rolling, and, in addition, Road Board Specifications Nos. 1 to 6.

In conclusion, it may be suggested that as a work of reference the volume is one which should be upon the engineer's own bookshelf, and that it may be recommended to students on the understanding that it has not been brought up to date throughout, nor fully so in any particular, and is not an authoritative work, except as regards the periods to which the different parts specifically apply.

SURVEYORS' TABLES AND DIARY FOR 1914. Price 1s. paper, 2s. leather. London: Metchin & Son.

The tables included in this very useful little book, which, by the way, is of very convenient size for the pocket—contain much information which the sur-

veyor in practice will find very useful for daily reference. Among much other matter will be found a summary of the London Building Acts, a list of district surveyors and their fees, and many tables of use to quantity and building surveyors. The book forms a very neat and useful pocket remembrance and diary for all surveyors.

Vol. V. Part I. of the "Transactions" of the Concrete Institute contains, in addition to information regarding the personnel and work of the institute, papers and discussions on "The Settlement of Solids in Water and its Bearing on Concrete Work" (Dr. J. S. Owens); "Steel Frame Buildings in London" (Mr. S. Bylander); "Economy in Reinforced Concrete Design" (Mr. J. A. Davenport); "The Strength of Cement" (Mr. H. C. Johnson); and "Props and Beams in Mines" (Prof. S. M. Dixon).

One of the best reference books published is "Sell's Directory of Registered Telegraphic Addresses," and this year the volume for size and comprehensiveness surpasses all previous records. It contains 2,500 pages of the kind of information required at a moment's notice in convenient form by nearly all business men many times every day of the week. Telephone numbers, postal and telegraphic addresses are given after the name of each firm, and an index to the telegraphic addresses registered in every part of the United Kingdom forms the only clue published from official lists to the owners of such addresses. The trades of the United Kingdom are classified, and the names of manufacturers, merchants, and traders are collated in the division entitled "The National Directory of Commercial Houses." Here each name is inserted under a particular trade, and there are something like 100,000 names in this section of the book.

Street Lighting in Leicester.—It has been agreed to make an experiment in the West End of Leicester as to the relative merits of gas and electricity for public lighting purposes. In effect the scheme recommended will, if adopted, standardise the lighting of the town in three sections. Hitherto there has been no method or order in this respect, and the different types of illumination used in two thoroughfares of equal importance has led to one being better lighted than the other. A sub-committee of the Watch Committee directed special attention to this aspect of the matter, and under the new scheme the lighting will be more uniform. The most important thoroughfares will have one degree of lighting; those of second importance will be illuminated at slightly less capacity, while the "back" streets (as the smaller streets of the town are classed) will be lighted on a third standard. The committee have paid particular attention to this third class, and "back" streets will be better lighted than hitherto.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A.,
Borough Surveyor, Great Yarmouth.

MANCHESTER MEETING.

A meeting of the institution will be held in the North-Western District at the Town Hall, Manchester, on Friday and Saturday, February 20th and 21st.

PROGRAMME.

Friday, February 20, 1914.

- 12.30 p.m. Meeting of District Executive Committee.
1 p.m. Members of District Executive and members of council attending the meeting will lunch with the Lord Mayor and the chairman of the Improvement Committee and of the Town Planning Committee.
2.15 p.m. The members will assemble in the Manchester Town Hall, where they will be received by the Lord Mayor (Alderman McCabe) and Alderman Frowde (chairman of the Rivers Committee).
2.30 p.m. North-Western District meeting in the Town Hall, Manchester.
Minutes of the previous meeting.
Any other district business.
3 p.m. Description of some of the municipal works of the city of Manchester (illustrated by lantern slides) by Mr. T. de Courey Meade, M.INST.C.E., city surveyor of Manchester.

Drawings and photographs will be exhibited in the Lord Mayor's Parlour showing the works described and intended to be inspected.

A short paper on "The Future Government of Great Cities" (illustrated by lantern slides), by Councillor Joseph Swarbrick, M.INST.C.E.

6.30 p.m.—Dinner will be provided in the town hall at the invitation of the Lord Mayor and the Rivers Committee.

Saturday, February 21, 1914.

9 a.m.—Meet at Town Hall. Special tramcars (provided by the Tramways Committee) will leave Albert-square at 9.15 a.m. to convey members to any or all of the following works they may desire to inspect—viz.:—

Tramway car repairing works and permanent way depot, Hyde-road.

Intercepting sewers at Withington and Didsbury.

Outfall sewers in Stretford and Davyhulme.

Stuart-street subway and Coal Railway. Lakes in Platt Fields and Heaton Park.

1 p.m.—Luncheon, at the invitation of the Tramways and Improvement Committees, at the Grand Hotel, where members will be received by the respective chairmen: Alderman Bowes, J.P. (chairman of the Tramways Committee), and Alderman Wilson, J.P. (chairman of the Improvement Committee).

A. W. BRADLEY, M.INST.C.E.,
Hon. District Secretary

St. Helens, Lancs.

NORTH-EASTERN DISTRICT.

A meeting of the North-Eastern District will be held at Wakefield on Saturday, March 21, 1914.

SOUTHEND MEETING.

A meeting of the institution will be held in the Eastern District at Southend on Saturday, June 6th.

THE ANNUAL MEETING.

The date for the annual meeting of the Institution of Municipal and County Engineers at Cheltenham has been fixed definitely for June 24th, 25th, 26th and 27th next. It has been decided to make a special feature of town planning and of roads, and, if possible, to arrange for an exhibition of town plans.

92 Victoria-street, S.W.
THOMAS COLE,
Secretary.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

EASTERN DISTRICT.

A meeting of the Eastern District of the institution will be held at Oundle on Saturday, February 21st.

PROGRAMME.

2.10 p.m.—Assemble at Oundle Railway Station and proceed to inspect the widening of the North Bridge (adjoining the station), under the direction of Mr. J. H. Dyson, clerk of works to the Northants County Council, who will give a brief description of the works.

3 p.m.—Visit of inspection to the schools of the Grocers' Company, by kind permission of the head master, Mr. F. W. Anderson, M.A.; also the new science and engineering block in course of erection by Messrs. Thompson & Sons, of Peterborough.

Time permitting, visits will also be paid to the Oundle Urban District Council's sewage disposal works, waterworks, cemetery, &c., under the direction of Mr. G. Belson Chilvers, surveyor and water engineer to the council.

4.15 p.m. Meeting at the council offices. Election of chairman and hon. district secretary.

Forthcoming meetings.

Paper, "The Municipal Undertakings of the Oundle Urban District Council," by Mr. G. Belson Chilvers.

4.50 p.m.—Tea at the Talbot Hotel.

P. S. BENNETT,
Hon. District Secretary.

Ramsay, Hunts.

FORTHCOMING MEETINGS.

Arrangements have been made for the following meetings: February 14th, Newcastle; February 21st, Oundle; February 25th, council meeting, London; June 13th, Tisbury. Meetings are being arranged also for Leeds and Birmingham during March.

NEXT COUNCIL MEETING.—The next meeting of the council will be held on Wednesday, February 25th.

MUTUAL AID AND DEFENCE FUND.

The attention of corporate members and students resident in the British Isles is directed to the fact that a half year's subscription to this fund fell due on January 1st, the amount being 1s. 3d. in the case of members and 6d. in that of students.

B. WYAND,
39 Victoria-street, S.W. *Secretary.*

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

ORSETT RURAL DISTRICT COUNCIL.

A Clerk of works is required for an extension of the Little Thurrock Sewer, about 800 yds. of which is in tunnel. The candidates must have had previous experience in this work, and be thoroughly qualified to take levels and set up sight rails, &c.

Salary, £3 3s. per week: the work is estimated to last four to six months.

Applications, marked "Clerk of Works," with copies of testimonials, to be sent to the undersigned on or before Wednesday, the 11th inst.

(By order)

JAMES BECK,

Clerk to the Council.

Council Offices,
2 Orsett-road,
Grays, Essex.

(1,245)

WITNEY RURAL DISTRICT COUNCIL.
APPOINTMENT OF HIGHWAY SURVEYOR.

Applications are invited for the appointment of Highway Surveyor for the Eastern Division of the above District.

Applicants must not exceed the age of 40 years, have had previous experience in the repair and maintenance of roads, and a thorough knowledge of modern methods of construction.

Salary £140 per annum, and £35 per annum for the provision and upkeep of a motor bicycle.

Applications are to be made on printed Forms only, which will be sent on receipt of a stamped addressed foolscap envelope.

These must be returned to the undersigned not later than 12 noon on February 12th, 1914.

Canvassing in any form will be deemed a disqualification.

H. T. RAVENOR,
Solicitor,

Clerk to the Rural District Council.

Witney,
January 29, 1914.

(1,240)

WANTED, immediately, Temporary Assistant, qualified to prepare Plans, Specifications, Quantities, &c., for Housing Scheme. Applicants to state full particulars of qualifications and experience and salary required—Box 1,375, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,249)

COUNTY BOROUGH OF BOLTON.

BOROUGH ENGINEER AND SURVEYOR'S DEPARTMENT.

APPOINTMENT OF BUILDING INSPECTOR.

The Streets Committee invite applications for the appointment of Building Inspector at a salary of £110 per annum.

Applicants must have a thorough practical knowledge of all Building Trades, and have had experience as a Building Inspector of the Model By-laws and the Public Health Acts.

Applications, in candidate's own handwriting, stating age, experience and qualifications, together with copies of three testimonials of recent date (which will not be returned), and endorsed "Building Inspector," to be sent to the undersigned not later than 12 o'clock noon on Monday, the 16th day of February, 1914.

SAMUEL PARKER,
Town Clerk.

Town Hall, Bolton.

February 4, 1914.

(1,244)

TENDERS WANTED.

COUNTY BOROUGH OF READING.

SEWERAGE AND SURFACE-WATER DRAINAGE.

TO CONTRACTORS.

The Corporation invite Tenders for the execution of Works of Sewerage and Surface-water Drainage in and in the neighbourhood of the Tilehurst area of the Borough.

Persons desirous of tendering may inspect the Plans and Sections of the Works at the Offices of the Engineer, Mr. G. Midgley Taylor, of the firm of Messrs. John Taylor & Sons, Caxton House, Westminster, where copies of the Specification, General Conditions and Bill of Quantities, and Forms of Tender may be obtained on and after Monday, 2nd February, 1914, upon payment, by cheque, of the sum of £2, which will be returned upon receipt of a *bona-fide* Tender.

The person whose Tender is accepted will be required to enter into a Contract for the execution of the works, to give security for the due performance of the Contract by means of a bond of an approved guarantee society, and to observe and comply with the terms of the fair wages clauses set out in the general conditions.

Sealed Tenders, in printed addressed envelopes provided for the purpose, must be delivered to me, the undersigned, at my Office, situate at the Town Hall, Reading, on or before Saturday, 28th February, 1914.

The Corporation do not bind themselves to accept the lowest or any Tender.

Dated this 26th day of January, 1914.

W. S. CLUTTERBUCK,

(1,235)

Town Clerk.

MATLOCK URBAN DISTRICT COUNCIL.

SEWAGE DISPOSAL.

STEEL BRIDGES, &c.

The Matlock Urban District Council invite Tenders for the supply, delivery and skilled labour in the erection of Steel Bridges over the River Derwent to carry Steel Tube Sewers.

Plans and General Conditions of Contract may be seen, and Form of Tender, Specification, and all other particulars obtained, on application to Messrs. James Diggle & Son, Civil Engineers, 14 Victoria-street, Westminster, S.W., and Hind Hill-street, Heywood, Lancashire, on payment of a deposit of £2, which will be returned on receipt of a *bona-fide* Tender fully priced out in accordance with the Conditions of the Specification, but not otherwise.

Sealed Tenders, endorsed "Matlock Sewerage: Tender for Bridges," must reach me not later than Saturday, February 28th, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

RICHARD TAYLOR,

Clerk to the Council.

Council Offices,
Matlock.

February 3, 1914.

LEGAL NOTICE.

1914 L. No. 64.

IN THE HIGH COURT OF JUSTICE.

CHANCERY DIVISION.

MR. JUSTICE ASTBURY
FOR MR. JUSTICE NEVILLE.

In the matter of

THE LIMMER ASPHALTE
PAVING CO., LTD.,

and

In the matter of

THE COMPANIES
(CONSOLIDATION) ACT, 1908.

NOTICE is hereby given that a Petition was on the 20th day of January, 1914, presented to the High Court of Justice by the above-named Company and amended the 29th day of January, 1914, to confirm an alteration of the said Company's objects proposed to be effected by special resolution of the Company unanimously passed at a General Meeting of the said Company held on the 10th day of October, 1913, and subsequently unanimously confirmed at a General Meeting of the said Company held on the 7th day of November, 1913, and which resolution is as follows:—

"That the Memorandum of Association contained in the printed document submitted to the Meeting and for the purpose of identification subscribed by the Chairman thereof, or such modified form thereof as may be approved by the court be and the same is hereby approved, and that such Memorandum of Association, with such modifications (if any) as aforesaid be and it is hereby adopted as the Memorandum of Association of the Company to the exclusion of and in substitution for the existing Memorandum of Association."

The following is a copy of the said proposed Memorandum of Association—that is to say:—

1. The Name of the Company is "THE LIMMER ASPHALTE PAVING COMPANY, LIMITED."

2. The Registered Office of the Company will be situate in England.

3. The Objects for which the Company is established are—

- (1) To purchase and work the contracts or concessions, rights, and interests held by MYLAUS COHEN for or relating to the importation into and sale and use within the United Kingdom of Great Britain and Ireland of the "Limmer" Asphalt, and also any other contracts or concessions, rights, estates, or interests relating to or in or over the same or any similar material or substance which the Company may at any time or times think fit to purchase or acquire, and which either already have been or hereafter may be made or granted either to the said MYLAUS COHEN or to any other person or persons whomsoever or which the Company may take directly in their own name.
- (2) To search for, inspect, examine, and explore, work, purchase, take on lease, or otherwise acquire any mines, mining rights, quarries, lands, and places in the Republic of France or the Empire of Germany or elsewhere which may seem to the Company capable or possibly capable of affording a supply of asphalt or other bituminous substances, stone, or materials for the preparation of artificial stone, cement, or concrete, and to develop, exercise, and turn to account the same.

(3) To crush, with g.t. quarry, smelt, calcine, refine, dress, amalgamate, manipulate and prepare for market asphalt and other bituminous substances, concrete, cement, stone, and artificial stone, and to carry on any other mining, mineralogical, or manufacturing operations which may seem conducive to any of the Company's objects.

(4) To purchase, acquire, import, export, manufacture, use, sublet, sell, exchange, deal in, and turn to account asphalt and other bituminous substances, concrete, cement, stone, artificial stone, wood, or other similar materials.

(5) To obtain or purchase and to undertake, work, execute, and carry out any contract for making asphalt, concrete, cement, stone, artificial stone, or other foundations for buildings and other works, or for paving or covering any places with asphalt or other bituminous substances, concrete, cement, stone, artificial stone, or wood or other similar materials, or any contracts for any other purpose for which asphalt or other bituminous substances, concrete, cement, stone, artificial stone, or wood may be found useful, and to carry out any ancillary or other works comprised in such contracts, and also to sublet any such contracts to any other person or company, and to contract with any person or company to supply him or them with asphalt or other bituminous substances, concrete, cement, stone, artificial stone, or wood.

(6) To carry on the businesses of Manufacturing and other Chemists, Importers, and Manufacturers of and Dealers in Chemical, Industrial, and other Preparations and Articles, Compounds, Cements, Oils, Paints, Pigments, and Varnishes, Makers of and Dealers in Electrical and Chemical Materials.

(7) Generally, to carry on the businesses of an Asphalt Company, Contractors, Engineers, Road Makers and Paviors; and to work and develop the same businesses, and to grant licences and concessions to other companies or persons for the same purposes or any of them.

(8) To carry on any other business (whether manufacturing or otherwise) which may seem to the Company capable of being conveniently carried on in connection with the above, or calculated directly or indirectly to enhance the value of or render more profitable any of the Company's property or rights.

(9) To purchase or by other means acquire, sell, exchange, deal in, and turn to account any freehold, leasehold, or other property for any estate or interest whatever, and any rights, privileges, or easements over or in respect of any property, and any buildings, factories, mills, works, wharves, roads, railways, tramways, machinery, engines, rolling stock, plant, live and dead stock, barges, vessels, or things, and any real or personal property or rights whatsoever which the Company may think necessary or convenient for the purposes of its business, or necessary for, or convenient to be used with, or likely to enhance the value of any other property of the Company.

(10) To build, construct, maintain, alter, enlarge, pull down, and remove or replace any buildings, factories, mills, offices, works, wharves, roads, railways, tramways, machinery, engines, walls, fences, banks, dams, sluices, or water-courses, and to clear sites for the same, or to join with any person, firm, or company in doing any of the things aforesaid, and to work, manage, and control the same, or join with others in so doing.

(11) To apply for, purchase, or by other means acquire and protect, prolong and renew, whether in the United Kingdom or elsewhere, any patents, patent rights, brevets d'invention, licences, protections, concessions, and the like conferring any exclusive or non-exclusive or limited right to use or any secret or other information as to any invention which may appear likely to be advantageous or useful to the Company, and to use and turn to account

and to manufacture under or grant licences or privileges in respect of the same, and to expend money in experimenting upon and testing and in improving or seeking to improve any patents, inventions, or rights which the Company may acquire or propose to acquire.

- (12) To acquire and undertake the whole or any part of the business, goodwill, and assets of any person, firm, or company carrying on or proposing to carry on any of the businesses which this Company is authorised to carry on, and, as part of the consideration for such acquisition, to undertake all or any of the liabilities of such person, firm, or company, or to acquire an interest in, amalgamate with, or enter into any arrangement for sharing profits, or for co-operation, or for limiting competition, or for mutual assistance with any such person, firm, or company, and to give or accept, by way of consideration for any of the acts or things aforesaid or property acquired, any Shares, Debentures, Debenture Stock, or securities that may be agreed upon, and to hold and retain, or sell, mortgage, and deal with any Shares, Debentures, Debenture Stock, or securities so received.
- (13) To improve, manage, cultivate, develop, exchange, let on lease or otherwise, mortgage, sell, dispose of, turn to account, grant rights and privileges in respect of, or otherwise deal with all or any part of the property and rights of the Company.
- (14) To invest and deal with the moneys of the Company not immediately required upon such securities and in such manner as may from time to time be determined.
- (15) To lend and advance money or give credit to such persons and on such terms as may seem expedient, and in particular to customers and others having dealings with the Company, and to give guarantees or become security for any such persons.
- (16) To borrow or raise money in such manner as the Company shall think fit, and in particular by the issue of Debentures or Debenture Stock (perpetual or otherwise), and to secure the repayment of any money borrowed, raised, or owing by mortgage, charge or lien upon the whole or any part of the Company's property or assets (whether present or future), including its uncalled capital, and also by a similar mortgage, charge or lien to secure and guarantee the performance by the company of any obligation or liability it may undertake.
- (17) To draw, make, accept, endorse, discount, execute and issue promissory notes, bills of exchange, bills of lading, warrants, debentures, and other negotiable or transferable instruments.
- (18) To enter into any arrangements with any Governments or authorities (supreme, municipal, local or otherwise), or any corporations, companies or persons that may seem conducive to the Company's objects or any of them, and to obtain from any such Government, authority, corporation, company or person any charters, contracts, decrees, rights, privileges and concessions which the Company may think desirable, and to carry out, exercise and comply with any such charters, contracts, decrees, rights, privileges and concessions.
- (19) To subscribe for, take, purchase, or otherwise acquire and hold shares or other interest in or securities of any other company having objects altogether or in part similar to those of this Company, or carrying on any business capable of being conducted so as directly or indirectly to benefit this Company.
- (20) To act as agents or brokers and as trustees for any person, firm or company, and to undertake and perform sub-contracts, and also to act in any of the businesses of the Company through or by means of agents, brokers, sub-contractors or others.
- (21) To remunerate any person, firm or company rendering services to this Company, and in particular any servant or employee of the Company, either by cash payment or by the allotment to him or them of Shares of the

Company credited as paid up in full or in part, or by giving to him or them a share or interest in the profits of the Company, or by a combination of two or more of these modes, or in such other manner as the Company shall think fit.

- (22) To pay all or any expenses incurred in connection with the formation, promotion and incorporation of the Company, or to contract with any person, firm or company to pay the same, and to pay commission to brokers and others for underwriting, placing, selling or guaranteeing the subscription of any Shares, Debentures, Debenture Stock or securities of this Company.
- (23) To support and subscribe to any charitable or public object, and any institution, society or club which may be for the benefit of the Company or its employees, or may be connected with any town or place where the Company carries on business; to give pensions, gratuities or charitable aid to any person or persons who may have served the Company, or to the wives, children or other relatives of such persons; to make payments towards insurance; and to form and contribute to provident and benefit funds for the benefit of any persons employed by the Company.
- (24) To procure the Company to be registered or recognised in any Colony or Dependency or in the Empire of India, and in any Foreign Country or Place.
- (25) To promote any other company for the purpose of acquiring all or any of the property or undertaking any of the liabilities of this Company, or of undertaking any business or operations which may appear likely to assist or benefit this Company, or to enhance the value of any property or business of this Company, and to place or guarantee the placing of, underwrite, subscribe for, or otherwise acquire all or any part of the shares or securities of any such company as aforesaid.
- (26) To sell or otherwise dispose of the whole or any part of the undertaking of the Company, either together or in portions, for such consideration as the Company may think fit, and in particular for shares, debentures, debenture stock, or securities of any company purchasing the same.
- (27) To distribute among the Members of the Company in kind any property of the Company, and in particular any shares, debentures, debenture stock, or securities of other companies belonging to this Company, or of which this Company may have the power of disposing.
- (28) To do all or any of the above things in any part of the world.
- (29) To do all such other things as may be deemed incidental or conducive to the attainment of the above objects or any of them.

And it is hereby declared that the intention is that the objects specified in each Sub-Clause of this Clause shall, except where otherwise expressed in such Sub-Clause, be in nowise limited or restricted by reference to or inference from the terms of any other Sub-Clause or the name of the Company.

4. The Liability of the Members is Limited.

5. The Capital of the Company is One Hundred Thousand Pounds, divided into One Hundred Thousand Shares of One Pound each.

And Notice is further given that the said Petition is directed to be heard before His Lordship Mr. Justice Astbury on Friday, the 20th day of February, 1914, and any person interested in the said Company, whether as creditor or otherwise desirous of opposing the making of an Order for the confirmation of the said alteration under the above Act, may appear at the time of hearing by himself or his Counsel for the purpose, and he is required to give two clear days' previous notice of his intention so to appear with the grounds of his objection to the undersigned, the Solicitors of the said Company. A copy of the said Petition will be furnished to any such person requiring the same by the undersigned on payment of the regulated charges for the same.

Dated the 3rd day of February, 1914.

WILLIAM STURGES & CO.,

Caxton House, Westminster.

Solicitors for the Company.

CORPORATION OF MADRAS.
SPECIAL WORKS DEPARTMENT. DRAINAGE
SECTION.

CONTRACT M. & M., No. 21.

The Corporation of Madras is prepared to receive Tenders from competent persons willing to enter into a Contract for the Supply and Delivery of 2,000 Cast-iron Manhole Covers and Frames.

Forms of Tender prepared by J. W. Madeley, Esq., M.A., M.INST.C.E., M.A.M.SOC.C.E., &c., Special Engineer to the Corporation of Madras, may be obtained from the undersigned, Agents to the Corporation, on payment of 4 (four) shillings per set, which will not be returned.

Tenders, accompanied by a deposit in currency notes or a draft on a Madras Bank for Rs.200, should be sent direct to the President, Corporation of Madras, so as to reach him at or before 12 noon on the 24th day of March, 1914.

The Corporation does not bind itself to accept the lowest or any Tender.

(Signed) JAMES MANSERGH & SONS,
Agents to the Corporation.

5 Victoria-street,
Westminster,
London, S.W.

February 4, 1914. (1,253)

DRUXFORD RURAL DISTRICT.
SUPPLY OF GRANITE OR HARD STONE.

The Rural District Council of Druxford invite Tenders for the supply and delivery of about 1,300 tons of Granite or Hard Stone.

Forms of Tender may be obtained of Mr. A. V. Carter, Surveyor, Druxford, Hants.

Tenders must be delivered to me in an envelope, sealed and endorsed "Tender for Granite," not later than Monday, the 16th March, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

H. GODFREY PEARSON,
Clerk.

Bishop's Waltham, Hants.
February 3, 1914. (1,256)

BOROUGH OF MANSFIELD.

The Corporation of Mansfield invite Tenders for the supply of the following Materials for a period of Twelve Months, ending 31st March, 1915 -

1. Granite, Slag and Tar-macadam.
2. Natural Flags, Kerbing, Channelling and Concrete Flags.
3. Portland Cement.
4. Stoneware Pipes, Junctions, Bends, &c.
5. Timber.
6. Sewer Ironwork and Castings.
7. Coal.
8. Ironmongery and General Stores.
9. Paints, Oils, Varnish, &c.
10. Brooms and Brushes.
11. Disinfectants.
12. Supply and Repair of Harness.
13. Supply of Groceries, Drysaltery, Soups and Sundries.
14. Butcher, Fishmonger, Baker, &c.

No Tender will be accepted from any person or firm paying to any workmen employed by him or them, whether on work for the Corporation or any other person, less than the standard rate of wages, or not complying with the recognised conditions of labour in the Borough.

Specifications, Schedules, and Forms of Tender may be obtained on application to Mr. Thos. P. Collinge, Assoc.M.INST.C.E., Borough Engineer and Surveyor, Exchange-row, Mansfield.

Sealed Tenders, endorsed "Tender for Stores," addressed to the undersigned, to be delivered on or before 12 o'clock noon on Monday, 23rd February, 1914.

J. HARROP WHITE,
Town Clerk.

Mansfield.
February 3, 1914. (1,252)

THE FINSBURY BOROUGH COUNCIL
invite Tenders for the underment oned Supplies,
&c., from 31st March next:

For Six Months
Fodder.*
For Twelve Months
Carbolic Acid.
Castings.
Chandlery, Oil, Brushes, &c.
Grants.
Horse and Cart Hire.
Pitch and Creosote Oil.
Portland Cement and Lime.
Sand Ballast, &c.
Stoneware Goods.
Timber.
Wood Paving Blocks.
Workmen's Clothing.
York Paving and Patent Stone.

Particulars and Forms of Tender may be had any day save Saturdays from 10 to 4, and on Saturdays from 10 to 12, on application to the Borough Surveyor at the Town Hall, except that in the case of items marked with an asterisk, similar application should instead be made to the Cleansing Superintendent, 24 Wharf-road, City-road, N. Postal requests must be accompanied by a stamped and addressed foolscap envelope.

Tenders, marked outside "Fodder," or as the case may require, must be delivered to me at this Town Hall not later than Saturday, 21st February inst.

Only those made upon the Official Form and properly filled up and signed, and confined to the articles specified therein, will be entertained.

GEORGE WHITEHEAD PRESTON,
Town Clerk.

Finsbury Town Hall,
Rosebery-avenue, E.C.
February 2, 1914. (1,250)

SHIPSTON-ON-STOUR RURAL DISTRICT COUNCIL.

SHIPSTON-ON-STOUR SEWERAGE AND SEWAGE
DISPOSAL WORKS.

CONTRACT No. 1.

The Shipston-on-Stour Rural District Council invite Tenders for the Provision, Laying and Jointing of about 3,632 yds. of 9-in. and 6-in. Stoneware Pipe Sewers, and about 300 yds. of 5-in. Cast-iron Rising Main; also the construction of Manholes, Lampholes and Flushing Chambers, Engine-house and Pump Well, Liquefying and Storm Tanks, Bacteria Beds, Sludge Beds, Approach Road and Footbridge, and other incidental works in accordance with the Drawings and Specification prepared by the Engineers.

Drawings and Specification may be seen, and Bills of Quantities and Form of Tender obtained, at the Offices of the Engineers, Messrs. Willeox & Raikes, 63 Temple-row, Birmingham, on or after the 9th day of February, 1914, on payment of a deposit of three Guineas, which will be refunded on receipt of a *bona-fide* Tender and the return of all documents to the Engineers.

Sealed Tenders, in envelopes supplied, endorsed "Sewerage and Sewage Disposal Works: Contract No. 1," to be delivered at my office not later than 12 o'clock noon on the 2nd day of March, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

WILLIAM ELLIS COE,
Clerk to the

Shipston-on-Stour Rural District Council.

Shipston-on-Stour.
February 2, 1914. (1,243)

BOROUGH OF OSSETT.

The Corporation of Ossett invite Tenders for the supply of Materials, Stores, Workmen's Tools, &c., required in the Highways, Gas, Lighting, Water, Sanitary and Educational Departments for one year from the 1st April, 1914, to 31st March, 1915.

Specification and Forms of Tender may be obtained at the Borough Surveyor's Office on application.

Sealed and endorsed Tenders to be delivered to me, the undersigned, at the Town Hall, Ossett, not later than 10 a.m., the 21st day of February, 1914.

The Corporation do not bind themselves to accept the lowest or any Tender.

T. W. WILSON,
Town Clerk.

Town Hall,
Ossett.

WESTRUMITE ASPHALT.

(LAID COLD.)

The **Ideal Asphalt Road** and the only method by which Natural Asphalt can be applied **Cold** in exactly the same manner as cement concrete: a simplicity which enables Surveyors to carry out work by direct labour. An Expert to supervise the Mixing and Laying is provided. **No Heating Plants are Required.**

A **Westrumite Asphalt Wearing Surface** 2 in. thick can be laid on a Macadam or Concrete foundation. Miles of roads, thus constructed, are found after seven years' wear to be **equal to when laid.**

Westrumite Asphalt is proving a **Boon for Tar-macadam Roads**, as being the only form in which Natural Asphalt can be used as a complete void-filler, as it penetrates the surface to a depth of at least one inch. An Asphalt Surface is thus obtained which neither heat nor cold can affect, thereby adding years to its life

Water-bound Macadam Roads can be given a perfect asphalt surface by using **Westrumite Asphalt** in a matrix of limestone dust, and applying it after the interstices of the macadam have been thoroughly cleaned out. The method is second to none for all classes of roads in the country, the process being so simple that ordinary roadmen can operate it.

HAMPTON URBAN DISTRICT COUNCIL. SUPPLY OF MATERIALS, &c.

The above Council hereby invite Tenders for the Supply of:—

- (1) Hand-broken Granite.
- (2) Granite Chippings.
- (3) Broken Kentish Brown Flints.
- (4) Derbyshire Limestone Marble Tar-paving Material.
- (5) Forage.
- (6) House Coal and Coke.
- (7) Best Scavengers' Bass Brooms.

Forms of Tender, Conditions, and all particulars may be obtained at the Offices of the Council, Hampton, Middlesex, where Tenders must be delivered, sealed and endorsed "Tender for —," not later than 5 p.m. on Thursday, the 26th day of February, 1914.

Dated this 2nd day of February, 1914.

(By order)

SIDNEY H. CHAMBERS,
Surveyor to the Council.

Public Offices,
Hampton, Middlesex. (1,251)

BOROUGH OF RAWTENSTALL. TENDERS FOR MATERIALS, LABOUR, PRINTING, STATIONERY, NEWSPAPERS, AND MAGAZINES.

The Corporation of Rawten-stall invite Tenders for the Supply of the following:—

(1) Road Metal, Earthenware Pipes, Gullies, Timber, Pitch, Creosote Oil, Disinfectants, Portland Cement (British), Iron Castings, Local Stone (Flags, Setts, &c.), Coal, Workmen's Tools, Scavenging Brushes, and Horse-shoeing. Also for the Carting of Road Metal from the Railway Stations and for Team Labour.

(2) Printing and Stationery required by the various departments.

(3) Newspapers and Magazines required at the Public Library.

Forms of Tender can be obtained on application to the Borough Surveyor, Town Hall, Rawten-stall.

Sealed Tenders, endorsed with the names of the articles tendered for, must reach the Town Clerk's Office, Rawten-stall, not later than twelve o'clock noon on Thursday, the 19th instant.

The Corporation do not bind themselves to accept the lowest or any Tender.

N.B.—Tender Forms will not be issued unless applied for, and no Tender will be considered that is not delivered within the prescribed time.

(By order)

JAMES WHALLEY,
Town Clerk.

Town Hall, Rawten-stall.

Vol. XLV.

FEBRUARY 13, 1914.

No. 1,152.

Minutes of Proceedings.

Society of Engineers: Presidential Address.

Last week we discussed that portion of Mr. H. C. H. Shenton's address which dealt with professional matters, and we feel that no apology will be needed from us by those who have perused that address for devoting a further portion of our space to the technical section. Before doing that, however, we wish to draw attention to the arguments advanced by Mr. Shenton against the existing method of remunerating the consulting engineer. While the fee is based upon a percentage upon the cost of the work, the more personal attention he gives to a scheme in order to reduce the cost to the lowest point compatible with efficiency the less will be his rate of payment. "Thus the careless or incompetent person who designs works of an unnecessarily expensive character will receive a much larger fee than the better engineer who works out a thoroughly economical scheme." This is obviously an anomaly, but the arguments in favour of its abolition should be addressed to local authorities and others who employ engineers, and if the Society of Engineers can do anything in this direction it will be performing good work. Another important point in connection with engineering is the economy of scientific treatment. This was discussed in the address in connection with water supply works, but it is, in our opinion, equally applicable to works of sewerage and sewage disposal. It was pointed out, as we have ourselves stated on many occasions, that the engineer must work with the chemist and bacteriologist, and that it is absolutely essential that water supply problems should be placed in the hands of those who can deal with them scientifically, and utilise the latest knowledge and experience on the subject. Mr. Shenton cited several cases, notably that of the water supply of London, in which the application of the sciences of chemistry and bacteriology has been of great value in solving difficult problems. While the larger and more wealthy local authorities are frequently willing to incur the necessary expense involved in the employment of additional scientific advisers, the smaller authorities seldom possess sufficient knowledge to see that such expense is, in most cases, well advised and the best economy in the end. Here, again, the Society of Engineers might do good work in educating our local government bodies.

In his general review of matters pertaining to works of water supply, Mr. Shenton emphasised the urgency of several reforms which have been suggested in various quarters. Among these are a systematic hydrographical survey for the whole kingdom, and the establishment of rivers boards with a central authority, so that the national water supply shall be considered as a whole, and combination, rather than separate action, among local authorities shall be organised. He also referred to the value of water waste detection, and gave particulars of an instance where the adoption of this method of investigation would have been the means of preventing the expenditure of a considerable sum in duplicating existing works, including well,

reservoir and pumps. Reference was also made to a suggestion in a recent Memoir of the Geological Survey that the chalk water-bearing stratum under London, in which the water level has fallen 100 ft. or more within recent years, should be replenished artificially with water. So far as we are aware, with the exception of Mr. Bryan's experiment, nothing has been done to put this into practice on a large scale, and unless there are grave objections to the adoption of the idea, it occurs to us that it would be an excellent method of storing the flood waters of the Thames without necessitating the enormous expense involved in constructing additional reservoirs.

In dealing with sewage disposal, after giving a clear and concise description of the recommendations contained in the latest report of the Royal Commission, Mr. Shenton expressed the opinion that "it must not be thought that there is any probability of persons or authorities being allowed to discharge unscreened crude sewage into rivers which serve as sources of water supply, though it is quite conceivable that in some cases where the dilution is sufficient, filters may be omitted." To this we would add that, from the experience gained in other countries, it is improbable that the discharge of unscreened sewage will be permitted under any circumstances, and that the utmost relief we may expect, in special circumstances only, is the omission of filters in a few cases. It is also gratifying to us to note that Mr. Shenton, who has obtained excellent results with a large number of contact beds which he has constructed in various parts of the country, agrees with what we have stated on several occasions, to the effect that where this system has proved unsuccessful it has usually been due to bad construction and improper operation. He also added that in this way "bad results have been produced, and discredit has been thrown upon a system which should be of very great value to the engineer," an expression of opinion with which we thoroughly agree. On the importance of good management Mr. Shenton spoke very strongly, and we heartily endorse his testimony to the excellent work of sewage works managers in their difficult and frequently arduous duties. Bad management will render the best designed works ineffective, while good management can often produce excellent results from a poorly designed and badly constructed works. In conclusion, we congratulate the Society of Engineers in having elected a president who evidently does not intend to allow his office to become a sinecure, and we hope the members of the Society will rise to the occasion and support him in every possible way.

* * *

Sewage Disposal by Dilution.

Although the letter on another page from Mr. Hugh Howell, M. Inst. C.E., chief inspector of the Rivers Mersey and Irwell Joint Committee, reached us after the foregoing notes upon the technical portion of Mr. H. C. H. Shenton's presidential address to the Society of Engineers were written, we gladly take this opportunity of complying with his request to deal with the subject of the *quality*

of the water which may be used for the disposal of sewage or sewage effluents by dilution. As a matter of fact, the point is very clearly stated in Mr. Stowell's letter, and should not need any further emphasis. We had noticed the omission from the "Summary of Conclusions" at the end of the Eighth Report of the Royal Commission, of any reference to the quality of the diluting water or its contents of dissolved oxygen, but we had in mind not only section 25 in the body of the report (p. 7), but also sections 16 and 17 (p. 5), dealing with the "quality of water as a factor in a graduated scale of standards." In section 17 it is clearly stated that "for the purpose of arriving at a standard, or scale of standards, the quality of the diluting water should be assumed to be constant and represented by the figure 0," which is the average figure for a *clean* water. In addition to this, in our special issue of January 31, 1913, p. 181, we stated that "a system of treatment by dilution in a river already highly polluted would, of course, be unsatisfactory, even if the amount of dilution is high. . . ." It is true that the Royal Commission state (Eighth Report, p. 7) that there may be *extreme* cases where the relative volume of the stream is very small and its actual quality is very poor, and the most exacting standard which could be attained would be insufficient to prevent the occurrence of offensive conditions. In such cases the commissioners considered that regard should not be had to the quality of the water, but only to the dilution, reliance being placed on the enforcement of standards in the upper reaches to improve the quality of the water in question. It should be noted, however, that this refers to the question of the adoption in certain cases of *especially stringent standards*, and that there is no suggestion that anything less stringent than the general standard as set forth in paragraph (c) of the "Summary of Conclusions" would be permitted. On the other hand, in the following section, they think that a claim for a relaxed standard may be entertained under certain conditions, the first of which is that mentioned by Mr. Stowell in his letter - *i.e.*, "when it can be shown that the particular river water is of such *quality* and volume that, when mixed with a sewage or sewage liquor of known or calculated strength and volume it does not, or would not, take up more than 0.4 part per 100,000 of dissolved oxygen in five days," which presupposes that the river water is of the quality described above as "clean." Apart from all this it should be understood that the object in view in all these accommodations is the prevention of nuisance in our streams and rivers, and we believe that no relaxation of standards will be permitted which may in any way tend to obstruct the attainment of that object or to postpone an improvement in the condition of rivers which are at present polluted.

**A New Departure
in
Pile Construction.**

During the last few years there have been a number of important advances in the art of constructing pile foundations. There have been devised several methods by means of which a concrete pile can be formed in solid and even in soft ground, and devices enabling the engineer to spread out the concrete at the toe of the pile have been adopted with success. By the use of the water-jet the rate at which piles can be sunk has in many cases been greatly accelerated, and the cost of sinking much reduced. Of solid piles, not formed in the ground, but driven or sunk into it, there are now three principal classes - timber piles, screw piles, and ferro-concrete piles. In the employment of the last-named there has been steady progress in matters of detail - lengthening, connection with bracing, and so forth - and some advances have been made in the measures taken to protect timber piles from the attacks of

bore-worms, and to render the concrete of ferro-concrete piles as resistant as possible to sea-water. In recent years there has been, however, no radical departure in the actual methods of construction of preformed piles, and we have therefore given prominence, in another part of this issue, to an account of a method of combining, in one coupled piece, a ferro-concrete and a timber pile, and a description of a device by means of which timber piles can be coupled so as to provide, at moderate cost, a pile of any required length. Our readers will draw their own conclusions as to the merits of the invention - the coupling itself - and of the idea which suggested the construction of the compound pile - namely, the advantage of using ferro-concrete and timber together in such a manner that one or both of them may be immune from influences causing corrosion or decay.

This basic idea seems to be of considerable importance, and the coupling described promises to provide a sound engineering joint; but, although there is much sound argument in Prof. Schönhöfer's contentions, it is impossible wholly to accept his conclusions, or even to admit that his promises are without flaw. In the first place, Prof. Schönhöfer's idea as to the corrosive effects of certain soil and water contents on concrete seems to be exaggerated; in the second place, it is evident that the Heimbach joint would itself be specially liable to attack in some of the situations described; and, thirdly, the difficulty of designing the work so as to secure the desired immunity for the timber or the concrete, or both, would often be very great, and would considerably restrict the scope or diminish the advantages of the compound piling. In the case of a sea work, such as that described in the article, the joint could, as is suggested, be protected from rust; but so could a corresponding length of timber pile be protected from the attacks of bore-worms, or a ferro-concrete pile from the corrosive action of sea water. Even if this were not the case, the argument, as stated, would apply only to very shallow waters. It would seem, indeed, that the case for the compound pile would be stronger if less stress were laid upon the ill-effects of sea water and marsh waters upon concrete, a consideration which is favourable to the design, since these effects are probably exaggerated in the "brief." Since, however, the importance of such effects is insisted upon, it must be remarked that a difficulty arises in situations in which the concrete would be affected by the water, below the lowest level of which the timber portion of the pile must be driven. Practically, in most cases the exposure of the concrete between these levels would be the lesser evil; but we must not forget the coupling, the susceptibility of which to rusting would be a serious matter. It is evident that this coupling would often be inaccessible after the completion of the work, or could only be reached at considerable expense. Further, the lowest water level is often at a considerable depth below the surface of the ground, and there would in situations of this kind be much difficulty in making the joint, especially in wet ground, since the timber pile has to be driven to its proper depth before the reinforcement is placed in the upper part of the tube and the concrete filled in. It is to be presumed, though the point is not referred to in Prof. Schönhöfer's article, that the ferro-concrete portion of the pile would sometimes be made beforehand, and its projecting reinforcement carried into the tube, though, when not attended with any special difficulty, the method of construction by moulding in situ might be preferred. It may be remarked, in conclusion, that there is a considerable range of conditions under which the above criticisms would not apply, or would apply with less force, and there seems to be in Mr. Heimbach's methods quite enough merit to ensure a considerable application of them in small and large works.

Buildings for Small Holdings.

At the meeting of the Society of Architects held last night the members were privileged to hear an excellent paper by Mr. A. Ainsworth Hunt on the important subject of "Buildings for Small Holdings." Needless to say, Mr. Hunt, who is a member of the Departmental Committee of the Board of Agriculture on the subject, was able to speak with great authority; and his concluding hint that architects should pay particular attention to small holdings for the next few years, as large sums of money will inevitably be spent upon them, will doubtless be widely acted upon. Mr. Hunt pointed out that when the Small Holdings Act, 1909, was first introduced, there were no regulations as to what should be provided in the way of buildings, with the result that each county council was a law unto itself. The consequence is seen in the comparative costliness and unsuitability of many of the earlier buildings. The Departmental Committee was appointed mainly in order to insure an improvement in these respects. In the words of Mr. Hunt, the great problem in the proper equipment of a small holding is to provide, at the smallest cost, buildings which will be suitable and sufficient for the holdings concerned, but not in excess of their practical requirements. Insufficient or unsuitable equipment must lessen the productive capacity of the holding; while, on the other hand, excessive equipment must represent so much dead weight upon it, and involves the occupier in expenditure for which he can get no real return. Mr. Hunt's paper dealt separately with the construction of the house and of the necessary farm buildings, and was illustrated by several designs, all of which we reproduce elsewhere in this issue. We may perhaps draw attention, as of special interest, to the design for a pair of cottages erected at various places in West Suffolk at prices varying from £310 to £345, and to the designs for single cottages erected for £250 and £206 respectively. While making a special appeal to those more directly concerned with rural development, Mr. Hunt's paper will also be found of interest to all who are called upon to consider questions appertaining to inexpensive cottage design.

* * *

A Warning.

As long ago as November last we commented on a case which had then recently been heard in the Market Harborough County Court, and in which the Stellovite Company, of 60 Rue de la Victoire, Paris, unsuccessfully sued a local builder and others for various amounts alleged to be due for steel supplied. Following upon our reference to this case we heard in connection with the same firm of several other instances of a similar kind which seemed to show that the firm's operations were on an extensive scale. In one case, to which we alluded in our issue of December 5th last, there was a threat of legal proceedings against a local authority in respect of an "order" given by their surveyor, but, so far as we have heard, these proceedings have never matured. Complaints continue to reach us with such frequency as to demonstrate beyond doubt that certain foreign firms dealing in steel are still systematically obtaining orders—in many cases from the surveyors to local authorities—usually in a foreign system of weights, under such circumstances that the person giving the order does not realise the amount or price of the goods. The usual method adopted appears to be to coax an unwary and busy official into giving an apparently small order for a sample bar "just as a trial." Presently a bill is presented for several hundredweight of steel at an exorbitant price. It cannot be too clearly pointed out, therefore, that orders should not be given to these specious travellers for steel of special quality without the clearest understanding of what the transaction means in pounds, shillings and pence, and the exact value

being written upon the face of the order before it is given. Further, the full name and address of the firm should be definitely ascertained, and a sample of the steel to be supplied should be insisted upon, such sample to be retained by the person giving the order. We understand that a determined attitude in regard to the last-named condition often causes the canvasser to beat a retreat!

Consulting Engineers.

In another column will be found an account of the very successful inaugural dinner of the Association of Consulting Engineers held recently under the presidency of Mr. G. Midgley Taylor. At the time when the association was formed we pointed out the advantages which might be expected to follow advantages which were epigrammatically described by Mr. J. H. Balfour-Browne, K.C., as "keeping the profession of engineering on the heights." The speech made by Mr. Balfour-Browne will be of special interest to our readers, because he had something to say in regard to the profession of municipal engineering. We are in cordial agreement with the view to which he gave utterance that "municipal engineers should devote all their time and attention to the work of the municipality, and be adequately paid for doing this duty." We are unable, however, entirely to concur in the observations which followed in regard to municipal engineers engaging in private practice. With the grant of adequate remuneration by local authorities in every case, we think that it ought not to be necessary for engineers holding public appointments to look elsewhere for a livelihood. But where this course has to be followed we do not agree that a municipal engineer is in any way unfitted to do consulting work because "he is liable to have a narrow outlook." So long as he sticks to matters which are within his special province, and in regard to which he is a real "specialist," there is no reason why the municipal engineer should not be a thoroughly efficient consultant. We do not desire, however, to be unduly critical of a speech, the occasion of which was a highly enjoyable gathering to celebrate the successful launching of an association, the formation of which in our view must tend to the benefit of the engineering profession generally.

Highway Developments in California.

References to the State roads of California will be found in our issues of December 13, 1912, and June 27, 1913, and we hope to be able to place before our readers further notes as to the development of the highway system of that state, and engineering features of the roads constructed by the Highway Commission. Through the courtesy of responsible officials in different parts of the world, we are in a position to record, from time to time, the developments which take place in a considerable number of countries in which the highway work carried out is interesting in itself, and where the conditions are more or less typical of important areas in many different climates, and under various economic conditions. From the United States we received much interesting information relating to the small eastern states and New York State, and, finding that in the case of California we had an opportunity of recording developments from the date at which the Highway Commission was appointed, we are paying special attention to that state, which, by reason of its area and population, represents conditions quite distinct from those of European countries of about the same area, and distinct too, from those of provinces with about the same population but of much less extent. Some notes on recent developments will be found on another page of the present issue.

Buildings for Small Holdings.*

By A. AINSWORTH HUNT, Member of the Departmental Committee of the Board of Agriculture on Buildings for Small Holdings.

When the Small Holdings Act was first introduced there were no regulations as to what should be provided in the way of buildings, with the result that each county council or its adviser was a law unto itself. Some of the earlier buildings erected are not very suitable, some are too large and expensive, and planned without due regard to their requirements. To obviate this in future the Board of Agriculture appointed the Departmental Committee on Buildings for Small Holdings, of which I had the honour to be a member. The duties of the committee were generally to consider the most suitable houses and buildings to be erected on small farms of 50 acres and under. In the course of our investigations we visited small holdings in various parts of the country. Although we saw some buildings which certainly were very carefully thought out, the experience we gained from these visits was principally what to avoid. . . . The great problem in the proper equipment of a small holding is to provide, at the smallest cost, buildings which will be suitable and sufficient for the holdings concerned, but not in excess of their practical requirements. Insufficient or unsuitable equipment must lessen the productive capacity of the holding, while, on the other hand, excessive equipment must represent so much dead weight upon it, and involves the occupier in expenditure for which he can get no real return.

PROBLEMS IN PLANNING.

The first question to be considered in planning a set of buildings is: What is the land expected to produce? Speaking generally, I think the buildings should be divided into three groups—(1) market gardening, (2) general farming, (3) dairy farming. The houses for each of these classes of holdings can be much the same, but the farm buildings must be especially arranged for the special purpose for which they are required.

THE HOUSE.

The class of house to be erected must necessarily depend somewhat on the size and nature of the holding. For a holding of, say, 10 acres or under, which is not used as a market garden, a house of the nature of a labourer's cottage will be quite sufficient. This should contain living-room or kitchen, 15 ft. by 12 ft.; scullery, 8 ft. by 10 ft.; larder, 6 ft. by 4 ft.; three bedrooms, 12 ft. 6 in. by 12 ft., 11 ft. by 9 ft., 9 ft. by 8 ft.

This arrangement may be varied by providing a small parlour and a combined living-room and scullery. I will deal with this point again later. An earth-closet should be provided, situated away from the main building, and a good fuel store at least 7 ft. by 5 ft. As the holding increases in acreage, the size of the house must be increased also. A holding of 25 acres should have a sitting-room or parlour. This house would then contain: Parlour, 12 ft. by 10 ft.; kitchen, 13 ft. by 15 ft.; scullery, 10 ft. by 9 ft.; larder, 6 ft. by 4 ft.; fuel store, 7 ft. by 5 ft.; three, or perhaps four, bedrooms, No. 1 12 ft. by 13 ft., No. 2 12 ft. by 10 ft., No. 3 10 ft. by 10 ft., No. 4 9 ft. by 8 ft.

In addition to the above, on most holdings a dairy will be required, the minimum size of which should be 5 ft. by 8 ft. This would only be sufficient for two cows. If the holding is to be devoted principally to dairy farming, the size of the dairy must be increased proportionately.

In considering the planning of the house, the general conditions of house planning will apply, but I should like to draw particular attention to one or two points.

The Kitchen or Living-room.—This is the room in which the family will mainly live. It should, therefore, have the best aspect, which should be south or south-east, even if there is a parlour provided, for experience shows that the kitchen will be always in use, but the parlour only occasionally. Most careful attention should be given to the position of doors and windows. The cooking range should be in this room. It should also contain a good dresser and cupboard. In many districts it is usual to provide a tiled floor.

The Scullery.—In the scullery most of the dirty work of the house is done. This should contain the sink, copper and a small fireplace for occasional use in

summer. It is not necessary to put a proper stove in the fireplace opening; a few bars cross the front and a grating at the bottom are all that are necessary, as wood is generally burnt in the scullery. It is also advisable to put a brick oven, so as to encourage the baking of bread at home. A scullery should not be made too large, or it is likely to be used as a living-room. The door of the scullery must be so placed as to give easy access to the farmyard, and the kitchen or scullery window should command a view of the farmyard, so that the wife may see what is going on out there when the husband is away on the land. Care should be taken to see there is a suitable place for washtubs, mangle, &c. It is also very desirable that a bath should be provided.

The Larder and Fuel Store. These require to be made larger than those of the average small town house. In the larder a larger stock of provisions has to be kept, as shopping is not very convenient in the country. There should be storage room for all kinds of home-made provisions and a barrel of beer, also room for salting-pans for bacon, as these cannot be kept in the dairy. In the fuel store provision must be made for wood as well as coal; it should be borne in mind that in the country coal can seldom be obtained economically in very small quantities.

The Dairy.—On most small holdings a dairy will be required, as one or two cows are almost certain to be kept to provide milk and butter for the family. Under no circumstances should the dairy open into any room in the house, and it must always be quite separate from the larder. It must be well ventilated and lighted, have a north window if possible, and all means of ventilation should be fitted with flyproof wire gauze. The floor should be tiled or stone, with proper means for washing same. The shelves should be of slate, and not fixed quite close to the walls.

The Bedrooms.—In planning the bedrooms, it is important to see there is a suitable place for the beds, a point so often overlooked in cottage construction. In the large bedroom provision is required not only for a double bed, but frequently for one or two cots.

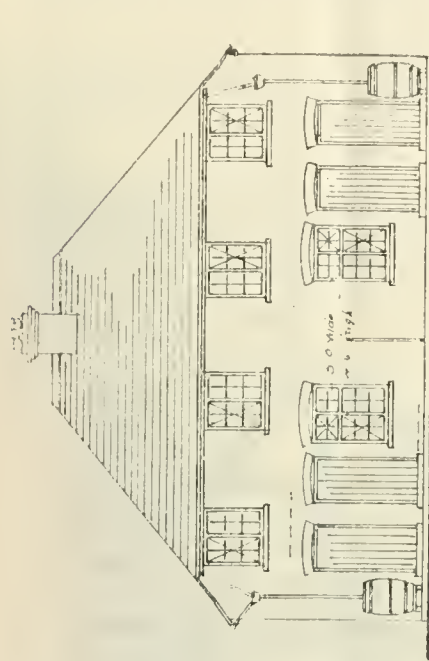

The Parlour.—The question of a parlour in very small houses is a point upon which there is a great difference of opinion. Some people assume that a parlour is not necessary. During the last few years I have erected several different sets of cottages, and provided a large living-room, and put a cooking range in it, and a small scullery containing the copper and sink. I have generally found, on inspecting these when occupied, that the living-room is furnished as a parlour, and the family lives in the scullery, no matter how small it may be. Personally, I am inclined to think that for country houses where only two rooms are provided, it will be much more appreciated by the smallest family if a small parlour is provided, and a large combined living-room and scullery, which would then contain the cooking stove, sink and copper. The sizes of the rooms would then be: Parlour, 12 ft. by 9 ft. 6 in.; living-room, 12 ft. by 13 ft. It is difficult to alter the habits of the labouring classes by providing rooms for them which they will not use as they should. Even the agricultural labourer generally has a few small articles of furniture which he specially values, and likes to display them in his "best parlour," as he generally terms it. A certain amount of house pride may be beneficial in keeping the home neat and tidy. I have several sets of cottages in the course of erection now, where I am providing a small parlour, and a large combined living-room and scullery. I am sorry they are not yet completed to enable me to give my experience of them. When three living-rooms are provided in the larger type of house, a room 12 ft. by 10 ft. 6 in. will be quite large enough for the parlour, and will give a fair-size second bedroom over it.

Wash-houses.—In some districts a wash-house is required away from the house, separated from the scullery. On a small farm a building of this description serves other useful purposes, such as a store for cycles, perambulators, &c. If a separate wash-house is erected, it is not a bad plan to provide two coppers—one for the family laundry, and the other for boiling food for cattle, it being obvious that one copper cannot serve the two purposes.

* Paper read last night at a meeting of the Society of Architects.

The Structure of the House.—In deciding on the structure of the house, much must depend upon the local materials at hand, but the building should be of such a nature as to ensure the minimum of expenditure in subsequent repairs and upkeep. Economy

facing bricks of even colour are not required; good, sound, common bricks, of a texture that will weather well, are preferable in every way. In some cases it may be necessary to provide cavity walls, or use the cheaper kinds of bricks, and rough-cast them. The

First Floor Plan.

PLAN OF COTTAGES FOR SMALL HOLDINGS OF 5 TO 10 ACRES.

(Erected in various places in West Suffolk at prices from £310 to £345 per pair; Mr. A. Ainsworth Hunt, Architect.)

should therefore be sought by careful planning and construction, and not by undue cutting down of the size of the room, or the quality of the materials, workmanship and fittings. In selecting materials, preference should always be given to those which belong to the district. In cases where bricks are used, expensive

old-fashioned method of giving a wide projection to the eaves and gables will materially assist in keeping the walls dry, but the gables should not have an expensive barge board and timber work which is costly in upkeep in the way of painting. The height of the rooms on the ground floor should be 8 ft. from floor

to ceiling, and the bedrooms 6 ft. 6 in. to the springing of the roof and 8 ft. 6 in. to the collars of the ceiling.

The Floors.—The most economical floors are concrete, and will do very well for the scullery, pantry and dairy. The kitchen or living-room floor should be generally of good, red tiles on concrete, but in some districts there is a prejudice against this. A considerable amount of mud is brought into the house at times, and tiles are much easier to clean than boarded floors. If a boarded floor is used, it is likely to be covered with linoleum, and this has a tendency to encourage dry rot, especially on new floors.

Windows.—The simplest and most economical window is the Yorkshire slide, and if oak cills with oak pegs are used instead of the retaining fillet, they are very durable. Casement windows come next in the matter of simplicity, but care should be taken to

Another method is to sink the land immediately adjacent to the outlet, and provide a galvanised iron tank on wheels, the distribution of the water over the land can then be easily carried out. If the ordinary cesspool is provided, it is usually not watertight, with the result that it is liable to percolate into the sub-soil and pollute any well near. If it should be watertight it results in the slop water remaining in the cesspool until it becomes offensive, and then there is a large quantity to deal with at one time, upon the same area of ground.

WATER SUPPLY.

The provision of a good water supply is absolutely necessary for a small farm. The cost of a deep well is generally prohibitive, unless it is intended to supply a group of small holdings.

Front Elevation.

(Erected in 1911 at a cost of £250; Mr. A. Ainsworth Hunt, Architect.)

see that a sufficient amount is made to open, especially above the transom.

THE SITE AND DRAINAGE.

In choosing a site, the cost of the scheme will depend very much on the facilities for water supply and drainage. Where available, land should be chosen which will allow of the houses being placed so that the ground will fall away from them, particularly at the back, where slop water has to be dealt with.

In some districts it is not usual to provide drains or even a sink. The slop water is simply thrown on to the land, but this has a tendency to cause a nuisance near the house. The best means of dealing with the slop water from a small farm is to put the usual sink and gully, and a length of drain, say, 20 ft. to 30 ft. from the house, and from this point lay a few lines of field drains, if the soil is suitable, radiating from a point where the glazed drain stops. The liquid can then easily be distributed where required.

When water can be found at a reasonable depth a shallow well will generally be sunk into the water-bearing stratum, but it is essential to guard against any risk of contamination. The well should be lined with bricks or concrete, and made watertight to a sufficient depth to prevent the percolation of surface water into it.

In some districts where there is no water-bearing stratum at an available depth recourse must be had to the storage of rain water for domestic purposes. In that case a strong storage tank must be provided. This should be built of brickwork or concrete, and made thoroughly watertight, so as not only to retain the water, but exclude any surface water. The top should be domed over much the same as an ordinary well, an overflow pipe should be provided, and this as well as the outlet should be protected by grids to exclude vermin. Arrangements should be made to exclude the first flush of rain water from the tank, as this will not generally be very clean.

The maximum amount spent on the house should

never exceed £350, and on the buildings £400, as this with interest, sinking fund, repairs, management expenses, &c., on a fifty years' loan will be equal to a rent of 5½ per cent or £41 5s., which is as much as a small holder on the maximum of 50 acres can afford to pay.

THE FARM BUILDINGS.

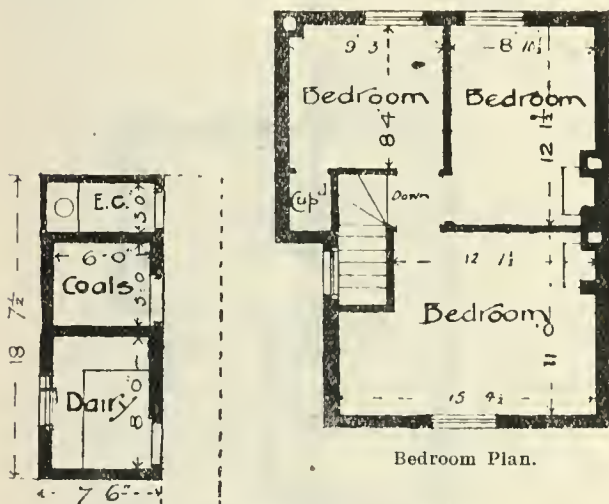

In considering the nature and character of farm buildings necessary to meet the convenience and requirements of small holders, it is obvious that the difficulty of laying down definite rules is even greater than in the case of houses. The house may be much the same, whatever the nature of the holding, but the farm building must be specially planned to meet the requirements of the particular holding concerned.

In planning the buildings allowance should be made for the possibility of future extension, and the type of buildings provided should be capable of being added to without much difficulty, only the minimum of accommodation should be provided at the outset.

An extra loose box is a great convenience. It can be used for so many purposes, for calves, pigs, or a sick animal. The general opinion among modern farmers is that the old-fashioned pig-sty should not be built. Pigs do much better in a loose box, and should have the run of the yard or a field. It is a good plan to provide a low platform of wood upon which the pigs can lie. This should be portable, so that it may be moved when the box is required for other purposes.

All stables should have floors of grooved concrete or grooved paving bricks, and laid with a good fall. Care should be taken to see there is proper ventilation without draught. Barn floors should be of concrete, or preferably of wood. Cart sheds should have backing rails and guard posts. The stables, cow-houses, cattle sheds, &c., should be readily accessible from the barn or mixing-house, so as to save labour in carting fodder.

It is most important that stock-yards should be

PROPOSED COTTAGE ON SMALL HOLDING AT BEYTON.

(Cost £206 18s.; Mr. A. Ainsworth Hunt, Architect.)

If the tenant is consulted beforehand, care must be taken not to provide equipment in excess of what the holding can produce, for he will generally take a rather extravagant view of his requirements, without realising the extra amount of rent or interest involved.

The smallest type of buildings are those required for market gardening or fruit growing. The requirements for this will be: A packing shed, fruit store, stable and cart shed; a rough shed for tools and artificial manure.

A very good timber building of this class could be erected for about £100.

ARABLE HOLDING OF 20 TO 30 ACRES.

The equipment for a holding of this character can be very simple, and would contain the following: Fodder and chaff house, 14 ft. by 15 ft.; stable for two horses, 12 ft. by 15 ft.; cattle shed, 14 ft. by 18 ft.; cart shed, 14 ft. by 18 ft. For holdings of larger size the chief additions would be the provision of loose boxes, cow stalls, and possible stabling for an extra horse.

sheltered from the north and east winds, and at the same time open to the sun and air. The buildings are therefore best planned L-shape, and placed backing to the north and east. All the doors and windows should be on the south and west, and opening into the yard. The cattle will thus, when in the yard, get all the sun and be protected by the buildings from cold winds.

DAIRY FARMING.

The main object on a holding of this description is to provide sufficient cow-houses at the lowest possible cost. The cost will work out at about £10 per stall if built of brick and tile, and £6 or £8 if built of timber.

Cowsheds must comply with the requirements as to cubic space laid down by any regulations adopted by local authorities under the Dairies and Cowshed and Milk Shops Order. The usual minimum space prescribed is 800 cub. ft. per cow, in cases where they are habitually kept in the building, and 600 cub. ft. where they are turned out for part of the day. The

lower figure will be quite as much as is necessary on a farm. In calculating the cubic space, it is usual not to allow anything above 12 ft. in height above the ground line.

The lighting of cowsheds is a matter of great importance, as good lighting is one of the essentials for clean milking. The simplest method is by glass tiles in the roof, but windows should also be provided both for light and ventilation. The space admitting light should not be less than 2 sq. ft. per cow.

The cowshed should have a grooved concrete floor, but rammed clay or chalk for a width of 4 ft. from the manger will make a more comfortable surface for the cows to kneel on, and will help to prevent swollen knees. The gutter should be formed in the concrete with a roughened surface. It should be 2 ft. wide, and 6 in. deep, with a fall of 1 1/2 in. to the gangway, and a semi-circular channel for liquid formed at the back about 3 in. wide. The gutter should have a fall of 1/4 in. per yard, and discharge 6 in. beyond the wall with glazed pipes. A grid should be fixed at the end to prevent solids entering the drain. The drain from

HOMESTEAD ON A SMALL HOLDING AT BUSHBURY.

(Mr. J. M. Hotchkiss, County Land Agent, Stafford.)

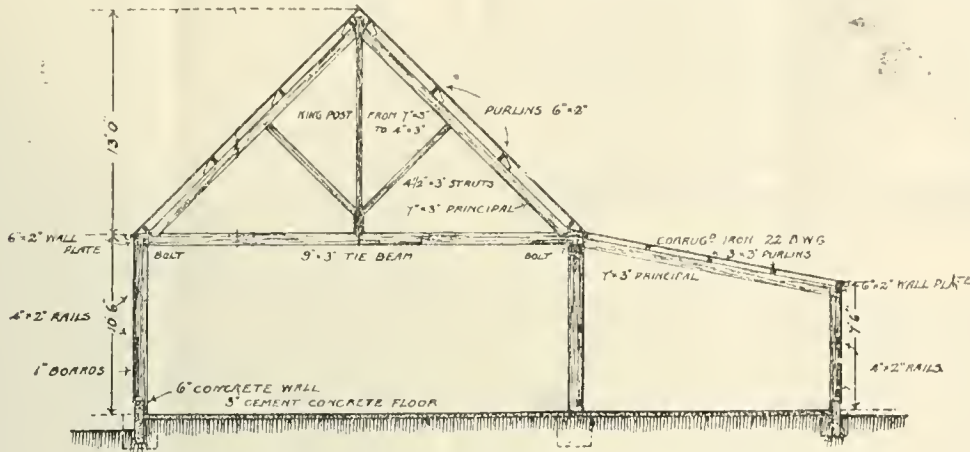

the gully should lead into a liquid manure tank, which should be watertight, and fitted with either a loose top or a pump.

The feeding trough should be a semi-circular trough formed of concrete or glazed stoneware, and should be continuous in length so that it can easily be cleaned out, and if supplied with tap or pump at one end and a waste at the other, it will make a good water trough as well. Arrangements for tying cows are required, but all other fittings, including stall divisions, are superfluous.

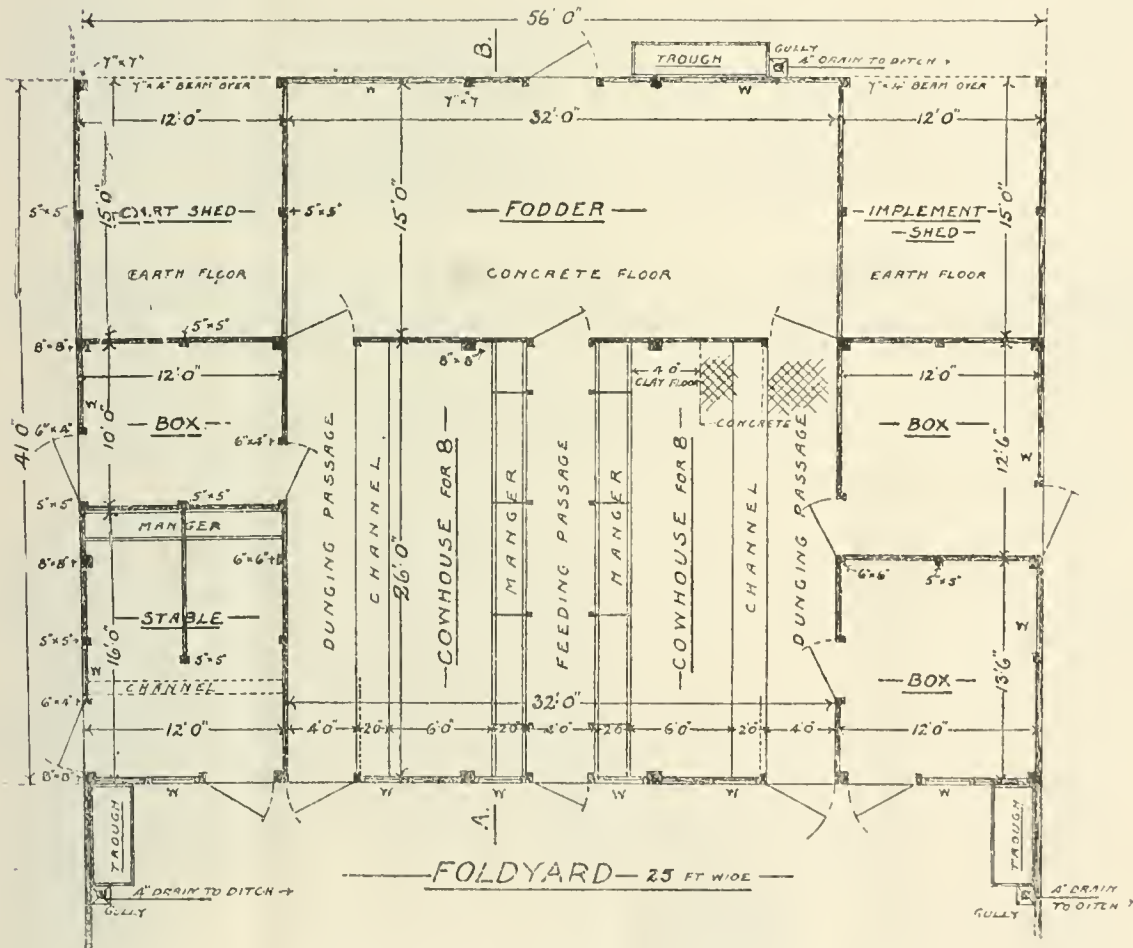

Allowing 3 ft. 6 in. per standing for cows will be

judice against drains of any sort for farm buildings, the liquid manure is run into the yard, which is littered down from time to time to soak up the moisture. If drains are provided, they should all be collected together and run into a manure tank. This should have a pump fixed at a good height from the ground (so that a cart may be backed under it), and the liquid manure pumped into it for carting to the land. If a small holding should be situated in any district which is sewered, the liquid manure should never be run into the drains, as by that means it would be wasted.

A class of farm buildings which is being largely

Section A B.

Ground Plan.

BUILDING FOR DAIRY HOLDING OF 50 ACRES.

(From Report of Departmental Committee.)

quite sufficient, so that twelve cows in a line will require a building 42 ft. long. The width will be 14 ft. to 15 ft., as follows: Feeding trough, 2 ft.; standing, 6 ft.; gutter, 2 ft.; gangway, 4 ft. or 5 ft., preferably the latter. Where there are less than twelve or fourteen cows, a feeding passage is not necessary. It is important in all farm buildings to keep the horses and cows well separated, as any odour arising from the stable is liable to put the cows off their feed, and consequently affect the milk.

In some parts of the country there is a great pre-

used now is provided with what is known as the open (or Yorkshire) boarded roof. These are generally wooden buildings on brick or concrete foundations, with stud walls, weather-boarded outside. The roof is covered with boarding laid at right angles to the purlins, each board being grooved on the top about 1 in. from the edge, and fixed with a space of about 1/4 in. between each board. A roof of this description looks as if rain will simply pour through it, but it does not.

In constructing the walls, three sides must be com-

pletely closed in, and a portion of one side left partly open. This causes a slight upward current of air, and prevents any rain coming through the joints between the boards. The bar and chaff house should be kept at one end of the building, and this portion should be tiled or slated. This class of building is most economical in construction and very healthy for cattle, being warm in winter and cool in summer. They are most suitable for large cow-houses.

In conclusion, I would point out that it is impossible to lay down any definite regulations to suit particular buildings, as agriculture and the method of living differ very considerably in various parts of the country. Architects and county land agents should pay particular attention to small holdings for the next few years, as large sums of money will inevitably be spent upon them, and it is only by care in planning every detail, with special reference to the need of the localities concerned and the industry in question, that the small capitalist can make a living upon his holding.

ASSOCIATION OF CONSULTING ENGINEERS.

INAUGURAL DINNER.

The inaugural dinner of the Association of Consulting Engineers was held at the Whitehall Club, Princes-street, Westminster, on Monday, February 2nd, under the presidency of Mr. G. Midgley Taylor, chairman of the Committee of the Association. The members and guests present numbered about ninety, and included Sir R. Antrobus, K.C., C.B., Sir A. B. W. Kennedy, LL.D., F.R.S., Sir H. Tanner, C.B., D.S.O., Prof. D. S. Capper, Messrs. A. Bruce Anderson, J. H. Balfour-Browne, K.C., H. Percy Boulnois, C. E. C. Browne, W. Duddell, F.R.S., F. Gore-Browne, K.C., Robert Hammond, W. M. Morley, G. Scott Ram, J. F. C. Snell, and James Swinburne, F.R.S.

After the toast of "The King" had been duly honoured, "The Association of Consulting Engineers" was proposed by Mr. J. H. BALFOUR-BROWNE, K.C., who said that he was in the happy position that evening of having a good client whom he need not defend, but only praise. There was a necessity for the new departure which had been made in the formation of that association. It was an attempt to keep the profession of engineering on the heights, that profession which was among the greatest, and whose monument, if it were sought, could not be better indicated than in the word "Circumspice." He could conceive no worse fate for engineers than that they should become an instrument of manufacturers or a slave of a municipal corporation. In order to maintain a profession at its highest level it was essential that it should have an external conscience in addition to the individual consciences of its members. Their society with its rules for moral guidance was a conscience of this kind. When a society was on the down grade its behaviour as a body was worse than the behaviour of its individual members, and the opposite equally applied when a society was on the up grade. Examples of the down grade were to be found in secret societies and of the up grade in the Christian Church. The spirit of a society, the *esprit de corps*, was therefore different from the spirit of the individuals forming it. With regard to trade and commerce the members of the Association of Consulting Engineers must stand in splendid isolation. The engineer was certainly serving God when he was working at his best, but the engineer commercialised was as certainly serving Mammon. The latter was the condition of the State and the municipal engineer when he competed with private enterprise. Continuing, Mr. Browne said he felt very strongly that new trades ought not to be handicapped by the competition of public departments which operated with funds provided by the very people with whom they were competing. Further, State and municipal engineers should not be allowed to compete with what he would call ordinary consulting engineers. They should devote all their time and attention to the work of the municipality, and be adequately paid for doing this duty. If they did devote their time and attention adequately to the work of the municipality they ought to have no time for engaging in private practice. Apart from this there was the danger in a municipal engineer acting in a consulting capacity that he was liable to have a narrow outlook. The variety of the work engaged in by the consulting engineer was his strength, and was apt to give a judicious breadth to his decisions which was invaluable to his client.

In future municipalities would tend more and more to demand whole-time engineers whose work would be subordinated to collectivist doctrines, inimical to the free opinions which should be held by every consulting engineer. The Association of Consulting Engineers was therefore doing good work, both for itself and for the public, in keeping up the standard of the profession.

This toast was replied to by the CHAIRMAN, who said he felt some diffidence in responding to the toast of a new association. It had, however, by this time successfully passed through most of its infantile diseases, and was growing up. He hoped it would have a numerous progeny, and many grandchildren. Mr. Balfour-Browne had described the aims of the association with great exactitude. Its members did not seek to elevate themselves among their brethren. The association was not a scientific society, and its members remained loyal to those societies to which they already belonged. The rules were very definite on this point, and it was not desired to usurp the functions of these high bodies. But no scientific association, having necessarily a very varied membership, could make rules which would be applicable merely to consulting engineers. So, proceeding on the idea that heaven helps those who help themselves, the association had been formed for the better protection both of consulting engineers and of the general public. The lives of the community were as much in the hands of the engineer as in those of the doctor, and that was another reason why this association had been formed as a body of professional men to work on professional lines, and to advise clients to the best of their ability irrespective of their own pockets.

The toast of "The Guests" was proposed by Mr. H. Percy Boulnois, who said that the number of distinguished guests present that evening was a good augury for the future of the association. He compared this inaugural dinner to a christening feast, and dwelt humorously on the infant troubles of "Dykes's Baby." The association had been changed with being a trade union and a purity party. He did not object to either. It was necessary that the consulting engineer and expert witness should be beyond suspicion. They had many precedents for what they had done. Both the legal and medical professions had their trade unions, and even the House of Commons was a society of the same kind.

This toast was responded to by Mr. C. E. C. Browne, president of the Society of Parliamentary Agents, and Mr. A. Bruce Anderson.

Mr. JAMES SWINBURNE proposed the toast of "The Hon. Secretary and Hon. Treasurer of the Association," and remarked that what might be thought to be a fortuitous concurrence of atoms had now become the Association of Consulting Engineers entirely owing to the initiative of Mr. Dykes. Mr. Dykes had done a tremendous amount of hard work in forming the society, and some of his numerous expeditions for this purpose were humorously described by the speaker. In connection with the formation of the association there had been a great deal of difficulty in discovering exactly what a consulting engineer was. He had been said by some to be a purveyor of zinc chimney-pots, by others a patent agent, by others an employee of an insurance company, and by others as a man who received a retaining fee from a railway company. The difficulty of exactly defining the consulting engineer seemed to be insuperable, but it had been overcome. The association were deeply indebted to Mr. Dykes and Mr. Lowcock for the work they had done on the part of the profession.

Mr. Dykes, in reply, pointed out that the success of such an association depended upon the co-operation of its members. Every member should therefore do his best to make the association known to both engineers and to the public, and to acquaint the secretary of ways in which the association might be useful to its members. To form such an association had meant a great deal of hard work, but the results were worth it, and he felt satisfaction in that he could truly say he had "lived and toiled with men."

Mr. Lowcock also briefly replied to this toast, and pointed out that this dinner was not really a christening, but a confirmation. He, as treasurer, had no difficulty in obtaining the subscriptions, and they would be pleased to hear that the association was financially sound.

Road Improvement in Sussex.—Costing £70,000, a scheme for the improvement of the Sussex part of the main road from London to Brighton has been approved, the Road Board contributing £28,000.

BRITISH AND AMERICAN ROAD TAR.

MAJOR W. W. CROSBY'S INVESTIGATIONS.

In order that he might obtain data bearing upon the apparent superiority of British tarred roads over American roads treated in a similar way, Major W. W. Crosby obtained a sample of typical British road tar and compared it with samples of American tars by

GARDEN CITIES AND TOWN PLANNING ASSOCIATION.

Owing to continued ill-health, the Hon. Mr. Justice Neville, president of the Garden Cities and Town Planning Association, will be unable to preside at the annual meeting of that body at Carpenters' Hall,

fully revised by Major Crosby, and certain important corrections have been made.

Major Crosby considers that the analyses account for the superiority of the British tar for road work; it seems to become hard and brittle less quickly, and the residue from the evaporation tests is softer and changes less than do those from the American tars. He notes, however, that our ranges of temperature are less than those experienced in the United States.

M.P. will be the chief speaker. Cards of admission to the meetings can be obtained from Mr. Ewart G. Tulpin, 3 Gray's Inn-place, W.C.

New Refuse Destructor for Lincoln.—The foundation-stone of a new refuse destructor to be erected at Lincoln by Messrs. Heenan & Froude was laid last week.

Compound Piles of Timber and Ferro-Concrete.

By Professor R. SCHÖNHÖFER, DR. ING.

Specially translated for THE SURVEYOR from an article in the "Zeitschrift für Betonbau."

A great development in the domain of pile construction has taken place in the past ten years or so, in that, by the employment of concrete and ferro-concrete, it has seemed that timber, the material exclusively employed for hundreds of years, would be almost entirely superseded. To-day the number of methods of construction and of systems for concrete and ferro-concrete piles is legion. The chief reasons for the change are to be found, on the one hand, in the rising price of timber and the increasing cost of piles of considerable length, and in the fact that timber is soon destroyed by decay where the ground-water level is subject to rise and fall; while, on the

simple manner in the design of Mr. Michael Heimbach, engineer, of Bregenz, Austria; these designs being protected by patents at home and abroad.

It will not be without interest to remark here that the coupling of a timber pile with a ferro-concrete pile to form a compound pile, which naturally to a great extent combines the advantages of both, is a distinct step in advance, as can often be noticed in the history of technical matters concerning an old method of construction when it is developed so as to be united to a new and more advantageous method. Ferro-concrete as a compound material of construction composed of iron and concrete, is recognised as furnishing in this respect one of the most striking examples of the kind.

THE METHOD OF MAKING THE COUPLING.

The manner in which this compound pile is made is shown in Fig. 1. Before being driven, the timber pile H is made cylindrical at the top, so that a wide binding ring or band can be driven on to it. The timber pile is then driven down until its head is about a metre above the ground or water level. The band is then taken off and a steel tube S, conical in a downward direction, is driven on to the head of the pile by means of a tube head-piece. A ring-wedge,

FIG. 1.

FIG. 3.

other hand, concrete and ferro-concrete piles, which are not affected by the level of the ground-water, can, almost without restriction as to length, be provided at a relatively low cost.

Many as are the advantages which attend the use of concrete and ferro-concrete piles, there is a limit to their scope, owing to the circumstance that concrete is attacked by certain kinds of soils and subsoil waters. This is specially the case in marshy or boggy soils, and in subsoil waters containing acids or acid salts, magnesium salts, sulphur compounds or carbonic acid.

Since, then, timber is not attacked in such soils, nor in subsoil waters of the kinds mentioned, and since, in this respect the only proviso is that a timber pile must be permanently under water, we are led to the idea that in such cases where the soil or the subsoil water attacks concrete, we might construct a compound pile with the lower part of timber and the upper part of ferro-concrete. Intimate as is the association of ideas, we are confronted with the practical difficulty as to how two structural materials so dissimilar as timber and ferro-concrete are to be coupled together in a satisfactory manner. The problem has been solved in an effective and yet

FIG. 2.

FIG. 4.

FIG. 5.

K, is then set upon the head of the pile and is driven into it by means of the ram with a suitable dolly. By the driving in of this ring-wedge the originally cylindrical pile-head is forced into the form of a cone, completely filling the conical part of the steel tube, and pressing the pile-head very tightly against the constraint of this shell. The ring-wedge shown in Fig. 2 has radial wedge-ribs, the use of which secures, not only a symmetrical radial expansion of the pile-head, but also the absence of random radial clefts. When the pile is very hard a conical wedge with radial wedge-ribs may be employed instead of the ring-wedge; and a compound pile constructed in this manner is shown in Fig. 3. To avoid the danger of the steel tube changing its shape during the driving in of the ring-wedge, an iron strengthening ring, R, is provided.

By this simple joining of the steel tube and the wooden pile both parts are wedged together, and a tight joint is obtained by the ample pressure between the tube and the wood. When the tube has been made fast on the pile in this manner the pile can be driven into the desired depth by means of a tube head-piece. Then the iron reinforcement is placed inside the tube, and the concrete filled in. The coning of the steel tube may sometimes be omitted, but in this case it must be taken into consideration that the re-

sistance of the cylindrical tube is much less than that of the conical tube, and that a change of shape of the tube at the joint is therefore much more to be feared. For this reason specially stout strengthening rings should be provided. Fig. 4 shows such a compound pile with a quite cylindrical tube. In a somewhat different, or double, form the wedge-ring can be adapted to the coupling of timber piles. For this purpose a double-coned steel tube, S, is rammed on to the cylindrically shaped pile-head. The double ring-wedge, K¹¹, is then placed on the top of the pile, and the lengthening pile, H¹¹, is rammed with its cylindrically formed end in the open end of the steel tube. By further ramming the double ring-wedge is driven into the ends of both piles, which are forced each into the form of a cone, and firmly wedged with considerable force against the steel tube.

THE ADVANTAGES OF THE COMPOUND PILE.

As will already have been perceived, it has become possible, by means of this compound pile, to employ ferro-concrete pile work in soils in which the destruction of concrete is to be feared—a possibility much sought after in the case of concrete and ferro-concrete piling. In this respect the Heimbach compound pile provides a welcome and perfectly satisfactory solution of the problem. The pressure on the pile-head, which is tightly held by the tube, makes a watertight joint against the concrete, so that a creep of ground water or of dampness from the soil into the concrete is fully guarded against.

These advantageous applications by no means exhaust, however, the scope of the employment of the Heimbach compound pile, for there are numerous cases for which it is specially suitable. This method of construction has, too, a number of valuable advan-

FIG. 6.

tages. An essential advantage consists in the fact that the pile can be driven with the pile-driver usually employed for timber piles. The costly special pile-drivers necessary for ferro-concrete piles, and the heavy staging necessary in the employment of such pile-drivers are not required. This advantage is specially welcome in the case of pile work in boggy and marshy soils, for in such places the erection of the heavy staging is not only very troublesome, but also involves considerable expense.

A valuable advantage of this compound pile is that it is a very simple matter to place it in position, and that no special precautions need be taken. In the employment of ferro-concrete piles it is necessary to make special arrangements for the assembling of the reinforcement, the setting up of the forms, and the moulding of the piles, for which reason the use of ferro-concrete piling is confined to the larger undertakings. These compound piles will be specially suitable for the carrying out of small works for which, though it is desired to obtain the advantages of ferro-concrete piles, the establishment of a special plant for their erection is avoided on account of the cost.

These compound piles share with those of timber a further advantage over ferro-concrete piles, in that timber piles in soft, loamy, boggy or marshy ground, develop, after a long period of rest, a notable increase of resistance, and a corresponding increase in load-carrying power—a fact which has often been proved by experience and research, and is due to the strong pressure and grip upon the soil, developed as a result of the swelling of the timber.

In comparison with timber piles the compound piles have the further advantage that they are not destroyed by rot, as the result of changes in water levels, or in the subsoil water levels, the timber portion being, of course, always below the water line. An unforeseen and lasting drop in ground-water levels, which, in the case of timber piles, is often followed by serious consequences, cannot affect the compound pile, provided that the timber portion be driven deep enough.

THE COMPOUND PILE IN SEA WORKS.

The compound pile has a special advantage in sea works. A timber pile standing in sea water will very soon be destroyed by boring shellfish and bore-worms, while, on the other hand, ferro-concrete piles are not seldom attacked by the sea water. By the employment of the Heimbach compound pile in such a manner that the timber portion is in the ground, and the part which is surrounded by sea water consists of ferro-concrete girt with the iron tube, a very durable pile is provided. The steel tube would, of course, be protected from rusting by a coating or metallic covering, and would be made of a suitable thickness and strength.

It may here be remarked that the Heimbach coupled timber piles likewise effect a very useful advance, since they can be used in any place where, for sufficient reasons, timber piles are necessary, but where, on account of the great length required, these cannot be made, or where the cost of piles of sufficient length is very great. This applies especially to fender piling required in navigable ways, for which only timber piles are used, since they possess the necessary resiliency. Since the inadequacy of the methods hitherto employed in coupling piles has precluded the use of coupled piles for such purposes, it has been necessary, for deep navigable ways, to make exceedingly long piles at very great cost. But now, by means of the Heimbach coupling, a coupling has been provided which is in every respect firm, elastic and waterproof, and therefore quite suitable, and by the employment of these lengthened piles large sums can be saved. The Heimbach coupled piles should, therefore, be generally adopted for such purposes.

As regards the cost of the compound piles of timber and ferro-concrete the following may be noted. In view of the simplicity of their erection—that is, on account of the avoidance of the use of special pile-drivers and heavy staging—the Heimbach compound piles are in general much cheaper than ferro-concrete piles; especially is this the case for the greater lengths, for which ferro-concrete piles, to stand being driven, must have a strength many times greater than that needed to carry the load. As has already been explained, ferro-concrete piles are very costly when used in small works. As regards timber piling, the compound or the coupled pile is much cheaper in the greater lengths; since the price of long timbers is out of all proportion to their length.

The invention of this new type of compound pile is not confined to paper, as are so many other inventions, but has already been carried into practice in a number of cases. The firm of Heimbach & Schneider, contractors for structural works, at Hard, in Bregentz (Austria), and at Lindau (Germany), has already employed the compound pile in various works, and is, in all respects, satisfied with the results. As a single instance there is shown in Fig. 6 an example of piling work carried out at Lindau.

Sunderland's Electrical Undertaking.—A record year's working of the Sunderland Corporation Electricity undertaking is anticipated, while, having regard to the increase of output, the whole of the items of working the system show decreases, or, in other words, the cost of production per unit during the year is lower. The total estimated working expenses for the year ending March 31st next amount to £35,132, and interest and redemption will absorb £28,196, a total of £63,328, as compared with actual working expenses for the year ending March 31st last of £34,070, and interest and redemption of capital charges of £27,038, a total of £61,108. The estimated revenue is £73,599, an increase of £4,055, as compared with the year ended March 31st. The estimated credit balance of £10,270 is placed to the Renewals Fund, an increase of £1,835 on the previous year. The Electricity Committee intend to ask the council to reduce the charge for the ordinary incandescent street lamp from 49s. to 46s. per lamp per annum, which will put them on equal terms with the charges of the gas company.

REINFORCED CONCRETE FENCE POSTS.

Among the many directions in which reinforced concrete is making headway at the present time, and one in which it seems to have a promising future, is in connection with fencing.

The advantages of a reinforced concrete fence post are that the cost of maintenance is practically *nil*, the posts cannot burn, and the more wet weather they are subjected to the harder they become for some considerable period, after which they remain impervious to moisture.

Of course, it is most essential that they should be

well made, for amateur attempts have in some cases produced bad results; but there is no doubt that a properly constructed concrete post is more economical than a wooden one as regards upkeep and renewal, and, generally speaking, it is cheaper in the first cost, while after five or six years its superiority over wood becomes evident.

The Reinforced Concrete Fence Posts Company, Limited, Broadway-court, Westminster, are exclusively engaged in the manufacture of these posts at several places in England, and have recently supplied their fencing to the Metropolitan Water Board, the Pembrokeshire and East Suffolk County Councils, and the Lichfield and Portland Urban District Councils. In some cases they have also carried out the work of erection.

These posts are now in use upon seven English railways, and the Port of London Authority are also testing them with a view to their further adoption.

Institute of Sanitary Engineers.—On Monday evening next, at Caxton Hall, Westminster, Mr. John D. Watson, M.INST.C.E., the president, will occupy the chair at a meeting of the Institute of Sanitary Engineers, at which Mr. F. R. O'Shaughnessy, F.I.C., A.R.C.S., will read a paper entitled "The Significance of Colloidal Matter in the Problem of Sewage Disposal."

LONDON AND THE ROAD BOARD GRANTS.

THE PROPOSED INQUIRY.

At Tuesday's meeting of the London County Council the refusal of the Road Board to contribute to the carrying out of a number of street improvements suggested by the council was criticised by a number of members.

Mr. H. H. Gordon pointed out that London was providing money for the Road Improvement Fund, and it was being used for extra-London purposes. There was no evidence that, as contended by the Road Board, the cost of London improvements would not increase in time. The evidence pointed in the contrary direction. In twenty years the traffic, north and south, had increased by 5,000,000 vehicles a year. The needs of central London were great, and the same state of things existed all over the administrative county.

It was pointed out by various speakers that, in all, London had contributed £500,000 to the fund, and only £115,000 had been given back or promised to it, this money going entirely to the borough councils for the improvement of road crusts damaged by motor vehicles.

Viscount Peel, chairman of the Improvements Committee, emphasised the statement that the

REINFORCED-CONCRETE FENCE POSTS AT CHINGFORD (METROPOLITAN WATER BOARD) AND ON THE L. & N.W. RAILWAY.

money of the board was to be devoted to road-crust purposes, and pointed out that that meant neglecting some of the main duties for which the board was set up. He thought it very hard that the London County Council should be penalised because they did not wish to have the Great Western Road scheme.

Sir John Benn said the board was being regarded as a sort of relieving officer for a local authority which neglected to do its duty in the matter of street improvements in London. The board had endeavoured, with both hands, to meet the council.

The council finally resolved to ask the Road Board whether it adhered to its suggestion of a public inquiry on the subject of the distribution of the Board's available funds, and, if so, on what lines it was proposed that the inquiry should be conducted

SOME RECENT PUBLICATIONS.*

PRACTICAL SANITATION. By George Reid, M.D., D.P.H. Seventeenth edition. Price 6s. London: Charles Griffin & Co., Limited.

The popularity of this well-known work is such that, although it is only eighteen months since the last edition appeared, a new edition has again become necessary. As a compendium for the use of sanitary inspectors, students, and all who are interested in matters of sanitation, this book would be difficult to improve upon. The various chapters deal with water supply, ventilation and warming, sewerage and drainage, sanitary appliances, plumbers' work, sewage and refuse disposal, house construction, disinfection and food. There is an appendix of sanitary law, but the author does not claim that it is more than a guide to a student's more extended reading, and a carefully selected list of the essentials with which they must be familiar in official positions. So rapid is the progress in sanitary practice at the present time that it has been found necessary to introduce many alterations and additions into this edition. A thorough revision has accordingly been made, and the work in its present form is an excellent up-to-date textbook of sanitation.

APPLIED MECHANICS. Vol. I.: Statics and Kinetics. By C. E. Fuller and W. A. Johnston. Price 10s. 6d. nett. London: Chapman & Hall, Limited.

The authors of this book are Professors of Theoretical and Applied Mechanics at the Massachusetts Institute of Technology, and the work is intended primarily for students. The subjects dealt with in the present volume are treated in five chapters devoted respectively to introductory matters, statics, centre of gravity, moment of inertia, and kinetics. Throughout the work a thorough discussion of the underlying theory is given, so far as it is required to elucidate the principles which are required in the solution of practical engineering problems. Many problems are included to be worked by the student, and full solutions are given, where necessary, to indicate the methods of applying the theoretical principles. The more elementary operations of the differential and integral calculus are freely used. The authors have treated their subject clearly, logically and scientifically, and have succeeded in producing a book which should admirably fulfil the requirements of the college student of applied mechanics.

TARRED ROADS IN NORTHUMBERLAND.

COUNTY SURVEYOR'S RECOMMENDATIONS.

Northumberland County Council have approved a report of the county surveyor, Mr. J. A. Bean, to the Bridges and Roads Committee on the subject of the tar-surface treatment of roads. The report, after reviewing what had been done in the past, stated:—

"In order to meet the complaints raised against the slippery state of tarred roads, I have one suggestion following on that made at the last council meeting—viz., that it is desirable to construct the surface in two kinds of material, one suitable for horses and the other for self-propelled vehicles. This may be carried out as follows: (1) Where the road is hilly and the gradient steep to lay two tracks for horses in ordinary water-bound macadam, 3 ft. wide, one on either side of the road; (2) the channels and centre of the road to be laid in tar-macadam (not pitch), but without the finer material on the surface; (3) where the road is fairly level, tar-macadam (not pitch) to be laid the full width. The committee must remember that the dust nuisance and economy are important factors in road construction. The above is the cheapest way out of the difficulty, although the dust nuisance will prevail to a certain extent. Difficulties will present themselves in laying the material, also widening the macadam will be involved on some sections. There are other ways of preventing the dust nuisance, but the limit to which rates may be increased is soon reached, and I cannot suggest a more economical method."

It is notified that the Road Board are prepared to make grants amounting to £10,000 for work of tarring and improvements of roads, and the widening and reconstruction of bridges in the county, the cost being estimated at £17,070.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain,
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii, 2.

MR. BOULNOIS' "GLOSSARY OF ROAD TERMS."

To the Editor of THE SURVEYOR.

SIR,—Although I am anxious to reply to your criticism of my letter of the 7th ult., I am afraid that it is not possible to do so fully by correspondence, and, in my opinion, a conference of all interested parties is necessary so that an early settlement of the whole question could be arrived at.

I am opposed, as you say, to the interference with the present usage of the words "bitumen" and "asphalt" as understood by all leading analysts and other authorities, but I cannot agree that "there is no class of persons who, as a class, consistently use these terms in the same way."

I have been interested in these materials for some considerable time, and have always found analytical chemists, manufacturers and users of asphalt, bitumen, pitch, asphaltum, &c., in various trades, to use these terms in the same way, and it is only in connection with road work that the words are being so loosely used, and I repeat that it is evidently being done for the purpose of gain.

There has never before been any misunderstanding, and I am confident that the absurdity of the proposal of those who have only recently become connected with the use of bitumen, &c., to draw up and publish definitions for engineers owing, presumably, to themselves being strange to the subject, and not acquainted with the regular usage of the terms, will be apparent to you and all your readers.

It has therefore been asked what objection there is to the term which has all along been applied to the residuum obtained from petroleum oil—viz., petroleum pitch—and what object is there in endeavouring to have it altered? No answer has been given, nor, perhaps, under the circumstances is one necessary. There are many in this country who, to my knowledge, have made a study of, and are well acquainted with, the various bitumens and asphalts, and if the opinions of these and authorities on the Continent were taken—openly and not in private—there is not the slightest doubt that the efforts of those who are endeavouring to get petroleum pitch—i.e., the residuum obtained from the distillation of petroleum oil classified as bitumen would be defeated, and this and all other artificial products relegated to their proper position.

The loose way of using these words commenced in America some time back, and apparently spread to this country with the introduction of petroleum residuum for road work under the title of bitumen. This same material has been imported largely from the Continent for many years past under its proper title—viz., petroleum pitch. The residuum from coal tar is coal-tar pitch, and the residuum from petroleum is very rightly termed petroleum pitch. This, then, is partly why I am opposed to interference with the present and proper usage of these words.

Asphalt, bitumen, asphaltum, manjak, &c., are being imported into this country continually, and if it is desired to publish definitions for the use of engineers I consider advice should be sought from the city markets, London Chamber of Commerce, analytical chemists and others, and not from those who have undertaken the duties to say "we will ourselves draw up these definitions in private."

I am glad you consider there is some force in my contention that the term "bitumen" has all along been understood to apply to a natural product. That is practically my sole point, and if that is agreed it is only necessary, as I have before said, to consider the three classes:—

(1) Rock Asphalt.—Limestone and sandstone found naturally impregnated with a small percentage of bitumen in France (Seyssel), Germany (Limmer), Switzerland (Val de Travers), Sicily, &c.

(2) Natural Bitumens or Asphalts.—Venezuelan, Cuban, Trinidad, Nigeria, Barbadoes, Dead Sea, &c.

(3) Pitches.—Coal, petroleum, Swedish, wood, bone, &c.

Any material that does not come under the classification of rock asphalt, and is not a natural asphalt or bitumen always described with a prefix denoting country of origin, such as Cuba, Trinidad, &c.—or is not an asphaltum or manjak, is a pitch of some kind.

likewise always described with a prefix, such as coal tar pitch, petroleum pitch, &c.

All the sources and deposits of rock asphalt, natural bitumen or asphalt, and all the different kinds of pitches are known, and these materials are all being dealt with daily on the markets. There is then no necessity to make the matter more complicated by inventing different definitions for surveyors and engineers only. Have we been wrong all these years, and are the bitumens, &c., which have been known since the days of Noah, now to have fresh description, at the bidding of a certain few?

You say there has been no restriction in the use of the term "bituminous." I quite agree, and in my opinion there never can be, as anyone has the right to describe a substance of any kind as "bituminous" if it is of this nature. "Bituminous," "asphaltic," &c., are good sounding terms for probably tar and pitch compositions sold under fancy names, and pitch may be said to be "bituminous," although it does not follow that it contains any percentage of bitumen.

I am interested in Dr. S. Judd Lewis's letter appearing in your issue of the 23rd ult., and no better definition of bitumen has yet been published than the one he gives. I suggest that Dr. Judd Lewis's definition be adopted without the alteration of one single word and that all engineers and surveyors keep Dr. Lewis's letter before them for future reference. Dr. Lewis very rightly says that the word "bitumen" signifies a natural substance, and is therefore not one produced by artificial distillation, but I would point out that all other materials "employed for purposes for which true bitumen is especially available" have already their proper terms, and these are, without exception, pitches of some kind. The prefix applied to each, such as coal-tar pitch, petroleum pitch, &c., describes each of these materials perfectly. It is then not necessary to seek for some new term to give to any of these pitches that may be so specially favoured and singled out, and "artificial bitumen" and other misleading terms can only help to confuse engineers; and, strictly speaking, bitumen being a natural product, cannot be produced artificially, and this description is both absurd and incorrect.

I note from your remarks that "the sub-committee on bituminous materials appointed by the Engineering Standards Committee" is conducting its proceedings in private, and it is, I presume, correct that, as Mr. Bastian writes: "Colonel Crompton states that it is his intention and that of those associated with him to confer with certain American engineers, and as a result of their united action, and, presumably, the co-operation of the Engineering Standards Committee, to obtain the classification of petroleum pitch as "bitumen."

A great deal more, of course, has yet to be said on the subject, and it may be advisable for some other committee, composed of European authorities, to be formed to refute any incorrect definitions that may be published.

In the meantime may I ask who are the members of the sub-committee on bituminous materials appointed by the Engineering Standards Committee? I do not wish to be personal, but in the interests of all concerned it is necessary to know what is being done.—Yours, &c.,

ENGINEER.

February 4, 1914

SEWAGE DISPOSAL BY DILUTION.

To the Editor of THE SURVEYOR.

SIR, In your issue of yesterday I see that you propose, in your next issue, to deal with the technical portion of Mr. Shenton's address to the Society of Engineers. I hope you will excuse me if I make a suggestion that you would be doing good service if in your comments you called attention to the omission in Mr. Shenton's remarks on the relaxation of the General Standard for Sewage Effluents (when dilution of certain proportions is afforded by the river flow) of any reference to the fact that such dilution can only be urged as a reason for relaxation when the diluting water is of a certain quality as regards purity, or, rather, has a certain power of oxidation. I find there is much misunderstanding on this point due to the fact that in the "Summary of Conclusions," on p. 17 of the Eighth Report of the Royal Commission on Sewage Disposal only quantity of dilution is mentioned, and not quality. A large proportion of readers take these conclusions without reading the body of the report in which, on p. 7, section 25, the quality

of water on which a claim for a relaxed standard by dilution may be entertained is described.

I may say that on several occasions I have had the "conclusions" quoted to me by local authorities as a reason why they should not be compelled to purify small sewage flows in isolated parts of their districts, where the river flow is far greater than the sewage flow, basing their appeal on quantity only in spite of the fact that the rivers in question are purely industrial ones which can probably never reach the purity figure on which the Royal Commission base their "conclusions."

I am sure that if you could see your way to include a reference to this matter in your leading columns you would be correcting a fairly widespread misunderstanding, and owing to your large circulation among professional men such correction would be of great service. Yours, &c.,

HUGH STOWELL.

41 Mosley-street,

Manchester.

February 7, 1914.

P.S.—May I express my hearty appreciation and thanks for your issue of January 30th?

[A note on the matter to which Mr. Stowell refers will be found under "Minutes of Proceedings."—Ed. SURVEYOR.]

NORWICH ROAD SIGNS.

To the Editor of THE SURVEYOR.

SIR,—In my article on road signs published on pp. 187 to 189 of your issue of the 30th ult. I find I made a mistake in the diagram at the bottom right-hand corner of p. 188. This indicates that route 77 turns to the left and again to the left. It really is first to the left and then to the right—that is to say, the point of the arrow should point upwards instead of downwards. Yours, &c.,

ARTHUR E. COLLINS.

City Engineer.

City Engineer's Office,

Norwich.

February 9, 1914

Cost of Birkenhead Water Scheme.—The increased quantity of peat required to be removed from the reservoir bed, an increase of 40 per cent in the cost of cast-iron pipes, an increase of 50 per cent in the cost of Portland cement, and an increase of 20 per cent in navvies' labour, were reported at Wednesday's meeting of the Birkenhead Council to be primarily responsible for the Parliamentary estimate of £800,000 for the Alwen water scheme being exceeded by £197,765. The council gave authority for the Parliamentary Committee to apply for power to exceed the original estimate.

Official Tests with Fire Extinguishers. The British Fire Prevention Committee devoted considerable time last year to an exhaustive investigation into the reliability of existing portable chemical fire extinguishers, in which inquiry they had the co-operation of a number of Government departments, corporations and institutions, who lent the committee extinguishers which had been in their possession for periods varying from a few months to as long as thirty-five years. The reports on these investigations have been issued by the British Fire Prevention Committee as Red Books Nos. 185 and 186, of which the latter may be deemed the more important, and contains a comparative table as to the results of tests with about 100 appliances in all. It is interesting to observe that the great majority of the appliances under test were of British make, and that all existent types of extinguishers (although not every individual make) were under investigation. Regarding the strength of the appliances and their aptitude to burst, which has caused fatalities, it is interesting to observe that out of a series of fifty-seven extinguishers tested hydraulically ten failed at under 300 lb. pressure, and eight failed to withstand the committee's official 350-lb. pressure test, while thirty-three passed the latter-named test. Again, on looking through the table it will be found that the working pressure generated by one of the extinguishers when the nozzle was closed was 319 lb., and in another case it was 340 lb., which plainly shows the wisdom of the committee insisting on a margin of safety for the future. The Fire Prevention Committee's reports deal with many aspects of the extinguisher question, and Memorandum III, (signed on behalf of the Extinguisher Research Sub-committee by Mr. D. W. Wood) is a particularly valuable contribution.

STATE HIGHWAYS IN CALIFORNIA.

A NOTE ON THE WORK OF THE HIGHWAY COMMISSION.

By REGINALD RYVES, M.CONS.E., ASSOC.M.INST.C.E.

The 2,300 miles of State roads which had been planned by the Californian Highway Commission some two years ago will be extended to not less than 2,700 miles and, according to information furnished in a recent issue of the *Times*, some 900 miles will be in the mountains. The principal characteristics of the type of main road to be adopted are set forth as follows:—

(1) A right of way not less than 60 ft. in width where it is reasonably possible and as direct between objective points as is consistently possible.

(2) Gradients not exceeding 7 per cent, even in the mountainous parts of the State.

(3) Curves as open as possible, and in no case of less than 50 ft. in radius.

(4) As many culverts of sufficient capacity as are needed to take care of surface and underground water.

(5) A travelled way under ordinary conditions not less than 21 ft. in width, with the centre paved or surfaced so as to be hard and smooth under all climatic conditions at all times of the year, the width of surfacing to be in general 15 ft.

(6) Smoothly-graded roadsides, reserved for future tree-planting.

As regards the first of these points, it is, of course, evident that, although control of the land to a width of 60 ft. may be an important advantage on mountain roads, the practicable right of way will be hardly wider than the wheelway in the more rugged parts of the mountain country. On the plains, it may be assumed, the expression "not less than 60 ft." will cover cases in which control is obtained over considerably greater widths, but whether it is desirable in such cases to declare the whole of such width to be a right of way width is a matter that may demand consideration. As regards the second and third points, it may be suggested that they are hardly compatible, and that even when much steeper gradients than 1 in 14 are allowed it is difficult to avoid sharp bends unless the work includes some tunnelling and the building of costly viaducts. It is, in a rugged country with deep valleys of considerable size, almost impossible to avoid hairpin turnings and sharp bends, unless, by building large viaducts, both sides of the valley be utilised.

It is interesting to note that, out of six leading points, one refers to a sufficiency of culverts. In many districts the culvert is one of the chief, if not the most important, of the elements which go to make a successful road, and this applies both to roads in the plains and to mountain roads of a certain character. As regards the fifth point, it is not unlikely that the commission will revise this. Under most traffic conditions, and certainly with the through traffic that may be expected to be developed in California, it is bad engineering to make a 15-ft. road crust on a travelled way of 21 ft. Sooner or later, American highway engineers will see this, and will adopt the method of making a strong road crust for the full width of the carriageway, though the middle 12 or 15 ft. may be surfaced with a harder metalling than that of the rest of the crust. It is significant that one of the six main points is the reservation of roadsides for future tree-planting. It may be pointed out, however, that it takes a considerable time for trees to grow to a height at which they exert nearly their most beneficial effect. In our latitudes, where screening of radiation in frosts and shade in spring and autumn sunshine prevents too rapid surface thawing, young trees are relatively efficient; but to keep a road cool under the conditions of a Californian summer, in the South at any rate, tall trees which give shade without shutting out the breeze are much more useful. Very tall trees which will provide a thick canopy at a considerable height above the road, and spread sufficiently to shade the whole road, are found to be better in tropical or semi-tropical climates than are trees of smaller and lower growth. The Californian Highway Commission might do well to put tree-planting in hand at once wherever the levels allow of this being done before the road is made. The point is of special importance on account of the probability that bituminous materials will be largely employed for the road crusts.

The oiling of earth roads has, we learn, been aban-

doned to a large extent. It has no doubt served a useful purpose, and will probably be employed for some time for roads which are awaiting developments which will justify the putting down of solid crusts. In Los Angeles county a considerable mileage of oil-macadam roads has been constructed, and reference has already been made in *THE SURVEYOR* to the main road which has an asphaltic carpet on a concrete crust. Apart from the work of the Highway Commission, there is much activity in road construction in California, and the development of motor transport in that State will be watched with much interest by road engineers in America and elsewhere.

THE ROAD BOARD.

APPOINTMENT OF ENGINEERING INSPECTOR.

Mr. C. Curtis Gray, engineer and surveyor to the Urban District Council of Scunthorpe, has been appointed to the recently-advertised position of engineering inspector to the Road Board.

Mr. Curtis Gray served his articles with the late Mr. Albert Latham, M.INST.C.E., then borough engineer of Margate. Upon the completion of his articles he became an assistant, and later chief assistant, in Mr. Latham's office. In 1898 he was appointed assistant

MR. C. CURTIS GRAY.

surveyor to the Malvern Urban District Council under Mr. H. P. Maybury, and served in that capacity for six years. Early in 1904 he resigned, and took up an engagement with Mr. Maybury under the Kent County Council. In the autumn of the same year, however, he was appointed engineer and surveyor to the Hayes, Middlesex, Urban District Council, a position which he occupied for four and a-half years, and in 1909 was appointed engineer to the Scunthorpe, Lines, Urban District Council. Scunthorpe is a rapidly growing town in the midst of the ironstone district, and its development has entailed a large amount of hard work in private and other street works and improvements, sewerage and waterworks extensions.

Junior Institution of Engineers.—The annual dinner of this body will take place on Saturday, the 28th inst., at the Holborn Restaurant.

Lower Thames Valley District Surveyors' Association.—The usual monthly meeting of this association was held in the Town Hall, Twickenham, on Saturday, the 7th instant, when a fair number of members attended. The Superannuation Bill promoted by the National Association of Local Government Officers was further discussed. A most interesting and instructive discussion on "Town Planning" was opened by Mr. F. W. Pearce, engineer and surveyor to the Twickenham Urban District Council. Mr. Pearce fully outlined the whole of the procedure from the time of the decision of the local authority to apply to the Local Government Board for permission to prepare a scheme, through the various subsequent stages to the period of the actual preparation of the scheme. A very hearty vote of thanks was accorded to Mr. Pearce at the close of the meeting.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC. M. INST. C. E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:

370. Temporary Building Design.—A temporary building is required, 50 ft. long, 30 ft. wide, and 10 ft. to eaves. Design a suitable structure, with steel trusses and stanchions, to be covered with corrugated iron on boards and felt, the bays to be filled in with 4-in. reinforced brickwork. (J. M. N., *Hitchin*.)

377. Machine Shop.—An electric crane is to be fitted in a machine shop on existing piers, as shown in sketch. The piers are bonded into the wall, and about

VERTICAL SECTION THROUGH WALL AND PIER

12 ft. centres. Assuming the foundations are good, and the work is in Staffordshire brick set in cement and sand, what is the safe load these piers will withstand? (B. W., *Cradley Heath*.)

378. Cost of Running Steam Engine. Compare the cost of running a steam engine with that of an electric motor in the following circumstances: The horsepower required is 30; electricity costs 1d. per unit, coal (best steam) costs 18s. per ton delivered; the engine is required to drive a stone crusher working an average of eight hours per day for five days per week. (Crusher.)

379. Testing Pipes. What tests should stoneware pipes be subjected to before they are accepted for use? What defects are often thereby disclosed? (B. W., *Tadcaster*.)

380. Belt Gearing. A belt running at 1,500 ft. per minute transmits 80-horse power. Find the difference of tension of the two sides of the belt. (T. R.)

REPLIES TO QUESTIONS.

376. Foundation for Stanchion.—A built-up steel stanchion, as shown in the diagram, transmits a load (including its own weight) of 250 tons. Design a suitable steel base and concrete and steel joist grillage foundation for the stanchion. The safe load on the earth may be taken as 2 tons per square foot. (L. W. S., *Clapham Junction*.)

Base.—The number of rivets connecting the gusset plate and stanchion must be sufficient to carry the

total load. The gusset plate will be $\frac{1}{2}$ in. thick, according to general practice, and the rivets $\frac{3}{4}$ in. in diameter.

Let $f_s = 5$ tons per sq. in.; $f_b = 8$ tons per sq. in. for rivets in shear and boring.

Value of 1 $\frac{3}{4}$ " rivet in single shear = $\frac{\pi}{4} (\frac{3}{4})^2 \times 5$ tons = 3 tons.

" " in bearing in $\frac{1}{2}$ " plate = $\frac{3}{4} \times \frac{1}{2} \times 8$ tons = 1.4 tons.

Total load 250 tons.

\therefore Number of rivets required = $\frac{250}{3} = 83$ rivets.

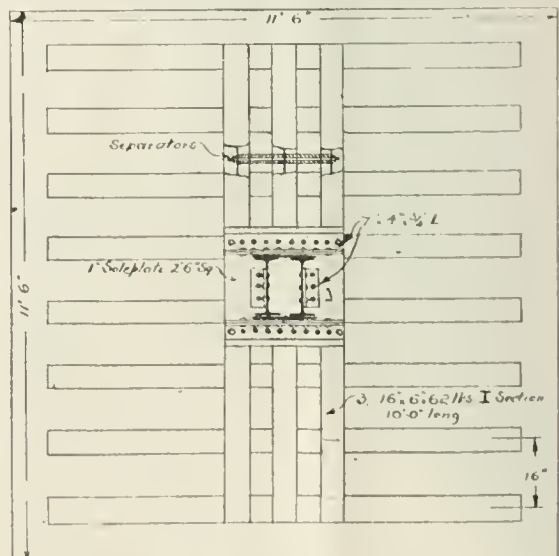

As the rivets will be arranged in four rows in the flanges of the stanchion, as shown in the sketch, 68 rivets will be used.

The pitch of rivets will be 3 in.

\therefore The height of the gusset plate will be $\frac{88}{4} \times 3$ in. = 2 ft. 9 in.

The gusset plates will be fixed to the base plate by means of 7-in. x 4-in. x $\frac{3}{8}$ -in. angles running the full width of the base plate. The rivets through these angles and the solepiece must be countersunk on the lower side, so that a true bearing on the joists below can be made.

Assume a thickness of 1 in. for the soleplate; then, according to the general practice, this plate must

GRILLAGE FOUNDATION.

not overhang the sides of the stanchion by more than eight times the thickness of the plate.

$8 \times t = 8$ in.

Then, adding 16 in. to the least width of the stanchion (15 in.), we have 31 in. for the width of plate.

\therefore Let the base plate be 30 in. square.

The Surveyor

And Municipal and County Engineer.

It will be necessary to check these dimensions of the soleplate, to ensure that it is safe against shearing stresses. The worst case of shear is covered by supposing the maximum shear on the base to be one half the total load—i.e. maximum shear on base = $\frac{250}{2}$ tons = 125 tons. Treating the overhanging portion of the base as a cantilever, the maximum shear will occur under the sides of the stanchion.

Section of plate at this line is 30 in. x 1 in. = 30 sq. in. \therefore shearing strength = 30 in. x 5 tons = 150 tons. \therefore The base plate is strong enough in shear.

The bending action on the base plate is resisted mainly by the gusset plates and angles riveted to it.

Foundation.—In designing a concrete and steel joist grillage, the area of the foundation is fixed according to the bearing power of the ground. In this case the earth will stand 2 tons per square foot, and the total load is 250 tons.

$$\therefore \text{Area of foundation} = \frac{250}{2} \text{ sq. ft.} = 125 \text{ sq. ft.}$$

If the foundation be square, the side will be 11.1 ft., say, 11 ft. 6 in.

The placing of the joists is governed by the fact that concrete must be rammed between them. In practice a minimum of 3 in. between the flanges is allowed, and a maximum spacing of 18-in. centres. In this case, if the joists in the bottom layer be placed at 16-in. centres, and there are eight of them 10 ft. long, sufficient concrete will be left round the sides and ends to protect the steel from corrosion. In the top layer three joists will be required, 10 ft. long; this number is limited owing to the width of the baseplate. Having decided upon the number and length of the joists, it is necessary to ascertain their dimensions. The overhanging portions of the joists are treated as cantilevers under a uniform load equal to the upward pressure. Overhang of all joists = 5 ft. - 1 ft. 3 in. (see sketch).

$$= 45 \text{ in.}$$

Bottom Layer.—The intensity of upward pressure per inch run on one joist—

$$p = \frac{P}{n.L}$$

where P = total load, n = number of joists, L = length in inches.

$$\therefore p = \frac{250}{8 \times 120} \text{ tons} = 262 \text{ tons per in. run.}$$

Let y be the overhang of joists.

Then maximum bending moment =

$$\frac{p.y^2}{2} = \frac{262 \times 45^2}{2} = 265 \text{ tons in.}$$

Allowing $f_t = 7.5$ tons per square inch for tensile strength.

$$\text{The section modulus required, } Z = \frac{M}{f_t} = \frac{265}{7.5} = 35.3 \text{ in.}^3$$

From a table of British Standard Sections, the section 10 in. x 6 in. x 42 lb. I-beam, will be found suitable, as its $Z = 42.3 \text{ in.}^3$

Testing for Shearing Strength.—The web of this section is .40 in. thick.

$$\therefore \text{Area of web} = .4 \text{ in.} \times 10 \text{ in.} = 4 \text{ sq. in.}$$

\therefore Shearing strength of 8 joists = $8 \times 4 \times 5 = 160$ tons.

Taking $f_s = 5$ tons per square inch shearing strength, this section is quite strong as regards shear.

$$\text{Top Layer.}—p = \frac{250}{3 \times 120} = 694 \text{ tons per in. run}$$

$$\text{Maximum bending moment} = \frac{p.y^2}{2} = \frac{694 \times 45^2}{2} = 700 \text{ in. tons.}$$

$$Z = \frac{M}{f_t} = \frac{700}{7.5} = 93.3 \text{ in.}^3$$

Referring to the table of Standard Sections,

The 16 in. x 6 in. x 62 lb. I section is most suitable with a modulus $Z = 90.7 \text{ in.}^3$

Thickness of web of this section = .55 in.

$$\therefore \text{Area of web} = .55 \text{ in.} \times 16 \text{ in.} = 8.8 \text{ sq. in.}$$

\therefore Shearing strength of 3 joists = $3 \times 8.8 \times 5 = 132$ tons.

This section is amply strong in shear, but a little deficient in bending strength; however, as no allowance has been made for the concrete, this section may be safely adopted.

It is the general practice to fit cast-iron or steel tube separators between grillage joists at intervals not greater than 5 ft. The concrete must be well rammed between the joists, and the latter should be well surrounded with at least 12 in. of concrete below the bottom layer. The concrete may be proportioned 1:2:3 for good work. The stanchion is attached to the foundation by four 1-in. holding-down bolts passing through the corners of the baseplate and the flanges of the top joists. (H. V. O., West Bromwich.)

Portland's New Waterworks.—A new water supply scheme for Portland was formally opened last week by the chairman of the urban district council, Mr. W. Edwards. The cost of the new works, together with purchase of the land, is approximately £15,785. The pumping station is situated right in the valley, and the most modern machinery for lifting water has been installed. Side by side are two boreholes, one 24 in., capable of supplying 696,000 gallons of water per diem, and the other 10 in., giving 240,000 gallons per day. The depth of each borehole is 355 ft. The engineer to the Portland authority is Mr. R. Stephenson Henshaw, who was responsible for the construction of the works.

Paving Renewals in North London.—In a report submitted lately by Islington Finance Committee, it was stated that the renewal of the surfaces of such roads as Upper-street, Holloway-road and Seven Sisters-road—not to mention many smaller roads—was a matter which would have to be faced before very long. The committees held the opinion that such renewals should properly be made the subject of a loan, and that the London County Council should not object to sanction such loan. That body, however, in pursuance of a financial policy which, however desirable from their point of view, pressed very hardly upon the present ratepayers, had refused sanction to a certain loan recently applied for, and the council, thinking it a matter of importance both to Islington and other boroughs, are appealing from that refusal to the Local Government Board.

Institution of Civil Engineers: Students' Meetings.—At the students' meeting held at the Institution on Friday last, Mr. R. C. S. Walters, STUD. INST. C. E., read a paper entitled, "Ancient Surveying." The chair was taken by Prof. S. M. Dixon, M.A., B.A.L., M. INST. C. E. The paper, an extremely interesting one, dealt with the various instruments used and methods employed in surveying by the Greeks and Romans, so far as can be gathered from existing records. The author quoted various authorities, more especially Schöne, who has reconstructed a number of instruments. The paper was accompanied by lantern slides of the various instruments reconstructed, and of ancient engineering works probably set out by their aid. In the course of his remarks, the chairman referred to the similarity between ancient and modern surveying instruments and to the knowledge and proficiency of the ancient Chinese. The author replied briefly to various questions raised, and the meeting adjourned with the customary vote of thanks to the chairman.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Barnes U.D.C. (January 20th. Major J. Stewart).—£800 for the laying out of tennis courts and a bowling green, and the provision of a shelter with lavatory accommodation, on Sheen Common. The surveyor (Mr. G. B. Tomes) explained the position of the proposed tennis courts and bowling green, which would, he said, cover an area of four-fifths of an acre exactly. The pavilion would be constructed of timber and rustic work. There would be no fences whatever except stop netting of wire mesh round the tennis courts.

Christchurch R.D.C. (January 27th. Dr. F. St. George Mivart).—£700 for the provision of an administration block at their isolation hospital in Fairmile.—The proposal is that the administration block shall contain suitable accommodation for caretaker and wife, three nurses and a store for food. The plans were prepared by Mr. L. Raine, the surveyor, who explained what was proposed to be done. He said he estimated the cost of erection at £550, and the rest of the £700 was to be for water supply and drainage.

Felling U.D.C. (February 3rd. Mr. R. H. Bicknell).—£1,000 for street improvement works. Plans were produced by the surveyor, Mr. C. W. Hall, of the proposed work, which included the laying of whinstone chip paving in several streets. The inspector said he had been trying for many years to persuade surveyors and councils to discontinue whinstone chip paving, and had, he thought, been successful in every instance. Besides being the most insanitary paving they could put down, and impossible to cleanse, it was noisy. Water stood on it, too, and it was no cheaper than good tar-macadam. Properly attended to, tarred, and sprinkled over with chipping, tar-macadam lasted practically for all time. The surveyor stated that the gradients varied from 1 in 12 to 1 in 30. He should not use tar-macadam on a gradient of more than 1 in 20. Mr. Bicknell suggested that the council should take into consideration what streets they would be disposed to pave with tar-macadam in place of the chips. The cost per yard would probably be 5s. 2d., instead of 5s. in the case of the chip paving.

Newcastle-on-Tyne T.C. (February 3rd. Mr. R. H. Bicknell).—£7,968 for a recreation ground.—One item of expenditure was £930 for a bowling green, which led the inspector to ask if the greens were paved with gold. It was explained by the borough engineer, Mr. W. J. Steele, that a large part of the cost was due to excavation in the side of a hill, and to the use of Silloth turf at 1s. 6d. per yard. The city engineer added that the average cost of a bowling green was about £600.

Oxfordshire C.C. (January 29th. Mr. W. O. E. Meade-King).—£2,888 for the purposes of main road improvement. The county surveyor, Mr. S. Stallard, stated that the work of reconstruction of certain sections of main roads, for which application is made to borrow, are on the following roads: Oxford and Banbury, from Oxford city boundary to Banbury borough boundary; Oxford and Cheltenham road, from Swinford Bridge to the Gloucestershire county boundary; Oxford and Chipping Norton road, from Oxford city boundary as far as the Chipping Norton borough boundary at Southcombe; Oxford and London road *via* Henley-on-Thames, from Oxford city boundary to Henley borough boundary; Oxford and London road, from Oxford city boundary to the Bucks county boundary at Stokenchurch. The total length of these roads is, approximately, 90 miles. Of this mileage, after omitting the sections already reconstructed with bituminous material, the hills on which it is too steep to put tar-macadam, and the sections that have no foundations and are waterlogged, there remain about 60 miles on which it is proposed to lay tar-macadam. It is proposed to commence the work in March, and it is hoped that it will be finally completed within a period of three years.

Penybont R.D.C. (February 5th. Mr. A. G. Drury).—£10,759 for the construction of a system of sewerage for Pen-coed.—The clerk, Mr. R. H. Cox, stated that the council hoped the repayment of the loan would be extended over sixty years. The in-

pector, I can hold out no hope of your getting that nor fifty. It is the settled practice of the board to sanction loans for works of this kind for thirty years only. Mr. J. E. Moss-Flower, Bristol, who had prepared the scheme, explained the engineering details, and said he thought there was an ample water supply for flushing purposes. It could be further improved by increased storage at the source. Mr. W. A. Howell said the parish council were negotiating for additional springs.

Rhyl U.D.C. (February 10th. Mr. T. C. Ekin).—£3,900 for the purposes of the electricity undertaking, £1,150 for the purposes of the gas undertaking, and £892 for works of water supply. It is proposed to enlarge the electricity generating station, and install a second Diesel engine set. The original steam generating plant is maintained as a stand-by. The Diesel engine put down a few years ago has been very successful both in efficiency and reduced cost of the current generated. The loan for the gasworks is for a new station meter and other improvements, that for water supply is to cover the cost of laying a new main for a distance of practically a mile from Boddywyddan in the direction of Abergele, to increase the pressure of water at Abergele, and to enable the council to supply water in bulk at the boundary of the district to the parish of Llanddulas.

Stoke Newington B.C. (January 21st. Mr. R. H. Bicknell).—This was an application for consent to the appropriation of the site of 42 and 44 Milton-road, and for sanction to borrow £1,300 for the erection of wash-houses. The borough surveyor, Mr. W. F. Loveday, produced the plans he had prepared, and stated that in the scheme wash-houses were provided on the ground floor with an entrance in the centre, payments being taken in an inner room. There would be two hydro-extractors, twenty-four drying closets, two mangles and ironing tables, and a stove for the heating of the irons. At Islington it was found that the stove was only used for a couple of hours one day per week. At Stoke Newington they could have either a gas or electric stove. The cost of the wash-houses, exclusive of the first floor, would be £1,900, including equipment, and the first floor would necessitate an expenditure of £300, making a total of £2,200. The inspector said the council had better pass a resolution for the extra sum, and he advised them to get in provisional tenders.

Tynemouth T.C. (February 4th. Mr. R. H. Bicknell).—This was an application for permission to issue a Provisional Order empowering the council to put in force the Land Clauses Acts with respect to the purchase and taking of land for the widening of Bell-street and Liddell-street, North Shields.—The town clerk (Mr. Stanley Wilson) said the streets in question were situated in what was known as the Low Town, and they were practically the only approaches to the Fish Quay for the great volume of vehicular traffic coming across the river. Following this a further inquiry was held with reference to an application for sanction to borrow £1,575 for the purchase of an area known as the Rosella Horse Field, Spring-terrace, North Shields, for the purpose of laying it out as a recreation ground. The area was stated to be 10,800 sq. yds.—The borough surveyor, Mr. J. F. Smillie, gave evidence.

Wallasey T.C. (February 3rd. Major J. Stewart).—£95 for the provision of public gardens between Breck-road and Hilary-drive, Wallasey; £5,860 for the erection of a fire station in Manor-road, Liscard, and the purchase of No. 8 Anglesea-road as a residence for the superintendent; £1,950 for the purchase of two motor fire engines; and £8,725 for the widening and improvement of Claremount-road, Breck-road and St. Hilary-brow, Wallasey, and Wallasey-road, Liscard.—Evidence was given by the town clerk, Mr. W. H. Cook, and the chairmen of the committees concerned with the several schemes. The borough surveyor, Mr. W. H. Travers, stated that a scheme for the provision of about sixty workmen's dwellings had been prepared, and would probably be the subject of a Local Government Board inquiry in about two months' time. There was reason to believe that by the summer there would be abundant accommodation provided for the working classes in Wallasey Village.

Whitworth U.D.C. (January 30th. Mr. F. H. Tulloch).—£5,000 for paving in Market-street.—It was stated that the main road where the paving was required was the connecting link between Rochdale and Bacup, and between many of the large towns in North Lancashire. The scheme for granite paving

had the approval of the Lancashire County Council, who had agreed to enter into an agreement with them to contribute 90 per cent of the annual repayments in respect of principal and interest on account of the loan of £5,000.

APPLICATIONS FOR LOANS.

- Accrington T.C.**—£9,500 for extensions to the car shed.
- Axminster R.D.C.**—£1,815 for the erection of ten workmen's dwellings at Colyton.
- Banbury T.C.**—£5,400, supplemental loan for bacteria beds at the sewage farm.
- Bootle T.C.**—£1,554 for hospital extension, and £800 for the purchase of land for an electricity station.
- Bournemouth T.C.**—£1,600 for the purchase of a site for a dispensary, and £7,000 for sewage outfall works.
- Chippenham T.C.**—£2,460 for the erection of twelve workmen's dwellings, and £2,460 for the Blind-lane improvement.
- East Grinstead U.D.C.**—£2,900 for a refuse destructor, and £800 for the site.
- Epsom U.D.C.**—£9,500 for new pumps and a rising main at the waterworks.
- Horwich U.D.C.**—£400 for the provision of an open space.
- Leeds T.C.**—£1,200 for tennis courts at the training college; £4,000 in connection with the electricity undertaking.
- Lincoln T.C.**—£9,000 for the purchase of land for a housing scheme.
- Monmouthshire C.C.**—£1,450 for school extensions, and £175 for an art centre.
- Newton Abbot R.D.C.**—£4,500 for a water supply scheme.
- Oswestry R.D.C.**—£900 for new water mains.
- Poole T.C.**—£3,360 for alterations to the Alderney Hospital, and £260 for school extension.
- Radcliffe U.D.C.**—£15,000 for the provision of sixty-four workmen's dwellings.
- Staffs C.C.**—£6,350 for the purchase of land for a county farm institute.
- Sunderland R.D.C.**—£1,750 for sewerage works.
- Sunderland T.C.**—£1,029 for alterations at a school.
- Westhoughton U.D.C.**—£3,070 for sewerage works extensions.
- Wigan T.C.**—£1,862 for the construction of manholes.
- Winchcombe R.D.C.**—£2,300 for the erection of twelve cottages.
- Worcester T.C.**—£1,150 for a site for a new school.

LOANS SANCTIONED.

- Arklow U.D.C.**—£150 for gas extensions.
- Ballymoney U.D.C.**—£400 for the extension of the technical school.
- Bentley U.D.C.**—£265 for street improvements.
- Burton T.C.**—£13,000 for the purchase of gas undertakings and gasworks extensions.
- Garnarvon T.C.**—£1,081 for laying out the cemetery and walling.
- Chapel-en-le-Frith R.D.C.**—£1,287 for the extension of the water mains in Chinley, Hope, and Wormhill. The engineers are Messrs. Brady & Partington, Chapel-en-le-Frith.
- East Grinstead U.D.C.**—£470 for a public convenience.
- Grantham T.C.**—£1,108 for a new school (repayable in fifty years).
- Kirkburton U.D.C.**—£1,250 for the erection of six dwellings.
- Lutterworth R.D.C.**—£5,110 for a housing scheme.
- Mexborough U.D.C.**—£5,960 for the provision of public baths.
- Rochdale T.C.**—£65,000 for extensions of the gas and electricity works.
- Tilbury U.D.C.**—£2,000 for road construction.
- Tredegar T.C.**—£9,900 for gas supply extensions.
- Ulverston U.D.C.**—£3,000 for the erection of a public hall.
- Upton-on-Severn R.D.C.**—£876 for the erection of four cottages.
- Wanstead U.D.C.**—£2,808 for road improvements.
- Whitefield U.D.C.**—£450 for road works.

FORTHCOMING INQUIRIES.

FEBRUARY.	£
16.— Surbiton. For the provision of a burial ground (Mr. R. H. Bicknell)	6,900
16.— Walthamstow. For public convenience and street purposes (Mr. F. H. Tulloch)	1,889
17.— Exeter. For the provision of a public convenience (Mr. W. M. Cross)	1,110
17.— Haywards Heath. For the provision of a cemetery (Mr. R. H. Bicknell)	1,700
17.— Whitefield. For the purpose of municipal offices (Mr. Edgar Dudley)	840
18.— Blofield. For the purposes of sewerage (Major J. Stewart)	8,250
18.— Glastonbury. For sewage disposal purposes (Mr. W. M. Cross)	4,400
18.— Hemel Hempstead. For street improvement purposes (Mr. R. H. Bicknell)	6,275
18.— Manchester. For street and open space purposes (Mr. Edgar Dudley)	29,766
18.— Orsett. For works of water supply (Mr. F. H. Tulloch)	428
19.— Chatham. For the formation of a joint sewerage board (Mr. A. G. Drury)	—
19.— Lowestoft. For lavatory extension (Major J. Stewart)	517
19.— Shepley. For the provision of a recreation ground (Mr. Edgar Dudley)	—
19.— Watford. For road widening purposes (Mr. M. K. North)	500
20.— Poole. For road improvement and drainage works (Mr. W. M. Cross)	4,069
20.— Samford. For works of water supply (Major J. Stewart)	1,271

TOWN PLANNING SCHEME.

- 17.—**Manchester.** (Mr. Thomas Adams)

West Ham Tramways.—A report states that the West Ham Corporation tramways are threatened this year with a deficit of £8,000.

Louth Surveyorship.—A sub-committee of Louth Town Council reported in favour of combining the offices of surveyor and sanitary inspector, at a joint yearly salary of £225, the person appointed to reside in the borough, and give his whole time to the duties.

South Shields and Water-carriage System.—South Shields Town Improvement and Health Committee on Wednesday decided to recommend the town council without delay to adopt the water-carriage system in existing properties as well as in all new properties. The cost is estimated at £30,000.

Aberdeen Fish Market Extension.—An extension of the Aberdeen Fish Market, which has been completed at a cost of £11,000, has just been opened. The existing wharf has been lengthened by 500 ft., and new market buildings have been erected. The extension has been carried out by the Harbour Commissioners jointly, and the Aberdeen Fish Market will now rank as one of the largest fishing wharves in the world.

Stirling Tramways Question.—The Stirling Town Council on Monday had before them a report on the subjects of the electricity and tramway schemes. An offer to purchase for £32,000 the electricity undertaking was declined. With regard to the tramway project, it was estimated that a complete system could be constructed at a cost of £74,000, with a reasonable certainty of financial success, but it was agreed that the draft report should be supplemented by a further statement on certain aspects of the question.

Housing Question at Penrith.—The Local Government Board, as a result of the recent inquiry into the alleged lack of housing accommodation at Penrith, have intimated to the urban district council that the case is not one in which the board could declare the council in default, but that there are cases of overcrowding and some insanitary houses in the town. The board recommend the council to build with the least possible delay a few new houses with three bedrooms each. A suggestion that six such houses be built under the Working Classes Housing Act has been referred to the Sanitary Committee of the council for consideration.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Birmingham £19,261, Margate £6,000, Torquay; housing and town planning—Cardiff, Walsall; roads and materials—East Lothian, West Sussex, Whitby £11,000; sewerage and sewage disposal—Aberystwyth £25,000, Kilkenny £22,000; water, gas and electricity—Edinburgh, Newport. Particulars of other works projected will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Belfast T.C.—Councillor Shaw, at last week's council meeting stated that in 1904 a sum of £5,250 was required for the public baths, £100 for the lodging-house, and a rate of 1½d. For the present year they only required £3,790 for the baths, they had £10 to the credit of the lodging-house, and they only needed a rate of ½d., so that he thought the committee had been doing very good work.

Birmingham T.C.—The Baths Committee have been authorised to obtain tenders and proceed with the erection of baths in George Arthur-road, Saltley, at an estimated cost of £19,261.

Bodmin T.C.—The borough surveyor, Mr. R. T. Buscombe, has received instructions to prepare plans for a new fire station.

Coalville U.D.C.—The surveyor, Mr. L. L. Baldwin, has received instructions to prepare a rough plan of the proposed additional wards for the isolation hospital.

Darlington T.C.—A scheme for the erection of spray baths is to be carried out at an estimated cost of £300.

East Molesey U.D.C.—The tender, at £72, of Mr. W. J. Cooper, of East Molesey, has been accepted for the erection of a coal and apple store at the isolation hospital.

Hampton U.D.C.—The surveyor, Mr. S. H. Chambers, having reported the estimated cost of the proposed open-air swimming bath at £1,146, it was on Tuesday decided to apply to the Local Government Board to sanction the borrowing of £1,150.

Hove T.C.—The Works and Improvement Committee recommend the acceptance of the tender of Messrs. McKellar & Westerman, Hove, at £2,097, for enlarging the police station, and constructing underground lavatories in Norton-road.

Littlehampton U.D.C.—It has been resolved to seek powers at the Sessions to close the southern portion of Fitzalan-road to permit of an enclosure being made around the bandstand, thus enabling the council to make a charge for admissions when bands are playing.

Margate T.C.—The success of the municipal bathing scheme has led the corporation to undertake the erection, at a cost of £6,000, on the Westbrook side of the town, of a pavilion with accommodation for 100 bathers. The building will include tea-rooms and an assembly hall.

Mold U.D.C.—It is proposed to erect a new fire station at a cost of £500.

Seaham Harbour U.D.C.—Lord Londonderry has made over to the council as a free gift his interest in the Literary Institute and of the freehold on which it stands for the purposes of municipal offices.

Stockton T.C.—The borough engineer, Mr. M. H. Sykes, has prepared a report on the proposed new accommodation for the corporation offices on the site of the borough hall and adjoining land. Mr. Ivan C. Barling, M.INST.C.E., has been appointed to inspect a site with a river frontage of 1,000 ft., for the purposes of a new wharf, and report to the council.

Torquay T.C.—Plans have been approved of the proposed medical baths and large swimming bath at the Bath Saloons.—A scheme for a technical school has been adopted, the estimated cost being £11,000, one half of which will be contributed by the county council.

West Sussex C.C.—It has been agreed thoroughly to overhaul and repair Norfolk Bridge, at a cost not exceeding £1,000.

HOUSING AND TOWN PLANNING.

Altrincham U.D.C.—The council have authorised the Housing Committee to prepare a scheme for the erection of artisans' dwellings on a plot of land which was formerly occupied by the fever hospital in Lloyd-street. The council have already built about fifty houses on Hale Moor, which are let at low rentals to working men, and the chairman of the committee informed the council that the scheme had been so successful that many other authorities had determined to adopt similar plans in their own districts.

Buckfastleigh U.D.C.—The surveyor, Mr. A. Warren, last week presented plans and specifications for new workmen's dwellings, and it was decided that they should be submitted to the Local Government Board, who will be asked to make an appointment to see the clerk in London.

Cardiff T.C.—The city engineer, Mr. W. Harpur, has prepared for the Housing Committee a scheme for thirty-seven houses on the site of the old cattle market, Canton, costing £150 each, with four rooms, two upstairs and two downstairs, to let at about 6s. 6d. Bath-rooms would not be included. This the engineer estimated would cost an additional £10 per house. Regarding the Portmanmoor-road site, the city engineer has submitted a scheme for the provision of fifty-one 4-roomed houses, costing £155 and £165, forty-five with five rooms, costing £175, and forty-three 5-roomed houses of a larger type, costing £230 and £240. Each house would have a bath-room. Both schemes are still under the consideration of the committee.

Kingstown U.D.C.—Steps are to be taken for the promotion of additional housing schemes.

Lurgan U.D.C.—The housing scheme approved by the council, and sanctioned by the Local Government Board, is to be carried out at a cost of £135 per cottage.

Narberth (Pembooke) R.D.C.—The council have approved plans for building a dozen workmen's cottages at Ridgeway, Saundersfoot.

Renfrew T.C.—A special committee has been appointed to deal with the provision of municipal dwellings, to report within three months.

Walsall T.C.—A scheme is to be prepared forthwith under the Housing Acts for the provision by the council of 125 dwelling-houses, of which twenty-five at least shall be reserved for the purpose of rehousing families removed from insanitary dwellings.

Winchcombe R.D.C.—It has been agreed to erect twelve cottages on Great-road. Each cottage will have attached ¼ acre of land, and it is proposed to charge a rental of 4s. 6d. per week.

Wolverhampton T.C.—A scheme is to be prepared for the provision of houses at rentals not exceeding 1s. per week.

PARKS AND OPEN SPACES.

Birmingham T.C.—It is proposed to purchase 14 acres of land, at the price of £5,000, for the extension of King's Heath Park.

Fulham B.C.—A bowling green and two tennis courts are to be laid out in the recreation ground at a total estimated cost of £525.

Hove T.C.—In connection with proposed alterations to the Palmeira Lawn, the Works and Improvements Committee have decided to invite tenders. The alterations involve the shortening of the lawn by 40 ft. at the western end, and by 50 ft. at the eastern end, the parts so cut off being thrown into the roadway, and used for reconstructing the present underground lavatory; while at the west end of the lawn it is proposed to form a footway pavement 5 ft. wide, and one at the east end 10 ft. wide, the extra width of the latter being required to roof over the new lavatory. The estimated cost of the work is £1,280.

Seaford U.D.C.—The council have adopted a report by the surveyor, Mr. B. A. Miller, with respect to laying out 10 acres on the Salts as a recreation ground. Invitations have been issued for competitive schemes for laying out the grounds, and the council offer a first prize of £75 and a second prize of £25, the plans securing prizes to become the property of the council.

The schemes sent in are not to exceed £3,000 in cost, and are to include the laying-out of the ground, draining, yacht pond, tennis and bowling green, the making of roads and paths, retaining walls, seats, planting trees, and shrubs; sites to be reserved for swimming bath, shelters, handstand, tea rooms, public conveniences, sand pit, children's playground, and kursaals.

REFUSE COLLECTION AND DISPOSAL.

Hackney B.C.—Tenders have been accepted for the collection and removal of house refuse at 4s. 2d. per ton for the northern division, and 4s. 3d. per ton for the southern division, representing a total saving of £1,759 upon the tenders of the previous year.

ROADS AND MATERIALS.

Bath T.C.—An important improvement is foreshadowed in the minutes of the Corporate Property Committee when the Castle Hotel property falls into the hands of the corporation. This proposal will involve the further rounding of the corner of New Bond-street (Post Office Chambers) and the widening of Green-street.

Bristol T.C.—The Sanitary Committee have adopted the plan of the city engineer, Mr. L. S. McKenzie, for the widening of Sea Mills-lane to 40 ft.

Cumberland C.C.—The county surveyor, Mr. William Finch, it was reported at the council meeting held recently, had visited various places and works for the purpose of inspecting and testing road rollers. After careful consideration of the tenders submitted, a sub-committee recommend that two 10-ton road rollers, including scarifiers, sprinklers and water carts, be purchased at a cost of £1,250—one from Messrs. Aveling & Porter, Rochester, and the other from Messrs. Marshall, Sons & Co., Gainsborough. The county surveyor has also inspected various types of tractors for road haulage, and submitted tenders. The sub-committee recommend that the sum of £1,550 be provided in next year's estimates for the purchase of power haulage, and that at the present time one steam tractor, fitted so as to be available for alteration to a light road roller if required, with two trailer wagons, be purchased from Messrs. Marshall, Sons & Co. at a cost not exceeding £650, and that the purchase of a second tractor, out of the balance of the sum of £1,550, be delayed for the present pending a report from the county surveyor as to the relative methods of propulsion adopted by the various makers of vehicles used for this purpose.

Darwen T.C.—The borough surveyor, Mr. R. W. S. Saville, has prepared plans and estimates for making good a number of streets.

Dublin T.C.—The council have sanctioned the preparation of a scheme for widening Wexford-street and Redmond's-hill.

East Lothian C.C.—The council have authorised capital expenditure by the Eastern District Committee of £11,783, by the Western District Committee of £17,771, for road roller, stonebreaker, and other expenditure in improving roads, to be borrowed from time to time from the Road Development Commissioners, repayable in five years. This is expenditure in connection with the new county roads improvement scheme.

Exeter T.C.—It has been agreed to carry out the widening of Haven-road and Water-lane, at a cost of £800, plus the cost of fencing, not to exceed £300.

Gateshead T.C.—It has been agreed to add £830 to the estimates for the purpose of coating three streets with tar-macadam.

Guildford T.C.—The borough surveyor, Mr. C. G. Mason, has submitted an estimate, amounting to £2,850, for the London road widening scheme, and, subject to satisfactory contributions being received from the county council and the Road Board, it has been agreed to proceed with the improvement.

Harrogate T.C.—The corporation are advised by the Highways Committee to borrow £2,096 for private street works.

Hucknall U.D.C.—Plans of an improvement in Bulwell-lane, estimated to cost £1,715, have been forwarded to the county council.

Hull T.C.—A discussion arose at a recent committee meeting as to whether street paving was best done by corporation employees or by contract, and the chairman (Alderman Larard) said he had wondered whether they got as much for their money as the outside contractor. One reason was they were very chary about dismissing a man on account of age. The assist-

ant city engineer said that, taken all round, he had nothing to say against the men employed by the corporation.

Melton Mowbray U.D.C.—The council are considering the adoption of the full paving scheme prepared by the surveyor, Mr. Edmund Jeeves, providing for an expenditure of £3,060, to be met by loan.

Monaghan C.C.—From a report of the county surveyor, Mr. J. J. Hannigan, B.E., presented at a recent meeting, it appeared that in districts where work had to be done by direct labour under his supervision all the money set apart for the roads had been expended, whereas under the contract system there was a balance of £600 for money struck off or deferred. The chairman, Mr. T. Toal, J.P., said that in that county they had not a scheme of direct labour, and he did not consider it would be advisable for them to adopt a scheme, as in some other counties it had not proved successful; but while they had no scheme, there were few counties of its area giving as much employment under direct labour. The sum of £12,000 was to be expended under direct labour this year. That was giving encouragement to the labouring man who wished to remain in his country, and if the direct-labour gangs employed in the county gave satisfaction, it would encourage the council to go further in this direction.

Newton Abbot R.D.C.—The tender of Mr. Edwin Harris, Clysthydon, at £948, has been accepted for re-making Haccombe-road, Chudleigh.

Nottingham T.C.—The Improvement Committee have prepared a modified scheme for the widening of Main-street, Bulwell, and instead of a sum of £8,500 being involved, an estimate of £1,600 has been agreed to.

Stewartry C.C.—A scheme of improvement has been approved of the main road from Creetown Quarries to the station, and on the Dromore road from Gatehouse to the station, the estimated cost being £7,400, and application is to be made to the Road Board for a grant.

Swansea T.C.—It has been agreed to proceed with a widening scheme on the Mumbles road.

Torquay T.C.—The tender of Messrs. Yeo & Sons, at £1,490, has been accepted for the widening of Torbay-road, by the gasworks.

West Riding C.C.—Experiments are being made with glutrin macadam in the repair of roads. Hopes are entertained that the product, which contains no tar, will prove to have the same dust-resisting qualities and durability as tar-macadam. Experiments in Hull have shown, it is claimed, that the new material makes roads which are "non-slip," and safe for equestrian traffic.

West Sussex C.C.—With respect to the proposed road reconstruction scheme, the Road Board have made a grant of £16,000, and a further loan of £25,000, to be repaid in seven years, the first instalment only to be repaid next year. The total estimated cost of the scheme is £41,000. It was recently explained by Lord Leconfield, chairman of the Roads and Bridges Committee, that the committee had taken out all the roads which had heavy gradients, where tarred macadam would be dangerous, and they recommended tarred macadam to be used entirely on the Lancing and Worthing road, some parts of the Horsham and Cowfold road, the Crawley and Horsham road, and the Broadbridge Heath and Rudgwick road. The rest of the work under this scheme of £41,000 would be done with a water-bound road tar-painted.

Whitby R.D.C.—Consideration is being given to a proposed new road between Whitby and Sandsend, estimated to cost £14,000, of which the Road Board would pay one half, the county council one quarter, and the Whitby rural and urban councils one eighth each.

SEWERAGE AND SEWAGE DISPOSAL.

Aberystwyth T.C.—A sewage disposal scheme, prepared by Messrs. J. Diggle & Son, has been submitted to the Local Government Board. The probable cost will exceed £25,000.

Cambridge T.C.—The borough surveyor, Mr. Julian Julian, has prepared a report on the borough drainage, in which he recommends the carrying out certain alterations and surface-water drainage, at an estimated cost of £1,135.

Downham U.D.C.—The tender of Mr. Reuben Shanks, Chatteris and Hunstanton, has been provisionally accepted for the sewerage scheme, the plans of which have been prepared by Messrs. Elliott & Brown.

Kilkenny T.C.—The Local Government Board have sanctioned the issue of a Provisional Order in connection with the scheme of main drainage proposed for the city, the estimated cost of which is £22,000. The engineer is Mr. James F. Reade, Assoc.M.I.N.S.T.C.E., of Waterford.

Matlock U.D.C.—The tender of Ames-Crosta & Co., at £211, has been accepted for sprinklers for the sewage works.

Perth T.C.—The question of sewage disposal is being investigated by a special committee.

Teddington U.D.C.—With regard to the sewage contract No. 1, abandoned by Messrs. Cunliffe & Son, there has been accepted an offer from the Fidelity and Deposit Company to guarantee the due completion of the work by Mr. T. J. Moran, trading as the Standard Construction Company, of Prince's-street, Ipswich, whose amended tender was £10,926 and £250 allowed for plant and material on the works. The other tenders were from Messrs. Dick, Kerr & Co., £13,131 and £401 for materials, and Messrs. Hughes & Stirling, £14,335 and £395.

Uttoxeter R.D.C.—A plot of land at Abbots Bromley is to be leased for the purposes of sewage disposal.

WATER, GAS, AND ELECTRICITY.

Ballinrobe U.D.C.—Application has been made to the Local Government Board for a loan to cover the cost of a water supply scheme.

Edinburgh T.C.—The corporation's consulting engineer has advised that an additional power station will be required within the next few years for the electricity undertaking. The capital expenditure will be approximately £125,000.

Kensington B.C.—The Works Committee have had under consideration the question as to the advisability of further improving the street lighting in the borough, so far as regards those streets and places where garden enclosures exist. The estimated cost of the scheme will be £1,254, and the cost of the necessary extra gas supply will be £320. It is proposed to provide 116 new lamps and to move 163.

Kingstown U.D.C.—A report is to be prepared on the subject of installing a system of electric lighting.

Kirkby-in-Ashfield U.D.C.—The water engineer has reported upon the advisability of additional water storage, and a sub-committee has been appointed to go into the matter.

Lurgan U.D.C.—Steps are to be taken to purchase the local gasworks on behalf of the ratepayers.

Malton R.D.C.—The pumping tests at the Anotherby boring have yielded very satisfactory results, the water being pumped at the rate of 140,000 gallons per twenty-four hours.

Newport (Mon.) T.C.—It has been agreed to carry out water main extensions in the Maesglas district.

Perth T.C.—Messrs. Crouch, Hogg & Eastern, Glasgow, have been appointed to advise the special committee that is investigating the condition of the city water supply.

Riccall R.D.C.—A £3,000 scheme has been adopted for a water supply for Barlby. The supply will be drawn from the Selby waterworks, and the main will be laid across the bed of the river Ouse to the Barlby side.

Sleaford R.D.C.—The tender of Mr. John Hudson, of North Hykeham, at £2,514, has been accepted for the Heckington water supply extension scheme.

Swansea T.C.—At a recent meeting of the Electricity Committee, during the consideration of proposals for the erection of sub-stations, Colonel Sinclair (the chairman) said they had to bear in mind the large development in contemplation in connection with the corporation's housing scheme. Although that only provided for the immediate erection of 500 houses, there would altogether be erected on the town hill site quite 2,000 houses, and not only would the streets require electric light, but a large proportion of the houses would be customers as well.

MISCELLANEOUS.

Beverley R.D.C.—A decision has been reached for the joint provision with other local authorities of a fire engine and appliances.

Coleraine U.D.C.—Tenders are to be obtained for a motor suitable for attachment to the existing fire brigade apparatus.

Hove T.C.—The Watch Committee recommend the purchase of a motor fire engine from Messrs. Merryweather, for £950.

Molesley U.D.C.—A resolution has been passed that no man in the employment of any cartage contractor doing business with them is to be paid a rate less than 2s. a week.

Stepney B.C.—It has been reported to the Finance Committee that it will be necessary at an early date to take up loans amounting to £75,148. Of the total £60,000 is for electricity purposes, £3,600 for the construction of underground conveniences, £10,000 for the erection of buildings for the electricity supply undertakings, and £1,548 for street improvements.

PERSONAL.

Mr. H. W. Bowen, county surveyor of West Sussex, has had his salary increased from £400 to £500 a year.

Mr. H. E. Stilgoe, M.I.N.S.T.C.E., city engineer of Birmingham, had his salary increased on Tuesday from £1,250 to £1,400 per annum.

Mr. Harley Heckford, M.I.N.S.T.C.E., borough engineer of Poplar, is making a favourable recovery from the effects of a motor-car accident.

Mr. A. E. Darby, Assoc.M.I.N.S.T.C.E., borough surveyor of Bethnal Green, has been voted an increased salary at the rate of £500 a year.

Messrs. G. E. Gregson, Coard Squarey Pain, and J. Marcus Rea will represent the Surveyors' Institution at the Royal Sanitary Congress at Blackpool in July next.

Mr. Joshua Priestman, of London, member of the Hull firm of engineers, Priestman Brothers, Limited, passed away, we regret to have to report, on the 27th ult., after a short illness.

Mr. Geo. Heaton, of Birmingham, has been appointed manager of the streets and sanitary department of the Scarborough Town Council, at a salary of £150, rising to £200, per annum.

Mr. W. Louis Carr, surveyor to the Ruislip-Northwood Urban District Council, who has been ill since before Christmas through overwork, is now, we are pleased to state, convalescent, and has resumed duty.

Mr. John W. Cangley, on the occasion of his retirement on superannuation from the sanitary staff of the Liverpool public health department, where he had held a responsible position for nearly forty years, was on Tuesday presented with a silver tea and coffee service. The presentation was made by Mr. D. B. Cowden, chief sanitary inspector, who spoke in very high terms of the way in which Mr. Cangley had always discharged his duties during his long connection with the department, and of the esteem in which Mr. Cangley was regarded by his colleagues and all with whom he had been in contact.

Improved Roads for Manitoba.—A Bill providing for the expenditure by the Province of Manitoba of £500,000 in improving the main highways of the Province has been introduced in the Legislature by Dr. Montague, the Minister of Public Works.

Limerick County Surveyors.—The Limerick County Council are inviting applications for two county surveyors at a salary of £300 per annum each, inclusive of all expenses. Applications should be made not later than February 28th to Mr. John J. Quaid, county secretary, Limerick.

FOR OTHER ADVERTISEMENTS

See End of Paper.

SUTTON-IN-ASHFIELD URBAN DISTRICT COUNCIL.

APPOINTMENT OF ASSISTANT SURVEYOR.

The Sutton-in-Ashfield Urban District Council invite applications for the appointment of Assistant to their Surveyor, at a salary of £80, rising to £110 per annum. Applications, stating age and previous experience, and accompanied by copies of three recent testimonials, must be sent in to me, the undersigned, not later than Wednesday, the 25th day of February, 1914, endorsed, "Assistant Surveyor." Canvassing will disqualify.

WALTER BURN, A.M.I.C.E.,
Surveyor.

Surveyor's Office,
Outram-street,
Sutton-in-Ashfield.

(1,300)

ASSISTANT ENGINEERS and DRAUGHTSMEN required by Sierra Leone Government for Public Works Department for two tours of twelve months, with possible extension.

Engineers £300—£15—£400. Draughtsmen £300—£10—£350.

Furnished quarters or allowance.

Free first-class passages. Liberal leave. Age 25—40.

Candidates for Engineer vacancies should have served Articles with an Associate Member of the Institute of Civil Engineers, possess a diploma from some recognised Engineering College, or have been engaged for at least three years from the completion of Articles on Public Works in British Colony. Must be neat and expeditious draughtsmen, capable of designing and carrying out building, bridges and other structures, and of taking out bills of quantities and preparing detailed estimates; should have some knowledge of book-keeping and accounting and office routine, and be competent to execute surveys, take sections, and lay out and construct roads. Should have some knowledge of sanitary and water engineering.

Candidates for Draughtsmen vacancies should have had considerable experience in architectural and engineering draughting, and should have held a responsible position in the drawing office of an architect and surveyor, or civil engineer in good general practice. Neat and expeditious draughtsmen. They should also have had experience in control of a drawing office staff, and be capable of getting out designs and details of buildings, including steel frame work, bridges, &c., with some experience in architectural design. Should be well up in building construction, the preparation of specifications, bills of quantities and estimates, and preference given to those who have served articles with an architect, surveyor, or civil engineer.

Candidates should apply at once to the Crown Agents for the Colonies, Whitehall-gardens, London, S.W. (1,308)

Portland.
February 11, 1914. (1,301)

BOROUGH OF EALING.

The Town Council of the Borough of Ealing hereby invites Tenders for the Supply and Delivery of Goods and the execution of the Works as follows, for the twelve months ending 31st March, 1915—viz.:

- (1) Limes, Pipes, &c.; (2) Cement; (3) Ironmongery;
- (4) Iron Castings; (5) Paints, Oils, &c.; (6) Granite;
- (7) Disinfectants; (8) Refined Tar; (9) Official Books and Stationery; (10) Printing; (11) Timber; (12) Uniforms; (13) Tarred Macadam; (14) Tar Paving Material and Work in situ; (15) Harness Repairs, &c.;
- (16) Wood Paving Repairs; (17) Slab-laying, &c.

Printed Forms of Tender, Conditions of Contract, and full particulars may be obtained on application to the Borough Surveyor, Mr. W. R. Hicks, Assoc.M. INST.C.E., at his Office, Town Hall, Ealing, W., on or after Monday, the 16th February, 1914.

Tenders (in the envelopes provided) to be delivered at the office of the undersigned not later than 9.30 a.m. on Monday, the 2nd day of March, 1914.

The Council does not bind itself to accept the lowest or any Tender, and any person whose Tender may be accepted must enter into a proper Contract, with, if required, two sureties to be approved by the Council.

The Tenderer whose offer is accepted shall be held to have bound himself to an agreement, and may be compelled to carry out the obligations arising from his Tender, even though he may not have signed a formal Contract.

(By order)
GEO. E. BRYDGES,
Town Clerk.

Town Hall, Ealing, W.
February 13, 1914. (1,304)

GOOD second-hand light Steamer wanted. State make, age, capacity, and price.—Chief Officer J. C. Southcombe, Fire Brigado, Barnstaple. (1,305)

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A.,
Borough Surveyor, Great Yarmouth.

MANCHESTER MEETING.

A meeting of the institution will be held in the North-Western District at the Town Hall, Manchester, on Friday and Saturday, February 20th and 21st.

PROGRAMME.

Friday, February 20, 1914.

12.30 p.m.—Meeting of District Executive Committee.
1 p.m.—Members of District Executive and members of council attending the meeting will lunch with the Lord Mayor and the chairman of the Improvement Committee and of the Town Planning Committee.

2.15 p.m.—The members will assemble in the Manchester Town Hall, where they will be received by the Lord Mayor (Alderman McCabe) and Alderman Frowde (chairman of the Rivers Committee).

2.30 p.m.—North-Western District meeting in the Town Hall, Manchester.

Minutes of the previous meeting.

Any other district business.

3 p.m.—Description of some of the municipal works of the city of Manchester (illustrated by lantern slides) by Mr. T. de Courey Meade, M.INST.C.E., city surveyor of Manchester.

Drawings and photographs will be exhibited in the Lord Mayor's Parlour showing the works described and intended to be inspected.

A short paper on "The Future Government of Great Cities" (illustrated by lantern slides), by Councillor Joseph Swarbrick, M.INST.C.E.

6.30 p.m.—Dinner will be provided in the town hall at the invitation of the Lord Mayor and the Rivers Committee.

Saturday, February 21, 1914.

9 a.m.—Meet at Town Hall. Special trams (provided by the Tramways Committee) will leave Albert-square at 9.15 a.m. to convey members to any or all of the following works they may desire to inspect—viz.:—

Tramway car repairing works and permanent way depot, Hyde-road.

Intercepting sewers at Withington and Didsbury.

APPOINTMENTS OPEN.

WADEBRIDGE URBAN DISTRICT COUNCIL.

APPOINTMENT OF INSPECTOR OF NUISANCES AND SURVEYOR OF ROADS, &c.

The above-named Council invite applications for the offices of Inspector of Nuisances and Surveyor of Roads, &c., for their District, which has an estimated population of 2,400.

The person appointed will be required to devote the whole of his time to the duties of the offices, to perform all the duties of an Inspector of Nuisances as defined in the General Order of the Local Government Board, dated 13th December, 1910, and such other duties as may be required under the Public Health Acts, and any other Acts or Orders affecting the office.

He will also be expected to carry out the duties of Road Surveyor, &c., full particulars of which may be obtained on application to the undersigned.

Candidates must possess the qualifying Certificate of the Royal Sanitary Institute, or some other responsible body granting a similar Certificate of qualification.

Commencing salary for the combined offices, £110 per annum, rising by annual increments of £5 to £120.

The appointment as Inspector of Nuisances will be subject to the approval of the Local Government Board, and as Road Surveyor to the approval of the County Council.

Applications, in the handwriting of the Candidates, stating age and qualifications for the office, accompanied by three testimonials, must be sent to the undersigned not later than Saturday, February 21st, 1914. Duties to commence April 1st, 1914.

WALTER O. WELLINGTON,
Clerk to the Council.

Wadebridge,
Cornwall. (1,272)

BOROUGH OF BEDFORD.

TEMPORARY ASSISTANT.

Applications are invited for the appointment of a Temporary Assistant in the Borough Engineer's Office for a period of not less than six months, to assist in preparing drawings, &c., for new Isolation Hospital Buildings. Salary, 50s. to 60s. per week, according to qualifications.

Applications, in candidate's own handwriting, stating age, together with full particulars of experience (and enclosing copies of not more than three recent testimonials), endorsed "Temporary Assistant," to be delivered to the undersigned not later than Saturday, 21st instant.

Preference will be given to candidates with some Architectural knowledge, and who have had experience in Hospital Work.

Canvassing will disqualify.

N. GREENSHIELDS, ASSOC. M. INST. C. E.,
Borough Engineer and Surveyor.

Town Hall, Bedford.
February 5, 1914. (1,274)

KIVETON PARK RURAL DISTRICT COUNCIL.

Temporary Assistant required, experienced in the preparation of Surveys, Plans, Estimates and Appointments under the Private Street Works Act, 1892.

Apply immediately, with copies of testimonials, stating age, experience and salary required, to—

FRANK HEWITT,
Engineer and Surveyor.

Council Offices,
Kiveton Park,
Near Sheffield. (1,289)

BOROUGH OF LEIGH.

The Corporation of Leigh invite applications from suitable persons for the position of Paying and Building Inspector. Wages, £2 10s. per week.

List of duties and forms of application may be obtained from Mr. Tom Hunter, Borough Engineer, Town Hall, Leigh, Lancashire.

Applications, in candidate's own handwriting, and on prescribed forms (none other will be considered), are to be delivered, accompanied by copies of not more than three testimonials, at the office of the undersigned on or before Monday, February 23rd.

W. H. COWBURN,
Town Clerk.

Town Hall, Leigh, Lancashire.
February 11, 1914. (1,287)

COMPETITIONS OPEN.

**BURTON-UPON-TRENT UNION.
TO ARCHITECTS AND SURVEYORS.**

The Burton-upon-Trent Board of Guardians invite competitive designs for Children's Cottage Homes to be erected in Burton-upon-Trent.

Premiums of £25 and £10 offered for the first and second prizes respectively. General Conditions, Instructions and Site Plan may be obtained on application to the undersigned (to whom designs are to be delivered not later than the 25th March, 1914) on receipt of one guinea, such sum being returned upon the receipt of a *bonâ-fide* design.

(By order of the Board)
C. F. CHAMBERLIN,
Clerk.

Union Offices,
Burton-upon-Trent.
February 10, 1914. (1,286)

TENDERS WANTED.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

**CORPORATION OF LEICESTER.
TRAMWAYS AND ELECTRICITY COMMITTEE.**

The Tramways and Electricity Committee of the Leicester Town Council are prepared to receive Tenders for the Erection of an Octagonal Brick Chimney Shaft, 212 ft. high, on the Site of the Generating Station, "The Lero."

CHESHAM URBAN DISTRICT COUNCIL.
RECONSTRUCTION OF MAIN SEWERS.

The Chesham Urban District Council invites Tenders for the Reconstruction, with Cast-iron Pipes, of about 712 lineal yards of 12-in., 977 lineal yards of 9-in., and 935 lineal yards of 6-in., existing stoneware pipe sewers and house connections, together with all necessary Manholes, Flushing Chambers, &c., in Broad-street, Berkhamstead-road, Vale-road, Nash-leigh-hill, Essex-road, George-street, Alexander-street, Hivings-hill, Sunnyside-road, and Bellingdon-road, situate within the Urban District of Chesham.

Plans, Sections, and Specification may be seen

upon application to the undersigned any morning between the hours of 9.30 and 10.30 or at other suitable time by appointment.

The person whose Tender is accepted will be required to enter into a Contract and Bond in an approved Guarantee Society, as surety for the due performance of the Contract, a copy of which may be seen at the Office of W. J. Standing, Esq., Clerk to the Council, High-street, Chesham, to whom Tenders, sealed and endorsed "Tender for Reconstruction of Sewers, &c.," are to be delivered by the first post on Saturday, March 14th, 1914.

The Council does not bind itself to accept the lowest or any Tender.

PERCY C. DORMER,

Engineer and Surveyor.

Council Offices,
Chesham.

February 2, 1914.

(1,281)

KENT COUNTY COUNCIL.

PETROL MOTOR LORRIES.

The Bridges and Roads Committee of the County Council invite Tenders for the Supply of Six Petrol-driven Motor Lorries. The bodies to be constructed of steel with end tipping gear, and capable of carrying a load of five cubic yards.

Specification and Forms of Tender can be obtained upon application to the County Surveyor, Maidstone.

Sealed Tenders, endorsed "Tender for Petrol Motors," must be sent to the undersigned (upon the prescribed Form) not later than 12 noon on Saturday, February 28th.

The Committee reserve the right to apportion the order as they may feel disposed.

The lowest or any Tender will not necessarily be accepted.

W. B. PROSSER,

Clerk to the Council.

Sessions House,
Maidstone.

February, 1914.

**VOIDLESS
ASPHALT MACADAM**

Improved Methods, High-grade Bitumen and Exclusive Machinery solve the problem of Economical and Efficient Construction of Roads at a Low Cost.

WRITE FOR THIS BOOK.

Voidless Asphalt Macadam construction is explained and illustrated in an interesting book issued by Highways Construction Limited. It will be sent on request addressed to:—

HIGHWAYS CONSTRUCTION LTD.,

Finsbury Court,

Finsbury Pavement, London, E.C.

Bayard
"The First-Grade
Car without the First-
Grade Price"

ALWAYS ready for service - reliable - comfortable - and extremely economical to run. There is no better investment for the busy "outdoor" man.

CATALOGUE ON REQUEST.

Minutes of Proceedings.

Road Dispute Sequel.

An interesting sequel to the decision in *Tottenham Urban District Council v. Rowley* (noted at p. 254 *ante*) is the case of *Porter v. The Same Council*. The facts to be gathered from the reports of the two cases were briefly as follows: Rowley (the defendant in the first case) laid out, in accordance with an approved plan, a 40-ft. road called Keston-road, bounded on the north by land belonging to the council, and on the south by land of Rowley's, on which houses were afterwards built. Only half the width of the road—viz., the portion next the houses—was made up, but the entire road was thrown open in 1908, and had since been used by the public, both with and without vehicles, without let or hindrance. In 1912 the council entered into a contract with Porter (the plaintiff in the second action) for the erection by him of a school on their land on the north side of Keston-road. The contract provided that the contractor should be at liberty to enter on the land immediately, and that he should complete and deliver up the building fit for use within ten months, subject to penalties if this time was exceeded. The only means of access to the land was over Keston-road, and the council, in order to give the contractor access, made an opening in their fence, and put a gate in it. Porter started work on July 20, 1912. On March 6th, however, Rowley wrote to him claiming the right to prevent carts from passing over the road, and threatening him with proceedings for an injunction. Porter thereupon, considering that he had no alternative, gave an undertaking not to use the road, and discontinued the work, giving notice to the council of what had occurred. Attempts were made by the council to arrange matters amicably with Rowley, but he resisted all overtures, so that the council were forced in the interest of the public to obtain an injunction against him, which they did on May 11th.

The proceedings were prolonged by Rowley's unsuccessful appeals, first to the Court of Appeal and then to the House of Lords. His contention, briefly, was that the unmade half of the road had never been dedicated as a highway, or alternatively that it had only been dedicated as a footpath. But the facts were too strong for him. He had shown by his plan, his intention to dedicate the whole road and this, combined with the unrestricted use of the road by the public, was sufficient evidence of dedication.

The contractor, however, without awaiting Rowley's final discomfiture, resumed work as soon as the injunction was granted by the Court of first instance. But he had already been delayed for over two months, and for this delay he claimed damages against the council. The matter came before an Official Referee, who awarded him £560 12s. 6d. damages, but this decision was overruled by the King's Bench Division. The principle which guided the Court in this ruling appears to have been that Rowley's interference was in the nature of *vis major*, so far as regards the council's undertaking to give the contractor possession of the site. In other words, the council did not by their undertaking ensure that possession should be given, but merely bound themselves so far as their own acts and ability were concerned.

The decision is of the utmost interest and importance to building owners and contractors. The result to the contractor in this case may be hard, but (as Mr. Justice Ridley pointed out) if a building owner were to be held responsible for the acts of a mere trespasser over whom he had no control, it would be difficult to define any limit to his liability.

The Design of Sanatoria.

About a year ago the Local Government Board issued a memorandum—upon which we commented at the time—in which was indicated, in a general way, how inexpensive sanatorium accommodation for tuberculous persons could be erected within a comparatively short period in order to meet any pressing need in a particular locality. This has now been followed by a further memorandum, prepared jointly by the architect and the medical officer to the board, which is designed to afford local authorities and others further assistance in the provision of special residential institutions in connection with permanent schemes for the treatment of pulmonary tuberculosis. The object to be achieved in the design of such an institution is the old one of judiciously combining efficiency with economy, and in the latter connection it is pointed out that the principal factors which go to determine the cost are the cost and character of the site, the planning of the buildings, and the nature of the materials used in its construction. The choice of a suitable site is a most important matter, and among the considerations to which particular attention must be paid are the natural slope and surroundings and the character of the subsoil. It is essen-

tial that the site should be dry, and this must be secured, if necessary, by proper drainage.

Having dealt with questions affecting the choice of a suitable site, the memorandum proceeds to discuss some general considerations as to the accommodation to be provided for the patients. For this purpose, possible patients are divided into four groups—namely, (a) cases in which permanent improvement or recovery may usually be anticipated; (b) cases in which only temporary, though possibly prolonged, improvement may be anticipated; (c) advanced cases requiring continuous medical care and nursing, and (d) cases requiring special observation. Special considerations arise in regard to each of these classes of patients, as, for example, the kind of sleeping accommodation to be provided. Here it is desirable that patients in different stages of disease should, as far as practicable, be treated in different wards or rooms, and it is further desirable, in order to secure adequate and continuous attention to patients along with economy of staff, that, so far as practicable, all patients requiring special nursing should be treated in a section of the institution devoted to this purpose. The memorandum is accompanied by a series of very suggestive drawings, which aim at giving an indication of the lines on which buildings may be suitably designed—drawings which will be of great assistance to those whose duty it may be to provide institutions for tuberculous patients. The drawings comprise block plans of 100-bed sanatoria, with three separate pavilions and with a single pavilion respectively; ground and first-floor plans of a staff block; plans of dining-hall and kitchen block, nursing pavilion for thirty-six beds, and convalescent pavilion for thirty-two beds; and two alternative plans of a two-storied pavilion for 100 beds. Generally, it is recommended that the accommodation should be so arranged that a floor space of at least 64 sq. ft. will be available for each patient, and that the distance between the centres of the heads of any two adjoining beds should not be less than 8 ft., measured along the wall behind the heads of the beds. The building of sanatoria will necessarily proceed with considerable rapidity in view of the provisions of the National Insurance Act, and there can be no doubt that the effort made by the Local Government Board to assist the local authorities concerned by means of this memorandum will be much appreciated.

Road Crust Types in New York State.

The practice of the highway department of New York State is now of special interest to British road engineers since the new regulations for wheels, loads and speeds of motor vehicles are in several respects similar to our own. The maximum gross weight of 14 tons more or less strikes an average between our traction engine regulations and those for heavy motor cars, and the maximum axle weight of 8 short tons is nearly the same as ours. The speeds allowed are, on paper, greater in proportion to the weights of the vehicles for iron tyres, but for rubber-tyred vehicles weighing up to 6 tons the same (in our case nominal) limit is adopted. The road crusts now being put down on different classes of State roads in New York State are described and illustrated in a recent *Engineering News* article by Mr. W. G. Harger, with special reference to the roads in the division with which he is particularly connected. We have taken the liberty of making extracts from Mr. Harger's article, with brief summaries of the main points from other parts of it, and have reproduced the drawings of cross-sections of the wheelways of the different types of road. Mr. Harger's conclusions as to the merits of the different pavings and crusts employed are extremely interesting. He looks with little favour upon concrete as the wearing crust, and has found that a thin bituminous coat does not effectively protect such crusts. This type of roadway, which we may, perhaps, call the "Ann Arbor

residential street type," is certainly not promising as regards country main roads. Mr. Harger also suggests that the rock asphalt and sheet asphalt types can be eliminated, and he notes that the asphalt roads, as constructed in New York State, provided poor foothold, gave rise to skidding of motor cars, and were not suitable for gradients steeper than 1 in 29. He speaks favourably of grouted bituminous macadam, but, we are not surprised to learn, recommends an increase in the thickness of the wearing course.

As regards the use of brick and of vitrified clay cubes, the low heat conductivity and small specific heats of the materials are against their employment in our variable climate, since the number of times that such a paving is chilled to freezing-point during the cold season is much greater than in the case of other kinds of crust and paving. In this respect a water-bound crust has, when not very dry, a marked superiority over most others, and surface tarring reduces this advantage to only a moderate extent. Any solid crust of fairly high specific heat conductivity, especially if it be in close contact with the road-bed, is superior in this respect to crusts and pavings of an insulating character. Mr. Harger's sections show that the construction of road crusts has advanced considerably in his State, but it may be suggested that some of the designs are defective in that they bring both wearing course and foundation to an abrupt edge; while the proposed modifications, with thinner foundations towards the edges, are by no means to be commended.

An Institution of Structural Engineers and Architects.

The Concrete Institute is one of the associations in which the bond between the members consists in their common interest in certain kinds of work. It differs from most other associations of a similar character in that the subjects discussed at the meetings and studied by the committees relate largely to structures and processes in which architects are interested; and the institute forms, in fact, a meeting ground for architects and engineers on which matters concerning both professions may be studied and discussed. Modern structural work often presents features which demand the attention of both engineers and architects, and it is of much advantage to both professions, and to the interests of those whom they serve, that they should in these cases act together rather than separately.

The old, vicious idea was that in some cases the engineer would design a structure, such as a bridge, and that the unhappy architect would afterwards "embellish" the design. On the other hand, a building, the design of which really demanded the attention of an engineer from the beginning, would be entrusted to an architect, who would be supposed to call in an engineer to help him in the design of one or more details. The results were far from satisfactory. It is better that works of either character should be designed in one of the three following ways: In many cases it is desirable that the architect and the engineer should work together in unison from the beginning of the design. In other cases, where the design is mainly one which calls for the instincts and technical qualifications of the architect, he should be entrusted with the whole design of the work, but will consult an engineer both as regards certain details and with respect to the effect of these features on the design as a whole. Similarly, an engineer who is designing a structure as to which the opinion of an architect is desired will consult the architect at different stages in the design as well as, and especially, with respect to the design as a whole. It is largely in connection with concrete and reinforced concrete work that engineers and architects meet at the house of the Concrete

Institute, but since no other association specially concerns itself with structural work in which engineers are interested, the range of the institute may well be extended to cover the whole field of structural engineering. While, therefore, concrete and ferro-concrete are still prominently mentioned in the memorandum of association of the institute, that document has now been altered by the inclusion in many of its clauses of the phrases "structural engineering" and "materials employed in structural engineering"; and with this wider range of subjects before it the institute bids fair to attain to an important position among scientific and professional bodies.

**Underpaid
County Officials
in Ireland.**

Among the many points of Christian ethics that are overlooked or depreciated by a large number of public authorities is the affirmation that the labourer is worthy of his hire. In Ireland this would appear to be the case particularly. Here the obstinate refusal to place an adequate valuation upon skilled service in municipal and county administration is a fault that is far too prevalent, and it is one, moreover, that does not receive the reprobation from public opinion which, considering all things, it certainly ought to. The instance of the Queen's County Council and the salary which it assigned to the office of county surveyor, was recently revived when the matter came up for consideration at a specially convened meeting. The Local Government Board by letter once more pressed upon the council the view that an inclusive salary of £350 for the county surveyor was inadequate, and added that they would not be disposed to object if a suitable allowance for travelling and office expenses were given in addition. The cost of travelling is manifestly a very heavy item in the personal expenditure of a county surveyor, and none can be better aware of this fact than county councillors themselves. These gentlemen, however, remained adamant to the appeal of the Local Government Board, and proceeded forthwith to appoint a gentleman at the salary advertised, "subject to the sanction of the Local Government Board." How far the authority of the board goes we know not, but it is to be hoped that it can or will be exercised in insisting upon the improved conditions of service which they indicated in their letter to the Queen's County Council. In connection with this subject of official salaries a letter appears in the *Irish Times* calling attention to the "paltry" sum of £100 or £120 a year paid to assistant surveyors in the service of county councils, a sum which includes travelling expenses, postage, and other outgoings. That such salaries should be paid is, of course, little less than a scandal, but we fear that not much, if anything, would be gained by an appeal to the Road Board. Lack of jurisdiction renders this authority powerless. The local controlling authority—namely, the county council—ought to be subjected to such pressure from outside as will force it to recognise its responsibilities for the better remuneration of competent officials, and the representative professional associations of Ireland ought to be instant and insistent in creating and directing this pressure for the common good of their members.

* * *

**Sewer
Ventilation.**

In our Special Annual Issue (p. 236) we printed some extracts from a report upon the ventilation of sewers by the Main Drainage Committee of the London County Council, in which the difficulties of preventing the possibilities of nuisance arising from foul emanations from surface openings and from shafts are clearly

described. The result of the consideration of the subject with reference to the particular instances in question was that the committee could recommend no departure from the existing practice of considering each case of complaint on its merits, and, if it is possible, remedying the defect. Reference was made to the Manchester experiments with various mechanical contrivances, and the conclusion arrived at that none of these systems could be recommended for use in the Manchester sewers, and the committee concluded that there would be little to be learned by further experiments on these lines in London. It is, however, interesting to note, in view of the Local Government Board's report upon the intercepting trap, that the committee express the opinion that if the intercepting traps were abolished (presumably along the line of the main sewer in question) this procedure would "go a long way towards the solution if the ventilation problem, as a system of shafts which would serve both as inlets and outlets, would thereby be established." Surely this was an opportunity for the committee to have had the courage of their convictions, and take the bold step of recommending the abolition of the intercepting trap, especially as they could then have safely closed all the surface ventilators as requested by the local borough council, and thus have removed all possibility of complaints in the future. On the other hand it is surprising to notice that the Main Drainage Committee were of the opinion that "bends and elbows" tend to impair the efficiency as ventilators of stack pipes on houses. We referred to this matter in our "Coming-of-age" Issue of January 17, 1913 (p. 81), when we mentioned the experiments carried out by Dr. H. R. Kenwood, and described in a paper he read at the Sanitary Congress in 1892, which demonstrated that the air-currents in soil pipes were not influenced by the number and nature of the bends in such pipes.

* * *

The Canadian people are eminently practical, and among their latest accomplishments is the provision of municipal skating rinks and toboggan slides. Vast possibilities are opened up by their introduction. Sliding and backsliding may now be indulged in by both councillors and officials, and an occasional cropper, while entailing possibly some momentary loss of dignity, will have no injurious effect upon the moral reputation. That elusive member of committee who, blowing hot and cold in the same breath and hunting with hare and hounds, blows cool and steers a midway course when the Press are in the room, may now disport himself at will, turning and twisting and cutting intricate figures to his heart's content. Treading on thin ice will necessarily be avoided with care, although valour may occasionally outrun discretion when the surveyor is being harried into a dangerous corner by a municipal pack in full cry. Tobogganing, too, will have its attractions. On a sled of sufficient capacity the whole council will be enabled to slide in manner both unanimous and dignified, although a team of horses would have to be employed for a similarly qualified backsliding. An official of evil disposition could possibly cajole his council to enterprise in a leaky toboggan fitted to a water-chute, his trouble being well repaid by the final splash. The switchback toboggan would specially commend itself as typical of public office, with its ups and downs (the downs preponderating), its joyous mountings to the empyrean followed speedily by its fearful descents to Avernus, its unexpected turns, its gradual slowing down, and its ultimate and complete stagnation. Certainly there is more in the idea than meets the eye at first sight.

The Building of Sanatoria.

LOCAL GOVERNMENT BOARD MEMORANDUM.

In a memorandum of the Local Government Board dated February 25, 1913, it was indicated, in a general way, how inexpensive sanatorium accommodation for tuberculous persons could be erected within a comparatively short period in order to meet any pressing need in a particular locality. Another memorandum, prepared by the board's architect, Mr. Brook Kitchin, and the medical officer, Dr. Arthur Newsholme, has now been prepared with a view to affording local authorities and others further assistance in the provision of special residential institutions in connection with permanent schemes for the treatment of pulmonary tuberculosis. The unit taken in setting out the details has been 100 beds in buildings, with 10 additional beds in shelters.

ECONOMY IN BUILDING.

In preparing this memorandum economy has been borne in mind throughout, but, it is believed, without any sacrifice of efficiency. The cost of an institution—apart from the cost and the character of the site—depends, it is pointed out, primarily on its planning; after this on the character of the materials used in its

but a site requiring extensive drainage should, as a rule, be avoided.

(6) If drainage into a public sewer is impracticable, the site should be suitable for the provision of an adequate sewage disposal system.

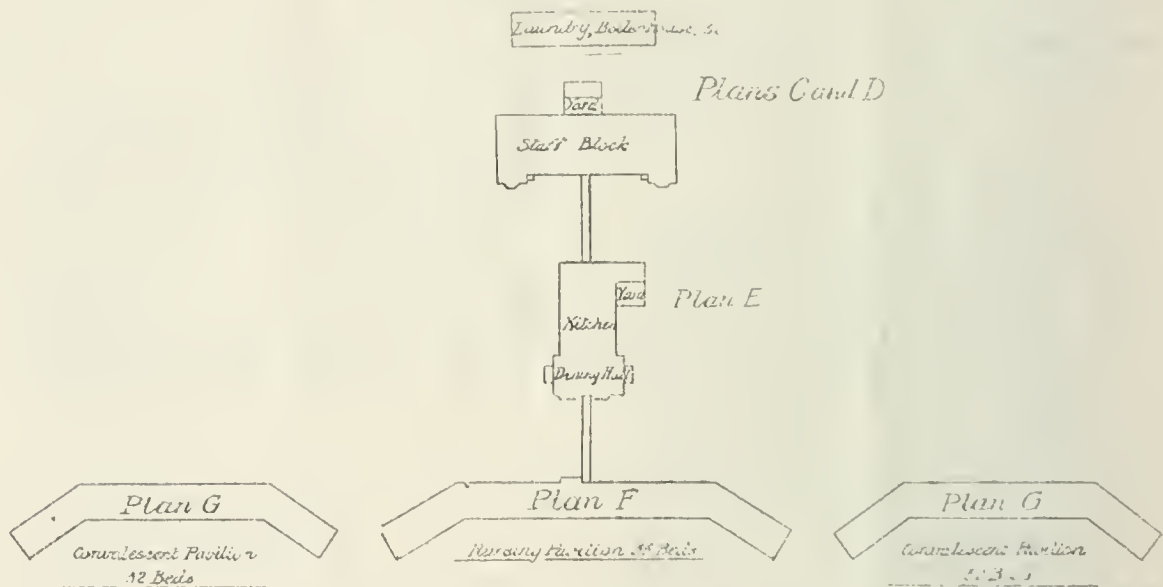

(7) It will be necessary to ascertain that an abundant supply of pure water is available.

(8) The site should, if possible, be within easy reach of a railway station. The cost of carriage from the station to the site will form an important factor, not only as regards construction, but also in the subsequent maintenance of the institution. There is the further consideration that it is undesirable that patients who are acutely ill should be unduly remote from their relatives.

BUILDINGS.

In residential institutions for the treatment of pulmonary tuberculosis the following provision will be required:—

(1) Patients' sleeping accommodation; (2) kitchen, dining-hall, and offices; (3) staff block containing quarters for resident medical officer, matron and staff;

SCHEME I: BLOCK PLAN "A."

construction. The local circumstances must be taken into account in determining the choice of building materials.

SITE.

In the selection of a site the most important considerations to be taken into account are: (1) Area; (2) elevation in relation to surrounding country; (3) cheerfulness of outlook; (4) protection from certain winds; (5) subsoil; (6) drainage facilities; (7) water supply; (8) convenience of access.

(1) The area of land required for the site will depend upon the number of patients and the type of cases. The site of a sanatorium should be sufficiently large to permit of open-air employment of a considerable number of patients. It is desirable that a site of 50 acres in extent should be provided for 100 patients if land is readily available and the cost is low; but an area of not less than 20 acres may suffice for this number of patients where suitable land is difficult to obtain or the cost of land is high. It is desirable that in all cases an area of at least $\frac{1}{2}$ acre should be allowed per patient.

(2), (3) and (4) The site should preferably slope gradually to the south, and be protected on the north and east by high ground, preferably wooded. In some districts protection from westerly and south-westerly gales may be desirable. The site should be moderately elevated above the country lying to the south of it.

(5) The subsoil has importance, not only as regards dampness or dryness, but also because the cost of building may depend somewhat upon its character. The main consideration is that the site should be dry. This must be secured, if necessary, by proper drainage.

(4) outbuildings, including laundry, boiler-house, disinfectant, sputum destructor, mortuary, &c.

GENERAL CONSIDERATIONS AS TO ACCOMMODATION FOR PATIENTS.

As the planning of the institution will depend on the stage of the disease of the tuberculous patients proposed to be admitted to it, it is necessary to set out a classification of cases of pulmonary tuberculosis arranged from the standpoint of accommodation in residential institutions.

Group A.—Cases in which permanent improvement or recovery may usually be anticipated.

Group B.—Cases in which only temporary, though possibly prolonged, improvement may be anticipated. Such cases will include: (1) Patients who may be expected to recover considerable ability to work, as a result of protracted treatment; (2) patients admitted for a short term for educational treatment; (3) patients with advanced disease, many of whom improve greatly under institutional treatment.

Group C.—Advanced cases requiring continuous medical care and nursing.

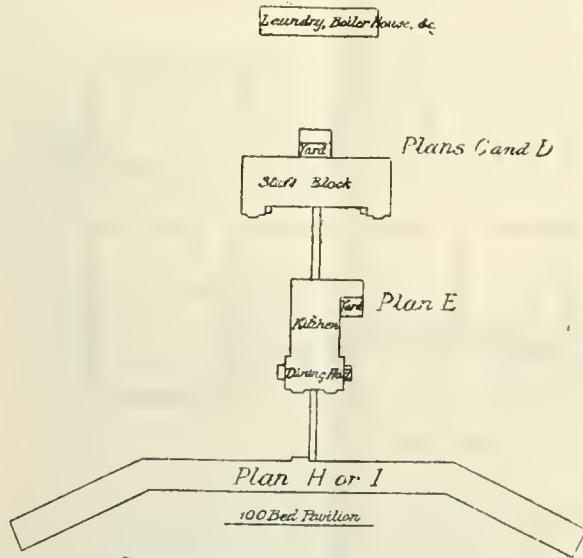

Group D.—Cases requiring special observation: (1) Patients admitted for the purpose of diagnosis; (2) patients needing to be watched before the best form of continued treatment can be determined.

The patients in all four groups may be treated in a combined institution, in separate rooms or pavilions. This arrangement is most suitable for areas with a population too small to require the provision of 100 beds for patients in group A. A combined institution should be so situate as to secure fairly easy access of

relatives to patients acutely ill, while giving good local conditions for patients in group A.

TYPES OF BUILDINGS.

The drawings which accompany this memorandum aim at giving an indication of the lines on which buildings may be designed, and it is hoped that these may be of service to those who are engaged in the

SCHEME II.: BLOCK PLAN "B."

provision of institutions for tuberculous patients.

The following plans are appended to the memorandum:—

- A—Block plan of a 100-bed sanatorium with three separate pavilions.
- B—Block plan of a 100-bed sanatorium with a single pavilion.
- C—Ground plan of staff block.
- D—First floor plan of staff block.
- E—Plan of dining-hall and kitchen block.
- F—Plan of nursing pavilion for 36 beds.
- G—Plan of convalescent pavilion for 32 beds.
- H—Plan of two-storied pavilion for 100 beds.
- I—Plan of two-storied pavilion for 100 beds (alternative design).

It will not usually be practicable to provide in a single one-storied building 100 beds in rooms or

special nursing section, and two separate pavilions for males and females respectively.

Schemes I. and II. have both been prepared upon the assumption that equal accommodation will be required for each sex. They may require modification in this respect according to local needs.

An arrangement is also shown by which ten beds between the duty-rooms in the special nursing pavilion in plan F, and in the central section of the ground floor in plans H and I, ordinarily intended, in each instance, for five male and five female patients, can be utilised either entirely for male or entirely for female patients as occasion may require. Some elasticity in the amount of accommodation for the two sexes is thus secured.

SCHEME I.

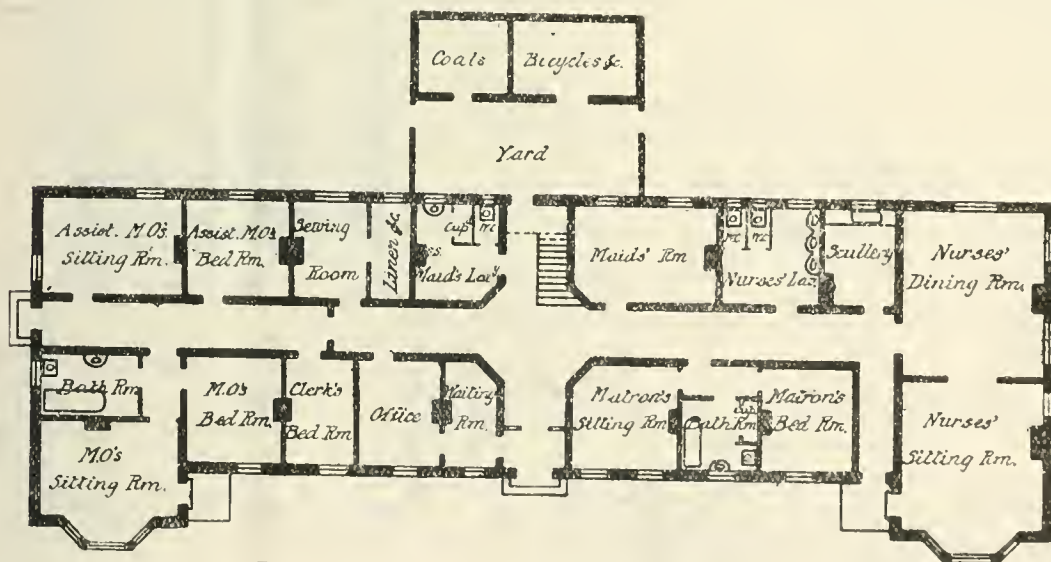

(Details of the various blocks are given in plans C, D, E, F and G).

Scheme I. has been prepared to secure the advantages to be obtained by having one pavilion for patients requiring special nursing or supervision and in the separate pavilions for male and female patients, respectively, who are able to be up and about all day. This arrangement makes for efficiency and economy in nursing, and secures separation of the sexes more efficiently than is possible if all patients are treated in the same building.

It has been prepared for a combined institution, and shows a special nursing pavilion for thirty-six patients, a pavilion for thirty-two male and a pavilion for thirty-two female patients. The plan can be modified so as to make it suitable for a sanatorium by reducing the accommodation in the special nursing pavilion to about twenty beds, and by increasing that in the separate pavilions for male and female patients.

The block plan shows that the central portion of the site is occupied by the staff block, kitchen and dining-hall block and outbuildings, and by the special nursing pavilion; the eastern and western sections are occupied by the separate convalescent pavilions for male and female patients respectively. The portions of the site devoted to male and female patients are thus separated, so far as possible, by administrative and other buildings.

Special Nursing Pavilion (Plan F).—For convenience of service this pavilion is connected with the centrally situated kitchen and dining-hall block by a covered way about 60 ft. in length. The plans show a central service kitchen. On either side of this kitchen is provided a nurse's duty-room and accommodation for ten patients in four double-bedded and two single-bedded rooms. It is intended that this central section should be used for those patients

PLAN "C": GROUND FLOOR OF STAFF BLOCK.

wards with beds arranged on one side only. Such an arrangement would necessitate a very long building, which may be expensive to construct, except on a level site, and which would be inconvenient to administer. For an institution for 100 patients it will often be preferable to arrange for three separate pavilions (scheme I.); under some circumstances it may be found desirable to provide the accommodation in one two-storied building (scheme II.).

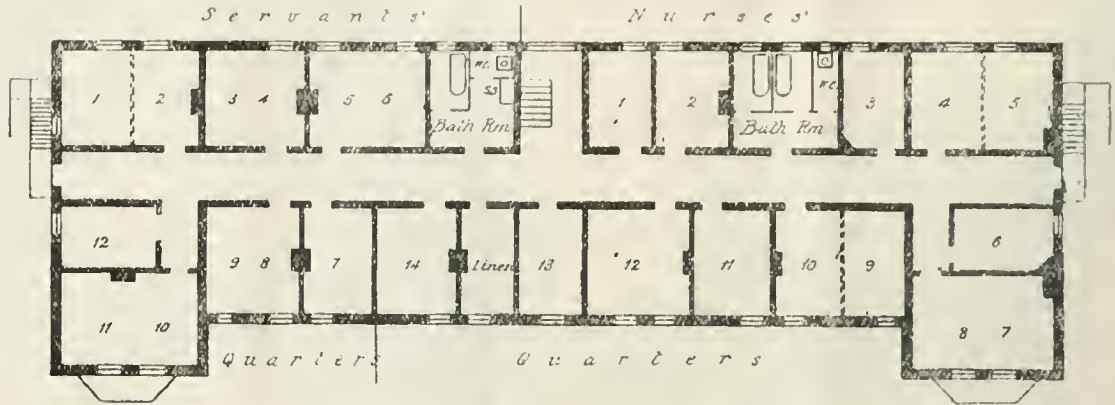

If an institution for more than 100 beds is required it will usually be preferable to adopt a modification of scheme I., with at least three pavilions—one a

who are acutely ill. The north verandah will be useful for nurses attending on the patients. At the end of this verandah a hospital slop sink has been provided. It is desirable that arrangements should be made for heating some of these bedrooms. At each end of these centrally situated rooms is a lavatory section, and beyond this, in the wings, is accommodation for those patients who require only a moderate amount of nursing. This accommodation may be provided either in double-bedded rooms or in small wards. The latter arrangement is shown on plan F. The section between the service kitchen and the duty-room

on each side is practically cut off from the section beyond the duty-room. A small lavatory annex situated behind the service kitchen, and containing two water-closets and one bath-room, has been provided for these sections. This arrangement makes it possible to use these sections entirely for male or entirely for female patients, or for five patients of each sex. In the event of the sections being occupied by

Windows should preferably be of the casement pattern and be hung "to fold" without mullions. Baths should be provided on a scale of about one to twelve patients. They may be of enamelled iron, and should be fitted with large taps and wastes to facilitate filling and emptying. Spray baths may also be provided.

There should be at least one water-closet for every

PLAN "D": FIRST FLOOR OF STAFF BLOCK.

patients of different sexes, each section would have a separate water-closet, but the bath-room would be common to the two.

Convalescent Pavilions (Plan G).—The sleeping accommodation is shown partly in double-bedded rooms and partly in a small ward. As patients occupying these pavilions will be able to take their meals in the dining-hall no provision has been made for the service of food, and the pavilions need not be situated close to the central kitchen block. No provision has been made in these pavilions for special nursing, as it is assumed that patients requiring this will be transferred to the special nursing pavilion.

SCHEME II.

(Details of the various blocks are given in plans C, D, E, H and I.)

Plans of a two-storied building have been prepared to meet those cases where local circumstances make it desirable to provide the whole of the sleeping accommodation for patients in a single building. The plans have been prepared for a sanatorium. If it is proposed to use such a two-storied building as a combined institution, the plan can be modified to secure more accommodation on the ground floor, within the special nursing section.

Provision has been made for a centrally situated special nursing section on the ground floor. The general arrangement of this section is similar to that of the special nursing pavilion included in Scheme I. Arrangements have been made for the accommodation of patients needing little nursing supervision on the first floor and in the wings on the ground floor. As it is suggested that the first floor shall be used only by patients who are able to be up and about, only narrow balconies for access to the rooms have been provided in order that the lighting and ventilation of the ground floor rooms may not be materially interfered with.

It will be noted that the plan of the first floor differs from that of the ground floor, only one duty-room having been provided.

GENERAL OBSERVATIONS.

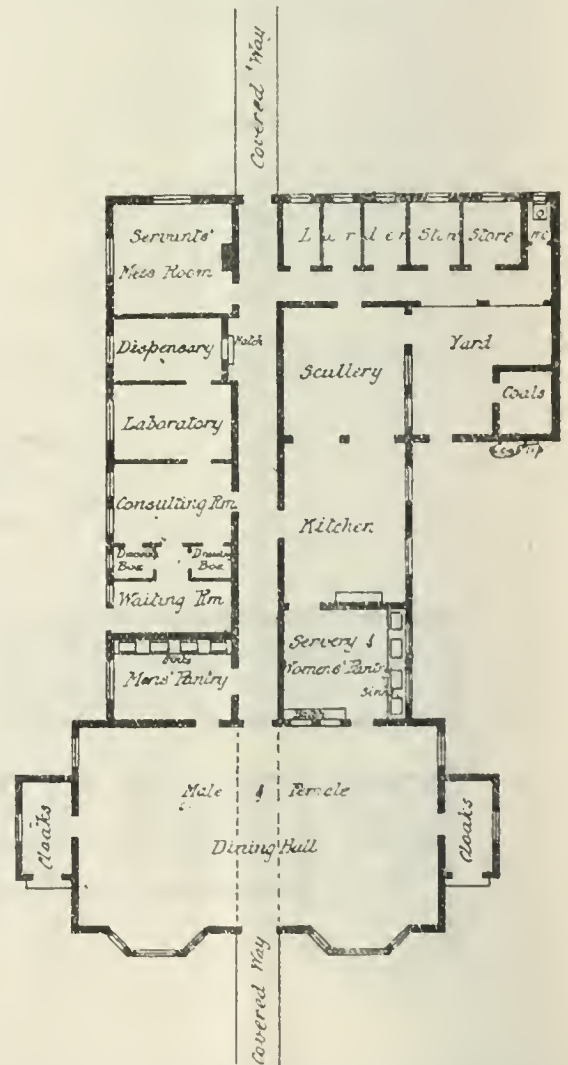

Space for Patients and Height of Walls.—The accommodation should be so arranged that a floor space of at least 64 sq. ft. will be available for each patient; the distance between the centres of the heads of any two adjoining beds should not be less than 8 ft. measured along the wall behind the heads of the beds.

Patients' rooms should not be less than 8 ft. 6 in. high; wards should be higher, but may be carried partly into the roof and ventilated by openings in the gable end.

Doors should be made on the "stable door" pattern, so that in inclement weather the lower portion may be closed while the upper portion is left open. They should be constructed in the form of French casements with a clear opening of not less than 3 ft. 6 in., so that beds may easily be wheeled through them.

twelve patients. Hospital slop sinks should be provided in the special nursing pavilion.

Every institution should have ample storeroom accommodation for linen, clothes, &c., and lockers for boots and shoes. The provision of some arrange-

PLAN "E": DINING HALL AND KITCHEN BLOCK.

ment for drying patients' clothes will also be advisable.

Day Shelters. The question as to whether day shelters shall be provided will require consideration for each proposed institution: if verandah accommodation is not adequate, day shelters will be needed. These should be of inexpensive construction.

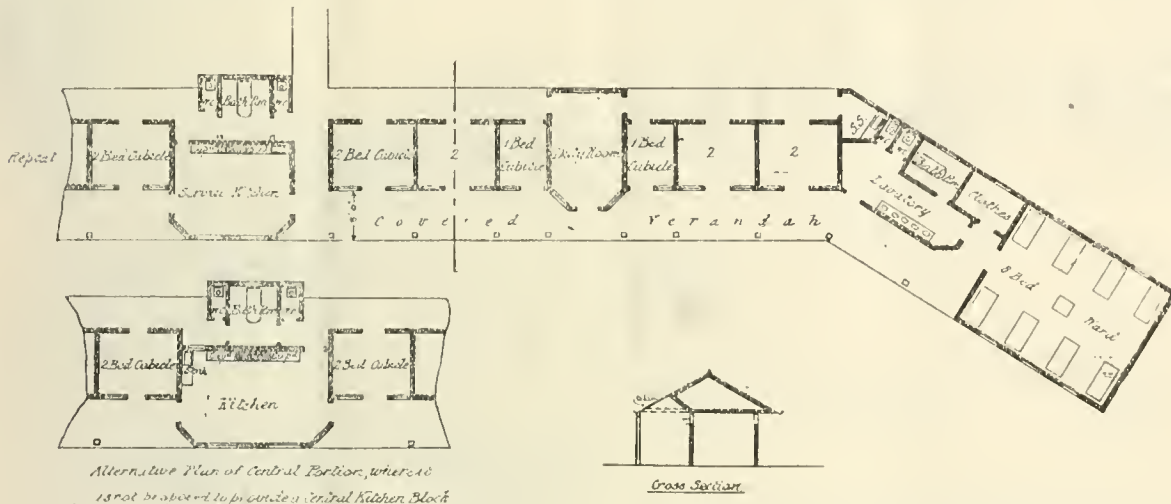

Recreation Rooms. In view of the importance of continuous open-air treatment of patients, it is unwise to encourage them to collect in a recreation-room, except for a very limited time, or on special occasions. In view of these considerations the dining-room has frequently been regarded as sufficing for the use of patients for recreation, lectures, &c. If it is considered necessary to provide special recreation rooms for use on wet days, or in winter evenings, these may conveniently be added at the ends of the pavilions for convalescent patients.

Kitchen and Dining-hall Accommodation (Plan E).—The block containing the patients' dining-hall and kitchen for patients and staff should preferably be a one-story building, which should be placed near to the administrative block and to the rooms for

so that a separate fully equipped kitchen is not required in the administrative block. A small kitchen pantry with food-store is shown on the plan adjoining the nurses' dining-room. This could be provided with a small range or gas cooker for minor cooking.

Out-buildings.—The laundry should consist of receiving room and wash-house, drying-room, and ironing and delivery room. Mortuary accommodation may be provided in the same block.

The amount of boiler-house accommodation will depend on the amount of steam required for laundry, disinfector, heating and hot-water supply, and for driving dynamos if electric current is to be generated in this way for lighting or other purposes. Special provision should be made for the sterilisation of sputum and for the cleansing of sputum cups. Unless

PLAN "F": SINGLE-STORY NURSING PAVILION FOR THIRTY-SIX BEDS.

patients requiring special nursing. It may be connected with the special nursing pavilion, if desirable, by a covered way.

The dining-hall should, if practicable, have a southerly aspect.

The consulting-room, dispensary and laboratory, which should be centrally situated, may also conveniently be included in this block.

Unless other accommodation is available for the male domestic staff, provision may be made for them

suitable arrangements are available elsewhere, some form of disinfector for clothing and bedding should be provided.

Hot-water Supply.—An ample and constant supply of hot water is desirable, and the system should be capable of easy extension.

Heating and Lighting.—It will usually be unnecessary to heat the patients' quarters, except the dining-hall and some of the rooms for patients requiring special nursing. A system of low-pressure hot-water

PLAN "G": SINGLE-STORY CONVALESCENT PAVILION FOR THIRTY-TWO BEDS.

in an upper floor of the kitchen and dining-hall block above the store rooms, &c.

Staff Block (Plans C and D).—The position of this building should be selected with a view to giving the greatest facilities for economical service and administration. The accommodation for a sanatorium with 110 beds will include medical officer's quarters, offices, matron's quarters, dining-room for nurses, bedroom accommodation for the nurses and servants. Each nurse should have a separate bedroom of an area of about 100 sq. ft. Usually one nurse will be required for twelve patients; but more will be needed if a considerable number of patients with advanced disease are being treated. Baths and water-closets should be provided in the proportion of not less than one to each twelve nurses or servants.

It is desirable that the principal cooking for the staff should be done in the central kitchen block,

heating will be found most economical for this purpose.

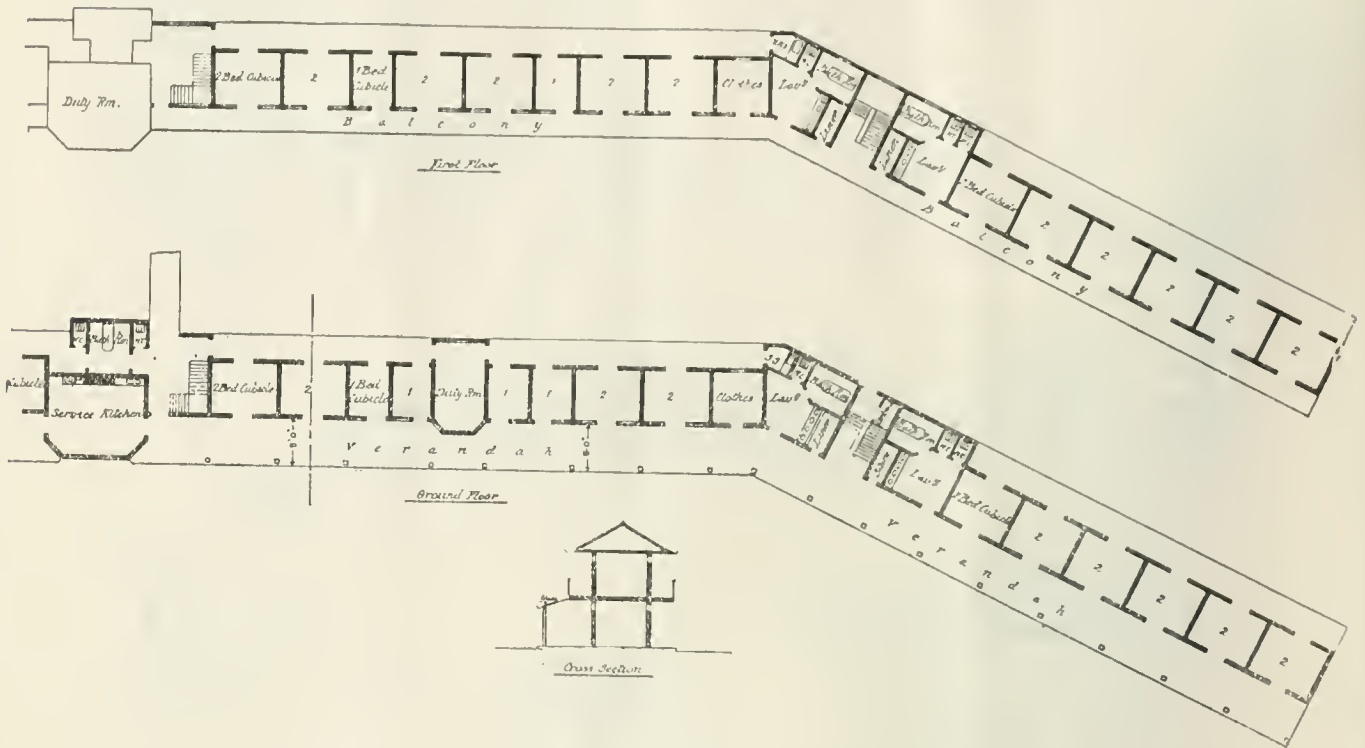

Electric lighting should be employed where electric current is available or can be produced economically. It may be necessary to use coal-gas, acetylene or petrol air gas; these illuminants have been found to be fairly satisfactory for use in sanatoria if suitable fittings are provided and adequate precautions are taken against fire.

Construction.—Where, owing to local circumstances, the use of brickwork would be economical, cheap bricks may often be employed faced externally, if necessary, with rough-cast or cement. Walls in exposed positions should be of hollow construction.

In some districts other materials may be less expensive and may be employed, such as steel framing carrying terra-cotta slabs, or concrete slabs or blocks plastered internally and cemented externally, or

timber-framing lined internally with asbestic sheeting or expanded metal lathing plastered with a hard-setting plaster, rough-cast or coated externally with weather boarding chemically treated. The roofs

Liverpool, Blackburn, Darwen, Oldham, and, of course, many local firms, are exhibiting. Model buildings which will be on view should prove of great interest to architects and other professional men, for whom

PLAN "H": 100-BED PAVILION.

should be of simple construction, and may be covered with slates, tiles or asbestic material. The floors of verandahs should be of impermeable material.

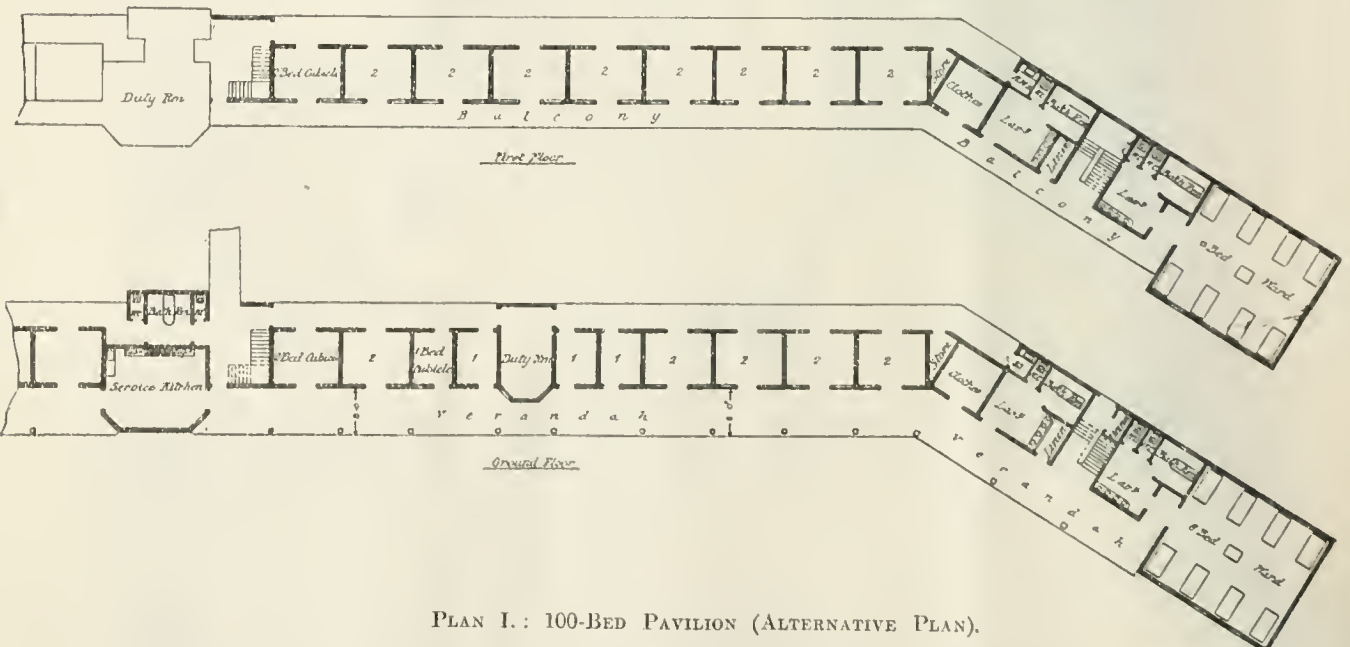

two special days have been set apart—viz., March 5th and March 11th, between the hours of 11 a.m. and 4 p.m.

EIGHTH MANCHESTER BUILDING TRADES EXHIBITION.

The exhibition director is Mr. Charles H. Luke, joint managing director of Messrs. Walter Cawood, Limited, who has had great experience in all classes of exhibitions, particularly those connected with the engineering and shipbuilding industries. The firm of Walter Cawood, Limited, was formed after the death of the late Mr. Walter Cawood to carry on the business, and since they have taken it over it has been extended and increased in all directions.

The eighth Manchester Building Trades Exhibition is now nearing completion, and will be opened on March 3rd at 3 p.m. by the Right Hon. The Lord Mayor of Manchester (Alderman D. McCabe, J.P.). The chair will be taken by Alderman J. R. Wilson, J.P., chairman of the Improvements Committee. The management inform us that in addition to the

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY

PLAN I.: 100-BED PAVILION (ALTERNATIVE PLAN).

majority of the old exhibitors being represented, a large number of new firms have taken space, and are supporting the exhibition. The list of exhibitors show that many firms from London, Belfast, Birmingham,

ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier*.

Types of New York State Roads.

[From an article in *Engineering News*, chiefly relating to Division 5. By W. G. HARGER.]

On October 20, 1913, new regulations limiting the weights of motor vehicles came into force. The gross weight upon State and county highways of vehicle and load is limited to 14 short tons, unless the permission of the State Commissioner of Highways has first been obtained for the passage of a heavier vehicle. The axle-weight is limited to 8 tons. The load per inch width of tyre, wheel, or roller is limited to 800 lb. per square inch (unless permission be obtained from the Commissioner). The width of motor vehicles is limited to 90 in. (7 ft. 6 in.), except traction engines, which may have a width of 100 in. (8 ft. 4 in.). Vehicles of a gross load of more than 4 tons are limited to a speed of 15 miles per hour; and if of more than 6 tons to 6 miles an hour, with iron or steel tyres, and 12 miles an hour with tyres of hard rubber or other similar substance.

[The section relating to projections upon the wheels of traction engines is somewhat difficult to

"(2) Main through automobile routes at a greater distance from the cities which have a large touring-car traffic and a medium heavy farm-produce traffic.

"(3) Secondary feeder roads and cross roads having a medium and light farm traffic and light automobile traffic.

"(4) Pleasure roads or scenic routes that have a heavy touring-car and light steel-tyre traffic.

"For Class 1 we have had the best success with a brick surface on a concrete base, using either Hill-side brick or stone block on grades of 5 per cent or higher. We consider this to be the most economical construction in the end.

"For Class 2 the first choice is a grouted bituminous macadam, which seems to be most economical in the long run. The economies in this type of construction are largely confined to selecting the cheapest type of suitable foundation course.

"The second choice is a water-bound macadam

understand, and the last provision seems to be impossible of accomplishment. This section is therefore given in full.—Ed. SURVEYOR.]

"Section 1.—No traction engine, road engine, hauling engine, trailer, steam roller, automobile truck, motor or other power vehicle shall be operated upon or over the State or county highways, the face of the wheels of which vehicle are fitted with flanges, ribs, clamps, cleats, lugs, or spikes. This regulation applies to all rings or flanges upon guiding or steering wheels of any such vehicle. In cases of traction engines, road engines, or hauling engines which are equipped or provided with flanges, ribs, clamps, cleats, rings, or lugs, such vehicles shall be permitted to pass over said highways provided that cleats are fastened upon all the wheels of such vehicles, and are not less than 2½ in. wide and not more than 1½ in. high, and so placed that not less than two cleats on each wheel shall touch the ground at all times, and the weight shall be the same on all parts of said cleats."

CLASSIFICATION OF STATE HIGHWAYS.

"Roads in this territory can be divided on a traffic basis into four classes.

"(1) Main feeder roads which extend from 10 to 15 miles out of cities like Rochester and Buffalo, and in the business sections of villages and third-class cities, which carry the concentrated garden truck traffic of a large area, and are subjected to continuous auto-truck and touring-car traffic.

surface treated with a surface coat of refined tar of the binder grade and maintained with periodical applications of cold refined tar. The indications are that in the near future the vitrified-shale cube surface will be able to compete economically with bituminous macadam for roads of this class. 'Amesite' and 'Roemac' are satisfactory, but are usually rejected on account of a slightly higher first cost. 'Amesite,' particularly, is a promising material.

"For Class 3 water-bound macadam treated with heavy refined tar and maintained with cold refined tar, or water-bound macadam treated with a light coat of No. 3 or No. 4 road oil once a season, or water-bound macadam treated two or three times a season with calcium chloride gives the best satisfaction.

"For Class 4 grouted bituminous macadam, concrete with or without a protecting bituminous surface, or water-bound macadam with 'Tarvia A.' asphaltic concrete, 'Amesite,' or 'Roemac' gives good results."

AVERAGE COSTS OF 16-FT. ROADS.

Brick on Concrete Foundation.—Cost of excavation \$2,200 (9 per cent); total cost per mile, \$24,400 (£5,083).

Asphaltic Concrete on Concrete Base.—Excavation, \$1,900 (9.9 per cent); total cost per mile, \$19,500 (£4,062).

Bituminous Macadam Surface, on Macadam, Field-stone, or Gravel Bottom Course.—Excavation £1,900 (15.9 per cent); total cost per mile, \$12,300 (£2,562).

Concrete with Thin Bituminous Surface. Excavation, £2,300 (18 per cent); total cost per mile, \$12,500 (£2,604).

The mileages of the different types of pavement as designed are as follows: Brick, 40; California sheet asphalt, 2; rock asphalt, 4; "Hassam" (concrete), 16; concrete, bituminous top, 21; bituminous macadam, 129; water-bound macadam, 4; total, 216 miles.

It does not seem safe to build any more concrete roads with bituminous tops until there has been more opportunity to observe the wear of the roads already built. The "Hassam," the rock asphalt, and sheet asphalt types can be eliminated with a resulting reduction in cost; and some of the brick pavement can probably be changed to another type with advantage. Most of the brick, bituminous macadam and water-bound macadam designs will probably stand without correction, except, possibly, for width.

Brick pavement, though the most available type for the heaviest traffic roads, has the bad features of any rigid construction, and longitudinal cracks develop, due to heave under frost action or settlement on new fills. The pavement is difficult to repair if anything goes wrong. With asphaltic concrete on a concrete base, the $1\frac{1}{2}$ in. thickness is evidently too small, for holes develop rapidly. It gives a poor footing for horses, and motor cars skid easily on it. It should not be used on grades over $3\frac{1}{2}$ per cent (about 1 in 29). Grouted bituminous macadam is available for a large percentage of roads in the section. It has been found that a 2-in. bituminous macadam top is too thin; $2\frac{1}{2}$ in. is successful on a macadam base, but 3 in. is necessary on fieldstone or gravel, and is advisable where the stone is crushed locally and is of large grade. The best results have been obtained with stone ranging from $1\frac{1}{4}$ in. to $2\frac{1}{2}$ in., spread and rolled, a thin layer of $\frac{3}{4}$ -in. stone being rolled in after the bitumen has been poured. Residuum bitumens are not so good for surface coats as are natural asphalt products and refined tars. A single-pour bituminous macadam road gives a good footing on grades up to 8 per cent (about 1 in 12), and a safe surface for motor travel. Bituminous-bound macadam roads have two disadvantages—they require unusually intelligent and conscientious inspection, and they cannot be built late in the season. For water-bound macadam with a refined tar surface coat, a top course of 3 in. has been found to be the best. A layer of $\frac{3}{4}$ -in. stone is rolled in over the tar.

The engineers of the division are not generally in favour of concrete road construction. While less liable to rut than are macadam roads, they crack badly under frost action and settlement, and are hard to repair. Concrete is not reliable as a road surface material, and it is difficult successfully to protect the surface with a thin coat of bitumen, particularly where there is much heavy steel-tyre traffic. But the type has not yet been tested to a conclusion.

Kentucky rock asphalt has not been uniformly successful in this division. It is available for Class 3 traffic, but is usually rejected on account of its costing more than bituminous or tarred macadam.

Vitrified clay cube surfacing may be said to be very promising. It is not unlikely that it will be used extensively in the near future for Classes 2 and 3, and possibly for Class 1.

The roads of division 5 have almost uniformly 16 ft. of metalling, with a graded section from 26 ft. to 32 ft. Mr. Harger believes that, provided the grading is kept the same width as for a 16-ft. road, in a great many cases the metalling can be reduced in width to 12 ft. or 15 ft., using gravel or loose stone on the shoulders, which latter can be widened if needed. With a proper selection of width and type, the average cost of "the balance" of the roads in the State system in the counties under discussion will probably be between \$14,000 and \$16,000 (say £2,920 to £3,330) per mile.

New Refuse Destructor for Lincoln.—The Mayor of Lincoln (Captain H. E. Newsam) recently laid the foundation-stone of a new refuse destructor, which the corporation are about to erect at a cost of £10,850 in Canwick parish, on a site for which a further £7,500 was paid. Councillor J. Mills said that by using at the adjacent sewage pumping station the heat generated by the refuse there would be a saving in their coal bill of about £900 a year. Mr. R. A. MacBair, the city surveyor, said about 65 tons of refuse would be burnt by the destructor each day. The contractors are Messrs. Heenan & Froude.

NEW YORK SEWAGE DISPOSAL.

METROPOLITAN COMMISSION'S REPORTS.

Three further preliminary reports have recently been issued by the Metropolitan Sewerage Commission of New York. Report No. VIII. gives full particulars of the float experiments which were made to show the tidal currents in the harbour, while Report No. IX. deals with the rainfall and the relations between the volumes of domestic sewage, storm water and tidal water in New York Harbour. Report No. X. contains recommendations for the appointment of a commission to construct a system of main drainage and sewage disposal for New York, and shows the urgency of the matter. The following interesting extracts are taken from the last-mentioned report:—

SYSTEM RECOMMENDED.

"The system which will be recommended will consist largely of intercepting conduits to collect the sewage from the local sewerage systems to a number of centrally situated disposal plants where sufficient of the impurities can be removed to permit the effluent to be discharged into the harbour waters without danger or offence. No interference is proposed in regard to the local sewerage systems. The main drainage system would take the sewage from the local sewers, and carry it to suitable points for treatment and disposal, and would thus relieve the harbour from its present excessive contamination.

"The system of main drainage which the commission will recommend is intended for adoption by the city both as a plan and policy for future construction, and should be carried out in successive steps and not as one undertaking. The immediate construction of the whole scheme is not necessary from a sanitary standpoint. Such parts of the system as are needed for the immediate future should be taken in hand at once, and the remainder built as required. The plans will be sufficiently flexible and elastic to permit of indefinite extension, and the adoption of any discoveries or improvements in the art of sewage disposal which may be made in the future.

"When complete the works will constitute a systematic and well co-ordinated scheme of main drainage for the city which will utilise the absorptive capacity of the harbour waters to the greatest extent consistent with due regard to the public health and welfare.

NEED OF IMMEDIATE ACTION.

"As to the urgency of providing a system of main drainage and sanitary sewage disposal, the commission and its advisers strongly recommend that steps at once be taken to correct the evils which exist. Even if corrective measures are begun immediately, it will necessarily be some years before the works can be completed and their benefit can be realised.

"At the present time the crude sewage of a population of over 6,000,000 persons is discharged through several hundred outlets into the harbour without purification, regulation or control of any kind. The discharges—all of which take place at the shore line or beneath the docks and piers—discolour the water, pollute the shores, produce offensive deposits, and cause solid matters, plainly recognisable as of sewage origin, to float about in plain sight. Bathing and the taking of shellfish for food are no longer safe north of the Narrows.

"The pollution, objectionable as it is at the present time, is rapidly increasing. Within the next thirty years the population will be about double what it is to-day, and the quantity of sewage will increase in proportion.

"The commissioners feel confident that their recommendation to place the disposal of New York sewage under a commission having central jurisdiction will prove to be a measure of economy, since this concentration of responsibility for the sanitary disposal of the sewage will ensure an orderly and well co-ordinated development of the city's main drainage works, and prevent either the piecemeal construction of works intended to improve intolerable local conditions or unnecessarily comprehensive and expensive main drainage schemes.

"The pollution is most objectionable in summer, when it is desirable that the water should be cleanest; it is most intense in those sections where the density of population and the congestion of water traffic are greatest.

"The members of the commission feel that they cannot state the need of improvement too strongly.

The public has been made aware of the situation through the numerous reports which the commission has issued from time to time. Among great cities New York is practically alone in not possessing either a system of main drainage and sewage disposal or a plan and policy for the sanitary conservation of its water highways. To facilitate the placing of the work of constructing a main drainage and sewage disposal system for New York in the hands of a commission suitable for that duty, the members of the Metropolitan Sewerage Commission hereby submit their resignations to the mayor, to take effect as soon as their final report, which is now in preparation, can be completed, which the commission intends shall not be later than April 30, 1914."

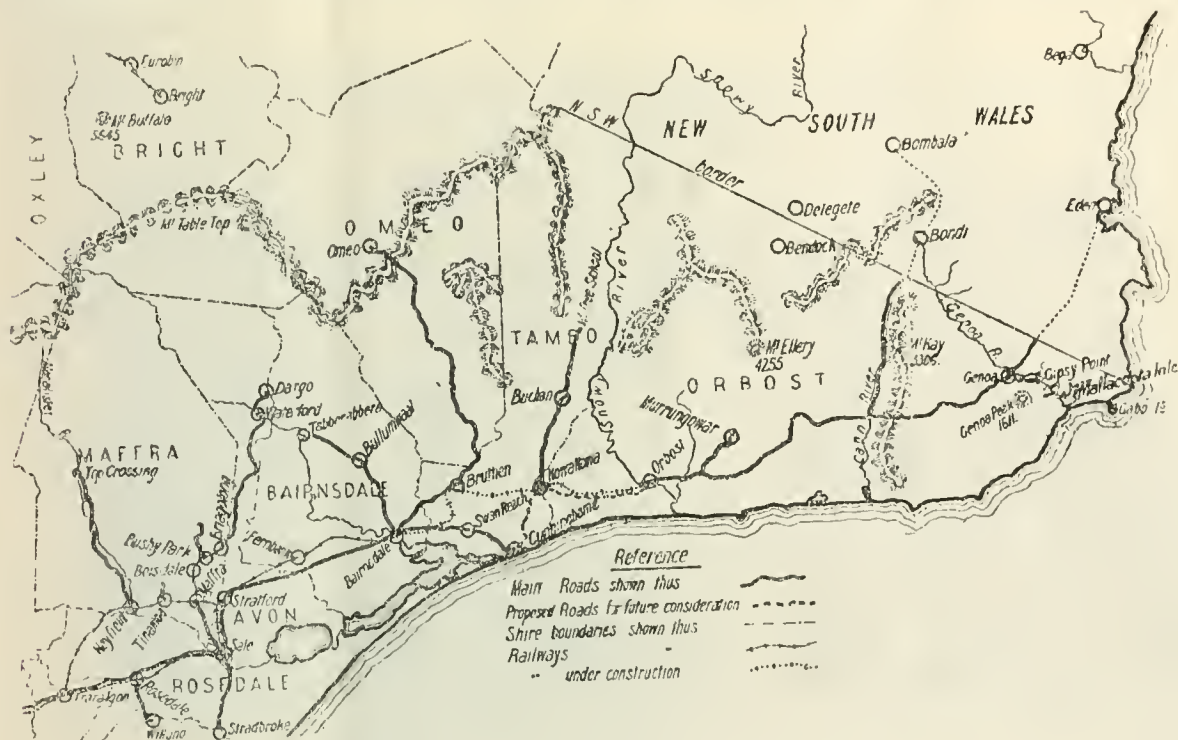

RUSHDEN HOUSING SCHEME.

The Rushden Urban District Council have accepted a tender of Mr. Robert Marriott for the erection of twenty-eight houses of the class A type at £206 5s.

THE COUNTRY ROADS BOARD OF VICTORIA.

PROPOSED MAIN ROADS FOR EAST GIPPSLAND.

The accompanying map, showing the main roads for East Gippsland, decided upon by the Country Roads Board of Victoria, is reproduced from the Melbourne Argus, to a scale only sufficiently open to show the locations of these roads, the names of the shires, and a few other details. A similar map of South Gippsland will be found on p. 11 of our issue of January 2nd. The point of junction is near the place marked "Traralgon" in small type, just over the same word in larger type, in the map of South Gippsland, the same place being marked with a small circle near the extreme left-hand bottom corner of the map, herewith reproduced, of East Gippsland. It will be seen that an important feature is the road roughly parallel with the coast, and that branches of considerable length run up the valleys of the river Cann (towards the east), Snowy River, and Maralister River (ending under the word

PROPOSED MAIN ROAD SYSTEM FOR EAST GIPPSLAND.

each, and one of Mr. W. Thompson for twelve houses of the class C type at £171 5s. each.

The plans have been prepared by Mr. W. B. Madin, the engineer and surveyor.

It is estimated that the receipts and expenditure in connection with the scheme will work out as follows:—

ESTIMATED RECEIPTS.		£	s.	d.
From Rents—				
28 houses (type A) at weekly rent of 5s. 9d.		418	12	0
12 houses (type C) at weekly rent of 1s. 9d.		148	4	0
		566	16	0
Less for empties and losses		18	8	0
		£548	8	0
ESTIMATED EXPENDITURE.		£	s.	d.
Repayment of loans at 3½ per cent—				
In respect of land, £1,485 5s. (80 years)		55	10	3
In respect of buildings, &c., £7,950 (60 years)		318	14	11
Rates at 8s. 8d. in £		99	3	2
Less empties		3	16	3
		95	6	11
Fire Insurance		5	18	6
Water		20	0	0
Repairs and maintenance		52	17	5
		£548	8	0

A loan of £9,436 is to be applied for.

"Maffra" in the west). Another branch runs right up-country in the Omeo shire. It is pointed out in the board's report that, apart from the main road to Bairnsdale, the roads are in the strictest sense of the term "development" roads, and are mostly in localities not served by railways.

Junior Institution of Engineers.—A meeting will be held to-morrow (Saturday) at the Cutlers' Hall, Sheffield, for the purpose of inaugurating a local section of the Junior Institution of Engineers with Sheffield for its centre. The chair will be taken at 8 p.m.

An Asylum Railway.—A short railway, just over 1½ miles in length, has just been completed by the Joint Asylums Committee of the county of Hampshire and the county boroughs of Bournemouth and Southampton. The line connects to the London and South-Western Railway near Basingstoke Station, and its terminus is at the site of the new joint lunatic asylum. The route is devious to avoid buildings, and the line ascends about 100 ft. The gauge is 4 ft. 8½ in., the rails being 87 lb. bull-headed, with ordinary type of chair and sleeper. The line is almost entirely in a cutting through the chalk hills and on embankments. There is one bridge carrying the Kingsclere-road over the line, and there are loop lines at commencement and termination. The line is for the conveyance of material to erect the asylum, and to convey goods to it when completed. The engineer was Mr. W. J. Taylor, M.INST.C.E., county surveyor of Hampshire.

A ROADSTONE QUESTION.

URBAN SURVEYOR'S COMPLAINT.

A question arose at a meeting of the Formby (Lanc.) Urban District Council recently with respect to the action of the surveyor, Mr. T. Grime, in agreeing with a firm of contractors to substitute basalt for granite in a contract entered into with the council. The surveyor said he was called upon to settle the matter, and as basalt was, in his opinion, a much harder stone, there was no loss to the council. The difficulty arose because they could not get Welsh stone, and it was a question of either having basalt or keeping the rollers waiting.

Councillor Buckley said the contract was made on the 14th.

The Surveyor: I did not see the contract. I do not get the chance to peruse the contracts.

Councillor Jones said that was a very alarming statement. He could hardly believe it.

The surveyor said it was quite true. He never got to see a contract or an advertisement before it was put in the paper in relation to his department. He

NEW FIRE STATION, GLOUCESTER.

thought it was most unfair. He had not been at any place which was like Formby in this respect.

Councillor Jones said he had been connected with councils and local boards for many years, and he had always understood that the surveyor was dealt with differently to that.

Councillor Rimmer: Who is the boss here?

Councillor Porter thought the surveyor had done good work to get basalt at the same price as Welsh granite.

The chairman said the surveyor was unable at the time to get the Welsh stone, and they confirmed his action in accepting the basalt stone.

Councillor Low wished to move that in future it be understood that the surveyor should see the contracts relating to his department, but the chairman ruled that it did not arise on the minutes.

Councillor Howe: It may be out of order, but it is quite right.

Trackless Trams for Nelson.—At a recent meeting of the Nelson Town Council it was decided to adopt a scheme of trackless trams for the higher parts of the town. Two lengths were suggested—from the centre of the town along Railway-street and Waids House-road to Halifax-road; the other being from the centre of the town along Railway-street, Netherfield-road, and Barberhouse-road to St. John's Church. The estimated cost is £6,678.

GLOUCESTER'S NEW FIRE STATION.

FERRO-CONCRETE CONSTRUCTION.

In a new station recently erected by the corporation of Gloucester accommodation is provided for two motor engines and for the efficient brigade which has been organised for dealing with outbreaks of fire in the city.

Designed to harmonise, as far as possible, with Bearland House and its surroundings, the new building is of fireproof construction throughout, the floors, roofs and stairs being of Mouchel-Hennebique ferro-concrete, with outer walls of Stonehouse hard burnt brick and Bath stone dressings.

The accommodation provided is as follows:—

Ground Floor.—Engine-room of sufficient size for two engines with escapes, office and instrument room, yard, workshop, coal and petrol stores.

First Floor.—Large recreation-room, two bedrooms, mess-room, bath-room and lavatory.

Second Floor.—Superintendent's quarters, consisting of three bedrooms, kitchen, living-room, sitting-room, bath-room, &c.

At the rear of the main building is a paved yard and a tower 46 ft. high to enable the men to practise with Pompiers ladders, and also for hose-drying purposes. The engine-room and recreation-rooms are heated by a low-pressure hot-water apparatus.

Our illustration—which we reproduce by the permission of *Ferro-Concrete*—shows the front of the new station, and at the right hand may be seen the upper part of the tower behind the main building. The lintels over the two large doors in front are of ferro-concrete, this material having also been used for the floors and roof of the tower.

The design and plans for the building were prepared under the superintendence of Mr. R. Read, Assoc.M. INST.C.E., city surveyor, by Mr. E. W. A. Carter, deputy surveyor, and Mr. G. E. H. Ross, the latter acting also as clerk of works. Details of the ferro-concrete construction were prepared by Messrs. L. G. Mouchel & Partners, of Westminster, who were represented during the execution of the work by their district engineer, Mr. Edmund J. Cullis,

Assoc.M. INST.C.E., of Gloucester. The contractors for the ferro-concrete construction were Messrs. Holbrough & Co., of Southgate-street, Gloucester.

Hours of Dust Collection.—A report on dust collection in other towns was presented recently to the Peterborough Town Council by the borough surveyor, Mr. J. W. Walshaw. This showed that in fourteen towns the hours were practically the same as in Peterborough—from 8 a.m. to 10 a.m. in the town, and from 7 a.m. to 4.30 p.m. in other parts. At four towns the work was finished at 9 a.m., and at two other places at noon. The work is carried out without special hours.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times*.

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

CROMER WATER SUPPLY.

NEW FILTERING PLANT.

New water-filtration plant for Cromer, situated at the Metton pumping station of the urban district council, was formally opened on Wednesday afternoon.

Up to the year 1906 Cromer was supplied with water from a pumping station situated about $\frac{1}{2}$ mile from the town, although as early as the year 1900, owing to the growth of the town, it was decided to go further afield to secure a larger supply, and the works were commenced in the following year.

The water is obtained from a well and adits with a borehole sunk 260 ft. into the chalk, and is pumped direct through the Candy high-pressure filters, against a head of 216 ft., up to a covered reservoir on high ground near the Roman Camp, $2\frac{1}{2}$ miles away, and thence through 3 miles of service main to Cromer. The water as obtained from the well is of exceptional organic purity, but contains a certain amount of iron in solution derived from the gravels overlying the chalk, and this soluble

Company for use in their filters. It is produced from a carbonate of iron, and rendered magnetic, absorbent, rustless and imperishable. When it is required to cleanse the filters, the flow of water through them is reversed, a revolving hydraulic double-scouring arm is put into operation, and the iron (which has been oxidised and arrested by the filters) is washed away, this washing process occupying but a few minutes.

The filters are entirely successful in removing the iron without the use and cost of chemicals, for, whereas the unfiltered water is slightly yellow and cloudy, and has a distinct inky taste, the filtered water is clear, bright and tasteless, and is shown by analysis to be of ideal purity, and entirely free from the objectionable iron.

The Royal Sanitary Institute of Great Britain gave their highest awards for the Candy patent iron-removing and purifying filters, and for their oxidising filtering medium, Polarite.

It is interesting to note that many other well-known health and pleasure resorts employ Candy filters for dealing with their public water supplies, among these being the corporations of Harrogate, Tunbridge Wells, Hastings, Hythe and Torquay, so that the Cromer

AN INSTALLATION OF CANDY FILTERS.

iron causes brownish and objectionable deposit in the mains.

After careful investigation of the subject, and full consideration as to the best method of effecting the removal of the iron from the water as it is pumped from the well, the council decided to put down an installation of Candy filters. The work has been carried out under the supervision of the consulting engineers, Messrs. J. C. Melliss & Co., M.M.INST.C.E., of Gresham House, London, who were the engineers for the Metton waterworks. The special filters of the mechanical type were installed by the Candy Filter Company, Limited, of Westminster. The cost of the work, including the filter-house and mains, has been £2,000.

The filter plant consists of four 9-ft. diameter Candy patent oxidising filters of the compound or double bed and double scour type, tested to 160 lb. hydraulic pressure, the filters being constructed of Siemen's best mild steel, and filtering at the rate of 40,000 gallons per hour. These filters combine all the latest improvements for the scientific and economic purification of public water supplies.

The water on entering the filters is aerated under compression, and passes through a coarse filter-bed which breaks up the air, and finally through a fine filter-bed composed of sand and the special oxidising material Polarite, which completes the purification of the water and the removal of the iron. Polarite, as is well known, is a powerful oxidising and purifying material manufactured by the Candy Filter

council, in adopting Candy filters, were following the example of other first-class watering-places.

A goodly number of spectators, comprising members of the district council, officials and visitors, were present at Wednesday's ceremony. In the engine-room of the Metton works ocular demonstration was afforded, by means of a number of samples, of the comparative nature and appearance of unfiltered and filtered water with reference to the presence and absence of iron. In the room containing the four Candy patent oxidising filters, a glass case on the wall showed the nature and arrangement of the filtering layers, and a filter was cleansed in the presence of the company. Mr. Pullen Candy readily and courteously replying to various questions as to the filters and their working.

On the return to Cromer Mr. Candy entertained the company to luncheon at the Hôtel de Paris, Mr. G. W. Wilkin, chairman of the council, presiding.

Mr. Candy proposed "Success to the Council's Water Undertaking."

Mr. Davison, vice-chairman of the council and chairman of its Water Committee, responded, and gave a carefully prepared and extremely interesting little historical review of the water undertaking from before 1891—when the council's powers were extended—to the present time. He observed that they had always had a good and pure supply, but it was found that many visitors were suspicious of the water on account of its colour; hence it was deemed advisable to eliminate the iron, though some authorities would, perhaps,

have exploited the water as chalybeate, and charged 1½d. a glass for it. It was thought at first that the iron might work itself out, but it did not, and they found, on trial, that the Candy system for removing it was a success.

In response to the toast of "The Engineers and Contractors," Mr. Melliss replied for the former, and Mr. Candy, in replying for the latter, said that Cromer now possessed, if not the largest, the most complete and up-to-date installation of the kind in the British Isles, and he showed that it was also economical; while, as regards duration, their system had been in use at Hastings for fifteen years, and was still as good as new.

Several other interesting speeches followed.

THE LAYING OUT OF NEW STREETS.

A SOUTHALL-NORWOOD CASE.

Before the Brentford magistrates on the 12th inst., a Mr. Baxter was summoned, at the instance of the Southall-Norwood Urban District Council, the offence alleged being that he had laid out a new street which was not of the width prescribed by the by-laws.

Mr. E. J. Naldrett, instructed by Mr. Houlder, the clerk to the council, supported the summons, and Mr. Sydney G. Turner, instructed by Mr. A. H. Procter, defended.

Mr. Naldrett, in opening the case, traced the history of the alleged new street. He said that the defendant was the owner of an estate at Southall, and in January, 1912, he had submitted for the approval of the council a plan showing a new street to be called Manor-road, which was on the site of the now alleged new street. This plan was approved, but had never, in fact, been carried out. In April, 1913, plans were submitted for a car factory and approved, the attention of Mr. Baxter then being called to the fact that Manor-road was not being constructed. When this factory was erected, a sleeper road was laid from the gate of the estate in order to give access to it. Prior to the erection of the factory, certain buildings which had formerly been used as stables were converted into warehouses, and in August, 1913, plans of an extension of these buildings were submitted to the council. These plans were disapproved, the council taking the view that Mr. Baxter was, in effect, laying out a new street on the site of the proposed Manor-road without making it in the manner prescribed by the by-laws.

Mr. Reginald Brown, M.A.N.S.T.C.E., gave evidence for the council, and after the defendant had given evidence.

Mr. Turner submitted that the plan in question was not a street within the meaning of the definition in the Public Health Act, and that, even if it were, the defendant had not laid it out between the dates mentioned in the summons. He contended that laying out a street involved the doing of some act to the street itself, and not merely the erection of a building fronting it.

In the result the bench adjourned the case for a fortnight, expressing the hope that in the meantime the parties might be able to come to some agreement.

South Coast Road Scheme.—At a conference of representatives of the boroughs of Eastbourne, Bexhill and Hastings and the Eastbourne Rural District Council, held lately at Eastbourne, the borough surveyor of Eastbourne, Mr. A. E. Prescott, submitted a plan showing the widening of the existing road in the rural district from the borough boundary to Pevensey Bay, and an extension along the coast towards Norman's Bay, with a new road and bridge over the railway to join up with the existing road at Pevensey Sluice, and a new road to the north of the railway adjoining the Cooden golf links, connecting up with the Bexhill road at the tramway terminus. The length of the proposed road would be about 6 miles, of which over 3½ miles would be in the Eastbourne rural district and the remainder in the borough of Bexhill, with a suggested width of 50 ft., and a 36-ft. carriageway. The meeting decided provisionally to approve the plan, and that the four authorities concerned should instruct their surveyors to prepare an approximate estimate of the cost in consultation, after which the Road Board should be asked to receive a deputation to discuss the project. A cordial vote of thanks was passed to Mr. Prescott for preparing the plan.

ROAD MAINTENANCE IN DEVON.

DISTRICT SURVEYORS' MEETING.

The second of the meetings of Devon District Surveyors in No. 1 Division, organised by the county surveyor, Mr. E. J. Stead, ASSOC. M.A.N.S.T.C.E., P.A.S.T.I., M.L.M. AND CO.E., took place on Wednesday, February 11th, at the Guildhall, Barnstaple. Those present, in addition to Mr. Stead, included Messrs. G. R. Folland, H. Bradley, R. P. Roberts, O. Staton, G. Robson (members of Mr. Stead's staff), and the following district surveyors: E. Y. Saunders (Barnstaple Borough), R. E. L. Hookway (Bideford Borough), W. Medland (Torrington Borough), H. E. C. Raynor (South Molton Borough), F. J. Worden (Okehampton Borough), W. E. Champion (Northam Urban), W. Yeo (Lynton Urban), A. A. Richards (Barnstaple Rural), S. Hooper and G. Smale (Okehampton Rural), F. J. Harris (Holworthy Rural), T. B. Fairchild (Torrington Rural), R. Kelland and S. H. Gardner (South Molton Rural).

A good many points in road construction and repair were brought forward, but the chief discussion took place in considering the instructions which have just been issued by the Devon County Council to all district surveyors and roadmen. Each paragraph was taken in detail and keenly debated, Mr. Stead illustrating his replies by means of diagrams.

On the motion of Mr. Fairchild, seconded by Mr. Hookway, Mr. Stead was heartily thanked for arranging the meeting.

A PRESENTATION.

Previous to the meeting Mr. Stead invited his staff and the district surveyors to luncheon at the Golden Lion Hotel, and advantage was taken of the occasion to present Mr. Stead, who is leaving to take up his appointment as county surveyor of Somerset, with a handsome hall clock and dining-room clock, both in oak, and with Westminster chimes, and inscribed: "Presented to Edward J. Stead, ASSOC. M.A.N.S.T.C.E., by his Staff and the Surveyors of North Devon on his leaving the District, March, 1914."

Mr. W. Medland, borough surveyor of Torrington, made the presentation, and Mr. G. R. Folland, chief assistant to Mr. Stead, supported on behalf of the staff.

Mr. Stead, in acknowledging the gifts, said he had had a somewhat strenuous time in North Devon, but what he appreciated was the personal feeling of friendship which existed between all the surveyors and himself. After their first meeting he thought they might eventually form a small association somewhat on similar lines to that which existed in Somerset. All of them were striving to give their best to the main road question. It had never been his good fortune to work with a staff which had given him greater loyalty than that at Barnstaple. A large amount of the success of the work accomplished had been due to the loyalty of his staff.

ALLOCATION OF THE ROAD BOARD GRANTS.

In the course of the debate on the Address in the House of Commons on Wednesday, the administration of the funds of the Road Board was raised by Sir J. Bethell, and in the course of the discussion the customary complaints were heard of unfairness in the apportionment of the grants. It was explained by Mr. Montagu, on behalf of the Treasury, that the funds were allocated upon the basis, roughly speaking, of population, and this worked out as follows:—

England and Wales	82 per cent
Scotland	11 " "
Ireland	7 " "

Scotland got slightly more than the share to which it would be entitled on this basis of population, because the Road Board took into account the exceptionally large volume of what would be described in that country as foreign tourist motor traffic.

Planning of Abattoirs.—A Canadian correspondent seeks information as to the best arrangement of lairages, dressing-houses, passages, cooling and storage rooms for each kind of animal slaughtered, and will be glad to receive catalogues of the apparatus employed at such abattoirs and Smithfields. We would refer our correspondent to the illustrated description of the new abattoirs at Belfast, which appeared in THE SURVEYOR of September 26, 1913; at the same time we shall be pleased to forward to him any material which readers may send to this office.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

BUILDING CONTRACT: ACCESS TO SITE OBSTRUCTED BY THIRD PARTY: LIABILITY OF BUILDING OWNER.—A decision of the utmost importance, alike to building owners and to builders and contractors, is that of the King's Bench Division in *Porter v. Tottenham Urban District Council* (January 21st), reversing the decision of an official referee. The case is a result of the unwarranted claim made by the defendant in the action *Tottenham Urban District Council v. Rowley*, which was recently finally disposed of by the House of Lords (see p. 251, ante). The plaintiff in the present case contracted with the council to build a school for them on ground to which access could only be obtained over Keston-road. The contract provided that the plaintiff was to be at liberty to enter upon the ground immediately and that he was to deliver the building completed within ten months, subject to penalties. In order to give the necessary access the council made an opening in their fence next Keston-road, and put a gate in it. On March 6th last, about a fortnight after he began the work, the plaintiff received a letter from Rowley claiming the right to prevent carts from passing over the road to the council's land, and threatening proceedings for an injunction. The plaintiff had no alternative but to give an undertaking not to proceed with the work, and notice of this was given to the council. Correspondence ensued, but Rowley resisted all overtures, and ultimately the council took proceedings and obtained an injunction against him on May 11th last, after which the plaintiff again proceeded with the work. Subsequently he brought this action to recover from the council damages caused by the delay from March 6th to May 11th. The Official Referee gave judgment for the plaintiff for £560 12s. 6d. From this judgment the council appealed. The Court allowed the appeal and entered judgment for the council. Mr. Justice Ridley, in the course of his judgment, said the reason of the delay and of the failure by the council to perform their obligation to give possession of the site was the interference of a third person, a mere trespasser, over whom the council had no control. If the decision of the Official Referee were right it would be difficult to define any limit to the liability of a building owner. The obligation to give possession was based in the builder's contract to complete the work in a given time. Therefore the liability put on the building owner had relation to the contract. There was no reason to be deduced from the position of the parties to the agreement why one of them rather than the other should be held to assume responsibility in the event of accidents which rendered performance impossible. In his opinion the council did not insure that prompt possession and use of the site should be given; they merely undertook to give possession so far as their own acts and ability were concerned, but not otherwise. Mr. Justice Bankes concurred.

WATER SUPPLY.—In *Bristol Guardians v. Bristol Waterworks Company* (House of Lords, February 6th) the guardians appealed from the decision of the Court of Appeal holding that they were not entitled to have a supply of water at the domestic rate to certain work-houses, offices, and homes for children. Water was supplied by the company to these premises by meter at the rate of 1s. per 1,000 gallons, part of the water being used for domestic and part for non-domestic purposes. The guardians claimed to be entitled to take these supplies separately, and to pay for the water used for domestic purposes at the domestic rate. By sec. 53 of the Waterworks Clauses Act, 1847, every owner of a "dwelling-house" is entitled, on complying with certain conditions, to demand a sufficient supply of water for domestic purposes, and by sec. 68 water-rates are to be payable according to the annual value of the tenement supplied. This Act is incorporated by the Bristol Waterworks Act, 1862, sec. 62 of which requires the company, at the request

of the owner or occupier of a "private dwelling-house," to furnish a supply of water for domestic purposes at water rents based on the rental value of the premises. Thus there is a discrepancy between the provisions of the special Act and those of the public Act incorporated therewith as to the kind of premises in respect of which a supply at the domestic rate can be claimed. The questions for determination, therefore, were whether this section of the local Act overrides the provisions of the public Act so as to limit the right of supply at the domestic rate to private dwelling-houses, and, if so, whether a workhouse is a private dwelling-house within the meaning of the local Act. The Court of Appeal answered the first question in the affirmative, and the second in the negative (Lord Justice Fletcher Moulton dissenting as to the first). The House of Lords affirmed this decision. Lord Loreburn said that if there was a blunder in the special Act, it was not their Lordships' function to repair that blunder; but it was for Parliament to say whether it would interfere. Lords Atkinson, Parker and Sumner concurred, and the appeal was dismissed with costs.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as *noms de plume*. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

WATER SUPPLY: STANDPIPE FOR WASHING CAR: DOMESTIC PURPOSES.—"Hazelwood" writes: (a) In view of the ruling of the High Court in *Harrogate Corporation v. Mackay* (1907), 2 K.B., 211, that the supply of water to a medical practitioner for the purposes of washing his motor car when used for professional purposes is a domestic supply—(1) Do you think, under the Waterworks Clauses Acts, 1847 and 1863, a doctor can demand the right to fix a separate standpipe within the garage to facilitate the washing of the car on the ground that the supply of water is for domestic purposes, without entering into an arrangement with the company to pay a rental for the pipe? (2) When the standpipe has been in existence for four years or more without the knowledge of the company, can the company now enforce payment of a rental after giving the doctor notice? (3) Would the serving of a demand note containing a special rental for the standpipe be held to be a sufficient notice when the doctor immediately protested against the charge on the receipt of the demand? (b) A premises in my district is assessed at £40 nett, and includes a dwelling-house, the front of which has been converted into a fish shop and a butcher's shop. At the back there is a small slaughter-house and a stable where horses are kept for trade purposes—within the same curtilage as the dwelling-house. In charging the water rate on the premises the following rates were made: (1) 5 per cent on the nett rateable value (£40) to cover the supply of water for domestic purposes on the whole of the premises. (This is in accordance with the special Act.) (2) 5s. 3d. per quarter for extra water consumed for trade purposes in the fish shop, on the assumption that such a supply is non-domestic. (3) 5s. 3d. per quarter for extra water used in the stable and slaughter-house, on the ground that the supply is non-domestic. It is contended that under the recent decision of the House of Lords in *Metropolitan Water Board v. Avery* (58 Solicitor's Journal, 171), the water used in the fish shop is a domestic supply. The Special Act contains no special powers. Please advise.

(a) (1) Sec. 19 of the Waterworks Clauses Act, 1863, prohibits a consumer from affixing "any pipe or apparatus" to a pipe belonging to the company, or to a communication or service pipe belonging to or used by the consumer, or from making any alteration in any such communication or service pipe, or in any apparatus connected therewith, without the consent, in every case, of the company. This provision would certainly appear to prevent a doctor from affixing a standpipe to any such pipe as referred to in the section, in the absence of the company's consent; and there seems to be no reason why the company should not make their consent conditional on a rental being paid for

the standpipe. It has been decided that the addition of a stop-tap to a service pipe requires the consent of the undertakers under this section, even although it could not lead to any misuse or waste of water (*Williams v. Llandudno Urban District Council*, 42 *Solicitor's Journal*, 34). (2 and 3) Assuming the erection of the standpipe to have been a contravention of the section, the person who erected it was liable to a penalty not exceeding £5, without prejudice to the right of the company to recover damages from him in respect of any injury done to their property, and without prejudice to their right to recover from him the value of any water wasted, misused or unduly consumed. The existence of a pipe, &c., erected without consent, is not made a continuing offence by the section, and it is too late now to take proceedings for the penalty. Although the company, if applied to for their consent, might have demanded a rental as the price of such consent, I do not see how they could now enforce such a demand. They could, however, recover the value of water "wasted, misused, or unduly consumed," from the person who erected the standpipe. (b) The ground of the decision in *Metropolitan Water Board v. Avery* was that, although the water was used in the trade of a restaurant proprietor, it was actually used for "domestic purposes," such as cooking and washing up plates and dishes. The question, therefore, is for what purposes is the water actually used in the shops, stable, and slaughterhouse? If it is used for purposes which can be properly termed "domestic," then, according to this decision, the supply is a supply for "domestic purposes," notwithstanding that the premises are used for trade. Water for the use of a horse and the washing of a carriage in a stable was held to be for domestic use as far back as 1858 (*Bushby v. Chesterfield Waterworks Company*, 22 J.P., 689).

PUBLIC HEALTH (BUILDINGS IN STREETS) ACT, 1888.—"H. W." writes: I thank you for your reply to my query. [See *THE SURVEYOR* for December 19th, p. 941.] The existing bay is one of the ordinary type,

and the proposed one will not project further beyond the front main wall, but will extend to the whole frontage of the house. I enclose a plan. In these circumstances have the council power to disapprove the plans?

This is a point under the Act which does not seem to have been decided. Reading sec. 3 literally there seems to be no doubt that the proposed alteration would be a contravention thereof, because it prohibits the bringing forward of "any part" of the building. Upon the whole I am of opinion that, in strictness, the council have power to disapprove the plan.

LANDLORD AND TENANT.—"Ajax" writes: A let a house to B for the purpose of a nursing home upon a yearly tenancy at a clear rental, A being responsible only for the maintenance of the main walls, roofs and outside spoutings. Having regard to the fact that the house was to be used as a nursing home, the following clause was inserted in the agreement: "The said tenant agrees to keep the interior of the said premises, the fixtures, locks, bolts, fastenments, blinds, glass and sashcords in as good condition as the same shall be at the commencement of the tenancy, damage by fire excepted, and also do all necessary decoration to the interior of the premises free of all cost to the landlady." B now wishes to terminate the tenancy, and incoming tenants are willing to take the house, but, having regard to the fact that the house has been used for the treatment of sick people, they wish the rooms repapered and decorated, and make this a condition of the taking. Your opinion is asked as to the construction of the before-mentioned clause—viz., if, in considering the nature of the tenancy (which was properly disclosed at the commencement), it is competent for A to call upon B to bear the expense of redecoration for the incoming tenant.

A clause of this kind is always rather difficult to construe, owing to the uncertainty of the sense in which the word "necessary" was intended by the parties to be understood. The general rules as to the construction of agreements are that the construction should be reasonable, liberal, favourable, and allowing for the popular sense of words, and that the whole contract is to be looked to. It is easier to state these principles than to apply them, but upon the whole I think B is bound to do such decoration as may

be necessary to render the house reasonably fit for occupation, having regard to the use to which it has been put.

WATER SUPPLY: WELL.—"Anxious" writes: The accompanying diagram shows five cottages which obtain their water from a shallow well, as shown. I shall be pleased to know whether the local authority can enforce the owner to lay on water from the water main, as shown, to the cottages, and close the well, if

the water is found to be pure. Can the local authority proceed on the grounds that the well is likely to be polluted on account of the drain and cesspool, as shown?

If the water in the well is so polluted as to be injurious to health the authority can take proceedings to have it closed under sec. 70 of the Public Health Act, 1875. In the notes to the latter section in "Lumley's Public Health Acts" (7th edition), p. 148, it is stated that: "The well . . . must be alleged to be polluted, not merely likely to be polluted, even if this is practically certain. The section would therefore not meet the case of the opening of a burial ground in close proximity to a well." But under sec. 62 of the Act the authority can compel the owner to take a supply from the main if it appears to them (on the report of their surveyor) that the houses are without a proper supply. This appears to leave it to their discretion to decide whether, having regard to all the circumstances, the supply is a proper one. No doubt they must exercise that discretion reasonably, and if the owner is aggrieved by their decision he can appeal to the Local Government Board under sec. 268. But if it is practically certain that the water in the well, though now pure, will become polluted in a short time, I think the authority would be justified in concluding that the houses are without a proper supply, and giving notice to the owner, under sec. 62, though they could not close the well until it actually became polluted.

PRIVATE STREET WORKS.—"P. S. W." writes: My council propose to make a portion of the length of a street under sec. 150 of the Public Health Act, 1875. This street is at present only 18 ft. wide, and is built up on one side only, the whole length of the opposite side being taken up by allotment gardens. At no distant date this street will, in all probability, be widened to a width of 36 ft. (a strip being taken from the allotments to widen the street), and houses erected on the opposite side. For the present it is proposed to construct a footpath, with kerb and channel, on the built-up side only, pitching and metalling the remainder of the present width to form the roadway. (1) Should the owners of the allotments be charged, according to their frontage, with a proportion of the work it is now proposed to do? (2) If so, and at some future time the allotment holders decide to develop their land, can the owners of the present built-up side be charged with a proportion of the cost of street works on the widened portion of the street? (3) If the council formally adopt the existing road, when made up, will they be committed to carrying out the street works on the widened portion when such widening takes place? (4) If the allotment holders should decide to at once develop their land, giving up sufficient to widen the street to 36 ft. (by-law width), I presume the whole cost of street works could be properly apportioned, according to frontage, on both sides.

(1) Yes. (I assume, though it is not so stated, that the street is not repairable by the inhabitants at large.) (2) No. Their premises would not front or abut upon the added strip. (3) No. (4) Yes.

ERRATUM.

At p. 290 *ante*, first column, line 5, for "1892" read "1907."

SOME RECENT PUBLICATIONS.*

AN OUTLINE OF LOCAL GOVERNMENT AND LOCAL TAXATION IN ENGLAND AND WALES (EXCLUDING LONDON). By Sir Robert S. Wright and the Right Hon. Henry Hobhouse. Price 7s. 6d. London: Sweet & Maxwell, Limited.

Originally published some thirty years ago, when the reform and simplification of local government was a matter of pressing public importance, this little work has proved so useful that further editions have been called for from time to time. The system as it existed when the book was first published has been vastly improved by the passing of the Local Government Acts of 1888 and 1894. Moreover, the powers and duties of local authorities have been increased out of all knowledge since that time by a large number of statutes. This book has been revised from time to time to incorporate the changes which have taken place, and it still maintains its position as the most authoritative account of our local government institutions within so small a compass. The first part of the work is devoted to an account of the units of local government, separate chapters being given to the parish, the poor-law union, the rural district, the urban district, the municipal borough, and the county. In the second part the several matters of local administration are dealt with, separate chapters being given to the more important, among which we may mention public health, highways, allotments and small holdings, working-class dwellings, drainage and embankment, and many others. Some account of the less important services is contained in the final chapter of this part, so that it is safe to say that no matter has been overlooked. The final part of the book contains an account of local finance, including valuation for local rates and local accounts, local taxation, and loans. In addition to the general index, there is a very useful index of Parliamentary Papers and Debates. Altogether, it would be difficult to conceive a better book than this for the official or student who desires an authoritative yet concise account of the several authorities, their areas, powers and duties, and of the financial basis upon which our local government institutions rest.

REINFORCED CONCRETE RAILWAY STRUCTURES. By J. D. W. Ball, ASSOC. M. INST. C. E. Price 8s. nett. London: Constable & Co., Limited.

This work forms one of the "Glasgow" series of text-books of civil engineering issued by Messrs. Constable under the general editorship of Prof. G. Moncur, B.Sc., M. INST. C. E., and in it the author deals with the application of the principles and processes of reinforced concrete construction to those structures which come within the practice of the railway engineer. The first three chapters are devoted to the consideration of preliminary matters, bending and shearing stresses, and are followed by separate chapters on Floors and Buildings, Foundations and Rafts, Retaining Walls, Bridges, Arched Bridges, and Sleepers and Fence Posts. A very useful final chapter consists of a summary of notation and formulæ. The author has avoided mathematical treatment and adopted graphic methods of procedure wherever possible; further, he has constantly kept in view the practical requirements of the designer, and by the aid of several curve diagrams, calculations can be made with ease and expedition. Moreover, a considerable number of worked examples are included, these covering the great majority of the problems which would occur in practice.

ELECTRO-THERMAL METHODS OF IRON AND STEEL PRODUCTION. By J. B. C. Kershaw, F. I. C. Price 8s. 6d. nett. London: Constable & Co., Limited.

In preparing this work the author has sought to amplify and bring up to date the information relating to electric methods of smelting and refining iron and steel that was presented in his earlier book published some six years ago. It is designed to meet the requirements of men actually engaged in the steel industry rather than for the constructors of large furnaces. Thus, the consideration of the theoretical side of the subject is confined to a general sketch of the scientific principles of electric heating together with the broad lines of furnace design. The main part of the book is occupied with full details of actual instal-

lations of various types, their methods of operation and summaries of the working costs and tests of the raw materials and finished steel. All improvements in design or method of work which have taken place since 1907 are fully dealt with in separate chapters. We fully endorse the view expressed by Dr. J. A. Fleming, F.R.S., in his introduction, that Mr. Kershaw's book may be strongly recommended to those iron and steel manufacturers who are first concerned to know what has already been done, and what are the proved points of value in electrical methods of production.

THE MAINTENANCE OF FORESHORES. By Ernest Latham, ASSOC. M. INST. C. E. Price 2s. nett. London: Crosby Lockwood & Son.

The subject of coast erosion and protection is of such vital importance that a handbook which treats each problem connected with it in a simple, practical and concise manner cannot fail to be of use not only to engineers, but also to many whose interest is only that of laymen. In the first section of this little work Mr. Latham deals with the classification of coast erosion, while the second section, contributed by Mr. A. E. Carey, M. INST. C. E., treats of the findings of the Royal Commission which sat from 1906 to 1911. The next two sections are respectively concerned with the protection and drainage of low-lying lands, and are followed by a section on the protection of high lands. Colonel Crompton, consulting engineer to the Road Board, contributes an article on the surfacing of promenades. Finally, there are chapters on considerations prior to the commencement of structural work on foreshores, and on materials and construction. The author only claims for this little book that it is a *résumé* of a wide and complex field of engineering practice. Although compressed into a small scope, the work has been written thoroughly and clearly, and with a keen eye to those practical points upon which the engineer is most likely to need some assistance.

THE GARDEN CITY. By C. B. Purdom. Price 10s. 6d. nett. London: J. M. Dent & Sons, Limited.

This fascinating work makes its appearance just ten years after the making of the garden city of Letchworth was begun, and it contains an account of the building and development of the town, and a timely restatement of the original ideas that brought it into being. The bold ideal of Mr. Ebenezer Howard, which resulted in the launching of the scheme for the creation of a city containing within itself all the elements of healthy expansion, has been realised to a remarkable extent, and the story of Garden City in the making forms most interesting reading. Mr. Purdom is specially qualified for the task he has undertaken, inasmuch as he has been concerned in the building of the town, and has first-hand knowledge of all the events of its remarkable growth. The growth and life of Garden City in all their aspects are dealt with in this work, which includes chapters on (*inter alia*) architecture, gardens, open spaces and the rural belt, churches and inns, arts and recreations, industries, workmen's cottages, health, and finance. Special matters affecting the scheme are dealt with in a series of appendices contributed by experts. There are four beautiful pictures in colour, and many half-tone and other illustrations. The book forms a thoroughly worthy record of a great enterprise.

VALUATIONS AND COMPENSATION. By Baister Fletcher, F.R.I.B.A., &c. Fourth Edition, by the Author and H. P. Fletcher, F.R.I.B.A. Price 7s. 6d. nett. London: B. T. Batsford.

This well-known standard text-book has been thoroughly remodelled and revised to bring it abreast of the recent developments in valuing practice, and to incorporate the results of recent legislation, which have brought the surveyor's profession into greater prominence and importance. The necessary changes which have accompanied this process have caused the book to be almost completely transformed; the number of pages has been more than doubled, owing to the introduction of several new chapters, such as those on Valuations for Rating, for Mortgage, and in connection with the Finance Acts, 1909-12. All of these are fully dealt with, and elucidated with numerous examples of the working out of actual valuations such as the surveyor meets with in practice. Fresh valuation tables have been added, and yet, by careful arrangement, all these additions have been made without detracting from the handy character of the book, and with only a slight addition to the price, which still remains at a very moderate figure for so valuable and comprehensive a work.

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

CONSTRUCTION AND RESURFACING OF ROADS.

WESTRUMITE ASPHALT.

We have received an illustrated booklet from the British Westrumite Asphalt Company, Limited, which acquired the sole rights for the manufacture of Westrumite asphalt and for the exclusive working of the system in the United Kingdom.

Mr. L. S. van Westrum, who is the inventor of the process, and is chairman of the British company, was also the inventor of a preparation known as the "Westrumite dust layer," which was introduced into this country some ten or twelve years ago. That liquid material, which was a preparation of mineral oil, was applied by water-cart to macadam roads for the purpose of laying dust, for which it proved very effective, being at the present time largely used on the Continent. Some eight years ago, however, Mr. van Westrum had the foresight to realise the future requirements in the construction and resurfacing of roads which the advent of motor vehicles would necessitate, and he therefore turned his attention to

asphalt remains fluid, being of the consistency of treacle. This liquid state, however, is only temporary, and it is a remarkable fact that while in this state Westrumite asphalt has no binding qualities whatever. On the contrary, it acts, so to speak, as a lubricant, coating and lubricating every particle of the mineral aggregate with which it is being mixed. This would not be possible if Westrumite asphalt while in this state had any binding power. When, however, it becomes exposed to the air, Westrumite asphalt rapidly changes from a fluid to a solid, it recovers again its original natural qualities—viz., that of asphalt, which it really is, and instead of acting as a lubricant it becomes an extremely strong asphalt binder.

The most simple way of explaining the construction or the surfacing of roads with Westrumite asphalt is to take, by way of an illustration, the mixing and laying of cement concrete, the only difference being that in this case the binder is natural asphalt instead of cement, the method and the labour-cost being about equal in each case. We observe, by the company's specifications, that, owing to its

WESTRUMITE ROAD IN ANTWERP.

the invention of a process by which the use of natural asphalts, such as Trinidad and Bermudez, as a binder might be simplified. In this he was successful, and the construction of experimental roads on an extensive scale was then started. This was eight years ago, and it was not until the beginning of 1911 that he decided the time was ripe for forming public companies in various countries to operate the system, as, before he would entertain utilising outside capital, he determined that his roads should have stood a test of at least five years under general traffic. During those five years about 2,000,000 sq. yds. were laid, and in 1911 the first European company was formed. In all nine companies have now been formed, five in the United States and Canada, and three on the Continent, the British company being the most recent.

Westrumite asphalt is composed of the best natural asphalts, such as Trinidad Lake and Bermudez asphalt. These asphalts are brought into a liquid state at the company's works by a special process protected by Letters Patent. The finished product is then filled into casks, when it is ready to be despatched to the place where the road work is to be done. There the Westrumite asphalt is mixed with the mineral aggregate cold in a concrete mixer or by hand, during which process the Westrumite

nature, Westrumite asphalt can be used in many ways, for while specifications "A" and "C" are for construction or resurfacing of roads with a 2-in. wearing surface on concrete or macadam foundations, there is specification "D" which provides for the surface-flushing of water-bound macadam roads with a mixture of Westrumite asphalt and limestone dust.

Westrumite asphalt also applies (under a separate specification) to the flushing or void-filling of tar-macadam roads. If, after the tar-macadam has been thoroughly rolled and consolidated, and while the very small interstices are clean, the whole surface is flushed with Westrumite asphalt and limestone dust, an asphalt surface is at once given to it, as a result of which it is hardened and rendered waterproof. Another important feature claimed for this material is the simplicity of its use for the repair of trenches, an operation which can be carried out by an ordinary roadman with Westrumite asphalt and screenings and the use of a rammer, no heating plant being required.

The accompanying view shows a Westrumite road in Antwerp constructed in 1911, since when there have been hauled over it all the materials employed in the erection of about fifty houses. Wagons carrying loads of 12 tons on wheels with 2½-in. tyres are common, notwithstanding which the surface remains in excellent condition.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

Mr. W. H. HALL, to whom was awarded a moiety of the premium for January, has selected the following books:—

- "Further Problems in the Theory and Design of Structures," by Ewart S. Andrews (Chapman).
- "Elementary Principles of Reinforced-concrete Construction," by Ewart S. Andrews (Scott, Greenwood & Son).

These have been duly forwarded.

QUESTIONS.

This week answers are invited to the following questions:—

379. Testing Pipes.—What tests should stoneware pipes be subjected to before they are accepted for use? What defects are often thereby disclosed? (B. W., *Tadcaster*.)

380. Belt Cearing.—A belt running at 1,500 ft. per minute transmits 80-horse power. Find the difference of tension of the two sides of the belt. (T. R.)

381. Town Planning.—An area of 1,000 acres, chiefly undeveloped, in an urban district, is to be included in a town planning scheme. The approximate number of owners, occupiers and lessees is 250. Assuming that the referencing is to be done by the staff of the urban district council surveyor's office, state the information which should be sought, and the best method of ascertaining and recording it. Give an estimate of the cost of the work if done by professional referencers. Compare the advantages and disadvantages of the two methods, both in the above case and in the case of an area of 1,500 acres in the same district, which includes a considerable extent of partially developed building estates, and is to form the nucleus of a later scheme. (Togun.)

382. Fire Hydrants.—Fire hydrants, 2½ in. in diameter, are taken from a 4-in. and a 12-in. main. What will be the ratio of discharge in the two cases, assuming that the initial pressure is the same in each main? (X. X., *Hounslow*.)

383. Grain Silo.—It is required to construct a grain silo, the bins of which are 64 ft. in height and 8 ft. square in cross-section. What lateral pressure at the base should be provided for? (X. X., *Hounslow*.)

REPLIES TO QUESTIONS.

377. Machine Shop.—An electric crane is to be fitted in a machine shop on existing piers, as shown in

VERTICAL SECTION THROUGH WALL AND PIER.

sketch. The piers are bonded into the wall, and about 12 ft. centres. Assuming the foundations are good,

and the work is in Staffordshire brick set in cement and sand, what is the safe load these piers will withstand? (H. W., *Cradley Heath*.)

The pier is under the influence of a direct compressive stress due to the weight of the pier, and to bending stresses due to the load not being applied at the centre of the section.

Let P lb. be the maximum load that can be applied. W lb. be the weight of the pier.

A be the area of the pier in square inches.

Then direct compressive stress = $\frac{W + P}{A}$ = f_a lb. per sq. in.

$$A = 18'' \times 32'' = 576 \text{ sq. in.}$$

The weight of 1 cubic foot of Staffordshire brick is 135 lb. (Molesworth)

$$\therefore W = \frac{576}{144} \times 20 \times 135 \text{ lb.} = 10,800 \text{ lb.}$$

$$\therefore f_a = \frac{10,800 + P}{576} \text{ lb. per sq. in. (compression)}$$

This stress will be uniform over the whole section, and may be represented by the rectangle *pqrs*.

The stresses due to bending alone will be tensile on one side of the section (*ab*), and compressive on the other (*cd*). The neutral surface, a plane in which there is no bending stress, bisects the section, and is indicated at *NA*.

The magnitude of the bending stresses depends upon the bending moment applied to the section, and varies inversely as the modulus of the section.

The bending moment upon a pier is found by multiplying the load by its eccentricity. In this case

the load is applied at 9 in. from the centre of the section.

$$\therefore M = P \times 9 \text{ in. lb.}$$

Using the basis formula for bending—

$$M = f_t Z_t = f_c Z_c$$

where f_t, f_c = tensile and compressive stresses
 Z_t, Z_c = moduli for tension and compression

the magnitude of the maximum tensile and compressive stresses in the planes ab, cd may be determined.

As the section of the pier is symmetrical about the neutral axis N.A., $Z_t = Z_c$ and therefore $f_t = f_c$

The modulus of the section $abcd$ about N.A. = Z

$$Z = \frac{B \cdot D^3}{6} \text{ where } B = ab \text{ and } D = cd$$

$$= \frac{18 \times (32)^3}{6} = 3,672 \text{ in}^3$$

$$\therefore \text{Bending stresses } f_t = f_c = \frac{M}{Z}$$

$$= \frac{P \times 9}{3,672} \text{ lb. sq.}$$

$$= \frac{P}{341.33} \text{ lb. sq. in.}$$

The limiting conditions of loading will be realised when the extreme tensile stresses at the base of the pier are balanced by the direct compressive stresses. This condition is found by equating f_t and f_a .

$$\text{i.e., } \frac{P}{341.33} = \frac{10,800 + P}{576}$$

$$\therefore \frac{P}{341.33} - \frac{P}{576} = \frac{10,800}{576}$$

$$\therefore P = \frac{10,800 \times 341.33}{234.67} = 15,700 \text{ lb.}$$

$$= 7.01 \text{ tons}$$

Thus, 7 tons is the greatest safe load that can be applied to this pier in the position shown.

The case may be represented graphically as in the diagram.

$pqrs$ represents the distribution of direct compressive stress.

$a'b'c'd'$ represents the distribution of bending stresses, $a'b'$ being the extreme tensile stress, and $c'd'$ the compressive, and $a'b' = ps$ as above

The resultant stresses upon the pier are obtained by combining the two diagrams, and are shown at xyz .

There is no stress on the face ab of the section at the base of the pier, but the compressive stress is twice the direct stress; but Staffordshire brick is amply strong enough to take this load.

There will be tensile stresses in the brickwork above the bottom section of the pier, but these will never exceed 15 lb. per square inch calculated as above, and the load transmitted by the roof has not been allowed for in neutralising the tensile stresses. Hence, this tension may be neglected, and, moreover, it is well known that good mortar will safely stand 25 lb. per square inch in tension. (H. V. O., West Bromwich.)

378. Cost of Running Steam Engine.—Compare the cost of running a steam engine with that of an electric motor in the following circumstances: The horse-power required is 30; electricity costs 1d. per unit, coal (best steam) costs 18s. per ton delivered; the engine is required to drive a stone crusher working an average of eight hours per day for five days per week. (Crusher.)

In making a comparison of two engines for a certain duty, the initial outlay involved and the suitability of the engine for its work must be considered as well as the running costs.

Comparing the steam engine and motor, we find that a vertical engine with vertical boiler complete, 30-h.p. and 130 r.p.m., will cost from £90 to £100. A D.C. motor, running at 750 r.p.m. on 220 volts, will cost £120.

The work the engine must do is continuous, and its nature indicates that the engine must be capable of resisting shocks and sudden overloads. These conditions indicate the advisability of a steam engine with a belt drive.

The steam engine, being an independent power unit, may be used in any desired place, whereas the motor can only be used in situations where power cables are at hand, and this is not always the case at stone quarries.

On the other hand, if the crusher is installed at

a highway depot, where space may be of importance, a motor would be very convenient.

The running of the engine would be superintended by the hands at the stone crusher, but the steam engine would require more time than the motor on account of stoking.

The running cost for one week's work may now be analysed, commencing with the heaviest item— motive power.

Coal.—The coal consumption of the steam set will be 5 lb. per indicated horse power per hour (see Molesworth)—i.e., 5 lb. \times 30 = 150 lb. of coal required per hour.

There are forty working hours per week.

$$\therefore \text{Weekly coal consumption} = 40 \times 150 \text{ lb.} = 6,000 \text{ lb.}$$

$$\therefore \text{Weekly cost at 18s. per ton} = \frac{6000}{2240} \times 18s.$$

$$= 48s.$$

$$= \text{£}2 \text{ 8s. 6d.}$$

Electricity.—1 unit of electricity is 1 kw.-hour; 1 kw.-hour is equivalent to 1.31 h.p.-hours.

Cost of 1 unit is 1d.

$$\therefore \text{Cost of 1 h.p. hour} = \frac{1d.}{1.31} = \text{746d.}$$

$$\therefore \text{Cost of running 30 h.p. motor for a week of 40 hours}$$

$$= 746 \times 30 \times 40 \text{ pence}$$

$$= 85d.$$

$$= \text{£}3 \text{ 13s. 9d.}$$

The depreciation on an engine per week may be only roughly estimated. The probable life of the engine is taken, and the initial cost is then divided by the number of weeks.

Taking the probable life of the steam engine at fifteen years,

$$\therefore \text{Weekly allowance for depreciation} = \frac{\text{£}90}{52 \times 15} = \text{2s. 6d.}$$

The life of the motor may also be taken at 15 years.

$$\therefore \text{Weekly allowance of depreciation on motor} = \frac{\text{£}120}{52 \times 15}$$

$$= \text{3s. 0d.}$$

The repairs and attention to the steam engine and boiler will be higher than for the motor, and the cost of water will be an added item, which will vary with the situation of the plant owing to extra labour in carting.

The following is a summary of the weekly expense of running a steam engine and motor:—

	STEAM ENGINE.		ELECTRIC MOTOR.	
	£	s. d.	£	s. d.
Coal 40½ cwt. ...	2	8 0	Power—1,200-h.p. hours ...	3 13 9
Depreciation ...	0	2 6	Depreciation ...	0 3 0
Repairs & attention ...	0	7 6	Repairs & attention ...	0 2 6
Oil and waste ...	0	4 0	Lubricants ...	0 1 0
Water ...	0	5 0		
Total... ..	£3	7 0	Total	£4 0 3

(H. V. O., West Bromwich.)

THE TOWN PLANNING INSTITUTE AND MUNICIPAL ENGINEERS.

As an outcome of the representations made to the Town Planning Institute by the council of the Institution of Municipal and County Engineers, it has been resolved that in addition to the Institution of Civil Engineers, the Royal Institute of British Architects and the Surveyors' Institution, membership of the Institution of Municipal and County Engineers shall be accepted as a qualification on equal terms with the societies mentioned above.

The use of the rooms of the institution is to be offered to the Town Planning Institute for the purposes of their meetings.

Rail Corrugation.—A paper entitled "Rail Corrugation and its Causes" will be read by Mr. S. P. W. D'Alte Sellon, M.INST.C.E., at a meeting of the Institution of Civil Engineers on Tuesday evening next.

Change of Address.—After March 1st next the address of the honorary secretary of the Association of Managers of Sewage Disposal Works, Mr. Chas. H. Ball, will be Corporation Sewage Works, Davyhulme, near Manchester.

The Surveyor

And Municipal and County Engineer.

SURVEYORS' MOTOR CARS.

LIVERPOOL CITY ENGINEER'S REPORT.

The taxation of surveyors' means of locomotion was the subject of a report received from Mr. J. A. Brodie, city engineer of Liverpool, at the last meeting of the council of the Institution of Municipal and County Engineers. Mr. Brodie says:—

"After discussing the above matter with our town clerk, he agrees that the authorities solely responsible for the administration of the motor car licence duties in England and Wales are the various county councils and county borough councils, but any decision to exempt surveyors' vehicles, &c., from the payment of taxation licence duty would, in the absence of any express authority in the Act so to do, be open to criticism by the Government Department to whom the proceeds of motor taxation are paid; which funds are afterwards allocated among the various authorities through a board appointed for that purpose.

"Up to the present I have been unable to get a remission of the taxes in Liverpool, and I am afraid that personal applications are not likely to be successful. I think, however, that it might be well for the institution to consider the desirability of asking the Chancellor of the Exchequer to include a clause in the next Finance Bill to exempt surveyors' motor cars from taxation, for which there are two precedents—viz.:—

"(a) The Locomotives Act, which exempts payment for steam rollers, and

"(b) The Finance Acts, which prescribe payments of half rates for doctors' motor cars."

Action is to be taken to give effect to Mr. Brodie's suggestions.

The Cheltenham Road Conference.—At the last meeting of the council of the Institution of Municipal and County Engineers, the secretary reported that Sir George Gibb intended, if possible, to be present at the conference to be held at Cheltenham, and would probably open the proceedings with an address.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain,
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii., 2.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS: ELECTION OF COUNCIL.

To the Editor of THE SURVEYOR.

SIR,—With your permission, I wish to make the following appeal: Corporate members of the institution will soon be called upon to cast their votes. May I appeal to each member to use his vote carefully and deliberately, and to see that it is lodged in time to be recorded?

With an institution of forty years' existence, and some 1,500 members, one would have thought that they could govern the profession and that everything would be well for its members. Instead of this we find men who have been educated and artied turned out into the world, scrambling for positions at a remuneration that would be, and is, looked upon with scorn by a bricklayer.

When successful, these men are struggling with cost of tuition, of examinations and of institution fees, and then very often ultimately only to find that they belong to the wrong institution, or not sufficient institutions, and are debarred from the sweet and refreshing fruits of the profession.

Should this be? I think not, and most members will agree with me. I do not wish to disown the council, or belittle their efforts. They are admittedly the best of the profession, and in their way do their best for the good of the institution, and accordingly deserve our best thanks. Unfortunately, things are not what they should be, and the council, though individually honoured men of the profession, are collectively as a council not, in my opinion, in full understanding of the present-day situation of the majority of the members of the profession. Their methods to me appear to be wrong, and I often think as an institution we would do well to start afresh upon different lines.

Our council strive after abstract things while its members require things material and concrete. Let me give an illustration: A district meeting is held and papers are read and discussed, and here the efforts of the council apparently cease. Later that particular town requires an engineer or assistant; here our men, who may perhaps have assisted in the paper or discussion, are debarred, and other men with other qualifications are sought for. If the knowledge expounded at the meeting is not edifying and does not qualify, why expound at all? Our men must be content to pass examinations, hold membership, pay subscriptions, attend meetings, and generally best qualify themselves for the posts, and then are forced to watch others step in and claim the positions. I do think our council should see that, if our institution does intend to govern the profession, it should do so to the full. If our examination is not the best, then it should be made the best, likewise the membership, and then see that they are fully recognised. As an alternative, let us cease to exist as an institution. Our institution specialises in municipal and county work, and these works solely, so surely it is our due that we should claim these appointments.

Our council should be practical, as well as theoretical, and in addition to an examination board they should form an appointments board to regulate, form rules of conditions, remuneration, qualifications, &c., in a manner similar to that in which the Royal Institute of British Architects regulate competitions; and in this way complete the work they commence in forming the institution and holding examinations.

I am afraid we must hold our present council responsible for letting town planning slip through their fingers into other hands. Surely it was our duty solely to govern town planning. Again, our council are theoretical: they will charge fees, hold examinations, but another institute will call the tune while we pay the piper. This is one more of the many institutions that we will be expected to join. It is a matter of paying and smiling; no wonder we have no money left to pay for our own defence fund. This fund failed, and I feel sure on one score only—viz., the fee was too high and threatened to break the bank. Had it been low (if only to commence

with), as in another institution, I feel sure it would have been a great success.

Before reforming the council was not representative, and now, although there is district representation, we are still unrepresentative institutionally.

Our corporate members number 1,498, or thereabout. Of these 1,038 are non-members of the Institution of Civil Engineers, while the other 450 are corporate members of the Institution of Civil Engineers. How are these represented upon the council? The 1,038 have at the most two members, while the 450 have thirty-five members. Thus the influence of the Institution of Civil Engineers may dominate. Remember, this is a rival institution which (shall I say?) encroaches upon our preserves, and only too frequently rivals or may supplant our qualification.

To illustrate to what extent this influence may predominate our council, may I refer the members to the new additional list to the board of examiners? There are upon that list eighteen, of whom fourteen are corporate members of the Institution of Civil Engineers, while only ten testamur holders can find a place thereon. I say nothing against these fourteen; they are honoured men of standing who will honour the board; but I do say when we have some 557 (at least) testamur holders upon our membership list we can find among them eighteen worthy and capable men who are first entitled to a seat upon the board. These testamur members have experience of the examination, have paid examination fees, supported the examination and set the example, and the council should honour them in return.

What is wanted are some additional non-members of the Institution of Civil Engineers upon our council, some younger men who know what it is to be in the present-day fight, who know the difficulties of keeping pace with modern qualifications of the too numerous institutions, and the expense, &c., attached thereto—men who will fight the rights of and demand full recognition for our institution. I do not ask the members in casting their votes to mislead any present member of the council. They are entitled to honour for their services, but should any not be seeking re-election, I trust the members will in voting vote in the best interests of themselves, and see that those elected in the future will concentrate their efforts and place the interests of our membership, and our institution only, first and foremost.

I must apologise, Mr. Editor, for the length of this appeal, but hope that the points raised will be fully discussed, and thus justify the space these remarks have claimed.—Yours, &c.,

MEMBER OF THE INSTITUTION.

CONTACT BEDS.

To the Editor of THE SURVEYOR.

SIR,—With reference to your remarks on that portion of Mr. Shenton's address dealing with contact beds, it may be of interest to state that a set of five double contact beds (ten in all), put down at Wokingham in 1905 to deal with a strong domestic sewage from a separate system of sewers, are still in good condition, and giving good results. The filtering media from a contact bed which had been in use fourteen years, for the final treatment of the effluent from irrigation plots has been washed, and again put into use, and the loss, if any, was inappreciable. The whole of the filtering material is gas clinker, and is readily washed and regraded in one operation by means of a small hand-driven machine which is easily worked by one man, and the gauges of which can be readily altered. In our case no other water is available, and the washing is done with screened sewage.

The subsoil at the outfall is a stiff clay, and the beds are simply excavations, with ample underdrainage and the necessary valves. The clinker is graded, and from inception care has been taken to keep the surface of the beds free from sewage by discharging the sewage into a grip about 18 in. wide and 6 in. deep in the surface of the bed, the result being that the surface of the greater portion of the beds is as clean as when first constructed. This permits free ventilation over the whole area, and no other provision is made for ventilating the underdrains.

Seventeen other beds have since been constructed on the same lines, and have given equally good results, with the exception of one primary bed, the clinker of which was much finer than that in general use here, the result being that the bed has lost capacity to a much greater extent. The clinker is therefore being washed, and will be used for secondary beds.

The grades in use are 3-in. to 12-in. for primary, 4-in. to 3-in. for secondary, and 2-in. to 4-in. for tertiary beds, with a layer of coarse clinker over the underdrains. I am fully aware of the merits of percolating beds, but, on the other hand, we find that in our case, owing to the configuration of the ground and a strong clay subsoil, contact beds can be cheaply and readily constructed, and give good results.

I may add that the effluent discharges into a tributary of the Thames, and is under the constant supervision of the Thames Conservancy. Yours, &c.,

C. W. MARKS,
Borough Surveyor.

Town Hall, Wokingham.

February 14, 1914.

SEWAGE DISPOSAL BY DILUTION.

To the Editor of THE SURVEYOR.

SIR.—Mr. Stowell, in his letter of February 7th, has raised an interesting point, but I feel sure that he has taken the wrong view.

If the Eighth Report of the Sewage Disposal Commission is carefully studied it will be seen that, although there are certain cases in which quality of water may be left to river authorities, it is quite clear that for purposes of the system of standards recommended by the commission dilution is to be the main consideration and not quality of river water (see Eighth Report, p. 5, par. 16, lines 8 and 9, and also p. 15, par. 55, lines 5, 6 and 7).

The paragraph on p. 7 of the Report to which you refer in your "Minute" bears this out. It is there recommended that, even in the extreme cases referred to, regard should not be had to the quality of the water, but only to dilution. These extreme cases are thus intended to be treated in the same way as normal cases, so far as quality of water is concerned.

Why should a small community on a large river be penalised by reason of the fact that the river which passes them is already polluted by the default of large towns higher up the river? (See Eighth Report, sec. 16.) The remedy consists in bringing pressure to bear upon the large towns who are producing the bulk of the pollution (see Eighth Report, sec. 55), and when this has been done, the river will be in a position to deal with the sewage from small communities by dilution.

The figure 0, in your "Minute" (p. 314, line 17) should be 2. Yours, &c.,

G. BERTRAM KERSHAW.

West Wickham,
Kent.

February 17, 1914.

STORM DAMAGE AT MORECAMBE.

To the Editor of THE SURVEYOR.

SIR, May I trespass on your valuable space to contradict entirely certain sensational paragraphs in many newspapers on the 16th inst. alleging immense damage to have been done to the sea walls in Morecambe during the heavy gale on Sunday last?

As a matter of fact, no damage whatever was sustained by any sea wall, and the total damage to the promenade does not exceed £7.

I ask your kind assistance in this matter, as the publication of fabrications of such a description are liable to do the responsible engineer a great injury professionally. Yours, &c.,

J. W. HIPWOOD,
Borough Surveyor.

Morecambe.

February 17, 1914.

Lostock Junction Railway Widenings.—Messrs. L. W. Pearce & Co., Limited, Bank Chambers, Ramsden-square, Barrow-in-Furness, have been successful in obtaining the contract for the widening of railway lines and sidings at Lostock Junction for the Lancashire and Yorkshire Railway Company. The works are estimated to cost about £36,000.

Metropolitan Water Board's New Offices.—The Metropolitan Water Board have decided to remove their central offices from Savoy-court, Strand, and to start building in about six months' time offices to accommodate about 800 persons, on one of the 7 acres of the freehold property which they own near Rosebery-avenue. One acre will be utilised for the new offices, and the remaining six, it is stated, will be sold for building purposes.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Bridgwater R.D.C. (February 13th. Mr. W. O. E. Meade-King).—£1,400 for works of water supply at Othery.—Mr. T. M. Reed (clerk to the council) stated that it was proposed to supply water for 400 inhabitants. Evidence in support of the application was given by the surveyor, Mr. W. A. Collins, the medical officer, Dr. Wilberforce Thompson, and the inspector of nuisances, Mr. R. Popham.

Burnley R.D.C. (February 10th. Mr. F. O. Stanford).—This was an inquiry into an application for power, under the Land Clauses Act, to acquire land for extending the water facilities of the township.—Mr. H. Pritchard, surveyor, said it was estimated that the proposed scheme would cost about £2,300. The scheme was essential.

Exeter T.C. (February 17th. Mr. W. M. Cross).—£1,110 for the provision of underground sanitary conveniences in Sidwell-street and Magdalen-street.—The town clerk (Mr. H. Lloyd Parry) asked for the loan for a period of thirty years.

Haywards Heath U.D.C. (February 17th. Mr. R. H. Bicknell).—£1,700 for the purchase of land forming part of Petland Wood for the purpose of a cemetery.—The proposed site, it was explained, comprises slightly over 14 acres. Eleven acres will be suitable for cemetery purposes, and it is proposed at first to lay out only 4 or 5 acres.

Liverpool T.C. (February 12th. Mr. T. C. Ekin).—£70,000 for the erection of pierhead baths and offices, and £9,000 for extensions to central library, museum, and Walker art gallery.—It was stated that the proposed site of the baths measured 3,718 sq. yds., and cost £18,590. The designs for the baths and offices had been prepared by Mr. Saxon Snell, and the city surveyor (Mr. T. Shelmerdine), the latter being responsible for the offices and the elevation. It was estimated that on the first year's working there would be a deficiency of £3,833, or about 1-5d. rate. With respect to the second loan, evidence was given that both the health of the staff and the convenience of the public called for the suggested improvements.

Manchester T.C. (February 17th. Mr. T. Adams).—This was an inquiry into an application by the corporation for authority to prepare town-planning schemes for two small areas in North Manchester. The schemes are additions to those already in progress, and together did not add more than 250 acres to the total area it is proposed to plan out in various parts of the city, and are largely on the southern side.—Mr. John Luke, deputy city surveyor, described the scheme, and gave reasons why it ought to be carried out.

Mansfield T.C. (February 12th. Mr. M. K. North).—£900 for the purchase of property in Chumber-street for street improvements, and £300 for the purchase of land in Nottingham-road as an open space.—The necessary evidence was submitted by Mr. A. H. Limb, from the town clerk's office, and the borough surveyor, Mr. T. P. Collinge.

Merton and Morden U.D.C. (February 9th. Mr. R. H. Bicknell).—£1,600 for the erection of a fire station, and £575 for the extension of the depot.—Mr. C. J. Mountfield, the clerk, stated that the area of the district was 3,236 acres, and the population, which in 1901 was 5,470, was now estimated at 17,000. It was asked that repayment of the loan should be spread over thirty years.

Surbiton U.D.C. (February 16th. Mr. R. H. Bicknell).—£6,900 for the purchase of 13.25 acres of land adjoining the new sewage disposal works, at about £142 per acre, for burial purposes, and £6,900 for the purchase and laying out of the land.—Mr. H. T. Mather, surveyor to the council, said he had prepared plans for under-drainage to an average depth of 12 ft., and also for surface-water drainage. The total estimate for the purchase and laying-out of the site was £5,000, and there was included in the application the estimated cost of erecting a chapel, lodge, lavatories, &c. Mr. W. B. Crouch, assistant surveyor, and Mr. R. H. Jeffes, surveyor to the Maldens and Coombe Urban District Council, were also present.

APPLICATIONS FOR LOANS.

Ashton-under-Lyne T.C.—£13,000 for sewage works extension.

Bedlington T.C.—£3,000 for sewerage works.

Bristol T.C.—£971 for road widenings.

Finchley U.D.C.—£1,170 for a recreation ground.

Harrogate T.C.—£2,096 for street improvement works.

Hinckley U.D.C.—£2,720 for a housing scheme.

Hitchin R.D.C.—£8,950 for a new isolation hospital.

Orsett R.D.C.—£5,592 for a housing scheme.

Paddington B.C.—£2,000 for the reconstruction scheme in Cirencester-street.

Rushden U.D.C.—£9,136 for the provision of working-class houses.

Sheffield T.C.—£6,500 for telephonic street fire alarms.

Tonbridge R.D.C.—£9,439 for the erection of forty-eight dwellings.

Twickenham U.D.C.—£5,910 for private street works.

Wakefield T.C.—£1,000 in connection with the electricity undertaking.

Widnes T.C.—£450 for road improvement works.

Wrotham U.D.C.—£12,000 for drainage works.

LOANS SANCTIONED.

Bromley T.C.—£528 for the purchase of land for road widening.

Castlederg R.D.C.—£3,230 for the provision of cottages.

Clones No. 2 R.D.C.—£1,300, supplemental loan for workmen's dwellings.

Croydon T.C.—£96,000 in connection with the water undertaking.

Harrogate T.C.—£7,639 for the electricity undertaking.

Islington B.C.—£9,300 for paving works.

Kiveton Park R.D.C.—£540 for works of road improvement, and £1,210 for surface-water drainage.

Leicestershire C.C.—£2,189 for the erection of dwellings.

Lowestoft T.C.—£1,750 for hospital extension, and £465 for road improvement.

Pembroke (Co. Dublin) U.D.C.—£12,000 for workmen's houses.

Raunds U.D.C.—£600 for the construction of a culvert.

Rushden U.D.C.—£476 for the recreation ground.

St. Mellons R.D.C.—£3,000 for road works.

Thornaby T.C.—£5,330 for road improvement works.

Watford U.D.C.—£2,852 for street improvement.

FORTHCOMING INQUIRIES.

	FEBRUARY.	£
23.—Melton Mowbray.	For the provision of a refuse destructor (Mr. R. H. Bicknell)	2,150
21.—Bridlington.	For road widening purposes (Mr. F. H. Tulloch)	1,300
24.—Frinton-on-Sea.	For the purposes of fire service and public offices (Mr. W. O. E. Meade-King)	2,770
21.—Turton.	For sewage disposal purposes (Mr. P. M. Crosthwaite)	8,361
21.—Wantage.	For a housing scheme (Mr. H. S. Stewart)	1,600
25.—Bradford.	For the purposes of cottage baths, a bowling green, and pleasure grounds (Mr. F. H. Tulloch)	8,527
25.—East Stow.	For a water supply scheme (Mr. W. O. E. Meade-King)	1,147

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Dudley £40,000, Leicester £12,350, Paddington; housing and town planning—Dublin, Newport, roads and materials—Aberdeen, Sunderland; sewerage and sewage disposal—Cuckfield £12,750; water, gas and electricity—Bradford £180,000. Particulars of other works projected will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Brighton T.C.—The Tramways Committee approve of the proposal to erect a tramway shelter at the south-west end of the approach to the cemetery. The provision of additional office accommodation at North-road works, at an estimated cost of £1,500, is approved by the Finance Committee.

Dudley T.C.—It is proposed to erect during the next four years a comprehensive suite of municipal buildings at an estimated cost of £40,000.

Esher and the Dittons U.D.C.—Proposals to acquire a site for and to erect new offices and depot buildings, at an estimated cost of £6,000, were discussed at last week's meeting, and were referred back for the special committee reporting to consider the question of acquiring a site for offices only.

Frome U.D.C.—Extensions are to be carried out at the Victoria Hospital at an estimated cost of £1,250.

Harrogate T.C.—The renovation of the baths is being proceeded with, and additional accommodation is to be provided at the sulphur wells pump room.

Leicester T.C.—A scheme has been adopted for the erection of sanatorium buildings for tuberculosis patients, on land adjoining the isolation hospital belonging to the corporation, at an estimated cost of £12,350.

Lowestoft T.C.—It has been agreed to erect a shelter on Ganton Cliffs.

Paddington B.C.—The council on Tuesday decided upon the completion of the purchase of land near Porchester-road, Paddington, at a cost of £16,000, for the purpose of public baths.

Sheerness U.D.C.—The surveyor, Mr. T. F. Berry, has received instructions to prepare a site plan for a new public convenience.

Sheffield T.C.—The Health Committee recommend the corporation to purchase, at a price not exceeding £3,244, a plot of land of 36 acres at Rivelin for the purpose of a sanatorium.

HOUSING AND TOWN PLANNING.

Dublin T.C.—A scheme for the erection of 156 houses, at an estimated cost of £44,810, was submitted to the council on Monday. It was proposed by the Housing Committee that the rents should be fixed at 7s. weekly for four-roomed houses, 6s. 6d. for three-roomed houses, and 4s. 6d. for two-roomed houses, but an amendment was carried fixing the rents as follows: Four-roomed houses, 7s. weekly to 6s.; three-roomed houses, 6s. 6d. to 4s. 6d.; two-roomed houses, 4s. 6d. to 2s. 6d.

East Preston (Sussex) R.D.C.—A scheme has been approved for the erection of eight cottages in the neighbourhood of Angmering.

Hereford T.C.—A scheme has been adopted for the provision of about ninety working-class dwellings.

Midhurst R.D.C.—The surveyor, Mr. A. G. Gibbs, has received instructions to complete the draft plans for workmen's dwellings at Milland, and obtain tenders for the work.

Newport (Mon.) T.C.—It has been agreed to promote a scheme for 100 workmen's dwellings.

Newton Abbot R.D.C.—It has been agreed to build twelve houses at Chudleigh in two blocks of six, the estimated cost of each house being £200, exclusive of the cost of the land.

Stratford-on-Avon T.C.—The borough surveyor, Mr. R. Dixon, has received instructions to prepare a scheme for the erection of thirty-six cottages.

Westhampnett R.D.C.—A housing scheme has been adopted for North Bersted, the estimated cost being £1,000. It is proposed to provide six cottages to be erected in three pairs, and to let them at a rental of 4s. 3d. per week.

REFUSE COLLECTION AND DISPOSAL.

Hammersmith B.C.—It has been agreed to increase the charge for the removal of trade refuse from 5s. 6d. to 7s. per ton.

ROADS AND MATERIALS.

Aberdeen T.C.—The Links Committee have approved the plans of the new street from King-street, at East North-street, through Shuttle-lane and along the north side of Frederick-street school to Park-street, and thence by Constitution-street to the Links. The estimated gross cost is £101,000, from which about £31,000 would be recovered from feuing and resale of property, leaving a net cost of £70,000. Of this amount over £20,000 would apply to the clearing out of slum property, which is not actually needed for the formation of the street.

Brighton T.C.—It is proposed to purchase several properties in West-street with the view of improving that thoroughfare, which is in a direct line from the railway station to the sea.

Cardiff T.C.—The Health Committee have included in their estimates for the ensuing year £899 for twelve additional road sweepers and twelve more hand-carts.

Chiswick U.D.C.—It has been decided to surface spray with "Tarco."

Cornwall T.C.—Having regard to the increasing expenditure on main roads, the council last week passed a resolution asking that they should be given statutory powers to levy and retain a tax on motor lorries and other mechanically propelled vehicles, the proceeds to be expended on the maintenance of local roads.

Dumfriesshire C.C.—The extra expenditure of about £1,000 a year for the ensuing eight years in improving the southern section of the Carlisle and Edinburgh road between Scotchdyke and Mosspace will be met, as regards three-fourths of it, by a grant from the Road Board.

East Preston (Sussex) R.D.C.—It has been agreed to purchase 12,000 gallons of tar for treatment of the roads, and the tender of Messrs. Wicks, of Maidstone, at £35, has been accepted for the supply of a tar-sprayer.

Esher and the Dittons U.D.C.—The Surrey County Council wrote asking the Esher Council to reconsider its decision as to the provision of land for the widening to 50 ft. of the road from Giggs Hill-green to Windows Bridge, but it was decided not to reconsider the matter. The surveyor, Mr. H. C. Fread, said the estimated cost of the widening would be £560, after deducting promised contributions from the county council and the Road Board.

Forden (Montgomery) R.D.C.—It has been agreed to obtain specifications for the purchase of a steam tractor. The surveyor, Mr. W. P. Hole, presented a statement showing the difference between the cost of the hauling of stone, &c., by hired traction compared with that of the purchase of a steam tractor. It was stated that the cost of the tractor would be £510, convertible gear for roller, £99, two-side tipping trailers, £128, sleeping van for five men, £57 10s., water cart, £27 10s., total, £852. The annual expenditure was estimated as follows: Interest on capital outlay, £31 1s. 7d.; depreciation and repairs at 20 per cent, £170 8s.; licence, £10; driver, fifty-two weeks at 30s., £78; coal, 52 tons at 20s., £52; lubrication and waste, £15 12s.; steerer (half wages), fifty-two weeks at 10s., £26; total, £386 1s. 7d. The cost of hiring a tractor he estimated at £517 per annum as follows: Breaking and rolling, 180 days, £180; hauling, 132 days, £181 10s.; coal, 104 tons, £104; and steerer, £52.

Huntingdon C.C.—The council have entered into a contract for the supply of "Tarco" for surface spraying.

Lancashire C.C.—A contract has been signed for a supply approximately of 300,000 gallons of "Tarco" for spraying purposes during the coming season.

Lowestoft T.C.—The question of acquiring an additional plot of land for the development of the Esplanade has been referred to a special committee for inquiry and report.

Marylebone B.C.—Lord Portman is to be asked to surrender the land necessary for the widening of Park-road by 10 ft.

Plymouth T.C.—The borough surveyor, Mr. J. Paton, has submitted to the Tramways Committee an estimate of the cost of constructing a track from Mutley Plain down Alexandra-road as far as Chudleigh road. He estimates the cost of constructing a single track with crossing places at £6,000, and a double track at £8,300.

Ross-shire C.C.—It has been agreed by the Mid Ross District Committee to apply to the Board of Agriculture for a grant towards the construction of a road from Inverbrum Bridge to Loggie, the estimated cost of which is £2,500. The proposed road is $5\frac{3}{4}$ miles in length.

St. Austell U.D.C.—It has been decided to proceed with the East-hill (a main road) improvement at an estimated cost of £550, towards which the county council have promised a contribution of £120.

Slough U.D.C.—It has been agreed to use "Tarco" for surface painting, and "Bi-tarco" for the construction of improved tar-macadam.

Stepney B.C.—In the course of a question with regard to the visibility of street names, it was suggested that they should be rendered visible by night. Councillor Barber replied that the committee were considering this matter.

Stirlingshire C.C.—The Eastern District Committee have authorised the road surveyor to proceed at once with the laying of an experimental length of different kinds of road surfacing with a view to ascertaining the most suitable system for general adoption. The trial is to be made on the road from Bonnybridge to Carmuir.

Sunderland T.C.—It is proposed to draw up a list of streets in which a heavy expenditure is necessary for permanent work, and to apply to the Local Government Board for sanction to borrow the money to cover the cost.

Weston-super-Mare U.D.C.—The council have agreed to an undertaking with the Road Board to advance to the urban district council by way of loan toward the cost of strengthening and surfacing a section of the Boulevard, estimated at £2,500, the sum of £2,000, free of interest, repayable by five equal annual instalments.

SEWERAGE AND SEWAGE DISPOSAL.

Bampton U.D.C.—Tenders are to be invited for flushing tanks at the new sewage works in Frog-lane and Millhead.

Cuckfield R.D.C.—A scheme is to be prepared for the sewerage of Handcross, Staplefield, and Slaughtam, by two main sewers, one running from Handcross to Staplefield, and the other from Handcross *via* Truckers Hatch and Slaughtam to Staplefield. The approximate estimate for the sewerage is £12,750, to which will have to be added the cost of outfall works. With regard to Warninglid, a small separate scheme, the Sanitary Committee consider, might be carried out with separate outfall, and a van system used for outlying places.

Newcastle (Ireland) U.D.C.—The tender of Mr. John Callan, Castleblayney, at £5,800, has been accepted for the sewage disposal scheme, the plans of which have been prepared by Messrs. Swiney & Crossdaile.

Norwich T.C.—Specially prepared, electrically driven, air-compressing plant is now being erected under the supervision of Mr. Arthur E. Collins, M.INST.C.E., the city engineer, in connection with an extensive scheme for the purpose of raising the sewage from one level to another, and for conveying it to the irrigation sewage farms at Newmill. This air-compressing plant, costing about £1,000, has been made in Aberdeen, and operates ejectors of the latest automatic type. A special feature about the plant is that the electric motor is directly coupled to the air-compressor, and no gearing or belts are used for the transmission of the power. The motor develops

65 h.p., and the output of the compressor is about 800 cub. ft. of free air per minute—amply sufficient for its purpose. It is expected the plant will be in full operation in about one month.

Seaton U.D.C.—The Local Government Board have refused to sanction the council's proposed scheme for the sewerage of Seaton Hole. The proposal was to pump the sewage into an extension of the existing sewer, at an estimated cost of £150. The scheme suggested by the Local Government Board, on the other hand, would, it was stated, cost £1,222, with an estimated expenditure of £26 a year for working, exclusive of renewals. The matter has been referred to the General Purposes Committee.

WATER, GAS, AND ELECTRICITY.

Battle U.D.C.—The question of an improvement in the water supply is to be considered at the next meeting of the council.

Bradford T.C.—It is proposed to duplicate the water supply pipes from the Nidd Valley to Chellow Heights at an estimated cost of £180,000.

Essex and the Dittons U.D.C.—It has been agreed to renew the contract for public lighting and maintenance with the Kingston Gas Company for three years, at £2 12s. 6d. per annum for part-night lamps, and £3 6s. per annum for all-night lamps.

Halifax T.C.—A new 3,500kw. turbo-alternator has been installed at the electricity works at a cost of £11,310.

Ipswich T.C.—The Admiralty and the Safford Rural District Council have jointly agreed to bear the cost of laying a 7-in. main from Bourne Bridge to Shotley for the purpose of a water supply.

PERSONAL.

Mr. Wm. H. Lambert has been appointed assistant surveyor of Rathmines district.

Mr. J. T. Pegge, city surveyor of Durham, has been voted an increased salary of £35 per annum.

Mr. G. B. Goodfellow, Buglawton (Cheshire), has been appointed surveyor to the Buglawton Urban District Council.

Mr. A. W. Hawtrey, ASSOC.M.INST.C.E., deputy engineer and surveyor of St. Pancras, has been voted an increased salary of £50 a year.

Mr. Richard F. Braithwaite has been appointed to succeed his late father as surveyor and inspector to the Selby Rural District Council, at a salary of £180 per annum.

Mr. E. J. Silcock, M.INST.C.E., of Westminster and Leeds, has been engaged by the Corporation of Eye to prepare a scheme of sewerage and sewage disposal for the borough.

Mr. S. J. James, surveyor to the Sherborne Rural District Council, was married recently to Miss E. M. Spurge, only daughter of Mr. and Mrs. Spurge, of Westcliff-on-Sea.

Mr. John Rorke, Clondalkin, has been appointed county surveyor of Queen's County, at an inclusive salary of £350, subject to the sanction of the Local Government Board (Ireland).

Mr. James Hine, a well-known West of England architect, who designed the Plymouth Guildhall and municipal buildings, died at Lanneston, Cornwall, on Sunday, aged eighty-four years.

Mr. Chas. H. Ball, manager of the Withington sewage works of the city of Manchester, has been appointed manager of the Davyhulme works of the city, the transference to date from March 1st next.

Mr. W. Nesfield, sanitary inspector to the Surrbiton Urban District Council, has been authorised to attend the Royal Sanitary Institute's Congress at Blackpool, the council paying reasonable expenses thereby incurred by him.

Mr. W. Holland, assistant county surveyor, has been appointed county surveyor of Cheshire in succession to the late Mr. H. Bull. The appointment was made unanimously by the county council. Mr. Holland was appointed a district and main roads surveyor in February, 1890. He held that office up to 1898, when he was appointed assistant county surveyor.

Mr. Alan Bromly, who has been Mr. Carter's assistant at Croydon for the past fourteen years, was on Tuesday unanimously elected borough surveyor and

water engineer to the Godalming Town Council. The rapid growth of Croydon during this period has given Mr. Bromly an extensive practical experience, and his qualifications include those of the Institution of Civil Engineers, the Institution of Municipal and County Engineers, the Surveyors' Institution, the Royal Sanitary Institute, and the Society of Architects.

Messrs. D. Calloway, burgh surveyor, Inverkeithing; W. Holland, county surveyor, Cheshire; H. Lister, town engineer, Barberton, Transvaal; L. D. Thompson, deputy county surveyor, Lancashire; and W. E. Woollam, engineer and surveyor, East Grinstead Urban District Council, have been elected members; H. I. Cutler, engineering assistant under Richmond Corporation; W. Platt, engineering assistant under Manchester Corporation, associate members; and Alan Entwistle, county surveyors' office, Preston; E. Small, assistant surveyor, Urnston Urban District Council; and B. A. Farley, assistant surveyor, Malling Rural District Council, students, of the Institution of Municipal and County Engineers.

Alderman R. W. Richards, a member of the Institution of Municipal and County Engineers since 1888, and hon. corresponding secretary for Australasia, has been elected Lord Mayor of Sydney. Mr. Richards entered the service of the Sydney City Council in 1879, being articled to the city surveyor. As soon as he had completed his articles, he was appointed surveyor and draughtsman in that department, and in 1887, when only twenty-three years of age, was placed in charge as city surveyor. He resigned from the service in 1902 to enter private practice, and was elected as a member of the council, being returned for Cook Ward. In 1905 he was appointed town clerk and city engineer of Dunedin (N.Z.), and after four years' service there returned to his native city, and was re-elected last year as a representative for Cook Ward.

FOR OTHER ADVERTISEMENTS

See End of Paper.

MADRAS CORPORATION, INDIA.

WANTED ASSISTANT WATERWORKS ENGINEER.

The President, Corporation of Madras, invites applications for the appointment of a Waterworks Assistant to the Special Engineer (J. W. Madeley, Esq., M.A., M.INST.C.E., M.AM.SOC.C.E., &c.).

The duties will be to assist the Special Engineer in the design, construction and maintenance of works connected with the Water Supply Distribution System of the City of Madras, especially cast-iron main laying and the installation and working of waste water meters.

The salary will be Rs.500 (£33 6s. 8d.) per mensem. An allowance of Rs.30 (£2) per mensem will be paid to the Officer appointed so long as he maintains and uses on the work a first-class motor bicycle in good running order. No other allowance of any kind will be made.

Before sailing for Madras the successful candidate will be required to sign a three years' Agreement, to be prepared by the Corporation. By mutual consent the appointment may be extended for a further period.

The Corporation reserves the right to determine the appointment at any time by three months' notice in writing, or by payment of one month's salary.

The Officer appointed will be allowed ordinary first-class railway fares and second-class steamship passage to Madras, *via* Marseilles and Bombay, by P. and O. steamer. A like class return free passage will be granted on the termination of the appointment, subject to satisfactory service, according to the conditions of the Agreement. Half-pay will be granted on the voyage out from the date of leaving England.

Leave will be granted on full pay to the extent of one month for every eleven months of active service, but for not more than three months at a time.

Preference will be given to candidates who have had experience in the design and maintenance of water-pipe distribution systems, including detection and prevention of waste by waste water prevention meters, stethoscopes and other means.

Applicants must not be more than 35 years old, and copies of certificates of age, testimonials and medical certificate of fitness for service in India must be enclosed with the applications; which must reach the undersigned *not later than* 11th March, 1914.

The applications will be sent out to Madras, where the selection will be made by the President of the Corporation.

The President reserves the right of rejecting all applications without giving reasons.

The Officer appointed will be required to commence his duties in Madras not later than eight weeks after he has received notification of the acceptance of his application.

Applications must be in writing, and should be sent to the undersigned in envelopes superscribed "Waterworks Assistant."

JAMES MANSEERGH & SONS,

Agents to the Corporation
of Madras.

BOROUGH OF NUNEATON. ANNUAL CONTRACTS.

Tenders are invited for the Supply of the under-mentioned Materials during the twelve months ending the 31st day of March, 1915:—

1. Blue Bricks, Kerbs, &c.
2. Coal, Slack, &c.
3. Disinfectants and Soap.
4. Earthenware Pipes, &c.
5. Granite Kerbs and Setts.
6. Iron Castings.
7. Petroleum.
8. Portland Cement.

Conditions of Contract and Forms of Tender may be obtained on application at my office, and sealed Tenders, endorsed "Tenders for Supplies," must be delivered to me not later than 12 o'clock noon on Tuesday, the 3rd March.

The Corporation do not bind themselves to accept the lowest or any Tender.

F. C. COOK,

Borough Surveyor.*

Municipal Offices,
Nuneaton.

February 19, 1914.

(1,340)

CUDWORTH URBAN DISTRICT COUNCIL. TO STONE MERCHANTS.

Tenders are invited for the supply and delivery of the following Materials:

- About 1,000 tons Tarred Slag.
- About 250 tons Granite.
- About 500 tons Slag.

Further particulars and Form of Tender can be obtained from W. T. Lynam, Surveyor, Council Offices, Cudworth, upon receipt of a stamped addressed envelope.

Sealed Tenders, endorsed "Tender for Road Material," and samples of same, to be addressed to the Clerk to the Council, Council Offices, Cudworth, on or before Wednesday, March 4th, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

W. E. RALEY,

Clerk to the Council.

Council Offices,
Cudworth.

February 18, 1914.

(1,336)

EAST BARNET VALLEY URBAN DISTRICT COUNCIL.

The East Barnet Valley Urban District Council is prepared to receive Tenders for the supply of the undermentioned for One Year, ending March 31st, 1915:—

- Broken Granite or Basalt for Roadways.
- Gravel, Hoggin, &c., for Roadways.
- Portland Cement.
- Stoneware Pipes.
- Tar-paving Materials.
- Brooms.
- Forage.
- Horse Hire and Cartage.

Specifications and Forms of Tender can be obtained on application to Mr. Henry Yorke, C.E., Surveyor to the Council.

Tenders must be on the Forms supplied, and delivered at the Council Offices, addressed to the Chairman of the Council, not later than 12 noon on Thursday, the 5th March, 1914.

Samples of materials must be deposited with the Tenders.

The Contractor or Contractors will be required to pay the local rate of wages prevailing in the district for the same class of work for which his or their Tender is accepted.

The Council do not bind themselves to accept the lowest or any Tender.

T. A. BUCKLEY,
Clerk.

Offices of the Council,
Station-road, New Barnet.
February 18, 1914. (1,337)

COUNTY BOROUGH OF SWANSEA.

VICTORIA BRIDGE, WITH APPROACHES THERE TO.

TO BRIDGE CONTRACTORS.

The Corporation of Swansea invite Tenders for the Construction of Masonry and Concrete Approaches, Piers, &c., for a Steel Girder Bridge of 111 ft. span, also for the Supply and Erection of Steelwork for the said Bridge.

The Contract has been drawn up in two parts—viz.:—

1. Masonry, &c., in Approaches and Piers, and
2. Steelwork for the Bridge.

but Contractors may submit Tenders for one or both parts.

Particulars, Detailed Plans, and Forms of Tender may be obtained from the Corporation's Consulting Engineer, Mr. H. Howard Humphreys, at 28 Victoria-street, Westminster, or from the undersigned, either by personal application or by letter, on any day after the publication of this advertisement, and until Tuesday, the 17th March.

Intending Contractors will be required to deposit a sum of Three Guineas prior to particulars being furnished, such sum being returned on receipt of a *bona-fide* Tender.

Tenders, endorsed "Victoria Bridge," must reach the undersigned not later than 11 a.m. on the 31st day of March, 1914.

The Corporation do not bind themselves to accept the lowest or any Tender for either part of the Contract.

H. LANG COATH,
Town Clerk.

The Guildhall,
Swansea.
February 20, 1914. (1,341)

COUNTY COUNCIL OF WEST SUFFOLK.
MAIN ROADS.

Tenders are invited for the supply of Broken Material, to be delivered at Railway Stations and Wharves in the County.

Conditions of Contract, with Specification and Form of Tender, may be obtained on application to the undersigned.

Tenders to be sent in by 10 a.m. on Monday, 2nd March, 1914.

W. LIONEL JENKINS, A.M.I.C.E., P.A.S.I.,
County Surveyor.

County Surveyor's Office,
Shire Hall,
Bury St. Edmunds.
February 18, 1914. (1,340)

EAST SUFFOLK COUNTY COUNCIL.

MAIN ROADS.

TENDER FOR ROAD MATERIALS.

The East Suffolk County Council are prepared to receive Tenders from actual Quarry Owners or Proprietors for the Supply of Road Materials for the three Districts in the County—namely, Ipswich, Halesworth, and Eye—to the 31st March, 1915.

Specification and Forms of Tender can be obtained on application to the undersigned, and applicants are requested to state for which District they wish to tender.

Scaled Tenders, endorsed "Tender for Road Materials," must be delivered at the Offices of the County Road Surveyor, County Hall, Ipswich, on or before the 7th March, 1914.

The Council does not bind itself to accept the lowest or any Tender.

W. JERVIS,
County Road Surveyor.

County Hall, Ipswich.
February 18, 1914. (1,342)

ESSEX COUNTY COUNCIL.

HIGHWAYS COMMITTEE.

RECONSTRUCTION OF LANGFORD BRIDGE, ONGAR.

Tenders are invited from Contractors licensed to execute Ferro-Concrete Construction on the Hennebique system for Building a New Bridge over the River Roding on the main road from Chipping Ongar to Brentwood.

Drawings may be seen, and Bills of Quantities and Specifications obtained, upon application to the undersigned.

The Council do not bind themselves to accept the lowest or any Tender.

Tenders, endorsed "Langford Bridge," are to be delivered to this Office not later than Monday, March 2nd.

PERCY J. SHELDON, M.INST.C.E.,
County Surveyor.

Chelmsford.
February 18, 1914. (1,335)

BOROUGH OF STRATFORD-UPON-AVON.

The Town Council of Stratford-upon-Avon invites Tenders for the undermentioned Works:—

CONTRACT No. 1.

Laying and Jointing 1,200 yds. 3-in. Cast-iron Water Mains in Shipston and Clifford Roads.

CONTRACT No. 2.

Laying and Jointing 3,000 yds. 4-in. Cast-iron Water Mains for New Supplementary Water Supply.

CONTRACT No. 3.

Erection of a Mechanical Filter and Pumping House, Warwick-road.

CONTRACT No. 4.

Construction of a small plain Concrete and Brick Reservoir at "Bluecap," Rowley.

Specification, Quantities, and Plans can be seen, and Form of Tender obtained, upon application to the undersigned.

Tenders, sealed and endorsed "Waterworks," must be delivered to the Town Clerk, Municipal Offices, Stratford-upon-Avon, not later than One p.m. on Monday, March 2nd, 1914.

The Town Council does not bind itself to accept the lowest or any Tender, and reserves the right to divide the work.

RODEN DIXON, ASSOC. M.INST.C.E.,
Borough Surveyor.

Stratford-upon-Avon.
February 12, 1914. (1,342)

GENTLEMAN (31, Diploma at Agricultural College, qualified Surveyor, P.A.S.I.) seeks position in town, country, or abroad; six years' experience as assistant in well-known firm of surveyors and valuers, one year's experience on engineering staff of Canadian Railway Company; good references.

Box 1,381, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,334)

MODERN LIFTING APPLIANCES.

The problems which come before municipal and county engineers for solution are many and varied. Whenever the question of lifting and shifting is involved in such problems we strongly recommend to the notice of our readers the catalogue issued by Messrs. Herbert Morris, Limited, of Empress Works, Loughborough, Book 507 "Modern Lifting." In this book, which gives some idea of the wide field covered

MORRIS ELECTRIC OVERHEAD TRAVELLING CRANES IN POWER-HOUSE.

by the firm's productions, lifting and shifting appliances of every description, and for almost every conceivable purpose, are fully illustrated and described.

As may be seen on reference to page 11 of the catalogue, specialities manufactured by Messrs. Herbert Morris, Limited, have been extensively adopted for use in sewage works, gasworks, waterworks, power-houses and other municipal departments. The various plants illustrated are most suggestive, and should be studied by all who are in any way interested in economical transport. They offer remarkable facilities, and are manifestly great time and labour savers.

In the book before us, cranes (electric and hand) are seen in actual operation under widely varying conditions. Prominence is given to the firm's Class 60 electric overhead travelling cranes. These cranes are made to hoist on wire rope, and they may be operated either from the floor or from a cage attached to and travelling with the crane. The crane may be electrically operated in all its motions, or any one or two of the three motions can be by hand. Cases are innumerable in which a hand-crane meets all requirements except that quicker lifting is desirable. It is claimed that Class 60 meets just such a want.

The Q. E. F. Runway, which is also illustrated under a great variety of conditions should particularly appeal to municipal and county engineers. Its flexibility, easy running, and perfect adaptability render it eminently suitable for adoption in cases where difficult and exacting conditions do not permit of other systems of lifting and shifting being installed. With the Q. E. F. Runway there can be a perfect maze of twists and turns. The runway can go anywhere, through doors, into corners, close to walls, in the open, and through stores, warehouses, sheds, and yards of all descriptions. Stuff can be dumped on the floor, and will not be in the way of the runway.

The Q. E. F. Runways are made in sizes from 2½ cwt. to 5 tons. The lifting gear, which is the well-known H. M. B. pulley-block, is attached to a trolley with ball bearings. The trolley travels along steel joists of I-section, which are fitted with junctions to allow the load to be run on to side tracks. The junctions are so designed that no stop is necessary at any point, the trolley being able to pass in any of the three directions open from the junction without pause or loss of impetus. There are no moving parts in the junctions, and therefore no vexatious delays or other "loose part" annoyances to be feared. There can be any number of trolleys on the system without complication, and as many side tracks as may be required. A great feature of the system is that, if desired, it can be adopted to quite a limited extent at first, and added to from time to time without detriment to the ultimate whole. The possibilities of an installation may perhaps be better realised when it is stated that a lad can pick up a ton and transport it 300 ft. inside a minute.

That Q. E. F. Runways have received a most enthusiastic welcome is proved by the fact that considerably over £500,000 worth have been erected in various works. Apart from admirably fulfilling the primary purpose for which they are installed, the experience of users proves that wherever Q. E. F. Runways have been erected they tend greatly to increase the efficiency of both workmen and plant, and by reason of the ease and speed with which material can be moved to its appointed place, they are also conducive to orderliness in every direction.

Many interesting examples are also given of the Morris electric runways, which are a valued part of the equipment of many of the leading dockyards, arsenals, and industrial firms at home and abroad.

The H. M. B. pulley-blocks manufactured by Messrs. Herbert Morris, Limited, are too well known to need detailed description. They are stocked in all sizes from 2½ cwt. to 60 tons, and are made from materials of the very highest quality, with cut gears

THE Q. E. F. RUNWAY IN GASWORKS.

throughout. All parts are made to limit gauges, and are interchangeable. The blocks are designed to give the highest possible efficiency, and it is to be noted that they are not rated by their test loads, but by the loads they are intended to lift in daily work. Each block is tested with a load 50 per cent greater than that which it is said to lift, and a certificate of test is issued with every block.

The tubular shear-legs illustrated may be specially

interesting to some of our readers. These useful appliances are extremely handy for pipe-laying and many other purposes. They are strongly yoked at the top, and carry a shackle for hanging the tackle into. The feet are pointed.

The remarkable developments which have been witnessed at Empress Works are largely the result of perfect business organisation, scientific works management, and standardisation. All manufactures have

TUBULAR SHEAR-LEGS—PIPE LAYING.

been gradually perfected and reduced to repetition lines with limit gauges and automatic machinery.

A copy of Book 50, "Modern Lifting," may be obtained from Messrs. Herbert Morris, Limited, free on application.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A.,
Borough Surveyor, Great Yarmouth.

WEST MIDLAND DISTRICT.

A meeting of the West Midland District will be held at Birmingham on March 5th.

NORTH-EASTERN DISTRICT.

A meeting of the North-Eastern District will be held at Wakefield on Saturday, March 21, 1914.

EASTERN DISTRICT.

A meeting of the Eastern District is to be held at Chelmsford on April 18th.

SOUTHEND MEETING.

A meeting of the institution will be held in the Eastern District at Southend on Saturday, June 6th.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham on June 13th.

THE ANNUAL MEETING.

The date for the annual meeting of the Institution of Municipal and County Engineers at Cheltenham has been fixed definitely for June 24th, 25th, 26th and 27th next. It has been decided to make a special feature of town planning and of roads, and, if possible, to arrange for an exhibition of town plans.

EXAMINATION.

The April examination of the institution will be held in London, at the New Examination Hall, Queen's-square, W.C., on April 2nd, 3rd and 4th.

92 Victoria-street, S.W.

THOMAS COLE,
Secretary.

PROPOSED VISIT TO HAMBURG.

Mr. Thomas Cole, the secretary, has circularised the members as follows:—

"An invitation has been received from the presiding burgomaster (Dr. Predöhl) for the institution to visit Hamburg at Whitsuntide next, when it is intended to inspect the municipal works of that city. These will include waterworks, gasworks and sewerage works, also town planning, of which Hamburg presents a striking example.

"It is proposed to leave London on Wednesday, May 27th, and return so as to be in London on Thursday morning, June 4th.

"The cost of the trip, travelling second class on rail, saloon on boat, with hotel, tips, &c., will be about £10. Carriage drives may be extra.

"As considerable pains are being taken by His Majesty's Consul-General, the presiding burgomaster, and other chief officials of the city to make the visit a success, I hope that members will respond in good numbers to the hearty invitation that we have received, and that you will facilitate the arrangements by giving me early intimation as to whether it is your intention to join the party."

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

EASTERN DISTRICT.

A meeting of the Eastern District of the institution will be held at Oundle to-morrow (Saturday).

Arrangements have also been made for the following meetings: February 25th, council meeting, London; June 13th, Tisbury. Meetings are being arranged also for Leeds and Birmingham during March.

39 Victoria-street, S.W.

B. WYAND,
Secretary.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers to be held on Monday, March 2nd, at the Institution of Electrical Engineers, Victoria-embankment, W.C., a paper entitled "Esperanto: An International Language for Engineers," will be read by Mr. T. J. Gueritte, B.Sc., M.SOC.C.E.(FRANCE), M.S.E., the following being a synopsis: Importance of standardisation in general—advantages of a universal language—the use of such a language in connection with (a) the study of science, (b) the carrying out of engineering work, (c) international congresses, (d) the sale of technical books at moderate prices—Is an international language possible?—Conditions that must be fulfilled—In what manner Esperanto fulfils these conditions—Illustrations of the applications of Esperanto.

The chair will be taken at 7.30 p.m.

A. S. E. ACKERMANN,

Secretary.

17 Victoria-street, S.W.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

METROPOLITAN DISTRICT.

Dr. G. McGowen, F.I.C., chemist to the Royal Commission on Sewage Disposal, has kindly consented to give a demonstration of the methods of analysis adopted by the commission, at the lecture hall of St. George's Hall (Y.M.C.A.), Bond-street, Ealing, on Monday, February 23rd, at 7.30 p.m. Nearest railway station, Ealing Broadway.

J. FIELDHOUSE,

Hon. Secretary.

The Value of Reinforced Concrete.—"Reinforced Concrete and its Application to Architectural Building Work" was the subject of a lecture delivered at a meeting of the Sheffield Society of Architects and Surveyors, held at the university last week. The lecturer was Mr. Gilbert Heathcote, B.A., of London. After giving a short outline as to the origin of reinforced concrete, and a short history of its progress up to the present day, Mr. Heathcote gave clear and concise facts to show that it is a material which has come to stay—first, owing to its ever-increasing strength, and secondly, because no annual maintenance charges of any consequence have to be expended upon it. The lecturer strongly deprecated the present methods generally adopted by users throughout the country in dealing with reinforced-concrete designs and estimates. He outlined what he thought to be the best manner in which to undertake work of this nature in the interests of the architect, his client and the contractor, and, as he considered, in the interests of the whole future progress of this form of construction in England.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

CLERK OF WORKS.—February 21st.—Cleckheaton Urban District Council. £3 per week.—The Clerk.

CLERK OF WORKS.—February 21st.—Willesden Urban District Council. £3 3s. per week.—Mr. J. S. Bridges, Education Offices, Dyne-road, Kilburn.

CLERK OF WORKS.—February 21st.—Stettle Rural District Council.—Mr. T. E. Pearson, clerk.

INSPECTOR OF NUISANCES.—February 21st.—Wadebridge Urban District Council. £110—£120 per annum.—Mr. Walter O. Wellington, clerk, Wade-bridge, Cornwall.

INSPECTOR OF ROADS.—February 21st.—Islington Borough Council. £2 10s.—£3 per week.—Mr. J. Patten Barber, borough engineer.

TEMPORARY ASSISTANT.—February 21st.—Corporation of Bedford. £2 10s.—£3 per week.—Mr. N. Greenshields, borough engineer and surveyor.

PAVING AND BUILDING INSPECTOR.—February 23rd.—Corporation of Leigh. £2 10s. per week.—Mr. Tom Hunter, borough engineer.

ARCHITECT.—February 23rd.—Exeter City Council. £220—£250 per annum.—Mr. H. Lloyd Parry, town clerk.

SURVEYOR.—February 24th.—Lisburn Urban District Council. £200 per annum.—Mr. T. M. Wilson, town clerk.

MAINS SUPERINTENDENT.—February 25th.—Hammersmith Borough Council. £150—£175 per annum.—Mr. G. G. Bell, borough electrical engineer, 5 Fulham Palace-road, W.

CEMETERY SUPERINTENDENT.—February 25th.—Sutton (Surrey) Urban District Council. £1 10s. per week, with house and gas.—Mr. H. Bolton, clerk.

ASSISTANT SURVEYOR.—February 25th.—Sutton-in-Ashfield Urban District Council. £80—£110 per annum.—Mr. Walter Burn, surveyor.

CLERK OF WORKS.—February 26th.—The Maldens and Coombe Urban District Council. £3 3s. per week.—Mr. J. W. Johnson, clerk, New Malden.

ENGINEERING ASSISTANT.—February 26th.—Corporation of Wigau. £110 per annum.—Mr. A. T. Gooseman, borough engineer and surveyor.

ASSISTANT COUNTY SURVEYOR.—February 28th.—County Palatine of Chester. £350 per annum.—Mr. Reginald Potts, clerk, County Offices, Chester.

SECRETARY.—February 28th.—Institution of Municipal and County Engineers. £400 per annum.—Mr. Thomas Cole, secretary, 92 Victoria-street, Westminster, S.W.

COUNTY SURVEYORS.—February 28th.—Limerick County Council. £300 per annum.—Mr. John J. Quaid, county secretary, Limerick.

CLERKS OF WORKS (Two).—February 28th.—Windsor Rural District Council. 13 guineas per month.—Mr. J. E. Gale, clerk.

SUPERINTENDENT OF FIRE BRIGADE.—February 28th.—Municipality of Karachi. 200 rupees per month, with free quarters.—Mr. Measham Lea, chief officer and chief engineer.

ROAD FOREMAN.—March 2nd.—Corporation of Birmingham. 40s.—45s. per week.—Mr. Henry E. Stilgoe, city engineer and surveyor.

ENGINEER AND SURVEYOR.—March 2nd.—Scunthorpe Urban District Council. £200 per annum.—Mr. H. M. Hett, clerk.

CLERK OF WORKS.—March 3rd.—Corporation of Southport. £3 per week.—Mr. J. Ernest Jarratt, town clerk.

ASSISTANT ENGINEERS.—April 1st.—Indian Public Works and State Railways Departments.—Secretary, Public Works Department, India Office, London, S.W.

ASSISTANT ENGINEER.—For Government Water-works in the Gold Coast. £600—£650.—Messrs. Hunter, Duff & Middleton, 17 Victoria-street, Westminster, S.W.

ASSISTANT ENGINEERS AND DRAUGHTSMEN.—Sierra Leone Government, Public Works Department. Engineers, £300—£400; draughtsmen, £300—£350.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

CLERK OF WORKS.—Cheshire County Council. £3 3s. per week.—Mr. W. Holland, county surveyor, The Castle, Chester.

TEMPORARY ASSISTANT.—Kington Park Rural District Council.—Mr. Frank Hewitt, engineer and surveyor.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

HENDON.—March 2nd.—Designs for public baths, for the urban district council. Premiums £100, £75, and £50.—The Clerk.

TWRCELYN.—March 9th.—Plans and specifications for a water supply and drainage scheme for Cemaes. Mr. T. H. Hughes, clerk, Fir-grove, Menai Bridge.

BELFAST.—March 20th.—Designs for an art gallery and museum, for the corporation.—Mr. R. Meyer, town clerk.

BURTON-UPON-TRENT.—March 24th.—For children's cottage homes, for the Board of Guardians.—Mr. C. F. Chamberlin, clerk.

LONDON.—May 4th.—Designs from British architects for the architectural treatment of the new St. Paul's Bridge, for the City Corporation. Premiums, £300, £200, and £100.—Town Clerk, Guildhall, E.C.

MOULD.—Plans for a fire station and caretaker's house, for the urban district council.—Mr. D. Thomas, surveyor, Town Hall.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

Buildings.

BISHOP AUCKLAND.—February 21st.—For the erection of a bandstand, for the urban district council.—The Surveyor.

COVENTRY.—February 21st.—For the erection of a public convenience, for the corporation.—Mr. J. E. Swindlehurst, city engineer and surveyor.

BEDWELLTY.—February 23rd.—For the erection of a public convenience, for the urban district council.—Mr. D. H. Price, surveyor.

WEMBLEY.—February 24th.—For the erection of caretaker's lodge, tool house, and conveniences, for the urban district council.—Mr. C. R. W. Chapman, engineer and surveyor.

BISHOP'S STORTFORD.—February 24th.—For supplying and erecting 44-h.p. gas engine and suction gas plant, making repairs to existing machinery, erecting an engine-house at the waterworks, for the urban district council.—Mr. Robert S. Scott, engineer.

CLOMEL.—February 25th.—For the erection of a retort house and coal store, for the council.—Mr. Henry O'Connor, engineer, 1 Drummond-place, Edinburgh.

MANCHESTER.—February 25th.—For the erection of pavilions at sanatorium, for the Sanitary Committee.—City Architect, Town Hall.

WETHERBY.—February 25th.—For the erection of engine-house and watch-tower, for the rural district council.—Mr. H. A. Johnson, engineer, 15 The Exchange, Bradford.

FALMOUTH.—February 25th.—For additions to pavilion, for the corporation.—Mr. J. S. Walton, borough engineer and surveyor.

MORLEY.—February 25th.—For the foundations required for gasworks plant, for the corporation.—Gas Office, Town Hall.

GOOLE.—February 25th.—For the erection of slipper baths, for the urban district council.—The Surveyor.

LUTTERWORTH.—February 26th.—For the erection of twenty-three houses, for the rural district council.—Mr. A. J. Ross, surveyor.

PEMBROKESHIRE.—February 26th.—For additions to a school, for the Education Authority.—Mr. O. T. Thomas, County Education Offices, Haverford-west.

BARTON-UPON-IRWELL.—February 27th.—For the erection of cart shed, office, mortuary, and store-room, for the rural district council.—Mr. A. H. Mountain, surveyor, Union Offices, Green-lane, Patricroft.

CARLISLE.—February 28th.—For the erection of an office and convenience at the cattle market, for the corporation.—Mr. H. C. Marks, engineer and surveyor.

BLOFIELD.—February 28th.—For the erection of four cottages, for the rural district council.—Mr. H. H. Cole, clerk, 12 Bank-street, Norwich.

FEATHERSTONE.—February 28th.—For the erection of 149 working-class dwellings, for the urban district council.—Mr. S. Chesney, architect.

ROMFORD.—February 28th.—For the conversion of buildings into a fire station, for the urban district council.—Mr. H. T. Ridge, acting surveyor.

LEICESTER.—February 28th.—For the erection of a brick chimney shaft, 212 ft. high, for the corporation.—Mr. E. George Mawbey, borough engineer and surveyor.

BECKENHAM.—March 2nd.—For the erection of an iron building, 60 ft. by 25 ft., at the Church Fields-road depot, for the urban district council.—Mr. John A. Angell, surveyor.

STRATFORD-ON-AVON.—March 2nd.—For laying water mains, erection of mechanical filter and pumping-house, and construction of concrete reservoir, for the corporation.—Mr. R. Dixon, borough surveyor.

MARGATE.—March 2nd.—For laying 1,900 yds. of 8-in. water main, for the corporation.—Mr. Stanley, waterworks manager, 13 Grosvenor-place.

PAIGNTON.—March 2nd.—For the erection of a public convenience, for the urban district council.—The Surveyor.

WEST RIDING.—March 6th.—For the erection of a school, for the Education Committee.—Education Architect, County Hall, Wakefield.

ANTWERP.—March 6th.—For the construction of two metal sheds, for the municipality.—Secrétariat, Hotel de Ville.

BEDFORD.—March 7th.—For the erection of buildings in connection with two pumping stations, and screening chamber, together with the construction of approach roads and areas, formation of site, and other works, for the corporation.—Major Tulloch & Haworth, 28 Victoria-street, Westminster, S.W.

BISHOP'S CASTLE.—March 10th.—For additions and alterations to the Smithfield, for the corporation.—Borough Surveyor.

BURNLEY.—April 4th.—For the completion of the construction of an impounding reservoir, with catchwaters, aqueducts, and meter-houses, for the corporation.—Messrs. James Diggle & Son, engineers, Hind Hide-street, Heywood, Lanes.

KEIGHLEY.—April 11th.—For the construction of a storage reservoir, filter beds, clear water basin, and other appurtenances, for the corporation.—Mr. Ratcliffe Barnett, engineer.

Iron and Steel.

SHIPLEY.—February 24th.—For the supply of steel girder tram rails and fish plates, for the urban district council.—Mr. H. W. Dawson, engineer.

MATLOCK.—February 28th.—For the erection of steel bridges over the river Derwent to carry steel tube sewers, for the urban district council.—Messrs. James Diggle & Son, 14 Victoria-street, Westminster, S.W.

MARGATE.—March 2nd.—For 573 yds. of wrought-iron fencing, with entrance gates, for the corporation.—Mr. E. A. Borg, borough surveyor.

WELLINGTON.—March 3rd.—For the provision of and laying about 5,750 yds. of 3-in. and 2-in. cast-iron water mains, with valves, meters, hydrants, stand-posts, air valves, and other incidental works, for the rural district council.—Messrs. Willcox & Raikes, 63 Temple-row, Birmingham.

NORTH BROMSGROVE.—March 3rd.—For the supply and erection of three sets of gas engines, and three throw pumps, capable of lifting in the aggregate 20,000 gallons per hour, for the urban district council.—Mr. R. Green, 37 Waterloo-street, Birmingham.

BEDFORD.—March 7th.—For the provision and erection of four sets of steam engines and centrifugal pumps, together with all necessary pipe work, for the corporation.—Major Tulloch & Haworth, 28 Victoria-street, Westminster, S.W.

MADRAS.—March 24th.—For the supply of 2,000 cast-iron manhole covers and frames, for the corporation.—Messrs. J. Mansergh & Sons, agents, 5 Victoria-street, Westminster.

Roads.

YEADON.—February 21st.—For the supply of materials, for the urban district council.—Mr. N. Houlden, surveyor.

BEDFORDSHIRE. February 21st. For the supply and cartage of road materials, for the county council.—County Surveyor, Shire Hall, Bedford.

HORBURY.—February 23rd.—For the supply of tarmac, granite, whinstone, limestone, dross, flags, kerbs and setts, for the urban district council.—Mr. W. Sugars, engineer and surveyor.

LEIGH.—February 23rd.—For the supply of road materials, for the corporation.—Mr. T. Hunter, borough engineer.

HIGHWORTH.—February 23rd.—For road repair and haulage, for the rural district council. Mr. O. Kimber, surveyor, Kite Hill, Wanborough.

LONDON.—February 23rd.—For the supply of Channel Island granite, granite sittings, red pit sand, screened river sand, cockle shells, screened gravel, pea gravel, Kentish flints and Kentish rag, for H.M. Commissioners of Works.—The Secretary, Storey's-gate, S.W.

BANBURY.—February 23rd.—For the supply of stone, for the corporation.—Borough Surveyor.

FINCHLEY.—February 23rd.—For the supply of grit for tar-painting, for the urban district council.—Mr. C. J. Jenkin, engineer.

FINCHLEY.—February 23rd.—For the supply of 55,000 gallons of tar for road surface treatment, for the urban district council.—Mr. E. H. Lister, clerk.

ROMFORD.—February 23rd.—For the supply of distilled tar, granite chippings, and clean sand, for the urban district council.—The Surveyor.

BEDWELLYTY.—February 23rd.—For making up a street, for the urban district council.

EPSOM.—February 23rd.—For making up Rosebery-road, Cheam, for the rural district council.—Mr. T. E. Ware, surveyor of highways.

WEST LANCASHIRE.—February 23rd.—For the supply of granite, granite setts, tar macadam, and tar mixtures, for the rural district council.—Mr. R. Rosbotham, Town End, Ormskirk.

MERIONETH.—February 23rd. For road rolling and macadamising, for the county council.—Mr. E. Vaughan, county surveyor, Arthog, Dolgelly.

PENARTH.—February 23rd.—For the supply of road materials, for the urban district council.—Mr. E. I. Evans, surveyor.

WOODFORD.—February 24th.—For the supply of small granite, granite chippings, tar, pitch, and creosote oil, for the urban district council.—Mr. W. Farrington, surveyor.

SEATON DELAVAL.—February 24th.—For the supply of tar-macadam, tarred slag, whinstone, and hire of steam roller, for the urban district council.—Mr. A. Dorin, surveyor.

ASHINGTON.—February 24th.—For work of making up, for the urban district council.—Mr. G. Beaty, surveyor.

LITTLEBOROUGH.—February 24th.—For 17,000 super. yds. of granite sett paving and other works, for the urban district council.—The Surveyor.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

THE INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

APPOINTMENT OF SECRETARY.

The Council invite applications for the post of Secretary to the Institution. The salary will be at the rate of £400 per annum. Preference will be given to candidates possessing a knowledge of Municipal and County Engineering and literary and administrative ability. Age not to exceed 45 years.

Conditions of the appointment may be obtained on application to the Secretary.

Applications, endorsed "Secretaryship," and accompanied by not more than three testimonials of recent date, must be delivered to the Secretary at the Offices of the Institution, No. 92 Victoria-street, Westminster, S.W., not later than noon on Saturday, February 28th.

Canvassing and communicating with Members of the Institution with reference to the appointment, either directly or indirectly, are disqualifications; but 12 copies of the applications and testimonials may be sent to the Secretary.

(By order of the Council)

THOMAS COLE,

Secretary.

92 Victoria-street,
London, S.W.
February 14, 1914. (1,322)

SUTTON-IN-ASHFIELD URBAN DISTRICT COUNCIL.

APPOINTMENT OF ASSISTANT SURVEYOR.

The Sutton-in-Ashfield Urban District Council invite applications for the appointment of Assistant to their Surveyor, at a salary of £80, rising to £110 per annum. Applications, stating age and previous experience, and accompanied by copies of three recent testimonials, must be sent in to me, the undersigned, not later than Wednesday, the 25th day of February, 1914, endorsed, "Assistant Surveyor." Canvassing will disqualify.

WALTER BURN, A.M.I.C.E.,

Surveyor.

Surveyor's Office,
Outram-street,
Sutton-in-Ashfield. (1,300)

COUNTY BOROUGH OF SOUTHPORT.**BIRKDALE AND AINSDALE MAIN SEWERAGE.****CLERK OF WORKS.**

The lowest or any Tender will not necessarily be accepted.

H. A. BROWN,
Engineer and Surveyor.

Town Hall,
Weston-super-Mare.
February 13, 1914. (1,327)

COUNTY BOROUGH OF MERTHYR TYDFIL.
30-IN. MAIN SEWER, TROEDYRHIW TO QUAKER'S-YARD.

The Corporation of Merthyr Tydfil hereby invite Tenders from responsible Contractors for the Providing, Laying and Jointing of the above Sewer, within the Borough of Merthyr Tydfil. The Contract will comprise about 4½ miles of 30-in. Concrete Tubes, and 173 yds. of 30-in. Steel Tubes on Masonry Piers, together with the necessary Manholes, Inspection Chambers, Tumbling Bays, Storm-water Overflows, River Walls, Subsidiary Stoneware Sewers and Surface-water Drains, 9-in. Cast-iron Syphon, and other appurtenant Works in connection therewith.

Plans may be seen, and Specification with Form of Tender and Bill of Quantities obtained, on application to the Borough Engineer, Town Hall, Merthyr Tydfil, upon payment of £3 3s., which will be returned on receipt of a *bona-fide* Tender and the return of all documents.

Sealed Tenders, endorsed "30-in. Main Sewer," must reach the undersigned not later than the 14th March.

The Corporation do not bind themselves to accept the lowest or any Tender.

T. ANEURYN REES,
Town Clerk.

Town Hall,
Merthyr Tydfil.
February 16, 1914. (1,318)

BOROUGH OF EALING.

The Town Council of the Borough of Ealing hereby invites Tenders for the Supply and Delivery of Goods and the execution of the Works as follows, for the twelve months ending 31st March, 1915—viz.: (1) Limes, Pipes, &c.; (2) Cement; (3) Ironmongery; (4) Iron Castings; (5) Paints, Oils, &c.; (6) Granite; (7) Disinfectants; (8) Refined Tar; (9) Official Books and Stationery; (10) Printing; (11) Timber; (12) Uniforms; (13) Tarred Macadam; (14) Tar Paving Mate-

rial and Work in situ; (15) Harness Repairs, &c.; (16) Wood Paving Repairs; (17) Slab-laying, &c.

Printed Forms of Tender, Conditions of Contract, and full particulars may be obtained on application to the Borough Surveyor, Mr. W. R. Hicks, Assoc.M. INST.C.E., at his Office, Town Hall, Ealing, W., on or after Monday, the 16th February, 1914.

Tenders (in the envelopes provided) to be delivered at the office of the undersigned not later than 9.30 a.m. on Monday, the 2nd day of March, 1914.

The Council does not bind itself to accept the lowest or any Tender, and any person whose Tender may be accepted must enter into a proper Contract, with, if required, two sureties to be approved by the Council.

The Tenderer whose offer is accepted shall be held to have bound himself to an agreement, and may be compelled to carry out the obligations arising from his Tender, even though he may not have signed a formal Contract.

(By order)
GEO. E. BRYDGES,
Town Clerk.

Town Hall, Ealing, W.
February 13, 1914. (1,394)

METROPOLITAN BOROUGH OF STOKE NEWINGTON.

The Surveyor

And Municipal and County Engineer.

Vol. XLV.

FEBRUARY 27, 1914.

No. 1,154.

Minutes of Proceedings.

The Manchester Meeting.

The meeting of the Institution of Municipal and County Engineers which took place at Manchester last week was undoubtedly one of the most successful gatherings held in connection with that body for many years past. Not only was the attendance very satisfactory, but the meeting was favoured throughout by excellent weather, while the hospitality of the corporation and the admirable arrangements alike contributed to the enjoyment of those who were present. The feature of the meeting was, undoubtedly, the remarkable paper presented by Mr. de Courey Meade, the able and popular city surveyor. This is reproduced in full in the form of a supplement to our present issue, and in it the author describes some of the more important undertakings with which he has been concerned during his long connection with the city. The first of the great works with which he deals is the scheme of main drainage and flood prevention. This was originally designed by Mr. John Allison, Mr. Meade's predecessor in office, and the same engineer was responsible for carrying out the first part of the work. Its completion, however, devolved upon Mr. Meade, and the difficulties which were then encountered have resulted in the adoption of an excellent system for supervising and keeping control of works subsequently executed.

That part of the paper having reference to the gangings of sewers and kindred matters was listened to with special interest at Friday's meeting. As was pointed out, the study of rainfall and the resulting floods is one of great interest to municipal engineers, and, bearing this in mind, Mr. Meade dealt with the subject at considerable length with a view specially to helping the younger members of the institution. Having described the new drainage scheme prepared by him and approved by Parliament in 1911, he proceeded to draw attention to several of the works inspected in the course of the meeting. These are of a very diverse character, including most of the matters which usually come within the ken of a municipal engineer, and some others. Special mention may perhaps be made of the agreement which the corporation entered into with the National Telephone Company, by which the danger and unsightly appearance of overhead telephone wires is obviated by providing pipes in the public streets for the conveyance of cables.

Again, in connection with the electricity undertaking there is a cable subway nearly $\frac{1}{2}$ mile in length in which the cables are carried on iron brackets. The same subway contains the sewer, which consists of iron pipes supported on concrete. Mr. Meade also dealt at some length with housing and town planning, and with a variety of other matters. He concluded with an apology for the disjointed character of the notes, but every municipal engineer will realise that this was far from necessary. The discussion which followed the reading of the paper contained many compliments to the author, and the general feeling was expressed by Mr. Boulnois when he said that the paper bristled with information of a novel kind, and that if it had been presented to the Institution of Civil Engineers it might well have earned a Telford medal. A fitting supplement to Mr. Meade's contribution was the paper by Councillor Swarbrick, dealing with the future government of great cities. The meeting terminated with a luncheon, at which Mr. Hayward voiced the opinion of all present by expressing their indebtedness to the city surveyor for the magnificent paper which, in spite of the many important works engaging his attention, he had managed to prepare, and for the excellent arrangements that had been made on their behalf. There can be no doubt that the large attendance was amply justified by the character of the proceedings.

*

"Once a Sewer Always a Sewer" (?) The maxim "Once a sewer always a sewer," established by the leading case of *Vestry of St. Leonard, Shoreditch v. Phelan* (1896, 1 Q.B., 533), can no longer be regarded as a hard-and-fast rule if the decision in the recent case of *Kershaw v. Alfred John Smith & Co., Limited* (1913, 2 K.B., 455) remains unchallenged. It will be remembered that in the *Shoreditch* case two houses in the metropolitan area were drained by a combined system, which (not having been constructed with the sanction of commissioners or under the order of a vestry or district board) was a "sewer" under the *Metropolis Management Acts*. Subsequently, the owner of one of the houses disconnected his drain, so that the "sewer" only drained the remaining house; but it was decided that, there being no provision in the statutes for divesting sewers,

or for relieving the local authority from the duty of maintaining them, the conduit—though only draining one building—continued to be a sewer vested in and repairable by the authority.

The facts in the recent case above referred to were not quite so simple. In 1884 a builder submitted to the Hampstead local authority a plan for draining twelve houses in the High-road, Kilburn, by combined drainage. According to the plan the houses were to be drained in two groups by two combined drains—one group, comprising five houses, discharging into the public sewer in the High-road, Kilburn, and the other group, comprising seven houses, discharging into the public sewer in Eresby-road. The plan was approved, and an order was made by the local authority for the scheme to be carried out. In executing the work, however, the builder departed from the plan in several particulars. He connected the drains of two of the houses of the second group with the combined drain of the first group, and he also connected with that drain the drain from a workshop at the rear of one of the houses and the gullies from an adjoining passage. There were also some minor deviations from the plan. Thus, by the builder's wrongful act, this combined drain became a "sewer." In 1912, the council having discovered the true state of affairs, gave the builder notice, under sec. 83 of the Metropolis Management Act, 1855, to alter the combined drain so as to make it conform to the approved plan, and on his default they themselves made the alterations. In the meantime the house under which the combined drain ran had been sold to a purchaser who had had no notice of the builder's wrongful acts. A nuisance having arisen in the drain, the question arose whether, notwithstanding the alterations, it was still a "sewer" vested in the council, or whether it had, on the completion of the alterations, become a "drain" so as to render the owner liable to remedy the nuisance. The Divisional Court, by a majority, decided in favour of the latter view. Mr. Justice Pickford, the dissenting Judge, was unable to distinguish the case, in principle, from the Shoreditch case, and pointed out that, although the authority of that case had been weakened by subsequent decisions and judicial dicta, it had never been overruled. The other learned Judges, however, laid stress upon the fact that the Shoreditch decision was based, to a large extent, upon the absence of any statutory provision for divesting a sewer after it has once become vested in the local authority—a consideration the force of which has been somewhat lessened by subsequent cases—and upon the further fact that sec. 83 of the Metropolis Management Act, 1855, was not brought to the notice of the Court in the Shoreditch case. Therefore, while not in terms dissenting from the Shoreditch decision, they considered that it had no application to the present case.

Whatever may be said for or against the conclusion from a strictly legal standpoint, municipal engineers will not, we think, be disposed to quarrel with it, but will rather welcome it as a step in the right direction.

**Aëration
as an Aid in
Sewage
Purification.**

In dealing with this subject last year (THE SURVEYOR, July 18, 1913, p. 87), we referred to some experiments which had been carried out at the Lawrence Experiment Station of the Massachusetts State Board of Health, and pointed out that it was very desirable to have some information with regard to the cost of aëration on the lines adopted in the experiments. Further details have now been published in a recent issue of *Engineering Record*, from which it appears that the cost for power alone for five hours' aëration is estimated at about 8s. 4d. per 1,000,000 gallons of sewage, or about £150 per annum. From the results obtained with experimental filters it was found that the aërated

sewage could be treated satisfactorily at five times the rate of sewage which was not aërated—an important difference. The sewage was aërated in a tank fitted with vertical slate slabs arranged 1 in. apart. As the result of the aëration a growth formed on the slabs, and, when the clarified sewage was drawn off, this growth, largely consisting of suspended matters, and the sludge was easily separated from the liquid at the bottom of the tank. In addition to the increase in the volume of sewage which was treated upon filters when aërated, it is stated that the sludge was practically odourless, and had lost all offensive characteristics common to sewage sludge.

The process which takes place when sewage is aërated in the manner described is apparently the same as that which occurs when sewage is discharged untreated into well-oxygenated river water, with the important difference that in the case of the river the suspended solids are deposited on the bed of the river, and not removed as in the case of the aërating tanks. Further, the dissolved oxygen taken up by the sewage in the river water is only replaced at a very slow rate by natural process from the air, while in the case of the tanks it is replaced artificially at a rapid rate, and the extra quantity of oxygen required for the deposits of sludge on the bed of the river is not required in the artificial process, in which the sludge is regularly removed. For these reasons it is hardly correct to describe it as a "new method" of sewage treatment, as suggested by our contemporary, *Engineering Record*. It is more in the nature of a scientific application of a natural method; but it certainly deserves careful consideration, and should now be tried on a larger scale under ordinary working conditions, careful observations being made as to the cost of operation, and particularly as to whether the very large increase in the possible rates of filtration, which were observed in the experiments, can be maintained in actual practice. In any case great credit is due to the staff of the Massachusetts State Board of Health for the results which have been obtained so far, and particularly for taking up the difficult problem of artificial aëration as an aid in sewage purification on lines which appear to afford much greater prospects of success than any of the attempts which have been made in the past.

**The Metropolitan
Paving
Committee's
Report.**

Although there was no general change of importance in the nature of the pavings used in London during the twelve months covered by the eleventh annual report of the Metropolitan Paving Committee, the developments recorded are of much interest, and the kinds of pavements used in the various boroughs indicate in a very definite manner the relations between the nature of the traffic and the character of the pavings best suited to the different conditions. Creosoted softwood continues to be the material chiefly employed in the repaving of important thoroughfares, and the extension of the use of tar-bound and asphalt-bound crusts is mainly confined to roads carrying traffic ranging from "light" to "considerable." Among other points of general importance, the savings effected by the tar-spraying of water-bound, broken-stone crusts especially demand attention, and the advantage of increasing the thicknesses of concrete foundations is a matter which is still engaging the attention of the committee. Individual boroughs continue to afford examples of new paving work carried out with materials the use of which is now definitely associated with particular areas. Hardwood blocks have been put down in Hampstead (Kilburn) and in Holborn, sectional jarrah

blocks being employed in both cases. Compressed asphalt has been laid in the areas in which it has already been largely used; the area of this material put down in the City during the year being about equal to that paved with creosoted deal. In St. Marylebone, on the other hand, the only material used was creosoted yellow deal, and creosoted Archangel deal similarly held the field in Wandsworth. In Holborn a considerable area has been paved with 5-in. by 4-in. granite setts, laid in pitch grout, while in Hammersmith bituminous macadam has been employed in thoroughfares with considerable traffic. Fuller information will be found on another page, and a study of the information there given will disclose many interesting and important facts. It may be remarked that as regards really important traffic routes the granite sett pavement in its modern form is the only important competitor for a place in the first rank with creosoted softwood and compressed asphalt; but asphalt-bound macadam is also worth watching in this connection.

The Press and Municipal Engineering.

In giving evidence before the Dominions Royal Commission on the subject of postal and telegraphic communication, Mr. William Francis Lathlain, president of the Perth Chamber of Commerce, protested against what he considered the lack of discrimination displayed in the selection of the news items cabled from this country to the Commonwealth. He instanced a cable from London stating that a famous jockey had a sore throat, another to say that he had recovered, while later a cable was despatched telling of the death of a dog, with a further message stating that it had been poisoned and was worth some £2,000. Unfortunately, this penchant of the Press towards the circulation of news of no importance is not confined to cabled items. Municipal engineering is a case in point. The columns of the great dailies may be searched in vain for any mention of municipal engineering activities, unless a lord or a lord mayor, or some such dignitary, attends a function and says a few words. What really matters seems to have no concern for the Press. The fact that some millions of pounds are expended annually in works of utility for the welfare of the nation dwindles to unimportance when considered side by side with, say, a boy scouts' rally, a contest at the National Sporting Club, an unsavoury trial at the Law Courts, or a sordid murder. Then the Press is glutted with detail, the wires hum incessantly, and the tape-machines unwind their rolls at top speed. It is a wondrous anomaly.

The Weybridge Surveyor's Plain Talk.

Public authorities, in common with individuals, are generally sensitive about their reputation, and candid speech is little to their liking. All the same, outspoken criticism has its merits, and not the least of these merits is the consciousness it arouses in the minds of councillors that when it is prompted by a sense of duty its very candour leans to virtue's side. Even a municipal officer may upon occasion overstep the strict line of etiquette and do a good stroke of business for the public by a little plain speaking. Recently the members of the Weybridge Urban District Council were somewhat taken aback when, it having been reported that negotiations for the leasing of a house belonging to them had fallen through, the surveyor, Mr. J. S. Crawshaw, bluntly told them he considered it a scandal for the council, as property owners, to keep the place in such a condition. "We

have condemned property," he proceeded to say, "that is in better form than this. That is the only way to speak to the council. I am quite in agreement with these people who advocate throwing the place up. It is not fair to submit it to be let in such a condition." It will be seen that Mr. Crawshaw did not mince matters. It is pretty certain, however, that his blunt intervention will do good in the long run, and he is to be congratulated upon having the courage of his convictions by giving it to the council "hot," as one of the members expressed it. The ideals of ordinary councillors in the matter of housing are notoriously open to a good deal of improvement, and this will be promoted—not hindered—by the conviction that their officers will refuse to follow them slavishly when the law is strained to breaking point.

The Study of Foreign Works.

The difficulty which confronts the English engineer in studying the works and scientific progress in foreign countries is considerable. It is true that those who are sufficiently learned may possibly be able to study the engineering literature of such countries as France, Germany, Italy, or Spain; but, speaking generally, there are few engineers who have knowledge of all these languages, while there are many who would find it very difficult to understand scientific writings in any one of them. But when we come to countries such as Hungary, Russia, China, Japan and others as far afield, it is practically impossible for any satisfactory communication to be established, except by means of an interpreter. Thus, if it were possible to find a language which could be learned easily within a short time and used universally, the advantages would be very great. It would, in particular, affect manufacturers and the technical Press, while the ordinary engineer would have a chance of studying the writings of foreign workers. Whether this is practically possible or not will be discussed at a meeting of the Society of Engineers to be held at the Institution of Electrical Engineers next Monday evening, when the author of a paper entitled "Esperanto—an International Language for Engineers" will produce a number of facts showing the great importance of his subject.

* * *

Town Planning Regulations.

In another column will be found a summary of the new Town Planning Procedure Regulations recently issued by the Local Government Board. A perusal of the changes which have been effected shows that many of the criticisms which have been made with regard to the former regulations were justified. Four years' working of the Act has sufficed to convince the board that some simplification of procedure was necessary—particularly in regard to matters to be done prior to an application for authority to prepare the scheme. It must be observed that the new regulations refer only to the preparation of schemes by local authorities, but there are foreshadowed additional regulations which will apply to the adoption by local authorities of schemes proposed by owners. The alterations which will be most appreciated are probably those which go to reduce the work which has hitherto been necessary in the preparation of maps. We concur in the view expressed by the board in their circular letter that the regulations, as altered, will suffice to retain all necessary safeguards, while reducing to a considerable extent the work imposed on local authorities and their officers by the earlier regulations, and that they will go far to remove some of the difficulties that have hitherto been experienced.

Why Tar-Slag Binds Well.

By REGINALD RYVES, M. CONS. L., ASSOC. M. INST. C. E.

Two samples of tarred slag, and a letter signed "Cretaceous," reproduced below, have been submitted to the writer as the basis of a note on the question why slag of a suitable quality makes better tar-bound road crusts than do certain other kinds of road metal.

LETTER BY "CRETACEOUS."

"Much has been written during the past few years about slag. The views generally given agree with the following paragraphs taken from an article published in 1905 by a well-known authority:—

"Good slag should be hard and close-grained, free from honeycomb or vitreous matter. . . ."

"Dealing with tar-macadam, the writer proceeds as follows:—

"Granite and syenite do not answer, because tar will not soak into them. . . ."

"The first thing to be done is to find a material which is hard enough to stand the wear and tear of traffic, but not too hard to absorb tar. Furnace slag has already been suggested as a useful material for road making, and it will also be found reliable in combination with tar if carefully picked by hand from ironworks, making a good class of residual slag."

"I feel sure I am right in stating that we all agree that slag is superior to granites, syenites, limestones, &c., when laid as tar-macadam."

"Having broken scores of pieces of tarred slag with a hammer and chisel, I have failed to find that the material is capable of absorbing tar. I therefore venture to suggest that we should reconsider our theories in connection with slag and endeavour to find the actual properties which enable the material successfully to combine with tar."

"For ordinary purposes slag should be free from honeycomb, but for tar-macadam I have found that a 'pitted' slag, if hard, gives excellent results."

CHEMICAL COMBINATION.

There are possibly some obscure reasons for the relatively good adhesion of the film of tar to the surface of the piece of slag, and it seems likely that one of these is that a slight chemical reaction takes place between constituents of the tar and the materials at the surface of the slag, this action resulting in the formation of a cementing material, the presence of which prevents the formation of smooth surfaces of separation between the tar and the slag. Further consideration of this point may be left to the chemist and the petrologist; but it may be pointed out that slag is a freshly-formed material, whereas the rocks from which other road metal is made are very old, and the materials of which they are formed are usually less ready to enter into chemical combinations. It may further be suggested that oxidation of iron compounds is often taking place to some extent on the surfaces of pieces of slag, and that, even if there be no reaction with the tar, the surface of the slag is thereby rendered somewhat more likely to provide a good grip for the sticky film. Chemists might also be asked to give an opinion as to whether a continuance of slight chemical change within the piece of slag would result in the absorption of gases, oxygen, for instance, and the resulting formation of a partial vacuum. Should such action take place within an air-tight film, that film would be held to the slag by atmospheric pressure.

SOME PLAINER REASONS.

There are four reasons why, from the known and visible properties of the slag used with success in road crusts, this material should be better for the purpose than certain other materials, such as granite, syenite, and limestone, mentioned by "Cretaceous." As regards limestone, it seems that the binding properties of tar-limestone crusts are very good, and the material has been used with success. Tar-sandstone crusts have also given satisfaction, and the superiority of slag in tar-bound crusts is, in comparison with these stones, mainly, if not wholly, due to its better wearing qualities. What properties, then, are shared by slags, limestones, and sandstones, and likely to tend to the binding of the tar with the metal? Inspection of pieces of these materials, broken for road

metal, shows that each possesses a kind of surface roughness which is not characteristic of pieces of road metal from the volcanic and plutonic rocks. A comparison of limestone with sandstone suggests, though of course it does not prove, that the small-scale roughness is an important factor. Many sandstones have a small-scale roughness which, it may well be believed, is likely to provide the tar film with a better grip than that afforded by more deeply indented surfaces, the projections of which consist of crystals with very smooth faces. The smaller the scale of the roughness down to some reasonable limit, the more likely is it that the surface tenacity of the tar will not be broken by an individual projection, and that, on cooling, the film of tar will have a continuous grip of the stone.

In view of what appears above under the heading "Chemical Combination," it may also be remarked that many sandstones are ferruginous. Some limestones present a fracture with a fairly large-scale roughness, but when they belong to the class called "compact," as distinguished from "crystalline" limestones, the surfaces of the projections and hollows are usually slightly rough, compared with the corresponding surfaces of igneous rocks; and it is the "compact" limestones which make the best tar-limestone crusts. The slag used for road crusts has usually a very consistent small-scale roughness.

Small-scale roughness is, then, one of the factors which may account for the superior bond in limestone, sandstone, and slag crusts with tar binders, when these materials are compared with granites, syenites, and other hard stones.

THE PROPORTION OF CLAY.

It is now known that clay forms an emulsion or pasty material in combination with tar and water.

In districts where little or no clay comes on to the roads from the land, the proportion of clay in the mud upon the road depends mainly or wholly upon its proportion in the road metal and binder, or, in the case of a tar-bound road, upon its proportion in the metal and such major binder as may have been used. Even in districts where a good deal of clay is brought on to the roads by the traffic, the effect of the clay which is ground up in the process of size diminution of surface stones of the road crust is likely to be more prejudicial to the crust than is the clay which makes a batter with the tar on the surface. Aided by the penetration of surface water, the closely mixed clay and tar of the top layer will disintegrate the crust much more effectively than will the batter on the surface, which batter does not penetrate much, except when it is quite wet. But when it is stiffening to plastic mud, the clay and tar below it may still be quite damp.

Now, it does not seem that clayey limestones have made good tar-bound crusts, though if such crusts have given satisfaction the fact should be recorded. Compact limestone is often very nearly pure carbonate of lime, the proportion of clayey matter being very small. Sandstones usually contain very little clayey matter. The cementing material is sometimes carbonates, and often oxides of iron, and even when clayey matter is present it may be the case that in the presence of a fair proportion of oxides of iron the tendency to form a batter with tar is much reduced. This point could be cleared up in a few days in a laboratory. As regards slag, the usual composition, with a high percentage of lime, is not such as tends to the production of characteristically clayey matter in the process of relatively rapid disintegration. It seems, then, that the absence of any considerable proportion of clayey matter in the detritus is a factor partly accounting for the successful use of these three materials in tar-bound crusts.

MINUTE PITTING OF THE SURFACE.

In his letter "Cretaceous" states that pitted slag, if hard, gives good results. Well-defined pitting may easily be believed to provide anchorage for the tar film, and it may be suggested that very minute pitting serves the same purpose if the materials are mixed at a sufficiently high temperature so that the tar may penetrate the small pores. In this respect

limestones are by no means all alike, but many "compact" limestones have surfaces in which the bottoms of the depressions are fairly deep, and the tar film may thus be rooted in the stone. The same is true of some sandstones, in the surfaces of which the hollows terminate in minute crevices. These are not of the nature of pores, in the usual sense of that term, but they may act in the same way. Reference has already been made to small-scale roughness, the further idea now introduced being that additional grip is provided when the sides of the depressions are steep, and especially when the tendency to pitting or to the development of crevices is dominant, and the development of slanting surfaces is suppressed. These slanting, and often very smooth, surfaces are sometimes a marked feature of the fractures of igneous rocks. These remarks apply only to the nature of the surface, not to the shape of the stone itself, though it may be noted in passing that diversity of size and shape of the pieces of road metal with which the crusts are made is a factor of some importance, and not without its bearing upon the results obtained with slag. Surface pitting, or steep-sided depressions may therefore be regarded as the third factor.

Having considered the effects of clayey matter in the detritus, and the qualities tending to provide surface grip which will prevent slithering action, we have next to consider whether there is any external force, the application of which to the film tends to hold it firmly to the stone.

ATMOSPHERIC PRESSURE.

It is here suggested that atmospheric pressure is exerted to hold the tar film to the stone, either permanently, or temporarily during the first part of the life of the crust. It is further suggested that this pressure is greater in the case of materials such as slag, sandstone, and limestone than it is when the road metal consists of hard, igneous rocks. The question whether, in the case of slag, such pressure may be exerted as a result of chemical action has been raised, and has been set aside for the consideration of chemists and petrologists. There are, however, other ways in which such a pressure may conceivably be caused, and there is some reason to suppose that, if the action takes place in the manner now to be suggested, it is stronger in the case of tar-coated slag, limestone, and sandstone than it is when igneous rocks are similarly coated.

The tarry matrix of a well-made tar-bound road crust is probably airtight up to some limit of pressure, and for the sake of argument we will assume that it is. If, therefore, the pressure of the air inside the stone be less than that of the air outside the stone, the difference in pressure helps to hold the film against the stone. Let us consider whether this difference of pressure is likely to be greater in the case of slag, limestone and sandstone than it is when hard igneous road metal or dense quartzite is employed.

Taking up the first table of absorption tests that comes to hand (United States Office of Public Roads), we look up, first, the maximum absorption in each class, averages not being given, and the maximum in each case being a figure of some significance, since the porous kinds of road metal are often deliberately chosen, each from its class, for the making of tar-macadam road crusts. The following are the maximum absorptions of water in pounds per cubic foot, the number of specimens tested being given in brackets:—

Sandstone (340)	11.60
Dolomite (183)	9.40
Slag (55)	4.40
Syenite (27)	4.21
Quartzite (90)	2.95
Granite (219)	2.77
Diabase (217)	2.73
Marble (37)	2.19
Gneiss (152)	1.24
Diorite (72)	1.08

The order of the materials in this table is not far from the order of merit as regards the making of tar-bound crusts, assuming that the sandstone crust is for light traffic, and the limestone and slag crusts for medium and heavy traffic respectively. The following figures (Greenwell and Elsdon) may also be cited: Basalts absorb, on the average, about 0.3 per cent of their weight; granites from 0.1 to 0.8; sandstones vary from 2.7 to 8.5; limestones vary from 4.0 to 12.0. The average absorption of sandstone is about 5 per cent. In this connection attention may again be directed to

the point made by "Cretaceous" as to the value of pitted slag, since a pitted or honeycombed surface in a broken piece points to a large proportion of voids within it.

Now, road metal before being tarred is usually heated, and, assuming that the tar film is impervious to air, at any rate up to some limit of pressure, let us consider what air pressure will be developed as the result of the cooling of the air within the stone. For the purpose of the argument any temperature may be taken as that of the stone—say, 180 deg. Cent. In the road crust the temperature on a hot day will not exceed about 50 deg. Cent. (122 deg. Fahr.), and, the volume being constant, we have:—

$$\frac{P_1}{T_1} = \frac{P_2}{T_2}$$

$$\text{or } P_2 = \frac{P_1 T_2}{T_1}$$

The absolute temperature, $T_1 = 273 + 180 = 453^\circ$

The absolute temperature, $T_2 = 273 + 5 = 323^\circ$

$P_1 = 14.7$ lb. per sq. in.

and $P_2 = \frac{14.7 \times 323}{453} = 10.5$ lb. per sq. in.

There is therefore a theoretical preliminary load of 12 lb. per square inch, whatever be the volume of the voids in the stone, and experience suggests that the effect is likely to be greater with the larger volume of voids than it is with the smaller volume.

May it not be the case that when the volume of voids is small, air, or oxygen, may pass through the film while it is cooling, and to an extent sufficient to bring the pressure nearly up to that of the atmosphere, while, when the volume of voids is large, in proportion, the passage of air through the film ceases, while the pressure inside the stone is still considerably below that of the atmosphere? A stone with a large proportion of voids will be one with a relatively porous surface; but if it is the tar film which is the chief obstacle to the passage of the air the total resistance before the film sets will be nearly the same in both cases. The greater porosity of the surface of the stone with a large proportion of voids might, on the other hand, be a favourable factor, allowing of the more rapid escape of the heated air, and a consequent greater reduction of pressure on cooling. This, as a factor against the use of the denser kinds of stone, would point to an advantage in extending the period of heating these, and in allowing the stone to remain for some time at its maximum temperature before mixing it with the tar.

As regards possible effects due to the penetration of the stone by vapours given off by the tar, no direct ultimate decrease of pressure can, it would seem, be attributed to this; but it may be suggested that by temporarily increasing the pressure near the surface of the less porous stone, these vapours might hold back the tar film until it had set too hard to get an effective grip of the stone. This consideration is possibly of much importance.

TEMPORARY EFFECTS OF ATMOSPHERIC PRESSURE.

Let us now suppose that it can be shown that a tar film cannot permanently, or for any considerable period, prevent the air pressure inside the stone from becoming equal to that outside it. It by no means follows that the effects which have been suggested as possibly taking place would be without value. If it be granted that the facts point to the development of a temporary suck towards the inside of the stone, it must be admitted that this would tend to give the tar film a good grip of the surface. While still hot the tar would tend to flow into the pores or crevices, and if the pressure were maintained long enough, the stiffer but still plastic film would be pressed down firmly into the roots so formed and against the projections. It is here definitely contended that such effects do take place, and that they are very important, and it is further suggested that this points to the advisability of heating the stone to as high a temperature as may be reached without injury to it, or to the quality of the tar. When the latter limit is the lower, it might be advantageous to make the stone a little hotter, spread it on cooling plates kept at the lower temperature, and apply the tar as soon as the temperature had fallen to the safe limit. This would give the maximum safe difference in pressure as the stone cooled. The best rate of cooling could only be found by direct experiments, and these experiments would show whether it is better to lay the materials hot or to let them cool first.

As regards the depth to which the tar film pene-

trates, it is obvious that a rooting effect would not always be visible to the naked eye. A microscopical examination of suitably prepared specimens would, however, show whether the film penetrates more deeply when the stone is heated, and coated when hot, and the microscope would also show whether the penetration stopped short at the bottom of pits and crevices or whether it went beyond into well-defined pores or into cavities reached by pores of smaller diameter in each case than the cavity itself. In the case of slag specimens it is important to remember that there is sometimes discoloration near the surface due to the formation of red oxide of iron, and this must not be confused with discoloration caused by the penetration of the tar or of some of its lighter constituents.

The writer has put forward in this article considerations of three classes. First, there are certain indisputable facts, important deductions from which are made with confidence; secondly, certain other facts can be less definitely applied, but form the basis for what is, it is submitted, sound theory; and, thirdly, there are considerations, possibly of much significance, the application of which can only be made subject to the opinions of petrologists, chemists and physicists. Criticism is invited; but if critics do not agree with the writer as to the results of any of the conditions referred to they should, it may be suggested, say what in their opinion actually does happen as the result of those conditions. If, on the other hand, it be contended that any of the writer's conclusions as to the manner in which the effects take place have already been accepted, or stated in a definite manner, he would be glad to be given the references to the publication of such statements. It is understood, of course, that the statement that slag absorbs the tar, or "oil of tar," has often been made, and the present article is to some extent an attempt to indicate the relation of this idea to the facts.

ROADS IMPROVEMENT ASSOCIATION.

Mr. Robert Todd occupied the chair at the February meeting of the council of the Roads Improvement Association. Correspondence concerning the association's campaign for facilities to be provided for the special training of highway engineers was received, and it was reported that Mr. H. Percy Boulnois (vice-chairman) had been invited by the president of the Institution of Municipal and County Engineers to read a paper on this subject at the conference of the institution at Cheltenham in July next, at which it is understood Sir George Gibb will deliver the opening address.

Mr. H. Percy Boulnois, Captain H. H. P. Deasy and Mr. W. H. Thompson were appointed to represent the Roads Improvement Association at the sectional conferences convened by the Local Government Board upon arterial road communication in the Metropolis.

Further consideration was given to clause 23 in the Middlesex County Council (Great West Road) Bill, in which power is sought to levy a special tax upon public service traffic using the new road, and a resolution protesting most emphatically against the introduction of this principle was passed. It was resolved that the clause be opposed, and that witnesses on behalf of the association attend before the Parliamentary Committees to support the association's objections.

Sewage Pumping Plant.—The Bingley (Yorks) Urban District Council have placed their order for pumping plant, including two pneumatic ejectors, for lifting sludge, with Messrs. Jones & Attwood, Limited, of Stourbridge.

Motor Vehicles and Damage to Roads.—In reply to questions in the House of Commons recently Mr. Herbert Samuel, the president of the Local Government Board, stated that the length of motor cars was not restricted by any statute or regulation. The weight of a motor car was, by virtue of the Motor Car Acts and the Heavy Motor Car Order, 1904, limited to 5 tons unladen. The weight of a loaded car must not exceed 8 tons on any axle, or a total of 12 tons on all the axles. The width of a motor car weighing, unladen, 3 tons or more was, by the same Order, limited to 7 ft. 6 in.; other motor cars must not exceed in width 7 ft. 2 in. Complaints had been made to the Local Government Board as to the damage to roads caused by heavy motor-car traffic, and the subject was at present engaging their attention.

TOWN PLANNING PROCEDURE.

LOCAL GOVERNMENT BOARD REGULATIONS AMENDED.

The Town Planning Procedure Regulations prescribed by the Local Government Board under sec. 56 of the Housing, Town Planning, &c., Act, 1909, have now been in force nearly four years, and the experience gained in that period has led the board to the conclusion that the regulations may properly be modified in certain respects so as to simplify, to some extent, the procedure required to be followed, especially in regard to the procedure prior to an application to the board for authority to prepare a town planning scheme. In connection with the matter, the board have given careful consideration to the representations which have been made to them on the subject by local authorities and other bodies.

The amended regulations which have been issued apply only to the preparation of schemes by local authorities, and the existing regulations will, for the present, remain in force in regard to the adoption by local authorities of schemes proposed by owners. The board propose at an early date to prescribe an amended code in regard to the latter class of schemes.

The principal alterations that have been made are as follows:—

(1) The reduction from two months to four weeks of the period required to elapse between the service of notices of intention to prepare a scheme and the making of an application to the board for authority to prepare the scheme.

(2) The omission of all requirements as to service of notices on occupiers of lands.

(3) A variation of the requirement that, where land outside the district of the promoting local authority is proposed to be included in a scheme, a complete copy of map No. 1, on the scale of 25'34" in. to the mile, shall be supplied to the outside local authority. A map on the 6-in. scale is substituted, coupled with a right of the outside local authority to ask also for a map on the larger scale confined to the land in their district.

(4) An alternative to the meeting of owners and other persons interested at the first stage of the procedure is provided for by allowing the local authority to make a formal offer to confer with such persons if they so desire.

(5) It is made clear that map No. 1 may be utilised for the purposes of map No. 2, without the dispensation of the board which is at present required. Thus, map No. 1 can be converted into map No. 2 by the addition of certain further particulars indicated in the regulations.

(6) The requirement that map No. 2 shall show the lines and widths of principal roads that may be contemplated, the proposed open spaces and certain other particulars, is omitted.

(7) Maps Nos. 3 and 6 required by the present regulations will no longer be required to be supplied by the local authority.

(8) Notice of authority having been given to prepare a scheme may be given by advertisement only.

(9) An option is given in regard to the form in which maps Nos. 1 and 2 are to be submitted to the board.

The regulations as altered will, the board think, suffice to retain all necessary safeguards, while reducing to a considerable extent the work imposed on local authorities and their officers by the earlier regulations, and should go far to remove any difficulties that have hitherto been experienced.

Pudlo for School Buildings.—It is especially essential that accommodation for children should be damp and rain proof. Many architects, to ensure dry schools, are specifying a waterproofing compound for use in the cement work, which is particularly liable to let the damp through. We learn that the Bilton council schools are being built with Pudlo incorporated in the cement work.

Cheap Rural Cottages.—At a meeting at Crewe recently of the North-western Centre of the Sanitary Inspectors' Association, Mr. Storey, of Nantwich, said that on Sir Delves Broughton's estate at Doddington the rural housing problem had been solved from the agricultural labourer's point of view. They had cottages there with three good bedrooms, a large living-room, with well-ventilated and well-lighted pantry, and large scullery with boiler, and the rent was £7 10s. per annum, plus rates. That did not meet the cost, and the landlord had to stand something and the tenant farmer something.

Institution of Municipal and County Engineers.

THE MANCHESTER MEETING.

THE INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS AT MANCHESTER.

(Group photographed on the steps of the town hall.)

Members of the Institution of Municipal and County Engineers spent a pleasant and what was generally acknowledged to be an entirely profitable time at Manchester on Friday and Saturday last. Even for a district embracing many of the greatest cities and towns in the country the gathering was something of a record one; that it was to prove a success was evident from the moment when the members received the customary official welcome. A North-Western District meeting, in the course of which complaint was made of the infrequency of annual meetings in the North of England and the Paignton resolution with respect to the Journal came in for some debate, was first held, the institution meeting following. This opened with a description, by Mr. T. de Courcy Meade, the city surveyor, of some of the municipal works of Manchester, Councillor Swarbrick afterwards reading a paper on the subject of the future government of great cities. Interest naturally centred on Mr. Meade's valuable contribution to the proceedings, and the ensuing discussion, as will be seen from the report which follows, had reference chiefly to the mass of information he presented with regard to the extensive scheme of main drainage which he is at present engaged in carrying out. Of the hospitality accorded to the members during their two-days' stay in Manchester too much cannot be said; it was, needless to say, generous in its character, and the arrangements in every other respect were all that could be desired. The list of acceptances included Messrs. O. P. Abbott (Hindley), G. H. Bayley (Manchester), J. S. Brodie (Blackpool), W. E. Beacham (Leek), Wm. Bentley (Bolton), E. W. Booth (Manchester), H. Percy Boulnois (London), F. L. Boydell (Leigh), A. W. Bradley (St. Helens), S. B. Edwards (Liverpool), H. E. Brown (Altrincham), C. Brownridge (Birkenhead), S. E. Burgess (Middlesbrough), W. Burn (Sutton-in-Ashfield), T. Burrows (Lathom), R. Burslam (Congleton), A. H. Campbell (Edinburgh), J. Cartwright (Bury), A. O. Cole (Nelson), I. Cunliffe (West Didsbury), T. A. Clare (Leigh), W. Clough (Audenshaw), F. W. Dean (West Didsbury), J. W. Cockrill (Great Yarmouth), president, H. Collins (Norwich), F. J. K. Conway (Liverpool), A. E. Coupe (Fulwood), W. Debney (Birkenhead), J. H. Drew (Wath-upon-Dearne), D. J. Driver (Marple), F. I. Dixon (Ashton-under-Lyne), A. Dodgeon (Clayton-le-Moors), R. H. Dorman (Armagh), W. H. Else (Bacup), J. England (Wrexham), H. Entwistle (Swinton), J. P. Evans (Wrexham), J. W. Foster (Bradford), J. M. Fowler (Manchester), D. Furness (Manchester), F. R. Gibbins (Manchester), H. Goodfellow (Southport), A. T. Gooseman (Wigan), A. D. Greatorex (West Bromwich), J. Gregson (Padiham), W. G. Harbottle (Manchester), N. Hardie (Eccles), G. A. Hart (Leeds), T. H. Hartley (Colne), T. W. A. Hayward (Battersea), T. Henry (Retford), J. W. Hipwood (Morecambe), E. Hodgkiss (Walkden), R. B. Holden (Oldham),

H. T. Hughes (Stockport), F. Hutton (Ashton-upon-Mersey), P. Holt (Rawtenstall), W. Holt (Sale), J. Johnson (Rawtenstall), R. R. Jones (Milnrow), W. Jones (Colwyn Bay), R. W. Johnson (Birkenhead), J. D. Kennedy (Retford), C. G. Kent (Didsbury), L. Kenyon (Tottington), G. Kershaw (Old Trafford), W. T. Lancashire (Leeds), C. Lund (Cleckheaton), F. Massie (Wakefield), E. L. Morgan (Bolton), H. Mattinson (Manchester), B. Milnes (Birkenhead), J. Mitchell (Birkdale), W. Moss (West Didsbury), S. H. Morgan (Prestwich), A. H. Mountain (Patricroft), J. D. Nuttall (Heywood), F. W. Mozley (Nelson), J. Openshaw (Salford), P. H. Palmer (Hastings), S. S. Platt (Rochdale), M. A. Piercy (Warrington), E. Parker (Old Trafford), E. Picker (Beverley), T. S. Picton (Eccles), E. Pilling (Lytham), Wilfred Platt (Manchester), E. Prescott (Leigh), A. J. Price (Lytham), A. J. Price (Eccles), W. H. Price (Leeds), W. T. Redford (Manchester), J. L. Redfern (Gillingham), C. V. Richards (Manchester), C. Rivers (Harrigate), A. Rothera (Liversedge), J. Rowbottom (Ashton-under-Lyne), M. Sellars (Dundalk), J. A. Settle (Bury), J. S. Shaw (Wrexham), H. Shillington (Lurgan), J. S. Sinclair (Widnes), A. P. Statham (Salford), W. Stubbs (Blackburn), H. C. Swindells (West Didsbury), J. H. Walters (Congleton), C. Watson (Ambleside), J. P. Wakeford (Wakefield), W. Welburn (Middleton), S. Whitehead (Nelson), E. Wickenden (Manchester), C. F. Wike (Sheffield), G. H. Wild (Littleborough), J. Wilding (Runcorn), F. Wilkinson (Prestatyn), J. P. Wilkinson (Manchester), M. H. Wilkinson (Leyland), J. W. Wile (Manchester), J. Wilson (Bacup), W. E. Wood (Curch), H. Wood (Norwich), R. H. Winterbottom (Irlam), E. Worrall (Old Trafford), H. Yelland (Bury) and T. Cole (secretary). Among the visitors were Alderman Thompson (Patricroft), Messrs. G. S. Coleman (Didsbury), J. Cooke (Manchester), J. Coppock (Wakefield), Davies (Eccles), D. Denton (Manchester), R. Evans (Eccles), T. Henderson (Manchester), W. Hill (Eccles), H. T. Hughes (Chapel-en-le-Frith), J. Leith (Chiswick), F. J. A. Matthews (Eccles), W. Pickstone (Bury), W. Pritchard (Liverpool), J. T. Royle (Irlam), M. J. Swarbrick (Manchester), T. Lee Syms (Tyldesley), A. E. Wheatley (Manchester), W. Whitehead (Altrincham), G. F. Wild (Smithy Bridge), J. Wilkinson (Manchester), H. C. Williams (Wrexham), R. Wormell (Bury), and E. W. B. Wright (Manchester).

In the absence of the Lord Mayor (Alderman McCabe), the members were welcomed on behalf of the corporation by Alderman HARROP, chairman of the Parks Committee, who expressed a cordial hope that the gathering would result beneficially, both to Manchester and to the cities and towns which the visitors represented.

A short acknowledgment was made by the PRESIDENT (Mr. J. W. Cockrill).

In the course of a North-Western District meeting.

which followed, Mr. W. STUBBS (Blackburn) drew attention to the fact that an annual meeting had not been held in that district since 1898, and suggested that, in fairness to their part of the country, one of the members of the North-Western District should have been nominated for election as a vice-president instead of another Southern member. A speaker, after pointing out that population justified the idea which had been put forward, expressed the view that the annual meetings should be held alternately in the North and South.

The PRESIDENT said that, unfortunately, the proceedings in the matter referred to had proceeded too far to permit of any alteration now being made, and the matter dropped.

THE JOURNAL.

Some applause greeted the reading by the hon. district secretary of the resolution with reference to

MR. T. DE COURCY MEADE, M.INST.C.E.,
City Surveyor of Manchester.

[Mr. Meade is an Irishman, was born in November, 1853, educated at the Bandon Grammar School, and was afterwards articled to the county surveyor of Cork. Subsequently he was engaged under the late W. H. Dorman, M.INST.C.E., in the construction of the Cork and Skibbereen Railway, and then went to the Guildhall, London, where he was under the late Colonel Haywood, engineer to the City Corporation. After five or six years he was elected engineer to the then Hornsey Local Board. He established the Highgate Museum of Sanitary Appliances, which was opened by the then Lord Mayor, Sir Stuart Knill, Bart. A feature of that institution was the practical testing of materials used by the municipal engineer. He designed the machine still in use for testing road material. The appointment at Hornsey he held for 13 years. He was allowed private practice whilst at Hornsey, and was consulted by many of the large towns in England, Scotland, the South of France, Italy, Switzerland, and elsewhere. He was appointed city surveyor of Manchester in September, 1894. Mr. Meade is a member of the Institution of Civil Engineers, the Institution of Mechanical Engineers, and the Concrete Institute, and a Past President of the Institution of Municipal and County Engineers.]

the Journal which was passed at the recent meeting at Paignton.

Mr. A. J. PRICE (Lytham) recalled that at the annual meeting at Great Yarmouth he spoke somewhat strongly against the "Proceedings" being altered, and even now he could not say he was in love with the present production. But, having gone so far, his feeling was that they ought to continue with it, at any rate until the next annual meeting, when the whole matter, he proposed, should be considered.

Mr. T. S. PICTON seconded.

Mr. H. PERCY BOULNOIS (Westminster) asked how the question would be brought up at the annual meeting, and whether it would not be necessary to give notice to rescind the resolution of the Yarmouth meeting. He might be somewhat conservative in his views, but he was filled with regret when he heard of the proposed change, and his feelings were in no wise changed when he saw the first issue of the Journal. His desire was to give expression to his views on the matter, and so long as he had the president's word that that would be made possible at Cheltenham in June next it would be quite sufficient for him.

The PRESIDENT suggested that when the members saw the new volume they would be better able to judge.

Mr. BOULNOIS said it appeared to him that the council rather feared a referendum.

The PRESIDENT said that was not the case.

After some further discussion it was decided that the postcard poll proposed by the Paignton resolution should not be taken, but that the question be deferred to the next annual meeting, as suggested by Mr. Price.

MANCHESTER'S MUNICIPAL WORKS.

The institution meeting which followed the proceedings reported above opened with the presentation by Mr. T. de Courcy Meade, the city surveyor, of a paper which we reproduce fully with this issue in the form of a supplement—descriptive of some of the more important undertakings with which he has been concerned during his connection with Manchester. A number of excellent lantern views added to the interest of the address, which was listened to with the closest attention by all present.

FUTURE GOVERNMENT OF GREAT CITIES.

In a paper on this subject, Councillor J. Swarbrick, M.INST.C.E., a member of the institution, dealt with the manner in which large towns extend their boundaries. We should, no doubt, he said, see provincial cities become larger and more populous than even "Greater Birmingham." But the system of local government which would, in his opinion, be adopted ultimately could not be one of centralisation like that of Birmingham, Glasgow, Liverpool, Manchester, or Leeds, nor was it likely to be a dual system, such as that of London. In the case of cities having a population of more than 500,000, and an area of more than 20 square miles, it would be desirable, whenever future extensions were probable, to constitute one central council for the whole area to deal with certain functions, and district councils to deal with all strictly local matters.

Two schemes of extension were open to Manchester. But no progress whatever could be made until there had been a perfectly frank and candid exchange of opinion between the whole of the parties concerned. The first scheme would include the whole of Salford, Eccles, bounded on the east side by the Mersey; on the west Barton, Worsley, and Prestwich, and the other intervening districts of Failsworth, Droylsden, Audenshaw, and Denton. This would cover an area of 87 square miles against 68 in the case of Greater Birmingham, while the people would approach 1,250,000. This would result in making a Greater Manchester, what he would call the Manchester of Commerce, and would bring under one central council a considerable portion of South-East Lancashire and that part of Cheshire which was largely in touch with Manchester trade and commerce.

The second scheme would comprise the whole of the municipal boroughs within a radius of 8 or 9 miles of Manchester and intervening districts, with the jurisdiction of minor authorities, and an area of 250 square miles, with a population of upwards of 2,000,000, and a rateable value exceeding £10,000,000.

DISCUSSION OF PAPERS.

The PRESIDENT said he would like to congratulate Mr. Meade on carrying out the important engineering works described in the paper, and the Manchester Corporation on having such an officer as Mr. Meade. He moved a vote of thanks to Mr. Meade and Mr. Swarbrick for their papers.

Mr. J. S. BRODIE (Blackpool) seconded the vote of thanks to Mr. Meade for the interesting paper he had prepared. He was rather interested in the diagram showing the interior of storm-water sewers, and had then turned back to the diagram showing the workmen in attitudes of penance for the defective work which was going on. Perhaps Mr. Meade had given the workmen in attitudes of due contrition for the work they were engaged upon. It was stated that proceedings were instituted against some of the contractors, and others who had made default endeavoured to remedy their deficient work. The result, however, was not satisfactory. He would like to ask Mr. Meade if there was anything short of capital punishment at Strangeways inflicted upon these contractors, because otherwise there was a serious miscarriage of justice. Nothing short of capital punishment would adequately meet their offence. The tables in regard to rainfall were most interesting. He had been studying this question for a good number of years, and he had seen nothing so clear as these excellent tables put forward. Surveyors were responsible for the adequate sewerage of their districts. Few of them had the courage to provide sewers of adequate size to cope with the whole of the conditions. Any-

thing which threw light on this subject of localised rainfall, anything which kept them on safe ground, was worthy of their heartiest thanks. The tables of flow of sewage were also very interesting; a large amount of original information was given to them in those tables. They had to thank Mr. Meade very sincerely for his great trouble and courtesy in giving that information; also the Manchester Corporation for their courtesy in putting these facts before them, and keeping them abreast of the information which they had found out themselves. The whole paper seemed to be very suggestive, very informative, and, as might be expected from Mr. Meade, very thorough and straight to the point. These great aggregations of population such as Mr. Swarbrick had referred to had created problems of sanitation which they would easily understand required the very greatest ingenuity in order to deal with them adequately. Great towns such as London, Manchester, Liverpool, Leeds, and towns approaching their size, had created a position of things, where they had great aggregations of population, which taxed to the highest degree the ability and ingenuity of the sanitary engineers. He thought it was not too much to say that, in the twenty years Mr. Meade had been responsible for that great city, Manchester had more than met those difficulties, and solved them in a way which stamped him as a sanitary engineer of the very highest ability. Two things struck one in this paper—viz., the sufficiency of the means taken to meet certain problems, and, secondly, the efficient economy of those means. Anyone could spend money and make a first-class job, and in doing so spend money recklessly. At any rate, many of their ratepayers told them they did spend money recklessly; but there were evidences in this case that the works, while they had been highly efficient, had also been just sufficient economically to accomplish the end in view, and that, after all, was the great point they had to consider as engineers. They had to show their ratepayers that their money was worthily spent; that they got 20s. worth of work for every sovereign, and if they did that there was no grumbling, and everything went satisfactorily. If they made an excellent job at too high a price the result was not satisfactory, and if they made a poor job at an ordinary price the result was even less satisfactory. He complimented Mr. Meade publicly on the mark which he had made in Manchester, and especially he complimented him on those monumental works he was now carrying out—the main drainage of Manchester—which would indeed be a lasting memorial to his work in that great city.

Mr. T. S. PICTON (Eccles), in supporting the vote of thanks, said a careful study of these two papers would repay the members. They were full of very useful information indeed. Many of them must be very indignant to read and hear of the very inadequate work that was done in that city before Mr. Meade was appointed. Surely if a corporation paid for the work that they required done it was only common honesty for the contractors to give the best work required by the specifications and quantities, and he considered that no punishment of them could be adequate. He thought the automatic sampler was a very ingenious idea; also Mr. Meade's method of measuring the depths of the manholes. He was thankful to be privileged to take part in the meeting, because the Eccles Corporation had before the Local Government Board a large drainage scheme which was to cost £60,000, and what he would see in Manchester would be advantageous to the Eccles Corporation in connection with the reconstruction of their main culvert.

Mr. E. L. MORGAN (Bolton) said he thought the city of Manchester was to be congratulated on the good work which Mr. Meade was carrying out with so much energy. With respect to Mr. Swarbrick's paper, the last of the diagrams of probable future extensions of the city of Manchester which he had used to illustrate his remarks got very near to Bolton, and a friend who was near him remarked, "Your number is up." He noticed in Mr. Meade's specification that he gave the absorption test as for the engineering bricks 3 per cent, common bricks 10 per cent, blue bricks 3 per cent. He would like to know if he was able to get bricks to conform to this specification. He knew that brickmakers would like to get 90 per cent of water. He had been able to get common bricks with less moisture than 10 per cent. The difficulty which arose with bricks was the quantity of lime contained in the brick. Another question which they had to meet was the local influence of members of council who were connected with

brickmakers. His experience was that influences had been brought to bear to get engineers to accept bricks which did not conform to the specification. From whispers which had reached him something of that kind had taken place not very far from Manchester. He would like to refer to Mr. Meade's statement showing the ratio of impervious surface to population, and the apparent relation between density of population and death-rate. He noticed in the first five districts down to Moss Side the whole of the water, rainfall and sewage seemed to be carried away; yet the death-rate was higher than in the other districts. That rather shattered the idea which prevailed in his district. In Bolton they had a clay subsoil, and it had been argued that it was unnecessary to have any town planning scheme, because it was better to have the area built upon and the water carried away immediately. But in Manchester, where the water was carried away immediately, they had the highest death-rate. Whether that was due to the area being entirely built upon, or to the lower condition of the residents of those districts, he did not know, but it certainly seemed to him a reason for town planning and limiting the number of houses per acre.

Mr. H. PERCY BOULNOIS (Westminster) said he could not refrain from expressing his appreciation of the admirable paper of his old friend. What astonished him was that he should have presented such a contribution to them instead of giving it to the Institution of Civil Engineers, for, elaborated and read before the latter body, it might have earned for the author the Telford Medal. The paper frankly began by describing failures for which it had been necessary to find remedies, but they learned more from the accounts of failures than they did from successes—at any rate, he did. The paper bristled with information of a novel kind. There were many tables in it that were practically new to him, and the one showing the duration and intensity of storms in South Lancashire was one which illustrated the care and precision with which Mr. Meade arrived at his results. His observations in regard to the area affected by rainfalls of great intensity were especially important, and were something new to him (the speaker). Not content, too, with the information provided by the text-books, Mr. Meade had conducted investigations for himself as to the self-cleansing of sewers, and a table in the paper showed the results of his experiments. From that they would see he had found that cinders would move at 73 ft. per second, the figure for sandstone chippings being 219. It was curious in that connection to find from what they had heard that their old friend 225, as being the minimum velocity of flow, was not far wrong. Then, again, in the table of the actual measured flow of a certain diameter of sewer into the tank they found that their old friend Santo Crimp had come out well, results having proved up to the hilt the accuracy of his investigations. A particularly useful table in the paper was the one giving the number of bricks required per lineal yard in sewers of various diameters—from 4 ft. 6 in. up to 13 ft. 6 in. He had had the advantage that morning of seeing at Stretford a large section of the outfall sewer in course of construction, and he saw that three or four different kinds of bricks were being used in the various rings, Accrington or engineering bricks, as Mr. Meade called them, being employed for the inner ring. Better bricks he had never seen used on any job. The importance of good brickwork could not be over-estimated; it was essential in a job of that kind, and had good bricks been used in earlier work some of the terrible failures of which they had heard that day would not have occurred. The employment of air pressure without an air lock was interesting, and, personally, he had never heard of a case where it had been found practicable to keep back water without an air lock. No doubt the air in some way got into the pores of the soil, and thus retained the water. It saved a great deal of trouble and expense, but how Mr. Meade dared to do it he did not know. Perhaps he would elaborate that part of his paper a little. Concluding his remarks, Mr. Boulnois spoke in congratulatory terms of the photographic views accompanying the paper. Having regard to the difficulties that presented themselves, the way in which these had been taken reflected the highest credit on all concerned.

Mr. E. WITTON BOOTH (Manchester), referring to Diagram E, said he noticed from that that there was a decided increase between the years 1905 and 1910 in the conversion of pail-closets into water-closets, and he would like to ask whether that was due to any local Act at the time. He rather differed from

Mr. Boulnois in regard to Fig. M. As he (the speaker) read the paper, Kutter's was the only formula which agreed with the actual measurements taken by Dr. Fowler. As to Mr. Swarbrick's paper, he was sorry that in that the author had not dealt with one point of interest to members of the institution. What would be the position of the borough engineers in these large towns if all these schemes of amalgamation were carried through? It seemed to him that too much departmentising was not for the benefit of the members.

Mr. A. J. PRICE (Eccles) remarked that the difference between Kutter's, Crimp's, Eytelwein's, and Beardmore's formulae, as shown in diagram M, appeared to be that Crimp's gave a discharge about 20 per cent higher than Kutter's; while Beardmore's gave one about 20 per cent lower. As Kutter's formula had been verified by Dr. Fowler's tank measurements, would it not be advisable to scrap Crimp's and Beardmore's formulae? It seemed to him that if Kutter's formula was correct, all sewerage schemes should be designed on that formula. It was stated in Mr. Meade's very interesting paper that the contractors' prices included the cost of any timber left in and of strengthening foundations as might be required. Did that mean that the contractor had to include in his contract price per lineal yard of sewer for any timber left in? If it were so, unless adequate information of the strata was given, it would hardly be fair to the contractor, as there would be too great an element of risk. Instead of giving a reasonable price, would not the contractor put a large one in his tender to cover himself from loss? There was also the question as to who was to decide what timber was to be left in—the engineer or the contractor? Was the two years' maintenance relied upon to reveal any cracks or subsidences taking place in the sewer or road before the contractor's liability was ended? Another point was the clause which required the contractor to furnish a return of extra work done every week, and if no weekly return was sent in it was deemed to be an admission that no extra work was done during that week. That was a very good clause which was often used, and he thought it should be included in every sewerage contract. There was a table given in the paper of the minimum transporting velocities in sewers. He would be glad to know the sizes of the sewers in which they were taken. It seemed to him that it depended more on the percentage of the depth of flow than the depth of flow itself.

Mr. S. S. PLATT (Rochdale) said there was one question he would like Mr. Meade to answer in reference to the grouting of this retaining wall. Could Mr. Meade remember at what air pressure the grouting was injected?

Mr. P. C. COWAN (Local Government Board, Ireland) said he had a very special interest in that meeting because by coming to it he had got a new view of his old friend Mr. Meade, who, as a rule, could not be induced to talk about his achievements. He had known him now for a quarter of a century—first at Hornsey—and throughout his career he had proved himself a leader. Personally, he had always found him ready to give of his best; he was a model professional man in that respect. Like other Government servants, he (Mr. Cowan) received the greatest kindness from the leading engineers of the British Isles, and when in difficulties was able to obtain from the engineers of Manchester, Liverpool, and London the latest and best information. Mr. Meade's paper was practically a small text-book, up to date, and they might rely with perfect confidence on anything that they found in it. With regard to the question of bricks, bad bricks put into an important sewerage work would probably serve the purpose very well for a number of years, but it was inevitable that, in course of time, they would go. About twenty years ago a culvert of large size was provided to convey the whole of the sewage of Belfast, and he had lately seen a section taken up in order that the bad bricks of which the arch was constructed could be replaced. There ought to be no question about it; only the very best materials should be put in these important works. In one matter they were ahead of England. At Cork they were in communication with Queen's University in the laboratory of which all the bricks used in the city were tested very carefully. The last test had reference to Pudlo in Portland cement. In conclusion, Mr. Cowan expressed his gratification to the Corporation of Manchester for giving the members of the institution an opportunity of seeing their municipal works. He thought that in Manchester

they could see much of the best of British life, and he wished the town prosperity and progress.

Mr. T. W. A. HAYWARD (Battersea) asked that Mr. Meade might be kind enough to reply to any queries that might suggest themselves to the younger members after they had had an opportunity of reading his paper. Mr. Meade no doubt had some fuller information on the subject of sewer ventilation, and if he could supplement the paragraph on that matter he was sure it would be most acceptable to the members and add to the value of their "Proceedings."

The vote of thanks was passed.

Mr. DE COURCY MEADE said he hardly knew how to return thanks for the extremely kind and flattering expressions which had fallen from some of the members. He had first to thank the president, and their district chairman, Mr. Brodie, for the references they had made to himself, and he also desired to acknowledge what had fallen from other speakers. It had been a great pleasure to him to produce his paper, and the only difficulties with which he had been confronted had been limitations of time and a superabundance of matter. After dealing with a number of points raised in the course of the discussion, Mr. Meade announced that he proposed to communicate a formal reply in writing. This we have since received, and is as follows: "In reply to Mr. Morgan, it is, of course, unnecessary to explain to engineers the reasons for the failure of bricks made from surface clays and containing coarse grains and lumps of lime, but as this reply may be read by some who are not experts, I will, for their information, say that lime acts as a flux and lessens contraction, but coarse grains of lime are likely to weaken the brick when it is used in wet or damp situations, and frequently result in its destruction. If lumps of lime are present under such conditions, the failure of the brick is certain. It is merely a question of time; when the moisture reaches the lime the latter slakes and bursts the brick. Bricks containing lumps or coarse grains of lime are therefore quite unsuitable for use in sewers. It is remarkable that a practical man like my predecessor, with numerous examples of the failure of this class of brick around him, could have been persuaded by the brickmakers that they had so improved the manufacture of the surface-clay brick that they could produce a sound and lasting brick from such materials. Naturally, one's wish is to support all branches of local industry, but an official's first duty is to his employers—in this case the Manchester Corporation and the ratepayers of the city. The common bricks now being used in the new sewer-are made from shale, and cost little, if any, more than the surface-clay bricks. The shale bricks are made in the city of Manchester and other parts of South Lancashire. I agree with Mr. Morgan that the absorption of 10 per cent by weight of water in common bricks is a large allowance. We can obtain common shale bricks with a maximum absorption of less than 7 per cent. The red engineering bricks absorb about 1½ per cent of water. With reference to the remarks of Mr. Price, junr., on the diagram showing the discharging capacity of the outfall sewer by various formulae, an explanation will be found at the top of p. 11.* Santo Crimp's formula is:—

$$V = 60 \times 124^3 \sqrt{R^2 \sqrt{S}}$$

Where V = Velocity in feet per minute

$$R = \text{Hydraulic radius in feet} \frac{\text{area of sewer}}{\text{wetted perimeter}}$$

$$S = \frac{\text{head}}{\text{length}}$$

It will be seen that he does not give a variable coefficient for friction.

Kutter's formula is—

$$V = 60 \left[\frac{41.6 + \frac{1.487}{n} + \frac{0.0281}{S}}{1 + \left(\frac{41.6 + \frac{0.0281}{S}}{n} \right) \sqrt{RS}} \right] \sqrt{RS}$$

Where V = Velocity in feet per minute

R = Hydraulic radius in feet

$\frac{\text{area of sewer}}{\text{wetted perimeter}}$

$\frac{\text{Diameter}}{4}$ for circular sewers running full

S = $\frac{\text{head}}{\text{length}}$

n = 0.015.

The value of the coefficient n can be varied by this formula to suit any degree of roughness or smoothness in the sewer. In reply to Mr. Platt, the grouting

* See p. 9 of Supplement accompanying this issue.—ED. SURVEYOR.

machine is worked at pressures varying from 30 lb. to 60 lb., according to the character of the work. In reply to Mr. Boulnois as to the work under compressed air without the use of a shield, no difficulty has been experienced in this respect. The water is kept back by a pressure varying from 6 lb. to 9 lb., and the work is carried on in the ordinary way by excavation, timbering, and brickwork in cement. The materials are brought in and the spoil taken out through the air lock, which is built into the sewer near to the base of the working shaft. Mr. Hayward asked if inquiries on any points in connection with the paper might be sent to me later; of course, I will be glad to answer any queries that may reach me. Mr. Hayward also referred to the question of ventilation of sewers, and suggested that I should supplement the information given on that subject. I would refer him to a paper read by me on the occasion of the visit of the Royal Institute of Public Health to Berlin in 1912, a report of which appeared in *THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER* dated September 27th of that year, and in other professional papers published about that time. In answer to Mr. Booth, the conversion of pail-closets to water-closets was expedited by the Sanitary Committee during the years 1909 and 1910 on the advice of the medical officer."

Mr. SWARBRICK also made a short reply.

DINNER.

In the evening the members were entertained to dinner at the town hall, Alderman Harrop presiding.

The toast of "The Institution of Municipal and County Engineers" was proposed by Alderman Frowde, chairman of the Rivers Committee, who mentioned, in the course of his remarks, that the Manchester Corporation dealt annually with some 214,000,000 gallons of sewage. There was one fault which he always had to find with corporations, and that was that they did not look far enough ahead. Accordingly, he sympathised with municipal engineers who when they put forward a scheme for adoption a suggestion was made that a cheaper one—which in the end was likely to prove more costly—should be carried out.

The PRESIDENT, in response, observed that municipal engineers were, in many cases, doing their best under difficult circumstances.

"The City of Manchester" was proposed by Mr. H. PERCY BOULNOIS. Manchester, he said, was made by, and its prosperity was due to, the great energy of their ancestors, who had, however, left behind them a legacy of evil in the shape of slums. But Manchester was not to be beaten, and the city had tackled the problem in an admirable manner. With infinite pains they had examined every single one of the houses, and converted the bulk of them into habitable dwellings. It would, of course, have been much easier to have swept them all away, but in doing what they did they avoided dispossessing the people, merely pulling down a few houses where necessary. The paper which Mr. de Courcy Meade had read to them that day was a monolith of engineering work, added Mr. Boulnois. It only showed what a man, backed up by a corporation, could do in such matters.

Alderman HARROP, in reply, said that if the city fathers of the past had been more ready to take the advice of their officials, many of the blunders which had occurred would have been avoided. He thought municipal engineers would welcome the Town Planning Act, which would result in a more beautiful England in a few years. All that was wanted was to form strong committees, backed by the experience of those who knew best. Manchester, he hoped, in a few years would startle them with the grand projects it had in hand.

SATURDAY'S PROCEEDINGS.

The meeting terminated on Saturday, when parties of the members inspected some of the works which have been recently completed or are being carried out by the corporation. These parties went to Platt Fields, the intercepting sewers at West Didsbury and at East Didsbury, the outfall sewers at Stretford and Davyhulme, to the tramcar depot in Hyde-road, the subway at Stuart-street, the Smithfield Market, and the Elm-street cold stores.

Speaking at a luncheon given at the Grand Hotel by the Tramways and Improvement Committees, Alderman BOWES, chairman of the former body, in proposing the toast of "The Institution," said he was convinced that it was quite impossible for any body of men such as municipal engineers to meet in conference as they had been doing during the past two days without going back to their different towns with more knowledge than when they left them. That

morning they had been inspecting some of the work done by their respected city engineer, Mr. Meade. They felt proud of their city engineer, who had done noble work for Manchester, although he was afraid they had not compensated him adequately for the services he had rendered them. He was one of those who believed in paying their staff well, and having the best.

The PRESIDENT, in reply, said he felt that the institution, after an existence of some forty years, had, in some measure at any rate, justified its existence.

"The Tramways Committee of the Corporation of Manchester" was proposed by Mr. J. A. BRODIE (Liverpool). Mr. Brodie said he thought it would ill become them to leave Manchester without expressing in some form their acknowledgments of the admirable treatment meted out to them during their stay in the city. No one could see the works they had been shown without forming a very high opinion of the abilities of those responsible for their carrying out. He was glad to have an opportunity of saying something about tramways, for there was no doubt they were on the eve of very important improvements in connection with the different forms of conveyance between the centres and outskirts of our great cities. Whether it was by tramways or motor vehicles, the people in the large towns must be transported much more quickly than at present from one point to another. Having been a resident of Manchester many years ago, he could bear testimony to the improvements in the methods of transport which had taken place since those days.

The CHAIRMAN, in reply, said the present satisfactory position of the tramway undertaking was due to the general manager, Mr. J. M. McElroy. The Manchester tramways, he observed, paid a higher percentage on the capital invested than any other undertaking of the kind in the country. They contributed to the rates £100,000, which was about the equivalent of a 6d. rate.

The health of Mr. de Courcy Meade was proposed by Mr. T. W. A. HAYWARD (Battersea) in a speech expressive of the institution's indebtedness to the city surveyor for the magnificent paper which, in spite of the many important works engaging his attention, he had managed to prepare for their meeting, and for the excellent arrangements made on their behalf. They had been full of admiration of the way in which everything had been carried out during their stay in Manchester. Mr. de Courcy Meade had thrown himself heart and soul into their visits, and they would go away feeling that they had had a real good time. He desired to couple with his toast the name of the tramway manager, Mr. McElroy.

Mr. DE COURCY MEADE, in returning thanks, said that whatever measure of success had attended the meeting was due to the able staff over which he had the honour of presiding. When it was known the institution were going to Manchester, they immediately expressed their willingness to help in every way possible, and with their assistance and the help he had received from the admirable hon. district secretary, Mr. Bradley, he, personally, had very little difficulty in making the arrangements.

Mr. McELROY also replied. In Manchester, he said, they were always glad to welcome their brother officers from other parts of the country. Touching on the question of future means of transport in great cities, Mr. McElroy added that that was a matter which would have to be gone into with the help of municipal engineers.

Inspection of Motor Vehicles.—In the House of Commons on Friday last the President of the Local Government Board was asked by whom the inspection of motor vehicles was carried out for the purpose of ascertaining whether these vehicles complied with the regulations as to weight and width; and whether, in view of the large dimensions of these vehicles as at present constructed, proper facilities existed for ascertaining their weight, laden and unladen. Mr. Herbert Samuel said that on every application to a registering authority for the registration of a heavy motor car, certain particulars, including the weight of the car, laden and unladen, were, under the Heavy Motor Car Order, 1904, required to be furnished by the owner. The same Order made provision (i.) for the ascertainment of these weights by or in the presence of an officer of the registering authority, if the authority so direct, and (ii.) for bringing any car upon a highway to a weighing machine for the purpose of ascertaining whether the registered axle-weight was exceeded. He was not aware that the facilities referred to were inadequate.

LOAN PERIODS FOR FERRO-CONCRETE.

[The following interesting article is quoted from the February issue of *Ferro-Concrete*.]

On the present occasion we do not intend to add anything to previous criticism of the Local Government Board policy in regard to ferro-concrete, but simply to show how benefit may actually be derived from the relatively short loan periods usually fixed by the board for work of this description.

With this object we take three examples from recent practice, and to them invite the attention of local authorities and their professional advisers. In each case the amount of the annual repayments is based on interest at the rate of 3½ per cent per annum.

EXAMPLE I.

£ s. d.	£ s. d.
<i>Ferro-concrete Bridge</i> —	<i>Masonry Bridge</i> —
First cost ... £6,000	First cost £10,000
Loan period 10 years.	Loan period 30 yrs
Total repayments:	Total repayments:
£71 8s. 9d. for 10	£343 15s. for 30
years 7,214 7 6	years 15,312 10 0
Total saving effected	
by Ferro-concrete. 9,098 2 6	
<u>£16,312 10 0</u>	<u>£16,312 10 0</u>

The saving here evidenced is rather startling and deserves a little careful investigation. The difference of first cost in favour of ferro-concrete was £4,000, and the saving in interest consequent on the smaller outlay and the shorter loan period was £6,312 10s.—£1,214 7s. 6d.—£5,098 2s. 6d., the two items making up a total of nearly £10,000 to the good.

Possibly some members of municipal and other councils may echo the well-known Irish bull of Sir Boyle Roche: "Why should we legislate for posterity? What has posterity ever done for us?" and imbued with this sentiment may not hesitate to cast a heavy and wasteful burden of expenditure upon their constituents, with the object of lightening the annual amount of repayments.

But those who wisely look to the future will naturally view with dismay the continuance of useless payments through a long vista of years.

The true wisdom of a far-sighted policy is clearly denoted by the following comparison:—

REPAYMENTS DURING THE FIRST TEN YEARS: EXAMPLE I.

Year.	Total amounts of payments at various periods.	
	Ferro-concrete.	Masonry.
First	£ s. d. 721 8 9	£ s. d. 542 15 0
Second	1,412 17 6	1,087 10 0
Third... .. .	2,104 6 3	1,631 5 0
Fourth... .. .	2,885 15 0	2,175 0 0
Fifth... .. .	3,607 3 9	2,718 15 0
Sixth... .. .	4,328 12 6	3,262 10 0
Seventh... .. .	5,050 1 3	3,806 5 0
Eighth... .. .	5,771 10 0	4,350 0 0
Ninth... .. .	6,492 18 9	4,893 15 0
Tenth... .. .	7,214 7 0	5,437 10 0
	Bridge entirely paid for.	£10,875 more to pay.

It will be seen that at the end of the tenth year the total cost of the ferro-concrete bridge, including payments in respect of interest, will be only about 72 per cent of the bare cost of the masonry bridge originally contemplated, and that at the same date there would have remained for payment no less than £10,875, or £543 15s. a year for twenty more years if the alternative form of construction had been adopted.

Let us now see what would have been the position if the Local Government Board had sanctioned, and the local authorities had accepted, the loan period of thirty years for the ferro-concrete bridge.

In that event the repayments would have been £326 5s. a year, and the total cost of the bridge would have worked out at £9,787 10s., or £2,573 2s. 6d. more than the cost with a loan period of ten years. Thus it is evident that short loan periods are really beneficial, a fact which will undoubtedly weigh with all municipal and county councillors who have at heart the true welfare of their constituents.

In order to make things clear at a glance, we have prepared the diagram reproduced as Fig. 1, showing

graphically the effect of different loan periods on the annual repayments and total cost of the ferro-concrete and masonry bridges. It will be noticed that by the time £7,214 7s. 6d. had been paid as the entire cost of the ferro-concrete bridge, payments for seventeen years more would still be due on the masonry bridge, and for nine years for ferro-concrete with a thirty years' loan.

FIG. 1.—DIAGRAM ILLUSTRATING EXAMPLE I.

(The first line represents the relative amount of annual repayments and the total cost for the ferro-concrete bridge, with a loan period of 10 years; the second line denotes similar values for a masonry bridge with a loan period of 30 years; and the third line indicates what would have been the effect of a 30-year loan period for the ferro-concrete bridge)

EXAMPLE II.

£ s. d.	£ s. d.
<i>Ferro-concrete Bridge</i> —	<i>Steel or Masonry Bridge</i> —
First cost £50,000	First cost £80,000
Loan period 30 yrs.	Loan period 50 yrs.
Total repayments:	Total repayments:
£2,718 15s for 30	£3,410 16s. 8d. for
years 81,562 10 0	50 years 170,541 13 4
Total saving effected by Ferro-concrete 88,979 3 4	
<u>£170,541 13 4</u>	<u>£170,541 13 4</u>

In this case it will be noticed that, despite the extra twenty years offered for repayment, the annual payments on account of the ferro-concrete bridge are actually £692 1s. 8d. less than they would have been for a steel or a masonry bridge. The saving at the end of ten years will amount to nearly £7,000, while at the end of thirty years, when the ferro-concrete

FIG. 2.—DIAGRAM ILLUSTRATING EXAMPLE II.

(The first line shows the relative amount of annual repayments and the total cost for a steel or masonry bridge, with a loan period of 50 years; the second line represents similar values for the ferro-concrete bridge with a loan period of 30 years; and the third line denotes the higher total cost that would be entailed by a 50-year loan period for ferro-concrete.)

bridge will be completely paid for, the payments on account of a steel or masonry bridge would have come to no less than £102,325, or £20,762 10s. more than the entire cost of the ferro-concrete bridge, including interest. That is not all, for during the suc-

ceeding twenty years the ratepayers would have been mulcted to the additional extent of £68,216 13s. 4d., making up the huge excess payment of £88,979 3s. 4d. for nothing at all.

Therefore the choice of ferro-concrete was a very happy one for the community; but, strange to say, there were some misguided people who wished to incur largely increased annual payments for a long additional period of years.

It will be observed that we have put nothing down for maintenance of the steel or masonry bridge. In either case this would be a considerable item, and if steel were adopted the amount would be a very heavy one by the time the bridge had attained the age of fifty years. Moreover, the structure would have seriously depreciated long before it was paid for, while ferro-concrete would entail no outlay for maintenance and would go on increasing in strength year after year.

Again, if the loan period for the ferro-concrete bridge had been extended to fifty years, the repayments would have been £2,131 15s. 5d. per annum, making the total outlay £106,588 10s. 10d., or £25,026 0s. 10d. more than that involved by the period of thirty years. Hence the apparently tempting bait represented by a reduction of £587 in the yearly payments is a very flimsy disguise of the cruel hook attached to the line of extended pecuniary liability.

EXAMPLE III.

Ferro-concrete Reservoir —		Concrete and Masonry Reservoir:—	
£ s. d.		£ s. d.	
First cost ..	£1,200	First cost ..	£2,900
Loan period 10 years.		Loan period 30 years.	
Total repayments:		Total repayments:	
£156 6s. 3d. for 10		£157 13s. 9d. for 30	
years ..	1,563 2 6	years ..	4,730 12 6
Total saving effected			
by ferro-concrete ..	3,167 10 0		
	<u>£4,730 12 6</u>		<u>£4,730 12 6</u>

In this instance the marked economy of ferro-concrete and the shorter loan period result in a saving of £3,167 10s., which is nearly 10 per cent more than the first cost of a reservoir constructed in the ordinary manner.

The reader should note that while the payments for ferro-concrete only continue for ten years, the amount per year is less than that for ordinary construction, and if the latter had been adopted the ratepayers would have been compelled to go on wasting their money for twenty additional years. If a loan period of thirty years had been arranged for the ferro-concrete reservoir the result would have

FIG. 3.—DIAGRAM ILLUSTRATING EXAMPLE III.

(The first line denotes the relative amount of annual repayments and the total cost for a concrete and masonry reservoir; the second line shows the slightly smaller repayments and the much lower total cost for ferro-concrete; and the third line represents the actual extravagance of a longer loan period for ferro-concrete.)

been a total expenditure of £2,120 12s. 6d., involving the ratepayers in a loss of £2,120 12s. 6d.—£1,563 2s. 6d.—£557 10s., although the annual repayments would have fallen from £156 6s. 3d. to £70 13s. 9d.

The figures adduced in this article are absolutely convincing as to the advantage of short loan periods in conjunction with ferro-concrete construction, and if county and municipal councils throughout the kingdom will accept the suggestions here brought forward, their constituents will have reason to bless the restrictive policy of the Local Government Board in respect of loan periods for ferro-concrete.

What with increasing expenditure on drainage,

water supply and other necessary works, to say nothing of luxuries now generally provided for the working classes, local rates are quite high enough without useless and avoidable outlay.

RAIL CORRUGATION AND ITS CAUSES.

PAPER AT THE INSTITUTION OF CIVIL ENGINEERS.

Discussing, in a paper which he read before the Institution of Civil Engineers on Tuesday evening, the causes of rail corrugation, Mr. Stephen Sellon, M.INST.C.E., gave it as his opinion that the rail steel now used for rails was not hard enough or tough enough for its work. Possibly modern methods of steel and rail making were at fault in this direction. The use of wheels of small diameter was evidently severe on the rails, but the conditions of tramway working made alteration impracticable, and it therefore became necessary to find a material which would not yield to the wheel actions which were the immediate cause of corrugation.

Mr. Sellon said he believed that hard rails—i.e., with a high proportion of carbon—were essential, and gave some evidence from his own and others' experience that such high-carbon rails resisted the corrugating actions of the wheels, as well as ordinary wear. The British Standard Specifications were established before corrugation was realised as a serious possibility, and the range of carbon content permitted, besides being rather wide, only approached the hard side for Bessemer steel, while it was on the soft side for open-hearth steel.

The general character of corrugation was described by Mr. Sellon, and he laid stress upon the facts that the "crests" had the appearance of planished or cold-rolled steel, and were relatively hard and refractory to acid, while the "hollows" were dull, showed some lateral detrusion and pitting, and were only slightly harder than the body of the steel. The conclusion he drew was that the "crests" were cold-rolled, and the "hollows" were surface which had been crushed, due to the vertical loads imposed by the wheels oscillating about the elastic compressive limit of the steel. How the oscillatory character of the load was brought about was not considered, but it was pointed out that at ordinary speeds the usual pitch of the corrugations on tramway rails corresponded with a frequency of the order of 100 per second.

The possibility of the rails receiving initial corrugations in the processes of rolling and cooling was briefly discussed, but it was pointed out that such initial corrugation, if it ever existed, was uncommon. Differences of surface hardness or internal stresses received during manufacture were suggested as possibilities.

Leaving these suggestions, the fact remained that corrugation was due to the failure of the rail-table under the stresses imposed upon it. The surface was alternately cold-rolled and disintegrated. In measurements of static pressure made by Mr. Worby Beaumont, and set out in the paper he presented to the British Association in 1911, were shown to prove that pressures of such magnitude as to produce destructive effects occurred, but that it was probable that the compressive elastic limit of rail-steel was not generally exceeded. The evidence, therefore, seemed to show that a comparatively small increase in the compressive strength of the steel would prevent the particular kind of wear under consideration.

Mr. Sellon suggested that the essential points to be specified were mechanical properties corresponding with the working stresses imposed upon the rails, and first compressive strength. The British Standard specification prescribed an ultimate tensile strength of 40 tons per square inch. The compressive strength was probably about the same as the tensile, but the actual wear of tramway rails suggested that it was somewhat in excess of 40 tons per square inch. Probably steel with an ultimate tensile strength of 50 to 60 tons per square inch would be hard enough to resist the destructive stresses, but it was essential that it should not have a high degree of ductility. The minimum pressure needed to produce surface crushing and flowing should be determined. It is suggested that a Brinell test might give all the information needed. The tup test might have to be modified, but rails laid on a continuous concrete sub-structure had a large margin of safety against breakage from vertical shocks, and a less severe tup test should suffice. The whole specification of the rail in respect to its mechanical qualities should bear a direct relation to the stresses which it would be called upon to resist.

INSTITUTION OF MUNICIPAL ENGINEERS.

EASTERN DISTRICT MEETING AT OUNDLE.

The meeting which was held at Oundle on Saturday last included in its programme a most enjoyable and interesting round of visits. Those present as members of the institution were Messrs. W. T. Unwin, chairman of the district, J. Bailey (Spalding), W. R. Bailey (Holbeach), G. F. Bearn (Wellingborough), A. W. Broker (North Witchford), G. Belson (Chilvers (Oundle), N. Dixon (Oundle), O. Gillson (Peterborough), J. W. Lloyd (Rushden), C. Mayfield (Godmanchester), G. A. Penwill (Peterborough), and B. Wyand, secretary of the institution. Among the visitors were Messrs. J. W. Walshaw, city surveyor, Peterborough; S. Broadbent, sanitary surveyor, Oundle Rural District Council; Geo. W. Chilvers, consulting engineer and surveyor, London; M. Fox, Oundle; O. P. Drevor, contractor to the North Bridge widening; J. Hanson, general foreman, North Bridge; M. Dye, general foreman at Grocers' Company Schools, New Science Block; R. Ashworth, school engineer; and J. T. Dewey, Peterborough. The following members of the urban district council also were present: Messrs. Jos. Rippiner (vice-chairman), Jno. Hayes (chairman of the Public Health Committee), Jno. M. Siddons, Colonel C. Percy Lees, W. B. Wood and Robt. Knight (clerk of the council).

A start was made with an inspection of the works in progress in the widening of the North Bridge, under the direction of Mr. O. P. Drevor, the contractor, and Mr. J. Hanson; Mr. J. H. Dyson, the clerk of the works, was unfortunately unable to be present owing to illness. The inspection proved of great interest to the party, and warm praise was bestowed on both the appearance and stability of the structure. The bridge is said to be one of the longest in the county. A hearty vote of thanks was accorded Mr. Drevor, with whose name was coupled that of Mr. Hanson, for their kindness in explaining the works.

The party then proceeded, under the direction of Mr. Ashworth, to inspect the buildings in connection with the Grocers' Company's schools. A visit was also made to the new science block in course of erection, where Mr. Dyer, general foreman to Messrs. Thompson Brothers, the contractors, ably explained the work.

An adjournment was afterwards made to the council's offices where a short business meeting was held, Mr. Unwin, the district chairman, presiding.

Mr. John Hayes, chairman of the Oundle Urban District Council Public Health Committee, said that, on behalf of the members of the council and the town generally, he wished to offer a word of welcome to the members of the institution present. Mr. Unwin returned thanks for the welcome, and stated that it had given him and fellow-members the greatest pleasure to visit the town, the North Bridge, the school, and the other buildings they had seen that day. He (Mr. Unwin) had now completed three years' service as chairman of the district, and he thought a change would be better and give an added interest in district matters. It was thereupon proposed, and carried unanimously, that Mr. Chas. F. Mayfield, the borough surveyor of Godmanchester, be chairman for the ensuing year.

Mr. P. S. Bennett, the hon. district secretary, having intimated his desire to resign his position, it was proposed, and carried unanimously, that Mr. G. Belson (Chilvers, surveyor to the Oundle Urban District Council, be the secretary for the ensuing year.

It was resolved that for present working purposes, the Eastern and North-Eastern Districts be combined.

Arrangements were made for holding future meetings at Finedon in May next, and at Hunstanton in July next.

A paper, entitled "The Municipal Undertakings of Oundle," was then read by Mr. Chilvers, the surveyor and water engineer to the council, and will be found reproduced on another page of this issue.

After a brief but interesting discussion the members adjourned to tea at the Talbot Hotel.

NORTHERN DISTRICT MEETING.

At a meeting of the Northern District of the institution, held in the Town Hall, Newcastle-on-Tyne, on February 14th, there were present Messrs. W. Finch, chairman of the district, John Davison (Morpeeth), Joseph Halstead (Harrogate), J. R. MacMillan (Earsdon), C. W. Hall (Felling), R. E. Riddle (Bellingham), Thos. Young (Sunderland), Jas. Jameson (Ponteland), Wm. Wallin (Newcastle-on-Tyne), Geo.

W. Ayton (Chester-le-Street), Robt. Appleby (New-Egginton-by-the-Sea), W. Bean (Loughborough), J. H. Mole (Chester-le-Street), F. N. Taylor (Newcastle-on-Tyne), Thos. Knox (Benfield-side), W. J. Coulson (Cramlington), M. Turnbull (Shildon) and John Robinson, hon. district secretary (Darlington).

Forthcoming Meetings.—The report of the sub-committee, fixing dates for meetings during 1914, was confirmed, the following being the meetings arranged: March, Leeds (day to be arranged); April 18th, Darlington; May 2nd, Hexham; May 16th, Hull; June 13th, Cumberland; July 11th, Alnwick; August 15th, Cumberland or Westmorland; September 12th, Harrogate; October 10th, Sunderland; November 7th, Newcastle; December 12th, Newcastle.

Superannuation. On the motion of Mr. John Davison, seconded by Mr. M. Turnbull, the following resolution was unanimously carried, and the secretary was requested to send a copy to Mr. L. Hill, secretary to the N.A.L.G.O., and to Mr. Wyand: "That all local authorities be asked to pass a resolution in support of the proposed Bill providing superannuation for officers and servants of all municipal and local authorities, and that the clerk to each authority be asked to reply to the secretary stating the decision of his authority." Mr. Turnbull proposed, Mr. John Davison seconded, that, provided Mr. L. Hill, secretary to the N.A.L.G.O., agrees to carry out suggestions given in Mr. John Davison's resolution, a copy of the resolution be then sent to every member of the Northern Division asking them to approach members of their councils with a view to obtaining as much support as possible in order to get resolutions passed in favour of same. The secretary was requested to ask Mr. Wyand for a full report of what the council of the institution are doing in the matter, and to submit same to next meeting.

Federation with the N.A.L.G.O.—The secretary was asked to forward form of application to Mr. Hill, with cheque for £2 2s.

Suggested Fund for Northern Division.—Mr. J. Davison gave notice that at the next meeting he would move that a local fund be formed by obtaining annual subscriptions of 2s. 6d. each from members of the Northern District, such fund to be used entirely for local purposes.

Discussion of Papers read in London, November 7th, 1913. Mr. Turnbull proposed, Mr. Halstead seconded, that the three papers "Electricity as a By-product," by R. J. Spencer Phillips; "Temporary Buildings in Relation to By-laws," by T. C. Barralet; "The Need for Standardisation in Drainage Details," by Arthur Palmer—having been circulated, be taken as read. Very interesting discussions upon the papers then followed, most of the members present taking part. The chairman proposed, and Mr. Coulson seconded, that the secretary write Mr. Wyand and thank him for giving the members of the Northern District an opportunity of discussing the papers, and asking him to convey to the writers of the papers their thanks and appreciation of same. The resolution was unanimously carried.

Election of Council.—The chairman suggested that, prior to the next election of members for the council of the institution, a meeting of the Northern District should be held to nominate the names of the members they propose supporting, in order to ensure proper representation.

A vote of thanks was passed to the Lord Mayor of Newcastle for the use of the Committee Room.

THE EASTBOURNE-HASTINGS COASTAL ROAD.

With reference to the above scheme, noticed in last week's Surveyor, it should be explained that Mr. G. Ball, Assoc. M.A.S.T.C.E., borough engineer and surveyor of Bexhill, prepared the plans of route so far as the proposed road will pass through that borough. The scheme is, in fact, one for which Mr. A. E. Prescott, borough surveyor of Eastbourne, and Mr. Ball are jointly responsible, and the preliminary plan was prepared in consultation. Mr. Ball has attended each conference held at Eastbourne, and at the last conference a vote of thanks was unanimously passed to both borough surveyors for their services.

Town Planning Institute.—At a general meeting of this body to be held on Friday, March 13th, at 92 Victoria-street, Westminster, a paper on "The Town Planning Proposals of the Urban Land Report" will be read by Mr. Raymond Unwin, F.R.I.B.V. The chair will be taken at 8.30 p.m.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

HIGHWAY: DEDICATION: OLD BRIDLEWAY AND FOOT-PATH.—The decision of the Court of Appeal in *Cababé v. Walton-upon-Thames District Council* (noted in Vol. XLIII., p. 256) has been affirmed by the House of Lords. The question in this case was whether an old private bridleway and footpath, known as Cottimore-lane, was a highway repairable by the inhabitants at large. The way was set out in 1804 under an Inclosure Award for the use of the occupiers of certain allotments. In course of time these occupiers used it as a cartway also, and by 1864 it had become a public highway for vehicles; but it had never been formally dedicated or adopted under the Highway Act, 1835, or otherwise, and the evidence showed that it had not become a public highway until after 1835. In 1910 the council resolved to make it up under the Private Street Works Act, 1892. The appellant, Mrs. Cababé, objected to the provisional apportionment on the ground that the road was a highway repairable by the inhabitants at large. In support of this objection it was contended that the conditions of sec. 23 of the Highway Act, 1835, must be presumed to have been complied with, or, alternatively, that they did not apply to this road, but only to highways which had been intentionally dedicated as such. The objection was overruled by the magistrates, whose decision was affirmed both by the King's Bench Division and by the Court of Appeal. The appeal to the House of Lords was (as already stated) equally unsuccessful. In the course of his judgment in that House Lord Loreburn said that it was common ground that Cottimore-lane had been a highway since 1864, but Quarter Sessions found that it was not a public highway in 1835, and two other courts had agreed with that view. On the evidence it seemed fairly certain that the road became a highway at some date after the Highway Act, 1835, came into operation. The question then arose, Was it repairable by the inhabitants at large? It would have become so had it not been for sec. 23 of that Act; but in his lordship's opinion the effect of that section was to prevent that result. It might be a hard case on the appellant. He was afraid the law was against her, and accordingly he moved that the appeal should be dismissed, with costs. Lords Dunedin, Kinnear, and Atkinson concurred.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words, as *noms de plume*. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

FIRE ENGINE: CHARGE FOR ATTENDING FIRE: DISTRICT COUNCILLOR: DISQUALIFICATION.—"Urban" writes: (1) My council have a motor fire engine and brigade. The practice in the past has been to charge for attendance at fires in the district, but no charge has been made for the water used. It has been pointed out that the council cannot legally make any charge whatever for attendance at a fire within the urban district, although the insurance companies have hitherto paid without demur, it being to their advantage to have the fire put out as quickly as possible. Can the council make any charge, and, if so, under what statute? The custom in many districts is to charge for attendance at fires, although it may be that such charges could not be upheld if contested. (2) Several large contracts will shortly be let in this district. Can a member of the council legally supply bricks or other material to the general contractor who carries out the works for the council? My opinion is that a member of the council cannot do so, as it is trading with the council indirectly.

(1) No. Sec. 33 of the Towns Police Clauses Act empowers them to charge for attendance at fires without the district, and it has been held that this clause impliedly negatives any right to charge for engines and apparatus when employed within the district (*Bridlington Local Board v. Bower*, 38 J.P., 73). (2) In my opinion a councillor who supplied bricks to a contractor, to be used by the latter

in carrying out works for the council under his contracts, would be disqualified under sec. 46, sub-sec. (1), clause (e), of the Local Government Act, 1891, and would be liable under sub-sec. (8) of the same section to a fine not exceeding £20 every time he acted as councillor.

SEWER LAID IN STREAM.—"MORUM" writes: Some three years ago a sewerage scheme was completed in this district. A stream of water, being the back-water from a mill, passes under the public road by means of a large brick culvert, across which and on the bed of the stream a 9-in. iron sewer pipe was laid. No complaint had been received from the mill owners until quite recently, when a new turbine (being a more powerful one) was fixed. On working this it was found that it did not develop the full horse-power. This, they contend, is caused by the pipe obstructing the flow of water from the turbine, besides causing silt to collect, and they have requested my council to have the pipe removed. I would point out that the bed of the stream is very flat, and that the water from the pond below this mill "backs up" nearly level with the top of the pipe in question. My council are of opinion that the bed of the stream being very flat is the cause of the trouble, and I shall be glad of your opinion as to whether the mill owners can compel my council to remove the pipe, seeing no objection was raised until a new turbine of greater horse-power had been fixed.

The bed of the stream presumably belongs to the riparian owners on either side, each being entitled to half the width. If the sewer was laid without notice to these owners (or to the occupiers of their lands) they could probably obtain an injunction for its removal. See *New River Company v. Ware Union R.S.A.* (1883, L.J., No. of Cas., p. 20), unless the owners consented, and thus waived formal notice. See *Long v. Fulham Vestry* (47 W.R., 56). In any case the mill-owners would be entitled to compensation, under sec. 306, for any damage sustained by reason of the exercise of the council's statutory powers.

BUILDING BY-LAWS: "HABITABLE" ROOM.—"Billiards" writes: A large cellar, entered on a plan deposited with the council as a store, has been fitted up for use as a billiard-room. The room measures about 28 ft. by 18 ft., and is 7 ft. 5 in. high, and has a fireplace. The window area is 13 super. ft. I should be glad to know whether such a room is a "habitable" room. According to the council's by-laws, habitable rooms should be at least 9 ft. high, and have a window area equal to at least one-tenth of the floor space. The house is practically completed, but the habitation certificate has not yet been issued. How would you deal with such a case? Copy of our by-laws forwarded.

By-laws 53 and 63 appear to be those referred to. By-law 53 provides that every person who shall erect a new building, and shall construct any room therein so that it may be used for human habitation, shall comply with certain specified requirements. These requirements prescribe a height of 9 ft., except for an attic or a room wholly or partly in the roof and intended to be used as a sleeping-room. In my opinion a billiard-room "may be used for human habitation" within the meaning of this by-law. By-law 63 provides that every person who shall erect a new building shall construct in every habitable room of such building one window at least, as therein prescribed. In my opinion a billiard-room is a "habitable room" within the meaning of this by-law.

PRIVATE STREETS CLOSED BY GALES.—"Semper Idem" writes: In my district I have several private streets in each of which there are a number of houses built. These streets have gates across at the entrances, some of which are, presumably, closed once a year, and others are always kept closed. The streets are considerably out of repair, and no works have been recently carried out by the owners. Would you let me know (1) if the council have power to make up these streets under the Private Street Works Act, 1892 (which has been adopted)? (2) Is there anything to prevent them being taken over as highways repairable by the inhabitants at large, under sec. 19 of the Act of 1892 after the street works have been completed? (3) If the council have power, when carrying out the street works, to remove the gates?

(1) Yes, assuming that they are not repairable by the inhabitants at large. (2) Nothing whatever. (3) Not until they have been taken over.

London Street Pavings.

METROPOLITAN COMMITTEE'S ELEVENTH ANNUAL REPORT.

The Metropolitan Paving Committee have issued their eleventh annual report relative to the paving works carried out in the County of London by various road authorities, compiled from information furnished by the engineers to the various authorities concerned. The committee was formed as the result of a conference of representatives of the metropolitan borough councils held at the Westminster City Hall on January 8, 1903, for the purpose of considering the general question of materials and means of paving the streets of London. The information furnished in the returns on which this report is based relates to practically all the best-known descriptions of paving, the method of laying, the period the paving has lasted, cost of laying, saving on tar-sprayed roads, and other details.

The chief features of this year's return may be very briefly summarised as follows:—

Principal Kind of Paving Laid.—Softwood has been principally used during the year. In Holborn it is noticeable that a considerable area of granite setts has been laid down on foundations varying from 6 in. to 14½ in. in place of asphalt, in consequence, it is presumed, of the altered traffic conditions. Bituminous macadam has been adopted in a number of districts in place of ordinary water-bound macadam, and large areas of macadam roads have been tar-sprayed.

Foundation.—Various thicknesses of concrete foundation, ranging mostly from 6 in. to 9 in., have been adopted—in some cases 12 in., and in one (Holborn) as much as 12 in. to 14½ in. It appears to be recognised that the altered conditions of traffic demand a greater thickness of concrete foundation than has hitherto been adopted for the paving of London streets.

Saving on Tar-sprayed Roads.—The adoption of the system of tar-spraying macadam roads has been continued and extended in several districts, and an appreciable saving in the cost of scavenging and watering has resulted. It is, moreover, generally admitted that a great improvement in the road is the result.

Tar Slag Macadam.—The committee's attention has been drawn to the use of this material in several streets in the borough of St. Marylebone, and to the trial experiments made by the Road Board at Sidcup and Wandsworth. In St. Marylebone the material was laid in two coats and rolled, the surface being covered with fine granite chippings, and the total thickness when finished being 4½ in. The price varied from 1s. to 4s. 8d. per yard super, and the paving is said to be wearing well. The New Eltham and Sidcup road . . . trial length . . . was laid down in July, 1911, by the Kent County Council by arrangement with the Road Board. The material used was blast furnace slag ranging from 2½ in. down to ¾ in. When laid in one coat of mixed gauges, the proportions are about 60 per cent, ranging from 2½ in. down to 1½ in., 30 per cent from 1½ in. down to ¾ in., 10 per cent from ¾ in. down to ½ in. The binder used is distilled tar, without any admixture of other material, and after first setting it is not affected by normal changes of temperature. The cost per yard super, was 3s. 3d. as paid to contractors, and the paving has stood well and is said to be satisfactory. Another section, 794½ super. yds., on the same road, laid with the same material, is also satisfactorily reported upon. The Road Board say (the committee point out): "This section is quite good, and shows comparatively little wear. The roadway on both sides of this section is properly kerbed and channelled, and has properly constructed footpaths. These abutments give considerable support to the material forming the carriageway, preventing lateral thrust, and enabling better initial consolidation." In the borough of Wandsworth, on the Portsmouth road, trial lengths were laid for the express purpose of making comparison between the rates of wear of previously treated tarred granite when compared with similarly treated tarred slag macadam. A section of the latter—1,629·16 super. yds.—was completed in August, 1911, coated slag being spread in two layers, first layer graded from 2½ in. down to 1½ in., second layer from 1½ in. to ¾ in., surface finished with fine chippings. The cost per yard super, was 4s. The condition of this section is said to be good, and the surface wearing uniformly.

The returns sent in during the past year have been put in tabulated form, and are briefly summarised by the committee as follows:—

FULHAM.

The returns from this borough deal with four streets, in all of which the traffic is considerable. They were laid with 8-in. by 5-in. by 3-in. creosoted deal blocks, close jointed and grouted in with pitch and cement on an existing concrete foundation. The work was done by the borough council at a cost of 8s. 7d. to 8s. 8d. per yard super., without foundation, and the paving which this replaced had been down some sixteen years.

The surveyor, Mr. Francis Wood, states that about 40 miles of road surface has been tar-sprayed in Fulham during the year under review at a cost of, approximately, ½d. per super. yard. He also states that the annual cost of maintenance of softwood roads is about 3·63d. per super. yard, i.e., if certain repairs have been made in a road, the cost of these repairs is spread over the total paved surface of the road. If the cost was spread over the total wood-paved area of the roads, the cost per square yard would be about 2·89d. per super. yard. In Fulham the cost of maintenance for the past two years has increased over that of previous years. This is due to the heavier and self-propelled traffic, which very rapidly discovers the weak parts of the paving, and which, if allowed to continue unrepaired, would develop into serious depressions, and at the same time be a serious factor in causing damage to the foundation. The policy in Fulham is to carry out these small repairs as soon as they appear, which involves extra cost; but this increased cost is more than compensated for, as a record of the wear of the timber indicates that the life of the paving is extended at least 20 per cent to 25 per cent. This increased life is possibly accounted for by the growing use of rubber tyres that is of a softer material than the timber forming the road surface, and the reduction of horse traffic.

The tar-spraying of the roads and the adoption of the method of asphalt macadam construction show a considerable saving in the scavenging work of the borough. The amount of street refuse in 1906-7 was 11,189 tons, at a cost of about 2s. 6d. for collection and cartage per ton, and 1s. 6d. per ton for the shoot. The results shown have been very satisfactory, as this year the amount of refuse collected was only 8,275 tons—a decrease of 5,914 tons, or a reduction of about 40 per cent from 1906-7, equal to over £1,100 per annum. As this saving has every appearance of being permanent, the capital value it represents is at least £27,500. The saving is actually much greater than is shown by the above figures, as this year the cost of the shoot has risen from 1s. 6d. to 2s. 11d. per ton. The council has abandoned ordinary water-bound macadam construction, and adopted bituminous macadam (Trinidad Lake bitumen). The advantages resulting in this change will be gathered from the above comment. The scavenging of each road in the borough is done once per day at no greater annual cost than before.

GREENWICH.

In this borough 5 miles 7 furlongs, or an area of 94,073 yds., have been tar-sprayed, and the surveyor, Mr. E. J. Heward, states that the cost of cleansing and scavenging (including watering) for the year ending March 31, 1913, was £9,546, which is less by £286 than the average for the three years ended March 31, 1910, previous to which date little or no tar-spraying was done.

HAMMERSMITH.

Creosoted deal and bituminous macadam were laid in this borough during the year. The 8-in. by 5-in. by 3-in. creosoted deal blocks were laid with close joints run in with a mixture of boiling pitch and creosote oil, grouted with Portland cement and coated with a layer of ½-in. pea gravel on 8 in. of new Portland cement concrete in one case and on an existing foundation in other cases, at a cost per yard super, of 11s. 10d. with and from 7s. 2d. to 7s. 8d. without foundation. In Wells-road, a thoroughfare carrying considerable traffic, bituminous macadam was laid, consisting of 4 in. of granite in two coats grouted with Plascom, laid on a foundation of old macadam. The Plascom was laid

by the contractor, the road being scarified, the foundation prepared, and the granite laid by the borough council. The cost was 5s. 11d. per yard super. A larger quantity than usual of Plascom was laid as this road is a motor omnibus route. In another thoroughfare the bituminous macadam laid consisted of 3 in. of granite in two coats grouted with Keysite on a similar foundation to the foregoing, and laid in a similar manner, the cost being 1s. 6½d. per yard super.

In Waterloo-street 3 in. of granite was laid in two coats grouted with Plascom. One coat of the granite used was new, and the other old macadam. The excavation in this case was small, entailing only the taking up of asphalt blocks, the material being laid on a foundation of old asphalt blocks. The Plascom in this case was laid by the contractor, the road being excavated and the granite laid by the borough council. The cost of this work was 3s. 5d. per yard super.

The surveyor (Mr. H. Mair) states that 213,662 yards super. have been tar-sprayed in Hammersmith at a cost of £693, including labour in spraying.

HAMPSTEAD.

Both hard and soft wood were laid in this borough. The former laid in High-road, Kilburn, a road carrying considerable traffic, consisted of 9-in. by 3-in. by 3½-in. sectional Jarrah, the blocks being divided by in. thick, and the joints run with pitch and $\frac{1}{10}$ fillets creosote oil, grouted with Portland cement and sand. The paving was laid on an existing concrete foundation, which was made good and the whole surface rendered with Portland cement and river sand. The cost per yard super. was 13s. 6d. with foundation, and the Jarrah paving which this paving replaces had been down from nine to ten years.

The creosoted deal 9-in. by 3-in. by 4½-in. blocks were put down in Belsize-road, a road with considerable traffic. They were laid with close joints run in with pitch and creosote oil, and grouted with Portland cement and sand on a 9-in. foundation, at a cost of 6s. 2d. per yard super., without foundation. Similar paving was put down in West End-lane, 9-in. by 3-in. by 4-in. blocks being utilised, at a cost per yard super. of 6s. 10d., which included the cost of making good an existing foundation and floating the whole surface with Portland cement and river sand.

Tar-macadam, 4½ in. deep, was also laid, the work being carried out by the council at a cost of 3s. 6d. per yard super. with foundation, and a small area of Durax paving 3½ in. deep, laid on ¾ in. of tarred chippings, and grouted in with tar, at a cost of 8s. 11d. with foundation.

HOLBORN.

The only wood paving put down in this borough consisted of some 2,000 super. yds. of 3-in. Acme sectional Jarrah wood blocks 8½ in. by 3 in. by 3 in., laid in Woburn-square on an existing concrete foundation repaired and laid by a contractor at a cost of 13s. 6d. per yard super. with foundation and 11s. without foundation, the contract providing for three years' free maintenance. The Karri wood blocks which this paving replaces are stated by the surveyor (Mr. E. F. Spurrell) to have been down fourteen years. The traffic in this thoroughfare is limited, the annual cost of maintenance being 6d. per yard super.

The other paving laid in this borough consisted of compressed rock asphalt and granite setts. The asphalt was laid 2 in. thick, compressed with heated pelons, the foundation of Portland cement concrete varying from 6 in. to 12 in., according to the nature of the traffic carried by the street.

The cost of this asphalt was from 9s. 3d. to 9s. 6d. without foundation, and 11s. 9d. to 15s. 6d. with foundation. In the case of the higher figure, the Portland cement concrete foundation is 12 in. thick, and two years' free maintenance is provided.

A considerable quantity of granite setts have been laid, the size being generally 5 in. by 4 in., laid in pitch grout on a foundation varying with the nature of the street from 6 in. to as much as 14½ in. in High Holborn, where the traffic is particularly heavy. The cost of this paving per yard super. varies from 13s. 4d. to 13s. 5d. without foundation, and 10s. 10d. to 18s. with foundation, and in some cases redressed granite setts were used.

The asphalt which this paving replaced had been down from ten years (in Holborn) to twenty-nine years (in Hart-street).

ROYAL BOROUGH OF KENSINGTON.

The greater part of the new paving laid down in this borough consisted of creosoted wood blocks, 8 in.

in length, 3 in. in width, and varying in depth from 4 in. to 5 in. These were laid and grouted with tar pitch and cement on a Portland cement concrete foundation 6 in. to 9 in. in thickness. The cost of laying per yard super. varied from 6s. 3¼d. to 7s. 6d. without foundation, and from 9s. 3¼d. to 11s. 9¼d. with foundation. The thoroughfares previously paved with wood have lasted from ten to eighteen years; with cork asphalt, two years. A quantity of Kensington asphalt clinker blocks were laid in high-class residential thoroughfares, but the cost of these is not given.

Asphalt macadam was also put down in a residential thoroughfare to a depth of 3 in., at a cost of 4s. per yard super. without foundation.

CITY OF LONDON.

Approximately equal quantities of creosoted deal blocks and natural rock asphalt were laid in the City.

The thickness of the natural rock asphalt varied from 1½ in. to 2½ in., and the Portland cement concrete foundation from 4 in. to 9 in. The asphalt was compressed in situ, the cost per yard super. of the 1½-in. on a 4-in. foundation being 8s. 3d. with foundation and 5s. 10d. without foundation, and the annual cost for maintenance 4d. per yard super. The cost per yard super. of the 2-in. asphalt, which was laid on a 6-in. foundation, was 13s. 6d. with and 9s. without foundation, a credit of 9d. per yard being allowed for old asphalt, while the cost per yard super. of the 2½-in. asphalt, which was laid on a 9-in. foundation, was 14s. 6d. with and 9s. without foundation, 1s. per yard being allowed for old asphalt. The cost of maintenance per super. yard per annum being 1s. for the 2-in. and 1s. 3d. for the 2½-in. asphalt. The paving, presumably asphalt, which this paving replaced had lasted from twenty-two to twenty-six years.

Creosoted deal blocks, 3 in. by 7 in. by 5 in., were also laid, the joints being filled in with a boiling mixture of pitch and oil on a 9-in. Portland cement concrete foundation, at a cost per yard super. of 11s. 2d. with foundation, and 7s. 8d. without foundation, the cost of maintenance being 8½d. per yard super. per annum. On St. Andrew's Hill, a thoroughfare with a gradient of 1 in 19, the 3-in. by 9-in. by 5-in. creosoted deal blocks were laid with 1½-in. pitch pine strips inserted in every fourth course to improve the foothold on a 7-in. foundation, at a cost per yard super. of 13s. 9d. with and 9s. 1d. without foundation, the cost of maintenance per yard super. per annum being 9d.

LONDON COUNTY COUNCIL.

The return from the county council deals with paving laid in six boroughs, deal, Jarrah, sectional Jarrah and natural asphalt being the materials used. The work in each case was done by a contractor, and the foundations varied from 8 in. to 12 in. in thickness. The cost per yard super. of the softwood varied from 6s. 10d. to 9s. 2d. without foundation, and from 9s. 2d. to 13s. with foundation, while the hardwood cost 13s. 4d. without and 17s. 2d. with foundation.

ST. MARYLEBONE.

Only one description of wood paving has been used in this borough, both for renewals and new paving—namely, creosoted yellow deal blocks, 5 in. by 3 in. by 9 in., laid close, jointed and grouted with pitch and creosote oil. The new paving was laid on a 9-in. cement concrete foundation, at a cost of from 12s. 9d. to 14s. 2½d. per yard super. with foundation. As regards renewals, a new concrete foundation of from 9 in. to 12 in. in thickness was generally laid to replace the foundation previously existing, the cost per yard super. of the paving being from 8s. 4½d. to 9s. 11½d. without foundation, and from 10s. 11d. to 16s. 2½d. with foundation.

The annual cost of maintenance of this softwood paving is from 4½d. to 6d. per yard super., and the paving which this paving replaces had been down for from eleven to seventeen years.

An area of 101,092 super. yds. have been tar-sprayed at a cost of £737 12s. 7d.

Compressed asphalt, 2 in. deep, laid in a 6-in. cement concrete foundation, has been laid at a cost of from 11s. to 13s. per yard super. with foundation.

A considerable quantity of tar slag macadam was laid, the macadam being excavated to approved depths, and the surface consolidated and levelled, tarred slag being laid in two coats and rolled, the total thickness when finished being 4½ in., bottom coat 2½-in. gauge, top coat 1½-in. gauge, the surface

being covered with fine granite chippings. The price at this work, without foundation, when carried out by contract, was 4s. 8d. per yard super., and when carried out by the council with direct labour from 4s. 0½d. to 4s. 4½d.

WANDSWORTH.

In this borough only one description of new paving has been laid—namely, creosoted softwood (Archangel thirds) blocks, 8 in. by 3 in. by 5 in. These were laid dipped in a mixture of tar and pitch, and grouted with Portland cement mortar on a 9-in. Portland cement concrete foundation.

The work was carried out by a contractor on a lump sum contract, which included other works, but the price in the schedule attached to the contract was 13s. 9d. per super. yard for extra work with foundation. The creosoted deal blocks which some of this paving replaced had been down twelve years.

CITY OF WESTMINSTER.

Softwood and asphalt, and on steep gradients "combined strip" paving, were laid in the city of Westminster. The softwood consisted of 5-in. creosoted pine blocks laid close jointed, grouted with a mixture of boiling pitch and creosote oil, and after with cement grout, top dressed with 3-in. ballast on an 8-in. Portland cement concrete foundation, at a cost per yard super. of from 7s. 5d. to 8s. 3d. without foundation, and from 9s. to 13s. 2d. with foundation.

The asphalt was laid 2 in. thick on an 8-in. foundation, at a cost per yard super. of from 7s. 9d. to 8s. 6d. without foundation, and from 12s. 8d. to 14s. 4d. with foundation. The cost per yard super. of the "combined strip" paving was 10s. 6d. without, and 15s. 5d. with, foundation.

RETURN OF MILEAGE OF DIFFERENT KINDS OF PAVING AND MATERIALS USED AS EXISTING IN THE YEARS 1910-1912.

The committee append to their report a return ("A") compiled from information supplied to them by the officers of the City of London and fourteen metropolitan boroughs giving the mileage of the different kinds of paving and materials used, &c., as existing in the years 1910, 1911 and 1912. This return, it is anticipated, will be of interest if only as showing a considerable diminution in the quantity of slop removed in those boroughs where a marked increase has taken place in the mileage of tar-painted macadam roads as existing in the year 1912 as compared with the year 1910. In the Royal Borough of Kensington, for example, where, in 1912, 24½ miles of macadam had been tar-painted, the quantity of slop removed in that year was 19,130 tons as compared with 24,694 tons in the year 1910, when no tar-painting had been undertaken. In the borough of Wandsworth also the mileage of tar-painted macadam roads increased from 37 miles 3 furlongs 50 yds. in 1910 to 68 miles 2 furlongs 129 yds. in 1912, while the number and loads of slop, &c., removed was only 34,564 in 1912, as compared with 55,810 in 1910. It must, however, be remembered that the reduction in horse traffic must have an appreciable effect on the amount of slop.

RETURN OF COST OF MAINTENANCE, &c., OF ROADS IN THE CITY OF LONDON AND VARIOUS METROPOLITAN BOROUGHES.

The committee also append to their report a return ("B") showing the cost of maintenance, &c., of the roads in the City of London and various metropolitan boroughs. The expenditure under the first item—(a) maintenance (including new paving works), repair and improvement—of course, varies from year to year according to the number and importance of the streets repaved. Generally speaking, there has been a slight increase in the amount expended under this head, although in some cases the expenditure in 1912 was less than in 1910, and in others practically the same.

The expenditure for 1912 in respect of (b) cleansing and scavenging, including watering, with one or two exceptions shows an increase as compared with 1910, the principal exception being Wandsworth, where the expenditure under this head fell from £37,566 in 1910 to £30,888 in 1912, other reductions being noticeable in Fulham, Kensington and Paddington.

The appreciable saving effected under this item in certain boroughs is stated to be almost entirely due to the effect of tar-spray on macadam roads and asphalt construction.

An increase in the cost of scavenging in the borough of Holborn from £12,842 in 1910 to £17,177 in 1912, although less slop was removed in the latter year, is accounted for by an increase in the amount of the

scavenging contract, scavengers' and street orderlies' wages, increased cost of night flushing, including water, provision of additional hydrants, &c. The drop in the tonnage of slop is explained by the extension of cleansing by flushing in the place of other means, which naturally reduces the quantity of solid matter for removal.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain,
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii., 2.

SEWAGE DISPOSAL BY DILUTION.

To the Editor of THE SURVEYOR.

SIR, I have read Mr. Kershaw's letter in your last issue with some regret. Written by an official of the Royal Commission on Sewage Disposal, it will presumably be read as stating the official views of the Royal Commission. The paragraph on p. 7 of the Eighth Report which Mr. Kershaw quotes is par. 24, and relates to specially stringent standards and only to extreme cases. My previous letter referred to relaxation of the general standard, and not to increased stringency.

I am fully acquainted with his other quotations. Par. 16 refers to quality of water as a factor in a graduated scale of standards, and says "variations in the quality of the water should not be taken into account in fixing standards."

The important word appears to be "variations." As water of a certain defined quality has been assumed in fixing the general standard, and is specifically mentioned in par. 5, p. 7, as one of the conditions on which "a claim for a relaxed standard may be entertained," it is difficult to follow the suggestion that quality of the water is not to be considered.

Par. 55, p. 15, states "the scheme on which our suggested standards are based does not take directly into account variations in the quality of the diluting water." I agree. If variations were directly taken into account, then the formula on p. 4 would answer all purposes. A system of standards based on this formula is not recommended by the Royal Commission on three grounds (see pars. 14 and 15, p. 4)—(a) difficulty of administration, (b) unequal distribution of burden of purification, (c) unnecessary differentiation—and is followed by "we do not therefore recommend a system by which the degree of purification required for each separate discharge is determined automatically by the quality and the relative quantity of the water receiving it. Quality and quantity of river water are, however, highly important local conditions of which account should be taken in framing systems of standards."

If Mr. Kershaw's interpretation of the Royal Commission view is correct, I fear that little progress will be made in purifying the rivers in an industrial watershed. In the watershed in which I am interested—the Mersey and Irwell watershed—I have no doubt that the efficiency of sewage purification has reached a point when it can be said that the deficiency in dissolved oxygen in the main rivers in dry weather is chiefly due to pollution by trades waste.

Existing Rivers Pollution Acts only allow proceedings to be taken in the case of manufacturing pollution, after proof that there are reasonably practicable and available means for rendering harmless the polluting liquid. Even when all matters in suspension are removed, there remains a large amount of soluble pollution capable of vigorously destroying dissolved oxygen. The Royal Commission have been investigating for some considerable time the question of the treatment of trades waste, but no report has been issued. Is it at all likely that they will suggest, in any proposed standard, that it is practicable to remove these soluble oxygen-absorbing constituents?

Mr. Kershaw, from the last paragraph in his letter, seems to base his remarks on rivers which are polluted by sewage only. When he takes into consideration the great area of industrial rivers in Lancashire, Yorkshire, Derbyshire and Cheshire, he will surely not contend that relaxed standards based on volume only can possibly be entertained, and I venture to hope that no such suggestion is contained in the Royal Commission's Eighth Report.

If Mr. Kershaw is right in his interpretation, then I feel sure that strenuous opposition will be offered by rivers boards having jurisdiction over rivers in industrial areas to any legislation proposing relaxation of standards based on volume only.

I must apologise for the length of this letter, my

excuse being the importance of the points raised.—
Yours, &c.,

HUGH STOWELL, M.INST.C.E.,
Chief Inspector,
Mersey and Irwell Watershed.

41 Mosley-street,
Manchester.

February 21, 1914.

TRAFFIC STATISTICS: SEVERITY FACTORS.

To the Editor of THE SURVEYOR.

SIR, Accept my compliments on the splendid issue of THE SURVEYOR for January 30th. It is an excellent summary of the work of the past year in municipal engineering.

I was particularly interested in your very pertinent remarks on pp. 156 and 157 under the heading of "Traffic Generally," and perhaps this interest was intensified by my noting contemporaneously in the issue of the *Municipal Journal* of New York for February 5th a reprint on p. 168 of the paper of Colonel Wm. D. Sohler, presented before the American Road Builders' Association, on "The Need of Traffic Records." Colonel Sohler, the recently appointed chairman of the Massachusetts Highway Commission, states in his paper that "some uniform method of taking traffic counts and uniform formulae that will fairly represent the weight or damage done by different kinds of traffic based upon the weight per yard weight per year, or per day," is needed, "so that we can compare results," and this statement seems to accord, in general, with those made by you.

You printed on March 10, 1911, on pp. 364 and 365, an article by me in this connection, editorially emphasising, on pp. 358 and 359 of the same issue of THE SURVEYOR, the importance of certain points I suggested, and, I thought, endorsed them, as I infer you do now, the suggestion that it was most desirable to have general agreement on "severity factors" for use in connection with actual counts of traffic, so that comparisons between them could then be simply and readily made.

I do not think that the importance of an early agreement as immediately above suggested can be over-estimated, or that such general agreement concerning "severity factors" can be had at too early a date. Massachusetts and many other of our States are rapidly accumulating traffic data, some of which, at least, if put in proper shape, would be of the utmost value immediately as well as in the future; but if these accumulations and the progress from them are allowed to drift along, or to proceed on lines that are not co-ordinated, there will unquestionably be considerable loss and delay result when the inevitable general agreement shall finally have been made.

Many American engineers naturally look to the conclusions of the British Road Board for information of the greatest value. Colonel Sohler says that "the English Road Board has adopted an assumed weight for various vehicles, and many traffic statistics based upon this formula have been made, and are now available in various reports. We could well adopt the same formula based upon American tons, so that we could compare our results with others upon a uniform basis."

I feel that the British Road Board is in an advantageous position for doing highway engineers an enormous amount of good in this matter. As a national body of the first importance, if they would consider this matter of "severity factors" in connection with traffic censuses, and lay down a rational schedule of that sort, I believe their conclusions would be readily followed at least by many American engineers (of course, with such modifications as different conditions or customs made necessary), and that a veritable mine of information concerning the value of methods and materials for road crusts and pavements would be opened up. Unless they do it fairly promptly, it seems to me that the opportunity will be lost, or at least that it cannot be again presented to anyone with as few encumbrances in the shape of accumulations of records or of misdirected efforts.

Will you not therefore continue to use your influence to bring about general agreement on some rational method by which a comparison of traffic censuses may be had?—Yours, &c.,

W. W. Crosby.

Baltimore, Maryland.
February 10, 1914.

[We are much gratified by Major Crosby's good opinion of our Annual Issue. His letter is, we con-

sider, a very weighty communication on this important subject, and we shall refer to it in our next issue.—Ed. SURVEYOR.]

BROKEN GRANITE: THE BRITISH STANDARD SPECIFICATION.

To the Editor of THE SURVEYOR.

SIR, In revising specifications for broken granite, I naturally thought that a specification which is over twelve years old might be out of date when matters in connection with roads are supposed to progress in proportion with the talent brought to bear upon them by the eminent authorities one sees on the Standards Committee on Road Material. It was therefore my intention to adopt the British Standard Specification for sizes of broken granite. The size I use is 1½-in. gauge, the standard specification for which reads as follows:—

Broken stone specified a 1½-in. gauge shall all pass through a 1½-in. ring, and shall consist of the following percentages by weight:—

Not more than 15 per cent passing through a 1-in. ring in every direction.

Not less than 65 per cent over 1 in., and not exceeding 2 in., in greatest length by measurement.

Not more than 20 per cent over 2 in. in greatest length by measurement.

On reading it through for the first time on Thursday, I could hardly believe my eyes. Fifteen per cent allowed to pass through an inch ring; this, so far as the specification is concerned, might be dust. Of the 65 per cent over 1 in., and not exceeding 2 in., in greatest length by measurement, no minimum thickness is given, so that the whole of this 65 per cent might consist of flat, thin pieces which would offer little or no resistance to the crushing effect of traffic, while the remaining 20 per cent might be over 2 in. in greatest length; in fact, were it possible to manufacture such material, it might be 3 in. in length.

The same wording is practically used in specifying for other sizes.

I thought it only right to call the attention of surveyors to the faulty nature of this specification, as I understand many have adopted it. Woe befall them if they fall into the hands of contractors who take advantage of the specification in question! Yours, &c.,

C. H. COOPER, M.INST.C.E.,
Borough Engineer and Surveyor,
Wimbledon.

February 20, 1914.

THE INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

To the Editor of THE SURVEYOR.

SIR,—I was very pleased indeed to see in your last issue the letter from "Member of the Institution," which deserves the deepest study of the younger members. In my humble opinion, the institution will be sadly left behind unless something is done, and that quickly, to improve the present wretched outlook of the younger members.

I think the example of the Surveyors' Institution might well be followed, and about four young members—who know and feel the hardships existing—elected to the council. These members should not be over 35 years of age, hold the testamur, should not hold a chief appointment or be engaged in the same office as another member of the council, and their travelling expenses should be paid from the funds.

Why should not the testamur of the institution be accepted throughout the country as the highest and best, and the *only* qualification desirable for municipal appointments? The present heavy fees and expenses of joining several institutions are a serious drag on ambitious young men.

The existence of two rival institutions is nothing short of a disgrace to the municipal engineering profession. What are members of a public body to think of members of a profession who cannot agree among themselves? Young members should pause to think how the rivalry has come about.

I think amalgamation with the Institution of Municipal Engineers, and making the holding of the testamur absolutely necessary for admittance to the institution, are very desirable. I do not think any real and lasting progress will be made unless these reforms are carried out.

What the institution needs are young fighting men who will not pander to any institution, but who will exercise their powers to the utmost to do something practical to improve the present state of affairs.

What *can* be done is shown by the magnificent

example recently set by the National Union of Teachers, whose profession is not a "closed" one.—Yours, &c.

ANOTHER MEMBER.

February 24, 1914.

THE SUPERANNUATION BILL.

To the Editor of THE SURVEYOR.

SIR, May I be permitted the use of your columns to call attention to the proposed superannuation scheme as approved at a recent meeting of the National Council of Local Government Officers?

As the Bill is now drafted, it would appear that all municipal officers who have attained sixty years of age when the scheme becomes operative are to be excluded from its benefits; and, further, that on an officer attaining the age of sixty-five years the local authority in whose service he is may retain his service for a further period not exceeding three years, when his retirement is to be compulsory.

The ranks of municipal officers contain many good and capable men who have, or who will have by the time the Bill becomes operative, attained the age of sixty years. It is due to the strenuous and life-long exertions of these during many weary years of office that superannuation of local government officials generally is at length in sight, and by the irony of things it is now proposed that they shall be debarred from participating in it.

It is to be hoped that the Parliamentary Committee of the Institution of Municipal and County Engineers will keep a wary eye on this Bill, and see that none of its members are to be treated in the manner proposed, and that local authorities who wish to retain the services of experienced and trusted officers, whom they consider capable of satisfactorily discharging their duties, are not to be compelled to dismiss them and turn them adrift at an age when they may be expected to be unfitted to take up other work.—Yours, &c.,

M. INST. M. AND C. Y. E.

February 21, 1914.

Torquay Meeting Arrangements.—We received yesterday particulars of the arrangements made in connection with the South-Western District meeting of the Institution of Municipal and County Engineers which is to be held at Torquay on March 21st. The proceedings will open at the town hall at noon, when the question of nominations for district officers for the ensuing year will be discussed. A visit to the recently completed pavilion will follow, and after lunch an inspection of the new town hall and municipal buildings will be made. Mr. H. A. Garrett, the borough surveyor, will give a description of the pavilion buildings in the course of the meeting.

Bradford's Sewage By-products.—The income derived from the grease and the sludge, together with the rents paid by the tenants of the Esholt Hall estate, kept the cost of sewage disposal in Bradford last year down to a 4⁵d. rate. Last year the total cost was £89,000, towards which the grease alone contributed no less than £48,000. The call upon the rates was only £31,000, which is £2,000 less than is required to pay the interest and sinking fund charges on the undertaking. These charges will, of course, eliminate themselves in course of time. Apart from the capital charges, the Bradford sewage works have the unique distinction of being self-supporting. The grease produced at the works finds a ready market among grease distillers, who get from it oleine, stearine, and pitch. The prices obtained vary with the state of the market between £8 and £11 per ton, and between 100 and 120 tons are produced every week of the year. After leaving the presses the sludge is broken up, and a great deal of it is pressed into oval lumps, each about the size of a man's fist. This is done to suit the convenience of foreign customers, who prefer to receive the manure in this form, packed in sacks. From 7s. to 11s. a ton is paid for the manure, and about 600 tons are dealt with each day. Large quantities have been sent to fertilise the vineyards and sugar-beet fields of France, the market gardens of Belgium, and the cotton fields of Florida. Its fame, however, appears to be spreading farther than this, for recently, in response to a request, says the *Yorkshire Post*, a sample was sent out to a tea garden in India on the slopes of the Himalayas. English manure manufacturers and merchants are using it, too, in increasing quantities, and Bradford is able to get rid of all it produces.

THE MUNICIPAL UNDERTAKINGS OF OUNDLE.*

By G. BILSON CHELVERS, M.I.M.S.E., M.R.S.A.N.E.,
Engineer and Surveyor to the Urban District Council.

The town of Oundle is of a picturesque and old-world appearance, and most of the buildings are of stone covered with Collyweston stone slab roofing. The population of the urban district is nearly 3,000 persons, with an area of 2,076 acres. It has a rateable value of over £13,000. The town is the centre of an agricultural district, and its only industry is a brewery; although at one time it was a recognised market centre for farmers and others, this business undoubtedly has gradually become less, although the establishment of a cattle market by a private company in the year 1910 has, I understand, stimulated it somewhat, and the business transacted has increased each year. At Christmas last the first fat stock show was held with great success.

The principal feature of the town is, without doubt, the school and buildings of the Grocers' Company, and these give it much importance. The company are almost yearly erecting new buildings to provide better educational facilities, and at present have in course of erection a large building to be used as a science and engineering block. Very few of the large public schools have buildings to compare with them, and generally the facilities afforded for education compare favourably with such public schools as Repton, Rugby, Cppingham, Bedford and Marlborough.

The town is efficiently sewered and drained, and it also owns the waterworks; the present schemes of water and sewerage were carried out in 1892, although several alterations have been made since then. We endeavour, as far as possible, to keep up to date, and generally, I believe, the town will compare favourably with any other about the same size. I will now briefly describe the undertakings of the council.

WATER SUPPLY.

The town water supplies nearly all premises in the district; it is of a satisfactory character, except that it is somewhat hard, being of about 21 deg. temporary and 6 deg. permanent hardness. The source of the supply is the river, the water infiltrating through gravel to a gathering well 21 ft. deep and 50 yds. distant, a 9-in. glazed stoneware pipe with open joints being laid from a point 15 yds. from river to the well to assist in the collection of the water. For some time the flow of water has been exceedingly low, and on my advice the council have decided to extend the gathering pipe for a distance of 25 yds. at a right angle to the present pipe, and running parallel with the river. The work is to be carried out with pipes perforated in the top half, and the gravel excavated is to be twice screened to remove sand and pieces 1 in. or less in size. The larger pieces will then be placed directly on the top of the pipes, the 1 in. or less will form a second layer, and the sand a third, the remaining portion being filled up to the ground level with surplus material. From the gathering well the water is pumped by a centrifugal pump to sand filters, and thence by a treble-plunger pump direct to the mains, the surplus going to a reservoir of 70,000 gallons capacity situate about 1½ miles from the pumping station on the north-west side of the town. The average daily consumption is about 90,000 gallons, which is, I think, somewhat high.

With regard to the hardness of the water, the council have under consideration the question of installing a softening plant, the estimated cost of which for treating 9,000 to 10,000 gallons per hour would be about £650, including lime store, foundations and pipe connections. The hardness of the water being due principally to carbonate of lime, the cost of softening will be at the minimum, and roughly would entail an annual outlay of £26, or about 3d. per 1,000 gallons, to reduce to 6 deg. Expenditure which entails an increased rate is usually delayed, although sometimes it is false economy, and it is probable that the outlay in this case would be more than covered by the saving effected in not having to scale boilers and pipes. Less soap would, too, be required for all purposes, and I believe it is recognised that a moderately soft water is more healthful than a hard one.

SEWAGE DISPOSAL.

The sewage from the main portion of the town gravitates to the sewage disposal works, a small portion only gravitating to a large underground tank near the

South Bridge, whence it is pumped into the higher level sewer by means of a pump driven by air compressed at the waterworks pumping station. The sewage disposal works are rather primitive, the treatment being precipitation by aluminio-ferric, after which the sewage passes through two settling tanks and thence direct to the river. The effluent is, I consider, fairly good considering the method of treatment, but is undoubtedly much below the usual standard. The tanks are in duplicate, and are allowed to run from three to four days before they are cleaned out. An ejector is installed for the purpose of pumping the top water on to land, and the sludge to sludge beds. Until last year the ejector was worked by the compressor plant at the waterworks pumping station, but owing to leakages in the air main a petrol-engine and air compressor was installed on the site with far better results. With a view to obtaining a more satisfactory effluent, I have brought before my committee the question of installing filter-beds and doing away with the use of precipitants, the annual cost of which amounts to £28, and I estimate that for an extra expenditure of £5 per annum to cover repayment of a loan and interest, two 70 ft. diameter percolating filters, with sprinklers and other works necessary, could be installed at a cost of from £550 to £600. The average daily dry-weather flow is 70,000 gallons, approximately.

REFUSE DISPOSAL.

House refuse is collected from nearly all the premises in the town twice weekly, the receptacles being placed ready for tipping into the carts. The major portion of the refuse is carted to the sewage disposal works, where the tins are sorted out and the paper burnt, the remainder being then mixed with the sludge from the settling tanks, and ultimately carted away by farmers and others for use on the land. The effect of the mixing apparently neutralises any smell, and no nuisance is caused.

HIGHWAYS.

There are 3 miles of main roads in the district, and these are maintained by the council under agreement with the county council, the amount allowed being £400 per annum, under a five years' agreement. This amount is for all work done, including repairs, paving, kerbing, and channelling; one-third only of the cost of scavenging is allowed. At present the whole of the repairs are being carried out with Tarmia binding, a section being done each year, and towards the extra cost (amounting to about 4½d. per square

yard) the Road Board contribute three-fourths and the urban council and the county council one-eighth each. The total cost during the last three years has been from 1s. 6½d. to 1s. 9½d. per square yard, 3 in. to 3½ in. thick. There are about 7 miles of district roads under the council's jurisdiction, and the repairs to these have been carried out with granite and slag by the ordinary method, except two short sections. These have had a binding of tar and pitch, which has, I think, stood well. During the coming year I am hoping to lay a section with Tarmac.

The main streets have been surface tarred each year, and the cost has been from 62d. to 84d. per square yard, ordinary gasworks tar at 2d. per gallon, being used. The variation in cost is due to the material (sand, slag, or granite chippings) used for surface dusting or sprinkling.

STREET LIGHTING.

The whole of the built-upon area of the district is lighted by the council, upright incandescent burners being used. I am hoping gradually to convert them to the inverted type, and the new lamps on the North Bridge are the first start in the matter. The gas is supplied by a private company, who light and clean the lamps and supply mantles for a charge of 36s. per lamp during the period from August 15th to May 1st, the lamps being kept alight until 12 midnight. An additional charge of 3d. per lamp is made for certain lamps lighted during the whole of the night. The lamps are not lighted for three nights before and three nights after a full moon, except on dark nights.

FIRE BRIGADE.

The town has an efficient volunteer fire brigade, towards the expenses of which the council contribute. An effort is being made to procure a new steam fire engine, the cost to be raised by voluntary contribution. The brigade is then to be reformed and to come under the direct control of the council.

BATHING PLACE, RECREATION GROUND AND ALLOTMENTS.

The council also maintains an open-air bathing place, which is very popular during the season. Dressing sheds are provided, and an expert swimmer is in constant attendance. Two hours daily from 11 a.m. to 1 p.m. are reserved for the use of females and boys in their charge under ten years of age, and this is greatly appreciated, a large number making use of the privilege. The council also rent a small recreation ground and provide allotments.

CEMETERY.

The cemetery, which is under the council's control, is about 3 acres in area; it is acknowledged to be laid out, planted and kept in very good condition, a caretaker being constantly employed. It compares very favourably with any I have ever seen.

ISOLATION HOSPITAL.

The council have entered into an agreement with the rural district council for the joint use of their hospital, the urban district council having agreed to contribute £1,000 towards a sum of £1,200 to be expended on the erection of a new ward block containing eight beds and the usual offices. The new building is to be a brick structure. The existing buildings comprise administration block, containing caretaker's and nurses' rooms, &c.; office block, containing mortuary, laundry and disinfecting station, &c.; ward block of eight beds, this building being a galvanised iron structure. On the completion of the new work the two councils will become joint owners, and the affairs will be managed by a committee elected from the members of each body. The cost of administration will be shared by the councils in the proportion of quarter urban and three-quarters rural. The architects for the new work are Messrs. Traylen & Son, of Stamford, and tenders are now being invited.

The district possesses, it may be added, a golf links of nine holes, situate about 1½ miles west of the centre of the town, and maintained by a golf club. There are also splendid facilities for rowing, fishing, quaits, bowls, and other sports.

Business Announcement. — Hill's Patent Motor Vacuum Road Cleanser, Limited, of 4 Broad-street-place, E.C., have acquired the services of Mr. W. Afford Blythe, A.M.I.M.E., as engineer to their company. Mr. Blythe comes from Messrs. J. & P. Hill, Ordnance Works, Sheffield, for whom he was chief draughtsman and plant engineer.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC. M. INST. C. E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:

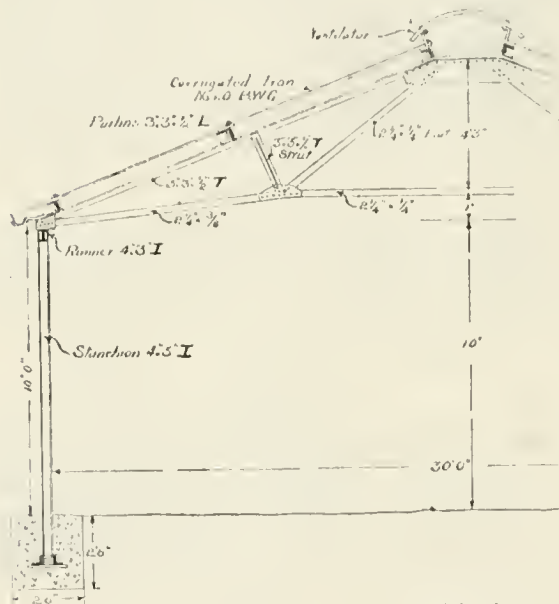

381. Town Planning. An area of 1,000 acres, chiefly undeveloped, in an urban district, is to be included in a town planning scheme. The approximate number of owners, occupiers and lessees is 250. Assuming that the referencing is to be done by the staff of the urban district council surveyor's office, state the information which should be sought, and the best method of ascertaining and recording it. Give an estimate of the cost of the work if done by professional

383. Grain Silo. It is required to construct a grain silo, the bins of which are 64 ft. in height and 8 ft. square in cross-section. What lateral pressure at the base should be provided for? (X. X., Hounslow.)

384. Timber. Sketch the cross-section of an oak tree and show the different modes of conversion. How does oak compare with elm for use inside or outside a building?

REPLIES TO QUESTIONS.

370. Temporary Building Design. A temporary building is required, 50 ft. long, 30 ft. wide, and 10 ft.

SECTION

DETAIL AT FOOT OF TRUSS

ELEVATION

TEMPORARY BUILDING DESIGN.

referencers. Compare the advantages and disadvantages of the two methods, both in the above case and in the case of an area of 1,500 acres in the same district, which includes a considerable extent of partially developed building estates, and is to form the nucleus of a later scheme. (Togun.)

382. Fire Hydrants. Fire hydrants, 2 1/2 in. in diameter, are taken from a 4-in. and a 12-in. main. What will be the ratio of discharge in the two cases, assuming that the initial pressure is the same in each main? (X. X., Hounslow.)

to eaves. Design a suitable structure, with steel trusses and stanchions, to be covered with corrugated iron on boards and felt, the bays to be filled in with 4-in. reinforced brickwork. (J. M. N., Hitchin.)

In the design of a small building in which the loads are small, the sizes of the steelwork are often determined by practical considerations only, but should, nevertheless, be checked to insure sufficient strength.

The general arrangement of the steel in the building will be seen in the elevation. The trusses,

spaced at 12-ft. 6-in. centres, will be four in number, and carried by runners. The latter are supported by six stanchions, four of which form the corners of the building.

The trusses of the simple type shown in the section are in general use for spans up to 35 ft., and the dimensions of the members are taken from practice. If a stress diagram for this roof be drawn, the loads in the members would be found to be so small that the sections thus determined would be quite impracticable.

The roof will be covered with corrugated iron sheets 8 ft. by 3 ft. in dimensions, and of No. 20 B.W.G. thickness, attached to the angle iron purlins by hook bolts, with washers. In fixing the sheets, 3 in. lap at the sides must be allowed, so that bolts will be put in at intervals of 2 ft. 6 in. It should be noticed that these bolts should pass through the ridges of the sheets, and not the valleys, or leaks will occur. As the rafters are 16 ft. long, two layers of sheets 8 ft. long will be required, and these can be fixed to the three purlins, as shown in the section.

The curved ventilator, formed of corrugated iron, is supported by Zed bar cleats, 3 in. wide, riveted to the top purlins at intervals of 4 ft., and adds to the appearance of the roof.

The eaves gutter is supported by bent wrought-iron strips 3 in by 3/4 in., 4ft. apart, which may be riveted to the sheeting, the rafters, or the runners.

In order to fix the size of the stanchions, the loads transmitted by the roof must be found.

The central stanchions carry the load of two trusses and one-half the total load of the roof.

The loads on one stanchion are as below:—

Weight of 1 truss—

37 ft. 3" x 3" x 1/2" T, 8 lb. per ft. = 296 lb.

50 ft. 2 1/4" x 1/4" flat, 1.89 lb. per ft. = 94

390 lb.

Weight of corrugated iron roofing = 3 cwt. per 100 sq. ft. (Molesworth).

Area of roof over 1 stanchion = 16' x 25' = 400 sq. ft.

∴ Load due to this area = 400 x 336 = 1,344 lb.

Maximum wind pressure = 40 lb. per sq. ft. horizontal

∴ Vertical load due to this = 40 x 341 lb. (Molesworth) = 13,640 lb. sq. ft.

∴ Total load due to wind = 400 x 13.6 lb. = 5,440 lb.

Total load on 1 stanchion = 7,174 lb.

The stanchion adopted will be 4 in. by 3 in., 1 section, as it is impracticable to use a smaller, and this is amply strong for direct loads, as may be shown by checking by Rankine's formula for struts.

$$P = \frac{A \times f_c}{1 + a \left(\frac{L}{K}\right)^2}$$

P = permissible load
 A = area of section
 K = least radius of gyration
 L = equivalent length of a pin-jointed strut
 f_c = 7.0 tons sq. in.
 a = $\frac{1}{300}$

$L = \frac{2}{3} \times 10 \text{ ft.} = 6.67 \text{ ft.}$
 From a table of British standard sections
 for a 4" x 3" I
 $A = 2.80 \text{ sq. in.}$
 $K = .677 \text{ in.}$

$$\therefore P = \frac{2.80 \times 7 \times 2,240}{1 + \frac{1}{9,000} \left(\frac{6.67 \times 12}{.677}\right)^2} = \frac{43,900}{1 + 1.544} = 17,280 \text{ lb.}$$

This extra strength will guarantee the safety of the stanchion for eccentricity of fixing the trusses.

As the runners are supported along their whole length by the brickwork, we may assume that the load on them is solely the dead load—i.e., neglect wind.

Central load on 25 ft. of runner = load on 1/2 truss.

Weight of 1/2 truss = 195 lb.

Weight of 200 sup. ft. roofing = 672 lb.

867 lb.

Bending moment—

B. M. = $\frac{W.L}{4} = \frac{867 \times 25 \times 12}{4} = 65,000 \text{ in. lb.}$

$M = f_t \times Z$ where $f_t = 7.5 \text{ tons sq. in.}$

∴ $Z = \frac{65,000}{7.5 \times 2,240} \text{ in.}^3 = 3.87 \text{ in.}^3$

∴ In table of sections 4" x 3" I section will be found suitable for the runner.

The stanchions will be bedded in 2 ft. 6 in. of 6:1 concrete, and the walls will have footings at least 9 in. wide, carried down below the top soil.

The windows may be of the ordinary cast-iron pattern, as shown; but these and the doors will depend upon the exact requirements of the building, which are not stated.

The boards and felt are not included in the design, as the combination is not very practical; but if really required they may easily be allowed for in the foregoing. (H. V. O., West Bromwich.)

FAILURES OF RESERVOIR DAMS.

SOME TYPICAL EXAMPLES.

In a paper read before the Liverpool Engineering Society Mr. J. R. Davidson selected five dam failures of historical interest, all attended with serious loss of life and destruction of property, and after describing the circumstances in each case considered the lessons to be learnt from them.

The examples he selected (the *Times* Engineering Supplement reports) were the Puente dam, of rubble-faced with ashlar, which was built towards the end of the eighteenth century at Lorea in Spain, and which failed in 1802 owing to the erosion of water percolating through a permeable stratum of sand and gravel in its centre, the Bouzey dam in France, from which, in 1895, a huge block of masonry 594 ft. long and 32 ft. deep was suddenly torn out and hurled down stream, the cause being tensional stresses set up at a point at which there was little more to resist them than the tensile strength of a weak mortar; the Dale Dyke or Bradfield dam near Sheffield, an earthen embankment which gave way in 1864 owing to water under high pressure perforating the puddle wall at the line of the pipe trench, eroding material from the inner portion of the bank, and thus causing settlement immediately above the fault; the South Fork dam, Pennsylvania, near Johnstown, which failed in 1889, because owing to heavy rains the water overflowed the embankment and washed it away until ultimately a breach was formed 420 ft. wide at the top and 50 ft. at the ground level; and the Austin dam, where in 1911 the concrete wall fractured into seven pieces, percolation of water under the dam causing one layer of the rock upon which it was built to slide over another, and also permitting an upward pressure, approximating to that due to the head of water in the reservoir, to be brought to bear on the base, thus virtually reducing the weight of the dam.

He summarised the lessons to be learnt from these failures as follows: (1) A gravity dam of masonry should be founded wholly on rock; (2) tensions should be practically non-existent in a masonry dam; (3) in an earth dam provision should be made for settlement and unequal settlement prevented; (4) adequate provision should be made for exceptional floods in every case; and (5) in a masonry or concrete dam a secure foundation should be obtained and precautions taken to guard against uplift. Examination of a large number of failures, he thought, leads to the conclusion that unsound foundations have been the most fertile source of disaster to masonry and concrete dams, while in the case of earthen embankments either inadequate provision for dealing with floods or faulty arrangements for drawing off water have been chiefly responsible for failure.

A New Athens.—Mr. Thomas H. Mawson, lecturer in landscape design at the University of Liverpool, and author of two standard works on landscape architecture, has just been entrusted, on the personal recommendation of the King and Queen of Greece, with the preparation of the plans for the extension, remodelling and beautification of Athens on a vast scale. The scheme includes the provision of a great modern railway station, where the railway lines now running to three separate termini will converge together with the new line which is to bring Paris within forty-eight hours of Athens. Outside there is to be a vast piazza, laid out with beautiful gardens, statuary and colonnades, from which radial avenues will be carried through the city. The piazza will command a fine view of the Acropolis at the back, the Temple of Theseus on the right, and the new Houses of Parliament piled up on a hill at the end of a great boulevard.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Bexhill T.C. (February 10th. Mr. F. H. Tulloch).—£3,710 for the laying out of land near Egerton Park for the purposes of public walks and pleasure grounds.—The town clerk, Mr. G. Ball, stated that the council were anticipating a development of Bexhill, and were endeavouring to provide a recreation ground. They were therefore going forward with a scheme of filling up the ground with house refuse. Expenditure was being incurred week by week, and it was desirable, in view of this, that the loan should be applied for.

Blifield R.D.C. (February 18th. Major J. Stewart).—£8,200 for purposes of sewerage for the parish of Thorpe.—Mr. Arthur J. Martin, M.A.S.T.C.E., engineer for the scheme, stated that the work would be done by contract, but no tenders had been obtained yet. After an exhaustive survey of the district, and the consideration of a number of alternative sites for purification works, he prepared the scheme which formed the subject of the Local Government Board inquiry held on March 6, 1912. Since the holding of that inquiry the district council had come to an agreement with the corporation of the city of Norwich, by which the latter had undertaken the pumping and treatment of the sewage. He accordingly prepared the new scheme, in respect of which a loan was now being applied for. The scheme included a complete set of sewers for the village, with all necessary manholes, ventilating shafts, &c., as well as a pumping station and rising main. The city engineer of Norwich, Mr. A. E. Collins, M.A.S.T.C.E., also gave evidence.

Castlecomer R.D.C. (February 18th. Dr. T. H. Browne).—This was an inquiry into a proposed lighting scheme.—The clerk, Mr. Denis O'Carroll, gave evidence generally as to the necessity for the scheme, and Mr. Edward Fogarty, engineer to the council, also gave evidence in support of the application.

Essex C.C. (February 13th. Mr. H. R. Hooper).—£6,000 for the purchase of property in Duke-street and Threadneedle-street, Chelmsford, as a site for new county offices.—It was stated that the property had already been purchased, but the application for a loan had been deferred until the council were able to ascertain the full extent to which they were likely to require increased accommodation.

Londonderry T.C. (February 18th. Mr. P. C. Cowan).—This was an inquiry regarding a temporary and emergency water scheme.—In the course of the proceedings the inspector said he felt that his board would not take exception to his going outside the scope of his official duties and exhorting the Derry Corporation to proceed at the earliest possible moment with the provision of an ample supply of pure water for the citizens. For fifteen years the corporation had been carrying out small schemes which experience showed to be only expensive stop-gaps. These they had invariably entered upon in the face of expert advice. The result had been that in the autumn of 1911 the city was on the verge of a water famine, which could not have failed to prove disastrous.

March U.D.C. (February 9th. Mr. W. H. Collin).—£2,900 for the purchase of 6 acres of land.—The land in question, being about 1½ mile from the station, it was explained that the council proposed to build houses, more particularly for labouring men, to take the place of the insanitary houses at present occupied, and they could follow the scheme up by building again nearer the station if the railway company did not. It was stated that the rent of the proposed houses would be 4s.

Mexborough U.D.C. (February 11th. Mr. M. K. North).—£400 for laying out the Castle Hills Park.—The surveyor, Mr. G. P. Carter, explained that the area of the land was 17,977 sq. yds. The council intended to have a bowling green on the site.

Warrington T.C. (February 12th. Mr. T. C. Ekin).—£14,551 for the extension of the electricity works and plant.—The deputy town clerk, Mr. A. T. Hallaway, explained that the principal reason for the loan was that the corporation had not a sufficient margin of safety for their present demand. The maximum capacity of the plant was 3,150 kw., and the maximum demand was 2,409 kw. Since December they had contracted for further connections amounting to 422 kw.,

which brought them to their maximum capacity. The present application would increase the capacity by 1,000 kw.

APPLICATIONS FOR LOANS.

Bangor (Co. Down) U.D.C.—£550 for the provision of Venturi water meters, and £3,800 for a public park.

Beckenham U.D.C.—£700, supplemental loan for road reconstruction.

Blyth U.D.C.—£400 for street works.

Buckhurst Hill U.D.C.—£850 for works of street improvement.

Carshalton U.D.C.—£1,100 for improvements in Carshalton Park.

Earby U.D.C.—£1,670 for the purposes of the depot and road widening.

East Ardsley U.D.C.—£2,442 for the erection of twelve houses.

Egremont U.D.C.—£1,739 for street construction and sewerage.

Frinton U.D.C.—£600 in connection with the sewer outfall.

Hastings T.C.—£610 for sewerage works.

Hayes U.D.C.—£200 for street and sewerage works.

Ipswich T.C.—£1,000 for extensions of the Orwell electricity works.

Llandudno U.D.C.—£11,000 for the purchase of land for golf links.

Merthyr T.C.—£860 for the provision of manual instruction and domestic subjects buildings at a school.

Rowley Regis U.D.C.—£10,000 for paving works, and £200 for cemetery extension.

Southend T.C.—£500 for a main sewer.

Spalding R.D.C.—£1,680 for the erection of eight cottages at Quadring, and £1,150 for six cottages at Surfleet.

Sutton-in-Ashfield U.D.C.—£20,000 for a sewerage scheme.

LOANS SANCTIONED.

Congleton R.D.C.—£300 for sewage disposal works.

Dawlish U.D.C.—£5,525 for the purchase of land in connection with the water undertaking.

Earby U.D.C.—£4,638 for extensions at the sewage disposal works.

Knarborough R.D.C.—£280 for drainage works.

Monaghan R.D.C.—£1,250 for the erection of working-class dwellings.

Selby U.D.C.—£8,800 for the provision of working-class houses, and £600 for street works and sewerage.

Wantage R.D.C.—£1,000 for the erection of four cottages.

FORTHCOMING INQUIRIES.

MARCH.

	£
2.— Finchley. For the provision of working-class dwellings (Mr. W. H. Collin) ...	93,443
3.— Haslemere. For the purposes of a depot (Mr. F. H. Tulloch) ...	1,300
3.— Irlam. For a housing scheme (Mr. C. H. Eyles) ...	36,780
3.— Rhondda. For the purposes of the gas and water undertakings, and laying out a burial ground (Major J. Stewart) ...	17,000
3.— Seaford. For the purchase of land for a pleasure ground (Mr. Edgar Dudley) ...	1,100
3.— Whitehaven. For works of sewage disposal (Mr. W. M. Cross) ...	2,800
4.— Brighton. For works of street improvement (Mr. Edgar Dudley) ...	2,515
4.— Carlisle. For street and electricity purposes (Mr. W. M. Cross) ...	31,560
4.— Dewsbury. For the purchase of land for sewage disposal (Major C. E. Norton) ...	2,650
4.— Pontypridd. For the purposes of the gas undertaking (Major J. Stewart) ...	4,700
5.— Hove. For street improvement (Mr. Edgar Dudley) ...	10,000
5.— Newport (Mon.). For the provision of a refuse destructor (Major J. Stewart) ...	11,697
5.— Southend. For the purposes of baths, bridge, building alterations, and public conveniences (Mr. M. K. North) ...	7,000
6.— Wantage. For sewage disposal purposes (Major J. Stewart) ...	350
6.— West Hartlepool. For public library extension (Mr. W. M. Cross) ...	2,200

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Cardiff, Deptford, Portland £3,000, Stockton; housing and town planning—Lynn; roads and materials—Lewisham £24,474, Limerick £54,000, Whitby £14,000; sewerage and sewage disposal—Camborne £25,000, Cleethorpes £13,750, Sutton-in-Ashfield £20,000, Uckfield £12,512; water, gas and electricity—Dunfermline.—Particulars of other projected works will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Bath T.C.—A small pavilion is to be erected in Alexandra Park, at an estimated cost of £150, for the use of bowlers and the public generally.

Cardiff T.C.—The question of providing more public baths, including cottage baths, is to be considered in committee.

Cumberland C.C.—A committee has been appointed to report on the best means of providing improved accommodation for the council and the staff.

Deptford B.C.—A conference of the Baths and Wash-houses and Libraries Committees has adopted the plans of the borough surveyor, Mr. John Sutcliffe, ASSOC. M. INST. C.E., for combined baths and library, giving to each service distinct and separate means of administration. Mr. Andrew Carnegie is defraying the cost of the library, and until he has given his approval to the plans the scheme is not to be submitted to the council.

Lewisham B.C.—The Works and Highways Committee have under consideration the construction of a public convenience near Forest Hill railway station.

Llanelli T.C.—The council are giving consideration to a proposal for the construction of an underground convenience, at an estimated cost of £1,050.

Manchester T.C.—The city architect has received instructions to prepare plans for a tramway shelter and public convenience at the southern cemetery.

Newark T.C.—£2,000 is to be paid for property adjoining the town hall, and it is proposed to erect upon the site a police court, police station, and a public hall.

Portland U.D.C.—It is proposed to build new council offices at a cost not exceeding £3,000, and certain architects have been requested to submit rough sketches of the proposed buildings.

Saltburn U.D.C.—An isolation hospital is to be erected at Marske-lane, at an estimated cost of £600.

Stockton T.C.—The council are giving consideration to a report by the borough engineer, Mr. M. H. Sykes, upon the proposed new municipal offices.

Stonehaven T.C.—It has been agreed to erect an additional shelter on the beach.

Stratton and Bude U.D.C.—The tender of Mr. E. Hannaford, at £154, has been accepted for the construction of a public convenience near the fire station.

Tyrone C.C.—The council have agreed to purchase Dungannon House, with about 50 acres, at £2,200, for the purpose of a sanatorium.

Warrington T.C.—The tender of Mr. Peter McLachlan, at £973, has been accepted for the erection of boiler-house, laundry, and chimney, at the public baths.

HOUSING AND TOWN PLANNING.

Buckhaven T.C.—It has been agreed to erect thirty dwelling-houses.

Gwyrfaï R.D.C.—It has been agreed to purchase 2 acres of land for a housing scheme to consist of about thirty-six houses.

Hayes U.D.C.—A housing scheme is to be carried out at an estimated cost of £4,550, including the purchase of a site.

Lynn T.C.—A scheme prepared by the borough surveyor, Mr. A. J. Smith, has been adopted for laying out the Friars Field in building plots for 130 semi-detached houses to be let, twenty-two at £18 per annum, eighteen at £15 per annum, fifty-three at £12 per annum, and thirty-seven at £10 per annum.

Magherafelt R.D.C.—A scheme for the provision of eighty-nine labourers' cottages is to be carried out, at an estimated cost of £15,150.

PARKS AND OPEN SPACES.

Dover T.C.—The Pleasure Grounds Committee have approved a scheme, estimated to cost £500, for improvements at the athletic ground.

REFUSE COLLECTION AND DISPOSAL.

Camberwell B.C.—The borough engineer, Mr. William Oxtoby, M. INST. C.E., submitted a report on the removal of trade refuse, showing a loss on the cost of collection ranging from £251 to £376 a year, and the Works Committee recommend the council to raise the charge from 3s. 6d. per load to 5s. 6d. per load.

Derby T.C.—It has been agreed to pay £8,000 for 76½ acres of land in Osmaston Park-road. Part of the land is to be used for a tip, and part for garden allotments.

Halifax T.C.—Replying at a recent meeting to criticisms on a report with respect to the dust manipulator, Councillor Branson, chairman of the committee concerned, said the council had no reason to regret the work of this manipulator at Charlestown. In 1912 the advantage was £104, and in 1913 £130. But beyond the financial side they had got rid of a nuisance that previously existed. Matters were so bad that they had been threatened with injunction. It was a scandal to the borough. The manipulator had a good work so far, and he did not think they would be doing wrong if they considered further work, in a larger capacity, in that direction.

Horsham U.D.C.—It was reported recently that refuse burning at the electric lighting station was regularly commenced on February 4th. The total number of loads destroyed during the week amounted to twenty-seven, each load averaging 1¼ tons. The units generated on this refuse were 2,620—approximately 25 per cent of the week's output. This worked out at 76½ units generated per ton of refuse. The saving in coal for full three days' burning (after allowing for the slight difference of load) was 5 tons 2 cwt. Compared with the previous week, the actual cost figures were as follows: Week ending February 1st, 11,291 units, 20 tons 7 cwt., £21 16s.; week ending February 8th, 10,330 units, 15 tons 2 cwt., £16 4s.

ROADS AND MATERIALS.

Aberdeen T.C.—Various improvements are to be carried out at the Links upon the recommendation of the Links and Parks Committee. It has been agreed to tar-macadamise, at an estimated cost of £300, a 10-ft. footpath from Constitution-street to the bathing station on each side of the tramway rails. It has also been agreed to make a footpath from Urquhart-road to Cotton-street, 20 ft. in breadth, the estimated cost being £80. A decision has been come to to put shrubs and turf on the triangular piece of ground at the foot of Constitution-street, and to widen the road at least 20 ft., so as to make a wider entrance to the Links at this particular point, the expenditure being estimated at £45.

Argyllshire C.C.—The Lorn District Committee have passed a motion in favour of the construction of a new road from Ballachulish to Kinlochleven, and an appeal is to be made to the Road Board for a grant to meet part of the cost of the proposed scheme.

Carrickfergus U.D.C.—A new granolithic footway is to be constructed from the top of Davy's-street to the entrance of the salt works, Minorin, at an estimated cost of £90, and upon the suggestion of the surveyor, Mr. W. W. R. Teggart, it has been decided to repair the kerbing along the south side of Joy-mount at Scotch Quarter, at a cost of £135, the work to be performed by direct labour.

Conway T.C.—The council have adopted a scheme for a new road from Conway to Llandudno, and have requested the borough engineer, Mr. F. A. Delamotte, to prepare an estimate of the cost.

Isle of Wight R.D.C.—It has been decided to set aside £400 for highway improvements during the ensuing half year.

Kingussie T.C.—The council have formally given support to the proposal to construct a road from Braemar to Kingussie.

Leamington T.C.—The repaving of the west side of the Parade is to be taken in hand in sections, and a start is to be made with the portion from Dormer-place to Regent-street, where the work is estimated to cost £100.

Lewisham B.C.—The Finance Committee recommend that application be made to the London County Council for their sanction to the borrowing, when required, of the sum of £24,474, the estimated cost of paving with creosoted deal blocks certain roads, or portions of the roads, in the borough.

Llanely T.C.—The Markets Committee have approved a scheme for widening the Stepney-street entrance to the market at an estimated cost of £5,000.

Limerick T.C.—A proposal has been submitted by a committee for works of block paving and asphaltting estimated to cost £54,000.

Paignton U.D.C.—The tender of Mr. M. Bridgman, at £1,294, has been accepted for the widening of the Torquay main road at Hallacombe.

Stirling T.C.—The scheme for the improvement of St. Mary's Wynd has been advanced a stage by the decision of the council to purchase properties at a cost of £1,876.

Ulverston R.D.C.—Representations are to be made to the county council with a view to obtaining financial aid for widening and improving the road from Lowick Bridge to Torver.

Whitby U.D.C.—The council have agreed to the proposals of the county council on the proposed diversion and improvement of the Sand-ey-rod. The estimated cost of the scheme is £14,000, and the Road Board offer to pay £7,000 (an increase of £2,000 on the previous offer). The county council offer to pay £3,500, and the Whitby Urban and Rural District Councils are asked to pay £1,750 each.

SEWERAGE AND SEWAGE DISPOSAL.

Aylesbury R.D.C.—A sewerage scheme for Whit-church is to be carried out at an estimated cost of £6,000.

Brampton R.D.C.—The scheme of sewerage and sewage disposal prepared by Messrs. Taylor & Wallin, Newcastle-upon-Tyne, is estimated to cost £1,250. It is a gravitation scheme, and the sewage will be disposed of bacterially. The Local Government Board inquiry was held recently.

Burton-upon-Trent T.C.—Reports with regard to closet conversions have been prepared by the borough surveyor, Mr. G. T. Lynam, and steps have been taken by the Health Committee in order to bring about the desired improvements.

Camborne U.D.C.—A sewerage scheme estimated to cost £25,000 is being considered.

Cleethorpes U.D.C.—The Local Government Board are to be asked to assent to the altered design for the sewage storage tank, as the council understand that the type of construction now to be adopted will enable the board to grant a period of repayment of twenty-five years. The board are therefore asked to sanction a loan of £13,750 for the tank, and to cancel the £8,880 previously asked for.

Dalkeith T.C.—The council have advertised for tenders for the carrying out of their scheme for the purification of the burgh's sewage before it enters the river South Esk.

East Grinstead R.D.C.—The surveyor, Mr. C. Turton, has received instructions to prepare the necessary plans and specification for such surface-water sewers as might be required in connection with the roads proposed to be made up, with a view to tenders being invited for the work.

Leek R.D.C.—The tender of Messrs. S. Salt, at £307, has been accepted for the culverts for the proposed alteration in the road at Rudyard.

Penrith R.D.C.—An offer of 7s. 6d. a year has been accepted for the privilege of having a clothes-line on the sewage field. Here is a new source of revenue which those in charge of sewage disposal works should cultivate. Every little helps, as has been said before.

Penrith U.D.C.—For the supply of 1,000 yds. of 9-in. drainage pipes for the extension of sewage carriers on the sewage farm, the tender of Messrs. Ten-

perley & Sons has been accepted at 1s. 7½d. per yard delivered at Penrith Station.

St. Dogmells R.D.C.—The council have instructed Mr. T. J. Moss-Flower, of 28 Victoria-street, Westminster and Bristol, to prepare separate sewerage and sewage disposal schemes and water supply schemes for St. Dogmells, Newport and Kilgerran.

Sutton-in-Ashfield U.D.C.—The council have approved the plan and estimates of Messrs. Willeox & Raikes, Birmingham, of the proposed works in connection with the sewerage scheme, estimated to cost £20,000, and they have been forwarded to the Local Government Board.

Uckfield R.D.C.—The details of the Waldron drainage scheme were submitted to the council on Monday. The scheme provides for draining Tilmore-corner and Horeham-road by gravitation to an outfall in the parish of Heathfield in the Hailsham Rural District. Mount Pleasant and Cross-in-Hand could be connected up to the system if required, but it is not proposed to do so at present. The estimate of the costs of the scheme is as follows: Sewers, man-holes, ventilating columns, &c., £7,707; outfall works, including the provision of two cottages, £1,971; engineering fees and clerk of works, £634; wayleaves and compensation, £1,000; purchase of outfall land and legal expenses, £500; contingencies, £700; total, £12,512. The advice of Mr. Midgley Taylor is to be obtained before the scheme is forwarded to the Local Government Board.

Wakefield R.D.C.—The council have decided to carry out sewerage schemes in Crigglestone and Crofton, estimated to cost respectively £9,542 and £1,300.

WATER, GAS, AND ELECTRICITY.

Aberdeen T.C.—The Electricity Committee have approved the recommendation of Mr. Bell, electrical engineer, to provide an additional 1,000kw. La Cour converter suitable for transforming a three-phase 6,000-volt supply to low tension for either lighting power or traction, and to replace the two sets which are going to Rubislaw and Boardford works. It was stated that that would mean a saving of £430 per annum. The committee have also agreed to recommend the adoption of Mr. Bell's suggestion for the condensing of a water supply from the Dee, augmenting the present water supply.

Ballinrobe U.D.C.—Application is to be made to the Local Government Board for sanction to a water supply scheme.

Bewdley T.C.—The council recently received a report that the new borehole had been completed, and had proved that there was an abundance of water of excellent quality. The council decided to apply to the Local Government Board for sanction for the remainder of the loan of £3,000 for the carrying out of the necessary work with as little delay as possible. The Kidderminster District Council have agreed to obtain the water supply for Wribbenhall from the corporation.

Dunfermline T.C.—The council recently considered a report by Messrs. Crouch, Hogg & Easton, Glasgow, on the question of an additional water supply to the city. Part of the scheme is the erection of a surface reservoir, and the carrying of a main right down to Rosyth. The total length of pipe will be nearly 20 miles, and the estimated cost of the whole scheme is £82,000. Part of the works, involving an outlay of £10,000, it was agreed to defer for a period of at least ten years, or until such time as it was required, but it was decided to proceed with the other work at once.

Lampeter T.C.—The Local Government Board, writing with reference to the council's application for a loan of £3,365 for the water supply scheme, stated that they observed that the proposed loan included sums for scraping and cleaning mains and for repairs to valves and a tank. It was not the board's usual practice to sanction loans for works of that nature, but the board had decided on this occasion to authorise the borrowing of the sums in question for a period of ten years. Their formal sanctions to loans of £3,000 and £275 were enclosed.—The town clerk explained that sanction for the £3,000 would be extended for thirty years and £275 for ten years.

Marylebone B.C.—The council have intimated to the staff at its municipal electricity works that substantial remuneration will be given to workers who supply valuable suggestions or inventions calculated to perfect the plant and machinery at the works.

Newmill U.D.C.—It was lately agreed to give further consideration to a report by Messrs. Marriott, Son & Shaw on the proposed construction of a reservoir of 1,000,000 gallons capacity at Goose Holes. The site, it was stated, was not an ideal one, and the bottom and sides would have to be concreted. The approximate estimate was from £2,500 to £2,750 (excluding engineer's costs). An alternative site further from the road would cost from £3,250 to £3,500.

Penrith R.D.C.—Application is to be made to the Local Government Board for sanction to borrow £410 for works of water supply for Newbiggin, Croglin.

Selby U.D.C.—The council have approved of a draft agreement for supplying water to the Riccall Rural Council for Barby at 9d. per 1,000 gallons.

Wolverhampton T.C.—The tender of Mr. John Thompson, of Ettingshall, has been accepted for the supply of a steel water tank.

MISCELLANEOUS.

Batley T.C.—Plant for the purification of the water used in the swimming baths is to be provided at a cost of £1,200.

Ghatham T.C.—The tender of Messrs. John Freeman, Sons & Co., Limited, at £35, has been accepted for the supply of a Cornish granite horse trough, 9 ft. long, to include a dog trough between the supports of the cattle trough.

PERSONAL.

Mr. Frank Harris, borough surveyor of Penryn, has resigned.

Mr. F. J. Worden, borough surveyor of Okehampton, has been voted an increase of salary.

Mr. J. H. Walters, borough surveyor of Congleton, has been voted an increase of salary.

Mr. J. Atkinson, borough surveyor of Stockport, has had his salary increased from £600 to £700 per annum.

Mr. B. White, of Kendal, has been appointed assistant surveyor to the Bowland (Yorks) Rural District Council.

Mr. W. H. Cousins, surveyor and inspector to the Street Urban District Council, has been voted an increased salary of £40 a year.

Mr. Arthur Andrew, clerk to the Buglawton Urban District Council, died on Tuesday evening, we regret to learn, at his residence, Shelton, Stoke-on-Trent.

Mr. W. Beach, who now holds the office of sanitary surveyor to the Cuckfield Rural District Council, has been appointed consulting surveyor to the same authority at a salary of £100 a year.

Mr. Robert E. Wilson, surveyor and inspector to the Knaresborough Urban District Council, has been appointed surveyor, inspector, and water engineer to the Leiston (Suffolk) Urban District Council.

Mr. A. W. Humpherson, borough surveyor and inspector of Bewdley, has had his salary increased from £115 to £150 a year, and has been voted a grant of £25 for extra work done in connection with the water supply.

Mr. F. A. Bailey, surveyor of highways to the Leek Rural District Council, has been voted £50 for additional services, and it has been decided to pay him an adequate sum for all plans he prepares on the instructions of the council.

Mr. G. A. Ballard, Assoc.M.Inst.C.E., engineering assistant to the city engineer of York, was on Tuesday last appointed assistant borough surveyor of Guildford. Prior to his York appointment he was assistant to the city engineer of Birmingham.

Mr. Andrew Young, valuer to the London County Council, is retiring from that position, after twenty-five years' service, on November 30th next, with a pension of £1,166 a year. Mr. Young was formerly surveyor to the London School Board, and the position which he is about to relinquish is worth £2,000 a year.

Mr. H. D. Blake, managing director of the Limmer Asphalte Paving Company, Limited, was recently involved in a motor car accident, and his numerous friends throughout the country will be sorry to learn that he was unfortunate enough to sustain injuries which have prevented his attendance at his office for the past two weeks. It is expected that some

little time will elapse before he is able to get about again as usual.

Mr. G. Brown Deas, of the engineer and surveyor's department, Finchley, London, has obtained an appointment under the county council of Fifeshire in connection with the extensive town planning scheme proposed for the Kirkealdy district. Mr. Deas served his pupilage with the late Mr. Alex. McCulloch, of Dundee and Leith, and was subsequently under the corporation of the county borough of Devonport and the works department of the Admiralty.

Mr. G. S. Coleman, B.Sc., Eng.(Lond.), Assoc.M.Inst.C.E., has resigned his position as senior engineering assistant to the city surveyor of Manchester in order to take up a similar position under Mr. Oswald J. Wilkinson, Assoc.M.Inst.C.E., of Manchester, who has charge, among other important works, of the designing of the extensive alterations to the Manchester sewage disposal works at Davyhulme. This work will entail an initial outlay of £180,000, and is to be proceeded with immediately.

Mr. James Caine, an employee of the Eccles Corporation, has invented and patented two machines—a plough and a cleanser—to remove obstructions from sewers and prevent floods in wet weather. The borough surveyor, Mr. T. S. Pieton, reported to the Drainage Committee that the appliances had been successfully tested, and the council have encouraged the inventor by purchasing the original machines. In a trial they removed 20 tons of solid sediment in 83½ hours without the aid of water. The obstructions included macadam, bricks, lead piping, and a Rugby football.

Mr. J. J. Knewstubb, surveyor and sanitary inspector to the Penrith Urban District Council, has received an increase of salary of £30 per annum, £15 of which is, subject to the approval of the Local Government Board, to be apportioned in respect of his office as inspector of nuisances. It was stated in the course of the discussion that this was the first increase for ten years, the addition thus being at the rate of £3 per annum, and it was further alleged that "the surveyor would soon leave the council if he could get a better job." We can well imagine he would. The prospects Penrith holds out to a professional man are not so alluring as to invite a loyal life's service.

Road Board Publications.—The specifications issued by the Road Board relating to the tar treatment of roads, and for strengthening and surfacing a water-bound road have now been revised, and can be obtained from Messrs. Waterlow & Sons, Limited, London-wall, E.C., price 8d. (post free 9d.), and 5d. (post free 6d.) respectively. A description of simple tests for ascertaining the quality of tar has been added to the specifications relating to the tar treatment of roads.

FOR OTHER ADVERTISEMENTS

See End of Paper.

EAST HAM CORPORATION.

STREET WIDENING AND TRAMWAY DUPLICATION WORKS.

LEADING FOREMAN.

The East Ham Corporation invite applications for the position of Leading Foreman on the work of Street Widening and Tramway Duplication in High-street North, East Ham, which will probably last for about 6 months.

Salary, £4 1s. per week.

Candidates must have had experience in work of a similar character, and be thoroughly capable of taking charge of men.

Applications, on Forms to be obtained from the Borough Engineer, Town Hall, East Ham, and accompanied by copies of three recent testimonials (which will not be returned), to be addressed to "The Worshipful the Mayor, Town Hall, East Ham, E." and endorsed "Foreman," not later than 12 o'clock noon of Monday, the 16th March, 1914.

Canvassing, either directly or indirectly, will disqualify.

(By order)

C. EUSTACE WILSON,

Town Clerk.

Town Hall,

East Ham, E.

February 25, 1914.

(1,377)

URBAN DISTRICT COUNCIL OF ENFIELD.

TO CONTRACTORS.

TARRED SLAG MACADAM.

The Council invite Tenders for the supply, delivery, spreading, rolling and completing, including six months' maintenance, of about 12,950 yds. (i.e., 1,850 yds. long by 7 yds. wide) super. of Tarred Slag Macadam on the Cockfosters-road, within the Enfield District.

Specification, Form of Tender, and all information can be obtained by Contractors experienced in this class of work on application to Mr. Richard Collins, the Council's Surveyor, at these offices.

The Contractors will be required to observe Trade Union hours of labour, and to pay wages according to the published scale of the London County Council for the time being in force.

Tenders (on the form supplied only) to be sent in to me not later than noon on Tuesday, the 10th day of March next, endorsed "Tender for Tarred Slag Macadam."

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

T. W. SCOTT,

Clerk.

Public Offices,

Enfield, Middlesex.

February 25, 1914.

(1,378)

COUNTY OF ARMAGH.

The County Council are prepared to receive Tenders for the supply of—

- One Light Compound Steam Motor Tractor.
- Two End-Tipping Wagons.
- One Portable Stonebreaker.

For Conditions and Form of Tender apply to Mr. R. H. Dorman, M.INST.C.E., County Surveyor, Armagh.

Sealed Tenders, endorsed "Tender for Machinery," to be delivered at this Office not later than Monday, the 9th March, 1914.

The lowest or any Tender will not necessarily be accepted.

JOSEPH ATKINSON,

Secretary to the County Council.

Courthouse,
Armagh.

February, 1914

(1,376)

BOROUGH OF REIGATE.

TO CONTRACTORS.

The Council of the Borough of Reigate invites Tenders for the Supply of the following materials, and for the execution of the following works—viz. :—

- Granite Macadam, Basalt and Flints.
- Granite Kerb.
- Kent Ragstone.
- Tar-paving.
- Artificial Stone Paving.
- Gravel.
- Concrete Beach.
- Pea Beach.
- Compo Grit.
- Portland Cement.
- Beddington Grit.

Forms of Tender, Conditions of Contract, and full particulars may be obtained upon application to Mr. Fred T. Clayton, the Borough Surveyor, and every person tendering will be required to deposit at his office, at the Municipal Buildings, Reigate, a sample of the material for which he tenders.

Every person whose Tender may be accepted will be required to enter into a Contract in writing, the form whereof may be seen at my office, and himself and his sureties will be required to enter into a bond for the due performance of his Contract.

Sealed Tenders, endorsed "Tender for Granite Macadam," or as the case may be, are to be delivered at my office at the Municipal Buildings aforesaid, on or before Noon of Wednesday, the 11th day of March next.

The Council does not bind itself to accept the lowest or any Tender.

Dated this 23rd day of February, 1914.

(By order of the Council)

ALFRED SMITH,

Town Clerk.

(1,373)

BOROUGH OF REIGATE.

TO CONTRACTORS OF TARVIA.

The Reigate Town Council invites Tenders for the Supply of about 16,000 gallons of Tarvia in barrels for tarring purposes, to be delivered at Reigate or Redhill Stations.

Forms of Tender, Conditions of Contract, and full particulars may be obtained upon application to Mr. Fred T. Clayton, the Borough Surveyor, at his office at the Municipal Buildings, Reigate.

The person whose Tender is accepted will be required to enter into a Contract in accordance with the form to be seen at my office at the Municipal Buildings aforesaid.

Sealed Tenders, endorsed "Tender for Tarvia," are to be delivered at my office at the Municipal Buildings aforesaid, on or before Noon of Wednesday, the 18th day of March next.

The Council does not bind itself to accept the lowest or any Tender.

Dated this 23rd day of February, 1914.

(By order)

ALFRED SMITH,

Town Clerk.

(1,375)

BOROUGH OF REIGATE.

TO ROAD TARRING CONTRACTORS.

The Reigate Town Council invites Tenders for Tar-washing about 170,000 yards super. of Roads within the Borough, the price to include Cleaning, Tarring, and Gritting the Tar Surface, and all other necessary works in connection therewith.

Sealed Tenders, which are to state the price per yard super., will full description of the mode of treatment, are to be delivered at my office at the Municipal Buildings, Reigate, on or before Noon of Wednesday, the 18th day of March next.

The person whose Tender is accepted will be required to enter into a Contract in accordance with a form to be seen at my office aforesaid.

The Council does not bind itself to accept the lowest or any Tender.

Dated this 23rd day of February, 1914.

(By order)

ALFRED SMITH,

Town Clerk.

(1,374)

WEST WARD RURAL DISTRICT COUNCIL, WESTMORLAND.

WATER SCHEME.

The West Ward (Westmorland) Rural District Council invite separate Tenders or one whole Tender for:—

CONTRACT No. 1.

- 1½ miles (approximate) 3-in. diameter Mannesman Steel Tubes delivered and laid complete.
- 6½ miles (approximate) 5-in. diameter do.
- 7 miles (approximate) 6-in. diameter do.
- With Specials, Valves, &c.

CONTRACT No. 2.

The Erection of Intake Works, Screening Chamber, Three Service Reservoirs, Break Pressure Tank, Valve Chambers, &c., on route of Contract No. 1.

CONTRACT No. 3.

- 3 miles (approximate) 3-in. diameter Mannesman Steel Tubes, delivered and laid complete.
- 4½ miles (approximate) 4-in. diameter do.
- 33 miles (approximate) 3-in. Cast-iron Pipes, delivered and laid complete.
- 12 miles (approximate) 4-in. do.
- 1½ miles (approximate) 5-in. do.
- ¼ mile (approximate) 7-in. do.
- With Specials, Valves, &c.

CONTRACT No. 4.

The Building of Break Pressure Tanks and Valve Chambers, &c., on route of Contract No. 3.

The whole of the Works to be carried out in accordance with Plans and Specifications prepared by Mr. Joseph Graham, Civil Engineer, 28 Castle-street, Carlisle.

Intending Contractors, upon deposit of £5 (cheque only), will obtain copies of Specification and Bill of Quantities with Form of Tender at the Office of the aforesaid Engineer, where the Drawings will be on view. The cheque will be returned to the Contractor upon the receipt of a *bona-fide* Tender and the return of all documents to the Engineer.

The Council do not bind themselves to accept the lowest or any Tender.

JAMES TAYLOR,

Clerk.

1 Brunswick-road,
Penrith.

February, 1914.

(1,372)

SOME RECENT PUBLICATIONS.*

THE ENGINEER'S YEAR-BOOK of Formulae, Rules, Tables, Data, and Memoranda, for 1914. A compendium of the modern practice of civil, mechanical, electrical, marine, gas, and mine engineering. Compiled and edited by H. R. Kempe, M.INST.C.E., M.I.MECH.E., M.I.E.E. Price 15s. London: Crosby Lockwood & Son.

Having recently celebrated our own coming of age, we extend our hearty congratulations to Mr. Kempe on the appearance of the 21st edition of his excellent annual, and on his enterprise in facing boldly the necessity for expanding his Year-book in order to deal adequately with the ever-increasing scope of engineering practice. The 1914 edition contains no fewer than 1,770 pages, and the fact that fifty-three pages are occupied by the index is not only important as indicating the thoroughness with which the work of indexing has been done, but is also significant of the great range of subjects included in the work. There are over 1,350 illustrations, specially prepared for the volume.

Important new sections and parts of sections have been added in recent issues, but the services of specialists have again been called into requisition for the preparation of fresh matter for the 1914 edition. There is a new section, short, but valuable, on "The Cost of Engineering Works," and one on "The Arrangement and Construction of Engineering Workshops," by Mr. H. N. Allott, M.INST.C.E. The first part of the mining section has been entirely rewritten by Prof. Henry Louis, M.A., D.SCI., and "Irrigation" and "Rainfall" by Mr. Reginald Ryves, M.CON.S.E., ASSOC.M.INST.C.E., who has also supplied data on bridges, struts, columns, and piles. There is a fresh contribution on "Link Motions and Valve Gear," by Mr. W. H. Booth, M.AM.SOC.C.E.; and the sections on "Machine Tools" and "Power Transmission" have been revised and simplified by Mr. Dempster Smith, M.I.MECH.E.

As we pointed out in our review of last year's issue, the comprehensive nature of the work makes it specially valuable to men who, like surveyors to local authorities, are engaged in a great many different kinds of work, and to those engineers who are thrown upon their own resources at stations distant from headquarters. It may also be pointed out that students and assistants will find the book to be an excellent investment, since it will often save them from the necessity of buying expensive books for a temporary purpose, or spending time in visiting libraries, and will make it possible to avoid expenditure on volumes which will have to be replaced later on by fuller and more authoritative works.

An important feature of the volume is the ease with which it can be used as a work of reference, owing to the full and conveniently arranged index, the excellent printing, and the skill employed in the binding. The last-named factor is one of considerable practical importance, and it may be noted that while a new copy opens properly at any page, a copy used much during the past twelve months is equally efficient in this respect, the back standing stiffly when the pages near the beginning or the end are consulted. Most engineers are, of course, familiar with this Year-book, but to the few who have not been accustomed to use it, and to the younger men, including those whose means are limited, it may be recommended as a thoroughly sound compendium of information in engineering practice generally, and a convenient book of formulae and formal data.

STUDIES IN WATER SUPPLY. By A. C. Houston, D.S.C., M.B. C.M., Director of Water Examination, Metropolitan Water Board. Price 5s. nett. London: Macmillan & Co.

"It is easy to carry conservatism too far in these matters, and more than one case could be quoted where a more tolerant attitude would have saved the ratepayers large sums of money." These words occur in Dr. Houston's book entitled "Studies in Water Supply," and have special reference to the fact that in the United Kingdom the process of sterilisation by means of hypochlorite has been looked upon with considerable disfavour without any reasonable justifica-

tion. It is to be hoped that this book will be carefully read by all those who have to do with matters of water supply. Dr. Houston has written a book which is a monograph, as distinguished from the ordinary textbook, in which the writer generally gives a statement of matters upon which he has special experience, and fills in the rest of the book—sometimes the larger portion—with material collected from a number of other sources. Such books as that written by Dr. Houston are therefore of altogether exceptional value, because in them there is no chance of the errors which creep into the most careful compilation from other men's work.

Dr. Houston's reports have from time to time been dealt with in *The Surveyor* fully, so that it is unnecessary again to discuss them. They tend to justify rivers as sources of water supply; they deal with the important question of abstraction, the supplementary process of water purification, with sterilisation and with the treatment of water with lime for the purpose of sterilisation. The storage of water in relation to purification is a matter with which Dr. Houston's name will always be associated. The present book gives, in a handy form, the information which is contained in a large number of reports and other publications written by Dr. Houston in the past. Great attention is given to the question of water-borne disease, and the improbability of London water at the present time having any influence upon the incidence of water-borne disease is very clearly stated, while the importance and extreme danger of accidental infection is emphasised. Dr. Houston appears to throw some doubt upon the question whether the fall in the typhoid death-rate, which is so remarkable in American cities where sterilisation of the water has been introduced, is due altogether to the purification of the water. Apparently he regards the purification of the water as only one of the causes which have produced the beneficial result. However, there is no suggestion that the treatment of the water is not highly beneficial.

The financial value of a pure water supply forms an interesting chapter in the book. The final chapters deal with bacteriological routine methods and special methods which will be of value chiefly to the bacteriologist, as they are entirely technical. The book is very well indexed, and contains many diagrams which have been excellently prepared and reproduced.

A general study of Dr. Houston's results is desirable, for at the present time we have before us the results of much research work, and what is chiefly required is to educate the general public. The teachings of science will remain useless until they are practically applied.

STANFORD'S GEOLOGICAL ATLAS OF GREAT BRITAIN AND IRELAND. Edited by H. B. Woodward, F.R.S. Third Edition. Price 12s. 6d. nett. London: Edward Stanford, Limited.

One of the most interesting and valuable books ever published is this handy volume, which, although of a size that may be carried in a pocket, contains complete geological county maps of Great Britain, Ireland and the Channel Isles, together with sections, views, complete illustrations of the fossils belonging to the various formations, together with small scale maps. Over 490 pages of printed matter deal with the geological structure of Great Britain, the formations and the mineral products. This is followed by descriptions of the geology of the counties, each being taken separately in detail. It would be difficult to suggest a more useful and practical way of teaching geology than the method which has been adopted of describing the features observable along the principal lines of railway. With this book in hand the ordinary railway journey must become a perfect object lesson. For mile after mile we have the geology of the country made clear to us in the ordinary railway cutting, and what better practical training can be imagined than in a country like our own, where the strata are ever changing as we advance, to note the exposed surface of each formation as we pass through it in the train, having in hand a carefully written description, the work of one of our greatest geologists? Exactly the same method has been followed in dealing with Ireland as with Great Britain.

The atlas should be among the books of reference of every engineer; not among those kept in the bookshelves, but on the desk, and it will also accompany him on his journeys. Moreover, unlike most books of reference, it can never become obsolete.

To the student the book will be invaluable. We in this country are peculiarly and fortunately situated in that the various geological strata are spread out

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

before us like an open book, while the deep cuttings of railways intersect the various formations in all directions. By following the notes contained in this book, a single long railway journey from east to west will prove a lesson in practical geology that will give the student a more solid grasp of his subject than can be gained by months of ordinary study.

LOCKWOOD'S BUILDERS' PRICE BOOK, 1914. Edited by F. T. W. MILLER, A.R.I.B.A. Price 4s. London: Crosby Lockwood & Son.

Any increase in the cost of building which has taken place during the past year has been due to a rise in the price of labour rather than in that of materials, although certain of the latter have also shown an upward tendency. Due effect has been given to both factors in adjusting the prices for the present issue of "Lockwood." Every section of the work has been thoroughly revised and corrected where necessary, while many have been amplified so as to embrace modern building developments. As in former issues, a separate section is devoted to each trade, each being divided into subsections dealing with measurement, memoranda, and prices respectively. The memoranda are usually very full, and will be found of great practical value. A large amount of useful matter for reference will be found in the several appendices, which include one comprising legal notes. There is also a supplement containing the London Building Acts, 1894 to 1908, and other enactments and regulations relating to building in the metropolis. The new edition of "Lockwood" retains the familiar form and the old excellence, and we have no hesitation in again recommending the work to our readers.

THE INTERNATIONAL "WHITAKER," 1914. Price 2s.

The appearance of the second annual issue of the International Whitaker is abundantly justified by the success which attended the publication of the first volume last year. The main body of the work is again devoted to an account of the government, trade and defence of every country in the world. These have been revised in every instance from official sources, and in many cases by Government Departments. It has been said that this book forms the best universal school geography yet published. It is certainly a wonderfully complete compilation, and excellent value for so modest a price.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—MR. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A.,
Borough Surveyor, Great Yarmouth.

WEST MIDLAND DISTRICT.

A meeting of the West Midland District will be held at Birmingham on March 5th.

PROGRAMME.

5 p.m. Meet at the Council House, Birmingham.

Business: Paper by MR. H. M. LAWSON, deputy road surveyor, Birmingham (associate member), entitled "Modern Road Construction."

It is hoped there will be a good attendance at this the last meeting of the present winter season.

F. C. COOK, A.M.INST.C.E., A. T. DAVIS, M.INST.C.E.,
Hon. District Secretary. District Chairman.

NORTH-EASTERN DISTRICT.

A meeting of the North-Eastern District will be held at Wakefield on Saturday, March 21, 1914.

SOUTH-WESTERN DISTRICT.

A meeting of the South-Western District of the institution will be held at Taunton on March 21st.

EASTERN DISTRICT.

A meeting of the Eastern District is to be held at Chelmsford on April 18th.

SOUTHEND MEETING.

A meeting of the institution will be held in the Eastern District at Southend on Saturday, June 6th.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham on June 13th.

THE ANNUAL MEETING.

The date for the annual meeting of the Institution of Municipal and County Engineers at Cheltenham has been fixed definitely for June 24th, 25th, 26th and 27th next. It has been decided to make a special

feature of town planning and of roads, and, if possible, to arrange for an exhibition of town plans.

EXAMINATION.

The April examination of the institution will be held in London, at the New Examination Hall, Queen's-square, W.C. on April 2nd, 3rd and 4th.

THOMAS COLE,
Secretary.

92 Victoria-street, S.W.

PROPOSED VISIT TO HAMBURG.

Mr. Thomas Cole, the secretary, has circularised the members as follows:—

"An invitation has been received from the presiding burgomaster (Dr. Predöhl) for the institution to visit Hamburg at Whit-sundie next, when it is intended to inspect the municipal works of that city. These will include waterworks, gasworks and sewerage works, also town planning, of which Hamburg presents a striking example.

"It is proposed to leave London on Wednesday, May 27th, and return so as to be in London on Thursday morning, June 4th.

"The cost of the trip, travelling second class on rail, saloon on boat, with hotel, tips, &c., will be about £10. Carriage drives may be extra.

"As considerable pains are being taken by His Majesty's Consul-General, the presiding burgomaster, and other chief officials of the city to make the visit a success, I hope that members will respond in good numbers to the hearty invitation that we have received, and that you will facilitate the arrangements by giving me early intimation as to whether it is your intention to join the party."

INSTITUTION OF MUNICIPAL ENGINEERS.

President—MR. HORACE BOOT, M.I.E.E., M.I.MECH.E.

Arrangements have been made for a meeting to be held at Tisbury on June 13th. A meeting will also take place at Birmingham in March.

B. WYAND,
Secretary.

39 Victoria-street, S.W.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers to be held on Monday next at the Institution of Electrical Engineers, Victoria-embankment, W.C., a paper entitled "Esperanto: An International Language for Engineers," will be read by Mr. T. J. Gueritte, B.Sc., M.SOC.C.E.(FRANCE), M.S.E., the following being a synopsis: Importance of standardisation in general—advantages of a universal language—the use of such a language in connection with (a) the study of science, (b) the carrying out of engineering work, (c) international congresses, (d) the sale of technical books at moderate prices—Is an international language possible?—Conditions that must be fulfilled—In what manner Esperanto fulfils these conditions—Illustrations of the applications of Esperanto.

The chair will be taken at 7.30 p.m.

A. S. E. ACKERMANN,
Secretary.

17 Victoria-street, S.W.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

ASSISTANT COUNTY SURVEYOR.—February 28th.—County Palatine of Chester. £350 per annum.—Mr. Reginald Potts, clerk, County Offices, Chester.

SECRETARY.—February 28th.—Institution of Municipal and County Engineers. £400 per annum.—Mr. Thomas Cole, secretary, 92 Victoria-street, Westminster, S.W.

ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

STOURBRIDGE URBAN DISTRICT COUNCIL.

The above Council invite applications for the post of Assistant to the Surveyor, at a salary of £60 per annum.

List of duties will be supplied on application to the undersigned.

Applications, in candidate's own handwriting, stating age, and accompanied by three testimonials, endorsed "Assistant," to reach the undersigned not later than noon, the 9th day of March.

FREDK. WOODWARD,
Surveyor.

The Town Hall,
Stourbridge.
February 21, 1914. (1,351)

CITY OF SHEFFIELD.

TO QUANTITY SURVEYORS.

Applications are invited for the post of Assistant Quantity Surveyor in the City Architect's Department.

Salary £150, increasing by £10 per annum to £180.

Form of application may be obtained by communicating with the undersigned.

F. E. P. EDWARDS,
City Architect.

Town Hall,
Sheffield.
February 24, 1914. (1,362)

KNARESBOROUGH URBAN DISTRICT COUNCIL.

SURVEYOR AND INSPECTOR OF NUISANCES.

The above Council are prepared to receive applications for the combined office of Surveyor and Inspector of Nuisances for their district, at an annual salary of £55 as Surveyor and £70 as Inspector.

The person appointed will be required to perform all the duties usually attaching to the office of Surveyor of Highways; prepare plans for the Council; keep the necessary books and accounts; and superintend the carrying out of drainage and sewerage works. As Inspector he will have to perform all the duties imposed upon Inspector of Nuisances by the

Public Health Act, 1875, and subsequent Acts, and by the Orders of the Local Government Board, and also act as Inspector under Dairies, Cowsheds, and Milkshops Orders; and the Housing and Town Planning Act, 1909; devote the whole of his time to the performance of his duties, and reside in the house belonging to the Council, at a rental.

The appointment as Inspector will be for one year, and subject to the approval of the Local Government Board. The Surveyorship subject to two months' notice on either side.

Applications, in candidate's own handwriting, stating age and qualifications, with copies of two testimonials of recent date, must reach me, the undersigned, on or before Thursday, 5th day of March next. Notice will be sent to any candidate required to attend before the Council. Canvassing, either directly or indirectly, will be deemed a disqualification.

(Signed) THOMAS MAINMAN,
Clerk to the above Sanitary Authority.
February 21, 1914. (1,366)

MADRAS CORPORATION, INDIA.
WANTED—ASSISTANT WATERWORKS ENGINEER.

The President, Corporation of Madras, invites applications for the appointment of a Waterworks Assistant to the Special Engineer (J. W. Madeley, Esq., M.A., M.INST.C.E., M.A.M.SOC.C.E., &c.).

The duties will be to assist the Special Engineer in the design, construction and maintenance of works connected with the Water Supply Distribution System of the City of Madras, especially cast-iron main laying and the installation and working of waste water meters.

The salary will be Rs.500 (£33 6s. 8d.) per mensem. An allowance of Rs.30 (£2) per mensem will be paid to the Officer appointed so long as he maintains and uses on the work a first-class motor bicycle in good running order. No other allowance of any kind will be made.

Before sailing for Madras the successful candidate will be required to sign a three years' Agreement, to be prepared by the Corporation. By mutual consent the appointment may be extended for a further period.

The Corporation reserves the right to determine the appointment at any time by three months' notice in writing, or by payment of one month's salary.

The Officer appointed will be allowed ordinary first-class railway fares and second-class steamship passage to Madras, via Marseilles and Bombay, by P. and O. steamer. A like class return free passage will be granted on the termination of the appointment, subject to satisfactory service, according to the conditions of the Agreement. Half-pay will be granted on the voyage out from the date of leaving England.

Leave will be granted on full pay to the extent of one month for every eleven months of active service, but for not more than three months at a time.

Preference will be given to candidates who have had experience in the design and maintenance of water-pipe distribution systems, including detection and prevention of waste by waste water prevention meters, stethoscopes, and other means.

Applicants must not be more than 35 years old, and copies of certificates of age, testimonials and medical certificate of fitness for service in India must be enclosed with the applications, which must reach the undersigned not later than 11th March, 1914.

The applications will be sent out to Madras, where the selection will be made by the President of the Corporation.

The President reserves the right of rejecting all applications without giving reasons.

The Officer appointed will be required to commence his duties in Madras not later than eight weeks after he has received notification of the acceptance of his application.

Applications must be in writing, and should be sent to the undersigned in envelopes superscribed "Waterworks Assistant."

JAMES MANSERGH & SONS,
Agents to the Corporation
of Madras.

5 Victoria-street,
Westminster,
London, S.W.
February 19, 1914. (1,371)

COUNTY BOROUGH OF HALIFAX. SURVEYOR'S JUNIOR ASSISTANT.

Applications are invited for the appointment of a Junior Assistant in the Borough Engineer's Department, at a salary of £78 per annum.

Preference will be given to candidates with experience in the routine duties of a Municipal Engineer's Office, of Private Street Improvement Works, and of Sewer Construction.

Applications, in candidate's own handwriting, stating age and experience, enclosing copies of not more than three recent testimonials, and endorsed "Surveyor's Assistant," must be sent to the undersigned not later than Saturday, 7th March, 1914.

PERCY SAUNDERS,
Town Clerk.

Town Hall, Halifax.

February 20, 1914.

(1,360)

SCUNTHORPE URBAN DISTRICT. APPOINTMENT OF ENGINEER AND SURVEYOR.

The Scunthorpe Urban District Council invite applications for the position of Engineer and Surveyor to the Council. Salary £200 per annum.

Applicants must have had practical experience in the works usually undertaken by an Urban Authority, including Waterworks (electrically driven), Markets, Slaughter-house, Fire Appliances, &c., Private Street Works, Highways, Sewers, Sewerage Works, and Sanitary Works of every description; and must be competent to prepare Plans, Drawings and Quantities for Municipal Works or Buildings, and perform all the ordinary duties of a Surveyor of Highways.

Applications, in candidate's own handwriting, stating age and experience, and enclosing copies of not more than three testimonials, must be sent to the undersigned not later than Monday, the 2nd day of March, 1914.

Further particulars of duties and terms of engagement supplied on application.

H. M. HETT,
Clerk to the Council.

18A High-street,
Scunthorpe, Lincolnshire.

(1,330)

THE ROYAL BOROUGH OF KENSINGTON. APPOINTMENT OF RESIDENT MANAGER AT WOOD-LANE DEPOT.

The Council of the above Borough require the Services of a Competent Manager to take sole charge, under the direction of the Borough Engineer, of the Council's Refuse Destructor, Clinker Block-making Installation, and the Works generally at the Wood-lane Depot, Shepherd's Bush. Candidates must be between 30 and 40 years of age, and should have had practical experience in connection with the working of installations of a similar nature, have a practical knowledge of steam plant, and be conversant with the general duties of a manager of works.

The salary attaching to the position will be at the rate of £160 per annum, rising by conditional annual increments of £10 to a maximum of £200 per annum, with house and allowance of coals and lighting.

The appointment will be subject to the provisions of the Kensington Borough Council (Superannuation) Act, 1907, under which percentage deductions are made from all salaries and emoluments.

Application must be made in the candidate's own handwriting on printed Forms to be obtained at my Office, and must be delivered to the undersigned, accompanied by copies of not more than three testimonials of recent date, not later than four o'clock in the afternoon of Tuesday, March 17th, 1914.

Personal canvassing of any Members of the Council will be a disqualification.

(By order)

WM. CHAMBERS LEETE,
Town Clerk.

Town Clerk's Office,
Town Hall,
Kensington, W.

CITY OF COVENTRY.

WATERWORKS STORES (CAST-IRON PIPES, LEAD PIPES, SOLDER, &c.).

The Waterworks and Fire Brigade Committee of the Corporation of the City of Coventry invite Tenders for the Supply and Delivery of Cast-iron Pipes, Lead Pipes, Solder, Hydrant and Valve Boxes, &c., for the year ending 31st March, 1915.

Form of Tender and full particulars may be obtained, and Samples inspected, on application to the undersigned.

Tenders are to be delivered at the Water Engineer's Office, St. Mary's Hall, Coventry, on or before Monday, the 16th day of March, 1914, sealed and endorsed "Tender for Waterworks Stores."

The lowest or any Tender will not necessarily be accepted, and no Tender will be considered which is not made out on the Form supplied.

J. E. SWINDLEHURST, M.INST.C.E.,
Water Engineer.

St. Mary's Hall,
Coventry.

February 23, 1914.

(1,355)

CITY OF COVENTRY.

CONTRACT FOR MATERIALS.

The General Works Committee of the Corporation of the City of Coventry invite Tenders for the Supply and Delivery of the following Materials during the year ending 31st March, 1915:—

Broken Road Stone.
Granite Kerbs.
Granite Setts.
Stoneware Pipes.
Castings.
Workmen's Tools.

Form of Tender and full particulars may be obtained, and Samples inspected, on application to the undersigned.

Tenders to be delivered at the City Engineer's Office, St. Mary's Hall, Coventry, on or before Monday, the 23rd day of March, 1914, sealed and endorsed "Tender for Materials."

The lowest or any Tender will not necessarily be accepted, and no Tender will be considered that is not made out on the Form supplied.

J. E. SWINDLEHURST, M.INST.C.E.,
City Engineer and Surveyor.

St. Mary's Hall,
Coventry.

February 23, 1914.

(1,356)

BOROUGH OF MAIDSTONE URBAN DISTRICT COUNCIL.

TO STONE MERCHANTS, QUARRYMEN AND OTHERS.

The above Authority is prepared to receive Tenders for the Supply of Road Materials, &c., according to the Schedule mentioned below.

Specifications, Forms of Tender, and all other information may be obtained on application at the Office of the Borough Surveyor, Mr. T. F. Bunting, at the Fair Meadow, Maidstone.

Sealed Tenders, which will only be received on the Forms supplied, endorsed "Tender for the Sup-

ply of —," must be delivered at my Office not later than Tuesday, March 10th, 1914.

Samples of the Materials which it is proposed to supply must be sent to the Office of the Borough Surveyor by the same date, carriage paid.

The Council do not bind themselves to accept the lowest or any Tender.

S. LANCE MONCKTON,

Town Clerk.

Maidstone.

February 20, 1914.

Schedule of Materials:—

Guernsey Granite.
Cornish Elvan or Stone of a similar nature.
Cherbourg Quartzite.
Tarred Ragstone Concrete.
Portland Cement.
Ballast (Thames or Colne). (1,344)

EAST HAM CORPORATION.

ANNUAL SUPPLIES.

The East Ham Corporation invite Tenders for the aftermentioned Supplies, and for Executing the following Work, for the period ending the 31st March, 1915, except where otherwise mentioned:—

Glazed Stoneware Pipes.
Glazed Stoneware Gully Fittings (London Make).
Portland Cement.
Grey Stone, Chalk and Blue Lias Lime.
Lime for Sewage Precipitation.
Stock and other Bricks, &c.
Thames Ballast, Sand, &c.
Coal and Coke.
Engineer's Sundries (Oils, Colours, Painter's Brushes, Ironmongery, &c., for Borough Engineer's Department).
Engineer's Sundries (Ironmongery, Painter's Requisites, Brushes, &c., for Electric Lighting and Tramways Department).
Broken Granite.
Crushed Granite.
Granite Setts.
Guernsey and other Granite Chippings.
Granite Kerb and Channelling.
Broken Flints.
Cast-iron Work, Gullies, &c.
Shovels, Brooms, Picks and Handles.
Disinfectants.
Oilskins.
Hire of Horses and Carts for Watering Streets.
Hire of Horses and Carts for General Cartages.
Hire of Horses and Carts for Seavenging.
Hire of Horses and Carts for Collection of House Refuse.
Uniforms for Firemen, &c.
Uniforms for Tramway Employees.
Sewer Ventilating Columns.
Paving Flags.
Boots, Sewer Smocks, &c.
Veterinary Attendance on and Shoeing Horses.
Provender.
Reglazing and Repair of Street Lamps.
Jarrah Wood Blocks.
Receiving, Sorting and Levelling Refuse at Destructor Works.
Removal of Tinware from Destructor Works.
Redressing of Setts (Labour only).
Particulars and Forms of Tender may be obtained upon application at the Office of the undersigned, or by forwarding an addressed envelope (foolscap size), duly stamped.

The person or persons whose Tender is accepted will be required to observe and fulfil the obligations upon Contractors specified in the Fair Wages Resolution adopted by the House of Commons on the 10th March, 1909, which is fully set forth in the Form of Tender, and to enter into a Contract with a Bond for the due performance thereof.

Tenders to be sent in addressed to His Worship the Mayor, Town Hall, East Ham, E., and endorsed according to the supply or work tendered for, not later than 12 o'clock noon of Saturday, the 14th day of March, 1914.

The Corporation does not bind itself to accept the lowest or any Tender.

(By order)

C. EUSTACE WILSON,

Town Clerk.

Town Hall,

East Ham, E.

Minutes of Proceedings.

Severity Factors and Traffic Statistics.

In the correspondence columns of last week's issue we printed a letter from Major W. W. Crosby, chief engineer of the Maryland State Roads Commission, on the subject of traffic statistics and severity factors. We consider that this is a very important communication, since it presents, in forcible terms, the main arguments in favour of the adoption of a rational schedule of severity factors for different classes of vehicles, by the use of which the traffic statistics of different areas and different countries could be compared. We understand that Major Crosby does not think that the schedule so far adopted by the Road Board meets all requirements, and we take it that in commending our treatment of the subject on p. 156 of our Special Annual Issue he is inclined to support our view as to the need for taking into consideration the type of road crust as well as the type of vehicle. It may be contended, in opposition to our view, that if we had a suitable schedule of severity factors for vehicles the different effects upon different kinds of road crust would provide us with a measure of the merits of those crusts. This might be the case if the severity factors were promulgated as the result of superhuman intelligence, and represented the true averages of the effects on all kinds of roads. Practically, we might approximate to such a result by many years of experience, during which we assigned different "liability" or "endurance" factors to the different crusts. In this period, which now is before us, we should, it is here contended, obtain comparable results only by taking into consideration the main factors of each area. Results are not to be made comparable by the assumption that the "severity" of the vehicle is the same on all roads and in all climates. A typical schedule could, of course, be drawn up, but it should be specifically stated that it applied to a certain kind of road in a particular climate. This typical schedule could then be altered to suit local conditions and different kinds of roads, and the final procedure would either be to continue the use of revised local schedules or, if it were believed that an average schedule could be drawn up, this could be done, and the merits of different kinds of road crust and pavement would then be more or less measured by the relation of wear to total severity. Alternatively, the schedule adopted might be drawn up as the result of the behaviour of the most efficient and economical crust, the best crust, for each kind of vehicle. Such a schedule cannot, however, be drawn up beforehand—it is an impossible task.

We know very well that highway engineers would like to be able to compare the costs of

different road systems in relation to the traffic. This cannot be done, because the severity factors would be arbitrary, and would favour one locality as compared with the other. There are at present only two things which can be attempted with any hope of success. First, we may compare tonnages, or tonnages modified by "importance" factors, and use these tonnages of total traffic, in their relations to the costs of construction and maintenance, as measures of the combined efficiency of the roads and of the vehicles which run on them. This would enable us to compare the highway efficiency of one country with that of another country. Secondly, we may assign severity factors to the vehicles and endurance factors to the roads, and compare the efficiency of different areas by noting the tonnage, or importance-tonnage, carried in proportion to the average severity-endurance factor per mile. This is, in some respects, better than comparing costs, since prices of materials and labour differ greatly in different areas. Merely to enumerate the vehicles and assigning different endurance factors to different *crusts*, to let them take their chances as to the characters and weights of the vehicles running over them, would be no more illogical than is the procedure adopted in assigning severity factors to different *vehicles* and letting them take their chances as to the nature of the crusts traversed. We admit that the latter method provides the best rallying point, but we do not see how an arbitrary set of severity factors can be a measure of complex and often obscure phenomena, and we believe that the considerations which are set forth in this note provide the best basis for common action. This is a difficult subject, beset with subtleties which do not yield to forcible methods of attack, and we should be glad to know the views of our British and American readers as to the main points which we have endeavoured to express here and in the "Highways" article in our issue of January 30th.

* * *

Sludge Disposal.

On a recent occasion we dealt with this subject in connection with the presidential address to the Institute of Sanitary Engineers by Mr. J. D. Watson, M.INST.C.E., engineer to the Birmingham, Tame and Rea District Drainage Board. In the same week, on January 15th, the chemist to the same board, Mr. F. R. O'Shaughnessy, F.I.C., read before the Birmingham section of the Society of Chemical Industry a paper in which he described in detail the methods which have been adopted in recent years in dealing with the sludge produced at the works for which Mr. Watson is responsible. Managers of smaller sewage works may consider

that they are called upon to undertake impossible tasks in dealing with their sludge without causing a nuisance from smell, but what would they do with 4,860 cub. yds. of sludge containing 86.6 per cent of water, which is produced *every week* at the Saltley works at Birmingham? Yet this is the quantity with which Mr. Watson and his staff have to deal, and which they have satisfactorily treated during the past two years by the method indicated in the title of Mr. O'Shaughnessy's paper, "The Utilisation of the Phenomena of Putrefaction, with Special Reference to the Treatment and Disposal of Sewage Sludge."

Briefly, the sludge is first settled out in fine primary sedimentation tanks, with a total capacity of about one-sixth of the daily flow of 30,000,000 gallons, the passage of the sewage through these tanks occupying about four or five hours. Each of these tanks runs for two to three weeks, when it is put out of operation; the supernatant water is drawn off, and the sludge is pumped into the primary sludge digestion tanks. In two days the sludge begins to ferment vigorously, and after a fortnight the action slows down. A portion of the sludge is then pumped into the secondary digestion tanks, where further vigorous action takes place. A question was asked in the course of the discussion as to the reason why sludge which appeared to be "worked out" in the primary digestion tanks should show renewed activity when pumped into the second digestion tanks? The author's theory was that after a time the bulk of the solid matter in the sludge settled to the bottom of the primary digestion tanks, and that the fermentative action was stopped by the accumulation of the products of putrefaction immediately over it, so that when it was pumped a second time the whole mass became thoroughly mixed, and the organisms were again capable of acting vigorously. This seems quite feasible, but in any case the actual result was as stated, and it was estimated that the effect of the second pumping and further digestion of the sludge was the reduction of the time required for maturing by five or six weeks. Eventually the worked-out sludge from the secondary digestion tanks was pumped out on to specially prepared plots of land provided with ample sub-drainage and a layer of ashes over the floor. The sludge was spread over these plots to a depth of 18 in., and then left to dry. The time required for the drying process varies from three weeks to several months, according to the condition of the sludge and the state of the weather, but ultimately it becomes sufficiently dry to be carted away. No figures are given as to the water content of the "dry" sludge, but it is described as a "hard, innocuous mass." From this we may assume that it contained 50 to 60 per cent of moisture, and the cost of tankage digestion, pumping, drying and carting to tip was found to be 4.7d. per cubic yard of wet sludge, 86.6 per cent of water, or 6.3d. per ton of wet sludge. Calculated upon the sewage, these figures work out at 9s. 6d. per 1,000,000 gallons of sewage, or 1½d. per head of population. These costs were working costs, including maintenance and repairs of working parts of machinery, but not the interest on capital or sinking fund charges, which were stated to be probably small.

While this method of sludge disposal is suitable to this particular case, it should not be accepted as of general application, as it is well known that the sewage of Birmingham is of a peculiar character, due to the amount of special trade wastes which it receives. At the same time this record of the developments which have taken place at these works in this question of sludge disposal is extremely interesting, indicating as it does the ability and seriousness with which this vexed problem has been attacked, and the successful

manner in which the results of the local experience and of the scientific investigations of others have been applied. Those who, like ourselves, remember the state of the Birmingham sewage farm before Mr. Watson took charge of it are aware of the enormous improvement which has taken place during the past few years, and recognise that great credit is due to Mr. Watson and his staff for the present satisfactory state of affairs.

* * *

A Building Line Problem.

It is, of course, well known that neither the Public Health (Buildings in Streets) Act, 1888, nor the Public Health Act, 1875, which is to be read into it so far as definitions are concerned, contains any definition of the term "building." In case of a dispute as to whether a given structure is a building within the meaning of the Act of 1888, it appears, according to the authorities, to be a question of fact for the magistrates to decide, "provided the thing erected is of such a nature that it is capable of being a building." The proviso is rather suggestive of hair-splitting, since one would think that a tribunal competent to decide the one question would be equally competent to decide the other. In practice we suppose it comes to this—that where magistrates have found a structure to be a building within the meaning of the Act, their decision may be upset by the High Court, by a side wind, as it were, if the latter come to the conclusion that the structure is of such a nature that it is not capable of being a building.

There are not many reported decisions under the Act of 1888 on this particular point, though there are several as to whether various erections are "buildings or structures" within the meaning of the London Building Act, 1894, under which the building lines of streets in the Metropolis are regulated. One of last year's cases under the Act of 1888—*Sunderland Corporation v. Charlton* (briefly referred to in our issue of January 30th last, page 231)—is of interest in this connection as indicating the possibility of driving, if not the proverbial coach and horses, at all events a wheeled construction of sorts, through the Act. One of the objects of this Act is manifestly to give urban authorities a voice in controlling the dimensions and character of projections such as bay windows, porches, and so forth, in front of buildings. In this case the owner of a house constructed a porch of wood and glass, with a felt roof, mounted it on wheels, and placed it before his front door. It was not attached to the house in any way, but in the position in which it stood it projected some 6 ft. 6 in. beyond the front main wall of the house (and, we presume, beyond those of the adjoining houses). On the owner being summoned for a contravention of the Act, the magistrates refused to convict, on the ground that the porch did not constitute an addition to the house. Upon appeal to the Divisional Court, it was held that the Court could not say that in so deciding the magistrates had gone wrong in point of law, and that therefore their decision must stand. It is evident that a structure of this kind is equally within the mischief aimed at by the Act whether it is attached to the house or not, and it is to be hoped that this decision will not create a precedent. It is to be observed, however, that the offence charged was building an addition to the house. It may perhaps be possible in similar cases so to frame the charge as to secure a conviction. The Act, it will be remembered, prohibits not only the building of an addition to a house beyond the front main wall of the building on either side, but also the erection of any building beyond the same datum line. Though an unattached porch may not be

an addition to a house, it may, we venture to think, itself be a building within the meaning and scope of the Act.

* * *

Practical Points in Road Crust Construction.

A very useful paper on road crust construction and maintenance, which was read yesterday at the Birmingham meeting of the Western Midland District of the Institution of Municipal and County Engineers, by Mr. H. M. Lawson, is reproduced in another part of this issue. Mr. Lawson's careful descriptions of the methods employed in Birmingham in constructing water-bound broken-stone crusts are especially welcome just now, since it is felt by not a few experienced surveyors that sufficient attention is not being paid to road crusts of this class. The position generally is that water-bound crusts are decidedly to be preferred under certain traffic conditions, while, when the traffic is a good deal more severe, other forms of road crusts are to be preferred, on economic grounds. It is clear, therefore, that unless we make the best water-bound crusts that can be made, or, at any rate, the most economical in first cost and maintenance combined, we are not in a position to say where the line is to be drawn, and there can be no doubt that in some cases the superseded crust has been by no means the best or most economical possible under the conditions of the locality. In some cases there has been almost a panic, and the superseded crusts have been considerably inferior to the best that could have been made and maintained for the same total cost. Sometimes, of course, the surveyor is looking ahead, and has reason to believe that before long the severity of the traffic will be such as will definitely justify the changes in the methods of construction.

But, apart from the economics of particular cases, it is very desirable that the construction and maintenance of water bound crusts should be carried to the highest pitch of efficiency, since we have no other means of comparing costs in all parts of the country. The cost of the water-bound crust is, in fact, the least common denominator of costs generally. The diagrams accompanying Mr. Lawson's paper show road crusts of a very good type. It is probably intended that the concrete foundation of the channel shall be well keyed into the slag course, so that there may be a continuous crust beneath the kerb and channel, and it may be suggested that, since the junction of the slag with the concrete is the weakest part of the crust, the concrete might be a little thicker, and its underside in line with that of the slag course. Other points in the paper to which attention may be specially directed are the use, in rolling, of small quantities of water, the careful mixing of the stone so that there may be no segregation of sizes, the favourable opinion of small cube granite paving, and the use of oak block paving. The only fault we have to find with this useful paper is that the author does not give as fully as might be desired the results of his experience with the different kinds of paving described.

* * *

Sewage Disposal in the United States.

The forty-fourth annual report of the Massachusetts State Board of Health deals with the year ending November 30, 1912, and records, among other matters, the results of various experiments which were carried out at the Lawrence Experiment Station in connection with the purification of sewage and trade wastes. Some of these results were described in these columns during the past year. Among the other experiments, those dealing with the disposal of sludge in deep tanks produced varying results, and the conclusions arrived at were that the experiments made with sludge in these tanks, 17 ft. deep, seemed to show that sludge from certain domestic sewages may be offensive under all conditions of deep tank treat-

ment, except when containing iron or other metallic salts, or an equivalent alkalinity. They also showed that modification of the odour of some of the sludges was obtained by stirring this sludge with slight air or water currents. The results do not agree with the published records of results obtained with Imhoff tanks in Germany, and ought not properly to be compared with them for the reasons that the experimental tanks were not so deep as Imhoff tanks have generally been constructed, and the sludge was introduced into the tanks artificially, and not allowed to settle out naturally from crude sewage passing through the separate channel in the tank as arranged in Imhoff tanks. While, therefore, the results of these experiments are interesting and useful, they should not be accepted as having any bearing upon the efficiency of other types of tanks.

Another series of experiments mentioned in the report was carried out with the view of ascertaining to what extent the volume of sewage treated upon sprinkling filters could be increased by more complete preliminary clarification of the sewage. The results showed that when practically all the suspended matters were removed from the sewage the possible rate of filtration could be doubled without causing any deterioration of the final effluent. It is stated in the report that these results add valuable confirmatory evidence to the statement which has frequently been made in previous reports, that the practical rate at which any biological filter can be operated is largely dependent upon the amount of organic matters which are applied to it, and not upon the amount of water by which those organic matters are carried. The practical man will, however, wish to know whether the extra cost of the more complete clarification, involving chemical precipitation, is justified, or whether it would be more economical in the end to construct larger filters at the outset and save the cost of chemical treatment.

* * *

Rather Mean! Long experience of the ways of a certain type of councillor has led us to view without

surprise the reports which appear from time to time in local journals of particular instances of shabby treatment meted out to officials, and especially, it seems, to surveyors. The latest example comes from the Wellington Rural District, where Mr. E. V. Richards has put in twenty-eight years of continuous service as surveyor. It might have been thought that this long record would have rendered him immune from petty treatment at the hands of the council, but apparently this is far from being the case. It appears that on certain occasions recently Mr. Richards has been obliged to visit outlying parts of his district on urgent business at the end of his ordinary day's duties, and after he had driven his horse and trap for long journeys. In these circumstances, rather than postpone his visit to the next day, he ventured to hire a motor car, the total cost amounting to £2 13s. It is somewhat surprising to find that the Finance Committee "did not feel justified in passing the account," and although one member pointed out that one item at least concerned the safety of the public, the council took the same view as the Finance Committee, with the result, presumably, that Mr. Richards will himself have to pay the amount. The matter hardly calls for criticism, inasmuch as a mere statement of the facts is sufficient to demonstrate the spirit of these worthy representatives of local government. Treatment of this kind, however, is very disheartening to any official, and must result in the creation of a relationship between him and his authority which is not calculated to secure the best interests of the public.

Road Construction and Maintenance.*

By H. M. LAWSON, Deputy Road Surveyor, Birmingham.

In submitting this paper the author is conscious of the fact that this subject has been dealt with by many well-known road engineers, but his object is to give actual experience of various methods of road construction, and to invite other engineers to do likewise, so that comparisons may be made. It is well known that the area of water-bound macadam roads far exceeds that of any other method of construction, and therefore he proposes to deal with this class first.

In many instances water-bound macadam roads are condemned as useless under average traffic conditions; the chief reason for this is that in many cases

MR. H. M. LAWSON.

[Mr. Lawson served his articles—from 1900 to 1903—with Messrs. Lacey, Sillar & Leigh, civil engineers, Westminster, and King-street, Manchester. From 1903 to 1905 he served as assistant under Mr. F. W. Lacey, M.INST.C.E., borough engineer of Bournemouth, and was then appointed assistant engineer with Messrs. J. G. White & Co., Limited, London, being engaged with the firm on contracts which comprised road making, sewer and bridge construction, and general public works. In 1908 Mr. Lawson joined the staff of Messrs. John Mowlem & Co., Limited, of Westminster, being engaged as chief assistant engineer and works superintendent on contracts of a value of £100,000. This work entailed reconstruction of bridges, road alterations and improvements on an extensive scale. He had full charge of all men employed in these works, and was responsible for the measuring and rendering of all accounts. Previous to his present appointment, Mr. Lawson held the position of road surveyor and superintendent to the Metropolitan Borough of Chelsea. His district comprised about fifty miles of main roads, two-thirds of which were constructed in macadam, tar-macadam, and bituminous-grouted macadam, the remainder being wood, stone, and asphalt. He had sole charge of all outside work, which in most cases was executed by direct labour.]

these roads have no foundations or proper drainage. In this respect many of the macadam roads in Birmingham district come under this heading; therefore it is of great importance to get a solid and well-drained foundation, and adequate surface drainage, also to ascertain that every care has been taken to decide the wearing qualities of the stone employed, and to ensure that it is of one uniform quality.

Some time ago the author had his attention called to a road that was being constructed, where the contractor proposed to lay stones of different qualities. He took exception to this, and found that the contractor could hardly understand why objection was raised. However, it is obvious to any road engineer that, wherever one has stones of different qualities (and this applies also to stone-sett and wood paving), the softer stone soon begins to show itself by wearing down below the harder, resulting in a series of ups and downs.

The city engineer of Birmingham, in dealing with the construction of new water-bound macadam roads carried out by contractors with a view eventually to their being taken over by the city authorities and maintained by "the inhabitants at large," issues a specification which is strictly adhered to, inspectors being appointed for the special purpose of looking after this class of work.

The form of construction is as follows: A layer of clean clinker ashes or broken stone, 6 in. in depth when rolled solid, is followed by a second layer, consisting of hand-pitched slag, 6 in. to 8 in. in depth (according to the nature of the traffic), set on edge, in the manner of a rough pavement. Over this layer a coating of broken slag or other approved material is laid, so as to fill up the interstices to form a smooth surface; each layer is thoroughly consolidated. A row of 4-in. by 6-in. granite setts on concrete is laid outside the channel stone as a margin course. The metalling for finishing the carriageway is then spread with forks in two coats. The first coat having been uniformly spread over, the whole carriageway is then rolled until consolidated. The second coat is then uniformly applied and consolidated, making a thickness of 6 in., the surface then receiving a coating of fine chippings of the same description of material as the metalling used; the chippings are screened through a 3-in. mesh, and include the finer material, down to dust. The carriageway is then lightly watered and rolled until thoroughly consolidated, two men being engaged in sweeping the chippings into the interstices of the stone. On completion, it is coated with a thin layer of 3-in. chippings of similar material, free from dust. Each layer is laid to a camber or gradient of 1 in 25.

The author has found, in carrying out this work, that at times, unless one has been careful in choosing a sufficiently tough stone (and in some cases the cost prohibits this), the stone is broken and crumbled in the process of consolidation by steam rolling; to obviate this, a little binding material in minimum quantity is spread over the metal and slightly watered. Too much attention cannot be given to the spreading of the stone, which really requires great care and skill, as the evenness of wear of the surface greatly depends upon uniform spreading.

In Birmingham the city engineer pays a small bonus to the spreaders; this method works exceedingly well, as there is competition among the men, and only the ablest men are selected for the work. Great care must be taken to see that very little water is used, as there is a tendency on the part of rollermen to use as much as possible, to expedite rolling operations. The loading of this stone into the carts is done with forks, but in a district formerly under the author's supervision, when carting stone on to a site and tipping it close to the spreading, a difficulty was experienced owing to a thorough turning over of the material being impracticable. This was remedied by tipping the stone on to concrete mixing boards, thereby ensuring that it was properly turned, and so obviating any chance of having larger stones in some parts of the road and smaller ones in other parts, besides preventing all the dust, &c., from settling at the bottom.

The method of recoating is to scarify the crust of the old road, regulating the old material, and then applying a 3-in. coat of new metal. Generally speaking, there are two ways of repairing a macadam road, patching or recoating the whole surface. As soon as any potholes or uneven wear appears it should be attended to immediately, the cause ascertained and remedied, and the necessary repairs undertaken. If repairs are delayed it generally means that in a very short time the recovering of the whole surface is necessary, which adds considerably to the cost of repair. Any road, the crust of which is weak, will very soon become bumpy. It is most difficult to keep the surfaces of roads in good condition, owing to the various statutory authorities, such as gas and water companies, interfering with them; also by reason of the fact that in most of the main roads in this city there is a tramway track, and in many parts the sides between the track and the channel is constructed in macadam. This requires constant attention, owing to the traffic causing a rut to form next to the paving.

Macadam roads are also being considerably damaged by motor bus traffic, and in comparing the repairs to a certain road prior to buses running with a corresponding period afterwards, the cost was found to be practically trebled. These motor vehicles do a vast amount of damage, particularly in roads not constructed to sustain their weight and destructive

* A paper read at the meeting of the West Midland District of the Institution of Municipal and County Engineers, held at Birmingham yesterday afternoon.

influence. In some counties the surveyor is suggesting the advisability of establishing weighbridges, with a view to having the gross loads and axle weights of heavy motor vehicles checked, as there is no doubt that the registered axle weights are in many cases greater than those allowed under the Heavy Motor Car Order, 1904.

TAR-SPRAYING.

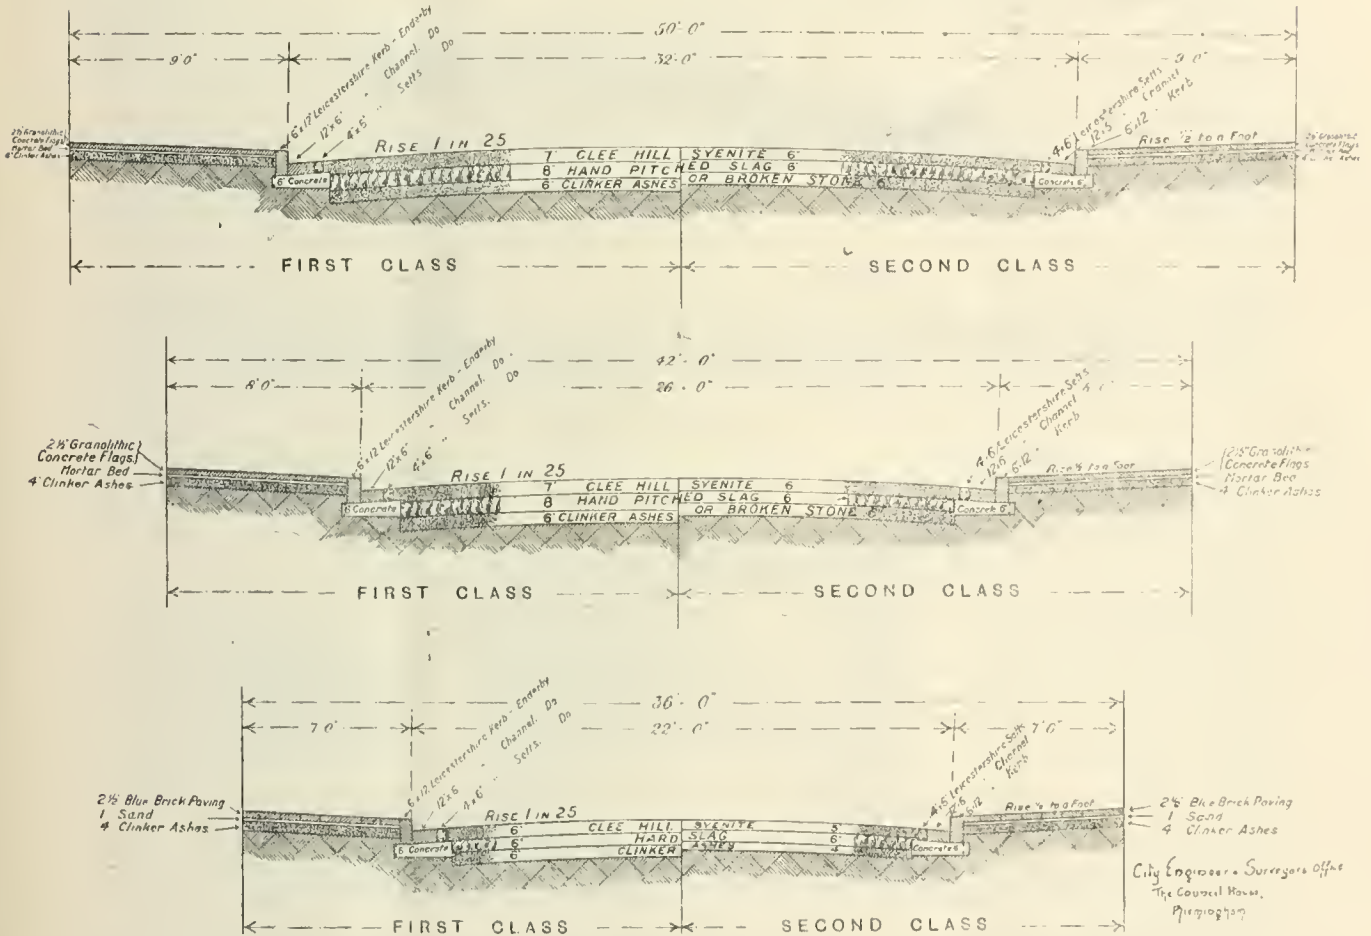

In treating road surfaces by the application of tar, the author has found that the life of the roads is prolonged, and also the dust nuisance reduced to a minimum. The chief object is to secure a deep penetration of tar below the surface, so that the metal may be kept together, and a road treated properly in this manner should have the appearance of a tarred-macadam road.

Last year, in Birmingham, 1,771,515 super. yds. of roads, comparable with a length of over 131 miles, were tar-sprayed. The major portion of this work was done by six 1,000-gallon machines, hauled by

strengthened where necessary, and rolled to an even surface. The asphalt macadam was conveyed a considerable distance from the works in specially lined carts, and laid at a temperature of about 250 degrees, regulated, and then rolled. A coat of Trinidad bitumen, properly fluxed, was squeegeed over the surface after rolling, and then 3-in. granite chippings sprinkled over the whole surface. The price per square yard was 5s. 6d., including excavating and carting away the old material.

At the same time an experiment was tried by laying Roadmant, 1 in. thick, direct on to the surface of an existing macadam by-road used by motor buses in order to avoid the necessity of turning round in the main thoroughfare. The material was supplied in rectangular blocks, weighing about 1/2 cwt., these were placed in an ordinary asphalt cauldron and heated. The material, on becoming plastic, was well stirred, and 3-in. granite chippings added, stirred again, and mixed with specially prepared flux. The method of laying is similar to that of

STANDARD SECTIONS OF MACADAM STREETS.

steam rollers, the cost per super. yard being just under a penny. Of course, it must be borne in mind that it was a most favourable season for this class of work.

To get the best results from tarring, the surface must be thoroughly clean and dry, it being a waste of time and money to treat the surfaces of roads with tar when in a bad condition. The author has observed many failures owing to this alone, and thinks that it is obvious that by tar-spraying a bad road it cannot be converted into a good one.

Tar-spraying should be carried out in a methodical manner, all roads coated or reconstructed in the winter months being tar-sprayed in the early spring, and again, if necessary, in the early autumn. Hills having a steep gradient should be specially gritted if tar is applied to the surface.

ASPHALT MACADAM, ETC.

Some two years ago the author supervised the laying of a considerable mileage of Trinidad Lake asphalt macadam.

The old road was scarified, material heaped up and carted away, the crust and foundation being

mastic asphalt, the material being conveyed from the cauldron in buckets, tipped up, and laid with wooden floats. The whole surface is then dusted over with sharp sand, which is afterwards rubbed in. One difficulty that presented itself in laying this asphalt was to impress on the men the necessity of constantly stirring, to ensure proper mixing and to avoid the burning of the material. The cost was 3s. 6d. per yard super., and at the time of writing the author understands it is in good condition, no repairs of any kind having been necessary.

Some good results have been obtained with Plascom grouting, by scarifying the old road and excavating to a depth of 4 in., regulating and well rolling the same. A layer of 2 1/2-in. stone was then laid and well rolled, clean chippings spread over it and brushed into the interstices, before the Plascom (which was mixed with one-third proportion of Leighton Buzzard sand) was applied. Another layer of 2 1/2-in. stone was then spread on the top of the above layer in a similar way, except that in this case the top layer was dressed with 3-in. clean chippings after the grouting was completed, the same being applied and rolled before the Plascom had set. The cost per super. yard

was, approximately, 6s. Very bad weather was encountered during this work, which added considerably to the cost.

Glutrin (a non-bituminous binder) has been used in the reconstruction of a road in Birmingham, being mixed with $\frac{1}{2}$ -in. limestone chippings to form a matrix, then spread over the whole surface to a thickness of 1 in. Stone was then applied and rolled until the matrix rose to the surface. At the time this certainly hardened the surface, but now the hardness has disappeared. The author has obtained more success with this binder in patching work after diluting the glutrin with water and spraying it from a water cart.

ARMoured PAVING.

Some time ago the author supervised the laying of Durax cubes, to what is generally known as the oyster shell pattern (owing to its intersecting segmental courses), on an existing foundation of a

5-in. or 6-in. setts laid upon a foundation consisting of Portland cement base concrete, 9 in. thick (6 to 1), on which is placed a bedding of slightly damped cement and sharp sand, free from silt or loam, to a thickness of 1 in. The paving should be laid before the concrete becomes too hard, when sufficiently damp or mellow enough for the 1-in. feed to unite with it. The setts should be damped with a rose-water can, and then grouted with a mixture of 3 of sharp sand to 1 of cement, and rammed as soon after as possible, the whole forming a 16-in. seal of solid mass. Great care must be taken to see that the whole of the materials are thoroughly mixed and of the best quality. No traffic should be allowed over the paving for at least ten clear days.

Both cement and pitch have been used for grouting sett paving, but the author favours the former in all cases where possible, although, to meet present-day requirements, pitch grouting has certain advantages inasmuch as roads finished in this manner can

macadam road. The road was scarified, the crust trimmed down, and the foundation strengthened where necessary. Cubes about 3 $\frac{1}{2}$ in. in depth were laid in segmental courses on a bed of tarred chippings $1\frac{1}{2}$ in. thick, $\frac{3}{4}$ -in. pea ballast having been swept into the joints, and the steam roller then carefully run over the surface before grouting with pitch and creosote oil. The cost was 7s. 9d. per yard super., the company giving five years' maintenance. This form of paving has also been laid on a concrete bed $7\frac{1}{2}$ in. thick in a very narrow thoroughfare traversed by heavy warehouse traffic. The cubes were bedded on sand, well rammed and grouted in with pitch and creosote oil, at a cost of, approximately, 12s. 4d. per super. yard. This class of paving is both useful and economical in roads of medium heavy traffic, being cheaper in construction than ordinary granite paving.

SETT PAVING.

The author is of opinion that the following describes the most serviceable form of paving for heavy traffic—

be opened to traffic immediately after completion. There is also less tendency for mud to collect on this kind of grouting, which, however, must be skilfully handled to ensure the proper proportion and correct mixing of the ingredients. The method adopted by the writer is to use a grouting mixed to the following proportions: 2 to 3 gallons of creosote oil and 1 gallon of coal-tar added to every 1 cwt. of pitch. (The quantities of oil and tar being determined by the nature of the pitch.) The joints of the setts having been filled about half way up with $\frac{3}{4}$ -in. or $\frac{1}{2}$ -in. pea ballast, or shingle, and then rammed. Great care must be taken to see that this racking is thoroughly dry. The pitch mixture is then poured from a spouted pail into the corner of the setts (this prevents surplus being left on the top), to about half their depth, and the remainder of the joints filled up with racking as before. Sweep with hard broom and squeegee over the whole surface with the pitch mixture as quickly as possible, so as to leave the smallest accumulation on the top. On no considera-

tion should this work be done other than when atmosphere and materials are in a perfectly dry state.

Perhaps here it might be of interest to mention a particular form of paving in which the author is concerned, which consists of specially dressed 5 in. wide by 4 in. deep Grey Royal setts, laid on a concrete foundation. The contractors were called upon to replace a considerable number of setts with broken corners. The stones were paved when wet on bedding which was more than damp, and when the stone was surface dry, boiling pitch grout was poured into the joints, with the result that it attacked the shakes or flaws in the setts, generated steam in them, and this acting as a wedge, slightly detaching the flaw or shake portion of the sett. Under heavy continuous traffic it became wholly detached, pulverised, and peeled out. The author is of the opinion that had this work been completed with pitch grouting in dry weather this would not have happened, or, under the above circumstances, had cement and sand instead of pitch been used for grouting.

In Birmingham the standard size of setts used is 4 in. by 4 in. by 5 in. deep, laid with a crossfall of 1 in 45 from the crown of the road to channel, and in straight diagonal courses, meeting in the centre at an angle of 90 deg., with the apex pointing downhill, at an angle of 45 deg. with the channel where the kerbs are parallel. The setts are paved on a 1-in. bed of local sand grouted with a proportion of 5 parts of clean sharp sand to 2 parts of cement. The concrete bed is 7½ in. in depth, the ballast for it consisting of clean, non-porous blast-furnace slag with such an admixture of sand sufficient to fill up the interstices of the stone. After completion, a layer of clean sand is spread over the whole surface, and no traffic allowed over it for three weeks.

In this district the most suitable material for paving streets of steep gradients traversed by heavy traffic has proved to be "grit-stone," the steepest gradient paved with this material being 1 in 11. Care should be taken to see that this class of paving is constantly swilled with water so as to prevent an accumulation of mud and dirt on the surface, and if this has proper attention, complaints of slipperiness are practically unknown. In London and other cities specially dressed 5 in. wide by 1 in. deep Grey Royal setts have been laid on steep gradients, with very close joints, with much success. . . .

ASPHALT.

The author has had some little experience with asphalt, laid and maintained by one of the well-known companies who specialise in this class of work. The paving consisted of compressed asphalt, 1½ in. in thickness, in a bed of concrete 6 in. in depth. The advantages of this class of paving are many, its disadvantages few, the chief being its slipperiness in times of rain, mist, &c., to horse traffic; but in the author's opinion it is, under similar conditions, no worse than granite-paved roads. The cost for new asphalt work was, approximately, 12s. per square yard, the corporation preparing the carriageway for the concrete foundation.

HARDWOOD PAVING.

This, like granite paving, is laid on a concrete bed, and in Birmingham the following method is adopted. The concrete being laid out to a correct level and curvature, with a camber or crossfall of 1 in 45, the surface is rendered and floated over to a depth of 1½ in., with a rendering composed of 2 parts of Portland cement to 5 parts of Hartshill granite chippings, which has been well turned over and intermixed—three times while dry, and three times after the water has been added. The Hartshill granite chippings used are washed, and are such as will pass through a ½-in. mesh, free from dust, but containing the coarse grit.

Prismatic oak blocks, 9 in. long, 3 in. wide, and 4 in. deep, are laid in straight courses, square, transversely to the line of kerb, just tight enough for a semblance of a joint to appear. (This joint is obtained by the use of a creosoted deal strip ¼ in. in thickness.) A boiling mixture of pitch and creosote oil is then squeezed over the surface, and worked into the interstices while hot. The blocks forming the channel on each side of the road are in three courses running longitudinally. Each block in the channel courses is dipped on one side and one end immediately before being laid, and alongside the kerb on each side of the road an expansion joint, 1½ in. wide, is allowed, this being filled with boiling pitch grout to a depth of 1 in., and the rest of the joint filled with puddled clay.

When the paving is complete, the surface is top-dressed with a layer of ¾-in. Hartshill granite chippings, and closed to vehicular traffic for at least seven days. Wherever wood paving abuts against macadam a tender course of granite setts, consisting of three courses, is laid.

In laying Jarrah or Karri hardwood paving, the author favours paying the blocks tight on a bedding of sand, and ramming each course, similarly to granite paving, and squeegeeing with a pitch mixture sufficient to fill up the interstices between the blocks, and spreading over the whole surface a thin layer of fine, sharp sand, this wood being too dense to be top-dressed with grit. This method minimises the wear at the joints (which, combined with the expansion and contraction, makes this paving so difficult to deal with), and also acts as a cushion between the blocks and the hard foundation, which affords more elasticity and resiliency, and consequently gives a consistency in the wear of the blocks.

Another method adopted by the author was, after the surface of the concrete had been rendered, to dip each block into a small tank containing pitch and creosote oil, to half their depth, and then squeegeeing the whole surface. The latter grouting, uniting with the film formed by the hand-dipped blocks, gives as nearly as possible a well-filled joint, and a plastic film is formed which is watertight between each course and end of blocks.

The author has seen some paving laid with sectional hardwood blocks, and thinks that experience has not yet proved that this class of paving justifies the laying of 9 in. and 12 in. of concrete foundation (including floating) to receive a 3-in. deep hardwood block. In fact, no hardwood paving, in addition to its initial cost being more, has any advantages over softwood to justify its selection. There is, however, this in its favour—old blocks which have become worn and uneven on the surface can be taken up, cleaned and trimmed, and sawn to the required thickness, and then relaid. In this city a machine for this purpose has been used effectively, dealing with many thousands at the rate of about twelve per minute, the cost being, approximately, 10s. per 1,000.

SOFTWOOD PAVING.

The foundation for this class of wood paving is similar to that for hardwood, with the exception that the camber or crossfall in this case should be 1 in 36. The author favours the following method: Uniformly cut creosoted deal wood blocks, either 4 in. or 5 in. deep, which are sound and free from sap and shakes. (The creosoting of the blocks should have been done at a pressure of not less than 80 lb. to the square inch, and they should absorb about 8 lb. to 10 lb. of oil to the cubic foot of timber.) The blocks should be laid close jointed in straight courses, with the grain vertical to the rendering, the surface afterwards squeegeed with a boiling pitch mixture well worked into the interstices while hot. In some cases the joints are filled to the top with pitch and oil, and in others the final grouting is with a 3 to 1 mixture of sand and cement. The channel courses formed as in the case of hardwood paving previously mentioned. An expansion joint of 1½ in. to be left alongside the kerb, and filled in as before described.

The author is of the opinion that the best form of expansion joint consists in a mixture of sawdust and tar. A barrel of tar and 16 bushels of sawdust will be sufficient to do about 70 lin. yds. of an expansion joint 1½ in. wide by 5 in. in depth. This method is somewhat costly, but excellent results have been obtained both with hard and soft wood paving. No traffic should be allowed over the finished surface until at least seven days after the wood has been laid and grouted. Before being opened to traffic, the whole carriageway should be dressed with a layer of good, sharp, angular ¾-in. grit or flint.

In all cases of wood paving the author has provided a "weep-hole," consisting of two holes of ¾-in. diameter, drilled in suitable positions in both ends of the gully, the bottom of the hole being on a level with the surface of the rendering. This has proved very useful in the case of water getting under the blocks.

CLEANSING.

It is obvious that road surfaces need systematic cleansing, gritting and watering, but the author would like to emphasise the trouble that has been experienced in regard to sweeping newly constructed water-bound macadam roads, for, if careful attention is not given to this matter, the binder will soon be removed. In a former district under the author's control,

machine sweeping brushes were not used on water-bound macadam surfaces.

The watering of streets in any city is also of great importance, especially as there is now so much motor traffic on the roads. The author had under his control steam motors fitted with tanks, and has found that this method is much more economical and effectual than horse-drawn water carts. These machines were fitted with interchangeable bodies, so that the motors, when not engaged for watering, could be utilised for carting stone or any other materials. In addition to these machines, a steam motor vacuum extractor was used for emptying gullies, and a considerable saving was effected, as compared with ordinary gully vans, besides being more hygienic and saving that splashing which invariably takes place when gullies are being emptied.

The author is aware that it is a much debated point whether the use of mechanically propelled vehicles should be used by road authorities owing to the damage caused to the roads; but he is of opinion that, as this mode of traction is increasing so much, in time the roads will be able to withstand this form of traffic.

In conclusion, the author wishes to express his appreciation of the city engineer's kindness in allowing him to give this paper.

AN INTERNATIONAL LANGUAGE FOR ENGINEERS.

At a meeting of the Society of Engineers on Monday a paper entitled "Esperanto: An International Language for Engineers," was read by Mr. T. J. Gueritte, B.Sc., M.S.E., M.Soc.C.E. (FRANCE).

The author pointed out that there were four main reasons for the adoption by scientific and technical men of a universal language: (1) that modern science is, to a considerable degree, *specialised* and *international*, Engineers, of whatever nationality, are obliged to study works by authors of other nations; (2) that in the actual carrying out of engineering works or the pursuit of research abroad one comes in contact with people of diverse nationalities, and it is a difficult and interminable task to master a number of different languages; (3) that the work of international congresses would be greatly facilitated and their expense reduced; (4) that the present high prices of technical books would be reduced, because, if written in an international language, they would have a much wider circulation, and translations would not be necessary.

That an international scientific language is possible is shown by the fact that at one time Latin was the medium of international exchange of ideas. This language is both difficult to learn and unadaptable to changing conditions. A modern national language such as English or French would never be generally accepted as a "world language" on account of irregularities of formation and pronunciation, and international jealousy. There is no probability of any one language becoming the universal language of all men, but an auxiliary language for intercommunication between scientists is practicable. Esperanto is such a language, and its use is possible because (a) it is a living language, (b) it is international and neutral, (c) it is learnt with the least possible difficulty, (d) it lends itself to the technical requirements of every science, (e) it has been used most successfully in public discussions at international congresses, (f) it is capable of reducing the cost of international books.

Mr. E. Fiander Etchells, who opened the discussion, proceeded to make a few remarks in Esperanto, which appeared to be greatly appreciated by a section of the audience whose knowledge of the language was evident. He then gave his own experiences, which were to the effect that Esperanto not only afforded an easy means of communication between engineers of different nationalities, but that it was possible to learn it and to speak it with such facility that one's nationality was not detected, which he took to be a great advantage, seeing that all met upon a common footing, and that, whereas it was practically impossible for an engineer to speak in public in a foreign language without detracting from the value of his speech by the strangeness of his pronunciation, in Esperanto the nationality of the speaker was not obvious.

Sir William Collins expressed his approval of Mr. Gueritte's suggestion, and applauded the enterprise of the Society of Engineers in bringing the subject forward.

Mr. Harrison Hill, who is an enthusiastic Esperantist, related some amusing experiences which

supported Mr. Etchells' statement that the nationality of the speaker was not obvious when speaking Esperanto.

Mr. Sexton considered that Esperanto had a special application to scientists. It was particularly fitted for the translation of scientific papers. One could learn to read it in a few hours, and the Society of Engineers would do good work if they would push the matter.

Mr. Chatterton also expressed great approval of Mr. Gueritte's suggestion.

Miss Lawrence stated that a knowledge of Esperanto had enabled her to get into touch with the poorer people on the Continent in a remarkable manner. From the remarks made by Miss Lawrence and from those of other speakers it appears that Esperanto has been taken up with most satisfactory results by the poorer people on the Continent and by some of the mill people in Lancashire.

Mr. Moscheles strongly advised engineers to take up Esperanto.

Mr. Cox stated that the logical and mathematical construction of the language appealed especially to engineers. The expression was good, and there was no ambiguity. He found it possible to explain himself upon engineering matters very clearly and with great ease in Esperanto.

Mr. Honeysett dealt with the special fitness of Esperanto for expressing all technical terms. Whereas in English we had a great number of words coming from absolutely different roots dealing with the same subject, this was not so in Esperanto, where one root with suffixes would translate all the English words relating, say to digging—such as "trench," "navy," "spade," "spoil," "bank," "filling" and so forth.

Mr. Brock suggested that Spanish was more suitable than Esperanto as a universal language. Few Englishmen knew Esperanto, and they were not sufficiently enthusiastic to take up a new language. They would, however, take up Spanish readily, because it was particularly suitable for expressing engineering terms, and it was spoken by 75,000,000 people.

Miss Lawrence pointed out that after an Englishman had spent many months learning Spanish he would then be able to speak to people of one nationality in that language, while if he learned Esperanto, which would take a much shorter time to learn, he could speak to people of all nationalities.

Mr. W. C. Easdale considered that if Spanish had a claim to be considered as suitable for universal use, Hungarian had equal claims. He was, however, more in favour of Esperanto, owing to the fact that national prejudices would prevent the universal adoption of any national language. Esperanto appeared to him likely to be so useful that, although he understood several foreign languages, he certainly intended to learn it.

Mr. Sharp referred to the work of the Engineering Standards Committee. Standardisation had proved to be of the greatest advantage in all engineering matters, and it therefore seemed fit that the language of engineers should be standardised. As to the time taken to learn Esperanto, he would give the instance of the game of chess, which, though it might be learned in a short time so as to enable a person to take part in a game, would yet require a lifetime of study. The same might be said of Esperanto.

Prof. Smith held forth at some length upon the defects of Esperanto, and advocated the use of an improved form of Esperanto.

Madame Blaise also eloquently demonstrated the usefulness of Esperanto.

Mr. Mudie, who replied on behalf of the author to the discussion, stated that there are 200,000 persons who understand Esperanto; that, as it started upon the Continent, there are more Esperantists abroad than at home, but that the language is making considerable headway in this country, and is likely to be very useful to engineers.

Town Planning at Hull.—An extensive town planning scheme has been approved by the Hull Corporation Works Committee. The land involved lies in the north-eastern district of the city and extends into the area of rural authorities. The city engineer, Mr. A. E. White, estimates the total cost at £73,000, of which the corporation would pay £15,000, Sculcoates Rural Council £23,000, and the owners £35,000. The cost of the work it is proposed to carry out in advance of the development of the whole scheme is estimated at £27,000.

ROAD BOARD ADMINISTRATION.

THE HOUSE OF COMMONS DEBATE.

In the recent House of Commons debate on the Address there was a long disquisition—briefly noted in our issue of the 20th ult.—on the status and policy of the Road Board. Sir J. Bethell proposed as an amendment the addition of the words: "But humbly regrets that His Majesty's Speech contains no reference to the unfair administration by the Road Board of the funds under its control." The hon. member's main contention was largely based on a fallacious comparison, the claims of West Ham to a share in the Road Board grants being urged, with special reference to the Western approach road to London.

"The board," said Mr. Bethell, "appear to favour substantial grants being made for widening and improving roads on the West side of London to facilitate the rapid transit of the light motor car; but they declined to make grants towards the cost of improving the means of communication between London and the Albert and Victoria Docks." Now, the board has explicitly stated that its funds do not permit of the consideration of any important expenditure on costly urban improvements, the money being more urgently needed for the carrying out of large numbers of much less expensive improvements, and mainly in connection with through routes; and all that can be done for London, at present, is to assist the boroughs in the improvement of pavements on main traffic routes, and to make grants in aid of arterial thoroughfares connected with the network of country roads. The improvement of streets in West Ham is not in the same category as the creation of a great main road connecting London with the West and the South-west, and the Southern Midlands. We do not deny, however, that, in spite of the moderating influence of Sir George Gibb's perfectly judicial attitude in the matter, there may be, owing to the constitution of the board, and especially in view of recent happenings, some tendency towards a policy favouring the owners of ordinary motor cars at the expense of those interested in other forms of traffic, and perhaps also at the expense of the ratepayers. But we are not aware of any conspicuous opportunity for the consideration of the claims of commercial traffic having been neglected by the board; and if its policy is to be modified, the claims of agricultural districts would demand special attention, and the advantages of improving secondary and by roads would have to be considered.

Continuing the debate, Mr. W. Thorne supported the claims of West Ham, and Mr. W. Pearce contended that the question raised was one affecting the whole trade of London, good approaches to the docks being necessary for the development of business. It may be pointed out, however, that if this matter is really one in which the Road Board should be concerned, it is desirable that a complete scheme in relation to the docks should be put forward, and the advice of the board obtained as to its soundness.

Sir Archibald Williamson struck into the debate with a plea for Scotland, the only important point in his speech being that a county with roads already in good order does not obtain as much from the board as one in which the roads are in great need of improvement. With the justice of the cases cited we are not for the moment concerned, but when neglect of the roads has been caused rather by poverty than by lack of enterprise, it may be contended that the county deserves help. A more important consideration is that it ought to be possible for the board to assist counties in which the roads are in good or fair condition by making grants in aid of ordinary maintenance. This view was urged later in the debate by Colonel Weston.

GRANTS TO RURAL AND TO URBAN AREAS.

A different note was struck by Mr. Kellaway, who, after stating that the county of Bedford had been "very badly used" by the Road Board, expressed the opinion embodied in the following extract from his speech: "I do not think anyone will be able to discover any principle on which the Road Board is now making its grants. I do not believe that the Road Board itself has ever yet formulated a policy on which its grants shall be made to the different authorities of this country." On this point it may be remarked that, as regards the classes of improvements which are considered to be most urgently needed, the board certainly has a policy—that ex-

pressed in its circulars; but with respect to repartition of the funds in different areas it seems to have no general policy; and we have more than once expressed the opinion that the claims of different areas should be considered in the light of definite principles, involving the necessary number of factors, and not confined to a single aspect of the question.

Mr. J. Samuel criticised the policy of the board in making grants chiefly to the counties, and he pressed the claims of the towns, and especially of non-county boroughs. On this point it is sufficient to remark that the policy of the board, which may, of course, be modified in the future, seems to be consistent with the needs of the immediate present.

A case was cited by Sir Richard Winfrey, in which, as the result of an expenditure, including a sum of £7,000 granted by the Road Board, the ratepayers found themselves burdened with an extra twopenny rate. There seem to be many such cases, in which the ratepayers, and sometimes the local authority, regret the action taken. The responsibility rests, however, with the local authority which asks for the grant, and if the outcome is unwelcome, it is the sagacity of these gentlemen which is at fault; it is futile to blame the board.

In support of the policy of the Road Board in this respect, Mr. Walter Rea pointed out that if the board is to pay the whole cost of certain classes of improvement "we shall have one wild scramble to create unnecessary roads in every area in the country, the pressure on the Road Board will be such that they will be unable to give proper consideration to what is really required, and the money will be frittered away in areas represented by the most persistent Members of Parliament. Mr. Rea seems to confuse road making with road improvement, and to be unduly apprehensive as to the effect produced by the claims of Members of Parliament in the interests of their constituencies; but the underlying idea is sound. Mr. Rea also pointed out that large numbers of motor cars registered in London are used chiefly on country roads, a fact which is no doubt considered in the attitude of the board towards applications from the counties near London.

A NATIONAL ROAD AUTHORITY.

Continuing the debate, Mr. McCurdy said that he regretted that the Road Board had been created. The real indictment of the Road Board does not, he said, turn upon the minor matters referred to in the debate, but is a matter of broad principle. The Road Board is not, he considers, showing either the wisdom or the courage to grapple with the great problems of national traffic upon the scale that the time and the occasion demand. Neither London nor other urban areas receive their fair share of the attention of the board. "The Road Board are mainly confining their energies to the petty and parochial task of rounding-off road corners in rural districts, instead of turning their attention to great schemes or improving the main roads where the great centres of population are." Weak and inaccurate as is this statement in the light of the facts, we see in it some support of our own view—namely, that the attention of the board might well be directed to works of reconstruction of important routes or groups of roads rather than to petty improvements, and the putting down of costly crusts on roads on which they will not last as they would on properly designed or suitably reconstructed roads. But we have in view roads in rural areas where, with their present resources, the board can do much better work than they can in urban areas. The grievances of County Longford and of Lincolnshire were then set forth by Mr. Farrell and Mr. Bentham, but no consideration of importance was raised by either member.

THE GOVERNMENT'S CASE.

On behalf of the Government the Financial Secretary to the Treasury, Mr. Montagu, pointed out that the Treasury cannot control the Road Board in the manner suggested by some of the speakers, since the independence of the board was carefully provided for in the Act. He protested strongly against the wording of the amendment. "There is," he said, "no evidence whatever, and none has been produced to-night, that there has been anything at all unfair in the allocation of money by this independent body of commissioners who administer the Road Board grants." As regards the principle upon which the funds are allotted, he had, however, very little to say, pointing out that the allotment is, roughly, 82 per cent to England and Wales, 11 per cent to Scotland, and 7 per cent to Ireland on a population basis. This, of course,

hardly touches the question of a policy as regards the actual distribution of the funds, and it may be suggested that it is a bad principle and very unfair to Ireland with her large mileage of roads and poor population. This view was expressed later in the debate by Mr. W. Field, who said that the poorest districts and the sparsely populated districts are precisely the places where grants ought to be given. Mr. Montagu went on to say that the second principle on which the board acts is that reconstruction of road crusts is to be given precedence over other matters.

On this point we consider that the policy of the board leaves much to be desired. Some expenditure in this direction is necessary, but there is too much of it, and not enough expenditure on works which should come first in logical and engineering sequence. We have fully explained our view on several occasions, and need not repeat here the arguments which we have used. Mr. Montagu's third point—that the board avoids the making of grants which would be largely spent in acquiring property—is an important one, and we think that this policy is approved by a great majority of road surveyors and local authorities throughout the country.

The speeches that followed were not important, except that on one point Mr. Joynton-Hicks raised a wide question of policy. He said: "The Road Board likes to make a contribution or grant where there is a certainty that a rich county council will make a correspondingly large grant. There is a very great difficulty in poorer districts in getting the county council or the local authority to make a corresponding grant." The main idea underlying this observation is worth consideration, and it is desirable that the board should assist the poorer authorities to a greater extent than they do at present—not in the carrying out of petty improvements demanded by certain classes of road users, but in primary reconstruction, with a view to decreased costs of maintenance. In the division the amendment was supported by only 55 votes against 248 for the Government. These figures are significant of the attitude towards the Road Board of the Opposition, showing, as they do, that the occasion was not considered to be one which could fairly be seized for an attack upon the Government.

We heartily congratulate the board upon this result, since, although we think that its policy needs development both as regards the basis of allotment to different areas, and with respect to road engineering—we consider that the terms of the amendment were harsh and unjust. What Sir George Gibb has done in the face of great difficulties suggests very forcibly that he could do much better with a somewhat differently constituted board, and especially if he were relieved of the undue pressure exerted from influential quarters, and, apparently, through the Treasury.

The debate on another amendment, regretting that there was no mention in the King's Speech of an intention to readjust local taxation so as to provide for larger Imperial contributions towards the cost of education and main road maintenance, led to an important expression of opinion by the Chancellor of the Exchequer. Mr. Lloyd George said that the benefits conferred by motor traffic were not proportionate to the expenses incurred by the local authorities. The great development of business traffic in areas round large towns led to much damage being done to the roads, and the local trader had to pay higher rates on account of the very traffic that took away his business. This, the Chancellor said, "is unjust, and irritatingly unjust." It was also unfair to the railway companies which pay heavy rates in the districts through which their competitors run. The Government intended, he said, to take measures for the relief of local taxation. Possibly we shall know before long whether this means that Imperial grants will be made on some settled plan towards the cost of main road maintenance, or whether we are to look for a widening of the basis of contributions to Road Board funds, and for an extension of the Road Board's powers so that they may make grants for maintenance as well as for improvement.

The Birmingham Waterworks.—A paper dealing with the Birmingham waterworks will be read by Mr. E. A. Lees, M.I.C.E., at a meeting of the Institute of Sanitary Engineers to be held on April 20th at Caxton Hall, Westminster. Mr. John D. Watson, president, in the chair.

A PROFESSORSHIP FOR MR. E. R. MATTHEWS.

UNIVERSITY OF LONDON APPOINTMENT.

Mr. E. R. Matthews, A.S.M.I.C.E., F.R.S.E., the borough engineer of Bridlington, has been appointed to the Chadwick Chair of Municipal Engineering in the University of London.

Mr. Matthews is only recently one of the selected candidates from whom the appointment of city engineer of Capetown was to be made, the result of this being not yet known.

Prof. Matthews intends, in addition to the duties of the professorship, to practise at Westminster as a consulting engineer, and more particularly as an

expert in the design and construction of coast defence works. He recently delivered two lectures at the Manchester University on this important subject, and, as is well known, is the author of a treatise on this and other engineering subjects. He gave evidence on two occasions before the Royal Commission on Coast Erosion, and accompanied them, at their request, when inspecting the Yorkshire coast. He also supplied the Royal Commission on Canals and Waterways with much data regarding the silting up of the estuaries of our rivers. Born in 1873, Prof. Matthews was educated at St. Michael's private school, Hastings. He was for nearly nine years one of the assistants to the borough engineer of Hastings, Mr. P. H. Palmer, M.I.C.E., and has held his present appointment as borough engineer of Bridlington since October, 1898.

DEVON COUNTY SURVEYORSHIP.

THE NORTHERN DIVISION APPOINTMENT.

The Devonshire County Council Bridge and Main Roads Committee on Friday last interviewed the following gentlemen for the post of surveyor for the northern portion of the county at a salary of £600 a year: Mr. J. A. Reay, surveyor, Hertfordshire County Council; Mr. R. O. Jones, assistant surveyor, Glamorgan County Council; Mr. A. J. Lyddon, deputy county surveyor, Essex; Mr. E. H. Collett, engineering inspector of the Road Board. The appointment will be made at the next meeting of the county council.

Royal Institute of Public Health.—The annual congress of this body will be held in Edinburgh from July 15th to 20th inclusive.

Immingham Tide Table.—We have received from the Great Central Railway Company a copy of the Immingham Tide Table for 1914. This neat booklet, which has been produced in pocket size, gives the high water and low water tides at Immingham for each day of the year, in addition to useful facts and figures, charges, steamship services, &c., respecting the ports of Immingham and Grimsby. Copies of the tide table will be sent free on application to Great Central Publicity Office, 216 Marylebone-road, London, N.W.

Sewage Disposal and Works Management.*

By JOHN E. FARMER, Sewage Works Manager to the Corporation of Croydon.

Last, but not the least, item in the management of sewage disposal is the finding by observation and research the means of improvement in the present methods of purification, and also the cause of the effect obtained. Some work in this respect which I have done may be of some interest.

It has been known for years that a filter of fine-grade material gives better results in purification than one of coarse grade; also, some materials give better results than others; but there has not been, to my knowledge, any work done to settle definitely the cause of these differences.

One difficulty has been the want of a means to measure the physical properties of the different materials used as a nidus for the bacteria. If this could be overcome, the point could be settled as to whether the cause of the difference between two different materials when used as a nidus was due to greater absorptive powers of one than the other, or to greater surface area. The former used to be given as the reason by many a few years ago, but I think the latter is generally recognised as the reason at the present time.

To find the purification given by clinker as a nidus in a filter, as compared with gravel, a filter was constructed in two halves—one half filled with clinker, and the other half with gravel—in 1904, at Croydon, the gradient being the same for both materials—*i.e.*, drainage tiles and 3-in. gravel=9 in.; 3-in. to 1-in.=1 ft.; 1-in. to 3-in.=3 ft. 3 in.; total, 5 ft. Area, 200 sq. yds.; rate of working, 200 gallons per square yard per twenty-four hours; fed by revolving sprinkler.

The average results of thirty-one samples taken between October 13, 1904, and June 19, 1905, are:—

TABLE I.

	Tanks' Effluent,	Clinker half,	Gravel half,	
Free ammonia as nitrogen ...	5.747	0.665	4.148	parts per 100,000.
Albuminoid as nitrogen ...	0.367	0.068	0.166	" "
Oxygen absorbed, 4 hours ...	4.157	0.914	1.843	" "
Chlorine ...	9.45	9.14	9.71	" "
Nitrates as nitrogen ...	—	4.529	1.265	" "
Nitrites as nitrogen ...	—	0.165	0.284	" "
Dissolved oxygen ...	—	5.8	4.4	c.c.'s per litre.

The above results show that clinker gives much better results than gravel; but the question is, What is the cause of this? To find the reason I have carried out some experiments in the laboratory.

The first thing investigated was the physical properties of clinker and gravel. It is quite obvious that a piece of clinker has more surface area than a piece of gravel of the same size, but the problem is how to measure the difference in surface area. After trying a number of experiments, I finally based a method on the principle that if a solution of a substance of known strength covers a surface, and a known volume of a solvent is allowed to act on it, the resultant solution will be of a strength proportional to the amount of the substance covering the surface. The solution used for covering the surface was salt (sodium chloride), and the solvent, water.

If a known volume—say, 1 cub. ft.—of clinker is soaked in a known strength of salt solution, on drawing off the excess there remains a certain amount on the surface, and also an amount held by capillary attraction between the different particles. If a known volume of water acts on this and the salt estimated, the amount of salt added to the water must be proportional to the area of surface covered with the salt solution plus that held by capillary attraction.

During my experiments I kept on having discordant results until I found that the amount absorbed by the materials experimented with must be taken into account.

I will not trouble you with the details that led me finally to decide on the following method of procedure:—

A known volume of material of known grade is taken, and allowed to soak for forty-eight hours in a salt solution of a strength that 1 cubic centimetre = 10 milligrammes chlorine. The salt solution is then drawn off without disturbing the material, allowed to drain twenty minutes, and the same volume of water as that drawn off of salt solution added, allowed to stand ten minutes, drawn off, refilled again, and

immediately drawn off, allowed to drain twenty minutes, and the amount of chlorine estimated in the solution. This estimation gives the volume of salt solution on the surface of the material, and also that held by capillary attraction. To estimate the absorbent powers of the material, a volume of water equal to the volume obtained from the last running off is added, and allowed to remain for forty-eight hours, when it is drawn off and the chlorine estimated.

It will be seen that there are three properties estimated—*i.e.*, in the first estimation, surface retention and capillary retention; in the second, the absorbent powers. I consider the first estimation will give a truer index of the qualities of the material for filtration purposes if the surface and capillary retentions are taken together, and I include the two under the name of "surface retention."

The formula to obtain the volume in cubic centimetres of the surface retention is

$$x = \frac{a(c-d)}{b-c}, \text{ when}$$

- x* = volume in cubic centimetres of the salt solution retained on the surface by capillarity.
- a* = volume in cubic centimetres of water added.
- b* = chlorine in milligrammes per cubic centimetre in salt solution.
- c* = chlorine in milligrammes per cubic centimetre in water after addition to material.
- d* = chlorine in milligrammes per cubic centimetre in water before addition to material when tap water is used.

The formula for obtaining the volume absorbed is

$$\bullet \quad x = a \frac{(c-d) - fc}{b}, \text{ where}$$

- x* = volume in cubic centimetres of the salt solution absorbed.
- a* = volume in cubic centimetres of water added.
- b* = chlorine in milligrammes per cubic centimetre in salt solution.
- c* = chlorine in milligrammes in water after the addition in surface retention estimate.
- d* = chlorine in milligrammes in water before addition if tap water is used.
- e* = chlorine in milligrammes per cubic centimetre in water after standing with the material forty-eight hours.
- f* = the volume in cubic centimetres obtained of the surface retention plus the difference, if any, between the volume run off finally from the surface retention estimation and that added for the same.

The following shows the results of some experiments regarding the water capacity of the interstices, expressed as per cent of water capacity:—

TABLE II.

Grade of Material	$\frac{3''-1\frac{1}{2}''}{1\frac{1}{2}''-1\frac{1}{2}''}$	$\frac{1\frac{1}{2}''-1\frac{1}{2}''}{1\frac{1}{2}''-1\frac{1}{2}''}$	$\frac{1\frac{1}{2}''-1\frac{1}{2}''}{1\frac{1}{2}''-1\frac{1}{2}''}$	$\frac{1\frac{1}{2}''-1\frac{1}{2}''}{1\frac{1}{2}''-1\frac{1}{2}''}$
Material, clinker (1) ...	46.3	50.6	48.2	48.6
Material, clinker (2) ...	49.0	52.0	51.3	50.0
Material, gravel ...	34.2	35.1	34.8	35.7

- (1) This clinker was graded without crushing.
- (2) This clinker was graded from crushed masses. The vessel used in the above experiments was circular in plan, holding 1,500 cubic centimetres. If one of much larger capacity had been used, the results would probably have been much closer.

It can be shown mathematically that a given capacity will contain the same total mass of spheres providing that the total of the diameters of a row equals the length of the side on which they lay. For example, a cube-foot vessel will contain exactly twenty-four 1/2-in. spheres in line on any one side, or a total of 13,324. These spheres will take up 52.36 per cent of the volume, and the same per cent volume is taken up by 1 in. or 3 in. or even a sphere of ft. diameter.

From the results obtained on clinker and gravel there is every reason to assume they do not differ as regards the mass in unit of volume being the same for all grades of the same material. This is made use of for the comparison of one grade with another grade of the same material. When, in carrying out experiments, the masses differ, they can be brought to an average mass per unit capacity for that particular

* Extracts from paper read at a meeting of the Institute of Sanitary Engineers on Wednesday evening.

material. By expressing the result of an estimation as the percentage of the gross volume, the number of cube inches in a cube foot can be readily calculated.

After obtaining a method that would give a comparison as regards surface area or surface retention, there still remained the problem of putting the results obtained into an expression of surface area. The following experiment was carried out, the results of which I cannot claim as giving the actual surface area, but I believe it gives a very near approximation.

I took four grades of stone marbles, such as boys use, grading them by means of round holes in a steel plate. Each grade was estimated by the above method for surface retention and absorption, the following being the results:—

TABLE III.

Failed to pass O hole, dia. =	1/2	3/4	1	1 1/4
Passed O-hole, dia.	1/2	3/4	1	1 1/4
Number of marbles	116	350	990	310
Volume per marble in c.c.'s	2.33	2.0	1.6	1.2
= Dia. of each (of an inch)648	.616	.572	.518
= Surface area of each (sq. inches)	1.32	1.19	1.03	.843
Surface area of the total number of marbles in sq. inches	32272	116.5	5097	26133
C.c.'s of surface retention	68	133	17.5	88
Sq. inches of surface area per c.c. retained	285	313	288	267

The mean is 29.5 sq. in. per cubic centimetre, retained on the surface, which equals 512.8 sq. in. per cube inch retained.

Having obtained the surface area per cube inch of water retained on the surface, it only requires a simple calculation to obtain the surface retention of any material, after estimating the surface retention by the above method, when the result is expressed as per cent of the gross capacity.

The following are results obtained on two different qualities of clinker and on gravel as dug at Beddington:—

TABLE IV.

SURFACE RETENTION EXPRESSED AS PER CENT OF GROSS CAPACITY.	Clinker (1).			Gravel.		
	Mass capacity per cent	50	50	35	35	35
Grade:—						
1/2" - 3/4" (Mean dia. = 5/8")	10.0	9.4	7.5	88,612	83,294	66,459
3/4" - 1" (Mean dia. = 7/8")	9.4	9.0	5.5	83,294	79,751	48,736
1" - 1 1/4" (Mean dia. = 1 1/8")	8.0	7.6	4.3	70,880	67,315	38,105
1 1/4" - 1 1/2" (Mean dia. = 1 1/4")	7.8	6.9	3.5	69,117	61,112	31,014
EXPRESSED AS SURFACE RETENTION AREA PER CUBIC FOOT.						
1/2" - 3/4"	88,612	83,294	66,459			
3/4" - 1"	83,294	79,751	48,736			
1" - 1 1/4"	70,880	67,315	38,105			
1 1/4" - 1 1/2"	69,117	61,112	31,014			

These results, when plotted as curves against the curve for the surface area of spheres of the same diameter which a cube foot would contain, show that the estimation for diameters below 1/2 in. are, in the case of clinker, too low, and for gravel too high. The curves also show that they follow the surface area curve fairly closely considering the irregular-surfaced material worked upon; but if the mean is taken of a number of estimations the result is fairly accurate, and can be made use of for estimating the surface retention of other sizes by calculation. For example, in the estimation of a material of 1/2 in. diameter, the surface retention is found to be equal to 23,000 sq. in. more than would be in a cube foot of spheres of the same diameter, and as the curves are the same distance apart at all points, this extra area per cube foot need only be added to the surface area of spheres that a cube foot would contain of any other diameter to obtain the surface area of the material of the same diameter as the spheres.

Reverting to Table I., the difference can now be shown to be due to the larger surface area in the clinker half of the filter.

Taking as the units of impurity in the tank's effluent and the filtrate, the sum of the albuminoid nitrogen and the oxygen absorbed in four hours, less the oxygen equivalent of the nitrogen in the nitrites, the units are:—

Tank's Effluent.	Clinker	Gravel
4.517	Half Effluent.	Half Effluent.
	.794	1.674

Calculating the surface area from Table IV., the areas are expressed as per square foot of the total depth.

Clinker half: 291,000 sq. in.
Gravel half: 438,000 sq. in.

Equal to a ratio of 2.1 to 1.

Comparing this ratio with that of the units remaining in the effluent—i.e., 1 to 2.1, which is just the reverse of the surface area ratio, appears to show that the amount of impurity in an effluent is in proportion to the surface area in the filter.

As regards the reduction of the impurity by passing over the surface, there must be taken into consideration the fact that as the water passes downwards it gradually becomes less impure, so that after passing over one surface area it gives to the next a water which has less impurity than it received, so it is quite obvious that the same per cent purification cannot be effected by the second area of surface, assuming they have both the same surface area.

I have found that the difference is in proportion to the strength of the liquor each area receives. This being so, a calculation can be made of the impurity in the liquor after passing over a further 138,000 sq. in. in the clinker half, and also after passing over the last 15,000 sq. in., the calculation being: The reduction, on passing over 138,000 sq. in. is 2,843 units, and the strength of the liquor passing to the next 138,000 sq. in. is 0.37 of the original tank's effluent. This would give a further reduction after the second area of 1,952 units, and leave a liquor with a strength of 0.622 units to pass over 15,000 sq. in. This, calculated in the same way, would finally give a result that was less by 3.92 units than the tank's effluent. This calculation is 5.2 per cent higher than the reduction of units obtained in the clinker half, and considering the many experimental errors that can come in, this percentage difference is small.

From this experiment one comes to the conclusion that the surface area of the material is the factor which governs the comparison between one material and another as regards its suitability as a medium in a filter.

MANCHESTER BUILDING TRADES EXHIBITION.

The eighth Manchester Building Trades Exhibition was opened on Tuesday by the Lord Mayor of the city, Alderman McCabe. The exhibition, which is installed in the City Hall, Deansgate, will remain open until the 14th inst., and comprises some eighty stands, among the firms showing being Messrs. A. Winston & Co., Limited (London), Walter Cooper (Manchester), Burrows & Garland (Blackburn), F. W. Bromley (Manchester), J. H. Heathman & Co. (London), Bell's United Asbestos Northern Agency (Manchester), Vulcanite, Limited (Manchester), the British Portland Cement Manufacturers, Limited (London), Sano, Limited (Manchester), Harold Heydon & Co., Limited (London), D. Anderson & Son, Limited (London), Cakebread, Robey & Co. (London), the Stimex Gas Stove Company, Limited (London), the Ironite Company, Limited (London), G. R. Speaker & Co. (London), the British Fibrocement Works (Erith, Kent), the Manchester Ship Canal Portland Cement Manufacturers, Limited (Ellesmere Port), the Gelatinous White Company, Limited (London), and the Contract and Works Supply Company (Manchester).

A. WINSTON & CO., LIMITED.

Stands 12 and 13 are in the occupation of Messrs. A. Winston & Co., Limited, 12 Regent-street, London, W., and display scientific instruments—levels, clinometers, barometers, thermometers, field and opera glasses, and optical goods in general.

WALTER COOPER.

At Stand 15 are to be seen examples of the patent twin bridges for furnaces introduced by Walter Cooper, 21 Water-street, Manchester, chimney pots and steels being other features of the exhibit.

BURROWS & GARLAND.

Malacca cane drain rods, fitted with ordinary or lockfast joints, flexible steel drain rods, specially adaptable for house drainage, and wire-wrapped malacca sewer rods, for municipal work, form the exhibit of Messrs. Burrows & Garland, 9 King William-street, Blackburn, at Stand 19.

F. W. BROMLEY.

The "Dreadnought" specialities of F. W. Bromley, Urnston, Manchester, make an interesting show at Stand 20, the articles exhibited including the firm's patent standard concrete mixer, with tank and power side loader on truck, stone and concrete breaker, mounted on under carriage, and shafts, patent 3-speed 1 up and 1 down hand hoist, a 10-cwt. power hoist for various works, diaphragm hand pumps, steel and wood concrete barrows, rod benders, shearing

machines, latest steel split pulleys, "Dreadnought" textile belting, "Alligator" steel belt lacing, Stephenson bar dressings for all beltings, and super-flexible steel scaffold lashes.

J. H. HEATHMAN & CO.

Messrs. J. H. Heathman & Co., Parson's Green, London, have a display of their ladders at Stands 21 and 22.

BELL'S UNITED ASBESTOS NORTHERN AGENCY.

The exhibits of the above-named firm, whose offices are at 8A South Parade, Deansgate, Manchester, include Poilite roofing tiles, asbestos sheets for walls and ceilings, and for electrical works, veneered sheets for railway and tramcar construction, and compressed sheets for switchboards and electrical purposes generally.

VULCANITE, LIMITED.

One of the chief features of the display of this firm, whose Manchester offices are at Trafford Park, is a model swimming bath, waterproofed with patent vulcanite lining. On one side of the bath a large opening has been left in the glazed brick lining, leaving the vulcanite exposed in order clearly to demonstrate its waterproof qualities. Patent vulcanite lining has been used for waterproofing swimming baths, roof tanks, reservoirs, &c., in nearly every country in the world. Another interesting feature of the exhibit is "Bituna," pure bitumen damp-course, and many other specialities of the firm are also on view.

BRITISH PORTLAND CEMENT MANUFACTURERS, LIMITED.

The stall of the British Portland Cement Manufacturers, Limited, 4 Lloyd's-avenue, London, E.C. (Stands 31, 32 and 33), is of an educative description, as showing the ever-increasing uses for Portland cement. The small building is built of concrete cavity blocks, made with a winged block making machine. The building is lined with Poilite sheeting, which is a composition of asbestos and cement made by Bell's Asbestos Company, Limited, while the roof is tiled with the same material. On this stand will be seen such articles as reinforced concrete fence posts and fencing, concrete drain pipes, columns, flower vases, and so forth, all showing the steady advance of concrete and reinforced concrete in the manufacturing and building of all appliances and structures on the farm and estate.

SANO, LIMITED.

"Sano," which is described as an ideal jointless asbestos flooring and wall covering, and as suitable for any class of building, is being shown by Sano, Limited, 25 Brazemose-street, Manchester, at Stand 34. It is claimed for "Sano" that it is hygienic, waterproof, dustless, fireproof and durable, and that it can be easily cleaned with soda and hot water. It will not crack or bulge, it can be laid in any colour or design, and all colours are guaranteed permanent. "Sano" has been laid in schools, hospitals, offices, warehouses, showrooms, bathrooms, lavatories and factories. It is put down in two thicknesses, the top layer being $\frac{3}{4}$ in. thick, and the underlay or cushion also $\frac{3}{4}$ in., making a total thickness of $\frac{3}{4}$ in.

HAROLD HEYDON & CO., LIMITED.

Messrs. Harold Heydon & Co., Limited, varnish and japan manufacturers, Stratford, London, E., exhibit at Stand 35 their speciality—"Melana" damp-proof enamel.

D. ANDERSON & SON, LIMITED.

From their numerous and varied manufactures Messrs. Anderson, whose works are at Belfast and at Old Ford, London, E., have selected for exhibition their wood preservative, "Sideroleum," the "Rok" roofing, "Rokalba" roofing—which is "Rok" covered with asbestos, and so rendered fireproof—"Stoniflex" roofing, sarking and lining felts, and "Zerolite" insulating papers, among other things.

CAKEBREAD, ROBEY & CO.

Drain machines and drain rods, fitted with either ordinary or Lockfast patent joints, are shown at Stand 43 by Messrs. Cakebread, Robey & Co., Wood Green, London, N., among the appliances being their "Swivel Collar" joint and the "Standard" smoke test machine. The special feature of the firm's drain-testing plugs is their easy action owing to a wheel carriage revolving between the thumbscrew and the top plate.

STIMEX GAS STOVE COMPANY, LIMITED.

A "Stimex" patent hygienic gas range, cookers, and hot-water circulators are displayed by the Stimex Gas Stove Company, Limited, 169 Balham High-road, London, S.W., at Stands 47 and 48.

IRONITE COMPANY, LIMITED

The Ironite Company, Limited, whose managers are Messrs. S. Thornely Mott & Vines, Limited, 1 Victoria-street, S.W., are calling attention to their waterproofing process by means of an exhibit at Stand 49. "Ironite" is claimed to render, at a very low cost, cement, bricks, concrete, stone, chalk, slates, rough cast, coke and breeze, in new or old structures, such as tunnels, tanks, reservoirs, cellars, pits, bridges and walls, absolutely damp-proof against heavy water pressure. It is, moreover, stated to be a cheap, effective and permanent waterproofing for flat roofs and an excellent preservative for wooden fencing and all kinds of woodwork.

G. R. SPEAKER & CO.

The exhibit of Messrs. G. R. Speaker & Co., 29 Mincing-lane, E.C., at Stands 52 and 53, shows a wood and steel framed building covered with Speaker's "Eternit" slates, and lined throughout with Speaker's "Eternit" sheets, employing the different methods of fixing.

BRITISH FIBROCEMENT WORKS.

The British FibroceMENT Works, Erith, Kent, show at Stands 54 and 55 a simple type of building roofed with their patent "FibroceMENT" asbestos slates in two styles and colours, and lined internally and externally with their patent "FibroceMENT" fireproof asbestos sheets, skirtings and mouldings. Their agent for the Manchester district is Mr. John Stafford, 515 Corn Exchange Buildings.

MANCHESTER SHIP CANAL PORTLAND CEMENT MANUFACTURERS, LIMITED.

At Stand 56 are to be seen concrete block and other machines, and samples of concrete blocks made by the Cyclops Concrete Equipments Company from several kinds of aggregates with "England" brand Portland cement. The Shap Granite Company exhibit samples of their products made from their aggregate with the "England" brand of Portland cement, while there are also shown samples of raw materials from which the cement is made, and samples of the materials at the different stages of manufacture.

GELATINOUS WHITE COMPANY, LIMITED.

High-class sanitary distempers are the productions of the Gelatinous White Company, Limited, Southall, W., who are represented at Stand 60. Their "Filocol" paste, in five standard shades of white, is put forward as a substitute for whitewash. It is specially constructed so that it does not rub off or peel, though it can be easily washed off. "Filocol" is also made in a variety of art shades for frieze and wall decoration. Dry "Filocol" is supplied in powder form. "Filocol" paste can be made from this material with the simple addition of hot water in equal weight.

CONTRACT AND WORKS SUPPLY COMPANY.

The above-named firm, of 41 Corporation-street, Manchester, who exhibit at Stand 65, are the agents for various well-known productions, including Ceresit waterproofing material, "Premier" and "Rock" Portland cements, Kirton-Lindsey blue lias lime, "Apex" salt and enamelled bricks, sinks, &c., "Vitriuite" stoneware bacteria tiles and the "Oanco" patent pipe joint.

Tar-painting by Hand.—The coming season promises to be a record one for tar-painting by hand with the Waithman reservoir tarring apparatus attached to Johnston's patent double furnace tar-boilers. Among numerous orders received by Messrs. Johnston Brothers, of 79 Mark-lane, E.C., for these appliances may be mentioned those from the Berkshire County Council for two boilers, the Derbyshire County Council for six boilers, the Durham County Council for two boilers, the Hampshire County Council for five boilers, and the Worcestershire County Council for four boilers. Durham, Hampshire and Worcestershire purchased several of these boilers last year, so that these repeat orders are a proof of the success of these appliances. All these boilers are to be fitted with the double Waithman apparatus. Many boroughs, urban and rural district councils have also placed orders for boilers and apparatus with the same firm.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain,
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii., 2.

THE QUALIFICATIONS OF ENGINEERS.

To the Editor of THE SURVEYOR.

SIR,—I was much interested in seeing it reported in your issue of 30th ult. that at their last meeting the council of Municipal and County Engineers decided that, for the present, they were not prepared to recommend that their institution should join the Roads Improvement Association in the effort to provide means whereby "potential road engineers should receive special training in modern methods of road construction and maintenance." Further, that this proposed abstention did not proceed from any idea that such training was not a most desirable, indeed, a most necessary, item in the qualification of one who was designed to occupy the post of a high-ways engineer, inasmuch as this very matter was at present receiving most careful and particular attention from their council.

What leads an *ignotus* such as the writer to venture some remarks on a subject to which so many eminent members of the calling are giving so much consideration is the reading of the item in the "Minutes of Proceedings" in THE SURVEYOR of the 6th inst., in which you review the address delivered on Monday evening, 2nd inst., at the meeting of the Society of Engineers by the newly elected president, Mr. H. C. H. Shenton. The portion to which I would now ask particular attention is your reference to his remarks on the organisation of the engineering profession.

The efforts towards this, which, both in the address and the critique, are so tersely and correctly termed "individual and spasmodic," will, I feel thoroughly convinced, remain as individual and spasmodic as ever (if not, indeed, increasingly so), to the end of the chapter, unless the hindrances to the attainment of an end so desirable are rightly estimated and faced, and honestly and courageously combated. What are the hindrances? Well, Sir, I certainly could not undertake to schedule and describe them all; but may I once more instance a point to which I referred in a communication to which you kindly gave place in THE SURVEYOR of November 5, 1909? Nowadays, any man may, without law-breaking, write "C.E." after his name. I am not certain, but I should think that if the same man were unauthorisedly to write himself an M.Inst.C.E., or, without due enrolment, claim membership in the Institution of Municipal and County Engineers, the Institution of Municipal Engineers, the Institute of Sanitary Engineers, or the Surveyors' Institution, he could be proceeded against by law. But he can with impunity style himself "C.E.," no matter how groundless his claim.

After long-continued consideration of the subject, I have been led to conclude that the fundamental mistake lies in the fact that, from the oldest and most honoured society connected with the calling to the latest formed, the executive of each, in the regulation of admission to its membership, claims the right to receive and recognise as members men who have, in the judgment of the executive, shown that they possess a competent knowledge of engineering practice, but who have never seen their way to go through a training to which, strange to say, they accord a foremost place in their syllabus of qualifications—*i.e.*, a successful passage through the instruction of a properly constituted engineering school. That is to say, they will recognise a list of engineering schools, to a diploma from which they accord a high place in their list of qualifications, but reserve the right to elevate to the rank and privileges of membership any one whom they please.

Now, Sir, can anyone imagine what the Medical Society would say if one of its associated schools should seek to give its imprimatur to a "bone-setter," however skilful, or to a chiropodist, or even to an "L.D.S.," or to a chemist who had had years of experience in compounding the prescriptions of eminent medicos, and, indeed, of successfully prescribing himself? Would it not be irregular in the extreme? It would certainly be a very different thing from the action of a University Senate in conferring a degree *honoris causa*, for that distinction is one the recipient of which never possesses to the

extent of affecting the existence and welfare of others as an "M.D." would. . . Human life, and all safeguarding it, are much too sacred considerations to be made the subject of complimentary etiquette.

Then why should not the strictest regulation guard the entrance to a profession which I think I may truly say should include in the course of preparation for it the highest qualification attainable?

A little more than a year ago I was greatly struck by a query put at a Metropolitan meeting by a member of one of our older engineering institutions, who wanted to know of what use to an engineer was the study of chemistry. I think I may safely leave comment on such a query to anyone who has had the patience to read so far in these remarks.

But, Sir, may I seek to contrast such considerations with what was said to me by a young member of the profession (now, I believe, an A.M.Inst.C.E.) who entered it in what I firmly assert is the only state in which anyone should *now* be allowed to—*i.e.*, well educated? He entered, distinguished himself in and came successfully through one of our finest training schools (the London University Engineering School). He then went to a prominent engineer for a course of experience, and, not readily finding work at home, went to one of our Colonies. Finding progress rather slow in that particular Colony, he came home, and has just succeeded in getting a post in another Colony—and one which is more suited to his undoubted capability. In a farewell chat he told me that one thing his growing experience was increasingly pressing upon him was that nowadays, and of all men, an engineer cannot be too highly educated. In this opinion I entirely concur. No man can be exhaustively taught engineering, even in the most comprehensive engineering school course. After he has got a diploma, he will find that his education for the profession is but begun, and he will only go on to experience the great truth of what the late Dr. Haughton (of "Galbraith and Haughton") said in the hearing of the writer when beginning the first of one of his annual series of lectures on geology to the students of the Engineering School and the senior sophisters in Trinity College, Dublin—*viz.*, "You will make a great mistake, gentlemen, if you think you have come here to be instructed in the various branches of knowledge and learning which are put before you. All we can hope to do in the short course of a university career is to teach you how to learn for yourselves."

Over half a century has passed since I heard that utterance. The effect it produced has remained with me till to-day. At that time I think the Trinity School of Engineering was foremost among engineering schools. Since then others have come along, and I suppose now there are none more distinguished than the one with which I understand the Institution of Civil Engineers is more particularly associated—*i.e.*, the London University Engineering School.

But even as there are various schools for training the embryo medico, all worked efficiently by a central and representative council, why cannot we have various schools for training the young engineer, all as efficiently controlled by a central and representative council? Let me once more say it—let us unite and go for a legal recognition which will make unqualified practice illegal.

In his address Mr. Shenton said that "the Society of Engineers is at the present time devoting considerable attention to the subject referred to—*viz.*, the organisation of the profession and the well-being of the engineer—and will spare no pains in the future to promote this object, &c." If Mr. Shenton and his council can devise and bring into operation the means by which the institution and all other genuine engineering associations can harmoniously work to attain such a grand result as the proper qualification for, and protection of, the engineering profession, they will deserve the highest meed of praise and gratitude from its members. This result must be attained by a united action. No one society, however eminent, can *now* claim the right to dominate the situation.

In my communication to you in the beginning of January, 1907, I spoke of a possible course to be taken, if the matter could at any time be arranged, and particularly with the view of providing for the due recognition of the situation and rights of those who should be then qualifying as articled pupils, or were just about to be articled, and had for some time been preparing for it, and whose arrangements would

have been rendered useless were Government to accredit only those who had passed through, or should in future pass through, a university course. Let me now recall it—to suit the present date. Suppose an Act were now passed to make imperative the passing through an engineering school course as a part of an engineer's training. No one would be injured or interfered with were the Act to provide that such a restriction would come into operation on, say, August 1, 1918, and that anyone who had been duly articulated to a competent engineer, and received his certificate, could claim the approval of the examining council, even although he had not had a university school training. To the constitution of this examining board the councils of the institution, and of such other associations as would be approved by the Act, would necessarily contribute, and the board, if it were found advisable, could also include some professors of engineering from the different engineering schools recognised by Government.

It may be said, Why should not everyone qualified to do so join the institution, and then let all seek protective recognition? The expense of doing so is, to many, too great to warrant their doing so unless certain of the success of the institution in gaining the protection which alone would make it worth doing. While it is true that anyone of sense would not grudge £10 to begin with, and £3 3s. (or £4 4s.) per annum if it assured the right to qualified men only to practise, it is quite as true that, as things now go, to many well qualified men membership in the institution is, like the advantages of membership in a good club, a luxury. No; let us get admission to the profession properly regulated by legal enactment, and I feel certain that the ranks of the institution, and possibly other societies connected with the craft, would in time be swelled to an extent that would now be deemed improbable. A very few years would raise the scientific attainments of the members to a pitch which would place engineering first of all among the educated callings. Members of the profession would be still better able to specialise in road construction, or any other branch of engineering, from having had, *ab initio*, a sound training in general principles and knowledge, even just as medical men specialise in one or other direction, as gift or opportunity leads them to, but having *first* had the general training required by law—and, indeed, by necessity.—Yours, &c.,

MODERATUS.

February 17, 1914.

WARNINGS FOR DANCER POINTS ON ROADS.

To the Editor of THE SURVEYOR.

SIR,—I should like to make the following suggestions to road engineers:—

Those who have ridden by night in a motor car having the powerful lamps which are now in general use will have observed the curious effect produced by the reflection of the light in the eyes of dogs, cats, and other animals. From a distance of 100 yds. or 200 yds. the eyes glare like lamps with intense brilliancy. Also the light reflected by the small red reflectors carried by cyclists and others in place of tail lights is indistinguishable from the light thrown by a powerful red lantern.

It certainly seems that reflectors might be made to serve a very useful purpose, for if they were erected at points on the road where sharp turnings, cross-roads, or other dangerous features occur they would afford ample warning to the motorist. No person will drive recklessly into an unknown obstacle, and a red light is sufficient to cause any motorist to advance with caution. A single reflex lamp fixed in a proper position on the danger-post would be visible at night from a considerable distance to an approaching motorist. It would serve the same purpose as a fixed light, such as the acetylene lamp already used in some places, and as the cost would be a few pence, the economy, as compared with the acetylene lamp, is evident. Further, it would be possible to fix reflex lamps of such colours and in such positions as to indicate clearly the nature of the warning. For instance, the triangle could be indicated by three lamps, and green, white, or red lights could be used.

It is also questionable whether it would not be advantageous to apply the same principle elsewhere. For instance, it is sometimes very difficult to find the position of a yacht's mooring in the dark. One or two reflectors attached to the mooring buoy would be as useful as a permanent light, for with an ordinary

acetylene light flashed over the water in all directions the position of the buoy could be ascertained with great ease. It might even be possible to place similar reflectors on the buoys round our coasts, so that a vessel with a searchlight could avoid making any mistake as to the name of the buoy it happened to be passing. This might be particularly useful to yachtsmen, for it is possible to pass close to a buoy in the dark and to mistake it for another; also in these days when it is possible to obtain powerful acetylene lamps there would be small difficulty and considerable advantage in being provided with a lamp of the proper power to throw a light to a great distance.

The possibility of using reflectors for the purposes mentioned is perfectly clear. When riding in a car with ordinary lights the eyes of a cat seated on a wall 200 yds. away, or of a dog in the road, or even those of a rabbit, will glare to such a degree as to be mistaken for the lights of some vehicle at a distance. Also, there is the accepted instance of the reflex lamp used by the cyclist. It is therefore perfectly clear that proper reflectors could be placed at any required elevation for the purposes described.—Yours, &c.,

H. C. H. SHENTON.

28 Victoria-street, S.W.

March 4, 1914.

WHY TAR-SLAG BINDS WELL.

To the Editor of THE SURVEYOR.

SIR,—Your contributor, Mr. Reginald Ryves, in his article in your last week's issue, has ably dealt with points I have raised respecting slag used for tar-macadam purposes.

I hold the views that a chemical action of a high degree takes place between the slag and tar, and that no other known roadstone has properties enabling similar action to take place. Sandstones, limestones, &c., are dealt with, and your contributor states that the superiority of slag over these stones is mainly, if not wholly, due to its better wearing qualities. I venture to disagree with him. Slag untarred is a poor material to use, especially on clayey and wet subsoils; under reasonably heavy traffic it would not give a longer life than a first-class sandstone or limestone.

I fail to see that "small scale" roughness is such an important factor. Several types of limestones, sandstones, quartzites, syenites, &c., possess surfaces which appear to be ideal for tarring surfaces, but if any of these materials are examined after two or three years' wear under heavy traffic it will be found that the tar has lost a great deal of its original properties, and in the case of syenites, &c., it will hardly stain one's hands when small particles taken from interstices of the crust are rubbed between them. On the other hand, an examination of a slag-macadam will show that the tar retains its life for a very long period—over seven years, to the writer's knowledge—and that little change appears to have taken place.

In dealing with atmospheric pressure, Mr. Ryves assumes that slag is invariably heated before being tarred. I have laid tar-macadam with "hot" and "cold" stone, and have failed to find the slightest difference in the wear of the materials. I could show your contributor sections coated with clean slag which was simply dry-rolled and grouted in with gas-works tar. These sections have outlived several coatings of tarred granite and tar-painted macadam! An inspection would convince him that the theory he raises is not of much account.

The following simple experiments may be of interest:—

- (1) Cold slag mixed with boiling tar, after examination, showed that no absorption had taken place.
- (2) Heated slag mixed with hot tar gave results similar to the above.
- (3) Cold slag immersed in boiling tar for five minutes showed a brownish discoloration for a depth of about $\frac{1}{2}$ in.
- (4) Heated slag immersed in boiling tar for five minutes showed a brownish discoloration for a depth of about $\frac{3}{8}$ in.

I venture to express the opinion that the discoloration mentioned in (3) and (4) would not have any bearing upon the ultimate wearing properties of the slag.

In the above tests the slag was heated to a temperature much above what would be considered reasonable or safe for coating purposes.—Yours, &c.,

CRETACIOUS.

March 2, 1914.

SEWAGE DISPOSAL BY DILUTION.*To the Editor of THE SURVEYOR.*

SIR,—I have read Mr. Stowell's letter in your issue of February 27th.

The Eighth Report of the Sewage Commission deals exclusively with sewage or sewage containing trade wastes; the "Summary of Conclusions" (p. 17) refers solely to sewage or sewage liquors, and reference is not made to quality of river water in these conclusions, because dilution is the main consideration.

My object in answering Mr. Stowell's letter was to draw attention to the fact that the commission expressly recommend dilution, and *not* quality, of river water as the chief factor.

It must be carefully borne in mind that the commission's recommendations refer to the whole country and not to the particular watersheds in which Mr. Stowell is personally interested. Mr. Stowell not unnaturally applies these recommendations to his own rivers, where special conditions obtain.

It may be that in such a case application could be made to the proposed central authority for quality of water to be taken into account in that particular watershed, or at any rate in some parts of it.

But Mr. Stowell's special conditions do not affect the general recommendations, as might have been inferred from his letter of February 13th.

Even in the case of the rivers in Mr. Stowell's watershed, there might in certain instances be justification for disposal by dilution, where small communities are concerned.

One could imagine, for example, a small town on the banks of a large river being forced to carry out a complete system of treatment for the discharge of a very good effluent into a foul river water (which might possibly always remain foul), and such enforcement in my view would be an unnecessary waste of public money.

There has perhaps in the past been a tendency to press somewhat unduly upon the smaller and weaker communities, while neglecting the larger authorities.—Yours, &c.,

G. BERTRAM KERSLAW.

West Wickham, Kent.

March 2, 1914.

THE INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.*To the Editor of THE SURVEYOR.*

SIR,—On reading through the letter of "Member of the Institution" in your issue of February 20th, I cannot help being struck with the truth of what he states, and feeling that our institution is not doing for its members what it might do.

This especially applies to young members who are among the big crowd who, after passing examinations, or being elected members, find on applying for posts that more often than not the successful candidates are not members of our own or of any institution. . . .

Certainly this is enough to make one think whether it is worth while continually to pay membership fees. At the same time, is it not possible that public authorities, if approached in a proper manner, could be prevailed upon to give preference to our members and associates? Would not a circular letter, setting forth the advantages to be gained by appointing such officers, be a step in the right direction and give some encouragement to those who have to pay, besides, possibly, resulting in some cases of preference being shown to members of our body?

It is not the writer's intention to lay any blame at the feet of the present or of any previous council, but to add a few words to the reasonable complaints which have been made, and thereby endeavour to arouse the institution from its lethargy, and, by being up and doing, prove the use of our existence.—Yours, &c.,

ROAD SURVEYOR.

March 2, 1914.

Coleford and West Dean Water Supply.—In the House of Commons on Monday the President of the Board of Agriculture stated, in reply to a question, that an appeal for a contribution out of the Land Revenues of the Crown towards the cost of a scheme for supplying West Dean and Coleford with water had been received, and that he had been asked to see a deputation from the Gloucestershire County Council on the subject. He hoped to be able before long to give the deputation an interview.

THE SCOTTISH ROAD EXPERIMENTS.**MEETING AT FALKIRK.**

In connection with the Scottish road experiments the Road Committee of the Institution of Municipal and County Engineers (Scottish District) met in the District Offices, Falkirk, on Friday, February 27th, Mr. J. Walker Smith, convener, presided. There were also present all the road surveyors who intend to lay down trial lengths of road surface work in connection with the experiments in question.

With the exception of Inverness and Lunithgow districts, who had only recently agreed to take part in the experiments, plans and estimates were produced from all the other districts taking part in the trials, and these were carefully gone over and adjusted. The convener gave explanations on points of construction, supervision, and of inspection by the officers of the Road Board, and stated that so soon as he had all the applications and estimates in his hands he would forward the whole to the Road Board for approval, and obtain authority to proceed with the work.

The meeting thereafter proceeded to Carmuir, and inspected the portion of the Glasgow road on which the Eastern District Committee of the County Council of Stirling propose to lay down the trial length. Samples of the notice boards denoting the various kinds of treatment were erected on the road margin, and their size and style were discussed and approved.

The meteorological station, in connection with the section which was set up on ground adjoining the road, was also inspected. The enclosure is 27 ft. by 21 ft. In the centre a portion, 15 ft. by 9 ft., is laid with tar-macadam on which the following instruments are installed: Stevenson screen with thermometers for maximum and minimum readings, dry and wet bulb readings, solar and terrestrial radiation thermometers, rain gauge and sun recorder. There is also on the road itself a surface-box with thermometer for taking the temperature at 1 in., 2 in. and 3 in. below the road surface.

Mr. Ballantine, road surveyor, accompanied the party and showed them over the road and works, while Mr. Ronald explained the purpose and method of reading the various weather-recording instruments, in which all were keenly interested.

LONDON ARTERIAL MAIN ROADS.**DATES OF LOCAL CONFERENCES.**

It will be remembered that in November last a conference of metropolitan, borough and urban authorities, convened by the then president of the Local Government Board, Mr. John Burns, was held for the purpose of discussing the question of arterial main roads, and incidentally town planning, and that among the suggestions put forward by Mr. Burns was one for the holding of local conferences, whose duty it would be to decide the character, the varying methods, and, above all, the alignment of local roads. General agreement was expressed with this idea, and we now learn that the first of six sectional conferences—London having been divided into that number of areas for the purpose—will be held at the Local Government Board offices on Monday next, at 2.30 p.m., the remaining conferences being fixed for March 10th, 11th, 16th, 17th and 18th respectively.

Association of Engineers-in-Charge.—At the St. Bride's Institute, Bride-lane, Fleet-street, E.C., on Wednesday, March 11th, at 8 p.m., a paper on "The Storage of Coal with some Applications of Reinforced Concrete," will be read by Henry Adams, Esq., M.INST.C.E., M.I.MECH.E., F.S.I. Mr. W. Noble Twelvetrees, M.I.MECH.E., will occupy the chair.—The annual dinner of the association will take place on March 21st.

Cardiff Surveyor's Problem.—The amount voted for street cleaning at Cardiff during the ensuing financial year is £21,700, and the city engineer, Mr. W. Harpur, told the Finance Committee that it will require some arithmetical gymnastics to make the money go round. He explained that street upon street—miles, in fact—had been added to his work, involving more cleansing and house-refuse collection, and yet he could not get any more money for it. He had even been ordered to collect refuse from the hotels on bank holidays.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

The premium for February is awarded to—
 Mr. H. V. OVERFIELD,
 Town Hall,
 West Bromwich,

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

This week answers are invited to the following questions:—

381. Town Planning.—An area of 1,000 acres, chiefly undeveloped, in an urban district, is to be included in a town planning scheme. The approximate number of owners, occupiers and lessees is 250. Assuming that the referencing is to be done by the staff of the urban district council surveyor's office, state the information which should be sought, and the best method of ascertaining and recording it. Give an estimate of the cost of the work if done by professional referencers. Compare the advantages and disadvantages of the two methods, both in the above case and in the case of an area of 1,500 acres in the same district, which includes a considerable extent of partially developed building estates, and is to form the nucleus of a later scheme. (Tozun.)

382. Fire Hydrants. Fire hydrants, 2½ in. in diameter, are taken from a 4-in. and a 12-in. main. What will be the ratio of discharge in the two cases, assuming that the initial pressure is the same in each main? (X. X., Hounslow.)

383. Crain Silo.—It is required to construct a grain silo, the bins of which are 64 ft. in height and 8 ft. square in cross-section. What lateral pressure at the base should be provided for? (X. X., Hounslow.)

384. Timber.—Sketch the cross-section of an oak tree and show the different modes of conversion. How does oak compare with elm for use inside or outside a building?

385. Chimney Design.—Design a brick chimney shaft 130 ft. in height from ground level; the internal diameter at the base being 40 ft. (P. S., Plumstead.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

379. Testing Pipes.—What tests should stoneware pipes be subjected to before they are accepted for use? What defects are often thereby disclosed? (B. W., Tadcaster.)

Stoneware pipes being used chiefly for the conveyance of foul liquid matter, should, above all things, be impervious to water and able to resist the action of chemicals in sewage. Stoneware is manufactured from clay of the lias formation, containing silicates and aluminates mixed with powdered stoneware and glass; the silicates, &c., enable the clay to stand the high temperatures to which the pipes are subjected in baking, while the powdered stoneware prevents excessive shrinkage. The great heat used in the baking causes the whole mass to become thoroughly vitrified, tough, durable and impervious; and to ensure the pipes being absolutely impervious they are salt-glazed by throwing common salt on them during the baking, which spreads a glassy film over the whole surface of the pipes. Good glazed stoneware pipes should be straight, true in section, and free from flaws. A good test is to break a piece of the pipe; a fracture of stoneware should present a clean, white pasty appearance with a tough texture, and should give

a hard, clear ring on being knocked. A fracture with a yellow, granular appearance, together with a dull sound as the result of a knock, indicates fireclay, which is often substituted. This material is not nearly as good as stoneware, and may further be tested by putting the clean edge of a fracture to the lips—if fireclay, the lips will stick to the fracture, owing to moisture being absorbed; but if the pipe is stoneware there will be no effect. Inferior clay may be tested by picking the glazing; if it shells off easily the clay underneath may be assumed to be of poor quality. (H. B., Palmouth.)

The mechanical tests usually specified for stoneware pipes are the water and bearing tests. The pipes are filled with water and are required to stand a pressure of 15 lb. per square inch without showing signs of sweating, as that would denote that they were absorbent and porous. About 5 per cent of the pipes are usually tested in this way. Their resistance to bursting should then be ascertained by testing them to destruction under water pressure. They should withstand a pressure of 50 lb. per square inch before bursting. Lastly, the resistance to destruction from without should be tested. A 2-ft. length of pipe should be laid evenly on the ground, when it should support an evenly distributed weight of 2 tons before crushing. About 2 per cent of a parcel of pipes is generally taken for each of the destructive tests. So much for the tests as to strength. The whole of the consignment of pipes should be generally observed to see that each one is straight, cylindrical, perfectly smooth inside, free from blisters and fire-cracks. The glaze should be uniform, and broken pieces of pipes should show a fine, close grain, metallic appearance, thorough and uniform vitrification. A pipe when struck should give a clear, sharp, ringing sound. A ready test for a stoneware pipe is to chip off a piece and apply the broken portion to the tongue, when, if there is a sensation of suction, denoting absorption of moisture from the tongue, the pipe is composed of fireclay or earthenware, and should be rejected. If, on the other hand, there is no suction, it may be taken as being stoneware. (H. G. L., Dunfermline.)

[Further interesting replies to this question are held over until next week.—Ed.]

380. Belt Cearing.—A belt running at 1,500 ft. per minute transmits 80-horse power. Find the difference of tension of the two sides of the belt. (T. R.)

$$\text{Radians in Arc "A"} = \frac{180}{57.3} = 3.1416$$

$$\text{Radians in Arc "B"} = \frac{202.5}{57.3} = 3.5340$$

In all belt-driving there is a considerable pull or tension on both sides of the belt, and these two tensions T and t differ when motion is given from one shaft to another. The difference T—t between these tensions is the driving tension D, and D = V, where V = velocity in feet per minute =

W, where W = foot-lbs. of work done per minute, and
 $W \div 33,000 = \text{h.p. transmitted.}$

$$\therefore D^2 \times V = W, \text{ and } W = 80 \times 33,000$$

$$\therefore D^2 = \frac{80 \times 33,000}{1,500} = 1,760 \text{ lb.}$$

$$\therefore \text{Difference of tension of the two sides of the belt} \\ = 1,760 \text{ lb.}$$

The following notes on the subject may be useful: When fixing a flat belt it is evident that the belt must be tightly stretched over pulleys in order to get sufficient friction between belt and pulley. Hence there must be tension (t) on the slack side, and the greater t is, the greater may be the difference $T-t$ for a given angle of lap. As a matter of fact, $T-t$ increases approximately in proportion to the tightness t of the belt. If the tightness of the belt is kept the same, and the angle of contact be increased, the friction will rapidly increase.

The following law will be found useful when dealing with belts:—

$$\text{Log} \frac{T}{t} = e^{\mu \theta} \text{ where } T = \text{tension on tight side of belt}$$

$\text{,, } t = \text{,, ,, slack ,,}$
 $\text{,, } e = \text{base hyperbolic logs}$
 $\text{,, } \mu = \text{coefficient of friction between belt and pulley}$
 $\text{,, } \theta = \text{angle of lap in radians}$

(Base of hyperbolic or Napierian logs = 2.7183. They may be converted into common logs by multiplying by .4343.)

The coefficient of friction can safely be taken at .375, as a constant.

Now let us assume that the greatest working tension on a leather belt is 320 lb. per square inch of section; width of belt = 9 in.; thickness of belt $\frac{1}{2}$ in., $\mu = .375$; lap 180° ; velocity of belt 1,000 ft. per minute. We require to find T , t , and the horse power transmitted:—

$$\text{Following the above law, } \text{log} \frac{T}{t} = e^{\mu \theta}$$

$$\text{Log} \frac{T}{t} = .4343 \times .375 \times 3.1416 = .5115$$

$$\text{Anti log } .5115 = 3.247$$

$$\therefore \frac{T}{t} = 3.247$$

$$\text{Now } T = 9 \times .25 \times 320 = 720 \text{ lb.}$$

$$\therefore \frac{720}{t} = \frac{3.247}{1}$$

$$\therefore t = \frac{720}{3.247} = 221.7 \text{ lb.}$$

$$\text{Driving tension} = T - t$$

$$\therefore T_D = 720 - 221.7 = 498.3 \text{ lb.}$$

$$\text{The velocity of belt} = 1,000 \text{ feet per minute}$$

$$\text{Driving tension} = 498.3 \text{ lb.}$$

$$\therefore \text{H.P. transmitted} = \frac{1,000 \times 498.3}{33,000} = 15.1$$

(R. J. McK., Heywood.)

Ventilation.—Cushendall Church, Co. Antrim, is being supplied with Shorland's patent concealed extract ventilators by Messrs. E. H. Shorland & Brother, Limited, of Failsworth, Manchester.

"Ice-like" Road Surfaces.—The failure of manufacturers to produce an effective non-skid pneumatic tyre for motor cars is the subject of an article in last Tuesday's *Times*. The writer, however, points out that this is not so much the fault of the tyre maker as of the road builder, adding: "The modern highroad with its ice-like surface and the modern London street have become a hundred times more dangerous than the old muddy highways. Cross-country roads and secondary roads have not changed, but it can be only a question of time before they too are made dustless, mudless, and, from the point of view of the non-skid user, slippery as glass. That most progressive county of Kent is an apt case in point. Nowhere in the United Kingdom are roads of all grades so magnificently preserved. Kent is the ideal motorists' county, but it is well to exercise the greatest caution in driving a light car fitted with steel-studded tyres within its boundaries."

ASSOCIATION OF KENT SURVEYORS.

MEETING AT MAIDSTONE.

A meeting of the Association of Kent Surveyors took place on Saturday last at Maidstone. The members assembled at the electric light station, over which they were shown by Mr. T. L. Bunting, the borough engineer, an inspection of the public baths following. The meeting took place in the Board Room at the offices of the Maidstone Board of Guardians and Rural District Council. Those present were Messrs. A. E. Nichols, T. A. Busbridge, W. B. Smith, H. W. Longdin, W. L. Bradley, F. T. Elliott, T. G. Taylor, R. Craig, J. Hookins, C. Jones, J. W. Cooper, W. Banks, J. L. Redfern, J. A. Mitchell, T. W. Pullen, J. Randerson, D. E. Foster, W. Goodsell, E. M. Hendry, T. F. Bunting, J. S. Roper, F. G. Sargent, E. R. Lewis, F. W. Greig and F. Harris.

The chairman of the Maidstone Rural District Council, the Rev. J. R. Leigh, occupied the chair, and gave a hearty welcome to the members of the association on behalf of the rural district council and himself. Mr. A. E. Nichols, borough engineer of Folkestone, thanked Mr. Leigh for his kind expressions, and took the opportunity of congratulating the guardians and councillors of the Maidstone Rural District Council on their excellent offices.

Mr. T. A. Busbridge, surveyor to the Rural District Council of Maidstone, introduced the question of

EXTRAORDINARY TRAFFIC ON ROADS.

Mr. Busbridge said the subject was, to his mind, an all-important one, especially to surveyors of rural districts. The extraordinary usage of district roads other than main roads by mechanical traction, such as motor buses, lorries, tractors, and so forth, for commercial purposes, together with other through traffic, entailed a serious burden on the local rates, and rendered necessary some relief either from the Road Board or the county council by grants in aid or a system of "assisted roads." Most of them were only too well aware what rapid strides this new mode of traffic had made and was likely to make in the near future, and that many of their district roads were subjected to traffic which, until a comparatively short time ago, was unknown, and therefore not provided for. The consequence was that the roads were unable to carry it, unless entirely new and up-to-date methods were resorted to, and that meant that bituminous-bound roads with, in many instances, new foundations, must take the place of the old water-bound road. He believed it was generally admitted that the initial cost of the reconstruction of a road with a bituminous-bound coat very considerably exceeded the cost of a water-bound coat, although he believed it was agreed that it was the cheaper method in the long run. Now this initial cost was the item that was affecting them at the present time, because, although they felt bound to advise their various councils to delay no longer in making the necessary conversion of many of the roads under their jurisdiction, they were diffident about doing so owing to the extra cost it would incur. It entailed a serious burden on the local rates, a burden which many of their councils did not feel justified in imposing. Knowing that, and knowing also that the present-day traffic must necessarily considerably increase the cost of road maintenance, he ventured to think that the time had now arrived when some relief, either from the Road Board or the county council, should be granted in cases where rural district roads were subjected to this new class of traffic.

Mr. T. L. Bunting, borough engineer of Maidstone, said they had the same difficulty in Maidstone, as certain roads had become of equal or more importance than the main roads by reason of this increased traffic. Motor-bus services radiated from Maidstone to the surrounding villages and towns, using roads which were not main roads. Mr. W. L. Bradley, surveyor to the Tonbridge Urban District Council, said the time had no doubt come when some alterations must be made in the system of road maintenance, and that the trunk roads should be supported by an Imperial charge. Mr. J. L. Redfern, borough engineer of Gillingham, considered that the rural district councils had a grievance owing to this increased traffic. It was necessary to try experiments to ascertain what up-to-date system of road making suited a particular district, and the rural district councils had not the money to do it. Mr. W. Goodsell (Eastry) said flint had been used in his district, but it was useless now. Mr. J. W. Cooper, surveyor to the Hoo Rural District Council, said that in his district some of the parishes

were already burdened with rates of 9s. 2d. in the £. Mr. W. B. Smith, surveyor to the Romney Rural District Council, said he had 4 miles of sea road for which they had obtained a grant. Mr. A. E. Nichols, chairman of the association, thanked Mr. Busbridge for introducing the subject, and said that in Folkestone the cost of roads had decreased owing to foundations being put in where necessary in the past, and a liberal tar treatment. He had an instance of one road which had required remetalling every two or three years, but with the surface treated with plenty of good hot tar it had now gone eight years.

DINNER AND A PRESENTATION.

Dinner afterwards took place at the Queen's Head Hotel, the chair being occupied by Mr. A. E. Nichols, supported by Mr. H. P. Maybury, chief engineer to the Road Board (late president of the association), and Mr. H. T. Chapman, county surveyor of Kent (the new president).

Mr. Nichols said that the occasion was, in a way, a sorrowful one, as they were parting with their late president. Possibly they had not always agreed with him, or got all they wanted, but they had always found him ready to give the most careful consideration to the matters that came before him. He had been a personal friend, and it was his pleasant duty, on behalf of the association, to present Mr. Maybury, in remembrance of his being the first president of the association and of his appointment as chief engineer to the Road Board, with a solid silver salver on which was inscribed the names of seventy members. The members congratulated him on his appointment, and those who had appointed him on the wisdom of their choice. Mr. Nichols said he desired to take the opportunity of formally introducing the new president, Mr. Chapman, with the hope that the members would be as loyal to him as they had been to Mr. Maybury.

Mr. Maybury said he never thought the Kent surveyors would make him feel uncomfortable, but they had done so on this occasion. He valued the appreciation of his work, but not more than the good opinion of the surveyors of Kent. Whatever differences of opinion there might have been, they were never personal, and always amicably settled. The association was doing good work, and he had been much struck with the success it had attained; in his opinion, it was beneficial to the county and to the individual. He wished the association continued success.

Mr. Redfern proposed the health of the new president, and welcomed him to the county. Mr. Chapman

would have a difficult work to perform in following such an able man as Mr. Maybury, who had gained for the Kent roads a world-wide reputation for excellence. He had no doubt, however, that under Mr. Chapman that good reputation would continue.

Mr. Chapman thanked the members for their cordial reception. In Somerset they had a similar association, and knew the good work that could be done. He realised the difficult task of following Mr. Maybury, but he would do his utmost to follow in Mr. Maybury's steps, and as president would do his utmost to promote the welfare of the association and that of the individual members.

The health of the chairman was proposed by Mr. Maybury, and after some musical items a very enjoyable evening terminated.

ROAD MAKERS AND ROAD USERS IN CONFERENCE.

LONDON SUBURBAN SURVEYORS ENTERTAINED.

An informal discussion on road topics took place on Wednesday evening at a dinner given by the Roads Improvement Association and the Royal Automobile Club to county and district surveyors within a radius of 15 miles of London, but outside the area of the London County Council. The object of the function was to bring representative road users into closer touch with the executive officers of local authorities, and the points raised in the course of the conversation—which was opened by an admirable speech from Sir George Gibb—included questions connected with the administration of local roads, the steps that are being taken to improve them, and the difficulties confronting the various surveyors. In particular, information was sought as to the attitude of councils in regard to the cost of maintenance, the engagement of properly trained men for repair work, the quality of stone employed, the results obtained from the use of tar or bituminous compounds, the reduction of camber, and the desirability of preparing standard specifications for the resurfacing and reconstruction of roads upon modern lines. Allusion was made to the complaints of ratepayers as to the increasing cost of the highways, but it was pointed out that, as shown by figures given in the House of Commons by Mr. Herbert Samuel, President of the Local Government Board, and quoted in the *Motor*, the increase in the expenditure on main roads over a period of twenty years was only £1,800,000, against which had to be placed the net proceeds of motor taxation, £1,400,000. The excess expenditure on main roads was thus very nearly met, though there still, of course, remained to be considered the question of subsidiary roads, upon which the outlay had been very large.

Four county and some seventy urban and rural officials—metropolitan engineers were purposely excluded as the matters touched upon had reference more to country roads than to town streets—were among the company present, and it was freely acknowledged at the close of the evening that some exceedingly useful results had been attained from the gathering—which was presided over by the Hon. Arthur Stanley, M.P.

The question of the future training of the highway engineer was discussed in the course of the proceedings, without, however, any definite conclusion being arrived at.

ROAD BOARD APPOINTMENTS.

QUESTIONS IN THE HOUSE.

On Monday, in the House of Commons, Mr. Bridgeman asked if it was the usual practice in the Government offices to acknowledge the receipt of applications for important appointments and to state whether such applications are to be considered or not; and why the Road Board did not follow this practice?

Mr. Montagu said the reply to the first part of the hon. Member's question, so far as he was in a position to answer it, was in the affirmative. As regarded the second part of the question, he had no reason to believe that the Road Board intended to disregard the general practice.

Mr. Bridgeman: If I call the hon. gentleman's attention to a case, will he use his influence to see that the usual practice is followed?

Mr. Montagu: Certainly; but I would remind the hon. Member that in cases where there are a large number of applications it may sometimes be very difficult, though every effort is made.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Bridlington T.C. (February 24th. Mr. F. H. Tulloch). £1,301 for the purchase of property for widening a narrow and dangerous part of St. John street. The inspector expressed surprise that the council had not taken up several small loans which had been sanctioned by his board. He noticed that at the same time the council had an overdraft on the treasurer. It was explained that the overdraft was only made until such time as loans could be secured, and that the sanctions had been presented to the treasurer before he permitted a temporary overdraft. The inspector said that being so, it appeared that the council had, to some extent, taken advantage of the sanctions.

Carlisle T.C. (March 4th. Mr. W. M. Cross).—£29,940 for electricity extensions, £884 for the purchase of property and construction of a new street connecting Queen-street, Rigg-street, and Broad-guards, and £735 for the purchase of property and improvements at Twentymans-court, Finkle-street. In regard to the electricity extensions, Mr. Purse, the engineer, stated that during the past twelve months the electric light consumers had increased from 632 to 721, and were almost daily increasing.

Finchley U.D.C. (March 2nd. Mr. W. H. Collin).—£99,493 for the provision of working-class dwellings. It was stated that since 1901 the population of the district had increased by 22,000, but the accommodation had not increased accordingly. Of the 300 houses it was proposed to build, 240 were to contain two bed-rooms, two sitting-rooms, a kitchen, and a bathroom, and would let at a rent of 8s. 6d. per week. The remaining sixty would have one sitting-room less, and a reduction of 1s. a week in the rent would be made. It was estimated that the scheme would show a profit of about £5 a year.

Manchester T.C. (February 18th. Mr. Edgar Dudley).—£11,500 for the purchase of Hulme Cavalry Barracks, and the laying out of the site as a recreation ground.—Mr. T. de Courcy Meade, city surveyor, said his estimate of the value of the site was within £100 of that made by the corporation valuer. There were three chief rents on the property, but he did not know whether it was proposed to redeem them. It was further explained that the population of the city was 714,333, and of Hulme 63,177. Hulme had 132 persons to the acre, and Manchester generally 33 per acre. Manchester had 1,276 acres of parks and open spaces, but Hulme had $\frac{1}{4}$ acre. Afterwards an inquiry was held into an application by the Paving Committee to borrow £18,266 for works for private streets improvement.

Melton Mowbray U.D.C. (February 23rd. Mr. R. H. Becknell).—£2,150 for the provision of a refuse destructor on the site of the old sewage works.—The surveyor, Mr. E. Jeeves, stated that the distance of the site from the furthest part of the district was $\frac{2}{3}$ miles, and it was about $\frac{1}{4}$ mile from the market-place. The town refuse was now collected by their own men in carts, and tipped on to the site of the old sewage works. The quantity collected would be about 54 tons per week. The nearest house to the site in the urban district was 600 yds., and the nearest outside 700 yds. Mr. Dawson, of the firm of Messrs. Dawson & Mansfield, Manchester, explained the details of the destructor, and said there were two cells of 20 sq. ft. each. They were hand fed, and the burning capacity of each was about 10 cwt. per hour.

Poole T.C. (February 20th. Mr. W. M. Cross).—£4,069 for works of road improvement and surface-water drainage. Evidence was given by the town clerk, Mr. C. Lisby, and the borough surveyor, Mr. S. J. Newman, it being explained that the road improvement schemes had become necessary through the growth of vehicular and other traffic.

Tewkesbury T.C. (February 17th. Mr. W. H. Collins).—£8,000 for the purpose of building working-class dwellings.—The borough surveyor, Mr. W. Ridler, gave a detailed description of the houses, which will have three bedrooms, and a bath fixed in the kitchen under the table. The area of the garden attached to each house would be $\frac{2}{3}$ of a square chain. He was hopeful that the rent might be something under 5s. 6d. per week.

APPLICATIONS FOR LOANS.

- Billericay R.D.C.**—£9,000 for sewerage works.
- Brighton T.C.**—£16,000 for electric mains, motors, and heating appliances.
- Cannock R.D.C.**—£180 for sewer extension.
- Chelmsford T.C.**—£1,000 for sinking a trial borehole.
- Colne T.C.**—£8,900 for the construction of a new road.
- Grays U.D.C.**—£1,100 for road widening.
- Keighley T.C.**—£600 for motors to be let out for hire.
- Knaresborough U.D.C.**—£950 for road widening, and £300 for sewage disposal works.
- Littlehampton U.D.C.**—£710 for public lavatories.
- Maidenhead T.C.**—£2,500 for road repairs.
- Newbury T.C.**—£1,700 for gas mains extensions.
- Norwich T.C.**—£12,800 for the extension of the municipal buildings.
- Todmorden T.C.**—£800 for road improvements.
- Wakefield R.D.C.**—£10,842 for sewerage works.
- Walthamstow U.D.C.**—£5,900 for an additional boiler, overhead tankers, and conveying plant at the electricity works.

LOANS SANCTIONED.

- Bermondsey B.C.**—£4,560 for paving works, repayable as to £1,880 in fifteen years, and the balance in seven years.
- Durham R.D.C.**—£2,172 for sewerage and sewage disposal works.
- Larne R.D.C.**—£2,000 for a new road at Ballyhill.
- Melford R.D.C.**—£750 for the erection of four houses.
- Stoke-on-Trent T.C.**—£550 for the proposed High-street West improvement.
- Twickenham U.D.C.**—£5,300 for resurfacing work with asphalt macadam.
- Wandsworth B.C.**—£9,635 towards the cost of the improvement at High-street and East Hill, Putney.
- Wealdstone U.D.C.**—£7,000 for sewerage works.
- West Ham T.C.**—£5,000 for a site for a sanatorium.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—East Ham £5,200, Goole, £16,000, Norwich £12,800, Pudsey £8,659; housing and town planning—Risca; roads and materials—Bucks, Lanarkshire, Swansea; sewerage and sewage disposal—Benfieldside, Ince-in-Makerfield £17,500, Rotherham £15,045, South Shields £40,000; water, gas and electricity—Atherstone £15,000, Birmingham £36,595.—Particulars of other works projected will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Aberdeen T.C.—The Public Health Committee of the council have decided to advertise for a site on which to build a sanatorium.

Birmingham T.C.—The Education Committee propose to effect extensions at the Burlington-street school, Aston Manor, at an estimated cost of £3,700.

Bridlington T.C.—The council on Wednesday decided to enter into a provisional agreement with the New Spa Company, Limited, to acquire their undertaking at the price of £16,000, subject to the council obtaining the necessary Parliamentary powers.

Criccieth U.D.C.—Committees have passed recommendations for the provision of public conveniences, shelters, and other improvements.

Durham C.C.—The extensions it is proposed to carry out at the county hospital are estimated to cost £4,500.

East Ham T.C.—It has been agreed to build a block for diphtheria patients at the isolation hospital, at an estimated cost of £5,200.

Finsbury B.C.—It is proposed to carry out alterations and improvements at the town hall at an estimated cost of £991.

Goole R.D.C.—The council on Wednesday agreed to contribute £2,000 towards the scheme promoted by the West Riding County Council for the erection of a bridge over the river Aire at Carlton, at an estimated cost of £16,000.

Grays U.D.C.—The surveyor, Mr. A. C. James, has been instructed to make inquiries as to the provision of cottage baths.

Newtown U.D.C.—A smithfield is to be built on a municipal site near the railway at an estimated cost of £4,411.

Norwich T.C.—The council on Friday last adopted the plans of the city engineer, Mr. A. E. Collins, for the extension of the municipal offices on the site of the old fish market, at an estimated cost of £12,800.

Pudsey T.C.—A scheme has been adopted for the erection of a public swimming bath, fire brigade station, and the provision of workmen's dwellings, at an estimated cost of £8,659.

Stafford T.C.—The council have adopted a scheme of the borough engineer, Mr. W. Plant, for alterations and additions to the borough hall at an estimated cost of £2,500.

Staffs C.C.—The Education Committee recommend the erection of a school at Arncliffe at an estimated cost of £1,800.

Stoke Newington B.C.—It has been agreed to proceed with the scheme for the provision of public wash-houses in Milton-road, at an estimated cost of £1,900, together with certain municipal offices to cost £400.

West Ham T.C.—The borough engineer, Mr. J. G. Morley, has received instructions to prepare plans for a sanatorium and hospital, for which a site has been purchased.

Worthing T.C.—The borough surveyor, Mr. F. Roberts, has received instructions to prepare a scheme for the extension of the bandstand, and for the erection of a shelter on the parade.

HOUSING AND TOWN PLANNING.

Chailey R.D.C.—The housing question was raised last week as the result of the deliberations of a special committee appointed to consider the subject. The clerk said it was suggested that areas should be formed

and systematically worked by the council, and these areas were to be suggested by the medical officer. It was felt that the inspector of nuisances ought to be assisted by a temporary assistant in working these areas. It was decided to adopt the course proposed by the committee.

Chard T.C.—The council on Monday decided to complete the purchase of Old Town Farm for the purposes of the proposed housing scheme.

Holborn B.C.—It has been decided to purchase a site in Neal-street and Short's-gardens for a housing scheme.

Market Bosworth R.D.C.—The Housing Committee recommend a scheme for the provision of twenty houses at Destord.

Risca U.D.C.—The council have agreed to a scheme for the erection of 200 additional houses under the Housing of the Working Classes Act.

York T.C.—It was agreed on Monday to purchase about 50 acres of land near Tong Hall-lane and Howorth, at £125 per acre, for the housing scheme contemplated by the council.

PARKS AND OPEN SPACES.

Liverpool T.C.—Tenders have been accepted for carrying out the adopted plan of bowling greens, music stand, and shelter-houses on the Ruperi-lane barracks site, for the preparation of the lower Breck-road recreation ground, and for shelter huts for the men in charge of the various gymnasias throughout the city. Regarding the Walton Hall estate, the Parks and Gardens Committee have resolved to offer three premiums for planning the whole estate exclusive of over 49 acres which are to be retained as park land.

Manchester T.C.—The council on Wednesday agreed to purchase 24 acres of land in Levenshulme, at a cost of £457 an acre, for the purpose of playing fields.

Todmorden T.C.—It has been decided to institute refreshment rooms and a museum in the large mansion in Centre Vale Park. Tenders have been accepted for the erection of a bandstand, three shelters, and a bowling green pavilion, and for the construction of two large bowling greens.

REFUSE COLLECTION AND DISPOSAL.

Grieff T.C.—The burgh surveyor, Mr. A. W. Allison, has prepared an exhaustive report on the question of the collection and treatment of the town's refuse, and as a result the council have resolved to discontinue the contract system and to purchase horses, establish plant, and manage their own scavenging under the supervision of the burgh surveyor.

Paddington B.C.—It was recently agreed by the council that the chairman and vice-chairman, together with the surveyor, Mr. E. B. B. Newton, M.A.N.S.R.C.E., should be appointed to attend a conference on the question of the disposal of horse refuse. Mr. H. Wood hoped the delegates would make a full report, and take special notice of the matter of dust destructors. The cost of removal of refuse was increasing. In four years in the Queen's Park area the increase was £1,300.

ROADS AND MATERIALS.

Antrim C.C.—The council last week agreed to a scheme for improving the main road from Belfast to Antrim for about 5 miles, by a steam rolled coating with tar-sprayed surface, at a cost not exceeding £3,200, one-half of which will be defrayed by the Road Board.

Bampton U.D.C.—The contracts for Nos. 1, 3 and 4 divisions of the roads are to be terminated, and the work undertaken by direct labour, under the supervision of the surveyor, Mr. Rogers.

Benfieldside U.D.C.—The council have decided to lay tar grouting in certain thoroughfares, and to purchase a Phoenix rapid tar boiler of 160 gallons capacity; also to contract with the Edison Company for the use of a steam road roller for eighty days or more at a cost of 21s. 5d. per day, and to invite the Ness Company, of Darlington, to supply the necessary prepared tar for grouting purposes at 66s. per ton.

Bucks C.C.—It has been agreed to carry out a scheme for reconstructing portions of the London and Oxford main road and the Watling-street main road so as to render them capable of withstanding the constant traffic of heavy motor lorries and traction engines. The council have approved a scheme of the Road Board showing an estimated outlay of £30,072 in reconstruction, and £2,793 in additional plant. The Road Board assistance will be £15,000 as a grant to road work, and loans, free of interest and repayable in four years, of £7,700 for road work and £2,793 for plant, making a total of £25,493, which is £7,372 less than the outlay. The average excess expenditure by the council in obtaining Road Board grants is now £7,000 per annum. In addition to the foregoing, the Road Board will make grants up to £1,000 for the coming year towards improvements effected by district councils.

Cardiff T.C.—The city engineer, Mr. W. Harpur, has received instructions to prepare a detailed estimate for covering Kingsway with asphalt macadam from the present limit of the asphalted portion to the park end of Priory-street, at an estimated cost of £864. He also advised that Park-place be similarly treated, from Queen-street to the National Museum, at an estimated cost of £1,200.

Cheltenham T.C.—The Streets Committee recommend a paving scheme for a portion of Albion-street, at an estimated cost of £1,000.

Durham R.D.C.—It is proposed to make up ten private streets at an estimated cost of £4,741.

Manchester T.C.—In connection with the proposed town planning scheme for the southern suburbs it is proposed to construct a new trunk road, several miles in length, to run through Withington. It will lead from Upper Brook-street, and will go in a direct line to Cheadle and Wilmslow, almost parallel to the London and North-Western line, which turns off near Slade-lane and goes to Wilmslow. There are two schemes for this road, one for each side of the railway route. Either will be a shorter way than is at present possible, either by Stockport-road or Palatine-road.

Northampton T.C.—The Road Board have sanctioned a grant of £3,000 towards the Houghton-road improvement, the estimated cost of which is £7,400.

Paddington T.C.—The council have approved an estimate of £970 for new bituminous macadam in Stanhope-place and Westbourne-terrace, for inclusion in the 1914-15 estimates.

Pershore R.D.C.—A considerable amount of road construction is being proceeded with, and the council are making use of Messrs. R. S. Clare & Co.'s pitch-mac for grouting purposes.

Perthshire C.C.—A report has been submitted to the Highland District Committee stating that the Road Board had sanctioned a grant of £2,000 towards an improvement scheme, the total cost of which will be not less than £4,000.

Poplar B.C.—The Road Board have written to the council stating that they are prepared to make a further grant of £3,000 towards the cost of reconstructing East India Dock-road and Bow-road. In the first instance they made a grant of £10,000.

Elland U.D.C.—It was agreed on Wednesday to obtain further tenders for the improvement of the promenade.

Exeter T.C.—It has been agreed to lay down wood paving in St. Sidwell's-street.

Finsbury B.C.—It has been agreed to carry out paving works during the ensuing half year at a cost of £2,449, to be met out of the special paving fund.

Folkestone T.C.—It has been agreed to lay Lithofalt paving blocks in Sandgate-road and Cheriton-road, at an estimated cost of £3,512.

Hampstead B.C.—It has been agreed to carry out paving works in Belsize-road, Englands-lane, Finchley-road, Winchester-road, and Abbey-road.

Lanarkshire C.C.—Sir George Gibb, chairman of the Road Board, in a letter to the District Committee of the Lower Ward, indicates that the total grant for the whole county would probably be about £13,000 to £13,500, which is equal to about 50 per cent of the cost of the works it is proposed to carry out. He also states that the board did not now insist upon the distinction between scheduled and non-scheduled roads, and that the limitation of grants for tar-spraying to three years for the same roads would not be insisted upon.

Stafford T.C.—Upon the advice of the borough engineer, Mr. W. Plant, who prepared a special report on the subject, an application was made to the Road Board for a grant towards the projected new road from Lammascotes to the Lichfield-road. The Road Board have decided to make a grant of £1,000, and the borough engineer has been thanked by the council for his services.

Stretford U.D.C.—For the second season, Tarco is being used for surface spraying requirements.

Swansea T.C.—The council have resolved to carry out road widening and tramway extensions involving a total expenditure of about £20,000.

Wallasey T.C.—A contract for approximately 22,000 gallons of Tarco for surfacing treatment has been placed by the council with Messrs. R. S. Clare & Co., Liverpool.

Yarmouth T.C.—The council have agreed to make up certain roads at a cost of £7,912; to widen the South Marine Parade from the Nelson Gardens to the pickling plots, at an outlay of £100; to spend the same sum in repairing the Riverside-road in the vicinity of Darby's Hard; and to pave with granite setts Barrack-road, Cross-road, near Barrel Factory, and Lady Haven-road, at a cost of £595.

SEWERAGE AND SEWAGE DISPOSAL.

Ashby R.D.C.—The tender of Messrs. Willett & Sons, Old Hills, Staffordshire, at £1,349, has been accepted for the Ravenstone sewerage scheme.

Benfieldside U.D.C.—The tender of Messrs. Wilson & Co., Newcastle-upon-Tyne, at £7,120, has been accepted for the new sewerage works at Shotley Bridge. The scheme, including the purchase of land for the sewage outfall works, will involve a total outlay of £10,195.

Hamilton T.C.—An extensive addition to the plant at the corporation gasworks has been agreed to. This will consist of an installation of vertical retorts, with conveyers for handling coal and coke, and belt-driven lift, the total cost of which is £21,265. The new plant will be capable of making 1,500,000 cub. ft. of gas per day.

Hove T.C.—It has been agreed to accept the offer of the Cedes Electric Traction, Limited, to instal their over-running railless electric traction system as an experiment; the system to be experimentally laid down in Goldstone-villas, George-street, and part of Church-road, and a double-decked car to be run, on condition that the council incur no cost or liability.

Ince-in-Makerfield (Lancs) U.D.C.—A sewage disposal scheme, for the provision of new outfall sewer works at Westwood, and for the relaying of the sewers in the district, at an estimated cost of £17,500, has been approved, and the plans forwarded to the Local Government Board.

Mullingar R.D.C.—The tender of Messrs. Grainger Brothers, Belfast, at £13,555, has been accepted for the carrying out of the new sewerage scheme.

Newcastle (Ireland) U.D.C.—The tender of Mr. John Callan, Castleblayney, at £5,800, has been accepted for the sewerage scheme.

Rotherham T.C.—The borough engineer, Mr. E. B. Martin, has been instructed to prepare a scheme for a new main outfall sewer from the sewage outfall works to Effingham-square. The approximate cost is £15,045.

Saffron Walden T.C.—It has been agreed to place ventilating columns at certain dead ends of the main sewers at an estimated cost of £62.

South Shields T.C.—The council on Wednesday agreed to adopt the water-carriage system, the estimated cost being £40,000.

Westhampnett R.D.C.—The tender of Messrs. F. Osman & Co., Southampton, at £3,299, has been accepted for the execution of the Felpham sewerage scheme.

WATER, GAS, AND ELECTRICITY.

Atherstone R.D.C.—The council have resolved upon a new water supply scheme which, it is roughly estimated, will cost about £15,000. Boring operations upon land purchased by the council have resulted in a trial yield of nearly 250,000 gallons per day, and it is calculated that this quantity will be sufficient to serve the whole district with water.

Athy U.D.C.—The council have approved of plans and estimates submitted by Mr. J. J. Bergin, engineer,

for installing a filter to deal with occasional discoloration and mud in the water supply from the Queen's County. An application for a loan of £800 to carry out the improvement is to be made to the Local Government Board.

Belfast T.C.—A sum of £10,000 has been voted from the profits of the gas undertaking in relief of the rates.

Birmingham T.C.—It is proposed to lay down leading water mains in certain districts in the south-eastern portion of the middle level zone, at an estimated cost of £36,595. A balancing reservoir will also be constructed in connection with the scheme at Yardley Wood.

Blackrock (Co. Dublin) U.D.C.—An electrical engineer is to be asked to advise the council as to the most suitable scheme for the electric lighting of the district.

Budleigh Salterton U.D.C.—The tender of Mr. J. C. Palmer, at £4,448, has been accepted for pipe laying in connection with the new water supply scheme.

Galwyn Bay U.D.C.—Now that the council have decided to erect a destructor for house refuse, and have bought a site adjoining the public cemetery at Bronnant, on the edge of the Mochdre Valley, they are considering whether they should not erect at the same time and on the same site a new electricity generation station. Mr. A. R. Tudman, the electrical engineer, has reported on a scheme for removing the generating plant from Ivy-street works to a new station adjoining the proposed destructor. The new station as designed would cost £21,000, including the cost of laying the feeder cables to the Ivy-street site, from which the current would continue to be distributed.

Donaghadee U.D.C.—Water mains extensions are to be carried out at an approximate cost of £140.

East Ward (Westmorland) R.D.C.—The tender of Mr. Isaac Frith, Kirkbythore, at £1,110 has been accepted for the Long Marton and Crackenthorpe water scheme.

Kanturk R.D.C.—The Local Government Board is to be asked to hold an inquiry with respect to a proposed water supply for Newmarket, which is described as necessary and urgent.

Tredegar U.D.C.—A letter was received on Monday from the Local Government Board intimating that sanction was given for the borrowing of £9,900 for the erection of a new gasholder, extensions of the gas mains, and other works, but laid down the condition that certain steel tubes should not be used. The gas manager, Mr. D. W. Davies, expressed surprise that the tubes mentioned should be banned, as they were the most suitable for their district. The manager was instructed to prepare a report for submission to the board upon the advantages of the steel tubes it was proposed to use. A scheme for supplying water to the higher levels of Tredegar, which the surveyor, Mr. W. L. Roach, said would remedy all present difficulties, was submitted to the council last week.

Walsall T.C.—The balance of profit upon last year's working of the tramway undertaking was £4,348.

MISCELLANEOUS.

Brighton T.C.—It has been decided by the corporation gradually to substitute bathing chalets for the old-fashioned machines on the beach. A start will be made this year on the western foreshore, the authorities providing the structures, at an estimated cost of £200, and leasing them to the proprietors of the machines displaced.

St. Ives T.C.—It has been agreed to provide canvas hose, couplings, hydrants, and hose reel for the fire brigade at a cost of £150.

Junior Institution of Engineers.—At the thirtieth annual dinner of the Junior Institution of Engineers, which took place at the Holborn Restaurant on Saturday last, Mr. Ernest King, responding to the toast of "The Institution," said that the total membership had now reached 1,272 by an almost unbroken record of progress. During the past year situations had been found for 102 members, and at present only six out of the total membership were out of employment. In the first five months of the present session the membership had increased by the extraordinary number of 101 nett, as against an increase of thirty-five for the whole of last session.

PERSONAL.

Mr. D. Megaw has been appointed county surveyor of Antrim.

Mr. G. A. Ballard, of York, has been appointed assistant borough surveyor of Guildford.

Mr. T. Scott, surveyor of highways to the Tadcaster Rural District Council, has been voted £30 towards the upkeep of a motor car.

Mr. Henry O'Reilly, of the engineering staff, Congested Districts Board, has been appointed county surveyor of Cavan.

Mr. J. S. Walton, borough surveyor of Falmouth, has resigned, having taken up a private appointment in the North of England.

Mr. J. Buckley, M.INST.C.E., borough surveyor of Dublin, has, we regret to state, suffered bereavement by the death of his wife.

Mr. Norman J. McLean, Belfast, has been appointed surveyor to the Lisburn Urban District Council, at a salary of £200 per annum.

Mr. Frank Laurens, assistant surveyor, has been appointed surveyor to the Whitstable Urban District Council, at a salary of £180 per annum.

Mr. R. Stephens, surveyor to the Chard Rural District Council, has had his salary increased to £280 to meet the expenditure on his motor car and office.

Mr. T. Harold Davies, surveyor to the Oswestry Rural District Council, has been voted an increased salary of £25 per annum, bringing his salary up to £175.

Mr. W. F. Loveday, borough engineer and surveyor of Stoke Newington, will represent the borough council at the Westminster conference on the disposal of refuse.

Messrs. J. Dyson, council offices, Northfleet, Kent, and W. E. Woollam, surveyor to the East Grinstead Urban District Council, have been elected members of the Royal Sanitary Institute.

Mr. L. M. Blanchard, assistant to Mr. H. Fox Hill, surveyor to the Ware Urban District Council, has been appointed to a vacancy in the Luton borough engineer's office.

Mr. R. H. Kilburn, surveyor to the Guisborough Urban District Council, has been appointed to represent the council at the forthcoming conference on housing and town planning to be held at Darlington.

Mr. E. F. Spurrell, borough surveyor of Holborn, with Councillor James W. Coad, have been appointed to represent the borough council at the conference on the disposal of refuse convened by the Westminster City Council.

Mr. Roland Arthur Thomas, surveyor to the Holywell Urban District Council, died, we regret to state, last week after a paralytic seizure. He was forty-two years old, and leaves a widow and young daughter. He had prepared the plans for the contemplated sewage and water works for Holywell.

Mr. J. Watkin Thomas, surveyor and engineer to the Gwyrfa Rural District Council, has had his salary increased from £150 to £200 annually, with an additional allowance of £20 a year towards the upkeep of his motor cycle. Mr. Thomas is now preparing a scheme for the provision of thirty-six workmen's dwellings, and for this work he has been promised an honorarium of £100.

Mr. Arthur H. Blanchard, M.A.M.SOC.C.E., professor in charge of the Graduate Course in Highway Engineering at Columbia University, on February 14, 1914, delivered illustrated lectures at the University of West Virginia, on the subjects: "Park Boulevards," "Bituminous Surfaces and Bituminous Pavements," "Wood Block and Stone Block Pavements," and "Modern Developments in Highway Engineering in Europe."

Mr. R. S. Murt has been appointed by the Cornwall County Council to take charge of the main roads in the Liskeard and St. Columb district, together with the Road Board work in the eastern division, at a salary of £150, rising by annual increments of £5 to £175, with a motor-cycle allowance of £50 a year; and Mr. M. Spencer Rogers has been appointed architectural and engineering assistant in the county surveyor's department at a salary of £130, rising by annual increments of £10 to £150.

Mr. J. W. Armstrong, who has been for thirty-four years in the borough surveyor's department of the

Tynemouth Corporation, is about to retire from his position as assistant surveyor, and was recently entertained at a gathering of the local municipal officers, at which Mr. J. F. Smillie, the borough surveyor, on behalf of the members of the various municipal departments, presented him with a solid silver water kettle and stand, and a solid silver cigarette case, together with a silver-mounted umbrella for Mrs. Armstrong.

Mr. Clement B. Skellern, a portrait of whom is given herewith, recently resigned from the surveyorship to the Buglawton Urban District Council, Che-hire. Mr.

MR. CLEMENT B. SKELLERN

Skellern was appointed to the position of surveyor and inspector of nuisances in November, 1880, and although seventy-four years of age, is full of energy. He still retains his position of inspector of nuisances, and his official friends hope to see him among them for many years to come. Mr. Skellern has served under seven chairmen, three county surveyors, and four clerks.

Mr. Thomas Shelmerdine, city surveyor and land steward of Liverpool, and Mr. Joseph Parry, water engineer, are both about to retire on superannuation under the standing order of the city council which came into force at the beginning of this year and acts automatically when the age of sixty-five years is reached. At the monthly meeting of the council on Wednesday it was agreed to place both gentlemen on the consultative staff for a period not exceeding two years in each case, and that each shall receive fees at the rate of £300 per annum.

Middleton Town Hall Scheme.—The Middleton Town Council on Wednesday referred to a committee a proposal to erect a new town hall on a site adjacent to the old Boar's Head Inn, at a cost of £18,000. It was stated that the new hall would be so designed as to harmonise with the architectural features of the inn.

Inland Waterways. In the House of Commons on Monday the President of the Board of Trade was asked whether, in the event of the local authorities within all areas likely to derive benefit representing their willingness to contribute out of the local rates a substantial proportion of the total fund required for the development of the inland waterways of the country, and in view of the increasing and insistent demand by agriculturists and traders for such development, the Government would proceed to constitute a waterways board, as recommended by the Royal Commission on Canals, with a view to a percentage only of the total cost being provided from Exchequer funds and spread over a period of years during which such development would be carried out? Mr. Burns said he was afraid he could not say more than that any specific proposals made by local authorities to contribute towards the cost of acquiring and improving canals as recommended by the Royal Commission, would receive very careful consideration.

QUERIES AND REPLIES.

We cannot undertake to reply to any queries which are not accompanied by the writer's name and address. These are required as a guarantee of good faith, and not for publication. Sketches accompanying queries should be made separate, on white paper, in plain black ink lines. Lettering or figures should be bold and plain.

903. Sewerage.—"Rural" asks: What are the maximum and minimum falls allowed by the Local Government Board for 6-in., 9-in., 12-in., 15-in. and 18-in. sewers?

FOR OTHER ADVERTISEMENTS

See End of Paper.

JOINT COMMITTEE.

LLANDUDNO AND COLWYN BAY THROUGH ROAD.

A Temporary Assistant is required to make revised Surveys and Plans, to take Levels and prepare Drawings, Specifications and Quantities for the above Works.

Preference will be given to one who has had experience and supervision of road construction works and retaining walls. Engagement will be for about 4 to 6 weeks, and there is a possibility of a suitable man being re-engaged as Clerk of Works during the construction. Salary £3 3s. per week for first engagement. Applicants to give full particulars of experience, age, and copies of two recent testimonials.

Applications to be sent in on or before 16th March, 1914, addressed to—

MR. W. T. WARD,
Deputy Engineer.

(1,398) Town Hall, Llandudno.

TILBURY URBAN DISTRICT COUNCIL.

APPOINTMENT OF CLERK OF THE WORKS.

PRIVATE STREET WORKS.

The above Council invite applications from suitable persons for the position of Clerk of the Works. Salary 45s. per week. Period of employment about three months. Forms of application may be obtained from Mr. S. A. Hill-Willis, the Council's Engineer and Surveyor, 47 Dock-road, Tilbury.

Applications, on the prescribed Form, and in the candidate's own handwriting, are to be delivered to the undersigned at the Council's Offices, Tilbury, not later than 5 p.m. on Monday, the 16th day of March, 1914.

(By order)

THO. A. CAPRON,
Clerk to the Council.

47 Dock-road,
Tilbury.

March 5, 1914.

(1,402)

BOROUGH OF COLCHESTER.

BOROUGH ENGINEER AND SURVEYOR.

The Council invite applications for the appointment of Borough Engineer and Surveyor, at a salary of £100, rising by annual increments of £20 (subject to satisfactory service) to £500, a horse and trap or other suitable means of locomotion being provided.

Applicants must not be under 30 or over 50 years of age, must have thorough practical and theoretical knowledge of (a) Building and Engineering Works, (b) Road Construction and Maintenance, (c) Laying of Sewers, (d) Sewage Disposal, and (e) the legal enactments relating to the duties of the Office, and should state fully their qualifications for the appointment in the applications.

A Form for attaching to the application, and list of duties, may be obtained from me.

Applications, endorsed "Borough Engineer and Surveyor," and accompanied by copies of three recent testimonials (one at least of which must deal with personal character in addition to professional capability), should be addressed to me, and must reach my Office by not later than 26th March, 1914.

Canvassing, directly or indirectly, will be considered a disqualification.

Dated this 5th day of March, 1914.

H. C. WANKLYN.

Town Clerk.

Town Hall,
Colchester.

(1,401)

BOROUGH OF FALMOUTH.

APPOINTMENT OF BOROUGH SURVEYOR.

The Town Council invite applications for the appointment of Borough Surveyor at a salary of from £150 to £200 per annum.

The selected candidate will be required to commence his duties as soon as possible, must devote the whole of his time to the duties of the office, and not engage in private practice.

Lists of duties and conditions on which the appointment will be made can be obtained from the undersigned, to whom all applications, endorsed "Borough Surveyorship," and accompanied by copies of not more than three testimonials, must be delivered not later than the 16th March next.

Canvassing, directly or indirectly, will be regarded as a disqualification.

E. E. ARMITAGE,
Town Clerk.

Municipal Offices,
Falmouth.
March 4, 1914.

(1,396)

BOROUGH OF ACCRINGTON.

CHIEF ASSISTANT AND GENERAL ASSISTANT, BOROUGH SURVEYOR'S OFFICE.

The General Works Committee of the Borough of Accrington invite applications from qualified persons from 25 to 35 years of age for the positions of Chief Assistant and General Assistant in the Borough Surveyor's Office. Salary £150 and £101 respectively.

It is essential that Candidates should be fully qualified, and have had the necessary education and Municipal training of a Borough Surveyor's Office, to fill the positions, including actual experience in the design and supervision of Tramways, Sewage Works, Private and Public Street Improvement Works, &c., and sufficient architectural knowledge for general engineering works.

Full particulars of the duties and conditions relating to the appointment, together with Form of Application, can be obtained on applying to the undersigned.

Applications to be on the prescribed Form (no other will be considered), and addressed to me, endorsed "Chief Assistant" and "General Assistant," and delivered at my Office not later than the 23rd day of March next.

WM. J. NEWTON, ASSOC. M. INST. C. E., M. S. A. L.
Borough Engineer and Surveyor.

Town Hall, Accrington.
March 6, 1914.

(1,393)

A COUNTY ENGINEER AND SURVEYOR

has vacancy in his Office for an Articled Pupil. Apply Box 1,388, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,397)

MARTLEY RURAL DISTRICT COUNCIL.
SUPPLY OF GRANITE AND SLAG.

The Council invite Tenders for the Supply of Granite and Slag, delivered at the Stations and Wharves throughout their District, during the year ending 31st March, 1915.

Forms of Tender can be obtained from the Surveyor, Mr. H. L. Richardson, St. Denis, Malvern-road, Worcester.

Tenders, endorsed "Tender for —," are to be sent to me, the undersigned, not later than the 31st March instant.

The Council do not bind themselves to accept the lowest or any Tender.

J. GILSON SHEILD,
Clerk.

14 Foregate-street,
Worcester.
March 4, 1914.

(1,395)

COUNTY BOROUGH OF NORTHAMPTON.
TO CONTRACTORS.

The Corporation of Northampton invite Tenders for Granolithic Paving, Fencing, &c., in the Extension of the Cattle Market, Northampton.

The Drawings may be seen, and Specifications, Quantities and Forms of Tender may be obtained, on application to Mr. Alfred Fidler, M. INST. C. E., Borough Engineer, Guildhall, Northampton, on deposit of £2, which amount will be returned on receipt of a *bona-fide* Tender.

Sealed Tenders, endorsed "Cattle Market Paving," addressed to the undersigned, to be delivered not later than 12 o'clock noon on Friday, March 20th, 1914.

The lowest or any Tender will not necessarily be accepted.

HERBERT HANKINSON,
Town Clerk.

Guildhall,
Northampton.
March 4, 1914.

(1,394)

CORK COUNTY COUNCIL.
TENDERS INVITED FOR MARINE IMPROVEMENT WORKS.

The County Council of the Administrative County of Cork invite Tenders for the Construction of a Causeway and Sluices across the Ringabella Estuary, near Crosshaven, County Cork, in accordance with the Plans and Specifications prepared by Mr. R. W. Longfield, County Surveyor.

The said Plans and Specifications may be inspected on any day between the hours of 10 a.m. and 5 p.m., and all information connected with the work can be obtained at the Offices of the undersigned.

Sealed Tenders, on the prescribed Form, addressed to the County Secretary, must be lodged in the Tender Box in his Office not later than 2 o'clock p.m. on Saturday, the 4th instant.

Each Tender must contain the names of two solvent Sureties prepared to enter into a Bond to guarantee the Contractor.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)
E. CALLANAN,
Secretary.

Court House,
Cork.
March 3, 1914.

(1,400)

SOME RECENT PUBLICATIONS.*

THE INVENTOR'S ADVISER AND MANUFACTURER'S HANDBOOK OF PATENTS, DESIGNS AND TRADE MARKS. (9th Edition.) By Reginald Haddan. Price 5s. London: Harrison & Sons.

The aim of the author of this work has been to deal primarily with the commercial aspect of patents. Such a handbook will be specially appreciated by inventors, manufacturers, and others interested in patents as property, and the explanations which are given of the causes which sustain or detract from the value as well as the validity of patented inventions will be found of great practical interest. In scope the work covers the British law of patents, foreign and colonial patents, trade marks and designs, while in style it forms a happy medium between the popular guide and the technically abstruse textbook. A real inventor's adviser, it will save those who consult it time, labour and money.

SPON'S ARCHITECTS' AND BUILDERS' POCKET PRICE BOOK. Edited by C. Young, F.R.I.B.A., and S. M. Brooks, L.R.I.B.A. Price 2s. 6d. nett. London: E. & F. N. Spon, Limited.

In this the forty-first edition of this well-known work considerations of space have rendered it necessary to omit the diary which has been published with previous issues. The price book, however, has been added to in many particulars, and the whole has been thoroughly revised and brought up to date. The prices are arranged according to trades, and the work contains a wonderful amount of information for so small a volume—it can conveniently be carried in the breast pocket. Reference is facilitated by a full index, and we have no hesitation in once more recommending this book to all who are practically engaged in building work.

Ferro-Concrete for March is an exceptionally interesting number. "Ferro-concrete v. Timber" is the title of a short article making clear the important saving of public money resulting from the adoption of imperishable material at the pumping station of the Gloucester waterworks, the point being graphically demonstrated by an ingenious diagram. A remarkable demonstration of the coherence of monolithic construction is afforded by an article describing the behaviour of a reinforced-concrete granary building in Canada. Owing to subsidence of the ground, the structure settled at one side until it took an angle of nearly 30 deg. from the vertical, but without suffering injury of any kind, thus entirely eclipsing the record of the famous leaning tower of Pisa. The issue also includes a biographical sketch of Mr. H. Percy Boulnois, M.INST.C.E., giving an outline of the professional career of one who may almost be looked upon as the "father" of the municipal branch of the engineering profession.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A., Borough Surveyor, Great Yarmouth.

NORTH-EASTERN DISTRICT.

A meeting of the North-Eastern District will be held at Wakefield on Saturday, March 21, 1914.

SOUTH-WESTERN DISTRICT.

A meeting of the South-Western District of the institution will be held at Torquay on March 21st.

PROGRAMME.

12 noon.—Meet at the new Town Hall, Torquay.

Business: To confirm minutes of last meeting; to receive communications, if any; to decide as to nominations for district officers for the ensuing year.

1 p.m.—Inspection of the recently completed pavilion described in Vol. 37 of the "Proceedings."

1.30 p.m.—Lunch (prepared by electricity) at the Pavilion café by the kind invitation of the Mayor and Corporation of Torquay.

2.45 p.m.—Proceed by tramcar for a visit of inspection of the recently completed town hall and municipal buildings.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

3.30 p.m.—Description by Mr. H. A. Garrett, Assoc.M. INST.C.E., borough surveyor, of the Torquay Pavilion—public restaurant operated by electricity—with discussion.

4.30 p.m.—Tea at the Pavilion café.

D. EDWARDS, ASSOC.M-INST.C.E.,
Hon. District Secretary.

Municipal Buildings,
Taunton.

EASTERN DISTRICT.

A meeting of the Eastern District is to be held at Chelmsford on April 18th.

SOUTHEND MEETING.

A meeting of the institution will be held in the Eastern District at Southend on Saturday, June 6th.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham on June 13th.

THE ANNUAL MEETING.

The date for the annual meeting of the Institution of Municipal and County Engineers at Cheltenham has been fixed definitely for June 24th, 25th, 26th and 27th next. It has been decided to make a special feature of town planning and of roads, and, if possible, to arrange for an exhibition of town plans.

EXAMINATION.

The April examination of the institution will be held in London, at the New Examination Hall, Queen's-square, W.C., on April 2nd, 3rd and 4th.

THOMAS COLE,
Secretary.

92 Victoria-street, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

COUNCIL MEETING.

At a meeting of the council held in London on February 25th, the following applicants were recommended for admission:—

To Membership: Messrs. O. Frewin, surveyor, Newbury Rural District Council, and E. C. Young, engineer, Tientsin, China.

To Associate-Membership: Mr. E. W. H. Vallis, assistant surveyor, Langport Rural District Council. (Under the new by-laws these elections will be ratified at the next council meeting if no written objections are lodged within fourteen days.)

Highway Engineering.—Mr. E. A. Stickland, past-president, was appointed as delegate to represent the institution on the committee of the Roads Improvement Association.

Architect's Registration Bill.—A report on this Bill, which has been under the consideration of the General Purposes Committee, will be presented at the next council meeting.

B. WYAND,
Secretary.

39 Victoria-street, S.W.

FORTHCOMING MEETINGS.

Arrangements have been made for the following meetings: March 21st, Leeds; April, Birmingham; April 18, Hexham; May, Finedon and Wellingborough; May 16th, Hull; June 13th, Tisbury and Cumberland; July, Hunstanton; July 11th, Alwick; September 12th, Harrogate; October 10th, Sunderland; November 7th, Newcastle; December 12th, Newcastle.

Next Council Meeting.—The next meeting of the council will be held at Leeds on Saturday, March 21st.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

WATER INSPECTOR.—March 7th.—Corporation of Wakefield. 34s. per week.—Mr. C. C. Smith, waterworks engineer.

APPOINTMENTS OPEN.

WANTED, at once, a fully qualified Surveyor, or an Architect with a full knowledge of surveying, to take charge of some Garden City developments.

Applicants must be over 30 years of age, must be fully qualified to deal with all questions of Estate development, must have a thorough knowledge of plans, must be able to make surveys and measure up for certificates. Commencing salary £200 per annum.

Apply by letter only, stating age, full details of experience, and enclosing copies only of three recent testimonials, to

WELSH GARDEN CITIES, LTD.,
(1,361) 3 Dumfries-place, Cardiff.

**URBAN DISTRICT OF HOLYWELL.
APPOINTMENT OF SURVEYOR AND
INSPECTOR OF NUISANCES.**

The Urban District Council of Holywell invite applications for the appointment of a person to perform the duties of Surveyor and Inspector of Nuisances for the District.

The person appointed must be possessed of a Certificate of the Municipal Engineers' Institute, the Sanitary Institute, or some other similar examining body, and must devote the whole of his time to the duties of the office.

The appointment will be an annual one, and will be made on the distinct understanding that no pension or retiring allowance will be granted. A knowledge of the Welsh language is desirable.

The appointment will commence as from the 1st day of April, 1914, with a salary in respect of the office of Inspector of Nuisances (which will be subject to the sanction of the Local Government Board) at the rate of £70 per annum, and in respect of the other office at the rate of £35 per annum.

Canvassing is strictly prohibited, and any candidate found, directly or indirectly, canvassing any member of the Council will be disqualified for election.

Applications, with copies of three recent testimonials, marked "Inspector of Nuisances, &c.," must be delivered at the Offices of the undersigned, from whom can be obtained a Form of Application and a list of the duties appertaining to the offices, on or before Monday, the 23rd day of March, 1914.

J. KERFOOT-ROBERTS,
Solicitor, Holywell.
(1,391) Clerk to the Council.

**THE ROYAL BOROUGH OF KENSINGTON.
APPOINTMENT OF RESIDENT MANAGER
AT WOOD-LANE DEPOT.**

The Council of the above Borough require the Services of a Competent Manager to take sole charge, under the direction of the Borough Engineer, of the Council's Refuse Destructor, Clinker Block-making Installation, and the Works generally at the Wood-lane Depot, Shepherd's Bush. Candidates must be between 30 and 40 years of age, and should have had practical experience in connection with the working of installations of a similar nature, have a practical knowledge of steam plant, and be conversant with the general duties of a manager of works.

The salary attaching to the position will be at the rate of £160 per annum, rising by conditional annual increments of £10 to a maximum of £200 per annum, with house and allowance of coals and lighting.

The appointment will be subject to the provisions of the Kensington Borough Council (Superannuation) Act, 1907, under which percentage deductions are made from all salaries and emoluments.

Application must be made in the candidate's own handwriting on printed Forms to be obtained at my Office, and must be delivered to the undersigned, accompanied by copies of not more than three testimonials of recent date, not later than four o'clock in the afternoon of Tuesday, March 17th, 1914.

Personal canvassing of any Members of the Council will be a disqualification.

(By order)
WM. CHAMBERS LEETE,
Town Clerk.

Town Clerk's Office,
Town Hall,
Kensington, W.
February, 1914. (1,354)

SURVEYOR AND ENGINEER to a large Rural District Council (with main roads) has a vacancy for a pupil. Low premium.—Apply Box 1,382, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,345)

EX-PUPILS AND JUNIOR ASSISTANTS.

SURVEYOR'S ASSISTANT (21), 3 years Articles, desires appointment in Municipal Office, or Contractor executing Municipal Contracts. Experience levelling, surveying, draughtsmanship, building construction, architectural drawing, street works, waterworks. Excellent testimonials. Moderate salary. Free immediately.—Box 1,387, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,388)

TENDERS WANTED.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

**CHESHAM URBAN DISTRICT COUNCIL.
ERECTION OF WORKMEN'S DWELLINGS.**

The Chesham Urban District Council invites Tenders for the erection and completion of Twenty Workmen's Dwellings, together with all Fencing, Drainage, &c., upon land situate in Brockhurst-road, within the Urban District of Chesham.

Plans, Sections and Specification may be seen upon application to the undersigned any morning between the hours of 9.30 and 10.30, or at other suitable time by appointment.

The person or firm whose Tender is accepted will be required to enter into a Contract and Bond in an approved Guarantee Society as surety for the due performance of the Contract, a copy of which may be seen at the office of W. J. Standing, Esq., Clerk to the Council, High-street, Chesham, to whom Tenders, sealed and endorsed "Tender for Erection of Workmen's Dwellings," are to be delivered by twelve o'clock noon on Wednesday, March 25th, 1914.

The Council does not bind itself to accept the lowest or any Tender.

PERCY C. DORMER,
Engineer and Surveyor.
Council Offices,
Chesham.
February 25, 1914. (1,381)

CITY OF BIRMINGHAM.

The Public Works Committee are prepared to receive Tenders for Road and Sewerage Works at Lordswood-road and new road between Balden-road and Lordswood-road, Harborne.

The Drawings and Specification may be seen, and the Bill of Quantities and Forms of Tender obtained, at my Office on payment of a deposit of £2, which sum will be returned on receipt of a bona-fide Tender.

Persons tendering must, at the time of tendering, and at all times during the execution of the Works, be paying all their workpeople not less than the trade union or standard rate of wages in the district where such workpeople are actually engaged in the execution of the work, and must be observing the hours and conditions of labour recognised by the Association of Employers and the local organised bodies of workers in the various trades in such district. The Tender of any person not paying the trade union or standard rate of wages, or not observing such hours and conditions of labour in his ordinary business will not be accepted. The Contractor will be held responsible for the observance of these conditions by any Sub-contractor employed by him.

Tenders, sealed and endorsed "Tender for Road and Sewerage Works, Lordswood-road, &c.," and addressed to the Chairman of the Public Works Committee, to be delivered at my Office not later than 17th March, 1914.

The Committee do not bind themselves to accept the lowest or any Tender.

HENRY E. STILGOE, M.INST.C.E.,
City Engineer and Surveyor.
The Council House,
Birmingham. (1,382)

COUNTIES OF BERKS AND SOUTHAMPTON.

CONSTRUCTION OF A BRICK AND CONCRETE BRIDGE AT NEWTOWN FORD, NEAR NEWBURY.

TO CONTRACTORS.

Persons desirous of Tendering for the Construction of a Brick and Concrete Three-arched Bridge at Newtown Ford, on the Winchester, Whitechurch and Newbury Main Road, may see Plan, Specification and General Conditions, and obtain a copy of the Bill of Quantities and all other necessary information, on application at the office of Mr. W. J. Taylor, County Surveyor, The Castle, Winchester, on and after Monday, the 9th day of March, 1914, between the hours of 9 a.m. and 4 p.m. (Saturdays, 9 a.m. and 12 noon).

A deposit of two guineas will be required for a copy of the Bill of Quantities, which will be refunded on receipt of a *bonâ-fide* Tender.

Deposits must be made by cheque, payable to the "Hampshire County Council," and crossed "Capital and Counties Bank," or particulars will not be sent.

Tenders, on forms supplied by the County Surveyor, must be endorsed "Newtown Bridge," and be delivered to me on or before 10 a.m., Wednesday, the 25th March, 1914.

The County Council do not bind themselves to accept the lowest or any Tender.

H. BARBER,

Clerk of the Hampshire County Council.

The Castle, Winchester.

February 26, 1914.

(1,379)

GAINSBOROUGH URBAN DISTRICT COUNCIL.

ANNUAL CONTRACTS, 1914-15.

The Urban District Council are prepared to receive Tenders for the Supply and Delivery of the under-mentioned Materials as may from time to time be ordered during the year ending 31st March, 1915:

1. Broken Granite or Whinstone Macadam.
2. Granite or Whinstone Setts.
3. Broken and Block Slag, Slag Chippings and Dust.
4. York Setts, Kerbs, Channels and Flags.
5. Concrete Flags.
6. Stoneware and Earthenware Pipes, Gullies, &c.
7. Cast-iron Pipes.
8. Tar-macadam.
9. Pitch and Creosote Oil.
10. Portland Cement.
11. Coal.

Specification and Forms of Tender may be obtained by written application addressed to the undersigned.

Sealed Tenders, endorsed "Tender for —," accompanied by Samples of the Materials to be supplied (except Nos. 4, 7, 8, 9, 10, 11), to be delivered at the Office of Mr. Decimus M. Robbs, Clerk to the Council, 6 Lord-street, Gainsborough, not later than Wednesday, 18th March next.

The Council do not bind themselves to accept the lowest or any Tender.

SAM. W. PARKER,

Engineer and Surveyor.

Council Offices,
Gainsborough.

February 20, 1914.

COUNTY BOROUGH OF BURNLEY.

TO CONTRACTORS.

The Burnley Corporation invite Tenders for the Completion of the Construction of an Impounding Reservoir, with Catchwaters, Aqueducts, Meter-houses, &c., at Hurstwood, near Burnley.

Plans may be seen, and Specification, Schedule of Prices, Form of Tender, and all other particulars obtained, on application to Messrs. James Diggle & Son, Engineers, Hind Hill-street, Heywood, Lancashire, on and after Monday, the 23rd February, 1914, on payment of a deposit of £5, which will be returned on receipt of a *bonâ-fide* Tender, accompanied by the Schedule of Prices fully priced out, but not otherwise.

Sealed Tenders, endorsed "Tender for Completion of Reservoir," must reach me not later than Saturday, the 4th day of April, 1914.

PEREGRINE THOMAS,

Town Clerk.

Town Hall, Burnley.

February 11, 1914.

(1,312)

WEST WARD RURAL DISTRICT COUNCIL, WESTMORLAND. WATER SCHEME.

The West Ward (Westmorland) Rural District Council invite separate Tenders or one whole Tender for:—

CONTRACT No. 1.

- 1½ miles (approximate) 3-in. diameter Mannesman Steel Tubes delivered and laid complete.
- 6½ miles (approximate) 5-in. diameter do.
- 7 miles (approximate) 6-in. diameter do.

With Specials, Valves, &c.

CONTRACT No. 2.

The Erection of Intake Works, Screening Chamber, Three Service Reservoirs, Break Pressure Tank, Valve Chambers, &c., on route of Contract No. 1.

CONTRACT No. 3.

- 3 miles (approximate) 3-in. diameter Mannesman Steel Tubes, delivered and laid complete.
- 4 miles (approximate) 4-in. diameter do.
- 33 miles (approximate) 3-in. Cast-iron Pipes, delivered and laid complete.

12 miles (approximate) 4-in. do.

1½ miles (approximate) 5-in. do.

¼ mile (approximate) 7-in. do.

With Specials, Valves, &c.

CONTRACT No. 4.

The Building of Break Pressure Tanks and Valve Chambers, &c., on route of Contract No. 3.

The whole of the Works to be carried out in accordance with Plans and Specifications prepared by Mr. Joseph Graham, Civil Engineer, 28 Castle-street, Carlisle.

Intending Contractors, upon deposit of £5 (cheque only), will obtain copies of Specification and Bill of Quantities with Form of Tender at the Office of the aforesaid Engineer, where the Drawings will be on view. The cheque will be returned to the Contractor upon the receipt of a *bonâ-fide* Tender and the return of all documents to the Engineer.

The Council do not bind themselves to accept the lowest or any Tender.

JAMES TAYLOR,

1 Brunswick-road,

Clerk.

Penrith.

February, 1914.

(1,372)

ACTON URBAN DISTRICT COUNCIL.

Tenders are invited for—

- (A) The Supply of a Tar-spraying Machine.
- (B) Tar-spraying certain Roads in the District.
- (C) Coating certain Roads in the District with Bitumen.

Full particulars may be obtained at the Offices upon application to the Surveyor to the Council.

Tenders, in sealed envelopes, appropriately endorsed, must be delivered, addressed to me as under, not later than 3 p.m. on Tuesday, the 17th March, 1914.

The Council do not bind themselves to accept the lowest or any Tender, and canvassing the Members of the Council, either directly or indirectly, will disqualify.

(By order)

WM. HODSON,

Clerk to the Council.

Council Offices,

Winchester-street, Acton, W

March 2, 1914.

(1,369)

BUCKS COUNTY COUNCIL.

ROAD MATERIALS AND HAULAGE.

Tenders are invited for the Supply and Delivery of best quality Granite or other Hard Stone Spalls, not smaller than 6 in. or larger than 12 in., or close dense Slag, free from ventholes or honeycomb, during the next twelve months, free on rail or wharf at—

Bletchley Station, or Penny Stratford

Canal Wharf	10,000 tons
Beaconsfield Station	4,000 "
Gerrard's Cross Station	3,700 "

Tenders are also invited for unloading and hauling the above for distances up to four miles. All other particulars can be obtained from the undersigned, to whom sealed Tenders are to be forwarded by the morning of March 14th, 1914.

R. J. THOMAS,

County Surveyor.

County Hall,

Aylesbury.

GREAT CROSBY URBAN DISTRICT COUNCIL.

The above Council are prepared to receive Tenders for the Supply of the following Materials during the year ending March 31st, 1915, in such quantities and at such times as may be ordered:—

1. Granite Macadam and Chippings.
2. Limestone Chippings.
3. Tarred Limestone Macadam.
4. Portland Cement.
5. Stoneware Pipes, &c.
6. Disinfectants.
7. Pitch and Tar.
8. Incandescent Mantles and Chimneys.
9. Glass for Street Lamps.
10. Horse Provender.
11. Granite Setts.
12. Extra Cart Hire.
13. Horsing Fire Engine.

Specifications can be obtained from Mr. Joseph A. Wright, Surveyor, Council Offices, Coronation-road, Great Crosby.

Sealed and endorsed Tenders to be delivered to the Council Offices by noon on Monday, March 16th, 1914, addressed to the "Chairman of the Council."

The lowest or any Tender not necessarily accepted.

JOSIAH DEAN,

Clerk to the Council.

Minutes of Proceedings.

Roads for Heavy Traffic: The West Midland District.

In last week's issue we reproduced Mr. H. M. Lawson's paper on "Road Construction and Maintenance," which was read and discussed at the Birmingham meeting of the Institution of Municipal and County Engineers; and a report of the discussion which followed the reading of the paper will be found in the present issue. The paper itself was mainly confined to road crusts and pavements for heavy traffic, and although other matters bearing upon the construction and maintenance of roads and streets were usefully discussed at the meeting, most of the speakers dealt chiefly with this main part of the subject. The practical value of this concentration of mind was enhanced by the fact that the principal speakers in the discussion represented towns and counties all of which lie within the boundaries of a relatively small area—West Bromwich, Birmingham itself, Lichfield, and Cheltenham being the towns represented; and two counties, Worcestershire and Shropshire. The speakers referred therefore to conditions within a moderate range of rainfall and temperature, and the chief subject discussed being that of main roads and streets, the considerable variety of geological conditions is of much less significance than it is when roads of all classes, or secondary and by-roads are being discussed. The following points seem to be specially worthy of attention: Mr. J. S. Pickering has had in Cheltenham the same experience as that of metropolitan borough engineers—namely, that by the use of sectional blocks some of the objections to the use of hardwood paving are removed. Mr. H. E. Stilgoe pointed out that contractors who are responsible for the maintenance of softwood paving like to use cement and sand for the final grouting of the joints, the rest of the jointing being of pitch. Mr. C. F. Gettings cited a case in which a road with motor omnibus traffic had to be coated four times a year. He is advising his Roads Committee that a change should be made, but the bare fact that the state of affairs exists even temporarily is of interest from more than one point of view, and it can hardly be supposed that this water-bound road crust is a good one with suitable foundations. It is to be noted, however, that on a country road leading to Birmingham Mr. Gettings found that from 80 to 120 motor omnibuses passed in a day. Mr. Parsons referred to the ill effects of heavy loads on rubber tyres, and his view as to this was supported by Mr. Lawson. We are inclined to suggest that frequent sweeping of the roads is one of the best means of combating excessive wear by solid rubber tyres, and occasional

heavy watering may be advisable on water-bound roads in dry weather. Mr. Stilgoe's remarks on the width of roads in residential areas should be carefully read; the landowners, he pointed out, gladly accepted the tree-planting provision, coupled with a reduced width of carriageway. As regards patching, it may be noted that Mr. Pickering uses tar-macadam for this purpose, and finds it satisfactory, and Mr. A. T. Davis referred to the same practice as being followed in Shropshire. On general grounds, we have deprecated any considerable acceptance of the principle involved, that of new cloth in an old garment, but we are obliged to admit that under present traffic conditions there are often considerable difficulties in the way of the effective repairing of a road crust with its own or similar materials. For lack of space we can but mention other points which are specially significant—the depth of setts, which Mr. A. D. Greatorex considers should be at least as great as the width; the use of Clee Hill tarred macadam alongside tramway rails in Birmingham; the value of tar-macadam for county roads in Shropshire; and the important principle involved in the payment of extra wages to spreaders and to the men in charge of heaters.

* * *

Steel Frame Buildings.

The operation of the London Building Acts (Amendment) Act, 1909, has had a drastic effect upon the practice in regard to the design of steel frame buildings, and the period which has elapsed since the date of its passage into law has been sufficient to reveal both its good points and limitations. The subject chosen by Mr. W. Cyril Cocking for the paper which he read at the last meeting of the Concrete Institute was therefore very appropriate, and in dealing with "Calculations and Details for Steel Frame Buildings from the Draughtsman's Standpoint" he had much to say that was of great practical value. In the first place he did well to emphasise the desirability of an early agreement with the district surveyor in regard to essential matters as to which that official has to exercise a discretionary authority. The adoption of this course would be beneficial to draughtsman, architect, builder and engineer alike, and would make for smooth working in the erection of any structure to which the provisions of the Act are applicable. Although, as might have been expected, the execution of the Act has not been free from difficulties during the early years of its operation, its ultimate success would appear to be assured by the fact that the modern tendency is to adopt its requirements in the design and construction of the steelwork of buildings which are

not subject to its provisions. This is all to the good, inasmuch as it indicates a tendency towards the standardisation of details. Mr. Cocking dealt at length with eccentric loading, the aim of eccentricity, and the end fixing of pillars, and suggested a conference between the Concrete Institute and the District Surveyors' Association with the object of arriving at a mutually satisfactory practical solution of these problems. Great value would naturally attach to any solution obtained in the manner proposed, and such a conference as suggested would have the further advantage of enabling district surveyors and structural engineers better to understand each other's position and point of view.

As will be seen from the extracts which appear in another column, not the least valuable part of Mr. Cocking's paper was that devoted to expositions of the calculations involved in steel frame building design. Not only did he lay proper stress upon the importance of order and method, but he also showed how a large number of approximations can be made for the purpose of saving labour and time. In conclusion, he urged that all constructional engineers and draughtsmen should support the Act of 1909, and that the institute should do everything in its power to foster a spirit of co-operation between the engineer who has to design and erect steel frame buildings and the district surveyor who is appointed to see that the requirements of the Act are faithfully observed and complied with. Although amendments may be thought desirable in certain quarters, it must be remembered that no concessions can be expected or obtained unless all concerned with the working of the Act combine together to make the very best of it in its present form. As an Act it is, on the whole, both fair and practical, and time has already shown that it has been the means of considerably improving the general design of steelwork from the point of view of good practice, economy, and theoretical design.

* * *

National Health Week.

It is now almost a year ago since the second annual celebration of National Health Week, and the success which was achieved then and on the former occasion was such as to justify abundantly the hopes of the originators of the movement. This year certain changes are to be made. The "week" has been postponed until the latter part of the year (November 15-21), and the responsibility for the central organisation has very appropriately been taken over from the Agenda Club by the Royal Sanitary Institute. There has been issued a preliminary circular in which it is pointed out that notwithstanding all the achievements of sanitary science during the past fifty years much still remains to be done before the health of the people can be regarded as even approximately satisfactory. The improvement of health conditions is fast approaching its limit on existing lines, and no further general advance can be expected until the people themselves have been aroused to a sense of their responsibilities; for the health of a community depends as much on the man himself as on his surroundings, and on personal hygiene and cleanliness as much as on the work of the sanitary authority. A "Health Week" has an important function to perform in addition to the steady continuous work throughout the year. Both are needed. There is at present no driving force behind this question of health. Any cause which depends for its vitality and force upon public opinion must have something definite on which that public opinion may crystallise, some opportunity for focussing attention and rekindling the enthusiasm of its adherents. The splendid work which is being done by health authorities loses much of its effect for want of an adequate response on the part of those for whom it is done.

A most pressing need therefore exists for emphasising the importance of personal attention to hygiene. The immediate purpose of Health Week is to make health during the week the chief topic of public concern. The ultimate objects to be kept in view are to secure the recognition of the fact that disease is a thing which can and should be prevented; to impart sound information as to public and personal hygiene, and to build up a public opinion which will not tolerate a high disease rate or an excessive infant mortality, and which feels as a personal reproach the sight of an ill-nourished or neglected child. These objects are so excellent that we have full confidence in commending National Health Week to our readers in the hope that the movement may have their sympathy and support as opportunity may occur.

* * *

Orders for Foreign Steel.

On more than one occasion recently we have warned our readers against giving orders for steel to foreign firms without having the clearest possible understanding both as to the amount being ordered and the total price to be paid. We are led to return to the subject by reason of the continued frequency of litigation arising out of such orders. An example of the kind of thing that is going on is afforded by the case of the *Stellorite Company of Paris v. The Mythe and Sandgate Gas Company*, a report of which will be found in another column. In this case it will be observed that the circumstances attending the order contained all the characteristics to which our former warnings have been directed. In the first place there was the confusion in the mind of the person giving the order as to the value of the foreign measure in which it was expressed. Next there was the order which had been given by a neighbour, which was held out as a bait. Then there was the delivery of a large quantity of steel and the presentation of an invoice for an amount far in excess of anything required or expected. Finally, upon the order being disputed, there was the offer of a rebate with a view of avoiding litigation. In the course of the proceedings some interesting information regarding the *Stellorite Company* was made public. It transpired that the firm, which has only been in existence for a year, consists of three partners—namely, Mr. Tom Hayman, who has only been a partner since July 24, 1913, having formerly been a traveller; Mr. John Hayman, who attends to the correspondence; and Mr. Weinberg. They do not manufacture their own steel, and at present employ only about fifteen men. The defendants succeeded in the action on the ground that the person who ordered the steel from the company had no authority to do so, but the learned judge said that in this case there was no evidence of trickery. This may have been so in the case under discussion, but when it is remembered that the *Stellorite Company* has become involved in many other cases of a similar character, we feel that we are abundantly justified in reiterating the warning which we have formerly given to our readers. A similar case, with the same company as plaintiffs, stands adjourned at the Faversham County Court, while a further action of the same character (*Le Météore v. Litchfield & Soundy*)—the real plaintiff being Emile Levy—recently occupied the attention of the High Court. Enough has been said to show that the practices referred to are widespread and that it behoves engineers to be on their guard.

* * *

Skidding Vehicles and the "Commercial Motor."

In a recent editorial the *Commercial Motor* criticises a "Minute" on the subject of "skidding vehicles in London streets," which appeared in our issue of February 6th. Unfortunately, our contemporary has beclouded the issue by attributing to us state-

ments which we did not make. A little care in the reading of our article would have shown that we realised that more data must be available before final opinions can be formed as to what cambers are suitable for different kinds of pavement, with a view to the facts regarding skidding. The sentence to which we take exception is: "We are obliged to disagree, and do so very emphatically, in respect to that expert's recent declaration that the skidding and sideslip of motor 'buses are more due to unsuitable wheel and tyre dimensions than to excessive angles of crossfall in street construction." Now the word "tyre" does not occur in our article, nor do we refer even indirectly to tyres, except in so far as the diameter of a tyre is necessarily proportionate to that of the wheel. Next, it is to be observed that, of the two sentences to which the reference may possibly be intended to apply, one was a statement that, *in a particular case*, the opinion that skidding was due to the bad condition of the road surface "cannot be accepted as necessarily correct," and the other is an expression of regret that a specially conspicuous position in a daily paper should have been given to the statements that the shape of our streets is too often unsuited to modern traffic, and that the camber is excessive. The expression "too often" obviously reflects upon the capacity of the borough surveyors, failing any reservation in that direction. Our article was, as it happens, worded with meticulous care, since the significance of the contemporaneous development of vehicles and of certain types of paving is not to be missed by those who carefully study these questions, and there is in it not a phrase nor a word which we would alter now. As regards our reference to the brakes fitted to motor vehicles, our contemporary's suggestion that it was a "casual assertion" does not dispose us to go into technical points, and we think that this suggestion might be withdrawn. We consider, too, that some expression of regret is due to ourselves for the mistakes made in attributing to us statements which we did not make. We believe these mistakes to be due to a misreading of our article, and we rely upon the courtesy of the editor of the *Commercial Motor* to put the matter on a footing which will make possible an amicable discussion of the data and facts relating to this important subject.

The Cardiff Water Supply Dispute.

A matter of considerable importance to municipal water undertakings is engaging at present the attention of the Cardiff Corporation. Cardiff is a city which contains a powerful fellow-corporation to the municipal authority in the Bute estate, whose interests are both financially and locally of a large and far-reaching nature. Some time ago a firm of timber merchants made application to the corporation for a supply of water for a special fire-extinguishing apparatus installed to protect their stock, and steps were taken by the Waterworks Committee to comply with the request. It transpired that in order to connect up with the premises it would become necessary to construct a waterpipe a short distance within the boundary of the Bute estate, and the controllers of this property—who in respect of several matters affecting Cardiff exercise monopolist powers—refused to give permission unless the city council agreed to pay £675 per annum for easement over a much larger area, which is stated to be, however, less than one-fifth of the docks. This the Waterworks Committee regard as an impossible demand, and the corporation have refused to satisfy it on the ground that it is unreasonably excessive. The subject is attracting the attention of a wider constituency than the strictly local one, and not without cause, for it thus appears that owing to the uncontrolled authority of the Bute estate the legitimate development of the municipal water undertaking is

seriously interfered with, while at the same time local industry is subjected to perils from which in ordinary circumstances it would be adequately safeguarded. Meantime, things have reached an *impasse*, though there is just a glimmer of light reflected from counsel's opinion, which the Waterworks Committee have caused to be obtained, and which is said to be favourable to the attitude adopted by the city council. The statutory obligation of the city council to supply water is clear enough, and it is not easy to see why this can or should be overborne by the immoderate demands of any other authority, whatever powers this may claim to exercise.

Municipal Electrical Trading.

Returning to the charge with unabated zeal, the Incorporated Municipal Electrical Association has published the draft Bill which it will introduce into Parliament during the current Session, with a view to obtaining a freer hand for electricity supply authorities in the carrying on of their undertakings. Hitherto the opposition of the electrical contractors has invariably prevailed against the efforts of the municipalities; the Bill has passed the House of Commons, only to meet with shipwreck in the Lords, on the same familiar rock—the trading clause—which enables local authorities to sell, fix, let on hire, maintain and repair all kinds of electrical fittings (including lamps, motors, radiators, cooking apparatus, and so forth), and to execute the necessary wiring. This time, however, an attempt has been made to conciliate the contractors by adding a provision that wiring shall only be done through the agency of a contractor, with other sections intended to prevent undue preference to any one contractor, to guard against price-cutting on the part of the municipality, to ensure that the trading department shall not be run at a loss, and that its doings shall be open to public scrutiny, and so on. It is clear that the association has gone a long way on the path of concession, and we trust that its efforts to settle the question on lines satisfactory to both parties will be rewarded with success. The Bill contains other provisions designed to remove unnecessary restrictions upon municipal enterprise, and to promote the extension of electricity supply, to which we have not space to refer in detail; if adopted by Parliament it should prove highly beneficial to the industry and to the community in general.

London Arterial Roads.

It would appear from the speeches of the two Cabinet Ministers who took part at the Local Government Board offices on Monday in the first of the six district conferences on the question of arterial roads for Greater London that the following points are essential in carrying out any scheme: First, that there must be some agreement between the various authorities concerned; secondly, that town planning schemes must be initiated in the various localities affected; thirdly, that the owners of land must fall in with the views expressed by Mr. Samuel that the construction of roads through or near their estates will improve the value of their land; and, fourthly, that there is no immediate hurry to construct these roads so long as provision is made for their carrying out in the future. With regard to the payment out of Imperial funds of the cost of main roads, it must not be forgotten that the monies of the National Exchequer have to come out of the pockets of the taxpayers, and the provinces may have something to say if immense sums are expended in the directions proposed. However, we congratulate both Mr. Samuel and Mr. Burns on the statesmanlike views they took on this important question, and we trust and believe that good results will follow the several conferences.

Calculations and Details for Steel-Frame Buildings from the Draughtsman's Standpoint.*

By W. CYRIL COCKING, M.C.I.

When it is deemed desirable to take full advantage of the relief afforded by erecting buildings under the 1909 Amendment to the London Building Acts, it is essential that the draughtsman should be given every support at the outset, both in the preparation of the design and calculations upon which the estimates are to be based, and in the preparation of the working drawings and details.

In order to give the draughtsman a fair start it is necessary that certain matters should be agreed upon between the architect or his deputy and the district surveyor before the architect's plans are sent out for competitive tenders from constructional firms.

The matters to be so discussed and agreed are chiefly the following:—

(1) **Dead and Super Loads.**—All firms competing should be provided by the architect with the fullest possible details and particulars of floor construction, roof coverings, ceilings, casings to beams and pillars, partitions, the proportion of masonry in external walls such as heavy cornices and ashlar work and all special loading, such as lift gearing, water tanks, heavy safes, travelling cranes or runways, &c.

(2) **Foundations.**—The maximum pressures allowed upon the soil; the fullest possible information should be given for the design of party-wall foundations; depths and extreme limit of spread for foundations to party-wall pillars.

(3) **Eccentric Loading.** The district surveyor's requirements for the treatment of eccentric loading on pillars.

(4) **Pillar End Fixing.** The district surveyor's decisions as to what shall constitute a fixed or hinged end for the purposes of preparing the pillar calculations.

(5) **Form of Calculations.**—The form in which the district surveyor requires the calculations and detailed drawings to be prepared for submission to him for his approval.

With the above information the engineer should be provided by the architect with a set of the finished $\frac{1}{2}$ -in. scale plans and sections, $\frac{1}{4}$ -in. scale sections through the external walls, mansard roofs, and any other special external and internal decorative features that are required to be preserved.

The adoption of the above suggestions would relieve the draughtsman of much unnecessary labour in altering and revising his calculations and drawings. At the same time the architect would benefit himself and his client by obtaining a cheaper and more satisfactory job. The builder would profit in that he would obtain quicker and more continuous deliveries of his steelwork, and the engineer would benefit because the competition would be keener and fairer.

Other considerations which should be impressed upon architects in general when agreeing to tender are, firstly, that the engineer should be allowed a reasonable time in which to prepare his scheme and tender, and, secondly, that, should he be successful in securing the contract, he should have at least two to four weeks' start in advance of the builder or general contractor in order to prepare his working drawings, and settle the exact position of the pillars, foundations, &c., and the fabrication of the steelwork required for the first deliveries.

The working of the London Building Acts, 1909, Amendment Act has, during the last three years or so, been more or less in what might be termed the experimental stage. Most constructional firms have had their experiences of the Act's working and limitations, and though, as might have been expected, everything may not have been smooth at first, yet I think that ultimate successful working is already assured by the fact that the modern tendency is to adopt the provisions and requirements of the Act to the design and construction of the steelwork for buildings that are not necessarily subject to the requirements of the Act. This is certainly a step in the right direction, and it is to be hoped that this tendency will continue, and the design of all steel structures become more uniform and tend towards the standardisation of details.

The calculations and details required to be made

for the purposes of the construction of a modern steel-frame building is a much more extended process under the 1909 Act than has been required hitherto. It is only of late years that special calculations have been considered necessary for taking into account the presumed effects of eccentric loading on pillars; in fact, these latter calculations would have been considered in the past as being in the highest degree pedantic.

EECENTRIC LOADING.

Let us consider for a moment the question of eccentric loading of pillars. What is the effect of eccentric loading? To my mind this interesting and important question is not so easily answered as one would suppose from a casual consideration.

Take the case of a pillar composed of a 10-in. x 5-in. I at 20 lb. and 2-8-in. x $\frac{3}{4}$ -in. plates. This, considered as possessing one end fixed and the other end hinged, is capable of supporting a central load of 534 tons on a laterally unsupported length of 11 ft., according to the stresses allowed by the Act.

[The author here showed how rapidly the stresses are increased theoretically by adopting the usual formula for eccentricity coefficient, and neglecting two very important conditions of fixture—firstly, the connection of the beam to the pillar, and, secondly, the amount of continuity between two superimposed pillars.]

Firstly, the very presence of the deep beam which the pillar supports, and the necessity of a fairly rigid connection, reduces to a considerable extent the effect of the eccentricity.

Further, the actual stresses induced in the pillar will depend, to a large extent, upon the depth and deflection of the beam, the width and moment of inertia of the pillar, and the rigidity of the connection of the beams to the pillar; also chiefly upon the continuity of the pillar at the level of the beam connections—factors which the before-mentioned formula conspicuously ignores.

As a matter of fact, the formula is not the correct one to use at all; it can only be correctly applied to such examples of structural engineering as a lamp-standard, or the standards such as are used for supporting the electric transmission cables of an electric tramway or railway.

As soon as we make the pillar continuous, or securely fix the ends, the stresses are entirely altered in their distribution, and, in my opinion, the effects of the eccentricity vary from one to one-half those computed by the usual formula according to the amount of continuity and fixture at the ends.

END FIXING OF PILLARS.

Another difficult point regarding which the draughtsman must exercise his knowledge and experience is the question of "end fixing" to pillars. What constitutes a fixed end? What can be termed a hinged end? Also, what relation does a flat end bear to either or both of the above?

These questions are very irritating to the conscientious draughtsman, because no matter with whom he may discuss the question, the end fixing seems to depend not upon ascertained facts from experiments, but chiefly upon personal opinion. Nevertheless, the opinion is generally held that the topmost connection of a pillar in the topmost storey and the lower connection of a pillar in the bottom story shall be considered as hinged ends, though the latter connection or base of the pillar could reasonably be considered as a "flat" end; also, it seems reasonable to assume that the pillars in external walls which only receive two or three way connections, shall be considered as having one end hinged and the other fixed.

The important question remains, When can a pillar be assumed to possess both ends fixed? My personal opinion is, that in a case where a pillar is continuous both above and below the connection at two consecutive floors, and receive at both floor connections or "ends" a four-way connection in which the heavier or deeper beams are connected to the pillar perpendicular to its weaker axis, such a pillar shall be considered as having both ends fixed.

CALCULATIONS.

The calculations for a steel-frame building should

* Extracts from a paper read at the last meeting of the Concrete Institute.

be prepared once and once only, and they should be sufficient in detail for submission to the district surveyor for his approval, also for the complete working drawings to be made therefrom without any addition or alteration. If the structure is one in which there are several floors of similar construction and loading, the calculation forms proposed by the District Surveyors' Association are eminently suitable; but if the structure is somewhat complicated by reason of the various floors being designed for different purposes, it will be sometimes more convenient to propose other forms, according to the requirements of the district surveyor or the custom of the draughtsman.

For beam calculations the dead loads and superloads should be kept separate for the purposes of computing the reactions, if it is desired to take advantage of the rebate allowed on loads on pillars for buildings other than the warehouse class; but unless there are several floors for which the rebate is appreciable, the results are incommensurable to the additional labour entailed.

When a beam is required to support a complex system of loading, a diagram of the loads should be made upon the beam sheet; such diagrams should be drawn to the same scale as the steel-framing plans.

When calculating the reactions due to the loading on a beam, it is advisable that the separate reactions of each item of loading should be calculated and indicated upon the loading diagram separately.

It is not necessary to calculate the loads to more than one place of decimals, but each item of loading should be set down in detail in order that it can be readily verified and checked. The values of the reactions should be calculated to the second place of decimals when the loading is of comparatively small dimensions.

In setting up diagrams of loading, it is important that all beams should be viewed from the same aspect on plan—namely, the bottom right-hand corner—that is, beams shown horizontal on plan should be set out looking from the lower side or bottom of the framing plan, and beams shown perpendicular on plan should be set out as they appear looking from the right-hand side of the plan. This may be thought a minor point, but by adopting a system such as I have just mentioned, a common mistake—that of putting the wrong reaction on the pillar sheet—can be guarded against.

For a beam supporting a complex system of loading the position of the maximum bending moment should be dimensioned from either one of the reaction points, and the calculations for such dimensions should be fully stated on the beam sheet.

The calculation of the maximum bending moment is an important operation, and should be set down in detail on the beam sheet.

When making calculations a number of approximations can be made for the purpose of saving labour and time. The following formulae should be found of some assistance:—

APPROXIMATIONS.

(1) Section modulus for **I** sections as beams. It will be found that if

W_s = weight of **I** section in lb. per foot-run,
 d = depth over flanges of section in inches, approximately $M = \frac{W_s d}{10}$.

(2) The safe load on 1-ft. span for **I** sections as beams, stressed from $7\frac{1}{2}$ to 8 tons per square inch, is, approximately, equal to $\frac{W_s d}{2}$.

(3) The area of a bar of steel in square inches whose weight in lb. per foot-run = W_s , is, approximately, equal to $A_s = \frac{3 W_s}{10}$.

This latter approximation gives an error of 2 per cent.

(4) The safe load in tons for **I** sections as pillars, both ends considered fixed, is, approximately, equal to the weight per foot-run in lb. upon a laterally unsupported length in feet equal to twice the width of flange in inches.

(5) For the stress of $7\frac{1}{2}$ tons per square inch allowed under the Act, the section modulus M is exactly equal to 1.6 times the bending moment in foot-tons, and for beams supporting a uniformly distributed load w tons per foot-run; then $M = 0.2wL^2$, where L is the span of beam in feet.

(6) For determining the approximate total weight of a beam the following formula may be used when the cross-section is unknown but the depth is assumed—

$W_B = \frac{8 BL}{1000}$ or $\frac{WL^2}{1000d}$, where—

W_B = approximate weight of beam in tons,
 B = maximum bending moment in foot-tons,
 d = depth of beam in inches,
 L = span of beam in feet,
 W = total uniform weight or load or equivalent uniformly distributed load in tons.

(7) The weight of a pillar can be approximated from the following formula:—

$W_p = \frac{WL}{C}$, where—

W_p = approximate weight of pillar in tons,
 W = central load, or equivalent central load, on pillar in tons,
 L = laterally unsupported length of pillar in feet,
 C = a constant. 2,500 for both ends fixed, and 2,000 for one end fixed and other hinged.

(8) The weight of a beam casing is, approximately, equal to $W_c = 0.00035bdL$, where—

W_c = approximate weight of beam casing in tons,
 b = breadth of beam casing in inches,
 d = depth of beam casing below ceiling in inches,
 L = span of beam in feet.

(9) The weight of a pillar casing can be calculated by the same formula as for beams, where—

W_c = approximate weight of pillar casing in tons,
 b and d = breadth and depth of pillar casing in inches,
 L = laterally unsupported length of pillar in feet.

(10) For calculating the effects of eccentric loading due to the application of the usual formula, the following approximate factors can be used to considerable advantage, the eccentric loads considered to be acting on the face of web or flange of section in each case:—

For **I** sections, web connection —
 Equivalent central load = $1\frac{1}{2}$ times eccentric load.

For **I** sections, flange connection —
 Equivalent central load = $2\frac{1}{2}$ times eccentric load.

For **I** sections, web connection —
 Equivalent central load = $1\frac{1}{2}$ times eccentric load.

For **I** sections, flange connection —
 Equivalent central load = $2\frac{1}{2}$ times eccentric load.

For **II** sections, where centres of webs of **I** beams is equal to one-half the width of flange plates; web connection —
 Equivalent central load = $2\frac{1}{2}$ times eccentric load.

For **II** sections, where centres of webs of **I** beams is equal to one-half the width of flange plates; flange connection —
 Equivalent central load = $2\frac{1}{2}$ times eccentric load.

PILLAR CALCULATIONS.

The pillar calculations are somewhat involved by reason of the allowances to be made for eccentricity, but if they are clearly tabulated, and certain useful approximations are adopted, the labour can be reduced to a considerable extent.

DEFLECTION.

The question of deflection is not one that need cause us any grave concern, for sec. 22 clause 7, of the Act clearly indicates that the question of deflection can be ignored, except in cases where the ratio of span to depth of beam is greater than 21. When this ratio is exceeded the calculation of the deflection must be made in order to ensure that the maximum deflection shall not exceed $\frac{1}{450}$ th part of the span.

Seeing that the greatest deflection for a beam of uniform section is obtained with a uniformly distributed load, it is quite sufficient for all practical purposes to treat a beam which has to support a complex system of loading as if it were loaded with the equivalent uniformly distributed load, and not to put oneself to an unnecessary amount of labour by delving into the innermost recesses of the calculus to find the exact calculated deflection, especially when one realises that the assumed distribution of the loading seldom actually occurs in practice, and also that certain conditions of end fixing, &c., are not considered.

SHEAR.

The maximum vertical shearing values for webs can be ascertained from the following formula:—

$s = 5.5td$,

where s = maximum vertical shearing value for web in tons,
 t = thickness of web in inches,
 d = total depth of web or **I** beam in inches.

The depth of an unstiffened web must not exceed sixty times the thickness of web. This is a very liberal ratio, and should be reduced somewhat for very thin webs.

The question of rivets acting in double shear is one that is apt sometimes to be overlooked, especially

when designing pillars and beams where web connections are made on both sides of the beam. The bearing values for the rivets through the webs of pillars and beams should always be inquired into, especially when using the lighter sections, such as 10 in. x 5 in. I at 30 lb. and 12 in. x 5 in. I at 32 lb., which have relatively thin webs.

FLOOR JOISTS ENCLOSED IN CONCRETE.

It is generally admitted that steel beams as fillers or floor joists encased in concrete provide a much stronger floor, strength for strength, than if the concrete were omitted. Therefore I think it only reasonable to make some allowance for this additional strength in design. At the same time it is necessary to bear in mind the restrictions as to stress and the proportion of depth to span required by the Act.

RIVET PITCH IN BUILT-UP AND COMPOUND GIRDERS.

The rivet pitch in the flanges of compound girders and plate girders is a very important matter, and should always be checked, especially in cases where the maximum bending moment on the beam occurs more towards one reaction than the other.

In some cases of heavy plate girders I have had to design it has been necessary to give the girder an extended bearing in order to make provision for the minimum number of rivets required to suitably connect the flanges to the webs.

In this country it is not the general practice to vary the pitch of the rivets in the flanges of a girder chiefly owing to practical works considerations; it is also an advantage to maintain the same diameter of rivet throughout the beam for the same reasons.

GRILLAGE BASES AND FOUNDATIONS.

The steel I beams composing a grillage base should be designed to support the maximum load on the pillar, the concrete being used only as a filling and protection.

The depths of the I beams should be relatively deep to minimise the deflection as much as possible, and the thickness of concrete underneath the lowest tier should be from 6 in. to 12 in., and not more. The area of the undersides of the flanges of the lowest tier of grillage joists should be sufficient so as not to put a greater pressure upon the concrete than 12 tons per square foot—that is, the surface area of steel required in square inches is equal to twelve times the load on foundation.

The weight of the concrete base should be taken into account when determining the dimensions of the concrete in order not to exceed the safe pressure allowed upon the soil. The I beams should be checked for shear, and in any case channel stiffeners or other efficient stiffeners should be inserted between the webs of the upper tier of I beams.

The several layers of I beams should be laid direct upon one another in order to transmit the load from the pillar direct to the concrete by the lowest tier. No advantage is gained by interposing a cement grout between the top and second layers, seeing that cement grout is considered as concrete for the purposes of administering the Act.

The maximum bending moment upon the whole of the grillage joists in any one layer is obtained from the following formula:—

$$\frac{W(L - L_1)}{8}$$

where W = the total load upon the grillage,

L = the length of the grillage joists in feet,

L₁ = the overall width of the stanchion base or grillage joists immediately above.

When the stanchion or pillar is being fixed, care should be taken to ensure the several layers of grillage joists bearing evenly upon one another.

In cases where the grillage or base of the pillar is eccentric to the axis of the pillar, the pillar should be considered as supporting an eccentric load, the arm of eccentricity being equal to the distance from the axis of the pillar to the geometric centre of the area of grillage or concrete base.

Provision should be made when the eccentricity is great to ensure that there shall be a sufficient and proper connection of the grillage joists to the base of the pillar in order to take up any tension that may be induced upon the opposite side of the pillar to that of the eccentric base.

It is generally assumed that sec. 22 (12) c of the Act, which states that "the foot of every such pillar shall have a proper base-plate riveted thereto with sufficient gusset-pieces to distribute properly the load on the foundations, and the gusset-plates shall have sufficient rivets to transmit the whole of the load on to the base-

plates," is more particularly to be applied to pillars the bases of which bear directly upon the concrete.

In pillars provided with a grillage foundation, it is considered good practice to provide sufficient rivets to take half the load on the pillar.

It is also considered quite sufficient to provide enough rivets to take half the load on either side of the joint at the spliced connections of a pillar.

MANSARD WORK.

In the design of mansard work and sloping beams provision should be made to take up the whole of the thrust by the steelwork. The feet of the rafters should be efficiently tied back to the internal framework of the building, and at the top the thrust should either be provided for by taking into account the bending moment due to the thrust upon the pillar supporting the rafter or sloping beam, or the steel scheme should be so arranged that the thrust is distributed over a large area of the floor or roof.

Any beam receiving the ends of rafters should be checked for the lateral bending moment imposed by the thrust in order that the combined stresses should not exceed the maximum stresses allowed.

WIND PRESSURE.

One cannot do better than recommend the suggestions made by the District Surveyors' Association for the treatment of wind pressure upon the complete steel frame. As a rule the cases are extremely rare in this country in which the stresses induced by horizontal wind pressure assume any magnitude. Wind pressure should always be considered, however, in the case of gable-end framing to tall buildings, such as factory buildings and workshops, especially when they are constructed of light materials such as corrugated sheeting or light concrete partitions.

SEWAGE DISPOSAL AT WORCESTER.

COMPLETION OF NEW WORKS.

The completion is reported by the *Times* of the works for the bacterial treatment of Worcester's sewage. The scheme, the author of which is Mr. Caink, the city engineer, has cost, in capital expenditure, about £100,000; the repayment of loan and interest, covering a period of thirty years, will exceed £6,000 yearly, and the running expenses will amount to £2,000 a year, thus involving a rate of at least 10d. in the £.

The sewage from the city proper is conveyed under the river Severn by means of a tunnel, at a point where it used to be turned into the stream; that from the suburbs on the western bank, which used to enter the river close to Worcester Bridge, is now diverted through meadows to a junction with the deep-level sewer connected with the tunnel, and thus the whole of the city sewage is conveyed to the works at Bromwich-Jane. After passing through a screening chamber it goes to the detritus well, 84 ft. deep, where the heavy inorganic solids fall by gravitation to the mouth of sludge lifts, devised by Mr. Caink, which bring them to the surface for disposal. It is then passed to the primary pumps, one delivering 2,000,000 gallons daily and the other 4,000,000 gallons. There is also a pump which discharges 6,000,000 gallons a day, and which is used for lifting storm water when the quantity flowing along the sewers exceeds the capacity of the other pumps.

The primary pumps discharge the sewage into a series of chambers containing gravel-disintegrating screens, and thence it is returned to the engine-house, where it is raised by secondary pumps into the distributing tower. From the tower it is sent into a series of six rotating sprinklers of the Candy-Caink type, and distributed over the primary bacterial filters. The latter are six in number, circular in form, 200 ft. in diameter, and 8 ft. deep (of fine gravel). The beds are underdrained by drain pipes and Stiff's tiles laid radially from the centres to effluent channels which encircle the beds near their circumference. Each filter is surrounded by a number of vertical air shafts, which communicate with the effluent channel. From the channel the air passes along the underdrain and upwards, taking the reverse course to that followed by the liquid. The sprinklers run upon rails carried upon arched-concrete tracks, and are said to be the largest successful self-propelled sprinklers in the world. After passing through the beds, the liquid is taken to a series of sand filters, 3 ft. deep, on a layer of gravel 1 ft. deep, and is finally discharged into the effluent channel in cascades, which assist, it is believed, in oxygenating it before it flows into the river. All the tanks and filters are in duplicate.

Institution of Municipal and County Engineers.

THE BIRMINGHAM MEETING: DISCUSSION OF MR. LAWSON'S PAPER.

The reading by Mr. H. M. Lawson, deputy road surveyor, Birmingham, of the paper on road construction and maintenance produced an excellent discussion at the West Midland District meeting held on Thursday of last week. The paper, it will be recalled, was reproduced in last week's issue. The meeting was presided over by Mr. A. T. Davis, county surveyor of Shropshire, and there were present Messrs. A. D. Greatorex (West Bromwich), J. S. Pickering (Cheltenham), H. E. Stilgoe (Birmingham), W. G. Ballard (Birmingham), W. B. Chancellor (Lichfield), H. J. Coleby (Atherstone), F. C. Cook (Nuneaton), hon. district secretary, S. Douglas (Kenilworth), C. F. Gettings (Worcestershire), J. L. Harpur (Brierley Hill), W. H. Jukes (Tipton), G. W. Lacey (Oswestry), W. G. Lane (Ludlow), R. C. Moon (Nuneaton), A. S. Parsons (Birmingham), H. Richardson (Birmingham) and G. H. Stevenson (Shifnal), members; R. Fletcher (Worcestershire), S. J. Goodacre (Nuneaton), W. J. Goode (Wellington), A. R. Gray (Birmingham), H. M. Lawson (Birmingham), W. N. Thomas (Birmingham), H. G. Torney (Birmingham) and E. W. Turner (Birmingham), associate-members; J. T. Fitch (Birmingham) and T. S. Griffin (Wolverhampton), students.

Mr. Cook announced a letter of apology from Mr. J. Moncur, county surveyor of Staffordshire.

The CHAIRMAN, with a view of enhancing the value of the paper before the meeting, asked Mr. Lawson if he could give the cost of set paving and of hard and soft wood paving.

Mr. LAWSON explained that his reason for not mentioning the cost of the pavements named was that they varied so much in different parts of the country. His experience with this class of paving was in the South of England, and the figures might be misleading. The price in Birmingham was: Hardwood, 18s. to 20s. per square yard; softwood, 14s. to 14s. 6d.

Mr. J. S. PICKERING (Cheltenham), who proposed a vote of thanks to Mr. Lawson for his paper, remarked that it covered a very wide surface, and it was impossible to deal exhaustively with it in the way of discussion. There were a number of points on which probably many of them might not be in agreement with the author, but in the main they would agree that if one practised what had been suggested in the paper, one would have a very high class of road construction generally. The author emphasised the importance of a solid and well-drained foundation. They all recognised the desirability of a solid foundation, and of draining the foundation, but he would like to ask Mr. Lawson how he would suggest the foundation should be drained. His own opinion was that the only way to drain the foundation was to have an outlet for the drainage, and that was generally impracticable, and though Mr. Lawson spoke of the importance of the matter, he did not give them any method of effecting the drainage. He noticed that some roads in the city of Birmingham were carried out by contractors, and were subsequently taken over by the city authorities. That seemed to him a very undesirable practice. He did not know under what particular circumstances that might occur. In most towns the roads were not made up until the buildings had been erected, or substantially so, in a street, and the local authority then carried out the work. Then, dealing with the actual construction of a water-bound road, he noticed that the alternative was given for the bottom layer of either clean clinker ashes or broken stone 6 in. in depth. He would like to ask why the alternative was given. If the clinker was the best material, that should be named, while if the broken stone was preferable, that should be specified. If broken stone was used in the bottom layer, was it not better to have one foundation solidly bedded rather than two layers as suggested by the author? Then again, Mr. Lawson told them how he differentiated between what he termed first-class and second-class roads. He noticed there was a little difference in the method of construction, and one would like to know when a road was called first class and when second class. After a water-bound road was completed the chippings spread over it, and the road rolled and consolidated, a further layer of $\frac{1}{2}$ -in. chippings was used. It was not stated whether that further layer of chippings was rolled. Perhaps Mr. Lawson would

tell them what was the object of these $\frac{1}{2}$ -in. chippings, because the interstices could be filled and the road properly made with one coat. He did not understand the meaning of the sentence "unless one has been careful in choosing a sufficiently tough stone (and in some cases the cost prohibits this), the stone is broken and crumbled in the process of consolidation by steam rolling; to obviate this, a little binding material in minimum quantity is spread over the metal and slightly watered." If it meant that a tough stone was necessary, but if it was costly something else must be used, and to obviate the disadvantage a softer material must be spread over it. The clause seemed to him rather difficult to understand. It occurred to him that if a particular stone was specified and was necessary it should be used whatever the cost. Then the author emphasised the importance of spreading the stone evenly. He would like to ask how he got that carried out if the work was done by contractors. He also emphasised the importance of repairing the roads immediately potholes occurred. He would like to ask how he carried out those repairs in a large city like Birmingham. It must be a very difficult matter to attend to every pothole when it appeared. The author had not suggested the use of tar-macadam for this purpose for patching, but he believed it was very frequently used with success. In Cheltenham he kept a light roller for patching, as he appreciated the economy of doing so. In a large city like Birmingham, where the statutory companies had the power to break open the streets, were they required in each case to put in a foundation if the road before opening did not happen to have one? The whole thing hung upon the meaning of the word "reinstatement." It meant, to his mind, putting the road in an equally sound position, and not merely putting back the material that was there. With regard to the damage by heavy traction traffic, the county surveyors were not only suggesting the advisability of weighbridges, but in many counties the weighbridges had been actually erected, and they had been the means of checking the excessive weights put upon these vehicles. Then was the law as to the speed of heavy tractors—which, he thought, was 2 miles per hour—carried out? It was in Cheltenham, and it had had very beneficial results. If it was carried out everywhere traction engines would cease to exist, and their disappearance would be for the benefit of the community at large. He rather disagreed with the suggestion that there should be a bedding of sand under Jarrath wood blocks. He thought it was better to lay them on the concrete bed. He also took exception to the suggestion that there could be no advantage in the use of sectional blocks. In his opinion, the sectional block was a great advance on anything before in the shape of hardwood paving. The reason that hardwood paving had not been so successful had been the wearing of arrises causing corrugation. That in sectional blocks was, to a large extent, avoided. He had lately put down an area where the contractors had undertaken to maintain the blocks for a period of fifteen years, not only against wear, but against any appearance of corrugation; so that they had a good opinion of the blocks. He did not understand the author's reference to the thickness of these sectional blocks and the bed of concrete. It was not necessary to put a thicker layer of concrete under the sectional block than under a block of 4 in. or 5 in. The suggestion as to the weepholes was quite new, and he had some doubt as to the efficacy of this to overcome flooding. The gullies were at too long distances apart, and he did not see how the two small holes could have the effect of draining a wood pavement. In his concluding sentence the author suggested that there was some doubt as to whether mechanically propelled vehicles should be used by road authorities. As the law stood at present, the roads must be made to carry the traffic upon them, and there was no reason why local authorities should not take advantage of any economical means of transit.

Mr. A. D. GREATOREX (West Bromwich), who seconded, said he would have liked to see in the paper some references to tar-macadam, and the experiences Birmingham had gained in that particular class of road making. He believed tar-macadam had been tried in Birmingham for several years. It would add to the interest of the paper if something could be

given of their experiences, as in that district so much had been done with tar-macadam.

Mr. C. F. GERRINGS (Worcestershire) observed that Birmingham had a system of paying a bonus to stone spreaders, and he would be glad if the author would explain the system adopted. He had endeavoured to carry out a similar system in county work, but owing to various conditions, which were rather difficult to control, such as long haulage, delays in railway transit, and so forth, he had abandoned it. In a large town like Birmingham with central depots, no doubt it would be much easier to adopt such a system than in a county with wider areas. With regard to motor bus traffic, he noticed the author said that the cost of maintenance had been trebled in some instances. Unfortunately, Worcestershire had had even worse experience, as it had been found necessary to coat a water-bound road four times in one year, whereas prior to the motor bus traffic it used to be coated once a year. Of course, this could only be accepted as a very expensive form of construction, and he had advised his committee to abandon it in favour of bituminous-bound material. The author referred to a road that had been strengthened and a wearing surface consisting of a carpet of asphalt applied. He would be glad if the author would give them some particulars as to the strength of the road before it was treated, stating what amount of strengthening was carried out, the thickness of surface material applied, together with cost, also some idea of the amount of traffic. Mr. Grestorex had referred to tar-macadam. It would be interesting if the author would give some information with regard to his experience of this class of material in the city of Birmingham. One of the Worcestershire trunk roads, which joined Birmingham on the north side, had a fairly heavy motor bus traffic, varying from 80 to 130 motor buses per day. The construction of this road consisted of water-bound granite. The only foundation was some 8 in. to 9 in. of gravel laying on marl. Certain companies had offered to put an asphalt or bituminous-bound surface on the present surface, at a cost of about £6,000 per mile. He was very doubtful as to whether this material would stand the traffic without a proper foundation being applied, such as was being adopted in an extensive Road Board scheme now being carried out in Worcestershire. He would appreciate any information that the author could give them of his experience in similar methods of construction.

Mr. H. E. STILGOE (Birmingham) said Mr. Lawson had had considerable practical experience with one of the largest firms of road contractors in this country, John Mowlem & Co., at Chelsea, where, under Mr. Higgins, he had some first rate practical experience. He mentioned this because he was certain that the various methods which Mr. Lawson had described in his paper were well worthy of consideration and respect. A great many of the author's opinions might vary from those of others among them. It was a good thing they had these opinions expressed, because they were able to see how far their own work might vary or be at fault. One or two of those opinions he ventured to say were bold ones, but they were very excellent. In the paper was given the standard sections of macadam streets. He ought to explain that in Birmingham, according to their by-laws for the laying out of new streets, they were able to demand that a street should be laid out to 50 ft. in width between the forecourts, and they had another by-law which allowed them under certain conditions to reduce that width, the particular alteration being that a specified width should be allowed between the houses. Acting upon that, they had recently added to the three cross sections shown in the paper, and in the case of a 42-ft. street they had reduced the macadam from a width of 26 ft. to 18 ft. This was a very important point, because, but for hard-and-fast by-laws, it was quite unnecessary to lay out streets all of one width. It meant a larger area of macadam to be maintained, probably where it was not wanted, and if they got arterial roads laid out with a sufficient width of macadam, they could reduce the macadam on what he might call the estate roads, which served only the confined area in which they happened to be. They had not reduced the width of their streets between the forecourts, but merely the macadam, throwing the extra width into the footways. These footways were paved only a portion of their width, the remainder being in gravel. They had specified that on people laying out streets to this reduced specification they should plant trees, and set back the

buildings 15 ft. from the road. They could have these conditions or leave them. The landowners had very gladly accepted them, and had come to them with their plans, and laid out the arterial streets where required, and filled in the side roads where they wanted them, so that the side roads would not carry heavy traffic. It was a step in the right direction. It was really proceeding on town planning lines without a town planning scheme. He knew all districts had not a by-law which they could alter. With regard to the cost of tar-spraying, he would point out that the reason the work had been carried out so cheaply in Birmingham—considerably under a penny per square yard—was this: They had large storage tanks at several of their depots, and these tanks adjoined the canal. In some cases they held 14,000 gallons of tar, and they pumped the tar straight out of the boats into the tanks, which were kept heated with steam coils from the refuse destructor. Having the distribution tanks placed in the best positions for serving the districts they were able to do the work very cheaply. Mr. Lawson mentioned that the Plascom was mixed with one-third proportion of Leighton Buzzard sand. They found they were able to reduce the cost of the work very considerably by doing this without weakening the material itself. Under the heading of sett paving, Mr. Lawson mentioned a method of laying the setts on the concrete before it became thoroughly hard. This was in contradistinction to the usual practice of allowing the concrete to be thoroughly hard and finished off to a fairly true surface, and then an ordinary sand bed laid thereon to receive the setts. Mr. Lawson mentioned the principle by which the cement was mixed with the bed of sand, and it was damped, and the setts were put down while the concrete was damp, the whole thing coming together as a compact mass. If there was any difficulty in the method mentioned by Mr. Lawson, it was that one might not get quite so regular a surface. He did not say it was so. He thought the system was well worth trying, and let people judge the result. No traffic should be allowed over the pavement for ten days. They tried as far as they could to keep it off twenty-one days, and if the traffic was allowed to go on sooner it was only under special circumstances, and a heavy coating of sand was put on. Pitch-grouting had certain advantages. Undoubtedly it did enable a road to be opened to traffic much more quickly than with concrete or sand, but he did not think it made so good a job. He did not agree with Mr. Lawson that mud was less likely to collect on a pitch-grouted road. If the setts were grouted in properly it made one mass with the stone. Mr. Lawson emphasised the necessity of having the stone and racking thoroughly dry before the pitch grout was poured in. That was absolutely necessary, otherwise the grouting did not adhere. Mr. Lawson mentioned a very interesting circumstance in which the grout split the setts when they were grouted up at a time when the setts were damp. Mr. Lawson also mentioned that in London specially dressed Grey Royal setts had been laid on steep gradients with much success. He observed that the depth of the setts was 1 in. less than the width. He thought as a general principle that the depth of a sett should not be less than its width, and if deeper the better. For that reason they preferred the 5-in. by 4-in. setts. Mr. Lawson had raised another very interesting point—viz., that of laying Jarrah or Karri wood with a close joint, and of bedding this class of paving on sand. He did not suppose they would ever quite agree on the best method of laying these hardwood blocks, for the simple reason that the blocks themselves were very treacherous. Some of the planks were properly seasoned and some were not, and when they were cut up into blocks one got unseasoned blocks among the others, and expansion and contraction took place, and one was often inclined to put the demerit of this to the method of laying. With reference to the grouting of the softwood blocks, Mr. Lawson mentioned that in some cases the joints were filled to the top with pitch and oil, and in others the final grouting was a mixture of 3 to 1 of sand and cement. This was another point which was always open to doubt. They found that their contractors with a maintenance contract for softwood paving preferred to use a cement and sand grout for the final grouting, and they certainly did not do that for any saving of the use of pitch, because they had to undertake twenty years' maintenance. They must know that their own pocket and the job did not suffer by reason of the use of cement and sand. The question

of weepholes drilled into both ends of the gully was a most important matter. He was bound to say that Mr. Lawson drew his attention to the advisability of doing this, and they had followed his advice in drilling holes in the sides of the cast-iron gullies where they had laid softwood paving. He had had a wide strip round the gullies cut off, and had discovered that the holes were having the desired effect. One did find that, however carefully laid, the water did get down, and unless it could escape there was bound to be an upheaval. Another useful thing was the emptying of the gullies by an exhauster. That was a great saving. Mr. Gettings had raised the question of laying tar-macadam. The road he had mentioned—the Hagley-road—had no foundation. He might say at once it was no use putting tar-macadam or anything else on that road until it had been reconstructed. It was an absolute waste of time. He had experience with the road running parallel to that. It was laid with tar-macadam some six years ago, and in a few months it was all cut to pieces. The tonnage was about the same on the road which failed as it was on the Hagley-road. He had a census taken, and it came out at 187 tons per yard width of carriageway per day of sixteen hours. He obtained the information for the Road Board, and that was the figure. In one instance where the Worcestershire County Council laid tar-macadam on the Bristol-road, now in the city, that was in very good condition until the motor buses began to use the road. Now it was pounded to pieces. It was laid in this way—the top surface was removed, but no foundation was put in. They had two other roads which carried heavy motor bus traffic, and the roads looked as good to-day as if no traffic had been over them. Those had been in six years. The tar-macadam was laid 4½ in. thick on a thoroughly good foundation.

Mr. A. S. PARSONS (Birmingham), speaking with reference to ruts forming in the macadam adjoining a tramway track, mentioned that in an instance with which he was connected they got over the difficulty by laying an 18-in. coat of tarred Clee Hill macadam, which stood for eighteen months. A water-bound macadam would not have stood for that time. With reference to the gross loads of motor vehicles, he had no doubt that the registered axle weight was frequently exceeded by overloading. He did not consider the exception in favour of rubber tyres was justified. The majority of the damage done to roads in Birmingham was caused by rubber-tyred vehicles. They had not many steel-tyred vehicles. It seemed to him the Heavy Motor Car Order required some amendment in order to deal with heavy loads on rubber-tyred vehicles. As to weighbridges, that was rather a difficulty, because under the Heavy Motor Order they could not compel a man to take his motor to be weighed if the weighbridge was more than half a mile away. They could understand a wily driver giving an inspector a long chase and keeping half a mile away from a weighbridge. He did not think Mr. Lawson had arrived at the right solution of the failure of the Grey Royal setts. He thought the fine dressing and the shape of the dressing had contributed to that fault.

Mr. H. RICHARDSON (Birmingham) remarked that there was a Scriptural reference to the person who touched pitch, and from the roadmaker's point of view they knew that the man who touched pitch, asphalt, bitumen, or any of these substances placed himself in great difficulties, because he was in the hands of the man who had to do the work. The solution of the dust problem on the country roads would be the use of pitch or tar in some form or another, but it must be thoroughly understood before they started making roads with these materials that they were entirely in the hands of the workmen. They must have the best labour that could be obtained, and have men who would do the work conscientiously and carefully. Then good results would be obtained.

Mr. W. B. CHANCELLOR (Lichfield) said they were rather interested in ascertaining what to do with the road which was not blest with a foundation. Were they intending to reconstruct those roads and put in proper foundations. With regard to tar, they were doing the work very cheaply. He presumed it was crude and not distilled tar. He would like to ask whether it was the practice to grit the road after tar-spraying. He believed a certain quantity of Rocmae was laid in Birmingham some time ago.

Could Mr. Lawson give them any information about that? Then with regard to the tar-macadam, he would like to know whether it was granite or limestone. He was rather surprised to hear Mr. Stilgoe say he had roads with a carriageway of 18 ft. He understood that it was merely intended to have that width of carriageway on side streets, but he did not know whether motor buses could pass down those streets to main thoroughfares. If so, they would have difficulty in passing. He had a road with a carriageway of 18 ft. 6 in., and it was not wide enough for two motor buses to pass, and they had an application to widen that road.

Mr. W. N. THOMAS (Birmingham) asked whether limestone or furnace slag had been used in any of the residential streets.

The CHAIRMAN (Mr. A. T. Davis) said they were all interested in the point raised by Mr. Pickering in reference to the reinstatement of roads. Now that roads were broken up by properly constituted authorities, the question troubled most of them. The point was arising constantly in Shropshire, where they tried to induce the contractor in restoring roads which were broken up for sewerage purposes to use tarred macadam for the surface coat. The contractor replied that the road which he had broken up was not a tar-macadam road, and his duty was only to restore the road in the same manner and material as he found it. The county authorities, in repairing roads which were broken up by their own workmen, and in repairing potholes, were in the habit of using tar-macadam. They did that because in these days of rubber-tyred wheels broken stone put down in a pothole was very destructive to the tyres. When a sewerage contractor opened the road for a space of 2 ft. or 3 ft. he filled it up with ordinary broken stones. That was a very unkind thing to do, because while the motorist could avoid these patches in the daytime, he could not see them at night. It was doubtful whether they had the power to compel them to put in tar-macadam unless it was a tar-macadam road. In the country he had found that tar-macadam was a great boon. Every day he was more inclined to bless it. They were able, by the use of tar-macadam, to keep their roads fairly smooth. Without tar-macadam it would be almost impossible to do that without a patching roller to go about the county and be used on every bit of material put down. Such was the effect of fast motor traffic that if they had a pothole in a water-bound macadam road, and they filled it up and rolled it, the place was soon broken up again. Nothing but tar-bound material was effective. With regard to tar-spraying, it occurred to him that the price given in the paper was very low. Mr. Stilgoe had explained that, but he would like to ask whether the price of less than ½d. per square yard included gritting. He had seen some prices given of tar-spraying at less than ½d. a yard, which were ridiculous. It was very misleading. If a man gave the cost of the actual spraying without the cost of brushing and gritting, which were so necessary, they were unable to make proper comparisons. When a price of ½d. per square yard was given, and they were paying perhaps three times as much, they felt they were not getting the best value for their money. He found great difficulty in getting the tar-painting done under 1½d. per yard. He hoped this year he might be able to reduce it. He had got a lower price for tar, and it might probably come out at 1¼d. per square yard. With reference to Mr. Chancellor's remarks, an 18-ft. road ought to be capable of taking three lines of traffic, and it should take two comfortably.

The vote of thanks was passed unanimously.

Mr. LAWSON, in reply, said, with reference to Mr. Pickering's remarks about a solid and well-drained foundation, they found in Birmingham, owing to the clay subsoil, that the only way in which they could get a properly drained foundation was by reconstruction with a porous pitching. The reason why they preferred broken stone was that in the district they had large gravel pits. In many cases the gravel was quite good, and the only thing they stipulated was that it should be broken. As to the even spreading of the stone with work done by contractors, these were really private street works. The only hold they had over the contractors was this—that if they did not make the road as they required, it had to be remade before the city took it over.

Mr. PICKERING: You put in a foundation if you do not find one there?

Mr. LAWSON: It goes back as before.

Mr. GREATorex: Surely you put the foundation in for your own benefit?

Mr. LAWSON: We do it in some cases, but we cannot charge that.

Mr. LAWSON, continuing, said he could not agree with Mr. Pickering as to Jarrah wood sectional blocks. He could understand these sectional blocks being put down where they had the concrete bed laid, but how could they justify the laying of 9 in. of concrete for these 3-in. blocks? He found the weepholes a god-send. With reference to tar-macadam, before coming to Birmingham he laid about $\frac{3}{4}$ mile of various grading—2½-in., 1½-in. and ¾-in. on the top—and for some unknown reason he understood it was in very bad condition. He came to the conclusion, perhaps hastily, that for heavy traffic it was not any good.

Mr. GREATORIX remarked that he could show him one or two good roads.

Mr. LAWSON explained that, with reference to the bonus for spreaders, if a man was spreading every day for a week he got 2s. extra, and if only for a day 1d. With reference to Mr. Gettings' remarks as to the cost of roads on which motor buses run, they had the cost got out for all their motor-bus roads in the city, and they found it exceedingly heavy. In the road he had taken in his paper the extra cost was the least of all. His chief reason for laying the setts on slightly damped cement and sand was that in London and other places where there was exceptionally heavy traffic setts had been known to be broken in half, and his method was intended to prevent that. The reason the sett was broken was that they got two hard substances together. In St. Pancras they had a number of setts broken, and he believed that if this system was adopted it would be saved. He was surprised that his chief said there was not more mud on a cement road than on a pitch-grouted road. He was glad to hear from Mr. Parsons about the paving by the side of the tramway track. He agreed with Mr. Parsons about the damage to the roads by rubber tyres. The proportion of rubber tyres to steel tyres was very great, and it was the rubber tyres which did the largest amount of damage. He was afraid he could not agree with him as to the cause of failure of the setts. It was big flakes or shales which came off these setts. He was convinced there was no other reason for it but that mentioned in his paper. He had that particular piece of paving inspected, and about 100 yds. grouted in with cement had not been touched, and there was no sign of any of the flags or corners going. He could understand where these setts were laid, they were, to all intents and purposes, laid to square joints, but, owing to the manner in which they were dressed, they could not get them square dressed throughout. It would pay engineers to specify that all setts were properly squared so that when laid they were touching both at bottom and top. He quite agreed with Mr. Richardson that the man at the pitch-boiler had great responsibility. They always paid the man who boiled the pitch 1½d. or 2d. per hour more than the other men. It was remarkable how an experienced man could tell by the feel of the pitch when it was ready for pouring. With reference to Mr. Chancellor's question as to whether motor buses could run on streets of 18 ft. 6 in., in Birmingham they would be able to stop motor buses running because the city was the licensing authority, and would not allow buses to run along a street of that width. As to tar-spraying, the tar was not crude nor was it refined, but he understood all the heavy oils and water were removed. They had exceptionally good tar all last year. The price varied, and it was up at times to about 55s. per ton. They had no tar-grouted roads, though he had laid a good bit of ordinary macadam and sprayed it with tar, and he must say it had gone together exceptionally well. The cost of tar-spraying included sweeping and grouting and tar, also the cost of the tractor for pulling the machine. The cost was actually 92d. per square yard. With their machine they could easily do 5,000 or 6,000 sq. yds. per hour, and they could regulate the spray from 18 in. to 7 ft. 6 in., and also regulate the spray.

It was stated that a district meeting would be held at Birmingham on Saturday, May 23rd, when Mr. A. S. Parsons will read a paper on bridge construction.

Oilcans.—Messrs. Joseph Kaye & Sons, Limited, Leeds, have just received further orders from the British Navy for 4,468 of their patent seamless serrated oilcans, fitted with the firm's patent seamless spouts, making a total of 60,048 of this particular pattern alone, to be distributed next month to the different dockyards.

WATER SUPPLY AND SEWERAGE IN JOHANNESBURG.

The various sources from which the water supply of Johannesburg is drawn are at present as follow:—

(1) About three-fifths of the daily supply is from deep wells in the dolomite at Zuurbekom, 15 miles west of Johannesburg. This water is of exceptional purity.

(2) About 250,000 gallons altogether is obtained from—(a) Two boreholes in the Lower Witwatersrand beds in Ellis Park; (b) Two boreholes in hard shale in Staib-street, Doornfontein; (c) Two wells sunk in weathered slates through a track of alluvium in Braamfontein, east of Auckland Park.

(3) The remainder is from Zwaartkopjes (Klip River Valley), from wells in dolomite, with some admixture of surface water. This water has for the past six years been treated with chlorinated lime, in the proportion of 13 lb. (with guaranteed minimum of 30 per cent available chlorine) to 1,000,000 gallons, or about 3.9 parts chlorine per 1,000,000. The result has been satisfactory, and no complaints have been received.

The length of mains within the municipal area is now 345.07 miles, no less than 7.59 miles having been added during 1912-13, while during the same period 856,101,400 gallons of water were supplied to consumers. These figures show an increase over any former year, remarks Dr. Charles Porter, the medical officer of health to the city, in his last issued report. The draw-off from the Yeoville service reservoir has been very varied, and at times, when only a few inches have been left, has caused considerable anxiety. The Water Board has recently somewhat augmented its local sources of supply, and an important scheme is now being promoted for pumping water from the Vaal, between Vereeniging and Parys.

SEWERAGE AND SEWAGE DISPOSAL.

The municipal area of Johannesburg has, roughly, the figure of a circle, whose diameter is 10 miles, and its physical features are such as nearly to divide it into four equal quadrants, making four main drainage systems of nearly 20 square miles each. The south-west quadrant is an important one, because it contains, in its upper reaches, the most densely populated areas of Johannesburg, consisting of a large section of the town proper and the townships of Braamfontein, Marshalls, Ferreira's, Fordsburg, Newtown, &c. These areas are completely reticulated with underground storm-water conduits.

Main drainage work was continued throughout the year covered by the last report of the town engineer, Mr. G. S. Burt Andrews, M.INST.C.E., M.I.MECH.E., the total area sewered and drained during that period being, approximately, 172 acres.

The length of sewers and storm-water drains in use at the end of the year under review was 80 miles and 48 miles respectively. Owing to the torrential seasonal rains the separate system has been adopted.

The sewage is now screened, treated in a detritus tank and in continuous sedimentation tanks, and subsequently irrigated upon land laid out in such a manner that a considerable interval of rest usually elapses between each period of irrigation of any one particular area. The length of carriers is now 34 miles, and the maximum irrigable area is 790 acres. The average daily flow of sewage was about 1,500,000 gallons. Sludge disposal is by burial in suitable trenches.

Royal Sanitary Institute.—The annual dinner of this body will be held on Wednesday, May 13th, at the Langham Hotel.

New Welsh Trunk Road.—Representatives of the Denbigh and Carnarvon County Councils, the Colwyn Bay and Llandudno Urban Councils, and the Conway Rural Council met last week to arrange for the construction of the new trunk road between Llandudno and Colwyn Bay, towards which the Road Board will contribute £6,000, and the several authorities the balance. The committee, which was constituted from the meeting, instructed Mr. William Jones, engineer to the Colwyn Bay Urban District Council, and Mr. W. T. Ward, deputy-engineer to the Llandudno Council, to prepare plans and specifications, which will be submitted to the next meeting of the committee with a view to tenders being advertised for as soon as possible.

STORAGE OF COAL.

THE APPLICATION OF REINFORCED CONCRETE.

At a meeting of the Association of Engineers-in-Charge, held on Wednesday evening at the St. Bride's Institute, London, E.C., Mr. Henry Adams, M.A.S.T.C.E., vice-president of the Concrete Institute, read a paper dealing with some applications of reinforced concrete to structures intended for the storage of coal.

Coal storage, Mr. Adams observed, was chiefly required by the merchant who sold to the dealers and to private consumers, and by the large corporations for their own use in the production of light and power. The coal hoppers used by the merchants were built almost entirely of timber on a brick or iron column foundation, while those used by the corporations were mostly of brick.

There was always a risk of spontaneous combustion where a large quantity of coal was stored, but although the author had known of one or two cases, there was not much danger where it was kept under cover. In the various seaborne coal depots, there was always

REINFORCED-CONCRETE COAL BUNKERS AT HAMMERSMITH.

(Metropolitan Water Board.)

sufficient movement going on by coal going out and other coal coming in to minimise the risk. Spontaneous combustion of large collections of coal was more likely to happen when the cargo had been standing in trucks exposed for some time to rainfall, so that the coal was more or less damp throughout.

Proceeding to discuss the question of the weathering of coal, Mr. Adams said: "It has been established beyond doubt that coal exposed to the weather deteriorates, and loses some of its calorific value. The author has seen analyses which prove this, but cannot at the moment lay his hands upon them. The Admiralty made some experiments upon storing coal under water, and it was alleged at the time that it kept better than when exposed to the air; but possibly that result was desired rather than proved. It is often necessary to store coal for some considerable period in order to take advantage of cheap markets, and to avoid stoppages of work due to strikes in the coal trade. Under these circumstances stacking to a height of about 6 ft. upon the ground is usually resorted to, and it is likely that a cover of tarpaulins would be of advantage.

"The present century has, however, seen the intro-

duction of a new mode of building which is peculiarly suitable for the construction of coal stores—reference is made, of course, to reinforced concrete. In this material, composed as it is of steel rods embedded in concrete, there is the maximum of durability and the minimum cost of maintenance. Structures of creosoted timber may last for fifty years, with increasing expenditure for repairs after the first fifteen or twenty years; but in fifty years a reinforced-concrete structure will be in better condition than in the year it was built. It is probable that in the future this will be the only method of construction adopted for the purpose. It seems impossible to conceive of any better material: it has every advantage and no drawback.

"A somewhat fanciful objection to the use of reinforced concrete is being put forward by certain of the opponents to the employment of this material for structural purposes—namely, that, in consequence of its monolithic character and its extreme hardness, the work of demolition, where such is needed, entails excessive costs. In a recent instance in Germany, it is pointed out that some concrete vaults which had to be removed cost twice as much to destroy as they had cost to build, and that, in some cases, it has been found that only by recourse to blasting operations is it possible to break up the work in this material. There is no doubt that the strength and toughness of buildings in reinforced concrete increase with age, and that, in comparison with brick walling or even ashlar stonework, the expense of removal of the concrete is great; but the imperishable character of the structure and the small cost of upkeep are really great points in its favour. It is only in rare cases that new buildings have to be removed shortly after being built."

The paper was illustrated by a number of drawings and photographic views. One of the latter, which we reproduce herewith, shows a series of five coal bunkers constructed on the Hennebique system at Hammersmith for the Metropolitan Water Board by Messrs. L. G. Moucel & Partners, Limited, each bunker being 20 ft. square at the top and 21 ft. deep. The hopper bottoms are clearly shown in the photograph, as well as the slender reinforced-concrete columns supporting the entire range.

MONTREAL ROADS CONGRESS AND EXHIBITION.

The first Canadian and International Good Roads Congress will be held in Montreal from May 18th to 23rd. The congress will be held under the auspices of the Canadian Highway Association and Canadian Automobile Federation, with the co-operation of the American Highway Association. The principal object is to inaugurate a co-operative educational campaign which shall make for a uniform system of road building, proper methods, and economical management with a view to more practical work being accomplished.

Among the subjects proposed for discussion are matters relating to good roads legislation, the administration of public roads, the problems of construction and maintenance, the advancement of road building engineering in educational institutions, and other subjects of practical assistance to the good roads movement.

The various provincial governments have promised to send representatives, and invitations are also to be sent out to town engineers, county councils, boards of trade, engineering societies, and manufacturers' associations. A feature of the congress will be an exhibition of various appliances used in the construction and maintenance of roads.

The official opening of the King Edward Highway, 45 miles in length, and connecting Montreal with the New York State roads, will take place during the week of the congress.

Housing in Dublin.—On Monday, in the House of Commons, Sir Richard Cooper asked if the 20,108 families, stated in par. 8 on p. 3 of the recent report on housing in Dublin to be living in one-room tenements, were crowded into 4,577 one-room tenements, and, if not, how many one-room tenements the 20,108 families did occupy. Mr. Birrell said the 20,108 families referred to each had a one-room dwelling, and there were therefore 20,108 one-room dwellings, which, as he had already informed the hon. Member on the 3rd instant, were comprised in 4,577 tenement houses. Sir R. Cooper asked whether it was correct that, on an average, there were five living in single rooms in Dublin. Mr. Birrell said that was not so; it was sometimes four.

Modern Road Methods.*

By H. PERCY BOULNOIS, M.INST.C.E., Vice-Chairman of the Roads Improvement Association, and Member of the Engineering Advisory Committee of the Road Board.

The introduction of self-propelled traffic, the rapid motor car, the heavy commercial vehicle, and the ponderous motor bus have caused almost a revolution in our preconceived notions as to the construction and maintenance of our highways, and have raised considerable public and scientific interest in a question which has lain dormant and neglected for many years. The year 1908 brought with it the public outcry against the dust nuisance, and the excessive damage caused to the water-bound carriageways of this and other countries by the new description of traffic. Road makers became naturally much exercised in their minds at this outcry, and at once set to work to ascertain how this great change in the character of the traffic was to be met.

Three International Road Congresses have been held since then, the first at Paris, the second at Brussels, and the third in London. Extraordinary interest in the proceedings was shown at all these congresses, which were attended by delegates from all parts of the civilised world. Many interesting questions were discussed, but no very definite conclusions could be arrived at—beyond generalities—the fact being that there are so many conflicting and disturbing factors which enter into the question as to what should be the form of construction of the modern road surface.

The traffic on the road is the primary factor which governs the selection of the type of construction to be employed. The amount and description of this traffic varies in almost every locality, and the problem is further complicated because this traffic is in a state of transition. We have to deal with the self-propelled traffic of varying speeds and weights, but also with the horse-drawn traffic, and a surface that may be excellent for the one may not be the best for the other.

It has been stated, with some truth, that the bicycle requires a road as smooth as a billiard table, a traction engine, or heavy motor wagon, requires a solid stone causeway, a horse requires a soft and easy foothold, and that a rapid motor car requires a straight track all to itself. In addition to this, the pedestrian requires a footpath for safety, and there should be little or no dust, a requirement which is shared by the occupiers of adjoining premises; also there should be a minimum of noise. The ratepayer, who pays for the road, naturally requires that the construction and maintenance should cost as little as possible, while all the users of the road require that it shall be amply wide, so that there shall be plenty of unobstructed room for the traffic.

How are these problems to be solved is the question that exercises the minds of the modern road engineer.

EARLY ENDEAVOURS.

The earliest endeavours that were made to meet some of these difficulties consisted in tar-painting, or tar-spraying, the existing road surfaces, where the road was in good condition. The dust was no doubt greatly diminished, and the surface of the road was in great measure improved and preserved. Since then many hundreds of miles of road surfaces in this country have been thus treated, in most cases satisfactorily, and where there have been failures it has been due to want of proper precautions.

In this connection the Roads Improvement Association has issued a valuable little leaflet, entitled "Notes upon Tar Treatment of Road Surfaces,"† in which they point out the precautions that should be taken when dealing with the surface of roads in this manner. Shortly their recommendations are:—

(1) It is absolutely necessary that the crust and foundation of the road, taken together, should be sufficiently strong to carry the traffic.

(2) Before treatment the surface should be thoroughly cleansed from dust, caked mud and dung, in order that the tar may adhere properly, and that the surface of the road should be even and without depressions or potholes, &c., before the tar is applied.

(3) No tar should be applied unless the road is

thoroughly dug to at least $\frac{1}{4}$ in. below the surface, and they point out how impossible it is for tar to adhere to a wet, or even a damp, surface.

(4) Great care should be exercised in the selection of the tar; crude tar requires special care, as it may contain many detrimental compounds, and they give valuable hints as to the manner in which this may be avoided with reasonable care.

(5) The methods of tar-spraying by hand or machine are not discussed, but it is stated great care should be taken to apply only that quantity which the road will take, and at the same time amply cover the surface; from one-sixth to a quarter of a gallon of tar per square yard is suggested.

The leaflet contains many other valuable recommendations, and I advise all those who are engaged in this description of work to obtain a copy.

There can be no doubt that very excellent results have followed tar-spraying, and it has the advantage of being an exceedingly economical palliative, but it is only a palliative, and only solves the mere fringe of the problem of modern road methods. Something more is required in numberless cases where the traffic has abnormally increased, and a very large number of special methods of construction have been introduced during the last five or six years.

It would be impossible in a short paper to give a list of these various methods; suffice it to say that mainly all of them are on the lines of the introduction of a bituminous material to bind the stones together which form the road, instead of the now old-fashioned method of binding them with sand, dirt and water.

It has been found that the traffic not only wears the surface or crust of the road, but produces a movement among the stones themselves at some depth below the surface, causing a rocking action of the stones and producing an inter-attrition or rubbing which gradually wears off the angles of the stones until they are of a rounded shape and have no interlocking or power to resist movement among themselves. This is the main cause of the excessive mud on an ordinary water-bound road, and it is also the chief cause of the destruction of roads.

METHODS IN VOGUE.

It was to meet this interstitial wear, and to confine it, so far as possible, to the upper surface, that the bituminous-bound road has been introduced. The various methods that have been adopted may be divided into the following groups:—

The ordinary water-bound macadam road with surface tarring, or painting, already referred to, and the introduction of various patented preparations to take the place of ordinary tar for this purpose.

Tar-macadam, which consists of broken stones of various sizes, thoroughly dried, then coated with tar or other bituminous mixture (either by machinery or by hand), and then laid in the road and rolled into place.

Tar slag, where slag from blast furnaces is used instead of stone, the tar being applied when the slag is at great heat, thus ensuring penetration.

Tar grouting, where the tar or bituminous mixture is poured on to and into freshly laid dry macadam after it has been laid and rolled.

A modification of the above where special standardised pitch or bituminous mixture is used instead of tar.

A further modification of the above where a layer of very fine "tar concrete" is laid, and dry macadam is spread on the top and rolled into the tar concrete.

A still later development is that of the formation of a "carpet" or covering laid on a foundation or "strength crust" so that the surface or "wearing crust" somewhat resembles a compressed asphalt carriageway.

Each one of the above types of road construction has its merits and supporters: it is difficult, however, to say which of them, if any, will be the ideal road of the future. It is, of course, necessary to bear in mind that first cost of construction, and the life of the road, have an important bearing on the question of what type to adopt, and local considerations must in great measure decide; but so far as

* Paper read on Wednesday evening at a meeting of the Leicestershire and Rutland Branch of the Roads Improvement Association held at Leicester.

† Notes elsewhere in this issue.—Ed. THE SURVEYOR.

our present knowledge on the subject goes, it has become an established fact that the ordinary water-bound road is a thing of the past, and should only be employed where the traffic is light, both in the weights carried and in quantity, or where some special circumstances require that this method of construction should still be adopted. Otherwise modern road methods are undoubtedly in the direction of bituminous roads in some form or other.

THE POINTS TO BE AIMED AT

in modern road construction may be summarised as follows:—

(1) The carriageway should be built on a foundation or "strength crust" of sufficient strength to carry the weight of the traffic and to distribute the pressure of the wheels over the subsoil as to avoid any depressions or subsidences.

(2) Upon this "strength crust" there should be a wearing surface, or crust, so constructed as to minimise the abrasive action of the traffic, and also be quite impervious to water. It is universally agreed that water is even a greater enemy to a road than traffic.

(3) It has been discovered that the traffic not only wears the surface, or crust, of the road, but also produces a movement among the stones themselves at some depth below the surface, causing a rocking action of these stones, and producing what is known as inter-attrition or rubbing which gradually wears off the sharp angles of the stones until they are rounded in shape, and thus have no interlocking or power to resist movement among themselves. This is the chief cause of the excessive mud on an ordinary water-bound road, and is also responsible for the ultimate destruction of the road. It has been found that the bituminous mixtures now employed in all modern road making meet this difficulty, and tend to prevent this interstitial wear of the stones by interposing a resilient substance between the stones.

(4) In addition to this, the modern road, constructed with this bituminous binder, gives a slight elasticity or resilient action in the road, and this slight elasticity is very helpful to the present form of traffic. The elasticity of the modern wheel has played a very important part in helping forward the introduction and development of mechanical transport, and a similar elasticity in the surface of the road is equally necessary to preserve the road against the destructive forces of the traffic. It is also eminently desirable that the vehicle using the road should not be subjected to the violent reaction of an improperly constructed road surface. Such reactions must, of course, be detrimental both to the vehicle and to the road. The surface of the modern road should be smooth, and at the same time have a sufficient roughness or "grip" to prevent its being slippery. With care and a selection of the proper method any excessive slipperiness can be eliminated, though so long as horses still use the roads there may be some difficulty in altogether eliminating this objection.

(6) Under modern methods the excessive camber or crossfall of the surface of roads can be greatly reduced. Excessive camber is now altogether unnecessary, and should be avoided, as it tends always to divert the whole of the traffic on to the crown or centre of the road. The camber is only required to throw the water into the channels as speedily as possible, and the smoother the surface the less fall is required to effect this object.

MODERN REQUIREMENTS.

I think the requisites of a modern road may be summed up as follows:—

It should be sufficiently wide to meet the traffic requirements, but must not be extravagantly costly in its first construction.

The foundation must be sufficiently strong to bear the weight of the traffic, and the surface must be durable, and require the least possible amount of repairs at the least cost.

The road should be safe, firm, hard and at the same time resilient, with an even surface, and yet give sufficient foothold for horses.

It should be as noiseless as possible, and should be incapable of manufacturing any dust or mud. The surface should be so constructed that water cannot penetrate; that cleansing is reduced to a minimum; and that the camber or crossfall should be as flat as possible, compatible with the speedy draining off of the water falling on the surface. There should be no possibility of interstitial movement among the stones of which the road is constructed.

I have not dealt with the question of street paving but only with roads confined to a moderate traffic. When the traffic exceeds a certain limit it then becomes a question whether granite setts, natural rock asphalt, or wood should be employed.

The meeting of the Leicestershire and Rutland Branch of the Roads Improvement Association at which Mr. Boulnois' paper was read on Wednesday took place at the Grand Hotel, Leicester, and was presided over by the mayor (Councillor J. R. Frears), others present including Sir Samuel Faire, vice-president of the association, Messrs. Wallace E. Riche, general secretary, E. G. Mawbey, borough engineer of Leicester, H. G. Coales, engineer and surveyor to the Market Harborough Urban District Council, E. H. Crump, engineer and surveyor to the Hinckley Urban District Council, W. H. Blount, surveyor to the Market Harborough Rural District Council, J. W. Shaw (Leicestershire), H. Chapman, surveyor to the Blaby Rural District Council, J. Thorpe, surveyor to the Market Bosworth Rural District Council, and S. C. Winks, secretary to the Leicestershire and Rutland Branch of the Association.

Mr. E. G. MAWBEY, who opened the discussion on the paper, said he believed the county surveyors did their best to avoid loose stones. Their experience in Leicester was that whether they used best tar or pitch, or whether they used pitch and creosote oil, they found it was not strong enough for heavy traffic.

Mr. J. W. SHAW declared that he was "an out-and-out tar man." As to signs, he did not know of any better than those adopted in Leicester.

In replying to the discussion, Mr. BOULNOIS stated that he was entirely converted to tar slag. Incidentally, he expressed the opinion that tramways were condemned; the introduction of quick-running motor buses had practically put tramways in the shade.

A vote of thanks was passed to Mr. Boulnois for his paper on the motion of Sir Samuel Faire.

SEWAGE EFFLUENTS.

THE ROYAL COMMISSION'S FINAL REPORT.

In the House of Commons on Monday the President of the Local Government Board, asked when the proposed Bill for dealing with the question of sewage and trade effluents would be introduced, stated that in view of the expected issue of the final report of the Royal Commission on Sewage Disposal the question of introducing this measure was for the present postponed.

Local Authorities and Tarco.—Among the local authorities that have accepted the tenders of Messrs. R. S. Clare & Co., of Stanhope-street, Liverpool, for the supply of Tarco for the surface dressing of their roads are the Middlesex County Council, Staines Urban District Council, Altrincham Urban District Council, Bromsgrove Urban District Council, Wilmslow Urban District Council, Essex County Council, South Stoneham Rural District Council, and Huyton-with-Roby Urban District Council.

New Sewage Disposal Works for Yardley.—The Birmingham, Tame and Rea District Drainage Board at their meeting on Wednesday approved a scheme prepared by the engineer, Mr. John D. Watson, M.INST.C.E., to abandon Acock's Green Farm for the treatment of the Yardley district sewage, and convey sewage by gravitation to a site to be acquired in the parish of Sheldon, where a complete purification plant will be installed. The estimated cost of the scheme is £21,654.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times*.

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

ROAD CRUSTS AND ROAD CARPETS.

[The following note, under the heading "Concrete in Highway Work," is a report of remarks made by Major W. W. Crosby at a Good Roads Congress held in Philadelphia last December. In a covering letter addressed to *The Surveyor*, Major Crosby writes:— "These remarks were made in discussion under the topic of 'Concrete Roads,' and while they may seem particularly applicable to roads built of concrete, I think the points made have a bearing on the work of surfacing macadam roads with a pitch (or bituminous) carpet, such as is now quite a common practice in Great Britain, especially where these macadam roads are composed of rather soft stone." Major Crosby's note is suggestive of the importance of distinguishing between (a) a carpet which is too tough to be crushed and may be placed on a very hard crust, such as a sheet asphalt carpet on a cement-concrete crust; (b) a carpet (also a carpet proper, but not necessarily so tough as (a) which rests upon a relatively soft crust, and, because it is less tough, depends for its resistance (to excessive rolling out) upon good adherence to the crust; and (c) an upper wearing crust of bituminous material, which must either have sufficient thickness to act as a layer of considerable strength, or must be well bonded into the lower course upon which it rests. Most of our work falls into the very last, and probably most promising, class; but in some cases an old crust is hardly touched before the carpet is laid, and the results may be inferior to those obtained with thinner layers firmly bonded into the strength crust, or, on the other hand, with tar or pitch macadam crusts proper, capable of spreading the loads. As strength crusts for road carpets, sandstone crusts have the important advantages (1) They can be made very smooth, so that the thickness of the carpet hardly varies at all; (2) they are usually cheap enough to be made very thick; (3) they take a bonding coat very well. Since, however, a water-bound sandstone crust becomes very friable when dry, it is, when capped with a waterproof carpet, likely to disintegrate, at any rate when the carpet is thin, as in the cases cited by Major Crosby. This difficulty occurs with other crusts under tar films, and is likely to occur even when the carpets or wearing crusts, above the water-bound crust, are of considerable thickness.]

MAJOR CROSBY'S NOTE.

While at present there seems to be sort of a stampede, ably assisted perhaps by certain interests, toward the use of concrete for roads and streets, the speaker wishes to utilise this opportunity to express the opinion that the selection of concrete for such work may well be considered as divided into two main questions of great importance for proper determination.

The first of these questions is that of a necessity for rich concrete, or even for a concrete base itself, for the pavement or wearing surface itself, a condition by no means always existing, or likely to exist, during the life of the wearing surface. Many mistakes, it seems to the speaker, have been, and are being, made by the use of any concrete base or foundation where equal satisfaction at least and great economy would have been had by its omission or the substitution of a cheaper, but, under the local conditions, an equally efficient foundation. It is to be understood here that the speaker believes that the use of concrete for the wearing surface itself, except in a few cases under peculiar conditions, is already proved impracticable, but for the sake of brevity the reasons for this conclusion will not be again expressed here.

The second of the questions referred to is made up of the old questions as to (a) the character of the wearing surface to be supplied on top of the concrete base or foundation, and (b) the thickness of such wearing surface.

As to (a) the character of the wearing surface to be built, little need be said at this moment for the purposes of the speaker.

The point which the speaker wishes to make at this time is under (b) the thickness of the wearing surface when the latter is bituminous in composition. Wearing surfaces composed of pitch compounds (bituminous materials, such as asphalts, tars, and oils), mixed either previously or in situ, with sand, gravel or stone chips, have almost invariably proved unsatisfactory as carpets on concrete unless the

carpets have been of more than a minimum thickness, dependent for expression in figures on local conditions, while those of sufficient thickness have proved satisfactory where their construction was proper under all the conditions.

The speaker thinks a reason for this difference in results between carpets identical except in thickness, and for the failure of many too thin carpets, comes from the fact that the thin carpets do not sufficiently absorb the shocks of traffic to prevent the disintegration, and pulverisation to a greater or less degree by such shocks, of the surface of the concrete to which the carpet is applied. Hence such carpets, lacking sufficient coherency in themselves and the preservation of a proper surface to which to maintain their adhesion, soon break up and disappear, first in spots and then altogether.

The surface of the concrete base naturally contains a great deal of mortar—an extremely friable substance, readily disintegrated under horses' feet and hard tyres. If the effect of these is permitted to pass through the carpet and to reach the mortar the latter soon becomes broken up and the adhesion of the carpet to a stable surface destroyed.

The same phenomena have been noticed by the speaker in the cases of macadam built of a soft, friable sandstone covered with a thin carpet, and their failure to occur has been equally noticeable where the thickness and character of the carpet has been sufficient to absorb the shocks referred to and to prevent disintegration of the friable materials underneath.

The speaker realises the difficulties of thick carpets, but he feels they can be solved by proper methods, such as have been used in the case of a familiar form of carpet for city streets—the sheet asphalt pavement. He believes that further solution of the problem of adapting this pavement to country roads—by the substitution of a "paint coat" for the "binder course," for instance—is in sight. But this too "is another story."

SPRING AND THE ROADS.

THE OBSERVANT MOTORIST.

Surveyors are looking to their roads, and throughout the country heaps of stone by the wayside, steam rollers and tar-boilers are met with, giving evidence (says a writer in the *Royal Automobile Club Journal*) of what is being done for the comfort of the road user.

During a recent run through a great part of the South of England it was noticed that in most cases where the highways were under repair a better material was being laid in place of that already on the surface. To quote an example: Many of the Hampshire roads between Winchester and Farnham are at present surfaced with flint—well-rolled, it is true, and very satisfactory in all except extremely dry weather—but the same roads, wherever repairs are necessary, are being relaid with granite. On the Wiltshire Downs the same thing was seen, and in other places tarmac is taking the place of water-bound macadam. The route taken included roads in Middlesex, South Buckinghamshire, Somersetshire, Wiltshire, Hampshire and Surrey, and it is proposed to note them in the order of the run.

Starting from London, the full extent of the Bath road was inspected. Until Hungerford is reached it is chiefly of tar-macadam, with many stretches of Tarmac—notably that at Maidenhead—and, with the exception of a rather potholed length near Slough (which, however, is at present under repair), is entitled to its claim of being the best road in England. After Hungerford the way becomes rougher, often being of a gritty flint. It is rather a pity that such a fine highway does not end as well as it begins.

From Bath to Salisbury the road winds considerably, and is chiefly of flint usually in good condition, though granite is gradually winning its way into use, particularly in the neighbourhood of Salisbury Plain. Turning south to the New Forest, one finds flint roads, which are generally built by having loads of gritty stone strewn across the way and left for passing traffic to work in. In wet weather they are fair, but in summer—! From Winchester to Farnham the state of repair has been mentioned, and along this part of the country there are many evidences of much work this spring. For the next month or so motorists should beware when driving this way. The Hog's Back is always an excellent stretch of road, and from Guildford to London the Portsmouth road can rank almost equal with the highway to Bath.

HOUSING INSPECTION.

LOCAL GOVERNMENT BOARD CIRCULAR.

The following circular was issued by the Local Government Board last week to town councils, councils of metropolitan boroughs, and district councils:—

Sir,—For many years the housing of the working classes has been a subject of constant public discussion. The measures which have been taken have effected much improvement, but there is an almost universal agreement that many evils still remain to be remedied. With a view to determining the precise methods by which Parliament and the administrative departments can best assist the local authorities in their efforts to cure these evils, His Majesty's Government are anxious to obtain fuller information than is now available as to the extent and distribution of the defects with respect to which ameliorative measures are needed.

As the council are aware, the provisions of sec. 17 of the Housing, Town Planning, &c., Act, 1909, impose upon every local authority within the meaning of Part II. of the Housing of the Working Classes Act, 1890, the duty of causing to be made inspection of their district, with a view to ascertain whether any dwelling-house therein is in a state so dangerous or injurious to health as to be unfit for human habitation, and the Order of the Local Government Board of September 2, 1910, prescribes the records to be kept of the inspection pursuant to the requirements of the section referred to.

The board direct me to enclose a form showing the results of this inspection and other particulars to be filled up by the local authority, and to state that it is very desirable that it should be returned to the board at the earliest practicable date.

I am, Sir, your obedient servant,
H. C. MONRO, Secretary.

[COPY OF FORM REFERRED TO.]

HOUSING OF THE WORKING CLASSES ACTS.

Particulars as to inspection of houses and housing conditions.

Name of Local Authority ... Town Council
Metropolitan Borough Council
Urban District Council
Rural District Council

Administrative County

1. The estimated number of dwelling-houses in the district of the local authority.

2. The estimated number of dwelling-houses within the limit of rent applicable to the district under sec. 14 of the Housing, Town Planning, &c., Act, 1909.

3. The number of dwelling-houses which have been inspected under and for the purposes of sec. 17 of that Act, and the particulars required by the Housing (Inspection of District) Regulations, 1910, duly recorded:—

- (a) Within the limit of rent applicable to the district under sec. 14.
- (b) Above that limit.

N.B.—If in any district special provisions are contained in local Acts of a similar character to those in sec. 17 under which the local authority carry out their work, instead of under that section, this should be indicated and similar particulars given, care being taken to avoid duplication of entries:—

- (a)
- (b)

4. By what date can the inspection of dwelling-houses within the limit of rent above referred to be completed and the necessary records made?

5. (1) How many of the dwelling-houses inspected were found to be in a state so dangerous or injurious to health as to be unfit for human habitation:—

- (a) Within the limit of rent above referred to?
- (b) Above that limit?

(2) And how many of those houses are still in that state:—

- (a) Within the limit of rent above referred to?
- (b) Above that limit?

A schedule identifying the several houses under 5 (2) (and, in a rural district, arranged under the names of parishes) should be annexed.

6. (1) How many of the dwelling-houses inspected, though not found to be in a state so dangerous or injurious to health as to be unfit for human habi-

tation, were seriously defective from the point of view of danger to health or structural faults:

- (a) Within the limit of rent above referred to?
- (b) Above that limit?

(2) And how many of those houses are still in such defective condition:—

- (a) Within the limit of rent above referred to?
- (b) Above that limit?

A schedule identifying the several houses under 6 (2) (and, in a rural district, arranged under the names of parishes) should be annexed and the nature of the main defects should be briefly indicated in each case.

7. The number of vacant houses suitable for persons of the working classes and in all respects reasonably fit for human habitation.

A schedule of these houses should be annexed giving the following particulars as to each house—viz., address (including, in a rural district, the name of the parish), character (e.g., tenement, flat, &c.), rent, accommodation.

8. The number of houses which are overcrowded on the basis adopted in the Census returns—viz., more than two persons to a room.

A schedule should be annexed in the case of a rural district giving separate information under this heading as regards each parish in the district.

9. Number of new houses, which, in the opinion of the local authority, is required to provide any necessary accommodation for persons of the working classes in the district and the nature and extent of such accommodation, e.g., separate houses, tenements, number of rooms.

A schedule should be annexed in the case of a rural district, giving separate information under this heading as regards each parish in the district, and also in the case of a borough or urban district of extensive area showing approximately the part of the borough or district where the accommodation is required.

..... Clerk to the Local Authority.
(Date) day of 1914.

REORGANISATION AT LEEDS.

SEQUEL TO MUNICIPAL EMPLOYEES' STRIKE.

The Special Committee appointed to deal with the strike of municipal employees at Leeds have prepared a report in which they recommend the re-organisation of several of the municipal departments. For all practical purposes the highways department is now closed down—the work to be done in future by private contractors—and the sanitary services are to be put on a different footing.

These changes have called forth the resignations of Mr. Thomas Alinson Prince, the head of the highways department, and Mr. John J. Mann, superintendent of the street cleansing department. At present Mr. Prince is in receipt of a salary of £400 a year and Mr. Mann one of £340. It is understood that the Special Committee's recommendations include proposals of substantial grants to these officials, who have been in the service of the corporation for many years, and whose ability is in no way questioned.

Honiton Town Planning Scheme.—The Local Government Board have intimated to the Honiton Rural District Council that they have decided to comply with the application for authority to prepare a town planning scheme in the parishes of Salcombe Regis and Sidbury.

City Tramway Lines Vetoed.—The Corporation of the City of London last week resolved not to consent to the proposals of the London County Council to extend existing tramways (1) from Whitechapel High-street to Aldgate Station; (2) from Whitechapel High-street along Mansell-street to Tower-hill and Trinity-square; and (3) from Charles-street along Farringdon-road and Farringdon-street to Ludgate-circus, so far as the lines were within the City.

The Colchester and Falmouth Vacancies.—The Corporation of Colchester are advertising for a borough engineer and surveyor, at a salary of £400, rising to £500, with a horse and trap or other suitable means of locomotion. Applications should be addressed to the town clerk, Mr. H. C. Wanklyn, not later than March 26th. The vacancy at Falmouth is that of borough surveyor, at a salary of from £150 to £200, and the last day for sending in applications is March 16th.

LONDON PAVEMENTS.

[Notes from the detailed returns accompanying the eleventh report of the Metropolitan Paving Committee.]

The returns sent in to the Metropolitan Paving Committee from the cities of London and Westminster, seven metropolitan boroughs, and the London County Council give the main particulars of the new pavings laid in the year 1912-1913, and, in some cases, the nature and life of the pavement previously laid and renewed, or replaced by another kind of paving, in that year. The chief facts as given in the report itself have already been published in *THE SURVEYOR*, and the following notes on particular points are supplementary to that information.

LIVES OF WOOD AND ASPHALT PAVINGS.

The following particulars will be more significant to those who are well acquainted with London than to surveyors who know only the main thoroughfares; but in some cases the expression "considerable" or "limited" will give some idea of the severity of the traffic.

Wood paving, the kind of wood not being specified, but most of it being (creosoted) softwood, had lasted in Kensington for periods of ten to eighteen years; in Richmond-road, Brompton, ten years; Kensington High-street and Kensington-road, eleven years; Ladbroke-grove, sixteen years; Munster-road and Lillie-road, Fulham, sixteen years; New King's-road and the middle strip of Wandsworth-road, nearly seventeen years; Manchester-square, seventeen years; Gloucester-road, eighteen years. In many residential streets in Marylebone wood paving had lasted from eleven to fifteen years, and in Marylebone-road, under "considerable" traffic, eleven years.

Creosoted deal lasted nine years in Hammersmith-road, and twelve years in Clapham Park-road.

Jarrah and creosoted beech lasted twenty-two years in Hammersmith-broadway.

Jarrah—in High-road, Kilburn, ten years; in Belize-road, Fitzjohn's-avenue and Heath-drive, all in Hampstead, twelve years; in Uxbridge-road, Hammersmith, seventeen years. Old jarrah blocks relaid in Norland-road, Hammersmith, eight years.

Karri had lasted fourteen years in Woburn-square, Holborn.

Asphalt (671 sq. yds.) had lasted eleven years in a part of Hart-street, Holborn, and in another part of Hart-street (1,147 sq. yds.) had lasted twenty-nine years, under "considerable" traffic. In Woburn-square, under "limited" traffic, fourteen years, in Woburn-place, under "considerable" traffic, sixteen years, this being an omnibus route. In the City of London asphalt lasted twenty-two years in Furnival-street under "limited" traffic, twenty-four years in Old Broad-street, twenty-six years in New Broad-street, and twenty-five years in Gracechurch-street, all with "considerable" traffic. In the last case the new paving was creosoted deal. There were credits of 6d., 9d. or 1s. per square yard for the value of the old asphalt in these streets, the credit being 1s. in the cases of the pavements which had lasted twenty-four and twenty-six years. In High Holborn the asphalt had lasted ten years, and in Southampton-row and Bloomsbury eleven years.

Asphalt blocks lasted eleven years in Waterloo-road, Hammersmith, and cork asphalt two years in Thurloep-place, Kensington.

THE NEW PAVEMENTS.

The general practice of recent years was followed in most of the cases of renewals of paving or substitution by a different kind of pavement. The methods of dealing with existing foundations varied with the circumstances, and the reports are probably not all comparable as regards the extent of the information in this respect.

Tar-macadam, in Marylebone and Hammersmith, was laid on old macadam crusts, and in Waterloo-road, Hammersmith, on old asphalt blocks. In Castle-street, Holborn, redressed granite setts were laid on a foundation of blue lias lime concrete 6 in. thick.

Concrete foundations ranged, by inches, from 6 in. to 12 in.—10 in. in Marylebone-road, 11 in. in Harwood-avenue, Marylebone, 12 in. in Hart-street and Bloomsbury-square, Holborn, in Southgate-street, Hackney, and Park-road, Marylebone, and 12 in. to 14½ in. in High Holborn.

The thickness of tar-macadam crusts was 3 in. and 4 in. in Hammersmith, and 4½ in. in Marylebone and Hampstead.

Of the woods used, creosoted pine was largely employed in Westminster, Archangel "thirds" in Wandsworth, yellow deal in Marylebone, deal in the City of London, Kensington, Hammersmith and Fulham. Sectional jarrah was put down in Hampstead and Holborn. The principal methods of making the joints of wood block paving were as follows: (1) Close-jointed, grouted in with pitch and cement (Fulham); (2) close-jointed, run in with a mixture of pitch and creosote oil, grouted with Portland cement or Portland cement and sand (Hammersmith, Marylebone, Westminster and Hampstead); (3) grouted with tar-pitch and cement (Kensington); (4) pitch, or pitch and cement grout (London County Council); (5) dipped in a mixture of tar and pitch, and grouted with Portland cement mortar (Wandsworth).

The asphalt paving was nearly all natural rock asphalt, compressed in situ, the use of heated pelons being mentioned in many cases. The thickness was 2 in., except in the City, where it was 2½ in.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain,
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MANSINGER: "The Fatal Dowry," Act. ii., 2.

WHY TAR-SLAG BINDS WELL.

To the Editor of *THE SURVEYOR*.

SIR,—Your correspondent "Cretaceous," in his letter published in your issue of March 6th, makes some interesting and useful observations. He endorses and emphasises my opinion that chemical action between the tar and the slag is one of the reasons for the good adhesion of tar to slag, compared with the adhesion to other road stones.

As regards the wearing qualities of slag, I do not think that we are in disagreement. I alluded to its superior wearing qualities compared with limestone and sandstone as a reason for the better results obtained with tarred material, and the relatively poor results with untarred slag, "especially on clayey and wet subsoils," are probably due to its inferior weathering qualities compared with those two materials. Prof. Fearnside's views on this point may be somewhat too strong, but they have a foundation in fact.

With respect to small-scale roughness, my argument hangs upon what are, to the naked eye, very small differences in the appearance of the different kinds of stone, but I think that the differences are real and important. Syenites and quartzites, even when their roughness is on a small scale, have not the minute pores or small crevices with unsealed inner ends, which are found in most specimens of compact limestone or true sandstone. In pointing out that when certain stones are examined after two or three years' wear, the tar will be found to have lost its life, but not in the case of tarred slag, "Cretaceous" refers to a point of much importance, but not, I think, one which affects the initial grip of the tar. This initial grip is, I consider, a leading factor, since, if the tar will grip well for a few months, or even weeks, the crust will settle down well. This, I believe, gives sandstone and limestone crusts an important advantage compared with crusts of tarred syenite or quartzite.

The greater or more rapid deterioration of the tar coating of sandstone and limestone road metal, as compared with that of slag, is a further consideration, and I frankly admit that the observations made by "Cretaceous" point to the existence of an additional factor in favour of slag besides its greater strength or wear-resistance. It may even be the dominant factor if it can be established as a fact in the experience of road surveyors. Can "Cretaceous" suggest a reason for it? Does the chemical action between the tar and the slag actually tend to preserve the life of the tar?

I am much interested to learn that "Cretaceous" has found no difference in the results obtained with slag laid hot and laid cold; but a slag crust grouted with tar, to which he especially refers, is under somewhat different conditions to those of a crust of tar-macadam proper. If my theory of the efficacy of atmospheric pressure is sound, it should apply, to some extent, to grouted crusts; but it would be difficult to test it by the results of experience with respect to these. As regards crusts made by the mixing or by the coating process, the usual practice is to heat the stone, and my contention is that in such cases the advantage is not wholly due to the driving off of moisture, but is partly due to the establishment of at any

rate a temporary pressure on the tar film. If dry but cold stone does give equally good results, I may still attribute some virtue to the cooling of the stone after its temperature has been raised by the application of hot tar. If, however, cold stone and cold tar are found, in the long run, to give results equal to the best, my theory will fall to the ground. The experiments cited by "Cretaceous" are interesting, and worth giving in greater detail. For instance, if, after tests No. 1 and No. 2, the conditions allowed of a true film being formed, and slices under the microscope showed no roofing of the tar film in test No. 2, these are against my theory, but not if a definite film was not formed. In (3) and (4) my theory is supported, since, if it was not atmospheric pressure which gave the penetration in (4) thrice as deep as in (3), what was it? The discoloration might not in itself affect the wearing properties of the slag, but it seems to point to the existence of a force which, if a true film were formed in time, would hold that film to the slag.

In conclusion, I should like to invite "Cretaceous" to give his opinion as regards the effect of clayey matter in adding to the advantages of materials which make good tar-bound crusts, compared with those which make inferior tar-bound crusts. His observations on practical points in road maintenance are so much to the point that your readers would, I am sure, be interested to know his views as regards the considerations set forth under the heading "the proportion of clay" in my article in your issue of February 27th.—Yours, &c.,

REGINALD RYVES.

March 7, 1914.

SEWAGE DISPOSAL BY DILUTION.*To the Editor of THE SURVEYOR.*

SIR.—Mr. Kershaw says that his object in answering my first letter was to draw attention to the fact that the commission expressly recommend dilution and not quality of river water as the chief factor. I hoped my second letter would have convinced Mr. Kershaw that his contention was wrong, but apparently it has not done so. I must therefore point out that Colonel T. W. Harding, a member of the Royal Commission, in a discussion on the eighth report at the Royal Sanitary Institute on February 11, 1913, evidently agrees with my view of the "relaxation" suggestions. He says, "The normal standard would be the only statutory standard. There would be no statutory right to relaxation because of dilution, but certain conditions of dilution would warrant a *prima facie* case for consideration by the Rivers Board or central authority, as, for example, if admixture did not bring the water to such a condition as to take up more than '4, and if the river were able to return to the normal '2 before the next pollution." (*Journal Royal Sanitary Institute*, vol. 34, p. 209.)

That others agree with my view is confirmed by the following quotation from Mr. Silcock's article on "Sewage Treatment" in "Kempe's Engineers' Year-book," 1914, p. 914. After stating the conclusions on standards and relaxation by dilution, he says: "These standards are not intended to apply to effluents discharged into streams which are used for drinking water, or to streams the water of which, at the point of discharge of the sewage effluent, normally takes up more than 2 parts per 100,000 of dissolved oxygen in five days at 60 deg. to 65 deg. Fahr."

Mr. Kershaw correctly says, "The commissioners' recommendations apply to the whole country," and they therefore apply to the rivers in the Mersey and Irwell watershed, as well as extremely large areas in other industrial watersheds.

I do not think it necessary to enter into a discussion of the hypothetical case mentioned by Mr. Kershaw.—Yours, &c.,

HUGH STOWELL, M.INST.C.E.,
Chief Inspector,
Mersey and Irwell Watershed.

44 Mosley-street,
Manchester.

March 6, 1914.

THE INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.*To the Editor of THE SURVEYOR.*

SIR.—I am always interested in the various letters which appear in your issues from such persons as "Road Surveyor."

I thoroughly appreciate and endorse his remarks, which are true in every respect. But there is one

very important matter which he has appeared to ignore, and that is that there are men (you will observe I do not call them professional men, but I doubt whether he can call it a profession or not) today holding very high positions who allow their office boys to be drafted into the drawing department at a salary, and afterwards considered one of the professional staff. Such a thing as this tends to cause friction, and, naturally, hits the pupils very hard. Under the circumstances one can account for the overcrowding in the business, and the small salary obtainable by fully qualified assistants.

I may say that I have been advised not to sit for any examinations, as the various institutions do not appear to be of any assistance. From what I have seen so far it is much better to have Mr. So and So behind one.

I would like to suggest that all institutions should make it a rule in their syllabus that all candidates should forward their original indentures when applying for permission to sit for an examination. If this were done it would lessen the tendency of the office boy to become a surveyor.

I should also like to see the various institutions amalgamating and forming one large representative and recognised body, and thus raising the standard of the profession. Why not have a charter?—Yours, &c.,

DISGUSTED.

March 7, 1914.

SLUDGE DISPOSAL.*To the Editor of THE SURVEYOR.*

SIR.—In your issue of March 6th you were good enough to comment on my paper on "Sludge Disposal." I notice that you question the general applicability of the process, and with this I agree, but not on the grounds you give. At Birmingham we have to deal with every class of sludge—from domestic to industrial. Some of our outlying districts are purely residential, and the sewages from these localities have to be treated separately. The principles established here, and enunciated in my paper, are general principles, and the sludge to which it would not be possible to apply them would indeed be refractory. The peculiar character of the Birmingham sewage ceases to operate when the sludge is isolated from the liquor. This is a cardinal feature of the whole process, and the only considerations which might be urged in a particular case against adopting this digestive process would be engineering or other practical ones which would be purely local.—Yours, &c.,

F. R. O'SHAUGHNESSY.

Denman Chambers,
42 Temple-street,
Birmingham.
March 10, 1914.

WARNINGS FOR DANGER POINTS ON ROADS.*To the Editor of THE SURVEYOR.*

SIR.—It was with interest that Mr. L. J. Rogers and myself read Mr. H. C. H. Shenton's letter on the above subject, more especially as we are at the present time experimenting with a similar idea.

We have observed the instances referred to, and agree with him that reflectors might be made to serve a very useful purpose where sharp turnings or other dangerous features present themselves on our highways; at the same time, we think that he is somewhat optimistic as to the brilliancy obtainable from these reflectors.

It is with the object of ascertaining the effectiveness of such reflectors that we are carrying out these initial experiments.

Should these experiments prove successful, we hope to place before the readers of your journal something definite.—Yours, &c.,

C. G. ATKINSON.

Council Offices,
Wellingborough.
March 10, 1914.

Rye Water Supply.—The Rye waterworks extension has been completed, and the undertaking is now capable of supplying 150,000 gallons in ten hours, and supplying a population of 6,000. The estimate of the cost of the works is £4,308, and application is to be made to the Local Government Board for a further loan of £400.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC. M. INST. C. E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

381. Town Planning.—An area of 1,000 acres, chiefly undeveloped, in an urban district, is to be included in a town planning scheme. The approximate number of owners, occupiers and lessees is 250. Assuming that the referencing is to be done by the staff of the urban district council surveyor's office, state the information which should be sought, and the best method of ascertaining and recording it. Give an estimate of the cost of the work if done by professional referencers. Compare the advantages and disadvantages of the two methods, both in the above case and in the case of an area of 1,500 acres in the same district, which includes a considerable extent of partially developed building estates, and is to form the nucleus of a later scheme. (Togun.)

382. Fire Hydrants.—Fire hydrants, 2½ in. in diameter, are taken from a 4-in. and a 12-in. main. What will be the ratio of discharge in the two cases, assuming that the initial pressure is the same in each main? (X. X., *Hounslow*.)

384. Timber.—Sketch the cross-section of an oak tree and show the different nodes of conversion. How does oak compare with elm for use inside or outside a building?

385. Chimney Design.—Design a brick chimney shaft 130 ft. in height from ground level, the internal diameter at the base being 10 ft. (F. S., *Plumstead*.)

386. Storm Overflow Weir.—A 9-in. diameter stoneware pipe, laid on a gradient of 1 in 281, carries a mean dry-weather flow of 33,300 gallons per day. It is required to construct a storm overflow weir, in a manhole, to pass all above six times the dry-weather flow. At what height above the invert of the pipe should the lip of the weir be set? (H. V. O., *West Bromwich*.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

379. Testing Pipes.—What tests should stoneware pipes be subjected to before they are accepted for use? What defects are often thereby disclosed? (B. W., *Tadcaster*.)

The following are the most important tests which stoneware pipes should be able successfully to pass:

(1) The average thickness and weight of glazed stoneware pipes should be as follows:—

Length of pipe.	Diameter of pipe.	Length of socket.	Thickness of stoneware.	Average weight per 2 ft. length of pipe.
2 ft.	4 in.	1½ in.	½ in.	18 lb.
2 "	6 "	1¾ "	¾ "	32 "
2 "	9 "	2 "	1 "	58 "
2 "	12 "	2 "	1 ¼ "	90 "

(2) Tested pipes should bear the maker's name and the word "tested" stamped on the barrel. Such pipes should be capable of withstanding a pressure of 25-ft. head of water without showing signs of "sweating."

(3) The pipes should be salt-glazed inside and outside, and thoroughly vitrified. A minute inspection should be made to ascertain that the glaze is uniform, and that there are no air holes present.

(4) When struck with a hammer a pipe should give a good metallic ring. This is a most useful test, and should be carried out on every pipe.

(5) A section of the pipe, when broken, should show a dense and close grain with a somewhat metallic appearance.

(6) The pipes should be truly cylindrical in bore.

This can be tested by the use of inside and outside calipers.

(7) The pipes must be free from kiln cracks and other defects, and the pipes must be well burnt.

(8) The pipes should be tested as to the safe load they will carry by supporting a pipe at or near its ends and then building up a load gradually either by hanging weights on or by laying bricks on the top, course by course.

When these tests have been successfully passed through by the pipe, it may be assumed to be a good pipe. Some of the defects which may be disclosed (apart from those before mentioned) are that the pipe loses its truly circular section, it may lose its regularity in its length, it may prove to be too brittle, it may not be sufficiently dense, or it may not be strong enough in itself to resist a superincumbent pressure.

Any pipe that does not comply with all the above requirements, and which cannot undergo the above tests satisfactorily, should be rejected as being unfit. (T. W. P., *Bechill-on-Sea*.)

383. Grain Silo.—It is required to construct a grain silo, the bins of which are 64 ft. in height and 8 ft. square in cross-section. What lateral pressure at the base should be provided for? (X. X., *Hounslow*.)

The theoretical considerations affecting the lateral pressure in a grain silo are exactly similar to those which occur in determining earth pressures on vertical surfaces. As grain is of uniformly granular structure, it approaches more nearly than earth to the conditions which are assumed in constructing the formulae.

Rankine's formula—

$$p = w \cdot d \cdot \frac{1 - \sin \theta}{1 + \sin \theta}$$

will give the lateral pressure in a granular material at any depth provided the angle of repose and weight of the material be known.

The angle of repose of grain was not available in several tables consulted, but was found by taking several readings on piles of oats (not crushed). The heights of the piles and the horizontal distances to the feet of the slopes were measured. From these measurements the angles of the piles could be obtained from a table of tangents, and the mean of these was taken as the angle of repose of the grain.

Angle of repose of grain $\theta = 23^\circ$.

Wheat is probably the heaviest grain which will be stored.

Weight of 1 bushel of wheat = 60 lb.

$$\therefore \text{Weight of 1 cub. ft. of wheat} = 60 \times \frac{6 \cdot 23}{8} \text{ lb.} = 47 \text{ lb.}$$

In the formula, where

p = intensity of horizontal pressure,

w = weight of 1 cub. ft. of grain,

θ = angle of repose of grain,

d = depth.

$$\begin{aligned} p &= 47 \times 64 \times \frac{1 - \sin 23}{1 + \sin 23} \text{ lb. per sq. ft.} \\ &= 47 \times 64 \times \frac{.6093}{1.3807} \text{ " " " " } \\ &= 1,315 \text{ lb. per sq. ft.} \end{aligned}$$

The walls of the silo must be designed to resist a lateral pressure of 1,315 lb. per square foot at the bottom, but this pressure varies as the depth, and will be zero at the top. (H. V. O., *West Bromwich*.)

Bournemouth Road Improvement Scheme.—A Local Government Board inquiry was held at Bournemouth on Wednesday with regard to an application by the town council for compulsory powers to purchase property to carry out road improvements. Among other changes it is proposed to construct a direct road to the cliff from the centre of the town and a roadway between two parallel roads which, though within 100 yds. of one another, are without means of access for vehicles from one to the other for nearly a mile.

LOWER THAMES VALLEY DISTRICT SURVEYORS' ASSOCIATION.

A meeting of the above-named association took place at the Town Hall, Twickenham, on Saturday last, when, notwithstanding the very inclement weather, there were a fair number of members present. A most valuable paper, entitled "A Comparison between the Use and Cost of Suction Gas and Oil Engines," was read by Mr. H. F. Coales, ASSOC. M. INST. C. E., engineer and surveyor to the Sunbury Urban District Council. Mr. Coales first gave a description of the suction gas plant installed by the Sunbury Urban District Council, for the purpose of providing power at the sewage disposal works, and furnished reasons as to why suction gas had been adopted as the motive power. Details of fuel consumption and maintenance charges, showing that suction gas is a much more economical form of power than oil, were given.

A most interesting discussion followed, and further figures were given by other members, fully bearing out the economical nature of suction gas as a motive power.

The question of fire plugs and hydrants, and the admission of waste from gasworks to sewers, were also discussed.

A very hearty vote of thanks to Mr. Coales for his paper was passed at the close of the meeting.

Harrow's New Council Offices.—The new municipal offices at Harrow, built at a cost of £6,000 from plans by Mr. H. Prince, have been formally opened.

Agent versus Owner.—A corporation official negotiating for the purchase of some land for the widening of a main road in the East-end of the city went (the *Liverpool Post* states) to the estate agent acting for the owner. No amount of expostulation would move the agent from the figure he named—15s. per square yard—and an angry parting was the only result of the interview. The official entered his motor-car and was driven to the house of the owner of the land, a public-spirited gentleman, with whom he had no difficulty in concluding a mutually satisfactory bargain at 4s. 6d. per square yard.

ARTERIAL ROADS FOR GREATER LONDON.

IMPORTANT CONFERENCE.

The first of the proposed six district conferences on the question of arterial roads for Greater London was held at the Local Government Board Offices on Monday last. Both Mr. Herbert Samuel, the President of the Local Government Board, and Mr. John Burns, the President of the Board of Trade, were present, and commenced the proceedings with short speeches.

Mr. Burns pointed out that the object of these district conferences was to "get a grip" of the local needs and details of the requirements of the district for further main or arterial roads, and then to report to a final conference which would be held when all the district conferences were ready with their reports. He considered that there was great need of further roads in the N.E. district (the district which the conference had been called to consider), owing to its ever-increasing population, its mighty docks, its important manufactures, and its railways which were not all that could be desired. He urged the necessity of introducing town planning schemes in order that land might be secured and held in readiness for schemes of new roads, observing that it was lack of foresight in this direction which had so hampered the London County Council in their important schemes. He asked the conference to endeavour to remedy this heritage of past neglect, and to enter into "healthy" give-and-take arrangements with the owners of land in the district.

Mr. Samuel, who followed, also drew attention to the national importance of the Town Planning Act, and said that for want of it our towns and cities were not worthy of the present century. He owned there were difficulties in carrying out the lines of proposed roads, as there were no fewer than 117 road authorities within the Metropolitan Police District. These difficulties, however, could be overcome by co-operation, and it was the object of these conferences to bring these various authorities into friendly touch with each other. He wished the conference to understand that the suggested lines of roads shown on the map prepared by the Traffic Branch of the Board of Trade were not to be considered as "hard-and-fast" lines, but were open to amendment or alteration by the conference, and that any decision arrived at would not commit any authority to the cost of carrying out the scheme, and he made the important statement that there would very shortly be introduced into Parliament legislation by which the expense of main roads would be provided out of the National Exchequer. He further said that he did not wish any conference to pledge itself as to the immediate necessity for any particular road, but that it should confine itself to dealing with the future rather than the present. Neither was it necessary to deal with street improvements, which was entirely a local question. He did not consider, either, that the conference need deal with any question of compensation to the owners of land, as he was of opinion that the argument was a fair one that the construction of a road in an estate was in the nature of a gift to the landowner for which he should be much obliged, and certainly should not demand any compensation for receiving this gift. He suggested that if the lines of main or arterial roads—of adequate width—could be thus arranged and pegged out, it would be sufficient, for the present, to metal the central portion and leave broad strips on each side until they were required for the complete scheme.

A New Town Hall.—Marylebone Borough Council at its meeting last week decided to borrow from the Huddersfield Corporation a sum of £60,000, at interest $3\frac{3}{4}$ per cent per annum, for the building of a new town hall on a site in Marylebone-road close to the Royal Academy of Music.

Institution of Civil Engineers.—On Tuesday evening next, at the Institution of Civil Engineers, the discussion on the papers, "Rail Steels for Electric Railways," by Mr. William Willox, M. INST. C. E., and "Rail Corrugation and its Causes," by Mr. Stephen Sellon, M. INST. C. E., will be concluded. The following papers will afterwards be read: "Some Recent Developments in Commercial Motor Vehicles," by Mr. Thomas Clarkson, M. INST. C. E., and "Comparative Economics of Tramways and Railless Electric Traction," by Mr. Theodore Gribble, M. INST. C. E.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

ANCIENT LIGHT. PARTIAL OBSTRUCTION BY CONSENT: ABANDONMENT. An interesting point as to the effect of the partial obstruction of an ancient light by consent was decided in *Bailey & Son, Limited v. Halborn & Prascuti, Limited* (Chancery Division, Mr. Justice Sargant, February 6th). The plaintiffs were the lessees of Nos. 38 and 40 Oxford-street, and for twenty years before the year 1911 they had enjoyed good and sufficient light to these premises. In that year the owners of certain adjoining property made various alterations in and additions to their buildings which had the effect of somewhat diminishing the light coming to the plaintiffs' houses. The plaintiffs, however, in consideration of a money payment by the owners of the altered buildings, consented to these alterations. In the following year the defendants, who were the owners of other adjoining property, made alterations in and additions to their premises, which further diminished the light coming to the plaintiffs' property. The plaintiffs thereupon brought this action, claiming a mandatory injunction and damages. The defence was that the diminution of the plaintiffs' light by the building operations of 1911, to which they had consented, had so altered the character of the easement that it must be treated as having been abandoned, these operations having, in fact, changed the plaintiffs' property from a well-lighted to a badly-lighted building. Mr. Justice Sargant held that the case was not one for a mandatory injunction, but that the defendants had caused an actionable nuisance to the plaintiffs, and he awarded them £150 damages. In the course of his judgment he said he accepted the proposition that until twenty years had elapsed from the date of the previous building operations the plaintiffs could claim no greater right over the defendants' land than they could have claimed previously to those alterations; but he saw no reason for saying that the plaintiffs had altogether lost their right, unless it had become impossible to decide what they would have been entitled to under the previous state of things.

EXTRAORDINARY TRAFFIC: RECOGNISED INDUSTRY.—Some interesting points in connection with the subject of extraordinary traffic were decided in *Llangollen Urban District Council v. Coward & Company* (Llangollen County Court, February 6th). The traffic consisted of the haulage of timber by three-horsed wagons weighing 30 cwt. to 35 cwt. each, with 4½-in. and 5-in. wheels, each carrying a load of from 3 to 4 tons. On an average two loads a day were carted (except in frosty weather), three roads being traversed, one of them having gradients varying from 1 in 11 to 1 in 4. On this road ruts 12 in. deep were cut, and on the others ruts 6 in. deep. Prior to this traffic the roads were fit and suitable for the ordinary traffic of the district, which was purely agricultural, except for a certain amount of tourist traffic during the summer. The council claimed £48 14s. 1d. As to part of the claim the defendants relied on sec. 12, subsec. (1) (b) of the Locomotives Act, 1898, as barring any damage done more than twelve months before the commencement of the proceedings. They also contested the entire claim on the alleged ground that timber growing was a recognised industry of the district. Other objections were that the roads with which these roads had been compared were not comparable roads, and that, as to one of the roads, the whole expenses claimed were for labour, the bulk of which (the scraping of mud and stones into the ruts) was useless. The point taken under the Locomotives Act, 1898, was allowed, and a further reduction was made in respect of part of the cost of the labour complained of. As to the main point—the question of a recognised industry—his Honour held that, although this contention was supported by the evidence, nevertheless the traffic was extraordinary by comparison with the timber haulage which had previously taken place on these roads during the existence of that same industry, and that the case was indistinguishable from *Gwionydd*

Rural District Council v. Green (72 J.P., 321). He gave judgment for the council for £33 11s. 9d. and costs.

QUERIES AND REPLIES.

In order to avoid confusion queries are requested to use distinctive words, as *noms de plume*. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

ALTERATION OF AREAS: COMPENSATION TO OFFICERS.

"Auld Lang Syne" writes: An application has been made to the county council by three urban district councils for the unification of their districts into one. The arrangement to do so is friendly, no opposition is expected, and the Order will no doubt be made. What I wish to ask is: (1) Have not the county council the same powers with reference to including a section in the Order relating to compensation to existing officers who may be displaced, as if the Order were made direct by the Local Government Board (I am aware that the latter have finally to approve the Order)? (2) If so, cannot an existing officer refuse to take office under the new authority, and still be entitled to compensation? (3) That being so, would not compensation for an officer having fifteen years' service (without added years) be assessed at 1/3ths of his salary, and emoluments for the five years preceding the Order? (4) Is a recent ruling of the Treasury to the effect that no years must be added, and do you know of any alteration in the law which alters the method of assessing compensation for completed years of service as set out in paragraph No. 3?

(1) Sec. 120 of the Local Government Act, 1888, provides for compensation to existing officers, and there is no need to make a special provision for this in the Order. (2) Yes; but in fixing his compensation regard will be had to any emoluments which he might have acquired if he had not refused to accept a new office. (3) The compensation would not exceed 15/60ths of the annual service, and emoluments plus 7/60ths additional for added years. It does not follow that it would amount to that. (4) Power was given to the Treasury to make an additional allowance for added years by a Treasury minute dated June 14, 1859. So far as I can ascertain, this minute has never been formally withdrawn. But it is permissive only, and it appears that of late years it has been the practice of the Treasury not to allow for "added years" except in what they consider to be "special cases."

BUILDING BY-LAWS: "HUMAN HABITATION."

"Alpha" writes: In the grounds of a private boarding school there has recently been erected a wooden building intended to be used as a gymnasium, and occasionally for private entertainments to be given by the pupils of the school, to which parents and friends of the pupils would probably be invited. The building, if "not constructed or adapted to be used either wholly or partly for human habitation," would, from its situation, be exempt from the operation of the building by-laws. Its legality, or otherwise, therefore hinges upon the interpretation of the words "human habitation." Will you kindly inform me whether, in your opinion, the use of a building for the purposes stated would render it a building used "wholly or partly for human habitation"?

There does not appear to be any authoritative definition or explanation of the expression "human habitation" as used in by-laws. On reading clauses (1) and (2) of No. 2 of the Model By-laws, in which the expression occurs, I am of opinion that "habitation" is there used in the sense of "residence." This view seems to be corroborated by the clause excluding from the exemption a building used as a place of habitual employment in a business, &c., which clause would be redundant on the assumption that "habitation" extended to any user short of actual residence. In my opinion, therefore, the use of a building as a gymnasium and for occasional private entertainments, is not a use "wholly or partly for human habitation." I think the phrase "wholly or partly" is used to cover the case of a building of which part only may be used as a residence.

HIGHWAY DIVERSION.—"O. P. H." writes: Plans were deposited by the lord of the manor showing a proposed diversion of an old parish highway and the laying out of a new road. These plans were duly approved by the council, and the diversion and a new road have been roughly formed and ballasted. Now the council consider that the lord of the manor should complete the diversion. He offered to com-

plete the surface of the roadway if the council laid the kerb, channel, lighted and completed the foot-paths. This the council refused to do. Now the lord of the manor says he has done all he intends to do, and that the council can proceed under the Private Street Works Act, 1892. Can such a diversion of an old parish highway be dealt with under the Act, or is the lord of the manor bound to complete the road? The diversion is much wider than the old highway, the old road being about 18 ft. wide, and the diversion 36 ft.

The only way in which the diversion can be legally carried out, and the old highway stopped up, is by obtaining a magistrate's certificate in the manner prescribed by secs. 84 and 85 of the Highway Act, 1835. The consent of the council (exercising the powers of the vestry) is necessary for this purpose. The council could refuse to consent unless and until the new road is properly made up.

COUNTY SURVEYOR: LIABILITY OF COUNTY COUNCIL.—"Backfire" writes: The main roads of a certain county are directly maintained by the county council, and the county divided into certain districts. The surveyor in charge of each district has to provide a motor cycle, and use it in the course of his duties, the remuneration being an annual allowance. The surveyor's salary is over £150 per annum, and under £200 per annum. The remuneration as regards the running of the motor cycle is distinct from that of salary. The questions arising are: (1) In the event of the surveyor, in the course of his duties, meeting with a motor-cycle accident, and become injured in any way himself, who is the responsible party? (2) If the surveyor, riding the motor cycle, meets with an accident or mishap, and does injury to other parties, is he, or are his employers, responsible?

(1) Unless the surveyor's total remuneration, including the allowance for the motor cycle, exceeds £250 a year, the council would be liable to pay compensation under the Workmen's Compensation Act, 1906, for his personal injury by accident arising out of and in the course of his employment. (2) If the injury was the result of the negligence of the surveyor in the course of his employment the council would be liable.

PRIVATE STREET WORKS: ADOPTION OF STREET.—"Alphon" writes: Some time ago my council served notices under the Public Health Act, 1875, for a certain street to be made up, the work being ultimately put out to contract and duly completed to my satisfaction. Afterwards apportionment notices were sent out and all payments made except in one case, where a part of the amount was paid, the arrangement being that the remainder should be met in four yearly instalments. Before the work had been finished three months, and any money on account of apportionment had been paid, I was instructed to tar-paint the surface of the road, and now one of the frontagers who has paid maintains we have, by executing the aforementioned tarring, taken over the road. Is this so, considering the cost was paid out of the rates, and not out of any monies due to the contractor on account of his contract, and we have not declared it a public highway repairable by the inhabitants at large?

No. The only way in which the street can become repairable by the inhabitants at large is by notice under sec. 152 of the Act.

BUILDING BY-LAWS.—"Discipulus" writes: (1) Has an urban district council the power to permit a breach of its building by-laws? (2) If it has no power to do so, and yet permits a breach, can a ratepayer obtain a mandamus to compel the council to enforce its own by-laws?

(1) Not unless the by-laws themselves give the authority a dispensing power or discretion. See *Yabbicom v. King* (1899, 1 Q.B., 444). (2) I cannot find any recorded instance of a mandamus having been granted to compel a local authority to enforce their own by-laws, and I think it is doubtful whether a mandamus would be granted at the instance of a ratepayer, at all events, unless the Attorney-General were a party to the proceedings.

BUILDING BY-LAWS: "HUMAN HABITATION."—"A. R. S." writes: A building 12 ft. by 10 ft., which is on wheels, and constructed of galvanised iron, and is used for a coal order office. Can this building be classed as being used for human habitation? Can a council compel its removal?

I do not think this would be held to be a building intended for human habitation within the meaning of the by-laws. It is a question whether it is a building at all. See *London County Council v. Pearce* (1892, 2 Q.B., 109); *Same v. Humphreys* (1894, 2 Q.B., 755). Unless it is a building the council cannot compel its removal.

ERRATUM.

At p. 349 *ante*, column 1, line 30, for "July" read "February."

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Bradford T.C. (February 25th. Mr. F. H. Tulloch).—£6,705 for cottage baths at Greengates, Great Horton, Oswald-street, and Worthington-street; £800 for alterations and extensions at the Drummond-road baths; and £1,022 for the construction of bowling greens at Horton Park, Victoria Park, and Wyke Recreation Ground, and for transforming part of a tipping ground at St. Michael's-road into a recreation ground. The town clerk, Mr. F. Stevens, in explaining the grounds of the application, said that if there had been one thing more successful than another in the business of the corporation it had been the cottage baths. The baths were all erected in districts inhabited by the poorer classes of the population, and the convenience had been greatly appreciated. Evidence was also given with respect to the success of the existing bowlings.

Coalville U.D.C. (February 26th. Mr. F. H. Tulloch).—£216 for works of water supply.—The surveyor, Mr. L. L. Baldwin, stated that the work, which had been carried out, consisted of the laying of a 4-in. main to link up existing mains. A slight accident to a hydrant on the 12-in. supply main brought home to the council the risk of having the whole of the water supply to Coalville and Hugglescote cut off, and it was then decided to lay this connecting link. Owing to the tenders being excessive, the work was carried out by council labour. The inspector said if the tenders exceeded their estimate, it was wise for the council to carry out the work themselves.

East Stow R.D.C. (February 25th. Mr. W. O. E. Meade-King).—£1,147 for the purposes of water supply for Combs.—Mr. G. Midgley Taylor stated that the scheme would supply 250 people, and be a stand-pipe supply. A 6-in. diameter bore was contemplated, and the expected depth to the surface of the chalk was 90 ft. Each half of the proposed reservoir would contain three days' supply, that being 7,500 gallons.

Haslingden T.C. (February 25th. Mr. M. K. North).—£600 for the sewerage of Sunnybank, Helms-shore.—The borough surveyor, Mr. J. S. Green, said that the population which the sewer would serve was about ninety. There would be no separate surface water sewer, because the river ran parallel with the land, and the surface water could drain into that. They would use earthenware pipes except for 323 yds., where iron pipes would be used.

Hastings T.C. (March 11th. Mr. M. K. North).—£4,890 for the repaving of three streets.—In his evidence the borough surveyor, Mr. P. H. Palmer, stated that the experience of the council with regard to Jarrah blocks had been very good indeed.

Hove T.C. (March 5th. Mr. Edgar Dudley).—£10,000 for the widening and improvement of Hove-street.—The borough surveyor, Mr. H. H. Scott, stated that there was a considerable population in the north-western part of the borough, particularly in the summer-time, and this street formed part of the main artery to the sea front. The present street was only 30 ft. in width, and it was proposed to widen it to 60 ft. The widening had actually been commenced at each end.

Lowestoft T.C. (February 19th. Major J. Stewart).—£547 for alterations and extensions to the Royal Plain lavatory.—Evidence as to the proposed work was given by the borough surveyor, Mr. G. H. Hamby, it being stated that the lavatory, which was constructed some twenty years ago, was now inadequate.

Shepley U.D.C. (February 19th. Mr. Edgar Dudley).—£750 for the purchase of a recreation ground and bowling green.—The clerk, Mr. E. Emmott, stated that the area of the ground was 8 acres 730 sq. yds.

Stafford T.C. (March 10th. Mr. A. G. Drury).—£13,700 for gasworks' extension.—The gas engineer gave evidence as to the development of the undertaking, and said it was found necessary to increase the holder capacity by the addition of another gas-holder.

Tavistock U.D.C. (March 10th. Mr. W. O. E. Meade-King).—£750 for works of water supply.—The surveyor, Mr. F. Gamble, explained that it was pro-

posed to carry a main from the reservoir on Whitechurch Down to supply a number of houses on the Chollacott estate.

Wallasey T.C. (March 6th. Mr. T. Adams).—This was an inquiry into the application of the council for permission to prepare a town planning scheme for an area bounded on the north by Sandfield-road, on the east by Seabank-road, on the south by a line between the junction of Penkett-road and Stratheona-road and the junction of Elgin-drive and Seabank-road, and on the west by Penkett-road and Rake-lane. The total area is 1,423 acres, and practically all the land is potential building land, and extensive building operations it was stated might start at once.

Ware U.D.C. (February 25th. Mr. Edgar Dudley).—£1,000 for the widening and improvement of Star-street, and an application by the county council to borrow £1,500 as a contribution towards the improvement. The clerk to the urban council, Mr. G. H. Gisby, stated that the road was extremely narrow. There was a considerable amount of traffic over the road, which was a main road to the east side of the county. The junction of this street with the main street was particularly dangerous, and occasionally vehicles with wide angles had stuck in the narrow part of the street. The surveyor, Mr. H. Fox Hill gave figures and particulars regarding the materials of which the new street would be constructed.

West Hartlepool T.C. (March 6th. Mr. W. M. Cross).—£2,200 for the extension and rearrangement of the public library buildings. It was explained that it was proposed to adopt the open-access system in the lending department. The present news-room, which is to be converted into the lending department, will be enlarged to twice its size, and the present lending department will become the news-room.

Wilmslow U.D.C. (February 26th. Mr. P. M. Crosthwaite).—£1,100 for road improvements.—It was explained that it is proposed to widen Hawthorn-street, Macclesfield-road, Hough-road, and Mottram-road.

APPLICATIONS FOR LOANS.

- Bacup T.C.**—£1,000 for electric lighting extension.
Baldock U.D.C.—£420 for a water supply scheme, and £5,207 for a sewerage scheme.
Barnmouth U.D.C.—£2,300 for the provision of an open space.
Barrow-in-Furness T.C.—£8,000 for electricity mains, services, and other equipment.
Birkenhead T.C.—£1,350 for road improvement.
Bognor U.D.C.—£480 for the purchase of a steam roller with scarifier and water sprinkling attachment.
Christchurch T.C.—£3,850, supplementary loan for the sewerage scheme.
Croydon T.C.—£3,800 for the provision of a Game-well fire alarm.
East Cowes U.D.C.—£1,325 for pumps and a suction gas engine at the waterworks.
Epsom U.D.C.—£706 for water mains extension.
Hornsea U.D.C.—£1,500 for the erection of eight cottages.
Knaresborough U.D.C.—£3,180 for an electric lighting scheme.
Larne U.D.C.—£3,500 for road improvement.
Mansfield T.C.—£1,200 for road widening.
Rochdale T.C.—£17,000 for a tramway-car shed and machinery.
Swaffham U.D.C.—£1,110 for a new cemetery.
Torquay T.C.—£5,000 for the extension of electricity mains.
Ulverston U.D.C.—£5,612 for a sewerage scheme.
Workshop U.D.C.—£350 for a public convenience.

LOANS SANCTIONED.

- Beeston U.D.C.**—£28,770 for sewerage and sewage disposal works.
Chertsey R.D.C.—£1,520 for sewerage works.
Clevedon U.D.C.—£2,424 for drainage works.
Colne T.C.—£4,450 for the purchase of ground for a recreation ground.
Dartford U.D.C.—£1,835 for street works.
Glossop T.C.—£170 for road improvement.
Manchester T.C.—£10,000 for the purchase of Hulme Barracks site.

Nelson T.C.—£26,000 for vertical retorts and other equipment at the gasworks.

Potterspurty R.D.C.—£3,500 for works of water supply.

Ramsgate T.C.—£3,041 for tar-macadam paving, and £3,467 for wood paving.

Sandown U.D.C.—£490 for road improvement.

Scarborough T.C.—£3,412 for improvements in the South Cliff Gardens.

Twickenham U.D.C.—£5,300 for resurfacing Cross Deep and Waldegrave-road with asphalt macadam.

FORTHCOMING INQUIRIES.

	MARCH.	£
17.— Birkenhead. For street improvement (Mr. Edgar Dudley)		1,315
17.— Hereford. For the erection of workmen's dwellings (Mr. Edward Leonard)		11,752
17.— Leicester. For road widening and sewerage works (Mr. R. H. Bicknell)		1,381
17.— Manchester. For the purposes of water supply (Mr. W. M. Cross)		50,000
17.— Nelson. For the erection of slaughter-houses and street improvement (Major J. Stewart)		26,162
18.— Harrogate. For water supply and street improvement (Mr. R. G. Hetherington)		8,362
18.— Melton Mowbray. For cemetery extension (Mr. R. H. Bicknell)		700
18.— Preston. For works of sewage disposal (Mr. W. M. Cross)		12,075
19.— Bucklow. For works of sewerage (Mr. W. M. Cross)		1,624
19.— Crowle. For the provision of a refuse tip (Mr. Edgar Dudley)		150
19.— Keswick. For the erection of workmen's dwellings (Mr. C. H. Eyles)		600
19.— West Derby. For works of sewerage (Major J. Stewart)		2,200
19.— Willesden. For private street improvement (Mr. M. K. North)		3,755
20.— Chester-le-Street. For the erection of workmen's dwellings (Mr. C. H. Eyles)		50,600
20.— Congleton. For works of sewage disposal (Mr. W. M. Cross)		1,100

Scottish Road Works.—At the last meeting of Kilwinning Town Council the burgh surveyor reported that the cost of the proposed scheme to cause-way the main streets of the burgh would be £5,000. The council decided to communicate with the Road Board, pointing out their proposals for improving the roads within the burgh, asking what grant they were likely to offer in the event of the work being carried out, and the terms on which the board would grant a loan sufficient for the purpose, to be repaid in annual instalments spread over 30 years.—At the monthly meeting of Largs Town Council it was stated that, in reply to a request for a grant for the re-making of a portion of the trunk road through the burgh, the Road Board had intimated that they were not prepared to give any further grants to the burgh, but offering a loan of £600 without interest on the estimated expenditure of £900.

Refuse Disposal in Edinburgh.—In Mid-Lothian Justice of Peace Court on Tuesday a case was heard in which John Gibson, inspector of lighting and cleansing, in the employment of Edinburgh Corporation, was charged with depositing at Camps Quarries, Mid-Lothian, manure which contained waste paper, and failing to take means to prevent the paper being carried away by the wind. Evidence was given to show that the public road was covered for about 200 yds. with waste paper, and that it found its way into adjacent properties. Mr. Gibson, giving evidence, said that the disposal of city refuse was one of the most troublesome questions that corporations had to deal with. He mentioned the precautions taken to prevent paper flying about. Given certain weather conditions it was impossible to keep paper from flying about. Evidence was also given by Councillor Bruce Lindsay, convener of the Cleansing and Lighting Committee, who said that the spraying arrangements were the best that could be adopted. A penalty of £2 was imposed. Notice of appeal was given.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works, of which particulars appear below: Buildings—Forfarshire £20,000, Newport £15,000, Torquay £15,000; housing and town planning—Chester-le-Street; roads and materials—Lambeth £69,552; sewerage and sewage disposal—Dalkeith £8,000; water, gas and electricity—Birkenhead, Croydon £15,000, Torquay £50,000.—Particulars of other works projected will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Dudley T.C.—The Higher Education Committee recommend the erection of a hostel for men in connection with the training college, towards which a contribution of 75 per cent of the cost would be obtained from the Board of Education.

Dumfries T.C.—It has been agreed, in conjunction with the burgh of Maxwelltown, to erect swimming baths at an estimated cost of £4,400.

Forfarshire C.C.—A scheme has been approved for the adaptation of Noranside House as a sanatorium, at an estimated cost of £20,000.

Hexham U.D.C.—It is proposed to build a shelter on Tyne Green, at an estimated cost of £350.

Newport (Mon.) T.C.—It was agreed at the Works and Parliamentary Committee meeting on Monday to carry out extensions of the town hall, at an estimated cost of £15,000.

Prescot U.D.C.—The Local Government Board have sanctioned a loan for the provision of a fire escape station.

Salford T.C.—It has been decided to purchase the premises and the site adjoining a church school for £5,490, for the purpose of a council school.

Selby R.D.C.—It has been agreed to contribute £2,500 towards the cost of the new bridge over the Aire at Carlton, provided the Goole Rural District Council contribute a similar amount. The estimated cost of the scheme is £16,000, and the balance of £11,000 will be met by the county council.

Swansea T.C.—Plans have been prepared for a new school for 1,200 scholars.

Tunbridge Wells T.C.—A tea kiosk is to be built in the St. John's Recreation ground, at a cost of £250.

Torquay T.C.—A report has been submitted stating that the Local Government Board had approved generally of the corporation's scheme for the provision of medical baths and swimming bath, at an estimated cost of £15,000.

HOUSING AND TOWN PLANNING.

Balbriggan U.D.C.—The council have determined upon a scheme for the better housing of the working classes of the town. The scheme proposes to provide thirty houses in the urban area, to be let at rents of 3s. to 4s. 6d. weekly, for which class of dwelling there is a large and urgent demand.

Buckingham T.C.—A committee has been appointed to prepare a scheme of workmen's dwellings.

Chester-le-Street U.D.C.—It has been decided to proceed with a scheme of municipal housing on model lines. An estate of 17 acres has been secured on the western side of the town, near the railway station, in a most healthy position, and on this it is proposed to build 198 houses at a cost of £50,609. There will be 116 houses with a kitchen, scullery and two bedrooms; 70 with kitchen, scullery and three bedrooms; and 12 with parlour, kitchen, scullery and three bedrooms. Each house will have a bath in addition. The rents will be 5s. 9d., 6s. 9d., and 7s. 9d. a week respectively. Each house will have a garden both at the back and front; there will be no back streets, but the front streets will be 40 ft. wide, with grass verges, trees, and good footpaths. The main approach will be 50 ft. wide. About 3 acres of the land is to be reserved for a children's recreation ground, and twenty-four sites abutting on the main road are to be sold to private individuals for the erection of a better-class house than any of those to be built by the council.

Irvine T.C.—It has been resolved to consider in committee the advisability of erecting houses suitable

for the working classes under the powers contained in the Housing of the Working Classes Acts, 1890 to 1909.

Kidsgrove U.D.C.—The surveyor, Mr. F. C. Crimes, has received instructions to report upon the provision of cottages at Hardingswood, on land belonging to the council.

Motherwell T.C.—A housing scheme has been adopted, the class of house to be erected to be, approximately, thirty one room and kitchen houses, with scullery and bath-room, ten two-room and kitchen houses, with scullery and bath-room, the remainder to consist of a larger class of house.

Naas U.D.C.—The council have accepted the tender of Mr. Denis Corcoran, Naas, at £1,599, for the erection of six artisans' dwellings near the railway station.

Newcastle-on-Tyne T.C.—The city surveyor, Mr. F. H. Holford, has received instructions to prepare plans for the erection of workmen's dwellings in City-road, and round South Byker playground, consisting of houses of two, three and four rooms.

Swansea T.C.—The Housing Committee recommend the corporation to appoint a new official, at a salary of £150 a year, whose duty it shall be to draw up specifications in reference to dilapidated properties. The medical officer of health and the borough architect, who have advised this course, reported that in Birmingham and Nottingham there is a special department for this purpose under the health authority.

Tenby T.C.—A scheme is under consideration for the provision of workmen's dwellings, at an estimated cost of £3,000.

Upholland U.D.C.—The council on Monday approved plans of eight houses to be erected under the Housing and Town Planning Act. Four of the cottages are not to cost more than £160 per house, and four not more than £175 per house. It was stated that for years there had been a serious shortage of workmen's dwellings in the district. The land had been offered at 1½d. per square yard. The Local Government Board is to be asked to sanction a loan.

REFUSE COLLECTION AND DISPOSAL.

Tiverton T.C.—A special committee has been appointed to consider the desirability of purchasing a steam tractor to remove the town refuse and do the borough haulage.

ROADS AND MATERIALS.

Barnoldswick U.D.C.—A scheme is under consideration for the construction of a road from Long Ing to Earby and Salterforth-road, at an estimated cost of £2,600.

Bicester U.D.C.—A proposal is being discussed for the improvement of Market-square and the provision of public conveniences, at an estimated cost of £631.

Bridgwater R.D.C.—The surveyor, Mr. W. A. Collins, has been instructed to prepare plans and estimates of alternative schemes for the road improvement at Wenubdon Hill.

Chelsea B.C.—The Road Board have sanctioned a grant of £1,000 towards the cost of paving work on the Embankment.

Colne T.C.—The council have approved a report by the borough surveyor, Mr. T. H. Hartley, and the town clerk, Mr. A. Varley, with plans and estimates, on the construction of a road from Byron-street to Keighley, and it has been decided that the thoroughfare shall be made 14 yds. wide. The estimated cost of the scheme is £9,100.

Lambeth B.C.—The Highways Committee have prepared a list of repairs and paving works to be done to various roads, amounting to £69,552.

Lewisham B.C.—It was recently reported to the council that the Improvements Committee of the London County Council were considering a suggestion of a new road of 70 ft. from Southend Village, in a south-easterly direction along the Ravensbourne Valley, to a point in Bromley, in line with Mason's-hill. The new road is proposed in preference to the suggestion to continue the widening of Bromley-road for the whole of its length to the Bromley boundary.

Northampton T.C.—The Highways Committee have adopted a scheme for the improvement of the Houghton-road, at an estimated cost of upwards of £7,400, towards which the Road Board had agreed to make a grant of £3,000. The Road Board have intimated that in addition they will lend the council a further sum of £3,000, free of interest, for a period of six years, the amount to be repaid by annual instalments of £500.

Oxford T.C.—It is proposed to reconstruct the foundations of the main streets, at an estimated cost of £1,000.

Torrington R.D.C.—In consequence of the increase in road work a road foreman is to be appointed to assist the surveyor, Mr. B. T. James.

SEWERAGE AND SEWAGE DISPOSAL.

Beverley R.D.C.—At the meeting of the council recently, a letter was read from the Local Government Board stating that they heard with regret the decision of the rural council not to proceed with the sewerage scheme for the contributory place of Elloughton-with-Brough, as required by the board's Order of December 19th last. The board further stated that unless they received within two months from the date of that letter a satisfactory assurance from the council that the works necessary for providing the contributory place with sufficient sewers would be commenced within the time limited by the Order of the board, they would, without addressing further communication to the council, place the matter in the hands of solicitors with instructions to apply to the High Court of Justice, immediately after June 10th next, for a writ of mandamus to enforce the Order. The council decided only to acknowledge the letter.

Burntisland T.C.—Improvements are to be carried out in the drainage, at an estimated cost of £668.

Dalkeith T.C.—A site has been obtained at Newmills for sewage disposal purposes, and the council have accepted an estimate, at about £8,000, for the necessary works.

Haywards Heath U.D.C.—The tender of Mr. H. White, at £178, has been accepted for sewer construction in Eastern-road.

Hetton U.D.C.—The surveyor, Mr. J. Harding, has prepared a scheme of sewerage extension, the cost of which he estimates at £954.

Wrexham R.D.C.—The first instalment of the Gwersyllt drainage scheme is to be carried out, at an estimated cost of £2,000.

WATER, GAS, AND ELECTRICITY.

Aberayron R.D.C.—The council are being pressed by the county council to provide an efficient water supply, and it has been decided to obtain the views of the parish councils on the subject.

Birkenhead T.C.—A special sub-committee of the Water Committee have recommended the acceptance of the tender of Messrs. T. Wardle & Sons, Bristol, for £140,325, for the construction of the Dee tunnel and pipe line between Connah's Quay (Flintshire) and Birkenhead, in connection with the Plwen water supply.

Bradford T.C.—The Gas Committee have approved a scheme for new carbonising plant.

Croydon T.C.—The chlorine process of water purification, capable of dealing with 4,000,000 gallons daily, is to be installed, at an estimated cost of £15,000.

Derby T.C.—It is proposed to provide additional electricity plant, at an estimated cost of £12,540.

Doncaster T.C.—Since the Leeds ratepayers rejected the clauses in the Leeds Corporation Bill empowering that authority to supply water to Doncaster, the Special Water Committee of the Doncaster Corporation have been forced to consider other sources of supply, and the matter is still engaging their attention. It is understood that a scheme has been brought before them for a supply from the red sandstone strata underlying the town and district.

Exeter T.C.—The Electricity Committee have decided to instal a 1,000-kilowatt high pressure steam turbo alternator of the impulse type at the electricity works to meet the increasing demand for current, and particularly in view of the additional framecars to be provided. The price of the new generator is £4,211, and the total cost is estimated by the electrical engineer at £6,200; but he considers that it will save a minimum of £440 per annum.

Gateshead T.C.—It was agreed last week to adopt the electrolytic system for purifying the water used in the Mulgrave-terrace swimming bath. The council further decided that the plant laid down should be of sufficient capacity to provide, in addition, fluid for the disinfecting of schools and for other public sanitary purposes. It was estimated that the cost of the plant would be £450.

Grantham T.C.—The council have accepted the tender of the Grantham Gas Company for street lighting for five years.

Hay (Brecknock) U.D.C.—The surveyor, Mr. A. E. Smith, has received instructions to prepare a scheme for a water supply from Dulais Brook.

Kidderminster R.D.C.—Plans have been passed for the enlargement of the Bewdley waterworks, including the area of the new borehole. The council have also signed the agreement with the Bewdley Corporation for the supply of water in bulk for the parish of Wribbenthal.

Kinghorn T.C.—The question of an improved water supply is under the consideration of the council.

Torquay T.C.—The Local Government Board have sanctioned a loan for the first part of the new water main which it is proposed to lay from the reservoirs on Dartmoor to the town in sections at a total estimated cost of about £50,000.

Whitchurch (Ross) R.D.C.—It has been agreed to forward the plans of the new water supply scheme to the Local Government Board for their approval.

PERSONAL.

Mr. W. J. B. Smale, surveyor to the North District of the Liskeard Rural District Council, has been voted an increased salary of £25 a year.

Mr. H. Hamer, deputy borough engineer of Acerington, has been appointed chief assistant to the borough surveyor of Stockport in succession to Mr. Ward.

Mr. C. Moulds, surveyor for the Louth district under the Horncastle Rural District Council, has resigned in order to take up a position in the South of England.

Mr. Robert Thomas has been appointed, at a salary of £80 a year, rising to £100, surveyor to the Valley (Anglesey) Rural District Council in succession to the late Mr. J. Hugh Evans.

Mr. Archibald Edwin Hewitt, of Hexthorpe, Doncaster, has been appointed sanitary surveyor and inspector of nuisances to the Blyth and Cuckney Rural District Council, at a salary of £130 per annum.

Mr. T. G. Crump and Mr. S. S. Orchard, surveyors to the Taunton Rural District Council, have each been voted increases of salary, from £230 to £250 in the case of the former, and £180 to £220 in the case of the latter.

Mr. David Ronald, burgh engineer of Falkirk since 1898, has been appointed to the engineering staff of the Local Government Board for Scotland. Mr. Ronald is hon. secretary to the Scottish District of the Institution of Municipal and County Engineers.

Mr. W. W. Newman, ASSOC. M. INST. C. E., deputy engineer, Mr. W. H. Duckworth, and Mr. W. J. Staddon, engineering assistants to the Watford Urban District Council, have been granted an increase in their salaries, and further annual increases to a maximum of £300, £160, and £110 per annum respectively.

Mr. Arthur H. Blanchard, M.A.M. SOC. C. E., Professor in Charge of the Graduate Course in Highway Engineering at Columbia University, on February 19th delivered illustrated lectures at the Ohio State University on the subjects: "Road Legislation, Present and Future," "Bituminous Surfaces and Bituminous Pavements," and "Foreign Highways."

Mr. William Gibson, who at present holds the position of assistant burgh engineer, was on Tuesday appointed burgh engineer of Falkirk in succession to Mr. David Ronald. Mr. Gibson is a native of Falkirk, where he served his articles in an architect's office. For some time before becoming assistant burgh engineer at Falkirk he occupied a similar post in Arbroath.

Messrs. J. D. K. Restler, waterworks engineer's office, Rickmansworth, and W. J. A. Watkins, engineer's department, London County Council, have been transferred from the class of associate-members to

that of members, and Mr. J. Mayho, borough engineer's department, Burnley, has been elected an associate-member, of the Institution of Civil Engineers.

Mr. J. R. Davidson, M.Sc., Assoc.M.Inst.C.E., at present principal assistant engineer for the Rivington and Vyrnwy works, who has been in the service since 1898, and whose present salary is £600 per annum, is recommended by the Water Committee as water engineer of Liverpool, at a salary of £800 per annum, in succession to Mr. Joseph Parry, who is to act in the capacity of consultant city water engineer.

Mr. O. Claude Robson, engineer to the Willesden Urban District Council, has had his salary increased by £200 a year, and the council have also decided to provide him with a motor car upon the understanding that one-third of the cost thereof and of the annual maintenance expenses shall be borne by Mr. Robson. The car will be available for his private use when not required on official business. Mr. Robson, it may be added, has been in the service of the council for thirty-nine years, and the council have placed on record their appreciation of his "faithful and zealous service" during that long period.

Mr. E. Campbell MacCormac, formerly chief assistant in the sewage department of Messrs. J. Stone & Co., Limited, engineers, Deptford, S.E., has been appointed chief of the sewage department of Messrs. Daniel Adamson & Co., engineers and boiler makers, Dukinfield and Westminster. This firm's patent sewage (pneumatic) ejectors, air compressors, sewage distributors, &c., are now in extensive operation both at home and abroad. For many years Mr. MacCormac has been in close touch with the scientific design and lay-out of sewerage, sewage lifting and sewage disposal appliances, and many of his specialities have been adopted by the British Admiralty, the Crown Agents for the Colonies, and by numerous consulting civil engineers and municipalities.

FOR OTHER ADVERTISEMENTS

See End of Paper.

WANTED, in Surveyor's Department of Urban District Council, 16 miles from London, South-West Suburb, a Junior Clerk; must be good shorthand typist, and have had previous experience in a Municipal Surveyor's Office. Salary £45 per annum, rising to £65 per annum.—Box 1,395, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,429)

DRAUGHTSMAN-SURVEYOR seeks position or Partnership with Surveyor. Building Construction; Surveying and Levelling; good Draughtsman; 16 years with Liverpool Corporation. Could invest £100.—Box 1,397, office of THE SURVEYOR, 21 Bride-lane, Fleet-street, E.C. (1,434)

SURVEYOR'S ASSISTANT (22) desires appointment. Three years articled to a County Surveyor. Experienced and efficient surveyor, accurate leveller, neat draughtsman, and good photographer. Excellent testimonials. Moderate salary. Free immediately.—Box 1,396, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,433)

EAST GRINSTEAD RURAL DISTRICT COUNCIL.

TENDER FOR THE SUPPLY OF TAR.

The above Council invite Tenders for the supply of about 10,000 gallons (more or less) of Tar, prepared in accordance with the Road Board's Specification for Tar No. 1, delivered, carriage paid, in Contractor's own barrels, to the following Stations on the L.B. & S.C.Rly.:—

Three Bridges, Rowfant, Grange-road, West Hoathly, East Grinstead, Forest Row, Hartfield, Withyham, Groombridge, Ashurst, Crowborough.

The Council will pay railway carriage on the empty barrels to be returned.

Delivery will be required in full truck loads within 7 days from receipt of order, the first of which will probably be dispatched during the second week of April, 1914.

Tenders, endorsed "Tender for Tar," must reach Mr. Francis S. White, Clerk to the Council, 6 High-street, East Grinstead, on or before Wednesday, April 1st, 1914.

The Council do not bind themselves to accept the

lowest or any Tender, and reserve to themselves the power to require delivery of a greater or less quantity than the approximate quantity (10,000 gallons) named above, at the same rate as the Contractor's accepted price.

(By order of the Council)

FRANCIS S. WHITE,

Clerk.

March 11, 1914.

(1,431)

COUNTIES OF BERKS AND SOUTHAMPTON.

CONSTRUCTION OF A BRICK AND CONCRETE BRIDGE AT NEWTOWN FORD, NEAR NEWBURY.

TO CONTRACTORS.

Persons desirous of Tendering for the Construction of a Brick and Concrete Three-arched Bridge at Newtown Ford, on the Winchester, Whitechurch and Newbury Main Road, may see Plan, Specification and General Conditions, and obtain a copy of the Bill of Quantities and all other necessary information, on application at the office of Mr. W. J. Taylor, County Surveyor, The Castle, Winchester, on and after Monday, the 9th day of March, 1914, between the hours of 9 a.m. and 4 p.m. (Saturdays, 9 a.m. and 12 noon).

A deposit of two guineas will be required for a copy of the Bill of Quantities, which will be refunded on receipt of a *bonâ-fidè* Tender.

Deposits must be made by cheque, payable to the "Hampshire County Council," and crossed "Capital and Counties Bank," or particulars will not be sent.

Tenders, on forms supplied by the County Surveyor, must be endorsed "Newtown Bridge," and be delivered to me on or before 10 a.m., Wednesday, the 25th March, 1914.

The County Council do not bind themselves to accept the lowest or any Tender.

H. BARBER,

Clerk of the Hampshire County Council.

The Castle, Winchester.

February 26, 1914.

(1,435)

TRING URBAN DISTRICT COUNCIL.

TENDERS FOR MATERIALS.

The Council invite Tenders for the Supply and Delivery of Kerb, Setts, Broken Granite, Flints, and Hoggin, as and when required for the year ending 31st March, 1915.

Full particulars and Forms of Tender may be obtained on application to the undersigned.

Sealed Tenders, endorsed "Tender for Materials," and accompanied by Samples, must be delivered to me not later than noon on Monday, the 23rd day of March, 1914.

The lowest or any Tender will not necessarily be accepted.

S. S. GETTINGS, Assoc.M.Inst.C.E.,

Surveyor.

Surveyor's Office,

Tring.

March 11, 1914.

(1,425)

THINGOE RURAL DISTRICT COUNCIL.

Tenders are invited for the supply of Granite during the year ending 31st March, 1915.

Particulars and Forms of Tender may be obtained on application to the undersigned.

A. R. CAMERON.

Board Room,

Mill-road,

Bury St. Edmunds.

March 11, 1914.

(1,430)

URBAN DISTRICT COUNCIL OF THAME.

TENDERS FOR GRANITE.

Tenders are invited for the supply of Granite during the year ending March 31st, 1915.

Forms of Tender and all particulars may be obtained on application to Mr. James T. Robinson, Surveyor to the Council, Town Hall, Thame, to whom Samples of the Materials tendered for must be delivered not later than Monday, March 23rd, 1914.

Endorsed Tenders must be sent to the undersigned not later than Monday, March 23rd, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

C. SIMMONS,

Clerk to the Council.

2 High-street,

Thame.

March 10, 1914.

FIRE RESISTANCE OF REINFORCED-CONCRETE FLOORS.

At a time when the question of reinforced concrete is largely before the technical professions, and the question of regulating such structures is receiving the attention of the public authorities concerned, a report issued by the British Fire Prevention Committee (as Red Book No. 188), dealing with a fire test on a reinforced-concrete floor with triangular lattice reinforcement, may be deemed to be of special interest.

The prefatory note to the report indicates that, in comparison with other floor tests, the instructive feature of this investigation is that granite chippings do not appear so satisfactory from the fire point of view as some of the other materials that have been used in the committee's tests, and, further, that the question of protecting the soffit of the reinforced-concrete beams requires careful attention.

It speaks well for the system of construction and

MERRYWEATHER'S PORTABLE PETROL PUMPING SET.

the form of reinforcement used that, regardless of what appears to have been an unsatisfactory concrete aggregate, the floor stood up so well, and obtained the British Fire Prevention Committee's classification of "Full protection, Class B," which means a four-hour test with temperatures reaching 1,800 deg. Fahr., followed by the application of water from a steam fire engine, and it is obvious that if a better form of concrete had been used, and the question of protection had received more consideration, an even better result with less deflection must have been obtained—*i.e.*, a result that would have practically left the floor in such a condition that it need not be taken down for reinstatement after a severe fire.

The British Fire Prevention Committee is testing one to two large floors every year, and, apart from the non-proprietary systems of construction that they have tested, a number of patented systems have now obtained the highest classification, which gives them a special claim for employment by the public authorities and corporations with whom safety from fire is a matter of importance.

Some thirty floors have now been tested by the committee, of which about half were proprietary floors and half floors in common use.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier*.

FLOODED TRENCHES.

A PETROL-DRIVEN PUMP.

We illustrate a light portable petrol pumping set which has recently been supplied to the Rickmansworth and Uxbridge Valley Water Company by Messrs. Merryweather & Sons, of Greenwich, to suit the special requirements of Mr. J. D. K. Restler, the company's engineer. It is employed for pumping out flooded trenches when repairs are being executed.

The pump, which is of the centrifugal type, is capable of dealing with from 200 to 250 gallons of water per minute, and of working on a suction lift of 15 ft., and delivering against a head of 6 ft. The pump casting is of iron, with steel spindle and gunmetal impeller, and has 4-in. pipe connections. The suction inlet is fitted with a gunmetal flange, having screwed connection for the attachment of flexible suction hose and foot valve. The outlet is fitted with a 4-in. gunmetal bend, with connection screwed for the attachment of flexible hose. It is also provided with a smaller screwed connection at the top for priming purposes by hose from the street main. The engine is direct coupled, has two cylinders, and develops 4 to 5 b.h.p. when running at about 1,000 revolutions per minute. It is fitted with magneto ignition, automatic lubrication, and is water cooled by a branch from the delivery.

The engine and pump are mounted on a strong four-wheeled carriage, with angle-steel side frames suitably braced and stayed, and provided with drag-handle. Wide tyred wheels are fitted for use over soft ground, and a small wooden box for tools is placed over the fore-carriage.

A portable petrol-driven trench pump has, undoubtedly, been a long-felt want, and one may prophesy the speedy adoption of such an extremely handy little appliance by waterworks engineers generally.

Association of Engineers-in-Charge.

The nineteenth annual dinner of this body will take place at the Holborn Restaurant on Saturday, March 21st, Dr. R. T. Glazebrook, the president, in the chair.

Inland Waterways.—The Prime Minister was asked in the House of Commons on Monday if, in view of the growing interest in the Midlands and South and West of England in the development of inland waterways of the country, he would state whether the Government proposed to appoint a Waterways Board, as recommended by the Royal Commission on Canals, or to carry out by legislation or otherwise any of the other recommendations of that commission. Mr. Asquith, in reply, said the Royal Commission recommended that the first step should be the appointment of a Central Waterways Board for Great Britain, and most of the other recommendations were dependent on that step being taken.

Concrete Pipes and Paving Blocks.—In Johannesburg the manufacture of concrete pipes for storm-water drainage, and paving blocks, is carried out departmentally by white labour. During the twelve months ended June last the number and sizes of pipes made were as follows: 825 12 in., 644 15 in., 549 18 in., 542 22½ in., 223 25 in. Total, 2,783 pipes, or 2,668 yds. when laid. A large number of concrete paving blocks for approaches to refuse destructors and intakes, and for tramway tracks, were made departmentally. These blocks are faced on the upper surface with granite spalls. They vary in size up to 26 in. by 20 in., and are 4 in. thick. The total area of blocks made during the year amounted to 3,450 sq. yds.

ORDERS FOR FOREIGN STEEL.

STELLORITE COMPANY'S CLAIM.

We are indebted to our contemporary the *Hythe Reporter* for the following report of a case which was recently heard at the Hythe County Court, in which the Stello-rite Company, Paris, sued the Hythe Gas Company. They claimed £29 12s., the price for the following steel sold and delivered: 1 cwt. 2 qrs. 1 bar, Stello-rite steel, 2½ in. square, for cold sets, at 1s. 4d., £12 1s.; 3 qrs. 26 lb., 1 bar, Stello-rite steel, 1¼ in. square, for smith use, £7 6s. 8d.; 1 cwt. 1 qr. 8 lb. ½ bar, Stello-rite steel, 2 in. square, £9 17s. 4d.

Mr. H. J. Wallington, instructed by Mr. W. H. Speed, appeared for the plaintiff, and Mr. Clements, instructed by Messrs. Atkinson & Stainer, appeared for the defendants.

After Mr. Wallington had briefly opened the case—

Mr. Tom Hayman went into the box, and said he was a partner in the plaintiff firm. On July 21st last year he called at the offices of the Hythe and Sandgate Gas Company. Mr. Tully, the manager, was away. He discussed with the son the question of him giving an order for some of the Stello-rite steel, and he (witness) described the qualities and its capabilities. He said to the son, "Your father being away you have no power," and he replied, "Oh, yes; I have full power." Eventually he gave him an order.

Cross-examined by Mr. Clements: The gentleman who signed the order said he was the manager's son. He (witness) had been a partner in the firm since July 24th last year. He was a traveller for the firm for six months before he became a partner. Their address was in Paris. At present they were getting someone to manufacture for them in Paris, according to their instructions. The son did not say his father was away, and that he had no authority to order any goods. He said he had full power when his father was away. He told Mr. Tully he would like him to try some of the steel, as there were others who had tried it. He did not say, "It is a pity your father isn't here." The son certainly did not write the order at his dictation. He saw what orders he (witness) had, and copied one. He told him that the approximate cost would be £34. When he told him it was about £13 per bar he said it was a lot of money, but he told the son he was only getting half a bar. He swore that when the young man signed the order he knew he was signing for £34 worth of goods. He did not know that the invoice was not sent until months after the goods were delivered.

In reply to further questions witness said that he explained what three metres meant.

Mr. Clements: I put it to you that you played a trick on this young man?

Mr. Hayman: I object to that remark.

Did you play a trick on him?—Certainly not.

Is it the first time in the course of your business experience your customers have made a mistake in regard to this measurement of the metre?—Out of hundreds and hundreds of orders.

Mr. Clements mentioned three other cases which had been taken by the Stello-rite firm at Market Harborough; but Mr. Hayman said he did not think the defence set up was that he had tricked the people into the orders, and that they did not understand the measurement of a metre.

Mr. Clements: Having that experience, why didn't you make it perfectly clear to this young man, so that this mistake was not made by him?

Mr. Hayman: I did.

You don't suggest it is as clear as the invoice attached to the summons?—No, not as clear.

Mr. Hayman was questioned as to whether he had done business with the Gosport Urban District Council, and he replied that he did not remember. He did not remember the name of Mr. Harvey, at Gosport.

In reply to a remark by Mr. Wallington, Mr. Clements said he could show Mr. Hayman had been following this system of fraud, and therefore would be likely to follow it to the end.

His Honour: What he said to this gentleman I cannot hear.

Mr. Clements: I say it is a trick played on Tully, and I am entitled to show he has played a similar trick as a system of business. I am entitled to give evidence to show the state of his mind when he

gave this order, if he induced him by fraud to give this order. Did you take an order from Mr. Harvey on behalf of the Gosport Gasworks?

Mr. Hayman: I don't remember.

Have you sent in an account to the Gosport Urban District Council?—They are owing us some money.

Do you know as a matter of fact you have issued a writ against them?—I don't know.

Do you know they have refused to pay on the ground of fraud?

Mr. Wallington: I object to this kind of cross-examination.

Mr. John Hayman was the next witness, and said he was a partner in the company. It was a French company. He had control of the correspondence department, the sending off of the goods, and the invoicing. The goods mentioned had been sent by him to the defendants.

Several letters were read, in which defendants said it was understood from the representative that they would only be short lengths, otherwise they would not have ordered it, as they had no authority to order large quantities. They asked where the goods could be despatched to. The firm replied that there could not have been any mistake on their part, and the length of the bars had been pointed out to the person who signed the order. In reply the firm got a letter on August 23rd, which Mr. Clements pointed out was not signed by Mr. Tully, but was initialed by "J. T." The letter stated that it was quite true the steel had been ordered by their firm, and agreeing to keep one length, but it was of no use to them as they were such large bars. Could they send it anywhere to execute one of the orders. The firm replied that they were unable to take the goods back, and offering 10 per cent discount on the amount.

Cross-examined by Mr. Clements: They had works in Paris. They did not employ many men now—about fifteen. They did not make the steel supplied to the gas company, but it had been made for them according to their own instructions. He supervised the making, and it was sent off by themselves. He could not tell them who made the goods for them. They had several manufacturers. He could not tell them who made these particular goods. The Stello-rite steel was their own speciality, which could only be made according to their formula. They owned the sole rights for the world.

Mr. Clements contended the claim could not possibly succeed. On the admission by the clients in the box, the order was given by an agent of an agent. It was signed, not on behalf of the gas company, but on behalf of the manager of the gas company. In any case, that was assuming there had been delegation of authority, and the agent, Mr. Tully, the manager, would have no right to delegate his authority to his son or anyone else, except under express orders from his principals. He asked His Honour to say the plaintiffs had not proved the agency.

Mr. Wallington having addressed the Court, His Honour said that his present opinion was that the plaintiffs had not proved that young Tully, by legal evidence, had the authority to give an order on behalf of the gas company, and for that reason only the action failed. From none of the facts of the case that day had he heard anything whatever, on the part of the plaintiffs, of what they might be ashamed. He could see no evidence of trick or attempting to deceive. He only went on the facts of this case, and he saw nothing whatever discreditable to them.

Mr. Clements offered to give evidence in the case, and called Mr. C. B. Tully, who said he was the manager of the Hythe and Sandgate Gas Company.

Cross-examined by Mr. Wallington: He was prepared to swear he was away on holiday at the time, but he could not give the dates. When he was away his son conducted the business of the company, and looked after the office. His authority for orders was limited to £5, and he would not give an order for more than that amount without the authority of the board. His son told him there had been a steel traveller sent by Mr. Jones, of Burslem, and he had given an order for a sample for testing. He took his word that it was a small sample. His son Thomas told him he thought the steel would be about 1 in. long, as it was marked on his rule. He showed him the rule, and his son had taken centimetres for metres. When his son told him he thought it was 1 in. he laughed at him. He laughed at him for being such a fool.

Mr. Wallington: When did you come to the con-

clusion that this gentleman in offering these goods had been guilty of a trick?

Witness: I have known of the game for years.

Mr. Wallington: Will you be surprised to hear that this company has only been in existence for one year?

Asked what he meant by tricked, Mr. Tully said it was talking ignorant men into buying things they did not want. It was a gift. (Laughter.)

His Honour said he was compelled to hold plaintiffs had not proved their case. He held the company were not legally responsible.

His Honour granted a stay of execution for fourteen days.

THE PHYSICAL PROPERTIES OF CLAY.

By ARTHUR E. BROWN, B.Sc.

[We make the following extracts from an interesting paper on "Bricks and Brickmaking," which Mr. Brown read last night at a meeting of the Society of Architects.]

Clay is unique, though to many it is only dirt, because it is the only substance found in nature possessing the property of plasticity. Plasticity may be described as the property by virtue of which clay may be changed in form without breaking up or destroying its continuity, or may be joined without the use of any cementing material. In nature, most clays are only in a semi-plastic state, and become quite plastic when water is added to them. The purer the clay the more plastic it is in the natural clay beds, provided the silicate of alumina is in a state of division sufficiently fine. It would seem that this important property is due to the fact that silicate of alumina can absorb water in a large volume, at the same time becoming gelatinous and swelling up. It is this property that makes clay impermeable to water.

From this explanation we can easily understand that when clay is dried and the gelatinous particles lose their water, they become less in volume and shrink. We all know that clay shrinks in drying because of the way clayey soil cracks in summer time. It is also pretty widely known that the more "sticky" the clay is the more it cracks when dried. This, it is apparent, is because it is purer, and contains more of the gelatinous silicate of alumina in a given volume than a sandier clay or loam which shrinks less in drying. It will be clear, then, that a sticky or strong pipe or tile clay shrinks more in percentage than a sandy clay; but there is more in the matter than this.

Given a sandy, less sticky or "milder" clay, like that of the Suffolk brickfields, the amount it shrinks in drying depends also on the shape and size of the sand particles. These are surrounded by the gelatinous material when wet, and at a certain stage in drying they come so close together in the mass as to touch each other. Now, if the sand grains are rough and angular, their further movement is arrested, whereas if fine and round they can slide on one another into still closer positions, and so shrinkage continues further.

When a clay with fine, round, sand grains dries, shrinkage goes on till arrested by the grains getting as close together as is possible; but still the gelatinous pure clay surrounding them goes on shrinking, with the result that spaces or pores begin to be formed in the mass, into which air enters. We thus arrive at another condition in which the pores formed in the clay gradually lose water throughout the whole mass. The size of these pores depending on the size and shape of the grains, we get two different states in different kinds of clay—the one is called porosity and the other permeability. They are only different degrees of the same thing, but they are interesting to the brickmaker because of the difference in quality of the brick produced and the different results obtained by different processes of manufacture.

All clays found in nature become porous when dried, but those with the larger angular grains are permeable even before drying. This peculiarity is of great importance in a building, for the striking reason that a permeable brick will better resist the weather and will also "breathe" or allow air to pass through the walls. This is easily understood, and is illustrated by a simple proposition. Take a glass tube with a bore of, say, $\frac{1}{8}$ in., or a straw, and one can easily blow through it. But take the broken stem of a thermometer which has a very fine bore, and it is not possible. The passage of water is of corresponding ease or difficulty.

Now I can quite well believe that my arguments may convince you that the permeable brick will let more air pass than the merely porous one, but you will say that the same applies to water. This is true, but two points even in this connection still indicate that the permeable brick is best for buildings. The first is that, provided the wall is not too exposed to constant driving rains, in which case it should be built hollow, the water dries out very rapidly when the rain stops. In our variable climate, the permeable brick will usually dry out completely between the rain periods and before any water has penetrated the wall, and will again let air through. The porous brick will not, because it takes proportionately longer to dry than it does to wet.

The second point is the effect of frost. It is well known that water expands just before freezing; that is why it cracks our water pipes. The same thing happens inside a brick; but when the water in a permeable brick freezes, the holes are large enough to let the ice squeeze out when formed, and no harm is done. In a porous brick that is, one with extremely fine pore—the ice cannot squeeze out for the same reason that you cannot blow through a minute tube, and so it bursts the face off the brick instead.

I must speak here, in passing, of two kinds of brick in which the properties of porosity and permeability are of quite a different nature. These are the bricks made by the semi-dry process of manufacture, of which more later. In one type, exemplified by the Ebbton brick, the shale is pressed into shape in a nearly dry state, and plasticity is not present at any stage of the process. When burned in the kilns no change of physical condition of the clay takes place. Shale is in the form of flakes, and the interior of the brick, therefore, is in an irregular condition with no direct uniform pores or tubes in it. Yet it contains a proportion of spaces with air in them. The outside surface is more compressed than the inside, and is smoothed or polished by the action of the steel moulds in which they are pressed. When, therefore, after a long exposure to wet, the interior becomes more or less soaked or sodden with water, frost will produce the same disastrous results as with the "porous" non-permeable brick, but in a still greater degree. And once the skin is broken, further disintegration is still more rapid.

The second type is exemplified by the Acerington red brick. This, too, is generally made by the semi-dry process, but on burning in the kiln the clay begins to melt, and becomes vitrified. It is then practically impervious to water, and suffers no harm in frosty weather. It is a good, sound brick, but it does not breathe at all, and therefore possesses only one of the two important virtues of the brick that is perfect from the hygienic point of view.

I must not forget to mention that the permeable brick has a further virtue as it does not conduct heat and cold as much as the hard, impermeable brick, and for all these reasons I venture to express the opinion that a sandy hand-made brick, besides being more artistic, is more lasting and more hygienic than any other type made.

Practical Hints on Road Tarring.—A second edition of the leaflet entitled "Notes upon Tar Treatment of Road Surfaces," giving the elementary principles in road tarring work, has been issued by the Roads Improvement Association. The leaflet was prepared for the information and guidance of men actually engaged in tarring work on the road who do not usually have access to the various comprehensive technical publications upon this subject. The unsatisfactory results from the tar treatment of roads often complained of by road users have been traced, in many cases, to the non-observance of the elementary principles in this work. The leaflet deals with (1) the suitability of a road for tar treatment, (2) the preparation of the surface, (3) the type of tar to be used, and (4) the application of tar to the road and its subsequent gritting. Notes upon the removal of tar splashes from clothing, paintwork, animals, &c., complete the leaflet. The leaflet will be found considerably interesting to laymen as well as to the men actually engaged in road tarring work, and the secretary to the Roads Improvement Association (Mr. Wallace E. Riche, 15 Dartmouth-street, Westminster, London, S.W.) will be glad to supply copies on request at 2d. each, post free. The association, it may be added, are prepared to supply quantities to surveyors for distribution to their men at a nominal charge of 3s. per fifty copies, post free.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.E.A.,
Borough Surveyor, Great Yarmouth.

NORTH-EASTERN DISTRICT.

A meeting of the North-Eastern District will be held at Wakefield on Saturday, March 21st.

PROGRAMME.

2.30 p.m. Meet at the Town Hall, and proceed to Calder Vale to inspect the recently removed sewage disposal works.

4.30 p.m.—Return to the Town Hall, where tea will be provided by the kind invitation of his Worship the Mayor (Mr. J. W. Salville).

5.30 p.m. District business—

Correspondence.

To consider and arrange for the next whole membership meeting of the institution in the North-Eastern District.

To consider nominations for (a) two district representatives on the council, (b) district chairman, (c) hon. district secretary, for the year 1914-1915.

In accordance with notice given, Mr. A. Rothera (Liversedge) will move:—

“That the members of the North-Eastern District request the council to take a poll of members and associate-members as to whether they are in favour of the issue of the Journal of the institution in parts as at present, or the retention of the annual bound issue formerly existing, and that a copy of this resolution be sent to the secretary of the institution and the hon. secretary of each of the various districts, asking for their co-operation by supporting a formal resolution to this effect.”

J. P. WAKEFORD, M.I.C.E., F. MASSIE, M.I.C.E.,
Hon. District Secretary. *District Chairman.*
Wakefield. Wakefield.

SOUTH-WESTERN DISTRICT.

A meeting of the South-Western District of the institution will be held at Torquay on March 21st.

PROGRAMME.

12 noon.—Meet at the new Town Hall, Torquay.

Business: To confirm minutes of last meeting; to receive communications, if any; to decide as to nominations for district officers for the ensuing year.

1 p.m. Inspection of the recently completed pavilion described in Vol. 37 of the “Proceedings.”

1.30 p.m. Lunch (prepared by electricity) at the Pavilion café by the kind invitation of the Mayor and Corporation of Torquay.

2.45 p.m.—Proceed by tramcar for a visit of inspection of the recently completed town hall and municipal buildings.

3.30 p.m.—Description by Mr. H. A. Garrett, Assoc.M. INST.C.E., borough surveyor, of the Torquay Pavilion—public restaurant operated by electricity—with discussion.

4.30 p.m.—Tea at the Pavilion café.

D. EDWARDS, Assoc.M.INST.C.E.,
Hon. District Secretary.

Municipal Buildings,
Taunton.

EASTERN DISTRICT.

A meeting of the Eastern District is to be held at Chelmsford on April 18th.

SOUTHEND MEETING.

A meeting of the institution will be held in the Eastern District at Southend on Saturday, June 6th.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham on June 13th.

THE ANNUAL MEETING.

The date for the annual meeting of the Institution of Municipal and County Engineers at Cheltenham has been fixed definitely for June 24th, 25th, 26th and 27th next. It has been decided to make a special feature of town planning and of roads, and, if possible, to arrange for an exhibition of town plans.

THOMAS COLE,
Secretary.

92 Victoria-street, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

FORTHCOMING MEETINGS.

Arrangements have been made for the following meetings: March 21st, Leeds; April, Birmingham; April 18, Hexham; May, Finedon and Wellingborough; May 16th, Hull; June 13th, Tisbury and Cumberland; July, Hunstanton; July 14th, Abwick; September 12th, Harrogate; October 10th, Sunderland; November 7th, Newcastle; December 12th, Newcastle.

Next Council Meeting.—The next meeting of the council will be held at Leeds on Saturday, March 21st.

B. WYAND,

39 Victoria-street, S.W.

Secretary.

Eye Water Supply. The Local Government Board in a letter write that their inspector, Dr. Seymour, considered the administration of the borough of Eye deficient in many respects. He indicated the principal matters requiring attention, including a public water supply to replace the numerous existing wells, which are liable to pollution. It would seem, the letter stated, that pure water could be obtained by deep borings to the chalk. The town council should obtain expert advice with a view to the formulation of a suitable scheme for supplying the borough.

Irish Labourers' Cottages. In the House of Commons on the 5th inst. the Chief Secretary was asked whether the Local Government Board had informed the Longford District Council that they would not advance any further portion of the loan necessary to pay for building labourers' cottages, under the 1908 scheme, because twenty-eight cottages had not yet been contracted for, whether he was aware that this was not the fault of the rural district council, but of the Local Government Board itself, which had refused to allow the limit of the cost of erection fixed ten years ago to be exceeded now, notwithstanding that materials and labour now cost more. Mr. Birrell said the loan sanctioned in this case amounted to £28,800, of which the council had already received £25,000. That was as much as they were entitled to having regard to the present position of the scheme—namely, 129 cottages completed, eight in course of construction, twenty-eight not yet contracted for, and one apparently abandoned. The Local Government Board had felt it necessary to fix a limit of £170 per cottage in regard to the issue of money out of the fund provided by Parliament for the purposes of the Labourers' Acts, but that does not preclude a council from borrowing in the open market any additional sum that might be required to complete their scheme, and the council had been so informed.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon ON WEDNESDAYS to ensure their inclusion in the weekly list of summaries. TORQUAY.—March 19th.—For the supply of 500 tons of cast-iron pipes, for the corporation.—Mr. S. C. Chapman, water engineer.

COVENTRY.—March 23rd.—For the supply of cast-iron pipes, including bends, junction pipes, and sluice valves, for the corporation.—Mr. J. E. Swindlehurst, city engineer and surveyor.

MADRAS.—March 24th.—For the supply of 2,000 cast-iron manhole covers and frames, for the corporation.—Messrs. J. Mansergh & Sons, agents, 5 Victoria-street, Westminster.

BEESTON.—March 28th.—For the supply of cast-iron pipes and special castings, for the urban district council.—Mr. W. H. Radford, engineer, Albion Chambers, Nottingham.

Roads.

DROXFORD.—March 16th.—For the supply of granite or hard stone, for the rural district council.—Mr. A. V. Carter, surveyor.

DARTFORD.—March 16th.—For the supply of road materials, for the rural district council.—Mr. J. Hookins, surveyor, Gartly, Dartford.

CHURCH.—March 16th.—For making up certain streets, laying granite macadam, rolling, and tar-spraying, for the urban district council.—Mr. W. E. Wood, surveyor.

WAKEFIELD.—March 16th.—For repaving work, for the corporation.—Mr. J. P. Wakeford, city surveyor.

BRIDGE.—March 16th.—For the supply of hard flints and gravel, and carting, for the rural district council.—Mr. S. Gladden, highways surveyor, Littlebourne, Canterbury.

SWANSEA.—March 16th.—For the widening and improvement of Dunvant-road, for the rural district council.—Mr. G. Powell Thomas, highway surveyor, Station-road, Fforestfach.

EASINGTON.—March 16th.—For the making up and paving of certain streets, for the rural district council.—Mr. Gilbert Waterhouse, surveyor.

WEYMOUTH.—March 16th.—For the repair of district roads, for the rural district council.—Mr. R. H. Luckham, surveyor.

POCKLINGTON.—March 16th.—For the supply of best blue stone and slag, for the rural district council.—Mr. T. Robson, clerk.

NELSON.—March 16th.—For the supply of granite macadam, limestone macadam, limestone paving chippings, pitch, creosote oil, flags, kerbs, grit setts, and cement, for the corporation.—Mr. W. Shackleton, borough engineer and surveyor.

CHORLEY.—March 16th.—For the supply of broken granite, limestone, slag, rubble, chippings, grit setts, flags and kerbs, for the rural district council.—Mr. P. Whalley, district surveyor.

LLANFRECHFA UPPER.—March 16th.—For road metalling and hauling, for the urban district council.—Mr. G. Jones, surveyor, Richmond-road, Pontnewydd.

ROCHFORD.—March 16th.—For making up a road, for the rural district council.—Mr. H. T. Sidwell, surveyor.

LANARK.—March 16th.—For granolithic paving, kerb and channel, and causeway crossings, for the District Committee of the Middle Ward.—Mr. R. Spittal, road surveyor, Hamilton.

MARKET BOSWORTH.—March 16th.—For the supply of broken granite, for the rural district council.—Mr. J. Thorpe, highway surveyor.

HEBDEN BRIDGE.—March 16th.—For tar-spraying, for the urban district council.—Mr. T. Waddington, surveyor.

CROFT.—March 16th.—For the supply of whinstone, ironworks slag, and annealed slag, for the rural district council.—Mr. J. Hodgson, surveyor.

EDMONTON.—March 16th.—For the supply of Norway granite kerb and Guernsey granite, for the urban district council.—Mr. C. Brown, engineer.

HUNTS.—March 16th.—For the supply of granite, slag, and tar-macadam, for the county council.—Mr. Henry Lecte, county surveyor, Market-place, Huntingdon.

BILLERICAY.—March 16th.—For the supply of granite, Kentish rag, flints and gravel, and steam rolling, for the rural district council.—Mr. F. E. Ennals, surveyor, Shelley-road, Hutton.

STOCKSBRIDGE.—March 16th.—For the supply of road material, for the urban district council.—Mr. C. Hodgkinson, clerk.

BLACKBURN.—March 16th.—For making up certain new streets, for the corporation.—Mr. W. Stubbs, borough engineer.

NEWARK.—March 16th.—For the supply of tar-macadam, granite and basalt, for the corporation.—Borough Surveyor.

BIRMINGHAM.—March 17th.—For road and sewerage works at Lordswood-road, and new road between Balden-road and Lordswood-road, Harborne, for the corporation.—Mr. Henry E. Stilgoe, city engineer and surveyor.

STROUD.—March 17th.—For the supply of granite, basalt, limestone and tarred macadam, for the urban district council.—Mr. E. N. Witchell, clerk.

ABERGAVENNY.—March 17th.—For the supply of broken and unbroken stone, quarry stone, and hauling, for the rural district council.—Mr. A. J. Willcox, surveyor.

GARFORTH.—March 17th.—For making up certain thoroughfares, for the urban district council.—Mr. W. G. Smithson, 2 Basinghall-square, Leeds.

ACTON.—March 17th.—For the supply of a tar-spraying machine, tar-spraying work, and coating certain roads with bitumen, for the urban district council.—The Surveyor.

THURNSCOE.—March 17th.—For the supply of broken granite, granite chippings, broken slag, slag screenings, flags, kerbs, channelling, and asphalt, for the urban district council.—Mr. T. Bull, surveyor.

WARE.—March 17th.—For the supply of broken blue Guernsey granite, for the urban district council.—Mr. G. H. Gisby, clerk.

MEXBOROUGH.—March 17th.—For the supply of channel setts, pitching setts, granite and whinstone macadam chippings, slag macadam, tar-macadam, patent paving and Trent sand, for the urban district council.—Mr. G. F. Carter, surveyor.

CAERLEON.—March 17th.—For making up a certain road, for the urban district council.—Mr. C. J. Fox, surveyor.

WEALDSTONE.—March 17th.—For the supply of well-matured slag, for the urban district council.—Mr. Herbert Walker, surveyor.

REIGATE.—March 18th.—For tar-washing about 170,000 yds. super. of roads, to include cleaning, tarring, and gritting the tar surface, for the corporation.—Mr. Alfred Smith, town clerk.

TUTBURY.—March 18th.—For the supply of broken granite and limestone, for the rural district council.—Mr. H. S. Tebbitt, surveyor, Tatenhill, Burton-on-Trent.

REIGATE.—March 18th.—For the supply of about 16,000 gallons of Tarvia in barrels, for the corporation.—Mr. Fred. T. Clayton, borough surveyor.

CHEADLE.—March 18th.—For the supply of granite and other tar-macadam, broken granite, artificial stone flags, setts, and flags, for the urban district council.—Mr. E. Sykes, surveyor.

ISLE OF WIGHT.—March 18th.—For the supply of about 10,000 tons of quartzites, basalts, syenites, or granites, for the rural district council.—Mr. H. Eldridge Stratton, clerk, 30 Pyle-street, Newport, I.W.

DURHAM.—March 18th.—For taking off a corner and remaking road, for the rural district council.—Mr. Geo. Gregson, surveyor.

CAMBS.—March 18th.—For the hire of steam rollers, for the county council.—Mr. J. E. Blackwall, county surveyor, Cambridge.

CAERPHILLY.—March 18th.—For the supply of limestone metalling, for the urban district council.—Mr. A. O. Harpur, surveyor.

ELY.—March 18th.—For the supply of 4,080 tons of granite and 1,110 tons of gravel, for the rural district council.—Mr. F. W. Pirby, district surveyor.

CARSHALTON.—March 18th.—For treating about 11,000 yds. super. of road with bituminous, dust-preventing material, for the urban district council.—Mr. C. P. Lovelock, clerk.

CHESTER-LE-STREET.—March 18th.—For the supply of whinstone, broken slag, tarred slag, broken limestone, brooms and shovels, for the urban district council.—Mr. F. J. Gray, clerk.

GUILDFORD.—March 19th.—For making up part of a certain road, for the corporation.—Mr. C. G. Mason, borough engineer and surveyor.

CHELMSFORD.—March 20th.—For labour, haulage, supply of broken granite, broken Kent flints, and hire of steam road rollers, for the rural district council.—Mr. F. E. H. Powell, surveyor.

NEWMARKET.—March 20th.—For tar-painting 125,000 super. yds. of roads, for the urban district council.—Mr. W. H. Eley, surveyor.

NORTHAMPTON.—March 20th.—For granolithic paving and fencing, for the corporation.—Mr. A. Fidler, borough engineer.

BISHOP'S STORTFORD.—March 20th.—For the supply of tar in accordance with the Road Board Specification for tar No. 1, for the urban district council.—The Surveyor.

PERTH.—March 21st.—For paving with whinstone setts, for the corporation.—Mr. R. McKillop, burgh surveyor.

NEWBURY.—March 21st.—For the supply and carting of road materials, for the rural district council.—Mr. O. Frewin, district surveyor.

GUISELEY.—March 21st.—For the supply of granite, limestone, whinstone, and tar-macadam, for the urban district council.—Mr. J. Battye, surveyor.

GATESHEAD.—March 21st.—For the supply of road materials, for the corporation.—Mr. N. P. Pattinson, borough engineer.

STEYNING WEST.—March 21st.—For the supply of broken granite, flints, chalk, and compo. sand, for the rural district council.—Mr. F. Slaughter, engineer and surveyor.

BILSTON.—March 23rd.—For the supply and delivery of broken stone, for the urban district council.—Mr. Vincent Turner, engineer and surveyor.

BRIGHTON.—March 23rd.—For the supply of 1,700 tons of broken granite, for the corporation.—Borough Surveyor.

SOUTHAMPTON.—March 23rd.—For laying asphalt paving in Upper Canal-walk, for the corporation.—Borough Engineer.

KING'S LYNN.—March 23rd.—For tar spraying roads, for the corporation.—Mr. Alfred J. Smith, borough surveyor.

COVENTRY.—March 23rd.—For the supply of broken road stone, granite kerbs, granite setts, stone-ware pipes, castings, and workmen's tools, for the corporation.—Mr. J. E. Swindlehurst, city engineer and surveyor.

ALTRINCHAM.—March 23rd.—For the supply of granite macadam, Rochdale flags, kerbs, setts, and limestone chippings, for the urban district council.—Mr. H. E. Brown, surveyor.

TENTERDEN.—March 23rd.—For the supply of granite, Kentish ragstone, beach and haulage, for the rural district council.—Mr. W. L. C. Turner, district surveyor.

SOUTHAMPTON.—March 23rd.—For laying asphalt paving, for the corporation.—Borough Engineer.

EARSDON.—March 23rd.—For the supply of whinstone, whinstone kerb, and cartage, for the urban district council.—Mr. J. R. Macmillan, surveyor, Shiremoor, Northumberland.

NORMANTON.—March 23rd.—For the supply of stone and concrete flags, kerbs, channels, setts, granite, limestone, whinstone, limestone and granite chippings, and tar-macadam, for the urban district council.—Mr. J. W. Martin, clerk.

ORMSKIRK.—March 23rd.—For the supply of road materials, for the urban district council.—Mr. H. W. Chadwick, surveyor.

GATESHEAD.—March 24th.—For cement path work, for the corporation.—Mr. N. P. Pattinson, borough engineer.

CASTLEFORD.—March 24th.—For works of road improvement, for the urban district council.—Mr. W. Green, surveyor.

RUSHDEN.—March 24th.—For the supply of granite and slag, for the urban district council.—Mr. W. B. Madin, engineer and surveyor.

GOSFORTH.—March 24th.—For road construction works, for the urban district council.—Mr. G. Nelson, engineer and surveyor.

ORSETT.—March 24th.—For the supply of broken granite or basalt, chippings, and Kentish ragstone, for the rural district council.—Mr. F. T. Johnson, highway surveyor, 2 Orsett-road, Grays.

HAZEL GROVE.—March 24th.—For the supply of broken stone, setts, kerbs, and chippings, for the urban district council.—Mr. G. S. Doncaster, surveyor.

SUTTON BRIDGE.—March 24th.—For the supply of granite, slag, granite chippings and slag chippings, for the urban district council.—Mr. T. J. Whitehead, surveyor.

ISLINGTON.—March 24th.—For paving work with asphalt, wood blocks, and granite setts, for the borough council.—Mr. J. P. Barber, borough engineer.

NUNEATON.—March 24th.—For the supply of broken granite, for the rural district council.—Mr. C. Blakeway, clerk.

BARKING TOWN.—March 24th.—For private street works, for the urban district council.—Mr. C. F. Dawson, surveyor.

BAGSHOT.—March 25th.—For the supply of granite, chippings, flints, gravel, and carting, for the urban district council.—Mr. O. G. Stanley, surveyor.

CHELMSFORD.—March 25th.—For stone paving certain footpaths, for the corporation.—Borough Engineer.

CHATHAM.—March 26th.—For the supply of granite, chippings, flints, and Kentish ragstone, for the corporation.—Borough Surveyor.

WESTMINSTER.—March 26th.—For the execution of paving works, for the city council.—City Surveyor.

KING'S LYNN.—March 27th.—For the supply of road materials, for the corporation.—Mr. Alfred J. Smith, borough surveyor.

HARROGATE.—March 27th.—For the supply of whinstone, limestone, kerbing, channelling, flagging, setts, shovels, picks, and concrete and artificial stone flagging, for the corporation.—Mr. C. E. Rivers, borough engineer and surveyor.

RICHMOND (Surrey).—March 27th.—For making up a certain road, for the corporation.—Mr. J. H. Brierley, borough surveyor.

CLUTTON.—March 27th.—For laying kerb and rebuilding culvert, for the rural district council.—Mr. T. Orchard, The Grange, Hallotrow.

BLEAN.—March 28th.—For the supply of gravel, flints, chalk flints, brick rubble, and cartage, for the rural district council.—Mr. F. A. Ward, surveyor, Eddington, near Herne Bay.

EAST GRINSTEAD.—March 28th.—For the supply of 12-in. Quenast granite, Quenast granite screenings, tarred macadam, hand-picked surface flints (broken), Kentish ragstone, and brick rubble, for the urban district council.—Mr. W. E. Woodlam, engineer and surveyor.

WORSLEY.—March 28th.—For the supply of macadam, tarred macadam, granite setts, grit setts, granite chippings, limestone chippings, grit kerbs and loukey kerbs, for the urban district council.—Mr. J. Howard, surveyor.

HORNSEA.—March 30th.—For making up certain roads, for the urban district council.—Mr. W. E. Warburton, surveyor.

KIRKBURTON.—March 31st.—For steam rolling and scarifying, for the urban district council.—Mr. G. W. Smith, clerk, 23 John William-street, Huddersfield.

LEWISHAM.—March 31st.—For laying wood paving in various streets, for the borough council.—Borough Surveyor.

MALDON.—March 31st.—For the supply of materials, and hire of steam roller, for the rural district council.—Mr. E. J. Ennals, surveyor.

MARTLEY.—March 31st.—For the supply of granite and slag, for the rural district council.—Mr. L. H. Richardson, surveyor.

HORSHAM.—April 1st.—For the supply of 4,750 cub. yds. of flints, 4,250 yds. of granite, and 1,000 yds. of gravel chippings, for the rural district council.—Mr. W. Dengate, surveyor.

BULKINGTON.—April 6th.—For the supply of stone, for the urban district council.—Mr. H. W. Wilson, surveyor.

INVERNESS.—April 11th.—For the upkeep of roads and bridges, for the Badenoch District Committee.—Mr. A. M. Grant, district road surveyor, County Buildings, Kingussie.

KIDDERMINSTER.—April 17th.—For the supply of broken granite, granite screenings, broken slag and slag screenings, for the rural district council.—Mr. G. J. Shepherd, surveyor.

Sanitary.

MERTHYR TYDFIL.—March 14th.—For providing, laying and jointing a 30-in. main sewer, comprising about $4\frac{1}{2}$ miles of concrete tubes and 173 yds. of 30-in. steel tubes, for the corporation.—Borough Engineer.

CHESHAM.—March 14th.—For the reconstruction with cast-iron pipes of about 712 lin. yds. of 12-in., 977 yds. of 9-in., and 935 yds. of 6-in. existing stone-ware pipe sewers and house connections with manholes and flushing chambers, for the urban district council.—Mr. Percy C. Dormer, engineer and surveyor.

BENFIELDSIDE.—March 14th.—For the removal of refuse, for the urban district council.—Mr. T. Knox, surveyor, Shotley Bridge.

KEIGHLEY.—March 16th.—For scavenging work, for the rural district council.—Mr. T. Burton, inspector.

READING.—March 16th.—For the construction of sewerage and manholes, for the corporation.—Mr. J. Bowen, borough engineer and surveyor.

DARTON.—March 16th.—For the construction of earthenware pipe sewer, surface-water sewer, manholes, and lampshafts, for the urban district council.—Mr. S. Wilkinson, surveyor.

ROCHFORD.—March 16th.—For the removal of house refuse and the supply of disinfectants, for the rural district council.—Mr. A. J. Dardis, surveyor.

LEIGH.—March 17th.—For the supply of disinfectants, for the corporation.—Mr. W. H. Cowburn, town clerk.

FRINTON.—March 17th.—For the construction of drains and filter-bed, for the urban district council.—The Surveyor.

MITCHAM.—March 17th.—For scavenging and street watering, for the rural district council.—Mr. E. J. Gowen, clerk, Croydon.

ST. COLUMB.—March 18th.—For laying a 6-in. sewer, for the rural district council.—Mr. B. C. Andrew, engineer, St. Austell.

MAIDSTONE.—March 18th.—For the construction of pipe sewer and manholes, for the rural district council.—Mr. T. A. Busbridge, surveyor.

HIGHER BEBINGTON.—March 18th.—For the removal of refuse, for the urban district council.—Mr. G. M. Lloyd, surveyor.

NUNEATON.—March 18th.—For laying earthenware pipes, storm sewers, and road work, for the corporation.—Mr. F. C. Cook, borough engineer.

YORK.—March 20th.—For the construction of earthenware pipe sewer, for the corporation.—Mr. F. W. Spurr, city engineer.

NORTHWICH.—March 23rd.—For the collection and disposal of house refuse, for the urban district council.—Mr. J. W. Cowley, clerk.

RUISLIP-NORTHWOOD.—March 23rd.—For the construction of roads, sewers, and subsoil drainage at cemetery, for the urban district council.—The Surveyor.

SEATON DELAVAL.—March 24th.—For the erection of thirty-three sanitary earth closets, for the urban district council.—Mr. A. Dorin, surveyor.

MOUNTAIN ASH.—March 24th.—For scavenging

and team work, for the urban district council.—Mr. W. G. Thomas, surveyor.

MADRAS.—March 24th.—For the supply and delivery of 2,000 cast-iron manhole covers and frames, for the corporation.—Messrs. James Mansergh & Sons, agents, 5 Victoria-street, Westminster, S.W.

BEESTON.—March 28th.—For the construction of culvert, iron and stoneware sewers, manholes, Dortmund tanks, bacterial filter beds, humus tanks, and other works, for the urban district council.

NANTWICH.—March 28th.—For the construction of sewage disposal works, including detritus, settling, storm-water, and stand-by tanks, laying stoneware pipe sewers, construction of 104 manholes, and other appurtenant works, for the rural district council.—Mr. Charles E. Davenport, engineer, 152 Hospital-street, Nantwich.

SWANSEA.—March 31st.—For the construction of about 2,350 yds. of roads, sewers, surface-water drains, manholes, inspection chambers, gullies, and other works, for the corporation.—Borough Surveyor, 13 Somerset-place.

CAMBORNE.—April 2nd.—For the provision of and laying about 11 miles of stoneware sewers, the construction of manholes and other works, the construction of about 1,000 yds. of tunnel, the provision and laying of a 24 in. by 16 in. egg-shaped sewer therein, and the provision and laying of about 175 yds. of 18-in. cast-iron outfall sewer, for the urban district council.—Mr. John Chadwick, engineer, Bletchley, Bucks.

NANTWICH.—April 11th.—For the construction of pipe sewers, for the urban district council.—Mr. W. F. Newey, surveyor.

DURHAM.—For constructing sewer, manholes, and lampshades, for the corporation.—Mr. J. T. Pegge, city surveyor.

Stores.

GREAT CROSBY.—March 16th.—For the supply of granite macadam and chippings, limestone chippings, tarred limestone macadam, Portland cement, stone-ware pipes, disinfectants, pitch and tar, incandescent mantles and chimneys, glass for street lamps, horse provender, granite setts, extra cart hire, and horsing fire brigade, for the urban district council.—Mr. Joseph A. Wright, surveyor.

SUTTON COLDFIELD.—March 16th.—For the supply of granite macadam, kerb, limestone macadam, setts, gravel, broken pebble stones, Yorkshire or Pennant kerb, Rowley setts, earthenware pipes, cement, lime, iron castings, iron, steel, timber, hardware, oils, paints, and bass brooms, for the corporation.—Mr. W. A. H. Clarry, borough engineer and surveyor.

BEDWELLY.—March 16th.—For the supply of stores and materials, for the urban district council.—Mr. Dan H. Price, surveyor, Aberbargoed.

GAINSBOROUGH.—March 18th.—For the supply of broken granite or whinstone granite or whinstone setts, broken and block slag, slag chippings and dust, York setts, kerbs, channels and flags, concrete flags, stoneware and earthenware pipes, gullies, cast-iron pipes, tar-macadam, pitch and creosote oil, Portland cement, and coal, for the urban district council.—Mr. Sam. W. Parker, engineer and surveyor.

HEYWOOD.—March 21st.—For the supply of setts, kerbs, flags, earthenware pipes, bends, junctions, taper pipes, traps, gullies, pitch, creosote oil, limestone chippings (white), hand-broken granite, granite chippings, and Portland cement (English), for the corporation.—Mr. J. B. Nuttall, borough surveyor.

LEEK.—March 23rd.—For the supply of flags, kerbs, channels and setts, macadam stone and chippings, limestone and tar slag macadam, Portland cement, sanitary pipes, pitch and oil, scavenger's bass brooms, cast-iron manhole and lampshades covers, galvanised malleable step irons, and cast-iron gullies and frames, for the urban district council.—Mr. W. E. Beacham, surveyor and water engineer.

LITTLEBOROUGH.—March 24th.—For the supply of setts, kerbs, flags, granite macadam, sanitary pipes, tools, and iron castings, for the urban district council.—Mr. George H. Wild, surveyor.

KENT.—March 28th.—For the supply of shovels, forks, scavenging brooms, scoops, scrapers, cart grease, tallow, oil, and general tools and materials, for the county council.—County Surveyor, St. Peter-street, Maidstone.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

* Accepted † Recommended for acceptance.
‡ Provisionally accepted.

ALFRETON.—For the supply of a 10-ton steam road roller, fitted with scarifier, water spraying apparatus, and canopy, for the urban district council.—Mr. R. F. Ward, surveyor:—

Clayton & Shuttleworth, Limited, Lincoln	£530
Ruston, Procter & Co., Lincoln	527
Marshall, Sons & Co., Limited, Gainsborough	527
Aveling & Porter, Limited, Rochester	527
Robey & Co., Lincoln	525
J. Fowler & Co. (Leeds), Limited, Leeds	521
T. Green & Son, Limited, Leeds	518

BEDWELLTY.—For the erection of a public convenience, for the urban district council.—Mr. D. H. Price, surveyor:—

J. B. Packer, Hengoed	£85
T. Vadden, Bargoed*	83

BENFIELDSDALE.—For constructing main outfall sewer and sewage purification works, for the urban district council. Messrs. Taylor & Wallin, Newcastle-on-Tyne:—

H. Naylor & Son, Bradford	£8,741
G. E. Simpson, Newcastle-on-Tyne	7,799
W. Kennedy, Jarrow	7,618
W. Wilson & Co. (Newcastle), Limited, Ponteland	7,420
J. W. Henderson, Gosforth (Newcastle)	7,365
W. G. Armstrong, Blaydon	6,957

BENTLEY (Yorks). For the construction of a surface-water drain, for the urban district council.—Mr. R. G. Whitley, surveyor, Doncaster:—

H. Drake, Adwick-le-Street	£621
F. G. Stubbs, Bentley	405
H. C. Pullar & Co., Pickering	382
T. H. Wilburn, Doncaster	381
S. Porter, Doncaster*	365

BIRKENHEAD.—For the supply of granite, Rawtenstall kerbs and channels, Penmaenmawr breaking stone, natural flags, paving setts, and crosoted red deal paving blocks, &c., for the corporation.—Mr. C. Brownridge, borough engineer and surveyor:—

Granite Kerbs and Channels.—H. Campbell & Son, Newry.
Pwllheli Channels.—Pwllheli Granite Company, Limited, Runcorn.
Rawtenstall Kerbs.—I. Law, Rochdale; W. Lovick & Co., Stacksteads; Lord & Lord, Limited, Stacksteads.
Self-faced Flags.—J. Brooke & Sons, Halifax; A. H. Evans, Liverpool; J. Farrar & Sons, Limited, Halifax; A. Jagger, Halifax; J. Thompson & Sons, Halifax.
Breaking Stone, Macadam.—Penmaenmawr and Welsh Granite Company, Limited, Penmaenmawr; J. Ross & Co., Liverpool.
Pwllheli Macadam.—Pwllheli Granite Company, Runcorn.
Wood Paving Blocks.—Acme Flooring and Paving Company, Limited, London.
Portland Cement.—J. E. Beard & Co., Limited, Birkenhead; J. Crossfield & Sons, Limited, Warrington.
Coal.—Mersey Coal Company, Birkenhead.
Bricks.—Seacombe Pressed Brick and Tile Works, Limited, Seacombe, Cheshire.
Stoneware Pipes.—J. E. Beard & Co., Limited, Birkenhead; Doulton & Co., Limited, Liverpool.
Iron Castings.—Jenkins Brothers, Birkenhead.
W.I. Bars.—D. H. Collins & Sons, Birkenhead.

BOURNEMOUTH.—For the construction of surface-water drainage, for the corporation.—Mr. F. W. Lacey, borough engineer:—

Grounds & Newton, Bournemouth, £2,448.
J. Francis, Winton
Saunders & Co., Bournemouth.

BUSHEY.—For laying glazed stoneware pipe sewer, for the urban district council.—Mr. E. E. Ryder, surveyor:—

J. Williams & Sons, Manchester	£198
W. Wright, Chesham (Bucks)	197
Clark Brothers, Watford	167
F. P. Bliss, Bushey	147
W. Bailey & Sons, Bushey Heath	133

NORTHAMPTONSHIRE.—Accepted for the supply of broken granite, for the county council.—Mr. C. S. Morris, county surveyor, Northampton:—

BROKEN GRANITE.

B. J. Forder & Sons, Nuneaton	Tons.	9,960
Whitwick Granite Company, Leicester		8,855
Groby Granite Company, Leicester		3,115
Enderby and Stoney Stanton Granite Company, Leicester		2,665
Cliffe Hill Granite Company, Leicester		2,275
W. Griffiths & Co., Nuneaton		1,630
Charnwood Granite Company, Loughborough		1,340
W. L. Ireland, Atherstone		1,310
Forest Rock Granite Company, Leicester		900
Mountsorrel Granite Company, Loughborough		790
Clee Hill Granite Company, Ludlow, Salop		785
Ellis & Everard, Leicester		685
Rockside Stone Company, Stanton-under-Bardon, Leicestershire		660
Jess' Hartshill Granite Company, Atherstone		385
Abdon Clee Granite Company, Bridgnorth, Salop		335
Judkins, Limited, Nuneaton		310

BEST SLAG.

TAR-MACADAM.

W. Prestwich & Son, Kettering	3,264
Constable, Hart & Co., Wellingborough	2,498
J. Smart & Son, Walsall, Staffs	403

CHERTSEY.—For making up and draining certain roads, for the rural district council.—Mr. H. Beeny, surveyor, West Byfleet:—

T. Free & Son, Maidenhead	£1,910
S. Kavanagh & Co., Surbiton Hill	1,804
J. Mowlem & Co., Westminster	1,677
A. Hardy & Co., Woking	1,480
Surveyor's estimate,	£1,560.

FALMOUTH.—For additions to pavilion, for the corporation.—Mr. J. S. Walton, borough engineer and surveyor:—

E. H. Moss, Falmouth, £441

ROMFORD.—For the conversion of buildings into a fire station, for the urban district council.—Mr. H. T. Ridge, acting surveyor:—

J. Butterfield & Co., Romford	£182
E. W. Best, Romford	175
J. S. Hammond & Son, Romford	175
F. J. Cooke, Romford	170
G. J. Harvey, Romford*	165

TONBRIDGE.—For making up a street, for the rural district council.—Mr. F. Harris, engineer and surveyor, Tunbridge Wells:—

W. T. Burrows, Maidstone	£1,759
E. Free & Sons, Maidenhead	1,611
Road Maintenance and Stone Supply Company, Limited, London	1,596
W. H. Wheeler & Co., London	1,521
W. Arnold & Sons, Paddock Wood	1,474
A. Streeter & Co., Limited, Guildford	1,398
W. Pratt, Hildenborough	1,361

WARE.—For making up certain streets, for the urban district council.—Mr. H. F. Hill, surveyor:—

G. Crook, Ware	£336
N. Porter, Haekney, N.E.	326
Pilgrim & Son, Whetstone, N.	303
W. Jackson, Forest Gate, E.*	211
Surveyor's estimate,	£338.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

MARCH.

- 13.—Town Planning Institute: Mr. Raymond Unwin on "The Town Planning Proposals of the Urban Land Report." 92 Victoria-street, S.W. 8.30 p.m.
- 16.—Junior Institution of Engineers: Mr. W. A. Tookey, M.I.MECH.E., on "The Running of Gas Engines and Gas Producers." Institution of Electrical Engineers, Victoria-embankment. 8 p.m.
- 17.—Illuminating Engineering Society: Mr. W. C. Clinton on "A Comparison between Illumination Estimates and Performance in Practice." Royal Society of Arts, 8 p.m.
- 21.—Association of Engineers-in-Charge: Annual Dinner.
- 21.—Institution of Municipal and County Engineers: North-Eastern District Meeting at Wakefield.
- 21.—Institution of Municipal and County Engineers: South-Western District Meeting at Torquay.

APRIL.

- 3.—Royal Sanitary Institute: Meeting at Southampton. Discussion on "The Housing, Town Planning, &c., Act, and its Application to the County Borough of Southampton." 7 p.m.
- 20.—Institute of Sanitary Engineers: Mr. E. A. Lees, A.I.N.S.T.C.E., on "The Birmingham Waterworks." Caxton Hall, Westminster. 8 p.m.

MAY.

- 13.—Royal Sanitary Institute: Annual Dinner, Langham Hotel.
- 23.—Institution of Municipal and County Engineers: West Midland District Meeting at Birmingham; Mr. A. S. Parsons on "Bridge Construction."

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

BOROUGH OF SCARBOROUGH.

Wanted, an Assistant in connection with Housing and Town Planning; must be qualified Surveyor; one familiar with the Housing, Town Planning, &c., Acts preferred. Salary £2 2s.

Applications, accompanied with copies of three recent testimonials, to be sent to the undersigned not later than 12 noon on Friday, the 20th March, 1911.

HARRY W. SMITH ASSOC. M. INST. C. E.,
Borough Engineer.

Town Hall,
Scarborough. (1,417)

ENGINEER AND SURVEYOR to District Council has a vacancy for Articled Pupil. Water and Sewerage Works, and good general experience.—Box 1,386, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,370)

Bayard

"The First-Grade Car without the First-Grade Price"

ALTHOUGH by the initial test of price alone the BAYARD is one of the cheapest of modern first-grade cars, it is only after years of service that the owner discovers how "cheap" a car it really is. Light on tyres, easy to maintain, with an exemplary m.p.g. return.

8 h.p. to 30 h.p. Catalogue on request. 10 H.P. MODEL, as illustrated, with Four-seater Body, Hood, Screen, Horn, 5 Lamps Five Detachable Wheels and Tyres. Fully equipped for the road. £300

BAYARD CARS LIMITED,
Sole Concessionaires for A. Clement-Bayard, of Levallois, Paris.

BOROUGH OF SHREWSBURY BOROUGH SURVEYOR'S STAFF.

Applications are invited from persons qualified by training and experience in the office of a Borough Surveyor and Engineer for the following appointments—viz.:—

- (1) Chief Assistant, at a salary of £140, rising, on approved service, by annual increments of £10 to £180 per annum, and
- (2) Engineering Assistant, at a salary of £90, rising, as above, to £120 per annum.

Applications, endorsed "Chief Assistant" or "Engineering Assistant," as the case may be, setting out concisely the candidate's experience and attainments, also giving age (which should not exceed 30 years), and enclosing copies of two recent testimonials, together with the names of two professional referees, must reach the undersigned not later than first post on Monday, the 23rd instant.

A. W. WARD, ASSOC. M. INST. C. E.,
Borough Surveyor.

Shrewsbury.
March 10, 1914.

(1,427)

BOROUGH OF ACCRINGTON. CHIEF ASSISTANT AND GENERAL ASSISTANT, BOROUGH SURVEYOR'S OFFICE.

The General Works Committee of the Borough of Accrington invite applications from qualified persons from 25 to 35 years of age for the positions of Chief Assistant and General Assistant in the Borough Surveyor's Office. Salary £150 and £104 respectively.

It is essential that Candidates should be fully qualified, and have had the necessary education and Municipal training of a Borough Surveyor's Office, to fill the positions, including actual experience in the design and supervision of Tramways, Sewage Works, Private and Public Street Improvement Works, &c., and sufficient architectural knowledge for general engineering works.

Full particulars of the duties and conditions re-

lating to the appointment, together with Form of Application, can be obtained on applying to the undersigned.

Applications to be on the pre-scribed Form (no other will be considered), and addressed to me, endorsed "Chief Assistant" and "General Assistant," and delivered at my Office not later than the 23rd day of March next.

Canvassing will be a dis-qualification.

WM. J. NEWTON, ASSOC. M. INST. C. E., M. S. A.,
Borough Engineer and Surveyor.

Town Hall, Accrington.
March 6, 1914.

(1,393)

WILTS COUNTY COUNCIL. TRUNK MAIN ROAD RECONSTRUCTION.

ROAD FOREMEN WANTED.

The County Surveyor is desirous of engaging three or four Road Foremen for work to be carried out in the reconstruction of the London and Bath Trunk Road.

Applicants must have a full knowledge and experience of all matters appertaining to the making of Roads with bituminous or tarred material. Must be accustomed to the management of men, and able to keep accounts.

Preference will be given to applicants who are cyclists. Age between 30 and 50. Salary, £2 10s. per week.

The persons appointed will be expected to commence their duties on the 20th day of April next.

Applications to be on Forms obtained from the undersigned, and to be sent in on or before the 25th instant.

J. GEORGE POWELL,
County Engineer and Surveyor.

County Offices,
Trowbridge.

Minutes of Proceedings.

The Present Position of the Sewage Disposal Problem.

Any hope that may have existed with regard to the introduction during this Session of a Bill in Parliament dealing with this problem on the lines recommended by the Royal Commission on Sewage Disposal has been dispelled by the statement made in the House of Commons by the President of the Local Government Board, and reported in these pages last week. It is not known definitely, although it has been surmised, that a Bill has been drafted, and even if it has been prepared in rough outline it is not certain that the recommendations of the Royal Commission have been adopted. All we know is that the question of introducing this measure has been postponed for the present for the reason that the issue of the final report of the Royal Commission is expected shortly. On the face of it this would appear to be good grounds for delaying the introduction of fresh legislation on the subject, but it must be borne in mind that the Eighth Report, which included final conclusions on most of the main issues involved, was published in November, 1912, and the appendix to this report appeared last summer. Further, the final report referred to by the President of the Local Government Board will deal only with methods of disposal not involving water-carriage, and with standards in regard to trade effluents. In addition to all this, the prospects of a general election will very probably cause a further postponement of this question. It is thus evident that an important matter urgently needing fresh legislation will not be brought before Parliament until three or possibly four years after the Royal Commission appointed to deal with it has made definite recommendations as to what should be done. Meanwhile developments are taking place in several directions, and by the time the proposed Bill is introduced into Parliament improved and possibly entirely new methods of sewage disposal will probably have been discovered and be actually in use.

That this is not vain imagination is clear from the references we have made in these columns to new methods of sludge disposal, aeration as an aid in sewage purification, and similar matters. Further evidence appears in the extremely interesting paper read by Dr. Gilbert J. Fowler, F.I.C., before the Liverpool Engineering Society at the beginning of this month. From the extracts which we print on another page we gather that Dr. Fowler is supervising experiments in the aeration of sewage similar, in some respects, to those which have been carried out at the Lawrence Experiment Station of the Massachusetts State Board of Health, as described in these pages recently. He even goes so far as to say that he "looks for-

ward with confidence to the time when it will be possible completely to purify sewage in a tank with production, on the one hand, of inoffensive sludge, which can be readily handled and disposed of as manure, and, on the other, of a well-aerated effluent in which aquatic plants and fish will make final use of the nitrates and phosphates in solution." He also draws attention to various improvements in methods of sludge disposal, the great bugbear of sewage works managers at the present time, and suggests that in the future a sewage works will no longer be a source of nuisance and trouble either from decomposing offensive sludge or from flies and odours from percolating filters. It is, however, the concluding paragraphs of the paper which have the most direct bearing upon the delay in the introduction of fresh legislation upon the subject referred to above. Dr. Fowler emphasises the importance of realising that real advance in the art and practice of sewage disposal must come through the avenue of scientific research of the highest order, and that such research work necessitates well-equipped laboratories and large staffs of highly trained workers. He expresses the hope that "the present Royal Commission will not be concluded before its work has been put upon a permanent footing in the establishment of a national research department which could carry out work of a wider scope than is possible for any one local authority, and could correlate the work done by such authorities to the general benefit of all."

We have no desire to minimise in any way the importance and value of the investigations already carried out by the Royal Commission, but under its present constitution its scope is limited, and the continual delay in setting up the proposed central authority which would, we presume, be furnished with the means for carrying out the scientific research work mentioned by Dr. Fowler, postpones the time when full and prompt advantage may be taken of the various developments in methods of sewage disposal. The loss to the community caused by this delay is fourfold. In the first place, there is the loss due to the lack of the more efficient and more economical methods of treatment which would be available. Secondly, there is the waste of the large sums of money now being spent on works which may be rendered obsolete in a few years' time, and might have been avoided. Thirdly, there is the loss from the public health point of view by the delay in the thorough purification of our at present polluted streams and rivers, and last, but not least, there is the enormous loss due to the waste, under existing methods of disposal, of the valuable fertilising agents present in sewage. The opinion expressed by Dr. H. Maclean Wilson, and confirmed by Dr. Fowler, indicates that there

is an almost unlimited outlook for properly prepared sewage manure, either alone or as a basis for enrichment by artificial fertilisers, and the necessary investigations into the various developments in this direction described in the paper would alone be ample justification for the establishment of a national research department. It may be too late now to press for the introduction of the proposed Bill in the present Session, but it cannot be too strongly urged upon those in authority that the need for new legislation on the lines recommended by the Royal Commission is very great, and that the loss caused by the delay in dealing with the subject is much greater than is generally imagined.

**Is Cancer
a Water-borne
Disease?**

It has long been contended by several of the greatest authorities that the value of pure water is insufficiently recognised. Independent observers in America and in Europe discovered that a fall in the death and disease rates from causes other than typhoid fever followed the adoption of improved methods of purification. It was observed that, while with a purer supply there was a decrease in the general death-rate from causes other than typhoid, in cases where the supply to a town had remained unchanged no such decrease in the death-rate occurred during the same period. That this view is not generally accepted is evident. The very fact that the bacteriologist only acknowledges certain diseases as being water-borne seems to outweigh all other evidence, for "the mere fact," says Dr. Houston, "that there has occurred a decline in the incidence of tuberculosis, pneumonia and respiratory diseases generally—none of which can reasonably be regarded as at all likely to be water-borne—throws some doubt on the hypothesis that an improved water supply necessarily tends to produce any marked and continuously operating decrease of mortality for general and particular diseases." Cautious as this comment is, it seems to infer that certain diseases cannot be water-borne because they are not officially recognised as water-borne diseases. Dr. Houston's remark refers to a paper written by Prof. Sedgwick and Dr. J. Scott McNutt, already dealt with in these pages, and published by the Massachusetts Institute of Technology, which paper gave facts and figures relating to certain phenomena observed independently by Mr. H. F. Mills, of Lawrence, Massachusetts, and Dr. J. J. Reincke, of Hamburg.

We now have before us some very important investigations on cancer in trout carried out for the United States Bureau of Fisheries by Dr. H. R. Gaylord, director of the State Institute of Malignant Diseases at Buffalo. These are reported in the *Engineering Record* of New York, and they tend to show that cancer is a water-borne disease notwithstanding the established fact that cancer is of a non-contagious nature. It is reported that every one of nineteen trout hatcheries from Maine to Yakima, Washington, which were examined had cancer incidence, and the same thing is said to be true of trout hatcheries in all parts of the world. The important point is this, that "dogs drinking the water develop growths, and so do rats fed on the scrapings of the hatching troughs." It has been suggested that there may be "an intermediary host-bacteria which an infinitesimal cancer bacteria infects." Such a discovery would not be surprising to engineers, who have for some time been growing more and more sceptical as to the value of analysts' reports as compared with the results of practical experience and knowledge of conditions. Having first been under the impression that a chemist's analysis was final evidence of purity, the average layman was slow to appreciate the importance of bacterial examination, and now, having grasped the importance of the microbe, he is quite ready to learn that there are more things

in heaven and earth than are dreamt of in the scientist's philosophy, and that impure water or sewer gas may produce disease for reasons as yet unknown to the bacteriologist. It is to be hoped that the question raised in America will be carefully followed up by our own workers; also, we thoroughly agree with the *Engineering Record* that this water which appears to carry cancer should be filtered and sterilised or otherwise treated in order to find out whether it is possible to purify it. If it should thus be established that cancer is a water-borne disease, and that treatment will effectively remove the dangerous quality from the infected water, the fact will indeed be "of tremendous import to the waterworks field."

**"Constructive
Misfeasance."**

It is somewhat of an anomaly that, although it is the duty of a highway authority to keep their highways in a proper state of repair, they are not liable for accidents caused solely by mere omission to perform that duty. This doctrine of non-liability for nonfeasance—according to Mr. H. Hampton Copnall in his valuable work, "The Law Relating to Highways"—arose from the consideration that "if individuals who had suffered damage were allowed to sue the inhabitants at large it would lead to the multiplication of actions," which looks as if the originators of the doctrine did not expect very great things in the way of road repair from the powers that then were. But, however this may be, it would appear that the doctrine has of late years been somewhat modified in its application. The writer of a most interesting article on this subject, which appeared in the "Solicitor's Journal" for January 10th, after reviewing the nature and history of the doctrine, proceeds to discuss a few recent cases showing how greatly its operation has been limited by re-interpretation and restatement. He shows that the effect of this whittling-down process is to extend the term "misfeasance" so as to include some things which look like "nonfeasance," and to give rise to a novel doctrine of "constructive misfeasance." In other words, while in theory "nonfeasance" is still not actionable, certain defaults have been taken out of the category of "nonfeasance" and included in that of "misfeasance," so that while the area of the latter has extended, that of the former has correspondingly shrunk. The principle on which this new doctrine (or rather this new reading of the old doctrine) is founded is thus stated: "If a road authority has either in that capacity or in conjunction with some other public powers possessed by it, two duties connected together, and if it performs one of them, but leaves the other unperformed, then non-performance of that other duty which causes injury to any person ceases to be mere nonfeasance and becomes actionable misfeasance."

By way of illustration three cases are cited. The first was the case of a street in Manchester ending in an unfenced ravine, into which a motorist fell. Here the local authority had three separate duties—viz.: (1) To make up the road, (2) to light it, and (3) to fence the ravine. The performance of the first two of these duties turned the default in performing the third from "nonfeasance" which it would have been by itself—into "misfeasance," for which the authority were liable (*McClelland v. Manchester Corporation*, 1912, 1 K.B., 118). The next was an Irish case, in which the road authority repaired half of a road, leaving the other half unrepaired, but open to traffic. They were held liable for an accident due to the non-repair, the repair of the one half of the road being a partial and faulty performance of the duty to repair the whole (*Ryan v. Tipperary North Riding Council*, 1912, 2 I.R., 392). The third was the case of an accident to a cyclist caused by a defective sewer grating at Battersea. The dis-

trict council were both road authority and sewer authority, but they had made up the road without repairing the grating, and they were held liable (*Papworth v. Battersca District Council, Times, December 22, 1913*). It is true that, as the writer of the article referred to points out, the decision in this case was based chiefly on the view that non-feasance on the part of a sewer authority is in itself actionable. And there are reported cases which go to support that view. But as there appears to be some doubt upon this point, the case may for practical purposes be considered as an illustration of the principle in question.

The Amateur Surveyor Again. "At any time we are electing a surveyor, it would be very much better, I think, if we were to select a man from some trade—either a mason or a carpenter—who could get into contact with matters that were being done." These illuminating words were spoken by Councillor Bennett at a recent meeting of the South Molton Town Council. As an expert on road making Councillor Bennett stands very high in Councillor Bennett's opinion, and in moving for a return of the expenses of the council's steam roller during the past three months, and the number of yards of stone rolled in, he was consequently able to deliver a lecture on the subject for the benefit of the surveyor. At the conclusion of this discourse, Councillor Tucker observed: "Now we shall see who are the ratepayers' friends!" This worthy gentleman viewed the matter in its legal aspect, his speech containing the following gem: "I take in the Acts of Parliament every year, and look up the sections and subsections, and I tell you we are not compelled to roll in stones the same day. There's nothing in the Acts about it." Twelve members—friends of the ratepayers voted in favour of the return moved for, which was granted. Encouraged by his success, Mr. Bennett presently moved for another return as to the terms upon which a tar-sprayer had been tried, "the number of days it was in use, and the cost thereof." The last word of the motion suggests that the assistance of the legal expert was obtained in its drafting. This time, however, all did not go smoothly, for, when waxing eloquent as to the expenses which had been incurred, Councillor Bennett was reminded that he himself had signed the cheque! This caused a temporary hesitation, for it became necessary for the mayor to exhort the speaker to "go on," whereupon the discussion proceeded as follows:—

Mr. Bennett: I would go on, but they keep interrupting. (Loud laughter.) Then a bill was sent in by Fothergill's for the very handsome sum of £17—just for spraying a little bit of tar over our stairs—I mean our square. (Laughter.) It's a darn shame to the ratepayers. (Hear, hear.) It's ten pounds thrown away if it's ten pence; and I want to know how that £17 was made up.

Mr. Tucker: I second. Now we shall see who are the friends of the ratepayers.

The surveyor ultimately gave an explanation of the circumstances under which the hiring took place, and upon a vote being taken, fourteen members expressed themselves as being satisfied. Councillor Tucker may continue his efforts to discover who are the friends of the ratepayers, but we would observe that incidents of the kind referred to make it easy to find out those who are not.

* * *

Main Roads in Greater London. In our issue of November 11, 1913, there will be found a report of a conference of borough and urban authorities convened by the President of the Local Government Board for the purpose of discussing the subject of main routes in the London area. The sectional conferences held last week and this week carry matters a stage further, and the memoranda prepared by Mr. T. Adams and Colonel R. C. Hellard provide useful data, and suggest important considerations the recogni-

tion of which is essential to a wise solution of the problems which have to be faced. Mr. T. Adams, who is the town planning inspector to the Local Government Board, dealt first with matters pertaining to the subject generally, and then described the conditions in each of the separate areas in which authority for the preparation of schemes of town planning has been obtained. In the north-western district, it will be noticed, a draft scheme has already been prepared. Colonel Hellard, representing the London Traffic Branch of the Board of Trade, submitted a memorandum mainly relating to traffic statistics and to engineering features of the situation. These memoranda, which are reproduced in another part of this issue, should be carefully read by all who are interested in the planning of arterial roads in the London area, or in those general features of town planning schemes which are bound up with the subject of the alignment or improvement of main routes. We desire to endorse Mr. Adams' opinion, that those local authorities which have in view the preparation of town planning schemes should not defer obtaining the consent of the Local Government Board to the preparation of such schemes until the general conclusions of the sectional conferences have been reached. As Mr. Adams pointed out, a recently issued circular of the Local Government Board makes it clear that arrangements may be made for reserving the strips of land which are likely to be needed for new roads or widenings, and that new roads, when actually made, need not, in the first instance, be so made as to be sufficient for their ultimate purpose. It is unfortunate that the principle is not more generally recognised and more often acted upon in both urban and rural areas, and it may also be observed that many road problems would be much simplified if the authorities concerned would grasp another important fact—namely, that it is neither necessary nor desirable to look to the development of a road into a shopping street as a contingency that must always be provided for. If this fact could be recognised by the sectional conferences, their main problem would be much simplified.

* * *

Engineering and Finance. From the engineering point of view Mr. Adams' remarks as regards the topographical significance of the Lea Valley in the north-eastern section, and the need for cross communication in the northern section, are specially interesting. Colonel Hellard directed the attention of the conference to the engineering difficulties due to the numerous railways around the fringe of the most densely peopled area, these railways being the worst obstacles to a free choice of route. Highway engineers who frequently travel into and out of London will have observed that there are many places where an otherwise desirable route for a road is blocked by railways. A railway line is often, as Colonel Hellard pointed out, at such a level that it is not easy to carry a road either over it or under it, and places where many lines cross one another and join one another near the same spot are particularly troublesome in this respect owing to the considerable range of levels at which any intersecting line of route is obstructed. The advantages obtained fully justify the abandonment of considerable areas of valuable land to a few minor uses, and, this being so with respect to 44 per cent of the 2,000 million passengers carried by public services in the London area—the share of the railways—it is clear that a similar devotion of valuable areas is also worth while in the case of the 66 per cent carried by road. There are, it is true, some elements of the situation which tend to reduce the difficulties of main route problems; but since the actual numbers of passengers travelling by road is likely to increase considerably, it is not unreasonable to regard the expenditure of fairly large sums of money representing land values—as one of the elements of successful planning of main routes.

The Present Position of the Sewage Disposal Problem.*

By GILBERT J. FOWLER, D.S.C., F.I.C.

On May 7, 1898, a Royal Commission was appointed with wide terms of reference to inquire and report on the whole question of the treatment and disposal of sewage. The present Royal Commission submitted its first interim report in 1901, and its eighth report, embodying final conclusions on some of the main issues involved, was published in 1912.

ARTIFICIAL PROCESSES.

In the interim report of 1901 the commission state that it is in their opinion practicable to produce by artificial processes alone effluents which will not putrefy, and which might be discharged into a stream without fear of nuisance. These artificial processes are summarised in a list in the interim report.

STANDARDISATION OF METHODS.

A great part of the Royal Commission's work has consisted in the collection of evidence and the conduct of experiments, with the object of working out the conditions of efficiency of these various processes, and of standardising the methods employed as far as practicable, so that an authority may have a fair idea what sort of a result is likely to be obtained for a given expenditure.

FIFTH REPORT OF COMMISSION.

The Fifth Report of the Royal Commission and its Appendices are a mine of information in this respect, and the appointment of the commission would have been more than justified by this report alone, introducing as it does the idea of quantitative accuracy into the operations of sewage disposal.

There is no excuse now for authorities to launch out on expensive works without any preliminary study as to the character and amount of the sewage to be treated. The commission show clearly that the design and extent of the works must depend on the concentration or "strength" of the sewage. This is roughly proportionate to the water supply per head, and the amount of subsoil drainage finding its way into the sewage system. The composition of the sewage is also affected, *e.g.*, by the quantity and character of the trade effluents discharged into the sewers, and by the proportion of water-closets to pail-closets in the district sewered, and by other factors.

In the Fifth Report the commission indicate in general terms the kind of works necessary to obtain a satisfactory effluent from sewage of a given character.

NEED OF PRELIMINARY STUDY OF EACH PROBLEM.

This, of course, does not mean that in future all that a corporation or council has to do is to take a sample or two of the sewage, have it classified as "strong," "medium," or "weak," and order a sewage works accordingly.

The chemical and engineering conditions are in no two places alike, and in order to obtain the maximum efficiency and economy under any given set of conditions, careful thought and study on the part of the engineer and bio-chemist will always be necessary.

The author has, *e.g.*, on more than one occasion, recently found that the sewage to be dealt with in small installations in the country is rendered much more offensive and difficult to treat by the drainings from manure heaps which are allowed to enter the sewers. A creamery in a country district may also introduce unforeseen difficulties.

DEFINITION OF DRY-WEATHER FLOW.

The question of what really constitutes the dry-weather flow is one of great importance and some difficulty. The actual water consumption may vary from 100 to 150 gallons per head, as in New York, to, say, 10 gallons per head or less in a country town or village.

It does not quite dispose of the question to say that the strength varies in inverse proportion to volume, and therefore the provision of tanks and filters must be the same for all strengths, the rate of operation alone varying.

Obviously, as regards capacity of sewers the actual quantity to be dealt with must be considered, especially in reference to storm water. While it might be quite reasonable to construct sewers to take six

times, say 30 gallons per head, the problem becomes enormous if 100 gallons per head is to be taken as what may be called unit flow. On the other hand, if the dry-weather flow is, say, 10 gallons per head strength, storm overflows set at six times the dry-weather flow would discharge at only twice the dilution of ordinary 30 gallons sewage.

The question of actual quantity, apart from strength, also has to be considered in the design of disposal works. Tanks, channels and distributing mains, have all to be larger if six times an originally dilute sewage has to be dealt with, than if the original sewage is strong. There is also the physical limit of speed within which filters can be operated without water-logging. This question of what is to be taken as the dry-weather flow is, therefore of great importance in calculating the sizes and sort of works necessary to deal with a given sewage.

NEED OF STATISTICAL REPORTS.

It is because so few towns give returns of what has actually been thoroughly dealt with at their works as compared with the total quantity received, and the cost of such treatment, that it is so difficult to make just comparisons between one method of treatment and another, or one town and another. It is comparatively easy to get constantly good results when filters are carefully nursed, the test curves when they are called upon to take the day-to-day fluctuations year in, year out.

It is to be hoped that reports giving full data of costs in reference to flow and population will be more frequently published in future by municipal authorities than is now the case. Their value cannot be over estimated.

COST OF EFFECTIVE TREATMENT.

From such figures as are available, *e.g.*, from Leeds or Wolverhampton, Glasgow, and the Manchester statistics, it may be roughly assumed that the total revenue and capital cost for the production of a good effluent will amount to at least 2s. 6d. per head per annum. For small towns it may be more.

The term "satisfactory effluent" has been used in this paper so far without precise definition. This definition has been given by the Royal Commission in their eighth report as follows:—

"An effluent in order to comply with the general standard must not contain as discharged more than 3 parts per 100,000 of suspended matter, and with its suspended matters included must not take up at 65 deg. Fahr. (18.3 deg. Cent.) more than 2.0 parts per 100,000 of discharged oxygen in five days."

Under certain circumstances they indicate that an even more stringent standard may be called for. Few will deny that if every inland town produced an effluent of the character defined above year in, year out, the condition of rivers, especially in the North of England, would be very different. It can be done at a price, and is done, the author believes by certain towns in the potteries and in the Midlands. The more reason that full statistics should be published for the encouragement of others.

EFFECT OF DILUTION.

Where the effluent is considerably diluted by the body of water into which it flows, the commission conclude that the standard may, under proper supervision, be relaxed or suspended altogether.

It is, however, by no means easy accurately to judge of the effect of dilution. The problem is in the first place one of efficient mixing. Cases will readily be called to mind where sea-outfalls can become a source of serious nuisance if not carefully chosen. Bombay is an example where, owing to a clerical error, the tidal currents were wrongly marked on a map, the outfall site chosen in consequence has proved far from satisfactory, as the sewage lies in a still pool under Malabar Hill, one of the best residential quarters of Bombay.

Probably the most complete studies on the problem of disposal of sewage by dilution ever made have been carried out by the Metropolitan Sewerage Commission of New York.*

* Extracts from a paper read before the Liverpool Engineering Society on the 14th inst.

* Details of the results of the investigations of this commission and the recommendations which have been made have appeared from time to time in THE SURVEYOR.—EDITOR.

FURTHER PROBLEMS.

It has been shown that it is possible to dispose of sewage without causing offensive pollution in the body of water into which it is discharged. The outstanding problem remaining is the utilisation of the sewage. This has been the dream of the sewage enthusiast ever since modern ways of living forced most people away from the simplicities and economies of the Chinaman. The city of Shanghai makes a handsome profit from the sale of night soil, and the water carriage system is unlikely to be installed there, at any rate in the immediate future, if ever.

With its greater convenience and cleanliness the water carriage system entails constant wastage of valuable fertilising agents which should come back into the cycle of Nature. That they eventually do so to some extent as fish may be granted, but the world needs wheat, and the fact that the Manchester sewage works and others have been able to sell dried sewage manure at a profit in Canada, that Bradford has concluded a contract for its dried sludge with the intensive gardeners of Northern France, indicates that there is an almost unlimited outlook for properly prepared sewage manure, either alone or as a basis for enrichment by artificial fertilisers. This is the conclusion of Dr. H. Maclean Wilson in a recent report, and the author is quite in agreement with him.

In their conclusions as to the value of sewage sludge the Royal Commission do not appear very convincing. They seem to have insufficiently differentiated between sludges of different origin and composition, and it will be of interest to consider the possibilities of each of these in turn:—

Taking first sludge from sedimentation and chemical precipitation processes, which are very similar in character. The most successful utilisation of sludge is carried on at Bradford, Yorks, where the whole sewage, containing as it does, a high percentage of grease from wool-washing, is treated and "cracked" with sulphuric acid, the resulting sludge hot pressed, the grease thus recovered sold at a profit, and the residual cake sent away, as has been said, to France.

At Oldham, Dr. Grossmann finds a ready sale for the residue left after distilling away the grease from the sludge. It is largely the presence of soap and fat in sludge which precludes its use as manure, as if they are present it will not readily incorporate with the soil. Ordinary pressed sludge cake also contains seeds of weeds and undesirable plants. Thus, if the grease and these seeds are eliminated, a much more satisfactory product is obtained.

Other kinds of sludge than those referred to above are produced in modern sewage works either by anaërobic or aerobic processes.

The latest development of the anaërobic process is the Emscher tank, the first one of which in this country is now being erected at the Withington works of the Manchester Corporation. The Emscher tank consists of two parts, a settling chamber and a sludge digesting chamber. The sewage passes through the settling chamber, and the sedimentary matters (other than heavy grit, which must first be removed) fall through a slot in the sludge-digesting chamber, which is much larger than the settling chamber. Here the sludge remains and undergoes thorough fermentation, after which it can be run out, and, owing to the peculiar granular nature which it acquires by fermentation, can be readily dried in properly constructed draining beds. The residue thus obtained is quite inoffensive, and is useful itself as a light manure, and can easily be enriched.

In Dublin a process of fermentation of sludge by addition of yeast is in operation. A considerable separation of water occurs in the process, and the fermented and concentrated sludge is dried in an ingenious manner, and the resultant powder sold by itself for 50s. per ton and more, in proportion to added artificial fertilisers.

The mode of action of the yeast is not properly understood, but it has been suggested as the result of experiment that the yeast breaks down and the cellulose cuticle of the yeast ferments somewhat, yielding hydrogen and other gases which cause the solid matters to rise to the top of the fermentation tank, with separation of a considerable percentage of water.

Fermentation of sludge may also be aerobic, and this takes place in the Dibdin slate filter and the ordinary contact bed or percolating filter. The residuum in a Dibdin slate bed has to be washed out from time to time, the filtering medium in a contact

bed is taken out from time to time, and the humus from a percolating filter is generally caught in so-called humus tanks. These various products, though probably different in many ways, especially biologically, are at any rate generally free from grease, and are granular and inoffensive in character. They are therefore more readily dried than ordinary tank sludge, and in Manchester it is the "slurry," so called from the washing of the contact beds, which is being dried, powdered and sold at a price which covers cost.

It will be seen that the function of the filter-bed, whether slate bed, contact bed, or percolating filter, is largely the collection and granulation of the colloidal matters in the sewage or tank effluent.

In an address given in November, 1911, as chairman of the Manchester section of the Society of Chemical Industry, the author made the following among other concluding observations:—

"I cannot forbear to mention also a most illuminating suggestion made to me by Dr. Maclean Wilson, that it might be possible to discover some kind of clotting enzyme, which should do the work which now apparently takes place in the surfaces of the medium of the filter-bed. If this could be done, there is a possibility of enormous saving in costly works." While considering the problem of New York, this question was anew forced on the author's attention. The idea, as an alternative to the scheme of sea-disposal already mentioned, of treating some 1,000,000,000 gallons of sewage daily on percolating filters appeared altogether impracticable in view of the possible nuisance from flies and odours. Chemical treatment of such volumes had also its special difficulties.

But experiments on various systems of forced aëration, and collection of the oxidised solids on surfaces seemed to offer possibilities, according to the experiments of Major Black and Prof. Phelps. At the Lawrence Experimental Station the author saw sewage in a bottle which under certain conditions had been completely purified by nineteen hours' aëration. This work is referred to in the recent annual report of the Massachusetts Board of Health. But the element of surface and consequent cost remained.

Since then it has been possible in the author's laboratory at the Manchester University to go further. The author's assistant, Mr. E. M. Mumford, discovered a bacillus in the water of the old colliery workings at Worsley which has the property of precipitating iron from solution in presence of organic matter. It was then found, as already reported at the congress of the Royal Sanitary Institute at Exeter, that if this organism is added to sewage effluent, together with a little iron salt, and air is blown through, complete clarification results, and the resulting deposit has a very high nitrogen content. Since then the engineering developments of the process have been the chief concern, but it has been possible successfully to inoculate about 5,000 gallons of sewage with a pure culture of the organism, and a plant is now being experimented with capable of dealing with 10,000 gallons per day.

Laboratory experiments are in progress at Davyhulme which indicate even more far-reaching possibilities, and the author looks forward with confidence to the time when it will be possible completely to purify sewage in a tank with production on the one hand of inoffensive sludge, which can be readily handled and disposed of as manure, and of the other on a well aërated effluent, in which aquatic plants and fish will make final use of the nitrogen and phosphates in solution. The problem in its present stage is largely one of engineering, but granted the possibility of applying large quantities of air economically to sewage, the saving in space and capital cost may be very great.

It should be practicable even for seaport towns to purify their sewage without great difficulty before discharge, retaining the insoluble matters in an inoffensive form, easily disposed of as fertiliser. A sewage works will then no longer be a source of nuisance and trouble, either from decomposing offensive sludge, or from flies and odours from percolating filters.

NEED FOR RESEARCH.

In conclusion, it is necessary to emphasise again that real advance in the art and practice of sewage disposal must come through the avenue of scientific research of the highest order. It is well to remember that the modern developments are only the prac-

tical application of principles discovered long since by men like Pasteur, Warrington, Frankland, and many others, without whose work sewage disposal would be mere empiricism.

Such research work necessitates well-equipped laboratories and large staffs of highly trained workers. The author realises the responsibility in having at his disposal the resources of the Manchester University and the Manchester Corporation for this purpose, but the work is a national one, and it is to be hoped that the present Royal Commission will not be concluded before its work has been put on a permanent footing in the establishment of a national research department which could carry out work of a wider scope than is possible for any one local authority, and could correlate the work done by such authorities to the general benefit of all.

In what has been said the author is not for a moment forgetting that for the practical application of the discoveries of the bio-chemist the close co-operation of the engineer is necessary. It is through this harmonious working together of two great professions that advances may be looked for in the future adequate to the demands of complex modern life.

THE VALUE OF COST DATA IN HIGHWAY ENGINEERING.

By Major W. W. CROSBY,

Chief Engineer, Maryland Geological and Economic Survey.

The mention of cost in connection with any discussion of highway work seems almost inevitable, and its analysis or even its statement always arouses interest and, frequently, discussion. Cost is the ready yardstick of the world for measuring the worth of many things, including the results of road and street work. Often it is not the only one that can and should be used, but, generally speaking, it is the one most frequently applied. The importance of its standardisation may hence be readily inferred. In the engineering prescription toward a result, almost the first question after the possibilities of the solution of the problems have been indicated is, "What will it cost?" If variety in the solution is practicable, a comparison of the costs becomes necessary in order to assist if not to determine the wise choice. The recording and compilation of cost figures regarding work in progress is the most practical way, in these days of enormous operations, for testing the efficiency of the organisation and individuals employed thereon, and for enabling the proper management of the work. In small operations, where the details are not beyond the capacity of the individual in charge, personal knowledge and ability might be successfully depended upon to produce economical results and proper work; but as soon as the operation grows in size beyond the capacity of the individual in charge to control the details, inefficiency is bound to result unless proper records of cost are promptly presented.

The desiderata for cost data may be said to be comprehensiveness, clearness, conciseness, low expense of keeping, ease of keeping by unskilled employees, readiness of and clearness in compilations, regularity of compilation, and periodicity of publication.

Of course, if vouchers containing sufficient detail concerning each expenditure are preserved and filed, it may be said that cost data is being accumulated in a way, but few will pretend that such a course is sufficient. However, every record of expenditure should be so comprehensive on its face as fully to explain the payment made. Clearness should mean intelligibility without the aid of personal explanation from the responsible party in the case of a voucher, and, in the case of accounts, the reasons for segregation of different vouchers into one or more accounts should always be clearly logical or apparent from the established rules provided.

It may be said, without fear of contradiction, that the large majority of costs yet published, either of details of road work or of organisations for road work, are of no scientific value, nor are they of any appreciable value, except to members of the respective organisations themselves, and no fair comparisons between the work of different organisations, such as the various state highway departments, are possible in spite of the voluminous publications available.

The speaker has suggested before the advisability of better co-ordination in this matter of collecting and compiling costs. It was with a proper consideration of co-operation, as well as of local interests, that he devised the system adopted by the Maryland State Roads Commission.

It will be readily seen that if several states or organisations engaged in similar work kept and published their expenses along similar lines it would easily be possible to compare the relative efficiency of each, even though many local conditions were dissimilar, and allowance had to be made therefor. A type of organisation could thus be tested. Types of construction could be proved. Even corruption or inefficiency could be detected, and real defects of materials or methods could be observed. With all these advantages would also come that of presenting to the taxpayers, in understandable form, a concise report as to the expenditure from the public funds so that criticism could be made effective when good, and disarmed when merely captious, unreasonable, or malicious.

In establishing any system for recording and compiling cost data, while the outline may proceed from the top down, the actual work must be begun at the bottom and proceed upward. Hence consideration of the foundation in this matter, as in all highway work, is necessary. No system can be successful which relies on an impractical foundation—that is, the compilations and accounts must be settled with a clear view as to the possibility of obtaining the data on which they are to rest. For instance, unless expert timekeepers are to be employed regularly, it is useless to provide too much sub-division of accounts. In ordinary maintenance work by a patrol-man all that can be expected on this line from the patrol-men best fitted for the physical work is that they will be able to report separately the expense for earthwork culverts (including shoulders), bridges and drains and surfacing, with occasional special reports, from a special inspector perhaps, of such special work as the painting of the edges of the surfacing or the taking up and relaying of a pipe. It may even turn out to be impracticable for the maintenance work to be separated between two differently contracted-for sections of the same road.

Further, in proceeding upward from the collection of facts regarding costs toward the final compilation, the accounting and the intermediate compilations should be so arranged as to fit progressively into the final scheme without the necessity for retracing at any time the steps taken up to that point. This is an important feature, and one which seems to be too frequently ignored. If such progression is not carefully arranged, it will be found that the delay and work necessitated for a special or even routine report at an intermediate stage completely destroy the value of the system for many of the purposes for which it has been installed.

It is true, as first stated, that "cost" is not the only measure of value of work done, though it is a very common one. But other criteria should not be neglected or allowed to slip into "innocuous desuetude." Engineers have been criticised as lacking breadth, and as being too materialistic. It behoves us, therefore, to keep our eyes open to the criteria other than "first cost," or even "long-run cost," in passing judgment on work done, important as the cost factor may seem to be.

Preliminary Studies in Bridge Design.—This little book,* a reprint of articles which appeared in *THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER*, is intended as the first of a series of similar volumes which, taken together, will form a treatise on the design of ordinary highway bridges of moderate spans. This first volume goes further back in the evolution of the bridge than do most treatises, and considers the bridge in its essential elements, that is as the means of providing a crossing for man and beast across a watercourse. The bridge engineer is apt to forget this primary purpose and to consider his bridge merely as a framework or a carrier of stresses. Mr. Ryves, in a refreshingly original manner, has emphasised the necessity for studying natural and economic predispositions, one might say, of the bridge site, with a view toward producing, not the best type of bridge, but the best method of getting the river and the traffic across one another.

Forms for Concrete Work.

By ALLEN GRAHAM, A.R.I.B.A., M.C.I.

At a meeting of the Concrete Institute held on Thursday of last week, a paper on "Forms for Concrete Work" was read by Mr. Allan Graham, A.R.I.B.A., M.C.I.

"We do not often hear," said the author, "of failures occurring in reinforced concrete buildings after their completion, but generally during their erection, and although all failures cannot be attributed to defective forms, the forms are to blame in a sufficient number of cases as to render the forms for concrete work an important element in securing efficiency in construction, and not merely in the utilitarian aspect. Although it is not the practice, in England at any rate, for engineers to design their forms, that being generally left to the contractor, it is the author's belief that an engineer, for his own protection, should at least set out some typical portion of the forms for the contractor's guidance, thus doing all he can to circumvent failure in this direction at any rate. Of course, good forms alone will not ensure safety, and we have to use vigilance likewise in detecting bad work, bad design, and bad material.

"Formwork is a term embracing all kinds of moulds or centering set up to give shape to the concrete or similar plastic material. It is so employed in America. There is a consensus of opinion in favour of the definition 'formwork' as an inclusive term, owing to the real meaning of the term 'centering' having a more limited application than usually attributed to it. As the word 'form' is the same, and has the same meaning in French, German, Italian and Spanish, the author believes it will be agreed we are on safe ground if we accept it for our purpose. The term has great merit, being superior to such terms as falsework or shuttering.

"The contention that the engineer should prepare the design of formwork has much to recommend it. An engineer will generally have no hesitation in setting out the design of centering for a bridge or other equally important work, but for some reason or other the design of ordinary formwork which plays such an important part in the cost of reinforced concrete is never considered. There is no doubt that a thorough understanding of the principles underlying the everyday practice of concrete form design is one worthy of the best engineering talent. With this understood, the problem can be analysed, the requirements realised, and the design decided upon that will be the most economical and efficient, giving due consideration to the salvage of materials.

"It is not merely that a design is required for a specific case which will safely support a certain volume of concrete, it is rather the problem of designing a set of forms which can be erected, taken down, and many times re-used during the progress of work. The factors involved are many, such as the type of centering, the kind of timber, how much to centre at one time, and what clamps, bolts, nails, wire, or strap steel should be used. These things properly considered will repay the trouble taken, and result in better and more economical work.

"Various authorities place the cost of formwork at anything from 20 per cent to 60 per cent of the total cost. The possibility of reducing this hindrance to the more general use of concrete ought to be sufficient inducement for us to give the matter close consideration. The great American constructional firms have struck out in many directions to reduce this cost to a minimum, and to this end the forms in most instances are designed in the drawing office, and this we are told at a cost of 2 per cent, and a saving of 10 per cent."

The author dealt with the kinds of timber that are used for formwork, the desirability of giving a camber to the bottom of beam boxes, the desirability of carefully checking the measurements, to see that the concrete members are actually carried out as designed, the necessity of having joints close to prevent the mixture escaping, the remedying of cracks, the removal of forms, clamps and nails to hold the forms together, the repair and re-use of formwork, the number of sets required in order to get on fast enough with the work of building, the importance of carefully clearing forms of all sawdust, dirt and chips before filling with concrete, the wetting of timber to

prevent sticking, the use of sheet metal, the time for striking forms and methods of determining the strength.

TIMBER.

With regard to the question of timber, Mr. Graham said:—

"White pine, yellow pine and spruce are all excellent for the purpose, and should be free from knots, and must not be so dry that they will absorb the water from the concrete and so swell and bulge as to entirely distort the forms. On the other hand, if the timber be green it will shrink and cause the same trouble. Varieties with hard surfaces should be chosen in order that forms may be oftener used before dilapidation.

"The timber has to resist the weight or pressure when a considerable height of wet concrete is being poured, as in walls and columns. Many authorities calculate this pressure as a liquid of half its own weight—namely, 75 lb. per cubic foot. When the concrete is placed in layers no calculation is necessary, as it has been found in practice that for beams the bottom boards should be 2 in. to 2½ in. thick, with sides 1½ in. to 2 in. thick. Column sides should be 1½ in. to 2 in. thick. For walls 1½-in. boards are used. Of course, the thickness of boards can be varied just as we place the clamps or braces, but it must not be overdone, nor the material made too thin. A more solid board will ensure greater economy, from the fact that the form can be used over and over again. For slab panels 1-in. stuff is generally used, but 1-in. boarding requires staying every 2 ft., 1½-in. boarding requires staying every 3 ft., 2-in. boarding requires staying every 4 ft. to 5 ft. Studs should be of sufficient size and spaced so as to prevent the boards between them springing.

"They may be 2 in. by 4 in. to 2 in. by 6 in. if not used beyond 2 ft. to 3 ft. centres; 3 in. by 8 in. may be spaced about 4 ft. 6 in. centres; 4 in. by 10 in. at from 6 ft. to 8 ft. centres; 6 in. by 12 in. from 8 ft. to 10 ft. centres; but the spacing of the supports must be governed by the nature of the weight coming upon the boards."

CAMBER.

On this question the author remarked:—

"It is necessary to give to beams a camber of at least ¼ in. in 5 ft.—i.e., $\frac{1}{20}$ th of the span. This generally comes out during the ramming and tamping of the concrete and in the squeezing of the wedges. After the filling, the beams should be examined to see if the camber has come out during the process of tamping, so that it may again be secured by tightening up the wedges before the concrete has set.

"In cases where a great deflection was found in the beams, the failure of the supports to the studs has been the root cause, probably owing to soft ground. For that reason a little judgment should be used to see that the sole plates under the supports are sufficiently large to distribute the load safely over a sufficient area."

CALCULATIONS FOR STRENGTH.

All timber supporting floors, the author advised, should be calculated for deflection rather than strength.

Sanford E. Thompson, A.A.M.SOC.C.E., a recognised authority, calculates from the following data:—

(1) Weight of concrete with reinforcement 154 lb. per cubic foot.

(2) Live load—slabs, 75 lb. per square foot; beams, 50 lb. per square foot.

(3) In calculating planks, beams, and joists, he takes as the coefficient in the deflection formula a mean between the value for a beam fixed $\frac{5}{8}$ and a beam supported $\frac{1}{384}$. This average therefore amounts to $\frac{3}{384}$.

Then the deflection = $\frac{3}{384} \frac{Wl}{EI}$, where W = total weight or load (in lb.), l = length of span (in inches), E = elastic modulus = 1,300,000, I = moment of inertia.

The moment of inertia is, of course, $I = \frac{ba^3}{12}$ where d = depth and b = breadth (in inches).

He limits the deflection to $\frac{1}{8}$ in.

For struts the allowable compressive stress must be reduced in proportion to their slenderness. If we assume them to be in a condition intermediate between pin connected and fixed because of their flat ends, the values for spruce or fir may be taken as in the following table, wherein—

l = unsupported length of strut in inches,

g = gyration radius of strut in inches,

g being equal to $\frac{d}{\sqrt{12}}$ for square struts, and to $\frac{d}{4}$ for

round struts, where d is the diameter (in inches).

	Ratio of l/g						
	60	75	90	105	120	135	150
Value of allowable compressive stress	960	900	825	675	450	410	340

Mr. Graham afterwards dealt in detail with forms for various parts of construction, as, for example, floors, beams and pillars, culverts, conduits, tall chimneys, silos, tanks, gas-holder tanks, dams, domes and bridges.

The paper was illustrated by lantern slides and a considerable number of working drawings.

TAR AND TAR PRODUCTS.

CO-OPERATION BETWEEN SUPPLIERS AND USERS.

In his presidential address to the Southern District Association of Gas Managers at the annual meeting of that body, on Thursday of last week, in London, Mr. Thomas Glover, of Norwich, observed that the place that tar and bituminous binders would take in road surfacing and road crust construction was a subject worth closely following, and a sympathetic spirit of co-operation should exist between the producers of tar and tar products and the engineers who were responsible for the making and maintenance of our roads.

Commenting on the appointment of Mr. H. P. Maybury—at one time closely identified with their industry—as chief engineer to the Road Board, Mr. Glover said they might be quite sure that, in view of the splendid work done on Mr. Maybury's initiative with tar products in Kent, the use of the right quality of bituminous matter originating in gasworks would receive favourable consideration, and this would exercise a beneficial check on the exploitation, to an undue extent, of natural bitumen.

Mr. Glover proceeded: "While the surface treatment of water-bound roads for the prevention of dust, and the reduction of wear of road surfaces by attrition, is now out of the experimental stage, and the advantages of the process are well known and acknowledged, much remains to be done to ensure uniformly good results being obtained. Gas engineers, and particularly those who are also tar distillers, can be of much assistance to the road authorities in this matter, and while the final tribunal must be actual experience on the roads, the gas engineer and his staff are better equipped for the experimental work and standardising of the bituminous preparation than the road surveyor. The best results can only be obtained by the co-operation of those supplying with those using these materials.

"The specifications framed by the Road Board have been of some assistance.

GASWORKS TAR.

however, differs so much in its properties and characteristics with every variation in the class of coal carbonised, and particularly the method of carbonisation adopted, that it becomes necessary, in the interest of uniform results, that the tar from every works be separately studied. In the case of heavy-charge tar and vertical-retort tar, the material is usually readily rendered suitable for road surfacing by removing the lighter portions of the tar by distillation. Certain tar, however, as made at high temperatures from small, horizontal charge work, is of such a nature that the removal of its lighter constituents is not sufficient to bring it into conformity with the Road Board specification. This, it would appear, can only be done by synthetically blending the pitch from such

a tar with heavy oils (practically free from naphthalene) in the required proportions—a process usually too expensive to be admissible. Adherence to the Road Board specification would appear to mean the exclusion of many such tars, so reducing the source of supplies, with a consequent rise in prices—a feature undesirable in the interest of extension of the use of tar for such purposes. It has no doubt been observed that heavy viscous tar requires more and larger shingle or chippings, but a much more durable coating is obtained by its use. It has been estimated that the saving in tyres on a tar-surfaced main road from London is equal to £2,000 per mile per annum. The cost of tar surfacing such a road would be about £70 per mile.

"Viscosity and specific gravity are not qualities which follow on parallel lines, and of the two it is desirable to have a test for, and to adhere to, a standard of viscosity. The purer the tar the more difficult it is to get the specific gravity of the Road Board specification without getting a viscosity which the county engineer or his contractor finds inconvenient in application. The preparation of

AN IDEAL ROAD DRESSING

involves the exclusion of water-gas tar, the removal of water, naphthalene, and light oils. The naphthalene content should be as low as possible, and the free carbon should not exceed 16 per cent. The nearer the material approaches a mixture of pitch of low, free carbon content and anthracene oil the better the results are likely to be. Such a tar, when applied to the roads, is not readily soluble in water, and during wet weather it does not discolour drainage water, and will therefore not pollute streams. Properly prepared tar does not cause the death of fish. The surface treatment of existing macadam roads must continue for some years to come. At best, however, it is only a thin veneer, and there is little doubt that the substitution of bituminous-bound for water-bound roads will extend as existing roads are reconstructed, particularly in the towns and their environs.

"While the required properties for a bituminous binder for road construction are few, they are, nevertheless, exacting. The temperature of a road surface may vary between 26 deg. Fahr. in the winter and 120 deg. Fahr. in the summer, and the binder must stand this range of temperature without becoming brittle at the lower, or unduly softening at the higher, temperature. The problem appears to centre, for the most part, around the relative resistance of these bituminous binders to this range of temperature. The material must remain resilient at the lower temperature, and not soften too much under the summer sun, nor perish by the evaporation or oxidation of its constituent oils, after long wear and exposure.

"Natural bitumen has proved an almost ideal material for the purpose, but the limited supply and high price prevent its extensive use except for first-class roads. The provision of a substitute presents, therefore, an attractive market for the bituminous product of gasworks. Various pitch grouts, consisting of soft pitch loaded with sand and other materials, have been tried with varying degrees of success. Along with other workers in this line of investigation and experiment, I have been to some trouble to devise such an article as will answer the requirements, and am looking forward with reasonable expectation to disposing of the whole of the Norwich production of pitch in this way."

The Surveyors' Institution.—The next ordinary general meeting will be held in the lecture hall of the institution on Monday, March 30th, when a paper, entitled "London before the Fire: as Referred to in Sixteenth and Seventeenth Century Literature," will be read by Mr. W. W. Jenkinson (Fellow). The chair will be taken at eight o'clock.

The Proposed Visit to Hamburg.—It appears that up to the present very few acceptances have been received for the proposed visit of members of the Institution of Municipal and County Engineers to Hamburg. It should be noted that those who hope to attend must communicate with the secretary before the end of March. Through the mediation of His Majesty's Consul-General at Hamburg, the civic authorities are making such arrangements as should ensure the visit being most interesting, and it is hoped that members will respond to the invitation in good numbers in order that the institution may be well and worthily represented.

MUNICIPAL ENGINEERING IN INDIA.

CALCUTTA PROBLEMS.

As a rule (a writer in the *Englishman* observes), municipal engineering is of such a humdrum nature that the average man rarely finds anything in it to interest him. This much, however, cannot be said of Calcutta, which has undergone many and remarkably rapid changes within recent years. One of the most vital problems with which the municipal engineers have had to grapple within comparatively recent times was the efficient supply of filtered water—the ultimate solution of which was the erection of the Tallah overhead reservoir. The magnitude of this problem may be judged from the fact that the supply of filtered water has been increased during the past nine years from 20,500,000 gallons per day to over 36,000,000 gallons per day, and even this extraordinary increase does not meet with the demands of the public, and more especially the Indian inhabitants of the city.

Shortly after Mr. W. B. MacCabe came to Calcutta as the chief engineer of the Calcutta Corporation in 1903, he proposed and drew up a scheme for the supply of 50,000,000 gallons of filtered water per day, but the corporation called for an immediate supply of 32,000,000 gallons per day, gradually rising, as the population increased, to 40,000,000 gallons per day in the course of twenty-five years. The scheme hung fire till 1911, when it was brought into operation only to be found that 32,000,000 gallons per day was totally insufficient for a continuous supply at high pressure, and the amount had necessarily to be increased, with the result that it is now far ahead of what the corporation originally proposed, there being over 36,000,000 gallons coming into Calcutta daily at the present time. This increase is more especially interesting in view of the fact that as late as 1905 there was only 20,500,000 gallons of filtered water per day available in Calcutta.

It is thus self-evident that a daily supply of 40,000,000 gallons—the maximum for which the scheme was designed—requires to be delivered in Calcutta as soon as possible; in fact, it is probable that the amount will be delivered in the course of a year and a-half. Yet even when this figure has been reached it will be found insufficient to give a continuous *high pressure* supply. Emphasis is laid on the words *high pressure* because, although there has been a continuous supply of water in Calcutta since 1911, it is not given at high pressure throughout the twenty-four hours owing to the enormous draught which takes place in the northern half of the city. The supply must therefore be increased daily beyond the figure of 40,000,000 gallons adopted by the corporation, or somewhat drastic measures will have to be taken to control the excessive waste and misuse of water. This will not, however, entail any increase of size in the present elevated reservoir at Tallah, which is the main feature of the improved water supply scheme of Calcutta, and for the design and construction of which Mr. McCabe was responsible. This scheme, by the way, cost the corporation about 60 lakhs of rupees.

DRAINAGE OF THE FRINGE AREA.

Another great work now nearing completion is the drainage of the Fringe area, which has long been a slur upon the Calcutta drainage system, as it was little better than an area of swamps during the rains. It is confidently expected that the scheme will be in working order before next rains. The executive engineer of suburban drainage has undertaken the work, under the guiding spirit of the chief engineer. In carrying out this scheme some extremely difficult ground has been met with, and the worst portion is now that which has to be dealt with. In this length all sorts of expedients, such as interlocking steel piles, have had to be resorted to. There is no reason to anticipate any failure, although the short length referred to will be rather tedious to complete.

SILTING OF THE BIDYADHARI.

But perhaps the most important drainage problem with which the corporation has been confronted for many years past is the silting up of the Bidyadhari River, into which the whole sewage of Calcutta discharges. Although this problem is still in the melting-pot, careful observations are being kept of the behaviour of the Bidyadhari, and tentative estimates are being got out for various possible schemes, one

of which will ultimately have to be adopted. Two Government Committees, of which Mr. McCabe and Mr. Ball Hill are members, are dealing with the matter. One of these committees deals with the drainage and the engineering portion, and the other, which might be called the Chemical Committee, is seeking the best means of treating Calcutta sewage chemically or biologically should it be found necessary to adopt one of these expedients in order to get an inoffensive effluent. The alternative schemes are to treat the sewage chemically or biologically, and discharge the effluent into a canal or other water-course in the vicinity of Calcutta, the sludge being disposed of either out to sea or on the land, or to find an outfall where the untreated sewage can be discharged without undue cost of construction owing to difficulties and the distance to be traversed. An experimental works, for which the Government of Bengal has sanctioned Rs.50,000, is shortly to be erected.

SLIPPERINESS OF TAR-MACADAM ROADS.

At the present moment the public, and also the corporation, are greatly exercised about the slipperiness of the tar-macadam roads. This slipperiness has, of course, been cured by the employment of the same means as that adopted for the same trouble at home—namely, by painting the surface with the particular bituminous binder with which the road is constructed, and then blinding the surface with crushed stone or fine gravel. There the corporation have let the matter stand, principally owing to the expected rapid development of heavy motor traction. If this comes up to anticipation it will play havoc with all the Calcutta roads as they are now constructed, but the march of progress cannot be stopped until the problem of building roads strong enough to withstand the heaviest of traffic has been solved. It should, however, be borne in mind that the problem of road construction in Calcutta is an extremely difficult one, owing to the many adverse conditions which exist, chief among which are the exceptionally soft and wet subsoil on which the whole of Calcutta rests, the heavy cost of stone for making proper foundations, the high temperature in the sun during the hot weather, the long period of drought, and the phenomenal rains, and last the bullock-cart with badly mounted wheels and tyres which cut up the road surface. With the introduction of motor traction these will eventually be abolished, but even then a new destructive agency will merely be substituted for another and more ancient one.

The Civic Engineer's Who's Who, compiled by the editor of **THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER**, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier*.

International Engineering Congress, 1915.—Rapid progress is being made in working out the final programme of papers for the International Engineering Congress to be held in San Francisco in 1915. The first volume of the publication of the congress will consist of a series of articles descriptive of the various technical features of the design and construction of the Panama Canal. This volume will constitute practically an official technical record of the gigantic engineering feat which is just nearing completion, and will be of interest, not only to engineers, but to laymen. The programme of papers for the various sections of the congress is practically completed, and notices of them will be published in the near future.

Back-to-Back Houses in Rochdale.—In the House of Commons last week the President of the Local Government Board was asked whether his attention had been called to the recent reports published by the medical officer of health of Rochdale, in which it was stated that here were 5,482 not-through houses in Rochdale, of which 3,470 were back-to-back; whether he was aware that Manchester had got rid of over 5,000 back-to-back houses in the last six years, and Salford had reduced the number of such houses from 2,525 to 73; if he could give any reason why similar action had not been taken at Rochdale; and if the Local Government Board proposed to take any steps in the matter. It was stated, in reply, that the President of the Board was aware of the facts stated in the question, and that he was in communication with the Rochdale Town Council on the subject.

Town Planning and Arterial Roads.

MEMORANDUM BY MR. THOMAS ADAMS.

[Mr. Adams is, as is well known, town planning inspector to the Local Government Board, and the subjoined memorandum has been prepared by him in connection with the sectional conferences on arterial roads in Greater London which commenced last week at Whitehall.]

The question of improving the road communication of Greater London has been fully dealt with in the reports of the Royal Commission on London Traffic, the Advisory Board of Engineers appointed by that commission, and the London Traffic Branch of the Board of Trade.

It is important that the evidence collected and the suggestions made by these bodies should receive the consideration of the sectional conferences, but it is equally important that the conferences should start their work without being committed in the slightest degree by any of the proposals put forward.

The constitution and representative character of the conferences will enable expert local knowledge to be brought to bear upon the details to be considered, which will be extremely valuable, and has not hitherto had such opportunity for concerted expression. This is one reason why members of the conferences should not be committed to any of the suggestions made in the past. Another reason is that the powers of local authorities to plan their areas and to co-operate with each other and with owners have been greatly extended under Part II. of the Housing, Town Planning, &c., Act, of 1909, and it is desirable that full regard should be given to these extended powers in dealing with the question of through roads.

The making of any new arterial road, any new connecting road of considerable length, or the widening of any existing arterial road in Greater London, cannot, as a rule, be carried out in its entirety within the area of one local authority, and it is therefore important that adjacent authorities should co-operate with each other in connection with such matters.

It seems probable that the best way to secure this co-operation will be by means of town planning schemes.

The improvement of the road communication of Greater London is only a part of the larger problem of the town planning of Greater London; but, whereas it is desirable for arterial and connecting roads to be considered over large sections of the Greater London area embracing the areas of many local authorities, it is only practicable to prepare town planning schemes for comparatively small portions of each section. These conferences would appear to have the opportunity of suggesting a skeleton plan for each section on which the separate town planning schemes could be based. But any local authorities which have in contemplation the preparation of town planning schemes should not defer the first stage—that is, the stage of obtaining the consent of the Local Government Board to the preparation of schemes—until the general conclusions of the sectional conferences have been reached. On the contrary, it will probably be found desirable to determine the areas which authorities may desire to include, and which the board may approve for inclusion, in town planning schemes in advance of the settlement of the lines of any arterial roads which may traverse these areas, and to proceed at an early date with any such proposal, so that the full advantage of the provisions which can be included in town planning schemes may be obtained by the various authorities in developing an improved system of road communication for each section.

When the conferences come to consider any question regarding the cost of making new and widening existing roads, it may be desirable to inquire into the advantages to be gained from town planning in regard to the development of intervening areas between the main lines of communication. If, by the preparation of town planning schemes, owners could be permitted to make purely residential roads not required for through traffic of lesser width than would be required in the absence of any properly considered schemes, it may be found that the land required for arterial roads will be provided by the owners free of cost to the authorities. An arrangement of this kind has been suggested in connection with schemes already submitted to the Local Government Board.

As pointed out in the circular of the Local Government Board issued on January 31st last, one of the chief advantages to be obtained from the preparation of town planning schemes is that arrangements may

be made for earmarking land which it may be decided is necessary for the construction of new roads or widenings of existing roads before it is necessary to proceed with construction, and new roads when actually constructed need not be "so made, in the first instance, as to be sufficient for their ultimate purpose."

The conferences are not limited in their consideration of arterial roads to such parts of the area of Greater London as are suitable for inclusion in the areas of town planning schemes—i.e., the parts which are in course of development, or which are likely to be used for building purposes—but it may be considered desirable to have regard, in the first instance, to the question of how far a system of roads can be planned in respect of these parts of the area, and then to consider how far the remaining parts may either be included or left for future inclusion in street improvement schemes.

In 1903—six years before the passing of the Housing, Town Planning, &c., Act—the Royal Commission on London Traffic suggested in their report the need for applying some method of the planning of such portions of the metropolitan area as were not developed, or only in process of being developed. They drew attention to the growing building operations round London, and urged that no time should be lost in arranging that all new streets should be laid out in accordance with a proper plan. Among other incidental matters referred to by the Royal Commission were the absence of sufficient power to define frontages on roads, and the need for preserving gardens and forecourts in existing streets, both of which matters can be dealt with more satisfactorily in town planning schemes than otherwise.

The relation between town planning and arterial roads is a very intimate one, and it is desirable to consider the two questions—if they can be described as two questions—together. The principal point to note at this juncture in connection with both matters is that the conferences should have full regard to their powers under the Act of 1909 in considering the questions that have been referred to them.

NORTH-EASTERN SECTION.

The Walthamstow Urban District Council have been authorised to prepare a town planning scheme in respect of the areas edged in green on the 6-in. ordnance map.* The undeveloped land in Walthamstow consists largely of a series of comparatively small units, separated by areas which are already built upon, and it will be observed that the proposal of the council is to prepare one scheme with reference to all these detached or partially detached areas. The combined areas coloured green comprise 1,530 acres. Part of the North Circular Road proposed by the London Traffic Branch of the Board of Trade goes through Walthamstow, and most of it is within the area of the scheme. The Walthamstow Council are now engaged in developing their proposals, and, among other matters, are considering the question of arterial roads. Walthamstow occupies an important position between the existing Norwich and Cambridge roads. Any scheme to connect these two radial roads by a new road across Walthamstow will not be easy to carry out. The engineering difficulties created by the levels and by the reservoirs, railways and other artificial formations which have to be encountered along the Lea Valley, whatever line of road is adopted, will make such a scheme a task of no small magnitude.

Tottenham Urban District Council will be most closely concerned with Walthamstow in connection with any scheme for bridging over the Lea Valley near the centre of the radial line formed by the Cambridge-road. The question of cross-communication by road over the whole of the Lea Valley requires careful consideration, and this conference, representative as it is of the two counties and the several boroughs and urban districts which lie on both sides of the River Lea, will provide a useful opportunity for the interchange of views on this im-

* The areas edged in green on the ordnance map are those in respect of which the board have given authority to prepare schemes.

portant local problem. It is desirable, however, in this as in other sections, that those councils who have the preparation of schemes in view should proceed simultaneously, so far as it is practicable to do so.

On the map circulated to the delegates the part of Enfield situate in this section, Woodford, Buckhurst Hill and Barking are hatched in blue to indicate that the councils of these districts have the question of preparing schemes under consideration, but since the map was prepared a further advance may have been made both in these four districts and in others which are uncoloured.

NORTHERN SECTION.

In the North Section, Finchley Urban District Council have been authorised to prepare a scheme in respect of an area comprising 1,044 acres. The council are proposing to make a further application in respect of the remainder of their district, which they regard as suitable for town planning. The board have received an application for authority from the Hendon Urban District Council in respect of an area comprising 5,195 acres, and consisting of the northern portion of their district. This council have also decided to make a further application for authority to town plan the remainder of their district.

Notices have been issued by the Wood Green and Barnet Urban District Councils. The Hendon Rural District Council have decided to prepare a scheme for the parish of Edgware in this section, and other councils have the matter under consideration.

It appears to be desirable that authorities in this section should give consideration to the improvement of cross-communications between the Edgware-road and Cambridge-road, as well as the provision of more adequate arterial road communication toward the eastern boundary of the section.

NORTH-WESTERN SECTION.

The Ruislip-Northwood area in this section is the only one in respect of which a draft scheme has been prepared.

The area consists of 5,906 acres, of which 5,843 acres are in the urban district and 63 acres are in the rural district of Watford. The scheme provides for several roads of from 50ft. to 60 ft. wide, intersecting the area from north to south and from east to west and linking up with main roads outside the district.

It will be observed that the line of the Great Western-avenue crosses part of the area on the extreme south, but the Ruislip-Northwood Council were unable to include this road in their scheme. It is hardly likely that separate authorities will be able to provide for the construction of short lengths of new arterial roads without some guarantee that the entire roads will be constructed, or at least a sufficient length to link up with a populous part of London.

Attention may be drawn to a few points in the proposed scheme regarding the method of meeting the cost of street construction, &c., but it should be noted that these proposals have not yet received the sanction of the Local Government Board.

The two principal streets intersecting the Ruislip area are proposed to be 60 ft. wide. In respect of these streets, and any other roads exceeding 40 ft. in width, no owner is to be required to bear any greater expense in the execution of the street works than he would have been required to bear had the new street been 40 ft. wide, with a carriageway of a width of 24 ft. Any greater expense is proposed to be borne and paid by the council.

If at any time the council desire to construct any of the new streets shown on the map, or part thereof, they are to be required to give six months' notice to the owners of their said desire. All costs and expenses incurred by the council are to be deemed to be expenses of private street works within the meaning of the Private Street Works Act, 1892.

An owner or owners of land over which a new street exceeding 40 ft. in width is shown on the map to be constructed, provided such street when constructed shall communicate at each end with a highway repairable by the inhabitants at large, are to give six months' notice requiring the council to construct the said new street. The costs and expenses incurred are to be met in the same way as in the case where the council themselves construct the street.

It is proposed to construct narrower streets of certain minimum lengths, varying from 20 ft. to 30 ft. in width, and to give special facilities for the construction of streets round quadrangles or open spaces. Provisions of that kind represent concessions to owners which have a bearing on the ques-

tion of land being secured free of cost to the local authority for constructing wide streets where required.

Twenty-two highways are proposed to be diverted or stopped up, and alternative routes are provided by the construction of new roads.

Under "Space about Buildings," provision is made for building lines to be shown on the map, varying from 15ft. to 35 ft. from the boundary of the roads, and, subject thereto, it is intended that no building can be erected nearer to the centre of any street than 30 ft., and nearer to the boundary of any street than 15 ft. Exceptions are made in respect of corner sites, shops, &c.

Probably the Ruislip-Northwood Council would have had extreme difficulty and been put to much heavier expense in securing their proposed new roads, and the widening of existing roads, if they had been unable to negotiate with the owners under the powers conferred by Part II. of the Act of 1909.

The Hanwell Urban District Council have also been authorised to prepare a scheme in respect of an area of 198 acres.

The Harrow-on-the-Hill Urban District Council have applied for authority to prepare a scheme for 1,720 acres.

Notices have been issued by the Acton and Willesden Urban District Councils.

Several other local authorities, whose combined areas represent the greater part of the section, have either decided to apply for authority, or have the matter under consideration.

SOUTH-WESTERN SECTION.

The Borough of Richmond and the Urban District Councils of Twickenham and Ham have been authorised to prepare schemes in this section. The respective areas are:—

Richmond	514 acres.
Twickenham	1,860 ..
Ham	976 ..

It will be noticed that Richmond and Twickenham are traversed by the proposed by-pass road to Chertsey. Notices have been issued by the Surbiton Urban District Council, and several other local authorities are likely to take action in the near future.

Cross-communication by road in this section is rendered very difficult owing to the fact that it is traversed by the river Thames and numerous railways.

SOUTHERN SECTION.

Carshalton Urban District Council have been authorised to prepare a scheme in this section in respect of an area of 2,320 acres.

The board have also decided to authorise the preparation of a scheme for a large area in Beckenham urban district.

Both the above districts are situate in important positions from the point of view of arterial and connecting roads, but it appears to be specially difficult to get any satisfactory treatment of connecting roads in this section without co-operation between the different authorities.

No action appears to have been taken in the South-Eastern section.

COLONEL HELLARD'S INVESTIGATIONS.

The proposals of the London Traffic Branch of the Board of Trade in regard to the subject of arterial roads are set out in another memorandum prepared by Colonel R. C. Hellard.

In 1909 the London Traffic Branch of the Board of Trade was directed to investigate the sufficiency or otherwise of the arterial roads leading into London, and to make suggestions for their improvement, and put forward proposals for new roads which might be found necessary to supplement them. The results of these investigations were published in the reports of this branch for 1910 and 1911.

In the first place the whole of the 6-in. maps of Greater London had to be brought up to date before much useful investigation could be made on the ground for any proposed new lines of road that might be considered necessary. Meanwhile, the existing arterial roads were examined, and their adequacy, or otherwise, for the population they serve and the traffic they carry was carefully considered, with a view to relieve the worst cases of congestion or to improve their direction.

TRAFFIC RECORDS.

The census figures and the estimates of the Registrar-General and of the medical officers of health afforded information as regards the distribution and

growth of population, but no systematic records of traffic existed, and it became necessary to ascertain at once the volume of traffic passing over each of the main roads leading out of London. A census of traffic was accordingly arranged for. The first was taken in January and February, 1910, and to compare winter with summer traffic a second was taken in June and July of the same year. It was found that in the central and eastern districts the difference is not great, but in the western districts and on the outskirts on all sides traffic is much greater in summer than in winter. The enumeration was made by the trained staff of the London County Council, and with their assistance a traffic census has now been taken each successive summer. They were thus gradually accumulating a mass of useful statistics that become more valuable each year in showing the nature, growth and conditions of traffic in and round London, and in indicating the measures necessary to relieve existing congestion, or to eliminate the possibility of such conditions arising in future.

In dealing with the arterial roads, it was found convenient to divide the area of London into six sections, each containing a group of main roads converging on the centre that could be considered in relation to the state of the traffic, population and development, in order to arrive at general conclusions as to their sufficiency or otherwise.

With the aid of the revised 6-in. maps, investigation was then commenced on the ground for the selection of those lines of road . . . which full consideration of all the circumstances in each case had shown to be necessary to supplement the existing roads. It was obviously necessary to follow lines of level that would ensure good grades for the roads, and at the same time avoid the closely built-up areas on the outskirts. The large number of railways round the fringe of the more densely populated portions of the metropolitan area, however, proved the worst obstacles to the free choice of route. On the lower levels most of the railways are on embankments, many of them too low to pass under, yet high enough to make it almost impossible to cross over, while level crossings on main roads round London must be considered impossible. On this account, and owing to the many junction lines and the wide areas devoted to railway sidings, the places where crossing is possible were comparatively few, and these constituted ruling points which governed and limited the selection of route. Again, in some cases the best line for a new road was already occupied by a railway, which it was obviously impossible to cross and recross, and yet to be restricted to one side or the other was distinctly prejudicial to the grade of the road. Many trial sections had to be made, and again and again a route which had promised well at its commencement had to be abandoned on account of some insurmountable obstacle encountered at some part of its course. A map gave no indication of the importance of buildings, and was therefore only a partial guide; all details had to be gone into on the ground itself, in order to find the line of least resistance, as a basis for discussion, prior to consultation with landowners and local authorities.

The 25-in. plans of the routes thus provisionally selected were next brought up to date, and plans of these roads, both on the 6-in. scale and on the 25-in. scale, are now available for those who might have to consider them further. As all these investigations were made on the ground either by him or his assistant, he could safely say that up to 1910 there were no serious engineering difficulties to be encountered on any of the routes selected. Development had, of course, proceeded since then, and buildings had been erected here and there which might add to the cost or even entail some deviation, but in most cases the lines were still open. In the course of these investigations, no systematic inquiries had been made as to ownership or cost of property, &c. So far as compatible with direction and levels, the cheapest route suited for the purpose was selected, although in many cases there are alternatives which it might be worth while to consider.

DEVELOPMENT OF ROAD TRAFFIC.

Although this question had been considered in the interest of traffic generally, it should not be overlooked that it was due to the introduction of the motor vehicle that the matter has now become so pressing. The convenience of the motor for passenger traffic rapidly asserted itself, and its development for commercial purposes was now making great progress, with the result that traffic of all sorts was being withdrawn from the railways to the roads.

The number of passengers carried by public services in 1912 within the metropolitan area reached the enormous total of well over 2,000 millions—the equivalent of 278 journeys per head of the population—and this figure was increasing far more rapidly than the population. Of these journeys, 66 per cent were made by road as against 34 per cent by rail, and while this of itself was sufficient to show the importance of the roads, there was the vast amount of commercial traffic to be considered of which they could make no satisfactory comparison as to the relative variation in the figures by road and by rail. They did, however, know that the delivery of goods by road had been largely extended within recent years, and that for commercial purposes the roads had now attained an importance that they never previously possessed. At the same time they were painfully aware that the present road system of London was practically identical with that of a hundred years ago.

As regarded relief, they must bear in mind that the possible sites for roads were limited, and that, once built over, enormous additional expense would be entailed in years to come to reopen the route. In most cases, it became a question of "now or never," particularly in view of the development in prospect under the Town Planning Act.

MUNICIPAL ENGINEERING IN NEW ZEALAND.

AUCKLAND'S ACTIVITIES.

With its rapid development into an important commercial centre—it is now easily the largest of New Zealand cities, its population, including suburbs, numbering 110,000—Auckland is at the present time a scene of municipal activity which is doubtless providing ample scope for the energies of the capable city engineer, Mr. Walter E. Bush, M.INST.C.E., who, it will be remembered, went out from England some years ago.

The city itself has recently extended its boundaries by close on 1,000 acres, having absorbed the suburban districts of Parnell and Arch Hill, and large areas of land reclaimed from the foreshore by the Auckland Harbour Board, a progressive body for whom Mr. W. H. Hamer is engineer.

The municipality are busy on an extensive scheme of street improvements, comprising, for the twelve months ended December last, over £60,000 worth of paving works, including compressed asphalt, Jarrah wood and New Zealand red brick (powellised) block-paving, and a short length of basalt stone setts and some £35,000 worth of macadam streets.

Mr. Bush has also in hand a sea swimming bath costing £2,500, new tepid salt-water baths, including men's swimming pool, 100 ft. by 50 ft., and women's swimming pool, 60 ft. by 30 ft., and slipper baths estimated to cost £10,000.

Mention may be made of the completion of large reinforced-concrete retaining walls at a cost of over £8,000, and a water service reservoir of the same material, and of a capacity of 1,500,000 gallons—the third of its kind Mr. Bush has constructed in Auckland, the other two, however, having each a capacity of 3,000,000 gallons.

Good progress has been made with the important scheme which the Auckland and Suburban Drainage Board—for whom Mr. Bush acts as engineer—are engaged upon. Work to the value of £350,000 has been completed, or nearly so, storage tanks and screening chambers—of 7,750,000 gallons capacity—and a sea outfall sewer alone accounting for an expenditure of no less than £50,000.

That there is a busy time ahead is evident when it is stated that, quite apart from ever-increasing demands in connection with maintenance, administration and general organisation, the projects for this year include additional street works, drainage, the provision of a new depot, new parks, and possibly another impounding reservoir to hold 100,000,000 or 200,000,000 gallons of water.

New Tracing Cloths. Attempts are frequently made to reduce drawing office expenses. One of the costliest articles, and that most frequently in use in large offices, is tracing cloth, the manufacture of which has been confined to a very few firms. For many years past prices have been maintained at a high figure, but Messrs. B. J. Hall & Co., Limited, of Chalfont House, Westminster, are now offering a series of excellent cloths of British manufacture which are stated by users to be equal in quality to the expensive cloths now in use.

LEEDS REORGANISATION PROPOSALS.

SPECIAL COMMITTEE'S DRASTIC RECOMMENDATIONS.

The *Yorkshire Post* on Saturday last devoted a special two-page supplement to the reproduction of the essential portions of the report which has been issued by the Special Committee appointed by the Leeds City Council to deal with the recent strike of corporation workmen. A thorough investigation into the working of the various corporation departments consequent upon their having to be administered for a considerable time with depleted staffs has indicated several directions in which effective reorganisation can be accomplished, and large sums of money saved for the ratepayers, and these matters are embodied in a series of important recommendations which the committee make to the council. The committee's report, inclusive of appendices, covers no fewer than 139 pages.

As a result of their review of the history of the trouble and of their experience during the strike the committee make the following recommendations to the city council:—

- (1) That a General Purposes Committee be formed, and that the committee consist of seven members.
- (2) That the council delegate to such committee full power to deal with all matters arising out of or in connection with—
 - (a) The appointment, control, and dismissal of all workmen.
 - (b) Wages, hours, and conditions of labour of all workmen.
 - (c) The distribution and supply of labour to the various departments.
 - (d) The reorganisation of the cleansing and highways departments.
- (3) That Mr. J. B. Hamilton be appointed executive officer of the General Purposes Committee at a salary of £500 per annum, to act under the instructions of the committee in the above duties and in such other duties as may from time to time be delegated to the committee.
- (4) That only applicants who are found suitable and are certified as fit after being medically examined shall be permanently engaged.
- (5) That no one in an official position shall be a member of a union existing among those over whom the official is placed.
- (6) That the city council meet once in each quarter, and that the necessary consequential alterations be made in the Standing Orders and delegations of duties to the committees.

LESSONS OF THE STRIKE.

In a section of the report explaining these recommendations, the committee say:—

"The strike has shown the necessity for improved methods of dealing with wages, conditions of work, hours of labour, &c., of municipal workmen. To enable such matters to be dealt with properly, the fullest information as to comparable work in other towns must be systematically obtained, as well as the conditions obtaining with private employers in the city, and also with trades unions, where standard rates have been established. The formation of a 'Commercial Department' for obtaining and collating such particulars is an absolute necessity. This would probably lead to a similar arrangement in other cities, and there would thus be a constant interchange of actual facts.

"We recommend that a General Purposes Committee be appointed as one of the Standing Committees of the council, with power to act in regard to all the foregoing matters. In our opinion such committee must be entrusted with the general arrangements as to labour in all departments of the corporation. To enable this to be carried into effect, it is necessary to appoint a commercial manager, to carry out the work above indicated. One important result of such appointment would be to eliminate casual employment, and to render permanent as far as possible the positions of men who are efficient under the corporation.

"The recommendations of the committee involve a complete change in the accepted form of council work. They are, however, the logical and inevitable result of the development within the last fifteen or twenty years of so many trading departments employing a large number of workmen, and the necessity of such a change is the distinct and unavoidable lesson of the strike.

"The corporation, as a large employer of labour, has made no advance during the last twenty years in its methods of considering demands for altered conditions, except by the formation of the Consultative Committee, whose decisions were not final. Such matters need to be dealt with uniformly and on business lines

"The powers and scope suggested for the proposed committee would bring the methods of considering all matters relating to their workmen in line with present-day requirements, and avoid the disabilities of the Consultative Committee."

A section of the committee's report shows how the work of the various departments was affected by the strike.

At the commencement of the strike the various waterworks, filter-beds, pumping stations, &c., were strongly picketed, but most of the men connected with the department who went on strike on December 11th offered to return to work almost immediately after the first announcement of the committee had appeared in the Press.

The electrical power station at Whitehall-road was maintained in a state of efficiency throughout the strike, and, as a matter of fact, 30 per cent more electricity was sold during the strike than under normal conditions.

The gas lamps of the city remained unlighted for some time, but the electric lighting of the streets was well maintained throughout the strike.

SUGGESTED ECONOMIES.

"It is clear," the committee state, "that a saving of £6,000 would be effected annually in connection with the lighting of the gas lamps of the city if an automatic system of turning the lamps on and off were generally adopted. The total cost of equipping the city with such a mechanical system would be approximately £19,000. With regard to the lighting of the electric arc lamps, these could be fitted with automatic controllers at an expenditure of £500, and this would bring about an annual saving of £500 on current used."

Little difficulty was experienced in maintaining the sewerage engineer's department in a state of comparative efficiency throughout the strike.

The committee are convinced that the various gasworks have been overmanned in the past, and that a system of "go-easy" has been in operation. They consider also that much of the plant is obsolete, and suggest that the whole should, by the adoption of the most efficient equipment, be thoroughly modernised.

As a result of their investigation of the cleansing department, the committee express the view that, with competent organisation, direction and supervision, this could be efficiently carried on with 300 fewer men than have hitherto been employed, and effect a saving of £21,000 a year.

In the highways department 248 men went on strike. The committee are convinced that a considerable saving can be effected if all possible work is put out to contract. They are of opinion that the road work of the highways and tramways departments touch at so many points, and overlap in so many ways, that uniformity of control as regards the maintenance of the roads and the paving of the permanent ways would result in considerable saving, and a great reduction in inconvenience to the citizens. It is therefore a matter for grave consideration whether the direction and control of the whole of the streets and highways of the city should not be combined in one department. Such combination would result in a considerable saving due to the avoidance of overlapping and waste consequent on two departments controlling the one road. Co-ordination would prevent the frequent opening of roads, and produce greater efficiency and a decrease in the expenditure.

The tramways department employs over 2,000 men. The general rule that has been in operation for many years is that no official in charge of other men shall be a member of any union. Consequently, when the strike was declared, everyone in an official position, including foremen, inspectors, timekeepers, gangers, and leading hands, remained at their posts, and the committee think it is not too much to say that the speedy termination of the strike in this department was due to the fact that so large a body of men remained loyal.

While the committee take up a neutral position as to whether the workmen should or should not be members of a union, they recognise that, in the case of those in official positions, the obligations of a

union prevent them from doing their duty properly towards their employers. It is for this reason that the committee recommend that in future it be a condition of appointment that no one in an official position shall be a member of a union existing among those over whom the official is placed.

A considerable portion of the work of the tramways department, particularly in the repair and renewal of the permanent way, is seasonal. At the present time many men who are employed in the tramways department through the summer go to the gasworks during the winter; but in the absence of a central organising office for the exchange of labour between the different departments, a very considerable amount of casual employment ensues. The committee hope that as a result of their inquiry and recommendations this will not obtain in the future.

As was stated in last week's SURVEYOR, Mr. Mann, the superintendent of the cleansing department, has placed his resignation in the hands of the committee, who have accepted it, and have granted him a retiring allowance of £250. The committee, having decided to recommend to the city council a complete re-organisation of the work of the highways department, had an interview with Mr. Prince, the highway surveyor. After friendly discussion Mr. Prince placed his resignation in the hands of the committee. On the understanding that Mr. Prince would place his special knowledge of the city and his services when required at the disposal of the council, the committee granted him a retiring allowance of £120 a year. An agreement has accordingly been entered into embodying the foregoing terms. The committee expressed to Mr. Prince their appreciation of the forty-eight years' faithful service that he had given to the city.

VIEWS ON THE COMMITTEE'S PROPOSALS.

The *Manchester Guardian* has gathered the opinions of representative men in other cities with respect to the Leeds proposals.

The Mayor of Manchester, Alderman McCabe, described the new departure as undemocratic. "Why," he asked, "should seven aldermen be appointed to deal with the arrangements and conditions of the workmen? Even if the system be adopted in Leeds, which is doubtful, I think it will not be adopted generally throughout the country; nor will it become permanent in Leeds. It seems to me to be subversive of all our ideas of government by the elected of the people. Of course, Leeds has recently been suffering some inconvenience caused by the recent strike, but this feeling of annoyance is probably only temporary in character, and would soon pass away."

The Mayor of Salford, Alderman Desquesnes, said he thought the proposal rather a good one, because there was a great deal of confusion and want of common action in almost every corporation when dealing with the labour side of its affairs. "In Salford, for instance," he said, "we have very awkward questions arising from time to time—questions of principle, really, in regulating the relations of the corporation to its workmen. What is being done by the Leeds Corporation seems—I speak generally—quite a rational thing. It does very often happen that you have in the employment of one committee more men than you can find employment for at the time, and it is always difficult to know what to do with them. A majority of members of the council will be against dismissing them, and you have no means of correlating what you want to do with what has been done by other committees."

The general view in Sheffield municipal quarters is that such a tight rein has been kept on the municipal departments in Sheffield that the necessity for drastic reforms such as those proposed in Leeds does not exist. It is considered, however, that the Leeds plan would be an excellent one for improving the type of corporation worker. "The growing practice of many councillors trying to find work for any voter who asks for a recommendation is threatening to weaken the municipal service," said one official, "and I think the Leeds plan will reduce the number of opportunities of this kind."

One of the civic chiefs of Newcastle-on-Tyne said his first impression was that the Leeds Corporation desired to find a scapegoat for use during the forthcoming clearing up of the strike trouble. He feared there would be many dismissals of employees for which the new manager might be made responsible. A prominent labour leader said the new scheme was, in his opinion, a further sample of the Americanisation of English concerns. It would be followed by a general speeding-up, and the dismissal of those who refused to be hustled.

AN ENGLISH ENGINEER IN PERU.

The life of an engineer in a South American State would seem, from a letter which we have received from Mr. Henry Criswell, ASSOC. M. INST. C. E., not to be altogether devoid of excitement. Writing from Lima, under date of February 10th, Mr. Criswell says:—

"There has been an attack on the Government Palace, the President has been imprisoned, and a council of six members appointed to take charge of affairs until the elections, when a new President will be elected. . . . As I was in the palace at the time of the assault, I am able to give you a few particulars if they will be of any interest to you, as it does not fall to the lot of every engineer to pass through such an interesting experience in the execution of his duties.

"By the courtesy of the ex-President I had been given quarters in the Palace of Government, so that in the usual way I went to bed about 10 o'clock on Tuesday evening last. At 4 o'clock next morning I was awakened by the marching of troops in the courtyard outside my rooms. As, however, I knew trouble was expected, I concluded that the authorities were simply marshalling the troops against a possible attack. So I looked out, but not seeing anything very unusual I went back to bed till 5 o'clock, when I was roused again by volleys of musketry. I knew then that the blow had fallen and a revolution was in progress. Owing to my bedroom adjoining the magazine there was considerable danger, but as the firing was directly outside my door—fortunately parallel to it—I did the only thing left for me to do, which was to dress as quickly as I could and sit in the safest place I could find. At six o'clock the 'Cease fire' was sounded, and I knew the place had been taken by the troops outside. I must say that perfect order was maintained throughout. There was no shouting, but the noise of the firing was terrific, as there were either Maxims or Gatling guns at work.

"I took this opportunity of getting through the main gate, which was simply riddled with bullets. Strange to say, no one challenged me, though the entrance was packed with troops. As soon as I got to the Plaza de Armas I made the quickest time I have ever done across this Plaza, because there were a lot of stray bullets flying about for several hours after this in the squares and streets. The rest of the day I spent with some brother Englishmen at Miraflores, and they kindly put me up for the night.

"It speaks very highly for the authorities of Peru that business was perfectly normal next day, confidence was restored, the banks were opened as usual, and but for bloodstains on the streets there was no sign of there having been any disturbance. I was filled with admiration at the moderation of the troops and their superiors, and I do not think Peru will suffer by the loss of credit in any way.

"It seems to me that the ex-President allowed his enthusiasm perhaps in some small way to overrun his good judgment, for I have the greatest respect for his integrity, his desire for the public good, and his honesty of purpose. I can speak with a certain amount of confidence, as it has been my privilege to have had a number of interviews with him with reference to the works proposed for me to carry out.

"A son of Mr. Lloyd George is in Lima at the present time representing the Pearsons, and after the assault I showed him the results of the firing at the Palacio."

Royal Institute of British Architects.—The annual dinner of this body will take place at the Hotel Cecil on June 17th.

Housing in Rural Districts.—In the House of Commons on Monday the President of the Local Government Board was asked how many cottages built under the Housing Acts by the rural district councils were now in existence, and how many were under consideration. Mr. Herbert Samuel said he could not state how many of the cottages referred to were now in existence, but he might say that the Local Government Board had sanctioned loans to rural district councils under Part III. of the Housing of the Working Classes Act, 1890, for the erection of 1,570 houses, and that applications for sanction to borrow for the erection of 363 more were now before him.

LIGHTNING CONDUCTORS.*

By FREDERIC H. TAYLOR, A.M.I.E.E., A.M.I.M.E.

The subject of lightning conductors is one which is, or certainly should be, of great interest to everyone, and particularly, I think, to engineers and architects. The latter are justly expected to provide means of protection to the buildings they erect, and the former to see that these are properly erected and duly tested, &c. The engineer also requires to provide protection to sundry structures which are more peculiarly within his own province, such as power stations, waterworks, oil tanks, overhead wires, &c.

PRESENT-DAY NEGLECT.

It is frequently supposed by several classes of people who might well be expected to take a more considered view that protection from lightning is of but little consequence in this country. I agree that this country is let off very kindly in the matter if you are going to compare it, say, with South Africa; but, nevertheless, the damage done and the risk incurred through want of adequate protection is considerable, and very largely, if not quite, preventable.

The Lightning Research Committee during the three years 1901-1904 were advised of over 500 cases of buildings in Great Britain damaged by lightning, or an average of 166 per annum. If you omit the first two and the last two months of the year as being those in which storms are least likely to occur, this leaves your average of 166 spread over eight months—that is, approximately, twenty cases of damage per month. I hardly feel such figures are not worthy of our serious consideration.

It is sometimes urged that buildings provided with lightning conductor systems are occasionally struck. This may be so, but what was the condition of the lightning conductor system at the time; and even if in order so far as it went, was it adequate? The answer which appears to be justified by modern knowledge is that either the system was in bad condition or inadequate.

In a report to the Metropolitan Asylum Board in 1912, the engineer-in-chief, Mr. W. T. Hatch, mentions 400 buildings as being damaged by lightning each year in England. Of these only 2 per cent have been fitted with conductors, the remaining 98 per cent not having been so provided. Where damage has occurred to what were facetiously called protected buildings, "it has generally been found to be due to an insufficient number of conductors, or to the latter having been applied incorrectly, or, after being fixed, no subsequent attention having been given to see that their earth connections remained in order."

Some persons are inclined to suppose that if a lightning conductor is struck and partly fused or destroyed, it proves uselessness. It proves the very opposite.

FALLACIES REGARDING LIGHTNING CONDUCTORS.

I would like to mention two which one often hears. One is that the conductors attract the lightning. This is nice of the conductors, and probably therefore the gutters attract the rain. The other fallacy I would mention is that of supposing that only very tall buildings need protection. Other circumstances than height above ground must be considered if reasonable protection is to be obtained. A building may have two chimney stacks—a tall one and a shorter one. Where the former has been fitted with a conductor, the latter has been known to be struck, and the reason has been definitely ascertained.

It might be urged that it is cheaper to repair buildings damaged by lightning, or even in some cases to rebuild them, than to provide complete systems of conductors and to have them tested by an expert periodically. This may be so, particularly as fire insurance policies commonly cover damage due to lightning. But there still remains the risk of human life—in these days the dearest risk of all.

LIGHTNING DISCHARGES.

I do not propose to deal, except very scantily indeed, with the purely scientific aspect of a lightning discharge. The engineer's lot is more often that of dealing with facts than of finding scientific theories for their occurrence. The generally accepted opinion, however, is that lightning discharges are of two distinct kinds, named by Sir Oliver Lodge

the "A" flash and the "B" flash respectively. The "A" flash is simple in character, and consists of a discharge between an electrically charged cloud which is approaching the surface of the earth without any intermediate cloud intervening. The path of the "A" flash is more or less prepared by the electrostatic conditions of the case, and it is said to strike pointed conductors in preference to others.

The "B" flash is a disruptive discharge of great suddenness, and arises where another cloud intervenes between the cloud carrying the primary charge and earth, the two clouds acting like a condenser. The Lightning Research Committee of 1905 reported that "when a discharge from the upper cloud takes place into the lower cloud the free charge on the earth side of the lower cloud is suddenly relieved, and that the disruptive discharge from this to the earth takes such an erratic course that no series of lightning conductors of the then hitherto recognised type suffice to protect the building."

THE PROTECTION OF BUILDINGS FROM LIGHTNING

Protection against the "A" type of flash is fairly easy, and it is considered that the ordinary system of conductors, when properly constructed and maintained is reasonably safe. Discharges of the "B" type involve more complex treatment, and, in the words of the Lightning Research Committee, 1901-1905, "absolute protection can only be assured by a complete wirework enclosure, in fact, of the nature of a bird cage." In any case, the extent to which a building shall be protected, and the cost of such protection, usually have to bear a certain relation to the importance and the first cost of the building itself. Unfortunately, the lightning conductor work of most buildings is treated with an indifference as dangerous as it is unjustifiable.

PARTS AND DESIGN OF LIGHTNING CONDUCTOR SYSTEMS.

Briefly put, any lightning conductor system comprises—(1) The air terminal, consisting of what is called the "elevation rod," the top of which is provided with one, three, four, or even five points; (2) the conductor from the elevation rod to the ground, with branch conductors from other parts of the building, or from the metal work of the structure, such as gutters, stack pipes, metal roofing, &c.; and (3) the earth connection.

The metal most commonly, in fact, almost universally used is copper, in the form of copper tape from 1½ in. by ¼ in., down to ½ in. by ¼ in. Iron is electrically efficient, but is more subject to corrosion, and not so easily fitted into position. As to the design of the conductor system, this can only be settled when the design of the building, including its chimneys, turrets, gables, ridges, &c., roofing material, &c., are known, and some consideration must also be had for its general situation. For rough guidance, however, a few general first principles may here be given:—

(1) Conductors should run in as direct a line to earth as possible. Some persons prefer to keep them a certain distance from the wall. This has the advantages of avoiding an accumulation of dirt, and also avoiding sharp bends when crossing over cornices, &c.

(2) Vertical rods should preferably be connected by horizontal conductors fixed to ridges or other suitable parts.

(3) Roof metal work, &c., should be connected to the system.

(4) Chimneys should be protected as being specially liable to be struck, due, of course, to the column of hot gases which are good conductors, the carbon lining to the chimney in the form of soot and the mass of metal work at the base, in the form of a stove.

(5) Any joints in conductors should be both soldered and screwed together.

(6) Conductors should be kept as much away from interior gas pipes or electric pipes, &c., as possible.

(7) Similar metals should be used throughout—i.e., the holdfasts should be of gunmetal, and screws or rivets, &c., of copper.

(8) Long runs along ridges, &c., should preferably have more than one elevation rod, say at least one at each end, several short points along a ridge being better than a few tall ones.

EARTH CONNECTIONS.

The earth connection of any lightning conductor system, however simple that system may be, is of the very utmost importance. It is the connection

* Extracts from a paper read at a meeting of the Junior Institution of Engineers on Friday last.

to earth, and if this be inefficient the whole system may be regarded more as a danger than as a protection. The mere fact of taking the conductor into moist earth, or even into water, does not necessarily form a good earth unless there is a considerable area of contact. The usual method of forming an earth connection is by means of a copper plate. The thickness is not important, provided it is sufficient to withstand oxidation. A plate measuring 30 in. by 30 in. by $\frac{1}{2}$ in. would be more efficacious than one 12 in. by 12 in. by $\frac{1}{2}$ in., although the latter gives 72 cub. in. of copper as against 56 cub. in. of the former. The copper tape conductor should be well connected to the plate, preferably riveted as well as soldered, and the soldered joint painted over to retard electrolytic action. Many people bury the plate horizontally; personally, I always make the interment vertically. The earth connection should always be kept well away from the building, and also well away from gas mains.

It is usual to bury a quantity of broken coke or cinders with the plate, with a view to retaining the moisture. If either material be used it must be thoroughly washed so as to get rid of any sulphur present, which would destroy the copper.

It not infrequently happens that the earth plate originally installed on a job has failed, and that for various reasons one cannot sink another. In this case a live water main makes an excellent and a lasting earth contact, care being taken, of course, that the connection between the tape and the pipe is properly made. Such connection will, of course, be external to the building.

TOWN PLANNING CONFERENCES.

PAYMENT OF DELEGATES' EXPENSES.

Mr. Thomas Cole, the secretary of the Institution of Municipal and County Engineers, has received from the Local Government Board a letter on the subject of a communication from the institution with reference to the Town Planning and Road Conference which has been arranged in connection with the forthcoming annual meeting at Cheltenham.

The letter states that the board are not prepared to sanction expenditure in connection with the representation of a local authority at more than one conference on the subject of town planning in the present year. They understand that several such conferences at different centres are being convened, and, generally speaking, they think that any local authority desiring to send representatives to any of these conferences should select the centre most conveniently reached from their district. The board also think that, usually, the local authority should be represented by their surveyor, or other officer concerned in the working of the Housing, Town Planning, &c., Act, 1909.

Subject to the conditions above indicated, the board will be prepared to consider applications from local authorities under that Act whose accounts are subject to audit by district auditors for sanction to the payment of the reasonable expense of not more than two delegates to the proposed conference.

It is added that, in cases where the surveyor or other officer of the council concerned in the working of the Act referred to is a member of the institution, the board do not consider that they could properly sanction the payment of his expenses in connection with the annual meeting of the institution other than those of attending at the conference.

IRISH COUNTY SURVEYORS.

THE QUESTION OF EMOLUMENTS.

At a meeting of the Institution of Civil Engineers (Ireland) recently a resolution previously passed by the council was adopted stating that attention has been drawn to recent cases in which county councils have proposed terms of remuneration for county surveyors which appear quite inadequate, having regard to the great responsibility and arduous duty connected with such a position. The council are of opinion that in no cases should the initial salary for the office be less than £400 a year, with provisions for reasonable increments dependent on satisfactory services, and that such salary should be independent of allowances for offices, travelling and other necessary expenses.

ORDERS FOR FOREIGN STEEL.

ACTION AGAINST ISLE OF WIGHT COUNCIL.

Judge Pery Gye concluded on Friday last, in the Isle of Wight County Court, the two days' hearing of an action of the Stellorite Company, of Paris, against the Mayor and Corporation of Newport and their surveyor, Mr. F. W. B. Waterworth, for £16 18s. 8d. for 4 metres of Stellorite steel. The surveyor rejected the goods on the ground that more than eight times the quantity he understood he had ordered was sent.

Mr. Tom Heyman, a partner in plaintiffs' firm, who was acting as their traveller in the Isle of Wight in August last, said that Mr. Waterworth gave him the order, which he (Mr. Waterworth) wrote out himself, for 4 metres of Stellorite, and in cross-examination he ridiculed the contention of defendants that the surveyor could have been misled by the use of the term "metres," as a knowledge of the metric system was the necessary qualification of a surveyor.

Mr. Waterworth gave evidence to the effect that Heyman recommended the Stellorite for laying pick-axes and cold sets, and he (witness) told him he would have a small experimental piece, valued at not more than £2. He wrote out the order at the dictation of Heyman, and just as he was about to write "feet," in describing the quantity required, Heyman said: "Put it in French lengths; our people over there won't understand English terms of measurement." He then said: "What shall I put?" and Heyman said: "Four metres."

In cross-examination, witness said he was not conversant with the metric system, which was not taught when he went to school, and he had never before had any transactions dealing with French metres during the thirty years or more he had been borough surveyor of Newport. He thought a large percentage of surveyors would fall into the same trap. He trusted to Heyman to tell him the French equivalent of the quantity he had told him he required. Mr. Heyman denied that the conversation as alleged took place, or that he dictated the wording of the order.

Mr. Cababe, counsel for the mayor and corporation, said he had three surveyors of other public authorities—Mr. Oakes, of Ventnor, Mr. Dashper, of Sandown, and Mr. Harvey, of Gosport—as well as several tradesmen, who had given orders to Heyman under similar circumstances, and were now disputing the plaintiffs' account.

Mr. Heyman warmly declared that those people were simply conspiring to repudiate the orders because they unjustly said they had been misled by the use of the term "metres."

The Judge held that there was no concluded contract, but only a verbal agreement on the part of the surveyor to take a small trial quantity of the steel. The surveyor did not appreciate the difference between "metres" and "feet," though he (the judge) could not understand how a man with the experience of a borough surveyor had not come across the terms of the French metric system before; but Mr. Waterworth gave his evidence with such obvious truth and veracity that he was bound to believe him. He therefore gave judgment for the corporation and their surveyor, with costs on scale C, and refused leave to appeal.

Tarco and Bi-Tarco.—Tenders for the supply of Tarco and Bi-Tarco for the surface dressing of roads and the construction of improved tar-macadam have been accepted by the Sale Urban District Council, the Cheshire County Council, Leyland Urban District Council, Urnston Urban District Council, Malling Rural District Council, Breconshire County Council, and the Corporation of Ossett.

Tunbridge Wells Meeting.—We received yesterday the official programme of a South-Eastern District meeting of the Institution of Municipal and County Engineers which is to be held at Tunbridge Wells on Saturday, the 28th inst. Members will assemble at the town hall at 11.30 a.m., and be received by the mayor (Councillor C. W. Emson, J.P.), and after the transaction of district business a luncheon will take place at the Royal Mount Ephraim Hotel. The members will later proceed in motor conveyances to Mount Ephraim, Major Yorke's-road to Forest-road, along Forest-road, and thence to Pembury to inspect the corporation waterworks. A visit will subsequently be paid to the corporation electricity works. Tea will be provided by the mayor.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC. M. INST. C. E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21, Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

Mr. H. V. OVERFIELD has selected the following books in respect of the premium for February which was awarded to him:—

- "Mechanism," by S. H. Dunkerley (Longmans).
- "Elements of Machine Design, Part II.," by Unwin & Mellanby (Longmans).
- "Building Construction," by Prof. Henry Adams (Cassell).

These have been duly forwarded to him.

QUESTIONS.

This week answers are invited to the following questions:—

381. Town Planning.—An area of 1,000 acres, chiefly undeveloped, in an urban district, is to be included in a town planning scheme. The approximate number of owners, occupiers and lessees is 250. Assuming that the referencing is to be done by the staff of the urban district council surveyor's office, state the information which should be sought, and the best method of ascertaining and recording it. Give an estimate of the cost of the work if done by professional referencers. Compare the advantages and disadvantages of the two methods, both in the above case and in the case of an area of 1,500 acres in the same district, which includes a considerable extent of partially developed building estates, and is to form the nucleus of a later scheme. (Togun.)

382. Fire Hydrants.—Fire hydrants, 2½ in. in diameter, are taken from a 4-in. and a 12-in. main. What will be the ratio of discharge in the two cases, assuming that the initial pressure is the same in each main? (X. X., *Hounslow*.)

385. Chimney Design.—Design a brick chimney shaft 130 ft. in height from ground level, the internal diameter at the base being 10 ft. (F. S., *Plumstead*.)

386. Storm Overflow Weir.—A 9-in. diameter stone-ware pipe, laid on a gradient of 1 in 281, carries a mean dry-weather flow of 33,300 gallons per day. It is required to construct a storm overflow weir, in a manhole, to pass all above six times the dry-weather flow. At what height above the invert of the pipe should the lip of the weir be set? (H. V. O., *West Bromwich*.)

387. Boring.—Describe, with sketches, the appliances necessary in carrying out borings to a depth of 100 ft. for the purpose of ascertaining the character of the soil. (W. N. B., *Cambridge, N.Z.*)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

384. Timber.—Sketch the cross-section of an oak tree and show the different modes of conversion. How does oak compare with elm for use inside or outside a building?

Good oak is a light-brown colour when new, but turns to a brownish yellow on seasoning with a hard, firm, glossy appearance; a cross-section shows that the annual rings are very distinct, but small and regular, with strong radial lines from the centre known as the "medullary rays." When these are cut obliquely across they show beautiful marks known as the "silver grain." This property makes the wood valuable to cabinet makers for high-class joinery. The smaller and more indistinct the medullary rays, the stronger is the wood.

The timber is very strong, hard, tough, and used

for all purposes where strength and durability are required. As compared with elm for building purposes, oak is far superior for outside work—such as window and door sills, treads of steps, gates and other positions alternately dry and wet—as elm decays quickly in such a state; but if the latter wood is kept perfectly dry or wet, it is quite as durable as oak. Both timbers are strong, tough and durable, and for inside work, where large scantling, to take heavy compressional forces, is required, they are equally good; but for inside high-class joinery and small work elm is inferior, not having so good an appearance as oak, and being much harder to work.

There are several methods of conversion, the following four being among the best:—

The log is first cut into four quarters; each quarter may then be converted by any of the following methods:—

SECTION OF OAK.

The best method is shown at A, in which there is no waste, as the triangular portions form feather-edged laths for tilting and other purposes. This method also cuts very obliquely across the medullary rays, and thus exhibits well the "silver grain" of the wood.

Of the other three methods B is the best, and D the least good. The method shown at C is useful for cutting up thick stuff. (H. B., *Falmouth*.)

NOTES.

J. K. P. points out a slight mistake which occurs in the reply to question No. 380, *re* belt gearing, which appeared in our issue of March 6th. In the reply it

states the law for belts is $\text{Log} \frac{T}{t} = e^{\mu \theta}$

The correct formula is $\frac{T}{t} = e^{\mu \theta}$

and the reply proceeded as if the formula had been so stated.

In regard to question 383, a reply to which appeared in our issue last week, we are indebted to Mr. Hugh Stowell, M. INST. C. E., for the following references in the "Proceedings" of the Institution of Civil Engineers:—

Pressure of Grain in Silos H. A. Sanseen, Vol. cxxiv., p. 553.

Measurement of Pressure of Grain—Prante, Vol. cxxix., p. 481.

Paper on "Pressure of Grain"—Wilfrid Airly, Vol. cxxxi., p. 347.

"Notes on Pressure of Grain"—Wilfrid Airly, Vol. cxxvi., p. 336.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain,
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii., 2.

THE INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

To the Editor of THE SURVEYOR.

SIR,—By the amount of correspondence relating to the above subject which has been published in your journal it appears that the younger members are taking a keen interest in the affairs and management of the institution. If the correspondence had contained less grumbling, and a few more practical suggestions as to what it is that requires to be remedied and how this might be accomplished, I think we should have made more advancement.

One has only to attend a few of the meetings to be aware that many of the younger members are dissatisfied with the institution as it is to-day, the chief causes of complaint being:

(1) That a preliminary examination has to be passed before a candidate is eligible to sit for the institution's examination. The institution not holding a preliminary examination of their own, but recognising that of the Surveyors' Institution or the Institution of Civil Engineers, thus forcing men to abandon all idea of taking the proper qualifying examination, or to join other associations as a student, many then preferring to go on and obtain the A.M.I.C.E. or F.S.I. qualification, rather than that of their own professional institution.

(2) That many associates and members have been elected during the past two years without examination qualification whatever (see the "Journal" for 1912-13), thus causing it in some cases to be more difficult to obtain permission to sit for the examination than to obtain election as associate or member of the Institution. Also it puts the worker who has spent time and money in order to become properly qualified on the same footing as the man who has no knowledge except that which he may (?) have picked up during the few years of his experience. (The institution has held examinations annually since 1886, and there can now be no reason or excuse for electing to membership men who do not hold the diploma of the institution.)

(3) That the junior members of the institution do not receive the consideration to which they are, if only by reason of their numbers, entitled.

As a junior member, I take the liberty of making the following suggestions:—

(a) Any person having served articles of pupillage with a municipal engineer or surveyor shall be eligible to sit for the institution's examination.

(b) No person shall be elected to membership or associate membership unless he holds the testimony of the institution.

(c) Junior members should be well represented on the council by deputy or assistant engineers or surveyors.—Yours, &c.,

LEONARD J. SMALL.

Council Offices,
Woodford Green, E.
March 18, 1914.

WHY TAR-SLAG BINDS WELL.

To the Editor of THE SURVEYOR.

SIR, Mr. Ryves, in your issue of the 13th inst., asks if I can suggest a reason for the more rapid deterioration of the tar-coating of limestones and sandstones as compared with that of slag. It can be deduced from my letter appearing in THE SURVEYOR of the 6th inst. that I attribute the better wearing qualities of tarred slag, as compared with other materials, as being due to the fact that the valuable properties of tar as a binding agent are retained practically to the end of the life of the slag, and the only conclusion I can possibly come to is that there must be some chemical action between the slag and tar whereby the life of the latter is preserved.

Your correspondent considers that my experiments are worthy of being recorded in more detail. He will, I feel sure, be interested to hear that four separate batches were weighed before and after the mixing with tar. Each batch registered exactly the same weight, but as I did not consider my weighing apparatus sufficiently accurate for a test of this description, I withheld the figures until I could repeat the tests under more scientific conditions.

Mr. Ryves invites me to express an opinion upon

his views given under the heading "The Proportion of Clay." To be candid, I do not quite follow him, especially in the paragraph—"that the absence of any considerable proportion of clayey matter in the detritus is a factor partly accounting for the successful use of these three materials in tar-bound crusts." Wouldn't this apply to granites, &c., of which it is said that in combustion, silica, alumina, alkalines, earthy bases, &c., have in cooling separated into quartz, mica and feldspar?

I have no experience of roadstones containing a fair proportion of clayey matter, and cannot conceive that such stones would make a first-class tarred material.

Clay as a binder is still used, and it is claimed that a granite surface so bound and afterwards tar-painted gives better results under motor traffic than a surface bound with hoggin or chipping and painted. Personally, I disagree with these views.

When laying tar-macadam I pay particular attention to the proper scavenging of the crust so as to prevent clayey matter, manure, &c., being ground into the interstices of the material. When ordinary heavy traffic passes over the crust for a few days the surface is sufficiently smoothed out to take a thin film of hot tar. A subsequent dusting with slag-dust renders the surface impervious to moisture; consequently, any bad effects which would be caused by dirt, &c., are obviated.—Yours, &c.,

CRETACEOUS

March 16, 1914.

SEWAGE DISPOSAL BY DILUTION.

To the Editor of THE SURVEYOR.

SIR,—I have read Mr. Stowell's letter of the 13th inst. I am reluctant to trespass further on your space with regard to this question, but I think I ought to say that I am in complete agreement with the statement made by Colonel T. W. Harding as to the conditions of dilution which would warrant a *prima facie* case for consideration by the Rivers Board or the central authority for the relaxation of the normal standard. The example cited is perfectly correct, but it is not the only possible example. Another one is the case of a small town discharging into a river whose volume is sufficient to admit of relaxation, but the quality of which is impaired by reason of pollution from a large town higher up stream. In this case, as I have already said, relaxation might be allowed under the recommendations by the commission, as expressed in their eighth report.

I can hardly agree with Mr. Silcock's statements regarding the commission's conclusions, as given in Kempes' "Engineers' Year-book," and quoted by Mr. Stowell. In my view, both these statements are incorrect. How is the "two parts per 100,000 of dissolved oxygen" arrived at?

I think I must now let the matter rest.—Yours, &c.,

G. BERTRAM KERSHAW, M.A.M.SOC.C.E.

West Wickham,
Kent.

March 17, 1914.

CANDIDATES' EXPENSES.

To the Editor of THE SURVEYOR.

SIR, An authority within ten miles of Blackpool recently advertised for an assistant to their surveyor.

Out of the applicants six were selected to appear before the council, three having only to travel a few miles and the other three coming from a greater distance.

The gentlemen who came from the greater distance were allowed what they asked for as expenses; but the local men were told that they would not be allowed any expenses as they had only come a short distance.

May I suggest that this was unfair, as the local men, who had the trouble and expense—though this latter might be small—of attending the meeting, had as much right to their expenses as the others?—Yours, &c.,

FAIRPLAY.

March 17, 1914.

WARNINGS FOR DANCER POINTS ON ROADS.

To the Editor of THE SURVEYOR.

SIR, Referring to Mr. Atkinson's letter on the above subject, I have clamped the ordinary red reflex light on the posts of the danger signs, just

CONCRETE INSTITUTE.

NEW MEMBERS.

At the last meeting of the Concrete Institute it was announced that Messrs. A. Kelway Bamber, London; B. J. Day, M.I.E.E., A.M.I.MECH.E., Cardiff; H. Gayton, A.M.Q.S.A., Accra, Gold Coast; C. Fleming McDonald, Dunedin, New Zealand; L. Messy-Rhine, DIPL.ING., Brisbane, Australia; and J. F. Warden, London, had been elected as members; Messrs. H. A. Clarke, Westminster; Thomas Crowdy, A.M.S.E., A.J.I.E., Salisbury; Arthur L. Johnson, M.A.(CANTAB), Middlesbrough; Sydney J. Kelly, A.M.I.MUN.E., Port Elizabeth, South Africa; and J. Leask Manson, B.SC.ENG. (LOND.), M.R.SAN.I., Leicester, as associate-members; and Messrs. Cyril P. Crabtree, Cardiff, and G. T. Uren, London, as students.

The next meeting of the institute will take place at Denison House, 296 Vauxhall Bridge-road, Westminster, S.W., on Thursday next at 7.30 p.m., when there will be an adjourned discussion on Mr. Cyril Cocking's paper, "Calculations and Details for Steel-frame Buildings from the Draughtsman's Standpoint," some extracts from which appeared in our issue of last week.

WORCESTERSHIRE MAIN ROADS.

RECONSTRUCTION SCHEME APPROVED.

The Road Board have approved the scheme for the reconstruction and coating with bituminous-bound material of some 53½ miles of main roads in Worcestershire, estimated to cost £127,000, and have given a second grant towards the proposed expenditure.

Business Announcement.—Mr. Chas. H. Johns, formerly highways surveyor, Southampton, has, we are informed, taken over the management of the Tarred Macadam Department of Claridge's Patent Asphalt Company, Limited.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

NEW SECRETARY APPOINTED.

Mr. J. W. Dudley Robinson, B.SC.(LOND), secretary in the central offices of the University of London, has been appointed, at a salary of £400 per annum, as secretary of the Institution of Municipal and County Engineers in succession to Mr. Thomas Cole, ASSOC.M.INST.C.E., whose resignation of the office was announced recently.

Fifty-seven applications for the position were received, and three of the candidates, in the persons of Mr. H. Laurence Butler, assistant in the office of Mr. A. S. E. Aekermann, secretary of the Society of Engineers, Mr. A. Clifford Swales, secretary of the Junior Institution of Engineers, and Mr. Dudley Robinson were selected to appear before the council

MR. J. W. DUDLEY ROBINSON.

From Photo by C. E. Fry & Son, Kensington.

of the institution at their meeting on Saturday last, the choice, as stated above, falling upon the last-named.

Mr. Robinson is twenty-eight years of age. He received his education at the Mathematical School, Rochester, and at the South-Western Polytechnic Institute, and he has had altogether ten years' administrative experience under the Kent and Surrey County Councils and the University of London. He will commence his new duties at the beginning of May next.

As already stated in these columns, Mr. Cole is to be retained as consultant at a salary of £250 per annum, and will succeed the late Mr. Charles Jores as hon. secretary of the institution.

A Resolution that is Ultra Vires.—At the meeting at Bristol on Saturday last of the Council of the National Association of Local Government Officers a delegate made reference to the action of the Wallasey Corporation who had passed a resolution "That in future if any official makes any application for increase of salary contrary to standing order No. 4, and without his application being accompanied by his resignation, as provided for by previous resolution of this committee, such official be given notice to terminate his engagement." He moved a resolution asking that the association take the necessary steps to safeguard the interests of the Wallasey officials. The chairman of the General Purposes Committee said they had the matter under consideration, and no resolution was necessary. They would take all necessary action. A Bolton delegate asked if it was not a fact that the Local Government Board had already advised another district council that a resolution such as that passed at Wallasey was illegal. He was told in reply by the chairman that that was so.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction, without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

HIGHWAY CANAL BRIDGE: STANDARD OF REPAIR.

The decision of Mr. Justice Phillimore in *Attorney-General, at the relation of the Worcester Corporation v. Sharpness New Docks and Gloucester and Birmingham Navigation Company* (noted at p. 234 *ante*) has been reversed by the Court of Appeal (January 28th). Under their special Act of 1791 the company were required to make bridges over their canal, and to keep them in "sufficient repair." The point in dispute was whether the term "sufficient" fixed the standard of repair for all time measured by the requirements of the ordinary traffic at the date of the Act, or whether it implied a standard varying from time to time according to the traffic for the time being. It was admitted that the bridges (with one exception) were insufficient to bear the heavy motor traffic of the present day, and the company had had notices put up under sec. 61 of the Locomotives Act, 1861, declaring the bridges to be insufficient to carry weights beyond the ordinary traffic of the district. Mr. Justice Phillimore decided in favour of the company, being of opinion that their liability was only to keep the bridges in a state of repair sufficient to bear such traffic as was ordinary on the highways at the time of the original construction of the bridges. In the Court of Appeal Lord Justice Vaughan Williams said that, in his opinion, the statutory obligation of the company was to support and repair the bridges sufficiently to bear the ordinary traffic of the district which might reasonably be expected to pass along the highways carried by the bridges over the canal—not according to a standard fixed once and for all, but according to a standard varying from time to time sufficient to carry the traffic of the day. Lord Justice Kennedy said that if the bridges had not been constructed, as they were, for the convenience and advantage of the company, the highways in the places where the bridges now were would have been repairable by the road authority according to the standard of the requirements of traffic from time to time. Was it reasonable (his lordship asked) to assume that the Act of 1791, which authorised the cutting of the canal, could have intended that the public, who had a right to use the highways, should be placed in a worse position than would have been the case if the Act had not been passed? He did not think such a construction of the Act reasonable or right. The Act imposed on the company a duty equivalent to the right which the public would have enjoyed if the Act had not been passed. The Court gave no ruling as to any particular class of traffic, but merely decided the general principle of law. It might be that some of the bridges were suited to the present-day requirements of the ordinary traffic, whereas in other parts of Worcester—for instance, urban districts—much heavier traffic might now be the ordinary traffic. The Court desired merely to lay down a general standard of maintenance which would be flexible and adaptable to the requirements of each particular district. Lord Justice Swinfen Eady concurred, and the appeal was allowed.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as *noms de plume*. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

HOUSE DRAINAGE.—"Wight" writes: A house situated on the sea coast in a rural district has, since its erection, been drained into a cesspool, which receives the solid matter. The overflow passing into a drain together with the storm water is discharged at the foot of the cliff bordering on the foreshore at about high-water mark. The house has recently been enlarged and plans submitted to the council, who have objected to this means of disposal, which has been in use for a number of years without complaint or nuisance, as they have bathing stations on each side of the outfall at about 200 yds. distance. It was then proposed to carry an outfall into the sea for a distance

of 140 ft., but this was also disapproved. Will you inform me if the council have powers to disapprove this method of drainage, and, if so, under what Act?

If the drain from the house to the cesspool is not sufficient for effectual drainage," the authority can compel the owner to make a new drain under sec. 23 of the Public Health Act, 1875. If, however, the drain is sufficient, this power cannot be exercised. The overflow drain from the cesspool to the foreshore does not fall within the statutory definition of a "drain," because it is not made for the purpose of communicating from the house "with a cesspool or other like receptacle for drainage, or with a sewer into which the drainage of two or more buildings or premises occupied by different persons is conveyed." It is therefore a "sewer," and the council are responsible for it (unless it comes within any of the exceptions mentioned in sec. 13 of the Act).

COMBINED DRAINAGE.—"V. V." writes: Two adjoining houses, A and B, belonging to the same owner, have separate drains which join together at a point C, the combined drain then discharging into the river at a point D. The drainage of B has been found defective, and the occupier of A has complained of a nuisance caused by the combined drain discharging into the river. The owner of the property has suggested that the combined drain should be dispensed with and a fresh system substituted, the council to carry out the work of connecting with the manhole on the sewer. In what way can the council compel the owner to connect with the sewer in the street in order to obviate the laying of a sewer on his property?

The drainage of B being defective, the council can require the owner, under sec. 23 of the Public Health Act, 1875, to make a drain for that house emptying into a sewer which the council are entitled to use, within 100 ft. from the site of the house; or, if no such means of drainage are within that distance, then emptying into such cesspool or other place not being under any house as the council direct. But unless the drainage of A is also defective they cannot compel the owner to make a fresh drain for that house.

SURVEYOR TO URBAN DISTRICT COUNCIL.—"W. L. F." writes: The urban district council appointed an assistant surveyor to act as surveyor during the illness of the surveyor. The surveyor was appointed under secs. 189 of the Public Health Act, 1875, and he now wishes to resign. The question is: (1) Can the urban district council appoint the assistant surveyor to the surveyorship without advertising the appointment? (2) Will the appointment, if made, be in the nature of a contract, and come within secs. 173 and 174 of the Public Health Act, 1875?

(1) Under sec. 189 the council are bound from time to time to appoint a fit and proper person to be surveyor. The section does not expressly require the appointment to be advertised, and there appears to be nothing to prevent the appointment of the assistant surveyor, assuming him to be a fit and proper person, without advertising the appointment. (2) The appointment will be complete by election, of which a minute should be made. But if the appointment is worth £50 or upwards, there should be a sealed contract for the officer's protection in case any dispute should arise between him and the council, and should lead to litigation, in which event he would be out of Court in the absence of a sealed contract. (Lumley's "Public Health Acts," 7th Edition, page 454.)

HOUSING AND TOWN PLANNING, &C., ACT, 1909.—"W. S." writes: By sec. 17 a sleeping-room should be not less than 7 ft. in height. (1) Does this apply to rooms where the floor is above the level of the adjoining ground? (2) In case the council find certain rooms unfit for habitation, is the proper course to close the whole of the house, or only apply for a closing order for part of the house? (3) If the rural council decide to erect cottages under Part III. of the Act, is it necessary to get the consent of the county council before making application to the Local Government Board for a loan?

(1) No. This provision applies only to a room "the surface of the floor of which is more than 3 ft. below the surface of the part of the street adjoining or nearest to the room." (2) A sleeping-room to which subsection (7) of section 17 applies is to be deemed a dwelling-house; therefore the closing order should apply only to the room. In other cases the order should apply to the whole house, there being no power to close separate rooms, unless they are such sleeping-rooms as previously mentioned. (3) I presume Part III. of the Housing of the Working Classes Act, 1890, is meant. The consent of the county council does not appear to be necessary.

SOME RECENT PUBLICATIONS.*

CARPENTRY AND JOINERY. Fourth Edition. By Banister F. Fletcher, F.R.I.B.A., &c., and H. Phillips Fletcher, F.R.I.B.A. Price 6s. nett. London: Whittaker & Co.

In this well-known book the authors have endeavoured to meet the requirements of the craftsman, and at the same time to produce a work that will be useful to the professional man in the designing of the various structures. The new edition has been, to a large extent, rewritten and brought up to date, and while retaining all the main features of former editions, contains a most interesting additional chapter on artistic craftsmanship. The whole range of carpentry is dealt with in a manner which reveals the author's intimate knowledge of the subject and their skill in lucid exposition. The work is copiously illustrated, and the sketches of the best examples of the craft to which reference is frequently made are calculated to rouse and sustain the reader's interest. As a textbook for architects, engineers, surveyors, craftsmen and students for the several professional examinations, the work is to be very highly commended.

RAILROAD SURVEYING. By G. W. Pickels and C. C. Wiley. Price 10s. 6d. nett. London: Chapman & Hall, Limited.

The authors of this book have had considerable experience in the teaching of engineering students, and the work is a summary of the notes used by them for a number of years in their classes on railroad surveying. The subject is treated in a condensed form, a large reduction in space having been effected by the omission of detailed mathematical working. The assumption of a knowledge of elementary surveying and plane trigonometry on the part of the reader has enabled the writers to confine their work to outlined solutions. The work is conveniently arranged in paragraphs, the main divisions of the subject being railroad surveys, maps, distance curvature and grades, curves, earthwork and turnouts, connections and crossings. The theory of the spiral is dealt with in an appendix, while a number of useful tables complete the work, which is one of undoubted value. British readers, however, must bear in mind that certain of the matters are considered with regard to American practice.

A RHYMING SEWAGE WORKS MANAGER.

"If a body write a body,
Getting no reply,
May a body ask a body
What's the reason why?"

wrote Mr. Thomas Coleman, manager of the sewage works at Athenry, to the Loughrea Rural District Council requesting them to pay him his quarter's salary. The writer added that he had applied for his salary a fortnight ago, but had received no reply. When the assistant clerk read the postcard, the chairman remarked, "Well, what is this body going to do with that body?" "I suppose," remarked Mr. O'Loughlin, "pay him the same as any other body." "This body would have paid him before if we had a financial meeting," explained the assistant clerk. "He will be paid to-day."

Suggested Exeter Improvement Scheme.—The committees of the Exeter City Council charged with the consideration of the provision of a site for the new library and museum, towards the erection of which Mr. Carnegie has contributed £15,000, have (the *Western Morning News* states) presented to the council a report prepared by Mr. T. H. Mawson, the well-known town planning and landscape architect, in which not only is the site for the library dealt with, but a scheme of improvement for Queen-street and neighbourhood is sketched out, the execution of which, it is suggested, might be spread over a century, and which if carried out would not only provide Exeter with a noble range of municipal offices, but would at the same time open up new views of the Guildhall and Cathedral, and transform Queen-street into a great civic centre, around which would be gathered the municipal and principal educational activities of the city.

* Any of the publications reviewed or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

SANATORIA IN COUNTIES AND COUNTY BOROUGHS.

The President of the Local Government Board was asked in the House of Commons on Tuesday whether any councils of counties or county boroughs neither owned nor were now building their own sanatoria; and, if so, whether he would give their names?

Mr. Herbert Samuel said the answer to the first part of the question was in the affirmative. As he explained in an answer of February 19th, councils were empowered to provide the necessary sanatorium accommodation for their areas in various ways other than themselves building sanatoria, and in many cases were doing so. The councils of the following counties and county boroughs had not yet provided sanatorium accommodation, and were not building sanatoria at the present time:—

COUNTIES.—*Bedford, Berkshire, Buckinghamshire, *Cambridge, Isle of Ely, Cheshire, Cornwall, *Hereford, *Huntingdon, Holland (parts of), Kesteven (parts of), Lindsey (parts of), *Norfolk, Northampton, Soke of Peterborough, Northumberland, Oxfordshire, Rutland, Southampton, *Isle of Wight, Sussex (East), Sussex (West), Warwickshire, *Yorks (North Riding).

COUNTY BOROUGHS.—Barnsley, Barrow-in-Furness, Birkenhead, Canterbury, Coventry, *Devonport, Dewsbury, *Gateshead, *Great Yarmouth, Grimsby, Norwich, Oxford, Plymouth, Preston, Reading, Rochdale, *South Shields, Stockport, Sunderland, Walsall, West Bromwich, *West Hartlepool.

Of the others named in the list, seven county councils and seven county borough councils had submitted proposals for the provision of sanatorium beds, three county councils and five county borough councils were at present arranging for the provision of beds at or in connection with existing institutions, and six county councils and five county borough councils had purchased or proposed to purchase sites for the erection of new buildings.

SEWAGE DISPOSAL AT SPALDING.

THE SURVEYOR'S SCHEME.

Spalding Urban District Council have received a letter from the Local Government Board with regard to the sewage scheme, which was recently the subject of an inquiry, and on which it is proposed to expend nearly £30,000. The Local Government Board state that they are satisfied as to the necessity of carrying out the complete scheme, but they are advised that the proposals submitted require extensive revision, and for this purpose it would be desirable for the council to consult an engineer who has had considerable experience in designing and carrying out schemes of sewerage and sewage disposal. The board would be prepared to arrange for their engineering advisers to confer with the engineer appointed by the council and the council's surveyor, with a view to a revision of the scheme. At a special meeting of the council held on Friday night to consider the letter, strong opposition was taken to the proposal for the appointment of an engineer. The following resolution was unanimously passed: "That this council has every confidence in the ability of their surveyor, Mr. John Bailey, to carry out the scheme he has already spent months in planning, and are therefore of opinion that it is unnecessary to sanction the appointment of an engineer as suggested by the board."

Modern Road Surfaces.—In his annual report published recently the borough engineer and surveyor of Nuneaton, Mr. F. C. Cook, says it is evident that there will be a marked increase in the cost of road maintenance within the near future. Wages have risen, and the price of all materials has gone up considerably; while the advent of motor buses and the increase in the number of motor vehicles generally necessitates the provision of stronger and better road surfaces. The day of water-bound roads is passing by, and although tar-spraying has proved a valuable expedient during the period of transition, there is little doubt of the ultimate economy of the use of more lasting material than ordinary macadam in all cases where the traffic is other than of a purely local character.

* These councils have not yet submitted proposals for the provision of sanatorium accommodation.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Birkenhead T.C. (March 7th. Mr. Edgar Dudley).—£1,315 for the purchase of property in Holborn-square, close to the junction of Old Chester-road and Queen-street, Lower Tranmere. It was explained that at this point Old Chester-road is extremely narrow, and it is intended to demolish the present buildings and to widen the thoroughfare.

Birmingham T.C. (March 13th. Mr. A. G. Drury).—£10,556 for the purchase of Bilberry Hill and land surrounding Perry Reservoir, Perry Barr, for the purpose of public pleasure grounds.—Evidence was given by Mr. Fleetwood (surveyor) and Mr. W. H. Morter (superintendent of the parks), and the application was supported by Councillors W. Brown and Johnson.

Burley (Yorks) U.D.C. (March 11th. Mr. P. M. Crosthwaite).—£1,400 for the installation of a system of Bell's mechanical water filters, for the purpose of purifying the water supply.—The water, it was explained, is gathered from the moorland, and the object of the council is to bring the supply to a higher level of purity, to render unnecessary the regular scraping and flushing of the mains, and to obviate any plumbosolvent action.

Haslemere U.D.C. (March 3rd. Mr. F. H. Tulloch).—£1,300 for the purchase of land in West-street, and the erection of buildings thereon, for the purposes of a highways depot.—The surveyor, Mr. H. V. Snook, stated that the land to be acquired was situated near the centre of the district at a distance of 750 yds. from the railway goods station, and the contract price for carting materials from the station to the depot would be 9d. per ton.

Newport (Mon.) T.C. (March 5th. Mr. W. O. E. Meade-King).—£11,697 for the provision of a refuse destructor adjoining the Great Western Railway, and £4,263 for the purposes of street improvement in Cardiff-road and Chepstow-road. The borough engineer, Mr. H. Tremelling, explained that the proposed destructor was for dry refuse only. The committee, before finally deciding, visited several towns and examined numerous destructors, and they eventually adopted the scheme of Messrs. Heenan & Froude, of Manchester and Worcester. Mr. A. W. James, a representative of the firm, gave evidence regarding the capacity of the destructor. Three men would be employed per shift. Evidence was also given with respect to the proposed street works.

APPLICATIONS FOR LOANS.

Barnsley R.D.C.—£1,400 for a sewerage scheme.

Carlisle T.C.—£3,189 for paving works.

Hastings T.C.—£4,000 for wood paving renewals.

Hendon U.D.C.—£2,000 for an underground convenience, and £750 for road widening.

Littlehampton U.D.C.—£1,850 for sewage disposal works.

Newport (I.W.) T.C.—£1,000 for school extension.

Paignton U.D.C.—£1,210 for paving and road widening, and £150 for sewerage.

Radcliffe U.D.C.—£3,918 for electricity mains extension.

Rainford U.D.C.—£2,500 for the erection of fourteen cottages.

Rotherham R.D.C.—£1,600 for works of road improvement.

Rowley Regis U.D.C.—£2,972 for the purchase of sites for schools.

Ryde T.C.—£5,025 for the purposes of water supply.

Saltash T.C.—£750 for street improvement.

Sutton-in-Coldfield U.D.C.—£8,600 for a water supply scheme.

Ventnor U.D.C.—£160 in respect of public conveniences.

Westhampnett R.D.C.—£1,330 for the erection of dwellings at North Bersted.

West Kent Main Sewerage Board.—£35,300 for tanks and machinery at the outfall works.

Woodford U.D.C.—£11,329 for surface-water drainage.

LOANS SANCTIONED.

Atcham R.D.C.—£993 for the erection of working-class houses.

Bourne R.D.C.—£5,482 for an isolation hospital.

Brecon T.C.—£100 in respect of the market hall.

Cleckheaton U.D.C.—£2,830 for the purchase of land for recreation purposes.

Dorset C.C.—£3,000 for a new school at Ham-preston.

Manchester T.C.—£18,656 for the proposed Crow-croft Park school.

Paignton U.D.C.—£1,628 for water mains extension.

Penybont R.D.C.—£698 for road improvement.

Richmond (Surrey) T.C.—£1,000 for a public convenience.

Torquay T.C.—£4,535 for a new water main.

Worcester T.C.—£1,150 for the purchase of a site for a new school.

FORTHCOMING INQUIRIES.

MARCH.		£
23.—	Winchester. For the erection of slipper baths (Mr. R. H. Bicknell)	2,600
24.—	Bideford. For the provision of working-class dwellings (Mr. H. A. Chapman)...	2,700
24.—	Devonport. For the purposes of electricity, streets, and sewerage (Mr. P. M. Crosthwaite)	22,799
24.—	Friern Barnet. For the provision of pleasure grounds (Mr. Edgar Dudley)	5,264
24.—	Leyburn. For sewage disposal and water supply (Mr. M. K. North)	2,650
24.—	Sawbridgeworth. For the purchase of a fire engine (Mr. R. H. Bicknell) ...	186
24.—	Southall. For street improvement (Major J. Stewart)	1,410
24.—	Swansea. For bridge reconstruction (Mr. F. O. Stanford)	1,000
25.—	Cowbridge. For sewage disposal works (Mr. F. O. Stanford)	2,000
25.—	Paignton. For laying out land and the provision of shelters and convenience (Mr. P. M. Crosthwaite)	5,705
25.—	Rawtenstall. For public lighting and electricity (Mr. H. R. Hooper)...	11,000
25.—	Walsall. For works of sewerage (Mr. F. H. Tulloch)	1,700
25.—	Wharfedale. For works of sewage disposal (Mr. M. K. North)	2,741
26.—	Coventry. For works of paving and road widening (Mr. F. H. Tulloch) ...	6,675
26.—	Flockton. For the purposes of public lighting (Mr. H. R. Hooper)	480
26.—	Tonbridge. For the provision of working-class dwellings (Mr. Courtenay Clifton)	9,439
26.—	Tetbury. For work of well sinking (Mr. F. O. Stanford)	795
26.—	Wakefield. For works of sewerage (Mr. M. K. North)	17,813
27.—	Skelton. For the purposes of electrical lighting (Mr. H. R. Hooper)	—
27.—	Stoke-on-Trent. For town hall extensions and new public buildings (Mr. M. K. North)	26,263
30.—	Hendon. For private street improvement (Mr. F. H. Tulloch)	18,194
31.—	Rhyl. For the purposes of the sewer outfall (Mr. P. M. Crosthwaite) ...	3,377

Village Sanitation in Cumberland.—Dr. McLeish, in his first annual report presented recently to the Coekermouth Rural District Council, described the sanitary arrangements in many villages as mediaeval survivals. Public scavenging methods were unbusiness-like and absolutely haphazard, and a large number of water and sewerage schemes were hung up. Many had been on the tapis for years, the failure to carry them out being due to local opposition to the raising of rates involved. If the Government carried out Mr. Lloyd George's promise, and provided larger grants for the relief of the local rates, he believed the result would be the adoption of a steadily progressive sanitary policy.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Bristol £2,000, Connah's Quay £5,700, Merthyr £21,750, Sevenoaks £5,000, Sunderland; housing and town planning—Belfast £36,117, Chester-le-Street, St. Helens; refuse collection and disposal—Sutton Coldfield; roads and materials—Bromley £13,000, Notts; sewerage and sewage disposal—Billericay £9,000; water, gas and electricity—Colwyn Bay £21,000, Linlithgowshire £30,000. Particulars of other works projected will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Acton U.D.C.—A public convenience is to be erected at a cost of £243, and it has also been agreed to build a cottage and shelter at North Acton playing fields, at an estimated cost of £700.

Billericay R.D.C.—Official sanction has been given to a loan for an isolation hospital.

Bristol T.C.—A municipal lodging-house for women is to be provided at an estimated cost of £2,000.

Connah's Quay U.D.C.—A scheme has been adopted for the erection of municipal buildings, at an estimated cost of £5,700.

Gourock T.C.—It is proposed to build municipal offices in Shore-street, adjoining property to be taken over by the county council for a police station.

Melrose T.C.—The question of providing a public swimming bath has been referred to a special committee.

Merthyr T.C.—It is proposed to provide new schools at Gellytaelog, at an estimated cost of £21,750.

Paignton U.D.C.—The tender of Messrs. R. Aitken & Sons, at £273, has been accepted for the erection of a public convenience on the Green, opposite the Pavilion Pier.

Scarborough T.C.—The borough surveyor, Mr. H. W. Smith, has been asked to amend plans and estimate for the proposed conveniences on St. Nicholas Cliff.

Seaton Delaval U.D.C.—The council have decided to take on lease a modern house in Avenue-road, Seaton Delaval, for the purpose of converting the building into council chambers.

Sevenoaks U.D.C.—A scheme has been adopted for the erection of swimming baths, at an estimated cost of £5,000.

Sunderland T.C.—Several costly improvements are in contemplation, including the building of the Wearmouth Bridge, at an estimated cost of £120,000, and the extension of the town hall buildings.

HOUSING AND TOWN PLANNING.

Belfast T.C.—A solution of the housing scheme in connection with the Hamill-street area improvement scheme has been arrived at by the decision of the city council to erect 252 three-roomed houses in accordance with the plans of the city surveyor, Mr. H. A. Cutler, M.INST.C.E., at a total cost of £36,117. This means the abandonment of the previous decision to erect two-roomed as well as three-roomed houses.

East Kerrier R.D.C.—The Housing Committee have been authorised to select a site for the purpose of a housing scheme.

Edinburgh T.C.—The town planning scheme for Fountainbridge and Lochrin, which include the construction of a street to connect Lochrin-place and Lochrin-terrace with Gilmore-place, and the acquisition of certain properties for this purpose, has been approved by the Town Planning Sub-Committee, and recommended to the council for adoption.

Chester-le-Street R.D.C.—A housing scheme for the provision of 100 dwellings is to be carried out in the vicinity of Harraton Colliery.

Hitchin U.D.C.—It is proposed to carry out a slum improvement scheme, at an estimated cost of £7,000.

Penzance T.C.—It has been agreed to proceed with a housing scheme for the provision of twenty-two houses, at an estimated cost of £5,784.

Ryton (Durham) T.C.—The preliminary steps have been taken with a view to the erection of twenty-five workmen's dwellings.

St. Helens T.C.—The Health Committee have passed a resolution to apply for sanction to borrow £23,000 for the purpose of acquiring two sites and erecting on one tenement dwellings to accommodate ninety families, and on the other self-contained cottages to accommodate thirty families. The Local Government Board had written asking the number of houses that were required to provide necessary accommodation for persons of the working classes, and the medical officer suggested that 1,000 additional houses were required. It was decided that the Local Government Board should be informed that 500 extra houses were required.

Seaton Delaval U.D.C.—The council had before them a development plan for the south-east portion of their area from the architect to the Seaton Delaval estates. On this was shown the proposed erection of some 600 houses, of the semi-detached villa type. As the council have, in conjunction with the Whitley and Monkseaton Urban District Council, decided to include this particular area in a town planning scheme, the plans were referred to a special meeting for consideration, and the surveyor, Mr. A. Dorin, was instructed to prepare Map I, and incorporate the architect's proposals, with necessary alterations and amendments found desirable.

PARKS AND OPEN SPACES.

Gardiff T.C.—It is hoped to obtain land for an additional park on the top of Penylan Hill, commanding a view of the Channel and of the Somerset coast. For some time negotiations have been proceeding between the Parks Committee and the Roath Court and Tredegar estate for the acquisition of 16 or 18 acres of land, consisting of a portion of the quarry and the land adjoining on the top of the hill. The city engineer, Mr. W. Harpur, stated at the Parks Committee meeting that the terms were that the corporation should make the roads and construct the sewers. The negotiations are to be continued.

Seaton Delaval U.D.C.—The council have approved plans and estimates prepared by the surveyor, Mr. A. Dorin, for fencing the recreation ground, and have instructed him to obtain tenders.

Southport T.C.—The borough surveyor, Mr. A. E. Jackson, has been instructed by the Parks Committee to prepare plans and submit a complete estimate of the cost of laying out hard tennis courts in Victoria Park.

REFUSE COLLECTION AND DISPOSAL.

Burton T.C.—New refuse destructor machinery is to be installed, at an estimated cost of £2,500.

Hinckley U.D.C.—The surveyor, Mr. E. H. Crump, has received instructions to prepare a scheme for the provision of a new pumping main, 15 in. in diameter, a refuse destructor, the necessary steam pumping engines, boilers, engine-house and chimney stack, for the council's consideration, preparatory to applying for the necessary loan.

Nottingham T.C.—There was produced last year from the Easteroft destructor 1,148,179 units of electricity, a falling off from the previous year of 24,098 units.

Sutton Coldfield T.C.—The council are considering a scheme, prepared by Messrs. Hughes & Stirling, for the construction and equipment of a refuse destructor at a cost of £5,050.

ROADS AND MATERIALS.

Armagh C.C.—The county surveyor in his report to the council last week, stated that the Road Board had agreed to contribute one-half the cost of all the proposals passed by the district councils. The total cost of these works he estimated at £3,332. Looking at the nature of the proposals, all of which were for works of improvement on first-class roads, but some of which were really only of local importance, it seemed to him that the board had dealt very fairly with County Armagh, and had even stretched their usual policy to meet the wishes of the council.

Belfast T.C.—The Land and Improvement Committee have agreed to purchase the Working Men's Institute for the widening of Castle-street.

Bromley T.C.—It has been decided to lay wood paving in High-street and East-street, at an estimated cost of £13,000.

Cannock U.D.C.—The tender of Messrs. Jukes & Co., Tipton, at £2,637 has been accepted for making up several streets.

Dalbeattie T.C.—A scheme has been proposed for dealing with the road from the burgh boundary at the railway bridge to Bellvue, a length of 1,200 yds., with tar-macadam, at an estimated cost of £729. The Road Board is to be asked to grant financial aid to the scheme.

Dublin T.C.—It has been agreed to borrow £1,000 for the improvement of the road between Dublin and Bray, at Stillorgan, conditional upon one-half of that amount being borne by the Rathdown No. 1 Rural District Council, and the Road Board providing the balance of the cost.

Edinburgh T.C.—A scheme of tree planting has been completed in various streets in the city. In all 726 trees have been planted in sixteen different streets. The trees selected are poplars, Huntingdon willow, London planes, English elm and sycamore.

Fraserburgh T.C.—As the result of a joint conference of the Streets Committee and the Cleansing Committee, the council have agreed to try the effect of using only stone chips without other blinding when remetalling the ordinary macadamised streets, and have also decided that more thorough scavenging and brushing be employed in the removal of the mud, and that additional men be engaged as scavengers when required.

Hendon U.D.C.—The tender of Mr. A. Wooster, at £911, has been accepted for making up Lockett-road and Radnor-avenue.

King's Lynn T.C.—The borough surveyor, Mr. A. J. Smith, has received instructions to proceed with several schemes of road improvement.

Manchester T.C.—The Improvements Committee last week approved of a scheme for the street improvements in the Miles Platting district. It includes the construction of a new street from Hulme Hall-lane, across Oldham-road, absorbing Wilson-street, and having an outlet in Lamb-lane, near the railway station.

Newcastle-under-Lyme T.C.—The Road Board have sanctioned a grant of £500 towards the cost of the Deansgate and Keel-road improvement. The board have also decided to make a grant of one-half the cost of tar-spraying the main roads, and three-fourths of the cost of tar-macadam for such roads.

Notts C.C.—The old Rufford-road is being entirely reconstructed of clinker-ash foundation, rough slag sub-crust, and slag for the surface. The new direct road reduces the distance from Nottingham to Bawtry to 35 miles. It is expected that the cost of the present scheme will be about £6,000, of which amount the Road Board will contribute half; but to complete the road throughout with permanent material will eventually cost from £35,000 to £40,000.

Renfrew C.C.—It was reported to the Upper District Committee that the cost of maintaining a length of 5 miles of the Kilmarnock road had increased in ten years from £83 per mile to £326 per mile, and the committee have agreed that representations be made with regard to the cost of maintenance, to which heavy motors made no contribution, and that the matter be submitted to the County Road Board with a view to its being again brought before the County Councils Association.

Roxburghshire C.C.—The details of a new scheme of main road improvement, prepared for the Hawick District Committee, and estimated to cost over £4,000, have been submitted to the Road Board with a view to a grant from that authority.

Southwark B.C.—The council have decided to construct two additional street refuges in Old Kent-road, and the borough engineer, Mr. Arthur Harrison, M.INST.C.E., has received instructions to place a temporary refuge in the Borough High-street in order that its utility might be gauged in actual practice before it was permanently established.

Staffs C.C.—The council last week agreed to a recommendation of the Main Roads Committee that the salaries of assistant surveyors of main

roads be as follows: On appointment, £175 per annum; after 1½ years' service, £200 per annum; after a further 5½ years' service, £225 per annum; with a further annual increment of £5 after each succeeding year's service until a maximum of £250 per annum is reached. Specific increases were granted to present-time officials.

Sunderland T.C.—It has been agreed to pave Newcastle-road with Durax, at an estimated cost of £4,830.

Whickham U.D.C.—It has been decided to carry out road improvement works, at an estimated cost of £1,367.

Worcester C.C.—The council are advised by the Highways and Bridges Committee to purchase a patching roller, four sleeping van, and six horse road-sweeping machines.

SEWERAGE AND SEWAGE DISPOSAL

Ayrshire C.C.—A report by the medical officer and sanitary inspector to the Northern District Committee recommends that a special drainage district be formed for Skelmorlie, with not more than two sewage outfall on the foreshore. At present there are thirty-two drains discharging on the beach.

Barnstaple R.D.C.—The General Purposes Committee reported only one tender for draining Instow back roads, and the committee, considering this much too high, recommended that it be not accepted, but the surveyor, Mr. E. G. Kingwell, be empowered to get the work done if possible by day labour. The committee's suggestion was agreed to.

Billericay R.D.C.—It is proposed to carry out a sewerage and sewage disposal scheme for Hutton, at an estimated cost of £9,000.

Chapel-en-le-Frith R.D.C.—The council have agreed to apply to the Local Government Board for sanction to a general sewerage scheme for Bamford, and have requested Messrs. Brady & Partington, Town Hall, Chapel-en-le-Frith, to prepare plans and estimates for sewerage and sewage disposal works for the district.

Hayfield R.D.C.—As the outcome of recent investigations into the sanitary conditions of Hayfield, the Local Government Board have instructed the council to cause all closets to be converted to water-carriage, to undertake public scavenging at Hayfield and Mellor, and to carry out with more vigour the inspection under the Housing Act.

Hexham R.D.C.—A sewage disposal scheme for Acomb, estimated to cost £1,400, has been prepared by Mr. A. S. Dinning, of Newcastle-upon-Tyne.

Hinckley U.D.C.—Certain requisites are to be installed at the sewage disposal works, including pump, pumping main, settling tank, and a second filter, if required.

Newhaven R.D.C.—The surveyor, Mr. A. C. Groves, has received instructions to prepare specifications and invite tenders for a scheme of storm-water drainage at Rettingdean.

Norwich T.C.—It has been agreed to lay a 21-in. surface-water sewer from Barraek-street to discharge into the river Wensum, at a cost not exceeding £350, subject to the city engineer, Mr. A. E. Collins, being able to obtain the necessary wayleaves.

Retford R.D.C.—A proposed sewage disposal scheme for Ranskill, estimated to cost £1,317, has been referred to the parish council for consideration.

Seaton Delaval U.D.C.—The council have approved the plans and estimates for the erection of thirty-three sanitary earth-closets, prepared by the surveyor, Mr. A. Dorin, and have instructed him to obtain tenders for the work.

Whitby R.D.C.—The Local Government Board have returned to the council the plans of the sewerage scheme for Sleights—concerning which an inquiry was held as to the council's application to borrow £5,700—with the request that certain alterations be reconsidered on the lines suggested by the inspector, who thought a less expensive scheme would suffice.

Willington U.D.C.—The surveyor, Mr. J. H. Gardner, has been instructed to prepare a scheme for pumping sewage on to the land at Pagebank.

WATER, GAS, AND ELECTRICITY.

Bingley U.D.C.—A municipal electricity scheme has been established at a cost of about £6,000. Current will be received in bulk under agreement from the Keighley Corporation, and will be trans-

formed to be used for power and lighting purposes in Bingley, and for the running of the tramways opened recently.

Burton T.C.—The Gas and Electricity Committee has allocated £8,000 from their profits in relief of rates.

Gardiff T.C.—The council have unanimously recommended the Waterworks Committee to consider the advisability of seeking Parliamentary powers, if necessary, to enable them to meet the demands of firms on the Bute Docks estate. This is the case in which the Bute Docks estate have made a demand for the payment of £675 per annum for easement in respect of a water supply to certain firms within the docks.

Chapel-en-le-Frith R.D.C.—The council have instructed Messrs. Brady & Partington, Town Hall, Chapel-en-le-Frith, to prepare plans and estimates for a scheme for utilising the springs at "The Nook" to augment the Fernilee water supply.

Colwyn Bay U.D.C.—A scheme prepared by the electrical engineer, Mr. Tudman, for the erection of a new electricity generating station in connection with the destructor works at Bronnant, at an estimated cost of £21,000, is to be submitted to a consulting engineer to advise thereon.

Connah's Quay U.D.C.—It has been agreed to promote a scheme for the electric lighting of the district.

Gourock T.C.—The council are recommended by the Gas Committee to build a new gasometer, at an estimated cost of £7,000.

Leicester T.C.—The nett profit on last year's working of the gas undertaking was £19,740.

Linlithgowshire C.C.—The Linlithgow District Committee, having decided to proceed with their scheme for supplying water from Riccarton Burn area for a considerable portion of the county—the initial cost being estimated at £30,000—have agreed that, for the purposes of this new scheme, the following districts shall be amalgamated as a combined special water district—viz., Abercorn, Blackness, Muirhouses, Carriden and Linlithgow rural.

Rosehearty T.C.—Messrs. Jenkins & Mare, Aberdeen, have received instructions to report upon the water supply, and especially as to the advisability of a new scheme suitable to the requirements of the district.

Spalding R.D.C.—The engineer, Mr. E. J. Silcock, of Leeds, on Monday reported that 700 yds. of 7-in. main, thought to have been laid in the parish of Weston, could not be found. It would be necessary to lay a new main, which would add about £300 to the cost of the water supply scheme.

Torpoint U.D.C.—A contract has been sealed with the local electric light company for supplying 75-candle power lamps, at £1 9s. per lamp for current only, the council to have full control.

Walsall T.C.—The annual balance sheet of the corporation gas undertaking shows a nett profit for the year ended December 31st last of £6,098, being a decrease of £3,391 compared with the previous year. The reduction is attributed mainly to an increase of £2,654 in the cost of coal, while the amount received for the sale of residual products was less by £620. It is also pointed out that a reduction in the price of gas supplied for power purposes recently came into effect.

MISCELLANEOUS.

Margate T.C.—The advisability of providing a motor fire engine, at an estimated cost of £2,000, is engaging the attention of a committee.

Royal Masonic Institution for Boys: April, 1914, Election.—The support of municipal officers is earnestly solicited on behalf of Frederick Charles Lloyd, the eleven-years-old son of the late Bro. Frederick Charles Lloyd, town clerk of Croydon, who died on July 18th last, leaving a widow and six children, five of whom are under twelve years old and dependent upon her. Before going to Croydon Bro. Lloyd was town clerk of Huddersfield, and prior to that deputy town clerk of Cardiff. He was initiated in the Bute Lodge, No. 960, Cardiff, in 1891. The candidate will be twelve years of age in July next, and will not be eligible to contest another election; this is therefore a "last-chance case." Proxies will be thankfully received by W. Bro. T. W. Wood Roberts, P.M. 1556 and 3363. L.R., 59 Park-lane, Croydon (hon. secretary).

PERSONAL.

Mr. W. D. Bell, surveyor to the Kingswood Urban District Council, has resigned.

Mr. Graham, Hawiek, has been appointed road surveyor for Liddesdale in succession to the late Mr. John Elliot.

Mr. A. C. James, surveyor to the Grays Urban District Council, has been voted an increased salary of £20 a year.

Mr. A. J. Blight, surveyor of highways to the St. Austell Rural District Council, has been voted £30 for extra services.

Mr. Duncan Cumming, sanitary and cleansing inspector of Perth, died, we regret to state, last week, at the age of sixty-eight.

Mr. Henry G. Reece, assistant surveyor to the Dulverton Rural District Council, has had his salary increased by £10 per annum.

Mr. Herbert Heap, ASSOC.M.INST.C.E., of Grimsby, has been appointed engineer and surveyor to the Scunthorpe Urban District Council.

Mr. W. Jervis, chief surveyor of main roads to the East Suffolk County Council, has had his salary increased from £400 to £500 per annum.

Mr. R. W. Burr, of the Chesterfield borough surveyor's staff, has been appointed surveyor of highways and inspector of nuisances to the Wadebridge Urban District Council.

Mr. Edward Park, Sedburgh, was on Tuesday appointed surveyor of highways for the South sub-district of the Horncastle Rural District Council, at a salary of £130 per annum.

Mr. H. A. Scott, a member of the surveyor's staff of the Esher and the Dittons Urban District Council, has been appointed general assistant to the engineer and surveyor of the Maldens and Coombe Urban District Council.

Miss Jean Wearing Brodie, eldest daughter of Mr. J. S. Brodie, borough surveyor of Blackpool, died recently, we regret to state. Mr. and Mrs. Brodie and family have the sympathy of a wide circle of friends in their bereavement.

Messrs. H. T. Chapman, county surveyor of Kent, J. R. Fothergill, borough engineer's office, Bexhill-on-Sea, J. R. Hill, borough surveyor's office, Ipswich, and R. B. Phillips, Westminster City Hall, have been elected members of the Royal Sanitary Institute.

Mr. J. Richardson, who for over ten years has been general manager and engineer of the electricity department of Dundee, has been recommended for appointment as borough electrical engineer of Salford, in succession to Mr. H. J. Hawkins, who recently resigned. The salary is £1,000 a year.

Mr. G. Winter, borough surveyor of Darlington, has been voted an increased salary of £100 a year, "in appreciation," as the mayor (Alderman J. G. Harbottle) stated, "of the able and distinguished services he had rendered to the town for a great number of years," and also because of the extra duties and responsibilities that had been placed upon him during recent years.

Mr. H. D. Blake, managing director of the Limmer Asphalte Paving Company, Limited, who, as reported in these columns, sustained somewhat severe injuries in a motor-car accident a few weeks ago, has now, we are glad to be able to state, recovered sufficiently to be able to proceed to the South of France, where he will remain until his health admits of his returning to business.

Mr. C. F. Gettings, county surveyor of Worcestershire, has had his salary increased by £150 per annum, and the following increases have been granted to officials in his department: Mr. Roland Fletcher, assistant surveyor, £25; Mr. B. C. Hammond, senior surveying assistant, £10; Mr. E. F. Gravenall, second clerk, £15; Mr. A. B. Farmer, junior clerk, £6 10s.; and Mr. G. J. Harman, junior clerk, £13.

Mr. H. Hamer, the new chief assistant to the borough surveyor of Stockport, was described last week as the deputy borough engineer of Accrington. As a matter of fact, his position was that of chief engineering assistant, the deputy borough surveyor being Mr. William J. Heard, who has held that office for eleven years. Mr. Heard is now taking over the engineering work of the department, in addition to that he has hitherto done in the architectural department.

FOR OTHER ADVERTISEMENTS

See End of Paper.

WANTED, in the City Engineer's Office, YORK, an Engineering Assistant, with Municipal experience; also an Architectural Assistant, with good knowledge of Municipal requirements. Salary £100 per annum.

Applications to be made on a Form to be obtained from the undersigned, and to be sent in not later than the 28th inst.

F. W. SPURR,
City Engineer.

Guildhall, York.

March 18, 1914.

(1.461)

URBAN DISTRICT OF FINCHLEY.

The Council of the above-named District requires the services of a Temporary Engineering Assistant (not less than 21 years of age) for Private Street Works and Road Improvements, at a salary of 2½ guineas a week.

Candidates must be accurate surveyors and levellers, and neat and expeditious draughtsmen.

Previous experience in similar work is essential, and preference will be given to candidates holding the certificate of the Association of Municipal and County Engineers.

Form of application and list of duties may be obtained on application to the Engineer and Surveyor at the Council Offices, Finchley, N.

Canvassing, directly or indirectly, will disqualify. Applications, endorsed "Temporary Engineering Assistant," and accompanied by copies of three recent testimonials, to be delivered to the undersigned not later than twelve o'clock (noon) on the 4th April, 1914.

E. H. LISTER,
Clerk of the Council.

Council Offices,

Church End,

Finchley, N.

March 19, 1914.

(1.464)

**BARNET URBAN DISTRICT COUNCIL.
APPOINTMENT OF ENGINEER AND SURVEYOR.**

The Barnet Urban District Council invite applications for the position of Engineer and Surveyor to the Council.

Commencing salary £250 per annum.

Applicants must have had practical experience in the works usually undertaken by an Urban Authority, including Private Street Works, Highways, Sewers, Sewage Works and Sanitary Works of every description, and must be competent to prepare Plans, Drawings, and Quantities for Municipal Works or Buildings, and perform all the ordinary duties of a Surveyor of Highways.

Applications, in candidate's own handwriting, stating age and experience, and enclosing copies of not more than three testimonials, must be sent to the undersigned not later than the first post on Thursday, the 2nd April, 1914.

Canvassing of any Member of the Council, either directly or indirectly, will be a disqualification.

H. W. POOLE,
Solicitor,
Barnet,
Clerk of the Council.

March 18, 1914

(1.465)

ROTHERHAM RURAL DISTRICT COUNCIL.**CONVERSION OF PRIVIES INTO WATER-CLOSETS.**

The above-named Council are prepared to receive Tenders for the work of Converting Privies into Water-closets, and the alteration of Ashpits into Sheds for Dust-bins, including the provision of the necessary Drains and Connections for (1) 58 Houses in Duncan-street, Brinsworth; (2) 62 Houses in Saville-street and Osberton-street, Dalton; and (3) 75 Houses in Doncaster-road, Whinney-hill, Cross-street and Silver-street, Thrybergh.

Plans may be seen, and Specifications, Bills of Quantities and Forms of Tender obtained, from the Engineer to the Council, Mr. B. Hey, M.A.M.V.N., Imperial Buildings, Rotherham, on payment of £1 1s. (cash or postal order), which will be returned upon receipt of a *bonâ-fidè* Tender. In the case of the accepted Tender the deposit will be retained until a

Contract and Bond have been entered into, and, in the event of a withdrawal, the deposit will be forfeited.

Sealed Tenders, endorsed "Privy Conversions," to be delivered to the undersigned not later than first post on Monday, the 30th inst.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

OXLEY & COWARD,

Clerks to the Council.

Suffolk

March 17, 1914

(1.460)

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A R.I.B.A.,
Borough Surveyor, Great Yarmouth.

NORTH-EASTERN DISTRICT.

A meeting of the North-Eastern District will be held at Wakefield to-morrow (Saturday).

PROGRAMME.

2.30 p.m.—Meet at the Town Hall, and proceed to Calder Vale to inspect the recently remodelled sewage disposal works.

4.30 p.m.—Return to the Town Hall, where tea will be provided by the kind invitation of his Worship the Mayor (Mr. J. W. Salville).

5.30 p.m.—District business—

Correspondence.

To consider and arrange for the next whole membership meeting of the institution in the North-Eastern District.

To consider nominations for (a) two district representatives on the council, (b) district chairman, (c) hon. district secretary, for the year 1914-1915.

In accordance with notice given, Mr. A. Rothera (Liversedge) will move:—

“That the members of the North-Eastern District request the council to take a poll of members and associate-members as to whether they are in favour of the issue of the Journal of the institution in parts as at present, or the retention of the annual bound issue formerly existing, and that a copy of this resolution be sent to the secretary of the institution and the hon. secretary of each of the various districts, asking for their co-operation by supporting a formal resolution to this effect.”

J. P. WAKEFORD, M.I.C.E.,
Hon. District Secretary.
Wakefield.

F. MASSIE, M.I.C.E.,
District Chairman.
Wakefield.

SOUTH-WESTERN DISTRICT.

A meeting of the South-Western District of the institution will be held at Torquay to-morrow (Saturday).

PROGRAMME.

12 noon.—Meet at the new Town Hall, Torquay.

Business: To confirm minutes of last meeting; to receive communications, if any; to decide as to nominations for district officers for the ensuing year.

1 p.m.—Inspection of the recently completed pavilion described in Vol. 37 of the “Proceedings.”

1.30 p.m.—Lunch (prepared by electricity) at the Pavilion café by the kind invitation of the Mayor and Corporation of Torquay.

2.45 p.m.—Proceed by tramcar for a visit of inspection of the recently completed town hall and municipal buildings.

3.30 p.m.—Description by Mr. H. A. Garrett, Assoc.M.I.NST.C.E., borough surveyor, of the Torquay Pavilion—public restaurant operated by electricity—with discussion.

4.30 p.m.—Tea at the Pavilion café.

D. EDWARDS, ASSOC.M.I.NST.C.E.,
Hon. District Secretary.

Municipal Buildings,
Taunton.

EASTERN DISTRICT.

A meeting of the Eastern District is to be held at Chelmsford on April 18th.

SOUTHEND MEETING.

A meeting of the institution will be held in the Eastern District at Southend on Saturday, June 6th.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham on June 13th.

THE ANNUAL MEETING.

The date for the annual meeting of the Institution of Municipal and County Engineers at Cheltenham has been fixed definitely for June 24th, 25th, 26th and 27th next. It has been decided to make a special feature of town planning and of roads, and, if possible, to arrange for an exhibition of town plans.

92 Victoria-street, S.W.

THOMAS COLE,
Secretary.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

NORTHERN AND NORTH-WESTERN DISTRICTS.

A Northern and North-Western District joint meeting will be held at Leeds to-morrow (Saturday).

PROGRAMME.

YORK.—Accepted for sewerage, levelling, paving, metalling, and channelling private streets for twelve months, for the corporation.—Mr. F. W. Spurr, city engineer:—
 T. Lane, Acomb, York, Schedule.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

MARCH.

- 21.—Association of Engineers-in-Charge: Annual Dinner.
- 21.—Institution of Municipal and County Engineers: North-Eastern District Meeting at Wakefield.
- 21.—Institution of Municipal and County Engineers: South-Western District Meeting at Torquay.
- 24.—Institution of Civil Engineers: Mr. T. Clarkson on "Some Recent Developments in Commercial Motor Vehicles;" Mr. T. G. Gribble on "Comparative Economics of Tramways and Railless Electric Traction." 8 p.m.
- 30.—Surveyors' Institution: Mr. W. W. Jenkinson (fellow) on "London Before the Fire: As Referred to in Sixteenth and Seventeenth Century Literature." 8 p.m.

APRIL.

- 3.—Royal Sanitary Institute: Meeting at Southampton. Discussion on "The Housing, Town Planning, &c., Act, and its Application to the County Borough of Southampton." 7 p.m.
- 20.—Institute of Sanitary Engineers: Mr. E. A. Lees, A.I.N.S.T.C.E., on "The Birmingham Waterworks." Caxton Hall, Westminster. 8 p.m.

MAY.

- 13.—Royal Sanitary Institute: Annual Dinner, Langham Hotel.
- 23.—Institution of Municipal and County Engineers: West Midland District Meeting at Birmingham; Mr. A. S. Parsons on "Bridge Construction."

JUNE.

- 17.—Royal Institute of British Architects: Annual Dinner, Hotel Cecil.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1016) subject to later confirmation by letter.

**WANSTEAD URBAN DISTRICT COUNCIL.
 JUNIOR ASSISTANT IN SURVEYOR'S OFFICE.**

The Council are prepared to receive applications for the appointment of Junior Assistant in Surveyor's Department. Candidates must be under 22 years of age, possess a competent knowledge of surveying, building construction, sanitation, and a general acquaintance with the official routine of a Surveyor's Department.

Salary £70 per annum, rising by annual increments of £5 to £100. Applications should be made on Forms to be obtained from the Clerk to the Council, accompanied by copies of three recent testimonials, and should be delivered to the undersigned in the envelopes provided for that purpose not later than Wednesday, April 1st, 1914.

BRUCE BLEWITT,

Clerk to the Council.

Council Offices,
 Wanstead.

March, 1914.

(1,442)

WILTS COUNTY COUNCIL.**TRUNK MAIN ROAD RECONSTRUCTION.****ROAD FOREMEN WANTED.**

The County Surveyor is desirous of engaging three or four Road Foremen for work to be carried out in the reconstruction of the London and Bath Trunk Road.

Applicants must have a full knowledge and experience of all matters appertaining to the making of Roads with bituminous or tarred material. Must be accustomed to the management of men, and able to keep accounts.

Preference will be given to applicants who are cyclists. Age between 30 and 50. Salary, £2 10s. per week.

The persons appointed will be expected to commence their duties on the 20th day of April next.

Applications to be on Forms obtained from the undersigned, and to be sent in on or before the 25th instant.

J. GEORGE POWELL,

County Engineer and Surveyor.

County Offices,
Trowbridge.

March 10, 1914.

(1,426)

BOMBAY MUNICIPALITY.**WANTED: FOREMAN PIPELAYERS.**

Two Foreman Pipelayers required for the Bombay Municipality for a period of about 18 months. Age 30 to 40. Salary Rs.450/- (£30) per mensem (less income tax, about 16 shillings per month).

Free second-class passage from London to Bombay, with half-pay during the voyage, and free second-class passage from Bombay to London on satisfactory completion of period of service. The duties will be to take charge of one or more pipe-laying gangs and lay large water mains (up to 50-in.) in public roads and along an existing pipe line. Applicants must state their age and experience, giving brief particulars of works they have been engaged upon, and state the earliest date by which they will be prepared to leave for India. Before appointment they must submit a medical certificate of physical fitness. Applications, addressed to the undersigned, with copies of recent testimonials, will be received up to Wednesday, 25th March, 1914.

JOHN TAYLOR & SONS.

Caxton House,

Westminster, S.W.

(1,439)

NEATH RURAL DISTRICT COUNCIL.**WATERWORKS MANAGER.**

The Neath Rural District Council invites applications for the Office of Waterworks Manager, at a salary of £300 per annum.

The candidate must have had commercial experience of water undertakings, and must be between the ages of 30 and 45 years.

Applications, stating age, qualifications and experience, accompanied by copies of not less than three testimonials, to be sent to the undersigned not later than Monday, the 6th April, 1914.

(By order)

CUTHBERTSON & POWELL,

Clerks.

(1,447)

TO LOCAL AUTHORITIES.**EXPERIENCED SURVEYOR.****USED TO MUNICIPAL WORK.**

is prepared to make accurate surveys, plans, &c., for town planning or other public purposes.

References to many Municipal Engineers.

Address—

Box 1,403, office of THE SURVEYOR,

(1,452)

24 Bride-lane, Fleet-street, E.C.

BOROUGH OF KING'S LYNN.

General Foreman wanted; 35s. per week. Application, in candidate's own handwriting, stating age, previous experience, &c., together with copies of not more than three recent testimonials, to reach the undersigned not later than Monday, 30th March, 1914.

ALFRED J. SMITH,

Borough Surveyor.

Town Hall, King's Lynn.

March 17, 1914.

(1,454)

NENAGH URBAN DISTRICT.**TO HYDRAULIC ENGINEERS.**

The Nenagh Urban District Council invite applications from Hydraulic Engineers to inspect the Public Water Supply System (gravitation) of their District, to report on the best means to meet the increased demand on said system, and submit estimate of the probable cost of any proposed improvement.

The reservoir is situate within 5 miles of Nenagh. Line of supply pipes about 10 miles.

Applicants to submit their terms, with particulars of qualifications and experience in water supply of towns, to the undersigned on or before the 31st day of March, 1914.

Signed) FRANK R. MALONEY, J.P.,

(1,437)

Town Clerk, Nenagh

SHANGHAI MUNICIPAL COUNCIL.**PUBLIC WORKS DEPARTMENT.****FOUR SURVEYING ASSISTANTS.**

Four thoroughly qualified Surveying Assistants, with experience in town surveys and cadastral work, are required in the Public Works Department.

Candidates should be about 25 years of age and unmarried.

Salary, taels 250 per mensem, without allowances, under a three years' agreement, with first-class passage from home, half pay on voyage, and medical attendance. There is an excellent superannuation scheme.

The value of the tael at the present rate of exchange is about 2s. 7d., but it is liable to fluctuation. Taels 250 per mensem taken at Exchange 2s. 7d. is equivalent to about £385 per annum. Particulars of the appointment may be obtained of the Council's Agents, and applications, in Candidate's own handwriting, stating qualifications, experience, &c., accompanied by copies of not more than three recent testimonials, and endorsed "Surveying Assistants," should be forwarded on or before April 21st, to Messrs. John Pook & Co., Agents for the Shanghai Municipal Council, 68 Fenchurch-street, London, E.C.

March, 1914.

(1,412)

ENGINEER AND SURVEYOR to Urban District short distance from London has vacancy for Pupil. Large sewerage scheme in hand.—Apply Box 1,393, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,423)

PUPIL.—One vacancy for Articled Pupil in Offices of undersigned, Reginald Brown, M.INST.C.E., M.I.MECH.E., F.S.I., &c., Engineer and Surveyor, Town Hall, Southall, and 21 Old Queen-street, Westminster.

TENDERS WANTED.**CUMBERLAND COUNTY COUNCIL.****HIGHWAYS AND BRIDGE DEPARTMENT.****REBUILDING "METAL BRIDGE."**

The above Council invite Tenders from Contractors licensed to execute Ferro-Concrete Construction on the Hennebique System for the Reconstruction in Ferro-concrete of "Metal Bridge" across the River Esk, in the Parish of Kirkandrews-on-Esk, about 6½ miles from Carlisle, on the Glasgow main road.

Plans and Specifications, &c., can be inspected, and Forms of Tender obtained at the Office of the undersigned, on payment of £2 (which sum will be returned on receipt of a *bona-fide* Tender), on and after the 23rd of March, between the hours of 9.30 a.m. and 4 o'clock p.m.

Sealed Tenders, endorsed "Tenders for Metal Bridge," must be delivered to the undersigned before twelve o'clock noon on the 25th of April, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

WILLIAM FINCH,

County Surveyor and Bridge Master.

The Courts,

Carlisle.

March 17, 1914.

(1,448)

MALDON RURAL DISTRICT COUNCIL. SUPPLY OF MATERIALS.

Tenders are invited by the above Council for the Supply and Delivery of Materials for the year ending March 31st, 1915—viz.: Broken Granite, Basalt, Slag, Flints, Gravel, and Picked Stone.

Forms of Tender and all particulars may be obtained from the undersigned.

Tenders to be sealed and delivered at my Office, 6 Market-hill, Maldon, Essex, not later than Tue-day, 31st day of March, 1914.

Tenders to be endorsed "Tender for —."

The Council do not bind themselves to accept the lowest or any Tender.

E. J. ENNALS.

Surveyor.

6 Market-hill, Maldon, Essex.

(1,443)

MALDON RURAL DISTRICT COUNCIL. STEAM ROLLING.

The above Council invite Tenders for the Hire of Steam Rollers for the year ending June 30th, 1915.

All particulars and Forms of Tender may be obtained of the Highway Surveyor.

Tenders to be sent to me, the undersigned, securely sealed and marked "Tender for Steam Rolling," by Tuesday, March 31st, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

E. J. ENNALS.

Surveyor.

6 Market-hill, Maldon.

(1,444)

TAUNTON RURAL DISTRICT COUNCIL. WATERWORKS, NORTH CURRY.

The above Council invite Tenders for the under-mentioned Materials and Work:—

CONTRACT No. 1.

For the Supply and Delivery at Durston and Hatch Beauchamp Stations, G.W.R., of 4-in., 3-in., and 2-in. Sluice Valves, Air Valves, Hydrants, and Surface Boxes, &c., in accordance with the Specification prepared by Mr. Sidney S. Orchard, Engineer and Surveyor to the Council, Creech St. Michael, Taunton.

CONTRACT No. 2.

Also for the Supply and Delivery of about 2 miles of 4-in., 4 miles of 3-in., and 4 miles of 2-in. Cast-iron Mains, respectively, together with all necessary Specials, &c.

CONTRACT No. 3.

Also for Carting, Excavating, and Laying and Jointing about 2 miles of 4-in., 4 miles of 3-in., and 4 miles of 2-in. Cast-iron Water Mains, including Fixing Valves, Hydrants, &c., and all Works in relation thereto.

Copies of the Specifications, with Forms of Tender, may be obtained from the aforesaid Engineer, or the undersigned, on or after March 20th instant, upon payment of £2 2s., which will be returned upon receipt of a *bonâ-fide* Tender and delivery to the Engineer of all documents, &c.

Tenders, endorsed "North Curry Water Contracts" (No. 1, or No. 2, or No. 3), are to be delivered to me on or before 14th April next in a sealed packet.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

W. F. B. DAWE,

Clerk to the Council.

Union Offices, Taunton.

March 14, 1914.

(1,457)

ISLE OF THANET RURAL DISTRICT COUNCIL.

The above Council invite Tenders, to reach me through the post, marked on cover "Tenders for Materials," by 10 a.m. of Thursday, the 9th April next, for the Supply of:—

1,715 yards Broken Flints.

1,816 tons Broken Granite.

Tenders will only be considered on Forms which may be obtained by writing for them (enclosing stamped addressed foolscap envelope) to Mr. G. L. Butterworth, Surveyor, Birchington.

CHAS. TAYLOR,

Clerk.

Board Room, Minster, near Ramsgate.

March 17, 1914.

(1,455)

RURAL DISTRICT COUNCIL OF WITNEY, OXON.

BAMPTON WATERWORKS EXTENSION.

The Rural District Council of Witney invite Tenders for—

1. The Construction of a Concrete Lining to a dug well 32 ft. deep.
2. The Laying of about 1,800 yds. of 3-in. Service Mains, with necessary Fittings.
3. The Supply and Fixing of a Vertical Oil Engine, Three-throw Pump, two Air Compressors, Air Lift Plant, and necessary Piping to connect to existing Main.

The Contract has been drawn up in two parts viz.:—

(A) Lining the Well and Laying Mains, &c.,

(B) Machinery,

and will be let as two separate Contracts.

Particulars and Forms of Tender may be obtained from the Council's Consulting Engineer, Mr. H. Howard Humphreys, of 23 Victoria-street, Westminster, S.W., on 23rd, 24th, and 25th days of March, 1914, between the hours of 10 a.m. and 5 p.m.

Intending Contractors will be required to deposit a sum of Two Guineas prior to particulars being furnished, such sum being returned on the receipt of a *bonâ-fide* Tender.

Tenders, endorsed "Bampton Waterworks," must reach the undersigned not later than 11 a.m. on the 6th day of April, 1914.

The Council do not bind themselves to accept the lowest or any Tender for either of the Contracts.

N. JOHN G. RAVENOR,

Clerk to the Council.

Witney,
Oxon.

(1,416)

CAMBORNE URBAN DISTRICT COUNCIL.

The above Council invite Tenders for the following Work in connection with the Sewerage and Sewage Disposal of the District.

The Provision and Laying of about 11 miles of Stoneware Sewers and the Construction of Manholes and other Works, the Construction of about 1,000 yds. of Tunnel, the Provision and Laying of a 24-in. by 16-in. Egg-shaped Sewer therein, and the Provision and Laying of about 175 yds. of 18-in. Cast-iron Outfall Sewer.

Plans may be seen at the Office of the undersigned, and copies of the Specification, Bills of Quantities, and Forms of Tender obtained from the Engineer, Mr. John Chadwick, Bletchley, Bucks, on payment of £3 3s., which will be refunded upon receipt of a *bonâ-fide* Tender and the return of all the documents.

Sealed Tenders, endorsed "Tender for Sewerage Work," to be delivered to me, the undersigned, on or before Thursday, the 2nd day of April, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

C. V. THOMAS,

Clerk to the above-named Council.

Council Offices,

Camborne.

March 6, 1914.

(1,418)

KENT COUNTY COUNCIL.

The Bridges and Roads Committee invite Tenders for the supply of:—

Shovels,
Forks,
Seavenging Brooms,
Scoops,
Scrapers,
Cart Grease,
Tallow,
Oil,

and other Tools and Materials.

Particulars and Forms of Tender may be obtained on application to the County Surveyor, St. Peter-street, Maidstone.

Sealed Tenders, endorsed "Tenders for Tools," are to be sent to me on or before 12 o'clock noon on Saturday, the 28th March, 1914.

The lowest or any Tender not necessarily accepted.

W. B. PROSSER,

Clerk to the County Council.

Sessions House.

Maidstone.

March 7, 1914.

MARCH 27, 1914.

No. 1,158.

Minutes of Proceedings.

Elsewhere in this issue we re-
produce in summary form an
excellent and comprehensive
paper on "The Comparative Economics of Tram-
ways and Railless Electric Traction," which was
read by Mr. Theodore Gribble at Tuesday's
meeting of the Institution of Civil Engineers.
The importance of the subject is manifest, in view
of the numerous and increasing applications which
are being made to Parliament for the authorisa-
tion of schemes involving the use of the trackless
trolley car. Mr. Gribble's paper consists of a de-
tailed discussion of the various economic features
of the railless system as compared with those of
tramways, with a view to defining the sphere of
usefulness of the former. The problems of modern
urban and suburban transport are in no small
measure due to the congestion of population which
followed upon the introduction of railways, coupled
with the comparative failure of the Light Rail-
ways Act to effect the purpose of its authors. The
decentralisation and distribution which have now
become matters of extreme urgency are being
effected to a considerable degree by means of
mechanical highway traction, and the tramway,
in particular, has performed a great public service
in relieving central congestion in our great cities.
That tramways are not necessarily the last word
in cheap transport has been proved by the success
which has attended the advent of the trackless
trolley car. Regarding the distinctive economic
features of the two systems, we must leave our
readers to study for themselves the analyses and
comparisons to be found in Mr. Gribble's paper,
but the general conclusion drawn by the author
that it requires no more current to carry the
passenger by railless electric traction than it does
by a tramway is worthy of special note. Other
important propositions laid down are: (1) That
with a traffic-density represented by a 2½-minute
service—that is to say, that of one of the largest
tramways—the economy of construction and opera-
tion is still in favour of railless electric traction;
as to the cost of operation by about 7 per cent, and
as to cost of construction by about 44 per cent.
(2) That the economy increases inversely with the
traffic-density; so that with a time interval of 30
minutes, the economy of operation is about 36 per
cent, and that of cost of construction about 70
per cent.

That part of the paper which deals with the
wear and tear of highways caused by mechanically
propelled vehicles, and the contribution by the
owners of the latter towards maintenance, is of
special interest. We have repeatedly pointed out
in these columns that the obligation which the
legislature has cast upon tramway companies of

maintaining the highway between their rails and
for a space of 18 in. on each side is an anachronism
since the general introduction of electric traction.
Instead of relieving the tramway undertaking from
this obligation, Mr. Gribble suggests the levy of
a contribution towards maintenance from other
special users of the highway, such as carriers pro-
viding regular services for passengers and goods
upon definite routes; and he further points out the
responsibility of the owner of the private auto-
mobile and commercial tractor. We agree with
him that to apportion the responsibility is no easy
task. In our view it is doubtful whether the case
can be met by any system of local contributions.
The tendency of highway legislation from a date
prior to the passing of the great Highway Act,
1835, when the inhabitants of every parish were
liable at common law for the maintenance of every
dedicated road in the parish, to the passing of the
Act of 1909 which created the Road Board, has
been constantly to increase the size of the unit of
area for highway administration. With the
advent of mechanically propelled traffic it became
evident that the small unit of area was no longer
fair in consequence of the vast increase in the
volume of through traffic. The creation of the
Road Board was the first recognition by the Legis-
lature that highway administration might be made,
in part at any rate, a national charge. Once this
fundamental fact is grasped, the fairest method
of securing contributions from special users of
the highways appears to be by taxation, the pro-
ceeds of the special taxes being distributed among
the various local authorities who are responsible
for the actual work of highway maintenance.

* * *

The Carpeting Principle for Surrey Main Roads.

From the summary of a re-
port of the proceedings at a
recent meeting of the Surrey
County Council, which will be
found in another part of this issue, our readers
may learn the main facts with regard to the county
surveyor's proposal for providing stronger wearing
courses for the crusts of some 26 miles of important
main roads. Mr. Dryland has evidently gone into
the matter very thoroughly, and has prepared a
scheme which has proved acceptable to his council
and meets with the approval of the Road Board.
We are glad to see that the provision of means for
supporting the edges of the road crusts is an integral
part of the scheme, this being a matter of more
than usual importance, since the life of the carpet
layer is estimated as seven years as a minimum.
In all cases the most effective means of protecting
the edges of a road crust is likely to be the most
economical, but the actual losses due to insufficient
attention being paid to this point are greater in

the case of a crust with a long life than they are when the crust is one which is frequently renewed to a considerable depth. As regards the probable lives of these 1½-in. carpets of sand and bitumen, laid on an intermediate bituminous course 2 in. thick, we are by no means so sanguine as Mr. Dryland seems to be. "A minimum of seven years, with a maximum running up to double that life, or even more," sounds somewhat improbable, and it can hardly be said that there are precedents which justify it. To begin with, the existing crusts are not to be remade, and as strength crusts they are likely to be less efficient than the 9 in. of concrete now found to be necessary for asphalt carpets in important London thoroughfares. Secondly, the traffic conditions on main roads in the country are in some respects more severe than in crowded city streets, where the winding character of the average course taken by an individual vehicle goes far to mitigate any tendency to rutting or specially severe wear along certain parts of the road width. Further, Surrey is a county in which very heavy loads per inch width of tyre are carried on horse-drawn vehicles, and although the backwardness of the county in this respect may be corrected by the adoption of suitable by-laws, the evil is one which must be reckoned with for the time being. We may here repeat an observation which we made with regard to the recent surfacing of a portion of the Bath road—namely, that it might be well to put down for a part of the area dealt with a broken stone crust with an asphaltic binder and without a carpet. Such a material would probably be suitable on gradients somewhat steeper than those which limit the use of the sand-bitumen carpet. The allowance of 5d. per square yard (2s. 6d. per yard run on a 31-ft. road, or 1s. 8d. on a 20-ft. road) is clearly no more than sufficient to provide for the effective strengthening of the edges of the crust, and clearly there is nothing left over for work of the nature of earthwork or drainage. Surrey main roads generally, or usually, are markedly lacking in some of the most important elements of security for the road crust, and, more than most other counties, Surrey needs a considerable expenditure on works which must be regarded as antecedent to crust improvement. The present proposals, however, relate to only 26½ miles of road, and future estimates for main road improvements, less urgent as regards time, will probably include a provision for works of the character referred to.

The Surrey County Council is to be congratulated upon having at last come to the conclusion that the subject of the maining of roads is one that must be taken up in earnest, and we trust that a considerable mileage of main roads will soon come under the direct management of the county. Some of these roads are badly in need of drainage works and culverting, and the local authority can hardly be expected to expend upon such improvements the sums necessary for carrying out the work in a proper manner.

* * *

Natural Soil Roads and Sand-clay Roads.

The water-bound, broken-stone road, the several types of which have all some important elements in common, provides an efficient and economical highway for an almost unlimited range of climatic, geological and traffic conditions. Only after a severe economic struggle does it give way to the stronger types of road crust rendered necessary by the severe traffic of to-day on important roads; and, on the other hand, it provides in its more modest forms an effective rival to still humbler types of road. It is not to be expected that any single development, or set of developments, will apply to the whole range of broken-stone roads, and it is by no means certain that we have within this range correctly estimated the value of particular

principles and definite types. It may be that near the lower end of the scale of importance there is a field in which the merits of several types of broken-stone roads should be reconsidered, as well as those of certain other types, the scope of which may not have been fully appreciated in the past. In some parts of the British Empire, notably in India, several other types of road have proved to be of considerable importance. The "fair-weather road" proper, crude or quite undeveloped as an earthwork, and hydraulically, demands here only a passing recognition of its usefulness during certain seasons, but another type, of which there is a large mileage in India, is worthy of closer attention in the present connection. As regards alignment, grading, culverting, and minor bridge work, a road of this type is practically in the same condition as an important, fully metalled road. It is finished, however, without metalling, or, more usually, with such metalling as may be cheaply effected by using the materials from rock cuttings or from gravelly places on the site of the road itself or close alongside it. In other cases sand is obtained from the beds of the streams and is added to the soil of the road crust, where that is clay or heavy soil, or, when the soil is very sandy, clay is brought and added to it.

In the United States considerable use has been made of sand-clay and earth roads, which are kept in good condition by dragging; and in an article, further reference to which will be found elsewhere in this issue, Mr. L. W. Page, director of the United States Office of Public Roads, strongly advocates the making of an attempt so to construct and maintain such roads that they may prove capable of economically withstanding a considerable traffic, including that of motor vehicles. We commend Mr. Page's remarks to the attention of our readers, reminding them that the principle involved is largely this—to keep a road efficient by the use of more labour and less material is sometimes economical and effective. We have advocated a trial of such a policy with respect to roads of a certain character in this country, suggesting that over some of the stretches on important roads it might be an economy to spend more money on sweeping, watering, and frequent light rolling, and less on stone and tar. To maintain, under different conditions, an earth road by such or similar means, keeping it in a condition fit for a fair amount of traffic, is a task which is by no means unlikely to meet with a fair measure of success, and we trust that Mr. Page's remarks will lead to serious attempts being made in the United States to test the value of his suggestions.

The Repair of Canal Bridges.

The Railway Clauses Act, 1845, sec. 46, which makes railway companies liable for the maintenance of bridges over their lines, except as otherwise provided by their special Act, does not apply to canals. In fixing the liabilities of canal companies, therefore, for the repair of bridges carrying highways over their canals, reference has to be made in each instance to the special Act under which the canal was made. It would appear from an old case decided in 1815 (*Rex v. Kerrison*, 3 M. and S., 526) that, even in the absence of any provision in their special Act, a canal company which cuts a canal across a highway is bound at common law to make and maintain a bridge, though this question is probably now more or less academic, inasmuch as we conceive that most canal Acts impose this liability on the company. A point of much more practical importance at the present time, and, we believe, a novel one, has recently been decided—namely, what is the extent of a canal company's liability with respect to bridges—that is to say, what is the standard of repair which these companies are bound to maintain? Are they bound, in fact, to make and keep the bridges fit to bear present-day ordinary traffic, including

heavy motor cars, or merely in such a condition as would have been equal to sustain the ordinary traffic prevailing at the date of their construction? In *Attorney-General, at the relation of the Worcester Corporation v. Sharpness New Docks and Gloucester and Birmingham Navigation Company* (noted at pp. 234 and 520 *ante*) the company's liability under their special Act, passed in 1791, was to support, maintain and keep the bridges over their canal in "sufficient repair." Mr. Justice Phillimore thought that this meant "sufficient" for such traffic as was ordinary on highways in 1791, but the Court of Appeal took the contrary view, and held that the company must maintain the bridges not according to a standard fixed once for all, but according to a standard varying from time to time sufficient to carry the traffic of the day. Lord Justice Kennedy put the matter very cogently. After pointing out that, but for the existence of the canal and bridges, the sites occupied by the latter would have had to be maintained by the highway authority according to the standard of the day, he showed how reasonable it would be to construe the special Act in such a way that the public generally, who have a right to use these highways, would be placed in a worse position than if the Act had not been passed.

The decision will no doubt be received with satisfaction by highway authorities, and it is an interesting question whether the same principle would be applied to bridges carrying highways over railways. The wording of sec. 46 of the Railway Clauses Act, 1845, is slightly different from that of the special Act in the Worcester case. The obligation under the public Act is simply to "maintain" the bridge, but it would surely be somewhat too nice a distinction to discriminate between an obligation to "maintain" pure and simple and an obligation to "maintain in sufficient repair."

* * *

St. Austell's Council and its Waterworks Loan. The very competent corps of Local Government Board inspectors, who, all things considered, lead a busy and trying life, are wont to frown with some severity when they learn that part of the work which may be the subject of their inquiry has been already undertaken. It is, of course, a very proper thing that in such circumstances a Government officer should have authority to criticise acts of anticipation which, if freely indulged in, might prove highly inconvenient, and possibly lead to an amount of confusion as between the central and local officials, which is always best avoided. But there have been instances in which extenuation, if not justification, could be pleaded for the proceedings of the local council. Big bodies do not generally move with expedition, and the Local Government Board is no exception to what may not incorrectly be called the rule. On the other hand, the pressure of circumstances must occasionally be all-powerful, with the result that works must necessarily be proceeded with and the official inquiry ordered by the Local Government Board in a measure forestalled. The proceedings of the St. Austell Rural District Council last week supply a typical instance of such a supposition. The official intimation that the Local Government Board had sanctioned the borrowing of £4,325 for the Penwithic waterworks having been received, the clerk said the announcement was a matter for satisfaction as the scheme had been a source of very great trouble and anxiety. It was, he added, more than twelve months since the board held the inquiry. Meanwhile, it appeared from the discussion that ensued, the money had been raised out of current revenue, and it was suggested that arrangements should be made in the estimates by which the parishes should be relieved to the extent of the amount now sanctioned. The chairman explained that the reason why they undertook the work was that the council were in a very great

difficulty. They were practically forced to proceed with the scheme in order to avert a water famine. If these circumstances were known to the Local Government Board, as they should have been, and presumably were, it is difficult to explain why a period of twelve months should have elapsed between the official inquiry and the granting of sanction for the loan. Can it be that the records of the scheme were duly pigeon-holed at Whitehall and overlooked? Such a thing is possible even with the Local Government Board, but whether this is the explanation of the delay is only a matter of conjecture, for the officials wisely refrain from entering into what might prove to be awkward explanations.

Lightning Conductors.

If the frequency with which buildings and engineering structures are damaged by lightning were more generally realised, the prevention of accidents of this kind would arouse much more interest as a subject for discussion than is at present the case—except among the experts. In the paper by Mr. Frederic H. Taylor, which appeared in our last issue, it was stated that the Lightning Research Committee, during the three years 1901-1904 were advised of over 500 cases of buildings in Great Britain damaged by lightning. This destructive agency is therefore responsible for no fewer than 166 accidents every year, or over twenty in each of the eight months during which lightning may be expected to occur. The experience of the past affords conclusive evidence of the effectiveness of the protection afforded by a properly designed system of conductors; for not only has observation over a given period shown that 98 per cent of damaged buildings were entirely unprotected, but that in the case of the remaining 2 per cent the accident has generally been found to be attributable either to an insufficient number of conductors, or to unintelligent placing, or to want of subsequent attention. Economists may suggest that even in the light of the statistics quoted above the risk is so insignificant that for most buildings the expense of a conductor system is not justified. Risk to human life, however, must not be left out of account, and when this is considered, we think that in many cases it will be the determining factor. Again, in buildings which are provided with conductor installations, the work is sometimes carelessly and inefficiently carried out, or, if properly done at first, becomes inefficient because of subsequent neglect. The whole question is one of importance, and the practical points in Mr. Taylor's paper—which was read at a recent meeting of the Junior Institution of Engineers—are worthy of close attention.

* * *

Superannuation. From the reports which appear elsewhere in this issue it will be seen that two district meetings of the Institution of Municipal and County Engineers were held on Saturday last—at Wakefield and Torquay—and that at the Torquay gathering a very interesting debate on the important matter of superannuation took place. As was pointed out in the course of the discussion, this is essentially a young man's question, and if this fact were more generally realised, every young official would without hesitation help to forward the matter by joining the National Association of Local Government Officers, which is doing all in its power to press the Bill forward. The meeting appeared to appreciate that superannuation and security of tenure are distinct questions, and that if the former is pressed forward alone at present this is a mere matter of tactics, and by no means involves the jettisoning of the latter, which is of peculiar importance to surveyors.

Doncaster Refuse Destructor.

DESCRIPTION OF PLANT: TEST FIGURES.

An interesting destructor installation on the "Horsfall" system has recently been set to work for the borough of Doncaster.

The population served by the destructor is 32,500, and although the water-carriage system is being installed throughout the town there are still a good many privy middens, and a considerable quantity of night-oil has to be dealt with, this amounting, approximately, to 15 per cent by weight of the total.

It had been felt by the corporation for some considerable time past that the old method of disposal by tipping was unsatisfactory, and it was eventually decided to instal an up-to-date destructor at the sewage pumping station adjoining the river Don, thus utilising the heat available to raise steam for the pumping station, while at the same time dealing with the refuse in a satisfactory manner, and, as the Germans say, "making one hand wash the other."

Tenders were invited by advertisement on a speci-

it is shovelled out and fed into the cells in the manner usual with the "back-fed" type, which is claimed to have been first introduced by the Horsfall firm at Oldham in the year 1891.

There are four grates arranged as continuous cells, each having an area of 27 sq. ft. The hot gases from the cells pass into a large combustion chamber, which is also arranged as a beast cremator, tackle being installed for drawing in a whole carcase when required. The heat maintained in this combustion chamber is very high, ranging from 1,700 to 2,100 deg. Fahr.

From the combustion chamber a by-pass flue lead direct to the dust-catcher and thence to the chimney, a suitable gas-tight damper being provided for closing it when required. The direct course for the gases through the combustion chamber, however, lead into the space below a water-tube boiler of the Babcock & Wilcox type. The boiler was designed of

DONCASTER REFUSE DESTRUCTOR. GENERAL VIEW OF DESTRUCTOR BUILDING AND ENGINE-HOUSE.

fication prepared by the borough engineer, Mr. F. O. Kirby, M.Sc., Assoc. M.Inst.C.E., and eventually the "Horsfall" system was decided upon, and a tender for that type of plant accepted.

The works were commenced in January, 1913, and completed in August, 1913.

The whole of the building work was carried out by Messrs. Holloway Brothers, Limited, the well-known London contractors, the ironwork and machinery being all produced at the Horsfall works at Pershore. Mr. G. Watson, M.Inst.C.E., M.Mech.E., was engineer for the contractors.

The site being somewhat restricted, it was decided to instal a hydraulic refuse hoist, thus permitting the carts to approach on ground level.

Just inside the entrance gates a weighbridge, weigh-house and office have been installed, so that the carts pass to and fro over the weighbridge, and an exact record of the weight of material destroyed is recorded.

On arrival at the destructor, the carts tip into a big hopper mounted on a hydraulic ram, and controlled by hand lever with automatic arresting gear at the top and bottom of its travel.

The hopper is so designed as to tip automatically when it reaches the top of its travel, delivering the refuse into a large bin at the back of the cells, whence

sufficient size to work the sewage-pumping machinery, but is not nearly large enough to absorb the whole heat of the destructor when in full operation, the heat available being considerably in excess of the requirements of the works.

The total heating surface of the boiler is 870 sq. ft., and it is arranged as a three-pass boiler, the working pressure being 120 lb. to the square inch.

The feed water is supplied by a Worthington feed pump with an injector as a stand-by. Either the injector or the feed pump draw their water from a tank arranged in the roof of the engine-house.

The steam is used mainly for driving the sewage-pumping engines in the adjoining engine-house, and is found to be adequate for the purpose, and the steam is also, as a matter of course, used for driving the forced draught apparatus, the feed pump and injector, and the hydraulic pump which actuates the refuse hoist. All this machinery is installed in a neat engine-house adjoining the destructor. The forced draught is of the special type favoured by the Horsfall firm, and consists of two positive blowers of their own make (of the Root's type), which draw the air for combustion from the ventilating duct in the roof of the main destructor building, and force it to the fires at a very high pressure. The great advantage

claimed for this type of blower over any other is that it delivers the requisite quantity of air quite independently of the thickness of the fire. In practice the blast arrangements are found to be extremely

stokers were employed, and on the second day three stokers.

The reason for the total evaporation being lower on the second day, although the quantity burned was

DONCASTER REFUSE DESTROYER. FURNACE FRONT.

effective, and it appears that the rate of burning on the grates is extraordinarily high, as will be seen from the test figures given hereunder.

Arrangements are made for heating the blast and adding steam when required. It is found better to work with dry air blast only when the nightsoil is being burned, as this is already so extremely wet, and requires no addition of moisture.

The blowers and hydraulic pump are driven from a countershaft, the power being supplied by a high-speed horizontal engine made by the Horsfall firm at Pershore.

The products of combustion on emerging either from the boiler or from the by-pass flue enter a Horsfall patent centrifugal dust-catcher constructed round the chimney shaft, any fine flying particles of dust being thrown off in this apparatus by centrifugal force, and caught in a suitable chamber, from which they can be withdrawn without interrupting the working of the plant. The dust-catcher is found to be extremely efficient, and no complaints whatever have been received during the seven months in which the destructor has been in operation.

The chimney is of the "Custodis" type, and the buildings are of brick with slate roof, and have a pleasing elevation, as will be seen from the accompanying photographic view.

The guarantees, which were somewhat drastic, were more than fulfilled on all points. Exhaustive tests were held in November last on two succeeding days, the results being set forth in the accompanying table:—

	First day's test. 8 hours.	Second day's test. 6 hours.
Quantity of refuse burned	At the rate of 53 tons 6 cwt. 2 qrs. per 24 hours	At the rate of 82 tons 12 cwt. per 24 hours
Ditto per cell per 24 hrs.	13 tons 6 cwt. 2 qrs.	20 tons 13 cwt.
Average steam pressure	116 lb. per sq. in.	117 lb. per sq. in.
Average evaporation actual	285 galls. per hour	258·3 galls. per hour
Evaporation from and at 212 deg. Fah.	342 galls. per hour	310 galls. per hour (= about 20% in excess of the guarantee).
(Note.—This evaporation was over 30% in excess of the guarantee.)		
Cost of labour	8·05d. per ton	6·2d. per ton.
Percentage of clinker and ash	24·3%	23·1%

higher, was that less steam was required, and the damper in the by-pass flue was raised so as to by-pass a large proportion of the heat.

It may be remarked that the rate of burning per

DONCASTER REFUSE DESTROYER: REFUSE HOIST, DUST-CATCHER AND CHIMNEY.

cell per twenty-four hours is believed to be in excess of that obtained in any hand-fired plant hitherto

It may be stated that on the first day two

erected in any part of the world. When this result is considered in combination with the other figures given, it must be conceded that the efficiency of the plant is quite remarkable. It may be mentioned that, the period of maintenance having expired, the repairs required were found to be practically nil, and the authorities are thoroughly satisfied with the wear and tear of the plant under somewhat onerous conditions.

SURREY MAIN ROADS.

THE PROVISION OF SAND-BITUMEN ROAD CARPETS.

At a meeting of the Surrey County Council held on Tuesday of last week the Highways and Bridges Committee presented a report on the subject of main road maintenance. In the preliminary memorandum the county surveyor, Mr. A. Dryland, drew attention to the effects of heavy motor traffic on the main roads of the county. During the last four years the number of heavy motor cars registered in the county has increased by 132 per cent, and in the County of London, whence considerable streams of such traffic emerge and traverse the Surrey roads, the increase has been 201 per cent. Motor-omnibus services are now being extended to considerable distances from London, and from such centres as Aldershot, Reigate, and Guildford; with the probability of further developments of this kind. Water-bound road crusts are not adequate, nor economical, and Mr. Dryland has come to the conclusion that the best form of crust is likely to be one with a wearing surface layer of dense asphaltic composition. This is a favourable development for Surrey, where good road stone of the harder and tougher kinds is costly, but sand, with which good bituminous carpets can be made, plentiful and well distributed. By setting up suitable plant the cost can be reduced to 20 or 25 per cent below the cost of such work when carried out by contractors. Mr. Dryland submitted another report, in which he referred to the use of asphaltic carpets, and pointed out that during the past thirty years many pavements had been laid in which the bitumen was mixed with a suitably graded sand, providing a surfacing which approaches, if it does not equal, rock asphalt carpets in durability, and is less slippery. It has been found that a concrete foundation is not necessary, and with a suitable strength crust the life of such a carpet may be estimated as seven years as a minimum, with a maximum ranging up to fourteen years or more, without the necessity for annual surface dressings. There are already 500,000 sq. yds. of tar-macadam on the main roads of the county (equivalent to about 66 miles of 20-ft. road), and a comparatively thin coating of asphaltic materials will probably be the cheapest method of surfacing these roads when that becomes necessary. There are 2,000,000 sq. yds. of water-bound road, and a large part of this area will undoubtedly have to be provided with bituminous surfaces in a few years.

In a further report the county surveyor pointed out that the work already done on the Portsmouth and Great Western roads has mainly provided for the immediate needs of the western part of the county, and that the eastern part now needs to be taken in hand, especially the roads between Merton and Epsom, Mitcham and Surrey, the Brighton road from Croydon through Redhill to Crawley, and the northern part of the London and Eastbourne road, all of which roads have motor-omnibus services and a considerable heavy motor-car traffic. These lengths amount to about 26½ miles, and nearly 400,000 sq. yds. of surface, and the conversion will probably take about three years. Mr. Dryland recommended that the plant should first be set up in the eastern part of the county. He proposes to provide side support for the crust, and to put down a 2-in. intermediate course of bituminous-bound material, as well as the 1½-in. wearing carpet. It is not intended to lay this material on steep hills. The estimate for two complete plants, one portable and one semi-portable, is £2,650, and Mr. Dryland recommends the purchase of two rubber-tyred petrol lorries for the distribution of the material, each costing about £750. Including provision for contingencies, the total of the estimate is £5,000 for an output of 12,000 tons of the carpet material per annum. The cost of the intermediate crust, which will rest on the old surface, is estimated at 1s. 3½d. per sq. yd.; of the 1½-in. carpet, 2s. 7d.; side supports, 5d.; contingencies, 2½d.; or a total of

4s. 6d. per sq. yd. This is about 1s. a square yard less than the lowest quotation obtained from the contractors. On the part of the Great Western-road which will have to be dealt with, about a tenth of the total area, a further allowance is made to provide for additional material which will be required for the undercoat. The Road Board are prepared to lend £5,000, free of interest, and repayable in five equal instalments. In the financial scheme the initial costs are estimated as: For 1914-15, £28,839; for 1915-16, £46,742; for 1916-17, £12,391; total £87,972. Allowing £34,556, Road Board grants and for the repayment of loans, the cost to the county would be £57,750, spread over a period of seven years. The Highways and Works Committee recommended the scheme for adoption, and the Finance Committee recommended that the Highway and Bridges Committee should be empowered to take the necessary steps to purchase the plant and carry out the work. The report was adopted by the council.

THE MAINTAINING OF ROADS.

The Highways and Works Committee reported on the subject of "maining" roads, and recommended that the district road authorities should be asked to state what lengths should, in their opinion, be declared to be "main" roads. Alderman Pain pointed out that there are only 222 miles of main road in Surrey, which compares unfavourably with many of the counties near London. The volume and severity of the traffic have increased very much, and the subjects of maining roads and of Government grants should be gone into very thoroughly. There would probably be grants to assisted roads as well as to main roads. The recommendation of the committee was adopted, as was the further recommendation that weigh-bridges should be purchased in order to check the axle-weights of vehicles.

A SANITARY INSPECTOR'S SALARY.

QUESTIONS IN THE HOUSE.

In the House of Commons on Monday the President of the Local Government Board was asked whether the Rural District Council of Torrington were required by the board to appoint a whole-time inspector of nuisances; if so, would he state the increase of salary given to the officer so appointed on the salary paid to the officer employed part-time, also the total amount of the salary now paid; whether the officer had to pay his own travelling expenses out of his salary; and whether, where a local sanitary authority, in complying with the request of the board to appoint a whole-time inspector of nuisances, refused to pay at least £100 per annum, clear of travelling expenses, he would consider the advisability of preventing a moiety of the salary being refunded to such authority by withholding the board's consent to the appointment.

Mr. Herbert Samuel said the Local Government Board in August last requested the Torrington Rural District Council to consider the question of arranging for their inspector of nuisances to give his whole time to their service at an adequate salary. The council appointed the inspector as a whole-time officer in November, at a total salary of £80, which was £8 in advance of his previous salary, and he had to pay his travelling expenses out of his salary. The board, in giving their assent to the appointment, informed the council that they considered the salary a low one, especially as no allowance was made for travelling expenses, and they trusted that the council would take an early opportunity of reconsidering it. Mr. Samuel added that he was again drawing the council's attention to the matter.

Waterproofing of Cement.—It will be of interest to many architects and builders to know that Pudlo was used in the cement work of the recently opened Midland Adelphi Hotel at Liverpool.

Commons Enclosure and Regulations.—Mr. Runciman was asked on Monday if the Government contemplated the introduction of a Bill during this Session dealing with the question of enclosure and regulation of commons, and founded upon the report of the Committee which considered the matter last year. In reply, he stated that a draft of a Bill was now under consideration, but he could not say at present whether it would be introduced this Session.

Institution of Municipal and County Engineers.

SOUTH-WESTERN DISTRICT MEETING AT TORQUAY.

A meeting of the South-Western District of the Institution of Municipal and County Engineers was held at Torquay on Saturday. The visitors were officially welcomed by the Mayor (Councillor C. T. Towell), who was accompanied by the town clerk (Mr. F. S. Hex) and the assistant town clerk (Mr. P. H. W. Almy). Mr. J. Paton (Plymouth) presided in the absence of the district chairman (Mr. H. T. Chapman), and there were present Messrs. D. Edwards (Taunton), hon. district secretary, E. Stead and E. Y. Saunders (Barnstaple), T. Moulding, W. Robinson and R. H. Dymond (Exeter), H. A. Garrett and C. Gillard (Torquay), C. D. White and R. A. Rogers (Newton Abbot), C. Owen Baines and C. D. H. Vanstone (Paignton), J. Siddalls (Tiverton), F. W. E. Vanstone (Teignmouth), W. J. Goode (Buckfastleigh), W. Merritt (Redruth), A. Warren (Totnes), S. Hutton (Exmouth) and R. H. Beaumont (Torpoint). In addition to the town clerk and assistant town clerk, the visitors present included Messrs. J. Silley (Brixham), R. G. Foster, H. S. Ganderton, and the borough electrical engineer (Mr. C. W. Salt).

The MAYOR, on behalf of the Corporation of Torquay and himself, expressed pleasure in welcoming the visitors. As they all knew, the engineering profession—and their branch in particular—had many and various duties, and each district had its own. He considered those meetings in different parts of the kingdom must be beneficial, because each district had its own way of going on, and different materials to deal with. The first meeting held in Torquay was in 1894. Those who were present on that occasion would notice the very great advance Torquay had made since that time. They had sewerage and water works and now a pavilion, which was a tribute to the great efforts and skill of their engineer and architect, Mr. Garrett.

Mr. PATON proposed a vote of thanks to the Mayor and Corporation of Torquay for extending to them such a hearty welcome. It was not the first occasion on which they had participated in their hospitality, and not only in their hospitality, but in the interesting matter always placed before them when they visited Torquay. It was a long way back now, but he happened to be there in 1894, when the harbour works were in full swing, and a great many of them then obtained some very useful information. He took a very great interest in Torquay, from the fact that he looked upon the corporation of Torquay as a most progressive body. Whatever they did they did well, and the Pavilion, which they were going to inspect, reflected the greatest credit not only upon the architect, but upon the corporation. He had visited the Pavilion, and it struck him that the details had been very well thought out.

Mr. C. OWEN BAINES (Paignton) seconded, and the resolution was carried by acclamation.
