INDEX.

NOTE.—The figures in parentheses have reference to pages in Supplements.

A

A Borough Engineer's Travels, 1017
 Adams on Town Planning and Arterial Roads, Mr. Thomas, 510
 Aeration as an Aid in Sewage Purification, 390
 Agent *versus* Owner, 483
 Allocation of Road Board Grants, 362
 Amateur Surveyor Again, The, 503
 American View of French and English Highway Engineering, 2
 America's First City Manager, 270
 An Asylum Railway, 359
 An English Engineer in Peru, 514
 A New Athens, 411

Annual Reports:—

Cape Town, 645
 Gloucestershire, 805
 Nuneaton, 521
 Prahran, 681
 St. Austell, 583
 Skegness, 784
 Tonbridge Rural, 260
 A Prospect of Municipal Engineering in 1914, 237
 Architect as Structural Engineer, The, 707, 715
 Architects, Registration of, 86
 A Rhyming Sewage Works Manager, 521
 A Roadmender's Letter, 931
 Ashpits, Control of, 910, 920, 968, 999

Assistants' and Students' Section:—

Belt Gearing, 445
 Boring, 619
 Building Construction 60
 Building Inspection, 812
 Cemetery Lay-out, 252
 Chimney Design, 648
 Column Design, 1053
 Concrete Floor, 775
 Cost of Running Steam Engine, 368
 Design of Floors, 648
 Fireproof Construction, 1002
 Foundation for Stanchion, 330
 Grain Silo, 482
 Machine Shop, 367
 Magnetic North, 253
 Plumbing, 852
 Rain Gauge, 1053
 Reactions on Beams, 682
 Removal of House Refuse, 727
 Specific Gravity, 957
 Storm Overflow Weir, 590
 Strength of Materials, 852, 923
 Strength of Shaft, 124
 Structures, 956, 1002
 Surveying, 889
 Temporary Building Design, 410
 Testing Cement, 923
 Testing Stoneware Pipes, 61, 88, 445, 482
 Timber, 517
 Town Planning, 554
 Tree Guards, 89
 Water Supply, 20
 Working-class Dwellings, 292
 Association of Consulting Engineers, 41; Inaugural Dinner, 322
 Association of Engineers in Charge, Annual Dinner, 549
 Association of Kent Surveyors, 446
 Association of Somerset Surveyors:—
 Annual General Meeting, 119
 Street Meeting, 729
 Atherstone Water Supply 91, 113
 Atherstone Working-class Dwellings, 285

Attacks on Public Officials, 607
 Auckland, Municipal Engineering in, 512
 A Unique Resignation, 43

B

Back to Back Houses in Rochdale, 509
 Balfour—Civil Engineer, Mr., 681
 Basement House, The, 574
 Beams, Reactions on, 683
 Beauty in Sewage Works, 813
 Belt Gearing, 445
 Berlin Water Supply, 277
 Beverley Council's Defiance, 111
 Birmingham Highway Bridges, 876
 Birmingham Motor Omnibuses, 70
 Birmingham's New Building By-laws, 21
 Boring Tools and Appliances, 618
 Boulnois' "Glossary of Road Terms," 53, 93, 125, 250, 327
 Bridge Work in 1913, 142
 Brisbane's Sewerage Scheme, 916
 Bristol Tramways, 766
 British and American Road Tars, 323
 Broken Granite: The British Standard Specification, 407
 Brotherhood of the Cheerful Sparrows, 902
 Brushes for Engineering Purposes, 971
 Building By-laws, 43.
 Building Inspection, 812
 Building Line Problem, 430
 Building Materials, Supply of, 559
 Building Regulations in Shanghai, 783
 Buildings and Street Construction By-laws, 766
 Buildings for Small Holdings, 315, 316
 Building, What is a. 813
 Bull, Death of Mr. H. F., 247
 Burton's Sewage Problem, 971
 Bygone Building Acts and the Development of London, 634

C

Calcutta Improvement Trust Engineering, 811
 Calcutta: Its Evils and Required Improvements, 707, 708
 Calcutta, Municipal Engineering in, 509
 Calcutta, Tar Macadam Roads in, 694
 California Highway Developments, 315, 329
 Canadian "L.G.R.," 192
 Canal Bridges, Repair of, 255, 538, 557
 Canals Development: Proposed Waterways Board, 579
 Candidates' Expenses, 518
 Cape Town, Street Maintenance in, 645
 Cardiff Water Supply Dispute, 167
 Carpeting Principle for Surrey Main Roads, 537, 542
 Cast Iron v. Steel Pipes, 126
 Cement Injections for Foundations, 41, 52

Cement Testing, 923
 Cement, Waterproofing of, 228
 Chain, What is a? 875
 Chartered Surveyors' Golfing Society, 694
 Cheaper Houses: Urban Surveyor's Suggestions, 577
 Chelmsford, Recent Public Work at, 670
 Chelmsford Schools, Designs for, 61
 Chemical Oxidation as a Process of Sewage Treatment, 576
 Chicago's Sewage Disposal Problem, 916
 Chimney Design, 648
 China, Municipal Engineering in, 642
 Christmas Boxes, Municipal Employees and, 59
 Clacton Sea Front Improvements, 278
 Clacton's New Pavilion, 887
 Clay, Physical Properties of, 492
 Coal, Storage of, 475
 Colchester Borough Surveyorship, 780, 808
 Commercial Motor Vehicles, Recent Developments in, 565
 Commons Enclosure and Regulations 542
 Competitions, Engineers and 583
 Competitive Schemes for Engineering Works, 583, 634
 Compiler, Work of the, 633
 Compound Piles of Timber and Ferrocement, 311, 324
 Concrete Floors, 775
 Concrete Institute, 350, 519, 617, 715, 957
 Concrete Pipes, 891
 Concrete Pipes and Paving Blocks, 490
 Concrete, Proportioning, 831
 Concrete Works, Forms for, 507
 "Constructive Misfeasance," 502
 Contact Beds, Electrically-operated Apparatus for, 190
 Contractors' Negligence, Liability for, 607
 "Controlling" the Municipal Engineer, 271
 Co-operation between Authorities, 667, 669
 Cork City Engineer and the Question of Employment, 3
 Corporation's Profits in Property Deal, 61

Correspondence:—

Ashpits, The Control of, 999
 Broken Granite: The British Standard Specification, 407
 Calcutta Improvement Trust Engineering, 811
 Candidates' Expenses, 518
 Cast Iron v. Steel Pipes, 126
 Contact Beds, 370
 Corrosion of Iron, The, 250
 Definitions of Road Terms, 21

 Is the Street Tramway Doomed? 609, 641, 755, 763

J

Jamaica, Roads in, 284
 Johannesburg, Water Supply and Sewerage in, 474
 Jones, The late Mr. Chas., 248
 Junior Institution of Engineers, 451

K

Kenilworth, Enteric at, 666
 Kensington, House Refuse Collection at, 54
 Kent Contractor and Discharged Workman, 120
 King's Lynn and Vancouver, 737

L

Law Notes:—

Ancient Light: Partial Obstruction by Consent: Abandonment, 484
 Building Contract: Access to Site Obstructed by Third Party: Liability of Building Owner, 363
 Extraordinary Traffic, 431, 958
 Highway: Accident: Dangerous Building: Liability, 592
 Canal Bridge: Standard of Repair, 520
 Railway Bridge: Standard of Repair, 1059
 Highway Dedication, 556
 Old Bridleway and Footpath, 403
 Strip not Made Up, 254
 Housing of the Working Classes: Premises out of Repair: Injury to Tenant's Daughter: Landlord's Liability, 892
 Private Street Works: Charge on Premises, 958
 Sewage Disposal: Manufacturing Effluents: Rivers Pollution Prevention Acts, 1876 and 1893, 686
 Sewage Disposal: River Pollution, 853
 Water Supply, 363
 Law of Dilapidations, 79

Law Queries:—

Alteration of Areas: Compensation to Officers, 184
 Building By-laws: Approval of Plan Contravening By-laws, 731
 Exemption, 958
 Footings, 592
 Habitable Room, 403
 "Human Habitation," 484, 485
 Joists and Rafters, 123
 Rear Air Space, 686

Law Queries (continued:—

By-laws: Permitting Breach of, 485
 Switchback Railway, 254
 Combined Drainage, 520
 Cesspool, 592
 Common Lodging-house: Registration, 87
 County Surveyor: Liability of County Council, 485
 Crossing over Footway in New Street, 959
 District Councillor, 1059
 Extraordinary Traffic, 686
 Steam Tractor on Highways, 592
 Fire Engine: Charge for Attending Fire: District Councillor: Disqualification, 493
 Gates Across Road, 651
 Highway: Boundary, 958
 Dedication, 686
 Diversion, 484
 Flooding, 123
 Repair, 289
 Repair of Ditch, 254
 Road Material, 254
 Road Set Out Under Award, 254
 Surface Water, 731
 House Drainage, 520
 Housing and Town Planning, &c., Act, 1909, 520, 731
 Improvement of Main Roads, 650
 Landlord and Tenant, 364
 Laying Out a New Street, 556
 New Building in Space at Rear of Dwelling-house, Erected Before the Adoption of the By-laws, 123
 Officer of Local Authority: Insurance Agencies, 731
 Remuneration for Extra Services, 1059
 Open Space: Recreation Ground, 892
 Overcrowding: "Free-house System," 651
 Petroleum and Petrol Licences, 87
 Private Streets Closed by Gates, 403
 Private Street Works, 364
 Adoption of Street, 485
 Apportionment, 556
 Footpath, 123, 290, 556, 853
 Occupation Road, 853
 Sewering, 892
 Surface-water Sewer: Quarry, 1059
 Public Health Acts Amendment Act, 1907, The, 853, Sec. 39: Closet Accommodation, 892
 Public Health (Building in Streets Act, 1888), 650
 Purchase of House and Land for Offices and Recreation Ground: Sale of Surplus Land, 651
 Reducing Width of Footway, 290
 Removal of House Refuse, 686
 Rights of Riparian Owners, 289
 Rural District: Special Expenses, 892
 School Buildings and By-laws, 650
 Sewage Farm: Faulty Conveyance of Land, 289
 Sewer Laid in Stream, 403
 Street Scavenging: Heaps Left in Street: Accident: Liability, 556
 Surveyor to Urban District Council, 520
 Underground Water, 1059
 Water Supply: "Fixed Bath," 651
 For Street Watering, &c.: Disagreement, 731
 Sec. 62 of the Public Health Act, 1875, 87
 Standpipe for Washing Car: Domestic Purposes, 363: Well, 364
 Laying Out of New Streets, 362
 Lead in Water, 110
 Leather, Dressing Oil for, 189
 Leeds, Reorganisation at, 479, 513
 Legal Precedents of 1913 in Relation to Municipal Engineering, 231
 Legislation of 1913 in Relation to Municipal Engineering, 238
 Leicester, Street Lighting in, 300

MR. THOMAS MOLYNEUX, ASSOC.M.INST.C.E.,

Corporation Water Engineer, Stockport.

President of the Institution of Water Engineers, 1914-15.

The Surveyor

And Municipal and County Engineer.

Vol. XLV.

JANUARY 2, 1914.

No. 1,146.

Minutes of Proceedings.

New Year Resolutions.

Premature decay and early decease are the fate of the New Year resolution, and the graveyard of 1914 has already been opened. The pits were dug ere 1913 died, and quickly, far too quickly, they are being occupied and filled in. Ere February is with us there will be row upon row of pathetic mounds with scarce a break, and every mound will be in memory of some broken resolution. Happily, "great actions are not always true sons of great and mighty resolutions," and the world jogs along very well in spite of these betrayals of one's annual self-plightings. The failure of the New Year resolution may be traced to humanity's weakness for taking itself seriously, without a leavening of the saving grace of humour. Heroism is for the few; for the many life must of necessity be humdrum and unheroic, and happy is the man who, realising this, poods the beaten track with such content as his temperament will allow of. There is but one New Year resolution worth the making, and that is a resolve to make no resolutions at all. Still, resolutions are made yearly, by the hundred thousand, and a little advice as to their making will not be out of place on this the second day of a new year, when most of them will already have gone by the board.

The heroic resolve is always fatal. The early rise, the cold tub, the sunrise walk—none of these can be acquired on the strength of a bare resolve. The sluggard will return to his sluggishness on the third day; the unwashed will scrap his tub possibly while he first shivers on the brink of it; and with the failure of these the other becomes a physical impossibility. Rising may be accelerated, to some extent, year by year, and washing may progress downwards by slow inches—to decide on more is to court ignominious failure. Study falls within the same category; it must progress by degrees. The real student needs no incentive to further effort, for his work is his life, and only an increase of span can help him. The lazy man, who swots for ignoble ends, will quickly retrogress, no matter how fervid his resolve, and his only hope (if hope he has any) is in infinitesimal advance as the years roll on. There still remains the man who steers a mean course, who, really desirous of improvement, finds the distractions of life too much for him. He may put some curb upon his proclivity for pastime, and add at least some minutes daily to his working hours. For the diarist, it may be said at once, there is no hope. The entries in the first week will be voluminous, in the second less so. Then hiatuses will appear, a week's doings will go unrecorded, a spurt or two, in moments of self-examination, will follow, then complete disaster and silence of the utterest.

A New Year resolution must be moderate to be effective, as must all resolutions. Bad habits are seldom broken by sudden resolves, any more than good ones are broken by the lack of them. A slight improvement is all that should be aimed at, and the heavy smoker (to take a concrete example) will do better to cut out a couple of "pipes" or half-a-dozen cigarettes a day than to consign his smoking outfit to the flames on January 1st and purchase a

fresh stock on January 2nd. When quite a simple resolution is made, the difficulty of adhering to it may not be quite insurmountable; and this is important to remember, as any deviation from it will be fatal. Nothing deteriorates the individual more surely than resolutions made and broken. They weaken the will and bring about a self-contempt which, subconscious as it may be, works untold mischief on the character. How many of those who have resolved on great things for the New Year will be able to lay a grain of flattering unction to their soul on December 31st? The ardour of the aspirant to stern resolve will long, long have cooled ere that. "Think naught a trifle, though it small appear; Small sands make mountains, moments make the year, And trifles life," says the poet; but a New Year resolution is not a trifle. It is a big proposition to get up against, and big propositions are best left alone except by "big" men.

The Status of the Sewage Works Manager.

Among the papers read at the recent Annual Meeting of the Association of Managers of Sewage Disposal Works, one of the most interesting was that by Mr. J. Custance, as indicating the views held by some, at least, of the members of the Association as to the desirability of fuller recognition being accorded to them, and the important work in which they are engaged. In these times, when many bodies of men (and women) are striving to secure greater recognition of their rights and wrongs, there is no reason why the managers of sewage works should not take steps in the same direction. Indeed, those who are acquainted, as we are, with the admirable, unassuming manner in which these men, as a rule, carry out their arduous duties in the face of many difficulties and discouragements, will readily admit that they fully deserve any improvement in their position that they can secure. Among the suggestions made by Mr. Custance we think that the idea of the Local Government Board paying the whole of the salaries of the sewage works managers is impracticable. We cannot imagine that the employment by a local authority of a manager paid wholly by a Government department would work satisfactorily, and we believe that the manager himself would soon find his position insupportable under such conditions. On the other hand, when the proposed new rivers boards are formed there is much to be said for an arrangement by which the appointment of sewage works managers would be subject to the approval of the rivers board in control of the district in which their works are situated, the rivers board contributing one-half of the managers' salaries. In this way the rivers board would be in a position to ensure that the men in charge of the works under its supervision were competent, and at the same time it would, by its financial assistance, help to provide better remuneration, which, in many cases, is greatly needed.

The Association might well make an attempt to improve the status of its members on these lines in addition to the good work it has done and is still

doing on their behalf. On the other hand, the members themselves can do much individually to make their work better known in their own localities. Not more than one in a hundred of the ratepayers of any town has the faintest idea of the importance of the work done day and night, year in, year out, at their sewage works. In this connection we are reminded of the case of a district council which, not very long ago, had to consider the granting of an increase of a few shillings per week to the salary of the sewage works manager. During the discussion one of the councillors remarked that he did not see why any increase should be given, as the manager was already receiving more than they paid to their roadmen! Surely this is an indication that their efforts to secure fuller recognition should begin at home, and it has occurred to us that a very suitable opportunity for such efforts is to be found in Health Week, which was carried out in a number of places this year and is to be organised in the future by the Royal Sanitary Institute. If the managers could persuade their respective committees to arrange visits of the ratepayers to the sewage works during Health Week the visitors would acquire some knowledge of the value and importance of the work of sewage disposal, and in this way come to recognise the value of the manager himself. It is true that visits of this kind could be arranged at any time during the year, but Health Week would be a specially suitable occasion, for the reason that, during that period, matters pertaining to health and sanitation are discussed in quarters where they are, as a rule, almost entirely ignored during the rest of the year. Local authorities themselves should welcome the organisation of such visits as a means of bringing to the knowledge of the public some of the good work carried out in their interests. In any case, we offer these suggestions for what they are worth, and we shall be only too glad if we have, even in a small way, assisted the managers of sewage disposal works to secure that fuller recognition which they desire and deserve. In the foregoing remarks we have had in mind those managers who are directly responsible to their respective committees. The greater majority are, of course, on the staff of the surveyor, who is directly responsible to the council for the work of sewage disposal, but even in such cases we believe it would be to the advantage of the head of the department to have as manager of his sewage works an official who would be better paid and more competent than under present arrangements, and we do not think there would be many surveyors who would object to an improvement in the status of sewage works managers.

**An American
View of
French and English
Highway Engineering.**

In an article which appeared in a recent issue of the *Contract Record*, Toronto, Colonel W. D. Sohler, chairman of the Massachusetts Highway Commission, describes some of the most striking features of French and English practice in highway engineering, especially drawing attention to points which road engineers on the Western side of the Atlantic should take into consideration in their own work. The article, which is entitled "Lessons from the International Road Congress," is clearly the result of a study of the papers submitted to the congress as well as of Colonel Sohler's personal observations made in traversing the roads of France and England. The most important lesson to be learned from France is, Colonel Sohler considers, that proper location should be secured for highways, and he believes that France has the best roads in the world as far as location, lay-out, foundations, and drainage are concerned. The paved gutters, usually provided on grades of over 3 per cent, can be used by vehicles when necessary, being almost at the same level as the road, and Colonel Sohler's appreciation of this advantage is in accordance with views set forth in our own pages as regards the

importance of the principle, whatever be the precise nature of the emergency or drainage strip. The wide and shallow gutters across roads in French villages and in the parks near Paris allow of vehicles passing without inconvenience at speeds up to about 15 miles an hour, and this observation is worthy of note with respect to drainage as well as perhaps to automatic control of speeds. Especially noticeable, in England, was the large number of traction engines and trailers, but it may be remarked that a study of English roads in connection with a congress in London may, unless it be conducted under very careful guidance, tend to produce an erroneous impression in this connection, one way or the other. The crust thickness of 9 in., which Colonel Sohler seems to believe has been found to be necessary in order to meet the effects of such traffic, has, it may be remarked, been about the least thickness regarded as sufficient for important main roads in many European countries for the past forty or fifty years, and in many cases considerably greater thicknesses have been held to be, on the whole, economical. This does not apply, of course, to roads made directly on a very hard and firm soil. American engineers make their road crusts too thin.

Colonel Sohler considers that there is much to be learned from British practice in road maintenance, and the comparatively large sums per mile which we find it advantageous to spend on maintenance seem especially to have attracted his attention. As regards surface tarring, he noticed only 1 mile in all of roads the surface of which was being picked up, and he believes that the tar used in England is more sticky and more elastic than that used in America. The permanent employment of engineers and foremen leads, both in England and in France, to efficiency and economy, and the practice "in most of the cities abroad" of leaving the restoration of street surfaces to the highway authority, after excavations, is far more satisfactory than that of entrusting it to the various parties making the excavations. In American cities a street may be dug up two or three times in one year, and it is hardly ever properly repaired.

* * *

**Europe
and America:
A Comparison.**

Mr. George Janin, the chief engineer of public works at Montreal, recently visited several of the more important cities of France, Belgium and England, and in the course of his travels he was able to collect much valuable information in regard to the municipal engineering work which is being carried on in these places. This information was embodied in a memorandum intended primarily for the Board of Commissioners and members of the city council of Montreal, but Mr. Janin has very generously placed it at our disposal in order that the members of the profession generally may have the benefit of his observations. Accordingly we have great pleasure in publishing the memorandum, which will be found in another column in this issue. The greater part of Mr. Janin's time was spent in Paris, and it is interesting to note that this city was the scene of his earliest professional work some thirty-five years ago. Paris is justly noted for the magnitude and perfection of its public works, and visits of inspection have been made by many British municipal engineers; but the comparison which Mr. Janin draws between the respective administrations of Paris and Montreal shows that this perfection is not attained without a relatively large expenditure and the employment of a large staff of technical experts. Thus, the staff at Paris numbers about 1,100, whereas Montreal, with a considerably greater superficial area, has a technical staff of only about 350. In this connection, however, it must be remembered that the population of Paris is about five times as great as that of the Canadian city. In the matter of the construction of roads which have to bear very heavy

traffic, Paris favours the use of stone pavements, and the city owns and works profitably one of the finest quarries of paving material in the country. This quarry is but 20 miles distant, and is, of course, an incalculable boon to the department of highway administration. The use of asphalt is being restricted on account of its slipperiness in certain states of the weather coupled with the comparatively high cost of laying and repairing; but the experience of Montreal is different. The comparative noiselessness of asphalt, too, is a distinct point in its favour as a paving material for busy city streets.

Mr. Janin also has a good deal that is of interest to say regarding the various sanitary services of Paris, including street cleansing, refuse removal and disposal, water supply and sewerage—all of which are in a high state of efficiency. Dealing with the English cities which were visited, it appears from the memorandum that the Liverpool waterworks impressed the traveller more than anything else he saw in this country, and he draws the conclusion that the enormous expense of these works justifies the policy adopted by the Montreal Council in establishing their intake at some distance from the shore of the St. Lawrence. If it be true that intelligent travel is an important part of a liberal education, it is no less true that those who have not the opportunity of undertaking long and expensive voyages themselves can profit very considerably by studying the records of those more fortunately circumstanced. The thanks of British municipal engineers are thus due to Mr. Janin for placing at their disposal such an interesting and instructive account of the professional aspect of his recent European tour.

* * *

Cork City Engineer and the Question of Employment. The question of unemployment is one that usually meets with the sympathetic consideration of borough councillors, but there are limits beyond which abuses may creep in, with the result that some harm, as well as good, may be done. A discussion that took place recently at Cork Town Council on the allocation of money for the employment of workless men disclosed the existence of one of these abuses. Nothing is dearer to the heart of the ordinary councillor than the dispensing of patronage, but it is obvious that patronage may easily become a very undesirable factor in municipal life. One of the Cork councillors in the course of the discussion made reference to a supposed "right" which he claimed each member had of nominating two, three, or four men for work. Precisely how this impression came to be created does not appear, but the city engineer must frequently have had sad experience of the worries appertaining thereto. It was sought upon the particular occasion under notice to set out in a formal resolution a request that the city engineer should "give equal rights of nomination of labourers to every member of the council," but the city solicitor was quick to perceive the embarrassments of the situation. He told the council that such a resolution would not be in order, and he added that he was quite sure the city engineer would give due weight to the suggestions of councillors. He proceeded to say: "He could only repeat that the city engineer and the other officers would do their best to see that any money available for employment would be used between that and Christmas. No matter what recommendation was made, the money of the corporation should be expended under the direction of the responsible officers of the corporation. If the city engineer saw that twenty additional men were required he could employ them without any recommendation from the Public Works Committee or the council. He would repeat that if the matter were left to the officers they would do what he said." The prompt action of the city solicitor had the desired effect of bringing the members to a consciousness of the unreasonable position they were taking up, and the resolution was not persisted in. It would, of course,

be most unfortunate for a borough engineer to become the innocent victim of a position in which personal and party jealousies are exercised for electioneering purposes—for this, it was evident from a subsequent discussion, was the particular object which the city councillors had mainly in view.

* * *

Inland Waterways. The general interest in the possibility of improving our canals which was aroused by the Royal Commission's reports has by no means subsided. It is still maintained, and it is growing. This is noticeable particularly in the Midlands, where canals are largely used, and where the advantages of the improvement of the canal system throughout the country are most evident. Further, some fear is felt that, if better waterway communication is not afforded, industries must tend to leave the Midlands for the sea coast. While it is improbable that the whole of the general improvements and alterations outlined in the report, involving the expenditure of £17,000,000, will be carried out for many years to come, it is fairly certain that some of the work will be done in the near future.

Mr. R. B. Dunwoody's paper read lately before the Institute of Sanitary Engineers is one of a number of similar efforts which are being made at the present time to keep the matter before the public. It may be regarded more as an able summary of what has been said in the Royal Commission's reports than as a statement of anything new. Mr. Dunwoody laid considerable stress upon the fact that the four main canals connecting Birmingham respectively with London, Bristol, Hull and Liverpool for the greater part of their course presented no great difficulty as to the water supply. A considerable portion of the route was along the course of the great rivers, and the difficulties attending the work of improvement in such parts of the system were not great. When it is considered that the manufacturer of Mannheim or Cologne, 200 miles or so inland, can compete for the London trade with the manufacturer in Birmingham owing to the excellence of the continental canals, it is clear that a very strong argument exists in favour of making a good canal connection between London and the Midlands. The sanitary engineers present naturally raised the question of the possible insanitary condition of canals. Mr. H. Percy Boulnois pertinently instanced the Manchester Ship Canal, which is, without doubt, an object lesson, and it cannot be said that the question was answered very convincingly. Whether the new method of barge propulsion by means of aerial propellers has any bearing upon the question of canal improvement was not considered.

* * *

The Goole Council and their Surveyor. At a meeting of the Goole Urban District Council on December 12th there was an echo of the recent proceedings at the Leeds Assizes which arose out of an assault on a councillor by the engineer, Mr. C. G. Bradley. It will be remembered that the assault took place in the council chamber in consequence of the offending member's persistence in making defamatory statements about the engineer, and that Mr. Justice Darling, at the assizes, said the prosecutor had made a false charge and had done the defendant a wrong, and as a gentleman he ought to have apologised; moreover, the learned judge refused to order the defendant (the engineer) to pay the costs of the prosecution. At the meeting above referred to a councillor who was a witness for the prosecution moved the resignation of the engineer, but failed to obtain a seconder. We congratulate the surveyor on this evidence of the fair view taken by the council of the incident, and their recognition of the fact that their officer, though technically in the wrong, acted under extreme provocation. A report of a forthcoming presentation to Mr. Bradley, we may add, appears in another column of this issue.

Mechanical Engineering Aspects of Road Construction.

COLONEL CROMPTON AT THE INSTITUTION OF MECHANICAL ENGINEERS.

A very interesting paper was read before the Institution of Mechanical Engineers on December 19th by Colonel R. E. Crompton, M.I.N.S.T.C.E., consulting engineer to the Road Board. In this paper, an abstract of which follows, Colonel Crompton briefly reviewed the development of self-propelled road vehicles, described the waving of road crusts and the conditions which cause and accentuate it, and explained his views as to the most promising methods of road-crust construction intended to prevent or minimise such action. He pointed out that there is a great tendency for modern motor vehicles of the heavier classes to have nearly the same percussive and rounding effects—to be similar, that is, with respect to rhythmic movements—and that the frequent passage of motor vans, and particularly of lines of omnibuses, along a road tends to produce a regular wave formation of equal wave lengths. He also pointed out that initial waving is produced in the process of rolling, and advocated the use of the three-axle roller which he has devised with the object of reducing this initial wave formation to a minimum. It may be noted, in passing, that in his Manchester paper Colonel Crompton pointed out that the rhythmic action of a vehicle is started by inequalities in the crust, such as manhole covers or hard places. This, in our view, is a more important factor than the initial waviness produced by rolling, for the simple reason that it leaves the vehicle free to continue to beat the road at its own period of rhythmic percussion, while in the case of initial waving due to rolling the wave lengths are likely to be quite different from those which the vehicle produces. It may also be pointed out that the wave length must vary with the speed of the vehicle, since the natural rate of vibration of the wheels on their springs, and the natural rate of heave and fall of the vehicle on its springs, cannot change very much, while the length of road covered in each rhythmic movement varies with the speed. The wave lengths produced by rolling are often fixed by the effects of concentration of the run-off of surface water, and, in such cases at any rate, the wave lengths due to the passage of vehicles can only be superimposed on the initial waves, like those of a sudden storm on a heavy Atlantic swell.

ROAD VEHICLES AND CRUST DEFORMATION.

It may also be pointed out that the effects of slow vehicles in rolling down a road are much more effective than Colonel Crompton supposes, and slow, heavy, horse drawn vehicles—and, in some cases, heavy motor wagons and trailers—often exert such effects. Further, there is, under some weather conditions, a rolling out of the road surface under mixed traffic, including a large proportion of swift motor cars, and this rolling not only destroys lengthwise rutting and tracking, but also reduces and even annihilates all but the longest and least objectionable of the crosswise waves. This applies to unrolled water-bound crusts, to tarred crusts from which some of the tarry skin has been worn, and, under steady temperature conditions at moderately high temperatures, to fully tarred crusts. Generally, Colonel Crompton's ideas on this subject, though useful with respect to important main roads leading out of very large towns, must, before they can be applied to a large mileage of main roads, be much diluted with other considerations. At the same time, it may be pointed out that his three-axle roller is a machine well worth the attention of surveyors, not only on account of its probable superiority as regards initial waving, but also because it permits of the use of a considerable range of pressures. In his book "The King's Highway," published in 1908, Mr. Reginald Ryves suggested that initial waving under rolling was caused by the use of a roller too heavy for the particular piece of work, and added: "Probably, on the whole, the rollers used in Great Britain are too heavy, except when used on roads with naturally firm beds or good foundations." He advocated, however, the use of high-pressure rollers for the final consolidation of the upper course or of the whole crust. Years before the same engineer pointed out that one puddle in a road "breeds a string of puddles," and since then, if not before, the rhythmic effect of vehicles has been the subject of remark in several quarters. It was pointed out in a technical journal, in 1900, that the period of the lurches of the motor omnibus plying between Kennington Gate and Vic-

toria Station were longer than those of other vehicles, and the kind of rhythmic motion referred to by Colonel Crompton was indicated as "vibrations . . . the period of which is too short for the motion to be a swaying, and not short enough for it to be in the region of sound." Generally, surveyors have long recognised the percussive effect of wheels with springs, and were fully aware of the fact that the deformation of road surfaces is only partly caused by removal of material. It is most unfortunate that Colonel Crompton should have said in his paper that, with respect to deformation, "no one assigned the waviness to what the author believes is the chief cause—that is, the repeated action of vehicles closely resembling one another in their harmonic action." We give the consulting engineer to the Road Board full credit for being the first to realise the importance of this similarity, and the significance of the running of lines of vehicles and motor vans of a similar character upon important main roads leading out of large towns, but he might have informed himself more fully as to general appreciation of facts and principles.

THE CARPETING PRINCIPLE AND ITS APPLICATION.

There are in the paper several other passages which might seem, to those who have not realised Colonel Crompton's singleness of purpose, to disclose an attitude of mind by no means satisfactory to those members of the profession of civil engineering—in its wider sense—who are entrusted with the management of our roads. We consider unfortunate the expression "that branch of mechanical engineers who are the modern road constructors." Again, take the following passage: "It is the author's opinion that for some time to come the work will be carried out by responsible contractors, although in some cases existing road authorities may elect to provide themselves with their own plant, and to train their own staff." This can hardly be pleasing either to surveyors or to consulting engineers, who are the persons usually entrusted with the engineering control of works carried out by contractors and with contractors' plant.

Colonel Crompton's enthusiastic pursuit of the study which, for the time being, engages his attention is doubtless, and indeed obviously, productive of useful results; but it leads him to take too narrow a view. The particular application of the carpeting principle which he so zealously advocates is of quite limited range, especially as regards gradients, and in putting it forward Colonel Crompton seems to be unaware of the true character of the mixed traffic of to-day. He does, in fact, speak in the past tense of vehicles which are present on our roads in numbers which have hardly decreased during the past fifteen years, and he seems to overlook altogether the valuable features of certain kinds of road pavement—such as wood blocks, to take a conspicuous instance. A wood pavement has the great advantage that it can be armoured with fragments of grit, and its period of slipperiness during certain weather phases is shorter than that of several other kinds of pavement. Even in his advocacy of large-diameter wheels Colonel Crompton fails to satisfy the student of rhythmic effects, and actually suggests that "when rubber tyres are used, the shocks imparted to the road are so cushioned by the tyre itself that increased wheel diameter is not of great importance." Does he really believe that the dwarf wheels of motor vans and motor omnibuses are *not* among the chief causes of the rapid wear and deformation of certain classes of main roads? The thumping action of wheels in producing waves and, be it noted, wear also, is largely due to the fact that they roll over the humps smoothly and bump into the hollows. This effect is inversely proportionate to the diameter of the wheel.

THE TREND OF COLONEL CROMPTON'S INVESTIGATIONS.

Colonel Crompton's paper is a really important contribution to the study of road-crust deformation, and the specifications for asphaltic carpets and the details of the methods employed in laying them are worth careful study. He has also shown that his road machine at Teddington is likely to furnish some useful comparative data, and he sets a splendid example to younger men in the matter of energetic pursuit of the study of the moment. Far from being deceived by his apparent opinion of types of road crust other than those the features and merits of which at pre-

sent occupy his attention, we feel sure that other forms of crust, such as asphaltic macadam, will, in turn, come within the range of his careful study and experiment. The profession as a whole is bound to recognise, too, the advantage of being able to count upon the presence at headquarters of an engineer so well versed in experimental work and in mechanical engineering.

We have prepared for the present issue an abstract of Colonel Crompton's paper, with long passages of special technical interest quoted in full, and trust that, in spite of the compression necessitated by the heavy demands on our space, we have given a fairly adequate presentation of most of this valuable paper.

ABSTRACT OF COLONEL CROMPTON'S PAPER.

The author believes that the time has come when the development of road locomotion must be jointly studied by designers of vehicles and by "that branch of mechanical engineers who are the modern road constructors." Like a railway and its rolling stock, the

ENDURANCE TEST IN MODEL TAR-MACADAM ROAD: LONGITUDINAL CONTOUR AFTER TEST (2-IN. MATERIAL).

vehicle and the road should be treated as a whole. "The development of road vehicle design is well advanced. The science of preparing the road surfaces to suit these vehicles is comparatively new, and requires careful attention." The author's successful work with the Indian road train, described in a paper read before the Institution of Mechanical Engineers in 1879, was followed by valuable work done by French engineers, and by 1901 there was already a great development in the use of the pleasure motor car. During the period of development of traction-engine design their chief features were so far fixed and standardised that the traction engine of to-day has been but little altered from that of 1871. The engines were necessarily heavy, and it was not until Thomson, in

water which had to be carried, added to the restrictions imposed by legislation, confined the benefits of road locomotion as it then existed to farmers and the few who used traction engines for transporting heavy weights.

The adoption of the internal combustion engine by Panhard, De Dion, Benz and others gave such an impulse to road-vehicle design that constructors were able to lighten their machines, and to avail themselves of a knowledge of framing developed in experience with the bicycle, and learned, from the same source, how to deal with the vibrations occurring at high speeds. When the "Red Flag Act" was repealed, it was not long before some of the problems entailed by the increased speed demanded the attention of designers. Solid rubber and pneumatic tyres minimised the difficulties experienced from shock and vibration in the case of the lighter vehicles, but with the heavier commercial vehicles the case was otherwise. Up to this time full loads were necessary to enable traction engines to pay their way, and this was against door-to-door delivery; but it was soon evident that there

would be a great opening for the carriage of smaller loads at higher speeds. Distribution up to 100 miles from a seaport or manufacturing centre is now found to occupy about a third of the time occupied by railway transport. For goods in small consignments it is a great advantage to be able to use vehicles which can run up to a speed of 20 miles an hour, and to deliver goods up to a radius of 50 miles within a few hours of the order being received. Modifications of pleasure vehicles

proved unsatisfactory, and designers then sought to reduce repair bills by a study of the stresses introduced by the road shocks, and they were able to do this without materially increasing the tare weight. Improvements were followed by a reduction of the cost of maintenance, and the demand for vehicles increased, their use extending rapidly. Nearly all the business houses in our large towns now distribute a considerable proportion of their output by motor vehicles.

There are now in London nearly 3,000 motor omnibuses dealing with the rapidly increasing passenger traffic, which has been created solely by the speed facilities, the regularity of service, and the comfort of the passengers. The saving of time has added nearly

10 per cent to the use of the lives of many persons. Many roads previously deserted by all but local or farmers' traffic now carry quite a large fraction of the passenger traffic and of the tonnage of goods previously carried by the railways. The increasing number of the lighter vehicles and their higher speed produced the dust nuisance, and it was found that heavy vehicles caused extensive deformation of road surfaces, and "a tax has been levied on road locomotion" in the form of a licence tax on the vehicles themselves and a petrol tax on the fuel they consume. The Road Board was formed to administer grants in aid of road improvement, and the funds raised from the vehicle and petrol taxes cannot, as is often supposed, be applied to the maintenance of roads.

"The author, in his position as consulting engineer to that board, has had considerable opportunity of noting and studying the whole question of the deterioration of road surfaces, as far as it appears

to be due to modern traffic, and lays some of the results of these investigations before the institution. Road surveyors and others, when discussing the effect of the new traffic on roads, are accustomed to talk of the unevenness of the surface wear—that is, by the actual removal of the road material by the rolling of the wheels or impact of the horses' feet from parts of the surface so as to wear down the depressions or low places; but although this was partly true when water was used as the binding material for macadam roads, the mud being scraped away in the winter or the dust blown off the road in the summer, this actual removal of material from the surface almost entirely ceased after

ROAD CONSTRUCTION MACHINE, NATIONAL PHYSICAL LABORATORY: CROSS SECTION THROUGH PATH.

1868, fitted solid rubber tyres to the driving wheels of vehicles, which he called "road steamers," that it was found possible to reduce the weight of these tractors to one half that of the traction engines then in use on account of the increased adhesion. One of the author's Indian engines, weighing 8½ tons, or with a separate tender carrying fuel and water 12 tons 14cwts., drew behind it a train weighing 64 tons 6cwts., with a nett paying load of 42 tons, or 55 per cent of the total moving load. But everyone seemed to combine to oppose the development of road locomotion; or, at any rate, before the development of the internal combustion engine in France, the weight of fuel and

the roads had been tarred or rendered waterproof; so that the deformation of the road surface, which continues to show itself wherever traffic is heavy, must be put down to other causes."

TRIALS OF ROAD-SURFACING MATERIALS.

"Soon after the formation of the Road Board the author was engaged in preparing specifications for a number of trial lengths of road-surfacing material to be tested, in competition, on the main Folkestone road at Sidcup, in Kent, on the London and Kingston road in the borough of Wandsworth, and within London itself on certain streets in the borough of Fulham." These trial lengths were intended to be, as far as possible, comparable as regards traffic. For measurements of wear the author adopted the stretched-wire instrument used by Mr. J. A. Brodie, city engineer of Liverpool, and notes were taken at regular intervals—at first every month, and afterwards every six months. There were unexpected results, for although, in most cases, the cross contour was lowered, in other parts the surface had actually risen. Measurements considered doubtful were repeated, and the first measurements were confirmed. The raising of the surface was due, the author found, to the fact that

action, passing over the road at a speed sufficient to transform the smooth rolling of the wheels into bounding or pulsating motion."

Prof. Archibald Sharp came very near to this conclusion in discussing a paper read by the author on the subject of road vehicles before the Institution of Automobile Engineers in 1903. In 1907 Mr. Lanchester pointed out that, logically, highway traffic moving below a certain speed limit ought to counteract the wave-forming effect of high-speed traffic, but considered that it was not probable that speeds low enough to produce this beneficial effect are ever observed.

"The next point requiring investigation was to determine, if possible, the manner in which the materials forming a road surface are moved into new positions when the wave formation is in progress or complete. When a wheel rolls over any surface the individual particles of which that surface is composed must be rocked to and fro by the rolling action of the wheel. . . . Rocking action must take place, whatever the form of the particles may be, and it is practically certain that it is greatly intensified when pulsating or percussive action of the wheels is sub-

THREE AXLE MOTOR ROLLER (CROMPTON & TAPP)
(Barford & Perkins)

the point coincided with the crest of a wave which had been formed. It was "deformation," and there was really a transfer of material in the direction in which the traffic was rolling. "These observations, added to many others taken on other roads in various parts of the kingdom, have led the author to reconsider the question of road wear, or, as he prefers to call it, of 'road deformation.'"

The author believes that the deformation caused by modern traffic is due to the action of the wheels being rhythmic percussion rather than true rolling, tending to reform the original flat surface into one having well-defined waves. This wave formation may be so intense as to cause the road to break up.

"This tendency towards wave formation had already been often noticed by road surveyors, but the causes of it in the past were put down to original unequal spreading of the road material, to unskilled rolling, irregular consolidation, insufficient or irregular foundations, excessive watering—in fact, to many causes other than the one now brought forward by the author. Everyone knew the roads were wavy, but no one assigned the waviness to what the author believes is the chief cause—that is, the repeated action of vehicles, closely resembling one another in their harmonic

stituted for "smooth rolling." The particles must, in the action of rocking, upbraid one another and gradually lose their angular form. "In a well-designed newly made road of the existing type, angular pieces of stone of a definite size or gauge are used, the voids between these stones are partly filled with smaller angular pieces, and with sand and fine material, so that when the whole is consolidated by the roller, the rocking action of the wheels of the traffic is resisted, to some extent, by the angular interlocking of the stones and sand." A time comes when the stones can "actually roll over, and thus transfer themselves to new positions, being propelled to these new positions by the percussive action of the wheels. This has a greater effect on the larger than on the smaller stones, so that in practice, when one examines the cross sections of a crust of any roadway that has been subjected for some time to the action of traffic, and that has acquired a waved surface, one finds the smaller rounded stones underneath the troughs, and the larger stones underneath the crests of the waves." The author's observations on this matter have been made on a very large number of cross-sections of roads exposed by trenching. The wave-forming action of the modern self-propelled vehicle is far more intense than

that of horse-drawn traffic, one reason being that, the speed being greater, the change from true rolling to pulsating action is also greater. "The wheels, as a rule, are of smaller diameter, are more equal in size, and the general harmonic characteristics of the

at speeds from 3 to 20 miles per hour. The wheels at present in use are 1 metre in diameter, 3 in. wide, and can be loaded up to 1 ton per wheel, or about 800 lb. per inch width of tyre. Each wheel has a positive end-traverse of 1 in. inwards and outwards from its radial position, and makes the complete traverse of 2 in. in $1\frac{1}{2}$ revolutions of the frame. The wheels are spring loaded. It is intended eventually to vary the diameter of the wheels, and to test wheels fitted with various forms of rubber tyres. The path itself is to be heated, cooled or wetted to imitate weather conditions. "All the tests that have been hitherto carried out show a marked tendency to produce wave deformation. The machine itself has a harmonic period, and this reduces the time necessary to test a surface and to compare its merits with others in resisting this wave deformation."

DIAGRAMS SHOWING ACTION OF THREE-AXLE ROLLER. (Lower diagram illustrates rolling of freshly laid material.)

mechanically propelled vehicles resemble one another far more closely than was the case with horse-drawn vehicles, for of the latter many were slow-moving two-wheeled springless carts with wheels of large diameter, others were light carts or four-wheeled wagons with unequal-sized wheels. There was also the blow of the horses' feet, which must have considerable modifying effect on the road surface; therefore, in all essentials the conditions of horse-drawn traffic were far more heterogeneous and non-harmonic than the new traffic."

time necessary to test a surface and to compare its merits with others in resisting this wave deformation."

INITIAL WAVES ON NEWLY FORMED ROAD SURFACES.

"In considering what might be done to improve the vehicles so as to minimise their tendency to deform the road by wave formation, the author's ideas were first directed to the original initial waves, which are always found, to some extent, on newly formed road surfaces. The chief reason why no surfaces but those of wood pavement, or of the sheet asphalt laid with a trowel and adjusted by hand beaters, are free from initial harmonic waves is that the road roller used when, as is usually the case, the rolling is carried out in the direction of the line of traffic—however skilfully the operation of rolling is performed—always produced waves which eventually are intensified by the traffic, for when an ordinary two-axle roller is first brought on to newly spread road material, it alternately pushes the material forward until a certain resistance to forward movement is encountered, and then rolls over the accumulation thus formed in front of it. This alternate action is periodic, and the wave length depends on the diameter of the roller wheels, the total weight, the distance between axles, and to some extent on the speed at which the rolling is carried out; but in all cases the finished surface is waved. It is found to be much easier to roll to a surface of small-wave

HAMMER FOR TESTING ASPHALT MATERIAL FOR TOUGHNESS.

Again, fleets of vehicles, practically identical in their harmonic features, run regularly over the roads, and have a severe harmonic effect, and the wave formation produced is very regular and definite in wave length.

MACHINE FOR COMPARING EFFICIENCY OF METHODS OF ROAD CONSTRUCTION.

Confirmation of wave formation has been obtained from the working of the road machine at the National

height certain soft road materials—such as blast-furnace slag or some of the limestones—than is possible with the harder and more incompressible granites and basalts, but in no case is the finished surface ever truly flat and waveless. When the traffic comes on to the road there is little doubt that the small waves left by the rolling serve as a starting-point for the shorter-period waves eventually formed by the traffic itself, and as it appeared to the author that all two-axle vehicles must cause this action, it occurred to him that it would be better to commence by modifying the design of the rollers themselves so as to produce a non-wave-forming roller. He has succeeded in doing this by adopting the three-axle principle, and it is probable that the same three-axle principle might be with advantage extended to all vehicles carrying heavy loads.

IMPROVED 18 FT. STRAIGHT EDGE.

Physical Laboratory. The length of time needed for the development of wear or deformation in actual road crusts led to the setting up of this machine, in the design of which the author collaborated with Dr. Stanton. It was set to work early in 1913. On a circular path a frame carrying eight wheels revolves

The idea of designing the three-axle roller (illustration herewith) was suggested to the author by a study of the Renard train, these being "the only vehicles

THREE-AXLE ROLLER.

which the author has seen in use which have a real tendency to correct the wave formation caused by the ordinary two-axle vehicular traffic." The rolling resistance to the Renard train is small, and the author believes that much might be done by the designers of vehicles developing the three-axle principle. The three-axle roller "has certainly produced surfaces freer from waves than has heretofore ever been the case." The weight taken by the three rollers must constantly vary, so that it can exert maximum pressure on the high places and the minimum pressure on the low ones. The central, driving roller must be weighted sufficiently for adhesion. It is therefore mounted on springs, so that it can fall below but cannot rise above a fixed point relative to the front and rear rollers. On freshly laid material there is a very light pressure during the first time of rolling; but as the road surface becomes less yielding, the weight is concentrated on the centre roller, just as if a light roller was first employed and followed by a heavier one, but more gradually. The difference in the levels of the rollers is adjustable, and by raising the rear roller clear of the ground 90 per cent of the weight can be concentrated on the central roller. The front roller has always sufficient weight for steering. The wheel bases are unequal as a further proportion against the production of waves.

"In the present design the diameter of the centre roller is 3 ft. 6 in., and that of the end rollers 3 ft., but in the new design the centre roller has been altered to 4 ft. The width of the rollers over all is 4 ft., the long wheel-base 8 ft., and the short wheel-base 6 ft. 6 in. The distribution of weights can be varied by the hand-wheel adjustment between the limits given in the table below, with corresponding rolling-pressure variation of from 160 lb. up to 500 lb. per inch width of roller.

LARGE WHEEL DIAMETERS.

"When rubber tyres are used, the shocks imparted to the road are so cushioned by the tyre itself that increased wheel diameter is not of great importance; but when the problem of carrying considerable weights at a paying rate of speed—say up to 8 miles an hour—at the lowest combined cost of the vehicle and the road is attacked, it will be found that much can be done with steel-tired wheels by a very considerable increase in the diameter of the driving wheel." By adopting the suspension principle, large-diameter wheels may be used with only a small increase in weight, and the author has designed a tractor, which he believes is the first of its kind, to utilise 7-ft. wheels with a comparatively light axle weight. It has given very successful results.

IMPROVEMENT OF ROAD SURFACES.

"We now come to consider what are the chief features of road design, to enable the surface to carry the wheeled traffic of the future at a minimum cost with the least deformation of the surface, and therefore with the greatest comfort to passengers, and at the lowest cost of maintenance of the vehicles that roll over it." Already the effects of climate are minimised by rendering the road surface impermeable by dressing it with bituminous substances, and such roads are practically dustless for eight months in the year, but the action of the tar does not go deep enough to hold the surface together in winter. The author for a long time believed that this was due to want of strength or mechanical causes, "but he now believes it is also due to surface tension properties of the tar used. He has also noticed that no such action occurs in the most perfect impermeable and durable surface of all, the asphalt pavement, which stands the effect of traffic of all classes just as well in the wet and cold days of winter as in the dry days of summer."

Road stones and similar material held together with bituminous binders form a partially elastic concrete, "these bituminous binders taking the place of the Portland cement of an ordinary concrete." Success in the use of this method has been considerable and progressive, and has been largely due to the employ-

ment of machinery. Tar-slag surfaces, blast-furnace slag being employed, have been very successful, but the expectation of further advantages by treating high-class granites and basalts in a similar manner have not been fully realised. "The tarred slag macadam of Hooley still holds its own; there have been fewer failures by its use than with any of the other road stones when such previously coated material is used." The second class of deep treatment is by the grouting or penetration method. Both systems have their advocates.

SHEET ASPHALT OR DOUBLE-COAT WORK.

A system largely adopted in America is that of "producing artificial asphalt by covering a concrete foundation with a sheet asphalt artificially formed from a graded sand aggregate held together by a bituminous binder, or, as the Americans call it, an 'asphaltic cement.'"

"If we take the heavily trafficked streets and roads of the world, there is probably now under traffic a larger area of this class of sheet asphalt pavement than of any other form of surface, and the latest efforts of road engineers appear to be in the direction of extending this method of surfacing to all classes of roads which have to bear considerable traffic. Already much machinery has been designed to produce such surfaces at the lowest cost.

"When the author began to examine the road surfaces which resisted the harmonic wave-forming action of modern vehicles in the most satisfactory manner, he found that the sheet-asphalt pavements of the towns were the best and most durable, and were least deformed under traffic. They are now used in many forms. Sometimes the original and hitherto expensive arrangement of supporting the sheet-asphalt surfaces by concrete foundations has been used, but in many cases successful attempts have been made to utilise the existing macadam roadways as a supporting crust, and to lay on them a bituminous-bound new surface in one or two layers. Many examples of this have been laid in various parts of London, and the surface of the Thames Embankment from the Westminster Bridge to Blackfriars may be noted; here the method adopted has successfully resisted for several years exceptionally heavy traffic with but little deformation and at a low cost. During the past year or so similar surfacing has been carried out on many of the great omnibus routes, and has certainly justified itself by the successful way in which the harmonic effect of this most difficult type of traffic has been successfully dealt with, the wave deformation being very small and not appearing to increase to any marked extent.

"In considering the cost of surfacing, perhaps the important question is that of the carriage of the material. The cost of railway and road haulage, taken together, forms a large fraction of the total cost of resurfacing a road. It is therefore most desirable to use local material wherever this can be done without affecting the quality of the work. For this reason the author suggests that the bulk of the material forming a road wearing surface should consist either of local sand (the distribution of which throughout the United Kingdom is very wide, so that, as a rule, the cost of suitable sand delivered at the roadside is only half that of good road stone), or that an ideally perfect aggregate for the wearing surface should be provided by crushing sandstone or any similar local stone which is composed of hard sand cemented together by binding matter."

In some cases the material of the existing crust can be partly utilised and crushed at one operation into part of the aggregate required. In both cases portable machinery, placed as close as possible to the point where the road material is to be laid, is necessary. Artificially produced sand is better than natural sand. "Speaking generally, only about one-tenth of the weight should consist of grit or granular particles passing a 6-mesh sieve and retained on a 10-mesh sieve, about 40 per cent should pass the 10-mesh and be retained on the 36-mesh, another 40 per cent passing the 36-mesh and retained on the 100-mesh, with 10 per cent only passing the 100-mesh. In order that such a graded aggregate may be cemented by the binder into a solid rock-like sheet to form the road surface it should have added to it about 10 per cent of fine limestone powder or Portland cement as a filler, and about 12 per cent of pure bitumen as the binder." The author then describes, with illustrations, a fixed or semi-portable plant (Lightning Crusher Company) for crushing the desired aggregate to any size, or

grading, heating it, and coating and mixing it with the binder. The crushers are of the high-speed rotary type; each piece of stone is struck twice in the air, the hammers rotating with a high velocity in an enclosed chamber. The number of blows per second and their force can be regulated to a nicety, as the crusher is driven by an independent electric motor. The crushed material is very cubical. By an arrangement of flues with an exhaust fan the fine dust can be separated to be used if required. The dried and heated aggregate falls through shoots into the buckets of the mixer-elevators, and after being weighed or measured close to the foot of the elevators, it is dumped into the mixers in the quantity required for each batch. The binding material is stored in melting kettles, fluxed from the flux tank, measured off in measuring drums, forced through pipes by compressed air, and delivered at the surface of the aggregate already in the mixer. In a day of ten hours 200 tons of hot mixture can be delivered on the road. The author considers that "the modern road engineer should test his road material as an engineer would test steel or other materials of engineering construction," taking frequent test pieces from the batches of hot material. He should therefore be provided with portable testing apparatus. Moulds for moulding the test pieces will be required, and a test hammer and press (herewith illustrated). The author then describes a portable straight edge (herewith illustrated) which he has devised for testing the truth of the road surface as finished. The actual contour of the road is drawn to full size by the recording pen of this instrument. The author prefers the placing of hot material directly on to the road

aging 1.75 tons each, and that the one-third balance is in the form of 24,000 heavier vehicles between 2½ and 7½ tons, averaging 5 tons.

(3) It is assumed that the damage done to roads by 1 ton of traffic carried on steel tyres is 1½ times that carried on rubber tyres.

(4) That the cost per vehicle-mile for the lighter class, the bulk of which use pneumatic tyres, may be taken at 8.25d., and that of the heavy 5-ton vehicle be taken at 16d., both of which are well-ascertained average figures.

(5) That the cost of the roads as they are is the common case where a main road, 18 ft. wide, requires re-coating every three and a-half years at a cost of £800 per mile, or £223 per annum, which, with the annual cost of trimming and share of lengthsman's wages, brings the total cost to £300 per annum; the reconstructed road to be resurfaced with double-coat work, 4 in. thick, at a cost of £3,400 per mile, having a life of twelve years, which, with the item for lengthsman's wages, also comes out at £300 per mile per annum.

(6) That the reduced vehicle costs shown are those now obtainable from vehicles running most of their mileage on well-surfaced urban roads, and are due not only to savings in fuel and repairs, but to the greatly increased speed and increased mileage run by each vehicle on the improved roads.

The large saving shown, amounting to upwards of £800 per annum, to the owners of the vehicles using this mile of road brings forcibly before the members the case which the author has attempted to make—that the time has arrived that this problem of the new industry of road locomotion should be most carefully considered by all classes engaged in it—not only the

TABLE SHOWING HOW RUNNING COSTS ARE REDUCED BY ROAD RECONSTRUCTION ON ONE MILE OF ROAD CARRYING 1,000 TONS A DAY.

to the other method of previous coating and cold rolling, in which the setting process is slow and the risk of damage greater.

The author then refers to the portable plant of the Ransome ver-Mehr Machinery Company, which can be worked on the roadside on the batch principle. In this machine an excess of heated air is forced over the stone contained in the rotary drier, the size and weight of which can therefore be reduced. Cylindrical driers, batch mixers, conical rotating mixers, rotating hand mixers, and combined heating and mixing machinery are then described, with illustrations of machinery constructed by Messrs. Ord & Maddison and Stothert & Pitt.

ECONOMICAL CONSIDERATIONS.

"As it is obvious that, if we wish to obtain the best results, using any of the various forms of road-making machinery herein described, the plant should be worked by trained labour under skilled engineering superintendence, it is the author's opinion that, for some time to come, the work will be carried out by responsible contractors, although, in some cases, existing road authorities may elect to provide themselves with their own plant and to train their own staff."

The author concludes by showing, in tabular form, the extent to which the running costs of vehicles as they are will be reduced by well-considered reconstruction of road surfaces. In order to bring into comparison the data which are obtainable from the old type of roads with those obtainable from reconstructed roads, in the preparation of this statement he has adopted the following assumptions:—

(1) That we take the case of a mile of road carrying a traffic of 1,000 tons per day, or 360,000 tons per annum.

(2) That it is assumed that of this traffic two-thirds will be in the form of pleasure vehicles or light commercial vans weighing from 1 up to 2½ tons, or aver-

aging 1.75 tons each, and that the one-third balance is in the form of 24,000 heavier vehicles between 2½ and 7½ tons, averaging 5 tons.

Mr. A. DRYLAND, county surveyor of Surrey, was among the speakers in the discussion which followed the reading of Colonel Crompton's paper. Mr. Dryland said that he was in agreement with some of the views expressed in the contribution, but disagreed with others, and he proposed to touch upon some of the points in which he was at variance with him. Colonel Crompton had observed in opening that the design of self-propelled vehicles had reached a very advanced stage. That was quite true, as far as the power of conveying loads was concerned, but he should like mechanical engineers to devote some of their attention to the effect which those vehicles had on the roads, and endeavour to modify those effects. Colonel Crompton seemed to think the deformation he had spoken of had not been noticed much in the past, but it had always been a bugbear with him (the speaker). The remark had also been made that materials laid hot had an advantage in that they were less likely to form waves; but the diagrams accompanying the paper showed the opposite effect, and in all the Road Board trials of material laid cold the deformation was less than with material laid hot. He did not say that would be the case in the end,

because some of the materials laid hot would recover by reason of their elasticity. His experience had been that hot laid material generally had more corrugations than the other, and as there was likely to be a considerable development of materials laid in a hot condition, one of the problems would be to obtain an even surface. He did not know how far the three-axle roller which Colonel Crompton had described would meet the case, but from what he had seen of its working up to the present it did appear to produce a more even surface than the ordinary tandem roller. Weight was undoubtedly the greatest factor in the deformation of roads. He considered there was a great deal in the point about rhythm of the wheels, and mechanical engineers ought to see whether that could be varied by making wheels of a different size front and back. Colonel Crompton's view was that where rubber tyres were used the shocks imparted to the road were so cushioned by the tyre itself that increased wheel diameter was not of great importance, but that could scarcely be regarded as accurate when applied to motor omnibuses, which, of course, had rubber tyres. Personally, he should like to see self-propelled vehicles provided with larger wheels. He agreed that, so far, slag had produced admirable results and held its position well with other materials. He had tried bituminous coats on the ordinary macadam crusts, and up to the present with very promising results, the idea being where one had sufficient strength of metal to carry the weight it was not necessary to have what Colonel Crompton called a strength crust. He realised there were possibilities in regard to the connections between the two coats, but he had some work in his mind where there was no evidence of parting between the surface and base, nor any deformation. Colonel Crompton was rather sanguine in his estimate of the amount of material—200 tons per working day of ten hours—which the bituminous mixer he had described could deliver on the road, and he did not think he need say it was necessary for a plant of that kind to be very near the work—although it was desirable—for, as a matter of fact, these bituminous mixtures could be laid 30 miles from the works. He did not want to criticise closely the figures with regard to cost in the future. He thought that some of the author's assumptions were assumptions only, and would not be justified by results. Colonel Crompton had assumed twelve years as the life of his road. He did not think he would prove to be correct in that—although he hoped so—or that the saving, both to vehicles and road, would be as great as was anticipated. Concluding his remarks, Mr. Dryland said the question of deformation was a serious one for those in charge of roads. It was going to be a difficult matter to remedy without reconstruction, and if that reconstruction was to be a frequent occurrence it would prove so costly to local authorities that the good roads that were so desirable would not be possible of attainment.

Following remarks from other speakers, Colonel Crompton made a short reply. One could not, he observed, go on to a modern road without seeing the harmonic waves to which he had alluded, and roads had to be remade simply because of that deformation. Surely it was an object that ought to be followed up. For his own part, he felt confident that he would be able to stand by the opinions he had expressed, and that his claims for the system of road making he advocated were, considering the nature of the traffic on which his figures were based, quite moderate in their character.

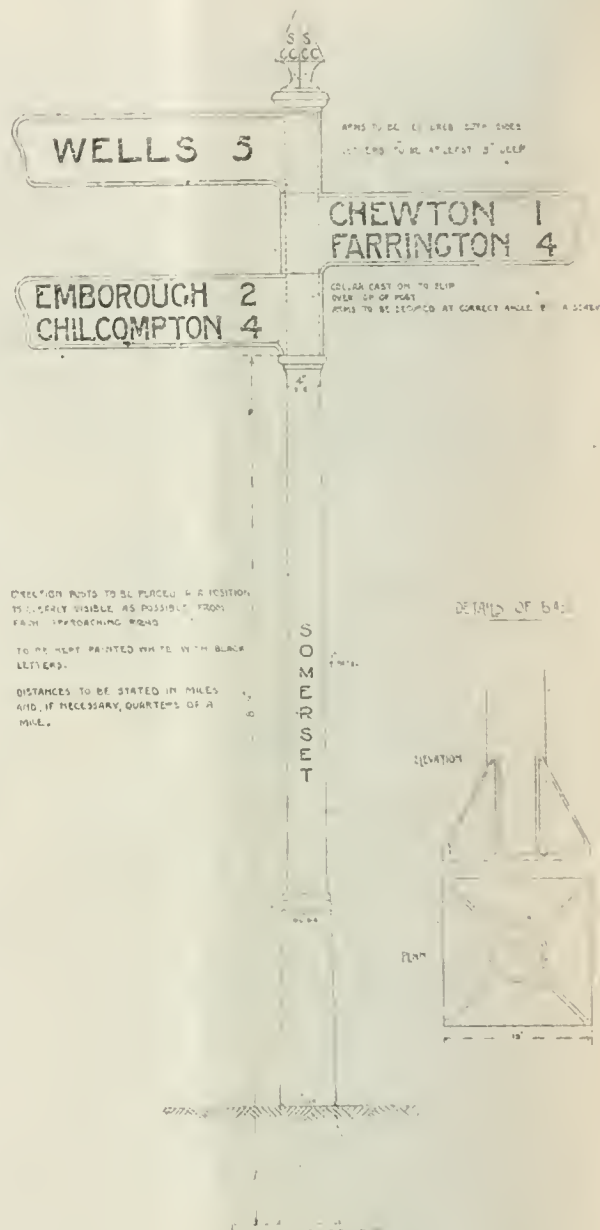

Wall Calendars.—Messrs. John Smith & Co., Grove Works, Carshalton, Surrey—engineers, millwrights, iron and brass founders—have issued their usual annual hanging calendar; and we have to acknowledge one also, with tear-off monthly slips, from the Union Assurance Society, Limited, of Royal Exchange Buildings, E.C.

Business Announcement.—Messrs. Browett & Taylor, auctioneers, valuers, architects and surveyors, 9 Warwick-court, Holborn, W.C., announce that they have taken into partnership their manager, Mr. T. Alfred Cordery, A.A.I., M.C.I., who has been associated with them for upwards of twenty years, and has had the control of the surveying department of their practice. The business will be carried on as Browett & Taylor, as heretofore.

DIRECTION POSTS.

THE SOMERSET COUNTY TYPE.

Mr. H. T. Chapman, the county surveyor of Somerset, to whom we are indebted for the original of the accompanying drawing, has from time to time been in receipt of requests for particulars of the direction posts in use on his roads—which have already been adopted by the authorities of several other counties—and we reproduce the design for the

benefit of readers of this journal who may in the near future find it necessary to give attention to the provision of improved means of sign-posting the highways in their charge.

A model of a four-armed direction post of the type illustrated was, it may be recalled, shown at the International Road Congress Exhibition in June last.

Institute of Sanitary Engineers.—On February 16th a paper on "The Significance of Colloidal Matter in the Problem of Sewage Disposal" will be read by Mr. F. R. O'Shaughnessy, F.R.C.E., at a meeting of the Institute of Sanitary Engineers to be held at Caxton Hall, Westminster. The chair will be taken at 8 p.m. by Mr. John D. Watson, the president.

War Office Contract.—A notification has been issued by the War Office that the tender of Bell's United Asbestos Company, Limited, of Southwark-street, London, has been accepted for the supply during the three years from December 17, 1913, of asbestos-cement ("Poilite") roofing slates, wall and ceiling sheets, &c., made at Bell's United Asbestos Company's "Poilite" factory at Harefield, Middlesex.

An Engineer's Report on Some Features of Municipal Engineering Works in Europe.

By MR. GEORGE JANIN, Chief Engineer of Public Works, Montreal.

[By the esteemed courtesy of Mr. Janin, we are enabled to present the report made by him to the Board of Commissioners and Members of the City Council of Montreal concerning his recent visit to Europe. Some of its details are further referred to in "Minutes."]

During a trip to Europe which I recently took for the benefit of my health and for other personal reasons, I profited by my stay in a number of important cities to devote as much of my time as possible to obtaining information, both documentary and otherwise, relating to the public works administration of these cities.

I remained for a longer or shorter period in each of the following important cities: In France—Paris and vicinity, Versailles, Melun and Fontainebleau; in the West—Poitiers, Angoulême and Rochefort-sur-Mer; in the North-West—Rheims, Charleville and Givet; in Belgium—Charleroi and Namur; in England—London, Birmingham, Liverpool and Bristol.

I began my career in Paris thirty-five years ago, and during this trip I spent more time there than anywhere else. It was through the kindness of a number of the leading officials of the city government that I was enabled to secure fuller data in Paris than in any other city I visited. In this connection I would refer specially to the courtesy of Mr. Barratte, chief engineer of bridges and roadways, in the water and sewer department; and also to that of Mr. Lirman, the assistant of Mr. Labordaire, engineer of highways, who was away on his vacation during my visit. This gentleman has charge of the workshop for treating wooden pavements.

I will therefore begin my memorandum by communicating to you the results of my observations in the capital of France—a city celebrated for the magnitude and perfection of its public works.

LIST OF DEPARTMENTS AND STAFF COMPOSING THE MANAGEMENT OF THE PUBLIC WORKS OF PARIS, GIVING COMPARISONS BETWEEN THEM AND THE SAME IN MONTREAL.

PARIS.		MONTREAL.
2,800,000	Population	568,000
34½ sq. miles	Area	406 sq. miles
\$ 0,000,000 (£2,000,000)	Budget as per last published statement.	\$8,720,000 (£1,744,000)
\$800,000 (£ 60,000)	Salaries of managing staff	\$315,000 (£63,000)

The composition of the staff is as follows:—

1 Inspector-General of Bridges and Roadways, Director of Public Works	1 Chief Engineer, Director of Public Works and Railways.
1 Chief Engineer of Highways, Lighting, Cleansing, Planting and Railways.	1 Engineer of the Road Department.
1 Chief Engineer of Water, Sewers and Drainage.	1 Waterworks Engineer. 1 Sewer Engineer.
1 Chief Engineer of Quarries, Paris underground.	(This office is not required in Montreal.)
31 Chief section-Engineers of social works and technical studies.	52 Engineers, 12 of whom are employed for the Department of Geography, which in Paris is not under the control of public works, but under the title of the Paris Plan Service, employs 9 geometers, draughtsmen and chainmen.
815 Overseers and checkers.	220 Works inspectors. 30 Checkers.
7 Head gardeners.	This service comes under Parks and Ferries.
10 Chief clerks.	4 Chief clerks.
155 Clerks.	38 Clerks.
10,000 Men approximately.	12,000 approximate.
Workmen and foremen (both permanent and temporary).	

The above figures speak for themselves, and show that the administration of the public works of Montreal, compared to that of Paris, one of the model

cities, is beyond all criticism from the point of view of economy, because on a considerably greater superficial area, and with an annual budget of expense nearly equal, it gives employment to about 350 technical officers, as against 1,100 such employees in Paris.

NOTES MADE ON THE OPERATIONS OF THE VARIOUS SERVICES OF THE MANAGEMENT.

I.—SERVICE OF PUBLIC HIGHWAY (under the higher orders of a chief engineer under the direction of public works).

1ST. PAVEMENTS.		PARIS.	MONTREAL.
8,500,000 yds.	Permanent sidewalks	2,000,000 yds.	
10,000,000 yds.	" pavements	2,600,000 yds.	

This area is split up into the various kinds of pavements in the manner shown in the annexed schedule, which is an exact copy of that of the official report of the civic administration of Paris.

1	twentieth Asphalt.
3	" Macadam (water and tar bound).
5	" Wood
11	" Stone or artificial blocks.

In Paris, as in Montreal, the proprietors pay for the first pavement laid, and the city keeps it in order. The same applies to the sidewalks.

Stone Pavements.—As shown by the above statistics, pavements of stone and artificial blocks still predominate (the latter furnishing the smaller proportion). These are considered by authorities on public works as most suitable for heavy, dense traffic, as well as being the cheapest in the end, in view of the wearing qualities (40 years), and of the re-utilisation of their materials in making repairs. Moreover, the administration of Paris states that the reason for the very extensive use of the stone pavements in that city is because Paris itself owns and works profitably, at only a short distance (about 20 miles), one of the finest quarries of paving material in the country. This material is extracted from extensive beds of silicious sandstone, slightly resembling the products called "sandstone," of which we have used a certain quantity in Montreal during the last few years. Its principal feature is that it is less slippery and less noisy than the granite pavements which are also used in Paris, though in smaller quantities.

Artificial Block Pavements.—Artificial block pavements occupy only a small area in Paris. This, it would appear, is on account of its high cost; but tests are being made in the use of a new product which was briefly explained to me, and which, according to its promoters, would fulfil the conditions of durability, economy, and the least amount of noise, which would make it, if desirable, a suitable substitute for stone or scoria block pavements. I shall keep myself informed of the further progress of these tests.

Asphalt Pavements.—The excessive noise from stone pavements has induced the administration to look for less noisy substitutes for paving level residential streets. For this purpose the use of smooth asphalt was favoured at first; but, as shown by the foregoing statistics, its use is not progressing to any extent. The principal reasons given are its slippery surface and the high cost of laying and repairing. For my part, while respecting the opinions of the Paris administration, I still believe that this pavement suits Montreal well for level streets which have no tramways. Moreover, its cost here is in no wise prohibitive, seeing that we do not use rock asphalt, as in Paris.

Wooden Pavements.—The most frequently used substitute for stone, so far, is the wooden pavement. Trials of this pavement had already been begun over twenty years ago, when I belonged to the Paris administration; but these trials had been far from giving results which were expected from them, particularly in respect to the rapid deterioration of these pavements. On a small scale, Montreal formerly

underwent the same experience. After repeated researches, a remedy seems to have been found for this serious drawback. Until quite recently the various selections of woods, and treatments of these woods, had raised the hope of obtaining a practically incorruptible, and at the same time sufficiently resistant, material to be effectively and economically used. The installation and recent improvement in Javel's manufactory, and the new treatment applied there appear to have brought about the solution of the problem. I visited this factory and received valuable information from the manager. The details of the apparatus and of the method of treating would be too lengthy for this memorandum, but I have taken the necessary notes, and this information will be completed on request, and at a suitable time and place I will give you my opinion as to what opportunity there might be for imitating the city of Paris in this direction. I may now inform you, nevertheless, that the principle of this treatment consists in mechanical freeing of the wood of nearly all the materials it contains which are readily liable to decay, and replacing them by heavy mineral oils at a slight cost, and thus to render the wood durable and resistant at the lowest cost. Pavements in this way now cost the city of Paris from \$1.90 (7s. 11d.) to \$2.30 (9s. 7d.) per yard. I shall receive shortly a document giving the analysis of this cost price, by means of which I hope to be able to calculate with sufficient exactitude the cost of a similar plant in Montreal. The kinds of wood which the Paris authorities prefer are those of the maritime pine of the Landes and the Norway pine, which much resemble the "long-leaf yellow pine," the tamarack, and the hemlock of the American countries. The duration of the wooden pavement is given by the Paris authorities at about ten years. This pavement is generally condemned for tramway strips and sideways.

Macadam.—There are at the present time about 1,300,000 sq. yds. of macadam on the streets and avenues of Paris. This macadam has been put down and is kept in repair by the city. All the stone thus used is of a very hard kind, partly of volcanic origin, porphyry or granite, little or none being calcareous, which, although considered suitable for constructing good roadways for traffic, is too apt to be broken up by frost.

Tar-macadam.—Since the year 1904 the direction of works has begun to follow various methods, among which I have noted the superficial tarring of macadam. In 1912 this method covered a surface of about 600,000 sq. yds. Its success, as far as the suppression of dust and mud is concerned, is recognised, but it appears that it does not last over one year.

Asphaltic Macadam.—On account of the short duration of these coating processes, the administration has been induced to begin the use of so-called penetrative processes, and especially those of coating with bituminous or asphaltic concrete, which are nearly all patent processes. The most extensive test which has so far been made is that of the "Bitulithic" system, which was used on about 15,000 sq. yds., principally on one of the most beautiful avenues of Paris—viz., the Avenue de l'Alma, where I noted its fine appearance. This composition, if not exactly identical, appears to me to be similar to what is submitted to us in Montreal under the name of "Bitulithic," but I am awaiting fuller information before deciding this point. Other compositions of asphaltic or bituminous concrete are also in the trial stage—such as Tarvia, Pix Road, Gutrin, &c. The authorities consider it advisable before venturing further to await the results of practical tests after those in the laboratories have been completed. It will probably be interesting to note that the opinion of the municipal authorities of Paris confirms my own in this respect—viz., that until further experience with these compositions, it is preferable to have such paving experiments conducted under guarantee by the contractor, rather than for the city to start a testing school to test, at its own risk, processes which are still in the experimental state. In the connection I should like to draw your attention to the importance of the work done by the Paris municipal laboratories in experimenting with and analysing the materials to be used in public works. The latest budget published shows an expenditure of almost £4,000 for the maintenance of these laboratories. I shall later submit to you a scheme for the organisation of a similar branch based on our new and increasing requirements in this respect.

II.—TREE PLANTING.

The systematic planting of trees in the highways of Paris is directed and carried out under the depart-

ment of public works. I will not enter into the details of this system, which appears to give the very best results. In Montreal this service is under the department of parks and ferries, and is not under my control.

III.—CLEANSING, SPRINKLING AND SNOW REMOVAL BY WAY OF CARTS OR SEWERS.

This service has an admirable organisation in Paris, and I have the necessary documents for a thorough study of those features which might with advantage be adopted in Montreal. The rolling stock—consisting of sweepers, sprinklers, dump carts, &c.—is still, to a large extent, horse-drawn; but these vehicles, as in the case of Montreal, are being replaced by automobiles.

At the time the latest report was published there were in active service about 500 horse-drawn machines and 30 automobiles, of which several were of the Durey-Sohy type, the same as that selected by you recently to be tested in Montreal. Apart from these, thirteen other automobile machines have been ordered from four different manufacturers for a competitive test before placing an order for forty machines.

During my stay in Paris I was greatly interested by my visit to one of the factories of the firm of Durey-Sohy, from whom we have ordered three sprinkler-sweepers, and was assured by them that our machines would be delivered to us without delay. M. Durey, jun., will be in Montreal personally at the time of their delivery in order to satisfy himself that they are in perfect working order, and also to furnish a complete stock of duplicate parts to effect any possible repairs. At this factory I examined various machines for municipal requirements, such as wagon for manure removal, portable boilers for asphalt and bitumen, &c., which, in case of need, might prove useful in Montreal.

IV.—REMOVAL AND DISPOSAL OF HOUSEHOLD REFUSE.

This important service, which in Montreal is not under the control of the department of public works, comes under that department in Paris. It is being completely reorganised on the principle of absolute municipalisation. I have in my possession a document setting forth, at the disposal of the Board of Commissioners, any information they may desire on this subject.

V.—PUBLIC AND PRIVATE LIGHTING.

In Paris this service is under the management of the department of public works; in Montreal it is an adjunct of the department which I administer. I have therefore not considered it necessary to go minutely into the subject of its operation in view of the small amount of time at my disposal.

VI.—RAILWAYS.

In Paris the metropolitan and cable (funicular) railways are city property, and their construction and operations are under the direct control of the department of public works. The other railways are under the control of the municipality, which exercises such control through the agency of the said management.

I have brought back with me documents which will give you full information about the system, and likewise about those of cities in other countries I visited, where the street railway and autobus systems are owned by the city. I intend to carefully work out this important question, and if you desire, will at a later date lay before you a special memorandum on this subject.

VII.—SERVICE OF WATER, SEWERS AND DRAINAGE (SANITATION)

(under the higher order of the chief engineer, who is under the control of the department of public works).

Water.—The drinking-water supply of Paris is furnished by aqueducts 321 miles in length, and is drawn from the waters of four different rivers, which are afterwards distributed by gravitation unfiltered. These aqueducts furnish nine-tenths of the water consumed, the other one-tenth being pumped out from the river and then distributed, after having been filtered by the works at Ivry and St. Maurice, which I visited on my last trip. The average consumption in Paris per capita is 198 gallons. In Paris the water used is measured by meters. The average number of bacteria per cubic centimetre as found by analysis of the rivers which have been diverted is 830. In Montreal the average found by analysis of the water of our conduits, which have been extended into the St. Lawrence, was, last year, 650 bacteria, before the sterilisation by hypochloride of lime. The water-pipe system of Paris has about 8,000,000 ft. of pipes, that of Montreal about 1,315,000 ft. On the total length of the water pipes of Paris, about 7,000,000 have been placed in the sewers

or special underground passages, and only 1,000,000 in the ground. The first system is that which I have long recommended for Montreal, for economical and practical reasons, and which the Board of Commissioners has begun to adopt as it has been possible to do so.

Sewers.—The total length of the Paris sewers is about 1,300,000 yds., that of Montreal being about 602,178 yds. The style of sewers is much larger than that used in Montreal, to enable water conduits and other services to be placed within them. Nearly all the sewers are made of concrete mixed on the spot.

Sanitation.—Purification fields and works for treating sewage from the sewers. The City of Paris empties little or no sewer water into the Seine. Purification by means of sewage farms and cultivation, which was begun on a small scale over thirty years ago, is now of great extent, and occupies an area of 12,644 acres. The difficulty in procuring the additional ground which would be necessary in order to treat the ever-increasing volume of sewer water, has induced the administration to establish separating basins and percolating beds capable of purifying on small surfaces the excess sewer water which the sewage farms can no longer receive. I visited the most recent installation—viz., that of Carrières-Friel, which is situated 12 miles from the city—and found the system to be so practical and so much superior to anything I had heard of before or recently seen elsewhere that I shall not hesitate to recommend, with the changes necessary for the Montreal climate, the application of this system to the plant which we are now constructing for the treatment of the water at the collector in Notre-Dame-de-Graces. I have all the latest documents dealing with the treatment of sewer water in Paris, which I shall place at the disposal of Mr. R. S. Lea, in order that we may make profitable use of them when we are dealing with the question which Mr. Lea has been instructed to investigate, with my assistance.

OBSERVATIONS AND STUDIES IN THE OTHER CITIES OF FRANCE AND IN OTHER FOREIGN COUNTRIES.

The limited time at my disposal for attending to personal matters and for collecting professional information has, I very much regret to say, only enabled me to gather certain information in a hasty manner in cities other than Paris on matters which might be of interest to the departments under my direction. I shall therefore give the following brief notes which I consider to be especially noteworthy.

FRANCE.

Tar and Asphaltic Macadam.—At Versailles I examined the great Paris highway, where traffic of all kinds is enormous, especially that of automobiles. This road was partially paved in 1912 with a composition of crushed stone and liquid Trinidad asphalt, and seems to be now in good condition. At Melun and Fontainebleau, on the national highway between these two cities, where both heavy and automobile traffic are considerable, a test of tar-macadam was made in 1908; but, from what I have seen of this route, it is now, after five years, completely broken, and its appearance does not argue favourably for the system used, which, according to information I have received, is, nevertheless, one of the systems generally recommended for penetrative tar-macadam.

Stone Pavements.—At Poitiers and Angoulême, which I visited for purely personal reasons, stone paving is most in use, and there is little or no macadam, either with or without the application of bituminous products. The use of stone pavements appears to be completely justified by the situation of these two cities on hills, which are only accessible on nearly all sides by steep gradients. At Rochefort-sur-Mer, which is built on perfectly flat ground, there is about as much macadam and asphalt as stone pavement. This macadam is made of pebbles without tar. At Rheims, Charleville and Givet, whose streets are fairly level, the amount of paving appears to be about equally divided between stone and macadam. I did not notice whether there was any tar-macadam in these cities, but some highways which meet at Rheims and Charleville have been coated with tarry or bituminous preparations which appear to be in good order, and which, moreover, are perfectly dustless, in spite of the heavy traffic.

Purification Field (Sewage Farm).—In the outskirts of Rheims there is a field for purifying the sewer water. This has been much improved since I visited it at the time of its installation, over twenty years ago. I noted certain features of this system which might with advantage be made use of in Montreal.

BELGIUM.

Pavements.—In Belgium—where I made a short stay some of the important cities, especially Charleroi and Namur—I noticed, as far as pavements are concerned (and this was substantiated by what I was told by those authorities whom I met), that the coating of streets and roads with asphalt, tar-macadam, or asphaltic compositions, was hardly ever resorted to, if at all.

Scoria Concrete Pavement.—The ordinary macadam itself, considered as being too dusty, is being gradually replaced by concrete composed of lime, cement and pulverised scoria (slag). The last, being a by-product of foundries, is so common in the country that it is also almost exclusively used for paved roads.

Scoria Block Pavement.—Many of the streets in the cities which I visited are paved with artificial blocks, similar to those used by us in Montreal, but which cost much less there.

ENGLAND.

Wooden Pavement.—In England I made short visits to London, Liverpool and Bristol. As regards the paving of streets or roads, I found that wood, asphalt and stone are almost exclusively used. I was told that the cost of wooden pavements, including foundations, is from \$2.50 (10s. 5d.) to \$3.30 (13s. 9d.) per square yard.

Tar-macadam.—Numerous tests of special tar, or asphaltic macadam, are being made, but I could not obtain much information in this connection. The few experts which I had time to consult informed me that the ordinary water-bound macadam is still being used at the present time for the paving of most of the rural roads and streets of small towns.

Bituminous Macadam.—At Liverpool trials of tar or asphalt macadam are being made, but with a layer of not less, in every case, than 3 in. thick on concrete foundation.

Aqueduct.—The water supply of Liverpool is now secured by such an extensive and remarkable civil engineering work that I took the time and trouble to make inquiries, as far as possible, in connection therewith, and I even travelled, partly by rail and partly by automobile, over the distance of about 65 miles as far as the dam and the large artificial basin which supplies the municipal aqueduct with 70,000,000 gallons of water per twenty-four hours, the population being about 750,000. The dam, which bars the valley of Vrnwy, is 1,172 ft. long, 84 ft. high, and 127 ft. thick at the base, with foundations 60 ft. deep; the masonry weighs over 500,000 tons. This dam forms an artificial lake, having an area of about 1,200 acres. The area of the water basin is about 23,000 acres. The aqueduct is 70 miles long, being tunnelled over a distance of 24 miles under the mountains. The cost of these works, which were begun in 1881, exceeds \$20,000,000 (£4,000,000). Liverpool had not, like Montreal, the powerful and limpid St. Lawrence within its reach; it only has the sea and polluted and muddy rivers. Is not the enormous expenditure incurred for bringing from the mountains the water (which will likely have to be filtered later on) a glaring justification for the preference which you have given to our scheme of establishing the intake at some distance from the shore of the St. Lawrence?

Stone Pavement. At Bristol, as regards the pavements, I have ascertained that several streets without any slope were paved with wood, but the city being partially built on hills the stone pavement prevails.

I am proud to be able to say that, generally speaking, the remarks which I above submit to you, and which are almost all corroborated by the documents in my possession, tend to justify the professional policy which I have followed in the recommendations which I have had the honour to make to you concerning roadworks, as well as waterworks or sewers.

Water Supply Statistics.—The Local Government Board report that the preparation of the return ordered by the House of Commons in 1910 as regards each water undertaking and the water supply of every district in England and Wales was considerably advanced during the year. The forms which were sent out for the purpose of obtaining the information required for making the return are necessarily somewhat complicated, and much difficulty has been experienced in getting them correctly filled up. On March 31, 1913, some 3,000 forms had been received from local authorities, companies and private proprietors, and very few were outstanding. In many cases, however, more especially in rural areas, full information is unavailable.

Institution of Water Engineers.

WINTER GENERAL MEETING IN LONDON.—(3.)

At the recent winter meeting of the Institution of Water Engineers in London the following paper was submitted for discussion:—

THE PORTLAND URBAN DISTRICT COUNCIL WATERWORKS.

DESCRIPTION OF FRIAR WADDON BOREHOLE SCHEME AND PUMPING STATION.

By R. STEVENSON HENSHAW,
Surveyor and Water Engineer.

Mr. Henshaw commenced his paper by enumerating briefly previous attempts made by the Portland Council to obtain a sufficient supply of water for the inhabitants of Portland, including the Naval Station of the Admiralty. The author was appointed engineer to the council at the end of 1902, and after careful investigation of the conditions reported in August, 1903, to the following effect—viz.: (1) That in a dry season the council would not be in a position to supply the Admiralty with any water at all, but, in order to supply their own consumers, would have to work the temporary machinery in a well near the churchyard day and night; and (2) that in the autumn of a dry season the council could not expect to obtain more than 160,000 gallons a day from the new well in the chalk. As, however, the suction pipes had been fixed some 7 ft. or 8 ft. from the bottom of the well and above the headings, the author recommended the lowering of the pumps to within 4 ft. of the bottom, by which means he estimated that a total of 175,000 gallons per day might be obtained. He further estimated that the consumption in twelve months' time would be 323,500 gallons per day, and that a new scheme was therefore imperatively necessary.

This report naturally created considerable surprise, but no definite steps were taken until the following year, when it was found that, although the pumps had been lowered to the lowest possible level in the new well, the average yield for the six days ending December 7, 1904, was only 154,076 gallons per day.

The author suggested the sinking of a small borehole in what is known as the Portisham Valley, and as some members of the committee were in favour of deepening the new well and increasing the length of the adits or driving fresh ones, Mr. C. E. Hawkins, who had previously studied the geology of the district, was engaged to report upon the matter. Early in 1905 he reported that he did not recommend the council either to execute any further work at the new well or to sink another shaft in the chalk in the immediate neighbourhood, but advised the sinking of a trial borehole on a site to the east of that selected by the author, where he thought that water from the Portland stone would be obtained at a depth of 150 ft., and would rise to within 70 ft. of the surface. This report did not, however, meet with the unanimous approval of the committee, and they decided to take further advice.

In the meantime the author took the levels and temperature of the water in the various springs and wells for several miles round, and prepared a chart showing the rise and fall of the "Wishing Well" spring, and its relation to the rainfall. This spring rises in the centre of the village, and flows at a rate varying from 17,000,000 gallons to just under 2,000,000 gallons per twenty-four hours; the water has a fairly uniform temperature of about 51 degrees, and appears to represent the drainage from an area of about 12 square miles, the greater part of which is in the chalk area, the area of the Purbeck and Portland beds in the immediate neighbourhood being comparatively small and quite insufficient to account for the large volume of water which this spring yields; moreover, the analyst, when reporting on a sample of the water, termed it "a chalk water."

The nearest chalk outcrop is about $\frac{1}{2}$ mile north of the spring, the southern boundary being formed by the Ridgway fault, so that this water is bound to cross the intermediate valley or trough formed of the Purbeck and Portland beds before reaching the spring. The problem was, however, to ascertain where it did cross.

The author formed the opinion that a borehole or

well in the centre of this valley would tap the chalk water flowing over the edge of the Kimmeridge clay at the point where, owing to the dip of the strata south of the fault, the top of the clay was below the line of saturation in the chalk. . . .

Finally, he was instructed to prepare the necessary plans and specification in order to apply to the Local Government Board for a loan of £250, covering the cost of a 6-in. trial borehole, 175 ft. deep, on the site previously recommended by him. . . . The loan was sanctioned subject to repayment within a period of five years.

Boring operations were commenced in November, 1909, and on January 17, 1910, at a depth of 280 ft., the boring, which was 10-in. diameter, had passed through 16 ft. of hard blue shale, which was thought to be Kimmeridge clay. The boring was then enlarged for a depth of 75 ft. to 11 in. in diameter for the purpose of inserting 10-in. lining tubes, the author having previously arranged to continue the hole 10 in. in diameter instead of reducing to 6 in. at a depth of 175 ft., as had been proposed. While this work was in progress it was ascertained that what had been considered to be Kimmeridge clay was, in fact, the Portland clay overlying the Portland sand, which proved to be about three times the usual thickness. The identification was due to the discovery of the fossil *Modiola autissiodorensis*, which is characteristic of the Portland clay, but not of the Kimmeridge clay. The boring was continued, 3 in. in diameter, for a further depth of 75 ft. 3 in., well into the Portland sand, the thickness of the Portland clay proving to be 31 ft. At a depth of 355 ft. 3 in., the presence of a considerable number of clay pockets seemed to indicate the proximity of the Kimmeridge clay, and it was therefore decided to cease boring.

The results of the boring as regards water supply were as follows:—

When the boring had reached a depth of about 89 ft. the water rose until it overflowed at the surface at a rate of 1,450 gallons per twenty-four hours, reaching a maximum of 17,140 gallons at a depth of 219 ft., but after the Portland clay had been pierced the water level suddenly dropped 90 ft., gradually, however, rising again and overflowing the top at the rate of 2,400 gallons per twenty-four hours. The cost of the boring, lined with steel tubes to a depth of 68 ft., was £319.

With the object of ultimately substituting two boreholes for a well, the author recommended the committee to test the yield by means of an air-lift plant. This was done, and one installation being unable to properly test the yield, the plant was duplicated and a test made in May, 1910, proved a yield of 351,000 gallons per day, the water level being lowered to a depth of 134 ft. 6 in. from the surface, and on the last day of the test, by driving at an increased speed, it was found possible to obtain 400,000 gallons per day. The cost of this test was £207.

Although the author was satisfied with the result, the committee were advised that, as the "Wishing Well" spring was then flowing at the rate of 5,364,900 gallons per day, whereas in the November of a dry year it had been as low as 1,970,200 gallons, they might expect to obtain under similar circumstances a yield of only 147,000 gallons per day from the boring.

The temperature of the water taken at every 50 ft. in depth on August 26, 1910, and compared with the temperature of the water that had previously overflowed the borehole, seemed to indicate that the water was flowing into the boring at a depth of about 150 ft. from the surface. The author, however, insisted that the water came in at the 310 ft. level, and, still contending that the yield was satisfactory, suggested to the committee that if they were not satisfied they could again test the yield in November, which they eventually decided to do.

This test was commenced on November 30, 1910, and was continued for fourteen days. The result proved an average yield of 380,570 gallons per day for the fourteen days, but on the last day, when the engines were driven at full speed, it was found possible to obtain 452,000 gallons, with the water level

reduced to 145 ft. 9 in. from the surface. The cost of this test was £303 10s.

The author, in order to prove once for all whether the water entered the borehole at a depth of 150 ft., or (as he contended) at a depth of 310 ft., advised the committee to plug the hole at 280 ft., in the centre of the Portland clay, and test again for a few hours.

Owing to the static head of the water from above the Portland clay being superior to that of the water under the clay, the plug was forced down to a depth of 311 ft. below the surface, incidentally proving the author's contention, but the boring being effectually plugged at a depth of 280 ft., a further test with the air-lift plant proved that the supply available from above the Portland clay was only 195,740 gallons per day at a depth of 185 ft. below the surface, and therefore that the larger supply came from below the Portland clay and not from above it.

The committee were, however, still advised that the test was not satisfactory, owing to the fact that the flow of the "Wishing Well" spring had increased from 4,500,000 gallons on the first day of the test to 11,000,000 gallons on the last day, and that the only way to obtain a sufficient quantity of water on that site was to sink a well about 150 ft. in depth with adits driven in easterly and southerly directions; but, nevertheless, it was decided to adopt

A BOREHOLE SCHEME,

the author's estimate for which amounted to £15,600, compared to the estimated cost of a well scheme, with an adit of the length mentioned, amounting to £32,500.

In the first instance it was decided to deal with the borehole only, so that the question of a borehole scheme *versus* a well scheme could be fought out at the earliest opportunity.

The local inquiry of the Local Government Board was held on March 9, 1911, on the council's application for sanction to a loan of £1,450 for sinking a borehole 30 in. in diameter for a depth of 100 ft., 24 in. down to 312 ft., and 12 in. to 355 ft., and for enlarging the trial boring from a depth of 280 ft. to the bottom.

In view of the opposition to the borehole scheme, the committee consulted Mr. Percy Griffith, M.INST.C.E., F.G.S., on the matter, and were advised by him to proceed with the boring. In the course of his evidence at the inquiry, he stated his opinion that 800,000 gallons would be obtained with the water level reduced to 185 ft. below the surface, and it is interesting to note that in the result it has been proved that 744,000 gallons per twenty-four hours are obtained when the water level is depressed to 152 ft. below the surface.

The consent of the Local Government Board having been obtained, the boring was commenced in August, 1911, but, owing to the varying bands of rock, clay and shale found in the Purbeck beds, the first 100 ft. of 30 in. diameter boring was not completed until November 17th. Cast-iron flush-jointed tubes, 24 in. in diameter, 1 in. thick, were then lowered and bedded into 3 ft. of neat cement. The tubes were kept slung until the cement had set, when the annular space between the tubes and the boring was run in with cement grout. The boring was then continued through the tubes 24 in. diameter to a depth of 208 ft., which depth was not reached until April 4, 1912.

As the council had to be in a position to supply the Admiralty with a maximum quantity of 300,000 gallons per day, and 2,000,000 gallons per week by September 29, 1912, the author decided to reduce the diameter of the hole from 24 in. to 16 in. in order to expedite the work, and a depth of 355 ft. 3 in. was reached on May 31, 1912.

In the meantime the 10 in. trial boring had been enlarged and sunk a further 5 ft. to a total depth of 360 ft., and the cement plug removed.

Unfortunately an injunction had been obtained by the owners of a house adjacent to the old well in Upwey Village to restrain the council from pumping at this well after March 25, 1912. As it was presumed that the council had no other alternative, the petitioners offered to waive their claim for a period of three years on payment of £100 a year as rent for the house, £150 as costs and legal expenses, £30 as out-of-pocket expenses, and on the council undertaking to supply a farm and the fields adjoining with water in perpetuity, and to lay the necessary pipes free of charge, involving a total cost of, roughly, £500.

The author, however, advised that, the rainfall in the previous six months having been in excess of

anything previously recorded, he considered it would be possible to keep up the supply from the new well until the middle of June, and in the meantime the machinery at the lower (village) well should be removed to the trial boring and there be used in connection with an air-lift plant until the permanent pumps were fixed in the 24-in. new borehole.

The whole of this temporary machinery and plant was completed and ready for testing on June 10th, at which date the yield of the new well had fallen below the consumption and the storage in the reservoir had consequently got rather low.

On starting the plant it was unfortunately found that the water could not be lifted at a greater rate than 65,000 gallons per day. The position of affairs was then serious, and the supply of water to the island was only maintained by making the most of the air-lift plant in the trial boring, and going forward with all speed the fixing in the new boring of the large test pump, which was fortunately on the site. A large boiler had been previously placed in position, so that within a period of ten days the new pump (a direct-acting steam-driven vertical pump with a 15½ in. working barrel and 3 ft. stroke) was started to work, and utilising the fourteen days test pumping, together with an additional week, saved the situation.

In order to increase the yield of the trial boring the author decided to fire a cartridge containing a charge of 19 lb. of blasting gelatine in the 10-in. hole at a level of 311 ft. or 312 ft. from the surface.

It was decided to raise the 6-in. tubes some 30 ft. or 40 ft., so as to bring them above the scene of the explosion, and this being done the charge was lowered and fired. The result was somewhat unexpected and peculiar; although there was no sound or concussion, and no water was driven above the top of the hole, the tubes themselves (some 280 ft. in length and weighing about 3 tons) were gradually lifted out of the hole, carrying everything before them, including the 9-in. delivery pipe from the large steam pump, to a height of about 25 ft. above the surface, and, in falling back, straightened out a 3-ton hook at the top of the shear legs, smashed two pairs of large clips supporting the tubes on the top of the boring, and careered to the bottom of the hole, thus leaving the upper end about 75 ft. below the surface.

The tubes were duly brought to the surface full of water, the reason being that the two bottom lengths had been telescoped for a length of 4 ft. and completely jammed with silt from the bottom of the boring. The tubes having been again lowered, another start was made with the air-lift plant, this time with complete success, 12,500 gallons per hour having been pumped from this boring, very often night and day, for a period of over fourteen months. The 24-in. borehole, although only about 6 ft. away, had not been damaged to the slightest extent by the explosion, the only effect being that the water in it was discoloured for a few hours afterwards.

The test pumping from the 24-in. borehole, with the suction strainer 198 ft. from the surface, showed a yield of 600,000 gallons per twenty-four hours with a good pressure of steam in the boiler, the average working out at 555,000 gallons per day. The cost was £430. On testing both holes together for a short period the delivery was increased to 900,000 gallons per day without lowering the water in the 10-in. hole beyond 152 ft. 6 in. from the surface.

The author has since proved that the copper-wire gauze placed over the suction strainer of the pump—to protect the working barrel from the steel shot left in the borehole—had checked the inflow to an appreciable extent, and he has arranged for the permanent plant to have a capacity of 650,000 gallons per twenty-four hours with the suction pipe extended 7 ft. lower.

A loan to cover the cost of the 10-in. rising main for a distance of 3,300 ft. was sanctioned in October, 1911, and the work carried out concurrently with the sinking of the 24-in. borehole; this main was therefore ready for use by the time the temporary plant was completed.

On April 12, 1912, a Local Government Board inquiry was held on the council's application for a loan of £11,250 for the permanent work, and the loan was sanctioned on September 20, 1912, subject to the test proving a yield of 600,000 gallons from the 24-in. borehole.

The pumping station and cottage are completed, and the fixing of the machinery, which has been supplied by Messrs. J. Simpson & Co., London, is approaching completion. The plant for the 24-in. borehole has

been fixed, and a preliminary test made on September 6th gave a favourable result, the water, after 2½ hours' pumping, being lowered to only 172 ft. below the surface and rising 62 ft. in five minutes on stopping the plant in the 24-in. boring. The water delivered was greatly in excess of the specified quantity, being at the rate of 708,000 gallons per twenty-four hours, although at the same time the water was being raised from the 10-in. trial boring by the air-lift plant at a rate varying from 300,000 to about 220,000 gallons per day.

A second test of sixty-six hours' duration was made with the 24-in. plant running alone, and the lowest point then reached was 153 ft. from the engine-room floor (which is 15 in. above the former ground level) with the low-lift pump raising 31,000 gallons per hour.

The approximate cost of the whole scheme since the 10-in. borehole was tested on the second occasion is as follows:—

	£	s.	d.
24-in. borehole to 355 ft. 3 in. in depth, including test pumping for fourteen days, and enlarging the 8-in. borehole	1,160	0	0
Machinery, including oil engine	5,940	0	0
Venturi meter and water-level recorder ...	268	0	0
Pumping station, cottage, roads, drains, irrigation area, &c.	2,900	0	0
10-in. rising main and cable	1,050	0	0
Fencing	183	0	0
Land and expenses in connection therewith	3,669	0	0
Legal expenses, printing, &c.	85	0	0
Consulting engineer	250	0	0
Clerk of Works	160	0	0
Sundries	120	0	0
Total	£15,785	0	0

The author's original estimate was £15,600.

DISCUSSION OF MR. HENSHAW'S PAPER.

Mr. H. PRESTON (Grantham) said the paper was of importance to those interested in geology. Unfortunately he was not well acquainted with the district dealt with, and therefore he craved indulgence if he made any little mistakes in the remarks he would make. The author had referred to a well sunk 206 ft., and said that there was a lot of decomposed sewage in it, but he did not tell them where it came from, and it was certainly curious to find it in a well of that depth. Then he told them that a well was condemned because it was near a churchyard, but on the opposite side of the valley. Was the pervious strata between the well and the churchyard continuous? Because very often a stream would come down the valley and cut any drainage from the churchyard. With regard to that extraordinary spring, the "Wishing Well," seeing that it fluctuated between 17,000,000 and 2,000,000 gallons in the twenty-four hours, he would like to know where the water came from. Did it come from above the Portland shale or below, from the sands? His idea was that it would be coming from the sands, and his further references would be based on that assumption. He thought the author was correct in the statement that a borehole or well in the centre of the valley would tap the chalk water flowing over the edge of the Kimmeridge clay at the point where, owing to the dip of the strata south of the fault, the top of the clay was below the line of saturation in the chalk. He thought that the subsequent remarks and the tests made showed that the supply really came from that. Still, the author pointed out that the committee were not satisfied, and advised the driving of an adit 2,000 ft. in length. It seemed strange advice that an adit should be driven southward through the fault, because he thought they would have cut through the fault in the valley. They generally expected the water to be on the top side of a fault, but in this case they had the interesting example of a fault bringing a large quantity of water on the lower side. Then followed that extraordinary result where, after the blue shale had been penetrated, there was a drop in the level of the water of 90 ft. He had been trying to think out the reason of this, and it appeared to him to be as follows: First, the water in the Portland stone was possibly fed by the chalk water—that was on the top of the fault—and it was under full pressure, due to the water in the chalk, and hence the overflow got up to something like 17,000 gallons per day. The "Wishing Well" he assumed to be fed by the chalk water also, but it passed through the

sand, and the outlet at the "Wishing Well" was more free than the water which passed through the sand in consequence of the friction. Consequently that would cause a partial vacuum underneath that impervious shale. This stream passing through the Portland clay would let the higher water down into a partial vacuum, and would cause the water to fall until it had balanced the pressure, and the result established itself as a flow of a little over 2,000 gallons a day. If this was correct, incidentally the boring had helped the supply to the "Wishing Well," and would increase its degree of fluctuation, because the water held up above the Portland stone was let down to the sands below, and would get to the "Wishing Well" more quickly than it did before. Finally, he would like to know if the depth of the chalk had been proved north of the fault. Would it not be the fact that if the boring had been continued at the higher well a more certain reservoir of water would have been reached which was held up by the fault below on the edge of the Kimmeridge clay?

Dr. H. LAPWORTH (Westminster) said that the point of the change of water level during the process of boring was a fairly common occurrence, and unfortunately sometimes they lost the water altogether in passing through some impervious body. In Gloucestershire there was a curious experience in an exceptionally dry year, when many of the wells were deepened, with the result that in boring into the red sandstone they lost the water altogether, and never had been able to recover it. He thought that Mr. Preston's explanation was probably a correct one. It was difficult to understand why the water rose again to such a height, and it seemed to him it must have resulted in a large increase, or some increase, in the "Wishing Well" spring. With regard to the point as to the relation of the flow of the "Wishing Well" spring and the rainfall, as a matter of fact, the diagrams showing flows as comparable with the rainfall or water levels in wells as compared with the rainfalls were rather unsatisfactory, for the reason that they were comparing two things not strictly comparable. For instance, in the summer time very little of the rainfall really did reach the underground reservoirs at all. A much more satisfactory thing to do was to construct a percolating tank in the district and find what the percolation was month by month, and distribute that throughout the year, and plot the percolation against the water levels. In that case they would find a distinct relation between the two, although perhaps they could not express it mathematically. In plotting the water levels in reference to the percolation tanks at Rothhampton, they found there was a distinct relation between the two, and here came the very interesting result that in the chalk there was something like a lag of several minutes between the percolation which took place from the surface and the water in the wells. He would like to ask the author one question in relation to the "Wishing Well" spring as to tests. It was a question which had never been thrashed out by the institution, and it was whether the tests really did test the yield of the well at all. He did not think the tests really did in a great many cases. He was inclined to think that the test of a fortnight, or even a month, was rather a test of the percolation into the well, and not its true yield. They had many cases all over England where there were copious yields at the time of the test, but as years went on, with the same amount being pumped, yet the water level had gone gradually down and down. It seemed to him that it took years to find out what the real yield of a well was, and he doubted very much whether these tests told them more than whether the flow into the well was free or not. Lastly, he saw the author quoted Mr. Percy Griffith about the probable yield with the water level reduced to 185 ft. below the surface. He did not know whether Mr. Griffith meant that the height was proportionate to the water level in the well, because he thought that was generally agreed. Some engineers assumed that it was proportional to the square foot, but he thought it was generally accepted as being proportional to the lowering of the water level. As to the sinking of the trial boreholes, was it not an advantage in some cases to sink a borehole to its final diameter instead of starting it with a small diameter?

Mr. W. MATTHEWS (Westminster) said he agreed with the last speaker as to the effect of percolation. As the result of some twelve months' experiments in South Hampshire, it was found that, except in excep-

tional years, from May to September there was absolutely no percolation at all. The returns came in month after month "zero" with regard to these five months. Therefore, any diagram showing rainfall in that time, with an endeavour to plot it in connection with the rise and fall of the well must clearly be totally misleading. Coming to the boring part of the business, he was greatly interested in the effect which was created by firing a shot in the bottom. It rather showed the danger of doing these things without some little consideration of what was likely to be the result. It was perfectly impossible that a column of water should have been shot up, and it was equally impossible that nothing should have given way. He understood that 19 lb. of gelatine explosive was used. This, on explosion, would increase thirty times in volume, and, as a fact, would have displaced, without a 6-in. pipe, 70 ft. head of water. The explosion might be taken as practically instantaneous, the result being that, to get a column of water flying up without anything else being displaced, would mean putting the column of water at a speed of 250 ft. per second. They must know that the water could not go through the pipe. If the water had started at all—which, he considered, was doubtful—it could only have had the effect of carrying the pipes up with it. He thought that, although the effect of the borehole itself on the column of water was very little, yet the explosion did act as an expanding force on the strata, and created a more or less bellows action, because he assumed that the shot was fired under water, and that the soil round about was in a completely saturated state, and therefore the shot was fired in an incompressible medium, except as to the rock and clay which was there. What probably happened was that an expansion of the soil took place, and was brought back again, and it would be very interesting to know whether there was any measurable interval between the time the shot was fired and when the tubes appeared on the surface. As to the machinery, he considered it was a pity, and an example not to be followed, that the whole of the power for driving the pumps should be taken off in one direction off the engines. The effect of the arrangement they had had described was that 100 per cent of the work was passed through one crank and one shaft from the gas engine. With these internal combustion engines the trouble was at starting, and the strain thrown on the engine was very considerable, and unless the very greatest possible care was taken in the upkeep of the engine, and keeping the brasses of the inner rods very close and true, that was where difficulties were going to arise. In his opinion, it was a much better plan to put the gas engine central, and take the power for their two pumps off the other side. To start with they divided the forces acting upon the crank-shaft of the engine better, and they had two clutches. Another defect in taking power off in only one direction was that it limited the speed of their high-lift pumps. In this particular case the low-lift pumps had to be run at twenty-two strokes per minute. Twenty-two for a deep-well pump of that sort he considered rather too high a speed. Personally, he did not adopt a speed of more than eighteen for well pumps. On the other hand, it limited the high-lift pumps to twenty-two, which he thought was an unnecessarily low speed, and might be carried up to thirty or even more. In the last plant he had been associated with, which had passed through its trials, they had got the low-lift pump to eighteen, and the high-lift pump up to thirty-four and a-half with excellent results, and they could not wish anything to run better or quieter. As regarded the pump slip, it was stated that it was only 1 per cent; but he did not understand that any very detailed trials had yet been made, and he would rather like to know how the figure of 1 per cent had been arrived at, because in his experience, although they might get it off a trial for the first week, they were not likely to maintain it for long, and so to give figures which were not maintainable was rather misleading. If they could be furnished with the figures of any trials made since the paper was written it would be a great advantage. Members might be interested to know that, in the case of some trials which had recently been carried out on a plant of 50,000 gallons capacity per hour, they got these over 1.45 lb. of coke per pump horse power, which was, he believed, one of the best results which had been obtained by suction gas plant. Doubt had been thrown on the desirability of using coke instead of anthracite coal, but his experience was that with a properly designed producer there was no more trouble with coke than with anthracite. One little thing which would, doubtless, interest the author was that of the lubricant. He had recently had some trouble

owing to pre-ignition in gas engines where, apparently, everything was right, and ultimately they traced the cause to the fact that a heavy oil was used which had a tendency to carbonate and stick on the interior of the cylinders, and remain incandescent after the exhaust had taken place and ignited the incoming charge. It was a warning in the case of internal combustion engines not to use unsuitable material.

Mr. A. TOWLER (Leeds) said he was rather at issue with the last speaker's views as to driving the well pumps and the high-lift pumps by a separate gearing, except in one particular—viz., that it enabled them to run the well pumps at a lower speed and the high-lift pumps at a high speed. The well pumps must run slowly to be satisfactory; of course, the speed depended on the size and upon the stroke. He did not think it would matter very much with regard to the starting up of the gas engine, provided they had a very powerful clutch which could be put in gradually so as to allow a considerable amount of slip without jerking action. But it was very difficult to get such a clutch to have quite an even action, and a very good plan was to put in a by-pass on the force pump, which was usually more powerful than the well pump, so that the by-pass valve could be opened and closed at a gradual rate. Where they were driving one kind of gearing, he thought it was a better arrangement and slightly more effective, while in the arrangement suggested by Mr. Matthews, of separate gearings for each pump, it gave the advantage of either set of pumps being run separate from the other, which, in certain cases, was rather a desirable thing.

Mr. MATTHEWS remarked that the efficiency of the plant he had spoken of, where the power was taken off on both sides, came out at 53½ per cent. There was nothing in Mr. Towler's point as regarded the question of mechanical efficiency.

Mr. TOWLER said that two sorts of efficiency had been spoken of. In the paper there was a pump efficiency which was 1 per cent. It was very high, and was very difficult to measure. When they came to mechanical efficiency he supposed Mr. Matthews referred to actual horse power of the gas engine as against indicated power.

Mr. MATTHEWS: Pump horse power at the time as against indicated horse power, and that gave 55 per cent.

Mr. TOWLER: That would be rather a poor result. I could get 70 per cent.

Mr. C. H. ROBERTS (Aberdeen) asked where the Weymouth waterworks were. He remembered seeing the works there, and he thought it was in the neighbourhood of Frier Waddon.

Mr. PERCY GRIFFITH (Westminster) said the question which Dr. Lapworth put him was certainly very interesting—more interesting, perhaps, in its form than in its substance—because he rather implied that he (the speaker) should have, as a matter of course, adopted the more or less standard method of deducing the relationship between the yield and the depth. He had had sufficient experience to avoid any such definite method of procedure in any circumstances whatever. He had found that it was impossible to dogmatise on the probable yield of a boring, and therefore he certainly adopted no hard-and-fast standard method of arriving at the estimation that he made. He really adopted the much more simple plan of plotting a curve formed by a number of readings. He was not quite sure, for the moment, how many readings he had, of a more or less reliable character, of tests made in the trial borehole, but he had sufficient data to enable him, with great care and hesitation, to plot out a curve. The fact was, he had several readings very close together, and he had a prolongation of the curve of considerable length before he arrived at the reading which he wanted. He meant by that that he had a very small proportion of "known" and a very large proportion of "unknown," and, as one often did in dealing with problems of this sort, he had to speculate very largely; but, as a matter of fact, the evidence available was, of course, not limited alone to that particular question of the tests already made, and, without saying that he could dogmatise, a general consideration of the local circumstances and a careful study of the geological conditions enabled him to prognosticate, as he did with some confidence, that successful results would be obtained by the work. He was also interested in the subsequent remarks of Dr. Lapworth with regard to the relationship between tests made under conditions like those referred to in the paper and the ultimate yield from a given source. It was perfectly true that one could not even dogmatise and prophesy here from the data obtained over short

periods, but he thought, with a fairly large and increasing experience of underground water, he would hesitate to adopt the view which, he thought, was suggested—that the yield of underground water generally, if not invariably, fell very much below the results obtained by the earlier tests. It would be quite an erroneous impression for one to assume that that was generally the case. Of course, no experienced engineer would deduce his figures from a short period of test. He would not go so far as to say that the underground water level would invariably fall through continued pumping.

Dr. LAPWORTH: If I said "generally" I did not mean that. I thought I said "often," which is very different from "general."

Mr. GRIFFITH said one did not know of cases where the yield was increased by continued pumping, which, perhaps, adjusted the balance of these cases where it was reduced. The geological problem in the case before them was, of course, of very great interest, and he was sure the author would, with him, acknowledge the value of the remarks made by Mr. Preston upon that point. Perhaps neither the author nor himself were sufficiently expert in that as to say definitely where the water came from and how it travelled, either from the point of the "Wishing Well" or to the boring, but Mr. Preston's careful study of the circumstances was certainly extremely interesting, and, personally, he should be disposed to accept his theories as being very reliable indeed. He would like to make a general remark with regard to pumps driven by gas engines. They were always faced with the difficulty of the high-speed engine and the low-speed pump or machine. It was the difficulty of designing a satisfactory and economical (separating the two things for the moment) method of connecting the two and driving the one from the other. So far he was convinced of the wisdom of being old-fashioned, and he had himself so often successfully used belting instead of clutches that, while he saw his competitors—not only the younger men, but the older men—adopting the more modern patent friction clutch, he himself was not yet convinced that it was a desirable method of coupling a gas engine to a pump. He had seen both at work, and had been much struck with the fact that with a belt one had just that elasticity in the form of slip which enabled the engine to start the pump without undue strain. The friction clutch might do that or it might not. The only disadvantage he could see to it was that it did require more space to take the lengthy belt; but, seeing that the extra space was useful for other purposes, he was not disposed to restrict the size of the house, and so give the room for what he considered the far more preferable method of driving, which was the old-fashioned belt.

Mr. HENSHAW, in reply, said there was a difference of opinion whether the "Wishing Well" water came from the top of the Portland clay or the outcrop of the Kimmeridge clay. He thought it came from the latter, and that there was an overlapping deposit which hid the Kimmeridge clay at that point. It was rather peculiar that the water level in the borehole should be 1 ft. lower than the "Wishing Well" spring, and it was a point he could not very well understand. It showed that the "Wishing Well" spring could not be increased from the boreholes, as it was 1 ft. higher than the water level in the borehole. The depth of the chalk in the higher well had not been tested, so far as he was aware. As to the decomposed sewage getting into the old well sunk on the island, he took it that it got down some of the numerous quarries there and also from the churchyard, and came through the fissures in the Portland clay until it got into the well. As to the water regaining its level again in the borehole after the Portland clay had been pierced, he was rather of opinion that was caused through the choking up of the fissures through the boring operations. Some silt, or something of that description had got into the fissures, so that the water from the higher level did not escape as freely as at first, but subsequently it rose again and overflowed the surface. Before the cartridge was fired in the hole the matter was discussed rather fully, and the advice of Messrs. Curtis & Harvey was taken, and it was their opinion that if the tubes were raised 30 ft. or 40 ft. above the explosive there would be no damage done to them. They were so raised, but he thought it would be better to take the tubes out altogether another time. He had a photographer to take the column of water, but he only took the pipe. He did not think it took many seconds. The pump slip, as a matter of fact, was 1.07, which was

calculated by the Venturi meter. He sent to the makers, and they sent down an expert to test the meter, and he said it was in order. The fuel consumption for gas generators appeared to be 1.50 lb. anthracite, and the cost of raising 1,000 gallons 100 ft. was 1.3d., with anthracite delivered at the works at 3d. 7d. The efficiency was guaranteed to be 70 per cent after six months' running, so that he hoped it would be considerably more than the 50 per cent mentioned. The engines at present had not been indicated, so that he could not give any information as regarded that. The Weymouth Water Company was supplied from Sutton, and the water came from the greensand. It would be 3 or 4 miles from Portland. The friction clutch did start the pumps rather suddenly, as some members thought it might.

(To be concluded.)

LONDON COLLEGE OF MUNICIPAL AND SANITARY ENGINEERING.

There was a large gathering at the inaugural meeting of students of the above college in the new home at 18 Nightingale-lane, Clapham Common, London, on Saturday, the 20th ult., when Sir Krishna G. Gupta, K.C.S.I., presided and delivered an address.

Mr. Nandy Hoskins, the principal, in the course of a statement at the outset of the proceedings, mentioned that the formation of the college was due to the request of a number of Indian students, a commencement being made early in 1910 in Victoria-street, Westminster. It was pointed out that much could be done to better existing insanitary conditions throughout India if facilities were afforded for Indian students to receive a practical training in modern methods of sanitation. During its brief existence the college could claim to have done some good work. Of the past students, twenty-eight were holding appointments under various governments (twenty-four in India), five were holding civil appointments or were in private practice, and seventeen students were completing their training. After taking the complete course and passing their final examination, the students were given a diploma and elected associates of the college, by which means they were kept in touch with the college and with one another. The course extended over two years, the last six months of which period could be spent with a municipal engineer, should the students so wish, arrangements having been made with some engineers to take the students for short or long periods after the course. Students were also encouraged to enter for the examinations of the various sanitary institutions in this country, including the Royal Sanitary Institute, Institute of Sanitary Engineers, and the Institution of Municipal and County Engineers.

In his address Sir Krishna Gupta urged upon the Indian students present the importance of gaining a good practical knowledge of sanitary engineering, to learn all they could in this country, so that when they returned to India they could apply their knowledge to the benefit of their own country.

A vote of thanks, proposed by Mr. W. J. Dibdin, was afterwards afforded to Sir Krishna Gupta.

INSTITUTION OF MUNICIPAL ENGINEERS.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District of the Institution of Municipal Engineers will be held at Manchester on Saturday, January 31st.

PROGRAMME.

- 1.30 p.m.—Business meeting at the Mitre Hotel, Cathedral-close, to elect district chairman and hon. district secretary, and to arrange programme.
- 3 p.m.—Visit to the Stuart-street station of the Manchester Corporation electricity works, by kind permission of Mr. S. L. Pearce, M.I.N.S.T.C.E., M.I.E.E., the chief engineer. Members are requested to assemble at 3 o'clock sharp.

Surveyors' Institution.—The annual dinner of this body will take place on Monday, February 23rd, at the Whitehall Rooms, Hotel Metropole.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC. M. INST. C. E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

The premium for December is awarded to

MR. T. W. PHILLIPS,
Town Hall,
Bexhill-on-Sea,

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

This week answers are invited to the following questions:—

365. Retaining Wall Stability.—Give a proof of the following graphical method of determining the magnitude of the earth pressure behind a wall (Prof. Rehbann's method): In the accompanying sketch BC

represents the back of the wall, and CD the upper surface of the earth. Draw BD, making an angle A with the horizontal, equal to the angle of repose of the earth. On BD describe a semi-circle BGD. From C draw CE, making an angle = 2A with the back of the wall. At E draw EG perpendicular to BD to cut the semi-circle in G. With centre B and radius BG, cut BD in K. Draw KL parallel to CE, cutting the upper surface in L. Make KM = KL, and join LM. The triangle KLM is called the earth pressure triangle. Suppose it to represent a triangular prism of earth 1 ft. thick, as shown at T. Then the resultant pressure P per foot-run behind the wall, including the effect of friction between the earth and wall, is given by the weight of this prism of earth, or P = area KLM in square feet \times 1 ft. \times weight of earth per cubic foot. (H. K., *Ramsbottom*.)

369. Tree Guards.—Give sketches of an economical and slightly tree guard, suitable for good-class residential roads, with details of cost of same. Ordinary iron guards are barred because of "stiff" appearance and high initial cost. (Togun.)

370. Temporary Building Design.—A temporary building is required, 50 ft. long, 30 ft. wide, and 10 ft. to eaves. Design a suitable structure, with steel trusses and stanchions, to be covered with corrugated iron on boards and felt, the bays to be filled in with 4-in. reinforced brickwork. (J. M. N., *Hitchin*.)

371. Testing Stoneware Pipes.—What is the maximum head of water which may safely be applied in the testing of stoneware pipes? Does the diameter of the pipe affect the safe head? If the head be excessive will failure occur first in the pipes themselves or at the joints—ordinary cement or Stanford and cement? Give references to publications, &c., where details of tests are set out. (Togun.)

REPLIES TO QUESTIONS.

368. Water Supply.—What is the maximum amount of water in gallons per hour that can be pumped through a 3-in. cast-iron water main, $\frac{3}{4}$ in. thick, from a reservoir into a tank 190 ft. higher, with the most economical expenditure of power, the distance being 3,750 ft.? (T. G. P., *Barrow-in-Furness*.)

The maximum amount of water that can be

pumped per hour is readily obtained from the following formula, which is due to Hawksley. It is—

$$G = \sqrt{\frac{(3d)^5 h}{L}}$$

wherein

G = discharge of pipe in gallons per minute.

d = diameter of pipe in inches,

h = available head of water in feet,

L = length of pipe in yards.

Squaring both sides of the equation gives—

$$G^2 = \frac{(3d)^5 h}{L}$$

$$\text{Now, } d = 3 \text{ in., hence } (3d)^5 = (9)^5$$

$$L = 3750 \text{ ft.} = 1250 \text{ yds.}$$

$$\text{Hence, } G^2 = \frac{(9)^5 \times 190}{1250}$$

$$= \frac{59049 \times 19}{125}$$

$$= 8975.448$$

$$\therefore G = \sqrt{8975.448}$$

$$= 94.74 \text{ gallons per minute.}$$

\therefore Discharge of pipe = 5,684 gallons per hour.

It should be noted that the velocity of flow in the pipe is obtained from

$$v = \frac{5,684}{6.25 \times 3600 \times (\text{area of 3 in. pipe})} \text{ ft. per sec.}$$

also that the total head H, inclusive of that lost in friction and in pumping is given by

$$H = 190 + \frac{4fL}{d} + \frac{v^2}{2g} + 4 \cdot \frac{v^2}{2g}$$

$$\text{where } f \text{ may be assumed} = .07$$

$$= 190 + \frac{4v^2}{2g} \left(\frac{fL}{d} + 1 \right) \text{ feet.}$$

The weight of water raised per minute

$$= \frac{5,684 \times 10}{60} \text{ lbs.}$$

hence, h.p. required to pump this amount of water

$$= \frac{\frac{5,684 \times 10}{60} \times 190 + \frac{4v^2}{2g} \left(\frac{fL}{d} \times 1 \right)}{33,000}$$

All the values are known in this formula, and hence the horse-power required can easily be deduced.

However, if for d we substitute 4 in. or 6 in., it will be found that considerably less horse-power is required to pump the same quantity of water in the same time, and, hence, if the main has not already been laid, it would be more economical to lay a 4-in., or possibly a 6-in., water pipe. (T. W. P., *Bexhill-on-Sea*.)

NOTES.

The following correction should be made in the answer to question 366, which appeared in our issue of December 19th:—

In the cross-section given in Fig. 2 (p. 945) the top plate of the boom is shown as 12 in. \times $\frac{3}{4}$ in. \times 11 $\frac{1}{2}$ ft. This should be 12 in. \times $\frac{3}{4}$ in. \times 23 ft. Similarly, the next plate, instead of reading 12 in. \times $\frac{3}{4}$ in. \times 15 ft., should read 12 in. \times $\frac{3}{4}$ in. \times 30 ft.

Birmingham's New Building By-laws.—At their meeting on Tuesday next the Birmingham City Council will have before them a report of the Public Works Committee recommending the approval of supplementary by-laws. Provision is made in these by-laws that every person who erects a new building must submit to the city surveyor complete plans and sections of every roof and floor, together with detailed plans and sections illustrative of the construction drawn to scale, and a description in writing of the materials of which it is intended that such roof and floor shall be constructed, and of the manner of support of such roof and floor.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain,
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii., 2.

DEFINITIONS OF ROAD TERMS.

To the Editor of THE SURVEYOR.

SIR,—In your issue of the 12th inst. you state on p. 896 that "the long-awaited decision of the committee as to the meanings of the terms 'asphalt' and 'bitumen' amounts to this: 'Asphalt' is 'limestone naturally impregnated with bitumen.' This is definite enough as far as it goes—but 'bitumen' is not defined." The definition given of "asphalt"—viz., "limestone naturally impregnated with bitumen," is meant, I presume, for rock asphalt, which is, of course, a very different thing to those materials that come under the classification of asphalt.

I gather from your remarks that some new definitions are to be given by "the committee" to the words "asphalt" and "bitumen," and do I understand that it is proposed to dictate, say, to old-established city merchants, many of whom are members of the London Chamber of Commerce, as to what terms they are in future to give to goods they have imported and marketed for a considerable number of years? The suggestion is, of course, absurd, and is not likely to be tolerated for one moment.

I have heard of certain steps being taken to obtain the classification of petroleum pitch as bitumen, and I hope those steps will not eventually lead the interested parties beyond the spot they wish to reach, and if the definition, &c., of "asphalt" as given above is an example to go by, it would be interesting to learn who is responsible for this. It is either ignorance or there must be some motive in giving these new and incorrect definitions to materials like petroleum, pitch and asphalt. In this case the rose with another name is doubtless intended to smell sweeter.—Yours, &c.,

M. SOAL.

107 Bradgate-road,
Catford, S.E.

December 30, 1913.

[In reply to our correspondent, we may say that, in our view, there is a necessity for some agreement

being come to as to the use of the terms "asphalt" and "bitumen," and that, failing a general agreement acceptable to all parties, it may be necessary to invoke professional and scientific authority in order that confusion may be avoided in the future. Well-established usage must certainly be taken into account, and we are fully alive to the necessity for preventing interested or badly-informed parties from exerting an influence likely to be prejudicial to those who have used these terms for many years; or, on the other hand, such an influence as may result in the use of definitions which will leave us in a worse confusion than before. At present there are some who desire that the word "asphalt" shall apply only to the natural product; others would allow a wider use of the term, and distinguish the natural product by calling it "rock asphalt," or "natural asphalt." A like difficulty arises as regards the term "bitumen." If it is to be allotted to certain natural products we shall want a general word when referring, for instance, to bituminous-bound roads. We might use the term "pitch" as a general word in this sense. At present there are not enough words to go round. It is evident that, like ourselves, the committee referred to have not come to a definite conclusion in the matter. We have kept our pages open to discussion and expressions of opinion for more than a year, and have not yet gone fully into all the letters and papers in which the subject is referred to. This we are now about to do, and we should be glad to add our correspondent's own definitions of "asphalt" and "bitumen" to those which we are collecting and comparing. Later, we hope to publish definitions which will be acceptable both to the profession and to traders.—Ed. SURVEYOR.]

SHREWSBURY BOROUGH SURVEYORSHIP.

To the Editor of THE SURVEYOR.

SIR,—It will be gratifying to know that, with regard to the above appointment, there was absolutely no canvassing allowed, either directly or indirectly, and I understand that none of the six selected candidates knew anyone connected with this town; further, the Finance Committee entrusted with this appointment went thoroughly into the applications, and when the selected list was reduced to three—viz., Mr. Fellowes (Willenhall), Mr. Ward (Stockport) and Mr. Wilkinson (Wimbleton)—a sub-committee visited the towns where these gentlemen came from.

Without doubt the Shrewsbury Council have selected a gentleman who has great abilities, and will fulfil the position in a very worthy manner.—Yours, &c.,

AN UNSUCCESSFUL CANDIDATE.

December 22, 1913.

[We print the above with considerable pleasure, and with a feeling that the example set by Shrewsbury is one that might be followed by many other authorities. The eminently fair and business-like methods of the committee concerned with this appointment will have the approval of all public officials.—Ed. SURVEYOR.]

SOMERSET COUNTY SURVEYORSHIP.

COMMITTEE'S RECOMMENDATION.

Mr. Edward Stead, ASSOC. M. INST. C.E., has been unanimously recommended by the County Works Committee for the position of county surveyor of Somerset, with a commencing salary of £550, rising to £800, and the recommendation will come up for confirmation by the county council on the 6th inst.

Mr. Stead, who was formerly assistant county surveyor for Somerset, has since February been county surveyor for the Northern Division of Devon, and has resided at Barnstaple, where he established the county surveyor's office. He has had under his charge in North Devon a considerable amount of road remaking under the Road Board scheme.

To Manufacturers.—Mr. L. W. Wynne-Roberts, B.Sc., of Regina, Canada, who is engaged in connection with various public works of importance in that city, and who is at present on a visit to England, is desirous of obtaining manufacturers' catalogues and other information referring to heating, lighting, ventilation, water softening and sewage disposal. Communications should be addressed to Mr. Wynne-Roberts, c/o The Editor.

"THE SURVEYOR" SPECIAL ISSUE.

CHIEF FEATURES.

In the Special Annual Issue of THE SURVEYOR to be published on January 30th, the customary comprehensive list of the works projected by the various local authorities for 1914 will, as usual, be preceded by a series of

ARTICLES CONTRIBUTED BY SPECIALISTS

reviewing the progress which has taken place during the past year in connection with sewerage and sewage disposal, road work, water supply, refuse disposal, street lighting, electricity supply, bridge construction and the provision of public buildings.

LAW AND LITERATURE.

The legal precedents and legislation of 1913 in relation to municipal engineering will be reviewed by the Law Editor, Mr. J. B. Reignier Conder, while another valuable feature of the issue will be a survey of the year's literature of municipal engineering.

In addition there will be the customary Law Notes, Reports of Municipal Work in Progress, Local Government Board Inquiries, Personal News, and the fullest information relating to Vacant Appointments, Municipal Contracts and Competitions.

WORKS PROJECTED.

As stated in our last issue, those of our readers who propose to comply with our request for particulars of works projected in their districts will greatly oblige us and facilitate the production of the Special Number by forwarding their returns without delay.

The form which these should take is now generally understood, but the exact nature of the information sought can be seen by reference to our issue of January 31st last, over thirty pages of which were devoted to the publication of these official forecasts.

We would repeat what we have said in previous years—that any other material which readers may consider sufficiently interesting for inclusion in the issue will be welcomed, and this matter also, particularly if its use involves the reproduction of drawings or photographs, should likewise reach us at the earliest possible moment.

To non-subscribers, it may be added, the price of the Special Issue will be 1s., but subscribers will receive their copies without extra charge.

Ilkley's Open Spaces.—The Local Government Board have refused to sanction the application of the Ilkley Urban District Council for power to borrow £9,500 for the purchase of 44 acres as a pleasure ground. The board state that, having regard to the fact that the council already possess an extensive area of moorland and a number of pleasure grounds in the town itself, the site seems unnecessarily large, and the proposals for providing access to and laying out the area very costly.

The Reconstruction of French Roads.—It is flattering, says the Paris correspondent of the *Daily Telegraph*, to hear M. Fernand David, French Minister of Public Works, talking of "the network of English roads, which to-day are admirable." On the other hand, French roads have gone to rack and ruin in the last six years. The reason is, as every motorist and expert knows, that in England the high roads have been remade scientifically to suit motor traffic, whereas French roads have been left to old-fashioned engineers and old-fashioned methods, and the new motor traffic has ruined them. What the French roads want are new methods and go-ahead men, and the Minister says that young engineers no longer care for small positions in the State Roads Department, preferring more promising positions in private undertakings. In order to remake French roads to suit modern motor traffic the Minister estimates that £1,000 per kilometre will have to be spent, and France possesses 600,000 kilometres of roads of different kinds, of which 40,000 kilometres are national high roads. To remake a quarter of the national roads of France for motor traffic, £10,000,000 would be wanted.

WATER SOFTENERS.

A PROMISING AMALCAMATION.

Intimation of an important combination of leading makers of water softeners in the United Kingdom is contained in the announcement that arrangements have been concluded under which the two concerns of Lassen & Hjort and Water Softeners, Limited, will henceforth operate in the British Isles as a joint concern under the title of United Water Softeners, Limited.

Messrs. Lassen & Hjort are well known as the patentees of one of the most successful modern systems of softening water by means of lime and soda, carried out in a plant which has achieved a wide and well-founded reputation for efficiency, while Messrs. Water Softeners, Limited, are the proprietors of the recently introduced "Permutit" regenerative process, which, even in the short time it has been before the public, has, to a large extent, revolutionised accepted methods of treatment, and certainly possesses a future of brilliant promise.

Experience and comparison of the two methods working in competition have established the remarkable fact that, so far from being mutually exclusive or antagonistic, the two processes are, in a very large number of cases, essential complements one of the other, and while, in many instances, neither system alone could yield perfect results, by combining the best features of both it has been possible, in those cases, to evolve a process which affords the ideal treatment for the particular purpose in view.

This being so, the joining of interests on the part of the two firms is a natural consequence, and one which should considerably benefit the user of water-softening plant in this country, who will now be able to depend with certainty on obtaining the process best suited to his individual needs.

For some waters and for some purposes the lime-soda process remains the most suitable treatment, for other waters and other purposes the "Permutit" process (by which method alone can the hardness be reduced to zero) is more particularly appropriate. There is also a large class of waters which can be most effectively and economically dealt with by a combination in one plant of lime and "Permutit" treatments. The two processes together cover the whole field of water purification—bacteriological, chemical and mechanical.

The management of the new company will be in precisely the same hands as was that of the two original concerns, and pending the acquisition of new and more commodious offices in which both staffs will be brought together under one roof, the business of the new company will be carried on at the existing offices of the two concerns jointly.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times*.

Essex Road Improvement Scheme.—A scheme for resurfacing the main roads of Essex, which has been prepared by the county council, has received the approval of the Road Board, and when the work is completed it is believed that the chief arteries of traffic leading from London into East Anglia will, so far as Essex is concerned, be the finest in the country. The problem, which has been under consideration for some time, has been forced to the front (says the *Telegraph*) by the steady increase of heavy motor traffic, and in order to remake the roads so that they may be able to stand the tremendous amount of wear and tear to which they are now subjected, the Road Board has decided to earmark the entire funds available, so far as can be foreseen at present, for the administrative county during the next five years. In other words, no grants will be available for any other class of road improvement—such as widenings or diversions—before the close of 1918, at which date it is expected the great scheme which has just been officially approved will be completed.

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Basingstoke T.C. (December 18th. Mr. T. C. Ekin).—£14,000 for new electricity undertaking.—The town clerk stated that the Provisional Order had been granted this year, and it was desired to lay down the works so as, if possible, to be in a position to supply by September, 1914. The London and South-Western Railway Company had agreed to take a minimum supply of 50,000 units for power and lighting at 2d. per unit. Their probable consumption was, however, about 80,000 units per annum. The borough engineer, Mr. F. Reginald Phipps, ASSOC. M. INST. C.E., explained his scheme, which comprised two Diesel engines of 150-b.h.p. direct coupled to 100-k.w. dynamos, balancer, booster, battery of 300-ampere hours at the four-hour rate, capable of being enlarged to 500-ampere-hours, paper insulated armoured cables and switch-board. Provisional contracts had been entered into for all the sections, and the amount of £14,000 asked for was amply sufficient for the scheme as at present designed. The public lighting would be taken over in the streets where mains were laid, the number of lamps to be immediately taken over being fifty-nine; the same illumination would be given at the price paid to the gas company—viz., £3 5s. for all-night lamps, and £2 5s. for midnight lamps. The system of supply was direct current at 460-230 volts. A very suitable site had been acquired in a central position for £300 from St. Mary Magdalen College, being part of the rectory meadow.

Blofield R.D.C. (December 22nd. Mr. W. A. Chapman).—£750 for the purpose of erecting four dwelling-houses in the parish of Acle under Part III. of the Housing of the Working Classes Act, 1890.—Mr. King (sanitary inspector) explained plans of the dwelling-houses which he had prepared. On the ground floor there would be a large-sized living room and a small parlour or sitting-room. It was thought in that district people would have a small parlour, and if they made a small scullery in the back and a large living room they would not live in the large front room but in the small scullery, and keep the large front room shut up. The council thought it better to make the large room at the back to be used as a living room, and a small room in front to be used as a parlour. The plans provided for that. There would be three bedrooms on the first floor—viz., 15 ft. 6 in. by 9 ft. 6 in., 12 ft. 9 in. by 8 ft.; and 10 ft. by 7 ft. 3 in. The ground floor rooms would be 8 ft. 6 in. high, and the first floor rooms 8 ft. high, and there would be a coal place and a small wash-house at the back for the copper, to keep the steam from coming into the cottage.

Chertsey R.D.C. (December 12th. Mr. M. K. North).—£1,663 for street improvements.—It was stated by the assistant clerk, Mr. L. Porter, that the making up of the road was a necessity. Referring to the disposal of the surface water, he said plans had been prepared but did not show any surface-water scheme, and therefore after the preparation of the plans they had to consider the making of arrangements for the disposal of the surface water. The scheme for dealing with the surface water in Byfleet had been prepared, and was of a comprehensive character, the cost of which would be £1,200. That scheme went forward to the parish meeting in March last, which seemed somewhat alarmed at the expense, and they accordingly vetoed it, the scheme being now in abeyance. The council then amended the scheme so as to deal with the streets mentioned. They suggested that the water should be sent into the foul water sewers. Mr. H. Beency, surveyor, gave other details relative to the streets. The inspector asked whether other parts of the district had separate or combined systems for dealing with the surface water. The surveyor replied that there were separate systems in all the other parts. The inspector: You are creating a dangerous precedent by this. The surveyor: That is so. The inspector said that in view of the fact that they wanted to discharge into the foul water sewers it would be necessary to go into the question of disposal works as to whether they were able to take the extra flow.

Goole U.D.C. (December 30th. Mr. W. O. E. Meade-King).—£8,000 for the purpose of building municipal

offices in the centre of the town and in front of the Goole Market Hall.—The plans had been submitted by Mr. E. E. Fetch, of Westminster, who, out of seventy-eight competitive designs, was awarded the first and second prizes. The chairman of the council, Mr. G. E. Hill, in supporting the application, said the site belonged to the town. The offices would hide the Market Hall front, which was an eyesore and gave visitors the impression that there was a large tranway shed in the centre of the town.

Hayes U.D.C. (December 8th. Mr. F. H. Tulloch).—£5,700 for making up a number of streets under the Private Streets Works Act. The clerk, Mr. C. Dudley Lewis, stated that complaints had been received with respect to the condition of the roads, whereupon an objector asked whether the complaints were sent direct to the clerk or to the members of the council. The inspector said the question was not material. The roads wanted making up, complaint or no complaint. He had seen the roads, and considered they wanted making up. Whether there was a complaint or not did not affect the question at all. If anybody was of opinion that the roads did not require making up he would be willing to make a further inspection. The surveyor, Mr. Douglas C. Fidler, stated that his experience of tarred channels in other districts was that they were unsatisfactory. He did not think any road was complete without a proper channel—except, of course, sett or wood-block roads. A tarred macadam road without a channel was not satisfactory. As a surveyor, he should strongly object to a tarred pavement in such a locality as this. In a residential area it would be quite suitable.

Huddersfield T.C. (December 12th. Mr. W. H. Maxwell).—This was an inquiry relative to an application for a Provisional Order authorising the town council so to vary their powers in regard to disputes as to the apportionment of the charges for new streets that the disputes should be referred to a single arbitrator under the Arbitration Act of 1889.—The town clerk (Mr. J. H. Field) said that in the absence of the power sought, secs. 27 and 35 of the Lands Clauses Act applied to the settlement of disputed apportionments. The procedure at present was that each party had to appoint an arbitrator, and the arbitrators had to appoint an umpire. If they could not agree upon an umpire the Board of Trade had to appoint one. Power was sought to appoint a single arbitrator, to be appointed, failing agreement between the parties, by the Local Government Board, and that the provisions of the Arbitration Act should apply so that the arbitrator would have full power to deal with the costs in his discretion.

Isle of Wight R.D.C. (December 15th. Mr. A. W. Brightmore).—£4,371 for works of water supply to the parishes of Shorwell, Kingston and Chale.—The council have carried out experiments in the neighbourhood of Shorwell and Limerstone in an endeavour to find a supply, but without success, and they now propose to purchase a supply from Shanklin Urban District Council, and to run a 4-in. main through Kingston and Shorwell, and at the same time give an auxiliary supply to Chale.

St. Annes-on-the-Sea U.D.C. (December 30th. Mr. F. H. Tulloch).—£1,114 for street improvements.—The chief feature of the scheme, it was stated, will be the demolition of garden walls, and replacing them with ornamentally arranged spar rockeries, banked behind with shrubberies.

Scarborough T.C. (December 31st. Mr. H. Shelford Bidwell).—£3,262 for various public improvements.—It was explained by the town clerk (Mr. Sidney Jones) and the borough engineer (Mr. H. W. Smith) that £1,150 was required for the purchase and abolition of the North Pier premises, and the alteration and improvement of the adjacent roadway and sea wall: £1,000 for the erection of conveniences, shelter, and shops in Clarence-gardens in place of those done away with at the North Pier; £520 for tennis courts and a pavilion in Clarence-gardens; £1,972 for improvements in the South Cliff rose garden and terraces; £1,450 for the erection of public conveniences in the South Cliff Gardens; £490 for the erection of a bowling green on land adjoining the Royal Albert Drive; £1,580 for the erection of a shelter, refreshment rooms, and conveniences in Pasholme Park; and £100 for the making of a tennis and bowling pavilion in Alexandra Gardens.

Sheffield T.C. (December 12th. Major J. Stewart).—£7,123 for works of private street improvement in

Vulcan-road, Tinsley. The road is situated between Weedon-street and Sheffield-road, Tinsley, and it was pointed out on behalf of the city council that an increase in the already heavy traffic from many of the big works was anticipated, and it was proposed to have the work substantially done.

Torquay T.C. (December 30th. Mr. W. M. Cross).—£15,000 for the extension and improvement of the bath saloons, including the provision of swimming and medical baths; £250 for the extension of the refuse destructor; and £5,000 for laying a new water main from Totliford to Hennock, in the parish of Hennock.—With respect to the extension of the baths, the town clerk, Mr. H. L. Parry, stated that the principle had been conceded by the Provisional Order which was granted after an exhaustive inquiry in 1912. Fourteen reliable firms sent in tenders for the work, with the result that, subject to the sanction of the Local Government Board, the lowest tender of £14,912 had been provisionally accepted. This showed that the work could be done within the limits of the amount applied for. Mr. Alfred John Taylor, architect, of Bath, explained the plans, and gave details of the scheme. Mr. H. A. Garrett, borough surveyor and engineer, said the refuse destructor was erected and first used in 1897, and that it had been working continuously ever since. There was an average of 45 loads of refuse per day consumed, but at certain periods of the year this was increased to 60 loads. The quantity of refuse to be collected increased as the town increased, and therefore the present four cells were found to be inadequate, and two more were necessary. When the destructor was designed provision was made for future extension. The application for £5,000 for the proposed new water main was taken next, the town clerk stating that the reason for the application was that, although the corporation had three very large storage reservoirs on Dartmoor, with a plentiful total capacity of nearly 500,000,000 gallons, there were only two mains which were available for the purpose of bringing this water from the reservoirs to the places to be supplied.

Weston-super-Mare U.D.C. (December 16th. Mr. W. M. Cross).—£11,000 for the erection of new abattoirs in Longford-road; £2,120 for works of wood paving in Waterloo-street and Regent-street; and £1,600 in respect of the construction of a new road as an extension of the Lower Milton-road to Worle.—Mr. S. C. Smith (clerk to the council) explained that the present slaughter-house dated from 1860, and the necessity for the proposed new buildings arose from the fact that the present accommodation was not only objectionable on account of being situate in grounds adjoining the Statutory Hospital, but was defective, inconvenient, and ill adapted to meet the growing requirements of the district. Formal evidence was tendered with respect to the other proposals.

Whitby R.D.C. (December 16th. Mr. H. R. Hooper).—£5,700 for a sewerage scheme for Sleights.—The period asked for repayment of the loan was sixty years for the land and thirty years for the purpose of the works. Mr. Ough, who had prepared the scheme, explained the details. Sewering of the whole of the village, about 1 mile in length, is provided for. The inspector said he considered that a reduction of tanks and filters could be effected, thereby reducing the cost, and that an open channel instead of pipes and less costly concrete work would suffice. He raised objection to the council undertaking the whole cost of connecting Lowdale Hall and Esk Hall, and said he considered the expense would have to be borne by the township and not by a special area. The inspector asked if the cost of the land, at £250 an acre, was not excessive? Mr. Gray thought not, considering that practically compulsory powers of purchase were instituted. The engineer said it was the only suitable site.

APPLICATIONS FOR LOANS.

Cookstown (Ireland) R.D.C.—£400 for a water supply for Pomeroy.

Crediton U.D.C.—£17,000 for a sewage disposal scheme.

East Grinstead U.D.C.—£2,900 for the erection of a dust destructor, and £800 for the purchase of the land.

Hawarden R.D.C.—£500 for building two workmen's cottages at the sewage works.

Ledbury R.D.C.—£250, further loan for building cottages.

Llandudno U.D.C.—£736 for reconstructing sewers.

Newbury T.C.—£1,000 for a wood paving scheme.

Ripon R.D.C.—£2,012 for alterations at the isolation hospital.

Saltash T.C.—£500 for the extension of the recreation ground.

Walton U.D.C.—£200 for the purchase of land for a depot.

LOANS SANCTIONED.

Erampton R.D.C.—£540 for street works and the erection of a public convenience.

Bridlington T.C.—£1,340 for workmen's dwellings, and £1,500 for sanatorium extension.

Cheadle R.D.C.—£500 for the purchase of additional land for sewage disposal.

Fareham R.D.C.—£14,725 for works of sewerage.

Kidderminster T.C.—£13,500 for sewage farm extension.

Porthcawl U.D.C.—£1,300 for surface-water drainage.

Rotherham R.D.C.—£1,197 for sewerage works.

St. Austell U.D.C.—£5,062 for workmen's dwellings.

Stoke Newington B.C.—£6,000 for the electricity undertaking.

Twickenham U.D.C.—£3,000 for school extension.

York T.C.—£5,478 and £2,400 in respect of the purchase by the Asylum Committee of Naburn Lodge Farm, the latter sum representing the apportioned value of the buildings. The Local Government Board have allowed sixty years for the repayment of the loan on the land, and twenty-five years for that on the buildings.

FORTHCOMING INQUIRIES.

	£
3.— Southend-on-Sea. For the purchase of the nursery ground (Mr. Edgar Dudley)	4,350
5.— Cardiff. For the erection of a fire brigade station (Mr. R. H. Bicknell) ...	18,707

13.— Newquay. For the purchase of premises for a sanatorium (Dr. F. St. George Mivart) ...	—

TOWN PLANNING.

11.—**Wrexham.** (Mr. Thomas Adams) ...

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works, of which particulars appear below: Buildings—Berwick, Ilford, West Riding £12,000; housing and town planning—Docking; roads and materials—Deptford £23,000, Middlesbrough, Penge, Rotherham; sewerage and sewage disposal—Branston £21,000, Crediton £16,487, Hale; water, gas and electricity—Dublin, Forfar. Particulars of other works projected will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Airdrie T.C.—It has been agreed to build a local sanatorium instead of joining a county scheme. The precise nature of the scheme has yet to be determined.

Berwick T.C.—It is reported that the Road Board have prepared a scheme for the building of a new bridge in place of the old bridge, which is unsuitable for modern traffic. The new bridge would cost £80,000, and of this the Road Board were prepared to pay 80 per cent, and it was proposed that the Berwickshire and Northumberland County Councils should each contribute its quota, so that the share payable by Berwick would be small. The new bridge will be built of stone, and the site will be near to the present structure, which, in view of its historical associations, will be untouched.

Bodmin T.C.—A new fire station is to be built at an estimated cost of £250.

Brynmawr U.D.C.—The new municipal offices, erected at a cost of about £1,150, were formally opened on Monday last.

Chester-le-Street R.D.C.—The council have agreed to the proposition of the Houghton-le-Spring Council to re-open negotiations for the construction of a bridge over the Wear between Cox Green and Washington.

Dumfries C.C.—Sanction has been given to the construction of a joint sanatorium for the counties of Dumfries, Kirkcubright, and Wigtown, and the burghs of Dumfries and Maxwelltown.

Hitchin R.D.C.—The surveyor, Mr. J. C. Hooper, has received instructions to prepare plans for a mortuary.

Horsham R.D.C.—The question of establishing an isolation hospital is under consideration.

Huddersfield T.C.—Alterations and additions are to be carried out at the office of the borough engineer, Mr. K. F. Campbell.

Ilford U.D.C.—A hospital for consumptives is to be built at an estimated cost of £1,400.

Kent C.C.—Plans have been sanctioned for a new school and special subjects centre at Broadstairs at an estimated cost of £4,850.

Nairn T.C.—The council have decided to purchase the local swimming baths, and spend £1,200 in renovating the buildings.

Rochdale T.C.—Alterations estimated to cost £1,100 are to be carried out at the town hall.

Thirsk R.D.C.—An extension scheme is to be carried out at the isolation hospital at an estimated cost of £1,000.

West Riding C.C.—It has been decided by the Education Committee to build a school at Stainforth at an estimated cost of £12,000.

HOUSING AND TOWN PLANNING.

Coventry T.C.—The purchase of property for temporarily housing tenants ejected by the operation of closing orders has been considered by the Sanitary Committee, and the town clerk has been instructed to enquire whether the Local Government Board will sanction a loan for this purpose.

Docking R.D.C.—Plans are to be prepared for a housing scheme at Branceaster.

Huddersfield T.C.—Five and a-half acres of land are to be purchased at Broadlands for the purpose of a housing scheme.

St. Austell U.D.C.—With respect to the application for sanction to borrow £5,062 for the purchase of land and the erection of working-class dwellings, a letter has been received from the Local Government Board stating that while they were satisfied as to the need

of working-class dwellings, they could not approve a scheme which contravened the by-laws in force, and had no power to suspend the operation of those by-laws as suggested. The board were, however, prepared to approve the scheme on condition that it was amended as suggested in an interview between the chairman of the council and officers of the board—by setting back blocks A and E so as to comply with the by-laws, the council to proceed at once to amend their by-laws in respect of streets, parapets, height of chimneys, &c., and carry out the scheme in compliance with such amended by-laws as the board approved. The council have agreed to comply with the request of the Local Government Board. In the course of the proceedings Mr. Bellamy said great credit was due to their surveyor, Mr. E. D. Groves. If plans that went before the Local Government Board did not come back pulled to pieces it was very remarkable, and congratulation was due to Mr. Groves for the able manner in which he had discharged his part of the work. The chairman endorsed this tribute, and said they were also indebted to their clerk for the capable way in which he had prepared the financial scheme. Resolutions of thanks to these officers were passed.

Settle R.D.C.—As a result of pressure by the Local Government Board it is expected that the council will have to arrange for housing schemes, in some of the large townships at all events.

PARKS AND OPEN SPACES.

Coventry T.C.—The Baths and Parks Committee recommend the purchase of 23½ acres of land opposite St. Paul's cemetery, Holbrooke-lane, Foleshill, for £3,700, as a new park.

Harrogate T.C.—It has been agreed to establish an 18-hole golf course on the corporation farm, provided sufficient support is accorded the scheme by the public at an annual subscription of 25s. a year.

Horbury U.D.C.—It has been agreed to purchase a property known as Low Park, of 11 acres, for £3,204, for the purpose of a public park.

Newport (I. of W.) T.C.—It has been decided to lay out a bowling green on the recreation ground at a cost of £66.

Penzance T.C.—The mayor, Mr. A. K. Barnett, has subscribed £100 towards the cost of laying out the serpentine works, and the work is to be carried out provided an additional £400 is subscribed voluntarily. The borough surveyor, Mr. Frank Latham, estimates the total cost of the scheme at £800.

St. Austell U.D.C.—The council have accepted from Sir Charles Graves-Sawle, the gift of a playground for children.

REFUSE COLLECTION AND DISPOSAL.

Lewisham B.C.—Five additional dust vans are to be provided at a cost of £329.

ROADS AND MATERIALS.

Cardiff T.C.—At a meeting of the Cardiff Public Works Committee last week, the tender of Messrs. Adams & Sons Monk Meadow Dock, Gloucester, for the supply and stacking of Archangel red deals for the relaying of the main streets of the city was accepted. The firm quoted £13 15s. per standard of 9 by 3, and £12 15s. per standard of 8 by 3. It was stated that the tender worked out approximately at £15,000.

Deptford B.C.—A scheme for repaving some of the principal roads is to be undertaken at a cost of about £23,000. The roads to be improved are New Cross-road, Deptford-broadway, Deptford Bridge, and Queen's-road, and the present granite setts are to be replaced with wood blocks. Application is being made to the Road Board inquiring what assistance it will give, and the London County Council is being asked to allow the granite setts in the tramway tracks to be superseded by wood paving.

Gnosall (Staffs) R.D.C.—The surveyor, Mr. H. V. Heath, at the recent council meeting, stated that the condition of the highways was the result of the continued wet weather, and the constant softening of the surface of the roads. The haulage of farm produce also damaged

the roads in the vicinity of farms, and the supply of material being inadequate bad roads were the result. The time was close at hand when the highway rate would have to be increased, as the traffic had increased, and the weights hauled by mechanical power were beyond the strength of the roads. Mr. J. R. Ball thought it was impossible to keep the roads in proper condition on the amount of money they were spending. The chairman pointed out that their roads cost about £14 per mile, as compared with £95 per mile spent on the county roads. Mr. J. R. Ball said the wear of the district roads had increased by 50 per cent, and at the present time the roads were a disgrace to the council. They could not blame the surveyor; the money spent on the roads was judiciously expended. It was a serious matter, and the time had come when they would have to spend more money on the roads. The matter was not pursued further.

Haslingden T.C.—It has been decided to carry out an improvement scheme in Waterside-road.

Mansfield T.C.—A further step in the scheme for the Belvedere-street improvement has been taken by the purchase of property at a cost of £1,075.

Middlesbrough T.C.—The Local Government Board have approved the scheme of the borough engineer, Mr. S. E. Burgess, M.INST.C.E., in connection with the paving of streets at Newport, the cost of which has to be paid by the frontage-owners. The streets concerned were Tarran-street and Cunningham-street, which the corporation decided should be paved with whinstone setts. An objection was taken by the frontagers that the work demanded was excessive, having regard to the requirements of the neighbourhood. An appeal was made to the Local Government Board, and a local inquiry was held by one of the board's inspectors. The board have now made an order under sec. 268 of the Public Health Act, 1875, confirming the decision of the Streets Committee, and ordering the appellants to pay the sums apportioned on them for road work charges.

Newry No. 1 R.D.C.—It has been agreed to adopt the Road Board scheme for steam rolling main roads in the rural district. The share of the board's contribution to the work in the county (£10,700) allotted to the rural council is £906.

Penge U.D.C.—It has been decided to pave several thoroughfares with artificial stone paving.

Rotherham R.D.C.—The county council have agreed to make a grant of £3,440 to the rural council for the cost of constructional works on the main roads at Maltby and Bramley.

Roxburgh C.C.—The Jedburgh District Committee have received from the Road Board an offer of a grant of £6,000 for the improvement of the roads and the construction of suitable bridges, on condition that the district road authority impose an additional road rate of 1d. per £1 for the next ten years. No definite decision has yet been come to, but the offer is regarded by members of the committee with favour. It is suggested as part of the scheme of improvement that the old bridges should be allowed to remain, and that the new ones should be erected in a more direct line than the existing road.

Salford T.C.—The question of road improvement work and the expenditure upon it by the Highways Committee, which has been referred to a special committee of the corporation for report to the council, has had its sequel in the application of the committee for a supplementary estimate of £3,715 to enable them to complete the present year's work. The deficiency which the first six months' work has shown was not at all unexpected, for, in spite of a number of economies which have been effected, the cost of the work done has exceeded the half year's estimate by £2,163. The Highways Committee are at present in communication with the Road Board on the question of a grant from that authority.

Wigtownshire C.C.—The county road board have agreed to a scheme promoted by the Rhins District Committee to tar-macadam and reconstruct 50 miles of the main roads in the Rhins district, at an estimated cost of £25,000, the Road Board having agreed to give a free grant of £8,500, and a loan of £16,500, free of interest, repayable in eight years.

Wirral R.D.C.—The surveyor, Mr. T. Davies, has been requested to prepare plans for widening Mill-lane.

SEWERAGE AND SEWAGE DISPOSAL.

Branston R.D.C.—A drainage scheme for Boultham, North Hykeham, and Skellingthorpe, estimated to cost nearly £21,000, is under consideration.

Crediton U.D.C.—The council have adopted the plans for the sewage disposal scheme prepared by Mr. Jasper. The total estimated cost is £16,487.

Croft (Yorks) R.D.C.—Sewage disposal works are to be established at Barton, the initial cost of the main drain and septic tank being estimated at £270.

East Grinstead R.D.C.—As a result of the surveyor, Mr. C. Turton, having prepared the Groombridge and St. John sewage disposal schemes, the council have effected a saving of £273, and it has been decided to pay Mr. Turton £136, in accordance with the agreement made with him.

Hale U.D.C.—A scheme for new sewage disposal works is being considered by the council.

Holsworthy R.D.C.—Mr. F. Gamble, surveyor to the Tavistock Urban District, who had been called in to advise the rural council in the matter, has submitted a report in which he gives his opinion in favour of the adoption of a comprehensive scheme of sewerage and sewage disposal for Halwill.

Llandilo R.D.C.—At the meeting held recently a proposition was made that the surveyor, Mr. Evan Jones, be instructed to prepare an alternative scheme for the drainage of the parish of Quarterbach, as the ratepayers were strongly opposed to joining the combined scheme for the Amman Valley. They would then be prepared for the Local Government Board inquiry, as it was to the interests of the parish they should be heard. Mr. D. Davies pointed out that the rural district council had bound themselves to the joint scheme. The surveyor declined to prepare a local scheme for the treatment of the sewage of Quarterbach separate from Llandilofawr. He would be acting for the district council in one part and for the parish of Quarterbach in another. It would be fooling the council themselves. The motion to instruct the surveyor was defeated by a large majority.

Rotherham R.D.C.—The tender of Mr. R. Snell, at £202, has been accepted for sewerage works at Bramley, and the tender of the same contractor, at £1,100, for the Thurcroft sewerage scheme.

Wantago R.D.C.—A report is being prepared with respect to the suitability of the land at Harwell for a filtration plant and for an irrigation scheme.

WATER, GAS, AND ELECTRICITY.

Barnstaple R.D.C.—The Combemartin Parish Council have forwarded to the rural council a resolution pressing upon that body the necessity of providing a water supply for the district. They urge the acceptance of the Sherrcombe scheme, with respect to which the engineer reports that the watershed is upland moor, quite open, and with no woodland high in elevation, meeting all needful conditions, and yielding an abundant supply of pure water, where no filtration would be required. The soil is partially clay, an ideal soil for a reservoir. The land has little or no agricultural value, and the waters at present are serving no useful purpose. Moreover, it could, if necessary, be made possible to include all the water from Bearn in this scheme. It would, however, be a rather more costly scheme than either of the two schemes previously suggested.

Blaenavon U.D.C.—The tender of Messrs. Webb & Son, Abercynon, has been accepted for the water-works extensions.

Chorley R.D.C.—The surveyor, Mr. A. Jolly, has prepared a scheme for the extension of the water mains at Bretherton, the cost of which he estimates at £750.

Cookstown R.D.C.—A scheme for a water supply for Pomeroy village, prepared by Mr. W. J. O'Neill, Lurgan, and estimated to cost £356, has been forwarded to the Local Government Board.

Dublin T.C.—The Electricity Supply Committee announce that it is their intention from time to time, gradually to replace the old arc lamps of the city, which are becoming inefficient, with the best type of the new flame arc lamps. Two firms agreed to the conditions laid down—the General Electricity Company and Messrs. Johnson & Phillips—and a trial of the new lamps was made on the Grafton-street, Westmoreland-street, and O'Connell-street circuits. A separate trial was also made of two lamps from Messrs. Crompton & Co. The city engineer now reports that the extended trials of the lamps have proved satisfactory, and he recommends the taking over of the lamps from these two firms.

Forfar T.C.—Consideration is being given to a scheme for an extensive development of the gasworks.

Leyburn R.D.C.—A scheme of water supply at Middleham is to be carried out at an estimated cost of £250.

Menai Bridge U.D.C.—The Marquis of Anglesey, who owns the land required by the council for the construction of a reservoir, is impressed favourably by the scheme prepared by Mr. W. Owen, the surveyor, subject to some slight modifications suggested by Mr. T. B. Farrington, the expert engaged by Lord Anglesey to examine the site and the plans. This is the third or fourth scheme submitted by the council, and it is now hoped that, as water is scarce in the parish, the present scheme will be sanctioned and carried into effect quickly.

Newport (Mon.) T.C.—In consequence of the expeditious manner in which the new installations were erected at the corporation electricity works recently, the Electrical Committee have recommended that Mr. Nicholas Moore, the borough electrical engineer, be given a bonus of 25 guineas, and Mr. W. L. Thain, the deputy engineer, 11 guineas, 25 guineas to be divided among the workmen.

Stockton T.C.—It has been agreed to charge the Thornaby gas consumers the same price as Stockton, instead of 2d. more per 1,000 cubic feet as heretofore, upon condition that the Thornaby Corporation withdraw their proposal to apply for power to construct their own gasworks.

PERSONAL.

Mr. Ernest C. Bond, assistant surveyor to the Foleshill Rural District Council, has had his salary increased from £62 to £85 per annum.

Mr. E. W. Turner, of the city engineer's office, Sheffield, has been appointed deputy building surveyor under the Birmingham Corporation.

Mr. W. Keith Leslie, of the city engineer's office, Edinburgh, has obtained an appointment as assistant engineer on the staff of Mr. A. Fidler, M.INST.C.E., borough engineer of Northampton.

Mr. H. P. Maybury, chief engineer to the Road Board, has now left Maidstone, and letters should be addressed to him either at Greenhithe or at the offices of the board, Queen Anne's Chambers, Westminster.

Mr. John McFarland, the well-known Irish contractor who carried out the Thirlmere waterworks scheme, figures in the New Year's Honours List, being among those upon whom a baronetcy has been conferred.

Mr. Edward Davenport, manager of the Swineshaw Valley waterworks, under the Ashton-under-Lyne, Stalybridge and Dukinfield Waterworks Joint Committee, has resigned his position after thirty-three years' service.

Mr. J. Luke, hitherto one of the assistants in the Manchester city surveyor's department, has been appointed deputy surveyor at a salary of £325, subject to a probation of twelve months. Mr. J. Dutton-Walker has been appointed an assistant in the department.

Mr. G. L. Murray, surveyor to the Hexham Urban District Council, who has left England to take up an important appointment in Cape Colony, was, before his departure, presented with a purse of gold by the members of the council, ex-members, officials and other friends.

Mr. M. Tutin, for fourteen years a building inspector on the staff of the Sheffield Corporation, has resigned owing to ill health, and recently he was presented by his colleagues with a case of cutlery. Mr. Tutin went to Sheffield from Southend-on-Sea, and previously he held the position of building inspector at Stockton-on-Tees upon the office being first established.

Mr. A. W. Ward, deputy borough surveyor of Stockport, whose appointment as borough surveyor of Shrewsbury, at a salary of £400 per annum, was reported in our last issue, has held his present office for the past six years. He served his articles with the borough surveyor of Harrogate, and afterwards held a position on the staff for two years. Subsequently he secured the appointment of assistant borough surveyor of Batley, and after five years' service in this capacity he removed to Northampton to take up the position of assistant borough engineer and surveyor. He held this office for four years before going to Stockport. Mr. Ward is an associate member of the Institution of Civil Engineers and a member of the Institution of Municipal and County Engineers.

STREET PAVING CHARGES.

MAGISTRATE'S CRITICISM IN NORTH LONDON CASE.

On Wednesday last, at North London Police Court, Mr. Thomas Bremner, of West End-lane, N.W., appeared before Mr. Chester Jones to show cause why he should not pay £298, due on an apportionment made by the Hackney Borough Council in respect to the paving of a new street. Mr. C. V. Young conducted the case for the council.

At the hearing of the case last week it was explained that Mr. Bremner was the owner of a strip of land 10 ft. wide, running along one side of the road, and it was in respect of this side that the apportionment was made. On the case being called on Wednesday, Mr. Bremner, in answer to the magistrate, said it was very difficult to make any proposal as to the payment of the money, as such property was now at a discount.

Mr. Chester Jones: Do the council know of this case, or has it been initiated and carried on by the officials?

Mr. Young: Oh, yes; the council know all about the case.

Mr. Chester Jones: I cannot imagine an elected body doing anything of this kind, but it is the sort of thing that officials sometimes do.

Mr. Young: It simply arises out of the fact that this gentleman bought the land as a speculation.

Mr. Chester Jones said that he felt there must be something behind this case, and, questioning the defendant, he elicited the statement that he had given £50 for the land. He made an order for the payment of the £298 8s. 10d. at the rate of £2 per month, remarking: "It will take you twelve or fourteen years to pay it off."

Mr. Young: I do not ask for costs.

Mr. Chester Jones: You would not get any if you did. I am sorry to see you in such a case. I have too much regard for you to think that you are in it willingly.

QUERIES AND REPLIES.

We cannot undertake to reply to any queries which are not accompanied by the writer's name and address. These are required as a guarantee of good faith, and not for publication. Sketches accompanying queries should be made separate, on white paper, in plain black ink lines. Lettering or figures should be bold and plain.

902. Treatment of Sewage from Adjoining District.—"Cymro" writes: "I have been asked by my council to prepare an estimate to allow an adjoining authority to connect to our sewers. It has been suggested that this should be arranged on the basis of per 1,000 gallons passing through a meter. I am not aware of this basis being adopted for sewerage purposes, being under the impression that either the population or rateable value is generally considered. I should be glad to know of any district where the 1,000-gallon basis has been adopted."

Good Roads for Manitoba.—The announcement by the Provincial Government of Manitoba (says the *Standard* correspondent) of its intention to further the "good roads" movement, and to encourage intensive farming, has been greeted with popular approval, these matters being regarded as the chief necessities at present in the direction of the development of Manitoba.

FOR OTHER ADVERTISEMENTS

See End of Paper.

HERTFORDSHIRE COUNTY COUNCIL. TENDERS FOR GRANITE SLAG AND TAR-MACADAM.

Tenders are invited for the Supply of Broken Granite, Slag and Tar-macadam required for the Main Roads during the year ending March 31, 1915.

Forms of Tender and Conditions of Contract may be obtained on application at my office, or will be sent through the post upon receipt of a stamped addressed foolscap envelope.

Tenders, which must be on the forms provided, are to be delivered not later than February 5th, 1914.

The lowest or any Tender will not necessarily be accepted.

URBAN A. SMITH, M.INST.C.E.,
County Surveyor.

County Surveyor's Office,
Hatfield, Herts.
December 31, 1913.

URBAN DISTRICT COUNCIL OF ENFIELD. TO CONTRACTORS.

The Council invite Tenders for Making Up the following Private Streets in their District—viz.:—

Drapers-road, Enfield.
Warwick-road, Enfield Lock.

Plans and Specifications can be seen, Forms of Tender and all information obtained, on application to Mr. Richard Collins, the Council's Surveyor, at these offices, any day (except Saturday) between the hours of 9 a.m. and 5 p.m.

The Contractor will be required to observe Trade Union hours of labour and to pay wages according to the published scale of the London County Council for the time being in force.

Separate Tenders for each Road (on the Form supplied only) to be sent in to me not later than noon on Wednesday, the 14th day of January, 1914, endorsed "Tender for —."

The Tenders must be accompanied by a schedule of hours of labour and of prices and wages to be paid for different classes of work, which schedule will be embodied in the Contract.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

T. W. SCOTT,
Clerk.

Public Offices,
Enfield, Middlesex.
December 31, 1913.

(1,092)

RURAL DISTRICT COUNCIL OF CLUTTON. TAR.

The above-named Council invite Tenders for 15,000 gallons of Dehydrated Refined Coal Tar, for surface tarring, complying in every respect with the Road Board Specifications for Tar No. II.

Delivery to be made as requested between the 31st day of March and 1st day of July, 1914, at Hallatrow Station, carriage paid, in Contractors' barrels.

Tenders to be sent to the undersigned on or before the 20th day of January.

Further particulars to be obtained from Mr. T. Orchard, The Grange, Hallatrow, Bristol.

J. SUMNER DURY,
Clerk to the Council.

Temple Cloud,
Bristol.

December 31, 1913.

(1,094)

DOWNHAM MARKET URBAN DISTRICT COUNCIL. DOWNHAM MARKET SEWERAGE AND SEWAGE DISPOSAL.

The above-named Council invite Tenders from responsible Contractors for Sewerage and Sewage Disposal Works. The Works comprise about 2,100 yds. of Stoneware Pipe Sewers, together with Manholes and Appurtenant Works, the Construction of Storage Chamber and Pumping Station, and 712 yds. of 5-in. Rising Main; also Purification Works, consisting of Tanks, Bacterial Filters, &c.

Plans and Specifications can be seen at the offices of the Engineers, Messrs. Elliott & Brown, A.M.M. INST.C.E., Burton Buildings, Parliament-street, Nottingham, and copies of the Bills of Quantities and Form of Tender may be obtained on deposit of Two Guineas (by cheque), which will be returned on receipt of a *bona-fide* Tender, not afterwards withdrawn, and the return of all documents lent to the Contractor for purposes of making up his Tender, within 14 days of the Notice informing him a Tender has been accepted. A copy of the Plans can be inspected at the Offices of the Surveyor to the Council, Mr. J. M. Jackson, The Chambers, Downham Market.

Sealed Tenders, endorsed "Tender for Downham Sewerage and Sewage Disposal Works," to be delivered to the undersigned not later than the first post on the 26th day of January, 1914.

The lowest or any Tender not necessarily accepted.

(By order)

H. R. B. WAYMAN,
Solicitor and Clerk to the Council.

Council Offices,
Downham Market,
Norfolk.

December 31, 1913.

(1,093)

BOROUGH OF HAMMERSMITH. TO PAVING CONTRACTORS.

The Borough Council invites Tenders for paving the Carriageways and Footways of Foliot-street, Fitzneal-street, and Erconwald-street, on the London County Council Old Oak Estate. (Total length, approximately 2,200 ft.)

Plans may be seen, and Specifications and Forms of Tender obtained, on application to Mr. H. Mair, Borough Surveyor, after Monday, 5th January.

Sealed Tenders, endorsed "Tender for Paving Works," must be delivered to me not later than 4 p.m. on Wednesday, the 14th January, 1914.

The Council does not bind itself to accept the lowest or any Tender.

LESLIE GORDON,
Town Clerk.

Town Hall, Hammersmith.
January 1, 1914.

(1,098)

BIRMINGHAM TAME AND REA DISTRICT DRAINAGE BOARD.

RAILWAY SIDING AT THE SALTLEY WORKS.

TO CONTRACTORS.

The Board invite Tenders for Works comprised in the Supply of Railway Material and the Laying and Ballasting of about 950 lin. yds. of Permanent Way, the Construction of a Brick and Concrete Bridge over the River Rea, 213 ft. long and 50 ft. wide, in 3 spans, together with other Works in connection therewith.

The works are situated on the lands of the Board at Saltley, in the City of Birmingham.

Persons desiring to submit Tenders are requested to make application to the Office of the undersigned on and after Wednesday, 7th inst., where the Contract Drawings may be seen and a copy of the Specification and Bill of Quantities obtained.

Tenders, duly signed, sealed and endorsed "Tender for Railway Siding," must be delivered at the Office of Mr. Arnold E. Harris, Clerk to the Board, 117 Colmore-row, Birmingham, not later than 10 a.m. on Wednesday, 14th January, 1914.

The Board do not bind themselves to accept the lowest or any Tender, and Contractors tendering do so at their own cost.

JOHN D. WATSON, M. INST. C.E.,
Engineer to the Board.

Engineer's Office, Tyburn, Birmingham.
(Castle Bromwich Station, M.R.)

January 1, 1914.

(1,095)

CITY OF BATH. SEWAGE DISPOSAL WORKS.

Applications are invited for the appointment of Manager of the Bath Sewage Disposal Works situated at Saltford, near Bath. The Works are sufficient for the disposal of the sewage from a population of about 80,000.

Preference will be given to applicants who have had experience in the management of similar works, and are able to undertake the charge of and carry out repairs to small machinery for mixing lime, pumping sludge, &c.

The salary will be 50s. per week, together with a residence.

Applications, stating the candidate's previous experience and the earliest date upon which he will be able to take up his duties, and accompanied by copies of three recent testimonials, must be sent to me not later than 10 a.m. on Saturday, the 10th instant.

FREDK. D. WARDLE,
Town Clerk.

Bath.
January 1, 1914.

(1,096)

APPLICATIONS are invited for the position of Assistant in a Municipal Surveyor's Office. Salary, 50s. weekly. It is desirable that candidates have a general knowledge of the routine work of such an office, but none without a good architectural experience need apply. Applications, giving full particulars of candidate's qualifications and experience, are to be sent not later than Monday, 5th January, 1914, to Box 1,357, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,099)

SOME RECENT PUBLICATIONS.*

MODERN METHODS OF WATER PURIFICATION. By John Don, F.I.C., &c., and John Chisholm, A.M.I.MECH.E. Price 16s. nett. London: Edward Arnold.

The first edition of this work, which was originally published some two years ago, having become exhausted, the authors have taken the opportunity of thoroughly revising the book, and of adding a chapter devoted to the description of processes which have recently come into prominence. The scope of the work is comprehensive, various chapters dealing with the sources of supply, storage, reservoir construction, filters of several kinds, purification, household appliances, water testing, problems of distribution, and recent advances in sterilisation. Thus the authors have brought together within the scope of a single volume a discussion of all matters with regard to which those interested in the treatment of water should have reliable and up-to-date information. Advances in the method of treating water have followed one or other of three different lines. Arising from a knowledge of the influence of coagulants on turbid waters, there has come into use a large variety of mechanical filters, which in many cases deal rapidly and effectively with waters that are hardly amenable to treatment in the older fashion. Again, the urgency of excluding pathogenic germs from service water has favoured the adoption of some form of sterilisation, either by fluid bactericides or by ozone. Lastly, well marked progress has been made in preparing crude waters for a final sand filtration by means of successive prefiltration, by which the effluent comes to attain great uniformity of quality, with freedom from undesirable bacteria. All these matters are discussed in full detail, and a thorough revision of the whole work secures that the new edition presents to the reader the actual condition of the methods of water treatment as they now exist.

THE CIVIC ENGINEER'S WHO'S WHO. Second (1913) Annual Issue. Price 2s. 6d. nett. London: St. Bride's Press, Limited.

The reception accorded to the first edition of this work was sufficiently encouraging to induce the publishers to issue this second edition, which not only retains the best features of the first, but also marks a considerable advance in more than one direction. The present edition is fifty pages larger than its predecessor, the increase in size being partly due to the addition of several new biographies of engineers belonging to the classes previously represented—chiefly municipal and county engineers or surveyors—and, in particular, to the enlargement of the scope of the work so as to include a number of biographies of the urban district council surveyors of England and Wales. As the work only deals with living engineers, death has necessitated the omission of some articles that appeared in the first edition. Some deaths and other changes have occurred while the work was in the press, but, substantially, the information given will be found to be up to date in these as in other respects.

HAZELL'S ANNUAL, 1914. Edited by T. A. Ingram, M.A. Price 3s. 6d. nett. London: Hazell, Watson & Viney, Limited.

Once more our infallible friend "Hazell's Annual" is at hand with its record of the movements of the world in the year that has just closed and its intelligent anticipation of the questions likely to occupy our attention in the year that is opening. Whether the reader seeks for the 1914 Budget of a foreign country, the latest balance-sheet of an insurance company, the complete list of winning jockeys, or the newly-appointed Suffragan Bishop of Buckingham, he will not be disappointed. Some idea of the extraordinary extent and variety of the information compressed into this wonderful work may be conveyed by the statement that its index contains some 10,000 references. For those who require a reliable digest of hard facts, we can only say that "the blue books of the year boiled down into one red one" is a fitting description of what they will find in "Hazell's Annual."

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

HANDBOOK ON SANITATION. By George M. Price, M.D. Price 6s. 6d. nett. London: Chapman & Hall, Limited.

The author of this book has had considerable experience of public health work in America, and is consequently well qualified to write on sanitation. Although intended primarily as a manual of theoretical and practical sanitation for the use of sanitary inspectors, Mr. Price's work will be found of much value to all students of sanitary science. The book is divided into three parts, the first of which deals with sanitary science as applied to air, water, sewerage and drainage. The second part is devoted to sanitary practice, including factory inspection, offensive trades, food inspection, and disinfection; while the third part deals with sanitary inspection as a profession. The book is written in regard to American practice, but it will be found very useful to sanitary inspectors and students in this country, both as a means of comparison and because of its intrinsic practical value.

FARM GAS ENGINES. By C. F. Hirschfeld and T. C. Ulbricht. Price 6s. 6d. nett. London: Chapman & Hall, Limited.

This book is intended as a practical guide to enable a prospective purchaser of a Farm gas engine to select that type which will be most efficient and economical for his purpose. Undue prominence is therefore not given to the actual operation and care of these engines, but these matters are discussed sufficiently fully to enable the reader to appreciate the necessary conditions of successful working. The greater part of the book is devoted to a discussion of the weak and strong points in the various designs, to the features which give long and useful life and those which tend to cause early failure, and to the characteristics which best adapt different types to different uses. A very useful chapter on "power, price, and speed" is included. The book is copiously illustrated, and the aim of the authors has been admirably carried out.

THE GOOLE COUNCIL INCIDENT.

A PRESENTATION FOR THE SURVEYOR.

A presentation is shortly to be made to Mr. C. G. Bradley, the surveyor to the Goole Urban District Council, who at Leeds Assizes was fined £10 for assaulting Councillor William Jackson, the vice-chairman of the council. Ten of the councillors have decided to pay the fine, while the following address is to be presented to the surveyor: "We, the undersigned property owners, ratepayers, and voters in the Goole urban district area, desire to express our sympathy with you in the trying position in which you have recently been placed as a result of an unfortunate incident which occurred in the Goole council chamber on October 29th. We consider that this regrettable affair was principally the outcome of your strict fidelity to duty, and your upright adherence to the interests of the ratepayers. We wish to take this opportunity of placing on record our appreciation of your professional work in Goole, and the honourable manner in which you have carried out your duties."

Glasgow Street Paving.—Mr. T. Nisbet, the Glasgow master of works, reports that, during the year which ended on May 31st, the amount of capital expenditure on the paving with granite or whin setts of streets within the city was £8,057, being £4,372 less than the amount authorised. The ordinary expenditure for the maintenance and repair of streets was £88,817, as compared with an estimated charge of £79,851. The cost of sanding streets was £3,663, of which £1,101 was allocated against the tramways department.

Society of Engineers: Status Prize.—The council of the Society of Engineers may award this year a premium of books or instruments to the value of £10 10s. for an approved essay on "The Status of the Engineering Profession." The council reserve the right to withhold the premium if the essays received are not of a sufficient standard of merit. The competition is open to all, but, before entering, application for detailed particulars should be made to the secretary, 17 Victoria-street, Westminster. The last date for receiving essays is May 30th next.

SURFACE TREATMENT OF ROADS.

Early last year arrangements were made by which the two classes of business, tar-spraying and road construction, which had been carried on by the Taroads Syndicate, Limited, and the Praed Road Construction Syndicate, Limited, were separated and extended. The fact of this separation has enabled the Taroads Syndicate, Limited, to devote the whole of their attention to the surface treatment of roads. It may not unnaturally be expected to make for an even greater efficiency in the organisation and execution of the work, which has been, and will be, continued by them at their old offices, 9 Victoria-street, Westminster, S.W., under the personal supervision of the chairman, Sir Herbert Mackworth Praed, who has associated with him the same experienced superintendents and staff as in the past.

A record amount of work was done by the company last year, and of the very large number of authorities for whom they have done work, there are none, it appears, that have not given large repeat orders during the seven years the firm have been carrying out these contracts.

A number of advantages are claimed for the machine used by the company in the execution of work undertaken by them. The large type of machine is capable of treating as much as 20,000 yds. super. of road per day, thus rendering it possible to take the fullest advantage of spells of fine weather—a material consideration. Penetration is absolutely assured with the machines, and in practice it has been found that roads treated for two or three years show a tar penetration of from 2 in. to 3 in.; further, complete, even distribution is assured. An immense saving in scavenging and watering is also claimed for roads that have been treated by the process.

It should be added that the machines are thoroughly overhauled after each season's work, and certain improvements and additions increasing their efficiency have recently been embodied with a view of carrying out work under the best conditions during the present year; and, finally, it is eloquent testimony to the simplicity of the system that the firm are able to make use of local labour in any district where they happen to be engaged in the carrying out of a contract.

HIGHWAY MAINTENANCE AND REPAIR IN ENGLAND AND WALES.

Part III. of the forty-second report of the Local Government Board—just issued—contains the following particulars with regard to the mileage of roads in

Description of Roads.	Year 1910-11.		
	Gross expenditure.	Mileage.	Average expenditure per mile.
	£	Miles.	£
<i>Main roads repaired by County Councils other than the London County Council</i>	1,712,653	18,351	93
<i>Main roads repaired, on behalf of County Councils, by Councils of—</i>			
<i>Boroughs other than county boroughs and metropolitan boroughs</i>	281,691	1,243	227
<i>Urban districts other than boroughs</i>	488,793	2,315	211
<i>Rural districts</i>	472,989	5,842	81
<i>Roads (not being main roads) repaired by Councils of—</i>			
<i>Boroughs other than county boroughs and metropolitan boroughs</i>	549,342	4,871	111
<i>Urban districts other than boroughs</i>	969,604	11,411	85
<i>Rural districts</i>	2,312,581	98,077	24
<i>Public roads and streets repaired by Councils of—</i>			
<i>County boroughs</i>	1,287,476	9,366	137
<i>Metropolitan boroughs</i>	686,931	2,144	325
<i>Public streets repaired by the Corporation of London</i>	37,862	48	747

England and Wales, and the money expended on their maintenance and repair from 1910-11 by the several classes of councils.

CHANGE OF TELEPHONE NUMBER.—Readers are requested to note that "The Surveyor" telephone number is now City 1046.

PORTABLE REINFORCED CEMENT BUILDINGS.

Messrs. F. H. Heath, Limited, 22 Bridge-street, Manchester, have recently applied for a patent in connection with a portable sectional reinforced-cement building. The firm have designed this building in response to numerous demands for a building of a semi-permanent type that can be removed to another site when desired and they have already erected several schools, village halls, sanatoria, dispensaries, and so forth, on the new system.

The buildings are timber-framed structures, and the sections are made in a special manner overlapping each other, being attached by means of slots and plates, while on the inside and outside moulded fillets are attached by means of slots and plates. On the inside and outside moulded fillets are attached by screws, so that they are easily moved when required. The walls are made in panelled sections of a convenient width, so that they can be taken down without damage to the cement and plaster work.

The outside of the buildings are finished imitation stonework or rough cast, and the insides are plastered in the usual way, or, in the case of isolation wards, finished in Keen's cement. The roofs are either covered with red asbestos-slates, Goussac, or other superior waterproof coverings.

It may be mentioned that the Local Government Board have approved of this construction, and are granting a twenty years' redemption loan to local authorities for buildings so constructed.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A., Borough Surveyor, Great Yarmouth.

EXAMINATIONS.

Notice is hereby given that the syllabus of the examinations held by the Institution of Municipal and County Engineers has been altered by the addition to Subject IV. (Sanitary Science) of the following section:

(c) The Improvement of Insanitary Areas.

NEW SUBJECT: TOWN PLANNING.

A new subject (VI.), dealing with the town planning portion of the Housing and Town Planning Act of 1909, has been added to the syllabus as an optional subject. The questions set will be based on—

(1) A general knowledge of the town planning portion of the Housing and Town Planning, &c. Act, 1909, and the Local Government Board Regulations thereunder with regard to the preparation of a town planning scheme.

(2) Suitability of area for town planning.

(3) Natural features, consideration of drainage, preservation of forest trees, &c.

(4) Buildings; allocation of areas for dwelling-houses (sites and number per acre), shops, factories, protection from noxious trades, from obstructive buildings, &c.; protection of ancient buildings and monuments.

(5) Building lines.

(6) Streets; arterial and subsidiary or estate streets; their direction and design in relation to traffic and configuration of the ground, and their embellishment.

(7) Provision of parks, open space, playing fields and allotments, disposition and size in regard to the area of the scheme and the nature of the locality.

Candidates who have received the testamur of the institution will be allowed to sit for examination in this subject only should they desire to do so. A certificate will be given to candidates satisfying the examiners.

WEST MIDLAND DISTRICT.

A meeting of the West Midland District of the institution will be held at Birmingham on January 15th.

SOUTH-EASTERN DISTRICT.

A meeting of the South-Eastern District of the institution will be held at 92 Victoria-street on January 17th.

NORTH-WESTERN DISTRICT.

A meeting of the institution is to be held in the North-Western District at Manchester on February 20th and 21st.

THOMAS COLE,
Secretary.

92 Victoria-street, S.W.

INSTITUTE OF SANITARY ENGINEERS.

The president-elect, Mr. John D. Watson, M.Inst.C.E., chief engineer to the Birmingham, Tame and Rea District Drainage Board, will deliver his inaugural address to the members on Wednesday, January 7th.

SEA-COAST EROSION.—For a very complete and expensive library on the cause, prevention and repair of coast erosion the following three works are recommended: "Coast Erosion and Foreshore Protection," by John S. Owens, M.D., Assoc.M.Inst.C.E., F.R.C.S., and Gerald C. Case (price 7s. 6d., post free 7s. 10d.), with numerous illustrations and diagrams; "Sea-Coast Erosion and Remedial Works," by R. G. Allanson-Winn, M.Inst.C.E.I. (price 1s., post free 1s. 1d.); and "Erosion of the Coast and its Prevention," by F. W. S. Stanton, Assoc.M.Inst.C.E., F.S.I. (price 3s., post free 3s. 2d.), with numerous maps and other illustrations. The publishers are the St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, London, E.C.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

CLERK OF WORKS.—January 3rd.—Devonport Town Council. £2 10s. per week.—Mr. J. F. Burns, borough surveyor.

SURVEYOR'S CLERK.—January 3rd. Gellygaer Urban District Council. £80—£100 per annum.—Mr. Frank T. James, clerk, Council offices, Hergeot, Glam.

MANAGER OF SEWAGE DISPOSAL WORKS.—January 5th.—Sutton-in-Ashfield Urban District Council. £2 per week.—Mr. John D. Fidler, clerk.

ASSISTANT BUILDING INSPECTOR.—January 6th.—Corporation of Coventry. £2 5s. per week.—Mr. J. E. Swindlehurst, city engineer and surveyor.

JUNIOR ASSISTANT.—January 7th. Borough surveyor's office, Corporation of Smethwick. £65 per annum.—Mr. A. Hosken, borough surveyor.

BURGH SURVEYOR'S ASSISTANT. January 7th. Alton Town Council. £75 per annum.—Mr. C. Thomson, town clerk.

STREETS AND SANITARY SUPERINTENDENT.—January 7th.—Corporation of Scarborough. £150—£200 per annum.—Mr. Harry W. Smith, borough engineer.

SURVEYOR OF HIGHWAYS.—January 7th.—Louth Rural District Council. £100 per annum.—Mr. F. C. Chard, clerk.

ASSISTANT.—January 10th.—Water engineer and surveyor's department, Bilston Urban District Council. £100—£120.—Mr. Joseph L. Arlidge, clerk.

WATERWORKS ENGINEER.—January 12th.—Bridlington Town Council. £190—£120.—Mr. A. E. Matthewman, town clerk.

CITY ENGINEER.—January 17th. City of Cape Town. £1,500 per annum.—Messrs. Davis & Soper, agents for the corporation, 54 St. Mary-axe, London, E.C.

ENGINEER AND SURVEYOR.—January 31st.—Rhondda Urban District Council. £500—£750.—Mr. W. P. Nicholas, clerk, Pentre, Rhondda.

ASSISTANT ENGINEERS.—April 1st.—Indian Public Works and State Railways Departments.—Secretary, Public Works Department, India Office, London, S.W.

ASSISTANT ENGINEER.—Government Electric Light Department, Southern Nigeria. £300—£350 per annum, with allowances.—Messrs. Preece, Cardew & Suell, 8 Queen Anne's-gate, Westminster, S.W. Quote M6541 on letter of application.

ASSISTANT ENGINEERS AND DRAUGHTSMEN.—Sierra Leone Public Works Department. Engineers, £300—£400; draughtsmen, £300—£350.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

TEACHER OF LAND SURVEYING.—Early in January.—Guildford Technical Institute.—Mr. F. A. Tosswill, Director of Technical Education, Technical Institute, Guildford.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

COVENTRY.—February 1st.—Sketch plans for a technical institute, for the corporation.—Education Offices, 44 Bayley-lane.

BELFAST.—March 20th.—Designs for an art gallery and museum, for the corporation.—Mr. R. Meyer, town clerk.

LONDON.—May 4th.—Designs from British architects for the architectural treatment of the new St. Paul's Bridge, for the City Corporation. Premiums, £300, £200, and £100.—Town Clerk, Guildhall, E.C.

NEWPORT PAGNELL. (No date).—Plans and specifications for working-class cottages, for the rural district council. Award of ten guineas.—Mr. C. W. Powell, clerk.

DURHAM.—(No date).—Plans for a residential school for defective children, for the county council.—Education Committee, Shire Hall, Durham.

BATH.—(No date).—Designs for a secondary school, for the corporation.—Mr. F. D. Wardle, town clerk.

BRIGHTON.—(No date).—Designs for a clock tower in Queen's Park, at a cost, including the clock, not exceeding £1,000, for the corporation.—Mr. H. Talbot, town clerk.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

Buildings.

TEDDINGTON.—January 3rd.—For erecting buildings, chimney shaft, sewers, manholes, connections, and roadways in connection with sewage disposal and refuse destructor works, for the urban district council.—Mr. Marshall Hainsworth, surveyor.

SAWBRIDGEWORTH.—January 5th.—For the erection of council chambers and offices, for the urban district council.—Mr. W. Morris, clerk.

SOUTHPORT.—January 5th.—For the construction of a sea-bathing lake, for the corporation.—Borough Surveyor.

DROYLSDEN.—January 5th.—For the erection of a shelter, for the urban district council.—The Engineer.

SOMERSET.—January 6th.—For the rebuilding of Marston Magna bridge and the widening of the main road approaches, for the county council.—Mr. H. T. Chapman, county surveyor, Wells.

SHEFFIELD.—January 6th.—For laying foundations for three boilers, base of chimney stack, and two motor houses, for the corporation.—Mr. S. E. Feddan, electricity manager, Commercial-street.

- 23.—Surveyors' Institution: Annual Dinner, Whitehall Rooms. 7 p.m.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

BILSTON URBAN DISTRICT COUNCIL.
WATER ENGINEER AND SURVEYOR'S DEPARTMENT.

The Council invite applications for the Appointment of an Assistant in the above Department at a salary of £100, rising by annual increments of £10 to £120 per annum.

Experience in a Surveyor's Office essential, and preference will be given to candidates who have passed the Qualifying Examination for Assoc. Membership of the Institute of Civil Engineers, or hold the Testamur of the Institute of Municipal and County Engineers.

Applications, stating age and experience, accompanied by not more than three recent testimonials, and endorsed "Surveyor's Assistant," must be sent to me not later than Saturday, the 10th of January, 1914.

Canvassing, directly or indirectly, will be a disqualification.

JOSEPH L. ARLIDGE,

Clerk to the Council.

Town Hall,
 Bilston, Staffs. (1,066)

SUTTON-IN-ASHFIELD URBAN DISTRICT COUNCIL.

APPOINTMENT OF MANAGER OF SEWAGE DISPOSAL WORKS.

The Sutton-in-Ashfield Urban District Council invite applications for the appointment of a Manager of their Sewage Disposal Works at a salary of £2 per week.

Candidates must have had experience in a similar capacity.

Applications, in candidate's own handwriting, stating age, present position and previous experience, and accompanied by copies of three recent testimonials, to be sent in not later than 5 o'clock on Monday, the 5th day of January, 1914, endorsed "Manager," to the undersigned.

JOHN D. FIDLER,

Clerk.

Clerk's Office,
 Forest-street,
 Sutton-in-Ashfield, Notts. (1,075)

A FIRM of standing requires the services in London and District of a representative for Sewage Ironwork Fittings. Experience in this class of business and connection with engineers and contractors are essential points. Salary and commission would be the basis of remuneration.—Apply, with full particulars, to Box 1,350, office of THE SURVEYOR, 21 Bride-lane, Fleet-street, E.C.

GUILDFORD EDUCATION COMMITTEE.

Wanted, early in January, Teacher of Land Surveying for the Guildford Technical Institute. Tuesday evenings (two hours). Travelling expenses paid. Applications, stating age, qualifications, teaching experience and salary required, accompanied by testimonials, to be sent to F. S. Tosswill, Director of Technical Education, Technical Institute, Guildford. (1,075)

BOROUGH OF SCARBOROUGH. STREETS AND SANITARY SUPERIN- TENDENT.

The Town Council of Scarborough invite applications from persons, not over 45 years of age, for the position of Superintendent of the Streets and Sanitary Department of the Corporation.

Terms of appointment and list of duties may be obtained on application to me.

Candidates should have had actual working knowledge in some town other than Scarborough in the performance of the duties to be carried out.

Salary £150 per annum, rising, by such amounts and at such times as the Council may think proper, to £200 per annum.

Applications must be on printed form only, which form can be obtained from me, and should be sent to me in a sealed envelope, endorsed "Superintendent," so as to reach me not later than 12 noon on Wednesday, January 7, 1914.

Canvassing, directly or indirectly, in any way whatsoever, is distinctly forbidden, and will be deemed a disqualification. This condition will be strictly observed.

No more than two copy (not original) testimonials may accompany each application, and such testimonials must be from persons having actual knowledge of the candidate's experience.

Dated this 20th day of December, 1913

HARRY W. SMITH,
Borough Engineer.

Town Hall,
Scarborough. (1,065)

CITY OF COVENTRY. ASSISTANT BUILDING INSPECTOR.

The General Works Committee of the Corporation of the City of Coventry is prepared to receive applications for the appointment of a Temporary Assistant Building Inspector in the City Engineer's Department.

The appointment will be temporary, but will be of at least 12 months' duration.

Candidates must be thoroughly qualified persons between the ages of 27 and 40, and will be required to undertake the inspection and testing of drainage, and to make accurate surveys and records of all new buildings, drainage, &c., and generally to assist the Building Inspector.

Candidates must have had experience in the above work, and should possess the certificate of the Sanitary Institute.

Wages will be at the rate of £2 5s. per week, and the appointment will be terminable by one week's notice on either side.

Applications, in candidate's own handwriting, stating age, experience, past and present employment, accompanied by copies of not more than three recent testimonials, and endorsed "Assistant Building Inspector," to be sent to the undersigned not later than Tuesday, the 6th proximo.

Canvassing, directly or indirectly, will be considered a disqualification.

J. E. SWINDLEHURST, M.INST.C.E.,
City Engineer and Surveyor.

St. Mary's Hall,
Coventry.
December, 1913. (1,085)

GELLYGAER URBAN DISTRICT COUNCIL. SURVEYOR'S CLERK.

The above Council require the services of a Clerk in their Surveyor's Department. Applicants must have had previous experience in a similar position, and must be capable of checking and allocating all bills, keeping and balancing wages books, cash and other accounts, and have a knowledge of the general routine of the office. Preference will be given to candidates who have also a knowledge of shorthand and type-writing. Salary £80 per annum, rising by yearly increments of £5 to £100.

Applications, giving age and full particulars of experience, and accompanied by copies of not more than three recent testimonials, to be sent to me not later than the 3rd day of January, 1914.

FRANK T. JAMES,
Clerk to the Council.

Council Offices,
Hengoed, Glam. (1,079)

JUNIOR ASSISTANT required. Temporary. Westminster. Must be good draughtsman, with some experience in levelling. 3 or 3½ guineas, according to qualifications.—Apply Box 1,354, office of THE SURVEYOR, 24 Bride-lane Fleet-street, E.C. (1,051)

RHONDDA URBAN DISTRICT COUNCIL. APPOINTMENT OF ENGINEER AND SURVEYOR.

The Rhondda Urban District Council invite applications for the position of Engineer and Surveyor to the Council.

Candidates must have gained experience in the duties relating to the office in a large and developing Urban Sanitary District, and must be Members of the Institute of Civil Engineers.

The gentleman appointed to the position will be required to devote the whole of his time to the duties of the office, and must reside within the Rhondda Urban area.

Candidates must not be under 30 nor more than 45 years of age.

Commencing salary £500 per annum, rising by annual increments of £50 to a maximum of £750 per annum.

Offices will be provided by the Council, who will also find all the necessary clerical and other assistance.

Applications must be made on the Form provided for the purpose, which may be obtained from the undersigned, and which Form, accompanied by copies of three recent testimonials, enclosed in an envelope, and endorsed "Engineer and Surveyor," must be delivered to me, the undersigned, on or before the 31st day of January, 1914.

Canvassing Members of the Council, or asking from them letters of introduction or recommendation, is absolutely prohibited, and any applicant canvassing a Member by circular or otherwise, or obtaining from him a letter of recommendation to any other Member or Officer of the Council, will be disqualified.

Candidates, if they so desire, may print the prescribed Form of Application as filled in by them and the testimonials submitted in support thereof, and may send 40 copies thereof to the undersigned, who will distribute the same to the Members of the Council.

W. P. NICHOLAS,
Clerk of the Council.

The Council Offices,
Pentre, Rhondda.
December 22, 1913. (1,077)

COMPETITIONS OPEN.

COMPETITION FOR PROPOSED CONCRETE COTTAGES.

THE Proprietors of *Concrete and Constructional Engineering* invite Architects, Surveyors and their Assistants, residing in the British Empire, to compete in the preparation of the Design of a suitable Detached or Semi-detached Labourer's Cottage, largely or mainly of concrete, to be erected in sets of six in the Home Counties of England (at least 30 miles from Charing Cross), at a prime cost to the owners of £125 per cottage.

The Proprietors offer the following Premiums:—

First Prize—One Hundred Guineas.

Second Prize—Fifty Guineas.

Third Prize—Twenty-five Guineas.

Fourth and Fifth Prizes—Ten Guineas each.

The Assessors (whose decision as to the competition is final) will be:

Max Clarke, F.R.I.B.A.

Prof. A. Beresford Pite, F.R.I.B.A.

Edwin O. Sachs, F.R.S.E.D.

The Competitive Designs must be delivered not later than May 15th, 1914, Noon, at the Offices of *Concrete and Constructional Engineering* (but not earlier than May 1st).

The Conditions of the Competition will be found in the January issue of *Concrete and Constructional Engineering*, obtainable after January 3rd, 1914, on application in writing with remittance of 1s. 3d. to the Publisher, *Concrete and Constructional Engineering*, North British and Mercantile Building, Waterloo-place, Pall Mall, London, S.W. (1,029)

TENDERS WANTED.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

RURAL DISTRICT OF WOODSTOCK.
HARTSHILL, LEICESTERSHIRE GRANITE,
ROWLEY REGIS, AND BEST RUBBLE,
OR OTHER HARD STONE.

The Rural District Council of Woodstock invite Tenders for the Supply of Stone of each or either of the qualities above named at per ton—viz.:—

Best Hand-picked Unbroken Stone, Best Broken Stone (2-in. gauge, clean and free from chippings), Best Double-screened Nuts for patching purposes (1½-in. gauge), Best Double-Screened Coarse Chippings and Binding Chippings, and Best Rubble.

The Stone is to be delivered to the Council at the undermentioned Wharves on the Oxford and Birmingham Canal—viz.: Aynho, Semerton, Heyford, Euslow, Thrupp Landing, Langford-lane, Kidlington, Bridge, King's Bridge, and Wolvercote; and at the undermentioned Railway Stations—viz.: Handborough and Woodstock.

The Stone is to be delivered at the dates and places and in the quantities to be specified in the Surveyor's written orders, to be sent by post to the Stone Contractors from time to time, and the whole of the Stone is to be supplied before the 1st of October next.

A person tendering, if his Tender is accepted, will be required to sign a written Agreement to supply the Stone in accordance with the terms of this advertisement and the Surveyor's orders.

Tenders and Samples must be delivered at my Office in Woodstock on or before Monday, the 12th day of January, 1914.

Wharfage and Railway Charges are payable by the Stone Contractors.

Forms of Tender can be obtained on application at my Office.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)
A. G. HIGGS,
 Clerk to the District Council.

Woodstock.
 December 29, 1913. (1,086)

MIRFIELD URBAN DISTRICT COUNCIL.
SEWAGE DISPOSAL WORKS.

The Mirfield Urban District Council invite Tenders for the Extension of Works for the Disposal of Sewage at the Sewage Farm, Northorpe, within the District of Mirfield.

Contract No. 1 comprises the Construction of Screening Channel, Detritus Tanks, Gauge Channel, Settling Tanks, Stormwater Tanks, Sludge Drainers, Conduits, Drains, Manholes and other incidental works.

Contract No. 2 comprises the supply and delivery of Sluice Valves, Sludge Valves, Gauge Plates, Cast-iron Pipes and Specials, Wrought-iron Ladders, Manhole and Lamphole Covers, &c.

Copies of General Conditions of Contract and Specification and Bill of Quantities with Forms of Tender may be obtained and Drawings inspected on application to Mr. Edwin Gill, Engineer and Surveyor, Council Offices, Mirfield, on or after 1st of January, 1914, for Contract No. 1, and after the 5th of January for Contract No. 2 on payment of £2 2s., which must be forwarded with the application for Quantities, which amount will be returned on receipt of a *bona-fide* Tender and return of all documents entrusted to the Contractor for the purpose of Tendering.

The Council do not bind themselves to accept the lowest or any Tender.

Sealed Tenders, with the Bill of Quantities, in envelopes supplied, and endorsed "Sewage Disposal Works," must be delivered not later than 12 o'clock noon on January 19, 1914.

EDWARD B. WILSON,
 Clerk to the Council.

Council Offices,
 Mirfield.
 December 28, 1913. (1068)

SURREY COUNTY COUNCIL.

MAIN ROADS UNDER DIRECT COUNTY MANAGEMENT.

URBAN DISTRICTS OF WALTON-ON-THAMES AND WINDLESHAM, AND RURAL DISTRICTS OF GUILDFORD AND HAMBLEDON;
 (Portsmouth Road North of Godalming only).

MATERIALS.

Tenders are invited for the supply of high-class Granites, Basalts, Limestone, Slag, Tar-Macadam, Bitumen, Pitch, Tar, and Tar Oils delivered at Railway Stations; also for Flints, and Fine Gravel for footpaths, delivered either at Stations or at the road-side.

Specifications, Schedules, and Forms of Tender may be obtained on application to the County Surveyor, County Hall, Kingston-on-Thames, to whom Tenders must be sent in sealed and endorsed envelopes so as to reach his Office on or before the 20th day of January, 1914.

By order,
A. DRYLAND,
 County Surveyor.

County Hall,
 Kingston-on-Thames.
 22nd December, 1913. (1067)

AMMANFORD URBAN DISTRICT COUNCIL.
PROPOSED SEWERAGE SCHEME.

The above Council invite Engineers to quote their terms (inclusive) for—

- (1) Preparing a Scheme for the Sewerage of their Urban District with Plans, Details, &c.
- (2) For preparing all necessary Plans and rendering all necessary assistance in the promotion of a private Bill in Parliament.
- (3) For superintending and carrying out to its completion the above-mentioned Sewerage Scheme.

All Plans, Sections, &c., to be the property of the Council.

All applications to be in the hands of the undersigned, marked "Sewerage," on or before the 6th day of January, 1914.

T. M. EVANS,
 Clerk to the Council.

Dated this 22nd day of December, 1913. (1,060)

SHARDLOW RURAL DISTRICT COUNCIL.
DRAYCOTT AND BREASTON SEWERAGE AND SEWAGE DISPOSAL WORKS, &c.

The above-named Council invite Tenders from responsible Contractors for the Sewerage and Sewage Disposal Works in the Parishes of Draycott and Breaston, near Derby. The works comprise about 3 miles of Stoneware Pipes (12 in. to 6 in.), with Manholes and other appurtenant Works; three Ejector Chambers with 1½ miles of 3-in. and 2½-in. Compressed Air Main and 1,815 yards of 7-in. and 5-in. Rising Main; with Air Compressor Station. Also the Construction of Purification Works, consisting of Tanks, Bacterial Filters, &c.

Plans and Specification can be seen at the Offices of the Engineers, Messrs. Elliott & Brown, A.M.M. INST.C.E., Burton Buildings, Parliament-street, Nottingham, and copies of the Specification, Bills of Quantities, and Form of Tender may be obtained (after the 9th day of January) on deposit of Three Guineas (by cheque), which will be returned on receipt of a *bona-fide* Tender, not afterwards withdrawn, and the return of all documents.

Sealed Tenders, endorsed "Tender for Draycott and Breaston Sewerage Works," to be delivered to the undersigned not later than the first post on Friday, the 23rd day of January, 1914.

The lowest or any Tender will not necessarily be accepted.

(By order)
J. W. NEWBOLD,
 Clerk to the Council.

Becket-street,
 Derby. (1,089)

RAILS, F.B., wanted; about 1,000 yds. 20-22 lb. per yard. Must be in good condition. State full particulars and lowest price delivered Manchester.—Box 1,356, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

COUNTY BOROUGH OF SWANSEA. VICTORIA PARK BRIDGE, WITH APPROACHES THERETO.

The Corporation of Swansea invite Tenders for the Construction of Masonry and Concrete Approaches, Piers, &c., for a Bow-string Truss Steel Girder Foot-bridge of 111-ft. span, and also for the Supply and Erection of the said Bridge.

The Contract has been drawn up in two parts—viz.,

- (1) Masonry, &c., for Approaches and Piers.
- (2) Steelwork for the Bridge;

but Contractors may submit Tenders for one or both parts.

Particulars and Forms of Tender may be obtained from the Corporation's Consulting Engineer, Mr. H. Howard Humphreys, of 28 Victoria-street, Westminster, S.W., on Wednesday and Thursday, the 14th and 15th days of January, 1914, between 10 a.m. and 5 p.m.

Intending Contractors will be required to deposit a sum of Three Guineas prior to particulars being furnished, such sum being returned on receipt of a *bona-fide* Tender.

Tenders, endorsed "Victoria Park Bridge," must reach the undersigned not later than 11 a.m. on the 26th day of January, 1914. The Corporation do not bind themselves to accept the lowest or any Tender for either part of the Contract.

H. LANG COATH,
Town Clerk.

Guildhall,
Swansea.

December, 1913. (1,064)

SLEAFORD RURAL DISTRICT COUNCIL. EXTENSION OF WATERWORKS FOR THE PARISH OF HECKINGTON.

CONTRACT No. 2.

The Sleaford Rural District Council are prepared to receive Tenders for the Supply, Laying and Jointing of about 8½ miles of Cast-iron Mains and Specials, 4 in. and 3 in. diameter respectively, the Provision and Fixing of Sluice and Air Valves, Standposts, and other Works of Water Supply for the Parish of Heckington, in accordance with the Specifications and Quantities prepared by Mr. W. B. Marsden, Engineer and Surveyor to the Council, Sleaford.

Copies of the Specification and Bills of Quantities, with Form of Tender, may be obtained from, and the Plans inspected at, the Office of the aforesaid Engineer, 74 Southgate, Sleaford, on and after the 1st day of January, 1914, upon payment of £2 2s. (cheque only), which will be returned upon receipt of a *bona-fide* Tender and the return to the Engineer of all documents, &c.

Tenders, endorsed "Heckington Water Supply, Contract No. 2," are to be delivered to me, on or before Saturday, the 24th day of January, in a sealed packet.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

EDMUND CLEMENTS,
Clerk to the Council.

74 Southgate,
Sleaford.

December 23, 1913. (1,082)

SLEAFORD RURAL DISTRICT COUNCIL. PARISH OF KIRKBY-LA-THORPE. WATER SUPPLY.

CONTRACT No. 1.

Tenders are invited for a Deep Boring in the above Parish, about 2½ miles east from Sleaford.

Specification, Schedules and Form of Tender, with all particulars, may be obtained from the Council's Engineer, Mr. W. B. Marsden, 74 Southgate, Sleaford.

Sealed Tenders, endorsed "Kirkby-la-Thorpe Water Supply," to be sent to me on or before January 10th, 1914. The Council do not bind themselves to accept the lowest or any Tender.

(Signed) EDMUND CLEMENTS,
Clerk to the Rural District Council.

74 Southgate,
Sleaford.

December 30, 1913. (1,088)

BARNET URBAN DISTRICT COUNCIL. TO BUILDERS AND CONTRACTORS.

The Barnet Urban District Council invite Tenders for the Erection of New Council Offices, Underground Convenience and Work in connection therewith, in Wood-street, Barnet.

On payment of a deposit of £2 2s., the Bills of Quantities can be obtained from, and the Plans inspected at the Office of, Mr. W. F. Wilkins, Surveyor to the Council, No. 40 High-street, Barnet, Herts., any time during office hours.

The deposit will be returned upon receipt of a *bona-fide* Tender, together with all documents relating thereto.

The Contractor will be required to pay all trades the standard rate of wages for the district.

The Council do not bind themselves to accept the lowest or any Tender.

Approved Sureties will be required as security for the performance of the Contract.

Tenders, on the Form supplied, and accompanied by the Bills of Quantities properly filled in, must be delivered, sealed and endorsed "Council Offices," to the undersigned at No. 40 High-street, Barnet, not later than Noon on Thursday, January 29th, 1914.

(By order)

HY. W. POOLE,
Clerk of the Council.

Barnet.

December 30, 1913.

(1,091)

BOROUGH OF PLYMOUTH.

Notice is hereby given that after the expiration of 10 days from the date hereof the Corporation intend to enter into Contracts for the Supply of the following Goods and Materials for one year:—

Schedule No. 3.—Section A—Paints.

Section B—Varnishes.

- | | | |
|----|----|---|
| .. | .. | 5.—Ironwork. |
| .. | .. | 7.—Petroleum Oil. |
| .. | .. | 8.—Broomheads. |
| .. | .. | 9.—Household Brushes. |
| .. | .. | 11.—Iron and Steel. |
| .. | .. | 13.—Pitchpine, Deals, Flooring, &c. |
| .. | .. | 14.—Carbolic Powder. |
| .. | .. | 15.—Portland Cement. |
| .. | .. | 16.—Lubricating Oils. |
| .. | .. | 17.—Tar and Pitch; includes refined tar for use in the construction of tarred macadam roads and for tar-spraying. |
| .. | .. | 18.—Painters' Brushes. |
| .. | .. | 19.—Explosives. |
| .. | .. | 22.—Soap. |
| .. | .. | 23.—Wood Blocks, Soft. |
| .. | .. | 24.—Creosote. |
| .. | .. | 28.—Disinfectant Fluid (Bacteriological test). |
| .. | .. | 29.—Granite Kerbs, Setts, &c. |
| .. | .. | 30.—White Lead, Red Lead, Linseed Oil, and Turpentine. |
| .. | .. | 31.—Refilling Machine Revolving Brooms. |
| .. | .. | 33.—Benzoline and Motor Spirit. |
| .. | .. | 34.—Tools. |
| .. | .. | 35.—Indiarubber Goods, Hose, &c. |
| .. | .. | 36.—Ship Chandlers' Goods (Sundry Oils, Waste, Grease). |

Tenders must be based on the whole of a Schedule (with the exception of Schedules Nos. 3, 4, 22, 29 and 36), and not on any particular item contained therein.

(Separate Tenders will be considered for Sections A and B of Schedule No. 3.)

Schedules may be obtained on payment of a deposit of £1 in cash for each Schedule. The deposits on the Schedules will be returned, provided *bona-fide* Tenders are received on or before the 17th January, 1914. Should the Contractor withdraw his Tender, or fail to send in one, the amount of his deposit will be forfeited, and the Contractor who applies for the Schedules must do so on the distinct understanding that he is willing to abide by the terms of this advertisement.

The lowest or any Tender will not necessarily be accepted.

Tenders to be delivered not later than Saturday, January 17, 1914, addressed to the undersigned.

JAMES PATON,
Borough Engineer and Surveyor.

Cement Injection for Foundations.

The formation of foundations under ground or under water by means of cement injection is no new idea. Portland cement grout when forced through a tube under pressure into a substratum of gravel will, under suitable conditions, form good concrete at and near the point of injection. It is more than twenty years since Mr. W. R. Kinnipple advocated the method, and from time to time works have actually been carried out in which the principle has been employed, but owing to the uncertainty of the results the grouting of gravel in river beds, or elsewhere, in order to form foundations for piles, piers, or similar works, does not appear to have been seriously adopted hitherto. On the other hand, the principle of forcing cement grout under pressure through pipes in order to strengthen inaccessible work, or in order to fill fissures or cavities, has certainly been adopted with considerable success. One has only to instance the common practice of forcing cement grout behind the iron cylinders in ordinary tube railway work or sewer work, the restoration of the walls of Winchester Cathedral by the process of injecting grout to fill up all cracks, cavities and bad joints, or the work done at the Walshaw reservoir, Halifax, where liquid cement was successfully pumped into 5-in. boreholes in order to fill up all crevices in the stratum under the dam. Similar work has also been done recently in America under the Lahouta dam in Nevada, where 2½-in. tubes were used. The injection of grout behind the concrete linings of the Catskill pressure tunnels is a further instance showing the important part which cement injection plays on works of the first magnitude at the present time.

Notwithstanding the undoubted efficiency of the process of cement injection, in similar processes, it does not appear that much certainty exists as to the result of grouting gravel under water, as may be seen from the experiments recently carried out in America, and described by Mr. H. H. Cartwright in a recent number of the *Engineering News*. These experiments, which are of a most interesting and instructive character, are dealt with elsewhere in the present issue. They certainly demonstrate the many difficulties with which the engineer must contend when he attempts to grout gravel in river beds. The facts that the exact quality and condition of underground gravel cannot be known, that unsuspected beds or patches of silt or mud may exist, that cement injected travels along the line of least resistance, that with air-blown charges the cement is apt to be carried towards the surface of the water with the escaping air, are among the difficulties to be encountered. The value of the process therefore depends primarily upon the possibility of forming the required

foundation in any other way with equal economy. Where, however, it is found to be worth while to make the necessary borings to prove the existence and quality of the gravel, to drive sheet piling in order to confine the cement and prevent its lateral escape, and to prove the extent, quality and character of the concrete foundation when formed by borings made after the work has set, a case will exist in which the method can be used with advantage, for it has certainly been shown by the experiments referred to that good, hard concrete can be formed under water of considerable depth by forcing cement into the gravel through pipes by means of air pressure.

* * *

The Association of Consulting Engineers.

Of all the events of the year that has just drawn to a close there is one which, in its significance as regards the status of the engineering profession, stands out from the rest, marking as it does almost the only definite achievement in the attempts which have been made to obtain for the engineer a due recognition of his standing as a professional man. The granting of the official certificate to the Association of Consulting Engineers has raised the status of every genuinely professional and duly qualified engineer and highway surveyor in the country. Recognition of the consulting branch of the profession necessarily implies recognition of other branches. The engineer to a local authority is no longer a person who, if he were not an official, might be regarded as ranking with plumbers, electric-light fitters, and other mechanics. On the contrary, his official position will merely mark him as belonging to one branch of a profession now recognised as such by the authorities. If it be admitted that one bough of a large tree is an oak bough, it necessarily follows that, apart from "graft," the whole tree is an oak. *Verb. sap.* The Association of Consulting Engineers makes no attempt to arrogate to itself professional pride or position. A member of that body who found it expedient to sever his formal connection with it in order to take a post in the employment of a Government, a public body, or a contractor, would merely be regarded as one who had stepped aside, not in any sense as one who had stepped down. It would be assumed, of course, that in his new capacity his view of the relations between consultants, officials, and engineers in private employment would be exactly what they were before. The Satyr who objected to the processes which he deemed "blowing hot and cold with the same mouth" was, of course, a person of undeveloped intelligence, who did not realise the significance of the difference in temperature between cold fingers and hot porridge, and his prototypes of to-

day will continue to blame the engineer for an impartiality which, on account of differences in the objects of criticism or report, seems to them like inconsistency. While the worth of the individual must be judged not only by his actions, but also in the light of his opportunities and temptations, the worth of the profession as a whole is judged on results alone, and the Association of Consulting Engineers has done well in deciding that, as far as they themselves are concerned, the opportunities shall be as good as possible, and the temptations, as far as may be, removed. A narrow, but significant, view held by a materialistic substratum of society is that a gentleman is a person who need not cheat nor be guilty of meanness, because he is fortunately situated. Let us on the one hand inculcate the higher ideal, and on the other hand extend, in our own profession at least, the fortunate or favourable conditions.

* * *

Conditions Affecting the Maintenance of Roads.

Until a very few years ago, ideas as to most of the conditions affecting road maintenance and the serviceableness of roads were exceedingly crude, and often erroneous. Several of the most important factors were, of course, carefully studied. The effects of traffic, the influence of tyre width and wheel diameter, the extent to which bonding took place in different kinds of crust—all these were carefully considered, and much attention was given to the choice of stones and binders, and, recently, to the qualities of different bituminous binding materials. There were, too, some factors to which attention was directed less consistently, but often usefully, such as the nature of the soil of the road bed, and the influence of subsoil springs and seepage water; but successful methods based on a knowledge of these factors were seldom studied in such a manner as to make manifest their underlying principles, and the information gained added but little to the common stock of knowledge. A large number of other conditions, some of them very important, were, moreover, scarcely ever considered, and current ideas as to these matters often were, and still are, erroneous. The effects of the rainfall of the district, and its characteristic wet and dry spells were sometimes practically taken into account in the locality, but the methods adopted were not always traced to their causes and were often considered as though they were based upon general conditions, and could be regarded as standard practice; and they were therefore recommended for localities to which they were not suited. Again, engineers who were concerned with the conversion of muddy and swampy roads into hard highways were so impressed with the difficulties of trampling through mud, and with the measures taken to dry roads which had been swampy for generations, that they recommended such measures as suitable for the maintenance of all roads, including those in dry climates and traversing hard, gravelly uplands.

The situation was profoundly changed by the publication, by the St. Bride's Press, of Mr. Reginald Ryves' book, "The King's Highway." A number of chapters in this book provide the basis for the study of geological, topographical and climatic factors, and roadside conditions, and of the means which may be taken to combat their ill effects or enhance their favourable influences. To take a single example, the study of the measures to be taken to prevent Northern roads from being blocked by snowdrifts is an important contribution to the science of road planning. Since then we have repeatedly pointed out that a large amount of useful data would be provided if roads, selected on account of sudden and sharp changes in one factor at a time, were divided into lengths, and the costs of maintenance of these lengths separately recorded. The effects of width of carriageway,

width between fences, and the different kinds of shade and screening from wind could then be separately studied and compared. Such data would, cost for cost, be worth more than any to be derived now from official laboratories, since the main facts as regards laboratory experiments are widely known, and fresh information is constantly before us from various sources.

* * *

The Scottish Experimental Lengths.

The method which we have advocated is now, we are glad to be able to announce, accepted by a number of Scottish road surveyors, and the Roads Committee of the Scottish District of the Institution of Municipal and County Engineers are organising a series of experiments of this character. In order that the trial lengths may be the more strictly comparable, these will be specially made to close specifications in situations chosen in the manner which we have recommended. It is intended that, as far as possible, the different factors or sets of factors shall be separately compared, and since the climate cannot be eliminated it is to be taken first. This means that the first set of road lengths will be in other respects as similar as possible. The other factors cannot, of course, be isolated, but by a wise choice of the sequence of the comparisons much useful information may be gained. We have devoted a large part of the present issue to a presentment of the scheme as set forth in the draft memorandum of the Roads Committee, and have given nearly all the particulars relating to the meteorological stations which are to be established alongside the experimental lengths. It is perhaps to be regretted that the committee have not specified road crusts more representative of general practice, but the point is not one of dominant importance. No doubt the committee will see the wisdom of drawing the attention of the observers to facts already known, in order that their powers of observation may be whetted and concentrated on what really matters.

In this connection it may be suggested that the idea that the different factors can really be isolated should not be conveyed in the memorandum. It may also be pointed out that the passage beginning—"The description of road fences . . . is unfortunately worded, for, although it contains a reference to walls, it definitely suggests that the free circulation of air is mainly prevented by over-shading trees or other large obstructions; whereas in actual fact the effect of walls in preventing the favourable circulation of air currents is many times greater than that of trees, and, in many cases, greater than that of large obstructions, such as houses. The memorandum is, however, a first draft, intended for the use of those surveyors who are beginning the work at once, and its authors will have the opportunity of revising it before the experiments are in full swing. The initiative and energy of the Scottish surveyors deserve the highest praise, and their experience with these trial lengths of road will be watched with the greatest interest. There is nothing, however, to prevent similar experiments from being made on selected lengths of existing roads.

* * *

The Drainage of Schools.

The paramount importance of modern sanitation for inhabited buildings of all kinds is now so generally recognised that it is no longer necessary, as was at one time the case, perpetually to urge the danger to the health of the inmates which is inherent in defective drainage systems. In no class of buildings perhaps is it more necessary to bear this principle in mind than in the case of schools, and, recognising this, the Local Government Board have just issued an important memorandum setting forth their views in regard to the drainage of public elementary schools for which loans under

the board's sanction are required. The memorandum has special reference to schools in rural districts where sewers and water services are not available, and its importance is such that we reproduce it *in extenso* in another column. The principles which are laid down in regard to the removal and disposal of waste matters are in no sense novel, but it is necessary to remind educational authorities of their duties in regard to the matters dealt with, and the memorandum therefore serves a very useful purpose. In particular, it is emphasised that the best means for disposing of waste matters must vary in different cases, according to the existing facilities of drainage and water supply, and other local conditions, so that it is impossible to lay down any stereotyped code of regulations. It is clearly pointed out, however, that in no case can disposal of sewage by subsoil irrigation, or any system of leakage into the subsoil, or by its discharge untreated into a ditch or watercourse be regarded as satisfactory. A further rule of general application is that land for irrigation should have an adequate area and suitable soil, and should be at a sufficient distance from any inhabited building or source of water supply, so as not to create a nuisance or pollute the water. It is to be hoped that the contents of the memorandum will be strictly observed in the future by educational authorities, both as regards old and new schools.

* * *

A Unique Resignation.

To resign one's position is, in the municipal engineering world, to lay oneself open to a certain amount of suspicion. There are, of course, resignations and resignations. A man may resign owing to having already been appointed to a better post. He may resign to escape from a life which has become a miniature hell. Ill-health, change of occupation, increasing years, an Irishman's rise, an unexpected inheritance—these are among further reasons of a quite *bona-fide* nature for tendering one's resignation. And there remains the enforced resignation, enforced not necessarily owing to any misfeasance or non-feasance on the part of the officer, but simply, only too often, as the result of some dispute or misunderstanding. Resignation as an alternative to dismissal is, happily, of rare occurrence. We now have a new reason for resignation put forward, and the circumstances strike us as unique. Mr. W. Clement, engineer to the Municipality of South Vancouver, has tendered his resignation because his duties were too light. It is not on record that he asked for less pay, but he certainly desired more work. His salary was £600 a year—not perhaps a very alarming one in a country like Canada, but equal, roughly speaking, to some £300 or £400 in England. Had Mr. Clement thought of it he might have "swopped jobs" with a municipal engineer here. He would then have found no lack of work, while he might have had the good fortune to drop into a berth where the halfpence were solemnly counterbalanced by the kicks. The happening is one which might well engage the attention of the new Canadian Institution of Municipal Engineers. "Work for all" would make an excellent motto for the institution device, with, as crest, a municipal engineer rampant—for work.

* * *

At a recent meeting of the **Building By-laws**, British Constitution Association an interesting paper on the subject of building by-laws was read by Sir William Chance. Sir William pointed out that the origin of regulations relating to building must be sought at least as far back as the Great Fire of London. The paper, however, was only concerned with the by-law problem as it exists in rural areas, in regard to which aspect of the question the associa-

tion has drafted a Bill for submission to Parliament. In pointing out that the rural code has been evolved with too little emendation from the Model by-laws which were originally designed for urban districts the reader of the paper was not breaking any new ground. This anomaly has been to a great extent remedied by the new Model by-laws of the Local Government Board, drafted with special reference to the requirements of rural districts. In the memorandum which prefaced this new series the board stated that it had been represented to them that it would be useful if a series of Model by-laws were framed dealing only with those subjects which were most in need of regulation and control in a rural district from a sanitary point of view, and omitting the additional requirements usually found in an urban code. The new series of by-laws are confined to matters affecting health as distinguished from matters affecting the structure of buildings. It is well known that since the issue of the new series of by-laws the Local Government Board have made considerable efforts to secure their adoption in those rural districts in which the old code was in operation. The principle aimed at by the British Constitution Association is such an elasticity as will leave a builder free to do what he likes so long as he does nothing which will endanger public health. They thus desire to give the local authorities a mere general control over buildings, and they suggest that, in case of difference of opinion between a council and a builder, the Local Government Board should act as arbitrator. In our view such an arrangement is open to considerable objection, both as regards the details of administration and the maintenance of a high standard of building. The subject is one of great difficulty, and, having regard to the present condition of rural housing, we welcome any serious contribution to its discussion, even though we may not be able to express full agreement with the views set forth.

* * *

A County Surveyor's Salary.

The advent of the mechanically propelled vehicle has necessarily resulted in a very large increase in the work of those responsible for highway administration during the past few years. Perhaps those to whom most additional work has fallen are the county surveyors, and it is not surprising that with the enormous increase in the funds which they have to administer there should have been a corresponding tendency to raise salaries. In many places this state of affairs has been frankly accepted, but in certain instances the voice of the self-styled economist has been raised. We observe from the *Derbyshire Times* that an attempt is being made to make the salary of the surveyor of that county matter of public controversy. The proposal is that the salary should be raised by £200 a year by increases spread over two years. One enlightened councillor has intimated his intention of moving the rejection of this proposal, and has expressed the view in the public Press that a man "more amiable and quite as competent" could be obtained to fill the office at £500 a year. An attempt was made to raise a discussion on the matter at a meeting of the South Wingfield Parish Council, whose interest is, to say the least, indirect. At this meeting one worthy member asserted that no surveyor is worth £800 out of public money. It will evidently be a long time yet before local authorities will learn that the cheapest officials are not necessarily the most economical. If the members would only apply in their public capacity the same principle as that which they use when selecting a private doctor or lawyer, some progress would be made. What large public bodies require is high professional ability, and this cannot be obtained unless the proper price be paid.

Experimental Road Construction in Scotland.

SPECIFICATIONS AND CONDITIONS.

[Notes and extracts from a memorandum prepared for the Roads Committee of the Institution of Municipal and County Engineers, Scottish District, by J. Walker Smith and David Ronald. This Memorandum in its present form is a first draft, issued for the assistance of those who wish to instal the measuring and recording instruments at an early date, and possibly make a beginning with actual construction.]

In December of last year the Scottish District of the Institution of Municipal and County Engineers appointed a Roads Committee to "collect and tabulate reliable data as to improved methods of road construction, and, particularly, information as to the effect of climatic conditions taken in conjunction with traffic upon experimental road lengths to be laid down in districts in Scotland having distinctive climatic conditions."

After several meetings the committee have decided to lay down experimental road lengths in a number of districts in Scotland. It is desired to obtain useful information from the first, and ultimately to be able to decide which are the best and most economical form of road construction to meet any given condition of traffic and weather. It has been arranged to put down experimental lengths of road crust in localities where traffic is fairly comparable, and where the surveyors will cordially co-operate with the committee.

Provisional arrangements have already been made with the following county surveyors: Messrs. R. S. Anderson (Peebles), T. Callen (Haddington), P. Clarke (Dunbar), G. Donaldson (Kirkcaldy), W. L. Gibson (Dunblane), R. Paterson (Lockerbie), R. Spittal (Hamilton) and A. Stevenson (Ayr), with Mr. David Ronald, burgh engineer, Falkirk.

The keeping of records should afterwards be extended to all main roads, and thereafter gradually extended. "and sufficient and careful records kept by engineers or surveyors in the ordinary and recognised course of their duties."

THE NATURE OF THE RECORDS.

For intelligent appreciation of results there must be carefully recorded the conditions which obtain at the commencement of the experiments:—

(a) Physical and local conditions; (b) specification and record of methods of construction and materials employed. Then a careful record must be kept of the factors tending to destroy the road: (c) traffic; (d) meteorological conditions. These combined factors will operate to produce certain conditions which must be recorded by (e) measurements of wear, (f) observations of condition of surface. The factor of cost must then be considered under two headings: (g) initial cost; (h) maintenance.

Physical and Local Conditions.—These may best be recorded upon a 25-in. plan with horizontal and cross-sections, as an example sheet A (reproduced herewith). These plans and cross-sections should contain such information as may be necessary, including the following:—

The formation of the present roadway and nature of substratum; the width of the roadway available for vehicular traffic; the width of the footpaths and grass wastes at roadside; the description of road fences, hedges, walls, &c., and particularly the extent to which the roadway is overshadowed by large trees or other obstructions tending to prevent the access of the sun's rays or the free circulation of air; the means of surface drainage, and the points of outfall for surface water; the position occupied by each section under experiment (each section should be 100 yds. in length); the points where the cross-sections have been taken (the centre of each experimental section is most suitable); the points where the measuring blocks are to be inserted in the roadway for the purpose of measuring surface wear (these should fall upon the lines of cross-section); the point where the census of traffic is observed; the location of the meteorological station—if conveniently close.

The measuring blocks should be placed in position before the original surface has been disturbed to enable the original section to be plotted upon squared paper.

There are so many unknown factors in this problem that it is necessary to isolate each in turn. For the present it is desired to keep constant all conditions except climate, which is purposely selected for its variation. The width, grade, subsoil, materials and methods of construction, time of construction, traffic,

&c., are hoped to be reasonably similar. The width is desired to be 18 ft.; the grade should be easy; the subsoil should be good, of dry gravel, if possible; the materials and methods of construction are closely specified, and binders will be supplied from the same bulk. The date of construction is expected to be approximately the same for all localities; the traffic in the various localities chosen should be reasonably similar. A continuous length without cross or junction roads, open and free from overhanging trees should be chosen.

The roads chosen for these first experiments should be such as are at present maintained at a cost of about £75 per annum. The desirability for subsequent experiments with suitable materials upon roads which necessitate a larger annual cost for maintenance is, however, quite recognised. The forms of road construction at present proposed are simple and inexpensive, and suitable for considerable lengths of road in Scotland.

They are eight in number, as follows:—

- (1) Ordinary water-bound macadam with metal as generally used in the locality—preferably whinstone.
- (2) The above, surface tarred with distilled tar to Road Board specification.
- (3) Macadam, 3 in. thick, grouted with a mixture of pitch and sand.
- (4) Macadam, 3 in. thick, grouted with pitch alone.
- (5) The above, surface sealed with prepared bituminous mixture.
- (6) Macadam, superimposed upon and rolled into a layer of tarred chippings, then grouted and surface sealed as above.
- (7) Tar-macadam—*i.e.*, tarred material—surface sealed with distilled tar.
- (8) The above, surface sealed with prepared bituminous mixture.

It is not desired to exclude other forms of construction, and the intention to employ such may be intimated to the secretary, but at present the cost should not exceed 2s. 6d. per square yard.

SPECIFICATION FOR SECTION NO. 1.

This should follow the ordinary practice of the surveyor, and so far as possible should conform with the specification issued by the Road Board for the construction of ordinary macadam roads.

Before laying the new surface of macadam the thickness of the old crust, including foundations, and the nature of the subsoil should be ascertained by opening two trial trenches in the section to be dealt with, extending from the haunch of the road to the centre, such trenches to be made on opposite sides of the road.

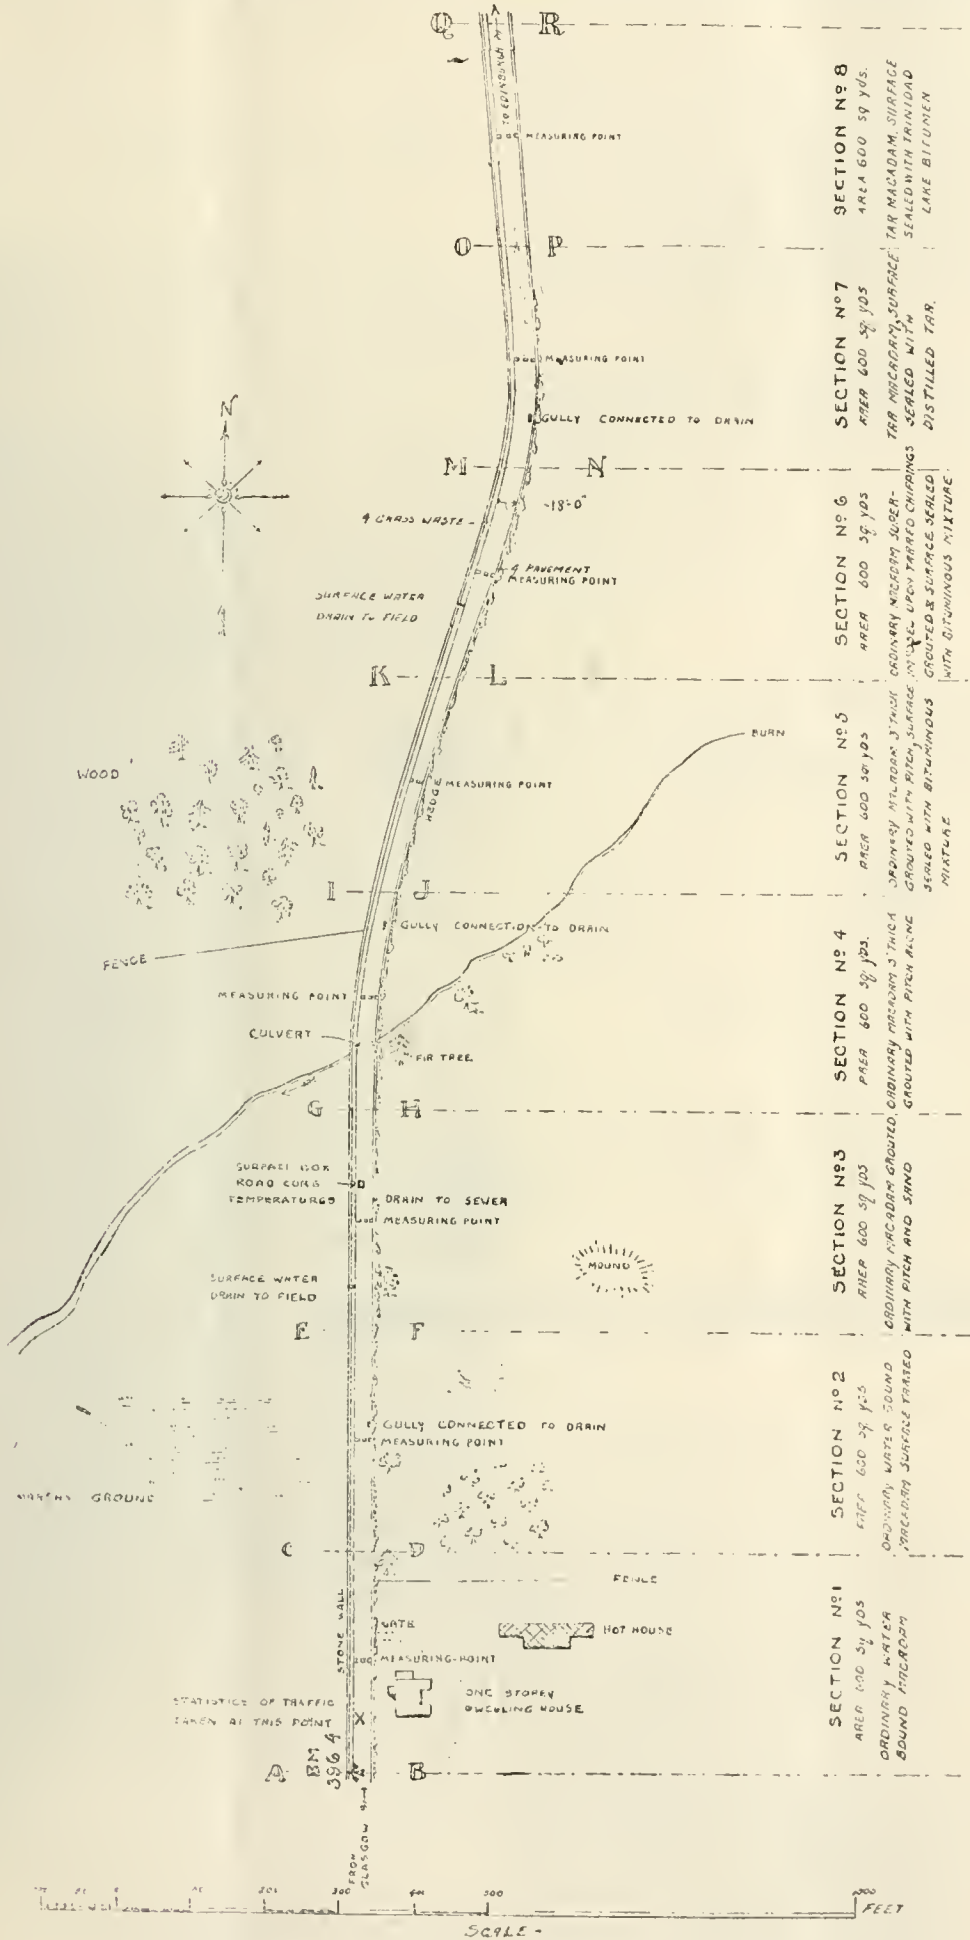

SPECIFICATION FOR SECTION NO. 2.

The new surface of ordinary macadam, prepared as for section No. 1 (with stone chippings as binder, and no fine material), is to be tarred and thoroughly dry, spraying machines being recommended; but hand-work gives good results, and could well be adopted for the small areas in question. The tar used must comply with Road Board specification for tar No. 1, applied hot, the desired temperature being probably between 220 and 240 deg. Fahr.

If the road must be opened for traffic before the tar has set hard, grit should be spread upon the surface to prevent the tar from adhering to the wheels of vehicles; but gritting should be delayed as long as possible, and the quantity of gritting material to be spread should be no more than sufficient to prevent the tar from adhering to the wheels. Stone chippings, crushed or pea gravel, coarse sand or other approved material, free from dust, and not larger than will pass through a 2-in. to 1½-in. mesh, should be used for gritting in quantity not exceeding 1 ton for 120 super. yds. if grit is used, and 1 ton for 200 to 250 super. yds. if coarse sand is used. If heavy grit or chippings

be used the surface should be very lightly rolled after the chippings have been spread.

In all cases careful record should be kept of the quantity of tar used, the superficial area covered, the

SCOTTISH EXPERIMENTAL ROAD SECTIONS: TYPE PLAN.
(Plate A.)

Precautions should be taken to prevent liquid tar passing directly through gratings or outlets.

state of the weather during the progress of the work, the time occupied in actual work and in waiting while

work is stopped owing to wet weather, the number of men employed and full details of the cost of labour, materials, haulage, &c.

SPECIFICATION FOR SECTION NO. 3.

The road which is to be surfaced with pitch-grouted macadam should have a good natural foundation of gravel or similar subsoil, and should be of sufficient strength to bear the traffic likely to use it. The thickness of the old crust should be ascertained. The thickness of the surface coating of pitch-grouted macadam, when finished and consolidated by rolling, should be 3 in. The finished surface should have a crossfall of about 1 in 32. If reasonably possible, and not prevented by considerations of levels, the old surface should be left intact and unscarified, and the new pitch-grouted macadam should be superimposed upon it.

Not more than 15 per cent passing through a 1½-in. ring in every direction; not less than 65 per cent over 1½ in., and not exceeding 2½ in., in greatest length by measurement; not more than 20 per cent over 2½ in. in greatest length by measurement. In addition to this, 5 per cent of chipping of the same stone, varying

SPECIFICATION FOR SECTION NO. 4.

As for No. 3, but with 1½ gallons of pitch per square yard. No sand will be added.

SPECIFICATION FOR SECTION NO. 5.

The same as for section No. 4, but with a sealing coat of bituminous mixture. It is suggested that this might be a preparation of Trinidad Lake asphalt, so that all the experimental lengths (No. 5) could be treated alike. The cost (Trinidad Lake asphalt) is estimated at about 6d. per square yard; £7 15s. per ton, covering 320 sq. yds.

SPECIFICATION FOR SECTION NO. 6.

As for No. 5, save that the existing road surface should first be tar-sprayed or painted with Road Board tar No. 1, and afterwards spread with a 1-in. layer of tarred chippings, treated with Road Board tar, No. 2; the dry macadam to be then spread, rolled and grouted.

SPECIFICATION FOR SECTION NO. 7.

The road which is to be surfaced with tar-macadam should have a good natural foundation of gravel or similar subsoil and should be of sufficient strength to bear the traffic likely to use it. The thickness of the old crust and foundation should be ascertained by opening two trial trenches. The thickness of the surface coating of tar-macadam when consolidated by rolling should be 3 in. The finished surface should have a crossfall of about 1 in 32. If reasonably possible, and not prevented by consideration of levels, the old surface should be left intact and unscarified, and the new coat of tar-macadam should be superimposed upon it. The aggregate of the new surface of tar-macadam should be composed of broken stone or selected slag of approved quality, and should conform with the British Standard specification for 1½-in. gongee as follows: Not more than 15 per cent passing through a 1-in. ring in every direction. Not less than 65 per cent over 1 in. and not exceeding 2 in. in greatest length by measurement. Not more than 20 per cent over 2 in. in greatest length by measurement. In addition there shall be used 10 per cent of ¾ in. to ½ in. for closing. The last-mentioned size should be kept separate, and used as a top dressing during rolling operations.

Tar No. 2 Road Board Specification to be used. The quantity of tar used should be approximately 11 gallons to a ton of stone.

The tar-macadam, after having been spread and levelled, should be rolled to a smooth surface, but too much rolling should be avoided.

Less rolling is required than in the case of water-bound macadam. A 10-ton roller is a suitable size for use in most cases, but good results can be obtained by using a 6-ton roller and finishing with a 10-ton roller. A coating of tar should be applied to the surface after the road has been used by traffic for about three weeks. This tar should be of the same quality as that used for the mixture, and should be poured or sprayed on the surface at a temperature of about 270 deg. Fahr. Stone chippings, crushed gravel, coarse sand, or other approved material (free from dust) not larger than will pass through a ¼ in. square mesh should be used for gritting in quantity not exceeding 1 ton for 300 to 350 super. yds. if grit is used, and 1 ton for 200 to 250 super. yds. if coarse sand is used.

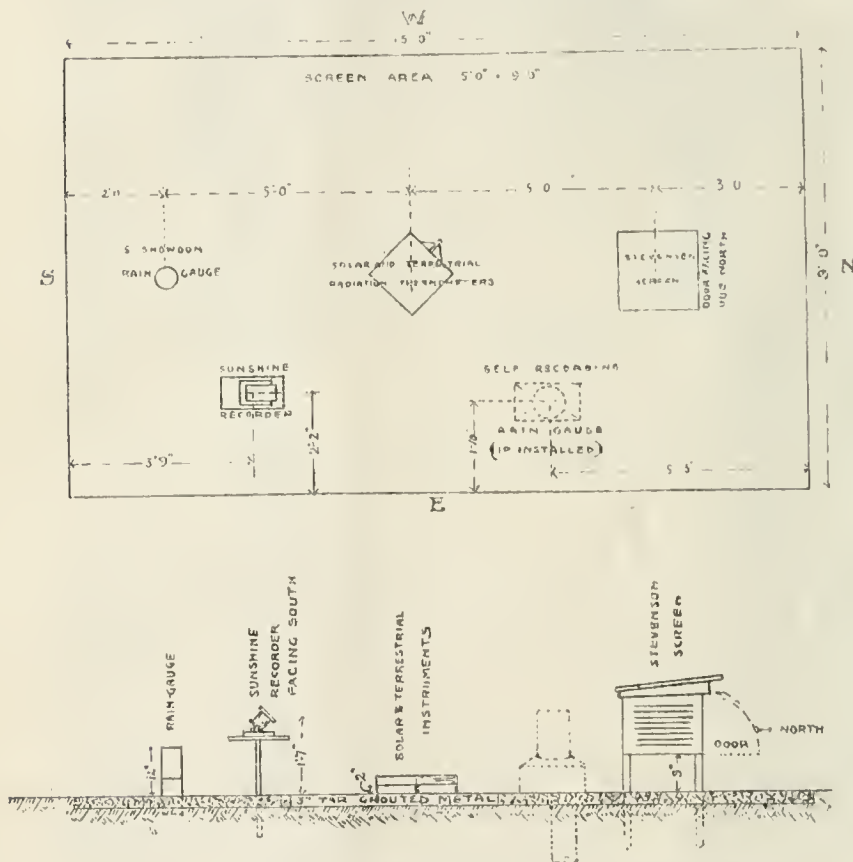

SPECIFICATION FOR SECTION NO. 8.

As for section No. 7, except that, instead of No. 2 tar, Trinidad Lake asphalt will be used for sealing the surface, as in the case of No. 5.

RECORDS.

Before any experimental lengths are put down the meteorological instruments should be installed.

Samples.—Samples of the stone used should be sent

SCOTTISH EXPERIMENTAL ROAD SECTIONS: ARRANGEMENT OF METEOROLOGICAL STATION.

(Plate II.)

from ¾ in. down to ¼ in. should be used for closing after the grouting with pitch. The pitch should comply with Road Board specifications, and the stone must be dry when the pitch is poured. The voids should be filled, and the quantity used recorded; it will be about 1½ gallons per square yard. The aggregate, having been spread and levelled, must be rolled down dry until the surface is formed, but without the addition of any small material. The pitch must be raised to a temperature of 300 deg. Fahr. Clean, sharp sand (pit sand is to be preferred) must be heated on sand heaters to a temperature of 400 deg. Fahr. A dandy or portable mixing vessel is then to be filled with 58 per cent by measurement of the heated pitch mixture, and 42 per cent hot sand (1½ pitch mixture, ¾ hot sand by volume), and the mixture, hereafter called the matrix, is to be kept well stirred while it is being emptied from the dandy or portable mixing vessel into pouring cans of from 2 to 3 gallons capacity, which are used for pouring the matrix on to the roadway. Not only during the process of mixing, but afterwards, up to the time of actual pouring, the matrix must be kept well stirred. The matrix prepared in the quantities specified above should be sufficient to fill the voids in the aggregate.

to the National Physical Laboratory for petrological description, determination of specific gravity, and dry and wet attrition tests, the name of the quarry being sent with the stone. The test sheet obtained from the laboratory should be forwarded to the secretary of the Roads Committee, Local Government Board, Edinburgh.

Tar Thermometer and Tar Tester.—Great care is to be exercised in the heating of pitch, tar and bitumen so that these may be brought to the temperatures set forth in the specifications, and for this purpose it is recommended that the surveyor should provide himself with a suitable thermometer, probably of the pattern or similar to that made by Mr. Hutchinson, Westminster. The cost of the instrument is about £1.

Viscosity tests of tar, pitch and oil should be made, and this might be most conveniently done by using Hutchinson's tar-tester. The cost of this instrument is £2 2s. The temperature at which the viscosity tests should be made for tar Nos. 1 and 2 is 70 deg. Fahr., and for mixtures of pitch and oil 77 deg. Fahr. The record of the viscosity tests should be carefully written up.

Traffic Census.—The traffic census upon the Road Board forms should be taken before the original surface has been disturbed, and at such intervals thereafter as may be necessary, having regard to the extent and fluctuation of the traffic. It is probable that, on the average, the census would require to be taken over a period of seven consecutive days once in every six months. A special note should be kept of any extraordinary traffic, heavy loads or any other abnormal factor tending to destroy the road surface.

METEOROLOGICAL OBSERVATIONS.

Under this heading there falls to be observed and recorded the effects of rainfall, atmospheric humidity, maximum and minimum shade temperatures, solar and terrestrial radiation, winds, fogs, mists; also extremes of temperature in the core of the road. Sheet H shows, in plan and elevation, the instruments as they are to be set up at the meteorological station. Sheet J shows the surface box and tubes to be placed in the roadway for the reception of thermometers to record road core temperatures. (Sheets H and J are reproduced herewith.)

It is proposed to instal a 5-in. Snowdon rain gauge, a Stevenson thermometer screen, a wet and dry bulb hydrometer, a self-registering maximum thermometer, and a minimum thermometer.

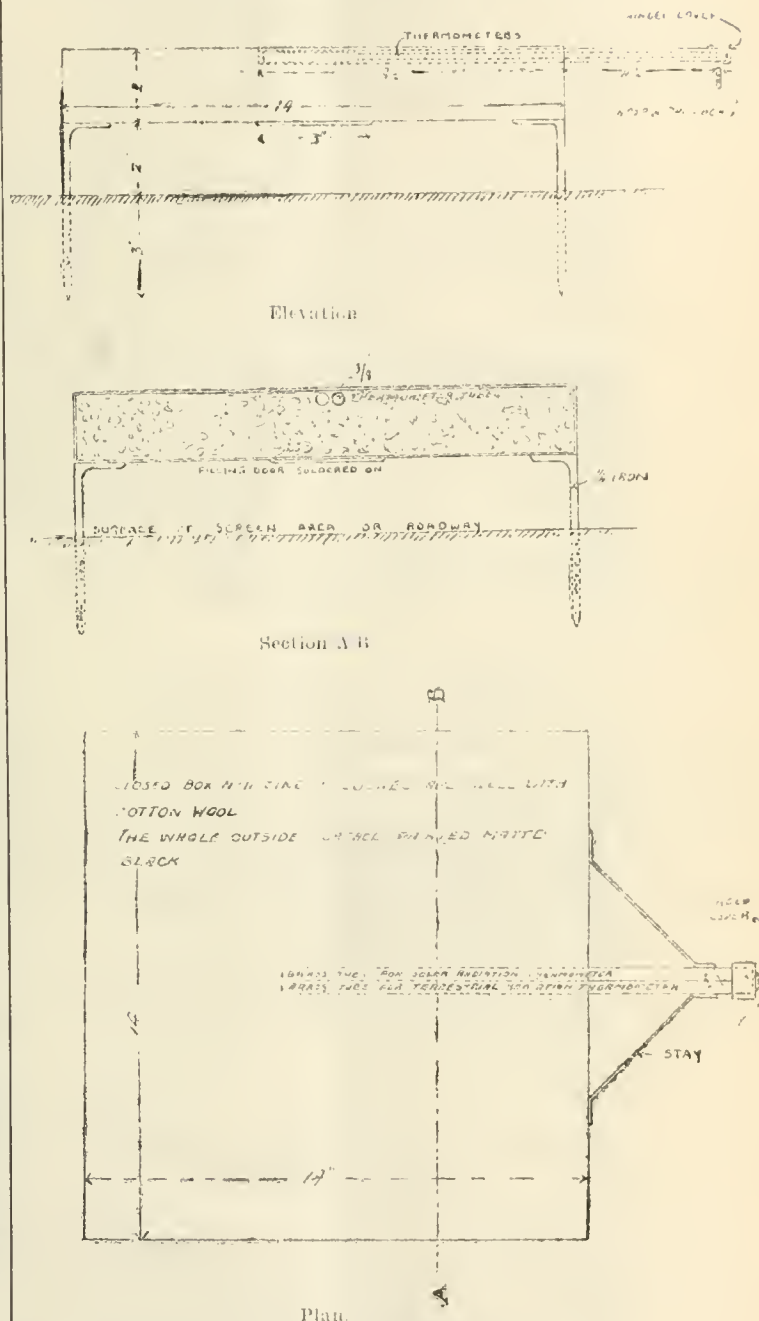

The observing station should be placed as near to the side of the experimental road as practicable, and not more than ¼ mile therefrom. The area, 15 ft. by 9 ft., upon which the instruments are to be set up is shown on sheet H. It is to be constructed of tarmacadam or pitch-grouted metal 3 in. in thickness. The level of this area should be, as nearly as possible, the same as the surface of the experimental road lengths, in order that the stratum of air over the station may be the same as that over the roadway.

The rain gauge should be set exactly 1 ft. above the ground level in an open situation on a level piece of ground free from air eddies and currents. If a perfectly open site cannot be obtained, shelter is the least harmful on the north-west, north and east. The gauge should be distant from the object forming the shelter at least twice the height of the object. These conditions should be kept in view when fixing the site for the station. The mode of reading the gauge does not require description, except that it and all the other instruments should be read at 9 a.m. each morning, and the reading entered in the record under the previous day's date; thus the reading at 9 a.m. on the 15th would be entered under the 14th. In the event of a snowfall, the snow in the funnel should be melted by adding a measured quantity of hot water, and this amount deducted from the gross reading. Approximately, 1 ft. of snow is equivalent to 1 in. of rain, and *pro rata*. The Stevenson screen should be set up so that the door faces north. For meteorological observations the general height of the thermometers is 4 ft., but for road work the temperature should be observed as near the road as possible.

The terrestrial radiation thermometer and solar radiation thermometer are to be placed inside a specially constructed metal box, which can be supplied by Messrs. R. & A. Main, Gothic Ironworks, Falkirk, at a cost of about 25s. The box (sheet I.) is to be set into the area previously referred to, and in the position shown on sheet H. The thermometers are placed in the tubes provided for the purpose. The terrestrial radiation thermometer (spirit filled) is to measure the minimum temperature near the level of the road surface, and the solar radiation

thermometer (mercury filled, scale reading to 160 deg.) is to measure the amount of solar heat near the level of the road surface. The reading of the solar radiation thermometer is to be entered in the proper column in the record, under the date previous to that of observation, as in the case of rainfall and maximum shade temperature, and the reading of the maximum thermometer in the shade deducted from it and entered in the proper column. The difference so obtained is the measure of solar radiation for the day. This measurement, however, does not give the duration of maximum solar heat, and an effort is to be made to get a measure of this by installing a sunshine recorder.

The sunshine recorder proposed to be installed is of the Jordan single-cylinder pattern, the principle

SCOTTISH EXPERIMENTAL ROAD SECTION MOUNTING OF RADIATION THERMOMETERS. (Plate I.)

of which is that the sun penetrates through two small oblong apertures in the cylinder, the rays falling on a chart of sensitised paper contained within the cylinder, leaving a trace resembling a blue print. Full instructions for setting up the instrument will be supplied by the makers, Messrs. Negretti & Zambra. The position the instrument is to occupy is shown on sheet H.

The six thermometers are combined maximum and minimum thermometers, and are to be used to ascertain the maximum and minimum temperatures in the body of the road at various depths. It is suggested that observations should be made at depths of 1, 2 and 3 in. The thermometers should be placed in

the iron tubes, to be set horizontally in the body of the tar-macadam or pitch-grouted road lengths at the depths previously stated, access being obtained to them from the surface box, after described. The maximum reading should be entered under the date previous to that of observation, and the minimum reading under the date of observation.

The surface box and tubes may be obtained from Messrs. Watson, Gow & Co., Elma Foundry, Falkirk. The surveyor is requested to state that these are for the "Scottish Road Experiments." The cost of the surface box and tubes is about 22s. 6d. The arrangement is shown on sheet J.

In addition to the records before described, a note should be made each morning of wind, its direction and force, also of fogs, dew, hoar frost, hail, snow,

End Elevation.

Section A B.

Plan.

SCOTTISH EXPERIMENTAL ROAD SECTIONS: BOX FOR ROAD CORE TEMPERATURES.

(Plate J.)

sultry weather and thunder. Columns for these entries are provided in the record sheet.

WIND VELOCITY TABLE.

- Dead calm denoted by "D.C.," 0 miles per hour.
- Calm denoted by "C.," 3 to 8 miles per hour.
- Light breeze denoted by "L.B.," 8 to 18 miles per hour.
- Moderate breeze denoted by "M.B.," 18 to 28 miles per hour.
- Strong breeze denoted by "S.B.," 28 to 34 miles per hour.
- Moderate gale denoted by "M.G.," 34 to 48 miles per hour.
- Strong gale denoted by "S.G.," 48 to 56 miles per hour.
- Whole gale denoted by "W.G.," 56 miles per hour and over.

These velocities can only be roughly estimated by the observer.

PARTICULARS TO BE FORWARDED.

Particulars to be sent to the secretary of the Roads Committee are entered as follows: Recorded by —, at —, in the county or burgh of —, latitude and longitude —, height of station above ordnance datum —, distance of station from road, in feet, and its direction —, height and distance of nearest obstruction to station; height in feet; breadth in feet; obstruction —.

MEASUREMENTS OF WEAR.

Profiles of the original surface and new surface are to be plotted from readings taken from the attrition gauge. The sections accompanying the plan A are to be taken with the dumpy level. An attrition gauge already used with success is the Davy & Maybury.

In each section one set (two in number) of measuring sockets is to be inserted—i.e., eight sets will be required for each series. One of these sockets is to be placed upon each side of the road, about 1 ft. 6 in. from each side, but always so as to leave a distance of 15 ft. between the sockets.

The sockets are to be well bedded upon and fixed to cement concrete. Light cast-iron covers are fixed upon the sockets, and great care must be taken that each pair is fixed at the same level. The arrangement for measurement of the wear is by straight-edge and micrometer gauge. The straight-edge will be 18 ft. in length, and when in use will be set upon brass standards. A more simple and inexpensive arrangement than the micrometer gauge is, however, being considered, and will be communicated at a later date.

Measurements are to be taken at every 1 ft.

Having obtained the measurements, they should at once be plotted on squared paper, as per example sheet G.

OBSERVATIONS OF CONDITION OF SURFACE.

A description of the condition of the road surface should be entered on sheet L (not reproduced), if possible, each day, and certainly not less than once per week. Herein there is, unfortunately, difficulty in eliminating the personal element from the equation, and care will need to be exercised in making comparisons. However, much could be done to unify recorded observation, which should include condition of slipperiness, muddiness, excessive hardness, softness, dustiness, resistance to traction, &c., under rain, hoar frost, heat, wind, &c. In the event of it being found impossible for the engineer or surveyor himself to make the weather observations this might be done by deputy; but while the reading of the instruments may be made each morning by deputy, it is imperative that the condition of the road surface should be observed by the engineer or surveyor. It is also essential that he should make an inspection of the roadway at a sudden change in the weather conditions, which might have a destructive effect on the road surface.

INITIAL AND MAINTENANCE COSTS.

A careful and accurate record of costs is to be kept showing as much detail as possible. It will be at once apparent to every one in charge of these trial lengths that this is a most important item in the experiments, and it is believed that great care will be taken with this part of the work so that the utility of the records may not be impaired.

These remarks will equally apply to maintenance. Sheet X (not reproduced) shows how the entries under this head might be made. Where a patch of roadway requires repairing, the extent thereof is to be entered in the maintenance sheet.

Records to be forwarded to the Secretary—

1. Immediately after the road lengths have been laid down—
 - (a) Plan, cross-sections and longitudinal section of road lengths as per Sheet A.
 - (b) Census of traffic filled in on Sheets C. (These census forms may be obtained from the Road Board.)
 - (c) The test sheets obtained from the National Physical Laboratory.
 - (d) Any deviation from the percentages of different sizes of metal or quantities as set forth in the specifications.
 - (e) A note of the temperatures at which the tar, pitch, and asphalt have been used.
 - (f) A note of the viscosity tests that have been made.
 - (g) A note of the time elapsing between the completion of the road surface and the application of the sealing coats.
 - (h) A profile of the original roadway, and the finished surface as per Sheet B. (not reproduced).
 - (i) Particulars as to meteorological station.
 - (k) Cost sheets for each length as per Sheet M.
2. Not later than the 10th of each month following the month to which the records apply—
 - (a) The monthly record of meteorological observations.
 - (b) Condition of the road surface, Sheet L; a note of any abnormal traffic or other factor tending to destroy the road surface, should be recorded upon Sheet L. (not reproduced).
 - (c) Maintenance costs for each length.
3. As often as may be considered necessary, probably once every six months—
 - (a) A record of the measurement of road wear, as per Sheet G.
 - (b) A census of traffic, as per Sheets C. (neither reproduced).

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier.*

READING WATERWORKS.

A PROFITABLE MUNICIPAL UNDERTAKING.

The profits of the waterworks department for the year ended March 31, 1913, were £3,283, of which £3,000 was carried to the credit of the district fund, the balance being applied in part payment of the expenses of the installation of the new filters at Southcote works.

The waterworks engineer to the corporation, Mr. Leslie C. Walker, reports that the most important event in connection with the undertaking was the completion and setting to work of the four additional Candy filters at the corporation's Southcote filtration and pumping station on December 6, 1912. They have now been working continuously ever since, with results which have in every way justified the expenditure incurred—an expenditure which has proved remunerative, inasmuch as by installing these filters full use is made of the available water-driven pumping machinery, thereby saving a considerable number of hours' pumping by steam power at Fobney works, and the consequent expense in coal. The outstanding features of the new filters are that, when compared with the old system of slow sand filters, and taking cost per 1,000,000 gallons filtered, their capital outlay is half, and their upkeep or maintenance is one-fifth, while the area of the land required is one-twentieth.

The purification of the water is of the highest degree, and is corroborated by the periodical examinations, both bacterial and chemical, which are undertaken by the Royal Institute of Public Health, under the direction of the principal, Prof. W. R. Smith, M.D., &c., and by Drs. John C. Thresh and John F. Beale, of the Public Health Laboratories of the London Hospital Medical College, who, in a report upon water from the Candy filters at Southcote, stated: "The waters were of the highest standard of bacterial purity."

Since its completion the installation has been visited by engineers and others interested in the efficient and economical purification of water from, among other places, Bloemfontein (South Africa), Shanghai (China), Fukuoka (Japan), and by several deputations from many important towns in this country.

INTERNATIONAL ROAD CONGRESS.

DIRECTION POST COMPETITION.

In connection with the International Road Congress held in London in June last, a competition was instituted by the Local Organising Council for designs for direction posts and plates, with a view to securing a standard type suitable for general adoption by highway authorities.

Fifty-nine entries were received, and the Judging Committee, presided over by Sir George Gibb, chairman of the Road Board, have issued their awards. The successful competitors are:—

- (1) E. S. Sinnott, M.INST.C.E., county surveyor of Gloucester, £16.
- (2) W. & F. Wills, Limited, Perseverance Works, Bridgwater, £12.
- (3) W. Weeks & Son, Limited, Perseverance Works, Maidstone, £7.

Captain H. P. Deasy, Weybridge, Surrey, also received special mention in consideration of the value of his reasoned study of the subject of directions for the guidance and information of travellers.

The designs and descriptions of the successful competitors have been reproduced by the committee in a pamphlet, of which a limited number of copies are available on application to Mr. Rees Jeffreys, the hon. general secretary, Queen Anne's Chambers, Westminster, S.W.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

DRAINAGE AND DISPOSAL OF WATER MATTERS AT PUBLIC ELEMENTARY SCHOOLS.

LOCAL GOVERNMENT BOARD MEMORANDUM.

[The Local Government Board have issued a memorandum on the arrangements for drainage and disposal of waste matters at public elementary schools for which loans under the board's sanction are required. The memorandum, which has special reference to schools in country places where sewers and water services are not available, is reproduced below.]

At a school, even where no one resides on the premises, provision will have to be made for the disposal and removal of the following matters:—

- (1) Excremental matters. (On the boys' side the urine may be in part dealt with separately from the faeces, but this will not usually be practicable on the girls' side.)
- (2) Ashes and other dry refuse.
- (3) Waste water, as from lavatories and floor washing.
- (4) Surface water from roofs, yards, &c.

The best means for disposing of these several matters will vary in different cases according to facilities of drainage and water supply and other local conditions, and in choosing the most suitable arrangements careful regard will have to be paid to the circumstances of each case.

1.—Where an efficient system of public sewers and a constant water supply under pressure are available, water-closets should be provided and their contents conveyed into the public sewers by drains, which should also receive the liquid waste from urinals, lavatories and sinks, and where permitted, the surface water.

Water-closets should be of a suitable and efficient type, with adequate separate flushing arrangements for each closet.

2.—Where a water supply for flushing is available, but there are no sewers, if water-closets are adopted they should be drained into a watertight tank with an overflow discharging on to an efficient filter or a suitable area of land for irrigation, or into a watertight cesspool without overflow, which should be so arranged that the contents can be readily removed by means of a suitable pump into a tank cart, or by some other efficient method.

In no case can disposal of sewage by subsoil irrigation or any system of leakage into the subsoil, or by its discharge untreated into a ditch or watercourse be regarded as satisfactory.

Where drainage is into a tank or cesspool, rain-water should be excluded from the sewage with a view to lessen its volume, and in the case of a cesspool, to avoid the need for frequent emptying.

3.—Where sewers are available, but no supply of water is laid on for flushing, it will generally be best to adopt some form of dry-closet, as described hereafter. Hand-flushed water-closets do not work satisfactorily.

4.—Where neither sewers nor water service are available, as is often the case in small villages, some form of dry-closet will be necessary. The closets may be furnished with movable receptacles (pail closets), or with small fixed receptacles on the lines set out in the board's Model By-laws with respect to new buildings in rural districts—*i.e.*, the receptacle should be of small capacity and watertight construction, with bottom at least 3 in. above the level of the ground, and with arrangements to facilitate the application of dry earth or other absorbent and the removal of the contents. Privies with large, deep pits or open middens cannot be approved.

The contents of the closets should be kept dry by excluding rainfall, and, as far as practicable, all other liquid, and by the use of a suitable absorbent, which will be especially needed in the girls' closets. The absorbent may be dry earth, ashes, sawdust, peat dust or road sweepings dried and sifted. (The ashes produced at a school are not usually sufficient in quantity alone, and there are none in summer.) A shed or other suitable accommodation should be set apart for the drying and storage of the absorbent.

Arrangements will have to be made for the supply and application of the absorbent, and for the frequent periodical removal and disposal of the contents of the closets.

Even where dry closets are provided and rainwater is separately dealt with, there will still be need for some means of disposing of foul waste liquids as from

urinals, sinks, lavatory basins and wash pails. If sewers are not available these liquids may be taken by drains to a filter or irrigation area, or into a small cesspool constructed as already mentioned.

In some instances, where there is no ground belonging to the school sufficient for the placing of a tank or cesspool, it may be necessary to use movable receptacles for the reception of waste liquids from lavatories, urinals, &c., the receptacle for urine being filled with some absorbent, such as sawdust. Such expedients, of course, require constant attention at least daily—if nuisance is to be avoided, and in the case of new schools, and, where possible, in all other cases, sufficient ground should be provided to render resort to them unnecessary.

Where there is no public water service, rain water from the roofs may often be usefully collected for washing purposes, being softer than well water. Where not so collected, if there is no sewer into which to take it, it should be excluded from the sewage, and may be discharged in any convenient method, as into a ditch or watercourse, or where the soil is porous, into a soakaway pit at a sufficient distance from the building so as not to cause dampness of the foundations.

Where possible it is desirable that the sewage from the schoolmaster's house should be dealt with by the same system as that from the school buildings, but where this is not feasible one or other of the methods for the disposal of excretal matters and liquid waste already mentioned should be adopted.

Where sewers and public water service are not available, it is desirable that there should be in connection with the house plenty of garden ground on which to dispose of refuse matters.

GENERALLY.

In connection with the drainage and sanitary arrangements for schools, the following points should receive special attention.

Generally.—The drainage and closet arrangements should be planned on the general lines embodied in the Model By-laws of the Local Government Board.

Drains.—The drains for foul water should be laid in straight lines between inspection chambers, and so as to be quite watertight; they should be properly ventilated and be disconnected, by means of a trap in an inspection chamber, from any cesspool or covered tank into which they discharge. Should a drain have, unavoidably, to be laid near a well, or other source of water supply, the drain, if of stoneware pipes, should be surrounded with cement concrete at least 6 in. in thickness, or should be of cast-iron pipe with lead joints. It is desirable that pipes of 4 in. diameter should have a fall of not less than 1 in 48, and 6-in. pipes of not less than 1 in 60.

Cesspools and tanks should have walls and floors so constructed as to be quite watertight (this also applies to the floors of filters and so much of their external walls as are below the surface of the ground). They should be not less than 50 ft. distant from the school or from any dwelling-house, and should be as far as possible from any well or other underground source of drinking water which might be in danger of being polluted by leakage. The sewage disposal works should be fenced in so that they cannot be interfered with by the children.

Cesspools and covered tanks should be properly ventilated and provided with a suitable pump, and should be in positions conveniently accessible by a tank cart for the purpose of emptying.

The capacity of tanks which overflow on to a filter bed or irrigation area need not exceed from one to two days' volume of sewage; this may generally be assumed at 2½ gallons per head of the accommodation provided (including teachers) at the school if water-closets are used, or at 1 gallon per head where only urine and slop water have to be dealt with. Cesspools which have to be emptied from time to time should be of larger capacity. Filter beds should be not less than 2 ft. 6 in. in depth, and the filtering medium should consist of some hard and clean material, care being taken that the liquid is evenly distributed over the surface of the filter bed by a suitable apparatus. Filters should in all cases have free outlets so as to drain the whole of the filtering media. If no land treatment is provided, the area of the filter bed should be sufficient to deal with the liquid at a rate not exceeding 40 gallons per square yard per day for a filter 2 ft. 6 in. deep, or at a proportionally greater rate for a deeper filter. When subsequent land treatment of the effluent is adopted, a rate of filtration twice as rapid as the above may be allowed.

Irrigation Areas.—Land for irrigation should have an adequate area and suitable soil, and should be at

a sufficient distance from any inhabited building or sources of water supply so as not to create a nuisance or to pollute the water. The nature of the soil should be stated in the application.

Land.—Where land outside the school premises is required for tanks, filter beds, irrigation, &c., its use should be secured by a definite legal agreement, and if the works are to be carried out by means of a loan, the land should be purchased or leased, the purchase or lease being made conditional on the board's sanction being obtained to the loan.

EARTH CLOSETS.

A footnote to the memorandum states that the following arrangement of earth-closets has been found to work satisfactorily at some rural schools:—

At the back of the range of closets is a covered "earth chamber," extending the whole length of the range, and measuring some 7 ft. from front to back. At the back the chamber is partially divided by a dwarf wall into two compartments—one for dry and the other for used earth—leaving space for a gangway between these compartments and the backs of the closets. In front the floor of the earth chamber is continued into the space under the closet seats with a slope towards the centre of the chamber. The space under the seats is open at the back for its full width to the earth chamber. Down the gangway runs a channel for urine which discharges into a small tank; this channel and tank are filled with peat moss or

Where this system is adopted careful attention must be given to the following points:—

(1) Impervious materials must be used in all places where earth or faecal matter is liable to come in contact with the structure. Wood should not be used.

(2) The earth chamber should be properly roofed to exclude rainfall, and well ventilated. Its floor should not be below the ground level.

(3) All urine should be conveyed away from the earth chamber, received in an absorbent, and removed.

(4) Suitable dry earth should be used, preferably top soil from a field or garden "in good heart." Ashes are unsuitable.

(5) Careful and intelligent attention must be paid to the working of the closets by a person specially detailed for this purpose, and the earth must be shifted and redistributed at least once a week. It must not be allowed to get saturated with liquid.

A door for access to the earth chamber will be needed, but should be kept locked when not in use.

THE SEPARATOR TREATMENT OF SEWAGE.

A STAFFORDSHIRE INSTALLATION.

By the courtesy of the engineer, Mr. Fred. J. Cummin, of Victoria-street, S.W., we are able to re-

SEPARATOR AT STONE SEWAGE WORKS.

sawdust to absorb the urine; when the absorbent is saturated it has to be removed, and fresh material substituted.

The mode of use is as follows:—

One or more loads of dry earth are placed in one of the compartments, and a layer of this earth, 6 in. deep, is spread on the floor under each closet seat, so as to receive the excreta upon it. Once a week, conveniently on Saturdays, the faecal matter is covered up with a fresh layer of the earth until in course of time the heap reaches a depth of about 2 ft. It is then removed to the empty compartment to dry, and a fresh layer of earth is spread under the seats. This process is repeated until all the earth has been shifted to the other compartment. It is then worked back again in like manner, using first the portions of earth which have been drying longest. When this process is properly carried out it has been found that faeces and paper are inoffensively disintegrated by the action of the earth with its contained organisms, and that the same earth can be used over and over again without the need for addition or removal.

produce a photograph of the separator now installed at Stone, Staffordshire, sewage disposal works.

Prior to the issue of the Fifth Report of the Royal Commission on Sewage Disposal, a scheme for dealing with the sewage from this town was investigated by the commission, together with a proposal to make use of a chemical process for the final treatment of the effluent, it being considered that the large amount of brewery refuse contained in the sewage rendered something of the kind necessary. The scheme actually carried out, of which the accompanying view shows part, was, we are given to understand, installed at rather less than a half the estimated cost of that referred to by the Royal Commission in their report. It has been working with thoroughly satisfactory results for the past twelve months.

Abertillery Water Scheme.—At a meeting of the Abertillery Water Board at Newport (Mon.) last week it was decided to apply next Session in Parliament for powers to construct an additional reservoir, and for other purposes.

FORMING FOUNDATIONS IN GRAVEL BY CEMENT INJECTION.

AN ACCOUNT OF SOME AMERICAN EXPERIMENTS.

Interesting experiments made in order to ascertain the value of the method of forming concrete in place by the injection of cement are described in an article by Mr. H. H. Cartwright, published in the *Engineering News* of New York. These experiments were carried out at Nashville for the Louisville and Nashville Railroad, under the supervision of the author, with the object of ascertaining the possibility of forming the foundations of bridge piers, &c., in river beds composed of sand and gravel deposits, by the method of forcing cement grout, under pressure, through pipes driven into the gravel under the water.

FIRST EXPERIMENT.

In the first experiment 2-in. pipes, each fitted with a perforated end 2 ft. long, and terminated with a point, were driven 23 ft. into gravel down to the bed rock. The water level in this gravel was 8 ft. below the surface. In order to be able to inspect the work when done, the grouting pipes were driven on the circumference of a circle 15 ft. diameter, there being sixteen pipes in all, about 3 ft. apart. By this method a buried hollow cylinder of concrete was formed. The gravel was as follows: Coarse material, 12 per cent; very fine gravel, 34 per cent; sand, 44 per cent; silt, 10 per cent. Fairly good concrete was thus formed.

The pipes were kept open by means of a water hose and air pressure.

In subsequent experiments it was found that clogging material could be best removed from the tubes by lowering a 3-in. water hose inside the pipe and washing the cement away. The perforations in each pipe covered a length of 17 ft., and after the quantity of cement assumed to be sufficient had been forced through the pipe, it was raised 17 ft. and the process was repeated. An average pressure of 20 lb. per square inch was sufficient for the grouting, but sometimes a pressure of 60 lb. would not clear the tube. Thus it was found to be necessary to insert the small water hose already mentioned, and to jet the point. One batch of cement was made of 1 sack of cement and 3½ cub. ft. of water, which was mixed almost instantaneously in the pneumatic machine to the consistency of rich cream.

It was found that when any pipe was left open at the top, and air forced into the next pipe, that water was forced out of the adjoining pipe sometimes 40 ft. high, indicating a good underground connection. This result would occur even where the pipes were 10 ft. apart. Considerable difficulty was experienced in raising the pipes. After the pipes were raised to water level, 8 ft. below the surface of the gravel, only 15 lb. pressure was required to eject the grout.

After the grouting work was done, the gravel from the centre of the concrete cylinder thus formed was excavated. Practically no concrete was struck for the first 4 ft., and from 4 ft. to 8 ft. deep solid concrete was encountered for the full diameter. This was very hard concrete. Below the water level the concrete was not nearly so good, being irregular like large lumps of clinker. There were many leaks in the walls, but it was found to be possible to pump the water down to within 2 ft. of the rock. The test proved that cement could be forced out at a depth of 23 ft. below the surface of the gravel under 15 ft. head of water; but the difficulty was that the cement would take the path of least resistance, which was upward, and would not spread laterally far enough to make a very tight wall. The illustration accompanying the paper shows a mud seam or stratum at about water level which could not have been made into concrete by the cement. The concrete also was not very well bonded owing to a film of mud surrounding each stone. However, we are told "it set very hard later, and would have made a strong foundation."

EXPERIMENT WITH A TANK.

In the next experiment an endeavour was made to work under a head of 57 ft. of water, and for this purpose a steel tank was made and filled with sand and gravel. The tank was made on a concrete base, 6 ft. square, and steel sheet piling of channel form; seven on each side formed the tank. After this had been made watertight, the tank was half filled with sand and gravel. Before filling, five pipes, 60 ft. long and 2 in. diameter, similar to those used in the previous experiment, were placed in the tank. The tank was then filled with water to within 3 ft. of the top.

There were 40 cub. yds. of sand and gravel in the tank. Five sacks of cement were forced through each pipe, and then the pipes were all lifted 2 ft. 6 in. and the process was repeated. This was continued till 200 sacks of cement had been used. It was found that a pressure of from 70 lb. to 80 lb. per square inch was required in order to clear the pipe, although 40 lb. was the expected pressure. Every time cement was forced down it appeared on the surface of the water, and caused it to boil up and splash out of the tank at times. At the end of the day the pipes were all raised several feet above the last shot of grout. Then forty-eight hours elapsed before work was resumed, when it was found that all the pipes were stopped up, and could not be drawn. All the water was then let out of the tank, and the pipes were unjointed at the top of the gravel. For 10 ft. above the gravel cement was set up solid in the pipes.

After the cement in the water had precipitated, the tank was found to contain 33 ft. of material. An 18-in. layer of gravel was then put in, then 7 ft. of clean sand, 3 ft. of gravel, 2½ ft. of sand, and 5½ ft. of gravel. Only one pipe was driven into this material in the centre of the tank. It was found that the sand entered the tube through the holes, and gave so much trouble that the pipe was withdrawn, and the perforated portion wrapped in with some 10-mesh wire gauge. This was found to be an effective remedy. Ninety-five sacks of cement were injected, and finally 3 ft. 6 in. of crushed stone was placed in the tank, and forty-seven sacks of cement were injected. After twelve days the sides of the tank were removed, when it appeared that very little of the material was solid, except the stone concrete at the top, and that neat cement had found its way to the sides in thin veins. However, after the loose material had been removed, it appeared that the lower half of the tank contained good concrete of about 66 per cent of its volume. Above this was a layer of neat cement from 3 ft. to 5 ft. thick. There was a core of concrete, 12 in. in diameter, through the sand where the single pipe had been, and which core increased in size towards the top; also a portion of the cement having run to the sides of the tank, good concrete had been formed against the steel. The stone concrete at the top was perfect. All concrete in the tank set, and was very difficult to blast to pieces.

It was thus demonstrated that cement could be forced into gravel under a head of 57 ft. of water as easily as where the depth of water was 10 ft. or 20 ft. As the cement was blown into the tubes by charges of air, and as this air could not escape laterally in a small tank, it carried much of the cement up to the surface. The best results also were obtained where the percentage of voids was the largest.

THIRD EXPERIMENT.

In another experiment two tanks of the same cross-section as that already described, and 20 ft. deep, were each filled with gravel and sand. Grout pipes placed close together were used, and also a larger quantity of cement per cubic yard. This gave a good result, the tanks being filled with concrete.

CONCLUSIONS AND RECOMMENDATIONS.

It was found, as a result of these experiments, that, since it is necessary to fill the voids in the gravel with the solid contents of the grout, it is necessary to use about three times the quantity of grout that would be required if the voids had to be filled merely with the liquid grout, seeing that 75 per cent of the grout is water. The gravel to be grouted should be enclosed by piling or by grouting a wall round the proposed foundation, as in the first experiment. This must be done to prevent the lateral escape of the grout. As the air coming out of the pipe induces an upward flow of the water, it may bring up mud or muddy water to the water level; if it does so, this is clear evidence of the presence of a layer of mud or silt of which concrete cannot be formed. Excessive air pressure is apt to remove a large quantity of cement already deposited, and thus to produce bad concrete. When a pipe clogs, it is best to lower a water hose into it, and to jet out the cement rather than to attempt to blow it out with air. The size of the perforations in the grouting point should be gauged to the size of the material into which it is to be inserted; thus, in a coarse gravel there should be large openings, and in sand small openings. The perforations should be just small enough to exclude the sand or gravel. A strong current of air should be passed through the grouting pipe while it is being driven, in order to keep out the fine material which will otherwise clog the pipe. The driving pipe should be heavy enough to stand

driving with a big hammer. The binding of the pipe is a frequent cause of trouble otherwise.

Finally, it is stated that there is no doubt that safe foundations can be made by this grouting process; but test borings must first be made to prove the quality of the gravel. If coarse gravel is found to exist, an excellent foundation can be made. It is, however, essential that when the work has been completed test borings should be made to prove the solidity of the work.

ELECTRIC ROAD VEHICLES.

A recent issue of the *Engineer* contains a short review of the progress of the past year with respect to electric vehicles. An Electric Vehicle Committee has been formed to look after the interests of the electric automobile generally, and is endeavouring to fix a uniform charging rate for storage batteries, and to make arrangements for charging at many convenient places in London and the Provinces. A car of the Arrol-Johnston Company made a successful run from Dumfries to London, the cells being charged at different places on the road. Several of the large trading concerns of London are now employing electric vehicles equipped with Edison cells, and they are being used by electric supply authorities in various parts of the Kingdom. In Glasgow a 1-ton van has been in use for some time. A roadster car has been supplied to the Blackburn electricity works, and a 1-ton tower wagon to the urban district council of Ilford. "Edison pleasure cars are in course of construction, and we are told that there are very strong possibilities of Edison electric omnibuses being put into public service." In New York there are now twenty-one manufacturers of electric vehicles, whereas two years ago there were only eight, and in the United States 12,000 commercial and 25,000 pleasure vehicles are in use.

It is contended by the *Engineer* that the introduction of electric traction into London would be a boon, that it would tend to reduce noise in the streets, and would improve the state of the atmosphere. According to the *Lawyer*, the "petrol haze" created by the exhaust from petrol engines is a grave menace to public health.

SOMERSET COUNTY SURVEYORSHIP.

At the meeting of the Somerset County Council on Tuesday the recommendation of the County Works Committee that Mr. Edward Stead, ASSOC.M.INST.C.E., be appointed county surveyor in succession to Mr. H. T. Chapman, who has been appointed county surveyor for Kent, was agreed to unanimously. At the same time the council placed on record their high appreciation of the faithful and valuable services rendered to the county by Mr. H. T. Chapman during the last five years.

Damp Walls.—It is not uncommon for churches to have damp walls, and we learn that Messrs. Bromley & Dahl have specified that in the repairs to St. Margaret's, at Folkestone, "Pudlo" should be included in the cement for the rough casting, to ensure the walls being damp-proof.

Worthing Municipal Schemes.—A special meeting of the Worthing Town Council on Tuesday confirmed the proposal to promote a Bill in Parliament for the purchase of Beach House estate, to confer further powers with regard to the provision of winter gardens, recreation grounds, and entertainments, water and electricity supply, and various improvements.

Nelson Town Planning Scheme.—On Wednesday the Nelson Town Council decided to make application to the Local Government Board for permission to prepare a town planning scheme. Councillor Rickard, who proposed the resolution, said the scheme was absolutely essential for the future development of the town.

Extension of Birkenhead Recreation Ground.—The Birkenhead Town Council on Wednesday decided to purchase from Mr. R. C. de Grey Vyner, for £6,000, a little over 8 acres of land adjoining Bidston Hill. It was announced by the mayor (Mr. James Moot), who presided, that the King had consented to open the land for the use of the public when he visited the town in March.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain;
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii., 2.

MR. BOULNOIS' "GLOSSARY OF ROAD TERMS."

To the Editor of THE SURVEYOR.

SIR.—The traditions of the lexicographer reveal so much ingratitude on the part of those whom his labours are designed to benefit that anyone attempting to enlighten his fellows on the derivation or application of words must be prepared to get "more kicks than ha'pence." If, however, he possess the necessary patience and determination long to labour as a hewer of wood and drawer of water for others—so long and so thoroughly indeed as to compile a fairly complete work, giving only definitions which are almost beyond criticism—then he will be recognised as a benefactor to the community, and gain the lasting gratitude and golden opinions of all. At least, one likes to think so.

Unfortunately, one cannot feel that Mr. Boulnois' glossary places him in such a happy position. In your issue of November 21st Mr. J. A. Jenkinson has already passed some criticisms on the general English of the articles. Mr. Jenkinson's contribution to the discussion is most enlightening and valuable. I cannot, however, agree with his suggestion to omit such a word as "clay." We need a definition of "clay" such as will define it from all other earthy material and say what clay is; but our glossarist fails to give such information. Then there are several explanations of engineering terms given by Mr. Boulnois which one would like to have confirmed by other engineers before they find a place in a permanent record. And now one must consider the numerous chemical expressions which are included in the list. It is a pity that this part of the glossary was not submitted to a chemist for criticism before publication, for inaccuracy in the definitions can only intensify the regrettable confusion which already exists in this department of the literature on road making.

Happily, Mr. Boulnois invites criticism, so that I may perhaps be allowed to challenge some of the definitions given by him, especially those relating to the asphalt and similar industries. A few of them may be reviewed in alphabetical sequence.

Ammoniacal Liquor.—It would be quite correct to say that "an aqueous solution of ammonia and compounds of ammonia and of phenols" is an "ammoniacal liquor," but the converse cannot be accepted. The term as applied technically refers to a by-product of specific character obtained in the manufacture of coal-gas, and this is not evident in the definition given.

Anthracene is not "heavy tar oil." The heavier tar oils contain anthracene, which is quite another matter. The latter part of the description is correct, but it applies equally to at least a score of other "aromatic hydrocarbons," so that one is not much the wiser.

Artificial Asphalt.—Does it usually "contain more or less natural rock asphalt"? Of course it may; but do not most manufacturers take the utmost advantage of the adjective?

Asphalt.—"Sometimes spell 'asphalt.'" Is it not usually and preferably spelt without the "e"? The description is, in the main, satisfactory, but in a glossary intended to guide the inquirer into the way in which he should go it would have been better to omit the last sentence, or to point out the undesirability of applying the terms "to various bituminous mixtures"; or, again, to define the "various mixtures" to which it may be applied.

Asphaltens.—"A term applied to certain component of bitumens in petroleum products, &c." The light here is very diffuse. What is the nature of the "certain components"? The expression, as used by the asphalt chemist, has a perfectly well-known connotation, even if the pure chemistry of the substance is in question. True, asphaltene is obtained from bitumen—to be more explicit, from natural bitumen—but what is one to understand by the "bitumens in petroleum products, &c.," in which the asphaltenes occur? What evidence have we that bitumens are present in "petroleum products, &c."? We are told (quite rightly), under "Bitumen," that "the word is often applied wrongly to residuums of distillation." In "a glossary of road terms" what "petroleum products" is one likely to

imply other than those which are "residuum of distillation"?

Bitumen.—"A mineral substance of a resinous and viscous nature, chiefly composed of hydrogen, carbon, &c." It is extremely unsatisfactory to find such a fundamental term as "bitumen" so carelessly defined. On referring to "Resin," one is met with an equally unfortunate lack of accuracy. But has bitumen anything whatever in common with resin? Even its "viscous nature" is of a very different character. The " &c." spoils the one observation which is substantially correct, for bitumen is composed chiefly of hydrogen and carbon; but so are petroleum, turpentine, coal gas, &c.

Calcium Chloride.—The description applies equally to a multitude of other compounds of calcium.

Carbencs.—The description "components of bitumen petroleum, &c." is meaningless.* One requires to know which components.

Carbon.—"From 'Carbo,' a coal. It is insoluble and infusible." This is wellnigh, if not actually, the only word of which we are given any etymology, but the language of origin is not stated. Two of the properties—insolubility and infusibility—are mentioned, but the reader would like to know what carbon is, or something about its nature.

Cresote.—"A powerful antiseptic obtained from coal tar, and used extensively in the preservation of wood blocks." This is very inadequate. Similar antiseptic properties are exhibited by a hundred other substances obtained from coal tar, and several of them might be applied to the preservation of wood—some of them are. Moreover, there are numerous varieties of "cresote." They are characterised by the presence of cresol, or other phenolic bodies; yet this is not mentioned. But when the glossary is specifically of "road terms," the user most interested will look for some precise description of those varieties of cresote employed in road making.

Deliquescent.—"Capable of attracting moisture from the air, and retaining it." This definition applies to *hygroscopic*; the all-important distinction of simultaneous liquefaction which pertains to deliquescence fails of recognition.

It is hoped that these few criticisms on the chemical words occurring on the first four pages may be suggestive of what one may look for in the revised work. Mr. Boulnois has undoubtedly rendered service in compiling so large a vocabulary of the terms used in the road-making industries, and when editing the permanent publication, one wishes him all success in fathoming the depths of this area of the ocean of philology, and bringing to the surface some of those treasures of scientific definition which the faithful student is ever seeking.

No one who has not taken part in such work can appreciate the immense difficulties of the colossal task Mr. Boulnois has set himself.—Yours, &c.,

S. JUDD LEWIS, D.S.C., F.I.C.

London, W.C.

January 5, 1914.

MUTUAL DEFENCE.

To the Editor of THE SURVEYOR.

SIR,—I note in your columns that "the members of the Eastern District" of the Municipal and County Engineers "are giving a good lead in forcing the question of mutual defence again to the front." Seeing that the Institution of Municipal Engineers already has a Mutual Aid and Defence Fund, to which contribution is compulsory on the part of all corporate members and students resident in the British Isles, and that the fund has now, at the present moment, a separate account at the institution's bankers, with money in hand—I say, having regard to these facts, that the question of "a good lead" being given in other quarters is not a little misleading. It is nothing less than astonishing that with columns in the technical Press concerning a projected fund (which is still in the clouds), no mention is ever made of a working fund which actually exists!—Yours, &c.,

B. WYAND,

Secretary, Institution of Municipal Engineers,

39 Victoria-street, S.W.

January 6, 1914.

[We fail to see how the note referred to—which appeared in our "Minutes of Proceedings" of the 19th ult. (page 923)—suggests anything except that the members of the Eastern District of the Institution of Municipal and County Engineers are giving a lead

to those in the other districts of that body, for, in the concluding words of the sentence from which Mr. Wyand quotes, the hope is expressed that "when the position is fully realised the general body of members will see that the establishment of a fund would be in their best interests." Having succeeded in establishing a fund of their own, the younger institution obviously require no such "lead." As is well known, the present articles and by-laws of the older body prohibit the enforcement of a compulsory levy on the members for purposes of defence, and the observations in our issue of the 19th ult. had reference solely to the praiseworthy efforts of the Eastern District to obtain support for a voluntary scheme.—Ed. THE SURVEYOR.]

THE SOMERSET DIRECTION POST.

To the Editor of THE SURVEYOR.

SIR.—The description of this appliance on p. 10 of the current issue of your journal reminds me that I was lately cycling from Bath to Weston-super-Mare through Marksbury. About $\frac{1}{2}$ mile south-west of the latter place the road forks—one branch to Weston and the other to Wells. Some wag had reversed the Weston arm which pointed to Bath—that is, north-east instead of south-west. I am too well acquainted with the district to be misled by such a trick, but I can imagine a good many motorists and others were placed in some difficulty before the matter was rectified.

It is evident that the design should be varied to prevent such an occurrence, and I take it this could be easily accomplished either by shrinking the arm on the post, or providing a rib on one part running in a groove in the other.—Yours, &c.,

OLD BIRD.

January 6, 1914.

PORTLAND WATERWORKS: THE FRIAR WADDON BOREHOLE SCHEME.

To the Editor of THE SURVEYOR.

SIR.—In your report of the discussion on this paper in your issue of the 2nd instant I am reported as having stated that the cost of raising 1,000 gallons of water per 100 ft. was 13d., which is obviously an error, as it should be 13d. Then the fuel consumption of 140 lb. of anthracite is for raising 2,000,000 ft.-lb. of water.

I am also reported to have stated that the Weymouth Water Company's pumping station was 3 or 4 miles from Portland, whereas it should have been from the council's waterworks at Friar Waddon.

With reference to the decomposed sewage getting into the old well sunk on the island, this obtained access through the fissures in the Portland stone and not in the clay, which is not fissured, but forms a floor, as it were, upon which the water travels.

I might also add that at that time there were a large number of cesspools on the island, which probably added to the impurities found in the water.—Yours, &c.,

R. STEVENSON HENSHAW,
Engineer and Surveyor.

Portland, Dorset.

January 6, 1914.

House Refuse Collection in Kensington.—A report on the experimental daily collection of house refuse during the months of July, August and September in that portion of Golborne Ward, Kensington, north of the Great Western Railway, has been prepared by the borough engineer, Mr. A. R. Finch, Assoc. M. Inst. C.E. He states that a daily collection could not be effected in some 159 cases out of a total of 923. The actual weight of refuse collected was only 21 tons more than the estimated quantity for the corresponding period of the previous year. The cost per ton for collection and removal showed an increased expenditure of 4s. 0½d. This increased expenditure was largely accounted for by the fact that in the majority of cases it was found that there was very little refuse to be removed from day to day, and also by the extra labour involved by reason of the receptacles being unsuitable or being placed in positions not readily accessible to the dustmen. After considering the matter, the borough council has decided that, subject to the necessary provision being made in the annual estimates, a bi-weekly collection of house refuse shall be made throughout the borough between May 1st and October 31st next, the cost of which, the borough engineer estimates, would be met by the provision of a further sum of £1,500.

Institute of Sanitary Engineers.

PRESIDENTIAL ADDRESS OF MR. JOHN D. WATSON.

There was a large gathering at Caxton Hall, Westminster, on Wednesday evening, when Mr. John D. Watson, M.INST.C.E., engineer to the Birmingham, Tame and Rea District Drainage Board, delivered his inaugural address as president of the Institute of Sanitary Engineers in succession to Mr. H. Percy Boulnois, M.INST.C.E.

Mr. Boulnois, who occupied the chair at the opening of the proceedings, said it was unnecessary for him to introduce Mr. Watson to the members, for his successor in the chair had a world-wide reputation as an engineer, and possessed a knowledge of sewage disposal as great as that of any man in the country.

Mr. Watson having assumed the chair, Mr. A. J. Martin, past-president, rose to propose a vote of thanks to Mr. Boulnois for his services to the institute during the past year. Twelve months ago, in pursuance of his duty, he inducted Mr. Boulnois into the chair into which he had that evening inducted Mr. Watson. He congratulated the institute at the time on its choice of president. It was always a pleasure to say "I told you so," but he was quite sure that the members of the institute would agree that Mr. Boulnois had more than fulfilled their expectations in regard to him. He had not only presided with dignity and distinction over their proceedings, but had created a record by the way in which he had thrown himself into the everyday work of the institute. He did not think any president before him had taken the same close interest in the ordinary spade work of the institute, nor had any president made such a mark on its prosperity and well-being.

The vote of thanks was seconded by Mr. BLAKE, and on being put to the meeting was carried with acclamation.

In a short reply, Mr. BOULNOIS protested that he was not really worthy of all that Mr. Martin had said of him. He had tried to do his best, and a man could not do more than that. His year of office had been an exceedingly pleasant one, because he had had the unanimous support of the council of the institute and of Mr. Hasluck, their admirable secretary. Presidents, he added, might come and presidents might go, but without a good secretary it was impossible for any institute to thrive. He offered his congratulations to the members on having secured Mr. Watson as their president for the ensuing year.

MR. WATSON'S ADDRESS.

Mr. WATSON then delivered his address, speaking as follows:—

My first duty on rising to address you is to make fitting acknowledgment of the honour you have done me in electing me to be your president. I appreciate the distinction of being called upon to succeed men like Mr. Boulnois, Mr. Martin, and the many other distinguished sanitarians who have preceded me in this chair, and shall try during my year of office to promote the objects for which we are banded together.

The profession of a civil engineer is usually defined as "the art of directing the great sources of power in Nature for the use and convenience of man." This is a quotation from the original Charter of Incorporation granted nearly one hundred years ago to the Institution of Civil Engineers. Although this definition is, and was intended to be, comprehensive enough to embrace engineering of all kinds, the rapid development of applied science in recent years has induced hiving off from the parent institution both for the purpose of obtaining what may be termed more specialised pabulum, and of affording opportunities for specialists to promote their more immediate interests; therefore, we now have the mechanical engineer confining himself chiefly to mechanics, the electrical engineer to things electrical, the mining engineer to mining, and the sanitary engineer to works which have for their object the promotion and maintenance of public health. This object, however, is so comprehensive that it embraces waterworks, sewerage and sewage disposal works, refuse incinerating works, architecture in its relation to dwelling-houses, and the manufacture of articles needed to build and maintain structures required for the promotion of the health of the people.

A presidential address to a body whose functions and studies are so varied should, I apprehend, be made interesting to more than one section of its members; but I fear my remarks will be of interest chiefly to those engineers who are engaged in the purification of sewage.

HOUSING.

In inculcating sanitary reform, I heard our late King (Edward VII.) emphasise the catholicity of its nature. He said, *inter alia*: "Although the heaviest penalties of insanitary arrangements fall on the poor, who are themselves least able to prevent or bear them, no class is free from their dangers." These words are as true to-day as they were in 1891, but I think the general community are now better able to appreciate them than they were when they were spoken; yet we are a long way from being sufficiently careful to obviate those penalties which are the inevitable results of neglecting the laws of Nature, or, in other words, the laws of sanitation. The danger zone is almost invariably in the slum districts of our cities, and although the poor suffer most from the outbreak of infectious disease, the well-to-do reap their own share of the penalties. To circumscribe this danger zone, therefore, is in the interest not of one, but of all classes of the community. Who among us can contemplate the immense number of British people who are obliged to live in one-room dwellings without feeling that the existence of so many insanitary dwellings, as this fact implies, is a blot upon our national escutcheon which we should exert every nerve to remove? Whether the blot is due to poverty, ignorance, drink, or, what is more probable, to all three combined, it is evident that much remains for the sanitarian to do before he can be allowed to rest from his labours as propagandist, scientific guide or engineer.

To gain courage for greater efforts in the future by contemplating the gradual reduction of the death-rate is commendable; to attempt to apportion credit for what of late years appears to be an annual decrease is not only futile, but mischievous. Our duty is to work with all whose objects are in accord with our own for the realisation of our common aim. Whether the money required for building 100,000 or more cottages in the country is to be provided by Liberals or Conservatives is of no consequence to the sanitarian. The need for cottages in the country and habitable dwellings in the towns is so clamantly required that our duty is to press the work forward irrespective of party interests.

There is encouragement also in the reflection that King Edward's exhortation should be less difficult to obey now than it was in 1891; the nation is much richer, and knowledge of hygiene fuller and more scientifically directed than it was then; not only so, but the work of each generation, if it is good, renders the work of the next generation less arduous. For instance, the introduction of Loch Katrine water to Glasgow, nearly sixty years ago, is still a source of health and wealth to its citizens, and although extensions of the works have taken place from time to time, the rate originally imposed to pay for the scheme has been gradually reduced until now it costs occupiers of dwellings only 5d. per £ on their rental, and owners of all classes of property 1d. per £, while water sold to factories, workshops, &c., has been reduced in price from 1s. to 1d. per 1,000 gallons.

WATER SUPPLY.

To the waterworks engineer we owe facilities for keeping clean the houses of the poor; if, owing to ignorance or carelessness, advantage is not taken of these facilities, the estimable boon of having water upstairs, downstairs and in my lady's chamber still remains.

We speak of the work of the Romans with something like bated breath, but can it be maintained that their waterworks were either so great or so useful as the work of the modern engineer? The feat of introducing an abundant supply of water to almost every dwelling-house in a city of 7,000,000 people is unprecedented. It took several generations to accomplish. Now the London works are only second in magnitude to the colossal works of New York, where the authorities are just completing a duplication of their 500,000,000 gallon supply. When the

Catskill Mountains scheme is completed. New York will have a supply of potable water equal to 1,000 million gallons per day, or more than the volume of the river Thames at Teddington in summer.

Contemplate what it means to introduce water to the gold mining districts of Coalgardie and Kalgoorlie from a source 350 miles across the desert waste of Australia, or even the greater work of building the Los Angeles aqueduct, which extend through wild, rugged country for a distance of 250 miles. But even more than the feats of engineering represented by aqueducts and reservoirs is the almost universal manner in which water is laid on to every room in which it is wanted, even in the highest building of the highest part of every modern city. The Romans attached the utmost importance to the provision of public and private baths, but the introduction of water to the dwellings of the poorest formed no part of their ambition.

The engineer's work may appear at first sight to be restricted to the introduction of water, but it is also his duty, as well as that of every sanitarian, to check the widespread prodigality of its use.

The average consumption of water in England is from 25 to 30 gallons per head per day, but in Scotland, where the people are credited with being more frugal, it is double that quantity. In the United States generally it is about four times as much. If supplies were unlimited, and money available for public works inexhaustible, little need be said, but neither is the case, and it cannot be too definitely fixed in the minds of the people that to waste water is to waste money. . . .

I have had the pleasure of introducing water into not a few small towns and villages, and it has always been a gratification to witness the happiness of the people at receiving for the first time water laid on to their premises—this, too, when they had to pay as much as 2s. per £ for it. Before long, however, they ceased to husband the water as if it had ceased to be the precious liquid that it is; then came indifference to waste, with the inevitable consequence that either extensions of the works or retrenchment became essential. There is the widest difference between legitimate use and waste of water. The consumption will no doubt increase if the plunge bath becomes a recognised feature of the artisan's dwelling, but it is an increase that portends health and comfort much to be desired.

SEWAGE PURIFICATION.

In the purification of sewage change and uncertainty have played a conspicuous part during the past half century. In conjunction with the chemist and biologist, the engineer has had many problems to consider, not always with satisfactory results. During the first moiety of the last half century, engineers advocated irrigation as the only reliable method of disposition of sewage without detriment to a stream. Chemists generally advocated a chemical process, and they took out no fewer than 500 patents for that purpose. After a long fight, the Royal Commission of 1885 pronounced strongly in favour of land irrigation as the only reliable method. This decision ceased to be correct when the biological showed another way of efficiently purifying sewage, and for twenty years we have been constructing bacteria beds.

How do we stand to-day? Mr. A. J. Martin, speaking at Exeter last summer, summed up the present position by saying: "We can produce with certainty an effluent which is inoffensive and chemically stable. The putrescible solids in sewage can be converted, either by aerobic or by anaerobic methods, into a much smaller volume of inoffensive residuum. The effluent can be completely sterilised, although not without risk of upsetting the balance of life in the river into which it is discharged."

In order to arrive at these general dicta we have travelled many a controversial path. The conflicts have been severe, but none of the combatants have been mortally wounded. It is to the credit both of the chemist and the engineer that the contests were without rancour, notwithstanding the fact that engineers of eminence have had the soundness of their judgment impugned within sight and hearing of their clients. Good temper under such circumstances is highly commendable, and could have been preserved only when each party to the controversy recognised in his opponent perfect good faith and a single eye to the advancement of science.

Throughout the controversies two facts have stood out clear and undisputed—namely, that satisfactory

effluents could be produced by treating sewage on suitable land, and by treating it on well-constructed bacteria beds. In both cases the purification process is due to a combination of biological, chemical, and physical laws which hall-mark it, so to speak, with Nature's own stamp. The admission of these facts proves that differences were not fundamental in character, and the all but universal adherence to them now shows, not that further investigation and test are unnecessary, but that there is a good starting point from which definite scientific research may begin. At one of our sessional meetings last year Mr. Martin pleaded for the establishment of a Government department to undertake such work, and I venture to say that there is no more urgently required department. This institute should add the full weight of its authority to the advocacy of this work, as well as to the establishment of the central authority proposed by the Royal Commission on Sewage Disposal.

THE PROPOSED CENTRAL AUTHORITY.

There should be no assumption that because the Royal Commission have proposed that a central authority should be set up, Parliament will agree to it. The very fact that money will be required to equip such a department, and that the appointment of more Government officers is certain to be resented by a section of the Legislature, is the very reason why the institute should be vigilant and insistent. I am sure no one interested in the purification of sewage will misunderstand the proposal to establish a department which, in addition to performing the function allocated to it by the Royal Commission, should, as part of its usual and permanent routine, conduct scientific investigations in every phase of the work. This branch of work should be urged upon the Government; but if failure has to be admitted, that is no reason for relaxing every effort to induce Parliament to approve the proposal to establish a central authority. If that is conceded it is, in my view, only a question of time when the central authority will find it necessary to equip a research department. The present anomalous state of things is intolerable, whether due to the fault of the Statute or to its faulty administration, and should be remedied. The bare idea of compelling a township like Llanwrst to purify its sewage completely, although the effluent must be discharged into a river more than 2,000 times its volume shows that the wealth of the country is not husbanded properly. There is nothing so objectionable as a slavish obedience to the letter of the law when the spirit is not even remotely apprehended.

The great work of purifying the rivers of England is necessarily costly, and the nearer I come to understanding the problem the more am I convinced that we need an authority like the central authority to guide local bodies, as much as we need one to see that they obey the law. Cast-iron rules are applicable to some things (for instance, the breaking of other people's windows), but they are inapplicable to standards of sewage effluents. In my view it is nearly as bad to waste money upon perfect sewage effluent where that is not required as it is to neglect the work of purification altogether where it is required. Obviously it would be wrong to allow Birmingham, which is situated 120 miles from the sea, to discharge sewage into the nearest stream without treatment because Hull does so, or to allow a township on the Thames to pollute the river because it may be done with impunity at Dundee, where the queen of Scottish rivers is 2 miles wide.

A suggestion was once made to Mr. Balfour, when he was Prime Minister, that much money might be saved if local authorities would only construct their sewage works on plans to be provided by a Government department, and he retorted that the suggestion was unworkable, as it was in direct antagonism to the English character, which would rather work out its own salvation by blundering into success than accept specifications of a perfect scheme at Government dictation. This view must command respect, but there is the widest difference between the preparation of a specific scheme and the establishment of an authority which will be a scientific body skilled in all subjects relating to pollution of rivers, as ready to advise as control, and which will be the ultimate determining authority, beyond whom there will be Parliament only.

It is the creation of such an authority that the Royal Commission on Sewage Disposal recommend, and which, without unduly anticipating the report of

the municipal representatives appointed by the Association of Municipal Corporations, appeals to them as being the only workable alternative to setting up a standard of purification by Act of Parliament.

IMPROVEMENT OF RIVERS.

May I suggest that the incidence of taxation for maintaining clean rivers should not be beyond the cognisance of such an authority? If each sewage effluent is to be made to suit the needs of each stream for the benefit of the community at large, should not the community share part of the burden?

The analogy between rivers and roads is by no means complete, but the association of ideas leads me to remind you that it is not very long since the public were satisfied if a road were repaired from the tolls taken from the vehicles running over it. Now the county and district councils levy rates on all assessable property within their respective districts, and even this, it is now admitted on all hands, is too circumscribed an area of taxation.

To improve the condition of a river is sometimes as much national as local in its reach. Parliament has already accepted this principle, to some extent, in the Bill promoted by the corporation of Edinburgh. This Bill was opposed by millowners in both Houses of Parliament, but without success, and an Act was passed in 1889 constituting a special board charged with the duty of preserving the amenities of the water of Leith, and conferring power to rate all owners of property *ex adverso* of the river. This district, under the jurisdiction of this board, is a purely arbitrary one, and, roughly speaking, is about 12 miles long by 3 miles broad. The area is an irregular one, and seems to have been laid down on the plan so as to enable the board to deal with those mills, villages and properties whose refuse and sewage actually did or in the event of extension naturally would drain into the water of Leith. For the purposes of the Act, each of the portions of the landward district within the jurisdiction of the landward local authorities is declared to be a special drainage district under the Public Health Acts, and under the powers contained in these Acts the respective local authorities may extend and enlarge any such special drainage district. The assessable rental of the whole district is nearly £3,000,000.

It may be taken for granted that riparian owners would object to be rated for the elimination of impurities for which they disclaim all responsibility. It should be borne in mind, however, that some rivers would have been available as sources of water supply had it not been for the ramification of land drains, which, in these modern times, convey soakage from highly manured arable land direct to the nearest stream. The case of the city of Aberdeen comes to my mind. There the authorities propose to abandon an excellent water supply derived from the river Dee, and introduce one estimated to cost upwards of £1,000,000 in order to avoid the risk of impounding tainted water.

AERIAL NUISANCE.

Another sewage problem which has not yet been satisfactorily solved is that which relates to aerial nuisance. It is a problem which affects large communities more than small ones, as, to some extent, it is a question of atmospheric dilution. One of the schemes for treating the sewage of New York involved the construction of 1,400 acres of bacteria beds at one place, and in commenting upon this proposition I ventured to say: "I have grave doubts about the wisdom of placing so vast an area of bacteria beds so near to an industrial centre as they would be on Barren Island. In contemplating such a scheme one should take into account the after effects of the evaporation of so much foul liquid as there must necessarily be from such an area of filters. In 1911, when the summer weather in England was warmer than usual, there were complaints of smell nuisance from a small installation at Hanley, where the sewage is of about the same strength as the average American sewage, and where it is distributed over rectangular percolating beds by mechanical distributors moving backwards and forwards. Complaints were also made by residents near the 30-acre installation at Birmingham, where strong sewage is sprayed over the beds by fixed nozzles. The chief lesson to be learned from the 1911 experience is that an increase of flies is to be looked for in the neighbourhood of bacteria beds in hot weather, and that objectionable smell adjacent to them is more pronounced during prolonged hot weather than at other times—*e.g.*, seasons like the average English summer, when the temperature rarely exceeds 65 deg. Fahr. in the shade. But a much more serious drawback to a great area of bacteria beds dur-

ing spells of prolonged hot weather is the formation of vapour 'clouds,' due to the evaporation of sewage. These imperceptible clouds appear to form over the beds in quiet weather. They rise to some distance above the earth, and at sundown, when the earth begins to cool, they return not alone as refreshing dew, but with offensive odour. If this occurred only in the vicinity of the bacteria beds, where the land is generally less valuable than at some distance, it would not be so serious in its consequences; but it generally occurs at some distance from the bacteria beds, the direction and distance depending upon the tendency and velocity of the wind."

Of course, it is only the malodorous element in sewage that makes this phenomenon noticeable; evaporation from clean water would act precisely in a similar manner, but it would manifest itself in welcome dew on the grass. This led me to adopt at Birmingham the use of hypochlorite of calcium with excellent results, but the cost would be a serious matter where 700,000,000 gallons had to be treated each day; indeed, the bare probability of hypochlorite of either calcium or sodium (and the latter is even more effective) having to be used frequently would be sufficient in itself to retard the adoption of a scheme which would be many times as large as anything now in existence.

NEED FOR RESEARCH.

It is obvious that climate is of paramount importance. The weather experienced in England in the summer of 1911 stands by itself in our meteorological records, and it would be extravagant to build all our bacteria beds to suit the tropical conditions which obtained then. The question therefore arises how much money would be spent to meet the very occasional spells of hot weather experienced in England; but there should be no question as to the need for research to ascertain what is best to be done. I hoped to be ready to give to this meeting the results of experiments which are being made on the saturation of sewage with oxygen before applying it to the bacteria bed; but, unfortunately, the experiments are not yet complete, and as questions of cost enter so largely into the practicability of any scheme of this kind, it may be found that the economic will overbalance the scientific side of the problem.

Mr. Scott-Moncreiff, in a speech some years ago, asked whether the great cost entailed in the purification of sewage really paid a community. If there were only a limited definite sum available for the promotion of public health in this country, I would say, without hesitation, that there are other works which would probably produce greater benefit to a greater number than purifying our rivers; but in England there is plenty of money to pay for the maintenance of reasonably clean rivers, and the conservation of those delightful rural districts which no patriot would willingly see permanently injured. It is as essential for a local authority to maintain a clean town or district as it is for an individual to keep a clean home. Cleanliness is one of the chief characteristics of civilisation—not the surface cleaning merely as I have seen it in many towns abroad, and some, I am sorry to say, at home, but that cleanliness which is dear to the heart of a medical officer of health. The cholera plague at Hamburg a generation ago, and the more recent epidemics of typhoid fever at Maidstone and Lincoln, directed the minds of the least thoughtful of the community to the need for the absolute purity of the water supply, and indirectly to the disposal of sewage. In England, during the last generation, both subjects have received conspicuous attention, and we have, to some extent, merited such encomiums as Dr. W. Roth, of Saxony, paid us when he said: "It is unquestionable that, in the whole field of hygiene, England has been foremost in practical work, thanks to the great number of eminent men who have devoted their powers to the subject"; but I am seriously doubtful whether we are not at this moment prone to rest on our oars. Nothing succeeds like success; but if we rest content with having been successful once, we live in a fool's paradise. If we cannot individually prosecute scientific research, let us unitedly and wholeheartedly call upon the Government to establish a research laboratory which will take up or initiate subjects of investigation on our behalf.

I have been engaged in many inquiries as to the best method of disposing of sewage, but I frankly own that when I was engaged last year on the problem of how best to sewer New York and treat the sewage of that great population, I found a wealth of minute scientific and practical investigations already pre-

pared by the Metropolitan Sewerage Commission out of all proportion to anything ever prepared for a similar purpose in this country, and it made me feel that if the president's methods were typical of American practice, we are far behind in this respect. No question could be put in relation to facts, or line of investigation suggested, which Dr. Soper or his officers had not anticipated, and that, too, in the most complete and exhaustive manner.

National or local investigations of the kind I considerate might appear for the moment to be upsetting. A community may have completed its sewage purification scheme when a better way of doing part of the work is discovered, but even if this were so, there could be no suggestion of remissness. Hedley, when he built the "Rocket," was not guilty of short-sightedness in not constructing it with all the marvellous devices which go to make the modern decapod locomotive.

The sludge question, for example, has not been exhaustively studied. It is a very complex substance, which in one place may yield copper and in another grease in such quantity to pay for recovery, and it may be that in every case sufficient nitrogen can be obtained from it in quantities to be remunerative. As it is, we are usually content to get rid of it without creating nuisance, in some cases by pressing and burial, in others by pressing and burning, and burial alone, at coast towns by disposal at sea, and in at least one case in this country (Birmingham), and several in Germany, by septicising and air drying. All the processes are efficient as a means of getting rid of sludge without nuisance. From a hygienic point of view, dumping at sea is unrivalled; but this method is rarely available, and I doubt if it is always wise.

SLUDGE AS A FERTILISER.

When the British Association met at Bristol in 1898, Sir William Crookes delivered a presidential address which, to say the least, was distinctly alarming. He stated that wheat-growing land all over the world was becoming exhausted unless it became the universal practice to apply to the land a moderate dressing of chemical manure. From the time that speech was made until about 1906 foods of various kinds tended to rise in price, but the corresponding rise in wages and economies practised by purveyors, chiefly those relating to transportation and handling, kept the increased price from being felt by the poor consumer until about 1906, when he began to talk about the cost of living, a phrase which we have hardly had out of our hearing ever since, and, so far as one can forecast the future, not likely to have out of our hearing for some time to come.

I fear the cost of living is bound to go up, for the reason that the food-producing countries are having a greater demand for their produce by the world's ever-increasing population. Until recently North America was able to supply her own wants, and had a surplus to send to the English markets. Now all that they can produce is required to feed the rapidly increasing population of the States and Canada, the States alone having a population of almost 100,000,000 persons. To aggravate the situation, from the English point of view, the United States Legislature recently took the duty off foodstuffs, with the inevitable result of diverting food from various European States and British Colonies to New York and other ports where better prices can be obtained. Beef, for example, is sold in New York at 3s. per lb. Civilisation demands for the labourer, whether he speaks English, French, or German, a higher standard of living now than formerly, so that, in addition to the large increase of world population, there is a greater demand for foods, some of which the people of two or three generations back called luxuries. All this tends to increase the demand for farm produce without a corresponding increase of production. Unless the production of food is increased by the means suggested by Sir William Crookes, or by an even more intensive cultivation of the cultivable soil, prices are bound to rise, more especially if European countries are driven to follow the American example and encourage the free imports of edibles.

Now the question arises, Are we sanitary engineers doing our part as well as we might? Are we satisfied to rest content with converting a noxious product like sludge into an innocuous substance, knowing that it contains a nitrogenous base which might be utilised as a fertiliser? Probably Sir William Crookes was unnecessarily pessimistic, but his words were spoken with conviction, and that, too, long before emigration from the States into Canada became a commonplace

occurrence. The reason for this emigration is to be found in the fact that the tillers of virgin soil soon find that manure is essential if land is to continue to give a reasonable return for the labour expended upon it. Manure was found to be too costly, and its use involved new methods and new plant. They prefer, therefore, to migrate to "fresh fields and pastures new," accepting a gift of prairie land from the Government of Canada rather than change methods to which they have become accustomed. Even if there were only a modicum of truth in this, it shows what may be looked for. In England there is an upward tendency in manure prices. Until recently London alone provided farmers with enormous quantities of stable dung; now that the motor is fast driving the horse off the streets there is but little town manure available for the farmer. If this is true of London to-day it will be true of the provinces to-morrow, and it accentuates the need for the conservation of the fixed nitrogen in sewage sludge, so essential to the efficient cultivation of the soil.

If Sir William Crookes is right, we have to face the startling fact that in the United Kingdom we are content to hurry down our drains and watercourses into the sea fixed nitrogen to the value of no less than £16,000,000 per annum. In Birmingham alone upwards of 400,000 tons of liquid sludge are air dried and converted into a non-smelling residuum at a cost of £6,000 per annum, and the best use to which it has been put so far has been to use it as an auxiliary fuel during the protracted coal strike. Many will no doubt say that it is enough to control effectually the enormous potential nuisance in sewage from so vast a population as 1,000,000 persons, without establishing a huge municipal trading concern for the recovery of waste products. But if we have gone so far, and if the way seems open to go further by the possibility of converting sludge into a readily saleable fertilising substance, the local authority, and all who stand to gain by increasing our scanty wheat-growing area, or otherwise adding to the food-producing capabilities of the soil, should encourage such a project.

It has been felt for some years past that there is profit for someone who could invent a process to utilise the manurial value of sludge, but the difficulty has been to get a plant capable of converting wet sludge into a dry powder quickly, efficiently, and economically. I have examined machines at work in England, Scotland, Germany, and Belgium, without being satisfied with the results.

THE DUBLIN PROCESS.

Two years ago my attention was directed to the Dickson process as it was worked at the Dublin sewage outfall works. It was claimed for this process that the introduction of brewery yeast into the sludge promoted rapid fermentation, and rendered the sludge easily separated from the water. When attention is drawn to what appears to be one of the many patents that have already proved to be abortive, one is prone to brush aside a claim of this kind without sufficient attention. Fortunately I was induced last autumn to go to Dublin to see the process (which I shall describe anon), when I formed the opinion that the patentees were justified in claiming that they are able to make quickly and economically a fertiliser of which sewage sludge forms the base. At my instigation the Birmingham Drainage Board sent Mr. L. F. Mountfort, Assoc. M. Inst. C. E., to Dublin to make a fortnight's careful test of the process and the plant, and Mr. Mountfort's report fully confirms me in the opinion which I formed as the result of personal observation.

The process may be divided into two main sections:—

- (1) The fermenting of the crude sludge mixed with a small percentage of yeast, and the separation of as much water as possible by this means.
- (2) Drying the resulting sludge, mixed in this case with certain compounds containing phosphates and potash to produce a fertiliser.

The sludge produced from the fermentation has a water content of about 82—84 per cent. Thus in the case of a 95 per cent crude sludge, about two-thirds of the water is separated in the fermenting process, and the remaining one-third in the dryer.

It is found that this density figure is obtained whatever the quality of the crude sewage, and therefore the variation in the amount of water to be separated per pound of solid matter due to variation in density of crude sludge is entirely taken charge of by the fermenting process, and the work of the dryer remains practically constant per pound of solid matter.

In the present plant the sludge is pumped into an

overhead tank, and from there a pipe is taken to an open trough leading to a small screen. At this point about 0.5 per cent of its weight of ordinary yeast is added to the sludge, this yeast being mixed with water to enable it to be supplied through a pipe.

The mixture of sludge and yeast is then pumped through a "heater" which consists of a number of pipes placed in the path of the hot air from the furnace, and is then delivered to the fermenting troughs, which are eight in number, each about 50 ft. long by 4 ft. wide, and holding about 3,000 gallons. Under each trough is a hot-air duct, and the sludge is kept as far as possible at a temperature of about 90 deg. Fahr. during the fermenting process. In about twenty-four hours it is found that, as the result of the fermentation, there is a distinct separation of water, the sludge at a density of about 83 per cent occupying the surface while the water can be readily drained away from underneath.

Before being taken to the dryer the fermented sludge is mixed with a compound of phosphates and potash in about equal proportions by weight of sludge and compound based on a dry, solid matter, because, although a satisfactory manure can be made from the sludge only, it is found that a greatly enhanced value is given to the final product at a much less than proportionate cost. The mixture, containing about 73 per cent water, is then pumped into the dryer, which is one of the most important pieces of apparatus in the whole plant. It consists essentially of a cylindrical vertical casing containing a series of arms and platforms revolving upon a centre shaft, and between fixed arms and platforms. The platforms have large perforations in the shape of sectors of a circle, and the mixture which is fed in at the top is scraped over the surface of the plates and gradually falls through the dryer to the outlet at the bottom. Air at a temperature of about 450 deg. Fahr. is blown in at the bottom and passes out at the top of the machine. The dried product then falls into a disintegrator, consisting of a revolving paddle, which beats up the product into a powder, which is blown out at one end of the machine by a draught of hot air.

I have referred to the process throughout as a fermentation one, but it is probably even more correct to speak of it as a digestive process. The introduction of yeast into the sludge evidently provides stimulating food for the putrefactive bacteria, as the rapidity with which the solid part of the sludge is separated from the liquid part is one of the extraordinary features of the process; but, however it may be designated, its

merits are sufficiently conspicuous to warrant me in saying that its discovery marks a decided advance in the treatment of sewage sludge which no engineer can afford to ignore. Apart from the hygienic and profit-making elements, I attach much importance to the utilisation of the nitrogen of sludge, which, up till now, has been literally thrown away.

I do not endorse the language, but I recommend to your notice the sentiments of Liebig, who wrote more than half a century ago words that now appear to have had a wonderful insight into the future: "Nothing will more certainly consummate the ruin of England than a scarcity of fertilisers—it means a scarcity of food. It is impossible that such a sinful violation of the Divine Laws of Nature should for ever remain unpunished, and the time will probably come for England sooner than for any other country, when, with all her wealth in gold, iron and coal, she will be unable to buy one-thousandth part of the food which she has during hundreds of years thrown recklessly away."

Liebig was probably much too pessimistic, but the very suggestion of possible calamity should stimulate us to do whatever is possible to avert even an echo of it. In conclusion, allow me to remind you again that an engineer's profession is the art of directing the great sources of power in Nature for the use and convenience of man.

In proposing a vote of thanks to Mr. Watson, Mr. A. P. I. COTTERELL said that in his masterly address the president had spoken emphatically as to the present from the basis of practical experience, and had taken them confidently into the future. The various phases of sewage purification with which the address dealt were phases as to which he was not speaking from the book, but from what he had actually ascertained by his own personal research on one of the largest, if not the largest, works in the world. The remarks which had been made upon the sludge question were such as warranted their very careful consideration; the problem was not one which should be regarded as insoluble.

Prof. BOSTOCK HILL, in seconding, said that everyone who knew Mr. Watson's work was aware that the sanitary world, and Great Britain in particular, were indebted to him for extraordinary advances in the treatment of sewage.

Mr. COLIN FRYE and Dr. S. RIDEAL having spoken in support, Mr. BOULNOIS put the vote of thanks to the meeting, remarking in doing so upon the practical nature of Mr. Watson's address. Dealing with the question of the utilisation of sludge, Mr. Boulnois observed that farmers, owing to the cost of labour and transport, favoured the use of concentrated manure, adding that, until sludge could be sold at a rate commensurate with the little manurial value it possessed, he doubted very much whether it would make much headway in the direction suggested. Concluding, Mr. Boulnois said he regarded Mr. Watson's address as an augury of the success of the institute in the future.

The vote of thanks was carried, and, Mr. Watson having replied, the proceedings terminated.

To Manufacturers.—Mr. L. W. Wynne-Roberts, B.Sc., of Regina, Canada, who is engaged in connection with various public works of importance in that city, and who is at present on a visit to England, is desirous of obtaining manufacturers' catalogues and other information referring to heating, lighting, ventilation, water softening and sewage disposal. Communications should be addressed to Mr. Wynne-Roberts, c/o The Editor.

Municipal Employees and Christmas Boxes.—At a meeting, last week, of the Bradford Cleansing and Team Labour Committee the following resolution was passed: "That from this date any workman employed by the Cleansing and Team Labour Committee soliciting Christmas Boxes, New Year gifts, or gratuities of any description at any time of the year, shall be instantly dismissed." The resolution is to be strictly enforced. We are given to understand that the question has not been brought forward by the committee of management to take away an old privilege from the men, but raised entirely by one of the men themselves who had been away from work for over five weeks before Christmas owing to an accident to his leg, spending his time, although in receipt of his full pay of 50s. per week, going about the city Christmas Boxing. The workman has been dismissed, and the committee have decided to stop the practice altogether.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC. INST. C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

369. Tree Guards. Give sketches of an economical and sightly tree guard, suitable for good-class residential roads, with details of cost of same. Ordinary iron guards are barred because of "stiff" appearance and high initial cost. (Togun.)

370. Temporary Building Design.—A temporary building is required, 50 ft. long, 30 ft. wide, and 10 ft. to eaves. Design a suitable structure, with steel trusses and stanchions, to be covered with corrugated iron on boards and felt, the bays to be filled in with 4-in. reinforced brickwork. (J. M. N., *Hitchin*.)

372. Cemetery Lay-out. A new cemetery is to be provided in an urban district having a population of 17,000, increasing at the rate of 800 per annum. Flat, meadow land, in a suitable position, having frontage to a district road (sewered), can be obtained at £350 per acre; subsoil, 5 ft. ballast overlying stiff clay. State area of land which should be acquired; give an approximate estimate of the cost of laying out the same, including buildings; state also principles governing the lay-out, and describe in detail method of drainage, arrangement of plots, disposition of buildings, &c. (Togun.)

373. Strength of Shaft.—What is the safe diameter of a wrought-iron shaft to transmit 60-h p. at 120 revolutions per minute? (T. R.)

374. Magnetic North.—What is the difference in degrees between the magnetic and true north? (J. T. C., *Nottingham*.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

367. Building Construction.—What is the meaning of the following technical terms? Give sketches, if necessary: (a) Guide piles, (b) efflorescence, (c) lewis, (d) hollow roll, (e) couple close. (Puzzled.)

(a) Guide piles (Fig. 1) are 9-in. x 9-in. or 12-in. x 12-in. timbers, driven at intervals of 8 ft. to 10 ft.,

FIG. 1.

to which are attached the walings for the support of sheet piling.

(b) Efflorescence is the name given to the white patches which sometimes appear on the surface of brickwork when it is drying. The chemical composition varies, but crystals of the sulphates of

lime and magnesia are the commonest cause of efflorescence.

(c) A lewis, or lewis bolt, is used for lifting a block

FIG. 2.

FIG. 3.

of stone by means of an undercut hole sunk in the upper surface. The lewis consists of a shackle

FIG. 4.

attached to a wedge A (Fig. 2), whose widest part is sufficiently narrow to enter the hole, and when in it

FIG. 5.

is held tightly by a loose key driven in at the side. To release the lewis, it is knocked down with a

FIG. 6.

hammer, and the loose key can then be removed, and the wedge lifted out. Another form of lewis bolt is shown in Fig. 3.

(d) A hollow roll is employed to join the sheets of lead covering a roof, so as to allow of expansion and contraction without buckling. The edges of adjoining sheets are turned up about 6 in. and 7 in. respectively, and the 7-in. one is folded over the other as shown (Fig. 4). The flap of lead so formed is then bent over till the edge touches the roof, forming a hollow roll. Clips, about 2 in. wide, are nailed to the boarding at intervals of 2 ft., and are folded in between the sheets of lead, as shown in Figs. 4 and 5. They serve to secure the lead firmly to the boarding.

(e) A couple-close roof (Fig. 6) is one where the ceiling joists are nailed to the feet of the rafters. Sometimes the ceiling joists may be sunk and dove-tailed into the rafters as shown. This form of roof is only suitable for spans not exceeding 18 ft. or 20 ft. (W. H. H., *Southwark*.)

371. Testing Stoneware Pipes.—What is the maximum head of water which may safely be applied in the testing of stoneware pipes? Does the diameter of the pipe affect the safe head? If the head be excessive will failure occur first in the pipes themselves or at the joints—ordinary cement or Stanford and cement? Give references to publications, &c., where details of tests are set out. (Togun.)

The maximum head of water which may be safely applied to stoneware pipes, or pipes of other material, is found thus:—

$$H = \frac{46 \times t \times F}{f \times d}$$

- H = head in feet,
- t = thickness of pipe in inches,
- F = tensional breaking stress of material,
- f = factor of safety,
- d = diameter of pipe in inches.

A fairly large factor of safety should be used—say, about 25—as the pipes are brittle, and not always of even texture.

The diameter will certainly affect the safe head, as can be seen by the above formula.

If the joints are well made and undisturbed, fracture due to an excessive head may first occur in the pipes themselves; but if the pipes be affected by mechanical or earth tremors, the joints would be likely to give trouble first.

R.I.A. Horse Shoe Competition.—Over 750 horse shoes have been entered for the Roads Improvement Association's £100 Horse Shoe Competition for which the Royal Society for the Prevention of Cruelty to Animals have presented the prize money. Shoes have been received from the United States, Canada, China, Germany, Holland, France, Australia, South Africa, and all parts of the United Kingdom.

Hastings Tramways Condemned.—For many years past a tramway service has been maintained along the Hastings front, worked on the Dolter stud system. The tramway has now been condemned by the Board of Trade, and the town council have been informed that the order to stop the service must take effect forthwith. Recently the tramway company sought powers to instal the overhead system, but their Parliamentary Bill was thrown out.

Corporation's Profits in Properly Deal.—At the last meeting of Lancaster Town Council Mr. Bell (chairman of the Properties Committee) said a few years ago the corporation spent £25,294 in the purchase of property at the southern entrance to the town, and in carrying out street widening. They had received for the sale of land, and for the sites of two hotels, £23,538, and it was now proposed to sell other land for £400 and £2,900, so that already the receipts amounted to £26,438, or £1,143 more than the cost to the corporation. There was still 960 sq. yds. of land, with frontage to the main street, the value of which was about £2,000.

Designs for Chelmsford Schools.—The following architects have been invited by the Chelmsford Education Committee to submit designs for two elementary schools to be erected in the borough: Messrs. P. M. Beaumont, Maldon; J. T. Bressey & Son, 91 and 93 Bishopsgate, E.C.; P. Brockbank, 13, 14 and 15 County Chambers, Southend; H. J. Chetwood, 5 Bedford-row, W.C.; W. D. Clark, 3 High-street, Colchester; N. J. Dawson, 17 Duke-street, Chelmsford; C. J. Dawson, 11 Cranbrook-road, Ilford; Goodey & Cressal, St. Peter's Chambers, High-street, Colchester; H. Harrington, 234 Bishopsgate, E.C.; A. S. R. Ley, 214 Bishopsgate, E.C.; J. W. Start, High-street, Colchester, and L. T. Weaser, 132 High-street, Southend.

“THE SURVEYOR” SPECIAL ISSUE.

CHIEF FEATURES.

In the Special Annual Issue of THE SURVEYOR, to be published on January 30th, the customary comprehensive list of the works projected by the various local authorities for 1914 will, as usual, be preceded by a series of

ARTICLES CONTRIBUTED BY SPECIALISTS

reviewing the progress which has taken place during the past year in connection with sewerage and sewage disposal, road work, water supply, refuse disposal, street lighting, electricity supply, bridge construction and the provision of public buildings.

LAW AND LITERATURE.

The legal precedents and legislation of 1913 in relation to municipal engineering will be reviewed by the Law Editor, Mr. J. B. Reignier Conder, while another valuable feature of the issue will be a survey of the year's literature of municipal engineering.

In addition there will be the customary Law Notes, Reports of Municipal Work in Progress, Local Government Board Inquiries, Personal News, and the fullest information relating to Vacant Appointments, Municipal Contracts and Competitions.

WORKS PROJECTED.

As stated in our last issue, those of our readers who propose to comply with our request for particulars of works projected in their districts will greatly oblige us and facilitate the production of the Special Number by forwarding their returns without delay.

The form which these should take is now generally understood, but the exact nature of the information sought can be seen by reference to our issue of January 31st last, over thirty pages of which were devoted to the publication of these official forecasts.

We would repeat what we have said in previous years—that any other material which readers may consider sufficiently interesting for inclusion in the issue will be welcomed, and this matter also, particularly if its use involves the reproduction of drawings or photographs, should likewise reach us at the earliest possible moment.

To non-subscribers, it may be added, the price of the Special Issue will be 1s., but subscribers will receive their copies without extra charge.

The Adamant Stone Company's Diary.—We have to thank the Adamant Stone and Paving Company, Limited, for a 1914 pocket-book diary, which is quite one of the most tasteful and complete that have come under our notice. The firm have been established for over a quarter of a century, and the special merits of their reconstructed Aberdeen granite slabs are now so generally known that we need say nothing laudatory of them here. We would only add that the London offices of the company are at Palace Chambers, 9 Bridge-street, Westminster.

Lower Thames Valley District Surveyors' Association.—The usual monthly meeting of the above association was held at the Town Hall, Twickenham, on Saturday evening last, the 3rd instant, when a good number of members attended. Both the president and vice-president were unfortunately absent through illness, and Mr. M. Hainsworth was elected chairman for the evening. The proposed Superannuation Bill, promoted by the National Association of Local Government Officers, was discussed, and a sub-committee was appointed to consider the question of obtaining the support of the Members of Parliament for the Parliamentary Divisions comprised in the area represented by the association. Mr. E. Willis opened a discussion on the Middlesex County Council Western Road Bill, and the Brentford Gas Company's Bill, and gave an explanation of the various provisions of these measures. The question of connections to public sewers and the fixing of hydrants in streets was also discussed.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Aldershot U.D.C. (December 23rd. Major J. Stewart).—£765 for the erection of sanitary conveniences in Barrack-road and The Grove.—During the consideration of the details of the proposed underground convenience in The Grove, the inspector mentioned the strength of the roof, and asked what would happen if a motor bus broke through the railings and rested half-way on the roof? "Would it go through?" he asked. "Such things have happened, and I believe the effects have not been quite so bad as one expects." The surveyor (Mr. F. C. Uren) promised to reconstruct the roof to carry a greater weight.

Burnley T.C. (December 30th. Mr. M. K. North).—£5,000 for the waterworks undertaking.—The town clerk, Mr. P. Thomas, stated that the total was made up of £2,210 for construction of mains for supplying the Lowerhouse and Cheapside districts, and £2,790 for the general extension of mains.

Chapel-en-le-Frith R.D.C. (January 1st. Major J. Stewart).—£1,320 for water main extensions. It was stated by Mr. J. B. Boycott, clerk to the council, that during the last dry summer urgent necessity for the extensions was clearly proved. Representations had been made to the Local Government Board by property owners about the present unsatisfactory supply of water. Some of the extensions would be of considerable benefit, and would probably lead to further building. The schemes were explained in detail, and the plans presented by Messrs. Brady & Partington, the council's engineers. There was no opposition.

Kendal T.C. (December 17th. Mr. Edgar Dudley).—£3,875 for the widening and improving of Allhallows-lane.—The town clerk, Mr. J. E. Bolton, stated that the application was to borrow part of the sum (£3,000) for sixty years. He explained that Allhallows-lane ran up from High-street, opposite the town hall, and was formerly the main road to Underbarrow and Ulverston. There was a considerable amount of traffic there, and it was the central means of access to the west of the town. When they advanced on that road a little distance there was a hill with a steep gradient. The borough surveyor (Mr. F. W. Oxberry) said the length of the proposed improvement was 118 ft. The maximum width at present was 19 ft., the new minimum will be 36 ft., and the new maximum 43 ft. 5 in. In the course of the inquiry the inspector asked why the council preferred to give £3,500, nearly double what it seems to him the site was worth, when they had only to go to the board for compulsory powers, which would cost at the outside £20.

Oldham T.C. (December 18th. Mr. M. K. North).—£3,300 for the purpose of providing public wash-houses on a site adjoining Robin Hill Baths.—The town clerk, Mr. J. H. Hallsworth, stated that the corporation had powers to construct wash-houses, but they had not been exercised up to the present time. The Baths Committee felt they had good reason why a scheme of this kind should be tried. Public wash-houses had been established in large towns, and in the neighbouring city of Manchester six had been very successful and much appreciated. Oldham was essentially a working-class town. There were mostly four-roomed cottages for the people, and there was no very adequate provision in these houses for the carrying out of the family washing. The baths at Robin Hill adjoined the refuse destructor, and it was proposed to use the waste steam from the destructor for the purpose of boiling water used for washing the clothes. Electric motors would be used for the purpose of driving the machinery. The town clerk added that the £3,300 was made up as follows: Cost of building £1,902, plant and equipment £1,158, contingencies £240. The plant would consist of a steam boiler, three electric motors, four hydro-extractors, twenty wash-stalls, twenty drying-horses, two mangles, and one calorifier.

Rathmines U.D.C. (December 18th. Mr. P. C. Cowan).—£12,160 and £13,660 for the purpose of extending the electricity works and purchasing a free wiring installation, and constructing sewers.—There was no opposition to either of the proposals. Mr.

Dixon, engineer to the council, gave evidence as to the manner in which it was proposed to carry out the sewerage scheme. He said that portions of the district were served with old, antiquated sewers, and it was a matter of great importance that a more modern system should be introduced. The inspector: This scheme is the second instalment of a proposed improvement in the sewerage of the district? Mr. Dixon: Yes, that is so. Mr. G. F. Pilditch, electrical engineer, stated the case for the proposed extension of the electricity works.

APPLICATIONS FOR LOANS.

Beckenham U.D.C.—£5,000 for resurfacing Bromley-road.

Belfast T.C.—£15,000 for laying out lands at Drumbadrought as a park.

Beverley R.D.C.—£9,583 for a drainage scheme.

Bristol T.C.—£1,110 for street widenings.

Coventry T.C.—£999 for road improvement purposes.

Dover T.C.—£6,065 for working-class dwellings, and £2,665 for paving works.

Highworth R.D.C.—£785 for working-class dwellings.

Lowisham B.C.—£1,000 for new hot-water apparatus at Forest Hill baths.

Leyburn R.D.C.—£2,400 for the Middleham sewage disposal scheme.

Loftus U.D.C.—£2,000 for street improvements.

Rochdale T.C.—£68,500 for the extension of the electricity plant.

Wells R.D.C.—£1,500 for the provision of dwellings.

Winchester T.C.—£358 for surface-water drainage.

LOANS SANCTIONED.

Chester T.C.—£2,100, repayable in eighty years, for the purchase of 12½ acres in Saltney for the provision of workmen's cottages.

Doncaster T.C.—£12,000 for the purchase of property for the widening of St. Sepulchre Gate.

Ludlow R.D.C.—£351 for sinking a borehole and making tests in connection with the Craven Arms water supply.

Market Bosworth R.D.C.—£2,189 for the erection of twelve working-class dwellings.

Northwich U.D.C.—£8,500 for the purchase of land and the erection of forty-eight cottages.

Precsall U.D.C.—£500 for improvements to the promenade.

Todmorden T.C.—£8,050 for electricity and road widening purposes.

York T.C.—£1,765 for laying out public gardens, and £8,370 for road improvement works.

Ystradgynlais R.D.C.—£11,925 for the provision of workmen's houses.

Winchester T.C.—£320 for road widening.

FORTHCOMING INQUIRIES.

	£
13.— Braintree. For the erection of a bridge (Mr. H. Shelford Bidwell)	1,000
13.— Derby. For the purchase of property for road widening (Mr. F. H. Tulloch)	5,272
13.— Easington. For works of sewerage (Mr. P. M. Crosthwaite)	23,000
13.— Liverpool. For municipal buildings extension (Major C. E. Norton)	19,400
13.— Market Bosworth. For sewage disposal purposes (Mr. R. G. Hetherington)	—
14.— Nottingham. For works of paving (Mr. F. H. Tulloch)	23,000
15.— Bournemouth. For laying out a cemetery (Mr. W. O. E. Meade-King)	5,000
15.— Morpeth. For works of sewerage (Mr. P. M. Crosthwaite)	9,000
15.— Woodhall Spa. For works of sewerage (Mr. F. H. Tulloch)	560
16.— Ardley. For works of sewage disposal (Mr. R. G. Hetherington)	600
16.— Itchen. For the purchase of a Mann combination steam roller (Mr. W. O. E. Meade-King)	650
16.— Sevenoaks. For the provision of public conveniences (Mr. F. H. Tulloch)	600
16.— Whitefield. For housing purposes (Mr. C. H. Eyles)	14,600

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Brighton, Essex £3,800, Wealdstone £2,000; housing and town planning—Dover £6,065; roads and materials—Birmingham, Grimsby, Keighley £2,200, Middlesbrough £3,600, Salisbury £3,380, Stepney; sewerage and sewage disposal—Bishop's Stortford £3,000, Leyburn £2,400, Stowmarket £6,000, Swansea £19,000; water, gas and electricity—Basingstoke £14,000, Cardiff £48,330, Dunoon £6,970.—Particulars of other projected works will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Brighton T.C.—The plans for the proposed kursaal have been prepared by Messrs. Clayton & Black, of Brighton.

Cardiff T.C.—A modified scheme, estimated to cost £500, has been agreed upon by the Parks Committee for the building of a bridge over the lake out-wash in Roath Park, and adding to the accommodation round the bandstand.—The Finance Committee have decided, at the request of the Waterworks Committee, to recommend the council to ask the Local Government Board to sanction a loan of £500 for a house for the use of the manager at the western sewerage works, and £560 for a shed at the works for fuel and for sheltering the stokers. The house, it was pointed out, was needed in order that the manager might reside on the spot, and a rent would be charged him for it.

Eccles T.C.—It is proposed to carry out extensions of the town hall for the purpose of Health Committee offices, at a cost of £1,140.

Essex C.C.—The Education Committee have approved the plans for the extension of the county high school for girls at Chelmsford, at an estimated cost of £3,800.

Farnham R.D.C.—It has been agreed to proceed with the rebuilding of Ash Vale bridge. The War Office has promised a contribution of £200 towards the cost.

Londonderry C.C.—The new technical school at Magherafelt was formally opened last week. The building and equipment are estimated to cost £2,200.

Norfolk C.C.—Mr. Harvey Mason, in moving the adoption of the report of the Joint Bridges Committee at a meeting on Saturday last, said he hoped the council would appreciate the work the county surveyor (Mr. T. H. B. Heslop) had done in regard to the bridges. He had had a great deal to do, and his health had further broken down under the strain. He hoped the bridges would be found to be satisfactory when finished. There had not been much public discussion upon the subject, but some complaints had been made because a temporary bridge was not erected at once. That, however, was put right after a time. Then there was some discussion about the appearance of one or two of the bridges. The modern forms of construction did not add to the artistic appearance of bridges. They had to be constructed to meet modern traffic, and he was glad to be able to say that the bridges built by the county surveyor would withstand any future floods, as those he had previously put up resisted the flood of 1912.

Rotherham T.C.—It is proposed to build a new administrative block at the Kimberworth hospital, at an estimated cost of £1,250.

Shoreham U.D.C.—A scheme has been adopted for the construction of two additional rooms at the town hall, and also public baths.

Wealdstone U.D.C.—Improvements are to be carried out at the municipal offices, at an estimated cost of £2,000.

HOUSING AND TOWN PLANNING.

Bristol T.C.—The council have adopted an instruction to the Health Committee to frame a scheme under the Housing of the Working Classes Act, 1890 (Part III.), with the view to providing suitable dwellings for the working classes where required.

Dover T.C.—A scheme for the erection of twenty-four cottages in Beach-street is to be carried out, at an estimated cost of £6,065.

Foleshill R.D.C.—The surveyor, Mr. A. E. Newey, has received instructions to prepare a scheme for the building of working-class dwellings.

Haverfordwest R.D.C.—It has been agreed to build sixty-six houses in the various parishes of the rural district.

Narberth R.D.C.—At the monthly meeting on Monday a letter was read from the Local Government Board relative to the provision of workmen's cottages for St. Issill's parish. The board stated that they could not allow the matter to be further postponed, and the council must therefore submit within two months a scheme to be approved by the board. If that was not done the board would issue an Order declaring the council in default. The chairman (Mr. Lewis Thomas) said they had appointed an architect, and he would prepare plans.

Scalby U.D.C.—An offer by the Duchy of Lancaster of 12 acres of land fronting on Hackness-road for housing purposes has been accepted, and it is proposed to erect dwellings from plans prepared by the surveyor, Mr. J. A. Iveson. Councillor Hill, referring to these plans, said he thought they reflected great credit on the surveyor. He was on a building committee elsewhere, but no such plan had been brought before them so neat and so well thought-out as Mr. Iveson's.

Stoke-on-Trent T.C.—A letter has been received from the Local Government Board calling attention to the default of the council in the systematic inspection of houses. It was stated in explanation that, owing to the reduction of the health department's staff on the ground of expense, it was found impossible to carry out the work, and if an improvement were desired, there would have to be a reorganisation.

Tonbridge R.D.C.—The surveyor, Mr. Frank Harris, has submitted a balance-sheet for the proposed cottages in the parishes of Brenehley, Hadlow, Hildenborough, Harmondton and Pembury, showing the cost of the cottages to be £165 respectively in two designs and £170 in one. The surveyor reported that he had studied every detail with a view to economy. It was somewhat difficult to acquire suitable sites in Hildenborough and Pembury, the land being of a higher value than in other parts of the district.

PARKS AND OPEN SPACES.

Birmingham T.C.—The city council have accepted the offer of Mr. George Cadbury of 5 acres of freehold land at King's Norton for a recreation ground.

Oldham T.C.—The borough surveyor, Mr. E. C. Foote, has reported that the cost of the scheme for Waterhead Park will probably be about £2,600. The area consists of about 15 acres. The matter is under the consideration of the Parks Committee.

Scarborough T.C.—It has been agreed to lay out a tournament bowling green, at an estimated cost of £500.

Sidmouth U.D.C.—It has been agreed to offer £4,250 for the Blackmore Hall estate for conversion into a public park.

Southgate U.D.C.—The laying out of Broomfield Park, at an estimated cost of £2,000, is under consideration.

ROADS AND MATERIALS.

Amersham R.D.C.—It is proposed to make up Long Park-avenue, at an estimated cost of £793.

Ashburton U.D.C.—The council have adopted a recommendation of the Highways Committee that, in preparing the specifications for main and other road contracts for the next three years, the surveyor, Mr. A. Wilson, should insert a clause making it compulsory for the contractor to pay not less than 1s. 6d. per yard for the breaking of Chuley Quarry stone.

Belfast T.C.—After inspecting the site of the proposed public improvement and the plan for laying out streets, the Improvements Committee have adopted the scheme with slight modifications.

Birmingham T.C.—The Finance Committee have been authorised to borrow the sum of £7,550 to cover the cost of constructing the corporation's portion of that section of the new road from Salford Bridge to Kingsbury-road lying between Salford Bridge and Wheelwright-road, together with the length of the

extension between Wheelwright-road and Broadford-lane.

East Kerrier R.D.C.—On the recommendation of the Finance Committee, it was decided to grant the council workmen a general advance in wages of 4d. per day, the increase to commence from January 1st. The surveyor, Mr. J. H. Chubb, was instructed to inform the men that they were expected to work from 7.30 a.m. to 5 p.m., with an hour for dinner, the hours on Saturday to be from 7.30 to 1 p.m. By this arrangement three foremen would receive 21s. per week against 19s. previously, and the other men 20s. against 18s.

Eccles T.C.—Plans have been passed for a new street between Barton-lane and Trafford-road.

Exeter T.C.—The council have asked the Streets Committee to report upon a street improvement scheme, estimated to cost £3,000.

Grimsby T.C.—A £22,000 scheme for the widening and straightening of Weelsby-road and the construction of a subway under the Great Northern Railway has been considered by the Highways Committee. The borough surveyor, Mr. H. Gilbert Whyatt, submitted sketches. The purchase price of the land required for the widening and the cost of straightening the road would be £11,000, and the cost of the subway proposals a further £11,200. The subway would be 60 ft. wide, and it would be necessary to raise the railway track 8 ft. for a considerable length. The committee have resolved to approach the Development Commissioners and the railway company with a view to ascertaining what proportion of the cost they might be prepared to bear.

Halifax T.C.—Road improvement works are to be carried out, at an estimated cost of £1,926.

Horsham U.D.C.—The surveyor, Mr. R. Renwick, has prepared an estimate of the cost of completing a number of roads on the Grandford estate, and a sub-committee has been appointed to consider the details of the scheme.

Hull T.C.—Negotiations are in progress for the purchase of land for the purpose of improvements at Marfleet.

Kcighley T.C.—A new road is to be made from West-lane to Devonshire-street, at an estimated cost of £2,200.

Leeds T.C.—It is proposed to purchase for improvement purposes, at a cost of £2,800, property abutting upon Burley-street and Newton-street, comprising an approximate area of 1,077 sq. yds., and property in Burley-road, between Newton-street and Pembroke-street, comprising an approximate area of 230 sq. yds.

Middlesbrough T.C.—Upon the advice of the borough engineer, Mr. S. E. Burgess, it has been decided to pave Smeaton-street with whinstone cubes, at an estimated cost of £3,600.

Newton Abbot R.D.C.—It has been resolved to carry out a further improvement in the Widecombe-road at an estimated cost of £70.

Norfolk C.C.—At a meeting of the council on Saturday a proposition was carried that the salaries of the district surveyors should be £110 a year upon appointment, to include all travelling expenses, instead of £130 a.s. at present, and should be increased by £10 for the year ending December 31, 1914, and thereafter should be increased at the rate of £5 a year up to £180. The Road Development Committee submitted a report stating that they had considered a scheme from the county surveyor, Mr. T. H. B. Heslop. The letter from the Road Board, dated April 25th, stated that the board would favourably consider an application for a grant of £14,000 towards road reconstruction work, to be carried out in the year ending March 31, 1915. The committee therefore recommend the council to make application to the Road Board for a grant in respect of this scheme, and that if such grant be given the work be proceeded with as recommended by the county surveyor.

Salisbury T.C.—The General Purposes Committee have been requested to consider a scheme of main roads improvement, estimated to cost £3,380.

Sidmouth U.D.C.—The question of the extension and widening of the Esplanade, and the provision of suitable lavatory accommodation, at an estimated cost of £3,000, has been referred to the General Purposes Committee for report.

Stepney B.C.—The Road Board have promised a grant of £4,750 towards the cost of an extension scheme of road improvement which it is intended to carry out.

Stockton R.D.C.—The tender of Mr. G. A. Revell, Stockton, at £317, has been accepted for private street works.

Todmorden T.C.—The proposed loan for the widening of Burnley-road has been sanctioned by the Local Government Board.

SEWERAGE AND SEWAGE DISPOSAL.

Belper R.D.C.—A sewage scheme for Denby is to be carried out at an estimated cost of £350.

Bishop's Stortford U.D.C.—A new sewerage scheme for the Hockerill district is to be carried out at an estimated cost of £3,000.

Elland U.D.C.—An engineer has been called in to advise the council with respect to the sewage disposal works, which had been inefficient for some time past.

Hexham R.D.C.—The tender of Mr. Isaac Lishman, at £220, has been accepted for the execution of the Horsley sewerage scheme.

Leyburn R.D.C.—A sewage disposal scheme for Middleham is to be carried out at a cost of £2,100.

Sheffield T.C.—It is announced that it is the intention of the corporation to prepare, ready for submission to the Local Government Board by January 31, 1915, a complete scheme for the full treatment of the city's sewage.

Stowmarket U.D.C.—The proposed scheme of sewerage, for which Mr. G. Midgley Taylor is engineer, is estimated to cost £6,000.

Swansea R.D.C.—The council have approved a drainage scheme which is estimated to cost £19,000.

Weetslade U.D.C.—It has been agreed to proceed with the scheme of Mr. C. Murphy, of Morpeth, for dealing with the whole of the council's sewage at Amnitsford.

WATER, GAS, AND ELECTRICITY.

Barnstaple R.D.C.—It has been agreed to adopt the Shencombe scheme for the purpose of the Coombe Martin water supply, and Messrs. Montague, Luke & Partners have been requested to proceed with the necessary plans and details.

Basingstoke T.C.—A scheme for lighting the town by electricity, estimated to cost £14,000, has been prepared by the borough surveyor and waterworks engineer, Mr. F. R. Phipps.

Cardiff T.C.—The waterworks engineer, Mr. C. H. Priestley, has submitted a report to the Waterworks Committee advising the construction of new trunk mains from Llanishen or Lisvane reservoirs to the Heath filter beds, at an estimated cost of £48,380.

Coleraine U.D.C.—A report by the gas manager with regard to the extension and improvement of the gas-works, at an estimated cost of £3,000 has been referred to a committee for consideration.

Dewsbury T.C.—The Gas and Water Committee have decided to extend the gas mains from Whitley to Briestfield, and from the Wool Pack Inn to the Bebo at Whitley, at an estimated cost of £1,000, for the lighting of those districts. The Dewsbury gas manager has also been directed to write to the Grange Moor District Council, asking them to receive a deputation with respect to the lighting of that district, which is outside the Dewsbury Borough area.

Dunoon T.C.—It has been agreed to proceed with the erection of a new reservoir above the present one in order to give an addition of 17,500,000 gallons. The cost is estimated at £6,970.

Newton Abbot R.D.C.—The question of the extension of the Chudleigh water main to the station has been referred to the Parochial Committee for consideration.

MISCELLANEOUS.

Liverpool T.C.—An important scheme for dealing with the traffic problem of the city and port of Liverpool was presented last week to the Liverpool Tramways Committee by Mr. C. W. Mallins, general manager of the city tramway. With the view of relieving the street congestion in the centre of the city, and improving communication with Birkenhead and Wallasey, he suggests the construction of a new tunnel under the Mersey, of sufficient width to accommodate fast and slow traffic. A site adjoining the Old Haymarket is proposed as the starting-point on the Liverpool side, and the cost is estimated at £3,000,000.

Todmorden T.C.—It has been agreed to purchase a motor fire engine and motor ambulance carriage at an estimated cost of £1,600.

PERSONAL.

Mr. P. C. Woodhall, borough engineer and surveyor of Blandford, has been voted an increase of salary.

Mr. G. W. Egglestone, surveyor to the Weardale Rural District Council, has had his salary increased from £130 to £150 a year.

Mr. W. Auerbach has been appointed director of Claridge's Patent Asphalt Company, Limited, in place of Mr. F. T. Cutbill, deceased.

Mr. F. Court, for eight and a-half years surveyor to the Bilston Urban District Council, has resigned with the object of taking service with a firm of contractors.

Mr. Henry Jones Lanchester, F.R.I.C.E., who was responsible for laying out, forty-three years ago, the best part of Hove, died, we regret to state, last week.

Mr. H. T. Chapman, the recently elected county surveyor of Kent, entered upon his new office on January 1st, but he will also give attention to Somerset county affairs until his successor, Mr. Stead, commences his duties.

Mr. Glover, county surveyor of Kildare, has been granted three months' leave of absence to recuperate, and Mr. L. J. Fullam, who has been acting during Mr. Glover's illness, has been appointed temporary county surveyor.

Mr. F. W. Duckworth, surveyor to the Blackburn Rural District Council, has had his salary increased for the current quarter by the sum of £45 for extra and special services as engineer in connection with the Orphanage district sewerage scheme.

Mr. E. Graham, temporary assistant to Mr. J. H. Mole, sanitary surveyor to the Chester-le-Street (Durham) Rural District Council, has been appointed a permanent officer, at a salary of £2 2s. per week. The council have also resolved to appoint a costs clerk in the sanitary surveyor's department, to be under the direct supervision of the clerk to the council.

Mr. J. Williams, for thirty-four years surveyor and sanitary inspector to the Llangollen Rural District Council, has resigned, and at the last meeting the chairman, Mr. D. W. Roberts, and the members generally, spoke in high terms of his services to the district, the hope being expressed unanimously that he might live many years to enjoy his well-earned retirement.

FOR OTHER ADVERTISEMENTS

See End of Paper.

METROPOLITAN BOROUGH OF ISLINGTON.

Wanted, in the Borough Engineer and Surveyor's Department, an Assistant. Must have had experience in the Office of an Engineer and Surveyor, and be able to survey, level, and prepare plans. Selected candidates will be examined as to their professional knowledge.

Salary to commence at £90 per annum, rising by annual increments of £7 10s. to £120 per annum.

Applications, in the handwriting of the candidates, stating age, present employment, and past experience, accompanied by copies of not more than three testimonials of recent date, and endorsed "Engineer's Assistant," must be received by the undersigned not later than 12 noon on Monday, January 26th, 1914.

WM. F. DEWEY,
Town Clerk.

Town Hall, Upper-street,
Islington, N.
January, 1914. (I,133)

SINGAPORE, STRAITS SETTLEMENTS. MUNICIPAL ENGINEER'S DEPARTMENT.

The Municipal Commissioners of the Town of Singapore require an Assistant Engineer, between 25 and 30 years of age, of sound constitution. He must have had a good technical education, a regular training as a Civil Engineer, and have a practical knowledge of Surveying, Levelling and Estimating, and experience in ordinary Municipal work, including the collection, filtration, pumping and distribution of water, and in Sewerage Works, both in the design and in the construction of new works and in ordinary maintenance. Preference will be given to an Assistant connected with the Institution of Civil Engineers.

The engagement will be for three years, and the

applicant is to state the earliest date upon which he could be free to leave for Singapore. The selected candidate must pass a medical examination.

A second-class passage will be provided by mail steamer, or a first-class passage by other steamer, with half-pay during the voyage out.

The salary will be 300 dollars per month for the first, 320 dollars per month for the second, and 340 dollars per month for the third year, paid monthly in dollars, the currency of the Colony, the value of the dollar being two shillings and fourpence sterling. Local transport duty allowance of 60 dollars per month will be paid.

Applications, stating age and place of birth, and giving details of education, training and experience generally, and in Waterworks, Sewerage and Municipal Engineering, and referring to the above requirements seriatim, accompanied by copies (only) of testimonials, and also personal references, to be lodged with C. C. Lindsay, Esq., M.INST.C.E., 180 Hope-street, Glasgow (who will give further particulars if requested), not later than Tuesday, 20th January, 1914. (I,130)

ASSISTANT ENGINEERS and DRAUGHTSMEN required by Sierra Leone Government for Public Works Department for two tours of twelve months, with possible extension.

Engineers, £300—£450—£400. Draughtsmen, £300—£10—£350.

Furnished quarters or allowance.

Free first-class passages. Liberal leave. Age, 25-40.

Candidates for Engineer vacancies should have served articles with an Associate-member of the Institute of Civil Engineers, possess a diploma from some recognised Engineering College, or have been engaged for at least three years from completion of articles on Public Works in British Colony. Must be neat and expeditious draughtsmen, capable of designing and carrying out buildings, bridges and other structures, and of taking out Bills of Quantities and preparing detailed estimates; should have some knowledge of bookkeeping and accounting and office routine, and be competent to execute surveys, take sections, and lay out and construct roads; should have some knowledge of sanitary and water engineering.

Candidates for Draughtsmen vacancies should have had considerable experience in architectural and engineering draughting, and should have held a responsible position in the drawing office of an architect and surveyor or civil engineer in good general practice. Neat and expeditious draughtsmen. They should also have had experience in control of a drawing office staff, and be capable of getting out designs and details of buildings, including steel-frame work, bridges, &c., with some experience in architectural design; should be well up in building construction, the preparation of specifications, bills of quantities and estimates, and preference given to those who have served articles with an architect, surveyor or civil engineer.

Candidates should apply at once to the Crown Agents for the Colonies, Whitehall-gardens, London, S.W. (I,131)

ASSISTANT required in a Civil Engineer's Office, Plymouth. Must be a good Draughtsman, with experience in Levelling. Salary 30s. a week. Apply, giving experience and qualifications, Box 1361, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (I,124)

CANNOCK URBAN DISTRICT COUNCIL. APPOINTMENT OF SURVEYOR'S CLERK.

The Council invite applications for the above appointment. Applicants must have had experience in a Municipal Surveyor's Office, including the keeping of all the various books, and be an efficient shorthand-typist.

The salary will be 25s. per week.

Applications, in candidate's own handwriting, stating age and qualifications, to be addressed and delivered to the undersigned, accompanied by copies of three testimonials, not later than 10 a.m. on Friday, the 30th inst., endorsed, "Surveyor's Clerk." Canvassing will be deemed a disqualification.

C. A. LOXTON,
Clerk to the Council.

Council Offices,
Cannock.
January 7, 1914. (I,129)

CITY OF SHEFFIELD.

DEPARTMENT OF HIGHWAYS AND SEWERS.

ANNUAL CONTRACTS, 1914-15.

The Highway and Sewerage Committee of the City Council are prepared to receive Tenders for the under-mentioned Labour or Materials for the year ending March 25, 1915:—

- Contract No. 1.—Asphalting or Tar Paving (Labour and Materials), for two years.
 Contract No. 2.—Bricks, Red, Blue, Square and Radiated.
 Contract No. 3.—Castings for Sewer and other Work (Manhole Covers, &c.).
 Contract No. 4.—Cement.
 Contract No. 5.—Earthenware Pipes, Blocks, Traps, &c.
 Contract No. 6.—Freestone and Gritstone Kerb and Setts, Flags, Quarry Sand, &c.
 Contract No. 7.—Concrete Flags.
 Contract No. 8.—Granite Setts, Kerb, Ringsmall, Gravel and Chips.
 Contract No. 9.—Limestone (Lump and Chippings).
 Contract No. 10.—Slag Shingle.
 Contract No. 11.—Pitch, Tar, and Creosote Oil.
 Contract No. 12.—Timber (Deals, Cart and Barrow Timber, &c.).
 Contract No. 13.—Iron, Steel, Tools and Sundries.
 Contract No. 14.—General Stores (Oils, Paints, Brushes, &c.).

Particulars and Forms of Tender may be obtained at the office of Mr. W. J. Hadfield, Surveyor of Highways, Town Hall, Sheffield, on payment of the sum of 10s., which will be returned on receipt of a *bonâ-fide* Tender. All applications for and correspondence relating to Tender Forms should be addressed as above. Tenders enclosed in official envelope provided, and (where not otherwise specified) accompanied by samples, addressed to "The Chairman of the Highway and Sewerage Committee," to be delivered at the Surveyor of Highways' Office, not later than 10 o'clock a.m. on Monday, the 26th day of January, 1914. Persons wishing to Tender for Cement are requested to send in sample at the earliest possible date.

The Committee do not bind themselves to accept the lowest or any Tender, and reserve the right to divide the quantities between various Contractors.

(By order)

WILLIAM E. HART,
Town Clerk.

Town Hall, Sheffield.
January 7, 1914.

The Contracts will comprise the Fair Wages and Conditions of Labour Clause which has been adopted by the Sheffield Corporation, particulars of which will appear in the Conditions of Contract. (1,128)

RURAL DISTRICT COUNCIL OF EAST GRINSTEAD.

The above Council invite Tenders for the Supply of 400 cubic yards, more or less, of Fine Compo. Sand, Flint Grit, or other Material suitable for use in connection with the Surface Tarring of Roads.

Tenders should state price per cubic yard, delivered in such quantities and at such times as may be required by the Council's Surveyor, before the 30th September next, to the following Stations, carriage paid:—

- Three Bridges, Rowfant, Grange-road, East Grinstead.
 Forest Row, Hartfield, Withyham, Groombridge, Ashurst.
 Crowborough, West Hoathly, Crawley and Kingscote.

Tenders, sealed and endorsed "Tender for Sand," should reach me on or before Monday, February 2nd, 1914, at my Office at 6 High-street, East Grinstead.

Samples of the Material quoted for must be sent, addressed to me, at the Union Workhouse, East Grinstead.

The Council do not bind themselves to accept the lowest or any Tender.

(Signed) FRANCIS S. WHITE,
Clerk to the Council.

6 High-street,
East Grinstead. (1,127)

RURAL DISTRICT OF CLAYPOLE.

TENDERS FOR ROAD MATERIALS.

The above Council invite TENDERS for the Supply of about 1,850 tons of Granite, and 1,200 tons of Slag, to be delivered in such quantities and at such times and places in their district as the Council or their District Surveyor shall require and direct.

Sealed Tenders, marked "Tender for Road Material," to be delivered to me, the undersigned, not later than Thursday, the 22nd inst.

Samples must be delivered, free of expense, at the Board Room, The Ossington, Newark, on Monday, the 26th inst.

The Council do not bind themselves to accept the lowest or any Tender, and they reserve to themselves the right to accept such part of any Tender as they may deem proper.

The Contractor will be required to enter into a bond for the due fulfilment of his Contract.

Further particulars may be obtained upon application to the District Surveyor, Mr. P. A. Watford, 13 Milner-street, Newark, upon receipt of a stamped and addressed foolscap envelope.

By order of the Council,

A. J. FRANKS, Clerk.

Union Offices, 24 Lombard-street,
Newark, January 6, 1914. (1,126)

CROYDON RURAL DISTRICT COUNCIL.
REBUILDING HACK BRIDGE, WALLINGTON.

The above Council invite Tenders from Contractors licensed to execute Ferro-concrete construction on the Hennebique System for the removal of the present Hack Bridge over the Wandle at Wallington, and the provision of a new ferro-concrete bridge.

Plans and Specifications, prepared by the Council's Surveyor, Mr. Robert Chart, junr., can be inspected, and Forms of Tender obtained at his Office, Katharine-street, Croydon, on payment of £2 (which sum will be returned on receipt of a *bonâ-fide* Tender).

Sealed Tenders, endorsed, "Tender for Hack Bridge," must be delivered to the undersigned before Twelve o'clock noon on Thursday, January 22nd, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

E. J. GOWEN,

Clerk of the Council.

Council Offices,
Katharine-street, Croydon.
January 3, 1914. (1,125)

BOROUGH OF WIMBLEDON.

PRIVATE STREET WORKS.

The Corporation of Wimbledon invite Tenders for the making up of both or either of the following streets—namely:—

- Wilton-grove,
Compton-road (Section 11).

Plans and Specification may be seen, and Form of Tender obtained, at the office of the Borough Engineer and Surveyor, Town Hall, Wimbledon.

A separate Tender for each street must be submitted, and sent in a separate envelope, endorsed "Tender for — Road," addressed to the Chairman of the Buildings and Improvements Committee, Town Hall, Wimbledon.

Last day for receipt of Tenders, Tuesday, 27th January, 1914, at 12 o'clock noon.

The Corporation does not bind itself to accept the lowest or any Tender.

A. STEELE SHELDON,

Town Clerk.

Town Clerk's Office,
Wimbledon.
January 7, 1914. (1,132)

BOROUGH OF BRACKLEY.

SUPPLY OF GRANITE.

The Town Council of the above Borough invite Tenders for the Supply of Granite for the Year ending 31st March, 1915.

Particulars and forms of Tender may be obtained on application to Mr. A. A. Green, Borough Surveyor. Tenders to be delivered at my office on or before the 30th January.

The Town Council do not bind themselves to accept the lowest or any Tender.

C. E. BARNES,

Brackley, Northants.
January 6, 1914. (1,123)

Institution of Water Engineers.

WINTER GENERAL MEETING IN LONDON.

(Conclusion.)

The closing business at the recent winter general meeting of the Institution of Water Engineers, held at Burlington House, was the consideration of a paper on

THE TREATMENT OF PLUMBO-SOLVENT WATER BY MEANS OF MECHANICAL FILTERS.

By FREDERIC JOHN DIXON, ASSOC. M. INST. C.E.

The works of the Ashton-under-Lyne, Stalybridge and Unkinfield (District) Waterworks Joint Committee, where the treatment in question was carried out, were very fully described in our issue of October 12, 1912. For fourteen or fifteen years prior to that date the committee had been treating certain water in the Swineshaw Valley with a neutralising reagent for the purpose of rendering the water non-plumbo-solvent, but as the discoloration and turbidity was not in any way removed under this method of treatment, the joint committee decided, in 1908, to make exhaustive inquiries as to a more up-to-date plant, by which the process of mechanical filtration and chemical treatment could be advantageously applied.

The results of the investigation were incorporated in a report presented by the engineer, when the joint committee immediately decided to put down a small experimental plant at Ashway Gap, for the treatment of the water from the Greenfield reservoir. Three pressure filters with a chemical apparatus capable of dealing with a maximum flow of 432,000 gallons per twenty-four hours, were installed in June, 1909, under Messrs. Mather & Platt's patent.

The results given by the experimental plant during the period under observation were so satisfactory that the joint committee decided to take steps to deal with all the water supplied in their district. The joint committee visited and inspected similar plants installed by other water authorities, and, after careful consideration, decided to instal in both valleys mechanical filters of Messrs. Mather & Platt's pressure type, fitted with patent washing apparatus.

The two installations comprise thirty-six pressure filters, designed to purify collectively 5,352,000 gallons of water per day, and together form one of the largest pressure-filtration schemes in the country. Each installation consists of two major parts—viz., the filters and the chemical plant.

In Mr. Dixon's paper are given tables prepared by Prof. Delépine giving the average results of eight sets of analyses of the unfiltered and filtered water, and the author, in conclusion, submits the following points which have come under his personal notice during the period of working:—

(1) That, where possible, it is advisable to provide means for sedimentation of the raw water prior to treatment and filtration.

(2) That the installation should be fixed on by-pass mains in preference to being fixed direct on trunk mains.

(3) That the apparatus for injecting the chemicals should be provided in duplicate, and so designed as to operate only in direct proportion to the actual rate of flow of the water to be treated.

(4) That every part of the apparatus in contact with chemical solutions should consist of a metal unaffected by such solutions.

(5) That, where possible, a clear-water well should be provided for the filtrate prior to actual distribution. In the author's case it was impracticable to provide this, and the filtrate had to go direct into consumption from the filters, as the reduction of pressure was an important factor in the area to be supplied.

(6) That all chemical tanks should be in duplicate, and each capable of dealing with a twenty-four hours' flow, with facilities for accurate measurements.

(7) That lime tanks are suitable if constructed of iron or steel; but those for alumina should either be built in wood, stoneware or reinforced concrete, so as to be unaffected by the action of the chemicals. The author, however, prefers a reinforced-concrete tank.

(8) That the maximum rate of filtration through an 8-ft. filter should not exceed 6,000 gallons per hour, and provision should be made in the installation, by stand-by plant, for dealing with periods occupied in cleansing.

(9) That all filters, after washing, should be allowed

to "soak" for at least ten minutes, ample provision being made for thoroughly draining off each filter.

(10) That it is essential for the proper cleansing of the medium to have a scouring action in conjunction with actual washing, the water so used being equal in quality to that of the filtrate.

(11) That it is absolutely essential for the mechanical filtration of a plumbo-solvent water to provide a coagulant; the author found that without this the removal of acidity and discoloration is extremely doubtful.

(12) The author finds very little advantage in using graded quartz as a medium over that of Leighton Buzzard sand (or sand of an equal quality). The Leighton Buzzard sand, perhaps, uses slightly more water for efficient cleansing, but the percentage of loss of medium by washing, at any rate in the initial stage of maintenance, was found to be greater in the case of quartz than that of Leighton Buzzard sand.

(13) It is of the greatest importance that the man in charge should be competent to carry out all repairs, manipulate the plant efficiently, and make daily tests of the character of the waters treated for the purpose of correctly ascertaining the quantity of chemicals required from time to time.

DISCUSSION OF MR. DIXON'S PAPER.

The PRESIDENT (Mr. C. Clemesha Smith) said the institution was indebted to Mr. Dixon for his full and complete account of methods adopted by him to deal with a plumbo-solvent water. As he was dealing with a water from the eastern slope of the Pennines, within a few miles of the catchment area referred to in the paper, which had similar characteristics, it might be of some slight interest if he gave one or two comparisons. Wakefield water was the more plumbo-solvent, taking up from 1½ to 2½ grains of lead per gallon, whereas the Ashton water dissolved up to three-quarters of a grain per gallon; hence it was necessary for him to increase the hardness by 1 degree (from 3 to 4 on the average), against an increase of not more than half a degree at Ashton. After filtration and treatment, the water at Wakefield was capable of taking up from 0 to .03 grains per gallon, the Ashton water varying from 0 to .5 per gallon. The sand filters at Wakefield apparently effected a greater chemical change in the water than the mechanical filters at Ashton, for he noticed in his own case that the free ammonia was reduced from .07 parts per 100,000 before filtration to .001 parts per 100,000 after filtration, and the albuminoid ammonia was reduced from .015 parts before filtration to .001 parts after filtration. At Ashton the reduction in the case of free ammonia varied at the different works, the amounts before filtration being .0133, .0074, .0078, .0414, and after filtration .0128, .0072, .0076, and .0019; whereas the albuminoid ammonia before filtration was .0080, .0057, .0065, and .0045, and after filtration .0032, .0025, .0028, and .0020. This greater chemical change in the case of the sand filter was, he thought, to be expected. A few details showing comparative working costs might also be of interest. The cost of treatment and maintenance per 1,000,000 gallons filtered was as follows:—

	Ashton-under-Lyne.	Wakefield.
	s. d.	s. d.
Total cost	7 10	7 0½
Chemicals only	1 11	2 7½
Percentage of water used in washing	.91	.5

Dr. S. WOLFE (Manchester) said he had examined plumbo-solvent water at regular periods, and had adopted the same methods as Professor Delépine, and had found them one of the best means of determining lead in water. The advantages of using carbonate of lime was that it was a neutral substance, and it was very slightly soluble in water, so that even if an excess of carbonate of lime was added no ill-effects could happen as it would be removed by the filters. Another advantage of its use was that no nasty alkalinity got into the water. It was interesting to know that not only soft moorland water, but also that waters which had a permanent hardness, could have an action on lead. It appeared that both should be carefully examined for lead sol-

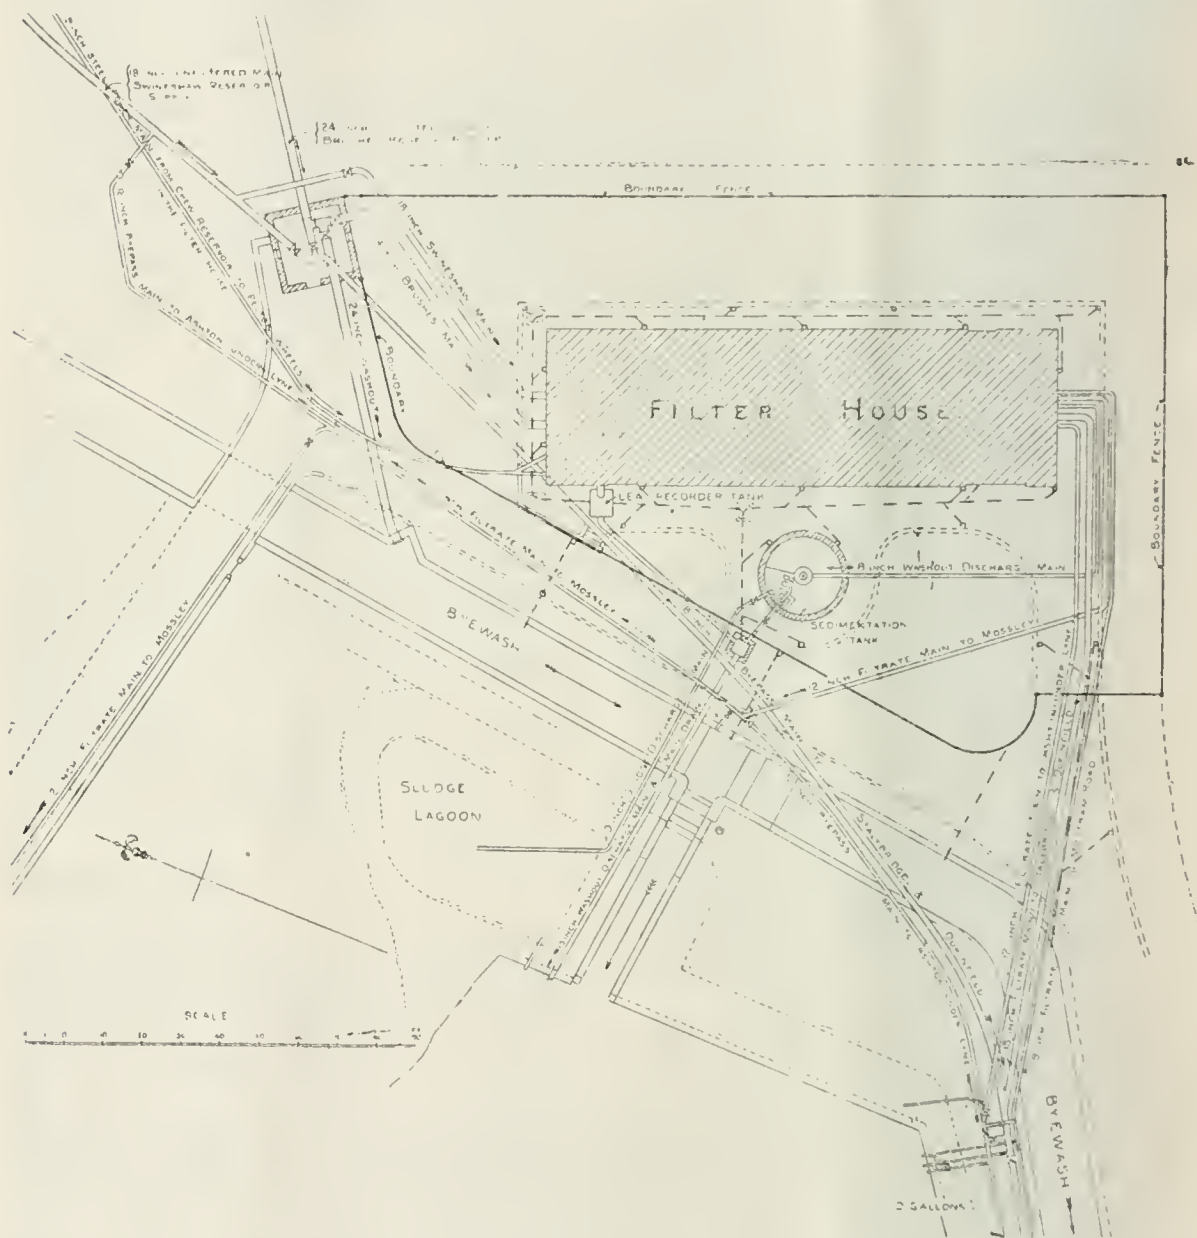

vency, and that the results of the examinations of raw water should be properly recorded, which, in his experience, was seldom done.

Mr. J. C. WALKER (Reading) said the president had made a comparison between sand and mechanical filters. He had had the advantage of having experience of both the ordinary sand filter and the Candy mechanical filter. The president said the mechanical filter had the advantage over the sand filter as to capital cost, and that was generally admitted; but, on the other hand, the president seemed to think the mechanical filter was not so lasting. He differed with the president on that point, and thought the mechanical filter was quite as lasting as the sand filter. As to maintenance, he found that mechanical filtration, as in use, coupled with a preliminary

enter into the controversy, for he thought each case had to be considered on its own merits. Another point was the trouble sometimes caused by dealing with the wash water containing sulphate of alumina. He knew a case where the water authority had been sued by a neighbouring proprietor for poisoning his cattle.

Mr. F. H. BRIST (Rochdale) remarked that a great point to be considered in relation to mechanical filters was that they could be worked at any time.

Mr. J. S. PICKERING (Cheltenham) said it struck him, from the opening remarks of the author, that his authority was unwilling to embark on the scheme, as it seemed to have taken them twenty years to deal with it. He doubted if any water company would have been allowed to continue to supply the water men-

TREATMENT OF PLUMBO-SOLVENT WATER: GENERAL PLAN OF "BRUSHES" INSTALLATION.

system of filtration, cost about 3s. 6d. per 1,000,000 gallons, while sand filtration cost about 15s. per 1,000,000 gallons.

Mr. C. H. ROBERTS (Aberdeen) said it must not be forgotten that in most cases the conditions differed. In Edinburgh and in the North they had been putting down mechanical filters, and there had been a considerable amount of controversy over them. The engineers of the Edinburgh Water Board contended that the total cost of sand filtration—the interest on capital and working charges—was less than the total charges of mechanical filtration. On the other side it was contended that the mechanical filters were the cheapest. As to the life of mechanical filters, as compared with sand filters, it must not be forgotten that the Local Government Board would not grant a loan for the same period for mechanical as for sand filters, and the engineer had to consider the question of loan. He did not, however, wish to

mentioned for so long a time. The title of the paper was a little misleading. He gathered from the author that what was of equal importance was the removal of discoloration, and he noticed that the conditions of the contract were that 95 per cent should be reserved. In the tables they had such expressions as the water being "yellow," "less yellow," "yellowish" and "colourless." To his mind these expressions were not very valuable, and it would be far better if the colour of the water could be reduced to figures, the same as the analyses of the author's had been. He did not know if the author was familiar with the Lovibond tintometer, and if not he recommended it to his notice. The colour of the water could be indicated by that instrument by a series of clocks. He had a very turbid water, and by the tintometer he kept a record every day. The tables given were very interesting, and particularly one which showed the weakness in the mechanical filters, which was the time imme-

diately after the filters had been washed. It was a weakness with all filters, as in the case of the sand filter when the film was taken off the surface. Another table showed the plumbo-solvent action on unfiltered water was 0.14, and it was only reduced in filtered water to 0.07, and in one case to 0.05. It might be pointed out that these were taken out at different intervals varying from five to sixty minutes after the filters had been started, and that the average as shown by the other tables was all that could be desired. Still it would have been more interesting if the author could have gone a little further, and given the time when the effluent from the filter gave a plumbo-solvent action. He noticed that permanent hardness had to be increased in less than 10 per cent. He presumed it was correct to say permanent hardness. In the same table he noticed that the hardness had not been increased at all, but it had been decreased by the filter working thirty minutes, and was about the same when the filter had worked sixty minutes. The author would naturally see that one must take the average and not the time when the filters were working at their worst. The author had no coagulating tank prior to the water passing on to his filters, so that the filters would require washing out more than they otherwise would, and perhaps he would tell them at what periods, roughly speaking, the filters required washing out. In his conclusions the author rather suggested that he would prefer a clear-water tank for the filter water prior to passing it on for distribution, and also suggested that he would prefer not to have his filters on a trunk main. He gathered from that that if practical he would have adopted mechanical gravity filters instead of pressure filters. There was, no doubt, an advantage in seeing what was taking place in a gravity filter. The author also referred to the necessity of having a competent man in charge to regulate the supply of chemicals, and to test the water on its leaving the works. He would like to know if he had any written regulations as to what the manager of the works was required to do in regard to adjusting the quantity of chemicals. It was stated that the water varied very considerably, and he wondered how the foreman regulated the supply of chemicals to meet the varying conditions. Was any test also made to ascertain whether any alumina escaped through the mechanical filters? Even if it did, he supposed there would be no serious objection to a small quantity.

Mr. F. W. Hodson (Loughborough) asked if the tintometer acted in a regular circle or did it take samples intermittently.

Mr. Dixon said that, on account of the time, his reply must be short. He was driven for time in the preparation of the paper, and did it hastily. He had also prepared fourteen photographs of drawings for insertion with the paper, but the money at the disposal of the Plans Committee did not allow of them all being produced. Unfortunately, he was not consulted as to what plans should be produced, and those relating to the compound weir were not given. He would have liked to have had inserted a diagram showing the loss of head due to the process of filtration—a most important question. He did take into account the velocity of approach when calculating the discharge of the weir. He had had experience of the Candy filters, and there was a medium called oxididium, which was part of the filtering medium, and there was no cost of chemicals. At Harrogate he used both chemical and sand filters, and, in his opinion, the mechanical filters far surpassed the sand filters, with the exception of the bacteriological test. Those who lived in the North of England would readily understand the difficulties of sand filters when there were hard frosts; while with mechanical filters they could work no matter what the climatic conditions were. Mr. Roberts had referred to the period of loan granted by the Local Government Board, but the Local Government Board were not the sole judges of the life of a mechanical filter, and in his opinion they did not understand it. He considered there was far more life in a mechanical filter than many people realised. He noticed that at Paignton a loan for a period of sixty years had been granted for mechanical filters. He thought when the Local Government Board knew more of mechanical filters and their construction they would extend the period of the loans. He had had no difficulty in dealing with the wash water. He had to deal with Dr. Maclean Wilson, who took samples of his decanted water and tested them, and at present he had had no complaint, which showed that they satisfied the West Riding Rivers Board. In his case sand filters were impossible. Any loss of head would mean pumping 5,000,000 gallons a day at a high elevation. Mr. Pickering was quite right about his authority not being

anxious to embark on the scheme until the West Riding authorities insisted on it. When dealing with plumbo-solvency they dealt with discoloration as well. Permanent hardness had been alluded to, and if he could have his way he would include it in the conditions of contract. The man in charge was a fully qualified mechanic, and also knew a little bit of chemistry, and he regulated the amount of chemicals which went in every day. Every morning he made a careful analysis, and he knew what chemicals to use. The failures at works where mechanical filters were adopted was largely due to the incapacity of the men in charge. In reply to Mr. Hodson, the tintometer was working day and night.

On the motion of the president a vote of thanks was passed to the Geological Society for the use of the rooms, and to the authors of the papers.

SOME RECENT PUBLICATIONS.*

APPLIED MECHANICS AND MECHANICAL ENGINEERING. Vol. V.: The Theory of Machines. By Andrew Jamieson, M.INST.C.E. Price 7s. 6d. nett. London: Charles Griffin & Co., Limited.

The popularity of Prof. Jamieson's well-known work on applied mechanics and mechanical engineering—increased, if possible, since its division into five volumes—is shown by the frequency with which new editions are demanded. The present is the eighth edition of volume V., dealing with the theory of machines, and incorporates the author's latest additions and alterations, although no substantial rearrangement has been found necessary. In drawing up the several lectures the author has generally followed the syllabus of the final B.Sc. examination in engineering for external students at London University. This also covers the ground prescribed for the Theory of Machines paper at the A.M.I.C.E. examination, and includes the following subjects: Tooth, friction, belt, rope, chain and miscellaneous gearing, with their applications to machines; shapes and strength of teeth; automatic tooth-cutting machines; velocity ratio and power transmitted by gearing; motion and energy; and practical applications to governors, flywheels and centrifugal machines. All these matters are dealt with in the author's well-known lucid manner, and the volume, being well illustrated and indexed, fully maintains the standard of former editions as a student's textbook on the subject.

GODALMING BOROUGH SURVEYORSHIP VACANT.

RESIGNATION OF MR. J. H. NORRIS.

Mr. J. Herbert Norris has resigned his position as borough surveyor of Godalming. Mr. Norris has arranged to go into private practice as an architect and surveyor in association with Mr. S. Welman, his uncle, who has practised in the town for very many years.

A Telephone Companion.—Messrs. Bristowe & Co., Limited, of Broad Sanctuary Chambers, 11 Tothill-street, Westminster, S.W., send us a most useful and elaborate pad record for noting the names and exchange numbers of firms regularly communicated with by telephone, with index pages and tear-off sheets of memoranda paper. The only suggestion of advertising conveyed is the one word stamped in gold letters on the front of the pad—viz., "Tarvia," the material now so well known to road engineers.

Russian Garden Cities.—The movement in favour of rational settlements of the garden city type is growing very rapidly in Russia. A Garden Cities Association is to be formed in St. Petersburg as soon as the necessary sanction has been obtained. Many other cities (says the *Times* Russian Supplement) propose to establish garden suburbs to be connected by tramways with the city. Garden cities are already being laid down near Moscow, Warsaw and Odessa, while Riga already has a garden city named Kaiserwald. The problem of town planning in connection with the decentralisation of fast-growing cities is one that will demand solution in the near future.

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

THE ESSEX ROAD IMPROVEMENT SCHEME.

£300,000 EXPENDITURE IN FIVE YEARS.

As briefly reported in our last issue, an important scheme for resurfacing the principal main roads in Essex has been prepared by the county council and approved by the Road Board. About 150 miles of road are involved, and the work will be spread over a period of five years. The total cost of reconstructing the surfaces of these highways is estimated at something like £300,000.

THE SCHEME DESCRIBED.

The scheme had its genesis in the desire of the Road Board to deal with the question of road improvement in a comprehensive and systematic fashion. Hitherto the Essex County Council and various local bodies have put forward a number of comparatively small proposals. The feeling of the board was that more permanent good would result by a method which, while involving a heavy initial outlay, would result in some lasting improvements. Accordingly, the county council were asked to submit plans with this end in view, and the county surveyor, Mr. Percy J. Sheldon, and his staff prepared the necessary particulars from which the present scheme, after many months of negotiation, has been formulated.

Three trunk roads and two branches are included in the scheme, and they may be indicated as follows:

(1) From London to Stratford St. Mary (Suffolk), being the main road from the county boundary at West Ham to Ipswich, passing through portions of the urban districts of East Ham, Romford, Chelmsford, Witham and Colchester.

(2) From London to Newmarket and Cambridge, being the main road from the county boundary at Lea Bridge, passing through portions of the urban districts of Leyton, Walthamstow, Woodford and Saffron Walden.

(3) From London to Southend, being the main road from the county boundary at East Ham (Anne Boleyn's Tower), passing through portions of the urban districts of East Ham, Barking and Grays.

(4) From Epping Forest to Chelmsford, being the branch road from London to the East Coast, leaving the Epping new road at Epping Plain, and terminating at its junction with the London to Ipswich main road in the borough of Chelmsford at Springfield-road-corner, High-street, Chelmsford.

(5) From Colchester to Harwich, being the main road from London to Harwich, commencing at its junction with the London to Ipswich main road in East-street, Colchester, terminating in Harwich at the end of the existing main road known as Church-street.

COST OF THE WORK.

Towards the total cost of this great scheme, amounting to £300,000, the Road Board are willing to pay £125,000, and to lend, free of interest, an additional sum of about £175,000, repayable in five years. The difference will, of course, have to be provided out of the county rates, but the scheme is being so arranged that the annual demand on the ratepayers will be no greater than it is at present for the upkeep of the existing surfaces.

The material to be used in reconstructing the surfaces will be some form of bitumen (tar-macadam or asphalted granite, possibly both—according to local circumstances and requirements. A certain amount of work will be carried out each year, the period allowed for the total being, as already stated, five years from October 1st last.

The increase of motor-omnibus and other heavy motor traffic is primarily responsible for making some large scheme of this kind necessary. Already the highways in the extra-Metropolitan area of Essex are being worn almost to the point of destruction by heavy traffic, which is growing greater every day. The Essex County Council naturally see possibilities of still further developments in this direction, and they desire to embrace a favourable opportunity which is now presented of putting the trunk roads in such a condition as to withstand the demands of the future. Those sections nearest London will be first put in hand, and probably the highways in the north and east of Essex will not be dealt with until the fourth or fifth year.

One fairly extensive piece of work has already been carried out in Essex under Road Board auspices. This was the resurfacing, some two or three years ago, of about 7 miles of road in the neighbourhood of Marks Tey, at a cost of £10,000. The surface has worn mag-

nificently, not £d. having been spent on it since it was originally remade, and, in Mr. Sheldon's opinion, there is probably not a better piece of road in England.

ENTIRE FUNDS EARMARKED.

A circular letter explanatory of the scheme is being sent out to the various urban district councils directly concerned by direction of the Highways Committee of the county council. In this document the committee state:

"The scheme is one that has been submitted by the council to the Road Board with the view of carrying out the suggestion contained in the annual report of the board, and with which the council are in entire agreement, that the present most pressing problem in connection with main roads is the reconstruction of surfaces with materials calculated to withstand the wear of heavy motor traffic.

"The board have expressed their approval of the scheme, and to enable it to be carried out have earmarked the entire funds of the board that are available, so far as can be foreseen at present, for the administrative county during the period in question (five years), and nothing further will be available for either the county or other road authority within the administrative area for any other class of improvement the county having, therefore, to forego several important widenings and diversions until the completion of this scheme.

"The routes selected will pass through the districts of a number of urban authorities claiming to maintain their main roads, and the board have intimated to the committee their willingness to make grants up to 25 per cent of the capital cost of such resurfacings within these districts provided the works contemplated are approved by the county council through the county surveyor; no schemes other than resurfacings can be considered, and no separate schemes will, during the period in question, be favourably considered by the board.

"It is quite possible that it will prove more advantageous to urban authorities to pave, either with stone or wood, certain sections of the prescribed routes, in which case no grants will be made by the board, their opinion being that the cost can be more properly and favourably dealt with under long-period loans raised under sanction of the Local Government Board.

"In all such cases, where the schemes have been previously approved by the county council, the loan repayments would be favourably considered by the county council when renewing the maintenance contracts with the urban councils.

"Where bituminous materials are to be used, these must be under the sanction and approval of the county surveyor, and the county council will be prepared to negotiate with the urban authorities with the view to an equitable apportionment of the balance of the cost not covered by the grant from the board."

The circular concludes by inviting urban councils who may be contemplating any resurfacings upon the routes mentioned and are prepared to fall in with the conditions and proposals of the board as defined to the county council and outlined above, to open up communications with the county surveyor, who will consider any schemes submitted to him at the earliest possible date.

Birmingham Motor Omnibuses. In a recent report Birmingham Tramways Committee deal with the question of the acquisition by the corporation of the interests within the city of the Birmingham and Midland Motor Omnibus Company and the various allied companies concerned. They state that as a result of negotiations the company are willing to sell to the corporation, upon terms set out in a draft agreement which has been approved by the committee and the company, for £30,000, their leasehold interest in the premises comprising the garage and buildings (suitable for the accommodation of eighty motor omnibuses) in Tennant-street, Birmingham (the lease of which expires in 1951, the annual rental being £80 16s. 8d.), together with thirteen 30-h.p. and seventeen 40-h.p. Tilling-Stevens motor omnibuses. The agreement provides for a deduction for depreciation at the rate of 20 per cent per annum as from January 1, 1914, until the date of completion in respect of the cost of the motor omnibuses. In addition, a portion of the machinery, tools, plant, and stores applicable to these motor omnibuses is to be purchased at a valuation. The agreement is conditional upon the corporation obtaining during 1914 an Act authorising them to run a general service of motor omnibuses within the city.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A.,
Borough Surveyor, Great Yarmouth.

WEST MIDLAND DISTRICT.

A West Midland District meeting will be held at Birmingham on Thursday, January 15th.

PROGRAMME.

5 p.m.—Meet at the Council House, Birmingham—
To consider letter from the South-Western District asking for the opinion of members in regard to the new institution journal;
Paper by Mr. H. J. Coleby (Atherstone), entitled "Some Notes on Water Supply in the Rural District of Atherstone."

Mr. Coleby's paper is of very general interest, and it is hoped there will be a good attendance.

F. C. COOK, A.M.I.C.E., <i>Hon. District Secretary,</i> Borough Surveyor, Nuneaton.	A. T. DAVIS, M.I.C.E., <i>District Chairman,</i> County Surveyor, Salop.
--	---

SOUTH-EASTERN DISTRICT.

A South-Eastern District Meeting will be held at 92 Victoria-street, Westminster, S.W., on Saturday, January 17th.

PROGRAMME.

5 p.m. Meet at the offices of the institution, 92 Victoria-street, S.W.—
To elect a junior representative for Sussex;
Chairman's report on arrangements for future meetings;
General business.

6.30 p.m.—Dinner at Westminster Palace Hotel, to be followed by a musical entertainment. Tickets, 3s. 6d. each.)

H. W. BOWEN, A.M.I.C.E., <i>Hon. District Secretary,</i> County Surveyor's Office, Horsham.	A. DRYLAND, M.I.C.E., <i>District Chairman,</i> County Surveyor, Surrey.
--	---

NORTH-WESTERN DISTRICT.

A meeting of the institution is to be held in the North-Western District at Manchester on February 20th and 21st.

92 Victoria-street, S.W. **THOMAS COLE,**
Secretary.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

NORTHERN DISTRICT.

The annual general meeting of this district will be held at the town hall, Newcastle-upon-Tyne, at 3.15 p.m., on Saturday, January 10, 1914, when the papers read at the annual meeting held in London on November 7, 1913, will be discussed. Copies of the papers referred to may be obtained on application to the undersigned. They are—

- "The Need for Standardisation in Drainage Details," by Arthur Palmer, F.A.S.T., M.R.SAN.I.
- "Electricity as a By-product," by R. J. Spencer-Phillips, ASSOC.M.INST.C.E.
- "Temporary Buildings in Relation to By-laws," by T. C. Barralet, M.R.SAN.I.

The meeting will be followed by the annual dinner, to be held at the Royal Turk's Head Hotel, Grey-street, at 6.30 p.m. Evening dress optional.

JOHN ROBINSON,
Hon. District Secretary.

Union Offices,
Darlington.
January 1, 1914.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District of the Institution of Municipal Engineers will be held at Manchester on Saturday, January 31st.

PROGRAMME.

1.30 p.m.—Business meeting at the Mitre Hotel, Cathedral-close, to elect district chairman and hon. district secretary, and to arrange programme.

3 p.m.—Visit to the Stuart-street station of the Manchester Corporation electricity works, by kind permission of Mr. S. L. Pearce, M.INST.C.E., M.I.E.E., the chief engineer. Members are requested to assemble at 3 o'clock sharp.

B. WYAND,
39 Victoria-street, S.W. *Secretary.*

ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

Buildings.

DUNMOW.—January 10th.—For repairs to a bridge, for the rural district council.—Mr. A. E. Floyd, clerk

LEWES.—January 10th.—For the erection of a school, for the Education Committee.—Mr. E. H. Fuller, architect, 19 High-street.

SLEAFORD.—January 10th.—For a deep boring in Kirkby-la-Thorpe, for the rural district council.—Mr Edmund Clements, clerk.

CROMPTON.—January 10th.—Schemes and tenders for refuse destructor and steam disinfector, for the urban district council.—Mr. F. F. Gartside, clerk and surveyor, Town Hall, Shaw, near Oldham.

EDINBURGH.—January 12th.—For alterations at 25 Waterloo-place, for the Gas Commissioners.—Engineer, 15 Calton Hill.

INVERNESS.—January 13th.—For the construction of new waterworks, for the county council.—Messrs. Geo. Gordon & Co., civil engineers, Inverness.

DURHAM.—January 13th.—For the erection of a new school, for the county council.—Mr. W. Rushworth, Shire Hall, Durham.

DURHAM.—January 13th.—For extensions of a school, for the county council.—Mr. W. Rushworth, Shire Hall, Durham.

BARKING.—January 13th.—For the erection of workmen's dwellings, for the urban district council.—Mr. C. J. Dawson, architect, Clock House Chambers, East-street, Barking.

BIRMINGHAM.—January 14th.—For the supply of railway material, laying and ballasting 950 lin. yds. of permanent way, construction of a brick and concrete bridge, and other works, for the Birmingham, Tame and Rea District Drainage Board.—Mr. John D. Watson, engineer to the board, Tyburn, Birmingham.

GLASGOW.—January 14th.—For alterations and additions to police buildings, for the corporation.—Mr. J. Lindsay, town clerk.

RICHMOND (Surrey).—January 14th.—For the erection of a cookery centre, for the Education Committee.—Mr. J. H. Brierley, borough surveyor.

BOURNEMOUTH.—January 14th.—For the erection of conveniences and shelters, for the corporation.—Mr. F. W. Lacey, borough engineer and surveyor.

KENT.—January 15th.—For the erection of two blocks of asylum buildings, for the Asylums Committee.—Mr. F. R. Howlett, clerk, 9a King-street, Maidstone.

HACKNEY.—January 15th.—For the construction of an additional vapour bath and refreshment room, and alterations to offices, for the borough council.—Mr. Norman Scorgie, deputy town clerk.

BELFAST.—January 15th.—For the erection of 252 houses, for the corporation.—City Surveyor.

LANCASTER.—January 16th.—For taking down a chimney and building a new chimney, for the corporation.—Town Clerk.

WARRINGTON.—January 16th.—For the erection of a school, for the corporation.—Mr. I. Moore Murray, Education Office.

RADCLIFFE.—January 17th.—For the erection of sixteen dwellings, for the urban district council.—Mr. W. L. Rothwell, engineer and surveyor.

MARGAM.—January 17th.—For the building of new gasworks, for the urban district council.—The Surveyor.

GLASGOW.—January 17th.—For the construction of tunnels, cutting trenches, and laying water pipes, for the corporation.—Mr. J. R. Sutherland, engineer, Water Department, 45 John-street, Glasgow.

NEWPORT PAGNELL.—January 17th.—For the erection of eight houses, for the rural district council.—Mr. W. J. Budds, surveyor.

WEST RIDING.—January 19th.—For the erection of a boiler-house, chimney shaft, and boiler seating at the Menston Asylum, for the Asylums Board.—Mr. W. E. H. Burton, engineer, Wakefield.

ALTRINCHAM.—January 19th.—For the erection of public conveniences, for the urban district council.—Mr. H. E. Brown, surveyor.

CARNARVON.—January 19th.—For the erection of a school, for the Education Committee.—Mr. R. Lloyd Jones, county architect, Carnarvon.

RAMSGATE.—January 19th.—For the erection of a shelter, for the corporation.—Mr. T. G. Taylor, borough engineer.

CHELMSFORD.—January 20th.—For the provision and laying of 2,500 lin. yds. of 3-in. water mains and fittings, for the rural district council.—Mr. W. Almond, surveyor.

SWANSEA.—January 26th.—For the construction of masonry and concrete approaches, piers, for a bow-string truss steel girder footbridge, and also for the supply and erection of the bridge, for the corporation.—Mr. H. Howard Humphreys, 28 Victoria-street, Westminster, S.W.

BARNET.—January 29th.—For the erection of new council offices, and an underground convenience, for the urban district council.—Mr. W. F. Wilkins, surveyor.

DORSET.—January 30th.—For the erection of a school, for the Education Committee.—Messrs. Fletcher & Bratt, Wimborne.

WHARFEDALE.—January 30th.—For the erection of a diphtheria pavilion, and additions to administration block at isolation hospital, for the Joint Hospital Committee.—Mr. Phil. S. Wade, clerk, Union Offices, Otley.

EGREMONT.—January 30th.—For the erection of seventy-six houses, for the urban district council.—Mr. J. S. Stout, architect, 36 Lowther-street, Whitehaven.

Iron and Steel.

SPRINGHEAD.—January 10th.—For the supply of 260 manhole and lamphole covers, for the urban district council.—Mr. R. Kilner, 25 Queen's-street, Oldham.

BOOTLE.—January 14th.—For the supply and erection of wrought-iron railings, for the corporation.—Borough Engineer.

NEWPORT (Mon.).—January 15th.—For supplying and fixing wrought-iron unclimbable fencing and ornamental fencing and gates, for the corporation.—Borough Engineer.

HARTSHORNE AND SEALS.—January 16th.—For laying 5,000 yds. lineal of 4-in. and 3-in. cast-iron spigot and socket pipes, fixing valves and hydrants, constructing service reservoir and pump well, and erecting windmill and pumps, for the rural district council.—Mr. Norman F. Spence, engineer and surveyor.

WORTHING.—January 22nd.—For the supply of 30-in. and 36-in. diameter cast-iron pipes, valves, tidal flaps, and other special castings, for the town council.—The Borough Surveyor.

SLEAFORD.—January 24th.—For the supply, laying and jointing of about 8½ miles of cast-iron mains and specials, 4-in. and 3-in. diameter respectively, the provision and fixing of sluice and air valves, stand posts, and other works of water supply, for the rural district council.—Mr. W. B. Marsden, engineer and surveyor.

LONDON.—January 27th.—For the supply of 584 tons of special section-rolled steel bar for magnetic brake shoes, for the county council.—Chief Officer, London County Council Tramways, 62 Finsbury-pavement, E.C.

WARSAW.—February 16th.—For the supply of two vertical compound engines, with plunger, piston, or differential pumps, or of two turbines, with centrifugal or turbo-pumps, for the Municipality.—Sir William H. Lindley, 29 Blittersdorpherplatz, Frankfort-on-Maine.

Roads.

BISHOPSTHORPE.—January 9th.—For the supply of the best hand-broken 2½-in. whinstone and slag, for the rural district council.—Mr. F. Ware, clerk.

HARDINGSTONE.—January 9th.—For the supply of road materials, for the rural district council.—Mr. J. R. Phillips, clerk, 2 St. Giles'-square, Northampton.

HASTINGS.—January 10th.—For the supply of best unbroken blue stone, for the rural district council.—Mr. David Paine, surveyor, Stonelynk Farm, Fairlight.

ABERSYCHAN.—January 10th.—For the execution of private street works, for the urban district council.—Mr. W. H. V. Bythway, clerk.

BOURNE.—January 10th.—For the supply of roadmen's barrows and tools, for the rural district council.—Mr. T. Lake, district surveyor.

BRIDLINGTON.—January 10th.—For making up certain roads, for the corporation.—Borough Surveyor.

ROYTON.—January 12th.—For the supply of non-slippery granite setts, pitch, oil and cement, for the urban district council.—The Surveyor.

HUNTLY (Aberdeen).—January 12th.—For works of formation and macadamising, for the corporation.—Mr. J. Allan, burgh surveyor.

ESSEX.—January 12th.—For works of paving and kerbing at Ilford, for the county council.—Mr. Percy J. Sheldon, county surveyor, Chelmsford.

WOODSTOCK.—January 12th.—For the supply of hand-picked unbroken stone, best broken stone (2-in. gauge, clean and free from chippings), best double-screened nuts for patching purposes (1½-in. gauge), best double-screened coarse chippings and binding chippings, and best rubble, for the rural district council.—Mr. A. G. Higgs, clerk.

TRING.—January 12th.—For the supply of 12,000 gallons of refined coal tar, for the urban district council.—Mr. S. S. Gettings, surveyor.

FLINTSHIRE.—January 12th.—For the supply of broken granite, chippings, and local stone, for the county council.—Mr. S. Evans, county surveyor, County Buildings, Mold.

EDMONTON.—January 13th.—For resurfacing roadways with Roadamant and Smith's Trinidad asphalt-macadam, for the urban district council.—Mr. C. Brown, surveyor.

PERRY BAR.—January 13th.—For the supply of Rowley rag and blast furnace cinder, for the urban district council.—Mr. E. Bailey, surveyor, Green-lane, Hamstead, near Birmingham.

BRIXHAM.—January 13th.—For relaying footpaths, for the urban district council.—The Surveyor.

STOKE-ON-TRENT.—January 14th.—For making up certain streets, for the corporation.—Borough Surveyor.

EASINGWOLD.—January 14th.—For the supply of whinstone slag, for the rural district council.—Mr. F. J. H. Robinson, clerk.

WEYMOUTH.—January 14th.—For the supply of distilled tar and tar paving, for the corporation.—Town Clerk.

GLAMORGAN.—January 14th.—For executing a main road improvement, for the county council.—Mr. T. Mansel Franklen, clerk, County Hall, Cardiff.

BIRMINGHAM.—January 14th.—For the reconstruction of a portion of a street, for the corporation.—Mr. Henry E. Stilgoe, city engineer and surveyor.

ENFIELD.—January 14th.—For making up the following private streets—viz., Drapers'-road, Enfield, and Warwick-road, Enfield Lock, for the urban district council.—Mr. Richard Collins, surveyor.

HAMMERSMITH.—January 14th.—For paving work in Foliot-street, Fitzneal-street and Erconwald-street, for the borough council.—Mr. H. Mair, borough surveyor.

WEST BRIDGFORD.—January 15th.—For making up certain streets, for the urban district council.—Mr. W. Pare, surveyor.

LEEDS.—January 15th.—For the construction of portions of the tramway track, for the corporation.—Mr. J. B. Hamilton, tramways manager, Standard Buildings, City-square, Leeds.

SPILSBY.—January 16th.—For the supply of about 5,000 tons of broken granite, 9,500 tons of broken slag, and 500 tons of slag chippings, for the rural district council.—Mr. W. Cook Brakenbridge, district surveyor of highways, Spilsby.

HALIFAX.—January 17th.—For the execution of private improvement works, for the corporation.—Mr. J. Lord, borough engineer.

NORFOLK.—January 17th.—For the supply of local materials in pits or delivered to the various stations and staithes, for the county council.—Mr. T. H. B. Heslop, county surveyor, Norwich.

MIDHURST.—January 17th.—For the supply of granite, tar-macadam and tar, for the rural district council.—Mr. A. G. Gibbs, surveyor.

HAILE.—January 17th.—For making up a street, for the urban district council.—Mr. T. Blagburn, surveyor.

EAST COWES.—January 19th.—For the supply of 200 cub. yds. of granite, for the urban district council.—Mr. A. E. Barton, surveyor.

CHERTSEY.—January 19th.—For road construction, drainage, kerbing, and fencing, for the rural district council.—Mr. H. Beeeny, surveyor, West Byfleet.

GLOUCESTER.—January 19th.—For the supply of stone for use on main roads, for the county council.—Mr. E. S. Sinnott, county surveyor, Shire Hall, Gloucester.

WANDSWORTH.—January 19th.—For road repairs in certain roads, for the borough council.—Mr. P. Dodd, borough engineer.

SURREY.—January 20th.—For the supply of high-class granites, basalts, limestone, slag, tar-macadam, bitumen, pitch, tar, and tar oils, for the county council.—Mr. A. Dryland, county surveyor, Kingston-on-Thames.

LONDON.—January 20th.—For work of road construction at Tottenham, for the county council.—Architects' Department (Housing Section), 19 Charing Cross-road, W.C.

SKIPTON.—January 20th.—For the supply of road materials, for the rural district council.—Mr. A. Rodwell, surveyor.

LEWISHAM.—January 20th.—For laying wood paving in Bromley-road, for the borough council.—The Surveyor.

CLUTTON.—January 20th.—For the supply of 15,000 gallons of dehydrated refined coal tar for surface tarring, complying with the Road Board Specification for tar No. 14, for the rural district council.—Mr. J. Sumner Dury, clerk.

BOURNEMOUTH.—January 21st.—For relaying wood block paving, for the corporation.—Mr. F. W. Lacey, borough engineer and surveyor.

WORTHING.—January 22nd.—For the supply of broken granite, granite chippings, and granite dust, for the corporation.—Borough Surveyor.

ESSEX.—January 24th.—For the supply of team labour, stoneware pipes, Norwegian granite kerb and setts, York korb, and distilled tar, for the county council.—Mr. Percy J. Sheldon, county surveyor, Chelmsford.

BIRMINGHAM.—January 24th.—For the supply of granite kerbs, setts, crossing stones, chippings, flags, paving bricks, wood paving blocks, ragstone, limestone, tarred limestone, gravel, sand, and slag, for the corporation.—Mr. Henry E. Stilgoe, city engineer and surveyor.

WORKSOP.—January 26th.—For the supply of slag, for the urban district council.—Mr. G. Featherstone, clerk.

CUCKFIELD.—January 26th.—For the supply of about 6,500 tons of broken granite, tarred material, and flints, for the rural district council.—Mr. A. Macarthur, surveyor, Haywards Heath.

DEVON.—January 26th.—For steam rolling and scarifying on the main roads in the Bideford Rural District, for the county council.—Mr. Edward Stead, county surveyor, No. 1 Division, Barnstaple.

EPSOM.—January 26th.—For the supply of about 100,000 gallons of coal tar, for the rural district council.—Mr. T. E. Ware, surveyor.

PLOMESGATE.—January 26th.—For the supply of broken granite, and flint, broken or unbroken, for the rural district council.—Mr. David R. Read, clerk.

BROMLEY (Kent).—February 2nd.—For the execution of sewerage, levelling, paving, metalling, channelling and making good portion of a road, for the rural district council.—The Surveyor, Maulden House, Sidecup-hill, Sidecup.

HERTFORDSHIRE.—February 5th.—For the supply of broken granite, slag and tar-macadam required for the main roads during the year ending March 31, 1915, for the county council.—Mr. Urban A. Smith, county surveyor, Hatfield.

Sanitary.

DOWNPATRICK.—January 10th.—For the construction of a sewer, for the rural district council.—The Clerk.

SMALLTHORNE.—January 12th.—For the construction of new sewers, for the urban district council.—Mr. J. W. Deane, surveyor.

CHORLEY.—January 12th.—For emptying privies, ashpits, and cesspools, for the rural district council.—Mr. R. E. Aspden, clerk.

LEWES.—January 12th.—For the construction of main sewers, for the corporation.—Messrs. Brierley, Holt & Co., 46 Abingdon-street, Blackpool.

ST. MELLONS.—January 13th.—For the construction of stoneware pipe sewers, for the rural district council.—Mr. G. S. Morgan, engineer, Pontypridd.

EBBW VALE.—January 13th.—For work of scavenging, for the urban district council. Mr. T. Hughes, clerk.

BOOTLE.—January 14th.—For the execution of drainage work, for the corporation. Borough Engineer.

ROCHDALE.—January 14th.—For work of sewerage, for the corporation.—Borough Surveyor.

TENTERDEN.—February 14th.—For the construction of about 5 miles of stoneware and iron pipe intercepting sewers, of 9-in. and 12-in. diameter, with manholes, flushing tanks, and other appurtenances, driving a deep tunnel heading, and constructing purification works, for the corporation. Messrs. John Taylor & Sons, Caxton House, Westminster, S.W.

HACKNEY. January 15th. For the collection and removal of house and other refuse, for the borough council.—Mr. N. Seorgie, deputy town clerk and borough engineer.

WHITBY.—January 16th.—For the construction of an automatic sewage filter, for the rural district council.—Mr. W. Seaton Gray, clerk.

CLAYTON.—January 16th-19th.—For the construction of 224 yds. of sewers, for the urban district council. Mr. B. Ashton, clerk.

HALIFAX.—January 17th.—For the extension of sewage disposal works, for the corporation.—Mr. J. Lord, borough engineer.

CROYDON.—January 19th.—For the supply of stoneware drain pipes, for the corporation.—Borough Engineer.

MIRFIELD.—January 19th.—For the extension of sewage disposal works, for the urban district council.—Mr. E. Gill, engineer and surveyor.

WALTHAMSTOW.—January 22nd.—For drainage and other works, for the parochial charities.—Mr. W. Houghton, surveyor, 58 Old Broad-street, E.C.

SHARDLOW.—January 23rd.—For the construction of 3 miles of stoneware pipes (12-in. to 6-in.), with manholes and other appurtenant works, three ejector chambers, with 1½ miles of 8-in. and 2½-in. compressed air main, 1,815 yds. of 7-in. and 5-in. rising main, with air compressor stations, and purification works, for the rural district council.—Messrs. Elliott & Brown, Burton Buildings, Parliament-street, Nottingham.

DOWNHAM MARKET. January 26th.—For constructing 2,100 yds. of stoneware pipe sewers, manholes and appurtenant works, storage chamber, pumping station, 712 yds. of 5-in. rising main, tanks, and bacterial filters, for the urban district council.—Messrs. Elliott & Brown, Burton Buildings, Parliament-street, Nottingham.

WESTHAMPTON.—January 29th.—For laying sewers, building manholes and lamp-holes, and all necessary work connected with the main drainage of Felpham, for the rural district council.—Mr. H. Howard Humphreys, 28 Victoria-street, Westminster, S.W.

NEWCASTLE (Co. Down).—January 31st.—For the construction of a complete sewerage scheme, for the urban district council.—Messrs. Swiney & Crossdale, Avenue Chambers, Belfast.

LONDON.—February 2nd.—For the execution of works for three years in the reparation, maintenance, and reconstruction of sewers and drains, for the corporation of the city. Bell, Guildhall, E.C.

Stores.

ST. PANCRAS.—January 12th.—For the removal of road-sweepings and gully soil, horsing water vans, horsing road-sweeping and other machines, cartage, and the supply of timber, creosoted deal blocks, jarrah wood blocks, barrows, trucks, handles, paints, oils,

ironmongery, smiths' and founders' works, tools, Yorkshire stone and artificial paving slabs, granite kerbs, paving setts, broken granite and Kentish rag, gravel and other roadway materials, bass brooms and horse brush stocks, tarpaulins, hemp, rubber goods, pitch, tar, creosote oil, and carbolic powder, and coke, for the borough council.—Mr. W. Nisbet Blair, borough engineer and surveyor.

LAMBETH.—January 15th.—For the supply of men, horses, carts, cartage and materials, for the borough council.—Mr. Henry Edwards, borough engineer.

PLYMOUTH.—January 17th.—For the supply of paints, varnishes, ironwork, petroleum oil, broom-heads, household brushes, iron and steel, pitchpine, deals, flooring, carbolic powder, Portland cement, lubricating oils, tar, pitch, painters' brushes, explosives, soap, softwood blocks, creosote, disinfectant fluid, granite kerbs, setts, white and red lead, re-filling machine-revolving brooms, benzoline, motor spirit, tools, indiarubber goods, hose, and ship chandler's goods, for the corporation.—Mr. James Paton, borough engineer and surveyor.

BERMONDSEY.—January 19th.—For the supply of road and sanitary materials, wood blocks and York paving, for the borough council.—Mr. F. Ryall, town clerk.

MIDDLESBROUGH.—January 19th.—For the supply of annealed scoria blocks, bricks, castings, concrete flags and kerbs, Portland cement, pitch and tar, sanitary pipes, gullies, junctions, broken slag, domestic coal, timber, whinstone and granite (broken), whinstone and granite setts and kerbs, brushes, bolts, nuts, disinfectants, general stores, glass, hardware, indiarubber goods, iron, steel, leather belting, oils, paints, varnishes, packings, picks, shovels, hatts, polishes, cleaning materials, and ropes, for the corporation.—Mr. S. E. Burgess, borough engineer.

CHELSEA.—January 21st.—For the supply of water-proof goods, broken granite from the Channel Islands, wood blocks, hoggins and ballast, removal of trade refuse, scavengers' tools, dust baskets, tools, and carbolic disinfectants, for the borough council.—Mr. T. W. E. Higgins, borough surveyor.

ACTON.—January 23rd.—For the execution of works and supply of Portland cement, ground blue lias lime, stoneware pipes, granite, flints, household coal, shoeing horses, manhole covers, granite kerb and channel, artificial stone paving, York stone, cycle repairs and accessories, prints, oils, team labour, horsing fire brigade, brooms, disinfectants, wood blocks, and tarpaving materials, for the urban district council.—Mr. W. Hodson, clerk.

BIRMINGHAM.—January 24th.—For the supply of lias lime, Portland cement, drain pipes, gullies, gully pans, brown bricks, timber, drysaltery, malleable-iron castings, iron castings, galvanised goods, iron and steel ware, lamps, glass, enamelling, brooms, hose pipes, hose coupling, rubber goods, incandescant mantles, and miscellaneous stores, for the corporation.—Mr. Henry E. Stilgoe, city engineer and surveyor.

CHELTENHAM.—January 31st.—For the supply of Portland cement, forage, stoneware pipes, broken stone, kerbs, setts, disinfectants, oils, colours, ironmongery, timber, indiarubber goods, lead, brass fittings, tools for highways, wrought iron, steel, tiles, electric light fittings, road brooms, lias lime, bricks, clothing, and cast-iron pipes, for the corporation.—Mr. J. S. Pickering, borough engineer.

STEPNEY.—February 10th.—For the supply of bricks, lime, fireclay, brooms, east-iron work, colours, varnishes, painters' brushes, drainage materials, oilman's goods, Portland cement, pitch, tar, green oil, bitumen, timber, tools, implements, ironmongery, wheelwrights' materials, ballast, shingle, sand, hoggins, flints, uniform clothing, boots, disinfectants, paving materials, horse hire, and squaring and re-dressing old paving materials, for the borough council.—Mr. M. W. Jameson, borough engineer.

HASTINGS.—December 29th.—For the supply of manhole covers, gullies, brooms, and brushes, for the corporation.—Mr. P. H. Palmer, borough engineer.

Miscellaneous.

MATLOCK.—January 10th.—For the purchase by the urban district council of a second-hand fire engine.—Mr. Joseph Turner, engineer and surveyor.

NORTHAMPTON.—January 12th.—For the construction of a double line of tramways to Far Cotton, and the doubling of a section of the Kingsthorpe

route, together with the necessary overhead equipment, underground feeders, and telephones, for the corporation.—Mr. Alfred Fidler, borough engineer.

CHESTERFIELD.—January 19th.—For sinking a trial borehole, for the Gas and Water Board.—Mr. J. Middleton, clerk.

TREDEGAR.—January 20th.—For the supply of a 5-ton steam tractor and two side-tipping wagons or trailers to carry 4 tons each, and the immediate hire of a similar tractor, with driver, or two similar wagons or trailers, for the urban district council.—Mr. H. J. C. Shepard, clerk.

BIRMINGHAM.—January 24th.—For the supply of uniform clothing, for the corporation.—Mr. Henry E. Stilgoe, city engineer and surveyor.

RAMSGATE.—January 28th.—For fixing a hydraulic flag-making plant, and revolving mixer and grinding mill, for the corporation.—Mr. T. G. Taylor, borough engineer.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

CHISWICK.—For making up two roads, for the urban district council.—Mr. Edward Willis, engineer and surveyor:—

F. G. Brummell.—Elmwood-road: Council paving, £1,513; Croft, £1,565; Excelsior, £1,533; Atlas, £1,546. Park-road, fourth section: Council paving, £1,240; Croft, £1,271; Excelsior, £1,251; Atlas, £1,259.	
G. Wimpey & Co.—Elmwood-road: Croft paving, £1,591. Park-road, fourth section: Croft paving, £1,357.	

DOVER.—For the collection of house refuse, for the corporation.—Mr. W. C. Hawke, borough engineer:—

S. Terry, Dover	£36
C. Gambill, Dover	27
W. J. Kennett, Dover	21
J. T. Bright, Dover	20

DUNMOW.—For the construction of sewerage and sewage disposal works, for the rural district council.—Messrs. Sands & Walker, engineers, Nottingham:—

E. Ireland, Bath	£8,125
A. Brown & Son, Braintree	8,100
T. Wood & Sons, Swanley, Kent	8,066
F. Osman & Co., Southampton	7,998
G. Bell & Sons, Limited, Tottenham, N.	7,993
G. P. Trentham, Limited, Birmingham	7,987
H. Farrow, Brixton, S.W.	7,927
W. & C. French, Buckhurst Hill, Essex	7,820
Laue Brothers, Mansfield	7,724
J. Moran & Son, Kensington High-street, London	7,559
T. W. Pedrette, Enfield, N.	7,150

KESWICK.—For the erection of a common lodging-house, for the urban district council.—Mr. W. Hodgson, surveyor:—

W. Cowperthwaite (Builder), Keswick	£438
I. & R. Hodgson (Builder), Keswick	424
T. Hodgson & Sons (Builder), Keswick	382
Cutts & Dixon (Builder), Keswick	309
J. Millern & Sons (Joiners), Keswick	112
F. & W. Green (Joiners), Keswick	111
T. Walker (Plumber), Keswick	64
C. Greenwood (Plumber), Keswick	65
J. R. Raiton (Painter), Keswick	25

PATELEY BRIDGE.—For laying earthenware pipe sewers, and constructing manholes and sewage disposal works, for the rural district council.—Messrs. Spinks, Pilling & Rodwell, Leeds:—

Bushby & Sons, Headingley	£4,040
Naylor & Son, Bradford	3,696
Middleton & Hopper, Aspatria	3,324
Hannam & Co., Otley	3,240
A. Schofield, Leeds	3,237
M. Arundel, East Ardsley	3,167
Dougill & Son, Bedale	3,071
J. H. Grange, Pateley Bridge*	3,069

ROCHDALE.—For making good certain roads, for the corporation.—Mr. S. S. Platt, borough surveyor:—
Contract No. 414.—R. & T. Howarth, Rochdale.

SOUTHGATE.—Accepted for the execution of private street works in Andurley and St. George's roads, for the urban district council.—Mr. C. G. Lawson, surveyor:—
W. & C. Hampton, Palmer's Green, N.

STONE.—For the conversion of pail closets and privies into water-closets, for the urban district council.—Mr. A. R. Ridout, surveyor:—

Swift & Sons, Stone, Staffs	£2,041
W. Smallwood, Stone, Staffs	1,834
W. A. Hales, junr., Stoke-on-Trent	1,781

WEMBLEY.—For constructing 6 miles of pipe sewers and manholes at Northern Wembley, for the urban district council.—Mr. C. R. W. Chapman, surveyor:—

T. W. Pedrette, Enfield	£9,827
E. T. Bloomfield, Tottenham	9,549
J. Ford, Willesden	9,202
F. W. Southern, Harpenden	8,795
T. Adams, Wood Green	8,635
F. E. Binns, Croydon	8,580

J. Stone, Balham	£8,390
J. Dickson, St. Albans	8,322
A. E. Palmer, Leicester	8,307
A. Thompson, Finchley	8,198
E. Free & Sons, Maidenhead	8,086
S. W. S. Saunders, Bournemouth	8,058
W. Jackson, Forest Gate	7,811
D. R. Paterson, Limited, Camden Town	7,668
G. Bell & Sons, Limited, Tottenham	7,360
G. P. Trentham, Limited, Birmingham	7,337
W. Wright, Chesham	7,292
H. Farrow, Brixton	7,185
W. & C. French, Buckhurst Hill	7,034
T. J. Davies & Co., Penarth	6,790
J. M. Vine, Eastbourne	6,725
Willis & Powis, Wembley	6,306

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

JANUARY.

- 9.—Junior Institution of Engineers: Mr. C. H. Woodfield on "The Future of the Institution." 8 p.m.
- 10.—Institution of Municipal Engineers: Annual General Meeting of Northern District, Town Hall, Newcastle-on-Tyne. 3.15 p.m.
- 12.—Surveyors' Institution: Mr. Graham Mould, Barrister-at-Law, on "The Law of Dilapidations."
- 15.—Institution of Municipal and County Engineers: West Midland District Meeting at Birmingham.
- 15.—Society of Architects: Annual General Meeting. 8 p.m.
- 15.—Illuminating Engineering Society: Mr. P. J. Waldram, F.S.I., on "Some Problems in Daylight Illumination, with Special Reference to School Planning." Royal Society of Arts, 8 p.m.
- 17.—Institution of Municipal and County Engineers: South-Eastern District Meeting at Institution Offices.
- 19.—Surveyors' Institution (Junior Meeting): Mr. H. J. Smith on "The Housing and Town Planning Act in Working." 7 p.m.
- 26.—Surveyors' Institution: Mr. George Corderoy on "Measuring and Quantity Surveying."
- 29.—Concrete Institute: Discussion on Joint Report of the Reinforced Concrete Practice Committee and the Quantity Surveyors' Association, on "Standard Methods of Measurement for Reinforced Concrete Work." 7.30 p.m.
- 31.—Institution of Municipal Engineers: North-Western District Meeting, Mitre Hotel, Manchester. 1.30 p.m.

FEBRUARY.

- 4.—Institute of Sanitary Engineers: Annual Dinner, Holborn Restaurant.
- 16.—Institute of Sanitary Engineers: Mr. F. R. O'Shaughnessy, F.I.C., on "The Significance of Colloidal Matter in the Problem of Sewage Disposal." Caxton Hall, Westminster. 8 p.m.
- 20-21.—Institution of Municipal and County Engineers: Meeting at Manchester.
- 23.—Surveyors' Institution: Annual Dinner, Whitehall Rooms. 7 p.m.

EXAMINATIONS.

ROYAL SANITARY INSTITUTE.

PATRON - - HIS MAJESTY THE KING.

EXAMINATIONS—

SANITARY SCIENCE.

INSPECTORS OF NUISANCES,

SMOKE INSPECTORS,

MEAT INSPECTORS.

SCHOOL HYGIENE.

HEALTH VISITORS AND SCHOOL NURSES.

Centres for 1914 (those marked * are for Meat Inspectors only):—

Plymouth—January.	Cardiff—June.
Hull—February.	Liverpool—June.
Preston—February.	*Leeds—July.
Hereford—February.	London—July.
Southampton—March.	*Birmingham—October.
*Hull—March.	Aberdeen—October.
Bristol—March.	Nottingham—October.
Edinburgh—March.	*Dublin—October.
Norwich—April.	Liverpool—October.
*Liverpool—April.	*Cardiff—November.
London—April.	Sheffield—November.
Manchester—May.	Newcastle—November.
*London—May.	Manchester—December.
Leeds—May.	London—December.
Dublin—June.	*London—December.
Birmingham—June.	

The Examinations are officially recognised as qualifications for appointments by Government Departments and Municipal Authorities.

COURSES OF LECTURES for candidates preparing for Examinations are held by the Institute in London in the Spring and Autumn.

Application Forms and full particulars can be had from the Secretary, 90 Buckingham Palace-road, London, S.W. (1.113)

APPOINTMENTS OPEN.

RHONDDA URBAN DISTRICT COUNCIL. APPOINTMENT OF ENGINEER AND SURVEYOR.

The Rhondda Urban District Council invite applications for the position of Engineer and Surveyor to the Council.

Candidates must have gained experience in the duties relating to the office in a large and developing Urban Sanitary District, and must be Members of the Institute of Civil Engineers.

The gentleman appointed to the position will be required to devote the whole of his time to the duties of the office, and must reside within the Rhondda Urban area.

Candidates must not be under 30 nor more than 45 years of age.

Commencing salary £500 per annum, rising by annual increments of £50 to a maximum of £750 per annum.

Offices will be provided by the Council, who will also find all the necessary clerical and other assistance.

Applications must be made on the Form provided for the purpose, which may be obtained from the undersigned, and which Form, accompanied by copies of three recent testimonials, enclosed in an envelope, and endorsed "Engineer and Surveyor," must be delivered to me, the undersigned, on or before the 31st day of January, 1914.

Canvassing Members of the Council, or asking from them letters of introduction or recommendation, is absolutely prohibited, and any applicant canvassing a Member by circular or otherwise, or obtaining from him a letter of recommendation to any other Member or Officer of the Council, will be disqualified.

Candidates, if they so desire, may print the prescribed Form of Application as filled in by them and the testimonials submitted in support thereof, and may send 40 copies thereof to the undersigned, who will distribute the same to the Members of the Council.

W. P. NICHOLAS,
Clerk of the Council.

The Council Offices,
Pentre, Rhondda.
December 22, 1913. (1,077)

WILLESDEN DISTRICT COUNCIL.

The services of an Assistant in the Engineer's Department of the Willesden District Council are required forthwith.

Applicants should state if they have had any experience in the preparation of Town Planning schemes, and it will be necessary for selected candidates to submit specimens of their draughtsmanship. It is likewise desirable that they should have passed the Examination of the Institution of Municipal and County Engineers.

The commencing salary will be £150 per annum.

Applications, accompanied by copies only of three testimonials, to be delivered to the undersigned not later than Thursday, January 22nd, 1914.

O. CLAUDE ROBSON,
Engineer to the Council.

Municipal Offices,
Dyne-road, Kilburn, N.W.
January 6, 1914. (1,106)

CITY OF SHEFFIELD. APPOINTMENT OF TOWN PLANNING ASSISTANT.

The Corporation of Sheffield invites applications for the post of Assistant in the Town Planning Department of the City Engineer and Surveyor's Office.

Preference will be given to applicants who have had previous experience in the preparation of Town Planning Schemes and who are well acquainted with the Housing and Town Planning Act, 1909.

Candidates must be good draughtsmen and experienced levellers and surveyors, and have a good knowledge of road and sewer construction.

Applications, stating age, qualifications and salary required, to be made on forms which may be obtained from the undersigned, accompanied by copies of not more than three testimonials, to be sent in not later than Friday, January 23, 1914.

CHARLES F. WIKE,
City Engineer and Surveyor.

Town Hall,
Sheffield (1,117)

COUNTY BOROUGH OF WARRINGTON.

The Street Improvement Committee of the Council of the County Borough of Warrington invite applications for the appointment of a Temporary Assistant for a period of not less than 6 months, with experience in Town Planning. Salary £3 3s. per week.

Applications, in candidate's own handwriting, stating age, and giving full particulars of experience and present employment, and accompanied by copies of not more than three recent testimonials, to be sent to the undersigned, endorsed "Application for Town Planning Assistant," not later than Tuesday, the 20th day of January, 1914.

Canvassing, either directly or indirectly, will be a disqualification.

ANDREW M. KER,
Borough Engineer and Surveyor.

Town Hall, Warrington.
January 6, 1914. (1,116)

MISCELLANEOUS.

WANTED, to borrow or buy set of Coaching Papers for the Institution of Municipal and County Engineers Examination.—Box 1,390, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,120)

TENDERS WANTED.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

ACTON URBAN DISTRICT COUNCIL. ANNUAL CONTRACTS.

Tenders are invited for the Execution of Works and Supply of Goods for one year from the 1st April, 1914, as follows: Portland Cement; Ground Blue Lias Lime; Stoneware Pipes; Granite; Flints; Household Coal; Shoeing Horses and Ponies; Man-hole Covers; Granite Kerb and Channel; Artificial Stone Paving; York Stone; Cycle Repairs and Accessories; Paints, &c.; Oils; Team Labour; Horsing Fire Brigade; Brooms, &c.; Disinfectants; Wood Blocks; Tar-paving Materials; Coke; Coke Breeze; Tools and Plant; Plumbing Work and Material; Iron and Steel, &c.; Ironmongery, &c.; Wheelwright's Work; Winding and Maintenance of Clocks.

Full particulars and Forms of Tender may be obtained, and Forms of Contract and Bond required to be entered into, may be seen at the Offices upon application to the Surveyor to the Council.

Tenders, in sealed envelopes, endorsed "Tender for —," must be delivered to me not later than 3 p.m. on Friday, the 23rd January, 1914.

The Council do not bind themselves to accept the lowest or any Tender, and canvassing Members of the Council, either directly or indirectly, will disqualify.

(By order)
WM. HODSON,
Clerk to the Council.

Council Offices,
Winchester-street, Acton, W.
January 5, 1914. (1,108)

ESSEX COUNTY COUNCIL. HIGHWAYS COMMITTEE.

The Essex County Council are prepared to receive Tenders for the Year ending 31st March, 1915, for the Supply of Materials, Team Labour, &c., as set out in the Schedule below:—

- (1) Team Labour.
- (2) Stoneware Pipes.
- (3) Norwegian Granite Kerb and Setts, York Kerb, &c.
- (4) Distilled Tar.

Forms of Tender, with the special envelope in which Tenders are to be delivered, and all other information and particulars, can be obtained at the County Surveyor's Office at Chelmsford.

Tenders to be delivered on or before Saturday, the 24th day of January, 1914.

PERCY J. SHELDON, M. INST. C.E.,
County Surveyor.

Office of the County Surveyor,
Chelmsford.
January 1, 1914. (1,118)

The Surveyor

And Municipal and County Engineer.

Vol. XLV.

JANUARY 16, 1914.

No. 1,148.

Minutes of Proceedings.

Sewage Disposal and the Sludge Problem.

Evidence of the great interest that is taken in this subject is afforded by the fact that within the past few weeks two presidential addresses have been devoted to this matter. We recently discussed the address of Dr. Bostock Hill, the new president of the Association of Managers of Sewage Disposal Works, and last week we printed the address of Mr. J. D. Watson, M.INST.C.E., of Birmingham, the new president of the Institute of Sanitary Engineers. Although Mr. Watson dealt with housing and water supply to some extent, his address was, as he himself stated, mainly of interest to those engaged in the purification of sewage. His remarks upon the proposed central authority and the need for scientific research merit careful consideration, and it was gratifying to note that Mr. Watson's high opinion of the thoroughly practical and scientific manner in which the investigations into the conditions of New York Harbour have been carried out by the Metropolitan Sewerage Commission coincide closely with the views we have expressed on several occasions. The extent of the experiments made and information obtained in the case of New York Harbour is a measure of the magnitude of the problem to be solved, and while it may be out of all proportion to anything ever prepared for a similar purpose in this country, we need not despair so long as we possess an organisation capable not only of initiating and carrying out the very practical investigations recorded in the appendix to the Eighth Report of the Royal Commission on Sewage Disposal, but of arranging the results of their observations and drawing conclusions therefrom in such a useful and at the same time scientific manner. From Dr. Watson's remarks upon the cause of aerial nuisance from sewage works it appears that great care must be exercised in the future in selecting sites for sewerage works, and particularly in the case of large installations. On the other hand there is still some doubt in our minds whether the nuisance described by Mr. Watson is not confined to percolating filters. It would be interesting to learn what happened during the periods of high temperature mentioned at Manchester, Sheffield, Leicester, Chiswick, Twickenham, and other places where contact beds have been in operation for a considerable time.

The most important part of the address was that devoted to the sludge problem, in which Mr. Watson uttered strong warnings against the waste of the manurial value in sewage sludge. Similar warnings have been given in the past

in many quarters, but in no case has any practical suggestion been made towards preventing such waste. Mr. Watson, however, described a system of sludge treatment which he has investigated, with the result that he considers its merits sufficiently conspicuous to warrant him in saying that its discovery marks a decided advance in the treatment of sewage sludge, which no engineer can afford to ignore. The chief difficulty in sludge treatment is the separation of the liquid from the solid. The most usual method is to add chemicals, and force the liquid out by pressing. Some time ago Dr. Grossmann described in these pages a process in which the addition of a little acid caused the liquid to settle out at the bottom, leaving the solids at the top. In the method described by Mr. Watson a similar result is obtained by the addition of yeast to the sludge. He stated that "the introduction of yeast into the sludge evidently provides stimulating food for the putrefactive bacteria, as the rapidity with which the solid part of the sludge is separated from the liquid part is one of the extraordinary features of the process." We have always understood that "yeast" is the common name for the bacteria known to biologists as *Saccharomyces*, and in our opinion it will probably be found that it is these organisms, added in the form of yeast, which find stimulating food in the sludge and produce the result described.

Another point which arises in this connection is the necessity of adding phosphates and potash to the sludge in order to form a marketable manure. The manurial value of sewage sludge is not high, and, as Dr. Rideal pointed out in supporting the vote of thanks to Mr. Watson for his address, modern methods of fixing nitrogen have made it possible to produce an artificial manure which is cheaper than ordinary manure. We therefore appear to be reverting to methods similar to the A.B.C. process which was in operation at Kingston-on-Thames for a number of years, and to be recognising that in order to produce a marketable manure the sludge must first be enriched by the addition of phosphates, potash, or other suitable chemicals, and then dried to form a powder. The question of cost is important, and if the use of yeast reduces the cost of treatment it will be an important factor in the solution of the problem. It must also be borne in mind that the conversion of sewage sludge into a manure on the lines described is a real solution in the sense that the sludge is "got rid of" completely, and in a satisfactory manner from the sanitary point of view.

The Training of Highway Engineers.

In a short leading article, the *Automotor Journal* supports the proposal of Mr. H. Percy Boulnois that Chairs of Highway Engineering should be established for the purpose of training our future road engineers. Our contemporary considers that the present surveyors "are mostly doing their best with the knowledge and materials at their disposal," but expresses the opinion that "there is an enormous amount of waste going on simply because our road engineers have not received a proper training, and are bound by the traditional methods which were in vogue in the time of our grandfathers, when roads did not matter much to anyone." The use of the expression "the presence which comes of proper scientific training" in connection with a consideration of "future needs" will suggest to our readers that a high average in the matter of qualification is, in this connection, not so important as is the establishment of such an organisation of highway engineers as that which, in its main outlines, we have ourselves recommended. With or without a definite official organisation of a highway department, it ought to be possible that in case of need any stretch of road presenting difficult problems should come under the notice, successively, of persons corresponding to the executive, superintending, and chief engineer of an organised department of roads. Should this idea prove acceptable to those who may be considered responsible in the matter, it may be necessary to consider whether the training would not be more effective if the persons trained were divided into different ranks depending partly upon the length of time which their pecuniary resources would allow them to give to a college course, and partly upon their fitness to take up positions in the higher or lower ranks, which would be largely a matter dependent upon the level reached in the general education of each individual. If one kind of training would be suitable for all engaged in the reconstruction and maintenance of roads they could conveniently be trained at the different universities, each of which would turn out a relatively small number every year; if, however, the policy indicated above be accepted, it would obviously be more convenient to train the men at one or, at the most, three centres, in order that the instruction afforded might be given to classes containing each a reasonably large number of students.

It may also be pointed out that whereas it would be practically convenient for men at present engaged in highway work to attend short courses in special subjects at such a training college, it would not be so convenient to give instruction of this character to relatively senior men at an ordinary university. A training college such as we have in mind would stand to highway engineering in much the same relation as the colleges at Cirencester and Aspatria stand in relation to scientific and practical farming. In a number of countries men practically engaged in highway work are sometimes given opportunities of attending special courses in subjects relating to their profession, and it would seem to be sound policy to give, at any rate for the next five or six years, the fullest possible opportunities of this character to our own highway surveyors, as well as to assistants and those pupils and students who are just finishing courses of training which are in some respects unsatisfactory. One of the advantages of the policy which we have outlined would be the opportunity which would be afforded of developing a fully equipped training college from a nucleus which might consist of a very modest building and a staff, including two professors, one with special experience of highway engineer-

ing in the British Isles, and another with knowledge of Colonial or Indian conditions. The disappearance of Cooper's Hill College has left a gap which is by no means adequately filled by the present system of recruiting assistant engineers for India; and the great developments which are taking place or are about to take place in Canada and South Africa point to the probability that numbers of young highway engineers, properly trained in scientific and practical work and in surveying, will be wanted in those countries. It seems desirable, therefore, that a beginning should at once be made, in a suitable situation, with the idea of providing full courses in highway engineering suitable for the training of engineers for all parts of the Empire, and commanding, as a result of the relatively large number of students who would be attracted to it, a really adequate equipment and the services of a highly qualified technical and scientific staff.

County Councils and Rural Housing.

The activity which is now being displayed in many quarters in discussing the problem of rural housing and in making suggestions for the amelioration of the present admittedly deplorable state of affairs is a most excellent symptom, and we observe with pleasure that the latest proposals emanate from no less an authority than the County Councils' Association. In the current number of the official gazette of this body there appears a memorandum on "County Councils and Housing," which is of the greatest importance; and it is interesting to observe, in view of the opinion which has been expressed on more than one occasion that county councils have not hitherto done as much as they might in regard to housing matters, that the memorandum states that it cannot be denied that many county councils are not so ready as they might be to exercise their non-obligatory powers. Further, were the county councils, without exception, to act upon the principle that, so far as the law and other circumstances allowed them, they would see that the conditions of the population inhabiting the area over which they had control were as good as they should be, there is no doubt that a very vast benefit would accrue to the community as a whole. The policy advocated by the memorandum is based upon the conduct of a thorough independent investigation by the county medical officer of the housing conditions throughout each county. Having obtained reliable information in regard to the existing state of affairs in this way, it is next suggested that each county council should take action for the remedy of insanitary conditions, firstly, by bringing pressure to bear on the district councils, by making complaints to the Local Government Board, or otherwise, and secondly, if that fails, by undertaking the duty themselves. It is further proposed that similar action should be taken with regard to the provision of new houses for the working classes, both generally and for special classes of persons, such as small holders.

It appears that a survey for the purpose of obtaining complete and accurate information in regard to existing conditions is the proper point at which to begin any reform on broad lines. It has recently been indicated by the Chancellor of the Exchequer that an investigation of this kind may at some future time be undertaken on behalf of the Government with a view to the erection of a large number of cottages by the central authority; but it would appear to be very undesirable that county councils should abstain from taking any action which may do immediate good on the ground that other proposals are in the air. The memorandum, in conclusion, points

out that the policy outlined must involve some burden on the rates. It must be observed, however, that some of the work which is optional to county councils is obligatory on district councils, and that therefore, whichever authority undertakes it, the cost will fall on the ratepayers; further that the cost is likely to be less, rather than more, and that the burden will also be more widely spread if the work is done on the larger scale by the authority for the larger area. As regards expenditure which is not within this category, it is fully recognised on all sides that the housing conditions of the working classes are a crying evil, and that private enterprise cannot cope with it. It is, therefore, a matter which must be dealt with by means of public money, and it is a matter of such pre-eminently local concern that it should not be left completely in the hands of the central authority. If this is admitted, it necessarily follows that the whole cost cannot be expected to be paid out of the National Exchequer, but that some of it, at any rate, must be met out of the rates. There are few, if any, subjects upon which the contributions of the ratepayers are at present expended which are so likely to promote the health and prosperity of the community as a policy which will sweep out of existence the insanitary dwellings in towns and villages, improve those which are capable of improvement, and supply wherever needed a sufficiency of healthy cottages at a reasonable rent.

Law of Dilapidations.

The admirable paper on the "Law of Dilapidations" read by Mr. Graham Mould at last Monday's meeting of the Surveyors' Institution should certainly be perused by all surveyors who are concerned with the letting or management of private property, while as a brief summary of an important subject of examination study it should also be much appreciated by students. The subject, too, is not so far removed from the sphere of public health administration as might at first sight appear, for the implied obligation of a landlord in regard to the repair of premises demised by him is almost entirely the result of housing legislation. The rule of the common law that a landlord is under no implied obligation as to the condition of the premises (with the exception of furnished houses) which he lets, however ruinous or dilapidated such premises may be, still holds good, but this immunity of the landlord from liability has been considerably whittled away by the Legislature in recent years. The first step in this process was the passing of sec. 75 of the Housing of the Working Classes Act, 1890, which provided that where any house or part of a house is let for habitation at a rental not exceeding that specified there shall be an implied condition that the house is at the commencement of the holding in all respects reasonably fit for human habitation. Next came sec. 12 of the Housing of the Working Classes Act, 1903, which rendered nugatory any attempt to "contract out" of the provisions of sec. 75. Finally, by secs. 14 and 15 of the Housing, Town Planning, &c., Act, 1909, the rents specified in sec. 75 were considerably raised, and an implied undertaking was added that the landlord shall *during the holding keep* the premises reasonably fit for human habitation. The last-named provisions, however, are not applicable when the letting is for a period of not less than three years upon the terms that the premises are put by the lessee into a condition reasonably fit for occupation, and the lease is not determinable by either party before the expiration of that term.

Mr. Graham Mould, in discussing these provisions, expresses the opinion that "apparently there is nothing to prevent the landlord contract-

ing out of the Act of 1909, although he cannot contract out of the Act of 1890." While we are not prepared to disagree with this proposition—the space at our disposal would be insufficient to set forth the necessary arguments—we venture with respect to suggest that the statement should, at all events, not be put any higher than is implied by Mr. Graham Mould's "apparently." The point is one of difficulty, in regard to which much may be said on either side. It may here be pointed out that a landlord who commits a breach of this statutory undertaking is liable only to his tenant, and not to a stranger or even a member of the tenant's family in respect thereof. We have only discussed here that part of Mr. Graham Mould's paper which is most likely to interest our readers. The contribution further dealt exhaustively and ably with the respective obligations of landlord and tenant both in the absence and presence of an express contract to repair.

* * *

Housing in 1913.

The reports which have been published from time to time by the Local Government Board since the coming into operation of the Housing, Town Planning, &c., Act, 1909, show that the passing of that Act has produced considerable activity on the part of local authorities in regard to those matters with which that statute deals. The latest of these reports, issued last week, shows that this activity was considerably increased during 1913. In the first place, the powers conferred by sec. 15 of the Act, which relates to giving notice to landlords to make houses fit for habitation, have been utilised very extensively, and there has been a substantial increase in the number of local authorities who have exercised these powers. The total number of notices served during the year was 43,781, and they were issued at the instance of 865 authorities. In regard to the provision of new houses, too, the amount of sanctioned loans continues to increase at a larger rate. The loans sanctioned or under consideration at the end of 1913 exceeded £1,750,000, and the schemes provide for the erection of 7,700 new houses by local authorities. It is especially satisfactory to observe in this connection that improvement has been particularly noticeable in the case of rural districts. As regards town planning, it is stated that the regulations governing the procedure in regard to town planning schemes have now been in force some three and a-half years, and that, in view of the experience gained and representations made in favour of certain amendments, the board contemplate a revision of the regulations at an early date.

Road Models in the United States.

We are indebted to the courtesy of the officers of the United States Office of Public Roads for the opportunity of placing before our readers, in the present issue, some very good illustrations of different types of road crust taken from models which are used in the educative work of that office. The illustrations showing Roman and French road crusts give a much better idea of the actual method of construction than can be gained by a study of the sections only of such roads, and we have selected several other plates which convey useful information as regards bituminous and brick-paved roads, or serve to assist an engineer in explaining to his assistants and foremen how such work should be carried out. Our frank criticisms of certain passages in the text of the catalogue are by no means intended to apply solely to American practice, but form a part of our own propaganda of certain advanced ideas in matters of highway engineering.

Road Models in the United States.

[Notes and extracts from the descriptive catalogue of road models of the United States Office of Public Roads]

"The Office of Public Roads of the United States Department of Agriculture made an exhibit of road models for the first time at the Alaska-Yukon-Pacific Exposition. The aim was to put on view such striking examples in miniature of model roads that visitors would not only appreciate the beneficent effects of improved highways, but would, at the same time, be able to understand the methods of their construction."

The exhibit has since been displayed at a number of exhibitions, and the models have been shown on "road trains" at important places on several of the principal railways.

The models illustrate standard types of road construction, and represent the modern ideas of highway

FIG. 1.—MODEL SHOWING THE APPIAN WAY (300 B.C.).

engineers. All of them are built on the scale of 1 in. to the foot, or one-twelfth of the full size. With the exception of the brick model, they represent roads with a hardened surface 16 ft. wide, and with earth shoulders on each side about 6 ft. wide. Owing to climatic conditions and the varying character of local materials, modifications in construction will be found necessary, and if application for expert advice concerning any special road problem is made, the Office of Public Roads is prepared to furnish it free of charge.

"The descriptions of the models are so arranged in this bulletin as to present the historic development of road building. The Roman road is described first, and then descriptions are given successively of the French roads, after the ideas of the Romans and of Trésaguet, the roads of MacAdam and Telford, and finally the various types of modern construction. Among the latter are models showing brick, concrete, asphalt block, macadam, sand-clay, gravel and earth roads. There are other models showing the process of maintenance, resurfacing, and bituminous macadam construction by the mixing, penetration and prepared-filler methods."

SOME OF THE ILLUSTRATIONS.

The following passages from the text of the catalogue relate to the illustrations selected for reproduction, to which consecutive numerals are here assigned.

"Fig. 1 shows a model of the Appian Way. This is the highest developed type of road constructed by the Romans.

"Section A shows the *contignatum pavementum*, composed of lime and sand, straw, rushes or reeds, and sometimes laid on sills or boards.

"Section B shows the *statumen*, or foundation, composed of two courses of flat stones laid dry or in lime mortar. The depth of this course was from 16 in. to 18 in.

"Section C shows the *rudus*, or rubble, composed of broken stone mixed with lime in the proportion of 1 part of lime to 3 parts of stone. Sometimes the material was taken from old buildings. This course was laid from 6 in. to 9 in. deep.

"Section D represents the *nucleus*, composed of coarse gravel and lime used hot, or bricks, potsherds

or broken tile mixed with lime and covered with a thin layer of lime mortar.

"Section E shows the *summa crusta* or *pavimentum*, consisting of polygonal block-joined with the greatest nicety. This course was about 6 in. deep, and about 16 ft. wide.

"Section F indicates the kerbs, which were 2 ft. wide and 18 in. high, with upping blocks as shown in the illustration. These blocks served as seats for travellers and as mounting blocks for riders.

"Section G shows a side road, the surface of which was composed of gravel flushed with mortar. The width was from 6 ft. to 8 ft.

"Fig. 2 illustrates the type of road constructed in France previous to 1775. This type was modelled on the Roman system.

"Section A shows the earth foundation, which was flat.

"Section B represents the stone foundation. This course was composed of flat stones laid by hand in two or more layers. The total width of this foundation was 18 ft., and the depth was from 9 in. to 10 in.

"Section C shows the layer of small stones, which were broken in place with hand hammers.

"Section D shows the finished surface. This course was composed of stones broken by hand into sizes smaller than the underlying material. It was left to be consolidated by traffic. The total thickness of the road in the centre was from 18 in. to 20 in., and at the sides from 12 in. to 14 in."

TRÉSAGUET METHOD.

"Fig. 3 illustrates the type of road constructed in France by Trésaguet from 1775 to 1830. After this period the MacAdam method was used almost exclusively.

"Section A shows the earth foundation parallel to the finished surface.

"Section B represents the stone foundation, which was composed of flat stones laid on edge, lengthwise across the road, and beaten to an even surface. The depth of this foundation was about 5 in.

"Section C shows the small stones laid and beaten by hand hammers. The finished layer was composed

FIG. 2.—MODEL SHOWING A FRENCH ROAD BUILT BEFORE 1775 (ROMAN METHOD).

of broken stones about the size of walnuts, and was spread with a shovel.

"Section D represents the finished road as consolidated by travel. The crown was made 6 in., the width 18 ft., and the total thickness about 10 in.

"Section E shows the kerbs, which were composed of rough, flat stones, set on edge. The upper edge was made flush with the surface."

PENETRATION METHOD.

"Fig. 4 illustrates the construction of a bituminous macadam road built according to the penetration method.

"Section A represents the prepared subgrade 16 ft. wide, with the crown $\frac{1}{2}$ in. to the foot; section B, the first course of No. 1 stone, 4 in. compacted after

rolling; section C, the second course of No. 2 stone, 2 in. compacted after rolling; section D, the application of bitumen at the rate of about 1½ gallons to the square yard; section E, the application of stone chips, after being rolled; section F, a bitumen paint coat applied at the rate of about ½ gallon per square yard; and section G shows the completed surface, with clean stone chips lightly rolled, and the crown of the finished road, representing an average fall of about ¼ in. to the foot.

"The construction of this road, through the application of the No. 1 and No. 2 courses, is the same as

FIG. 3.—MODEL SHOWING A FRENCH ROAD OF TRÉSAGUET, BETWEEN 1775 AND 1830.

an ordinary macadam road. It varies from the method of construction of a macadam road in that hot tar or asphalt is flushed into the No. 2 course before the screenings are applied.

"After the application of hot tar or asphalt a light coat of clean stone chips is spread and rolled lightly into the surface."

MIXING METHOD.

"Fig. 5 illustrates the construction of a tar, oil, or asphalt macadam road, built according to the plan ordinarily referred to as the 'mixing method.'

FIG. 4.—MODEL OF A BITUMINOUS MACADAM ROAD—PENETRATION METHOD.

"Section A illustrates the prepared subgrade 16 ft. wide, with the crown ¼ in. to the foot; section B, the first course of No. 1 stone compacted to a depth of about 4 in.; section C, the second course of bitumen-covered stone spread to a depth of about 2 in. when compacted; section D, the application of a layer, about ¼ in. thick, of bitumen-covered sand or stone chips, which, after being rolled firmly into the surface voids, should add nothing to the thickness of the road; and section E shows the completed surface and the clean chips or sand lightly

rolled, leaving the road with a sloping crown of about ¼ in. to the foot. The course of bitumen-covered stone is prepared by applying sufficient hot bitumen to cover a graded mineral aggregate when mixed. This graded aggregate is composed of No. 2 stone and stone ranging in size from ¾ in. to dust in proportions of 960 lb. to 350 lb.

"Before applying the bitumen-covered sand this course must be thoroughly rolled, and the sand then applied in such quantities that it will fill the surface voids and bring the surface to a smooth and even condition. The final coat of stone dust is applied merely for the purpose of taking up any excess of bitumen and of giving the road a pleasing appearance."

PREPARED-FILLER METHOD.

"Fig. 6 shows the construction of a bituminous macadam road built according to the prepared-filler method.

"Section A represents the prepared subgrade, which has a crown of ¼ in. to the foot and is well rolled.

"Section B shows the first course of No. 1 broken stone. The stone varies in size from 1½ in. to 3 in., and is placed to a depth of about 5½ in. loose, or 4 in. rolled.

"Section C represents the second layer of broken stone. The size of the stone in this layer varies from

FIG. 5.—MODEL OF A BITUMINOUS MACADAM ROAD—MIXING METHOD.

¾ in. to 1½ in. The stone is spread to a depth of about 3 in. loose, or 2½ in. rolled.

"Section D illustrates the application of the bituminous prepared filler, spread to a depth of about 1½ in. The filler is made up as follows: Stone chips, from ½ in. to ¾ in., sand, and from 7 to 12 per cent bitumen, each heated separately and mixed. The mixture is applied hot.

"Section E represents the mixing of the prepared filler with the No. 2 stone by means of harrowing. The harrowing is continued until the No. 2 stone appears in the surface, after which the filler is thoroughly rolled with a steam roller.

"Section F represents the second layer of filler, which is spread to a depth of about ½ in. and thoroughly rolled.

"Section G shows the application of a light covering of screenings to take up the surplus bitumen, after which a thorough rolling completes the road."

BRICK ROADS.

"Fig. 7 illustrates the construction of a brick road where frost conditions are encountered, and differs from the other models in that the surface width is 14 ft., including the kerb. The crown of the completed roadway is ¼ in. to the foot.

"Section A illustrates the prepared subgrade for the foundation course; section B, the concrete kerbing placed along the edges of the road; section C, a stone foundation 6 in. deep; section D, a concrete foundation 6 in. deep, which is often used in place of the stone foundation; section E, the sand cushion, 2 in. deep, placed on top of the foundation previously described; section F, the surface before grouting; section G, the expansion joints, and section H illustrates

the grouted brick surface ready for travel. In addition, a properly constructed mixing box is shown, illustrating the manner in which the grouting is prepared."

SOME OTHER POINTS AND COMMENTS.

The text of the catalogue is not confined to descriptions of the models, but includes passages descriptive of the methods employed, and separate consideration is given to the subject of "foundations or subgrades-

FIG. 6.—MODEL OF A BITUMINOUS MACADAM ROAD—PREPARED-FILLER METHOD.

and shoulders." The terms "foundation" and "sub-grade" seem to be used synonymously, and the opportunity may be taken to recommend THE SURVEYOR'S distinction between the road-bed and the foundation proper, or foundation course. A hard road-bed may be used, of course, as the only foundation for a single crust, and the terms "road-bed," "foundation," "foundation course," and "bottoming" or "bottoming course," have each a proper place in road terminology.

One of the chief weaknesses of American road construction is displayed in the statement that "the

FIG. 7. MODEL OF A BRICK ROAD.

shoulders are usually finished with a sharper crown than is given the hardened surface." The models, it may be suggested, are lacking in adequate presentment of that important detail the junction of the edge of the main or wheelway crust with the shoulders or subsidiary crusts, and it would, perhaps, be supposed, from the illustrations of them at any rate, that the carriage-way crust has a vertical edge against plain earth, the latter being then sloped somewhat sharply to the ditch. The English nearly level turf border,

with grips for surface drainage, gives much better support.

Various methods of road drainage are briefly described, and it is pointed out that the V stone drain foundation "is cheaper than the Telford method, and in a section of country where rock abounds in ledges, it is also cheaper than the side drain construction." It might, however, have been pointed out that the V drain is, in many cases, much less efficient than Telford drainage, and tends to render the road crust wavy.

A passage relating to sand-clay roads, which suggests the experience of some of our overseas dominions, may be quoted in full as a good summary of main points:

"The mileage of roads in the United States is so vast, and the traffic on many of the country roads is so light that it is out of the question to improve more than a small percentage of these roads with a hard surface. This does not mean, however, that all other roads must be neglected. They should be improved just as far as their importance and the traffic will warrant. The common clay roads may be vastly improved by a little judicious grading and systematic maintenance. In many cases, especially in the vast regions of the South, most of the common roads may be improved, for all practical purposes, merely by the addition of sand or clay, as the case may require, and incorporating this with the surface soil of the road. Thousands of miles of sand-clay roads have already been built in the Southern States at an average cost of about \$750 per mile. These roads are almost without exception answering the purposes as well as a far more expensive form of construction would do."

As regards earth roads, it is pointed out that "such roads should be worked when they are damp and soft. The material can then be handled more economically, and the resulting road surface will be more satisfactory. After earth roads have once settled down in the spring or summer, they should not be disturbed. If work is then attempted the material will be brought upon the roads in clods, which make only a rough surface when dry and an excess of mud when wet."

This reflects the conditions of a climate with strongly marked and regular seasons, and would not apply to climates such as those of the British Isles.

Epsom Opposes New Road.—At a meeting of the Epsom Urban District Council last week it was decided to oppose the proposal to construct a new road, which would run through a portion of the Common Fields, recently given by Lord Rosebery to Epsom as a public place of resort, as the road would cut up the ground, interfere with the intention of the donor, and nullify the expenditure being incurred on the property by the council.

The Belfast Park Scheme.—At a special meeting of the joint Law and Tramways and Electricity Committee of the Belfast Corporation recently, a letter was read from the Local Government Board stating that on legal grounds they could not give their sanction to an application to a loan of £15,000 for the completion of the Bellevue Gardens as public recreation grounds in connection with the tramway department. The Board of Trade previously sent a similar reply to a like request made by the corporation. On Wednesday the corporation decided to promote a Bill in Parliament giving them power to spend the necessary sum.

Metropolitan Water Board.—At last Friday's meeting of the Metropolitan Water Board the General Purposes Committee—authorised by the board to select six architects to prepare competitive plans for the new central offices, and to appoint a professional assessor to advise on conditions of competition and on the design submitted—brought forward the following names: Mr. Burnett Brown, Mr. Edwin Cooper, Mr. H. O. Ellis, Mr. E. T. Hall, Mr. D. T. Hare and Messrs. Warwick & Hall. The committee stated that they had invited the president of the Royal Institute of British Architects to nominate an assessor. The report was adopted.—The tender of Messrs. R. McAlpine & Sons, at £37,404, was accepted for the construction of a tunnel under the Thames between Twickenham and Richmond. The various tenders received provided for construction in either one or two shafts, and both with and without compressed air, and that of Messrs. McAlpine was the lowest of those for work in a single shaft, using compressed air.

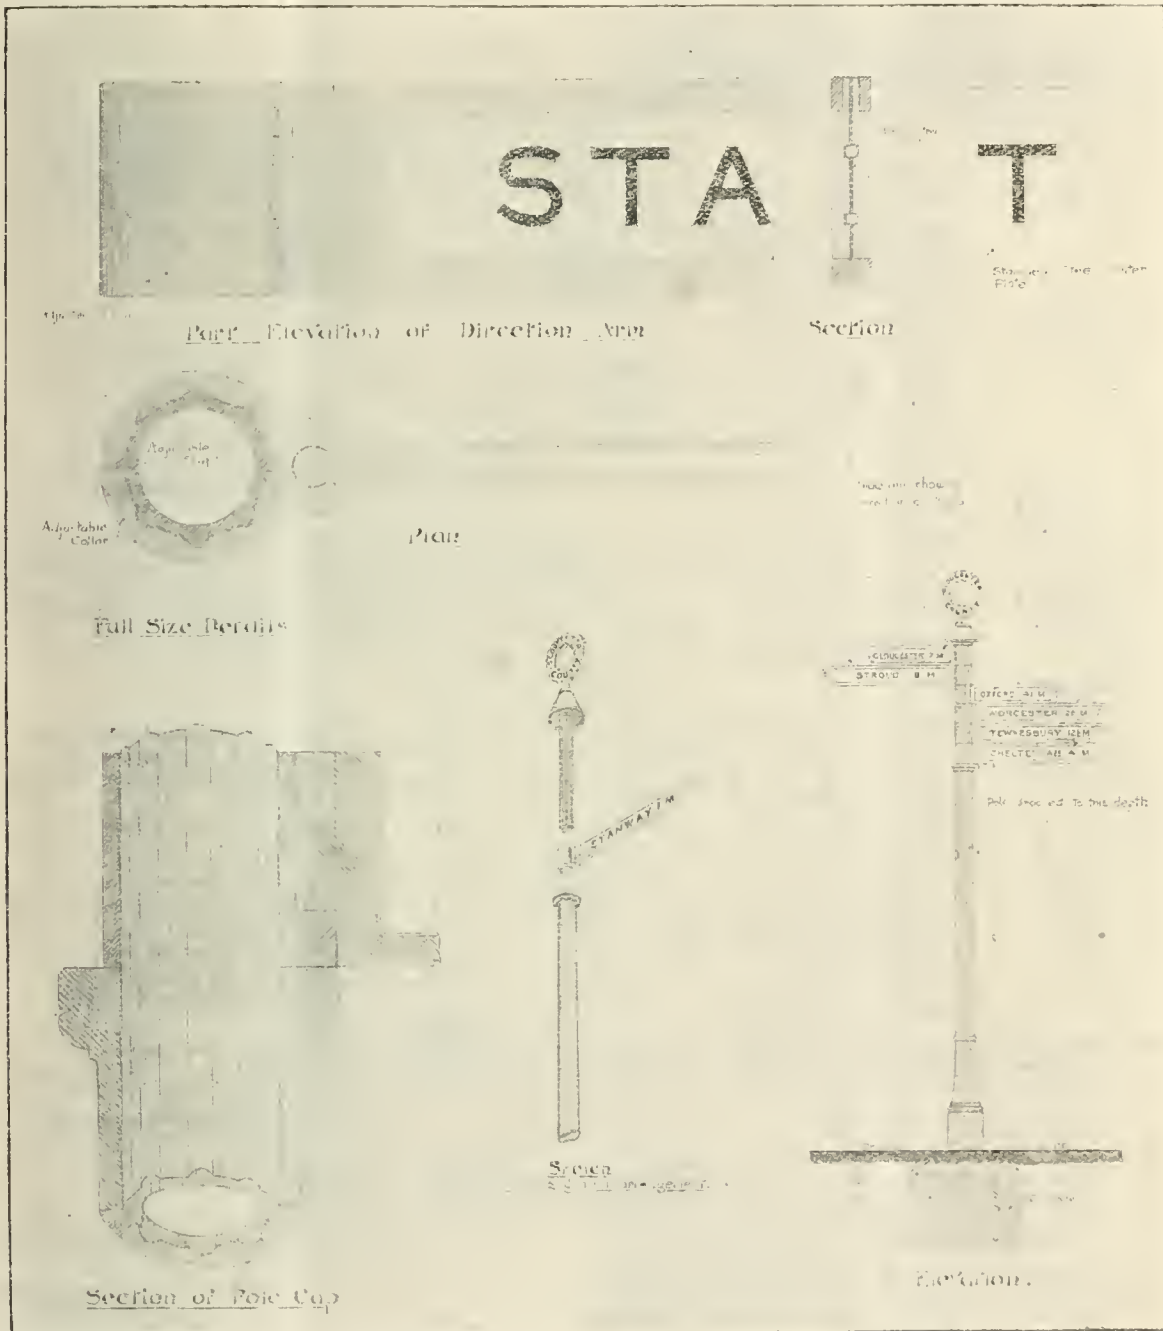

Direction Posts Competition.

GENERAL DESCRIPTIONS OF WINNING DESIGNS.

As we announced last week, Messrs. E. S. Sinnott, M.INST.C.E., county surveyor of Gloucester, W. & F. Wills, Limited, Perseverance Works, Bridgwater, and W. Weeks & Son, Limited, Perseverance Works, Maidstone, have been awarded the first, second and third prizes respectively in the competition for designs for direction posts and plates instituted in connection with the International Road Congress held in London in June last. The object of the competition was to secure a standard type of post suitable for general

sliding shaft, which can be moved vertically. This sliding shaft is shaped to correspond with the octagonal form in the post above referred to.

Adjustable collars are provided which can be placed in any one of the eight positions on the shaft at which it is desired to indicate direction. To these collars cast-iron direction arms are attachable after the collars have been fixed in position. The sliding shaft remains in position by its own weight, and the cap at the top forms a protection over the topmost collar.

GENERAL DESIGN FOR DIRECTION POSTS BY MR. E. S. SINNOTT, M.INST.C.E. (FIRST PRIZE).

adoption by highway authorities. Fifty-nine entries were received.

GLoucester COUNTY SURVEYOR'S DESIGN.

Accompanying the general description of the design submitted by Mr. E. S. Sinnott, county surveyor of Gloucester, are five illustrations. The drawing reproduced herewith gives particulars of the post, arm, letters, and so forth, and the others particulars for the four schemes set forth in the rules governing the competition.

The post is of cast iron, having on the inside, at the upper end, a special octagonal form to receive a

The top of the vertical shaft is in circular form, and bears the name of the county in which it is erected.

The lettering on the direction arms consists of steel stamped raised letters inserted in the arms, as shown upon the drawing, and appears on both sides. In the case of words which recur many times—such as Gloucester, Cheltenham, Tewkesbury, &c.—steel plates containing the whole word can be stamped complete. In the case of villages which occur but seldom—such as Stanway, the word can be made up by placing a series of independent letters in the necessary order. The same remark applies to the mileage, which is left blank for the insertion of the actual figures for each

particular arm. The letter M, indicating miles, is cast on both sides of the arm.

The design has the following objects:—

(a) To provide a post and arm that can be used in every possible situation.

(b) To avoid the use of all screwed attachments.

(c) To admit of all breakages being readily replaced, and to avoid the necessity for new castings, which is the drawback to the ordinary cast-iron arm.

(d) Adjustability of the direction arm upon the ground after the post is in position.

By the method set forth in the above description no expense in the way of special patterns for direction arms is needed. Any arm can be prepared in a few minutes by placing the necessary lettering and figures into the slot of the arm, as shown upon the drawing. Where it is necessary to place two or more arms pointing in the same direction—such as Cheltenham, Tewkesbury and Worcester (see drawing)—the lowest arm indicates the nearest town. As will be observed, no two arms are in the same horizontal plane, with the advantage that they are not obscured by the motorist when approaching from any direction.

The details required by clause 2 of the rules governing the competition are as follows:—

- | | |
|--|--|
| (i) POST. | Cast iron. |
| Shape. | Circular. |
| Size. | Diameter at ground line—9½ in.
Diameter at arm line—4½ in.
Height above ground for lowest arm—10 ft. |
| Colouring. | White, with black letters. |
| (ii) ARM. | Cast iron. |
| Shape. | As shown on drawing with slot from the top to admit of steel stamped letters and figures being inserted (see general description above). |
| Size. | Three feet long by 4½ in. deep. |
| Colouring. | White. |
| Attachment. | The arms are let into the adjustable collars as shown on Drawing A (see general description). |
| (iii) LETTERING. | Two inches in depth. |
| Shape. | Rectangular and raised one-eighth of an inch from surface of plate. |
| Colour. | Black. |
| Description. | To consist of stamped steel plates having single raised words such as Gloucester, Cheltenham, Tewkesbury, &c., or made up to form words from individual letters. The mileage also shown to same size, made up from individual figures to suit each particular case. The plate, or rather, series of plates, would give all the necessary direction, as shown in the typical instance taken (see drawing), which is on the top of Crickley Hill, on the road from Gloucester to Oxford. |
| (iv) COST.—Posts, with concrete foundation, including four arms with letters fixed and painted complete in quantities of 1,000, £4 10s. each. In quantities of 100, £4 18s. each (the cost of post with four arms is given as a fair average). | |
| (v) METHOD OF ERECTION | consists in the necessary excavation and concrete for foundation (see drawing). The subsequent fixing of the adjustable collars upon the sliding shaft can be arranged with ease by an unskilled man upon the ground. |
| (vi) ESTIMATED COST OF MAINTENANCE.—9d. each per annum. Owing to the lettering or the steel plates being raised, skilled workmanship is not required in repainting the lettering. | |

DESIGN OF MESSRS. W. & F. WILLS, LIMITED.

The post is of east iron in two castings, the lower part forming a socket for the upper part. The lower part has also a flanged base provided to make a satisfactory fixing in the ground, and it carries the name of the county in a vertical position, as shown on the model. The upper part is of circular section, and of the length required for the particular number of plates for any position.

A sufficient length of this part projects downwards beyond the plates into the lower part of the post which it fits. It is securely fastened therein by set screws, screwed against it through the lower part. The set screws are undercut at the correct length, so that after

screwing in tightly the heads may be twisted off flush with the post, and are thus proof against tampering. The upper part of the post is capped by a cast-iron finial cast solid with it, bearing the initial letters of the county or other authority. The plates are lettered on both sides. They are fixed by means of an undercut set screw in the back of each plate, which screws against the upper part of the post, and so holds the

GENERAL DESIGN FOR DIRECTION POSTS BY MESSRS. W. & F. WILLS, LIMITED (SECOND PRIZE).

plate in position. The head of the screw is twisted off so that the plate cannot be tampered with or altered in direction in any way.

The details required by clause 2 of the rules governing the competition are as follows:—

- | | |
|---|--|
| (i) POST. | Cast iron. |
| Shape. | Circular. |
| Size. | Diameter at ground line—9 in.
Diameter at arm line—4½ in.
Height above ground for lowest arm—9 ft. |
| Colouring. | White with black letters. |
| (ii) ARM. | Cast iron. |
| Shape. | As shown by model. |
| Size. | Length varying—not less than 2 ft. 6 in. from boss.
Depth for one name, 7 in.
Depth for two names, 8½ in.
Depth for three names, 12½ in. |
| Colouring. | White. |
| Attachment. | See general description. |
| (iii) LETTERING. | 3 in. deep by 2 in. wide by ⅜ in. line thickness.
Fractional figures 1¼ in. deep by 1 in. wide by ⅞ in. line thickness. |
| Shape. | Plain block, raised ⅞ in. |
| Colour. | Black. |
| Information. | Names of places and mileage from post and any other information required.
The number of names on one plate need by no means be confined to three. |
| (iv) COST.—One post (upper and lower parts to take up to four deep plates), 39s. One plain plate for one line, 5s. 6d., two lines, 7s., three lines, 8s. 3d. Letters, 1s. per dozen. These prices refer only to small quantities. | |
| (v) METHOD OF ERECTION.—See general description. The whole of the work can be done on the site with unskilled labour. | |
| (vi) ESTIMATED COST OF MAINTENANCE.—Occasional painting is all that is required. | |

DESIGN OF MESSRS. W. WEEKS & SON, LIMITED.

The post is a hollow cast-iron column in one piece, the upper portion being round and the base octagonal. The length below the ground flange for fixing in the

ground is 2ft. 9in. This part is octagonal, and has four long slots to allow the concrete to fill in and form a solid mass.

Short, single-flanged pieces or sockets are provided for fixing on top of the column for carrying the arms. The inside end of each arm is provided with a short, curved, projecting piece top and bottom, and a groove is formed round in the flange of each socket to take this projecting piece. A separate loose flange is provided also, having a groove round it for taking the other projection of the arm.

The top of the column is cast with tee-slots to take four long bolts, and the method of erecting is to put the four bolts in position, slip the socket over these, and also the top flange, and then screw the nuts on the bolts sufficiently tight to hold the parts together.

base of the finial is hollowed out inside, so that it can be screwed down over the four bolt ends and nuts to hide them from view.

A useful addition might be made to these posts by fixing a N. S. E. W. cross at the top to indicate the points of the compass.

The details required by clause 2 of the rules governing the competition are as follows:—

- | | |
|------------|---|
| (i) Post. | Cast iron. |
| Shape. | Circular. |
| Size. | Diameter at ground line, 6½ in.
Diameter at arm line, 5 in.
Height above ground for lowest arm, 8 ft. 6 in. |
| Colouring. | White. |

GENERAL DESIGN FOR DIRECTION POSTS BY MESSRS. W. WEEKS & SON, LIMITED (THIRD PRIZE).

By just undoing the nuts one side the flange can be raised sufficiently for the arm to be inserted, and its projecting pieces to come in their respective grooves, and they are securely held in position when the nuts are again tightened up. It will be seen that this system of fixing allows the arms to be erected so that they point in any particular direction required without any variation in construction.

At a cross-roads, such as has been selected, for example, it is much better to construct the post so that one pair of arms is above the other, and all four can be plainly seen from any position. To accomplish this an extra socket and flange are provided, and the tie bolts are made longer accordingly. The top flange is drilled and tapped in the centre to receive the stud, which is cast in the finial cap for securing it. The

|------------------|--|
| (ii) ARM. | Cast iron. |
| Shape. | Rectangular, with plain end, rounded off with a small set-off at the corners. Middle portion raised 5 in. to form a panel for location name. |
| Size. | Varying according to information:
A plate 8 in. deep is 3 ft. 1 in. long.
" 11 in. " 3 ft. 3 in. " |
| Colouring. | White. |
| Attachment. | See general description. |
| (iii) LETTERING. | May be 6 in. or 4 in. with 3 in. deep and 2 in. wide as a minimum, except location letters, 1½ in. deep. |
| Shape. | Raised plain block. |
| Colour. | Letters black; figures red. |

- Information. Principal places near at hand in smaller letters.
Main town eventually reached in larger letters.
Location name in 1½ in. letters.
Arrow giving direction.
- (iv) Cost.
- | | |
|--|---------|
| Cast-iron post, complete with final top and bolts... | £ s. d. |
| One socket and flange to take two 11 in. arms ... | 0 4 6 |
| One socket and flange to take two 8 in. arms ... | 0 3 6 |
| Two 11 in. arms ready lettered and painted ... | 1 11 6 |
| Two 8 in. arms ready lettered and painted ... | 1 1 0 |
| Total ... | £5 0 6 |
- In quantities of 6 or more a 5 per cent reduction, and
In quantities of 12 or more a 10 per cent reduction.
- (v) METHOD OF ERECTION.—A hole about 18 in. or 24 in. square and 3 ft. deep is dug and the post put in plumb and fixed in with concrete. The arms are put up and erected after the post is in position.
- (vi) ESTIMATED COST OF MAINTENANCE.—Almost negligible, as, beyond repainting occasionally, with unskilled labour, nothing is required.

REGISTRATION OF ARCHITECTS.

PROPOSED LEGISLATION.

A Bill providing for the registration of architects has been prepared by the Society of Architects for presentation in the forthcoming Session of Parliament. It will provide that all architects in *bona-fide* practice at the passing of the measure shall be permitted to register, and that thereafter registration shall be limited to such as have been properly educated and have proved their qualifications by proper examinations.

The object of the Bill is to enable persons requiring professional aid to distinguish qualified from unqualified architects. It is proposed to establish a Council of Architectural Education and Registration of the United Kingdom. The council is to consist of (1) persons nominated by His Majesty with the advice of his Privy Council; (2) architects chosen by the council of the Royal Institute of British Architects, the council of the Society of Architects, founded 1834, and the council of the Royal Institute of Architects, Ireland; and (3) architects elected as direct representatives by registered practitioners.

Persons qualified to be registered comprise Fellows, Associates, and Licentiate of the Royal Institute of British Architects, members of the Society of Architects, founded 1834, or professional members of twenty-two specified provincial societies, as well as persons actually practising architecture in the United Kingdom, who were practising on January 1, 1914; also apprentices, assistants, or practitioners in architecture of a certain standing. Other applicants for admission after January 1, 1915, must be not less than twenty-one years of age, and must have been educated for architecture and pass an examination authorised by the council.

The Bill provides that after January 1, 1915, no person shall be entitled to take or use the name or title of architect unless he be registered; and any person who, not being registered, takes or uses any such name shall be liable to a fine not exceeding £20, and on repetition of the offence £50. No person shall be entitled, after January 1, 1915, to recover any charge in any Court of Law for any professional services rendered as architect unless he is registered under the Act. The right of members of the Institution of Civil Engineers and other bodies to recover charges "for work of any kind falling within the duties of their calling" is untouched.

Road Rollers in Victoria.—The Country Roads Board, Victoria—of which Mr. W. Calder is the chairman—has recently accepted tenders for road-making plant, including five steam road rollers, four of these being by the well-known English firm, Messrs. Aveling & Porter. Two of these will be 7-8 ton interchangeable rollers and tractors.

HOUSING AND TOWN PLANNING PROGRESS.

LOCAL GOVERNMENT BOARD MEMORANDUM.

The Local Government Board issued last week a memorandum giving particulars of the operation of the Housing and Town Planning Act. It appears from this that the activity of local authorities with regard to various phases of the housing question increased materially during 1913. The board are satisfied that considerable progress has been made in most districts with the work of inspecting dwellings, with the view of ascertaining whether any are in a dangerous or insanitary condition. In many districts where houses and areas regarded as most in need of inspection were dealt with first, some of the worst conditions have been remedied. In a large number of cases in which it does not appear that reasonable progress has been made, the board have impressed upon the local authorities the necessity of increased activity.

During 1912-13 a large number of houses, previously insanitary or in need of repair, were made fit for habitation. Below are set out the main results of the operations of local authorities in this direction, together with the corresponding figures for 1912:—

	1911-12.	1912-13.
Houses reported against	47,429	55,707
Houses made fit for habitation without closing orders	13,417	18,107
Closed or demolished voluntarily	1,935	2,167
Closing orders made	9,761	10,695
Demolished after issue of closing order	1,072	1,550
Demolition orders made	1,423	2,133

In the three years ending on March 31st last no fewer than 129,620 houses were made fit for habitation at the cost of the landlords or owners, and this in addition to the large number dealt with under the Public Health Acts.

During the five years ending on December 31st the board sanctioned to local authorities loans aggregating £1,403,869, on account of schemes providing for the erection of 6,355 houses, and at the date mentioned they had under consideration loans totalling £351,045, proposed to be spent on erecting 1,338 more. In addition, the Public Works Loan Commissioners advanced to societies for the provision of working-class dwellings £657,390 in the three years to March 31, 1913, compared with £660,504 for the previous twenty years.

TOWN PLANNING SCHEMES.

It is stated that the board have communicated with a large number of local authorities from time to time with a view to securing proper attention on their part to their statutory duties in relation to insanitary property, overcrowding, and the provision of further housing accommodation. "Much good has resulted from the board's action in regard to these matters, and the increased activity indicated in this memorandum, though due largely to the willingness and desire of local authorities to effect improvements in regard to housing conditions, may to a material extent be directly traced to the administrative pressure of the board."

With regard to town planning, the following table indicates the general position at December 31st:—

	No. of schemes.	Authorities concerned.	Acres affected.
Schemes finally approved by the board	2	1	3,762
Schemes prepared and submitted for approval	3	3	6,503
Schemes authorised to be prepared or adopted by local authorities	17	37	70,900
Applications for authority to prepare schemes under consideration	14	11	29,761
Totals	66	55	110,926

Many other schemes are under consideration by local authorities. It is added that, in view of the experience gained under the Act, and of representations made to the board in favour of amendment in certain respects, a revision of the regulations governing the procedure in regard to town planning schemes is contemplated at an early date.

"Pudlo."—The engineer to H.M. Board of Public Works in Ireland used "Pudlo" in an underground heating chamber recently constructed at the G.P.O., Dublin, and the result being entirely successful, he has now specified it for a large job at the Botanic Gardens, Dublin.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, II, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words, as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

PETROLEUM AND PETROL LICENCES.—"Ynys" writes: My council having decided to exercise their powers under the Petroleum Act, 1871, and that licences under sec. 7 of the said Act be granted for a period of twelve months, a fee being charged in respect of each licence, I have had placards posted up in the district giving notice to vendors and dealers of petroleum and petrol of the necessity of applying for licences, and I have also delivered copies thereof personally to such dealers and vendors. As a result I have received twenty-one applications from shopkeepers and others for licences for storing petroleum in quantities varying from 10 to 400 gallons, many storing the petroleum (paraffin oil) on the premises in iron tanks. The dealers referred to purchase their supply from a company who have a store in this town, and carry the oil to their customers in a large tank on wheels drawn by two horses. This company was also supplied with a copy of the placards referred to, and in reply they wrote "that none of the petroleum burning oil they sell gives off an inflammable vapour at a temperature of less than 73 deg. Fahr., and that therefore it does not come within the meaning of the Petroleum Acts, and no licence is necessary for its storage." Moreover, four of the dealers in petrol wrote that, as they do not store petroleum spirit in quantities exceeding 60 gallons, they are exempt under rule 5, and invite me to inspect their stores under rule 7. These dealers also obtain their supply of petrol from the company already referred to. I forward copy of placards and form of application, and shall be glad if you will kindly inform me: (a) Whether paraffin, benzoline and naphtha come within the meaning of petroleum? (b) Whether the council is justified in giving licences for storing petroleum on the premises providing it is not stored near an open fire, forge or other sources of danger, including explosive goods, and that all necessary precautions are taken for the prevention of accidents from fire? (c) Whether sec. 7 of the Act of 1871 applies, in the cases referred to in the query, for licences for petroleum providing that the oil does not give off an inflammable vapour at a temperature of less than 73 deg. Fahr.? (d) Whether a licence is required for petroleum spirit if the quantity is below 60 gallons, providing rule 7, as to storage, is observed (*vide* regulations enclosed)? (e) In order to prove whether the oil referred to is petroleum to which the Act refers, it will be necessary, of course, to get it tested; will you kindly supply me with names of makers of such apparatus, and of firms who would undertake the testing?

(a) By the Petroleum Act, 1871, sec. 3, as amended by the Petroleum Act, 1879, sec. 2, "petroleum" includes any rock oil, Rangoon oil, Burmah oil, oil made from petroleum, coal, schist, shale, peat, or other bituminous substances, and any products of petroleum, or any of the above-mentioned oils, which, when tested in manner set forth in the first schedule to the Act of 1879, gives off an inflammable vapour at less than 73 deg. Fahr. If paraffin, benzoline, and naphtha contain, or are the products of, any of the above oils or substances, and do not stand the above test, they are within this Act. (b) The Act of 1871 does not prescribe the conditions on which licences are to be granted, but leaves it to the discretion of the local authority to prescribe such conditions as they think fit (sec. 9), subject to an appeal to the Secretary of State (sec. 10). (c) No. See sec. 2 of the Act of 1879 (above referred to). The test must be made according to the Act. (d) By sec. 5 of the Locomotives on Highways Act, 1896, the keeping of petroleum for the purpose of light locomotives is to be subject to regulations made by a Secretary of State, which are to have effect notwithstanding anything in the Petroleum Acts. Petroleum spirit may therefore be kept for the purpose of light locomotives, in accordance with these regulations, without a licence. (e) I regret that this question is quite outside the scope of these notes, and I am unable to answer it. Perhaps some reader will kindly furnish names.

COMMON LODGING-HOUSE: REGISTRATION.—"Ynys" writes: A dwelling-house in this urban district is being used as a common lodging-house in contravention of sec. 86 of the Public Health Act, 1875. Secs. 76

to 89 of this Act are also embodied in the council's by-laws (Model series). The tenant has been notified of the provisions of secs. 77 and 86 of the Act of 1875, and the penalty she incurs by using an unregistered common lodging-house, and at the same time requested to apply to the council for registration. A reply has been received intimating that she is prepared to register the house, and I understand that a lady householder has been approached for a certificate of character, but the latter was informed by our clerk that as she is not a householder the certificate would not be in order; besides, sec. 76 of the Act provides that the certificate must be signed by three inhabitant householders. I have examined the house in accordance with the provisions of sec. 78 of the Act, and the sanitary defects then existing have all been made good by the owner excepting the provision of a supply of water to the water-closet and for domestic purposes. The water supply has been cut off by the waterworks company owing to non-payment of water-rate by the tenant; but I understand that arrangements are being made by the owner with the water company, and I learn that the water supply will be turned on as soon as the former signs the necessary arrangement in connection therewith. I may add that my council is not unanimous on the registry of the house, owing to its being situated only a short distance from the centre of the town, and many complaints have been made as to overcrowding, rowdyism, &c., while being used as a boarding-house by seafaring men and others, and it has since been used as a common lodging-house (unregistered). Will you kindly advise as follows: (a) whether the council is obliged to register a house as a common lodging-house if the applicant complies with the requirements of the by-laws, and produces a certificate of character signed by three inhabitant householders, or, (b) in the event of the council taking proceedings for using the house as a common lodging-house without being registered, what other steps should the inspector take in the matter before instituting proceedings as aforesaid?

(1) Yes, unless sec. 69 of the Public Health Acts Amendment Act, 1907, is in force in the district, in which case the council may refuse to register unless they are satisfied of the character of the applicant and of her fitness for the position. Where this section is in force the latter part of sec. 78 (from the words "and the local authority may") and sec. 88 of the Act of 1875 are repealed. (2) The reception of lodgers in a common lodging-house without its being registered entails the penalties mentioned in sec. 86 of the Act of 1875. In proceedings under this section it would appear to be sufficient to prove (a) that the house is a common lodging-house; (b) that it is not registered; and (c) that lodgers have been received there. "A common lodging-house is that class of lodging-house in which persons of the poorer classes are received for short periods, and although strangers to one another are allowed to inhabit one common room." (Lumley's "Public Health Acts," 7th edition, page 153.)

WATER SUPPLY: SEC. 62 OF THE PUBLIC HEALTH ACT, 1875.—"Chiefhunt" writes: In my district a new sanitary inspector has been appointed. The previous inspector was appointed under the above section as surveyor. The present inspector has not received that appointment, and the responsibility falls on me as surveyor. Would it be sufficient if I were to inspect and report certain premises without proper water supplies and leave the matter there for the sanitary inspector to take up, even for him to go as far as to execute works on default of owner and recover the costs in Court?

The council have to exercise a discretion, and to decide, upon the surveyor's report, whether the house is without a proper supply, and whether a supply can be furnished at the cost mentioned in the section; and the notice must be given by their direction. A notice given without their direction would be insufficient. See *Festry of St. Leonard's, Shoreditch v. Holmes* (50 J.P., 132). By 266 of the Act the signature of a notice by the clerk, surveyor, or inspector of nuisances is sufficient. In the note to this section in "Lumley's Public Health Acts" the opinion is expressed that a notice should be signed by such officer as can properly sign it by virtue of his office. As it is the surveyor who has to report under sec. 62 it would appear that he is the proper officer to sign a notice under that section (of course, by direction of the council, as already stated), and also to superintend the execution of the works. The proceedings for recovery of expenses would be taken in the name of the council.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

370. Temporary Building Design.—A temporary building is required, 50 ft. long, 30 ft. wide, and 10 ft. to eaves. Design a suitable structure, with steel trusses and stanchions, to be covered with corrugated iron on boards and felt, the bays to be filled in with 4-in. reinforced brickwork. (J. M. N., *Hitchin*.)

372. Cemetery Lay-out.—A new cemetery is to be provided in an urban district having a population of 17,000, increasing at the rate of 800 per annum. Flat meadow land, in a suitable position, having frontage to a district road (sewered), can be obtained at £350 per acre; subsoil, 5 ft. ballast overlying stiff clay. State area of land which should be acquired; give an approximate estimate of the cost of laying out the same, including buildings; state also principles governing the lay-out, and describe in detail method of drainage, arrangement of plots, disposition of buildings, &c. (Togun.)

373. Strength of Shaft.—What is the safe diameter of a wrought-iron shaft to transmit 60-h.p. at 120 revolutions per minute? (T. R.)

374. Magnetic North.—What is the difference in degrees between the magnetic and true north? (J. T. C., *Nottingham*.)

375. Working-class Dwellings.—Twenty working-class dwellings have been built at a cost of £3,500 for the buildings and £250 for the land. What must the rental be to ensure that the income will defray all loans, &c., charges? Give details as to how the allowances for empties, taxes, insurance, repairs, &c., are arrived at in the estimate. The money has been borrowed from the Public Works Loan Board at 3½ per cent for the usual periods. The poor and district rates are 6s. 8d. in the £ per annum. (Togun.)

376. Foundation for Stanchion.—A built-up steel stanchion, as shown in the diagram, transmits a load (including its own weight) of 250 tons. Design a suitable steel base and concrete and steel joist grillage foundation for the stanchion. The safe load on the earth may be taken as 2 tons per square foot. (I. W. S., *Clapham Junction*.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

371. Testing Stoneware Pipes.—What is the maximum head of water which may safely be applied in the testing of stoneware pipes? Does the diameter of the pipe affect the safe head? If the head be excessive will failure occur first in the pipes themselves or at the joints—ordinary cement or Stanford and cement? Give references to publications, &c., where details of tests are set out. (Togun.)

After securely plugging the lower end of a drain, it is filled with water until the required head or pressure of water is brought to bear upon the interior of the pipes and joints. The necessary head or pressure of water may be obtained by temporarily fixing a bend with one or two lengths of pipe at the upper end, or a force pump and pressure gauge may be used.

Glazed stoneware pipe drains with ordinary cement joints should not be tested to a greater head

of water than 5 ft. or 6 ft., as it is not desirable to subject joints of this description to any greater pressure. Selected stoneware pipes with approved safety joints can, however, be tested to a greater head of water if required.

Now, 1 ft. head of water gives a pressure of 433 lb. per square inch at its base, so that a pressure of 1 lb. per square inch represents a column or head of water 2.31 ft. in height. A hydrostatic test of 5 ft. of water consequently causes an actual pressure of 2165 lb. per square inch upon the whole of the interior surfaces of the pipes and joints under test.

The majority of pipe manufacturers now produce specially selected and tested pipes, each pipe being examined, tested to a considerable head of water, and stamped with the word "tested" and the maker's name before leaving the works.

A little thought will quickly show that the diameter of the pipe has no effect whatever on the safe head, for from the principle of the transmission of hydrostatic pressure we see that the pressure per square inch will be the same for the same head of water, no matter what the diameter of pipe may be. This principle states that if a fluid at rest have any pressure applied to any part of its surface, that pressure is transmitted equally to all parts of the fluid. This is also the principle of the hydraulic press.

As to the mode of failure under excessive pressure, it will be better to consider the following first:—

Let D = internal diameter of pipe in inches.
 p = fluid pressure in pounds per square inch.
 t = thickness of the pipe in inches.
 P = total pressure on the end of the pipe.

$$\text{Then, } P = \frac{\pi D^2}{4} \times p.$$

Take any circumferential section—not too near the ends of the pipe—there will be tensile stress uniformly distributed over it, due to the pressure P . The area of this circumferential section of the pipe is given approximately by—

Sectional area = $\pi D \times t$, sq. in.

$$\begin{aligned} \therefore \text{Stress on section} &= \frac{P}{\pi D t} \\ &= \frac{\pi D^2}{4} \times p \\ &= \frac{p D}{4 t} \text{ lb. per sq. in.} \end{aligned}$$

Similarly, by considering the forces acting on a portion of the pipe between two cross-sections taken 1 in. apart, the stress on a longitudinal section of the pipe can be proved to be $\frac{p D}{2 t}$ lb. per square inch. That is: Stress on longitudinal section is just double that on a circumferential section.

Now, even the best joint employed in drain work is not so strong as the pipe itself, and, moreover, it is quite clear that, however tightly the drain is plugged, the stopper will be forced out before the pipes will burst, and from the above reasoning we see that the stress tending to burst the joints and to blow the stopper out is twice that which is tending to burst or break the pipe barrels themselves.

Hence, it is certain that if excessive pressure be applied, the joints, no matter how well they are made, will be the first to fail, provided that the stopper remains in position meanwhile.

As regards references giving details of how drains should be tested, the querist cannot do better than to consult "The Main Drainage of Towns," by F. Noel Taylor (Griffin & Co.), where the whole subject is most exhaustively treated in chapter ix., pp. 195, 196, 197.

Full details of testing, with the errors to look for, are also set out in "Practical Sanitation," by G. Reid (Griffin & Co.), in chapter vi., pp. 139, 140, 141. (T. W. P., *Beckhill-on-Sea*.)

369. Tree Guards.—Give sketches of an economical and sightly tree guard, suitable for good-class residential roads, with details of cost. Ordinary iron guards are barred because of "stiff" appearance and high initial cost. (Togun.)

Chestnut pale fencing might easily be adapted to form a cheap tree guard of good appearance. This fencing consists of split pales held together at about 6-in. intervals by stout wire, as shown in Fig. 1. Four pales, arranged round the tree, as shown in Fig. 2, would provide quite sufficient protection.

and if extra strength was required, a split collar could be made to encircle the tree near the top of the guard, and keep the pales in position. Such a collar, which could easily be cut out of board, is shown in Fig. 3. The cost of these tree guards should not exceed 1s. each, and they ought to last several years. (W. H. H., Southwark.)

Crematoria.—The Royal Institute of British Architects have set, as a final examination for architectural students, "Design for Mortuary Buildings in Connection with Cremation." In this connection we draw attention to the fact that the best text-book on the subject is "Crematoria in Great Britain and Abroad," by Albert C. Freeman, published, at 5s. nett, at the offices of THE SURVEYOR.

"DANGER" SIGNS TO PREVENT ACCIDENTS ON STREET WORKS.

Local authorities and public works contractors are nowadays subjected to so many claims for compensation for accidents alleged to have been caused by some lapse or act on the part of their officials or employees, and are so often mulcted in heavy damages and costs, that we have little doubt they will welcome a device termed the "A-L" Reversible "Danger" Sign, which forms a valuable adjunct for facilitating road traffic, and, at the same time, marks a notable advance in protective measures for road works by

"A-L" DANGER SIGN, ILLUMINATED FOR NIGHT USE.

which the chances of accidents to the public are greatly lessened, and the possibility of claims for compensation minimised.

The mode of employing these "danger" signs is self-evident from the illustrations here given, which show their use and effect both at night and in the day time for warning drivers that works of road repair are in progress. The bold lettering of the signs when brightly illuminated at night is clearly visible at a distance of 100 yds., thus enabling those in charge of vehicles

"A-L" DANGER SIGN, REVERSED FOR DAY USE.

to slacken speed and take precautions to pass the obstacle without mishap. By simply reversing the sign an equally conspicuous warning sign suitable for day use is exhibited.

Signs are supplied with any desired wording. One should be employed at each end of all street works of magnitude.

These "danger" signs are constructed to withstand

rough usage, being of iron throughout. The acetylene light burns for sixteen hours without attention or re-charging; its cost is infinitesimal, and its generation simplicity itself, and quite easy to manage by an ordinary night watchman.

Illustrated circulars and particulars of the "A-I" "danger" signs may be obtained on application to Messrs. Wettern Brothers, Limited, 16 Water-lane, Great Tower-street, E.C.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Cardiff T.C. (January 5th. Mr. R. H. Bicknell).—£18,707 for the erection of a fire brigade station in Westgate-street.—The town clerk (Mr. J. L. Wheatley) said the intention was to erect the station upon land in Westgate-street, at the corner of Quay-street, which the corporation had received permission to appropriate for the purpose. Mr. E. V. Harris, architect, London, said there would be accommodation for sixteen married men, three single men, two engineers, and one superintendent.

Margate T.C. (December 29th. Mr. H. Shelford Bidwell).—£4,000 for the construction of a new road in extension of the front road known as the Royal Esplanade, £12,000 for the construction of a new sea wall promenade, and £1,700 for the purchase of No. 1 Fort-paragon, for the purpose of street improvements.—The town clerk, Mr. E. Brooke, stated that the applications in respect to the sums of £4,000 and £12,000 arose partly out of the work of the Town Planning Committee, and partly as a consequence of the recent extension of the borough boundaries. The proposals had been unanimously approved by the council. Practically the whole of the sea wall was outside the old limits of the borough. The borough engineer (Mr. E. A. Borg): Three-quarters of the esplanade will be within the added area. Mr. Borg proceeded to give evidence, explaining the plans in detail. The inspector asked for what period the corporation required the loans, and the town clerk suggested twenty-five years.

Richmond (Surrey) T.C. (January 7th. Major J. E. Stewart).—£1,000 for the erection of a public convenience in the Town Hall Gardens.—Mr. Brierley, the borough surveyor, said it was intended to provide accommodation for both sexes, and to have attendants in charge. The building would be properly screened. The only objection raised was as to the site, and this could, apparently, be met by the adoption of a site, at a cost of £100 further, on the opposite side of the gardens.

Southampton T.C. (December 19th. Mr. A. W. Brightmore).—£1,800 for the purpose of constructing storm-water drainage for the Northam and Bitterne Park districts.—The town clerk, Mr. R. R. Linthorne, said £1,500 was required for Northam, and £300 for Bitterne Park. The borough engineer, Mr. J. Crowther, stated that the district was below high water on exceptionally high tides, which depended largely upon the wind. There was some sort of bank along the river, which belonged to private owners. It was stated that the proposed drainage would only affect storm water, and would not be able to cope with floods caused by exceptionally high tides in addition to the storm water.

Southport T.C. (December 31st. Mr. F. H. Tulloch).—£4,500 for the construction of a bathing lake abutting on the Marine Drive, and £5,500 for the erection of a shelter on the children's playground.—It was stated that the proposed lake would be 400 ft. long, and 200 ft. wide, and would have a maximum depth of 6ft. Bathing would be done exclusively from a railed-in enclosure between the Marine Drive and the lake. It was calculated that in the summer months there would be an average of sixteen tides a month in the lake.

Spalding U.D.C. (December 7th. Mr. F. O. Stanford).—£29,550 for a sewerage scheme.—It was explained that the town is divided by the river Welland into the east and the north. It was proposed, in order to avoid going under the river, to have two distinct systems—one in each part. On the east side it was proposed to have a biological system, and on the north a broad irrigation system. The council had already conditionally purchased 17 acres of land on the east side, and 71 acres on the north. On the east

side the treated sewage would be let into the Exeter Drain to the Nene at Sutton Bridge, 18 miles further down to the north into the Welland. All the former, and 40 acres of the latter, would be immediately required, the remainder being used for allotments until needed. This would provide for 9,000 of the population, the remaining thousand odd being in rural districts where they were able to dispose of sewage on their own land.

APPLICATIONS FOR LOANS.

- Bootle T.C.**—£1,371 for a children's playground.
Bournemouth T.C.—£5,675 for school extension, and £3,250 for a woodwork and cookery centre.
Cardiff T.C.—£21,869 for the western sewer.
Dawlish U.D.C.—£5,250 for the purchase of land in connection with the water undertaking.
Devonport T.C.—£3,061 for works of road improvement.
Houghton U.D.C.—£11,718 for the erection of fifty-two houses.
Luton T.C.—£350 for a foul-water sewer.
Nuneaton T.C.—£5,000 for electricity plant.
Rotherham T.C.—£15,956 for extensions at the electricity generating station.
Torquay T.C.—£500 for lighting Princess Gardens.
West Bromwich T.C.—£16,518 for new schools.
Wigan T.C.—£50,638 for the Hoscarr and Pemberton sewage disposal scheme, and £7,890, supplemental expenditure on the Hoscarr outfall sewage works.
Wigton U.D.C.—£160 for water mains extension.

LOANS SANCTIONED.

- Barnet U.D.C.**—£350 for paving works.
Beeston U.D.C.—£1,958 for paving works.
Bognor U.D.C.—£2,400 for the provision of dwellings.
Carlisle T.C.—£7,970 for extensions to plant and buildings, and for £4,300 for the installation of a high-tension electricity plant.
Chard T.C.—£1,200 for the purchase of land in Old Town for working-class dwellings.
Chesterfield T.C.—£1,950 for road widening.
Dartford U.D.C.—£1,950 for road improvements.
Hendon U.D.C.—£23,769 for the reconstruction of Golder's Green-road.
Llanelli T.C.—£16,971 for a new council school.
Loughborough T.C.—£11,000 for buildings and additional electricity plant, and £3,000 for mains and services.
Marsden U.D.C.—£350 for an ambulance shed.
Monaghan U.D.C.—£4,000 for artisans' dwellings, repayment to be spread over sixty years.
Newport (Mon.) T.C.—£1,100 for school building extension.
Pembroke (Co. Dublin) U.D.C.—£80,218 for housing schemes.
Swansea R.D.C.—£1,000 for street improvements, and £550 for sewerage works.
Uttoxeter U.D.C.—£550 for alterations to the town hall.

Some Notes on Water Supply in the Rural District of Atherstone.*

By H. J. COLEBY, Engineer and Surveyor to the District Council, Atherstone.

In submitting these notes for your consideration the author does so, not with the idea of reading a paper on the subject of water supply, but rather to bring before your notice some features of general interest in his own district, and to give prominence to certain works which have not been altogether successful, in the hope that others may profit by the mistakes that have been made in the past.

The rural district of Atherstone is, roughly, 25,000 acres in area, and has a population of about 18,000. It is divided into eleven parishes (of which the town of Atherstone forms one), which, for purposes of water supply, are grouped into four areas.

No. 1 area is supplied from a well which was sunk in the year 1882, in what was then called the "Permian" formation, but which is now said to be part of the "Carboniferous." The well is 9 ft. in diameter, 70 ft. deep, and for the first 30 ft. from the surface is lined with brickwork in cement, in order to exclude all surface water. Below this point the well has been excavated in the red sandstone, which here is very hard and calcareous. At the bottom of the well a 12-in. diameter borehole was sunk, but as this was found to have been filled up with clay, presumably no benefit by way of increased yield was derived therefrom.

The machinery consists of two sets of double-barrelled, single-acting bucket pumps of the standpipe pattern, fixed in the well, and driven by horizontal steam engines, steam being supplied by two Cornish boilers.

When first sunk this well yielded 300,000 gallons per day on the test pumping, and for some years a constant supply of about 100,000 gallons per day was obtained therefrom. The yield, however, gradually decreased, until, at the present time, the average quantity obtained is only 55,000 gallons per day, while it has sunk so low as 25,000 gallons per day.

The author regards this as an indication that the underground reservoir of water has been exhausted by continuous pumping, and that the amount which can now be obtained is governed entirely by the rainfall and the area of outcrop. This latter is very difficult to determine, the site being near to the eastern boundary of the Warwickshire coalfield, and the ground being very much faulted. The recent investigations of the Geological Survey Department tend to show that, so far from there being a large and continuous area of water-bearing rocks, these are so divided by beds of impervious marl and broken by faults that the actual watershed drained by this well is very limited in extent, and is probably confined to the immediate vicinity of the well itself.

This source of supply must, therefore, be regarded as a failure, and the author mentions it in order to point out the very capricious character of this formation from a water supply point of view.

As a further instance of this, but of a more fortunate character: In 1887 a boring only 5 in. in diameter was made to a depth of 60 ft. in the so-called "Permian," at another part of the district, for the supply of No. 2 area, and this has yielded an average of 50,000 gallons per day ever since. In 1906 the author made a test of this boring by pumping day and night for a week with all the power then at his command, and was able to obtain 104,000 gallons per twenty-four hours without materially lowering the water level. This level, when pumping, is about 15 ft. below the surface, and in this case two sets of horizontal, treble-plunger pumps, driven by belts from Hornsby oil engines of 16 and 22 h.p. respectively, are used.

One of the difficulties experienced in the working of these oil engines is that arising from the variable quality of the petroleum, and it has been found that a difference of .001 in the specific gravity of the oil will have a very appreciable effect on the working of the engines. The author has found it necessary, when inviting tenders for petroleum, to define strictly the limits of specific gravity between .820 and .815 at a temperature of 60 deg. Fahr. The use of oil of a greater density than .820 leads to imperfect vaporisa-

tion and consequent waste of oil, while if the density be less than .815 the heat generated is sufficient to burn both the petroleum and the lubricating oil, with the result that after the engines have been stopped and have cooled down, they can only be restarted with great difficulty, owing to the pistons being set fast in the cylinders with partially carbonised oil. In point of fuel costs, there does not seem to be much difference between oil and steam engines, the balance being slightly in favour of oil up to a certain point, when oil reaches 6d. per gallon; but with oil at 7½d., which is the present price, the steam plant becomes cheaper. In large installations, however, the cost of labour would undoubtedly be heavier with steam than with oil, and it is probable that a Diesel engine, burning residual petroleum, would compare very favourably with steam plant.

The water for supplying No. 3 area is purchased from a colliery company, under an agreement, by which the company agreed to sink a well in the coal measures sandstone, to put down the necessary machinery, build a service reservoir, and deliver water into the council's mains at a cost of 6d. per 1,000 gallons, the council undertaking to pay for a minimum quantity of 60,000 gallons per day. The distributing mains were laid by the council, and the scheme came into operation shortly after the author's appointment in 1902. After a short time, considerable trouble was experienced by reason of a large amount of reddish-yellow deposit which was found to be taking place in the mains. Complaints were also received from consumers that the water, which was quite clear when first drawn, could not be used for drinking, owing to its foul smell and astringent flavour, and that potatoes boiled therein rapidly turned black, while it was quite unfit for laundry purposes.

Upon investigation the water was found to contain iron, held in solution by carbonic acid. In its passage through the service reservoir and mains it became sufficiently aerated to oxidise the iron, which was then precipitated as iron oxide in the mains, more particularly in those parts of the system where very little flow took place, and where the whole of the water was not changed very frequently. To remedy this state of affairs the author, in conjunction with Mr. H. J. Clarson, of Tamworth, advised the adoption of Candy's filters, and two of these of the "pressure" type were fixed upon the pumping main. These have proved effectual in oxidising and removing the whole of the iron.

The author is, however, of opinion that permanent injury has been done to the mains by passing water charged with iron through them, since an examination of sections cut from different mains shows that the bituminous coating has been almost entirely removed from the inside, leaving the metal bare.

It has been suggested that this may be due to the action of the iron bacterium (*crenothrix*), but as analyses of the water show it to contain very little or no organic matter, the author is inclined to think that it is due to the action of the liberated CO₂, and he would like to hear the opinion of any member who has had a similar experience.

Since the above was first written, the author has had the pleasure of reading the very excellent paper on the "Corrosion of Water Mains,"* by Mr. Wm. Ransom, the assistant city engineer of Worcester, and he finds the phenomena mentioned in that paper almost identical with those given above. It remains to be seen whether the destructive action on the bituminous coating will cease now that the iron has been removed, or whether, in oxidising the iron, CO₂ has been liberated in sufficient quantity to render the water acid enough to attack the metal of the mains. If this latter be the case, then it would appear that the treatment of the water at its source is incomplete, and, in addition to oxidisation and filtration, some means must be found for removing the liberated CO₂.

No. 4 area is supplied from a boring 170 ft. deep, in the Cambrian rocks. The yield, however, is very

* Paper read yesterday at a meeting of the West Midland District of the Institution of Municipal and County Engineers at Birmingham.

* See THE SURVEYOR, November 21, 1913.—ED.

small, and it is proposed to augment this from another source in the near future.

DISTRIBUTION.

Water is distributed over the greater part of this district from three service reservoirs, through over 45 miles of mains. The reservoirs are placed so as to command the whole of the areas in which they are situate, and are conveniently near the chief centres of population. The mains have been carried through nearly every road in the areas supplied, and out of the eleven parishes which comprise the rural district, nine have water mains in almost every road or street, and the remaining two are partially supplied. So that, as a whole, the district is well served so far as the leading mains are concerned. In some of the country parishes, indeed, long lengths of mains have been laid which only supply a few scattered farm-houses and cottages, from which very little revenue is derived by way of water rate, and in those parishes the repayment of the loans must be a heavy burden on the rates for years to come, while the mains, radiating as they do from the reservoir to the extreme boundaries of the parishes, cannot be made to form circuits, and so come to objectionable "dead ends."

The author would submit this point as one for discussion this evening—viz., whether, in designing a scheme for a country district, it is good policy to provide for mains reaching to every part of every parish for supplying a few scattered houses, where there is already, or where there can be obtained, a good supply from wells on the premises.

In such a case it seems to the author that the only excuse for burdening a parish with a thirty years' loan is that the water mains afford protection in case of fire; but it is also his experience that these country parishes have no means for making use of a fire hydrant, and would have to await the arrival of a fire brigade from the nearest town, by which time the house might be burnt to the ground.

FAULTS IN DISTRIBUTION SYSTEMS.

In one part of the district a service reservoir is supplied from another reservoir about 1½ miles distant, with only a small difference in level. The main connecting the two reservoirs was laid to follow the contour of the ground, and although it just comes below the hydraulic gradient, considerable trouble is experienced from "air locking" at the highest points.

The author has reason to believe that when this main was designed, the head taken for discharge was that due to difference between top water level in the upper reservoir and floor level in the lower reservoir. The result is that if the water level in the upper reservoir falls, and the lower reservoir is nearly full, the head is so reduced that the main only discharges about 50 per cent of the amount for which it was designed, while the high points in the main rise above the hydraulic gradient, and the air locking eventually becomes bad enough to almost stop the flow.

Of course, air valves were fixed at all the high points, but under the peculiar circumstances they were found to be of very little use, in fact, under certain conditions, they were the means of admitting air to the main. Further than this, it was found, by tapping the main at short intervals, that the air did not accumulate at the highest points only, but also in those portions of the main which are comparatively flat and well below the hydraulic gradient. The air appeared to lie in the top part of the main in the shape of an elongated bubble, similar to the bubble of a spirit level, and did not move forward at the same rate as the water. The charging of this main and getting rid of the air is a long and tedious process, and on more than one occasion recourse has been had to pumping through it while keeping several fire hydrants open.

As a remedy, the author has advised his council to either relay the main to proper gradients, or, since the upper reservoir is fed direct from the pumps, to erect a standpipe on the pumping main and to place the main in question under the standpipe head. The matter is now under consideration, but probably the second suggestion will be adopted.

This is perhaps an extreme case, but the author is of opinion, firstly, that when calculating the discharge of such a main as this no account should be taken of the height of water in the upper reservoir, but that the head should be the difference in level between the floor of the upper and the top water level

of the lower reservoir. If this be done, then any alterations in the respective water levels would give an increasing rather than a diminishing discharge through the main. Secondly, that mains under a small head should not rise above nor approach near to the hydraulic gradient, and that it is better to lay such mains to proper gradients, even if it necessitates deep excavations, as the extra cost involved would be amply repaid by the increased efficiency of the main.

SIZES OF DISTRIBUTING MAINS.

Owing to mistaken ideas of economy in the past, the distributing mains in several parts of the district are much too small, and although the static head in some parts reaches 300 ft., yet the loss of head is such that very little more than 20 lb. per square inch working pressure is available, and when any extra demand is made upon the larger supply mains, little or no water can be obtained from the small service mains.

As an instance: The author tested some fire hydrants fixed on a 2-in. main, 230 yds. long, and found that although the static head was 220 ft. the working head, when discharging 40 gallons per minute, was reduced to 40 ft., or a loss of 180 ft. head.

In another case, with a static head of 140 ft., no pressure at all could be obtained, and the fire hydrant was useless. A 3-in. main was substituted for the 2-in. in this case, with the result that the loss of head was reduced to 40 ft., leaving 100 ft. available for working.

It is the author's intention to carry out a series of tests of the capacities of all the fire hydrants in his district, and he would be glad to learn whether any member has used Prentice's hydrant flow gauge for this purpose, and whether this has been found a reliable means of testing the discharge from hydrants.

NEW BORING.

It has been stated earlier in these notes that the Atherstone district is fairly well served, in that the mains penetrate to nearly every part of the district; but, unfortunately, the supply of water in some parts is very variable, and during the recent dry years 1911 and 1913 there has been a considerable shortage.

As the population of the district has increased and is still increasing rapidly, it has become necessary to seek for a further supply of water to meet both present and future needs.

On the advice of Dr. Herbert Lapworth it was decided to make a boring in the "Bunter beds," which outcrop over a fairly large area in the northern part of the district. This boring was completed in May last, to a depth of 300 ft., and on being tested yielded 240,000 gallons per twenty-four hours for fourteen days.

This, however, must not be taken as the maximum yield, but was the limit of the capacity of the pump employed.

The rest level of the water is 41 ft. below the surface, and the working level did not fall more than 63 ft. below the surface when pumping at the rate of 10,000 gallons per hour. Upon the cessation of pumping at the end of the fourteen days' test the water rose 18 ft. in the borehole in twenty-five minutes, and regained its normal level within twenty-four hours.

At a depth of 160 ft. a bed of soft, white sandstone, coarse grained, and containing some small pebbles, was met with. This gave some trouble during the test pumping, and it was decided to line the portion of the borehole between 160 ft. and 240 ft. with steel tubes. The boring is 20 in. in diameter, and the lining tubes will be 18 in. internal diameter, with ordinary screwed and socketed joints. The author hoped to have been able to give an account of the inserting of these tubes, but owing to the strike in the tube trade they have only just been delivered, and have not yet been inserted.

If any trouble is experienced from sand washing in after these tubes have been fixed, it has been suggested that an air lift should be used for raising the water to the surface, instead of the ordinary bore-hole pump. The author would be glad to hear the experiences of any member who has made use of an air-lift plant under similar circumstances.

The Society of Architects.—The annual report of the council, presented at a meeting last night, states that the membership of this body was, at the end of October last, 1,185, of which number 960 are corporate members.

CORRESPONDENCE.

Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii., 2.

MR. BOULNOIS' "GLOSSARY OF ROAD TERMS": PROF. FEARNSIDE ON "THE PART PLAYED BY WATER IN MACADAM ROAD CONSTRUCTION."

To the Editor of THE SURVEYOR.

SIR,—Will you permit me, as an interested reader of THE SURVEYOR for a number of years, to offer you my hearty congratulations on two articles published in your columns during the past year of 1913?

It seems to me, as a highway engineer, that a long step in the right direction has been made through your assistance in the compilation and publication of a glossary of road terms, and that Mr. Boulnois, as well as yourself, deserves the sincere thanks of highway engineers generally for his efforts in preparing this glossary. Having been interested in the subject for some time, and having attempted more or less work under it, the writer fully appreciates the amount of effort necessary for results, and wishes to compliment Mr. Boulnois for the excellence of the results, as well as to thank him for his efforts.

While, naturally, criticism is to be expected, and, indeed, is most desirable, in order that the most general concordance may finally be had, perhaps it will not be officious for the writer to suggest that the greatest good will come from constructive rather than destructive or captious criticism. Personally, the writer feels that, if anything, Mr. Boulnois has too thoroughly covered the field, and that there may be little, if any, need for inclusion in the list of some of the terms set down. However, for the final draft of the glossary, elimination of such terms as shall be proved unnecessary will be easily accomplished, and quite possibly additional emphasis thereby be had of the value of the other definitions agreed upon.

It would be, the writer thinks, unfortunate if, in view of the amount of road work now being done on this side of the water, British engineers should accept and finally establish such a glossary as referred to without proper consideration of the terms and their meanings used here, but probably no apprehension may be warranted on this score, because it is understood that the Engineering Standards Committee of Great Britain already has this matter in charge, and will arrange for proper consideration of American terms in this connection.

The second article to which the writer referred in his opening sentence was that of Prof. Fearnside on "The Part Played by Water in Macadam Road Construction." This, in the opinion of the writer, is one of the most scientific articles concerning highway work which has yet appeared in print, and the profession is certainly greatly indebted to Prof. Fearnside, not only for the highly scientific way in which he has treated this subject, but also for the happy expression of the treatment in language intelligible to both lay and scientific minds. It is just such treatment of many of the problems of highway work which, in the opinion of the writer, is most necessary for the advancement of the profession, and the establishment of its art upon its proper foundation of science. Unless such advancement and establishment are pursued and won, the right of highway engineering to be called a profession may be questioned, and a highway engineer as such will be overwhelmed and exterminated by an artisan.

Accept my best wishes for a happy and prosperous New Year, and believe me, yours &c.,

W. W. CROSBY.

Baltimore,
Maryland, U.S.A.
December 29, 1913.

[We are much gratified to receive so encouraging a letter from such an eminent authority on road engineering matters as Major Crosby, M.A.M.SOC.C.E., whose good wishes we cordially reciprocate.—Ed. SURVEYOR.]

To the Editor of THE SURVEYOR.

SIR,—In your reply to the correspondence on this subject, appearing in THE SURVEYOR of the 2nd inst., it is interesting to learn you are of the opinion that "well-established usage must certainly be taken into account" in drawing up definitions of the terms

"bitumen" and "asphalt," and that you "are fully alive to the necessity for preventing interested or badly informed parties from exerting an influence likely to be prejudicial to those who have used these terms for many years."

I quite agree with your views, although it is not likely, as your correspondent remarks, that old-established merchants and manufacturers would agree to be dictated to, or be willing to attach to their goods terms that might be incorrect and opposed to old-established trade definitions.

The terms "asphalt" and "bitumen" are not of modern origin or invention, and I cannot see the object of departing from old-established definitions and usage except for the purpose of gain.

On referring to past correspondence on this subject, I notice Mr. Bastian, in one of his letters as far back as July last, writes:—

"Colonel Crompton states that it is his intention, and that of those associated with him, to confer with certain American engineers, and, as a result of their united action, and, presumably, the co-operation of the Engineering Standards Committee, to obtain the classification of petroleum pitch as 'bitumen.'"

My view of this is that it would be quite as absurd for, say, bitumen and asphalt makers to advise electrical engineers that in future the terms "volts" and "amperes" were to be altered and revised as it is for Colonel Crompton or other electrical engineers to say that it is proposed to alter the established definitions of bitumen and asphalt, and "obtain the classification of petroleum pitch as bitumen."

Your correspondent in last week's issue very rightly points out that the definition given of asphalt—viz., limestone naturally impregnated with bitumen—is incorrect, as this clearly describes rock asphalt, "a very different thing to those materials that come under the classification of asphalt." The prefix of the word rock alters the case entirely, and denotes a totally different material to the asphalts of Cuba, Venezuela, Trinidad, Turkey, Nigeria, &c. The latter are also correctly termed "natural bitumens"—natural asphalts and bitumens always being known as one and the same thing—and the term "rock asphalt" refers only, of course, to the limestone or sandstone which is found naturally impregnated with a small percentage of bitumen in France, Germany, Switzerland, Sicily, &c.

It is only necessary, therefore, to consider what materials come under the classification of—

- (1) Rock asphalt.
- (2) Natural bitumens and asphalts.
- (3) Pitches.

There are many of the last named, such as coal, petroleum, Swedish, wood, bone, wax, reed, Burgundy, British pitch, &c., and if petroleum pitch is to be called "bitumen," then the same thing applies to Swedish, Burgundy, and all other pitches.

I contend that they are either all "bitumens" or none, and although the term "artificial bitumen" has been introduced—any one pitch is as much entitled to this term as the others—it is very misleading, inasmuch as the word "bitumen" has all along been understood to refer to a natural product.

I notice Colonel Crompton, in his paper "Commercial Motor Road Transport"—the abstract you give, however, in your issue of December 26th last, principally deals with the experiments Colonel Crompton has carried out in his laboratory—refers to the work that has been done in America, but I fail to understand why American practice is considered of so much importance, as in no country in the world have the words asphalt and bitumen been used in such a loose manner as they have in America.

In the construction of bituminous roads America is also far behind France, Germany and other European countries, which are the home of asphalt for paving purposes, and if anything is to be learnt it is to France, Germany, &c., that we should look. Proof of this is, I think, to be found in the remarks of Colonel W. D. Sohler, whose article "Lessons from the International Road Congress" you referred to in your last issue.

If it is thought necessary to copy foreign practice, and someone abroad must be consulted, by all means let those on the Continent be consulted who have had the experience, as no reliance is to be placed on American terms, these, apparently, having only been adopted to suit their own convenience.—Yours, &c.,

ENGINEER.

January 12, 1914.

[We have omitted from our correspondent's letter some phrases which, in our opinion, are too personal

for publication in THE SURVEYOR, and do not really affect the problem with which we are concerned—viz., to attach to "bitumen," "asphalt," and other road-engineering terms definite meanings which shall be generally accepted.—Ed. SURVEYOR.]

To the Editor of THE SURVEYOR.

SIR,—I am exceedingly obliged to Dr. F. Judd Lewis for his able criticism of some of the definitions I attempted in my glossary, and I wish that others of your readers would have taken the trouble to do so.

I have, however, one fault to find with Dr. Lewis, and this is that, although he objects to some of my definitions he does not suggest others that should take their place.

I should therefore be greatly obliged to him if he would give me a correct, scientific, and short definition of the words to which he takes exception—viz.: "Ammoniacal liquor," "Anthracene," "Artificial asphalt," "Asphaltenes," "Bitumen," "Resin," "Calcium chloride," "Carbon," "Creosote," and "Deliquescent." I can assure Dr. Lewis that, before embarking on the glossary I consulted all the books and other sources of information I had at my disposal, in order, if possible, that my definitions should approximately describe, to the lay mind, the meaning of the word.

That is the sole object of the glossary, which was not compiled for the purpose of "fathoming the depths of this area of the ocean of philology"—a task which would be far beyond my powers.

I quite realise the difficulty of defining chemical terms, as even chemists themselves are not always in agreement as to the true meanings of words that they use.

If Dr. Lewis will help me in my difficulty by replying to this letter in your next issue, and will suggest some better definitions than I have given, I need not say how grateful I shall be to him for his valuable assistance.—Yours, &c.,

H. PERCY BOURNOIS.

7 Victoria-street, S.W.

MUNICIPAL AUTHORITIES AND THE SANCTITY OF LIFE.

To the Editor of THE SURVEYOR.

SIR,—In a recent issue of the *Referee* I read some comments on authorities, with reference to the outbreak of winter influenza, from the pen of Mr. George R. Sims. The writer asked: "Why should there be an epidemic of influenza every year?" and commented strongly on the authorities for its occurrence; but the remedies he suggests are of little use. We must get at the origin of the disease.

Previous to the year 1901, Members of the House of Commons were stricken with influenza in numbers out of all proportion to other communities or assemblies. A Select Committee was appointed, and expert evidence called. The correct conclusion arrived at was that it was due to the impure saturation of the air, the major portion of the impurities coming from the adjoining sewers of the London County Council and the Westminster Council. A pure saturation of the air supplied to the House was provided, and resulted in no epidemic having been reported since. Other cases could be cited where an improved air saturation has prevented any recurrence of the disease.

Without going into details as to why influenza is epidemic, it only occurs when we have a late autumn or mild winter. When a cold snap sets in the output of impurities which give an impure air saturation is very great.

The prevention of such epidemics is the work of the engineer rather than that of the medical officer or bacteriologist, by taking efficient means to make it impossible for an impure air saturation to come from sewers or drains.

During the past year no less than seven men have been killed in the sewers of London and the Provinces through contact with gaseous compounds from sewage. Some are non-smelling, and are heavier than the air, and the men have great difficulty to locate their existence.

Sewer men are not killed unless there are gases which asphyxiate them. Influenza is not prevalent except where heavy volumes of sewer emanations pollute the air saturations.—Yours, &c.,

R. H. REEVES.

Walton-on-Naze.
January 5, 1914.

THE ROAD BOARD.

GRANTS TO HIGHWAY AUTHORITIES: THIRTEENTH LIST.

During the months of October, November and December, 1913, the Road Board indicated additional advances to county councils and other highway authorities amounting, in the aggregate, to £396,985, of which £677,452 was by way of grant and £228,633 by way of loan.

The total advances made and promised up to December 31st from the constitution of the board amounted to £4,528,872.

The grants formally made, with the approval of the Treasury, during the last quarter amounted to £95,063, and were applied as follows:—

	£
To road crust improvements	77,302
To road widenings and improvement of curves and corners	9,465
To road diversions	6,727
To reconstruction and improvement of bridges	1,569

During the same period advances by way of loan have been arranged to the sum of £298,786.

The total grants formally made up to December 31, 1913, were applied as follows:—

	£
To road crust improvements	1,439,563
To road widenings and improvement of curves and corners	143,312
To road diversions	40,655
To reconstruction and improvement of bridges	60,996
To construction of new roads and bridges ...	83,498

The total sum arranged to be advanced on loan up to December 31st amounted to £564,896.

* NOTE.—This amount of £12,550 is part of a total sum of £280,000 now in course of distribution in Greater London and is made up as follows:—Hammersmith, £4,000; Hendon, £1,500; Paddington, £1,200; Stepney, £4,750; Richmond, £1,100.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Bexhill £6,000, Bournemouth £60,000, Rhyd £19,000, Sheffield, Worcester £9,970; housing and town planning—Cardiff, Greenock; roads and materials—Holland, Ramsbottom £14,153, Teddington £6,577; sewerage and sewage disposal—Carlisle; water, gas and electricity—Leigh, Rotherham, Warrington.—Particulars of other projected works will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Acton U.D.C.—It is proposed to erect a park-keeper's lodge at the North Acton playing fields at an estimated cost of £600.

Barnsley T.C.—The council on Tuesday adopted the proposals of the Treatment of Tuberculosis Committee for the establishment of a sanatorium at Mount Vernon. A revised scheme, providing for forty beds and the purchase of additional land, was presented. It was calculated that ten of the beds would be available for letting to adjoining authorities, and an estimated income of £900 from this source was included in the estimate, which left a deficit of £1,420 to be met, half of which would be paid by the State.

Belfast T.C.—A new shelter is to be constructed in the Botanic Gardens Park.

Bexhill T.C.—A scheme is being promoted for the erection of a permanent isolation hospital at an estimated cost of £6,000.

Bournemouth T.C.—It has been agreed to erect a pavilion on the Belle Vue site at an estimated cost of £60,000.

Bradford T.C.—Plans and estimates have been approved for a number of cottage baths in various parts of the town.

Brighton T.C.—The Education Committee propose to enlarge the Coombe-road school by the provision, at an estimated cost of £6,750, of a third department for the accommodation of about 370 infants and junior scholars.

Clacton T.C.—A large bathing pavilion is to be erected in the East Cliff at an estimated cost of £850.

Falmouth T.C.—An enlargement scheme is to be carried out at the Princess Pavilion at an estimated cost of £600.

Galashiels T.C.—The council have agreed to proceed with the necessary alterations on and additions to the municipal buildings.

Inverness T.C.—The burgh surveyor has received instruction to prepare estimates for the erection of a public wash-house and swimming bath.

Penrith R.D.C.—The plans of the surveyor, Mr. W. S. Lythgoe, for the proposed new bridge at Ivegill have been adopted, and the county council is to be asked for a grant towards the estimated cost of £550.

Rhyd U.D.C.—It has at length been agreed to proceed with a scheme for rebuilding the pier. This scheme will cost about £16,000, and, with new works proposed in connection with the extension of the promenade to join the pier, will entail an expenditure of about £19,000. The new scheme provides for the removal of the old Bijou Theatre, the widening of the pier to its site, reconstruction of the pier head, and the erection of a handsome amphitheatre at the entrance. The work will be taken in hand as soon as sanction to the necessary loans can be obtained.

Sheffield T.C.—It has been agreed to build two sanatoria for consumptives, one with 100 beds for women, and another with 150 beds for men.

Southwold T.C.—Subject to the Local Government Board granting a loan, it has been agreed to erect a groyne to the north of No. 1 groyne.

Torquay T.C.—A tramway shelter is to be erected near the railway station at an estimated cost of £100.

Walsall T.C.—The Electricity Committee recommend that plans and estimates be prepared of a new generating station.

Worcester T.C.—Plans have been approved for the provision of a new council school at an estimated cost of £9,970.

HOUSING AND TOWN PLANNING.

Blaenavon U.D.C.—As a result of the recent Local Government Board inquiry into the housing conditions at Blaenavon, the council have received a formal letter from the Local Government Board requesting them to submit a scheme for the provision of not less than fifty houses before February 26th next, and that the whole of such cottages be ready for occupation before November 26th next.

Blaydon U.D.C.—Ten houses are to be erected by the council at Chopwell, the rents to be 7s. per week each.

Buckfastleigh U.D.C.—The surveyor, Mr. A. Warren, has received instructions to prepare plans for a housing scheme.

Cardiff T.C.—The city engineer, Mr. W. Harpur, has submitted to the Housing Committee schemes of housing for the 6 acres of land near Portmannoor-road, which the Bute estate has offered the committee on a ninety-nine years' lease at £30 per acre per annum. Scheme A submitted provided for the erection of 144 houses, with an open square in the centre, at a total cost, including street and private improvement works, of £24,748. The total ground rent would be £193 2s. 6d. per annum, or £1 6s. 10d. per house. Scheme B provided for 180 houses, reserving no open space, at a total cost of £30,148, ground rent per house £1 1s. 6d. per annum. The houses proposed were four-roomed dwellings, with a 14-ft. frontage. The city engineer was instructed to prepare a plan of houses of four and five rooms, and submit it to the committee.

Clones U.D.C.—The council have decided to support the petition of Irish municipal authorities to Parliament for better facilities for acquiring loans to carry out housing schemes in cities and towns.

Coventry T.C.—The Housing Committee will shortly present to the council, for adoption, a comprehensive scheme of housing. The proposals will not be confined to the building of houses on one site, but will embrace several sites, and the scheme can be proceeded with in sections. The total cost will reach a very large figure, but the experience of the council with regard to the Narrow-lane scheme is that municipal houses pay without any charge upon the rates.

Denbigh R.D.C.—Detailed estimates are to be prepared for a housing scheme at Llandulas estimated to cost £2,281.

Greenock T.C.—Competitive plans for a housing scheme are being invited. Eighteen tenements, to contain 162 two-roomed houses, are to be erected at an estimated cost of about £40,000.

Lostwithiel T.C.—A housing scheme is to be carried out at a cost of £1,250.

Stewartry C.C.—The Northern District Committee have appointed a sub-committee to inquire into the advisability of erecting working-men's houses in Dalry.

Winchcombe R.D.C.—Plans and estimates are to be prepared for twenty cottages under the Housing and Town Planning Act, to be erected on land near Winchcombe Railway Station.

PARKS AND OPEN SPACES.

Bradford T.C.—The council are recommended by the Parks Committee to construct bowling greens at Horton Park, Victoria Park, and the Wyke recreation ground.

REFUSE COLLECTION AND DISPOSAL.

Pontypool U.D.C.—The work in connection with the new refuse destructor has been completed. The installation contains two cells, each capable of dealing with about 15 cwt. of refuse per hour, and an emergency cell. The cost of the destructor was £2,140.

ROADS AND MATERIALS.

Ayrshire C.C.—A plan for a proposed new road between Irvine and Stevenston has been prepared by Mr. John B. Brodie, Glasgow. The proposed new roadway will reduce the distance between the two towns for road users by 1½ miles, and in addition to this will relieve them of the trouble of negotiating ten or eleven corners. A liberal grant from the Road Board is expected for the project.

Ballycastle R.D.C.—Consideration is being given to a proposal to provide for improving the surface of main roads from Larne to Ballycastle, for about 2 miles, from the district boundary at Waterford through Cushendall by giving a steam-rolled coating with a tar-sprayed surface, in such manner as should be approved by the Road Board, at a cost of £1,250.

Banffshire C.C.—The Road Board have decided upon the construction of a new road over the Corsemaul from Bakebrae to Glenmarkie. The road will be wholly in the parish of Mortlach, and the estimated cost is £300.

Brighton T.C.—The Improvements and Buildings Committee recommend the purchase of property for the sum of £1,800 for the widening of Market-street. —It is proposed to renew the tramway track in Richmond-terrace at an estimated cost of £3,500.

Derbyshire C.C.—The Highways Committee have decided to recommend a grant of £200 to the Chesterfield Corporation towards the proposed improvement and widening of the Newbold main road.

Essex C.C.—The council have adopted a report prepared by the county surveyor, Mr. P. J. Sheldon, on the reorganisation of the main road inspectors' districts, rendered necessary by the large capital expenditure to be incurred by the county council during the next few years, under the Road Board scheme. Motor cycles are to be provided for eight inspectors, together with an allowance of 10s. per week for upkeep. It was stated that the expenditure upon upkeep of the main roads and bridges in the county had now reached an annual sum of £210,000, excluding all expenditure upon Road Board schemes.

Fifeshire C.C.—The Road Board have sanctioned a grant of £500 to the St. Andrews District Committee for road improvement purposes.

Frome U.D.C.—The surveyor, Mr. F. W. Jones, has submitted to the Highways Committee a scheme for the improvement of Christchurch-street West, at an estimated cost of £1,218.

Haddingtonshire C.C.—The District Committees of the council have practically completed an extensive scheme of proposed improvement of the coast and post road routes through the county. The scheme has been informally submitted to the chairman of the Road Board, and there is reason to believe that a grant of money will be voted. The scheme will cover a period of five years. The committees have definitely adopted the tar-macadam system of treatment.

Holland (Lincs) C.C.—A deputation from the Roads and Bridges Committee has had an interview with the Road Board with reference to a grant for the improvement of the main roads of the county. The roads proposed to be dealt with included the Boston and Lynn roads, the Wrangle road, and the Wainfleet road, and the expenditure on strengthening and widening was put at £9,680. The chairman of the Road Board intimated that they would make a grant of half the estimated expenditure, and it is proposed that the work should be carried out.

Newport (Mon.) T.C.—It is announced that the Road Board have made a grant of £1,700 towards the improvement of the Cardiff-road as far as the railway bridge.

Perthshire C.C.—The Road Board have agreed to make a grant to the West Perthshire District Committee of three-fourths of the cost of reconstructing 27 miles of the main roads in the district. The cost to the District Committee will be about £1,000.

Ramshotbottom U.D.C.—The council have adopted the scheme of the surveyor, Mr. T. H. Bell, for the reconstruction of $1\frac{1}{2}$ miles of the Manchester-road with granite setts on a concrete foundation. The estimated cost is £14,153. The plans are to be submitted to the county council with a view to getting them to do the work on a 90 per cent basis, leaving Ramshotbottom to pay 10 per cent.

Roxburgh C.C.—The Jedburgh District Council have agreed to accept a grant from the Road Board of £6,000 for the construction of bridges and the repair of roads in the district on the condition that the local authority put on an extra 1d. in the £ on the road rate for ten years. A sum of £2,061 will be allocated to surface improvements, and £3,870 for bridges.

Swansea T.C.—The Highways Committee have given instructions for the planting of certain streets with trees, and Mr. Bliss, parks superintendent, reports

it will not be many years before the Parks Committee will be able to supply from their own nursery all the trees that will be wanted for the streets.

Teddington U.D.C.—Mr. M. Hainsworth, the surveyor, is to furnish the Middlesex County Council with particulars as to paving Kingston-road with creosoted deal at an estimated cost of £6,577.

Twickenham U.D.C.—It has been agreed that the Middlesex County Council shall make an annual charge for laying asphaltic macadam in Cross Deep and Waldegrave roads; that the offer of the Road Board to grant £500 be accepted; and that application be made to the Local Government Board for sanction to a loan of £5,300 for resurfacing these roads.

Willenhall U.D.C.—The council have adopted the plans of the surveyor, Mr. T. E. Fellows, for the widening of Morfital-lane, Walsall-street, and Lone-lane, at an estimated cost of £4,500, subject to grants being received from the Staffordshire County Council and the Road Board.

Worcester T.C.—Upon the advice of the city engineer, Mr. T. Calk, it has been agreed to treat certain roads with tar-macadam, at an estimated cost of £2,314, and to apply to the Road Board for a grant towards the cost of the work.

SEWERAGE AND SEWAGE DISPOSAL.

Beverley R.D.C.—Opposition was again manifested recently to the Elloughton and Brough drainage scheme, which the Local Government Board, after an inquiry on the spot, had insisted should be carried out. A letter was read from the Board ordering that the sewerage must be commenced within six months, and completed in eighteen months. Mr. J. Jackson, the chairman, moved that the council proceed to carry out the scheme in accordance with plans prepared by Messrs. Fairbank, and that application be made for sanction to a loan of £9,583 for the purpose. This, he said, was the fourth time he had made a similar proposition, and he hoped that on this occasion it would be finally settled. The vice-chairman, Mr. W. W. Forge, seconded, but the proposition was defeated, eight voting for and nine against.

Carlisle T.C.—At the meeting of the Health Committee, the city surveyor, Mr. H. C. Marks, stated that the Local Government Board had intimated that they were prepared to issue their sanction to borrow what was needed for the sewerage of Botcherby, Harraby and Durran Hill. The estimate for the work had been increased from £6,500 to £7,200 since it was first made in 1909, chiefly owing to the increases in the price of materials and the cost of the labour. The work would be commenced at once, and the Cumberland and Westmorland lunatic asylums would be included in the scheme.

Chelmsford T.C.—The Joint Sewerage Committee's account for the past year showed a profit on the working of the farm (no charge being made in respect of instalments of loans and interest) of £82, against £63 the year before, and a debit balance (representing the cost and disposal of the sewage of the constituent authorities, excluding instalments of loans and interest) of £394 in 1911. The sale of stock, produce, &c., during the year came to £1,045, and the total receipts were £1,970.

Glasgow T.C.—Sir William H. Lindley, engineer-in-chief of Warsaw, having written requesting information in connection with the Glasgow sewage purification scheme, and stating that a deputation from that town would visit Glasgow in the spring of this year to get acquainted with the scheme, the Sewage Committee recommend that arrangements be made for receiving the deputation, and that the town clerk supply in the meantime the information desired.

Haywards Heath U.D.C.—The surveyor, Mr. G. Plummer, has been instructed to prepare plans for the sewerage of a part of Eastern-road.

Macclesfield T.C.—The Highway Committee, having considered replies from other towns in the county as to the procedure adopted with respect to cleaning out intercepting traps, have passed a resolution that the owners of property be charged a fixed sum of 1s. 6d. for cleaning out the interceptors on their private drains, and in cases where it is necessary to open the ground to clear the interceptor they be charged the actual cost of the work.

St. Austell R.D.C.—Plans are to be prepared of drainage schemes for St. Dennis and Pentewan, and a committee has been asked to report on the drainage of St. Blazey.

WATER, GAS, AND ELECTRICITY.

Chelmsford T.C.—It has been agreed, in the event of the Local Government Board sanctioning the purchase, for £1,000, of the field adjoining the Admiral's Park water tower, to sink a borehole there to provide a new supply in substitution for the surface springs should they become polluted.

Coleraine U.D.C.—A scheme is under consideration for the extension and improvement of the gasworks at an estimated cost of £3,000.

Leigh T.C.—It was agreed on Tuesday last to spend £11,919 on extending the electricity undertaking, and it was also decided to apply for permission to borrow £11,420 for improvements at the gasworks.

Rotherham T.C.—Extensions to the electricity undertaking, estimated to cost £68,500, are recommended by the Electricity Committee.

St. Austell R.D.C.—The council have ordered a report to be prepared on the water supply of Pentewan.

Todmorden T.C.—The Local Government Board have sanctioned the loan which the council applied for for the extension of the electricity works.

Warrington T.C.—A scheme is being considered for taking a water supply from the upper reaches of the Mersey at an estimated cost of £35,000.

MISCELLANEOUS.

Brierley Hill U.D.C.—A new steam fire engine is to be purchased at an estimated cost of £400, the whole of which has been subscribed voluntarily.

Wimbledon T.C.—The tender of Messrs. Dennis Brothers, Limited, of Guildford, to supply and deliver a motor ambulance for £670, has been accepted, and application for sanction to borrow that sum is to be made to the Local Government Board.

Queen's County Surveyorship.—The Queen's County Council (Leinster) are inviting applications for the position of county surveyor at a salary of £250 a year.

School Ventilation.—The new council schools, Oldham, are being supplied with Shorland's patent exhaust roof ventilators by Messrs. E. H. Shorland & Brother, Limited, of Failsworth, Manchester.

German Town Plans and Housing.—A lantern lecture entitled "German Town Plans and Housing" will be given by Mr. Charles C. Reade at the Royal Institute of British Architects (9 Conduit-street, W.) on Tuesday, February 3rd, at 8.30 p.m., when Mr. Raymond Unwin, F.R.I.B.A., will preside. Mr. Reade (who is assistant secretary of the Garden Cities and Town Planning Association) lately spent two months in Germany investigating housing and town planning conditions in many of the principal towns and cities in Germany, and has marshalled much illustrated material, and many plans showing not only recent developments in modern German town planning, but the effect of many of these plans on the housing of the people. Those desirous of attending should apply for an invitation to the Secretary, Royal Institute of British Architects, 9 Conduit-street, W., or to the Garden Cities and Town Planning Association, 3 Gray's Inn-place, W.C.

Tar-painting Main and Subsidised Roads.—The Highways Committee of the Middlesex County Council have issued a circular letter stating that they are prepared to recommend the county council to allow local authorities to include in their account for the maintenance of main, light railway, or subsidised roads, in respect of tar-painting operations, charges on the following scale: If carried out by hand labour, 2½d. per yard super.; if carried out by horse machine, 1½d.; if carried out by mechanical spreaders, 1d. Where these charges are made, watering, where necessary, will be allowed on the road at a rate not exceeding ½d. per square yard per annum for the area watered, and charges on this scale may also be included in the accounts. It is added that the county council will only bear a moiety of the above charges in respect of subsidised roads "A," and one-fourth part in the case of subsidised roads "B," and the contribution of the county council in respect of all roads will only be paid in circumstances where the county engineer and surveyor certifies that the tar-painting operations were commenced during the months of March, April, May or June, and completed not later than June 30th. The above scale will come into effect on March 1, 1914.

PERSONAL.

Mr. John Breeze, surveyor to the Wellington Rural District Council, has resigned after forty-five years' service.

Mr. G. W. Lambert, Rathmines, has been appointed assistant surveyor to the Rathmines Urban District Council.

Mr. S. W. Harman, assistant surveyor to the Twickenham Urban District Council, was on Monday awarded an increase of salary.

Mr. G. V. Roberts has been appointed second assistant (main roads) in the county surveyor's offices, Hereford. Mr. Roberts served his articles with Mr. G. H. Jack, county surveyor of Hereford.

Mr. G. Edgar Fryer, who has for the past two years held the position of deputy surveyor and inspector to the Ripley (Derbyshire) Urban District Council, has been appointed surveyor and inspector to the Melton Mowbray Rural District Council.

Mr. Donald M'Coll has resigned his position as superintendent of cleansing to the corporation of Glasgow, which he has occupied since 1894. Mr. M'Coll has been connected with the cleansing department since it was formed in 1868.

Mr. S. E. Burgess, M.INST.C.E., the borough engineer and surveyor of Middlesbrough, has, in consideration of extra and special work undertaken by him in connection with the borough extension, been voted an honorarium of £100 by the corporation.

Mr. Sam Owen, formerly of Birmingham, passed away on Sunday, at his residence at Aberdovey, at the age of sixty-four. Many years ago Mr. Owen was the surveyor to the old Balsall Heath Local Board, and when the district was annexed to Birmingham, in 1891, he was compensated for the loss of his position by a superannuation allowance. On ceasing to hold his official appointment, he practised for a number of years as a surveyor in Birmingham.

Messrs. E. Potts, borough engineer's office, Rotherham, J. A. Rodwell, waterworks office, Belfast, and P. G. Smales, borough engineer's office, Southend-on-Sea, have been elected associate members of the Institution of Civil Engineers; and Messrs. F. J. Dixon, water engineer, Ashton-under-Lyne, L. Mitchell, Bolton, H. J. T. Smith, Bombay, and J. P. Wakeford, city engineer of Wakefield, have been transferred from the class of associate member to that of member.

Mr. S. Barlow Bennett, the city engineer of Nanaimo, British Columbia, was born (says the *Contract Record* of Toronto) at Burslem, and educated at Newcastle. After serving an apprenticeship to sanitary engineering, he took a three years' course at the Municipal School of Technology, Manchester, where he became a silver medallist. Later he entered the Armstrong College at Newcastle, and spent several years in the chemical laboratory, chiefly with a view to studying chemistry as applied to engineering and the analysis of water supplies, and then took the civil engineering course leading up to Intermediate Science. For several years he practised drainage engineering in Manchester, and acquired considerable experience in the reconstruction of slum areas, town planning, sewerage and other municipal work. Next he obtained an appointment as sanitary expert to the Durham County Council, which was followed, in 1911, by his acceptance of his present position. Mr. Bennett is a member of the Royal Sanitary Institute and the Institute of Sanitary Engineers, is a frequent contributor to the technical Press, and devotes much of his leisure time to research on dangerous occupations. Foremost among his hobbies is the making of geological specimens.

Institution of Municipal and County Engineers.—The next examination of the Institution of Municipal and County Engineers will be held on the 2nd, 3rd and 4th of April, 1914, at the Examination Hall, 8 Bloomsbury-square, London, W.C. The use of slide rules in connection with the examination is no longer prohibited.

Tarmac Ponies.—An advertiser in the *Daily Mail* offers for sale a "cheap, smart, fast, reliable, Tarmac handsome black pony gelding." It is well known that the county surveyor of Notts has done wonders with furnace slag, but this ingenious use of it is novel. Mr. Boulnois must extend his "Glossary" to cover this latest application of "Tarmac."

INSTITUTION OF MUNICIPAL ENGINEERS.

NORTHERN DISTRICT ANNUAL DINNER.

The annual dinner of the Northern District of the Institution of Municipal Engineers was held at Newcastle on Saturday last, and a large gathering, some ninety all told (most of whom were members of the institution), was present. The chair was taken by Mr. W. Finch, county surveyor of Cumberland and chairman of the Northern District, and among those present were the Lord Mayor of Newcastle (Councillor Johnstone Wallace), the Sheriff (Councillor Herbert Shaw), Aldermen Dixon (Cumberland), Dalton (Carlisle), and Gilbertson (Southwick-on-Wear), Councillors T. A. Yelder (Cumberland), R. H. Humphrey (Darlington), F. J. Mathews (Gosforth), Swinney (Morpeth), A. L. Scott-Owen (Houghton-le-Spring), Bertram (Whitley Bay), Parkin (Felling), Captain H. W. Taylor (Newcastle), Captain F. P. Mill (Newcastle), Mr. John Robinson (honorary secretary of the district), and Mr. B. Wyand (secretary of the institution). A letter from the president, Mr. Horace Boot, regretting his absence through indisposition, was read.

The toast list was a long one, and following the loyal toasts were "Army, Navy, and Imperial Forces," proposed by Mr. J. T. Pegge (Durham), and responded to by Captain Harry W. Taylor (Newcastle); "Local Government Board, Road Board, and Administrative Bodies," proposed by Mr. J. W. Moncur (Sunderland), responded to by Alderman W. Dixon (Cumberland); "The Institution of Municipal Engineers," proposed by Sheriff Herbert Shaw, responded to by Mr. W. Wallin (Newcastle); "The City and County of Newcastle-upon-Tyne, and Northern Municipalities," proposed by Mr. C. W. Hall (Felling), responded to by the Lord Mayor of Newcastle-upon-Tyne; "Our Guests and Visitors," proposed by Mr. J. W. Holbrook (Houghton-le-Spring), responded to by Alderman Dalton (Carlisle); "The Chairman," proposed by Mr. J. W. Hulstead (Harrogate). Mr. Holbrook made a most efficient toast-master, and an excellent musical programme was interspersed among the various speeches.

A full report of the proceedings will appear in our next issue.

A Middlesex Conference.—A conference of Middlesex highway authorities will be held at Caxton Hall, Westminster, on Tuesday, February 3rd.

FOR OTHER ADVERTISEMENTS

See End of Paper.

ESSEX COUNTY COUNCIL.

HIGHWAYS COMMITTEE.

APPOINTMENT OF MAIN ROAD INSPECTORS.

The above Council are prepared to receive applications for the appointment of three District Inspectors of Main Roads in the County, under the superintendence and direction of the County Surveyor.

Applicants must not exceed the age of 35 years, have had previous experience in the repair and maintenance of roads, and be conversant with modern forms of construction; they must also devote their whole time to the duties of their office.

Salary, £175 per annum, rising by annual increments of £5 to a maximum of £220 per annum.

Applicants must be competent to ride the motor cycle provided by the Council, for the upkeep of which an allowance will be made additional to the salary stated above.

Applications, on the form to be supplied, accompanied by copies of three testimonials of recent date, are to be delivered to the undersigned not later than the first post on Friday, January 30th, 1914.

PERCY J. SHIELDON, M.INST.C.E.,

County Surveyor of Essex.

County Surveyor's Office,
Chelmsford.

January 16, 1914.

(1,160)

TEMPORARY ASSISTANT required. Must be good draughtsman, experienced in preparing Specifications and Bills of Quantities. State experience, and salary required, to H. Hind, Surveyor, Urban District Council, Erith.

(1,157)

OFFICE ASSISTANT and **PROVINCIAL ENGINEER** required by the Gold Coast Government for the Public Works Department for two years of twelve months, with possible extension.

Office Assistant £500, with duty allowance of £100.

Provincial Engineer £400-£20-500, with duty allowance of £80. Furnish bed quarters or allowance. Free first-class passage. Liberal leave on full salary. Age 28-40.

Candidates for the post of Provincial Engineer should have had experience in charge of works such as would be met with in Town or District Surveyor's Office, and in both appointments Corporate Membership of the Institute of Civil Engineers is essential.

Application should be made at once to the Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

(1,170)

EALING TOWN COUNCIL.—Wanted, in the Drawing Office of the Borough Surveyor, a Junior, age between 18 and 21. Preference will be given to one who has occupied a similar position, and is a neat and accurate tracer, and used to helping in the making of Surveys, &c. Salary £50 per annum. (1,165)

BATH RURAL DISTRICT COUNCIL. MONKTON COMBE AND AVON VALLEY SEWERAGE SCHEME.

The Rural District Council of Bath invite Tenders for the following work in connection with the Sewerage of Monkton Combe, Combe Down, Claverton, Bathford, Bathampton, Batheaston, and Swainswick:—

Twelve miles of 15, 12, 9 and 6 in. Stoneware Pipe Sewers, and about 1 mile of 12, 10, 7 and 6 in. Cast-iron Sewers, including Railway, Canal and River Crossings, together with Manholes, Lampholes and Flushing Chambers, and other works.

Also for the Erection of Engine-house and Construction of Pump-well at Batheaston.

Plans and Specifications may be seen at the Offices of the Engineers, Messrs. Willcox & Raikes, Union Chambers, 63 Temple-row, Birmingham, from whom copies of the Bills of Quantities and Form of Tender may be obtained (after the 19th day of January) on payment of a deposit of Five Guineas, which will be refunded on receipt of a *bonâ-fide* Tender and the return of all documents to the Engineers.

Sealed Tenders, in envelopes supplied, and endorsed "Monkton Combe Sewerage—Contract No. 2," to be delivered at my Office not later than 12 o'clock noon on the 14th day of February, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

R. H. WHITTINGTON,
Clerk to the Council.

1 Queen-square, Bath.

Dated January 14, 1914.

(1,164)

COUNTY BOROUGH OF SOUTHPORT. BIRKDALE AND AINSDALE MAIN SEWERAGE—CONTRACT No. 3.

The Corporation of Southport invite Tenders for the Construction of Storm-overflow Sewer, Concrete Storm Tank to hold 500,000 gallons, and other works appertaining thereto.

Plans may be seen, and Specification and Form of Tender obtained, at the Borough Engineer and Surveyor's Office, Town Hall, Southport, upon the receipt of a cheque for £3 3s. (made payable to the "Southport Corporation"), which will be returned upon the receipt of a *bonâ-fide* Tender.

Sealed Tenders, endorsed "Birkdale and Ainsdale Main Sewerage—Contract No. 3," and addressed to the Town Clerk, must be delivered at the Town Hall, Southport, not later than 10 a.m. on Thursday, the 5th day of February, 1914.

The Corporation do not bind themselves to accept the lowest or any Tender, and all who Tender must do so at their own cost.

J. ERNEST JARRATT,

Town Clerk.

Town Hall,
Southport.

Specifications and Forms of Tender may be obtained upon receipt of 5s. for each Tender Form, on and after Monday, January 19, 1914, upon application to Mr. O. Claude Robson, M.INST.C.E., Engineer to the Council, Municipal Offices, Dyne-road, Kilburn, N.W. The deposit for Tender Form will be returned upon receipt of *bonâ-fide* Tender.

Tenders to be delivered to the undersigned not later than 4 p.m. on Tuesday, January 27, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

STANLEY W. BALL,
Clerk of the Council.

Municipal Offices,
Dyne-road, Kilburn, N.W.
January 13, 1914.

(1,162)

PORHCRAWL URBAN DISTRICT COUNCIL. DRAINAGE.

TO CONTRACTORS.

The Urban District Council of Porthcawl invite Tenders for the Construction of certain lengths of Stoneware and Iron Sewers of 9, 12 and 24 in. diameter, and Concrete Tube Sewers of 30 in. in diameter, with the necessary Manholes, Flushing Tanks, and other appurtenances. The Contract also includes the Construction of a Sea Outfall, formed of 24-in. Cast-iron Pipes, to be laid through the rock foreshore, in accordance with Plans and Specification prepared by Messrs. John Taylor & Sons, Civil Engineers.

Contractors desirous of tendering may obtain copies of the Specification and the Bill of Quantities with Form of Tender from the Offices of the Engineers, Caxton House, Westminster, S.W., upon payment of 5s (cheque only), which will be returned upon receipt of a bona-fide Tender. The Drawings may be inspected either at the Offices of the Engineers, or at the Office of the Surveyor to the Council, Porthcawl.

Tenders, endorsed "Porthcawl Drainage, Contract No. 1," must be delivered in a sealed package, addressed to the Clerk to the Council, before 10 a.m. on the 5th February, 1914.

The acceptance of a Tender will in any case be provisional upon sanction being granted by the Local Government Board for a loan to defray the cost of the works, for which application has already been made, and the Council do not bind themselves to accept the lowest or any Tender.

(By order)

WM. CHORLEY,

Clerk to the Council.

(1,161)

EAST HAM CORPORATION.

CHURCH-ROAD RECREATION GROUND.

SUPPLYING AND ERECTING WROUGHT-IRON UNCLIMBABLE FENCING AND GATES.

The East Ham Corporation invite Tenders for the above.

Particulars, Drawings, Specification and Form of Tender may be obtained on application to Mr. J. Birch, Borough Engineer, Town Hall, East Ham.

Tenders to be sent in, addressed to "The Worshipful the Mayor, Town Hall, East Ham," endorsed "Tender for Iron Fencing," not later than 12 o'clock noon of Monday, the 26th January, 1914.

The firm whose Tender is accepted will be required to observe and fulfil the obligations upon contractors specified in the Fair Wages resolution adopted by the House of Commons on the 10th March, 1909, which is fully set forth in the Specification and particulars of Tender, and to enter into a contract with a Bond for the due performance thereof.

The Corporation does not bind itself to accept the lowest or any Tender.

(By order)

C. EUSTACE WILSON,

Town Clerk.

Town Hall,

East Ham, E.

January 14, 1914.

(1,171)

(1,166)

HILL'S MOTOR VACUUM ROAD CLEANSER AT BRADFORD.

Mr. J. Hill's Patent Motor Vacuum Road Cleanser, Limited, 4 Broad-street-place, London, E.C., have had their patent motor vacuum road cleansing machine at work in Blackburn during the strike of the scavengers. They loaned a machine to the Blackburn Corporation, and it has been doing excellent work. The street, owing to the lockout, have been in a very dirty condition through the frost and their unsympathetic condition, and the firm's representative on the spot informs them that in a few hours on Thursday of last week their machine swept and collected over 12 tons of refuse.

Northwich Water Supply.—A town's meeting at Northwich last week approved the promotion by the urban council of a Parliamentary Bill empowering the council to provide, at a cost not exceeding £20,000, a supplementary water supply for Northwich.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

BOROUGH OF BEDFORD.

APPOINTMENT OF MECHANICAL ENGINEER AND FOREMAN.

Applications are invited for the appointment of Mechanical Engineer and Foreman to take charge (under the direction of the Borough Engineer) of the Sewage Pumping Stations and the Refuse Destructor.

Applicants should not be under 30 or over 40 years of age.

Candidates should be able to execute small repairs, and preference will be given to those who have had experience in similar work.

Wages will commence at £2 10s. per week, rising by four annual increments to a maximum of £3 per week, together with house, coal, rates, and light free.

Applications, in candidate's own handwriting, stating age, previous experience, together with copies of not more than three recent testimonials, to be sent to the undersigned not later than 12 noon on Friday, January 30th, 1914.

Canvassing is strictly prohibited, and will be deemed a disqualification.

N. GREENSHIELDS, ASSOC. M.INST.C.E.,
Borough Engineer and Surveyor.

Town Hall, Bedford.

January 9, 1914.

(1,137)

BOROUGH OF NEWARK.

SURVEYOR'S ASSISTANT.

The Council invite applications for the appointment of an Assistant to the Borough Surveyor, at a commencing salary of £90 per annum, rising by annual increments of £10 to £120 per annum.

Candidates should be neat draughtsmen, accurate Surveyors and Levellers, and should have had experience in Building Construction and Sewerage Works.

Applications, endorsed "Surveyor's Assistant," stating age and experience, accompanied by copies of not more than three recent testimonials, must reach the undersigned not later than Tuesday, the 27th January.

GODFREY TALLENTS,

Town Clerk.

Town Clerk's Office,
Newark.

January 10, 1914.

(1,141)

SINGAPORE, STRAITS SETTLEMENTS.

MUNICIPAL ENGINEER'S DEPARTMENT.

The Municipal Commissioners of the Town of Singapore require an Assistant Engineer, between 25 and 30 years of age, of sound constitution. He must have had a good technical education, a regular training as a Civil Engineer, and have a practical knowledge of Surveying, Levelling and Estimating, and experience in ordinary Municipal work, including the collection, filtration, pumping and distribution of water, and in Sewerage Works, both in the design and in the construction of new works and in ordinary maintenance. Preference will be given to an Assistant connected with the Institution of Civil Engineers.

The engagement will be for three years, and the applicant is to state the earliest date upon which he could be free to leave for Singapore. The selected candidate must pass a medical examination.

A second-class passage will be provided by mail steamer, or a first-class passage by other steamer, with half-pay during the voyage out.

The salary will be 300 dollars per month for the first, 320 dollars per month for the second, and 340 dollars per month for the third year, paid monthly in dollars, the currency of the Colony, the value of the dollar being two shillings and fourpence sterling. Local transport duty allowance of 60 dollars per month will be paid.

Applications, stating age and place of birth, and giving details of education, training and experience generally, and in Waterworks, Sewerage and Municipal Engineering, and referring to the above requirements seriatim, accompanied by copies (only) of testimonials, and also personal references, to be lodged with C. C. Lindsay, Esq., M.INST.C.E., 180 Hope-street, Glasgow (who will give further particulars if requested), not later than Tuesday, 20th January, 1914. (1,130)

COUNTY BOROUGH OF WARRINGTON.

The Street Improvement Committee of the Council of the County Borough of Warrington invite applications for the appointment of a Temporary Assistant for a period of not less than 6 months, with experience in Town Planning. Salary £3 3s. per week.

Applications, in candidate's own handwriting, stating age, and giving full particulars of experience and present employment, and accompanied by copies of not more than three recent testimonials, to be sent to the undersigned, endorsed "Application for Town Planning Assistant," not later than Tuesday, the 20th day of January, 1914.

Canvassing, either directly or indirectly, will be a disqualification.

ANDREW M. KER,

Borough Engineer and Surveyor.

Town Hall, Warrington.

January 6, 1914.

(1,116)

KARACHI MUNICIPALITY.

APPOINTMENT OF SUPERINTENDENT OF FIRE BRIGADE.

Applications are invited for the post of Superintendent of the Municipal Fire Brigade. Salary Rs.200/- per mensem. with Free Quarters, unfurnished.

The Superintendent will be a full-time Officer, and, in addition to taking charge of a Motor Fire Engine at fires, will be required to organise the Brigade, to conduct fire drills regularly, and to see that all fire appliances are always in good working order, and generally to act under the orders of the Chief Engineer of the Municipality.

Preference will be given to a young, active man, with experience in a properly organised Brigade, used to obeying and enforcing discipline.

The selected candidate will be subject to all the Municipal Rules, including Leave and Provident Fund Rules, and the appointment may be terminated at any time by three months' notice on either side.

Single second-class fare will be paid to enable the candidate to join his appointment.

Applications, stating age, nationality, qualifications and experience, will be received up to 28th February, 1914.

MEASHAM LEA, ASSOC. M.INST.C.E.,
Chief Officer and Chief Engineer,
Karachi Municipality.

(1,138)

BOROUGH OF GODALMING.

Applications are invited for the position of Borough Surveyor and Water Engineer. Salary £250 per annum, rising by annual increments to £350. Age limit 28 to 45. Canvassing, directly or indirectly, will disqualify.

Particulars and conditions of appointment, and Form of application showing the information which must be furnished, may be obtained at the Town Clerk's Office.

Applications, endorsed "Borough Surveyor," must be delivered at the Town Clerk's Office, Godalming, on or before Saturday, the 31st day of January, 1914.

T. PERCIVAL WHATELY,
Town Clerk.

Town Clerk's Office,
Godalming, Surrey.
January 12, 1914. (1,151)

**BUXTON URBAN DISTRICT COUNCIL.
TEMPORARY ENGINEERING ASSISTANT.**

The above Council require the services of a Temporary Engineering Assistant in their Engineer and Surveyor's Department, at a salary of £2 per week.

The appointment will be made for a period not exceeding 12 months.

Candidates must be competent Levellers and Surveyors, and good Draughtsmen, and must have had general experience in a Municipal Engineer's Office.

Preference will be given to those who have passed the examination of the Institution of Municipal and County Engineers.

Applications, endorsed "Temporary Assistant," stating age, qualifications and experience, and accompanied by copies of three recent testimonials, must be delivered to the undersigned not later than 12 o'clock (noon) on Friday, the 23rd January, 1914.

Canvassing, either directly or indirectly, will be deemed a disqualification.

F. LANGLEY,
Engineer and Surveyor.

Town Hall, Buxton.
January 10, 1914. (1,148)

**BOWLAND RURAL DISTRICT COUNCIL.
APPOINTMENT OF ASSISTANT HIGHWAY
SURVEYOR.**

The above Council invite applications for the Office of Assistant Surveyor of Highways, at a salary of £60 per annum, inclusive of travelling expenses, for the above district, which comprises 19 Townships and about 147 miles of Highways, of which 16 miles are Main Roads.

The person to be appointed will be required to reside at some place within the District approved by the Council, and to devote the whole of his time to the service of the Council.

Applicants must have had previous experience, and the appointment is subject to termination by either party by a month's notice.

Applications, marked "Assistant Surveyor," with copies of two testimonials, to be sent to me on or before the 31st day of January instant.

(By order of the Council)
THOMAS EASTHAM,
Clerk.

21 Church-street,
Clitheroe.
January 12, 1914. (1,154)

**CANNOCK URBAN DISTRICT COUNCIL.
APPOINTMENT OF SURVEYOR'S CLERK.**

The Council invite applications for the above appointment. Applicants must have had experience in a Municipal Surveyor's Office, including the keeping of all the various books, and be an efficient short-hand-typist.

The salary will be 25s. per week.

Applications, in candidate's own handwriting, stating age and qualifications, to be addressed and delivered to the undersigned, accompanied by copies of three testimonials, not later than 10 a.m. on Friday, the 30th inst., endorsed "Surveyor's Clerk." Canvassing will be deemed a disqualification.

C. A. LOXTON,
Clerk to the Council.

Council Offices,
Cannock.
January 7, 1914. (1,157)

COUNTY COUNCIL OF DEVON.

The Council invite applications for the Office of Bridge and Main Road Surveyor for the Northern Division of the County.

Applicants must not be more than 45 years of age, and must have had not less than seven years' experience in the maintenance of Main Roads and County Bridges under a County, Borough or District Council.

Applicants must be either Members or Associate Members of the Institution of Civil Engineers.

Salary £400 a year, with £200 a year for expenses. Office stationery and postages are provided by the Council.

The Officer must devote the whole of his time to the duties of his office, and will be required to provide and use a motor car in the discharge of his duties.

Particulars of the conditions and duties of the office, together with the prescribed Form of application, can be obtained from the undersigned.

Applications, on the prescribed Form, must be endorsed "Application for Surveyorship," and must be received at the Offices of the Council, The Castle, Exeter, on or before the 9th February next.

Canvassing, directly or indirectly, will be regarded as a disqualification, but candidates are at liberty to send copies of their applications and testimonials to members of the County Council.

F. BAILEY,
Clerk of the County Council.

Castle of Exeter.
January 8, 1914. (1,153)

**BOROUGH OF HARROGATE.
SURVEYOR'S ASSISTANT.**

The Harrogate Corporation invite applications for the appointment of an Assistant in the Borough Engineer and Surveyor's Department at a salary of £100 per annum.

Applicants must be neat and expeditious Draughtsmen and accurate Surveyors and Levellers, and must have had previous experience in the preparation of plans, estimates and apportionments, and the carrying out of Private Street Works.

Applications, in candidate's own handwriting, stating age, qualifications and experience, accompanied by copies of not more than three recent testimonials, to be addressed to the undersigned on or before Monday, the 26th January, endorsed "Assistant."

Canvassing, directly or indirectly, is prohibited, and will be deemed a disqualification.

C. E. RIVERS, ASSOC. M. INST. C.E.,
Borough Engineer and Surveyor.

Municipal Offices,
Harrogate.
January 13, 1914. (1,155)

Middlesex Guildhall,
Westminster, S.W.
January 12, 1914. (1,152)

SEVENOAKS RURAL DISTRICT COUNCIL.

TENDER FOR MATERIALS. STEAM ROLLING, TEAM LABOUR, &c., IN CONNECTION WITH THE REPAIR OF HIGHWAYS.

YEAR ENDING 31st MARCH, 1915.

The Rural District Council of Sevenoaks invite Tenders for—

(1) The Supply of Chert, Flints and Ragstone on to the various Roads in the district. (2) The Supply of Granite, Quartz, &c., Basalt, or other approved Hardstone to various Stations in the district. (3) Steam Rolling. (4) Team Labour and Cartage. (5) Haulage from Stations and Quarries for the year ending 31st March, 1915.

Specifications, Conditions of Contract, Schedule of Quantities, with Form of Tender, may be obtained on application at my Office, or from Mr. R. Bailey, Sundridge, Sevenoaks, and Mr. J. Randerson, Leigh, Kent, Surveyors to the Council. Persons applying for Form should state which they require.

The Council do not bind themselves to accept the lowest or any Tender, and they reserve to themselves the right to accept such part of any Tender as they may deem proper.

Samples of Material to be delivered, carriage paid, at this Office, Sevenoaks, and sealed Tenders, marked "Tenders" on the outside of the envelope, to be returned with the conditions intact to me on or before Friday, the 30th day of January.

(By order of the Council)

F. H. VIBERT,
Clerk of the Council.

Bank Chambers,
82 High-street, Sevenoaks.
January 8, 1914. (1,136)

SCUNTHORPE (LINCOLNSHIRE) URBAN DISTRICT COUNCIL.
WATERWORKS EXTENSIONS.

Tenders are invited for the Sinking of a Pump Well, 12 ft. clear internal diameter by about 60 ft. deep, the driving of Adits, and the sinking of Boreholes.

Specification and Bill of Quantities, &c., may be obtained from the undersigned on payment of a deposit of £2 2s., which will be refunded on receipt of a *bona-fide* Tender made out on the form supplied, and accompanied by the Specification and Bill of Quantities.

Drawings may be seen at the Engineer's Office by appointment.

Sealed Tenders, endorsed "Tender for Well, Adits, &c.," must reach Mr. H. M. Hett, Clerk to the Council, High-street, Scunthorpe, on or before the 4th day of February next.

The Council do not bind themselves to accept the lowest or any Tender.

C. CURTIS GRAY,
 Engineer and Surveyor.

Council Offices,
 High-street,
 Scunthorpe, Lincs.
 January 10, 1914.

COUNTY BOROUGH OF GRIMSBY.
TEN-TON ROAD ROLLER, WITH SCARIFIER, FOR SALE.

The Corporation of Grimsby invite offers for a Steam Road Roller, with Morrison Scarifier (weighing, loaded, 13 tons 5 cwts.), made by Messrs. Aveling & Porter in 1900. The Roller is in excellent condition.

Further particulars, including dates when it may be seen working, and also opened out for inspection, may be obtained from the undersigned on receipt of an addressed foolscap envelope (unstamped).

Sealed Tenders, addressed to the Chairman of the Highways Committee, to be delivered at my Office not later than noon on Friday, January 30th instant.

H. GILBERT WHYATT, M.INST.C.E.,
 Borough Engineer and Surveyor.

Municipal Buildings,
 170 Victoria-street,
 Grimsby.
 January 13, 1914.

COUNTY BOROUGH OF GRIMSBY. TO CONTRACTORS.

The Corporation are prepared to receive Tenders for the supply of the following materials, in such quantities as may from time to time be required, between April 1st, 1914, and March 31st, 1915:

1. Chalk.
2. Whinstone or Columnar Basalt Macadam (100 tons per fortnight or 200 tons per month).
3. Slag (Lump, Macadam and Specimens, 500 tons per month).
4. Flags, Artificial.
5. Flags, Yorkshire.
6. Yorkshire Kerbs, &c.
7. Granite Setts, Kerbs and Channels.
8. Pitch.
9. Coal Gas Tar.
10. Lime.
11. Portland Cement (6 tons per month).
12. Drainage pipes, &c.
13. Miscellaneous Brushes.
14. Scavenging Brushes.
15. Drysalteries.
16. Lubricating Oils.
17. Oils (except Lubricating).
18. Paints.
19. Bottles and Corks.
20. Carbolic Acid.
21. Carbolic Oil.
22. Disinfectant Fluid.
23. Disinfectant Powder.
24. Formalin.
25. Formalin Tablets.
26. SO₂ Tubes.

Specifications, Forms of Tender (in duplicate), and all requisite information may be obtained at my Office. Applications to be accompanied by addressed foolscap unstamped envelopes (postcards will not be responded to).

Sealed Tenders, addressed to the Chairman of the Highways Committee, and endorsed "Tenders for Annual Supplies," must be delivered at the office of

the Town Clerk, 170 Victoria-street, Grimsby, not later than noon on Friday, January 30, 1914.

By order)

CORPORATION OF NORTHAMPTON.

The Corporation invite Tenders for the Supply of the following materials for a period of twelve months ending March 31st, 1915:—

1. Broken Granite.
2. Granite Kerb, Setts, &c.
3. Artificial Stone Paving.
4. Stoneware Pipes, Gullies, &c.
5. Portland Cement and Lime.
6. Ironmongery, Wrought Iron, Steel, &c.
7. Tar-paving, Tar-macadam.
8. Blue Bricks, Local Lime, Gravel and Sand.
9. Brooms and Brushes.
10. Coal and Coke.
11. Iron Castings.
12. Timber.
13. Team Labour.

Specifications, Schedules and Forms of Tender may be obtained on application to Mr. Alfred Fidler, M.INST.C.E., Borough Engineer, on and after Monday, January 19th.

Sealed Tenders, endorsed "Yearly Contracts," addressed to the undersigned, to be delivered to this office on or before 12 o'clock noon on Saturday, the 14th February, 1914.

Minutes of Proceedings.

The Nomenclature of Bituminous Substances.

In a letter contributed to our correspondence columns of last week, "Engineer" comments on certain passages in our reply to a letter from another correspondent, and it may be gathered from the general trend of his letter that he is opposed to interference with present usage as regards the terms "bitumen" and "asphalt." We need not repeat the arguments by which we have sought to show that it is necessary that some action should be taken in the matter, but we may point out that there is no class of persons who, as a class, consistently use these terms in the same way; and if an orderly and convenient use of the term is to be brought about it will be necessary to suppress certain uses of one or both words. Our correspondent states that he cannot see the object of departing from old-established definition and usage except for the purpose of gain. But this statement is based on the assumption that only one usage in the case of each word can be regarded as old-established. There is, on another point, some force in our correspondent's contention that the term "bitumen" has all along been understood to apply to a natural product. Unfortunately, the term "bituminous" has not been so restricted. Again, although, to a considerable extent, natural bitumen and natural asphalt have been considered identical as regards their most important constituent, we cannot practically develop this idea, since there would not then be enough words to go round. A prime difficulty in the way of a satisfactory solution of the problem lies in the fact that while the term "asphalt" is usually applied—in this country at any rate—to materials containing certain natural products, the term "bitumen" is, it seems, that which is going to give us the adjective. At the same time the adjective "asphaltic" is sometimes used in referring, for instance, to a petroleum with an asphaltic base. Probably the most promising line of attack is first to decide what meanings are to be given to the words "tar" and "pitch," and afterwards to allot to "bitumen" and "asphalt" each its proper sphere of application. This course, we understand, is being taken by the sub-committee on bituminous materials appointed by the Engineering Standards Committee which is dealing with the subject of road materials. The proceedings of the sub-committee are conducted in private, and it is not permissible therefore to suggest what arguments were adduced by individual members of the sub-committee for or against certain decisions; but the provisional conclusions to which the committee has come are, we believe, substantially as follows:—

It is proposed, in the first place, to divide the materials into two groups, containing respectively

bitumens, and coal tar and pitches. Materials of a hydro-carbon base used as road binders are to be known as bituminous substances, which settles the choice of a word for the general adjective. This definition covers oils of all kinds, and it may be pointed out that possible developments may lead to the use of non-bituminous hydro-carbons as road binders, materials of a sugary nature having been already so employed—at any rate experimentally. This difficulty could perhaps be met by introducing the words "insoluble in water" after "hydro-carbon base." The distinction between tar and pitch is to be made by defining tar (provisionally) as the condensate at ordinary temperatures (freed from water) from the volatile products of the "destructive" distillation of hydro-carbon matter, and a prefix must indicate the nature or source of the hydro-carbon matter, as coal tar, oil tar, wood tar. Pitch will be defined as the residue from the partial evaporation of tar, and possessing a viscosity of not less than some standard to be defined later. The definition for tar seems to accord with ordinary usage, since the term is usually understood to imply that the material has an origin such as those mentioned. As regards pitch, it may be assumed that the viscosity to be defined later will be such as will give us materials solid at ordinary temperatures, since it would be an advantage to retain the meaning usually given to the word "pitch," which is, in popular language at any rate, always a solid at ordinary air temperatures. It might be necessary, however, to adopt some other measure of viscosity which would imply that the material is quite soft at a defined temperature. It may be suggested that if such definitions as these meet with acceptance, it would be desirable that our American friends should agree to use the term "petroleum-tar" and "petroleum-pitch," or perhaps "petroleum-bitumen," giving up the use of the word "asphalt" in describing products derived from petroleum. It can also be pointed out that those persons who are specially interested in the use of the terms "bitumen" and "asphalt" should feel themselves called upon to give opinions as to the employment of the terms "tar" and "pitch," for, as we have pointed out, there are hardly enough words to go round, and the use that can be made of the former pair of words depends upon the range of the latter pair. We are inclined to suggest that such pure or nearly pure natural products as are known sometimes as "asphalt," and sometimes as "bitumen," should be called "asphalt-pitch," and so be distinguished from rock asphalt. The terms "pitch-mastic," "tar-mastic," and "asphalt-mastic" might be employed to describe artificial mixtures of bitumens with mineral matter, such as are used for road carpets.

The danger of symptoms of lead poisoning appearing as a result of consuming water which has a plumbo solvent action is one to which water engineers are fully alive, but it is happily a rare occurrence for an epidemic of a serious character to be directly attributable to this cause. Dr. Frank Seymour's report to the Local Government Board on an outbreak of lead poisoning in the urban district of Guisborough, and its relation to the public water supply is therefore of special interest. It appears that in May, June and July of last year no fewer than seventy-seven cases of known or suspected lead poisoning were treated by the medical officer of health in the course of his private practice, and on reporting this fact to the Local Government Board, Dr. Seymour was sent down with a view to investigating the cause of the outbreak. By a process of elimination he was led to the conclusion that no supposition other than the action of an agency such as the drinking water common to the whole community would meet the case. In investigating the matter some difficulty was caused by the varying results of analyses made at different periods of the year. Part of the water is obtained from a gathering ground of open peaty moorland, and part from springs, and Dr. Seymour points out that variations in acidity and in plumbo-solvency are to be expected in such a water on account of variations in the amount of rainfall which occurred in the period preceding the time of analysis.

It is well known that in gathering grounds of this nature the first flow of the feeders after a drought is markedly acid in reaction, and has considerable plumbo-solvent properties, whereas at the end of a dry period such water as remains flowing in feeders is often free from these characteristics. Since 1912 the water at Guisborough has been subjected to lime treatment with a view to counteracting its plumbo-solvent activity, and although this must have had a considerable effect in reducing acidity, it is a curious fact that more cases of lead poisoning have been discovered in the town since that date than occurred during the preceding years. This is attributed to the erosive ability of the water in regard to lead, a property which requires particular consideration in a place like Guisborough, where great lengths of lead pipe are commonly found. Dr. Seymour accordingly concludes his report with a recommendation that the water company should employ a competent analyst for a period sufficient to enable him to devise and carry out a series of differential experiments. These should be made in reference both to plumbo-solvency and to plumbo-erosive ability, and extend over some considerable time, so that the nature of the water at different seasons of the year, in storm and in drought, may be fully investigated. Laboratory experiments on different methods of treating the water should be carried out, so that not only the widest possible variations, but also the best possible treatment of this particular water may be fully ascertained.

The Policy of Waste.

The Anglo-Saxon race has been described as the most wasteful on earth, and, though other qualities may mitigate the evil, it must be admitted that there is considerable truth in the accusation. In engineering matters the waste occurs partly through ignorance and stupidity, but largely owing to the essentially English method of ignoring obvious facts and the teachings and warnings of authorities, and muddling through to ultimate success, with the dogged perseverance and obstinacy characteristic of the race. This method of procedure, absorbing as it does a vast amount of energy and causing immense waste of money, is exemplified in the large amount of engineering work which is carried out by local authorities without proper advice. The comparatively small sum of money saved upon the

salary of the district surveyor or engineer is wasted many times over owing to the extravagant and sometimes useless works carried out. When after many years of muddling a competent engineer is appointed to look into matters, the local authority is at last forced to recognise its folly, and by the incontrovertible evidence and reasoning of the engineer, backed by the pressure of the Local Government Board, is made to set things in order at last.

The paper read by Mr. H. J. Coleby at the West Midland District meeting of the Municipal and County Engineers on Thursday the 15th inst., appears to contain a record of money spent to small advantage. We do not pretend to any knowledge of the case beyond the author's statements. It may be that bad luck, which occasionally attends the work of the best engineers, may account largely for the trouble, or it may be that Mr. Coleby is in the position of many other engineers who have to take up and make the best of works which have been muddled, having been carried out practically on the unaided advice of a number of un instructed persons. The failure of a large well, the corrosion of mains, the failure of bituminous coating on pipes, an ill-planned system of mains full of elementary mistakes as to arrangement, sizes and levels, are recorded in a very interesting paper. These are, at any rate, typical of the work carried out at the present time by a large number of district councils who are permitted to waste money which could be entirely saved by the employment of a properly paid engineer.

An Interesting Competition.

As we pointed out last week, in commenting upon the memorandum recently issued by the County Councils Association, there can be no doubt that the rural housing question is distinctly in the air at the present time. The present deplorable conditions have led to more than one scheme being propounded for building cottages on a large scale, and some anxiety is now felt in many quarters lest the countryside should be disfigured by rows of ugly cottages built to a stereotyped design. "It would be a national tragedy," said Lord Curzon of Kedleston some time ago, "if, in the building or rebuilding of labourers' cottages, that is likely to follow any systematic attempt made by the Legislature to improve the conditions of agricultural life, these old buildings were to be replaced by a new type of standardised cottage, dumped down either singly or, still worse, in rows like a lot of hand-boxes, or canisters, or dog-kennels, or whatever may be the parallel suggested by the precise degree of monotony and monstrosity presented in their construction. It is doubtful whether the labourer would be more comfortable—he certainly would not be happier—and a cruel injury would be done to the beauty of the countryside. The best way to prevent such a catastrophe seems to me to lie in the preparation of plans, sketches and models of cottages of different materials and styles, suitable to differences of locality, climate and surroundings, which could be erected at moderate prices. Such a work, abundantly illustrated and accompanied by careful estimates, might be an invaluable guide to landed proprietors, building societies, syndicates, county or district councils, and even to Government departments in the near future."

In order to carry out this suggestion the proprietors of *Country Life* have organised a National Competition, the practical value of which will be considerably enhanced by reason of the fact that a number of landowners have agreed to build a pair of cottages to the prize-winning design in each of the districts into which the competition is divided. The jury of assessors which has been appointed will command full confidence, and many valuable prizes are offered. It is hoped that the architectural profession will prove their ability to produce designs

combining skilful planning, pleasing exteriors, and rigid economy. It is only by solving the difficult problem in this way that the threatened defacement of rural England can be avoided.

* * *

The Design of Signposts: The Road Congress Awards.

In our issue of last week we described the designs for road direction posts, or signposts as they are usually called, which have been placed first, second and third in the competition in connection with the Third Road Congress. It will be noticed that the three designs have several features in common, the point of chief practical importance being the way in which the arms are fitted to the post. In this respect the simplicity and robustness of Mr. Sinnott's design is a very good feature, and we congratulate the county surveyor of Gloucester on his success in satisfying the judges on this and other points. The main features of his design are such as could be utilised with arms of a different pattern, and it is probable that few surveyors will accept the proposal to use stamped steel plates for the lettering. It would, we think, be better to use squares of a very hard wood, or of cast iron, with the letters painted on a flat surface. There would be no difficulty in fitting a plain wooden arm with a metal boss which would fit into the socket of Mr. Sinnott's adjustable collar. The British committee which reported to the congress on the subject of signposts recommended the use of wooden arms, and we endorsed this recommendation in our issue of October 31st.* If raised letters are, as we believe, inferior in visibility to letters painted on a flat surface, the cost of repainting is not a matter that should decide the choice. As regards the precise form of the upper part of Mr. Sinnott's post, the reason for the adoption of the beadings is not apparent, for a simple octagonal section would seem to fulfil all the requirements, and it would be easier to make the collars which have to be slid on to it. The principle is excellent, however, since an octagon would almost always provide a side facing nearly enough in the required direction, and the device provides, in a very practical manner, the advantage of having a post which can be fixed without reference to the directions in which its arms will point. It may be suggested that Messrs. W. & F. Wills' signpost has the disadvantage that the arms cannot readily be removed for alteration or renewal, while the attachments devised by Messrs. W. Weeks & Son are not so simple and are less rigid than that of Mr. Sinnott.

* * *

Lettering and Legibility.

Of the three designs, that of Messrs. Wills appears to us to be the best in one respect, the arms being without bordering, while that of Messrs. Weeks may be commended for the introduction of the name of the place near or in which the post stands. This should not, however, we suggest, be shown on the arm itself, but in some other position, preferably on the top of the post, and in any case with the lettering horizontal. Within a mile of the border of a county the name of the county might be used instead of the name of the place: but not elsewhere, as it is a vital error to introduce symbols or words which may intercept the glance of the traveller. As regards the lettering, there is no advantage whatever in specifying the size of the letters. Two principles should be followed - first, the best shape and thickness for each size of letter should be found by actual tests of their visibility. Some relation of height to depth will give the best visibility for each thickness, and these being found, the letter which is actually the best of a given width will be ascertained by a further test, the width being the dimension deciding the size for a given word in a given space. Next, a further set of tests will disclose what spacing in a given length, and therefore what size of letter,

gives the best results. If larger letters are adopted the word will be less visible, because the letters will be too close together, and if smaller letters are used the word will be less visible for that reason. The usual error is to make the letters too large, visibility being reduced not only by crowding, but also by lack of margin. In many cases the word begins too near the post, where, even when the arms are not at the same level, it may be obscured by another arm. In this respect Mr. Sinnott's design is the best of the three. These principles should be followed, and no attempt made to specify the size of the letters, except that for each length of the word there will be a suitable size fixed, in the case of very short words, by the amount of margin above and below the word which is found to give the best results. In the case of longer words these margins will be ample, and the length assigned will be fixed by the end margins.

* * *

The Beverley Council's Defiance.

By nine votes to eight the Beverley Rural District Council have determined to ignore the order of the Local Government Board to provide an adequate drainage scheme for Elloughton within the space of eighteen months. In other words, the council have resolved openly to defy the board. In vindication of this attitude a councillor pointed triumphantly to the death-rate of Elloughton, which he stated was only six per 1,000. As a mere figure this may appear rosy enough, but translated into the vocabulary of zymotics it may be quite bad enough to demand the serious attention of the health authority. The important point to consider, however, is not so much mortality statistics as the fitness of the local sanitary conditions to ensure as far as this is humanly possible the public health from the danger of preventable disease. In this respect it is notorious that the district is grievously in default. The officer who inspected the locality was an independent expert, and according to his judgment a scheme of sanitation in Elloughton is necessary and urgent. Thus the majority of the Beverley Rural Council are sinning against the light by setting themselves in direct opposition to the advice of the Local Government Board. The chairman, Mr. John Jackson, pleaded vainly with them to pursue a reasonable policy, and pointed out that the only possible result of their obstinacy would be that the council would incur an additional expense of £600 or more if someone else did the work. Even this did not move them, and the vote resulted as stated. Whether the council will persist in this course to the end remains to be seen. If they do we fear they will have a rude awakening, and realise when too late that it is hard to kick against the pricks.

* * *

London Traffic.

A close study of London traffic problems discloses the fact that while the principles upon which these problems must be attacked can be discovered, and are fully applicable, they are so obscured by compromises and apparent paradoxes that a study of London's traffic problems is of less general interest outside the metropolitan area than are technical studies relating to municipal work. In other areas demand and supply in traffic matters are usually more or less balanced; but in London the demand for facilities seems inexhaustible, and when passenger-carrying enterprises suffer reduction of their profits the public gains in convenience and comfort. The Sixth Report of the London Traffic Branch of the Board of Trade, which has just been issued, contains, therefore, much that is of interest to engineers familiar with the Metropolis, but little that need be studied by other engineers and surveyors, and, in the review of this report, which will be found on another page, we have confined our attention to a few leading points.

* See pp. 658 and 684.

London Traffic.

SIXTH REPORT OF THE LONDON TRAFFIC BRANCH OF THE BOARD OF TRADE.

The reports of the London Traffic Branch of the Board of Trade are of much interest to Metropolitan borough engineers, who find in these documents more or less authoritative pronouncements on matters affecting the maintenance of streets, and suggestive of policy as regards street widening, or the construction of new thoroughfares, and the sixth report, which has recently been issued, demands careful consideration. Even the statistics of street accidents, though primarily a matter to be studied by the police authorities, have a bearing upon the work of highway engineers, on whom falls the responsibility for the adaptation of the roads to the requirements of tramway and motor omnibus traffic. As regards the nature of the streets which are classed among the sixteen worst thoroughfares with respect to fatal accidents, nothing can be gathered from a study of their features unless we apply the necessary corrective factors for length, some of these thoroughfares being much longer than others. It has been suggested that the fact that all but three of these roads are tramway routes is "extremely significant," and it is certainly worthy of note that neither Fulham-road nor King's-road is included in the list of roads the accidents in each of which have caused from four to nine deaths. The number of journeys per head of population has increased since 1903 from 145 to 244; and, taking into consideration the passengers carried by local railways, the number of journeys per head taken by road has about doubled. The population has also increased by about one-tenth, so that the proportion of accidents may be considered to be about the same, although the actual number has about doubled.

MOTOR OMNIBUS ACCIDENTS.

The large number of deaths caused by motor omnibuses is, however, a very serious matter. The proportion of fatal accidents per 1,000,000 miles-run was 2.14, against 0.42 for tramcars; or for omnibuses 0.339 per 1,000,000 passengers, against 0.046 per 1,000,000 passengers carried by tramcars. It is quite likely that the latter vehicles were mainly responsible for some of the deaths directly caused by motor omnibuses; but, however they arise, the number of these fatal accidents is too high. The adoption of the rear-wheel guard will, however, considerably reduce the number of fatal accidents, and a front-wheel guard will no doubt be devised. The motor omnibus is responsible for a large number of accidents where traffic is "considerable," "congested," or "very congested," but where the traffic is "medium or light" it compares "most favourably" with other vehicles. Commenting on this the *Engineer* remarks: "Clearly, therefore, if there be room for it to avoid foot passengers it does so; whereas light motor cars, which, if carefully driven, should be much more easily managed than motor omnibuses, account for very nearly half the fatalities that occur where light or medium traffic prevails, and in uncontrolled streets are the most dangerous of vehicles." It may be pointed out, however, that a speed which is safe under some circumstances for a motor omnibus is much too high for some kinds of motor cars under the same circumstances; the reason being that with the latter vehicles the proportion of braked weight to total weight is much smaller than it is with the motor omnibus. Defective as it is in some respects, the motor omnibus is in other respects a much handier vehicle than some of the large private motor cars which use the main roads of London.

CENTRE STANDARDS.

Centre standards are condemned in the report, except in so far as they act as refuges. "Usually, however, there is so little space between them that they become practically one continuous refuge, and as such, in the majority of streets in which they exist, are redundant, and so unnecessarily obstructive. In combination with the failure of slow-moving vehicles to keep to the kerb they form a grave obstruction, and indirectly a danger, in that they induce faster vehicles in overtaking those moving less rapidly to pass either the vehicle or the standard on the wrong side." It is clear that the relatively close spacing is a factor of importance, and the sentence quoted

does not necessarily express a view at variance with our own—namely, that in streets of a certain character refuges properly shaped and spaced at considerable distances apart serve to steady the two streams of traffic, while allowing of a reasonable latitude in the use of the other half of the road. On streets of a different character any kind of central obstruction is a disadvantage, and on semi-urban and country roads they are highly objectionable.

BREAKING UP STREETS.

The right to break up the roads and streets of London is vested in some forty to fifty authorities and companies, and in some individual streets the number of such authorities is considerable. The report recommends that the Commissioner of Police should be consulted as to the breaking up of streets, and that work should be carried on by night as well as by day. It is difficult to see how the Commissioner of Police could expedite matters, and if suitable pains and penalties could be enforced in cases of delay or of needless obstruction, the only person able to weigh the facts would be the borough engineer or highway surveyor. To place matters in the hands of non-technical officials would result, on the one hand, in the acceptance of ingenious but unfounded excuses for delay, and, on the other hand, in a failure to see the importance of real difficulties and consequent friction.

OTHER POINTS.

It is worth noting that in 1913 88 per cent of the trade vehicles in London were horse-drawn, and it is therefore necessary to continue to pay attention to all those features of street paving which have been developed during the last twenty years.

As regards the widening of streets and the creation of new ones, the report is in favour of the latter policy. The widening of a street is always costly, the premises fronting it being much more valuable than the average of the properties of which they form a part, while during the whole of the period occupied by widening traffic is obstructed and business interfered with. In this connection it may be suggested that before any important roads are planned careful consideration should be given to the advantages as regards first cost and future serviceableness which are offered by roads so designed that they shall not be streets. This principle, as applied to by-pass roads, was put forward in an article by Mr. Reginald Ryves, M.CONS.E., which appeared in one of our issues of last year.

Surveyors' Institution.—At a meeting of the Surveyors' Institution to be held on Monday evening next at Great George-street, Mr. George Corderoy, member of the council, will read a paper entitled "Measuring and Quantity Surveying." The chair will be taken at eight o'clock.

Snow Removal in a Canadian City.—In Toronto during the past year the length of sidewalks from which the snow was cleared opposite vacant properties, and for which the owners were charged, was no less than 446 miles. An idea of the extent of other civic works carried out there during the same period—under the direction of Mr. Harris, the Toronto Works Commissioner—is gathered from the fact that over 23 miles of sewers, 54 miles of pavements, and 68 miles of sidewalks were constructed. Five miles of macadamised roadways were resurfaced.

Oaklands' Enterprise.—Direct evidence of the new spirit of enterprise on the Pacific Coast is to be found in the large civic undertakings in which the city of Oaklands, on the east shore of San Francisco Bay, is engaged, including the initial expenditure of £500,000 on the construction of a quay wall along its inner harbour, to be equipped with modern warehouses, electric cranes, and a belt railway; the reclamation of over 400 acres of submerged lands which are to be made available under municipal control for factory and warehouse sites; the erection of a new city hall to cost £300,000, and the elaboration of an extensive system of parks, boulevards, and public recreation grounds. The city is also spending £600,000 in the extension of its educational facilities, and the building of a municipal auditorium and convention hall.—From the *Times* "Pacific Coast Number."

Institution of Municipal and County Engineers.

WEST MIDLAND DISTRICT MEETING AT BIRMINGHAM.

The Institution of Municipal and County Engineers held a district meeting in the Council House, Birmingham, on Thursday afternoon, the 15th inst., the business including the consideration of a paper, "Water Supply in the Atherstone Rural District," prepared by Mr. H. J. Coleby, the engineer and surveyor to the local authority. The contribution in question, we may remind our readers, appeared in last week's issue of *THE SURVEYOR*.

Mr. A. T. Davis (Shrewsbury), county surveyor of Shropshire, presided, and there were present Messrs. H. E. Stilgoe (Birmingham), C. F. Gettings (Worcester), H. J. Coleby (Atherstone), G. W. Lacey (Oswestry), W. Plant (Stafford), W. B. Chancellor (Lichfield), W. H. Jukes (Tipton), A. S. Parsons (Birmingham), H. M. Lawson (Birmingham), R. Fletcher (Worcester), T. Stanford Griffin (Wolverhampton), J. D. Barrs (Bromyard), E. H. Crump (Hinckley), T. H. Eayrs (Birmingham), J. S. King (Birmingham), J. T. Fitch (Birmingham), J. A. Burnett (Nuneaton), R. C. Moon (Nuneaton), E. B. Savage (Birmingham), F. C. Cook (Nuneaton, hon. district secretary), H. J. Clarson (Tamworth), E. J. Goodacre (Nuneaton) and A. J. Dickinson (Redditch). The visitors attending the meeting were Messrs. T. H. Jones (Nuneaton) and T. V. Oliver (Tamworth).

Letters of apology were received from Messrs. S. Douglas (Kenilworth), J. Green (Wolverhampton), E. Hallway (Evesham), A. E. Newey (Foleshill) and W. Ranson (Worcester).

A letter was read from Mr. H. H. Richardson thanking the members of the district for the present of a silver salver made to him on the occasion of his wedding. His wife and himself very much appreciated the gift, but still more did he value it as proof of the fraternal feeling of the members.

THE JOURNAL.

Mr. COOK read letter from Mr. D. Edwards, hon. secretary of the South-Western District, forwarding the following resolution passed at a meeting of the South-Western District of the institution at Paignton: "That this meeting of the Institution of Municipal and County Engineers request the council of the institution to take a postcard poll of all the members of the institution asking them whether they are in favour of retaining the annual volume or not."

The CHAIRMAN said he would like to hear the views of the meeting on this resolution. The South-Western District wanted them to join in petitioning the council with regard to the change from the annual volume to the monthly journal. They had had the journal now for some months, and were in a better position to decide individually which they liked best. He thought in a matter such as this they should sink their individual opinion, and try to ascertain what was best for the institution. He might say that when the change was made he did not like it, and was sorry about the proposal to abolish the annual volume; but he was getting used to the change.

Mr. R. FLETCHER (Worcester) asked why the council did away with the annual volume. He did not understand why the change was made.

The CHAIRMAN took it that the change was made because it was thought it would be in the best interests of the institution that they should have earlier information of the proceedings of the institution. Of course, he was quite aware that they got that information through the various technical publications. He was not a member of the council at the time the change was made.

Mr. H. E. STILGOE (Birmingham) said it was thought by a good many members that the publication of the volume came too late to be of great interest to the members.

Mr. G. W. LACEY (Oswestry) said he was one of those who at the annual meeting at Yarmouth took some objection to the change. Innovation always gave rise to criticism, and one hardly liked to leave the beaten track. He did not think there was a great deal in the fact that they got the papers and discussions earlier, because they had the papers in the technical press, and the bulk of the discussions upon them. He felt himself that there were some advantages in the new arrangement, and seeing also that it had received the sanction of a general meeting, he did not feel disposed to invite the council to take a

poll of the members at this stage. He did not think it was so vital a matter that it was necessary to go behind the council at that meeting. If at the end of twelve months they were not satisfied, then was the time to raise it. His views had not changed since the annual meeting at Yarmouth in that one preferred to get the volume as before, but he thought the change was not so vital that they need make a fuss about it.

The CHAIRMAN: Shall we let the matter rest for twelve months, and send an acknowledgment to this letter intimating that the members of this district are not in favour of asking the council to take a poll on this point at present?

On the proposition of Mr. W. B. CHANCELLOR (Lichfield), seconded by Mr. W. H. JUKES (Tipton), this course was adopted.

WATER SUPPLY IN THE ATHERSTONE RURAL DISTRICT.

In submitting his paper on this subject, Mr. COLEBY added that he had brought with him a section of the borehole. Further it occurred to him that some of the members might be interested in the housing question, and he had brought the plan of ten cottages which his council had just finished in Atherstone. The cost was £148 per house, and they were let at 5s. per week.

Mr. H. J. CLARSON (Tamworth) proposed a vote of thanks to Mr. Coleby for his paper. With regard to the Candy filters, so far as he could judge they had been a great success. They got part of their water from Kingsbury, and in that parish they had more than 30 miles of mains to serve a population of less than 5,000. As Mr. Coleby said, they got a precipitation of iron oxide in the pipes, and although the water was as pure as it possibly could be, and there were no ill effects from drinking it, yet the people were loth to use it because of its discoloration. They went to Buxton and other places and saw different types of filters. Ultimately they decided to ask the colliery company to adopt the Candy filter. The filters had been down a little over twelve months, and so far they had done the duty expected of them. They could not speak too highly of them.

Mr. E. B. SAVAGE (Birmingham) asked Mr. Coleby to give them the degree of hardness, as the question was a very interesting one to Birmingham at the present time. One of the principal points Mr. Coleby put for discussion was whether, in designing a scheme for a country district, it was good policy to provide for mains reaching to every part of every parish for supplying a few scattered houses, where there was already, or where there could be obtained, a good supply from wells on the premises. That put him rather in mind of a sewer which was put in some thirty years ago to drain one farmhouse. That farmhouse belonged to the chairman of the council. So he thought a good deal depended on who lived in the houses and whom they belonged to. Still, he would have thought, taking it all round, that the wells in country districts, if sunk to a proper depth, should be a sufficiently good supply. Mr. Coleby asked whether any member had used Prentice's hydrant flow gauge for testing the capacity of the fire hydrants in his district. He had no experience of that particular gauge, but in Birmingham they used a good many meters, in fact, all the water they used for street watering and flushing purposes was passed through a meter. It was on the turbine principle, and as far as he knew they worked very satisfactorily. The only point was whether the water passing through the gauge, in the case of a fire hydrant would not take off the pressure; but he hardly thought it would, as they were on the turbine principle. Mr. Coleby also asked as to any experience in the use of an air lift. The only place he knew in Birmingham where an air lift was in use was Saltley. So far as he could see it was very simple and very effective.

Mr. W. B. CHANCELLOR (Lichfield) said with regard to providing water mains for scattered houses, if wells were sunk sufficiently deep they ought to be quite satisfactory. The great difficulty in rural districts was with regard to the treatment of sewage. There was always the danger of pollution taking place, particularly when people lived in cottages. Then as to

the prevention of fires, his experience was that in most country parishes they had no means of making use of a fire hydrant. He did not know whether Mr. Coleby had considered the question of providing a good house reel, and instructing a man how to use it. Sometimes it would prevent a good deal of damage.

Mr. J. S. KING (Birmingham) said the cost of carrying the mains to scattered houses in a rural district would be the principal item; but when they got a house with a pigstye at the rear and well close by not properly protected, it was very likely there would be pollution. As the medical officers in rural districts were now equally active as in the towns, it would be as well, where they could possibly do so, to provide mains and supply water. As to fire, a small hose cart was very good if they had a supply of water, but without the pressure it would not be any good at all. At Worcester they had an air lift working on the sewage disposal works.

Mr. A. S. PARSONS (Birmingham) said he noticed that it was proposed to line the 20-in. borehole with lining tubes of 18 in. If it was proposed in that way to blanket the sand, it would be well to get the lining as tight as possible, or otherwise he would get a good deal of sand into the pumps. The lining was to start at a depth of 160 ft., where the friable bed began. As to air-lift plants, Mr. Savage was not correct in saying there was only one in Birmingham. He had put in two himself, and he should say there were a dozen others. An air-lift plant was an uneconomical way of raising water. The maximum efficiency was from 30 to 35 per cent. It seemed to him that 10,000 gallons an hour was a low yield for a borehole of this diameter, and he doubted very much if they would get a great deal more out of it as it took twenty-four hours to regain the saturation level. It indicated that the rock round the well was hard, and offered obstruction to the free flow of water.

Mr. F. C. COOK (Nuneaton) said the whole of the water supply at Nuneaton was obtained from wells sunk in the Permian formation, which had not been regarded as rich in water. They had a very curious experience of what Mr. Coleby called the capricious character of the yield of the water-bearing rocks of this description. Their first well was taken down to a depth of over 600 ft., but it was yielding to-day only 80,000 gallons. That had been the maximum yield, but a well sunk in the same measures, nearer the outcrop, to a depth of 320 ft., was yielding from 600,000 to 700,000 gallons. One curious point in connection with the water from these two wells was that at the deep well they were not troubled with the oxide of iron; yet they got oxide of iron in a considerable degree in the second and shallower well. This oxide of iron was dealt with by sand filters put down twelve or fifteen years ago, and they had very little evidence of the deleterious effect on the coating of the pipes. One point Mr. Coleby mentioned was the small difference in level between the two service reservoirs. That should be taken as a curious instance of optimism in the original calculations for the scheme. In his mind it was absurd; it was a waste of money to extend mains to rural districts where the population was small unless there was a very obvious reason for the extension of those mains. He took it from the paper that the mains had been extended because there was a house here and there. That seemed to be the very reverse of economical administration, and it was rather surprising to hear of its being done.

Mr. W. PLANT (Stafford) said Mr. Coleby had given them records of failures which were more interesting than successes. He would like to ask Mr. Coleby whether he got many complaints as to "dead ends," as he must have a large number of them. He had a few dead ends, and was constantly getting complaints. As regarded the supply of the whole of the houses in scattered districts, assuming they had already got a supply of well water, he should say it was not desirable to extend under such conditions. The paragraph with reference to the connecting main between two service reservoirs was very interesting. It occurred to him whether it would not be useful to keep the main constantly charged to prevent it getting air-locked. He was rather surprised to hear that any local authorities were in the habit of laying 2-in. mains. It left very little room for incrustation, and in the case of fire was almost useless. He wished to know whether the tube to be inserted in the new borehole would be perforated.

Mr. T. S. GRIFFIN (Wolverhampton), speaking of the water supply of farmhouses in country districts, said in the district where he was prior to taking up his present position, they had three water schemes,

but there was a good deal of the district to which it was impossible to take the water under pressure, except at considerable expense. They had to supply a small hamlet of twenty-two houses, for which there was not a good well. A borehole was sunk about 350 ft., a pump was fixed there, and a good supply obtained for the houses. The nearest main to those houses was $3\frac{1}{2}$ miles away. Mr. Coleby had mentioned that the water had attacked the mains in his district and caused trouble, but in a case like that he had spoken of, where they would have to carry the water a long distance, and allow it to lie in the mains, it would cause even greater trouble. Then in the case of a school which was $3\frac{1}{2}$ miles away from the main, a borehole was sunk, and plenty of water was obtained. He could also tell Mr. Coleby of a very successful air-lift plant at Wolverhampton. It was installed at a dairy.

Mr. R. FLETCHER (Wolverhampton) said Mr. Coleby told them that a colliery company supplied him with water in bulk at a cost of 6d. per 1,000 gallons. Would he tell them the cost per 1,000 gallons of the water which he pumped, so that they might have an idea how it compared with the cost of the water he bought in bulk?

Mr. E. J. GOODACRE (Nuneaton) asked the relative positions of the wells in No. 1 and 2 area, considering the success of the one and the failure of the other.

Mr. J. D. BARRS (Bronyard) asked Mr. Coleby how he explained the faults in distribution systems. He said: "In one part of the district a service reservoir is supplied from another reservoir about $1\frac{1}{2}$ miles distant, with only a small difference in level. The main connecting the two reservoirs was laid to follow the contour of the ground, and although it first comes below the hydraulic gradient, considerable trouble is experienced from air-locking at the highest points. The author has reason to believe that when this main was designed the head taken for discharge was that due to difference between top-water level in the upper reservoir and floor level in the lower reservoir. The result is that if the water level in the upper reservoir falls, and the lower reservoir is nearly full, the head is so reduced that the main only discharges about 50 per cent of the amount for which it is designed, while the high points in the main rise above the hydraulic gradient, and the air-locking eventually becomes bad enough to almost stop the flow." He could not see how that was compatible. Then with regard to the elongated air bubbles in the main. He had experienced the same difficulty, and he had got over it by placing a valve on the highest point of the distributing main.

Mr. G. W. LACEY (Oswestry) commented on the very small difference in specific gravity which Mr. Coleby found had an appreciable effect on the working of his oil engine. Motor engines were used with all sorts of specific gravity oils, ranging from 7.2 up to 8.1. One was rather surprised that even such a small range as .005 should have that effect. Still, if Mr. Coleby had proved it, there was nothing like proof. With regard to this question of air locking, some five years ago he laid a main for a subsidiary supply with only 10 degrees of fall between the intake and the delivery. Although he went down 8 ft. or 9 ft. in the lowest point, he was bound to keep the main about 2 ft. above the hydraulic gradient. Notwithstanding that he had difficulty in starting the main with air locks, and a very long time was taken to suppress all the air from the highest points. Even with pretty good-sized air valves the air leaked back, and moved very slowly where they had a main discharging under a low head. The main was from the Liverpool Corporation's aqueduct joined up to the Oswestry service reservoir, the difference of height being the level of water in the Liverpool aqueduct and the height of the water in their own reservoir. It was a combined main of three diameters, and making the calculation for the combined main with the difference in head the delivery was ascertainable. The effect of the delivery through that main was not quite in accordance with that. They got during the period of maximum draught a delivery considerably over what they calculated to be the delivery on the hydraulic gradient between the two reservoirs as a combined main. When he designed the main Mr. Parry, the engineer of the Liverpool works, said to him: "I am afraid you have got it too small; if I had put it in it would be a 10-in. main throughout." They did not want to put it in that size, because they only wanted to use it, perhaps, once in five years. It was interesting to know that they had been getting a larger supply than they expected. He believed the Prentice hydrant flow gauge

was a reliable means of gauging pressure in the mains. When a flow took place it was the only way of ascertaining what pressure they had in their mains under working conditions.

Mr. T. W. EAYRS (Birmingham) said Mr. Coleby told them it remained to be seen whether the destructive action on the bituminous coating of the mains would cease now that the iron had been removed, or whether in oxidising the iron CO_2 had been liberated in sufficient quantity to render the water acid enough to attack the metal of the mains. That was more a matter for the chemist than the engineer; but he did not think it was at all likely it would affect the coating or the metal.

The CHAIRMAN (Mr. A. T. DAVIS) said Mr. Coleby did not tell them who the engineer was; they knew it was not Mr. Coleby for he had only been in the district about twelve years: but whoever was responsible for designing this scheme did not make very careful calculation of the hydraulic gradients; that was pretty obvious. There were two ways of looking at this question of a water supply for a rural district. The medical officer of health was busy in the rural parishes. He looked round and said: "You have not a proper supply; the water is contaminated," and he advised the authorities to go in for a public supply. The question of cost then came in. If they could find wells, and keep them free from surface contamination, all well and good. That was more difficult than it seemed. The wells were sunk in close proximity to offensive matters, manure pits, and so on, and it was most difficult to exclude contaminating matter from the water. With regard to these long links of main radiating from a centre it was foolish to put in a 2-in. main to distribute water a considerable distance from the source. It was ridiculous to expect to get any pressure to combat a conflagration from a 2-in. main. The first cost must be considered, but it would be far better to put in a 3-in. main; then it would be an easy matter to put a hose reel and hydrant in a village, and thus get the full benefit of the water running out to isolated hamlets.

The vote of thanks having been adopted,

Mr. COLEBY, in reply, said that Mr. Savage had asked as to the hardness of the water. The hardness of the water for one half of the water which was covered by the carboniferous formation was about 26 deg. In the other part of the district in which they had just sunk this new borehole in the bunter, or new red sandstone, they had got from the first samples 18 deg. of hardness; but when they had excluded a portion of the water they expected that to fall to 15 deg. As to the hydrant flow gauge Mr. Savage had mentioned, that was an ordinary standpipe with a meter attached. He did not think that arrangement would answer for testing the flow from a fire hydrant, because there was a considerable loss of head in passing the water through the meter. The Prentice hydrant flow gauge was constructed so that there was nothing to obstruct the flow. There was simply a tube with an anemometer and pressure gauges attached, so that they could tell the exact flow at any minute. Mr. Chancellor suggested that a hose cart and reel might be kept in the country parishes in case of fire. In his district the parish councils undertook the maintenance of the fire brigade—that was, where there was a brigade—but there were only two brigades in eleven parishes. The parishes he was more particularly referring to were parishes with very small populations indeed. They were a few scattered houses and farms, and he did not think it would be advisable to get a hose reel.

Mr. CLARSON: They never have a fire, except a rick, and it is better to let that burn out.

Mr. COLEBY remarked that Mr. Parsons asked why the tubes in the borehole were to be 18 in., while the borehole was 20 in. The 18 in. was the size of the interior of the tubes, which were $\frac{7}{8}$ in. thick, and externally socketed, which would bring the external diameter up to the size of the borehole within 4 in. Then it was proposed to cement the tubes. The sand was very fine, and found its way through almost any perforation. Then as to the yield of 10,000 gallons per hour, or 224,000 gallons per twenty-four hours, pumped for fourteen days, it was the opinion of their geological adviser that they could obtain 400,000 gallons a day from the borehole, considering the strata and the outcrop. There were a number of fissures in the strata. The water was good. He was glad to hear from Mr. Cook that the water did not affect the pipes in his district. He was not sure whether in his case some of the trouble was not due to the improper coating of the pipes. There were complaints from

people who lived at the dead ends. The pipes were being constantly flushed. While the water charged with iron was going through there were more complaints. He agreed that a good deal of the foulness was due to sulphuretted hydrogen. There was a distinct tarry smell or flavour about the water, though some of the mains had been down for nine years. Mr. Plant suggested that the mains should be kept charged to prevent air-locking. Since the Candy filters had been installed the trouble from air-locking had been more than usual. It occurred to him that the oxidisation being done by compressed air would have the effect of charging the water with air, which would account for some of the trouble in the mains. He had not found air valves which would act in both directions satisfactorily. The supply of rural villages must always be ruled by circumstances. They had long lengths of main—in one case 3 miles of main which had only six connections for cottages on the whole length. The cost of long mains like that where the rateable value was very small, went very near to the limit of the borrowing power of the parish, and they had nothing left for other work. Mr. Fletcher asked for the cost of water pumped in comparison with water bought, but he was not able to give it. He was asked as to the reason for difference in yield between the wells in No. 1 and 2 districts. They were in the same formation, the perinian. No. 1 was in that part of the perinian which lies immediately over the top of the coalfield, while No. 2 was situated on an outlier on the boundary side of the Warwickshire coalfield. Why there should be such a good supply from No. 2 well while there was a failure in No. 1 he could not tell them, but he should say that the water had been depleted by colliery workings. The hydrant was tested under real working conditions, as if there were a fire. The standpipe was put on with hose and nozzle, and the water was measured through a meter. At the same time, the main was supplying all the houses, and, having only a 2-in. main, the head was reduced in that way before it got to the hydrant. They had to take these things as they were, and these were the absolute conditions as would obtain in the case of a fire. The main ought to be sufficient to supply for a fire as well as the house services at the same time. In this scheme there was evidence of bad designing, but he did not think from what he had heard that the engineer was to blame. They all had to give way to their council. As to the size of the mains, they were laid thirty years ago, and he did not suppose the Local Government Board would sanction a loan for 2-in. mains to-day. He had heard that when this scheme was first introduced a consulting engineer got out a very efficient scheme with nothing less than 4-in. mains, but the cost was so great that the council would not hear of it. Someone else came along and said: "I can do this job for half the amount," and so they had got 2-in. mains throughout the district.

THE ANNUAL MEETING.

The date for the annual meeting of the Institution of Municipal and County Engineers at Cheltenham has been fixed definitely for June 24th, 25th, 26th and 27th next. It has been decided to make a special feature of town planning and of roads, and, if possible, to arrange for an exhibition of town plans.

SOUTH-EASTERN DISTRICT MEETING.

At the meeting of the South-Eastern District held on Saturday last at the institution offices, Mr. A. Dryland presiding, the question of the recognition of the institution by the Town Planning Institute was raised, and it was decided to request the council to take steps to secure the desired representation, which, it was stated on the authority of Mr. T. Adams, the president of the new body, was likely to be forthcoming.

A meeting at Tunbridge Wells on April 4th was announced, mention being also made of one at Dover on May 16th, and of another—since definitely fixed for June 6th—at Southend-on-Sea.

The annual dinner of the South-Eastern District was afterwards held at the Westminster Palace Hotel, among the company being Messrs. H. Percy Boulnois, H. W. Bowen (hon. district secretary), J. H. Brierley, E. R. Capon, R. Chart, junr., A. Clark, T. Cole (secretary), J. S. Crawshaw, W. H. Grieves, F. Harris, R. Honey, W. Hosken, H. W. Longdin, J. Marshall, T. A. F. Phillips, A. E. Pre-cott, G. M. Seels, C. Chambers Smith, G. W. Warr, R. Wilds and W. Wright. Mr. Dryland presided over the gathering.

RAMSBOTTOM'S LATEST MUNICIPAL UNDERTAKING.

REFUSE DESTRUCTOR AND STEAM DISINFECTOR.

A destructor plant which is now completed and in readiness for active operation is the latest feature of development in the town of Ramsbottom. For several years past the unsatisfactory disposal of the town's refuse has been a matter of concern to the council, for it was fully recognised that the tipping of the refuse at certain points was, to say the least, a most insanitary method, and one giving rise to objections from the householders living in the neighbourhood of such places of deposit. As far back as 1907 a sub-committee of the council visited various towns, with a view to ascertaining what was being done in the way of destroying the waste materials collected from the houses. Following on the committee's report, a Local Government Board inquiry was held with regard to the council's application for sanction to borrow £2,150 for the purchase of land, a portion of which it was proposed to utilise as a site for the destructor and disinfector plant. Spirited opposition was met with at this inquiry, but in due course the board's sanction to the loan was obtained and the land was acquired. The site selected is a very central one, and will afford great economy in access, for it has the advantage that practically the whole of the carrying to it will be downhill, the only rising gradient being from the lowest portion of the town, a matter of about 12 ft.

Following upon a report of a sub-committee in July, 1910, Mr. Thos. H. Bell, the engineer to the council, was called upon to draw up a detailed scheme and specification for the erection of a refuse destructor and steam disinfector. It was considered highly desirable that the disinfector should be provided in conjunction with the plant, so that the existing necessity of sending infected goods to the neighbouring town of Bury for disinfection might be avoided. In due course seven tenders were received, and it was decided to place the work in the hands of Messrs. Dawson & Manfield, sanction to a loan of £4,300 to cover the cost being subsequently obtained.

Including the fencing around the buildings, which is yet to be erected, the total cost will be slightly under the figure mentioned.

DESCRIPTION OF THE BUILDINGS.

The plant is situated about one-third of a mile from Ramsbottom Railway Station. The buildings are constructed with Acerington plastic engineering bricks on all exposed faces, and the brickwork is built in Old English bond, set in lime mortar. The angles to all outer walls have stone quoins, and all window heads and door heads and sills are of Fletcher Bank stone. The foundations consist of a ferro-concrete raft laid to one level and extending over the whole site. The raft is constructed of concrete 18 in. in thickness, made with a grit stone aggregate varying from $\frac{1}{4}$ in. to $\frac{3}{4}$ in. in size, and the concrete is reinforced with two layers of expanded metal. The chimney shaft, which is 80 ft. in height, as measured above the ground level, is supported upon foundations of a special character. Eight ferro-concrete piles, each 12 in. by 12 in., reinforced with four steel bars 1 in. in diameter, the bars spirally wound, were made in a horizontal position, and allowed ample time to set. The piles were then driven until the iron shoe of each struck into solid ground, and the heads of the piles were then cut off to a fixed level, and a concrete base 3 ft. in thickness, reinforced on scientific methods with steel bars, was constructed. The depth to which the piles were driven varied from 24 ft. to 26 ft. The chimney, which is on the Alphons Custodis type, with the object of minimising the weight of the shaft, was then built upon the foundation so obtained. The octagonal base of the chimney, for a height of 14 ft. above the ground level, is constructed of Acerington engineering bricks, and the remaining height is a circular shaft erected with the Alphons Custodis blocks, and is firebrick-lined throughout, and is protected from lightning by three copper spikes fixed at the top. The high temperatures which will be passed up the chimney almost compelled the continuous firebrick-lining. The inside diameter of the shaft at the top is 3 ft. 6 in., and at the base 4 ft. 10 in. Steel roof principals have been used, well secured on pad stones built into the walls, and the roofs are all covered with tongued and grooved boards, covered with felt and slated. All windows are fitted with steel window frames, and are glazed with wired glass.

The buildings comprise the destructor house and a spacious unloading shed with storage hopper, clunking floor and boiler-house, which is part of the main destructor building. Other rooms provided are a mess-room 10 ft. by 8 ft. internal dimensions, provided with fireplace, fitted with a small range for cooking purposes; bath-room 8 ft. by 6 ft. internal measurement, fitted with full-size enamelled bath, with hot and cold water supply and drainage complete; store-room, 8 ft. by 6 ft.; and water-closet accommodation.

The disinfector house is so arranged that it is divided into two apartments, the only direct communication being through the disinfector, which is fitted with two hinged doors, one door of which is to be always kept closed. The apparatus, which is of the Manlove, Alliott & Company's make, includes a cradle so arranged that it will run on rails from the receiving apartment into the machine, and thence into the delivery or disinfected apartment. The appointments are complete in all respects, including concrete floor, drainage, wash basin, and other details.

The buildings are lighted throughout with electricity, and are approached from the main highway by a road 18 ft. wide, the gradient for a length of about 70 ft. rising into the unloading shed being 1 in 12. The roadway is formed for part of its length with lounkey setts paved on a foundation of concrete 6 in. in thickness.

The refuse to be destroyed in the destructor is the ordinary general domestic and trade collection from the greater portion of the town's area. The present daily collection of refuse is about 11 tons, and the plant is guaranteed to be capable of destroying a total quantity of 14 tons in sixteen hours. The buildings are, however, designed to give room for further extension if it be found desirable in the future to provide an additional cell. The back-feed system is adopted, and the plant at present provides two cells on the continuous grate type.

The whole of the contracts have been completed under the supervision of Mr. Thos. H. Bell, acting for the council. Certain savings will be brought about by the abolition of rentals which have up to now been paid for tips, and other economies will be brought about by the increased loads which will be possible with so much down-hill carting. Taking these into account, the working of the destructor plant, and repayment of sinking fund and interest charges, will, in the opinion of the council's surveyor, as based on calculations, amount to a trifle under one penny on the rates. This amount, equivalent to £228, is over and above the present cost of disposal of the refuse on tips, but as the loans are gradually paid off, and use is made of the by-products from the burning operations, this charge on the rates will be substantially reduced. The new buildings and plant have already been inspected by representative deputations from various towns, who have the question of refuse destruction under consideration. The Dumfries authorities have as a result of their visit placed a contract with Messrs. Dawson & Manfield for a similar plant.

Health Week.—The Lord Mayor of London has consented to act as chairman of the General Committee promoting Health Week, which will be held from November 15th to 21st.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier*.

Richmond (Surrey) Bridge.—With reference to the improvement of Richmond Bridge the Bridge Commissioners have been advised by their engineer that for an expenditure not exceeding £15,000 the narrowest part of the carriageway could be slightly widened, the gradient on the south side materially improved, and the footways made adequate for the convenience of foot-passengers. The county council, considering that alterations of this nature would meet the present requirements and those of the immediate future, on Tuesday agreed to enter into negotiations with the Middlesex County Council for the provision by the two councils in equal moieties of a sum not exceeding that named, to be expended by the commissioners, subject to plans being first approved by the two councils.

Institution of Municipal Engineers.

NORTHERN DISTRICT MEETING AND ANNUAL DINNER.

The annual meeting of the Northern District of the Institution of Municipal Engineers was held in the Town Hall, Newcastle, on January 10th. Those present comprised Messrs. Wm. Finch, chairman of the Northern District, Chas. Hearder (Ormesby), W. Wallin (Newcastle-on-Tyne), W. H. Butler (Cumberland), Thos. Young (Sunderland), M. Turnbull (Shildon), S. Crisdale (Cockermouth), G. W. Ayton (Chester-le-Street), F. A. Burgess (Stockton-on-Lees), J. W. Pooley (Hexham Urban District Council), W. J. Coulson (Cramlington), Jas. Jameson (Ponteland), H. G. Kaines (Durham), J. W. Holbrook (Houghton-le-Spring), J. T. Pegge (Durham), J. W. Moncur (Sunderland), G. Beaty (Ashington), John J. Davison (Wigton), John Davison (Morpeth), T. S. Dight (Durham Rural District Council), L. Simpson (Barnard Castle), J. H. Mole (Chester-le-Street), R. E. Riddle (Bellingham), John Robinson, honorary district secretary, and B. Wyand, secretary of the institution.

Before commencing the business of the meeting, the chairman read a telegram from Mr. Boot, the president of the institution, expressing his regret that owing to being indisposed he was unable to be present.

The minutes of the previous meeting held in November 22nd were read and confirmed.

SUPERANNUATION.

The secretary read a letter from Mr. Hill, the secretary to the N.A.L.G.O., dated December 10, 1913, and the following resolution was passed: "This meeting of the Northern District of the Institution of Municipal Engineers held in Newcastle on January 10, 1914, bind themselves to give every possible assistance to the N.A.L.G.O. with the object of getting the proposed National Superannuation Bill carried through Parliament, and with this object in view appoint a small committee to interview the various Members of Parliament representing the counties of Northumberland, Durham, Cumberland, Westmorland, and the North Riding of Yorkshire." This committee consists of Messrs. M. Turnbull, J. T. Pegge, and Geo. Gregson, and the district secretary, Mr. Turnbull being asked to convene meetings with various Members of Parliament representing the constituencies of the counties aforementioned. The secretary was also asked to write Mr. Hill to obtain copies of the proposed Superannuation Bill.

DUTIES OF SURVEYOR AND MEDICAL OFFICER OF HEALTH.

The district secretary read a letter from Mr. John Davison, dated December 6, 1913, together with a draft copy of a letter which he suggested should be sent out to members in the Northern Division. Upon the suggestion of the district secretary it was agreed to allow the matter to stand over until a future meeting, and members were asked to send to the district secretary any list of the questions which had been sent out by the Local Government Board, marking those questions which they consider should be submitted direct to the surveyor, as much of the statistical and other information called for could not be properly supplied by the medical officer of health without the surveyor's assistance. The secretary was asked to forward to Mr. Wyand copies of any forms of queries sent out by the Local Government Board upon receiving them from members.

DATE OF NEXT MEETING.

It was decided that the next meeting should be held in the Town Hall, Newcastle, on Saturday, February 14th, at 3.15 p.m.

ANNUAL DINNER.

The annual dinner of the district was held in the evening at the Royal Turk's Head Hotel, Newcastle-on-Tyne. Mr. W. Finch, county surveyor of Cumberland, chairman of the Northern District, presided, and among the guests were the Lord Mayor of Newcastle (Councillor Johnstone Wallace) and the Sheriff (Councillor Herbert Shaw). There were nearly one hundred members and friends present, and prior to the dinner a reception was held by Mr. Finch.

The CHAIRMAN, in proposing the toast of "The King," remarked that one of the most pleasing

features of the International Road Congress held in London last year was the invitation of His Majesty to the members of that congress to visit Windsor Castle, thereby showing the keen appreciation of His Majesty in the objects of the congress. His keen interest and kind feeling in general had been amply proved, too, of late by his several visits to the industrial centres of the country, including his recent visit to the county of Durham.

Mr. J. T. PEGGE proposed "The Army, Navy, and Imperial Forces," which was responded to by Captain H. W. TAYLOR.

Mr. J. W. MONCUR (Sunderland) proposed "The Local Government Board, Road Board, and Administrative bodies." This was a matter which affected them all as officials. He felt that the Local Government Board was a piece of Government machinery that had served its day and generation so far as the works department was concerned. Why should they, as engineers, spend their time and ability, and not only that, but place what had been prepared before gentlemen who very often were not as well qualified to judge of the scheme? His point was that local gentlemen knew the local requirements. This was his feeling, and he was sure he had heard it expressed over and over again. He went on to show the different procedure adopted in Scotland with reference to the borrowing of money for schemes, and stated that some years ago a scheme was prepared which went before the sheriff, to whom the financial position was explained. The scheme involved the borrowing of £20,000. The borough engineer and himself (the speaker), the provost and chairman of the committee explained the scheme to the sheriff, and within three-quarters of an hour the sheriff passed the scheme; further, the money was carefully and well spent. No engineer was appointed now unless he could show he had passed some qualifying examination, and they were therefore able to study and prepare schemes for roads, sewerage and waterworks to meet the requirements of any authority. He considered that by meeting the cost of the schemes out of the rates, as far as possible, a saving of money was effected. For instance, in a very modest scheme—say, £500—it cost £750 before one had paid off interest and sinking fund. Why should not that £250 go into the scheme? The argument was very often heard, "Why should we pay for the future?" They should certainly pay for the future. In regard to the Road Board, he contended that that authority was in its infancy, or anyhow, only cutting its wisdom teeth. By-and-by they would acquire more sense. As regards local authorities, he was convinced that good engineers would find good masters.

Alderman W. Dixon, of the Cumberland County Council, in replying, said that as a member of the county council and other administrative bodies of the county, he had every opportunity of knowing what was required as far as municipal and county work was concerned, and also the good work which the members of the Institution of Municipal Engineers were carrying out in their respective spheres. Regarding the remarks of Mr. Moncur, he agreed with practically everything he had said. The Local Government Board were largely instrumental in seeing that the money allocated for carrying out improvements in their districts was well spent. With reference to the Road Board, this was a new feature. Large sums of money had now been placed in the hands of the Road Board for carrying out improvements in various parts of the country, and up to the present, as far as he could see, the greatest consideration had been given to the man who had been able to spend the most money. He meant the man who had had the most money at his disposal and spent it to the best advantage. In his opinion all the main roads should be in the hands of the Government and paid for by the Government, but there was one thing that he did object to (and he hoped it would never be carried out), and that was to their being administered from London. In his opinion the local authorities were themselves the best judges of what was required.

The SHERIFF, in proposing the toast of "The Institution of Municipal Engineers," said he found that the institution, although only established as recently as the year 1908, was now in a most thriving position.

It held an important position in the United Kingdom. In this short period the institution had no fewer than 1,000 members, and it was very plain from the work they had been doing, and the work they had planned to undertake in the future, that they had a great deal to do for the welfare of the individual members of that institution. One point that had struck him in looking up some notes that had been handed to him was that one of the great objects was the question of the status of engineers and surveyors connected with the various administrative bodies in the country. They were all trying to improve their status. That was a very laudable ambition, and he certainly hoped that whatever else the institution might succeed in doing they would endeavour as far as they possibly could to improve the status of every individual member of the institution. It was very important that an institution of that kind should devote some part of its work to the matter of the status of its members, for unless that were done, unless it looked after the interests of its members, there might be in certain parts of the country under similar administrative bodies injustices done to the members which could not possibly be remedied except by the aid of such a powerful society as the Institution of Municipal Engineers. He knew that, as engineers, they required ability to carry out their duties, but he thought there were other qualities which were equally as important, and these qualities could be summed up in two or three words—tact, common sense, and ability to guide their committees. Tact was a great asset to anyone. He had listened with very great interest to the speech of Mr. Moncur. From his own experience he believed that the less they had to do with Government departments the better. Having obtained little success at their hands, he would like to see them abolished altogether. (Laughter.) There was one point in which they all were considerably interested—the question of the proper maintenance of the roads in this country at the present time. The Road Board had been mentioned. Perhaps it was not sufficiently known what a large sum of money the Road Board, recently established, had at its disposal for the betterment of the roads. He had only been reading that day in a London paper that seven counties in this country were making application for half a million of money for the betterment of roads in different parts of the country. But what had happened? As a result of that being made known, several other counties were already making application to the Road Board for sums of money for the improvement of the roads. He would like to suggest (although he did not know whether it really came within the purview of their powers) that some representation should be made by an institution of that kind that the rights of the ordinary pedestrian should be preserved. He sometimes disappeared from the busy city of Newcastle-on-Tyne and betook himself to a little country village, and he could assure them that as he wandered about the roads there viewing the beauties of Nature one had to skip about from one side of the road to the other in order to preserve one's life. It was quite unnecessary for him to assure them that he wished the institution every happiness and prosperity. He realised that in their important work—and important work it was—the main object was to help towards the happiness and the comfort of those living under the authority of their administrative boards.

Mr. Horace Boot, the president of the institution, who should have responded to this toast, was—as already stated—unable to attend the dinner, being confined to the house by illness. Mr. Finch read a letter from Mr. Boot apologising for his absence and greatly regretting his inability to be present that evening. He appreciated very much the work done by the Northern District, of which he was very proud. The hon. district secretary was asked to write Mr. Boot expressing the sympathy of the members in his illness.

Mr. W. WALLIN (Newcastle), in responding, said that they were, as the Sheriff had remarked, a young institution, but they were exceedingly proud of their youth. Since the institution was formed two or three little improvements had been copied by older institutions. One matter they had been actively engaged upon was security of tenure. This was one of the things a municipal engineer had not. Poor-law authorities had security, but the municipal engineer had nothing of the sort, and if he should, through no fault of his own, fall foul of some of the members of his council, he was asked in a polite way to send in his resigna-

tion, or, to use a vulgarism, he got the "sack." He had no redress, and therefore this was one of the matters that the institution was strongly taking up. On the question of the maintenance of roads that was a far-reaching question which had been ably put by Mr. Moncur and Mr. Alderman Dixon. As to motor traffic, it had to be recognised that motors had now passed the stage of luxury, and had become part and parcel of the commercial success of countries.

Mr. B. WYAND, the secretary of the institution, also responded.

Mr. C. W. HALL (Felling), in the absence of Mr. J. Jardine, town clerk of Morpeth, through illness, proposed the "City and County of Newcastle-on-Tyne and Northern Municipalities."

The LORD MAYOR, in replying, thanked the members for the honour they had done him by inviting him to join them that evening. It was a pleasure to him to see so many engineers who were skilled in their profession and who were doing their best to improve the health and comfort of the community. He gathered from what he had read of the institution that it was largely a mutual improvement society, and although the day of mutual improvement societies had perhaps gone, there was no reason why an institution of that kind should not try and benefit its members as they were trying to do. There was a great deal to be gained by men gathering together and exchanging their opinions on important matters which they were called upon to consider. The many things that an engineer had to know and do were really appalling. They had to look after the making of roads and the formation of streets; they must know something about trams, electricity, gas, water, and many other things, and in these days when it was necessary to have suitable dwellings for the people, and when public buildings should be worthy of the great cities in which they were erected, it was very pleasing to know that the engineers were so ably carrying out the duties they had to fulfil. Newcastle-upon-Tyne were spending a great amount of money. It would be his duty within the next few weeks to preside over the council meeting at which the budget would be presented. They would have to budget for about a million of money. They were quite capable of spending the money, and spending it to the best advantage of the city. He agreed that they wanted as little interference as possible from the Local Government Board in London. He was pleased to see that the institution devoted special attention to the training of young men. One of the most difficult tasks of the engineer in these troublesome times was the management of men, and in that they had to display great tact. It seemed important that the engineer should have more control than he had, and he thought there should be as little interference as possible on the part of the members of municipalities. He hoped the institution would grow and prosper, and the attendance that evening spoke well for the vigour and future of the society.

Mr. J. W. HOLBROOK (Houghton-le-Spring) proposed "Our Guests and Visitors." The institution was, he said, exceedingly honoured by the company of the Lord Mayor of Newcastle, the Sheriff, and the various aldermen and councillors of the adjoining counties, together with the other guests. He believed, and with a certain amount of pride, that not only was their district designated as No. 1 District of the Institution of Municipal Engineers, but they were No. 1. This was undoubtedly largely due to the energy exhibited by the members of the Northern Division. Referring to security of tenure, Mr. Holbrook said there was no getting away from the fact that the speeches they had heard that night had been uplifting and inspired them to go on. They knew that the Lord Mayor took a very keen interest in technical affairs.

Alderman DALTON, of Carlisle, responded. He said he had come from Carlisle for the purpose of making the acquaintance of the members of the institution, and especially for showing his high esteem of the chairman (Mr. Finch). He was very pleased to have been at such an enjoyable gathering.

Mr. J. H. HALSTEAD (Harrogate) proposed "The Chairman," coupling with him the honorary secretary of the Northern Division (Mr. John Robinson). The Northern Division of that institution had been well served in the past by chairmen. They sincerely appreciated their valuable services, and in the election of Mr. Finch they had obtained a gentleman who well maintained the dignity of that office. When they

took into consideration the fact that Mr. Finch had practically risen to the head position where he served his articles he thought that was sufficient to show them what a competent man he was.

Mr. FINCH, replying, said he hardly knew how to thank them sufficiently for the hearty reception they had given him. It was certainly a very great honour for him to occupy the position as chairman of the Northern District of the institution that night, and he took it as an honour to have the company of the Lord Mayor, the Sheriff and the aldermen, councillors, and friends of the members of the institution. This all went to show that they were going ahead in the proper spirit, and he was especially pleased to see so many members present. On several occasions the friends almost outnumbered the members, but that night he was glad to see that the majority were members, which showed that the spirit of the Northern Division had been kept up. He was particularly pleased to see that night his vice-chairman (Alderman Dixon) and Alderman Dalton. It showed that his position as surveyor of the County Council of Cumberland and the work that he was trying to do for that authority was appreciated, and he had every reason to be satisfied with their treatment of him. Referring to the excellent work which had been done for the Northern Division of the institution by Mr. John Robinson, the honorary secretary, any work that he (Mr. Finch) had done in assisting Mr. Robinson had been a pleasure, because the work was practically three parts done before he had the opportunity of touching it. The institution should do everything to retain the services of their hon. secretary.

The pleasure of the evening was much enhanced by the able efforts of Mr. Harry Tomkins (humorist), the Orpheus Quartette Party from Carlisle, and other friends. Mr. V. Raw acted as pianist.

MIDDLESEX COUNTY OFFICERS' ASSOCIATION.

PRESENTATION TO MR. AND MRS. H. T. WAKELAM.

The first Bohemian concert in connection with the Middlesex County Officers' Association was held on Friday last in the Council Chamber of the Holborn Restaurant, and the complete success that attended it should certainly encourage its promoters to arrange other similar functions. Mr. H. T. Wakelam, M.INST.C.E., the county engineer, occupied the chair, and a large number of ladies graced the gathering with their presence. Altogether there was a company of about 240 present.

The music provided left nothing to be desired, the items being varied and well chosen, humorous numbers predominating. Detailed reference to each item in the programme is unnecessary here, but we may instance, as particularly pleasing contributions, Miss Nellie Walker's rendering of "My Ships," and the spirited singing by Mr. John Eversleigh of Wilfrid Sanderson's "Drake Goes West." It may be noted that no fewer than four of the songs in the programme were by this gifted composer. Humorous items at the piano by Miss Haidee Hamilton and Mr. Willie Rouse were also greatly appreciated.

A pleasing little ceremony in the course of the proceedings was the presentation to Mr. and Mrs. H. T. Wakelam of two pairs of handsome silver candlesticks, two pairs of silver vases, and two silver bon-bon dishes, an appropriate gift from the members of the present and former engineering staff of the Middlesex County Council to commemorate the recently celebrated silver wedding of the recipients. In the unavoidable absence of Mr. Alderman Pinkham, the chairman of the Highways Committee, the presentation was made by Mr. County Councillor Goodyear, vice-chairman, who eloquently testified to the high regard in which Mr. Wakelam is alike held by the officials of his own staff and by the members of the county council. Mr. Wakelam, in acknowledging the gift on behalf of his wife and himself, said he felt it difficult to give adequate expression to his feelings in thanking those who had subscribed for the handsome gift, and paid a high tribute to the loyal support given him at all times by those associated with him in his department. Mr. County Councillor Marlow Reed proposed, in humorous terms, a vote of thanks to Mr. Goodyear for making the presentation, and endorsed all that had been said by that gentleman regarding Mr. Wakelam's many excellent qualities, emphasising his exceptional capabilities and broad sympathies.

ASSOCIATION OF SOMERSET SURVEYORS.

ANNUAL GENERAL MEETING AT BRIDGWATER.

On Saturday, the 10th inst., the annual general meeting of the Association of Somerset Surveyors was held at the new police court, Bridgwater. The attendance numbered about thirty members, including Mr. H. T. Chapman, county surveyor of Somerset (recently appointed county surveyor of Kent), and Mr. E. J. Stead, county surveyor of Devon (recently elected to succeed Mr. Chapman as county surveyor of Somerset), and the gathering was presided over by Mr. F. Parr, ASSOC.M.INST.C.E., borough surveyor of Bridgwater.

The officers for the ensuing year were elected as follows:—

President: Mr. W. A. Collins, surveyor, Bridgwater Rural District Council.

Vice-presidents: Messrs. F. Parr, borough surveyor of Bridgwater; F. W. Jones, surveyor, Frome Urban District Council; and J. Ace Beynon, surveyor, Frome Rural District Council.

Hon. Secretary and Treasurer: Mr. D. Edwards, borough surveyor of Taunton.

Executive Committee: Messrs. E. J. Stead, county surveyor; H. C. Sunderland, Midsomer Norton Urban District Council; T. Goldsworthy Crump, Taunton Rural District Council; G. Alves, Glastonbury Urban District Council; Chas. Durie, Williton Rural District Council; J. Johnson, Keynsham Urban District Council; and R. Stevens, Ilminster Rural District Council.

The president, Mr. W. A. Collins, in his inaugural address, thanked the members for electing him to the office, and assured them that his utmost energies would be devoted to promoting the interests of the association and mutual kindly feeling among the members.

Mr. D. Edwards thanked the members for electing him hon. secretary and treasurer, and moved a hearty vote of thanks to Mr. Parr for his services as president during the past year, which was carried unanimously.

A PRESENTATION.

Mr. H. T. Chapman was elected an hon. life member of the association, and presented with an illuminated and framed address containing the names of the whole of the members, together with an expression of regret at his leaving Somerset, and wishing him every success and happiness in his new appointment as county surveyor of Kent.

Mr. Chapman, in thanking the president and members, said that during the six years he had been among them he had looked upon them, not as officials of various authorities, but as personal friends, with whom he had worked in a most harmonious manner. The address would occupy a most prominent position in his office, and always serve to remind him of the very pleasant and happy years he had spent among them. He sincerely hoped he might be as happy in Kent as he had been in Somerset. He wished the association every success in future years. By co-operation many difficulties could be overcome, and the interchange of opinions on subjects appertaining to their work was most helpful. He congratulated the members on Mr. Stead's appointment; he had worked with Mr. Stead for several years, and was quite confident of his ability and suitability for the office.

Mr. E. J. Stead, who was most heartily received, said he had been closely associated with Mr. Chapman, whose personal friendship he valued most highly, and wished him every success in his new sphere.

SUPERANNUATION.

Mr. F. W. Jones introduced the subject of superannuation of officers of local authorities. A discussion ensued in which it was elicited that action was being taken by the County Surveyors' Association to forward the proposed Bill to be introduced into Parliament.

It was resolved to give the Executive Committee power to act should any communication on the matter be received from the Superannuation Committee.

The members were entertained to tea by the kind invitation of Mr. H. T. Chapman.

"THE SURVEYOR" SPECIAL ISSUE.—The Special Annual Issue of "The Surveyor" will be published next week.

THE QUESTION OF MUNICIPAL CREMATORIA.

REPORT BY THE BOROUGH SURVEYOR OF GREAT YARMOUTH.

The borough surveyor of Great Yarmouth, Mr. J. W. Cockrill, M.INST.C.E., A.R.C.B.A., at the town council meeting last week presented the following report to the Cemeteries Committee:—

"You have expended on cemeteries £14,770, of which £1,271 remained unpaid on March 31st. Twenty-six acres between Northgate-street and Nelson-road North, worth at least £26,000, is utterly ruined, and can be of no useful purpose. A further expenditure is about to be undertaken for a necessary extension at Caister. These figures show the waste incurred in polluting soil and atmosphere. The total cost of your cemeteries for the past year was £1,306, which, by payments under the various tables of fees, left £291 to be provided out of the rates. The average cost of each burial is about 25s., of which more than 30s. is paid by the friends of the person buried.

"A plain, suitable building, with up-to-date appliances, can be put up for £3,800. If constructed inside the cemetery grounds no extra expense for attendant and superintendent will be incurred. Interest and sinking fund will amount to about £200 per annum; cost of fuel is about 7s. per cremation when only one takes place in a day, reduced to 5s. if two or more. No crematorium can be erected within 200 yds. of any dwelling-house without written consent of the owner, lessee or occupier of such dwelling-house, nor within 50 yds. of any public highway, nor in the consecrated part of the burial ground of any burial authority. These conditions make it very difficult to secure a site; for such conditions the site of the Nonconformist chapel in the North Cemetery would be the best available, but I dare not venture to hope that consent could be obtained from fifty to sixty occupiers in addition to the owners. No nuisance can be created by this method of disposal. Since the erection of the Golder's Green crematorium houses of large rateable value have been erected inside the distances named in the Act of Parliament. The chief object of providing a crematorium is to reduce the quantity of land spoiled by the present method of disposal. If the increase in population continues, and the present system of burial is persisted in, 1 acre of land will be drawn each year from production. There is also the cost of carrying bodies to Caister, which must be considered. If disposal can be effected by cremation in the existing town cemeteries it means that a saving in each case of an average of £2.

"If the purchase of land at Caister is proceeded with, the unused portions of existing cemeteries, and the opportunities of burying a second body in the same grave in all the cemeteries will give from twenty-five to thirty years before you will need to consider the question again. Cremation by that time will be very general if opportunity is provided to educate the public. This method of disposal is increasing in use. In 1912 there were thirteen crematoria established, Woking, erected in 1885, being the first. In 1892 Manchester, followed in 1895 by Glasgow, 1896 by Liverpool, in 1901 by Hull and Darlington, in 1902 by Golder's Green and Leicester, in 1903 by Birmingham, and in 1905 by Leeds, Hford, Bradford and Sheffield. Six of these establishments are the property of companies and societies, and seven of corporations. Thirteen cremations took place at Woking in 1885 and 1886, and 125 in 1912. Manchester had three cremations in 1892, and 149 in 1912; Golder's Green commenced with five in 1902, and had 591 in 1912; 1,134 cremations took place in 1912 in the thirteen buildings named.

"If you can establish a crematorium, and keep the charges down to the lowest point likely to pay expenses, I have no doubt the custom will become general in a few years, so that the present outlay for land may be the last for that purpose. Charges at private crematoria are usually £5 5s., with a reduction of 21s. if it takes place before 10 a.m., and another cremation follows. Other charges are: Urn, from 10s. 6d.; chaplain, 10s. 6d.; niche for urn, £3 3s. to £5 5s., and other sums for various services. In corporation establishments the charges are £2 2s. and £3 3s. if the person has lived for six months previously within the borough, and larger fees for other persons. Failing the site of the Nonconformist chapel in Yarmouth cemetery, both the Gorleston and Caister cemeteries could be used, but the advantage of the shorter distance for removal is lost. A middle course would be to try and make some arrangements with the

trustees of the Catholic cemetery on Caister-road, where there is ample room. In consequence of the decrease in the death-rate the number of burials per year is now considerably less than it was thirty years ago."

The report is to be considered at another meeting of the committee.

THE CANDY DE-CLOR FILTER.

ROYAL SANITARY INSTITUTE AWARD.

After nearly six months' investigation into the Candy De-Clor filter system, the judges of the Royal Sanitary Institute of Great Britain have given their highest award—a silver medal—to the Candy Filter Company, Limited, of Westminster, for the "De-Clor" waterworks filter, which is claimed to ensure the absolute destruction of the *B. coli*, typhoid bacilli, and other pathogenic bacteria.

By the De-Clor filter system free chlorine (hypochlorite of calcium) is added to the water by means of an extremely simple and automatic arrangement known as the Hydro-Pneumatic Apparatus, which proportions, or adjusts, the quantity to be used according to the flow of the water. The thorough mixing of the chlorine with the water and its proper duration of contact with the water are fully provided for, and the subsequent dechlorination and entire removal of the free chlorine from the water—a matter of the greatest importance—forms a most essential and valuable part of the process.

"The filtered water," the Candy Filter Company assert, "is not only absolutely free from *B. coli* and pathogenic bacteria, but is also highly oxygenated, and of the greatest palatability, being entirely free from the unpleasant taste and odour frequently found in water that have undergone chemical treatment. The enormous value of the De-Clor filter system will be understood when it is remembered that by its use it is impossible for the *B. coli* and pathogenic bacteria to escape destruction."

De-Clor filters have been in use at the Reading Corporation waterworks for three years; they are also employed by the Truro Water Company, the Teignmouth Urban District Council, and at many other places where the water supplies were not bacteriologically satisfactory. We are also informed that they have been shipped to various parts of the world, and in districts where typhoid was hitherto prevalent they have enabled municipal and other authorities to supply a water absolutely safe from water-borne disease.

It is interesting to remember that Mr. Frank Candy, who is so actively associated with the De-Clor and other filter patents, won the Royal Sanitary Institute's Medal thirty years ago for his invention Polaxite—the powerfully active oxidising and purifying substance employed in the De-Clor and other filters.

DISCHARGED WORKMAN'S ALLEGATIONS.

KENT CONTRACTORS' UNPLEASANT EXPERIENCE.

A rather extreme instance of the readiness with which certain individuals will listen to complaints against officials and contractors who are engaged in the execution of public works occurred recently at Dartford. It appears that the rural district council had undertaken the construction of a sewer at Wilmington—a work for which Mr. Reginald Brown, M.INST.C.E., was the engineer, and Messrs. Thomas Wood & Sons, of Swanley, were the contractors. A man who had been employed on the work having been discharged for drunkenness, made a complaint to the council that in certain places the work had been carried out in an improper manner. Instead of the local authority treating information obtained from such a source as it deserved, the contractors were asked to open up the work at the places specified. The result of this investigation was, as might have been expected, a complete vindication of the contractors, the clerk of works and the engineer. Only one cracked joint was found, and it was clearly proved that the damage had been done by the complaining workman himself, the joint being, in fact, watertight under test, and so cleverly concealed by him as to evade detection.

All those responsible for the execution of the work are to be congratulated on this result, and it only remains for the council to make some amends by taking upon themselves the cost of the opening up and inspection.

ROAD IMPROVEMENT PROBLEM.

COLONEL CROMPTON AND FUTURE DEVELOPMENTS.

A meeting of the Epping Forest Municipal Officers' Association was held at the Buckhurst Hill Council Offices last Friday evening, when Mr. L. W. Liell presided over a representative attendance, and Mr. J. A. Simpson, clerk to the Woodford Urban District Council, delivered an address on "The King's Highway: Past, Present and Future." Mr. Simpson said he thought they were tending towards three things: First, an absolutely new classification of highways; secondly, the establishment of a central authority; thirdly, the classification of district roads according to their user.

Colonel R. E. Crompton, consulting engineer to the Road Board, pointed out that the great problem who was to pay for the roads—whether it was to be the taxpayer or the user—was settled long ago. The whole community benefited so much by increased facilities of travel that it was better to spread the burden over the whole community as evenly as possible. He believed they would be doing a fatal thing if they taxed any particular class of user or any particular class of vehicle. It had become apparent that the vehicle which was costing the public the most now was the vehicle the public most used. Any taxation of the motor bus or motor wagon would fall as much on the public as if they paid it in the form of rates. He thought the more advanced politics pointed to a more equal and a fairer division through the rates or from Imperial taxation. The owners of vehicles gained enormously by paying their taxes at present. He had pointed out to the great carrying companies and the private car owners that their tyre bill was such an enormous item that if it was halved it was an important consideration. He was afraid the rubber industry would not approve of what he was saying, but they could not consider that.

The Road Board had very little power and very little money. Those who had come to the Road Board for grants had asked for about twenty times what the board could give them. The Road Board had been fearfully abused because it had succeeded in extracting from every authority a large sum of money in addition to its own grant.

He held that what they wanted was uniformity of road construction. The construction of a modern road was much more difficult than the construction of a railway. The motor car and motor wagon had been developed within a few years, and they expected surveyors to develop a new system and invent new methods of road construction. The Road Board was doing the research work necessary to make roads in all parts of the Kingdom in the cheapest possible manner. That was what he was engaged on. If a surveyor wanted to know what they were doing, what advice they could give from their general study of the subject, they would tell him what they knew. He did not say they knew very much yet, but they were getting on very rapidly, and he hoped in a few years' time they would make great improvements.

Modern road construction differed from the old in this—that it was much more dependent on the weather. Roads must be made in dry weather, and our climate was not a dependable one. It did seem that in future road reconstruction schemes would have to be carried out much in the same way as railways were built. Encouragement would have to be given to a class of contractors who would be responsible for local schemes. The mode of the construction of highways would have to be reconsidered. It would be necessary to consider schemes in order to deal with great lengths at a time. He believed the present high prices of road construction to meet omnibus traffic was due to the short lengths undertaken. He predicted they would see great changes in that respect. The modern road surveyor would find himself able to deal with certain contracting firms, and to give contracts out not only for construction, but for maintenance, as had been done not only in England, but abroad. In those cases the road had been made and maintained for several years at a certain price. At present that was a tentative process. No contractors knew what their liabilities would be under such a system, and they were obliged to put on high prices; but directly the system was understood, and contractors of a high class were attracted to that line of business, they would find prices would go down, and road construction would proceed very rapidly.

He believed there was a great opening for engineers and machinery in this direction, and that in a few years' time highways would show as great a develop-

ment as railways. Facilities for traffic would have a great effect. They would equalise the value of land, population would be spread wider out in consequence, and they would have the ideal state they looked for without arterial roads connecting town-planned areas with the business centre. Town planning was an absolute failure. With the motor bus they could get the town worker 7 or 8 miles from the business centre; but they wanted plenty of roads, and plenty of straight roads, to and from the business centre.

On the motion of the chairman a hearty vote of thanks was accorded to Mr. Simpson and Colonel Crompton for their addresses.

PORTABLE CHEMICAL FIRE EXTINGUISHERS.

BRITISH FIRE PREVENTION COMMITTEE'S WARNINGS.

The British Fire Prevention Committee have found it necessary to formulate a standard test for portable chemical fire extinguishers from a constructional point of view, having regard, firstly, to the several fatalities that have occurred through these appliances bursting when being operated, and, secondly, through the tendency of certain irresponsible makers or their agents to put on the market appliances of the "cheap-jack" type that are distinctly dangerous to handle. The committee have also formulated a provisional specification for standard portable chemical fire extinguishers from the constructional point of view, which should serve as a guide for would-be purchasers of such appliances.

Both memoranda are obtainable from the offices of the British Fire Prevention Committee, 8 Waterloo-place, London, S.W., upon written application to the registrar (with return postage).

The committee's executive has been in communication with various public authorities as to the advisability of adopting the committee's requirements for the extinguishers they purchase for their departments or require to be installed in establishments under their supervision, and various authorities, corporations, &c., at home and overseas, propose in future to adopt the safeguards the committee advocate.

In making this announcement the British Fire Prevention Committee wish to indicate that, while portable chemical fire extinguishers meet a public requirement, the members of the general public, when purchasing extinguishers, should not only see that they conform to the standard test and specification adopted by this committee, but that they should keep constantly in mind that such appliances require care in maintenance and handling.

The committee also desire to impress upon the public that portable chemical fire extinguishers are nothing more than first-aid appliances.

In addition, the public should remember that portable chemical fire extinguishers are not the only form of portable first-aid appliances, but that ordinary buckets of water and hand pumps are equally, if not more, effective in the majority of cases.

New Waterworks for Weston-super-Mare.—The Bill promoted by the urban district council of Weston-super-Mare for further provisions with regard to the water supply and waterworks, including the construction of new and additional waterworks at Banwell, Worle and Weston-super-Mare, has been certified for first reading.

Bristol Corporation and the Tramways.—The Bill of the corporation of Bristol to work tramways and to enter into arrangements with the Bristol Tramways and Carriage Company, Limited, for the purchase or taking on lease of their tramway undertaking, has passed the initial Parliamentary stage, and has been certified for first reading when the House of Commons meets next month.

Birmingham and Town Planning.—At the meeting of the Town Planning Committee of the Birmingham City Council recently, it was stated that the International Garden Cities and Town Planning Association proposed to hold their annual meeting in Birmingham on July 24th. Special interest will attach to the function because the meeting will be held in conjunction with the National Housing and Town Planning Council and other housing bodies. It is expected that the number of English and foreign visitors will be upwards of 200.

DERBYSHIRE COUNTY SURVEYOR'S DUTIES.

A COUNCILLOR'S ILL-JUDGED PROPOSITION WITHDRAWN.

At the meeting of the Derbyshire County Council last week considerable discussion took place on the question of the duties and salary of the county surveyor, Mr. J. W. Horton. The chairman, Alderman J. Oakes (we quote from the *Nottingham Guardian* report), said he had a suggestion to make to Mr. White in regard to a proposition to the effect that the council considered that the terms upon which the county surveyor (Mr. J. W. Horton) was appointed—viz., a maximum salary of £600 a year—should be adhered to, and that should further application for increase be persisted in by the surveyor he be called upon to resign and a successor be advertised for at a salary of £500. The chairman thought that inasmuch as this matter was referred back to the committee at the last meeting, it would be discourteous to them to discuss the proposition prior to considering their reconsidered report.

Mr. White not only accepted this hint, but confessed that he was in a temper when he wrote the second portion of the proposition, which he intended to delete.

Alderman Johnson Pearson then introduced the report of the Highways Committee, which contained a lengthy statement in support of their renewed recommendation that Mr. Horton's salary should be forthwith increased from £600 to £700, and then by two annual instalments to £800 per annum. In this it was pointed out that on his appointment an entirely new system of management was established. Unlike his predecessor, he was not allowed to take private practice, nor did he receive any commission in respect of new works, while he was required to spend a great portion of his time out of doors in actual personal inspection of roads and bridges. The work of the department had enormously increased, as had the expenditure, which latter circumstance, however, could not be charged against the surveyor. He was responsible for the direct maintenance of over 500 miles of main roads and 400 bridges, and for the supervision of 110 miles maintained by local authorities. The cost of the former amounted to £95,000 per annum, and of the latter to an additional £18,000. The efficient performance of the outdoor duties necessarily entailed a great deal of travelling, and there was no better or more economical method than the use of a motor car. The committee felt that it was most unjust to Mr. Horton to suggest that because he had loyally complied with the instructions of the council and spent as much time as possible on outdoor supervision, he had done so for his own amusement. In addition to the duties enumerated he had to examine and report upon all Bills before Parliament, applications to the Board of Trade, &c., affecting county interests, and, if necessary, to give expert evidence thereon. The committee trusted that the council would not refuse to recognise the care and attention which Mr. Horton paid to this work, and the improvement to the roads and bridges throughout the county which had taken place during the past eight years.

Alderman Pearson, in proposing the adoption of the report, amplified these arguments, and denied that a maximum was specified when Mr. Horton was appointed. He added that his present salary was lower than that of any county surveyor.

Mr. White, seconding a motion by Mr. Turner that the matter should again be referred back to the committee, charged the latter with discourtesy in bringing up the same recommendation after the council by an overwhelming majority had sent it back to them. He also drew attention to the facts that when Mr. Horton was appointed there were no fewer than 235 applicants for the post, that his motor car cost the county over £400 per annum, and that since 1901 the salaries of the surveyor and his staff had increased from £2,010 to £2,981.

On a division the amendment to remit the question to the committee was rejected by 36 votes to 23.

Alderman G. Slater then succeeded in bringing about a compromise by which the salary will advance at the rate of £25 per annum to £700.

Thereupon Mr. White definitely abandoned his motion.

CHANGE OF TELEPHONE NUMBER.—Readers are requested to note that "The Surveyor" telephone number is now City 1046.

WATER SUPPLY AND STREET IMPROVEMENTS IN LOS ANGELES.

The policy followed with regard to public utilities has given to the chief city of Southern California one or two notable undertakings. The greatest of these is the water rights, by which water is brought to the city a distance of 240 miles. The plans now in process of execution are designed to provide a water supply for a population of 2,000,000, and a surplus of water will be available for electric lighting and for factories.

A great aqueduct is designed to deliver a minimum of 2,800,000 gallons daily into the San Fernando reservoir, 25 miles north-west of the Los Angeles city hall. The system is gravity throughout. No pumping plants are required. The watercourse is constructed entirely of steel and concrete. There are 47½ miles of tunnel, 14 miles of syphon, 103 miles of lined and covered conduit, 40 miles of open lined conduit, and 21 miles of open unlined canal. Much preparatory work had to be undertaken, including the construction of 225 miles of mountain roads and trails, many cut in solid rock, and a telephone system 350 miles long. The total cost of the work will be about \$25,000,000. It is estimated that the surplus waters of the aqueduct will be sufficient for the irrigation of 135,000 acres of dry land contiguous to the city. The generation of power from a fall of 1,500 ft. in the aqueduct has been provided for. The total power possibilities approximate 120,000-horse power, the major portion of which can be developed within 50 miles of the city.

Considering that twenty-five years ago it had not a single paved street, Los Angeles has made remarkable progress in street improvements. There are now over 660 miles of graded and gravelled streets, including 110 miles of paved streets. There is a complete sewerage system of 523 miles, including an out-fall sewer to the ocean.—From the *Times* "Pacific Coast Number."

TOWN PLANNING LECTURES FOR AUSTRALASIA.

Mr. W. R. Davidge, F.S.I., A.R.I.B.A., ASSOC. M. INST. C.E., has been invited to deliver two addresses on town planning before the Economics Section of the British Association at Sydney and Melbourne during the course of the annual meetings, which are to be held in Australia next August.

Subsequent to the meetings, the Garden Cities and Town Planning Association is arranging for Mr. Davidge and Mr. Charles C. Reade, organiser of the Australasian Town Planning Tour, to deliver a series of lantern lectures in the principal centres of Australia and New Zealand. Mr. Reade is leaving for Australia early in March to make the necessary arrangements.

It is a sign of the times that such an old-established body as the British Association for the Advancement of Science is devoting a section of its activities to the broader aspects of town planning. Mr. Davidge's experience and qualifications should enable him to show the fundamental bearing that town planning has upon every important department of civics.

Recent developments in Australia suggest that town planning lectures in favour of legislation on the subject will be received with interest and popularity. Australia is not only seeking to lay out its new capital on modern lines, but the State of New South Wales has founded a garden suburb near Sydney, while there are a number of similar ventures being carried out in other parts of Sydney and at Newcastle by private enterprise.

As a London district surveyor Mr. Davidge is acquainted with the growth of many large cities both in England and Europe. He has carried out large housing schemes for the London County Council, including housing estates and artisans' colonies in the neighbourhood of London. Mr. Davidge is a member of the Town Planning Committee of the Royal Institute of British Architects, which has done valuable work in securing proper consideration of the subject of town planning of Greater London. He is a member of the Examining Board of the Royal Institute, and holds the gold medal of the Surveyors' Institution of Great Britain for a valuable contribution on the subject of town planning. He is also an active member of the Garden Cities and Town Planning Association, the National Housing and Town Planning Council, and the London Society.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

HIGHWAY: FLOODING.—"Surrey" writes: A repairable highway is occasionally flooded, and has been flooded from time immemorial, by the overflowing of a non-tidal river. The highway authority constructed a raised footpath some years ago along the flooded portion and parallel with the highway for the convenience of foot passengers. The water in the carriageway is sometimes 4 ft. in depth, and there are no lamps at night, and no warnings in existence. Part of the flooding is alleged to be due to obstructions in the river. Motorists sometimes inadvertently drive into the floods at night, and the cars, of course, stop, thereby causing damage to the machines and injury to the clothes and health of the driver and passengers. (1) Is it the duty of the highway authority to raise the carriageway above flood level? (2) Can the highway authority compel the riparian owners or occupiers to remove the obstructions in the river? If so, what is the course to pursue? (3) Could any person suffering damage by the existence of floods successfully sustain an action for damages? (4) The highway authority desire to erect warning signs at each end of the flooded road. If they did so would their action constitute an admission of liability for the flooding, with the consequent liability for damage to persons and property using the highway?

(1) No. "The fact that a highway is occasionally impassable on account of floods does not entail an obligation to raise its level." (Copnall's "Law Relating to Highways," 2nd edition, page 231.) (2) I think the riparian owners who placed the obstructions in the river could be compelled to remove them if they materially increase the floods which would naturally occur without them. In that case the best course would be to bring an action, with the concurrence of the Attorney-General, for an injunction. (3) If the accident was directly attributable to the increase in the floods caused by the obstructions, and if there was no want of ordinary care on the part of the injured party, he could probably sustain an action against the parties who fixed the obstructions. (4) I do not think that the erection of warning signs by the highway authority could properly be held to constitute an admission of liability on their part.

PRIVATE STREET WORKS: FOOTPATH.—"Velox" writes: The parish council of X contemplate making up a footpath between the points marked A and B on the accompanying sketch (Fig. 1). A public right of

FIG. 1.

way already exists between these two points, but it is not repairable by anyone, and a portion of it, between the points C and B, is ploughed up from time to time. The parish council have suggested that the

FIG. 2.

path, when made up, should be taken over by the district council. (1) If the district council agree to this, would they, under the Private Street Works Act, be chargeable with half the cost of making up a road which might be laid out (as shown) after the path was put in order? (2) Would the district council be charge-

able with any expenses under the Act if the road was so laid out that the footpath was situate along the centre of the road, or, say, 18 in. or 2 ft. from its north side (see Fig. 2)?

(1) No person would be chargeable in respect of the footpath, whether the district council had adopted it or not. See *Plumstead Board of Works v. British Land Company* (L.R., 10 Q.B., 203). The footpath would, however, have to be included in the provisional apportionment (*Herne Bay Urban District Council v. Payne and Wood*, 1907, 2 K.B., 130); and the proportion of expenses assignable thereto would have to be borne by the district council. (2) If the district council adopted the footpath, and the added strips were treated as separate streets (assuming that this could be done), the position would be practically the same as in the case of sketch 1. If, on the other hand, the strips and footpath were dealt with as an entire street, the frontagers might object on the ground that part of the street was repairable by the inhabitants at large.

NEW BUILDING IN SPACE AT REAR OF DWELLING-HOUSE, ERECTED BEFORE THE ADOPTION OF THE BY-LAWS.

—"Ynys" writes: An owner of a dwelling-house erected about forty years ago, or ten years before the by-laws were adopted in this urban district is desirous of constructing a small wash-house at the rear of his premises. The replies I have hitherto seen to such questions invariably state that it is necessary to decide whether the proposed additions constitute a new building, and that it is a question of fact for the magistrates to decide, &c. But I would like to know, supposing that it is a new building, and that the council could accordingly demand the deposit of a plan, whether they could disapprove of it, seeing that it reduces the air space in connection with the existing house erected before the by-laws were adopted, and not at the rear of a house erected under the by-laws? The by-laws now in force are the Model series, but there were no by-laws in force when the house was built. We have no by-laws as to alteration of buildings.

There does not appear to be anything in the Model By-laws prohibiting the erection of a new building on the ground that it diminishes the air-space in connection with an existing building, unless such air-space was provided in pursuance of the by-laws. In my opinion, therefore, the council cannot disapprove the plan on this ground. But, inasmuch as the wash-house (assuming it to be a new building) comes within the definition of a "domestic building," it must itself be provided with front and rear air spaces in order to comply with the by-laws. As it is not provided with an air space in front (and possibly also not at the rear) the plan can be disapproved on this ground.

BY-LAWS: JOISTS AND RAFTERS.

—"G. R." writes: As a very old subscriber to THE SURVEYOR, I am writing to ask you if you will kindly give me your opinion on the following (by-law copy herewith): Joists and Common Rafters for Domestic Buildings—p. 29, (a). What is your interpretation of (a) *re* the distance apart—viz., 15 in.? p. 30, (b), also your interpretation of (b) *re* the distance apart—viz., 15 in.? How would you explain the distance apart being 15 in. when really they are only 12 in.? The following are the by-laws referred to:—

(a) The rules relating to joists in floors are applicable only to joists laid at a distance of not more than 15 in. apart, measured from the middle of one joist to the middle of the next or to the nearest wall. And joists not exceeding the dimensions specified in the foregoing rules shall be laid and fixed at not more than the aforesaid distance apart—namely, fifteen inches; (b) the rules relating to rafters and purlins in roofs are applicable only to rafters laid at a distance of not more than fifteen inches apart, measured from the middle of one rafter to the middle of the next or to the nearest wall, and to purlins laid at a distance of from six to nine feet apart, measured from the middle of one purlin to the middle of the next or to the ridge or to the bearing upon the wall. And rafters and purlins not exceeding the dimensions specified shall be laid and fixed at not more than the aforesaid distances apart—namely, fifteen inches and nine feet respectively.

The meaning of these clauses evidently is that the joists or rafters (as the case may be) must be at such a distance apart, or at such a distance from the nearest wall, that the measurement from the middle of one joist to the middle of the next, or to the nearest wall, shall be not more than 15 in. The actual "distance apart" will, of course, vary according to the width of the joists and rafters themselves. The by-laws use the expression "distance apart" as meaning "distance apart measured in the manner described."

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC. M. INST. C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

Mr. TREVOR W. PHILLIPS, of Bexhill-on-Sea, to whom the premium for December was awarded, has chosen the following books:—

- "Main Drainage of Towns," by F. Noel Taylor (Griffin),
 - "Machine Drawing and Design," by Low & Bevis (Longmans), and
 - "Municipal Engineering" (St. Bride's Press, Ltd.).
- These have been duly sent to him.

QUESTIONS.

This week answers are invited to the following questions:—

370. Temporary Building Design.—A temporary building is required, 50 ft. long, 30 ft. wide, and 10 ft. to eaves. Design a suitable structure, with steel trusses and stanchions, to be covered with corrugated iron on boards and felt, the bays to be filled in with 4-in. reinforced brickwork. (J. M. N., Hitchin.)

372. Cemetery Lay-out.—A new cemetery is to be provided in an urban district having a population of 17,000, increasing at the rate of 800 per annum. Flat meadow land, in a suitable position, having frontage to a district road (sewered), can be obtained at £350 per acre; subsoil, 5 ft. ballast overlying stiff clay. State area of land which should be acquired; give an approximate estimate of the cost of laying out the same, including buildings; state also principles governing the lay-out, and describe in detail method of drainage, arrangement of plots, disposition of buildings, &c. (Togun.)

374. Magnetic North. What is the difference in degrees between the magnetic and true north? (J. T. C., Nottingham.)

375. Working-class Dwellings.—Twenty working-class dwellings have been built at a cost of £3,500 for the buildings and £250 for the land. What must the rental be to ensure that the income will defray all loans, &c., charges? Give details as to how the allowances for empties, taxes, insurance, repairs, &c., are arrived at in the estimate. The money has been borrowed from the Public Works Loan Board at 3½ per cent for the usual periods. The poor and district rates are 6s. 3d. in the £ per annum. (Togun.)

376. Foundation for Stanchion.—A built-up steel stanchion, as shown in the diagram, transmits a load (including its own weight) of 250 tons. Design a suitable steel base and concrete and steel joist grillage foundation for the stanchion. The safe load on the earth may be taken as 2 tons per square foot. (I. W. S., Clapham Junction.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

373. Strength of Shaft.—What is the safe diameter of a wrought-iron shaft to transmit 60-h.p. at 120 revolutions per minute? (T. R.)

The formula for calculating the diameter of a shaft is:

$$Tm = \frac{\pi f d^3}{16} \quad \text{and} \quad d = \sqrt[3]{\frac{Tm \times 16}{\pi \times f}}$$

where Tm = Twisting moment or "torque" in inch-lb.,
 f = Safe working stress in lb. per square inch,
 d = Diameter of shaft in inches.

This formula is determined on the assumption that rupture of a shaft occurs when the shear stress

put upon the outer skin of the shaft exceeds the shear strength of the material.

The diagram shows cross-section of a shaft which is assumed to be split into very fine portions, as

shown by circles dx . The stress on each of the very narrow rings is again assumed proportional to the radius x .

∴ The stress is greatest at the outer radius R , and the

$$\text{rule} = Tm = \frac{\pi f_s D^3}{16}$$

Where f_s = Shearing stress in inch-lb.,

Tm = Moment of resistance and torque in inch-lb.,

R = Outer radius in inches,

x = Radius of any small ring,

s = Stress per square inch at radius x ,

f = Stress per square inch at radius R ,

D = Twice radius ($2R$).

Now since the resistance increases uniformly as distance from centre we have:—

$$\frac{f}{s} = \frac{R}{x} \quad \text{and} \quad s = \frac{f \times x}{R}$$

The area of, say, the inner small ring shown on diagram = $2\pi x dx$ and its resistance = $2\pi x dx s$, which = $2\pi x dx$

$\frac{f x}{R}$, and the moment of this resistance = $2\pi x dx \frac{f x}{R} x$, which

$$= \frac{2\pi f}{R} x^3 dx.$$

Now the sum of all such terms will be the moment of

resistance of the whole section, and that = $\frac{2\pi f}{R} \int_0^R x^3 dx$

which by integration is reduced to $\frac{2\pi f}{R} \frac{x^4}{4}$. And when x

becomes R_1 , the extreme radius, the moment of resistance

$$\text{of the section} = M = \frac{\pi f R^4}{(R^2)^2} = \frac{\pi f R^3}{2^2}$$

$$\text{And} \quad \frac{\pi f R^3}{2^2} = \frac{\pi f \left(\frac{D}{2}\right)^3}{2^2} \quad \text{which} = \frac{\pi f D^3}{16}$$

∴ $Tm = \frac{\pi f D^3}{16}$ The twisting moment Tm of a shaft

transmitting 60 h.p. at 120 revolutions per minute

$$= Tm = \frac{HP \times 12}{n \times 2\pi} \quad (\text{where HP} = \text{Horse power transmitted, } n = \text{revolutions per minute})$$

$$= \frac{60 \times 33,000 \times 12}{120 \times 2 \times \pi} = 31512.6, \text{ say } 31,520 \text{ inch-lb.}$$

∴ $31,520 = \frac{\pi f D^3}{16}$. Now f = Safe tensile stress in lb. per sq. inch.

Allowing ultimate tensile strength of good wrought iron = 50,000 lb. per sq. inch, and allowing a factor of safety

of (say) 5, then $f = \frac{50,000}{5} = 10,000$ lb. per sq. inch.

$$\therefore d = \sqrt[3]{\frac{31,520 \times 16}{10,000 \times 3 \cdot 1416}} = \text{say, } \sqrt[3]{16} = 2 \cdot 54.$$

\therefore Diameter of shaft = 2.54 inches.

The factor of safety must always depend on local conditions. The question of bending moment has not been considered in the above, no data having been given. A safe rule to work to, and which combines bending and twisting moments, is:—

$$T_1 = B + \sqrt{(B^2 + Tm^2)}.$$

Where T_1 = Equivalent twisting moment,
 B = Bending moment,
 Tm = Twisting moment of shaft.

(R. J. M., *Heywood*.)

The formula showing the relationship between the diameter of a shaft and the horse-power transmitted by it is—

$$D = 3 \cdot 3 \sqrt[3]{\frac{H.P.}{N}}$$

Where D = Diameter of shaft in inches,
 N = Revolutions per minute.

$$\begin{aligned} \therefore D &= 3 \cdot 3 \sqrt[3]{\frac{60}{120}} \\ &= 3 \cdot 3 \times \frac{1}{\sqrt[3]{2}} \\ &= \frac{3 \cdot 3}{1 \cdot 26} = 2 \cdot 62 \text{ inches.} \end{aligned}$$

Society of Engineers.—On Monday, February 2nd, Mr. H. C. H. Shenton will deliver his inaugural address as president of the Society of Engineers in succession to Mr. Arthur Valon, M.INST.C.E. The meeting will take place at the Institution of Electrical Engineers, and the chair will be taken at 7.30 p.m. During the evening the premiums awarded for papers published in the Society's "Journal" will be presented.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain,
 Each man's opinion freely is his own
 Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii, 2.

MR. BOULNOIS' "GLOSSARY OF ROAD TERMS."

SIR,—I much appreciate the kind reply of Mr. Boulnois, in your last issue, to my letter of criticism of certain portions of his glossary. He just touches upon the purposes of the work, and so raises the question as to how far they are served by the very brief definitions he has given. It is a matter for consideration to what extent a "glossary" of technical terms should include detailed information. Bare definitions, however correct, may fail to be useful. A little description is often more enlightening. The following definitions, given in response to the invitation Mr. Boulnois is good enough to extend, share this character. But whether a mere definition or a more or less elaborate description is given, it should satisfy the inquirer so far as to leave him in no doubt of the significance of the term when applied to the practice of "road making."

Ammoniacal Liquor is the term applied to the aqueous distillate obtained as a by-product in the manufacture of coal gas. It contains ammonium carbonate, ammonium sulphide, other ammonia compounds, cyanogen compounds, and numerous other substances in solution. On distillation with lime it yields ammonia.

Anthracene is a solid hydrocarbon; formula, $C_{14}H_{10}$; melting at 213 deg. Cent., boiling at 351 deg.; contained in coal tar. Commercial "anthracene" is the solid deposited from "green oil" (*q.v.*), and is composed chiefly of phenanthrene, carbazol, and 30 to 50 per cent of true anthracene.

Asphaltene is the name given originally by Boussingault to the non-volatile portion of the hydrocarbon left on steam-distilling bitumen. Some still persist in this view, but it has long been customary to apply the term to that portion of the bitumen of asphalt which is soluble in carbon disulphide but not soluble in petroleum ether. Some chemists employ other solvents for the separation. "Asphaltene" is not a definite compound.

Bitumen is a naturally occurring mixture of hydrocarbons, usually with an admixture of some sulphur compounds of mineral origin; it is often intimately associated with inorganic matter, as in rock asphalt, and has a nature and properties comparable with those characteristic of the bitumens extractable from rock asphalt. "Bitumen" is employed by some, especially in America, to signify substances other than the naturally occurring hydrocarbon mixtures here described. Such a delimitation of the term is unfortunate and unnecessary, and should be discouraged. (See below also.)

Calcium Chloride.—A compound of calcium and chlorine; formula, $CaCl_2$. It is a white solid, having a great affinity for moisture, so much so that it rapidly deliquesces (*q.v.*) on exposure to air, hence its function as a dust palliative. The commercial article is obtained in large quantity as a by-product in the ammonia and other chemical industries, and holds in absorption a considerable proportion of water.

Carbon is a non-metallic element; symbol, C; atomic weight, 12; the purer forms of lampblack, charcoal, graphite, &c., are composed almost entirely of carbon. The term is applied technically to certain insoluble or non-volatile residues obtained in the chemical analysis of asphalt, pitch, &c., which consist very largely of carbon—as "free carbon," "fixed carbon" (*q.v.*).

Deliquesce (Lat. *deliquesco*—to melt away).—A body is said to deliquesce when on exposure to the atmosphere it not only absorbs moisture therefrom, but becomes liquefied with the moisture thus absorbed. See "Calcium Chloride." (Contrast *Hygroscopic*.)

I would place some reserve on the above definition of "Bitumen." One must remember that the word is used somewhat extensively in the wider sense, and that no other word is in use to comprehend the whole class of substances having bitumen-like properties. It is therefore a matter for very careful consideration to define this term in its technical application. Two words are needed—first, one to signify the pure natural bitumen as defined above; second, one to encompass the whole class of bodies employed for purposes for which true bitumen is especially avail-

able. We have only one word at present, hence the confusion.—Yours, &c.,

S. JUDD LEWIS, D.S.C., F.I.C.

London, W.C.

January 21, 1914.

To the Editor of THE SURVEYOR.

SIR,—With reference to my letter of the 30th ult. [THE SURVEYOR, January 2nd], I am glad to hear your views, but I don't quite understand if it is "the committee" or your good self who propose to issue the definitions.—Yours, &c.,

M. SOAL.

107 Bradgate-road,
Catford, S.E.

January 8, 1914.

[We are prepared to publish any definitions suggested by our readers, and will place the results before Mr. Boulnois for his consideration before he makes a final revision of his glossary. We do not know whether the committee reporting to the Road Congress continues in being, or whether any further action by the Permanent General Committee of Road Congresses may be anticipated in the near future.—Ed. SURVEYOR.]

CAST-IRON v. STEEL PIPES.

To the Editor of THE SURVEYOR.

SIR,—The article published in your issue of December 5th deserves more than passing notice, for the subject of corrosion of water mains must always have the very serious consideration of the authorities responsible for the public water supply.

It was a far cry to Australia to discover a case of the failure of cast-iron pipe, and that, obviously, under altogether exceptional conditions. It is safe to say that this single exception to the generally satisfactory life of cast-iron mains will be considered as a strong testimony to the eminently suitable character of cast iron for water service, and to its universal application.

At the present time an immense amount of trouble is being experienced with the steel mains of the city of Rochester, and the Atlantic City mains are in the process of being replaced by cast iron. The South African instances of deplorable wastage of steel mains by corrosion are too recent and well known to need more than mention. The accumulating cases of failure of steel give rise to fresh investigation of the subject of corrosion and methods for the preservation of steel.

Engineers are satisfied with the protection of cast-iron pipes afforded by the process of Dr. R. Angus Smith as now applied. In some cases engineers have called for sand-blasting the interior of pipes for water conduits, but in others, again, it is strictly enjoined that the surface shall not have the "skin" broken. Experience gained within the foundry is not in favour of sand-blasting or excessive chipping, and the best results will be obtained by solving the conditions of manufacture that will produce a fair, smooth surface from which the moulding sand can be removed without chipping or filing, so that the coating mixture, on being applied in an approved manner, and at the proper temperature, will leave a coated surface when dry—waterproof, tough, elastic, closely adhesive, bright and smooth.

A surface that has been wrought upon will always throw off the coating sooner than the natural surface of the casting. It goes without saying that rust should not be allowed to begin before coating takes place. Pipes that have been well coated will remain intact, and the surface bright and glossy for very long periods.

The question of the coating of cast-iron pipes, perhaps, receives less attention than it deserves because the material, grey cast iron, is itself not subject to rapid or continuous corrosion. It is found to-day that pipes laid down seventy-five years ago with no protection are in continuous service without material deterioration, and are calculated to remain in use for an indefinitely long period.

The increasing care that is being devoted to the quality of iron and its chemical and physical properties is calculated to maintain the highest resisting qualities of cast iron that marked it out as eminently suitable for underground mains, or, indeed, any class of permanent structural work that has to be put in inaccessible places.

In spite of all precautions, growths sometimes accumulate in the inside of pipes and obstruct the flow, but the incrustations may be removed without fear

of damaging the pipe, whose life service will not be diminished, while the original discharge will be restored.

It is well known that the materials presently available for protecting steel are not sufficiently reliable, and that the steel itself is very much more influenced than cast iron by all the causes operating for destructive corrosion, and in the long run cast iron will be found cheaper than steel, even if steel, in the first instance, should appear to show a margin of economy over the cast-iron mains, for the latter have a wider margin of safety, and their practical immunity from corrosion relieves the authorities in their financing from providing funds for replacement.—Yours, &c.,

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Derby T.C. (January 13th. Mr. F. H. Tulloch).—£3,750 for the purchase of property for the widening of the Wardwick.—The town clerk, Mr. G. T. Lee, stated the Wardwick was a narrow street carrying a large amount of traffic, and in consequence of the presence of interlacing tram lines in front of the property it was proposed to acquire the road was constantly being blocked. In addition to the removal of this inconvenience, the plans allowed of the improvement of a dangerous corner. The inspector also inquired into a request for sanction to a loan of £1,522 for widening Sten-on-road and the approach to the Normanton recreation ground.

Easington R.D.C. (January 13th. Mr. P. M. Crosthwaite).—£23,200 for the construction of a sewer from Haswell to the sea, a distance of about 7 miles.—Mr. R. I. Simey, barrister, appeared for the council, and explained that the scheme was for the purpose of taking the sewage from Haswell, South Hetton, East Murton, Cold Hesledon, and Dalton-le-Dale to the sea at Seaham Harbour. Filtration schemes had been proposed and rejected, and at length, in 1909, the council decided on the sea scheme, and having done so in regard to Haswell and South Hetton, thought it was obviously the best plan to take in the other places. Though the initial expenditure was large, the sea scheme, besides being the best, would be the most economical in the long run, compared with the current expenses of a filtration scheme.

Littlehampton U.D.C. (January 14th. Mr. R. H. Bicknell).—£1,000 for the purposes of fencing and laying out a new recreation ground in St. Winifred's-road.—The inspector inspected the plans, and, referring to the pavilion, remarked that he had only one fault to find with it, and that was it was too small. A building 12 ft. by 20 ft. would not shelter many people in case of rain. The surveyor, Mr. H. Howard, said it was not intended as a shelter; and tea would be served on the lawn. The inspector pointed out that as the ground was a gift, more money might be spent upon providing a good pavilion. Another foot or two would not involve much extra expense, and would make a much better job of it. The inspector stated, with regard to the period for repayment of the loan, that the council would probably be granted twenty years, and not thirty years as had been asked for.

Nottingham T.C. (January 14th. Mr. F. H. Tulloch).—£23,000 for the purpose of street paving.—The city engineer, Mr. Arthur Brown, stated that various kinds of materials were utilised to meet varying kinds of traffic and varying gradients. Answering the town clerk, the city engineer said that it was in the interests of the property owners and of the rate-payers themselves that North Sherwood-street should be paved with granite setts rather than with tar-macadam. It would be cheaper in the long run. The practice of using granite setts, Durax paving, or tar-macadam, according to circumstances, was general in most large towns.

Scunthorpe U.D.C. (January 8th. Mr. T. C. Ekin).—This was an application for the issue of a Provisional Order to amend the Scunthorpe Gas and Water Act, 1899, to include the urban district of Brumby and Frodingham within the limits of their

gas supply, and to empower the council to use, for the manufacture and storage of gas and residual products, 8 acres of land belonging to Lord St. Oswald, in Dawe's-lane, adjacent to the North Lindsey Light Railway, the land in addition to be used for refuse disposal destructor (2 acres), for an abattoir, and for highway and storage purposes 1 acre each, or 12 acres in all, and asked for power to borrow £9,900 for the purpose. It was stated that the present works were stopping the development of the town westwards, and that there would be a great saving in carting coal and residuals with the new works being placed alongside a railway.

Southmolton R.D.C. (January 2nd. Mr. W. M. Cross).—£700 for works of water supply for the village of Bishopsnympton. It was stated that, after trial pits had been sunk with satisfactory results, Mr. W. S. Gardner, the sanitary surveyor, prepared a scheme for driving an adit and collecting water in the field, building a reservoir, and laying 3-in. distributing mains, with standpipes, throughout the village.

APPLICATIONS FOR LOANS.

Aylesbury U.D.C.—£1,800 for cemetery extension, and £1,700 for the extension of the sewage works.

Bideford R.D.C.—£2,750 for a housing scheme, to be repaid in sixty years.

Bucks C.C.—£4,300 for extensions to the Slough elementary school.

Congleton T.C.—£600 for gas mains extensions.

Derbyshire C.C.—£7,000 for sanatorium purposes.

Dursley R.D.C.—£2,000 for the purchase of land for housing purposes.

Greenock T.C.—£50,000 for gasworks extensions.

Hastings T.C.—£7,150 for laying out the Briscoe estate.

Leigh (Lancs) T.C.—£11,910 for the electricity undertaking, and £11,420 for the gasworks.

Lowestoft T.C.—£2,527 for making up certain roads, and £900 for extensions to the town hall.

Lytham U.D.C.—£23,700 for an electric lighting scheme.

St. Austell U.D.C.—£5,076 for the provision of workmen's dwellings.

Scarborough T.C.—£1,125 for a street improvement.

Tonbridge R.D.C.—£7,496 for the erection of cottages.

Twickenham U.D.C.—£5,300 for resurfacing roads with asphalt macadam.

Walton-on-Thames.—£1,587 for works of sewerage.

West Hartlepool T.C.—£3,000 for additional electricity mains.

Wigton U.D.C.—£550 for footpaths.

Yarmouth T.C.—£4,800 for paving works.

LOANS SANCTIONED.

Belfast T.C.—£10,975 for paving purposes.

Bourne U.D.C.—£915 for the erection of six workmen's dwellings.

Chingford U.D.C.—£1,819 for private street improvements.

Derry C.C.—£2,500 for the new courthouse at Limavady.

Dewsbury T.C.—£58,678 for works of sewage disposal.

Edmonton T.C.—£1,520 for resurfacing The Green.

Featherstone U.D.C.—£5,806 for private street works.

Grantham T.C.—£5,646 for the erection of a council school.

Hampton U.D.C.—£2,000 for sewage disposal, to be repaid within fifteen years.

Hemel Hempstead T.C.—£5,132 for the erection of working-class dwellings.

Howden R.D.C.—£545 for experimental works in connection with the water supply.

Linthwaite U.D.C.—£22,043 for a housing scheme.

Margate T.C.—£1,253 for laying out a recreation ground.

Margate T.C.—£3,300 for the enlargement of Westonville pavilion.

Monmouthshire C.C.—£8,277 for a new school at Sirlhowy.

Nelson T.C.—£2,013 for electricity mains, and £1,937 for services.

Sawbridgworth U.D.C.—£277 for the construction of new council offices over the fire station.

Swansea T.C.—£24,500 for road work and sewerage.

Wakefield T.C.—£2,100 for the purchase of property for the widening of Kirkgate.

Westport U.D.C.—£2,553 for new sewage disposal works.

West Riding C.C.—£786 for the erection of a school at Stainforth.

Widnes T.C.—£19,170 for the extension of the Netherley waterworks.

FORTHCOMING INQUIRIES.

JANUARY.

	£
25.— Warrington. For the purposes of a dispensary (Dr. Miles B. Arnold) ...	—

FEBRUARY.

2.— Exeter. For housing purposes (Mr. Courtenay Clifton) ...	2,115
---	-------

Journal or Volume?—The Journal Committee of the Institution of Municipal and County Engineers have had before them the recent resolution of the South-Western District suggesting that the council should take a poll of the members on this question. At the last council meeting the committee recommended, and it was agreed, that a reply should be sent pointing out that "the principle of the journal was accepted at the last annual meeting, and that in issuing the proceedings in the form of a journal the council are acting under the instructions of the annual meeting."

Flashlights on Roads.—At Ruxley Corner, Sidcup, there has been installed a lamp which, flashing sixty times to the minute, acts as a warning to night motorists to proceed cautiously. The lamp has been devised by a London firm, and is called the "Aga" flashlight. Its flicker principle is that of the lighthouse, but it has the enormous advantage of burning for a year, without attention, on a tubeful of compressed acetylene gas not much bigger than an ordinary vegetable marrow. The yearly cost is 30s., and the initial cost little more than that of an ordinary street lamp. The light of the lamp set up at Ruxley is visible 200 yds. away.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Essex £45,000, Middleton £18,000, Newcastle-on-Tyne £20,000; housing and town planning—Holsworthy, Southampton; roads and materials—Hyde £2,100, Surrey, Yarmouth £4,800; sewerage and sewage disposal—Banbury £30,500, Woking £9,450; water, gas and electricity—Alloa £6,000, Edinburgh. Particulars of other works projected will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Aberdeen T.C.—The question is under consideration of purchasing the militia barracks as an administrative centre of the tramway undertaking.

Coventry T.C.—It is proposed to bring before the council in the near future a comprehensive scheme for public conveniences.

Essex T.C.—A scheme has been approved for the erection of new county offices at Chelmsford, at an estimated cost of £46,000.

Hitchin R.D.C.—The question of providing an isolation hospital is under consideration.

Leds T.C.—A deputation from the corporation has visited Edinburgh for the purpose of inspecting the markets and slaughter-houses in that city.

Licicester T.C.—A public convenience is to be erected in the Newark at an estimated cost of £630.

Lowestoft T.C.—The council have approved and adopted the plans of the borough surveyor, Mr. G. H. Hamby, for extensions to the town hall, at an estimated cost of £887.

Middleton T.C.—It is proposed to build new municipal offices at an estimated cost of £18,000.

Newcastle-on-Tyne T.C.—Plans have been approved by the Education Committee for the extension of the Rutherford Technical College, at an estimated cost of £20,000.

Richmond (Surrey) T.C.—At the January meeting it was decided to authorise a committee to have prepared plans and estimates for extending the town hall by the inclusion of the whole site of the premises now occupied by Messrs. Mawers, Limited. It was stated that the original extension scheme of 1911 was estimated to cost £7,500; for the new scheme they would have to add, say, another £3,000, exclusive of furnishing, which would mean an annual charge of £600.—The suggestion that the first-class swimming bath should be floored over was revived owing to offers from badminton clubs to rent the hall for evenings at a total for the season of £120. Mr. J. H. Brierley, the borough surveyor, estimated the cost of the floor at £285, a shed for storing it at £50, and annual expenditure at £95. Decision was deferred pending definite arrangements for letting for badminton and other purposes.

Stoke-on-Trent T.C.—A new fire station has been built in Welch-street at a cost of £1,400.

Thirsk R.D.C.—It has been agreed to build an additional block to the isolation hospital, at an approximate cost of £1,000.

Wembley U.D.C.—Arrangements have been completed for the erection of a new fire station.

Yarmouth T.C.—Plans have been adopted for the extension of the isolation hospital, at an estimated cost of £750.

HOUSING AND TOWN PLANNING.

Belfast T.C. The tender of Mr. W. McVicker, Belfast, has been accepted for the erection of 252 working-class houses for the accommodation of people dis housed by a clearance scheme. The houses will be built in compliance with the plans which were prepared in the department of the city surveyor, Mr. H. A. Cudler, M.INST.C.E., after the abandonment of the maisonette design originally adopted. They will be of what is known as the kitchen house type, but the rooms will be somewhat larger. Half of them will be two-roomed and the other half three-roomed houses, the former containing a kitchen or living room, one bedroom and a scullery, and the latter including an additional bedroom. The houses can be

built in blocks of four or more, but are equally suitable for larger blocks or even continuous rows.

Bideford R.D.C.—It has been agreed, subject to the sanction of the Local Government Board, to build ten cottages—two at Buckland Brewer, four at Hartland, two at Parkham, and two at Woolsey. The estimate of the total cost of the scheme, exclusive of land, is £2,725.

Brixham U.D.C.—Three acres of land at Garlic Rea have been purchased for £100 for the purpose of a housing scheme.

Derbyshire C.C.—The council at their meeting last week, having considered a report by the county medical officer, decided to forward to the Local Government Board a formal complaint that the Clay Cross Urban District Council had failed to exercise their powers under the Housing of the Working Classes Act. It was stated that it was twenty years since the medical officer first drew attention to the sanitation of Clay Cross.

Foleshill R.D.C.—As the result of an inspection made on behalf of the Local Government Board by Mr. Courtenay Clifton, in company with the medical and sanitary officers, the council have been called upon forthwith to take into serious consideration the carrying out of a municipal housing scheme for a portion of the district, especially the populous parishes of Bedworth and Foleshill. The board also think houses are required in the parish of Walsgrave-on-Sowe, but the opinion of the Foleshill authorities is that there is a far greater need at Keresley, where a new colliery is being established.

Holsworthy U.D.C.—The Housing Committee have gone into the plans submitted for the proposed workmen's dwellings, and, subject to the proviso that the houses could be built for £200 each, they recommend the acceptance of one set.

Llanelli U.D.C.—The surveyor, Mr. George Watkeys, has reported upon a scheme for laying out on town planning lines the Stepeny estate lands situated between Andrew-street and Felinfoel, known as the Llanerch and Penynglawdd districts. The area to be dealt with is 80 acres, and sites are provided for 664 houses, equal to about nine houses per acre, including road area, but not including the 4½ acres devoted to open spaces. The Estates Committee recommend the council to adopt the scheme.

Mansfield T.C.—The General Purposes Committee have adopted the recommendation of the Town Planning Committee that the borough surveyor, Mr. T. P. Collinge, be instructed to prepare a plan of the undeveloped land in the western part of the borough, and including such part of the district of Mansfield Woodhouse as he might consider desirable, the plan to be submitted to the committee with a view to a scheme for this area being prepared and proceeded with as rapidly as possible. The committee also recommended that the scheme for the two areas in the town planning scheme for 1913 be proceeded with at once.

Newton Abbot R.D.C.—Arrangements have been completed for the purchase of land at Chudleigh for a housing scheme.

Sidmouth U.D.C.—A sum of £1,700 is to be paid for a site at Higher Salter's Meadow for the purpose of a housing scheme.

Southampton T.C.—The borough engineer, Mr. J. A. Crowther, has received instructions to submit alternative schemes for the erection of terrace houses (16 ft. frontages), or semi-detached houses (15 ft. frontages), on the land southward of the schools in Manor Farm-road, together with a report on the subject of rentals.

Troon T.C.—The question of promoting a suitable housing scheme has been referred to the council in committee.

Wishaw T.C.—In consideration of the fact that there is a scarcity of workmen's dwellings in this locality, and that the people ejected from their homes would have nowhere to go, the council have declined to grant closing orders meantime, or until the Housing Committee had gone further into the question of providing accommodation for these people.

PARKS AND OPEN SPACES.

Hastings T.C.—The work of laying out the Brisco estate land is proceeding. The council have sanctioned the expenditure of over £7,000, including £600 for bowling greens, £250 for tennis lawns, £250 for promenade lawns, £500 for terraces, £750 for shelters, £400 for pavilions, and £500 for lifts.

Llandudno U.D.C.—The council have purchased land for a new golf links. The area of land included in the purchase is 123 acres, and the agreed price is £103 per acre, making a total of £14,256, which amount the council will now seek power to borrow, together with a sum for laying out the links.

REFUSE COLLECTION AND DISPOSAL.

Hexham R.D.C.—The question of a properly organised system of scavenging has been referred to the Sanitary Committee for report.

ROADS AND MATERIALS.

Aberdeen T.C.—The Streets and Roads Committee recommend the widening of Guild-street at a cost of £300.

Abergele U.D.C.—It has been agreed to lay an asphalt belt 9 ft. wide along the whole length within the chains on the promenade at Pensarn, at a cost of £70.

Ballymoney R.D.C.—The council have agreed to the proposal of the county surveyor, Mr. John H. Brett, to improve the surface of the main road from Ballymena to Ballymoney for a distance of about 3½ miles from the Ballymena rural district boundary; to steam roll and coat with tar-spray in such a manner as would be approved by the Road Board, at a cost of £2,240, half to be defrayed by the Road Board, a quarter by the county at large, and the remainder by the rural district of Ballymoney. The council's share will be £560, and the period of repayment is to be spread over two years.

Balrothery R.D.C.—The county surveyor, Mr. William Collen, reports that, as a result of the strong recommendations made to the Road Board with regard to the uncompleted improvement of the Dublin to Dundalk road, a grant of £3,900 has been obtained.

Blackburn T.C.—The Finance Committee recommend an expenditure of £10,330 on improvements in Whalley, New-road, Bolton-road, and Victoria-street.

Bradford T.C.—It is proposed to carry out street works in several thoroughfares at a cost of £750.

Coleraine R.D.C.—After considering the list of road contracts, the council recently agreed to curtail the quantity of metal on a number of first and second class roads. By this a "saving," as it was termed, was effected of £525, of which they authorised an expenditure of £445 on urgent repairs to bridges, including a sum of £100 for the extension of the granite path promenade at Portstewart.

Colwyn Bay U.D.C.—The surveyor, Mr. William Jones, has been instructed to set back by 6 ft. the kerb in Station-road—the main entrance to the town from the railway station.

Fermanagh C.C.—An intimation has been received from the Road Board that they will be prepared to make grants of 50 per cent of the cost of improving roads leading to Bundoran, Omagh, Clones, and Swanlinbar. The grant amounts to £1,005.

Haddingtonshire C.C.—The Eastern District Committee have adopted a scheme for the maintenance of the great post roads for five years, including the purchase of the necessary plant. The scheme involves an expenditure of £11,800, towards which it is understood that the Road Board will make a grant estimated at £3,431, and also give a grant of £6,931, free of interest. The district road surveyor has been instructed to prepare a formal scheme to be submitted to the Road Board.

Hyde T.C.—Works of road improvement have been approved, at an estimated cost of £2,100.

Peterborough T.C.—The difficulty of dealing with the grievance of horses slipping on tarred roads was illustrated to the council recently by the borough surveyor, Mr. J. W. Walshaw, who stated that once they used sand and small gravel, but the sand got into a disagreeable state of mud and the gravel was injurious to the horses' feet, and sometimes the horses slipped on it because it would not grip. They then used granite chips as a preventative to slipping, and that was really best, but it affected cycles and motor tyres, so he gave it up, and lately had been using slug dust.

Sunderland T.C.—The Road Board have made a grant of £2,000 towards the £4,000 expended in paving a section of the Newcastle and Shields road.

Surrey C.C.—Plans and suggestions for the improvement of the East and West road between Shalford and Reigate have been sent to the local authorities interested, and Reigate (borough and rural) and Borking urban approve the scheme, but suggest further widenings. Hambledon, Guildford and Dorking rural councils disapprove, but favour certain widenings, and the Duke of Northumberland, who is the landowner for the greater portion of the route, also disapproves. It was decided on Tuesday that the county surveyor, Mr. A. Dryland, should negotiate with the approving authorities with a view to carrying out the widenings and improvements in their areas.—The Road Board have offered £800, approximately half the cost, of widening the Portsmouth main road between Windows Bridge and Griggs-hill, and will contribute to the widening of London-road, Guildford, if the land can be obtained at a reasonable cost. The extensive widening between Merton High-street and the Masonic Hall, estimated to cost £5,950, the board think, is a matter for a long loan. They will contribute about one-third of the cost of diverting and widening the Surbiton and Ewell-road near Tolworth Court Farm, a dangerous bend. The board also promise a third of the cost of widening and straightening the Esher and Molesey road, and of rounding-off and widening corners on the Godstone and Westerham road, and towards the rebuilding and widening of the bridge over the Ash Vale Canal.—The contemplated improvement of Richmond Bridge is referred to elsewhere.

Tiverton R.D.C.—The council have adopted the recommendation of the Highways Committee to employ labour direct on the district roads on the expiration of the manual labour contracts in March.

Wells (Norfolk) U.D.C.—The council have approved the plans of the surveyor, Mr. R. G. Coles, for repairing the Butlands roads at an estimated cost of £386.

West Dean R.D.C.—The surveyor, Mr. P. Phipps, has reported that the estimated cost of making a road at Worrall Hill would be £1,300, and the council have decided to schedule the scheme for future consideration.

Windsorham (Surrey) U.D.C.—Reference was made recently in the Highway Committee's report to the scheme for widening Bagshot Bridge and its approaches, and to the alternative scheme of constructing another roadway from a point near Bagshot Park Lodge to join the main road near the Fighting Cocks inn, in order to deal with the difficulty of the through motor traffic. The surveyor, Mr. O. G. Stanley, reported that the second scheme would mean the construction of an entirely new road 40 ft. wide, with a carriageway 26 ft. wide, and a new bridge would have to be built over Windle brook. The council decided to ask the county council to adopt the second scheme, provided that the Road Board were willing to contribute three-fourths of the cost and the county council two-thirds of the remainder.

Yarmouth T.C.—The council have adopted the estimate of the borough surveyor, Mr. J. W. Cockrill, for paving works estimated to cost £4,800.

SEWERAGE AND SEWAGE DISPOSAL.

Aspatia U.D.C.—The council have adopted the plans of Mr. Redwell for the extension of the sewers at an estimated cost of £319.

Atcham R.D.C.—A new sewerage scheme for the village of Pontesbury, constructed at a cost of about £3,000, has been formally opened.

Banbury T.C.—An extensive drainage scheme, estimated to cost over £30,000, is to be carried out under the direction of the borough surveyor, Mr. N. H. Dawson, by means of direct labour.

Coseley U.D.C.—The surveyor, Mr. C. E. Horton, has received instructions to prepare plans for a sewer extension scheme.

Halifax T.C.—Sewerage works, estimated to cost £2,295, are to be carried out under the direction of the borough engineer, Mr. J. Lord.

Ham U.D.C.—A sewerage extension scheme prepared by the surveyor, Mr. K. W. Hindhaugh, and estimated to cost £874, with an annual charge for electricity and water of about £25, has been adopted, and the usual application will be made to the Local Government Board.

Porthcawl U.D.C.—It has been decided to comply with the request of the Local Government Board to

submit at once a suitable sewerage scheme for the eastern portions of the district.

Woking U.D.C.—The council have approved a scheme prepared by Mr. G. Midgley Taylor for the improvement of the sewage disposal works, at an estimated cost of £9,450.

WATER, GAS, AND ELECTRICITY.

Alloa T.C.—The Water Committee have received authority to report upon a scheme for an improved water supply estimated to cost £6,000.

Edinburgh T.C.—The council have approved of a draft Provisional Order for extending the corporation area of supply of electricity so as to include the parishes of Cramond, Corstorphine, Colinton, Liberton, and Newton, in the county of Mid-Lothian.

Essex and the Dittons U.D.C.—At the last monthly meeting Mr. H. C. Fread, the surveyor, presented a statement showing terms quoted by the gas company and the electric light company for lighting the public-street lamps of the district. For a three years' contract the gas company's terms amounted to £1,121, being the terms of the present contract. The terms of the electric light company, including repayment of loan for cost of installation, were £625, but the latter estimate was for only 183 lamps, whereas the gas company's estimate was for the whole of the lamps—116. On a ten years' contract the figures were: Gas company £1,331, electric light company £1,560.

Frome R.D.C.—Consideration is being given to a water supply scheme for the village, which is estimated to cost £1,850.

Lexden and Winstree R.D.C.—The council have instructed Messrs. Taylor & Wallin, civil engineers, of Newcastle-on-Tyne and London, to prepare a scheme for and report upon water supply for the parish of Layer Marney.

Newport (Salop) R.D.C.—The services of an engineer are to be engaged to advise the council upon the matter of the provision of a scheme for supplying water to contributory districts within the council's area.

Plympton R.D.C.—The water engineer, Mr. F. A. Clark, recommends that a new 4-in. pipe should be laid for the supply of Lower Hooe and Turnchapel, the cost being estimated at £450. In connection therewith, the council's engineer, Mr. F. A. Clark, has been appointed to interview the superintendent civil engineer at Devonport to ascertain what contribution the Admiralty would be prepared to make towards the proposed scheme, together with the construction of a tank or reservoir at the highest part of Turnchapel.

Yarmouth T.C.—The tender of Messrs. Crompton & Co., Limited, at £883, has been accepted for a high tension switchboard.

MISCELLANEOUS.

Bermondsey B.O.—The borough council and the London County Council have been at variance for over a year as to whether the conduit system or the overhead system of traction should be adopted for electrifying the existing horse tramways from Tower Bridge-road to Lower-road, Deptford. It was stated that whereas the cost of the overhead system would be £56,940, the cost of the conduit system would be £137,030. The borough council have now submitted a scheme for reconstructing the line on the conduit system, the widenings to cost only £17,000 (instead of £67,000, as estimated, if the conduit system was adopted), and it is understood this proposal has commended itself to the Highways Committee, and will in all probability be recommended for adoption by the county council.

Brierley Hill U.D.C.—Brierley Hill fire brigade are to be congratulated upon the success which has met their appeal for funds for the provision of a steam fire engine; they have received just over £600, and on February 5th the new engine, which is of the Merryweather "Gem" type, will be "christened" and presented to the town.

Redcar U.D.O.—The "too old at forty" controversy was renewed at a recent meeting of the council, when, as on a previous occasion, an attempt was made to rescind the minute passed in September, 1912, that no new workmen over the age of forty be engaged permanently. Mr. T. Wrightson, who brought the subject forward, said the council were setting a bad example by having such a minute on the books. If other firms acted similarly

what would become of the workers? Mr. Tomlinson seconded the rescinding resolution, and after discussion it was carried with unanimity, the council also resolving that the surveyor, Mr. J. Howeroft, should have entire freedom in dealing with appointments.

Strabane U.D.C.—The Duke of Abercorn has offered to sell his market rights to the council, and a committee of the whole council has been appointed to go into the matter.

PERSONAL.

Mr. F. Hopkinson, surveyor and inspector to the Blyth and Cuckney Rural District Council, has resigned.

Mr. G. J. Wooldridge, surveyor to the Woking Urban District Council, has had his salary increased by £50 per annum.

Mr. F. W. Knight, surveyor and water engineer to the Teignmouth Urban District Council, has had his salary increased from £230 to £275 per annum.

Mr. J. H. Edmondson, chief assistant at the Hacken sewage works of the Bolton Corporation, has been appointed chemist and manager of the Southall-Norwood sewage works, Middlesex.

Mr. A. E. Darby, ASSOC. INST. C.E., A.M.I. MECH. E., borough engineer and surveyor of Bethnal Green, has had his salary increased to £500 per annum by a unanimous vote of the borough council.

Mr. J. H. Moore, assistant surveyor and nuisance inspector to the Hipperholme Urban District Council, having resigned, Mr. S. W. Thompson (the present clerk and surveyor) has been appointed in his place.

Messrs. T. W. A. Hayward (Battersea), P. H. Palmer (Hastings) and H. T. Wakelam (Middlesex) were, at the last council meeting, nominated as vice-presidents of the Institution of Municipal and County Engineers.

Mr. Richard Thomas Porter, engineer, of Beckenham and Rochester—whose death, at the age of seventy-nine, was recently announced—was the chairman of Messrs. Aveling & Porter. He left estate of the gross value of £108,284.

Mr. James Jerman, hitherto architect and surveyor to the Exeter Education Authority, has been appointed consulting architect to the authority at a salary of £52 10s. per annum. The town council have resolved to appoint an architect in the city surveyor's department at a salary of £220, rising to £250.

Mr. Herbert Goodyear, borough surveyor of Colchester, has resigned after twenty-eight years' service, and Mr. A. E. Slater, ASSOC. INST. C.E., is meanwhile acting as borough surveyor. Mr. Slater is the author of the work "Structural Economy," published by the St. Bride's Press, Limited, a little over a year ago.

Mr. Frederick P. Dixon, M. INST. C.E., surveyor to the Rathmines (co. Dublin) Urban District Council, was recently presented with a silver salver and a pair of sauce-boats, on the occasion of his retirement, as a token of the high appreciation in which he was held by his colleagues. He is succeeded in the position by Mr. W. R. Stephens, M. INST. C.E.I., who has been his assistant for the past twenty-two years.

Mr. Thomas Fenn, who died recently at the age of seventy, was for some years surveyor to the Short Heath Local Board. He was subsequently engaged in mining operations in South America, and on returning home was appointed clerk of the works in connection with the storm-water culvert constructed by the Leicester Corporation. His last appointment in a similar capacity was in connection with the construction of the high and low level sewers at Belper. Mr. Thomas Fenn, surveyor to the Belper Urban District Council, is the eldest son of the deceased.

Messrs. C. L. Roberts, borough surveyor, Pwllheli; E. W. Jones, county surveyor (Eastern Division), Denbighshire; J. A. Manning, divisional main road surveyor, Hampshire County Council; W. L. Jenkins, county surveyor, West Suffolk; E. J. Stead, county surveyor, North Devon; H. S. Wood, chief assistant to borough engineer, Brighton; F. Wood, borough engineer, Fulham, and W. F. Y. Molineux, surveyor, Ulverston Rural District Council, have been elected members. Messrs. T. Gourlay, chief assistant road surveyor to Fife County Council, and S. Brassy-Edwards, engineering assistant to city engineer, Liverpool, associate-members, and Messrs. P. G. Thorby, borough

engineer's office, Southend-on-Sea; E. T. Mobbs, engineer's office, Watford Urban District Council, and L. F. Dunbar, borough surveyor's office, Hemel Hempstead, students, of the Institution of Municipal and County Engineers. Messrs. H. K. De Kretser, district engineer, public works department, Ceylon, and J. Pryde, road surveyor for Western District of Kirkeudbright, have been transferred from the class of associate-member to that of member.

Brighton Aquarium Scheme.—The official report of the General Purposes Committee of the Brighton Town Council on the question of polling the town concerning the proposed developments at the Brighton Aquarium recommends that there be no poll of the town, and that the proposed Bill be withdrawn in order that the whole matter may be further considered. The scheme was recently condemned at a formally convened town's meeting.

FOR OTHER ADVERTISEMENTS

See End of Paper.

CITY OF ST. ALBAN.

APPOINTMENT OF SURVEYOR'S CLERK.

The Council invite applications for the above appointment. Applicants must have had experience in a Municipal Surveyor's Office, including the keeping of all the various books, and be an efficient Short-hand Typist.

The salary will be at the rate of £70 per annum.

Applications, in candidate's own handwriting, stating age and qualifications, to be addressed and delivered to the undersigned, accompanied by copies of three testimonials, not later than Thursday, the 12th February, endorsed "Surveyor's Clerk." Canvassing will be deemed a disqualification.

E. P. DEBENHAM,
Town Clerk.

Town Clerk's Office,
St. Albans.
January 21, 1914.

(1,182)

COUNTY BOROUGH OF STOCKPORT.

CHIEF ASSISTANT—BOROUGH SURVEYOR'S OFFICE.

The Highways and Sewers Committee of the County Borough of Stockport invite applications from qualified persons from 30 years to 35 years of age, for the position of Chief Assistant in the Borough Surveyor's Office. Salary £200 per annum, rising to £260 by annual instalments of £10.

It is essential that each candidate should be a fully qualified Civil Engineer, and have had the necessary Education and Municipal Training of a Borough Surveyor's Office, to fill the position—including actual experience in the design and supervision of Tramways and Bridge Construction, Sewage Works, Private Street Improvement Works, &c.—and sufficient Architectural knowledge to design Buildings in connection with Engineering Works.

Full particulars of the duties and conditions relating to the appointment, together with Form of Application, can be obtained on application to the undersigned.

Applications to be on the prescribed Form (no other will be considered), and addressed to the Borough Surveyor, endorsed "Chief Assistant," and must be delivered not later than Thursday, 12th February next.

JOHN ATKINSON, ASSOC. M. INST. C. E.,
Borough Surveyor.

Town Hall,
Stockport.

January 21, 1914.

(1,191)

METROPOLITAN BOROUGH OF WOOLWICH.

SUPPLY OF ROAD MATERIAL, FORAGE, STORES, &c.

The Council of the Metropolitan Borough of Woolwich are prepared to receive Tenders for the supply of the undermentioned Road Material, Forage, Stores, &c., from the 1st April, 1914, to the 31st March, 1915.

1. Ballast, Sand, &c.
2. Brooms, Brushes, &c.
3. Cement.
4. Chandlery.
5. Drain Pipes.

6. Forage (for six months only from 1st April, 1914).
7. Granite Kerb.
8. Harness.
9. Ironmongery.
10. Road Material.
11. Sewer Ironwork.
12. Timber.

Forms of Tender, with Schedules and further particulars, can be obtained from the office of Mr. J. Rush Dixon, M. INST. C. E., Borough Engineer, Town Hall, Woolwich.

The persons or firms tendering will be required to make a declaration that they have paid and will pay trades union rates of wages, and have observed and will observe trades union hours of labour upon all work carried out for the council. The persons or firms whose tenders are accepted will be required to enter into formal contracts.

Samples may be inspected at the Town Hall, Woolwich, between 9 a.m. and 1 p.m., and 2 p.m. and 5 p.m. (Saturday, 9 a.m. to 1 p.m.). No Tender will be considered in cases where samples are provided unless the tenderer or his agent has inspected them and signed the book to that effect. No tender will be considered unless on the authorised Form of Tender. Sealed Tenders, based on properly priced out Schedules, must be delivered to me at the Town Hall, Woolwich, not later than 12 o'clock noon on Wednesday, the 11th February, 1914, in envelope endorsed "Tender for—."

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

ARTHUR B. BRYCESON,
Town Clerk.

Town Hall,
Woolwich.

January 20, 1914.

(1,190)

ILFORD URBAN DISTRICT COUNCIL.

TO CONTRACTORS, MERCHANTS, IRON-MONGERS AND OTHERS.

The above-named Council invites Tenders for the following for the twelve months ending 31st March, 1915:—

1. Granite Macadam.
2. Broken Flints.
3. Tar Paving.
4. Portland Cement.
5. Lime, &c.
6. Stock and other Bricks.
7. Thames Ballast, &c.
8. Stoneware Pipes.
9. Iron Castings.
10. Coal and Coke.
11. Provender (six months only).
12. General Horse Hire and Cartage.
13. Miscellaneous Oils and Paints.
14. Wheelwrights' Timber, Tools, &c.
15. General Timber.
16. Brooms, Brushes, Baskets, &c.
17. Engineers' Sundries, Tools, &c.
18. Iron Farriers' Tools, Nails, Screws, &c.
19. Drysaltery, Soaps, and Sundries.
20. Draughtsmen's Materials.
21. Harness, &c.
22. Winding Clocks.
23. Pitch, Croosote, Oil, &c.
24. Hire of Cycles.
- Disinfectants.

Forms of Tender, conditions and full particulars may be obtained on application to Mr. H. Shaw, M. INST. C. E., Engineer and Surveyor, Town Hall, Ilford.

All applications for Forms of Tender to be accompanied by a deposit of 5s., which will be returned on receipt of bona-fide Tenders, and after adjudication by the Council on the Tenders received.

Sealed Tenders, endorsed "Tender for —" (as the case may be), to be delivered to the undersigned on or before Monday, 9th February, 1914.

The Council does not bind itself to accept the lowest or any Tender.

(By order)

ADAM PARTINGTON,
Clerk of the Council.

Town Hall, Ilford.

January 22, 1914.

(1,202)

METROPOLITAN BOROUGH OF SHOREDITCH.

ANNUAL CONTRACTS.

The Council of the Metropolitan Borough of Shoreditch are prepared to receive Proposals and to Contract with any person or persons for the following Articles and Works for one year from the 1st day of April next to the 31st day of March, 1915 (inclusive) viz.:-

1. Highways Department.—For Paving, Repairing, and Relaying the Footway and Carriageway Pavements within the said Borough, and the Supply of Materials. (A £10 Bank of England Note to be deposited with the Borough Accountant at the Town Hall at the time the Tender is lodged, otherwise the Council will not be responsible for same.)
2. For Supplying and Laying Patent or Manufactured Stone or other Paving Material.
3. Asphaltting.
 4. Broken Granite.
 5. Plumbers' Work.
 6. Smiths' Work.
 7. Drain Pipes, Junctions, Bends, &c.
 8. Drain Rods, Pails, Ropes, &c.
 9. Timber.
10. Sewer Ironwork and Street Posts
11. Lime, Cement, &c.
12. General Cartage. (A £10 Bank of England Note to be deposited with the Borough Accountant at the Town Hall at the time the Tender is lodged, otherwise the Council will not be responsible for same.)
13. Street Name Plates, Notice Boards, Writer's Work.
14. Ballast, Hoggin, Shingle and Sand.
Samples of the above Articles can be seen at the Depot, Flemming-street, Kingsland-road, N.
15. Scavenging and other Departments.—Iron, Ironmongery, Coach Ironmongery, Coal and Coke, Basket Work, and Miscellaneous Indianrubber Work, Brooms, Brushes, Harness, Sundries, Loin Cloths, and Sail Cloth Covers.
16. Uniforms and Costumes.
17. Paints, Oil, Cotton Waste, &c.
18. Gas Mantles and Chimneys.
Samples of the Articles required for these Departments may be seen at the Town Hall, Old-street, E.C.
19. Printing for 3 years.
20. Stationery for 3 years.

Samples may be seen at the Town Clerk's Office.

Forms of Tender for all the above-mentioned can be obtained on application to the undersigned.

Tenders must be sent, properly endorsed, to the Town Clerk at his Offices as under, before 3 o'clock on Tuesday, the 17th February, 1914, after which time no Tenders can be received.

Contractors must agree to pay the Trade Union rate of wages observed at the date of the Contract, and to observe the usual hours of labour recognised by the trade, and not to sub-let the Contract.

The Council does not pledge itself to accept the lowest or any Tender, and none but Tenders on the official printed Forms will be received, which, with any further information, may be obtained from the various Departments of the Council, or from

J. A. D. MILNE,
Town Clerk.

Shoreditch Town Hall,
Old-street, E.C.

January 20, 1914. (1,201)

NORTHAMPTONSHIRE COUNTY COUNCIL.

MAIN ROADS.

SUPPLY OF GRANITE.

The Roads and Bridges Committee invite Tenders for the Supply of Broken Granite, delivered at various Stations and Wharves in the County.

Tenders to be sent in not later than February 9th next to the undersigned, from whom Forms of Tender and other particulars may be obtained.

C. S. MORRIS,
County Surveyor.

County Hall,
Northampton.

January 21, 1914. (1,196)

RURAL DISTRICT COUNCIL OF NEWARK.

TENDERS FOR ROAD MATERIALS.

The above Council invite Tenders for the supply of about 850 tons of Granite, 1,900 tons of Slag, and 250 tons of Tar-macadam, to be delivered in such quantities and at such times and places in their district as the Council, or their District Surveyor, shall require and direct.

Sealed Tenders, marked "Tender for Materials," to be sent to me, the undersigned, on or before Saturday, February 7th, 1914, and samples must be delivered, free of expense, to the Board Room, The Ossington, Newark, on or before Monday, the 9th day of February next.

The Council do not bind themselves to accept the lowest or any Tender, and they reserve to themselves the right to accept such part of any Tender as they may deem proper.

The Contractor will be required to enter into a Bond for the due fulfilment of his Contract.

Further particulars, Specifications and Forms of Tender may be obtained from Mr. R. Oakden, junr., 27 Winchilsea-avenue, Newark, upon receipt of a foolscap stamped and addressed envelope.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A.,
Borough Surveyor, Great Yarmouth.

NORTH-WESTERN DISTRICT.

A meeting of the institution is to be held in the North-Western District at Manchester on February 20th and 21st.

NORTH-EASTERN DISTRICT.

A meeting of the North-Eastern District will be held at Wakefield on Saturday, March 21, 1914.

THOMAS COLE,
Secretary.

92 Victoria-street, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District of the Institution of Municipal Engineers will be held at Manchester on Saturday, January 31st.

PROGRAMME.

- 1.30 p.m.—Business meeting at the Mitre Hotel, Cathedral-close, to elect district chairman and hon. district secretary, and to arrange programme.
- 3 p.m.—Visit to the Stuart-street station of the Manchester Corporation electricity works, by kind permission of Mr. S. L. Pearce, M.INST.C.E., M.I.E.E., the chief engineer. Members are requested to assemble at 3 o'clock sharp.

B. WYAND,
Secretary.

39 Victoria-street, S.W.

CONCRETE INSTITUTE.

The forty-third ordinary general meeting will be held at Denison House, 296 Vauxhall Bridge-road, Westminster, S.W. (close to Victoria Station), on Thursday, January 29th, at 7.30 p.m., when a discussion will take place on the following reports:—

- (1) Draft report of the Joint Committee of Representatives from the Quantity Surveyors' Association, the Quantity Surveyor members of the Concrete Institute, and the Reinforced Concrete Practice Standing Committee of the Concrete Institute on a standard method of measurement for reinforced concrete.
- (2) Draft report of the Reinforced Concrete Practice Standing Committee of the Concrete Institute on a suggested tabulated form for preparing quantities for reinforced concrete.

The reports are compiled with a view to securing uniform practice and of economising labour, and contain illustrated suggestions for the manner of preparation of preliminary drawings by engineers for the information of their surveyors when preparing the quantities, and the discussion is arranged with a view to ascertaining the views of members collectively so that the reports may be put in final form subsequently.

Visitors' cards can be had on application.

H. KEMPTON DYSON,
Secretary.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

J. Oakes & Co., Alfreton Ironworks, Derbyshire	

(Quotation of prices but no tender.)

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

JANUARY.

- 23.—Institution of Civil Engineers (Students' Meeting): Mr. E. W. Monkhouse, M.A., M.INST.C.E., on "The Testing of Materials for Use in Engineering Construction." 8 p.m.
- 26.—Surveyors' Institution: Mr. George Corderoy on "Measuring and Quantity Surveying."
- 26.—Royal Institute of British Architects: Sir Herbert Jekyll on "London Traffic Problems." 8 p.m.
- 28.—Institution of Civil Engineers: Students' Visit to Southwark Bridge and Messrs. Kirkaldy's Testing Works.
- 29.—Concrete Institute: Discussion on Joint Report of the Reinforced Concrete Practice Committee and the Quantity Surveyors' Association, on "Standard Methods of Measurement for Reinforced Concrete Work." 7.30 p.m.
- 30.—Institution of Civil Engineers (Students' Meeting): Mr. E. W. Monkhouse, M.A., M.INST.C.E., on "The Testing of Materials for Use in Engineering Construction." 8 p.m.
- 31.—Institution of Municipal Engineers: North-Western District Meeting, Mitre Hotel, Manchester. 1.30 p.m.

FEBRUARY.

- 2.—Society of Engineers: Mr. H. C. H. Shenton delivers his Presidential Address. Institution of Electrical Engineers. 7.30 p.m.
- 4.—Institute of Sanitary Engineers: Annual Dinner, Holborn Restaurant.
- 9.—Royal Institute of British Architects: President's Address to Students; Presentation of Prizes and Studentships.
- 16.—Institute of Sanitary Engineers: Mr. F. R. O'Shaughnessy, F.I.C., on "The Significance of Colloidal Matter in the Problem of Sewage Disposal." Caxton Hall, Westminster. 8 p.m.
- 20-21.—Institution of Municipal and County Engineers: Meeting at Manchester.
- 23.—Surveyors' Institution: Annual Dinner, Whitehall Rooms. 7 p.m.

MARCH.

- 21.—Institution of Municipal and County Engineers: North-Eastern District Meeting at Wakefield.

APPOINTMENTS OPEN.

OFFICIALS AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, BUT THOSE RESPONSIBLE FOR THEIR DISPATCH ARE RECOMMENDED TO ARRANGE THAT THEY SHALL REACH THE SURVEYOR'S OFFICE BY NOON ON WEDNESDAYS TO ENSURE THEIR INCLUSION IN THE WEEKLY LIST OF SUMMARIES. SUCH ADVERTISEMENTS MAY, IN CASES OF EMERGENCY ONLY, BE TELEPHONED (CITY NO. 1040) SUBJECT TO LATER CONFIRMATION BY LETTER.

BOROUGH OF BEDFORD.

APPOINTMENT OF MECHANICAL ENGINEER AND FOREMAN.

Applications are invited for the appointment of Mechanical Engineer and Foreman to take charge (under the direction of the Borough Engineer) of the Sewage Pumping Stations and the Refuse Destructor.

Applicants should not be under 30 or over 40 years of age.

Candidates should be able to execute small repairs, and preference will be given to those who have had experience in similar work.

Wages will commence at £2 10s. per week, rising by four annual increments to a maximum of £3 per week, together with house, coal, rates, and light free.

Applications, in candidate's own handwriting, stating age, previous experience, together with copies

of not more than three recent testimonials, to be sent to the undersigned not later than 12 noon on Friday, January 30th, 1914.

Canvassing is strictly prohibited, and will be deemed a disqualification.

N. GREENSHIELDS, ASSOC. M.INST.C.E.,
 Borough Engineer and Surveyor.

Town Hall, Bedford.

January 9, 1914.

(1,137)

BOROUGH OF NEWARK.

SURVEYOR'S ASSISTANT.

The Council invite applications for the appointment of an Assistant to the Borough Surveyor, at a commencing salary of £90 per annum, rising by annual increments of £10 to £120 per annum.

Candidates should be neat draughtsmen, accurate Surveyors and Levellers, and should have had experience in Building Construction and Sewerage Works.

Applications, endorsed "Surveyor's Assistant," stating age and experience, accompanied by copies of not more than three recent testimonials, must reach the undersigned not later than Tuesday, the 27th January.

GODFREY TALLENTS.

Town Clerk.

Town Clerk's Office,
 Newark.

January 10, 1914.

(1,141)

KARACHI MUNICIPALITY.

APPOINTMENT OF SUPERINTENDENT OF FIRE BRIGADE.

Applications are invited for the post of Superintendent of the Municipal Fire Brigade. Salary Rs.200/- per mensem, with Free Quarters, unfurnished.

The Superintendent will be a full-time Officer, and, in addition to taking charge of a Motor Fire Engine at fires, will be required to organise the Brigade, to conduct fire drills regularly, and to see that all fire appliances are always in good working order, and generally to act under the orders of the Chief Engineer of the Municipality.

Preference will be given to a young, active man, with experience in a properly organised Brigade, used to obeying and enforcing discipline.

The selected candidate will be subject to all the Municipal Rules, including Leave and Provident Fund Rules, and the appointment may be terminated at any time by three months' notice on either side.

Single second-class fare will be paid to enable the candidate to join his appointment.

Applications, stating age, nationality, qualifications and experience, will be received up to 28th February, 1914.

MEASHAM LEA, ASSOC. M.INST.C.E.,
 Chief Officer and Chief Engineer,
 Karachi Municipality.

(1,138)

ESSEX COUNTY COUNCIL.

HIGHWAYS COMMITTEE.

APPOINTMENT OF MAIN ROAD INSPECTORS.

The above Council are prepared to receive applications for the appointment of three District Inspectors of Main Roads in the County, under the superintendence and direction of the County Surveyor.

Applicants must not exceed the age of 35 years, have had previous experience in the repair and maintenance of roads, and be conversant with modern forms of construction; they must also devote their whole time to the duties of their office.

Salary, £175 per annum, rising by annual increments of £5 to a maximum of £220 per annum.

Applicants must be competent to ride the motor cycle provided by the Council, for the upkeep of which an allowance will be made additional to the salary stated above.

Applications, on the form to be supplied, accompanied by copies of three testimonials of recent date, are to be delivered to the undersigned not later than the first post on Friday, January 30th, 1914.

PERCY J. SHELDON, M.INST.C.E.,
 County Surveyor of Essex.

County Surveyor's Office,
 Chelmsford.

January 16, 1914.

(1,160)

EALING TOWN COUNCIL.—Wanted, in the Drawing Office of the Borough Surveyor, a Junior, age between 18 and 21. Preference will be given to one who has occupied a similar position, and is a neat and accurate tracer, and used to helping in the making of Surveys, &c. Salary £50 per annum. Applications, in Candidate's own handwriting (endorsed "Junior"), enclosing copies of three recent testimonials, to be addressed to the Borough Surveyor, Town Hall, Ealing, W., not later than Wednesday, 28th January, 1914. (1,165)

BOROUGH OF GRAVESEND.
The Corporation invite applications for the Appointment of Road and General Foreman.

Applicants must possess a thoroughly practical experience in the control of Men, the making of Macadamised and Flint Roads, General Mason's and Paving Work, Drain and Sewer Work, Tar Paving and Tar-macadam work, and Scavenging of a district, and must be able to keep Time Books, &c.

Wages 45s. per week.
None but thoroughly competent men need apply, and canvassing is strictly prohibited and will disqualify.

Applications, in candidate's own handwriting, giving full particulars of age, qualifications, previous experience and present employment, and accompanied by copies of not more than three recent testimonials, to be sent to my Office not later than Thursday, February 5th, endorsed "Road Foreman." Applications must be made on a Form which will be supplied on application to the undersigned.

H. H. BROWN,
Town Clerk. (1,178)

WILLESDEN DISTRICT COUNCIL.
The services of an Assistant in the Engineer's Department of the Willesden District Council are required forthwith.

Applicants should state if they have had any experience in the preparation of Town Planning schemes, and it will be necessary for selected candidates to submit specimens of their draughtsmanship. It is likewise desirable that they should have passed the Examination of the Institution of Municipal and County Engineers.

The commencing salary will be £150 per annum. Applications, accompanied by copies only of three testimonials, to be delivered to the undersigned not later than Thursday, January 22nd, 1914.

O. CLAUDE ROBSON,
Engineer to the Council.
Municipal Offices,
Dyne-road, Kilburn, N.W.
January 6, 1914. (1,106)

GELLYGAER URBAN DISTRICT COUNCIL.
SURVEYOR'S CLERK.

The above Council require the services of a Clerk in their Surveyor's Department. Applicants must have had previous experience in a similar position, and must be capable of checking and allocating all bills, keeping and balancing wages books, cash and other accounts, and have a knowledge of the general routine of the office. Preference will be given to candidates who have also a knowledge of shorthand and typewriting. Salary, £80 per annum, rising by yearly increments of £5 to £100.

Applications, giving age and full particulars of experience, and accompanied by copies of not more than three recent testimonials, to be sent to me not later than the 31st day of January, 1914.

FRANK T. JAMES,
Clerk to the Council.
Council Offices,
Hengoed, Glam. (1,187)

THE RURAL DISTRICT COUNCIL OF BOURNE.

Wanted immediately, an Assistant, in the Office of the District Surveyor. Applicants must have experience of drawing and be capable book-keepers. Commencing salary £65 per annum. Applications, stating age and experience, accompanied by two recent testimonials, to be sent to me, the undersigned, on or before the 30th instant.

THOMAS LAKE,
District Surveyor.
Bourne, Lincolnshire. (1,183)

THE RURAL DISTRICT COUNCIL OF WELLINGTON, SALOP.

APPOINTMENT OF SURVEYOR AND INSPECTOR.

The above Council invites applications for the appointment of Surveyor and Inspector of Nuisances for the Rural District Council of Wellington, Salop. Area of District, 33,472 acres. Population, 11,901 (1911).

The appointment will be subject to the approval of the Local Government Board, and to the combination of the above offices.

The person appointed will be required to perform all the usual duties of Surveyor of Highways, Inspector of Nuisances, and Sanitary Surveyor to a Rural District Council.

The person appointed will be required to provide, maintain and use at his own expense, a motor bicycle, or other motor vehicle for use in connection with his duties.

The Council provide office, printing, stationery, and postage. Salary as Surveyor £100 per annum, and as Inspector of Nuisances £140 per annum.

He may be required to reside in some central part of the District, or in the Urban District of Wellington, and will be required to devote his whole time to the service of the Council.

The appointment will be as from the 1st day of April next.

A memorandum setting out more fully the terms of the appointment and duties, together with the prescribed Form of Application, may be had from the undersigned. Preference will be given to applicants possessing the Certificate of the Royal Sanitary Institute.

Applications must be sent to the undersigned, with copies of not more than three testimonials, on or before the 27th day of January, 1914.

Applicant must not in any way approach individual members of the Council, and any infringement of this clause may be treated as a disqualification.

(By order of the Council)
J. V. LANDER,
Clerk.

Queen-street Chambers,
Wellington, Salop.
January 15, 1914. (1,171)

THE GOVERNMENT OF INDIA have four vacancies for Assistant Sanitary Engineers, two on salaries of Rs.800 a month, rising by annual increments of Rs.50 to Rs.1,000 a month; one on a salary of Rs.500 a month, rising by annual increments of Rs.50 to Rs.700 a month; and one on Rs.400 a month, rising by annual increments of Rs.40 to Rs.620 a month.

Candidates for the two last-mentioned posts must not be above 33 years of age, and should either have passed the qualifying examination for A.M.I.C.E., or should hold such other engineering degrees, diplomas or certificates as are sufficient to show that they have attained the requisite standard implied by the above examination. They must also have had considerable practical experience both in the design and execution of works of water and sanitary engineering.

For the two other posts there is no fixed upper limit of age, but preference would be given to candidates not above 33 years of age, if highly qualified in all respects. Candidates must have a sound knowledge of modern methods of construction of water-works installations, and long—in one case not less than ten years'—practical experience of the working of such installations. Some drainage experience will be regarded as a strong additional qualification.

Further particulars and Forms of Application can be obtained from the Secretary, Revenue Department, India Office, London, S.W., to whom applications should be submitted not later than 7th February.

(1,175)

THE SERVICES OF A CHIEF ASSISTANT are required in the Offices of a North Country Municipal Engineer. In addition to professional attainments, applicants must have an intimate acquaintance with the routine work of such an office. Commencing salary £2 15s. weekly.

Applications, with copies of testimonials, are to be sent to Box 1,363, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C., not later than Monday, the 2nd February. (1,182)

The Surveyor

And Municipal and County Engineer.

Vol. XLV.

JANUARY 30, 1914.

No. 1,150.

Municipal Engineering in 1913.

This year we have once again attempted in our Special Annual Issue to present to our readers in the form of a series of articles from the pens of experts a survey of the progress which has been made during the past year in every part of the wide field of municipal engineering practice. It has been no easy task for the several writers to deal adequately with their respective subjects within the limits of the available space, and it would therefore evidently be impossible in an introductory article of this kind to do more than point to the most salient features of the year's work. The issue of the appendix to the eighth Report of the Royal Commission on Sewage Disposal aroused considerable discussion, and must be reckoned among the most important publications issued by that body. The pollution of streams is a manifest danger to the public health, and the information and records of investigations which have been rendered available by the appearance of the appendix will prove of the greatest possible value to all who are interested in their purification. The most important scheme of sewerage decided upon during the past year is undoubtedly that concerning the main drainage of Rochester and Chatham—a happy example of co-operation between adjoining towns—while, in regard to disposal, attention may be called to the new works at Sheffield, Halifax, Surbiton, Wakefield, and other places. It can be said generally that some progress has been made towards solving the sewage problem, a result which can only be fully achieved by the biologist, the chemist, and the engineer working hand in hand. It may safely be said that during the year 1913 the modern revival of interest in all matters appertaining to highway construction and maintenance has shown no sign of abatement. Signs of the activity that is being displayed are to be found in the appointment by the Scottish District of the Institution of Municipal and County Engineers of a Roads Committee, the Conference held under our auspices in the spring, and the third International Road Congress. The last-mentioned provided an opportunity for collecting data and statistics relating to road administration and road engineering in many different countries, and the various papers submitted contained a good deal of information, which will enable the student of road administration to realise how the systems of different countries have been formed and how they are developing. The necessity for standardisation of road materials is now generally recognised, and has often been discussed in our pages. In this connection the work of the Engineering Standards Committee on road materials is of the first importance, and will be watched with the greatest interest. The question of terminology has received much attention during the past year. It is essential that there should be agreement between highway engineers as to the precise meanings to be attached to various technical terms, and that there should be one accepted word or

phrase, and one only, to describe any given thing or process. The preparation of a standard glossary is a difficult matter, and Mr. Boulnois is to be congratulated upon his courage in essaying such a task. If the co-operation and friendly criticism which he has invited are forthcoming, however, there is no reason why the results of his efforts should not prove of great practical value. The next branch of municipal work which claims attention is that of water supply. The formation of a central authority is still "in the air," and long deferred legislation dealing with this important subject does not appear to have made any considerable advance during the year under review. The necessity for a pure supply is conceded on every hand, except, perhaps, by a few self-styled economists, who would even go so far as to carry their penny-wise policy into this sphere; but each of the two schools of thought—namely, those demanding purity at the source and those who are content with purification by artificial processes—still finds many champions. It is reassuring to learn from the investigations of Dr. Houston that the typhoid germ is not so generally present in water as is ordinarily supposed, and that sewage pollution does not necessarily mean typhoid pollution. In architectural and building work the most notable feature has been the continued interest which has been taken in the housing of the working classes. Efforts to produce houses which can be let at economic rents have again been forthcoming, and, while the ideal has not yet been attained, the nature of the accommodation which is necessary is better understood, and the importance of certain principles of construction is beginning to be realised. In the tramway world considerable progress has been made, due, in part at all events, to the keenness of the motor omnibus competition. The cry has been heard that the day of the tramway is over, but the experts are not afraid, and the improvements which have been made in the Metropolitan system are symptomatic of what is being done throughout the country. Not only are tramways very much alive, but we shall be surprised if important extensions and developments are not forthcoming in the near future. The question of street lighting has been comparatively quiescent during the past year. The chief matter to record is the increase in the use of distant control for gas lamps, several important towns now having the whole of their street lamps actuated in this way. There are two noteworthy features to be observed in regard to the collection and disposal of house refuse. One is the increased use of motor-vans for collection, and the other is the more general recognition of the efficiency of disposal by burning. Modern destructor development is largely in the direction of increasing the efficiency of furnaces so as to secure a maximum of heat available for power production. Although in various parts of the world there has been consider-

able activity in the building of large bridges during the past year, there are no works of the first magnitude to record in this country. The use of ferro-concrete, however, has become distinctly more general, and important works have been carried out in Northumberland, Surrey, Warrington, and elsewhere. Finally, in regard to progress in electrical work, many large municipal undertakings have important extensions in hand, and it is noteworthy that those which have hitherto generated continuous current only have been obliged to adopt high-pressure alternating current to cope with the larger powers and longer distances now met with. The

above review and the special articles which follow are amply sufficient to show that, although the past year may not have witnessed any epoch-making achievement, municipal engineers have again been called upon to execute an enormous amount of public works of a very diverse character. A good deal of this work is not such as to strike the public imagination, although it apparently makes a strong appeal to the critical faculty. Nevertheless the profession as a whole, while not neglecting any attempt to obtain just recognition, may rest in the assurance that work well done is its own reward.

BRIDGES.

In many different parts of the world the year 1913 has been one of great activity in bridge building. The authorities directing the administration and construction of highways in the United States have paid special attention to this, and in many far parts of the British Empire steady progress has been made in the provision of bridges on important roads. At home a considerable number of narrow or otherwise inadequate bridges have been replaced by new ones, and some important town bridges have been built. In spite, however, of the importance of the subject of bridge-building as a part of highway engineering, none of the "questions" or "communications" of the Third International Road Congress was devoted to bridge design, except in so far as the communication on the subject of the kinds of surfacing to be adopted on bridges included papers in which there was some discussion of other features of bridge design. The design of bridge floors did in fact receive a considerable amount of attention in the papers sent in, and some very useful information will be found in these reports (see *THE SURVEYOR* of July 11th).

ROAD BOARD GRANTS.

Road Board grants for the "reconstruction and improvement of bridges" in the financial year 1912-13 were as follows:—England and Wales, £24,458 (all within the area of extra-metropolitan administrative counties); Scotland, £4,801; Ireland, £90. No loans were made under this head. In addition to these grants some expenditure on bridges is included under the head of "new roads and bridges," the grants for which in England and Wales amounted to £55,650, of which £30,000 went to county boroughs and £25,650 to counties outside the metropolitan area. No grants were made under this head in Scotland or Ireland.

STEEL BRIDGES.

The Lower Ganges Bridge, now in course of erection, will have fifteen spans of 359 ft. centres and six spans of 75 ft. It will carry a double line of 5 ft. 6 in. railway. Bow N-girders with triangular end bays are employed for the large spans. Each girder has eleven bays, and there is a brace from the middle of each diagonal to the next intersection point on the lower chord.

SYDNEY HARBOUR BRIDGE.

As a fine example of its type, Sydney Harbour Bridge, the construction of which was decided upon last year, may be included in our selection of examples of bridge design in 1913. More than twelve years ago a number of competitive designs for Sydney Harbour bridge were considered, one of them involving the construction of a central span of 1,900 ft. The design now accepted will have a central span of 1,600 ft. between centres of the main piers, the middle 500 ft. being the length of the central girder. The shore spans will be each 550 ft. in length, and will be approached by viaducts of reinforced concrete or steel arches at both ends. The cantilevers and central girder will be of nickel steel, and the anchor piers will be built of masonry and bluestone concrete. The bridge will carry four lines of electric railway and a 35 ft. roadway between the girders, and outside them there will be a motor

roadway on one side and a footway 15 ft. wide on the other side. The estimated cost is £2,250,000. (See *THE SURVEYOR* of July 11th.)

TIMBER AND COMPOSITE TRUSSES.

A number of timber truss-bridges for 14 ft. roadways have recently been built in Washington State, U.S.A., on mountain roads which pass through forests. They were designed for floor loads of 80 lb. per sq. ft., and for spans of 40, 60, and 75 ft. A 40 ft. span is carried by two king-post or A-trusses with timbers equivalent to 12 in. by 12 in. The bottom chords are single poles. A 12 in. by 14 in. floor beam at the middle of the span is carried by two 1 in. round iron rods hanging from the apex of each truss, and the floor beam extends beyond the trusses to provide for lateral bracing. The 60 ft. spans are 3-panel queen-post trusses with counter braces in the central panel, the bottom chords being single poles of 68 ft. overall length. These poles were placed in position first, and supported the light staging used in erecting the other members of the trusses. Carpentry joints were made for the 40 ft. and 60 ft. spans.

The 75 ft. span is a 5-panel Pratt truss with steel eye bars for the lower chords and rigid upper and lower lateral bracing. Howe truss castings were used for the joints. The timbers were left round except at the joints.

A paper of great interest to bridge engineers was read before the Society of Arts towards the end of 1912, by Professor W. H. Warren, of Sydney University. (See *THE SURVEYOR* of January 3rd, 1913.) The life of timber bridges in New South Wales—that is, of the timber bridges of the Public Works Department—already averages about twenty-five years, with the exception of the floors, and Professor Warren has seen sound timbers which had been in use from forty to sixty years. In his paper Professor Warren described the tests which he carries out on timber specimens of considerable size, and furnished tables of the results.

FERRO-CONCRETE BRIDGES.

The reinforced-concrete bridges which have been constructed recently, and have been described in the engineering Press during the past year, fall into three main classes, and it is difficult to say which class is the most interesting. First, there are those bridges in which the design follows types which are definitely accepted and well understood, such as mass masonry bridges, girder bridges, and those the decking of which is supported by arch ribs or by beams spaced fairly closely together. In this class we may include twin arch bridges, or those with three arch ribs, since, although this type has only recently been developed, it has taken a very important place, and its ancestral forms may be found in some early timber bridges of large span. The next class includes those bridges in which reinforced concrete has been employed so as meet special features or special difficulties of the site. In some such cases the use of ferro-concrete is desirable, because it can withstand bending stresses: in other cases the material is very strong in proportion to its bulk, compared with the strength and bulk of alternative materials, or, thirdly, its use

may considerably reduce the loads upon foundations or the thrusts upon abutments. The third class consists of bridges which are unusual in the sense that the designer has deliberately aimed at an obvious and notable departure from ordinary design—as, for instance, in the case of through arches of reinforced concrete or arches intersected by the roadway. It must also be pointed out that in some cases a bridge of ferro-concrete is to be preferred to one of steel or timber, on account of its power of resistance to erosion or decay. The comparison is not by any means confined to that between the normal durability of the materials in question, since it is often necessary to allow for a greatly increased rate of corrosion of certain parts of a steel bridge, or for the rapid decay of timber which is sometimes dry and sometimes wet, or is buried in organically active soil.

A considerable number of the bridges of reinforced concrete which have been built during the past few years are by no means satisfactory, the designs showing, in some cases, a lack of knowledge of the distribution of stresses and a failure to grasp some of the important elements of stability and ultimate economy. It is not, however, expedient to criticise individual works which seem to fall into this category. In the first place, the particulars furnished are often such that a criticism would be alternative in character on account of the paucity of the information published. That is to say, the critic could only say "either this is wrong or that is wrong," which is not sufficiently definite for purposes of argument, although the conclusion formed may be logically beyond attack. In the second place, it would hardly be fair to attack particular designs which might be by no means the worst. Thirdly, such criticism would be a trespass upon the field of the consulting engineer, who could, in most of the cases referred to, have prevented the mistakes from being made had his services been retained, if only to check the designs.

LARIMER AVENUE BRIDGE, PITTSBURG.

A bridge which was completed in 1912, particulars of which were not to hand in time for inclusion in our article in last year's Annual Issue, may be mentioned here as a fine example of recent work, the type being the now well-known one in which the main arch consists of a pair of arch ribs upon which the decking is supported by spandrel columns or cross walls. In bridges of this type the arch ribs are sometimes of masonry or of plain concrete, and the rest of the superstructure of ferro-concrete. In other cases the ribs are lightly or strongly reinforced, in accordance with the nature of the loading and the ratio of rise to span. In this case, the Larimer Avenue Bridge at Pittsburg, the arch ribs are of ferro-concrete. The overall width of the bridge is 48 ft., a 30 ft. roadway and two footways, the latter being carried on cantilevers projecting beyond the arch ribs. The choice of this position for the footways must be considered one of the leading elements of economy in bridges of this type. The span is 300 ft. clear, with 67 ft. clear rise, or 312 ft. span and 70 ft. rise between centres. The ribs are spaced 33 ft. apart, centres, and each is 8 ft. wide, by 11 ft. deep at the springings and 6½ ft. at the crown. The spandrel columns are 19½ ft. apart, panel distance, carrying 30 in. by 84 in. floor beams, with 24 in. by 36 in. stringers, and a 10 in. floor slab. There is a stringer at each curb, two under the wheelway, and a fascia stringer at the outer edge of the footways. The tops of the spandrel columns are connected by spandrel arches, and as the approach spans on the steep sides of the valley are carried on similar columns, the design of the bridge as a whole is harmonious; but no attempt is made to force the approaches of the span into a closer conformity than is consistent with the natural development of the type to suit the site.

A single span arch-rib ferro-concrete bridge with masonry abutments has been built across the river Wansbeck, in Northumberland (Mr. J. A. Bean,

county surveyor—Details of Ferro-Concrete work by L. G. Mouchel and Partners). The span is 70 ft. with a rise of 15 ft. A little more than a third of the span rests directly upon the arch-ribs, the remainder of the decking being carried by spandrel stringers supported by columns, three over each haunch. The wheelway is 27 ft. wide, the footway being carried on cantilevers. The spandrel columns and the closely set pillars forming the parapet harmonise very well with the surroundings, and the whole effect is one satisfactory to a bridge engineer's sense of what is appropriate to the site (see THE SURVEYOR of November 14th).

A ferro-concrete arch-rib bridge of 70 ft. span at Guildford (Mr. A. Dryland, county surveyor) has a wheelway 27 ft. wide, with two footways of 6 ft. 6 in. Being an important town bridge, it has been designed to carry a load of 200 lb. per square foot, and for a test load of three 20-ton traction engines. The cost, approximately £5,500, works out to about 39s. per square foot of waterway roadway—by no means a very high rate for a single span bridge with heavy abutments.

WARRINGTON BRIDGE.

The new town bridge at Warrington (THE SURVEYOR of July 11th), the first half of which was opened by the King last July, is noteworthy as an example in ferro-concrete of a very important type, in which, by making the main members of a material which will stand fairly high compressive stresses, and by using a sufficiently large number of these members the cost of secondary members and of decking is small, and the rise of the arch is less than that necessary in some other types. Many bridges of this type have been built, the arch-ribs being of steel, as in the case of the new Vauxhall Bridge and other Thames bridges. The type is suitable for wide bridges, and differs essentially from that in which a pair of timber arches, or in modern practice, a pair of ferro-concrete arch-ribs, support a relatively narrow roadway. The Warrington bridge (Mr. J. J. Webster, M.INST.C.E., engineer) consists of ten parabolic ribs of ferro-concrete, supporting a roadway 80 ft. wide between parapets. The span is 134 ft. clear. The ribs are 3 ft. 9 in. wide, 4ft. 6 in. deep at the springings and 2 ft. 6 in. deep at the crown. About a third of the 6 in. slab decking rests directly upon the ribs, and over each haunch of every rib there are four relatively short columns, supporting stringers and cross beams. The bridge was hinged at the crown and springings during construction, the hinges being afterwards made up solid.

NEATH CANAL BRIDGE.

Having noticed a type of bridge well adapted for carrying highways across steep-sided valleys of small width which can be crossed in one span, and suitable also for small stream crossings, and having noticed also an example of a type suitable for wide urban roads carrying heavy traffic, we will now direct our attention to an example of another development of ferro-concrete in which the tensile strength of the material is fully made use of in the main members of the bridge. The ordinary through girder bridge with cross girders, usually of the same material as the main trusses or girders, is a general type, large numbers of which have been built both with steel and with timber. The number of ferro-concrete bridges of this type is steadily increasing, and the particular form in which ferro-concrete can most readily be used is that in which, when the bridge is of steel, the main members are plate girders and the cross girders are rolled steel joists, or joists built up of plates and angles. The cross girders are usually in rigid connection with the main girders. A good example of a ferro-concrete bridge corresponding to this form is the bridge over the Neath Canal, at Neath, S. Wales. The width between parapets is 24 ft. and the span is 49 ft. The parapet-girders are about 6 ft. deep, and a little more than 5 ft. deep between centres of reinforcement. The upper or compression member is

about 10 in. wide by 13 in. deep, the lower member 10 in. by 20 in. deep. The web of the girder is about 3 in. thick, and the stiffeners about 6 in. thick. There are ten stiffeners to each girder, and the spacing does not increase towards the centre of the span, since each of them corresponds to one of the cross beams, which are 4 ft. 6 in. apart. The cross beams, the under sides of which are flush with the under-sides of the main girders, are 24 in. deep by 8 in. wide, the 5 in. floor slab being between them and flush with their tops, so that each beam is effectively a T-beam with an ample area of concrete in compression. The foundations of the bridge rest on piles, and as the penetration showed that there was on the North bank hardly sufficient sustaining force, a ferro-concrete raft, 5 ft. in diameter and 9 in. to 14 in. in thickness, was formed *in situ* around the head of a pile under this abutment, in order to provide increased sustaining force.

Provision has been made for adding footways outside the main girders should that be necessary in the future.

AT MARSHALLTOWN, OHIO.

While the through girder type is suitable for road bridges of small or moderate width, the increasing cost of the cross girders with increase of their span sets a limit to the use of this convenient type except when it is permissible and practicable to divide the roadway into two parts. When there is sufficient headway for navigation or waterway for floods beneath the bridge the under girder bridge may be a suitable type. Recent examples of this type include a bridge which has recently been built near Marshalltown, Ohio, U.S.A. There are four similar spans of about 42 ft. clear, carrying a 16 ft. roadway. The three girders, which are physically continuous over the piers, are spaced 7 ft. apart, centres. They are 12 in. wide by 36 in. deep. The main reinforcement consists, in the middle of the span, of nine $1\frac{1}{2}$ in. sq. bars in three rows, two of which are bent up diagonally at suitable distances from the centre. There is, it seems, one row of these rods extending for about 9 ft. from the centre line of the pier towards the middle of the span; but the amount of such reinforcement is not such as would be provided if the girder were a truly continuous beam. This bridge is not a wide one, but a similar bridge of any greater width could obviously be built by adding to the number of the under girders.

Another beam bridge which deserves mention is that built over Whittle Burn, Northumberland (Mr. J. A. Bean, county surveyor). There are four spans of 20 ft. carrying a roadway 25 ft. wide between parapets. The spans are carried on trestles each consisting of three columns 12 in. square, connected by top and bottom cross braces and diagonal bracing (see THE SURVEYOR of Nov. 14th).

TWO BRIDGES AT CHINGFORD.

Two bridges built at Chingford in connection with the construction of the new reservoir of the Metropolitan Water Board provide examples of the use of ferro-concrete as mass masonry. When reinforcement is used in this way the design usually comes into somewhat severe competition with designs of the same type in plain concrete or masonry. In some cases, however, the reduced bulk of the reinforced concrete is an advantage; and in other cases it may be desirable so to design the bridge that occasional extraordinary loading of a half span is not likely to cause damage. One of the bridges to which reference has just been made is that over the intake channel of Chingford reservoir (THE SURVEYOR of May 30th). This bridge has an arch ring of reinforced concrete, the width of the arch being 14 ft. 8 in. The span is 50 ft., the rise 5 ft., the thickness at springings 2 ft. 6 in., and that at the crown 15 in. The lengthwise reinforcement of Kahn bars is carried into the mass concrete abutments. The spandrel walls are reinforced with $\frac{1}{2}$ in. and $\frac{1}{4}$ in. rods. Though the arch is considerably thinner, at the crown at any rate, than a corresponding arch of plain concrete, the bridge is

essentially a masonry arch under compression, with reinforced concrete spandrel walls, the adoption of which is in a sense a greater departure from construction in plain masonry than is that involved in the reinforcement of the arch ring.

The other bridge—that over the river diversion—is a massive masonry arch bridge of three spans of about 27 ft. The reinforcement is in part designed to strengthen the middle portion of the arch span, and seems to be partly intended to add to the margin of strength generally. This is essentially a bridge in which ferro-concrete plays the part of mass masonry, except as regards a small portion in the middle of each span (THE SURVEYOR of May 30th).

SOME UNUSUAL DESIGNS.

So far we have dealt with bridges which belong to definite types suited to a fairly wide range of conditions in each case. We will now consider a case in which ferro-concrete was employed in such a manner that a similar bridge could hardly be constructed of any other material but timber, which, under the circumstances of the case, would not have lasted for an economical life. We shall then consider a few examples of bridges which are unusual in character rather than the result of the free choice of the designer than on account of the special difficulties of the site.

MELLOR-STREET BRIDGES, ROCHDALE.

The interesting features of these bridges are the pile foundations, the use of ferro-concrete in the construction of light walls and slabs forming the abutments, and the adoption of a simple arch-ring of ferro-concrete, without ribs. The design is adapted to a site affected by colliery workings. The bridge is 40 ft. wide and 23 ft. 6 in. span, and has a considerable skew. Each foundation consists of two rows of ferro-concrete piles, the rows being 7 ft. apart, and the piles in each row from 8 ft. to 11 ft. 6 in. apart. On these piles rests a 9 in. ferro-concrete slab, and at the front edge of this slab, and resting directly over the front row of piles, is the abutment wall, 10 in. thick, which is buttressed over each pair of piles by 10 in. buttresses extending across the slab. With the earth filling, the slab buttresses and wing walls form the abutment for the arch, which has a rise of 2 ft., and is 14 in. thick at the springings and 9 in. at the crown. To withstand the thrust of the arch between the buttresses the arch-ring is extended behind the abutment wall to serve as a girder across the spans of about 8 ft. to 11 ft. A curtain wall is carried down about 6 in. below water level. There are two bridges, one with fourteen piles in the foundations and the other with twelve. The type may be considered as one in which reinforced concrete is so disposed that the bridge is a development of the mass masonry arch with abutment and wing walls backed by earth filling; but the nature of the stresses is greatly altered, and it should be clearly understood that a development such as this is very far from being the same thing as the construction with ferro-concrete of a bridge which *corresponds* to bridges constructed of other materials in the sense indicated in the reference to through girder bridges.

AT BOLLINGTON, SUFFOLK.

Arch rib-spandrels have been adopted as the main members of a bridge of three spans of about 36 ft. at Bollington, Suffolk (Mr. H. H. Hunt, county surveyor). The bridge provides a roadway of 30 ft., with two footways each 3 ft. 6 in. wide, the latter being carried on cantilevers, so that the three ribs are about 15 ft. apart. They are 10 in. thick and 20 in. deep at the crown, and spring from the tops of piles a little above water level. The $5\frac{1}{2}$ in. decking is carried on cross beams 6 in. by 12 in. Another feature of the bridge is the so-called half-arch, this shorter short span of about 18 ft. being constructed as if it were half one of the 36 ft. spans.

A FERRO-CONCRETE THROUGH ARCH.

A remarkable bridge of 197 ft. span has been built at La Mosela, France, to carry an electric

tramway. The rise of the arch is $28\frac{1}{2}$ ft. The roadway intersects the arches at such a level that 134 ft. of the span is suspended from the arches, the crowns of which are connected by overhead bracing. The middle segment has no diagonal bracing; this is provided, however, in the portions between the intersections and the abutments. The fascia stringers are about 16 in. square, and there are two 6 in. by 10 in. stringers under the roadway. The floor beams are about 10 in. by 12 in., the verticals about 10 in. by 12 in., and the arch ribs themselves are nearly 16 in. by 24 in.

Reference may also be made to an important viaduct across the valley of the Little Lehigh River, Pennsylvania, which includes nine spans of 120 ft., carrying a 32 ft. wheelway and two footways each 7 ft. wide. Each span consists of two arch-ribs, nearly semi-circular, spaced 26 feet apart at centres. Each rib is 8 ft. wide, about 11 ft. deep at the springings, and 4 ft. deep at the crown. The spandrel columns are connected by walls arched on the underside, forming a kind of striding pier standing on the arch-ribs. For some criticism of the design see our issue of May 23rd.

SOME GENERAL NOTES.

It would be a serious error to assume that the only important advances in the art of bridge-building are made with relatively new materials. A better knowledge of the distribution of stresses and greater care in the design of details have added considerably to our power of controlling the materials of bridge-building generally, and the various means now at our disposal for preserving from corrosion or decay the materials of which bridges are constructed tends to alter our estimates of the relative value of different materials and designs. In the case of steel bridges, for instance, we do not see nowadays so many of those struts with finicking bracing, difficult to paint and likely to corrode long before the main scantlings; nor do we see so many of the skimpy joints which disfigured many designs a few years ago. The importance of having in many cases plate and angle thicknesses considerably greater than those provided by the scantlings most economical of material is now frequently, though by no means generally, recognised, and the triangulation of main girders is bolder and better than it used to be. The fact that the painting of steelwork will be a constantly recurring expense is now more frequently given due weight as a factor in determining scantlings of bridge members. A fact which is slowly being perceived by bridge engineers is that the superior lasting qualities of wrought-iron compared with steel, or in some cases its greater toughness, justify its employment for some of the purposes for which steel would have been employed a few years ago without a second thought, and bridge engineers should pay attention to the contributions which have been made during the past year to the study of the relative durability of steel and of wrought-

iron. As regards timber bridges, no attempt is now being made to build them of the types which proved so successful in the hands of bridge-builders of the eighteenth century; the principles of such types can usually be better carried out under modern conditions, with masonry, steel, or reinforced concrete; particularly reinforced concrete. Trusses with a high proportion of depth to span provide a type of bridge which can conveniently and economically be built of timber, or of timber compression members and wrought iron or steel tension members, and the long lives of some of the timber truss bridges of the United States, and the successful construction of timber and composite bridges in Australia, show that this type of bridge, of timber, must be recognised as of leading importance in those areas in which suitable timber can be cheaply obtained.

Advances have been made, too, in the use of stone in bridge-building, especially by French engineers. The twin arch, or multiple arch rib, principles may be applied to masonry bridges generally, and the use of ferro-concrete for the decking and its supports has further extended the practical value of the masonry and plain concrete arch in some of its forms. In some cases the adoption of an unusual form of joint between the stones of an arch-rib has been an important element of the design. Further, the use of hinged arches has considerably affected the design of masonry and concrete bridges. There are not wanting examples of bridges in which reinforcement of the arch has been provided for no obvious reason, and in some cases the reinforcement of an arch which is wholly in compression has been definitely unsuitable. Other designs, however, show a grasp of the fact that a ferro-concrete arch which is wholly in compression should be so reinforced that its liability to cracking or to local disturbance is reduced by the use of a moderate amount of relatively small-sized reinforcement rather than by providing larger bars disposed as in the case of an arch which will be liable to bending stresses. In a few cases reinforcement has been buried in masses of masonry, in which it can hardly be expected to play any useful part. In other bridges, on the contrary, the facility with which a ferro-concrete bridge can be designed theoretically to resist the various stresses has led to the dimensions being too small; the bridge is strong enough in a sense, but it has not sufficient mass nor sufficient bulk.

The advances made in the design and construction of ferro-concrete bridges are mainly those which are due to better knowledge of ferro concrete construction generally, better methods of mixing and ramming, and more accurate information as to the behaviour of different mixtures; and in this connection special mention must be made of the excellent work performed by the Concrete Institute, the "Proceedings" of which furnish valuable data relating to such matters.

ELECTRICAL PROGRESS.

During the past year development has advanced along very similar lines to those followed since the epoch-making introduction of the tungsten lamp; there have been no remarkable changes in practice, but decided progress has been made in various directions. The tungsten lamp, made with real drawn tungsten wire, has continually improved in strength and durability, and is now so robust that it can be used for almost all the applications to which the carbon lamp was adapted, and can be handled without fear of fracture of the filaments, which gave so much trouble in the early days. Indeed, the longevity of the lamp, it is said, has proved somewhat embarrassing to the manufacturers. In view of the high price of the metal filament lamps compared with carbon lamps, users are very chary of discarding them until there is a marked falling-off in the candle-power, and as

this does not become noticeable until long after the lamps have burned for the proverbial one thousand hours, and in many cases for twice that period, renewals are seldom required on this account. It is true that after the lamps have been in use for a long time the filaments become brittle, but this does not matter provided that the lamps are not disturbed. Hence the demand for lamps arises largely from new users rather than from those who adopted the type a year or more ago, and as the carbon lamp becomes obsolete, the market offered by existing consumers of electricity tends to become appreciably restricted. On the other hand, the cheapening of electric light—due to the high economy of the tungsten lamps—has had the natural consequence of bringing many new consumers on the mains, and there is still a vast field for development in this direction. The price of the

lamps is also falling, and may well do so, for it bears little relation to the manufacturing costs.

III. QUESTION OF TARIFFS.

While the reduction in the current required for a given number of lamps has in many cases enabled the strengthening of the distributing network to be postponed, thus effecting an important saving in the capital cost of mains, which is a very heavy item, the central-station engineer is greatly hampered by the cost of making connections for new consumers, as well as by the low return received per connection from small installations already supplied from the mains. In spite of every effort of inventive ingenuity, it has not yet been found possible to reduce the cost of a service connection with underground mains much below £4, including a meter, or £3 where a current limiter is substituted for the meter, and the annual capital charges on the outlay, together with the cost of reading meters, and so forth, amount to about £1 per connection. To this must be added the capital charges on the plant and mains, bringing up the total to some £4 or £5 per annum, which must be covered, in the case of an installation of, say, ten 50-watt lamps, before the cost of the energy supplied is even considered.

It will be seen, therefore, that, at any rate in the case of the small consumers, the cost of giving the supply is tending to a definite minimum value, compared with which the cost of the energy is of little moment. For this reason the system of supply by contract, which has been repeatedly discussed during recent years, has attained considerable popularity, and other systems embodying a similar purpose—namely, to secure an adequate return for the fixed expenses—are being widely adopted. It is probable that this movement will continue, for it at the same time solves another very troublesome problem—namely, that of supplying electricity for cooking and heating at a low price, without necessitating the use of two meters and separate circuits for the two classes of consumption. A method which is growing in favour is that known as the "Norwich" system, it having been introduced by Mr. Loug, electrical engineer to the Corporation of Norwich. It consists in making a fixed annual charge, based on the assessment of the premises to the borough rates, and usually about 12 per cent of the rateable value, payable in quarterly instalments or otherwise. A single meter is provided, and all electrical energy, for whatever purpose it may be used, is charged for at a low rate—from 1d. to $\frac{1}{2}$ d. per unit.

From the central-station engineer's point of view this system adequately meets the requirements; but the peculiarities of the system of assessment lead in some cases to anomalous results, just as they do in the case of the water rates, for example, and such a tariff can hardly be offered without an alternative to meet these cases. The "Telephone" system developed by Mr. Seabrook, electrical engineer to the Marylebone Borough Council, embodies the same principle of a fixed charge to cover the constant expenses and a low price per unit, but in this case the first charge is arrived at by means of an inventory of the consuming devices comprised in the installation and an estimate based thereon of the consumer's probable maximum demand. Mr. Lackie, city electrical engineer to the Glasgow Corporation, has put in force a system of a somewhat similar nature, and numerous modifications are in vogue, showing that the need of a special tariff is very widely felt. We should add that whatever special system is adopted it is always necessary, in order to comply with the law, to offer a uniform price of so much per unit as an alternative, which the consumer may choose if he so desires; but the flat rate can be made uninviting by raising the price per unit to the highest limit allowed by law—usually 8d. per unit. An extremely ingenious system was introduced early in the year by Messrs. Handcock & Dykes, in conjunction with Mr. Duddell, president of the Institution of Electrical

Engineers, which renders it possible to control apparatus at all parts of a town through the distributing mains, and thus facilitates the working of a system of tariffs with differential rates depending upon the hour when the energy is consumed.

IMPROVED LAMPS.

In spite of the extraordinary advance in economy effected by the tungsten lamps which are already on the market, the limit of efficiency has by no means been reached yet. In the autumn of 1913 the announcement was made that tungsten lamps consuming only half a watt per candle-power would soon be on the market, and lamps of this efficiency were exhibited. Many of the large lamp-makers have taken up the manufacture on the lines laid down by the General Electric Company of the United States, the essential principle being that the bulb of the lamp, instead of being left in the condition of an almost perfect vacuum, is filled with nitrogen gas at atmospheric pressure, and the filament is coiled up into a very compact spiral, literally to keep it warm. The extended filament usually employed parts with its heat to the gas too rapidly; hence the coiling up. The temperature of the filament is much higher than in the ordinary lamp, as may be inferred from the high efficiency attained; but it is still very far below the melting-point of that extraordinary metal, tungsten.

Difficulties inherent to the combination preclude the possibility of making such lamps of small candle-power, and at first they will be restricted to candle-powers of 300 to 2,000, and pressures from 50 volts to 250; they will therefore not be suitable for domestic and general indoor use, but will be admirably adapted for the lighting of streets and open spaces, large halls and workshops, being equal in illuminating power and efficiency to the arc lamp, without the disadvantages of the latter, as they need no attendance once they have been installed. The fact that such lamps are about to be put on the market, and that as knowledge advances it will probably be found possible to make them in smaller candle-powers, intensifies the necessity which we have explained above for a radical change in the method of charging for electrical energy.

ELECTRIC COOKING.

The stimulus afforded to the development of other outlets for electrical energy by the diminished consumption of the lamps has had a marked effect upon the evolution of efficient and cheap cooking apparatus. The process of educating the public to realise that cooking can be done with electricity, not only as well as but much better than with gas, and at a moderate cost, is a protracted one, but is making good progress. The most important requirement for success in popularising this class of consumption is a low price for electrical energy, and this has been met in a very large number of cases by the offer of a supply for heating and cooking at 1d. per unit. At this price electric cooking can compete with gas at 2s. 1d. per 1,000 cubic feet. This is proved by the fact that it is being adopted by catering firms which have no predilections in favour of electricity and have no object to serve but that of efficiency in using it. The society, known as the "Point Fives," that was formed last year, consisting of central-station engineers who charge $\frac{1}{2}$ d. a unit for energy for cooking, is doing good work in discussing the details of construction of cooking apparatus and assisting manufacturers to improve their products, besides advertising the advantages of the system. The manufacturers, on their part, are doing their best to develop the best forms of apparatus, and, what is most important, to reduce the cost of manufacture. Hitherto electric cookers have been decidedly expensive, but there are indications that important reductions of price will be made by some firms this year, and the cost naturally decreases as the output of the factories grows.

The increasing importance of the business may

be gauged from the fact that, though it is quite in its infancy, in March last year there were 1,800 kilowatts of cooking apparatus connected to the mains of the Marylebone Borough Council, besides 2,300 kilowatts of electric radiators. Southampton had no fewer than 1,000 cooking and heating consumers, and the City of London Company, whose area is not a residential one, had 5,000 kilowatts of radiators connected. Mr. Seabrook, the Marylebone electrical engineer, reports that the highest cooking load is experienced at breakfast time, and that the effect of the cooking demand on the evening peak has been negligible—a very important fact, for many station engineers look askance at this class of business, fearing that it will increase their peak, and necessitate heavier mains. Several "all-electric" restaurants have been opened in London during the year. The business could be much more rapidly developed if the local authorities had statutory powers enabling them to purchase cooking and heating apparatus for hiring out, like the gas companies, and doubtless their disability in this respect will be remedied before very long.

GENERATING PLANT.

Excellent progress has been made during the year in cheapening the cost of turbo-generators, which are always used for extensions above 500 kilowatts; for instance, two 3,000-kilowatt sets put down at the Marylebone generating station in the autumn cost only £8,600, a sum actually less than the cost of the condensing plant, and less than that of four 1,000-kilowatt rotary converters. Unfortunately the cost of the steam generating plant is not going down in anything like the same ratio, but on the whole the cost of a generating station nowadays is far lower than it was even two or three years ago. Moreover, the efficiency of the plant is improving, and a 5,000-kilowatt turbine constructed by Dr. Ferranti to work with steam at extremely high superheat is reported to consume only 7 lb. of steam per horse-power-hour—a phenomenal figure. The progress of the Diesel engine in small stations has been checked by the high price of fuel oil, a condition which is expected to pass, but which is maintained with remarkable persistence. On the other hand, noteworthy progress has been made by the gas-engine, two 1,000 h.p. gas engines with by-product recovery plant having been installed at Accrington, with very satisfactory results. This plant is being extended on similar lines. One new water-power installation has been opened during the year—at Chester, where the city electrical engineer, Mr. Britton, has made use of the river Dee as an auxiliary to his steam station. Many of the large municipal undertakings are carrying out important extensions, and it is noteworthy that even those which have hitherto generated continuous current only have been obliged to adopt high pressure alternating current to cope with the large powers and longer distances now met with. Thus Glasgow, Birmingham and Belfast are preparing to erect new stations outside the city to transmit alternating current to sub-stations, and, in London, Marylebone and Hackney are adding three-phase plant to their existing direct current stations. The extensions contemplated by Glasgow will cost half a million sterling.

In view of the large demands now experienced and in prospect, and the higher efficiency, as well as lower cost, of large generating sets, it is a singular thing that the British municipal authorities are still very conservative in their ideas, and the largest size of turbo-generator yet at work in a municipal station is only 6,000 kilowatts, though Manchester has ordered one of 15,000 kilowatts. On the other hand, the company supplying the city of Chicago has had a set of 25,000 kilowatts built by a British company, and has ordered other sets of 30,000 kilowatts each from American makers. Precisely the same tendency hampered the development of electricity supply in this country in the early days, but with better excuse, for the extraor-

dinary development that has since taken place could not then be so well foreseen as the future load can be nowadays. The consequence was that much plant quickly became obsolete on account of its small size, and even in recent years the same thing has happened repeatedly owing to technical progress. For example, the turbo-dynamos put down at the Marylebone station in 1905 are now regarded as out of date, though they were the best obtainable at the time. Similarly, the turbines installed in the Lot's-road power station of the Underground Electric Railways in 1905 were replaced by others some time ago, and the largereciprocating engines put down in the London County Council's Greenwich power station in 1906 were broken up in 1913, their place being taken by turbines.

Evidently, therefore, not only must the greatest discrimination be used in designing the generating plant of a modern power station, but due allowance must be made in the shape of contributions to a sinking fund to enable advantage to be taken of the improvements that are likely to be effected within a decade. Many municipal stations are to-day working with wasteful plant simply because they are not permitted to discard the old plant until the debt upon it is fully paid off, and this again emphasises the folly of allocating large sums to the relief of the rates instead of accumulating substantial reserve funds to meet such contingencies. In this connection, it is interesting to note that the Corporation of Manchester has decided that the Electricity Department shall contribute only 1 per cent on the capital expenditure to aid the rates.

BULK SUPPLY AND LINKING-UP.

The early prejudice manifested by municipal authorities against co-operation with companies in the supply of electricity has died away to a marked extent during recent years, and now it is not uncommon for local authorities to take a supply in bulk from a neighbouring power company or other source. Thus the Metropolitan Boroughs of Marylebone and Woolwich are arranging for such supplies on a moderate scale as a stand-by, and there are numerous examples of small towns and villages making agreements for bulk supply, or handing over the whole undertaking to private hands. This question of co-operation, in fact, has attained to exceptional prominence during the year, and the satisfactory results recorded in Germany have frequently been quoted. In that country it is not unusual for a municipality to provide a large proportion of the capital required for the development of an electricity supply scheme on very profitable terms, or to lease the rights of supply in return for a heavy percentage on the gross income of the company. The question has arisen in connection with the future supply of London in view of the approach of the date when the London County Council will be entitled to purchase the undertakings of all the companies supplying the Metropolis. Although this will not take place until 1931 it is essential that action be taken in the near future, as otherwise it will be impossible for the companies to obtain capital for the development of their undertakings, and the result will be that electricity supply in London—which has become an absolute necessity to the public welfare—will stagnate for the last ten or fifteen years preceding the purchase date. One of the London companies, with this fact in view, is introducing into Parliament a Bill to enable the county council by agreement with the companies to postpone the date of purchase, and it is understood that negotiations are on foot for the formation of a company to amalgamate all the existing Metropolitan companies, and to reorganise the supply on up-to-date lines—a proceeding to which the assent of the county council will be indispensable. The subject has received the closest attention in electrical circles, and bids fair to become the most prominent question before the electrical world in this country in the near future.

A very important matter, which is also on the table at the moment, is the future supply of electrical energy to the railways. This will almost certainly demand the consideration of the municipal authorities adjoining the main lines, who will have to decide whether they are prepared to undertake the supply of the very large quantities of electricity required, or yield the field to others—in which event their own position as suppliers of electricity will be imperilled, owing to the cheapness with which electrical energy can be generated on the large scale. Already important schemes for railway electrification are on foot, and some of the companies are erecting large power-stations themselves, in the absence of an adequate public supply of electricity.

ADMINISTRATION.

The supply of electricity is becoming more and more a commercial matter, and the salesman is growing in importance compared with the man who is purely an engineer. Hence the controllers of the chief municipal undertakings prefer to style themselves "managers," and indeed have little time to spare for engineering work. The development of the commercial side of the business is of

the first importance, and the establishment of show-rooms, hiring-out departments and wiring departments is a valuable aid. The difficulties arising from the restrictions to which municipalities are subject with regard to such schemes hamper their activities, but some day these will be removed, as the Municipal Electrical Association is wide awake to the importance of reform in this respect. Until hiring-out becomes practicable the electric cooking business cannot be developed as it ought.

The notoriously inadequate wages of the junior staffs of municipal power-stations have led to the formation of a new society called the Association of Electrical Station Engineers, and it is probable that this will become a factor to be taken into account by Electricity Committees, as the leaders are advocating a militant policy. It is, however, questionable whether, under the conditions prevailing in the business of electricity supply, anything in the shape of a strike could be successfully carried out. None the less, this is a question which deserves the serious attention of the managing committees, for there can be no doubt that as a rule these men are paid wages far below the standard called for by their technical attainments and implied by the responsibility of the duties which they perform.

HIGHWAYS.

The year 1913 has been remarkable for the great amount of attention which has been paid to highway engineering and administration. The field of view has broadened, and problems which had previously been subject only to dogged and not always successful frontal attacks are now being attacked from several directions at once. The third International Road Congress provided a general stimulus, and a study of the large amount of comparative data which it brought to light serves, in many cases, to define the particular problems which we have to face in these islands, and to show us where we may pick up useful hints, where we may find justification for the principles which we follow and how much, or more often how little, the actual practice or administrative methods of foreign countries provide precedents or examples for ourselves.

The Road Board now fills an important place in highway administration and road engineering, and with the co-operation of the surveyors to local authorities it plays the part of a central office for roads, serves both to steady and to stimulate road finance, and is gradually collecting and recording the data and experience hitherto scattered over the country and disseminated throughout the pages of our own volumes. Sir George Gibb's wise and enlightened policy commands the respect of all who understand road problems. He will not allow the practical experience and local knowledge of the surveyors to be pushed to one side, but at the same time he insists upon the application of scientific methods and general engineering knowledge to the problems of reconstruction and improvement. On the administrative side he refuses to be a party to extravagant or untimely expenditure of Road Board funds on projects which do not properly fall into the general scheme of steady development, and he has shown himself ready to encourage developments which, while rendering road administration more efficient, will prepare us for the time when Parliament comes to some decision with regard to the extent to which central control and central finance will form a part of our system of administration. It is earnestly to be hoped that in the coming year some practical steps may be taken to weld the road authorities into a general organisation, or an effective association of organisations. Only thus can central control be kept within the limits which many of our readers would regard as desirable.

Amongst the activities of the associations of

which road surveyors are members, the most notable is the appointment by the Scottish District of the Institution of Municipal and County Engineers of a Roads Committee to collect and tabulate data, especially with regard to climatic conditions. We have often insisted on the importance of such studies, and recognise that in order to be of the greatest possible use they should be grouped in different parts of the British Isles. The results of the work of this committee will be awaited with interest by all who realise the importance of climatic conditions as influencing road making and maintenance.

The year 1914 may be expected to bring to light some of the practical results of the Road Board trials of road crusts and upper courses at Sideup, in Wandsworth and Fulham, and elsewhere. The behaviour of road crusts, new to the locality, which have been put down in several counties will also, it is hoped, provide data of importance. Main roads will be subjected to a steady increase of the more severe forms of traffic, and the development of motor-omnibus services will proceed apace, though not to the extent suggested by certain advertisements of a somewhat flamboyant character which have recently appeared.

It seems likely that during the present year attention will be given to the subject of special roads. Two kinds of projects are likely to be discussed. First, the provision of roads for heavy motor traffic between industrial and commercial centres, possibly on some of the routes now occupied by canals; and secondly, the construction of speedways for motor vehicles, including industrial traffic between London and the South Coast. Wide issues may be raised, especially as regards the control of such routes, by private companies or public authorities.

Matters of immediate interest to road engineers and surveyors received attention at the Surveyor Conference held at Olympia last April. The subjects discussed were: The organisation of highway departments; the relations between county and district surveyors; the circulation of official reports; the drainage of subsoil water; and the terms used in connection with bituminous roads (*THE SURVEYOR* of April 25th). A general paper on "Highways" was read by Mr. C. H. Cooper, borough engineer of Wimbledon, before the Society of Engineers, and was reported, with the discussion, in our issue of October 10th. Some principles of highway finance, with special reference to the position in the United Kingdom, are

discussed in an article by Mr. Reginald Ryves, *CONS.E.*, in our issue of August 8th. Highway finance was also the subject of a number of valuable reports to the Road Congress. In the article on "Highways" in our "coming-of-age" issue of January 17, we attempted to picture the development of roads in England, from the early 'thirties onwards, with special reference to the turnpike roads in counties near London and in four other counties representative of typical areas. The occupations and habits of the population as affecting the nature and extent of the traffic upon the roads were taken into consideration, and special attention was paid to the influence of topography and geology upon highway development. This article, it is hoped, may be commended to those students of the history of roads in England who wish to clothe the skeletons of dry fact which they study in various publications dealing with the history of highways. In the same connection, but from another point of view, the "Story of the King's Highway" may be recommended to the student of highway administration. The authors, Mr. and Mrs. Sidney Webb, are making a special study of local administration, and the work is the third of a series on this subject. Highway matters on the other side of the world are discussed in an article on "Australasian Road Problems," by Mr. J. M. Coane, of Melbourne, on p. 500 of our issue of October 3. The range of subjects which came within the scope of the Third International Road Congress was so great, and the treatment of those subjects so varied that no attempt will be made here to give even an outline of the proceedings. Our index will show where we have reported the proceedings and summarised main points in the reports, and some comments on the resolutions adopted will be found in our issue of August 29.

HIGHWAY ADMINISTRATION.

An important circular issued by the Road Board at the end of 1912 outlined the policy which has borne fruit during the past twelve months. In some respects, however, the practical response of local authorities to this circular has been decidedly disappointing. The chief clauses in the circular were given in our issue of December 27, 1912 (not 1913). In the following issue, January 3, 1913, there was a reference to a letter which Sir George Gibb addressed to *The Times*, pointing out that the Road Board did not express any preference for a particular method of road crust construction, but encouraged the local authorities to use many different forms of bituminous treatment. It is perhaps desirable again to direct attention to this point, since those who are not well acquainted with the facts might be led to suppose that the attention which the consulting engineer to the Road Board is at present giving to the carpeting system means more than it really signifies. It must be remembered that Colonel Crompton is not a whole-time officer of the Road Board and that his own investigations have led him to believe that the time has come to make a practical trial of the carpeting system on country main roads. In our issue of February 7 we advocated a policy of combination on the part of local authorities in order that fairly comprehensive works of road improvement near the borders of adjoining areas might be carried out with efficiency and economy. Possibly some development in this direction may take place during the next twelve months.

Criticisms of the Road Board's policy and references to its "boarded millions" have been effectually disposed of by the chairman of the Board and by official replies to questions in Parliament, and the country as a whole has not been impressed by expressions of discontent from various quarters as regards the apportionment of

the funds. We hope, however, that as regards the classes of roads towards the improvement of which the Road Board makes grants, certain kinds of rural highways of minor importance, per mile, will this year receive the attention of the Board. The sums necessary to encourage the improvement of these roads would be quite small, and it would be interesting to see what improvements could be effected, especially in regard to works which should be undertaken before any further developments take place in crust construction. Some notes from the Board's third annual report appear in our issue for August 1st.

During the past year there have been several authoritative pronouncements on the subject of the State control of main roads or State contributions to the cost of maintenance. The Select Committee on Local Legislation expressed the opinion "that the time has arrived when an authority should be constituted to decide which roads should be the main roads of the country, and that the cost of their maintenance should be taken off the rates and put on the taxes." The majority of the Committee reporting to the Road Congress on the subject of highway administration (Sir A. B. Hepburn, Bart., Messrs. Copnell, Munro Ferguson, Hodgkin, Heslop, and Jarrett) recommended the creation of four classes of roads—national, county main, county district, and local, with Exchequer grants for the first two classes. The British Committee reporting to the Congress on the subject of statistics of cost of construction and maintenance (Messrs. Ryves, Gowen, Harding, Moncur, Nichols, and Thomas) recommended that there should be four classes of roads—national roads, maintained by the counties, but the chief part of the cost defrayed by the State; county main roads, the cost defrayed by the counties, but one-half of it being a first charge upon the surplus of the Exchequer grants after meeting the prime charges set forth in the Act, 1888 (this being also a recommendation of the Joint Select Committee of August, 1911); and two classes of district roads, the counties making grants towards the cost of the first class, and the second class being maintained wholly by the districts (see *THE SURVEYOR* of December 5th). More drastic were the recommendations of the British Committee reporting on the Qualifications of Engineers and Surveyors (Messrs. Boulnois, Cowan, Sheldon, and J. W. Smith). They recommend the creation of a central department with the same powers as those now exercised by the Local Government Board with respect to public health and Poor-law administration, and by the Board of Trade in other matters. A department of roads is, they consider, urgently needed, and it should have a responsibility for the *personnel* of the local officers and a veto on their appointment or dismissal. "The nucleus of a central road authority," it is pointed out, "now exists in the Road Board" (see *THE SURVEYOR* of November 21st, p. 795).

Our issues for the past year contain several references to the primary data which must be taken into account in comparing the highway systems of different countries, especially with reference to the cost of maintenance. Traffic censuses will go some way towards indicating the true significance of comparisons of cost of maintenance, but for more general comparisons these are not usually available, and we must fall back upon statistics of mileage, population, and area. A short article on this subject appeared in our issue of June 20 (supplement page 47). It will be seen that in mileage of roads per square mile of area England, with 2.571 miles, ranks by far the highest of fifteen countries, the next being Ireland, 1.755 miles, while France has 1.750 miles per square mile. Scotland, 0.745, comes

between the United States and Italy in this list. An element of comparison of even more importance in most cases is the population per mile of road. Here the figure for Ireland is only 77.13, against 108 for France, 210 for Scotland, and 239 for England and Wales. Italy, we find, has the much higher figure of 371 and Spain 504. The United States has a population of only 41.8 per square mile. In both lists France comes next to Ireland.

The administration of highways in Ireland continues to improve, and there is an increasing desire on the part of county and rural district councils to bring the roads up to a higher standard. In all cases in which the period allotted to schemes for the maintenance of roads by direct labour had expired steps have been taken for making fresh schemes.

Reference to the sign-posting of roads will be found in our issues of October 31 and November 7. The former contains our summaries of reports to the Road Congress on this subject and our comments on the recommendations of the British committee, and in the issue of November 7 we referred to the proposal that the Motor Union should take a place as one of our highway authorities and undertake the sign-posting of the roads. The proposal has met, we believe, with scant support, and may be left, perhaps, to die a natural death. The surveyors to local authorities are quite able to erect sign and distance posts in a suitable manner, and will, no doubt, willingly carry out these duties in conformity with general principles to be agreed upon. Sign-posting is road improvement, and even if the Road Board does not see its way to provide funds for the purpose, we have no doubt that it would undertake the task of drawing up directions as to the general principles to be observed. It may be suggested that the various bodies which now provide warning signs for the roads might do well to pool the funds which they devote to this purpose and place them in the hands of a small committee nominated by a suitable authority or authorities. The placing of warning signals by clubs and private individuals should be under proper control if it is to continue. Many of the signs now displayed are misleading and even dangerous, both directly and in the general effects which they produce on the minds of the travelling public. It may also be pointed out that it is a dangerous practice to paint the words that matter most in red paint which rapidly fades. A diagram showing a method of sign-posting at cross-roads, adopted by Mr. C. H. Cooper, M.I.N.S.T.C.E., was reproduced on p. 813 of our issue of November 28. A criticism of Captain Deasy's proposals will be found in the issue of August 29.

ROAD SYSTEMS.

The past year has been remarkable for a general overhauling of ideas about roads. The Third International Road Congress provided an opportunity for collecting data and statistics relating to road administration and road engineering in many different countries, and the various papers submitted contained a good deal of information which will enable the student of road administration to realise how the systems of different countries have been formed and how they are developing. We have ourselves been at considerable pains to dig out the really significant facts relating to road maintenance and management in different countries, and to present them in such a manner that they are comparable. Amongst the prime elements of comparative studies none are more important than those relating to the areas which are under the charge of the different authorities concerned, and it is especially necessary to distinguish between national and provincial authorities, and to realise that the same words have not always the same significance in different countries

(see p. 351, February 21). We have, therefore, specially directed attention to the areas of small American States and small German States, as compared with English counties or with the main divisions of the United Kingdom, and on the other hand we have made comparisons of the larger American States and the largest of the German kingdoms with countries such as Italy and France. We have pointed out that the terms "State" and "State highway" have quite different meanings in different cases, and that State, provincial, or county road systems may in some cases be comparable. The national roads of France are not comparable with the State roads of Schleswig-Holstein, nor with those of Maryland and Massachusetts; not comparable, that is, as regards their extent or their relation to a national Government. The reader who is interested in the subject will find the following references useful, and they are also to be recommended to those who desire to obtain information as to the actual conditions with regard to highway engineering and road maintenance in the different countries mentioned. The Road Congress reports on the subject of highway finance to a considerable extent supplement those on highway administration, and in some cases give better information. Some of the most important points in these reports are noted in our issues of August 15 (administration), August 8 (finance), and December 5 (statistics), the countries represented being Germany, Belgium, Bulgaria, Canada, the United States, France, Italy, Hungary, Russia, and the United Kingdom. Our own comments on these reports will be found in the issues of August 8 and 22. On the subject of administration the several German States are treated separately, and in our summary we have devoted separate notes to the more important of these.

The German Empire.—Early in the year (p. 351, February 21) we drew attention to the real position of affairs in Germany, and the information contained in the Road Congress reports may be supplemented by reference to our article in that issue, showing the nature of the changes that are taking place, partly towards centralisation and partly towards decentralisation. Of the Road Congress reports relating to Germany, by far the most interesting in the present connection is that on Communication 9 (see p. 855, December 5).

France.—An interesting paper on highway administration in France, by M. de Pulligny, is reproduced in our issue of December 27, 1912 (not 1913), and some important facts and figures relating to the French road system are given on p. 551 of our issue of March 28.

Ireland.—A reference to the dual system of control in Ireland was made in our issue of April 18, p. 620, and other references to highway administration in that country will be found in the Road Congress reports. In some respects the Irish system compares favourably with that of England and Wales, but it needs development and some radical changes, in the interests of efficiency and economy.

Scotland.—The Scottish system is undoubtedly one which suits the conditions of Scotland and the genius of the people. Scotland has very nearly the multiple unit system, and the units seem to be about the right size. It is probable that such changes as may occur will be a development of the present system, which has produced results ranking amongst the best obtained in any country in the world, and these results seem to be reached with a minimum of friction. The subject of highway administration in England and Wales may be considered as covered under the present main heading, and no separate reference need be made to it.

Ontario.—Some indication of the part played

by the provincial authority in the road administration of Ontario will be found in our issue of September 12, p. 385, in a reference to a report by Mr. W. A. MacLean, provincial engineer of highways. It may be remarked that there were in Mr. MacLean's paper some very interesting passages relating to technical matters.

Victoria.—Information respecting highway administration in Victoria, Australia, has been conspicuously before our readers during the past year. The composition of the Country Roads Board and some indication of the procedure to be adopted will be found on p. 559 of our issue of April 4, and later, April 25, we gave a fuller account of the work to be undertaken by the Board and of its powers. This development in highway administration, obviously inspired by the establishment of a Road Board in London, is of unusual interest and, we believe, of very great importance not only in itself, but as a precedent which may be followed by other Australian States. Further information as to the nature of some of the districts in Victoria, and the character of the roads, is given in the issue of October 21, from a paper by Mr. W. Calder, who has already stamped with success his indefatigable work as chairman of the Board, and further details with a sketch of a part of the proposed main road system appeared in our issue of January 2, 1914.

United States.—A very carefully and intelligently compiled bulletin of the engineering experimental station at Iowa furnished matter which we placed before our readers in a concentrated form in our issues of February 28 and March 7, and we believe that the information there given cannot conveniently be found elsewhere by British readers. There are descriptions of State departments and State boards, and references to the arrangements which are made between these authorities and the smaller local authorities, and it will be seen that in many cases there is a considerable resemblance between the American system and that of England and Wales as it is at the present day.

Russia.—By far the best and most interesting information in the Road Congress reports with respect to highway administration in Russia is contained in the report for Communication 9 (statistics). This information is given largely in the form of tables, and as the lengths are in versts, the areas in square versts, and the costs in roubles, most of our readers will find it convenient to make use of our summary on p. 858 of the issue of December 5, in which we have made the necessary conversions to British units—no small task.

Other Countries.—Interesting information concerning other countries will be found in the Road Congress reports, and the main features of importance are noticed in our summaries (August 8th and 15th). Attention may specially be directed to the notes on Austria, Italy, Bulgaria, and Hungary. As regards Austria, see also page 856, December 5th.

ROAD PLANNING AND ROAD MAKING.

In the British Isles it is seldom that an important road has to be planned mainly as a matter of engineering alignment and with a view to adapting it to the topographical and geological features of the country which it traverses. The difficulties of alignment, in our case, are those which arise from the existence of densely built areas on or near the new route, and from the need for planning the road so that it will be the most economical and useful in the long run, and, for the time being, not unduly expensive in proportion to the advantages which it offers. Thus a project for a new road has usually to be considered in relation to the probable changes which will take place in the neighbourhood, the conversion of rural into urban areas, or the clearing away of slum property, and

sometimes an actual town-planning scheme. With respect both to the approach roads of great cities and relief roads passing towns, the particular work may have to be considered as part of a general plan, and it should also in some cases be studied in its relation to the main road network of the open country. Among the numerous articles and papers of the past year in which town planning has been discussed, one of the most generally useful is that by Mr. J. L. Jack, town clerk of Dunfermline, "Legal Aspects of Town Planning," August 22nd. Some of the chief passages in a Local Government Board report on housing and town planning are quoted in our issue of August 29th, and this report shows that up to March, 1913, authority had been given by the Board for the preparation or adoption of 33 schemes by 27 local authorities, embracing a total area of more than 50,000 acres; and it is evident that important main roads must traverse or skirt some of the areas affected by these schemes. A paper on the preparation of town-planning schemes, read before the Institution of Municipal and County Engineers, by Mr. J. E. Wilkes, will be found in our issue of August 15th.

The general principles which should govern the alignment and construction of by-pass roads were discussed in an article by Mr. Ryves in our issue of May 30, with special reference to the character of such roads and their width. A paper on Birmingham town planning schemes, read before the Institution of Municipal and County Engineers, by Mr. H. E. Stilgoe, M.I.N.S.T.C.E., city engineer, was reproduced in our issue of August 29. The diagrams of cross-sections of streets show that excellent and liberal designs have been adopted, including the extension of the strength crust beneath and well beyond the kerbs. As regards particular roads, the most conspicuous schemes are the western approach road to London and the Croydon relief or by-pass road. Both of these may be regarded not only as important in themselves, but also as precedents. In connection with the western approach road scheme, the question of the engineers' remuneration was discussed at a meeting of the Middlesex County Council (issue of December 5), and in commenting on this matter we expressed the view that while the proposed remuneration of the county engineer (Mr. H. T. Wakelam) is by no means excessive, a further expenditure on the salaries of specially engaged and fully qualified assistants should be contemplated as necessary for this important work. The Croydon project, prepared by Mr. E. F. Morgan, highway surveyor to the county borough, gave rise to an exceedingly interesting fight between the party desiring the construction of the by-pass road, and consisting of a majority of the town council and certain motorists' organisations, and the party opposing it, consisting of a minority of the town council, backed up by owners of shops fronting the main street and representatives of the Croydon Rural District Council. It was a very pretty fight, ably controlled by the Local Government Board inspector, Mr. Malet. The Road Board approved of the scheme, and were prepared to contribute considerable sums towards the cost. An indication of some of the engineering features of the proposed road, with a plan and some of the cross-sections, will be found in our issue of November 28.

The extent to which the principles of road-making proper enter into schemes for road improvement makes it necessary to consider those principles in connection with road improvement generally. The improvement of a road which is a good one except as regards the crust may be a matter of crust reconstruction only; but we have very few of such roads. It is, therefore, necessary to take into account matters such as those which are discussed in an article on "Road-making

Developments," which appeared in our issue of June 13, and deals with the road as an earth-work, hydraulic considerations, and other matters which should be taken into account in well-considered schemes of road reconstruction.

COUNTY MAIN ROADS: ADMINISTRATION.

Cornwall.—Early in the year the Roads and Bridges Committee of the county council considered the report of their surveyor, Mr. A. E. Brookes, on the subject of maining and dismaining roads, and decided not to entertain the principle of recognising secondary or subsidised roads. The maining and dismaining recommended in Mr. Brookes' second or alternative report was decided upon, and the council accepted the principle of forming a class of main roads of the second order. Our own comment on the proposals will be found on page 125 of the issue of January 24th.

Cumberland.—The county surveyor suggests in his annual report that the payment of an annual sum for main roads maintained by urban authorities is not a satisfactory system; and he considers that it would be better to make an annual payment for ordinary maintenance only, and to pay, in addition, the actual cost of remetalling and repairing the roads when they need it.

Southampton.—The year under review in the annual report of the county surveyor was the first year in which the main roads of the county of Southampton, 542 miles, were generally under the direct management of the county council. There are now four divisional surveyors, and roads are divided amongst 130 lengthmen, each of whom has about 4 1-6th miles of road in his care. Mr. Taylor lays stress upon the importance of training the lengthmen. One foreman and two sub-foremen or gangers were allotted to each division.

Herefordshire.—Special attention has been given in our pages to the difficult position of Herefordshire in the matter of highway finance, and the considerations which we have put forward need not be repeated here. It may be urged, however, that the case of this county is eminently one in which the propriety of assisting its main road maintenance out of general funds should be recognised. In his annual report for 1912-13 the county surveyor, Mr. G. H. Jack, points out that the rates have risen very sharply, and he defends, in very reasonable terms, his reluctance to recommend the adoption of new and expensive resurfacing material, in view of the lack of suitable foundations; but he points out that if such foundations could be provided the longer life of the road should more than compensate for the extra cost of the improved methods of maintenance. "It is quite useless," he remarks, "to enlarge upon the benefits derivable from tar washing or the application of thin carpets of bituminous compounds to such roads until the real difficulty of finding sufficient money to reconstruct the roads from the bottom has been tackled and overcome. This task would be impossible without substantial Government aid." Excluding the city of Hereford, the population of the county is only 91,700, or one person to about 5·8 acres (not 5·8 persons per acre, as stated on page 155 of issue July 25, 1913).

Worcestershire.—In December, 1912, the Road Board agreed to contribute towards the cost of a scheme for the improvement of about 53½ miles of trunk roads, at an estimated expenditure of £127,000. It was expected that the work would be completed in five years.

Middlesex.—The work of coating five miles of the Bath Road with asphaltic materials has been in hand, and a description of the methods adopted on 2½ miles of this length will be found in our issue of December 19th. In the same issue we suggested that a trial of asphalt-macadam proper, as the wearing crust, might be made. The county

surveyor, Mr. H. T. Wakelam, has also in hand the first stages of the work in connection with the western approach road to London. (See *THE SURVEYOR* of December 5th.)

Essex.—A scheme for the reconstruction of about 150 miles of road, and involving an expenditure of about £300,000, has been approved by the Road Board (see our issue of January 9, 1914).

COUNTY MAIN ROADS: TECHNICAL.

Somersetshire.—Mr. H. T. Chapman, county surveyor, points out that the cost of first-class road materials has recently risen very considerably, and he is turning his attention to the use of cheaper local stones with bituminous binders. During the year an area of 83,000 sq. yds., or 7·8 miles, was re-surfaced with granite and basalt, water bound and surface tarred, and a length of about 1,100 yards was re-surfaced with "tar-mac."

Surrey.—Mr. A. Dryland, county surveyor, has continued the use of asphalt macadam, and has found tar slag macadam suitable for the condition tar-slag macadam suitable for the conditions of his county. He has used pitch-grouted was needed.

Cornwall.—The probable cost of carrying out the works necessary on seventy miles of district roads in order that they might be fitted to be included in the main road mileage of the county of Cornwall was estimated as about 500 per mile by Mr. H. E. Brookes, county surveyor, who submitted a report on the subject in January, 1913.

Wiltshire.—In February we announced the decision of the Wiltshire County Council to expend a sum of £74,700 upon the reconstruction and maintenance for nine years of the London-Bath Road, thirty-five miles of which lie in the county. Extracts from the report of the county surveyor, Mr. J. G. Powell, are given on page 403 in our issue of February 28, and include passages describing the physical character of the route and the nature of the proposed improvements.

Cumberland.—Tar macadam is being put down in the villages at an average cost of 2s. 4d. per sq. yard, or about twice that of the clay-bound macadam which it replaces. The county surveyor, Mr. W. Finch, considers that with the aid of Road Board grants the better surface and increased life will compensate for the greater cost. It is pointed out in Mr. Finch's annual report that there is a considerable mileage of roads which may now be surfaced with granite or whinstone, instead of the inferior limestones and broken pebbles which have hitherto proved serviceable on these roads. Reference is also made to the necessity for strengthening foundations and for making sure that the outlets for the road drainage are in working order. Many of the main roads are narrow and suffer from tracking, especially by motor wagons and traction engines. The main roads maintained by the urban authorities under agreement cost £95 2s. 8d. per mile in 1912-13.

Southampton.—The county surveyor recommended a gradual change to bituminous-bound crusts on the parts of the main road which are subjected to the heaviest traffic. The mileages under different crusts were:—Granite, basalt, &c., 236·3; tar macadam, 2·15; flint, 183·1; gravel, 120·3; total, 542·2.

Forfar, Dundee County District.—A paper on the maintenance of county roads in the Dundee county district was presented to the Dundee meeting of the Institution of Municipal and County Engineers by Mr. J. B. Robertson, county road surveyor (see June 13, page 902). For roads carrying heavy traction engine traffic Mr. Robertson recommends the use of stones set on edge and wedged, on the Telford principle, but usually it is more convenient and quite satisfactory to provide a 6-in. crust with the metalling proper on the top. The Dundee-Perth road crust was re-

made with 6 ins. of 3-in. hand-broken stone, with a finishing coat of $2\frac{1}{2}$ ins. machine-broken road metal, the cost being 1s. 4 $\frac{1}{2}$ d. per sq. yard. To make another road capable of carrying heavy motor traffic in the spring months 2s. 2d. per sq. yard was spent on re-making the crust.

Northamptonshire.—The cost of maintenance of the county main roads was nearly £80 a mile. The county surveyor reported that some of the roads showed evidence of damage by heavy motor traffic, and he considers that the widening of the carriageways on some of the roads will have to be undertaken before long. Tar grouting, adopted on half the mileage, had given very good results, and Mr. Morris recommended the extension of the system to the whole mileage, in spite of the necessary increase in the number of steam rollers and metalling gangs.

Herefordshire.—The county surveyor points out that it is sometimes advisable to metal the sides of the road crust with limestone treated with bituminous material. Expensive Cleehill stone is, he points out, often wasted on weak sides. The principle involved is that when funds are limited, or as a matter of economy when there is no difficulty in furnishing such funds as may be necessary, it is often desirable to make sure that sufficient bulk is provided as well as a sufficient quantity of wear-resisting material. In this county ninety-three miles of roads are recognised as first-class roads.

Herefordshire.—In his annual report the county surveyor, Mr. C. F. Gettings, stated that good progress had been made with the work of improvement of trunk roads under the scheme approved by the Road Board in December, 1912. The cost of improvement, which is estimated as about £2,373 per mile, is fairly high on account of the necessity for dealing with clay subsoils, and, for a considerable portion of the fifty-three miles, providing foundations. For small repair work a patching roller has been employed with good results. Tar painting had recently been carried out for the first time, and, in spite of the unfavourable season, the results were satisfactory.

THE ROAD CRUST.

Several of the Road Congress reports were devoted to the road crust, and the SURVEYOR summaries of the papers contain a considerable amount of useful information. See issues of August 1 for bituminous-bound crusts; October 3, for comparisons of types; and August 22, for causes of wear and deterioration.

Since the subject of giving adequate strength to the edges of road crusts was brought forward at the second Irish Road Congress by Mr. Arthur Gladwell and Mr. Reginald Ryves, this matter has received a good deal of attention in different parts of the country (see issue of August 15, p. 247). On page 275 of the same issue Mr. H. W. Bowen, county surveyor of West Sussex, described methods which he has employed.

Notes from the Engineering Advisory Committee's report on the Road Board trials at Sidcup (January 31, p. 250) are followed by a review of the report (Feb. 7, p. 281). The trials in Wandsworth and Fulham are similarly dealt with on p. 322, February 14. Special attention is directed to the trials arranged as a series in Fulham.

Notes from a paper by Mr. T. R. Agg, of Illinois State Highway Commission (May 2, p. 701), are the subject of comment on p. 689 of the same issue; and the notes and comments, taken together, may be specially recommended to the attention of surveyors who are reviewing the subject of crust construction generally.

Mr. T. Aitken's valuable paper on tar spraying and tar macadam (issues of June 20 and 27) is of wider interest than might be supposed by the title,

and should be taken into consideration under the present head.

The part played by water in macadam road construction is the subject of a suggestive paper by Professor W. G. Fearnside, F.G.S., which is reproduced in our issue of November 28, Professor Fearnside's reply to the discussion which took place being given in our issue of December 19. The paper is somewhat unsatisfactory from the point of view of highway engineering, but read together with our comment on page 805, our report of the discussion, and Professor Fearnside's reply, it furnishes useful material for the study of the physics of the road crust.

A method of resurfacing main roads, which is being developed as a result of the particular manner in which motor traffic affects certain kinds of road crust, is referred to in last year's special annual issue, page 173; and some hints as to the manner in which the problems of surface preservation are being tackled will be found on page 495 of our issue of March 21.

In papers which he read last December at Manchester and before the Institution of Mechanical Engineers, Col. R. E. Crompton, M.INST.C.E., consulting engineer to the Road Board, developed the theory of rhythmic traffic effects upon the road crust, and described a method of applying the carpeting principle to country roads. Abstracts of the papers, with important passages quoted in full, appear in our issues of December 26, 1913, and January 2, 1914, and our own comments appeared in the same issues.

The expression "Road Carpets" is used by Major W. W. Crosby, chief engineer to the Maryland Highway Commission, to designate thin films of protective material as well as the somewhat thicker layers which are more usually regarded as coming within the scope of the term. (See pages 597 and 591, April 11.) The connection of ideas is of some importance, since various processes coming under the head of road tarring tend to produce a distinct layer as well as, or instead of, a clinging film or a permeated surface layer of the crust itself. An asphaltic carpet proper on a concrete crust has been adopted for an important State highway in California, the method of construction being described in our issue of June 27, p. 987. For British conditions, the main restriction of a general character limiting the use of such carpets is the small range of gradients for which they are suitable. It is further to be remarked that their suitability for the conditions of a main road which is not a street depends largely upon the amount of horse-drawn traffic upon the road. They are necessarily much more slippery than most kinds of paving under weather conditions which frequently recur in the winter and spring, and may be more slippery under autumn conditions. Col. Crompton estimates the life of such paving, under certain conditions, as twelve years, an estimate which Mr. A. Dryland, county surveyor of Surrey, received with "grave doubts."

The subject of "Road Drainage and Foundations" was discussed at a meeting of the American Society of Civil Engineers, and extracts from the report, together with notes and comments by Mr. Reginald Ryves, M.CON.S.E., appeared on p. 907 of our issue of December 27, 1912 (not 1913).

ROAD METAL.

A very practical paper on mining and quarrying for road materials was read before the Institution of Municipal and County Engineers, South-Western District, by Mr. C. O. Baines (Paignton). It is reproduced, with a report of the discussion, in our issue of December 26, 1913.

The results of tests of road metal, made at University College, Cork, are given in an article by Prof. C. W. L. Alexander, ASSOC.M.INST.C.E.

(see pp. 318 and 316, February 14). In his tables Prof. Alexander gives the separate figures for the percentages of different sizes of material formed in the attrition tests.

An account of the work done by the Engineering Standards Committee on Road Materials is given in our issue of August 1, with a preliminary list of the chief roadstone rocks classified under different heads. We pointed out at the time that some of the words which occur in the primary list of trade terms are also to be found in the secondary list, and we suggested that it would be well to make such alterations as may be necessary in order to prevent confusion from arising out of the identity of words which do not always carry the same meaning. That the subject has by now advanced so far is due in no small measure to the pioneer work of a metropolitan borough engineer, Mr. E. J. Lovegrove, and to his collaboration in 1905 and onwards with Dr. J. S. Flett, of the Geological Survey; Mr. J. Allen Howe, of the Geological Museum, and the editor of *THE SURVEYOR*. The subject was further advanced, in 1908, by collaboration between *THE SURVEYOR*, Mr. Lovegrove, and Dr. L. W. Page, of the United States Office of Public Roads. Dr. Page carried out a series of tests of stones collected in this country, and thus established important data on exactly the same basis as those obtained with American rocks. These tests provide, therefore, a useful link between British and American records, the results appearing in our issue of April 10, 1910.

As regards the best shape for stones forming a broken-stone or macadam road crust opinion is divided. Some engineers prefer stones which are as cubical as possible, but others regard a proportion of longer-shaped stones as of value on account of the better bond in a crust containing them compared with that in a crust consisting wholly of nearly cubical stones. It is sometimes considered that although a proportion of the longer stones is of value in the main body of the crust, it is desirable that those nearer the surface should be as nearly cubical as possible. The subject was raised at the Second Irish Road Congress by Mr. Reginald Ryves, who regards the superior bond afforded by stones of mixed shape and length as a matter of importance, and does not favour any considerable departure from this principle near the surface of the crust. This view is now to some extent supported by the considerations recently put forward by Colonel Crompton as regards the extent to which and the manner in which wave action occurs on roads. If the shifting of the stones takes place, even to a small extent, in the manner described by Colonel Crompton the disadvantage of making a crust with nearly cubical stones, and these alone, is at once obvious. The crust as a whole is not effectively bonded against the action described, and individual stones are, on the average, more likely to be pushed over into new positions. On facts supplied to us by Mr. Ryves, as one of the results of special studies of country roads which he has recently made, and extending over a number of years, we have pointed to the tendency of surface-tarred roads to become bumpy; that is, to be worked into short waves by the traffic. The roads in question were compared with similar roads in the neighbourhood, which were not tarred, or had only recently been tarred. If the tar is effective in preventing the access of water to the crust, it is clear that a tendency to too dry a condition of the binding material in the body of the crust would favour such a shifting action as that alluded to by Colonel Crompton; and the tar film does, as we pointed out, prevent the wearing down of humps by attrition, and to a considerable extent prevents the rolling out of the road crust under certain traffic and weather conditions. These considerations may be held to

give support to our views as to the importance of the principle of seasonal tarring, with rests for recuperation under attrition and rolling out.

BITUMINOUS SUBSTANCES.

The cost of tarring roads and of making tar macadam depends very much upon the cost of the tar itself, and the simplicity of the operation of preparing and placing the material does not give promise of any considerable reduction of cost under this head. In an article specially written for *THE SURVEYOR* by Mr. W. J. A. Butterfield, M.A., F.I.C. (February 28th), the various sources of coal tar, tar oils, and pitch in the United Kingdom are reviewed, and some of the other demands for these materials are referred to. A useful paper on "The Consistency of Bituminous Materials," by W. W. Crosby, chief engineer of the Maryland State Road Commission, will be found in our issues of March 7th and 14th. The paper on "Tar Spraying and Tar Macadam In Situ," by T. Aitken, M.INST.C.E., county surveyor, Cupar Fife, gives results of practical experience, and is well worth study in preparation for the work of the approaching season (issues of June 20th and 27th). The nomenclature of bituminous substances has received much attention during the past twelve months, but no decision was come to by any authoritative body as regards the use of the terms "asphalt" and "bitumen." This part of the subject was not tackled by the British Committee reporting to the third Road Congress on terms used in highway work. In a *SURVEYOR* article (March 21st) the subject is referred to, and Mr. Prevost Hubbard's definitions are given. Correspondence on the subject will be found in our issues of December, 1912, and January, 1913.

SURFACE TARRING.

In Surrey the cost of surface tarring for 1912-13 was 1'69d. per sq. yard, comparing with 1'60d. in the previous year. The length of county roads tarred, exclusive of "claimed" urban district roads, was 167 miles, and the area nearly 1,700,000 sq. yards.

In Warwickshire (Mr. John Willmot, county surveyor) the area tarred was 492,710 sq. yards at a cost of about 1'76d. per sq. yard. The season was unfavourable for surface tarring.

In the county of Southampton (Mr. W. J. Taylor, M.INST.C.E.) the tar was chiefly applied by means of machines of the Weekes and Waithman type, and one spraying machine was also used. The area tarred was equivalent to about 121 miles of 16-ft. road, and the cost was 1'20d. per sq. yard. The area covered per gallon was about 4'76 sq. yards.

In Northamptonshire (Mr. C. S. Morris) special attention was paid to expeditious tarring of roads passing through villages. Stretches of road which became slippery in autumn were covered with slag clippings. Mr. Morris considers that surface tarring does not increase the life of a road to a paying extent except on roads costing more than £100 a mile per annum.

In Somersetshire (Mr. H. T. Chapman) surface tarring on main roads costs 1'2d. per sq. yard. Mr. Chapman considers it advisable to tar all newly surfaced lengths as soon as the weather permits.

Mr. O. Claude Robson, M.INST.C.E. (Willesden), considers that tar surfacing "might fairly be applied to all newly macadamised roads, the experiments already carried out with this particular treatment having been sufficient to justify expenditure in this direction upon all important macadamised carriage ways."

In the Uxbridge rural district (Mr. J. W. Harrison) tar painting has been carried out on a larger scale than before, the area covered having

amounted to 65,000 sq. yards. With tar at 2½d. per gallon the cost was 1½d. per sq. yard.

Some idea of the extent to which different methods of road tarring are employed may be gathered from the British report to the Road Congress on "Road Machinery," and the gist of the replies to questions addressed to surveyors on this subject is given on page 448 (September 1914).

TOWN PAVING.

Town paving received a considerable amount of attention in the reports and proceedings of the Third Road Congress. The reports on stone paving are summarised in our issue of October 17 and those on wood paving in that of July 25. The advocacy of Algarrobo as a first-class paving material is specially interesting (see Dr. Dassen's report, summarised on page 166).

While wood pavement holds its own well, and, when provided with a sufficiently deep foundation, gives good results under the heavy traffic of our towns, the conditions in Camberwell are such that the borough engineer, Mr. W. Oxtoby, M.INST.C.E., has had under consideration the question of a reversion to granite in the form of specially dressed Norway setts four inches deep. In Newcastle the wood paving is jarrah, and the sett paving Aberdeen granite, but on gradients exceeding 1 in 10 sandstone setts are used. This paving is found to be safer than bituminous-bound macadam, while water-bound macadam is difficult to keep in place. A large proportion of the surface of Newcastle highways is paved with a kind of pitching made of granite or whinstone chips, and as funds permit these streets are being surfaced over the chip paving with tarred slag. Turning to another industrial area, we find that in Sheffield tar-macadam is giving satisfaction, and thirty-nine miles of streets were already paved with this material some twelve months ago. It is interesting to note, in comparison with Camberwell, that Mr. Hadfield believes that, under certain conditions where the traffic is especially destructive to sett paving, wood will prove as economical as granite. By taking special measures to improve the foothold, tar-macadam has in this town been made applicable to fairly steep gradients, and when the road is too steep to give good foothold on tar-macadam a width of nine to twelve feet of it is laid in the middle of the road, leaving room at the side for horse traffic. In this connection it may be noted that where the width of the road is ample a special flagway is sometimes provided on the uphill side, with sett paving between the two lines of stone blocks. The reduction in tractive effort amounts to the same thing as an improvement in foothold. For a description of trials of various kinds of paving in Sheffield, with notes of the cost, the reader may be referred to page 667, issue of October 31; and further information, with a very useful table giving particulars of the traffic on different roads and costs of maintenance, will be found in a paper read by Mr. Hadfield before the Institution of Municipal and County Engineers (*THE SURVEYOR* of August 1st).

A summary of main features of the Metropolitan Paving Committee's tenth annual report was given in our issue of February 21. The report shows that there had been no important change in the situation generally. Creosoted soft wood maintained its position, and was the material chiefly employed, though other kinds of paving predominated in some districts, and much tar-macadam was put down in residential and business streets with comparatively light traffic. There was a continued tendency to increase the thickness of concrete foundations. Tar-spraying of macadam roads led to economies in scavenging, watering, and maintenance taken together.

Heavy Motor Traffic in London.—The effect of

motor-omnibus and heavy motor-vehicle traffic had been to increase the cost of maintenance of macadam roads generally. The cost of paved roads was reported to have increased in areas in which the strengthening of foundations had not proceeded very far, but elsewhere this traffic had not increased the cost of maintenance. In Fulham the cost of maintaining wood-block pavements had decreased, and it had not increased in Finsbury, where the foundations are usually 9 ins. or more in thickness. A slight decrease in costs, on 8-in. and 9-in. foundations, is expected in Hammersmith, and there seems to have been no increase in cost in Marylebone, where the foundations now provided are usually 8 ins. or 10 ins. thick. The maintenance cost of wood paving in Westminster has not increased, but the cost of asphalt is perhaps somewhat greater. Reports of higher maintenance costs are usually accompanied by the statement that deeper foundations will be provided in future. Taking into consideration the increase in the passenger mileage and ton mileage of traffic, the cost of reconstruction and the costs of maintenance, there does not seem to be any cause for alarm as regards the paving of main routes in the London area. The extra expense of cutting through the deeper foundations has to be considered. It is not really necessary, however, to make these foundations of tough concrete throughout, since the greater depth very much reduces the tension on the under-side when the foundation acts as a beam or slab, and very greatly increases the area of road bed over which a wheel load is distributed. As a beam, a 10-in. slab has two and a-half times the strength of a 6-in. slab, and a relatively poor concrete for the lower 4 ins. or 5 ins. would in most cases be of ample strength. At the same time, the increased thickness of foundation would still be a factor to be reckoned with in making excavations, and the more severe the traffic the more difficult it is to make good the excavations so that they are fit to bear the wheel loads within a reasonable time. This points to the subway for pipes and conduits as an eventual economy in a great many thoroughfares. The present situation as regards street paving in Belfast is described, and anticipations of future developments discussed, in a paper presented to the Great Yarmouth meeting of the Institution of Municipal and County Engineers by Mr. H. F. Gullan. Attention may specially be directed to Mr. Gullan's tables of comparative costs, on pages 149-150 of our issue of July 25. In these tables the real cost is considered, all the necessary factors for a true comparison being included. In Manchester it is considered desirable to substitute asphalt paving for stone setts in some of the narrow streets of the more densely populated part of the city, but so far little has been done in this direction on account of the cost of making the change.

Brick Pavements.—While brick pavements have hardly been used at all in the United Kingdom except for footways, the possibility that they may be suitable and economical in various parts of the Empire must not be overlooked, and it is therefore desirable to watch closely the trend of opinion as regards brick paving in the United States, where it is largely employed, not only in towns, but also on country roads. One of the most interesting of the reports which have been made on this subject is that by Mr. J. E. Howard on "Thermal Effects on Brick Pavements," a summary of which was prepared for our issue of March 28. (See also under "The Road Crust" in this article.)

LONDON TRAFFIC.

A good many arguments used in the so-called "Bus *versus* tram controversy" fail to take

account of the fact that the Londoner has a strong attachment to the type of vehicle employed in the London omnibus services. This is no new development, but probably dates from the old coaching days, and in its present form from the time when the horse-omnibus was the Londoner's favourite means of traversing the metropolis. With many persons the omnibus is usually entered as a matter of choice, and other vehicles as a matter of necessity. The type of omnibus used in London needs modification, and there should be a place for other types, some of which have important advantages in certain kinds of weather, but it would be exceedingly difficult to do away with the normal type of omnibus, and it would be a mistake to assume that the Londoner will be content with a vehicle which did not give him the ride on the roof, which is preferred to the inside of the vehicle by nearly all passengers in summer and by not a few in fair and mild weather in winter. As regards accidents, it seems that, in the London area at any rate, the tram is safer for its own passengers than is the bus, but with respect to accidents to other persons, it is less easy to come to a definite conclusion, since the tramcar is often the cause of collisions in which it does not actually take part. Comparisons apart, however, it must be recognised that a real and serious drawback to the advantages of omnibus traffic is involved in the total of serious and fatal accidents which are directly due to that vehicle.

In some cases the wear and tear due to motor omnibuses would be considerably less if there were no tramways. Mr. Oxtoby, borough engineer of Camberwell, recently expressed the opinion that in that borough no saving results in consequence of the maintenance of the tramway tracks by the County Council, but that, on the contrary, the borough suffers loss from the lack of a continuous cross foundation—which is prevented by the presence of the conduits, constant opening of the tramway margins, the vibration of the heavy cars, and the concentration of the other traffic on the sides of the road. The object of these remarks is to suggest that in regard to the reconstruction and maintenance of streets and roads the highway surveyors of the metropolis and surrounding areas will have to reckon with a steady increase of motor omnibus traffic, not only on new routes specially favourable to such developments, but also on routes on which the London County Council would like to place extensions of their tramway system. The motor omnibus, all things considered, is going to be cheaper to work than the tram. Important developments at present outside the range of the tramway and omnibus system as now operated may, however, be confidently expected. The planning of streets and roads in the metropolitan area is an important matter in connection with London traffic problems, and a conference convened by the President of the Local Government Board last November has doubtless carried matters a step forward in the direction of achievement of common action by the various authorities concerned. Mr. Burns' view as to the manner in which decisions should be come to with respect to road-planning schemes gave rise, however, to some unfavourable comments, our own among the number, and we believe that a more definite means of coming to decisions in specific cases will have to be devised. (See THE SURVEYOR of November 28th.) Some interesting statistics of traffic in Gray's Inn-road and Rosebery-avenue, London, will be found on page 403, February 28th, and the effects of motor omnibus traffic on the costs of maintenance of roads in Middlesex are given in a noteworthy paper read by Mr. H. T. Wakelam before the Institution of Municipal and County Engineers (issue of August 8th).

TRAFFIC GENERALLY.

Traffic enumeration is now becoming an important element in the design of road crusts, or, at

any rate, in the studies which have an influence on the choice of methods and materials. The Road Board's traffic forms are now being used to a considerable extent, and in many cases the results are published in the Board's annual report. It is easy to attach too much importance to traffic statistics. The significance of each total, taking the vehicles class by class, depends very much on the nature of the crust, and the significance of a general total expressed as a tonnage is necessarily doubtful until it has been analysed into its component parts. It may be suggested that what is now needed is to do away with the weights except for purposes of comparison within the limits of each class in itself, and to assign to each distinct kind of vehicle a "severity factor." This severity factor will be arrived at by combining two factors, one for the class of vehicle and one for the actual weight; thus, if a motor delivery van belongs to a class with a factor of 6, and the individual vehicle has a weight unladen of 3 tons, and a weight laden of 6 tons, the severity factor for that vehicle would, for general purposes, be 27, being based on a gross load of 4½ tons. Where it is clear that the vehicle is usually fully laden when passing the census station on its outward journey, and is usually empty on the homeward journey, the proper factors, 36 and 18 respectively, could be applied.

Considering the cost and trouble involved in taking the census over a period of sufficient length, it is obviously worth while to spend the very small additional amount of time necessary to apply to each class of vehicle in that census a factor representing the effect of the particular class of vehicle upon the road crust which is the type being studied, and another factor which is the average or actual estimated weight of the locally predominating vehicle of the class. It is here definitely recommended, then, that in making up the totals representing the severity of the traffic, a range of values appropriate to each of the road crusts over which the traffic passes shall be separately used in combination with the weight factors of the sub-classes. Thus, while delivery vans on rubber tyres would have one class factor, the weight factor assigned to a particular vehicle, and afterwards, in the result, to a total of such vehicles, would depend upon whether the observer reckoned the vehicle as being in the light or heavy sub-division of the class.

A list of factors suitable for a main road with a bituminous bound crust is not at all suitable for limestone or sandstone crusts on secondary and by roads in country districts. If, for example, we compare the ordinary motor omnibus with a slow-moving, iron-tyred motor wagon on wood pavements, the severity factors might be about the same, or that of the motor wagon somewhat the greater; but on a good, strong, water-bound macadam road the motor omnibus would be twice or three times as severe as the motor wagon. The relations between width and traffic must be carefully studied as a part of the study of highway economies. During the past twelve months there has been a considerable advance as regards a general appreciation of the fact that there is such a thing as the most economic width of a carriage-way, while it is now being understood that the provision of a very wide road may be attended by serious drawbacks. There is, however, little or no exact information as to the relative cost of maintaining roads of different widths under the same traffic. If surveyors would select a few stretches of road, the carriage-way of which varies considerably in width, and would separately keep account of renewals and repairs for these lengths of road, we should soon have most valuable data as regards the economic width of carriage-way for different kinds and amounts of traffic. The total severity of the traffic on a road is not the sum total of the separate effects of the different elements forming

that traffic. It may be that in a few cases different forms of traffic accentuate each other's ill-effects, but it is more often the case that different classes of traffic mitigate each other's punishment of the road. It is not easy to express quantitatively such influences as these; we can only take them into account by way of comment on our numerical results.

Another elusive factor is the distribution of the different classes of traffic over the seven days of the week and the twenty-four hours of the day; and the mere fact that the whole of the traffic occurs during the same week does not necessarily imply that it may be regarded as mixed traffic in its effects on the road. The manner in which motor vehicles, for instance, wear a road depends very much upon the amount of other traffic which is present on the same day, and in some cases a large number of vehicles may pass a given spot without deviating more than a very little from the centre of the road. Mr. R. J. Thomas, county surveyor of Buckinghamshire, recently made some interesting observations on the subject of the width of the road actually used by the traffic, and these are noticed in a report to the Road Congress (*THE SURVEYOR*, p. 857, December 5th). A traffic census taken on the main roads of Warwickshire is reproduced on p. 288 of our issue of February 7, and on the preceding page is a map specially drawn for *THE SURVEYOR*, showing the roads of the county, the connections with other roads, and the census stations. Motor traffic in Middlesex, and the relation between highway rates and the costs and maintenance of main roads were recently the subjects of a discussion in the correspondence columns of the *Times* between Mr. H. T. Wakelam and Mr. E. S. Shrapnell-Smith. Our own view on the subject was expressed in a "Minute" on page 533, October 10, and another on page 573, October 17. The subject of super-elevation at bends and curves was discussed in a *SURVEYOR* article contributed by Mr. R. Ryves, M. CONS. E., to our issue of May 23.

As regards one of the latest traffic developments, the "Wire-Bus," there is but little to record. Experience with these vehicles seems to give satisfaction, and there are several projects on foot for the establishment of wire-bus routes. The contributory principle has been recognised in the decision of Parliament with respect to the Bills of the Chesterfield Corporation and the Rhondda Valleys Tramways Corporation. In the former case the undertaking will have to pay to the Derbyshire County Council the whole of the extra cost incurred in making and maintaining the route, but the Rhondda Company only a third of such cost, and in any case not more than three-eighths of a penny per bus mile. Further developments of the position as regards the relation of wire-bus enterprises to road-maintaining authorities may perhaps be expected during the current year.

As regards the best width for roads, some very timely remarks were made by the Chairman of the Road Board at a meeting of the London Society last November. Sir George Gibb clearly perceives that it is neither necessary nor desirable to provide roads of the great widths which in some quarters are regarded as suitable, or are even urged as a necessity. (See *THE SURVEYOR*, September 7th, page 703.)

TERMINOLOGY.

During last year a number of highway engineers and others expressed opinions concerning the meanings to be attached to various words used in highway work, and the words and phrases to be employed in describing things or processes. During this period we have tried to do two things. First, we have published the suggestions or definite opinions of those who have paid attention to the subject generally or within defined limits; and, secondly, we have attempted to steady and direct discussion by drawing attention to the prin-

ciples which underlie the preparation of glossaries and lists of definitions. This has been very necessary. Some writers, for instance, do not distinguish between definition amounting to specification, definition consisting in the writing of a synonym in words the meaning of which is plain, and definition by a synonym which contains words themselves requiring definition. Lists of terms with specification-definitions fall into two classes—those in which the specification is qualitative only, such as Mr. Prévost Hubbard's definitions of asphalt and bitumen (p. 505, March 21st) and Mr. Dussek's on p. 663, April 25th; and those the definitions of which are more or less quantitative, including, for example, limits of melting points or amounts of residue on distillation between certain temperatures. Such lists are exceedingly useful—they are, in fact, necessary—but they do not form a part of a general glossary, which should resemble a dictionary as regards both brevity and method.

In the preparation of a glossary it is essential that the terms used in defining a word "A" shall be such as are either unmistakable in meaning or can themselves be defined after being pursued through a chain of other definitions not involving the use of the term "A." Another principle is that, although in a group of words relating to similar things we may use one term to help us by limitation of meaning to define the others, we must have at least as many distinct words as there are things to define. We explained this in our issue of March 21. As regards the manner in which glossaries of road terms should be compiled, it is clear that the best practical way is for individuals to put forward their own lists and suggestions, and for one of them, or some other person, to draw up a final and consistent list on some definite plan. A committee, though necessary for the compilation of an international glossary, is usually unable to produce a practical and consistent list for one language, and those features of the glossary prepared by the British Committee reporting to the third Road Congress, which called for adverse criticisms by *THE SURVEYOR*, would not have been likely to occur in a list prepared by any of the individuals composing that committee. We recently observed that no glossary should be accepted until it has passed under the rigorous scrutiny of a person with literary qualifications, who realises the significance of word roots and, from a fair acquaintance with the component parts of the English language and the allied European languages, can realise whether a proposed word is likely to stay in its place or whether, by force of other associations, it will wander from it. The last consideration applies more especially to the deliberate choice of a word to convey a particular meaning.

The recommendation of words to be preferred when there are several which are now used to convey the same meaning should be a feature of any glossary of road terms. It might, for instance, be recommended that the word "camber," when quantitative, should signify a proportion, rise to width, and that "cross-fall" should be the term applied to a measurement of the actual slope at a given part of the cross-section. Again, the word "road-bed" might be preferred to "sub-grade," which is ugly, and less expressive, and to "subsoil," which is required to convey another idea. Distinctions might also be made between "foundation," "foundation course," and "bottoming." Some subtleties in wording are needed when we are referring to subtleties in fact. It is also important that we should remember that only a few of the words in a road glossary are such that we may decide and can establish their meaning. There are two other classes—those with respect to which we must take account

of the views of chemists, geologists, and specialists in other sciences, and those which are the common property of the nation, and for our treatment of which we are accountable to the public and to philologists. In his report to the Road Congress on this subject, Mr. Limasset, the French reporter, said:—"The terminology of the road is as much part and parcel of our current language as it is of our technical language," and this may be read as a timely warning to those of us who are concerned practically with the subject of highway terminology.

A short list which must be reckoned with is one drawn up by Major Crosby and reproduced in our issue of May 30. A consideration of Mr. Boulnois' glossary, the first instalment of which will be found in our issue of October 24, is deferred until we shall have been able to collect and analyse the correspondence to which it has given rise and to make our own suggestions with regard to it. Mr. Boulnois has invited all who are interested in the subject to express their views, and a number of useful suggestions have already been received by the editor of *THE SURVEYOR*, and published in our correspondence columns. For summaries of the Road Congress reports the reader may turn up page 811 of our issue of December 12.

ROAD MACHINERY.

Some very good descriptions of road machinery are to be found in the reports of the third Road Congress, Communication 1, and references to the most important of these descriptions are grouped under different heads in our issue of September 19, with notes of the leading features of the machines and indications of the trend of developments in the countries represented. Attention may specially be directed to the horse rollers in use in the Netherlands and to an ingenious hand roller described by the German reporter. By a very simple but effective device this machine can be readily changed from a high-pressure to a low-pressure roller, and contrariwise, without adding or taking away ballast. Pavement ramming machines are being tried in Germany and in France, and in the latter country a machine of this kind has been used for ramming patches in the repair of motor pot-holes. The exhibits in *THE SURVEYOR* section of the Building Trades Exhibition were described in our issues of April 11 and 18, and those of the Road Congress Exhibition in that of June 20. Some very precise information as to the costs of motor haulage was given in a paper read before a Northern District meeting of the Institution of Municipal and County Engineers by Mr. J. Robinson, who furnished particulars of experience with the vehicles of the Darlington Rural District Council and details of costs.

Road Cleansing Machines.—There have been few developments in road cleansing machinery, and we still see too many water-carts of an ineffective and wasteful type; but in many cases better methods of spraying the water have been adopted, and a recognition of the importance of distinguishing between spraying proper and swilling proper has led to the giving up of half-and-half methods which neither effectively laid the dust nor removed it. Descriptions of the performances of Messrs. J. and P. Hills' road cleansing machine were given in our issues of January 24 and May 2, and illustrations of the vehicle in the supplement of our issue of April 11.

Wagons.—A 30-horse-power, 3-ton tipping wagon, by the Laere Motor Car Company, Limited, is illustrated on p. 291, February 7, this being a vehicle purchased by the Glasgow Corporation. A "Clayton" 3-ton steam motor engine is described on page 43 of our supplement of June 20, and a macadam distributing wagon, the invention of Mr. A. Hogg, county road surveyor, Elgin, on

page 774, May 16. This vehicle carries six tons of road metal, which can be distributed in about ten minutes, the two wagons in use being drawn by a tractor.

Rollers.—Rollers of ten to twelve tons weight continue to be largely employed, but the widths of the rollers are so seldom mentioned in reports that it is impossible to compare one case with another. Surveyors may be reminded that the load in pounds or hundredweights per inch width of front and hind rollers should be given in all cases when rolling operations are being described. Messrs. Thomas Green and Sons are building compound steam rollers of twelve tons, and Messrs. Ruston, Procter & Co. a superheated steam roller of the same weight, the working pressure being 180 lb. per square inch. In the same class, ten to twelve tons, is Messrs. Aveling and Porter's compound roller of ten tons, empty. Lighter steam rollers of six to eight tons, readily convertible into tractors, are being built by Messrs. Marshall, Sons & Co., and these machines were illustrated on page 48 of the supplement, June 20. The rollers built by such firms include, of course, a large range of weights and sizes, and the above examples are merely selected as typical of the practice of 1913.

The motor rollers now being used are mostly of about seven or eight tons weight, the loads per unit width being seldom mentioned in reports of works carried out. Messrs. Green and Sons have recently exhibited a motor roller of 7½ tons, which may be regarded as typical of this class, and Messrs. Aveling and Porter one of about seven tons. A water-ballast motor roller, the water being contained in the rollers themselves, is illustrated in our issue of March 28, page 552. This machine, by Messrs. Barford and Perkins, gives a range of weights from 6¾ tons empty to 8½ tons full. A heavier machine, by the same firm, has a weight of about ten tons when empty and eleven tons when full.

A useful vehicle, which may be employed as a roller, a steam wagon, or a 1,000-gallon watering wagon, is described in our issue of April 18, page 22 of the supplement, the illustration showing it as Mann's patent steam patching roller.

The most interesting development of the year is the 3-axle roller designed by Colonel Crompton and Mr. Tapp, illustrated and described in our issue of January 2, 1914. This roller is designed to give pressures ranging from 160 to 500 lb. per inch width of roller: and even if its performance in producing crusts without initial waving do not fulfil the expectations of its designers, it should be able to do work that cannot be otherwise performed except by two or three rollers, or, within a much smaller range, by changing the rear rollers or adding and taking away ballast. Without ballast the range of pressures of the 3-axle roller is from 1 to 2½, centre axle, and more on the front axle, and the change is made by means of hand wheels, or automatically, as the road crust hardens under the roller. The performances of this machine should be carefully watched by road engineers.

Road Tarring Machinery.—A hand-tarring machine, by the Phoenix Engineering Company, is illustrated on page 785, May 16, this being a smearing machine, on the same principle as that sometimes employed with tarring wagons. Illustrations of the tar-heaters made by the same firm will be found in the supplement of April 11, page 8, and diagrams showing the construction of Messrs. Llewelyn & James' tar-spraying machine on page 11 of the same supplement. Another tar-spraying machine, by Messrs. John Gates & Co., is illustrated on page 25 of the supplement of April 18. These examples are typical of apparatus now largely used by surveyors.

Thermometers.—A very important part of a tarring equipment is the thermometer for registering the temperature of the tar in the heater. The old clumsy method of dipping a thermometer into the tar, with considerable risk of breaking the instrument by sudden temperature changes or blows, is now superseded in well-managed work by the fixed thermometer, so mounted that the temperature of the tar can be read at any moment. The most recent pattern, made by Mr. John Hutchinson, and illustrated in our issue of May 23rd, has a bent tube which is carried through the air space into the tar. In heating bituminous materials for road work it is often important that a certain temperature shall not be exceeded lest the nature of the material be changed for the worse. The risk of tar seething over by too rapid a rise

of temperature, or the attainment of too high a temperature, has also to be considered. Accidents do sometimes occur, and might easily be serious.

Machinery for preparing the materials for the construction of bituminous-bound crusts or road carpets was described in a paper read before the Institution of Mechanical Engineers by Colonel R. E. Crompton, M. INST. C. E., and machinery of this class was shown at the Road Congress Exhibition (pages 42-44, supplement, June 20th) by the Ransome-verMehrs Machinery Company, Messrs. Stothert and Pitt, and Messrs. Murphy, Stedman & Co. Messrs. J. and P. Hill's tarmacadam plant is described in our issue of April 11. A small portable plant for patching work on bituminous road crusts (Messrs. Johnston Bros.) is illustrated in our issue of December 12th.

MUNICIPAL AND PUBLIC BUILDINGS.

The most notable feature of the past twelve months under this head has been the interest taken in the housing of the working classes. Very useful papers on the subject have been read, and important memoranda have been issued by the Local Government Board. The plans that have been published during the past year show that on the one hand the efforts to produce cheap houses at economic rents are being maintained, while, on the other hand, the nature of the accommodation which is necessary is better understood, and the importance of certain principles of construction is beginning to be realised. In providing cheaper substitutes for the ordinary brick-and-mortar wall with internal plastering there are perhaps two directions in which design might be encouraged, or two main ideas which should be recognised. The new houses would thus fall into two classes. In one class, mainly suitable for urban conditions, the reduction in rents would be small but worth having, the efficiency of walls, roofs, and floors being equal to that of the type which we may call normal; and in the other class, mainly suitable for rural conditions, the cost of building would be very low and the dwelling itself in some respects less effective as a cold and heat-resisting shelter. The rents, however, would be so low that the occupant would be compensated for these drawbacks. The low rent all the year round would go a long way towards balancing the extra cost of fuel and warm clothing.

There is in this country a class of poor people, regarded as improvident and seldom looked upon as "deserving cases," but possessing certain important qualities tending to self-preservation. In this class the women aim at increasing the family income in various ways, out of doors, often in petty hawking, rather than at economising the spending of the man's wages by attention to domestic details. An expenditure on household conveniences to an extent amply justified in the case of the house-proud class is to a large extent thrown away in houses provided for the other class. A class considered more respectable, and paying much higher rents per family, may be distinguished by the neat and clean, but often inadequate, clothing of the children. Now, a class which despises appearances but feeds well and is warmly clad can be accommodated in houses of a comparatively cheap and unsubstantial character, and very good cottages of this kind, one to each family, would not cost more than the rents which are now paid for a part of a more substantial house. In the towns the rents per house paid by this class are often higher than those paid by the other class, which receives much more attention from the clergy and from charitable parish workers. When this latter or house-proud class is the object of a housing scheme it is worth while to make efforts so to design the houses that their occupants may take a pride in them, and the suggestion that it is neces-

sary to recognise a class of persons who take a pride in themselves but not in their houses is nowise at variance with the opinion that where pride in the house itself is a factor it should be duly recognised. These remarks may be considered by some to be out of place here, but housing questions need to be studied in the light of a knowledge of racial elements and class instincts of the people for whom improved housing accommodation is desired. Designers should, therefore, be very careful lest they produce types of dwellings which, being intermediate in character, between the really solid and costly house and the very low-rented cottage, do not adequately meet the needs of any important class.

As regards town planning, the references to the subject in the present article may be read in conjunction with those under the head of "Road Planning" on another page. Considerable progress has been made with actual schemes, and other projects are under consideration. Something has been done towards bringing conflicting ideas into accord, but traffic developments and the facility with which manufacturing firms shift their works from one place to another make it very difficult to gauge the relative advantages of different principles in the matter of the choice of sites for large building schemes. It may be suggested, however, that the main idea underlying the creation of Letchworth is one of the most important in this connection, and that the enormous value to the worker of a home within a few minutes of his work is greatly under-estimated, and the saving in time, money, and nerve tissue not sufficiently considered. It may be contended that in its effects upon the nervous organisation, and therefore upon the whole body, reading in the train is one of the worst of the vices of the present day.

To those municipal architects and surveyors who will be concerned with the design of public buildings, the following recommendations may be made. Aim at making your buildings much simpler in outward appearance than most of the public buildings erected for similar purposes for many years past. Many public buildings are too ornate to be permanently pleasing. It should be remembered that features which may please the educated public at the time the building is erected may fail to please their descendants. It should be the aim of the designer to express what is eternal or, at least, what will for many generations be in harmony with the instincts of the race. A local note in architecture is, moreover, not to be despised.

Many public buildings have this serious defect: the secondary features are so developed as to be better proportioned to a surface of twice or three times the area. The main features of the building are crushed into insignificance by the predominance of detail. In some cases there is a superabundance of detail, and in other cases, amongst

which are a number of buildings recently erected, it is rather the size of the details than their number which leads to the suppression of essential features. Some architects seem to consider that their chief function is to make a building as unlike as possible what it would have been if erected purely on a utilitarian basis. Accordingly, they are at great pains to prevent a corner from looking like a corner, a surface like a surface, or a column like a column. An appearance of height, width, or mass, and all the larger effects of light and shade are crushed into insignificance by the piling on of monstrous and incompatible details. The "Rodney" public-house on the southern approach of Westminster Bridge exemplifies far better architecture than that of some public buildings erected at great cost, including near neighbours. Lodging-houses in Gower Street have some excellent features when compared with other buildings which could be named. Now that the new county hall of Middlesex has been built, exhibiting between the windows perfectly plain areas of stone, and suppressing all details which would interfere with the two or three leading features, it will become necessary to demolish, and we doubtless shall demolish within the next 100 years, at any rate, a much larger building which lies to the right hand on the way from Westminster to Charing Cross.

There are some details of design which are essentially bad. For instance, a column divided up into series of short columns and very wide blocks, one upon the other, expresses nothing that is structurally real. Another bad feature of many designs is the dividing up of surfaces amongst different materials, and the alternation of stone and brick—different kinds of stone, or different kinds of brick—around windows has in many cases been carried out with far too much emphasis, and to an extent not justified by the employment of the materials in that manner for structural purposes. A further defect of many public buildings results from the adoption, in the design of a large building, of features made up of small scale elements and suitable only for small buildings. The result is that the structure looks like an overgrown model almshouse. As regards the adoption of Classic features in the design of modern buildings, it must, of course, be admitted that the Anglo-Saxon, whose instincts bear with wonderful precision on things which move, has not the building instinct. The Normans had it in them, however, to build with inspiration, and the Norman style of architecture, it may be suggested, would often be more appropriate to certain situations than are certain kinds of pseudo-Grecian buildings which are too often to be seen in England. This applies especially to places where tall trees are an important feature of the surroundings.

As regards the design of small buildings, the styles favoured at present are in several respects better than those of a few years ago, but there is a tendency to the over-development of certain features, and designers may be recommended to compare some of the modern houses, in which the chalet element is in evidence, with much older houses of a very plain type, considerable numbers of which may be seen in the suburbs of country towns. The special interest which attaches to these houses lies in the fact that they seem to provide a basis for the development of quite striking architectural forms, although the house itself is in most cases an exceedingly plain building.

MUNICIPAL HOUSING.

Steady progress has been made with municipal housing schemes in many parts of the country. At Taunton a block of workmen's houses has been built on three-quarters of an acre of land, the cost of each house being under £144, including sewers,

streets, and fencing, or at a rate of 4d. per cubic foot. The rent, inclusive of rates and taxes, water, and one electric light in the living room, is 4s. per week. Each house contains a living room and scullery on the ground floor and three bedrooms above. A design for a cottage with similar accommodation, having walls of reinforced brickwork, and estimated to cost £159, is illustrated on page 88, July 18, the design being that of Mr. F. H. Heaven, F.R.I.B.A. The internal cement plastering is perhaps an unfavourable feature of the design, but it is obviously not essential. Designers of cheap cottages, it is to be feared, too often fail to realise the value of thickness in itself in the walls, and overlook the principles which have led to the adoption of thick plastering of low heat conductivity for the inside of the walls. We have to consider not only heat conductivity, but also heat capacity, and materials with small heat capacities per unit of volume, not per unit of weight, are to be preferred to those which have higher heat capacities. When it is impossible to devise something equivalent to brick with good inside plastering, it may be well to consider the merits of weather boarding and of wattled and plastered walls. A weatherproof house with very thin walls may be better than a solid dwelling resembling a dungeon in some of its features. In answer to a question as to the healthiness of some wooden cottages from which it was proposed to remove the inhabitants, a medical officer of health recently said that there was the difficulty: the people insisted upon enjoying robust health in spite of outside opinion as to their dwellings. In this county, where a considerable proportion of the rural population live in wooden cottages or in houses with walls of wattling and plaster, the death rate is very low indeed.

Some interesting statistics relating to housing in Liverpool were given in a paper read by Mr. H. R. Aldridge, secretary to the National Housing and Town Planning Council, at the Exeter Congress of the Royal Sanitary Institute. Liverpool has now a population of more than 8,000 persons, every one of whom has been turned out of an insanitary house, a cellar, or an overcrowded house. The corporation pays £22,000 a year for this increase in civic efficiency and improvement in the welfare of the poor, or 1½d. in the £ on the rates. The older people cannot readily be persuaded to change their habits, but the children respond readily to the improved conditions. In this matter what the country is thinking of doing to-morrow Liverpool has already done.

An important memorandum was issued last spring by the Local Government Board on the subject of "the provision and arrangement of working-class dwellings." The report is accompanied by a number of plans of houses of different types, reproduced in our issue of April 4. Attention may be drawn to the recommendation that walls of habitable rooms should be finished internally with plaster, and it may be suggested that a definite minimum thickness might be specified, since the adequate internal plastering of a house is a very important item affecting the health and comfort of the occupants. Five types of houses are shown in the plans annexed to the memorandum, and these are reproduced in our issue of April 4 (see pp. 565 to 567, the numbers of adults and children for which each type is intended being given on p. 568). An expert in domestic requirements comments upon the report and plans as follows:—

"Height is quite as important in small houses as in large ones, and sometimes more important. The larger the number of persons in a room, in proportion to the cubic contents, the more necessary is it that a large part of the space should be above the heads of the occupants, allowing room for a collection of foul, hot air: and, even in small rooms, it may be worth sacrificing floor space to

gain height without increase of cost. A sufficiency of light is very necessary, and high windows for the same pane area may be preferred to wide ones. In any case, the proportion of the window which can be opened should be large, to allow of rapid cooling on hot summer evenings. A wide frontage can hardly be necessary for the sake of light, if the windows be carried high enough. The floors of sculleries should not be of concrete. In order that it may not wear slippery, the concrete provided must be somewhat soft and fairly rough, and it can never be swept clean of dust, which is created by the sweeping itself. The presence of this dust is very objectionable in the house. Tiles are much to be preferred, unless the cost is prohibitive; and it cannot be impossible to provide something better than concrete at a reasonable cost. Type C is to be preferred to type B, and generally every effort should be made to provide a parlour, however small. [This was recommended by a speaker at one of the discussions reported in *THE SURVEYOR* last year.] A parlour is a very great stimulus to the woman's pride in her house, and reacts favourably upon the domestic economy of a household and upon their courage in facing the problems of life. Physically, it is a strain which would not be worth while if it were not for the moral effect. Type C is to be commended for the position of the staircase, which allows of two bedrooms in front, usually an advantage, since the air of the street is, as a rule, better than that at the back. The position of the water closet right outside the house, as in types A and D, is to be preferred to the position inside the house, though with an outside entrance. The coal-hole should not be inside, as in type E; the arrangement is messy, and tends to lower the tone of the scullery. The passage in the report relating to back streets is not wholly approved. It is necessary not only to consider, as pointed out in the report, that back streets, if not properly looked after and lighted, may be a nuisance, but also that some of the classes for which these houses are being provided cannot be trusted to use a back entrance. If the house refuse is removed from the back various kinds of rubbish are placed in positions where they are more or less ready to be taken away, but in actual practice are forgotten and left. It is better to face the inconvenience of traffic through the living room than, when building for this class, to provide them with opportunities for accumulating rubbish or throwing refuse into a back street or alley."

OTHER BUILDINGS.

Forty-four years ago the City of Belfast was provided with an abattoir on what was considered the best design of those days, and this building was enlarged in 1883. A new abattoir, with separate departments for the three classes of animals, has now been built, and is equipped with modern appliances. The report of the Admiralty Committee on Humane Slaughtering was taken into account in designing the arrangements in the slaughter hall, and the plans show that the city is to be congratulated upon the completion of a work which is in line with modern views, both humanitarian and sanitary.

An important fire station, described in our issue of March 14, is in course of erection at East Ham. The work is being done directly, under the supervision of the borough engineer, Mr. J. Birch.

A large tramcar shed at Rochdale, described in our issue of June 20, is so arranged that cars can enter at one end and leave at the other, thus saving considerable interference with traffic. The depot is provided with a repairing shop and other workshops, and with accommodation for the men.

A very good site was obtained for the Staines Joint Isolation Hospital, which was opened last May. This hospital is arranged on the modern

plan, separate buildings being provided for diphtheria patients, scarlet fever patients, and cases under observation. The buildings stand well apart in an area of about four acres, but are so placed that additional blocks can be erected if necessary. All the buildings are connected by telephone. The provision of soakaways for most of the down-spouts of roofs might seem to be an undesirable feature of the design were it not for the fact that there is a bed of sand and gravel under the site, so that the level of the subsoil water in winter is at about 7 or 8 ft. below the surface.

Though not a municipal building, the home of the Institution of Civil Engineers is one with which many of our readers will soon be familiar. The interior arrangements seem to be excellent, and the architect has succeeded in expressing in the outward form of the façade some of the inspirations and, possibly, some of the limitations, of the "parent institution."

Amongst the small buildings noticed in last year's issues, the pavilion at Haslam Park, Preston (January 10, 1913), is conspicuous for the appropriateness of Mr. H. Mawson's very simple and yet attractive design. The attention of municipal architects and surveyors may be directed to Mr. Mawson's remark that "nothing gives a cheaper appearance to a park than a bandstand of spidery, ornamental cast-iron . . ." His further suggestion, that the design of a bandstand should be based on a classic model is, however, one which leaves one somewhat chilled. For most situations a much more primitive type, based on the forest hut or the tropical "pandal," is, surely, to be preferred. Where a classic design seems to be appropriate it might be best to go the whole hog and to adopt a fully classical design, such as the simplest form of circular temple with tall pillars.

BATHS.

A fine open-air bath which has been constructed at Wimbledon is intended for the use of children in a thickly peopled district of low-rated houses. There is a water supply from a stream and an additional supply from the gravel beds beneath Wandale Park. At Leek it is proposed to provide new baths for a population which is so addicted to swimming that "there are clubs in connection with almost every church and society," an unusual feature perhaps in the social life of a typically moorland town. Plans of the existing and the proposed baths are reproduced in our issue of July 18.

Though not one of the works carried out or finished last year, the open-air swimming bath at Southampton may be mentioned here, since a description of it, with illustrations, appears in *THE SURVEYOR*, February 28, from a paper read by Mr. J. A. Crowther, A.M. INST. C.E. This bath is interesting as a work carried out with a view to making the best of the existing bath and site at a moderate cost, this object being attained by employing ferro-concrete pile foundations and 4½-in. ferro-concrete for the sides and floor of the baths. This construction also effects the purpose of resisting stresses due to the rising and falling tide.

LITERATURE.

A considerable number of books on building and related subjects have been reviewed in our pages during the past year, and for the convenience of readers specially interested in the subjects dealt with in the present article the following references are given:—"The Clerk of Works," by G. Metson; "Building Supervision," by G. W. Gray; "The Law Relating to Town Planning," by H. Barlow (all three briefly reviewed in the issue of October 10); "The Law and Practice of Town Planning," by R. A. Glen;

"Fire Prevention and Fire Protection as Applied to Building Construction," by J. K. Freitag (both in the issue of February 28); "Our Village Homes," by H. Aronson; "Building Stones and Clay Products," by H. Ries; "Spon's Builders' Pocket Book" and "Spon's Architects and Builders' Pocket Price Book and Diary." For some "Hints" of the Local Government Board of Scotland on the provision of houses by local authorities see p. 513 of our issue of October 3, and a memorandum of the English Local Government Board on the provision of institutions for the treatment of tuberculosis will be found in our issue of March 7. A series of three lectures on "Practical Problems of Housing Reform" was recently delivered at Glasgow University by Mr. W. E. Riley, superintending architect to the London County Council (see issue of October 17).

Amongst technical papers of interest to those responsible for public buildings mention may be made of two which have been noticed in *THE SURVEYOR*. "The Protection of Buildings from Lightning" was the subject of a paper read by Mr. E. J. Berg, in Illinois, an abstract of which appeared in our issue of May 16th. A report on the surface treatment of concrete was recently submitted to the Concrete Institute by Mr. C. G. Workman, secretary of the Standing Committee on reinforced concrete practice. Nearly two pages of our issue of May 2 were devoted to this useful report, the subject of which concerns almost everyone who is interested in building work.

A paper on "Factors Causing Unsatisfactory Housing and their Prevention" was read by Mr. B. Hartfree, F.S.I., at the Yarmouth meeting of the Institution of Municipal and County Engineers (see *THE SURVEYOR* of September 19). The author's views on administrative and practical points are worth attention, and it may be noted that he is not in favour of the erection of State-aided cottages. In referring to by-laws and their relaxation, he pointed out that 9 ins. wall thickness may be considered necessary to afford privacy and to prevent the spread of fire. Mr. Hartfree's remarks on the distribution of trades and industries supports the view expressed in the preamble of this article, namely that housing questions need to

be studied in connection with other matters affecting the habits and customs of the people. He considers that centralisation of industries is the sole cause of the excessive cost of building in rural areas at the present day as compared with half a century ago, "when every village had its local sawyers, small brick-burning undertakings, stone cleavers or dressers, according to the materials at hand, which, under these conditions, were obtained and prepared at home. Modern progress has led to the establishment of large industries that have practically extinguished the smaller. If home-grown timber is felled in the country, it is hauled to the towns, sawn up and carted back." Possibly these results are in part due to the very conditions which they tend to perpetuate, the scarcity of houses. An energetic housing policy might tend to the re-establishment of village industries. A technical matter referred to by Mr. Hartfree is worth attention in this connection. He points out that in the southern counties strongly built chalk houses of past years still exist, but their building seems to be a lost art.

A paper relating to the further improvement of Dundee was read at the Scottish annual meeting of the Institution of Municipal and County Engineers last June by Mr. A. H. Miller. A sum of half a million has already been expended in transforming the centre of Dundee, and the City Engineer, Mr. J. Thomson, has in hand a project involving the spending of another half million. The nature of some of the changes proposed may be judged from the views reproduced in our issue of June 13th. This project, the actual cost of which reckoned as a pecuniary loss would be about £200,000, has been conceived in a liberal spirit, but, as Mr. J. Walker Smith, Chief Engineering Inspector of the Local Government Board of Scotland, remarked in the course of the discussion on Mr. Thomson's paper, it is not more ambitious than is justified by the beautiful situation of the city.

The subject of "Steel Frame Buildings in London" was discussed in a very practical manner in a paper read before the Concrete Institute by Mr. S. Bylander, the nature and scope of the paper being indicated by the extracts given on page 402 of our issue of February 28th.

REFUSE DESTRUCTION AND DISPOSAL.

Judging from the reports received from manufacturers, the method of disposal by burning would appear to be on the increase, and, with the exception of a few places with unusual local conditions, it is probably the most efficient and most sanitary method that can be adopted. Where the resultant heat can be utilised in the form of steam to provide power for operating pumps for sewage or water, or for driving electric lighting or power plants, it is naturally very economical. Modern developments for increasing the efficiency of the furnaces in securing more perfect combustion, eliminating smoke and dust, increasing the power available and utilising by-products, are being introduced, and all tend to facilitate the adoption of this method of disposal by local authorities who have the double duty of dealing with house and other refuse in a sanitary manner and at the same time at the least possible cost to the ratepayers whose interests they serve.

METHODS OF FEEDING AND OTHER DETAILS.

This is an important factor in the design of refuse destructors, and while some contractors appear to favour one method alone, others adopt either top, back or front feed according to the requirements in each case. On the other hand, we find that Mr. William Jones, Assoc. M. Inst. C.E., engineer and surveyor to the Colwyn Bay Urban District Council, in an admirable report to his

council upon the whole subject, brings forward a number of arguments against the adoption of the top-feed system. He adds that "the front or back feed enables the stoker to apply the refuse more evenly and with more discretion, and although the method of charging with the shovel may be considered as putting it on by the spoonful, yet, to obtain the highest efficiency, this method of stoking in small quantities at a time obtains the best results in the cremation of refuse," and, we may add, in the burning of any fuel when properly done.

Mr. Jones in his report, a copy of which was forwarded to us, also deals at some length with the advantages of the continuous grate type of destructor, and, as a result of exhaustive inquiries among municipal engineers, confirmed by his own personal observations, he recommended his council to adopt the continuous grate system with back feed. With regard to the question of grate area, it is pointed out in the same report that "refuse destructors burn the refuse at varying rates according to the grate area, quality of refuse, and other conditions connected with the refuse itself, as it is found that the higher the calorific value of the refuse, the longer it takes to incinerate." Thus it is obvious that, given the same grate area, the amount of refuse burnt by different destructors in different places must

vary with the character of the refuse, and for this reason the figures giving the amount of refuse burnt per square foot of grate area in the results of official tests do not always afford trustworthy comparisons between the several types of destructors. The same thing applies with equal force to the figures relating to the amount of water evaporated per lb. of refuse. It is, therefore, apparent that the results obtained by a particular type of destructor in one place with refuse of a certain character will not be obtained with the same type of destructor in another place where the refuse is of a different character.

We may possibly be accused of stating truisms in the foregoing observations, but we have in mind the competition which exists among the patentees of various details in the construction of destructors, each of which may have its value under certain conditions, but is not necessarily suitable for all sorts of conditions.

In a certain town in a foreign country the refuse consisted mainly of tin cans, waste paper, or fruit refuse, and in other places nearer home the refuse contains a considerable quantity of fresh vegetable matter. The net result of these considerations is that it is not upon the ingenuity of any particular device that the efficiency of a destructor plant will depend, but that the most satisfactory results will be obtained where the scheme and all its details are designed upon the basis of prolonged practical experience with different types under the greatest variation of conditions. For this reason we have much sympathy with Mr. Jones in the appeal which he made in the above-mentioned report to his council not to be led away by specious proposals on the part of the various contractors to depart from the specification and adopt some special contrivances without very careful consideration. At the same time the contractors undoubtedly have a very wide experience in the incineration of refuse and their suggestions and recommendations should not be ignored. Probably the best course to adopt is to insist on tenders being submitted in strict conformity with the specification, with alternative tenders for any modifications which the contractors may desire to submit for consideration. In this way the local authority will have tenders based upon uniform conditions to enable them to make a fair comparison of cost, and, in addition, they will have the opportunity of considering suggestions for modifications separately, and without interference with the original proposals in the specification.

Although the risk of nuisance from the chimney stack of a refuse destructor is much less than it used to be, now that modern design includes properly proportioned combustion chambers, flues and dust catchers, there are doubtless cases where the position of the works necessitates special consideration of the height to which the chimney stack should be constructed. This point was dealt with carefully by Mr. Jones in his report, and his observations may well serve as a guide to other engineers in preparing similar schemes. It is also satisfactory to note that the conditions under which the men work were taken into consideration, and that special attention was devoted to the provision of a proper system of ventilation of the destructor buildings.

METHOD OF COLLECTION.

The question as to whether collection by direct labour or by contract is the most satisfactory and economical has been discussed on many occasions and the latest information comes from Southampton, where the contract system has now been in operation for some time with success. It appears that the saving in cost up to the time of the last report was £1,300 over the direct labour method, and it was stated that the number of

complaints received was not more than under the previously existing system. It should be noted that under the present arrangement the contractor is paid a certain sum per ton for the refuse collected, instead of a lump sum per annum, and it is claimed that this method of payment is the cause of the saving in cost, a point worthy of consideration.

The question of collection by motor vans is receiving attention, and there are several points in connection which need careful consideration. On the one hand, there is the difficulty of speeding up the present rate of loading in order to take full advantage of the greater speed of the vehicles. On the other hand, this same factor of greater speed in transit by means of the motor van should allow of a wider choice of site for the destructor works. Instead of having to regulate the choice of site to suit the area which can be efficiently covered by the slower method of horse-drawn vehicles, it should be possible by the use of motor vans to disregard the factor of distance to a large extent, to place the destructor in the most suitable position from the point of view of utilisation of the waste heat and by-products, and to select the site which is least likely to cause a nuisance, either from the sentimental or practical standpoint.

Another point in connection with methods of collection is the manner in which the refuse is taken through the streets. This was discussed in these columns in a "minute" on September 19 last, when we referred to a comparison which had been made between the ordinary types of van and bin in use in this country and those adopted in Zurich. The latter would certainly appear to possess considerable advantages over the former, and we pointed out that in order to ensure the adoption of the best methods the local authorities must provide vans of the most up-to-date type, and the householders must also be compelled to store refuse in a sanitary bin of proper construction. This can only be secured by the enactment of suitable by-laws, and, as we observed at the time, in our opinion, while it would be unfortunate if this procedure were to result in the creation of quasi monopolies in favour of certain articles, it does appear to be desirable that standards should be set up with which such sanitary appliances, of whatever make, must comply. Further, although it is obvious that it would be a great advantage to have the sanitary bins of uniform type throughout each town or district, there may be difficulties in requiring that one particular type should be used by all householders, where suitable by-laws do not exist. In such cases the local authority would be well advised to take the earliest opportunity to secure such by-laws.

OTHER METHODS OF REFUSE DISPOSAL.

While the destruction of refuse by burning is usually the most satisfactory, especially from the sanitary point of view, there are other methods which may be adopted in certain cases. One of these is at Leek, and was described in a paper read at a meeting of the Institution of Municipal and County Engineers, held in that town last July, by Mr. W. E. Beacham, the town engineer and surveyor to the Leek Urban District Council. It appears that the use of an area of some 14 acres of clay and peat land at the sewage farm for broad irrigation had been abandoned because it was found to be unsuitable for the purpose, and, instead of proceeding to carry out a proposal for the erection of a destructor, it was decided to improve the character of this area by depositing the house refuse upon it to a depth of about 5 ft., after first removing the top soil and laying land drains. Subsequently the top soil was replaced over the refuse, carriers cut, and the sewage distributed in the ordinary manner. It was stated that the sewage

treated in this manner was satisfactorily purified, and this will be understood when it is recognised that this method of refuse disposal actually results in the provision of what is known as "suitable" land in place of the previously utilised "unsuitable" clay and peat subsoil. Meanwhile, until the whole area of the unsuitable portion of the sewage farm has been covered with the refuse, there will apparently be no need for the council to incur expenditure upon a refuse destructor, and all the time they will be improving the value of the land available for sewage disposal.

Another method of disposal is to add the house refuse to sewage sludge, the mixture forming a suitable manure. This method, however, can only be adopted in a limited number of places, and to a limited extent, governed by the quantity of sewage sludge produced. There is also the risk of nuisance from smell, and from this point of view the method of incineration in a destructor of modern design is much more satisfactory.

There is, however, a method of direct conversion of refuse into manure without the addition of sewage sludge, and this is done by the use of the Patent Lightning Crusher. This system has been in operation in the borough of Southwark for some years, and we understand it has, during the whole of that time, given every satisfaction. Further particulars with regard to this system appear later among the reports from manufacturers.

UTILISATION OF HEAT FROM DESTRUCTORS.

Greater attention is being devoted to the utilisation of the heat generated in destructor furnaces so as to conserve what would otherwise be a waste of power. There are many purposes for which this heat may be utilised in addition to its use for the power required in connection with the destructor itself. One of the most important is that of pumping sewage, where this is necessary. Another is the driving of the plant for the conversion of the clinker into mortar, paving slabs, and other useful materials. In all these, however, considerable foresight must be exercised in the preparation of the scheme if the most satisfactory results are to be secured. In this connection it may be of interest and value to describe a case of "how not to do it." A certain council discussed for some time a proposal to erect a destructor at its sewage works and to make arrangements for the waste steam to be used for pumping sewage. Much time was spent in discussing the scheme, but eventually, for some reason or other, it was decided not to proceed with the destructor. Meanwhile, the provision of additional sewage pumping plant had become urgent and could not be delayed and a suitable oil engine was ordered and installed for this purpose. In due course the destructor scheme was again brought forward and has now been approved, with the result that before many months have elapsed this council will have a considerable amount of heat going to waste and no means of utilising it, unless they include a much larger boiler and steam engine and leave the recently installed oil engine to act as reserve power for pumping when required. It should be noted that the advisers of the council recommended the utilisation of the destructor for sewage pumping and it was the council itself which lacked the necessary foresight in this case.

REFUSE DISPOSAL ABROAD.

It is generally recognised that, up to the present at any rate, this country is in advance of other countries in refuse destruction, and this is apparent from the reports given below, in which it appears that manufacturers in this country have secured important contracts for the erection of destructors in a number of foreign countries, so far apart as Russia, Burnah, New Zealand,

Australia, Argentina, Holland, France, Italy, United States, and Canada.

As might be anticipated, the greatest number of destructors outside the United Kingdom is to be found in North America. Since the first municipal refuse destructor was installed in 1906 at Westmount, Quebec, the number in the United States and Canada has grown to twenty-seven, including in each case three which are "pending awards." In the United States there are seventeen cities with nineteen separate plants of 115 grates and a daily capacity of 1,767 tons; in Canada ten cities with eleven separate plants of thirty-three grates and a daily capacity of 570 tons. Two of the cities employ the surplus power for pumping water for the city supply, or for fire protection, one furnishes auxiliary power for electric lighting, and another develops power for pumping sewage. In one large industrial works the destructor boiler is an auxiliary to the steam plant and in another city the destructor furnishes steam for the operation of a reduction plant. At four of the installations additional equipment is being installed for utilising the power from destructor boilers for pumping water and municipal electric lighting. In seven of those under construction and pending award it is proposed to use the power for several forms of municipal and private service.

Messrs. Manlove, Alliott & Co., Limited, of Nottingham, have, during the year 1913, completed a number of refuse destructors, the most important of these being plants for Margate, Bristol, and Stroud. The Margate plant consists of eight "cells" or furnaces arranged in two units, each of four cells on the continuous hearth principle. Each unit is complete with water-tube boiler and combustion chamber, and the cells are all provided with drying hearths and are arranged for back hand feed. The two boilers—one for each unit—are of the Babcock and Wilcox type and have a large heating surface. Two large direct steam-driven fans provide forced draught, and as an auxiliary means steam-jet blowers have also been provided. The destructor at Bristol, which was completed in December, consists of eight cells, arranged in two units each of four cells, combustion chamber and water-tube boiler. This plant is somewhat similar to the Margate destructor referred to above, but in this case the boilers are slightly larger. Forced draught is provided by two large electrically driven fans. The surplus steam generated by the destructor is employed for driving a clinker crushing and screening plant, together with a mortar mill, both of which have been supplied by Messrs. Manlove, Alliott & Co., Limited. At Stroud this firm have just completed a two-cell plant. The two cells are built side by side on the continuous hearth principle and are arranged for back hand feed. The plant also comprises a suitable combustion chamber and a Babcock and Wilcox water-tube boiler. Forced draught is provided by means of a direct steam-driven fan, also by steam-jet blowers. Messrs. Manlove, Alliott & Co., Limited, have also been recently notified that their tender for the erection of a destructor plant for Kirkby-in-Ashfield has been accepted. Several smaller destructor plants have been erected by this firm during the year, among which may be mentioned a one-cell plant for the Devon County Asylum, Exeter. Special furnaces have also been supplied during the year to the Crown Agents for the Colonies, the War Office, Metropolitan Asylums Board, and the Harwich Port Sanitary Authority, in addition to various institutions including infirmaries and asylums.

During the past year Messrs. Meldrums, Limited, have completed new destructors or remodelled existing ones at Littlehampton, Dartford, Longton,

Hunstanton, Bolton, Rangoon, Buenos Aires, and Monte Video, and have work in hand ready for shipment for Sydney. The plant at Littlehampton is one of their standard two-cell front-fed type with Cornish boiler and regenerator. The Rangoon destructor is of the steered-cased type specially arranged for burning carcasses. They have also completed large numbers of destructors for hospitals, asylums, factories, and similar institutions, and have fitted their forced-draught furnaces for burning towns' refuse at Stoke, Bolton, and Aberdare among other places.

The following is a brief *résumé* of the work carried out during the past year by Messrs. Heenan and Froude, Limited:—

City of Rotterdam.—This plant consists of forty Heenan grates, arranged in five units of eight grates each, large Babcock and Wilcox boilers, with Foster superheater, Heenan air heaters with motor-driven Heenan fans, monorail transporters, for lifting the collection skips from the barges, transporting and discharging their contents into the containers placed immediately over the furnace charging openings, a complete hydraulic installation with ram cylinders to control the charging doors between the containers and the furnace proper, overhead runways for the transport of the clinker to a Heenan clinker crushing and grading installation. The steam generated by three of the destructor units alone serves to drive a 1,250kw. generating set, which supplies current for the electric traction of the city. The guaranteed total capacity of the plant was 460 tons per day, but it is found that in average working well over 500 tons can be easily dealt with.

City of Paris.—(a) *St. Ouen.*—This installation was erected for the Société Anonyme des Engrais Complets, one of the concessionnaires for the disposal of the refuse collected in the city of Paris. The installation consists of twenty-four grates of the firm's latest improved trough mechanical clinking type, arranged in four units of six grates each, a water-tube boiler with a Foster superheater, Heenan air heater with motor-driven Heenan fans being adapted to each unit. Each destructor unit supplies steam for driving a 750kw. turbo-generating set, and the complete plant has a capacity of over 500 tons of refuse per twenty-four hours.

(b) *Issy.*—Another installation for the Société Anonyme des Engrais Complets, in another of the Paris arrondissements, consists of a three-grate trough type mechanical clinking Heenan unit with water-tube boiler, Foster superheater, Heenan air heater with Heenan fans, and motor for the forced-draught supply.

(c) *Nancy.*—This installation consists of three four-grate trough type mechanical clinking Heenan units, with special arrangement for dealing with the clinker, and other modern features. The refuse of the city of Nancy is collected in electrically propelled vehicles.

(d) *Rouen.*—The last of the official tests on this plant has been carried out during the past year. It consists of three units, each comprising three grates with water-tube boiler, Heenan air heater, Heenan fan, motor for forced-draught supply, and all the usual accessories.

St. Petersburg.—An extension unit to the plant installed some two years ago is in course of erection.

Other installations upon which this firm have been engaged are in Canada, at Ottawa, Calgary, Saskatoon and Strathcona; in the United States, at San Francisco, Atlanta, and other places; in South America at San Paulo, also at home at Rhondda, Rotherham, and elsewhere.

During 1913 Messrs. Hughes and Stirling have completed the following destructor installations:—

Abertillery (Mon.) Urban District Council.—60-

ton front-fed destructor in two units, with boilers, chimney, foundation, and buildings.

Napier, New Zealand.—Two-cell back-fed plant, complete, in connection with a new sewage pumping station.

Halifax, Nova Scotia, Canada.—Three-cell patent container-charged top-fed destructor, complete with water-tube boiler, chimney, foundations, buildings and accessories.

Pittsburg, Pennsylvania, U.S.A.—Three-cell top-fed destructor, complete with water-tube boiler and chimney.

Corporation of Bath.—Six-cell back-fed destructor, 90 tons daily capacity, with water-tube boiler, foundations, buildings, and flue connections to existing chimney.

Corporation of Weymouth.—Two-cell back-fed destructor, with water-tube boiler and accessories, erected in conjunction with the corporation electricity works.

The Salvation Army, Loudon.—Two special destructor furnaces for waste paper, with two Cornish boilers, chimney and accessories.

Destructor for the Royal Hospital for Sick Children, Glasgow, and also other small destructors both at home and abroad.

This firm have in hand at present the following contracts:—

Yeovil Corporation.—Destructor, extra work, comprising the installation of electric generating plant and pumps.

Horsforth Urban District Council.—Two-cell back-fed destructor, complete with boiler and accessories.

City of Columbus, Ohio, U.S.A.—Two-cell top-fed destructor, water-tube boiler, &c., in connection with city electricity works.

Teddington Urban District Council.—Two two-cell front-fed destructors, with Lancashire boilers, and all accessories in connection with the new sewage pumping station.

Farnborough Urban District Council.—Two-cell front-fed destructor, Cornish boiler, and accessories in connection with sewage pumping station.

City of Berkeley (California), U.S.A.—Three-cell patent container-charged top-fed destructor, complete with boiler and accessories.

Pembroke (Dublin) Urban District Council.—Three-cell back-fed destructor with water-tube boiler and all accessories in conjunction with the council's electricity works.

City of Turin, Italy.—Twenty-four cell top-fed destructor, with six water-tube boilers, buildings, approaches, two chimney shafts, and all accessory machinery. The steam will be fully utilised.

A new development introduced by Messrs. Hughes and Stirling is a patent self-clinking grate, designed with the express object of keeping the clinker in the ash-pit after it is discharged from the grate. By this means there is never any hot clinker either in the destructor building or in the yard. This apparatus is fully patented in Great Britain, Germany, France, Italy, Belgium, United States, and Canada. The idea of the grate is a distinctly novel one, inasmuch as the grate itself is in the form of two troughs, these troughs being made up in three sections, the centre section forms the centre ridge between the two troughs and has two curved surfaces forming one side of each trough. The two side sections form the other side of the two troughs, and likewise have curved surfaces. Upon the rotation of this grate by mechanical means the extremities of each section clean the grate surfaces of the adjoining section, thus the clinker operation is carried out mechanically, and the whole of the clinker is discharged into the ash-pit, where it is received in

buckets and cooled by the forced draught. A complete description of this patent would be too lengthy, but, judging from the design, it has many interesting and novel features.

The Patent Lightning Crusher Company, Limited, report that the system of disposing of house refuse by converting it into manure seems to meet with increased favour at the hands of municipal councils.

The Metropolitan Borough of Southwark is no longer the only corporation that has adopted this process, which seems to meet with general satisfaction. The county borough of Halifax, Yorks, followed the initiative of Southwark over three years ago. Next came Bispham, Blackpool, in Lancashire, and last year the Corporation of Hove, in Sussex, followed suit. Scotland has now taken the matter up, as we understand that the Corporation of Glasgow have decided to erect a double plant of patent Lightning Dust Manipulators at their Partick works, and several other municipal councils, both in England and Scotland, have the question under consideration.

The natural fertiliser produced from house refuse by this process seems also to meet with increased favour among farmers and kitchen gardeners, if we are to judge from the ever increasing consumption of this article wherever it has been placed on the market. From Halifax, Bispham, and Hove the reports are that the crushed refuse manure is sold as fast as it is manufactured, while in Kent the sales of the Southwark fertiliser, which in 1907 amounted to 2,206 tons, rose in the following year to 8,611 tons; in 1912 they had reached 15,440 tons, and during the current financial year are likely to exceed the figure of 20,000 tons. The special features of this process are stated to be the low cost of the plant, the simplicity of the apparatus and of the working, the absence of any nuisance, and the facility with which the output is disposed of to farmers.

NEW YORK AND CHICAGO.

Interesting developments took place in New York during the past year in connection with the disposal of refuse. From a brief review in the *Engineering Record* we learn that the previously existing contract for disposal of the city's refuse by the reduction process came up for renewal. Under the old agreement the city paid a sum of £10,000 per annum to a contractor for dealing with the refuse. For the next five years, how-

ever, another contractor has undertaken to pay to the city a total sum of £100,000, equal to £20,000 per annum, for the privilege of taking the refuse. There is a very great advantage to the city in the difference between these two arrangements, and it is apparent that considerable profit can be made from refuse by this process. On the other hand there appears to have been trouble with reduction plants in the past, due to the emission of obnoxious odours, but improvements are being devised to remedy these defects. In some cases reduction plants are being considered in combination with incineration furnaces.

From another source—*Municipal Engineering*—we find that the question of garbage disposal in Chicago has reached an acute stage. The city authorities have been unable to decide upon the method of disposal to adopt for the future. Meanwhile, the existing contract for this work has expired, and they are now begging the property owners to dispose of their garbage as far as possible upon their own premises, while the amount of garbage which they are bound to collect is being treated with chemicals, and then dumped into abandoned clay holes. In the course of recent investigations by the city authorities some interesting information has been collected, from which it appears that a combined reduction and incinerating scheme would cost about £268,000. The cost of the operation of this plant is not stated, but it is estimated that there will be a total gross income from fertiliser and power available of £106,000. This estimate was made by a French expert, and it is stated that even after deducting a sum of, say, 4s. per ton of refuse burnt as cost of operation, a handsome profit would remain from the adoption of this combined system.

In the review mentioned above, comment is made upon the fact that municipal authorities fail to appreciate the engineering element in refuse disposal work, and endeavour to solve their own local problems without competent engineering assistance as well as limiting their engineers to inadequate funds. Mention is made of a contractor who made it a rule to include in his tenders an item for contingencies equal to his estimate of the actual construction cost, in order to provide against the uncertainty of the specification. This is not likely to occur in many cases in this country, but it is not out of place to draw attention to this result of loosely worded specifications.

SEWERAGE AND SEWAGE DISPOSAL.

While it may not appear at first sight to those regularly engaged in connection with works of sewerage and sewage disposal that any event of outstanding importance has occurred during the past year, a review of the back numbers of this and other technical journals shows that many interesting reports, papers, and descriptions of works carried out and projected have been published, and deserve notice on this occasion. The issue of the appendix to the eighth report of the Royal Commission on Sewage Disposal in itself was an event of high importance, and a number of papers have been written upon the problem of sludge disposal, which still awaits final solution. As on previous occasions, we are indebted to our American contemporaries for particulars of new ideas and results of investigations made into matters relating to these subjects, which are at present occupying engineers in that country to a greater extent than at any time in the past.

SEWERAGE.

Commencing with matters relating to house drainage, it is worthy of note that the Chadwick lectures this year were devoted to "House Drain-

age Law." They were delivered by Mr. W. Addington Willis, LL.B., and dealt with the rights and responsibilities of councils and citizens, bye-laws and regulations, and the combined drainage problem. Earlier in the year an interesting paper on "House Drainage Regulations on the Continent" was read by Mr. Frank R. Durham, A.M.Inst.C.E., before the Institute of Sanitary Engineers (*THE SURVEYOR*, May 2, 1913), in which full details were given of the regulations in force chiefly in Germany. It was pointed out that the chief characteristics may be briefly summarised as (a) standardisation of regulations and materials, (b) departmental system of approval of plans and work, (c) direct connection to the sewer system without intercepting traps, (d) ventilation of the sewerage and drainage system, (e) necessity of placing all pipes within the houses, with the exception of rain pipes. The author observed that it is an exception in Germany to find cases such as occur in this country where a property may be developed and sewered privately, quite regardless of a general and uniform system for the whole area of the town and neighbouring districts, and in his opinion the development of

rational town planning has to a great extent arisen out of this system of planning of the drainage of the towns and cities in Germany.

This system of designing for the future and considering large areas, especially those in the same watershed, instead of allowing each separate small district council to carry out its own small scheme regardless of its neighbours, is one that should have been adopted here long ago. We should then have avoided the enormous waste of money, both in capital outlay and annual expenditure, referred to by Mr. F. W. Cable, ASSOC. M. INST. C. E., in his paper before the Institute of Sanitary Engineers on November 17 last. We dealt with this matter at some length in a "Minute" on December 5.

THE INTERCEPTING TRAP.

While dealing with house drainage reference may be made to some further discussion which took place during the past autumn with reference to the intercepting trap. At a meeting of the Institution of Municipal Engineers on October 18 last at Crowborough a paper upon the "Advantages and Disadvantages of Intercepting Traps" was read by Mr. W. E. Woollam, Surveyor to the East Grinstead Urban District Council, in which town these traps do not exist. The information given by Mr. Woollam has previously been published to a large extent in this journal, but it is interesting to note that when he first took up his present position he was "imbued with the importance of intercepting house drains," but after ten years' experience his views have been considerably modified. Further, in the course of the discussion, a neighbouring surveyor confessed himself a convert to Mr. Woollam's views. On the other hand, Mr. Arthur Palmer, P. A. S. I., in a paper upon "Drainage Details," read at the annual general meeting of the same institution, favoured the retention of the intercepting trap, and recommended the adoption of a standard type of trap on the lines of a pattern described and illustrated in his paper. His method of dealing with the problem of the fresh air inlet is, however, not very convincing. This detail is arranged more strikingly and more definitely in the special device with the imposing name of "Cuncta in unum," recently brought out by Mr. Isaac Shone.

This apparatus has been specially devised to meet the objections raised in many quarters to the ordinary intercepting trap. It is somewhat difficult to gather from the published descriptions of this appliance exactly how it works, but we believe we are correct in stating that it consists primarily of a receiving chamber or cylinder to which the various waste liquids flow by gravitation. When full the contents are automatically discharged by syphonic action, and fresh air is thereby drawn into the soil and other waste pipes connected to it. The plumbing system adopted in connection with this apparatus differs from the usual method, in that all the wastes appear to be connected to one down-pipe (soil-pipe) which is apparently provided with air-inlets and, although the published diagrams do not show this clearly, we assume that some arrangement is provided whereby these fresh-air inlets are prevented from acting as outlets. In any case the drain appears to be completely disconnected from the sewer, but whether the use of what to us at present seems to be a complicated apparatus will prove to be as efficient as the simple omission of the intercepting trap now generally adopted, remains to be seen. Mr. Shone's new apparatus has received the approbation of two municipal engineers, Mr. P. Dodd, borough engineer of Wandsworth, and Mr. S. H. Chambers, surveyor to the Urban District Council of Hampton-on-Thames, and the results of its operation elsewhere in due course will be awaited with much interest.

STORM-WATER SEWER CONSTRUCTION.

Various articles dealing with the construction of sewers have been published during the past year, notably in our American contemporaries. Among these is a description of some large storm-relief sewers which have been carried out in Toronto, the cost amounting to some £85,000. The details of construction given in the *Canadian Engineer* of March 20 last are interesting, and useful for reference. In making the calculations it was found necessary to provide for a rainfall of $1\frac{1}{2}$ inches per hour, allowance being made for absorption varying between 30 and 50 per cent, according to the character of the surface in different areas. This question of impermeability of surface was referred to at some length in the valuable series of articles upon "Storm-water Discharge," by Messrs. R. O. Wynne-Roberts, M. INST. C. E., and T. Brockmann, of Regina, which appeared in these pages on March 28 last and following issues. In those articles the whole question of storm-water discharge was dealt with in detail, including a number of different formulæ which have been deduced at different times, and the effect of rainfall intensity, impermeability of the surface of the drainage area, and retardation which depends on the shape, extent, and configuration of the drainage area, and also on the velocity of flow in the sewers. A number of useful diagrams and tables were also given.

The question whether sewers should be constructed on the "combined" or on the "separate" system, or partly on both, is a problem which frequently has to be considered by engineers, and in many cases it cannot be satisfactorily solved without careful study of the numerous factors which bear upon the subject. Two factors of the greatest importance are the questions of cost and of sewage disposal, and the latter was discussed in an article by Mr. John H. Gregory, consulting engineer of New York, entitled:—

SEPARATE AND COMBINED SEWERS IN THEIR RELATIONS TO THE DISPOSAL OF SEWAGE.

Extracts from this article appeared in our issue of October 24, and, although it was admitted that no hard and fast rules can be given for the adoption of either system, the author believed that, other things being equal, the separate system seemed to offer greater advantages, especially as more and more attention was being given to the question of sewage disposal. He rightly added that, with either system, to secure satisfactory results too much stress could not be laid on the necessity not only for proper design, but for satisfactory maintenance and operation. The subject of storm-overflows was discussed in the same article and also in a paper on "The Sewering of Towns," by Mr. F. W. Cable, ASSOC. M. INST. C. E., before the Institute of Sanitary Engineers (THE SURVEYOR, Nov. 21, pages 773, 777, and 793). So long as the combined system of sewerage is in use there will always be many difficulties and much controversy in connection with this matter. It is a great advantage in the separate system that no overflows need be provided, and that all the sewage which reaches the outfall can be subjected to proper treatment.

In the same paper Mr. Cable made some useful observations upon several other matters relating to the construction of sewers. Reference has already been made to his remarks upon the necessity for greater combination among adjoining councils, and it would be a good thing if his statements upon the relations between the engineer and the contractor, and upon the importance of providing competent, and consequently well paid, supervision, could be read and thoroughly digested by the members of all local authorities who have sewers to construct, and also by those engineers

who do not appear to understand their exact position as between their clients and the contractor. As Mr. Cable said, it is absolutely essential that public works should be carried out as far as possible as a business undertaking, and not as a speculation.

IMPORTANT NEW SCHEMES OF SEWERAGE.

It is now a rare occurrence for large and entirely new schemes of sewerage to be considered in this country, and it is therefore interesting to note that after many years of discussion and negotiation the town councils of Rochester and Chatham have at last entered into an agreement for the carrying out of a joint scheme of main drainage for the two towns. Mr. W. H. Radford, of Nottingham, has been appointed engineer, and the estimated cost is £300,000. This is a case where the value of combination between two adjoining towns has happily been appreciated, and others have recently occurred abroad. The *Engineering Record* of October 25 gives particulars, with maps and diagrams, of the results of an investigation into the organising and financing of a joint sewerage scheme for Greater Vancouver. In this case there are five drainage areas, and provision is to be made for dealing with the sewage from an ultimate population of 1,400,000. A very much larger scheme is that of Greater New York. Details of the work of investigation which has been in progress during the last few years have appeared in these pages from time to time, but it will be some years before a final decision can be reached. The area in question includes over 100 cities and towns with a present population of about 6,000,000, and a future population of about twice this figure. The volume of sewage from this area is 765,000,000 gallons per day, and it is estimated that within thirty years it will have increased to 1,500,000,000 gallons. The additional works of sewerage required to cope with such enormous volumes will be of gigantic proportions, and it will need great patience, foresight, and engineering skill to design a scheme which will be satisfactory.

Apart from the articles and papers which have appeared in our own columns, a number of interesting and useful descriptions of sewer work have been published by our contemporaries. The *Engineering Record* of March 15 contained a valuable article upon the methods adopted in the town of West Liberty, Iowa, in constructing sewers under unfavourable conditions. The subsoil was described by different people as "quick-sand, floating clay, sea mud, boiling sand," and it was stated to vary from a fine silty sand to a molasses-like mud in which men frequently sank up to their hips and had to be pulled out with ropes. All the various ordinary expedients of sewer construction were tried without success. Eventually, however, by adopting the special methods outlined in the article, the whole of the work was satisfactorily completed, and great credit is due to the contractor for the courage with which he stuck to the work and finished it at a great loss to himself. Another interesting article in the same journal of February 22 describes a scheme for making good existing defective sewers under abnormal conditions, and *Municipal Engineering* of May contained a useful description of a number of inverted syphons constructed under the subways in Brooklyn with satisfactory results in every case.

The question of the strength of drain and sewer pipes has been the subject of investigation by the engineering experiment station of Iowa State College, at Ames, Iowa, and the results were given in the *Engineering Record* of July 12. A study was made of the causes and prevention of pipe failures, and conclusions were arrived at upon the basis of experiments of loads in trenches. This

report is well worthy of careful study by all sewerage engineers.

SEWAGE DISPOSAL.

A general review of the progress which has taken place during the past year in the science of sewage disposal shows that the most prominent subject of discussion and investigation was disposal by dilution in fresh or salt water, while the questions of sludge disposal, as well as preliminary treatment in tanks, also received some attention.

ROYAL COMMISSION ON SEWAGE DISPOSAL: APPENDIX TO EIGHTH REPORT.

In a "Minute" on August 22 we briefly referred to the publication of this appendix, and we expressed the opinion that it would probably prove to be one of the most important of the many publications issued by the Royal Commission. Further study of its contents has produced no reason to alter that opinion, and while it is quite correct that the conclusions arrived at by the officers of the Commission suggest that in judging a sewage effluent the stream into which it is discharged should be the ultimate arbiter in the matter, the Commissioners did not take this view, as is explained in the eighth report itself, but decided to fix a normal standard suitable for the majority of places and make provision for fixing one or two higher or lower standards to meet cases in which a different standard could be justified.

The appendix is so full of valuable information and records of investigations of a practical character that it can only be properly appreciated by careful study of the whole of its contents. This would, however, necessitate close application for a much longer period than most busy engineers and surveyors are able to devote to this subject, and we therefore had much pleasure in printing in our issues of October 17 and 24 a carefully prepared article by Messrs. H. C. H. Shenton and W. S. Easdale, consisting of numerous extracts from the appendix interpolated with notes bearing upon the chief points in the record of investigations and conclusions set forth. The most interesting and most valuable part of this volume, which is entitled "Report to the Commission on the Results of Streams Observations carried out during the Years 1909 to 1912," is naturally the actual results observed in the twenty-seven rivers under observation, and these should be studied in detail by all who can spare the time required. On the other hand, Sections 4 and 5 of Part II., in which the results of the observations upon the discharge of sewage liquors and effluents into streams are brought together and discussed, conclusions being given at the end of each as to the "limiting dilutions" indicated for liquors and effluents of given strength, provide extremely interesting reading, forming, as they do, a brief but complete treatise upon the whole subject of the effect of the discharge of polluting liquids of different degrees of impurity upon the water, itself of varying degrees of purity, into which they are discharged.

The table in Section 6 of Part II. giving a classification of the various reaches of river with their respective general visible conditions will also be found invaluable for reference. It deals with the condition of the water as regards suspended matter, opalescence, smell, appearance, delicate and coarse fish life, stones in shallows and pools, water weeds, green and grey algae and insects, and classifies the different qualities of water under the headings of "very clean," "clean," "fairly clean," "moderate," "doubtful," and "bad." With this table in his hand any surveyor should be able to form a fairly accurate opinion as to the class in which any river or stream in his district would be placed, and the information in

Sections 4 and 5 should enable him to decide what steps should be taken to maintain its condition if good, or improve it if bad.

In the past we have deplored the lack of scientific investigation in connection with sewage disposal in this country compared with what had been done elsewhere. The streams investigations in the appendix to the eighth report were, however, carried out in a thoroughly scientific manner, and the officers of the Royal Commission who were engaged upon this work deserve great credit both for the work done and for the manner in which the results have been recorded and placed at the disposal of the public. A characteristic opinion upon the value of the eighth report of the Royal Commission is contained in an article which appeared in our American contemporary, *Engineering News*, as follows: "The proposed standards exhibit a rare use of practical 'horse sense' reinforced by scientific facts."

Other countries are realising the importance of having streams investigations carried out in order that remedial measures may be instituted to remove existing, and prevent future, contamination of their watercourses. In fact, one of the papers read at the Third Congress of the Canadian Public Health Association dealt with this subject under the title "Sanitary Surveys of Rivers," and after referring to some surveys which have already been completed details are given of the general lines upon which such work should be performed. These details were designed primarily for use in Canada, but they agree closely with the methods adopted by the officers of our own Royal Commission.

DISPOSAL BY DILUTION.

Although it might be assumed from the eighth report of the Royal Commission that under certain conditions—i.e., a dilution of 500 to 1—crude sewage may be discharged into a river, there is very little probability of such a method being adopted with success in this country, unless the velocity and direction of the flow of water are extremely favourable and the point of discharge is very carefully arranged. On the other hand, the ratios of dilution recommended as the chief factor to be considered in dealing with settled sewage appear to be perfectly safe. These observations are based upon the records of experience in America, where crude sewage has been discharged into large bodies of water where the volume, as in the Great Lakes or in New York Harbour, has been ample, but the lack of suitable currents has had the effect of causing the deposition of the heavier solids in large quantities or the drifting of the lighter floating solids into positions where they have created a nuisance. Even in otherwise well-regulated streams the unavoidable slackness of flow at the sides, or in weir-pools and in very dry seasons, has also caused the suspended solids to be deposited in such quantities as to form large accumulations of putrefying organic matter, which has inevitably given rise to serious nuisance in the form of objectionable smells, as well as exhausting the dissolved oxygen in the water and thus rendering it unfit to support fish life. It will be understood that when the bulk of the solids in suspension in the sewage have been removed by preliminary settlement, the above-mentioned objectionable results are less likely to occur. Indeed, an eminent American authority, Mr. G. W. Fuller, M.A.M.SOC.C.E., considers that a dilution of from 45-1 to 90-1, depending upon the manufacturing wastes in the sewage and the dissolved oxygen content of the diluting water, would be sufficient to prevent nuisance to sight or smell. Complications, so far as disease germs are concerned, in the case of a water used for drinking purposes should be obviated by filtration of the water.

Even if allowance is made for the more

dilute character of American sewage, these ratios of dilution are much lower than those recommended by the Royal Commission, and indicate, as stated above, that the standards in the eighth report are very safe. It is, however, important to remember that other factors have considerable effect upon the efficiency of this method of disposal. The point at which the sewage effluent is discharged needs careful selection, and arrangements must be made to ensure thorough mixing and dispersion of the sewage in the water. On these points all are in agreement, but differences of opinion exist with regard to the requisite amount of dissolved oxygen in the diluting water. Mr. Fuller has stated that he knows of no reason for departing from the teachings of the early experiments carried out by the Massachusetts State Board of Health by which it was established that a little oxygen—say, 1 to 3 per cent. of that necessary for saturation—would allow oxidation and nitrification to take place as satisfactorily, or nearly so, as if the water were saturated with oxygen. The experts engaged in the investigations into the conditions of New York Harbour also differed in their opinions. Some advocated that the dissolved oxygen content of the water ought not to be reduced below 70 per cent. of saturation, while others were prepared to allow it to be reduced to 50 per cent. In the eighth report our Royal Commission state that their "observations show that when the oxygen of the river is reduced to about 4.0 c.c. per litre (about 60 per cent of saturation) the water is usually in a doubtful condition, and is on the verge of producing nuisance; when the oxygen is reduced still lower nuisance may be expected to arise and become increasingly apparent to the senses." The Commissioners then proceed to point out that "under natural conditions the river water, while yielding oxygen to the unstable organic matters which are discharged into and mixed with it, is concurrently absorbing a fresh supply of oxygen from the atmosphere (and at certain seasons from plants) at a rate which depends on various conditions, but more particularly on the depth and velocity of the stream. The degree of de-oxygenation depends upon the amount of oxygen available in the water. By increasing the amount of oxygenated water with which the sewage is mixed the loss of oxygen can be reduced to such small proportions that it is counteracted by the natural process of re-oxygenation." (This whole process of de-oxygenation and re-oxygenation by natural process is well illustrated by the case of the river Thames as described by Mr. W. J. Dibdin, F.I.C., in one of his books.) There may be something in the contention of Mr. Fuller that these high estimates are due to exceptional allowances for the consumption of oxygen by existing accumulations of sludge, and that if suspended solids had been kept out of the streams from the beginning a very much smaller content of dissolved oxygen would be sufficient to prevent putrefactive decomposition; but it is satisfactory to find that the recommendations of our Royal Commission are, in this respect also, based upon figures which apparently allow a considerable margin of safety.

ARTIFICIAL AERATION OF FILTERS.

Ever since Mr. S. R. Lowcock, at Malvern, in 1892, and Colonel Waring, at Newport, R.I., in 1894, used forced aeration as an aid to the filtration of sewage numerous other attempts have been made to utilise this artificial method of increasing the efficiency of sewage filters. As a rule, the results have not been entirely satisfactory. According to Dr. S. Rideal, D.Sc., experiments of this kind were begun at Lawrence, Mass., in 1892, with coarse gravel filters, but the results indicated that while artificial aeration was beneficial to a certain degree, the benefit derived was

not in proportion to its cost. We have always felt that the chief difficulty in supplying an additional quantity of oxygen to a filter by forcing air through the material was to cause the air to permeate the whole of the material, and not to pass up or down through a few well-defined channels, without affecting the bulk of the filter. Whether the air be delivered to the filter from one or from twenty nozzles per square yard, the air immediately it leaves the nozzles is out of control, and will naturally follow the line of least resistance, which will usually be found in those portions of the filter which are least choked, and thus least in need of the artificial assistance. In a "Minute" on July 18 we referred to some recent experiments carried out in 1912 at the Lawrence experiment station by the chemists to the Massachusetts State Board of Health, in which the sewage itself was aerated before it was applied to the filters. The method of aeration adopted was to force or draw a current of air through the sewage while standing in a tank containing slabs of slate placed about 1 in. apart. It was not stated whether these slabs were placed horizontally, as in a Dibdin slate bed, or vertically, as the colloidors in the Travis hydrolytic tank, but in either case it is obvious that the air must have been well mixed with the sewage—much more efficiently than in a filter. The results of these experiments indicated that a very material increase in the rates at which sewage may be applied to filters can be obtained by preliminary aeration of the sewage, but, unfortunately, no information was given as to the cost of the aeration. It would be interesting to know how this annual outlay for aeration, when capitalised, compares with the initial expenditure for the additional filters which without aeration would be required to treat the extra volume of sewage treated with aeration.

PRELIMINARY TREATMENT.

There is still much diversity of opinion as to the best methods of treatment for the removal of the solids in suspension in sewage, and an even greater variety of tanks designed for this purpose. The efforts made to secure the removal of a greater percentage of the suspended solids is largely due to the desire in many quarters to use fine-grade material for the filters. Mr. W. H. Makepeace, borough sewage engineer of Stoke-on-Trent, in a paper read at the annual summer conference of the Association of Managers of Sewage Disposal Works last July, stated that the tank treatment of sewage is not by any means perfect, that better results can be obtained by increasing the number of tanks rather than increasing their capacity, and that in his experience rectangular tanks give more uniform results than any other type. He believes that much improvement could be effected by further treatment of the tank effluent before it is applied to the filters, either by chemicals, or by upward flow filters, cellular chambers, or by centrifugal action. It is obvious that all this additional tank treatment for the removal of the suspended solids is bound to increase the amount of sludge to be dealt with, and it is therefore not surprising to learn that Mr. Makepeace believes that "much more will be heard of this in the next few years." Fortunately, in other quarters much good work is being done in the direction of reducing the amount of sludge produced in the preliminary treatment of sewage.

An extremely interesting and valuable paper upon this subject was recently read before the League of Pacific North-West Municipalities by Mr. C. G. Hyde, Professor of Sanitary Engineering at the University of California. This paper was published in the *Canadian Engineer* of November 27 last, and dealt with ordinary septic tanks, Imhoff tanks, and a special system in which

the sludge is delivered to separate tanks for digestion. It also dealt with the question of smell from the various types of tanks, and the use of screens. It was pointed out that the question of smell is the most important consideration in determining the satisfactory use of an ordinary septic tank, but that apart from this it should be noted that septic sewage is more difficult to treat on filters than fresh sewage containing an equivalent load of organic matter, while in no case within his experience was the removal of suspended matter greater than 50 per cent. and was often much less. On the other hand, Mr. Hyde observed that experience with Imhoff tanks in Germany, and to a less extent in America, shows that, when they have been properly designed and maintained, these tanks have been satisfactory from the standpoint of the production of odours, they should remove from 90 to 95 per cent of the "capable-of-settling" suspended matters and from 50 to 70 per cent of the total weight of suspended matter in the sewage, while at the same time the sewage passes from them in a fresh condition, free from the disagreeable odours so commonly associated with the ordinary septic tank mentioned above.

The rapidity with which the Imhoff tank has come into use in America is remarkable. It is already in operation in several places, and is proposed for a large number of new schemes. Many interesting papers and articles dealing with the design and construction of these tanks have appeared in the technical journals in Canada and the United States. In one case even a special article was printed suggesting a method of constructing Imhoff tanks, which are usually of considerable depth and cylindrical in form, by sinking them as caissons. It is exceptional to find one particular type of sewage tank adopted so largely and almost universally in a whole continent, as in the present instance, and it is curious that there is hardly a single instance of a tank of this type in operation in this country, although it is certainly well known to some at least of our sewage-disposal experts.

It is generally recognised now that it is undesirable to allow the process of septic action to proceed too far, and that it is much better to arrange the preliminary treatment on such lines that the tank effluent will reach the filters in as fresh a condition as possible. This is one of the aims of the Imhoff tank, and Dr. Bostock Hill, in his presidential address to the Association of Managers of Sewage Disposal Works recently, stated that he had definitely come to the conclusion that, in the majority of cases at least, it was desirable to reduce the period of septic action to twelve or fourteen hours. It is not clear whether this is to be the actual capacity of the tanks or whether they should be constructed in such a manner that the sewage would take twelve to fourteen hours to pass through them. This is an important point, as very much depends upon the design, especially in the case of the outlets, as to the period occupied by the sewage in its passage through the tanks.

FILTERS.

No developments of any importance have taken place during the past year in connection with filters. Dr. Bostock Hill, in the address mentioned above, however, expressed definite opinions in favour of percolating filters, circular in form, with a standard depth of 5 ft., and material about 1 in. in size, with a little finer material on the top. This grade of material, while not so fine as that adopted in some places, notably in Staffordshire, is still much finer than many engineers would adopt, and in our opinion it is a much better method to have filters with medium-grade material, as near as possible of uniform grade, say, 1½ in., and to provide effluent settling tanks, properly designed, to intercept the suspended solids in the form of humus after they have passed through the filter.

The influence which the many living organisms found in filters have upon the purification of the sewage has been discussed on many occasions, but definite investigations into the relative importance of the different organisms have been few and far between. It is, therefore, encouraging to find that Mr. H. D. Bell, manager and chemist at the sewage works of Stratford-upon-Avon, has continued his investigations with regard to the effect of *podura* in his filters. Particulars of the results obtained up to the end of March last are given in his annual report, extracts from which were printed in our issue of September 5 last, and we commented upon them in a "Minute" on September 12th. Further experiments on the lines we then suggested would provide valuable information. In this connection we believe it has been suggested that in the soil there is a group of organisms detrimental to bacteria, and that the efficiency of the latter may be reduced by a preponderance of the former. It has also been observed that this may take place in artificial filters, and that it may be possible by a temporary sterilisation of the filter material to destroy the inimical organisms. The bacteria would, of course, be destroyed at the same time, but a new supply would rapidly develop as soon as the effect of the sterilising agent had passed away, and possibly without any corresponding development of the inimical organisms, in which case the efficiency of the filter should be increased. It might be well worth while for experiments in this direction to be carried out under ordinary working conditions and over a suitable period.

POLLUTION OF RIVERS.

The extent to which small rivers are polluted by the discharge of sewage into them is well known, but it was not anticipated that such ill effects would result in the case of large and rapid rivers. Recent investigations into the condition of the Niagara river, however, show that even in such cases the effect is serious. Below the Falls the waters of the river are uniformly and dangerously polluted from bank to bank, and the municipalities on both sides of the river are thereby affected. Above the Falls the waters at varying distances from the American bank are polluted by the raw sewage of several towns with a total population of about 500,000, and the public water supplies of each of them, when taken from the river without purification, are in varying degrees and at varying times injuriously, if not dangerously, affected by the sewage pollution from the towns farther up the river. In a preliminary report by the small committee which has been making investigations on behalf of the International Joint Commission it is stated that two things appear to be necessary—viz., suitable treatment of the sewage and purification of the water taken from the river, in order to secure a safe water supply for the towns on the Niagara river. It is believed that the further investigations to be undertaken will be devoted to ascertaining to what extent the sewage should be treated before discharge into the river, and what degree of purification will then be necessary to render the river water safe for drinking purposes.

THE SOLUTION OF THE SEWAGE PROBLEM.

Recently (on December 26th last) we discussed this subject in connection with the very interesting presidential address of Dr. Bostock Hill to the Association of Managers of Sewage Disposal Works, and we do not propose to repeat all we said on that occasion. We may, however, be permitted to state that in our opinion the solution of this problem will be found, as stated by Dr. Bostock Hill near the end of his address, in the close co-operation of the chemist and the biologist with the engineer, so that their combined skill and science may be directed to elucidate the

problem in each particular case and to lay down those conditions for treatment which experience has evolved.

The general principles which govern the prevention of rivers pollution are extremely well set-out in a series of conclusions drawn from a large number of replies to questions sent out to sanitary engineers, chemists, bacteriologists, and others by Mr. Paul Hansen, engineer, State Water Survey, Illinois, U.S.A. Although these conclusions have already appeared in these pages we believe they deserve greater prominence, and we therefore repeat them here.

"(1) No stream (unless the entire watershed is owned or controlled) can be maintained in its original and natural purity.

"(2) Streams may be, and should be, maintained free from danger to the public health, inoffensive to a proper public sense of decency, and beyond this they should be controlled so as to contribute the greatest serviceableness to the people at large. Within these limits it is permissible to discharge any liquid wastes into streams, local conditions to control in every instance.

"(3) Public water supplies may be drawn from moderately polluted streams, provided the supply is adequately purified to prevent danger to health, the extent of pollution permissible under these conditions to be determined by the limitations imposed by the art of water purification, and to some extent by purely æsthetic considerations.

"(4) The desirability of maintaining fish life in streams is largely an economic problem. In the case of streams along which fishing industries are established, prior right should be considered a basis for preventing pollution dangerous to fish life or for awarding damages. The presence or absence and character of fish life may, under some circumstances, serve as an index of the extent of pollution.

"(5) Stream pollution is primarily a menace to human health through domestic water supplies which may be drawn from polluted streams; but there are various other avenues of danger to health, prominent among which are danger to bathers and pollution of shellfish, which should be duly recognised in considering any specific problem.

"(6) While the determination of permissible stream pollution must depend primarily on public health considerations, and secondarily on economic considerations, æsthetic considerations and civic decency must always be factors, and many times the controlling factors.

"(7) Control of stream pollution by laws defining specifically the extent to which streams may be polluted and enforced by the ordinary police power is unwieldy, unwise, and unjust. Instead, the laws should be made very general, and their enforcement placed in the hands of central expert authority as interpreter of the laws in the light of local conditions. To guard against abuse, it should be made easy to appeal from decisions of the central authority to an impartial commission of experts, and finally to the courts.

"(8) Since, from an economic and engineering point of view, control by drainage boards over complete drainage areas is the logical and efficient form of control, it should be adopted wherever conditions permit."

SLUDGE DISPOSAL.

Numerous attempts are being made in various quarters to solve this difficult problem. Several companies are making arrangements to take over the total output of sludge from selected sewage works for the purpose of utilising it in various ways, but up to the present no definite records of the results obtained have reached us. From the point of view of the municipality or local

authority this method of getting rid of the sludge, if guaranteed for a number of years, should be perfectly satisfactory.

Two interesting articles by Dr. J. Grossmann, of Manchester, appeared during the past year. In the one (*THE SURVEYOR*, October 21, 1913) he describes a method of concentrating sludge by adding to it a small amount of acid and allowing it to stand for a few days. At the end of that time the sludge accumulates at the top and the liquid separates out underneath. The liquid can be drawn off, leaving a sludge containing about 20 per cent. of solid matter. He recommended that this sludge should then be mixed into cinders, and he claimed that the resultant mass is equal to the average filter-pressed sludge-cake at about one-third the cost. His second paper was read before a North-western District meeting of the Institution of Municipal Engineers, and dealt chiefly with the process in operation at the Oldham sewage works. In the paper the author stated that he did not claim that large profits could be made, but if the sludge could be got rid of for nothing it would be a boon to the community at large. This is quite true if getting rid of sludge "for nothing" means that the cost of sludge disposal would be *nil*. Later on, in replying to the discussion, Dr. Grossmann said that he would be prepared to undertake that it should not cost more to get rid of the sludge altogether by turning it into manure than the present cost of producing the pressed sludge-cake alone. While this represents in some cases a distinct advantage in favour of conversion into manure, it is still a long way from getting rid of the sludge for nothing.

Other papers dealing with the sludge problem appeared in the *Engineering Record* of September 20th and October 18th last. The latter deals with the best methods of construction to adopt in order to ensure uniform distribution of sludge in settling tanks. The former describes the differences between fresh and decomposed sludge as ascertained by experiments carried out at several sewage works in the district of the Emscher Drainage Board in Germany, where Imhoff tanks are in use. The conclusions arrived at are to the effect that the examples quoted illustrate the general truth that within certain limits the question of sludge utilisation does not depend so much upon the quantities of valuable elements contained as upon the amount of moisture and the physical character of the sludge. It is also stated that in most cases the cost of recovery for fresh sludge will be so great as to place the whole question of utilisation beyond economic limits, whereas it may be possible in some of these cases with decomposed sludge to derive at least some profit.

THE EFFECT OF SEWAGE POLLUTION UPON FISH LIFE IN STREAMS.

This question has been the subject of investigation at the Lawrence experiment station of the Massachusetts State Board of Health, and some results were given in a "Minute" in our issue of June 6th last. From these it appears that fish could survive indefinitely even under stagnant conditions when sewage was diluted with nine times its volume of water. This may explain the facts mentioned in our issue of July 11th in connection with the breeding of fish in Germany in ponds supplied with sewage, where the results are stated to be so satisfactory that this method of sewage disposal is apparently accepted as a possible alternative to land treatment, especially from the financial point of view. The American experiments mentioned above also showed that a dilution of 3 to 1 in the case of the best filter effluents, or of 1 to 1 in the case of contact-bed effluents, was sufficient to maintain fish life. It is evident from these results that a good sewage effluent discharged into

a clean stream which gives a dilution of 2 or 3 to 1 will cause no injury to fish life.

LITERATURE.

While several books of minor importance have appeared during the past year, the only one which deserves special notice was the volume entitled "Trade Waste Waters: Their Nature and Disposal," by Drs. H. Maclean Wilson and H. T. Calvert, the chief inspector and chief chemical assistant respectively of the West Riding of Yorkshire Rivers Board. We printed a lengthy review of this book in the form of a "Minute" on June 13 last. The authors are particularly well qualified by their experience for the compilation of such a work, and it should be studied not only by engineers, but also by manufacturers, who will find that in many cases the cost of a purification process may be to a great extent counterbalanced, and in some cases even made profitable, by the value of by-products recovered.

OPERATION OF EXISTING SEWAGE WORKS.

Particulars of the results of the operation of existing sewage works have appeared from time to time in the form of extracts from reports issued by their respective managers. While not of general interest, they are useful for reference, and are worth keeping for that purpose. Among the sewage works described were the following, the dates quoted referring to the issue of this journal in which the extracts appeared:—Nuneaton (March 14th), Manchester (August 29th and October 10th), Stratford-on-Avon (September 5th), Lincoln (September 19th), Cheltenham (October 10th), Harrogate (October 10th), Bolton (December 12th).

In connection with the Cheltenham sewage works it is interesting to note from the report quoted above that a definite application was made to the Local Government Board to ascertain whether a scheme of land treatment would be acceptable to the Board, provided the necessary land could be obtained. The Board stated that, having regard to the report of the Royal Commission on the subject of broad irrigation, they were not prepared to entertain the proposal.

NEW WORKS.

Among a number of new sewage works completed or in course of progress during the past year the following may be mentioned:—

Linthwaite and Golcar: Engineers, Messrs. Abbey and Hanson, of Huddersfield.—The interesting features of this scheme are nine precipitation tanks, each 96 ft. by 20 ft. by 11 ft. average depth; two humus tanks, each 65 ft. 6 ins. by 18 ft. by 11 ft. 6 ins.; and an underground sump, 40 ft. by 30 ft. by 12 ft., with its roof 11 ft. below ground level, the whole of these tanks being constructed of reinforced concrete on the indented bar system.

Gerrard's Cross: Engineer, Mr. Arthur Gladwell, surveyor to the Eton Rural District Council.—These works were designed to deal with a dry weather flow of 125,000 gallons per day, and consist of screening and detritus chambers, storm-water stand-by tanks, continuous flow liquefying tanks, dosing tanks, percolating filters, humus tanks, and final purification on land, which is of such a porous nature that the effluent will readily be absorbed.

Hulifar: Engineer, Mr. Jas. Lord, M. INST. C. E., borough surveyor.—These works deal with a dry-weather flow of about 4,000,000 gallons per day, of which about 45 per cent is traders' effluents. The sewage is treated in detritus tanks, followed by precipitation tanks and final purification in fourteen pairs of contact beds and thirty-six percolating filters. The effluent from the percolating filters further passes through humus tanks, and contact beds are provided for dealing with the top water from the precipitation tanks, while sludge draining beds were constructed for drying

the humus removed from the effluent from the percolating filters.

Sarbiton: Engineer, Mr. H. T. Mather, surveyor to the Urban District Council; consulting engineer, Mr. A. P. I. Cotterill, M.INST.C.E.—There are four sets of pumps, two capable of raising 370 gallons per minute each, and two capable of raising 1,000 gallons per minute each. The whole of the steam required by the pumps and for other purposes is provided by two two-cell Heenan & Froude refuse destructors. The sewage is treated by chemical precipitation in six settling tanks, followed by five primary and five secondary percolating filters. In times of storm the whole of the filters act as primary filters, the necessary diversion of the respective effluents and supply being performed automatically by a special apparatus. The works are designed to deal with an ultimate daily volume of sewage of 1,050,000 gallons.

Wakefield: Mr. J. P. Wakeford, borough engineer.—Additions to and re-modelling of old works, including two electrically driven pumps with a total capacity of 16,500,000 gallons per day, chemical plant, recorders, increase of tank capacity to about eighteen hours' dry-weather flow, 3½ acres of percolating filters, with humus tanks and storm beds, the daily dry-weather flow being 2,000,000 gallons.

STREET LIGHTING.

Comparative quiet has reigned in this department of the public service during the past year; nothing very exciting has happened in connection with the actual work of street lighting, though there has been a good deal of discussion regarding it. The Joint Committee which was appointed in 1911 to prepare a draft specification for street lighting arrived at the conclusion, by a majority, that the specification should be based upon illumination and not upon candle-power, the standard of comparison recommended being the minimum horizontal illumination at a height of 3 feet 3 inches above the ground level. But the representatives of the gas interests opposed this recommendation, and as unanimity was regarded as a very important desideratum—without which, indeed, the specification would probably be a dead letter—an attempt was made to arrive at a satisfactory agreement by open discussion on the neutral platform of the Illuminating Engineering Society in April. The case for the majority was stated by Mr. A. P. Trotter, whose paper proved a valuable contribution to the literature of the subject; and the remarkable fact was brought out that when a large number of streets were classified as regarded their illumination by direct measurement, and again (by the representatives of the Institution of Municipal and County Engineers) by eye, the two classifications agreed absolutely. It was contended, however, that this result did not afford any ground for believing that the same result would have been arrived at if the lighting of those streets had been planned and carried out by contractors working to the specification, which opened the door to "freak" lighting in which every consideration but that of securing a fixed minimum illumination was ignored, and it cannot be denied that there is great force in this argument. Two evenings were devoted to the discussion, without reaching a solution to the problem, and eventually the draft report was taken back by the Committee for further consideration. No new proposals have yet been put forward, but it is generally agreed that a satisfactory specification is greatly to be desired, and no doubt every effort will be made to find a way out of the present *impasse*.

GAS LIGHTING.

Development has been normal and uneventful

Lepton: Mr. E. H. Essex, engineer and surveyor to the Urban District Council.—Additional tank capacity to provide increased storage in times of storm. A circular concrete tank is proposed 82 ft. 6 in. in diameter, with a depth of 24 ft. and a capacity of 500,000 gallons.

Sheffield: Mr. C. F. Wike, M.INST.C.E., city engineer and surveyor.—The scheme submitted to the Local Government Board in 1904 has made considerable progress, and will probably be completed within the next few months. The total cost works out at a little over 11s. per head of the present population, and it is claimed that this is lower in cost than any other scheme for a similar community. The scheme includes, among other works, new catchpits with mechanical screens and an electrically driven travelling bucket dredger, nine new settling tanks, and the conversion of the lime precipitation tanks into additional tanks having a total capacity of 15,000,000 gallons, sixty contact beds, each ½ acre in area, sixteen storm beds, each about one acre in area, a bridge, four 4 ft. diameter syphon tubes, roads, railways, and other works. The average daily volume of sewage treated in the contact beds or on land during the year ending March 31, 1913, was 19,205,000 gallons, and a further average volume of 2,300,000 gallons of storm water received treatment in tanks.

during the year, but real progress has been made. The possibilities of low-pressure gas lamps have not been exhausted yet, and such lamps, for which a candle-power of 1,500 and an efficiency of 40 candles per cubic foot per hour are claimed, have been brought out. It is certainly a great advantage to be able to obtain such results without increasing the pressure of the supply, for there are circumstances under which it is not convenient to install the necessary apparatus, and in which it is better to sacrifice a little in efficiency in order to keep down the cost of plant and maintenance. A high-power single-mantle inverted lamp has been developed in the United States, which has the advantage that the reflectors can be designed more accurately to produce a given result than with multiple mantles. A high-pressure lamp rated at 500 or 1,100 c.p. according to size, with gas at a pressure of 55 inches, and giving 50 c.p. per cubic foot with mantles of artificial silk, hails from the same quarter.

A more important innovation introduced on this side is the adoption of a fused silica cup to protect the inverted mantle, instead of the large glass globe rendered necessary by the great heat of the high-pressure lamp. The silica cup is about the size of a tumbler, and completely encloses the mantle, excluding the secondary air supply altogether, and reducing the size of the lamp. It is stated that there is an increase of 10 per cent. in efficiency with this device, after allowing for the slight absorption of light, and it is made for lamps of 60-1,500 c.p. Owing to the remarkably small coefficient of expansion of silica, the cup does not crack even if it is splashed with water whilst red-hot, so that it can be used without any protection from the weather; and it does not break if the mantle fails and allows the flame to strike the cup, so that the breakage of a mantle does not involve the total extinction of the light, parts of the mantle being kept in contact with the flame by the cup.

DISTANT CONTROL.

The use of distant control for gas lamps makes steady progress, several towns having the whole of their street lamps actuated in this way: in Newcastle, for instance, the whole of the public lighting gas lamps, amounting to some 10,000 lanterns, of which many are of high candle-power, are thus controlled from the works. One

maker of controlling apparatus reports that he has 175,000 in use. Two new controllers on the pressure-wave system have been brought out. The construction of pilot lights has been improved by the adoption of the Bunsen system and better protection for the jets. The various systems of distant control now available formed a special feature of the street-lighting section at the National Gas Exhibition in October.

In the case of electric lighting also there has been devised a new system, which enables any desired switching operation to be performed from a central position. The essence of this system is the superposition of an alternating current of special frequency upon the ordinary supply current in the mains, which, without affecting the supply to consumers in any way, actuates suitable relays at the points where a switching operation is to be effected. This invention is of a very elastic nature, enabling any number of different operations to be performed as desired, such as switching out a number of the lamps at suitable hours, whilst leaving others alight until a later period, and it should prove of great value in various applications. There is no doubt that the use of automatic appliances is capable of effecting marked economies as compared with lighting by hand; at Newcastle, for example, a saving of £784 per annum was reported, as the result of adopting the automatic system.

ELECTRIC LIGHTING.

Undoubtedly the most noteworthy feature of

the past year in connection with electric lighting was the introduction of the nitrogen-filled half watt tungsten lamp, which cannot fail to make its influence felt in the near future—although, as a matter of fact, it has only just come on the market. This lamp is made in sizes from 600 to no less than 4,000 c.p. in a single bulb. The smaller sizes require a low voltage—50 or 60 volts—but the larger ones take 100 or 200 volts, and they can readily be substituted for arc lamps, over which they have the advantage that, once installed, they require no further attention, except occasional cleaning of the bulbs. The filaments run at this high efficiency have a very high intrinsic brilliancy—about eight times that of the ordinary tungsten lamp—and therefore must be screened from direct vision, like the arc lamp. The light is, of course, much whiter than that of any other type of electric glow lamp. The useful life of the new lamp is stated to be about 1,000 hours. In spite of the high efficiency attained, the annual cost of the half-watt tungsten lamp is not less than that of the yellow flame arc lamp, so that the latter is still unbeaten.

In March an interesting paper on the comparative trials of high-pressure gas and flame-arc lighting carried out by order of the Manchester Corporation was read before the Institution of Electrical Engineers. This gave valuable information as to the best types of reflectors and globes to be used in connection with the arc lamps, the outcome of an extended investigation.

TRAMWAY PROGRESS.

During the past year the most prominent question in tramway circles has been the competition of the motor omnibus in the London area, and the deductions to be drawn therefrom as to the future trend of urban and suburban transit in general. There have not been wanting those who maintain that the day of the tramway is over, and that the self-propelled vehicle will at no distant date drive it from the public roadways; and this view has received powerful support in the columns of the daily Press. But those who are familiar with the technicalities of the subject, and are not deceived by superficial arguments based upon inadequate premises, know well that there is plenty of life in the tramway system still, and that, under equal conditions, the motor omnibus cannot possibly compete with the car on rails. Whether the supply of motive power from a central source, as in the electric tramway system, is necessarily superior to the generation of power on the tramcar is less certain, and experiments have been and are being made to settle this question. Were the tramway not handicapped with the heavy burdens of rates, road maintenance, workmen's fares and other restrictive conditions, the motor omnibus would not be able to enter into competition with it at all; and as regards the question of congestion of the roads, the fact that at least twice as many buses as tramcars would necessarily be required to deal with the same traffic is a sufficient answer. There can be little doubt that before long the omnibus companies will be compelled to make some contribution to the upkeep of the roads which they destroy so quickly, and already there is a proposition on foot that they shall be obliged, like railways and tramways, to carry workmen at reduced fares—burdens which will very materially modify the keenness of their competition with their elder brethren.

THE POSITION IN LONDON.

The metropolis differs fundamentally from provincial towns in that the local authorities have no power at all to control the number of omnibuses placed on the streets, or the routes which they shall follow, powers which are possessed by the

provincial municipalities and frequently exercised. Thus the London County Council tramways are open to the severest competition, and in addition the omnibuses are able not only to reach all parts of the suburbs within a wide range with facility, but also to make use of the busiest thoroughfares, such as the Strand and Fleet Street, and to traverse the City itself, where tramways are taboo. The ready communication thus obtained between north and south, and between east and west, is another great advantage in favour of the omnibus traffic. Thanks to these and other considerations, throughout the first half of 1913 the London County Council tramways lost ground at an alarming rate, while the omnibus receipts rose with corresponding rapidity, the situation giving rise to the popular impression referred to above—that the omnibus was going to supersede the tramway. It proved, however, that appearances were deceptive, and that the set-back to the tramways was but a temporary one. The turn-over of traffic to the omnibuses was largely due to a great increase in the number of these vehicles in service, and the rate of the increase in their receipts was not maintained; the omnibus traffic showed signs of having reached the limit of its expansion, and tended towards a steadier value. On the other hand, the management of the tramways was stimulated by the severity of the attack and introduced into the service a number of improvements, which quickly exerted a salutary influence upon the receipts. At the commencement of the year the tramways were losing about £2,000 a week to the omnibuses, and by the end of March the receipts showed a total decrease of over £100,000; but the rate of decrease diminished and reversed, and steady improvement was maintained during the latter part of the year. The recovery was due mainly to numerous reductions in the fares, and the issue of cheap return tickets, as well as to minor changes in the conditions, which resulted in a greatly increased volume of traffic.

The Council's experiment with eight trailer cars has proved very successful, and as soon as the sanction of the Board of Trade can be obtained to the

extended adoption of this system a large number of trailers will be put into commission. The Council have also experimented with petrol-electric cars, but the result has turned out unsatisfactory.

PROGRESS IN THE PROVINCES.

Not only in London, but also in provincial towns the spirit of progress has been in the air, and whereas many believed that a stage had been reached at which the tramway was near the limit of its usefulness, there has been abundant proof that plenty of scope remains for invention and improvement in tramway methods. For one thing, the necessity for increasing the speed of the cars has been impressed upon the attention of local authorities by the continuous acceleration of other means of transit, and many of them have obtained the sanction of the Board of Trade for this purpose.

Five municipal authorities have inaugurated experimental trials of petrol-electric tramcars, and on the Stirling-Bridge of Allan tramway the company has put in service a petrol-driven car. It is of interest to note that on the Karachi tramways, in India, petrol-driven cars have proved extremely successful, converting a losing business into a thriving concern; in this case the line was too short and the traffic too small to justify electrification. The cars run satisfactorily on the old horse tramway tracks, and weigh only $3\frac{1}{2}$ tons each, carrying forty-six passengers. The use of vestibules on cars to protect the drivers is extending, and marked improvements have been made in the construction of radial trucks, which enable a long wheel-base to be secured, with resulting benefit to the comfort of the passengers and the life of the cars, whilst retaining all the advantages of the four-wheel truck with a motor on each axle. The use of boxes on the cars for used tickets has been found advantageous, reducing litter, while the sale of waste paper pays for the cost of the boxes. Collapsible wind screens have been devised, in place of vestibules, and have the advantage that they do not impede the view of the driver. The Bradford Corporation have commenced building vestibule cars, with pneumatic brakes. At Aberdeen and York the use of trailer cars has been sanctioned by the Board of Trade, and several other municipalities are seeking powers. Sheffield Corporation have experimented with an ingenious device for counting the number of passengers on the top deck, without requiring the conductor to ascend the staircase. In Huddersfield has been adopted an improved double-deck car, which enables passengers to leave at the driver's end on the near side, saving time and preventing accidents. All-night cars are under trial at Manchester, but the results have not been very satisfactory. Sheffield Corporation decided to link up the tramway power-station on Kelham Island with the electricity supply station at Neepsend, for the sake of economy in capital and running costs. A new trolley wire has been introduced, giving perfectly smooth running at the points of suspension.

RAILLESS TROLLEY SYSTEMS.

The progress of the railless electric trolley car has, of course, been a noteworthy feature of the past year. A new installation was put in operation by the Keighley Urban District Council in June, and was of especial interest in that, unlike those previously installed in this country, the cars were not fitted with trolley poles to collect the current from the overhead wires, but were equipped on the Cedes-Stoll system with collectors hanging on the overhead conductors, and towed after the cars with flexible cables. On this system, too, there is no gearing, the motors being built into the wheels and thus driving them directly. The tram-

way manager, Mr. H. Webber, reports that the installation has given every satisfaction, although the vehicles were not specially designed to suit the local conditions, and the system has proved very popular; he has had four years' experience with motor omnibuses on the same route, where they proved a failure, and he is thus in a unique position to compare the respective costs and other performance of the two types of vehicle.

Mr. Webber states that the motor omnibuses cost 15d. per bus-mile to run, while the receipts were only 11½d. The railless car, on the other hand, costs about 10d. per mile (inclusive of capital charges), and the revenue is 12d. per car-mile. Moreover, a careful watch kept on the road surface indicates that the wear due to the railless car is about one-fourth of that caused by the omnibus, and the wear on the tyres is less in about the same proportion. The experience of the Tramways Committee with the trial length of 1¼ miles has been so favourable that in all probability the remaining routes will be equipped on the same system.

The first combined tramway and railless omnibus system to be carried out *ab initio* was opened at Aberdare in October; it comprises 2¼ miles of tramway and 3½ miles of railless route, the latter consisting of four branches, acting as feeders to the main tramway line. The gradients on the railless routes in this district are hilly, the steepest being 1 in 9, but the cars surmount them without difficulty. Here also the Cedes-Stoll system was employed. The railless trolley system is also in use at Leeds, Bradford, Dundee, Rotherham and Ramsgate, and a number of other installations are under way. In the case of the Brighton-Hove system, a double-deck railless car has been approved by the Board of Trade, the first of its kind in this or any country. Other installations that may be mentioned are those at Chesterfield, Rhondda and Mexborough.

THE MOTOR OMNIBUS.

To the tramway manager the motor omnibus has two distinct aspects: that of a competitor, and that of an auxiliary. As mentioned above, the provincial authorities are in a position to prevent competition from private motor-omnibus ventures in their areas; the main question, therefore, from their point of view, is whether the motor-omnibus or the railless car is the more profitable type of auxiliary vehicle to employ in conjunction with their tramway systems, and this subject was dealt with at the Conference of the Managers' Section of the Municipal Tramways Association at Sunderland in June, when Mr. C. J. Spencer, of Bradford, read a paper on the respective merits of the rival types. He regarded the addition of a large number of petrol omnibuses to an extensive tramway system as sound, but considered that the use of a small number of omnibuses was inadvisable, on account of the relatively high cost of the special skilled labour necessary to keep them in repair. In his view the total cost of the omnibus worked out at 10d. per mile, against slightly over 7d. for the railless car.

Another question was exhaustively discussed at the Conference of the Association at Sheffield in September, in a paper by Mr. J. B. Hamilton, of Leeds; unfortunately there was little time for general discussion of the figures which were put forward by the author of the paper, but on the face of it, he made out an overwhelming case for the tramway.

When all the important factors are taken into account, including the maintenance of the roads by the tramway authorities, and the return in rates on the undertakings, the total monetary benefit derived by the twenty-seven British towns of more than 150,000 inhabitants works out at over 1½ millions sterling, whereas if motor omnibuses

were substituted for the tramcars, even when favourable costs were taken, the result would be a loss of over 2½ millions—a total difference of more than 4 millions. Apart from the working costs, Mr. Hamilton pointed out that the motor omnibus had seven times as many fatal accidents per vehicle, and twice as many injuries per million passengers, per annum, as the tramcar; that the cost of providing transport by motor omnibuses was twice as great per seat as in the case of tramways; and that in fine weather two, in wet weather four, omnibuses would be necessary in place of each tramcar. As an auxiliary, however, the motor omnibus has been found decidedly serviceable, and numerous municipalities have acquired a number of them, in addition to some twenty authorities which are about to purchase them or to obtain powers to do so. Sheffield Corporation propose to obtain authority to send their omnibuses into the adjoining districts. Edinburgh is going to experiment with petrol-electric omnibuses in conjunction with the Tramway Company.

THE PAY-AS-YOU-ENTER CAR.

Although the conditions prevailing in this country differ materially from those in America, where the "P.A.Y.E." system came from, it has proved very successful in the few instances in which it has been tried on this side of the water. The main difficulty is the rare occurrence of a uniform fare for any distance, which was held to be a fundamental feature of the system, but this has been demonstrated to be a mistaken view. At Aberdeen, after twenty-one weeks' operation, it was reported that the passengers had taken kindly to the system, and had their fares ready before boarding the cars. The system, according to the manager, Mr. R. S. Pileher, was much safer for the passengers, as the conductor was always on the rear platform; a longer time was taken to load up the car at a busy terminus, but time was saved en route, as passengers could leave at both ends of the car. Moreover, all the fares could be collected. In June a partial prepayment system was adopted in Bradford, the fares of the top-deck passengers being collected by the conductor on the platform. Mr. Spencer reported that the number of accidents to passengers when alighting had been halved, and the number of cases of passengers having no tickets or over-riding their destination had been very considerably reduced. Very good results were obtained also at Leicester, although a great variety of fares and tickets was in use there. On the other hand, at Liverpool the experiment gave unsatisfactory results.

LEGAL AND PARLIAMENTARY.

A serious blow was struck at the tramway by the House of Lords in July, when the judgment of the Appeal Court in the famous case of *Tottenham Urban District Council v. the Metropolitan Electric Tramways, Limited*, with regard to the rating of Light Railways was reversed. Although the Board of Trade, in introducing the Light Railways Bill in 1896, stated that it would cover the construction of tramways, and the Bill was also introduced into the House of Lords with the same statement, Lord Moulton declared that such construction was an abuse of the Act, and the judgment of the House required all tramways thus constructed to pay the full rates, instead of one-fourth of that amount. The chief sufferers from this decision, however, will be tramway companies, as the municipalities that own such tramways will only have to transfer the money from one account to another, and those which do not own the tramways will, of course, benefit by the increased payment of rates.

A movement has been set on foot, at the initiative of Mr. T. B. Goodyer, of the Croydon Corpora-

tion Tramways, to urge the Government to legislate upon the lines of the report of the Select Committee on Motor Traffic with regard to motor omnibuses, having in view the advantages derived by the latter from their free use of the public roads, and their exemption from the payment of rates and carrying workmen at cheap fares, and the matter received attention at the Municipal Tramways Association Conference, the obligation imposed upon the tramways to pay for the maintenance of a portion of the roadway which they do not wear out, as in the days of horse tramways, being regarded as a particularly sore point. The payment of bonuses to tramway employees was objected to by the auditor at Belfast, who surcharged the members of the Committee responsible for drawing the cheques; the matter will, of course, be the subject of appeal.

GOODS TRAFFIC BY TRAMCAR.

The possibility of utilising the street tramways for the conveyance of goods has frequently been the subject of discussion and experiment—even of litigation; last year it was brought to the front again by proposals to follow this course in South Lancashire. The late Mr. Bellamy, when manager of the Liverpool Corporation Tramways, put forward a scheme, which, however, fell through owing to his death. His successor, Mr. C. W. Mallins, has been advocating a similar project, with the object of relieving the increasing congestion of traffic in the streets, due to the volume of goods traffic to and from the docks having doubled in amount without corresponding improvements being made in facilities for transport on land. Much of the work is still done by horse haulage in a primitive fashion, and at high rates. The passenger traffic is too dense to permit of the use of the existing tramways for the transport of goods, but it is thought that storage-battery vehicles would serve for traffic between the docks and the stations and warehouses, while new lines, or a railless system, would have to be laid down for the service of the mills and transport to other towns. The scheme outlined by Mr. Mallins deals with the matter broadly, for the benefit of South Lancashire and Yorkshire, and the South Lancashire Tramways Company is prepared to co-operate with the Liverpool Corporation in carrying it out. Goods wagons are in use at Burnley and elsewhere.

THE BATTERY VEHICLE.

It seems appropriate to mention here the movement which is now on foot, under the auspices of the Municipal Electrical Association, to promote the development of the commercial electric battery vehicle in this country. In America some 20,000 electric automobiles are in service, and the charging of their batteries affords a most useful and profitable load for the central stations. Up to last year little progress had been made in this country, but an energetic committee representing all interests was formed by the Municipal Electrical Association in September, and outlined a propaganda with the object of urging supply authorities to provide charging facilities, to standardise the arrangements for charging and other details connected with the business, to offer energy for this purpose at a low price, and generally to assist in popularising the electric vehicle in every possible way. Some of the station managers have already taken active steps in this direction, and a fair number of vans and other vehicles were put into service in London during the year.

GENERAL DATA.

The annual return of the Board of Trade, recently issued for 1912-13, shows that the tramways of the country aggregated 2,662 route miles, of which 1,818 were owned by 171 local

authorities, representing a total outlay of £54,500,000; railless trolley routes, all owned by local authorities, amounted to 13 miles. During the period the number of passengers carried was equal to about seventy-one times the population of the United Kingdom, and the ratio of working

expenses to receipts was 62.68 per cent. The nett receipts of local authorities owning tramways amounted to £1,095,957, and £544,478 was paid in relief of rates, against £61,988 aid from the rates. The capital expenditure per mile of single track for all undertakings averaged £18,229.

WATER SUPPLY.

A comprehensive review of the water supply question made from day to day at the present time would, if complete, occupy considerable space. If it were a weekly review it would of necessity have to be of a condensed and cursory character, so many and various are the matters to be dealt with. When, however, the work of a whole year has to be considered, the reviewer is at once overwhelmed with the mass of evidence before him, and may well shrink from a task so formidable. Further, the greater his knowledge the less confidence will he feel. Certainly at no period in the world's history have so many great water works been under construction, in operation, or in contemplation, and never have so many workers been engaged in considering and in dealing with the subject from every possible standpoint. To treat the year's work in such a manner as to gain a profitable retrospect it is best to divide the subject under certain headings and to give such facts and instances as will best illustrate the progress made.

WATER SUPPLY A MATTER OF NATIONAL IMPORTANCE.

Perhaps the most noticeable thing with regard to water supply in our country at the present time is the growing demand that the question shall be dealt with as a whole. This demand is shown in various ways, but chiefly by the increasing expectation that systematic observations shall be taken and returns made as to all sources of supply. The recommendations of the Royal Commission on Sewage Disposal were followed by those contained in the Report of the Royal Commission on Canals and Waterways and by those of a Parliamentary Committee, all in close agreement; but there are many other bodies and persons whose efforts and work constitute a growing power which will ultimately produce a much needed reform.

During the year our appetite for information has been quickened by a large number of reports and similar information received. The rainfall returns, the publication of the memoir of the Geological Survey on the London wells, the constant repetition by various authors of the information given in the Royal Commission's Report on Canals and Waterways, and of the complaint therein made as to the absence of trustworthy evidence as to the flow of streams, Sir Alexander Binnie's recently published work on rainfall reservoirs and water supply dealing with the question of the run-off from land, Mr. Baldwin Latham's paper on water and water supplies read before the Louth Naturalists' Antiquarian and Literary Society, and many other similar works have tended to direct the minds of water engineers and others interested in the subject to the importance of obtaining accurate information as to the sources of our supplies and also as to the great difficulty of doing so. Mr. Dunwoody, at a recent meeting of the Institution of Sanitary Engineers, urged young engineers to spend their spare time in the much-needed work of gauging streams.

This alone demonstrates the position we are in. A great deal of work is done by private individuals and by water authorities in recording the levels of water in wells and so forth, but even where such information has been made public it exists in a scattered form in numerous books, published transactions, and technical journals,

and it cannot be collected hurriedly when wanted. The Local Government Board are collecting certain data, but this has not as yet been published. Mr. J. Chisholm, at the recent meeting of the Institution of Water Engineers, drew attention to the need that water authorities should be compelled to make returns to a Government Department, giving particulars of their works. Here again we see the expression of the same feeling of the growing need for the systematic consideration of the waterworks question as a whole.

Legislation long expected does not appear to have made any considerable advance during the past year, and we still wait for the formation of a Central Authority. All are agreed as to the need for the legislation, seeing that it vitally affects every member of the community, but we nevertheless acquiesce in the delay, being attracted by the seeming importance of matters which are relatively of very small value. Whether the year 1914 will show any advance remains to be seen. The delay is certainly an adverse comment upon our present methods of Parliamentary procedure.

THE METROPOLITAN WATER BOARD.

That it is possible for a water authority to prepare and to present such statistics and information as are required is made evident by the admirable annual reports of the Metropolitan Water Board. This, the greatest water authority in the world, including as it does the works of several older water companies, finds it necessary to consider its area as a whole, and in order to do so obtains the fullest and most exact information, which it records and publishes. Similarly, if the water supply of the whole nation is to be properly and economically dealt with, the same methods as are applied to the metropolitan area must be applied to the whole country.

We see that the total rainfall on the whole of the valleys of the Thames and Lea is gauged and its quantity estimated, the flow in the rivers is carefully gauged and the results are compared. Thus at once the run-off of the watersheds during the different months can be compared with the flow in the rivers, and we are provided with valuable data which is of use under similar conditions. The same praise may be given to the work done in connection with all the various departments of the Board. Dr. Houston's work is well known, and the careful and continual examination of the London water and the published records of this work are of value to the world.

WATER PURIFICATION.

The Purification of water as regards disease germs has perhaps not aroused so much interest and discussion in the past year as was the case during the years which have immediately preceded it. This is due to the fact that methods which were then on trial have now been finally accepted or rejected, or have, at any rate to a great extent, fallen into their proper places, and are among the ordinary accepted processes applicable according to the special requirements of each case. It may be said that there are in this country two schools of thought. First, those who regard pure water as a manufactured product, and next those who demand in all cases water pure at the source.

Both opinions are to be treated with respect, but there is an intermediate class of persons whose opinion is really, consciously or unconsciously,

that money must be saved at all costs. Such persons possessing a supply which is known to be of inferior quality belittle the risk, and object strongly to any suggestion of carrying out works in order to obtain water from a purer source. They object even more strongly to the use of any artificial process of purification. They do not want their water "doctored." This intermediate class, priding itself on its common-sense, carries considerable weight, and is probably the chief cause of a large amount of expense, ill-health, death, and general distress, particularly among the poor.

The fall of the death and disease rate wherever a purer supply of water has been distributed to the people supports the contention of the medical scientist, and proves the wisdom of the accepted principle that a pure supply is necessary. The worst water may be purified by proper treatment where, as is often the case, a perfectly pure supply cannot be obtained at the source. Indeed, the opinion held by some of the highest authorities is that no water exists which is absolutely free from contamination, or which, from one cause or another, does not need treatment. Thus, on the grounds of economy alone, one water needs treatment to reduce its hardness; another to remove its corrosive qualities productive of lead poisoning or wasteful corrosion of iron pipes; another to prevent the formation of animal and vegetable growths producing clogging and incrustation of mains and other troubles; another to prevent unpleasant tastes and odours due to algal growths, and so on. There are, in fact, few supplies, if any, that do not need treatment of one sort or another for the sake of public economy alone, without regard to the question of disease germs. The work of the past year has brought this fact prominently forward.

THE TYPHOID GERM.

It is interesting to consider some of the work recently done by Dr. Houston together with that of the Royal Commission on Sewage Disposal. The officers of the Royal Commission have shown that where the volume of a river is enough to provide proper dilution to sewage discharged into it, the natural purification effected is sufficient to prevent any possible nuisance. They leave the water authorities, however, to purify such water as may be abstracted from the river for domestic use. Dr. Houston, on the other hand, having examined samples of sewage polluted river waters, reports an absence of typhoid germs, and not only so, but he also fails to find these germs in various samples of sewage collected from the large towns.

While this does not prove that typhoid germs are never present, it tends to show that they are not so generally present as is ordinarily supposed, and that sewage pollution does not necessarily mean typhoid pollution. However, seeing that typhoid cases may at any time occur in a town, there is always a potential danger which must be guarded against, and it is notable, and should be thoroughly grasped, that at no time has Dr. Houston advised any relaxation of protective measures; he has merely pointed out that the sewage-polluted water may not be so dangerous as regards typhoid fever as was formerly supposed.

There is, moreover, another point which is often lost sight of. The bacteriologist is the first to admit that his science is in its early stages, and that complete reliance as to the safety of a supply must not be based on the bacteriological test alone. Experience through the ages has shown that cleanliness and a pure supply of water promote health and well-being. The exact causes are not known to absolute certainty even yet.

It is quite possible that in the future the scientist will discover other causes yet undreamed of for disease arising from dirt and from the consumption of polluted water. We

have found by bitter trial and error, not by scientific investigation, the value of pure water, and though the scientist is now finding out slowly the various causes, it would be rash and foolish to place entire dependence upon theoretical observations, and to ignore previous experience. That this view is correct may be seen from the numerous reports of chemists and bacteriologists upon sources of supply in which they urge the strong necessity of a careful examination of the surroundings on the ground. They refuse absolutely to be bound by a standard: that is to say, they decline to admit that a water of a certain chemical and bacteriological character, approved in one case after examination of the conditions, is fit for use elsewhere where the conditions are unknown.

FILTRATION.

During the past year we have had before us numerous instances of water purification on the largest possible scale. It is evident that nothing is impossible. Waters of all kinds are treated in a variety of ways and are made fit for public consumption by the removal of hardness, corrosive qualities, iron and other objectionable characteristics; falling death and disease rates prove the satisfactory nature of the various processes. Waters containing matters in suspension and solution are treated in precipitation tanks, chemicals are added to produce coagulation varying indefinitely according to the nature of the water; purification by long storage in reservoirs allowing for natural precipitation and for the devitalisation or destruction of bacteria is now working in London: filtration through slow sand filters when efficiently carried out still holds its own, although in a very large and increasing number of cases it is found to be better, more economical, and more productive of the continuity of good results to use mechanical filters. These are now used for the very largest supplies, as may be seen elsewhere in these pages. Plants to deal with three or four million gallons per day are becoming common. It is not very clear why the sand filter with rotary distributor is not more in use.

We have in this country an excellent example at the Bedford waterworks, where slow sand filters and sprinkler sand filters are working side by side, entire preference being given to the sprinkler filters after several years' trial. The objections of short circuiting and unequal working applicable to the slow sand filter do not apply to the sprinkler filter, while the purification effected by the sprinkler filter is superior. The chief disadvantage experienced in slow sand filtration is the speedy clogging of the surface of the sand whereby the effective life of the filter is limited. This difficulty is overcome by the sprinkler filter.

THE PUECH-CHABAL FILTER.

Again, the Puech-Chabal filter also does away with the same difficulty. This filter consists of compartments filled with materials of differing grades, and is too well known to need detailed description. The system has been installed at several important waterworks in England and also abroad, and one has only to refer to such works as Cherbourg, Paris, Pau, Port Said, the Derwent Valley at Bamford, and Cawnpore, India, all of which are large works and have been photographed, the illustrations being published in the December issue of *Water*, to show the manner in which this new system is being universally adopted.

STERILISATION.

Where owing to the particular conditions of the case sterilisation is required the work of the past year shows the continued good results of hypochlorite sterilisation, which from the number and importance of the works at which it has been adopted, and from the extraordinary improvement

in the death and disease rates which has been recorded as a result of its application, is by far the most important system at present in use. This, however, refers chiefly to America and England. On the Continent there is a strong prejudice against the method. One may refer to the case of Paris, where recently the authorities had to draw 35,000 cubic metres from the river Marne, and in this emergency Dr. E. Roux advised treatment with sodium hypochlorite, but only as an exceptional measure. Similarly M. A. Calmette did the same during a recent cholera epidemic at an institution at Marseilles. There are signs, therefore, that the prejudice against the hypochlorite system is giving way in France.

Although the ozone system is well in evidence in France, it does not appear to have gained much ground generally. In this country there has been little reported beyond the examination made by Messrs. W. J. Dibdin and Son on behalf of Messrs. Ozonair, Limited, of water treated in an ozonising plant erected at Knutsford.

The method of treatment by means of the ultra-violet rays has made some progress in France, where it is being used for the purification of fairly large supplies, apparently with satisfactory results. It is, however, somewhat disappointing that this process, which appears to have so many advantages, is not applied on a proper commercial scale in this country. It seems, however, that this new method of sterilisation of water has been developed to such a point as to be commercially useful. We are told by Mr. Max van Recklinghausen that in Marommes les Ronen 100,000 gallons of water are treated daily, while another supply of 1,700,000 gallons per day is being treated elsewhere, and one may gather that certain other supplies of similar magnitude are being treated by the ultra-violet rays in France. But as yet we wait for the working figures and the full particulars.

LIME TREATMENT.

Much attention has been given to the treatment of water with lime during the past year. Dr. Houston, in his eighth report on research work to the Metropolitan Water Board, dealt with the softening, purification, and sterilisation of water supplies by means of lime. The lime process was suggested for sterilisation primarily, and secondarily and incidentally for softening purposes. The idea of using lime as a sterilising agent was new in ordinary waterworks practice, though apparently it was no new idea to the chemists, as both Dr. Rideal and other chemists in published papers have stated. In Dr. Houston's method the water was to be overdosed with lime, so that the method was only suitable for such a case as he had in view—viz., that of London, where some part of the raw water is of inferior quality, and this after being treated with the lime could be mixed with at least 25 per cent. of pure water.

Mr. G. C. Whipple, in a paper read before the New England Waterworks Association, dealt with the addition to plumbo solvent waters of lime in the form of powdered chalk, advocating somewhat cautiously the accepted English methods. Mr. William T. Burgess, in a paper read before the Institution of Water Engineers, dealt also with the lime treatment of water both for softening and hardening purposes. Mr. F. J. Dinan also dealt with the same subject at the same meeting. The American chemists, Messrs. Hoover and Scott, of the Columbus Waterworks, have claimed and apparently proved the sterilising power of lime when added to the water in doses sufficient to remove the hardness without any overdosing. We find the manufacturers of softening plants also claiming the merit of sterilisation for their processes.

It is evident that lime is not only useful for

softening water, it is useful also when added to water containing carbonic acid in neutralising the acid and in removing plumbo solvent qualities; further, if added in proper proportion, it will prevent the corrosion of iron pipes, it being found that the thinnest possible film of lime acts as a preservative. Finally, there is the use of lime as a sterilising agent, as advocated by Dr. Houston, for, although his statements have been severely criticised by chemists, no one has suggested that the sterilisation is not effected.

CHLORINE GAS.

The sterilisation of water by chlorine gas has been tried in America recently. Compound chlorine liquefied under pressure is sold in cylinders. The gas is mixed with the water, and, combining with the hydrogen of the water, forms hydrochloric acid, while oxygen is liberated, and this nascent oxygen performs the work of sterilisation. The process has been severely criticised by chemists, who consider that it does not compare favourably with the hypochlorite method. Dr. Eric Rideal's criticism, which appeared in these pages, will be remembered.

MICRO-ORGANISM TROUBLES.

The causes of the clogging of mechanical filters have received considerable attention, and recent experience shows that the degree of clogging does not necessarily vary with the degree of turbidity of the water, but that certain micro-organisms tend to produce trouble. High turbidity may produce clogging of one kind, while the low turbidity in warmer weather is sometimes accompanied by clogging of another kind, due to the presence of micro-organisms. The remedy appears to be the sterilisation of the clear water before filtration, a simple matter. Considerable trouble has been experienced owing to the presence of algae in storage reservoirs, and a great deal of work has been done in investigating the causes. Generally speaking, it is found that the difficulty may be overcome by treatment with sulphate of copper. The chemist, as a rule, seems to have little difficulty in setting matters right. It is notable, however, that the presence and growth of the various forms of vegetable life which give trouble are not constant, neither do they vary with the seasons with any great regularity.

Whatever the causes may be, these reservoir troubles are intermittent, and not easily accounted for. The importance of the question is considerable owing to the large number of great storage reservoirs and to the ever-increasing number of supplies obtained from rivers and upland sources. In London we have had some small experience of algal troubles, and there is, of course, the possibility of the same troubles occurring on a much larger scale.

The investigation which the matter is receiving is therefore most necessary, and it is satisfactory to note the success which has attended the efforts of the chemist. The new principle of purification by storage suggests that the water admitted, viz., water needing such purification, might reasonably be expected to support or produce algal growth in a greater degree than water of purer quality; therefore it is probable that the principle of purification by storage has its limitations, and that flood waters of inferior quality will need preliminary treatment, as mentioned elsewhere.

THE CORROSION OF IRON.

The causes of the corrosion of metals by water have received an unusual amount of attention during the past year. While the metallurgist is endeavouring to prepare metal which shall be proof against ordinary water corrosion, the chemist is engaged in investigating its causes. Also the various methods of protection are receiving considerable attention. Dr. Eric Rideal's paper upon the corrosion of iron, read at a recent meeting of

the Society of Engineers, is still fresh in our memory. The paper read before the Society of Naval Architects and Marine Engineers of New York by Lieutenant-Commander Frank Lyon, Mr. William Ransom's paper upon the corrosion of water mains read before the Municipal and County Engineers, and many others may be mentioned.

In the present state of our knowledge we have no complete and satisfactory preventive or cure for the corrosion of pipes, but we are learning more and more about it every day, and we have at any rate reached a stage when it is worth while to consider the quality of the water in a pipe as well as the material of which the pipe is composed. We have to consider the corrosive action of acids and electrolytic action. If the acids are neutralised much corrosion may be prevented. One of the most interesting contributions to the discussion of the subject was Messrs. George and Melville Whipple's paper, read in 1912, describing the experiments made in order to ascertain the causes of pitting in steel pipes. These experiments, which were dealt with fully in these pages, seem to prove that the pitting is entirely due to electrolytic action, which occurs owing to differences of potential between the scale covering the steel and the metal underneath, and it should be remembered that in the experiments with steel plate from which the scale had been removed by grinding with emery absolutely no pitting took place under the same conditions that produced pitting in the same plate with its scale on. It has been shown that cast-iron mains and steel mains will rust under certain conditions, and practical experience has sometimes shown that the steel pipe is the less liable to corrosion of the two with a water of given quality.

After carefully considering the work done up to the present time, it seems as if in the future we should endeavour to prevent corrosion rather by treatment of the water than by altering the nature of the metal. Coating on the outside rather than upon the inside may in the future be considered the most important. While we can do away with the corrosive properties of the water by treatment, and even apply a preservative coating to the interior surfaces of the pipes by means of the water far more effectively than we can by other means, we cannot as easily deal with the corrosive agents which may exist in the ground. For instance, the corrosion of the Kalgoorlie mains was arrested by treatment of the water with lime; while the steel main mentioned by Mr. Ransom in his paper as having been severely injured by sulphuric acid in the soil, resulting from the oxidation of pyrites present, was coated with bitumen in order to arrest the corrosion.

INCrustation of Mains.

The causes of the incrustation of water mains have received considerable attention lately. This is no doubt due to the disappointing experiences of certain water authorities, who, having spent very large sums in order to obtain a water of absolute purity from upland gathering grounds, have discovered that their mains rapidly become coated on the inside with growths which affect the quality of the water and also reduce the volume of the delivery. Where supplies are derived from wells or underground sources, or where the water has been properly filtered, the incrustation due to animal growths is not to be expected, but where it is derived from rivers or upland sources the growths are apt to become apparent.

The subject of animal growths in water mains was dealt with by Mr. Samuel C. Chapman in a paper read at the summer meeting of the Institution of Water Engineers, and is of great interest. But whether the incrustation of mains results from animal or vegetable growths, corrosion or natural deposit, it is clear that the trouble may

be overcome by proper treatment of the water. External corrosion is to be overcome by efficient coating and electrolysis by efficient insulation.

STEEL MAINS.

Many engineers at the present time are halting between two opinions as to the desirability of putting in new pipe lines in cast iron or steel. Probably the chief stumbling block is the fact that the Local Government Board demand the repayment of a loan for steel mains within a short period. It seems possible, however, that when the work of the chemist is more complete, and when he and the engineer can show and prove conclusively that the water will be treated in such a manner as to remove the risk of internal corrosion, the Board will be able to change their policy. In the meantime, ascertained facts show the rapidly increasing confidence of engineers in steel mains. In many cases the steel main is being used to replace the cast-iron pipe. In the Colonies an enormous amount of steel pipe shipped from this country is being used.

We hear of the use of steel pipes at Belfast, Burnley, and in many other towns in this country. One occasionally observes long lengths of steel main being laid in London. And we have occasional reminders that the cast-iron main is not absolutely perfect by the bursting of a large pipe and the flooding of London streets in a manner which could not possibly occur with the steel main.

ARTIFICIAL REPLENISHMENT OF CHALK SUPPLIES.

The suggestion made in the recent memoir of the geological survey dealing with the London wells is of great interest. This suggestion is the replenishment by artificial means of the vast underground reservoir which exists in the fissures of the chalk underlying the whole of the London district. It is definitely advised that water falling upon the land outside London should be collected and drained into dumb wells sunk to the Thanet sand.

The experiments of Mr. Bryan, the chief engineer to the Metropolitan Water Board, showed that it was advantageous to pour a vast quantity of filtered water from the River Lea into the wells and galleries at Lea Bridge. This had the effect of keeping the water level in the chalk up in that locality and of raising it for a considerable period in spite of increased pumping. It must be remembered that in the London district there exist a very large number of wells, and these have multiplied considerably owing to the increased water rates. Many large institutions, breweries, office blocks, and so forth, have their own wells, it being found possible to obtain a pure water in sufficient volume by simply boring through the London clay into the chalk. The result of this large abstraction has been to lower the water level in the chalk under London 100 feet or more, and it is evident that if steps are not taken to lessen the pumping or to increase the quantity of water in the chalk that in time a great many important private supplies will run short.

One can imagine that the Metropolitan Water Board might regard the occurrence with complacency. On the other hand, if the supply in the chalk were artificially increased the Board might themselves benefit by it. An area of impermeable material of about 200 square miles' extent exists upon which in a moderately wet season some 15,000 million cubic feet of rain descends. This area of impermeable material exists in the London district, and none of the water falling upon it can enter the chalk, but a great deal of it could be made to do so, and this is pointed out very clearly in the geological memoir. The suggestion is startling, but it has without doubt been made only after the most careful considera-

tion, and it points to considerable possibilities in the future as to the artificial feeding of certain water-bearing strata.

PUMPS.

The progress of the rotary pump has been dealt with somewhat fully in these pages in previous annual reviews. This remarkable advance is due largely to the use of electric motors and steam turbines and high-speed engines generally. The efficiency of the centrifugal pump is high; it is cheap, and occupies small space. Though first used for low lifts, it has been adapted with success for very high lifts by working in series. As stated in the *Times Engineering Supplement*, a pump recently made for the Westinghouse Machine Company, of East Pittsburg, designed to lift 1,600 gallons of water per minute against a total head of 700 feet, making 1,450 revolutions per minute, has a maximum efficiency of 80.5 per cent overall when delivering 2,600 gallons per minute against a head of 480 feet. Special designing for particular cases, as distinguished from the indiscriminate adoption of standard designs, is essential in order to obtain the best and most economical results.

It is from failure to grasp this point that unsatisfactory results have occurred in the past, and the matter should be taken to heart. Among new types the Rotoplunge pump deserves attention. The following description is taken from the *Times Engineering Supplement*.

THE ROTOPLUNGE PUMP.

The piston-type rotary pump, developed in South Wales by the Rotoplunge Company, has yielded some interesting results as regards efficiency and smallness of slip. In this pump a cylindrical casing, having an inlet and outlet for the water, encloses a revolving casting, in which twelve radial cylinders are bored. In these cylinders are pistons, which are attached by pins to a connecting piece common to all, on which piece are projections fitting into an eccentric guide-groove in each of the end covers of the pump. The casting is rotated by the shaft, and as it rotates the pistons move alternately inward and outward, owing to the eccentric guides in the end covers. These guides are so situated that any piston is at its outward extension when the corresponding cylinder is at the top point of the revolution of the drum, while at the opposite point of the diameter vertically below the shaft the piston is at the innermost point of its stroke. At these two points, and for a distance on each side sufficiently great to cover the width of a cylinder, is a dividing segment closing the outer ends of the cylinders, but at all other points around the rotating drum the outer ends of the cylinders are open to either the inlet or the outlet of the pump. An outward motion of the pistons, therefore, forces the water through the outlet of the pump, the inward motion of the pistons drawing the water from the inlet. The dividing segments close the suction side from the delivering side. There are no valves to become choked, and the harmonic motions of the pistons acting in succession give a steady stream of water without shock; the pump is positive in its action, and therefore requires no priming, besides working equally well on the slowest as on the highest speed; and a vacuum within half an inch of the barometer can, it is claimed, be obtained.

In some tests made with a 12-plunger rotary pump of this type, each plunger being 7 ins. in diameter by 3 ins. in stroke and running at 200 r.p.m., the theoretical capacity was 160.4 cubic feet of water per minute. The actual delivery measured over a weir when the engine was exhausting into the atmosphere was 154 cubic feet per minute, giving a water efficiency of 96 per cent. When the stream from the engine was

passed into the pump the water output slightly improved, being 155 cubic feet per minute. The slip, therefore, had the low value of about 4 per cent.

A considerable amount of work has thus been done recently in the direction of establishing the position of the rotary pump in regard to reliability and efficiency. Its compactness, comparatively low first cost, and ease of maintenance make it a powerful competitor of the reciprocating type, and its importance cannot, therefore, be ignored.

THE HUMPHREYS PUMP.

The year 1913 was marked by the advent of the Humphreys explosion pump, about which so much has been written lately that it is unnecessary to refer to it in any great detail. The probable development of this pump for sewage lifting and for smaller installations of water lifting is of considerable importance.

ECONOMY IN POWER GENERATION.

The internal combustion engine has effected great economies in the lifting of water, and the use of the producer gas plant for pumping purposes and the great saving of fuel and working costs is shown by the work of the past year. This is, of course, chiefly notable in the case of the Humphreys explosion pump, where there is not only the saving of fuel, but the saving in the first cost by the omission of the engine.

Other instances are to hand showing an all-round saving where internal combustion engines of high power have worked alongside steam plant for the raising of water. But the year's work shows other possibilities. We have the inauguration of the Shuman sun-power plant in Egypt, whereby water is pumped with the steam generated by the heat of the sun. The use of sun power in tropical regions may in the future become a matter of great importance. Mr. J. Astley Cooper, in a paper read before the Royal Colonial Institute, demonstrated that the Sahara Desert receives daily an amount of solar heat equal to that produced by 6,000 million tons of coal.

The developments of water power are also very remarkable. In France it is estimated that 600,000 h.p. are now being utilised for the generation of electricity. Ontario derives five million horse power from the Niagara Falls. In Norway 500,000 horse power has been utilised, and a further 430,000 horse power will shortly be obtained. Italy will also soon be using 665,000 horse power derived from the fall of water. In this country we have not the same possibilities, but the hydro-electric works just completed upon the site of the old Dee mills for Chester include three turbines with an aggregate output of about 1,000 horse power, whereby the Corporation of Chester hope to obtain electricity at less than 0.3d. per unit.

It may not be possible to harness waterfalls for pumping purposes in many places, but it should be kept in mind, as was recently pointed out by Mr. W. B. Ellington in the Thomas Hawksley lectures, that our rainfall over the whole country is sufficient to give 100 horse power per square mile throughout the year if it could be utilised, whereas the quantity required for domestic use is less than 1 per cent. of the total rainfall, leaving 70 million horse-power hours per year available if it could be used.

RESERVOIRS.

The chief advance in reservoir construction during the past year is the growing use of reinforced concrete. For municipal work, however, certain facts have to be faced which have a very important bearing upon the question. First, the Local Government Board rightly or wrongly will not sanction a long-period loan for such work.

Notwithstanding this difficulty, however, such is the economy to be effected by the use of re-

inforced concrete that it may be found to be worth while to use the cheaper form of construction, the first cost being so much less that the annual sum to cover the repayment of the loan is the same as in the case of a long-period loan for the more costly masonry structure otherwise required, with the added advantage that the loan is paid off in half the time. A very large number of reinforced concrete tanks and reservoirs have been in course of construction in this country during the past year.

It is interesting to note that in order to provide an earthquake-proof fire service the authorities at San Francisco, after considering every known method, decided to instal a system of underground tanks in the streets. These tanks are formed of reinforced concrete, and are circular in form, and hold about 75,000 gallons each. There are no rigid pipe connections. The suitability of reinforced concrete for this purpose is clear; it has withstood earthquake shocks in the case of buildings. Where reinforced tanks have been made in waterlogged ground they have floated intact, and have been brought back to place without harm. Again, there are cases, such as that recently reported at Washington, in America, where, owing to an overflow of water, the foundations of a reinforced concrete flume, commonly called the Congdon Ditch, were washed away, and 41 feet of the flume were left unsupported, without any failure or harm occurring to the structure. Lastly, we have the convincing evidence afforded by the existence of reinforced concrete barges. The value of this form of construction where the ground is unstable is, therefore, evident.

Having regard to the extensive use of concrete in waterworks structures, the report drawn up by the Concrete Institute upon the subject of cracks in ferro concrete is very important. Surface cracking and body cracking in mass concrete are dealt with. Surface cracking is said to be due to the skin of the concrete being richer in cement than the body, while body cracks may be due to imperfect design or to contraction. Contraction joints in plain concrete are recommended at every 4 feet or 5 feet in the case of paving and at every 10 feet in the case of curtain walls, and in the case of exposed retaining walls at every 15 feet or 20 feet. In the case of basement retaining walls or of dock walls the distance between the joints may be increased to 50 feet.

SWIMMING BATH WATER.

The possibilities of the modern swimming bath as a medium for infection have often been pointed out in these pages, and the investigations of the Massachusetts Board of Health bear out the contention. It has been shown very clearly that unless a bath is emptied and refilled at frequent intervals some method of purifying the water is necessary. Methods of filtration and disinfection have been adopted, but it is fairly evident that unless the germs present in the water are removed the process is incomplete.

Very clear evidence is to hand that water, if properly purified, can be used over and over again. It can be satisfactorily cleansed and sterilised and restored to its condition of purity, and a saving of money can thereby be effected. The Belfast Corporation have installed purifying plant in their three swimming baths. As reported in the month of July, the bath first treated had not been completely emptied and refilled since the plant was started seventeen months previously. Only water sufficient to make up losses had been added during this period, the water having been kept pure and bright all the time. Bacterial analyses show the water to be as pure as the town drinking water supply. The water is filtered and treated chemically.

The installation of aerating and filtering plant for the treatment of the bath water of the Glasgow Corporation is also worthy of note. In this case a pump draws water continuously from the deep end of the bath and discharges it into an aerator, after which it is filtered, heated, and returned to the bath at the shallow end. Thus the same water is used over and over again for a long period.

There are several other instances in this country besides the well-known and often-quoted case of Poplar, where the bath water has been treated with electrolytic hypochlorite for some years past.

It should be understood that it is not sufficient to filter the water, but that some effective process is also required in each case whereby all bacterial impurities and disease germs may be eliminated. The success of this method of purification for bath water is striking confirmation of the theory that pure water is a manufactured product.

CONCLUSION.

Much might be said of the events of the year, such as the opening of Chingford Reservoir by His Majesty the King, the tercentenary of the New River, and the inauguration and completion of other great works, such as the Catskill supply for New York. The scanty reference to what has been done abroad is to be regretted, while there are many other matters of worth and interest mention of which within the space available is impossible. It is, however, hoped that the foregoing remarks may convey a true idea to the reader of some part at least of the work accomplished during the year 1913.

VAN PUTTEN'S PATENT STEAM ROAD ROLLER WHEEL SPRAYER.

The above patent attachment has evidently made a name for itself, as over 300 have now been fitted in various parts of the country, including Scotland and Wales, while a number have been shipped abroad, Bombay, Calcutta, Shanghai and Colombo being among the cities in which it is in operation. Its utility and economy have now been fully acknowledged. The following is a list of a few of the users—namely, J. G. Anderson, contractor (4), Camberwell Borough Council (5), East Sussex County Council (8), Dundee City, Essex County Council, Glamorgan County Council (9), Kingston Corporation (2), Lambeth Borough Council (4), Lewisham Borough Council (7), Lincoln City, Marshall & Sons (4), Middlesex County Council (3), Midlothian County Council (3), City of Oxford (2), St. Marylebone Borough Council (2), Southampton Corporation (3), Steyning District Council (3), J. Sparks, contractor (6), Wallis & Stevens (4), Wandsworth Borough Council (6), Wigtownshire County Council, Worcester Corporation (2), Worcestershire County Council (3), Zetland County Council.

Public bodies who do not own but hire rollers will find it a great advantage to have this apparatus fitted to the rollers.

A surveyor who hires has written the licensee saying he thinks the sprayers are excellent, and always insists on their being fitted to all rollers working for him. The apparatus, he states, effects a considerable saving in horse hire, and, what is more important, the work is carried out to perfection. Another well-known borough engineer writes that he had one fitted as an experiment only, but has since had the whole of his rollers, to the number of five, so fitted.

A saving of 5s. 6d. to 7s. 6d. per day is claimed to be effected by this attachment.

Full particulars and information can be obtained from Mr. W. E. Horsman, 127 Pendle-road, Streatham, London, S.W.

Water Supply in Renfrewshire.—The water supply to the Eastwood and Mearns district has been augmented by the turning on of the supply from the new reservoir at Bennan Loch in the parish of Eaglesham. The reservoir was constructed under the powers given in the Eastwood and Mearns Water Act (1907) to meet the needs of such growing parts of the area as Giffnock, Clarkston, Muirend, and Whitecraigs. Messrs. W. R. Copland & Sons, Glasgow, were the engineers.

Middlesex New Guildhall.

ARCHITECTURAL DETAILS.

MIDDLESEX NEW GUILDHALL.

In our issue of December 26th last the opening was briefly recorded of the New Guildhall erected at Westminster by the County Council of Middlesex. A description of the building, including reproductions of the plans, appeared in *THE SURVEYOR* as long ago as March 31, 1911, but we venture to think that our readers will be interested in some further details of the structure as illustrated by the accompanying photographic views, which we are able to present by the courtesy of the clerk to the county council, Mr. W. G. Austin.

The site of the new building covers an area of some 17,170 sq. ft., having a frontage of 102 ft. to Broad Sanctuary facing Westminster Abbey, and of 160 ft. to Little George-street.

The whole of the elevations have been executed in brown Portland stone, which after a few years' exposure to the weather will be greatly improved in appearance. The fronts are at present all one tone of colour, but when they have weathered and become varied in tone, and the carving and mouldings have been touched by the atmosphere, the whole building will become much more interesting and effective than it is at present.

The site of the guildhall is one of the finest in London, and surrounded as it is by historical and great public buildings, it made the question of the architectural design a very difficult one, it being quite impossible to compete with the big scale of buildings like Westminster Abbey or the Houses of Parliament, and a Classic treatment which would vie with the huge blocks of Government offices would have invited failure. No attempt, therefore, was made to design the building on a big scale, but rather to keep it quite distinct in style and scale so as to preserve its own individuality and act as a foil to the larger buildings near; somewhat in the same way as St. Margaret's Church enhances the scale of Westminster Abbey.

That spirit and form of Gothic giving a picturesque variety of features and a delicacy of detail was felt to be the most appropriate treatment, and the build-

ing should be considered as a dainty piece of ornament set among the austere and formal buildings of the neighbourhood.

The detail employed, while preserving many of the features and mouldings of the Later Gothic, has been imbued with a modern spirit of freshness in precisely the same way as the original Gothic must have been kept virile by the introduction of new detail.

If the design is sufficiently interesting to attract the attention of the passer-by, it has fulfilled one of the main objects of the designer. The chief features of the interior are the large entrance hall, with its stone columns and walls, in the centre of which is placed a marble bust of the late King Edward VII., executed by Mr. P. Bryant Baker. On the same floor are the two courts for the Middlesex Quarter Sessions, the larger one being 40 ft. long, 36 ft. wide, and 25 ft. high. The special feature of this court is the fan-vaulted roof containing the Royal Arms.

The second court is 40 ft. long by 30 ft. wide by 25 ft. high, is arcaded along one side, and has a coved plaster roof carried by big moulded oak beams, supported by stone corbels emblematical of the Law.

On the first floor will be found the committee rooms for the use of the county council. These vary in size and treatment, and are furnished in a style to suit the design of the building. In the majority of cases the walls are panelled, while the ceilings are treated with decorated plaster in low relief.

On the second floor are the council chamber and ante-room, the ante-room being panelled in oak. The council chamber is 54 ft. long by 36 ft. wide by 30 ft. high, and contains seats for ninety-seven members, besides galleries for reporters and the public. The lower part of the walls are panelled with oak, and the upper part is of stone, with large windows on each side, containing the arms of the Lords-Lieutenant of the county. The roof is formed by richly carved hammer beam trusses, the Arms of the county being carved in the oak.

The whole of the decorative stone carving has been designed by Mr. H. C. Fehr, and the following brief

description of the most important features will be of interest.

Over the principal entrance, and extending on each side, is a frieze portraying three scenes of historical interest, illustrated by figures almost life-size. On the left of the entrance is the "Magna Charta" King John granting the Charter to the Barons at Runnymede, and on the bosses under this frieze are the arms of (reading from the left) Earl Pembroke, Earl Salisbury, King John, and Earl Fitzwilliam. The central scene over the main arch of the entrance shows King Henry III. granting a Charter to the Abbey of Westminster, and on the bosses below are the arms of King Henry III., the Bishop of London, a Cardinal, and the Archbishop of Canterbury.

The keystone of the arch shows a view of the Great

Above the centre figure of Britannia is a figure of St. George, forming the apex of the gable.

On the upper part of the tower there is a richly carved band of Old English Heraldic Yales, lions, unicorns, with Tudor roses, thistles, shields and arms, all typifying the historical nature of the site upon which the tower is built, while the gargoyle figures show the four angels of the Winds and the four angels of Protection.

In the niche in the parapet of the tower is a figure of Government.

On the south front of the building is a richly traceried balcony at the first floor, supported by corbel figures of Law and Justice, and over this balcony is the Royal Coat of Arms to announce the use of the building as a court of justice.

The western entrance has a figure of Truth in the niche, while below are two small figures of Justice and Honesty.

Over the ground floor windows is a series of figures illustrating the toils of the Sea, Shipping, labours of the Land and Agriculture, Literature, Metalworkers, Engineering and Electricity, Commerce, Sculpture, Architecture, Painting, and Music.

In the interior of the building there are figures representing Law, Justice, Council, Government, and an amount of Heraldry, comprising the coats of arms of the Lords-Lieutenant of the county and others connected with the business of the County Council and the Quarter Sessions.

Among other decorative wood-work designed and executed by Mr. Fehr is a group of portraits of the Kings and Queens of England carved on the oak bench ends in the council chamber.

The whole of the buildings are heated by steam on the vacuum system. The air for the council chamber, the courts and other important rooms is drawn in at the basement and washed free of impurities, and then warmed and sent along ducts and delivered into the rooms about 7 ft. above the floor line. The vitiated air is drawn away at the level of the ceiling and at the floor by means of electrically driven fans, which discharge this air into the open at various points above the levels of the roofs. The temperature in the council chamber and courts is automatically controlled by means of a very delicately adjusted apparatus which is set to give any required degree of heat in the room. The heating and ventilating boilers and machinery are situated in the basement, and the whole scheme has been carried out by Messrs. Rosser & Russell, engineers.

Mr. J. S. Gibson (of the firm of Messrs. Gibson, Skipworth & Gordon) and Mr. H. T. Wakelam, M.I.E.E., the county engineer, were the architects in collaboration for the building, the estimated cost of which was £85,000.

MIDDLESEX GUILDHALL: VIEW OF MAIN ENTRANCE.

Hall at Hampton Court, with small figures of Law on each side, the whole surmounted by the present Coat of Arms of the Middlesex County Council.

The scene on the right of the entrance shows Lady Jane Grey accepting the Crown from the Duke of Northumberland. Lady Jane's mother, the Duke of Suffolk, Earl Dudley, and Archbishop Cranmer are also portrayed in this scene. On the bosses below are carved the Arms of Earl Dudley, Lady Jane Grey, Duke of Suffolk, and Archbishop Cranmer.

Between the scenes in the elaborate niches are placed statues of Justice and Prudence.

In the gable above the main entrance is a series of statues placed in niches, all elaborately carved, and reading from the left these are: Wisdom, Architecture, Literature, Government, Sculpture, Britannia, Music, Truth, Law, Shipping and Education.

Hill's Motor Vacuum Road Cleanser.—We are informed that one of these machines is still doing successful work in Blackburn, where it will remain until the present scavengers' strike is settled. The makers are now booking numerous orders for their new model machine, both from home and abroad. This model is 30-h.p., sweeps into the channels and a 7-ft. track, carries a full load of 3 tons, and tips direct into a standard dust cart.

THE NEW CAPITAL OF INDIA.

MATTERS AFFECTING THE CHOICE OF THE SITE.

The choice of a site for a city which is to be created on a definite plan and with full provision for future expansion is a matter of great interest to municipal engineers. In the case of a city intended to be the capital of so great and important an area as that comprehended under the title "The Indian Empire," it is inevitable that the reasons which have led to the choice of the site determined on will be much discussed, and since criticisms and comments in this matter will be made on various grounds, and from different points of view, we think it desirable to place before our readers the considered opinion expressed in a leading

sanitation, water supply, and communications of the future city, and accepting, of necessity, the instruction of the Government of India that 10 square miles were to be provided for the city itself, and 15 square miles for the cantonment, they selected what is known as the southern site. "How the Government arrived at this enormous area," comments our contemporary, "can only be conjectured."

In December, 1912, Sir Bradford Leslie had read before the Society of Arts his paper advocating his lake scheme, which meant the adoption of the northern site. A passage from the *Indian Engineering* article may here be quoted as indicating the weak points of Sir Bradford Leslie's proposal: "It was a pretty *tour de force* worthy of a romance-writer, but not of a great engineer. He overlooked the point that the Jumna irrigation canals drain the river dry at

their oftakes, and that the seepage and drainage accessions lower down do not amount to more than about 100 cub. ft. a second in the dry weather. He did not take into account the enormous area submerged by his proposed dam in the monsoon, or the vast expense of confining the lake to a reasonable area. He extravagantly over-estimated the power available for the generation of electric energy, and forgot that in times of flood the available fall would be inappreciable and the extraction of power a negligible quantity. He said his scheme would render Delhi healthy, and the sanitary experts reported it would add to the ill-health. In only one point, that of supplementing the supply of the Agra Canal, can Sir Bradford Leslie be said to have been right; but the cost of obtaining this additional supply for the Agra Canal rendered the scheme for this purpose alone out of the question; and, briefly, it may be said that the committee's report showed the lake project to be unsound from engineering and economical and sanitary points of view."

It may be well to point out, in view of the sentimental or physiological character of the motives leading to the choice of Delhi as the new capital of India, that the north site is associated with the events of 1857, and the Memorial on the Ridge, Metcalf's house, and other historical sites and structures would be frequently before the eyes of the inhabitants of a city built on that site. "It has the beautiful Kudsia Gardens and other amenities of the present civil station, and it is Delhi, real Delhi, the spot that visitors from all parts of the world come to see for the sake of all it means. It is not, like the southern site, a mere geographical site, empty and barren of all historic interest." The committee had considered these things, but the available area of good building

ground on the northern site is only some 5 square miles in extent, and although this would seem sufficient for a population of 57,000, the estimate of the Government of India, the greater freedom in planning and the unlimited space available for future developments may perhaps be held to justify the selection of the southern site, apart from the definite instruction that an area of 10 square miles was to be allotted for the capital.

COST.

As regards the probable cost of the works, this has been estimated at £4,000,000, but our contemporary is of the opinion that even if railway works are charged to railway capital account, and hydraulic works to irrigation account, the cost will be far greater, "and is much more likely to amount to £12,000,000."

MIDDLESEX GUILDHALL: FRIEZE OVER MAIN ENTRANCE.

article in a recent issue of our contemporary *Indian Engineering*.

Articles on matters of administration policy which appear from time to time in the columns of that journal are usually written with so full a knowledge of the facts and so competent a grasp of local and general conditions in India that they may be regarded as expressing the best and most unbiassed opinions available to the general public. The article to which we now refer reviews the matter of the three Blue-books on the subject of the selection of a site for the new Imperial capital which have been published. The first report of Messrs. Brodie and Lutyens and Captain Swinton relates to their preliminary investigations in April and May, 1912, when they inspected all the possible sites and considered their advantages and disadvantages. Taking into consideration the

SEATTLE'S BOULEVARDS, PARKS, AND WATER SUPPLY.

Seattle is from many aspects a beautiful city, and makes a special appeal to the visitor, even though he may have travelled far and wide (says the *Times* "Pacific Coast Number"). The city has 178 miles of paved streets, 121 miles of planked streets, and 617 miles of graded streets. The work of street improvement is carried on unremittingly. In the business districts and on streets subject to heavier forms of traffic the paving is of vitrified brick and stone block, extending from which, as traffic conditions warrant, are miles of smooth asphalt road, heavily based and maintained in a high degree of excellence.

boulevards. In addition to the 30 miles of completed driveways there are 20 miles more in the possession of the city waiting for improvement.

The boulevards, always winding, follow along the shores of the lake, through virgin forests of cedar and fir, with a dense undergrowth, making the air moist and cool; they traverse attractive residential districts, and climb the hills on an easy and winding grade, revealing the panorama of valleys, mountains, and lakes, and the far extending waters of Puget Sound. On all sides the mountain ranges stand against the sky, with Mount Rainier and other great peaks rising above the general level. Apart from the boulevards the automobilist will find many good roads, especially along the Pacific highway, which will ultimately connect Seattle with Spokane, San Francisco, Los Angeles, and other Southern cities.

The city is claimed to be one of the best lighted in the United States.

A supply of Cedar River water, soft and pure, drawn from a glacier source 20 miles distant, is owned by the city. The plant has a daily capacity of 65,000,000 gallons, while the reservoirs and stand-pipes have a total capacity of 272,000,000 gallons. The average daily consumption is 35,000,000 gallons.

Seattle may well be proud of its remarkably low death-rate, which, according to the last Census was 8.53 per 1,000.

TOWN PLANNING SCHEMES.

INCLUSION OF DEVELOPED LAND NOT FAVOURED.

As a result of an informal interview the Maldens and Coombe Urban District Council's clerk, Mr. J. W. Johnson, and the surveyor, Mr. R. H. Jeffes, have had with the Local Government Board, these officials have informed the urban council that the local town-planning scheme in its present form is not at all likely to receive the board's sanction. Recent town-planning schemes which have been before the Local Government Board have thrown a good deal of light upon the policy of the board in this matter, and it is now clear that they do not approve of schemes which cover more than the undeveloped land in the district, except under very special circumstances. Every case is, of course, decided on its own merits, but the clerk reported that, in determining what grounds they would accept as valid for considering that land was likely to be used for building purposes, it would be found that the board would lean towards a wide rather than a strict and narrow interpretation of the Town Planning Act. An important point bearing on the inclusion or exclusion of lands had arisen, and had been fully considered by the Town Planning Committee, and it was common knowledge that if the board were not ultimately satisfied that the reasons for inclusion were well founded, they would, in authorising the preparation of the council's scheme, exclude those parts of the district which were already developed, in which case all the trouble and expense previously incurred in connection with the service of notices would be wasted. Another point to be borne in mind was that the local authority would only be able to prepare a scheme dealing with the exact area of land embraced in the authorisation of the Local Government Board.

As a result of the report the whole question has been referred back to the Town Planning Committee.

'The "Magna Charta,"

Lady Jane Grey accepting the Crown.

MIDDLESEX GUILDHALL: FRIEZES AT SIDES OF MAIN ENTRANCE.

Throughout the city, in many of the residential districts, the asphalted thoroughfares at frequent intervals are connected with the macadamised roadways of the city's many parks.

The boulevards of Seattle are one of the distinctive features of the park system of the city. In the last seven years the city has expended £1,000,000 in parks, boulevards, and playfields, and as a result has better equipped play facilities for children and the general public than any other municipality west of Chicago, and has one of the most interesting and beautiful systems of boulevards to be seen anywhere in the entire country. Seattle, resting on her many hills, and spreading out between Elliot Bay and Lake Washington in the shape of a sheaf of grain, offers wonderful scenic possibilities in the laying-out of her

Road Signs.

By ARTHUR E. COLLINS, M.INST.C.E., City Engineer of Norwich.

It is agreed our usual arrangement of road signs is not satisfactory. In this country we have no system of marking routes so that a traveller, by noting, say, the mileposts, can satisfy himself he is continuing to travel on the route he desires. Our direction posts and plates are inefficient and inconvenient for many reasons, among these being:—

(1) Plates generally are too small to enable the instructions thereon to be written sufficiently large for reading at, say, 40 yds.

(2) Two or more plates on a post are fixed usually in one plane, and one plate often hides another, so that from some positions of approach reading is impossible.

(3) Plates are placed parallel with the roads they indicate. At acute angles they can only be read when

ROAD SIGN ON ST. CATHERINE'S PLAIN, NORWICH.

abreast. The chances of going right or wrong in such cases are even, which, of course, is absurd.

(4) Place names appear on plates which are not systematically repeated until the place, or the junction road thereto, is reached.

(5) Distances are not systematically stated.

(6) Signs to indicate peculiarities of route immediately ahead are rarely provided by the highway authorities.

(7) Lighting at night of direction posts and road signs is extremely unusual.

The writer is of opinion that the central authority (the Road Board) should decide which are the main routes of the country. Each of those routes should be provided with mileposts, each bearing, among other things, a distinctive route number. The direction posts and plates of that route should bear a similar number, and at junctions of such routes, or where two or more follow a section of route in common, the route number of each should appear.

HOW BEST TO INDICATE DIRECTION.

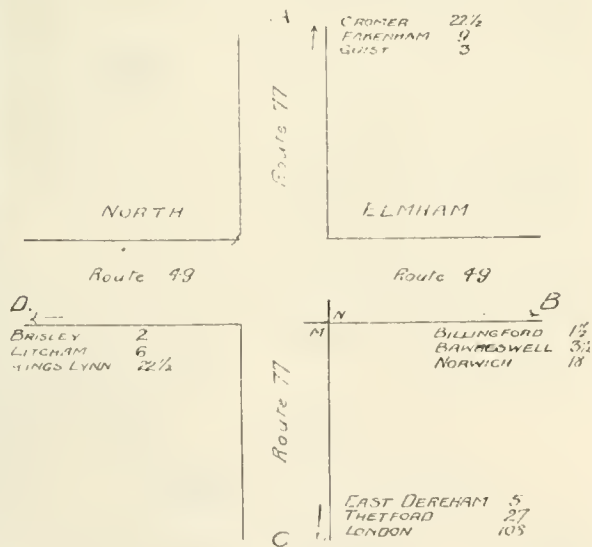

The best form of direction is a plan, and very effective and convenient road direction plates may consist of what is in effect a sort of plan as hereafter described.

It is evident the plate cannot be placed horizontally, but must be vertical to enable it to be read by approaching travellers. A traveller reading a route plan usually does so with the part of the plan indicating the area he is approaching uppermost, in which position the line on the plan indicating his line of approach runs upward, and the lines indicating the other routes are inclined at varying angles left and right on the plan, similar to the roads themselves.

The writer proposes that the plates at each junction shall repeat as far as necessary the indications of the route plan thereat in the following manner: Approximately facing each line of approach to a junction there should be a vertical plate on which is inscribed an arrow for each road leading from the junction, the arrows making similar angles with each other to those made by the roads, and to that extent repeating the plan. The road by which a plate is approached is indicated, when necessary, by an arrow pointing vertically downward, and the continuation of this road in a straight line through the junction by an arrow pointing vertically upward, the other roads right and left being indicated by arrows pointing right and left at the proper angles.

The place names, with distances and the route number or numbers of a road would be grouped abreast the arrow relating to that road. On each signpost the name of the county and place in which it is situated should be stated.

The author is fully aware that this system involves the use of much larger direction signs than are now usual; but, at the same time, he thinks the increased safety and convenience arising from them would fully justify their use. These signs form such a departure from what is now usual, that their significance would require explaining, but the essentially simple basis of the proposal could be grasped by any ordinary person in a few minutes, after which the full advantages in safety and time saving would always be realisable.

TYPICAL CASE (D).

In 1910 the author made an experimental installation of this system to guide strangers through a very awkward bit of navigation in Norwich. His experience of the public use of this has been such that in future he would endeavour to carry out his system in its entirety.

The lettering of these plates is in Egyptian block letters, black on white. They are 3 3/4 in. high, and just legible to the writer—who has normal vision—at 50 yds., and easily so at 40 yds.

TYPICAL CASES.

With reference to the typical cases of the recent Road Conference Competition, the arrangement of plates the author would adopt to suit typical case (1) would be as follows:—

The face of plate M facing A would be:—

NORTH ELMHAM, NORFOLK.			
East Dereham	5	↑	Route 77
Thetford	27		
Brisley	2	→	Route 49
Litcham	6		
King's Lynn	22½		
←	Route 49	(Billingsford 1½ Bawdswell 3½ Norwich 18

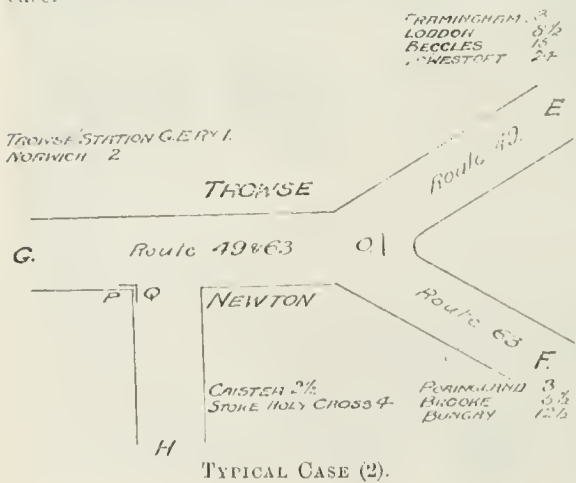

The reverse plate M facing C would be:—

NORTH ELMHAM, NORFOLK.			
Güst	3	↑	Route 77
Fakenham	9		
Cromer	22½		
Billingsford	1½	→	Route 49
Litcham	6		
Brisley	2		
←	Route 49	(King's Lynn 22½ Litcham 6 Brisley 2

The other plate would be arranged on the same principle.

If the plates projected over paths as shown in diagram plan, plate M would be attached to the support with its bottom edge level with the top edge of plate N, in which relative positions one plate would not hide the other.

At a crossing or junction of this description there is no necessity for the place names of the road from which approach is being made to the plate to be shown on the face of approach. Whether the plates project over the footpaths or the hedges or are fastened to walls will depend on the local circumstances of each case.

TYPICAL CASE (2).

The face of plate O facing E would be:—

TROWSE NEWTON, NORFOLK.			
Trowse Station (G.E.R.)	1	↑	Route 49
Norwich	2		
Caister	2½		
Stoke Holy Cross	4		
Framingham	3	↓	Route 49
Loddon	8½		
Beccles	15		
Lowestoft	24		
↙	Route 63	(Poringland 3 Brooke 5½ Bungay 12½

The face of O facing G would be:—

TROWSE NEWTON, NORFOLK.			
Poringland	3	↗	Route 63
Brooke	5½		
Bungay	12½		
Route 49	↖	(Framingham 3 Loddon 8½ Beccles 15 Lowestoft 24

The face of plate P facing H would be:—

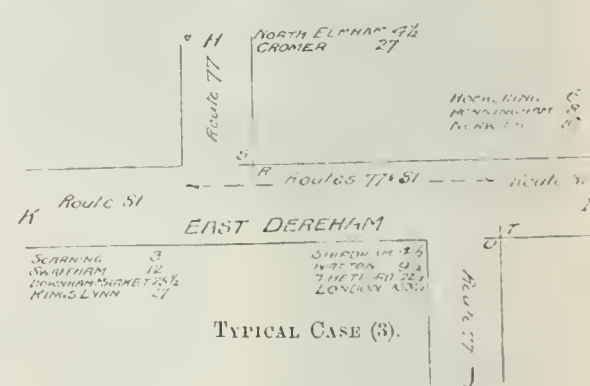

TROWSE NEWTON, NORFOLK.			
Beccles, &c.	}	→	Route 49 Route 63
Bungay, &c.			
←	Route 49	(Trowse Station (G.E.R.) 1 Norwich 2

The face of plate Q facing G would be:—

TROWSE NEWTON, NORFOLK.			
Caister	2½	→	
Stoke Holy Cross	4		

That facing E and F would be:—

TROWSE NEWTON, NORFOLK.			
←	(Caister 2½ Stoke Holy Cross 4	

TYPICAL CASE (3).

The face of plate S facing H would be:—

EAST DEREHAM, NORFOLK.			
Scarning	3	→	Route 81
Swaffham	12		
Downham Market	25½		
King's Lynn	27

The other two plates would be arranged on a similar basis.

As the result of many years' experience of painted wood, earthenware, enamelled iron, cut stone and painted cast-iron plates (the latter with raised or pierced letters), the author is of opinion the first and the last named are, taking them all round, more convenient than the others, the cast-iron plate with raised letters being the best for general use.

Lowest first cost with reasonable durability can be obtained by providing plain wood boards on wood posts, the latter creosoted or treated with carbolineum. To the boards would be nailed or screwed the requisite cast-iron words or letters and signs, which should have a minimum thickness of 5/8 in. Letters of place names should not be less than 3 3/4 in. high. Well-proportioned letters of this height are easily legible at 40 yds. distance. The letters for the name of place in which the sign is situated, and county, need not exceed 2 in. in height. The boards, letters and signs should be painted with two coats of genuine red lead in linseed oil, and three coats of Mander's white rubber paint, and the tops of the letters and signs painted with black paint. The name of locality in which the directing plate is situated, and of the county, should in all cases be cast as complete plates to save cost. Place names oft repeated should in all cases be so cast—i.e., separate letters should be avoided in words oft repeated.

Painting such as mentioned will last in exposed positions seven years before the necessity for repainting arises. It can be done by a handy labourer.

Generally, in towns the lighting of direction plates ought to be a part of the street lighting. This the author has done as opportunities have arisen. He finds direct lighting perfectly efficient and simple, and sees no reason for incurring the greater capital and maintenance costs of transparent signs with contained lights.

The author's aim in designing the system of road signs described is to enable any of them to be read while approaching them. Each required direction is arranged directly to face the traveller, and the common experience of attempting to read a sign the end of which alone is visible is obviated.

Before adopting the scheme he has outlined, the author considered the advisability of placing direction posts in advance of the road junctions, but abandoned this idea because it would too much facilitate fast driving at junctions to the danger of road users.

Street Mirrors.—Woking Urban District Council are experimenting in the use of mirrors at sharp and dangerous corners.

A MERRYWEATHER PUMP.

A very serviceable little pump, known as the "Ravensbourne," has recently been introduced by Messrs. Merryweather & Sons, of Greenwich. It is made in sizes ranging from 500 to 4,000 gallons capacity per hour, and can be driven by electric, petrol, oil, gas, steam or other available power. It is claimed to be the "best pump for small horse-powers," and is being extensively adopted in cases where light pumping machinery is in demand.

The illustration shows a compact little electric pumping set of this design, which has recently been fitted up at Pyrford Court, Woking (the seat of the Hon. Rupert Guinness), for garage water supply. The pump is of the double-barrel reciprocating type, con-

THE RAVENSBOURNE PUMP.

structed of gunmetal, with copper air vessels, and is capable of delivering 500 gallons per hour against a head of 100 ft. It is driven by an electric motor running at a speed of 960 revolutions per minute, and developing 1-h.p., the current being taken from the existing electric light installation.

The pump draws its supply from a rain-water tank, and delivers through a wrought-iron pipe into a tank placed on the roof of the garage. The roof tank is fitted with an outlet pipe to a tap close to the yard level, to supply water for cleaning operations—such as the washing down of cars. A branch is also taken from the delivery pipe at a point between the pump and the roof tank. The branch serves a small hydrant in the yard, from which the full pressure from the pump can be obtained for fire-extinguishing purposes. The roof tank is fitted with an alarm indicator, with float and electric bell, which rings automatically when the tank is full.

DRESSING OIL FOR LEATHER.

Mr. H. G. Keywood, whom many of our readers know as an old municipal engineer, has just placed on the market a dressing oil for leather which he has registered under the trade mark "Mesa." It is claimed for "Mesa" that it preserves and water-proofs leather, and is exceptionally valuable as a dressing for driving belts. One who has applied it to his footwear says it makes boots as soft as velvet, the leather absorbing all the oil and no residue whatever being left on the boots. Municipal golfers might make a trial of the oil in this way in order to gain an idea of its value when applied to harness and other leather goods. "Mesa," we understand, is already used by numerous councils, including Leeds, Leicester and Rotherham Corporations.

Mr. Keywood, who is in business as the Municipal Engineers' Supply Agency, at 40 Royal Exchange Chambers, Leeds, will be glad to send a sample of "Mesa" to any municipal engineer.

A New Type of Electrically Operated Automatic Apparatus for Contact Beds.

The new sewage disposal works at Harpenden include twelve of Dibdin's slate beds, arranged in four groups of three beds each, and the filling and emptying of the beds is worked electrically, making the whole cycle of operations automatic. The sewage enters the three beds in one group until it reaches some predetermined level, at which an electric contact is made which closes the inlet valves through which the sewage has been entering the beds, and at the same moment opens the valves in the next group and allows these to fill. At the same time a clock-work movement is started, which, at the end of about two hours, by means of an electrical contact, opens the outlet valves and allows the sewage to leave the

mechanism. The weights *W* (Fig. 3) begin to fall immediately, and after a few moments the inlet switch *H*₁ (Fig. 1) is closed, which closes the inlet valves of group No. 2 and opens the inlet valves of group No. 3. The timing mechanism continues working during the interval in which the tanks remain full, and when this interval is ended the outlet switch *K*₁ (Fig. 1) is closed, which opens the outlet valves of group No. 2 and closes the outlet valves of group No. 1. The sewage level falling in the tanks of group No. 2 will cause the float *F* (Fig. 3) to fall, and lower the rod *R* (Fig. 3), thus stopping the timing mechanism, and the further falling of the float will raise the weight *W* (Fig. 3) to its original position. When the

DIAGRAM OF WIRING.

FIGURE 1

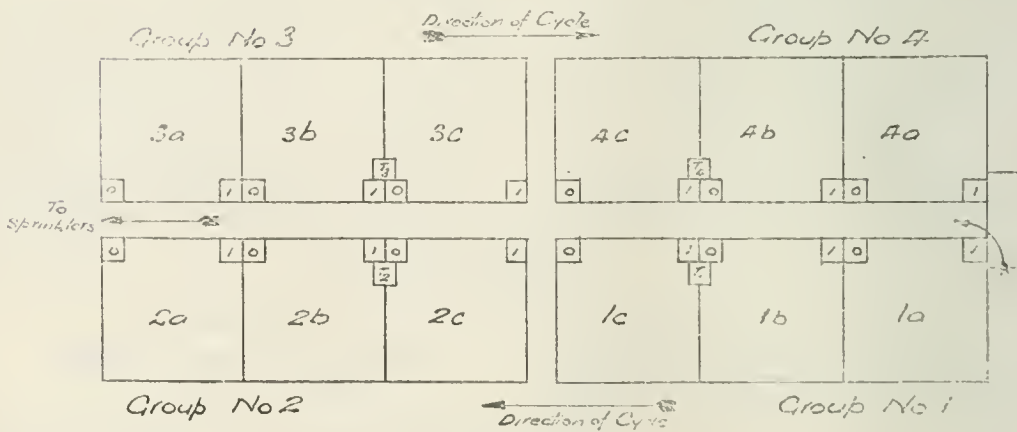

FIGURE 2

slate beds and flow to the spreaders. The subsequent treatment is similar to that at other sewage works.

The following is a detailed description of the mode of operation, illustrated by the explanatory diagrams.

The switches *H*₁ and *K*₁ (Fig. 1) are situated in and worked by the timing mechanisms, and are arranged so that if one of them is closed, say *H*₁ (i.e., the contact pieces *cc* and *dd* (Fig. 1) are pressed together), the electric current will flow through the inlet valves of groups 2 and 3, and operate them. Similarly, when *H*₂ is closed, the inlet valves of groups 3 and 1 will be operated.

Order of Operation of Valves. Assume the tanks of No. 2 group are filling, the sewage, in rising in the timing chamber *T*₁, lifts the float (Fig. 3), and raises the rod *R* (Fig. 3), which starts the timing

inlet switches *H*₁ (Fig. 1) close, the inlet valves close if their floats are immersed, and open if their floats are not immersed. Also when the outlet switches *K*₁ (Fig. 1) close, the outlet valves open if their floats are immersed, and close if their floats are not immersed.

Timing of Interval during which Tanks remain Full.—The timing can be regulated by altering the weights *W* (Fig. 3). To shorten the interval increase the number of weights. To lengthen the interval remove weights.

Inlet Valves (Fig. 1).—When the tank is full the float will be pressing upwards and tending to close the valve, which will be prevented by the roller *F* being in the lower slot of the cam *V*. When contact is made, in the timing mechanism of its own group of tanks, the roller *F* will be freed,

and the valve will close. When the valve is quite closed the roller F will fall into the upper slot of the cam and prevent any further movement until the electrical current again flows. When the tank is empty the float tends to fall, but is prevented by the roller F, so directly contact is made again,

should it be desirable to clean out the two tanks at the same time. When cleaning out either of the tanks *b* or *c* the penstock connecting it to the timing chamber should be closed also.

To Operate Valves by Hand.—If it is desired to operate valves by hand, remove plug which screws in

which occurs simultaneously with the closing of the inlet valves in the previous group, the valve will open.

Outlet Valve (Fig. 5).—When the tank is full the float will be pressing against the rods *x*, and will be prevented from rising by the rollers *F* and *Y* pressing in the top slots of the cams *ZZ*. When contact is made, in the timing mechanism of its own group, the roller *F* will be freed, the cams rise and push aside the rollers, and the stops *AA* come into contact with the arms *CC* and open the valve. When the valve is fully open the rollers fall into the lower slots of the cams, preventing the valve closing until the electric current again flows. When the tank is empty the whole weight of the valve is taken by the rollers, so directly contact is made again, which occurs simultaneously with the opening of the outlet valves of the next group, the valve will close.

Depth of Sewage in the Tanks.—This can be regulated by the position of the rod *R* (Fig. 3), which can be adjusted to any desired height by means of the screw *S* (Fig. 3).

Cutting Valves Out of Action for Cleaning Tanks. When it is desired to clean out any tank the inlet valve can be prevented from opening by inserting the pin *P* (Fig. 4). It is important that the inlet valves in tanks *b* and *c* in any one group are not cut out together, as the sewage must always be able to enter the timing chamber *T* from one side or the other. The valve in tank *a*, however, may be cut out at the same time as either of those in tanks *b* or *c*,

hole *E* (Fig. 6), and by means of a thin rod press back the armature *D* (Fig. 6).

Electrical Gear on Inlet and Outlet Valves.—The

ELECTRICAL GEAR

Figure 6

arm carrying the roller *F* (Figs. 4 and 5) and the sector *G* (Fig. 6) are both rigidly attached to the spindle *L* (Fig. 6). From Fig. 6 it will be seen that

the sector G is free to move downwards when the armature D (Fig. 6) is attracted by the electro-magnets N (Fig. 6), which occurs when contact is made in the timing mechanism. When the sector G is released it allows the roller F (Figs. 4 and 5) to move outwards and the valve to operate. When the contact is broken the spring U (Fig. 6) pushes the armature D back into mesh with M (Fig. 6).

An interesting addition to the gear consists of an indicator which is placed in the offices. This performs the double duty of showing at any moment which series of beds is being filled and which emptied, and also automatically registering the number of times the beds have been filled and emptied, thus measuring and recording the quantity of sewage treated. The indicator is operated electrically every time any of the valves are open or closed.

This apparatus is manufactured by the well-known firm Messrs. George Kent, Limited, of London and Luton.

A CANADIAN "L. G. B."

The suggestion has been made that some central authority, like the English Local Government Board, should be formed in Canada, in order that "municipal borrowings could be sifted for the satisfaction of lenders." It is argued that some such authority, which would control municipal borrowings and supply information concerning securities offered, is much needed; indeed, that some such organisation is essential to the maintenance of high municipal credit. It is felt here, in England, that the adoption of the suggestion could work only for good, and would do much to strengthen the advances made to the Canadian municipalities. The exercise of borrowing powers in England is regulated by the Public Health Act, 1875, and the regulations for the guidance of the board are of a stringency which might not meet with favour in Canada.

As to the personnel of the English board, this is composed almost entirely of ex-army engineer officers, whose knowledge of the requirements of a town is only too often of the vaguest.* Military men are seldom a success in civilian affairs, and an officer whose life has been spent in, say, the construction of bridges in India is scarcely the man to serve as a final court of appeal in a town's requirements. There has been one notable exception in these appointments, but that official—an experienced municipal engineer—is now superannuated, and none has taken his place. If Canada decides to appoint a board of her own, she would be well advised to be chary of introducing the military element. An engineering inspectorship is no sinecure, and only the best and most experienced men should hold a position of such national importance. A staff of men who are at least open to the suspicion of having failed at their own legitimate calling—else why the necessity for their retirement for civic offices?—cannot but prove a clog upon municipal enterprise, as the English municipalities have found to their sorrow on scores of occasions.—From an article in the *Contract Record* of Toronto by the London correspondent of that journal.

Municipal Engineering (Edited by Sydney G. Turner, ASSOC. M. INST. C. E. Price 3s. 6d. nett. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.).—This volume consists of model answers to questions set at recent examinations of the Institution of Municipal and County Engineers, and is the second edition. It is practically identical with the first issued. It is not suggested that it should take the place of recognised text-books, but it provides useful summaries of various subjects, as well as indications as to how different types of questions may be answered. Every effort has been made to render the answers as accurate and comprehensive as possible, though they contain more than a candidate would be expected to supply. The answers are founded upon examinations held in Birmingham, London and Manchester. The appendix contains examples of questions on sewerage, sewage disposal, tramway construction, bridges, water supply, road construction, buildings, sanitary science as applied to towns and buildings, drainage, and other matters.—*Local Government Journal*.

* This statement is not now accurate, as out of some twenty inspectors only two are ex-army officers.—ED. SURVEYOR.

PORTABLE RAILWAY PLANT.

In the extension of water undertakings and the carrying out of excavation work, portable railway plant will always be required, and Catalogue No. 78, issued by Messrs. R. Dolberg, 119-125 Finsbury-pavement, E.C., offers many suggestions to the engineer or surveyor.

The portable track, with steel sleepers, shown in the accompanying illustrations is a type much favoured, as the mounting of the rails is done quickly

Fig L.2005

DOLBERG'S TURNTABLE FOR PORTABLE RAILWAYS.

and the loose parts are but few. The turntable depicted has been found by those who use Dolberg's portable railways to work with the greatest success; the track, being flush with the top, offers no hindrance to the ordinary traffic.

When the track has to be shifted about a good deal, or the making of temporary branch lines is advisable, a climbing switch, as shown in the illustration, will be found very convenient indeed. No tearing up

CLIMBING SWITCH.

of the track is necessary. The switch is simply put on top of the main line, while the point rails rest on the next frame of the branch line. Dolberg's special pamphlet gives full particulars regarding this climbing switch.

The tipping wagon that is in so many instances used is well known to the surveyor and engineer; but the box all-round tipping wagon will be of interest to many readers. It is a very handy type of wagon, low

Fig. 744

TYPE OF TIMBER TRUCK.

and narrow, and can be used for practically any and every kind of work.

Lastly, we draw the attention of our readers to the illustration of a timber truck, which should be of special interest to surveyors in whose districts clearances of wooded country have to be undertaken.

Many other useful types of wagons are shown in Messrs. Dolberg's catalogue, copies of which will, we are asked to state, gladly be sent on application.

CHANGE OF TELEPHONE NUMBER.—Readers are requested to note that "The Surveyor" telephone number is now City 1046.

Works Projected by Local Authorities for 1914.

As will be observed from the returns given herewith, projected works for 1914 cover a wide field. Almost every form of municipal enterprise is dealt with, and it is noteworthy that many of the smaller municipal and urban areas, in particular some of the seaside resorts, are promoting schemes of considerable magnitude, involving a large outlay of public money. An outstanding feature is the increasing interest manifested by local authorities in the questions of housing and town planning. In this respect the record is one of distinct improvement and marked progress. The operations of the Road Board have contributed to a vast increase in the

work of road reconstruction in every part of the country, and from the details given in the following pages it will be seen that in addition to various large schemes which are now in course of fulfilment, the projected works include many new schemes of highway improvement. In once more submitting to our readers this interesting section of our Special Annual Issue, we desire to express our gratitude to correspondents who have so promptly, and with such welcome fulness of detail, co-operated in its compilation. The facts given are in every instance official, and they form in the bulk a supremely important and comprehensive record of municipal activities.

Abersychan (Mr. EDWARD WHITWELL, engineer and surveyor to the urban district council).—The council have decided on the erection of a refuse destructor with mechanical feed, tenders having already been obtained. Further houses are to be erected under the Housing of the Working Classes Act, to increase the number from 136 to 300. Three important main road improvements will also be taken in hand, involving the erection of three new bridges. A large number of private streets are to be made up under the Act of 1892. A site has been acquired for a new swimming bath to be erected in the South Ward, while a further bath is to be erected in the North Ward. Other works projected include a public park, about 1 mile of new sewers, conversion of the main roads with ordinary surfaces to tar-macadam, and the tar-spraying of an additional number of roads, with the purchase of a tar-spraying machine for the latter purpose. The council have instructed their surveyor to deal with the question of town planning, and have passed a resolution to include the whole district.

Accrington (Mr. WM. J. NEWTON, ASSOC. M. INST. C. E., borough engineer and surveyor, and engineer to the Accrington and Church Outfall Sewerage Board).—The principal works to be carried out during the year are as follows: Extensions to tramway depot to accommodate an additional thirty cars; enlargement of electricity works to provide for three 1,000-h.p. gas engines, with the necessary gas plant; the provision of a weaving shed at the technical school; the laying out of a new park presented to the town by Mr. Tom Bullough, to be called the James Bullough Park; public street improvements, private street improvements, and the completion of large extensions to the sewage works, which have been in progress during the past three years. These works are in addition to the ordinary work of the municipality.

Alsager (Mr. H. V. LYNAM, surveyor and inspector of nuisances to the urban district council).—The new sewage scheme will be completed early in the present year, and an official opening will take place. The water scheme is well in hand, and the work of boring is now almost completed. The building work, both for reservoir and pumping station, and the main-laying is to commence at once. Extra work is to be carried out on the by-road repairs owing to the heavy strain caused by motor haulage to the above schemes, and the council have under their consideration the question of tar-spraying the road surfaces, and the re-making of footpaths with tarred slag, in addition to the widening of several dangerous corners and narrow lengths of roadway.

Alton (Mr. G. BERTRAM HARTFREE, F.S.I., surveyor to the urban district council).—The projected works for 1914 include the completion of works for purposes of elimination of spring and surface water from the soil sewers, including cast-iron culvert, 30 in. in diameter, and 18-in. reinforced concrete pipes, increased bacteria beds at sewage disposal works, water-works extensions, road widening, and several private street improvements. The question of working-class housing is to be dealt with early in the new year.

Ardley (Mr. J. MORLEY, engineer and surveyor to the urban district council).—A public mortuary has been provided, and a complete tar-macadam plant in-

stalled at the depot, which has proved a great success. The projected works for 1914 are the completion of the cemetery extension, construction of the Wombwell-road sewage works, provision for dealing with the storm water and reconstruction of filter beds at Brodilly sewage works, widening and straightening of Wombwell-road at a probable cost of £5,000, tar-spraying additional lengths of the roads, and further work in strengthening the foundations of the roads.

Atherstone (Mr. H. J. COLEBY, engineer and surveyor to the rural district council).—The principal work carried out during the past year has been the sinking of a 20-in. diameter borehole for augmenting the existing water supplies of the district. This proved to be very successful, and a copious supply of water is now available. Extensions have also been made to sewer and water mains in various parts of the district and in the town of Atherstone. As a first instalment of a housing scheme ten cottages have been erected. During the present year it is proposed to proceed with the erection of about forty cottages in order to relieve the congested areas in Atherstone. Small schemes are in hand for sewerage and sewage disposal in three parishes, and a scheme for supplying water to the whole district from the new boring is now being prepared. This will comprise engine-house, engines and pumps, about 7 miles of mains, two service reservoirs, and other works. In addition to the foregoing, special attention will be given to the repair of the highways, and for this purpose a new steam roller has been purchased.

Aylesbury (Mr. HAROLD TAYLOR, engineer and surveyor to the urban district council).—During the past year three bacteria beds at the sewage works have been washed, involving the cleansing of over 1,400 cub. yds. of media. Extensions to the isolation hospital and the town hall have also been carried out. During the ensuing year, in addition to the ordinary work of road and sewer maintenance, the following is contemplated—viz., Extension to Wendover-road, Stoke-road, and Mandeville-road sewers; extension to cemetery; reconstruction of screening chamber, and the cleansing of three bacteria beds at the sewage works.

Barnes (Mr. G. BRUCE TOMES, ASSOC. M. INST. C. E., engineer and surveyor to the urban district council).—The actual work of widening the High-street, Barnes, will probably be commenced, a clearance of the sites of the properties acquired for the improvement being followed by the partial reconstruction of the carriage-way and footpaths. Widening and improvements of portions of the Upper Richmond-road, Upper Sheen-lane and Lonsdale-road will also be effected, and it is hoped that Priest Bridge, carrying the main road to London over the Beverley Brook, will be rebuilt by the Surrey County Council. The buildings at the refuse destructor for the new slab-making plant, and a new cottage for the Barnes Common keeper, were to be commenced early in the year. The question of a suitable site for the proposed public baths and hall will have further consideration, and when the land has been acquired, building will be commenced. The council has approved a scheme for an additional number of workmen's dwellings to be erected at Rosemary-lane, and it is anticipated that the scheme for a ward

block and dispensary for the tuberculosis sanatorium at the council's hospital will shortly be settled in conjunction with the county authorities. A bowling green and some tennis courts with a pavilion will be laid out at Sheen Common, and the Local Government Board will be asked to authorise the preparation of a scheme under the Town Planning Act, which will embrace nearly the whole of the available land in the district.

Barnoldswick (Mr. W. ELLIS, engineer and surveyor to the urban district council). The past year has been one of considerable activity, particularly in respect to building operations, some 130 to 140 houses having been built. Plans have been approved by the council for an additional 150 houses, which will be erected in the near future. A new weaving shed, to accommodate 2,000 looms, has been commenced, and a further similar shed is contemplated during the coming year; consequently, the present flourishing state of building within the district has every appearance of continuing. There have been three lengths of Roemac-bound road put down, which, considering the abnormally heavy traffic, is a marked improvement upon the ordinary water-bound road, and a comparative length of Glutrin-bound road is at the present time being laid. A trial length of Durax armoured paving was put down in a narrow street, over which a fair proportion of traffic passes, and meets the requirements very well. In addition to the ordinary routine work (no little matter in a rapidly growing town of this description), the department has been responsible for the carrying out of several footpath improvements, the making good of added strips to highways, and the erection of a reinforced-concrete footbridge, 6 ft. wide, over Butt's Beck. Lock woven mesh was the reinforcement adopted. The by-laws relative to new streets and buildings have been revised in accordance with the model clauses, and the Local Government Board's sanction thereto will presently be applied for. Plans are in preparation for the paving and making good (under the Private Street Works Act, 1892) of Bank-street, Smith-street and Lower Rook-street; also the whole of the front and back streets comprising the Dam Head, Croft and Gisburn-street areas. Plans for the widening of a portion of Gisburn-road to a width of 36 ft., and the widening of a portion of Rainhall-road to a width of 40 ft., entailing the erection of retaining walls, and the laying of new footpaths, are in hand, and sanction to a loan for the purpose will be applied for at an early date. It is expected the works will be commenced and completed during 1914. Two alternate schemes for the provision of a new road about 1½ miles in length from Barnoldswick, through Salterforth, joining the main road to Earby, are in progress. It is proposed to acquire land to enable a road, 36 ft. wide, ultimately to be constructed, and this will be of great benefit by establishing easier communication with the neighbouring Lancashire towns. For some time past the annexation of the township of Coates (now in the Skipton Rural District) to Barnoldswick, has been occupying the attention of the council, and it is expected the matter will culminate as desired in the early part of next year. The department has also instructions to prepare the preliminary particulars for a town planning scheme for a part of the district, which will be proceeded with as the opportunity presents itself.

Barnsley (Mr. J. HENRY TAYLOR, M.INST.C.E., borough surveyor and waterworks manager).—The coming year will be rather an eventful one so far as public works and new buildings are concerned. The proposals that are before the corporation of Barnsley at the present time are chiefly as follows: (1) The negotiations with the railway companies for the provision of a joint railway station. At the present time Barnsley is very badly served in the way of railway passenger station accommodation. Barnsley and the district served are rapidly developing into what will be one of the largest boroughs in Yorkshire. This is chiefly due to the development of the coal industry, and although many newly opened-out collieries and projected ones are to the east, in the locality of Doncaster, Barnsley will be the centre, for a considerable number of new pits which are to be opened both on the easterly and the westerly side. These colliery developments mean that Barnsley will not only be, as hitherto, the market town for a large outside population, but will have to provide educational and hospital accommodation for a population approaching 200,000. It is

essential, therefore, that the railway passenger stations should be brought up to date, and with this object in view preliminary plans have been prepared by the borough engineer, and interviews have taken place between the corporation, the Chamber of Commerce, and some of the railway engineers. The matter is still under consideration. (2) The next work of importance projected is that of a new town hall, the estimated cost of which is £20,000. A site has been purchased, or agreed to be purchased, and architects have been invited to send in competitive drawings for this building. A technical school is also spoken of, but not much progress has been made with this scheme. (3) The completion of the system of sewerage by the substitution of stoneware pipe sewers for rubble drains and a further extension of main surface-water drains within the borough will also be in actual progress, it is hoped, in the course of the next three or four months. (4) The corporation have practically agreed to purchase an estate, within 1½ miles of the borough, for the establishment of a tuberculosis hospital, which it is intended shall be large enough for a very considerable population. This is an important and expensive undertaking, and will probably materialise during the next few months. (5) The Road Board have been approached with a view of granting a sum towards the widening of the main roads within the borough, but their reply has not yet been received. (6) The corporation have decided to have a destructor, and the committee who have this matter in hand are now about to report upon the subject with a view to its consummation. (7) The Dearne Valley Light Railway scheme will be presented before Parliament, it is expected, during the coming Session, and the corporation of Barnsley have been invited to assist in the development of this important enterprise, which will involve an expenditure of probably £250,000. The corporation, however, are not participants in this expenditure. The money will be provided, it is anticipated, by the different urban district councils whose districts will be served thereby. (8) The corporation are promoting a Bill in Parliament for the extension of their waterworks, and for the provision of money for the erection of a town hall and other similar works. The total sum for which powers are sought by the Bill will be nearly £70,000. (9) Other works, such as public street improvements, private street works, and improvements to the markets, will also be carried out during the current year. For the information of contractors and others who supply local authorities with materials and labour for the carrying out of public works, it may be mentioned that these works, although in prospect, may not develop for the next few months, so that applications with respect to them should be delayed for some little time.

Barnstaple (Mr. E. Y. SAUNDERS, M.R.S.A.N.I., borough surveyor).—It is the intention of the town council during the coming year to carry out the conversion of a considerable quantity of their existing gravelled paths into tar-asphalt paving. The question of the erection of a new science and art school for the district, in conjunction with the Devon County Council, at an approximate cost of £13,000, is being considered. The old St. Anne's Chapel is to be altered and adapted for the purposes of a museum. Sundry sewer extensions to the outlying portions of the borough will be carried out during the year.

Barrow-in-Furness (Mr. ARTHUR RACE, borough engineer and surveyor).—The elementary schools in the Hindpool district, now in course of construction at a cost of about £8,000, also the fresh and salt water swimming bath in Abbey-road will be completed at a cost of about £16,000. The erection of two new pavilions at Devonshire-road fever hospital will be completed at a cost of £5,350. Plans will be prepared for a new public library in Ramsden-square, estimated to cost £13,500, and also for a new central police station to cost about £15,000; two elementary schools, to cost £22,000, and a secondary school to cost £35,000. A road improvement at the junction of Mill-lane and the Walney Promenade will be carried out at a cost of £3,000; also the widening and improvement of Salthouse-road and Fairfield-lane, at a total cost of £6,035. An area of about 18 acres will be added to Biggar Bank, and a new road constructed across same, at a cost of £3,000. In addition to the usual making up of private streets under the statutory powers, the corporation will lay out new

streets on their Risedale estate, at a cost of £2,300. Further ordinary macadam streets will be reconstructed with tar-macadam, and a large amount of tar-spraying is contemplated. The completion will be effected of several roads in the public park by surfacing with Ravenhall bricks and tar-macadam, and bowling green and tennis courts, including refreshment room and pavilion, will be constructed. A 12-in. relief sewer will be constructed on Barrow Island, at a cost of £800. Street improvements will be made at the junction of Roose-road and Rampside-road, and also at the corner of Holebeck-road. A further length of streets will be planted with trees, and a recreation ground of about 2 acres in extent will be laid out on Barrow Island. It is hoped that further progress will be made toward the realisation of the town planning schemes.

Barry (Mr. J. C. PARDOE, ASSOC.M.INST.C.E., engineer and surveyor to the urban district council).—Additional accommodation is to be provided at infectious diseases hospital, for which a loan of £5,050 has been applied for. The widening of Park-road and Palmerston-road will be effected at a cost of £3,500, and private street works will be carried out costing £2,000. A tender has been accepted for a manual instruction centre at Cadoxton boys' school, amounting to £400. Two shelters are in course of erection at Whitmore Bay, Barry Island, at a cost of £1,300, and a school clinic building is approaching completion, the accepted tender being £610. The council are considering the question of erection of houses for the working classes, and it is proposed to erect thirty houses, at a cost of £200 each, to commence with. Improvements are taking place in connection with street lighting, the remaining flat-flame burners being replaced by incandescent lighting. An underground convenience for both sexes has just been completed, at a cost of £2,000. A new petrol motor fire engine has been purchased at a cost of £1,100.

Basingstoke (Mr. F. REGINALD PIPPS, ASSOC.M.INST.C.E., borough surveyor and waterworks engineer).

—The chief work during the coming year will be the carrying out of the scheme prepared by the borough engineer for electric lighting. A Local Government Board inquiry has been held for sanction to a loan of £14,000, and provisional contracts have been entered into for the various sections, comprising Diesel engines and dynamos, battery, switchboard and cables. A site is also being acquired for a housing scheme, the lack of houses being acutely felt, and it is expected that about one hundred will be erected. The work of channelling in the town, for which a loan has been obtained, will also be completed during the year.

Batley (Mr. OSCAR J. KIRBY, ASSOC.M.INST.C.E., borough engineer).

—It is intended to undertake the following street improvements—viz., Primrose-hill, Ealand-road, Pearl-street, Amberstreet, Trafalgar-street and Cheapside-road. A new elementary boys' school for the Staincliffe district, extensions of the public baths, and further extensions to the sewage outfall works are also to be undertaken.

Bedwas and Machen (Mr. A. S. V. TAYLOR, ASSOC.M.INST.C.E., surveyor to the urban district council).—Road widening and improvements will be carried out during the year. A loan has just been sanctioned, and the work will be in hand early in the year. New council offices, fire station caretaker's house and stores will be commenced as soon as the loan is sanctioned, the inquiry having been held. Works of water supply will be undertaken, including the provision of storage tanks, filters and incidental works, together with extension of mains. A Bill for the lighting of Machen with gas is being promoted in the next Session of Parliament, and it is hoped that the work will be proceeded with at an early date.

Belper (Mr. ROBERT C. CORDON, engineer and surveyor to the rural district council).—During the ensuing year the council, in addition to alteration to several highways by removing dangerous corners and improving gradients, also contemplate the following works: Commencement of the Crich drainage scheme, estimated to cost £10,250; the construction of a bridge

over the river Derwent, estimated to cost £2,000; construction of sewers and sewage disposal works at Smalley, estimated to cost £500; surface-water culverts in the parish of Mackworth, estimated to cost £45; storm-water culvert in the parish of Kilburne, estimated to cost £140; the preparation of plans for a water supply scheme for the parishes of Kirk Langley and Mackworth; and many minor alterations to their highways, of which there are 162 miles in this district. These works are all under the jurisdiction of the engineer and surveyor to the council.

Belper (Mr. THOMAS FENN, surveyor to the urban district council).

—During 1914 the following works are intended to be carried out: Lander-lane Corner (near the market-place)—taking down of two dwelling-houses already purchased by the council, and the rounding-off of the dangerous corner thereat; the widening of the High-pavement from the butts to Market-place, the council having already purchased the necessary land; the widening of Kiln-lane, Park Side; rounding-off of an awkward corner situate at end of Green-lane, King-street, the land for this improvement being given by the chairman of the council, Mr. G. H. Strutt, J.P., D.L.; the laying of a storm-water drain across the recreation ground, south of Nottingham-road; the erection of an iron fence on the south side of the waterworks pumping station. During 1913 the English Sewing Cotton Company, Limited, have erected a new mill at a cost of some £40,000. The company are now erecting new offices in connection with the mill, Mr. Sidney Stott, of Oldham, being the architect of the mill and offices. The elevations of the mill present a prominent and pleasing appearance to the eye from whatever point in the surrounding landscape the building is viewed.

Bexhill (Mr. GEO. BALL, ASSOC.M.INST.C.E., borough engineer and surveyor).

—A scheme is now in course of preparation for the provision of new isolation hospitals. Contracts have just been entered upon for important road improvements, to cost about £9,000. The corporation are carrying out a scheme of groyning on the foreshore in front of the East Parade, estimated to cost £4,200. The works of levelling up low land of about 13 acres are in hand, and a scheme is now before the Local Government Board for sanction to a loan of £3,700 for recreation ground purposes. Several private street improvement works will be undertaken, and there will no doubt be further development of the several building estates in this rapidly growing health resort.

Bilston (Mr. VINCENT TURNER, ASSOC.M.INST.C.E., water engineer and surveyor to the urban district council).—The most important scheme under the council's consideration is the improvement of the surfaces of about 2½ miles of the Holyhead-road, which is estimated to cost about £14,000, and an application has been made to the Road Board for financial assistance. Other matters which will probably be taken in hand are installation of electric power at the disposal works; extensions to the fever hospital; alterations to the market hall; and some miles of new water mains.

Birkenhead (Mr. CHAS. BROWNRIDGE, M.INST.C.E., borough engineer and surveyor).

—It is expected that the erection of a sanatorium at Thingwall will be commenced. A considerable amount of paving of macadamised roads will be undertaken, and the Baths Committee will bring forward a proposal to erect baths at the south end of the borough on land already purchased for this purpose. Extensive works of road widening and improvement will be carried out, and a considerable length of new main sewers will be constructed, this having become necessary by the recent development of certain parts of the borough. The council have submitted a representation to the Local Government Board that it is desirable that the boundaries of the borough should be altered. The total area of the adjoining districts sought to be included within the borough is about 7,502 acres, and it is expected that the inquiry in respect of the representation will be held at an early date.

Birmingham (Mr. HENRY E. STILGOE, M.INST.C.E., city engineer and surveyor).—The following works are in progress or projected: River and Sewerage Works—Hay Hall sewerage, estimated cost £8,700; Erdington and Witton main valley sewer (not yet estimated); Griffin's Brook main valley sewer from Pershore-road to Bristol-road (not yet estimated); new sewers in Lordswood-road and New-road off same, including outfall, estimated cost £5,265; Rea main valley sewer extension across private property, between Dogpool-lane and Cartland-road; sewers in Flaxley-lane, estimated cost £950; enlargement of Acock's Green western outfall sewer, including canal crossing (estimate not yet prepared); Stratford-road surface-water sewers, estimated cost £5,500; and Hall Green sewerage (contract No. 2), a scheme necessitated by the increase in building operations in the Hall Green district. It is proposed to extend the Cole Valley sewer to pick up tributary sewers dealing with the sewage from the new buildings within the drainage area, and to do away with the existing cesspools. The Chinn Valley sewer will also be constructed for the same purpose. Storm-water sewers from the various roads will discharge direct into the river Cole and Chinn Brook. The total length of these pipe lines will be 7½ miles, in sizes varying from 9-in. pipes to 3-ft. brick culverts. Acock's Green Sewerage.—The object of this work is to do away with the existing sewage farm at Acock's Green owing to the site becoming surrounded with buildings. Alternative schemes have been prepared, two of them dealing with the problem by gravitation to some considerable distance lower down the valley, and the other by pumping, whereby the sewage will be discharged into the existing Cole Valley main sewer. Hockley Valley Flood Prevention Scheme.—A further length of 150 yds. of this work will be undertaken shortly. The brook will be widened on one side, and a retaining wall constructed of sufficient strength to allow of buildings being placed upon it. Public Street Improvements: Wheelwright-road, Erdington; Linden-road (extension), King's Norton; Pershore-road; St. James' place, Vauxhall; Alum Rock-road; Lordswood-road, Road No. 1 and Road No. 2 (Quinton and Harborne town-planning scheme). Private Street Works: Livingstone-road, King's Heath; Springfield, Erdington; St. Edwards-road, Bournbrook; Elmhurst-road, Handsworth; Headingley-road, Handsworth; Freer-road, Handsworth; Grove Hill-road, Handsworth; Newcombe-road, Handsworth; Uplands-road, Handsworth; St. Michaels-road, Handsworth; Insurance-passage (City). Bridges: King's-road (in progress); Forman's-road (in progress); Aston Church-road (in progress); Stratford-road (in progress); Brookvale-road (in progress); Witton-road; Cole Ford (footbridge) and Lea Ford (footbridge). Building Works: Extension to Victoria Law Courts; New weights and measures office; new underground convenience, Aston Cross; additions to police station, Selly Oak; new fire station, Aston; and new fire station, Stirehley. New Street Paving Works: Pickford-street, granite and wood; Berkley-street, granite; Holt-street, granite; Heath Mill-lane, granite and wood; Sampson-road North, granite; Barford-street, granite; and Lionel-street, granite. Widening: Marsh-lane, Erdington; Kingsbury-road, Erdington; Wharfdale-road, Tysley; Warwick-road, street widenings in connection with new tramways; Stratford-road, street widenings in connection with new tramways; Pershore-road, street widenings in connection with the doubling of the existing single tramway track; Lordswood-road; Rookery-road, Handsworth; and Oxhill-road, Handsworth. The construction of an underground convenience at Aston Cross, Birmingham, will be commenced at an early date.

Birstall (Mr. T. H. HAILSTONE, M.I.M. AND CO.E., M.R.SAN.I., surveyor to the urban district council).—During the year several roads have been tar-sprayed, and road crusts improved with various tarred materials. Improvements and extensions at the sewage works are in progress at the present time, including the putting down of new filter with Fiddian travelling distributor. Several street improvements have been carried out by this council on the county main and also on district roads, and probably a street will be made up under the Private Street Works Act, the plans of which are at present being prepared. The public lighting in the market-place is to be extended and brought up to date. A small destructor for trade refuse will be shortly completed; new sewers are to be laid, and the general highways improvements

continued. A town planning scheme is to be prepared, and map No. 1 has already been before the committee. The housing question is also receiving attention, a sub-committee having been appointed to consider and report upon a scheme.

Blackpool (Mr. JOHN S. BRODIE, M.INST.C.E., borough engineer and surveyor).—The renovation and enlargement of Cocker-street public swimming and marine baths were completed, and the baths reopened in July last. The new large public sanitary conveniences under the Queen's-drive have been completed and opened. A feature of the past year has been the extensive electrical public street illuminations and decorations, first started in connection with the visit of their Majesties the King and Queen in July, and continued until the end of October. The improved lighting will be permanent. The new large higher elementary school (1,450 scholars) has been completed and opened, and another council school in the Layton district of the borough is about to be commenced. In the immediate future, the extension of the promenade from the Gym to the borough boundary is projected, a distance of 440 lin. yds., at an estimated cost of £7,000. The scheme for a new sea wall and promenade southwards for a distance of 1,300 lin. yds. has been further enlarged and developed, the estimated cost being now £65,000. The negotiations for the land are making satisfactory progress. Several town planning schemes are being promoted, and many street improvements of an important character will be carried out. Two additional district reading rooms are being provided, and an additional municipal bowling green is being laid down. Two large underground conveniences have been decided upon, and the work will be undertaken forthwith. The formation of new private streets will be exceptionally large this year. The erection of new buildings during the past year has been unprecedented in number.

Bognor (Mr. OSWALD A. BRIDGES, M.R.SAN.I., engineer and surveyor to the urban district council).—During the year the work which the council intend carrying out will be very extensive, necessitated by the rapid growth of the town, which now ranks as one of the principal towns on the South Coast. The new outfall sewerage scheme and pumping station will be carried out, tenders for which have just been accepted. The scheme will cost about £12,000. Full military bands have been engaged for the season, and, in consequence, the bandstand and enclosure will have to be reorganised, and a large bandstand erected with a weather shelter. The widening of the eastern promenade will be carried into effect at a cost of £1,983. Public underground conveniences for ladies and gentlemen will be constructed at this end of the town. A scheme, entailing the erection of sixty-nine workmen's dwellings, has been embarked upon, and twenty-five have already been erected, while eighteen more are in course of erection. The cost is £150 per cottage, and the work is being carried out departmentally. It is proposed to make up Oxford-street, Green-lane, East-lake and Henry-street under the Private Street Works Act, 1892.

Bolton (Mr. E. LL. MORGAN, ASSOC. M. INST.C.E., borough engineer and surveyor).—The streets department has effected many important improvements, some of which had been long anticipated, while the work before the borough engineer and surveyor and staff is extensive and a material factor in pointing to the town's improvement and expansion. In 1913 the works carried out, including repair and maintenance of main roads and highways, absorbed a sum of £19,536, and private street improvement works accounted for £22,963, the previous year's figures being £13,000 and £20,000 respectively. The tramways in the centre of the town have been reconstructed, and of other works contemplated at the beginning of last year the Deane Church-lane Bridge has been widened, and is now open for traffic, and paving of that lane is being proceeded with, as is also Captain's Clough; the raising of Blackburn-road, Astley Bridge, will be completed this year, and Deansgate West improvements will be continued on the erection of the new post office; the paving of Victoria-square and Newport-street has been completed; Great Lever Park is completed, and the consumption pavilion in Hulton-lane hospital area will be completed very shortly. The Parliament Bill

provides for the improvement of Bridge-street, Deansgate, Church-wharf, Great Moor-street (from Mawdsley-street to Howell-croft), St. George's-road, Bridgeman-place, Newport-street, Oxford-street, Howell-croft North and Plodder-lane in the district of Hulton; also the following tramway extensions or improvements: From Doffcocker's Inn to Doffcocker (Delph-hill) Mill; from Eskrick-street, up Harper's-lane, through Elgin-street, on to Church-road; from Smithy Bridge to Maze-street (Darcy Lever); from Fletcher-street and Bridgeman-street to Higher Swan-lane; from Deane terminus to borough boundary about Fernhill Gate. The reconstruction of the Manchester-road route is being proceeded with. In addition to these there are contemplated improvements in Green-lane, St. Helens-road, White Gate-brow to Four-lane Ends; repaving portion of Belmont-road; completion of work on Victoria-square and Chorley New-road; improvement of Junction-road (from Wigan-road to Deane-Clough), and probable improvement of Hulton-lane. Something may also be done in providing improved corporate office accommodation, and developments are possible respecting recreation grounds and a boating lake.

Bolsover (Mr. W. G. H. BROWNE, F.I.SAN.ENG., ASSOC. R.SAN.I., surveyor and sanitary and water engineer to the urban district council).—The chief work which is likely to be carried out is the sewerage and sewage disposal of the village of Stanfree, at a cost of £2,000. The scheme has not been fully drafted yet, and it will probably be carried out from current rates. Implement sheds are to be built at the depot in Town End. There are also proposals for considerable extensions to the fire brigade. Two public urinals are to be built within the town area at an early date, one of which will be underground. Private street works, of which two contracts will be running at the end of the year, will be continued, and probably two or three more streets will be made under the Private Street Works Act. It is also likely that extensions will be made to the old sewerage outfall works, presumably by the addition of two or more bacteria beds.

Boston (Mr. G. E. CLARKE, M.INST.C.E., borough surveyor and harbour and dock engineer).—A considerable amount of tarred macadam is to be relaid during the year. Some of the roads are twenty-five years old. The road to the dock is to be relaid with granite setts, and sewerage is to be carried in the Norfolk-street area. Pumping plant to deal with storm water at the main sewer outlet is in hand. Destructors are contemplated, and estimates are before the committee. Additional cottages are to be erected on the farms. Further wood paving will be laid in business streets. The new Town Bridge has been completed at a cost of £7,000. Owing to the increasing trade, further warehouse accommodation is required, and the electric light will be extended. The new sidings are now completed at a cost of £12,000. Further lighted buoys are to be put down in the approaches; acetylene-lighted buoys, to burn twelve months, will be adopted, as that at present in use gives the greatest satisfaction. The buoyage system calls for a large amount of work, as there are ninety-six buoys afloat, and owing to the changes in the sands, constant surveying is required to keep the charts up to date. A new cradle is being fitted up to the 20-ton hydraulic coal hoist.

Bredbury and Romiley (Mr. ROBT. HARDMAN, surveyor and sanitary inspector to the urban district council).—The works proposed to be carried out by this council during 1914 include the purchase and laying out of a 4½-acre recreation ground in the Bredbury district, the widening of the Stockport main road, and an extension of the main sewer at a cost of £1,500, including pump to be driven by motor power. Land is to be purchased for the building of workmen's cottages, and for the extension of allotments. It is also intended to lay out and build a boundary wall at the Romiley recreation ground. Main road improvement and improvements on the local highways will be carried out as well as the extension of water mains in the district. Other contemplated works are the building of an eight-stalled stable, and the purchase of horses for the removal of night soil. A town planning scheme for the whole of the district is to be prepared, and paving work will be carried out in several new streets and back passages. The conversion of a good many privy closets into water-closets and other sanitary improvements have been decided upon. A length of 1½ miles of main road on the outskirts of Romiley is to be lighted.

Brentwood (Mr. A. JAMES MEESON, M.I.M.AND CO.E., M.R.SAN.I., surveyor and inspector to the urban district council).—The council are preparing a scheme for an extension of the urban area. The surveyor has been instructed to prepare a system of surface-water drainage for the district, and it is proposed to construct an underground public lavatory. The widening of a dangerous corner on county roads, in conjunction with the county council, is to be continued.

Housing and Town Planning Act, 1909.

Bridlington (Mr. E. R. MATTHEWS, ASSOC.M.INST.C.E., F.G.S., borough engineer and surveyor).—The works proposed to be carried out in Bridlington during 1914 include the extension of the borough sanatorium, to cost £1,500; the widening of Cardigan-road, at a cost of £4,600; new sewers in North-street and under the Sewerby sea defence roadway, to cost £600; the laying of several other sewers in the borough; the demolishing of Centre House Market-place, in order that the space now occupied by this may be added to the street; private street works in a number of streets; the demolishing of six houses at the junction of Quay-road and Brett-street, for street widening purposes; the erection of a house for the town's gardener, and also of a weigh office; in addition to the twenty-five workmen's houses recently erected in the old town, the erection of twelve workmen's cottages in North Back-lane, and ten in Portland-place, and the laying of wood paving in High-street.

Bristol (Mr. L. S. MCKENZIE, ASSOC.M.INST.C.E., city engineer).—Works to be put in hand this year include the erection of sanatoria for the treatment of tuberculosis, consisting of three blocks of twenty beds each, together with administration block; the erection of a tepid covered swimming bath, together with forty-eight slipper baths; the strengthening of a bow-string girder bridge across the river Avon by the insertion of a centre girder; the construction of an underground public convenience; also two new bowling greens and two tennis courts. The surface of about 140 miles of macadam roads will be treated with tar as before, and further experimental lengths of bituminous-bound macadam and carpeting will be laid, as well as the renewal of about 25,000 yds. of wood paving. A Town Planning Committee has been appointed, and a scheme is also being considered for a new low-level road to Avonmouth.

Briton Ferry (Mr. H. ALEX. CLARKE, engineer and surveyor to the urban district council).—The projected works for 1914 are: Workmen's Dwellings.—The council have now in hand their second housing scheme, comprising the erection of sixty-two workmen's dwellings, which are to be completed during the present year; nineteen houses are to be rented at 6s. per week, and forty-three at 6s. 6d. per week. When these are completed the council will have 113 dwellings. A scheme for the laying out of 6 acres of ground as a public park, with bowling green, tennis court and bandstand, has been submitted to the Local Government Board for approval. Upward of 2 miles of water mains will be added to the waterworks undertaking. The construction of new roads and sewers and other minor works is contemplated.

Burley-in-Wharfedale (Mr. HARRY RIDING, surveyor, inspector, and gas and water manager to the urban district council).—The council have approved plans and estimate, prepared by the surveyor, for a mechanical water filtration plant, and have applied to the Local Government Board for sanction to borrow £1,400 for carrying out the work. The water mains are to be extended in order to supply an adjoining authority with water, and several thousand yards of mains are to be scraped and cleansed. It is hoped that an early start will be made with an important road widening scheme, costing £2,600, to which the Road Board are

contributing one-third of the cost. Several other road improvements are at present under consideration, and it is proposed to lay down trial lengths of Tarvia, grouted granite, and Glutrin-bound granite on the main road. During the early spring about 30,000 super. yds. of Tarvia spraying will be taken in hand. There is every indication of a fairly busy year.

Burnham, Somerset (Mr. WM. H. CHOWINS, engineer and surveyor to the urban district council).—The New Year promises to be an exceptionally busy one. In addition to the ordinary routine work, which, owing to the rapid growth of the town is greatly increasing, the council have decided to construct a new promenade pier, and to carry out extensive repairs and alterations to the existing jetty. A Provisional Order under the Board of Trade is being applied for in the next Session to authorise the council to undertake these works. The extension of the urban area by including portions of two neighbouring parishes will probably come into effect on April 1st next, the county council having made the necessary Order. This will involve the construction of sewerage works, including pneumatic ejectors, gas engines and air compressors, which will have to be undertaken forthwith.

Burnley (Mr. G. H. PICKLES, M.INST.C.E., borough engineer and surveyor).—The following is a list of municipal works projected in 1914: Tramway extensions; Church-street widening; town hall extension; two schools; mortuary chapel at cemetery extension; Lightenhill Park shelter and bowl store; Barden-lane recreation ground bowling green, shelter and bowl store; and extension of sewage works, main sewer and street works.

Burton-upon-Trent (Mr. GEORGE T. LYNAM, M.INST.C.E., borough engineer and surveyor).—The question of the further widening of Burton Bridge is still under consideration. The relaying of the wood paving in High-street is to be continued. Station-street is to be further widened, for which property has been acquired. Negotiations are being conducted for the acquisition of property in Lichfield-street for improving the highway. The additions to the administrative block and sanatorium, and provision of additional bathrooms at the hospital are nearing completion. The duplication of the sewage rising main for a distance of $\frac{1}{2}$ mile from the pumping station will be completed, and the clearing of the old main of lime scale will be proceeded with. The extension of the office accommodation for the medical officer of health and treasurer's department is under consideration, and various small sewerage extensions are contemplated. The stores and workshops at the gasworks are being extended at a cost of about £3,000, and tenders are being obtained for extending the retort house at a cost of about £5,000. The construction of a museum and gas and electricity showrooms, to cost about £7,000, has been commenced. The extension of the gas mains to Rolleston and Tutbury is in hand. The improvement and extension of the refuse destructor plant will probably be considered.

Bury (Mr. J. AINSWORTH SETTLE, ASSOC.M.INST.C.E., borough engineer and surveyor).—The works contemplated during 1914 include the conversion of local sett and macadam roadways to granite paving on concrete, construction of tanks for treatment of trade waste water, extension of tramways, extension of electric power station, various works of sewerage and road improvements, conversion of an existing building into a tuberculosis dispensary, and the extension of the housing scheme.

Bushey (Mr. ERNEST E. RYDER, surveyor to the urban district council).—During the year the following works will be carried out: New fire station, storm-water sewer to deal with the Koh-i-noor estate, and the laying out of an open space in front of the old village church. The council will also have under consideration a scheme for developing about 100 acres as a garden suburb. The whole of the footpaths on the main London road will be paved, kerbed, and channelled. Negotiations are in hand for securing land and properties for purposes of street widening

and it is hoped that the county council will carry out a scheme of reconstructing the London-road, over which a frequent service of motor 'buses now runs.

Calverley (Mr. WILLIAM WALKER, surveyor, water-works manager, sanitary inspector, and housing inspector to the urban district council).—An application has been made to the Local Government Board for sanction to borrow £1,700 for purchase of land (10 $\frac{1}{2}$ acres). The inquiry has been held, and the decision of the board is expected shortly. Should sanction be given it is intended, in the near future, to construct works for the disposal of the sewage of the district. The existing works will be dismantled, and all the sewage diverted to the new works. An extensive improvement of a road between Calverley and the adjoining urban district of Farsley will be completed. The council having purchased a machine, most of the roads in the district will be tar sprayed.

Cambridge (Mr. JULIAN JULIAN, borough surveyor).—A considerable amount of work in connection with private street works, street improvements and small sewer extensions will be carried out during the year. The site for a new bridge for vehicular traffic over the river Cam is under consideration, and a further housing scheme is contemplated. The erection of two new ward pavilions and additions to the administrative block at the sanatorium will be commenced shortly. The County Borough Bill will probably come up for third reading during the next Session of Parliament.

Cannock (Mr. ROBT. BLANCHARD, engineer and surveyor to the urban district council).—The extension of the sewage disposal works, at an estimated cost of £12,270, is in course of construction, together with a further contract for sewers in the district. The usual work of tar-spraying of main roads and laying down tar-macadam will be continued, and it is anticipated that two road widening schemes will be undertaken, as well as various small improvements. Contract No. 3 for kerbing and channelling about 4 miles of district roads will shortly be let, and several streets will be constructed under the Private Streets Works Act, 1892. A new school will be erected during the year. The advisability of erecting houses under the Housing and Town Planning Act, 1909, and an isolation hospital, is receiving consideration by the council.

Cardiganshire (Mr. DAVID DAVIES, county surveyor).—The council carried out a splendid improvement last year at Llechryd to stop the river Twy flooding the road. The surface of the road was raised 7 ft. for 240 yds., and a new bridge was built. It is an excellent job, and the river has never flooded the road since. It cost the county £1,400. This year it is proposed to carry out the following improvements: Making a new road from New Quay to Gilfach Yrheda, and thence widen it to Llanarth, where it will join the old main road. This when done will open the country from New Quay to Aberayron and Aberystwyth. It will cost about £10,500. Reconstructing the main road from Cardigan to Cenarth, at a cost of £5,700. A new bridge is to be built at Rhydy Vallon, at a cost of £795.

Carlisle (Mr. HENRY C. MARKS, M.INST.C.E., city surveyor and water engineer).—The corporation's application for county borough powers having been granted, the council are proceeding with the financial adjustments with the county council, and are formulating schemes for the carrying out of the Insurance Act, and the requirements of the Board of Education with respect to higher education. Extensions to the swimming baths and electric power station are also contemplated, together with additional sewerage of the areas recently added to the city.

Carmarthenshire (Mr. R. W. JONES, M.M.C.N.E., county surveyor).—The chief additional works to be executed in the Western Division of the county to that of the ordinary maintenance of 153 miles of urban and rural main roads and the bridges thereon, will be the strengthening of about 10 miles of main roads, and surfacing with tar-macadam of about 8 miles of roads. About 15 miles of road will also be treated with surface tarring. A new bridge is to be erected at Nantyci, near Carmarthen.

Carshalton (Mr. W. WILLIS GALE, ASSOC.M.INST.C.E., surveyor to the urban district council).—The year 1914 will see many improvements carried out. The new bridge across the Wandle at Hackbridge will, it is hoped, be constructed. The question of an open-air bath in the newly acquired park is under consideration, and the town planning of the district will be actively proceeded with under the permission granted by the Local Government Board. The building of stables and the provision of horses and plant for the council's work will be taken in hand, and the question of building cottages for the council's employees has been referred to a committee for report. The making up of the roads on the Highfields and Fairview estates under the Private Street Works Act will be considered.

Caterham (Mr. H. R. MARTIN, engineer and surveyor to the urban district council).—An extension of the sewage works has been carried out during the past year, including new tanks, travelling sprinklers, revolving sprinklers, sand filter and sludge heds to take the drainage from the asylum, at a cost of £3,300. In addition to the usual work of resurfacing the roads, experiments have been made, with success, in crushing the round pebbles obtained from the local gravel pits for use in dressing roads and paths treated with tar.

Chelmsford (Mr. PERCIVAL T. HARRISON, ASSOC.M.INST.C.E., borough and water engineer).—During the past year the council have adopted a second housing scheme for 106 houses, which is well in hand. When completed an amount approximating to £30,000 will have been expended on workmen's dwellings in three years. Other works completed include stables and depot, borehole 540 ft. deep, new engine-house and suction-gas plant for main waterworks station, wood block paving (£7,000), several considerable improvements, and extensions of sewers and water mains. The schemes under consideration by the council include new municipal offices, further works of water supply, refuse disposal scheme, remodelling of the whole of the sewerage and sewage disposal works, and town planning.

Cheltenham (Mr. J. S. PICKERING, M.INST.C.E., borough surveyor and water engineer).—The scheme for the purification of the sewage of the borough, which has been in progress for some time, will be completed and brought into operation during the coming year. The works comprise precipitation tanks, percolation filters, and pumping machinery for dealing with the sludge. In addition to these works, the corporation own two sewage farms having an irrigable area of about 330 acres. Further progress will be made with the resewering of the borough, the council having approved an application to the Local Government Board for sanction to a loan for the reconstruction of sewers in another district. During the past fifteen years a sum of upwards of £50,000 has been spent on this work, and £40,000 on sewage disposal. The Local Government Board have sanctioned a scheme for the adaptation of five properties in the Promenade as municipal offices, the designs having been prepared by the borough surveyor. The conversion of the water-bound roads into tar-macadamised roads will be continued.

Chiswick (Mr. EDWARD WILLIS, ASSOC.M.INST.C.E., F.S.I., engineer and surveyor to the urban district council, and architect to the Education Committee).—The principal matter before the council in the present year is the proposed acquirement of the electricity undertaking, and the purchase of lands for burial ground and educational purposes. The engineer has already prepared plans in connection therewith, and the Bill has been deposited for submission in the coming Session. The extension of the surface-water drainage scheme has been proceeded with during the past year, and it is intended to further extend same during 1914, while the several street widenings and improvements set forth in the Chiswick Urban District Council Act, 1911, will also be proceeded with from time to time. Extensive widenings, in addition to those approved by the above Act, are also anticipated, and some will be carried out during 1914. Owing to the motor-omnibus traffic, it is hoped that the wood paving will be extended, but this may be held over if no assistance can be obtained from the Road Board. Additions to elementary schools are anticipated to be carried out by the architect to the committee, and the

new secondary school, for which the county architect (Mr. Crothall) is responsible, will probably be started in the spring. The laying out of a section of Chiswick Common for the use of children will be proceeded with at once, and it is possible a further open space may be acquired during the year. The most important feature in the district is the proposal to instal a huge gasworks undertaking, for which nearly 100 acres is to be purchased, and which would be erected and worked under the most up-to-date conditions if the company are successful in obtaining the necessary Act of Parliament. The present intention is for such company's land to immediately adjoin the sewage disposal works. Special provision would be made in the scheme for cottages to be erected on garden city principles, and a complete belt of tall trees would be planted to lessen the objection to existing outlooks. There is also a movement on foot to lay out an eighteen-hole golf course on the vacant land immediately adjoining the finishing point of the University Boat Race, and should such be successful, it is probable it would prove one of the most convenient courses for residents in the Metropolis. The necessary private street works will be carried out in the early part of the year.

Chorley (Mr. GEORGE H. HOPKINSON, borough surveyor).—Sanction has been obtained, and contracts partly let, for the sewerage of the southern portion of the borough, and the extension of the Cowling sewage works (£4,463), which comprises the construction of 1,283 lin. yds. of pipe sewers, additional tanks and filters. A new council school is to be erected, at an estimated cost of £6,000. The Town Planning Act is under consideration in respect of several areas, and the council intend applying for sanction to prepare schemes. A recreation ground, about 5 acres in extent, is nearing completion, and other matters occupying the attention of the authorities are the provision of baths, town improvements, and the making up of private streets and back passages.

Church (Mr. W. E. WOOD, M.INST.M. AND CO.E., surveyor to the urban district council).—During the year a gravitation sewer has been laid, at a cost of £5,000, to take the Altham sewerage into the Church sewers for treatment at the sewerage works at Coppy Clough. It is proposed to tar-spray one of the secondary roads leading to Clayton-le-Moors, at a cost of £770, though this work may not all be done in one year. New council offices have been erected in Blackburn-road, as well as new public conveniences. Several back streets are to be paved and sewerage. A new council school will be erected in Hyndburn-road, at a cost of £8,000.

Cleethorpes - with - Thruscoe (Mr. CHAS. H. WAITHMAN, ASSOC.M.INST.C.E., engineer and surveyor to the urban district council).—During the past year the principal works carried out were the construction of the pier approach shelter in reinforced concrete and terra-cotta, underground conveniences, bandstand, shelters on Kingsway, and the laying out of the Kingsway enclosure. A Local Government Board inquiry was held in connection with the erection of a 4-cell refuse destructor, and designs were approved for the new outfall and town pumping stations. The works projected for 1914 are the erection of refuse destructor and outfall and town pumping stations, the conversion of the Kingsway enclosure into a Floral Hall, and the laying out of 6 acres extension to Sidney Park. The council have also under consideration a scheme for the construction of a marine lake and extension of the promenade and gardens, which is estimated to cost £25,000, the surveyor's plans having been provisionally approved. There will be a considerable amount of street work, as, in view of the approaching completion of the sewerage scheme, several estates will be developed. The council's electricity undertaking, initiated in 1912, is now in working order, and further cable extensions are projected.

Clitheroe (Mr. ARTHUR R. BLEAZARD, borough engineer).—The most important works to be carried out by the Clitheroe Corporation during the year are: Erection of a new elementary school; laying out two parks; the erection of twenty semi-detached cottages, and the erection of sprinkler beds at sewage works. Several street improvements are on hand.

Clydebank (Mr. GEORGE ROSS, burgh surveyor).—During the year 1914 a ladies' shelter is to be built in the Overton Park, consisting of waiting-room, lavatory, and two water-closets, at a cost of £360. A number of private streets are to be temporarily repaired. A new 21-in. F.C. pipe sewer, 170 yds. long, will be laid in Singer-road, at a cost of £250. It is proposed to widen Killowie-road from 40 ft. to 60 ft. for a length of 240 yds., and to pave a portion of Dumbarton-road of about 3,600 sq. yds.

Colne (Mr. T. H. HARTLEY, borough surveyor).—During the year 1914 the following works will probably be put in hand under the borough surveyor: Tramways Purchase.—The corporation have promoted a Bill in the last Session which has now received the Royal Assent authorising the purchase of the undertaking of the Colne and Trawden Light Railway Company. The arbitration to settle the purchase price is shortly to be held, and no doubt this will entail new works of various kinds. Town Planning.—There has not been much further progress made in regard to the town planning scheme, which embraces 930 acres, up to the westerly boundary of the borough. Further steps will be taken during the year to forward the scheme. Main Sewers and Sewage Disposal Works.—Further developments in this direction are anticipated, but no definite scheme is yet formulated. Private Street Improvement Works.—Further works of private street paving and sewerage will be taken in hand out of the loan now sanctioned of £21,000. Main Roads Granite Paving.—The granite paving of the main roads will be completed during the year, at an estimated cost of £14,000, and a number of public street improvements and road widenings will be taken in hand. Water Carriage System.—Further works of this character will be executed, embracing the conversion from pail and tanks to water carriage, the sanction of the Local Government Board having been obtained to this work. The estimated cost is £4,470. Tar Spraying and Tar Grouting.—The highways are being reconstructed as far as the funds will allow on the most modern methods of tar construction, and further lengths will be dealt with.

Colwyn Bay (Mr. WILLIAM JONES, ASSOC. M. INST. C. E., surveyor and water engineer to the urban district council).—The continued remarkable progress of this seaside resort has made it the largest and most important coast town and the second largest town in North Wales, both as a residential and visiting centre. Plans of 111 new houses, twenty-eight additions, and of several other minor buildings and alterations were approved by the council during the last twelve months. The Promenade extension at Rhos has been completed at a cost of £3,000. There is now a continuous sea wall of 3 miles in length. Seven shelters have been erected on the Rhos section of the promenade at a cost of £1,150. An underground convenience is in course of erection at Rhos, at a cost of £1,100. The council are now in negotiation with the Victoria Pier and Pavilion Company for the purchase of the pier and pavilion at an approximate cost of £15,000. A great amount of road improvements and widenings will take place during the year—viz., Abergele main road widening to Colwyn, at an estimated cost of £12,000; Mochdre main road widening, at an estimated cost of £3,500; Brompton-avenue widening, at an estimated cost of £1,160; and Llanrwst-road widening, at an estimated cost of £1,500. A grant of £6,000 has been given by the Road Board towards the cost of widening and improving the through road between Colwyn Bay and Llandudno, the interested authorities making up the extra £2,000 of the estimate for carrying out this work. The council have approved of a scheme submitted by the surveyor for the erection of eighty-eight houses for the working classes on about 7 acres of land, at an estimated cost of £18,700, and the erection of these will be proceeded with as soon as the sanction of the Local Government Board has been obtained. The question of the provision of a refuse destructor is now very prominently before the council, and tenders will, it is expected, be very shortly advertised for. Owing to the extensive developments of the building estates in the district, several lengths of water, gas and electric mains will have to be laid, and several streets taken over by the council under the Private Street Works Act, 1892. An entirely new code of building

by-law will, it is hoped, come into operation during the year.

Coventry (Mr. J. E. SWINDLEHURST, M. INST. C. E., city engineer and surveyor and water engineer).—Much work of an important and varied nature will be carried out by the city engineer during the year 1914. Sanction has now been received to the borrowing of £35,000 for the purpose of constructing twelve bacteria beds and humus tank at the sewage farm, and the preliminary work in connection with this scheme has been started. Sewers are intended to be laid in Holbrooks-lane and Lythalls-lane for the purpose of the drainage of certain areas adjoining these thoroughfares. The corporation have in hand the preparation of a town-planning scheme for about 1,000 acres on the north-west side of the city, and other areas are under consideration. The city engineer has in hand a report on the question of annexation, together with an important scheme having for its object the relief of traffic in the central streets of the city. The Waterworks Committee have decided to treat the water which is derived from Whitley well chemically, and the city engineer has been authorised to deal with this matter. It is intended to proceed with the construction of an additional covered reservoir at Coundon, while the large water tank at Spon End waterworks will also be roofed in. A tar-macadam plant is about to be installed, as a considerable amount of tar-macadam road work will be undertaken during the year. Other works in hand, or under consideration, comprise re-sewering of the city; extensions to public baths (£15,400); public conveniences (£7,000); extension of housing scheme; depot for highways department (£4,000); erection of model lodging-house; extension of Drinkwater Arcade; public abattoir; extension and enlargement of water mains in certain parts of the city; and street paving scheme which will comprise the laying of many thousands of yards of flags manufactured at the refuse destructor from clinker. The Earlsdon and Chapel Fields surface-water scheme (£12,000) is proceeding apace, and the new arterial sewer to serve the Radford district has been commenced. The extensions to the city hospital have been completed during the past year, as have also the public mortuary, extensions to the market hall, three branch libraries, and the branch slipper baths at Primrose-hill; while the extension of the Narrow-lane housing scheme, comprising 104 cottages (four with shops), is being pushed forward rapidly by the contractors, several of the houses being ready for occupation. The order has been placed for the motor fire pump and motor first-aid appliance, and it is expected that these will be delivered within the next few months.

Cramlington (Mr. WILLIAM J. COULSON, M. M. UN. E., engineer and surveyor to the urban district council).—The council propose to purchase horses, instead of contracting, for the removal of house refuse and other work, and plans are now being prepared by the surveyor for the erection of stables, sheds, and other buildings. Instructions have been given for the preparation of plans for new sewerage and sewage disposal works for the northern portion of the council's district. It is expected that the laying of gas mains to Shankhouse, East Hartford, East Cramlington, and West Cramlington will be completed in time to enable the council to have the whole of the streets at these places lighted with gas from the beginning of next lighting season. Further extensions of water mains, private street works, and highway improvements will also engage the attention of the council.

Cromer (Mr. ROBERT CROOME, surveyor and sanitary inspector to the urban district council).—The widening of the coast road between Cromer and Overstrand is receiving consideration, and the cost will probably amount to about £2,500. The laying out of the Marrams, an open space at the top of the cliffs at the west end of the town, is also under discussion, with the provision of a bandstand and additional shelters.

Croston (Mr. Wm. T. HOGNEX, engineer and surveyor and inspector of nuisances to the urban district council).—The only works of importance in addition to the general routine projected for the ensuing year are extensions of sewers to embrace the Drinkhouse-lane and Grape-lane districts, and the provision of new duplicate sewage pumping plant and two additional ejectors.

Croydon (Mr. GEORGE F. CARTER, M.INST.C.E., borough engineer, surveyor and water engineer).—A new fire station and library at Thornton Heath will be completed early in the New Year. A local inquiry has been held in respect of the construction of a covered service reservoir to hold 10,000,000 gallons, a borehole, pumping plant and buildings at Waddon Well, and many miles of water main, the whole estimated to cost £95,000, and it is expected that the work will be put in hand. An application has been made to the board for further works of sewage treatment at the South Norwood sewage farm. Progress is being made with the extension and covering in of a swimming bath at South Norwood. The local inquiry has taken place for an addition to the borough of 5,658 acres. Tenders have been invited for the widening of West Croydon Bridge, at an estimated cost of £18,000, to improve the main London and Brighton road through the borough. Further extensions at the borough hospital are contemplated, as well as the provision of tuberculosis wards.

Cumberland (Mr. WILLIAM FINCH, county surveyor and bridgemaster).—This year promises to be a very busy and important one in connection with the county main roads and bridges. In addition to the usual maintenance and repair of the 530 miles of county main roads, and 490 county bridges, many other works are to be carried out. It is intended to erect a new ferro-concrete bridge on the Glasgow main road, to take the place of the historic metal bridge, built by Thomas Telford in 1820. The estimated cost of the new bridge and approaches is £16,000. The erection of a new stone bridge and road diversion in the Alston district will cost £3,500; road diversion at Rowrah will cost £5,350, and the completion of the sea defence works at Dibunill, near Allonby, £8,300. Several other smaller road and bridge improvements will be carried out. The resurfacing with tar-macadam, and the surface treatment with tar, of various sections of the main roads will be continued, as well as the scheme, commenced last year, of resurfacing with granite, or whinstone, those roads hitherto covered with land cobbles and limestone. Several applications have been made by rural district councils for contributions from the county council towards the cost of widening and improving certain district roads, with a view to such roads being eventually taken over as main roads by the county council.

Barlington (Mr. GEORGE WINTER, borough surveyor, waterworks engineer, and architect to the Education Committee).—A new pumping plant, consisting of two sets of three-throw ram pumps by Messrs. Hathorn, Davey & Co., belt-driven from a 220-h.p. Hornsby-Stockport double-cylinder gas engine, and gas-producing plant, will be installed at the waterworks, and the necessary alterations and extension required to the existing buildings carried out. A new elementary school, to accommodate 1,200 children, will shortly be commenced, and later in the year two elementary schools, accommodating 840 and 200 children respectively, will be commenced. Application has been made to the Local Government Board for a Provisional Order to extend the borough boundaries, and obtain the powers of a county borough. Twenty-two and a-half acres of land in the Cockerbeck Valley will be laid out as a recreation ground and as allotment gardens. It is proposed to spend about £5,000 on improvements to the corporation cattle market. About 8,000 tons of tarred slag macadam will be laid, about 2 miles of private streets put into permanent repair, and various lengths of the main roads paved with granite setts. A new main sewer, 1 mile in length, will be laid in the Cockerbeck Valley. Sewage disposal works, comprising septic tanks, storm-water tanks and percolating filters, which it is proposed to substitute for the present system of irrigation on land, will also be commenced.

Denbighshire, Western Division (Mr. R. B. ADAMS, county surveyor).—In addition to the usual road repairs, which are becoming more costly every year, owing to the great increase of all kinds of motor vehicles on the roads, the council propose, during the year ending March, 1915, to improve the main road from Abergele, through Llangerniew, to Llanrwst, by cutting off seven dangerous curves or corners. It is also proposed to widen the Abergele and St. Asaph main road near the entrance to Abergele. These improvements are estimated to cost £277. The council also propose to tar-spray a much larger area of road

surfaces than has been done heretofore. The widening of certain sections of the main road between Colwyn Bay and Llanrwst will be carried out during the year.

Derby (Mr. JOHN WARD, M.INST.C.E., borough surveyor and waterworks engineer).—During the present year it is expected that a considerable amount of work will be taken in hand. A town planning scheme is being considered, additions to the sanatorium are to be made, and the re-sewering of the Alvaston district will probably be carried out. Additions to the public recreation grounds, including new bowling greens, tennis courts, and running and cycling tracks for the training of athletes, are in hand. The fire brigade station is to be remodelled and extended, and various large street improvements will be taken in hand on several of the main roads, and the use of tar-macadam will be extended. Several new streets are being laid out by private owners. The Education Department will be erecting new schools and extending other existing schools.

Disley (Mr. C. S. RIGHTON, F.A.S.T., M.R.S.A.T., engineer and surveyor to the rural district council).—It is again proposed to tar-spray the whole of the main trunk road, except such portions as are being relaid with tar-macadam, and paving works are being carried out on one of the district roads. The sewerage of the Furness Vale portion is almost completed, and it is expected that the Local Government Board's sanction to the sewerage scheme for the Newtown portion and enlargement of the outfall works will be received shortly. Gas is now laid throughout the district, except in the outlying areas. Several large houses are being erected in the district.

Borchester (Mr. H. D. STRANGE, borough and water engineer).—In addition to the usual work, the council have under consideration schemes of street improvements, extensions to surface-water sewers, alterations and additions to stables, cart sheds and corporation depot, the provision of disinfection plant and premises at the isolation hospital, alterations and improvements to corporation properties and shelters in the borough gardens. At the sewage disposal works a scheme of improvement is under consideration by deepening the existing filters, the provision of sprinklers, erection of pumping plant, and the extension of irrigation area.

Douglas, Isle of Man (Mr. FRANK COTTLE, borough engineer and surveyor).—During the past year the following works have been carried out: A service-water reservoir has been constructed at Ballaquayle; a system of waste-water meters installed; the Victoria Pier has been widened on the south side, and the Kursaal, a large public hall built by the corporation on the sea front adjoining Villa Marino Gardens, has been completed and opened. The Kursaal has accommodation for 3,000 persons, and has cost £25,000 to build, the grounds adjoining covering over 8 acres, and which the corporation purchased at a cost of £60,000. Further private street works have been carried out. The Harris Promenade has been improved by the removal of the public shelter and the space given up to traffic. Broadway, a main thoroughfare leading from the promenade, has been widened and improved. The works pending are: The widening of the Harris Promenade; the erection of a public shelter and convenience adjoining Villa Marina; the widening of Promenade-south; sec. 2 of the Town Improvement Scheme; and erection of artisans' dwellings; further private street works; public swimming baths at Port Jack, and extension (to include the Onchan district) of the borough boundaries.

Dover (Mr. W. C. HAWKE, ASSOC. M. INST.C.E., borough engineer and surveyor, and water engineer).—During the current year the corporation will be constructing a ferro-concrete viaduct in the Pier district. This work will include the demolition of a large number of properties, the laying out of new streets, diversion of sewers, and the erection of workmen's cottages. Other work will include the erection

of an elementary school for 700 children, provision of new tennis courts, tar-painting of about 7 miles of carriageway, and new kerbing and channelling, Folkestone-road.

Droithwich (Mr. H. HULSE, M.I.M.E., borough engineer and surveyor).—The scheme for the erection of twelve working-class dwellings has been developed during the past year. The houses were commenced in November last, and will be completed early in 1914. The present police station, which is municipal property rented to the county council, has been reported upon adversely, and the county council have communicated with the town council as to providing other quarters for the police. The highways department will deal with about 40,000 sq. yds. of surface tarring during the year, using local tar refined to pass the Road Board Specification. Several corner improvements and road widenings are likely to be carried out, so as to improve the roads for motor traffic. The usual work for road maintenance and strengthening of surface crusts will be carried out.

Droxford (Mr. ARTHUR VICTOR CARTER, surveyor to the rural district council).—In addition to the ordinary repairs and maintenance with local material, several of the more important district roads will be strengthened and the granite sections extended, with one or two improvements by widening. About 10 miles of surface tarring will be carried out.

Dukinfield (Mr. SAMUEL HAGUE, borough surveyor).—The corporation contemplate carrying out the following work during the ensuing year—viz., the making up of Adamson-street with concrete bed and granite paving; Corra-street and Malpas-street, for which borrowing powers have been obtained, and the widening of several streets, in addition to the ordinary work of maintenance. Extensions at the sewerage works will be carried out, also the erection of urinals in various parts of the borough, and the erection of a new dining-room, bathroom and storeroom at the gasworks. Several private streets are near completion.

Dundee (Mr. JAS. THOMSON, city engineer and city architect).—The corporation have made good progress with their schemes under the National Insurance Act, 1911, and have acquired Ashludic Mansion House and grounds, extending to 50 acres, as a sanatorium. It is proposed to provide accommodation for sixty patients, and to alter the existing buildings for administrative purposes, the total cost being about £8,500. At King's Cross Hospital an additional eighty beds will be provided for advanced cases, at a cost of £14,000, including the necessary administrative buildings. Three town planning schemes, embracing a total area of 297 acres, are in course of preparation, and it is expected that the approval of the Local Government Board will be given shortly. A commencement will soon be made with a central improvement scheme, involving an expenditure of about £500,000, for which sanction was obtained in last Session of Parliament. Under the Dundee Boundaries Act, 1913, the burgh of Broughty Ferry was annexed, and it is anticipated that several improvements will be carried out in the newly acquired area. The tramway system is being extended along the Blackness-road route, at a cost of about £7,000.

Dunfermline (Mr. W. R. MAXWELL, F.I.S.E., burgh engineer, surveyor and master of works).—During the year it is proposed to proceed with the construction of the third section of the large outfall sewer to the sea, costing about £35,000. It is also proposed to causeway several streets in the city, and renew water mains in others.

Durham (Mr. JOHN T. PEGGE, F.A.S.L., city engineer).—The Local Government Board have approved of alterations to the pump well at the sewage works, and the work is to be commenced at once. The council have selected two ferro-concrete bridge schemes, and if the Local Government Board will give an early consent, it is expected that the work will be proceeded with forthwith. The city and county councils have arranged a

programme for improving and strengthening the main roads during the year, and a grant has been made by the Road Board. Several important improvements are contemplated to provide for the ever-growing rapid motor traffic through the city, which will be paid for out of revenue. The workmen's dwellings are well in hand, and a smaller type of house is now under consideration for the next block. Several streets are under consideration for repaving with Durax, this being considered cheaper, longer-lived, and the cleanest type of granite paving. A ferro-concrete river wall will be commenced in spring. A number of private street works will be done during 1914. The matter of public conveniences is also being considered. Numerous small works of no special importance are in hand.

Ealing (Mr. W. R. HICKS, ASSOC. M.INST. C.E., borough engineer and surveyor).—The following is a list of the works contemplated during the year: Building of the senior block of the North Ealing school; finishing of the town hall extension; laying of 1½ miles of 24-in. surface-water culvert; extension of branch library, West Ealing; erection of new branch library, South Ealing; erection of new slipper baths, South Ealing; various public improvements, and the laying of some 2 or 3 miles of carriageways with tarred slag; the usual private street works, and the routine work in connection with a borough surveyor's department.

Earby (Mr. J. E. ALDERSLEY, engineer and surveyor to the urban district council).—The council will carry out an extension to the sewage disposal works at a cost of £4,790. Eleven streets will be made up under the Private Street Works Act, at a cost of £3,600. It is expected to carry out bridge construction costing £760, and to build stabling and a depot at a cost of £1,500. It is also intended to construct several sections of roads in tar-macadam.

Eastbourne (Mr. A. ERNEST PRESCOTT, borough engineer and surveyor, and surveyor to the education authority).—The main and surface-water drainage scheme will be continued during the present year, when it is hoped that two-thirds of the scheme will be brought into operation by connecting up the whole of the Upperton district, the heaviest part of the work having now been completed. The Pleasure Grounds Committee are now considering a scheme for the extension of the Central-parades, immediately opposite the Western bandstand, which will mean a probable outlay of £10,000. It is hoped also during the present year to come to some definite decision with regard to the proposal for the formation of a new coastal road between Eastbourne, Bexhill and Hastings. Plans for this work have already been prepared in the Eastbourne borough engineer's office, and a conference will be held very shortly of the various authorities interested. It is hoped that a Bill will also be promoted in Parliament at the next Session for the acquisition of the Devonshire Park, including grounds, pavilion, baths, theatre and shops, for £108,000.

East Grinstead (Mr. W. E. WOOLLAM, M.R.SAN.I., engineer and surveyor to the urban district council).—The projected works include the purchase of a site for depot, and the erection thereon of a refuse destructor (a tender for which has been provisionally accepted by the council); purchase of property for the purposes of erecting public sanitary conveniences; purchase of land for allotments and public recreation purposes, and private street works and sewer extensions.

Eccles, Lancashire (Mr. THOMAS S. PICTON, M.I.M. AND C.O.E., borough engineer and surveyor).—The coming year is likely to be a busy one, as it will see the commencement of several large schemes and the completion of many smaller ones. A portion of the main trunk sewers is to be reconstructed and enlarged; a new outfall sewer with a large catchpit, fitted with duplicate screens and automatic bucket elevators, will be constructed; and two large storm-overflow sewers are also included in this scheme, which is estimated to cost nearly £60,000. The South-East Eccles area scheme is for the purchase and demolition of about 7 acres of insanitary pro-

perty, and the erection on the site of artisans' dwellings after the necessary road improvements have been carried out. Owing to the very heavy traffic on the main road between Manchester and Liverpool, which passes through this borough, a portion of it, for about 1,800 lin. yds., is to be entirely reconstructed, the old grit setts being replaced by 5-in. by 4-in. granite setts on a foundation of concrete 6 in. thick. This work is estimated to cost £4,140. Peel Green-road for a distance of nearly 400 yds. will be widened from a 6-yd. road to a 14-yd. one, and will be repaved, flagged and kerbed. Additional office accommodation is to be provided on a site at the rear of the town hall for the sanitary and surveyor's departments. Several alternative schemes have been prepared for the laying out of a triangular plot of land in Clarendon-crescent, which the council have under consideration. A large number of private streets at Peel Green will be paved with tar-macadam. The council have obtained powers to borrow £600 for the revision of the 1/500 Ordnance survey of the borough, and this work will probably be undertaken during the present year.

Evesham and Pebworth (Mr. E. HOLLOWAY, M.I.M. AND CO.E., surveyor and inspector to the rural district councils).—The councils contemplate carrying out the undermentioned works this year—viz.: Extension of the water scheme to the parishes of Hampton, Offenham, Badsey, Wickhamford, Aldington; completion of road from Bretforton to Littleton Station; making up of three private streets under the Private Street Works Act, in the parish of Badsey; and a small sewerage scheme in the parish of Ashton-under-Hill. The housing schemes under the Housing Acts are: Offenham, 26 cottages; The Littletons, 20 cottages; Bretforton, 20 cottages; Harvington, 12 cottages; Honeybourne, 10 cottages; Pebworth, 10 cottages.

Exeter (Mr. THOMAS MOULDING, M.INST.C.E., city engineer and surveyor).—During the coming year my council will be considering schemes for improving the sewage disposal works both at St. Thomas and Belle Isle, and also for connecting up the Whipton and Heavitree sewage works to the Belle Isle works. The street widenings in Bartholomew-street, Paul-street and Blackboy-road will be completed during the year, and the necessary workmen's dwellings for housing dispossessed tenants in the above areas will be erected. A scheme for improving the Commercial Road side of Exe Bridge will be before the council. A scheme for improving the steam pumping power at the waterworks will also be submitted for the approval of the water committee. It is intended to consider the resurfacing of several roads, and the paving of Sidwell-street with wood will also be considered. The above work, in addition to the ordinary administrative work, which this year is increased by the annexation of the neighbouring authority, will keep the surveyor busy.

Falmouth (Mr. JOHN S. WALTON, borough engineer and surveyor).—The contractors have now the work of erecting the forty-four houses under the housing scheme well in hand. Four of the houses are occupied, three more are roofed in, and another four are up to the first floor. Plans are being prepared for additions to the Princess Pavilion, which was erected early in 1911. It is proposed to lay out the new cemetery, 7 acres in extent, during the year, an agreement for the purchase of the land having been entered into. A number of private streets will be dealt with under the Private Street Works Act, 1892, and a scheme, estimated to cost £6,000, for dealing with the footpaths throughout the town is under consideration. The paving of the main street is receiving the careful consideration of the council. It is certain that a greater length of roads will be treated with tar next summer, as last year's tarring proved such a success, and also a saving in watering, scavenging and repairs. A scheme for the further widening of High-street, at the old town prison, will be carried out, and the question of a new approach road to the town is being discussed. It is hoped that the East Kerrier Rural District Council and the adjoining landowners will join with the Falmouth Town Council to carry out a scheme to repair the damage caused by the sea at Swanpool. The town council are willing to contribute

substantially to the cost, although the damage is outside the borough boundary.

Farnborough (Mr. J. E. HARGREAVES, surveyor to the urban district council).—The important works to be carried out in this district during 1914 are: Completion of refuse destructor, extensions to the sewage disposal works, extensive footway improvements, erection of artisan dwellings, and sundry private street works. These works represent a prospective capital expenditure of about £18,000.

Foleshill (Mr. A. ERNEST NEWBY, M.I.M. AND CO.E., engineer and surveyor to the rural district council).—During the past year the streams at Bedlam and Holbrooks-lane, Foleshill, have been bridged over, and the highways are now being raised to the required new level and widened. The footpaths in Mill-street, Bedworth, and Station-road, Longford, have been paved with granolithic slabs, and this paving work will be continued in other parts of the district. Other work to be undertaken is a sewerage and sewage disposal scheme for Walsgrave-on-Sowe, the approximate cost of which is £7,000. Additional septic tanks and reconstruction of filter-beds at Bedworth (first scheme) will cost £1,200. The culverting of the stream and widening of Watery-lane, Keresley, owing to the increasing traffic to a new colliery, will be undertaken, and it is the intention of the council to apply to the Road Board for a grant towards the cost of this work. The making good of Sleath's-yard and Eden's-yard, Foleshill, under the Private Street Works Act, 1892, will be taken in hand, notices having already been served upon the owners. Other schemes receiving consideration are a refuse destructor and water reservoir for Bedworth, and the extension of sewers and water mains; also the purchase of a steam road roller instead of hiring.

Friern Barnet (Mr. E. J. REYNOLDS, ASSOC.M.INST.C.E., engineer and surveyor to the urban district council).—Road widenings, private street improvements, and various works continue to keep the engineer and surveyor's department busy. The widening of the Colney Hatch-lane from about 40 ft. to 50 ft. wide, near the Hornsey boundary, is now proceeding. The widening of the Friern-lane, opposite the North Middlesex golf links and Queen Elizabeth's well, to 50 ft. is being continued. The Friern Watch estate, a large estate in the north of the district, is being developed, new sewers constructed, new streets laid out, and building operations are now in progress on the estate. Plans have been deposited for further developments on the White House and other estates, and a scheme is now in hand for a garden village on the Bethune estate. The building of workmen's cottages in the southern portion of the district will shortly be commenced. The council have purchased and taken over for the purpose of allotments some 5½ acres of land, which includes Rathbone cottages, in Oakleigh-road North, Whetstone. The widening of the bridge carrying the Friern Barnet-road over the Great Northern Railway from 30 ft. to 50 ft. has now been completed. Further improvements have been carried out at the Friary Park. The bowling green is now considered among the finest around London, and winter tennis courts are now in the course of construction. The council have before the Local Government Board an application to borrow money to complete the purchase of land comprising some 22½ acres for the purpose of forming another recreation ground, and the development of this will be commenced as early as possible. A scheme is before the council for the construction of an underground convenience near the Great Northern Railway station. The building trade is brisk in the district, some 200 houses, in addition to other buildings, being in course of erection at the present time.

Frome (Mr. FREDERICK W. JONES, ASSOC.M.INST.C.E., surveyor and waterworks engineer to the urban district council).—The council will consider proposals for modernising the pumping plant at the waterworks and alternative proposals for an entirely new pumping plant. Other questions to be considered will be the reconstruction of Christchurch-street West, carrying out various street improvements, constructing a bridge over the river Frome below the town, and the provision of additional public conveniences.

Gillingham (Mr. JOHN L. REDFERN, borough engineer and surveyor).—It is proposed to widen Woodlands-lane, which at present is about 12 ft. wide, to 40 ft. for a length of 1½ miles, and construct foul and storm sewers. A large relief culvert is to be laid in Dockyard Approach-road. A block of eight workmen's flats will be erected in Wood-street, Brompton, and fifteen artisans' cottages in Toronto-road. Brompton infants' school is to be remodelled.

Godalming (Mr. J. H. NORRIS, borough surveyor and waterworks engineer).—The following proposals are now before this corporation: (1) Construction of new open-air swimming bath; (2) erection of a memorial cloister to Jack Phillips, the "wireless" operator of the "Titanic"; (3) underdraining and grading land at the sewage outfall works, and (4) erection of public sanitary conveniences.

Codmanchester (Mr. C. MAYFIELD, borough engineer).—The only work contemplated is the remaking of the High-street, and for this purpose the borough engineer intends to make use of a new binder, the outcome of the six months' experiments.

Gosforth (Mr. GEO. NELSON, ASSOC. M. INST. C. E., engineer and surveyor to the urban district council).—The following works are receiving the consideration of the council—viz., erection of residence for fire brigade superintendent, making up a number of private streets (tenders are being invited for these works), the provision of open spaces for recreation grounds, an important road improvement in Church-road and Station-road, the purchase of a site for a storeyard and refuse destructor, revision of the building by-laws, and a number of minor works.

Gosport (Mr. HERBERT FROST, engineer and surveyor to the urban district council).—With the exception of the reconstruction of the ferry landing at Portsmouth Harbour, known as the "Hard," the works so far projected for the forthcoming year are not of special importance, being more of the routine order. The sewage outfall at Stokes Bay is already well in hand, and a tender has been let for the substitution of a steel steam main at the air compressing station. The estimated cost of the "Hard" work is £2,800, in ferro-concrete, with greenheart king piles and Purbeck paved surface. About eight new streets are to be made up, and other roads constructed and improved to give increased facilities for intercommunication within the more newly developing parts of the district. Certain lengths of road are to be laid down with Tarmac, and small areas paved with soft wood blocks or asphalt. A number of the older houses at present not connected up with the new drainage system are to be connected up at the general cost, in accordance with a scheme recently approved by the Local Government Board.

Gloucester (Mr. RICHARD READ, ASSOC. M. INST. C. E., city surveyor).—During the coming year it is contemplated to complete the tunnel and syphon under the river Severn in connection with the new sewer outfall. If the recent pumping test of the 15-in. borehole 350 ft. deep in the new red sandstone at Kelford proves satisfactory, it is intended to sink another borehole or a well, with a pumping installation, and probably a 10-in. or 12-in. rising main to the reservoir at Ipleadon, 2½ miles distant. This scheme is being advised upon by Messrs. Fox, Moore, Bateman & Fox, of Victoria-street, London, and will probably be proceeded with during 1914. By the generosity of Mr. Henry Nice, a citizen of Gloucester, twenty-four houses are about to be built on land given by him, subject to their being let at not exceeding 3s. 6d. per week each, the whole, both cottages and land, to become the property of the corporation at the death of Mr. Nice.

Greenock (Mr. ROBERT MILLAR, burgh surveyor).—The works to be carried out during 1914 include the completion of five tenements of dwelling-houses, now

in course of erection, for the housing of the poorer classes. A further and more extensive housing scheme will shortly be proceeded with. In this scheme twenty-four tenements, providing about 216 houses, will be erected on ground recently acquired by the corporation. The cost is estimated at about £30,000. The corporation have under consideration the acquiring of a suitable site for the erection of public baths and wash-houses. A public bowling green and a pleasure ground are to be formed at one of the public parks. An extensive scheme for the repaving of the main thoroughfare is also being considered, and a proposal to carry out an improvement scheme at a part of the town which is very much congested, and where the streets are very narrow.

Grimsby (Mr. H. GILBERT WHYATT, M. INST. C. E., borough engineer and surveyor).—During the past twelve months several constructional works have been carried out, the most important of them being the following: The extension of the new cemetery, the estimate of which was £9,300, has been completed at an actual expenditure of £9,204; the new sewer in Welholme-avenue across the line of an old river bed filled with peat, has also been completed; the length of the sewer was somewhat over 300 yds., and some of the piles reached a length of over 60 ft. During the construction two previous sewers were found, both of which had subsided so much as to be of no further use, and in one position no fewer than five different roads were found superimposed, the total thickness of road metal being nearly 6 ft. The estimated cost was £1,560, but the actual cost of the work will probably not exceed £1,390. The conveniences for both sexes at Nelson-street have been completed, at a total cost of £553. The ventilation of the sewers of the Western District, the estimate for which was £850, is now approaching completion. The construction of the culverting of the fresh-water streams in the Clee District received sanction of the Local Government Board, at an estimated cost of £5,990, and the work is now in hand, the accepted tender being £5,663. Stables for the Watch Committee are now approaching completion, the tender being £248. The construction of a new street on the corporation estate is now well in hand, the tender being £599; and in December a tender was accepted for the construction of streets upon the Freeman's estate for the sum of £3,639, and this work is now in hand. The corporation, last autumn, appointed a whole-time town clerk, the last town clerk, who had held office for over fifty-two years, having died, being, at his death, the oldest and the longest appointed town clerk in the country. Offices are now being constructed in the municipal buildings for the newly appointed town clerk, at a cost, including furnishing, of nearly £700. Schemes are before the Local Government Board for the purchase of the Fisherlads' Institute in the town, at an estimated cost of £2,476, and also for the construction of public conveniences for both sexes in Hainton-square, and for males only near Welholme-road level crossing, at a total estimate for the two of £1,100. Sanction has been received from the Local Government Board for the construction of new sewers and culverts in the Ainstie-street and Wintringham-road district, at an estimated cost of £7,948, and tenders are being obtained for the constructional work. Schemes are now being prepared for the construction of a foot subway under the railway at Wellowgate, at an estimated cost of £3,600; the widening and improvement of Weelsby-road and Bargate, including the construction of a bridge under the Great Northern Railway, the estimate probably being £18,000; additional slipper baths at the Oxford-street lavatories; further public conveniences in Pasture-street and Ropery-street, and for an open-air bath 100 ft. in length. A town planning scheme will be put in hand early in the new year, this matter having been delayed owing to the change in the town clerkship. A committee is considering the erection of a new bridge over one of the docks, on the cantilever principle, but a certain section of the town council think, for the present, it would suffice to repair the present swing bridge. A scheme for the erection of a porter's lodge and reception office at the sanatorium will probably be prepared early in the year, the expenditure having been delayed from this last year in order that laundry machinery, at an estimated cost of £400, might be installed. The Great Central Railway obtained Parliamentary powers in 1912 for the construction of a large extension to their fish dock at Grimsby, and as trial borings, for the purpose of preparing the plans

for the lock pit, were taken last autumn, it is anticipated that work will be commenced early in 1914.

Guildford (Mr. C. G. MASON, ASSOC. M. INST. C. E., borough engineer and surveyor).—The council propose to erect new offices and carry out an important street widening to open up a district to the south of the town, at a cost of from £6,000 to £7,000. A proposal to widen the main road from

London, commencing at the northern boundary of the borough, and continuing a distance of 1,300 yds. on the western side, is receiving careful consideration, and will no doubt be carried out in order to facilitate the motor traffic through the town. A new secondary school, to accommodate 235 girls, is to be opened during the coming year, and a suggestion is being considered to extend the technical institute. Several large building estates are being laid out in the borough, and further developments in this direction are likely. A good many trial sections of road surfacing have recently been laid, and other experiments will doubtless be carried out in the near future. A new artesian tubed well is being sunk to the north of the town, and water has already been found in considerable quantities.

Halifax (Mr. JAMES LORD, M. INST. C. E., A. M. I. E. E., borough engineer and surveyor).—In addition to the usual maintenance works, a considerable amount of granite paving will be carried out on certain of the main roads. An important widening of the Huddersfield-road, co-extensive with the sewage works, involving the construction of a heavy retaining wall, and doubling the existing tramway, will be taken in hand on receiving sanction from the Local Government Board. Towards this scheme the Road Board have made a substantial contribution. It is proposed to relay portions of the tramway permanent way in Haley-hill, Gibbet-street, and Commercial-street. The 48-in. cast-iron main outfall sewer in the bed of the Hebble Brook will probably reach completion, while contracts are about to be made for relaying the 24-in., 18-in., and 15-in. cast-iron sewers in the higher reaches of the Hebble Brook. A start is about to be made on the first section of the Ovenden sewerage scheme. The sewage works will probably be completed by a scheme for the treatment of storm water by the provision of "stand-by" tanks and appurtenances. The schemes for town planning in Ovenden, Warley, and Bradshaw are in preparation, permission to proceed in each case having been granted by the Local Government Board.

Harrogate (Mr. C. E. RIVERS, ASSOC. M. INST. C. E., borough engineer and surveyor).—Among the works projected for the year 1914 are the duplication of about 1 mile of inverted cast-iron siphons on the south outfall sewer, the provision of new surface-water drainage schemes for several districts in the borough, and the relaying of several old sewers; the laying of a new sulphur-water main from the springs on the Harlow Car estate, which has been recently purchased by the corporation, and which is situated just outside the borough; the erection of a new elementary school for 450 children; and the erection of a new bandstand and shelters in the Crescent Gardens. Private street improvement works will proceed as usual; twelve streets are now in hand, or are to be commenced shortly, and plans are being prepared for a further fifteen streets. The council have under consideration the provision of a refuse destructor, several improvements to the Stray, the provision of a municipal golf course, and alterations to the Kursaal. The work of converting the roads from ordinary water-bound macadam to tar-macadam will be continued.

Hartlepool (Mr. A. P. HORSLEY, borough engineer and surveyor).—The council have under consideration a scheme for clearing away a large insanitary area in the centre of the town, and the erection of about 100 artisans' dwellings on the site. The council have passed plans for a public shelter and lavatories on the Headland Promenade, and a new elementary school for 841 scholars. The new cemetery chapels and lodge

are now in course of erection, also the workmen's dwellings in High-street.

Harwich (Mr. F. HAROLD FRENCH, borough surveyor).—The projected works for 1914 comprise sewerage works and new pumping plant, estimated cost £3,000; extensions of sewerage system; main road widenings and improvements, estimated at £2,000; resurfacing a considerable length of main road; and completion of new elementary school, known as Hill schools.

Haslingden (Mr. J. SINGLETON GREEN, borough engineer and surveyor).—Several important road widening schemes have been prepared, which will probably be carried out during the present year. An improvement at Acre on the main road will include the setting back of a retaining wall which supports the road, and is about 17 ft. deep. This wall will be built upon reinforced concrete foundations. The erection of a new council school, estimated to cost close on £20,000, is progressing, and is expected to be near completion towards the end of the year. The council also propose to erect new education offices, plans of which have been prepared by the borough surveyor. Several important drainage schemes will be carried out, and lengths of road treated with Rocmac. In addition to the resurfacing of the roads and maintenance of sewers, a number of private street improvement works will be completed. There is also a scheme on hand for developing a portion of Knowl Gap estate as a garden city, and plans for this have been deposited with the town council.

Haverfordwest (Mr. W. BEVAN, M. I. M. U. N. E., C. R. S. I., borough surveyor, water and gas engineer, and sanitary inspector).—The year 1914 promises to be a fairly busy one as regards municipal matters. The town council will have under consideration the advisability of erecting a refuse destructor for the disposal of the town's refuse. They have decided to apply to the Local Government Board for a loan for the installation of a complete scheme of sewer ventilation on the Webb's sewer ventilating lamp system, and an application is now before the Local Government Board for a loan for the purchase and laying out of about 5 acres of land, adjoining St. Martin's burial ground, as a public cemetery, which it is hoped will mature during the present year. New paving work is to be undertaken in Dew-street and Barn-street, and an application will be made to the Road Board for a grant in aid of removing a dangerous corner and carrying out a much-needed improvement in City-road, opposite St. Martin's burial ground on the St. David's-road. The old pebble paving in Tower-hill, Goat-street and Rosemary-lane will in all probability be taken up, and the roadways made up on the Rocmac system, or with tar-macadam. A few short lengths of defective sewers will be reconstructed on modern principles, and the council will consider the installation of a water level indicating apparatus communicating between the high-level reservoir, the borough surveyor's office, and the pumping station. An improvement is to be effected on the fair ground in Merlin's Hill, by properly draining, sloping and surfacing a considerable area with impervious material; and a street improvement scheme, involving the demolition of a house adjoining the Bethesda Baptist Church is to be considered forthwith. An application now lies with the Local Government Board for sanction to a loan for the erection of a new gasholder at the corporation gasworks, and provisional tenders have been accepted for the work, which will probably be put in hand early in the spring. It is quite possible that the erection of an isolation hospital for the borough will again engage the attention of the town council, as the joint isolation hospital scheme that has been before the county council for the last two years has been deferred indefinitely.

Haworth (Mr. JAMES REDMAN, surveyor to the urban district council).—During the past few years the council have spent £3,000 on road widenings and general improvements, and it is proposed shortly to finish the widening of the Lees and Hebden Bridge main road at Lees. This has become necessary by reason of the trackless trolley system, which has been installed by the Keighley Corporation, who have obtained sanction

to run into the district. There is also on foot a movement to establish a free library, which is being supported fairly well.

Hayes (Mr. DOUGLAS C. FIDLER, M.S.E., engineer and surveyor to the urban district council).—The following works will be proceeded with during the ensuing twelve months: Private street works, costing about £6,000; Yeading housing scheme, consisting of twenty-two houses, and costing about £5,000; Yeading sewerage scheme, consisting of about 2,000 yds. of sewers, an ejector station, rising and air mains, estimated cost £3,000; Botwell housing scheme will probably cost about £12,000. The sewage disposal works will be enlarged and additional percolating filters provided, and the town planning of the district proceeded with in accordance with the request of the Local Government Board.

Hebden Bridge (Mr. T. WADDINGHAM, surveyor and water engineer to the urban district council).—A new road-retaining wall will be built on the Todmorden, Halifax and Bannley main road, alongside the Rochdale Canal, for about 110 yds. Schemes have been submitted to the Road

Board for two widenings on this main road, to be carried out at an estimated cost of £4,500. These include the demolition of buildings and the widening of one bridge over the river Hebden at West End, and the erection of a new steel girder bridge to replace a stone arched bridge over the Golden Water, at Bank-foot. Several streets in the town will be repaved with Lancashire setts, and many private streets will be made up, principally with sett paving. The tar-spraying of roads will be continued, and a portion of the Todmorden main road at King-street will be recoated with tarred slag. An additional filter-bed will be constructed at the Hollin Hall filtration works. Additional hydrants and valves will be fixed on 3-in., 4-in., 6-in. and 8-in. water mains throughout the town, and a waste-water detecting meter will be fixed on the 10-in. main at Hollin Hall. The sewage from a large adjoining portion of the Todmorden Rural District's area will be connected up to the council's system. The enlargement of the filtration accommodation at the sewage disposal works will, it is expected, be commenced early in the year. Surface and spring water will be disconnected from the sewers in several districts, and new sewers laid for this water, thus relieving the pumping at the sewage disposal works. The question of providing additional public conveniences is under consideration. The work of widening the Station-road bridge over the Rochdale Canal will be commenced by the Lancashire and Yorkshire Railway Company at an early date. The council have appointed a committee to consider the question of providing public baths.

Herefordshire (Mr. G. H. JACK, F.G.S., M.S.A., county surveyor, architect and bridgemaister).—Further progress will be made with the four years' scheme of road reconstruction under Road Board grants. Roughly the work to be done during 1914-15 consists of 7 miles of new foundations and 8 miles of Tarmac surface, together with some miles of draining.

The bulk of the main roads of Herefordshire, 434 miles, are now maintained by direct management, only 30 miles being dealt with under the old contract system. Several bridges and culverts are to be rebuilt, and the ancient 6-arch bridge and culverts over the river Wye at Ross is to be strengthened and the parapets rebuilt. This, one of the finest masonry bridges in the West of England, was built late in the sixteenth century. The architectural department will be kept busy with the building of two new schools, and enlargements and improvements to several old ones. Preliminary plans are in preparation for new county offices, new police court at Ross, and additions to the county asylum. Sketch plans have been prepared for the establishment of a sanatorium for the treatment of tuberculosis on high ground near the city of Hereford.

Hertford (Mr. J. H. JEVONS, ASSOC. M. INST. C. E., borough surveyor and waterworks engineer).—The works projected for next year include new sewage disposal works and about 4,000 yds. of new water mains.

Hessle (Mr. W. COULSON, surveyor to the urban district council).—With respect to projected works, the council are in virtually the same position as they were

last year. In addition, they propose erecting, as an experiment, six working-class dwellings under the Housing of the Working Classes Act, 1899. The council are also proceeding to get authority to prepare a town planning scheme for the district.

Heywood (Mr. JAMES B. NUTTALL, borough surveyor).—In addition to the usual amount of work for the various committees of the corporation, the borough surveyor will be called upon to maintain the main and secondary roads and highways in the borough, the macadam surfaces being tar-sprayed again. The constructional works in hand include granite paving (£13,000 sanctioned), widening of Heap Brow (£1,100 sanctioned), and more than the average amount of private street works. Besides these it is expected that during the coming year the following will mature—viz., laying out as a miniature park the proposed town hall site, and the provision of a new market ground and public conveniences; extensions of electricity works for a bulk supply; further development of recreation grounds and provision of a playing field for secondary school purposes; and, in all probability, the opening stages connected with the town planning scheme.

High Wycombe (Mr. T. J. RUSHBROOKE, borough surveyor and waterworks engineer).—It is proposed to extend the use of tar-macadam in road reconstruction. A scheme has been prepared for the erection of fifty-four workmen's dwellings, which it is hoped will be erected during the present year. The estimated cost is £11,200. The provision of a refuse destructor is under consideration. It is hoped that the sewage disposal scheme (£33,500), prepared last year, will be proceeded with during the coming year. A town planning competition was held during the past year, the first prize being awarded to Mr. E. W. Turner, of Sheffield. It has not yet been decided to take any further steps. A new road with ferro-concrete bridge is proposed to be constructed, connecting the manufacturing part of the town now directly with the main London and Oxford roads. Further extensions of water mains are to be carried out.

Hinckley (Mr. E. H. CRUMP, ASSOC. M. INST. C. E., surveyor and waterworks engineer to the urban district council).—Additional working-class houses similar to those now being erected will be provided. The parish of Burbage will be provided with a new water scheme. Experiments are now being conducted at the sewage disposal works with a view to the provision of

additional liquefying tanks, and the treatment of the whole of the sewage by means of trickle beds, and such scheme will probably be prepared during the coming year. It is also hoped to provide a refuse destructor in connection with this scheme. Additional lengths of tar-macadam roadway will be laid, and the work of tar-spraying all other roads will be continued.

Hindley (Mr. OSWALD P. ABBOTT, engineer and surveyor to the urban district council).—A large number of private streets will be constructed during the year, and the conversion of grit paving to granite paving on the main roads will be continued. Electricity is intended to be distributed in a portion of

the district under the council's electric lighting order. A contract for the fencing and draining required at the proposed infectious diseases hospital has been made, and the building of a part of the hospital is expected to be commenced in the spring. Plans are in course of preparation for a new elementary school at Platt Bridge to accommodate 450 scholars, and building will be commenced as early as possible. Extensions to the Platt Bridge sewage works are proposed; the sub-pumping station in connection with the works is nearing completion. The question of a public bowling green is under consideration.

Holsworthy (Mr. FRANK J. HARRIS, M. INST. M. AND C. E., ASSOC. M. R. SAN. I., surveyor to the rural district council).—The work in the highway department for next year (besides the ordinary routine) consists chiefly in the substitution of imported basalt and granite for inferior local material, and the substitution of clean limestone binding for all main roads to replace mud binding. The widening, filling and strengthening of sides of roads will also be taken in

hand, in addition to the ballasting and altering gradients and contour of roads subject to heavy traffic. It is intended to abolish the contract system for all main roads and, it is to be hoped, for district roads at an early date. In the sanitary department very little work will be done besides the routine work of inspecting. Both the urban and rural councils, however, are pledged to build houses to replace old and insanitary dwellings, and to meet the increased demand for working-class cottages. The urban council are taking this in hand, and are offering a premium for competitive plans for the first block of houses.

Holland, Lincs, South Division (Mr. A. W. LLOYD, district county surveyor).—The following works are proposed in this division during the present year: Lyme-road (from Sutton Bridge to Norfolk boundary, length 1½ miles).—It is proposed to widen, remet and steam roll this road. Boston-road (Spalding boundary to Surfleet, length 2½ miles).—It is proposed to remet and steam roll this length. Other roads, having a total length of just over 2 miles, are to be remet and steam rolled. Tar-spraying.—It is proposed to tar-spray the main road from Spalding to the Norfolk boundary (east of Sutton Bridge), a length of about 11 miles. This is the main road to many East Coast resorts, and consequently much used by motor traffic. The total amount to be spent on roads and footpaths in this division is about £10,000. An application has been made to the Road Board for a grant towards the roads named and the tar-spraying.

Honiton (Mr. A. TILLOTSON, M.I.M.E., borough surveyor, sanitary inspector and waterworks manager).—The town council are applying to the Local Government Board for sanction to borrow £4,500 for the carrying out of a scheme, prepared by the borough surveyor, for sewer extensions and alterations, and also new sewage disposal works. The work is expected to be carried out this year. A scheme is likewise in preparation for the extension and improvement of the water supply, at an estimated cost of about £3,000.

Horsforth (Mr. H. RAVEN, M.I.M.E. AND CO. E., R.SAN. I., M.I.MUN.E., engineer, surveyor and waterworks manager to the urban district council).—The work proposed during the next year, apart from the ordinary routine work, is as follows: The erection of a two-cell destructor, with appurtenant works; sewerage of the Newlay district of the council area; erection of a pumping station, and provision of extra filters at the sewage works, and several street improvements and private street works. Public baths are also under consideration.

Horsham (Mr. R. RENWICK, surveyor and water engineer to the urban district council).—No new works of any importance are in contemplation for the coming year.

Hove (Mr. H. H. SCOTT, borough surveyor).—The enlargement of the police department at the town hall will shortly be put in hand, together with the construction of underground lavatories for men and women near the town hall, and of another on the Western Esplanade. The town council have approved plans, &c., for widening Hove-street, at an estimated cost of £10,000, and have agreed to contribute £3,750 towards the reconstruction of the railway bridge over Sackville-road.

Hoyland Nether (Mr. F. J. THACKRAY, surveyor to the urban district council).—It is anticipated that sanction will be received from the Local Government Board to proceed with the construction of humus tanks and sludge lagoons at the sewage disposal works, in accordance with the plans prepared by the surveyor. The council have definitely decided upon a small housing scheme, and the surveyor has been instructed to prepare the necessary plans. The provision of a covered swimming bath is also to receive the attention of the council during the forthcoming year, the council having abandoned the idea of an open-air bath. The proposed scheme for the lighting of the district by means of electricity has considerably advanced during the past year, and it is anticipated that a definite scheme will be decided upon during the early part of the year.

Hucknall Torkard (Mr. W. SWANN, surveyor and waterworks engineer to the urban district council).—The council have under consideration the widening of Nottingham-road, Spring-street, and Watnall-road, according to plans and estimates prepared by the surveyor. A considerable length of tarred material (Tarmac) is being laid on the grant-in-aid roads.

Huddersfield (Mr. K. F. CAMPBELL, M.I.M.E., borough engineer and surveyor).—In addition to the usual work connected with the maintenance of highways and sewerage system of the borough, a commencement will be made with granite and wood paving of certain sections of six main roads within the borough, involving an expenditure of £72,000. Various improvement schemes will also be carried out as properties are acquired under a recent Provisional Order. The extension of the tramway system, a portion of which is now in course of construction from the borough boundary to the neighbouring town of Elland, will be completed during the early part of the year, after which it is proposed to commence other extensions for which Parliamentary powers were obtained last year, involving an expenditure of £126,378. The corporation propose to erect 500 working-class dwellings in various parts of the borough. The Local Government Board have approved of a loan amounting to £103,555 for the purchase of land, and the erection of Houses under Part III. of the Housing of the Working Classes Act, 1890. An application will shortly be submitted to the Local Government Board for authority to prepare a comprehensive scheme of town planning confined to three areas within the borough. The preparation of plans for new baths and washhouses is in progress, and it is intended to deal with this subject on an extensive scale early next year. Plans and estimates are now before the Local Government Board and the Board of Education for the erection of a tuberculosis hospital for children and adults, involving an expenditure of about £20,000. Three large additions are in progress to existing schools for the Education Committee. Plans and estimates have been prepared in connection with an open-air school, and the subject is one which will be dealt with on an early date. From the foregoing short account of the special works committed to the corporation during the ensuing year, it will be observed that a very busy time may be anticipated in the engineer's department for some time to come.

Hull (Mr. A. E. WHITE, M.I.M.E., city engineer).—No street works or street widenings are likely to be carried out. A certain number of paving works will be undertaken in existing streets, including the paving of two streets with granited asphalt, which has not hitherto been tried in the town. The tramway extension on Hessle-road is nearly completed, and afterwards a loop through Brook-street and Jameson-street will be put in hand. This will probably be followed by other extensions which have been authorised. It is intended to erect extensive repair shops at the Liverpool Street depot. The ground is being levelled for the erection of a tuberculosis hospital at Cottingham Castle. Early in 1913 a boating lake was presented to the town by the Rt. Hon. T. R. Ferens, M.P. for East Hull, and this has proved such a success financially that it is proposed to add about 3 acres to the lake. It is also proposed to construct another bowling green, and make some minor improvements at the parks. The Education Committee will continue to add to their schools.

Hyde (Mr. JAMES DIGGLE, ASSOC. M.I.M.E., borough and water engineer).—The council are now completing the construction of a new swimming bath and other offices in connection therewith, at a cost of about £9,000. They are also extending the town hall by the addition of a large public hall, police and coroner's courts, cells and other offices, at a cost of £15,000. This work will probably be completed by the end of next October. Borrowing powers for additional sewerage, and the paving of certain highways with granite, estimated to cost about £6,000, are also under consideration.

Ilford (Mr. H. Shaw, M.INST.C.E., engineer and surveyor to the urban district council).—The projected works in Ilford for the forthcoming year include town hall extensions—£20,000. The council have approved plans for this, and quantities are about to be prepared. It is intended to commence the work in the early part of 1914. The extensions consist of new offices and council chamber, committee rooms, minor hall, extensions to stage and dressing rooms. Baths.—Sketch plans and rough estimate have been prepared for new baths to be erected at a cost of about £18,000. Outfall Works.—Extensions will be made to the outfall works. The laying of a new main sewer is contemplated. The town planning scheme will be dealt with by a special committee of the council. Goodmayes recreation ground will be extended by about 17 acres. Motor fire pump and first-aid equipment and tender will be supplied by Merryweather & Sons, Limited, subject to the consent of the Local Government Board. Plans have been prepared, and it is proposed to commence the erection, as early as possible, of extensions to the hospital for the treatment of consumptives. It is also proposed to erect a refuse destructor, at an estimated inclusive cost of £21,578. The usual number of private street works, laying out new estates, road and sewer construction and channelling, will be carried out as in former years. An electricity transformer station is about to be erected, at an estimated cost of £4,000, and the council are at present considering plans and estimates for artisans' dwellings.

Ilkley (Mr. T. H. SMITH, surveyor to the urban district council).—The council have under consideration the installation of electric light in the town, including the erection of a power station and the laying of mains and services, at a cost of £18,000. Application has been made to the Local Government Board for sanction to the borrowing of the money. In connection with the laying out of "The Holmes" as pleasure grounds, sanction to a loan of £9,500 is being sought. This scheme includes a suspension bridge over the river Wharfe, an open-air swimming bath in reinforced concrete, a large shelter, bandstand, fountain, conveniences, and a special playground with boating pool for children. The Winter Garden, which is being built as an annexe to the town hall, will probably be opened early in the year, as also will the underground public conveniences in Station-road. At the sewage works, two percolating filters, each 80-ft. diameter, have been installed. During the past year a large number of private streets have been made up and taken over by the council, and this policy will be continued during the coming year.

Inverkeithing (Mr. DAVID GALLOWAY, burgh surveyor and master of works).—The council propose to renew 3 miles of roads in macadam and tar-macadam, reconstruct the bridge at the harbour, and erect new public conveniences. The town planning scheme, which embraces a large area within and beyond the burgh, is expected to be in operation during 1914. Owing to the large amount of labour in the district, and the housing accommodation being rather limited, the town planning area is expected to be built on rapidly. This will mean the construction of new roads, large extensions to distributing water mains, and a complete new sewerage scheme.

Ipswich (Mr. JOHN R. MEAD, borough engineer and surveyor).—The following works will be carried out during the year: Extensions to infectious diseases hospital, £5,000; extensions to borough sanatorium, £4,500; school clinic, tuberculosis dispensary, and new offices for medical officer, £7,250; ferro-concrete bridge over Orwell, £3,000; steel bacule bridge over Orwell, £7,500; and public swimming and slipper baths, £7,000. Schemes are being prepared (and the work will be commenced during the year) for modernising the sewage works, providing new plant for lifting the sludge, erecting a storage reservoir for the sludge, building a new jetty and steam barges for removing the sludge, and disposing of the sludge by taking it out to sea. A portion of the corporation estate will be developed on the lines laid down in the town planning scheme, which was prepared in connection with the competition open to the public.

Kettering (Mr. THOMAS READER SMITH, ASSOC.M. INST.C.E., engineer and surveyor to the urban district council).—The principal work in the current year, so far as the surveyor's department is concerned, will prob-

ably be the erection of new public baths, comprising both an open-air bath and covered swimming bath. The preliminary works, consisting of concrete foundations and bath walls, are being executed directly by the council, and the contracts for the constructional works will be offered early in the year. A cleansing and disinfecting station is also in hand, and this will be completed in the early months of the year. Various matters are under consideration, but no further works have at present been decided on.

Kidderminster (Mr. A. JAMES, borough surveyor).—The council will have under consideration the drainage of the areas recently incorporated into the borough, and new sewage disposal works; also a scheme for strengthening the foundations of certain main roads, due to the inauguration of a motor bus service, and the tar-painting of 7½ miles of roads and gravelled footpaths.

Kingston-upon-Thames (Mr. R. HAMPTON CLUGAS, borough surveyor).—The principal work for the year, in addition to the ordinary routine work, includes extensive road widening of the main London road. The corporation have completed the contract for wood-paving various streets at a cost of £15,000, and propose adding to the area by including St. James's-road and Penrhyn-road. Additional overground conveniences are to be constructed, and the relaying of a bowling green with Cumberland turf; making two Cumberland turf greens. Other projected works include the laying out of extra hard tennis courts, and alterations to the town hall. A proposal to provide a new justices' court and to rearrange the present courts is being considered by the committee. Several streets will be made up under the Private Streets Works Act during the year.

Kiveton Park (Mr. FRANK HEWITT, F.S.L., engineer and surveyor to the rural district council).—Sewerage.—The sanction of the Local Government Board having been received to a scheme of additional sewers at Dinnington, the work will shortly be commenced. Surface-water sewers at Kiveton Park and Firbeck are being laid at present, and plans for several others are in preparation. The sanction of the Local Government Board to a surface-water scheme prepared by the surveyor for part of Dinnington is expected shortly. The work is estimated to cost about £1,300, and consists of stoneware pipes and steel-ribbed concrete tubes, with all manholes. The outfall sewer from South Anston having subsided, it is to be raised; the pipes are of iron carried on back piers. Several sewer extensions are contemplated in various parishes. Sewage Disposal.—The surveyor is preparing a scheme of sewerage and sewage disposal for the hamlet of Waleswood. Drawings for considerable enlargements of Dinnington outfall works have been prepared by the surveyor, and are ready for despatch to the Local Government Board. The work proposed includes screening chambers, pumping sumps, alterations to engine-house, storm-water tanks, septic tanks, humus pits, filters, and sludge-drying beds. The cost will be nearly £4,000. The surveyor has received instructions to get out plans for extension to the sewage works at Kiveton Park embracing screening chambers, sludge beds and sand filters. Improvements at Anston sewage works may also be asked for during the year, and small improvements to the Woodsetts works. The Local Government Board are pressing the council to proceed with a scheme of sewerage and sewage disposal for Harthill. Refuse Destructor.—Some improvements will be made to the destructor during the year. Water Supply.—The Thorpe Salvin scheme is nearly completed. A number of extensions of water mains are to be made this year in various parts of the district. Buildings.—The alterations to the council offices are now completed, and specifications for the painting work are being prepared. The question of erecting depot buildings from the plans already prepared by the surveyor is like to come up shortly. Instructions have been given for the preparation of drawings for a mortuary at Dinnington. Public conveniences are to be erected at Dinnington and Kiveton Park. Over 100 houses are in course of erection in Dinnington. Bridges.—Turner Wood Bridge was recently reconstructed in steel. The surveyor is preparing plans for a new bridge at Hardlane. Highways.—Several widenings in Laughton-road have been recently completed, and plans are nearly finished for six other road widening schemes. These are to be followed by about seven more. The Local Government Board's sanction to the Outgaulane improvement scheme is expected. The surveyor's estimate for the work is £600. A large amount of re-surfacing will be done during 1915 with granite, slag,

limestone and tar-macadam, and considerable tar-spraying and tar-grouting carried out. An additional tar boiler and sprayer will probably be obtained. Private Streets.—A large number of private streets require making up at Dinnington, Anston, Harthill and Kiveton Park, and application has been made to adopt the Private Street Works Act, 1892. The surveyor has prepared a scheme for the surface-water drainage of several back streets at Dinnington, and the work will probably be done during the year.

Knaresborough (Mr. ROBERT E. WILSON, M.I.M. AND CO.E., surveyor to the urban district council).—In addition to the ordinary routine work, the council intend widening Stockwell-lane to 36 ft., and also to lay a new asphalt footpath, 9 ft. wide, in Stockwell-road, and one 6 ft. wide in Stockwell-lane. About 600 yds. of 9-in.

sewer is to be laid in Park-lane, Stockwell-lane and High Bond-end. A portion of the old stone culvert in Kirkgate is to be replaced with 9-in. earthenware pipes. A new three-stall urinal is to be erected in High-street. Application is being made to the Road Board for a grant towards the reconstruction of the roadway in High-street and York-road. The numbering of houses and naming of streets not already named will be carried out. The question of putting down electric lighting plant for street lighting is now being considered by the council.

Knaresborough (Mr. W. LUPTON and Mr. J. H. HALSTEAD, surveyors to the rural district council).—During the past year several lengths of new drainage work have been carried out, and inspections under the Housing Acts have been made. The chief work to be carried out during the coming year,

in addition to the ordinary sanitary and highway work, will be private street works in about six parishes, and the widening of several dangerous corners on main and district roads. Extra lengths of main and district roads are to be tar-sprayed, as the success of this work during the past four years warrants its extension. Several miles of new footpaths are to be made, while many of the present gravel footpaths are to be asphalted.

Leeds (Mr. W. T. LANCASHIRE M.INST.C.E., city engineer and surveyor, and building surveyor).—The work necessitated by the extension of the city boundaries in November, 1912,

is in hand, the outlet sewer having been carried a considerable distance up the main valley, and the completion of the scheme will occupy at least another twelve months. A considerable part of the added area and the adjacent portions of the city as it existed prior to the extension of the boundaries, have been included in two town planning schemes, comprising altogether about 3,700 acres, which have been approved by the city council. During the last Session Parliamentary powers were obtained for the construction of a new street 60 ft. wide in connection with the extension of the Leeds General Infirmary. This street will afford a valuable alternative route to the north-west suburbs. Most of the land has already been purchased, and demolition is being proceeded with. The reconstruction of the area in the centre of the city, containing about 66 acres of slum property which was acquired under the Housing of the Working Classes Act, 1890, is proceeding steadily. To date upwards of 1,600 houses have been demolished, and the diversion and culverting of becks, extensions of subways for pipes, and the widening and construction of new thoroughfares is being dealt with. The construction of a new road 60 ft. wide and about ½ mile long, lying about 1 mile east of the centre of the city, is in hand. The question of the housing of the working classes is receiving considerable attention, and a census has been prepared of the unoccupied houses in the city, but no decision as to housing by the municipality has yet been arrived at. The tramways department are now constructing central sheds for trams and work on the plot of land purchased from the Improvements Committee in the centre of the city. Under Mr. G. A. Hart, M.INST.C.E., considerable progress has been made with regard to the sewage disposal works at Thorpe Stapleton, and contracts have been let for the construction of a portion of the high-level im-

cepting sewer, and for portions of the new disposal works; some of these works are being carried out at the present time. Parliamentary powers are being obtained for waterworks, including the laying of a long line of pipes in connection with the supply of water to Doncaster and other places, and for considerable extensions of the tramway system, trackless trolley system, and street widenings in connection therewith.

Leek (Mr. W. E. BEACHAM, surveyor and waterworks engineer to the urban district council).—During the past year the main sewerage of the town has been proceeded with, and the western outfall sewer coupled with that of the north district preparatory to dealing with the provision of sewage disposal works for that area. A new convenience has just been completed, and during the year the first-class swimming bath at the public baths has been stripped and retiled and a serious leakage remedied. During the present year Ashborne-road and Buxton-road, both county main roads, will be widened and improved. Plans for the laying out of Brough Park are being prepared, and an early application to the Local Government Board is intended, so that the work may be proceeded with. The housing scheme which was under consideration at the early part of last year, but was deferred to await the result of local enterprise, is likely to be again advocated, as there is still a dearth of houses of the artisan type in the town. Several street widenings are under consideration, and are likely to receive attention. The new council school, which has been erected under the supervision of the surveyor, is just opened. Extensions and additions to the disposal works at the south district are foreshadowed, and altogether the year promises to be up to the average in municipal progress.

Leicester (Mr. E. GEORGE MAWPEY, M.INST.C.E., borough engineer and surveyor).—Several important works will probably be put in hand during the year. Chief among these may be mentioned a storm-water sewage disposal scheme. The Local Government Board inquiry for this has been held. Another work will be the extension of the electric tramways, sanctioned by Parliament last year. One route will be commenced in the early spring. A large building for car-repairing shops has just been started in Abbey Park-road, as an additional to the main car depot, the estimated cost of which work is about £23,000. The extension of the tramway generating station and erection of a new chimney shaft will shortly be carried out. A start has been made with the work of the improvement of another section of the Willow Brook. The estimated cost is £5,025, and the work will be done by direct labour. Extensive street improvements in connection with the electric tramway extensions will be taken in hand during the year, and three new public conveniences will be built.

Leighton Buzzard (Mr. E. J. SAUNDERS, A.R.SAN.I., surveyor to the urban district council).—A scheme has been prepared for an additional water supply for street watering purposes. An artesian-bored tube well has been sunk, and application for a loan has been made to the Local Government Board for the carrying out of the scheme. A new fire engine-house, to be built on the same site as the old, off North-street, is also included in the application. It is anticipated that tar-painting will be extended to some of the main roads resurfaced this winter.

Leiston-cum-Sizewell (Mr. CHARLES F. BROWN, M.I.M. AND CO.E., A.R.SAN.I., water engineer, surveyor, and inspector to the urban district council).—The council are in negotiation for the purchase of land on which to erect some fifty or sixty houses for the working classes. Plans are also to be prepared for the laying out of about 4 acres of land as a cemetery. Plans have been prepared for the erection of an engine driver's cottage; also forming roadways, fencing site, and providing entrance gates at the new waterworks pumping station, and application is to be made for sanction to the necessary loan. The new liquefying tanks at the sewage outfall works are nearing completion, and should be

in operation early in the new year. Certain private street works will also be carried out under the 1892 Act.

Lincoln (Mr. R. A. MacBRAIR, M.INST.C.E., city engineer and surveyor).—The Lincoln Corporation are considering large schemes for the extension of the city boundaries and the provision of houses for the working classes. If the first named is carried out as proposed Lincoln will be more than double its present size. A phthisis sanatorium, with all necessary buildings, sewage sprinklers at the sewage farm, the laying out of three old burial grounds for the public use, the construction of a bowling green in the recreation ground in Monks-road, and the construction of a bathing-place on the river Witham at the east end of the city will be put in hand. The building of a refuse destructor, of the Heenan & Froude type, has just commenced. The following works commenced will be completed—viz.: Administrative block and pavilion at the city infectious diseases hospital, the recreation ground in Westgate, and the continuation of the tar-macadamisation of the suburban roads, with the help of the Road Board. A complete new set of building by-laws will be adopted as the final revision will shortly be considered. A length of the river wall behind the old houses on the High Bridge (a feature well known to tourists), the repair of which has been in dispute for many years, will be taken in hand. The work is to be carried out at the joint expense of the corporation, the Great Northern Railway, and the owners. The place is locally known as "Glory Hole," a name given humorously, considering all circumstances.

Littleborough (Mr. GEORGE H. WILD, surveyor to the urban district council).—The work to be carried out includes the conversion of macadam, on Todmorden-road, about 1½ miles, to granite-sett paving on a concrete foundation, at a cost of £9,600; also a portion of Halifax-road. Several private street improvements are to be proceeded with, and an extension of sewer in the Summit district, where an estate is to be developed on garden city lines.

London, Deptford (Mr. J. SUTCLIFFE, ASSOC. M. INST.C.E., borough surveyor).—Plans are in preparation for the erection of a public library and a public baths and wash-houses in Evelyn-street; a well is to be sunk for the water supply. The Jarrah wood-block paving of High-street, and the 6-in. concrete foundation are to be taken up, and a 2-in. thickness of asphalt laid on a 9-in. bed of concrete, at an estimated cost of £3,128, early in the year. White Post-lane has been taken over as a new street, and the work of paving is at present in hand. Other paving works to be put in hand during the year include the making up of portions of each of the following roads—viz., St. Norbert-road, Arica-road, Revelon-road, and Avignon-road. The carriageway breasts of New Cross-road, Deptford Broadway, and the portions of Deptford Bridge and Queen's-road within the borough, are to be paved with creosoted deal blocks upon a 12-in. concrete foundation, at an estimated cost, including all necessary footway alterations, of £22,854. The council propose to construct a public convenience in the neighbourhood of Brockley Tips. Alterations and additions are to be carried out at the council's depot, Knott-street, and consideration is being given to the question of roofing over the yard. In addition to this the ordinary maintenance work in highways and other borough council properties will be undertaken with the usual or improved materials.

London, Finsbury (Mr. P. G. KILLICK, borough surveyor).—It is not anticipated that any very special work will be done during the present year. A considerable area of carriageway paving in the main roads of the borough will have to be repaved, probably with creosoted deal. A few sewers will be reconstructed. It is hoped that a further portion of Whitecross-street will be widened, and a portion of Garrett-street.

London, Holborn (Mr. E. SPURRELL, borough surveyor).—This council have not yet decided on the works to be carried out in the coming year, but they will include the reconstruction of certain sewers and the repaving of certain roads. The council have

also under consideration the erection of workmen's dwellings.

London, Lewisham (Mr. ERNEST VAN PUTTEN, M.INST.C.E., borough engineer and surveyor).—It is proposed to pave a number of roads with improved surfaces, at a total of £24,474 for wood pavement, and £7,015 for bituminous-bound and tar-macadam roadways. Practically the whole of these roads are motor-omnibus routes, and these improved forms of surfacing are to take the place of water-bound macadam, which will not stand the modern traffic. A still larger sum was spent last year on other roads in consequence of the advent of the motor omnibus. At the Forest Hill public baths a new system of water heating is being adopted, at a cost of £750, replacing two Cornish boilers which were fixed about thirty years ago. At the Ladywell public baths a reinforced-concrete storage tank, to hold 75,000 gallons of water, is to be erected at a cost of about £500. At these baths there is a well and borehole belonging to the council; by providing a storage tank it will now be possible to fill both swimming baths each night without drawing any water from the Metropolitan Water Board's mains, and a very large saving will thus be effected. A tuberculosis dispensary is to be erected on a site adjoining the Ladywell baths, at a cost of about £1,000. An extension of the existing tramways from Victoria to Catford will be opened as far as Southend village. The terminus of the tramways at Park-road, Forest Hill, will be connected by a linking-up line of about ¼ mile in length, to the terminus in London-road, Forest Hill, thus abolishing two dead ends. The following is a list of the roads proposed to be paved with improved surfaces, 1914-15: Wood paving (creosoted deal blocks laid upon a concrete foundation)—Eltham-road and Lee Green, 2,643 yds. super., at 14s. per yard, £1,850; Dartmouth-road, Forest Hill, 5,070 yds. super., at 14s. per yard, £3,631; High-street, Sydenham, 5,898 yds. super., at 14s. per yard, £4,129; Kirkdale, 6,818 yds. super., at 14s. per yard, £4,773; West-hill (Kirkdale to Lawrie Park-road), 436 yds. super., at 14s. per yard, £305; Sydenham-road (from Newlands Park to railway bridge), 2,200 yds. super., at 14s. per yard, £1,540; London-road (from Dartmouth-road to near Queen's-road, breasts of road along tramways), 2,287 yds. super., at 14s. per yard, £1,601; Lee-terrace, 5,867 yds. super., at 14s. per yard, £4,107; Lee-road, by Blackheath Railway Station, 800 yds. super., at 14s. per yard, £560; Belmont-hill (part of), 2,826 yds. super., at 14s. per yard, £1,978; total, £24,474. Resurfacing with bituminous-bound macadam—Belmont-Hill (part of), 2,937 yds. super., at 4s. 9d. per yard, £697; Lawrie Park-road, 4,800 yds. super., at 4s. 9d. per yard, £1,140; Dover-road, Blackheath, 8,929 yds. super., at 4s. 9d. per yard, £2,121; Burnt Ash-hill (Newstead-road to Baring-road), 1,894 yds. super., at 4s. 9d. per yard, £450; total, £4,408. Tar-carpeting surface of road—Baring-road (Burnt Ash-hill to Grove Park Station), 19,249 yds. super., at 2s. per yard, £1,925; Royal-parade and road to Montpelier-row, 2,153 yds. super., at 2s. per yard, £215; Montpelier-row (part of) and Shooters Hill-road, 4,668 yds. super., at 2s. per yard, £467; total, £2,607.

London, St. Pancras (Mr. WM. NISBET BLAIR, M.INST.C.E., borough engineer and surveyor).—The works for which provision has already been made are limited to the period prior to March 31st next, and no estimates have yet been considered for the subsequent period.

London, Woolwich (Mr. J. RUSH DIXON, M.INST.C.E., borough engineer and surveyor).—In connection with the electrification of the tramways by the London County Council, the widening of a further portion of the Woolwich main road to Greenwich and London will be completed. The paving works, &c., are being carried out by the council by arrangement. The question of linking up the London County Council tramways in the Eltham district is under consideration, and if it is decided to proceed with the work, extensive street widenings and improvements will be undertaken. The resurfacing of part of the main London and Folkestone road through Eltham, estimated to cost £26,000, will be completed. Sewering and flood prevention schemes for the old Woolwich portion of the borough, estimated at some £12,000, have been passed, and the work in connection therewith will be put in hand during the year. In addition to the usual

private street works, there will be further development of the several large building estates in the borough, one in particular, on garden city lines, being already commenced at New Eltham.

London, Paddington (Mr. E. B. B. NEWTON, M.INST.C.E., F.S.I., borough surveyor).—The council's works for the ensuing year are not yet decided upon, but it is probable that they will include the erection of new public baths and washhouses, extensive wood paving renewal works, new wood paving works, an important street improvement, new cleansing station, and the extension of area of "special" macadam. Probably the new Ranelagh-road footbridge will be completed early in the year.

Louth (Mr. D. STARKIE, M.I.MUN.E., district surveyor to the rural district council).—In addition to the ordinary work of maintenance of some 500 miles of highways, considerable steam rolling will be carried out. In all probability the area of road surface to be tar-sprayed will be increased. Plans are in hand for the improvement of several dangerous corners on the main and district roads.

Lowestoft (Mr. G. H. HAMBY, ASSOC.M.INST.C.E., borough engineer).—Application has been made to the Local Government Board for a loan for £11,000 for the drainage of districts on the outskirts of the borough, and involving the construction of three pumping stations and mains to convey the sewage to the existing outfall. A large number of bathing huts and chalets will be constructed on the South Beach, and a new shelter will be constructed on Gunton Cliff. A new pavilion for eleven beds, two single-bed observation wards, and a lodge will be erected at the isolation hospital. A much-needed public convenience will be erected on the South Cliff, and additions practically doubling the existing accommodation will be made to the Royal Plain convenience. Some thirty private streets are under notice to be made up, and the council are turning their attention to the planning of areas about to be developed. It is likely that considerable additions will be made to the town hall to provide much-needed extra office and committee room accommodation. Under the increasing heavy traffic of the rapidly expanding fishing trade, it has been found impossible to keep certain macadam roads in repair without great expense, and a scheme is under consideration for paving the more important of these with granite setts. Some road widenings and improvements will also be carried out, and altogether a very busy year is anticipated.

Luton (Mr. J. W. TOMLINSON, borough engineer and surveyor).—The confirming Bill granting county borough powers will be before the House of Lords Committee at the beginning of the next Session. Considerable progress has been made with the storm-water drainage scheme, and it is anticipated that the whole of the scheme will be completed during the coming year. While this is in progress, enlargements of foul-water sewers will be carried out. A scheme has been submitted to the Local Government Board for the extension of the sewage disposal works, and it is expected that the whole work, involving an expenditure of £7,500, will be carried out during the year. A new refuse destructor to deal with 70 tons per day is to be installed. A railway footbridge, 17 ft. wide, spanning both the Great Northern and Midland railway stations, together with a roadway between them, will be constructed. It is expected that a town planning scheme will be finally submitted to the Local Government Board for confirmation. Hard tennis courts are to be provided in the public park. One elementary school for 450 children and one for 1,000 children will be erected. Subject to the application for county borough powers being successful, a scheme for a large boys' secondary school will be proceeded with. A length of main road included in the town planning scheme is to be constructed, involving the provision of large sewers and the construction of a railway bridge.

Macclesfield (Mr. S. C. BAGGOTT, M.I.M. AND CO.E., borough engineer and surveyor and waterworks engineer).—The following schemes are now before the Local Government Board—viz.: Waterworks scheme for mechanical filters and 4 miles of high-level trunk mains; cost about £15,000. Provision is to be made for an additional impounding reservoir. The borough isolation hospital will be considerably enlarged during the year, and this together with the redrainage of the existing hospital will be connected to the sewerage system; total cost £7,000. A scheme is in course of preparation for extensions at the sewage works, comprising percolating filters, humus tanks, pumping mains, &c., to cost £10,000. It is expected that a considerable quantity of granited rock asphalt will be put down on the highways, and that the committee will purchase some traction engines to replace horse-drawn vehicles. Other work includes about 4 miles of private streets, main sewerage extensions, sanitary conveniences, additions to public baths. The council are revising their present code of by-laws relating to new streets and buildings. A new electric lighting and power station is being erected, in connection with which the cables are at the present time being laid.

Maesteg (Mr. SAMUEL J. HARPUR, engineer and surveyor to the urban district council).—During the past year several small contracts have been carried out, including public and private street improvement works and sewer extensions. The larger works carried out include heavy retaining walls alongside the river Llynfi, relaying of main sewer, new road to secondary school site, and new bridge crossing the river. At present the following works are in progress: Alterations and additions to town hall and markets; river retaining walls; and private street improvement works. The following works will be put in hand during the coming year, the sanction of loans having been obtained: New municipal buildings, £4,360; new sewage disposal works, £20,000; private street works in about twenty streets. All the foregoing works have been designed and carried out by Mr. Harpur and his staff.

Maidstone (Mr. T. F. BUNTING, borough surveyor).—The new works to be carried out include an extension of the electricity generating station, which, with the machinery to be put in and the addition of new offices, will cost upwards of £5,000. A considerable amount of work will have to be done for the preservation of the ancient Tithe Barn, which has recently been purchased by the corporation as an ancient building. One or two small street improvements are also in view, but beyond this the work of the year will be ordinary maintenance and repairs.

Maidon (Mr. T. R. SWALES, M.INST.C.E.I., borough engineer and surveyor).—A scheme is in course of preparation for the provision of thirty-two working-class dwellings, the erection of which will probably commence at an early date. Extensive road improvements will be carried out, in addition to the usual work of maintaining and tar-surfacing the main roads of the borough. The council have under consideration the further development of their pleasure grounds, including the providing of additional tennis courts. A further extension to the water supply will be carried out. An entirely new code of building by-laws will come into operation during the year.

Mansfield (Mr. THOS. P. COLLINGE, ASSOC.M.INST.C.E., borough engineer and surveyor).—The work proposed during the ensuing year will include the making up of several new streets under the Private Street Works Act, and the carrying out of a number of public street improvements under a Provisional Order. Plans for additions and extensions to the infectious diseases hospital have been approved by the town council, at an estimated cost of £5,000, and the work will be put in hand during the year. Application is to be made to the Local Government Board for a loan of £1,600 for sewerage purposes in Westfield-lane and Sandy-lane, and a scheme is being prepared for sewerage a portion of Pleasley-hill. It is hoped this

work will be put in hand at an early date. A town planning scheme, to comprise the whole of the district unbuilt upon is in hand, and the first conference of owners and interested parties has been held. New council schools will be erected in Chesterfield-road and at Rainworth. Plans for the erection of a new town hall and municipal offices are in course of preparation, and the council have under consideration the erection of a new fire station and public abattoir. The buildings in course of erection in the borough include three large picture houses, and considerable additions to the Mansfield hospital and free library. During the past year 215 new houses have been certified for occupation. The new railway through Mansfield from Clipstone to Kirkby is now nearing completion.

Marple (Mr. D. J. DIVER, engineer and surveyor to the urban district council).—The works projected for 1914 consist of sewerage the Low Marple portion of the district, and the making up of the following private streets—viz., Derby-street, John-street, Eastvale, Chadwick-street, and Chapel-fields. The Towns yard recently purchased at Rose Hill will be adapted to suit the council's purposes. The question of erecting a refuse destructor, disinfector, and tar-macadam plant is now being considered by the council.

Matlock (Mr. JOSEPH TURNER, M.R.S.A., surveyor and water-works engineer to the urban district council).—The council have recently purchased some old buildings in the centre of the town, and it has been decided to have these taken down for the purpose of widening and improving one of the approaches

to the county bridge. Additional improvements will be carried out on the Hall Leys Pleasure Grounds. To improve the entrance from the main road into the pleasure grounds arrangements are being made for the re-erection in a more suitable position of an existing footbridge over the river Derwent. The surveyor has been instructed to invite tenders for a steam fire engine, and also to prepare plans for alterations and additions which it is contemplated to make to the present fire station. The main sewerage scheme for the district is being proceeded with.

Meriden (Mr. THOMAS HENRY NEGUS, surveyor to the rural district council).—The proposed works include some 2 miles of sewers and outfall works at Fillingley; completion of a further section of Hampton-in-Arden sewerage; a "lifting" scheme of sewerage and outfall works at Coleshill; the sewerage of Bickenhill and Marston Green. Plans are in hand for two or three other schemes of village sewerage. The extension of water mains will doubtless be carried out in four or five villages, and scavenging schemes at Coleshill, Castle Bromwich and Water Orton; while the erection of cottages for the council's workmen in some of the twenty-two villages within the district is foreshadowed.

Merthyr Tydfil (Mr. A. J. MARSHALL, borough engineer and surveyor).—The ensuing year is likely to be a very busy one from the standpoint of municipal engineering works. The council have had sanction for a loan amounting to £24,000 for main sewer diversion works, and this work will probably be started in the spring. Several street improvement works are contemplated within the borough, and the renewing of the permanent way of the electric railways through the main thoroughfares; substituting wood blocks for stone setts will be undertaken. A new recreation ground will be laid out at Gellifaelog, and the widening of a long length of roadway in connection therewith. It is also intended to lay out a new cemetery at Aberfan. The question of a refuse destructor is also under consideration, and a special committee has been appointed to report upon the sites available. In addition to the ordinary maintenance works connected with the highways and sewerage system, several schemes are in hand for their improvement and extension respectively, and various storm-water mains and overflows will be constructed. The usual private street works will be carried out, and further developments of building estates, including a new garden village, is in progress.

Middleton (Mr. W. WELBURN, M.I.M. AND CO.E., borough surveyor).—The following works are in hand: Post office extension, school extension, granite paving (£4,100). The following works are proposed for 1914:

Private street works (£2,440), new sewer (£3,000), tram shelter (£270), and new town hall (£18,000).

Middlesbrough (Mr. S. E. BURGESS, M.INST.C.E., L.R.I.E.A., borough engineer and surveyor).—

The borough boundaries have recently been extended by the taking in of an additional area of 1,500 acres. During the coming year extensive works are contemplated as follows:—Floods prevention scheme: The first section has just been commenced; estimated cost, £33,000. The total estimated cost of the complete scheme is £69,000. Road and street paving works: Public works, £20,000; private street improvement works, £10,000; total, £30,000. Road widening schemes, £9,000; provision of recreation ground, Ayresome district, 7½ acres in extent, with swings and giant strides, £7,000; the abolition of privy middens and pan closets and conversion into water-closets is to be proceeded with, at an estimated cost of £12,000; and the extension of the sanatorium and the provision of a new laundry for same, £6,000. A new divisional police station is to be built at a cost of £4,000, and new bowling greens, tennis courts and pavilions at the Albert Park, at an estimated cost of £1,200. The alterations to public mortuary will probably cost about £60. In addition to above, schemes have been adopted under the Housing and Town Planning Act, 1909, for dealing with the insanitary property in the borough, and further schemes are being prepared. A town planning scheme has been completed for the unbuilt-up portion of the borough, and a further scheme will be put in hand in connection with the unbuilt-up portion of the recently added areas. A committee has been appointed to consider the question of extending the public swimming baths. A Bill is being promoted in the next Session of Parliament for the abolition of the toll bars in the borough, the purchase of the North Ormesby Gas Company's undertaking, and seeking further powers with respect to building by laws.

to allow boats to land at any state of tide, estimated cost £3,700; and making up carriageways with tar-macadam to the extent, probably, of about £800.

Monmouthshire (Mr. WILLIAM TANNER, F.S.I., county surveyor and county architect).—There is a considerable amount of work in hand from last year not finished, and the council do not intend to consider any new work until this is completed.

Montgomeryshire (Mr. G. A. HUTCHINS, M.INST.C.E., county surveyor).—The works in hand on the main roads at the present time and expected to be carried on and completed by the county engineer during the year 1914-15 are: The installation of a tar-macadam mixing machine, fed by a rotary heater and drier with the metalling to be used in its manufacture, patented by Messrs. Ord & Maddison, of Darlington; about 15 miles in length of tar-macadam surfacing on the Welshpool, Newtown and Llanidloes main road, under a Road Board grant, 7 miles of which have been done this year, and the remaining 8 miles, it is expected, will be finished by next September; tar-spraying main roads through the town of Montgomery, the villages of Meifod, Llanfechain, Llandisilio and Llandrinio and the hamlet of Arddlyn, besides rolling-in on the main roads the usual 24,000 tons of water-bound macadam, as against the 8,000 tons per annum laid down in the year 1890-91 and left for the local traffic to consolidate. In the Education department seven new provided schools are to be built at Llanwrin, Cemuaes, Esgairgeiliog, Hirnant, Rhos-y-Briithdir, Faenor and Berriew, and existing council schools are to be improved and brought up to date at Llawryglyn, Staylittle, Glandwr, Trefnannau and Rhiwhiraeth, making in all a round dozen to be dealt with by the county architect, in addition to the thirty-eight already completed since the appointed day.

Morecambe (Mr. J. W. HIPWOOD, ASSOC.M.INST.C.E., borough engineer and surveyor).—The council are considering schemes for the further development of their pleasure grounds and for their electric illumination, also the provision of additional sanitary conveniences and shrubberies

on the promenade. New groynes will be erected, and the surface-water drainage scheme at the west end, which is proving so successful, will be completed. The recent rapid increase of building operations will necessitate the making up of several streets with tarmacadam, and the laying of a number of water mains. The successful application of the Deacon waste detection system, which resulted in a saving to the town of £1,150 last year, will be extended. Tests are being conducted with automatic pressure wave street lighting, and complete adoption is anticipated. The electrification of the corporation tramways, which is the burning question of the day, will probably be decided upon. The extension of the Victoria Esplanade to the borough boundary and to Hest Bank is also receiving consideration. The widening of Slyne-road, deferred from last year, will be carried out with the assistance of the county council. Plans for the alterations of the council chamber are under the consideration of the council. The tar-spraying and Pulviciding of all roads in the borough will be carried out as usual.

Morley (Mr. F. TURNER, B.S.C., ASSOC.M.INST.C.E., borough engineer and surveyor).—The year 1914 will be a season of activity in municipal work. The corporation have under consideration the provision of houses for the working classes, and plans and estimates are being prepared for the erection of about seventy cottages, together with the construction of the necessary streets and sewers. Additions are to be carried out at one of the public elementary schools, and a caretaker's lodge erected at the infectious diseases hospital. Experiments are to be carried out at the sewage disposal works for the recovery of grease from the sewage sludge, and also for reducing the volume of sludge, which is rapidly accumulating. The by-laws with respect to the erection of new buildings and the laying out of new streets are being remodelled, and the draft of the proposed regulations will shortly be submitted to the Local Government Board. In nearly all cases the resurfacing of the macadam roads (both county and district) will be carried out with tarred metal, and all water-bound macadam roads will be tar sprayed where the gradients will permit.

ET
FLUMINA HABITARE

Morpeth (Mr. J. DAVISON, borough surveyor).—Some of the private streets commenced during last year are to be completed. Improvements to streets are contemplated at Castle-square and Dam-side, where it is proposed to widen the road by the acquisition of a portion of the adjoining property and land. A new concrete ford across the river Wansbeck has just been completed, and thirty-three houses have been finished and occupied during the year just ended. The town council are now inviting offers of land suitable for building purposes with a view to erecting more houses. Improvements to corporation property in Corporation-yard are to be made during the current year, plans having already been approved. It is hoped that during the next few months arrangements will be completed for the erection of a quay wall, and the making up of a road by the riverside between the Mayor Bridge and Oldgate Bridge.

Mossley (Mr. R. H. BUCKLEY, borough engineer and surveyor).—The most important schemes which the council propose to undertake during the present year are: Another new council school, to be built in Lancashire Ward; public baths, which are being given to the town by the generosity of Mr. John L. Tattersall, a large ratepayer and employer of labour; and several long lengths of additional sewers.

Motherwell (Mr. W. ROSS, burgh surveyor).—The town council have agreed to erect a swimming pond and baths at a site in High-road, adjacent to the town hall. The construction of the sewage purification works for the western district of the burgh will be started shortly. Land has been secured on advantageous terms from Lord Hamilton of Dalzell for a

housing scheme, and competitive plans are presently being invited for same from local architects. A Parliamentary Bill is to be promoted for a large extension of the burgh, and extension of water area. Plans are now in hand for the construction of a phthisis pavilion at the burgh hospital, and for extensions to the administrative block. Several street improvements have recently been carried out, and one street has been laid with tarred steel slag with satisfactory results.

Nantyglo and Blaina (Mr. W. J. DAVIES, M.I.M. AND CO.E., surveyor and water engineer to the urban district council).—The year 1914 will see the completion of the Central Ward housing scheme—viz., the erection of seventy-four cottages, at a cost of £17,000, including purchase of the land and the construction of roads. The works projected in the district during 1914 include the following: The erection of 101 cottages in the South Ward; the erection of a laundry and disinfecting block at the isolation hospital; a public convenience, and the widening of a part of High-street, Blaina; children's recreation ground at Nantyglo, and the widening of Cwmcelyn Bridge, Blaina, and the approaches thereto. Improvements are to be effected in the following streets: Abertillery-road, Part-street, Lancaster-street and Surgery-road, Blaina. A considerable expenditure will be incurred in providing foundations and strengthening road crusts on the main roads through the district in view of the proposed running of railless electric traction cars by the Western Valleys (Mon.) Railless Traction Company.

Neath (Mr. D. M. JENKINS, ASSOC. M.INST.C.E., borough engineer).—

Contracts have just been let for auxiliary waterworks, comprising service reservoir and mains, in connection with the Ystradfellte water supply, and the work will be proceeded with at once. Additional feeders are being laid for the purposes of the electricity undertaking, and extensions of distributing mains are to be carried out during the year. The widening of Gasworks-road is in hand, and other street improvements are being considered. The erection of ninety-three workmen's dwellings, at a cost of £16,000, and extensions of the Gnoll council school, at a cost of about £10,000, are well in hand; and various private street works are being proceeded with. The council have under consideration the erection of cottage flats to be let at low rents; and the improvement of houses, under the powers of the Housing and Town Planning Act, 1909, will be continued during the current year. Among the works completed during last year were the extension of Llantwit sewage purification works, the paving of stone yards with lithofalt blocks, and extensions of sewers and electric distributing mains.

Nelson (Mr. W. SHACKLETON, ASSOC.M.INST.C.E., borough engineer).—

The present year promises to be an exceptionally busy one. A scheme of public abattoirs, estimated to cost £20,000, has been prepared and forwarded to the Local Government Board for their sanction for a loan. The high-level sewer and sewage works extensions, comprising additional liquefying tanks, storm and detritus tanks, and sludge press house and presses (£23,500), and Carr Hall Bridge (£3,500), will be completed. Application has been made to the Local Government Board for a loan of £35,000 for the making up of seventy-five private streets, a great number of which will be put in hand immediately sanction is obtained. Further steps will be taken in respect of a town planning scheme for some 1,300 acres within the borough. A Provisional Order for extensive street widenings—obtained last year—will be put into effect, and others are likely to develop.

Newark-on-Trent (Mr. T. P. FRANK, ASSOC.M. INST.C.E., F.S.I., borough engineer and surveyor).—It is proposed to add a new infectious ward to the present isolation hospital, and plans are in course of preparation for the scheme. The preliminary work in connection with the proposed sewage disposal scheme has been commenced. Plans have recently been passed by the council for a sewage installation at the sanatorium. One or two public street improvements are under consideration, as is also the question of the adoption of new building by-laws and new waterworks regulations.

Newbury (Mr. S. J. L. VINCENT, ASSOC. M. INST. C. E., borough surveyor).—The works projected for 1914 include: wool paving, £4,000; infant school, £2,600; cattle market extension, £1,350; corn exchange reconstruction, £3,000; reconstruction of outfall works, £2,700; and surface water scheme (second instalment), £400.

Norfolk (Mr. T. H. B. HESLOP, M. INST. C. E., county surveyor).—The works projected by the county council for the present year are as follows: An expenditure of about £20,000 for reconstruction of roads; about £4,000 for road widenings and improving dangerous corners; a new steel bridge over the river Waveney at Mendham, approximate cost £3,000; completion of steel bridges at Ingworth and Ellmehdale; construction of a ferro-concrete bridge at Saxthorpe Ford; restoration of the interior of the Shirehall at Norwich, and refacing the exterior in brickwork with stone dressings; new kitchens at county asylum, and additions; drainage of the county asylum premises; and erection of cottages for roadmen.

Northampton (Mr. ALFRED FIDLER, M. INST. C. E., borough engineer and surveyor).—The Bridge-street improvement scheme will be continued, and probably completed. The scheme provides for a width of 50 ft., which will involve the purchase of much valuable property, and the widening of a three-arch masonry bridge over the river Nene. During the year the Far Cotton tramway scheme, which passes along Bridge-street, consisting of a double line, will be constructed. In connection with this the car depot is to be extended, and additions to the generating plant carried out; also a portion of the Kingsthorpe section will be doubled. The erection of workmen's dwellings will be further continued by an addition of about forty cottages to the fifty which are already in course of erection. Schemes in connection with the racecourse, Far Cotton, and Kingsthorpe recreation grounds will be executed. The question of the provision of district baths is under consideration, and schemes which have been prepared, in all probability, will be adopted. The erection of a branch police and fire station is contemplated. The cattle market is to be extended, by the construction of cattle pens, to the extent of half an acre, and the erection of settling rooms in other buildings.

Northfleet (Mr. J. A. MITCHELL, surveyor to the urban district council).—The Northfleet Council have recently purchased a farm of about 68½ acres, which will be laid out as allotments and depots for the treatment of refuse, and a site for a smallpox isolation hospital. A comprehensive improvement of the High-street is also under consideration, and the improving of Springhead-road is about to be carried out. The subject of the housing of the working classes is under consideration, and the improvement and strengthening of road surfaces is also being steadily proceeded with.

Northwich (Mr. JOHN BIRTWISTLE, surveyor to the rural district council).—The council have decided to remodel the Hartford sewage works, and to resewer two portions of the township. The main sewer of the Heyeswood district will be carried over the railway cutting by means of a steel bridge. It is hoped to proceed with the laying of about 6 miles of water mains for the benefit of three townships if the approval of the Local Government Board can be obtained. Land has been obtained, and a scheme for the erection of twelve farm labourers' cottages approved. It is intended to erect six in the first place by way of experiment. New building by-laws are expected to come into operation during the year. Several important schemes of water supply and sewage disposal are under the consideration of the council. During the past year the supplies of water to three of the council's works have been supplemented, and the supply to another installation is being augmented from an additional source. The reservoir and pumping plant in connection therewith will shortly be completed, when it is hoped to extend the service mains about 3 miles.

Notts (Mr. E. PURNELL HOOLLY, M. INST. C. E., county surveyor).—Few counties are developing coalfields much faster than Notts. This necessitates a great number of new schools, and it is anticipated that new schools will be required at Harworth, Ramworth, Kirklington, Rampton, Mansfield Woodhouse, Work up, and other places this year. A new police station is to be built at Mansfield Woodhouse. A commencement is to be made of the new direct road to North Notts from Nottingham, with the assistance of the Road Board. This road, which will be about 3½ miles long, will pass directly through the Dukeries, and link up sections of country roads that are now practically derelict. It is anticipated that about 30,000 tons of Tarmac will be used on the existing ordinary macadam roads of the county this year in continuation of the work of improved surfacing, commenced over ten years ago.

Norwich (Mr. ARTHUR E. COLLINS, M. INST. C. E., city engineer).—The city engineer anticipates that the following municipal works will be commenced, proceeded with, or completed during the present year—viz.: Arising out of the 1912 flood, schemes have been prepared for dredging, widening and improving the rivers Wensum and Yare between New Mills (Norwich) and the Haven Bridge (Great Yarmouth). The total cost of the works is estimated to be £350,000. Where the river passes through the city the scheme proposes to purchase properties adjacent to the existing banks, so as to give a minimum width of 80 ft. Between the limits of the city proper and Breydon the new river widths proposed to be secured will vary from 80 ft. to 220 ft. The proposed new depths will vary from 10 ft. below mean water level between New Mills and Foundry Bridge (Norwich), and 17 ft. below mean water level between Foundry Bridge and Great Yarmouth Haven Bridge. The proposals also include the construction of new cuts, removal of inconvenient bends, and provision of washes, giving a minimum width of 150 yds., with suitable river walls. Such works as the corporation have actually undertaken are on the lines of these proposals, but the scheme as a whole has not yet been adopted, financial considerations standing in the way. In connection with the demolition of dilapidated houses, consequent upon the Norwich flood, it is proposed to clear away a number of dwellings in the area which was inundated, and to erect housing accommodation for the displaced population on a site belonging to the corporation near at hand. Plans are in hand for the erection upon the site of the old wholesale fishmarket in the centre of the city, of large additions to the municipal offices. The scheme under consideration is estimated to cost £12,000. To enable this to be done a new fish market has been built, and this was opened on December 24, 1913. Negotiations are in progress for the purchase, or lease, of a site now occupied by dwellings situated between Prince of Wales-road and the river Wensum, for the construction of a wharf for loading lighters with domestic refuse. The carrying out of this scheme will necessitate the pulling down of some of the houses; others will be remodelled for letting. The method of refuse disposal at the sewage farm marshes adopted a few years since is continuing to prove quite satisfactory. Preliminary attention will be given to the question of further enlarging the city asylum. An underground convenience, estimated to cost £660, will be erected on Tombland, this provision mainly being made in the interest of the 30,000 to 40,000 tourists who annually visit Norwich Cathedral. The Norwich Electric Tramways Company are desirous of obtaining Parliamentary sanction to the carrying out of extensions and modifications of the existing tramway system. The estimated cost of the works, including street widenings and a contribution towards the cost of the widening of Duke's Palace Bridge over the river Wensum, is about £35,000. There is a Bill in Parliament for this for next Session. Improvements of the main roads of the city, assisted by loan and grant from the Road Board, will be effected. The expenditure incurred under this heading is expected to be about £7,000, almost entirely for extending the large areas of solidly grouted bituminous macadam existing in Norwich. New sewerage, it is

expected, will include the extension of Unthank-road storm-water relief sewer (£2,600); provision of sewage and surface-water sewers for the drainage of Earham-road and western district (£5,800); storm-water outlet for Queen's-road and south-eastern district (£4,000); repairs and reconstruction of existing sewers, and providing surface-water sewers in private streets previously to their being made up by the corporation for adoption as public highways (£1,200). It is anticipated that the labour demands requiring to be met by the Distress Committee will be satisfied in connection with some of the above works, more particularly the river widening.

Nuneaton (Mr. F. C. COOK, ASSOC.M.INST.C.E., borough surveyor and water engineer).—A new water pumping station at Griff is on the point of completion, and will be brought into use during the year. Other works to be carried out comprise the conversion of two primary contact beds into percolating filters and the provision of separating tanks at the sewage disposal works; the erection of a steel foot-bridge over the Coventry Canal; the Newdegate-corner street improvement, involving an expenditure of £8,250 in the purchase of property; and the straightening of Ansley-road, in respect of which a grant has been received from the Road Board. An addition will also be made to Riversley Park, in connection with the gift of an art gallery, made to the town by Councillor Melly, a former mayor.

Oakham (Mr. ARTHUR L. PARKER, M.I.M. AND CO.E., M.I.MUN.E., engineer and surveyor to the urban district council).—Sanction to a loan has been given by the Local Government Board for widening the High-street, and the work will be put in hand early in the year. Plans have been prepared for additional septic tanks at the sewage farm, and it is the intention of the council to commence this work in the spring. Tar-painting of the roads will again be carried out next summer; more than two-thirds of the roads have already been so treated. In the year's estimate for road maintenance, Vianex binding is included instead of the ordinary road-binding material commonly used, and it is hoped that better results will be obtained with very little extra cost.

Okehampton (Mr. FRANCIS J. WORDEN, borough surveyor).—The principal works contemplated during the ensuing year are—(1) Proposed extension of reservoir and water mains, and a scheme for scraping old mains which have become corroded on inside; (2) extensions of sewers to take drainage of new buildings; (3) public conveniences for both sexes; (4) proposed development of a site purchased for the purpose of erecting public buildings; and (5) block flooring and heating apparatus in market hall. Among other works projected are erection of a police station by the county authority, workmen's houses, and a scheme for proposed cottage hospital, under a joint arrangement of the local Nursing Association and the Holditch Trustees. A scheme for the extension of the borough boundary will also be considered, but in this respect opposition is anticipated.

Ongar (Mr. W. N. JARVIS, A.R.SAN.I., surveyor to the rural district council).—The council have under consideration sewerage schemes for the village of Blackmore and the village of High Ongar, and a short length of new road under the Private Street Works Act.

Ossett (Mr. H. HOLMES, M.INST.C.E.I., borough surveyor and water engineer).—There is every prospect of a busy year in the borough surveyor's department. Several schemes included in last year's forecast are completed, including the reconstruction of the main outfall sewer and storm tanks; the erection of fire station, stores, workshops, &c.; the purchasing of a motor fire engine; Pildacre-hill sewerage scheme; the preparation of land for filtration; and also the Gawthorpe surface-water and sewerage scheme, during the carrying out of which rock was encountered in the headings and progress could only be made by the use of ammunition. The forecasted extensions to the water mains are being completed, and further schemes will be considered during the year. A sludge main at the sewage disposal works is now being completed, and the underground conveniences in the Market-place are in course of construction. Sanction has just been received for a loan of £8,356 for extensions to the sewage disposal works. These include

four 100-ft. percolating filters, settling tanks, concrete carriers, and the laying out of more land for filtration. This work will be begun at once and carried out by direct labour. There are still many private streets in the borough which require making up and sewerage, and a number of these are scheduled for consideration during the year. An extension to the isolation hospital is proposed, and a scheme has been prepared. A considerable amount of tarred slag has been used on the main and district roads, and this work will no doubt be continued this year. The corporation and officials are at present engaged on a Private Parliamentary Bill by which further powers, particularly with reference to the disposal of trade refuse, are sought. The Parliamentary Agents for the Bill are Messrs. Sharpe, Pritchard & Co., Westminster.

Oswestry (Mr. G. WILLIAM LACEY, borough surveyor and water engineer).—The chief proposals for the year 1914 are the laying of a duplicate 7-in. water main for a distance of 1½ miles, tenders for which have already been accepted; the reconstruction in reinforced concrete of the water service reservoirs, at an estimated cost of £5,000; and the erection of a park lodge. Tar-macadam for roadways is likely to be still more largely adopted for the repair of the main streets of the town.

Oxford (Mr. W. H. WHITE, M.INST.C.E., city engineer).—During 1914 it is expected that the long-pending question of the electrification and extension of the tramways will be brought to an issue, or in lieu thereof of a complete motor omnibus service installed. At present appearances seem to point to the latter alternative. Another river bathing-place (the seventh), similar to the one for women opened this year, will probably be provided, and the question of covered public baths is being considered. It is intended to build two or three additional public conveniences, and there will be several new roads, water-works extensions, and street improvements. The subject of town planning is also before the council, and a scheme may be formulated.

Oxfordshire (Mr. S. STALLARD, ASSOC.M.INST.C.E., county surveyor).—The principal work in this county that is pending is the reconstruction of 60 miles of main roads, at a cost of £95,000. This will be commenced in April next, and, it is hoped, will be completed in two and a-half years.

Paignton (Mr. C. OWEN BAINES, engineer and surveyor to the urban district council).—About £9,100 will be expended upon road improvements during the year, chiefly on main roads. Included in this sum is the provision of a motor road approach to the town from Preston to meet the Marine-drive, alongside the large area of lands and foreshore recently purchased by the council at a cost of £5,200. A further sum of £5,600 is being applied for to lay out, level, and plant these lands, and to provide public conveniences, promenade, and shelters. It is intended to proceed with the erection of a new isolation hospital, at a nett cost of £2,500, exclusive of land. The year 1914 will also see the preparation of a new scheme of sewerage for the district, also the completion of the new machinery depot in Well-street.

Pembrokeshire (Mr. ARTHUR H. THOMAS, A.R.I.B.A., county surveyor).—In addition to the annual routine of repairs and maintenance of the county buildings, bridges and main roads, it is contemplated to carry out considerable improvements to the main roads with the assistance of grants from the Road Board. These latter comprise the substitution of granite in place of local limestone macadam on the Tenby—Carmarthen road; removal of dangerous corners; diversion of Wolfseastle-hill and that from Fishguard to Lower Town, both of which have steep gradients and hair-pin bends; removal of the hair-pin bend and improvement of the gradient of Windy Hall-hill between Fishguard and Goodwick, and alterations to King's Bridge, Pembroke, with diverted approaches. A new police station is being built at Pembroke, and alterations and additions are to be made to the police station at Spittal.

Peterborough (Mr. J. W. WALSHAW, city surveyor).—The council have before them a report upon the Housing and Town Planning Act. No action has, however, yet been taken in the matter. They also have under consideration a borough extension scheme, and reports upon the subject by the several corpora-

tion officers are in course of preparation. A further extension of a surface-water drainage system will be carried out, and £600 expended on in situ concrete footpaths for which a loan has been obtained. All main and principal roads upon which there is much motor traffic will be tarred and granited. An application has been made for a loan of £11,000 for the purchase of land for a new cemetery and the laying out of the land.

Portsmouth (Mr. ARTHUR W. WARD, ASSOC. M. INST. C. E., borough engineer).—

A scheme for considerably enlarging the infectious diseases hospital is under consideration, and the provision of a sanatorium is contemplated. The new tuberculin dispensary being now completed, the old one will be used to house the plant for the manufacture of disinfectant by the Hermite system. An immediate start is to be made with the installation of a salt-water supply for the northern part of the town, dealing with an area equal to about one-third of the borough. Portsmouth is an island cut off from the mainland by a narrow arm of the sea, over which there is only one road bridge; consequently, there is but one road out of the borough. It is hoped, however, that in the near future a second and entirely new road out will be provided. The making up of new roads under private improvement powers will be steadily pushed forward during the present year, and possibly many schemes now only mooted will materialise. Progress is being made with a £20,000 system of storm-water sewers, the work being about half completed. The contract has been accepted for the erection of forty-three houses under the Portsea Improvement scheme.

Prescot (Mr. RICHARD NORRIS, surveyor and inspector of nuisances to the urban district council).—Plans are being prepared for fourteen workmen's dwellings, to be built on land belonging to the council, and adjoining the thirty-eight already built under the Housing of the Working Classes Act. Plans have been passed for a new fire

escape station, and the building will be completed, and a new escape purchased from Messrs. John Morris & Son, Salford, by the end of February. A scheme is under consideration for the general conversion of all the privies in the town (about 850) into water-closets under the Act of 1907. An inquiry has recently been held as to an application from the council for an extension of their district by including an area of 112 acres of the adjoining township of Whiston, and developments in connection with this may be expected during the present year. It is proposed to make up a number of passages under the Private Street Works Act, 1892, at an estimated expenditure of £1,000. Several important street improvements, consisting of converting macadam surfaces to granite sett pavement on concrete are being considered.

Preston (Mr. THOMAS COOKSON, ASSOC. M. INST. C. E., M. R. SAN. L., borough engineer and surveyor).—

The Parliamentary Bill for Session 1914 comprises works in connection with Ribble navigation, streets improvement, three bridges, tramways, and many matters for the general improvement of the government of the borough. It is likely that, in addition, the new baths scheme will be carried out; also new markets offices at an estimated cost of £3,250; playfield for grammar school, and piling the bank of the river Ribble opposite the parks. A number of minor streets improvements are to be taken in hand, and paving works of considerable magnitude in addition to extensive private improvement works.

Potterspurty (Mr. J. B. FAIRCILD, surveyor, sanitary inspector and inspector of nuisances to the rural district council).—Owing to the unsatisfactory state of the wells in Potterspurty Village, the council instructed Messrs. J. Treadwell & Son to prepare plans, &c., for a public water supply. On the advice of a

local water diviner a well has been sunk, and at a depth of 47 ft. a good spring was struck, producing over 100,000 gallons per day. The engineer's plans, together with an application to borrow £3,000, have been sent to the Local Government Board. With regard to its water supply, a similar state of affairs exist at Old Stratford, and the services of Mr. G. Roberts, engineer, have been obtained to advise the council as to the best means of providing a public water supply. When this is complete, six out of the twelve villages in this small rural district will have a public water supply.

Prestwich (Mr. SYDNEY H.

MORGAN, ASSOC. M. INST. C. E., engineer and surveyor to the urban district council).—On April 8, 1913, the council received the authority of the Local Government Board to prepare a town planning scheme, and the work of building up the scheme is steadily progressing.

Town planning will take an important place in the programme for 1914. The Polefield Hall estate, consisting of about 43 acres, will be developed under the scheme by a private company on co-partnership lines. The houses will not exceed twelve to the acre, and will vary in rental from £20 to £60 per annum. The Bury Old-road improvement, which includes the reconstruction of the surface with granite setts on a concrete foundation, and a system of surface-water drainage, will be carried out at an estimated cost of £11,043. A considerable length of single tramway track on the Bury Old-road will be converted into double track during the year. The first length, from Northwood to Park Hill, is estimated to cost about £2,092. It is anticipated that about £2,500 will be spent on the maintenance of highways in the district, and about £1,100 on public lighting during the year. An 18-in. sewer will be laid in George-street in January or February. During 1913 a large number of private streets have been made up under the Private Street Works Act, and it is estimated that during 1914 twenty-two streets will be constructed, at a cost of £4,700. Fairfax-road will be paved with granite rock asphalt at a cost of £700. The ward boundaries have been rearranged so as to obtain more equal representation, and the elections in April next will be the first on the altered register. Extensive additions to the stables and town's yard have been completed. An office, a harness-room, a two-stall stable, a loose box, a store, and about 90 yds. of open shedding have been added to the existing accommodation. Early in the year conveniences for men and women will be erected in the Clough. The most important matter concerning the welfare of Prestwich, which will probably be settled during 1914, is its very existence as a self-governing authority. Manchester Corporation have made an effort to amalgamate the district, and in addition to making application to the Local Government Board for a Provisional Order, have included a clause in the Corporation Bill for next year for this purpose. The Salford Corporation have also applied for a Provisional Order to include Prestwich within the borough. The council and ratepayers are opposed to amalgamation, and hope the general efficiency of the district, its historic name, and the low rate may be sufficient to warrant a continuance of its independence.

Pwllheli (Mr. CHAS. L. ROBERTS, borough surveyor and water engineer).

The year 1914 promises to see important developments of the housing question within the borough. The corporation are in communication with the Welsh Housing Association with a view to co-operation in the erection of cheap model dwellings for the poorer working classes. It is probable that a scheme will be adopted during the year for erecting houses on the land reclaimed by the corporation during the harbour operations. An application will be made to the Local Government Board for sanction to borrow money for enlarging the public slaughter-house, and new pig slaughtering and boiler chambers will be added. A large drill hall and caretaker's house will be built for the Territorial Association. A conference of adjoining harbour authorities is being arranged to co-operate if possible in the purchase or hire of a steam dredger for use along the coast, as all the authorities are more or less troubled with the silting of the harbour entrances and channels.

Ramsbottom (Mr. THOS. H. BELL, M.I.M. AND CO.E., engineer and surveyor to the urban district council).

—A scheme has been submitted to the council and approved for the reconstruction of a length of main road, known as Manchester-road, extending over a distance of about 1½ miles, commencing at a point almost opposite Fletcher Bank Quarries, and terminating at the district boundary at Bassfield. The increased heavy motor traffic has caused consideration to be directed to granite-sett paving on a concrete foundation, which is estimated to cost £14,152. A sub-committee has been appointed to bring the scheme to the notice of the county council, with the object of making arrangements to take up a loan to carry the proposals through. It is intended, during the early portion of the year, to purchase two additional railless cars to work in conjunction with the four already in use on the railless tramways, which were inaugurated last August. The contract which was entered into last year for pumping plant, new bacterial filter and detritus tank at the sewage works is to be completed by the council with direct labour. The widening of a portion of Bolton-street, the main thoroughfare in the town, has received consideration, and the plans and details have already received approval. The arrangements for the additional land which is required have been now satisfactorily completed. The scheme, which will embrace the erection of a concrete retaining wall faced with wall stones, with two flights of stone steps to give access to the land, is estimated to cost £1,250. An application is to be made to the Local Government Board for sanction to borrow money to proceed with the work.

Ramsgate (Mr. T. G. TAYLOR, borough engineer).—The works projected in Ramsgate during 1914 include the following: Scheme for town planning; shelter on the West Cliff; shelter on the East Cliff; lavatories (for ladies and gentlemen); street widening in the High-street and Boundary-road; sea-bathing pool and sea-bathing arrangements generally.

Rawmarsh (Mr. J. A. TONGE, engineer and surveyor to the urban district council).—This council have in hand or just completed enlargements to coal store, gasworks, several painting contracts, much road and sewer work, and many minor jobs. The contemplated works include new sewerage scheme for the low levels of the town to prevent flooding, refuse destructor, and enlargements and alterations to council offices.

Rawtenstall (Mr. J. JOHNSON, borough engineer and surveyor).—In addition to the usual works of maintaining the large mileage of roads and sewers, further new sewer and surface-water drainage work will probably be taken in hand, and several road improvements carried out. A scheme of main road reconstruction will also be taken in

hand. Private street improvements, estimated to cost £4,000, will be carried out under sec. 150 of the Public Health Act, 1875, and further works of house drainage will be completed.

Redditch (Mr. ARTHUR J. DICKINSON, A.M.I.E.E., engineer and surveyor to the urban district council).—A considerable length of tar-macadam has been laid during the past year, and it is proposed to add a similar quantity during the coming year. Practically

the whole of the roads will be tar-painted. Thirty-six cottages are being erected on the council's Ipsley estate at an estimated cost of £7,128, and the new recreation ground is being fenced. The surveyor has been instructed to report as to a desirable site for public conveniences for both sexes. The bridge in Windsor-road will be enlarged and the road widened, and it is probable that the new bridge over the river Arrow will be proceeded with at an estimated cost of £1,600.

Richmond, Yorks (Mr. H. W. MARSDEN, M.I.MUN.E., borough surveyor).—In addition to the ordinary routine in the surveyor's department, plans have been prepared for workmen's dwellings, and will be submitted to an early meeting of the town council. It is hoped that the erection of these houses will be commenced

during the year. Plans are also in course of preparation for public conveniences (one scheme underground)

fitted with the latest sanitary improvements. The improvements on the roads and footpaths will continue, and the present year will be a very busy one in Richmond.

Redcar (Mr. J. HOWCROFT, engineer and surveyor to the urban district council).—The works under consideration are—(1) Macadamising private streets; (2) paving back streets; (3) waterworks extension; (4) process for softening water.

Ripon (Mr. A. BARLOW, ASSOCIATION OF MUNICIPAL ENGINEERS AND SURVEYORS, city engineer and surveyor).—The work at the museum is progressing favourably, and the opening ceremony is expected to take place early in the New Year. New sewers and storm-water sewers will be taken in hand, and the relaying of 300 yds. of 15-in. sewer has been commenced. The council have

given instructions for a report on the footpaths of the city, and these will doubtless receive special attention. The roads have been kept in good order with tar painting, and this work will again be done next year. The sewage farm continues to pay its way from profits received from the crops, and more beds are to be underdrained.

Rochdale (Mr. S. S. PLATT, M.I.MUN.E., F.R.S.T., borough surveyor).—The town council, which completed last year, at an expenditure of about £32,000, the first portion of an extension of the sewage disposal works, will have under consideration the latter portion, consisting of thirteen percolating filter-beds, and other accessory works, at an

estimated cost of £22,000. They will also be extending the main sewerage in the north-western portion of this district, between Foot Mill and Caldershaw, in iron pipes principally up the bed of the river Spodden. Several other projects are under consideration, including extending the ferro-concrete covering over the river Roch, adjoining the site of the new G.P.O.; the covering of another portion of the river higher up, about 125 yds. in length; the acquisition of land and the provision of a sanatorium for tuberculous patients, and probably open-air school; the purchase of land for workmen's dwellings; the preparation of a second scheme of town planning, comprising 1,700 acres, 1,200 acres of which are in the borough, and the remainder within the areas of two adjoining authorities; the extension of the central baths, and main road widenings in connection with a promised grant in aid by the Road Board.

Rotherham (Mr. ERNEST B. MARTIN, M.I.MUN.E., borough and waterworks engineer).—The following works are contemplated by the corporation during the next twelve months: Waterworks.—Construction of a service reservoir; laying of 6 miles trunk main. Sewage Works.—Erection of detritus tanks, and relaying portion of the outfall sewer; pumping station for sewage works. Tramways.—Extension to carsheds, and laying of about 2,000 yds. of double track; extension of electricity generating station. Police Station.—Erection of a suburban station. Hospital.—Erection of administration block for the fever hospital.

Rushden (Mr. W. B. MADIN, engineer and surveyor to the urban district council).—The year 1914, like the two preceding ones, promises to be a busy year so far as municipal works are concerned. The following is a list of works for which plans and particulars have been prepared by the surveyor: Contract No. 1 of the new sewage disposal works, now in hand, at a cost of about £11,500, will be completed early in the summer. The second contract, relating to the erection of a house for the works manager, will be let at an early date. The council are also applying to the Local Government Board to borrow money for the erection of thirty-two workmen's dwellings on the Rectory estate, and it is fully expected these will be well on the way to completion before the end of the year. The council have decided to erect a disinfecting station, and plans for these will be put in hand shortly. In the new recreation ground, which was laid out last year, it is proposed to make two shelters, and provide further seats and extend the paths. In the highways department considerable lengths of bituminous-bound metalling have been laid on both main and district roads during the past few years, and it is intended to extend this system considerably. The council have already decided to make up Shirley-road under the Private Street Works Act, 1892.

Rutlandshire (Mr. J. RICHARDSON, county surveyor).—The county council contemplate making a culvert

over the ford between the parishes of Wardley and Belson, on the main road from Leicester to Uppingham, and strengthening the approaches thereto, at a cost of £325.

Ryton (Mr. JOHN P. DALTON, engineer and surveyor to the urban district council).—The council intend to carry out several works of private street improvement. It is proposed to erect a number of workmen's dwellings, and various highway improvements and sewer extensions are contemplated.

Salisbury (Mr. W. J. GOODWIN, ASSOC. M. INST. C. E., city engineer and surveyor).—So far as can be seen, the chief municipal works to be carried out during the year will be several road widenings and improvements. The approval of the Local Government Board has been obtained to the scheme for straightening

and widening the dangerous entrance to The Friary, involving the demolition and rebuilding of property on both sides of the road. This work is to be proceeded with at once. Three other schemes are being dealt with, and will no doubt be carried out during the year. Two are road widenings, and the other the formation of a loop road at the junction of two main roads, which at present meet at a dangerous acute angle. A new outfall surface-water sewer for the north-western district will be laid. This is necessary through the growth of that part of the city, but is chiefly required on account of the enormous quantity of clean water which will be discharged from the milk factory now being extended at a cost of several thousand pounds. The improvement of the roads will be continued by the substitution of tar-bound granite macadam for the old flint surface.

St. Albans (Mr. J. ASHURST, city engineer and surveyor).—The year 1914 is to be a very busy one at St. Albans. The extended area, comprising about 2,000 acres, is now being taken into the city. A new storm-water and sewerage scheme is to be put in hand to deal with this added area, at an estimated cost of about £40,000. Public conveniences, a new fire station and additions to the police station are projected, and it is hoped that a good many private street improvements will be carried out, and extensive main road works taken in hand. Amended by-laws will be considered, and it is hoped these will come into operation before the year is out.

St. Andrew's (Mr. WM. WATSON, burgh and water engineer).—The new waterworks at Cameron are now approaching completion, as is also the Fourth or Eden Golf Course, which is to be opened for play on June 1st next. The town council had under consideration the following schemes during the year—viz., the erection of a refuse de-

structor; the protection with rubble pitching of the foreshore near the links; the introduction of a gravitation scheme of water supply, with hydrants to each green on the four golf courses; the laying down of an additional eighteen-hole putting green on the Bruce Embankment; the further development of their pleasure grounds, including the provision of two lawn-tennis courts, and a public bowling green. The tar-spraying of all the roads within the burgh will be continued, and other minor improvements on the roads and streets are to be carried out.

St. Austell (Mr. E. D. GROVES, M. I. M. AND CO. E., A. R. SAN. I., engineer and surveyor to the urban district council).—A scheme prepared by the surveyor has received the sanction of the Local Government Board for the provision of twenty-two working-class dwellings. The contract has been let, and the erection of the cottages will be commenced at an early date. The council have received a munificent gift from Sir Charles Graves-Sawle, Bart., of a field in Truro-road, near the centre of the town, to form a recreation and pleasure ground, and Sir Francis Layland-Barrett, Bart., has promised a children's shelter for same. The work of fencing, planting and laying out this ground will be carried out by the council at an early date. The work of street improvements and road widenings will be continued. The first portion of the Duke-street improvement scheme will be completed at an early date. It is hoped to extend the main road widening and new footways on East-hill, and also complete the High Cross-street improvement. The cost of these improvements is estimated at £1,700.

The whole of the work will be carried out by the surveyor's department. New sewers will be laid in the Caroath district, and extended to take the drainage from the council's working-class dwellings. This work will be done by direct labour in the surveyor's department. The preparation of the scheme for the extension of the urban boundaries is nearly complete, and application will be put forward early in the new year.

St. Helens, I.W. (Mr. A. S. LILLEY, surveyor to the urban district council). The chief works that will be carried out by the council during the year 1914 will include the construction of a new concrete tube tank sewer, and cast-iron sea outfall and other drainage work, at a total estimated cost of £3,200, for which works contracts have already been let. Outside the ordinary administrative work, the council have also under consideration the question of road resurfacing improvement works, the provision of sanitary conveniences, and street improvement works.

St. Ives, Cornwall (Mr. SIDNEY PALMER, M. INST. M. AND CO. E., P. A. S. I., borough surveyor, waterworks manager and sanitary inspector).—The following schemes are being discussed by the council, but it is doubtful whether they will be carried out during the year—viz., new sea

wall and roadway from new pier and wharf around harbour, probable cost £3,000; extensive road widening, Stennack-road and Zemor-road, probable cost £600. The following will probably be done: New tanks at sewage outfalls at Westcott's Quay for retaining solid matter until suitable tides, probable cost £500, and extension to reservoir for supplying neighbouring districts, probable cost £600.

Saltash (Mr. W. W. HARVEY, surveyor to the urban district council).—Kerbing and channelling will be carried out in Fore-street and Silver-street, and the laying of footpaths with Dean stone. It is also intended to carry out improvements in the recreation field by providing lavatories and public shelters. The council have recently acquired some additional ground which commands one of the loveliest spots in the West of England, with a beautiful view of the river Tamar and the Dartmoor Hills.

Scunthorpe (Mr. HARRY W. SMITH, ASSOC. M. INST. C. E., borough engineer and surveyor).—The corporation are again adding to the attractions of their gardens in the north and south bays. In the north bay the works in progress include a café and public lavatories in Peasholme Park, and a match bowling green and three lawn and hard tennis courts in the Clarence Gardens. The remaining portion of the Promenade Pier is being demolished, which will greatly improve the appearance of the Royal Albert-drive, and a block of buildings containing shops, shelter, and lavatories is to be erected on the opposite side of the road. The Burniston-road is being widened and improved for a length of 400 yds. In the south bay the corporation are developing the South Cliff Gardens by the addition of rose gardens, terraces, footpaths, pergolas, and shelters. The construction of a large bathing pool is expected to be taken in hand. Lavatories for both sexes are to be constructed in these gardens for the use of the frequenters of the Esplanade.

Scunthorpe (Mr. C. CURTIS GRAY, surveyor and waterworks engineer to the urban district council).—The construction of a main sewer of 36-in. and 42-in. diameter through the centre of the town has just been completed, also the making up of several streets under the Private Street Works Act. The council have instructed the engineer to at once prepare a scheme for the extension of the waterworks, comprising the sinking of deep well and boreholes, the driving of adits, putting down new deep-well pumps, and the extension of the rising main and power cable. The provision of a refuse crushing plant is under consideration, also another depot for highway purposes, and swimming baths. Practically the whole of the streets will be tar-sprayed as usual; certain further street improvements and widening will be carried out, and a number of streets be made up under the Private Street Works Act. Several preliminary meetings have been held with a view to the adoption of the Town Planning Act, and it is probable that a scheme will soon be in course of preparation. Building operations are continuing rapidly, and a busy year is anticipated.

Seaton Delaval (Mr. ANTHONY DORIN, surveyor and inspector to the urban district council).—During 1913 extensive road improvements have been carried out at a cost of £800, including resurfacing with tar-macadam and the removal of a dangerous corner at Horton. A public shelter and a public convenience have been erected at the seaside at a cost of £300, and better provision has been made for life-saving. The first section of the scheme of lighting has been laid down at a cost of £300. The following works are projected for the year 1914: Urinal at Seaton sluice at a cost of £70; extension of lighting scheme, at a cost of £600; the provision of a recreation ground at Seaton Delaval; the laying out of Seaton sluice under a town-planning scheme in view of this part of the district being tapped by the North-Eastern Railway Company, and the provision of two railway stations, which, it is predicted, will open out this part of the area as an ideal watering place; the extensions of water mains and the laying of tar-macadam on all highways, and the provision of allotments, if suitable land can be obtained, at Seaton Delaval.

Seisdon (Mr. W. CANNAN, highway, sanitary and waterworks engineer to the rural district council).—During the year 1914-15 it is proposed to lay a considerable length of tar-macadam. The council have their own plant for making tar-macadam, which Mr. Cannan has designed and erected with his own staff. Considerable lengths of tar-painting will also be carried out. Several awkward corners will be removed, and the roads improved. It is anticipated that considerable improvements will have to be carried out on the roads, by widening and strengthening the surface, to meet the increased traffic to and from the stations on the new railway now being constructed through the district from practically end to end by the Great Western Railway Company. Considerable additions will be made to the distributing mains of the Kinver waterworks. A scheme for a supply of water to Pittingham village is under consideration. A new outfall sewage works for a portion of Wrottesley parish is also to be constructed soon.

Sheffield (Mr. C. F. WIKE, M. INST. C.E., city engineer and surveyor).—In addition to the usual routine work of the department, including sewage treatment, the scheme for the disposal of the Sheffield sewage (estimate £270,000) will probably be completed during the year. Several important street improvement schemes are to be taken in hand, at a probable estimated cost of £120,000, together with numerous smaller improvements, powers for which were included in the Sheffield Corporation Bill, 1912. A scheme (estimated to cost upwards of £250,000) is also in hand for the widening of two important thoroughfares, providing a large open square at the very busy junction of these streets. A portion of the river Sheaf is to be covered over in connection with this scheme. A considerable amount of work is in progress in connection with town planning, and will be proceeded with during the year. The total area of the town planning schemes at present in hand is about 6,000 acres. Negotiations are in progress for the widening of bridges over a railway and canal, which work may be commenced during the year (approximate estimate £15,000), and two other widenings of bridges are to be taken in hand at a probable cost of £14,000. Public conveniences are to be erected in various parts of the city, at an estimated cost of £2,000. The corporation are promoting a Bill in the next Session of Parliament for certain street widenings, tramways doubling, extension of city boundaries, and a scheme for the erection of a public abattoir. A tipping dock and railway sidings for the loading and transit of the town's refuse by rail is to be constructed, at an estimated cost of £2,000. In addition to the ordinary work in connection with parks and recreation grounds, a new park is to be laid out, and additional bowling greens and tennis courts will be laid down, in connection with which several pavilions will be erected. The corporation have recently purchased 65 acres of land for the provision of a cemetery, and plans for laying out are now in hand. It is expected that the execution of the work, and erection of lodges and offices in connection therewith, will be commenced during the year.

Sheffield (Mr. W. J. HADFIELD, surveyor of highways and deputy city surveyor).—The principal works likely to be taken in hand during the present financial year by the highway department, under the

supervision of Mr. W. J. Hadfield, surveyor of highways, are as follows: Highways.—At present the corporation are carrying out a special scheme for the improvement of highway surfaces at a cost of about £40,000; £17,000 has been granted by the Road Board, £3,000 will be paid out of revenue, and the balance has been sanctioned by the Local Government Board. Part of the work has been done, and the remainder will be done during the next financial year. For the general maintenance and upkeep of the 332 miles of adopted streets in the city, a sum of £64,000 has been voted. Private Street Works.—A large number of private streets will again form part of the highway department's work, and involve an expenditure of £30,000. Sewers.—The policy of reconstructing the old rubble and other defective sewers is to be continued; £25,000 will be spent upon this work during the year under sanction of the Local Government Board. The maintenance of the existing sewerage system will also entail a revenue outlay of about £11,000. Tramways.—It is expected that a sum of £40,000 will be expended on the upkeep of the tram tracks already existing and the construction of various new lines. To the above must be added the usual recoverable work, consisting of drainage, which the department is continually called upon to carry out, and which involves a sum approaching £20,000 per annum. The total estimate for the year is as follows: Highways (revenue), £64,000; Road Board grant (balance), £9,860; paving loans, £20,000; private street works, £30,000; tramways, £40,000; sewerage works, £36,000; recoverable work, £20,000; total, £219,860.

Sheringham (Mr. F. HALL SMITH, M.I.M. AND CO.E., P.A.S.I., M.R.S.A.N.I., engineer and surveyor to the urban district council).—1913 has been a very expensive year owing to the damage caused by the floods of August, 1912, so the council do not propose to do any work except ordinary routine work. Application is being made for a loan of £400 for sewerage of the Beeston Common estate.

Skelton and Brotton (Mr. R. S. MOON, surveyor to the urban district council).—During the last year several road widening schemes have been carried out, and owing to mine subsidence two of the sewers have been diverted at a cost of £2,500. The council are applying to the Local Government Board for sanction to a loan of £10,000 for lighting the district with electricity. A new sewer is being laid at Carlin How, to cost £1,200, and various private street works are to be carried out.

Somerset (Mr. H. T. CHAPMAN, county surveyor).—The following works of improvement will no doubt be continued with the aid of Road Board grants—viz.: Strengthening, widening, and surfacing with improved materials, in lieu of local limestone and flint, considerable areas of the most important main roads; surfacing with Tarmac about 4½ miles of the Bath to Bristol main road; strengthening and surfacing with local tarred limestone macadam about 40,000 super. yds. of main roads in the neighbourhood of Bristol; and surface tarring about 100 miles of main roads. The improvement of the East Brent-road, the southern approach to Weston-super-Mare, including diversions, widenings, strengthening and surfacing with granite at an estimated cost of £7,500, will be completed. An alternative and important access to Weston-super-Mare from the Bristol main road, near Worle, *via* Milton-road, will also be completed. Many bad junctions and dangerous turns will be improved by opening out the view. Several county bridges will probably be rebuilt. The council contemplate building six houses for roadmen engaged on the main roads, and also a depot for plant, tools, &c., in the Long Ashton rural district.

Southampton (Mr. J. A. CROWTHER, ASSOC. M. INST. C.E., borough engineer and surveyor and architect to the Education Committee).—Plans and estimates are being prepared for twenty private streets. Contracts have just been let for seven streets, and this work is now proceeding. One elementary school for 1,230 scholars is now in course of erection. The portion for infants (a separate building accommodating 430) was finished and occupied in August last; the portion for boys and girls,

accommodating 800, will be ready for occupation about Easter next. Plans for enlarging one of the smaller elementary schools are now before the Board of Education. Asphalt and Tar-macadamising.—A large area of carriageways was coated during 1913 with this class of paving. This type of road coating will be largely substituted for flint, gravel and ordinary water-bound macadam in the coming year. Disposal Works.—Tenders are being invited for reconstructing the quay-wall of the principal depot on the river Itchen. The wall will be constructed of ferro-concrete piles in substitution of the old wooden piling. The council have under consideration a scheme for modernising the treating of the sewage from one of the small suburban districts of about 360 acres, which is at present treated by broad irrigation. Refuse Destructor.—The Local Government Board have sanctioned borrowing the cost of a new destructor in one of the outlying districts, the plant to be provided being six cells, two boilers, and a chimney shaft. The council have under consideration the provision of another destructor in an outlying district, the requirement being caused by the rapid growth of the population during the last few years in that district. Isolation Hospital.—A tender has just been accepted by the council for additions to the administration block at this hospital; these consist of twelve bedrooms, bath-rooms, stores, dispensary and offices. Plans for a new pavilion to cost between £6,000 and £7,000 are before the Local Government Board. Tuberculosis Dispensary and School Clinic.—During 1913 these buildings have been provided and fitted up for their special requirements, and have recently been opened. Fire Station.—A small fire station has been erected in the suburbs, and is now ready for occupation. The mayor (Alderman W. Bagshaw) performed the opening ceremony on January 1st. Sewers.—There will be the usual extension of the sewers carried out in the coming year owing to the large amount of building work now going on and contemplated in the suburbs. The corporation have submitted a scheme to the Local Government Board for the prevention of flooding to one of the low-lying districts of the town (comprising 80 acres of fully built upon land), which is occasionally flooded with tide water, the greater portion of the land being very little above the level of high-water ordinary spring tide.

Southend-on-Sea (Mr. ERNEST J. ELFORD, M.INST.C.E., borough engineer and surveyor).—The area of the borough has been increased by 2,500 acres as the result of the Borough Extension Act of last Session, and now includes the whole of the Urban District of Leigh-on-Sea, and part of the Rochford Rural District. In April, 1911, when the borough

becomes a county borough, the administrative work of the department will be further increased by the addition of the main roads and county buildings. The new main sewerage and sewage disposal works and refuse destructor, costing £171,000, will be in operation early in the present year. Other works now being constructed, which will be finished during the present year, are the Western Esplanade extensions and Marine Gardens (£67,000), reinforced concrete commercial pier (£11,000), sea-water swimming bath (£11,000), Southchurch Boulevard and tramway extensions (£24,000). Improvement works on the existing promenade pier, including extensions of the outer head, additional siding and track accommodation on the pier tramways, refreshment room, lavatories, and slipway for motor boats (total cost £18,500) have been commenced, and will be completed during the year. Other work under construction includes extensions to sea water slipper baths, lavatories, and concert stand at Pier Hill Buildings (£3,100), Sutton-road improvement (£3,300), Hadleigh-road and Southchurch-road improvement (£5,500), and surface-water intercepting sewers (£1,100). Shelters costing £7,000 will be erected on the sea front during the year. A town planning scheme for an area of 2,400 acres is in preparation. Other schemes in preparation include the laying out and drainage of the West Cliffs, recently purchased by the corporation at a cost of £25,000, road improvement and tramway track doubling in Leigh Broadway (£10,500), road improvement and doubling tramway track in High-street and Southchurch-road (£7,000), the provision of a new highways depot, including stables, motor sheds, workshops, and stores. Private street works will proceed as usual, and the expenditure for this purpose will probably be

about £35,000. Considerable lengths of highways will be resurfaced with tar-macadam or bituminous material at a cost probably exceeding £20,000. Works under consideration include a new pavilion at the sanatorium (£3,400), tuberculosis hospital, recreation ground for Leigh, extensions to the pier pavilion and pier entrance, and the provision of a winter garden. The erection of a new town hall and municipal buildings is also under consideration, and cannot be much longer delayed.

Southport (Mr. A. E. JACKSON, ASSOC.M.INST.C.E., borough engineer and surveyor).—The works for the sewerage of Ainsdale and Birkdale are in course of construction, and also the first section of the laying out of the gardens in Lord-street. Borrowing powers are being obtained for the construction of a bathing lake and bungalows on the shore, together with shelter and café; also for construction of a sports pavilion in the Victoria Park. The council are considering a scheme for the remodelling of the municipal buildings, and for the construction of new buildings on the market hall site. They have under their consideration schemes for the town planning of Birkdale and Ainsdale, for which they have received authority to prepare a scheme, and also other parts of the town. The existing building by-laws have been revised, and the new by-laws will come into operation next year.

South Shields (Mr. LESLIE ROSEVEARE, A.M.I.C.E., A.M.I.MECH.E., borough engineer and surveyor).—The works in hand include a foreshore main drainage scheme with ejector pumping station, the reconstruction of main brick and concrete sewers in the centre of the town; a £1,300 lavatory and shelter, terracing a portion of South Marine Park to give added seating accommodation for band performances; a new bowling green, and the extension of municipal buildings for a tuberculosis dispensary.

Schemes to be carried out in the present year include further development of the foreshore by properly laying out about 5 acres of the North Marine Park; new shelters; lighting the Sea-parade with arc lamps; further main sewer and road reconstructions under loan; large extension to the electricity station; and in connection with the construction of the second largest dock on the Tyne, a scheme of sewer road diversions. Proposals before the council to be commenced this year include a new fever hospital of about 130 beds; diversion of the Newcastle-road; a new main road to Jarrow including a bridge over the river Don; a scheme of town planning, and an extension of the borough boundaries. A proposal for a tunnel under the Tyne, between South and North Shields, is before Parliament this Session.

Southwold (Mr. JAMES S. HURST, borough surveyor and inspector of nuisances).—During the past year a good deal of tar-paving and tar-dressing to roads has been carried out with satisfactory results. A new groyne has been erected on the beach to the north of the town, and the sea defence in front of the Gun Hill has been recon-

structed in concrete. Early in the New Year the workmen's cottages now in course of erection will be completed. These are twelve in number, and are built in three blocks of four cottages to each block. The contract price was £2,150. Among the works projected are laying out of two small garden enclosures, the reconstruction of the North-parade, works of sea defence, improvements to the town greens, and extensive tar-spraying of roads. The council are also at the present time considering the question of improvements at the sewage disposal works, owing to complaints regarding aerial nuisance arising from time to time. The Southwold Golf Company, whose links are on land leased from the corporation, are carrying out extensive alterations with a view to still further increasing the popularity of their course, and the cricket club, who also are tenants of the corporation, are improving their ground, and laying down a bowling green.

Sowerby (Mr. JAMES EASTWOOD, ASSOC.M.INST.C.E., engineer and surveyor to the urban district council).—The following works are in contemplation here for this year in addition to the usual routine work: Completion of Wood Nook-lane and Gratrix-lane improvement; widening of Holmes-road at Mearclough; Beech-road improvement, and providing hand valves for the bacteria beds at the sewage works in place of the present automatic apparatus.

Stafford (Mr. WM. PLANT, ASSOC.M. INST.C.E., borough engineer and surveyor).—Sixty working-class dwellings now in course of erection will be completed early in the spring, and a further scheme for forty similar dwellings is now in course of preparation, and will be proceeded with shortly. The new Carnegie free library will be formally opened in February. A new 50-ft. road, nearly $\frac{1}{2}$ mile long, and raised 6 ft. above the surrounding ground, including a ferro-concrete bridge over the river Sow, and five ferro-concrete culverts, is now being constructed across the river valley, and will probably be completed during the year. An experimental plant for treating sewage on bacteriological lines is now being laid down, and a scheme is in course of preparation for treating the whole of the town sewage on this principle. The corporation are proceeding with the laying out of two estates to accommodate 750 houses. During the year the borough hall will be remodelled, and additional police accommodation will be provided at the Guildhall.

Stoke-on-Trent (Mr. A. BURTON, ASSOC.M. INST.C.E., F.S.I., borough surveyor).—The task of bringing into working order the administration of the federated area, which was formed in 1910 by the amalgamation of one county borough, three boroughs and two urban districts, has now become an accomplished fact. In addition to the ordinary maintenance of over 150 miles of roads, and the upkeep and repair of sewers, parks, cemeteries and other corporation properties, the corporation propose to carry out as many street improvement works as possible, and to make up a large number of private streets under the Private Street Works Act, 1892. Several important road paving works will be completed this year, and the council contemplate paving a further large area of main roads with granite setts on a concrete foundation. The construction of the Burslem storm-water drainage scheme, at a cost of £11,000, is being carried out departmentally, and during this year it is hoped that the greater portion of this work will be completed. Two town planning schemes are in progress under the Housing and Town Planning Act, 1909—one in the Burslem area, and the other in the Stoke area of the county borough. The borough surveyor has been instructed to prepare plan and estimate for the laying out of a park at Fenton, and a recreation ground in the Goldenhill district is under consideration. Building operations in connection with the provision of a public dispensary are well in hand, and alterations and additions are being considered in connection with the adaptation of the Stanfield hospital for sanatorium purposes. A police station is to be erected at Fenton, and alterations and additions to the police station at Burslem carried out. Another public convenience is to be erected at Hanley. The old town hall, Burslem, is to be reroofed, and alterations are contemplated in order to adapt this building for the purposes of a public library and district municipal offices. Provision is to be made for cold storage at the Hanley abattoirs, and it is proposed to erect a pavilion at Longton Park, a mortuary for the Stoke district, a new fire station at Hanley, new refuse destructor works for the Tunstall district, and carry out alterations to the Hanley Museum.

Stretford (Mr. ERNEST WORRALL, F.S.I., surveyor to the urban district council).—The extension of the town hall is nearing completion, following the opening of the adjacent new baths. The erection of a new reinforced concrete and masonry bridge and approaches 50 ft. wide over the Bridgewater Canal on the Chester (main) road is in hand, and should soon be completed. A new infants' school is being erected as an annexe to the Victoria Park schools, also a new mixed school in Trafford Park. The widening of Edge-lane—a thoroughfare to South Manchester—from 10 yds. to 18 yds. wide is in progress. In this road the forming of an elevated path behind to save a belt of mature trees has caused much favourable comment in the locality; and Manchester is acquiring powers in its pending Bill to extend the widening into the city. Seymour-grove, an arterial road at the Old Trafford end of the district, is also being widened from 16 yds. to 18 yds. The development in Longford Park of 70 acres, recently acquired, is in progress, and a portion of the hall is to be opened as a museum. The con-

struction of a storm-water sewer and channel, 1 mile long and 3 ft. to 5 ft. diameter, has been sanctioned by the Local Government Board, and will proceed forthwith; and a scheme for settling tanks of 1,000,000 gallons capacity, and a duplicate pumping set at the sewage farm is in preparation. The usual batch of private street works is scheduled and will be completed, besides several public streets repaving in granited rock asphalt. The council continues its pioneer work in the laying of this type of pavement. The lighting of the main roads by electricity is to be improved. The scheme under Part III. of the Housing of the Working Classes Act is to be completed by the erection of fifty additional cottages in semi-detached pairs on the acquired site. The continued growth in population and rateable value of the district involves a number of smaller items of improvement and increasing maintenance.

Suffolk (Mr. HENRY MILLER, M. INST.C.E., civil engineer and county surveyor).—The works to be executed in the present year include a new bridge over the river Waveney, jointly with Norfolk, near Haleston. The abutments will be in ferro-concrete. Considère system, with steel superstructure. The contractors for the abutments are Messrs. Malcolm Macleod & Co., and for the steelwork Messrs. Dawnay & Co. It is proposed to build some small houses for police constables in certain villages where suitable cottages are not available for the purpose. Plans for dispensaries for the treatment of tuberculosis are under consideration, also for the enlargement of certain schools.

Sudbury (Mr. WM. IRONSIDE TAIT, ASSOC.M. INST.C.E., P.A.S.I., borough and waterworks engineer).—The council propose during the current year to take out the existing steam plant and one pump at the waterworks pumping station, and to erect new suction-gas producers and engines, and new deep-well pump. A further length of Roemac road will be laid, and an increased area of tar-painting done during the summer. The question of building by-laws will also engage the attention of the council during 1914.

Sunderland (Mr. J. W. MONCUR, M. INST.C.E., F.I.S.E., borough engineer and surveyor).—The schemes that this corporation have in hand include the erection of a day training college and hostel for females; estimated cost, £30,000. Bede Collegiate School for Boys is to be erected upon a site that has recently been purchased on Low Barnes estate; the site and buildings are estimated to cost £25,000. Open-air salt-water baths are to be provided adjoining the new lower promenade at Roker from plans prepared by the borough engineer, estimated to cost £1,000. The Floral Hall, to seat 2,000, is to be built from plans prepared by the borough engineer; estimated cost, £4,000. Numerous street improvements will be carried out at an estimated cost of £7,000, and a scheme has been prepared for a new bridge, 90 ft. wide, to replace the existing bridge, 40 ft. wide, over the river Wear. The estimated cost is £120,000.

Sutton Coldfield (Mr. W. A. H. CLARRY, ASSOC.M. INST.C.E., borough engineer and surveyor). Tenders for a refuse destructor are now under consideration; this will be erected at an early date, and supply additional steam to the electricity central station. Plans are now in course of preparation for a boys' manual instruction school and girls' domestic service school, also for the extension of a girls' elementary school. A scheme for town planning 6,400 acres is being prepared, and will be submitted to the Local Government Board as soon as completed. Application is being made to the Road Board for a grant towards the cost of strengthening the foundations of the main roads, and it is hoped the work may be carried out during the year. It is also intended to carry out a number of widenings, rounding of corners, also sewerage and drainage work, besides the actual routine duties.

Sunbury-on-Thames (Mr. HAROLD F. COALES, ASSOC.M. INST.C.E., engineer and surveyor to the urban district council).—The new Shone ejector station,

erected at a cost of £1,650, will be completed early in the current year, and will prove a valuable addition to the sewerage system of Sunbury Common. The Metropolitan Water Board have obtained their Act of Parliament for power to construct a new conduit, filter beds, railway and incidental works; also giving power to the council to acquire land and execute widenings at Charlton, where a new reservoir is to be constructed. The widenings are to be proceeded with forthwith. The tar-painting of road surfaces will be greatly increased, and street watering proportionately reduced during the coming summer.

Sutton-in-Ashfield (Mr. WALTER BURN, ASSOC.M.INST.C.E., engineer and surveyor to the urban district council).—The concrete tube sewer contemplated last year is now in hand, and will be completed early in the present year. It is proposed to enlarge and improve the sewage disposal works, at an estimated cost of about £10,000. Application is being

made to the Local Government Board for sanction to borrow £2,895 for carrying out private street improvement works in twelve streets. The public convenience for both sexes will be completed early in the ensuing year. During the year it is proposed to build a new fire station (in respect of which a Local Government Board inquiry was held) and a new post-office. More road widenings and improvements will be carried out, and it is intended to make extended use of tar-macadam and tar-spraying.

Sutton, Surrey (Mr. W. HEDLEY GRIEVES, surveyor to the urban district council).—During the past year various classes of road construction were inspected by the foreign delegates of the Third International Road Congress. The various roads were again tar sprayed. Several road improvements have been effected, and two streets have been made up under the Private

Street Works Act. A new departure was made in these roads in the matter of planting shrubs instead of the usual method of planting trees at stated intervals. This has proved successful. The Sutton (Garden Suburb) is now in course of development, and about fifty houses have been constructed or are in course of construction. The widening of Rose Hill main road will be proceeded with, the sewer for this purpose having already been laid. The town planning scheme will be further proceeded with. During the year the new public park—the sanction of the Local Government Board for the purchase having been received—will be thrown open to the public. A new secondary school for boys will be erected, and probably a secondary school for girls. At the sewage works a new 100-ft. sprinkler, humus chamber, and effluent channel have been constructed, and during the ensuing year important extensions will be made at the low level works. Parliament has extended the time for the construction of the Sutton to Wimbledon railway, and it is hoped that it will be commenced during the year. The London, Brighton and South Coast Railway are reconstructing the bridge carrying the main road over the Epsom Downs line. The extension of the electrification of the Brighton Railway Company's line from London to Sutton is also in progress, and, generally speaking, this important residential district is looking forward to a year of progress. Already the idea of applying for a Charter of Incorporation is being discussed.

Swindon (Mr. H. J. HAMP, ASSOC.M.INST.C.E., borough surveyor).—A Bill will be before Parliament in the ensuing Session for powers to take over that portion of the derelict Wilts and Berks Canal within the borough, including Coate Reservoir. Powers are also being sought to make Swindon a county borough. The promotion of these will entail considerable work in the borough engineer's department during the year. The Whitworth-road cemetery will be completed in the spring, at a total cost of £4,500, which includes subsoil drainage, boundary walls and fences, chapel, roads and paths. Additional engineering laboratories are to be built at the technical schools, at an estimated cost of £4,550. New public conveniences at Whale Bridge and Gladstone-street are to be provided, and extensions made at the Broome sewage works. A new approach road, 40 ft. wide, is to be constructed to the Imperial Tobacco Company's new factory site, at a cost of £1,350. Several private streets

and about three dozen back roads will be made up during the year. A 15-in. sewer, from Graham-street to Stratton-road, is to be constructed, at an estimated cost of £600.

Tarporley (Mr. S. GREENWAY, A.S.L., surveyor, inspector and assistant overseer to the urban district council).—The council, during the coming year, propose to carry out improvements on the main roads, to Tarmac several lengths, and tar-spray 10 ft. wide in the centre of such roads, except on the steepest gradients. It is intended to strengthen and improve the district road through Eaton village, which is now being used considerably by motors instead of the Tarporley main road; also to round-off a dangerous corner on the Delamer-road, near Stable-lane farm, Utkinton. The cost of these improvements is estimated at £1,200. Applications have been made to the Road Board for contribution towards the cost of the work.

Taunton (Mr. DAVID EDWARDS, ASSOC.M.INST.C.E., borough surveyor).—The town council have recently completed twelve workmen's dwellings in the East Ward of the town, at a cost of £143 per house, inclusive of sewers, electric light, streets and fencing, to let at a rent of 4s. per week inclusive. It is expected that

additional houses of this class will be provided in other parts of the town during the present year. The borough surveyor has been instructed to prepare plans for the erection of slipper baths on a site at the electricity works. This scheme may be supplemented on corporation property adjoining it at any time the swimming bath is to be erected. The construction of an overflow weir 200 ft. long will be carried out on the river Tone in substitution of the present penstock.

Tenby (Mr. B. MORLEY, M.R.S.A.N.I., borough surveyor, and water and harbour engineer).—A scheme is now under preparation for the erection of fourteen working-class dwellings at Broadwell Hayes. The construction of the new sewerage outfall, including tank sewer, is now in hand, and it is hoped to complete this work

during the year; the cost is about £18,000. The water supply will also receive attention during the coming year, and the council are considering the question of constructing new filter-beds. The erection of more shelters and lavatories will also be considered.

Tenterden (Mr. W. L. C. TURNER, borough surveyor).

During the year tenders will be invited for constructing new sewers and outfall works, and the building of cottages. The Local Government Board have sanctioned the loan of £14,000 for the above. It is proposed to extend the tar-painting of roads.

Tenterden (Mr. W. L. C. TURNER, surveyor to the rural district council).—It is contemplated during the coming year to extend the sewers in one of the parishes in the district, and to construct outfall works for treating the sewage of same. The question of building cottages in many parishes will probably receive attention during the year.

The Maldens and Coombe (Mr. REGINALD H. JEFFES, ASSOC.M.INST.C.E., engineer and surveyor to the urban district council). The principal works upon which the council will be engaged will be considerable additions to the sewage disposal works, and the provision of a refuse destructor, both of

which projects have received the sanction of the Local Government Board. The additions to the council offices, comprising new council chamber and additional offices, now proceeding will be completed. The work of making up private streets will be continued. Further extensive sewerage operations are also contemplated. Application will be made to the Local Government Board for a loan for purchasing about 10 acres of land to be used for municipal allotments.

Thornton, Lancs (Mr. HENRY FENTON, engineer and surveyor to the urban district council).—The council, during the year, have applied to the Board of Trade for the necessary powers for the supplying of electrical energy in their district. Application is being considered by the Local Government Board for their sanction to borrow the sum of £6,000 for extensive additions to the council's gasworks, including the provision of

a new telescopic gasholder. It is proposed to make up, under the Public Health Act, a number of back streets, and also to tar-spray a considerable length of roads within the district. During the year the underground conveniences at Cleveleys for both sexes will be completed, and development is expected of several large building estates.

Tiverton (Mr. J. SIDDALLS, borough engineer).—The past year has been such a busy one that the present year will be chiefly occupied in finishing off various schemes of municipal enterprise already commenced. These include the construction of two concrete service reservoirs of 250,000 gallons and 70,000 gallons respectively, and other works of water supply, various improvements at the sewage works, and further progress with the first part of the municipal housing scheme. The complete scheme comprises 114 houses of three types—(a) containing parlour, large living-room, scullery, with three bedrooms, to cost £190 each, and let at 6s. 3d. per week; (b) large living-room, scullery and three bedrooms, £150 each, 5s. 3d. per week; (c) large living-room, scullery and two bedrooms, £120 each, 4s. 6d. per week, inclusive of rates in each case. The roads are 36 ft. wide, with 18-ft. carriageway, surfaced with tar-macadam, grass verge 4-ft., tar asphalt footpaths, 5 ft. wide. A new departure is to be made during the coming year by the council undertaking their own traction hauling of the stone for highways and the town refuse, for which purpose a 6-h.p. engine with four trucks is about to be purchased.

Todmorden (Mr. J. A. HEAR, borough surveyor and waterworks engineer).—The works projected during 1914 include the following: Completion of Burnley-road widening and granite paving; sewerage works; storm-water tanks; private street improvement works; bandstand; two bowling greens, and four shelters at the Centre Vale Park.

Tonbridge (Mr. FRANK HARRIS, engineer and surveyor to the rural district council).—The council will carry out schemes of lighting, heating and hot water supply for the wards and establishment blocks at Capel hospital. In connection with rural housing, schemes for the erection of cottages will be submitted for the following parishes: Brenchley, ten cottages; Hadlow, twenty-four; Hildenborough, four; Horsmonden, ten; and Pembury, sixteen. The building by-laws will be amended; the seven parishes now having the urban code will have the intermediate, and the four parishes now without by-laws will have the rural code. Hilden Park-road, Hildenborough, will be made up under the Private Street Works Acts. Schemes for improving dangerous corners are in preparation for submission to the Road Board. Water main and sewer extensions will be carried out in certain parishes. During the year about 200,000 yds. of surface tarring will be carried out, and about 5,000 cub. yds. of tarred rag macadam laid.

Torquay (Mr. H. A. GARRETT, ASSOC. M.INST.C.E., M.R.SAN.I., borough engineer, surveyor and harbour engineer).—In addition to the usual extension of sewers, new roads and paths, consequent on the natural growth of the borough, the chief works projected by the town council for 1914 are the construction of medical baths and a swimming bath, for which a tender has already been accepted in the sum of £14,942; an underground sanitary convenience at Castle-circus, at a probable cost of £2,000; alterations to the concert hall and shelters, and the erection of a new bandstand on the Princess Pier; the construction of a Marine-walk from the Bath saloons along the rocky face of the cliff to Meadfoot, a distance of about 1½ miles; and the construction of a cliff railway from the top of Babbacombe Downs to Oddicombe Beach, a length of about 600 ft., at a gradient of about 1 in 2½. An extensive scheme of street improvement in connection with a suggested sweeping away of the thickly populated area in the centre of the old part of Torquay, and a scheme for rehousing the people dispossessed is under discussion, and will probably take some definite form in 1914.

Tottington (Mr. LAWRENCE KENYON, surveyor and inspector to the urban district council).—During the year, in addition to the routine work, the sewerage of a portion of the district, and the remodelling of the sewage disposal works, will be commenced. The

scheme has been sanctioned by the Local Government Board, and the estimated cost is £21,000.

Tring (Mr. S. S. GETTINGS, ASSOC.M.INST.C.E., surveyor to the urban district council).—The chief work of the past year has been the making up of Longfield-road, including foul and surface water sewers, the paving costing £2,366, and the laying of sewers in Beaconsfield-road, Miswell-lane and Aylesbury-road costing £352. This work has recently been completed. In addition to the ordinary maintenance of main and other roads, Station-road has been strengthened and resurfaced throughout at a cost of about £1,100. A considerable quantity of tar-spraying has been executed departmentally during the past year, costing about £300, and the council have decided to allocate £400 to this work for the year 1914. Plans are now being prepared for a new sewer in Bunstrux-hill, and the work will be put in hand shortly. The Highway Committee have instructed the surveyor to include for tar-paving a considerable part of the Station-road and Park-road footpaths in the annual estimate, and also for the provision of kerbing and channelling for the New Mill district. The council have recently acquired a new tip for house refuse in the dry canal at Little Tring, and the necessary works of road making and fencing for the same is now in hand.

Tutbury (Mr. H. S. TEBBITT, M.I.M. AND CO.E., engineer and surveyor to the rural district council).—There are no large works projected in this district for the coming year. The dangerous corners are receiving the consideration of the council, and improvements in this direction will be carried out. A small extension of the sewerage scheme at Branstone, at a cost of £300, is contemplated.

Tyldesley with Shakerley (Mr. FRANCIS E. JONES, engineer and surveyor to the urban district council).—Sanction to a loan of £25,000 for a main outfall sewer and extensions to the sewage works has been granted, and it has been decided to carry this work out by administration. The provision of a new town hall, post-office, fire station, and stables is under consideration; a suitable site has been purchased, and plans are now in course of preparation. The council have in hand the conversion of 1,200 privies to water-closets. The further substitution of granite paving for macadam, and other paving will be carried out on the main and secondary roads, and a number of private streets will be made up.

Ulverston (Mr. C. TELFORD HAGUE, surveyor to the urban district council).—The council have under consideration two sewerage schemes. One for the town proper, includes the provision of two settling tanks to replace the existing obsolete tanks, two new storm-water tanks with overflow to adjacent stream, a relief sewer 15 in. diameter, and the replacing of the present 15 in. diameter outfall sewer to the tanks with a 21 in. diameter cast-iron pipe sewer. The total cost will be about £3,000. The other scheme consists of a pumping station and two storage tanks at the tidal outfall, which will make the sewers in that neighbourhood independent of the state of the tide. The cost of the scheme will be about £2,800. The Local Government Board have held an inquiry into an application of the council for sanction to borrow £2,890 for the purpose of widening and improving a portion of Priory-road. The council also propose to make up several streets under the Private Street Works Act. A committee has been working for some time in connection with a proposal to build a Coronation hall, part of the cost of which will be defrayed by public subscription. An inquiry has been held by the Local Government Board into an application by the council for sanction to borrow £3,000 to defray a portion of the cost of the building. The architects have prepared plans of the hall, and the total cost is estimated at £6,400 or thereabouts.

Upton-on-Severn (Mr. M. D. PRICE, surveyor to the rural district council).—It is anticipated that the sewerage and sewage disposal scheme carried out by Messrs. Law, of Kidderminster, at Kempsey, will be completed early in the year. House connections will follow. A similar remark will apply to the scheme for Powick, designed and carried out by the district surveyor. In the review last year it was reported that

Messrs. Willeox & Raikes had submitted their scheme for dealing with the sewage of Madresfield and Gnarlford, and that the council had adopted and presented it to the Local Government Board. Soon after the appearance of this report, Lord Beauchamp, the principal landowner of these parishes, instructed Messrs. Strachan & Weeks, engineers, London, to prepare an alternative scheme for dealing with the parishes separately. Their plans came before the council, with the result that the latter gave further instructions to Messrs. Willeox & Raikes to revert to one of the original schemes, which they presented to the council for consideration. The council then declined to adopt that piecemeal proposal, and resolved to approve of a comprehensive scheme on the grounds that they considered it undesirable and uneconomical to multiply sewage disposal areas. At the present time the council are reconsidering the whole matter. Upton-on-Severn Water Supply. The quantity tests of the yield from the borehole proved ample for the area proposed to be served. Application has been made to the Local Government Board for their sanction to a loan that will enable the council to complete the scheme. The board have promised an inquiry, and in doing so point out the fact that the loan now asked for, added to the existing debt of the contributory place, will be largely in excess of the borrowing powers of the parish. How to meet this difficulty was a subject discussed at the last meeting of the council held in 1913. The representatives of the parish of Upton-on-Severn appealed to the council to remove the difficulty by taking over the whole scheme and its financial responsibilities, and it was suggested that the council by doing so would then be in a position to supply the surrounding parishes with a wholesome supply, which was much needed. The council declined to adopt this course, so that the problem remains unsolved. The rates, at present, for the contributory place of Upton-on-Severn are within a small fraction of 10s. in the £. Housing of the Working Classes.—The council having adopted a scheme for building four cottages in the parish of Castlemorton, have applied to the board for sanction to a loan of £876. The inquiry has been held, and they are now waiting for the board's decision. Mr. T. W. Holds, architect and surveyor, Great Malvern, has been appointed the council's architect under the Housing and Town Planning Act.

Uttoxeter (Mr. JNO. B. HADFIELD, M.I.M. AND CO.E., surveyor to the urban district council).—During the past year several private streets have been made up, and are now being taken over by the council. New pumping plant has been provided at the waterworks. Alterations to the town hall are to be proceeded with, including the provision of additional dressing-rooms, emergency exits, heating apparatus, and improved ventilation. The auction ring in the Smithfield cattle market is to be roofed over, and additional conveniences provided for users of the market in inclement weather. A larger number of new buildings are now in course of construction than has been recorded at any one period for a long time past.

Ventnor, Isle of Wight (Mr. H. HUGHES OAKES, M.R.SAN.I., surveyor to the urban district council).—The year has been an extremely busy one for the Ventnor Urban District Council, and there is at the present time every possibility that 1914 will see many additional improvements. During the past year the new landing stage to the Royal Victoria Pier was constructed at a cost of over £6,000, and the Esplanade extended a considerable distance eastwards. This latter work has met with such hearty approval in the town that it is quite possible that the extension will be further proceeded with; in fact, the plans have already been before the council and approved, but the actual letting of the contract has been postponed. The council have recently advertised for tenders for the construction of a new groyne, and this will be commenced about April next. The type of groyne is different from those previously erected on the foreshore, and is being put down on the advice of the surveyor as an experiment, the cost being about one-third that of the old type. Should this prove the success anticipated, two further groynes will be constructed. The extension of the cemetery, which has been in hand for the past twelve months, will be further proceeded with, and it is hoped to finish the first section by about the middle of the year. Further lavatory accommodation will in all probability be provided, the surveyor having pre-

pared plans of several alternate schemes, and these will be considered at an early meeting of the council. Several minor road improvements have been suggested, also the extension of the tennis courts at the park, and it is more than likely that some of these will be carried out during the year under review. It is generally admitted on all hands that the last season was one of the best Ventnor has experienced for some considerable time, and the council are fully alive to the importance of keeping this well-known health and pleasure resort to the high standard for which it has always been noted. Extensive advertising is being done on the Continent, and it is confidently anticipated that the influx of foreign visitors into the town will be even greater than in previous years.

Wakefield (Mr. J. P. WAKEFORD, ASSOC. INST. C.E., city surveyor).

It is anticipated that the year 1914 will be an exceptionally busy one in the city of Wakefield. The widening of Wakefield Bridge, estimated to cost £25,000, is under consideration, while designs for thirty-six houses for the working classes are in the hands of the Local Government Board, and plans for a further seventy similar dwellings will be submitted as speedily as possible. A scheme for extensions and additions to the fever hospital is being prepared, and application will be made to the Local Government Board at an early date for the necessary borrowing powers for such work, which is estimated to cost £12,000. Application has been made to the Local Government Board in respect of the carrying out of a district drainage scheme for the western half of Sandal, an agreement having been entered into with the rural district council to treat the sewage of a portion of the adjacent parish of Crigglestone. The estimated cost of this work is £18,000. The repaving of several thoroughfares with granite setts will also be undertaken, a loan for this purpose, amounting to £14,000, having been sanctioned by the Local Government Board. The relaying of a portion of the sewer in Denby Dale-road will be carried out during the coming summer. The widening and improvement of Kirkgate, Castle-road, Sugar-lane, Barnsley-road, and Back Bond-street is contemplated, plans having been prepared, and in some cases negotiations entered into with the owners of the property required for the improvements. During the past year private street works have been carried out to the value of £1,300, and the council have given instructions for a number of other streets to be similarly dealt with. A scheme is in course of preparation for the demolition of an insanitary area in Westgate, known as Spawforth and Tidswell's yards, and the construction of a new street 40 ft. wide between Back-lane and Westgate. Alterations to the fire station are in hand in order to provide the necessary accommodation for the recently purchased motor fire engine. Instructions have been given for the provision of public conveniences in various parts of the centre of the city, and the building by-laws are in course of revision. The coupling up of the existing sewage disposal works at Agbrigg to the main outfall works at Calder Vale will be taken in hand, such work involving the construction of a syphon under the river Calder. The remodeling and extension of the sewage disposal works, which have been in progress for upwards of three years, was completed in October last. The works comprised the construction of 3½ acres of percolating filters, 6 ft. deep, upon which the distribution is effected by means of butt-jointed earthenware pipes laid upon the surface of the filters, and fed from dosing chambers fitted with automatic syphons, so that the liquid escapes from every joint of the pipes. Humus tanks, precipitating plant and buildings, storm-water tanks, and other appurtenant works have also been provided, the total expenditure amounting to £30,000.

Waltham (Mr. W. C. HOLLOWAY, ASSOC. INST. C.E.I., M.R.SAN.I., engineer and surveyor to the urban district council).—No works of any magnitude are contemplated during the year 1914. A loan will probably be raised for several road widenings on main roads, and the construction of slab footways. The mileage of tar-spraying will be considerably increased, and a further length of wood paving laid in the town. The strengthening of the

roads at High Beech to carry the motor-bus traffic to the centre of Epping Forest will be carried out, and the usual work of re-coating and maintaining the large mileage of roads will entail plenty of work. Several lengths of Tarvia A having been laid in the past two years, this material will again be used for grouting. A new code of by-laws of a less stringent character, enabling wooden buildings to be erected in the country area, is in course of preparation, and this should give a stimulus to the building of this class of house. The erection of a refuse destructor is in contemplation.

Wantage (Mr. JOHN W. HARRIS, engineer and surveyor to the rural district council).—In addition to ordinary routine work, the erection of four workmen's dwellings, together

with the extension of sewer, house drains and fencing in village of Harwell will be put in hand. A housing scheme for the erection of six workmen's dwellings in the village of Letcombe Regis is now before the Local Government Board with a view to sanction of a loan for carrying out the work. The council have under consideration a scheme for the extension of the sewerage and sewage disposal works in the parish of Harwell, at a cost of about £1,200, and have also under consideration a water supply scheme for the parish of Letcombe Regis.

Ware (Mr. H. FOX HILL, surveyor to the urban district council).—A scheme for the improvement of the pressure of the water supply in the higher parts of the district is contemplated. One of the Cornish boilers at the Musley Hill waterworks has recently been reset, and the resetting of the other boiler is contemplated. The widening of Star-street, the main road to Bishop's Stortford from Ware, will be carried out during the coming year. Plans for the same have been deposited with the Local Government Board, and a grant of £1,500 towards the cost of the works has been made by the Hertfordshire County Council. Two streets are to be made up under the Private Street Works Act. Further lengths of old cobble footway paving will be relaid with artificial stone paving, and there will be the usual road repairs and tarring of footpaths in the spring. Beyond this nothing is contemplated apart from the usual routine work.

Watford (Mr. D. WATERHOUSE, engineer and surveyor to the urban district council).—The principal work for the year will be in connection with a water scheme which is being carried out under Parliamentary powers, at an estimated cost of £114,000. The scheme comprises boreholes and wells, pumping station, softening works, a covered service reservoir of 2,000,000 gallons capacity, and 5 miles of 18-in. mains. Four 40-in. lined boreholes 350 ft. deep, and one 72-in. diameter well have been completed. The erection of the pumping machinery and the construction of the pumping station buildings and the softening works will be commenced during the year, and the work in connection with the service reservoir and mains will be put in hand. An electrically driven pumping plant of the Roturbo type to deal with the sewage of a portion of the Callow Land district is in course of construction, and will be completed with the buildings and tanks during the year. A comprehensive scheme of highway reconstruction, dealing with the main thoroughfares in the urban district, is being dealt with. The estimated cost of this work is £46,646. Several streets will be made up under the Private Street Works Act, 1892. The provision of public slipper baths, at an estimated cost of £2,100, is under consideration. Other works in hand include twenty-two working-class dwellings being erected under the council's housing scheme, at a cost of £4,000; the laying out and planting of the Waterfields Recreation Ground, and the construction of a pavilion and conveniences thereon; the provision of shelters on the Callow Land Recreation Ground; and the improvement of Watford Heath. The purchase of Cassiobridge Common has been completed, and the necessary protective works will be carried out. The council have made application for a large extension of their district in consequence of the development of the surrounding neighbourhood. It is anticipated that the new line of the Metropolitan Railway shortly to be constructed will cause a still more rapid growth of the town.

Wath-upon-Deerne (Mr. J. H. DREW, M.I.M. AND CO. E., M.R.SAN.E., engineer and surveyor and waterworks engineer to the urban district council).—The present

year will be an extremely busy one. The Local Government Board have approved a waterworks scheme estimated to cost £12,000, and 3 miles of 4-in. to 8-in. cast-iron and Mannesmann steel tube distributing mains have already been laid. Two covered service reservoirs having 624,000 gallons capacity will be constructed, together with 340 sup. yds. of new sand filters. After careful consideration it has been decided to abandon the air-lift system of raising water from the boreholes, and to instal a Hathorn, Davey & Co., Limited, high-class compound, surface condensing, differential waterworks pumping engine, with borehole and force pumps. After repayment of principal and interest on the loan borrowed for this plant, a saving of at least £350 per annum will accrue, in comparison with the cost of working the present system. When complete the waterworks undertaking will be easily capable of supplying 300,000 gallons per day, and there will be reservoir storage equal to three days' supply, or 900,000 gallons. The Local Government Board have held an inquiry into the council's application for a loan of £13,000 for sewage works extensions, which includes pumping machinery, screens, lime-mixing plant, gas engines, and suction gas plant, detritus chambers, precipitation tanks, percolating filters, humus tanks, shallow sand straining filters, and sludge drying beds. The main road will be further improved by strengthening foundations and surface covering with Tarmac, this being a continuance of the very satisfactory policy adopted during the past two summers. "Rocmac" has been tried where the gradients were not suitable for tar-macadam. Under pressure from the Local Government Board a committee will consider the necessity for a municipal housing scheme, and negotiations have been opened for the purchase of suitable sites. The greatest scheme proposed for the district is one of municipal tramways, conjointly with the urban councils of Wombwell, Bolton-on-Deerne, and Thurnscoe. This scheme is the outcome of the Wath Council's successful opposition to the Mexborough and Swinton Tramway Company's proposals to run railless cars in the district. Much interest was manifested in this Mexborough and Swinton Bill when before the Parliamentary Committee in June and July last, and the company only proposed to contribute at the rate of 3d. per car mile towards the cost of road maintenance, which would have been inadequate in proportion to the damage which would have resulted to the macadam roads. In addition to the tramways scheme an electric lighting order is being applied for to the Board of Trade. The estimated cost of the tramways is £151,891 (18 miles, 1 furlong, 69 chains), and electric lighting scheme £57,000. Considerable road improvement and widening schemes will be necessary before the tramways can be constructed along some of the routes. The engineer for the tramways and electric lighting schemes is Mr. Stephen Sellon, M.I.N.S.T.C.E., 36 Victoria-street, Westminster, S.W., and this gentleman is working in conjunction with the local surveyors in regard to highway improvements and details of construction.

Wednesbury (Mr. E. MARTIN SCOTT, borough engineer and surveyor).—Various private street works are contemplated, as well as important general street improvements. Main roads and other roads are to be treated with Tarvia grout. Considerable artificial stone flag pavement is to be substituted in place of blue bricks on footways. An important road diversion is also to be carried out. The housing question is also to have careful consideration. Improvements to existing open spaces will be proceeded with, consisting of tree planting and laying out convenient areas for athletic exercises. The new county Metallurgical Institute, now in course of completion in the borough, will be formally opened some time during the year. New public baths and enlarged municipal offices have recently been instituted and opened.

Wellingborough (Mr. E. Y. HARRISON, ASSOC. M.I.N.S.T.C.E., A.M.I.MUN.E., surveyor and water engineer to the urban district council).—Works projected during the coming year comprise several important street improvements, including widening of Cannon-street, Cambridge-street and Victoria-road. The properties are now in the hands of the council, and the pulling down and the neces-

sary street works are about to be undertaken. In the central space at the junction of the streets a partly underground public convenience is to be erected in a suitable enclosure. Workhouse-road is to be widened and a surface-water sewer laid throughout its length, the grammar school authorities receiving £75 for the land, and building a retaining wall along their frontage. Plans are before the Road Board for improvements of dangerous corners and the construction of a new road at Hobill's Mill, the latter application being a joint one with the rural district council. The Park-road storm-water scheme will be completed, and several lengths of foul-water sewers laid. The result of the new borings in the neighbourhood of Bushfields has been moderately successful, and a well is to be sunk from which it is expected that the available water at these works will be augmented by 300,000 gallons per week. Preliminary surveys are to be made in the immediate neighbourhood, and gaugings of the streams and springs in the valley are being taken with a view to estimating the yield of the area under consideration. The new bandstand, with enclosure and paving works, will be completed in Castle Fields early in the year, and the making up and levelling for bowling greens and tennis courts is proceeding. The new Wellingborough motor omnibus undertaking has proved a great success, and has been the means of linking up all the large towns and many of the villages with the town. It is proposed that a Central Boat and Shoe Institute for the county be erected in Wellingborough, it being generally considered the most accessible and convenient place for the students from all parts of Northamptonshire. The town generally is progressing favourably, the staple trades are flourishing, and building operations are not keeping pace with the increasing demand for new houses.

Wells-next-the-Sea (Mr. RICHARD G. COLES, A.R.S.T., M.I.MUN.E., surveyor and inspector, and port sanitary inspector to the urban district council).—The following works are contemplated during the present year—viz., culverting the Marsh Dyke, at a cost of £680; southern drainage scheme, £700; making up roads, at a cost of £300; a housing scheme under the Housing and Town Planning Act, 1909; the reconstruction of several insanitary areas; and the draining and paving of all the large public yards.

West Bromwich (Mr. ALBERT D. GREATOREX, M.INST.C.E., M.S.A., borough engineer and surveyor).—A Bill was successfully promoted in the last Session of Parliament, and powers obtained to carry out street improvements, and provide a service of trolley vehicles and motor omnibuses, among other works. Negotiations are nearly completed for the

purchase of the property in connection with these improvements, to cost £15,000, and these works will be commenced at an early date. The council have under consideration the provision of a trackless trolley vehicle service to two outlying districts, and it is expected that this scheme will be undertaken in the spring. Four acres of recreation grounds are being laid out, and the construction of new streets in connection with the Oakwood estate and several new sewers is proceeding. The new work contemplated for the coming year also includes two new schools, large extensions to sewage outfall works, reconstructing and strengthening several roads, the usual street widenings, and improving road surfaces. The council have under consideration the provision of a dispensary, alterations to hospital, and a town planning scheme. A fairly busy year is therefore to be expected.

West Hartlepool (Mr. NELSON F. DENNIS, M.INST.C.E., borough engineer).—The council has, during the past year, completed the erection of a new power station in connection with the utilisation of waste heat from the blast furnaces in the production of electrical energy, for, among other objects, the supply of current to the recently ac-

quired tramway system. The present generating station will be dismantled, and the new premises extended for car-shed accommodation. The extension of the Cameron Hospital, through the generosity of Alderman J. F. Wilson, J.P., from designs undertaken by the borough engineer, has also been completed, and there is in course of erection, emanating from the same designer, a large covered sea-water swimming bath of

reinforced-concrete construction near the foreshore, the munificent gift of Mr. Wm. Cresswell Gray, D.L. Plans have been approved for a new elementary school for Seaton Carew area of the borough. The two bowling greens laid down by the corporation are greatly appreciated, and have proved self-supporting upon the first year's working. Ornamental pavilions in reinforced concrete have been erected in connection therewith, the one at the Burn Valley Gardens being the gift of Alderman M. H. Horsley, J.P. There has also been erected at the Ward Jackson Park, of similar construction, a boathouse for the accommodation of the Model Yacht Club, and consideration is being given to the provision of a tennis pavilion in the same place. The municipal buildings are being extended to include a showroom for electrical appliances, and an extension is to be made at the public library in connection with the adoption of the "Open Access" system. The Stranton Garth is being laid out as an ornamental space, the same having been enclosed by a concrete wall surmounted with iron railings. The construction of a road across the Burn Valley Gardens, in extension of one previously formed, has been completed, and affords accommodation for all kinds of traffic from the west end of the borough proceeding southward, and there is now under consideration the construction of another road leading still further southward, to terminate at the Golden Flatts estate, near Seaton Carew Station, from whence traffic will have further access to the new road to Middlesbrough, which the council has so long urged. By the latter scheme, which has been commenced, the distance between the boroughs will be reduced by five miles. The other proposal for constructing a road from Horden to give access to West Hartlepool from the colliery districts northward has not received definitive sanction; but when both roads are completed, holding out scope for further developments, the aspect of the district will be very promising. Messrs. W. Gray & Co. have already acquired land on the Snooks for the establishment of a shipyard. The corporation are considering the question of extending the tramway system to the Snooks, also of town planning of a large area both within and without the borough boundary. The work of reconstructing the sewers in the older part of the town is in progress. The North-Eastern Railway Company have erected a footbridge over one of the level crossings, and are shortly entering upon the construction of a further bridge (length 800 ft.) for pedestrians over the main line level crossing. They are also effecting extensions to sidings and improvements to the dock accommodation to relieve the present congestion.

West Lancashire (Mr. R. ROWBOTHAM, surveyor to the rural district council).—It is intended to continue the tar-spraying of the more important secondary roads by direct labour; also to continue the conversion of grit setts to granite cubes, and the coating of secondary roads with tar-macadam. The rebuilding and widening of several bridges is also contemplated; also the acquisition of the necessary lands for widening out bends on the more important roads.

West Sussex (Mr. H. W. BOWEN, ASSOC.M.INST.C.E., county surveyor).—The programme of work contemplated in this county during the ensuing year will include extensive works of reconstruction and strengthening of foundations to weak roads and surfacing with tarred macadam, also grouting with pitch, Vianex, and other approved forms of up-to-date road-binding materials. In fact, the enormously increasing traffic over the whole of the county roads entails considerable additional work each successive year, and the question of reconstructing and maining certain of the heavily trafficked district roads in the county is now receiving careful consideration.

Whitley and Monkseaton (Mr. A. J. ROUSELL, ASSOC.M.INST.C.E., engineer and surveyor to the urban district council).—The following schemes will be carried out by the surveyor's department during the ensuing year—viz.: Completion of lower promenade and shelter, £4,000 (work now in hand); erection of thirty-eight cottages, with streets and sewers, at Hill Heads, £10,000 (commenced); enlargement of existing public conveniences and the provision of a new convenience for ladies; enlargement of main outfall sewers, for which plans are now being prepared (£14,000); a town planning scheme for the northern portion of the district, now under consideration; and the reconstruction of a further list of private streets, and various public improvements.

Widnes (Mr. JOHN S. SINCLAIR, ASSOC.M.INST.C.E., borough surveyor).—The town council have decided upon the provision of a refuse destructor at the depot, Moor-lane. Tenders have been invited, and are now under consideration for a three-cell back-feed destructor to be worked in combination with a tar-

macadam plant, stone breaker, and mortar mill. A bowling green, 45 yds. by 45 yds., is being laid out at Victoria Park, making three greens in this park. A recreation ground is to be laid out at Lower House-lane of a total area of 14.7 acres; the estimated cost of fencing and gates is £780. A further extension of the Victoria Promenade Gardens, fronting the river Mersey, and adjoining the Transporter Bridge, is contemplated, at an estimated cost of £750. The fencing and laying out of Pex Hill Common as a recreation ground adjoining the corporation reservoirs in the township of Cronton has been approved by the town council. The estimated cost of the work is £650. An extension to the borough accident hospital is to be proceeded with at an estimated cost of £1,500. The plans for the levelling and widening of Deacon-road, at an estimated cost of £4,400, towards which sum the county council contribute £1,500, has been approved by the Local Government Board. The substitution is contemplated of granite cube setts and tar-macadam for water-bound macadam on several of the roads used by the motor buses. The making up of several streets and passages under sec. 150 of the Public Health Act, 1875, is under consideration. Application has been made to the Local Government Board for the extension of the Netherly waterworks, at an estimated cost of £19,000. Mr. Isaac Carr, M.INST.C.E., gas and water engineer, is the engineer. During the past year the corporation's Transporter Bridge of 1,000 ft. span, connecting the towns of Widnes and Runcorn, and thus the counties of Lancashire and Cheshire, and forming the only roadway crossing over the Mersey between its mouth and Warrington, has been thoroughly overhauled and the method of working altered. In place of the direct-driven overhead carriage, which carried its own motors, a wire rope haulage system, of the main and tail rope type, has been adopted. The winch, electrically driven by two 40-horse power motors, either of which is capable of doing the work, and having two-speed gear, has been installed on a steel platform spanning the approach road on the Widnes side of the river. A new top carriage, little more than half the weight of the old one, has been erected, and from it the old car or travelling platform, considerably lightened, is suspended. The dead travelling load has been thus reduced by some 30 per cent, while the carrying capacity has not been in any way interfered with. The control is, as before, carried out from the car, the winch motors being started and stopped, reversed, and brakes applied by the movement of a handle in the driver's cabin. It is hoped that the results of these modifications will be greater economy in working and a more certain and reliable service to the pedestrian, horse, and motoring public of the district. The bridge was closed to the public from September 16 to December 8, 1913, and the reopening was performed by the Right Hon. Sir John Brunner, B.L. The work has been carried out to the designs of Mr. Basil Mott, M.INST.C.E., of Westminster, and his assistant, Mr. Robert Anderson, M.INST.C.E., by Messrs. Sir William Arrol & Co., Limited, of Glasgow, and at a cost of about £10,000.

Wigan (Mr. A. T. GOOSEMAN, borough engineer and surveyor).—The following work has been carried out during the past six months: The widening of a bridge 50 ft. span with steel girders, carrying Darlington-street over the river Douglas; alterations and additions to the market hall; alterations to underground conveniences; conversion of house into dispensary under the Insurance Act; alterations and additions to the pavilion in Mesnes Park; and the construction of roads of wood, granite, grit setts, and tar-macadam. Alterations and additions to Pemberton Hospital are now being carried out. The most important work to be commenced during the present year will be the sewage disposal scheme. The town council have this month sanctioned the borrowing of £50,638 for this work, which includes the laying of concrete pipe sewers, altering the existing screen chamber, and fitting the same with detritus elevator and sewage screen-raking apparatus, the building of preliminary settling tanks, and the construction of bacteria beds

for twenty-eight revolving sprinklers, each 80 ft. diameter, and ten of 33 ft. diameter. The average depth of the media will be 6 ft. The scheme also includes the building of two humus tanks with conical bottoms, altering and retraining the existing sludge beds, and providing new sludge beds. The sewage disposal works are situated 7½ miles from Wigan, and the storm water, from three to six times the dry-weather flow, will be treated at the Wigan end. It will be pumped from a suction well with three Rees Roturbo patent pressure chamber pumps, worked by electricity. The sewage will be pumped through a 24-in. rising main into four storm-water tanks, each 150 ft. by 40 ft., with an average depth of 6 ft., and a total capacity of 900,000 gallons. The storm-water tanks will be carried on a reinforced raft to assist in equal settlement in case subsidence should take place from mining operations. Other works to be carried out include a storm-water scheme for the Miry-lane district. The erection of a refuse destructor is being considered, and a large scheme for the conversion of pails and privies to the water carriage system. Sanction has been received from the Local Government Board for the reconstruction of the carriageway of Poolstock with granite setts at a cost of £2,973. The swimming baths will probably be extended. A large number of public and private street works will be carried out.

Winchester (Mr. WALTER V. ANDERSON, ASSOC.M.INST.C.E., city engineer and surveyor).—A site comprising 20 acres for a new cemetery was purchased last year, and is now in course of laying out. A lodge and offices are being erected. A contract for extensive alterations and additions to the Guildhall, public reading-room, and school of art buildings has been entered into. The work has been commenced and will be completed this year. A scheme for the erection of public baths has been approved by the council, and the working drawings are being prepared. After sanction to the loan has been given by the Local Government Board, tenders will be invited, and the work carried out during the present year. Designs for additions to the open swimming baths are being prepared. Additional shelters and other improvements at the new recreation ground will be carried out. The fencing and levelling of a site for a general depot is in hand. A Local Government Board inquiry has recently been held with reference to the purchase of the corn exchange and market place from a private company. A scheme has been prepared for paving with wood blocks a portion of the main Southampton-road.

Wokingham, Berks (Mr. C. W. MARKS, M.I.M. AND O.E., M.R.S.A.N.E., borough engineer and surveyor).—The council are applying for a Provisional Order to obtain powers for the purpose of extending the gasworks. Further improvements to main roads are in hand, and will probably be carried out during the year. The additional ejector station and compressing plant will be completed, and the extension of the sewers for the south-east portion of the borough, and the making up of a number of private streets under the Act of 1892, for which the sanction of the Local Government Board has been obtained, will be carried out. Further extensions of the contact beds at the sewage works will be executed during the coming year.

Wolverhampton (Mr. GEORGE GREEN, M.INST.C.E., borough engineer and surveyor).—The principal works contemplated include the widening and reconstruction of a narrow portion of Cannock-road, over the canal, which will necessitate the construction of a new bridge, at an estimated cost of £1,270. It is intended to demolish certain property in North-street, between Molineux Hotel and Wadham's Hill, enabling the setting back of the footway to be carried out, and the widening of the roadway at a point where the thoroughfare is congested and dangerous. The council have also purchased other properties and land in Dudley-road, Great Brickkiln-street, and Stubbs-road, for the purpose of improving these thoroughfares. The abolition of the pan system and the substitution of the water-carriage system will, it is expected, be an accomplished fact during 1914, if not over the whole of the borough in a great number of houses which at the present time have the pan system. Negotiations are in progress for the opening up of two estates under the Town Planning Act, besides which consideration will be

given to a scheme which the borough engineer is preparing for the erection of a ladies' swimming bath. In a borough such as Wolverhampton there are always improvements to streets and public buildings which cannot be ascertained at the commencement of the year, and it is safe to say that this borough will not be behind other years in considering and dealing with schemes in this direction other than those already enumerated which may come before the council from time to time during the year.

Wood Green (Mr. C. HOWES CROXFORD, engineer and surveyor to the urban district council).—The present year promises to be one of considerable activity, and several works of importance will be projected. The council will have under early consideration much-needed additions to the existing public baths, the provision of a pavilion at the White Hart-lane recreation ground, the provision of a new elementary school, and the construction of a new underground convenience. In addition to the above, further sections of Muswell Stream will probably be dealt with, the widening of Wolves-lane proceeded with, and additional private street works carried out. The council will also have under consideration the revision of their present by-laws. The general work of maintenance of high-ways and sewers will probably remain normal, with the exception that a further large amount of tar-spraying is likely to be done. The council are considering the question of town planning, and no doubt early applications will be made to the Local Government Board for permission to prepare a scheme. The new fire brigade station is nearing completion, and will shortly be opened.

Worcestershire (Mr. C. F. GETTINGS, county surveyor).—In the early part of 1913 a scheme for the reconstruction of some 53½ miles of main trunk roads, at an estimated cost of £127,000, was approved by the county council, and the work was commenced in April. It was proposed to spread the work over a period of five years, but in consequence of the motor traffic increasing so rapidly during the past twelve months, it will be necessary to complete the work in less time. The work chiefly consists of widening, strengthening and surfacing with bituminous-bound material, together with a considerable amount of surface-water drainage. The council also propose to tar-paint some 80 miles of roads during the ensuing season. The whole of the foregoing works will be carried out by direct administration. In addition to these special works it is anticipated that the ordinary maintenance estimates will be considerably increased. The county surveyor has received instructions to prepare alternative schemes for providing a bridge across the Avon near Evesham, and it is anticipated the cost will be at least £15,000. Considerable sums will also be spent on strengthening and improving various existing bridges in the county.

Worthing (Mr. FRANK ROBERTS, ASSOC. M.INST.C.E., borough engineer and surveyor).—The works in hand and projected by the corporation include the following: Surface-water drainage scheme, £4,000; additions to pumping station, pumps and new outfall, £8,000; winter garden, £20,000; and also extension of street widenings.

Wrexham (Mr. JOHN ENGLAND, borough engineer and surveyor).—During the year it is expected that the concreting of the remaining portion of the river bed will be completed, at a cost of £800, the portion completed having proved very satisfactory from a sanitary point of view. The laying out of the Parcian is being proceeded with, the children's playground, shelter, bowling pavilion, lavatories and stores being near completion, while the two bowling greens will be opened in the spring. Application has been made for permission to town plan 823 acres of the borough, and the usual inquiry has just been held. Several streets will be constructed under the Private Street Works Act, 1892, and an important section of the 18-in. storm-water drainage carried out. It is expected that a housing scheme will be commenced shortly owing to the local authority having been called upon to immediately provide thirty cottages.

Yorkshire, East Riding (Mr. ALFRED BEAUMONT, county surveyor and bridgemaister).—In addition to the ordinary direct maintenance of main roads and the

application of bituminous binders, the council are completing a steel drawbridge over the river Hull, at a cost of £10,000. Plans for another opening bridge, with 200-ft. span, are in course of preparation. A new divisional police station and court house is on the point of completion, and the alteration and improvement of other stations are in hand. The building of houses for the accommodation of roadmen, policemen and other officials is under consideration.

Yorkshire, West Riding (Mr. F. G. CARPENTER, county surveyor).—The county council have approved of an estimated expenditure of £245,380 in respect of the maintenance and repair of the main roads in the Riding. Among the special improvements to be carried out are: Surface tarring of main roads, £20,000; extensive road widenings in the Rotherham rural district, £9,350; and Early urban district, £5,200; reconstruction of Cottingham Bridge, £4,650; Carlton Bridge, £16,200; High Bridge, £6,900; Leppings Bridge, £7,080; Stock Bridge, £14,700; and Silsden Canal Bridge, £2,500.

THE WATERPROOFING OF CEMENT.

Messrs. Kerner-Greenwood & Co., the manufacturers of "Pudlo," have sent us a very interesting book, which deals with many points of interest to surveyors. We notice the firm claim that a concrete reservoir or bath can be perfectly waterproofed with a rendering composed of 3 and 1, with the addition of a very small percentage of their powder, if the work is done on the green concrete. They state that the cost only works out at about 1s. 3d. per super-yard for this class of work, though if the tanks are small the lining may be reduced in thickness, thus lowering the cost for Pudlo.

As our readers well know, a neat cement rendering is extremely liable to crack and craze, and it is rather expensive, and some surveyors have given dense concrete receptacles a very thin rendering, almost a skimming, of cement and Pudlo composed of 2 of sand, 1 of cement, and 5 per cent of Pudlo calculated to the cement.

Another important use which the book mentions Pudlo can be put to is the jointing of sanitary drain pipes. We have before us a very interesting table showing the comparative cost of jointing a drain pipe with neat cement, as against jointing a drain pipe with a Pudloed cement mixture of 3 parts of sand to 1 part of cement and 2 per cent of Pudlo. The saving on 400 lb. of weight amounted to 2s. 4d. in favour of the Pudloed cement joint, after paying for the Pudlo. The cement was calculated at 36s. per ton. It is obvious that if the cement to-day costs more, more money would be saved on the Pudloed proportions, for the simple reason that there would be less cement in the mixture than if a non-Pudloed mixture were used.

In addition to these two important uses, we see that tanks, manhole linings, and sewers can be rendered waterproof satisfactorily with this material.

Messrs. Kerner-Greenwood in their pamphlets make a very great point of the tests which they have had carried out by Messrs. Faija, Messrs. Kirkaldy, and the University College at Cork. We have seen copies of the results of these tests, and all go to show that an increase in tensile and compression strengths are shown for those cubes in which Pudlo is included. The gain is certainly satisfactory from the makers' point of view, and this proof that Pudlo does not adversely affect cement may induce those who have previously avoided a waterproofer to try its efficacy.

Road Construction and Surface Treatment.—Messrs. H. V. Smith & Co., Limited, of 20 Victoria-street, Westminster, S.W., are prepared to give quotations for, or information with regard to, the construction of roads with Trinidad asphalt macadam or surface treatment with Tarvia, Tareo, refined tar, or any other compound. We understand the company have laid Trinidad asphalt macadam roads in many districts, including Chelsea, Islington, St. Pancras, Hackney, Hornsey, Waltham-stow and Woodford. They have also carried out tar-spraying contracts in a very large number of districts throughout England and Wales, and it speaks well for the efficiency in which the work is carried out that some of the councils have entrusted their tar-spraying work to Messrs. H. V. Smith & Co. for four and five years in succession.

UNITED STATES STEEL SHEET PILING.

Shortly described, this is a simple, plain, rolled section ready for use as it comes from the mill. Each piece is complete in itself, and all pieces of the same width are interchangeable. The strength of the section is uniform throughout, and each pile of the same

TEST PILES AT NEWPORT, MON.

weight per foot is as strong as any other. In its profile, the makers state, it incorporates the advantages of the ball and socket joint, with sufficient clearance in the interlock for ease of driving and sufficient space for the use of a packing substance between its adjacent edges to insure watertightness. The section

cofferdams, and so forth, such flexible joints allow distances to be gained or lost by longitudinal displacement in the joints themselves, or by slight deflections from line. They are also an aid in bringing the piling back to its vertical alignment in either direction after a departure from it caused by meeting obstructions or careless driving. The clearance in the interlock between the ball and the socket is such as to insure ease in driving and pulling, but at the same time this clearance has been kept down to the minimum so as to make the section as nearly watertight as possible.

Tests under identical conditions and experience in use have proved the ease with which United States steel sheet piling is driven and pulled. The reason for this is believed to be the absence of a leading groove, combined with the line contact obtained in the joints.

United States steel sheet piling is furnished in the following sizes and weights—namely, 12½ in. by 33 lb.; 9 in. by 16 lb. The 12½ in. section cannot drive less than 12½ in.; it may drive 13½ in., and will average about 13½ in.; 91 pieces should drive 100 ft. of wall. The 9 in. section cannot drive less than 9 in.; it may drive to 9½ in., and will average about 9½ in.; 130 pieces should drive 100 ft.

It is pointed out to us that a further distinctive feature of United States steel sheet piling is the fact that while it is rolled as nearly watertight as other rolled types of piling, provision is made in the interlock for insuring more perfect watertightness in quite a simple way, and in a way which does not depend for its success upon absolute accuracy in the process of manufacture. In clear water the piling may be made watertight with wooden packing strips which are assembled with the sections of the piling before driving. These packing strips swell in contact with the water, close the joints, and effectually prevent leakage. Experience with them has demonstrated that they in no way interfere with the driving of the piling, as they act rather as a lubricant.

These packing strips may be half round or rectangular in form, the latter being the better, for the reason that contact is made with the inner surface of the interlock by lines rather than by surfaces, and the friction of driving is also smaller. Packing strips for 12½ in. by 33 lb. piling may be 1½ in. half round, or 1½ in. by ¾ in. They need not be ordered to any specified length, but may be used in random or ordinary stock lengths, pieces being inserted on top of each other until the desired space is filled. Packing strips for 9-in. piling may be made of shingling laths. The size of packing strips should be verified for each

TRENCH IN COURSE OF CONSTRUCTION, NEWPORT, MON.

has been designed on a scientific basis; contact between the head and the socket is made by lines and not by surfaces, so that wedging action is prevented and the maximum strength is secured to resist forces in both lateral and longitudinal directions.

The joints are flexible, and permit the entrance of silt and clay into the interlock to aid in securing watertightness. They permit also the easy passing of boulders, old logs, and other obstructions encountered in driving, and the construction of circular or irregularly shaped pockets without the use of specially bent or fabricated pieces. In making closures for pockets,

lot of material used so as to conform to unavoidable irregularities in rolling and jaw openings. They should be of very dry, tough wood, preferably spruce, or wood with similar grain that will swell readily to a much larger volume when water-soaked.

The example illustrated recalls the collapse of the west wing wall trench of the New Dock at Newport, Mon. Running sand caused the disaster, and to insure the safety of subsequent operations steel sheet piling was used. Before deciding what section to employ, the contractors, Messrs. Easton, Gibb & Son, tested samples of three different makes. The result

was an order for United States steel sheet piling. The first view is indicative of the success which attended the driving of the three test piles. The second shows the trench in course of construction, the third and fourth show the trench after the piles had been driven to their full depth.

A treatise on the properties and uses of United States steel sheet piling, issued by the makers, will be found most useful to engineers and contractors for reference purposes. Applications for copies of this

ROAD MAINTENANCE IN CORNWALL.

Mr. A. E. Brookes, county surveyor of Cornwall, in his report to the Cornwall Main Roads Committee, expresses regret that, after very careful consideration of the present condition and requirements of the roads, he had no alternative but again to recommend increased expenditure, amounting for maintenance only to £2,538 in the eastern division and £953 in the western in excess of last year's estimates. The total estimates totalled £28,341, as against £25,802 for the previous year, in the eastern division, and £26,365, against £25,412 in the western division. Added to this would be an estimated expenditure on the general account of £2,000; sanctioned works and improvements, £50; directing posts, £2,800; county bridges, £3,962; Development and Road Improvement Funds Act, 1909, county contribution, making a grand total of over £63,500, as against £56,750.

In recommending the extension of tar surface treatment, Mr. Brookes says he is of opinion

work, together with complete information, should be addressed to the United States Steel Products Co., 36-38 New Broad-street, London, E.C.

Flashlights on Roads.

—A Scottish reader asks for the name and address of the firm interested in the "Aga" flashlight, which, as stated in our issue of last week (p. 127), has been installed at Ruxley-corner, Sidecup, as a warning to night motorists to proceed cautiously. From the description we gave of the lamp our correspondent thinks the idea "sounds excellent." We suggest that he should communicate with the Gas Accumulator Company, 2 Norfolk-street, Strand, W.C.

Spokane's Great Apple Road.—Good roads have been given much attention in the country round Spokane, the second largest city in the State of Washington (says the *Times* "Pacific Coast Number"). A notable piece of road building is called the Great Apple Way—a smooth piece of gravel-bound macadam highway running east from Spokane to the Idaho State line, a distance of 18 miles. Ultimately the road will be extended through Idaho, and its sides planted with apple trees. Spokane's street improvements have kept pace with the expansion of the city, which has an area of 39½ square miles, there being 63 miles of paved streets, 386.2 miles of graded streets, 142 miles of sewers, 127.5 miles of gas mains, and 369 miles of water mains. The water supply of the city is drawn from an underground flow reached by deep wells 4 miles east of the business district.

STEEL SHEET PILING AT NEWPORT DRIVEN TO FULL DEPTH.

that this, provided it is properly carried out, not only protects the road from injury by wet, but helps to increase the life of the surface stone. The county surveyor adds: "I have, following the same course as last year, recommended the allocation of the whole of the proposed grant to strengthening roads, making up low quarters, and widening carriageways, after providing for tar surface treatment, and a tentative allocation of three sums for improvements in urban districts. While admitting the desirability of providing a more durable road surface than that of the ordinary water-bound macadam, such as tar, asphalt, or other bituminous macadam, I am strongly of opinion that until we have got through more of the work of strengthening these roads, which, due to their weakness, are being most seriously affected by heavy traffic, it is the best economy to devote all available funds to that class of work, finishing the surface with the water-bound macadam."

The Legal Precedents of 1913 in Relation to Municipal Engineering.

By J. B. REIGNIER CONDER, a Solicitor of the Supreme Court.

By far the greater number of the decisions which we have to note relate, as will be seen, to highway matters, comprising questions of dedication, fencing, repair and control, obstruction, extraordinary traffic, private street works, and accident cases. Next in point of numbers come cases connected with the important subject of water supply. The remaining decisions deal with points relating to buildings, contracts, officers of local authorities, the seashore, sewers, drains, and sewage disposal. There are eight decisions of the House of Lords, fifteen of the Court of Appeal, twelve of the Divisional Court, ten of Chancery Judges, eight of King's Bench Judges, two of County Courts, one of the Railway and Canal Commission, and one of the Irish Divisional Court.

Among the statutes which have received elucidation are the Harbours Act, 1814 (sec. 21); the Highway Act, 1835 (sec. 23); the Waterworks Clauses Acts, 1847 (secs. 6, 28 and 53) and 1863; the Telegraph Act, 1863 (sec. 12); the Public Health Act, 1875 (secs. 112, 150, 155); the Water Companies (Regulation of Powers) Act, 1887 (sec. 4); the Public Health (Buildings in Streets) Act, 1888; the Public Health (Ireland) Acts Amendment Act, 1890 (sec. 19); the Private Street Works Act, 1892; the Burgh Police (Scotland) Acts, 1892 to 1903; the London Building Act, 1894 (secs. 22 and 31); the Local Government Act, 1894 (sec. 26); the Public Health Acts (Amendment) Act, 1907 (secs. 30, 31 and 51); the Metropolitan Water Board (Charges) Act, 1907 (sec. 25); and the Housing and Town Planning Act, 1909.

Among the localities affected may be mentioned Above Derwent, Andover, Ayr, Bolton, Bristol, Bishop Auckland, Chorley, Colchester, Croydon, Edinburgh, Folkestone, Finchley, Great Crosby, Heaton Norris, Hollywood, Hendon, Ledbury, Lye and Wollescote, Morpeth, Manchester, Nenagh, Nuneaton, Paignton, Rhyl, Spitalfields, Southampton, Swansea, Sharpness, Sidmouth, Sunderland, Tenby, Watford, Walton-on-Thames, and Windlesham.

Buildings.

The first three cases to be noted have reference to the subject of building lines.

In *Sunderland Corporation v. Charlton* (77 J.P., 126) the owner and occupier of a house within the district of the corporation, without their consent, placed in front of the entrance door a porch on wheels, constructed of wood and glass, with a felt roof, and projecting 6 ft. 6 in. beyond the front main wall of the house. The corporation summoned him for contravening sec. 3 of the Public Health (Buildings in Streets) Act, 1888, but the magistrates dismissed the summons on the ground that the porch did not constitute an addition to the house. It was held by the Divisional Court that in so deciding the magistrates had not gone wrong in law, and that therefore their decision must stand.

In *Attorney-General v. Parish* (vol. xliii., p. 604) a plan was signed by the chairman of the Lye and Wollescote Urban District Council, showing a building line passing through the site of a house about to be taken down and rebuilt. Mr. Justice Joyce was of opinion that this was not a sufficient prescription of a building line under sec. 155 of the Public Health Act, 1875; and that in any case compensation should have been paid or tendered to the owner before he began to rebuild. He refused to make an order for the pulling down of a new building erected by the defendant in front of such building line. This decision, however, was reversed by the Court of Appeal (vol. xlv., p. 113), who held that the signed plan was a sufficient prescription of the building line, and that there is nothing in the section requiring the tender or payment of compensation to be made at any particular time. A mandatory injunction was therefore granted for the pulling down of the new house.

It will be remembered that sec. 22 of the London Building Act, 1894, prohibits the erection of buildings beyond the general line of buildings in a street without the consent of the London County Council. Sec. 31 of the Act, however, provides that nothing in the earlier section shall affect the exercise of any powers

conferred upon any railway company by any special Act for railway purposes. The Metropolitan Railway Company's special Act incorporates the Railways Clauses Act, 1845, by sec. 16 of which the company may erect and construct such buildings and other works and conveniences as they may think proper. In *Metropolitan Railway Company v. London County Council* (1913, 2 K.B., 249), it was held that the company were entitled to erect an accumulator shed, for use in connection with electric signalling, in front of the general line of buildings, without the consent of the council.

Another interesting decision under the same Act is that of the House of Lords in *Barry v. Minturn* (vol. xlv., p. 370)—viz., that where differences arise between adjoining owners (in the metropolitan district) as to proposed works to a party wall, and there is an appeal to the County Court from the award made by surveyors under the Act, the County Court Judge cannot take into account the past history of the wall, but must have regard solely to its existing condition.

Questions are constantly arising as to whether a particular structure is a "building" within the meaning of by-laws. In *James v. Tudor* (77 J.P., 130) the defendant occupied two vans as a dwelling-house for three years. He then removed them, and after building a low wall, replaced them, partly on the wall and partly on wooden blocks (making a mortar joint), built a chimney stack into the side of one of them, and again occupied them as a dwelling-house. It was held that there was evidence that he had erected a building, and that the vans constituted a dwelling-house.

Building Contract.

A most important decision for builders and architects, and also for dealers in building materials, is that in *Ramsden & Carr v. Chessum & Sons* (vol. xlv., p. 771; 58 Solicitors' Journal, 66). By instructions of the architect of a cinematograph palace in Oxford-street, which the defendants were erecting for the London Cinematograph Company (1909), Limited, the plaintiffs supplied certain door fittings, which were used by the defendants in the building in accordance with the terms of their contract. It was held by the House of Lords (overruling the Court of Appeal) that the defendants were liable to the plaintiffs for the price of the fittings.

Contract with Local Authority.

The question of the liability of a local authority to pay for work done in spite of the absence of a sealed contract has frequently arisen. In *Douglass v. Rhyl Urban District Council* (vol. xlv., p. 66), the plaintiff, an engineer, was appointed by resolution of the council to make a valuation of Rhyl Pier, and estimates of the cost of repairing and widening it, upon the terms of a letter from him to the council. The scheme for which the valuation and estimates were prepared was not proceeded with. It was held that the plaintiff was entitled to recover his fees from the council, notwithstanding the absence of a contract under seal.

Highways and Bridges.

(a) ACCIDENTS.

In *Huntrod v. Above Derwent Parish Council* (vol. xliii., p. 256), the plaintiff sustained injuries when crossing a stile erected by the parish council on a public foot-path in 1908, a step of the stile having given way when he trod on it. The learned Judge of the Keswick County Court held that the council were not liable, there being no evidence either of any want of care in the original construction of the stile, or that the fact of its being out of repair had been brought to the notice of the council.

In *Newcombe and Another v. Croydon Rural District Council and Yewen* (vol. xliii., pp. 370, 388), the plaintiffs were respectively the widow and daughter of a commercial traveller who was killed by falling into an unprotected trench left in a highway by the council's contractor. The jury awarded the plaintiffs £1,000 and £200 damages respectively. The contractor was

bound by his contract to indemnify the council against loss or damage arising by reason of accidents to third parties; but it was contended, on his behalf, that this stipulation was void as being contrary to public policy. Mr. Justice Darling, however, did not accept this view, and made a declaration that the council were entitled to the indemnity, and that it included the costs of the action.

In this case, it will be observed, the council did not deny their liability to the plaintiff, but merely sought to enforce the contractor's indemnity; but in the case of *Thurlstone v. London Electric Railway and Another* (29 T.L.R., 514) the company attempted to shift their responsibility on to a contractor, who was employed by them to build a superstructure over a railway station adjoining a public street. During the progress of the works the plaintiff, while walking along the street, was injured by falling timber. The jury found that the accident was caused by negligence, there being no sufficient protection to the public. It was held by Mr. Justice Scrutton that there was a duty on the company to safeguard the public during the building operations on their premises, and that they did not fulfil that duty by delegating it to an independent contractor. Judgment was given against both the company and the contractor.

(b) DEDICATION.

In *Brockman v. Folkestone Corporation* (76 J.P., 443) it was held by the Court of Appeal that a certain road laid out in 1827 by the then Earl of Radnor was a highway repairable by the inhabitants at large. The road was used principally as a means of access to houses erected on building plots leased by the Earl, but it had been used by the public to some extent from 1831, tolls being levied for horses and vehicles (but not for foot passengers), and notices being fixed prohibiting the passage of motor cars, cattle and sheep, and describing it as a "private road." Since 1836 it was kept in repair by the Earl or his lessees, and it had never been repaired by the local authority, and had never been formally dedicated under sec. 23 of the Highway Act, 1835. Nevertheless, the majority of the Court were of the opinion that there was sufficient evidence of the user of the road as a highway prior to 1836 to justify the conclusion that there had been a dedication by Lord Radnor, and that he had acquiesced in such user.

Another interesting decision involving a question of dedication is that of the Divisional Court in *Openshaw v. Pickering* (77 J.P., 27). In 1852 a piece of land adjoining a highway was leased for 999 years. Cottages were erected on the land, and a cobblestone footway was constructed in front of them. Upwards of twenty years ago flags were substituted for the cobblestones in that half of the width of the footway which was nearest to the road. The cobbled half was repaired by the leaseholder until about 1897, when flags were substituted for the stones by the urban authority, who from that time repaired the whole of the footway. The public had had the use of the entire footway from 1852 to 1890. In the latter year the cottages were converted into shops, and from that time the appellant (the occupier of one of the shops) had had a showcase standing on the footway. He was convicted for causing an obstruction, and the conviction was upheld on the ground that the user of the footway by the public for about forty years was evidence of dedication, and that such user had been so notorious that the lessor must be presumed to have acquiesced in the dedication.

In *Cababé v. Walton-upon-Thames District Council* (vol. xliii., p. 256) an old private brideway and footway became a public highway by user some time after 1835. There was no record of compliance with the formalities required by sec. 23 of the Highway Act, 1835, and the road had never been repaired at the public expense. The Court of Appeal held (1) that the section applied not only to a road made by an owner with the intention of dedicating it, but to cases where the dedication was only a presumption raised by user; (2) that there was no evidence to justify a presumption that the section had been complied with; and (3) that the road was not repairable by the inhabitants at large.

In *Bell & Sons v. Great Crosby Urban District Council* (77 J.P., 37) the owner of land abutting on a street erected a new building thereon, and shortly after its completion he inserted five stone pillars along the site of an old garden wall, leaving a space between the building and the street, unenclosed save for these pillars. A portion of this space was asphalted, and the public passed and repassed over the whole of it without let or hindrance. The council having commenced proceedings, under the Private Street Works

Act, 1892, for the making up of the street, wooden rails were placed between the pillars, and other rails were placed across the space to the house. The local authority never acquiesced in the fixing of the pillars and rails, and it was held by the Divisional Court that there was sufficient evidence that the land in question formed part of the street.

The next case is of interest as showing that dedication is not always to be presumed merely from the fact that the public have been permitted to use a new road—*Kibby v. Paignton Urban District Council* (vol. xliii., p. 438). In 1906 the owner of a building estate bounded on the north by private land and on the south by an old road constructed a new road (a *cul-de-sac*) leading from the old road to the northern boundary of the estate, with proper sewers, kerbs and footpaths. Gas and water mains were laid in the road, and no steps were taken to exclude the public from using it. In 1910 two building plots at the extreme north end of the estate, and on the east side of the new road, were sold to the plaintiff together with the piece of road (about 90 ft. in length) on which they abutted. Mr. Justice Neville held that there had been no dedication of the new road to the public, and that the plaintiff was at liberty to build a wall enclosing the bit of road in question.

Disputes frequently arise as to the respective rights of landowners and the public in those grassy borderlands between the metalled road and the wayside hedge, which are so characteristic of many parts of the country. In *Attorney-General v. Lindsay-Hogg* (76 J.P., 450) a landowner enclosed three such strips, partly overgrown by trees and underwood, and separated from his land by a steep bank with an old irregular hedge at the top. The other side of the road was bounded by a straight artificial hedge. The highway authority relied upon the legal presumption that the entire space between the two hedges was dedicated to public use. They also called evidence to show that the strips had been used by the public, and that gravel had been taken therefrom for road repairs. The defendant, on the other hand, proved numerous acts of ownership by himself and his predecessors in title, and he also relied upon tithe, ordnance and other maps. It was held by Mr. Justice Eve that the old hedge, having been originally planted naturally, had no connection with the laying out of the road, and that therefore the usual presumption that the two hedges constituted the road boundaries did not arise. His lordship also held that the defendant's evidence as to acts of ownership outweighed the evidence as to public user, and that the action therefore failed.

(c) EXTRAORDINARY TRAFFIC.

In *Windlesham Urban District Council v. Seward and Others (Eveleigh, Third Party)* (77 J.P., 161) the defendant, Seward, engaged a contractor to deliver bricks by traction engine at a building estate. The contractor sub-contracted with Eveleigh for the cartage of the bricks, and, damage having been done to a certain road, the council claimed extraordinary traffic expenses from the owner of the original contractor, the sub-contractor being joined as third party. The original contractor knew the size and weight of the engines to be used, but he did not determine the particular road to be traversed. It was held by the Divisional Court that the original contractor was a person "by or in consequence of whose order" the traffic was conducted. Mr. Justice Scrutton expressed the opinion that there is no reason why two or three persons should not be held liable in respect of the damage done to a particular road. The words "by whose order" bring in the contractor, and the words "in consequence of whose order" bring in the building owner. And Mr. Justice Ridley considered that the sub-contractor would also be liable.

A rather more complicated case is that of *Colchester Corporation v. Gepp (King, Third Party)* (76 J.P., 37). The defendant was sued as the clerk to and as representing the visiting committee of a county lunatic asylum, consisting of twenty members, seventeen of whom represented the county and three represented the plaintiff corporation. King contracted with the committee (represented by their clerk) to erect a lunatic asylum on land conveyed to the committee by the corporation, and to indemnify them from liability for extraordinary traffic. In carrying the building materials extraordinary traffic took place, and the corporation claimed expenses from the committee, the contractor being joined as a third party. It was held by Mr. Justice Channell (1) that neither the fact that some members of the committee

represented the corporation, nor the fact that the land had been conveyed to the committee by the corporation estopped them from bringing the action; (2) that the committee were persons "in consequence of whose order" the traffic was conducted, and were therefore liable; and (3) that the contractor was liable to indemnify the committee. His lordship, in the course of his judgment, expressed the opinion that in fixing the amount payable by a person liable for extraordinary traffic the following deductions should be made: (a) For the ordinary expenses of repair, ascertained by taking the average cost of repairing the road in question and similar roads in the district; and (b) for "betterment"—i.e., the extent to which the structure or general condition of the road is improved as a result of the repairs (such as, e.g., the fact that the road has been "granited," or widened, or provided with a thicker crust).

Having regard to the rules laid down by the learned Judge in the foregoing case, the interlocutory decision of the Court of Appeal in *Morpeth Rural District Council v. Bullock's Hall Colliery Company, Limited* (57 Solicitors' Journal, 373) is instructive. The council claimed £801 extraordinary traffic expenses in respect of coal haulage by a traction engine and trailer along a road called Bullock's Hall Road. The company applied for an order for particulars of (a) the average expense for the past five years (stating the cost of labour, establishment charges, and nature and amount and cost of materials) of the highways in the neighbourhood; (b) the extraordinary expenses, showing (1) how the £801 was arrived at, and (2) the average expense of Bullock's Hall Road for the past five years (stating the cost of labour, &c., as above). The council were ordered to give the particulars (a) and (b) (1), but not of (b) (2), on the ground that the latter related rather to the defence than to the claim.

Another case of interest in regard to the method of calculation to be adopted in adjusting claims for extraordinary traffic expenses is *Ledbury Rural District Council v. Colwell Park Quarries Company, Limited* (77 J.P., 198). In this case damage had been done by the cartage of stone by steam tractors over an ordinary agricultural road resting on clay, metalled (in the middle only) to a depth of from 4 in. to 6 in., with a gradient at one part of 1 in 6. The surveyor certified that £770 10s. 2d. was due in respect of extraordinary expenses of repairing the road, but the council only claimed in respect of damage to one part of it. It was held by Mr. Justice Scrutton: (1) That the surveyor was not bound to specify the exact parts where the damage was done; (2) that allowance should be made for the fact that the road was dearer to maintain than the other roads in the district, and that the average cost of repairing the particular part of the road should be taken into account; (3) that the company should pay the excess of the amount actually spent in repairing the damaged part over the amount which would have been spent in repairing the damage done to the same section by the other traffic which actually used it during the period in question, making due allowance for (a) the weather; (b) the fact (if it was the fact) that the ordinary expenditure in repairs had been rising; (c) the "betterment" of the road.

(d) FENCING.

In *Upjohn v. Willesden Urban District Council* (77 J.P., 174) the owner of vacant land adjoining a street appealed from the decision of the magistrates ordering him to pay the amount spent by the council in fencing the land. Sec. 32 of the Willesden Urban District Council Act is somewhat similar to sec. 31 of the Public Health Acts Amendment Act, 1907. Where land is, owing to the absence or inadequate repair of a fence, a source of danger, or is used for any immoral or indecent purpose, or for any purpose causing inconvenience or annoyance to the public, sec. 31 of the Public Act empowers the local authority to recover from the owner the cost of fencing it. In the local Act, however, the words "in the opinion of the council" are inserted after the words "where land is." In the present case the council were of opinion that this land was causing inconvenience or annoyance to the public owing to the absence of a proper fence, but although they were prepared to give evidence that such was the case, the magistrates thought this unnecessary, and no evidence was called. The Court of Appeal held that the words "in the opinion of the council" applied only to the first part of the section (as to the land being a source of danger), and not to the latter part (as to inconvenience or annoyance), and that as to this the facts must be

proved by evidence. The case was remitted to the magistrates for rehearing.

In *Jenkins v. Great Western Railway Company* (81 L.J., K.B., 525), the plaintiff (a child, aged 2½) got through a post and rail fence separating the company's property from a highway, strayed on to the line, and was injured. Between the fence and the line there were a siding and a pile of sleepers. The company's servants knew that children were in the habit of playing on the sleepers, but not that they were in the habit of getting on to the line. The jury found that the fence was not a reasonably fit fence for separating a railway from the high road, that children played on the sleepers by leave and licence of the company, and that the latter were guilty of negligence in not taking some sufficient means of preventing the children from getting on the line. But it was held by the Court of Appeal that the leave and licence (if any) to play on the pile of sleepers was confined to that spot, that there was no duty on the part of the company to fence off the sleepers from the line, and that they were not liable.

(e) OBSTRUCTION.

In *Attorney-General v. Horner* (57, Solicitors' Journal, 498), the Court of Appeal, affirming the decision of Mr. Justice Warrington, held that the lessee of Spitalfields Market was not entitled to obstruct traffic by holding an overflow market in adjoining streets, except on Thursdays and Saturdays—the days mentioned in the charter granting the franchise. The lessee alleged that he and his predecessors had from time immemorial held the market every weekday, and contended that the court ought to presume a lost grant, or a dedication of the streets subject to a reservation or an easement, justifying the daily market; but these arguments did not prevail.

In *Thornhill and Another v. Weeks and Others* (77 J.P., 231) the defendants, in order to assert an alleged public right of way, broke open the entrance gates to a drive through the Drayton Estate, Southampton, and walked over the drive through the estate. The plaintiffs (who were respectively the owner of the estate and the tenant of the drive) brought this action claiming an injunction to restrain the defendants from trespassing. The Andover Rural District Council passed a resolution (in accordance with sec. 26 of the Local Government Act, 1894) that the council should assist the defendants in defending the action, and instructed their clerk to take all necessary steps. It was held that the plaintiffs were entitled to join the council as defendants in the action.

In *Lyons, Sons & Co. v. Gulliver* (29 T.L.R., 428) the defendants were the proprietors of the Palladium Theatre, Argyll-street, at which three daily performances were given. People waited for the doors to open in a queue, frequently extending some distance past the plaintiffs' business premises, situate about 40 yds. from the theatre. The defendants paid for two extra police constables to regulate the crowd, and they kept first one and afterwards two gaps, one opposite the plaintiffs' premises. It was held by a majority of the Court of Appeal that the queue was an obstruction, and a nuisance to the plaintiffs for which the defendants were liable.

In the Scottish case of *Glasgow and South-Western Railway Company v. Provost, &c., of Burgh of Ayr* (50 Sc.L.R., 9) the company asked for a declaration that a strip of ground purchased by them for "extraordinary purposes" in 1899, and forming half of a street, was not subject to any of the provisions of the Burgh Police (Scotland) Acts, 1892 to 1903. The company made no use of the ground until 1908, when they laid down a double line of rails on it. The ground had never been made up as a road or metalled, but it had been used by the public as a right of way for all purposes since 1841. It was held by the House of Lords that the road was not part of the railway, but must be regarded as a private street, and that the rails must be removed as obstructions.

(f) PRIVATE STREET WORKS.

It was decided in 1906 that, under sec. 150 of the Public Health Act, 1875, the authority of one district cannot charge the owners of premises situate in another district with private street works expenses, even where such property abuts on a street situated in the former district (see *Hornsey Borough Council v. Birkbeck Freehold Land Society*, 79 J.P., 140). In the recent case of *Bishop Auckland Urban District Council v. Alderson* (76 J.P., 347) it was held by the Divisional Court that the same rule applied to proceedings under the Private Street Works Act, 1892, and that such premises cannot be included in the provisional apportionment.

A dispute of a rather unusual kind was determined in *Denman v. Finchley Urban District Council* (76 J.P., 405). On November 17, 1911, the council served the plaintiff with notice under sec. 150 of the Act of 1875, requiring him to make up the private street in front of his premises, and, among other things, to make connections with the sewers within six weeks. Another street (the only access to which was through the street in question) was being made up at the time, and the plaintiff (having informed the council of the fact) waited until about March 16, 1912 (when those works were completed), before commencing the work on his street. The council, however, refused to supply the levels, or to co-operate unless the plaintiff would sign an agreement to pay a fee for the supervision of the work, which he refused to do. The works were ready for the connections with the sewers on May 1st, but the council refused either to let him make the connections or to make them themselves; and when he started to make them the council had them removed. He therefore brought this action, claiming an injunction. An arrangement was come to, under which the connections were made, and the case came on to decide the question who was to pay the costs of the action. Mr. Justice Joyce held that the plaintiff had *bona fide* endeavoured to comply with the notice, that there had been no unreasonable delay on his part, that he was entitled to have the connections made, and that the council must pay all the costs of the proceedings.

An important question as to the time within which proceedings can be taken to recover private street works expenses was decided in *Bolton Corporation v. Scott* (77 J.P., 193). The Bolton Improvement Act, 1872, provides that private improvement expenses shall be recoverable either as a debt in any court of competent jurisdiction or by distress after summoning the owner. In this case the corporation gave notice to the defendant of apportionment of the expenses of making up a street in February, 1906, and made a demand for payment in June, 1906. In August, 1911, they took summary proceedings to recover the amount, but these were dismissed as being out of time. In March, 1912, they brought an action for the amount in the Salford Hundred Court. It was held by the Court of Appeal that the six months' limit for summary proceedings did not apply to an action, which could be brought within six years from the date of the demand. Judgment was therefore given for the council for the sum claimed.

(g) REPAIR AND CONTROL.

An important decision under sec. 30 of the Public Health Acts (Amendment) Act, 1907, is that of the Divisional Court in *Cheshire Lines Committee v. Heaton Norris Urban District Council* (10 L.G.R., 972). That section (so far as material to this case) provides that if, in any situation fronting, &c., on any street or public footpath, any stream, dam or bank is, for want of sufficient repair, &c., dangerous to persons lawfully using the same, the local authority may enforce its repair, &c. In this case the committee were the owners of parts of the bank of the river Mersey, over which an ancient footpath ran; but they were not liable to repair the footpath *ratione tenuræ*. By the action of the weather and by erosion portions of the bank were washed away, portions fell into the river, and other portions threatened to fall. The council served the committee with a notice to repair and protect the bank; but it was held by the Divisional Court that the section did not apply to such a case, and that the committee were not bound to comply with the notice.

The extent of a canal company's liability to repair the bridges over its canal was considered in *Sharpness New Docks, &c., Navigation Company v. Worcester Corporation; Attorney-General v. Sharpness New Docks, &c., Navigation Company* (77 J.P., 121). The company's local Act, passed in 1791, provided that they should not make the canal across any highway until they should at their own cost have made such bridges over the canal, of such dimensions and in such manner as the commissioners appointed under the Act should adjudge proper. The canal was made in 1812, and bridges were constructed by the company to carry several highways over it. A question having arisen as to the repair of the bridges, it was held by Mr. Justice Phillimore that the company were only liable to keep them in a state of repair sufficient to bear such traffic as was ordinary on the highways at the time of their original construction.

In *Postmaster-General v. Hendon Urban District Council* (vol. xlv., p. 370) it was held by the Railway and Canal Commissioners, following *Redhill Gas*

Company v. Reigate Rural District Council (1911, 2 K.B., 563), that the council were not the "body having the control" of certain public roads not repairable by the inhabitants at large within the meaning of sec. 12 of the Telegraph Act, 1863; and that they could not therefore consent to the erection of telegraph poles and wires in these roads.

Housing, Town Planning, &c.

An extremely important decision as to the powers of the Local Government Board under the Housing and Town Planning Act, 1909, is that of the Court of Appeal in *Rex v. Local Government Board, ex parte Arlidge* (58 Solicitor's Journal, 10)—viz., that, on an appeal by the owner to the board from the refusal of a local authority to determine a closing order, the appellant has a right to be heard, and to see the inspector's report on the public inquiry held by him, and that the board have no power to decide solely on the report of the inspector and the written evidence. This was the decision of the majority of the Court of Appeal (Lords Justices Vaughan, Williams and Buckley), Lord Justice Hamilton dissenting.

Nuisances.

An important decision as to the powers of local authorities with respect to offensive trades is that of the Divisional Court in the case of *Butchers' Hide, Skin and Wool Company, Limited v. Seacome* (77 J.P., 219). It will be remembered that by sec. 112 of the Public Health Act, 1875, penalties are imposed on any person who, after the passing of the Act, should establish within the district of an urban authority, without their consent in writing, the trade of a blood boiler, bone boiler, fellmonger, soap boiler, tallow melter, tripe boiler, or "any other noxious or offensive trade, business or manufacture." In districts in which sec. 51 of the Public Health Acts (Amendment) Act, 1907, has been applied, the earlier enactment is varied by substituting for the words "any other noxious or offensive trade," &c., the words "any other trade, business or manufacture which the local authority declare, by Order confirmed by the Local Government Board and published in such manner as the board shall direct, to be an offensive trade." In this case it was decided that the later section is not retrospective, and does not apply to a trade established before the coming into operation of the Order.

In *Charing Cross, West End and City Electric Supply Company v. London Hydraulic Power Company* (29 T.L.R., 649) the defendant company, acting under statutory powers, placed in certain streets mains containing water at high pressure. The statutes contained a provision that nothing therein should exempt the company from proceedings in respect of any nuisance caused by them. The mains were fractured by subsidence of the soil caused by heavy traffic, with the result that the water escaped and damaged the plaintiff company's electric cables. There was no negligence on the part of the defendant company, but Mr. Justice Scrutton held that, having for their profit brought into the road a dangerous thing—viz., water at high pressure—they were liable for the damage caused, apart from any question of negligence.

Officer of Local Authority.

In *Forsyth v. Manchester Corporation* (29 T.L.R., 15) a gas inspector employed by the corporation attended at the house of the plaintiff's father to inspect an automatic gas meter which was out of order. He tried to put it right with his penknife, but, not succeeding, went off for some tools, leaving the knife in the room, where the plaintiff (a small boy) found it and injured his eye with it. At the trial before Mr. Justice Bray and a jury, the jury found (1) that the inspector ought not reasonably to have anticipated that if he left the knife where he did some such accident might result; (2) that he was negligent in leaving it where he did; (3) that the accident was caused by his negligence; (4) that he was acting in the course of his employment in attending to the meter; (5) that those in charge of the child were not negligent. And they awarded the plaintiff £125 damages. But it was held by the Court of Appeal that there was no evidence to support finding (4), and judgment was therefore entered for the corporation.

Seashore.

In *Lake v. Smith* (76 J.P., 71) the plaintiff, who was surveyor to the Sidmouth Urban District Council, summoned the defendant for unlawfully taking shingle from the foreshore contrary to an Order of the Board of Trade. The proceedings were taken under sec. 21 of the Harbours Act, 1814, which provides that half the penalty shall go to the informer and half to the

Crown. On behalf of the defendant it was contended that the council, being a corporation, could not sue for the penalty unless they were expressly authorised by statute; but it was held by the Divisional Court that as the surveyor and not the council was the informant the proceedings were in order.

Sewers, Drains, and Sewage Disposal.

A novel and important point in connection with the subject of combined drainage in the London area was decided by the Divisional Court in *Kershaw v. Alfred John Smith & Co., Limited* (77 J.P., 297). The local authority made an order for the draining of a group of houses by combined operation, but the builder, in carrying out the work, surreptitiously connected the drains of two other houses with the combined drain, thereby making it a "sewer." The defendant bought the house under which the drain passed without notice of the builder's wrongful act. The local authority subsequently, after notice to the builder, disconnected the two unauthorised drains, and a nuisance having arisen in the combined drain, the question arose as to who was liable to repair it. It was held by the Divisional Court (Mr. Justice Pickford dissenting) that as soon as the unauthorised drains were disconnected the combined drain ceased to be a "sewer," and became a "drain," and that the defendant was liable. The Court distinguished this case from *Vestry of St. Leonard, Shoreditch v. Phelan* (1896, 1 Q.B., 533), which has heretofore been looked upon as an authority for the maxim "Once a sewer always a sewer." In that case the owner of two houses drained by a combined system disconnected his drain, and it was held that the combined drain continued to be a "sewer," notwithstanding that it only drained the one remaining house. The maxim must therefore henceforth be accepted with caution.

Another important decision on this subject (which, however, only affects Ireland) is that in the case of *Hollywood Urban District Council v. Granger* (1913, 2 Ir.R., 126)—viz., that a pipe with which are connected the drains of several houses belonging to different owners, and which has been constructed on private ground, is not a "sewer" vested in the sanitary authority, but a "single private drain" within the meaning of sec. 197 of the Public Health (Ireland) Acts Amendment Act, 1890.

In *Hanley v. Edinburgh Corporation* (vol. xliii., p. 872) the House of Lords (reversing the decision of the Court of Session) held that the corporation were liable for damage done to the pursuer's market garden by the overflow from a burn into which sewage from the city of Edinburgh was discharged. The overflow was due to the inadequacy of the culvert to carry away the water in time of spate, and the House were of opinion that the corporation were guilty of negligence in not providing a proper culvert. The decision of the Lord Ordinary, awarding the pursuer £150 damages, was therefore restored.

In *Phillimore v. Watford Rural District Council* (vol. xlv., p. 332) an injunction was granted to restrain the council from permitting the discharge of the effluent from their sewage farm into an agricultural ditch constructed by an adjoining landowner for the sole purpose of draining his land. It was held that the ditch was a sewer made for profit, and hence was not vested in the council.

In *Rees v. Tenby Corporation* (vol. xlv., p. 470) the plaintiff's land was flooded owing to a wooden trunk, constructed by the corporation in continuation of a stone culvert conveying water and sewage having become choked and rotten. The corporation were under no obligation to construct the trunk, but the Judge of the Tenby County Court held that, having done so, they were bound to maintain it in such a manner that it should not be injurious to the adjoining land. Judgment was given for the plaintiff for £27 damages with costs.

Water Supply.

In *Metropolitan Water Board v. Avery* (vol. xlv., p. 332) it was held by the Court of Appeal that water used for cooking, washing up, &c., in connection with a catering business carried on at a public house was water supplied for "domestic purposes" within the meaning of sec. 25 of the Metropolitan Water Board (Charges) Act, 1907. This decision has been affirmed by the House of Lords. The *ratio decidendi* was that, to hold that every use of water for a trade was a use for non-domestic purposes, would lead to such astounding results as to be flagrantly in conflict with common sense, and would render liable to the trade rate every shopkeeper who used a damp sponge to clean dusty goods.

In *Harpur v. Swansea Corporation* (vol. xlv., p. 470) the corporation, as water authority, laid a main in a highway. The work was done to the satisfaction of the highway surveyor, but the road subsequently subsided, and it cost the highway authority £87 10s. to make it good. It was held by the House of Lords that this was not a case of damage done by the corporation in the execution of their statutory powers within the meaning of sec. 28 of the Waterworks Clauses Act, 1847, but a case of "land injuriously affected by the construction or maintenance of the works" within sec. 6.

In *Metropolitan Water Board v. Bunn* (77 J.P., 156) it was held that the limitation of six months imposed in respect of the recovery of water rates in a summary manner before justices does not apply to an action in the county court.

In *Metropolitan Water Board v. Johnson & Co.* (29 T.L.R., 203) the defendants were erecting an addition to barracks at Hounslow under the instructions of the Secretary of State for War. The board supplied water to the barracks by meter, and the water necessary for the building operations was taken by the builders from the barracks free of charge (in accordance with the terms of their contract). The board sued the builders for a sum calculated at the rate of 7s. per £100 on the probable cost of the building; but the Court of Appeal (reversing the Divisional Court) held that they could not recover, the builders never having "required a supply" from them. The Court also expressed the opinion that the board cannot pass a general resolution that no builder shall be supplied by meter, but must pay 7s. per £100 on the probable cost of the work. They must take the circumstances of each case into consideration for the purpose of deciding what deductions they shall allow.

In *Bristol Guardians v. Bristol Waterworks Company* (76 J.P., 273) the Court of Appeal had to reconcile two incompatible clauses (one being contained in a local Act, and the other in a public Act), or, rather, to decide which of the two should prevail. Sec. 68 of the Bristol Waterworks Act, 1862, obliges the company to furnish a supply of water for domestic use at the request of the owner or occupier of a "private dwelling-house." The Act, however, incorporates the Waterworks Clauses Act, 1847, which, by sec. 53, requires a supply to be furnished at the request of the owner or occupier of a "dwelling-house" (omitting the word "private"). The guardians having requested a supply for certain workhouses, offices and homes for children at the domestic rate, it was held that these were not "private dwelling-houses" within the meaning of the special Act, and that the Act of 1847 must be read subject to the provisions of such special Act. The claim of the guardians to be supplied at the domestic rate therefore failed.

In *Liverpool Corporation v. Chorley Union Assessment Committee* (77 J.P., 185) the House of Lords affirmed the decision of the Court of Appeal (noted in vol. xxxix., p. 373)—viz., that the corporation were liable to be rated in respect of a large tract of moorland used as a gathering ground for their waterworks.

An important point as to the powers of a water authority to cut off water was decided in *South-West Suburban Water Company v. Hardy* (77 J.P., 283). The company were authorised to supply water by a special Act (which incorporated the Waterworks Clauses Acts 1847 and 1863), and by an Order of 1878, which empowered them to make reasonable regulations for preventing waste, and to prescribe the apparatus suitable for supply; also, if the regulations were not observed, to cut off the supply. One of their regulations was that no service pipes should be so arranged as to supply more than one house. The defendant was the owner of seven houses supplied by a single service pipe, and by agreement with the company he was liable for the water rate. The board cut off the supply, and refused to restore it until he put in a separate service pipe for each house. The Water Companies (Regulation of Powers Act), 1887, sec. 4, provides that when the owner is liable for the rate, no water company shall cut off the supply for non-payment. The question was whether, notwithstanding this enactment, the company were entitled to enforce the regulation as to separate service pipes by cutting off the water. The Divisional Court held that they were not.

A somewhat complicated question was decided in *Stanley Brothers, Limited v. Nuneaton Corporation* (77 J.P., 89). The plaintiffs were the owners of a colliery and some brick and tile works. In 1900 an agreement was made by which, in the event of the plaintiffs not being able to obtain sufficient water for the purposes of their works from their own sources of supply, the corporation agreed to supply them with water at cost

price, not exceeding 2d. per 1,000 gallons. Before this agreement the plaintiffs had taken water from the corporation at 8d. per 1,000 gallons, and they continued (apparently through inadvertence) to pay at this rate after the date of the agreement until the year 1910. Their attention was then called to the agreement, and they thereupon claimed a return of 6d. per 1,000 gallons on the amount supplied during the preceding ten years as money paid under a mistake of fact. The Court of Appeal held that the money was paid under a mistake not of fact, but of law, and that, in any event, it was irrecoverable, because the right to demand a supply at the lower rate never arose, the company never having given notice that their available supplies were exhausted.

In *Postmaster-General v. Nenagh Urban District Council* (1913, 1 I.R., 238) the council were the water authority in their district, and the plaintiff occupied a post-office not entered on the valuation list and not rated. It was held that the council were bound to furnish a supply of water to the premises for domestic purposes without prepayment of water-rate, subject to the plaintiff complying with the council's rules and regulations, and on payment of the value of the water supplied.

SEWER VENTILATION IN LONDON.

MAIN DRAINAGE COMMITTEE'S REPORT.

At the meeting of the London County Council on Tuesday an important report on the ventilation of sewers was presented by the Main Drainage Committee *apropos* of a difficulty which has arisen between the council and the Greenwich Borough Council with respect to the existence of an alleged nuisance in the Greenwich area.

"For a long time past," the committee report, "correspondence has taken place between the council and the Greenwich Metropolitan Borough Council with regard to smells issuing through the surface ventilators of the main sewers in that borough. The length of main sewers under the council's control in Greenwich is, approximately, 12 miles, and for the proper ventilation of these provision was originally made at ninety-nine points, nearly all in the highway. Owing to complaints, as many as sixty-one of these surface ventilators have been entirely closed, thirty have been sealed and connected to ventilating columns or stack pipes, and eight only, including two at penstock houses belonging to the council, now remain open. Notwithstanding the efforts made by the council to avoid inconvenience owing to the emanations, the borough council persisted in its demand for the closing of the surface ventilators, and a deputation from the borough council attended before the committee in 1908 in support of its contention. It was then intimated that if the borough council would provide suitable sites, the committee would be prepared to recommend the council to erect ventilating columns. In reply to this suggestion, the borough council furnished a list of five places where the owners would be prepared, upon payment, to allow the council to erect stack pipes against the walls of houses, but the committee could not see their way to agree to this proposal. The sewers in Greenwich, they point out, comprise among them some of the largest in London, and ventilation pipes, if provided, require to be of the most ample dimensions, and to be erected in the most favourable positions. Their intention was that the borough council should provide sites for shafts on the highways, but this the latter refused to do on the ground of alleged serious obstruction and inconvenience to the public. The borough council subsequently complained to the Secretary of State for the Home Department, and asked him to inquire, under the provisions of sec. 31 of the Metropolis Management Amendment Act, 1858, into what it stated to be the 'failure of the London County Council to comply with its statutory obligations.'

"The problem to be solved is first," the committee observe, "to provide a sufficient number of inlets for fresh air, to distribute them properly, and to ensure that they will not act as outlets, and, secondly, to provide outlets that will extract foul air without creating a nuisance, and so to distribute them that all parts of the sewer will be ventilated.

"The closing of any particular surface ventilator intensifies the smell at adjacent gratings which are left open, and leads to complaints which otherwise might not have been made. Were all the surface ventilator gratings unsealed, doubtless a better condition of affairs would obtain, and such a course might re-

ceive support in some boroughs. We fear, however, that the difficulty of obtaining general support is too great for such a course to be advocated. The suggestion previously put forward that every houseowner should provide a ventilating pipe on the sewer side of the interceptor on the house drain, or, as an alternative, and partly for other reasons than ventilation, that the interceptor itself should be abolished, would undoubtedly go a long way towards the solution of the ventilation problem, as a system of shafts which would serve both as inlets and outlets would thereby be established. . . .

"The council has from time to time erected tall ventilating columns on the highways when permission has been obtained from the metropolitan borough council concerned. These columns allow the air from the sewers to escape, and a supply of fresh air finds its way into the sewers through surface gratings which must be retained for this purpose and, to a small degree, by way of house connections. The use of a large number of ventilating columns would diminish the emanations through the surface gratings, but under certain weather conditions the circulation of the air becomes reversed, and the surface ventilators would act as outlets. The usual height of the columns put up by the council is 42ft., this being the greatest height which can safely be erected without support. This is lower than many buildings, and complaints would undoubtedly arise of smell entering the upper windows. The cost of erecting one of these columns has in the past varied from £30 to £100, and the wholesale erection of such columns would mean a very large expenditure. In order that the columns may be effective, they must be erected in the most suitable positions, as nearly over the top of the sewer as possible. This points to their erection in the centre of the roads or on the footways, and we can hardly suppose that the erection of columns in many of the principal thoroughfares would long remain unchallenged.

"As we have before pointed out, in certain cases use has been made of stack pipes against houses. The cost of one of these is about £25, and apart from the difficulty of securing permission from property owners to attach them to houses, they are not very efficient. They can only be of small section, must be at some distance from the sewer—necessitating a length of connecting pipe—and, in many cases, have to be made with bends and elbows so as to clear projections on the building. All these things tend to impair their efficiency as ventilators.

"The difficulty concerning emanations from sewers is not confined to London, and in many provincial towns the question has been under consideration. In Manchester, in particular, the corporation has conducted a costly series of experiments extending over a period of four or five years. The experiments were made with various mechanical contrivances, and the report of the corporation issued in 1906 stated that none of the systems under consideration could be recommended for use in the Manchester sewers. In view of these experiments there appears to be little to be learned in London by further experiments on these lines.

"The council will realise that the problem which lies before it is one of extraordinary difficulty, and that there is at present no scheme for sewer ventilation which can be considered satisfactory from all points of view. We are unable, from the facts which have been placed before us, and which we now submit, to advise any departure from the existing practice of considering each case of complaint on its merits, and, if it is possible, to remedy the defect. It may even be necessary, in the interests of the council or its employees, to reopen some of the surface gratings which have been temporarily closed."

It is recommended, in conclusion, that a copy of the report should be forwarded to the Secretary of State for the Home Department.

Buildings for Small Holdings.—A paper on this subject will be read by Mr. A. A. Hunt at a meeting of the Society of Architects on the 12th prox.

Disappearing Footpaths.—A motorist member at a recent meeting of Marlborough Rural District Council protested against the widening of the main London-Bath road for motorists by the absorption in some places of the footpaths at the side of the road. He said the footpaths were the only protection the pedestrians had, and even now they had to spring into hedges and run the risk of being blinded by thorns or covered with mud. It was decided to call the attention of the county authorities to the matter.

A Prospect of Municipal Engineering in 1914.

A QUITE IRRESPONSIBLE FORECAST.

(By a Correspondent.)

Retrospects are good things in their way, and have their undoubted uses. They tell us what has been done, and in any study of the past an inkling of the future lies for him to read who can. But mankind is not built on one intellectual plane, and while the few are fertile in imagination and quick of apprehension, the many are uncompromisingly dull and slow-witted. What is set down in plain, homely language may be absorbed by the majority without much trouble. They read the cold print as it is set, line by line, oblivious of the fact that the lines themselves are of little importance in comparison with that which lies between them. To the average man a million is a row of seven figures—a one and six noughts, with two commas interposed to avoid confusion in reading. Beyond that his intellect cannot go, and yet he will read on with a complacent smile, possibly rolling the figures on his tongue in an occasional burst of admiration, and yet having as much appreciation of their value as a cow has of the calculus. In the same way (although in adverse direction), when he is told that every cubic centimetre of a gas contains 20,000,000,000,000,000 molecules, or that the rate of expansion for Portland cement concrete is some 0.00067 per degree Fahrenheit, he gasps for a moment at the figures and then passes on—just about as wise as if he had never seen them. It is the poet alone, not the mathematician, who can realise the values of such formidable arrays of numerals, ciphers and “damn’d little dots,” and in precisely the same way it needs a poet (or at least a man of imagination) to evolve the future from the past, or, in other words, from the dead bones of a last year’s retrospect to create a warm, living, flesh-and-blood prospect for the year that is.

What, then, are the prospects of municipal engineering and of the municipal engineer in the year 1914? Three weeks of that year have now gone without any alarming developments, although it is gratifying to us to record that Mr. Smith has not only been promised a rise in his salary of £20 (by annual increments of 15s.), but is, on the 31st of the present month, to have the additional 1s.3d. actually added to his cheque. Another instance well worth recording is that of an assistant in a Midland office whose salary was doubled last year, with a prospect of parallel munificence in the present. He is one of that large class known as *volontaires*, a fact that may detract somewhat from the generosity of his employers. Still, these cases, trifling as they may seem, have their meed of encouragement, and augur well for a possible rise all round before the year ends.

The question of security of tenure of office has hitherto offered a wide field for conjecture, and yet, if the happenings of last year may be taken as aught, attainment of the long-desired is practically assured ere the sun of December 31st sets. One of the merry retorts of childhood runs somewhat as follows: “Those who ask shan’t have, and those who don’t ask don’t want.” And this infantile excuse for greed precisely fits the present situation of security of tenure. That it has been asked for none can deny, but then those who have so far interested themselves as to ask for the most part really don’t want it. They are the top dogs, and they practically have it. As for those who haven’t asked, it may be assumed that they, for the most part, don’t want it. Now, logically, the man who gets a thing that he wants and the man who doesn’t get a thing that he doesn’t want are in the same position. The double affirmative is equal, in such a case, to the double negative. The “askers” for the most part not wanting it, and the “non-askers” for the most part not wanting it, both may be said to have got it. It only remains now for the residue to get it, and everyone will be satisfied.

The year 1913 witnessed the superannuation of quite a number of municipal engineers. In order to make the matter quite clear, it will be well for the reader to understand that the verb “to superannuate” has two primary meanings: (1) To impair or disqualify by old age or infirmity, (2) to pension off on account of old age and infirmity. So it will be seen that impairment or disqualification by reason of old age and infirmity is, indeed, a form of superannuation, and stands first in the dictionaries. It is perfectly clear, then, that a number of municipal engineers were orthographically and orthoëpically superannuated during the past year.

Hence, reasoning analogically, a number also will be orthographically and orthoëpically superannuated during the present year. Old age and infirmity are the common lot, and are the sure precursors of superannuation; hence, superannuation is the common lot, and all get it who live long enough. Definition (2) may therefore be ruled out of the argument as entirely superfluous.

Mutual defence funds have been well to the fore during the past year, but there no longer remains the need for them. Aggression is the order of the day, for only by aggression can amicable relations be preserved between councillors and engineers. Fresh in the minds of our readers will be the remarkable case of the municipal officer who pulled the nose—or inflicted some such indignity upon the person—of one of his council. Reward and honour have been his since, and 1914 will inevitably see many such cases. Councillors will necessarily retort, pulling the noses and otherwise maltreating their officers, and a reign of peace and goodwill will be inaugurated. The road to mutual defence has, strangely enough, been made possible by methods the most aggressive, and funds—save such as are subscribed for as a testimony to the personal worth of the aggressor—may now be entirely dispensed with.

Turning to matters technical, the fewest of words must suffice. The problem of cheap street lighting is well on the way to solution, and possibly before the year ends there will be a return in the form of profit, the greater the cubic feet or units consumed the greater being the profit. The gas companies have demonstrated clearly that gas only costs half as much as electricity, while the electrical companies have proved quite as incontrovertibly that electricity costs only half as much as gas. Hence, by a continuation of this halving process the figures work out practically to *nil*, and it only requires the least improvement in the method of manufacture or distribution to ensure the profit already referred to.

The sewage disposal problem is also well on the way to solution, for it is obviously a waste of time and money to worry about such a detail when the sewage may be deposited in a convenient corner of the house, where it will give off a pleasant gas far and away more pure than the air of some wretched seaside town or insanitary plain. The year 1914 will possibly see the installation of a sanitary bin, with perforated top, in every decent sitting-room, and around this the family may sit the long evenings through, inhaling the purity and fragrance which are now said to be such a feature of decomposing sewage.

Space does not allow of further dealing with the technical advance that is foreshadowed in the retrospect of 1913. Suffice it to say that in every department great and beneficent changes are working, and the chemist and the bacteriologist are receiving their due meed of reward. Of the share of the municipal engineer in these developments there is not, perhaps, much to say, as he has for the past year been devoting what energy and genius he has to the making of a satisfactory road crust. This finally completed and done to a turn, he may be free to bestow more of his time on the consideration of other problems. The ratepayer cannot live on road crust alone.

Reclamation of Tidal Lands.*—The author has done good service by bringing together in this handy booklet the scattered information contained in various books and papers dealing with the part played by vegetation in the reclamation of tidal lands. A large part of this is drawn from the remarkable observations made by Prof. F. W. Oliver during his long-continued work on the physiography and plant ecology of maritime regions, especially at Erquy, in Brittany, and at Blakeney Point, in Norfolk, with reference to the stabilisation of drifting sand and shingle by means of vegetation. As these and other observations summarised in this booklet clearly show, there are large areas of foreshore in this country which might profitably be planted with suitable vegetation and subsequently reclaimed from the sea.—*Nature*.

The Legislation of 1913 in Relation to Municipal Engineering.

Thirty-eight public general statutes received the Royal Assent in 1913, but a very small proportion only of this number are even remotely concerned with municipal engineering or local government matters. It is a matter for satisfaction that the various enactments relating to the preservation of ancient monuments have been consolidated, with amendments, into a single Act. It is to be hoped that the practice of thus consolidating the law on particular subjects will be continued and extended. Among the amendments contained in this Act is one remitting the relaxation of local by-laws where their enforcement would hamper the erection of artistic buildings. The Local Government (Adjustment) Act lays down certain rules and regulations for financial adjustment between areas on alteration of boundaries, and these will be found stated in detail below. The other Acts noticed are those relating to the Consolidated Fund, Expiring Laws Continuance, Public Buildings (Expenses), Public Health (Prevention and Treatment of Disease) and Public Works Loans.

Ancient Monuments.

The *Ancient Monuments Consolidation and Amendment Act*, as its name implies, consolidates, with certain alterations, the existing law relating to the acquisition, guardianship and protection of ancient monuments. An Ancient Monuments Board is to be constituted by the Commissioners of Works, consisting of members representing the Royal Commissions on Historic Monuments in England, Scotland and Wales respectively, the Societies of Antiquaries of London and Scotland respectively, the Royal Academy of Arts, the Royal Institute of British Architects, the Trustees of the British Museum and the Board of Education, and such other members as the Commissioners of Works may appoint. Inspectors of ancient monuments are also to be appointed with the consent of the Treasury.

Where it appears to the council of a borough or district that the erection of buildings of a style of architecture in harmony with other buildings of artistic merit is impeded by by-laws, they may, with the consent of the Local Government Board, relax the by-laws, provided that the buildings can be erected with due regard to safety from fire and to sanitation.

Expiring Laws Continuance.

The *Expiring Laws Continuance Act* continues until December 31, 1914, various Acts which would otherwise have expired with the year 1913, including (among others) the Locomotives Act, 1865, and the various amending Acts, the Municipal Elections (Corrupt and Illegal Practices) Act, 1884, the Local Government (Elections) Act, 1896, and the Motor Car Act, 1903.

Local Government.

The *Local Government (Adjustment) Act* makes sundry changes in the law as to the adjustment of financial relations between local government areas on the alteration of boundaries, &c.

Adjustments of Local Taxation Licences, Estate Duty Grant, and the residue under sec. 1 of the Local Taxation (Customs and Excise) Act, 1890, are to be carried out in accordance with rules contained in Part I. of the Schedule to the present Act, and provision is to be made for payment to authorities of such sum as seems equitable according to rules contained in Part II. of the Schedule, in respect of any increase of burden thrown on the ratepayers as a consequence of alteration of boundaries or other change.

The rules in Part I. of the Schedule are to the following effect:—

(1) Local Taxation Licences and Estate Duty Grant are to be apportioned between the councils between which an adjustment is to be made, on the following basis: (a) To the council of the county from which an area is severed, amounts equal to the average annual compulsory payments and transfers made by that council in accordance with sec. 24 of the Local Government Act, 1888, for five years ending 31st March preceding the appointed day, less the portions of such average attributable to the separated area, which are to be paid to the council of the other county; (b) out of any balance the council of the first-mentioned county is to receive amounts equal to the average

compulsory payments and transfers made by them in accordance with sec. 26 of the Act of 1888 for the same five years, less the portions of such average attributable to the separated area, which are to be paid to the council of the other county. (Sec. 24 of the Act of 1888, we may remind our readers, provides for the payment by county councils of half the salaries of medical officers and nuisance inspectors previously paid by the Treasury, and sec. 26 provides for an annual grant by county councils for the cost of poor-law officers and district schools.) (c) Out of any balance the first-named county council is to have half the average cost during five years preceding the appointed day of the maintenance of main roads (including interest on and repayments of loans), less half the proportion of such cost attributable to the severed area, which is to be paid to the council of the other county; but if the first county council have failed to declare any roads to be main roads which ought to have been so declared, or *vice versa*, appropriate adjustments are to be made in the calculations by the inclusion or exclusion (as the case may require) of the cost attributable to such roads. (d) Any balance is to be divided between the two councils in proportion to the respective rateable values of the first-named county and the severed area. (e) Any difficulty in calculating any item for the purposes of rules (a) or (b) is to be solved by attributing to the severed area a portion of such item proportionate to its rateable value. (f) If the amount available is insufficient, the amounts apportionable are to be reduced proportionately.

(2) The residue under sec. 1 of the Local Taxation (Customs and Excise) Act, 1890, for the area of the first-named county is to be divided in proportion to the respective rateable values of the county less the severed area, and that area.

(3) In the foregoing rules "county" includes a county borough, "appointed day" means the day fixed for the transfer of the severed area or the later date at which such transfer is to be deemed to take effect, and "rateable value" means (unless otherwise agreed) the rateable value as determined by the valuation list or (if there is no such list) the last poor-rate.

The rules in Part II. are to the following effect:—

(1) Regard is to be had to (a) the difference between the burden on the ratepayers which will be incurred by the authority in executing any of their powers and duties, and the burden which would have been incurred if no alteration of area or other change had taken place, and (b) the probable duration of the increased burden. But no alteration of income consequent upon an apportionment under Part I. is to be taken into account.

(2) The sum payable (or the capitalised value of the instalments or annuity payable) to an authority in respect of increased burden is not to exceed fifteen times the average annual increase of burden.

(3) Any sum payable in respect of maintenance of main roads is to be payable by way of annuity.

Public Health.

The *Public Health (Prevention and Treatment of Disease) Act* makes certain alterations in the public health laws relating to the prevention and treatment of disease, and the powers of county councils, sanitary authorities and joint boards in connection therewith.

Sec. 281 of the Public Health Act, 1875, provided that on the constitution of a joint board the local authorities of the component districts should cease to exercise any powers, or perform any duties which the joint board was authorised to exercise or perform; but that the joint board might delegate any of its powers or duties to the authority of a component district. The present Act empowers the Local Government Board (notwithstanding the section cited), by order, to authorise a local authority having jurisdiction in any part of a united district to exercise, in relation to that part, any of the powers of the joint board, subject to such conditions and restrictions as may be imposed by the order.

Under sec. 130 of the Act of 1875 the Local Government Board have power to make regulations for the treatment of persons affected with cholera, or any other epidemic, endemic or infectious disease, and for

preventing the spread of such disease, and to declare by what authorities such regulations are to be enforced. The present Act gives the board power to declare that one of the authorities to enforce the regulations shall be the council of a county; but the board are not (except in case of emergency) to require a county council to enforce the regulations without the consent of such council.

Sec. 3 empowers county councils and sanitary authorities to make such arrangements as may be sanctioned by the board for the treatment of tuberculosis.

Expenses incurred under the Act are in the case of a sanitary authority to be defrayed as expenses incurred in execution of the Public Health Acts, and in the case of county councils as expenses for general county purposes, or (if the board by order so direct) for special county purposes charged on such part of the county as may be provided by the order.

Public Works Loans.

The *Public Works Loans Act* authorises the issue by the National Debt Commissioners of £6,000,000 for the purpose of loans by the Public Works Loan Commissioners, and of £600,000 for loans by the Commissioners of Public Works in Ireland. The amounts

"DEXINE."

"Dexine" is the name and registered trade mark in Great Britain, its Colonies, and foreign countries, of a patent compound, the owners and sole manufacturers being Dexine, Limited, whose extensive works, fitted with specially designed plant, rolling and moulding mills, are situated at Abbey-lane, Stratford, London, E. "Dexine" was discovered some eighteen years ago, after years of experiment and research, and is, briefly, a composition of vulcanised india-rubber and other ingredients manipulated by a special process, the resulting material being of an exceedingly tough and frictionless nature, capable, we are given to understand, of withstanding extreme temperatures and quite impervious to the deleterious action of acids, oils, gases, ammonia, or grease.

As a high pressure steam jointing it possesses undoubted advantages. It is claimed that it does not blow, burn, or squeeze out; does not in any way injure faced flanges as metal joints do; retains its normal elasticity indefinitely, and can, with care, be used several times over.

In addition to the sheeting, which is usually made in rolls 36 in. wide, any length or thickness, the company do a large and ever-increasing trade in joints cut to template.

This is an obvious economy, as they can be made to any shape or size ready for fixing.

In the form of manhole and mud-hole door joints, "Dexine" has proved its efficacy, and it would seem to be peculiarly adapted for the manufacture of conical gauge glass rings, as it does not melt and run down the glass, or harden, crack, and consequently blow. It will also retain its normal shape and elasticity under a steam pressure of 300 lb. to the square inch. Waterworks engineers, both at home and abroad, will find many

useful applications for this material, which has, in fact, already established its value in connection with waterworks plant.

London Tramway Shelters.—It is proposed by the Highways Committee of the London County Council, in order to deal more promptly with the rush-hour traffic at the Blackfriars Bridge end of the Victoria Embankment, to erect a second tramway shelter 88 yds. westward of the existing structure. As designed, the shelter would be 105 ft. in length and 7 ft. in width. The present one is 190 ft. in length.

Property Owners and Tar-macadam Roads.—At Swansea Police-court last week, in a case in which the Swansea Corporation sought to recover costs of street works against certain property owners, it was urged against the claim by Mr. Ed. Harris that the policy of the corporation was too sweeping, and that too great expense had been incurred. The town clerk said the whole point of the objection seemed to be against the requirement of tar-macadam for the roads, but he argued that the difference caused by that was infinitesimal. It was adopted by the corporation to remedy the almost disgraceful state of the streets. The corporation were prepared to keep up the road after it was made. The deputy surveyor (Mr. Swarbrick) gave particulars of the cost. The Bench, after hearing Mr. Harris and retiring, said it was reasonable to have front roads made in the way advised, but it was unreasonable to deal with back roads in the same way. The case was adjourned for a month, in order that both sides might consider this decision.

FORMING "DEXINE" ARTICLES FOR MOULDING DEPARTMENT.

are to be issued during a period ending on the day on which a further Act granting money for the purposes of these loans comes into operation, and in accordance with the provisions of the National Debt and Local Loans Act, 1887. Portions of certain local loans are written off, the only one in England being a loan of £10,000 to the Eyemouth Harbour Trustees (of which £200 is written off), and the others being in Ireland.

The Training of Road Engineers.—A number of resolutions have been received by the Roads Improvement Association in support of its suggestion that means should be provided to enable potential road engineers to receive special training in modern methods of road construction and maintenance, and the Institutions of Municipal Engineers, Mechanical Engineers and Automobile Engineers have already intimated their willingness to co-operate on the small committee to develop the proposal. At the last meeting of the council of the Institution of Municipal and County Engineers, the Roads Committee reported that they had carefully considered representations on this subject made by the Roads Improvement Association. They pointed out that the question of training of engineers in highway construction, both practical and theoretical, had always engaged the attention of this institution, and inasmuch as the institution were at the present moment carefully reconsidering the whole question of special training of engineers in highway construction, they were not prepared meantime to recommend that the institution join the association in the movement proposed.

Sewage Disposal Appliances.

MANUFACTURERS' REPORTS.

The following notes relating to the activities of manufacturers of sewerage and sewage disposal appliances show that this branch of engineering business has shared in the general trade prosperity of the past year. The reports are also interesting in demonstrating that makers are not standing still, but are continually bringing out new patterns as well as improving existing types with advantage to themselves as well as to engineers who are always ready to consider new ideas.

AMES CROSTA SANITARY ENGINEERING COMPANY, LIMITED.

This firm report that the past year has shown a steady increase in business all round. Sewage disposal specialities have been in good demand, and a large number of installations of both rotary and travelling sprinklers have been carried out. Among the most important works may be mentioned the opening of the sewage disposal works at Halifax, Yorkshire, in which twenty-four of their large patent "Simplex" rotary sprinklers are installed. The patent "Simplex" travelling sprinklers have now been adopted, and are giving great satisfaction at a number of sewage works, and the economical value of these machines has been fully demonstrated. About five years ago an installation of these sprinklers was installed at the Cole Hall sewage works, Birmingham, and they were naturally gratified to receive an order recently from the engineer to the Birmingham, Tame and Rea Drainage Board for a further six machines, which are now being installed at the same works.

These machines give a uniform distribution, and automatically deal with large and small flows. They are very substantially built with the best materials and workmanship, and are of a light type which reduces wear and depreciation to a minimum. All moving parts are fitted with ball bearings, and the driving power developed will keep the machines moving during the strongest head gales. Each machine is fitted with an automatic control brake, which prevents the machines from racing when gales are blowing in the direction of travel. These sprinklers are specified for a number of important sewage works about to be carried out, and it is anticipated the present year will show a largely increased demand.

The new auto-dose valve for intermittently feeding sewage to the sprinklers has proved very satisfactory, and the demand for this valve is steadily increasing. An increased business has been done in sewage screens and sludge elevators; among the larger installations we may mention one just completed for the borough of Nelson (Lanes), in which electrically driven screening and sludge elevating machinery of the latest type has been installed. A good business has also been done in tiles for the floors of filter-beds, all kinds of ordinary sewage ironwork, sluice valves, penstocks, stoneware pipes with patent joints, &c.

A portion of the large order for sewage ironwork for the new sewage disposal works now being carried out at Leeds has been entrusted to this firm, consisting of large and heavy balanced grit doors and special fittings. The "Fieldhouse" patent sedimentation tank is giving excellent results, and has now been adopted, and is in course of construction at several important sewage works.

Business in other sanitary specialities has been well maintained. The Crosta patent double-trapped surface-water gully is supplied to leading sanitary authorities throughout the United Kingdom. Large orders are now being executed to contractors carrying out work at the London Docks under the Port of London Authority. The "Crosta" gullies have been in use at the London Docks for many years past, and have satisfactorily withstood the exceptionally heavy wear incidental to dock traffic. The sales of the Ames' patent "Adaptable" road broom are still on the increase, and the same may be said of the patent "Grip-mac" manhole covers for macadam roads, the economy and advantages of these being now appreciated by sanitary engineers.

Among new specialities they are putting upon the market may be mentioned the "Cross-field" patent manhole cover. This is a light and cheap type of cover combining special features desirable in a cover for use on sewers crossing fields, or in places not subject to heavy vehicular traffic. Another speciality is the "Essex" patent recorder for street watering vans.

This ingenious instrument should be on every watering van, as all operations of the van are accurately and automatically recorded, whether standing still, filling, emptying, or travelling full or empty; the records obtained are extremely interesting and valuable, and should enable important economies to be effected in street watering.

CAMPBELL GAS ENGINE COMPANY, LIMITED.

The Campbell Gas Engine Company, Limited, of Halifax, have supplied a number of their oil and gas engines for sewerage and drainage purposes, including three 175-b.h.p. vertical gas engines driving direct-coupled Cochrane centrifugal pumps, for the London County Council, and one 92-b.h.p. crude-oil engine, and direct-coupled pump capable of raising 80 tons of water per minute for the Methwold and Feltwell Drainage Commissioners.

JONES & ATTWOOD, LIMITED.

Messrs. Jones & Attwood, Limited, Stourbridge, have engaged the services of Mr. J. A. Coombs to superintend the design and installation of pneumatic sewage ejectors, air compressors, pneumatic lifts, sewage aerators and pneumatic apparatus of all kinds. This firm's business in the "Janda," or Fiddian, water-wheel type of distributor has continued to grow, and orders have been booked during the year for upwards of seventy-seven of this type for circular and rectangular filters, and for beds with circular ends. Many of these distributors are of large size capable of sprinkling any quantity up to 400 gallons per minute, and covering areas up to $\frac{1}{4}$ acre under one distributor, and $\frac{1}{2}$ acres in one installation. These are for works for H.M. War Office, the Governments of Russia, Holland, and Western Australia, Messrs. Baldwin Latham, M.INST.C.E., Sidney R. Lowcock, M.INST.C.E., Gilbert Thomson, M.INST.C.E., Crouch, Hogg & Easton, M.M.INST.C.E., and many other well-known engineers. Other business carried out by this firm's hydraulic department includes many installations of their "Crown" type of sewage sprinkler with fixed pipes, and of their sewage aerating plants, of which much more is likely to be heard in the near future. Their business in general sewer ironwork has also made much progress.

PULSOMETER ENGINEERING COMPANY.

A branch of the Pulsometer Engineering Company's business which is interesting to municipal engineers relates to the "Stereophagus" centrifugal pump manufactured by them (Hon. R. C. Parsons' patents). This pump has been specially designed for dealing with unscreened sewage, thus saving the cost of screens and, what is perhaps more important, the constant labour required for cleaning screens. Although the "Stereophagus" pump has only been placed on the market recently, the Pulsometer Engineering Company have already supplied several important installations for the following authorities: Riceall Urban District Council (Barlby pumping station), Evesham Urban District Council, Chingford Urban District Council, Rossington sewage (Doncaster Corporation). Other pumps have been ordered by the Glastonbury Urban District Council, the Harpenden Urban District Council, the Corporation of Southend-on-Sea, and the Wanstead Urban District Council.

J. STONE & CO., LIMITED.

Messrs. J. Stone & Co., Limited, of Deptford, S.E., report that their drainage and waterworks department has carried out many important contracts last year, both in this country and abroad, among which the following are the most important. Crown Colony of Fiji, Suva Main Drainage.—This scheme was referred to in our last year's special issue, and is a complete installation of six ejectors, oil engines, air compressors, air receivers, &c. The whole installation was erected at their works and tested under working conditions by the inspecting engineers to the Crown Agents for the Colonies before transhipment. In addition to the above, all the sewerage ironwork for this scheme, comprising special manhole covers, vent columns, floating arms, disc and sluice valves, was supplied by the same firm. London General Omnibus Company, Limited, Walthamstow Works.—This installation comprised one pair of Stone's patent pneumatic ejectors, capable of working alternately and independently, electrically driven air compressors

driven by d.c. motors with reducing gear, and fixed on the same bedplate. Automatic starting panels start and stop the motors when the air pressure in the receiver reaches predetermined limits. At Fort Blockhouse, Haslar, a pair of Stone's patent ejectors, embodying new features, has been installed, while at Fort Cumberland, Eastney, Portsmouth, an improved lift has been supplied and erected, both to the order of the Admiralty. The lift is operated by the direct pressure of water from an ordinary supply main, controlled by a ball valve so that the power water will not be running unless the flow of sewage demands a supply of compressed air. The only moving parts other than the ball valve are the inlet and outlet reflux valves; consequently the efficiency is maintained with certainty for an indefinite period.

This firm's well-known patent sewage distributors are reported to continue to give excellent results, as proved by the repeat orders received. These comprise rotary, reciprocating, fixed pipe and nozzle and power-driven sprinklers for operating any type of bacteria bed. In the case of power-driven reciprocating distributors, one electric motor may be used to drive any number of machines by means of ropes, or separate motors may be fixed on each machine, and provided with trolley arms. If the electric current is not available, a paraffin engine may be mounted on the distributor, or placed in a cabin to operate a rope drive. Two methods of distribution may be adopted—(a) where the filter is of great length, the distributor may discharge across the entire width of the filter, when the rest and spray interval are alternately long and short, and (b) where the filter is of normal length, the distributor may discharge across half the width of same, in one direction, and the other half on the return journey. In the latter case the rest and spray intervals are equal. If desired, a combination of these two methods may be employed, so that the rest and spray intervals may be equal with a normal flow, and alternately long and short in storm time, the distributor automatically adjusting itself to the sewage flow. This firm also supply power-driven distributors which have no small holes to choke.

Messrs. J. Stone & Co., Limited, further report that they are making a speciality of domestic sewage purifiers, and they have just issued a descriptive pamphlet dealing with these appliances. They state that a copy of this will be forwarded on request. The apparatus is sent out complete ready for work, and the orders in hand and contemplated provide evidence of the great utility of this purifier. Large orders for Stone's patent flushing syphons have been executed during the past year. Fifty syphons have been shipped to Colombo for the Crown Agents for the Colonies, and a quantity are in hand for Madura Tuticorin drainage to the order of the India Office. Cesspool emptying cylinders, working on the vacuum principle, are manufactured by Messrs. J. Stone & Co., Limited, and embody all the latest improvements. With these cylinders there is no nuisance from smell when emptying the cesspool. The vacuum is formed by a pump, driven by hand, or from a road wheel of the vehicle, or by an independent oil engine. The cylinders are mounted on suitable trolleys with strong axles, the road wheels being suitable for travelling on soft ground.

Orders from all parts of the world have been received for this firm's well-known sewage and water valves and fittings, in which they have specialised for upwards of seventy years.

TUKE & BELL.

Messrs. Tuke & Bell, of 599 High-road, Tottenham, London, N., report a year of increased activity. The main increase in their work appears to have been in the raising of sewage by means of ejectors and by direct air lifts. They have in the past twelve months completed important contracts of this kind for the Hornsey Borough Council, the Oldham Corporation, Hayes Urban District Council, and several others. They have also been very successful as regards their special patent apparatus for small sewage disposal schemes, such as for villages, sanatoria, and other isolated buildings, special attention having been devoted to the production of an apparatus which requires the minimum of attention. This effort on their part has been much appreciated by engineers of several sewage schemes in country districts where their apparatus has been fixed.

THE STODDART DISTRIBUTOR.

As previously announced, the manufacture and sale of this appliance is now in the hands of Mr. Charles Walker, of 20 Denmark-avenue, St. Augustine's,

Bristol, Mr. F. Wallis Stoddart, the original patentee, having reverted to his original practice as consultant on matters of sewage disposal and water supply. Mr. Stoddart has now no financial interest in the business, and Mr. Walker reports that he has experienced a very successful year in the sale of the Stoddart distributor, as well as other sewage appliances. Quite a large proportion of the business has been done in the Colonies, especially South Africa and Canada, while the business done in Great Britain has been encouraging, and shows great promise for the future.

There are now over 700 places in Great Britain and the Colonies where these distributors have been installed, and are, so far as can be ascertained, giving satisfaction.

DIBDIN'S SLATE BEDS.

Among other schemes for sewage purification carried out by Messrs. Dibdin's biological slate beds during the past year mention should be made of the completion of the slate beds for treating the sewage and storm water of Faversham, the slate beds for the Harpenden works, and a complete installation of six slate beds, two slate storm-water beds, humus beds, and six clinker beds, formed with slate slab construction, including slate paths, copings and channels, at the Borstal Institution, Rochester, for the Prison Commissioners. The new works for the Blean Rural District Council consist of eight slate beds, seven humus beds, and eight clinker beds, with slate paths, copings and channels. The slate bed installation at Bitterne Manor, Southampton, has been completed.

The slate bed scheme for Park Prewett Asylum has been approved by the Local Government Board, and the contract for this scheme is let. Similar schemes for Crediton, Devon, Gravesend, and the Redruth Rural District Council have been adopted, and will shortly be laid before the Local Government Board, and the High Wycombe slate bed extension scheme is now before the Local Government Board.

Numerous tenders for slate bed installations in various parts of the country are now awaiting formal acceptance, and this firm seems to have a full programme for the present year.

ADAMS-HYDRAULICS, LIMITED.

Messrs. Adams-Hydraulics, Limited, of York, have been uniformly busy in all departments during the year, and at the present time have many large contracts in hand, including no less than nineteen ejectors. Early in the year the local corporation passed plans for large extensions to their engineering works, including new pattern and erecting shops. These have been carried out, and will enable them to produce the largest and heaviest class of penstocks and valves. To further economise floor space in the works, the motors by which all the machines are driven have been removed, and now occupy overhead positions. The number of revolving sprinklers for percolating filters supplied during the past year by this firm has been more than in any previous year, and this applies also to the sale of their patent conical "Mota" man-hole and lamphole covers.

MANLOVE, ALLIOTT & CO., LIMITED.

Messrs. Manlove, Alliott & Co., Limited, of Nottingham, have carried out a considerable amount of work in connection with sewage disposal during the past year. A large sewage plant, consisting essentially of sludge pumps, water pumps, centrifugal pumps, lime mixers, gas and oil engines, &c., for the city of Bath, is now practically completed. A sewage ejector plant capable of dealing with 3,600 gallons of sewage in two hours, with a maximum lift of 40 ft., is being built by Messrs. Manlove, Alliott & Co., Limited, for the Rushden Urban District Council. The plant consists of one of their automatic pneumatic ejectors, air compressor, air receiver, piping, &c. The ejector will be arranged with special automatic valves, so that when once the air pressure has been turned on, the ejector will work continuously and automatically. This firm have also supplied filter-pressing plants for dealing with sewage sludge to the corporation of Nelson, Lancashire, also to the Stalybridge and Dukinfield Joint Sewerage Board.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier*.

Literature of Municipal Engineering in 1913.

[Any book included in this summary will be forwarded, post free, on application to the St. Bride's Press, Limited, 24 Bride Lane, Fleet Street, E.C. The published price must be enclosed.]

In accordance with our usual custom, we publish below a summary of the books dealing with subjects of interest to municipal engineers which have been issued during the past year. In doing so we would again direct the attention of our readers to the Book Department carried on in connection with THE SURVEYOR, through which technical books, issued by various publishers, may be obtained from a single source with the minimum amount of trouble. Orders by post receive careful and prompt attention, and particulars and lists of books on any desired subject may be obtained upon application. The references in brackets are to the volume and page of THE SURVEYOR in which a review has appeared.

Annuals and Year-books.

- "Hazel's Annual, 1913." Edited by Hammond Hall. Price 3s. 6d. nett. London: Hazell, Watson & Viney, Limited. (Vol. 43, p. 49.)
- "Mechanical World' Pocket Diary and Year-book for 1914." Price 6d. Manchester: Emmott & Co., Limited. (Vol. 44, p. 783.)
- "The Englishwoman's Year-book and Directory, 1913." Edited by G. E. Mitton. Price 2s. 6d. nett. London: A. & C. Black. (Vol. 43, p. 49.)
- "The Gasworks Directory and Statistics for 1913-14." Price 10s. 6d. nett. London: Hazell, Watson & Viney, Limited. (Vol. 44, p. 872.)
- "The International Whitaker." Price 2s. nett. (Vol. 43, p. 49.)
- "The Municipal Year-book for 1913." Price 15s. nett. London: The Municipal Journal, Limited. (Vol. 43, p. 577.)
- "The Social Guide, 1913." Edited by Mrs. Hugh Adams and Edith A. Browne. Price 2s. 6d. nett. London: A. & C. Black. (Vol. 44, p. 35.)
- "The Writers' and Artists' Year-book, 1913." Edited by G. E. Mitton. Price 1s. nett. London: A. & C. Black. (Vol. 43, p. 107.)
- "Whitaker's Almanac, 1914." By Joseph Whitaker, F.S.A. Price 1s. (paper) and 2s. 6d. (half bound). London: J. Whitaker & Sons, Limited. (Vol. 44, p. 977.)
- "Whitaker's Almanac, 1913." Price 2s. 6d. (cloth). 1s. (paper). (Vol. 43, p. 107.)
- "Whitaker's Peerage, Baronetage, Knightage and Companionship, 1913." Price 5s. nett. (Vol. 43, p. 49.)
- "Whitaker's Peerage, Baronetage, Knightage and Companionship, 1914." Price 5s. nett. London: J. Whitaker & Sons, Limited. (Vol. 44, p. 977.)
- "Who's Who, 1913." Price 15s. nett. London: A. & C. Black. (Vol. 43, p. 49.)
- "Willing's Press Guide, 1913." Price 1s. London: James Willing, Limited. (Vol. 43, p. 260.)

Applied Mathematics.

- "Elementary Graphic Statics." By J. T. Wright, A.M.I.MECH.E. Price 4s. nett. London: Whittaker & Co. (Vol. 44, p. 977.)
- "Elements of Hydraulics." By Mansfield Merriman. Price 4s. 6d. nett. London: Chapman & Hall. (Vol. 43, p. 414.)
- "Four-place Tables of Logarithms and Trigonometric Functions." By E. V. Huntington. Price 3s. nett. London: E. & F. N. Spon, Limited. (Vol. 44, p. 173.)
- "Graphics and Structural Design." By H. D. Hess, M.E. Price 12s. 6d. nett. London: Chapman & Hall, Limited. (Vol. 44, p. 782.)
- "Strength of Materials." A Text-book for Secondary Technical Schools. By Mansfield Merriman. Price 4s. 6d. nett. New York: John Wiley & Sons. London: Chapman & Hall. (Vol. 43, p. 414.)

Architecture and Building.

- "Builders' Quantities." By W. E. Ballard, ASSOC. M. INST. C.E. Price 2s. 6d. nett. London: Longmans, Green & Co. (Vol. 44, p. 273.)
- "Building Supervision." By George W. Grey, L.R.I.B.A. Price 2s. 6d. nett. London: E. & F. N. Spon, Limited. (Vol. 44, p. 554.)

"Fire Prevention and Fire Protection as Applied to Building Construction." By Joseph Kendall Freitag. Price 17s. nett. New York: John Wiley & Sons. London: Chapman & Hall. (Vol. 43, p. 113.)

"Fire Protection in Buildings." By Harold G. Holt, A.R.I.B.A. Price 8s. 6d. nett. London: Crosby Lockwood & Son. (Vol. 44, p. 173.)

"Laxton's Price-book, 1913." Price 4s. London: Kelly's Directories, Limited. (Vol. 43, p. 260.)

"Lockwood's Builders' Price-book for 1913." Edited by F. T. W. Miller, A.R.I.B.A. Price 4s. London: Crosby Lockwood & Co. (Vol. 43, p. 260.)

"Modern Technical Drawing." By George Ellis. Price 5s. nett. London: B. T. Batsford. (Vol. 44, p. 912.)

"Structural Details of Hip and Valley Rafters." By C. T. Bishop, C.E. Price 7s. 6d. nett. New York: John Wiley & Sons. London: Chapman & Hall, Limited. (Vol. 43, p. 260.)

"The Elements of Heating and Ventilation." By A. M. Greene, junr. Price 10s. 6d. nett. London: Chapman & Hall, Limited. (Vol. 43, p. 504.)

"The Public Works Calculator." By a Public Works Officer. Second Edition. Price 2s. 6d. nett. London: Crosby Lockwood & Son. (Vol. 44, p. 912.)

Coast Protection.

"Coast Erosion and Protection." By Ernest R. Matthews, ASSOC. M. INST. C.E., &c. Price 10s. 6d. nett. London: Charles Griffin & Co., Limited. (Vol. 44, p. 488.)

"The Use of Vegetation for Reclaiming Tidal Lands." By Gerald O. Case. Price 2s. nett. London: The St. Bride's Press, Limited. (Vol. 44, p. 783.)

Electricity.

"Bells, Indicators, Telephones, Fire and Burglar Alarms, &c." By J. B. Redfern and J. Savin. Price 1s. 6d. nett. London: Constable & Co., Limited. (Vol. 43, p. 414.)

"Electric Furnaces in the Iron and Steel Industry." By W. Rodenhauser and I. Schoenawa; authorised translation and additions by C. H. Vom Baur. Price 15s. nett. London: Chapman & Hall, Limited. (Vol. 43, p. 818.)

"Essentials of Electricity." By W. H. Timbie. Price 5s. 6d. nett. New York: John Wiley & Sons. (Vol. 43, p. 377.)

"Switchgear and the Control of Electric Light and Power Circuits." By A. G. Collis, A.M.I.E.E. Price 1s. nett. London: Constable & Co., Limited. (Vol. 44, p. 872.)

"The Practice of Electrical Wiring." By D. S. Munro, A.M.I.E.E. Price 3s. nett. London: H. Alabaster, Gatehouse & Co. (Vol. 43, p. 167.)

Heat Engineering.

"Elements of Heat Power Engineering." By C. F. Hirschfeld and W. N. Barnard. Price 21s. nett. London: Chapman & Hall, Limited. (Vol. 43, p. 679.)

"Heat: A Manual for Technical and Industrial Students." By J. A. Randall. Price 6s. 6d. nett. London: Chapman & Hall, Limited. (Vol. 43, p. 747.)

"The Working of Steam Boilers." By E. G. Hiller, B.Sc., &c. Fifth edition. Price 1s. 6d., cloth 2s. Manchester: Taylor, Garnett, Evans & Co., Limited. (Vol. 44, p. 783.)

Highways.

"Asphalt Construction for Pavements and Highways." A Pocket-book for Engineers, Contractors and Inspectors. By Clifford Richardson, M.A.M. soc. C.E., F.C.S. Price 8s. 4d. nett. London: The Hill Publishing Company, 6 Bouverie-street, E.C. (Vol. 43, p. 967.)

"English Local Government: The Story of the King's Highway." By Sidney and Beatrice Webb. Price 7s. 6d. nett. Longmans, Green & Co. (Vol. 43, p. 459.)

- "Prospective Opportunities for Highway Engineers in a National Highways Department." By C. H. Davis, President of the National Highways Association, United States. (Vol. 44, p. 414.)
- "Public Road Systems of Foreign Countries and of the Several States [United States]. Prepared under the direction of the Hon. Jonathan Bourne, junr., chairman of the Joint Committee on Federal Aid in the Construction of Post Roads, United States. (Vol. 44, p. 294.)
- "Specifications for Street Roadway Pavements: With Instructions to Inspectors on Street-paving Work." By S. Whinery, M.A.M.SOC.C.E. (Second Edition.) Price 4s. 2d. nett. New York: The McGraw-Hill Book Company. London: The Hill Publishing Company, Limited, 6 Bouverie-street, E.C. (Vol. 43, p. 911.)
- "Text-book on Highway Engineering." By Arthur H. Blanchard and Henry B. Drowne. Price 19s. nett. New York: John Wiley & Sons. London: Chapman & Hall, Limited. (Vol. 44, p. 628.)

Hygiene, Public Health, and Sanitation.

- "Chloride of Lime in Sanitation." By Albert H. Hooker. Price 12s. 6d. nett. London: Chapman & Hall, Limited. (Vol. 43, p. 963.)
- "Disinfection and Disinfectants." By M. Christian. Translated from the German by Charles Salter. Price 5s. nett. London: Scott, Greenwood & Son. (Vol. 44, p. 273.)
- "Modern Sanitary Engineering and Plumbers' Work." By A. Herring-Shaw and H. F. V. Newsome. Vol. I., price 2s. nett. Vol. II., price 2s. 6d. nett. London: Longmans, Green & Co. (Vol. 44, p. 35.)

Legal.

- "Local Government, 1912-1913. Comprising Statutes, Orders, Forms, Cases and Decisions of the Local Government Board." Edited by Alexander Macmorran, M.A., one of His Majesty's Counsel, and Kenneth M. Macmorran, M.A., LL.B., of the Middle Temple and Western Circuit, Barrister-at-Law (Editors of "Local Government, 1908-1912; Statutes, Orders, Forms, Cases, Decisions.") Price 20s. nett. London: Butterworth & Co., Bell-yard, Temple Bar; Shaw & Sons, 7 and 8 Fetter-lane, E.C. October, 1913. (Vol. 44, p. 758.)
- "The Land Transfer 'Scandal.'" By J. S. Rubenstein. Third edition. Price 2s. 6d. London: Sweet & Maxwell, Limited. (Vol. 44, p. 526.)
- "The Law and Practice of Town Planning." By R. A. Glen, Barrister-at-Law, and Arthur D. Dean. Price 15s. London: Butterworth & Co. and Shaw & Sons. (Vol. 43, p. 413.)
- "The Law of Extraordinary Traffic on Highways." In eight parts. By Bernard Lailey, Barrister-at-Law, of the Middle Temple and South-Eastern Circuit. Price 7s. 6d. nett. London: Sweet & Maxwell, Limited. (Vol. 43, p. 26.)
- "The Law Relating to Highways." By H. Hampton Copnall, solicitor, clerk of the Notts County Council, author of "The Law Relating to Locomotives on Highways," "The Law Relating to Infectious Diseases and Hospitals," &c., &c. (Second Edition.) Price 21s. nett. London: Charles Knight & Co., Limited. (Vol. 43, p. 49.)
- "The Law Relating to Town Planning." By Harry Barlow, Esq., Barrister-at-Law. Price 6s. 6d. nett. London: Eyre & Spottiswoode, Limited. (Vol. 44, p. 554.)
- "Tithe Rent-charge Table, 1913." By P. W. Millard, LL.B. Price 1s. London: Shaw & Sons. (Vol. 43, p. 260.)

Materials.

- "A Manual of Cement Testing." By W. A. Richards and H. B. North, D.Sc. Price 6s. nett. London: Constable & Co., Limited. (Vol. 44, p. 35.)
- "Cement, Concrete and Bricks." By Alfred B. Searle. Price 10s. 6d. nett. London: Constable & Co., Limited. (Vol. 44, p. 782.)
- "Natural Rock Asphalts and Bitumens: Their Geology, History, Properties and Industrial Application." By Arthur Danby. Price 8s. 6d. nett. London: Constable & Co., Limited. (Vol. 43, p. 967.)
- "Paint and Painting Defects: Their Detection, Cause and Cure." By J. Cruickshank Smith, B.Sc., F.C.S.

Price 3s. 6d. London: The Trade Papers Publishing Company, Limited. (Vol. 43, p. 747.)

- "Portland Cement: Its Manufacture, Testing and Use." By D. B. Butler, ASSOC.M.INST.C.E. Price 16s. nett. London: E. & F. N. Spon, Limited. (Vol. 44, p. 628.)
- "Practical Stone Quarrying." By Allan Greenwell, ASSOC.M.INST.C.E., and S. V. Elsdon, D.Sc. Price 12s. 6d. nett. London: Crosby Lockwood & Son. (Vol. 44, p. 783.)

Miscellaneous.

- "All about Engineering." By Gordon D. Knox. Price 6s. London: Cassell & Co., Limited. (Vol. 44, p. 783.)
- "Books that Count." Edited by W. Forbes Gray. Price 5s. nett. London: A. & C. Black. (Vol. 43, p. 26.)
- "British Rainfall, 1912." By H. R. Mill, director of the British Rainfall Organisation, assisted by Carle Salter, chief assistant. Price 10s. London: Edward Stanford, Limited. (Vol. 44, p. 449.)
- "Computations for Marine Engines." By C. H. Peabody. Price 10s. 6d. nett. London: Chapman & Hall, Limited. (Vol. 44, p. 273.)
- "Engineering as a Profession." By A. P. M. Fleming, M.I.E.E., and R. W. Bailey, WH.Sc. Price 2s. 6d. nett. London: John Long, Limited. (Vol. 44, p. 554.)
- "Forest Physiography." By Isaiah Bowman. Price 21s. nett. New York: John Wiley & Sons. (Vol. 43, p. 818.)
- "Gas and Fuel Analysis for Engineers." By Augustus H. Gill, S.B., PH.D. Price 5s. 6d. nett. London: Chapman & Hall, Limited. (Vol. 44, p. 173.)
- "National and Municipal Finance." By Walter Jones, J.P., M.I.MECH.E. Price 1s. nett. London: Frank Palmer. (Vol. 44, p. 35.)
- "Our Village Homes: Present Conditions and Remedies." By Hugh Aronson, M.A., Barrister-at-Law. Price 2s. 6d. nett. London: Thomas Murby & Co. (Vol. 43, p. 747.)
- "Report on Coal and Power Investigation, for the Board of Highway Commissioners, Saskatchewan." By R. O. Wynne Roberts, M.INST.C.E. (Vol. 44, p. 872.)
- "The Art and Craft of Garden Making." Fourth Edition. By Thomas H. Mawson. Price £2 10s. nett. London: B. T. Batsford. (Vol. 43, p. 26.)
- "The Improvement of Rivers. A Treatise on the Methods Employed for Improving Streams for Open Navigation, and for Navigation by means of Locks and Dams." By B. F. Thomas and D. A. Watt. Second Edition. Price 31s. 6d. nett. London: Chapman & Hall, Limited. (Vol. 44, p. 758.)
- "The New English System of Money, Weights and Measures, and of Arithmetic." By Engineer Rear-Admiral Elbow, R.N. Price 1s. nett. London: P. S. King & Son. (Vol. 43, p. 1,019.)

Reinforced Concrete.

- "Cassell's Reinforced Concrete." Edited by Bernard E. Jones, assisted by Albert Lakeman and a staff of Specialist Writers. Price 15s. nett. London: Cassell & Co., Limited. (Vol. 43, p. 413.)
- "Continuous Beams in Reinforced Concrete." By Burnard Geen, ASSOC.M.INST.C.E., M.S.E., M.C.I. Price 9s. nett. London: Messrs. Chapman & Hall, Limited. (Vol. 43, p. 773.)
- "Estimating for Reinforced-Concrete Work." By Major T. E. Coleman. Price 4s. nett. London: B. T. Batsford. (Vol. 43, p. 26.)

Sewerage and Sewage Disposal.

- "Drainage and Sanitation." By E. H. Blake, F.S.I. Price 10s. nett. London: B. T. Batsford.
- "Trade Waste Waters: Their Nature and Disposal." By H. Maclean Wilson, M.D., B.Sc., and H. T. Calvert, M.Sc., PH.D., F.I.C. Price 18s. London: Charles Griffin & Co., Limited.
- "Water Purification and Sewage Disposal." By Dr. J. Tillmans, director of the chemical department of the Municipal Institute of Hygiene, Frankfort-on-Main. Translated by Hugh S. Taylor, M.Sc. (University of Liverpool). Price 7s. 6d. nett. London: Constable & Co., Limited. (Vol. 44, p. 75.)

Structural Engineering.

- "A Treatise on Wooden Trestle Bridges and their Concrete Substitutes." Fourth Edition. By Wolcott C. Foster. Price 21s. nett. London: Chapman & Hall, Limited. (Vol. 44, p. 591.)
- "Earthwork Haul and Overhaul." By J. C. L. Fish. Price 6s. 6d. nett. London: Chapman & Hall, Limited. (Vol. 43, p. 1,019.)

Surveying.

- "Land and Mining Surveying." By G. L. Leston. Price 6s. nett. London: Crosby Lockwood & Son. (Vol. 43, p. 260.)
- "Records of the Survey of India." (Vol. II., 1910-1911. Prepared under the direction of Colonel S. G. Burrard, C.S.I., R.E., F.R.S., Surveyor-General of India. Price 6s. (Vol. 43, p. 704.)
- "Survey of India: General Report on the Operations during the Survey Year 1911-1912. Prepared under the direction of Colonel S. G. Burrard, C.S.I., R.E., F.R.S., Surveyor-General of India. Price 2 rupees (3s.). Survey of India Office, Calcutta, and agents. (Vol. 44, p. 753.)
- "The Field Engineer's Handbook." By G. Carveth Wells, A.C.G.I., and Arundel S. Clay, B.Sc., A.C.G.I. Price 7s. 6d. nett. London: Edward Arnold. (Vol. 43, p. 841.)

Topography.

- "Northampton." By S. S. Campion, J.P. Price 3d. London: The Homeland Association, Limited. (Vol. 43, p. 107.)
- "Northwood (Middlesex)." By Arthur Henry Anderson. Price 3d. London: The Homeland Association. (Vol. 44, p. 943.)

Valuation.

- "Valuation of Real Property." By C. A. Webb, F.S.I. Third Edition, revised and enlarged by Arthur Hunnings, F.S.I. Price 7s. 6d. nett. London: Crosby Lockwood & Son. (Vol. 44, p. 526.)
- "Valuation Tables." By Richard Parry, F.S.I., & C. Price 7s. 6d. London: The Estates Gazette, Limited. (Vol. 44, p. 912.)

Water Supply.

- "Catskill Water Supply of New York City." By Lazarus White. Price 25s. 6d. nett. New York: John Wiley & Sons. (Vol. 44, p. 590.)
- "Elements of Water Bacteriology." By S. C. Prescott and C. E. A. Winslow. Third Edition. Price 7s. 6d. nett. New York: John Wiley & Sons. (Vol. 44, p. 591.)
- "Modern Pumping and Hydraulic Machinery." By Edward Butler, M.I.MECH.E. Price 18s. nett. London: Charles Griffin & Co., Limited. (Vol. 43, p. 704.)
- "Transactions of the Institution of Water Engineers, Vol. xvii., 1912." Edited by Percy Griffith, M.INST.C.E., F.G.S., secretary. (Vol. 44, p. 173.)
- "Underground Waters for Commercial Purposes." By Frank L. Rector, B.S., M.D. Price 4s. 6d. nett. London: Messrs. Chapman & Hall, Limited. (Vol. 44, p. 782.)
- "Waterworks Directory and Statistics." Price 10s. 6d. nett. London: Hazell, Watson & Viney, Limited. (Vol. 44, p. 872.)

Pocket-books.

- "The American Civil Engineers' Pocket-book." Second Edition. Edited by Mansfield Merriman and others. Price 21s. nett. London: Chapman & Hall, Limited. (Vol. 43, p. 377.)
- "The Civil Engineers' Pocket-book." By Albert J. Frye. Price 21s. nett. London: Constable & Co., Limited. (Vol. 43, p. 818.)
- "The Engineer's Year-book of Formulae, Rules, Tables, Data, &c." A compendium of the Modern Practice of Civil, Mechanical, Electrical, Gas, Marine and Mine Engineering. By H. R. Kempe, M.INST.C.E., with the collaboration of eminent specialists. Price 12s. 6d. With over 1,250 illustrations specially engraved for the work. London: Crosby Lockwood & Son. (Vol. 43, p. 377.)
- "Molesworth's Pocket-book of Engineering Formulae." Twenty-seventh Edition. Price 5s. nett. London: E. & F. N. Spon, Limited. Vol. 44, p. 554.)

New Schools for London.—The London County Council Education Committee on Wednesday arranged to build ten new elementary schools in Bethnal Green and Hackney at a cost of £260,000.

WATER IN MACADAM ROAD CONSTRUCTION.**SILICATE BINDING AT SHEFFIELD.**

Prof. W. G. Fearnside, M.A., F.G.S., Sorby Professor of Geology at Sheffield University, last week repeated before the Sheffield Society of Architects and Surveyors the address on "The Part Played by Water in Macadam Road Construction," which he delivered at a recent meeting of the Surveyors' Institution in London. [See THE SURVEYOR, November 28th and December 19th last.]

In the course of the discussion which ensued, a letter from Mr. W. J. Hadfield, surveyor of highways for Sheffield, was read.

Mr. Hadfield wrote that whereas five years ago water-bound macadam constituted about 66 per cent of the material used for Sheffield's macadamised roads, and tar-macadam about 33 per cent, during the last two years tar-macadam represented more than 80 per cent, and water-bound macadam less than 20 per cent. Water had also become a less important factor in macadam roads which were not made of tarred materials. "We are now binding the macadam of some of our important roads," said the writer, "with silicate. This kind of work has been done here for three or four years with excellent results. . . . Slag, properly used, is a most excellent material for surfacing and foundations. Our trouble is to get sufficient of the right quality."

Commenting on the letter, Prof. Fearnside said he thought Mr. Hadfield would admit that there was such a thing as a foundation for a road, and unless he was prepared to replace all foundations by concrete or some other very strong material, Mr. Hadfield must at least deal with the water as it came up from below and in from the side. Binding with silicate was a very interesting process. Although silicates were very efficacious in keeping down the dust for a considerable portion of the year, there did at times come a very terrible reaction, and that wanted looking into. He thought the use of silicates on the average was generally good. He agreed with Mr. Hadfield's allusion to slag, but he would underline the words "right quality."

NEW SESSIONS HOUSE FOR LONDON.**ARRANGEMENT OF THE BUILDING.**

The new sessions house at Newington will, states a report of the Local Government Committee of the London County Council, contain four floors.

The lower ground floor will be occupied chiefly by the cells and other accommodation for the prisoners, the remaining space being used for storage rooms, records, and for the public refreshment room. On the principal floor, which is about 6 ft. above the courtyard level, there will be a large public waiting hall, two courts for criminal business, and one for civil business, a reference library, rooms for the chairman and deputy chairman of quarter sessions and various officials, and offices for licensing, assessment and other business. On the first floor will be rooms for the grand jury and the jury in waiting, and a committee room and other offices. On the second floor there will be common rooms for the justices, the bar and the solicitors, and kitchen and office accommodation. The rooms on the upper floors will be served by passenger lifts. The fronts to the principal forecourt and Union-road will be faced with Portland stone, and all the walling at the back and the remaining flank will be finished with plain stock brick. The roofs will be slated. Internally the finishings will be simple and substantial. Panelling will be introduced in the courts and in some of the more important rooms, but generally the walls will be plastered.

Having regard to the size and character of the building, the committee suggest that only selected firms of known capacity should be invited to tender for the work, and as the building is required to be provided with the least possible delay, they recommend that alternative prices for completing the work in twelve, sixteen and twenty-one months should be obtained.

Sewage Disposal at Rothesay.—Mr. J. B. Brodie, consulting engineer, has prepared a scheme of sewage disposal which, with an alternative scheme, is now under the consideration of the Rothesay Town Council. Under the alternative scheme the work is divided into three sections, the estimated cost being £24,000.

Water Supply Works in 1913.

MANUFACTURERS' REPORTS.

The reports received from manufacturers this year are of particular interest.

PURIFICATION PLANT.

Messrs. Mather & Platt have carried out a large number of works in which their mechanical filters and coagulating plant have been installed. The Sheffield Corporation possesses a plant capable of dealing with 7,000,000 gallons a day, the filters being thirty-two in number and 8 ft. in diameter. This has been working regularly during the past year giving excellent results, which fact has induced the Sheffield Corporation to order a further installation of 8-ft. diameter filters, twenty-four in number, which is to be set up at Rivelin. More filters have been installed for the Rhymney and Aber Valleys Water Company, making the total sixteen 8-ft. diameter filters. These are all now in working order, and are giving most excellent results. Similar installations have been fixed at Fraserburgh, the South Staffordshire waterworks, and at many other places.

The "Turn-Over" Filter Company, of Belfast, reports that a great deal of work is being done in connection with the purification of river waters for industrial purposes. They have also completed some interesting works in connection with public baths, notably one for the Bradford Corporation and another for Brighouse. In the case of Belfast, an analysis was made of the town water just before the plant was started, and a sample of the bath water was analysed after the bath had been in constant use for six months; both gave practically the same results, and were pronounced by the county analyst as being passable drinking waters. The town water used in the pond was so brown and peat-stained that the bottom of the pond could not be seen; but two days after the plant had been at work the water was transformed into one brilliantly clear and colourless. The process of purification consists of chemical treatment and filtration, lime water being used as a steriliser.

The Kennicott Water Softener Company, of Wolverhampton, have lately put on the market an entirely new type of water-softening plant which has no valves or cups for proportioning the lime used for softening, thus eliminating a serious source of trouble. It is also equipped with a means for entirely removing the whole of the sludge from the bottom of the main settling tank without emptying out the plant, and, further, it is the only plant on the market which provides mechanical agitation for this purpose without employing any outside power, the power of the incoming water being used. During the past year this company have installed plants for the corporations of Bootle, Ashton-under-Lyne, Hull, Swindon and Manchester, and at Mexborough on the Great Central Railway, and they have erected the latest water-softening plant installed on any railway in the United Kingdom. The Kennicott Water Softener Company have also supplied large plant to the South Australian Government and to the South African Government, and plant for various industrial concerns throughout the country.

During the past year Messrs. The Ransome-verMehrs Machinery Company, Limited, have installed filter plant for the Merthyr Tydfil Corporation at their reservoirs at Torpantau, for the North Pembroke-shire Water and Gas Company at their Fishguard works, for the city of Toronto at the Lake Shore pumping station, for the Fisheries Department of the Canadian Government at Collingwood, and they have in course of completion at the present time filters for the Antofagasta (Chili) and Bolivia Railway Company, Limited, and for Recife, South America. The largest and most important plant is a battery of ten filters with a capacity of 3,000,000 gallons per day for supply through the Crown Agents for the Colonies to the city of Kingston, Jamaica.

There is no doubt whatever that the Lassen-Hjort Softener owes its widespread adoption to its distinctive devices for the rigidly accurate measurement of both the hard water and the chemical required to treat it. The plant is designed so that the water to be treated (no matter how large a quantity) may be first measured automatically in small definite parcels, and then mixed—also automatically—with the exact

amount of chemicals required to soften it completely without there being any excess of chemicals allowed to remain in the treated water as it passes from the softener. This mechanism is exceedingly simple and accurate, possessing few moving parts, and all these readily accessible. A salient feature is the employment of a positive chemical measuring valve which enables the user to exercise absolute control over the quantity of chemical delivered into the water, and admits of the most delicate adjustment. A large number of important contracts have been carried out by Messrs. Lassen & Hjort during 1913, among the most noteworthy of these being the water softening installation for the Middlesex County Council at their Napsbury Asylum, the completion of the installations for treating the entire supplies to the towns of Walton-le-Dale, Lancashire, and Brumby and Frodingham, Lincolnshire, and the erection of huge water softening plants for the English Sewing Cotton Company, and Messrs. Fox Bros., Wellington, Somerset. Other large installations include the Rossington Main Colliery Company, Limited, 400,000 gallons per day; Thomas Owen & Co., Limited, Ely Paper Mills, Cardiff, 300,000 gallons per day; Denby Iron and Coal Company, Limited, Denby, 150,000 gallons per day; John Spencer & Sons Limited, Newburn, Newcastle-on-Tyne, 100,000 gallons per day. It is interesting to note that negotiations have been concluded between Messrs. Lassen & Hjort and Messrs. Water Softeners, Limited, under which the two firms will henceforth operate as a joint concern under the title of the United Water Softeners, Limited. Messrs. Water Softeners, Limited, are the proprietors of the recently introduced "Permutit" regenerative process. The "Permutit" process reduces a water, however hard, down to zero, whether the water is of a changeable character or not, and is the only method other than distillation by which the hardness of water may be so reduced. The advantages of a completely softened water are very great in trades such as dyeing and bleaching, wool scouring, laundry work, &c.

The Candy Filter Company, of Westminster, have recently installed a large battery of their oxidising and aerating filters for removing iron without the use of chemicals for the Biggleswade Water Board; another battery for the same purpose for the Nuneaton Corporation, and for the Baddesley Collieries Trustees, who supply the towns of Tamworth and Atherstone. Cromer has also adopted Candy oxidising filters for removing the iron from the public supply, a filter plant of the compound type for dealing with 40,000 gallons per hour having just been completed for that town. De-Clor filter plants have, during the last year, been supplied to towns in the United Kingdom, as also shipped to South Africa, Madeira, China, Japan, the Malay States. The Candy Filter Company's works are also busy with orders from Australia, New Zealand and elsewhere abroad. One of the largest butter-making firms in the world purifies all the water used in its dairies by the De-Clor system, in order to ensure the absolute bacterial purity of the water used in its manufacturing processes. In our issue of December 19th we described the improved method of water softening and iron removing plant erected by the Candy Filter Company for dealing with the public water supply of the town of Stowmarket. This installation includes what the Candy Filter Company term their "Compound" mechanical filter, which is found especially valuable for dealing with waters that have been treated chemically prior to filtration, or for any waters containing an unusually large amount of suspended matter, such as river or flood waters, turbid or muddy supplies generally. One of the many advantages claimed for the Candy "Compound" filter is that it combines in one cylinder two separate and distinct filters, one being a pre-filter, and the other a fine bed filter; this arrangement enables the filter to work for a much longer period without being put out of operation for cleansing than the ordinary mechanical filter. Among other filter plants supplied by the Candy Company in 1913 are a set of pre-filters for the West Hampshire Water Company, extensions and chemical plant for the Pontypridd and Rhondda Joint Water Board, the completion of a filter installation for the South Molton Corporation, and filters for many

other places, including Barnoldswick, the towns of Chippenham, Guisborough, Yorkshire, &c. &c.

SPECIAL TREATMENT.

Messrs. Royles, Limited, of Irlam, Manchester, have supplied an automatic filter with a capacity of 10,000 gallons per hour to the Swan Lane Collieries, Limited, of Wigan. This is used for filtering ochre water from a mine, which was previously discharged into a local stream. This discharge caused trouble with firms lower down the stream who utilised the water for boiler feed and for manufacturing purposes. The filter was put down to get over this difficulty, and the water now enters the stream perfectly clear and free from all trace of iron. This firm has also provided a very large number of plants of various kinds for large institutions and firms at home and abroad, softening plants, hardening plants, and filters too numerous to record in detail, not the least interesting of which is the large plant supplied to the Manchester Royal Infirmary for the prevention of rust and corrosion of the pipes.

The economical production of pure water from brine has been a branch of the Multiple Effect Evaporator business which the Mirreles Watson Company, Limited, of Glasgow, have developed largely and successfully for a number of years. Among their output for 1913 may be noticed a number of Sextuple Effects, whose guaranteed production is rated at 36 lb. of gained water per 1 lb. of fuel consumed, a figure which in actual work is generally exceeded by 20 per cent or more. Two such plants, one of large and one of moderate size, have been erected in the East for the Ottoman Government. A larger installation than the latter has been sent to the Italian Government for their Red Sea service, while in Southern Spain a leading railway company has installed the largest of all. The Peruvian Legation has been supplied with a small but highly interesting apparatus, designed for easy transport, being self-contained and accompanied by its own locomotive boilers. Another installation has gone to Australia.

PUMPS.

During the year that has closed the Pulsometer Engineering Company, Limited, of London and Reading, have carried out many important and interesting pumping installations for public authorities. Electrically driven turbine pumps for increasing the pressures in water mains to supply high-level districts now form a very convenient method of overcoming the difficulties so often experienced by municipal engineers in rapidly growing localities, and the Pulsometer Engineering Company have successfully installed pumps for this purpose to the Pontefract Urban District Council (two sets in different pumping stations), Castleford Urban District Council, Rotherham Corporation, &c. &c. Notwithstanding the fact that it has been on the market for many years, the Pulsometer steam pump has held its own against many claimants to the public notice, and retains its reputation as one of the handiest, hardest and certainly the most useful pump known. The number of instances where the Pulsometer steam pump has been utilised by municipal authorities during the past twelve months are far too numerous to permit of our mentioning them all, but the following two cases will probably prove of interest to our readers: Owing to the dry season, it was necessary to supplement quickly the water supply from a waterworks, and a No. 9 Pulsometer steam pump was installed. The duty of this pump was to deal with 20,000 gallons of water per hour, from 75 ft. below the surface, and deliver it through about $\frac{3}{4}$ mile of piping to one of the other pumping stations of the company. Another interesting instance where Pulsometer steam pumps have been utilised was at the recent army manoeuvres in Bucks, where five small Pulsometer steam pumps and boilers were used for supplying the whole of the water required by the troops and their horses. In this instance the water was drawn from five separate wells, down which each of the pumps was lowered by means of sling tackle.

Messrs. Ruston, Proctor & Co., have installed a large number of producer gas plants and engines for pumping purposes, having a power of from 100 to 152 b.h.p., to municipal and public waterworks. A very large and important list is furnished. Large crude oil engines for pumping purposes also form interesting items on the list.

Messrs. Drysdale & Co., Limited, of Glasgow, have supplied to the Portuguese Government centrifugal pumps driven by direct-current electric motors

arranged with vertical spindles. The pump in this instance is placed at the bottom of the well, just above the water-bearing strata, and the delivery pipe leads from this up to the storage reservoir. Messrs. Drysdale have also erected during the year a very large pumping station of this type in Canada for the supply of water to one of the Western towns. The method of distribution in this case was to pump the water into the pipe network throughout the city, no standpipe or reservoir being used. This was a case in which the centrifugal pump was specially adaptable, because when water is being drawn from the mains the pressure does not rise above a fixed limit depending upon speed and rotation. This pressure is constant, as the motors for driving the pumps are of the constant speed synchronous type. Each pump has a guaranteed output of 10,000,000 gallons per twenty-four hours and maintains with this delivery a pressure of 110 lb. per square inch. When the two units are arranged in series the pressure can be brought up to 160 lb. per square inch. For fire service a change over can be effected in a very short space of time owing to the arrangement of valves. Messrs. Drysdale have also supplied to the same Colony a turbine pump driven by water turbine. The water turbine is driven by water obtained from the same source as that from which the pump draws its supply. The pumped water is delivered to a standpipe, as is the usual practice in America. As in the previous case, the pressure can be raised by speeding up the turbine. Messrs. Drysdale have also supplied Booster pumps for fire service for increasing the pressure in existing water supply mains fed from gravitation reservoirs. These pumps were driven by A.C. motors.

Messrs. Tangyos, Limited, of Birmingham, have completed a large number of installations during 1913, driven by gas engines and suction-gas producers. These have been supplied for large waterworks at home and abroad. Large steam engines and pumps, lifting against a head of 1,663 ft., have been supplied for Hong Kong.

Messrs. the Campbell Gas Engine Company have carried out a large number of pumping installations during the past year, including gas engines, suction-gas plants and engines, oil engines, and turbine-driven pumps for various large municipal works.

The Dowson & Mason Gas Plant Company, Limited (combining the Dowson Economic Gas and Power Company, Limited, London, and Mason's Gas Power Company, Limited, Manchester), Alma Works, Levenshulme, Manchester, have carried out during the past year many works, the most important contract being that for the Metropolitan Water Board for their Chingford reservoir to drive four Humphrey patent gas pumps. This consists of four Dowson generators to develop a total of about 1,350-horse power. The year 1913 has been a very busy one, and on the furnace side the most important contract has just been completed for Sir W. G. Armstrong, Whitworth & Co., Limited, for their new Armstrong Shipyard, Walker-on-Tyne, Newcastle. This consists of a complete installation of gas-fired plate, bar and forge furnaces, and the necessary "Duff" gas producers, steel chimneys, flues, foundations, &c. They have also received many orders for the "Moore" patent water-jacketed gas producer with by-product recovery.

METERS.

Messrs. Kent report that the use of small and large meters for the measurement of water, air, &c., has been increased considerably during the year. Among the more interesting installations is one supplied to a large Chilean railway company. Several "Venturi" meters and reservoir level recorders were supplied to reservoirs at various points along the railway, and their records are conveyed electrically over a considerable distance to the office of the engineer-in-charge, where they all appear in one large cabinet, thus enabling the engineer to see at a glance the condition of these reservoirs. Another interesting installation is that supplied to a group of three mines in Asia. It was desired to obtain water from a common source situated at a considerable distance from the mines. The mineowners wished to avoid the expense of laying three pipe lines for the whole distance, but at the same time wished to ensure the equal division of the water. A common main has been brought to a point roughly equidistant from three meters governing the three separate supplies, and equity of division is assured by the use of "Venturi" meters and control gear, by means of which a record is given of the actual rate of flow passing to each main as well as

a registration of the total consumption by each. A Butterfly valve is contained in the downstream cone of each of the three "Venturi" tubes, and is controlled by means of the "Venturi" head and through the intermediary of a hydraulic cylinder. If any sudden demand upon the part of one main causes a rate of flow in excess of the proper quantity, the control gear within a few seconds closes the valve sufficiently to bring the flow within its proper limits; on the other hand, the control gear opens the valve wider when the diminished flow on the inlet side reduces the rate of flow.

STEEL PIPES.

Messrs. Stewarts & Lloyds report that last year's output of steel pipes was an easy record, and that this is principally due to the gradual adoption of steel where cast-iron was formerly used. The principal extensions in water supply in the past year have been in the newer countries, particularly Canada, Australia, South Africa, South America and India. Among the larger orders executed, or in progress, by Stewarts & Lloyds, Limited, may be mentioned 25 miles of 30-in. for Colombo waterworks, 10 miles of 24-in. for Port Arthur, Canada; some further 10 miles of 20-in. and 24-in., being extensions of previous large quantities supplied to Calgary (Canada), Vancouver, and Sarnia (Ontario); also some miles of 20-in. pipes for Santos; and sewage and water mains for Belfast, Burnley, and a number of other towns. Messrs. Stewarts & Lloyds have also supplied many hundreds of miles of smaller sizes (3-in. to 12-in.). All the above pipes were made by the lapwelded process; in addition they have a contract in hand of 5 miles of 45-in. diameter of the Mephan-Ferguson Lock Bar pipes. It will interest borough surveyors and engineers to note that in many of the above contracts steel pipes have now been adopted where cast-iron was formerly used. A visit to any one of Stewarts' & Lloyds' large pipe works, in England or Scotland, would well repay any municipal or water engineers who have water-pipe extensions in contemplation, and would certainly impress them with the immense developments in the steel pipe trade during the last ten years.

WELLS.

To report or to deal in detail with the long list of contracts for wells carried out during the past year by Messrs. A. C. Potter & Co., of Lant-street, Borough, would demand a long article dealing with the geology and water-bearing strata of many places. The work of this firm includes wells and pumping plant of various kinds of great magnitude.

Messrs. Le Grand & Sutcliffe, of Magdala Works, 125 Bunhill-row, have during the past year carried out a number of wells to which it is impossible to do justice in a short notice, so many and various are the instances and conditions, and so interesting are the results. The success of the year's work, and its importance and extent are very remarkable.

British Columbian Roads: A £33,000 a Mile Section.

—The remarkable fact is disclosed by the British Columbian estimates for 1913-14 that the province is spending for that period no less than £1,192,300 on roads, streets, bridges and wharves, and the appropriation for the greater part will be for roads and road bridges. Over 2,000 miles of road were built in 1913. The greatest single item in the provincial programme is an inter-provincial road from the western coast to the frontier of Alberta, and it is interesting to note that 6 miles of the old road—from Hope, up the Fraser, to Yale, and constructed by Sir James Douglas—was probably the most costly and dangerous ever built. The expense of replacing it would be over £200,000, and the new highway will therefore strike eastward from Hope to Princeton. The justification for so elaborate a scheme of road making is to be found in the prevalent use of the motor car. The distance from Vancouver to Seattle—some 200 miles—is daily covered by thirty or forty motor cars in the space of eight or nine hours. The road mileage of the province now exceeds 20,000—a figure which will be multiplied threefold when the Government's plans are completely carried out. The present total includes 2,050 miles in towns and rural municipalities, not under provincial management; 5,166 miles of trail passable at least by a pack-horse; and 12,847 miles of provincial roadway, of which over 5,000 have been brought up to standard—that is, they are surfaced with gravel or rock, and are not less than 16 ft. wide, while the highest grade is not over 8 per cent.—From the *Times* "Pacific Coast Number."

LONDON TRAFFIC PROBLEMS.

SIR HERBERT JEYKLL AT THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

"London Traffic Problems" was the subject of a paper read on Monday evening at a meeting of the Royal Institute of British Architects by Sir Herbert Jekyll. Discussing the need for new roads, Sir Herbert said that of the two methods of effecting improvement the construction of new streets was generally preferable to the widening of old ones, as it did not interfere with traffic, and in the end gave greater relief. Additional and wider bridges were also one of the pressing requirements at the present time. Necessary as it was to widen the principal thoroughfares or to add to their number, something might be done, at comparatively small expense, to increase their capacity. The greatest of all obstructions were the centre lamp-posts. They were even more pernicious than they appeared to be, for, although they were not wide, there was always a margin on each side within which no vehicle would pass, while the intervals between them were so short that little use could be made of the spaces between them. These were often occupied by cab ranks, so that practically a strip in the centre of the roadway was thrown out of use and the remainder was divided into two. Their retention was the less excusable because the advantages of central lighting could be had without them.

Reference was made by the author of the paper to the plan of new roads in London prepared by Colonel Hellard, and said the proposed roads were of three kinds—(1) radiating main roads; (2) encircling roads connecting with these, and making it possible to pass through London without traversing the crowded centre, and (3) by-pass roads, avoiding certain places where traffic was abnormally congested. Main roads should not be less than 100 ft. wide. In fixing this width it was not intended that the whole of it should be brought into use at once, but that no building should be allowed within 50 ft. of the centre line. If the width of new roads—especially such as radiated from the centre—were sufficient to admit of light railways on tracks of their own, apart from the roadway for ordinary traffic, such railways would assist materially in developing building areas, provided that the stopping places were far enough apart to admit of a high rate of speed.

Concluding his remarks, Sir Herbert strongly urged the establishment of a central authority with power, first, to lay down the lines of arterial roads, and, secondly, to require local authorities to make their schemes conform to prescribed lines.

DEATH OF CHESHIRE COUNTY SURVEYOR.

Mr. Harry F. Bull, ASSOC.M.INST.C.E., county surveyor of Cheshire, died, we regret to state, on Friday last at his residence Beechwood, Canal-street, Chester, after an illness of six months. He was fifty-one years of age. Mr. Bull became associated with the county surveyor's staff in 1889 as assistant to his uncle, the late Mr. Stanhope Bull, who was then county surveyor. On the death of his uncle, in 1896, Mr. Bull was appointed county surveyor. In addition to being an associate member of the Institution of Civil Engineers, he was a member of the Institution of Municipal and County Engineers, and a past-president of the County Surveyors' Society. For many years he was a well-known Freemason. He was a past-master of the Birkenhead Lodge, and for seventeen years had been a member of the Cestrian Lodge, being also a member of the Rose Croix Chapter and a Knight of the Temple. He leaves a widow and three young children. The funeral took place on Monday last.

"Asphaltmac."—This is now being used on an extensive scale, and from reports to hand it appears to be a material that will go far in the direction of solving the problem of an inexpensive pavement suitable for modern traffic conditions. Mr. Claude R. Berry, the managing director of the Premier Bitumen and Asphalt Company, Limited, has been intimately identified for many years with the manipulation of asphalts and bitumens for road surfaces, and it has been asserted that to him belongs the credit of the introduction of the first natural asphalt matrix.

THE INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS AND THE PROPOSED AFFILIATION OF CANADIAN ENGINEERS.

[On the principle that it is good occasionally to see ourselves as others see us, we quote the following comments from a letter forwarded to the *Contract Record* of Toronto by its London correspondent, who deals trenchantly with some considerations arising out of the formation of a Canadian Institution of Municipal Engineers and its suggested affiliation to the British Institution of Municipal and County Engineers, and with the admission of consulting engineers to such bodies.]

Very considerable interest attaches here, in England, to the formation of the Canadian Institution of Municipal Engineers. Opinions are divided as to the desirability of affiliation to one of the English societies, and even if affiliation were deemed the politic course a further difficulty would arise. The profession of municipal engineering is represented in England by two bodies—the Institution of Municipal and County Engineers, with a life of some forty years, and the Institution of Municipal Engineers, with a life of a little over five years. Six years ago the former body was lying moribund of sloth and inanition. Its rules, its methods of procedure, its administration were obsolete. It was controlled by quite a small section of its members, and no outsider could hope for admittance within the charmed circle unless he undertook to fight innovation and progress to the last ditch. The membership class was limited to those who held chief appointments, and there existed the anomaly that, while the deputy engineer of a city such as Manchester, Liverpool or Birmingham was ineligible for the class, the “chief” of the smallest district council—who might combine the offices of surveyor, sanitary inspector, petroleum inspector, rate collector and clerk, all for some £70 a year—was admitted without demerit.

The formation of the Institution of Municipal Engineers has changed all that, for the younger body is nothing if not progressive. It quickly realised the anomaly referred to, and it went further, for it recognised that gas, water and electrical engineers to municipal authorities were municipal engineers equally with the men who controlled simply the highways and bridges and sewerage and sewage works of the country. So, as fast as the younger body progressed, introduced new methods, abolished anachronisms and modified obsolete procedure, so fast did the older body follow in its footsteps, accepting all and giving nothing, but none the less setting its house in order, and taking on a new lease of life.

That is precisely how matters stand, the newer body constantly progressing, and the older body being as constantly forced by its members—by outside pressure, that is, for the circle still tenaciously cling to tradition—to adopt any and every measure. It has to be remembered, however—and the point is an important one—that the older body scores largely as regards prestige, while its roll contains the names of the greater proportion of the engineers to large cities and towns. Defections from its ranks have taken place among the smaller fry alone; but, again, it must be remembered that the small chief or the deputy of to-day will be the big man of to-morrow, and the next few years will see a considerable levelling upwards in this respect.

The Canadian institution will do well carefully to weigh matters up before affiliating with either one body or the other; indeed, it remains open to grave doubt whether affiliation would not be a most unwise proceeding. In any event, it would surely be wrong to take any such step until independent working had been tried. The English societies would necessarily be in friendly touch with the Canadian, and such little courtesies as exchange of “Proceedings” and the extension of facilities to visit works (when members contemplated crossing the pond) would not be wanting.

REGULATIONS OF THE PROPOSED INSTITUTION.

It is customary, in drawing up the rules and regulations which are to govern a new society, first to obtain copies of those of existing societies of a similar nature. These are then submitted to the process known as “boiling down,” the result of which has been exemplified by scores of instances. Experience has taught us that the happier the country the fewer its laws; hence the extreme anarchist (or no law) ideal. The really necessary by-laws for a professional society

could be written on one side of a sheet of foolscap paper, whereas there is scarcely a body in existence that is regulated by less than some twenty printed pages. Is it too much to hope that the Canadian institution will make its own regulations, and that it will, in their making, aim at brevity and clearness?

The question of whom to admit and whom to exclude is always a difficult one in the case of a professional society, and the solution is to be found only in the admittance of all. Thus, in a municipal engineering society, all who are municipal engineers (in any capacity) and all who are in training for such a calling—whether as premium pupils or not—should be admitted, regardless of age, colour or nationality. Such a society is only too often of the mutual admiration order, and a few top dogs rule the roost. Admit the rank and file, on equal terms if possible, and such a condition of things becomes impossible. The Institution of Municipal Engineers started with one class only—it has now three, and is proposing a fourth, and to that capitulation to the attacks of snobbery and dignity may be traced the slowness of its numerical progress during the past three years.

A third point of no little importance is the position of the consulting engineer as an applicant for membership. A consulting engineer is not a municipal engineer in any sense of the word, even though he may call himself a consulting municipal engineer or some such hybrid name. He is out for business as much as is a manufacturer or contractor, and if the members of the last-named classes are ineligible for election, there seems no reason why those of the other should be admitted. As a member of an institution composed of civil, mechanical or electrical engineers, the consultant has nothing much to gain. It is useless for him to canvass his fellows, for they are all out for work themselves. Turn him loose, however, among municipal engineers, and his course is clear. He will utilise his membership for business purposes, and such being the case it might be argued that he should be refused admittance. But then, he is a very useful man, of considerable experience, and free to speak his mind as he thinks fit, and so long as he keeps within decent bounds, there is no reason why, on the other hand, his application should not receive full consideration. Men styling themselves consulting municipal engineers should be sternly taboo, however, and the writer may be trusted to have good and valid reasons for such a strong pronouncement.

THE LATE MR. CHARLES JONES.

THE PROPOSED MEMORIAL: AN APPEAL.

A circular letter, bearing the signatures of the president, Mr. J. W. Cockrill, and the secretary, Mr. Thos. Cole, has been sent to members of the Institution of Municipal and County Engineers appealing for assistance in raising a fund to commemorate the association of the late Mr. Charles Jones with that body.

Mr. Jones, the circular recalls, was one of the original founders of the institution, and at all times gave the best of his characteristic energy and powers of organisation in furthering the interests of the institution. Beyond this, it adds, his genial disposition endeared him to all, few men being so universally esteemed, and he occupied a place in the friendship of many that it will be difficult to replace.

Road Surfaces in Northumberland.—At a Newcastle meeting called to discuss the dangerous condition of roads in Northumberland, one speaker said some roads in the district were like skating rinks, and horses ought to be shod with indiarubber.

Municipal Work at Lytham.—The chief work in Lytham during the ensuing year will be the completion of the West End sewer outfall works, the provision of an additional pump, and, probably, the installation of an improved screening and sludge removal apparatus at the East End sewage works. Improvements, Mr. A. J. Price, the engineer and surveyor, reports, are to be carried out on several of the principal roads, and a further extension of tar-macadam and tar-painting is contemplated. A number of new streets are scheduled to be put in statutory order, and several small sewerage schemes are to be carried out. The Local Government Board have been asked to sanction a loan of £24,000 for installing an electricity scheme, and this work, it is expected, will be, to a great extent, carried out this year.

Measuring and Quantity Surveying.*

By GEORGE CORDEROY, Member of Council of the Surveyors' Institution.

Measuring and quantity surveying is one of the branches of the surveyor's profession in which members of this institution practise.

What is the nature of the work comprised under this head? In our charter it is defined as the "Measuring and estimating artificers' work." I will venture, however, to amplify that definition by saying that it is concerned with—

- (a) The measuring, bringing to account, and valuation of all works of construction, whether of an architectural or engineering character, above or below the surface of the ground or water.
- (b) The ascertainment of the nature and quantities of the work required to be done in order to give physical embodiment to the designs and specifications prepared by an architect or an engineer, and the setting out of such character and quantities in a detailed, lucid, and orderly manner in a document entitled "A Bill of Quantities," thus enabling a precise estimate to be made of the cost of the execution of the work.

In the first half of the nineteenth century, when quantities were prepared for the purpose of obtaining tenders for proposed works the builder appointed a surveyor to represent him, and the architect, or engineer, Government department, or public body concerned appointed another to represent them, and the two sitting down together took off the quantities jointly, dividing the fees. This practice subsisted very largely until about thirty years ago, and in the early years of their practice many members of this institution have been thus nominated from time to time as their surveyor by the builders. Gradually the two surveyors gave up taking off together, and divided the work to be done between them, one taking off one portion, and one another, ceasing to collaborate.

The desuetude of the practice of collaboration—and, I suppose, the desire to reduce fees—and also the great extension of the system of letting contracts by competitive tendering, led to the

DIRECT EMPLOYMENT OF SURVEYORS

by architects, engineers, and public bodies to prepare bills of quantities for issue to competitors, making the payment of their fees part of the cost of carrying out the work. The surveyor so employed then adjusted any variations which had arisen on the contract, and in these days this has become practically universal in connection with private work. Some Government departments and public bodies, however, employ a surveyor to prepare bills of quantities, but not to make up the variation accounts. There is no doubt, in my opinion, that this is most undesirable and to the disadvantage of all parties to a contract. No one can be so well qualified to deal properly with the variations on a contract and to interpret truly the bill of quantities or schedule as the man who prepared it.

What is the present scope of a surveyor's employment in connection with measuring and quantity surveying?

The principal field is in connection with the letting of contracts for the purposes of works of construction—whether architectural or engineering—and the measuring and making up of accounts of work done. The determination of the method to be pursued in letting a contract depends upon varying considerations. This is a preliminary point upon which a surveyor's advice should be valuable and is usually asked.

One of the primary considerations is as to whether the lump-sum or schedule method is the better. If it be decided to let a contract as a lump-sum contract, it is a necessary postulate that the conditions of its execution are precisely known. The lump-sum method of contracting is especially applicable to all surface or above-ground work, such as buildings of an architectural character, or, in the case of engineering work, buildings required for the service of a dockyard, shipyard, railway, or important factory, where the conditions are known, and the design and methods of construction can be precisely determined beforehand.

Schedule contracts are measure and value contracts, and are of two classes:—

(1) For Specific Works.—It is possible to carry out any class of work under them, but they are particularly applicable to heavy engineering work and work below the surface, such as that involved in the construction of docks, harbours and breakwaters, foundations for factories, machinery, and important buildings where the nature of the site, the conditions under which the work will be carried out, and the method of construction to be employed cannot be precisely determined beforehand.

(2) For Contracts Let under Permanent Schedules of Prices.—These schedules are prepared mainly for the ordinary works of repairs and maintenance for large buildings or groups of buildings. This is a familiar method pursued by the Government in connection with barracks, hospitals, and other buildings. It has great advantages, and might be adopted with benefit to themselves by large property owners and corporations of all descriptions. The method of estimating is for contractors to state the percentage addition to or deduction from the rates in this permanent schedule at which they are prepared to undertake the work.

The work executed under this form of contract is measured and brought to account at stated periods by the surveyors of the employers or employing body.

It is usual to proceed by way of

COMPETITIVE TENDERING

in connection with all of these systems of contracting. Under all, however, it is likewise possible for an estimate to be agreed with an individual contractor without competition. If, however, this course is to be pursued, I am sure that, from the youngest to the oldest of my professional brethren, it will be agreed that the surveyor conducting the negotiations must be a man of large experience, sound judgment, and a person of recognised authority. It is possible to be able to prepare a very good bill of quantities or schedule for the purpose of competitive tendering and yet not to have had sufficient experience to agree a close and just estimate for the carrying out of an important work. After a very long experience of all the methods of obtaining estimates which I have outlined, I am of opinion that the fairest method to all parties is the competitive system, tenders being obtained upon the basis of particulars prepared by a surveyor of experience. Incidentally this system gives the best opportunity to young surveyors in their early practice, and also to young and enterprising contractors to establish themselves in business.

In my judgment the ideal arrangement with regard to any important work is the following:—

(1) That the architect or engineer should concern himself principally with the preparation of the design and the execution of the work, and the obtaining of the finished result within the period of time laid down in the contract.

(2) That the surveyor should either prepare quantities or a schedule, and all documents for the purpose of obtaining tenders, and, where the work is done on schedule, measure it as it proceeds, and when by lump-sum estimate deal with the valuation of all variations in design as they arise from time to time, and finally settle up the accounts under either system of contract.

(3) That the contractor should be left a free hand as to the method to be employed in carrying out the work, the architect or engineer only concerning himself with the quality and character of the finished work and seeing that it conforms to his design, and the surveyor with the valuation of the work ordered to be done by the architect or engineer.

Under an arrangement of this kind the employer has the great advantage of the combined energies of three separate orders of mind in producing the best-designed work, the best-constructed work, and the most economically executed work.

It must never be forgotten that

SURVEYORS' POWERS UNDER CONTRACTS

are strictly limited to making up an account of work done upon the basis of an agreed set of facts placed before them by the parties thereto. They have no control over the conduct of the work, and therefore

* From a paper read on Monday last at a meeting of the Surveyors' Institution.

the principal element affecting ultimate cost. Their position is very much that of an accountant's, with the important addition that under the terms of most contracts they usually value as well as bring to account the work executed.

The principal avenues of employment are—

- (1) Direct employment by an architect or engineer, as agent of the building owner.
- (2) Direct employment by a contractor or a solicitor.
- (3) Direct employment by public bodies.
- (4) Direct employment by the building owner.

When a surveyor is employed either by an architect, an engineer, a contractor, a lawyer, or a building owner, the nature of his work is generally understood. When, however, he is directly employed by public bodies, this is very often not the case. Members of committees and corporations appear unable to realise that the loss occasioned to the public by bad or inaccurate quantities and the

EMPLOYMENT OF INCOMPETENT SURVEYORS

to measure and make up accounts is most serious. Not understanding the professional position of the surveyor and the fiduciary character of his services, they have frequently resorted to the practice of inviting surveyors to tender for employment, with the result that irresponsible persons, with little training or knowledge or experience, quote fees which are an altogether inadequate remuneration for the work required to be done. Any system by which the financial return for professional work is reduced below the point at which it becomes remunerative to a properly trained and qualified man must inevitably in the long run lower the professional standard and prejudice the public, who, though they know it not, must necessarily depend to a great extent upon the ability and integrity of the surveyors they employ.

Even when the system of tendering is not resorted to, public bodies often assess the fees for work which they require done at altogether inadequate rates. I am glad to say, however, that it is becoming a practice (under the influence of the Royal Institute of British Architects) for public bodies to allow outside architects whom they employ, through means of competition or otherwise, for designing important public buildings, to nominate their own surveyor. I trust that this may do something to check the tendency to reduce the fees paid below reasonable limits.

To conclude, the surveyors practising in measuring and quantities have onerous duties to perform, and "demands are made upon their patience which would have taxed a Job to the utmost." It is pleasant to be able to add that with their brethren in general they are trusted all round for skilful, painstaking, intelligent, and honourable men of business. May it ever be so! The first and last requisite for the maintenance of these fine traditions is character. May we all, as members of this institution, guard it jealously!

Darwen Water Supply.—Mr. H. Howard Humphreys on Saturday closed the arbitration proceedings in London in which he is to determine the price to be paid to Bolton for 300,000 gallons per day. The Bolton Corporation claims 11-4d. as the result of adjustments agreed upon between the two corporations, and the evidence offered by Darwen is to the effect that the charge should be 6½d. per 1,000 gallons.

Horseshoe Competition.—Horseshoes from many nations are among the 800 received by the Roads Improvement Association in connection with their offer of a prize of £100 for a horseshoe which will best enable a horse to keep its footing securely on roadways without damage to the road itself. About 75 per cent have been made in the United Kingdom. The shoes selected by the judges next Tuesday will subsequently undergo practical tests.

Town Planning in the Doncaster District.—A conference of representatives of local authorities in the Doncaster district was held at Doncaster in Friday last to consider the question of town planning in connection with the extensive building operations in the district. The conference was called at the suggestion of the Local Government Board, who were represented by Mr. T. Adams. In the course of the discussion it was stated that the Rotherham Rural District Council had applied for a scheme of town planning for Thurgroft. The opinion was expressed that the Rotherham and Hensworth districts should be dealt with separately from the Doncaster district. The conference concluded on the understanding that another conference would be called in about three months to hear the reports of the delegates.

CORRESPONDENCE

*Sir, though I would persuade, I'll not constrain,
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii. 2.

JOURNAL OR VOLUME?

To the Editor of THE SURVEYOR.

SIR, I see in your current issue (p. 127) a paragraph to the effect that the Journal Committee of the institute allege "that the principle of the journal was accepted at the last annual meeting, and that in issuing the proceedings in the form of a journal the council were acting under the instructions of the annual meeting."

The first half of this paragraph is quite correct—the principle was accepted, but it was only accepted because the meeting was informed that the council had already executed a contract with the printers for the monthly Journal, including the alteration of size. If the council had not executed this contract, it is almost certain that their action would not have been confirmed, and it is going somewhat too far to say that "the council are acting under the instructions of the annual meeting."

Many of us strongly deprecate the action of the council, and wish that the council had consulted the members before they entered into the contract. I enclose my card.—Yours, &c.,

ONE WHO WAS PRESENT.

January 26, 1914.

MR. BOULNOIS' "GLOSSARY OF ROAD TERMS."

To the Editor of THE SURVEYOR.

SIR,—I am greatly indebted to Dr. F. Judd Lewis for his courteous reply in your last issue to my appeal for some definitions of certain terms which I had attempted as a foundation for the glossary. They are precisely what I required, and I can assure Dr. Lewis that before publishing the glossary in book form I shall give his proposed definitions every consideration. I agree with him also that it is difficult to decide as to how far a glossary should include detailed information upon the words used in it. If a glossary is too much extended it becomes something in the nature of an encyclopædia, and such a work would necessarily be of great length, and involve an enormous amount of work.

My object in the preparation of the glossary was merely to give a fairly clear idea of what was intended to be conveyed by certain words that are used in highway nomenclature. Further than this I did not intend to go, as I believe it is the first effort that has ever been made even to group together the words commonly used in the construction, maintenance, and use of roads.—Yours, &c.,

H. PERCY BOULNOIS.

7 Victoria-street, S.W.

THE CORROSION OF IRON.

To the Editor of THE SURVEYOR.

SIR,—As I notice that the subject of corrosion of water mains, &c., has lately been occupying your columns, I am reminded that the difficulty of utilising chloride of lime for street watering purposes has recently been raised with us, owing to corrosion, &c., of the water tanks, and I am hoping that some of your readers will be kind enough to enlighten us as to the best means of minimising such evils.—Yours, &c.,

JAMES S. DUNN,

City Sanitary Inspector.

Town Hall,

Kimberley, South Africa.

December 19, 1913.

Garden Rollers and Seats.—Garden rollers of every description, and seats with cast-iron or wrought-iron supports, are illustrated in Catalogue No. 580 which Messrs. Summerscales, Limited, Keighley, have just issued.

Newent Town Hall.—Mr. H. W. Bruton and Mr. James Bruton, of Gloucester, have written to the Newent Parish Council stating that they have purchased the historic town hall of Newent, and they propose, with the approval of the council, to hand it over to the town to perpetuate the memory of their father, the late Mr. Henry Bruton, who was born at Newent in 1813.

SOME RECENT PUBLICATIONS.*

SEWAGE-DRAINAGE SYSTEMS. By Isaac Shone, Civil, Mining, and Sanitary Engineer, M.I.M.E., F.S.I. Price 25s. nett. London: E. & F. N. Spon, Limited.

This book, which is extremely well got up, is remarkable in two ways. In the first place it is the most elaborate description we have ever seen of the author's special systems of sewerage, sewage lifting by mechanical means, and sewer ventilation. Secondly, it is remarkable for the manner in which the author's views are set forth, consisting, as it does, of an open letter to the President of the Local Government Board, including an autobiography of the author, and numerous extracts from papers, discussions, and correspondence upon subjects of which Mr. Shone has made a speciality for a greater number of years than most people can remember. It is also noteworthy that the author should be capable of bringing out such a book at an age when most men would have retired from active life. At the same time we fear that, while there may be many who would gladly possess such a complete record of the views of the author, there will be few who will be prepared to pay the price demanded for it.

We have also received a handsomely bound smaller volume dealing with Mr. Shone's latest system of house drainage, including the apparatus which he has named the "Cuncta in unum," which was described in these pages on November 7th last.

BIBLIOGRAPHY OF ROADMAKING AND ROADS IN THE UNITED KINGDOM. By Dorothy Ballen. Price 15s. nett. London: P. S. King & Son.

This work forms the third volume of the series of bibliographies by students connected with the London School of Economics and Political Science. It was undertaken by the compiler at the suggestion of Prof. Sidney Webb, in view of the recent revival of interest in highway problems, and is merely a revised and considerably enlarged edition of the bibliography compiled by Mr. and Mrs. Webb in 1906. The first section consists of a list of bibliographies, and this is followed by a list of general works. The next part of the work is divided into sections topographically, each section being subdivided into history and description and administration. Complete lists of works dealing with the construction and repair of roads and streets are then given, and the final section is devoted to traffic on roads. The work is completed by comprehensive indexes of authors and subjects. As Sir George Gibb points out in his introduction, the proper attitude of mind towards a bibliography is one of simple gratitude, and in commending the result of Miss Ballen's arduous labours to our readers we can only say that if at any time they want to find the most complete information on any road topic, they cannot do better at the outset than consult this excellent work, and be thankful that its author has placed within their reach such a touchstone to all available authorities and references.

PRACTICAL SURVEYING. By Prof. Henry Adams. Price 4s. 6d. London: Macmillan & Co.

In adding to the already large number of textbooks on practical surveying, it might be thought that Prof. Adams was undertaking an unnecessary task. The scope of this new book, however, as revealed by the table of contents, shows that Prof. Adams' work has an individuality of its own, and that it ought quickly to achieve a wide popularity among students. While less ambitious than the large and expensive books, the author has treated in a clear and concise style not only the usual subjects which occur in the daily practice of the land surveyor, but also such matters as railway surveying, curve ranging, astronomical surveying, latitude and longitude. The book is divided into thirty-three chapters, the whole subject being logically arranged. It is well illustrated throughout, and, in addition to test questions at the close of each chapter, there are at the end of the volume 300 questions selected from papers set at the examinations of the Institution of Civil Engineers, the Institution of Municipal and County Engineers, the Surveyors' Institution, and many other bodies. We cordially recommend students of practical surveying to possess themselves of this book.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

A HANDBOOK OF HYGIENE. By A. M. Davies, M.R.C.S., &c. Fourth Edition by the Author and C. H. Melville, M.B., C.M. Price 10s. 6d. nett. London: Charles Griffin & Co., Limited.

This work may fairly be described as a compendium of preventive medicine, and although intended primarily for the medical man who may not have access to a large number of books—as, for example, when travelling abroad—it will be found very useful to medical officers of health, sanitary inspectors, and all who are interested in public health administration. The several chapters, each of which is divided into several sections, deal respectively with air and ventilation, water and water supply, food and dieting, the removal and disposal of sewage, clothing, habitations, personal hygiene, soils and sites, climate and meteorology, the causation and prevention of disease, and disinfection. Each of these subjects is dealt with systematically. For example, in the first chapter the properties and composition of air are first considered, then the impurities which may occur and their effects on health; the amount of fresh air required is next touched upon, followed by sections devoted to cubic space, and methods of supply of fresh air. Again, the chapter on water supply deals in order with the properties and composition of water, its impurities and their effects, and, in a separate section, with the subjects of collection, storage, distribution purification and examination. Of course, all these matters are treated only in their relation to hygiene; but enough has been said to show that as a handbook on this subject the work is comprehensive, lucid, and well arranged.

RECORDS OF THE SURVEY OF INDIA. Vol. III., 1911-1912.

Prepared under the direction of Colonel S. G. Burrard, C.S.I., R.E., Surveyor-General of India. Price Rs.4 (6s.).

In this volume the reports from the survey parties, briefly summarised in the General Report recently noticed in these columns, are given more fully, and a large amount of further information is given as regards survey operations generally. Under the head of "Triangulation" there is an interesting account of the Kashmir secondary operations, with extracts from the letters of the late Lieutenant H. G. Bell, R.E., who died during the course of the survey, the favourable progress of which was largely due to his energy. This party was in touch with the Russian survey party which was carrying on operations intended to effect a junction between the Russian survey in the Pamirs and the Indian triangulation. The report is embellished with some very good photogravures, some of which illustrate in a very effective manner the nature of the rugged mountain scenery in which the north-western operations were being carried on. The report contains many tables, giving the detailed results of observations, and notes on matters of practical detail as regards the manner in which the records are obtained and recorded. It is accompanied by about a dozen excellent maps.

THE "MECHANICAL WORLD" ELECTRICAL POCKET-BOOK FOR 1914. Price 6d. nett. Manchester: Emmott & Co., Limited.

In this pocket-book the electrician will find a mass of useful information in a well arranged and convenient form. The present issue is a considerable improvement on its predecessors in many particulars, some sections having been entirely rewritten, and several new features having been introduced. Among the latter may be mentioned new sections on Telephones, the Electrical Equipment of Ships, Lifting Magnets, Dry Batteries, Sparking Distances in Air, and Burglar Alarms. Reference is facilitated by a copious index, and a diary showing fourteen days at an opening is included. The book is excellent value at so modest a price.

WILLING'S PRESS GUIDE. Price 1s. London: James Willing, Limited.

The forty-first annual issue of Willing's Press Guide contains all the old features, but, as usual, it has been carefully revised. The complete alphabetical list of newspapers and periodicals, and the various other specially classified lists render the guide indispensable to all who have literary wares to dispose of, or who are in any way interested in the mighty engine of the Press. The present issue well maintains the reputation of its predecessors.

New Municipal Offices for Lewes.—The new municipal offices at Lewes, built from designs by Mr. R. H. Halls, were opened formally on Tuesday last.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

370. Temporary Building Design.—A temporary building is required, 50 ft. long, 30 ft. wide, and 10 ft. to eaves. Design a suitable structure, with steel trusses and stanchions, to be covered with corrugated iron on boards and felt, the bays to be filled in with 4-in. reinforced brickwork. (J. M. N., Hitchin.)

375. Working-class Dwellings.—Twenty working-class dwellings have been built at a cost of £3,500 for the buildings and £250 for the land. What must the rental be to ensure that the income will defray all loans, &c., charges? Give details as to how the allowances for empties, taxes, insurance, repairs, &c., are arrived at in the estimate. The money has been borrowed from the Public Works Loan Board at 3½ per cent for the usual periods. The poor and district rates are 6s. 8d. in the £ per annum. (Togun.)

376. Foundation for Stanchion.—A built-up steel stanchion, as shown in the diagram, transmits a load (including its own weight) of 250 tons. Design a suitable steel base and concrete and steel joist grillage foundation for the stanchion. The safe load on the earth may be taken as 2 tons per square foot. (I. W. S., Clapham Junction.)

377. Machine Shop.—An electric crane is to be fitted in a machine shop on existing piers, as shown in sketch. The piers are bonded into the wall, and about

VERTICAL SECTION THROUGH WALL AND PIER.

12 ft. centres. Assuming the foundations are good, and the work is in Staffordshire brick set in cement and sand, what is the safe load these piers will withstand? (H. W., Cradley Heath.)

378. Cost of Running Steam Engine.—Compare the cost of running a steam engine with that of an electric motor in the following circumstances: The horsepower required is 30; electricity costs 1d. per unit, coal (best steam) costs 18s. per ton delivered; the engine is required to drive a stone crusher working an average of eight hours per day for five days per week. (Crusher.)

REPLIES TO QUESTIONS.

372. Cemetery Lay-out.—A new cemetery is to be provided in an urban district having a population of 17,000, increasing at the rate of 800 per annum. Flat meadow land, in a suitable position, having frontage to a district road (sewered), can be obtained at £350 per acre; subsoil, 5 ft. ballast overlying stiff clay. State area of land which should be acquired; give an approximate estimate of the cost of laying out the same, including buildings; state also principles governing the lay-out, and describe in detail method of drainage, arrangement of plots, disposition of buildings, &c. (Togun.)

Since this town appears to be growing very rapidly, it will be advisable to obtain a large area of land which is to be laid out as a cemetery, but only a part of the ground need be laid out to begin with, and the remainder laid out as the occasion arises. A good proportion is to allow 1 acre of land to every 1,000 inhabitants, but in this case it will be better to be slightly in excess, and so, if the ground is available, a site of about 20 acres should be acquired. The cost per acre is stated to be £350; hence the cost of the land alone will be £7,000. This should be materially reduced by setting the site back some distance from the road, and having an entrance and a carriage drive up to the cemetery site. There will thus only be a small frontage to the road, and the land at the rear (not abutting on the road) should be obtained at a much cheaper rate. However, it has been assumed that the cost per acre is £350 in the following approximate estimate, and it is marked with an asterisk as indicating that it should be considerably reduced by adopting the above suggestion, for it will be noticed that it is this item which constitutes more than one half of the total cost of the cemetery.

APPROXIMATE ESTIMATE.

Cost of laying out cemetery	£1,500
Cost of fencing (an iron fencing of an unclimbable nature, and about 8 ft. high)	1,200
Cost of cemetery site	7,000
Cost of cemetery lodge	600
Cost of cemetery chapel	600
Cost of laying on water supply	100
Total	£11,000

The general principles to be borne in mind in laying out the cemetery are as follows: Certain portions of the land have to be consecrated and other portions not. The lodge should be built in such a style that it presents a pleasing elevation to the road, and it should be at the entrance to the cemetery by the entrance gates. It should be arranged that the chapel be placed at or near the centre of the cemetery. As indicated by the above estimate, it need only be of a small size, and it need not be of an elaborate character as regards internal fittings, but should be of an imposing character externally, in keeping with its general surroundings. A chapel to seat about 100 persons would be sufficient. In some cases two chapels are built—one for Nonconformists and the other for Church of England—but this practice is not general.

Care must be exercised in drawing up the regulations that no grave must be less than 5 ft. in depth for the following reason: Clay is impervious to water, while ballast is just the reverse; hence, if the graves were less than 5 ft. deep, it is quite conceivable that the surface water would become polluted with the foul matter that is generally associated with dead bodies, and the neighbouring watercourses would thus become polluted also, with very detrimental effects to cattle, &c. If, on the other hand, the graves are dug well below the clay line, it is impossible for the polluted water and decaying matter to soak away. A minimum depth of 7 ft. should be insisted upon. One point of primary importance is to arrange that all the graves face east and west, and not in any other direction.

As regards drainage, if the ground is very low it may become necessary to employ land drains, 3-in. diameter, laid open-jointed, and surrounded with 6 in. of washed beach. All the paths which are formed will have a minimum width of 6 ft., and should be drained by means of iron or stoneware gullies, 2 ft. deep, led into a sewer of 9-in. diameter, laid to a proper fall with proper cement joints, in the usual manner. If the separate system of drainage is in force, it may be convenient to drain all the surface water into the surface-water sewer; but if the combined system is in force, then it will, perhaps, be better to drain into any existing ditches or watercourses in the vicinity. The main carriage drive should be 30 ft. in width, the main paths and walks in the cemetery should be 18 ft. in width, and all subsidiary and other paths should have a minimum width of 6 ft. The paths should have a good fall to the channels, and their cross-section would conveniently consist of 3 in. of gravel on 6 in. of hardcore foundation.

All natural beauties—such as clumps of trees, isolated trees, hillocks and streams—should be fully taken advantage of, and attended to in order to give a bright and pleasing, but nevertheless a dignified, appearance to the cemetery. Paths and carriage drives need not necessarily be laid out in straight lines in all places; it will greatly add to the general appearance of the place if they are given graceful curves where possible. The edges and borders of the carriage drives and the boundary (about 8 ft. within the boundary fence) should be well planted with shrubs, flowers, &c., and a turf border of about 4 ft. in width, railed by a dwarf wire fence of about 18 in. in height, would further add to the general appearance of the cemetery. (T. W. P., *Bechill-on-Sea*.)

374. Magnetic North.—What is the difference in degrees between the magnetic and true north? (J. T. C., *Nottingham*.)

The angle between the direction of true north and the magnetic north at any place is called the declination or variation. To ascertain the value of this angle, the direction of geographical (or true) north is found by taking careful astronomical observations, and the direction of magnetic north is found by noting the position a magnet takes up when it is freely suspended, care being taken that no iron or steel is allowed near the magnet.

The declination is obviously not the same in all parts of the world, for it is well known that a freely suspended magnet will always have its N pole attracted towards the magnetic north pole, and its S pole attracted towards the magnetic south pole (N.B.—The north magnetic pole is really of south polarity, and *vice versa*), and consequently some places have westerly variation and some have easterly variation. There are two lines of no declination, termed agonic lines—that is, lines joining places which have the direction of true north and magnetic north coincident. The two lines pass from north to south, one being along the east coasts of North and South America, the other passing through Norway, the Black Sea, Southern India and Western Australia. There is also an agonic line in the form of an oval situated near to Siberia, and usually termed the Siberian Oval.

The continuous record of the values of the magnetic elements at any point show that these are undergoing a slight gradual change; such changes are termed secular. The earliest record of the declination at London was made in 1850, and was found to be 11° 20' E; from that date the easterly declination slowly diminished. The compass pointed true north in 1659, and then gradually moved to the west of true north. In 1823 the declination acquired a maximum value of 24° 30' W, and afterwards diminished. In 1908 the declination at Greenwich was 15° 53' 5" W, and is diminishing at an approximate rate of 5' per annum, and so the declination in London for 1914 may be taken at about 15° 23' 5" W.

In addition to the secular changes in the magnetic elements, there are also smaller changes extending over shorter periods. The annual change in declination at Greenwich amounts to 2' 25" with a maximum easterly and westerly value in August and February respectively. Periodic daily (or diurnal) changes in the elements are also observed; thus, the declination has a maximum value (easterly and westerly) at 8 a.m. and 1 p.m. respectively. In addition to these changes the declination varies in perfect unison with the eleven-year cycle of solar activity, the disturbance increasing and decreasing

with the increase and decrease of sun spots during this period. A similar sympathetic correspondence is found in the frequency of occurrence of polar lights or auroræ. (T. W. P., *Bechill-on-Sea*.)

The difference at the present time is approximately 14° 52'. It must be kept in mind, however, that the difference between the magnetic and true north is a variable item. At any particular place the direction of the compass needle undergoes a gradual change; the needle at one time pointing to the west of true north, and at another time to the east. This change of "declination" extends over centuries, during which period it passes from its maximum westward position to its maximum eastward position. We have no record of the variations previous to the year 1580. In that year the N. pole of the needle at London pointed nearly 11° east of the true north. The declination then gradually decreased, until in 1657 there was no declination. The N-seeking pole then began to move to the west, attaining its greatest westerly declination (24° 30') in 1816. At the present time (1901) the declination is slowly decreasing.

From the following table a more complete idea of the variations at London will be obtained:--

Year.	Declination.	Year.	Declination.
1580	11° 17' E.	1868	2° 33' W.
1634	1° 6' E.	1882	18° 22' W.
1657	0° 6'	1888	17° 40' W.
1705	9° 6' W.	1893	17° 11' W.
1760	19° 30' W.	1898	16° 39' W.
1816	24° 30' W.	1914	11° 52' W.
		(Approx.)	

The mean annual change of declination is nearly 7'. (From Poyser's "Magnetism"). (W. S., *Louth*.)

NOTES.

The following notes are submitted *apropos* of the answer to Question 371, which appeared in our issue of January 16, 1914:—

In your issue of this week I notice that the correspondent answering this question makes the following statement:—

"A little thought will quickly show that the diameter of the pipe has no effect whatever on the safe head."

Now, the total pressure of steam or water in any direction in a pipe is equal to the pressure on a plane perpendicular to that direction. Therefore if *d* is the inside diameter, *L* the length of the pipe, and *p* the unit pressure in lb. per square inch, the total pressure on the cylindrical walls is:—

$$P = pdL.$$

If *t* is the thickness of the pipe and *s* the working strength of the material, then the internal resistance of each half of the pipe is *tLs*, and as the total pressure must be equal to the total resistance, we have—

$$pdL = 2tLs, \text{ or } pd = 2ts,$$

From which the safe pressure of the pipe is—

$$p = \frac{2ts}{d} = fd$$

in which *F*=ultimate tensile strength of material, and *f*=factor of safety.

The head of water under which a pipe can be placed is found —

$$134 H = \frac{2tF}{fd}, \text{ H} = \frac{2tF}{434 fd} = 46 \frac{tF}{fd}$$

It will be readily seen by the above formulæ that it is impossible to get the same safe head for two pipes of equal thickness, but having different diameters. (H. V. A., *Clypton*.)

Proposed Three Towns Amalgamation.—At Plymouth a Local Government Board inquiry is now proceeding to consider the application by the Plymouth Corporation for an order to amalgamate the three towns of Plymouth, Devonport and Stonehouse, which together have a population of nearly 250,000. Devonport strongly opposes the scheme, while Stonehouse has consented to amalgamate if Devonport comes in.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

HIGHWAY DEDICATION: STRIP NOT MADE UP.—The House of Lords have affirmed the decision of the Court of Appeal in the case of *Tottenham Urban District Council v. Rowley* (noted in vol. xlii., p. 830). The facts were shortly as follows: The defendant was the owner of a building estate, and submitted to the council a plan for its development, showing (*inter alia*) a proposed new street (to be called Keston-road), 40 ft. wide, running east and west, and bounded on the north by the boundary fence of a public park belonging to the council. Houses were built on the south side of the road, and that half of the width of the road only was made up, the northern half being left in the rough. In 1908 the road was thrown open to the public, and had since been used both by foot passengers and vehicles without any objection by the defendant. In 1912 the council removed a portion of their fence in order to enable them to convey building materials into the park from Keston-road. The defendant then blocked up the opening, alleging that the road was a private road and had never been dedicated, or alternatively that the northern half had not been dedicated, or had been dedicated only as a footpath. The Court of Appeal held that the plan showed an intention to dedicate the whole road, which intention had been completed by user of the road by the public, and that the council were entitled to access thereto from their park. In the course of his judgment, moving the dismissal of the defendant's appeal from this decision, Lord Dunedin said that this road had all along been used by the public. Whether the defendant had dedicated it was to be judged by his acts, and not by what he said. The defendant's contention was that although the road had been thrown open it had only been made up in a way convenient for wheeled traffic as regards half its breadth, and that, therefore, where dedication was being inferred from user such dedication should not be held to extend to a greater breadth than the user had ordinarily extended to. His lordship thought that was really, in the circumstances, an impossible proposition. Persons would always, of course, use that part of the road which was in the best condition, and no doubt the actual traffic had gone along the made side of the road. But the rest of the road was open, and it was impossible to suppose that, if there was dedication, it was not a dedication of the whole. Lords Atkinson, Parker and Sumner concurred, and the appeal was dismissed with costs.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as nouns de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

HIGHWAY: ROAD SET OUT UNDER AWARD.—"W. S." writes: In an old township award a "road" or "lane" is set out for the purpose of giving access to the fell or moor, and any owner or occupier in the township may get stones on the moor for building or repairing drains within the township; also may cut and cart away bedding for the cattle. Some time ago part of the road was washed away by flood and is now impassable. The award further states that the lane is to be kept in repair in the same manner and by the same persons as repair the public highways in the said township. At that time each township repaired its own highways. The lane can be of no possible good to the general public, who would, indeed, be trespassers on the moor. Would the council be empowered to charge the cost of restoring such road (under sec. 7, Highways and Locomotives Act 1878) upon the township? Sec. 3, Highways and Bridges Act, 1891, would appear to assist the rural district council in doing this, but would the consent of the inhabitants of the parish be needed? The rural district council succeeded the Highway Board.

The rural district council, as successors to the Highway Board, could exercise the power given by sec. 7 of the Act

of 1878—i.e., they could divide their district (with the approval of the county council) into two or more "parts," and charge exclusively on each "part" the expense of repairing the highways in such part. Having done this I think the cost of repairing the awarded road would, under the terms of the award, be chargeable on the "part" in which it is situate. The Act of 1891 only applies where agreements are made between highway authorities as to the construction or improvement of a road.

HIGHWAY: REPAIR OF DITCH.—"Gem" writes: I should be obliged if you would give me your opinion on the following matter: In the area of the rural district council there is a road, and on one side of this is a drain or ditch, owned by the owner of the land on that side of the road. In several places the side of this drain adjacent to the road has slipped and let down the road. The owner of the drain says it is the heavy traffic on the road that causes these slips, and therefore it is the duty of the rural district council to repair them. Do you think this is so? In my opinion the cause of the slips is that the slope of the side of the drain is too steep for the nature of the soil, which is silt. I should be glad if you could quote me any decision bearing on this case.

The only duty of a landowner with respect to his ditches adjoining the highway appears to be to cleanse them to such an extent as to prevent nuisance or obstruction to passengers. I can find no authority to show that he is under any liability to repair his ditches (except so far as cleansing them may involve any repair). I think it is the duty of the highway authority to do what is necessary to reinstate the road.

HIGHWAY: ROAD MATERIAL.—"S. E. R." writes: A rural district council have completed an agreement with a landowner for getting road material from his enclosed land at a price per cube yard, and compensation paid to the occupier. The lord of the manor objects to the council taking the stone away into another township unless he is also paid a sum per yard. Can the lord of the manor enforce this? There does not appear to be any provision made for any payment to the lord of the manor under sec. 51 or 54, Highways Act, 1835, except compensation to the occupier or owner, and this has been agreed upon as above.

I presume this is a case in which the council have contracted with the landowner for the purchase of the materials under sec. 46 of the Highway Act, 1835, and assuming that the land is freehold, I do not see, from the information given in the query, on what ground the lord of the manor founds his claim. If, however, the land is copyhold of the manor, the question is whether the mines and minerals under the land belong to the lord or to the copyholder. In most manors mines and minerals belong to the lord, and if that is the case in this manor, of course the copyholder cannot dispose of them without the lord's consent.

BUILDING BY-LAWS: SWITCHBACK RAILWAY.—"Tapah" writes: Plans have been submitted to my council by a gravity switchback railway company for the proposed erection of a figure 8 railway, to be situated at a distance of 55 yds. from a dwelling-house and 8 yds. from the boundary of the property. My council have no special by-laws regarding the erection of such structures, and it is considered that this form of structure does not come under the building by-laws. Your opinion upon the following queries will be much esteemed: (1) Can the council impose conditions in considering or approving of plans for such structures more particularly (a) as to the distance of such structures from dwelling-houses, and whether there are any prescribed regulations relating thereto; (b) as to noise or nuisance arising therefrom; (c) as to whether the motor house should be fireproof? (2) Can the structure be treated as an exempted under the building by-laws?

(1) The first point is whether this is a new building within the meaning of the by-laws. It has been held that the word "building" in a by-law means some structure containing some feature contemplated by and dealt with in the by-laws, such as (for instance) walls and a roof (*Slaughter v. Sunderland Corporation*, 7 T.L.R., 296). The switchback railway itself presumably contains no feature contemplated by the by-laws, and if this is so I think it would probably be held not to be a "building." In that event the council cannot impose any conditions. The motor-house, on the other hand, probably is a "building," and if this is so it must comply with the by-laws. (2) No. I think not.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Barrow T.C. (January 21st).—£75,000 for proposed new gasworks near Roose.—It was stated that the present gasworks were working at their maximum capacity, and could not be extended. The Barrow Board of Guardians opposed the application, on the ground that the site was less than 150 yds. from the workhouse and the infirmary. Dr. Orr, medical officer, stated that inmates would be injuriously affected from any fumes from the works. The gas manager said his opinion was that gas fumes were not injurious to public health.

Bournemouth T.C. (January 22nd. Mr. T. C. Ekin).—This was an inquiry into an application for powers to extend the borough boundary, and to rearrange the existing wards.—It is proposed to take in 1,465 acres with a rateable value of over £10,000, and a population of 782. Mr. F. W. Lacey, the borough engineer, said the proposed extension was very desirable. It was very necessary to begin town planning in the district, having regard to the developments that were likely to take place.

Brentwood U.D.C. and Billericay R.D.C. (January 9th. Major J. Stewart).—This was an application by the Brentwood Urban District Council for a loan of £532 for works of sewerage and sewage disposal; and by the Billericay Rural District Council to borrow £1,548 for works of sewerage and sewage disposal for the South Weald and Shenfield special drainage district, including the execution of works in the Brentwood Urban District.—The loans required are to meet excess expenditure on the sewerage scheme recently completed.

Bristol T.C. (January 27th. Mr. W. O. E. Meade-King).—£1,800 for the purchase of properties for the widening of Filton-road (Horfield), Kingsland-road (St. Philip's), Ashley-road, Old Market-street and East Tucker-street (Counterslip). The necessary details were submitted by the town clerk, Mr. W. H. Wise, with whom was in attendance the city engineer, Mr. L. S. McKenzie.

Dalkey (Co. Dublin) U.D.C. (January 19th. Mr. A. D. Price).—£2,041 for sewerage works and the construction of water mains.—Mr. S. R. Goings, engineer, stated it was the intention to have the work carried out by direct labour. There was no opposition.

Hollywood U.D.C. (January 14th. Mr. P. C. Cowan).—£4,000 for the purpose of providing an additional storage reservoir in connection with the district waterworks.—It was stated that the existing waterworks were constructed in 1883 at a cost of £6,600, the balance of the £10,000 loan being paid for compensation, and so forth. The present capacity of the reservoirs was 12,000,000 gallons, but since they were constructed 229 houses with modern sanitary conveniences had been built, and the consumption of water had increased by close on 100 per cent. Mr. James A. Hanna, surveyor, gave details of the proposed works.

Morpeth R.D.C. (January 16th. Mr. P. M. Crosthwaite).—£9,000 for a scheme of sewerage.—The scheme embraces a new system of drainage for the townships of Bullock's Hall, Chevington East, Chevington West, Hodstone, and Widdrington.

Rotherham R.D.C. (January 21st. Mr. Thomas Adams).—This was an inquiry into an application for a housing and town planning scheme covering an area which includes Brampton-en-le-Morthen and Loughton-en-le-Morthen.—The new Thurocroft Colliery Company proposes to lay out a building estate, plans for which have been adopted by the Rotherham Rural Council, and the latter, as the local authority, desire to prepare a town planning scheme co-extensive with the colliery estate.

Stafford T.C. (January 22nd).—This was an inquiry with respect to an application for the extension of the corporation's area for the supply of gas and water, for permission to supply gas in bulk, and for permission to raise loans during the next twenty years of £50,000 for the gas undertaking, and £10,000 for the water undertaking. The proposals of the corporation are to supply gas and water to the parish of Colwich, and water to the parish of Seighford, and to supply gas in bulk to the West Staffordshire Gas Company.

Sewage Disposal at Glasgow.—The Glasgow Corporation last week entrusted the order for travelling sewage distributors for the second instalment of their new filters at Dalmarnock to Messrs. Jones & Attwood, Limited, of Stourbridge. Each distributor will be capable of sprinkling up to 1,188,300 gallons per day.

Repair of Canal Bridges: Important Decision.—On Wednesday the Court of Appeal unanimously allowed the appeal of Worcester Corporation against the judgment of Mr. Justice Phillimore, who held that Sharpness new docks and the Gloucester and Birmingham Navigation Company were liable only to keep the bridges over their canal in the city of Worcester in order so as to be sufficient, having regard to their original construction in 1812, to bear such traffic as was then ordinary on the highway carried over the canal by the bridges. Lord Justice Vaughan Williams said, in his judgment, defendants were liable to support and repair bridges sufficiently to bear ordinary traffic of the district according to the standard of the present day. Lord Justice Kennedy said if the bridges had not been constructed as they were for the convenience of the canal company, the highways in places where bridges now were would have been repairable by the road authority according to the standard of requirements of traffic from time to time. He thought the Canal Act imposed on the canal company a duty equivalent to that which the public would have enjoyed if the Act had not been passed.

Wallasey T.C. (January 24th. Major J. Stewart).—£995 for the provision of public gardens between Breck-road and St. Hilary-drive, Wallasey; £5,860 for the erection of a central fire station in Manor-road, Liscard, and the purchase of No. 8 Anglesea-road, as a residence for the superintendent; £1,950 for the purchase of two new motor fire engines; and £8,725 for the widening and improvement of Claremount-road, Breck-road, and St. Hilary-brow, Wallasey, and Wallasey-road, Liscard. The necessary details were supplied by the corporation officers.

Winchcombe R.D.C. (January 22nd. Mr. A. W. Brightmore).—£17,100 for a water supply.—It was stated that the scheme would cost Great Washbourne £8 3s. per inhabitant; Southam £11 15s. per inhabitant. The rates all round, it was thought, would be raised to the extent of 1s. 3d. in the £.

APPLICATIONS FOR LOANS.

Abergavenny T.C.—£2,100 for the purchase of property for road widening.

Beckenham U.D.C.—£350 for road widening.

Brampton R.D.C.—£445 for sewerage works.

Gosforth U.D.C.—£375 for the Coxlodge-road improvement.

Hayes U.D.C.—£2,700 for the Yeading drainage scheme.

Kinsale R.D.C.—£730 for a water supply scheme.

Louth T.C.—£2,000 for the Ugate improvement scheme.

Mansfield T.C.—£1,200 for sewer extension.

Middlesbrough T.C.—£5,000 for the purchase of a recreation ground.

Nantyglo and Blaina U.D.C.—£24,600 for a housing scheme.

Paignton U.D.C.—£200 for a storm-water drainage scheme.

Portsmouth T.C.—£30,000 for the extension of the isolation hospital.

Southend T.C.—£1,000 for public conveniences, £420 for the purchase of land for road construction, and £1,350 for the electricity undertaking.

Wallsend T.C.—£3,250 for sewerage works.

Wantage R.D.C.—£1,600 for the purchase of land for a housing scheme.

LOANS SANCTIONED.

Carshalton U.D.C.—£500 for new stables.

Deptford B.C.—£600 in respect of the execution of granite paving works in White Post-lane, and £1,500 for laying concrete foundations for asphalt paving in High-street, the period of repayment being three years.

Eastleigh U.D.C.—£2,930 for private street works.

Grimsby T.C.—£315 for a public convenience.

Huddersfield T.C.—£30,000 for the electricity undertaking.

Knaresborough T.C.—£425 for a school recreation field.

Luton T.C.—£350 for the construction of a foul-water sewer.

Mansfield T.C.—£1,075 for the purchase of property for street improvement.

Newark T.C.—For the purchase of a school site at £650 an acre.

Norman Cross (Hunts) R.D.C.—£700 for the Longueville drainage scheme.

Poole T.C.—£256 for sewer extensions.

Shoreditch B.C.—£1,500 for paving works.

Woolwich B.C.—£1,098, repayable in thirty years, supplemental contribution towards the widening of Church-street and High-street.

FORTHCOMING INQUIRIES.

	£
2.— Exeter. For a housing scheme (Mr. Courtenay Clifton)	2,115
2.— Middlesbrough. For works of road improvement (Mr. R. H. Bicknell) ...	5,192
3.— Felling. For private street improvement (Mr. R. H. Bicknell)	1,000
3.— Frinton-on-Sea. For sea defence works (Mr. H. Shelford Bidwell)	—
3.— Great Ouseburn. For sewerage works (Mr. W. M. Cross)	4,500

3.— Newcastle-upon-Tyne. For the provision of a recreation ground and public convenience (Mr. R. H. Bicknell) ...	9,231
3.— Wallasey. For the purposes of gardens, fire station, and motor fire engines (Major J. Stewart)	17,530
4.— Walton-on-the-Naze. For the repair of a groyne (Mr. H. Shelford Bidwell) ...	500
5.— Brampton. For sewage disposal works (Mr. W. M. Cross)	1,240
5.— Dartford. For electricity works extension (Mr. H. R. Hooper)	11,000
5.— Penybont. For works of sewage disposal (Mr. A. G. Drury)	10,750
6.— Leyburn. For sewage disposal works (Mr. W. M. Cross)	300
6.— Northfleet. For the purchase of property (Mr. Edgar Dudley)	300

REINFORCED CONCRETE WATER TOWER, KEIGHLEY.

This water tower has just been completed at the electric power station of the Keighley Corporation, and has a capacity of 159,000 gallons.

The tower is 50 ft. 6 in. high, and the tank is 17 ft. 6 in. diameter and 23 ft. 6 in. deep. Owing to the poor quality of the ground, the foundation raft

KEIGHLEY WATER TOWER.

was designed to impose a load of only 16 cwt. per super. foot on it.

"It is interesting to note," says the *Indented Bar Bulletin* for January, "that this structure was the subject of a loan from the Local Government Board, who approved the plans and calculations, and granted the loan without question. This is rather a pleasing development, and seems to show that reinforced concrete will soon be treated in the same way as other materials of construction for which applications for loans are made to the Local Government Board."

The tank is open at the top, and a series of radiating beams have been provided to carry a water-cooling installation which will be erected to the designs of the engineer, Mr. Harry Webber, A.M.I.C.E.

The tower has been constructed by Messrs. Hird Brothers & Co., of Keighley, to the designs prepared by the Indented Bar and Concrete Engineering Company, Limited. Indented steel bars have been used as the reinforcement throughout the work.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Bethnal Green, Coventry, Dudley, Torquay £11,000; housing and town planning—Coventry £40,282; roads and materials—Croydon £38,000, Holland £9,686, Lewisham, Northamptonshire £41,625; sewerage and sewage disposal—Morpeh; water, gas and electricity—Cardiff, Mansfield.—Particulars of other projected works will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Bethnal Green B.C.—A report is being prepared upon the provision of public swimming baths.

Brownhills U.D.C.—It has been agreed to provide a disinfectant at an approximate cost of £200.

Burnley T.C.—The Education Committee have adopted a scheme for the provision of two new schools.

Coventry T.C.—It is proposed to effect extensions at the Little Heath school, at an estimated cost of £6,750.

Dudley T.C.—The Education Committee recommend the provision of a men's hostel, at an estimated cost of £8,560.

Finsbury B.C.—The question of constructing an underground convenience at the City end of St. John's-street has been referred to committee.

Greenwich B.C.—The Adoptive Acts Committee report that they have given instructions for certain necessary repairs to be carried out at the baths and washhouses, and they add that it is their intention to report fully at an early date on the whole question so as to give the council ample opportunity of considering the desirability of bringing the baths and washhouses more up to date.—The Public Health Committee are negotiating for a site for the erection of a permanent dispensary for the treatment of tuberculosis.

Huddersfield T.C.—A tuberculosis sanatorium is to be erected at Bradley Wood, and a hospital for children. It is also proposed to build a model lodging-house for women.

Radnorshire C.C.—A scheme has been agreed to for the widening and improvement of the bridge over the Wye at Builth, at a cost not exceeding £1,700, subject to a substantial grant being obtained from the Road Board.

Tamworth T.C.—The council have approved a recommendation of the Burial Board Committee to erect a chapel on a site at the cemetery, and that a design and estimate be prepared.

Torquay T.C.—The Education Committee on Tuesday agreed to a scheme for the provision of a new technical school to cost £11,000.

Windsor T.C.—A resolution has been passed adopting the Baths and Washhouses Acts.

HOUSING AND TOWN PLANNING.

Basingstoke T.C.—A scheme has been approved for the erection of fifty cottages, at an estimated cost of £1,743.

Brigg U.D.C.—A proposed housing scheme having been rejected on the ground that the site was unsuitable, and that the rent (4s. 9d. per house) would be insufficient to make the scheme self-supporting, the Local Government Board have written requesting the council not to allow the matter to remain in its present position. It was the duty of the council, the Board stated, to take effective action. Though a housing scheme should be self-supporting as far as possible, it was pointed out that a small deficiency would not necessarily deter sanction being given for a loan.

Coventry T.C.—Following the Local Government Board's refusal to consent to the clearance of a slum area until provision was made for the tenants, the council decided on Tuesday to erect 198 workmen's dwellings at a cost of £40,282, an average of £203 each. The council already own 184 houses.

Devizes R.D.C.—The council have adopted a scheme for building cottages at Poterne for the accommodation of the working classes. It is intended to erect

six cottages, each with three bedrooms, living room, scullery, and offices. The area allowed is $\frac{1}{2}$ acre for each two cottages.

Hayes U.D.C.—A scheme has been adopted for the erection of fifty workmen's houses at Botwell.

Hinckley U.D.C.—The surveyor, Mr. E. H. Crump, has received instructions to prepare plans of a further housing scheme.

Pwllheli T.C.—The council have resolved to invite the Welsh Housing Association to prepare and submit a scheme for twenty houses on land belonging to the corporation as a first instalment, such scheme to be for ten houses to be let at 5s. per week, and ten at 3s. 9d. per week, the National Welsh Housing Pioneers' Company to submit at the same time an estimate of cost at which they would be prepared to carry out the scheme.

Stirling T.C.—With a view to clearing the St. Mary's-wynd slum area the council have made offers to owners for the purchase of their properties.

PARKS AND OPEN SPACES.

Exeter T.C.—For laying out Northway House grounds the city surveyor, Mr. T. Moulding, has prepared the following estimates: Making paths and drainage, £550; walls, steps, and balustrading, £1,320; planting and turfing, £130; bandstand, £440; fountain, £220; seats and chairs, £176; entrances from Rougemont and the college grounds, £110; total, £2,946.—For laying out the Exeter Nursery estate an expenditure of £853 is recommended, including tennis court and bowling green, £156; conveniences, £200; pavilion, £90; shelter, £60; seats, £31.

Kingston (Surrey) T.C.—£120 is to be included in next year's estimates for the construction of two additional gravel lawn-tennis courts at the Canbury Gardens.

REFUSE COLLECTION AND DISPOSAL.

Scarborough T.C.—In order to prevent overlapping and waste in future in the cleansing department, it has been agreed to amalgamate the streets and buildings and the sanitary and lighting departments. It is hoped thereby that the team labour account will be considerably reduced by using the carts and horses belonging to the present sanitary department for the dual purpose of looking after the roads and sweeping them.

ROADS AND MATERIALS.

Aberdeen T.C.—A special committee has under consideration a series of schemes for the construction of a new access to the Links, and a scheme for a new access to the joint station. For the Links access three main schemes are proposed. The first one is estimated to cost £29,400, with alternative schemes costing £36,000, and £53,680. The second scheme is to cost £80,750, with two alternatives costing £70,000 and £63,660, while the third scheme, which has no alternative, would cost £26,100. A scheme for a new access to the joint railway station from Union-street at a nett cost of £72,000 is also being considered.

Croydon T.C.—Several schemes of road improvement are to be carried out at an estimated aggregate cost of £38,000.

Deptford B.C.—The council have agreed to make up St. Norbert-road, Avignon-road, and Arica-road, Brockley, as new streets.

Elgin C.C.—A report and estimate (£1,066) with respect to the widening of the main highway from Teit Hill Wood to Llanbry, and part of the road to the east of Shanbryd, are to be submitted to the Road Board with a request for a grant.

Exeter T.C.—The city surveyor, Mr. T. Moulding, has been instructed to submit a scheme for the widening of Topsham-road on the city side of Barnardo-road.

Greenwich B.C.—The council recently approved specifications for forming and paving Hervey-road (portion), Woodville-road (portion), and Eastbrook-road as "new streets," and it was then decided that the footways should be paved with approved patent

stone. The Highways Committee have since reported that they had inspected samples of flag paving, manufactured by the Bermondsey Borough Council, and the Guardians of Greenwich Union at Grove Park, and recommended that the accepted contractors for the paving works in the above district be required to obtain the necessary patent stone for the footways from the guardians of Greenwich Union. The council adopted this recommendation.

Holland (Lincs) C.C.—The Roads and Bridges Committee have submitted to the Road Board proposals for strengthening and widening main roads in the county at an estimated cost of £9,686.

Islington B.C.—With respect to a proposed loan of £5,744 for repaving works, the Finance Committee of the London County Council reported recently that the application was in respect of repaving with materials which were not of a more substantial character than the original wood paving for which loans were granted, and it did not appear to them that the proposals of the borough council (apart from the improvement of foundations) justified an exception being made to the council's rule not to sanction loans for repaving works. In the case, however, of the foundations, it appeared that the whole of the expenditure might be regarded largely as adding to the value of the foundations, and in the circumstances the committee recommended the council to sanction the borrowing of £1,696, repayable within three years, in respect of foundation works included in the two applications. The council agreed to the recommendation, and the sanction was therefore limited to an amount of £1,696.

Kingston (Surrey) T.C.—The guardians have purchased from the council 120 tons of granite at 10s. 6d. a ton.—Mr. R. H. Clucas, the surveyor, was on Tuesday authorised to obtain a tar-boiler at a cost of about £41, a slop van at £35, and, for trial purposes, a truck load of cement kerbing at about £10.—The offer of Messrs. G. J. Palmer & Sons, of 250 to 300 tons of charcoal at the rate of 35s. per ton dry weight, has been accepted.

Lewisham B.C.—Road improvement schemes amounting to £27,000 have been recommended by the Works Committee. It was explained that a loan could be obtained for the wood-paving works, and the annual charge for repayment of principal and interest would be about £4,080. As to the other works, costing £7,015, it was hoped the Road Board would make a grant, although so far they had expressed their inability.

Liverpool T.C.—Replying recently to a question by Mr. H. E. Davies as to the replacement of boulder-paved streets, Alderman Muirhead said that if the council would go in for a loan of £250,000, they would be able to do away with all the boulder paving very soon, but as that was out of the question, the committee were dealing with a proportion of these streets each year, taking the wards in rotation. Mr. Davies moved that the committee should be instructed to provide for a larger proportion of streets being converted from boulder paving to impervious paving. This work of conversion should be greatly accelerated. It was quite impossible to cleanse streets properly when they were boulder paved; and streets of this class were all in the poorer districts where there was the greatest need for cleanliness. There were some parts of Liverpool where 60 per cent of the streets had boulder paving, and at the present rate of progress it would be thirty years before they could all be put into anything like a sanitary condition. Everton, which was the heaviest-rated part of Liverpool, suffered particularly in this respect. Mr. Davies's proposition was carried.

Llandudno U.D.C.—A letter has been received from the Local Government Board giving authority to borrow the amount required for improving the promenade roadway at Craigydou, for taking out the dangerous double angle curve, and for laying out the promenade with grass as far as Maes-y-Mor.

Manchester T.C.—The Paving Committee have decided to pave St. Ann's-street from Cross-street to Deansgate with granited rock asphalt in place of the present wood blocks.

Northamptonshire C.C.—A scheme has been approved for completing the resurfacing of certain main roads with single pitch-grouted materials, and widening the carriageways to a minimum width of 20 ft. The work is estimated to cost £41,625, of which £23,625 is maintenance and £18,000 improve-

ment. Towards this the Road Board will make a grant of £13,500, and lend £15,000 free of interest, repayable by five annual instalments.

Paignton U.D.C.—The surveyor, Mr. C. O. Baines, estimates the cost of the road widenings at Collaton, including land, at £2,216.

Penzance T.C.—It is proposed to carry out improvements at Newlyn Green, at an estimated cost of £1,500.

Plymouth T.C.—The Special Works Committee recommend the adoption of road improvement schemes at an estimated cost of £2,800.

St. Ives T.C.—The widening of Stennack-road is to be carried out at an estimated cost of £1,265.

Sedgley U.D.C.—Estimates have been adopted for the construction of roads on the Sedgley estate.

Twickenham U.D.C.—The Finance Committee have reported the receipt of a letter from the Road Board, enclosing a draft statement of the proposed grant of £500 from the Road Improvement Fund to be made by the board to the council towards the cost of resurfacing Cross Deep and Waldegrave-road. The draft grant referred to was a proportion of the following improvement: Paving with a wearing surface of Trinidad Lake asphalt on a sub-crust of bituminous concrete, from King-street to parish boundary, 13,281 sq. yds. at 10481d. per square yard, £5,800; less estimated cost of resurfacing without improvement at 1973d. per square yard, £1,092; net estimated cost of improvement, £4,708; grant by the Road Board, £500.

Westminster B.C.—It has been decided to serve notices to treat upon the property owners for the widening of Wardour-street, and that the city engineer, Mr. J. W. Bradley, carry out the necessary paving work at a cost of £225. The inclusive cost of the scheme is £9,240, towards which the London County Council will make a contribution.

SEWERAGE AND SEWAGE DISPOSAL.

Blean R.D.C.—Sewerage extensions are to be carried out at a cost of £580.

Crediton U.D.C.—Mr. Jasper (engineer) has submitted estimates of the new sewage disposal works at £8,450, and the scheme has been forwarded to the Local Government Board.

Durham T.C.—The tender of Messrs. G. Bailey, Limited, Newcastle-on-Tyne, at £1,680, has been accepted for a new screening chamber and apparatus at the Barker's Haugh sewage works.

Guiseley U.D.C.—The scheme of Messrs. Paterson & Nicholson, Bradford, for the improvement of the effluent from the sewage works has been adopted, and Mr. I. N. Nicholson has received instructions to prepare the necessary plans and estimates for submission to the Local Government Board.

Holywell (Flintshire) U.D.C.—The council have agreed to ask the Local Government Board for a further loan of £240 in respect of the sewage disposal scheme, this sum having been inadvertently omitted from the original estimates. At the same time they passed a resolution thanking the clerk, Mr. I. K. Roberts, and the surveyor, Mr. R. A. Thomas, for the able manner in which they placed the case for the scheme before the Local Government Board inspector at the recent inquiry.

Morpeth R.D.C.—Amended plans for the sewage disposal scheme, estimated to cost £9,000, have been forwarded to the Local Government Board.

Portknockie T.C.—The council are considering the extension of the sewerage system at the west end of the town.

WATER, GAS, AND ELECTRICITY.

Cardiff T.C.—Some months ago a Local Government Board inquiry was held into an application of the corporation to borrow various sums of money required for the purchase of lands in connection with the extension of the waterworks undertaking. The necessary sanction has been granted for all the items with the exception of about £18,000 involved in the purchase of 50 acres of land in the Beacons.

Fulham B.C.—The council have accepted the tender of the British Thomson-Houston Company, at £7,646, for supplying and fixing a 3,000kw. turbo-alternator and Worthington condenser.

Greenock T.C.—An application has been made to the Water Committee, on behalf of the Lower Ward

of Renfrewshire County Council, for an augmented water supply for Wemyss Bay. It is suggested that a new pipe should be laid from the upper end of the pipe at Kelly Cut, to be connected with the outlet pipe at Kelly Dam, which would increase the pressure and prevent the present break in the tank. The Water Committee have agreed to give the suggestions favourable consideration.

Hertford R.D.C.—The council have adopted a scheme for a water supply for the districts of Datchworth and Tewin.

Huddersfield T.C.—The council have agreed upon a filtration scheme at Blackmoorfoot reservoir.

Leicester T.C.—The council are recommended by the Gas Committee to construct mains for high-pressure gas, at an estimated cost of £24,000.

Leyburn R.D.C.—The scheme for the Middleham water supply is to be carried out at an estimated cost of £250.

Linlithgowshire G.C.—The question of obtaining a greater reserve of water supplies for the eastern division of the county, including Queensferry, is engaging the attention of the council.

Mansfield T.C.—It was stated at a council meeting recently that the Gas Committee required £6,000 for new mains, and £2,000 for meters, and the Water Committee £1,180 for waterworks purposes at the Chesterfield-road pumping station.

Pickering R.D.C.—The engineer, Mr. C. E. Parker, has received instructions to report upon the cost of a water supply scheme for Thornton Dale.

Shrewsbury T.C.—The Local Government Board have refused to grant the council a Provisional Order in respect of the water undertaking of the borough. The objection of the board arose out of their disapproval of the dual water supply in the borough—two separate systems which they had previously notified as being, in their opinion, unsatisfactory. It was hoped, however, the board would sanction the council financing the conduit supply out of the profits of the Severn supply, and the building up of a reserve fund.

MISCELLANEOUS.

Margate T.C.—The corporation are considering proposals for the construction of two lifts connecting the eastern promenades with the sands.

Newton Abbot U.D.C.—The council have instructed the Lighting Committee to consider the question of providing a motor fire engine or motor lorry for the fire brigade.

PERSONAL.

Mr. W. Crozier has resigned his position as county architect of Durham after twenty-five years' service.

Mr. J. E. Smith, chief drainage inspector, Rochdale, has been elected a member of the Royal Sanitary Institute.

Mr. C. Kenneth Robertson, of Luton, has been appointed assistant surveyor to the East Barnet Urban District Council.

Mr. G. P. Pearson, surveyor and inspector to the Leake Rural District Council, has been appointed borough surveyor of Marlborough.

Mr. N. Spence, surveyor and inspector to the Harts-horne and Seals Rural District Council, has had his salary increased from £150 to £179 per annum.

Mr. William Jones, surveyor to the Rhondda Urban District Council, who died in October last, left estate of the gross value of £515, of which £131 is net personalty.

Mr. R. W. Smith Saville, borough surveyor of Darwen, has been taken ill at a London hotel. He is one of the principal witnesses in an arbitration case at the Surveyors' Institution between the corporations of Bolton and Darwen, to determine the price to be paid by Darwen to Bolton for a supply of 300,000 gallons of water daily.

Mr. A. T. Hobbs, ASSOC.M.INST.C.E., who has for eighteen months been an assistant in the department of Mr. R. H. Jeffes, surveyor to the Maldens and Coombe Urban District Council, is, it was announced at the last meeting of the council, resigning in order to take up an appointment under the Birmingham

City Council, and a committee was authorised to take what steps they thought advisable to fill the vacancy.

Mr. Reginald Brown, of Westminster and Southall, has been elected a member of the Institution of Mechanical Engineers. Mr. Brown is a member of the Institution of Civil Engineers and of the Institution of Municipal and County Engineers, a fellow of the Surveyors' Institution, a member of the Royal Sanitary Institute, and a hon. member of the Association of Managers of Sewage Disposal Works.

Mr. Henry Mattinson, ASSOC.M.INST.C.E., permanent way engineer to the Manchester tramways, has been appointed chief civil engineer to that department, under an agreement for four years, at a salary of £500, rising to £600 per annum. Mr. Mattinson recently made a tour of the principal cities of the Continent, United States and Canada, to study the methods of dealing with local passenger transportation in those countries, the congestion of traffic in Manchester calling for urgent attention.

Mr. H. Talbot-Crosbie, the town engineer of Yorkton, Saskatchewan, was born at Ardfert Abbey, Ireland, and educated at the Alban Academy, Glasgow. His father is Mr. L. B. Talbot-Crosbie, late of the Royal Navy and at present Deputy-Lieutenant of County Kerry, Ireland. Mr. Talbot-Crosbie served his apprenticeship from 1894 to 1899 with Messrs. Johnstone & Rankine, civil engineers, of Glasgow, and during that time he attended classes at the Glasgow University and Technical College. Upon the completion of his pupilage he became associated with the firm of Kyle, Dennison & Frew, Glasgow, proceeding to South Africa in 1900, but returning the following year to take charge of construction on the Invergarry and Fort Augustus Railway, Inverness-shire. In 1902 he went to Canada, and soon joined Messrs. Mackenzie & Mann, by whom he was sent to Nova Scotia on railway construction work. After marrying, and for a time taking up farming, he, in 1911, accepted the position of town engineer of Yorkton, where at present the works under his charge include a new water supply from York Lake, 4 miles distant. Mr. Talbot-Crosbie (concludes the *Contract Record*, to which we are indebted for these particulars) is an associate-member of the Canadian Society of Civil Engineers.

Mr. William Ramsay, the city engineer of Fernie, British Columbia, entered the engineering department of the Dundee Corporation in 1895, and was articled to Mr. G. Baxter, M.INST.C.E., the waterworks engineer. While serving his articles he took an engineering course at Dundee University College and obtained several diplomas. Eventually he was made assistant waterworks engineer in charge of all survey work. During the eleven years he was in Dundee he was responsible for all the details of many improvements, including better fire protection, covered concrete culverts in place of open aqueducts, sand filters, and clear-water reservoirs. The last work upon which Mr. Ramsay was engaged in Dundee involved an expenditure of £75,000. At the time he was identified with Messrs. D. Y. Stewart & Company, of Glasgow, by whom he was appointed resident engineer on rather an exceptional piece of work—namely, the lifting of $4\frac{1}{2}$ miles of 27-in. cast-iron trunk main and replacing it with the same size of main, but with different joints. This main portion, working under a pressure of 480 ft., or 208 lb. to the square inch, caused constant trouble from bursting at joints which were leaded and driven. To obviate this the joints on the new main were simply roped, leaded and caulked. The old main was broken by means of a pear-shaped weight of 1,700 lb., dropped from a height of 12 ft., and the old metal was shipped back to the pipe foundries and recast. Upon the completion of the work tests were made, and not a single leaking joint was discovered, although in places the ground was so treacherous that the pipes had to be laid on piles driven 8 ft. into the ground. Mr. Ramsay went to Canada some two years ago, and was appointed city engineer of Fernie in June, 1912, in succession to Mr. Robert Potter, now of Battleford, Saskatchewan. We are indebted for these details to the *Contract Record*, of Toronto.

With respect to the announcement of the resignation of Mr. F. Hopkinson, surveyor and inspector to the Blyth and Cuckney Rural District Council, it should be explained that, owing to the increase of his private practice, he has resigned the positions of sanitary surveyor and sanitary inspector, but continues to hold the office of highway surveyor.

ROAD WORK IN TONBRIDGE RURAL DISTRICT.

SURVEYOR'S REPORT.

Road tarring in the rural district of Tonbridge, Kent, cost during the year ended March 31st last, states the engineer and surveyor, Mr. Frank Harris, £1,038 for 195,561 super. yds., an average of 1½d. per super. yard. This is about £100 under the expenditure of the previous year, and 1d. less per super. yard. Although a very large outlay, Mr. Harris is convinced that the expenditure is justified from a maintenance point of view alone. Without it, he points out, the surface of the roads would be destroyed by the motor traffic. The immediate result is saving in manual labour.

NEW RESERVOIR, ELGIN.

scavenging and clearing, and the prevention of scouring of the roads after heavy storms, while the system must necessarily result in less material for repairs being required owing to the prolonged life of the road surface.
